Letter read from the Newtown Municipality; also, from the Town Clerk's Office, referring to a letter of date 4th of November, applying for certain information in connection with the water supply to the city, and stating that the Mayor would be most happy to furnish all the information in his power with regard to the matter of inquiry; but that, with the exception of the yearly reports of the Municipal Council, submitted to Parliament, and such documents as have already been laid before the Commission by the City Engineer, there are no printed papers or reports in that department containing matter at all likely to assist the Commissioners in their inquiry.

The Minister for Works transmitted to the Commission a description of the Waterworks at New York, from Mr. Sheldon.

The Secretary was directed to obtain from the Government Astronomer the index errors of the barometers used by the Commissioners in determining altitudes.

The Secretary was directed to write to the Colonial Secretary, stating that the Commissioners, having examined the junction of the Warragamba and Nepean Rivers, with the view to judge of the practicability of supplying the city with water from that source—find that it is not possible to arrive at any definite conclusion without a section extending from thence to the Railway at South Creek, and requesting that the Surveyor General might be moved to cause the services of a surveyor to be placed at their disposal for that purpose.

The Secretary was directed to obtain from the Colonial Secretary authority for the printing of the evidence taken before the Commission.

The Commission resolved to proceed, on Wednesday, December 11th, to examine the country about the heads of the Woronora, Cataract, and Cordeaux Rivers, and Port Hacking Creek, and deliberated on the arrangements necessary for carrying out this inspection.

9 DECEMBER, 1867.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.

P. F. Adams, Esq.

F. H. Grundy, Esq.

T. Woore, Esq.

Letter read from the Marrickville Municipality.

The Commissioners deliberated on their mode of procedure at the Woronora, &c.

20 DECEMBER, 1867.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.

P. F. Adams, Esq.

F. H. Grundy, Esq.

T. Woore, Esq.

The Commissioners met at the office, according to appointment, at 10:30 a.m., on Wednesday, the 11th December, and proceeded, by Cook's River and George's River, to Bottle Forest, where they camped for the night.

Barometric observations were obtained during the journey, for the determination of altitudes.

The next morning they proceeded westward down the Bottle Forest Creek to its junction with the Woronora River, and then followed the river to its confluence with the tide, returning from this point by the Old Wollongong Road.

The Woronora, just above the junction of Bottle Forest Creek, was estimated to deliver 160 gallons per minute, and the Bottle Forest Creek about two-thirds of that quantity.

Barometric readings were taken during the day, and the corresponding altitudes estimated.

The next day the Commissioners proceeded towards the heads of the Woronora and Port Hacking River, and camped on a dividing ridge between these waters.

The next day (Saturday) the Commissioners proceeded towards the head of the Cataract River, examining on their way the sources of Port Hacking and O'Hare's Creeks and the Woronora, and camped that night at the head of the Cataract River.

Barometric readings were taken as usual.

On Monday the Commissioners divided into two parties, one of which proceeded to the sources of O'Hare's Creek, and examined this creek down until it breaks from the tableland into a deep gorge, giving particular attention to places suitable for the construction of dams, and returned by Darke's Forest Road and across the head swamps of the Cataract River; the other party examined carefully the north-eastern tributaries of the Cataract River, going round all the swamps and creeks to the north of the road from Appin to Wollongong. The barometric readings were taken during the day, by both parties, for determining altitudes.

The next day (Tuesday) the Commissioners proceeded towards Appin, examining on their way the country draining into George's River on the one hand, and into the Cataract River on the other, and camped on King's Falls Creek, near Appin.

On Wednesday the Commissioners sent back the camp and equipments to Sydney, and proceeded themselves southward across the Cataract River, by Broughton's Pass, and thence along the dividing range between the Cataract and Cordeaux Rivers, examining the tributaries on either hand, arriving in the evening at Wollongong, where they obtained barometric observations at the sea level, and returned to Sydney yesterday (Thursday) by way of Appin and Campbelltown, verifying certain of the altitudes previously obtained.

23 *DECEMBER*, 1867.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Woore, Esq.

Various letters read.

The Secretary was instructed to write to the Mayor, stating that the Commission terminates on the 24th instant, but that, pending its reappointment and the resumption of the inquiry, His Worship would advance its object, by requesting the City Engineer to give facilities to any Member of the present Commission for observing the condition of the swamps and dams, and the working of the engines at Botany, especially during the continuance of the present drought.

The President read a Draft Progress Report, which was adopted, and ordered to be transmitted to the Colonial Secretary, together with a statement of the expenditure of the Commission up to the present time.

8 *FEBRUARY*, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		

The instrument, under the Great Seal of the Colony, reappointing the Commission to 23rd June, 1868, was read.

Mr. George E. Faithfull was reappointed Secretary to the Commission.

A letter was read from the Town Clerk's Office, transmitting, for the consideration of the Commission, a copy of a communication received from Mr. Campbell Mitchell, of Stamwell, Appin, upon the subject of obtaining a supply of water for Sydney from the Woronora River.

The Secretary was directed to acknowledge the same, with thanks, and to state that the Commission had examined the Woronora fully, before the receipt of the communication.

Mr. Moriarty presented a specimen of water which he had collected from the engine-pond at Botany, in December. The specimen was handed over to Professor Smith, for analysis.

Other letters read.

11 *FEBRUARY*, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		

Plan of the Couridjah Lagoons, in the County of Camden, was laid upon the table.

Mr. E. Barton was examined respecting the capabilities of the Grose, the Warra-gamba, the Colo, and other rivers.

15 *FEBRUARY*, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Woore, Esq.

The Secretary was instructed to obtain, from the Railway Department, the cross sections taken by Mr. Barton in the Valley of the Grose, at the junction of Barton's Creek, and the cross sections taken between the distances of 48 and 51 miles from Parramatta, by the western trial line, in the Valley of the Grose; also, the section taken along Bell's line.

Mr. E. Flood was examined respecting the Botany stream.

20 FEBRUARY, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Woore, Esq.

A letter was read from the Colonial Secretary, accompanying the following Reports, &c. :—

Description of the Manchester Waterworks.
 Description of the Glasgow Waterworks.
 Metropolis Water Supply.
 Future Water Supply of London,
 Constant Water Supply for London.
 Water Supply of the City of Paris.
 Water Supply of Bombay.
 Government Waterworks in Trafalgar-square.
 President's Address. Institution of Engineers in Scotland.
 Supply of Water to Liverpool.

Mr. Grundy laid on the table the following Reports :—

Report on the Leeds Waterworks.
 Report on the Dublin Waterworks.
 Report on the Supply of Water to Bombay.
 Series of articles on the Water Supply of London.

The President laid on the table two Reports on the Aberdeen Waterworks, together with Specification of Works.

Mr. Woore laid on the table a plan and section of his proposed Aqueduct from South Creek to Sydney, on a larger scale than the one formerly presented. Also, a plan and section of his proposed Railway Line, adjoining the Couridjah Lagoons.

The Secretary produced various plans and sections of the Valley of the Grose, obtained from the Railway Department.

The Commissioners examined the various plans and reports before them, and deliberated on their future proceedings.

It was resolved to visit the Botany Dams, on Saturday, 22nd instant, and to meet at the office, for that purpose, at 9 a.m.

22 FEBRUARY, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Woore, Esq.

The Commissioners, in accordance with the resolution adopted at last meeting, proceeded to the Botany Waterworks. Being joined there by the City Engineer, they proceeded up the stream, and examined the six dams, with the view of observing the effects of the recent heavy rain and floods.

27 FEBRUARY, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Woore, Esq.

Mr. Licensed Surveyor Wyndham's section from the Warragamba to South Creek, along a line pointed out by Mr. Woore, was laid on the table, and Mr. Wyndham attended to give such explanation as might be required.

Mr. Licensed Surveyor Pitt attended to give information to assist the Commissioners in their proposed visit to the Grose.

The Commissioners then proceeded by railway to Douglass Park Station, and thence to Nepean Towers.

Feb. 28.—The Commissioners went by water up the Nepean River, to above the junction of Allen's Creek; from thence down the river, as far as the junction of the Cataract, and then up this river for some distance.

Specimens of water were collected from both rivers, for the purpose of analysis.

The Commissioners then visited Broughton's Pass, on the Cataract River, with the view of determining the altitude of that point in the river, as compared with its mouth.

Feb. 29.—The Commissioners examined the country towards the Cordeaux, and the junction of the Cordeaux and Nepean, known as the Pheasant's Nest; and, lastly, the course of the Nepean from the Cataract River down to Menangle.

Barometric readings were obtained to determine altitudes.

5 MARCH, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Woore, Esq.

Resolved,—That the Commissioners do now record their high appreciation of the valuable co-operation and assistance which they received from R. L. Jenkins, Esq., of Nepean Towers, on the occasion of their recent examination of the Nepean, Cataract, and Cordeaux Rivers, and desire that their cordial thanks for such assistance, and for the facilities he so liberally afforded them for acquiring a knowledge of the capabilities of the district, in regard to the Water Supply of Sydney, be communicated to Mr. Jenkins by the President.

The Commissioners also record their thanks to Mr. J. B. Carroll, for the zealous services he rendered them on the occasion of their visit to the Woronora, and their opinion that some substantial recognition of such services should be presented to Mr. Carroll. [The Commissioners afterwards presented an Aneroid Barometer (at their own cost) to Mr. Carroll.]

Mr. Du Faur attended to give information to the Commissioners respecting the best mode of access to the upper parts of the Warragamba, and its junction with the Cox.

Resolved,—That the Commissioners should examine the Couridjah Lagoons, on Saturday, 7th instant.

7 MARCH, 1868.

PRESENT :—

Professor Smith, M.D., President.

P. F. Adams, Esq.		F. H. Grundy, Esq.
		T. Woore, Esq.

The Commissioners met at the Railway Station, at 9 a.m., and proceeded to the Couridjah Lagoons, beyond Picton. They examined the extent of these lagoons, and of their drainage area, and collected a specimen of the water for analysis.

10 MARCH, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Woore, Esq.

The Commissioners examined Mr. Surveyor Wyndham's section from the Warragamba to Rope's Creek, and entered on a lengthened discussion of the comparative advantages of the various schemes that have come under their notice. They also determined to visit, as early as circumstances will permit, the upper and lower parts of the Grose, together with the Wheeny Creek and the Colo.

The Secretary was instructed to plot Mr. Woore's trial section from Ashfield to Rope's Creek, and Mr. Wyndham's continuation to the Warragamba, on a scale of 10 chains to the inch horizontal, and 100 feet to the inch vertical.

The Secretary was further instructed to apply to the Commissioner of Railways, for any trial surveys and sections made for railway purposes, by the late Mr. Surveyor Berry, in the County of Cumberland.

17 MARCH, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Wood, Esq.

A letter was read from Mr. R. L. Jenkins, of Nepean Towers, acknowledging the communication of the Commissioners, and thanking them for the same, further stating that he should be glad to be of further use in forwarding the very important object confided to the Commission.

The Secretary reported that Mr. Bell was unable to attend in consequence of a previous engagement.

It was resolved that three Commissioners, namely, the President, Mr. Woore, and Mr. Grundy, should be deputed to visit Burragorang, with the view of determining the level of the Wollondilly at that place, and the level of the junction of the Cox with the Wollondilly.

The

The President reported that, in company with Mr. Grundy, he had examined the ridge by Newtown, Enmore, and Petersham, with the view of determining altitudes on it, and the possibility of forming there a large distributing reservoir.

The discussion on Mr. Woore's scheme having been resumed, Mr. Woore laid before the Commission a proposition for an amended section of his line. (*See Appendix.*)

The President read a letter that he had received from Mr. Woore on the same subject. (*See Appendix.*)

Discussion ensued, and the further consideration of it deferred till next meeting.

25 MARCH, 1868.

PRESENT:—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.

P. F. Adams, Esq.

F. H. Grundy, Esq.

T. Woore, Esq.

Letter read from Mr. Wyndham, on the subject of examining the head of the Grose.

Letter read from Benjamin Carver, stating that he had been up the Grose and inspected it; that the road is in a very bad state, a good many landslips having fallen into the track and blocked it up; and that there is a great deal of scrub.

The City Engineer was examined respecting the present supply of water to Sydney.

Mr. Grundy reported that he had not gone to Burragorang, in accordance with the former minute, considering that two Members of the Commission were sufficient for the duty required, and that unnecessary expense would be saved by his not going.

The President and Mr. Woore reported that, in accordance with the resolution adopted at last meeting, they had proceeded to Burragorang, carrying with them one of Newman's Mountain Barometers, obtained from the Survey Department, and also a trustworthy Aneroid Barometer. With these instruments they obtained careful readings, on three days, at three points on the Wollondilly, namely,—at the junction of the Cox; at the junction of the Nattai, 10 miles higher up; and at a point about 2 miles below the Nattai. Readings were also obtained at Picton, on going and returning. These have been compared with readings taken at the Sydney Observatory, and the results give about 170 feet as the altitude above the sea of the junction of the Cox, and 240 feet as the altitude of the junction of the Nattai. The Commissioners interrogated several residents in Burragorang, and learned that within the last thirty-five years the Wollondilly had been known several times to stop running, but that the Cox had never been known to stop. They learned also that the course of the Warragamba, down to the still reach where it joins the Nepean, presents a series of falls and rapids, with little still water.

The consideration of Mr. Woore's memo. having been resumed, it was moved by Mr. Moriarty, seconded by Mr. Adams, and carried:—

That, under the circumstances referred to in Mr. Woore's memorandum, it is resolved that, in order to expedite the proceedings of the Commission, it is considered advisable that any Member having any project or scheme to propose, shall do so by letter, setting forth in detail, as far as possible, the particulars of such scheme; and that all question of remuneration for suggestions as to the best means of obtaining a supply of water for the city be left for the consideration of the Government—the Commissioners being of opinion that it is not their province to fix the remuneration for any proposal, however valuable it may be.

Moved by Mr. Moriarty, and carried:—

That Mr. Grundy be detailed to make a section, in continuation of that of the late Mr. Shone, from Appin, along the crest of the ridge dividing the waters of George's River from those of the Nepean and its tributaries—such section to be continued to about the head of Duck Creek.

The Secretary produced the combined sections of Mr. Woore and Mr. Surveyor Wyndham, plotted, as directed, to the scale of 10 chains to the inch horizontal, 100 feet to the inch vertical.

The Secretary was instructed to write to the Commissioner for Railways, requesting that he would permit Mr. Quodling, Resident Engineer on No. 4 Contract of the Western Railway, to give assistance to the Commissioners on their visit to the head of the Grose, without, however, interfering with his proper duties.

31 MARCH, 1868.

PRESENT:—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.

P. F. Adams, Esq.

F. H. Grundy, Esq.

T. Woore, Esq.

Mr. Woore read a statement in reference to supplying Sydney with water from the Warragamba, accompanied by illustrative drawings. (*See Appendix.*)

Discussion ensued.

It

It was then moved by Mr. Moriarty, seconded by Mr. Adams, and carried :—

That Mr. Woore's statements be printed, for the use of the Commissioners, and that he be asked to afford such verbal explanations of his scheme as may be required by the Commissioners, at an early meeting; such explanations to be taken down by the shorthand writer in the ordinary way, and be attached to the other evidence.

Mr. Woore stated that, in the papers before the Commission, he had given all the information that he possessed, and that he was unable to give more till an amended section be made, but he will give evidence if the Commissioners desire it.

The Commissioners determined to visit the head of the Grose next week, starting on Tuesday morning, the 7th of April.

16 APRIL, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.

F. H. Grundy, Esq.

T. Woore, Esq.

The following letter to the President was read :—

Edgecliffe House,
1 April, 1868.

Dear Dr. Smith,

Having given all the information I can in the drawings and papers I have read to the Water Commission, on my Warragamba scheme, and during the discussion that took place upon them, I must decline appearing before it as an ordinary witness; at the same time, should the Commission have any questions to put to me that will further illustrate the subject, if they will do so in writing, I should very gladly attend to their wishes.

Remaining

Yours very faithfully,

THOMAS WOORE.

The Secretary was instructed to apply to the Colonial Secretary for a further advance of £200 towards defraying the expenses of the Commission.

The President reported that he and Mr. Adams, together with the Secretary, had attended at the Railway Station, at 6.45 a.m. on 7th April, as agreed on at last meeting, and no other Commissioners appearing, they thought it advisable to proceed in the character of a deputation from the Commission, to examine the upper part of the Grose. On arriving at One-tree Hill, they had an interview with Mr. Quodling, who kindly undertook to make various arrangements necessary for carrying out their programme. On the 8th, 9th, and 10th of April they examined the Grose to a point about half a mile below the junction of Govett's Leap Creek. On descending the valley to a level of about 800 feet below the Railway (and therefore, about 2,600 feet above the sea), they passed from the Sydney sandstone formation to the coal measures, through which they continued to descend to a further depth, probably, of 1,500 feet. Along the whole distance examined, the sandstone rose like a precipitous wall above the talus formed by the coal measures. Notwithstanding the preponderance of coal measures, the water appeared to be excellent; but this will not seem extraordinary when it is considered that the gathering ground is of sandstone formation, and that the water falls rapidly over protruding portions of the softer strata, with scarcely any percolation. The only suitable position for a storage reservoir is a little below the junction of Govett's Leap Creek with the River, where the valley narrows again after opening out into an extensive alluvial flat; and the observations taken lead to the conclusion that any dam capable of throwing back a sheet of water to the extent of 400 acres must be from 60 to 70 feet high, and from 600 to 700 feet long. The capabilities of the rock for resisting pressure of water appeared to be very low, and not adapted to building purposes, although a supply to any extent, probably, could be obtained by sliding down stones quarried from the sandstone formation, some 1,500 feet above it.

Moved by the President, and carried :—

That the thanks of the Commission be tendered to Henry Quodling, Esquire, Resident Engineer on No. 4 Contract of the Western Railway, for the valuable assistance afforded by him to the Members of the Commission visiting the Grose, by which their examination of the upper part of that river was so much facilitated.

(2.) That a copy of this Resolution be transmitted to Mr. Quodling by the Secretary.

Mr. Woore submitted the following resolution :—

That in order to obtain data from which an estimate of the cost of bringing water from the Warragamba River into Sydney may be calculated, an amended section of that line be gone into without delay.

The consideration of this resolution was deferred till next meeting.

18 APRIL, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
		T. Woore, Esq.

Discussion on Mr. Woore's resolution was resumed.

A letter was read from Mr. Grundy to the President, on the subject of Mr. Woore's scheme. (*See Appendix.*)

Moved by Mr. Moriarty, seconded by Mr. Adams, and carried :—

That before further expense be incurred in regard to Mr. Woore's scheme, printed copies of the various statements read by him to the Commission be supplied to the Members, with the view of eliciting written opinions thereupon.

Moved by Mr. Woore, seconded by Mr. Adams, and carried :—

That the letter from Mr. Grundy, just read, be printed, and supplied to the Members.

Resolved.—That the Secretary be instructed to examine the Cataract River, from the junction of the Loddon to Broughton's Pass, with the view of determining eligible sites for forming dams along the bed of the river, and the approximate dimensions of such dams.

5 MAY, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Woore, Esq.

The Secretary read a report of his examination of the Cataract River, made in accordance with instructions received from the Commission, at the meeting held April 18th, in order to determine suitable sites for dams.

Discussion on Mr. Woore's scheme of deriving water from the Warragamba was resumed.

A decision on Mr. Woore's motion of April 16th was deferred till a future meeting.

A memo. from Mr. Adams was read, conveying an opinion adverse to the proposed dam.

A letter from Mr. Adams to the President was read, stating that, owing to the pressure of business in his department, he wished to be relieved from regular attendance at the meetings of the Commission, and recommending that the services of Mr. W. C. Bennett should be obtained in his place.

It was resolved that a copy of this letter should be transmitted to the Colonial Secretary, with a recommendation that Mr. Bennett should be added to the Commission.

The Secretary was instructed to procure specimens of water from the mouth of the Grose River, and from South Creek, near the Railway Crossing.

The Commissioners determined to visit, on Tuesday, 12th instant, the sites of storage reservoirs proposed by Mr. Bell, City Engineer.

Mr. Woore reported that he had obtained specimens of water from Wollondilly, Mulwarree Ponds, Paddy's River, and Wingecarribee—all of which were handed over to Professor Smith for analysis.

May 12th.—The Commissioners, in company with the City Engineer, proceeded to examine the sites of certain of the reservoirs proposed by that gentleman;—first, a large natural basin on the ground formerly set apart as a cemetery, near the south end of Bourke-street; thence to Paddington; and lastly, to the highest ground at Waverley.

19 MAY, 1868.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Woore, Esq.

Mr. Moriarty handed in a memorandum on Mr. Woore's Warragamba scheme, which was ordered to be printed, and distributed among the Commissioners.

Discussion on this scheme was resumed, and again adjourned till a future meeting.

Mr. Woore then submitted a resolution bearing on the construction of dams, the consideration of which was postponed till next meeting.

The Commissioners, with the exception of Mr. Adams, then proceeded to Richmond by railway, on the way to Wheeny Creek and the Colo.

May

57

May 20th.—The Commissioners proceeded to the junction of the two Wheenys, about fourteen miles from Richmond, and followed the main stream about two miles up.

A specimen of water was collected below the junction, for analysis.

From the barometric readings at the junction of the two Wheenys, it appears that that point is 50 or 60 feet above the level of the sea.

Thursday, May 21st.—Mr. Moriarty and Mr. Grundy having returned to Sydney, Mr. Woore went to the summit of the Tabarag ridge, to view the drainage area of the Wheeny Creek, while the President and Secretary went along the Comleroy Road towards Wheeny and Colo.

A specimen of water was collected from the latter river, for analysis.

29 *MAY*, 1863.

PRESENT:—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		F. H. Grundy, Esq.
		T. Woore, Esq.

A report from Mr. Grundy, on the progress of the trial section from Broughton's Pass towards Sydney, was read.

Mr. Moriarty's memorandum on Mr. Woore's scheme was read, and discussion thereupon resumed in connection with Mr. Woore's resolution submitted on the 16th April.

This resolution being then put, was negatived.

Mr. Woore's resolution relating to the construction of dams, submitted at last meeting (19th May), was then put and negatived. (*For the resolution, see Appendix.*)

It was then moved by Mr. Woore, and carried, that the resolution now negatived be printed, and appended to the other papers connected with this subject.

11 *JUNE*, 1863.

PRESENT:—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		T. Woore, Esq.
		W. C. Bennett, Esq.

A letter was read from the Principal Under Secretary, intimating that His Excellency the Governor, with the advice of the Executive Council, had been pleased to appoint William Christopher Bennett, C.E., Commissioner and Engineer of Roads, to be an additional Member of the Commission—Mr. Bennett's Commission, under the Great Seal of the Colony, accompanying the same.

The President reported that he and Mr. Grundy had visited George's River, near Campbelltown. By aneroid observations, they made the river below the junction of Toggerai Creek to be 200 feet above the sea. The flow was gauged at a favourable point, and made to be about one and three-quarter million gallons per day. A specimen of water was collected for analysis.

The Secretary reported that he had visited South Creek, as directed, and obtained a specimen of its water for analysis. Had gauged the stream, and found the discharge to be at the rate of 575,000 gallons per day.

The President read a memorandum conveying his opinion of Mr. Woore's scheme of deriving water from the Warragamba.

Mr. Woore read a letter addressed to the President, commenting on the written opinions of the other Members of the Commission on his scheme. (*See Appendix.*)

18 *JUNE*, 1863.

PRESENT:—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		F. H. Grundy, Esq.
T. Woore, Esq.		W. C. Bennett, Esq.

The President laid before the Commission a tabular statement of the composition of twenty-eight specimens of water from the present source of supply, and from the various suggested sources that have been examined by the Commissioners.

Mr. Moriarty read a memorandum referring to the construction of the Parramatta Dam alluded to in Mr. Woore's letter of June 8th. (*See Appendix.*)

Mr. Grundy submitted a plan and section, together with a written description of his survey along the dividing ridge between the waters of the Nepean and George's River, so far as it has been completed.

As the Commission will expire on the 23rd instant, the President brought up a Progress Report, which was adopted and signed, for transmission to the Colonial Secretary.

11 JULY, 1868.

PRESENT:—

Professor Smith, M.D., President.
 E. O. Moriarty, Esq. | P. F. Adams, Esq.
 W. C. Bennett, Esq.

A letter from the Colonial Secretary was read, accompanying a renewed Commission, extending the inquiry into the Water Supply of Sydney to the 23rd December.

A letter from Mr. Woore to the President was read, requesting to be allowed coach fare and free railway pass from Pomeroy, to attend meetings of the Commission.

The Secretary was directed to forward this letter to the Colonial Secretary, and to state that the Commissioners considered Mr. Woore's request to be reasonable.

The Secretary was directed to write to the Colonial Secretary, requesting him to apply to the Government of Victoria for information respecting the Yan Yan Reservoir, and also to the Government of Bombay, for similar information respecting the Water-works there.

The future proceedings of the Commission were then discussed, and it was resolved that Mr. Moriarty and Mr. Grundy be requested to undertake the responsibility of working out the details of the scheme for bringing water from the Cataract and Cordeaux Rivers, and Mr. Bennett to undertake a similar responsibility in regard to the improvement and extension of the present supply from the Botany Swamps.

21 JULY, 1868.

PRESENT:—

Professor Smith, M.D., President.
 E. O. Moriarty, Esq. | P. F. Adams, Esq.
 F. H. Grundy, Esq. | W. C. Bennett, Esq.

A letter was read from the Colonial Secretary, acknowledging the receipt of a letter from the Commission, of date July 11th, enclosing one addressed to the President of the Commission, by Mr. Woore, requesting that he might be provided with a railway pass, and that his coach hire might be paid; and stating that the Colonial Secretary does not consider that he would be justified in making any additional recommendation to the Executive Council on the subject mentioned.

Mr. Grundy read a report on the progress of his survey of the Dividing Ridge from Sugarloaf to Prospect, and submitted plans and sections of portions of the same.

Discussion on the Cataract scheme being resumed, it was resolved that Mr. Moriarty and Mr. Bennett be deputed to examine, along with Mr. Grundy, the proposed line of aqueduct from the Cordeaux and Cataract Rivers to Prospect.

22 AUGUST, 1868.

PRESENT:—

Professor Smith, M.D., President.
 P. F. Adams, Esq. | F. H. Grundy, Esq.
 W. C. Bennett, Esq.

Two letters from the Colonial Secretary read.

Mr. Grundy laid before the Commission a map of the results of his surveys of the range south of Prospect, shewing two localities which he considered favourable for the construction of storage reservoirs. By a rough estimate of their capacity, he stated that the more northerly of the two would contain, when full, 30,000 million gallons of water, the surface being 230 feet above high-water level at Sydney; it would require embankments to the extent of 150 chains, rising at one point to a height of 105 feet. The more southerly of the two he estimated would contain 5,000 million gallons, the surface being 250 feet above high-water level at Sydney; it would require 120 chains of embankment; the greatest height would be 90 feet to water level, but one-third of the embankment would be only 9 feet high, the average height of the remainder being 50 feet. Mr. Grundy desired to take the opinion of the Commission as to the adoption of one or both of these reservoirs. He said that perhaps it might be considered advisable to make a more minute examination of each of them, with the contours and cross sections necessary to arrive at a more correct estimate of their capabilities; but if one only were to be adopted, he recommended the southern one as, on the whole, more advantageous. Mr. Grundy reported that clay was abundant in the locality. Discussion ensued upon the relative merits of the two, and also whether it might be better to go further south on the range. Mr. Grundy having stated that there was no other locality upon the range so suitable for extensive reservoirs, and that he had given particular attention to this question throughout his examination of the range, the southern reservoir was adopted, and Mr. Grundy was requested to carry contour lines round it, at the heights of 250 and 200 feet above sea level, and to make such cross sections as he found necessary, in order to obtain a closer approximation to its cost and capabilities.

15 OCTOBER, 1868.

PRESENT:—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.

F. H. Grundy, Esq.

T. Woore, Esq.

W. C. Bennett, Esq.

A letter was read from the Colonial Secretary, accompanying a letter from Captain Mayne, and a book descriptive of the Brooklyn Waterworks; also, a letter from the Colonial Secretary, enclosing answers to the queries of the Commissioners on the subject of the Melbourne Water Supply.

The President laid on the table a pamphlet on the "Design and Construction of Storage Reservoirs"; also, further drawings of the Aberdeen Waterworks.

The President reported that he had visited Buralow Swamp, and determined its altitude, by a good aneroid, to be 960 feet above the sea. It affords facilities for the construction of a reservoir of great capacity. He also visited the Wheeny Creek, above the "Gap," and found its altitude to be 720 feet above the sea. From both places he collected specimens of water for analysis.

The following report was read from Mr. Moriarty and Mr. Bennett, on the results of their inspection of the site of the proposed reservoir near Prospect, and of the proposed conduit as far as Sugarloaf:—

"Having examined the site for the proposed reservoir at Prospect, and gone over the line selected in detail by Mr. Grundy for the aqueduct from Menangle, we are of opinion that, with reference to the former, it would be judicious to slightly alter the position of the embankment so that the central ridge would divide it into two dams, thereby forming two distinct reservoirs. This alteration would also decrease the length of the embankment and the quantity of earthwork, and without increasing the height of the dam, will permit of the water being retained in the reservoir at a level 10 feet higher than would have been the case had the dam been constructed as proposed at first, thereby approximating to the height originally suggested by Mr. Grundy.

"With reference to the aqueduct, we think it probable that the line may be improved and shortened by taking the eastern side of the range from about the 22nd mile to where it enters the reservoir; and we would suggest that the country should be examined with that view.

"The fall economized by thus shortening the conduit, together with that obtained by lowering the reservoir 20 feet, we would suggest should be divided as may be found desirable, between the reservoir and Carne's Hill Toll-bar, affording facilities for crossing the depressions in the range, if required, with syphons. To effect this, it will be necessary to slightly change the position of the conduit to lower ground.

"The western side of the range, south of Mr. Chisholm's, should be examined, in order to ascertain the possibility of taking the line of aqueduct in that direction instead of along the eastern side, where the ground is steep, broken, and liable to slip.

"We would also express our concurrence with the manner in which the line has been selected and laid out, and our approval of the site chosen for the reservoir, which adds so much to the value of the project.

"E. O. MORIARTY.

"WILLIAM C. BENNETT."

Messrs. Moriarty and Bennett also gave a verbal report of their examination of Pheasant's Nest and Broughton's Pass, and of the country between the latter point and Sugarloaf. They also reported having made provision for the accurate gauging of the three rivers—Nepean, Cordeaux, and Cataract. Mr. Grundy produced a finished plan of the adopted reservoir, showing the amount of embankments required for the heights of 250 and 260 feet respectively; also, contour plans at 260, 250, 225, and 200 feet. A letter from Mr. Grundy to the President was read, enclosing a statement of his expenditure on account of his survey, and reporting progress. Several trial shafts have been sunk along the line of proposed embankment, and the material generally was found to be very favourable. Mr. Grundy had obtained evidence, from residents in the district, that the waterholes in the creek never dry up nor turn brackish. Mr. Grundy reported, also, that he had followed and blazed the highest line from under Prospect to the head of Duck River. The scrub is very dense, and required three men to clear it sufficiently for blazing; it is a well defined-ridge; the blazed line terminates about $\frac{1}{4}$ to $\frac{1}{2}$ a mile above the head of Duck River.

The Secretary was instructed to write to the Mayor of Sydney, for information as to the assessed annual value of city property, the number of houses on which water rates are charged, distinguishing those in the City from those in the Suburbs, the gross amount of water rates for 1867, and the total amount of charges on account of water supply for the same period. Also, to write to the Mayors of the Suburban Municipalities, for information as to the assessed annual value of property in each Municipality, and the number of houses on which rates are levied. Also, to write to the Registrar General, for the population of Sydney and Suburbs (separately) at the end of 1867 and middle of 1868. Also, to write to the Surveyor General, requesting him to cause a map to be compiled of as much of the Colony as would embrace the various possible sources of water examined by the Commissioners.

The Secretary was instructed to write to the Colonial Secretary, transmitting a statement of expenditure up to the present time, and requesting that a further sum of £1,000 be placed to the credit of the Commission in the Bank of New South Wales.

21 *NOVEMBER*, 1868.

PRESENT:—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		F. H. Grundy, Esq.
		W. C. Bennett, Esq.

Letters from the following Municipalities were read, in reply to questions from the Commission:—Randwick, Marrickville, St. Leonards, Glebe, Balmain, Redfern, Camperdown, Cook, Waverley, Newtown, Paddington, and Sydney.

A letter was read from the Lands Department, suggesting a transfer from Sir T. H. Mitchell's map, for the purposes of the Commission.

Mr. Moriarty produced a progress plan of the line of conduit from Broughton's Pass towards Sugarloaf, and a section of the dividing ridge from Prospect to Sydney, together with calculations of the earthwork in the embankments of the storage reservoirs, and of the capacity of the reservoirs at different heights.

Mr. Grundy produced a plan and section of the amendments suggested in the report from Messrs. Moriarty and Bennett.

Mr. Bennett reported the progress of his work at the Botany Swamps, and produced plans and sections.

Discussion ensued on the required capacity of the conduits to and from the storage reservoirs, near Prospect, and it was agreed that the higher canal should be capable of delivering not less than 60 million gallons per day into the reservoir, and that the lower canal should be capable of delivering not less than 20 million gallons a day into a distributing reservoir near Ashfield.

17 *DECEMBER*, 1868.

PRESENT:—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		W. C. Bennett, Esq.

Reports relative to the water supply of New York and Boston, laid on the table.

Mr. Moriarty reported that the survey and section from Pheasant's Nest to Sugarloaf was completed, and laid on the table the field plans of that portion. He also laid on the table the plan and section of the line from Prospect to Sydney; also, sketches of iron aqueducts proposed by him for certain portions of the line, and sections of open conduits. Mr. Moriarty also reported the results of gauging the Cataract and the combined waters of the Nepean and Cordeaux, by which it appeared that the daily discharge for the week ending December 12 averaged about $5\frac{1}{2}$ million gallons.

Mr. Grundy reported that his field work was completed, and his camp brought to Sydney. Mr. Bennett produced plans and sections connected with the Botany Swamps, and calculations of the overflow of water at the engine pond. It was resolved that a letter be written to the Mayor, informing him that the Commissioners are desirous of ascertaining, by actual observation, how many gallons of water the engines at Botany are capable of sending into the Crown-street reservoir in a given time, and requesting him to be good enough to issue such instructions to those in charge of the engines and reservoir as will facilitate these observations which E. O. Moriarty, Esq., and W. C. Bennett, Esq., have been deputed by the Commissioners to make.

As the present Commission will expire on the 23rd instant, the President brought up a Progress Report (being the third) which was adopted, and ordered to be transmitted to the Colonial Secretary.

The Secretary was instructed to furnish the Colonial Secretary with a statement of the expenditure and liabilities of the Commission up to the present date, and to request that a further sum of £600 be placed to the credit of the Commission in the Bank of New South Wales.

19 *FEBRUARY*, 1869.

PRESENT:—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.		P. F. Adams, Esq.
F. H. Grundy, Esq.		W. C. Bennett, Esq.

Various letters read.

Messrs. Moriarty and Bennett reported that they had visited the Botany Swamps on February 1st, before the breaking up of the drought. The stream supplying the tunnel was delivering about 5,000 gallons per day; men were employed opening drains through the swamps; the dams were empty.

Mr. Bennett reported that he had visited the swamps three days later. The water was running into the engine pond at the rate of about $3\frac{1}{2}$ million gallons daily, in consequence of the opening of drains to allow the water to flow.

Mr.

Mr. Moriarty reported that his surveys were complete, the plans and sections were being photographed; also, that he had prepared designs of the principal aqueducts. He further reported that, on examining the section from Prospect to Sydney, it appeared to him that the site of the larger reservoir at Prospect (the more northerly of the two submitted by Mr. Grundy at the meeting of 22nd August, 1868) ought to be adopted. The water surface would be about 1,200 acres, at a height of 195 feet above sea level; and if the water were drawn off at 24 feet below the surface, it would be capable of yielding 5,000 million gallons. From the reservoir the water would be carried in an open conduit about 5 miles, and by an iron aqueduct for 3 miles further. It would deliver the water 170 feet above sea level, at the high ground at the head of Duck Creek, about 11 miles from Sydney. There will be piping from thence to Sydney.

Mr. Grundy reported that his plans were in progress, and one sheet in the hands of the photographer.

The President laid on the table the results of the analysis of ten more specimens of water. The gaugings of the River Nepean and Cataract, from the 11th to the 20th of February, were laid on the table.

The Secretary was instructed to write to the Town Clerk, requesting a return of water pumped up to Sydney in 1868, and in each week of 1869 up to this date; also, quoting questions 1434 and 1435 of the evidence given by the City Engineer, to request returns of the gross water revenue and expenditure for each of the last three years.

6 MARCH, 1869.

PRESENT:—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.
F. H. Grundy, Esq.

P. F. Adams, Esq.
W. C. Bennett, Esq.

A letter was read from the Town Clerk, of date February 26th, in answer to a letter from the Commission, of date February 17th, respecting the arrangement which Messrs. Moriarty and Bennett desired should be made, to enable them to ascertain the quantity of water pumped into Sydney in a given time, and informing them that instructions had been given to have the supply of water to the city shut off from the reservoir, on Tuesday, March 2nd, between the hours of 9 p.m. and 12.

Also, another letter of same date, transmitting a statement shewing the Revenue and Expenditure of the Municipal Council on account of the Water Supply to the City and Suburbs, for the years 1866, 67, and 68.

Also, a letter from the Town Clerk, of date February 26th, transmitting a return shewing the quantity of water pumped up from Botany during the year 1868, and for each week of the present year up to the 20th January; from which it appeared that the quantity pumped during the year 1868 was 1,222,540,272 gallons:—

Week ending 2 January, 1869	30,081,024	gallons.
9	”	28,799,120
16	”	31,495,680
23	”	30,611,200
30	”	30,064,752
6 February,	”	29,774,736
13	”	27,590,400
20	”	24,935,472

The results of the gaugings at the Rivers Nepean and Cataract, showing a discharge, on the 7th of March, of 11,009,464 gallons, were laid on the table.

Mr. Moriarty gave a rough estimate of the probable cost of conduit, &c., along the portion of the line surveyed under his directions; also, an accurate estimate of the quantity of water that could be contained in the Prospect Reservoir; from which it appeared that, by the construction of a dam, 80 feet at the highest point, a reservoir would be formed, capable of containing 7,450 million gallons.

The Secretary was instructed to write to the Colonial Secretary, requesting a further advance of £600 towards defraying the expenses of the Commission to the 23rd of March.

20 MARCH, 1869.

PRESENT:—

Professor Smith, M.D., President.

P. F. Adams, Esq.

F. H. Grundy, Esq.

W. C. Bennett, Esq.

Mr. Adams produced a plan (in course of compilation at the Surveyor General's Office) shewing the various possible sources of water supply under consideration by the Commissioners.

It

It was resolved that a section should be made of George's River, near Koggerah, in order to determine the expense of damming the river; and also, a section between George's River and Woollli Creek.

As the Commission expires on the 23rd instant, the President brought up a Fourth Progress Report, which was adopted, and ordered to be transmitted to the Colonial Secretary.

22 APRIL, 1869.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.
F. H. Grundy, Esq.

P. F. Adams, Esq.
W. C. Bennett, Esq.

A letter was read from the Colonial Secretary, accompanying a renewed Commission extending the inquiry into the Water Supply of Sydney till 23rd May, 1869.

The following letter was read from Mr. Woore to the President :—

Pomeroy, 25 March, 1869.

My dear Dr. Smith,

I find, by a lithograph map of Cumberland, on which Mr. Adams has marked the line of duct the Commission recommend, and sent to me, that it is exactly the same as that I laid before the Minister of Works, on the 6th November, 1866, and again placed at the disposal of the Commission, the 27th November, 1867; it should therefore, in justice, be shewn on the map that accompanies the Report, as originally surveyed and proposed by me. May I request you will see to this.

Yours truly,

THOMAS WOORE.

The Secretary was instructed to compare the plans and sections of the two lines indicated, in order to ascertain to what extent they coincide.

Three letters from Mr. Holt to the President were read, on the subject of George's River as a source of supply. (*See Appendix.*)

Lithographed plans of a part of the line from Pheasant's Nest, surveyed under the direction of Messrs. Moriarty and Grundy, were laid on the table.

Mr. Bennett produced a section of a masonry dam such as would be required for the gorge of the Warragamba, on the same principle that dams of a similar height have lately been constructed in France; also, a plan shewing the present source of supply, and proposed improvements.

Mr. Moriarty laid on the table a plan and cross sections of George's River, at Tom Ugly's and Kangaroo Points, together with a plan and section between Saltpan and Woollli Creeks; also, cross sections proposed by him for the line of conduit from Pheasant's Nest to Sydney.

Mr. Adams laid on the table a plan shewing the various sources of supply examined by the Commission.

6 MAY, 1869.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.
F. H. Grundy, Esq.

P. F. Adams, Esq.
T. Woore, Esq.

W. C. Bennett, Esq.

The Secretary produced a plan and section shewing the relation between the line of aqueduct from Prospect to Sydney, surveyed by the Water Commission, and that submitted by Mr. Woore. It was resolved that Mr. Woore's line should be shewn, along with that of the Commission, on the map being prepared by the Surveyor General.

A section on the line from Pheasant's Nest to Sydney, on a scale of 2 miles to the inch horizontal, and 200 feet to the inch vertical, was laid on the table.

A letter from Mr. Holt to the President was read, on the subject of damming George's River, and supplying Sydney from thence.

Mr.

Mr. Grundy read a paper on the water available for storage from the Nepean and Cataract, calculated from the gaugings that have been taken since October, 1868.

A discussion ensued on the storage reservoir at Prospect, and on the means of supplying the higher levels of Sydney and Suburbs; and it was considered advisable to have a second reservoir of smaller capacity, and at a higher level, with a separate pipe to Sydney, capable of delivering water into Sydney at a height of about 225 feet.

22 *MAY*, 1869.

PRESENT :—

Professor Smith, M.D., President.

E. O. Moriarty, Esq.

P. F. Adams, Esq.

F. H. Grundy, Esq.

W. C. Bennett, Esq.

Discussion resumed on the means of supplying the high levels of Sydney with water.

The President was requested to make arrangements for taking the Rev. W. B. Clarke, along with a deputation of the Commissioners, to inspect the geological deposits on the sites of the proposed reservoirs.

The Secretary was instructed to write to the Town Clerk, requesting that he will furnish the Commission with a return of the rainfall on the Botany Swamps, as determined by the gauge recently established there by the City Engineer.

The Secretary was instructed to furnish an abstract of the expenditure of the Commission up to date, and to apply for a further advance of £208 towards defraying the expenses of the Commission.

As the Commission expires to-morrow, the question of a further extension was discussed; but as the Commissioners have no new work in contemplation, and as the Final Report is in progress, it was considered unadvisable to ask the Government for a renewed Commission.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE COMMISSION

APPOINTED TO INQUIRE INTO THE

WATER SUPPLY OF SYDNEY AND ITS SUBURBS.

TUESDAY, 22 OCTOBER, 1867.

Present :—

PROFESSOR SMITH, M.D.,	MR. PHILIP FRANCIS ADAMS,
MR. EDWARD ORPEN MORIARTY,	MR. FRANCIS HENRY GRUNDY,
MR. THOMAS WOORE.	

PROFESSOR SMITH, M.D., IN THE CHAIR.

Charles Moore, Esq., Mayor of Sydney, called in and examined :—

1. *President.*] In your capacity as Mayor, I suppose you have given a good deal of attention to the water supply of Sydney? Yes. C. Moore,
Esq.
2. We must, of course, expect information with regard to the details from the City Engineer, but I wish to ask you whether it is your opinion that the present supply is sufficient for the present inhabitants? When the dams in course of construction are completed, I think the supply will be amply sufficient. It will be adequate, I dare say, for twenty-five or thirty years to come. 22 Oct., 1867.
3. You think that, without the dams, the Botany stream is not sufficient? I think it would not be sufficient.
4. During your tenure of office, have there been in the city any complaints of the scarcity of water? I cannot say that there have been any complaints of the scarcity of water, unless they were during last February, when the weather was very dry, and we were obliged to shorten the supply.
5. You have had to put the city on short allowance? Yes.
6. Has that been done to such an extent, do you think, as seriously to inconvenience the inhabitants? No, it was done more particularly for the purpose of avoiding the supply at night. We shut it off from 6 at night till 6 in the morning. More water is always wasted during the night than during the day-time. It is allowed to run for the purpose of flushing closets and places of that kind. We always found that there was more waste at night, and consequently, during that dry time, we shut off the water at night.
7. During the day you think there was a plentiful supply? I think there was plenty of water in the day-time.
8. And that at night a great deal was wasted? No doubt; we were under the impression at the time that a great deal was wasted during the nights.
9. The complaints then, I suppose, were chiefly in regard to the probability of delay in the case of fires at night? The complaints were chiefly in regard to fires.
10. What arrangements did you make in regard to fires when the water was shut off at night? We had turncocks stationed at the reservoirs for the purpose of turning on the water in case of fires.
11. Do you think that by such an arrangement the water could be turned on with sufficient promptitude to meet such cases? I think so.
12. And do you think that plan resulted in a great saving of water? I think it effected a great saving of water. I believe the expenses were almost one-third less than usual.
13. But this shutting off of the water was not done to effect an economy of money: the object, as I understand you, was to economize the water? The object was to economize the water. It was not a question of money at all.
14. Have you any idea what is the principal cause of the waste of water during the night? I have heard that many of the large institutions, the banks for instance, keep the water running all night for the purpose of flushing closets and other places. They are under special rates, and they are not very saving of the water.
15. Are they simply rated, or do they pay by meter? They are rated at so much per year.

- C. Moore, Esq.
22 Oct., 1867.
16. Would not the general introduction of water meters be a great source of economy in regard to the use of water? I have no faith in water meters, because I do not believe that, as a general rule, they act well. It all depends upon the force of the water how a water meter will act. But Mr. Bell will be able to give you more full information upon this subject.
17. That would be a practical objection to the present water meters; but supposing you had a simple apparatus to measure accurately the water consumed, would not that be a great source of economy? No doubt it would; but I believe the force of water in a water meter would act very differently in some places to what it would in others.
18. Have you given any consideration to other schemes of water supply besides the present? I have heard and thought of many schemes, but at present I do not see anything better than the present dams for husbanding the water.
19. Still, if the matter had to be entered on anew, do you think the Botany stream would be the best source for a supply of water to the city? I think so. I firmly believe it would be the best.
20. Even if the matter were to be commenced anew? Even if it were to be commenced anew.
21. It is during your tenure of office, I think, that the dams have been constructed? I think they were begun after I came into office.
22. I believe no dam has yet been thoroughly tried? No. They will be finished, I hope, during the present year, and tried.
23. Your opinion is, then, that if it should turn out that these dams are not effectual, the Botany stream will not be sufficient to supply the inhabitants—You see, the dams are an experiment: supposing they turn out to be inefficient, do you think some other scheme must be tried? The Botany stream (*i.e.*, its volume) will not be affected in any way by the dams. If the present dams do not turn out sufficient to check the current, some other scheme must be adopted, such as pumping the water into Sydney, and storing it there, instead of letting it run into the sea as at present.
24. What I want to gather is this: Whether, in your opinion, the sufficiency of the present water supply depends upon the efficiency of these dams? Last year we had what I call a fair supply without the dams, and this year, when the dams are finished, we expect a better supply—a supply sufficient for years to come.
25. I think that last year was rather rainy—that there was more than the average rainfall? I did not pay any attention to that. A large amount of water runs to waste now, in consequence of there being no adequate means of keeping it back.
26. Supposing that provision for a supply had to be commenced anew, do you think it would be better to expend a larger sum in order to get a supply by gravitation; or have you sufficient confidence in pumping arrangements for the supply of a large city? I have sufficient confidence in the present arrangement to think it will be sufficient for the next twenty-five or thirty years.
27. But you would not like to look further forward than that? No; our city increases every year, and with an increase in population we must have a greater supply.
28. And do you think that the Botany stream is not capable of providing for the wants of the city to a distant future? I do not think it is capable of providing for the wants of the city for more than twenty or twenty-five years—I candidly confess it; but it will do for twenty-five years.
29. *Mr. Moore.*] That is, supposing these dams which you are now making are water-tight? We do not expect them to be water-tight, but we expect them to keep back water to a certain extent. Some water must go through.
30. Then your opinion depends upon how much they will retain—If they do not retain any large quantity, there will not be sufficient water to supply the city for twenty-five years? Not if they do not retain as much as we expect them to do; but if they do, the supply will be sufficient.
31. Then it rests, as Dr. Smith said in a question he put to you a short time ago, upon the efficiency of the dams? No doubt of it.
32. *Mr. Adams.*] Has not the water been stopped on several occasions from watering the streets? That was only during the month of February, I think, and for only a short time.
33. Did that take place in consequence of a scarcity of water? Yes; there was water, but we had no means of keeping it back.
34. *Mr. Moriarty.*] I would like to ask your Worship what is the present population of the city—about? I cannot give you any idea.
35. In estimating that the supply will be sufficient for the next twenty-five years, have you formed any estimate of the probable ratio of increase of the inhabitants? I have come to the conclusion, taking into consideration the increased population, that with these dams there will be an ample supply of water for the next twenty-five years.
36. But have you based that upon any numerical results? No, I have not gone into figures at all.
37. Have you estimated any allowance per head on the increase? No, I have not gone into detail at all.
38. I think you said that the water was shut off—particularly during the nights—some time this year? Yes.
39. Do you not think that the night supply is almost as necessary as the day supply? No doubt it is in cases of fire; but we find that there is a much larger amount of water wasted during the night than there is during the day.
40. In a town of the importance of Sydney, and in a climate like this, are you not of opinion that water should be freely wasted? No doubt about it.

41. That you should have as much water as you can freely use or waste? There is no doubt about it.
42. Do you not think that the night flushing of closets is absolutely essential to the preservation of the health of the people who reside in the houses? No doubt.
43. And you think it is a practice which ought to be encouraged? I do.
44. Then the night supply should be kept on if possible? No doubt.
45. For about how long was the night supply shut off from the city? I think not more than about five or six weeks: that is all.
46. About what time of the year was that? About February, if I recollect rightly. Then it was shut off principally in consequence of excavating a dam. We were obliged to keep the water lower. The weather too was dry. Both circumstances occurred together. We were sinking the dam for the purpose of taking out some matter which had remained there for some time.
47. Has it ever come to your knowledge of late years that the supply of water to the city has been short, or that it has been complained of? I am not aware that it has.
48. Never before this last year? Never before last year.
49. You never heard complaints in consequence of the water being cut off from watering the streets? In some streets the hydrants are not laid on, and therefore they could not be watered. Unless the parties petitioned, the water could not be laid on.
50. But when hydrants are laid down in such streets as George-street, has it ever occurred that the water has been shut off? Not to my knowledge, until about February last.
51. Have you ever heard complaints as to the quality of the water in dry seasons? Never.
52. *Mr. Grundy.*] I think you stated that the arrangement made by which the water cut off at night could be readily turned on in case of fire, was considered sufficient? Yes.
53. Is it not a fact that, on one or more occasions, fire-engines had to wait a considerable period for a supply of water? I am not aware that such has been the case.
54. It was so stated, at any rate? It might have been so stated, but many things are stated which are not facts.
55. How do you know whether that was a fact or not? I do not know. I do not think it was.
56. It is an extremely important thing, in case of fire, that water should be obtained without delay—Much damage would be done if a supply were not forthcoming for ten minutes or a quarter of an hour? No doubt; but the turncocks are there, and the water can be turned on at once. Inquiries have been made, and it has been almost always found that the water has been ready almost as soon as the fire brigades were ready to use it.
57. Almost—not always? In one instance there was a delay, but it was found to arise out of a dispute as to whether the Volunteer Company or another should first attach their hose.
58. You do not think there was any loss sustained in consequence of want of water? I am sure there was not.
59. *Mr. Woore.*] How do you ascertain that there is greater waste during the night than during the day? We can tell from the amount pumped in from Botany. We have a return sent in weekly of the amount supplied.
60. You know the amount pumped up? Yes.
61. But that would not give you the amount of waste, would it? Of course it would not.
62. You pump it into reservoirs? Yes, into the reservoir in Crown-street and Paddington.

C. Moore,
Esq.

22 Oct., 1867.

SATURDAY, 26 OCTOBER, 1867.

Present:—

MR. MORIARTY,
MR. WOORE,MR. ADAMS,
MR. GRUNDY.

PROFESSOR SMITH, M.D., (PRESIDENT), IN THE CHAIR.

Edward Bell, Esq., M. Inst. C. E., City Engineer, called in and examined:—

63. *President.*] In your capacity as City Engineer, I suppose you have charge of the Waterworks? Yes.
64. How long have you had this charge? Nearly twelve years—eleven years and three-quarters.
65. Was the present scheme of supply entered upon before you took office? The scheme was entered upon.
66. But it was not fully carried out? The Botany works were not commenced.
67. They were not actually commenced? No; some of the machinery had been ordered.
68. Then, the general scheme had been determined upon, but the works had not been commenced? No.
69. So that, although you are not responsible for the scheme, you have carried out the details? Yes. Some of the machinery was ordered before I came to the Colony. The 30-inch main was ordered, and a set of engines, but not the engines at present in use.
70. I understand that Sydney is supplied at present with water partly by the old tunnel from the Lachlan Swamp and partly by the pumping engine at Botany? It is.
71. Could you inform us how much of the city is supplied from each of those sources? Not exactly.
72. They are not kept distinct? They are kept distinct, but the extent of the different supplies varies according to circumstances. At one season of the year a much larger part is supplied from the Lachlan Swamp than in the drier seasons. The lower parts of Woolloomooloo

E. Bell, Esq.,
M.I.C.E., C.E.

26 Oct., 1867.

E. Bell, Esq., mooloo and the lowest parts of Kent and Sussex Streets between Bathurst-street and M.I.C.E., C.E. Erskine-street, are nearly always supplied from the tunnel. The remainder of the city is supplied from Botany.

- 26 Oct., 1867. 73. I believe the tunnel is liable to get out of order occasionally, and that when this takes place the supply stops? I know of only one instance. It has occurred but once during the last twelve years.
74. In such a case, have you the means of supplying those parts of the city with water from Botany? We have—the whole of them.
75. The Botany water, I believe, is pumped up into two reservoirs—What are the elevations of those two reservoirs above the sea? One is 136 feet, and the other 224 feet.
76. The elevation of the Crown-street reservoir is 136 feet? Yes.
77. And the elevation of the Paddington reservoir is? 224 feet above the level of the sea.
78. If the supply from the tunnel and the supply from the reservoirs run into the same pipe, how do you prevent regurgitation into the tunnel? The one service is shut off while the other is put on.
79. They do not flow at the same time? No; one service is entirely shut off while the other is in operation. The Paddington reservoir is entirely confined to its own district—the higher parts of Darlinghurst and Bourke and Crown Streets.
80. Is it your opinion that the water of the Botany stream is derived entirely from the rainfall on its drainage area, or that there may be springs bringing water from some other drainage area? I fancy that there must be springs.
81. I ask the question, because, on the occasion of our visit in your company to the Lachlan Swamp, I was struck with that comparatively large stream of clear water running down towards the tunnel, and it did not seem to me possible that the watershed within our view was sufficient to supply that stream—Have you ever traced that stream to its source? I have traced it a long way towards its source, and the supply was equally great, or in fact, greater, as we approached its source. The stream increased in volume on removing the sand, to let the water come more freely away from the hills near and at Waverley.
82. So that you infer there is a spring? I always did. I feel certain that there is a spring there. When more water is required from Lachlan Swamp, I have only to send men to clear away the sand-drift and the water flows more freely.
83. After allowing for evaporation, do you think all the rainfall drains off by the surface streams, or may a portion of the water find its way to the sea by percolation under ground? I do not think that any of it finds its way to the sea by percolation under ground.
84. You think it all passes from the surface? The rock crops out along the margin of Botany Bay to some little distance westward of the Waterworks. I think I have traced it nearly to the neighbourhood of La Perouse's Monument. Above that, the rock dips at an inclination of something like 1 in $1\frac{1}{2}$ or 1 in 2; and the surface of the stone is covered with clay as far as I have traced it—very compact, tenacious clay.
85. Then you think that the whole of the rainfall on the area may be accounted for in two ways,—that it passes off either by evaporation or by the surface streams? Yes.
86. Have you estimated the superficial area that drains into the tunnel? I think I did some years back, but I cannot tell you at this moment what that estimate was. I find, on reference to memoranda, that the superficial area draining into the tunnel is about 756 acres.
87. I see that there is a statement in regard to this matter in the Water Report of 1852, but I wish to know if you have verified that statement? Not since.
88. Have you made any general estimate of the drainage area of the whole of the Botany swamps? Yes; you mean the catch-water or water-shed?
89. Yes? I think it is as nearly as possible 10 square miles.
90. In the Water Supply Report of 1852, paragraph 211, it is said that a very slight engineering work will convey the drainage of 1,800 acres into Bird's Gully. Has that engineering work ever been done—has the water upon this land ever been conveyed into Bird's Gully? No.
91. Do you know from observation, whether it is a fact that a slight engineering work would convey this drainage into Bird's Gully? I think a good deal of drainage could be taken in there, but I would not speak confidently with regard to the acreage.
92. Are you aware whether the rainfall has been determined on any portion of this drainage area? I am not.
93. What amount of water is pumped up daily at the present time from Botany? From about 2 o'clock on Monday morning to about 2 p.m. on Saturday, a little over 20,000,000 gallons. In the winter-time it is about 14,000,000. The last return is 20,130,000 gallons. That is for the week ending 19 October.
94. That was the quantity supplied in the week? That was supplied in the week.
95. And in the winter-time you say the supply is about 14,000,000 a week? In the months of March and April it averaged from 12,500,000 gallons to 13,500,000.
96. That is still per week? Yes. At the beginning of the month of May the supply was 15,000,000. Towards the end of the month it rose to 19,000,000, but there was a special reason for that increase. The supply during the winter may be taken at an average of from 13,000,000 to 15,000,000 gallons, and it will extend now most likely to 22,000,000 gallons in the summer months.
97. The quantity pumped up is regulated, I suppose, by the condition of the reservoirs? Yes; when the reservoirs are full the engines stop.
98. Is it necessary at present to keep pumping continuously from Monday morning until Saturday? No. With one engine it would be necessary, but one is not sufficient; with two engines we stop occasionally four or five hours in the day; and we stop always, from 2 o'clock p.m. on Saturday, till 2 o'clock a.m. on Monday. 99.

99. How much water could the present pumping arrangements send up to Sydney? *E. Bell, Esq., M.I.C.E., C.E.*
Pumping the seven days through?
100. Yes; but not working the engines beyond their proper capability? Of course not. For nine months in the year, during wet seasons, the three engines could very well send in 26 Oct., 1867.
50,000,000 gallons per week—or 1,950,000,000, in the nine months.
101. *Mr. Grundy.*] Why do you say for nine months? Because the engines would want something doing to them occasionally. Three engines would work and keep in good order, without stoppage of any kind, beyond three or four hours at a time, for nine months of the year, and I have allowed for casual stoppages in the quantity I have stated. During other three months of the years, supposing each engine to be stopped for adjustment or repairs one month, and two of the engines to be constantly working, they would send in 32,000,000 gallons per week, or 416,000,000 in the three months; this, together with the before-mentioned quantity of 1,950,000,000, would make 2,366,000,000 gallons of water in the twelve months, or three times the quantity which is now pumped into Sydney.
102. *Mr. Moriarty.*] What is the power of the engines you have at work? Three hundred: they work exactly to a hundred each.
103. *President.*] Have you any mode of ascertaining the amount of water that at present escapes into the sea? Yes; by the weir and the sluices, with tolerable accuracy; but I have no means of calculating or ascertaining the quantity which flows over the margin of the engine pond at Botany, and passes over the surface of the paddock into the creek on the eastern side of Botany Reserve, and thus finds its way into the sea; the quantity is, however, very great.
104. Do you from time to time estimate the waste? Yes; by the weir and the sluices I am enabled to give a tolerably correct return. I make my calculations from the returns which come up to me from Botany. Fortunately, this year I have had a register kept of the depth of the water which passes over the weir, and the height to which the gates have been raised, each and every day. There are two sluice gates, each 45 inches wide, and one waste weir, 8 feet 7 inches in width. I submit a return, prepared from the daily register, in a tabular form, shewing the height the gates were lifted, the depth of water passed over the weir, and the head of water above the sill of the sluice gates each day. From the 24th March in this year to the 15th October, the gates were shut only eight days. The height both gates were lifted ranged from 6 inches to 45 inches. The depth of the water over the weir ranged from 1 inch to 10 inches. I calculate the minimum quantity that passed over the weir at 749,869,501 gallons.
105. During what period has that water escaped? From the 24th March, to the 15th October, over the weir and through the flood-gates. The quantity which escaped was 10,148,220,000 gallons, making a total, through sluices and over the weir, of 10,898,089,501 gallons. I have annexed hereto, marked Appendix A, a register of the depths of water passed over the waste weir, and of the heights the flood-gates were open daily from 24th March to the 24th October, 1867. The above quantity would be more than sufficient to supply the present population of Sydney and the suburbs for six years, at the rate of 40 gallons per head per diem.
106. That period, however, includes (I think) a time when the rainfall was unusual? It was the wet season in the Colony. The rain had been excessive; but I think the quantity that flowed across the paddock and passed away to the sea, through the creek, would compensate for the excessive difference.
107. You think that the excessive rainfall of this season would have passed over in that way, and that you cannot estimate it? In ordinary seasons sometimes the flow is greater than at others. But this has been an extraordinary season, and the quantity of water that must have passed over the paddock and through the creek will meet the extraordinary difference which has taken place this year.
108. On the occasion of the visit of the Commission, a few days ago, to the Botany Works, there was no water running over the weir, but there seemed to be a considerable leakage between the dam and the waste water canal—can you give any estimate of that leakage? I tried it yesterday. There was none coming in at the head of the race. I tried it again a few days since, and found equal to half an inch over the small weir, 8 feet 7 inches wide, by the side of the pond. I have not reckoned the quantity running to waste across the paddock, in these calculations.
109. At present is there water still running to waste into the sea? There would be, but some of the locks are shut at the dams up above. To-morrow (Sunday), there will be. To-day, two engines are working, and the locks in some of the dams being shut, the two engines are capable of sending into Sydney the water which runs into the swamps, between the locks which are shut and the engines. When the reservoirs are full, which will be in the course of this (Saturday) afternoon, the water will pass over the weir into the sea.
110. If the water were not kept back to-day, would there be water running into the sea? As soon as the engines cease working, it will overflow into the sea. The water is now as high as the edge of the weir.
111. In the beginning of the present year, before the heavy rains set in, was it the case, or not, that the supply of water was short on some occasions? Yes.
112. Had the engines then to be stopped on any occasion simply from the want of water? No.
113. Then why was not the supply kept up as long as there was water to be pumped? The engines would have been stopped if the street watering had not ceased. We ceased, for a time, to water the streets.
114. So that you economized the water in Sydney? Yes, by stopping the watering of the streets.

E. Bell, Esq.,
M.I.C.E., C.E.

26 Oct., 1867.

115. On that occasion, if the usual amount had been consumed in Sydney, do you think there really would not have been enough water to pump up? I think there would not have been enough to pump up, because the water which should have been at our service to pump had all run into the sea. We have no convenience in Sydney to keep it. I mean no storage reservoirs. It is very probable that we shall be in want of water again this year from the very same cause as last year, 10,000,000,000 of gallons having, as I have shewn, run into the sea in the last six months.

116. What I am leading to is, that the stream does not run all the year round at such a rate as to supply the engines? It does not run at such a rate as to supply the two engines—it would supply one very well.

117. And therefore, without some means of preserving the excess in the rainy period, the present supply would not be sufficiently abundant? The stream itself will not be sufficient. At one season of the year, for about six weeks, it requires supplementing to the extent of about 1,250,000 gallons per diem; during the remainder of the year the supply is super-abundant.

118. How many dams have been constructed, up to the present time, in the course of the stream? Six; one in course of construction.

119. Have you calculated how much water can be stored in these dams when completed? There are six in addition to the engine pond and the pond immediately above it within our own reserve. Those six dams will hold 200,000,000 gallons; the engine pond 10,000,000, and the upper pond 44,000,000, making 254,000,000 gallons altogether, which will be retained by the dams above the surface of the swamps. There will be a very large quantity in addition to this, which will be kept back below the surface of the swamps, and in the sandhills, which will not be able to drain away from them until the water retained by the dams above the surface of the swamps has been let off. This quantity is very considerable, and will be more so when all the dams are made. However, the 254,000,000 gallons will be sufficient at the present time to supplement the stream for 177 days, at the rate of 2,000,000 gallons per diem.

120. It is admitted, I believe, that these dams will not be watertight? Yes, they were never expected to be.

121. For how long a time do you suppose they would remain full if the supply of water were cut off? If it were cut off from the stream?

122. Yes? It would be a mere guess. Until they are completed I should not like to say. It would be some considerable length of time. The stream itself will keep the dams full for more than ten months in the year; the remainder of the year the water held in the dams would be used to supplement the stream.

123. The principal utility of these dams would be to preserve the excess of water at one period to supply the deficiency at another? That is one of the objects.

124. But if they would not hold water, say for three months, they would not so equalize the supply? They will retain the water in the swamps, for a considerably longer period than three months, and the stream has never yet required augmenting for a longer period than five or six weeks. There are two important uses in these dams: one is, to retain some of the water, which now finds its way rapidly to the sea, in the swamps longer than at present; and the other is, to afford us more control over the supply to the engine pond. At present, if anything occurs to the wells or machinery in them, at Botany, we have no means of getting at the supply-pipe to the engine without opening the sluice-gates, and letting all the water run away into the sea, whatever may be the season of the year. One of the most important objects in making these dams was, by shutting the sluices in them to enable us to keep the water back while we empty the reservoirs by the engines. Thus, by letting the stream flow only sufficiently fast to supply the engine, we could effect any repairs or work to the engine pond, or the pipes which take the supply from the pond to the engines, at any time, without wasting the water or stopping the engines. The next important object is, to keep the water back in the swamps for a greater length of time than we are now able, in order that during the dry season we may be enabled to supplement the stream sufficiently to keep up a supply equal to the present consumption of Sydney. In the year 1856, during the dry season, I gauged the quantity of water which the stream afforded, and have annexed hereto the result (Appendix B). By this it will be seen that, at the driest season, the stream afforded nearly 2,000,000 gallons per diem, and then the woolwashing dams were in operation. My reports on the gauging are annexed, marked Appendix B.

125. Still, if they are not watertight, their equalizing power cannot be very great? If they were quite watertight, we should have to keep the valve open to let the stream down in order to supply the engines; if they are not, we shall not keep the valve open to a greater height than is necessary to supply the engines—we shall merely supplement the filtration.

126. But supposing we had no rainfall for (say) six months, and the natural stream had stopped, or nearly so, would these dams equalize the supply over those six months? Probably not; I cannot undertake to say that they would or would not, because the demand is increasing every year; we must then construct the remainder of the dams projected, and some reservoirs in or near Sydney, such as I recommended in 1856. I then suggested that as the demand increased, reservoirs should be made to hold a sufficient supply, and that in future years as much as five or six millions of gallons per day more than was required for consumption in wet seasons should be pumped into Sydney, to meet the requirements of dry seasons. I made those suggestions to the City Commissioners, and prepared a plan in 1856, shewing the situation for such reservoirs in Hyde Park, which might be supplied by gravitation from the tunnel. I proposed to raise the bank, which you inspected on the Lachlan Reserve, two or three feet, and to bring all the water that now escapes over that bank

bank into the lower swamps, into Sydney through the tunnel, and deposit it in reservoirs under the Racecourse. I also suggested that the reservoirs in Hyde Park could be supplied from the low-level reservoir, that reservoir being about 24 feet above the level of Hyde Park.

E. Bell, Esq.,
M.I.C.E., C.E.

26 Oct., 1867.

127. Perhaps you could furnish the Commission with a copy of that report upon the subject? There is no report upon the subject: there is a plan, of which I have a copy annexed, marked Appendix C. The overflow from the Lachlan Swamp was to come into the reservoirs under Hyde Park by gravitation; and any further quantity that was necessary to fill these reservoirs in Hyde Park was to be taken from the low-level reservoir and pass through ornamental fountains in Hyde Park before going into the reservoirs which I proposed to construct under the surface. You will find some reference to that subject, I think, in evidence I gave in 1862.

128. Was that evidence given on the occasion of an inquiry by the Legislature? Yes, before a Select Committee. On page 13 of the evidence, question 279, you will see that I told the Committee—"It will be necessary at some future time to go to a considerable expense to store the water in the swamps between the Racecourse and Botany. It will be necessary to put some impediments in its way, and to cause it to come down more by filtration; and, in addition, it will be necessary to make a store for water in or near Sydney." That was in 1862; but there was a large report before that of 1862, in which my evidence of the same purport is given. I think it was on the occasion of an inquiry into the state of the City Commissioners' Department.

129. You perhaps could supply us afterwards with a copy of the plan of these Sydney reservoirs? It is a plan showing how the Park was to be laid out. The reservoirs were indicated by dotted spaces. My idea was, to put a very large reservoir or pond in the neighbourhood of Paddington, another at Waverley, another at Newtown, and another, of smaller dimensions, at the Glebe.

130. Were you in Sydney during any of the periods of great drought that have occurred? Not prior to 1856.

131. The last great drought was in 1849? I was not here. I have heard of that drought, and I know a great deal about it, from what I have been told; and for that reason, I conceived that it was necessary to store some hundreds of millions of gallons of water in Sydney, or in the neighbourhood of Sydney which would be far better.

132. In the Water Supply Report of 1852 it is mentioned that, in 1849, the water at the tunnel mouth fell to 3 inches, from its usual height of 2 feet 8 inches. Mr. Clarke, being examined, said—"The water decreased very considerably for the first year I had charge of the works, insomuch that the depth of the water at the eastern end of the tunnel decreased to 3 inches, from its usual height—2 feet 8 inches." That was in 1849? I think in 1856 it was nearly as low, until I sent men to the hills at Waverley to clear away the sand. When this was done, every day shewed an increase of 2, 3, and sometimes 4 inches, until we got a very good supply.

133. In 1849 the public records shew that $21\frac{1}{2}$ inches of rain fell at the South Head? Yes.

134. When the dams on the Botany stream are completed, do you think the supply could be trusted in such a drought as that which is described in the year 1849? We could not trust to those dams alone—certainly not. Six only are being made, out of ten or eleven which are necessary.

135. So that, in fact, the present arrangements could not be trusted to supply Sydney with water, in such a drought as that which occurred in the year 1849? They could not, so far as our present arrangements have gone; but if the whole scheme is carried out, I believe that with only one reservoir near the town, capable of containing 1,000,000 cubic yards, we could supply Sydney and the suburbs for the next fifteen years, without any additional works. There has been water running to waste, during the past six months, sufficient to supply Sydney for five years without a drop being added to it from the ordinary stream—there has been an enormous overflow into the sea at Botany for the last eleven years, to my knowledge, during the wet season. If only 40,000,000 of gallons of this water had been pumped into a storage reservoir each year, or had been retained in the swamps, Sydney would have been most abundantly supplied every year.

136. But then you think the dams on the Botany stream ought to be supplemented by watertight reservoirs in Sydney? Yes. I would rather have them near Sydney. There should be one on Hyde Park, to take the overflow from the Lachlan Swamp. There should be also, as I have previously stated, a very large reservoir at Paddington; another at Waverley, of smaller dimensions; another at Newtown; and another at the Glebe. It is not so important that there should be one at the Glebe, but it is necessary that Newtown should have a reservoir in its locality, as we can supply it more conveniently from Botany than from Sydney.

137. Do you know what amount of water is delivered daily at the Hyde Park end of the tunnel? I cannot say positively, but I believe it is about 3,000,000 of gallons per week.

138. There is no convenient mode of determining the quantity of water delivered? No.

139. Do you think that anything should be done to render the supply through the tunnel more permanent—I mean to prevent the effect of any accident? Yes; I have recommended, more than once, that pipes should be used—that an iron main should be run through the tunnel to bring the water to Sydney; and that the tunnel round the pipes should be filled. That would prevent any stoppage in future.

140. Could that be done without opening up the tunnel? Yes.

141. Have you made any estimate of the expense of laying such a pipe through the tunnel? Yes. The cost of a cast-iron main would not exceed £12,000.

E. Bell, Esq.,
M.I.C.E., C.E.

26 Oct., 1867.

142. What suburbs do you think ought to share in the general supply of water? The whole of them. At present we supply the Glebe, Redfern, and part of Paddington.
143. Do you supply Waverley? No.
144. This [*List handed to witness*] paper supplied by the Registrar General contains a list of the districts around Sydney. Which of those districts share in the supply? The Glebe shares in the supply, at present the whole of Redfern (but here they have combined Redfern and Botany), and a very small part of Paddington.
145. Then what suburban districts receive no part of the supply? We have no means of supplying the higher parts of Paddington. We must have a reservoir at Waverley to supply the whole of Paddington. It is for that reason I recommend that a reservoir should be constructed to supply Randwick, Paddington, and Waverley. To supply this reservoir it would be necessary to erect a small engine near the storage reservoir.
146. *Mr. Woore.*] What is the height of Paddington? The height is about 224 feet where the reservoir is made. It is 226 feet at the Windmill. The highest parts of Paddington range between 230 and 235 feet.
147. *President.*] And you want a reservoir to supply those parts? To supply Randwick, Waverley, and Paddington.
148. Does Newtown receive any share of the supply? No.
149. Does Balmain? No, not at present.
150. But those two places ought to share in the supply? Yes; I propose to have a reservoir at Newtown, to supply Newtown, Marrickville, &c.
151. I suppose Concord is too distant to share in the supply? Yes, probably.
152. And St. Leonards? Yes. To cross the river is not impracticable, but the expense would be enormous in proportion to supply to be given. St. Leonards might be better supplied from another source on the northern side of the harbour.
153. The district called St. George, including Marrickville, and extending towards Cook's River—ought that to share in the supply? That might also be supplied.
154. That should share in the general supply? Yes. Darlington is supplied.
155. In a general water supply, how much per head ought to be allowed to the population per day? I think 40 gallons per head here would be sufficient. Taking the population that we supply now at about 70,000, I think they use about 30 or 32 gallons per head.
156. Does that include water for manufactories? Yes, and for street-watering too.
157. You think that for all purposes 40 gallons per day per head of the population would be a sufficient supply? I think so.
158. Would that permit of a very free use of water for water-closets, flushing sewers, and such like purposes? I think it would. It is very freely used now for those purposes. It might be 45 gallons per head per day, but I think 40 gallons would be found as much as the people would use here.
159. Have you formed any estimate of what proportion of that supply would go to manufactories? No. I may say that there is a very large quantity of water now used by the Sugar Company. Their consumption of water is enormous for one establishment. Tooth's brewery is also supplied, as well as several soap works and tanneries. A great many other works within the city are also supplied with the city water.
160. Can you give us an approximate statement of the whole cost of the present plan for supplying Sydney with water—I do not include the pipes in Sydney, because they must be used for any supply—What we want to know is, what is the cost of the present arrangement for pumping water into Sydney? The cost of the engines and house, the 30-inch main, the high and low level reservoirs, was £130,000, exclusive of land.
161. And also the cost of the dams in course of construction? The six dams in course of construction will cost £10,000. The cost of those contemplated, and which ought to be constructed without delay, would be £8,000 more.
162. If you had been City Engineer when the present scheme was initiated, would you have recommended it as the best possible, or do you know of any other scheme that you would have preferred? I know of none that I would have preferred to this, if properly carried out.
163. But if carried out according to your views, the expense, I understand, would be very great? The expense would be no greater than that which you would have to incur if you brought the water from other places.
164. Would it not have been better to expend that amount, or even a larger sum, in procuring a supply of water for the city by gravitation? If you can get water equally good and pure, I should prefer to bring water into Sydney by gravitation. If brought from any other place than the present, I would not recommend that it should be brought in any other way than by gravitation through cast-iron mains, and the level of the source of supply or reservoir should not be less than 600 feet above-high water mark in Sydney, for a length of 50 miles of supply main. But with the purity of the Lachlan Swamp water, its excellence and abundance, I should certainly have been satisfied to have commenced the present scheme entirely, and taken the responsibility on myself. I believe there is to be obtained from that watershed a sufficient quantity of water to meet the wants of the city and suburbs for many years hence.
165. *Mr. Woore.*] Have you had an opportunity of comparing the expense and advantages of this scheme you have proposed with the expense and advantages of other schemes? I have considered this—that, bring the water from where you will, you must have reservoirs in or near Sydney, to ensure a safe supply to the city. You cannot depend, for instance, upon a main. For instance, the main at Melbourne might burst, and put the inhabitants to considerable inconvenience for some time. There is as much, and even more danger from that, as there is of our main being injured, through which we force the water from

Botany

Botany to Sydney. A sudden check to the current in the Melbourne main—in or near Melbourne (at any great distance from its source) must burst that main. Consequently I conceive that you are never safe until you have got an abundance in or near the town you wish to supply.

E. Bell, Esq.,
M.I.C.E., C.E.
26 Oct., 1867.

166. Never, by machinery? By machinery or by gravitation. That is by machinery too—the main and the apparatus connected with it are machinery.

167. But when you give this scheme of procuring the water from Botany so great a preference, have you had any opportunity of comparing it minutely with any other plan of bringing water from the interior? I have never had any other plan to compare it with. It is only my own conjecture.

168. It has never been compared with any other? It never has—it is only my own opinion. I have seen the Nepean—and I have inspected the Chain of Ponds above Picton. I consider the Lachlan Swamp, as a source of supply, preferable to both of these. My suggestion with regard to the present works would not necessitate the construction of enormous reservoirs at one time. There may be ground reserved sufficient to make them, but they need not be carried to their full extent in the first instance.

169. From the plan of the tunnel which we have here, I observe that there are several obstructions in it. Has it been cleared out since the time it was made? No. Once when the water ceased to flow through the tunnel, I opened the man-hole opposite Darlinghurst Gaol, and I found that the tunnel itself was perfectly clean.

170. All through? As far as I could get through.

171. How long is it since any person has passed through the tunnel? It is impossible for any one to pass through the tunnel. You will see by the section on the table that it is water-locked, and I found it so in reality.

172. I have been through it? Before the water was let in you may have been; but not since, as it is impracticable.

173. The water was then passing into Sydney. There are obstructions? There are places where the crown of the tunnel dips into the water. No one can get through there. There are two places which effectually prevent any one passing through.

174. What was the occasion of this mound [*indicated in the plan*]? I cannot say.

175. It must have fallen in? The clay and ironstone have fallen down and prevented the water flowing, but the dips must have existed when the tunnel was made.

176. There must be a large quantity of water to get through at all. How does the water now supplied to Sydney find its way into the tunnel? It runs into the end by gravitation.

177. Then there must be considerable depth to rise over the point. What depth of water is there at the entrance of the tunnel now? ———

178. Does the tunnel collect water as it passes in? When the stoppage took place in the tunnel there was no water on the city side of the stoppage, but there was a stream flowing into the swamps from the tunnel itself. It is very possible that that was from some pond. It might have been from that pond near the Barracks. It is impossible to say, however, with certainty. I do not think it was from any spring.

179. At the time I was in the tunnel it had not been opened all through, but it was then supplying the city. There was a considerable stream coming into the city. The water was running in many places in streams from the top? That was from swamps, above and not from springs.

180. Is that the case now? I cannot tell you. There must have been some water coming into the tunnel at the time it was choked up; otherwise we should not have seen a stream flowing from the tunnel into the swamps. I attributed that supply to the swamps above in the Sydney Common and the water reserve.

181. Then I apprehend that all the water now comes through the roof, and that there is nothing from the swamp? There is a very large quantity coming from the swamp. There is another question much more curious than the formation of this vertical section of the channel, and that is the tortuous course taken in the plan of the tunnel.

182. Have any borings taken place in the swamp under your directions? Yes, at the lower end.

183. Only at the lower end? Only at the lower end. I have probed the swamp all the way across with a bar, where the dams are placed.

184. Have you probed it down to the rock? Down to the hard sand crust underneath the bog.

185. It seems that these swamps are in a basin, and that the rock crops up along the shores of Botany. Have you ever bored to the bottom of that basin, and got on to the rock. You say there is a layer of clay on the rock? Yes; that is at Botany, where the outcrop takes place.

186. Has any boring taken place in any part of it? Yes. The engines were to have been placed in the paddock near to Mr. Costello's cottage, on the eastern side of the swamp. When I took charge of the works, I was told that was the site chosen by the engineer of the works, and there I bored to some extent.

187. Have you the details of that boring? I think we bored 70 or 80 feet, and it was all the same.

188. You did not come to the rock? We did not come to the hard, and the rods were lost. There is a cast-iron pipe now on the spot where the boring was taken.

189. Was that only in one quarter of the swamp? No, in many parts; the borings were about half a chain distant from each other.

190. To what extent? All over the reserve, except where the water was lying.

191. How many acres is it? I think it is 72 acres.

192. Have there been any borings made outside those 72 acres? Not made by me, or to my knowledge.

- E. Bell, Esq.,
M.I.C.E., C.E.
193. Have you the details of the borings? I think perhaps I might find them. [I have since endeavoured, and cannot find them.]
- 26 Oct., 1887. 194. It would be desirable to have them? My object was satisfied directly I found the nature of the land where it was proposed to put the engines. I knew it was absurd to attempt to put the engines on a place where I could bore 70 feet deep without finding a foundation. I found a place where the rock was cropping out into the sea, and I put them on the rock. I do not think there is anything recorded in the boring which will be of much service to you, but I will see if I can find the plan of the paddock on which I laid down the sections for boring every half chain.
195. *Mr. Adams.*] How many days' supply for the city do the various reservoirs hold? Do you mean in the city?
196. Yes? One and a half day altogether—two at the outside. Crown-street reservoir contains three and a half million gallons, and Paddington one and a half million gallons; and five million gallons will only last us two days. My idea is, that we ought to have reservoirs—in the first instance ponds—to contain 150 or 200 days' supply of water. We have the machinery to fill them with.
197. What sort of tanks did you propose to construct in Hyde Park? I proposed to make them of brick, with brick arches, and grass them on top, similar to the two reservoirs built at Crown-street and at Paddington.
198. Not open? No, they must be closed in the city; outside the city they may be open for some years to come. But I propose to build them in such a manner that they may be covered at any time when the population of Sydney becomes so dense as to render it necessary for the public health that they should be covered.
199. Have you ascertained the direction of the dip that the rock takes at the Botany Waterworks? The dip is to the north.
200. Have you made any bearings to ascertain the depth of the rock below the surface at that place? The rock crops out at the Waterworks. The engine-house is built on the crop of the rock.
201. But does that extend as a bar all across the natural outlet? Yes, excepting where the creek used to empty itself into the bay. It must be some considerable depth down at that crevice, but you can trace it all the way along the northern side of the bay as far as La Perouse's Monument.
202. Then, is it your opinion that the whole of the filtration is stopped by this bar? Yes.
203. You estimate the capacity of the new dams at 200,000,000 gallons. At what height do you estimate the water to stand in them to represent that amount? 8 feet at the lower end.
204. How much below the waste weir of the dam do you estimate that level to be? The wood-work is 2 feet higher, and the crown of the dam on the whole 3 feet higher than the weir.
205. Have you ever sunk any shafts, or taken observations by boring, to ascertain the probable capacity of the sub-strata of the Upper Lachlan Swamps for the retention of water? No; I have taken soundings by a bar.
206. Across the site of the intended dams, to ascertain how deep they are. How far did you go down? To the hard crust.
207. Did that lead you to suppose that there was any large capacity of loose strata that would hold water below the level of the present? No; I have dipped bars down in many places about the Lachlan Swamps to ascertain whether there were such holes and places we read of in evidence in which you can lose boring rods and bars; but the deepest place I have discovered is down in the paddock where it was originally intended to place the engine-house. You can go to any depth there.
208. What sort of bar did you sound with? Five-eighths or three-quarters of an inch in diameter.
209. To what depth did you go? Never more than 18 feet up the stream above the Botany Reserve. The greatest depth I found anywhere was, I think, 22 feet.
210. Then, I infer that you do not think any system of shafts and levels below the surface of the Lachlan Swamps would be of use as a means of supplementing the present supply? No, I think not. I suggested when these dams were in contemplation to excavate No. 4 dam; to take out the whole of the bog 18 feet in depth, and make a large permanent dam across the end of it sufficiently high to dam the water up 15 feet above the intended surface, and to pass a tunnel through the hill on the south side, and to carry a main through the tunnel so as to supply Botany direct from that immense reservoir in times of drought. Of course we could not expect the stream to take it. We should have to take a main from the bottom of that reservoir which I proposed to form and bring the water out at a lower level nearer to Botany, which I found we could do very easily. It might either be turned into the stream, or the pipe could be put into the engine well. It was found sufficiently elevated to discharge at a point near No. 1 Dam. If carried on to Botany, and anything had to be done to the dams between No. 1 and the discharge at Botany, I thought it would be advisable to carry the main at once to the engine well that we might work that stream for a considerable length of time. The cost of that work I estimated at about £45,000 if uncovered, and £80,000 if covered, and the suggestion was not entertained. I did not see any reason why a reservoir at that distance from Sydney should be covered. There is room there for an immense reservoir, the contents of which it is not possible to give without a special survey being made for the purpose. No. 4 Dam, as at present made, will cover with water an area of 26 acres. If the water be headed up to the height I suggested, we should cover with water over 35 or 40 acres, nearly 35 feet in depth in a natural basin. That reservoir would contain 300,000,000 gallons at least.

211. *Mr. Moriarty.*] I think you said that about 70,000 people are at present supplied from the city Waterworks? I suppose we supply about 75,000 people.
212. Do you know what is the total population of the city and suburbs? I do not know for a fact, but I think it does not exceed 80,000.
213. *President.*] You mean such portions as ever could come under the general supply? No, that does not include Newtown.
214. The population of Sydney and suburbs is 109,000. You would exclude several of the districts contained in that list? I think Concord might be supplied.
215. *Mr. Moriarty.*] Ought it not to be supplied? Yes, it might easily be supplied. I dare say the Newtown Reservoir might supply Concord; if not, we could erect one. Botany Redfern, Newtown, the whole of the Glebe, and Balmain, can be supplied. Sydney is supplied. Paddington can be supplied.
216. *President.*] In fact, the only one you would leave out would be St. Leonards? It is a question whether St. George's would not be better supplied in the neighbourhood.
217. You would leave out only St. Leonards? Only St. Leonards. There would then be about 105,000 people to supply.
218. *Mr. Moriarty.*] Then, there are 75,000 people now supplied, and 30,000 to be supplied? Yes, according to that return.
219. Do you not think that those 30,000 ought to be supplied? I do, undoubtedly.
220. I think you said that the quantity of water ordinarily delivered by the engines was 10,000,000 in winter and 20,000,000 in summer? About 22,000,000 in summer, and 14,000,000 or 15,000,000 in winter. I reckon that the average is about 18,000,000.
221. How many gallons per head are now supplied per day? I make it about 40.
222. That includes all the manufactories and shipping? I believe that every manufactory in the city is supplied with it.
223. Have you estimated the quantity of water taken by the manufactories? Only in one instance—that is, the sugar-house.
224. You do not know the exact quantity taken by the manufactories? No; but the quantity consumed by the sugar-house is something enormous.
225. You said (I think) that the rainfall was not the only source of supply at the Lachlan Swamp? I said I thought so.
226. Looking at the nature of the stratification, and seeing that there is, in fact, no higher ground in the immediate neighbourhood of Sydney than that of the watershed itself, where do you think springs could come from; or do you think there can possibly be any springs except from the rain-water that falls on that basin? Yes; the hills beyond our watershed are very much higher than the hills in the watershed.
227. But are they not intercepted by valleys? Not that I am aware of.
228. Then, in point of fact, they become part of the watershed? You will find on the hill above Sir Daniel Cooper's residence, above the Lower South Head Road, a high hill where there is a copious spring of good water.
229. Is not that in your basin? No, it is a long way out; but it shews that there are springs in that ridge. This is no part of the catch-water. A 3-inch pipe could be well supplied from that spring.
230. When you talked of opening the springs, and getting thereby an increased supply of water, did you not mean that you removed the sand through which water was or had been percolating? Yes.
231. So that, in point of fact, although you opened those springs and got the water, before you opened them that water was still running to waste through the sand? It was quietly filtering through a gully, the head of which had been filled with sand drift. That sand drift I was removing, and the more I worked into it the more rapidly the water came. I was enabled in a few days, with a large number of men, to raise the water in the tunnel, and give us as good a supply from the tunnel as we had in the wet season.
232. But before you removed the obstruction, was not that water escaping under the surface through the sand? It was kept back by the sand.
233. Do you think it was kept back permanently, or do you think it was escaping through the old basin? There was no way for it to escape; it was in a gully, and the head of the gully was filled with sand drift.
234. But would not the water escape through the sand drift? It was escaping, no doubt, as fast as the filtration would allow it. I attribute the increased supply to relieving it of perhaps a quarter of a mile of filtration. There was an immense tract of sand there.
235. *Mr. Woore.*] You were removing the impediment to its free flow? Yes.
236. *Mr. Moriarty.*] Do you think there is anything in the sand at Botany which would make it different from free soils in any other part of the world, through which we know that water does escape underground in enormous quantities—as, for instance, the sands of the London or Paris basins? Do you mean whether I think they differ in substratum?
237. No; what I desire to ask is, whether there is any peculiarity or density in the sands at Botany which would prevent water escaping through it, as it is known to do through the green sands, and gravels, and flints of the chalk and other basins where water is found by artesian sinking? Before the water was found on the bog I think it used to settle down by percolation; but since that time the bog has been carried by filtration into the sand, and filled up the pores, and so checked the natural filter, which you cannot clear. I think the filtration is seriously impeded, almost enough to stop it.
238. You are aware that bog is a vegetable growth? Yes.
239. And you have no doubt read of shaking bogs in various parts of the world? Yes.
240. Which means that a skin of bog has formed over a surface of water—you have heard of Chat Moss? Yes, I have seen it.

E. Bell, Esq.,
M.I.C.E., C.E.
26 Oct., 1867.

E. Bell, Esq.,
M.I.C.E., C.E.

26 Oct., 1867.

241. A film is formed on the top, shewing that bog is lighter than water? Yes, it can readily be seen floating on the water.

242. That being the case, do you think bog would be likely to come down through the sand, which is so much denser and heavier, and thereby interfere with its powers of filtration? I do not think the bog would go of itself; but there are certain portions of the bog mixed up with water, and which make it impure until it is filtered. Organic matter would pass off from the bog to the water, and the water filtering through the sand would deposit those impurities. Thus the interstices would be choked, and filtration would cease after a time.

243. Supposing we cut a moderate depth from the surface? I do not think that sand crust goes more than four or five feet in depth.

244. And what is under that? Probably sand again.

245. Would water percolate through that? It would percolate through clean sand. I have dug a great deal in those swamps, in laying the main, and wherever we came to this hard crust we found it very retentive of water indeed.

246. But is there not a free soil underneath that hard crust? I have not discovered it anywhere.

247. You considered it four feet from the surface? You would lose the colour of the bog.

248. You would get a stratum which would prevent water percolating away? To a certain extent.

249. Will you undertake to say that water will not percolate through the whole of the sand lying in the Botany basin, in considerable quantities? Certainly it percolates in considerable quantities, but to nothing like the extent it originally escaped. The bog is very retentive of water indeed; the hard encrusted sand is also —

250. I think I understood you to say that you did not consider that your dams would retain a sufficient quantity of water to supply Sydney, and that you proposed therefore to supplement it by the construction of some reservoirs in the city? I have stated that the dams will retain a sufficient quantity to supplement the stream in dry seasons, so as to supply Sydney for some time to come; to supply Sydney and the suburbs, reservoirs will be required also.

251. Have you tried at all the power of retention of the dams? No, not beyond one I made previously of sand entirely, and I found that retain the water remarkably well to a height of 8 feet. Mr. Atkinson's dam has retained water to the height of 10 feet perfectly well. There was always some passing through it, but not nearly so much as one would have thought. It was not enough for them to wash their wool with.

252. It did not hold water enough to wash their wool? Yes, it did; but it did not pass enough by filtration for that purpose—they were obliged to resort to the sluice as well.

253. Have you considered the least quantity of water that has fallen in Sydney in a year—do you know what the rainfall of the driest year has been? Yes. I cannot speak from memory with certainty, but I think it was 21 or 22 inches.

254. *President.*] In 1849 it was 21½ inches? Yes. That depth falling upon an area of 10 acres would yield more than our present requirements for Sydney, Redfern, the Glebe, and part of Paddington. I did intend to have put my views in a concise form in regard to the carrying out of those works, and to have handed them in; but my time is so fully occupied in attending to the duties of my office that I have had no time to devote to it.

255. *Mr. Moriarty.*] Shall we have an opportunity before long of examining as to whether these dams do really hold water or not? You will, very shortly.

256. How soon? In three weeks or a month. You will bear in mind that if these dams do not strictly succeed, we must have more expensive and permanent works.

257. *President.*] But you would not consider it fair to judge of the dams just at first; you think we ought to wait until they acquire a covering of organic matter? At first they would admit of more filtration than they will afterwards. I do not think that when they are first in operation there will be any excessive escapement. We shall have to pass a large supply through the sluices for the engines.

258. *Mr. Moriarty.*] Do you think the general effect of time will be to consolidate the stuff used as puddle both above and below? I do not expect it will ever be much more consolidated than it is during the first twelve months. But the filtration will carry some of the particles of bog into the sand, and we shall have a crust of the same description as that which we discover now below the surface of the bog. The percolation will be much checked. We know that such must be the case, because sand filters constructed in the ordinary way are never in operation above a week without being cleaned. The surface is skimmed for an inch or so in depth, and then occasionally a foot or so of clean sand is laid on to replace that taken off—otherwise the filters become choked and will not act.

259. That is to remove the deposit of clay or mud? And the vegetable or organic matter that may be in the water.

260. *President.*] I believe the choking up of the sand is by fine clay, as in the Chelsea works? I do not think you would have clay at all here, but you would have some boggy matter passing through. Instead of cleaning our filter-beds once a week, as they do at the Chelsea works, I dare say once a month or once in six weeks would answer the purpose; but I mention the circumstance to show that filtration is almost stopped by the impurities deposited in the sand by water filtering through it—

261. *Mr. Moriarty.*] It has occurred, has it not (we read it in the papers) that the water supply has been in a very precarious state; that there has been no water running to waste and very little in the reservoir; and that the engines have had to be stopped for want of water? I do not know what the papers say—I seldom read what they say about the Waterworks. It is not true beyond what I said to you,—that we had to cease watering the streets to enable us to get a sufficient supply to meet the wants of the people. The engine

engine was never stopped at all. We should never, in any instance, have been short of water for watering the streets or for any other purpose, if means had been adopted to prevent the water from running into the sea. E. Bell, Esq.,
M.I.C.E., C.E.

262. But, as I understand, the engines were able to pump off all the water that came down, so that there was none running to waste? Yes, for a short time in the dry season. 26 Oct., 1867.

263. Was that an unusually dry season? I do not think it was unusually dry. We had had four or five months' dry weather before that occurred.

264. At that time you just kept pumping the whole of the water that came down to the engines? We pumped all we could during that dry season, and that was not sufficient to water the streets.

265. And you were obliged to shut off the water at night—If you had had to provide for the whole of the population of Sydney and the suburbs, would you have had water enough to supply them? No; but we should have had a superabundance of water if we had only retained some of that which ran to waste in the winter.

266. If you could have kept the water from the winter to the summer? Yes.

267. Do you anticipate that your dams will hold water for six months? Which dams?

268. Those at Botany? I do not understand your meaning.

269. Will they hold the surplus rainfall of winter, for the purposes of summer? Yes, to a certain extent; but as the demand increases, we must have reservoirs made purposely for that, after all the projected dams are completed.

270. In addition to those you are now making? Yes. The surplus rain water this winter has largely exceeded 10,000,000,000 of gallons; the present dams will retain only about 250,000,000, so it would be impossible to retain the whole rainfall without some very extensive reservoirs; but we shall not require to retain the whole for many years. The present and the contemplated dams will retain sufficient of the surplus rainfall of winter for the purposes of summer, for several years hence. The filtration through each dam will be very slight, and what little passes through one dam will be retained by the one below it; so the filtration through the lowest dam is all that will pass off in that way, and this quantity will be very far from sufficient to supply one engine—the sluices must be raised in each dam, to assist the supply for the engine. The effects of filtration will only be felt in the highest dam, and what passes through it will be more than supplied by the stream, which is constant to the extent of nearly 2,000,000 gallons per diem in the driest seasons.

271. I think I understand you to say that you have not as yet made any examination as to the amount of filtration which takes place through the dams? Only when I got the water up 6 feet in one of them I found that the filtration was very slight indeed. My object in raising it was to test whether the contractor had done his work tight round the pipe, and I found he had not.

272. I think you stated, in answer to Mr. Adams, that although the rock crops up generally along the north side of Botany Bay, there is one little dip where the old stream was? Yes.

273. Do you know what is the depth there below the surface? No, I never tried it. I have put a dam across the stream with a puddle bank to prevent the escape of the water, and, as near as my memory serves me, that was only 19 feet deep.

274. Did you go to the bottom? I excavated to the hard rock, and put a puddled clay bank upon it.

275. Does the rock rise to the westward? Yes; the engine-house is placed on it. On the eastern rise it goes towards La Perouse's monument.

276. And to what level does the rock crop up as regards the level of the water in your reservoir? The natural crop of the rock was as nearly as possible level with high water mark.

277. Do you think any considerable accession of water would be got by putting a little clay dam at the top of that rock, at such a height as may divert the water now supposed to flow into the bay? Do you mean from other outlets?

278. I mean, to cap the outcrop of the rock by a small clay dam all the way along? I have done that at the Botany Waterworks. There is a 5-foot clay bank from the engine-house to the extreme point of our land embedded on the clay and taken from the clay surface above the rock. We took the outside of the crop of clay to make the puddled embankment of.

279. You have, in point of fact, done that? Yes; I did it to prevent the escape of fresh water into the sea, which I saw was going on rapidly.

280. You have given the particulars of the reservoirs you propose to construct in addition to the present works? That is, the storing reservoirs?

281. Yes. How many months' supply for the present population do you estimate they will contain? That of course depends upon the size of the reservoirs.

282. But have you not fixed any particular size? Yes, but I have not expressed any particular size here. I will add the dimensions.

283. How many months' supply would you make them capable of holding? I would commence with a supply for twelve months.

284. You would make reservoirs in the city, capable of holding a twelve months' supply? Yes, or near Sydney.

285. At the rate of how many gallons per head per day? Forty. I almost think, that for storing, thirty would be sufficient.

286. Have you made any estimate of the cost of these works? I have an idea of the cost of them all.

287. Have you gone into particulars? I know how much they would cost an acre to make. There is an eligible site for a storage reservoir on Sydney Common, at the site formerly intended for a necropolis. It is a natural basin, about 20 chains long, by 20 chains

- E. Bell. Esq., chains wide; on the western side is an opening, through which the drainage of the basin passes off to Shaw's Creek. Across this opening an impervious dam could be constructed; the interior of the reservoir puddled with clay, and made to contain 350,000,000 gallons of water, at an elevation to supply the districts now supplied by the Crown-street reservoir and the tunnel. It would cost about £35,000. A reservoir at Waverley, to contain 5,000,000 gallons, would cost £18,000; and a reservoir at Newtown, to contain 6,000,000 gallons, would cost £24,000. These works, together with the dams I have named on the Lachlan Swamps, will keep Sydney and the suburbs supplied for the next twenty years at the least, without fear of interruption, and sufficient storage room will be afforded for one year's supply, at a cost not exceeding £130,000.
- 26 Oct., 1867. 288. You have never had your attention drawn to any other source of supply? Yes, I have. I visited those ponds above Picton, and the Nepean.
289. Have you any opinion of them as a source of supply for Sydney? If their elevation is what I suppose it to be, I think they are very well placed for supplying Sydney. I should think an enormous quantity of water might be stored in those ponds. The extent of the catch-water appeared to be small, but I can give no decided opinion with regard to the extent of the water-shed, owing to the amount of wood which covers it and screens it from view, and to my want of knowledge of the country. I think they might be made so as to store an enormous quantity of water, which could be brought into Sydney by gravitation. The taste of the water seemed to me exceedingly soft, but it contained a great quantity of vegetable matter not pleasant to the taste. I believe their elevation to be high enough to send the water from there to Sydney by gravitation. I estimated the distance at 55 or 60 miles.
290. Is there any other place to which your attention has been drawn, as likely to furnish a supply of water to the city? No. I have been told of places of which I know nothing.
291. Have you ever looked at the Nepean, with a view to deriving a supply of water from it? In some parts I have—above Penrith. I think it is impossible to supply Sydney with water from that district, without putting engines on the bank of the river, to bring the water above the level of the banks at all seasons. The expense of works to bring the water from that place would cost £600,000 or £700,000 at the least. 50 miles of main laid would of itself not cost far short of £600,000.
292. The construction of the present dams at Botany was undertaken, I suppose, in consequence of either an existing or apprehended insufficiency of water? The greatest anxiety I had with regard to those dams was, to ensure a safe supply at the Botany end, in case of anything happening there. For instance, the pond at Botany has been deepened, and it is impossible to put in the weir and sluice to that pond until I am in a position to stop the water up above, unless we open the sluice and let the water run into the sea.
293. Or make a cofferdam? That would cost five times the amount of the work we have to do.
294. Then, in point of fact, the adequacy of the supply to the city hereafter depends to some extent on the retention of these dams and upon the formation of reservoirs within or in the neighbourhood of the city? I consider that it depends entirely upon the reservoirs, which ought to be constructed in the neighbourhood of Sydney. But some dams are indispensable, whether the reservoirs are made or not, to enable us to work with safety and convenience at Botany.
295. That is their main object? So far as I am concerned; except that I believe for a few years they will supplement the stream sufficiently to supply the present population of Sydney (not extending beyond the present limits in the suburbs), without rendering it necessary to cease to water the streets, or to deprive the people of water at nights.
296. *Mr. Grundy.*] The reservoir in Hyde Park would be the one by which you would supply a great portion of Sydney? Yes—all the lower levels. The district now supplied by the tunnel would be supplied from that reservoir; and, in case of need, we should have a large quantity of water at our disposal, which might be pumped from that reservoir and used, in cases of extreme drought, for other parts of the city.
297. But you would have very little head, and there would consequently be no force of water? You must supply Elizabeth-street from the reservoir, unless these Hyde Park reservoirs were full.
298. But you could not get a power of gravitation to throw the water over the houses? Not there.
299. You do not contemplate that? No; the object is to store the water so as to be provided against any casualty.
300. You could not supply it with anything like power—there being no head of water? Not except to the lowest levels of the city.
301. Is it not a fact that fresh water is known to come at low tide into some portions of Botany Bay? In some parts.
302. Is not that a proof that there is percolation? Not from our reserve, eastward of us there are two or three outlets. There is one on Captain Masters' property—a mile and a half to the eastward of our works. We might bring the whole of that water into our pond.
303. *Mr. Moriarty.*] That is what I asked you a short time ago? At our works the fresh water is entirely intercepted from the sea.
304. My question had reference to the Botany basin? There is an outlet that comes from Prince's woolwashing establishment also.
305. Would not that stop the woolwashing? Yes, but there is the water. There is a copious stream which comes out from Captain Masters' property, and flows into the sea. That I am sure might be brought into our Botany basin. That I have always considered ought

ought to be done, after we have pumped into Sydney the water which now runs from our present supply into the sea. Our object is to get the water into Sydney, and to have it there without any fear of the supply being cut off by failure of the pumping apparatus or any other cause.

E. Bell, Esq.,
M.I.C.E., C.E.

26 Oct., 1867.

306. *Mr. Grundy.*] With reference to the 1,800 acres which it is said can be drained into Bird's Gully—is that water in a condition to be used—is it not polluted by all sorts of things? I will not answer for there being 1,800 acres—I have not surveyed it. I have examined Bird's Gully and its neighbourhood, to a great extent; the water must find its way into our watershed.

307. It filters? Yes.

308. But if you made those works of which you have spoken in your report, it would no longer filter? —

309. *President.*] Have you in your office any plan of Sydney and its suburbs, showing the present distribution of the water? No, I have none beyond the trigonometrical survey, which is comprised of about fifty sheets the size of this table, on which our water mains are laid down. We find that on no smaller plan can we shew them. There are three pipes in some of the streets.

310. Would it not be comparatively easy to have a map of Sydney and its surrounding districts, showing those portions supplied with water and those that are not, by means of colours? That might be done, but even then, where one service meets another they must necessarily overlap in a hilly town like this. The pipes run past each other, and in some instances, the "dead end" has been carried up so that the foul water can be carried without injuring the water at a lower level. Then we have to carry the other a great way past it, to get a head of water above the houses.

311. Without going into details, I should like to see what portions of the suburbs are supplied and what portions are not? It would take a great deal of time to prepare a map.

312. *Mr. Moriarty.*] Could it not be done by an enlargement of the Surveyor General's plan of the town? It would be possible to do it, but it would take some time.

313. *President.*] What is the height of the Hyde Park end of the tunnel above high-water mark? 104 or 105 feet to the surface of the water.

314. A question was asked regarding the dip of the rock at the mouth of the Botany stream—you state that the rock dips to the northward—can you state the angle of the dip? No, I never tried it, but I fancied it was in some places, 1 foot in 2.

315. *Mr. Moriarty.*] Do you mean degrees? No, feet.

316. *President.*] You fancy the dip would be 1 in 2? I think it would be 1 in 2. Where I made that boring could not have been 3 chains from where the outcrop of the rock is. The edge of the basin must be very steep.

317. During the time of comparative scarcity, in the beginning of the year, there were complaints of the quality of the water, and persons asserted in the newspapers that the salt-water must have got in from the sea to the dam—do you think there was any foundation for that supposition? No, I think not. It was said by many that it must percolate through the masonry. We know that there was a leak in the masonry, but, five years ago, when I repaired the sluice gates, I caused a puddle bank to be put across the mouth of the pond, at its junction with the race carrying off the water, and when I had done with it I left it there. People, because they saw a little water weeping out through the masonry originally, conceived that where the weep was, the water found its way into the pond; but there was a puddle bank inside higher than the highest spring-tides. Those assertions were made by persons who afterwards found, very much to their annoyance, that there was a bank under the water which they did not see.

318. Was it a fact that the water, as delivered in Sydney, had a taste of salt? It had a taste which it does not always have. That I attributed to it having lain so long in the bog around the engine-pond over which the tide used to rise at one time. It was thought that the water was impregnated in some way with saline matter from what was originally deposited in the bog by the sea which used to rise up there before our dam was made. I believed myself that it was merely the flavour given to the water by the bog and that it was not caused by saline matter at all.

319. *Mr. Moriarty.*] Does the tide outside rise in dry seasons to the height of the water inside? In dry seasons, when the water is very low in the reservoir the high spring-tides rise 7 or 8 inches above it.

320. So that if there is any leakage, the salt-water would get in? Yes, but for the puddle bank between the sluice gates and the pond itself.

320½. We saw some water leaking out there the other day? Yes; but inside there is a puddled clay bank below the surface of the water but higher than the highest spring-tides, and through which no water can pass. The leak the Commissioners saw was from the dam, which is considerably higher than the clay bank.

321. *President.*] In the Water Supply Report of 1852, I find this statement made with regard to the watering of the streets:—"It is very much to be questioned whether this superficial watering of the streets does not in reality increase the evil. It is remarked of a similar proceeding at New York, that the filth of the streets, which no ordinances can prevent, was kept by constant watering in a perpetual state of decay. Under our fierce sun, the garbage soon became dry and comparatively harmless, but now it is watered hour after hour as fast as it shews any approach to dryness, and is thus kept incessantly fermenting and putrifying, to the great annoyance of delicate olfactories and the deterioration of the common air." Have you considered that possible effect of watering the streets? It is very possible that might be the case in towns where the streets are not so steep as they are in Sydney. I am certain it is not the case in Sydney.

E. Bell, Esq., M.I.C.E., C.E. 322. And you have heard no complaints of such an effect? No; I heard frequent complaints when the streets used to be watered with salt-water. People complained that their eyes were affected.

26 Oct., 1867. 323. But since fresh water has been used you know of no complaint? No.

324. Do you think of any other facts of importance respecting the present supply of water to the city, that have not been elicited by the questions put to you? No; if I should think of anything further I will mention it.

325. *Mr. Woore.*] When I was at Botany, some time ago, I observed that several of the pipes had been broken, and on inquiry I understood that they gave way in their bed. Can you account for that? In every case where I have taken up a broken pipe and replaced it by another, I have found that the crack was an old one. Many of the pipes were broken in coming out, on board the ship.

326. They broke in consequence—it was an original flaw? In many of them there was an original flaw—they had split in cooling after casting. I gave evidence to that effect at a trial on the subject, but my evidence was said to be extraordinary, and it was supposed that it could not be correct. The pipes, which were 9 feet long, were to be cast thoroughly sound, but many of those that came out were split from 9 to 12 inches at the socket end; very few were broken at the spigot end.

327. But there were some broken? Yes. What I attributed the breakage to was as follows:—They were cast vertically, with a core inside; that core was formed of bricks. As soon as the pipe is cast it begins to contract. It cannot contract without putting great strain upon the core inside. This brick core will not compress, nor can a bar be put down to cut the brickwork out in sufficient time to relieve the red hot pipe from strain, which it is unable to bear; hence the end of the pipe which is downwards splits, and the socket is always cast downwards. The pipes are cast in Scotland, and I know that in open castings the Scotch iron has not strength sufficient to draw itself together while contracting. To these facts I attribute the straining and cracking of the socket ends of the pipes.

328. It is only some of them that are cracked? Only some. Every one that has cracked has exhibited the appearance of having cracked when hot. Since those pipes were cast, there have been three patents taken out in Scotland for making a core of iron which will allow itself to contract by the outward pressure of the metal when cooling.

329. Can you account for these pipes supporting the pressure for a considerable time and then breaking? Yes; there has been some sudden check and a reaction. One of the stop back valves has probably been a little out of order. There has not been a pipe broken for these three or four years. When a pipe broke, another was put in its place within six hours.

330. Can you state the average cost of pumping water to Sydney, or the total annual charge on account of pumping? The cost per annum of pumping water into Sydney is £4,700.

331. What is the rate charged for water? 5s. per room.

332. What is the number of houses paying rates at the present time? I have no means of telling correctly.

333. What is the total amount of water rates received per annum? About £24,000 last year. The following is a list of the dams and reservoirs made, constructing, and proposed to be constructed, on the swamps between Waverley and Botany:—

Engine Pond	10 million gallons.
Upper Pond	44 "
No. 1 Dam	30 "
2 "	29 "
3 "	21 "
4 "	57 "
5 "	20 "
6 "	43 "
7 "	34 "
8 (Atkinson's)	46 "
9 "	26 "
10 (Armitage's)	22 "
11 Dam	36 "
12 "	42 "
13 "	26 "

486 million gallons.

Proposed reservoir on Sydney Common	361 million gallons.
Do. at Waverley and Newtown	12 "
Crown-street contains	3½ "
Proposed extension	4½ "
Paddington contains	1½ "
Proposed extension of do.	6½ "

875 million gallons.

Hyde Park
 20 " |

895 million gallons, exclusive of 800 million gallons which might be stored at No. 4 Dam, as before stated. Thus we shall be enabled to hold in reserve 875,000,000 gallons—a quantity more than sufficient to

to supply Sydney and the suburbs for twelve months, at the present time, without any pumping—quite sufficient to supplement the ordinary stream, and thus meet the requirements of the city and the suburbs for some years hence. When additional storage is required, a large dam should be constructed on the site of No. 4 Dam. Here in the gorge between the hill, a dam might be constructed at least 35 or 40 feet higher than the present dam which would give storage room for 800,000,000 gallons of water at the least. I believe I might state double this amount, but in the absence of more extensive surveys than have yet been made, I state the minimum quantity. The works I have enumerated would retain sufficient water to supplement the constant stream, and afford an uninterrupted supply of 45 gallons per head per diem of water, which cannot be excelled, if equalled, in purity and softness, in the Colony, to three times the number of the present population of Sydney and the suburbs. With regard to the loss which may be sustained by evaporation from the ponds formed by the several dams, I may state that the town of Bombay is supplied by a catch-water very similar to that from which the supply for Sydney is obtained. Across a valley some short distance from Bombay, dams are made to head up the water which falls during the wet season, and thus the two lakes of Vehar and Poway are formed, which retain sufficient water to supply the town of Bombay with water throughout the year. In a paper upon these works, which was read before the Institution for Civil Engineers, in London, by the Engineer who constructed the works, is the following statement, viz. :—“ Since the termination of the last rains the level of the lake has kept up remarkably well, its surface not having lowered more than six inches per month. This loss is stated to be principally due to leakage through the temporary plug by which the conical orifice of the pipe 41 inches in diameter is at present closed; no leakage whatever is perceptible through either of the dams. The small amount of this monthly loss proves how inapplicable the result of observational experiments on evaporation, on a small scale, are to the circumstances of a large body of water such as that constituting the Vehar Lake.”

Quantity discharged in gallons, from the 24th of March to the 24th of October, 1867, into the sea :—

	galls.
Over the weir	749,869,501
Through the flood-gates	10,148,220,000
Total... ..	10,898,089,501

in addition to a large quantity which passed over the paddock into the sea, and which could not be gauged or estimated.

E. BELL,
C.E.

APPENDIX B.

E. Bell, Esq.,
M.I.C.E., C.E.

The City Engineer to The Commissioners for the City of Sydney.

City Commission,
Engineer's Department,
Sydney, 30 July, 1856.

26 Oct., 1867.

Gentlemen,

In accordance with instructions received from you on the 11th instant, to gauge the escape of water at Lord's Mill, I made immediate preparations for so doing, by cutting off, as effectually as possible, every escape excepting that at the waste watercourse of the mill.

I had previously constructed a new wasteboard and gauge for the same purpose, at an elevation of six-teen and a half (16½) inches above the old one, in order to prevent the possibility of the sea-water at spring-tide from running over it into the mill-pond.

The notch in the new wasteboard is exactly five (5) feet wide, and in the side next the pond, in still water, a gauge is fixed, which is divided into inches and tenths of an inch, to denote the depth of water at the edge of the wasteboard, the point of zero on the gauge being fixed horizontally with the edge of the wasteboard.

The works were ready on the morning of the 18th instant, and the following table shews the result of the observations which have been made from the 18th to the 30th instant inclusive.

I have annexed a plan, section, elevation, and also a sketch of the wasteboard, to illustrate the arrangement by which the gauging was effected.

The gauging of the wasteboard will continue daily, and a return shall be made weekly of the results.

It is necessary to remark that, since the wasteboard was raised, the soakage through the sea-embankment is very considerable; previously it was almost imperceptible. The escape of water by this soakage is not less than ninety thousand (90,000) gallons per diem.

Also, that there is a small stream in the neighbourhood of Lord's Mill, which takes its water from this watershed, passes through the tannery, and discharges into the sea not less than two hundred and twenty thousand (220,000) gallons of water per diem.

In addition to the quantities escaping at Lord's Mill, as shewn by the annexed table, is the present supply from Lachlan Swamp to the city, which is computed at six hundred thousand (600,000) gallons per diem.

It will be seen by the annexed tables that (if the city contains ten thousand (10,000) houses) the smallest quantity stated therein will supply to each house two hundred and forty-six (246) gallons per diem, and the largest quantity two hundred and ninety-two (292) gallons per diem, or an average of two hundred and sixty-nine (269) gallons; and, with the addition of the Lachlan Swamp water, the average daily supply would be increased to three hundred and twenty-nine (329) gallons per house; therefore, taking the population of the city at sixty thousand (60,000) or six people to each house, the supply would average fifty-five (55) gallons per head per diem, or more than double the necessary quantity.

I have, &c.,
E. BELL, M.Inst.C.E.,
City Engineer.

The City Engineer to The Commissioners for the City of Sydney.

Engineer's Department,
City Commissioners' Offices,
Sydney, 11 August, 1856.

Gentlemen,

Annexed, I have the honor to lay before you my report upon the gauging of the water passing over the wasteboard at Lord's Mill, Botany, from the 1st to the 9th instant inclusive, and to observe that the quantity of water which escapes into the sea by filtration through the embankment without passing over the wasteboard, has increased very considerably since my last report to you on this subject; also, that there are no means of checking this escape until the permanent puddled embankment is made.

I have, &c.,
EDWARD BELL, C.E.,
City Engineer.

E. Bell, Esq.,
M.I.C.E., C.E.

26 Oct., 1867.

APPENDIX B—continued.

Date.	Time.	Depth in inches and decimal parts of the upper edge of the Wasteboard below the surface of the Water passing over it.	Escape in gallons of Water per diem passing over the edge of the Wasteboard, according to experiments made in Scotland.	Escape in gallons of Water per diem passing over the edge of the Wasteboard, as computed by Beardmore's Tables. Constant '666.	Remarks.

WATER SUPPLY OF SYDNEY AND ITS SUBURBS—EVIDENCE.

APPENDIX B—continued.

E. Bell, Esq.,
M.I.C.E., C.E.

The City Engineer to The Commissioners for the City of Sydney.

City Commission, Engineer's Department, 26 Oct., 1867.
Sydney, 6 October, 1856.

Gentlemen,

Annexed, I have the honor to lay before you the gauging of the water at Botany, from the 30th August to the 30th September inclusive, and to remark that soakage of water through the whole bank still continues, and the quantity of water which escapes by this means into the sea without passing over the wasteboard, increases considerably.

I have also added, for your information, the mean of the depths and quantities of water passing over the wasteboard, from the commencement of its rise, viz., from the 18th July to the 30th September, inclusive.

I have, &c.,
EDWARD BELL, C.E.,
City Engineer.

Date.	Time.	Depth in inches, and decimal parts of the upper edge of the Wasteboard below the surface, of the Water passing over it.	Escape in gallons of Water per diem passing over the edge of the Wasteboard according to experiments made in Scotland.	Escape in gallons of Water per diem passing over the edge of the Wasteboard, as computed by Beardmore's Tables. Constant '666	Remarks.

WEDNESDAY, 30 OCTOBER, 1867.

Present:—

MR. GRUNDY,
MR. ADAMS,MR. MORIARTY,
MR. WOORE.

PROFESSOR SMITH, M.D., (PRESIDENT), IN THE CHAIR.

Edward Lord, Esq., called in and examined:—

- E. Lord, Esq. 334. *President.*] I believe you have had a knowledge of the Botany Swamps for a considerable number of years? Yes; I recollect them for about forty years.
- 30 Oct., 1867. 335. Will you tell us of the driest years you have known? I could not tell you what was the effect upon the Botany Swamps of the driest year I have known, because at that time, in 1838-9, I was in the Bathurst district.
336. During the drought of 1838-9, then, you were not acquainted with the Botany Swamps? I was acquainted with them, but I was not in the locality, to form any opinion with regard to the effect of the drought upon them.
337. Did you observe the effect of the drought of 1849 upon them? Yes.
338. And after that I think the next very dry year was 1862? Yes.
339. Could you give us some account of the condition of the Botany Swamps during the driest periods you have known them, as compared with their present condition? I could not exactly give you that without reference to some data to aid my memory; but as to giving you a general description or opinion in regard to the swamps, I can tell you what my views have been during the period I have known them, and the effects which these continuous droughts have had upon them.
340. Has the stream ever actually ceased running in seasons of great drought? No, never.
341. Has it become very small as compared with its average condition? Latterly it has become very small.
342. Have you observed any material change in the appearance of the swamps since you first knew them? Yes, I have observed a very great change in them. The change is very material. That property of the soil enabling it to absorb water has been diminishing year after year.
343. Has it become less spongy and less retentive? It has become less retentive.
344. To what would you attribute that? To the cultivation which is carried on in the locality, and to the ground being trodden over by cattle and stock, and by men; generally, by population approaching more closely to the parts where this rain was retained.
345. When you knew the swamps first, were they more covered with brushwood than they are now? Yes, it was entirely covered with brushwood, from the boundaries of the city all the way out to the place in question.
346. I suppose that the mere destruction of the brushwood would tend to dry up the surface? No doubt of it.
347. Do you think the Botany stream is supplied entirely by the rain falling on its drainage area, or might it be supplied partly by springs? I have no doubt that it is supplied by the rain that falls on its area. I have had every opportunity of observing that.
348. Do you think the Botany stream can be relied on as a source of water supply to Sydney? I do not think so now. I may once have entertained an opinion that it could. I have thought that, if the same means had been adopted some seven or eight years ago that are being adopted now by the Council, of damming up the stream at intervals and saturating the contiguous land, there might have been preserved for a very long time sufficient water to supply Sydney; but I believe the population is so increasing, and the retentive property of this soil is so diminishing, that it cannot now be relied upon as a place from which so large a city with its suburbs can be supplied.
349. Have you examined the dams now in course of erection at Botany? No, I have not been there.
350. Do you think there would be any use in planting trees over the swamps—would they grow now? There are kinds of trees that I have no doubt would grow very well there, but I do not think that the planting of any trees now would have the effect desired. I do not think you could by any possibility restore the place to the same natural state in which it was thirty or forty years since.
351. Did trees grow there then, or only low scrubby vegetation? Trees were growing over the greater part of the place.
352. In average years, keeping out of view seasons of great drought, do you think there is a sufficient supply in the Botany stream for the present population of Sydney? Well, there might be for the present population of Sydney. The way I look at the matter is this:—If we got the same amount of rain spread over the year at such times as that it would not form a flood and run away, there is no question in my mind that it would be sufficient; but if it were to come in falls of a week or a fortnight, and then we were to have an intermission of two or three months, I do not think anything could be done to keep a sufficient supply there.
353. You do not think that the present system of dams would preserve the abundant supply of one period to make up for two or three months without rain? I do not.
354. Have you thought of any other source of water supply that would be preferable to the Botany stream? I have not an acquaintance with those rivers up above the Nepean; but from what I have heard, I think that the Government or the Corporation will have to adopt some means of procuring water from some source up that way.

355. You think that wherever it is to be obtained, there must be some further supply? There must be some further supply obtained. Wherever it is obtained, I think it ought to be sent in by its own gravity, and not forced in. I may mention to you, that this experience I have of the Botany Swamp, extending over such a length of time, has given me opportunities of seeing how the quantity of water is diminishing. When I was a boy, we had a flour-mill at the mouth of Cook's River. At that time—thirty or forty years ago—there was a stream there working the imperfect machinery then employed equal to 15-horse power; the wheel was undershot, and the pressure of water was never above from 3 feet 6 inches to 4 feet, that is, the height of water in the dam was never more than 3 feet 6 inches to 4 feet from the bottom of the race. If you were to try and apply the water for the same purpose, and with the same imperfect machinery now, I do not think you would be able to work it two hours a day. But at the time I speak of, it was continually employed. This shews how the water has diminished. There is another circumstance I have observed:—When we had a rainfall of a week or a fortnight, or three weeks, that would leave us a source of supply for the working of the mill and other purposes that would last for three or four months, according to the quantity that fell. But now, directly a heavy rainfall is over, the effect is removed immediately. The water runs off to the sea, and scarcely any of it is retained. In fact, it is nearly all drained off in three weeks or a month.

E. Lord, Esq.

30 Oct., 1867.

356. Do you think that is from the consolidation of the surface of the swamp? Unquestionably; and from the gardens, and the cuttings which have been made for the purpose of removing the water. There are two sources of supply to this place,—one coming from the northward or north-west, and the other more easterly. We used to have from that north-westerly source always a gradual supply of water. The swamps in that locality were almost always full; but the road now passes through several of them. There used to be a gradual supply all through the summer; but now, in the dry seasons, you will scarcely see a drop. There is another matter which I have noticed, as shewing how the treading down of the surface has destroyed the retentive property of the soil:—If it comes on any continuous rain, there is a flood immediately; whereas before, we were never apprehensive of a flood if it came on to rain five or six weeks at a stretch.

357. *Mr. Woore.*] Where was your mill? About half a mile from the old factory.

358. Was it erected at the same time as the factory? About the same time.

359. *President.*] Is there not a large amount of swampy ground to the eastward, on the Church and School Estate? Yes.

360. Can any of that be brought into the drainage of the Botany stream? I have no doubt that all of it could be brought into it, because all the waters of these reserves, or nearly all, fall into Botany Bay, through those streams you meet with as you go along. The first is where those veterans' farms are; then you come to another, and after that there is another one near Mr. Brown's. I suppose that by a small dam all along the margin of Botany Bay it might all be conducted to this stream.

361. You see no means of restoring the retentive character of the swamps? No, I do not. If this large area of ground which now drains into the bay had its drainage diverted into the stream, I have no doubt that a supply might be obtained sufficient to last for a considerable number of years, because you would almost double the area.

362. Do you know if portions of the watershed of the Botany stream are being built upon now? I believe not to a very great extent on the 640 acres [*indicated on map*] about where the tannery is. It is being taken up gradually; but there is nothing to prevent the whole of the land along that stream being taken up and built upon.

363. It is mostly private property? It is nearly all private property all the way up.

364. Can you make any comparison between the quality of the water when you knew it first and its quality now? No; the only thing I can say in regard to that matter is, that being subject to more frequent floods, and drains being cut, the water is more frequently impure. But if the water is allowed to remain for a length of time undisturbed, it is very pure.

365. *Mr. Moriarty.*] You said that there was nothing to prevent the whole of that land being built upon, or nearly the whole of it, from the Botany Waterworks almost up to the Water Reserve? Yes.

366. And the same causes which you have observed as having tended to drain the land about Shea's Creek may come into operation there? No doubt.

367. Drains may be cut over it, and the land may lose its power of retaining water? Yes.

368. And it will then, of course, be worthless as a source of water supply? No doubt it will.

369. And might not the same occur in regard to the Church and School Lands, which you mention as a place from which a large additional supply might be derived? Precisely so.

370. Then, unless the whole were reserved from beginning to end, you would not say that the supply could be trusted? Undoubtedly not; and even then I should have great doubt about it.

371. *President.*] I understand you to say that the evil is already done, and that the swamps have ceased to be trustworthy? Yes. You may judge of the circumstances from what I have said,—that a number of years ago there was a supply yielded gradually, and that if it rained for three or four weeks continuously, the effect of it would remain for four or five months; but now, immediately after a heavy rain there is a flood, and away the water goes.

372. During the thirty or forty years you have known the place, do you recollect whether there was any period of lengthened drought—Did you ever run short of water? No, we never ran short of water there; we always had plenty to work the machinery, and the quantity required for that is about the best criterion one could have. The lower part, where

E. Lord, Esq. where the road is, was relied upon as an assistant to the supply, but we always got the principal part of the water elsewhere. Now, in times of flood the water rushes down by the road with immense impetuosity; formerly it used to yield the water gradually.

30 Oct., 1867.

373. *Mr. Grundy.*] Some portions which then were swamps are not now swamps at all? No, they have been made into gardens. Where the present road goes, you could not get half the distance with a horse years ago.

374. You could not get half the distance you can get now? No. Of course they have made a good portion of the road, but the whole character of the country is altered altogether.

375. *Mr. Woore.*] When did you become acquainted with the swamps? I knew them when I was a child, and am speaking of them as far back as I recollect.

376. How many years ago is that? I have mentioned forty years as a time from which I have a perfect recollection of all the circumstances.

377. *President.*] Can you suggest anything further that could be done as a temporary provision, other than the dams that are being erected? I believe it is a matter of great magnitude, and that every precaution should be taken, judging from what took place last year. There was not then such a great drought, but the water was becoming very scarce. I think large additions might be made to the supply, if precautionary means were adopted to collect the water that now flows into Botany Bay from the reserves.

378. *Mr. Grundy.*] There is, I believe, quite a large stream running into Botany Bay to the eastward? There are two or three streams nearly always running.

379. There is one where the Long Bay road passes? There is a very large quantity of water collected over a large area running into the sea.

380. Do you know what difficulty there would be in bringing the water into the Botany stream—The ground rises between the Sir Joseph Banks Hotel and that place considerably, does it not? No, there is a bank all along the margin of the bay. The plan would be, to make a dam of sufficient elevation at Bunnerong and the intermediate streams, and convey it to the Botany Waterworks.

381. That part of the swamps appears to have been less interfered with than any other? Yes, its distance from Sydney has saved it from encroachments similar to those which have taken place on other parts.

382. *President.*] Do you know that portion of the swamp marked on the map "Bird's Gully"? Yes.

383. Have you traced that up to the head? No, I do not think I have. It is a tributary to this main stream.

384. Could any of the more easterly swamps be drained into the head of Bird's Gully, and so into the Botany stream? I dare say they could. It would not require a great deal of trouble to ascertain that, if the levels were taken to the end of Long Swamp.

385. One of the easterly swamps is called Long Swamp, is it not? Yes; the Long Swamp takes its rise almost at the back of Maroubra beach. It comes down and delivers its waters into Botany Bay at Bunnerong. I do not know whether the continuation of this would intercept others, but it would only get the portion of water above it. If you got to Bunnerong, three miles from Botany, by elevating the water a little, you might throw it down to the next stream, and from that into the reservoir at Cook's River, where the machinery is.

386. *Mr. Moriarty.*] We have been told that there is an outcrop of the rock all along the north shore of Botany, close to the beach—Do you know if that is the case? I never heard that there was. But at the time Mr. Rider was doing the engineering work there for the Corporation, he had a man making borings all over the place. There is no indication of rock at all till you come beyond Bunnerong—that is the point that runs out. The Long Swamp is not a continuous swamp—there is a rise in the middle, so that the water would percolate gradually.

387. Are you of opinion, supposing it is possible to reserve these lands for the purpose of supplying water to the city, that it would be advisable to do so in view of the probable increased requirements consequent on the extension of the city? I think it would be desirable to retain them in the hands of the Government until some other mode is adopted for supplying the city with water.

388. But generally, supposing it possible to get water from some other source, do you think it would be advisable then to retain the swamps in the hands of the Government? The necessity for doing so would then be done away with. I think any Government would be exceedingly culpable to allow things to remain in the same state as at present. That is my opinion, formed from the observations I have made during the last few years.

389. *President.*] Do you think that Sydney runs great risk now from the deficiency of water? It altogether depends upon the uniformity of the rainfall. If we have similar droughts to those we have already experienced in this country, they would be attended with considerable inconvenience and injury to the citizens.

SATURDAY, 2 NOVEMBER, 1867.

Present:—

MR. MORIARTY,		MR. GRUNDY,
MR. ADAMS,		MR. WOORE.

PROFESSOR SMITH, ESQ., M.D., (PRESIDENT), IN THE CHAIR.

Simeon Henry Pearce, Esq., called in and examined:—

390. *President.*] I understand that you are very familiar with the Botany Swamps? I am. S. H. Pearce,

391. Has your knowledge of that district extended back many years? For the last twenty years I have been living at Randwick in that neighbourhood. Esq.

392. And have you had occasion to pay much attention to the condition of the swamps and the streams that drain them? I have; I have made the subject a matter of much consideration. 2 Nov., 1867.

393. Could you give us your views of the condition of the swamps now, as compared with their condition when you first knew them? In the case of most of them, the surface is much harder than it was when I first knew them—twenty years ago. I think that is on account of the drains which have been cut through them—especially in the Lachlan Swamp—by the City Corporation. They cut those drains twelve or fifteen years ago, for the purpose of getting a supply of water when they were at that time very short of it. The City Corporation then opened a number of ditches through the swamp, towards the hills at Waverley, in order to get the surface drainage to supply the city. They thus drained the whole of the bed of the swamp to the depth they took the drains; and hence the hardness of the soil, which is, however, owing in part to the cattle that used to depasture there. The swamps became more dense, and consequently more dry, on account of the ditches which were cut to drain them, &c. The other swamps also, to the south of the Sydney Common, which were in the possession of private individuals—Atkinson, Armitage and others, who had sheep-washing establishments on the creek, made dams and cut channels, for the purpose of supplying themselves with water in drougthy seasons. They took a course similar to that pursued by the Corporation to supply the city. The consequence was, that when those dams gave way by the water percolating under the bottom, the water washed channels below those dams—large and deep, so that the original boggy matter (decomposed vegetation) which previously remained in the swamps, was to a certain extent washed away.

394. Then you think that the means taken to increase the supply had the effect of injuring the retentive power of the swamp? Exactly so; the bog on the surface was formerly very retentive—it kept back the surface water, excepting in very dry seasons; but when they cut the ditches through the swamps, the water was drained from the higher levels. If you have a swampy garden, the first thing to make it dry is to cut a ditch through it and drain it; and that is what has been done on the Lachlan Swamps.

395. When you knew the swamps first, was there more scrubby vegetation upon them—or even trees—than there is now? In some of the swamps there was. Since the City Corporation have fenced in the Lachlan Reserve, the scrub and other indigenous plants and grasses have been better preserved from fires, &c. The land has thus been preserved from the denudation which was previously caused by fires and the cutting of timber, as well as by the depasturing of cattle. There is more vegetation on the Lachlan Swamps now than there was previous to their being fenced in.

396. You think there is more vegetation over the general surface of the swamps than there was twenty years ago? That is, over the surface of the Lachlan Swamp which has been enclosed.

397. Does that apply also to the unenclosed swamps? No; because the fires which have occurred have to a certain extent destroyed the vegetation. There might be an answer given as to the use of the vegetation in two ways:—The vegetation, as it originally existed, no doubt prevented in some degree the evaporation of the water by the sun and air, and also retarded its course; but nevertheless, it required some moisture to support its own life, which it partly drew from the soil, and the absorption in one way was equal, I presume, to the absorption in the other.

398. Do you remember if there were trees growing on the slopes and on the drier parts of the district twenty years ago? There were but very few trees twenty years ago; but previous to my appointment as Commissioner of Crown Lands, in 1848, there were some large trees growing there, for the stumps remained in the ground at that time, and it became a part of my duty to protect what was then left.

399. Do you not think that the destruction of the trees that had once grown there would tend to diminish the drainage of water from the district? The preservation of the trees would have prevented the water flowing so rapidly from the surface, because the roots, and the leaves which would fall from the trees, would, as a matter of course, when decomposed, form a retentive substance, and act as surface dams for the retention of the surface water; in rainy weather, consequently, it would not flow off so suddenly as though the surface was smooth and regular.

400. Do you think, then, that the chief cause of the drying of the swamps is the cutting of these channels of which you have spoken? To a certain extent, to a very large extent, the surface has been drained in that way, and partly produced the present result.

401. Is much of the effect produced, do you think, in consequence of the treading down of the soil by the cattle? No doubt that has made the surface of the ground very hard, and consequently,

- S. H. Pearce, consequently, the water, instead of percolating into the sand in times of heavy rain, runs rapidly off into the ditches or channels referred to, and thence into Botany Bay.
Esq.
- 2 Nov., 1867. 402. Have you observed any evident diminution in the volume of the Botany stream, within your own knowledge? I have. Twenty years ago I could scarcely pass the place where the engine-house is now erected on the Randwick Road. There was no road to my property when I first resided there in 1848, and I had to wade over that place—the main stream—up to my knees in mud and water. I had to carry over in the same way a portion of the timber to build my house, it being impossible to take over a dray with a load. There was a large stream flowing there then, and until they began to cut the ditches I never saw that place without water.
403. What have been the driest years since you went to live there? I do not remember the dates, but I know that we have had two or three very dry seasons since I have been at Randwick.
404. Were you living there in 1849? I was.
405. It appears by the public records that that was a very dry year? It was; I believe it was very dry in 1848 and '49.
406. Have you any remembrance of the condition of the Botany stream at that time? Not towards Botany, but at the Lachlan Swamp, where I used to cross to go to Randwick, the stream was large, and continually running into Botany.
407. Even in 1849? Yes, in 1849. I remember it well, as previously stated.
408. *Mr. Woore.*] What part was that? At the watercourse near where the engine-house now is, on the Randwick Road.
409. *Mr. Grundy.*] Near the Racecourse? Yes, near where the old engine-house now stands.
410. *President.*] Do you think the Lachlan Swamp is supplied with water merely by the rain which falls on its drainage area? Exactly—by the surface drainage. Once I thought otherwise, on account of the large quantity of water which was continually running, but the present state of the stream clearly shows that it is merely surface drainage.
411. You do not think it is supplied by springs deriving water from other drainage areas? No, I do not think there is any supply except from the surface drainage of the land sloping to the swamp and its immediate vicinity. The Lachlan Swamp is surrounded by hills on the north-east and west, and in rainy seasons the water runs in from the top and slopes of those hills. There is, perhaps, a large quantity of water collected in the swamp by percolation from adjacent lands. My own opinion is, that the Lachlan Swamp was once an arm of the sea. I think the waters of the ocean originally extended to the Waverley Hills, and have no doubt that when proper experiments are made, it will be found to have been so.
412. Have you lately observed the stream of water that comes down towards the tunnel from a north-easterly direction? From Waverley?
413. Yes? I have many times crossed it, and found it dry except after rain. It is dry at the present time.
414. Do you think that could be supplied at present entirely from the rain that has fallen upon its drainage area? I do. All the rocks in that locality are known as ferruginous sandstone. The rocks and sandhills during winter absorb a large quantity of water, and supply it gradually by percolation into the lower levels.
415. Have you ever traced that stream to its source? I have. It is on property now belonging to my brother.
416. It arises from percolation through the rocks, and not from any distinct spring? Yes; there is no doubt as to its source, and that it is from surface drainage only—from the sandhills near the Episcopalian Church at Waverley.
417. To the eastward of the drainage area of the Botany stream, on the Church and School Estate, I believe there are many swamps of considerable size? There are several swamps in that locality, but in dry seasons there is no water in most of them. When dry, the surfaces of some are loam, others, I believe, rock.
418. Have you observed if they retain the water for a length of time after rain, or whether they dry speedily? In summer they dry speedily, on account of their shallowness, except the swamp we call "Seventy-four Swamp." The former Commission named it "Seventy-four Swamp," from some information I gave respecting it. My information was to the effect that even in dry weather I believed they could float a "seventy-four" in it. That is at the west of Maroubra Bay [*Witness pointed out "Seventy-four Swamp" on the map*], but since that time I have seen that swamp nearly dry, and was disappointed with reference to its anticipated depth.
419. *Mr. Adams.*] Where does that empty? It drains by percolation into Maroubra Bay. The bottom of this swamp is lower than the north end of "Long Swamp."
420. *President.*] Then that could not be made available? No, not without pumping apparatus. I once advised that a windmill and pump be there erected to assist in supplying the city, but I now see that the quantity would not be sufficient for any permanent purpose. I do not think that any of the water could be taken from there into Bird's Gully by drainage except the swamp was full, and then only a small quantity could be obtained in that way.
421. And it drains or percolates into the sea? Yes, it drains through the coast range into Maroubra Bay.
422. Can you point out the position of "Long Swamp"? Yes. [*Witness pointed to the swamp on the map.*]
423. Does that swamp retain much water? Not except in wet weather—then it is a series of small lakes; the surface soil in dry weather is loam. The water dries up very rapidly, in consequence of the percolation through the sandy loam, and the evaporation which is continually going on, consequent on its being exposed to the sun and air.

424. In the Water Report of 1852 it was stated that the Long Swamp could easily be connected, by a slight engineering work, with Bird's Gully—Is that your opinion? To a certain extent it is, by connecting it at the north end. There is a ridge of sandhills at the north-west end which would have to be cut through. In order to get a proper incline to drain that swamp into Bird's Gully, a long deep dyke would have to be cut. I think it would be necessary to put a tunnel through the hills, because if cuttings were made and left open, the sand would be constantly drifting into them and filling them up. Provision must also be made to prevent the sand being carried into the dams in times of flood.

S. H. Pearce,
Esq.
2 Nov., 1867.

425. Do you think that by connecting Long Swamp with Bird's Gully, a material increase in the supply of water can be obtained? *In wet weather it could.* An enormous quantity could be collected at Botany in rainy weather, if you connected all the swamps with the main stream below Bird's Gully—that stream which now supplies the present engine at Botany; but in very dry weather you would have but little from that source. The head of Bird's Gully is on the boundary of the parish of Alexandria and Botany, and further north than the Long Swamps. The Long Swamps are south of Bird's Gully, and could never be thoroughly drained into it, because Bird's Gully is much higher than the south end of the Long Swamps; but by cutting a tunnel through the hills, on the west of those swamps, south of Bird's Gully, they could be drained into the present stream that supplies the Botany Waterworks.

426. Then, in point of fact, to drain the Long Swamp would be only increasing a superabundant supply in wet weather? Yes, in very wet weather you would bring down such a flood that it would wash away all your dams, and also fill your reservoirs at Botany with sand. It would be much better to let it remain as it is, and be content with what is now received from those swamps by percolation through the hills.

427. You think that there would be no such accumulation of water as would increase the supply in dry weather? No; if you go out and see the place *even now*, you will find that what I say is correct.

428. What is the present outlet for Long Swamp in rainy weather? It runs out at the west end of Bunnerong. The Long Swamps all drain to the north-west of Brown's grant of 131 acres into Botany Bay.

429. What amount of ground is drained by that stream to the east of Bird's Gully—could you give us a rough idea of the superficial area? I should say that the Long Swamps drain about 400 acres, exclusive of water running into Bird's Gully. On the east of Bunnerong there are other swamps, but the watercourses are *dry in summer*.

430. And what by the other stream at Bunnerong? About 200 acres, but you could not bring that into the main stream, because there are spurs to the hills which divide the waters; and all the water from that area runs into a small creek between the grants of Brown and Crane. There is another swamp on the east of Crane's grant at Botany, which overflows in rainy seasons and runs into the bay.

431. Do you think that 600 more acres are drained to the east of Bunnerong? About 200 acres drain into the bay from that locality. *In wet weather* there is a beautiful stream running on the east of Brown's land—between the grants of Brown and Crane, but in *dry weather* there is but little water at either of those places.

432. Have you inspected the dams now being constructed on the Botany stream? I have not. If I had been asked any questions about them, I should have denounced the plan now adopted, as being a perfect waste of money.

433. You think they will not retain the water? My practical experience of these matters convinces me that no dam will retain water if it is built on a sandy foundation. The water will always percolate through the sand, and ultimately destroy the dam, similar to what lately occurred in Yorkshire. It is of no use putting a puddle dam on a rope of sand. My experience in the plan of making dams in England and in this Colony has been quite the reverse of the mode said to be adopted at Botany. The driving of piles to make dams to hold water with a sandy bottom is a perfect farce.

434. But might they not be useful in the way of keeping the surface more wet, and therefore so far retaining the spongy character of the surface? To a certain extent they might. When I was examined twenty years ago before the City Council on the same subject, I believe I recommended that dams should be made across certain places, being then under the impression that there was a good bottom to be found near the surface; but my experience since has convinced me that it is useless to make dams for the retention of water in that stream, believing as I do that the water of the sea formerly ran up to the base of the Waverley Hills, and that therefore it is all sand to a great depth. In some places the sand is perhaps more than 100 feet deep. I took great interest in the experiments made by the Commission appointed by the Parliament in 1852. I gave that Commission some information with reference to the water question, and paid great attention to their operations. They bored in the Lachlan Swamp, and at 60 odd feet (I forget the exact depth) they came upon a large log of timber lying horizontally in the sand. They bored with two tubes, but could get no further, on account of the timber. In many instances I saw them boring, and on one occasion they brought up in the tube chips of the indigenous timber of this Colony—*eucalyptus gumiferum*.

435. Is not that rather against your supposition that it was once an arm of the sea? No; because there is every probability that those hills and the slopes abounded with large timber trees, and by reason of floods or some other cause they may have been washed down the slopes to the centre of the stream, as is found in many places in England, where whole forests have been overturned and buried. In fact, we have sufficient evidence to shew from the coal deposits that such has been the case in the mother country, and the same causes may have produced the same effects here.

engine was never stopped at all. We should never, in any instance, have been short of water for watering the streets or for any other purpose, if means had been adopted to prevent the water from running into the sea. E. Bell, Esq.,
M.I.C.E., C.E.

262. But, as I understand, the engines were able to pump off all the water that came down, so that there was none running to waste? Yes, for a short time in the dry season. 26 Oct., 1867.

263. Was that an unusually dry season? I do not think it was unusually dry. We had had four or five months' dry weather before that occurred.

264. At that time you just kept pumping the whole of the water that came down to the engines? We pumped all we could during that dry season, and that was not sufficient to water the streets.

265. And you were obliged to shut off the water at night—If you had had to provide for the whole of the population of Sydney and the suburbs, would you have had water enough to supply them? No; but we should have had a superabundance of water if we had only retained some of that which ran to waste in the winter.

266. If you could have kept the water from the winter to the summer? Yes.

267. Do you anticipate that your dams will hold water for six months? Which dams?

268. Those at Botany? I do not understand your meaning.

269. Will they hold the surplus rainfall of winter, for the purposes of summer? Yes, to a certain extent; but as the demand increases, we must have reservoirs made purposely for that, after all the projected dams are completed.

270. In addition to those you are now making? Yes. The surplus rain water this winter has largely exceeded 10,000,000,000 of gallons; the present dams will retain only about 250,000,000, so it would be impossible to retain the whole rainfall without some very extensive reservoirs; but we shall not require to retain the whole for many years. The present and the contemplated dams will retain sufficient of the surplus rainfall of winter for the purposes of summer, for several years hence. The filtration through each dam will be very slight, and what little passes through one dam will be retained by the one below it; so the filtration through the lowest dam is all that will pass off in that way, and this quantity will be very far from sufficient to supply one engine—the sluices must be raised in each dam, to assist the supply for the engine. The effects of filtration will only be felt in the highest dam, and what passes through it will be more than supplied by the stream, which is constant to the extent of nearly 2,000,000 gallons per diem in the driest seasons.

271. I think I understand you to say that you have not as yet made any examination as to the amount of filtration which takes place through the dams? Only when I got the water up 6 feet in one of them I found that the filtration was very slight indeed. My object in raising it was to test whether the contractor had done his work tight round the pipe, and I found he had not.

272. I think you stated, in answer to Mr. Adams, that although the rock crops up generally along the north side of Botany Bay, there is one little dip where the old stream was? Yes.

273. Do you know what is the depth there below the surface? No, I never tried it. I have put a dam across the stream with a puddle bank to prevent the escape of the water, and, as near as my memory serves me, that was only 19 feet deep.

274. Did you go to the bottom? I excavated to the hard rock, and put a puddled clay bank upon it.

275. Does the rock rise to the westward? Yes; the engine-house is placed on it. On the eastern rise it goes towards La Perouse's monument.

276. And to what level does the rock crop up as regards the level of the water in your reservoir? The natural crop of the rock was as nearly as possible level with high water mark.

277. Do you think any considerable accession of water would be got by putting a little clay dam at the top of that rock, at such a height as may divert the water now supposed to flow into the bay? Do you mean from other outlets?

278. I mean, to cap the outcrop of the rock by a small clay dam all the way along? I have done that at the Botany Waterworks. There is a 5-foot clay bank from the engine-house to the extreme point of our land embedded on the clay and taken from the clay surface above the rock. We took the outside of the crop of clay to make the puddled embankment of.

279. You have, in point of fact, done that? Yes; I did it to prevent the escape of fresh water into the sea, which I saw was going on rapidly.

280. You have given the particulars of the reservoirs you propose to construct in addition to the present works? That is, the storing reservoirs?

281. Yes. How many months' supply for the present population do you estimate they will contain? That of course depends upon the size of the reservoirs.

282. But have you not fixed any particular size? Yes, but I have not expressed any particular size here. I will add the dimensions.

283. How many months' supply would you make them capable of holding? I would commence with a supply for twelve months.

284. You would make reservoirs in the city, capable of holding a twelve months' supply? Yes, or near Sydney.

285. At the rate of how many gallons per head per day? Forty. I almost think, that for storing, thirty would be sufficient.

286. Have you made any estimate of the cost of these works? I have an idea of the cost of them all.

287. Have you gone into particulars? I know how much they would cost an acre to make. There is an eligible site for a storage reservoir on Sydney Common, at the site formerly intended for a necropolis. It is a natural basin, about 20 chains long, by 20 chains

ought to be done, after we have pumped into Sydney the water which now runs from our present supply into the sea. Our object is to get the water into Sydney, and to have it there without any fear of the supply being cut off by failure of the pumping apparatus or any other cause.

E. Bell, Esq.,
M.I.C.E., C.E.

26 Oct., 1867.

306. *Mr. Grundy.*] With reference to the 1,800 acres which it is said can be drained into Bird's Gully—is that water in a condition to be used—is it not polluted by all sorts of things? I will not answer for there being 1,800 acres—I have not surveyed it. I have examined Bird's Gully and its neighbourhood, to a great extent; the water must find its way into our watershed.

307. It filters? Yes.

308. But if you made those works of which you have spoken in your report, it would no longer filter? —

309. *President.*] Have you in your office any plan of Sydney and its suburbs, showing the present distribution of the water? No, I have none beyond the trigonometrical survey, which is comprised of about fifty sheets the size of this table, on which our water mains are laid down. We find that on no smaller plan can we shew them. There are three pipes in some of the streets.

310. Would it not be comparatively easy to have a map of Sydney and its surrounding districts, showing those portions supplied with water and those that are not, by means of colours? That might be done, but even then, where one service meets another they must necessarily overlap in a hilly town like this. The pipes run past each other, and in some instances, the "dead end" has been carried up so that the foul water can be carried without injuring the water at a lower level. Then we have to carry the other a great way past it, to get a head of water above the houses.

311. Without going into details, I should like to see what portions of the suburbs are supplied and what portions are not? It would take a great deal of time to prepare a map.

312. *Mr. Moriarty.*] Could it not be done by an enlargement of the Surveyor General's plan of the town? It would be possible to do it, but it would take some time.

313. *President.*] What is the height of the Hyde Park end of the tunnel above high-water mark? 104 or 105 feet to the surface of the water.

314. A question was asked regarding the dip of the rock at the mouth of the Botany stream—you state that the rock dips to the northward—can you state the angle of the dip? No, I never tried it, but I fancied it was in some places, 1 foot in 2.

315. *Mr. Moriarty.*] Do you mean degrees? No, feet.

316. *President.*] You fancy the dip would be 1 in 2? I think it would be 1 in 2. Where I made that boring could not have been 3 chains from where the outcrop of the rock is. The edge of the basin must be very steep.

317. During the time of comparative scarcity, in the beginning of the year, there were complaints of the quality of the water, and persons asserted in the newspapers that the salt-water must have got in from the sea to the dam—do you think there was any foundation for that supposition? No, I think not. It was said by many that it must percolate through the masonry. We know that there was a leak in the masonry, but, five years ago, when I repaired the sluice gates, I caused a puddle bank to be put across the mouth of the pond, at its junction with the race carrying off the water, and when I had done with it I left it there. People, because they saw a little water weeping out through the masonry originally, conceived that where the weep was, the water found its way into the pond; but there was a puddle bank inside higher than the highest spring-tides. Those assertions were made by persons who afterwards found, very much to their annoyance, that there was a bank under the water which they did not see.

318. Was it a fact that the water, as delivered in Sydney, had a taste of salt? It had a taste which it does not always have. That I attributed to it having lain so long in the bog around the engine-pond over which the tide used to rise at one time. It was thought that the water was impregnated in some way with saline matter from what was originally deposited in the bog by the sea which used to rise up there before our dam was made. I believe myself that it was merely the flavour given to the water by the bog and that it was not caused by saline matter at all.

319. *Mr. Moriarty.*] Does the tide outside rise in dry seasons to the height of the water inside? In dry seasons, when the water is very low in the reservoir the high spring-tides rise 7 or 8 inches above it.

320. So that if there is any leakage, the salt-water would get in? Yes, but for the puddle bank between the sluice gates and the pond itself.

320½. We saw some water leaking out there the other day? Yes; but inside there is a puddled clay bank below the surface of the water but higher than the highest spring-tides, and through which no water can pass. The leak the Commissioners saw was from the dam, which is considerably higher than the clay bank.

321. *President.*] In the Water Supply Report of 1852, I find this statement made with regard to the watering of the streets:—"It is very much to be questioned whether this superficial watering of the streets does not in reality increase the evil. It is remarked of a similar proceeding at New York, that the filth of the streets, which no ordinances can prevent, was kept by constant watering in a perpetual state of decay. Under our fierce sun, the garbage soon became dry and comparatively harmless, but now it is watered hour after hour as fast as it shews any approach to dryness, and is thus kept incessantly fermenting and putrifying, to the great annoyance of delicate olfactories and the deterioration of the common air." Have you considered that possible effect of watering the streets? It is very possible that might be the case in towns where the streets are not so steep as they are in Sydney. I am certain it is not the case in Sydney.

to supply Sydney and the suburbs for twelve months, at the present time, without any pumping—quite sufficient to supplement the ordinary stream, and thus meet the requirements of the city and the suburbs for some years hence. When additional storage is required, a large dam should be constructed on the site of No. 4 Dam. Here in the gorge between the hill, a dam might be constructed at least 35 or 40 feet higher than the present dam which would give storage room for 800,000,000 gallons of water at the least. I believe I might state double this amount, but in the absence of more extensive surveys than have yet been made, I state the minimum quantity. The works I have enumerated would retain sufficient water to supplement the constant stream, and afford an uninterrupted supply of 45 gallons per head per diem of water, which cannot be excelled, if equalled, in purity and softness, in the Colony, to three times the number of the present population of Sydney and the suburbs. With regard to the loss which may be sustained by evaporation from the ponds formed by the several dams, I may state that the town of Bombay is supplied by a catch-water very similar to that from which the supply for Sydney is obtained. Across a valley some short distance from Bombay, dams are made to head up the water which falls during the wet season, and thus the two lakes of Vehar and Poway are formed, which retain sufficient water to supply the town of Bombay with water throughout the year. In a paper upon these works, which was read before the Institution for Civil Engineers, in London, by the Engineer who constructed the works, is the following statement, viz. :—“ Since the termination of the last rains the level of the lake has kept up remarkably well, its surface not having lowered more than six inches per month. This loss is stated to be principally due to leakage through the temporary plug by which the conical orifice of the pipe 41 inches in diameter is at present closed; no leakage whatever is perceptible through either of the dams. The small amount of this monthly loss proves how inapplicable the result of observational experiments on evaporation, on a small scale, are to the circumstances of a large body of water such as that constituting the Vehar Lake.”

E. Bell, Esq.,
M.I.C.E., C.E.

APPENDIX B.

E. Bell, Esq.,
M.I.C.E., C.E.

The City Engineer to The Commissioners for the City of Sydney.

City Commission,
Engineer's Department,
Sydney, 30 July, 1856.

26 Oct., 1867.

Gentlemen,

In accordance with instructions received from you on the 11th instant, to gauge the escape of water at Lord's Mill, I made immediate preparations for so doing, by cutting off, as effectually as possible, every escape excepting that at the waste watercourse of the mill.

I had previously constructed a new wasteboard and gauge for the same purpose, at an elevation of six-teen and a half (16½) inches above the old one, in order to prevent the possibility of the sea-water at spring-tide from running over it into the mill-pond.

The notch in the new wasteboard is exactly five (5) feet wide, and in the side next the pond, in still water, a gauge is fixed, which is divided into inches and tenths of an inch, to denote the depth of water at the edge of the wasteboard, the point of zero on the gauge being fixed horizontally with the edge of the wasteboard.

The works were ready on the morning of the 18th instant, and the following table shews the result of the observations which have been made from the 18th to the 30th instant inclusive.

I have annexed a plan, section, elevation, and also a sketch of the wasteboard, to illustrate the arrangement by which the gauging was effected.

The gauging of the wasteboard will continue daily, and a return shall be made weekly of the results.

It is necessary to remark that, since the wasteboard was raised, the soakage through the sea-embankment is very considerable; previously it was almost imperceptible. The escape of water by this soakage is not less than ninety thousand (90,000) gallons per diem.

Also, that there is a small stream in the neighbourhood of Lord's Mill, which takes its water from this watershed, passes through the tannery, and discharges into the sea not less than two hundred and twenty thousand (220,000) gallons of water per diem.

In addition to the quantities escaping at Lord's Mill, as shewn by the annexed table, is the present supply from Lachlan Swamp to the city, which is computed at six hundred thousand (600,000) gallons per diem.

It will be seen by the annexed tables that (if the city contains ten thousand (10,000) houses) the smallest quantity stated therein will supply to each house two hundred and forty-six (246) gallons per diem, and the largest quantity two hundred and ninety-two (292) gallons per diem, or an average of two hundred and sixty-nine (269) gallons; and, with the addition of the Lachlan Swamp water, the average daily supply would be increased to three hundred and twenty-nine (329) gallons per house; therefore, taking the population of the city at sixty thousand (60,000) or six people to each house, the supply would average fifty-five (55) gallons per head per diem, or more than double the necessary quantity.

I have, &c.,
E. BELL, M.Inst.C.E.,
City Engineer.

Date.	Time.	Depth in inches and decimal parts of the Water passing over the Waste-board, which is 60 inches in width. The City Engineer to The Commissioners for the City of Sydney.

Engineer's Department,
City Commissioners' Offices,
Sydney, 11 August, 1856.

Gentlemen,

Annexed, I have the honor to lay before you my report upon the gauging of the water passing over the wasteboard at Lord's Mill, Botany, from the 1st to the 9th instant inclusive, and to observe that the quantity of water which escapes into the sea by filtration through the embankment without passing over the wasteboard, has increased very considerably since my last report to you on this subject; also, that there are no means of checking this escape until the permanent puddled embankment is made.

I have, &c.,
EDWARD BELL, C.E.,
City Engineer.

WATER SUPPLY OF SYDNEY AND ITS SUBURBS—EVIDENCE.

APPENDIX B—continued.

E. Bell, Esq.,
M.I.C.E., C.E.

The City Engineer to The Commissioners for the City of Sydney.

City Commission, Engineer's Department, 26 Oct., 1867.
Sydney, 6 October, 1856.

Gentlemen,

Annexed, I have the honor to lay before you the gauging of the water at Botany, from the 30th August to the 30th September inclusive, and to remark that soakage of water through the whole bank still continues, and the quantity of water which escapes by this means into the sea without passing over the wasteboard, increases considerably.

I have also added, for your information, the mean of the depths and quantities of water passing over the wasteboard, from the commencement of its rise, viz., from the 18th July to the 30th September, inclusive.

I have, &c.,
EDWARD BELL, C.E.,
City Engineer.

Date.	Time.	Depth in inches, and decimal parts of the upper edge of the Wasteboard below the surface, of the Water passing over it.	Escape in gallons of Water per diem passing over the edge of the Wasteboard according to experiments made in Scotland.	Escape in gallons of Water per diem passing over the edge of the Wasteboard, as computed by Beardmore's Tables. Constant 666	Remarks.

355. You think that wherever it is to be obtained, there must be some further supply? There must be some further supply obtained. Wherever it is obtained, I think it ought to be sent in by its own gravity, and not forced in. I may mention to you, that this experience I have of the Botany Swamp, extending over such a length of time, has given me opportunities of seeing how the quantity of water is diminishing. When I was a boy, we had a flour-mill at the mouth of Cook's River. At that time—thirty or forty years ago—there was a stream there working the imperfect machinery then employed equal to 15-horse power; the wheel was undershot, and the pressure of water was never above from 3 feet 6 inches to 4 feet, that is, the height of water in the dam was never more than 3 feet 6 inches to 4 feet from the bottom of the race. If you were to try and apply the water for the same purpose, and with the same imperfect machinery now, I do not think you would be able to work it two hours a day. But at the time I speak of, it was continually employed. This shews how the water has diminished. There is another circumstance I have observed:—When we had a rainfall of a week or a fortnight, or three weeks, that would leave us a source of supply for the working of the mill and other purposes that would last for three or four months, according to the quantity that fell. But now, directly a heavy rainfall is over, the effect is removed immediately. The water runs off to the sea, and scarcely any of it is retained. In fact, it is nearly all drained off in three weeks or a month.

E. Lord, Esq.

30 Oct., 1867.

356. Do you think that is from the consolidation of the surface of the swamp? Unquestionably; and from the gardens, and the cuttings which have been made for the purpose of removing the water. There are two sources of supply to this place,—one coming from the northward or north-west, and the other more easterly. We used to have from that north-westerly source always a gradual supply of water. The swamps in that locality were almost always full; but the road now passes through several of them. There used to be a gradual supply all through the summer; but now, in the dry seasons, you will scarcely see a drop. There is another matter which I have noticed, as shewing how the treading down of the surface has destroyed the retentive property of the soil:—If it comes on any continuous rain, there is a flood immediately; whereas before, we were never apprehensive of a flood if it came on to rain five or six weeks at a stretch.

357. *Mr. Woore.*] Where was your mill? About half a mile from the old factory.

358. Was it erected at the same time as the factory? About the same time.

359. *President.*] Is there not a large amount of swampy ground to the eastward, on the Church and School Estate? Yes.

360. Can any of that be brought into the drainage of the Botany stream? I have no doubt that all of it could be brought into it, because all the waters of these reserves, or nearly all, fall into Botany Bay, through those streams you meet with as you go along. The first is where those veterans' farms are; then you come to another, and after that there is another one near Mr. Brown's. I suppose that by a small dam all along the margin of Botany Bay it might all be conducted to this stream.

361. You see no means of restoring the retentive character of the swamps? No, I do not. If this large area of ground which now drains into the bay had its drainage diverted into the stream, I have no doubt that a supply might be obtained sufficient to last for a considerable number of years, because you would almost double the area.

362. Do you know if portions of the watershed of the Botany stream are being built upon now? I believe not to a very great extent on the 640 acres [*indicated on map*] about where the tannery is. It is being taken up gradually; but there is nothing to prevent the whole of the land along that stream being taken up and built upon.

363. It is mostly private property? It is nearly all private property all the way up.

364. Can you make any comparison between the quality of the water when you knew it first and its quality now? No; the only thing I can say in regard to that matter is, that being subject to more frequent floods, and drains being cut, the water is more frequently impure. But if the water is allowed to remain for a length of time undisturbed, it is very pure.

365. *Mr. Moriarty.*] You said that there was nothing to prevent the whole of that land being built upon, or nearly the whole of it, from the Botany Waterworks almost up to the Water Reserve? Yes.

366. And the same causes which you have observed as having tended to drain the land about Shea's Creek may come into operation there? No doubt.

367. Drains may be cut over it, and the land may lose its power of retaining water? Yes.

368. And it will then, of course, be worthless as a source of water supply? No doubt it will.

369. And might not the same occur in regard to the Church and School Lands, which you mention as a place from which a large additional supply might be derived? Precisely so.

370. Then, unless the whole were reserved from beginning to end, you would not say that the supply could be trusted? Undoubtedly not; and even then I should have great doubt about it.

371. *President.*] I understand you to say that the evil is already done, and that the swamps have ceased to be trustworthy? Yes. You may judge of the circumstances from what I have said,—that a number of years ago there was a supply yielded gradually, and that if it rained for three or four weeks continuously, the effect of it would remain for four or five months; but now, immediately after a heavy rain there is a flood, and away the water goes.

372. During the thirty or forty years you have known the place, do you recollect whether there was any period of lengthened drought—Did you ever run short of water? No, we never ran short of water there; we always had plenty to work the machinery, and the quantity required for that is about the best criterion one could have. The lower part, where

SATURDAY, 2 NOVEMBER, 1867.

Present:—

MR. MORIARTY,		MR. GRUNDY,
MR. ADAMS,		MR. WOORE.

PROFESSOR SMITH, ESQ., M.D., (PRESIDENT), IN THE CHAIR.

Simeon Henry Pearce, Esq., called in and examined:—

390. *President.*] I understand that you are very familiar with the Botany Swamps? I am. S. H. Pearce,

391. Has your knowledge of that district extended back many years? For the last twenty years I have been living at Randwick in that neighbourhood. Esq.

392. And have you had occasion to pay much attention to the condition of the swamps and the streams that drain them? I have; I have made the subject a matter of much consideration. 2 Nov., 1867.

393. Could you give us your views of the condition of the swamps now, as compared with their condition when you first knew them? In the case of most of them, the surface is much harder than it was when I first knew them—twenty years ago. I think that is on account of the drains which have been cut through them—especially in the Lachlan Swamp—by the City Corporation. They cut those drains twelve or fifteen years ago, for the purpose of getting a supply of water when they were at that time very short of it. The City Corporation then opened a number of ditches through the swamp, towards the hills at Waverley, in order to get the surface drainage to supply the city. They thus drained the whole of the bed of the swamp to the depth they took the drains; and hence the hardness of the soil, which is, however, owing in part to the cattle that used to depasture there. The swamps became more dense, and consequently more dry, on account of the ditches which were cut to drain them, &c. The other swamps also, to the south of the Sydney Common, which were in the possession of private individuals—Atkinson, Armitage and others, who had sheep-washing establishments on the creek, made dams and cut channels, for the purpose of supplying themselves with water in drougthy seasons. They took a course similar to that pursued by the Corporation to supply the city. The consequence was, that when those dams gave way by the water percolating under the bottom, the water washed channels below those dams—large and deep, so that the original boggy matter (decomposed vegetation) which previously remained in the swamps, was to a certain extent washed away.

394. Then you think that the means taken to increase the supply had the effect of injuring the retentive power of the swamp? Exactly so; the bog on the surface was formerly very retentive—it kept back the surface water, excepting in very dry seasons; but when they cut the ditches through the swamps, the water was drained from the higher levels. If you have a swampy garden, the first thing to make it dry is to cut a ditch through it and drain it; and that is what has been done on the Lachlan Swamps.

395. When you knew the swamps first, was there more scrubby vegetation upon them—or even trees—than there is now? In some of the swamps there was. Since the City Corporation have fenced in the Lachlan Reserve, the scrub and other indigenous plants and grasses have been better preserved from fires, &c. The land has thus been preserved from the denudation which was previously caused by fires and the cutting of timber, as well as by the depasturing of cattle. There is more vegetation on the Lachlan Swamps now than there was previous to their being fenced in.

396. You think there is more vegetation over the general surface of the swamps than there was twenty years ago? That is, over the surface of the Lachlan Swamp which has been enclosed.

397. Does that apply also to the unenclosed swamps? No; because the fires which have occurred have to a certain extent destroyed the vegetation. There might be an answer given as to the use of the vegetation in two ways:—The vegetation, as it originally existed, no doubt prevented in some degree the evaporation of the water by the sun and air, and also retarded its course; but nevertheless, it required some moisture to support its own life, which it partly drew from the soil, and the absorption in one way was equal, I presume, to the absorption in the other.

398. Do you remember if there were trees growing on the slopes and on the drier parts of the district twenty years ago? There were but very few trees twenty years ago; but previous to my appointment as Commissioner of Crown Lands, in 1848, there were some large trees growing there, for the stumps remained in the ground at that time, and it became a part of my duty to protect what was then left.

399. Do you not think that the destruction of the trees that had once grown there would tend to diminish the drainage of water from the district? The preservation of the trees would have prevented the water flowing so rapidly from the surface, because the roots, and the leaves which would fall from the trees, would, as a matter of course, when decomposed, form a retentive substance, and act as surface dams for the retention of the surface water; in rainy weather, consequently, it would not flow off so suddenly as though the surface was smooth and regular.

400. Do you think, then, that the chief cause of the drying of the swamps is the cutting of these channels of which you have spoken? To a certain extent, to a very large extent, the surface has been drained in that way, and partly produced the present result.

401. Is much of the effect produced, do you think, in consequence of the treading down of the soil by the cattle? No doubt that has made the surface of the ground very hard, and consequently,

424. In the Water Report of 1852 it was stated that the Long Swamp could easily be connected, by a slight engineering work, with Bird's Gully—Is that your opinion? To a certain extent it is, by connecting it at the north end. There is a ridge of sandhills at the north-west end which would have to be cut through. In order to get a proper incline to drain that swamp into Bird's Gully, a long deep dyke would have to be cut. I think it would be necessary to put a tunnel through the hills, because if cuttings were made and left open, the sand would be constantly drifting into them and filling them up. Provision must also be made to prevent the sand being carried into the dams in times of flood.

S. H. Pearce,
Esq.
2 Nov., 1867.

425. Do you think that by connecting Long Swamp with Bird's Gully, a material increase in the supply of water can be obtained? *In wet weather it could.* An enormous quantity could be collected at Botany in rainy weather, if you connected all the swamps with the main stream below Bird's Gully—that stream which now supplies the present engine at Botany; but in very dry weather you would have but little from that source. The head of Bird's Gully is on the boundary of the parish of Alexandria and Botany, and further north than the Long Swamps. The Long Swamps are south of Bird's Gully, and could never be thoroughly drained into it, because Bird's Gully is much higher than the south end of the Long Swamps; but by cutting a tunnel through the hills, on the west of those swamps, south of Bird's Gully, they could be drained into the present stream that supplies the Botany Waterworks.

426. Then, in point of fact, to drain the Long Swamp would be only increasing a superabundant supply in wet weather? Yes, in very wet weather you would bring down such a flood that it would wash away all your dams, and also fill your reservoirs at Botany with sand. It would be much better to let it remain as it is, and be content with what is now received from those swamps by percolation through the hills.

427. You think that there would be no such accumulation of water as would increase the supply in dry weather? No; if you go out and see the place *even now*, you will find that what I say is correct.

428. What is the present outlet for Long Swamp in rainy weather? It runs out at the west end of Bunnerong. The Long Swamps all drain to the north-west of Brown's grant of 131 acres into Botany Bay.

429. What amount of ground is drained by that stream to the east of Bird's Gully—could you give us a rough idea of the superficial area? I should say that the Long Swamps drain about 400 acres, exclusive of water running into Bird's Gully. On the east of Bunnerong there are other swamps, but the watercourses are *dry in summer*.

430. And what by the other stream at Bunnerong? About 200 acres, but you could not bring that into the main stream, because there are spurs to the hills which divide the waters; and all the water from that area runs into a small creek between the grants of Brown and Crane. There is another swamp on the east of Crane's grant at Botany, which overflows in rainy seasons and runs into the bay.

431. Do you think that 600 more acres are drained to the east of Bunnerong? About 200 acres drain into the bay from that locality. *In wet weather* there is a beautiful stream running on the east of Brown's land—between the grants of Brown and Crane, but in *dry weather* there is but little water at either of those places.

432. Have you inspected the dams now being constructed on the Botany stream? I have not. If I had been asked any questions about them, I should have denounced the plan now adopted, as being a perfect waste of money.

433. You think they will not retain the water? My practical experience of these matters convinces me that no dam will retain water if it is built on a sandy foundation. The water will always percolate through the sand, and ultimately destroy the dam, similar to what lately occurred in Yorkshire. It is of no use putting a puddle dam on a rope of sand. My experience in the plan of making dams in England and in this Colony has been quite the reverse of the mode said to be adopted at Botany. The driving of piles to make dams to hold water with a sandy bottom is a perfect farce.

434. But might they not be useful in the way of keeping the surface more wet, and therefore so far retaining the spongy character of the surface? To a certain extent they might. When I was examined twenty years ago before the City Council on the same subject, I believe I recommended that dams should be made across certain places, being then under the impression that there was a good bottom to be found near the surface; but my experience since has convinced me that it is useless to make dams for the retention of water in that stream, believing as I do that the water of the sea formerly ran up to the base of the Waverley Hills, and that therefore it is all sand to a great depth. In some places the sand is perhaps more than 100 feet deep. I took great interest in the experiments made by the Commission appointed by the Parliament in 1852. I gave that Commission some information with reference to the water question, and paid great attention to their operations. They bored in the Lachlan Swamp, and at 60 odd feet (I forget the exact depth) they came upon a large log of timber lying horizontally in the sand. They bored with two tubes, but could get no further, on account of the timber. In many instances I saw them boring, and on one occasion they brought up in the tube chips of the indigenous timber of this Colony—*eucalyptus gumiferum*.

435. Is not that rather against your supposition that it was once an arm of the sea? No; because there is every probability that those hills and the slopes abounded with large timber trees, and by reason of floods or some other cause they may have been washed down the slopes to the centre of the stream, as is found in many places in England, where whole forests have been overturned and buried. In fact, we have sufficient evidence to shew from the coal deposits that such has been the case in the mother country, and the same causes may have produced the same effects here.

Nepean. I have seen it; but I cannot say that I am sufficiently acquainted with all its capabilities to enable me to give much information with regard to that source. But from what I have read and heard from persons capable of judging—men on whose opinion I place great reliance—I believe the only course you can adopt to get a pure, cheap, and an abundant supply of water is, to go either to the Grose, the Warragamba, or to the Nepean; and taking the elevations into consideration, I believe that from either of those sources you would be able to bring the water, by its own gravitation, to the highest levels in Sydney. That would save the expense of machinery, coal, and labour; and, by an aqueduct along the railway line, I think, at a reasonable cost, you could supply Sydney and its suburbs surely and constantly with a good, sufficient, and pure stream of water.

449. Do you think it would be worth while leaving the Botany stream for any other source, unless we could get the water into Sydney by its own gravitation? As the present common is granted to the citizens to depasture their cattle, and for the purposes of recreation, I think the water in the Lachlan Swamp might be reserved at present to supply the suburban municipalities of Paddington, Woollahra, Waverley, and Randwick. But there is this great difficulty with reference to recommending that,—that, to keep it pure, all the land on the western and southern slopes of Waverley in the drainage area must be purchased, or else the inhabitants must be prohibited from building too closely on lands now in private hands near the source of the Lachlan; otherwise the drainage from those localities will flow into that stream, and in the course of years, when the population has greatly increased, there is no doubt but that the water would become impure. If you take a grand and comprehensive scheme of supplying the city and suburbs with water, I would recommend that it should be taken from one source—either the Nepean, the Warragamba, Grose River, or some of the creeks which supply the Nepean. I think it important that the water should be obtained from a source from which it would flow into the city by its own gravitation, and thus save the expense of pumping machinery, labour, &c.

450. *Mr. Adams.*] Could you tell me whether the borings taken for the Commission of 1852 were made with a view of proving the substratum of the ground only? They were.

451. And not for the purpose of ascertaining the capacity of the ground underneath for water supply also—not for both purposes? I strongly recommended them then, if they could make dams to retain the water, to make them; and those borings were made to ascertain what the subsoil was. They could find nothing but quicksand and the logs I have referred to, and therefore they found that it would be impossible to make dams in those places.

452. Then we are to understand that the non-existence of rock or hard ground at the lower part, or below the Lachlan Swamp, was proved? In all the places they bored, they found, I believe, sand only. They bored in several places down the creek, and could find nothing but quicksand. What the depths were I could not undertake to say, except in that place where they came upon the logs. That was just above the present engine-house on the Randwick Road. The borings at that place clearly convinced me that an old creek had been filled up by the drifting of the sands and the washing of soil from the hills from time perhaps immemorial, and that the waters of the ocean had thus been shut out.

453. Were you often present at those borings? Yes, I was often present when they were being made.

454. Do you consider yourself in a position to state positively that the ground is proved in such a way as to leave no doubt that no hard ground or rock does exist? There is no hard ground at all, where the borings were taken, near the Randwick Road, within 60 feet of the surface.

455. But do you think a sufficient number of borings were taken to prove it? Yes, in the vicinity of the Lachlan Swamp. I do not think they went down the stream to Botany—I am satisfied that they did not. They thought of making one main or principal dam somewhere near the Randwick Road, and they bored above and below the place where they thought of making it. Mr. Dawson conducted the borings, and there was a report on the subject made by him, which, as far as I am aware, was not published.

456. *Mr. Grundy.*] You are then of opinion that the water percolates freely through the sand into Botany Bay? Exactly so.

457. Along the whole of the shore, almost? Yes, all the drainage of the Lachlan Swamp, and all the hills east and west, drain into the present Waterworks, and along the north shore, into the bay.

458. At a level below the present dams? Just so.

459. We have been told that the rock crops out in various places? There is no doubt that it does on the sides of the creek.

460. And that the swamps were a natural rock-bound basin, which would hold water continuously (I think) below a certain level, without any percolation into Botany Bay? The swamp is partly rock-bound, it is true, something like Sydney Harbour and Middle Harbour. There are rocks jutting out on the east and north sides. I have never seen any on the west, but on the east and north they are perceptible, like the rocks on the shores of the harbours referred to. But the Lachlan Swamp is 114 feet above the level of the sea, and I have no doubt that the sands in that swamp are much deeper than that. I am strongly of opinion that the waters of the sea formerly flowed to the Waverley Hills.

461. And you think the fresh water is escaping all over the area of the shore? Just so—you can perceive it. The late Mr. Brown, of Botany, who lived at Bunnerong thirty years or more, used to beach his boat on the north shore of Botany Bay, and he observed that the barnacles on the bottom of his boat were always killed by the fresh water oozing out of the sand.

475. Do you remember 1862—I think that that was a very dry year? I cannot remember it distinctly, but I think it was drier than 1865.
476. Had the water to be cut off at any time from portions of the city, in consequence of the scarcity of the supply? Yes. I have copies of letters upon that subject which I sent to the Government at the time. One of these is a letter dated 27th October, and having reference to the notice given in regard to restricting the supply. [*Letter handed in.*]
477. And had the watering of the streets to be stopped or restricted at that time? Yes; I ceased the watering of the streets, except during one hour in the day, or two—I am not certain which.
478. By means of those steps for economizing the water, was there a sufficient supply for manufactories and domestic use? There was; but fortunately in a very short time the rain came. Notwithstanding the precautions I took, the reservoir continued to fall.
479. The Crown-street reservoir? No, the reservoir at Botany. If the engine had been kept pumping, one day I was there, the reservoir would have been soon exhausted. It was pumping for two hours, and during that time the body of water fell $1\frac{1}{4}$ inch.
480. Shewing that the engine was pumping more water than the stream was bringing in? Decidedly.
481. Then if the dry weather had continued much longer, do you think that the supply for domestic purposes must have been restricted? Decidedly.
482. At that time I believe there were no dams excepting the engine-pond? None of the new dams. There were dams there, but since then those dams have been cleaned out—some of the mud from the bottom has been removed. I think the dams which then existed retained as much water then as they do now.
483. Are you aware that complaints were made as to the quality of the water supplied in times of drought? Yes.
484. And I suppose that you knew that the general opinion then expressed was that the salt-water must have got into the engine-pond, and been pumped up to supply the city? Yes.
485. Do you think that really occurred? I do.
486. Could you yourself taste salt in the water as delivered in Sydney? I do not remember. The only thing I remember is this,—that I went and examined the place, and I found that when the tide was flowing, it was higher than the bottom of our reservoir; consequently, the water of the sea percolated into the reservoir, and a puddle dam was then made across the weir to prevent it, and which I believe was the means of preventing it. Part of that puddle dam remains there now—at least it was there the last time I was at Botany.
487. Do you think the puddle dam that has since been put in will be sufficient to prevent such percolation? Partially it will—I do not think it will prevent it entirely.
488. Does the clay puddle rest on the sandstone rock? I do not think it.
489. Even if it did, might not the water percolate through the joints of the sandstone rock? I could not give an opinion upon that matter—I have never seen the bed of sandstone rock. It would depend entirely upon what kind of sandstone it was—whether it was solid or had many veins or layers.
490. Have you inspected the dams that are now being erected in the course of the stream? I have not been there for some time, but during their erection I saw some of them.
491. And I suppose you know thoroughly their mode of construction? I have a very good idea of it.
492. Have you any objection to express an opinion regarding the probable efficiency of those dams? No.
493. Will you state what you think of them? I stated in the Council my opinion as to the construction of those dams, previous to the tenders being accepted. I then said that I believed, from the way in which they were about to be constructed, that they would not answer the purposes contemplated. I never thought for a moment that the dams as constructed would stand against so great a body of water. I did not think they were sufficiently strong, nor could I believe that by putting bog upon bog upon a sandy bottom, a sufficient quantity of water would be retained to supply the citizens of Sydney. It was my opinion that the water would percolate under those dams or through them.
494. But if the water percolates freely, the strength of the dams will never be tried? I think the dams would stand in an ordinary season, but not in time of floods. It is my opinion that if those dams had been as far forward as they are now, in June last, the floods would have swept them away.
495. Then you think that the erection of these dams will not be of any material service to the water supply of Sydney? They can be made of service, as at present, but I do not think they will render the service contemplated. They may be the means of backing some of the water that would otherwise find its way into the sea. When the water falls in the stream, the water will no doubt percolate from the land into the dams; but I do not think the dams will have the effect of supplying that quantity of water which it is contemplated by the Engineer they will preserve.
496. You do not think they will be sufficient to carry the surplus water of a wet season over a dry season? I do not think so.
497. Do you know Mr. Bell's scheme of watertight reservoirs in and about Sydney? I know Mr. Bell's scheme of reservoirs at Botany; I have paid a good deal of attention to it.
498. He stated to us that his scheme, as a whole, involved the construction of large watertight tanks or reservoirs in and about Sydney? He sent a scheme down to the Council having reference to the excavation of a large reservoir at some place near to Mr. Atkinson's dams (I think), and he proposed to cover it over with galvanized iron; but I am not in a position to state whether in that scheme he stated that the dam ought to be puddled with clay or with bog, as the dams are at present.

J. Woods,
Esq.

2 Nov., 1867.

S. H. Pearce, Esq., 436. And you think the trees were of the same character as those which are growing at present? Yes, the *eucalyptus gumiferum*. I arrived at this conclusion from the chips I examined on the occasion.

2 Nov., 1867. 437. On the whole, do you think the Botany stream can be relied on as a source of water supply for the city of Sydney? Certainly not. At one time I thought otherwise; but twenty years ago I had not so much experience as at present, and also the population of the city and suburbs was less than it is now. *The experience of last year* should be sufficient to convince us that, with only the present population, the Lachlan and other swamps in that locality will not yield a supply sufficiently large to meet our present requirements; and what service will it be in twenty years time, when the population has increased to double the number it now is?

438. But if provision were made, by water-tight reservoirs, to preserve the surplus, would it be sufficient? If you could preserve *all the water* which falls on that area, you would have sufficient perhaps for the next thirty years; but unless you *can retain the water by good puddle dams sunk into the bed rock*, and prevent the evaporation, you will not be able to supply Sydney and the suburbs with water in sufficient quantity from that source.

439. I believe you were a member of a Commission appointed to inquire into the propriety of alienating certain lands situated on the Botany watershed? I was.

440. Has the Government acted in accordance with the recommendations of the report of that Commission? They have, that is, so far as reserving the land temporarily. Whether they have granted it to the City Corporation or not is a question I cannot answer. But they have so far adopted the suggestions of the Commission, by not selling those portions of land we recommended should be reserved for watersheds.

441. Do you think that at the present there is any objectionable drainage into the Botany watershed? At present I think there can be very little objection to the drainage into the Botany watershed, except the drainage from the heights at Waverley. That I am not so sure about, because the inhabitants are increasing, and the drainage from that locality must go direct into the head of the stream. It has however to percolate through the sand before it reaches the tunnel, and it thereby becomes filtered and cleansed from its impurities before reaching the swamp; but as the inhabitants of Waverley and other localities increase in number, the drainage will of course be larger, and whether the increased amount of sewage will ultimately injure the water after percolating and filtering through the sand is a question I am not able to determine. It is, however, certain that the purity of the water will not be improved by such addition.

442. Do you think, then, that in future there will be a greater liability to objectionable drainage? As the inhabitants increase on the southern and western slopes of Waverley, the eastern watershed and Paddington, there will be more or less noxious matter produced, which may, in the course of time, become injurious.

443. What becomes of the drainage of the Randwick Cemetery? I might say that in dry weather there is none. In wet weather there is a small amount of drainage, about the size of one's finger, through the pipes we put in, and which ultimately finds its way into the Botany Swamps.

444. It is not a pleasant thing to have a cemetery draining into the water supply? No; but there is a cemetery, I believe, in the locality of the engine-house at Botany, which does not appear to be considered injurious to the water.

445. And draining into the swamps? I do not know, but from what I have been told, it is not far from the engine-house.

446. Supposing the Botany Swamps were abandoned as a source of water supply, could much money be raised from the sale of the land at present reserved? Yes; I believe if all the land now reserved was sold, and the proceeds appropriated to the water supply, also all the money calculated which will have to be paid to Cooper & Co. as compensation for their property, which must be reserved if the present system is adopted, the total amount would be a very large sum. All the eastern portion of the Waterloo Estate drains into that stream which supplies the Sydney Waterworks; and if the present water supply is to be preserved, those portions of land will have to be purchased, perhaps at great cost. If that land is sold by its present proprietors, the probability is that it will be built upon and greatly populated, and that the stream will then become a common sewer, like the "Tank Stream" in Sydney. By selling the reserved land judiciously I think a large sum might be realized. For instance, if the allotments were sold, as a private individual would sell them—when and as they were required, and the proceeds added to the sum which would have to be paid as compensation to private individuals, the amount would go a long way towards the sum required to bring water by an aqueduct from the Nepean, the Grose River, or some other place near the Blue Mountains, which has been recommended by practical persons.

447. Could you give us an approximate idea of the amount of money which might be raised from the sale of those lands? Without making a calculation of the area I could not; but I know from the position and quality of the land that a large sum might be obtained for it. The stream below the Racecourse could be used for manufactories. All the manufactories of the city might be erected there. There would not be a sufficient supply of water to furnish water-power, but there would be sufficient to supply steam-engines, &c., &c. Manufactories could be established all down that stream to Botany Bay, and a large sum realized from the sale of the land for those purposes.

448. Do you think that stream is better suited to supply manufactories than to supply Sydney with water? Yes, to supply steam-engines for manufactories; but there is not sufficient to supply water power for those purposes.

448½. Have you thought of any other source of water supply which, in your opinion, would be preferable to the Botany stream? I have heard and read much with reference to the Nepean.

Nepean. I have seen it; but I cannot say that I am sufficiently acquainted with all its capabilities to enable me to give much information with regard to that source. But from what I have read and heard from persons capable of judging—men on whose opinion I place great reliance—I believe the only course you can adopt to get a pure, cheap, and an abundant supply of water is, to go either to the Grose, the Warragamba, or to the Nepean; and taking the elevations into consideration, I believe that from either of those sources you would be able to bring the water, by its own gravitation, to the highest levels in Sydney. That would save the expense of machinery, coal, and labour; and, by an aqueduct along the railway line, I think, at a reasonable cost, you could supply Sydney and its suburbs surely and constantly with a good, sufficient, and pure stream of water.

449. Do you think it would be worth while leaving the Botany stream for any other source, unless we could get the water into Sydney by its own gravitation? As the present common is granted to the citizens to depasture their cattle, and for the purposes of recreation, I think the water in the Lachlan Swamp might be reserved at present to supply the suburban municipalities of Paddington, Woollahra, Waverley, and Randwick. But there is this great difficulty with reference to recommending that,—that, to keep it pure, all the land on the western and southern slopes of Waverley in the drainage area must be purchased, or else the inhabitants must be prohibited from building too closely on lands now in private hands near the source of the Lachlan; otherwise the drainage from those localities will flow into that stream, and in the course of years, when the population has greatly increased, there is no doubt but that the water would become impure. If you take a grand and comprehensive scheme of supplying the city and suburbs with water, I would recommend that it should be taken from one source—either the Nepean, the Warragamba, Grose River, or some of the creeks which supply the Nepean. I think it important that the water should be obtained from a source from which it would flow into the city by its own gravitation, and thus save the expense of pumping machinery, labour, &c.

450. *Mr. Adams.*] Could you tell me whether the borings taken for the Commission of 1852 were made with a view of proving the substratum of the ground only? They were.

451. And not for the purpose of ascertaining the capacity of the ground underneath for water supply also—not for both purposes? I strongly recommended them then, if they could make dams to retain the water, to make them; and those borings were made to ascertain what the subsoil was. They could find nothing but quicksand and the logs I have referred to, and therefore they found that it would be impossible to make dams in those places.

452. Then we are to understand that the non-existence of rock or hard ground at the lower part, or below the Lachlan Swamp, was proved? In all the places they bored, they found, I believe, sand only. They bored in several places down the creek, and could find nothing but quicksand. What the depths were I could not undertake to say, except in that place where they came upon the logs. That was just above the present engine-house on the Randwick Road. The borings at that place clearly convinced me that an old creek had been filled up by the drifting of the sands and the washing of soil from the hills from time perhaps immemorial, and that the waters of the ocean had thus been shut out.

453. Were you often present at those borings? Yes, I was often present when they were being made.

454. Do you consider yourself in a position to state positively that the ground is proved in such a way as to leave no doubt that no hard ground or rock does exist? There is no hard ground at all, where the borings were taken, near the Randwick Road, within 60 feet of the surface.

455. But do you think a sufficient number of borings were taken to prove it? Yes, in the vicinity of the Lachlan Swamp. I do not think they went down the stream to Botany—I am satisfied that they did not. They thought of making one main or principal dam somewhere near the Randwick Road, and they bored above and below the place where they thought of making it. Mr. Dawson conducted the borings, and there was a report on the subject made by him, which, as far as I am aware, was not published.

456. *Mr. Grundy.*] You are then of opinion that the water percolates freely through the sand into Botany Bay? Exactly so.

457. Along the whole of the shore, almost? Yes, all the drainage of the Lachlan Swamp, and all the hills east and west, drain into the present Waterworks, and along the north shore, into the bay.

458. At a level below the present dams? Just so.

459. We have been told that the rock crops out in various places? There is no doubt that it does on the sides of the creek.

460. And that the swamps were a natural rock-bound basin, which would hold water continuously (I think) below a certain level, without any percolation into Botany Bay? The swamp is partly rock-bound, it is true, something like Sydney Harbour and Middle Harbour. There are rocks jutting out on the east and north sides. I have never seen any on the west, but on the east and north they are perceptible, like the rocks on the shores of the harbours referred to. But the Lachlan Swamp is 114 feet above the level of the sea, and I have no doubt that the sands in that swamp are much deeper than that. I am strongly of opinion that the waters of the sea formerly flowed to the Waverley Hills.

461. And you think the fresh water is escaping all over the area of the shore? Just so—you can perceive it. The late Mr. Brown, of Botany, who lived at Bunnerong thirty years or more, used to beach his boat on the north shore of Botany Bay, and he observed that the barnacles on the bottom of his boat were always killed by the fresh water oozing out of the sand.

S. H. Pearce, Esq.
2 Nov., 1867.

462. *Mr. Moore.*] Then in dry seasons would not salt-water percolate into the swamp? Yes, on the same principle that you cannot keep water in dams built on a sandy foundation—the salt-water would find its way to the lower levels. Supposing the dam or reservoir at the the Botany engine-house was emptied of the fresh-water, it would fill with salt-water by percolation from the bay, unless you adopted some mode which would keep the salt-water out and the fresh-water in. To do this effectually you must have the “puddle” bed sunk in a rock or other substantial foundation, and lengthened as required, to prevent the escape of the water.

463. It has been said that when the water is scarce it becomes brackish—How do you account for that? It arises from the percolation of salt-water through the rope of sand which divides the reservoir from the bay, and on account of the fresh-water being at a *lower level than the waters in the bay.*

464. *Mr. Grundy.*] You are aware that there is a puddle dam below the surface? Yes, but not to the *bed rock*, and unless a puddle dam goes not only to the surface of the rock *but into an excavation in the rock itself*, it can be of no service in preventing percolation. I have made, and seen many dams made, in England and elsewhere. Piles should never be used for such a purpose unless they can be driven into the clay, and even then they would decompose, and the water percolate underneath them. The proper way to make a dam is to *sink into the bed rock*, to excavate from 6 to 10 feet as the case may be, to the width you require, and into the solid rock on either side. Unless the clay puddle is so taken into the bed rock and secured at the ends, the water will never be retained, because its weight, with the perpendicular pressure of the atmosphere, will be sufficient to drive the water under the bottom of the dams, and ultimately the dams would be washed away. In very dry weather there would be no water in them. As long as the stream is sufficient to feed the dams and keep the water to a level, notwithstanding the percolation, no doubt you would retain water, but when the dry weather came on, and the feeder was cut off by drought, the water would escape by evaporation and percolation, and *when you wanted water for the special use of the citizens in dry weather, you would have none.* In the summer all those dams would be dry.

465. *President.*] Would it not be a difficult thing to make watertight dams on sandstone rock? Not if you excavated into the *proper bed rock* and put *clay puddles in.*

466. But seeing that the sandstone rock lies in layers, would not the water escape through the joints in the rocks? It would if you had not a proper bed. If you examine the rocks in that locality, you will see that they are not dipped much. The rock under the surface is nearly horizontal. There is a rock in my garden which covers the whole surface. I never was more deceived than when I came to cultivate that land. I thought it was a deep soil, but when I came to cultivate it I came on to the bed rock at 2 feet; and nearly the whole surface of that is horizontal. It is, therefore, evident that the rocks have but little dip in that locality.

467. *Mr. Grundy.*] It is then your opinion that there is a smaller quantity of water in the Botany Swamps now than there was twenty years ago, irrespective of the great increase of supply required? Yes, I believe that such is the case—not only from the causes I have already stated, but also from others. Every house that has been built at Randwick, Paddington, and Waverley, and also round Surry Hills, near the old tunnel, draws water from those hills for its own supply, and of course to that extent cuts off water from the city. They mostly have wells, and every one of those wells receives a portion of the surface drainage, which otherwise would find its way into the tunnel or into the Lachlan and Botany Swamps. Those people use a large quantity of water, not only for their own use, but also for *cattle, buss horses, &c., &c.* Those who have not wells, have erected tanks, more or less, to catch the rain water, and every gallon of water preserved in tanks or drawn from wells for the use of the people in those localities is, as a matter of course, so much taken from the Sydney supply. So that while the inhabitants of Sydney have been increasing, the supply of water has been decreasing, from the causes I have mentioned. And every year your supply from the present source will continue to decrease, while every year the demand for water in the city and suburbs will be greater.

John Woods, Esq., called in and examined:—

J. Woods,
Esq.

2 Nov., 1867.

468. *President.*] I understand that you have been Mayor of Sydney? Yes, I was Mayor in 1865.

469. And you have been a member of the Sydney Municipal Council since then? Yes.

470. And you were a member, I suppose, for some time before your election as Mayor? For six or seven years, I think.

471. Have you given much attention to the question of the water supply to the city of Sydney? Yes, I have given a good deal of attention to that subject; I have thought a good deal about it, as all the Aldermen have done, no doubt.

472. Since your connection with the City Council, have you known the supply of water from Botany deficient? Yes.

473. Would you state on what occasions? I think the first occasion was in the year 1865. It was brought more prominently under my notice during my term of office. In that year I caused letters to be written to the Government, and advertisements to be inserted in the daily papers, to the effect that the water supply was short, and that great care should be taken by the citizens to prevent waste.

474. And yet I think that 1865 was not an unusually dry year, was it? I think it was. I think we were some three months without rain in 1865.

475. Do you remember 1862—I think that that was a very dry year? I cannot remember it distinctly, but I think it was drier than 1865.
476. Had the water to be cut off at any time from portions of the city, in consequence of the scarcity of the supply? Yes. I have copies of letters upon that subject which I sent to the Government at the time. One of these is a letter dated 27th October, and having reference to the notice given in regard to restricting the supply. [*Letter handed in.*]
477. And had the watering of the streets to be stopped or restricted at that time? Yes; I ceased the watering of the streets, except during one hour in the day, or two—I am not certain which.
478. By means of those steps for economizing the water, was there a sufficient supply for manufactories and domestic use? There was; but fortunately in a very short time the rain came. Notwithstanding the precautions I took, the reservoir continued to fall.
479. The Crown-street reservoir? No, the reservoir at Botany. If the engine had been kept pumping, one day I was there, the reservoir would have been soon exhausted. It was pumping for two hours, and during that time the body of water fell $1\frac{1}{4}$ inch.
480. Shewing that the engine was pumping more water than the stream was bringing in? Decidedly.
481. Then if the dry weather had continued much longer, do you think that the supply for domestic purposes must have been restricted? Decidedly.
482. At that time I believe there were no dams excepting the engine-pond? None of the new dams. There were dams there, but since then those dams have been cleaned out—some of the mud from the bottom has been removed. I think the dams which then existed retained as much water then as they do now.
483. Are you aware that complaints were made as to the quality of the water supplied in times of drought? Yes.
484. And I suppose that you knew that the general opinion then expressed was that the salt-water must have got into the engine-pond, and been pumped up to supply the city? Yes.
485. Do you think that really occurred? I do.
486. Could you yourself taste salt in the water as delivered in Sydney? I do not remember. The only thing I remember is this,—that I went and examined the place, and I found that when the tide was flowing, it was higher than the bottom of our reservoir; consequently, the water of the sea percolated into the reservoir, and a puddle dam was then made across the weir to prevent it, and which I believe was the means of preventing it. Part of that puddle dam remains there now—at least it was there the last time I was at Botany.
487. Do you think the puddle dam that has since been put in will be sufficient to prevent such percolation? Partially it will—I do not think it will prevent it entirely.
488. Does the clay puddle rest on the sandstone rock? I do not think it.
489. Even if it did, might not the water percolate through the joints of the sandstone rock? I could not give an opinion upon that matter—I have never seen the bed of sandstone rock. It would depend entirely upon what kind of sandstone it was—whether it was solid or had many veins or layers.
490. Have you inspected the dams that are now being erected in the course of the stream? I have not been there for some time, but during their erection I saw some of them.
491. And I suppose you know thoroughly their mode of construction? I have a very good idea of it.
492. Have you any objection to express an opinion regarding the probable efficiency of those dams? No.
493. Will you state what you think of them? I stated in the Council my opinion as to the construction of those dams, previous to the tenders being accepted. I then said that I believed, from the way in which they were about to be constructed, that they would not answer the purposes contemplated. I never thought for a moment that the dams as constructed would stand against so great a body of water. I did not think they were sufficiently strong, nor could I believe that by putting bog upon bog upon a sandy bottom, a sufficient quantity of water would be retained to supply the citizens of Sydney. It was my opinion that the water would percolate under those dams or through them.
494. But if the water percolates freely, the strength of the dams will never be tried? I think the dams would stand in an ordinary season, but not in time of floods. It is my opinion that if those dams had been as far forward as they are now, in June last, the floods would have swept them away.
495. Then you think that the erection of these dams will not be of any material service to the water supply of Sydney? They can be made of service, as at present, but I do not think they will render the service contemplated. They may be the means of backing some of the water that would otherwise find its way into the sea. When the water falls in the stream, the water will no doubt percolate from the land into the dams; but I do not think the dams will have the effect of supplying that quantity of water which it is contemplated by the Engineer they will preserve.
496. You do not think they will be sufficient to carry the surplus water of a wet season over a dry season? I do not think so.
497. Do you know Mr. Bell's scheme of watertight reservoirs in and about Sydney? I know Mr. Bell's scheme of reservoirs at Botany; I have paid a good deal of attention to it.
498. He stated to us that his scheme, as a whole, involved the construction of large watertight tanks or reservoirs in and about Sydney? He sent a scheme down to the Council having reference to the excavation of a large reservoir at some place near to Mr. Atkinson's dams (I think), and he proposed to cover it over with galvanized iron; but I am not in a position to state whether in that scheme he stated that the dam ought to be puddled with clay or with bog, as the dams are at present.

J. Woods,
Esq.

2 Nov., 1867.

J. Woods,
Esq.
2 Nov., 1867.

499. But you do not know that part of his scheme which involved the construction of reservoirs in or about Sydney—in Hyde Park, for instance? I cannot say that I do. I never remember seeing it, to my knowledge.

500. How much water do you think ought to be supplied per head of the population? Well, I should say about 10 gallons per day.

501. I mean for all purposes, including the supply to manufactories and the watering of the streets? I do not know; I am not in a position to answer that question.

502. Do you think that if all the water which flows down the Botany stream could be preserved, it would furnish an abundant supply to the city of Sydney? I have no doubt that it would, if it could be all preserved.

503. Do you think it would be better to take means to preserve that water, or to go to some other source of supply altogether? I think it would be better to go to some other place where there was an inexhaustible stream. Ten years ago I expressed my opinion to that effect to Mr. Bell and to the City Commissioners.

504. Have you fixed, in your own mind, on any better source of supply than the Botany stream? I have read a good deal upon this subject in the Press, and much has been said by men who I suppose are better qualified than I am to give an opinion in regard to these matters. I think the Nepean or the Grose would be much preferable to Botany. I believe that in a very few years it will be necessary to go to some other place. Every year a less quantity is obtained from Botany Swamps. Many years ago the rain which fell on the watershed had not as great facilities to escape into the stream as it has at present. Many people have settled down on the watershed and round the suburbs. They have cut drains to drain their land, and thus, instead of the water remaining on the land and percolating into the streams, it runs off rapidly after a heavy rain. Every year the quality of the land is becoming less retentive, and the water would find its way into the stream almost at once. I think it is impossible to supply Sydney and the suburbs from the Botany Waterworks, or if not, that it would cost more than to go to an inexhaustible stream.

505. *Mr. Moriarty.*] Have the Corporation any control over the land below the Lachlan reserve—the land through which the stream flows?—It is shown on the plan as having been alienated? To Sir Daniel Cooper and other parties.

506. Have the Corporation any control over that land?—I have understood so; but I am not in a position to state it as a fact. I was led to believe so at the time these dams were under discussion in the Council.

507. But you have no knowledge as to whether they have any control or not? No, I have no knowledge in regard to that matter.

508. You do not know whether the persons who hold the land are prohibited or restricted from selling it? I do not think they are; I hardly think it can be possible. The only thing upon which there may be restriction is, the conveyance of objectionable matter into the stream.

509. As far as you are aware, is there anything to prevent them enclosing portions of land, making gardens on them, manuring the soil, and draining it? Nothing that I am aware of.

510. So that, practically, the only portion of the land really under the control of the Corporation is that which comprises the Lachlan Swamps? I think so. There is a great deal of valuable land in the hands of the Corporation at Botany.

511. Does that form any considerable part of the watershed? Yes, it does; as all the water that falls upon the land reserved at Botany, runs into the reservoir near to the engine-pond.

512. Whereabouts is that land? On this side of the engine-house and up the stream.

513. But not above the road? I am not prepared to state whether the land the stream runs through is the Corporation's or not, but I have heard that it belongs to other parties. I believe that Sir Daniel Cooper's agent and some other parties have sent in a claim.

514. For the land? For the soil or sand that is to construct the dams.

515. Then, in point of fact, houses might be built on either side? If the land belongs to Sir D. Cooper and others—which at present we have no means of disputing—they can do what they like with it; and the probability is, that in a few years the land will be built on.

516. A considerable part of the drainage now received at the Botany engine-house comes off that land? It must; that is inevitable; there is no other means by which it can get away.

517. So that, if the town rapidly extends in that direction, it may happen that the reserve for water will be seriously curtailed in a few years? Yes, to the extent of the land alienated from the Government to private individuals.

518. *Mr. Grundy.*] You have expressed an opinion that these new dams will not stand in case of a severe flood? Yes.

519. And you mentioned the floods of June last? Yes.

520. Did you happen to see the condition of the swamps at that time? No.

521. You do not speak then from your own personal experience? No; I was hemmed in with the floods at the time, at Shane's Park, South Creek. I have not seen the dams lately, but I have been told that one is gone already, and three others show signs of going.

522. It is probable that the City Engineer would see the dams during that period, is it not? No doubt he would. I think it is unwise to go to Botany for water, for this simple reason,—that the only stream near Sydney where it is possible to carry on any manufacturing establishments is the Botany stream. I stated this to the Commissioners years ago. And there is another objection which I think ought always to be taken into consideration:—Supposing an enemy came into the harbour, he could cut off the supply of water within an hour and a half of his arrival.

523. *President.*] Do you think that the supply through the tunnel should be carefully preserved? I do. J. Woods,
Esq.
524. Do you think it would be advisable to put an iron pipe through it, to prevent the risk of the tunnel falling in? I think it would be wise to put in a 30-inch main, to preserve it. 2 Nov., 1867.
525. Would you recommend a reservoir to be erected in Hyde Park to receive any surplus water from the tunnel? That would be a matter of great expense, and I do not think it would be wise or judicious if you go to another supply.
526. Even if we were to go to another source of supply, would it not still be judicious to have a second source as a stand-by? Such as the Lachlan—it would. If you go to the Nepean, you must have the machinery erected on a high place, to send the water into Sydney. It must be erected in some place where it will be out of the reach of the floods.
527. Do you think it would be worth while to go to the Nepean if we had to pump up the water? I would rather go further on to some place where we could obtain water that would flow into Sydney by its own gravitation. The first outlay would be larger, but I think it would be the cheapest in the end.
528. If we were to go to a distance from Sydney to obtain water, you think the supply ought to be by gravitation? I think so. There is an objection to the Nepean as a source of supply, because in time of flood the water is very dirty, and you would have to go to so large an expense to keep the machinery out of the reach of the floods. I think it would be much better to go to a place where you could obtain water by gravitation.
529. *Mr. Moriarty.*] Surely there would be no difficulty in keeping the machinery above the reach of the floods? No; but I say that the expense of erecting machinery in any place near Penrith, out of the way of the floods, would be very great.
530. What do you think it would cost to shift the Botany "plant" up there? I could not make any statement in regard to its erection, but if I saw the matter altogether I could give you a pretty good estimate of the cost. I have no doubt that the Botany engine-house could be used for some manufacturing establishment.
531. Have you ever thought what amount would be probably realized if the Lachlan Swamps were sold? I have not. I could not answer that question unless I knew the quantity of land. I have no doubt it would fetch a very large amount if it were properly sold, and if it were understood that the parties who bought it could erect manufacturing establishments along the stream.

TUESDAY, 5 NOVEMBER, 1867.

Present:—

MR. MORIARTY,		MR. GRUNDY,
MR. ADAMS,		MR. WOORE.

PROFESSOR SMITH, M.D., (PRESIDENT), IN THE CHAIR.

George Allen Mansfield, Esq., called in and examined:—

532. *President.*] The Commission has been favoured with copies of a pamphlet, containing three letters on the subject of the Water Supply of Sydney, one being signed by yourself, and the other two being signed "Senex"? So I understand. G. A.
Mansfield,
Esq.
533. Can you tell us the name of the writer of the two letters signed "Senex"? Yes; the author of those letters is Mr. Thomas Holt, of "The Warren," Cook's River. 5 Nov., 1867.
534. The pamphlet bears no date: when were those letters written? Towards the end of last year.
535. These letters advocate the abandonment of the Botany Swamps, and recommend George's River as a preferable source of supply? Yes.
536. Are you still of opinion that George's River best fulfils all the required conditions? No, I cannot say that I am, or ever was of that opinion. I do not wish to put myself forward as an advocate of the George's River scheme in preference to any other. I wrote this letter rather with a view to point that river-out as one source which seemed to me to have a good deal escaped attention. The idea was a new one to me; I had not seen it in print.
537. Do you still decidedly think that some other source of supply must be looked for than the Botany Swamps? I do, most decidedly. I have known the Botany Swamps for many years, and I am convinced that their character is altering. There are spots now perfectly dry and hard that were formerly swampy.
538. To what would you attribute that change? I would attribute it in a great measure to the occupation of the country; but I think that all swamps are natural features differing from mountains and rivers, as being in a transitional state. I think, from their very nature, they are transitional and constantly undergoing changes—swamps of that kind particularly. The drifting of the sands from the hills, I think, in a great measure tends to fill up the lower parts.
539. Since writing this letter, have you thought of any other source of water supply which you think would be preferable to George's River? The only sources that have come under my notice at all are George's River and the Nepean and its tributaries. It appears to me of great importance that the source of supply should be so elevated as to furnish water to Sydney by gravitation alone, without the expense of pumping engines. One source of danger,

G. A.
Mansfield,
Esq.

5 Nov., 1867.

danger, in connection with the use of pumping engines, has occurred to me. I allude to the danger of a boiler bursting, and injuring the machinery. The danger of accidents to the machinery I have often seen discussed, but I have not seen any reference to that special danger of a boiler bursting and sweeping away the machinery; such an accident, for instance, as that which happened some time ago at Messrs. P. N. Russell's works at the Dry Dock, and which I inspected. The boiler started endways, like a rocket, sweeping away machinery and heavy framings of metal. Even if there were two or three boilers, the bursting of one would probably displace and injure the others, so as to interfere with the efficiency of the engine for two or three weeks.

540. Then you think that, in looking for a new source of supply, we ought to obtain the water by gravitation? I think so.

541. Even although we find it necessary to go much further, and to be at a much greater expense? I think so.

542. The supply from George's River, I suppose, could not be got by gravitation, except by going to its head? Only by going considerably higher up the stream, and there, I think, you would lose some of the best feeders.

543. In this letter you say that you would be shortly in a position to send some rough calculations as to the probable cost of the works—Did you ever make those calculations? I did not. It was my intention at that time to have resided for several weeks at Rocky Point, in the immediate neighbourhood of the place to which I refer. This arrangement, however, was not carried out, and therefore I had not the opportunity of making the measurements which would have been necessary to the calculations.

544. If a dam were to be constructed at the point to which you refer, the water must be raised by pumping—Do you think it should be sent straight to Sydney, or *via* Botany? I am hardly prepared to say.

545. You did not consider the details of the scheme? No, I did not.

546. Had you any information as to the quality of the water in the various tributaries of George's River? I had only verbal testimony as to some of the feeders. I was informed that two or three of the tributary streams on the south side of George's River contained water of an excellent quality—that is, bright and clear, and that they were constant in their flow. The information had reference particularly to the quality of the water, as being bright, and clear, and tasteless.

547. But if any of the tributaries were otherwise, they would spoil the whole? Of course they would affect the contents of the whole reservoir.

548. On this tracing (*small tracing shewing George's River and its tributaries*) can you point out which are the principal tributaries—those supplying the most water? I cannot say which are those that supply most water. Those particularly mentioned to me were the Woronora Creek and (I think) Mill Creek.

549. As containing good clear water? Yes.

550. If a dam were constructed at the point to which you refer, would it rest on the sandstone rock? I cannot say; I could only tell that by boring.

551. *Mr. Moriarty.*] Which place are you speaking of? The place where it is proposed to make a dam across the river from Tom Ugly's Point. There are sandstone rocks on either side. Just at that point there is not much depth of water. What depth of mud there may be I cannot say. It is very much deeper a little way above and just below. There is a bank there. You can see the tow-rope of the punt lying on the bottom, nearly all the way across.

552. *President.*] Have you considered the question of making dams on sandstone rock—whether it would be easy to make them watertight? Do you mean by excavation?

553. Supposing that a dam were constructed at Tom Ugly's Point, and that it rested on the sandstone rock, full of fissures and crevices, would you expect it to be watertight? I think great precautions would have to be taken, but I do not think the difficulties are insurmountable. I think a dam could be made watertight under those circumstances, but it would probably increase the expense very considerably.

554. *Mr. Adams.*] Are you aware of any brackish tributaries to George's River? I am not aware of any, nor can I speak of the character of the tributaries from my own personal knowledge. I was informed, on what I regarded as good authority, that they were as before described, and therefore I wrote that letter to which you have referred, upon the spur of the moment. I saw that there was an opportunity of forming a very extensive reservoir, at a comparatively small cost.

555. *President.*] You wrote it more to keep the question alive? Yes, and to direct attention to what I thought might prove a practicable scheme. I do not profess to have gone minutely into the subject.

556. *Mr. Moriarty.*] Any scheme for bringing the water from the lower parts of George's River would still be open to the objection you have against machinery in general? Unquestionably; and it would be open to also another objection, namely, that of being accessible to an enemy's force.

557. I suppose you know that there are some manufactories on George's River, higher up, at Liverpool? Yes, there are the paper mills.

558. And the wool-washing establishments? Yes. At the time my letter was written, the paper mills had been commenced, but they were not in operation.

559. I imagine that that is a locality which would be likely to be used for the purpose of constructing manufactories, being convenient to the Southern Railway? Yes, it is not unlikely. It would be impossible, of course, to use George's River as a source of supply, with the wool-washing establishments and paper mills in operation. In the event of the river being used as a source of water supply, such establishments would have to be interfered with by legislation.

560.

560. You are aware that the tide flows up to Liverpool? Yes.

561. Do you think the soil is affected by the salt in such a way as to interfere with the quality of the water? I think not. My opinion is that a few floods would take it out, and that in the course of four or five years the water would be free from it; but I confess I should greatly prefer a scheme which would enable water to be brought to Sydney by gravitation.

G. A.
Mansfield,
Esq.
5 Nov., 1867.

562. Do you know anything of the country towards the head of the Woronora Creek? No.

563. You do not know whether the elevation is such as to render it practicable to bring the water from there by gravitation? No.

SATURDAY, 16 NOVEMBER, 1867.

Present:—

MR. MORIARTY,		MR. GRUNDY,
MR. ADAMS,		MR. WOORE.

PROFESSOR SMITH, M.D., (PRESIDENT), IN THE CHAIR.

James Murphy, Esq., called in and examined:—

564. *President.*] I understand, Mr. Murphy, that you have been Mayor of Sydney? Yes, J. Murphy, I was Mayor in the year 1860. Esq.

565. And for a considerable time you have been an Alderman? Yes, I have been an Alderman for several years. I was one of the first elected under the Act which legalized the present Corporation of the city. 16 Nov., 1867.

566. From your connection with the Municipal Council, I suppose you must have given a good deal of attention to the subject of the water supply to the city of Sydney? I have given some attention to that subject.

567. Do you think the present source of supply sufficient for Sydney? When the dams now being constructed are completed, I think the supply will be amply sufficient for some years to come.

568. Have you examined carefully the construction of those dams? Yes, but I do not pretend to be a judge in the matter. I have been to see them on several occasions. I do not think they have been carried out properly—I do not think they have been carried out according to the specification.

569. Do you think is the principle good? Yes, I think it is.

570. Do you think the dams can be made retentive on such a soil? We do not require them to be retentive altogether. We shall require the water to filter through the bed of the creek to supply the reservoir.

571. But is it not expected that these dams will preserve the excess of water in a wet season to make up the deficiency in a dry season? That is the purpose for which we intended them, and that is what we believe they will do.

572. But if they are not watertight, I imagine that they could not remain full for (say) three or four months? The supply will be equal to the leakage. There will be a continual supply, which will be, perhaps, even more than equal to the leakage.

573. Do you think that, even in the driest seasons, we may expect that there will be a sufficient current in the stream to supply the leakage in the dams? Yes.

574. Supposing the dams are sufficiently retentive, will they be sufficiently capacious to equalize the supply in wet and dry seasons? Yes, I think they will.

575. Do you think the present Waterworks are fitted for the supply of a much larger number of people than are at present supplied from them? Oh, yes! I think they could supply almost any number.

576. Could you give us an approximation as to how many more thousand people could be supplied by the present arrangement? No, I would not pretend to do that.

577. You see this is a question of the future as well as of the present, and we must calculate the probable increase in number that it will be necessary to provide for? I think the machinery and the supply will be sufficient to accommodate double the number that are at present supplied, providing the dams are properly constructed, and the water is stored which falls during rainy seasons.

578. Do you think it would be advisable to supplement these dams by watertight reservoirs in and about Sydney, of greater size than the present? I should think it would be necessary to do so, in order that there might be a provision in case of accident, such as a pipe bursting or anything of that kind, or an accident to the machinery.

579. Do you think, then, that the Botany supply is so abundant and trustworthy that it would not be worth while going to any other source? Not for some years to come; I should say not for twenty-five years. I risked an opinion, some time ago, that it would not be necessary to go elsewhere for water for fifty years to come. I have been out there during some very dry seasons, and I always found a very large stream of water continually running. When I was there, nine or ten days ago, there was a great quantity of water running away, and yet the engines were in full play.

580. What is the driest season you have known? I cannot say; for it is only during the last few years that we have thought anything of the water question, because previously we had an abundant supply. Until the last few years we were supplied from the Lachlan, and we did not turn our attention to Botany at all. I have no recollection of a drier season than we had last year, since my attention has been directed to the water question.

581.

- J. Murphy, Esq.
16 Nov., 1867
581. But was it not the case last year that the supply was frequently deficient? I think we got alarmed prematurely—we never were short of water. As a precaution, we discontinued watering the streets and we shut the water off at night. When it was shut off at night, we had an abundant supply during the whole of the dry season. I live myself in one of the highest localities, and I had an abundant supply of water every morning before 7 o'clock.
582. By shutting off the water at night, the reservoirs were kept constantly full? Yes.
583. If the water had not been shut off at night, would it have been possible to keep the reservoirs full? That is a question I could not determine. I am inclined to think that it would not have been.
584. But you think those measures were more precautionary than absolutely necessary? Most decidedly they were. The shutting off of the water at night made a considerable difference. There is a great waste of water in Sydney during the night—they allow the water supplied to the water-closets to be running away all night. In many establishments they let their taps be turned on all night, to wash out the drains; and sometimes they totally neglect them. We have known instances where they have been supplied with a meter (Mr. Manning's, for instance), and in one month the water was so much more than that supplied during another month that it was seen that it was impossible it could have been used. It turned out that some of the watermen turned on the tap to spite him, and thus allowed the water to run to waste. There is an immense waste of water during the night. Some of the Aldermen or water inspectors may at times discover these things during the day, but at night they cannot. You would hardly credit the saving effected in the supply by cutting off the water at night.
585. Are you aware of complaints having been made of the quality of the water when the supply was rather short. Yes, I recollect it.
586. Did you ever yourself observe any peculiarity in the taste of the water? No, not in the least. I thought it unadulterated.
587. But do you not think that there must have been some good ground for those complaints? I believe so, but to a very small extent.
588. Do you think the common opinion on the subject was correct,—that the sea-water must have got into the engine-pond? No doubt about it. I believe it was discovered. I did not see it myself, but I was told by one of the Aldermen that the leak had been discovered, and remedied immediately.
589. And an occurrence of that kind is not likely to happen again? No.
590. I think you said you had been down to the pumping-engines within the last fortnight? Yes.
591. And the engines were in full operation, were they? Yes.
592. And still there was a quantity of water running to waste? Yes, there was a great quantity running away.
593. Over the weir? Yes, a great quantity.
594. Were any of the upper dams closed at that time? No.
595. So that this was just the ordinary stream? I think the furthest one was closed, but it had only just been closed, and there was not much water in it.
596. You think then it was just the ordinary stream? Yes.
597. And that was more than sufficient to supply the engines? Yes; and I should imagine that quite as much was running away.
598. At that time the engines were just working sufficiently, I suppose, to keep the Sydney reservoirs full? Yes.
599. In dry weather, such as this, have the engines to work steadily day and night to keep the reservoirs full? No.
600. How many hours per day will they have to work to do this? That I cannot tell you. It is regulated entirely by the demand. They have information when the reservoir is full. Some days the engine has to work longer than on others, for instance, when there is a fire, or any accident of that sort. I believe there is no stated time. The engines work just as the supply is required.
601. Do you think that in the course of years it will be necessary to go to some other source of supply? It might be in the course of years, as the land round about the swamps gets cultivated.
602. Have you turned your attention to the question of a future supply of water to the city? No, not particularly. I am not acquainted with the country.

J. H. Atkinson, Esq., called in and examined:—

- J. H. Atkinson, Esq.
16 Nov., 1867
603. *President.*] I believe, Mr. Atkinson, you have had a long experience of the Botany Swamps? Yes, I have. Upwards of twenty years since; I first established a wool-washing place there.
604. And during that period, have you had constant opportunities of seeing the state of the swamps and the stream? Yes.
605. Have you observed any remarkable change in the character of the swamps? Yes, I have observed a very marked change, more particularly as regards the large dam at Waterloo. The head of water there is not half what it used to be.
606. That has a different drainage, I think, from the Botany stream? Yes, but that is most remarkable to me, having first located there. I afterwards moved on to the Lachlan Swamp, where the supply of water comes from.

607. Do you think the supply of water is getting less from the Lachlan Swamps? Yes. *J.H. Atkinson, Esq.*
Where the water was first pumped from, just by the Racecourse, is now nearly dry. There is a little water there after heavy rains, but the fact is the cattle have trodden down the springs and swamps. 16 Nov., 1867.
608. To what do you attribute the drying up of the swamps? To a succession of dry seasons, and also, as I have stated, the cattle grazing on the spot have a great effect on the character of the ground.
609. Were you acquainted with that district in 1849, which was a very dry year? Yes.
610. Do you remember the condition of the stream and the swamps then? Not particularly. There was a great deal more water then than there is now.
611. Even in that very dry year? Yes. I am alluding more particularly to the swamps nearer Sydney than the ones nearer to the bay. I have no distinct recollection of being at the bay in 1849, but my business called me daily to the other portions of the swamps.
612. Did you then experience any deficiency of water for your purpose, even in the driest seasons? No, not then.
613. If the same operations were to be carried on now, do you think you would have an equally good supply of water in dry seasons? No, certainly not.
614. Have you inspected the dams which are now being constructed in the course of the stream? No, I have not.
615. But from your knowledge of the surface of the ground, do you think that dams could be made there to hold water for any length of time? In 1849 (I think it was) I erected a large dam on the Lachlan Swamp, to give me sufficient water for wool-washing, and it cost about £1,200. We carted the clay to make it as strong as we could, but in many cases the water found its way underneath the dam, and we had frequently to repair it. The only danger I apprehended was from the undermining of the earthwork. The dam was built of earth puddled with clay. It was also made of clay at the bottom. Although we did this and puddled the sides, still the water got underneath.
616. On what did the lower clay rest? On the swamp—on the black, sandy soil.
617. Then you did not attempt to get down to any impervious stratum? We went a good distance down, I should say 8 or 10 feet below the bottom of the water, which was drawn off by means of a cofferdam. We made the best foundation we could. I think it was 8 or 10 feet below the level, when the water was out and the bed of the creek was dry.
618. But you could get no solid foundation? No.
619. And the water got below your puddle dam? Yes, on several occasions, and we had to use the best means we could to repair it. Whether some crawling things got under it or not I cannot tell.
620. Did the escape sometimes become very considerable? Yes, I remember that it escaped on one occasion under the take-away (the race which takes away the waste water). When the hands turned to at 5 o'clock, they found the water rushing through. On two or three occasions before that, we found leakages, and had to let the water off.
621. Then your experience has been against the supposition that retentive dams could be made? Yes, quoting that as my experience, and on that foundation.
622. Do you think, then, that the Botany stream can be trusted as a source of water supply to a city like Sydney? My opinion is that it cannot. But if it could, at extreme times the water is brackish.
623. Do you mean the water as pumped up to Sydney? Yes.
624. The water in the stream itself I suppose is never brackish? I have tasted it very much so, down towards Mr. Lord's.
625. I suppose that would be where it had been within the influence of the tide? I do not know to what influence it had been subject; whether it was an under-current or not. I know that in George's River the water called fresh above the dam is at low times impregnated with salt.
626. *Mr. Grundy.*] It finds its way through the dam? I do not know how to account for it; but I should hardly say that it finds its way through the dam there, because the foundation is solid.
627. *President.*] Then, even if retentive dams could be made, do you think the Botany stream is not to be trusted for a continuous supply? I am not prepared to say that. It depends upon the amount of water which could be retained in them. You might dam up the whole country round about, and get a large sheet of water which would last for many years, but that would interfere with private rights.
628. I believe you have a considerable knowledge of George's River? Yes, I know it very well.
629. Have you thought that would be a preferable source of supply to the Botany stream? Decidedly not. There is fresh water above the dam at Liverpool, but you could pump that all out with a centrifugal pump in about twenty days.
630. You think that in dry weather the supply is small? Yes; and, as I said before, sometimes the water is bad, although at other seasons it is good.
631. In dry seasons does the water become brackish? Yes, it has a taste of salt. I am inclined to believe that there are some salt springs in the neighbourhood. I know that in our paddocks the creeks leading into the river are quite salt.
632. *Mr. Woore.*] Does not Saltpan Creek run into it? That is below the dam.
633. *President.*] Might not this brackish quality be given by one or two tributaries? I have noticed it on a small scale in the paddocks leading to George's River from Sophienburg over the hills, and also at the extreme end where the source of the river is. There are small tributary creeks quite brackish. It is so strong that it is perceptible on the ground. 634.

- J.H. Atkinson, Esq.
16 Nov., 1867.
634. Are you acquainted with the principal heads of George's River? Do you mean the sources from which the supply of fresh-water comes?
635. Yes. In this map the principal tributary seems to be the Woronora Creek? It is to the left, towards the sea. That is the creek to which I have alluded, where in dry times I have found the salt so strong on the surface.
636. And that seems to be the largest feeder of George's River? Yes. In dry times there is very little water in it, and what is in it is bad.
637. Then you think that George's River would be no improvement on the present supply? No, there would not be sufficient in a dry time.
638. Have you thought of any other source of supply which could be made available with advantage? Yes; I have always thought we ought to get the water from the mountains, beyond the Nepean or the Hawkesbury. I have been across that country shooting for a few days together, and I have observed many places from which a supply could be obtained, more particularly from the Valley of the Grose. That, to my mind, would be the easiest of access for the operation.
639. Have you been up the Valley of the Grose for some distance? Yes; but it is now some years since I was there. I remember that it struck me at the time I was there, some fourteen or fifteen years ago. It was very strongly impressed on my mind, from having seen the Yan Yean works at Melbourne. We have the same means of securing the water, and the country is something like it.
640. Do you know if the bed of the stream rises rapidly as you ascend? No, I do not remember anything so particular as that. I remember a very cool, beautiful stream, from which I drank daily when we were out; it was beautiful water at that time, but I know nothing of it since.
641. You would conclude, I suppose, that the supply ought to be by gravitation, if we went there? Certainly.
642. So that we must get a sufficient elevation? I should imagine it would be suitable for that, but not being a surveyor I cannot tell. I do not remember to have seen any information in regard to the matter, but it strikes me that the land is high enough. It would be a great saving to do away with the pumping process.
643. Do you know the Warragamba at all? No; is it a tributary to the Grose?
644. It is the principal tributary to the Nepean? No. I am only speaking now from knowledge I acquired when shooting there for a few days.
645. *Mr. Adams.*] You said that when you made your dam on the Lachlan Creek, you proved the ground for some 7 or 8 feet? Yes.
646. Did you prove it by excavation only, or by pile? By both; by pile and excavation also. We took as much as we could out to fill with clay between the piles. That was the first forming of it. Then we banked it over, and puddled it on each side.
647. Did you feel satisfied when that was done, that you had done all you could to secure the bottom? Yes. We did what we thought would be best, without regard to expense. That dam cost me £1,200. It was eventually carried away *holus bolus* by a strong flood.
648. Where did you get the clay from with which you made that dam? I do not remember distinctly, but I think it was near the Botany Hills; it was eighteen years ago.
649. And did the dam hold water at first as well as it did afterwards, or did it improve and continue to hold water well until it broke away? I had no fault to find with the dam until it had been working two or three years, then we began to find a little water oozing underneath it.
650. You did not find it leak at first, and then gradually get tighter and better; your experience was rather the opposite of that? We had to find out where the leak was, and to repair it. At first there was not much leakage until the occasion I have described, when during the night the water burst through in a large volume underneath the race.
651. Am I to infer that your opinion of the ground is, that it will not by age tighten itself and make the dam more waterproof than it was before? My experience does not go to shew that.
652. *Mr. Moriarty.*] Was it a puddle bank? Yes, it was puddled on each side and facing, and there was a large quantity of puddle at the bottom. We got the best stuff we could from the swamp to mix up with the clay and made a sort of mortar of it. It was well rammed, but, as I have said, it was carried away by the flood.
653. You say that the dam did not subsequently become more tight than it was at first, and that there was just as much percolation through the sand underneath the dam and around it? Yes, at times.
654. In fact you found that it increased? Yes, on the occasion when it burst out in the night, there was a stream equal to that which could be supplied from a 6-inch bore. We imagined that it must have been a tortoise or something of that kind which made the hole—we could not account for it in any other way.
655. In your opinion, would the retention of water in dams constructed in such a sandy soil, have the effect of improving their water-holding properties, as a general rule? I think it would take a good many years to do that.
656. *Mr. Grundy.*] What depth of water stood in your dam? 11 or 12 feet.
657. That would be much more likely to work through the material of the dam than a pressure of 6 or 8 feet? I do not know whether it would or not. I think when the dam was quite full, that it was 11 or 12 feet.
658. *Mr. Moriarty.*] And was it usually up to the level? Yes; the supply was very great.
659. *Mr. Grundy.*] And the water got through, notwithstanding all the puddling? Yes.
660. But supposing you had not used clay? I do not think the dam would have held the water for six months.

661. Would the water have stood 6 or 8 feet above the level of the creek if the dam had been made without clay? No; there would have been less adhesive power. The weight of the upper portion of this dam of mine would naturally make it more solid. If it had not been so high, the pressure would have been lighter and the dam less solid. I am sure a dam made of that material without clay would not stand. Previous to constructing this big dam, we had to dam up water for our purposes in a small way, and our dams were frequently carried away. J.H. Atkinson,
Esq.
16 Nov., 1867.
662. How did you make your temporary dams? Of sods and the best stuff we could get.
663. And if a fresh came they were carried away? Yes.
664. As a thing of course? Yes; and yet we made them sufficiently strong for an empty cart to cross.
665. *Mr. Moriarty.*] And it was after the repeated failure of these temporary dams that you went to the heavy expense of constructing the large one? Yes.
666. Have you been much across the country about the head of the Woronora Creek? No, I know only the other side of the range.
667. The coast side? No, I mean towards the mountains leading across to the Hunter.
668. The north side? Yes.
669. I am speaking of the Woronora Creek running into George's River? Yes; there is no supply there of any consequence, except during heavy rains.
670. You do not know, perhaps, whether it is possible to construct large lakes there by means of dams? I do not know where you would get a supply from to make a lake. It all makes its way into George's River.
671. Was it high up the Woronora Creek where you saw the salt of which you spoke in a previous part of your evidence? No.
672. Was it near the tide? No.
673. Was it above the action of the tide? Yes.

Mr. John B. Carroll called in and examined:—

674. *President.*] I believe you reside on George's River, Mr. Carroll? Yes.
675. At what particular point? Koggerah Bay—the first bay on the right-hand side of George's River. Mr.
J. B. Carroll.
16 Nov., 1867.
676. That is called Townsend's Bay on the map? Yes, but it is generally called Koggerah—that is its native name.
677. Have you been long acquainted with George's River? Yes, it is nearly my native place; I have been living there since 1849.
678. And do you know the upper part of the river pretty well—the feeders of the river? I know the Woronora branch very well.
679. Do you know the other feeders? I know Saltpan Creek and other of the feeders, but I know more about the Woronora.
680. I believe you sent a letter to the *Sydney Morning Herald* on the subject of George's River as a source of water supply? Yes, I did, in consequence of one I had seen before that, recommending a dam to be put across at Rocky Point, in case it should be determined to take water from George's River to supply the city. I knew of a better place, and was therefore induced to publish that letter.
681. When was that letter published? I do not know exactly. It was some time ago—perhaps two years. It was published when the subject was exciting so much attention, and being discussed in the papers.
682. Do you still think that George's River would be a good source of supply for Sydney? I think the information I could give you on that subject would be more valuable if you at once determined to receive the supply from the George's River. All the lower part of George's River and the whole of the Woronora are of a sandstone character, but not so absorbent as the land about Sydney. The water would be good, but it would run off quicker. I think the George's River would be more valuable as a reservoir. It would be necessary, perhaps, to depend upon that more than upon the spring.
683. The last witness we examined told us that, in dry weather, the water in the Woronora Creek is brackish—Is that in accordance with your experience? It will be salt if the tide flows up.
684. But Mr. Atkinson spoke of a part not within reach of the tide? I have never found it anything but pure. From the nature of the soil, it must be so. It is a sandstone formation. Up above Liverpool there would be a forest soil, and the water would be brackish, the same as Cook's River.
685. Have you had an opportunity of observing the Woronora Creek in dry weather? I have seen it in an ordinary dry season.
686. What was the condition of the stream then? I think it would flow about a 2-foot stream.
687. Do you know if it ever dries up entirely, or ceases running? I do not think so.
688. In the driest time you have seen it, was the water quite good? Yes, it was always good when I tasted it.
689. But if it be that some of the tributaries of George's River above the dam at Liverpool are brackish, would not that be fatal to making George's River a source of supply? That brackishness would arise not from the salt, but from saltpetre that would come out of the soil. The water of all the forest ground is brackish, not with salt, I think, but with saltpetre. The water in Cook's River is not good, for the same reason. But the whole

- Mr. J. B. Carroll. whole of the lower part of George's River is of a different character—it is of sandstone formation, and the water is very pure and good. The water in all parts of my district is good and pure.
- 16 Nov., 1867. 690. But if you formed one great dam, you could not keep the brackish water out of it? Certainly not, if it was at the head.
691. How are the farms supplied about your place? Almost every farm has water on the surface. There is not a deep well in the district.
692. Then have you surface springs? Yes. In my place there is water flowing from the surface now, and through the beds of the garden.
693. Good water? Yes, pure water.
694. And does that not fail you, even in the driest seasons? It never fails. It runs in the driest seasons.
695. Are there swamps in the neighbourhood? There is a swamp half a mile from my place. That will go dry when the water will flow from my place. The water comes out of a clay soil, and not out of the swamp.
696. Do you know the nature of the country about the head of the Woronora Creek? Yes, I have seen it. There is some stunted timber upon it.
697. Is it a swampy country? No, it is very mountainous.
698. And is the valley of the creek rocky? The banks rise several hundred feet on each side. There are a few little flats just above the level of the tide. They appear to have been bays that have filled up with alluvial soil. There are many creeks in its course with permanent water running into the Woronora.
699. *Mr. Moriarty.*] Permanent water? Yes; there are streams, but with not a very large quantity in them.
700. *President.*] Do you remember the condition of those streams in 1849? I cannot say that I do.
701. And you cannot speak from your own experience in regard to the feeders of George's River above Liverpool? I cannot. I have never been in Liverpool. I have been within five miles of it.
702. And in regard to the Woronora Creek, you think it never stops running with good water? I do not think it ever stops running.
703. *Mr. Moriarty.*] I understand you to say that you had been nearly to the head of the Woronora Creek? Yes.
704. Do you think it would be possible to retain any considerable quantity of water, by constructing a succession of dams towards the head of it so as to form lakes? I think that would be easily done.
705. Is the formation of the country suitable for it? The banks are very steep on each side. It would be easy to construct dams across it.
706. Would they throw any considerable back water, do you think? It would require a succession of dams to hold any quantity.
707. Do you think any considerable quantity might be held by a succession of dams? I think you might retain a very large quantity.
708. Do you know of any position in particular on the Woronora Creek, where a considerable lake could be formed by dams of moderate size? I think it might be formed at any place about the head or near the head; for instance, where the road crosses at the head of it.
709. Which road? The old road to Wollongong—the Bottle Forest Road. It is thought that the whole of the Woronora and George's River was formed by a large crack in the sandstone.
710. Is that the Sydney sandstone? It is.
711. You are of opinion that a considerable quantity of water might be retained from a wet season to tide over a dry one, if a succession of dams were constructed on the Woronora? I have no doubt of it.
712. And that the water would be of good quality? It would be of good quality, for it is a sandstone country.
713. Have you any special acquaintance with the water, because we find on the Wollongong side of the coast the same formation, and you get the drainage there also of the same strata—the carboniferous shales and coal? The water has been always pure.
714. *President.*] How far does the tide rise in the Woronora Creek? To the crossing of the Illawarra Road.
715. And you think that from the head of the navigation the level of the creek rises rapidly? Yes, it rises considerably above the tide.
716. And I understand you to say that the creek flows through a narrow, rocky valley, with very precipitous sides? Yes; when you get above that, it is not so precipitous—there is more *débris*. It changes its character on getting to the head, and the rock is more broken; still the banks are very steep on either side.
717. Would you kindly oblige the Commission by procuring a specimen of water from the Woronora Creek above the influence of the tide? I will do so with pleasure.

WEDNESDAY, 20 NOVEMBER, 1867.

Present:—

MR. MORIARTY,		MR. GRUNDY,
MR. ADAMS,		MR. WOORE.

PROFESSOR SMITH, M.D., (PRESIDENT), IN THE CHAIR.

George Hill, Esq., called in and examined:—

718. *President.*] I understand, Mr. Hill, that you have for a long time been connected with the Municipal Council of this city? Yes, but not of late years. G. Hill, Esq.

719. And in former times you were Mayor? I have been Mayor. 20 Nov., 1867.

720. Have you given much attention to the question of the water supply of this city? During my mayoralty I paid great attention to it. There was a great scarcity in that year, which was the first of my mayoralty. I was three times elected. I think it was the third year after the election of a Municipal Council.

721. Sydney was supplied from the tunnel at that time? It was supplied from the tunnel alone.

722. Have you had any occasion to notice the condition of the Botany Swamps for a number of years back? How far do you wish to go back, because I can give you very distant dates?

723. I wish to know if you have observed any change coming over the condition of the swamps? There have been several changes. I have seen great droughts and heavy floods in the Colony. I think there has been a better supply of water during the last six or seven years than there was during the preceding six or seven years.

724. That is, since the Botany works were erected? Yes; since then we have had a better supply of water. But I think the seasons have been more general during the last five or six years than they were before. There were previously great droughts, and, as a consequence, great scarcity of water. I have seen the Nepean River so that I could walk over it without wetting my socks.

725. Do you remember how far back that was? No, but I suppose it must be twenty or twenty-five years ago.

726. What part of the river was that? About half a mile from the present Penrith Bridge. There is a crossing-place there, and on more than one occasion, and in more than one year following, I have gone across there without wetting my socks.

727. Have you examined the dams which are now being constructed in the course of the Botany stream? Yes; there is a series of dams there.

728. Do you think those dams will be sufficient to preserve the surplus of a wet season to make up for the deficiency of a dry? I think that is a question which would be better answered by a scientific man. I cannot say for certain whether those dams will contain the water when it is there. There is a good deal of peat in the swamp which would form a sediment; whether such sediment would be sufficient is another matter. If the bottom of the Lachlan is sand or peat, which it appears to be, I have no doubt the water will filter underneath the dam, unless some crust is formed on the peat which will enable it to hold the water.

729. Supposing that effective dams were constructed, do you think there is a sufficient supply of water in the Botany Swamps to serve even in dry seasons? I think there is sufficient to supply two cities like this, if you can retain it.

730. How much water per head of the population ought, in your opinion, to be supplied? That is a question I cannot answer. There is no doubt that the quantity required increases every week.

731. But, I suppose, unless efficient dams be prepared, the stream itself will not be sufficient to supply Sydney adequately with water? That would altogether depend on the seasons.

732. But you must have a permanent source of supply? You may fill your purse with sovereigns, and if there is a stream going out and none coming in, it will soon be emptied; but if at the same time there was something always coming in, it would never be emptied. If those dams would hold water, and the main dam would receive it as it was required, there would always be a good supply. With the dam alone, in a dry time, I do not think there would be sufficient water to supply the city.

733. Do you think it would be better to make provision for preserving the water that runs down the Botany stream than to go to another source of supply? That I shall have to answer at some length. If there should be reasonably moist seasons; and if the dams now in course of construction will retain the water, in my opinion there will be a sufficient supply for the next twenty years. And in the event of these dams not retaining water, there are other sources you could fall back upon and obtain an almost unlimited supply—I mean the two woolwashing dams belonging to Sir Daniel Cooper, in the neighbourhood of Botany. I believe there is an Act of the Legislature, which would enable the Municipal Council to take possession of those dams, for the purpose of water supply. Both those dams empty into Shea's Creek. There is also another property, belonging to Captain Masters, from which a good deal of water might be obtained. One was a grant to old Mr. Cooper, and the other to Andrew Byrne. That granted to Byrne is of the greatest importance. The first dam is fed from the swamp at the back of Baptist's garden, and also from a large swamp where the cricket ground is. The second is fed from that large area which leads up by the old Botany Road, and runs about east.

734. Even in dry seasons is there a plentiful supply of water in those dams? I have never

G. Hill, Esq. never seen them without a plentiful supply of water. I have heard complaints that they could not grind as much flour as they wished, on account of the scarcity of the water; but that was seldom. Both those dams are in the neighbourhood of Botany, and the water from them can be readily conveyed into the Lachlan Swamps, or into any of the dams. The main pipe that brings the water from Botany to Sydney comes over the head of the present dam.

20 Nov., 1867.

735. But are the streams to which you refer, not very much taken up by persons who carry on operations that injure the quality of the water? I will begin with the first stream. If I recollect rightly, Mr. Atkinson first settled down there, and was succeeded by Alderson & Sons. The second and third parts are taken up by two woolwashers, who hold a lease from the estate of Cooper. The place near the road is employed in wool-washing, by I do not know whom. It was let by Mr. Hayes, who died, and it is now re-let by his widow.

736 *Mr. Moriarty.*] The Waterloo Mills? Yes, the old Waterloo Mills. I now arrive at the second dam, which is taken up by a woolwasher at the bottom. It is not taken up above by any one. There is some person living at the head of the swamp, but what he is doing I do not know.

737. *President.*] Would it not be rather expensive to resume these streams? Of course you cannot do anything without expense; but I should say that the cost of conveying the water from both these dams into Botany would not amount to one-tenth of the interest on the money which would be required to bring the water into Sydney from any great distance.

738. But would it not be expensive to buy out the people that are carrying on operations along the stream? No. There is an Act which provides for an assessment, and no matter what value might be placed upon his property by the proprietor, it would be in the hands of the persons appointed to assess it, and it would be for them to determine the amount of compensation which ought to be given.

739. Do you know if those dams which have been erected for woolwashing purposes are retentive of water? I think so. They are common dams, made chiefly of clay. I have known them on one or two occasions to break out. I may as well mention, while I am on the subject of these two dams, that there is a drain cut from one to the other. There was a deficiency of water in the dam where the mill operations were carried on at the time of which I speak, and that deficiency was supplied from the further swamp. A drain was cut from one to the other, so that there is a free passage between them. I have seen both dams break away, but they have been repaired and hold water very well; but I think there is a good deal of drainage from the further one.

740. Below the dam? No; it appears to be more on the north side of the dam. As you go along the road, you pass over a bridge, and you see the water going in a north direction away from the point of the dam. Whether it is from the drain I speak of or from the embankment I am not prepared to say. I know there is a leakage there, and a considerable one; but independently of that, there is always a good supply of water.

741. Have you known a good supply to be in those dams in the driest seasons? I have always found a good supply there, and more particularly in the dam to the south (Byrne's grant).

742. Do you think is the water naturally good that flows that way? Are you speaking of those two dams?

743. Yes? I do not think anything could be finer, if they were cleared.

744. In fact, you think it as good as the water of the Botany stream? I do not think there is anything to surpass it in the world.

745. Is the area drained by that stream much built upon? Very much so, beyond the road westward.

746. Is it your opinion that, if the supply from those dams were added to the supply at Botany, there would be sufficient water to meet the requirements of Sydney for many years to come? Yes, but you must retain it first. It is a question whether those dams will be efficient—whether a sediment from the water will form a sediment on the peat, or whether the water will pass underneath.

747. If I understand you aright, you do not think it necessary to go to any distant source of supply—you think there is plenty of water near to Sydney, if it can be preserved? Plenty. If you saw the great body of water which flows after two or three days' rain, you would be satisfied that there would be no scarcity if you could only retain it.

748. *Mr. Woore.*] How many years have you had an intimate knowledge of the swamps generally? Ever since I was a child and able to get up on a saddle. I used to have cattle running on the coast before there was any establishment there, and I have known the swamps from that time to the present.

749. How many years can you recollect them? I think I was about ten years old when I had cattle on the coast, and I am sixty-five now.

750. What was the state of the swamps fifty years ago? I have seen the swamps with so much water in them that you might have taken your boat and pulled about from place to place, and after two or three dry years I have seen them dry. I have seen the head of the present Lachlan Swamp, that is now boggy, so dry that you could cross it on horseback.

751. As dry as it is now? I hope you do not call it dry now. I have crossed over on horseback a hundred yards above where the engine-house is on the road.

752. Do you recollect what year that was? No.

753. Do you recollect the years 1838 and 1839, when we had a great drought? I remember that time well, because I lost a great many cattle then.

754. Do you recollect the state of the swamp at that time? No, not exactly at that time; but I have seen it so that you could ride a horse over the narrow gut.

755. Could you do it generally? No; perhaps it would be twenty years before you could approach it again. I have seen it so two or three times. G. Hill, Esq.
756. Do you consider that the drought of 1838 and 1839 was greater than any you remember before or since? I think I saw as great droughts before that time. I have seen the country in an awful state on several occasions; but as to the dates I cannot recollect them. 20 Nov., 1867.
757. Do you remember 1814? No, I cannot recollect the dates. I have seen more than one great drought. During the great drought of which you spoke, I was punished severely on the Murrumbidgee. I have seen the Murrumbidgee at my station at Yanko, where the steamers now run past, so dry that I could walk over without shoes from stone to stone.
758. Do you recollect a great drought since that? There has been since no drought like it.
759. *President.*] Have you ever known the Lachlan stream to be dry? Never.
760. And in the driest time you speak of, do you remember the condition of the stream further down? The further down, the greater the stream.
761. But did that stream cease to run in the driest time you remember? Never. I am speaking now of the stream from the Randwick Road down to the water of Botany Bay. The stream at the gut I spoke of was running at the time I crossed, but the ground had narrowed itself to a small compass so that the horse could step over it.
762. *Mr. Moriarty.*] With regard to the creek from which you say a large quantity of water might be derived (that which takes its rise from the back of Baptist's Gardens) do you remember that, two years ago, the woolwashing establishment stopped for want of water? That, no doubt, may have been the case. I consider that a woolwashing establishment takes more water than the city. If you examine the operations of a woolwashing establishment, you will see a stream of water running as thick as three men's bodies. That running for twenty-four hours will consume an enormous quantity of water.
763. *President.*] Do you know the swampy ground to the east of the Botany stream, lying out on the Church and School Estate? Yes, well.
764. Do you think could a material supply be got from that quarter? I do not think it could be depended on.
765. Does it dry up rapidly? Yes, very; and I think it all filters into this stream. There is a dividing range. One portion of the water goes to the coast, and the other portion goes the other way. One portion empties itself into a creek below Masters' house, and the other into the Lachlan.
766. There are several small streams which drain into Botany Bay, between the engine-house and Bunnerong? I do not think any portion goes into the Lachlan; I think they all empty themselves into Botany Bay.
767. But you do not think they could be depended on for any material addition? I should not like to depend upon them myself, although a good deal of water might be got from them.
768. You would look more to the Waterloo dams? I have no doubt myself (although I may be wrong) about the supply which might be obtained from the Lachlan stream, providing the dams were made available. Retaining the water is the main thing.
769. Do you think that dams constructed on sandy soil can be made sufficiently retentive of water? I think so, judging from the two woolwashing dams erected on the Botany Road.
770. And you think that, even in a dry season, there would be more coming in than would leak out? A great deal more. The leakage is of no importance.
771. *Mr. Moriarty.*] Do you think that the present charge for water is a reasonable one, or that it is too high? I think that if it were properly levied, and confined to proper rooms, it would not be too high.

SATURDAY, 23 NOVEMBER, 1867.

Present:—

MR. MORIARTY,		MR. GRUNDY,
MR. ADAMS,		MR. WOORE.

PROFESSOR SMITH, M.D., (PRESIDENT) IN THE CHAIR.

William Speer, Esquire, called in and examined:—

772. *President.*] How long have you been connected with the Municipal Council of the City of Sydney, Mr. Speer? About eight years. W. Speer, Esq.
773. And during that time you were Mayor? I was Mayor in 1864, for one year.
774. Have you given much attention to the water supply of the City? Yes; I have given a good deal of attention to that subject. 23 Nov., 1867.
775. From your knowledge of the present source of supply, do you think it can be depended on to meet the requirements of Sydney? Previous to the dams now being erected I do not think it could have been depended on. During the year I was Mayor the water was very low in the dam at the engine-house. When the engine was in motion for about two hours it lowered the water so considerably that we were pumping in the mud. The same thing occurred last year, and I believe also in 1865.
776. On those occasions the stream did not deliver so much water as the engine could pump up? Exactly; and you could see a visible alteration in the dam at Botany, which I suppose covers three or four acres.
777. And on those occasions was the supply of water to Sydney insufficient? Yes, it was insufficient. Thus it was that the water was cut off from the gardens about the town. Occasionally

W. Speer,
Esq.
23 Nov., 1867.

Occasionally the water was stopped at night in the city; some of the manufacturers also got a short supply. Last year I believe was the worst I recollect. The water had to be stopped for a considerable time at night, and the citizens were grumbling that the streets were not watered with fresh water. There was not sufficient water at that time.

778. It would have been impossible to keep the reservoir full? Quite impossible. Three or four hours pumping of the engine would have brought you to the mud. In some instances salt-water was pumped in. On one occasion, when the aldermen went down they saw the salt-water running into the dam.

779. Do you know that as an actual fact? Yes, I saw it.

780. When was that? I do not recollect; it was some-time last year, probably it was about this time.

781. And after that was anything done to prevent the influx of salt-water? Yes, some clay was put on the face of the weir. The inflowing of the salt-water arose from the weir being too low.

782. *Mr. Moriarty.*] It was running over the top of the weir? The fresh-water was supposed to run over the weir; but when there was no fresh water running out the salt-water flowed in.

783. Over the top? Yes; another foot of material on the weir would have prevented it.

784. *President.*] You do not think it soaked through? No; it was running in at high-water. The engineer then put some clay on the top and prevented the water running over. I do not believe that any water gets in through the dam. It is well puddled.

785. Then, without some means of preserving the water in wet seasons, do you think that the Botany stream cannot be trusted as a means of supplying Sydney with water? Decidedly; there is no question about that at all.

786. Have you examined carefully the dams which are now being constructed on the Botany stream? I have.

787. Do you think they will be sufficient to preserve the excess of a wet season to make up the deficiency of a dry one? I do not think they will; but I am of opinion that they will materially add to the supply, because they will have the effect of keeping the ground saturated. The object in making them was not so much to store the water as to keep the ground saturated. The evaporation is very great in dry weather; but if the whole of the ground were kept thoroughly saturated a vast quantity of water would be retained in the area of the dams.

788. Then you do not expect the dams to be retentive? Decidedly not. That never was intended.

789. Do you think the chief utility of the dams will be to keep a large surface continually wet, and therefore more spongy? That will be their chief advantage. Some of the lower dams, no doubt, will also retain a considerable quantity of water; but in a very dry season, or after a series of dry seasons, such as we have had, I presume that there will be little water except what is under the surface. From what I have seen of the dams I am satisfied that they will be of immense importance in regard to the supply. They will add very much to it. My reason for arriving at that conclusion is this: it was understood when the dams were commenced that blue clay would be met very near the surface. This, however, was not the case. It was found, in some instances, as far down as 30, 40, and 50 feet; in others the sand was not gone through. It was found to be a regular quicksand. That is one of the reasons why some of the dams have given way—there being no bottom, except sand. I gather, therefore, from the nature of the ground, that the source of supply will be much enhanced by always keeping those dams full of water.

790. But supposing we had a recurrence of a long and severe drought, such as that described to have taken place in 1838 and 1839, and that in 1849—do you think these dams would enable us to tide over such a drought? I think not, because every day we require more water. It is as necessary to have a supply of water to flush the sewers of the city as it is to have a supply for other purposes. In fact, last year I think there was great danger of a plague breaking out, because the drains were not flushed through the summer months, when there was not an adequate supply of water. You could scarcely walk through the town, in some parts, owing to the stench. The drains must be flushed either with fresh or salt-water.

791. Then, even after the present dams are finished, you think they will not secure a good supply to Sydney during a long-continued drought? That is my opinion. I have no doubt that when the present dams are finished Sydney would be able (even if there were a drought for two years) to have water for ordinary purposes, but not for machinery or manufactories, or for flushing the sewers. Therefore, I calculate that the supply will be altogether insufficient.

792. Have you thought of any method of so increasing the supply in the Botany Swamps as to make it trustworthy, even in long droughts? I think nothing can be done excepting to keep those dams in order. It will take a year or two to consolidate them so that they will be able to stand any great pressure.

793. You think they will improve, then, by age? I think so. I think that in a year or two they will be consolidated by their own weight. They will require to be managed with great care when the next flood comes or else they will be swept away. Some of the dams were injured considerably during the late flood.

794. Do you think it will be necessary to supplement the Botany dams by watertight reservoirs in or about Sydney? I think the expense of that would be too great. You could not erect any watertight reservoir in or about Sydney that would hold more than a week's supply, perhaps, and the expense of that would be something enormous. I think the Crown-street reservoir cost about £30,000, and that will not supply Sydney for more than two days. I question whether it would give two days' supply. Storing water in that way does not seem to me to be practicable; the expense would be too great.

795. Then I understand your view to be, that the supply from the present source at Botany really cannot be trusted in serious droughts? That is my opinion, taking into account the requirements of the city, the manufactories now in operation, and those which are likely to spring up, and the flushing of the sewers, which I consider to be absolutely necessary.

W. Speer,
Esq.

23 Nov., 1867.

796. Have you formed an opinion as to the quantity which ought to be supplied per head of the population so as to cover all purposes? I have never considered that; but it will be very easy to get the fact from the Town Hall, because every gallon of water pumped in is registered.

797. Have you thought of any source of supply that would be more trustworthy and abundant than Botany? I have heard something about water being brought from beyond the Nepean, and George's River has been mentioned casually.

798. But of your own knowledge do you know of any other source? I am not aware of any; but I have no hesitation in saying this, from my own experience, extending over many years, that we require more water than Botany is able to give us. Where it is to come from I think you gentlemen will best form an opinion.

799. In going to a new source of supply, do you think it would be prudent to incur a great additional expense, except in order to get a supply by means of gravitation? I believe in the long run it would be cheapest to bring the water into the City by means of gravitation, for we can never tell what may happen to machinery. For instance, the whole of the engines at Botany might be broken. I should think that a supply by gravitation would be much preferable to any other mode, and that it would not be a constant source of expenditure. A very considerable supply, you are aware, comes from the Lachlan Swamp by gravitation. I suppose that half the city is supplied in that way. It is in course of contemplation to increase that supply by erecting a dam near the Randwick Road.

800. Do you know the stream of water which flows from the Waterloo dams? Yes.

801. Do you think that could be made of any use to supplement the present supply? I could not say anything in regard to that matter from personal observation. There is a difference of opinion on the subject. Some say that the water could not be used at all; others assert that it could. My own impression is that it could be used if a little expenditure were incurred.

802. But is it not occupied already by buildings, where operations are carried on that tend to contaminate the water? Yes; but I take it for granted that if it was considered desirable to use the water for the city these would be removed. The Water Act gives power to remove them.

803. That would be a great expense would it not? No doubt it would be a great expense, and before anything of that kind were attempted it would be better to ascertain if water could not be got from a more distant source, so as to furnish a permanent supply.

804. *Mr. Moriarty.*] Can you tell us the longest continued drought you either remember or have heard of in Sydney? I have known Sydney since 1843, and I think the late drought was the most severe one I recollect.

805. That is, during the last two or three years? Yes. I do not think the drought of 1849 was so severe on the water, because there was some rain on the coast, and a good thunderstorm is everything to Botany. It fills the dams and saturates the ground. There is no question that there was not a sufficient supply during the recent drought. When I was Mayor I took Mr. Martin and the Ministry of the day to shew them the deficiency of the supply.

806. Having in view the peculiarities of this climate—its liability to long and severe droughts—do you think it would be necessary, in a town of the growing importance of Sydney, to make sure of a year's or a year and a half's supply? Certainly.

807. Or, perhaps, for a two years' supply? I believe that the present dams, and the experience gained by putting them up, will enable the city to have a year's supply. I believe now, that if we had no rain for twelve months we should not be short of water, if the dams were finished and the water was in them. Under these circumstances I do not think we should, at the end of the twelve months, be so short of water as we were a year ago.

808. *President.*] But if the dams are not retentive? They will still keep back a considerable quantity of water. They were intended to act as filter beds rather than to keep back the whole of the water.

809. *Mr. Moriarty.*] Is it intended by the dams to preserve the water above the surface or under the surface? Under the surface.

810. Then it is not contemplated to keep large reservoirs on the surface? No doubt there will be kept above the surface as much as they will hold; but that was not contemplated in the beginning. The dams are not constructed to stand any great pressure.

811. Supposing that they do not hold water above the surface, it is anticipated that they will tend to the saturation of the ground under the surface? Decidedly; and from what I see and know of my own knowledge, if there were to be no rain for twelve months, from the manner in which the ground is saturated I do not think we should be so short of water as we were last year.

812. I think you said that when the dams were projected it was expected that you would meet with blue clay? Yes; it was thought that we should come to some stiff soil near the surface.

813. And has it turned out that there is clay? There is clay, but not in the place where we put the dams. It is there mostly sand.

814. Then the expectation of meeting clay has not been fulfilled? No; but there is clay in the neighbourhood. It was from the excavation that we gained the information that Botany is capable of furnishing a larger supply of water than we anticipated.

- W. Speer,
Esq.
23 Nov., 1867.
815. Below the surface of the sand? Below the surface of the sand.
816. And you expect that that water will drain out on the surface as it runs down towards the engine-house? Some of it will drain out in the lower dam. There is a series of dams, but there is not much fall. Some of the water will not shew on the surface until it comes to the lower dam.
817. We have a copy of Mr. Bell's section here, shewing that each dam will hold about 8 feet of water—do you anticipate that they will hold that quantity? I should not like to see 8 feet of water in them now. I do not believe they would stand the pressure. After a year or so, when they become consolidated, they might be capable of holding that quantity. They are made on sand and loose stuff, and some of the piles are driven only into the quick-sand.
818. Then the expectation of keeping water in those dams—as shewn in this section—will not be fulfilled so far as regards the first year? It may not be. The lower dam was not consolidated when the flood came and washed it partly away. The same thing might occur to all the dams.
819. If there is a strong current running, and a filtration of water underneath the surface, would you not expect it in some degree to wash down the sand in those dams? No doubt that must be looked after. The great danger is the current underneath.
820. Under the piles? Yes; some of the piles have no hold at all.
821. *Mr. Grundy.*] Would not that be likely to neutralize the consolidation? No, not with judicious management when the rain comes on. It will be necessary then to keep the sluice open to prevent an unnecessary accumulation of water in the dams. For instance, if there is an appearance of three weeks' wet weather it would be a great mistake to attempt to fill the dams during the rain. The policy would be to let the water off till the rain went away, and then to close the sluices, and let the dams fill slowly.
822. *Mr. Moriarty.*] It is not calculated that by means of these dams those flood waters can be saved over a dry season? Some look to that, no doubt; but the flood waters cannot be saved. It would be necessary to dam up the whole of the country to save three or four hours very heavy rain. No dams could be formed to keep that water.
823. Not there? No; but when the rain is over, and the flood gone, then the sluices could be shut and the water caught gradually.
824. I believe that most of the land adjoining that on which these dams have been constructed has been alienated—that it is private property? Yes; it belongs to Sir Daniel Cooper.
825. Have the Corporation any control over it? Yes; according to the Water Act the Corporation can take possession of any lands required for water purposes by paying compensation, and it is specified in the Act how compensation is to be given. If the owner is dissatisfied he appoints an arbitrator, and the Corporation appoint another. They then appoint a referee, and settle the matter.
826. What I am alluding to is not exactly the space occupied by the dams, but the adjoining country which drains down into them—is not that private land? Yes. There is also a clause in the Act which provides that any nuisance can be put down on the watershed, whether it arise from a house or from a manufactory. Several nuisances have been abated.
827. But supposing the land were sold for building purposes, is there anything in the Corporation Act to prevent the erection of houses? No.
828. Then, in point of fact, the town might extend over that land? I do not think it, because as soon as it became a nuisance, the Corporation would have power to step in and stop it. If a nuisance is created, you have to prove that it is a nuisance, and then it can be abated.
829. *President.*] But before you can prove a nuisance and have it abated, it must be something obtrusive. I think what Mr. Moriarty alludes to is the ordinary contamination which would be caused by dwelling-houses which in themselves are not so offensive as to be indictable as a nuisance? We had a case of that kind near Paddington, where a man erected a piggery and a cottage on the stream. In that case it was not the piggery but the cottage which was the nuisance, and he had to remove it; so that if a dwelling-house were erected on the stream, and it proved a nuisance, you see it could be removed.
830. *Mr. Woore.*] But the nuisance must exist before it could be removed? Yes.
831. *Mr. Moriarty.*] Then how would it be in the case of a man who spent four or five thousand pounds in building a villa? The law says that a man who erects a nuisance will not be entitled to damages if that nuisance be removed.
832. But would that law apply to the case of the building of a gentleman's residence? Yes, if the residence were a nuisance. If, for instance, the water-closets were built on the banks of the stream.
833. But supposing it is in the centre of his own ground? If a nuisance were created, and it were proved to be a nuisance, it would be removed.
834. Is there any possibility of preventing the extension of the town over that part? Yes. When Mr. Cowper was in office the Minister for Lands (I think it was Mr. Robertson) had a great deal of the gathering ground surveyed and put up for sale. The Corporation remonstrated with the Government, and they withdrew the land from sale simply on that ground. The Corporation, I think, would not have objected if the Government had put up the land in 2-acre lots, with a proviso that there should be but one villa on each lot. But they had no restrictions in the sale.
835. But I am speaking now with regard to land which has been alienated without any of these conditions? All such land would come under the same clause. If anything is erected that is a nuisance it can be abated. The law is very strict in that respect.

836. *President.*] If you look at this map [*produced*], shewing the upper portion of the Lachlan Reserve, you will see that within the boundary indicated by an orange-coloured line there are many building allotments and buildings? Yes, a vast number of villas have been erected, but I do not think they are any nuisance.

W. Speer,
Esq.

23 Nov., 1867.

837. *Mr. Moriarty.*] I am not speaking of this place, which is under the control of the Corporation, but of the land which has been alienated down towards the Botany Swamps? There is nothing to prevent Sir Daniel Cooper, or anyone else, erecting any structure there; but if it becomes a nuisance, or is calculated to damage the water, the Corporation could step in.

838. But that would depend upon what was looked upon as a nuisance. Supposing the land were sold in 2-acre building allotments, would the Corporation interfere to prevent villas and other houses being erected? They could not interfere till the nuisance existed. The Corporation can only step in when there is a nuisance.

839. *Mr. Woore.*] It would be a very expensive thing to purchase? The expense would be thrown on those who created the nuisance. We should not purchase. There was a case in point at Paddington, where a house was built on private property, and the Corporation interfered on the ground that a nuisance had been created. I think the case went to the Supreme Court. We had the opinion of the Judges in regard to the matter, and the result was that the parties were compelled to abate the nuisance and pay the cost.

840. *Mr. Grundy.*] Could the land be made use of which is granted to Sir Daniel Cooper and others in this locality? It might be used for market gardens.

841. *Mr. Moriarty.*] But if they went in for high manuring, would not that be a nuisance? Yes; but it would have to be proved.

842. *Mr. Grundy.*] But would not compensation have to be granted? When the question was first taken up by the city, Mr. Lord and others, who had what were called water-rights, were paid large compensation. But in resuming land now there would be no payment for water rights, but only for the loss of the land.

843. *Mr. Moriarty.*] But in the meantime the land is Sir Daniel Cooper's? Yes.

844. And he can do what he likes with it? Yes.

845. It would depend, then, upon what the Corporation thought a nuisance? No, it would depend upon the law.

846. But the primary action would depend upon the Corporation? Yes.

847. We have here in this evidence [*Minutes of Evidence taken before the Select Committee on the Sydney Water Reserve, on 18th November, 1862*] the following:—Mr. Bell was asked by the Chairman: "What about No. 4 on the map? No. 4 on the map, including about 685 acres, contains the main Lachlan Swamp, from which the city has been supplied for so many years. There is one thing I was going to add before, and it is this, that on No. 3 the night-soil of the city has been deposited for several years past." He is then asked: "And is it still deposited there? Yes. *By Mr. Caldwell:* On the block marked No. 3? Yes." "*By the Chairman:* And have the citizens taken no means to prevent it? We have put up boards lately to prevent people throwing it on one part, but they have continued to do so. Have you taken no course to punish them? We have endeavoured to find them, but we have been unable to discover the guilty parties. *By Dr. Lang:* I suppose it is done in the night? Yes; but it has been deposited on No. 3 to a very great extent for a number of years past. To my knowledge it has been deposited there for the last seven years. The water which falls on No. 3 is very heavy during storm times. It finds its way across the Randwick Road and into the stream which runs from Lachlan Swamp to Botany."—Now, if that is done with regard to No. 3, which is immediately above the tunnel, would it be possible, while such a thing is known to be in existence, to prevent the sale of this land for building allotments, or to hinder persons from erecting villas or cottages on the land? There is no law which can prevent a gentleman from selling his land; but there is an absolute law which would prevent him from retaining a nuisance on his land. No person would be likely to buy land with such restrictions.

848. Would a villa be considered a nuisance? Yes, if any of its drainage should run into the watershed or the creek.

849. But must not all the drainage necessarily run into the creek? No; I do not go with Mr. Bell in his remarks concerning No. 3. Evidence has been taken with regard to No. 3, as to whether any of the water, except a little at the lower end, goes into the swamp. I think they are putting night-soil now about the old cemetery. A good deal has been put near to the Military Cricket Ground. That is low ground, and any nuisance there will find its way into the tunnel. But there is a ridge there which will prevent any drainage from going into the swamp. In regard to No. 3, if a nuisance were permitted on three-fourths of that area, it would, as a matter of course, find its way into the tunnel. The nuisance we caused to be abated was upon No. 4.

850. And was that land with which the Government had to deal? No, it was on private land. A person erected a house on the banks of the creek going down to the swamp. We found it a nuisance, and caused it to be stopped. The proprietor was not satisfied with the decision of the magistrates, and went to the Supreme Court.

851. Have you pulled down that house? Most decidedly. He erected a cottage and piggery. We could not stop him while he was building, because a nuisance must exist before the Corporation have any power to move.

852. Supposing this land were marked off into building allotments and sold—do you think it would be a nuisance if villas were erected and gardens made on the allotments? It is doubtful. The country is now wholly broken up.

853. But supposing they were built on the watershed? I would consider them a nuisance if they were built on the eastern side. On the western side I should not consider them a nuisance, because any drainage would flow into Shea's Creek.

854.

- W. Speer, Esq.
23 Nov., 1867.
854. That is another course of waters—I am speaking of the drainage into the Lachlan? Wherever a nuisance exists, and it can be proved to be a nuisance, the law is sufficient now to abate it. But if the Corporation wished to take the Waterloo dam, or anything of that kind, compensation would have to be given to Sir Daniel Cooper for his water rights and the loss of his land, in the same way that compensation was given to Mr. Lord. He got compensation for both, because he had a mill on the place and the mill was discontinued.
855. *Mr. Woore.*] I suppose the view taken was that the water increased the value of the land? Of course.
856. *Mr. Moriarty.*] Have the Corporation the same control below the creek as they have above? Yes, the very same.
857. And they would have to purchase this land? Most decidedly; and the mode of purchase is described by the Act.
858. If they wanted to sell this land in building allotments, and the Corporation said, "We cannot permit you to sell"? The Corporation could not say that; but I do not suppose any one would buy under such circumstances.
859. Practically, then, that land cannot be sold—it is as though it were in Chancery? Practically it cannot be sold for the erection of villas. A nuisance must, however, exist before the Corporation can move. No person would buy that land with the knowledge that they could not erect a house on the watershed.
860. Do you think that knowledge has tended to prevent the erection of buildings? I do not think so. It is such an out-of-the-way place that no person would go there to live. In the course of a number of years they may go down there, but I do not think they are likely to do so at present. There is plenty of other land about.
861. *Mr. Bell* says: "The water which falls on No. 3 is very heavy during storm times; it finds its way across the Randwick Road and into the stream which runs from Lachlan Swamp to Botany." He is asked, further, by the Chairman: "That is the surface-water?" and he replies: "Yes; so much so has this been the case that we have traced the night-soil from No. 3 allotment to the stream in the Lachlan Mills Estate"? That I recollect.
862. Is it now obviated? There has been no night-soil put there for many years on that part of the ground. I do not think any night-soil is now put on No. 3. That evidence must be pretty old. There was a place set apart for night-soil four or five years ago. At any rate, this was decidedly a sad nuisance.
863. Would you consider if a building were constructed on the lower part of this creek, on the watershed towards Botany, that it would also be a nuisance? Decidedly; but before the Corporation took action they would have to prove it to be a nuisance. Practically speaking, I do not believe Sir Daniel Cooper, or any one else, has power to sell this land. He might possibly put up villas on 2-acre allotments, so as not to become a nuisance; but to erect a village, or anything of that kind, would, in my opinion, be impossible under the present Act.
864. But supposing a man put up a villa on a 2-acre allotment, and went in for high farming? The manure would shew immediately.
865. And he would have to discontinue it? Yes. In those sandy soils the manure does not stay in more than a year. But the difficulty would be to prove the nuisance with regard to manure or anything of that kind.
866. *Mr. Grundy.*] I think you stated that you considered the water supply of Botany insufficient to meet the requirements of the city. No; not in an ordinary season.
867. But you consider it insufficient for emergencies? Decidedly. It would be insufficient if we had a drought similar to that which terminated last year.
868. Since that time you have given an opinion that the dams at Botany are better than you anticipated they would be? Yes; I formed that opinion from information gained during the driving of the piles, and I think the public have gained the information too. It has been ascertained that the bed of the creek contains a larger quantity of water than was anticipated.
869. But, notwithstanding that more favourable opinion, you still adhere to the opinion that, in case of an emergency, the supply from Botany would be insufficient to meet the requirements of the city? Yes. It is not safe to have a city like Sydney, with its suburbs, depending upon such a supply. Balmain now is applying for water, and very shortly we shall have a similar application from the North Shore. The Corporation is bound, in accordance with the provisions of the Act, to supply all these places with water when they desire it. The Water Act applies to the city and suburbs. There is no question but the water will be laid on at the North Shore before long. The only obstacle the Corporation can throw in the way is the want of money; but whenever the inhabitants of the North Shore petition the Corporation for a supply of water, the Corporation are bound to get the money and furnish the supply.
870. And you think that, with the assistance of the dams in a dry season, the supply would be insufficient? No; it would after a series of dry seasons. I have said that if there were no rain for twelve months there would be a sufficient supply at Botany.
871. But for a series of dry seasons? It is not sufficient. The wants of the city are great and constantly increasing. The more the sewerage is extended the greater the quantity of water required to flush and cleanse them. I consider that one of the greatest draughts upon the water is the large quantity required to keep the sewers clean.
872. *Mr. Woore.*] You have no knowledge of the drought of 1837 and 1838? No; I was not in the colony at the time; but from what I have heard it must have been very severe. There is a vast quantity of water in the soil now. I have observed places full of water now which have not contained water for a number of years. The ground is thoroughly saturated. The little drought we have had has only affected the surface. There is a vast quantity

quantity of water at Botany now and in the swamps. In the years 1864, 1865, and 1866, it was not so, because we had scarcely any rain. The ground never got thoroughly saturated, and that accounts, as a matter of course, for the short supply last summer and the summer before.

W. Speer,
Esq.
23 Nov., 1867.

873. *President.*] Do you think that the North Shore could share in the Sydney supply? Yes, there is no question about that.

874. How would you propose to take the water across? In the ordinary way—across the harbour in pipes.

875. How would you carry the pipes across the harbour? We should place them along the bottom by means of the diving apparatus. It would of course be necessary to prevent vessels anchoring within reach of the main. There would be no difficulty in doing that, and it must be done, because the North Shore is a place where there is no proper supply of water. If an application came in now how could it be refused?—You could put a pipe over to the North Shore cheaper than you could lay it in George-street. But the question of water is one not for the City but for the Colony, and it ought to be taken up by the Government. If the supply be obtained from the Nepean or that neighbourhood, the whole of the intervening country could be supplied, and irrigation, to a great extent, might be carried on; because the nature of the country is such that dams could be formed at a very cheap rate. The whole question is one for the Government; no Corporation can attempt it.

WEDNESDAY, 27 NOVEMBER, 1867.

Present:—

MR. MORIARTY,		MR. WOORE,
MR. ADAMS,		MR. GRUNDY.

PROFESSOR SMITH, M.D., (PRESIDENT), IN THE CHAIR.

Thomas Buckland, Esq., called in and examined:—

876. *President.*] I understand that you are well acquainted with the Botany Swamps? T. Buckland, Esq. Yes, I have been acquainted with them for some years.

877. Have you known the swamps during any period of severe drought? Yes.

878. Could you name the periods of those droughts? Yes, I recollect the great drought of 1839, which I think was the most severe one we have ever had.

27 Nov., 1867.

879. Do you remember the condition of the Botany stream at that time? Yes.

880. Could you give us any idea of the quantity of water which flowed down it during that driest time? At the driest time that occurred in 1839, the stream that was then running down through the Lachlan, commencing at what we term Bridge-end, would not be a volume of more than 6 inches of water; that is to say, where the division takes place between the Water Reserve and Terry's Grant, at the place where Armitage's woolwashing place was and the old factory. The volume was much larger when you got down towards the "neck," what they now call No. 4 Dam. We considered the "neck" to be the place where the whole of the water could be intercepted at least expense. That was the point where the late Daniel Cooper originally intended to intercept the stream. At the time of which I speak, in 1839, the stream was running there in a volume about two-thirds the size of my body.

881. And that was before the drought broke up in 1839? Yes.

882. So that that would have been about the worst period? Yes. Why we went to look at it at the worst period was this:—We were trying to do something with the Waterloo Mills. We had serious thoughts of breaking them up, and going over to the Lachlan.

883. Do you remember the dry season of 1849? Yes, I remember the season; but I did not take the same interest then in looking at this stream, because in 1839 I had a special object.

884. Could you tell us what proportion the stream bore at that time to its average size? I should say it had gone down to about one-fifth of its average size. By its average size, I mean the size it runs (say) two months after rain. It has changed very much of late years. In former times the stream did not attain its magnitude immediately after rain, as it does now. If you look at the stream now just after a heavy rain, you find it at a full head; formerly it would require three or four days' rain to bring it to a full head.

885. To what do you think is that owing? To the hardening of the ground. In regard to this subject, I may say that I sat down last night and put my ideas together in a connected form; and after you have asked me such questions as you consider necessary, with your permission I will read over my observations.

886. Perhaps if you would read them over first it might save time? They are rather roughly thrown together, for I commenced them pretty late last night. They contain suggestions as well as observations, and you must pick the wheat from the chaff, if there is any wheat in it:—

"In addition to the present Water Reserve, all should be reserved eastward of Constitution Hill to Randwick Hills; fences should commence from the crown of the hill, and across the flat to the spur of the range that divides the Lachlan and Waterloo watersheds; the fence to be continued along the range, until it reaches a point in a line with the northern boundary of Holt's grant. Here the whole of the land between Holt's grant and the Lachlan stream should be reserved, to include the valley and swamps, which, although they

T. Buckland, Esq. they have no running outlet, percolate through the sand flats south-westerly, and reach the stream below Kellett's Bridge (No. 2 Dam).

27 Nov., 1867.

"On the eastern side of the stream the land should be fenced in from the hill over and between the sand-crossing No. 5 and the neck No. 4, to the south-west spur of the Randwick Hill; a line between the two points, diverging a little to east, southerly would include all the rainfall that naturally belongs to the Lachlan stream; the extreme eastern water drains off to two round swamps, and to the Man-of-war Waterhole; the rest to Bunnerong and the Veteran's. Having securely fenced in with a close fence the land indicated, a trench should be cut between the sand and the swamps, in order that the water in the higher land should soak into the swamps *under* the surface, instead of running rapidly *over* the now hardened edges, and thence at once into the channels which lead the water into the main stream. On no account should any leading drains be left open for the purpose of drawing the water out of the swamps into the main stream, except as a last resource in times of great drought. It is by this means the watershed has been very much injured and the swamps contracted; it causes the ooze to dry up and harden. Once thoroughly dried, it will take many months of extremely wet seasons to restore it, and in many instances it has never recovered its full capacity to retain water. The consequence of this hardening of the ooze is, that a moderate thunderstorm, which brings perhaps a few hours' rain, instead of filling the swamps, merely causes a rushing of water *over* the surface into the main stream and out to sea, instead of being held and stored in the swamps. The aim of the conservators of the Sydney Water Supply should be, to cause the swamps to *retain*—not to *discharge*. The bed of the stream and the circumference of the swamps have been narrowed by several causes, but chiefly as follows: when there is a continuous rainy season, and the water stands very high in the swamps for a considerable time, the herbage round the sandy edges dies off, but the seeds and germs of plants are covered up by the deposit which the water leaves as it drains off. Formerly these plants sprang up and formed a thick fringe round the edges, which gave shade to, and prevented the evaporation of the water which, for a long period after rain, gradually drains out of the high ground into the swamps; but since cattle, horses, and sheep have become so numerous, and the destruction of the brush from the hills so complete, the edges of the swamps and the sand near it are so much tramped over and disturbed, and sand is drifted in such quantities, that instead of the plants springing up again after every rainy season, the very reverse is the fact, for the edges remain barren, and are deducted from the capacity of the swamp every year. There is a striking instance of the effect thus produced, between the high range dividing Lachlan from Waterloo and the low ridge which encloses the Lachlan stream. There was once a succession of waterholes in wet weather, and of rush swamps in all seasons, but from the causes before mentioned, the whole valley is becoming a sand-drift. Dam No. 6 receives the water from this valley. The great cause of evaporation has been the destruction of the brush from the hills. The first and most important result is, that it allows the dry, hot winds to sweep over the surface of the waters; in the next, it allows the water gathered in the hills to evaporate instead of gradually percolating into the swamps. The wind is a more powerful agent in causing evaporation than the sun. Instance the Man-of-war Waterhole. It stands longer than any other, because it is backed up on three sides with good high scrub, although open to the full effect of the mid-day sun.

1. Enclose the reserve as indicated before, preserve the herbage by severe penalties, and find a Magistrate that is not afraid to convict and punish offenders (if you can); plant thick lines of fig and stone pine trees *across* the course of the west and north-west winds.

2. Intercept the fall of every considerable swamp, to increase their capacity for gathering and storing. Inexpensive flood-gates, to discharge water when required, may be erected at the outlet to the main stream.

3. Plant all bare, sandy patches with cactus cuttings, which can be got by cart-loads, and just stuck in the sand. A load or two of turf thrown into the centre of each patch will be sufficient. As the wind blows it to and fro, the cactus plants catch it, and as rubbish gathers round, it will soon take root and relieve you from all further trouble.

4. A dam should be erected along the north-east side of the Randwick Road. All the water that would run through Busby's bore should be used in the city, to save the cost of pumping; as I believe the reserve above the Randwick Road could be dammed up to supply the city six months out of twelve, and thus allow all the swamps below to increase in capacity. I propose that a tread-wheel should be erected, to force water to the Crown-street and Paddington reservoirs; and this could be worked by gangs from the Gaol, at a small expense, saving coals at Botany and wear and tear of engine, besides being a stand-by if the fortune of war deprived us of the Botany supply. The management of the water supply being of great importance, should be a special duty entrusted to one man, under the control of the Mayor and Corporation.

I feel perfectly assured that if, years ago, I had received authority and means to carry out the suggestions I have now made, no scarcity of water such as we have seen would have occurred. It will now take some years of judicious management to restore the water supply to its original quantity, but I believe it can be done, and then the gathering capacity of the reserve will be sufficient for the next generation, and the dams, when all erected, will store it; that is, if they are backed at an angle sufficiently obtuse to resist the weight which can be accumulated against them. Nos. 4 and 6 I should have made much higher than is proposed.

The Corporation are, I think, extending their mains too far into the suburbs. Where the populations surround good localities for such a purpose they should erect dams themselves. I believe the principle on which the dams are erected is a good one. I do not think the details have been well carried out."

In

In addition to what I have read, I may state that, since Atkinson's establishment was broken up, the people, in taking away the material, used the track on the opposite side. Others saw the track in use, and made a short cut of it to Randwick Hills. In consequence of this, the sand on the opposite side is broken up very much. A good deal of it has gone into the stream, and within the last twelve months it has spread over not less than seven acres of land. But there is in the line of the stream still the swamp underneath. I was nearly bogged the other day. The effect of this sand being there will be, that the rain will run off over the hardened surface, and go at once into the sea.

T. Buckland,
Esq.
27 Nov., 1867.

887. Then, do you think, if the various precautions you have described were taken, that the Botany Swamps would furnish a sufficient supply to Sydney? It is a very hard thing for an unscientific person to give an answer to such a question, except upon data accumulated by scientific men. But speaking from my general knowledge of the rain I have seen fall and run away from that place, I believe there is sufficient to supply a city with half as many more inhabitants as we possess. But we must very speedily take into consideration the proposition of supplying all the suburbs, and those suburbs will soon contain as many people as the city now contains. I think we may fairly calculate that, in the next thirty years, there will be 300,000 people in Sydney and the suburbs. Then comes the question whether we shall be able to supply them. With the present capacity for consuming water, I believe, we can continue to supply Sydney for fifty years.

888. Do you think that those dams on the stream can be made thoroughly retentive of water? I think they can be made sufficiently retentive, seeing that they have a stream below to catch the percolation. We have found that a common sand-dam, if you give it a pretty good base, and throw plenty of clay upon the up-stream facing, will be sufficiently retentive to stop the bulk of water. We find that is not sufficient to stop the water altogether, unless we "centre" it, that is, cut out the centre and puddle it with clay. This is not very expensive. After you have stopped the water with a base of sand, with a layer in front of clay, and bog earth and rushes, you can go down to any depth you like along the centre of the dam, and put in a clay centre that will stop the water sufficiently well for all practical purposes. In some places it would be difficult to find the bottom.

889. Do you think that, even in the driest seasons, the running stream would be equal to the percolation? I think it would be more than equal.

890. Even in the driest season to be expected? Yes.

891. In your opinion, I suppose, it would be necessary to preserve the surplus of a wet season to supply the deficiency of a dry one? Yes; because the water would spread over such a wide surface, that the evaporation would be enormous through a long succession of drought. In the year 1839 we walked over some of our deepest swamps on the Waterloo Estate, and they have never from that date, where the population is settled, recovered their retaining qualities. Of course we have not encouraged them to do so, because we wished to dry them up.

892. Do you remember the state of the supply from the tunnel in 1839? No, I did not notice that much.

893. Is it not the case that the stream, in a great part of its course, flows through private property? Yes.

894. And is that property not liable to be built upon? Yes, very liable. I am only waiting until Waterloo is populated sufficiently, and then I will commence on the Lachlan.

895. If that land is built on extensively, would there not be serious risk of the water being contaminated? It is sure to be contaminated, and that is the reason of this proposition to reserve.

896. Then a good deal of the land would have to be resumed, or bought back? Yes; I have marked on this map (*produced*) the line I propose to fence and the land I think should be resumed.

897. Does the line you have marked include much private property? Yes, it includes a great deal.

898. Then the resumption of that property would be a serious item of expense? Yes, it would.

899. But in your opinion, that property ought to be resumed? I think it should.

900. Could you give us any rough estimate of the approximate value of the property which, in your opinion, ought to be resumed? I shall be able to do so in a few days.

901. Will you be kind enough to give us a memorandum afterwards? I will. I am going out to value it in a day or two.

902. Do you think that any of the swamps to the eastward of the Botany stream could be drained into it? No, not further than the lines I speak of. Those diverging to the east a little can be brought in; but after that, the fall is to the Veteran Swamps and Bunnerong. There is a stony ridge where the Government cut out a little stone for the Bunnerong Road; that is almost the turning point of the two waters, one flows out to the Round Swamps and the Randwick Hills, and the other to Bunnerong and the Veteran Swamps. I do not see how it could be brought in, unless it were down towards Botany, and that of course would be too near the sea.

903. How would you propose to preserve the excess of water that comes through the tunnel—do you think it ought to be preserved in large reservoirs in Sydney? I think that when they have a large supply of water, they might very judiciously discharge some of it into the upper reservoirs above Busby's bore; but I understand that that would be rather difficult to do.

904. Do you think a retentive dam could be made below the tunnel—between it and the Racecourse—so as to dam back the excess of water? I think it could.

905. And you think that then it ought to be raised to a reservoir on a high level in Sydney?

T. Buckland, Esq.
27 Nov., 1867. Sydney? It might be put into the two reservoirs now in existence. If the question of pumping did not interfere, there is one magnificent place for a reservoir near where Logue's stables at Waverley drain into the Water Reserve, and another one trends out towards the Clergy Daughters' School. The place I speak of is just beyond where Mr. Hooper planted all those stone pine trees.

906. You think that is a good position for a dam? It is a magnificent place. It is very deep, and surrounded by barren rocky soil of no value to any one. The only question is, as to the difficulty of pumping the water back.

907. There is a little knoll here; I suppose that would be a place for a dam? * There is a patch of rocks, rather inside the road, to the eastward.

908. *Mr. Moriarty.*] I think you said that some parts of the swamps have never recovered since 1839? I was then speaking of the Waterloo Swamps—not the Lachlan.

909. Seeing the increase of population in that direction now; do you think anything can be looked for from the Waterloo, in regard to a supply of water to the town? Not from the Waterloo Swamp—that is all taken up. We have it covered with tanneries and wool-washing places, and fellmongering establishments, and all those kinds of things.

910. Then that place is out of the question, as regards a supply of water to the city? Yes.

911. Even if those establishments were bought up? You would have to pull the houses down. We have there 1,200 tenants and sub-tenants.

912. Then you have too large an interest for such a course? Yes, our interest is too great. The yearly rental assessed upon by the Municipal Councils is, I think, Waterloo £19,700, Redfern £27,767. A sufficient portion of Redfern drains into the Waterloo stream to make up for that portion (if any) of Waterloo that drains elsewhere.

913. Do you think that the same process of town extension is going on, and likely to go on, over the lower parts of the Lachlan Swamps—I mean from the Randwick Racecourse downwards? As soon as the people are thick enough on the Waterloo Swamps, I intend to commence letting land around the Lachlan stream. I intend to offer such inducements as will draw population—

914. And you think they will go? They will go, of course, from the inducements I shall offer.

915. And that part of the country will become injured as a source of water supply? Yes. I shall serve the lower part as the Government have served the upper—erect houses, build water-closets, and so forth.

916. But the Corporation can put a stop to it? By getting the Government to resume the land under the Water Act. There is a reservation in the grant of 10 acres at any one place, and of spars which may be cut for men-of-war; this, however, amounts to little, seeing that there is no timber on the ground bigger than your thumb. Under the Water Act, so far as between the Government and the grantee, the Corporation must call upon the Government to resume portions of the land, and they can do so.

917. More than the 10 acres? Yes, they could resume the whole of it.

918. And pay for it in the ordinary way? The Corporation would have to pay for it, but they cannot resume it without action on the part of the Government.

919. *Mr. Woore.*] According to the reservation in the grant, can the 10 acres be resumed in any particular part? They can.

920. *Mr. Moriarty.*] But it would be necessary to resume some six or seven thousand acres, would it not? No, not so much as that. I think it would be necessary to resume about 600 acres of our land, and about 200 acres of the Church and School Lands.

921. *Mr. Adams.*] What you describe would embrace six or eight hundred acres? Yes.

922. *Mr. Moriarty.*] You would require to reserve a portion to the west side of the Lachlan Creek? Yes.

923. And some on the east side? Yes, on the east to the Randwick Hills.

924. And about what extent of acreage will that be? I think about eight or nine hundred acres.

925. And from that down to the Botany Waterworks would have to be reserved, would it not? You would have to go into Mr. Lord's ground, but that is narrowed very much after you get down to Kellett's Bridge. I think a very narrow strip there would be sufficient.

926. What extent of land would you have to reserve down there also? I could not tell that. It would depend upon whether the land falls towards Kellett's garden or to the stream; but, in any case, you would not have to reserve one-fourth as much there, in consequence of the nature of the ground.

927. You are, however, of opinion that the whole drainage area of that creek must be reserved to keep the water pure? Yes; unless that is done you cannot keep the water pure.

928. Unless that land is immediately resumed, the same process of deterioration which has been going on will soon commence on it? Yes; if I had tenants I should let our portion of the land to-morrow.

929. I think you said that you thought the dams now in course of erection would be sufficient to store a large quantity of water? Yes.

930. Do you think they will store the water above the surface, or merely assist in preserving the water in the soil under the surface? I think they will do both.

931. You think that they would hold water above the surface? Yes, I think they would hold water above and below the surface. But I propose to intercept the water at the edge of each of the swamps where it goes into the stream. You might erect very inexpensive flood-gates, to allow the water to go into the stream when you require it.

932.

* This question refers to the proposition to erect dams at the east side of the Randwick Road, and has no connection with 907.

560. You are aware that the tide flows up to Liverpool? Yes.

561. Do you think the soil is affected by the salt in such a way as to interfere with the quality of the water? I think not. My opinion is that a few floods would take it out, and that in the course of four or five years the water would be free from it; but I confess I should greatly prefer a scheme which would enable water to be brought to Sydney by gravitation.

G. A.
Mansfield,
Esq.
5 Nov., 1867.

562. Do you know anything of the country towards the head of the Woronora Creek? No.

563. You do not know whether the elevation is such as to render it practicable to bring the water from there by gravitation? No.

SATURDAY, 16 NOVEMBER, 1867.

Present:—

MR. MORIARTY,		MR. GRUNDY,
MR. ADAMS,		MR. WOORE.

PROFESSOR SMITH, M.D., (PRESIDENT), IN THE CHAIR.

James Murphy, Esq., called in and examined:—

564. *President.*] I understand, Mr. Murphy, that you have been Mayor of Sydney? Yes, J. Murphy, I was Mayor in the year 1860. Esq.

565. And for a considerable time you have been an Alderman? Yes, I have been an Alderman for several years. I was one of the first elected under the Act which legalized the present Corporation of the city. 16 Nov., 1867.

566. From your connection with the Municipal Council, I suppose you must have given a good deal of attention to the subject of the water supply to the city of Sydney? I have given some attention to that subject.

567. Do you think the present source of supply sufficient for Sydney? When the dams now being constructed are completed, I think the supply will be amply sufficient for some years to come.

568. Have you examined carefully the construction of those dams? Yes, but I do not pretend to be a judge in the matter. I have been to see them on several occasions. I do not think they have been carried out properly—I do not think they have been carried out according to the specification.

569. Do you think is the principle good? Yes, I think it is.

570. Do you think the dams can be made retentive on such a soil? We do not require them to be retentive altogether. We shall require the water to filter through the bed of the creek to supply the reservoir.

571. But is it not expected that these dams will preserve the excess of water in a wet season to make up the deficiency in a dry season? That is the purpose for which we intended them, and that is what we believe they will do.

572. But if they are not watertight, I imagine that they could not remain full for (say) three or four months? The supply will be equal to the leakage. There will be a continual supply, which will be, perhaps, even more than equal to the leakage.

573. Do you think that, even in the driest seasons, we may expect that there will be a sufficient current in the stream to supply the leakage in the dams? Yes.

574. Supposing the dams are sufficiently retentive, will they be sufficiently capacious to equalize the supply in wet and dry seasons? Yes, I think they will.

575. Do you think the present Waterworks are fitted for the supply of a much larger number of people than are at present supplied from them? Oh, yes! I think they could supply almost any number.

576. Could you give us an approximation as to how many more thousand people could be supplied by the present arrangement? No, I would not pretend to do that.

577. You see this is a question of the future as well as of the present, and we must calculate the probable increase in number that it will be necessary to provide for? I think the machinery and the supply will be sufficient to accommodate double the number that are at present supplied, providing the dams are properly constructed, and the water is stored which falls during rainy seasons.

578. Do you think it would be advisable to supplement these dams by watertight reservoirs in and about Sydney, of greater size than the present? I should think it would be necessary to do so, in order that there might be a provision in case of accident, such as a pipe bursting or anything of that kind, or an accident to the machinery.

579. Do you think, then, that the Botany supply is so abundant and trustworthy that it would not be worth while going to any other source? Not for some years to come; I should say not for twenty-five years. I risked an opinion, some time ago, that it would not be necessary to go elsewhere for water for fifty years to come. I have been out there during some very dry seasons, and I always found a very large stream of water continually running. When I was there, nine or ten days ago, there was a great quantity of water running away, and yet the engines were in full play.

580. What is the driest season you have known? I cannot say; for it is only during the last few years that we have thought anything of the water question, because previously we had an abundant supply. Until the last few years we were supplied from the Lachlan, and we did not turn our attention to Botany at all. I have no recollection of a drier season than we had last year, since my attention has been directed to the water question.

581.

755. Could you do it generally? No; perhaps it would be twenty years before you could approach it again. I have seen it so two or three times. G. Hill, Esq.
756. Do you consider that the drought of 1838 and 1839 was greater than any you remember before or since? I think I saw as great droughts before that time. I have seen the country in an awful state on several occasions; but as to the dates I cannot recollect them. 20 Nov., 1867.
757. Do you remember 1814? No, I cannot recollect the dates. I have seen more than one great drought. During the great drought of which you spoke, I was punished severely on the Murrumbidgee. I have seen the Murrumbidgee at my station at Yanko, where the steamers now run past, so dry that I could walk over without shoes from stone to stone.
758. Do you recollect a great drought since that? There has been since no drought like it.
759. *President.*] Have you ever known the Lachlan stream to be dry? Never.
760. And in the driest time you speak of, do you remember the condition of the stream further down? The further down, the greater the stream.
761. But did that stream cease to run in the driest time you remember? Never. I am speaking now of the stream from the Randwick Road down to the water of Botany Bay. The stream at the gut I spoke of was running at the time I crossed, but the ground had narrowed itself to a small compass so that the horse could step over it.
762. *Mr. Moriarty.*] With regard to the creek from which you say a large quantity of water might be derived (that which takes its rise from the back of Baptist's Gardens) do you remember that, two years ago, the woolwashing establishment stopped for want of water? That, no doubt, may have been the case. I consider that a woolwashing establishment takes more water than the city. If you examine the operations of a woolwashing establishment, you will see a stream of water running as thick as three men's bodies. That running for twenty-four hours will consume an enormous quantity of water.
763. *President.*] Do you know the swampy ground to the east of the Botany stream, lying out on the Church and School Estate? Yes, well.
764. Do you think could a material supply be got from that quarter? I do not think it could be depended on.
765. Does it dry up rapidly? Yes, very; and I think it all filters into this stream. There is a dividing range. One portion of the water goes to the coast, and the other portion goes the other way. One portion empties itself into a creek below Masters' house, and the other into the Lachlan.
766. There are several small streams which drain into Botany Bay, between the engine-house and Bunnerong? I do not think any portion goes into the Lachlan; I think they all empty themselves into Botany Bay.
767. But you do not think they could be depended on for any material addition? I should not like to depend upon them myself, although a good deal of water might be got from them.
768. You would look more to the Waterloo dams? I have no doubt myself (although I may be wrong) about the supply which might be obtained from the Lachlan stream, providing the dams were made available. Retaining the water is the main thing.
769. Do you think that dams constructed on sandy soil can be made sufficiently retentive of water? I think so, judging from the two woolwashing dams erected on the Botany Road.
770. And you think that, even in a dry season, there would be more coming in than would leak out? A great deal more. The leakage is of no importance.
771. *Mr. Moriarty.*] Do you think that the present charge for water is a reasonable one, or that it is too high? I think that if it were properly levied, and confined to proper rooms, it would not be too high.

SATURDAY, 23 NOVEMBER, 1867.

Present:—

MR. MORIARTY,		MR. GRUNDY,
MR. ADAMS,		MR. WOORE.

PROFESSOR SMITH, M.D., (PRESIDENT) IN THE CHAIR.

William Speer, Esquire, called in and examined:—

772. *President.*] How long have you been connected with the Municipal Council of the City of Sydney, Mr. Speer? About eight years. W. Speer, Esq.
773. And during that time you were Mayor? I was Mayor in 1864, for one year.
774. Have you given much attention to the water supply of the City? Yes; I have given a good deal of attention to that subject. 23 Nov., 1867.
775. From your knowledge of the present source of supply, do you think it can be depended on to meet the requirements of Sydney? Previous to the dams now being erected I do not think it could have been depended on. During the year I was Mayor the water was very low in the dam at the engine-house. When the engine was in motion for about two hours it lowered the water so considerably that we were pumping in the mud. The same thing occurred last year, and I believe also in 1865.
776. On those occasions the stream did not deliver so much water as the engine could pump up? Exactly; and you could see a visible alteration in the dam at Botany, which I suppose covers three or four acres.
777. And on those occasions was the supply of water to Sydney insufficient? Yes, it was insufficient. Thus it was that the water was cut off from the gardens about the town. Occasionally

In addition to what I have read, I may state that, since Atkinson's establishment was broken up, the people, in taking away the material, used the track on the opposite side. Others saw the track in use, and made a short cut of it to Randwick Hills. In consequence of this, the sand on the opposite side is broken up very much. A good deal of it has gone into the stream, and within the last twelve months it has spread over not less than seven acres of land. But there is in the line of the stream still the swamp underneath. I was nearly bogged the other day. The effect of this sand being there will be, that the rain will run off over the hardened surface, and go at once into the sea.

T. Buckland,
Esq.
27 Nov., 1867.

887. Then, do you think, if the various precautions you have described were taken, that the Botany Swamps would furnish a sufficient supply to Sydney? It is a very hard thing for an unscientific person to give an answer to such a question, except upon data accumulated by scientific men. But speaking from my general knowledge of the rain I have seen fall and run away from that place, I believe there is sufficient to supply a city with half as many more inhabitants as we possess. But we must very speedily take into consideration the proposition of supplying all the suburbs, and those suburbs will soon contain as many people as the city now contains. I think we may fairly calculate that, in the next thirty years, there will be 300,000 people in Sydney and the suburbs. Then comes the question whether we shall be able to supply them. With the present capacity for consuming water, I believe, we can continue to supply Sydney for fifty years.

888. Do you think that those dams on the stream can be made thoroughly retentive of water? I think they can be made sufficiently retentive, seeing that they have a stream below to catch the percolation. We have found that a common sand-dam, if you give it a pretty good base, and throw plenty of clay upon the up-stream facing, will be sufficiently retentive to stop the bulk of water. We find that is not sufficient to stop the water altogether, unless we "centre" it, that is, cut out the centre and puddle it with clay. This is not very expensive. After you have stopped the water with a base of sand, with a layer in front of clay, and bog earth and rushes, you can go down to any depth you like along the centre of the dam, and put in a clay centre that will stop the water sufficiently well for all practical purposes. In some places it would be difficult to find the bottom.

889. Do you think that, even in the driest seasons, the running stream would be equal to the percolation? I think it would be more than equal.

890. Even in the driest season to be expected? Yes.

891. In your opinion, I suppose, it would be necessary to preserve the surplus of a wet season to supply the deficiency of a dry one? Yes; because the water would spread over such a wide surface, that the evaporation would be enormous through a long succession of drought. In the year 1839 we walked over some of our deepest swamps on the Waterloo Estate, and they have never from that date, where the population is settled, recovered their retaining qualities. Of course we have not encouraged them to do so, because we wished to dry them up.

892. Do you remember the state of the supply from the tunnel in 1839? No, I did not notice that much.

893. Is it not the case that the stream, in a great part of its course, flows through private property? Yes.

894. And is that property not liable to be built upon? Yes, very liable. I am only waiting until Waterloo is populated sufficiently, and then I will commence on the Lachlan.

895. If that land is built on extensively, would there not be serious risk of the water being contaminated? It is sure to be contaminated, and that is the reason of this proposition to reserve.

896. Then a good deal of the land would have to be resumed, or bought back? Yes; I have marked on this map (*produced*) the line I propose to fence and the land I think should be resumed.

897. Does the line you have marked include much private property? Yes, it includes a great deal.

898. Then the resumption of that property would be a serious item of expense? Yes, it would.

899. But in your opinion, that property ought to be resumed? I think it should.

900. Could you give us any rough estimate of the approximate value of the property which, in your opinion, ought to be resumed? I shall be able to do so in a few days.

901. Will you be kind enough to give us a memorandum afterwards? I will. I am going out to value it in a day or two.

902. Do you think that any of the swamps to the eastward of the Botany stream could be drained into it? No, not further than the lines I speak of. Those diverging to the east a little can be brought in; but after that, the fall is to the Veteran Swamps and Bunnerong. There is a stony ridge where the Government cut out a little stone for the Bunnerong Road; that is almost the turning point of the two waters, one flows out to the Round Swamps and the Randwick Hills, and the other to Bunnerong and the Veteran Swamps. I do not see how it could be brought in, unless it were down towards Botany, and that of course would be too near the sea.

903. How would you propose to preserve the excess of water that comes through the tunnel—do you think it ought to be preserved in large reservoirs in Sydney? I think that when they have a large supply of water, they might very judiciously discharge some of it into the upper reservoirs above Busby's bore; but I understand that that would be rather difficult to do.

904. Do you think a retentive dam could be made below the tunnel—between it and the Racecourse—so as to dam back the excess of water? I think it could.

905. And you think that then it ought to be raised to a reservoir on a high level in Sydney?

932. Then, the success of that project depends upon the dams holding water above the surface in sufficient quantity to tide over a dry season? It depends upon the dams being sufficiently strong to bear the pressure of water in wet seasons; otherwise, the whole of the water will go into the sea as before.

T. Buckland,
Esq.

27 Nov., 1867.

933. Do you think the only danger is that of the dams being unable to resist the pressure? I am not afraid of anything else.

934. Do you not think any serious difficulty is to be apprehended from a leakage under the sand? I have had a good deal to do with dams, and we have generally got rid of a difficulty of that kind by shovelling over the up-stream side the dust of clay. The weight of the stream keeps driving the clay among the sand and bog-earth until at last they form a cement, which stops the percolation; but to stop it altogether, I have never found any other way effectual except centring.

935. The only water you can expect to retain in those swamps is in the area covered with water? Yes; many of them have 10 or 12 feet of bog-earth, and wherever that is filled with herbage you will find little cells of water.

936. But do you not think that, when the water is dammed back 7 or 8 feet, it will be apt to work round the slopes of the hills underneath the bog?* That theory never struck me before. The question with me was, whether the water would not percolate through the flats beyond the edges of the water dammed up. If there should be white clay, like that found at the Upper Waterloo Dam and Maroubra, it would stop the percolation I speak of.

937. And if the clay is not there, the percolation will not be stopped? I should think not. There are other places where there is sandstone. I know one place where there is sandstone, and I have given persons encouragement to find another, if they can. I know there is white clay in some places.

938. *President.*] How deep have you had to go in any case to get to a hard impervious stratum? In no case, where we have sunk, have we gone down to the hard stuff; we have trusted to the weight we could put upon it, and to the centring with clay.

939. Then how deep have you gone with that clay core? Where we have had a dam holding about 4 feet of water, we would perhaps go down to the level of the bottom of the dam, and not seek to go lower.

940. But you did not make your dam retentive in that way? No, not quite. I think it was four or five years before we got the upper dam at Waterloo quite tight.

941. *Mr. Moriarty.*] But that was made with a large body of clay, was it not? It was made first with sand, and then in the way I speak of. They covered the surface of the sand with clay. When it burst away, we had a lot of navvies who came out from Lancashire, and they made the centring good, and covered the dam with clay.

942. *President.*] Looking at the whole question, do you think it would be better to perfect the present supply, or to go to some distant point for a new supply? I think the city is already saddled with a debt which would render it very imprudent for them to go into an undertaking of such magnitude as I understand it would be to fetch the water from some other sources of supply. I am told that it would be a question of something like a million of money, to supply the city from any one of those other sources. I think it would be well for the present generation to do that which will supply the present generation and the one which will immediately succeed it, and leave it to the great population we trust will follow us here in years to come, to enter upon an undertaking of the magnitude which I understand is involved in the project to which I have referred.

943. But even for present needs, I think you advise that all the private property within the watershed should be resumed? Yes.

944. And that would cause a considerable outlay? Yes.

945. On the other hand, if we were to go to a new source of supply, a quantity of land now in the hands of the Government could be then sold? Yes.

946. You do not think the proceeds of this land will balance the great additional expenditure which will be rendered necessary in going to a new source of supply? Not if the expense is anything like that which I have heard indicated.

947. *Mr. Moriarty.*] You mean if the expense is anything like a million? I have heard it said that it will take a million of money to supply this city, by hydraulic pressure, from some of the sources which have been named.

948. Upon what number of inhabitants have you made your estimate? I suppose the present inhabitants to be about 100,000 for the city and suburbs.

949. But the suburbs are not supplied? I suppose we are supplying not more than 80,000 or 90,000.

950. *President.*] The number supplied is about 70,000? I estimate that 50 per cent. upon our present supply may be produced by carrying out the plans now in progress.

951. *Mr. Moriarty.*] That would be sufficient to supply the present inhabitants and the suburbs, which are nearly as much more? Yes.

952.

* NOTE (on revision):—Mr. Moriarty drew a section of the supposed strata of the swamps, thus—

and asked, if the water was dammed up to AB, would it not work down to the quicksand and escape.

do you know? I have always seen it full of water. It has many falls, from which it derives its name. The Rev.
W. B. Clarke.

1040. Is the water good? It is beautiful water.

1041. Can you give us some information about the general character of the Cordeaux? The Cordeaux River rises a long way further south; its sources are on the range at the back of Mount Kembla, which runs on to Keera. The head there has several branches; there is one branch with several feeders a little to the southward of Kembla; then there is a branch that comes in straight from the range; and there are several others. I can give you all those points. The heights vary from 1,163 feet to 1,247 feet, 1,600 feet, and 1,680 feet. There is a creek called Cordeaux Creek, whose head is 1,400 feet above the sea.

3 Dec., 1867.

1042. Is the character of the country the same as that which you have already described? Yes, generally sandstone and swamps. The Cordeaux rises in the same part of the dividing range as American Creek.

1043. Where does American Creek go? It goes down to the coast. The ridge there is about 1,252 feet high. Its elevation increases to the southward and a little to the northward, so that the highest point of all where the creek comes in is about 1,322 feet. To show that this is not a bad level, I may say that Mr. Shone made it 1,321·47.

1044. Do you happen to know the level of the junction of the Cordeaux and Nepean? Yes; 428 feet.

1045. Can you tell us the level of the junction of the Bargo and the Nepean? No; for this simple reason,—I wasted a whole day in trying to get to it, and could not.

1046. Do you think there is much fall between the junction of the Cordeaux and the junction of the Bargo? The level of the Bargo, where it crosses the main road, is about 780 feet. Myrtle Creek, which enters the Nepean less than a mile below the Bargo, is a mile above its junction, about 630 feet above the sea; and the Cordeaux junction is about 428 feet at the Pheasant's Nest; so that the difference is considerable, especially as the Nepean, further on, at the junction of the Cataract, is probably about 215 feet.

1047. *Mr. Woore.*] Do you recollect the crossing of the road from Lupton's down through East Bargo? I know the place; I have been part of the way. But the Bargo River rises on the western side of Lupton's.

1048. *President.*] The junction of the Bargo and the Nepean is one of the places suggested to us as a probable source of supply? I have been close to it. There is a good deal of water. It is a tremendously rocky place, with cliffs.

1049. A deep, narrow gorge, is it? Yes; it is a steep, deep place. I went from Myrtle Creek with a view of going to that very point, but we did not find our way to it. I got out on the top of a stony ridge from which I could see it, but I did not get to it. I do not think you could do anything with a place like that.

1050. What is the nature of the Bargo? The Bargo River comes down through sandstone, but there is a good deal of shale in it; all about Lupton's there is shale, and right across to the railway. The great mass of the Bargo water comes down through sandstone, and I should think it is very pure.

1051. Is it a permanent stream? There are large pools of water, but in places it is very shallow and confined, as in all our rivers.

1052. There are not many swamps in it, I think? There are swamps, but they are on high ground.

1053. *President.*] Have you visited the Couridjah Lagoons? I have seen them, of course, but I have never examined them.

1054. Do you think much country drains into these lagoons? Not very much, I should think. You follow one ridge, and the railway is close upon another. It is a striking place; but the question is, whether the lagoons are at a sufficient height for your purpose. I think I could give you the height of them.

1055. We will now pass on to the Warragamba, which is another suggested source of supply. Do you know the level of the mouth of the Warragamba? I think it is somewhat higher than the water at Penrith, the bed of which latter is under 60 feet, at all events.

1056. Have you gone up the gorge of the Warragamba any distance? Yes, as far as I could go.

1057. How far did you go? Three or four, or perhaps five miles. You find the rocks there have fallen into, and block up the river. You can get out of the boat and walk over the blocks. I know that beyond there are large reaches of water.

1058. What is the character of the valley beyond the head of the navigation? It is one great gorge, which runs out from the Wollondilly, where it is joined by Cox's River, and has in it an open place where there are many acres of good feeding ground. It then passes into a gorge again, and runs in places as straight as you can draw a line.

1059. How far does this rocky gorge extend from the mouth upwards—does it go to Burragorang? If you could get a boat over the rocks, you could probably go to the junction of the Cox.

1060. Can you tell us the level of the junction of the Cox and the Warragamba? I cannot tell you to within a few feet. It is under 250 feet.

1061. What is the height of the junction of Nattai Creek and the Wollondilly, in Burragorang? I should think it is not much under 300 feet, if at all. My observations make it more.

1062. Have you ever estimated the drainage area of the Warragamba? No; but Sir Thomas Mitchell marked the area of the Hawkesbury basin on one of his maps, and it is included in that.

1063. Does the Cox supply a large quantity of water to the Warragamba? It must do so.

1064. Do you know the valley of the Grose? I do not know the whole of it; I know some parts of it.

1065.

to form a creek? There must be a point below, where you would have to form dams. It is a question whether it would not be desirable to make a survey of all the creeks. The Rev.
W. B. Clarke.

1088. Acre for acre, do you not think that country, on an average, receives more water than almost any other part of New South Wales, considering its elevation and its proximity to the coast? No doubt it must receive an immense quantity of water, because it is like a vertical wall intercepting the clouds from the south-east, east, and north-east. 3 Dec., 1867.

1089. Have you formed any idea of the proper quantity of water per head which a population like this ought to receive? I have not turned my attention to it; but, long before you began your work at Parramatta, the question was worked out. Now that you are looking for water, I should like you to avoid shales. The water on the North Shore lies on the top of sandstone, but there are beds of shale in hollow places. I am living on one of these beds of shale. We have gone down, in making a well, 30 feet through these shales, and have come to water. We had perhaps two or three hundred gallons in two or three days, but it was so bad in its taste and smell that it was utterly useless. It is just the same in Campbelltown and Liverpool—you cannot drink the water.

1090. But might not a river flow through a district containing shale, and not be much contaminated? That depends much upon whether there are salt and iron in it. Unfortunately, the shale on the North Shore is full of sulphide of iron. The water in such cases is covered with ferruginous scum all over the surface. With the microscope you can see the iron lying in it. It is the same with all those shales throughout the whole of the county of Cumberland. It is so at Parramatta and at Toongabbee—much of the water is perfectly salt.

1091. And there is no shale in the district you indicated, about the Cataract and the Woronora? I have not seen any at the spots I have spoken of. There is shale higher up, just as at the tunnel at Gibraltar, and above the Pheasant's Nest. That ends about Appin. Just when you descend King's Fall, you pass off the shales. The shales continue across the whole country, until you come to the escarpment of the Blue Mountains. You find blue shale at the bottom, and yellow shale above, and calcareous grit impregnated with saline matter. You cannot get good water in such a country.

1092. One witness has told us that the Woronora Creek has a saline taste in dry weather—Do you think that is likely? I have no doubt there are patches of shale along the lower part of the Woronora. The Bottle Forest Road runs partly through a series of hardish shale, with ironstone in places on the surface. Wherever you find that, you may depend upon it that there is some of this saline stuff in it; but, as Mr. Moriarty suggested, to a certain point below the heads of the rivers, there would be perfectly pure water.

1093. The water should be cut off before it comes to the shales? Yes. Supposing you had the means of getting water from the Nepean, it must be remembered that in that river the water is not all pure. It is pure in the sandstone part of it; but in some parts of it, as Professor Smith has already proved, there is a great quantity of magnesia. A part of the Warragamba water passes through a series of old rocks, granites, porphyries, and coal measures, and finally, about the junction, a portion of shale. The shales go up, at the back of the sandstone gorge, to Penrith. They extend from the railway station in Sydney, right across the country, with some interruptions.

1094. From the nature of the country drained by the Wollondilly, do you think the water would be of sufficient purity to furnish a supply to Sydney? Of course you must take it with some little exceptions. I think it might be. At any rate, those parts of it that are drained out of this sandstone country would be pure; but we know that, upon the top of the ridge which supplies some of these feeders of Burragorang, you will have shale. The Oaks district has much shale. The Werriberri, which rises there, runs into the Warragamba, where it becomes inaccessible. The top of the ridge is all shale for many miles. As soon as you are over it, you get into these sandstone ravines again. You go abruptly off the sandstone, at the corner of Inglis's fence, and on to the shale which continues to Sydney.

1095. Supposing it were possible to lead the water from the Warragamba to Sydney by means of an open canal, do you think the shale of which the country is formed would have any effect on the water passing through it? Of course it would.

1096. Do you think it would so affect it as to spoil it? Yes. At Castle Hill, just on the other side of Parramatta, you have these same shales (I am speaking now of the blue shales at the bottom) resting on the sandstone. When there has been much evaporation, after a heavy rain, I have seen the ground where the shale is, at Castle Hill, white with salt—it has been so thick that you could scrape it off. I believe it would be precisely the same anywhere else where the shale is exposed to the influence of the sun, under similar circumstances.

1097. *President.*] Are you aware whether there is any quantity of salt on the Cataract River near Nepean Towers? I have seen several places where there is salt, but I do not remember the distinct point spoken of.

1098. Does the salt originate there from shale also? No, I think it forms in the sandstone. You will find salt at the head of the Bundanoon Creek, and in many places there are stalactites and salt. You will find cavities in the sandstone where salt is deposited.

1099. *Mr. Grundy.*] If the water were brought from the Warragamba by an open cutting, what would be the effect on the water? I think it would be deteriorated. It is a known fact now that, in the interior, when they dig wells they come to salt water, and yet often find pure water below it, and they are obliged to have a portion of the soil carried away.

1100. *President.*] Would not the water of a running canal soon wash the soil sufficiently to free it from the salt? But it would always be liable to crumble and disintegrate.

932. Then, the success of that project depends upon the dams holding water above the surface in sufficient quantity to tide over a dry season? It depends upon the dams being sufficiently strong to bear the pressure of water in wet seasons; otherwise, the whole of the water will go into the sea as before.

T. Buckland,
Esq.

27 Nov., 1867.

933. Do you think the only danger is that of the dams being unable to resist the pressure? I am not afraid of anything else.

934. Do you not think any serious difficulty is to be apprehended from a leakage under the sand? I have had a good deal to do with dams, and we have generally got rid of a difficulty of that kind by shovelling over the up-stream side the dust of clay. The weight of the stream keeps driving the clay among the sand and bog-earth until at last they form a cement, which stops the percolation; but to stop it altogether, I have never found any other way effectual except centring.

935. The only water you can expect to retain in those swamps is in the area covered with water? Yes; many of them have 10 or 12 feet of bog-earth, and wherever that is filled with herbage you will find little cells of water.

936. But do you not think that, when the water is dammed back 7 or 8 feet, it will be apt to work round the slopes of the hills underneath the bog?* That theory never struck me before. The question with me was, whether the water would not percolate through the flats beyond the edges of the water dammed up. If there should be white clay, like that found at the Upper Waterloo Dam and Maroubra, it would stop the percolation I speak of.

937. And if the clay is not there, the percolation will not be stopped? I should think not. There are other places where there is sandstone. I know one place where there is sandstone, and I have given persons encouragement to find another, if they can. I know there is white clay in some places.

938. *President.*] How deep have you had to go in any case to get to a hard impervious stratum? In no case, where we have sunk, have we gone down to the hard stuff; we have trusted to the weight we could put upon it, and to the centring with clay.

939. Then how deep have you gone with that clay core? Where we have had a dam holding about 4 feet of water, we would perhaps go down to the level of the bottom of the dam, and not seek to go lower.

940. But you did not make your dam retentive in that way? No, not quite. I think it was four or five years before we got the upper dam at Waterloo quite tight.

941. *Mr. Moriarty.*] But that was made with a large body of clay, was it not? It was made first with sand, and then in the way I speak of. They covered the surface of the sand with clay. When it burst away, we had a lot of navvies who came out from Lancashire, and they made the centring good, and covered the dam with clay.

942. *President.*] Looking at the whole question, do you think it would be better to perfect the present supply, or to go to some distant point for a new supply? I think the city is already saddled with a debt which would render it very imprudent for them to go into an undertaking of such magnitude as I understand it would be to fetch the water from some other sources of supply. I am told that it would be a question of something like a million of money, to supply the city from any one of those other sources. I think it would be well for the present generation to do that which will supply the present generation and the one which will immediately succeed it, and leave it to the great population we trust will follow us here in years to come, to enter upon an undertaking of the magnitude which I understand is involved in the project to which I have referred.

943. But even for present needs, I think you advise that all the private property within the watershed should be resumed? Yes.

944. And that would cause a considerable outlay? Yes.

945. On the other hand, if we were to go to a new source of supply, a quantity of land now in the hands of the Government could be then sold? Yes.

946. You do not think the proceeds of this land will balance the great additional expenditure which will be rendered necessary in going to a new source of supply? Not if the expense is anything like that which I have heard indicated.

947. *Mr. Moriarty.*] You mean if the expense is anything like a million? I have heard it said that it will take a million of money to supply this city, by hydraulic pressure, from some of the sources which have been named.

948. Upon what number of inhabitants have you made your estimate? I suppose the present inhabitants to be about 100,000 for the city and suburbs.

949. But the suburbs are not supplied? I suppose we are supplying not more than 80,000 or 90,000.

950. *President.*] The number supplied is about 70,000? I estimate that 50 per cent. upon our present supply may be produced by carrying out the plans now in progress.

951. *Mr. Moriarty.*] That would be sufficient to supply the present inhabitants and the suburbs, which are nearly as much more? Yes.

952.

* NOTE (on revision):—Mr. Moriarty drew a section of the supposed strata of the swamps, thus—

and asked, if the water was dammed up to AB, would it not work down to the quicksand and escape.

T. Buckland, Esq. 952. There are about 70,000 people in the city and 30,000 in the suburbs, so that if the present works are carried out successfully, you will have enough water to supply the present city and suburbs? I think the present supply may be increased and stored to the extent of a supply equal to one-half as much more as is now given.

27 Nov., 1867. 953. But that will depend upon the quantity of water stored by these dams? And in the swamps.

954. By the dams and in the swamps? Yes. I do not propose to rely on the water you have got stored in those dams in open ponds, but on the swamps being kept full of water. That is why I propose that the water should be intercepted. Their retentive property has been injured by cutting drains. The men engaged in woolwashing will never cut a drain if they can help it. They will not touch the ooze, for they find that the moment you cut a drain you lessen the supply. I saw, the other day, that a number of "fishbone" or diagonal drains (as they call them) had been cut. This was the worst thing that could have been done to injure the water supply.

955. They allow the flood water to discharge immediately? Whenever there comes a rain, the water runs at once into the stream.

956. Do you think the dams which have been constructed are made on a good principle? I think the principle is good.

957. As to whether they are efficient, that will be a matter of experience? And of detail too. We never expect to get a dam very tight at first—we have always a number of little errors to make good.

TUESDAY, 3 DECEMBER, 1867.

Present:—

MR. MORIARTY,
MR. ADAMS,

MR. GRUNDY,
MR. WOORE.

PROFESSOR SMITH, M.D., (PRESIDENT), IN THE CHAIR.

John Lucas, Esq., M.L.A., called in and examined:—

J. Lucas,
Esq., M.L.A.

3 Dec., 1867.

958. *President.*] Mr. Lucas, we should like to hear, first of all, your opinion in regard to the capability of the Botany Swamps as a source of water supply—Do you think they are to be trusted for a permanent supply of water to Sydney? I do not. I think they are fast filling up, from the drifting of the sand from the neighbouring hills. I do not think the supply from the Botany Swamps will be sufficient to supply Sydney five years hence.

959. Have you known the swamps very long? Yes, I may say that I have known them for thirty-five years.

960. And your experience leads you to the conclusion that they are filling up? Yes, in consequence of the drifting of the sand from the neighbouring hills, and also from the growth and accumulation of decomposed vegetable matter.

961. Did you know the Botany Swamps during the great drought of 1838? Yes; in fact, I have been passing over the Botany Swamps frequently for the last thirty-five years.

962. Have you any remembrance of the condition of the swamps at the time of the drought? No, I cannot say distinctly in what condition they were then; but I am convinced of this,—that the supply of water from the Botany Swamps is not nearly so plentiful now as it was five or six years ago. I think that every year the supply is contracting considerably. I was out there the other day, on the invitation of the Mayor. Mr. Hume recommended to one or two of the Aldermen that I should be asked to go out and look at the dams. I have some knowledge of the construction of dams, and I went out. From my observation of the swamps on that occasion, I still concluded that they were fast drying up; and I do not think the dams they have made there will have the effect of preserving much water.

963. You think the dams will not be retentive? I do. I believe they will not be retentive.

964. Do you think it would be possible to make retentive dams upon such a soil as you have there? No, I think not. In my opinion, the water would percolate underneath the dams. I think the water would find its way below the level on which it would be possible to form dams to retain the water. There would be an underflow which would empty the dams very soon. You may judge from the nature of the soil 30 or 35 feet down. I think a great quantity of water also finds its way over that level and even under the dam at the Waterworks.*

965. And escapes into the sea? Yes; there is an under-current.

966. Another method has been suggested by which the surplus water may be preserved; that is, to construct large reservoirs in or about Sydney—Do you think it might be preferable to do that, rather than to go to a distance to a new source of supply? I do not think the watershed about Sydney would be sufficient to supply the city of Sydney with water ten or fifteen years hence, and particularly if the population increases as it has done since

* As a proof of the under-current and escape of water into Botany Bay: About 150 yards from the Waterworks, and at high water mark (indeed, very high tides run into it), there is a well of pure fresh water, which rises and falls with the ebb and flow of the tide. This well must be supplied from the Botany Swamps, and as the tide rises, it backs up the fresh water to its own level; and as the tide recedes, the fresh water percolates through the sand between the well and the bay. There is another well near Mr. Lord's residence over which the tide exercises the same influence. There is fully a mile along the beach of the same character of soil, about the middle of which our Waterworks are. There cannot be a doubt that a great quantity of water finds its way through the sand, into the sea; and as the water is stored up by the dams, there will be a greater pressure and consequently a greater escape.

since 1850. No matter what the expense might be to the Government or to the City Council, I believe, after all, it will be necessary to go to some portion of the Nepean for a supply. That was my opinion when the former Commission was appointed. I was acquainted with Mr. Robey, and had several conversations with him on the subject. Even at that time I thought it was a mistake to bring the water from Botany, and that it would be better to go to the Nepean.

J. Lucas,
Esq., M.L.A.
3 Dec., 1867.

967. That was before the present works were commenced? Yes.

968. Then have you formed an opinion as to what the best source of supply would be? Yes, I have for some time formed an opinion that the best source would be the head of the Nepean or Cowpasture River, some few miles above the present site of the Menangle Bridge. I think there you would get a very large supply—sufficient to drown Sydney, I may say—and which might be brought into the city by its own gravitation. I find that, at the Penrith Bridge, the rails are 94 feet above the level of the sea. The water of the Nepean, at Penrith, stands 50 feet below the rails on the bridge, so that the water of the Nepean River would only be 44 feet above the level of the sea. I have also been several miles up the Wollondilly River, and I find there very little difference in the level for several miles up.

969. The bed of the river rises very slowly? Yes, for some miles up; in fact, I have been some three or four miles in a boat.

970. Beyond the head of the navigation? Yes.

971. And the rise is very gradual? Yes; for 4 miles above the basin I do not think the rise is 4 feet.

972. And you would therefore infer that the low level precludes that as a source of supply? Yes, unless the water be pumped up, the same as the present supply, which I think very expensive. It would be much better and cheaper if you could get a supply which will come to Sydney by its own gravitation. I find that the Menangle Bridge is 259 feet above the level of the sea, which would give a difference of 165 feet.

973. I see it stated in your memorandum that the water at Menangle is 60 feet below the rails? Yes; I do not look much to that, however, because the bed of the river gradually rises from Menangle.* A few miles off I think you would be able to get an elevation of 200 feet above the Menangle Bridge; and from what I know of the nature of the country, I am convinced that you could keep back any quantity of water there. You could get sufficient, not only for the ordinary uses of the inhabitants of the city, but also for manufactories and other purposes for which water might be required.

974. Do you think a large dam would be necessary there, or would the stream itself be sufficient? I think it desirable that there should be a dam to keep up a good supply of water under any circumstances, if you can find a good situation for its construction. In this country I have known droughts for three or four years together, and I think it most desirable that a large quantity of water should be kept back, if you can get suitable positions to make dams.

975. Have you known the Nepean in any season of great drought? I have.

976. What was the condition of the stream? I have known the Nepean without any perceptible run. Nevertheless, there has always been an under-current, particularly where the falls are. Those falls are formed by what we call "lapstones" and sand. Under these there is, no doubt, a great flow of water.

977. Where is that fall to which you allude? There is one just below the bridge; there are several between that and Richmond.

978. At the point you indicate, a little way above the Menangle Bridge, do you think the nature of the soil and subsoil is favorable to the construction of dams? I think you should go up somewhere about the junction of the Bargo and Cowpasture Rivers.

979. Is the nature of the soil there favorable to the construction of watertight dams? I think so—I think the soil is chiefly what you require. There is some clay—the best material you can possibly have to make a dam watertight; I do not think you can have better material for a dam than sand, so long as you have a block of clay in the centre.

980. Could a large dam be formed near the junction of the Bargo and Cowpasture Rivers, without flooding useful country? I have no doubt of it; and not only that, but I think also, without having to pay much compensation. I think the land about there is of a very inferior kind, but it is a very good watershed. It is one having advantages not to be found in any other part of the county of Cumberland. In my opinion, all the impurities in the water of the Nepean at Penrith are gathered after the river leaves the Menangle Bridge. I know several parts of the county of Cumberland, where there are salt-water creeks. The brackish water is made additionally impure by dead animals.

981. Have you seen the Nepean in a state of flood? Yes.

982. Does the flood bring down much sand and gravel? The water is very thick.

983. Would the material brought down in floods not be liable to fill up the dam? It would be apt to fill up a dam there; but I believe all that sand and gravel is collected in the county of Cumberland.

984. Do you know the Woronora Creek? Yes, I know it well.

985. Do you know it to its head or source? Yes; my father had a mill there.

986. What sort of a stream is it in ordinary dry weather? I have seen it very nearly dry. In fact, during the time we had the mill there, I believe there was not sufficient water to drive the machinery.

987. What is the quality of the water? Very good indeed; it comes over a sandstone country.

988. What year was that when there was not sufficient water to turn the mill? I think it was in 1828. We had to give up.

989.

* The water at Menangle is 155 feet above that at Penrith.

J. Lucas, Esq., M.L.A. 989. In what sort of country does the Woronora Creek take its origin? In a sandy barren country.

990. Are there any swamps in the vicinity? There are a few, but none to speak of. I think, if I remember right, the creek turns up in a south-westerly direction.

3 Dec., 1867.

991. Do you know if there is any place near the head of the Woronora Creek favorable to the construction of a very large dam or artificial lake? I do not. But if there were, the expense of bringing the water to Sydney would be very great. You would have to form an aqueduct to bring it over George's River, and I do not think you will get sufficient elevation to bring it in by its own gravitation. It is next to impossible to form a dam there sufficient to supply the city of Sydney.

992. Then I understand your opinion to be that the most likely spot is near the junction of the Bargo and the Nepean? I do hold that opinion.

993. *Mr. Woore.*] The place you refer to, I think, is commonly called the Pheasant's Nest? It is somewhere about there. I think that would be best, because there you could get a sufficient fall to bring the water into Sydney by its own gravitation. It is desirable to do away with machinery as much as possible in connection with the water supply, for we all know that machinery is continually breaking and getting out of order. But besides that, it is a very great expense. I do not know precisely what are the working expenses of the machinery used to supply Sydney, but I believe they amount to £5,000 or £6,000 a year. It would be desirable, of course, to get rid of that; a sum so great would pay interest on a very large amount of money.

994. By what means do you think it would be advisable to bring the water into Sydney? I think it would be well to bring the water in by pipes. I should prefer two pipes, so that if any accident occurred to one pipe the city could be supplied from the other.

995. You think it would not be possible to bring it in by an aqueduct? I do not know any part of the county of Cumberland where it would be possible to bring it in by its own gravitation by an aqueduct.

996. *Mr. Moriarty.*] You think it would not be possible to bring the water by an open canal from Menangle to Sydney? I think it would not. The formation of the country would prevent anything of that kind without going to very great expense—an expense, in fact, which would be much larger than would be required to bring the water in by pipes. No doubt the friction of the water ascending and descending would affect the flow considerably. Still, if two pipes would not bring it, I would put in three.

997. You propose to leave the Menangle at a height of about 249 feet above Sydney? It is 249 feet where the bridge is, but I think you could get an elevation of 200 feet above that even. If so, there would be no question about bringing in any quantity of water, because the force of the water would counteract the resistance caused by the friction.

998. You would preserve the water, then, by constructing dams in the river itself? Yes, or on any part of the country suitable for it. Speaking from memory, I may say that I believe there are many places there which are now dry land where large reservoirs could be supplied even better, perhaps, than in the river.

999. You think that possibly it might be better to construct the dams and the retaining reservoirs on some of the adjoining creeks or tributaries to the river than on the river itself? In every place where a dam could be constructed to feed the main reservoir, I would construct a dam.

1000. But would you have the dam on the river, or on some subsidiary creek? If there was a place near, away from the great force of the water in flood times, perhaps it would be more desirable to have the dam in one of the neighbouring beds; but, of course, that would be a matter for further consideration. Speaking from memory, I may say that I believe there are several places there where large reservoirs could be made.

1001. The principle of course, then, on which you would recommend that the supply should be established, would be this: to hold over in a wet season a supply sufficient to enable us to tide over a dry one. I would recommend that a supply should be secured sufficient to enable us to tide over several dry seasons.

1002. What length of time would you consider it necessary to have a reservoir sufficiently capacious for? If possible, I would have a reservoir of sufficient capacity to furnish a supply for seven years. I believe you will find plenty of positions where you could preserve sufficient water to supply the wants of the city for so long a period.

1003. *President.*] How much water do you think ought to be supplied per head of the population per diem, for all purposes? I think in a hot climate like this, certainly not less than 15 gallons.

1004. *Mr. Moriarty.*] Sydney at present is supplied with 40 gallons per head per day, and that is described to be insufficient? But a large portion of the present supply is taken for watering the streets and for machinery. My answer refers to the ordinary requirements of private houses and establishments. The supply of water to the Sugar Company is immense. I believe they pay £600 a year to the Corporation for water. The Mint also is supplied by the same pipe, and it uses £600 worth per annum. Excluding the watering of the streets, and the water required for machinery and manufactures, I think for private houses the quantity required would be about 15 or 20 gallons.

1005. But taking the whole of the requirements of the town into consideration, the watering of the streets, the flushing of the sewers and water-closets, and the supply required by manufactories, what quantity would you say ought to be supplied in a climate like this? It is impossible to say what will be required by manufactories; they are now only in their infant state. In a few years I think four times as much water will be required for manufacturing purposes as is now used.

1006. Then you think that in a few years 80 gallons will be required? I believe it is impossible for any person to form an idea of what will be required.

1007. But in an inquiry like this, we must base our estimate upon the probable requirements of the city? It is impossible for any person to form any idea of what will be required for manufacturing purposes in this city. I believe that ultimately manufactories will have to spread along the upper portion of George's River and the Nepean, and to be established in those inland towns which have fresh-water rivers running through them. This will be brought about partly by the supply of water, and partly in consequence of the value of land being so great in the immediate vicinity of the city; and particularly as we have railways by which the results of the different industries can be brought into the city. As I have already said, my lowest estimate of what would be required for domestic purposes would be from 15 to 20 gallons for each individual. I should not think of estimating the quantity required for manufactories at less than four times that amount.

J. Lucas,
Esq., M.L.A.
3 Dec., 1867.

1008. That would give 80 gallons per head? Yes.

1009. Would you propose to bring the water into the city by pipes? Yes.

1010. Have you made an estimate of the size of the pipes which would be necessary? No, I have not entered into any details, but I think it would be desirable not to have the pipes too large. I would sooner have more pipes.

1011. You must remember that the friction would increase in inverse ratio? I do not think it would be desirable to have pipes above 20 inches, but I certainly would have two pipes. If they were not sufficient, we might have three or four.

1012. From your knowledge of the country about the head of the Woronora, do you think it would be possible, by a series of dams such as are constructed in many of the rivers of France, to prevent flooding, and by joining the watercourses on either side, to form a series of small lakes, which in the aggregate would hold water sufficient to supply the city? It may be feasible, but I think it would cost more than bringing the water from the Nepean. Not only would it be more expensive, but I think the level would be too low, and that it would be necessary to pump the water up to supply the city.

1013. But we are told that we can get water at a height of 600 feet? If so, you would not get water out of the tributaries.

1014. Further back, we are told, it rises to 1,300 feet? Yes; but then the water goes down into Wattamalla and descends into the sea. It is impossible for you to collect the water from there, and if you go very high you can collect no water from the tributaries. You would have to pump the water from Mill Creek, Dead Man's Creek, and Willman's Creek. But I do not know anything of the elevation above Bottle Forest.

1015. Your experience of the Woronora Creek is, that the water is always good? It is always good water, but I believe there is a very small supply.

1016. *Mr. Woore.*] Supposing it were possible to make an aqueduct across the northern part of the county of Cumberland which would give a supply of water for irrigation, do you think it would improve the value of the land? There can be no doubt about that, in regard to any property within such a distance that advantage could be taken of the water. It must increase the value of the land to an enormous extent, because we know very well that the whole of the county of Cumberland is dry.

1017. Could you say to what extent an unlimited supply of water would improve the value of the land? No.

1018. Do you think it would increase it in value tenfold? In some places it would, but in other places it would improve it only in a slight degree. I think it would increase the value of any land through which it passed, unless it passed through small properties in such a way as to destroy them. I believe it would increase the value at least fourfold.

1019. I am speaking of the increased value a supply of water would give to lands adjoining the aqueduct. It would not make much difference how far the land was from the aqueduct, would it, supposing they got a plentiful supply of water? Yes; if it cost one man £500 to draw water from the aqueduct, and another only £10, the value of the latter would be increased in a much greater proportion than the former.

1020. But supposing the water were delivered by gravitation, it would make no difference whether the land was near to the aqueduct or a mile or two from it? I cannot see that; I think the increase in value would depend upon the distance of the land from the aqueduct.

The Rev. W. B. Clarke called in and examined:—

1021. *President.*] Mr. Clarke, the Commissioners wish to avail themselves of your very extensive knowledge of the country, to get some information respecting the various rivers that have been suggested as possible sources of water supply. First, I would like to ask you your opinion of the Botany Swamps—whether they are to be depended on for a permanent supply of water? I have not examined the Botany Swamps in a way that would enable me to give a satisfactory answer to that question, which amounts to this,—whether the reservoir you have there will hold sufficient for the purposes required.

The Rev.
W. B. Clarke.
3 Dec., 1867.

1022. Do you think is the drainage area sufficient for the purpose of supplying such a city as Sydney? I cannot say. If there are complaints now of insufficiency of water, and the population increases to any extent (as no doubt it may), in all probability the drainage area would not be sufficiently large.

1023. Have you observed the condition of the Botany Swamps during periods of great drought? No.

1024. Then, leaving the present source of supply, another possible source that the Commissioners have had their attention directed to is the Woronora Creek—Do you know the source of that creek? I know the sources of all the creeks that run down into the same body of water in which the Woronora disembogues, but I do not know that so well as the rest of them.

The Rev. 1025. In what sort of country does the Woronora Creek take its rise? From swampy land
W. B. Clarke. over sandstone, the same as the others.

3 Dec., 1867. 1026. Is there a table-land? The range is tolerably level. There are depressions in it, but it has a sort of uniform level. On the slope to the westward there are swamps; for instance, between Appin and the top of the ridge descending to Bulli there are six large swamps.

1027. Do not you think that a stream arising from swamps is more likely to be permanent? Of course. I regard a swamp as a great sponge which holds water.

1028. Do you know if the Woronora Creek had a permanent stream during any of the great droughts? I have never seen it in great droughts. I have seen it in the month of April, when the country was tolerably green, but I have never been there in a time of drought.

1029. Amongst the many levels you have taken, have you ever taken any levels about the head of the Woronora Creek? I have levels all along the head of that land where these creeks rise. They are, however, only barometrical levels.

1030. As a supply by gravitation would be far preferable to a supply by pumping, a knowledge of the levels is a first requisite—Can you tell us any of the levels about the head of the Woronora? The general difference of level between the sources of these creeks and Sydney is about 40 feet in a mile. I can give you pretty nearly the levels of the whole of these. About six miles east of Appin you have a swamp they call Flat Rock; that is about 1,145 feet above the sea. Then there is a very high point just before the turn of the Bulli Road, which is 1,325 feet above the level of the sea. There is a creek coming in from the eastward which I think is called O'Hare's Creek. The Woronora lies more to the eastward. The head of Dahlia Creek is 1,264 feet above the level of the sea. From there you go down to what is called Tuggerai, which, in point of fact, is George's River. The crossing at King's Falls is about 744 feet above the level of the sea. Returning from this you rise to a swamp which is about the highest point on the old track. That is 1,202 feet above the level of the sea. There is one swamp further on, 1,247 feet, and another, 1,271 feet above the level of the sea.

1031. Still on the road to Bulli? Yes. There is another, 1,270 feet. Then close to the highest point, which is about 1,422 feet above the sea, there is a creek which, I think, runs into George's River, 1,313 feet above the level of the sea. There is also one 1,402 feet, and another, 1,389 feet above the sea level. Then you come to what they call London or Loddon River, which is a branch of the Cataract. I made three measurements of that, but 1,091 feet may be taken to be the level. It rises in a large swamp, 1 mile and 48 chains long, the exact height of which I do not know, but I think it must be 1,170 or 1,200 feet. In ascending from the coast between Bulgo and the Coal Cliff, you come to the first range of the sandstone ridges, at about 782 feet. There is a mass of sandstone here to the north (*indicated on the map*), about 800 feet above the level of the sea. Then you come to a creek about two miles and a third further on, and afterwards to a point 1,098 feet above the sea level. There you will find a broad arrow cut in the stone. It is the point where the road diverges. There is a creek at the head of O'Hare's Creek. In one place it is 1,145 feet, and I crossed it at another where it was 1,192 feet above the sea. O'Donohue's Rock, a point where the bushranger O'Donohue used to live, is about 1,417 feet. I cannot point it out exactly on the map, but it is a point in the bush between the top of the swamp of the Flat Rock and O'Hare's Creek. The top of the swamp is 1,223. The mean of six of these swamps is 1,282 feet. Between these and the London River and another creek there are two creeks, a river, and a swamp. The mean of the ten is 1,256 feet. We may take that as the mean of the swamps and ranges. George's River, a little below the junction with Dahlia Creek, is 272 feet, so that, taking a straight line from the head of Dahlia Creek for eleven miles, you get a fall of 87 feet per mile.

1032. Amongst these swamps, do you know of any spots favourable for the construction of any large dams or artificial lakes? These swamps discharge into deep ravines. It is not very deep at the London River, but it is exceedingly deep lower down.

1033. *Mr. Moriarty.*] That is where the table-land breaks away? The table-land is intersected by these ravines, which discharge the water collected in the swamps.

1034. *President.*] Do you think we could form a lake with a surface of two or three square miles, or several lakes collectively amounting to that? To do that, you must choose a point where the waters meet.

1035. Would you be kind enough to pass on to the Cataract River? One head of the Cataract River is about 1 mile and 72 chains from the head of George's River.

1036. Does the Cataract River rise from a swampy country? Yes, its source is very much the same as the others. Just after crossing the Waniora Hill, you come to a place called the Devil's Pinch. On the west of this is, I believe, the beginning of that branch. The mean height of the swamps and ranges of the country between the head of the Cataract and Sydney is about 1,260 feet (say 1,256, as before). The distance, in a right line, is $30\frac{1}{2}$ miles, which would give a fall of 40 feet in a mile.

1037. What is the level at the junction of the Cataract River with the Nepean? I can give you the level of the junction of the Cataract with the Wollandoola, which rises on the old road from Appin to Wollongong, a little beyond Stringy-bark Forest. The height of that is 1,060 feet close to where the road passes, and at another point 1,128 feet. The junction of the Wollandoola with the Cataract I make 423 feet; by Mr. Shone's railway level it is 419.

1038. But you have not the level at the junction of the Cataract with the Nepean? No, I have not a memorandum of it here; but it must be much lower than the level I have just given, as it probably does not exceed 215 feet.

1039. What is the general nature of the Cataract River—is it a tolerably permanent river,
do

do you know? I have always seen it full of water. It has many falls, from which it derives its name. The Rev.
W. B. Clarke.

1040. Is the water good? It is beautiful water.

1041. Can you give us some information about the general character of the Cordeaux? The Cordeaux River rises a long way further south; its sources are on the range at the back of Mount Kembla, which runs on to Keera. The head there has several branches; there is one branch with several feeders a little to the southward of Kembla; then there is a branch that comes in straight from the range; and there are several others. I can give you all those points. The heights vary from 1,163 feet to 1,247 feet, 1,600 feet, and 1,680 feet. There is a creek called Cordeaux Creek, whose head is 1,400 feet above the sea.

3 Dec., 1867.

1042. Is the character of the country the same as that which you have already described? Yes, generally sandstone and swamps. The Cordeaux rises in the same part of the dividing range as American Creek.

1043. Where does American Creek go? It goes down to the coast. The ridge there is about 1,252 feet high. Its elevation increases to the southward and a little to the northward, so that the highest point of all where the creek comes in is about 1,322 feet. To show that this is not a bad level, I may say that Mr. Shone made it 1,321·47.

1044. Do you happen to know the level of the junction of the Cordeaux and Nepean? Yes; 428 feet.

1045. Can you tell us the level of the junction of the Bargo and the Nepean? No; for this simple reason,—I wasted a whole day in trying to get to it, and could not.

1046. Do you think there is much fall between the junction of the Cordeaux and the junction of the Bargo? The level of the Bargo, where it crosses the main road, is about 780 feet. Myrtle Creek, which enters the Nepean less than a mile below the Bargo, is a mile above its junction, about 630 feet above the sea; and the Cordeaux junction is about 428 feet at the Pheasant's Nest; so that the difference is considerable, especially as the Nepean, further on, at the junction of the Cataract, is probably about 215 feet.

1047. *Mr. Woore.*] Do you recollect the crossing of the road from Lupton's down through East Bargo? I know the place; I have been part of the way. But the Bargo River rises on the western side of Lupton's.

1048. *President.*] The junction of the Bargo and the Nepean is one of the places suggested to us as a probable source of supply? I have been close to it. There is a good deal of water. It is a tremendously rocky place, with cliffs.

1049. A deep, narrow gorge, is it? Yes; it is a steep, deep place. I went from Myrtle Creek with a view of going to that very point, but we did not find our way to it. I got out on the top of a stony ridge from which I could see it, but I did not get to it. I do not think you could do anything with a place like that.

1050. What is the nature of the Bargo? The Bargo River comes down through sandstone, but there is a good deal of shale in it; all about Lupton's there is shale, and right across to the railway. The great mass of the Bargo water comes down through sandstone, and I should think it is very pure.

1051. Is it a permanent stream? There are large pools of water, but in places it is very shallow and confined, as in all our rivers.

1052. There are not many swamps in it, I think? There are swamps, but they are on high ground.

1053. *President.*] Have you visited the Couridjah Lagoons? I have seen them, of course, but I have never examined them.

1054. Do you think much country drains into these lagoons? Not very much, I should think. You follow one ridge, and the railway is close upon another. It is a striking place; but the question is, whether the lagoons are at a sufficient height for your purpose. I think I could give you the height of them.

1055. We will now pass on to the Warragamba, which is another suggested source of supply. Do you know the level of the mouth of the Warragamba? I think it is somewhat higher than the water at Penrith, the bed of which latter is under 60 feet, at all events.

1056. Have you gone up the gorge of the Warragamba any distance? Yes, as far as I could go.

1057. How far did you go? Three or four, or perhaps five miles. You find the rocks there have fallen into, and block up the river. You can get out of the boat and walk over the blocks. I know that beyond there are large reaches of water.

1058. What is the character of the valley beyond the head of the navigation? It is one great gorge, which runs out from the Wollondilly, where it is joined by Cox's River, and has in it an open place where there are many acres of good feeding ground. It then passes into a gorge again, and runs in places as straight as you can draw a line.

1059. How far does this rocky gorge extend from the mouth upwards—does it go to Burragorang? If you could get a boat over the rocks, you could probably go to the junction of the Cox.

1060. Can you tell us the level of the junction of the Cox and the Warragamba? I cannot tell you to within a few feet. It is under 250 feet.

1061. What is the height of the junction of Nattai Creek and the Wollondilly, in Burragorang? I should think it is not much under 300 feet, if at all. My observations make it more.

1062. Have you ever estimated the drainage area of the Warragamba? No; but Sir Thomas Mitchell marked the area of the Hawkesbury basin on one of his maps, and it is included in that.

1063. Does the Cox supply a large quantity of water to the Warragamba? It must do so.

1064. Do you know the valley of the Grose? I do not know the whole of it; I know some parts of it.

1065.

The Rev. W. B. Clarke. 1065. Have you ascertained any levels along the Grose? I know a level within a mile and a half of the head of it. It is about 2,840 feet.

3 Dec., 1867. 1066. Could you give a name to that point? No; it is about a mile and a half from the head. Mount Tomah overhangs it. It is not very far from where the railway overlooks what they now call "Petrolia."

1067. Do you know the junction of the Buralow Creek with the Grose? Not as measured. When there I had no instruments. I think, as a general rule, you may take the slopes of that country to be not more than 40 feet in a mile. Its source is about 900 feet above the sea.

1068. If a dam were placed across any of those rivers, such as the Warragamba or the Grose, do you not think it very likely that they would be filled up with the sand, and gravel, and other material brought down by the floods? Of course there would be an accumulation. At the mouth of the Warragamba there is such accumulation of drift. The Nattai and parts of the Wollondilly are blocked up with sand and pebbles. When I was last February on the Warragamba, the drift formed a peninsula. There was a very large accumulation of trunks of trees, and pebbles, with pieces of coal, all heaped up together a little way on this side of the mouth of the river. The Nepean and the Warragamba both bring down their supplies, and if both are flooded at the same time there is a contention between the currents. The beds of the Warragamba and the Wollondilly are filled with boulders.

1069. And as the Wollondilly drains a great amount of cultivated country, would it not in flood time be likely to bring down much fine mud? No doubt it would where it passes through country to produce it; but it passes also through a great deal of hard rock. The drift sand and pebbles, which are 30 feet deep in the Burrarorang Valley, must have been brought down by the floods.

1070. Could you indicate any points, say within forty miles of Sydney, where the country would be favourable to the construction of great dams? I should think that country at the head of the Cataract would be favourable for it, because there are some very deep ravines there.

1071. Would not that be more than forty miles away? In a right line I do not think it would be more than thirty or thirty and a half.

1072. On the whole, where do you think is the most likely spot whence to draw a permanent supply of water to Sydney by gravitation? I think the country I have pointed out—the head of the Cataract and further down to the Wallandoola—the table-land in which rise the Woronora River, the Cataract River, and Dahlia Creek.

1073. *Mr. Woore.*] I should like to ask you the nature of the swamps at the head of George's River and Woronora Creek—Are they similar to the swamps at Botany? Yes, they are similar.

1074. Are they not, then, liable to be dried up in the same way as the Botany Swamps? Yes, but there are all sorts of grasses and mosses growing there.

1075. And they would be liable to be hardened by the tramping of cattle? I should not think there would be many cattle tramping there. The swamps lie generally at the heads of the creeks, where you would find a regular sponge.

1076. *Mr. Adams.*] Are you aware which way the rock dips in the Lachlan Swamp? No; it would be difficult to tell that, because though the beds are generally horizontal, there is sometimes a dip which varies in direction. Mostly the dip is south-west or north-west. At the North Head the dip is north-west; on this side the dip is south-west. There is a very small dip till we get further south.

1077. Have you ever looked at the mouth of the Botany Swamp, where the present engine-house is erected? I saw it some time ago.

1078. Did you observe any natural bar of rocks which would stop the flow of water into the bay? No; the sandstone is very irregular there. The sandhills lie over, and act as a filter and a source of supply.

1079. *Mr. Moriarty.*] With regard to the country of which we have been speaking about—the heads of the Woronora and the Cordeaux—I understand you to say that the rivers and creeks break from the table-land into deep gorges? Yes.

1080. If we look there for a source of supply would it not be best to intercept the water above the gorges, on the table-land? That would be in the swamps.

1081. But sufficiently far off to keep clear of the gorges? You notice these ravines all through the country. The country slopes off, and all at once begins to drop.

1082. But before you get down to where the deep gorges are formed, do you think it would be possible to intercept the drainage, by constructing a series of dams wherever positions are favourable, and then opening canals, and following the natural fall of the country? Though the creeks fall rapidly, the country does not necessarily fall rapidly too.

1083. From your knowledge of the country, do you think that dams could be readily constructed near where the swamps break out? No doubt, if you had material that would resist percolation. But even then, from the nature of the rocks, the water might percolate below. It would be necessary to make a survey of the country.

1084. Do you think generally that it would be safer to intercept the water before it breaks out into the deep gorges, or afterwards? You could not intercept it before it goes there. It is only when it goes down to a certain depth that there is any collection of it, where there is a basin to receive it.

1085. Take, for instance, the London River,—the country is pretty flat about there? It is undulating.

1086. Would it not be better to intercept the water before it finds its way into the deep gorges? If you shut it off at the swamp, the question is whether it would not break out in another direction.

1087. But supposing dams were constructed at the lower end of the swamp, where it begins

to

to form a creek? There must be a point below, where you would have to form dams. It is a question whether it would not be desirable to make a survey of all the creeks. The Rev.
W. B. Clarke.

1088. Acre for acre, do you not think that country, on an average, receives more water than almost any other part of New South Wales, considering its elevation and its proximity to the coast? No doubt it must receive an immense quantity of water, because it is like a vertical wall intercepting the clouds from the south-east, east, and north-east. 3 Dec., 1867.

1089. Have you formed any idea of the proper quantity of water per head which a population like this ought to receive? I have not turned my attention to it; but, long before you began your work at Parramatta, the question was worked out. Now that you are looking for water, I should like you to avoid shales. The water on the North Shore lies on the top of sandstone, but there are beds of shale in hollow places. I am living on one of these beds of shale. We have gone down, in making a well, 30 feet through these shales, and have come to water. We had perhaps two or three hundred gallons in two or three days, but it was so bad in its taste and smell that it was utterly useless. It is just the same in Campbelltown and Liverpool—you cannot drink the water.

1090. But might not a river flow through a district containing shale, and not be much contaminated? That depends much upon whether there are salt and iron in it. Unfortunately, the shale on the North Shore is full of sulphide of iron. The water in such cases is covered with ferruginous scum all over the surface. With the microscope you can see the iron lying in it. It is the same with all those shales throughout the whole of the county of Cumberland. It is so at Parramatta and at Toongabbee—much of the water is perfectly salt.

1091. And there is no shale in the district you indicated, about the Cataract and the Woronora? I have not seen any at the spots I have spoken of. There is shale higher up, just as at the tunnel at Gibraltar, and above the Pheasant's Nest. That ends about Appin. Just when you descend King's Fall, you pass off the shales. The shales continue across the whole country, until you come to the escarpment of the Blue Mountains. You find blue shale at the bottom, and yellow shale above, and calcareous grit impregnated with saline matter. You cannot get good water in such a country.

1092. One witness has told us that the Woronora Creek has a saline taste in dry weather—Do you think that is likely? I have no doubt there are patches of shale along the lower part of the Woronora. The Bottle Forest Road runs partly through a series of hardish shale, with ironstone in places on the surface. Wherever you find that, you may depend upon it that there is some of this saline stuff in it; but, as Mr. Moriarty suggested, to a certain point below the heads of the rivers, there would be perfectly pure water.

1093. The water should be cut off before it comes to the shales? Yes. Supposing you had the means of getting water from the Nepean, it must be remembered that in that river the water is not all pure. It is pure in the sandstone part of it; but in some parts of it, as Professor Smith has already proved, there is a great quantity of magnesia. A part of the Warragamba water passes through a series of old rocks, granites, porphyries, and coal measures, and finally, about the junction, a portion of shale. The shales go up, at the back of the sandstone gorge, to Penrith. They extend from the railway station in Sydney, right across the country, with some interruptions.

1094. From the nature of the country drained by the Wollondilly, do you think the water would be of sufficient purity to furnish a supply to Sydney? Of course you must take it with some little exceptions. I think it might be. At any rate, those parts of it that are drained out of this sandstone country would be pure; but we know that, upon the top of the ridge which supplies some of these feeders of Burragorang, you will have shale. The Oaks district has much shale. The Werriberri, which rises there, runs into the Warragamba, where it becomes inaccessible. The top of the ridge is all shale for many miles. As soon as you are over it, you get into these sandstone ravines again. You go abruptly off the sandstone, at the corner of Inglis's fence, and on to the shale which continues to Sydney.

1095. Supposing it were possible to lead the water from the Warragamba to Sydney by means of an open canal, do you think the shale of which the country is formed would have any effect on the water passing through it? Of course it would.

1096. Do you think it would so affect it as to spoil it? Yes. At Castle Hill, just on the other side of Parramatta, you have these same shales (I am speaking now of the blue shales at the bottom) resting on the sandstone. When there has been much evaporation, after a heavy rain, I have seen the ground where the shale is, at Castle Hill, white with salt—it has been so thick that you could scrape it off. I believe it would be precisely the same anywhere else where the shale is exposed to the influence of the sun, under similar circumstances.

1097. *President.*] Are you aware whether there is any quantity of salt on the Cataract River near Nepean Towers? I have seen several places where there is salt, but I do not remember the distinct point spoken of.

1098. Does the salt originate there from shale also? No, I think it forms in the sandstone. You will find salt at the head of the Bundanoon Creek, and in many places there are stalactites and salt. You will find cavities in the sandstone where salt is deposited.

1099. *Mr. Grundy.*] If the water were brought from the Warragamba by an open cutting, what would be the effect on the water? I think it would be deteriorated. It is a known fact now that, in the interior, when they dig wells they come to salt water, and yet often find pure water below it, and they are obliged to have a portion of the soil carried away.

1100. *President.*] Would not the water of a running canal soon wash the soil sufficiently to free it from the salt? But it would always be liable to crumble and disintegrate.

The Rev. 1101. *Mr. Grundy.*] You said that the same effects would probably be produced on the large swamps in the Appin District, that had happened or were being brought about at Botany; but I think you said you were not intimately acquainted with the Botany Swamps, nor aware of the changes which have taken place in them? It is not a matter of which I could speak with any certainty. My impression is, that a large supply of water could be had at Botany from these swamps, if care were taken of them and they were not allowed to be drained or injured. Supposing you had a drought of two or three years' duration, who could tell what would be the amount of water required? It is not merely what people want now. I think you should take it for granted that the population will increase, and should give them at least two or three years' supply.

W. B. Clarke.
3 Dec., 1867.

1102. We are told that the Botany Swamps cover an area of ten square miles—I suppose the swamps to which you refer would be much more? Yes; the top part of that country seems to be a series of swamps. But I think a survey should be instituted, for the purpose of ascertaining precisely what are the facts.

1103. *Mr. Moriarty.*] You think the probability of getting a supply from that place so great that it would justify the expense of a survey? Yes.

1104. *President.*] Could you name a creek that flows entirely through shale, in order that we may examine the water? The Wianamatta Creek—the main branch of South Creek—flows through shale. But in the Wianamatta there are certain thick beds of grit, with a good deal of lime. These beds are at the top of the series. The blue shales we have on the North Shore lie immediately on the sandstone; but the upper beds are yellow and brown.

1105. And which of the two classes would most contaminate water? I should think that which contains the greatest quantity of iron, and the iron nodules are mostly found in the blue shales.

1106. Do you know of any place convenient to St. Leonards where a dam could be constructed to supply that Municipality with water? There are plenty of deep creeks. From the top of the hill there is a fall of 300 feet to the sea level.

1107. St. Leonards is so cut off from Sydney that it would be difficult for it to share in the general supply—Would it not be better if a local supply could be provided? It would all depend upon the rainfall. You could block up any of those deep ravines, and form a large tank.

ADDENDUM.

I would desire to add to my remarks on the levels of different localities, that as they were calculated from isolated barometrical observations (and only occasionally checked by the theodolite), they can only be taken as close approximations, and perhaps requiring correction of a few feet now and then. I would further wish to repeat what I said in my report to the Government (21 October, 1851),—that it would be advisable to pass a legislative enactment to prevent the drainage of swamps at the heads of our rivers, and to preserve them as sources of water supply.

TUESDAY, 11 FEBRUARY, 1868.

Present:—

MR. GRUNDY, | MR. ADAMS,
MR. MORIARTY.

PROFESSOR SMITH, M.D. (PRESIDENT), IN THE CHAIR.

Edwin Barton, Esq., called in and examined:—

Edwin 1108. *President.*] I believe that some years ago you made a survey of the Valley of the Grose for railway purposes? Yes.

Barton, Esq. 1109. Did you traverse the whole length of the valley? Yes.

11 Feb., 1868. 1110. And did you take levels along its course? Yes; the levels were taken both longitudinally and transversely throughout the whole length of the valley.

1111. I understand that your examination of the valley at that time impressed you favourably with it as a possible source of water supply for Sydney? No, not at that time; it was an after-thought. I do now think it a favourable source from which to get a good supply of water by gravitation.

1112. I believe the river runs entirely through Sydney sandstone? Yes.

1113. You did not find any beds of shale in it? In one place the coal measures come in a little—just underneath Mount Hay on the north side, but south of the river.

1114. Did you find any trap rock in any part of it? No; but Mount Tomah, on the north side, is trap.

1115. The valley, I believe, is almost inaccessible from any part of its sides? Yes, it is. In fact, above Mount George and Mount Hay it is surrounded almost by mural precipices.

1116. Of great height? Of great height.

1117. There is no arable land in the valley, I suppose? No; I do not think many people have ever been there.

1118. So that there does not seem to be a possibility of any settlement being formed in that valley? No, there is not the slightest chance of that. A part of Mount Tomah is arable, and a small portion near Shepherd's toll-bar; but it is so small as not to be worth speaking of.

1119. Do those small portions of arable land drain into the Grose? Yes; but I do not suppose that the whole extent of arable land draining into the Grose amounts to ten acres.

1120.

1120. Did you ever form any estimate of the drainage area of the Grose? I can only speak from memory in regard to that matter. I think one portion—that west of Mount George and Mount Hay—would be about eighty square miles. But I made a rough map during the time I was connected with the railway survey, and that would shew approximately (in fact, very nearly) the area of that portion.

Edwin
Barton, Esq.
11 Feb., 1868.

1121. Have you that map with you? Yes. [*Witness here produced the railway map, shewing the Grose and its tributaries; also, the whole of the trial lines of the western railway, as well as a section shewing the Valley of the Grose.*]

1122. This map and this section are the results of your own surveys? Yes.

1123. Do you think the usual current of the river would be sufficient to supply Sydney with water, or would it be necessary to dam the river at different points? It would depend upon the point at which the current would be taken. The velocity, I imagine, will not be the same throughout the whole length of the stream.

1124. But is there enough water in the river? I only judge by the catchment area. I have never gauged the stream, or taken the rainfall; but, judging from the rainfall near Windsor, I should think the supply would be enormous. I do not think there could be any doubt at all about the abundance of the supply.

1125. What sort of a season was it when you were encamped in the valley—dry or moist? It was after the very dry summer of 1857-8.

1126. Could you give a rough estimate of the quantity of water the river was delivering at its mouth at that time? The volume was very large indeed, but I could not give an estimate of the quantity.

1127. Could you compare it with any stream we know—for example, do you know the apparent size of the Botany stream? No. I have not seen the Botany stream except on one or two occasions, and I do not remember what kind of a season it was.

1128. Do you think it would be desirable to form dams at various points of the river? My notion of a scheme for working the Grose properly would be to form one large dam at Mount Hay, or rather at this place [*pointed out by witness on the map*] where the Govett's Leap stream joins the main river. The flat is there sufficiently extensive to hold a year's supply for Sydney. I would not bring the water from that point to Sydney direct through pipes, but let the stream itself bring it down to a lower level, and from that lower point I would have pipes, so that the water could descend to Sydney by its own gravitation.

1129. At this lower point, then, you would have another dam? Yes.

1130. *Mr. Grundy.*] And you would regulate the supply from the upper one? Yes, I would regulate it when necessary from the upper dam; but I think that throughout a great portion of the year this stream to the south, together with these tributaries below Mount George, might be sufficient without calling upon the impounded supply west of Mount Hay, and that I would keep for a storage reservoir.

1131. *President.*] This tributary to the south, which we may call Barton's Creek, seems to be nearly as large as the main stream? Yes, I think it is quite as large; very likely it is larger.

1132. And it joins the main stream about 10 miles from the mouth of the Grose? I think it is about 10 miles from the mouth of the Grose.

1133. You propose, then, a large storage reservoir just below the bifurcation of the river under Mount George? Yes.

1134. And then you would use the bed of the river as an aqueduct down as far as the junction (say) of Barton's Creek, and from there you would bring the water in pipes? Yes.

1135. The lower embankment, I suppose, would be more to give a head for the pipes? I should imagine it would be a masonry dam sufficient to give a head for the pipes.

1136. From that higher point under Mount George does the bed of the river rise rapidly? To the source of the river?

1137. Yes? It rises very rapidly.

1138. So that it would require a high embankment to throw the water back a great distance? For some distance there is a large flat, and I think it will be found that the rapid rise does not commence for a considerable distance from the point to which you refer.

1139. Could you give us an idea how far the water would be thrown back by an embankment (say) 50 feet high? I should think (speaking from memory) that an embankment 50 feet high would retain a year's supply of water for Sydney.

1140. *Mr. Moriarty.*] It would throw it up both creeks? Yes. When I say there would be a sufficient supply for Sydney for a year, I take a population of 200,000, and reckon 30 gallons per day for each person.

1141. *President.*] What would be about the length of such an embankment at that point? I suppose not more than a few chains, but I could not speak with certainty from memory.

1142. At that point are the sides of the valley very precipitous? They are very precipitous; but from the foot of the precipice there is a slope down to the creek. But at the portion where the reservoir would be, the precipitous sides do not approach the creek so nearly.

1143. I suppose it would be necessary to construct the dam of masonry? At this point [*witness indicated the point on the map—the junction of the creek under Mount George*] if good clay could be found for puddling, it might be made an earthwork dam.

1144. And you think that a dam at the point you have indicated would intercept the drainage of about 80 square miles? Yes.

1145. What was your impression of the quality of the water when you were encamped on the river? I have never had it tested, but I should say it is pure as nearly as possible. It is likely it might on analysis contain one degree of hardness.

- Edwin Barton, Esq.
11 Feb., 1868.
1146. What would be about the distance from the junction of Barton's Creek to Sydney? Following the line of railway, it would be about 45 miles.
1147. Do you imagine that there would be any material difficulty in crossing the Nepean with pipes? I should fancy it might be expedient to cross the Nepean by putting the pipes under the bed of the river. At that point there is a fall or bar, and shallow water. I think it is possible that the pipes might be put in this bar.
1148. Do you think it would be less expensive to carry the pipes under than over the river? I think so. If the pipes were put over the river, it would involve the necessity of having a viaduct or framing above the high flood level to carry the pipes.
1149. Do you think it would be necessary to bring the water in pipes from that point to Sydney—would the country not be suitable for an aqueduct? No; I think it would be necessary to bring it in pipes from that point or some point sufficiently high to overcome the resistance in the county of Cumberland. An aqueduct would only be practicable down to the Nepean River.
1150. Supposing the Commission wanted to visit the point to which you have referred, under Mount George, what would be the easiest mode of getting access to it? To go on the railway line as far as Darling's Causeway, and then to follow down my old track, if it exists. I fancy, however, that most of it is washed away by this time. I think it is almost impossible to get up the river now. To visit the lower part, the best way would be to go up from Richmond. Without a track, it would require great physical exertions to do four miles a day.
1151. How many miles is it from the railway line to the bifurcation of the river? I think it is about nine miles.
1152. Is it possible to get to it from Bell's line of road? No; you may get to the summit of these mural precipices, but it is almost impossible to get down. It took me a week to get down.
1153. And is there no possibility of getting from the Blackheath side? Not without going to enormous trouble.
1154. In times of heavy rain I believe the floods are very severe in this river? Yes, they rise to a very considerable height. The exact height to which a very high flood did rise before the survey was made is shewn on a large section which is now in the railway office. At every point where a lateral line was taken (and they were taken frequently—sometimes as often as three in a chain) the flood line is shewn.
1155. Do you remember the highest point to which the flood rose? I should think, speaking from memory, that it rose 30 or 40 feet.
1156. Would not the necessity of providing against these great floods materially increase the expense of dams? I do not think the principal part of the remarks I have just made would be affected by that consideration, because they refer mostly to the sources of the Grose. The water does not come down there in so powerful a current. But down below it is different. I do not think it is expedient, if you can avoid it, to put a dam in the main river. I refer to the lower dam, not as an impounding reservoir, but as a balance reservoir; one that could easily be cleared out if it happened to be filled up.
1157. But would not the same objection lie against the upper dam? I think not, because the current is not so great. If there is room (and a careful examination might shew it), perhaps the flood water might be passed off and only the clear water put into the reservoir. It might be done by means of some contrivance where the velocity would carry the flood water over an opening, and the decreased velocity would admit of the clear water falling in. This is a system very often adopted to get rid of the turbid water and preserve the clear water.
1158. *Mr. Moriarty.*] That would be at the balance reservoir? Yes, if possible; but I apprehend that the river would be too confined to admit of that. Perhaps, however, on examination, a dam might be so constructed as to turn the flood water into a side creek, by means of a short tunnel through a spur. But my opinion, for want of information, is not sufficiently matured just now to enable me to express any positive idea upon that point. The course I have pointed out was adopted in the Manchester water supply. The clear water fell into one channel, while the flood water, by its increased velocity, passed over the opening.
1159. *President.*] From your section, what do you make the altitude of the river above the sea at its bifurcation under Mount George? A little under 1100 feet. Above that there is a flat with very little rise for about a mile and a half.
1160. And from the section, what do you make the altitude of the junction of the Grose and Barton's Creek? About 250 feet.
1161. Are you giving us the height from the Nepean, or from the sea? From the sea level, high water, spring tide.
1162. *Mr. Moriarty.*] With regard to the dam at the junction of Barton's Creek, if the height is not sufficient, I presume there would be no difficulty in putting a dam four or five miles higher up the Grose, bringing the water from there in a pipe to Barton's Creek, and making that the starting point? There would be no difficulty in having a pipe from either creek. It is possible that two dams might be better than one.
1163. And you would take your piping from the dam at Barton's Creek? That might be sufficient; if not, from both. This creek rises much more rapidly than the Grose.
1164. It is the character of all tributaries, is it not, that they rise much more rapidly than the main river? Yes. On the north side, about the same height as on the south is attained in half the distance.
1165. As a general rule, do you think there would be any difficulty in bringing water from such a distance—say 40 miles from Sydney—by pipes following the natural inequalities of the

the soil? I do not think there would be any difficulty, providing the pipes were sufficiently strong to stand the pressure, and that proper precautions were taken to have valves for escape of air. Valves would be required during the time of filling the pipe and for passing off air generated during the flow of water through the pipes.

Edwin
Barton, Esq.

11 Feb., 1868.

1166. It is of course a mere matter of calculation as to the height required to bring the water here in pipes—Have you made any calculations as to the head which would be necessary? No; I have not been able to ascertain what the resistance would be through the county of Cumberland. A decreased height would involve an increase in the size of the pipe.

1167. Do you think it would be safe to attempt an earthen dam at the junction near Govett's Leap, seeing the large quantity of water that must come down there in times of flood? I would not like to speak positively in regard to that. If clay were found of a proper quality to make a puddled trench, and there were the means of passing off the flood water by a tunnel through a spur, it might be safe. It certainly would not be safe if the flood water were passed over the dam.

1168. Have you ever thought over the height to which it would be safe to build a dam of sandstone, having regard to its porosity? No, I have never entered into that question.

1169. You think that, by the upper intercepting dam and the lower dams we should be able to catch all the water draining down that stream in dry weather? Yes; and I think it likely that the water which would be so caught in dry weather would be greater in quantity than would be required to supply Sydney.

1170. You do not think there would be any chance of the water in the upper dam being lost by leakage or evaporation? If the dam were large, the evaporation would be considerable; but I do not know how much, for I had no means of ascertaining. It might be taken, I suppose, at about the same as in Sydney—6 inches per month during summer. The evaporation might not be so much there, because it is very cold and not much exposed to wind.

1171. Do you think there would be much loss by evaporation down the bed of the river? No, I do not think so. There would be some loss by evaporation, but not much, and none from any other source, and this would be more than compensated by addition to the stream.

1172. You think that more water would be supplied from springs and by the drainage of adjoining tributaries than could be taken up by evaporation? Much more. The tributaries from Mount Tomah and those on the north side of the river would supply a very large quantity. I think it would be almost equal to the volume of the river.

1173. *President.*] And this dam would be solely as a stand-by in case of the failure of these tributaries? The upper dam would be a stand-by in case of long-continued drought. At the head of the valley, on site of proposed reservoir, there is some magnificent blue-gum timber, but the valley below that is sterile.

1174. *Mr. Moriarty.*] Have you made any estimate of the probable cost of these works and the piping which would be necessary? No; I have not known the exact height. It would be enormously costly to carry pipes from Mount Hay or the upper dam to Sydney; but for a gravitation scheme it would not be very costly to make dams there (*referring to plan*) and carry the pipes from the creek and river at these points to Sydney.

1175. And there would be no difficulty in laying the pipes from the lower dams? To within about four or five miles of the confluence with the Nepean, I think there would be difficulty in getting the pipes on to the ground and in laying them; but I do not think there would be much difficulty after that, in working up from the lower end and making the track of the pipes the road for transit.

1176. There would be no insuperable difficulties in crossing these various tributaries? I think not. A small girder of wood or other material would be sufficient to cross them and carry the pipes.

1177. Would it be possible to bring water from the lower dam in an open trench to some good starting-point nearer to the level country? So that it would go to Sydney by its own gravitation?

1178. Yes, I mean keeping the track on the same level? I think it might be done on the north side, by a good deal of trouble—to Burnlow Swamp, for instance; but I think it likely that, in any case, communication through pipes would be cheaper.

1179. You would start with pipes, and continue them right through? Yes; I think the cost of getting the material on the ground to make a trench would be more than the cost of the pipes.

1180. You have not given any consideration, have you, to the details of the question? No, not more than just thinking of them. I have not gone into the question, not knowing whether you would carry the water from the mains to the service pipes in case of fire. I know that the cost would be enormous to bring it all the way in pipes from a point sufficiently high above Sydney. But if you have a lower head of water, the diameter of the pipe must be increased to make up for the diminished velocity.

1181. You could not have less than a couple of 30-inch pipes, or something of that sort? Much less than that would do for the head of water at Govett's Leap; and, but for the resistance (static and otherwise) through the county of Cumberland and the intervening ranges, a 2-foot pipe would supply the town with the quantity I mentioned.

1182. That is merely the statical resistance, but the friction is what you have to do with? Yes, the friction of bends vertical and horizontal, and in the pipe.

1183. Do you think that piping from the lower dam you have indicated to Sydney would cost more than half a million of money, or so much? I should think that it would not cost so much. I have not, however, calculated the pressure in, or the diameter of the pipes required.

Edwin
Barton, Esq.
11 Feb., 1868.

1184. Would it be asking too much to request you to think the matter over? I would make a rough calculation, if you would tell me the amount of water you want to supply, and whether you wish it to run constantly into a service reservoir, or into service pipes direct, or to limit its flow to a certain number of hours per day.

1185. It would be constantly running I apprehend? That would involve the necessity of the mains in Sydney being sufficient to stand the pressure. If not, it would be desirable also to have a fire main.

1186. And also proper provision for the cleansing of water-closets and matters of that kind—it would seem desirable to keep the water running all day? I do not think there would be much difficulty in making the calculation, if you once ascertain these heights (different heads of water). The diameter of the pipes could then be easily got at; but it would be too much for me to guess at the cost which would be necessary. To cross the river these little tributaries would incur an expense which I could not state. The cost of bringing the water to Sydney would depend mainly upon the head of water, the quantity required, the time of delivery, and the resistance. If the Government entertain the idea of getting water from the Grose, it would be well at once to reserve the whole land within the watershed.

1187. *Mr. Adams.*] Have you seen the river in times of drought anything like that we have experienced during the last two years? No; the time I saw it in its lowest state was in the summer of 1857-58. That was when I first examined the valley.

1188. Do you think there would be sufficient to supply the daily wants of Sydney from this spot in a dry season—I mean from the spot above the junction of Barton's Creek? I think so; the catchment area is very great including Barton's Creek.

1189. But in a time of actual drought do you think the supply would be sufficient? That would depend entirely upon the size of the impounding reservoir above Mount Hay. I think it possible that a reservoir might be made there that would contain nearly two years' supply of water.

1190. If a 50-foot dam were constructed below Govett's Leap, what do you think would be the width of the water area? I should think that just below Govett's Leap, where the dam would be constructed, it would be perhaps half a mile or three-quarters of a mile wide.

1191. *Mr. Moriarty.*] Are there cross sections? There are cross sections on the south side of this Govett's Leap, but I do not think they extend to the north side.

1192. I should presume that they are pretty uniform, north and south? They are below Mount Hay, but above they are not. The character of the valley above Govett's Leap changes considerably. It becomes much more extensive.

1193. *Mr. Grundy.*] I think you said it was during a dry season that you saw this place? Yes.

1194. And I understand you to be of opinion that at that time there was more than sufficient water for the city? Yes; the supply I then saw nine or ten miles below Mount George was a very large volume of water indeed.

1195. Then, the fact of making a reservoir at the place pointed out as a site for the upper dam would not alter that? It would not when the reservoir was full.

1196. Then, practically, you think that there is a sufficient supply of water without exhausting this dam at all? It is possible that the other tributaries of the river might be found sufficient in ordinary seasons for the daily supply.

1197. And you propose to make an earthen dam? I have not spoken positively in regard to that matter. I think the lower dam, or the lower dams, as the case may be, must be of masonry. The mode in which the upper dam should be constructed would be a matter of investigation.

1198. *President.*] Do you know the course of the Weeny Creek? Yes.

1199. Would that map of yours enable us to find the drainage area? No; it does not extend sufficiently to the north.

1200. Is Bowen's Creek, which I see marked there, a tributary of Weeny Creek? No; it runs direct into the Colo River.

1201. Could you, from what you have seen, form any judgment in regard to the drainage area of the Weeny? I should think its drainage area would be from 15 to 20 square miles—that is Big Weeny. There are two Weenys—Big Weeny and Little Weeny.

1202. Do you take into account a large tributary that comes from the north, and joins the Weeny just above what is called "The Gap"? Above the Tabara Gap, or the Kurrajong Range, I do not think any tributary to the north of the Weeny is very extensive. There is a good deal of flat land to the north, but I do not think there are any long tributaries. There is a large swamp on the north of Big Weeny, called Blue Gum Swamp; it is a flat.

1203. Is that what they call the Mountain Lagoon? Perhaps so. I have no idea what is the height of the valley of Big Weeny Creek at its junction with Little Weeny.

1204. Have you been at that spot where the junction takes place of the Big Weeny and Little Weeny? Yes; I have been from the junction of Big Weeny and Little Weeny to the head of both Big Weeny and Little Weeny Creek.

1205. Is it possible to follow up the bed of Big Weeny Creek from the junction of Little Weeny? The valley of Big Weeny Creek below the Gap is rather wide and extensive.

1206. Does the Colo Road cross near the junction of the two Weenys? No; you have to branch off, I suppose for a distance of perhaps a mile or two miles, to the westward of the Comleroy Road.

1207. That road crosses the creek lower down, does it not? Yes.

1208. The crossing is not very far from the junction, is it? I think it is a mile or so. There is a track from the road down to this point—the junction of the creeks at Town's farm.

1209. What is the nature of the valley where the two Weeny Creeks join? In its geological aspect?

Edwin
Barton, Esq.

1210. Its physical aspect rather? It is wide, something like the head of the Grose Valley. It is wide, with precipitous sides.

11 Feb., 1868.

1211. Could a dam placed there throw back very much water? Yes; a dam placed at the confluence of the Weenys would throw back a good deal of water. A very extensive dam may be made there.

1212. But you are not aware of the height of this place above the sea? No; I did take aneroid heights of that part, but I have not got them now.

1213. Have you followed up the bed of the Warragamba for any distance? Yes, I have been up the Warragamba for, I suppose, half its distance.

1214. Have you been as far as the junction of the Cox? Coming down the Cox River I have been to its junction with the Wollondilly, where the Warragamba is formed.

1215. Did you happen to take any barometric level at that time? Yes; but I have not that either. I made an exploration through Burragorang, as it is called, down Nattai, and all through the mountains to Hartley; but I have not now my note-book with the heights. The country was so rough that it was abandoned.

1216. We are anxious to get the altitude at the junction of the Cox and the Wollondilly, and the altitude of the Wollondilly in Burragorang? The junction of the Cox and Wollondilly?

1217. Yes? I have not got that.

1218. And the altitude of the Wollondilly in Burragorang? Which part?

1219. Any part? There are no levels; but it would not be difficult to get that. It might be obtained by a day's ride, with a barometer, from some bench mark. Picton would be the nearest point.

1220. What would be your opinion of the Warragamba as a source of water supply? As far as abundance is concerned, I should think it very good. There is an enormous supply there. The drainage area is the largest on the eastern side of the main dividing range.

1221. From all that you know of the two rivers, would you give the preference to the Grose over the Warragamba? For quality of water, and facilities for making an impounding reservoir, I think perhaps the Grose affords greater facilities than the Warragamba.

1222. Do you not think that a masonry dam, thrown across the gorge of the Warragamba, would throw back an immense body of water? At which point of the Warragamba?

1223. Within a very short distance of its junction with the Nepean—perhaps a mile up? So long as the dam stood it might; but almost every flood would have a tendency to fill up the reservoir. The timber and other matter coming down that river in flood-time is so great that it would soon fill up the river to the top of the dam.

1224. From your engineering knowledge, what height would you venture to make a masonry dam to bank up water? I should say 60 feet, except in cases where there are very great advantages indeed.

1225. You would not like to venture more than 60 feet? I do not think so; I should look upon 60 feet as a very high dam.

1226. Taking into account also the tremendous floods in the Warragamba, it would, I apprehend, be very imprudent to make a dam higher than that? The current in the Warragamba is so terrific in flood-time that it is doubtful whether any dam would stand, no matter what height it might be constructed. The whole volume of water coming from Goulburn and the western district accumulates there in one narrow gorge. I have seen that in times of flood, and the force of the current is tremendous. I think there would be extreme difficulty in getting any dam to stand.

1227. So that, although there may be more water in the Warragamba, you think there are not there the same facilities for storing water? I think the best part for storing water from that source would be the junction of the Wollondilly with the Cox, at the point where the Warragamba is formed. That is the only practicable point I know which is likely to give any impounding area for a reservoir.

1228. If a dam were formed there, would there be much difficulty in bringing pipes from it to the open country? There would be considerable difficulty. The whole of the Warragamba is difficult to traverse on foot. The sides are precipitous and rough. There would be considerable difficulty in getting pipes on to the ground even.

1229. But probably not more difficulty than would be experienced in the case of the Grose? In the case of the Grose, to the extent of 10 miles there would be much difficulty; but beyond that, the Grose would be not so difficult—the sides are not so precipitous.

1230. Do you remember what distance the junction of the Cox is from the mouth of the Warragamba, along the river? I should say it is fully 20 miles. It is almost impossible to walk up the Warragamba or down it. I have been down a very considerable distance, and up a very considerable distance, but I never made a thorough journey from either end.

1231. Are you well acquainted with the upper portions of the Nepean River? No, I am not well acquainted with them. I know the Bargo, and I know something of the Cataract and the Cordeaux.

1232. What sort of country is it at the junction of the Cataract with the Nepean? It is a sandstone country.

1233. With the same deep gorges you have already described? Yes; it is of the same character as all the land that surrounds the county of Cumberland. I think that is in the county of Cumberland. It falls into the Nepean direct, and is precipitous.

1234. Are there any facilities for making a great storage reservoir at the junction of the Cataract and the Nepean? I do not think so. The gorge is steep, and I do not think it is sufficiently wide to make a great storage reservoir.

Edwin
Barton, Esq.

11 Feb., 1868.

1235. Probably the beds of the rivers rise too rapidly to allow of the water being thrown very far back? Yes; I fancy they are all of the same character.

1236. Would the same objection apply to the junction of the Bargo with the Nepean? That is rather limited. I know the Bargo River very well down to the Nepean, and I do not think there is any chance there of making anything except a work something like what might be required on the Warragamba.

1237. Have you gone as high as the head of the Cataract River? Yes; I have been on the coast range.

1238. Have you observed any favourable ground there for reservoirs? I think I remember some large swamps at the head of that river.

1239. Do you know the tributaries of the George's River? No; I think the principal tributaries of the George's River are low down from its source. I know the head of the George's River.

1240. What county is the head of George's River in? It is beyond Appin. It is in the neighbourhood of Appin. I know the river there very well.

1241. *Mr. Grundy.*] It rises close to the Cataract? Yes.

1242. *President.*] Have you ever seen among the sources of the George's River any places suitable for great reservoirs? No, I do not think so. From what I know of the character of George's River at its source, I do not think it at all suitable for making large impounding reservoirs.

1243. What would be your opinion of the Couridjah Lagoons as a source of supply? In the first place, I do not think the quality of the water would be sufficiently good; in the second place, if there were any demand upon those lagoons, they would soon cease to be lagoons at all.

1244. In ordinary dry seasons I suppose there is no great flow of water from them? No; I have seen them in dry seasons and also in times of flood. In flood-times even I never saw a great flow of water from them. I often had occasion to cross below the largest lagoon in times of flood, where it falls into Cedar Creek, and I never saw much water flowing. The catchment area is so limited that it is impossible that from that source alone any large volume of water can be collected.

1245. And you do not think that the quality of the water is good? I think the quality very bad. I have had to drink the water there. I think it contains a large quantity of organic matter, and its colour is very bad too. Stonequarry Creek, and all the country about there is aluminous, and the water is perfectly salt. Stonequarry Creek comes from Cedar Creek, and these lagoons, and all the streams running into the Nepean about Razor-back, are brackish. It is impossible to drink the water.

1246. It is very likely that bad water comes down the Picton way? I know the water is so bad at Picton that persons unaccustomed to it are made ill by drinking it.

1247. Do you think that in the lower parts of the Cataract, before its junction with the Nepean, a great impounding reservoir could be formed? No. I think the Cataract and the Bargo, and several other small streams, are all of the same character. I do not think an impounding reservoir can be got from any of these streams, except near the source. This applies to almost all the streams throughout the sandstone country. The sources of the stream are the only places where you can make large reservoirs.

1248. Then, from your knowledge of the country, you do not know of any more suitable locality than the Grose as a source of supply of pure water? I think the water in the Grose is pure. I think there is a very large quantity of it. From my knowledge of the country, I do not think that, by any gravitation scheme water can be got from any point nearer to Sydney than the Grose, with everything that would be requisite for the scheme.

1249. Have you given much attention to the present source of supply—the Botany Swamps? No, I have not. It seems to be a very large source of supply. I saw a letter, written, I think, by a member of this Commission, which stated, I think, that twenty-eight millions of gallons of water were delivered into Sydney per week. In that case, it must be a very large supply. I had thought that, from some tributary in George's River, an auxiliary supply might be thrown into the Botany Swamps, and then be pumped into Sydney. This might be the means of putting off a good deal of anxiety in time of drought. I certainly think the Botany supply is one that ought not to be discarded.

1250. Have you seen the Yan Yean reservoir? I saw the ground before it was made a reservoir.

1251. And have you seen it since? I have not seen it since it was completed.

1252. In going over this country, have you seen any similar conformation of surface to that? No, I do not think so.

1253. A wide, shallow valley, pretty level in its bottom for a great distance? No, I do not think so. The country about the Yan Yean is tolerably level, except on one side, where there are plenty of ranges. I do not know any country similar to that in New South Wales.

1254. Have you gone over much of the drainage area of the Colo? Yes. I have been at the head of the Colo. I have been on the tributaries to the north of Bell's line (the south tributaries of the Colo). I have also been lower down the river, and up it for a considerable distance above the junction of Big Weeny Creek.

1255. The drainage area must be as large as that of the Grose? I should think it drains twice the extent of country. It comes from the Crown Ridge, on the Mudgee Road, and takes in the whole of the country from Piper's Flat, and a great extent of the country between Bell's line of road and the Colo River itself. The drainage area of that part of the country is very extensive indeed.

1256. Then it must deliver a larger quantity of water into the Hawkesbury than the Grose? Yes, a much larger quantity.

1257.

1257. Could it be put in competition with the Grose as a source of supply? I think it very likely that the Colo River would give an enormous supply of very pure water; but the distance from Sydney would be greater than that of the Grose River. And it may be difficult to find, in the Colo River, a place which would afford so great facilities as are afforded in the Grose for a large impounding reservoir.

Edwin
Barton, Esq.

11 Feb., 1868.

1258. Is the country equally impracticable? For a very considerable distance—I suppose for 10 miles above the Bulga Road, as it is called. This Colo or Comleroy Road passes the Colo. For a distance of ten miles, I suppose, you could ride on horseback along by the river.

1259. The elevation, I suppose, is not very considerable? No; I feel convinced that it would be low.

1260. If you followed the river till you attained an elevation of 400 feet, would you get into an impracticable country? It gets almost impracticable. It is of a similar character to the Grose. It is not inhabited, and the distance would be very great.

1261. And there would be a much greater distance to carry the pipes? Yes; but I think that the Colo is a source of supply that is really worthy of some attention.

1262. Do you know how far back we should have to go to get an altitude of 400 feet on the Colo? I think it is very likely we should have to go about 10 miles above the crossing of the Bulga Road. The valley does not rise rapidly; it is very like the Wollondilly, with sandstone cliffs and the same geological formation. The river winds about in sandy apple-tree flats, just in the same way as the Wollondilly. It would not be a difficult matter to ascertain the level. If levels were taken to the junction of the Little Weeny and the Big Weeny, a barometer almost would do it.

1263. *Mr. Moriarty.*] We have hitherto been going mainly on the high-service gravitation scheme—If such a plan were impracticable, except at great cost, do you think it would be feasible to have a combination—could not the greater part of the lower portions of the town be supplied by a low-service gravitation system, and the other parts by a high-service gravitation, trusting to pumping? That would be leaving the Botany Swamps to supply the lower part of the town, and bringing from a distance the water for the high service by gravitation—

1264. No. Supposing great difficulty were found in getting far enough up these rivers or creeks to get an elevation sufficient to give you a high-service gravitation system, do you think any considerable saving might be effected by introducing a sort of composite system—a low-service gravitation and a high-service pump? I do not think it would be advisable to go beyond the Botany Swamps for any pumping scheme. The difference in the distance you would have to go to get the necessary elevation to supply the whole of the town would be so small that, in my opinion, it would be advisable to abolish the pumping system. In the case of the Grose River, I think it is very likely that two miles more would give the necessary elevation to supply the whole by gravitation.

1265. And you would prefer going in at once for the high-service gravitation system? If it were thought advisable, after consideration, even to go to the Nepean River to pump (which I look upon as the nearest supply to be pumped from) I would be inclined to go to some very considerable cost to get an elevation beyond that, and dispense with the annual cost of pumping.

1266. What I refer to more particularly is, a scheme which has been partly put before us to bring water from a place which would not deliver it at a height sufficient for high-service, but which might deliver it into a low-service reservoir at Paddington, or some other part of the suburbs, from which most of the low parts might be supplied by gravitation—The water for the high parts would, of course, have to be pumped? I would prefer, in adopting a mixed scheme of that sort, to have the reservoir at the site of the source.

1267. But in the one case you would have to raise the whole of the water by pumping, while in the other you would only have to raise such a quantity as might be required for the higher parts of the town? Yes, I see; you would have two reservoirs.

1268. *President.*] But, referring again to the Grose River scheme, could you find out how much higher than the junction of Barton's Creek we must go, to reach an elevation of 400 feet above the level of the sea? Four miles. The section shews an elevation of 390 feet.

1269. *Mr. Moriarty.*] Would it be possible to bring the water by an open cutting? No, unless it were made with stone-work and cement. In that case, the cost of getting the material on the ground would be greater than the pipes.

1270. What do you think of the feasibility of making a dam 300 feet high in any of those rivers where there is a large volume of water? I do not think it practicable. Besides, even supposing that the dam stood the pressure, it would be difficult to keep the reservoir from being filled up.

1271. *Mr. Moriarty.*] And even supposing it were possible to construct such a dam so that it would stand, would not the enormous pressure of a head of 300 feet of water be likely to force new passages for itself through the horizontal stratification of the rock? If there were any places sufficiently weak, I have no doubt that a large body of water would find its way out through the stratification. At any rate, before that large quantity of water went into the dam, it would have to be examined and stopped where necessary.

1272. For this purpose it would be necessary to go back several miles? Yes; and the work might not be successful for the first two or three times. These points are not readily discovered.

1273. At all events, it would have to be made so tight that the leakage through these beds would not be so great as the amount of water coming down the river in dry seasons, otherwise the thing fails? If the leakage is greater than the supply, in time, of course, the reservoir would be dry.

1274.

Edwin Barton, Esq.
11 Feb., 1868.

1274. And in these deep reservoirs, the great body of the water would be practically useless, unless the bottom of the reservoir is above the point of delivery—There would thus always be a large standing pressure which could be of no service? It would be much better to move the dam a little higher up the river, so as to bring the bottom of the dam on a level with the top of the useless water. It will be found a difficult thing, and not at all advisable, to make a large dam in a main river subject to the high floods which in this country sometimes prevail, unless there is some way of getting the flood-water away from the reservoir without passing it over the dam.

SATURDAY, 15 FEBRUARY, 1868.

Present:—

MR. MORIARTY, | MR. ADAMS,
MR. WOORE, | MR. GRUNDY.

PROFESSOR SMITH, M.D. (PRESIDENT), IN THE CHAIR.

Edward Flood, Esq., called in and examined:—

Edward Flood, Esq.
15 Feb., 1868.

1275. *President.*] I understand that for a considerable number of years you have taken a large interest in the Water Supply of the city of Sydney? I have taken some interest in the matter. Several years ago I paid considerable attention to it.

1276. You have had opportunities for a number of years, I think, of observing the capabilities of the Botany Swamps? Yes, I have. I was born in Sydney, and have lived here all my life.

1277. Will you tell us the general result of your experience in regard to these swamps—Do you think they are now to be trusted for a permanent supply of water to Sydney? I think that a very small amount of artificial means has ever been attempted in reference to these swamps. There has been, certainly, a little done of late years, at and near the engine-house at Botany, but it is only a little. Anyone that has examined or inquired into the various strata of the basin which forms the Water Reserve, must know that it is composed entirely, or nearly so, of drift sand.

1278. Do you think that the running stream itself is sufficient to afford a constant supply, or must means be taken to impound the flood water, in order that the supply may be equal to the requirements of Sydney? I do not think the present stream would be sufficient, unless artificial means were adopted for the purpose of impounding the water, or causing it to concentrate itself at some point,—that is, taking the whole length of one side of what I call the basin of Botany Bay. This basin has four sides. The Cook's River Road is one, the Old South Head Road is the second, the dividing range at the coast is the third, and Botany Bay is the fourth.*

1279. But that would include a good deal more than the drainage area of the Botany stream, would it not? It would. I think the whole of the water falling within these lines will find its way into Botany Bay. The water running from the east of Cook's River Road finds its way into Shea's Creek. A great quantity of the water falling south of the range which divides the waters that fall on a portion of Sydney, will also find its way into Shea's Creek.

1280. Is not Shea's Creek hopelessly contaminated by various manufacturing operations? There is no doubt that it is to some extent contaminated, but that wholly arises from the apathy of the authorities. As a proof of this, I would instance the late sale that took place on the part of the Crown, under Mr. Cowper's Government, of land on the watershed near the Randwick Racecourse. When that land was advertised, I wrote to Mr. Robertson, who was then Minister for Lands. Unfortunately, I was late, for I only saw the advertisement on the morning of the sale. In consequence of my letter, however, he withdrew some of the allotments. In my opinion, none ought to have been sold. All those establishments which have the effect of deteriorating the quality of the water supply ought to be immediately abolished, at any cost.†

1281. But on the drainage area of Shea's Creek, are there not many buildings for manufacturing purposes and dwelling-houses? Yes; there are a good many east of the Cook's River Road, and there is certainly a large population at Redfern.

1282. It would be a very expensive thing now, to resume all those lands within the drainage area? I do not think that would be necessary. Under a proper sanitary system, I think all the sewage might be collected and carried into Botany Bay ‡

1283. Then do you think that, to complete the water supply, it would be necessary to add to it the drainage of Shea's Creek? I think so, and also of Cook's River. That was my opinion many years ago. 1284.

* NOTE (on revision) :—Since I made this statement I have looked at the watershed which drains into Shea's Creek; and, from the number of manufactories carrying on offensive trades, and the large number of inhabitants located upon the east side of Cook's River Road, and nearly the whole of the inhabitants of Redfern and Waterloo, as well as a considerable number in Sydney, from Redfern to near my house in Botany-street, I am now compelled to confess that the whole of the above area is lost to the city, and we cannot look there for the purpose of increasing our limited water supply.

† NOTE (on revision) :—The correction in my previous answer applies to this.

‡ NOTE (on revision) :—For the reasons already given, I must abandon the idea of obtaining water from either Shea's Creek or Cook's River.

1284. You think the Botany stream is not sufficient itself to supply Sydney? I do not think it would be sufficient, without using considerable artificial means to collect the whole of the water falling within the basin, as I have described it.

Edward
Flood, Esq.

1285. We have understood that several of the tributaries of Cook's River are brackish? Yes, Cook's River was originally a salt water stream. The tide went up nearly as far as the Punchbowl Road. The whole of the water was salt, and salt water fish used to pass up to within a mile of the Punchbowl Road. This river might be made use of for some of the outlying suburbs.*

15 Feb., 1868.

1286. If any of the tributaries be brackish, would not that be fatal to adopting Cook's River as a part of the supply? No doubt it would, unless you could reclaim these tributaries by wholly excluding the salt water. The only cause of the water of the Cook's River being now brackish is, I think, the leakage of the dam, which is a very rude construction.

1287. If the dam were made so as entirely to exclude the tide, do you think that by and by the water would be quite fresh? I have no doubt of it. I have a paddock on the upper part of Cook's River, and the water is fresh there now.

1288. We have it in evidence that some of the tributaries are brackish, and that they do not derive their saline properties from the sea water? I am not competent to give an opinion upon that point, but I am at a loss to know how those who gave the evidence arrived at the conclusion. There are no indications of salt, and no saline plants about.

1289. *Mr. Adams.*] But if there is any blue shale about there, that might render the water brackish? In all parts of Sydney we have blue shale, more or less. It will no doubt be a difficult task to exclude the salt water from Cook's River, if my theory be correct, and the dam is made on a bottom of sand and shells. Of course percolation will go on through that, unless you can get some retentive puddle fixed below. That is a very minor objection.

1290. *President.*] You have a decided opinion that the water of Shea's Creek and the water of Cook's River ought to be preserved, and added to the present supply? Yes.

1291. And you think that whatever expense may be necessary to buy up factories and other buildings must simply be faced? That is my opinion. I think that it would be much the cheaper way, in the meantime, of getting an adequate supply for a very large population.

1292. But this difficulty of forming retentive dams is a very serious one—Have you examined the dams which are at present being erected on the line of the Botany stream? I have not.

1293. But you have indicated the difficulty of constructing dams on a porous subsoil. To preserve these waters which you have named, it would be necessary to build dams, and it does not appear that there is any watertight basis to work upon? I would suggest—as I suggested many years ago—that you begin at Bunnerong or the Cook's River Road. You should sink as low as possible below low water mark. If I am correct in thinking that the formation is of sand, I do not believe there would be much difficulty in taking out the sand, so that a retentive soil could be put in, which would keep back the water below low water mark. We all know that sea water is much stronger than fresh water; that of itself will be sufficient to keep back the water to the level of high water mark. Supposing that percolation still goes on below the retentive soil which I suggest should be put in, I would insert a perforated drain pipe of sufficient size, the whole length, on a dead level or with a slight incline, so that it should convey the water to a given point.

1294. What would be the object of the perforated pipe? For the water to percolate into the pipe.

1295. And it would act as a drain? It would make a drain from one end to the other.

1296. But unless you could make a really retentive dam, it does not seem possible to store a large amount of water—If there were any considerable pressure, it would soak out? If you were to sink a hole on the beach at high water mark, at any part along the line I have indicated, I guarantee that you would get water at 2 feet—shewing that a large quantity of water is kept back by the sea, without any artificial means.

1297. Still, it seems necessary to have great storage reservoirs, and if the level of the fresh water be raised considerably above the salt water, and the dams be porous, the fresh water must leak out? I have stated, that unless you can get a puddle down sufficiently low, the dam will be of little use.

1298. What then becomes of the storage of fresh water? The whole formation, being like a sponge, must contain a considerable quantity of fresh water, and its operation of draining off is very slow indeed—something like the passing of water through a sponge or a drip-stone.

1299. Then you do not think it necessary to have great storage reservoirs—You think the ground, like a sponge, will contain a quantity sufficient? No; it would be better to have reservoirs, if you can get them. I would suggest one great reservoir. I proposed a scheme to the late Minister for Lands, Mr. Robertson. It consisted of constructing a dam, beginning at the highest land north of the toll-gate on the Randwick Road. The line would be about where the toll-house now stands; then it would continue along the side of the large sand-hill or range on the west of the Randwick Road, throwing part of the hill down for the purpose of forming the road; then a line about south, until you come to the bridge on the same road, through which the water passes and goes down the stream west of the Racecourse. From the bridge the road would form a sharp curve, and go direct to the public-house on the Randwick Road, opposite the Racecourse.

1300. To what height would you consider it safe to raise such an embankment? Without any particular data, and from merely looking at the place, I should think the extreme height

* NOTE (on revision):—I do not think Cook's River could be connected with the Waterworks at Botany, unless Shea's Creek could be made use of.

Edward
Flood, Esq.

15 Feb., 1868.

height above the level of the road would be something like 16 to 20 feet; and I would propose that the road should be fenced on both sides of the embankment sufficiently wide for a road 60 feet wide between the fence.

1301. And then you would dredge out the contents of the swamp inside, so as to form a lake there? Yes. That might be a work of years. The reservoir or lake could be enlarged as the exigencies of the times required. In seasons of drought you could go on with your operations; and for that purpose I should recommend a dredging machine, with silt punts, to which should be attached flanged wheels, so that they could be taken out of the water upon rails fixed so that the silt could be taken to such a position as it would be out of the way of the water. In connection with this upper dam there ought to be a large reservoir erected at the highest part at Waverley, from which all, or nearly all, the suburban municipalities might be supplied with water. The engine required to lift the water could be so placed that it could be also used to land the silt punts upon the rails. Should this work ever be carried into effect, some alteration would be required to the late Mr. Busby's tunnel, as the pressure of water would be so great that the tunnel would burst at Hyde Park, and serious damage might result therefrom.

1302. Do you know the result of the borings which were made in that locality a number of years ago? My recollection is faint. I have not seen the evidence for a number of years. I think they bored 60 feet and did not touch the rock.

1303. Keeping that fact in view, how would you construct a dam so as to raise the water 16 feet? At times, when we have heavy rainfalls, the water would rise there considerably, although at all times percolation must go on. I would recommend a puddle core to be used, 3 or 4 feet in thickness, and sunk as much below the present surface as possible. Percolation will, of course, still go on below the retentive soil. In times such as I have often witnessed, when we have great rainfalls, this place might get full in spite of the percolation, and then it would take years to run off. It is the same in the case of the small lagoons. There is a small lagoon near the toll-house; when that gets full, it takes a very considerable time for the water to run off. I have known some of these lagoons to be nearly full for years. By the same rule, we all know that a straw will raise water in a stream. Percolation may be going on in the upper work, but the leakage would all pass into the lower reservoirs.

1304. Still you see we must have provision made against a long-continued drought. This place has been subjected to droughts of more than a year's duration, as in the case of the great drought of 1838-9, and for a permanent supply we ought to have stored water sufficient to last for a year. Do you think a dam like that you have described would contain such a store? I think it would be a great auxiliary; that and the lower works would, I think, contain water enough for several years.

1305. Have you made any estimate of the quantity of water which ought to be supplied per head of the population? No, I have not.

1306. Sydney now requires a very large amount of water, and the present supply is admittedly insufficient? It appears to be insufficient, because there is no means—at least, I have not been able to discover any means—used for the purpose of increasing the quantity by artificial works.

1307. Until the present dams were made at Botany, and they are not in full operation yet? I think the whole thing is insignificant, from what I have heard of those dams. Many people here think they can get a supply by cutting open the sponge, and letting the water run away at full speed; but this is fatal to its permanence. They have nearly destroyed the swamp, by cutting away the sponge.

1308. Your scheme would involve the resumption of a good deal of land that has been sold, would it not?* Not necessarily; it would involve certainly the removal of all wool-washing establishments.

1309. But you must buy them up? I do not care how you get them. Of course, the owners of those properties must be compensated in some way. If the public require a man's dwelling, they must pay for it. When the public exigencies require a house, or works of any kind, they should be resumed, and the parties paid the full value of their property.

1310. We have it, I think, in evidence, that the rental of that portion of Sir Daniel Cooper's estate on the drainage area of Shea's Creek is not less than £16,000 a year—all that would have to be resumed? I do not think so. That must include the whole of the houses erected between the Cook's River Road and Shea's Creek. With a proper system of drainage, I think the sewage from most of those houses might be conveyed into the waters of Botany direct.†

1311. But even if the property were not resumed, a new and expensive system of sewerage would have to be introduced, to preserve the purity of the water—and the factories must be stopped and compensation given. Would it not be better, instead of incurring this large expense, to improve the present supply (which after all would have to be pumped up to Sydney by steam power), to go to a greater distance to procure a supply by gravitation? I do not know that it would be better. I think that in the first place you ought to tax the present water reserve to its fullest extent. I am not prepared to say that you could get from it sufficient water to meet the requirements of any amount of population. I think that, in addition, you ought to be making preparations to bring the water from some other source. In point of quality, I believe that the water collected at Botany is superior to any other water on this side of the mountain ranges.

1312.

* NOTE (on revision):—No; there is only a small portion of land, the drainage of which falls within the upper dam. The drainage of the Military Barracks might be diverted, at a small cost, into the sea or harbour, and this drain could be used by the Paddington Municipality.

† NOTE (on revision):—This, as I have already stated, I consider lost as a water supply.

1312. You would not contemplate your scheme as one to serve distant posterity, but you would regard it as one to serve for a time, until a larger supply could be got elsewhere? Yes; I think you should contemplate going elsewhere to get a larger supply. My opinion is that, in times of great drought, the water you would bring from the Nepean would be very impure.

Edward
Flood, Esq.

15 Feb., 1868.

1313. Do you know the Warragamba River? No, I cannot say that I know much about it. I know little of any of those rivers, having only crossed them.

1314. *Mr. Moriarty.*] Do you not think that, as a general rule, to trust to machinery for a supply of water to a large population in a hot climate is objectionable, and a thing to be avoided, if possible? It would be better if it could be avoided.

1315. If a boiler were to burst, it might lay the whole thing in ruins? Yes, it might.

1316. And the entire population of the town might some morning find themselves without a drop of water? No doubt. There is always that difficulty in any kind of public works. If you have not a second engine and a second set of machinery, and anything should go wrong, of course the operations would be stopped. This would be to some extent obviated by the erection of works at the upper dam, alluded to in a preceding page.

1317. But suppose you had two sets of engines (there are three at Botany), one of the boilers blowing up might bring the whole thing to the ground? Yes.

1318. So that there is considerable risk, you think, in trusting to any pumping arrangements for supplying a large and increasing population with water? No doubt you must always labour under that difficulty. During the time of the Russian war, I often thought that it would be better if the machinery were nearer to Sydney. I used to think it would be a very serious thing if the Russians took charge of our waterworks. The expense of removal would no doubt be great; but you could get a better lift in Sydney than at Botany, and there would be a large saving in the cost of fuel, owing to the much shorter distance it would be necessary to convey it.

1319. Looking also to the probable future requirements of Sydney, do you not think it is necessary that we should make provision here also for a very large extension of the great sea-port of the Colony? I think you ought to make a suitable provision for our probable future requirements.

1320. For the extension of the town itself, I mean? I should hope it will not extend in that direction, at all events.

1321. Do you think it can extend sufficiently in any other direction? There is nothing to prevent it extending in every other direction, because generally the country is of a sterile nature, and fit for little else than building sites.

1322. But if the whole of the area were converted into a town, do you not think it would seriously interfere with the purity of the water? There is no doubt it would. If you built more houses upon the present water reserve, you do away with the object for which the reserve was intended. In fact, I believe the present Corporation, who are our sanitary protectors, contemplate now selling a portion of the water reserve, which I think is a great mistake. It appears the Mayor and Aldermen of the city have already sold about £4,000 worth, and are now seeking further power from the Legislature, by a short Bill, to dispose of more land which, I believe, drains into the water reserve, which was referred to a Select Committee on the 16th March instant, and passed through all its stages, and was reported upon on the 17th instant, or next day. The only gentlemen examined were the Mayor, the City Engineer, and the City Treasurer.

1323. Have you been lately at that place which you designate as "the old bridge," near the Racecourse? Yes, I pass there very frequently.

1324. Have you observed a lot of nightsoil and other stuff thrown on the sand? Yes—it is a common receptacle for nightsoil. They used to throw all the nightsoil a little on the Sydney side of where I propose to commence the dam.

1325. Do you know where the drainage of that land ultimately finds its way? A great quantity of it must go into the present water reserve. It passes down that stream to which I have directed your attention, west of the sandhill, which sandhill divides the main stream and this small stream, till it passes south of the sandhill, when it joins the main stream.

1326. And the little stream to the westward takes the drainage of that ground to which you have alluded? Yes, nearly the whole of it. The stream crosses the road a little below the toll-gate, and meanders down until it comes to the bridge. It then passes under the bridge and down the stream, and joins the main stream near the site of the Paper Mills.

1327. And the whole of the water is contaminated from the sewage and nightsoil placed on that area? More or less. All this has been done by our civic authorities.

1328. We are told that nearly all the land from the Racecourse down to the Botany Engine-house has been alienated and is now private property, which is very likely in a short time to be brought into the market for building purposes? If that be the case, that is an additional reason for constructing the large dam above the Racecourse. Sir Daniel Cooper's estate there, I think, is large; but I have an impression (it is merely an opinion formed without sufficient data) that in the original grant some reservations were made in regard to water.

1329. But if the land is really sold, do you think any amount of reservation would be practically available for preserving the purity of the water? No; I do not think you could prevent the water from becoming contaminated, if you allowed a large population to settle down on the reserve. It is impossible. But if land is granted for a special purpose, I question whether you can convert it to any other purpose; and that land, I think, was granted to several parties

Edward Flood, Esq. 1330. Do you think there is anything in the deed of grant to prevent their selling the land for building allotments, or for similar purposes? There may be nothing in the grant to prevent them selling the land as building allotments; but I think, if it was granted for a special purpose, and the water reserved for the use of the public, the law should step in and prevent the erection of any building or manufacture which would have the effect of injuring the water.

15 Feb., 1868.

1331. We know that on a considerable part of the drainage of the Lachlan Reserve there are, at this moment, houses built, the drainage of which finds its way into the reserve. Do you think there is anything to prevent the same thing occurring to a greater extent on the lower portion of the drainage, as the population extends in that direction? I do not, except by legislative enactment; and we ought not to hope for anything like that when we see the Government themselves, on the one hand, selling the land upon the watershed; and, upon the other, the civic Corporation are now, I believe, contemplating selling a portion which drains into the water we are now using.

1332. Well, recognizing both these as undoubted facts, and seeing that they probably arise from the natural conditions required for the extension of the town, do you not think it would be better, perhaps, at once to look the difficulty in the face, and seek for a gravitation system elsewhere? I do not at all object to your seeking a gravitation system elsewhere, but I would certainly recommend that additional means should be used to increase the supply from the present source, and to prevent further deterioration of the present water reserve. I think all the authorities, both Government and Civic, should be invoked for that purpose. As to the cost of the upper dam, supposing my views should be carried out, I think the work might well be performed by our convicts who are suffering for the lighter offences. Perhaps I shall be told that it would be bringing convict into competition with free labour; but these are our own convicts, and, instead of living in a state of luxury in Darlinghurst Gaol, they ought to be made to work.

1333. It was suggested to us by a former witness, that a treadmill might be erected at the Lachlan Swamp, and that the prisoners might be made to pump the water up to the Paddington reservoir—What do you think of that? I think that we have got past the age of treadmills, and can employ convicts more beneficially.

1334. You would not object to the thing as far as the prisoners are concerned, but you think they could be more usefully employed? Yes; if fellows won't work I should not object to placing them on the treadmill, because they would be obliged to work there.

1335. *Mr. Woore.*] If convicts are assembled at these outside places, it is a question whether the advantages of their labour would not be more than counterbalanced by the great expense of keeping them? But you must keep them, even in gaol; and I think the cost of escorting them to and from the works would be trifling.

1336. It seems to me that the cost would be entirely additional, because the gaol would have to be kept up as well? Of course it would; but I consider that we ought to try and inspire hope in our convicts. This might be done by allowing the privilege of working (for I consider it a privilege) to those who behaved themselves properly.

1337. Do you think you could get sufficient work out of convicts to pay for keeping them? That would depend upon circumstances—whether you have to erect extensive works. But that will not apply to my recommendation;—you have the gaol and the men at a reasonable distance from the work. I cannot conclude my remarks without again calling your attention to the fact of the Mayor and Aldermen selling a portion of the Water Reserve, which I consider a most insane act, and feel sure if the citizens were aware, they would at once convene a great public meeting to protest against the alienation of any portion of the land in question.

WEDNESDAY, 25 MARCH, 1868.

Present:—

PROFESSOR SMITH,
MR. MORIARTY,

MR. WOORE,
MR. ADAMS,

MR. GRUNDY.

PROFESSOR SMITH, M.D. (PRESIDENT), IN THE CHAIR.

Edward Bell, Esq., C.E., called in and further examined:—

E. Bell, Esq., C.E. 1338. *President.*] We should like to know the opinion you have now formed of the dams at Botany, after the experience you have gained during the late heavy rains and floods? Do you mean of the three upper dams or of the three lower dams, or of the whole of them?

25 Mar., 1868.

1339. Of the whole of them. We should like to have your general opinion of that system of dams? I think very little improvement could be made upon that system of dams for that swamp. I would of course prefer to have a clay bank in them if I could get it, but it is so difficult to get clay in the neighbourhood, and so expensive. The bog forms such an impervious dam, that I am almost as well satisfied with a bog bank, properly put in, as I would be with a clay one. It may be a matter of opinion, but I think it would be as well if each of those dams had another weir, with a self-acting sluice.

1340. But the principle of construction you think is sound? Yes.

1341.

1341. Under the circumstances? Yes; it may be desirable perhaps to make a few alterations in detail, but the principle is sound. E. Bell, Esq.,
C.E.

1342. The fact that three of them have been partially destroyed by these floods has not shaken your confidence in the principle of construction? No; the principle of their construction is correct. The partial destruction of the three lower dams is attributable to the stupidity or negligence, if nothing worse, of the man who was in charge of them. These dams were being constructed across the swamps, of timber, bog, and earthwork, between high natural banks of sand which skirt the margin of the swamps on both sides; they are, in fact, earthen embankments; and no earthworks, whether natural or artificial, will bear the action of a stream of water passing over them without certain destruction. The dams have been planted with couch-grass, and when this has grown so as to cover the embankments entirely, they will endure the action of water passing over them for some hours. The dams are about 14 feet in height above the level of the swamps, and were intended to sustain in the ponds above them 8 feet head of water. In each dam there is a sluice placed in the natural watercourse, the object of which is to regulate the flow of the stream towards Botany. There is also a weir to each dam, placed at an elevation of 8 feet above the level of the swamp, to admit of an overflow in the event of the stream being greater than the sluices will discharge, and thus prevent the water from rising in the ponds so high as to run over the earthwork of the dams. The general orders given to the man in charge, when the use of the sluices was explained to him, were, to allow no water to pass over the weirs whilst it could be passed off by the sluices, and his business was, when he saw the water rising in the ponds, to leave open the sluices, and allow their full and free operation. Instead of this, he shut down the sluices; and although strongly urged to the contrary, pertinaciously kept them closed, and allowed the water to pass over the top of the natural soil at the end of the artificial embankment of No. 3 dam, to its imminent peril and destruction. The dams Nos. 4, 5, and 6 were very little damaged by the flood; their sluices being kept shut, subjected them to far greater strain than they were ever intended to bear, yet they withstood it admirably; but had their sluices not been opened when they were, much damage must have occurred to the natural soil at the ends, which is lower than the dams themselves, by the action of water passing over and carrying away the natural sand formation. The ends of Nos. 1 and 3 were carried away in this manner, but the artificial embankments remain undisturbed and very slightly injured, although they were unfinished, and the pressure of water against them was 12 feet instead of 8 feet. No. 2 dam was in a very unfinished state. The timber-work was very badly done, and like that in Nos. 1 and 3, not at all according to contract. The filling or earthwork of No. 2 was not half done. If these dams were commenced in June and finished in January, as Nos. 4, 5, and 6 were, before the flood season commences, they could be made perfect; but they cannot possibly withstand the storm waters in an unfinished state, or during the time of their construction. The damage which the dams sustained was entirely attributable to the sluices being kept shut; and in order to prevent a recurrence at any future period, I recommended the immediate insertion of a self-acting sluice in each dam, in addition to the existing sluice, which is under the control of, and dependent upon, the man in charge. A self-acting sluice would, when the water rose to a certain height, open itself and allow storm waters to escape, without the aid of any one.

1343. And what happened then, in your opinion, did not prove any inherent weakness in the dams? No. The timber-work of the three lower dams (Nos. 1, 2, and 3), I should remark, was very badly executed; I was too ill at the time to devote any personal attention to them, and the work was very badly done; in fact it was condemned, and as far as practicable rectified by the Corporation after the fact was discovered. The work of the three upper dams (Nos. 4, 5, and 6) was very superior; they were, in fact, made very nearly according to contract. The wooden piles in those three were driven into the hard ground, but not so in Nos. 1, 2, and 3; part of No. 4 was slightly neglected, but the rest of it is very fairly done. If the workmanship of the whole of the dams had been done in like manner to Nos. 5 and 6, and the sluices had been attended to, we should have had no trouble with them.

1344. Does the Municipal Council intend to rebuild these three dams? Not at present. There was a resolution passed that they should not be touched until some inquiry had been made.

1345. And have they instituted any formal inquiry into the construction of those dams? They have not yet.

1346. And they will delay restoring those dams until such a formal inquiry has taken place? I do not know whether they will or not.

1347. I think that, in your former evidence, you stated that on the site of No. 4 dam you had proposed a much more extensive construction? Yes, that is on the site of what you may term No. 4 reservoir.

1348. After the additional experience you have gained in regard to those dams, do you still think that a very large reservoir could be formed there? Yes.

1349. With an embankment of a much greater height? The reservoir could be executed to a much greater depth. The depth of the bog is 18 feet. It might very well be excavated all over to a depth of 18 feet, and then I presume that no flood waters could ever affect that in any way. In addition to having the bank increased in height, you would have a larger dam.

1350. Has the general soakage through the dams been greater than you expected? No; rather less—in all of them less.

1351. And you would not hesitate to build a higher embankment, on the same principle, to retain a greater depth of water? No, I would not hesitate at all. I know now exactly what that bog will do, and I know exactly what weight of sand is necessary to keep it down.

25 Mar., 1868.

E. Bell, Esq., down. That was not known before, and we had no records from which to obtain such
C.E. information. It was merely a matter of opinion or judgment. Now I know perfectly well
what can be done with the bog, and what weight of sand is necessary to make an impervious
bank, because I conceive that it is only a question of weight after all.

25 Mar., 1868.

1352. Is there any obstacle in the way of greatly increasing the size of the engine-pond?
None whatever.

1353. Would it not be advisable to make that a much larger storage reservoir than it is?
Yes. I think that if any of them were extended in size so as to contain more water, it would
be an improvement.

1354. Would it not be easier to make a large storage reservoir of the engine-pond than
any of the others, in consequence of the deposit of clay upon the rock there? On that side
it would; but on the side next to the village of Botany it would not be very easy—it would
be an expensive work. On the sea-shore it would be very easy. In fact, the present
engine-pond might be carried out on the shore to the extent of 200 acres further than it is
now. That is a very eligible site for making a dam very cheaply. But to carry out a
work for a deep reservoir on the site of the present one, and within the reservoir fence,
would be rather an expensive work, so close as it is to Botany.

1355. But you think it would be more easy to extend it seaward? Yes.

1356. There is plenty of good clay there for puddling, is there not? There is plenty of
clay.

1357. And the rock is not far from the surface? The rock is near to the surface. It is not
fit for building, but it is good for rubble. The clay is excellent. There is stone very handy.
I believe it would be an immense improvement to Cook's River if some such work as that
were carried out, so as to narrow the mouth of the stream there and keep the channel
deeper than it is now.

1358. But is there any value in Cook's River as a means of transit? I think there would
be, if the depth of water were greater than it is now. The coal-ships now that supply the
engine-house with coals draw 6 feet. Vessels have to be made almost specially for the
trade.

1359. I think you proposed a dam not far below the tunnel, on the site proposed long ago
for a dam? I do not know whether that is a site proposed long ago, but it was near the
road. There was a dam I know proposed higher up.

1360. Do you know where there are a few piles driven? Yes.

1361. Is that the site of the dam? No; that which I proposed is near the Randwick
Road, where the two hills approach each other more closely than in any other part. It is
within a hundred yards of the Randwick Road.

1362. Would it not be a good thing to endeavour to construct a very large reservoir in
that position, and then pump the water directly up from that to the Paddington reservoir,
instead of allowing that body of water to go down to Botany? For the supply of the higher
levels it would.

1363. Would it not be much less expensive to pump it up there, than to allow it to go to
Botany and pump it up from there? No, I think not. The cost of coal is much cheaper
at Botany than at Randwick; we are paying less than half the price for coal to work the
engine on the Randwick Road. We paid 36s. and 38s. for coal on the Randwick Road,
but we never paid more than 15s. at Botany for a much better steam coal.

1364. So that the advantage in respect to height would be counterbalanced by the increased
expense of coal? Yes, unless we could get coal much cheaper than we have hitherto been
able to get it. That question was studied when I first took the works in hand, and it was
proved beyond a doubt that, at the price we were then paying for coal, it would be cheaper
to pump the water from Botany than to place the three engines at different intervals in
the stream, or to place one or two of them near the Randwick Road.

1365. Can you tell us how much water is pumped up to the Crown-street reservoir by the
expenditure of a ton of coal? I could, but I cannot tell you from memory.

1366. Can you tell us what is the expense of pumping (say) a million gallons? I have
taken the entire cost of the pumping establishment at Botany last year, inclusive of repairs
of machinery and renewals of pumps, at £4,700; and as 956 millions of gallons were sent
in during the same period of twelve months, the average cost per million gallons was, as
nearly as possible, £5. If we have reservoirs to contain as much water as the three engines
would pump in, the average cost would be decreased considerably.

1367. I should like to know what is the expense of pumping a given quantity up to
the high level reservoir? There is not a very great deal of difference, but in the course
of the year it would be felt. We work with the same pressure of steam to the high level
as to the low; but we throw one more grade on the lifting side of the piston—that is, the
side of the piston which lifts the bucket of the pump. Instead of cutting off the steam at
one-fourth, we cut it off at one-half. The consumption of coal consumed is, of course
greater, but it is difficult to arrive at the exact cost, because the high level reservoir being
small, the engines require to work to the high level only a few hours consecutively.

1368. Is the present main from Botany quite strong enough to send the water to a much
higher level—say up to Waverley? No, I think I would not trust it to work to a higher
elevation than I do now. The head of the present main is on the sand-hill between
Botany-street and the Barracks, and the water finds its way by gravitation from the sand-
hill to the high level reservoir at Paddington. Of course the column of water is the same
against the engine; but the water has not to travel so far in the main from the engine as
it would do if that main were extended to Paddington.

1369. Then, if you were to construct a reservoir for Waverley and the highest parts of
Paddington, how would you fill it? I would pump from one of the other reservoirs, or
from

from the Lachlan Swamp, but I would prefer to pump to Waverley from a large reservoir which I propose to make on Sydney Common, and from that place I could supplement the supply, if necessary, to Paddington, Crown-street, and Hyde Park, during dry seasons.

1370. By an independent engine? By an independent engine. I should supply Waverley, and when necessary, supplement Paddington. To Hyde Park it would run by gravitation, and to Crown-street reservoir also, while the Sydney Common reservoir was more than half full. I should not require for the purpose anything like so large a main as we have now from Botany to Sydney.

1371. Is it possible to greatly extend the area of the Crown-street reservoir? Yes, it might be made double the size it is at present; we have land sufficient to make it as large again as it is now.

1372. And could the Paddington reservoir be greatly extended? To any extent required.

1373. Are there facilities for forming a large open reservoir in the vicinity of Paddington or Waverley? Yes, there is a very good site for the formation of a reservoir near the site of the windmill at Paddington, and a very eligible site at Waverley.

1374. Is there plenty of clay there? There is plenty of ironstone, gravel, and clay too, at Paddington.

1375. At that elevation would not an open reservoir be quite sufficient? I would not recommend it at Paddington; I would cover that reservoir; it is too near the settled districts of Sydney and the suburbs to allow the water to remain pure.

1376. Do you know the height of the highest land in Sydney covered with houses that ought to be supplied? In the city of Sydney?

1377. And the suburbs? No, I cannot give you the height of the highest land in the suburbs to be supplied with water; the highest land in the city is about 189 feet, and that is supplied.

1378. Is Waverley about the highest land in the suburbs? I think it must be; in fact, I believe the site I propose for a reservoir is the highest point around Sydney for several miles.

1379. Do you know the highest part of Waverley? 320 feet above high-water-mark, and that is the site I suggest for the reservoir. I believe the highest part of Paddington to be 226 feet.

1380. Does the Sydney municipality charge for the water in the suburbs in the same manner as they charge in the city? Exactly.

1381. Five shillings a room? Five shillings a room.

1382. Have the suburban municipalities any control over the water supply? No.

1383. And as soon as a main is carried along a street in a suburban municipality, I suppose all the inhabitants are rated? All are rated as soon as the main is laid.

1384. But I suppose they are not rated at all until there is a main in the street? No; nor is there a main laid in a street unless a majority of the inhabitants of the street petition for it, and very often not then for some time.

1385. Returning to the question of reservoirs—Do you think it would have been better to construct large water-tight reservoirs in and about Sydney, than those dams in the Botany stream? I think that dams in the stream are indispensable, but in any case it would be better to construct large reservoirs in and about Sydney; because if you have these reservoirs in town the water is safe. If there should be any accident to the pumping engine, or any defect in the main, you would still have the water in store to supply the town for some time without pumping.

1386. And the present engines could in rainy weather pump up a great deal more water than is required for the city? Yes.

1387. You could therefore fill the reservoirs in wet weather with a supply that would hold out during the dry weather? Yes.

1388. Is the iron piping that is used entirely unprotected, or has any been procured with a protecting coat internally? No; the 30-inch main is neither protected internally nor externally. When that main was ordered, I believe the utility of Dr. Angus Smith's process had not been developed.

1389. It must be a great source of loss, using unprotected piping. The smaller piping is being rapidly choked up, I believe? No; we have not had any choked up that have not been under ground for twenty years. All the piping we lay now, and have done for the last four or five years, is coated by Dr. Angus Smith's patent process, and keeps perfectly clean.

1390. And as the old piping is taken up, new piping will be laid down in that way? Yes.

1391. In rainy weather there is generally a large quantity of water running to waste from the Sydney end of the tunnel? Yes.

1392. Is there at present no means of utilizing that water? No. I suggested a method which would prevent it from flowing over Hyde Park and into the streets; that is, by stopping the tunnel where the land in the park is higher than the old terminus. The land at the end of the tunnel would then be higher than it is at the Lachlan, and consequently the water could not run over. This has been carried into effect.

1393. But the best way, I suppose, would be to carry out your plan of forming reservoirs in Hyde Park? No doubt the overflow of the Lachlan in wet seasons ought to be run into reservoirs in Hyde Park by gravitation, instead of being allowed to run to Botany; a very much larger quantity of water might then be brought in by gravitation than now. Heretofore it has been partially stopped from flowing in during wet weather by a gate or sluice, because there are no means of storing it for use in dry seasons.

1394. I think you told us that when the water in the tunnel gets very low, the pipes usually supplied by the tunnel are then supplied from Crown-street? Yes, some part of them.

E. Bell, Esq.,
C.E.

25 Mar., 1868.

E. Bell, Esq., 1395. Is the tunnel water in such a case turned off and entirely wasted? No. Three or four of the lowest districts are always supplied from the tunnel; such as the lower part of Woolloomooloo, the lower part of Parramatta-street, the lower part of Kent-street, and a few other places. As the water decreases in the tunnel, we would shut off Parramatta-street, and throw on the supply from the Crown-street mains. As the water still further decreases, we turn off Kent-street from the tunnel supply, and give the water from Crown-street.

C.E.
25 Mar., 1868.

1396. And you would so do it in detail? Yes, we just manage to suit the supply.

1397. Will you please to give us an estimate of the cost of the construction of reservoirs, covered and uncovered? This depends on so many circumstances that it is almost impossible, unless a spot is indicated and the nature of the sub-strata known. The reservoir I propose to make on Sydney Common would be very large—it need not be covered—and in consequence of it being a large natural basin, the earthworks and excavation required to convert it into a reservoir would be very small in proportion to its extent and capacity. I believe the sum of £35,000, which I named for it, will be sufficient to form, puddle, and complete it.

1398. Do you know the total quantity of water pumped up by the engines during last year? Nearly 956,000,000 of gallons.

1399. *Mr. Grundy.*] You said that the flood water carried away the natural ground near the Botany dams, but not the dams themselves? Yes.

1400. Is not that a greater difficulty to overcome than if the floods had affected the dams themselves? No, I think not.

1401. Any fault in the construction of the dams could be remedied, perhaps easily; but if the floods carry away the natural ground, it appears to me that the difficulty would be more serious? Not at all. We have merely to fill up the space with an embankment.

1402. You must fill it up all round, and then it would not approach the natural ground at all? We have not swamp to contend with where the natural ground is washed away. We can put a bog or sand-bank on the natural ground at a quarter the price we can put an embankment across the swamp.

1403. But that would only drive the difficulty further back until you get above the higher level of the water? No. If the sluices are kept shut instead of being open in storm-time, and the storm-water is not allowed to escape during excessive floods, the water will run over the embankments at some place or other, and, as I have before stated, no earthworks will bear the action of water passing over them. Steps must be taken to prevent this, and the responsibility must not be dependent on any person. The embankments were not finished at the time of the flood, and the natural surface of the ground was lower by the depth of a foot or eighteen inches than the dams themselves, because the former was not covered with sods and finished. The dams require to be made about a foot higher in the centre than the ends, so as to allow the middle, where the bog is steepest, to settle, and so that, when it had settled, the dam, instead of being hollow, may be straight. Before it had time to settle, the water came over the ends, and in consequence of the proper escape for the water being closed, the water ran over, and carried away a portion of the natural soil at the ends of the artificial dam, but not the dams themselves.

1404. *President.*] Have you any regular means of inspecting the houses supplied with water, to see that everything is in good order? Yes; and we have the power to cut the water off from any house where we discover a leak and waste, if it is not remedied at once. Notice is served as soon as it is discovered, and if it is not remedied that day or the next, the water is cut off until the repairs are made.

1405. But in spite of that there is great waste? Yes, there is an enormous amount of waste. The chief waste arises from allowing persons to use other than self-acting cocks and water-closets, and by leaving the taps open permitting the water to run night and day.

1406. Do you not think that the only means of distributing the water fairly would be to make the consumers use meters? Yes, it would for all large consumers; but there would be a difficulty in the use of very small meters for house services. The Sydney water gives a brown vegetable deposit, which would clog the screen placed in the meter to prevent any large substance getting through. When meters are clogged and out of order, there is difficulty in getting them put right again. If the water were filtered, there could be nothing better than Simmons' patent meters, but they are clogged by this deposit, and the difficulty is to force people to get them cleaned.

1407. *Mr. Woore.*] Does that deposit injure the pipes? No, but it prevents the proper action of small meters, unless they are carefully attended to.

1408. Do the pipes soon get foul? The 20-inch main, which has been laid eleven years, and in work for ten, has got a crust inside of $\frac{1}{8}$ th or $\frac{1}{16}$ th of an inch thick on the lower side.

1409. *Mr. Moriarty.*] With regard to the reservoirs which are proposed. On page 14 you have given some estimates for reservoirs in the city, which you consider necessary for a permanent and sufficient supply. You do not, I think, there include the cost of the Hyde Park reservoir? If I did not, I can state the price of construction.

1410. How much would have to be added to that £130,000 for the Hyde Park reservoir? I stated, in question 287, what would be necessary for the present time or for some few years hence.

1411. The Hyde Park reservoir was supposed to form part of a scheme, and I think it was omitted to ask you what its cost would be? I think for the making of the reservoirs in Hyde Park and covering them, you could not put down less than £10,000 or £11,000 an acre.

1412. Do you think £11,000 an acre would be sufficient to include the cost of excavation and covering? Yes.

1413. *President.*] What depth are you supposing they would be? About 16 feet.

1414. And they would cost £11,000 an acre? Yes.

1415.

1415. *Mr. Moriarty.*] Have you formed any estimate of the number of acres you would propose to make this reservoir in Hyde Park? I have stated its capacity, in my reply to question 333, at 20 millions of gallons. This would require a space underground of about $5\frac{1}{2}$ acres.

E. Bell, Esq.,
C.E.
25 Mar., 1868.

1416. Your project is that the stream of the Botany Swamps, supplemented by the dams and by certain reservoirs, will give an adequate supply? Yes.

1417. You have given us the cost of certain reservoirs, but I find that the one I understood to be the most important is omitted; I want you to endeavour to supply that omission now? I do not deem the Hyde Park reservoir the most important one; but the others, for the supply of the city and suburbs, I deem to be indispensable. The reservoir at Paddington is expensively made. We shall shortly be able to get hydraulic lime here (so I am told); and if we do, we shall be able to make the walls of these reservoirs much cheaper than formerly. I estimate the cost of the reservoir I propose in Hyde Park at £55,000.

1418. Are there any other expenses connected with the pumping, than the £4,700 you have given us—does that include the whole cost? Yes, wages and everything.

1419. And the £24,000 is the amount of the rates received per annum for water? Yes.

1420. That is, from the 75,000 people already supplied? Yes; the revenue for the half-year was £7 over £12,000.

1421. So that if the whole population of the city and suburbs were supplied, a corresponding increase of revenue might be naturally expected? Yes.

1422. *President.*] Do you think the inhabitants of Sydney would submit to a higher water rate for a more abundant supply of water by gravitation? I think not if they could help it. They are crying out loudly now about the rate. It is difficult to get the water rates in, and particularly so in the suburbs. I find that the manufacturers complain of the price of water at $7\frac{1}{2}$ d. per ton.

1423. Is that the charge by meter? Yes. Some of them when they have worked for three or four years by meter we can average and reduce to a special rate, but then it sometimes happens that they use a great deal more in consequence; some of them are very careful with their meters. After the rate that has been levied, I think it would be difficult to get more than 5s. from the citizens.

1424. *Mr. Moriarty.*] Could the price not be increased if you gave them any additional quantity of water? No; the houses have now as much as they can use. They have a constant service at their command. It is the factories, the steam-engines, and so on, who would use a great deal more if they could get it cheaper; but I doubt if they would use more water if it were not cheaper. Even now, pressure is brought to bear upon the Aldermen when they go up for election, with a view of obtaining a reduced rate.

1425. The water revenue is abundant to meet the expenditure? Yes; and to increase the works too, I think.

1426. Does it also pay interest on the plant? Yes.

1427. I want to get the working expenses? I have not got that. There are some men we keep constantly at work at the mains,—drawing plugs, attending to leaks and services; the expense of these goes into one fund, under the head “General City Works.”

1428. Do you not keep “works” and the management and distribution of the water separately? No.

1429. Could we get those accounts? I do not think we could get them separately.

1430. It seems to me that one should go down to the “capital account,” and the other to the “working expenses”? Your expenses in that respect would be just the same, whether you brought the water in from one source or another, that is, the city service expenses.

1431. I want to ascertain the amount available, after paying all these expenses, to go to interest on capital? On the half-year that £4,000 is charged, there were 6,000 yards of main laid; 1,460 yards of 3-inch, 3,642 yards of 4-inch, 1,000 yards of 6-inch, 51 yards 9-inch, and 229 yards of 12-inch.

1432. Now could the cost of these things be put down separate from the gross amount—the balance would perhaps be the working expenses? It could be worked out by calculation. For instance, we pay about ten guineas a ton for the pipes; and the cost of their laying and other expenses might easily be arrived at, if one had the time to devote to it, and could know the nature of the ground.

1433. Do you mean additional? The cost of the pipes is ten guineas per ton. One contract may be £10 7s. 6d., and another £10 12s. Ten guineas is a fair average. The cost of laying is additional. That must depend on whether they are laid in rock or soil.

1434. *President.*] Is there a surplus in the amount of water rates, after paying all the expenditure on account of the water supply? No doubt can be entertained about it; and there is a considerable fund towards new works.

1435. Is that reserved for new works? I cannot say; the Treasurer would be able to tell you. You would get from the City Treasurer more information than I am able to afford relative to the accounts.

1436. But the present water rate is more than sufficient to maintain the present water supply? Yes.

1437. And to extend the mains into the suburbs? It is more than sufficient to keep the present works in operation and repair, and to pay the interest on the debt too.

1438. *Mr. Moriarty.*] You do not know how much of it would be available to pay interest on a new debt if it were incurred? No; the rate must be considerably increased. We laid 6,000 yards of pipes in the half-year to which I have referred, and the rate shewed a balance of £184 on the half year. The debt is £282,000.

1439. *President.*] Are the present pipes sufficient to distribute a greatly increased supply? Yes; but it would depend upon where you brought it in. If it were brought in at a different

E. Bell, Esq.,
C.E.

different place from that where it is brought in now, we should want new mains from that part to the town—to the reservoirs. The distributing mains, as they extend in distance from the reservoir, decrease in size.

25 Mar., 1868. 1440. *Mr. Woore.*] Would the present mains be large enough to supply much larger pipes? No; in many places now we are obliged to take up the main and put in a larger one. We are going to do so in O'Connell-street; we have already done it in Macquarie-street. The majority of the pipes used to be 3-inch, but now not more than 1,000 3-inch are laid to 3,000 or 4,000 4-inch.

1441. It is not economy to lessen the size of the pipes? No. The only use I now make of 3-inch pipes is to put them in remote corners, where only a small supply is wanted, and where it would be simply a waste of money to put in a larger pipe.

Since the foregoing evidence was given, I accompanied the members of the Water Commission to point out the sites I proposed for the reservoirs at Sydney Common and Waverley; and on that occasion I promised to furnish the particulars of the heights, extent, levels, &c., of the Sydney Common sites. These have been carefully taken, and I find that the average height of the hills which surround the basin is 142 feet above high water mark, that the length from north to south is 40 chains, and the width from east to west is 20 chains. The levels taken on a line drawn through the centre (from north to south) of the basin shew the elevation of the hill at the northern end to be 148 feet, and the southern 132 feet above high water spring tides; and the bottom of the basin to range from 101 feet, at the northern end, to 91 feet above high water at the southern end. Hence it is quite practicable and easy to convert this natural basin into a reservoir, 40 chains by 20 in extent, with a summit water-line of 137 feet above high water, and 94 feet on the bottom. This would contain (850,000,000) eight hundred and fifty millions of gallons, and would supply the Crown-street reservoir to as low an elevation as 120 feet by gravitation, and Hyde Park tunnel to 104 feet. When the water was below those elevations in the Sydney Common reservoir, any supplementary supply would have to be given by steam power to Crown-street and Hyde Park—in like manner to Paddington and Waverley. If this splendid natural basin were converted into a reservoir, as I have suggested, and the extensions in Crown-street and Paddington be made, we should be able to store, in the town and its immediate vicinity, 891 millions of gallons of water for use under any emergency, in addition to the stream which is constantly flowing in from the Lachlan Swamp, viz. :—

Sydney Common Reserve	850 millions
Crown-street and Extension	8 "
Paddington and do.	8 "
Waverley	5 "
Hyde Park	20 "
Total	891 millions

being sufficient water, together with the Lachlan Swamp stream, to supply Sydney and suburbs for a whole year, without pumping at all.

After careful measurement of the basin in Sydney Common, I estimate the cost of converting it into such a reservoir as I have described, together with an engine and the requisite pipes, &c., will not exceed

...	£56,000
The Hyde Park reservoirs	55,000
An open reservoir at Waverley	9,000
A covered reservoir at Newtown	24,000
Extension, Paddington and Crown-street	40,000
					<u>£184,000</u>

TUESDAY, 7 SEPTEMBER, 1869.

Present :—

PROFESSOR SMITH, | MR. ADAMS,
MR. E. O. MORIARTY.

PROFESSOR SMITH, M.D., IN THE CHAIR.

The Hon. Thomas Holt, M.L.C., called in and examined :—

The Hon. T. Holt, M.L.C. 1442. *Chairman.*] We have had from you several letters on the subject of supplying Sydney with water from George's River. Since writing those letters, you have no doubt considered the matter further? Yes.

7 Sept., 1869. 1443. Perhaps you would be good enough to state now your matured views on the subject? The more I see of the country, the more convinced I am that it is very easy to provide Sydney with an almost inexhaustible supply of water at a comparatively trifling cost. To accomplish this, two or three, or more, ways would present themselves, and we could ascertain which is the best only by an accurate survey of the country. A friend of mine, with whom I have been over the country, has suggested to me an idea which I think far better than any I have suggested myself, inasmuch as it would provide two different sources of supply—one for manufactories, and another for the city itself. We have been over the ground

ground together since the Commission met, and, as far as I can see at present, I am convinced that his scheme would be the best. He suggests that there should be a dam constructed on the west side of the present waterworks, where the water is shallow. This would make a road across Cook's River, and enable the citizens of Sydney to have easy access to the beautiful Seven-mile Beach. He suggests that a channel should be cut from Shea's Creek to the other side of the dam; and by means of this canal, he says, coal could be brought to the manufactories, which could be uninterruptedly established from Rickety-street, St. Peter's, to Rocky Point or (Sans Souci). He points out that there would be an inexhaustible supply of water from the swamps and from George's River (which could be let into the swamps when the water of that river is made sweet); but what he attaches great importance to is, the easy provision which could be made for disposing of the surplus water after it has been used. I know the importance of this, from what I have seen myself in Leeds and other manufacturing districts of England. When I was in Leeds, not very long ago, I was struck with the fact that some streams which, thirty years before I had known to be pure, were then quite black. I have also read a great deal of the evidence given before the Commission appointed to inquire into and report upon the pollution of rivers. I find that wherever manufacturing districts have been established, the first thing has been to pollute the water. What were before clean and wholesome streams became discoloured and impure; but, by availing ourselves of the swamps to which I have referred, all this might be entirely obviated, and manufactures to almost any extent could be carried on if effect were given to this idea of my friend, with whom I went over a portion of the ground yesterday. By small cuttings the swamps would connect George's River with Cook's River. There is from Rickety-street to the Cook's River a reserved road along the swamp. This road has never been used, and probably never will be. A canal might be cut along it without purchasing an inch of land; and thus water communication could be continued from St. Peter's all through the swamps to Sans Souci. Between George's River and the swamps there is only a distance of two or three hundred yards. Therefore, when the George's River is made sweet, supposing that a dam should be constructed at Sans Souci, the two waters can be readily united, and the united waters of the two rivers (George and Cook) and the swamps used for manufacturing purposes. And with respect to the supply of water for domestic use in Sydney, it is questionable whether it would not be desirable to have the pumping higher up the river; and if so, that original idea of mine, to bring the waters along Woolli Creek, could easily be carried out without any cutting, where the ground rises, near Saltpan Creek. The water might be conducted in the same way as it was originally taken part of the way into London by the New River Company—by conduits of wood. It could be raised by turbines or centrifugal pumps, and carried in a direct line through the valley to a point near the foot of Camden-street, Newtown. It is a question whether it would not be much better that the pumping of the water for domestic use should take place at a little distance from the dam. It would certainly be better if there were any leakage of the dam, which, however, ought to be avoided, and which I do not think would take place. But if the pumping took place higher up, I should think Saltpan Creek the best place. Since my attention has been directed to this question, I have never ridden or walked out without observing the face of the country, and seeing how easy it would be to furnish an abundant supply of water to the city of Sydney. Nature has done so much for us. There is in George's River one of the most beautiful reservoirs in the world—it has stone sides all the way to Liverpool, a distance of 28 miles—it has tributaries of considerable extent, and one of the finest watersheds on the face of the earth. Two or three floods would, in my opinion, make the water of that river as sweet as it could possibly be. I speak from experience, having lived for some years on the banks of George's River; and we drank nothing but the water of George's River, which was formerly as brackish, probably, as that of the ocean. It was kept sweet by means of a dam. Since that dam was erected, two large works have been erected, one for wool-washing and the other for the manufacture of paper. But I can give you a better instance of what may be done by a little dam. I refer to that at Cook's River, near Canterbury. Mr. Lucas was the contractor. He told me that his contract price was £146, and that so satisfied were the directors of the Sugar Company with the work that they gave him £160 for its construction. The result has been in this case the establishment of a large wool-washing establishment, at a cost of several thousand pounds, which uses an enormous quantity of water. The washing of wool requires a large quantity. If these two small dams have been so beneficial, how much greater benefits might not be derived from a dam over George's River at Sans Souci? The present dam over George's River at Liverpool dams what may be called only a creek. There is no storage capacity of any magnitude above the dam. I have known the water to rise there thirty-five feet in twenty-four hours. One of my men lived on the bank of the river, in a position which was considered to be perfectly safe; but on one occasion the water rose so rapidly upon him that he could not escape, and he was obliged to make an opening through the roof and sit on the top of the house for twenty-four hours before we could rescue him. But there are no floods of the kind lower down George's River. At Sans Souci, I do not think the floods ever rise more than two or three or six inches at the most—there is such a large opening. You might there store the water any height you please. There are wonderful facilities for making weirs, either at Cummings' Point opposite Sans Souci or at Tom Ugly's Point, where there is a promontory of solid rock which would only require a little scarping to make it available; or at Kangaroo Point, a little higher up the river. On these three points there could be weirs made to let off any quantity of water, so that a dam might be placed across the river without causing any flood whatsoever. The water could always be kept at one height. At the Liverpool and Cook's River dams there are no such facilities; and the consequence has been that, in times of flood, the dams have been greatly injured. The Liverpool dam was

The

7 Sept., 1869.

The
Hon. T. Holt,
M.L.C.
7 Sept., 1869.

once nearly washed away, and the dam at Cook's River has been so disturbed that it has cost a considerable sum to repair. But at any of the points I have mentioned on George's River there would be no danger of such injury to the dam. All that would be required would be to make the dam sufficiently high, and there are natural weirs over which any quantity of water could flow. By means of the numerous tributaries, the water would, I believe, always remain at the same height. From a calculation I saw made a short time ago of what pumping would do, it appears to me that all the pumps which would be required for a length of time would only reduce the water to so small an extent that the diminution would be scarcely perceptible. I think you mentioned, Mr. Moriarty, that the reservoir in George's River, between Sans Souci and Liverpool, would be about 3,000 acres; the Woronora would be one or two thousand more; but the source, now called Croton Lake, since the river was dammed, which supplies New York with water, is only five miles in length. This proposed lake of George's River may be compared to Windermere; and I think Windermere is only twelve or thirteen miles in length. I believe the capacity of George's River for storing water is as great as that of Windermere. There need be no doubt as to the quantity of water. When once the river was made sweet, the supply is so immense that there would be sufficient for London itself. I do think this matter is well worthy the attention of the Water Commission. And again, what would be the expense of making a dam? If you can make it without any cut stone or cofferdams—by merely piling up suitable materials—no skilled labour would be required. And I would particularly call your attention to what is said about metal roads, as being applicable to this subject. Macadam made a remark which, since I read it, has been often in my mind. He says—if stone broken to a proper size be laid down without any other material, the rough edges will join together so as to make one compact mass. I have read recently of one road being broken up which had only four inches of stones, and underneath the crust it was perfectly dry. It had been impervious to wet. Macadam lays stress on roads made in this manner which will become one solid mass, or as he puts it—"like boards." In making a road through swamps, too, these stones do not spread out and sink in the swamp, but become a solid mass. If that be the case, I think there is a new era in dam-making. Dams are more required in this country than perhaps in most others; and if we can make compact, solid dams, of broken stones in the same way that we can make a hard road, they will no doubt be very extensively constructed. When dams are made solely of sand without any counteracting force, such as the dams made by Mr. Bell, the City Engineer, at Botany, they cannot stand. If such a dam were constructed across George's River and a considerable body of sand on each side, I believe it would answer exceedingly well, and that it could be made at a comparatively trifling cost.

1444. You still think there ought to be a dam constructed at Rocky Point, of loose material—not a masonry dam rising from the solid rock? I think it would be a gross waste of money to have any masonry. I would have nothing but such material poured in as is spoken of by Macadam—stones properly broken and a sand beach on each side. I have spoken to many gentlemen on this subject, and they are of the same opinion as myself. Mr. Woore (Mr. Mort told me) has erected a similar dam, not of these rough stones, however, but of gravel, on the Wollondilly. This dam is impervious, and retains the water without any leakage. It is made simply of gravel and sand.

1445. But large filters are constructed exactly from these materials. At the Chelsea Waterworks, for example, some years ago, they had filter beds, each covering an acre, and they were made of a certain thickness of large stones, than smaller stones, gravel, and fine sand. Such a mixture is found to be freely pervious, and if it can be so used as a filter bed, how can it be used also as an impervious dam? But it is used; and these are the materials nature makes use of. Sand, and sand only, nature makes use of to enclose a large part of Holland. This is the material, too, which you find on nearly all the sea-coasts. I do not think we could do better than follow what nature has done and is doing.

1446. You recognize the necessity of having a watertight dam, I think? It would not do to let the salt water percolate through into the fresh water; but I do not think there would be any fear of that, because I think the fresh water would be always higher than the salt water.

1447. It would be necessary to keep the fresh water some feet above the salt water, would it not? I doubt the necessity, but I think it would be desirable to do so. When you got up to low-water-mark, you might fill up the centre with clay. That is what Mr. Lucas did, in the dam he constructed over Cook's River, at Canterbury.

1448. Was your experience of the water at Liverpool such as to make you confident that it would be good in all seasons—I mean the water of George's River? It was always good. A short time since I asked the opinion of a gentleman whose father was a clergyman there. I said—"What do you think of the George's River water at Liverpool?" and he said—"There is no better water in the world."

1449. We have had the evidence of Mr. Atkinson on this point. He was asked if he had a knowledge of George's River, and he said he knew it very well. He was asked if he thought that would be a preferable source of supply to the Botany stream; and he said—"Decidedly not." He said—"There is fresh water above the dam at Liverpool, but you could pump it all out in about twenty days." Then he was asked—"You think that in dry weather the supply is small?" He replied—"Yes, and as I said before, sometimes the water is bad, although at other seasons it is good." He does not say in what respect it is bad.

1450. He was asked—"In dry seasons does the water become brackish?" and he says—"Yes, it has a taste of salt." That may arise because the dam is not perfect. I do not consider that dam well constructed by any means. At one time it was injured, and for a lengthened period the salt water did flow through.

1451. *Mr. Moriarty.*] The evidence referred to the water before the injury had been done to the dam; and similar evidence has been given by other witnesses? But the mere fact that they wash wool there is a clear proof that the water could not be brackish—they could not wash wool with brackish water. As regards pumping it out in so short a time, that no doubt is quite correct, for there is no storage capability. As I have already stated, I have known the river rise in a short time thirty-five feet. What became of all that water? Two or three days afterwards it had gone down into the sea. The great advantage of taking George's River as a reservoir between the dam at Liverpool, and any one of the points I have mentioned, is that there is such an enormous storage capacity.
1452. Could you give us any idea of the width of the channel at the place where the water rose thirty-five feet in twenty-four hours, and the width it spread over? The river is very narrow there, but the water, I should say, spread over a quarter of a mile.
1453. Do you speak of the great flood which swept away the Sophienburgh piggeries? No; it was before I sold that place to Mr. Atkinson—it was two or three years previously. You will see a cottage there on the high land; that is the place where the man was who had to take refuge on the roof in consequence of the sudden rising of the waters.
1454. There must have been a considerable depth of water over the flats? Yes.
1455. And you think it extended a quarter of a mile back? Yes, I think so.
1456. Did there seem to be much current running down at the time? Yes, there was a current in the centre, but there was not room for the water to escape. If there had been, there would of course not have been any flood.
1457. There was a flood which ran with sufficient velocity over the flat to carry away a piggyery? Yes; but that was close on the banks, where the current would naturally be strong.
1458. It was three or four hundred feet from the bank, was it not? I do not think it was more than half that—it was almost close to the bank.
1459. Have you any authentic information as to rivers of the magnitude of George's River—subject to such a rapid tide, and forming so large an estuary of salt water—having become fresh? I know this, that George's River itself has been fresh about Sans Souci; I have drunk the water there on two or three occasions, and found it only a little brackish.
1460. That was water taken from the surface? That was from the surface; but if the salt water had been kept out, after two or three floods the river would have become perfectly sweet. I do not see that it makes any difference what is the size of the river, so long as there is a sufficient supply of fresh water to cleanse it; and beyond doubt there would be sufficient in George's River, from the vast extent of the watershed.
1461. From your acquaintance with the climate, should you say that floods of great magnitude are of sufficiently frequent occurrence to warrant the prediction that George's River would be fresh in any given time, if a dam were constructed—say five, ten, fifteen, or twenty years? I believe that if the dam had been erected twelve months ago, the river would have been fresh now.
1462. *Chairman.*] Have you known George's River in any very dry seasons? Yes.
1463. Do you know the amount of water delivered into the estuary of George's River by its tributaries during any dry season? No; but this I know,—there are some creeks from the Sutherland estate that never cease running. There are two running into Gawley Bay, (opposite Sans Souci) which never cease to flow even in the driest seasons, and there is scarcely any difference in the volume of the stream at any time except during heavy rains.
1464. If George's River were dammed at Rocky Point, would it not be necessary to buy up the factories at Liverpool? You are as good a judge as I am of the law of the case; but I understand the law to be this,—that any one on the banks of a river may draw from that river what he pleases, but is not entitled to pollute it. I would allow the factories at Liverpool to make use of as much of the water of George's River as they please, but require that they should find an outlet for the water, when made impure by use.
1465. At present they allow it to fall into an estuary of the sea. If that estuary were enclosed, so as to become a fresh water lake, I do not think the state of the law would prevent factories pouring impure water into it? But supposing you had to pay them compensation for removing their factories nearer to Sydney (and I would be very liberal in all such matters), where there would be a good outlet for the waste water, that would be a mere bagatelle in comparison to the importance of the work, which would furnish one-third of the county of Cumberland with an abundant supply of good water.
1466. Still it is an element in the expense? I think it is an item (with all due deference) not worth taking into account. There are very few manufactories at present. There is one at Canterbury, on Cook's River, and two at Liverpool. But the Liverpool people would be glad to raise the dam for the purpose of encouraging the establishment of other manufactories. If that were done, manufacturers would go twenty miles to find that which they might obtain close at hand if a dam were made across George's River at any of the points I have mentioned.
1467. There is another objection. George's River drains a considerable extent of agricultural country, and also receives the drainage of Liverpool and Campbelltown. It is scarcely desirable to draw our water supply from an area partly cultivated and settled? But what is the cultivation, and what the settlement? There are not more than three or four hundred people within the range of twenty-eight miles; and I doubt if there are twenty acres cultivated on the watershed between Sans Souci and Liverpool. Is that an item to take into consideration—a paltry amount of land under cultivation, and a small number of inhabitants in the only township at the head of the navigation!
1468. *Mr. Adams.*] You referred to a dam made by Mr. Lucas. Was that dam made on dry ground at the time, or in deep water? I am not able to say. I know what Cook's River is both above and below the dam.

The
Hon. T. Holt,
M.L.C.

7 Sept., 1869.

The
Hon. T. Holt,
M.L.C.

7 Sept., 1869.

1469. There could not have been any great depth of water to contend with? No; there is no great depth of water anywhere in Cook's River.

1470. *Mr. Moriarty.*] You were saying that, supposing the George's River scheme were carried out, it would give water to one-third of the county of Cumberland. Of course, whatever water was supplied by that arrangement, would be given only to persons residing on the immediate banks of the river, and those who would draw the water by pumping? Yes.

1471. No land could be irrigated except by means of the pump? I am not sufficiently acquainted with the nature of the country to reply with any confidence to that question. If there is any low land between here and Liverpool, it would be possible to irrigate it without a pump.

1472. But they would have to bank out the river first? Yes; but I am not sufficiently acquainted with the country to know whether there is much of that land which could be irrigated. I think irrigation is a separate scheme altogether. If you were to bring water fifty or sixty miles by gravitation, I do not think you would have much to spare for irrigation.

1473. Do you mean from the George's River? No; from the Nepean or elsewhere.

1474. That would depend upon the quantity? Yes.

1475. And then you have not made any estimate of the height to which it would be necessary to raise the water to allow it to gravitate into Sydney? No; that is a question for an engineer. A suggestion has been thrown out whether it would not be desirable to take the water from the river a little higher up, and make use of Woollen Creek. It would require some little cutting to take it from thence into Sydney by a watercourse. It might be raised by means of a centrifugal pump, and without any cutting be brought near to Sydney by gravitation.

1476. That, of course, would involve the expense of pumping? But the expense of pumping, when water is not taken to a great height, is scarcely worth taking into account.

1477. There are engines, coals, labour, machinery, &c. In Sydney, at present, they are paying about £5,000 a year for pumping water? But that is not a perpendicular lift; they force it to a long distance. It would cost probably not one-tenth of that amount to raise the water fifteen or twenty feet by centrifugal pumps.

1478. It would cost a little more than that. It would be in the ratio of the height to which it was lifted. The quantity supplied at present is utterly inadequate to the wants of a growing city like this. Have you made any estimate of the quantity which in your opinion would be required? No, I have not gone into any calculation of that kind. Where there would be so large a supply, and where the quantity taken from it would be so inappreciable, it would be superfluous to go into any minute detail. But these swamps could be supplied with water without pumping, and thus, at a trifling expense, any number of manufactories could be accommodated, and the city would be relieved to the extent of their consumption, while the manufactories would be encouraged. Then there is another thing I would suggest. In Holland they have canals almost everywhere. Here, seeing that you have the land—that it would not be necessary to purchase a single inch of ground, or build a single bridge—why not make a canal from St. Peter's all the way to Sans Souci through these swamps. For a distance of nine or ten miles there would be running parallel the east side of Botany Bay, into which the surplus water could be readily drained. The fresh-water canal would be useful for the transporting of commodities from one place to another. Wool brought to this port, at St. Peter's, near the church, could be taken alongside the wool-washing establishments without cartage. By an expenditure of £5,000, or probably less, ample provision could be made for all the manufactories that can be required.

1479. Keeping a distinct channel for the supply of water to the town? I think it is desirable that in a large manufacturing town a supply should be set apart specially for manufactories. If this were so, all the land between St. Peter's and George's Rivers, along the canal and swamps, would be the manufacturing part of Sydney. The land would not be the less valuable because it would not be used for suburban residences by merchants and other gentlemen—it would become all the more valuable—it would be used by those engaged in the manufactories, and the merchants and other gentlemen of Sydney would go elsewhere to reside.

1480. Supposing this scheme were carried out, where would you propose that Cook's River should be dammed? I think the best place is between Nos. 21 and 42 on Bishop's map, and Muddy Creek (which is fresh at its source) would also require to be dammed as near the mouth as possibly—say between Unwin's 50 and Webb's 300 acre grants. Shea's Creek, at the foot of what is called Rickety-street (St. Peter's), should be widened and deepened, so that vessels with coal and other materials could be taken up for the use of manufactories, and this canal would serve at the same time as a sewer for the waste water.

1481. Would it be below the junction of Shea's Creek? Shea's Creek need not be interfered with, except deepened and widened as above, and also straightened.

1482. With reference to Shea's Creek, we have had it in evidence that the whole of the water of that creek has been contaminated by woolwashing? That is true, but you would make the fresh-water canal at some little distance, and running nearly parallel with the creek. It would be invaluable as a sewer for the manufactories, and as a ship's canal for bringing coal, &c. There is a reserved road of I think 66 feet running from the river to Rickety-street. Although it is only marked on Bishop's map with one line, I know there is a reserved road, &c. It has never been used as a road and never will be, and that might be readily made into a fresh water canal, from St. Peter's, at the back of Mr. Chalder's house to Cook's River, and from thence through the extensive fresh-water swamps to George's River.

River. As the said swamps (on the *west* side of Botany Bay, and which run parallel with the Seven-mile Beach) are in some places one or one and a half mile wide, they alone without George's River (which could be united with them at any future time when George's River was dammed and the water perfectly sweet) would probably yield as much water as the swamps on the *north* side of Botany, which is all that Sydney, with her more than 100,000 inhabitants, have to depend on. I strongly recommend that a survey be made of the country, and the said swamps between Rickety-street (St. Peter's) and George's River.

The
Hon. T. Holt,
M.L.C.

7 Sept., 1869.

Alexander Kennedy Smith, Esq., examined:—

1483. *Chairman.*] What is your profession? I am a civil, practical, and consulting engineer, in Melbourne. A. K. Smith,
Esq.

1484. Have you ever been engaged in the construction of works for supplying towns with water? I have. 7 Sept., 1869.

1485. Where? In Scotland, and also in Devonshire, where I was engaged in works for supplying farms on the high-pressure principle, pumping up the water and sending it through pipes; and recently, as Engineer of the South Yarra Waterworks, Victoria.

1486. So that you have had an extended experience in storing and distributing water? Yes.

1487. You have heard the evidence just given by Mr. Holt, and you have been over the ground between Sydney and George's River? I have.

1488. Will you kindly give us your opinion of Mr. Holt's scheme for supplying Sydney with water? It seems to me that, although there might be considerable expense in damming the river at the various points indicated, it is not at all impossible to do so; and the amount of storage, with a depth of 4 feet, would be equal to three thousand two hundred and sixty-seven millions (3,267,000,000) of gallons.

1489. What surface do you assume? I was informed that it was 4,000 acres; but since coming into this room, I have been told that it is only 3,000 acres. $1\frac{1}{4}$ inch of rain on this watershed would give 4 feet of water in the reservoir, and supply something like sixty-two and a half million gallons per week.

1490. Do you think that a dam constructed in the way Mr. Holt has described would keep the water permanently 4 feet above the level of the sea-water outside? I cannot say that I thoroughly understand Mr. Holt's description of how he would make the dam; but I think it is possible to make a dam across George's River without having recourse to masonry. And with regard to keeping the fresh water permanently 4 feet above the sea-water, I would observe that the difference of level you would have to take into consideration would be the river in its highest known flood state. You would take the maximum height of fresh water, and the minimum height of the salt water outside the dam. That would give you, I suppose, during spring tides, at low water, about 5 feet 6 inches to be added to the increased depth of water during heavy thunder showers or storms. You might, therefore, have a pressure equal to 5 or 6 lbs. upon the square inch. I am of opinion that, if the dam were made sufficiently broad at the base, in a very short time it would be effective. The pressure being always on the fresh-water side, there would be sufficient silt and other deposits to keep it tight, even though it were not of such a character as would be necessary to dam a ravine where there would be a great pressure on one side and nothing on the other.

1491. Would it not be necessary to allow a certain height, in addition to the storage capacity, for the purpose of enabling the water to flow along a canal? That is simply a question for an engineer, after examination and survey. I am inclined to think that, if there is any high ground at or near George's River, or if George's River were connected with Cook's River, in a position common to both, it might be as well to have the pumping done at once. You might so command Sydney, if there is any ground sufficiently high; but of that, being a stranger, I am not aware.

1492. *Mr. Moriarty.*] There is not? Then the water would have to be raised by a dam, or some artificial means, to such a height as would enable it to flow along a canal to some place whence it could be supplied to Sydney by pumping machinery.

1493. How would you propose to construct a dam sufficiently watertight without masonry? I would make it sufficiently broad at the bottom, and use the best material I could obtain for its construction. I would put punts and rails across to run the waggons on, and make the dam by a deposit of stones and clay and sand. In a short time the silt would come down the river, and make the dam as tight as it would be necessary to have it made. You have such an enormous amount of storage that the difference of the level during the states of the tide would make the leakage slight. There would not be any very great pressure on the dam.

1494. But supposing you had to raise the fresh water 10 feet above the salt, do you think that plan would be sufficient? No; as an engineer I would prefer lifting it 10 or 20 feet, so as to give a good velocity in some other aqueduct. In coming from George's River towards Sydney there are swamps for a considerable distance. I would have the dam as low as possible in George's River, and raise the water only sufficient to keep it sweet and retain a sufficient quantity. Then I would lift the water, by a centrifugal pump and a moderately powerful engine, to a height of 6 or 8 or 10 feet, as might be requisite to bring a sufficient quantity of water along the aqueduct.

1495. But if it were necessary to raise the water 10 feet, you do not think a dam of loose material would suffice? There would be more danger of its leaking in proportion to the height you made it retain the water. I would raise the dam, at any rate, 10 feet above the surface

- A. K. Smith, surface of the water. I believe ample provision could be made for the overflow. Advantage
Esq. can be taken of a long stretch of rocks, and the bye-wash can be made sufficient to let off
7 Sept., 1869. any quantity of water which comes down George's River. Still, I am not aware what that
quantity might be. In Cook's River I looked carefully for the highest drift, and found it
6 feet above the position of the level of the water in Cook's River then, and I think it was
about half-tide. That is a pretty fair indication of the height to which the river would
rise. But George's River draining such a large area, it is possible the flood water coming
down there would require a large bye-wash to protect the dam; and that, even when the
bye-wash was in operation, the water would rise very high.
1496. It would not do to let the flood-water go over the dam? No, not unless it were a
proper dam of masonry.
1497. Unless the dam were perfectly watertight, what would become of the reserve of fresh
water in very dry seasons; for example, during several months we might have scarcely any
water running into George's River? You would have enormous quantities to spare. If
you were to save only an inch and a quarter on the watershed, that would give you sixty-two
and a half million gallons per week.
1498. But does it not seem necessary, for the sake of keeping a store of fresh water in times
of severe drought, that the dam should be perfectly watertight? I have no doubt it would
be so. It might not be exactly so at first, but I feel sanguine it would be so in a short
time, always providing the water was not raised to a very great height. The pressure
would not be severe if the water were raised to anything within ten or twelve feet. We have
instances of this in connection with railway works. Railway embankments, constructed of
stones and soil, have dammed back water of considerable depth until proper provision has
been made to carry it off.
1499. Do you know any example of an estuary such as George's River being dammed and
made fresh? I cannot recollect any instance. I have no doubt I could find one if I were
in my office and had access to my books. In Scotland rivers are dammed for the purpose
of getting falls for the working of ordinary machinery. Caulds, or, as we call them in
England, weirs, are made with stones and sand found in the immediate neighbourhood.
They are sometimes protected and strengthened by a little wood being built in them. I
know many caulds on the Tweed and the Teviot which raise the water to various heights,
for the purpose of obtaining a fall. During the summer-time these carry off the whole of
the water, and the leakage, if there is any, is a mere trifle.
1500. These dams do not raise the water many feet, as a rule; I should say, not more than
three or four? They raise the water to various heights. I have seen them from three to
eight feet.
1501. And they are constructed mostly on rivers of considerable magnitude, on which there
is always a permanent stream setting down? Yes; but the stream is much less in the
summer than in the winter.
1502. Those rivers discharge, as a rule, a considerable body of water? Yes; they
discharge more than perhaps would appear from observation, inasmuch as the velocity is
considerable.
1503. Do you not think, also, that in Scotland, as a rule, the country is more saturated
with water, in consequence of the greater frequency of the rainfall? Undoubtedly. I
can understand that the 300 square miles of watershed to George's River must be very
different.
1504. It is a barren plateau of sandstone rock, with scarcely a fragment of soil, except in a
few patches, and very sparsely covered with vegetation. It is very broken and precipitous
from first to last, so that the floods come down, as Mr. Holt has described them, with
extraordinary rapidity. As you have heard, the water rose, on one occasion, thirty-five feet
in twenty-four hours? I fancy that must be owing to some narrow neck preventing the
water from getting away.
1505. No? There is nothing known of this at Rocky Point. The river rises so little there
that they have failed to observe any particular increase in its height.
1506. I have seen floods extend over a quarter of a mile at Liverpool. Mr. Holt has
described their effect correctly. The water flows with great velocity? Is not that due to
some narrowing of the channel lower down the river?
1507. No. If you were to examine our rainfalls, you would find them very extraordinary
at times—about twenty inches have fallen in twenty-four hours. That is not a very common
thing, but we have enormous rainfalls occasionally. The heads of George's River are close
to the coast on the elevated table-land, so that there are heavier falls there than are
recorded in Sydney. Supposing that twenty inches of rain fall in twenty-four hours, over
that area of three hundred square miles, you can easily account for such a flood as that of
which Mr. Holt has spoken? Yes, but I do not think it would raise the river at Rocky
Point in anything like the way spoken of by Mr. Holt in regard to the floods at Liverpool.
1508. If you look at the section of the river, you will see that it is one third of a mile, by
a mean depth of thirty feet. That will discharge a large body of water? But the
quantity discharged would not be in accordance with the mean depth—it has an opposing
body in the tide.
1509. The whole will be discharging? Yes, at a given velocity.
1510. Having that in view, the extraordinary quantity that seems to come down, and the
objection to letting it flow over the dam, do you not think it would be necessary to raise
the dam a considerable height above the tide level? Care would have to be taken to have
it sufficiently large in its sectional area to take the largest flood. Supposing there would
be six feet of water flowing over the bye-wash, the dam must be six feet higher, and then
the ordinary height again above that, to guard against accident.

1511. We have it in evidence that George's River is, in some places, a quarter of a mile broad in times of flood, and that the channel of the river is thirty-five feet deep—Should you say, generally, that raising the dam six feet would be sufficient? No; I would be more inclined to take the area of the watershed, and estimate the whole quantity, and prepare for its being run off in a given time. A. K. Smith,
Esq.
7 Sept., 1869.

1512. Twenty inches in twenty-four hours? Yes; but I doubt whether such an abnormal quantity would fall over the whole of the 300 square miles. When I was in Newcastle, about two years ago, the river rose very high at Maitland and Singleton, but the heavy rainfall made very little difference at Newcastle. The rising of the waters at Maitland and Singleton was simply due to the river being narrow at particular places, so that there was not a sufficient space to allow the floods to discharge.

1513. Your project, then, as I understand it, would be to raise the water by pumping to such a height as to enable it to gravitate into Sydney from George's River? It has been pointed out that there is a possibility of connecting George's River with Cook's River. If this were done, and a canal were cut along the low ground alluded to by Mr. Holt, the water might be brought near to the present water supply, and there pumping operations could be commenced. I think it would be desirable to do so, inasmuch as it would bring you to an immense body of sand, and enable you to provide proper filtering reservoirs. If it were necessary to supply the water direct from George's River, it might be expedient to keep it first as low as possible, and then to raise it to the height required by means of centrifugal pumps. But that can only be determined by careful calculation and actual survey.

1514. That would involve a twofold system of pumping. First, it would be necessary to pump the water out of George's River into a canal, and then to pump it into Sydney? It would; but I apprehend that it would be better to bring it into the swamps than to incur that expense, although the expense of pumping the water into the canal would not be at all in proportion to the expense of pumping water into Sydney. To raise water six, eight, or ten feet, would be nothing compared with the expense of sending it to the higher reservoir.

1515. The object of that would be to save the risk and cost of raising the water permanently in the river so much? Yes.

1516. Have you made any estimate of the height to which it would be necessary to raise the water in George's River to store a twelvemonth's supply? It would be necessary to raise it about four feet.

1517. That would depend of course upon the quantity supplied to Sydney. What have you estimated the supply at? I have estimated that four feet would give 3,267 million gallons. Dividing that by the number of days in the year, would give you the quantity per day. A fall of an inch and a quarter of rain, of which you would save (say) 75 per cent., would fill the reservoir, and afford a supply of sixty-two and a half million gallons per week, as against the twenty-five millions now supplied.

1518. Do you estimate saving 75 per cent. of the whole rainfall? Decimal 617 (.617). Quoting your own figures, we might assume .75 on the country you spoke of.

1519. You are probably aware of the great difference in the available quantity of water over what are properly called watersheds, and the summer discharges of large rivers such as would be the case in George's River. It is found by experience that, although you may save .5, .6, or .8 of the water which falls over a limited watershed close to the head, when you come down low on the river you do not save anything like that quantity. It is well authenticated that the discharge of the Severn, and the Thames, and other large rivers, does not amount to more than one-eighth of the whole? That arises from a state of facts which would not apply here. There the banks are low, but here the river is well defined, and there is little or no fall almost from its source to the sea. It has been worn down to a level almost with that of high-water, and I think you have a greater quantity of watershed on such an area than those which supply the Severn and the Thames.

1520. That is a matter of opinion. We have here an enormous evaporation in summer—often one or two inches of rain have fallen in a month without being felt in the river at all, being taken up entirely by evaporation. But it is different in winter. I believe our measurements of the rivers here show that, although in the summer we do not get the same proportion of the rainfall as they do in England, in winter we get a larger quantity. In summer we only detect one-twelfth of the actual rainfall as making its appearance in the rivers. That which falls in winter comes down in floods, and runs away at once. It is absolutely necessary, therefore, to store. It will not do for us to go into abstract calculations, and say that if an inch of rain falls, we can get of it .5 or .12. George's River has ceased to run at the dam; it did last year, to my knowledge. We have it in evidence that it has done so frequently. We have it in evidence that such bodies of water as Lake George have been dry—twenty miles by fifteen, and of considerable depth. We must, therefore, provide for storage, and the question is, whether in any great scheme of water supply, it would not be necessary to make provision against extraordinary droughts. Having that in view, do you think four feet would be sufficient? I think it would be ample to give you the large quantity you are speaking of. Whatever quantity fell, you might safely calculate on getting three inches of rain during the twelve months, which would be sufficient.

1521. If you are to keep it, that involves storing it? But this lake is at the water level of the sea, and it must retain the water—it cannot get out.

1522. Unless by percolation through the dam? Unless through the difference of the levels.

1523. What do you consider would be sufficient? If you could get three inches of rainfall on that 3,000 acres, it would leave you a large supply for summer droughts, or leakages, or waste.

1524.

- A. K. Smith, Esq.
7 Sept., 1869.
1524. Can you form any estimate of the quantity of leakage you will have to allow for? That would depend upon the workmanship of the dam. I believe it is possible to make the dam practically water-tight.
1525. The bottom is not mud, but sea-sand. Do you think that on a bottom of thirty feet of sea-sand you could make a water-tight dam? I think so.
1526. You are aware that almost all the wells in the world are sunk into sand and free soils. The green-sand of London is the great water-bearing stratum. That underlies the clay beds, and the moment you get to the green-sand you get water. Is there anything to prevent a similar process in such a work as this? Yes; I think that in a short time the amount of silt and other impurities held in mechanical suspension by the water, and brought down on to the dam, would make it tight. In Victoria, on one occasion, Lake Learmonth was dry, and vegetation began to grow. Cattle were turned into it, and they puddled it so that it became retentive, and it is now a beautiful lake.
1527. But here you have thirty-nine or forty feet of water, so that cattle cannot tramp it down. You have also a river running through a sandstone formation, and bringing scarcely any deposit. As far as I am aware, there is no tendency in the river to deposit anything. If you go over the banks of George's River after a flood, you would not scrape as much mud as would cover your knife? Tanks varying from twenty to thirty feet, I have made tight by putting in soil. Sometimes manure from stables has forced its way down, and made tanks tight, showing that if you can introduce matter into the small interstices there is a chance of a dam becoming tight.
1528. But supposing you are dealing with a pure water and an easily moved bottom; would not the tendency be rather to carry away the sand, and increase the leakage through the sand at the bottom? With a depth of forty feet, and an embankment of five or six to one carried to a considerable height above it, I think the work would consolidate, so that there would be no danger of leakage from a moderate pressure.
1529. *Chairman.*] The drainage is partly through the Wianamatta shales, and would, no doubt, bring down some clay? It would settle.
1530. *Mr. Moriarty.*] But is there any necessity for its settling near the dam? If there is any considerable current and the bye-wash is close to it, it would draw all the impurities near to it.
1531. And you assert, as I understand you, that you consider a dam could be made and guaranteed to be water-tight on that bottom? I would have no hesitation, as an engineer, in undertaking to make such a dam, always bearing in mind that the water is not to be raised by the dam to any great height. For practical purposes, if you retained four feet of water above the level, you would have twelve millions of gallons per day. You could be sure of this, if you had three inches of water saved all over the watershed per annum.
1532. Then you start with it at four feet above high-water-mark, as I understand? The level of the bottom of the bye-wash should be at least four feet above high-water. It would then be level with the top of the water I wanted to save.
1533. And what height would you make the dam—You have heard what Mr. Holt has said of the floods, and you have heard also of the drainage and the extraordinary rainfall? You are speaking as if there were severe floods at Sans Souci; but, from inquiries and observation, it does not appear to me that at this point the river is affected by floods. They seem to have increased the height of the river so little as not to have been noticed by the people living there.
1534. But if you placed a dam there, you would prevent the discharge of the flood-waters, which now goes on, and bring about a totally different condition of things? Yes. We should have to provide for that changed condition of things, by making a bye-wash of sufficient length and at a proper level to carry off the greatest flood.
1535. Then practically you would get the same conditions? No; the conditions would be changed, inasmuch as the water would be rushing over the weir. The velocity would be less if it were running against the salt water.
1536. No doubt it would discharge more rapidly over a weir than out of the present channel? Yes. There is a small roadway crossing Cook's River now, near the toll-bar. Any one looking at that would imagine that if the base of that road were four times the width, it would be easy—by raising it—to keep the water of Cook's River four or even ten feet above the level of the sea-water.
1537. But I do not find that these things are done so? It is seldom that a person would attempt to dam a river of this description, unless he were compelled by necessity or financial considerations. It seems that Sydney is not receiving a proper supply of water, and it is necessary to consider the best and cheapest means of making suitable provision for the wants of the citizens. It becomes a question more of finance and calculation as to the relative cost of different schemes, taking into consideration that the one scheme would be complete by gravitation—the best of all modes of supply—and that, in connection with the other, there would be the cost of pumping.
1538. Do I understand you to say that there is difficulty, or that there is no difficulty, beyond the financial considerations, in constructing a dam of that sort? I have said that I would have no hesitation in taking a contract to make a dam across that river. There would be difficulties, but not such as would be, in my opinion, insurmountable.
1539. Are there any means by which you could puddle the clay, or consolidate it in such a depth of water? I would endeavour to get some sort of stone structures, or banks, and put broken stones or sand, or whatever the neighbourhood would afford, between them. The upper part of the dam must be constructed with stone facing, well pitched, to withstand the effect of the waves. But it would not do to allow the water to flow over such a bank, and therefore the waste weir or bye-wash ought to be of sufficient size to take away the largest quantity of water that has ever been known to flow down George's River.

1540. Do you think that the stones in the centre would have any effect in stopping the leakage—would you not have to depend on the clay puddle? I think that such a weight going on to a body of sand would have a tendency to consolidate. It would be laid in water instead of being mixed with water, as when used in a dry place. A. K. Smith, Esq.
7 Sept., 1869.
1541. Do you think that would make any great difference? You cannot, of course, take so much care when you are tipping great quantities of material into deep water, as when you are treating them on land.
1542. That is against the probability of success, is it not? Yes; but if you carry along two dams of stone parallel with each other, and fill in between them, I fancy you would get a tight dam for a moderate pressure of four or five pounds to the inch.
1543. *Chairman.*] Those retaining banks would be of materials thrown in loose? Yes.
1544. Would they be of large or small stones? Whatever they could quarry them, so as not to expend too much labour.
1545. *Mr. Moriarty.*] Sufficient to keep up the hearting? Yes.
1546. That would consist of stone, and clay, and gravel? Yes; if there was plenty of clay in the district I would get it by all means. I noticed clay near the river.
1547. Have you formed anything like an estimate of the cost of such a work as that? I have not.
1548. And you would not hesitate to say that you would guarantee that stone, and clay, and sand, tipped in in that way—the same as a railway embankment is formed—would be watertight? I think it could be made watertight.
1549. Do you not think the stone would keep it open? No.
1550. Are you not aware that breakwaters have one-third of their space vacant? But they have an entirely different object. They are made simply to break the surface of the waves.
1551. I am speaking of the cubic contents. Stone structures of that kind generally have one-third of their space vacant. If you measure a cubic yard of stone, you find one-third of the space vacant. It is the same with all open stone structures. Might not the same occur in the construction of this bank? I think you could run clay, earth, and sand in amongst them, so as to make them watertight.
1552. How? I have stated that I would run two dams across the stream, of considerable breadth at the bottom, and carry them to the top. The water would be comparatively still; and, by going on regularly instead of letting the water scour through, you might, with properly prepared materials, make them tight between the two dams.
1553. Do you not think that the action of the tide rising and falling, and the tide setting first one way and then another, would interfere with your sand and clay? No doubt it would interfere with it. You might put sheet piling across it as well.
1554. Do you not think that any sand thrown in under such circumstances would be washed away by the scouring of the current? You might prevent it by using sheet piling.
1555. Do you think sheet piling would be necessary? I think it would; but I am not in such a position as I would like to be in regard to this matter. I am asked to give evidence on a very important engineering subject; and I would not like to say at a venture that which, upon mature consideration, I might think to be wrong.
1556. Are you still inclined to say that you would not hesitate to undertake to make such a dam watertight? I would not hesitate to undertake to make it watertight for all practical purposes in connection with furnishing a supply of water to the city of Sydney; but how it could be best done would be a matter for careful consideration.
1557. Do you mean that you would not hesitate to undertake to make the dam watertight absolutely or relatively? Relatively. There might be some percolation of the fresh water at certain times of the tide.
1558. If there might be such a thing, would you undertake to measure the percolation, and say how many million gallons it amounted to? No.
1559. Might it not exceed the whole of your estimate? No. If it did, it would be no dam at all. You have only to conserve a small quantity of water.
1560. Pardon me; you would have to store a large quantity? I believe one good storm would give all that would be necessary to supply Sydney for twelve months.
1561. *Chairman.*] The question would be, how long would the natural percolation take to empty it? Just so.
1562. *Mr. Moriarty.*] Let us suppose an experiment—that you enclose a small piece of the sea-beach with a perfectly good clay puddle dam resting on the sand; do you think the water would rise in your dam when the tide rose outside? That would depend on the distance.
1563. Do you think that when the tide rose outside, it would not also rise inside from underneath your dam? It might on that sand.
1564. And supposing you poured any quantity of water you liked into your dam, would it not be absorbed by the sand and percolate into the sea? I do not think so. The swamps between Cook's River and George's River seem to me to be all in sand, and yet they retain water. I do not know what the level is.
1565. The level is a few inches above high-water-mark; but these swamps have a coating of peat, which is a perfectly retentive material. It has been used as a core for the Botany dams. I have seen many bogs where upon 6 inches of peat there have been 6 feet of water. These swamps are covered with a coating of peat—you can tell that by the colour of the water? I do not think there is much peat there.
1566. We find peat all over the Botany swamps. But to return to this suppositious case. If you poured ever so much water on that sand on the beach, do you think your dam would retain it? I do not think the sand would hold the water—it would sink down through it until the sand was charged. 1567.

- A. K. Smith, Esq.
7 Sept., 1869.
1567. Do you think it makes any difference whether the sand is thoroughly saturated with water, if there is a difference of level on the two sides? Yes; it depends upon the breadth of your base. You may have a large water-pipe, so long that at the other end the water will not run out. This is simply on account of the friction due to the pipe. Something of the same kind would apply to the length of the base of such a dam. Supposing it were 5 or 6 chains at the bottom, the percolation would not be so likely to take place as if it were of less width.
1568. But do you think anybody could reasonably attempt to measure that amount of percolation? There would be difficulty in measuring it.
1569. Or ascertaining that it did not take place to any great extent? I think it quite practicable nevertheless to make the dam answer its intended purpose. I know a case in point, at one of my own saw-mills in the ranges. The mill was built by some Canadians, and they formed a dam across a creek in the Dandenang Ranges. They made simply a timber frame in the bottom, and when I looked at it I had an idea that it would not be tight because there was nothing at the back, and the fall was considerable. But the creek brought down something which made a deposit, and the dam became perfectly tight.
1570. But do you not think the mere action of the tides during the period of constructing your dam would wash away a large quantity of the clay and light material as you put it in, and that it would assume the slope we find on beaches? It could not do that if the two walls or dams were placed on each side. Neither would I advise leaving any space so that the water would acquire a greater velocity.
1571. Do you think the masses of loose stones would prevent the sand from washing down? I think that if you properly place the broken stone and other material before proceeding to put in your core, it is possible to make such a dam as that of which I have been speaking.
1572. Is not one of the great difficulties in the construction of the Suez Canal the working of the sand from the outside to the inside? I am aware that they are putting down blocks of stone, as they did in the case of the Plymouth Breakwater, thrown in any position.
1573. But the sand works through them: might it not also work through this dam in the same way? I do not think it would. I think it would fill up the interstices, and that the pressure from the top would consolidate the dam still more.
1574. If there was any current there, would it not wash the sand out? It might; but then there is stiff retentive clay in the neighbourhood.
1575. How would you puddle your clay—would it not be likely to be washed away in the shape of liquid mud? No; I should put the clay in in a different state to that in which I should apply it under other circumstances.
1576. You would put it in much drier? Yes.
1577. Would you make certain that clay put into the dam in large dry lumps would work its way into the interstices of the stones? As soon as it softened, I think it would.
1578. Particularly if there was a strong tidal scour running through it? I think that scouring could be greatly prevented, either by the action of the breakwaters, or by sheet piling.
1579. We will assume that the water runs up at present at the rate of two miles an hour. That fills the estuary at one tide to a certain height. If we diminish the sectional area in a certain proportion, and leave (say) only one-third, the water would have a tendency to run up at an inverse ratio. That would give about six miles an hour through the interstices. The clay, I think, if put in very solid (as it must be) would not thoroughly commingle with the other materials—it would go down in clods, and be scoured out. Sand put in would have a tendency to assume a certain slope—it cannot be made to stand in the core of an open-work bank at 1 to 1—it will flow through the interstices of the stone till it assumes its natural slope? Still, I fancy that if you put two banks of stone, and then have two rows of sheet piling again between these, you could allow as much water to pass it as you chose. You could diminish or do away with that tendency of the tide to scour away the material you put between two such dams—they would, in fact, become a cofferdam, with this difference, that it would be upon sand, instead of into rock or clay.
1580. And you are still of opinion that a dam of loose stones such as you have described, made upon the sand, would be watertight? I do not say that it would be perfectly watertight, but it would answer its purpose in conserving a supply of fresh water.
1581. Do you not think it would sink into that sand? Yes, and so consolidate.
1582. Then, instead of having a sand-bed to rest on, it would have an open stone bed? No; the sand would mix with the stone. It is easy to imagine a dam placed across a river, without a puddle-bank, which would keep up the water six or seven feet, and do all you want it, and yet let a considerable quantity pass away.
1583. But the question is, whether one would be justified in going in for a scheme which involves such manifest difficulties; whether one would be justified in ignoring the difficulties, particularly as you admit that you cannot measure the leakage. If there is a fault anywhere you cannot detect it—you cannot see where it is, to correct it. If, in putting in the core, the work is not properly done by the contractor or workmen, you do not detect the error until you find you cannot keep the water in; and then it is too late to remedy it. In such a work, do you think there would be any possibility of correcting a defect? No; prevention would be the thing for an engineer to look to, and not correction.
1584. And from your knowledge of workmen and contractors, would you say that such a work could be guaranteed by any engineer to be watertight? I have said that I am aware of the difficulty of making a dam across that river; but seeing that it would be necessary only to maintain the water to a height of 4 feet, I do not think those difficulties would be insurmountable.
1585. That gives you nearly 10 feet at low-water; and then, in addition to that, you have the head, in times of flood, tending to force its way over that work. Supposing that the water,

water, in times of flood, rose 10 or 12 feet above the level, you would have all that water forcing its way against the dam? The bye-wash should be of sufficient length to allow it to escape. I do not think it would be advisable to allow the water to rise 12 feet.

1586. Well, put it at 6 feet—that is, 16 feet of a head inside your dam—Do you think an open-work dam on a sand bottom would be tight with such a pressure? Not unless it had a good wide base and sheet piling.

1587. And it would depend mainly on the sheet piling—Do you think any man would engage to make sheet piling such a depth tight from top to bottom? Although there are difficulties, I do not think there is any impossibility about it whatever.

1588. It appears to me that the difficulties are so formidable that I, for one, should be timid in undertaking to overcome them? I admit that they are formidable, but I do not think they are insurmountable. It is a question of some difficulty to begin with, and then a question of expense, but I do not think the difficulties in the way of constructing such a dam are insurmountable. First of all, careful surveys should be made to endeavour to find some part of the river where there is a pretty equal bottom. Numerous surveys should be taken, seeing that there is so large an area of storage ground. You might find places where the sectional area is not half what it would be in other places, and the depth not more than half. I am not prepared to say that there are such places, but before making the dam it would be desirable to exercise great care in the selection of its site, and to endeavour to find such a point.

1589. But the great storage capacity is in the lower part of the river. As you go up, the river becomes quite narrow? The storage is so enormous that if you took away a quarter of it you would still have abundance. It seems to me that you might get places where the river is only half the distance it is down there, and where probably the depth may be less. Still, in making the dam higher up, there might be difficulty in getting a bye-wash.

1590. Do you not think this would be a very expensive kind of work? Yes, it would be very expensive, for if done at all it must be done very carefully and every precaution taken.

1591. I have roughed out the cost, and I find that the sheet piling alone would come to some £180,000? If the difference was not very great, I would strongly recommend the gravitation scheme, but if there would be a difference between this and the gravitation scheme of some three hundred or five hundred thousand pounds, it would then be a matter worth thinking of. The only difficulty with which you have to contend is the erection of that dam, and keeping it tight under the peculiar circumstances of the case.

1592. That has always seemed to me to be the key of the whole work. The other matters are questions of detail which need scarcely claim consideration. The dam is the only thing I should fear? That is the only difficulty I see.

1593. And then having overcome all the difficulties, you have only a pumping scheme? Quite so.

1594. And do you not think that in a great work of that kind there would be accidents from floods and heavy gales? I have been led to believe that the sea does not get rough in that place. It is not on a long stretch.

1595. Still I dare say there would be some breaking in a heavy gale? You would have to pitch the inner bank to the flood level, and the outside where it would be subject to the action of the waves.

1596. Do you not think that a bank constructed in that way would be liable to settle from time to time? That would depend greatly on the width of the base, and the making it of sufficient height to allow for subsidence.

1597. But if subsidence takes place, will it not be irregular in regard to the disposition of materials—will there not be a little more clay in one part, and a little more stones in another—that would make a difference? I do not think the cohesion of the materials would allow it. I think they would be sufficiently free to go down in a body. We are speaking of it under the most favourable circumstances. There would be slopes on each side which would act as abutments, and the water would assist them.

1598. I do not agree with you that the water gives any abutment? We know that if you were to take water out of half the canals, you would bring in their banks. In those cases the water acts as abutments.

1599. I think that most materials have a tendency to assume a flatter shape in the water? It would be often dangerous, according to the opinion of many engineers, to take the water out of canals.

1600. That is because the banks are cracked; but I do not think it affects this question? I know an instance, where I constructed a dock, and it was found necessary to make some alterations. I cautioned the engineer against taking the water out, but he did take it out, and he broke in both the sides. It was made in a sort of black soil.

1601. But with reference to settlements; if any settlement did take place at any part of this dam, do you not think it would be likely to lead to serious leakage? I think, considering there would be water on both sides, that the settlement would tend more to the consolidation of the bank than to make it leak.

1602. But the effect of settlement is to alter the arrangement of parts? Yes—to consolidate them in many instances.

1603. And in others, perhaps, not to do so? It might not do so in particular instances.

1604. If a bank be carried out a certain height from one end to another, and there is a settlement in perfect mathematical uniformity, I can understand that the effect would be consolidation; but if the settlement did not take place with mathematical uniformity, the effect would be dislocation, and therefore, leakage? In railway embankments, we look for the greatest settlement at the greatest height.

1605. And according to the material of which the embankment is constructed? Yes, and the mode of construction.

1606.

A. K. Smith,
Esq.
7 Sept., 1869.

A. K. Smith, 1606. But railway embankments of great height are carefully constructed, and the material is put on in successive lifts. The consolidation goes on as the work proceeds. Here the bank would be made under very different circumstances: the material would have to be tipped into deep water, and be subject to a powerful current? There would be a current, but I do not think the term "powerful" should be applied to it.

^{Esq.}
7 Sept., 1869.

1607. I know there is a current there, because I put that punt at Tom Ugly's Point, and laid the chain across. We found a rapid current there. I noticed the other day that there was a current; I should say it was running not less than two miles an hour? That would be supposing you had nothing obstructing it; but suppose you had sheet piling, and two rows of stone breakwater, you would then arrest the current and its action.

1608. I have had experience of that sort of work, and I have found this to take place:— There has been a strip of (say) one-eighth of an inch between the piles, and at the bottom some little opening took place. Through this aperture you have a tremendous scouring, and the sand into which your piles are driven is cut away? Do you think that would take place at a depth of forty feet?

1609. I am certain it would. You would have the same scour forty feet deep as at the top, owing to the velocity due to its head. I have found this when dealing with rivers having bottoms of free sand. The sand is invariably cut away by the rush on each side, and the piles become loose.

WATER SUPPLY OF SYDNEY AND ITS SUBURBS.

APPENDIX.

To the President of the Commission to inquire into a Supply of Water for the City of Sydney.

Sir,

In accordance with your request, I have the pleasure of putting on paper the observations I have made on the swamps at Botany during the last thirty-eight years.

My first visit to that place was in December, 1829, being then a Sub-lieutenant on board H.M. Sloop "Zebra," on a passage to India, for promotion. The ship came here freighted with British coin, to replace the dollars and mutilated dollars (rings and dumps), that were then in circulation in this Colony.

During that month, in company with James Raymond, Esq., then Postmaster of New South Wales, and Mr. Garling, of the Customs Department, I rode from Sydney to Botany Bay, keeping the swamps principally on our left hands. There was then only one path between those places, which wound about over the sandhills. Our object was to visit the spot on which the unfortunate La Perouse and his companions were last known to have refitted their ships—the place where the monument has since been erected; but we were disappointed in this, *not being able to cross a stream that ran out of the swamps into the bay*, although we were on horseback. This, I apprehend, was where the present pumping works now are. It had been somewhat swollen by late rain, but there was evidence of a copious stream at all times.

I again visited these swamps in 1833 and 1834, after being promoted to a lieutenancy in H.M. Ship "Alligator," under the command of Sir George Lambert, the present Commodore's father. I did so in company with Baron Hügel, the present Austrian Ambassador at the Belgian Court, an enthusiastic naturalist, who was sailing in the "Alligator" as Sir George's guest.

Our principal object was the collecting of aquatic plants, which at that time grew there in considerable variety, as a great part of the surface was covered with water. This occupation led us over almost every part of the swamp that we could obtain footing on; but it was very difficult to travel, and in many places impossible to do so, from its semi-liquid state. We at all times carried a piece of rope, to drag each other out should we get immersed.

Much stunted timber and some large trees were at that time growing on the sand slopes in sheltered hollows, and the whole was covered with a thick coat of brushwood, that effectually prevented the sun's rays and hot winds from penetrating to the surface.

I have now many specimens of *Utricularia* and other plants of a similar nature we collected there, that can only exist in quagmires, and a sketch of the Waterloo Mills, I then made, which shews the building standing on the verge of an extensive marsh.

In the early part of 1834 the "Alligator" was anchored in Botany Bay, when the late Admiral King, Sir George Lambert, and myself, closely examined the shores of the bay. We were then employed inspecting the Harbours on the Southern Coast, to ascertain their capabilities.

It was at this time I made the survey of Twofold Bay that has been published by the Admiralty, and is still the only one in existence.

In January, 1835, I descended one of the tunnel shafts of what is known as Busby's Bore, and traversed the whole length that was then excavated, for the purpose of examining the nature and dip of the underlying rocky strata, and the manner in which that work was executed.

At that time the tunnel had been bored from Hyde Park to a point about midway under the first swamp lying south of the present Military Barracks, adjoining the Rifle Practice Ground, and was being actively proceeded with. There was then a considerable stream of water running through it into Sydney, which was teeming into the bore through the top and sides of the excavation; so much so, that I had not been in it more than a quarter of an hour before my clothes were thoroughly saturated. The swamp overhead was in a very moist state, and, even at that time, was being denuded of its scanty covering of timber. The tunnel was evidently tapping it underneath; and I observed, a few years after, that it was drained almost as dry as it now is.

Now, comparing that state of those swamps with the present aspect of the flat, it is evident a very great change has taken place. The stream that was once so copious into Botany Bay has nearly ceased to flow, unless heavy rain has fallen; the aquatic plants have entirely disappeared, and could not now exist there in the present dry state of the ground; the manufactory is no longer worked, for want of water; and an equestrian can now ride with safety over any part of what was originally a fluid morass, with the exception of a few acres in the immediate vicinity of the pumping machinery, which is becoming rapidly drained, and will shortly assume the same character as other parts.

Numerous

Numerous fires having passed through the brushwood in dry seasons, opened the way for parching winds and the fierce rays of the summer sun to dry the ground; cattle and horses then advanced to browse on the scant but moist herbage so grateful to them in warm seasons, still further hardening the surface by their continual tramping; when man followed, denuding the soil of its brushy covering, and cutting drains, either to collect the remaining water for his uses, or to free it of an excess of moisture, for the purpose of growing vegetables.

The whole area has thus been converted from what once may have been likened to a *great sponge*—that received the pure water from heaven as it fell—that, by its adhesive attraction, held it in store from seasons of abundance to those of scarcity—that, by its massy coating of brushwood, protection was given against waste by evaporation, until overcome by the greater force of gravitation, it gradually gave out its precious burden, cool and unpolluted for the use of man. And well had it been for the citizens of Sydney had this wondrous piece of mechanism, this glorious gift of God, apparently for the especial use of this city, been appreciated, and kept intact, instead of the wanton waste that has been going on—been permitted.

What has the scene now become! A tract of *barren sandhills*, that immediately the rain descends on them, rushes to the sea in torrents, leaving the ground, after a few weeks, as dry and parched as it was before it fell.

A small portion of the swamp, near to the pumping machinery, is still performing its original functions; but this, as I have said, is becoming still more rapidly changed, and must, in the ordinary course of nature, cease in a very short time to furnish any appreciable supply.

The character of the flat is entirely changed, and it is my opinion it can no longer be trusted to for a supply of water; its original powers have been destroyed, and the porous nature of the soil that formerly tended to harbour a superabundance is of the very worst description to establish retaining dams on; therefore I have no faith in their being made effective, no matter how well they are constructed.

I remain,
Sir,

Your very obedient servant,

5th November, 1867.

THOMAS WOORE.

HISTORY OF THE WATER SUPPLY OF SYDNEY.

THE following paper was read by Professor Smith, before the Members of the Royal Society, on Wednesday, 14 October, 1868:—

It is my intention to give, in this paper, a brief account of the manner in which Sydney has hitherto been supplied with water, reserving for some future occasion the question of the improvement and extension of the supply.

The first fleet sent out from Great Britain to found the Colony of New South Wales arrived, as you may be aware, in Botany Bay, on the 18th, 19th, and 20th January, 1788. Being disappointed with the capabilities of that locality,—“which,” says Mr. White, the Surgeon-general of the Expedition, “does not, in my opinion, by any means merit the commendations bestowed on it by the much-lamented Cook, and others whose names and judgment are no less admired and esteemed,”—the Governor (Phillip) and a small party went round to ascertain if nothing better could be found in Port Jackson. “The different coves of this harbour,” we are told in “Phillip’s Voyage to Botany Bay,” published in 1789, “were examined with all possible expedition, and the preference was given to one which had the finest spring of water. * * * This cove is about half a mile in length, and a quarter of a mile across at the entrance. In honor of Lord Sydney, the Governor distinguished it by the name of Sydney Cove.” In “Collins’s New South Wales,” published in 1798, it is said that “the spot chosen [for the settlement] was at the head of the cove, near the run of fresh water which stole silently along through a very thick wood, the stillness of which had then for the first time since the creation been interrupted by the rude sound of the labourer’s axe, and the downfall of its ancient inhabitants.” In this judiciously selected spot, abounding in natural beauty, and possessing many of the features (though by no means all) that ought to mark the site of a great city, the fleet was brought from Botany Bay on the 26th of January. The whole of the people were landed by the 6th of February, and were found to number 1,030. Thus was planted the germ—not, it must be allowed, a healthy or promising one, but still not devoid of irrepressible British vigour—which, through many vicissitudes and varying fortunes, has grown and expanded until, in eighty years, it has overspread a great portion of this island continent with nearly a million and a half of energetic, self-governing, English-speaking people. At the head of Sydney Cove, and on the banks of the clear running stream, the tents and huts of the infant settlement were erected. It was not long before the supply of water became a source of anxiety, for the stream was scanty, and doubtless sometimes stopped running, but we are told that the people soon began to dig wells, and were successful in finding springs.

By a notice in the *Sydney Gazette* of date October 19th, 1811, it appears that when the settlement was only in its second year, it fell into great straits for want of water. “From the best information we can collect,” says the *Gazette*, “so intense a drought at this time of the year has not been witnessed since the year 1789, when the

new

new colonists suffered a parching thirst for several months, the springs from which they had been before supplied either failing totally, or yielding scarcely a sufficiency to support nature."

As the town increased, wells were multiplied, and the rivulets falling into other parts of the harbour were laid under contribution, particularly the copious stream running into Blackwattle Swamp; but for a number of years the Tank Stream was the main dependence, and strenuous efforts were made, from time to time, to husband the supply and preserve its purity. Three reservoirs or "tanks" were excavated in the rock near the mouth of the stream, close to the point where Hunter-street and Pitt-street now intersect. I have not discovered the exact date of the construction of these tanks, but it must be at least as early as 1802; for a "General Order" was issued on the 14th of October of that year, and republished in the *Sydney Gazette* of 18th December, 1803, of which the following is an extract:—"If any person whatever is detected in throwing any filth into the stream of fresh water, cleaning fish, washing, erecting pigsties near it, or taking water up but at the Tanks, on conviction before a Magistrate their houses will be taken down, and forfeit £5 for each offence to the Orphan Fund." It is further enjoined that the fences along the stream should be kept in good repair—that no person might have access to it but at the Tanks. Allusion is made to this fencing in the *Gazette* of 16th October, 1803:—"The enclosure of the Tank, undertaken by Government, will, when completed, considerably improve the town in its appearance, and render universal benefit in the preservation of its excellent stream. Every appearance of rubbish has been removed from its sides, and the crystal current flows into the basin with its native purity."

In the "Government and General Orders" of date 15th September, 1810, I find the following:—"It having been represented to His Excellency the Governor as a very serious grievance, that the stream of water which flows through the town of Sydney, and the Tanks which have been constructed thereon (at considerable expense), for the purpose of procuring an adequate supply of pure and good water for the necessary accommodation and benefit of the inhabitants at large, are frequently polluted and rendered totally unfit for those valuable purposes (which become the more important by the scarcity of wholesome water with which the town is supplied), and it thence becoming an object of the first consideration to the health and comfort of all persons residing within the town of Sydney that said stream and Tanks should be strictly preserved and guarded against all abuses whatever, His Excellency deems it necessary to issue the following Orders:—

- "1. That no necessaries, slaughter-houses, tanneries, dyeing-houses, breweries, or distilleries, shall be in future erected on or near to the said stream, tanks, or springs flowing thereto * * * and further, that all * * * [such nuisances] already erected or established thereon shall be immediately pulled down, or otherwise suppressed, under pain of the owners or possessors being proceeded against and prosecuted under the Nuisance Act.
- "2. That no person shall presume to throw any dirt, rubbish, ashes, dirty water, or filth of any kind, into the tanks, or streams supplying them, or into any of the springs or streamlets flowing to and past the said tanks.
- "3. That no linen, clothes, or any other article, shall be washed in the said tanks, stream, springs, or streamlets.
- "4. That no pigs, goats, sheep, horned cattle, or horses, shall be permitted to drink at, or otherwise render foul, the said waters, or any part of them, under pain of forfeiture of said animals, as already prescribed in His Excellency's public notice, dated 11th of August last."

The next reference that I find to the Tanks is in the *Sydney Gazette* of March 2nd, 1811:—"The long prevailing drought has destroyed every hope of the maize crop, which is unfortunately past recovery. A scarcity of water has also been the consequence, scarcely ever before witnessed. In Sydney the Tanks have been several weeks empty, and those who were in want of water obliged to collect it from small cavities in the spring course above the Tanks, which has afterwards been sold at from fourpence to sixpence per pail." Heavy rains fell soon after the date of this notice; and, for several years thereafter (with the exception of 1814-5), floods were more characteristic of the country than droughts. So frequent, indeed, were these floods, and so destructive, that fears were entertained that the cultivation of the alluvial flats of the Hawkesbury, on which Sydney then greatly depended, would have to be given up.

In 1820 there were two or three heavy bursts of rain, causing floods, but there was also a continuance of dry weather, which brought out the following notice in the *Gazette* of October 28:—"The present dry season of the year being indicative of an approaching long drought, which will be much felt throughout the town of Sydney, we presume it would be advisable, as much for the sake of decency as cleanliness, to pay a little if not due regard to the General Orders in existence relative to the preservation from all filth and impurity of that valuable and serviceable reservoir the Tanks. With much pain we have lately observed individuals washing themselves in this stream of water, particularly in that part that runs central from King-street, because that spot is almost secluded from every eye, that of curiosity excepted. In former times the punishment for this offence, it may be recollected, was summarily severe"; and they go on to quote from the General Order of September, 1810. In 1823, the *Gazette* (November 6) again comes out in defence of the water supply, by a republication of the General Order of September, 1810, prefaced by the following words:—"In consequence of certain intelligence having reached us, to the serious injury and annoyance of the inhabitants of the town of Sydney, that the stream of water which flows through the

the town, and the Tanks which have been constructed thereon, at a vast expense to Government, are systematically polluted, and rendered totally unfit (if known generally) for the valuable purposes intended, we have thought it advisable to publish the following extract, &c." A drought of some severity began in this year, and continued till towards the end of 1824. In the *Gazette* of March 18th of the latter year we read:— "As we have had but little rain since July, water has been scarce in town; but then it should be gratefully remembered what a providential supply Blackwattle Swamp furnishes in the most dry season. It would be well to build a reservoir or tanks at this spot. * * * The kindness of the Government will, it is humbly presumed, ever secure this spot from the clutches of private individuals." Of course the kindness of the Government did no such thing; and indeed, it would have been utterly impossible to preserve the purity of the streams that drain the area on which Sydney stands; but had anything like the same care been bestowed on the waters that drain into the north side of Botany Bay as was fruitlessly lavished on the Tank Stream, Sydney might have been abundantly supplied at the present day; and yet, perhaps, it was a mere question of time, and it might have been no more possible to preserve permanently the drainage area of Shea's Creek (the chief of the Botany waters lost to the public) than it was to save from defilement the streams flowing into Darling Harbour and Sydney Cove.

The drought of 1823-4—we learn that 35 inches of rain fell in the former year, and only about 19 inches in the latter (*Gazette*, 10th March, 1825)—drew public attention more strongly than ever to the deficient supply of water; and at the Quarter Sessions commencing on November 9th, 1825, the presentment of the Grand Jury contained the following passage:—"The Grand Jurors have to lament that their repeated presentments of the inadequate supply of Sydney with water have been hitherto disregarded. They have, therefore, again strongly to urge the indispensable necessity of some immediate measures on this subject. The principal stream whence the inhabitants are at present supplied with this necessary article they find still unclosed, and polluted by common sewers, and every description of filthy pools emptying themselves into it, which must render it of highly deleterious quality." And at the Quarter Sessions, in February, 1826, the subject of the water supply is again brought forward in similar terms. The despairing attempts to preserve the Tank Stream, and the pathetic way in which the *Gazette* holds up its condition, have not a little of a comic element. "We actually beheld," says the *Gazette* of 1st March, 1826, "upwards of half a dozen boys bathing in the very stream from which, it is most probable, the next moment many of the inhabitants of Sydney were obliged to supply themselves with water for culinary purposes." These representations, equally with the authoritative Orders of Government, were all in vain. Nothing could save the Tank Stream. Its inevitable destiny was to become a filthy sewer, and, in that capacity, it has long been covered over and hidden from public view. After 1826 I find no further reference to it as a source of water; and, indeed, if you consider its limited drainage area, it is remarkable that it should have served Sydney so long. If a person start from the Custom House, and proceed (by Bridge-street and Macquarie-street) to the middle of Hyde Park, then across to Bathurst-street, thence to George-street, and round by the Police Office to York-street, thence to Church Hill, and back to the Custom House by Bridge-street, he will have enclosed (in a circuit of about 2 miles) the whole area drained by the Tank Stream, amounting to no more than 178 acres. Part of this area, however, was well fitted for the retention of water; for I have been informed by an old colonist that a spongy swamp once stretched from about the position of King-street back towards Park-street, and laterally towards George and Castlereagh streets—such a swamp as may still be seen in several places near Sydney, giving rise to streams of a remarkably permanent character.

The year 1826 began with heavy rain and floods, but soon changed to a prolonged drought, which must have helped materially to bring the question of water supply to a crisis. "This year," says Captain Sturt, "commenced one of those fearful droughts to which we have reason to believe the climate of New South Wales is periodically subject. It continued the two following years with unabated severity." If we consider further that the population of Sydney now amounted to 10,000, it will be understood that a new and more abundant source of water was imperatively needed. In 1824 Mr. John Busby had arrived in the Colony, with the appointment of Mineral Surveyor to the Government, and his labours were soon turned, by Sir Thomas Brisbane, to a search for water. After examining several localities near Sydney, he ultimately reported (in 1826) in favour of the Lachlan Swamp, lying to the south-eastward of Sydney, in the hollow between Paddington and Randwick. Mr. Busby's plan was adopted, and the work of driving a tunnel from Hyde Park to the Swamp was commenced in September, 1827. From the unmanageable and unskilful character of the labourers employed (convicts), and from unforeseen difficulties in the strata that had to be gone through, the undertaking was much more tedious and difficult than had been anticipated, and it was not till June, 1837, that it was brought to a successful termination. The tunnel, however, began to supply Sydney with water as early as 1830, by virtue of drainage from the surrounding rocks. The whole length of the tunnel is 12,000 feet, upwards of $2\frac{1}{2}$ miles, with an average width of 4 feet, and height 5 feet. Twenty-eight vertical shafts were sunk from the surface, varying in depth from 20 to 80 feet; the whole mass of excavation amounted to 255,930 cubic feet, fully nine-tenths being through solid rock; and the total cost was £24,000. The catchment basin of the Lachlan Swamp is about two square miles, but probably only about half that area actually drains into the tunnel; and as no provision is made for retaining storm-waters at the swamp, a great proportion of the rainfall runs down to Botany Bay. The tunnel remains in good order to the present day, and is used to supply the lower parts of Woolloomooloo, and a portion of the city along Darling Harbour, between Bathurst-street and Erskine-street. The termination in Hyde Park is

is about 104 feet above high-water-mark. The daily delivery varies much with the state of the weather, but it may be taken at somewhere between 300,000 and 400,000 gallons, which at the time the tunnel was opened was a fair supply for the population of 20,000 that then existed in Sydney. This quantity represents less than one-fifth the annual rainfall on the area draining into the tunnel. An important feature of the original scheme was to have a reservoir excavated in Hyde Park, capable of holding 15,000,000 gallons, but this, unfortunately, was never carried out.

Soon after the opening of the tunnel there commenced a calamitous drought, the severest and most general of which we have any record. Cotemporary accounts represent the Colony as reduced to great straits through the destruction of vegetation and live stock. One writer says:—"No words can express the miserable appearance of the country. * * * There is neither food for man nor beast. * * * God knows what will become of us all, if some change does not take place very soon." I regret that I can find no record of the rainfall at Sydney, or at any other part of the Colony, for the years 1838-9, during which the drought prevailed; but in Captain Stokes's *Voyage of the Beagle* there is a distinct assertion of the total absence of rain for a period of perhaps eight or nine months. He says:—"For some time previous to our former departure from Sydney, during the whole of our absence, and for several months subsequent to our return, not a drop of rain fell." Now the "Beagle" left Sydney on the 11th November, 1838, and returned 10th March, 1839. The close of the above period must have been May 29th, for I find this record in the *Herald* of May 31st:—"It rained very hard in Sydney on Wednesday night, blowing a perfect gale of wind." It is usually stated, however, that the drought did not break up till October.

There is evidence that, during this distressing period, the tunnel never altogether stopped running, although the supply became scanty. Even so early in the drought as 5th November, 1838, I find this statement in the *Herald*:—"Great distress exists in Sydney, especially at the northern end, in consequence of the scarcity of water. The stream from the pipes on the Racecourse is very small—so small that the men cannot fill the water-carts without waiting four or five hours for a turn. Threepence per bucket is the price now asked—a heavy tax upon poor people." I have been assured by a gentleman who lived in the northern part of Sydney at that time that he had to pay as much as sixpence a bucket. The increasing deficiency of water led the authorities to look about for some fresh source, and the Dam at Cook's River was begun about that time, with the view of increasing the supply. Speaking of the disposal of some prisoners, the *Herald* of 13th May, 1839, says—"The men are to serve the probationary period at Cook's River stockade, where they will be employed at the dam which is to supply Sydney with water." This dam, when constructed, was not found to exclude the salt water, and no further steps were taken in that direction.

The great drought of '38-39 was succeeded by nine years of abundant rain and frequent floods. During this wet period the tunnel seems to have kept Sydney pretty well supplied—at least I find no records of scarcity, nor of schemes for increasing the supply—but in the year 1849 there occurred a drought of considerable severity, and the water question again started into prominence. In that year the rainfall, as measured at South Head, was only 21½ inches (the average being about 50 inches), while the population of Sydney had increased to about 40,000, or double what it was when the Lachlan Swamp was first tapped. I find that in April, 1849, the Water Committee of the City Council directed the City Surveyor (Mr. F. Clarke), to examine the swamp and tunnel with the view of improving the supply. The Surveyor sent in his report in December, recommending that a dam should be carried across the lower part of the swamp, so as to form a lake of 40 or 50 acres, with an average depth of 4 feet, and to construct a reservoir of masonry near the east end of the tunnel, 25 feet higher than the lake, and capable of holding 10 million gallons; this reservoir to be filled by pumping from the lake. A commencement of the proposed dam was made, but it was soon abandoned, and the remaining part of the recommendation was neglected. The next movement was the appointment, in January, 1850, of a special Committee of the City Council, "to inquire into and report on the best means of procuring a permanent supply of water to the City of Sydney." This Committee did not close their labours till February, 1852, when they sent in a long and carefully-compiled report—the result evidently of a laborious investigation of the whole question. This report gives the population of Sydney at nearly 50,000 (the census of 1851 gave about 45,000, and there was a large accession about that time in consequence of the discovery of gold); the number of houses 8,482, of which only 2,300 were supplied with water; the assessed annual value of city property, £232,678; and the gross water revenue, £3,493. In discussing the mode of improving the water supply temporarily, the report condemns the embankment proposed by Mr. F. Clarke, and recommends instead that a trench should be dug at the lower part of Lachlan Swamp, and the water pumped from thence to a reservoir at Paddington, 207 feet above sea level. With regard to a permanent supply, the relative merits of George's River, Cook's River, the Nepean, and Lord's Dam at the mouth of the stream draining the Lachlan and other swamps, are discussed, and the preference is given to the last-named source. It is recommended, however, that this supply be supplemented by the drainage eastward as far as Bunnerong, and westward to Shea's Creek and Cook's River. Before any action could be taken on this report—before indeed, it was handed in—the Governor (Sir Charles Fitz Roy) appointed, in January, 1852, a board of five gentlemen to examine the question afresh. Their report (remarkable chiefly for its length) was laid before the Legislature in August of the same year. They did not take up, as the City Committee had done, the merits of different schemes, but restricted themselves to an examination of the Botany Swamps, as being undoubtedly the best available source; and they recommended that the stream flowing down from Lachlan Swamp should be intercepted at a point about

a mile and a half above Lord's Dam, and the water pumped up to a reservoir at Paddington, capable of holding 12 million gallons. They held that a supply of about twenty gallons per head would be sufficient, while the City Committee assumed that forty gallons ought to be provided.

On the 1st January, 1854, the management of the city passed from the hands of an elective Council to three Commissioners appointed by the Governor; and this arrangement lasted for three years. The Commissioners took up zealously the question of water supply, and passed speedily from inquiry to action. In 1854 (a very dry year in Sydney) they erected a small pumping engine at the lower part of the Lachlan Swamp, for the purpose of throwing more water into the tunnel,—by this adding about 150,000 gallons to the daily delivery; and at the same time, they entered on the necessary preliminaries for obtaining a new and more abundant supply from the lower end of the stream, at Lord's Dam. It was not, however, till November, 1858, that the pumping engines at Botany were set to work, and that system of supply commenced which we enjoy at the present time. Since then we have experienced some very dry seasons, and occasionally the pumps have not been fully served by the stream; but the Municipal Council has always been on the alert, and, on the whole, Sydney has been kept fairly supplied with water. Every dry season, however, has stimulated a fresh inquiry. In 1862, only 24 inches of rain fell, and a Select Committee of the Legislative Assembly was appointed to investigate the state of the Water Reserves. 1865-6 were rather dry (each year giving about 36 inches of rain), and the latter part of '67 very dry, with only 9½ inches in six months, which had the effect of starting inquiry once more. In September last year a Royal Commission was issued, appointing five gentlemen to take up the search for a more abundant and trustworthy supply of water, and these Commissioners have not yet sent in their final report.

The present state of the supply is this:—At Lord's Dam, the drainage of nearly seven square miles falls into Botany Bay. The pumping establishment there comprises three steam-engines of 100-horse power each, two of which are generally kept going night and day. The total quantity pumped last year was 956,000,000 gallons. A 30-inch main, about four miles long, leads to two reservoirs, one at Crown-street, 139 feet above the sea, holding 3½ million gallons, and the other at Paddington, 214 feet above the sea, and holding 1½ million gallons. As these reservoirs contain less than two days' supply, and as the great defect of the system is the want of storage for water in wet seasons, efforts have recently been made to form dams on the Botany stream, so as to preserve a surplus in wet seasons to make up the deficiency of dry. Six of these dams were constructed, but three were partially destroyed by heavy floods in the early part of this year. Had they remained efficient, they would have provided (along with the two ponds near the engine-house) storage capacity for 250,000,000 gallons. The total cost of the works for supplying Sydney (including the two service reservoirs, but excluding the cost of distribution) has been nearly £150,000. The cost of pumping up the water last year was £4,700; and if to this we add the interest on cost of plant, we find the total cost of supplying Sydney (still excluding the distribution) to be about £33 per day, or less than half a farthing per head of the population supplied. The water is distributed through the whole of Sydney proper, together with the municipalities of Glebe, Darlington, Redfern, and part of Paddington, by about 105 miles of piping.

When the present system of supply was completed, in 1858, the population of Sydney and suburbs was about 87,000: at the present time it must be about 118,000. Of this number, about two-thirds share in the public supply of water; and, adding the quantity delivered by the tunnel to that pumped from Botany, it appears that the distribution is at the rate of nearly 40 gallons per head,—a fair supply, if only it could be kept up and fairly distributed, and all could share in it. But we have no sufficient provision for a long drought, and there is nothing to spare for thousands of people in the suburbs, or for the natural increase of our population. Supposing, however, that these defects were remedied, we should not rest content with 40 gallons per head. In a hot climate like this, there ought to be a superabundance of water, as well for public health and safety, as for personal comfort and convenience. Sydney, however, is not favourably situated for an abundant supply, and it cannot be procured without enormous outlay. The words of Sir Thomas Mitchell, in his evidence before the City Committee, in 1850, are as true and forcible now as then—"I cannot but see that the weakest point in the character of this great city—for a great city it is likely to be—is the present insufficient supply of water; I should therefore desire a more certain source."

REPORT on certain Specimens of Water submitted for Analysis by the Sydney Water Commission.

In examining a water chemically with the view of determining its suitability for a town supply, it is rarely necessary to go through the tedious operations required in a full analysis. Every useful end will, in almost all cases, be served by a statement of certain leading particulars. In the first place, the appearance of a water should be noted, that is to say, its condition as to colour and transparency, and whether a sediment falls on standing. The sediment should be examined under the microscope, to ascertain if there

be

be living organic germs or animalcules present, as, from the character of these, we may draw useful inferences regarding the organic matter in the water,—whether it be of a harmless, inert nature, or highly azotised, and in a state of putrefactive change. It may be here stated that in none of the waters now under consideration did the organic matter appear to be of the latter character.

Next, the taste and smell of a water should be noted, although here we must guard against hasty inferences from specimens kept for some time in close vessels. A water containing organic matter and earthy sulphates may, in such a case, generate a little sulphuretted hydrogen, causing a bad odour and taste which the water originally did not possess; and the temperature of a water when tasted is of some consequence, for if this be over 70° there may be some disagreeable impression on the sense of taste, which at a lower temperature might be absent. For a town supply, a water should have no smell or taste whatever; and what is really meant when a water is said to have a good taste, is simply that it has no taste at all.

Irrespective of any possible injurious effects on health, it is of great consequence that a water intended for domestic use should be free from taste and smell, and be pleasant to the eye. It should be colourless, bright, and sparkling, and should deposit no sediment on standing. A water may be wholesome in the absence of these qualities, but people will be deterred from using it as a beverage, and will be tempted to substitute fermented and distilled liquors, to the detriment of health and morals.

After the physical qualities of a water, we may proceed to examine the impurities dissolved in it. The total amount of dissolved solid matter is readily ascertained by evaporating a known quantity to dryness at 212°, and weighing the residue. It is customary then to heat this residue to low redness, in order to destroy organic matter; and after weighing again, we put down so much of the total solid matter as fixed, and so much as volatile. The loss on ignition represents the whole of the organic matter, and usually something over. If there be earthy carbonates present, or chloride of magnesium, there will be a loss of carbonic acid or chlorine, but with certain precautions this loss may be obviated. If there be salts of ammonia or nitrates present, there will be loss which cannot be obviated, but in none of the waters under examination did these occur in any appreciable quantity; and in the following table the volatile matter may be taken as fairly representing the organic matter, or only slightly exceeding it.

The fixed or inorganic portion of the dissolved solid matter requires further examination. In the waters undermentioned this consisted mainly of common salt, with carbonates and sulphates of lime and magnesia, besides a little silica and oxide of iron, and sometimes a minute proportion of phosphate of lime. If the total quantity is not excessive, the exact proportion of these ingredients is of little consequence. The only practical point to determine is the proportion of the earthy compounds that communicate *hardness* to a water. By hardness is meant the property of destroying soap. It is usually represented in degrees, one degree being that amount of hardness communicated to a gallon of pure water by dissolving in it one grain of chalk; five degrees, that amount of hardness communicated by five grains of chalk, and so on.

It is hoped that these preliminary remarks will render the appended table sufficiently intelligible. In the first column is given the source whence the water was derived; in the second column, the date of its collection. The third column gives the total solid matter, in grains per gallon, when dried at 212°; the fourth column, the loss on ignition, slightly in excess of the organic matter; the fifth column, the fixed residue of inorganic matter. The sixth column shows the quantity of chlorine per gallon, in any form of combination. In most of these waters the chlorine is combined chiefly with sodium, forming common salt; and if the numbers in column VI be multiplied by 1.65, the product will show the greatest amount of common salt that could be present in any specimen, and in most cases may be taken as only a little, if at all, in excess of the common salt actually present,—the chief exceptions being George's River at Liverpool, Nepean at Blaxland's Mill, South Creek, and the Woronora, all of which contained earthy chlorides in notable proportion. The water from the Mulwarree Ponds is remarkable for containing more sodium than the chlorine present can take up.

In the case of the water supplied to Sydney at present from Botany, it was thought desirable to make a full and careful analysis. The sample chosen for this purpose was drawn from a pipe at the gate lodge of the University, on the 1st November, 1867. There had been no rain, or only a mere sprinkling, for three weeks, and the water was in fair average condition. Temperature of specimen when drawn, 71°. When viewed through a considerable bulk it showed a brownish colour, and it had a faint taste of peaty matter. The following table shows the nature and proportions of the earthy and saline part of the solid residue obtained on evaporation:—

	Grains per gallon.
Chloride of sodium (common salt)	2.863
Chloride of potassium.....	0.112
Chloride of magnesium	0.118
Carbonate of magnesia	0.059
Sulphate of magnesia	0.128
Sulphate of lime	0.233
Silica	0.222
Peroxide of iron, with trace of phosphate of lime	0.082
Total inorganic matter	3.817

By

By direct estimation the total solid residue was found to be 5·2 grains per gallon. On ignition, this lost 1·5, leaving 3·7 for fixed salts, and showing that about one-tenth of a grain had been driven off in excess of the organic matter. The hardness of this specimen was not directly determined, but probably it was seven-tenths of a degree. A trace of ammonia was detected.

It is probable that the waters derived from the drainage of sandstone districts would be found not to differ materially in composition from the Sydney water, but other rocks would give drainage of a different character; and, as Wianamatta deposits abound in the county of Cumberland, it was thought desirable to make a detailed analysis of a water derived from these deposits. South Creek was chosen for this purpose, as it drains a district covered entirely by Wianamatta beds. The specimen analyzed was taken on June 10th, 1868, when the creek was in its average condition. The water was clear and colourless, no smell, taste faintly saline, but not unpleasant. The components of the dry residue may be represented as follows:—

	Grains per gallon.
Chloride of sodium	25·72
Chloride of magnesium	3·45
Carbonate of magnesia	2·48
Carbonate of lime	2·00
Sulphate of lime	1·10
Silica and peroxide of iron	1·10
Total inorganic matter.....	35·85

The total solid matter found on evaporation was 38·7 grains; subtracting the above 35·85 from this, leaves 2·85 for organic matter. There may have been a little potash in this water, but it was not looked for, and if present it would go, in the above analysis, to the credit of the common salt. The hardness was 9°.

Action on Lead.—As lead is still used to a considerable extent in the distribution and storage of water, it is of consequence that the water adopted for the supply of Sydney should have no undue action on this metal. The amount of action was determined in the following manner:—In a certain number of the waters submitted for examination, a piece of sheet lead, exposing 20 square inches of surface, was immersed in a pint of each specimen, and allowed to stand 24 hours; the proportion of lead dissolved in the water was then determined. Examined in this way, different specimens of Sydney water, drawn at different times and places, were found to acquire a proportion of lead varying from one-tenth to one-fifth of a grain per gallon. The worst water examined was that of the Woolli Creek, which took up about one grain per gallon. The Woronora took up about one-tenth, and the Cataract the same. The Warragamba and the Nepean at Penrith had about the same action, each taking one-twelfth. Water from Pheasant's Nest took one-eighteenth; George's River above Liverpool Dam, one-thirtieth; and the Grose, a mere trace. With the exception, then, of Woolli Creek, the Sydney water was the worst of the running streams examined; which is so far satisfactory, because we already know that Sydney water may be conveyed through a moderate length of lead piping without dissolving so much of the metal as to be injurious. Lead cisterns even may be used with impunity for storing the Sydney water, provided they be well painted. White zinc paint seems well adapted for this purpose. And water that has been contaminated with lead in any way may be effectually purified by filtration through sand.

Separation of Clay.—Specimens of water taken at different times from the heads of Prospect Creek were always found to be nearly opaque from finely diffused clay; and this clay separated so slowly that the water was not clear after standing some weeks. Also, when clay from the adopted site of the storage reservoir at Prospect was diffused through Sydney water, it was found to be equally long in settling; while clay from the site of the University, similarly diffused, settled and left the water almost clear in a few days. Filtration through a depth of 9 inches of fine sand effected little or no improvement in the water containing Prospect clay; but when alum was dissolved in this water at the rate of 2 grains to the gallon, separation of the clay began very speedily, and within 24 hours the clay had completely subsided, leaving the water clear. On comparing the amount of dissolved solid impurity in the water, before and after the action of alum, it was found that this dissolved matter had increased at the rate of 1·1 grain per gallon. The crystallized alum contains 44 per cent. of water, so that it would appear that the alum had left all its solid matter in the water; but, on the other hand, there may have been double decomposition, and the alumina may have been precipitated, leaving some other base in its place. This point I have not yet determined.

J. SMITH, M.D.

University of Sydney,
July, 1869.

TABULAR VIEW OF THE COMPOSITION OF WATERS ANALYZED BY PROFESSOR SMITH FOR THE COMMISSION.

I.	II.	III.	IV.	V.	VI.	VII.	VIII.
Source of Specimen.	When collected.	Grains per gallon.				Hardness.	Remarks.
		Total Solid Matter.	Volatile Matter.	Fixed Matter.	Chlorine.		
Sydney Water :—							
Tunnel Mouth	15 Oct., 1867	5·3	1·1	4·2	2·08	} Taken in rather a dry season. 4 inches of rain fell in September, 1867, and only 1¼ inch for the remainder of the year.
Engine Pond, Botany	15 Oct., 1867	5·2	1·6	3·6	1·86	
Pipe, No. 8, Glebe Road	16 Oct., 1867	4·9	1·5	3·4	1·86	} Engine pond low. Water must have been contaminated with sea-water.
Pipe, University Gate	1 Nov., 1867	5·2	1·5	3·7	1·82	
Engine Pond, Botany	— Dec., 1867	9·9	1·9	8·0	3·99	} Four days after heavy rain, water slightly milky. Moderate rains; water of a faint tawny colour—brown sediment.
Pipe, 8, Glebe Road	13 April, 1868	6·0	2·0	4·0	2·02	0°·8	
Pipe, University Gate	4 June, 1868	5·4	1·4	4·0	1·91	0°·7	} Slight colour when viewed through a large bulk. Rainy weather; water of a faint tawny colour.
Do.	11 Nov., 1868	4·7	1·2	3·5	0°·6	
Do.	10 June, 1869	5·0	0·8	4·2	2·05	0°·6	} Slightly coloured. Clear and bright—no taste or smell—no sediment.
Do.	8 April, 1869	5·6	1·2	4·4	2·13	
Pipe, 183, Macquarie-street	13 April, 1869	5·6	1·4	4·2	0°·9	} Taste and smell have slight taint of organic matter. Clear and bright—taste not altogether satisfactory.
Woronora River	20 Nov., 1867	6·1	1·2	4·9	3·03	1°·3	
George's River, Liverpool Dam	4 Nov., 1867	15·0	2·6	12·4	6·52	} Do. taste and smell unexceptionable. River low.
Do. three miles above Liverpool	24 Oct., 1868	26·2	5·8	20·4	12·26	8°	
Do. junction of Toggerai	2 June, 1868	6·1	1·7	4·4	2·53	1°·1	} Colourless—trifling sediment. Two weeks after a flood. Clear—no smell—softish taste.
Catacart River, Loddon Crossing	— Dec., 1867	5·4	1·1	4·3	2·45	0°·6	
Do. near junction with Nepean	28 Feb., 1868	4·3	1·4	2·9	1·64	0°·7	} Clear and bright—faint taste of organic matter.
Do. Broughton's Pass	6 Nov., 1868	5·8	2·0	3·8	2·27	0°·7	
Do. do.	16 Mar., 1869	6·4	1·6	4·8	2·63	1°	} Do. no taste or smell.
Nepean, above Pheasant's Nest	2 Oct., 1868	4·6	1·3	3·3	1·53	1°·4	
Cordeaux, do.	2 Oct., 1868	4·2	1·3	2·9	1·70	0°·7	} Do. do. Do. do. River pretty full.
Nepean, below Pheasant's Nest	8 June, 1869	4·2	1·0	3·2	0°·8	
Do. at Douglass Park	28 Feb., 1868	4·7	1·3	3·4	1·47	1°·9	} Two weeks after a flood. Clear—softish taste. No colour, taste, or smell—slight sediment.
Do. at Blaxland's Mill	8 Nov., 1867	14·8	2·0	12·8	7·20	5°·8	
Do. at Penrith	11 Mar., 1869	10·0	2·2	7·8	2·50	3°·4	} Dirty white, almost opaque, from diffused clay. Faint tawny colour—tastes slightly of organic matter.
Couridjah Lagoons	7 Mar., 1868	3·7	1·8	1·9	0·65	None.	
Wollondilly, near Goulburn	26 April, 1868	12·4	1·56	8°	} Opalescent from fine clay. Taste not quite satisfactory. Contains a notable like the last. Iron abundant. [proportion of iron and carb. acid.]

REPORT by Mr. Bennett to the Sydney Water Commission on the Botany Water Supply and proposed improvements thereof.

IN accordance with arrangements made at the Meeting of the Commission on 11th July, 1868, I now submit Report on the Botany Water Supply, with the accompanying drawings, viz. :—

- No. 1. General plan.
- No. 2. Section from Crown-street Reservoir to Botany.
- No. 3. Section Botany to Long Swamp and Bird's Gully.
- No. 4. Survey of site of proposed Reservoirs at Cemetery Reserve.
- No. 5. Survey of Dams, 1, 2, 3, 4, 5, 6.
- No. 6. Plan of proposed Reservoir at Strawberry Hills.
- No. 7. Plan of proposed Dam and overflow at Lachlan Swamp.

The shedwater line and dams on General Plan are from actual surveys—the filling in from maps of the Survey Department—the sections are also from actual surveys.

The extent of the basin from which the present water supply of Sydney is derived amounts to about 4,249 acres.

An addition of about 1,224 acres can be made to this area, by intercepting near Bunnerong the water from the Long Swamp, and conveying it by a pipe partly along Bunnerong Road to the Engine Pond.

That this course is more advisable than to convey the water from the Long Swamp into Bird's Gully by a cutting, is evident from the section. An excavation 13 feet deep, for more than a mile, would be required to drain it northward; and to secure any reservoirage, a dam of much greater height than is now proposed, and a less available range, with an addition to the watershed of only 678 in lieu of 1,224 acres, the additional 546 acres being obtained below the site at which it would be necessary to put dam in order to convey the water northwards to Bird's Gully.

All the country to the southward and eastward of the shedwater on plan drains over the surface into the sea or Botany Bay, except the Seventy-four Swamp, the water from which must percolate into the sea, as its level is much lower than that of the outlet of the Long Swamp, into which it should drain to reach Botany.

It is extremely difficult to define the western boundary of the watershed, as there is no overground outlet from the narrow valley between the intermediate watershed of the Lachlan and the Waterloo Swamps. 54 acres of the southern portion certainly goes into the Lachlan Swamp, and it is assumed that the northern 169 acres included in watershed on plan percolates through the sand into the Botany Stream.

The external drainage of the north-western watershed is conveyed into Shea's Creek, the waters of which cannot be made available, as they are so contaminated by woolwashing and manufactures; but in the event of the Cemetery Reservoir being adopted, its area and that of its watershed (80 acres) must be added to the rain basin; and as this addition cannot very much affect the gross results, it has, for simplicity, been included in all the calculations, even where the Cemetery Reservoirs are not contemplated.

The drainage from the northern external slopes of the watershed flows over ground into Sydney Harbour, with a steep slope in that direction, rendering percolation very improbable.

It would not be possible to increase the area of gathering ground by drains round the exterior slopes of the hills bounding basin, discharging over the lowest summits, as the sides of those hills are so porous and absorbent that the water never flows in drains cut along them.

Having determined on the greatest area of gathering ground available, the next question to be considered is the quantity of water to be obtained from it.

It is clear, from the description of the catchment, that it is most unlikely any addition is made, by either springs or percolation, from any part of the surrounding district. In the evidence taken before the Select Committee of the Legislative Assembly in 1862, it was stated that there was a probability of the rainfall being supplemented by springs from the Blue Mountains. Apart from the fact that no springs have been discovered

discovered anywhere on the surface of the basin, where they would most unquestionably be found if originating in so elevated a source, geologically it is most improbable, from the relative position of the strata, that springs originating in the Blue Mountains would be met with in the Botany Swamps; the springs discharging into the tunnel are mere percolations of the surface water, and in the present state of the surface would not be at all a desirable addition to the supply.

As it cannot be considered safe to rely on a supplement to the supply from springs or other sources, in a basin so isolated from higher ground, the quantity of water to be dealt with can only be arrived at from the rainfall. As a rain gauge has been kept at Botany only since May, 1868, it will be necessary to assume that the gaugings at Sydney represent the rain at Botany for previous years; the difference between the gaugings at both places, from May, 1868, to March, 1869, being about 12 per cent., and as those at the Observatory are in excess, the supposition favours Botany.

As permanence is the one essential requirement for a City Water Supply in this dry climate, it will be necessary, in calculating the amount to be derived from the rainfall of any given area, to deal only with the driest period of which there is any authentic record; this, as far as can be ascertained, was from the beginning of November, 1848, to end of February, 1850, sixteen months, during which time 27·99 inches of rain are registered. Much drier seasons than this are stated by old colonists to have occurred—1812–1813 and 1839; but as this is the driest period during which the rain was registered, it may be assumed as the minimum rainfall. A period of months has been selected for consideration, instead of a cycle of years, as it would be impossible to obtain a reservoir in the basin large enough to store the water from year to year.

The total area, including basin of Cemetery Reserve, which can be made available, being 5,553 acres, 28 inches of rain will give a rainfall of 3,519 million gallons; or presuming that it were possible to utilize every drop of water falling on the shedwater *as extended*, and without any allowance for waste, absorption, or evaporation, an average of 7,271,125 gallons per diem for 484 days of drought.

To enable an accurate determination to be arrived at of the proportion of this rainfall available, detailed and constant observations of the quantity supplied by the engines and the tunnel, together with the quantities going to waste over the weir for some definite period, would be required.

It has not been possible for the Commission to obtain such observations during the drought of '68–9, by their own agents; as the control over the flow afforded to the Corporation by the dams, sluices, and tunnel, and the fluctuations in discharge caused by opening drains and cutting into swamps, so disturbed the train of the stream as to render observations impossible, except made by persons present day and night at the several points of discharge, or by self-registering instruments, the records of which, extending over so short a time, would not have afforded any very definite data.

On the 1st February, 1869, the Lachlan Swamp was quite dry on the surface. A drain, 4 to 6 feet in depth, going to the surface at the deepest part of swamp, had been cleaned out the preceding day, and was discharging at a rate not exceeding 135,000 gallons per diem, from an area of about 200 acres; this evidently being the water which had been stored in the swamp and liberated by the deepening of drain, which it was hardly possible to lower any further without going below the level of tunnel.

The dams, 4, 5, and 6, were quite empty, and drains, 2 to 3 feet in depth, were being scraped through the mud and marl in the bottom. The discharge observed at No. 4 dam was at the rate of 169,232 gallons per diem (62 gallons per acre per diem) from an area of 2,701 acres, exclusive of Lachlan Swamp (after a period of five very dry months). On the 3rd February, this was increased to 1,763,917 gallons per diem, by the deepening of most of the watercourses above the dams.

At low tide the engine pond was as low as could be permitted, the speed of the engines being reduced at high tide to allow the water to rise in engine pond, and prevent percolation of sea-water. The engines were also occasionally stopped at night, and for more than a month the streets were not watered.

The upper engine pond was used for the adjustment of the supply; and between the 1st and 3rd February, the watercourse between it and No. 4 dam was cleared, and deepened about 18 inches, raising the flow to three million gallons per diem—about one million and a quarter being due to the valley between No. 4 and engine pond. This resulted from a deepening of the watercourses, averaging 18 inches throughout the basin, and would have kept up the supply for perhaps a week, when another deepening would have been necessary, to draw on the gradually decreasing stores of this subterranean reservoir. Had not rain fallen most fortunately and opportunely on the 5th February, also on the 10th, and heavy rains on the 11th and 12th (3·3 inches in all), the citizens would have had an opportunity of learning, by bitter experience, how far this process could have been continued. In most cases the cuttings had gone through the peaty surface soil, and were on to the white marly sand—by no means so spongy or retentive of water as the upper soil.

To

To give some idea of what the state of things would have been, under the same circumstances, in January or February, 1850, the monthly rainfall of the two periods is given:—

	1848.		1867.
November.....	0·48	0·20
December.....	2·92	0·85
	1849.		1868.
January.....	0·57	4·52
February.....	0·81	15·30
March.....	1·18	0·85
April.....	1·13	0·06
May.....	5·61	5·03
June.....	1·80	3·08
July.....	3·48	4·80
August.....	1·66	2·60
September.....	1·33	2·01
October.....	1·95	1·46
November.....	1·56	2·42
December.....	0·41	0·92
	1850.		1869.
January.....	1·37—(26·26).....		1·03—(45·13)
February.....	1·73	7·21
	—————		—————
	27·99		52·34

Up to the 1st February, in both periods, the rainfall was 26·26 and 45·13, though with the greater rainfall and the assistance of the reservoirs, the utmost difficulty was experienced in obtaining a supply in '69.

It may be urged, however, that a very large proportion of the entire year's fall came down in February, 1868, and ran into the sea, and that the rainfall in the last four months was, respectively, 5·29 and 5·83, very nearly the same; but in the preceding four months it will be seen that the total fall in 1868 was 75 per cent. more than in '49.

From these facts two inferences may be drawn: either that the sands do not possess the great storing power attributed to them, or the flow on 1st February, 1869, would have been much greater; or, on the other hand, granting this storing power, that the supply in February, 1850, would have been little more than one-half what it was in 1869, which was insufficient.

With reference to the statements as to quantity of water going to waste at Botany, I have taken out the quantities from the dimensions given in Mr. Bell's table, (Appendix A), and with corrections for modes of measurement of head and of sluice opening, and for tidal backwater, and with coefficients of contraction and discharge which seem to me reasonable, the results are as shown in the following Table, which also contains the same calculations from October, 1867, to end of May, 1869, and the consumption and rainfall for each month.

	Waste.			Consumption.		Grand Total used and wasted per Month.	Depth in inches on Catchment accounted for.				Rainfall.	
	Discharge through Sluice, per Month.	Discharge over Weir, per Month.	Total to waste, per Month.	Pumped to Sydney, per Month.	Estimated Flow through Tunnel.		Wasted per Month.	Used per Month.	Total.		D.	
	Million gallons. A.	Million gallons. A.	Million gallons. A.	Million gallons. B.	Million gallons. C.	Million gallons.	Inches.	Inches.	Inches.		Inches.	Million gallons.

A. Quantities through sluice and over weir calculated from dimensions deduced from table attached to Mr. Bell's evidence, from 25th March to October, '67; the remainder, from the dimensions and times given in Mr. Westcott's return as copied by Mr. Wells; corrections for tide, from Fort Denison Register. B. From return of quantities pumped weekly. C. Estimated at 2,000,000 gallons per week. D. Rainfall, from Sydney Observatory Tables.

48—0 [335]

527

The discrepancy between the discharges of '67, as corrected, and '68, is so great that it is but reasonable to suppose that there has been some constant error in the observations of the sluice opening from March to October, 1867. This seems the more probable, as the remaining observations agree very closely as to proportion of rainfall with the result of the observations in other countries, and with the very accurate experiments made by Mr. Bell, in 1856, on a weir designed by him for this purpose, the result of which showed for the period:—

From 18th July to 31st December, 1856—A total flow and consumption of 2·316 inches, with a rainfall of 3·43 inches	} A proportion of	·6752
That by the table of corrected calculations for 1867—Being a total flow and consumption of 49·50, with a rainfall of 46·66		
And for 1868—20·25, with a rainfall of 43·04	" "	·4705
And for 5 months of 1869—10·69, with a rainfall of 33·24	" "	·321

The small proportion of 1869 will be, no doubt, increased considerably by the large proportion of flow to rain in June, the difference being stored in the sand and reservoirs and gradually discharged. Setting aside this result, and taking those of '56 and '68, years of very nearly the same rainfall, the coincidence in the results is pretty close, and the disparity which does exist appears only to be a guarantee of their accuracy as it can very fairly be attributed to the subsequent alteration in the character of the swamps, the cutting into which has, year by year, so dried their margins as to decrease their area very materially, killing all the aquatic vegetation, and allowing the sun to bake the surface hard, on which the rain falling flows off as if off iron, and the sand not being shaded by vegetation has all the surface moisture at once evaporated by the scorching sun and drying winds, to the full force of which the removal of the aquatic plants has exposed it.

The injury to the swamps is still further increased by the trampling of cattle and the destruction of the timber and shrubs on the hills by fires, &c., which has exposed the sand to be blown on to the flats, filling the interstices of the natural peaty soil and making it impervious to rain, all tending to the rapid discharge of floods and decrease of absorption.

It has, on the other hand, been urged that by the removal of the vegetation the evaporation from the surfaces of plants has been reduced, but it is not considered that this can compensate for the loss by the rapid discharge of floods.

To illustrate further the probable accuracy of the results of '57 and '68, the following Table of Discharges, as measured in other countries, is appended.

TABLE of Rainfall, and proportion collected.

Locality.	Area of Catchment.	Rainfall.	Flow.	Proportion of rain to flow.	
	acres.	inches.	inches.		
Loch Island Reevy	3,300	60 to 70	48 to 50	·753	As collected in reservoirs. Reservoirs containing 290,000,000 gals., filled in six months.
Longdendale	5	55½	49½	·892	Flow as ascertained by streams.
Swineshaw Valley	49½	37	·755	
Rivington Pike, Liverpool	10,400	56½	43 to 44	Quantity collected in reservoirs, 36 inches.
Ashton Waterworks	378	40	·384	Stored.
Belfast	980	32	·522	Used.
Bolton	1,041	50	·619	Used.
Dublin, Vartry	14,000	45	·500	Used.
Dunkenfield	383	36	·500	Stored and used.
Glasgow	43,000	60	·402	Is used.
Greenock	5,043	60	·603	Has been observed to run off into reservoirs.
Huddersfield	1,000	33	·537	Is stored and used.
Liverpool	10,400	55·5	·436	Is stored.
Macclesfield	2,000	40	·526	Is used.
Manchester	18,900	37	·617	Is actually used, Mr. Bateman is of opinion that three-fourths could be made available.
Oldham	2,700	35	·415	Is used.
Paisley	790½	56·33	·548	Is used. Mr. Copeland thinks 84 per cent. could be utilized.
Plymouth	4,000	44	·343	Is used for town purposes.
Preston	3,000	43	·232	Is used.
St. Helen's (Old Works)...	280	30	·122	Stored and used.
Southampton	120	23	·333	Collected.
Wigan	2,200	40	·26	Used.
Woodburn, near Belfast...	3,405	33·8	217	·606	
(a) Vehar Reservoir, Bombay.	3,515	102·0	53·4	·523	Average.
(b) London	84	32·5	·387	Dry season, 1864.
				·666	

(a) These observations are taken from the Report of the Executive Engineer on the improvement of the present supply to Bombay, published in July, 1868.

(b) The result of the frequent and varied measurements during the discussion of the best mode of draining London, when it was admitted on all sides that but two-thirds of the rainfall reached the drains or could be accounted for, notwithstanding the impervious surface exposed by the slated roofs and paved streets and yards.

The

The observations at Bombay are the only accurate records of flow into a large reservoir in a hot climate which we possess, and were taken in a year of average rain; but in 1864, when the monsoon was deficient, out of 84 inches of rain on the catchment, but 32·5 flowed into the reservoir, though the distance was short, the ground steep, the formation basalt, and denuded of any soil that could be washed away—all conditions most favourable to discharge.

It will be observed on the basin of the Vehar Reservoir, the proportion of flow to rainfall decreases in a much more rapid ratio than the rainfall itself.

The flow, with a fall of 102 inches, being 52·3 per cent.,
and with a fall of 84 " " 38·7 "

The proportionate flow under the same circumstances, with a fall of 21 inches, as in this country in 1849, would be but very trifling indeed, and would entirely depend on how the rainfall was distributed over the period under review.

The fact of the absorbent nature of the sandy soil, which is held to be one of the greatest advantages of the Botany shedwater, would, in a year of extreme drought, with partial gentle rains at intervals, be rather a disadvantage than otherwise, as all the moisture having been withdrawn by the parching winds and sun, the sand would absorb a considerable amount of the occasional rainfall before the level of saturation was raised to the discharging point.

But in order to make the strongest possible case for Botany supply, it will in the first instance be assumed that one-half of the rainfall in such a dry year will flow into the reservoirs and engine pond—being more than the proportion in the year of average rain, 1868; and taking it for granted, in order to illustrate the maximum capabilities of the shedwater, that it would be possible and advisable (neither of which can be admitted) to carry out the whole of the reservoirs projected as follows:—

	Contents in millions of gallons.	Superficies in square feet.
Cemetery Reservoir	850	3,484,800
Engine and Upper Ponds	25	1,257,048
Nos. 1, 2, and 3 Dams, if restored	70	2,322,050
Nos. 4, 5, and 6, as they exist	72	2,559,878
Nos. 7, 8, 9, 10, 11, 12, and 13 Dams, as proposed by City Engineer	232	6,200,000
Reservoir at Long Swamp	245	4,378,730
Covered Reservoir at Newtown	9	covered
Reservoirs at Crown-street, Waverley, Paddington, and Hyde Park	41	covered
	1,544	20,202,506

Assuming further that these reservoirs were full at the commencement of this period, and that the rain fell at such intervals as would admit of the reservoirs conserving completely the 50 per cent. of rainfall estimated as flow, the quantity supplied would stand thus:—

	Millions of gallons.
Total contents of reservoir at commencement of period	1,544
Half total rainfall, sixteen months, on 5,094 acres	1,614
The entire rainfall on 459 acres of reservoirs	291
	3,449
Less evaporation from reservoirs at the rate of 6 feet per annum, from a water surface of 459 acres exposed for one-half of the period, say 4 feet	498

2,951 millions of
gallons

being at the rate of 6,097,107 gallons per diem for 484 days. So that, granting all that can possibly be assumed by the most sanguine advocates of the retention of Botany as a supply, and presuming that all the works proposed by them were executed, as well as an extension of the shedwater not immediately contemplated by them, it is clearly shown that, in the period in question, the most that could be hoped for would be an augmentation of 46 per cent. to the quantity now being supplied, to secure which it is admitted it will be necessary to incur the following expenditure:—

Reservoirs at Cemetery Reserve	£56,000
Repairs of Dams, Nos. 1, 2, and 3	3,000
Construction of Nos. 7, 8, 9, 10, 11, 12, and 13... ..	8,000
Open Reservoir at Waverley	9,000
Covered Reservoir at Newtown	24,000
Extension, Paddington and Crown-street	40,000
Hyde Park Reservoirs	55,000
	195,000
Proposed addition to Shedwater, Dam at Long Swamp, and Pipes to Engine-house	14,000
	£209,000

To

To this amount must be added the estimated cost of all the alienated land in the shed-water; all the unbuilt portions of which it would be absolutely necessary to resume, should Botany be retained as a permanent source of supply, as follows:—

Say half the alienated land in Randwick and Waverley, the remainder being built on...	307
Williams' and Kellet's Grant...	7
Terry's Grant	402
Winder's Grant...	388½
Lord's Grant	395
Church and School Lands	1,865

3,364 acres

valued at £47,209.* So that, conceding the possibility of executing all those works in a permanent manner for the amounts estimated, the entire cost of securing a daily supply of 6 millions of gallons, in addition to the amount already expended, would be,—

For additional works	£209,000
For land	47,209

Total... .. £256,209

of absolute outlay; and contrasting this scheme with a gravitation supply, the capitalized cost of pumping should be added, being 6 millions of gallons per diem, at (say) £4 per million for (say) fifteen years, including coals, wages, wear and tear, cost of replacing boilers, engines, &c.

£131,400

£387,609

On the other hand, should the Government carry out any other scheme of water supply, there would be available for sale or other purposes,—

172½ acres Lachlan Swamp.	
475 „ of unalienated land north of Racecourse, including Common.	
219 „ „ „ „ south of Racecourse.	
41 „ Suburban lots, Randwick.	
74 „ Repurchased from Lord.	

981 acres, valued at £25,750.

So that, in contrasting a hypothetical supply of 6,000,000 of gallons daily from Botany, with that of an equal supply from any other source, the cost must be reckoned at £413,359, independent of any credit to be given for the 30-inch main, the engines and engine-house; the latter of which could be used for other purposes, and the former with advantage be worked into any other scheme.

A very large proportion of the land now reserved might be made very valuable as market gardens (so much required for the more plentiful supply of Sydney during dry seasons) by pumping or discharging by gravitation a portion of the sewage to be brought, as suggested to me by the Surveyor General, in a pipe through the tunnel, which would not be required in the event of a supply being obtainable elsewhere; thus securing a considerable revenue, and affording the only means yet known of utilizing sewage economically. This would also, to some extent, obviate the pollution and filling up of the harbour.

Having discussed the quantity to be derived during a dry season,—

1st—From the entire rainfall,—

2nd—From the probable flow, assumed as 0·5 of the rainfall, conceding the existence of all the reservoirs proposed,—

It now remains to set forth what may safely be calculated as the maximum supply during such a dry year as 1849, presuming that the reservoirs deemed possible and advisable to make were constructed.

The proportion of flow to rain in the average season of 1868 being 47, or about one-half, and the decrease at Bombay, with a diminution of 18 per cent. in the rain, being 13·6 per cent., the proportionate decrease in the case of Botany would be 49·8 per cent., reducing the flow to 24·8 per cent., or one-fourth of the rainfall; but it is considered this would be a rather small proportion; so that one-third of the rainfall has been calculated on, and may, it is considered, reasonably be relied on even in the driest years.

One-third of the rain would give, during the dry sixteen months,—

		Million gallons.
From the Lachlan Swamps	923 acres	195
Long Swamp	1,224 „	258
Remainder of Catchment	3,468 „	732
Millions of gallons		<u>1,185</u>

Having determined on the probable quantity of water obtainable, the best mode of conserving it is the next consideration.

The

* This valuation has been made by an officer of the Survey Department, and is very low, being an average of but £14 per acre, though the ex-Surveyor General stated, in his evidence before the Special Committee of 1862, that the average price given for the Randwick allotments at the Government land sales was over £100 an acre.

The primary requirements for any storage reservoirs in this climate are,—

- 1st—Impermeability ;
- 2nd—Depth, to reduce the evaporating surface ; and, for the reservoirs in this particular instance, elevation, and proximity to the locality to be supplied, so that the water may be delivered at the point of consumption with as much pressure as possible.

The chief storage reservoirs proposed in the last evidence of the City Engineer are those at the Cemetery Reserve, and at Hyde Park ; the other reservoirs and extensions coming more under the head of service than storage reservoirs.

Detailed surveys of the Cemetery Lagoons have been made, and they prove the impossibility of getting, at any reasonable cost, a reservoir to contain 850,000,000 gallons, at the elevation proposed of 137 feet ; as, to dam the Southern Lagoon to that height, an embankment of 20 feet high for a length of 32 chains would be required on a surface of pure sand, which would have to be removed to a depth of at least 10 feet to reach the indurated sand, and that could not be trusted as a foundation for a dam 30 feet high.

The Northern Lagoon, if embanked 40 feet at the present outlet, and 20 feet on the saddle, excavated to uniform slopes of 3 to 1, and puddled and bricked all over, might be made to contain 307,000,000 gallons, with a surface level of 137 feet. The probable cost would be £70,000 with dams puddled ; but the risk of such constructions in a soil chiefly consisting of pure white sand would be so great, that their execution could by no means be recommended, even if it were imperative to continue the supply to Sydney from Botany.

The Cemetery Reserve site is in many respects a very advantageous one for a reservoir, and it is with considerable reluctance an unfavourable opinion is expressed of it, but in addition to the difficulties of construction, there is the necessity of pumping from Botany every drop of water to be stored, only the upper 10 feet of which would gravitate to Crown-street, containing (say) 90,000,000 gallons, or not quite one-third of the entire ; the remainder would have to be pumped a second time either to Crown-street or to the high levels at Paddington and Waverley heights, varying from 76 to 113 feet to Paddington, and 183 to 207 to Waverley.

With reference to the districts most requiring improvement in their supply, the Glebe, Redfern, Newtown—this reservoir is not well placed ; so that, well-situated as it is in many other respects, its low level, and want of shedwater, as well as the comparatively great cost of construction, from the unfavourable character of the soil, preclude its further consideration.

The proposed reservoirs in Hyde Park would be at a comparatively low level ; their construction would involve an expenditure hardly commensurate with the amount of storage, a great interference with the traffic during the progress of the work, and probably large claims for compensation for real or fancied injuries to the property in this vicinity. It is considered that every end to be gained by their execution could be attained at much less cost, by providing a large storage reservoir at the Lachlan Swamp.

This reservoir to be formed by the construction of a dam on the site shown on plan, two rows of sheet piles with chisel-pointed shoes to be driven so as to enter the soft rock, the sand to be then dredged out by a small engine running on rails laid on top of piles, temporary strut frames to be inserted to keep piling in its place, the trench to be then puddled up, all internal timbers being carefully removed as the work proceeded, all material within the limits of reservoir excavated to the level of 107 feet over datum, a waste weir of 44 feet in length and two sluices, together capable of discharging two-thirds of the maximum of 20 inches of rain at a depth of 18 inches, to be provided on the rocky ground at the eastern end of dam, with a tunnel at a low level to empty the reservoir completely when required ; the entrance to the present tunnel to be built round with a masonry tower with inlet valves, to control the flow of water ; arranged so as to make the head in reservoir available for delivery.

An 18-inch pipe to be laid through the tunnel, to draw off the water to a level of 107 feet ; all below this level could in dry seasons be pumped to Waverley.

There would thus be secured a storage reservoir to contain 278,000,000 gallons, chiefly at an elevation of 107 to 115 feet, or within 22 feet of the height proposed for the Cemetery Reservoir, commanding all the city below level of Hyde Park with a good pressure and abundant supply, and saving the pumping from Botany of all the water falling north of this dam, and providing a reservoir in the most advantageous position for pumping to the high levels at Waverley and Paddington.

As a necessary adjunct to this reservoir, a pair of thirty-horse power horizontal double-acting engines and pumps should be placed in a suitable position to pump, when working together, 1,000,000 gallons per diem to Waverley or Paddington as required.

For the western portion of the city, the Glebe, Redfern, and Newtown, I would propose to have a reservoir on the Strawberry Hills, at the head of Riley-street, near Messrs. Goodlet and Smith's pottery. The sandhill there to be removed, and the reservoir excavated to a level of 150 feet over the sea, at or near which the shale substrata will be reached over the whole area.

It is proposed to make a brick-in-cement or stone retaining wall, and to concrete the bottom. This reservoir is calculated to contain 29,000,000 gallons, at a level from 150 to 166 feet, in a most favourable position for the supply of the south-western suburbs, where the want of water was most complained of last year. The height being intermediate between Paddington and Surry Hills, will not try the engines and machinery so much as pumping to Paddington ; and the removal of the sandhill will be a great benefit to the vicinity, the city, and more especially the harbour, as at present it serves to feed the southerly squalls with sand, to be deposited in the streets, and ultimately washed into Darling Harbour and Sydney Cove.

This

This reservoir may be left open, as it is not considered necessary to roof in so large an area, and no serious injury to the purity of the water is anticipated, even though the vicinity should be covered with buildings; there are none likely to be above the reservoir, and there are many instances of uncovered reservoirs for supply of towns. The depth would be considerable compared with the area, so that evaporation would not be more than ordinary, and if found absolutely necessary it could ultimately be covered.

In addition to the reservoirs at Lachlan Swamp and Strawberry Hills, a storage reservoir could be constructed at the Long Swamp, near Bunnerong, to receive and store the waters from the greater portion of the Church and School Estate.

The dam to be constructed in the same manner as that proposed at the Lachlan Swamp, to be 17 feet high, and contain 245,000,000 gallons; the water being conveyed, when required, to Botany by a 15-inch pipe.

It is not considered advisable to extend the Crown-street Reservoir, as that at the Lachlan will answer all purposes; but the proposed reservoir at Waverley should be constructed, and when required, that at Paddington enlarged.

With reference to the dams already constructed on the Lachlan Stream, it would not be considered safe to expose them to a greater head of water than 8 feet, as puddle not having been carried down to the impermeable substrata, the hydraulic pressure acts more or less through the sand; and though the dam itself is kept down by the weight of sand above, there is nothing to prevent the peat down stream being forced up, and the quicksand (which it will be when the pressure exceeds a certain limit) under dam from being blown out. It is very evident a slight addition to the pressure on No. 4 would produce this effect.

It will be absolutely necessary, in order to prevent the floods overtopping dams or rising to such a height as will cause them to blow up, to lengthen the overflow to 80 feet, and put two sluices in each dam.

The depth, therefore, being limited to 8 feet at the pipe, the average depth when water is level with weir will not exceed 6 feet, and that being the probable depth of evaporation in the dry period, the utility of those dams, in a long drought, is very questionable, and can only be confined to raising the limit of saturation in the sand. This command will be by no means equivalent to the height of the dam, on account of the comparatively considerable slope of the country; so that, though the contents of those dams is taken into consideration in the calculation for supply, no great reliance is placed on their stability or staunchness; and it is not recommended that the injured ones should be restored further than by patching up the best with the available materials from the others.

With reference to a large storage reservoir to be formed by a dam on the site of No. 4, the elevation is not sufficient to warrant its construction, as the height to be pumped to the high levels would be nearly as great as it is now, and the water for the low levels should flow to Botany, to be then pumped as at present.

A storage reservoir at Botany would answer all the purposes of one at No. 4; and in the event of Botany supply being continued, the present upper and engine ponds are capable of considerable enlargement; but the depth being restricted to the difference between the engine well and the Botany Road, sufficient range could not be obtained to counterbalance the evaporation. In addition, the water from three-fifths of the basin being intercepted and stored, except in very wet seasons, the flow from the intermediate country over what can be stored in Nos. 4, 5, and 6, and the engine ponds, will not exceed what the engines can pump up, and in wet seasons there will not be any great necessity for storage.

It is considered that the storage reservoirs proposed at the Lachlan, the Long Swamp, and the Strawberry Hills, with the service reservoir at Waverley, and the enlargement of Paddington reservoir, will admit of the conservation of all the available water from the respective districts, in the cheapest and most effective way. When those reservoirs are constructed, the rainfall and storage would stand thus during the dry season of 48, 49, 50:—

	Million gallons.	Superficial area, sq. feet.
Storage reservoir at the Lachlan Swamp to supply low levels, and to pump to Waverley and Paddington	278	4,530,000
Storage reservoir, Long Swamp	245	4,378,730

being at the rate of 3,382,231 gallons per diem, for 484 days.

Previous

Previous to going into the question of cost, it would be advisable to reconsider if the proportion between the reservoirs and the gathering ground is so adjusted as to admit of the conservation of the entire available rain, without incurring needless expense in making too large reservoirs.

With reference to the rain basin of the Lachlan Swamp, the reservoir, if empty, would hold nearly one-half of the entire rainfall in the period, though it has been considered safe to rely on one-third only.

The reservoir at Long Swamp will only hold between one-fourth and one-seventh, or 0·137 of the rain falling, so that the surplus must run down and be discharged into the engine pond, and thence pumped to Sydney; this portion may therefore be considered in conjunction with the remainder of the catchment.

The accompanying table will show the disposal of the rainfall of 28 inches on 4,646 acres, during the period in question. Commencing with the reservoirs containing 395,000,000 of gallons full, and drawing off daily 2,800,000 gallons, being five-sixths of the estimated daily supply, the remaining one-sixth being supplied from the Lachlan Swamp.

TABLE showing probable Supply and Consumption from the Botany Catchment, exclusive of Basin of Lachlan Swamp, with rainfall equal to that from November, 1848, to February, 1850.

Date.	Depth of Rain.	Total Quantity.	Available Quantity.	Consumption.	Increase.	Decrease.	Quantity in Reservoirs.

August	2·6	273	91	86·8	4·2	395	4·2
September ...	2·01	211	70	84	14	381	
October	1·46	153	51	86·8	35·8	245·2	
November ...	2·42	254	84	84	245·2	
December ...	0·92	96	32	86·8	54·8	190·4	
1869.								
January	1·03	108	36	86·8	50·8	139·6	
February	7·21	757	252	78·4	173·6	313·2	

It will be seen that, in February, 391 million gallons would run to waste, or to furnish additional supply which would have been given at the rate of two million gallons per diem, during January and February, 1868, making the supply from this portion of Catchment 4·8 million gallons for those two months; so that about 273 million gallons might run away, or be pumped through Paddington Reservoir into the Lachlan Swamp; during the remainder of the year there would be no waste, as the supply would be supplemented to the extent of the excess.

In addition to the construction of the Reservoirs at the Long Swamp, Lachlan Swamp, Strawberry Hills, and Waverley, and the enlargement of the Paddington Reservoir, it would be necessary to fence the whole of the land reserved and to be resumed, and all the roads through same, to plant the summits of the hills, more particularly on the north-western side, and to plant round the reservoirs.

The cost of the whole would be,—

Long Swamp Reservoir and pipe.....	£14,000	0	0
Lachlan Swamp Reservoir, and pipe through tunnel	42,442	0	0
Engines and Mains to Waverley and Paddington	9,000	0	0
Reservoirs and Mains at Strawberry Hills, including compensation for property required	39,000	0	0
Open Reservoir at Waverley.....	9,000	0	0
Enlargement of Paddington (Mr. Bell's Estimate)	20,000	0	0
Fencing and planting.....	3,000	0	0
Total for Works.....	136,442	0	0
Compensation for land	47,209	0	0
	183,651	0	0
Total outlay, to which must be added, as in the previous cases, value of land which will be available if another supply is adopted	25,750	0	0
	209,401	0	0
And the capitalized cost of pumping $3\frac{1}{2}$ million gallons per diem, at £5 per million gallons, for fifteen years	90,000	0	0
So that, for a minimum supply of $3\frac{1}{2}$ millions, the comparative cost would be	£299,401	0	0

On the 2nd March, 1869, the engines were tested, to ascertain, by measurement of reservoir, the exact quantity pumped; but the time allowed being only two hours, the result of the test was insufficient to base any very close calculations on. As far as could be observed, the engines were performing the work attributed to them, but there were many sources of error in the observations, which could not be eliminated during so short a trial. There is, however, no reason to apprehend that the engines will not suffice to pump all the water that they may be required to lift during the standard dry year; but to enable full advantage to be derived from the reservoir at Strawberry Hills, and the enlargement of Paddington Reservoir, the supplementary engine at the Lachlan would be necessary to relieve the Botany engines of the lift to Paddington and Waverley, and allow them to keep the Strawberry Hills Reservoir full, when not supplying the immediate wants of the city.

In years of average rains, however, the power of the engines will be the limit of supply, as all the surplus flow from the reservoirs which the engines cannot pump for extra supply must be allowed to go to waste.

CONCLUSION.

To recapitulate the foregoing, it is shown,—

1st. That all the rain on catchment and additions in the standard dry period, without any deduction whatever, will only give an average of 7,260,205 gallons per diem.

2nd. That, presuming all the projected reservoirs could be built (the possibility of which cannot be admitted), and were full at the commencement of the standard period, and that the very large proportion of half the rain was utilized, the supply would only be 6,000,000 gallons, to be obtained at a cost of—

£209,000 for works,

£47,209 for land to be resumed,

with the capitalizing of the cost of pumping, and value of land at present reserved, making a total of £413,359.

3rd. That the safe supply, to be depended on in the standard dry period, would be but an average of $3\frac{1}{2}$ million gallons, and that the cost of securing this would amount to—

£136,000 for works,

£47,209 for land to be resumed,

with the capitalizing of the cost of pumping and value of land already reserved, making a total of £299,401.

The quantity fixed by the Commission as the probable requirement of Sydney and Suburbs in some years hence, being 12 million gallons per diem, the figures given demonstrate sufficiently how inadequate the Botany watershed, however improved, is to afford the necessary quantity; the fact that, without any very great extension of area or of population, the consumption has doubled in four years, quite justifies the Commission in fixing 12 millions as the limit of supply, when it is extended to the suburbs, with only a reasonable allowance for the increase of population and growth of the city.

A copious supply of water is of more importance to Sydney than perhaps any city in the world, as, independent of its importance for all sanitary and other ordinary purposes of a water supply, it is indispensable for the preservation of the harbour, as when the supply of sand is cut off by the substitution of a basin of water for the Strawberry

Strawberry Hills, and the removal of the sandhill near the Barracks (now in progress as part of the Moore Park improvements), the constant and general use of hydrants will wash the dust and sand daily in small quantities into the gully-shafts, whence it can be removed by hand, instead of, as at present (except in the principal streets), accumulating until a southerly squall or thunder-storm sweeps it into the harbour or washes it into the gully-shafts, choking them up in the first few minutes, and leaving the great bulk of the material to be washed at once over the surface into the harbour.

Only second in importance to quantity is the quality of a water supply; and however pure the supply from Botany is at present, it is clear that even with the purchase of all the lands unbuilt on, the quality of the water will not improve, as the drainage from the lands partially built on, and from the Randwick Cemetery, will be getting more objectionable every year.

Much of the injury to the purity of the water, as described by Messrs. Trickett and Bowden, in the evidence before the Select Committee of 1862,—the deposit of dead animals, night-soil, and the digging of gravel-pits,—has since been obviated, and would be almost entirely prevented by fencing and strict supervision; but the sewerage of the portions of the watershed built on, for the discharge of which Mr. Bell, in his evidence before the same Committee, proposed to provide a brick sewer one mile in length, across from Randwick to Shea's Creek, would still remain; and as it would be necessary to allow a portion of the rainfall for flushing this sewer, each year the supply, as well as growing gradually more impure, would also be decreasing. At the same time, as the sewer could not take all the storm waters, they would, with the washings of the stables, pig and cow houses, and other offices, be swept occasionally into the water supply; and though great reliance is with justice placed on the purifying properties of the sand, still, like any other filter, it is liable to get saturated with filth, which it would do in the course of years, when the water would flow into the reservoirs as it came from the stables. There is also another increasing source of injury in the washings of the roads, which Mr. Bell has found to discolour the water after heavy rains.

Of the fourteen gentlemen examined before the Commission as to the condition of the Botany Swamps, seven—Messrs. Lord, Pierce, Woods, Mansfield, Atkinson, Speer, and Lucas—stated that they considered the Botany supply wholly inadequate; three—Messrs. Moore (Mayor), Murphy, and G. Hill—were not quite so conclusive, but they considered the swamps could, by improvement, be made to suffice for a time. Mr. Buckland thinks "it would be well for the present generation to do that which will supply the present generation, and the one which will immediately succeed it, and leave posterity to undertake the larger work"; and the Rev. Mr. Clarke had not examined the swamps closely enough to give a satisfactory answer.

Though it is much to be regretted that the statements as to the discharges are not more absolutely conclusive, in the absence of any detailed gauging by the Commission, of the consumption, discharge, and rainfall extending over a cycle of seasons, still the opinions of the above-named gentlemen, with experience varying from fifty years downwards, may be considered to bear out the results of the foregoing calculations, all agreeing that, sooner or later, a water supply must be sought elsewhere.

The only difference of opinion appears to be as to *when* the change should be made. For many reasons, it is desirable it should not be delayed longer than is necessary for the full ventilation of the question, and the collection of further data, the observations for which should be systematically commenced at once, by the establishment of local rain-gauges, and accurate means of gauging daily discharges at all the points where such information is necessary; *the observations to be continued without intermission*, until the completion of the new works would enable a permanent record to be established. Such information would be of the utmost value—in the first instance, to give greater confidence to the Government in finally determining on the means to be adopted for supplying Sydney, and next, in furnishing data for other works of a similar character which must be undertaken throughout the Colony before long.

As the works, even when commenced, will take some years to execute, some steps should be taken to avert or mitigate the ruinous consequences of a water famine in the interim.

It is obvious that the most advisable expenditure would be on some work which, while supplying our immediate wants, could be utilized in any alternative scheme that might ultimately be adopted.

The reservoir at Strawberry Hills would answer the purpose well, and should, it is considered, be at once put in hands, so as to permit of its being made available as soon as possible. The reticulation from this basin could also be made to answer the ultimate supply, both as to pressure and direction.

One of the injured dams on the Lachlan Stream might also be restored from the wreck of the others, as a temporary measure, and some additional provision be made for the discharge of floods at Dams 4, 5, and 6, by the lengthening of waster and the construction of sluices.

If the interval before the introduction of a new supply was so long as to require a further supplement to the present delivery, the enlargement of the Paddington Reservoir might be proceeded with; and if a still further increase was necessary, the reservoir at Waverley might be constructed, which would necessitate the temporary raising of the present embankment at the Lachlan Swamp, and the purchase of a thirty horse power engine to pump to Waverley and Paddington.

The merely temporary works to be constructed in the cheapest possible way, and so that any stone, iron, or timber could be converted to other uses. The engine for temporary purposes would resell for its value, when its services were no longer required.

The cost and effect of the works to prevent a water famine during the discussion on and construction of any other plan that may be adopted, would be—

1. Reservoir at Strawberry Hills	£39,000
2. Repairs of injured Dam, Lachlan Stream	2,000
3. Enlargement, Paddington Reservoir.....	20,000
4. Reservoir at Waverley.....	9,000
5. Temporary Raising Dam at Lachlan Swamp	2,000
6. Cost of Engines and Main to Waverley and Paddington	9,000
	£81,000

The 2nd and 5th being but temporary works, at a cost of £4,000; the remainder all being available for the new supply.

Their execution would, it is considered, afford a sufficient supply to the present area in all but the driest years, when, though they might not give the full quantity, they would prevent any absolute privation.

In conclusion, an apology is offered for the length of this paper, and for the manner of treating the subject. It has been necessary, for the purposes of argument as to their effect, to assume that certain proposed measures could be carried out, and to admit that larger supplies could be obtained than was considered likely; but this has been done with the object of more completely demonstrating the fallacy of the numerous theories and statements, showing that, even with the aid of all those measures and assumptions, the quantity to be obtained would be inadequate, and the necessary outlay considerable.

It was also necessary to refer at some length to the numerous alternative projects which have been brought under the notice of the Commission, for the increase and proper conservation of the water.

As this paper deals only with the Botany question, all reference to other means of supply, or discussion of the unit of supply, has been studiously refrained from.

It is but right to add, that the engines, mains, and reservoirs at Crown-street and Paddington, are in very excellent order, and are most creditable to all connected with their construction and management.

W. C. BENNETT.

REPORT BY MR. MORIARTY ON THE UPPER NEPEAN SCHEME.

To the President and Members of the Sydney Water Commission.

Gentlemen,

In attention to your minute of the 11th July, 1868, which delegated to Mr. Grundy and myself the task of working out the details of the project for supplying the city of Sydney and Suburbs with water, by gravitation, from the heads of the river Nepean, and its tributaries, the Cordeaux and Cataract, I have caused the necessary surveys and levels, plans, and estimates of my portion of the work to be prepared, and have now the honor to submit them for your consideration.

It was agreed that Mr. Grundy should undertake the surveys and the preparation of the plans of the central part of the line of canal—that is to say, of the portion lying between Menangle and Prospect; I taking the upper length, or that from the Nepean to Menangle, as well as the lower part from Prospect to Sydney.

The surveys and plans have taken a long time to complete, but not, I think, unduly so, considering the minuteness and accuracy of detail required under the circumstances, and which, in any project for hydraulic works of such magnitude, cannot safely be dispensed with. It may perhaps, at the first view, seem that too much elaboration and too much expense have been gone to, in regard to a project which may not, after all (however favourably viewed by its designers), secure the approval of the Government or Parliament; but a very little consideration will show that, in a matter of so great importance to the comfort and well-being of the community as that to which our attention is now directed, no pains should be spared, no care omitted, and no moderate expenditure grudged, to ensure the most thorough and searching preliminary inquiries. It is indispensable not only that the practicability of the project which we put forward should be thoroughly demonstrated, but that a close approximation to its probable cost should have been arrived at; and it is to be hoped the scheme now before the public, is so far matured as to warrant the anticipation of its being able to withstand the criticism to which it doubtless will and ought to be subjected—a criticism not from impartial or sceptical judges only, but also from those who, having from the first formed other views, can scarcely be expected to look without some prejudice on this.

The plans have been prepared in a similar manner, and with the same degree of minuteness of detail, as would be required by the Standing Orders of the House of Commons for works of the like character submitted for its sanction.

The Nepean, Cordeaux, and Cataract, take their rise on the western slopes of the Illawarra Ranges, and receive the drainage of the elevated tract of table-land which extends from Madden's Plains, near Bulli, on the north, to Mittagong on the south—a length of about 30 miles, and having a mean width of about 13 miles. The country above the points at which it is proposed to intercept the drainage has an area of about 354 square miles, or 226,560 acres. Its mean elevation is about 1,800 feet above the sea level, and its surface for the most part is a barren plateau of the Sydney sandstone formation, sparsely clothed with a stunted vegetation of eucalyptus epacridaceæ,

epacridaceæ, and proteaceæ. Near the range on its eastern side it spreads out into numerous swamps very similar to those of Botany, except in being much more elevated and extensive, while along its western margin the plateau is furrowed and seamed by the various tributaries which fall from the table-land down into the deep and precipitous gorge in which the Nepean flows almost from its source till it emerges in the open country near Menangle.

No country could possibly be more suitable as a gathering ground for a water supply of a large city than this, whether having regard to its extent, geological formation, great elevation, proximity to the sea, or the character of its vegetation; it is utterly unfit for agricultural purposes, and must ever remain so, by reason of its irreclaimable barrenness. It is equally useless for pastoral purposes—is, in fact, destitute of every quality which could render it fit for the occupation or habitation of man—But as a gathering ground for a water supply it is perfection: the numerous and extensive swamps so favourably situated to catch every coast shower, perform the twofold purposes of reservoirs and filters: in the deep rocky gorges where the streams unite, evaporation and absorption are reduced to a minimum; and while there is nothing to contaminate, the whole conditions to which it is exposed are most favourable to the purification and thorough aeration of the water. It is not to be wondered at, then, that the stream issues from its rocky channel cold, and clear, and bright as crystal. And beyond these advantages, the steady and nearly uniform dip of the stratification, and of the whole surface of the country, from the culminating point at Mittagong down to Sydney, presents every facility which could be desired for the cheap and easy conveyance of the water by gravitation. Indeed, in looking for the source of a supply of water by gravitation, the eye is first and inevitably attracted to the high country behind Wollongong and Kiama, the streams from which flow so invitingly towards Sydney; and a closer examination of the natural features discloses all the more strongly its suitability, for it is seen that the mountain ranges as well as the streams—not only in their general direction, but also in their elevation and rate of fall towards Sydney—are most favourable for bringing down the water by gravitation. It was these obviously great natural advantages which, at so early a period of our inquiries, drew the attention of the Commission in this direction, and it was soon found that it would only be necessary to intercept the water of one or other, or all those systems of which I have spoken, divert it on to the dividing range which separates the Nepean from George's River, and, following the natural slope of the country, lead it into Sydney by gravitation.

The Nepean, from its source to its junction with the Cordeaux at Pheasant's Nest, flows in a channel nearly parallel to, and distant about 16 miles from the coast range of Illawarra; from this point it winds away to the north-west, and after a circuitous course round the county of Cumberland, falls into the sea at Broken Bay.

At Pheasant's Nest, which is 425 feet above sea level, it is proposed to place a low dam in the channel of the river, below the junction of the Cordeaux, so as to raise the water 10 feet, and divert so much as may be required, by means of a tunnel, $4\frac{1}{2}$ miles in length, into the channel of the Cataract at Broughton's Pass, where we should have the three streams united, at an elevation of 421 feet above the sea, or 280 feet above the top level of the water in the Crown-street Reservoir; by another low dam in the Cataract, it is proposed to turn the water into a second tunnel of $1\frac{1}{2}$ miles in length, which would bring it out on the southern slopes of the main dividing range separating the waters of the Nepean from those of George's River, along and following which it would be conducted, now on one side of the range, again on the other, as the country is found most favourable for the line of the canal and the other works, down to Prospect, where it would be received in a reservoir capable of containing 7,000 millions of gallons; leaving which again, it would be conveyed, partly by open canal and aqueduct, partly by piping of large diameter, along the high ground forming the watershed between Cook's River and Parramatta River, into the reservoirs at Sydney—the whole way by gravitation.

However patent that the Nepean and its tributaries thus apparently possess all the requirements for a gathering ground of a great water supply, in extent, elevation, geological structure, proximity to the sea, and the direction of its drainage, these have not been considered sufficient to warrant its selection in preference to all others, without the further guarantee of actual measurements of the discharge of the rivers themselves, made during an unusually dry season, and continued to the present time, that the required quantity of water might be relied upon. For this purpose, gauges were erected on the Cataract and Nepean, which have been recorded regularly. The daily and monthly discharge of each river will be found in the tables attached hereto; and, as the Honorable the Secretary for Public Works, recognizing the great importance of having the gauging of these rivers continued, has been pleased to approve of my recommendation that a small sum should be devoted to this purpose, the measurements of the discharges will be continued as long as may be considered necessary. A rain-gauge has been fixed at Wilton, which is registered daily.

Before entering on the details of the subject, it will be interesting to consider how the present project, if carried out, would compare with the proposed or existing water supplies for the principal cities or towns in England and elsewhere, as regards extent of gathering ground and available rainfall. The area of the country drained by the Nepean is, as we have seen, 226,560 acres. The returns of rainfall, published at the Sydney Observatory, show that the mean of the twenty-eight years ending December, 1868, was $49\frac{1}{2}$ inches; the least fall in the whole period being that of 1849, in which only $21\frac{1}{2}$ inches fell. Let us now see how these figures will compare with other water supplies.

Sydney

Sydney and Suburbs:—Inhabitants, 120,000; proposed daily supply, 12 million gallons; drainage area, 226,560 acres; average rainfall, $49\frac{1}{2}$ inches. London:—Inhabitants, 3,000,000. By Mr. Bateman's project for the supply of London with water from the heads of the Severn, the main southern branch of the aqueduct receives the drainage of the Severn proper, having an area of about 64,192 acres, and a mean rainfall of 70 to 80 inches per annum, of which it is proposed to intercept and store 36 inches, which is calculated as being sufficient to furnish 130 million gallons per day, while the northern aqueduct, receiving the drainage off Cader Idris and Aran Mowddy, about 66,380 acres, is looked to as capable of supplying 130 million gallons per day; the storage reservoirs proposed to be constructed being estimated to hold 120 days' supply. By the other plan, recommended by Messrs. Hemans & Hassard, which advocates bringing the water into London from the Cumberland and Westmorland Lakes, it is estimated that a supply of 250 million gallons per day may be derived from a drainage area of 113,280 acres, the mean annual rainfall on which is taken at 80 inches, of which it is expected that 66 inches will be saved.

The Loch Katrine Basin, from which Glasgow is now supplied, receives the drainage of about 43,000 acres, the average annual rainfall on which is taken at 78.12 inches, the mean of three successive dry years being 66.2 inches. From this source, 23 million gallons are now daily delivered for town supply, and 40 million gallons for compensation to mill-owners and others, 63 million gallons in all, at which rate of consumption, 130 days' supply is stored in the lakes, and, of the entire 60 inches of rainfall, .402 is used.

Greenock is supplied from a drainage of 5,043 acres, the average annual rainfall on which is 60 inches, of which .603 has been observed to run into the reservoir.

The 550,000 inhabitants of Manchester receive their supply of water from the River Medlock and its tributaries. The drainage area of the watershed, which is for the most part of the millstone grit formation, is about 18,900 acres in extent. Off this area, 12 million gallons of water are daily delivered for town supply, besides $2\frac{1}{2}$ million gallons for compensation to mill-owners. Of the whole annual rainfall, which is taken as averaging 45.78 inches, .617 inches are used.

Liverpool is partly supplied by pumping from wells in the red sandstone, but principally from the Rivington District, from which latter 12 million gallons are daily supplied; the drainage area is estimated at 10,400 acres. 120 days' consumption is stored in the reservoirs; and of the mean annual rainfall of 46.23 inches, .436, or nearly half, is saved. The supply is now however considered as wholly inadequate; and Liverpool is looking to Bala Lake, in North Wales, a distance of seventy-eight miles, for its future supply, which is estimated at 60 million gallons per day.

Dublin, with a population of 340,000 souls, now receives its supply from the river Vartry, which, off a drainage area of 14,000 acres, furnishes 20 million gallons daily, besides compensation to mill-owners. The storage reservoirs are capable of containing 120 days' consumption at the above rates; and, of the mean annual rainfall of 60 inches, .402 is saved.

Plymouth, supplied from the Dartmoor Hills, receives the drainage of about 4,000 acres, the average annual rainfall on which is found to be 44 inches, of which, .343, or about one-third, is used for town supply.

Melbourne is supplied from the River Plenty, the waters of which are turned into the Yan Yean. The drainage area above the reservoir is about 40,000 acres, to which must be added the watershed of the Yan Yean, making in all 44,650 acres. The daily consumption of Melbourne may be taken at 6 to 12 million gallons, equal to about $\frac{1}{4}$ th of the mean annual rainfall, which is 25.61 inches. The mean annual rainfall of the dry group of years, 1865 to 1868, was only $20\frac{1}{2}$ inches. In 1866, after the long-continued drought, the water in the reservoirs was found to have been lowered 5 feet 3 inches. The Yan Yean, it must be remembered, cannot receive the whole of the drainage of the Plenty, as, in consequence of the water only being admitted through a short canal and tunnel, the freshets and floods, by which most of the rainfall would be carried off, are to a great extent shut off from the reservoir, and it is only the permanent stream which can be availed of.

It will be seen from the foregoing, how incomparably superior, in all the essential conditions, would be the water supply to Sydney, from the sources herein recommended, to that which is relied upon as sufficient in any of the great cities just enumerated. The watershed of the Nepean being, we have seen, nearly double as great as that of the heads of the Severn, from which it is proposed to supply London by one project; and just double that of the Cumberland and Westmorland Lakes, from which the other plan proposes to supply it; five times greater than the watershed of Loch Katrine; twelve times greater than the watershed of the Manchester supply; sixteen times greater than that of Dublin; twenty-one times greater than that of Liverpool.

Having just seen that as regards extent, the gathering ground on the heads of the Nepean and its main affluents is far greater than is considered sufficient for the supply even of London, it now remains to consider how we should compare with the towns I have named in regard to the amount of rainfall to be relied upon. It will have been observed that the rainfall on the gathering grounds referred to is unusually high;—with the exceptions of Manchester, Plymouth, and Melbourne, (which are lower,) they are far higher than we find recorded in the Observatory returns at Sydney; but then they are exceptional places,—the mountains of Wales, Cumberland, and Westmorland, the west of Scotland, and of Ireland, are most favourably situated for catching and precipitating the rain brought up by the S.W. winds. With regard to most of the other parts of England the rainfall is much less than with us. Of fifty-five towns and districts, of which

which the maximum, minimum, and mean rainfall are given in Mr. Beardmore's tables, there are only eight of which a greater rainfall is recorded than we have in Sydney; the others are considerably below it. The mean fall at Sydney for the twenty-eight years is $49\frac{1}{2}$ inches; whereas the mean of the English towns is only 33·03, that of Melbourne 25·61 inches.

It will perhaps be objected that, there being no records of rainfall on any part of the watershed of the Nepean, we are comparatively in the dark as to this most important part of the inquiry, and that the gauging of the rivers has been of too short duration to warrant any inferences being drawn from it as to what would be the supply in very dry seasons; but a little consideration will, I think, show that these objections are not of much weight, and that we shall be fully justified in assuming the rainfall on the basin of the Upper Nepean and its tributaries to be at least equal to what is recorded as falling at the Sydney Observatory, and, basing our calculations thereupon.

It is clearly proved by the records of other countries, notably so of England, that the three main conditions favourable to the deposition of rain are—proximity to the sea, elevation, and being situated on the lee or opposite side of the mountains to that from which the rain-winds come. These conditions are all found, in an eminent degree, in the tract of country in question. Mr. Bateman, in his pamphlet on the proposed schemes for supplying water to the metropolis from the upper tributaries of the Severn, observes, with reference to the rainfall on mountain ranges—"Generally it is found that the greatest rainfall in any country takes place in that portion of it which is towards the quarter from which the prevailing winds blow; in the case of a mountain chain, on the contrary, the greatest amount of water is deposited on that side of it which is generally to leeward. This latter fact being apparently due to the warm moist air being deflected upwards by the hills into a colder portion of the atmosphere, the formation of rain-clouds is a necessary consequence, and these discharge their contents on arriving over the sheltered valleys on the lee side of the mountains. In England the prevailing winds are westerly. Both the above-mentioned facts would tend to show that a very heavy rainfall might be expected on the eastern side of the Welsh hills, and the observations which have been made fully confirm this." This is also observed of the Cumberland and Westmorland hills. The same law would doubtless obtain here, where the prevailing rain-winds, which are from the S., S.E., and E., blowing the rain-clouds from the sea over the cold summits of the Illawarra Range, would discharge their contents on the sheltered valleys and deep ravines on its lee side, where the Nepean, Cordeaux, and Cataract take their rise. We may, I think, without the slightest hesitation, assume that the rainfall on this part of the country is at least equal in quantity and frequency to what falls at Sydney or Botany, and that most probably it is considerably greater. But assuming it to be only the same as at Sydney, we see how favourable the comparison would be were Sydney supplied from the sources now proposed.

That the comparisons here made are fair, and are fully sustained by observation, is shown by the circumstance that as much water has been measured passing down the Nepean in one day during an ordinary flood, as would (supposing it all stored) supply Sydney for ten years, at its present rate of consumption; but inasmuch as the circumstances do not admit of the flood waters being stored in the rivers—a careful examination of their channels having shown that there are no very favourable sites for storage reservoirs in them—it becomes necessary to look at the question from another point of view; and as it is obvious that the floods must be allowed, as heretofore, to wend their course comparatively uninterrupted to the sea, we must consider how far the ordinary streams will be sufficient, on the subsidence of the floods, to furnish the required quantity. Happily, it is found that these would be far more than sufficient, even were the requirements many times as great; and this brings us to the consideration of the quantities of water shown by actual measurements as passing down the rivers in dry seasons, as upon this depends mainly the character and cost of the works required for conveyance and storage of the requisite supply; for were the streams at all times sufficient, it would be only necessary, by means of an aqueduct of sufficient capacity, to supply any estimated demand, as is done at Aberdeen. But as the rivers might fail in extreme droughts, it becomes necessary to form reservoirs of a capacity to supplement them when at their lowest, so as to supply the estimated deficiency; and the aqueducts must likewise be so adjusted as to admit of advantage being taken of occasional freshets and floods to pour enough water into the reservoir to keep it charged and in readiness whenever called upon.

Before considering the measurements of the discharges of the rivers in detail, it will be right to take a glance at the returns of the rainfall for the same period, and compare them with those for other periods, in order to judge of what would have been the probable condition of things during those times of great drought of which ample evidence has been received by the Commission.

Although in the latter part of 1868, and the beginning of 1869, the supply of water at Botany was so seriously reduced as to give rise to grave apprehension of its total failure, and generally throughout the country the effects of the drought were severely felt, it will be seen, from published returns of the rainfall, that in Sydney and its neighbourhood the season was not a very unusually dry one. The rainfall for the entire year of 1868 was 43·58 inches, which, although less by six inches than the average of the last twenty-eight years, was more than double the quantity which fell in the year 1849, and nearly double the rainfall of 1862; in each of these years the latter months of winter, the spring, and early summer, were unusually dry. There was a similar scarcity in the latter part of 1847, and again in 1854, and for the last three months of 1867. No considerable reservoirs would have been required to supply the estimated consumption of 12 million gallons even during those years; yet, as other years are stated

stated by credible witnesses to have been much drier, it is evident that provision must be made for a very much greater amount of storage than would then have been required. It was only from the 16th of December, 1868, to the 6th of February, 1869, a period of 52 days, that the streams passing down the Nepean and Cataract fell below the quantity usually supplied to Sydney by the present arrangements.

Turning now to the accompanying tables of discharge, we find that, between the 15th September, when the rivers were first observed, and the end of the month, 78 million gallons flowed down the Cataract, and 293 million gallons down the Nepean,—in all, 371 million gallons. The rainfall during the fifteen days was 1·86 inches at Sydney. In the absence of any local observations, I am obliged to take those recorded at the Observatory; but I think I have shown that, although there may be some differences, they would be in favour of the former, and that any inference we may draw from the recorded observations will be more than sustained by the actual rainfall on the country in question. In October, 99 million gallons passed down the Cataract, and 498 down the Nepean, 597 in both, which would be equivalent to about $\frac{1}{3}$ th of the rainfall for the period, which amounted to 1·46 inches. In November, 2·42 inches of rain fell, which caused a fresh, and accordingly we find 1,186 million gallons registered as flowing down both rivers, or about $\frac{1}{6}$ th of the rainfall. In December, 0·92 inches of rain fell—it will be remembered as an unusually hot, dry month—and accordingly the flow in the river fell to 130 million gallons, equal to about $\frac{1}{4}$ th of the rainfall. January, 1869, was also an unusually dry, hot month, 0·96 inches of rain only having fallen; in fact, less rain fell in that month than in any other with the exception of January, 1849, since 1840; it is not to be wondered at, therefore, that the flow in the rivers fell to a minimum, only 63 million of gallons having been measured. Between the 15th September, 1868, and the end of the ensuing February, that is to say, during the five and a half months of summer, the total quantity of water which had passed down the rivers was 6,520 million of gallons—equivalent to about $\frac{1}{12}$ th of the rainfall which was recorded at the Observatory, viz., 14·90 in.

During the latter part of September, 372 million gallons flowed down the rivers, which would have afforded a supply at the rate of 23 million gallons per day; in October, 598 million gallons were measured, which would have allowed 19 million gallons per day. In November, December, and January, 1,380 million gallons are recorded; and, supposing that the surplus of the first month could have been stored to meet the deficiencies of the others, there would have been enough to have supplied 15 million gallons per day for those three months; or if the supply had been equalized from September, there would have been sufficient for an allowance of 16 million gallons per day,—enough to have afforded 133 gallons per day to each person in Sydney. The February measurements show a large increase—sufficient to have supplied 148 million gallons per day, or 1,200 gallons per head. Thus we find, from actual measurements of the rivers, that during the driest months of the unusually dry summer of 1868–69, the supply would have been ample for every requirement of the population; and comparing this with the driest year on record, namely, a similar period of 1849–50, in which, from September to January, 6·62 inches fell, and assuming that $\frac{1}{12}$ th of that quantity would have been available, we find that, during the driest period of the driest year experienced since the records have been kept, there would have been 17 million gallons per day available.

That $\frac{1}{12}$ th of the entire rainfall is a fair proportion to rely upon as finding its way into the river channel, where it would become available, is shown by a table, Appendix A, which has been compiled of the ordinary summer discharge of various large rivers and streams when uninfluenced by any immediate rain, and in which, in the summer, the discharge fell to about $\frac{1}{12}$ th of the total rainfall for the period.

Beardmore's tables show that the measurements of the Thames at Staines give 2·93 in., out of a rainfall of 24·5, or a little less than $\frac{1}{8}$ th of the annual rainfall on the basin of the Thames—which is 3,086 square miles in extent—consisting of chalk, green sand, Oxford clay, oolites, &c.

In the Severn at Stonebench the quantity passing down represented only an annual rainfall of 1·98 in. over a drainage area of 3,900 square miles.

The drainage of the Loddon represented 3·01 in. of rainfall per annum,—the actual average fall being 25·4 in.

The Nene at Peterborough gave 1·88, out of a total annual rainfall of 23·1 in.,—say $\frac{1}{12}$ th.

The measured discharge of the Lea, at Lea Bridge, represented 3·536 in. annual rainfall,—the total rainfall being 24·5.

That the measurements of the Nepean and Cataract represent a smaller proportion of the rainfall than the other rivers enumerated, is to be accounted for by the greater heat and dryness of the Australian summer, which takes up a much larger quantity of the rainfall in evaporation than would be the case in cooler climates.

To supply 12 million gallons per day, an effective rainfall on the drainage area of the Nepean of $\frac{1}{12}$ inch (say 875 in. per annum) only would be sufficient; and, as the least rainfall recorded in any year was that of 1849, when only 21·49 in. fell, we see that, at the low summer standard of $\frac{1}{12}$ th of that quantity, which we have taken, there would have been nearly double the required quantity. This, it must be borne in mind, is taking the very least favourable view of the case, as the $\frac{1}{12}$ th is due to the summer gauging, which is certainly far below what the entire year's measurement would show.

Having shown that the discharge of the river for the five and a half months of summer (that is to say, between the 15th September, 1868, and the end of February following) would represent about one-twelfth of the rainfall for the same period, as registered

registered in Sydney, it now remains to consider the proportion of available to actual rainfall shown by the gaugings of the river to obtain during the remainder of the year, or from 1st March to 15th September, 1869. We have the measurements of the entire year, a year too, during which it will be seen that considerably less than the ordinary mean quantity of the last twenty-nine years has fallen. In March, only 341 million gallons were measured in the river, which would have represented only one-seventy-seventh of the quantity which would have been due to the Sydney rainfall; but then the rains did not extend much further to the southward than Sydney, and must have been very light on the heads of the Nepean. In April, however, in which it will be remembered a heavy flood occurred in the Nepean, the quantity of water estimated as passing down the river was more than would have been due to the rainfall in Sydney; and this, although perhaps at first sight apparently anomalous, is I think quite probable. I say estimated as passing down the river, because all access to the gauges having been cut off for the time, it was not possible to make any accurate measurement of the flood when at its highest; and we have been obliged to take for the basis of the calculation the cross sections and slope of surface of the water as indicated by the flood-marks; and even from the results as given by this data, I have made a very considerable reduction, as the quantities would otherwise have seemed to be very considerably more than would have been due to the rainfall. I merely, therefore, give the quantities as a very rough approximation, but one which is probably far below the actual discharge.

In May we were more fortunate in getting accurate measurements, 26,186 million gallons were measured in the river, while 63,691 million gallons would have been due to the unusually heavy rainfall (12.42 inches) measured in Sydney, that is to say, about one-third of what would have been due to the rainfall was measured in the river. In June, 10,719 million gallons were measured in the river, which exceeded what would have been due to the apparent rainfall. In July the quantity gauged in the river was about one-fourth of the quantity due to the rainfall; and in August, the proportion rose to one-half the quantity due to the rainfall. The whole quantity of water estimated as having passed down the river between 15th September, 1868, and 15th September, 1869, is 87,688 million gallons, equal to .386 of the entire quantity which would have been due to the rainfall for the time, or 54 per cent. on the rainfall for the 6½ months of autumn and winter—*i.e.*, March to September—or 47 per cent. if we reject the doubtful measurements of April. We have seen that, assuming only the small proportion of ⅓th due to the summer gauging, we should have had many times more water than would have been required for the supply of Sydney, at 12 million gallons per day, even in the driest year recorded; and we now see that, taking the proportion due to the entire year, there would have been over twelve times more water available in the dry year of 49–50 than would have been required to have supplied 12 million gallons per day; and in this last year, which was also a dry one, there would have been nearly twenty times as much water as would have been required, or in other words, there would have been sufficient to supply to Sydney two and a half times the same quantity of water that is now delivered to the 3,000,000 inhabitants of London. It will be seen that, in the Cataract alone, as much water passed down as would have sufficed to supply 8 million gallons per day to Sydney.

Attached to this report will be found a statement, in a tabular form, representing the daily discharges of the river, and, compiled from it, a table showing also the monthly discharges. It is right that I should explain how these tables were constructed. During the summer months the gauging of the river was not registered every day. There seemed to be so little variation that it was considered sufficient, in order to avoid unnecessary expense, to send a person to register the gauge only twice a week, the discharge in the remaining days of the week being interpolated so as to divide rateably whatever difference might have been observed in the measurements, whether in the increase or decrease, following the ordinates of whatever curves the weekly measurements gave. In this way results have been obtained less than what the means of the observation would have given, and perhaps nearer the truth. And whenever there has been any doubt as to the results of the measurement of discharge, as in those of April, I have preferred keeping those at what must have been obviously below the truth, so as to be well on the safe side, rather than in any way seem to over-estimate.

We have seen that, in all the essential requirements for a great water supply, the advantages of the present scheme are unrivalled. The water is of the purest quality, and the quantity practically unlimited, only requiring that a reservoir shall be provided to store the surplus of the winter for the deficiency of the dry months of the summer. And this brings us to the consideration of the capacity of the reservoirs required, which must be sufficient to retain a quantity fully equal to the difference between the least permanent supply and the greatest permanent demand for such time as those conditions last. In England it is generally considered sufficient to make provision for the storage of 180 to 200 days' supply; but, having in view the evidence which has been offered to this Commission of the severity and duration of some of the droughts which have afflicted this country—droughts in which the Nepean at Penrith, it is said, ceased apparently to run, and when such a great natural reservoir as Lake George had dried up, I do not think it can be considered that storage for 180 or 200 days would be sufficient—probably double that time would be the safer limit to take—for a population rapidly increasing in numbers as ours is, and in a climate naturally subject to severe and long-continued drought. This is, of course, under the very least favourable view of the case; for the records of the rainfall at South Head and Sydney since 1840 would, if taken as the basis for calculation, show that considerably less storage would suffice. In 1849

only

only 21.49 inches of rain fell, on 140 days; and in January and February of 1850, 1.37 and 1.73 inches of rain fell, in twelve and seventeen days respectively, giving totals of 24.59 inches in fourteen months, in which there were 169 rainy days. In October, 1848, 5.35 inches of rain fell; and again, in December of the same year, 2.92 inches; so that there must have been floods in those months. Again, in May and July of 1849, 5.61 and 3.48 inches fell, which must also have caused floods in the rivers; and in March, 1850, there must have been another flood, as 4.80 inches of rain fell. It will be thus obvious, if the rain records are taken as the basis of our calculations, even in the driest year since 1840, there would have been an abundant supply of water from the Nepean, could it have been stored, and that the only trying periods would have been from January to April, 1849, during which 3.69 inches fell in forty days, and from August, 1849, to February, 1850, during which 10.01 inches fell in ninety-one days. With these exceptions, it will be seen that floods or freshes must have been of almost bi-monthly occurrence during the twenty-nine years recorded; and if we looked only to what would have been the requirements of that period, as judged by the rain tables, we see that storage for a few months' consumption would have been necessary.

But then—is the experience of twenty-nine years sufficient? I think not. We have had, within the last twelve years, in 1857 and 1867, floods the like of which the oldest inhabitants had not seen. May we not also have droughts as unprecedented in their severity and duration? To provide against such a contingency is simply a matter of constructing a reservoir of sufficient capacity: should we be warranted in omitting the precaution? Happily we find that, in this respect also, Nature has provided us with what we require. The proposed reservoir at Prospect is capable of storing 7,000 million gallons, or nearly nineteen months' supply for a consumption of 12 million gallons per day, supposing the rivers to fail wholly; and it is only necessary that the aqueduct connecting the rivers with the reservoir should be capable of keeping it charged, by taking advantage of occasional freshes and floods, to deliver into the reservoir so much more than the daily consumption as would preserve the equilibrium, to supply any quantity ever likely to be required.

The capability of the aqueducts was fixed by the Commission at not less than 70 million gallons per day; and it remains to be seen what would have been the condition of the reservoirs at the end of each month, supposing the works now proposed had been completed and in operation when the gauging of the rivers was commenced. We find by the measurements, that between the 15th September and the end of the month, 372 million gallons passed down the Nepean and Cataract; and, taking the rate of consumption at 12 million gallons per day in Sydney, there would have remained a surplus of 180 million gallons in the reservoirs, over and above the consumption, at the end of the month.

In October, 598 million gallons passed down the rivers, and as we are supposing, would have run into the reservoir, while 372 million gallons would have gone out for the city supply, leaving in all a surplus of 406 million gallons in the reservoir.

In November, 1,186 million gallons passed down, and would have been received into the reservoir, while 360 would have been withdrawn, leaving, with the surplus of the two former months, a balance of 1,232 million gallons to the good.

In December, 131 million gallons would have been received into the reservoirs, and 372 would have gone out, leaving, at the end of the month, a credit balance of 991 million gallons.

January, 1869, only 63 million gallons would have come into the reservoir, and, as before, 372 would have been withdrawn, leaving 682 million gallons in the reservoirs to the good.

In February, 4,170 million gallons ran down the rivers; but inasmuch as they did not commence to rise before the 7th February, from which, till the end of the month, the aqueduct would have been delivering 70 million gallons a day into the reservoirs, while 336 million gallons would have been withdrawn, there would have been 1,706 million gallons stored in the reservoirs on the 1st March, and 2,788 million gallons would have continued its course down the river,—an ample allowance for every requirement of compensation to those persons lower down, whose interests in this question of water supply must have been most carefully considered and jealously guarded, were it not that it is so incontestably proved that there is abundance for all.

In March, 341 million gallons would have run into the reservoirs, 372 would have gone out, leaving 1,675 million gallons in store. It will be observed that there is a great apparent discrepancy in the rainfall of this month, as recorded at the Sydney Observatory, and the quantity of water noted as flowing down the rivers. It seemed difficult of explanation at first, and until, by reference to the meteorological returns published in the *Sydney Morning Herald*, I discovered that the March rains were confined almost entirely to the districts to the north, and that the rain, although heavy at Sydney, did not seem to have extended to the southward. Without this explanation, I should have felt bound to reject the March observations as manifestly incorrect.

As to the quantity of water which flowed down the rivers in April, I am somewhat at a loss, as, in consequence of the great height to which the flood of that month reached, all communication was cut off with those places on the rivers where the gauges are fixed; and all we know is, that the rivers rose some 20 feet above the ordinary level, at the Pheasant's Nest and Broughton's Pass; but it is sufficient for our purpose to know that 1,975 million gallons would have flowed into the reservoir and 360 have gone out, leaving 3,290 million gallons in store in the reservoir, and 35,020 would have flowed down the Nepean. In May 2,249 million gallons would have been received into the reservoir, which, deducting the monthly supply, would have left 5,167 million gallons

in

in the reservoir, and 23,937 would have gone down the river. At the end of June there would have been 6,973 million gallons in store, 8,553 would have flowed away. At the beginning of July the reservoir would have been filled, and 2,664 million gallons would have flowed down the river as heretofore, unless otherwise utilized.

Seeing that what would be withdrawn from the river, once the reservoirs were filled, would be insignificant in comparison with the very large quantity still running to waste, it comes to be considered whether we should not expand our ideas of the requirements, and, not content with supplying Sydney alone, make provision for irrigation on an extensive scale. The water supply here proposed will be quite capable of doing both. The water is in such ample abundance, that considerations of economy in its use do not arise. The position of the canal, traversing the back-bone of the county, admits of subsidiary canals being taken off it, so as to convey the water along the crests of the secondary ranges which branch from it on both sides. Irrigation on an extensive scale, assisting the splendid sun power of this climate, would convert the county of Cumberland into a garden. The hot summer sun, which is now so detrimental to vegetation, scorching and drying every green thing, would, if the soil were properly moistened by irrigation, produce crops of tropical luxuriance. The water which is now allowed to run to waste may, at no additional expense, be turned into the aqueduct, and be the means of bringing under profitable cultivation many thousands of acres of land now doomed to barrenness and waste. It is not necessary to refer to the many instances which might be enumerated of the extraordinary benefits which have resulted, in Spain, Italy, India, and other countries, from irrigation, and there is no reason to doubt that similar results would here follow its adoption. I propose in a future paper, referring more at length to this question of irrigation.

Having, in the foregoing pages, given a brief description of the general features of the country from which it is proposed to derive the water supply for Sydney,—having, I think, shown that it is all that could be desired as a gathering ground,—and that the streams which drain it may be fully relied upon to supply any demand ever likely to arise, either for the supply of the city and its suburbs, or for irrigation on an extensive scale,—I shall now proceed to describe in such detail as is necessary at this stage, the various works which would be required in carrying out the project. I would, however, at the outset, observe that I do not mean to say that considerable deviations and improvements may not be introduced into the designs which have been prepared and which are intended to represent generally what would be required and what would be amply sufficient; but it is not pretended that they are in all cases the very best and most fitting, or that when the works come to be carried into execution, many improvements may not be introduced; however, as I have said, they would, as now proposed, be amply sufficient, and any alterations and improvements which might be introduced would be only to simplify and economize. In preparing the designs, I have taken generally for my guidance those works which have been constructed for similar purposes elsewhere, introducing such alterations as the circumstances would seem to require, but preferring to be guided by precedent—by the approved experience of other countries—rather than attempt originality or too much novelty. The Glasgow, New York, Boston, and other water-works of recent construction, afford such splendid and successful examples of hydraulic engineering, that they may be safely taken as models for our guidance, and I have accordingly drawn largely from their experience, without, I hope, too servile an imitation.

In describing, in detail, the different works, I shall commence at the upper end, and following down the course of the canal, take them in the order in which they occur, giving such a description of each as will, I trust, explain the design, without going into such minutiae as would be required for a specification.

Nepean Dam.—The first work which occurs in the above order is the dam or weir in the Nepean, by which it is proposed to raise the water to such a height as will throw it into the tunnel and keep it running at the required height in the canal. The summer level of the water in the Nepean is, as before stated, 425 feet above high-water-mark, Sydney Harbour, which has been taken as the datum or standard level. I propose that the weir should be 11 feet 6 inches high, so as to raise the level of the water and maintain it permanently at a height of $436\frac{1}{2}$ feet above high-water, or 297 feet above the top level of the water in the Crown-street reservoir. After a very careful examination of the bed of the river, a most favourable site for the weir was selected about 15 chains below the junction of the Cordeaux, where a solid mass of rock extends from side to side, affording an almost level, uniform, and perfectly solid foundation. The weir would be of the heaviest class of masonry, set in cement (stones of any size being procurable on the spot). The height being so inconsiderable, and the bed of the river both above and below being so much encumbered with huge boulders and masses of rock, it would not so sensibly impede the discharge of the floods as to bring it into any danger of being swept away or injured; and there need therefore be no apprehension whatever of injury from floods.

If it should be considered desirable to make provision for allowing any portion of the water to flow down the river in dry summers, to supply the wants of those persons having property on the river, it could be done without difficulty by means of a notch in the weir, or by partly closing the sluice-gate at the inlet of the tunnel; and provision would likewise be made, by a culvert and a stop valve in the weir itself, to allow of the water being drawn off in summer, so as to clear away any sand or other matter which might accumulate in the pond above it. The height of the weir would be sufficient to maintain the water at a depth of 5 feet 6 inches in the tunnel.

At a distance of about 30 yards above the weir, a narrow cut would branch off, and passing round the right flank of the weir, would re-enter the river again lower down. From this cut the tunnel would open, the object of the arrangement being to allow the turbid water in times of flood, and the drift timber, sand, and other debris to flow past without being drawn into the tunnel.

Nepean Tunnel.—The tunnel by which the waters of the Nepean and Cordeaux would be conveyed across to the Cataract is shown in cross and longitudinal section in the accompanying book of plans; it would be 8 feet in height to the crown, $9\frac{1}{2}$ feet in width, having a cross sectional area of $60\frac{1}{2}$ feet, and capable, with the inclination of two feet in the mile, of discharging 85 million gallons per day when full. The cross section of the tunnel is such as gives the greatest discharging capacity with the least amount of excavation. Throughout its entire length the tunnel would be cut through the softer beds of the Sydney sandstone formation, the stratification of which at this part is nearly horizontal or with a slight north-westerly dip. I know of no material that would be more easily or economically tunnelled than this, the rock being strong enough to stand without the support of timbering or lining, or if any should be required it would only be in a few places, and for a few yards, while at the same time it is not so hard as to prevent its being cheaply, safely, and easily excavated. No apprehension need be felt of encountering water, quicksands, or any of those strata which make works of this class costly and difficult. The length of the tunnel would be 4 miles 35 chains, and it is in this respect, and in the depth of the working shafts, only, that it could be considered as a work of any considerable magnitude; in all others it would be one of great simplicity, unattended with any risk or difficulty in the execution. Provision would be made, by means of valves and strainers at the upper end, for regulating the admission of the water, or shutting it off altogether, in times of flood, so as to exclude the turbid water. This tunnel would discharge into the Cataract, at Broughton Pass, at a point about 7 chains below where the present road crosses the river. The level of the lower end of the tunnel is kept 6 inches above the level at which the water would stand above the weir in the Cataract, in order to allow of its being laid dry, if required to be cleaned out, or for any other purpose, without interrupting the supply from the Cataract, which, by this arrangement, might continue discharging into the second tunnel for the supply of Sydney.

Cataract Weir.—Here, too, as in the Nepean, a most favourable site has been found, about 10 chains below the road-crossing, where an almost level ledge of rock forms the bed of the channel. The weir would be very similar in all respects to that in the Nepean; its greatest height would be 10 feet 6 inches, the length on the top about 230 feet; it would be of the same kind of masonry, with similar culvert, stop-valves, &c.

Cataract Tunnel.—Leaving the Cataract, the next tunnel, of 1 mile 64 chains in length, also through rock of the Sydney sandstone formation, would bring the water out on the level of the open country near Appin. As this tunnel would be of similar construction to the former, its cross-sectional-area, rate of inclination, and discharging capacity being the same, and as it would be equally free of any serious difficulty in the execution, it is not necessary to enter into any more detailed description of it. It would not be so costly in proportion to its length as the Nepean tunnel, in consequence of the reduced depths of the working shafts. The stop-valves, gratings, and other appliances for excluding turbid flood-waters, drift, and *débris*, would be similar to those referred to in the description of the other tunnel. At the lower end a waste-weir and sluice would be provided to drain the tunnel, if required for the purpose of repairs to it, or to the channel of the canal below it.

Open Canal.—After leaving the Cataract tunnel at 6 miles 30 chains from the Nepean, the water would be conveyed generally in an open canal, excavated in the rock—which is still the ordinary Sydney sandstone—down to Woodhouse Creek, when the character of the geological structure of the country undergoes a change. Advantage has been taken of the slope of the land towards the Nepean, to keep the line of the canal as near the surface level of the ground as possible, consistently with the preservation of easy curves. The bottom of the channel would be in about 6 feet of cutting, to avoid embankments, which are always more or less difficult to make and keep watertight. Proper provision is made, by means of the bridges, and culverts under the canal, to carry off the surface drainage of the land. The cross-sections on Sheet No. 33, numbered 3, 3a, 4, and 5, represent the kind of work which it is proposed to construct, and which would vary according to the nature of the stratification through which the canal is intended to pass. Very little of the more expensive and difficult kind of work represented by sections 4—5, would be required, as the contour line has been carefully selected, with a view to keep in the soundest, and, at the same time, the least difficult ground.

The form of cross-section proposed is not that which gives the greatest theoretical discharge for a given sectional area of water, which would be the semicircle; but, after mature consideration, I am of opinion that the slight deviation from that form which I propose would be preferable, as, although the semicircular cross-section may give the greatest theoretical discharge for a given cross-section of water-way, it would not do so when the excavation above the surface level of the water is taken into account. The form of cross-sections I have proposed may be considered as not very dissimilar to the semicircle, only differing from it in having the top sides brought in a little, in order to reduce the amount of excavation in the block above the water-line. The canal would for the most part be excavated in the sandstone, which, as far as may be judged by the surface indications, would be sound, and sufficiently watertight to warrant the expectation that there would be little, if any, loss of water by leakage. Overlying the sandstone is a
thin

thin layer of light sandy soil, generally not more than one to two feet in depth. The line of the canal follows generally the contour of the country, but not too servilely, as I have preferred keeping the line in light cutting rather than introduce too sharp curves, or keep too near the outcrop of the ledges, where the stratification might be expected to be broken, fissured, and leaky.

Simpson's Creek Aqueduct.—At 7 miles 5 chains the canal would be carried across Simpson's Creek, on an aqueduct of one span of 60 feet, consisting of a wrought-iron trough supported on abutments of masonry. The approaches on either side would consist of cast-iron troughs bolted together in segments, and supported on walls of coursed rubble laid dry or without mortar. The troughs would be six feet in depth, by nine feet in width, and with those dimensions would be capable of passing 83 million gallons of water per day. The total length of the aqueduct, inclusive of the cast-iron approaches, would be 115 feet. See plan No. 3, sheet No. 27.

Elladale Creek Aqueduct.—At 7 miles 70 chains the canal would cross Elladale Creek, on an aqueduct of three spans, each 60 feet, the height at the centre being 81 feet above the bed of the creek. This aqueduct, like the former, would consist of a wrought-iron trough supported on masonry piers, and cast-iron for the approaches, resting on dry stone rubble walls. The entire length from end to end would be 530 feet.

Ousedale Creek Aqueduct.—At 9 miles 36 chains the canal would cross Ousedale Creek, on an aqueduct of two spans, each 60 feet—80 feet in height at the centre. The aqueduct would consist of a wrought-iron trough top, on stone piers and abutments; the approaches consisting, as before, of cast-iron troughs on dry stone rubble walls. The total length, from end to end of the iron troughing, would be 330 feet.

Malaly Creek Aqueduct.—At 9 miles 72 chains the canal crosses Malaly Creek, on an aqueduct of one 60 feet span, 60 feet in height. In this aqueduct, also, the centre span would consist of a wrought-iron trough top on stone abutments, and cast-iron trough approaches on dry stone rubble walls. The total length of the iron-work would be 110 feet.

On this portion of the line, it will have been observed that the aqueducts are frequent and some of them of good size, but this is not to be avoided, in consequence of its being necessary to cross so many systems of waters almost at right angles.

There is a general similarity in all the aqueducts on this portion of the canal, as, by thus simplifying the designs, and making them as far as possible repetitions one of another, the work could be constructed at considerably less cost than if they differed one from the other, involving a different style and class of work in each.

Tunnel.—At 10 miles 27 chains the canal passes through a short tunnel, 36 chains in length; the rock is sandstone, similar to the other tunnels, no troublesome or difficult strata would be encountered, and its execution would be unattended with any difficulty.

Leaf's Creek Aqueduct.—On leaving the tunnel, the canal would cross another deep creek, called Leaf's Creek, at 10 miles 78 chains, over which it would be carried by an aqueduct of two 60 feet spans, 90 feet in height, with wrought and cast iron troughs supported on ashlar masonry piers, and rubble stone walls, as in the others. The total length of iron superstructure would be 270 feet. The design for this work is shown on sheet No. 27, plan No. 1.

At 11 miles 59 chains the canal would cross another creek with an aqueduct of one span 60 feet, consisting of wrought-iron troughs on masonry abutments, and cast-iron approaches on rubble stone; the total length from end to end being 193 feet. The design is shown on sheet No. 29, plan No. 2.

Woodhouse Creek Aqueduct.—At 12 miles 65 chains the canal would cross Woodhouse Creek, by an aqueduct of one 60 feet span, 58 feet in height. See plan No. 3, sheet No. 29.

On crossing Woodhouse Creek the country undergoes a change, the sandstone formation disappearing and giving place to the shales and clays; and from this point till it reaches the tunnel under Sugar-loaf Hill, the canal would be an open cutting, following the contour almost on the natural surface. At 14 miles 22 chains, it crosses Menangle Creek by an aqueduct—the design for which is shown on sheet No. 30, plan No. 1—and passing on, enters the Sugarloaf Hill tunnel at 14 miles 73 chains. The tunnel would be 41 chains in length, for the most part in shale and sandstone; but judging from the conical shape of the hill from which it derives its name, I am disposed to think that trap would be encountered in the centre, and I have estimated accordingly for the additional cost of excavating that material, as well as for some lining in the shale and other soft strata.

On leaving the tunnel, the general level of the country falls, and the canal, after dropping 17 feet, would continue at its former grade of 2 feet per mile. These drops in the canal would form admirable sites for the erection of water-mills, as a considerable power would be developed by the fall of so large a body of water. I estimate it as being equal to (57) fifty-seven horse power, assuming that only 20 million gallons per day passes down.

Crossing of Railway.—At 17 miles 10 chains, the canal would cross the Great Southern Railway, on an aqueduct, at a height of 42 feet above the level of the rails; and at 17 miles 49 chains, it would cross the creek which, after flowing past Campbelltown, joins the George's River.

From this point onwards to Prospect, the works have been designed by Mr. Grundy, by whom they will doubtless be fully described.

Commencing

Commencing again at Prospect, two sites for reservoirs presented themselves for selection, one at Bull's Hill, the other at Prospect, the choice between which, it will be remembered, was at first doubtful. After careful examination of both, considered in conjunction with the nature of the country thence on to Sydney, (which determined the character of the works that would be required,) the choice was made in favour of the Prospect or the larger reservoir, and it may not be out of place here briefly to recapitulate the principal reasons which led to its selection.

The Bull's Hill Reservoir was estimated to be capable of storing 4,636 million gallons when full, and the surface level of the water in it would then stand at 260 feet above high-water, or 121 feet above the top level of the water in the Crown-street Reservoir. The depth of water at the outlet would be 60 feet, and the water must have been brought in the entire way, from the reservoir to Sydney, by pipes, in order to obtain full advantage of the head in the reservoir. Thus, were the reservoir full, or nearly so, the water would flow through the pipes with a velocity due to a head of 121 feet, or say, in other words, with a rate of inclination of 6 feet per mile; but as, from the nature of the case, it is not possible to suppose that the reservoir would be always full—the very name of reservoir implying the contrary—we must consider the question on the supposition of the water being considerably reduced, as may occur after long-continued and severe droughts, so that it would be necessary to fix the size of the pipes at such dimensions as would deliver the full quantity required, say 12 million gallons per day, under pressure of the lowest state the reservoir was ever likely to be drained to, which may be taken at (say) 20 feet above the level of the outlet, or 81 feet above Crown-street Reservoir. All above that, as regards head of water, must therefore be regarded as surplusage, the only effect of which would be to keep the pipes subject to undue and unnecessary pressure, requiring a corresponding increase of strength, thickness, and weight. Therefore, in so far as regards the greater height at which the water in the Bull's Hill Reservoir would stand over that in the Prospect Reservoir, there would be nothing gained, while in all other respects the advantages are in favour of the Prospect Reservoir. The storage capacity of the Bull's Hill Reservoir is, as I have stated, 4,636 million gallons. To store this quantity, an embankment of $96\frac{1}{2}$ feet in height at the centre, and containing $2\frac{1}{4}$ millions of cubic yards of earth, would be required, giving 2,060 gallons storage per yard cube of bank. The area covered by water, when full, would be about 535 acres.

Passing Bull's Hill Reservoir, and continuing the canal about $2\frac{1}{2}$ miles nearer to Sydney, it would arrive at the valley of Prospect, which has been proposed as the other site of the reservoir, and which is shown on sheet No. 16 of the accompanying book of plans. The valley of Prospect at this part spreads out into a broad flat basin, bounded on the north-west and south by a semicircular amphitheatre of low hills, forming the *divisio aquarum* of Botany Bay, the Hawkesbury, and Port Jackson. Lower down, where it is proposed to place the dam, the valley contracts to about $1\frac{1}{4}$ mile in width.

The reservoir at Prospect, when filled, would cover an area of 1,291 acres, and would contain in all 10,635 million gallons; but as it is proposed to draw off only the upper 25 feet of the water, the quantity available for supply would be reduced to 7,110 million gallons, equal to 19 months' supply for the present population of Sydney and the suburbs, allowing 100 gallons per head per day. The Prospect Reservoir would be of about the same superficial area as the Yan Yean, but considerably deeper, and containing a much larger quantity of water. It will perhaps convey a better idea of its size to say it would be of nearly the same extent as that part of Sydney Harbour lying between Bradley's Head and Fort Macquarie.

The whole of the valley consists of a strong retentive yellow and grey clay, the most suitable of all materials for the bottom of a reservoir; and there is abundant material of the same kind in the neighbourhood for the formation of the dam. When full, the water in the reservoir would stand at 195 feet above sea level, and might be drawn off to 170 feet above it, or 31 feet above the top level of the Crown-street Reservoir. The total quantity of water stored per yard of earth-work in dam would be 3,338 gallons; it would be 80 feet in height, and would contain two million of cubic yards of earth.

The height of 170 feet above high-water, as the lowest level to which the water should be drained off, has been fixed on account of the levels of the country on this side of Prospect not admitting of an open canal being formed at any higher level, unless at considerable expense; and as it is very desirable, both on account of the larger quantity of water a canal will convey, and also of its greater cheapness, to bring the water on in this manner to a point as near Sydney as possible, I have preferred adopting the plan herein proposed, rather than bring the water in the whole way from the reservoir by piping.

The dam at the Prospect Reservoir would be a work of considerable magnitude, and would take a long time to construct; but this need not prevent the water from the Nepean being brought into Sydney in the meantime, as it would be only necessary to convey it across the valley on a timber flume or channel from the inlet of the canal on the western side to the outlet at the north-eastern extremity of the reservoir. By this means Sydney might commence to draw its supply on completion of the Cataract Tunnel Canal and other intermediate works, without waiting for the completion of the Nepean Tunnel and the Prospect Dam, both of which would occupy some two or three years to construct. It would probably be desirable, in any event, to allow the Prospect Reservoir one or two years to settle after the water was admitted, as it is generally found in all large reservoirs of this kind, that the water becomes somewhat discoloured on being first admitted. It will be remembered that such was the case in the Yan Yean—

and

and that the discolouration of the water was at first complained of, but that after a year or two it was found to become what it now is—perfectly clear and bright. I am of opinion, therefore, that in any case it would be better to bring the water required for town supply direct on from the rivers, which are perfectly clear, only allowing so much as may not be required for that purpose to escape into the reservoir, so as gradually to fill it. This, as I have shown in a preceding part of this report, would soon be the case, when it might be allowed to settle and redeposit any of the finer particles of the clay soil of the reservoir which were stirred up on the first admission of the water.

When it enters the reservoir on the western side, the canal drops 55 feet in a short distance, which would afford many suitable sites for water-mills. The power developed by the descent of (say) 20 million gallons of water per day would be equivalent to 184 horse-power.

The level of the canal at the top of the fall is 249·75 feet above high-water, or 36 feet above surface level of the water in the High Service Reservoir, Paddington. So much of the water as may be required for the supply of the high-service of Sydney (say 4 million gallons per day), might here, if thought desirable, be intercepted, and in place of allowing it to descend into the large reservoir, be conveyed across the dam, by means of a syphon-pipe, into a small-service reservoir to be constructed on the side of the Prospect Hill, near the outlet-tower. From this smaller reservoir all that part of the city commanded by the Paddington high-service could receive its supply; but, in order to keep up the high-service supply, in very dry seasons, as well as to be enabled to draw from the large reservoir if it should happen that the canal failed to deliver the 4 million gallons which we have estimated as being required for the high service of the city, as well as to command the very highest parts about Waverley, it would be only necessary to utilize the water escaping from the outlet-tunnel for the low-service supply, by causing it to pass through a turbine or water-wheel in the water-tower, which, by a simple arrangement, could be made to pump into either of the higher reservoirs. Thus, the water flowing out through the tunnel for the supply of the low service of the city would be made available for raising a sufficient quantity to supply the high service. An estimate of the cost of supplying the high services in this manner will be found in Appendix D.

The water would be drawn off from the reservoir through a water-tower into a tunnel excavated in the solid rock through the hill on which the dam abuts, at its eastern end; the tunnel would deliver into an open canal; and by the canal, the water would be conveyed a distance of $4\frac{1}{2}$ miles to a point within about a mile of where the railway crosses, where the general level of the country rapidly drops to 40 or 50 feet below our level. This depression continues for about a mile and a quarter, when the ridge rises again, near the crossing of the road from Parramatta to Liverpool. I propose that the water should be carried over this depression in an aqueduct, on the same rate of inclination as the canal, viz., 6 inches per mile, as by this means 2 or 3 feet of elevation at the lower end will be saved.

I am not, however, by any means prepared to say, seeing the very large surplus of water which would be stored in the reservoir, whether it would not be preferable to leave it at some higher level (say 2 or 3 feet); sacrificing so much water—about 400 to 600 million gallons—and dispensing with the aqueduct, substitute a syphon-pipe, whereby a saving of £20,000 would be effected. The aqueduct would be about 63 feet above the level of the rails where it crosses the railway, and 45 feet above the surface of the ground, the railway being in 18 feet of cutting.

At 48 miles 47 chains, where the line of aqueduct is shown as crossing the Parramatta and Liverpool Road, it is proposed to construct a small balance reservoir, by throwing an earthen embankment across the head of the valley—for the twofold purpose of supplying Parramatta with water, should it be determined to take it from this source, as well as to regulate any inequality in the delivery of the canal, and that of the syphon which commences at this point. I must here observe that a slight error has been made in the lithograph drawing, in showing the syphon as commencing at 49 miles 5 chains, instead of further back, at 48 miles 64 chains, as is intended.

It was my intention to have brought the line of canal along the crest of the ridge forming the watersheds of Parramatta River and Cook's River; but I found that at this part it made so considerable a bend round the head of Duck Creek as would have involved a detour of 4 miles; and as the country was not favourable for a canal on the natural surface, I found it would be cheaper and better to cross the deep depression of Duck Creek by means of a syphon pipe, getting on to the ridge again at 51 miles 40 chains, from which point about 1 mile of canal would be continued into another small balance reservoir, near the 53rd mile, and 11 from Sydney, from whence the water would be brought in by piping alone.

The water might be brought down from the reservoirs to this point in pipes, in lieu of by the plan I have described, but I have selected the latter for the following reasons:—In the first place, an open canal of the dimensions I have shown will convey a very much larger quantity of water, with a smaller rate of inclination per mile, than pipes would. This enables us to start at a lower level at the reservoir, and maintain a higher level at the end of the canal than would be the case were piping used, the friction and limited sectional areas of which considerably diminish their capacity of discharging, and make an open canal preferable wherever but a small fall can be obtained. The cost too, of piping, would be considerably greater than that of an open channel of corresponding capacity mile for mile. If piping had been used in this instance, it would have been necessary to have given it a fall of not less than 2 feet per mile, while with an open canal 6 or even 4 inches would be sufficient. Thus we must have started from the reservoir at

a higher level, and so left a considerable body of water unavailable, or the line must have been at a correspondingly lower level where the canal and aqueduct terminate at the 53rd mile. It will be seen that the plan I have sketched out, while admitting of the water being drawn down lower in the reservoir, also enables us to deliver a considerably larger body of water at a higher level, within about 11 miles of Sydney, than would have been possible had piping throughout been used; and if at a future time the requirements of the city should demand any larger supply than we now propose to furnish, it would only be necessary to lay another main, of any required dimensions, between Sydney and the termination of the canal, in order to supply it, instead of continuing the whole distance to the reservoir, as would otherwise be required, the canal being capable of delivering 29 million gallons per day at this point.

From 52 miles 33 chains to where the piping commences, the canal would be widened so as to form another balance reservoir, to admit the water in an easy and continuous stream into the pipes. By means of this arrangement, the water being always supplied to the pipes in greater quantity than they can carry off, a uniform head is preserved, and a more continuous and regular flow through them would be the result. Being kept more fully charged at their upper ends, there would be always a tendency to equalize the level of the reservoirs; and thus the water in the Petersham Reservoir would stand nearly, if not quite, at the same level as the others. In this way, by a succession of syphons, all tending to produce equality of level in the water at either extremity, we should keep the pipes of the low service (whenever it may be required, as in case of fire) under the full pressure due to the level at which the water would stand in the 49th-mile Reservoir, that is to say, 42 feet above the Crown-street Reservoir, without calling on the high service.

From the 53-mile Reservoir the water would be carried to the Petersham Reservoir by a system of piping. The dividing ridge between those points being too low to admit of the canal being continued, the most direct line has been selected for the pipes, as there are no buildings, formidable depression, or other obstacle, which would necessitate a departure from the straight line.

There would be many advantages in using two pipes to convey the water from where the canal would terminate to the Petersham Reservoir, and thence on to Sydney; chief amongst which would be that of preventing interruption to the supply in the event of accidents happening to the pipes, or when they required flushing, cleaning, or recoating, repairs to valves, or any of those other contingencies likely to arise. Two pipes, of 34 in. in diameter, would be sufficient to deliver the 12 million gallons we have been proposing for the town supply, or one of 48 in. diameter; but, as I have stated, although somewhat more costly in the first instance, I should prefer having two.

The size of pipes here stated is rather larger than would be required, but I have preferred erring on the safe side. In Boston, it is found that two pipes of 30 in. diameter deliver 10 million gallons per day with the same rate of inclination as ours would have, and probably two 32-inch pipes would be found sufficient; but I have thought it safer to estimate for the larger size.

The reservoir at Petersham would be at the highest point in that neighbourhood, and although the mean grade line of the pipes would give but 149 feet above datum, or 10 feet above the Crown-street level, I have no doubt that in general the water would stand at a much greater height; in fact, but little below the level of the upper reservoir at the other end of the pipes. I think we are safe to assume about 164 feet above datum, or 25 feet above Crown-street, as the ordinary level at which the water would stand. Provision would be made for allowing both the low-service pipes to discharge into this reservoir when required to keep it charged, or, by shutting them off from it, convey the water direct to Sydney either for the high or low service of the city. From the reservoir at Petersham I would propose to supply direct all those suburbs, lying to the west of the city, as Petersham, Ashfield, Marrickville, Newtown, Camperdown, Glebe, and Balmain; St. Leonards might also be supplied by an arrangement similar to that adopted at the Boston Waterworks for crossing the Chelsea Creek.

In selecting the line for the piping from Petersham to Sydney, I have taken advantage, as much as possible, of the roads, in order to avoid interference with the valuable properties which a straighter line would necessitate. On leaving the reservoir at Petersham, the line of pipes would be laid along the Stanmore Road, thence sweeping with a gentle curve into the Enmore Road, and along it to the railway bridge, crossing on the western side of which, over the line, the pipes would cross obliquely the Newtown Road, and thence on through Wilson-street, thence again crossing over the railway into Redfern-street, along Redfern-street to the crossing of Castlereagh-street, thence obliquely across the Surry Hills to the end of Riley-street, and along Riley-street into the Crown-street Reservoir.

The total distance from the Nepean being 63 miles.

I stated that at Prospect two small reservoirs might be constructed, one for the Paddington high-service, which would take its supply direct from the canal on the other side of the reservoir, being supplemented, when necessary, by water thrown up by the turbine—the other reservoir for the highest service at Waverley being wholly supplied by the turbine. A branch pipe, with stop-valves and other necessary appliances, would connect each of those reservoirs with a single main, which would be laid alongside of the low-service aqueduct as far as the 53rd mile, where, we have seen, the piping for the low service commences, with which the high-service pipe might be connected in the manner I shall now proceed to describe.

At

At its lower end, the high-service pipe would branch into two, each branch being connected with one of the pipes of the low service, with a stop-valve at the junction, so that the high-service supply might be conducted through either or both of the low-service pipes if required, or be shut off from both, should they be wanted for the low-service. A similar arrangement of branches and junctions would be required at the Sydney end. The operation would be somewhat as follows:—Let us call the two low-service pipes from the 53-mile reservoir to Sydney, A and B. Although both those pipes would discharge into the Petersham Reservoir, there would be an arrangement to continue them through to Sydney, so as to shut off either or both from the Petersham Reservoir. We will suppose that both low-service pipes are delivering into the Petersham Reservoir, and it is required to supply the high service either at Paddington or Waverley. Pipe A, we may suppose, is allowed to continue discharging into the low-service reservoir at Petersham, and pipe B is connected with the high-service pipe, by the valves being opened at each end; the water, would then flow from either of the Prospect high-service reservoirs, through pipe B, into either of the high-service reservoirs at Paddington or Waverley; or the same process might be performed with pipe A; or again, by shutting off both from the high-service pipes, the low-service supply would go on as before.

But the high services of Paddington and Waverley might also be supplied in an equally efficient and much cheaper manner by pumping up the water from Crown-street. One of the engines now employed at Botany would be sufficient for the service, and the annual cost for working expenses, for many years to come, would be quite insignificant. The estimate given in Appendix C shows the probable cost of the entire project, on the assumption that the high service would be supplied in this way. The other estimate, Appendix D, is for the gravitation principle throughout.

The remaining engines might be employed, as described in another report, in pumping back the sewage from the Tank Stream and main sewer, to be used in irrigating the Botany Swamps. We should thus dispose for ever of that, which if it be not so already, is certain to become at no distant date, a most gigantic evil,—as injurious to the health as to every other interest of the citizens.

E. O. MORIARTY.

APPENDIX A.

TABLE of ordinary Summer Discharge of the following Rivers:—

	Height above Sea.		Drainage Area.	Total Discharge.	Discharge per Square Mile.	Representing Rainfall per annum.	Total average Rainfall per annum.
	Valley.	Hill.					
	ft.	ft.	Square miles.	Cubic ft. per min.	Cubic ft. per min.	Inches.	Inches.
Thames, at Staines—chalk, green sand, Oxford clay, oolites, &c.	40 to 100		3,086	40,000	12.98	2.93	24.5
Severn, at Stonebench—silurian	400 to 2,600		3,900	33,111	8.49	1.98
Loddon (Feb., 1850)—green sand	110 to 700		221.8	3,000	13.53	3.01	25.4
Nene, at Peterborough—oolites, Oxford clay, and lias	10 to 600		620.0	5,000	8.45	1.88	23.1
Lee, at Lee Bridge—chalk (Rennie, April, 1796)	30 to 600		570.0	8,880	15.58	3.53
Medway, driest seasons (Rennie, 1787)—clay		481.5	2,209	4.59	1.04	
Medway, ordinary summer run (Rennie, 1787)		481.5	2,520	5.23	2.19	
Verulam, at Bushey Hall—chalk	150 to 500		120.8	1,800	14.9	3.37	
SYDNEY WATER SUPPLY.							
Heads of the Rivers Nepean, Cordeaux, and Cataract	1,400 to 1,800		354	s. d. 4,363	12.32	4.19 1.27	49.14* 14.90†

NOTE.—S. D. representing summer discharge for 5½ months, from 15th September, 1868, to 28th February, 1869.

* Mean of twenty-seven years.

† 14.90 represents the number of inches of rainfall in the summer months, and 1.27 inches the amount discharged through the rivers in the same period.

APPENDIX P.

Discharging capacities of Tunnels, Aqueducts, and open Conduits, from Pheasant's Nest to Sydney.

Number of Section on Sheet No. 33.	Depth of Water in centre of Canal.	Inclination of Surface of Water.	Area. Square feet.	Wet. Perimeter, feet.	Hyd. Mean Depth.	Velocity, in feet, per second.	Discharge, in cub. ft., per second.	Discharge, in gallons, per day.	Remarks.

APPENDIX C.

ESTIMATED Cost of proposed project for the Supply of Sydney with Water from the heads of the Cataract and Nepean River—the high services at Paddington and Waverley being supplied by *pumping* from Crown-street :—

<i>Nepean to Menangle—</i>		
Nepean Dam and other works	£2,278	
Tunnel from Nepean to the Cataract	42,325	
Cataract Dam and other works	2,278	
Tunnel from Cataract	16,441	
Open canal	2,428	
Aqueduct, Simpson's Creek	768	
Open canal	2,811	
Aqueduct, Elledale Creek	4,606	
Open canal	5,027	
Aqueduct, Ousedale	2,987	
Open canal	1,512	
Aqueduct, Malaly	961	
Open canal	1,320	
Tunnel	3,345	
Open canal	776	
Aqueduct, Leaf's	2,707	
Open canal	2,343	
Aqueduct	1,141	
Open canal	3,536	
Aqueduct, Woodhouse's	1,124	
Open canal	5,133	
Aqueduct, Menangle	2,237	
Open canal	1,832	
Tunnel, Sugarloaf	7,477	
Open canal to 16 miles 35 chains	3,536	
Aqueduct over Railway	1,195	
Do. Campbelltown Creek	1,602	
Land	880	
<i>Bull's Hill to Prospect and Reservoir—</i>		124,606
Open canal	5,750	
Reservoir, dam, and other works	176,136	
Land	10,400	
<i>Prospect Reservoir to Sydney—</i>		192,286
Open canal and aqueduct	£47,000	
Compensating reservoir, Duck Creek	4,800	
Syphon-pipes, Duck Creek	52,552	
Open canal	1,500	
Reservoir, Haslem's Creek	5,940	
Piping to Petersham	106,773	
Reservoir, Petersham	4,800	
Piping to Sydney	56,480	
Land	1,008	
<i>Supply to high-water level—</i>		280,853
A small high-service reservoir at Waverley	5,000	
Shifting Botany engine and pipes, and building new engine and boiler sheds	5,000	
		10,000
Total	£607,745	
Superintendence and other contingent expenses, say	20,000	
		£627,745

NOTE.—The above estimate does not include the cost of the canal between Menangle and Bull's Hill, which will be furnished by Mr. Grundy.

APPENDIX D.

ESTIMATED Cost of proposed project for the Supply of Sydney with Water from the heads of the Cataract and Nepean Rivers—the high services at Paddington and Waverley being supplied by *gravitation* from Prospect Hill :—

<i>Nepean to Menangle, as before</i>	£124,606	
<i>Bull's Hill to Prospect and reservoir, as before</i>	192,286	
<i>Prospect Reservoir to Sydney—</i>		
Open canal	£47,000	
Reservoir, Duck Creek	4,800	
Piping, Duck Creek	52,552	
Open canal	1,500	
Reservoir, Haslem's Creek	5,940	
Piping to Petersham	121,633	
Reservoir, Petersham	4,800	
Piping to Sydney	64,480	
Land	1,008	
<i>Supply to high-water level—</i>		303,713
Reservoir on Prospect Hill and turbine	6,000	
28-inch piping	86,241	
		92,241
Total	£712,846	
Superintendence and other contingent expenses, say	20,000	
		£732,846

NOTE.—The above estimate does not include the cost of the canal between Menangle and Prospect, which will be furnished by Mr. Grundy.

APPENDIX E.
TABLE of Rainfall and Discharges in Nepean and Cataract Rivers.

Day of the Month.	Rainfall at Wilton.	Rainfall at Sydney Observatory.	Cataract River.		Nepean River.		Cataract and Nepean Rivers.		Quantity of water running into reservoir.	Quantity of water running to waste in rivers.	General Remarks.
			Quantity of water due to Sydney rainfall on drainage area of 70 square miles.	Quantity of water measured as having passed down river.	Quantity of water due to Sydney rainfall on drainage area of 284 square miles.	Quantity of water measured as having passed down river.	Quantity of water due to Sydney rainfall on drainage area of 354 square miles.	Quantity of water measured as having passed down rivers.

REPORT BY MR. GRUNDY ON THE UPPER NEPEAN SCHEME.

To the President and Members of the Sydney Water Commission.

Gentlemen,

In pursuance of your minute of the 11th July, 1868, which confided to Mr. Moriarty and myself the important task of ascertaining whether it were possible to obtain a plentiful and reliable supply of water, by the means and from the sources already most favourably considered by you, namely, the Nepean and Cataract Rivers, I submit to you my report upon that portion of the necessary work which has been supervised by me.

It was arranged, to avoid expense, and because Mr. Moriarty's position at the head of a public department afforded him facilities for acquiring much information common to each report, that questions of fact such as the prices of materials should be left to that gentleman, and adapted by me to the details of my portion of the work subsequently; necessarily, my report follows Mr. Moriarty's, and leaves me little time for elaboration. Moreover, although I had collected statistics upon this subject, such as the catchment area, and circumstances of supply of water to other towns in other countries, I have decided, after having this day heard Mr. Moriarty's report, in which he includes almost all that can be written within the limits of such a paper, to withdraw from mine all outside matter.

When the surveying party under my supervision first went out, at the beginning of April, 1868, it was intended that their work should, as instructed by the Commissioners in March, commence at the Sugarloaf Hill, and extend to the highest land at the head of Duck Creek; this portion of the distance, between the proposed interception of the rivers and Sydney, was specially indicated, because from the broken country, and the uneven and puzzling nature of the Prospect Range, it was by no means clear that the water could be brought to Sydney retaining a height that would keep it available for a gravitation scheme, without so enormous a cost as would be prohibitory.

Trial surveys and approximate estimates only were contemplated; but, as the work went on, as it became more likely that the scheme was practicable, as the gauges certified to the supply of water, and sites for reservoirs were found, the Commission thought that close detail would be advisable, and the entire proposal has been worked out with much minuteness. It has been costly; but in dealing with water, an engineer has to consider circumstances which much increase the difficulty of preliminary work; he can have no rising gradients, nor long level stretches as occur on roads and railways; it is more than usually desirable that he should take it through good ground in slight cutting, avoiding embankment wherever he can do so, and lead it with a constant descending gradient besides. The difficulty thus caused must be evident enough in an involved country like the Prospect Range, much of which is truly called the "Puzzling Hills."

Whilst the earlier part of these surveys was being made, my attention was anxiously directed to the discovery of available storage reservoirs; upon this depended the fate of the undertaking; without a reservoir holding several months' supply it would be useless to bring water from the proposed sources, because there are long periods of drought when the total yield of the rivers is altogether inadequate, even if all the water flowing down them could be impounded, which if it could be done, would not, I think, be permitted. It was not until the survey was nearing the end of the range of hills at Greystanes, that the ground offered any favourable sites for large reservoirs, but I there found three—the contours of which I submitted to a meeting of the Commission, specially convened at my request for the consideration of them; of these three, two are situate at Bull's Hill, closely adjoining each other, with a spur only intervening, and either could readily be adopted, or they could be converted into one. Into these the water could be conveyed at a height of 260 feet above Sydney high-water-mark, and their joint capacity is about 4,600 million gallons; the third, distant some 2 or 3 miles, and being at Prospect, was of still larger area, but could only be constructed to hold the water at a level of some 200 feet above Sydney high-water-mark; at that level, however, it would impound about 7,000 million gallons. The Commission preferred the higher level reservoirs, and I was requested to cause details of these to be proceeded with, giving up the lower level or Prospect one. It was not until these two reservoirs had been fully elaborated—a work occupying nearly two months' time, that Mr. Moriarty, who had been absent at Melbourne when the decision just mentioned was arrived at by the Commissioners, recommended the reconsideration of my low-level reservoir at Prospect. I hope that when the Commissioners arrive at a decision, a pure gravitation scheme by pipes and pressure from the Bull's Hill Reservoirs may be chosen. However, if from a comparison of expense, or for other reasons, the Commission adopts the Prospect scheme, I may be permitted to say that I shall none the less consider the Commissioners successful in their endeavour to introduce an abundant supply of water into Sydney at a cost not prohibitory.

I will now proceed to describe my portion of the aqueduct.

There are few works of much magnitude beyond the tunnels and reservoirs requiring detailed drawings; and of these the most prominent is the crossing of the Railway at Menangle. This work, and the crossing of the Campbelltown Creek, are included in Mr. Moriarty's estimate, he having other similar works requiring special drawings and estimates, which equally suit these. As the distance supervised by me appears on the finished drawings to be twenty-one miles, it may be well to mention that the work involved would represent much more than double that distance. The object

of the Commission, when the field-work was undertaken, being to ascertain the possibility of finding *any* line over this part of the country, a trial survey was first made. Accordingly this is still shown upon the plans by the dotted line marked "Alternative line." When it was laid before the Commission, and the practicability of finding a line proved, it was resolved that another and shorter one, based upon the data obtained, should be surveyed, &c. This is the line adopted, and involves some miles of tunnel, but it is shorter by several miles than the first one. However, both have been carefully and completely got up, and either could be adopted. The first line, moreover, was continued all the way to Greystanes, where it was then thought possible to construct a high level reservoir, but on the levels being completed this was found impracticable. This line was $37\frac{1}{2}$ miles in length from the Sugarloaf.

Mr. Moriarty's first portion of line joins mine near the Sugarloaf at a point $16\frac{1}{2}$ miles from the commencement, and immediately afterwards we cross the road from Campbelltown to Camden, passing underneath it, leaving it undisturbed. At the $17\frac{1}{8}$ mile the line crosses the Railway by an iron aqueduct described by Mr. Moriarty. From hence the line skirts the east side of the dividing range of the Nepean and George's River watersheds, crosses several long spurs, contouring the mountain side until at the $17\frac{7}{8}$ miles, it crosses Campbelltown Creek—one of the upper tributaries to George's River—by an aqueduct, also included in Mr. Moriarty's estimates. Immediately beyond this it enters a short tunnel 90 yards in length; and at $18\frac{1}{2}$ miles is an aqueduct 150 feet in length. From this point the character of the country on the east side of the range becomes increasingly difficult, and being followed for some miles, it was almost impossible to find ground at the required level upon which the works could be constructed, the side of the hills being broken into long spurs and deep gulleys, almost precipices; on the west side of the range, however, the country was found to be quite different, falling away in long easy slopes, offering good constructing ground, with fewer watercourses and no precipices. The only resource, therefore, was to pierce the range, which is done by a tunnel 484 yards in length. There are two complete surveys hence to the $22\frac{1}{4}$ -mile and the Nepean watershed is adopted. Ten chains beyond the exit from the tunnel, or at the 19th mile, the aqueduct crosses the road from Campbelltown to Camden, at a level involving no material alteration of the road surface. At the 20th mile occurs an aqueduct 450 feet in length and 23 feet high. In construction, an embankment might be substituted, if thought advisable, with a small bridge at its deepest point. At the $20\frac{1}{2}$ mile is a tunnel 1,254 yards in length, which might be avoided in construction by a detour of about $2\frac{1}{2}$ miles over a good country. At the 22nd mile, the nature of the country necessitates a drop of nearly 7 feet in the height of the aqueduct; this is done by means of weirs. At the 23rd mile, a high spur runs out from the main range, necessitating a tunnel 220 yards in length, after which the country continues very good to the 25th mile, where must be another tunnel, through another spur, but only 84 yards in length; beyond which the entire range falls with great rapidity, and the line of aqueduct which is carried along the highest part of it has to be lowered many feet, 72 in all, by a series of weirs. Part of the fall of 72 feet is caused by a sudden drop in the range at Cairn's Hill, at about the 29th mile, but the weirs are mostly placed several miles short of Cairn's Hill, as the fall takes the aqueduct into better country, being the pasture lands on the west side of Mount Cordeaux. Here is an excellent site for utilizing the water power, if it should be found practicable to do so. It is near the old Cowpasture and the Denham Court Roads, affording easy access to the Great Southern Road, distant four or five miles. But I cannot say that I entertain any expectation of largely using the water as a mill power—at any rate above the reservoir—as the supply would be so irregular that the machinery would in all probability be idle half the time, and proper control of supply by the millers is almost an essential of water-power. At $27\frac{1}{2}$ miles the aqueduct is taken under the Denham Court Road, level of the road unaltered; at 29 miles under the Cowpasture Road, level of the Road unaltered; immediately afterwards, under the Bringelly Road, level also unaltered. Hence to the $31\frac{1}{2}$ miles, the aqueduct is carried along the very highest part of the range. From the 27th mile an alternative line has been chosen. The original contour kept to the west side of the range, and wound tortuously round it, avoiding heavy works, but materially increasing the length, until crossing once more the back bone of the range, it traversed the eastern side of it, skirting the sites of the Bull's Hill and Prospect Reservoirs, and continuing on to Greystanes, now the property of Walter Lamb, Esq. Here the Prospect Range terminates in a horse-shoe bend enclosing a valley which it was thought might be made available as a high-service reservoir, having its surface water at a level of some 300 feet above Sydney high-water-mark. This was afterwards abandoned, it being shown when the section was completed that the area submerged must be either very limited, or the aqueducts leading into it of great length and enormous height; and even then the impounding capacity was still small. The extreme distance from Sugarloaf to Greystanes was about $37\frac{1}{2}$ miles. It is necessary to make some mention of these various changes, as they include much more than twice the distance shown upon the completed drawings, which do not, without this explanation, fairly represent the money and time expended upon them, nor the work so ably performed by Mr. Licensed Surveyor Handcock, C.E., whose ability and perseverance I may perhaps be permitted to record. Returning to the description of the aqueduct:—At the $31\frac{1}{4}$ miles, an unavoidable tunnel of 180 yards is entered upon, succeeded by a good country to Judge's Hill, at the 33rd mile, where there is another tunnel, 80 yards in length, and also unavoidable. Hence the aqueduct traverses a broken country, with numerous culverts and short aqueducts, to the $34\frac{1}{2}$ miles, where it is on the back-bone of the range, at its lowest point, between Menangle and Prospect; hence to the 37th mile, where Mr. Moriarty again takes up the work. A variety of different lines were tried in the endeavour to avoid the bad country intervening, but
this

this could not be done save by the substitution of a line $7\frac{1}{4}$ miles long, and itself heavy, with nearly half the length of tunnelling of the direct one, which arrives at the 37th mile, in 3 miles and a half of broken country, necessitating three tunnels of 3,300, 240, and 340 yards in length respectively. I believe that this line may still be improved in construction, especially the long tunnel, which, although it cannot be much shortened, may be taken into ground where the depth of the shafts may be greatly diminished. At this point the water would, if the high-level reservoirs were adopted, be turned into them. The plans before you show the aqueduct to be continued into the Prospect Reservoir, as is described by Mr. Moriarty. I must mention that the further work of carrying on the line of aqueduct to Duck Creek, at the 50th mile, was performed by me to the extent of examining the country and clearing the line, which appeared to me the best. This was subsequently pointed out by Mr. Hancock to Mr. Moriarty's party.

This brings me to the Bull's Hill Reservoirs, as shown on the plan (15A) accompanying my report.

The two reservoirs at Bull's Hill might be connected by a tunnel piercing the short spur between them, at the level of the outflow pipe, and would then form one reservoir. The area covered by both when full would be 535 acres, would hold an available depth of 60 feet between the surface level of 260 feet and the outflow pipe of 200 feet, and would contain 4,636 million gallons of water, or 386 days' supply of 12 million gallons per day. In May last, some doubt still rested upon the minds of the Commissioners as to the sufficiency of the supply from the rivers; I therefore obtained a statement of the result of the rainfall and its consequences, taken from the gauges put up by Mr. Moriarty for the Commissioners. The means adopted by me to obtain a reliable result are explained in the accompanying table, and need not be recapitulated now; suffice it to say, that I was very hard indeed upon the reservoir, never withdrawing any water from the river unless under the most favourable circumstances; but I succeeded in producing results so suprisingly favourable as to satisfy myself and other Members of the Commission. Mr. Moriarty submits a more finished set of tables, and arrives at much more favourable results; but I have in my report preferred making reference to my own, chiefly because I know it to be almost unfairly hard against the reservoir, but partly because its simplicity, as a reference, may induce the public to examine it.

By referring to it, and substituting simply 4,636 millions for 7,000 millions, it will be seen that, as the other circumstances entering into the calculation remain the same, this quantity would never once during 28 years have been half emptied, and would have been full, practically, 26 years out of the 28. I am therefore decidedly of opinion that this reservoir is quite large enough.

The material of which the dam should be made is abundant and good.

It is those reservoirs, or one of them, which should be constructed if the high level scheme be adopted. I have already shown that the water they can hold would never be half withdrawn; in actual numbers they would have contained *once for one month*, 2,416 million gallons, as shown by the very severe test of my tables, which record no flow into reservoir, when less than 10 million gallons are flowing down the rivers, and, practically, the average would stand much higher. However, with the reservoir thus far exhausted, the level of the water in it would be 238 feet above Sydney high-water-mark. With this 238 feet, and with a distance of about 20 miles to convey the water, let us see what height in Sydney we could achieve by pipes all the way. I calculate a delivery of more than 4 million gallons to the highest level attainable, and under the worst circumstances, and more than 7 million gallons into the Crown-street Reservoir. The water would be drawn off at a level in the Bull's Hill Reservoir of 200 feet, with a head of 238 feet at lowest area, in two pipes of 36 inches in diameter each. But it must be borne in mind that for $\frac{2}{3}$ ths of the whole period of 28 years the reservoir is practically *full*.

However, at this *lowest* period the supply would have been—To Paddington Reservoir, four millions and a quarter, or thereabouts; to the Crown-street Reservoir, eight millions and a half; together, nearly 13 million gallons per day.

For details of supply see Appendix D.

The cost of the pipes, which would be each about 21 miles in length, and calculating upon a price of £11 per ton, would be about £460,000. (See Table, Appendix.)

It has been suggested that the pressure would be inconvenient or excessive, but it is a fact that a large proportion of the mains for the London and other Water-works are under a pressure of much more than 200 feet.

Now there are but few places where the difference of level, even according to Mr. Moriarty's section—which in all probability would not be the line chosen for these pipes—is anything like 200 feet under the full reservoir. This pressure, if it existed anywhere could easily be avoided, by elevating the pipes at the lowest places if necessary, which, however, it is not, because it is a mere question of thickness of metal, and is quite usual in England and elsewhere.

Both as regards the length of piping and the pressure, there is indeed nothing but what may be observed daily in other places.

I believe that the high level scheme would be preferable from its simplicity, if it be in other respects practicable. The compound system of pipes, aqueducts, syphons, and small reservoirs, would be a constant source of anxiety, trouble, danger, and expense, *necessarily* larger expense, on account of manual labour alone, for regulating sluices, turbine or engine, &c., whilst, by comparison, the pipes would be secure.

A *resumé* of the reasons which suggest themselves to me in favour of the Bull's Hill Reservoir is:—

1. That to adopt the Prospect Reservoir is to depart from what I conceive to have been the original decision of the Commission, namely, the supply of water to Sydney by gravitation.
2. The Prospect Reservoir, and canal therefrom, necessitate a clear minimum unnecessary loss of 68 feet, and a maximum loss of 90 feet head of water.
3. This loss of an average of *at least* 75 feet is lost for ever, in all future modifications of the scheme of supply, unless by adopting the extreme step of making *all* the reservoirs.
4. The mode of supplying the higher levels of Sydney from Prospect, from a small reservoir, is inefficient and uncertain. To fill such a reservoir for a six months' drought, such as occurred from July to December, 1847, would require a reservoir capable of containing something like 700 million gallons—but Mr. Moriarty having (October 1st) abandoned this suggestion in favour of pumping from Crown-street, it is now needless to criticise it further.
5. The Bull's Hill Reservoirs hold more than $4\frac{1}{2}$ thousand million gallons, over an area of only 535 acres, whilst the Prospect one has but 7 thousand million gallons available, over 1,291 acres area, *i.e.*, $\frac{1}{3}$ ths the quantity of water in Bull's Hill, over only $\frac{1}{4}$ ths the area; the evaporation therefore would be much greater in the Prospect Reservoir.

But there is yet another view to which I call the attention of the Commissioners,—exhibiting the Bull's Hill proposal in perhaps its best light for present adoption.

It is true that a quantity of 12 million gallons has been fixed upon by the Commissioners as the supply required—but it is equally true that that supply is to suffice for a doubled population and future generations. Sydney and its Suburbs do not require—probably could not use 12 million gallons *now*, indeed they would have been well satisfied with the 30 million per week (not *five* million per day), if it could have been assured to them. It was but the uncertainty of that supply and the reduction of it when most wanted, together with the prospect of a possible failure of it, that brought this Commission into existence. Then why not modify for the present, the scheme? It will be remembered that the Bull's Hill Reservoirs are divided by a high spur. Here nature has given exactly what is required. Make *one* reservoir, and bring for the present *one* line of piping into Sydney. Let us see how this suggestion will work out. The southern reservoir of the two extends over an area of 395 acres, and contains 3,475,000,000 (three thousand four hundred and seventy-five millions) of gallons of water, and is much the larger basin of the two,—holding, indeed, almost exactly three-fourths of the *whole*. I am not prepared to state that *any enlargement of this one reservoir need ever be made*, even to supply 12 million gallons, as my table indicates that it would never have failed for 28 years, but would have still contained 1,655,000,000, or 130 days' supply, when the worst drought of 28 years broke up. The cost of this would be about £630,000.

A further and very important modification of the above described Bull's Hill scheme is the following:—The natural basin admits, especially at the western or mountain side, of a further raising of the level of the water to a height of 280 feet above high-water-mark at Sydney. It would be possible then to cut off, as it were, a portion of the western part of the reservoir, and to isolate it from the remainder by a moderate embankment, *20 feet higher in level* than the main dam; but inasmuch as the level of the ground where this second embankment would be made would be some 240 feet above high-water-mark, the embankment performing this work would be but of moderate height—some 40 feet or so—the effect would be to obtain a high-level of 280 feet available for the supply by gravitation of all but the very smallest island of the heights of Waverley, whilst impounding to the extent of its area an additional supply of water available either for a Waverley supply, or for supplementing the water in the body of the reservoir. A branch pipe should be connected with this small reservoir, and would deliver to a height of 270 feet at Waverley when the Reservoir was full. A table of results is appended. Now the level of the line of aqueduct encourages this proposal, for on reference to the plan and section it will be seen that a line 20 feet higher would shorten the tunnels and reduce the depth of shafts over the last and roughest 3 miles of the whole distance; nay, I have already quoted this part of my work as capable of improvement probably in some such manner, irrespective of the reservoir level. I regret that no actual estimate of the cost of such work can be made without further and now impossible field work, but my impression is that the improved line would pay for the embankment.

Now, the adoption of the high-level reservoir need by no means bind the Commission to the immediate employment of pipes; they could just as easily descend to the canal level *after leaving* the reservoir as *before entering it*. The question of pipes or canal might therefore be for the present left open, if the Commissioners wished it; but it would, I think, be important to retain an impounding reservoir, at such a level as will admit of eventually adopting *either* mode of supply, now that we have found one.

No doubt the strongest argument in the minds of many will be the apparent capability of the compound scheme to convey 30 millions of gallons of water half-way from Prospect to Sydney; but this capacity is excessive, as can be readily shown. By Mr. Moriarty's tables of the water passing down the joint rivers, impounding a full aqueduct whenever it was to be obtained, and *all* the water passing down at other times,

I find that, between the months of October, 1868, and March, 1869, the reservoir delivering 30 millions per day would have been called upon to part with about 3 thousand million gallons more water than it received. Here was no remarkable drought, but the reservoir was half empty. But *during* a remarkable drought, namely, that of 1849 and 1850, I find that 11,700 million gallons would have been withdrawn, and, by the test I have applied throughout, only 2,550 millions supplied between January, 1849, and February, 1850; which means that the Prospect Reservoir would have been dry for three months. After February, 1850, to June, 1850, 2,500 millions more would have been supplied, and 4,500 millions required; so the reservoir would have been practically dry for eight months. Therefore, a canal conveying 30 millions per day from the reservoir would be least useful when most wanted.

Withdrawing 20 millions per day would have reduced the Prospect Reservoir to 1,750 million gallons in February, 1850; or 87 days' further supply, if the drought had continued; a reduction sufficiently close for safety. But this 30 million can only be brought within ten or eleven miles of Sydney—whereas by the pipe system, 14 million gallons could be brought *into* Sydney, namely:—

From the 280 feet reservoir at its lowest,	or 252 feet,	$5\frac{1}{2}$ millions to Paddington.
From the 260	„	or 238 „ $8\frac{1}{2}$ „ Crown-street.

14 millions

Mr. Moriarty's estimates for the various works contemplated by him being completed, I have only to append an estimate of mine. This I have accordingly done in Appendix A. I have next tabulated the cost of the Bull's Hill Reservoir, or a high-level scheme for delivering the same supply into Sydney (Appendix B).

As I have throughout this report placed before you only the very most trying condition of the supply, it is but fair that I should state the more favourable, and the average conditions, which is accordingly done in Appendix E.

In conclusion, I may repeat, that either scheme as now presented contains at least the great element of success—a sufficient supply of water. No more fear need be felt by the citizens, of droughts and their forerunner—diminished supply; but I regret that a scheme should be abandoned, in favour of *any* compromise whatever, which would supply all Sydney, and all its Suburbs (excepting indeed a very small area of the highest part of Waverley, which *cannot* be supplied) without artificial additions, which being supplied by pressure would give an available force for various city purposes, notably for extinguishing fires (high above the level of 149 feet), from which cause alone losses might be avoided, and at some time or other would be, which for aught I know might represent the whole amount expended in construction.

I cannot enter into any details of the arrangement of supply in Sydney, but it is self-evident that it is a very simple matter to connect with any or all the Suburbs (with the exception of Waverley heights), to deliver at all times into the Crown-street and Paddington Reservoirs, and to have a stand-pipe at Paddington, for the supply of all accessible parts of Waverley. This stand-pipe would never in 28 years have failed to supply to a height of 228 feet, would have supplied for $26\frac{1}{2}$ years out of the 28 years to a height of 238 feet; and for 13 years out of 28, would have supplied to 248 feet.

I find that I have omitted to mention the fact that the extreme lowering of the Bull's Hill Reservoir due to supply, and withdrawal only, would have been to a level of 245 feet above datum; the remaining 8 feet between this 245 and the 238 I have taken as the practical lowest, is allowed for absorption of reservoir and evaporation, which would tell most during the long droughts when the reservoir was most lowered.

FRANCIS H. GRUNDY.

APPENDIX A.

ESTIMATED Cost of proposed project for the supply with water from the heads of the Cataract and Nepean Rivers, the high services at Paddington and Waverley being supplied by *gravitation* from Prospect Hill.

	£
Excavation in earthwork, exclusive of tunnels	20,940
" rock	25,567
" tunnels	25,028
Fencing	4,053
Brick-lining in tunnels	7,256
Rubble masonry	14,056
Dry rubble	1,397
Concrete	6,006
Puddle	2,396
Stone pitching.....	6,420
Aqueducts	1,550
Culverts	1,500
Weirs	615
Road bridges	500
Accommodation bridges	10,000
Superintendence and contingencies	127,284

NOTE.—This is exclusive of Mr. Moriarty's estimate.

APPENDIX B.

ESTIMATED Cost of proposed project for the daily supply of upwards of 12 million gallons of water from the heads of the Cataract and Nepean Rivers, by *gravitation*.

	£
Moriarty, Appendix B, to Sugarloaf.....	124,929
Grundy, to Bull's Hill	127,284
Bull's Hill Reservoir, dams, &c.	224,708
Pipes to Sydney, laid	476,202
Two distributing reservoirs	10,000
Contingencies and supervision	10,000
	£973,123

ESTIMATED Cost of proposed project for the supply of upwards of 6½ million gallons, by *gravitation*.

	£
Joint Line to Bull's Hill	252,213
Reservoir, dam, &c.....	125,000
Pipe to Sydney	238,101
Two distributing reservoirs, say at Petersham and Waverley	10,000
Contingencies and supervision	7,000
	£632,314

APPENDIX C.

TABLE showing the number of gallons which could be discharged in 24 hours by two pipes each of 36 inches in diameter, from the Bull's Hill Reservoir, into Crown-street and Paddington Reservoirs respectively.

	Height at Bull's Hill above High-water- mark, Sydney.	Height of Discharge, above High-water- mark, Sydney.	Head of Water.	Gallons discharged in 24 hours, by one pipe of 36 inches diameter, 20 miles long.
Discharge at Paddington.	238	214	24	4,246,392
	240	214	26	4,429,980
	245	214	31	4,826,056
	250	214	36	5,200,680
	255	214	41	5,550,024
	260	214	46	5,878,680
	265	214	51	6,190,080
	270	214	56	6,486,336
	275	214	61	6,769,752
	280	214	66	7,041,768
Discharge at Crown-street.	238	139	99	8,625,600
	240	139	101	8,711,040
	245	139	106	8,923,992
	250	139	111	9,132,000
	255	139	116	9,334,080
	260	139	121	9,534,600
	265	139	126	9,729,600
	270	139	131	9,919,920
	275	139	136	10,108,080
	280	139	141	10,320,240

Calculated by Hawksley's formula $G = \sqrt{\frac{(15 D)^5 H}{L}}$

Where G = Gallons delivered per hour.
L = Length of pipe in yards.
H = Head of water in feet.
D = Diameter of pipe in inches.

APPENDIX D.

TABLE showing what could be done by two pipes of 36 inches in twenty-four hours.

Both drawing pressure from a height of	Deliver to Crown-street.	Deliver to Paddington.	Height to which 8 million could be delivered.	Proportion of time for which this delivery could be maintained.
280 feet	21 mill. galls.	15 mill. galls.	256 feet.....	7 out of every 9 months.
275 "	20 " "	13½ " "	251 "	About 2 years 10 months out of every 3 years.
270 "	19 ⁵ / ₁₆ " "	13 " "	Whenever the supply from the sources would allow the quantity to be taken out of Reservoir.
One pipe from 275 ft., the other from 245 feet.	10 " "	6½ " "	4 mill. to 256 ft.	2 years and 10 months out of every 3 years.
5 feet lower	9½ " "	6½ " "	Ditto to 250 feet.	Practically always. By the tables, 26 years and 10 months out of a period of 27 years and 3 months.

The probable eventual arrangement would be to construct a reservoir at Waverley, at a level of 250 feet; and Mr. Bennett's Reservoir at Strawberry Hills.

The supply to Sydney might always be 13 million gallons, and always fill the Waverley Reservoir, excepting for an *average* time of about one fortnight per year, but which would resolve itself into some 2 or 3 months once every 10 years or so.

APPENDIX E.

TABLE showing the heights in the Reservoir at Bull's Hill, during the various periods comprised within the tabulated twenty-seven years and three months, together with the quantity to, and height at which one 36-inch pipe would have delivered in Sydney; with a full Reservoir the water to be 260 feet above Sydney high-water-mark.

Time in Months.	Height in Reservoir.	Quantity delivered to Crown-street.	Quantity delivered to Paddington.	Height to which 8 millions could have been delivered.	Height to which 4 millions could have been delivered.	Supply divided between the two Reservoirs.

STATEMENT of the probable Quantity of Water available from the Upper Nepean and Cataract, read by Mr. Grundy, at a Meeting of the Commission, on 6th May, 1869.

THE satisfactory solution of the question of a sufficiency of water from the heads of the Cataract and Nepean is of vital importance to the success of the scheme for the future supply to Sydney, as proposed by the Water Commission. I have formed a table from the data in our possession, which completely satisfies me that the supply is ample—that an aqueduct carrying seventy-five million gallons in twenty-four hours is quite large enough,

enough, and that a reservoir containing seven thousand million gallons will never be even severely tried, *never being reduced below about five thousand million gallons during a trial of twenty-eight years.*

Gauges have been placed across the rivers—on the Cataract, for about five and a half months,—on the Nepean, four and a half months. It might be wished that the time had been longer, but the gaugings exhibit all the changes necessary for our purpose. All we want to know from the rivers is,—what is the effect of atmospherical changes upon them? Alternations of dry and wet weather occurred during the time of gauging; for each of the rainy periods we have the *depth* of rainfall, the *number* of *days'* rain, and the *effect* upon the rivers' discharge—the varied circumstances producing altered results, of course.

A fall of $2\frac{1}{2}$ (2.42) inches, extending over *fourteen* days, would have kept the aqueduct supplying seventy-five million gallons per day *full* for ten days,—a fall of $7\frac{1}{2}$ inches for fourteen days, full for fourteen days,—proving that these rivers respond immediately to a moderate rainfall, bring it down rapidly, rise almost the very first day of rain, and fall again quickly after it ceases, making the task of tabulating *results* easy—as we must depend chiefly upon the *number of days* of rain, not the quantity fallen.

Of course, during the 7 inches' fall, thousands of millions of gallons poured on down the river's course. This latter fall, then, was too rapid for us; clearly, if it had descended more moderately, we should have benefited more by it; for if $2\frac{1}{2}$ inches are enough to fill our conduit for ten days, these 7 inches, if they had obliged us by taking *twenty-eight* days to fall in, would have kept our conduit full for the twenty-eight days, and so on. Therefore, so far as the *effect* of the raining goes, we have, in even this short period of gauging, really sufficient data; for the *effect* is a *constant* quantity, and what $2\frac{1}{2}$ inches or 7 inches of rain did in 1868–9, it is logical to presume it did in 1859 or any other time, the circumstances of the watershed remaining unaltered, as we know they do; so that fortunately the short record we possess suffices for this item of our calculation. But the result of rainfall being thus ascertained, we require to know the probabilities as to how and when it will fall. *How often shall we have these $2\frac{1}{2}$ or 7 inches of rain in an available number of days?* Here is the *uncertainty*; and if we had the *rainfall* for a few months only, instead of *its effect* when fallen, calculation would be *impossible*. Fortunately we have the rainfall in inches, and time of falling in days, for every month, for twenty-eight years, and can come to a very perfect conclusion. It is true that the rain-gaugings have been taken in Sydney; it would have been more satisfactory had they been taken on the spot, rather than fifty miles away; but it is a known fact that the periods of rain at the two places are co-existent, whilst the river watersheds are similarly situated with our South Heads, as regards coast-line, and are at much higher elevation, and do practically receive much more rainfall than a *Sydney* register shews to be quite sufficient for our purposes.

The gauge tables show that a fall of 1 inch of rain in seven days (also 1 inch in ten days) produced scarcely any effect upon the supply of water, which must arise either from an inch of fall being required to saturate the ground of the watershed, or that the small fall was due to local causes (thunder-storms, &c.) nearer Sydney. I have in the succeeding tables omitted *all* rain-fall below $1\frac{1}{2}$ inch, however rapidly it may have fallen. I have also omitted *all* supply below 10,000,000 gallons per day; thus sacrificing 1,472,000 gallons on the very driest day of the five months, and an average of 5,000,000 gallons for 300 days every year, calculating indeed only flood water. This is very desirable, if not essential, as we thus avoid all interference with the *ordinary* supply of water in the Nepean, Sydney being supplied *entirely* from what would have been in the ocean or flooding the country in twenty-four hours.

The gaugings from the 1st to the 27th of November are for the Cataract only—those of the Nepean not beginning until the 27th; but for the $4\frac{1}{2}$ months succeeding, the volume of water discharged by the Nepean is always, at the least, three times that from the Cataract—generally more; and these comparative quantities fluctuate remarkably little. I have therefore calculated upon that proportion for November. I have, for convenience of calculation, put together the quantity discharged whilst in excess of 10 million gallons, taking, of course, on high floods, only 75 millions per day, and reduced it into days; thus, approximately, there were in November, 1868, 27 days of over 10 million gallons, together giving 750 million gallons, equal full conduit for 10 days. In February, from the 10th to the 22nd, 12 days *full*, and to the 27th, the remainder, making 14 days in *all*.

In March, there were no less than 12 days over 5 but under 10 million gallons delivery, and doubtless, in many months in every year, as many. These are all omitted, being unnecessary, as the reservoir never shows any alarming symptoms of exhaustion without them, and I think the question of sufficiency of supply may be considered satisfactorily settled—absolutely and satisfactorily, notwithstanding any weak points to be found in this argument.

Note.—When there is a deficiency of supply for one or even two months, but a full reservoir to draw from, *refilled* by a sufficient rainfall immediately afterwards, I have generally recorded a full reservoir in these tables, as the question is in no way affected by the withdrawal and replacing of six or seven hundred millions from six or seven thousand millions.

For convenience, I have considered that 360 millions are withdrawn per month from the reservoir, and that it takes *five* days' full conduit to give a month's supply— $75 \times 5 = 375$ —a little too much.

1868.....	January to				
1869.....	May				full.

The very large margin, tending to a still more favourable result, is easily seen. For instance, in the year 1847 a period of six months occurs in my tables without adding one drop of water to the reservoir—yet 7·15 inches of rain fell during that time in sixty-one days. Now we know that 2·41 inches gave a full conduit for 10 days; by deduction, the 7·15 inches would have given a *full conduit for the thirty days*; yet we add *nothing*; are not the chances greatly in favour of having received several—many—days' full supply? Again, during the prolonged drought of 1849 and 50 I allow nothing for a fall of 1·8 inch in eleven days in June, but a fall of 2 inches for eight days gives by the gauging a full conduit for that time; then, in August and September of the same year we have 3 inches (2·99) in 26 days, and allow nothing for it, yet 3 inches give a full conduit for *twelve* days. Should we have none of it? Again, 1½ inch in December, 1850, in six days—nothing allowed for it, yet 2 inches fills the conduit for *eight* days. In January, 1·74 inches in eight days—nothing allowed, and so on.

However, the reservoir reduced to its lowest at the end of 1849 still contains about 5,000,000,000 gallons.

SUMMARY.

In 28 years.....13 years full.
 „ 2 years.....Under 6,000,000,000 gallons.
 „ 2 months.....Under 5,000,000,000 gallons.
 „ 13 years.....Over 6,000,000,000 and under 7,000,000,000 gallons, or practically full.
 26 years practically full.

FRANCIS H. GRUNDY.

6th May, 1869.

Paper read by Mr. Woore at a meeting of the Sydney Water Commission, held on 27 November, 1867.

STATEMENT of the advantages to be derived from obtaining a supply of water from the Warragamba River, by means of an aqueduct, as proposed by Mr. Woore, of Pomeroy.

THE greatest collecting area of ground that exists within reach of Sydney would be tapped at its lowest point, but at an elevation sufficiently high to cause the water to run into Sydney by its gravitating force; consequently, the largest supply of water that can be obtained from one source would there be secured, and by means of an aqueduct would be conveyed into the metropolis at the least annual cost.

The country intervening between that river and Sydney being admirably adapted to form an aqueduct on, such a work may be constructed at a very moderate outlay.

The direction in which it is proposed to construct this work, and the elevation of the ground, is shewn on the accompanying map. The aqueduct would mostly pass along the top of a ridge; therefore, water may be distributed nearly throughout its whole course by its gravitating power alone.

Where the aqueduct would cross the Nepean River, the locality affords every facility to supplement that supply by pumping that stream into it, by a direct lift, to which the machinery now used at Botany may be applied when required. This river could not be dammed to the required height at that point, as it would inundate large portions of valuable land. The water in both is of the purest character, and the quantity that may be obtained from either (more particularly the Warragamba) far exceeds that of any other source. By diverting the Warragamba alone, or such portion of it as may be required, a liberal supply of water for present purposes, or for a greatly increased population, may be thrown into Sydney, Parramatta, and indeed Windsor, besides irrigating a large portion of the northern part of Cumberland. And when it is necessary to supplement that quantity, these rivers with their tributaries, the Cox, Nattai, and Bargo, are capable of being made to store an almost unlimited supply, by further damming towards their sources, sufficient for the requirements of ages to come.

Therefore, this work may be considered so substantial and permanent that, when formed, an ample supply of that necessary fluid will be established for ever.

To carry out this scheme, I propose to form a dam across the Warragamba, about a quarter of a mile above its junction with the Nepean, to such a height as will raise its waters rather above the level of the high ridge that crosses the valley of Mulgoa, from whence there is a gradual descent into Sydney.

An effective dam may there be formed that would resist the force of the heaviest flood that ever came down that river, at a comparatively moderate cost. The principles on which I would construct it are explained in the annexed drawing. The banks are almost perpendicular, composed of compact sandstone, lying in thick horizontal layers, well suited for the construction of such a work. All the heavy materials necessary are on the spot, and there is the facility of water conveyance for any other that may be required. Such a dam would convert from twelve to fifteen miles of the river into an immense reservoir, extending nearly into Burragorang.

This reservoir may be also used as a highway on which the traffic of that fertile district, which is at present blocked up by high mountains, could be worked with facility.

When the Warragamba is in ordinary flood, the surplus water would be allowed to run through an adjoining natural gully, as the supply required for use would be drawn off by a side cutting, furnished with a lock gate. The volume of water in excessive flood thus diminished, spread in a thin sheet over the top of the dam, and approaching it in an almost quiescent state, from having lost its momentum by passing over the extensive level surface of the reservoir, would then retain but little of its destructive power; and the diversion of so large a quantity of water from the parent stream as would be drawn off by such an aqueduct, would greatly reduce the evil of the inundations that take place on the fertile flats of the Hawkesbury River, relieving Windsor of the dreaded apprehension of being some day submerged.

In this light alone such a work would be highly beneficial, and would greatly increase in utility; as, the larger the quantity of water that would be drawn off to augment and fertilize one part of the county, the greater would be the benefit other parts would derive by lessening the evil effect of inundations.

It

It is proposed to convey the water from Mulgoa to Sydney in an open cut, sufficiently large to allow a considerable volume to pass, the sides of which, reduced to a proper inclination, should be grassed and securely fenced from molestation. Where the duct would cross minor valleys, small reservoirs may be conveniently formed for irrigating purposes.

Between the Warragamba and the ridge alluded to in Mulgoa lies the Nepean River, and a narrow spur that extends from the high land of Fairlight, both of which it is necessary the duct should cross. The formation there is all solid sandstone. To cross the Nepean I propose to sink two shafts—one on each bank, opposite to the other, and to connect them by a tunnel worked in the rock underneath the bed of the river. The whole would form a large inverted syphon. As the top of these shafts would be on the level of the water in the Warragamba reservoir, and connected with it by an open cut in the sandstone, the water in the shaft on the right bank (or that on the Mulgoa side of the river) would by the natural law of all fluids, stand at the level of that in the reservoir. From that shaft the fluid would be drawn off and conveyed through the mountain spur to the ridge in Mulgoa by open cut and a short tunnel, and from thence into the open aqueduct that has been described, to a great reservoir to be formed at the head of Ironstone Creek, near to the Newtown Railway Station, from which place the different municipalities would be supplied separately.

It will be seen that these works may be constructed by ordinary labour, few skilled artificers being required; and, as there would be no importation of material, the cost would be comparatively small, if judiciously carried out. The money would be spent entirely within the Colony.

Such a large expenditure, therefore, could not fail to give immediate life and energy to every trade within it. The country would not be drained of its capital. On the contrary, the money borrowed for the construction would be retained for future enterprise; while we were adding to the wealth of the Colony a highly remunerative work, the enormous advantages of which, in producing health, wealth, and comfort to its inhabitants, is beyond the human mind to grasp, and which any attempt to trace here would be out of place.

Until a more detailed survey than that I have made is effected, a correct estimate of the cost cannot be arrived at; therefore, it is desirable that should be immediately proceeded with.

THOMAS WOORE.

Sydney, 14 March, 1868.

Dear Dr. Smith,

I enclose the copy of a proposition I have to make to the Water Commission at our next meeting, that you may have time to consider the matter.

I am induced to offer this suggestion, from the very decided adverse opinions that were expressed at our last meeting, relative to my Warragamba scheme for bringing water into Sydney. These, coupled with certain prejudice I have observed to exist, from the commencement of our proceedings, are likely to lead to more unpleasant differences.

I need scarcely say that, both on public grounds, and as it affects the credit of the Commission, it is very desirable we should be friendly in our consultations, and unanimous in our results, and I see but little chance of that, unless I take the responsibility I offer, so as to remove the conducting of the details of that scheme from further discussion; for it is evident, very different views are entertained by the members of the Commission in the matter. But little confidence is placed on me, and I am not disposed to give way when I know that I am right.

I have the whole scheme of the Warragamba in detail before my mind, and only wait for the necessary sections to be made, to enable me to reduce it to figures. Not a doubt exists with me as to its practicability, great utility, and low cost of construction. I could convince any unbiassed reasoning mind of this in half an hour; but I object to making my thoughts gratuitously public, more particularly when they may be turned to my disadvantage. However, should such an arrangement as I propose be entered into, all objection to explaining my views to the Commission would then be removed.

Besides the desire of avoiding irritable discussion, I have another motive in making this offer, which is—to place myself in a true position before the public. I pledged myself to prove the practicability of this scheme, and to show it to be the best in the Colony, long before this Commission was thought of. The Government (as far as was in their power) have given me the opportunity, and I will do so if allowed by the Commission if not, all responsibility of failure will now rest with my opponents, if such exist. I contend that such a survey as I propose is *absolutely necessary*; that no one that understands the subject would object to it; that it is impossible to make an estimate that any dependence can be placed in without it; and for the Commission to put forth any other but what confidence can be placed in, would be highly discreditable; also, that in no other manner could that survey be so cheaply effected.

I remain, &c.,

THOMAS WOORE.

Memorandum

Memorandum of a proposition made by Mr. Woore to the Water Commission, in reference to a Supply of Water being drawn from the Warragamba River.—Read, 17th March, 1868.

If the Commission will remunerate me for that part of the trial section for a proposed line of aqueduct from the Warragamba River to Sydney that I have laid before it, *i.e.*, from Sydney to Rope's Creek (22 miles) at the rate it has cost to have the other part (14 miles), surveyed by Mr. Wyndham's party and myself, and will provide a similar party to complete that survey by making another section (an amended one), so as to enable an estimate being framed, I will engage to produce not only a practical scheme from the Warragamba to Sydney, but one that, from its ample supply of water, great utility, and small cost in construction, cannot be surpassed in this Colony. It would be accompanied by an estimate fit to lay before Parliament, and be a work that would, in every respect, be a credit to the Colony.

The aqueduct would be an *open cut*; the water supplied by *gravitation* in any quantity that is required, at a height that would command *all Sydney*.

During the time I am engaged in this survey and estimate, I would expect to be paid at the rate the Government have at present established, *i.e.*, three guineas per day with travelling expenses found.

Such an arrangement would not interfere with the Commission prosecuting their inquiries, and, should any other scheme be propounded, it may be treated in a similar manner. Under any circumstances, it is desirable the survey of one line should be advanced towards completion ready to be brought up with our report.

THOMAS WOORE.

Sydney, 17th March, 1868.

Paper read by Mr. Woore, at a meeting of the Sydney Water Commission held on 31st March, 1868.

A STATEMENT in reference to supplying Sydney with Water from the Warragamba River, made by Thomas Woore to the Royal Water Commission.

ACCORDING to the resolution passed by the Water Commission on the 25th instant, requiring that any proposal for supplying Sydney with water should be exhibited in detail, I have to explain my Warragamba scheme, and now do so, as far as practicable; but as the trial survey that has been made does not afford sufficient information even to lay the work out, much less any defined data to compute from, it is impossible to go into minutiae with any degree of accuracy. I can at present only state the principles on which I propose this great work should be constructed, and the mode of operation in effecting it. Before anything definite can be produced, an amended section must be made.

Having described the general character of the scheme in the paper read to the Commission on the 27th November, 1867, and plan then exhibited, I will now explain its principal features, and shew that it is practicable to convey the fluid into Sydney by the force of gravitation alone.

The main work required would be, a great dam to be built across the Warragamba River, to intercept the water there and raise it to the level of the ridge that traverses the Mulgoa Valley. This structure would of necessity be about 600 feet long (on the top), and about 170 feet high, filling up the contour of the gorge. In effecting it, there are three great difficulties to contend with:—

1. The enormous pressure of the fluid at that depth, which amounts to 78 lbs. on the square inch.
2. The great force of the flood currents.
3. The inconvenience attending a constant stream of water running over the work during its construction (as the river cannot be diverted until the dam is complete), and its being subject to violent and sudden inundations by floods.

No masonry wall, no matter how strongly constructed, would resist such a pressure, nor could the ordinary method of forming earthen structures be carried out there, for obvious reasons. Some new plan must be adopted, and I propose the following:—

That the form of the dam should be similar to that represented in the accompanying drawing. The inner slope, or that on which the river current would act, to have an inclination of at least one in ten. The outer, starting from the top of the dam at an angle of 45°, would terminate at the base at about 80° from the perpendicular, thus forming a curved face, so that any water running over the top of the dam would, before having descended to the bottom (or to the bed of the river), have obtained a horizontal motion in the direction of the stream in order to prevent injury being done to the foundation by continued friction, the effect of a perpendicular fall.

The

The advantages that would attend such an inclined face on the inner side of the dam are these:—

That it would remove the principal weight of the fluid from the immediate vicinity of the weakest part of the structure (which is the highest part) to a distance from it, where it would be more easily contended against; and, from the slight inclination it bears to the course of the current, that form would offer the most effectual resistance to the descending water, floating trees, and other debris brought with it.

There would be three forces acting on that incline—the effect of gravity, liquidity, and lateral motion of the current fluid. Their combined direction would depend on varying circumstances, principally on the different velocities at which the water would impinge upon it as the river current varied, but it would always fall within certain limits of which 32° from the perpendicular may be taken as the mean; if so, the force *to be resisted* would be downwards at an angle of 52° from the perpendicular in the direction of the stream, where it would be met by the solid rocky bottom of the river—a sure foundation.

Longitudinal Section.

The angular lines shew the proper direction a resisting force should be applied, to resist the river current and sustain the water in the reservoir.

This is a simple problem in statics capable of being clearly demonstrated; but an illustration may be taken from an extreme case, more easily understood—a dam with a perpendicular inner surface. In that case, the fluid impinging on the inner face at right angles to the surface, would strike the dam with its greatest force on the weakest point, where resistance is least attainable, and the whole weight of the fluid would operate with irresistible force on the broadside of the structure.

Mr. J. P. Nichol, LL.D., in his "Cyclopædia of Physical Sciences" under the head of "Hydrostatics," clearly explains the effect that would be produced on the surface of a basin such as would be necessary to retain the body of water we require. Considering the reservoir as a vase (by which name he designates all vessels containing perfect fluids such as water), he states that "all pressure, being alike *perpendicular to the sides*, are in a parallel direction. Their united action, therefore, is equal to the weight of the mass of fluid, of bulk equal to the column of water." In exemplifying which, he instances "a hole made in the side of a vessel through which the water gushes. To oppose this, if a board is placed over the hole, and a stick or bar of iron be held against that board to prevent the egress of the water, it will be necessary to hold that stick or bar *at right angles to the side of the vessel* to obtain the greatest power of resistance." Shewing that the water in the reservoir, when in a quiescent state, would press on the inclined bottom of the dam *at right angles to its surface*, and must be opposed by a force *directly opposite*, to obtain stability. That resisting force would be secured by the solid structure of the dam having its base resting on the bed of the river, and would suit itself to the different velocities of the current.

I desire to be particular in explaining these principles, as it is considered to be impracticable to construct an efficient dam, of the required height, in such a position; and I do so in plain language, to encourage the investigation of every mechanic, believing that the subject of damming up water for the purposes of irrigation is one of the greatest consequence in this dry and variable climate.

With reference to the composition of this work, I propose that the dam should consist of a masonry wall built across the river; on the upper side of which the river bed would be filled to the required slope by a mixture of puddling stones and clay, to vary in their proportions according to the situation in which it is deposited; the most compact mixture being next to the wall, that at a distance from it being composed of stones filled up with the surface soil or sand. The lower side adjoining the wall would be built up of well-packed rubble stones to the required curve, facing this curved apron with ashlar or timber, as may be found most expedient, so as to form a smooth surface for the water to pass over in excessive floods, if necessary.

It is not supposed that this wall will offer any great resistance to the pressure of the water. The objects in placing it there are, to form a retaining back to the puddling mixture, to facilitate the construction of the work by affording means for applying sluice gates, and to prevent the escape of water in the first instance, that is, before the work becomes consolidated. Therefore, it is intended to lay this stonework carefully in cement, and to carry the extremes of the wall into the solid rock at each bank. The strength of the dam, as has been already stated would be derived from the rocky bottom of the river. Such a structure would be yearly increasing in strength, from the sand and debris brought down by the river being deposited on it.

The mode of constructing so great a work under the inconveniences of a river constantly flowing over it I propose as follows:—That after lowering the water at present standing on the proposed site as much as possible, to put in the foundations by means of the usual cofferdam; and when the work has been brought up to the surface of that water, to continue it by means of shifting sluice-gates fitted on the inner face of the wall. These gates,

gates, of which there would be four or more, placed at intervals along the top of the wall (see the accompanying drawing), to be formed of iron, 8 or 10 feet long by 4 or 5 feet deep. Their number and size would depend on the quantity of water they would be required to discharge. They would be made to slide upwards on vertical iron bars secured to the masonry, and capable of being made watertight round their edges when in position, by caulking. Each gate would be fitted with an apparatus, such as racks and pinions, to raise it when required. They would be worked alternately; that is, in two sets. Those at one end of the wall or side of the river would always be advanced upwards one-half the width of those at the other end or side; so that when in operation, the course of the stream would be continually changed from one side of the river to the other, as the water would always find its way to the lower sluices, and thus leave the opposite side free from interruption to continue the building. The work would thus be gradually raised by alternate shifts.

Cross Section shewing the working of the shifting sluices. The dotted lines AA mark the position of the gates at the next shift; BB, the height the water will attain after that shift has been effected; ○○○ the iron bars on which the gates slide.

It is proposed to carry up the whole embankment simultaneously, say two courses of the masonry of the wall at a time, with a corresponding thickness of the puddling mixture and rubble work. The former would be carefully laid level, well rammed or trodden down by bullocks or horses, and when complete, the water turned on from the other side of the river over which it had been flowing, doing good service by consolidating the last layer of earth and stones. The puddling material and stone work would be delivered on the work wherever required, from tram stages and trucks overhead.

Thus would the work gradually proceed in horizontal layers until complete; and the running water, which at first appeared an insurmountable obstacle, turned to good account in consolidating the whole. And there would be small risk of damage to the structure, were the heaviest flood known to come down during its progress; for every part would attain its full strength as the work rises, the structure would offer but little obstruction to the stream, and as each layer was added, the water would have more room to escape.

It is not intended that the surplus water, after the requisite supply is drawn off for Sydney, &c., should be allowed to run over the dam, except in very extraordinary cases of high flood, and even that can be avoided if necessary. There is a natural watercourse on the left bank of the river, that may be made to draw off all ordinary waste and deliver it into the river again, about two miles below the dam; but as this has never yet been measured in any way, it would be absurd to guess at its details.

The next feature of importance in this scheme is, the conveyance of the water intercepted by the dam into Sydney. A short tunnel would be required through the right bank of the Warragamba into the Nepean gorge, which at this point has the appearance of a formidable obstacle, being from cliff to cliff 466 feet wide and 200 feet deep. But it is not necessary to cross at this elevation; a considerably lower level will do. This it is proposed to effect by an inverted syphon cut through the rock (which is here solid sandstone) under the bed of the river, or by a bridge over the stream, as may be found on consideration to be the most economical. The dam water would find its level through this syphon, then pass along a short open cut and another shorter tunnel all through the sandstone into the open valley of Mulgoa.

To give any detail of these works in the present state of the survey is utterly impracticable, as their dimensions entirely depend on the level on which it is determined to construct the aqueduct, and that cannot be arrived at until an amended section is made and the whole subject carefully considered.

The object in making a trial survey of the proposed route was twofold. In the first place, to ascertain positively whether there was sufficient fall in the ground to conduct the water to Sydney by gravitation. Secondly, to mark a line along the land, the different levels of which would be noted, so that another line might be traced by means of it, at such level as would be required to lay out the proposed work on. These objects have been entirely accomplished. It has been proved, provided the work is correct, that an available fall exists from the Warragamba to Rope's Creek of 84 feet, in a distance of 11 miles; and from thence to the bridge on the Liverpool Road, near Ashfield, of 69 feet, in a distance of 20 miles.

This is sufficient for all purposes required, and it now only remains that the matter should be well considered, and another section laid out on the land, adapted to the most judicious manner of managing the water supply. When this is done, the dimension of the various works would be got at, and an estimate computed from them, the correctness of which would, of course, depend on the degree of minutiae that would be gone into in that survey.

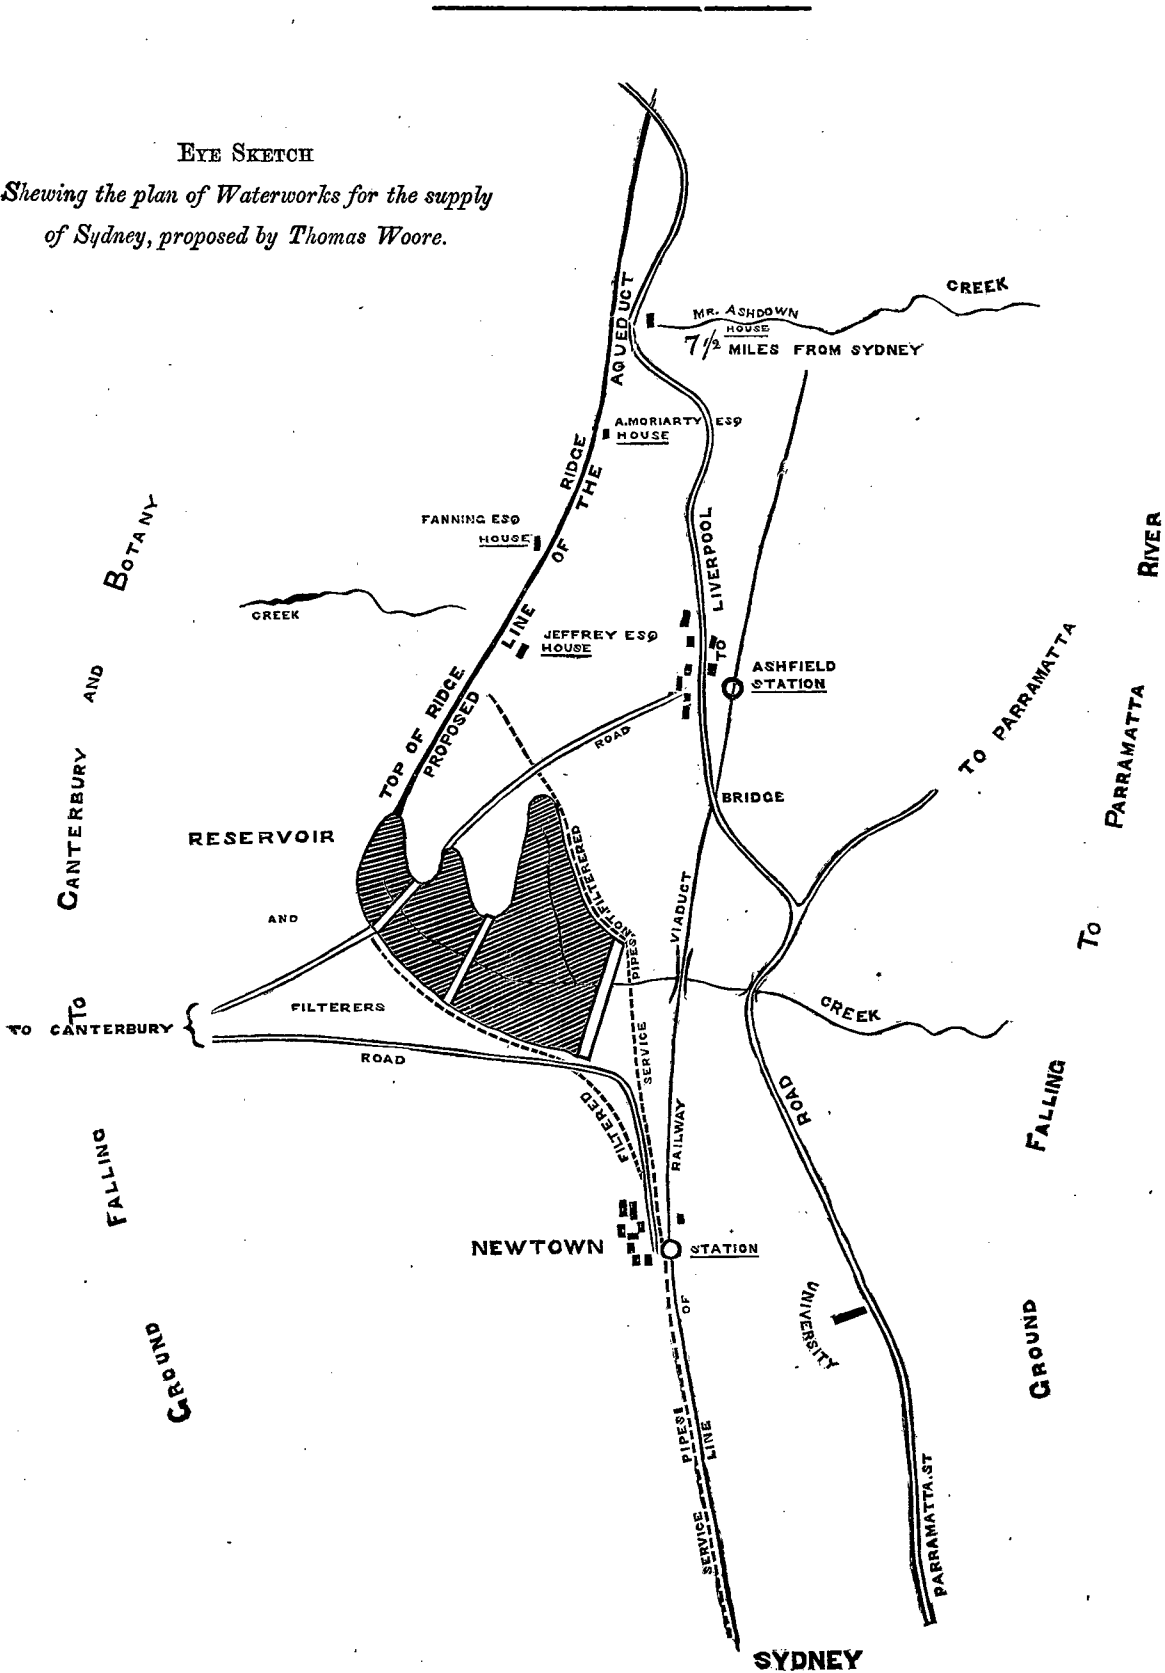

I annex an eye sketch of the works proposed to be constructed in the neighbourhood of Sydney, for the supply of the town and its neighbourhood. It will be seen that it is intended to form large reservoirs capable of storing a considerable supply of water on the ridge at the head of Ironstone Creek, at Petersham. This is the highest land in the vicinity of Sydney, and I think would command every part of it; but here again we wait for a survey to determine the elevation. The city and most of the suburban municipalities would be supplied from these reservoirs by separate pipes.

These are all the details I can at present furnish.

THOMAS WOORE.

31 March, 1868.

EYE SKETCH
 Shewing the plan of Waterworks for the supply
 of Sydney, proposed by Thomas Woore.

(Explanatory Note by the President.)

At the meeting held on April 16th, Mr. Woore submitted the following resolution:—“That, in order to obtain data from which an estimate of the cost of bringing water from the Warragamba River into Sydney may be calculated, an amended section of the line be gone into without delay.” The consideration of this resolution having been deferred till next meeting (April 18th), it was then moved by Mr. Moriarty, and carried—“That before further expense be incurred in regard to Mr. Woore’s scheme, printed copies of the various statements read by him to the Commission be supplied to the Members, with the view of eliciting written opinions thereupon.” At a meeting held on May 29th, Mr. Woore’s resolution of April 16th was put and negatived.

F. H. Grundy, Esq., to The President, Sydney Water Commission.

183, Pitt-street, Sydney,
17 April, 1868.

My dear Sir,

The accompanying document contains my views upon Mr. Woore’s proposal to dam the Warragamba. I have little to say beyond what is already expressed therein. I have thought my best upon the subject, and have decided that I could not conscientiously avoid making this statement.

I shall be purposely absent to-morrow, and desire that my opinion may be considered as finally embodied in my written statement.

Question may be raised as to absolute dimensions given; therefore I wish to state definitely, that possible minor inaccuracies will in no way alter the belief I have expressed
I am, &c.,

FRANCIS H. GRUNDY.

MR. WOORE’S SCHEME FOR DAMMING THE WARRAGAMBA.

F. H. Grundy Esq., to The President, Sydney Water Commission.

Sydney Water Commission,
17 April, 1868.

Dear Sir,

My opinion of the extreme importance of arriving at a correct conclusion as to the practicability of Mr. Woore’s great scheme, and the propriety of adopting it, if practicable, has led me to give it my most earnest consideration. Nothing but the magnitude of the error which, I believe, we should commit, in permitting Mr. Woore’s scheme to go forth to the public with the silent consent of this Commission, would have induced me to advance an opinion so completely opposed to the views of that gentleman. Even as it is, I adopt this course with regret, having high respect and esteem for Mr. Woore. However, I can only trust that he will believe me to be actuated by a desire to solve satisfactorily the vexed question which has been entrusted to this Commission for solution. I much regret that Mr. Woore has decided not to meet the Commission for the purpose of discussion upon this subject. Such protest against his scheme as any of the Commissioners might have thought it his duty to make, might well have been expressed during the conversation which would have arisen. It is also, I think, much to be regretted, that Mr. Woore declines to prepare any approximate estimate of his works. Now, an approximate estimate is *essential*; for, granting the practicability of all he proposes to do, the entire question hinges upon the *cost*. The *cost* will settle whether it is *worth* doing,—whether a similar result cannot be arrived at with less expense elsewhere,—and therefore, in considering the whole subject, I have found it necessary to make an approximate estimate for myself; and in doing this, I have made a closer investigation of the whole subject. “Facts upon figures” are the foundation of every engineering work, and Mr. Woore’s noble superstructure is, I fear, but a “baseless fabric” without them.

Of course I labour under much disadvantage in advancing an estimate of another man’s scheme, as it is quite competent for him to question every detail; and having given no absolute statistics himself, he cannot easily be disproved.

However, we have, I am confident, ample data for an approximate estimate. I desire it to be distinctly borne in mind that this calculation is merely an attempt to arrive at something like *the cost of constructing Mr. Woore’s works in his own way*, as described to us by himself.

The object of this work being to keep back the waters of the River Warragamba, until they are raised to such a height above the bed of the river, that they will not only flow down into Sydney, but when there, still maintain sufficient height to supply the city by gravitation,—

We have to consider—

1. The height of distributing reservoir in Sydney;
2. The gradient necessary for the descent of the water;
3. The height at which the water in the dam must stand above the outlet whence it commences its descent;
4. The additional height required to oppose the sudden rush of floods.

One only point, indeed, can be questioned, and that one is, the gradient necessary to carry the water into Sydney by gravitation in an open cutting.

But even on this point we have reliable information. We have the scientific result of analytical examination, from renowned English chemists, which declares that to keep such an aqueduct as is proposed free from the growth of vegetable matter, and also of animalculæ, a gradient of no less than three feet per mile is desirable. Considering, however, the nature of the country to be crossed, the difficulty of obtaining the necessary height, and the other circumstances involved, I believe I am right in saying that two feet per mile has been fixed by all the members of the Commission (with the exception of Mr. Woore, whose opinion I do not remember to have heard), as the minimum gradient upon which our calculations should be based. At any rate, it is *my* opinion that we *must not* have *less* fall, and *should* have *more* if possible.

Our facts then are :—

1. Height of distributing reservoir, near Sydney, above high water—136 feet. This is the height of the present reservoir in Campbell-street, which is nearly the same as the high land above Newtown. It is not high enough, by some 60 feet or more, to fulfil Mr. Woore's conditions, namely, to provide a plentiful supply to *all Sydney* by gravitation; but let that pass.
2. Loss of level by gradient:—Distance of proposed dam from Sydney in a straight line, thirty-three miles, to which must be added at least one-third for irregularities of contour; for it must not be forgotten that for a canal a regular gradient must be found, accommodating itself wherever practicable to the natural surface of the ground, so that numerous windings of large extent are unavoidable. This would give forty-four miles, but I have adopted forty miles, because that distance certainly will not exaggerate Mr. Woore's estimate, and gives us the convenient number of 80 feet due to gradient.
3. Height of ordinary surface water of dam must be 20 feet at least above supply outlet. Not only is this necessary in order to avoid the collection in the aqueduct of floating impurities, and the obstruction of the orifice by foreign bodies, trees, &c., but in times of drought, a head of 20 feet is a very small depth from whence to draw an enormous supply for Sydney, and a plentiful quantity for irrigation.
4. An additional height of 40 feet to allow for the rise in the river at times of floods. The rise of the floods from the present ordinary level is from 70 to 80 feet, but the permanently raised level, due to the dam, would widen the sides of the gorge, and reduce it to about 40. I add this 40 feet to the height, although Mr. Woore has not done so, because I am confident that it cannot be that gentleman's intention to pour a Niagara over the dam, 600 feet broad, 40 feet high, with a fall of 200 feet, and a weir would (though perhaps essential) be much more expensive than this.
5. Height of bed of river, where the proposed dam is to be, above high water mark—41 feet.

The height of dam, then, must be as follows :—

1. Height of distributing reservoir	136 feet
2. Loss of level by gradient	80
3. Outlet below surface	20
4. Increase for floods	40
			276 feet
5. <i>Less</i> the height of the bed of the river above high water level	41
			235 feet
Total height of dam			235 feet

Mr. Woore informs us that the width of the gorge at the high level is 600 feet, at the bed about 130 feet; the *mean* width is consequently 365 feet.

Given for breadth of front embankment of dam at top the very small width of 30 feet, the height of 235 feet, the face slope of 10 to 1, and the back perpendicular (as resting against the wall), the width at the bottom would be 2,380 feet, and the mean width 1,205 feet. The cubic content of this mass of material would be 3,840,000 cubic yards. By a similar calculation, which need not be repeated here, the embankment at the back of the wall which has to sustain the falling water would represent about 600,000 cubic yards. I confess that I am at a loss to estimate the cost of the wall in the middle of this mountain of earthwork. It seems to me to be *unnatural* that it should be there at all, interfering with the united solidity of the mass it so mischievously subdivides, unless, indeed, it be of the proper proportions for a retaining wall, or in other words, a masonry dam. However, as it is 235 feet high, I suppose it cannot be less than 10 feet thick at the top, with a batter of 2 inches to the foot on either side. By a calculation equally simple with the foregoing, it will be found to contain more than 100,000 cubic yards of very superior masonry. It is to be perforated and fitted with iron sluices, which would of course add to the cost.

There would next be required some 40,000 square yards of pitching, the stones used being of extraordinary size and weight.

Estimate.

Earthwork :—

For this work the material and attention to construction varies, but a large proportion is to have great attention, to be very closely rammed, puddled, &c., and it is all to be puddled more or less; most of it would practically be done under water! and I have estimated it at 5s. per cubic yard :—

4,444,000 cubic yards, at 5s	£1,111,000	0	0
Masonry, 100,000 cubic yards, at 30s.	150,000	0	0
Pitching, 40,000 square yards, at 20s.....	40,000	0	0
	£3,101,000	0	0

Contingencies :—

A work of this magnitude would certainly take three years to complete—three years during which time there must never be a flood. Here I must express my opinion that no contractor would ever undertake it. If he did, he would most certainly add 50 per cent. for contingencies. This would raise the estimate to £1,950,000. Upon paper, then, we have the dam constructed for the sum of *Two Millions* of money.

But it is my conviction that this dam *would never be built at all*. Every flood which came down during its construction would annihilate it—not a vestige would remain; and it is terrible to contemplate the disaster which would follow. Suppose the dam progressing, and up 100 feet, then comes a flood—the water has been rising with the construction, and immediately begins to sweep over the unfinished works. It is not within the bounds of reason to suppose that in such a condition there is no weak spot anywhere; the water finds it, and away goes the whole structure. What follows? A wall of water dammed back for *very many miles* bursts suddenly down the valley of the Hawkesbury 100 feet high. Irrigation there would be, indeed! Death, destruction, desolation, incalculable! and I believe that this would really happen. At all events, I can scarcely conceive that any one could be found to accept the responsibility of such a contingency.

Having endeavoured to arrive at some conclusion as to the proposed dam, I may, perhaps, be permitted to add some of my own opinions thereupon. And first, I do not think that this dam would hold water. There would be an enormous pressure on each of the sandstone sides, seamed with fissures and broken passages. I believe the water would force numerous outlets for itself in all parts, and that instead of a head of 20 feet we should not have any. Nor do I think that, even if completed, this dam would withstand the passing over it of one single flood. I believe such a disposal of the flood-water is *impracticable*, and that a weir is essential. To construct a weir means to cut through the solid rock 100 feet down, by a width of more than the river channel, but say 600 feet, and by a length beginning in front of the works, and re-entering behind them, or considerably more than half a mile, necessitating more than 6,000,000 yards of *rock-cutting*, which at 5s. only would represent £1,500,000. My estimate for Mr. Woore's proposed dam, *if I had to construct it, and dared to make the attempt*, would be at the least £3,500,000.

I feel compelled, therefore, to state my belief that, however the future supply of water for the city is obtained, it will *not* be by damming the Warragamba to the height necessary to supply Sydney by gravitation.

I regret the great length of this communication, but cannot see how my opinions could have been clearly explained in a shorter one.

I remain, &c.,

FRANCIS H. GRUNDY.

(Memorandum by Mr. Adams on Mr. Woore's scheme of damming the Warragamba.)

I HAVE carefully considered Mr. Woore's scheme for supplying Sydney with water, and believe that the erection of a dam on the plan proposed would be impossible—the force of a flood sweeping over the works while in progress of erection would carry away the puddling, the wall would not be strong enough to check the torrent, and the whole would be swept away.

I have not attempted an estimate of the cost; in fact, I do not know where a sufficient supply of puddling material could be obtained. Even at Mulgoa, clay suitable for the purpose is only found in thin strata derived from the shale formation.

P. F. ADAMS.

Surveyor General's Office,
30 April, 1868.

(Memorandum on Mr. Woore's project for obtaining a supply of water from the Warragamba.)

HAVING proposed the resolution to the effect that, before incurring any further expense for surveys in respect to Mr. Woore's scheme for obtaining a supply of water for Sydney from the Warragamba, it would be advisable to obtain the views of each member of the Commission thereon, I now beg to state, as briefly as the subject will allow, the objections which seem to me to stand in the way of its successful accomplishment. In doing so, it will be necessary to refer to the letters and memoranda laid by Mr. Woore

Woore before the Commission; and I would take this opportunity of expressing the hope that, if I have had the misfortune to differ from Mr. Woore as to the practicability of his great project, as he terms it, he will not attribute it to prejudice on my part, but to an anxious desire to endeavour to arrive at facts—at a true solution of the question proposed for our inquiry. The subject is too important a one to permit prejudice on the one hand, or a too great complacency on the other, to interfere with the candid and honest expression of one's opinion. I am drawn into these observations by an expression which occurs in Mr. Woore's letter of the 14th March, where he refers to the very decided adverse opinions which were expressed at a meeting relative to his Warragamba scheme, and which he states were coupled with certain prejudices which he had observed to exist from the commencement of the proceedings. As regards myself, I am free to confess that, after having visited the Warragamba, carefully examined the site pointed out by Mr. Woore for his dam, and attentively considered all he had to say in support of the project, I arrived at the opinion of its utter impracticability—an opinion which has only been confirmed by everything which its designer has since said and written in support of it. I have not hesitated, when necessary, to express this opinion at the Commission, because I believed it to be my duty to do so—the subject, as I have said, being too large to permit of minor considerations interfering with the candid and full expression of each member's opinion.

Referring to Mr. Woore's paper read to the Commission on the 27th November, and which was accompanied by a plan and section of the line of aqueduct by which it was proposed to bring the water from the Warragamba to Sydney,—we find it stated, in the opening paragraph, that “the greatest collecting area of ground within reach of Sydney would be tapped at an elevation sufficiently high to cause the water to run into Sydney by its gravitating force.” This assertion was made at a time when, according to Mr. Woore's own admission, he had no knowledge (although he produced a section, which, however, he afterwards admitted was altogether valueless) of the difference of level between the Warragamba and Sydney; he did not know the height of the former, or of either the high or low service reservoirs, or of any part of the city which he proposed thus to supply by gravitation. At the time, I felt, and perhaps expressed my surprise at so crude a project being announced in such positive terms; and the more so, as a simple inquiry at the City Engineer's Office would have elicited for Mr. Woore the fullest information as to the levels of the city, as it had done for the other members of the Commission; and an application to the Railway Office would have settled the question of the height of the water at the Warragamba; but neither had been done, and the project came before us, announced, no doubt, with sufficient confidence, but unaccompanied by a single proved fact which could enable it to pass the critical examination to which it should have been foreseen it would be subjected.

Referring again to the paper of 27 November, we find it stated, in the third paragraph, “The country intervening between that river and Sydney being admirably adapted to form an aqueduct on, such a work may be constructed at a very moderate outlay.” This would appear to be a sufficiently positive assertion to warrant the inference that it was based on some specific knowledge, particularly when accompanied and illustrated by a plan and section; but subsequently, the Commission were told (after having been asked to guarantee a payment for this very survey) that it would be necessary to employ another surveyor, to make a survey and take the levels of a portion of this same line—namely, from South Creek to Warragamba, which was done at considerable expense, under Mr. Woore's own supervision, and which demonstrated that, so far from the country being admirably adapted to form an aqueduct on, it would involve the construction of an embankment or bridge of some 18 miles in length, and, on an average, about 100 feet in height. We were then told that Mr. Woore's own first section was valueless, as was also that made by Mr. Wyndham under Mr. Woore's direction, and were asked (see memorandum of 17 March) not only to remunerate Mr. Woore for this very section which he admits to have been thoroughly worthless, at the same rate as the other had cost, but also to provide a similar party to complete that survey by making another section—“an amended one—so as to enable an estimate being framed.” He would “then engage to produce not only a practical scheme from the Warragamba to Sydney, but one that, from its ample supply of water, great utility and small cost of construction, cannot be surpassed in the Colony.” The aqueduct would be “*an open cut*”; the water would be supplied by *gravitation* in any quantity that could be required, at a height that would command *all Sydney*. This would seem to be very like what is called putting the cart before the horse. Mr. Woore will guarantee all these things, if he be allowed to make a survey to ascertain positively whether there be sufficient fall in the ground to conduct the water into Sydney by gravitation—the very result of which survey might be (as it has turned out it would be) to show the utter impossibility of doing so. That the guarantee must have failed was subsequently rendered sufficiently patent by Mr. Woore himself. He will guarantee to supply *all Sydney* with water by *gravitation* from the Warragamba, by constructing a dam at the latter of 170 feet in height; the level of the water at the Warragamba being 56 feet above sea level. Supposing it possible, for the sake of argument, to construct this dam, we shall then have, bed of channel at Warragamba, 41 feet above sea level, to which if we add height of dam, 170 feet, we get 211 for the top of the dam above sea level; but the high service reservoir at Paddington is 224 feet above sea level, or 13 feet higher than the proposed reservoir; therefore, unless the water of the Warragamba runs up hill, it cannot supply that part of Sydney at present drawing its supply from the Paddington reservoir; and, as many parts of Waverley are still higher, it is evident that Mr. Woore's guarantee to supply “all Sydney by gravitation” could not have been sustained. Having been told, on the 27th November, that “such works could be constructed at a very moderate outlay”—

outlay"—"that they could be constructed by ordinary labour—few skilled artificers being required—and as there would be no importation of material, the cost would be comparatively small,"—and on the 14th March, being further told that Mr. Woore has "the whole scheme in detail before his mind, and only waits for the necessary sections to reduce it to figures,—not a doubt exists as to its practicability, great utility, and small cost, but that he objects to making his thoughts gratuitously public, the more particularly when they may be turned to his disadvantage." On the 31st March, we hear that he can at present only state the *general principles* on which he proposes his great work should be constructed, and that, before anything definite can be produced, an amended section must be made. The whole scheme existed in detail, we are told in Mr. Woore's memo., on the 14th March; but on the 31st, we are told he can only state the principles on which this great work should be constructed—details having in the interval expanded into principles—contrary to the usual mode of induction.

Mr. Woore's project must be divided into two parts. The first would be the dam and works necessary for the storage of the water; the second, those required for its conveyance into Sydney. As to the dam of course no engineer would ever venture to construct it on the principles laid down by Mr. Woore. It consists of five classes of work,—"loose puddling, middling puddling, compact puddling, a masonry wall" and rubble stone backing. The effect of a flood on the three degrees of puddling would be, to wash out all the clay composing it, leaving a disjointed mass of rubble, having no cohesion, and permeated throughout by the water. This would bring the whole statical pressure of the water on the masonry wall which forms the core of the dam; and, accepting Mr. Woore's dictum that "no masonry wall, no matter how strongly constructed, could resist such a pressure," the result must be, that the wall would give way, and the whole mass be swept down the valley. It is easy to imagine what the consequences would be. But supposing, for the sake of argument, that this dam could be made to stand, and as Mr. Woore says that it is not intended that the water should overtop the dam, then we have the following condition of things:—The top of the dam, which is 170 feet in height altogether, must be about 70 feet above the ordinary level of the water in the reservoir. As the floods would rise about that height in the gorge, this would leave 100 feet of head; from which subtract (say) 20 feet for level of outlet sluice below permanent level, and subtracting from the remainder 80 feet, which would allow about 2 feet per mile in the conduit, this would deliver the water in Sydney at about 41 feet above sea level. It is obvious, then, that a dam of 170 feet would not be sufficient to fulfil Mr. Woore's own condition of supplying all Sydney by gravitation.

Let us next consider what height would be sufficient; and, in doing so, let us take the expression "all Sydney" to mean only such portion of it as is supplied from the low service reservoir in Crown-street, which is 136 feet above sea level. Starting from this point, and allowing, as before, say 2 feet per mile for 40 miles, we have 216 feet as the level of water at the outlet sluices. Allow 20 feet for permanent head of water in the reservoir, and 70 feet above that for top of dam, if it is to be high enough to prevent floods passing over, this gives 306 feet for top of dam above sea level. Deduct 56, present level of water, and allow 15 feet for foundation of dam below that level, we get 265 feet for height of dam. This would give a pressure of about 900 tons on every foot run of the dam. No possible arrangement of the materials proposed could prevent this pressure coming on the wall; and no wall, even supposing its dimensions to be properly proportioned, which they are not in Mr. Woore's plan, could be made water-tight under such a pressure. The project, in as far as the dam is concerned, must therefore be regarded as impracticable.

With regard to the second part of the project, namely, the proposed means for bringing the water into Sydney in an open canal, the surveys which have been made show that such a canal must cross the valleys of South Creek, Roper's Creek and Eastern Creek, with their intervening ridges, at right angles, and at about the middle of their course. This would necessitate an aqueduct of over 130 feet in height in many places, for more than 18 miles in length. These considerations show so clearly the utter impracticability of the scheme, that I for one should feel bound to object to any more expense being incurred to demonstrate further an impracticability which is already so patent. It needs no further argument to shew that the level of the Warragamba is too low to allow of the water from it being brought into Sydney by gravitation. To raise it to the required elevation would necessitate the construction of a dam of a height never before attempted. And, were this even practicable, there is little doubt but that the leakage through the seamed and fissured sides of the gorge, under the enormous pressure to which they would be subject, would in dry seasons far exceed the quantity coming down the river; and in times of flood, nothing could resist the furious torrent which passes out of these gorges, as every one will admit who witnessed the last flood in the Nepean. The objections to the second part of the scheme,—that of constructing a canal which would have to cross several systems of waters, at an elevation of about 130 feet above the natural surface of the ground, for over 18 miles,—is perhaps more a financial than an engineering difficulty, and one which it is fortunately unnecessary to encounter; as, by tapping the Nepean and its tributaries at a higher point of their course, and following the natural fall of the country, we shall be able to obtain a gravitation system amply sufficient for our requirements.

E. O. MORIARTY.

28 May, 1868.

(Memorandum

(*Memorandum by Professor Smith, on Mr. Woore's scheme of damming the Warragamba.*)

As it is thought desirable that every member of the Commission should express in writing his opinion of Mr. Woore's Warragamba scheme, I submit the following as indicating briefly the main reason why I feel compelled to join the majority of the Commission in setting this project aside. It is not without reluctance that I have come to this conclusion; for, in several of its features, this scheme commends itself strongly to our acceptance. It is the most abundant source of water that has come under our notice. The running stream would in most seasons be more than sufficient for the growing wants of Sydney, and, as a stand-by in long droughts, the proposed dam would probably contain a supply for three years, if the outlet were only 20 feet below the highest surface of the water. Besides this, the river has done its work and is of no more use after joining the Nepean, so that there could be no claims for compensation if its waters were impounded. With these advantages we should not be warranted in laying Mr. Woore's scheme aside, unless for objections of the most serious character.

Now, without going into any engineering details, which fall more properly within the consideration of the other members, it is sufficient for me to know that a dam at the mouth of the Warragamba, high enough to supply Sydney with water by gravitation, would be higher than any similar work of which I have ever heard, or can find any record, in other countries. We know that dams in England of much less height, constructed, it may be presumed, with the best engineering skill, have given way and spread devastation in their course. The building of the required dam on the Warragamba would undoubtedly be of the nature of an *experiment*—a costly and dangerous experiment—for it would be a new thing in engineering, and success could not possibly be made certain beforehand; for, let it be granted that, working on known principles, the materials might be so arranged as to resist successfully the enormous pressure to which the dam would be subjected, yet it is impossible to predict how the native rock would stand that pressure, and whether, through some weak joint or porous stratum, a leak might not be established that would either empty the dam, or bring about its destruction.

If the experiment is capable of being made a success I believe it can only be so at an enormous outlay; but I admit that, if successful, the results would be magnificent, and the work would be a monument of engineering skill and boldness that could not fail to command a world-wide fame. On the other hand, if unsuccessful, the direct pecuniary loss would be immense; and should the dam be carried away after completion, or when near it, the consequences to life and property might be very lamentable.

J. SMITH.

6 June, 1868.

P.S.—June 20th.—Since writing the above, I have learned that a masonry dam has recently been constructed on the Furens, an affluent of the Upper Loire in France, of a height nearly as great as would be required on the Warragamba. This weakens the force of one of the objections stated above, but does not altogether remove it; for in several important particulars the conditions of the Furens dam were much more favourable than could be obtained at the Warragamba. For example, it was possible there to turn off the water entirely while the building was going on; and the catchment area that drains into the reservoir is under ten square miles, with an average annual rainfall under 40 inches, so that there could be no such terrific floods as would have to be contended against here.

J. SMITH.

(*Resolution moved by Mr. Thomas Woore, at the meeting of the Commission held on May 19th,—put and negatived on May 29th.*)

IN carrying out any scheme for the supply of water to Sydney, it is desirable the forces acting on dams should be thoroughly understood—that the proper form for their construction may be arrived at. It is therefore resolved, as a difference of opinion exists among the members of this Commission, that two or more disinterested gentlemen, familiar with the laws on which hydrostatics are founded, should be respectfully solicited to consider the subject, and separately give their opinions as to the science of the matter, in reply to the accompanying papers, viz. :—

That read by Mr. Woore to the Commission on the 27th November, 1867.

That read on the 30th March, 1868; and the following :—

It is proposed to construct a dam across a river gorge, the sides of which are composed of sandstone inclined about 40 degrees from the perpendicular; the dam to be about 600 feet in length, and 170 feet high at its centre. The water intercepted by it would form a lake from 10 to 15 miles long, 1,000 to 1,500 feet wide, and say 170 feet deep near to the structure, diminishing to naught at the other extremity, the fall in the bed of the river being 8 or 10 feet in a mile.

The question to be solved is—"What is the proper form such a structure should take, to offer the greatest resistance to the forces exerted upon it by the retained fluid?" This to be considered entirely irrespective of dimensions, the substance that dam would be composed of, or of the mechanical application of that substance.

Mr.

Mr. J. P. Nichol, LL.D., in his Cyclopædia of Physical Sciences, under the head of Hydrostatics, designates all vessels containing perfect fluids, vases. It is in this light that it is desired the bottom and sides of the reservoir should be considered, *i.e.*, supposing them to be composed of thin glass or metal plate, "*in what direction would the fluid exert its force upon that plate?*"—the final object of that consideration being to determine how and where to apply proper resistance externally to that force.

The fluid may first be considered as a quiescent body, then allowance made for its lateral motion, caused by the river current acting on it.

It is not intended the water should be allowed to run over the dam in this instance, but that the river should be blocked by it at that point, and divided into two streams. What water would be required for Sydney and Cumberland, to be forwarded by an aqueduct through the right bank, the surplus allowed to run off through a natural gully that exists in the left bank, to join the Nepean River two miles below the dam.

Under these circumstances, the effect of the river current on the dam when in time of flood would be inconsiderable, as the streams would pass off without approaching it further than as an eddy working round a bay. Therefore, in this secondary view of the case, it is only necessary to examine—"What would be the velocity and strength of a current on the surface of a reservoir from 10 to 15 miles in length, with a fall in the river immediately above where it enters of 8 or 10 feet in a mile, discharging say 500 tons per minute as a maximum?" and, "What force would such a current exert at different depths?" with the object of determining the effect the eddy caused by that current would have on the dam.

As there have not been any measurements or plans made of the locality, this latter consideration can only be conjectural, from the want of positive data to compute from, but it does not affect the first and material point—"What is the proper form a dam should take to offer the greatest resistance to the forces exerted upon it by the retained fluid?"

To the President of the Royal Water Commission.

Sir,

I very much regret that the opinions expressed by the members of this Commission on the Warragamba scheme for bringing water into Sydney, should be so adverse as to prevent further investigation of the subject; because when proposing it, I pledged myself to shew that it could be carried out advantageously, which their act prevents. And having been appointed to this Commission for the purpose of advocating that scheme (should no better be presented), I am now in a position I cannot honorably recede from without doing so; and this will draw forth expressions that must be disagreeable to my companions. The question with me is,—shall I be doing my duty by giving way to their adverse opinions, when I conceive all the evidence that has come before us has tended to strengthen my original views? Were I to do so, it would be an acknowledgment I had lost faith in the scheme, or nerve to carry it out when opposed, and had committed a great error in proposing it so confidently as I did. The subject would be condemned, perhaps cast into oblivion, without that proper investigation the public are entitled to expect at our hands. As I cannot do this, I have no other course but to defend my position, however disagreeable that may be; but I may remind you, I am not the opposing party.

Before entering into the merit of the case, I must reply to an unwarrantable accusation made by Mr. Grundy, in his paper, which is not justified by the facts of the case, *viz.*:—"That I had decided not to meet the Commission for the purpose of discussion on this subject." Our minute book and printed papers prove the contrary. The subject has been under frequent discussion, in which I have always joined, giving all the information in my power, having been anxious to prosecute this scheme. I have laid a section of the intervening country, several plans, explanatory drawings, and three written documents on the subject, before the Commission, while my colleagues to this date, have not committed themselves to any other view than a rigid opposition to this scheme. After having done this, and expressly stated in writing that I had no further information to give, or could have any until the survey was advanced, I was called upon to appear before the Commission, to be cross-examined as an ordinary witness, having a shorthand writer at my elbow, taking down every word I said, and threatened by Mr. Moriarty, who was the proposer) with a summons if I did not attend. This I refused to do, because the Commission had no right to put one of the members to such an ordeal; it was very disrespectful to me; and on a subject of so much difficulty, in its present crude state, the answers to questions coming from known adversaries, required consideration; but in doing so, I expressed willingness to reply to any queries that would be put to me in writing. Such an interrogation would not have been a discussion; I regarded it as a trap laid to entangle me, that I was not disposed to put my head into. I have never refused discussion; on the contrary, I am very desirous it should be continued until some proof of the scheme, whether good or bad, be arrived at. It has been open to members to bring the subject forward for discussion at any time. Whenever that has been done, it has invariably been at my instance; therefore, Mr. Grundy is not warranted in making such an assertion, but it serves to illustrate the prejudice that exists. If these gentlemen think so lightly of the scheme, what do they wish to cross-examine me for, if it is not to catch me tripping?

In

In replying to the papers read by the different members to the Commission,—as they all bear on one subject, and are unanimous in their adverse sentiments, I may take them collectively. You, sir, not having expressed an opinion on the engineering question, and as our President having always taken an unbiassed part, are entirely exempt from any unfavorable expressions I may find it necessary to make. It may be deemed presumptuous that I should make such confident assertions on this subject. I know it is considered so within this Commission. It seems to be peculiarly repugnant to Mr. Moriarty; but is it not time for a man over 64 years of age, and having 42 years experience in engineering science (if he has any brains at all), to be able to arrive at definite conclusions in a matter founded on the clearest physical laws? As this is a subject of great public interest, and it is of consequence that those interested should be enabled to judge of the value of the opinions that are set before them, I may be excused the egotism of showing on what mine rest, more particularly as I stand alone in advocating this cause against such high officials.

In the years 1826 and 7, when I suppose my companions were either in the nursery or at a baby school, I was employed on board H. M. Ship "Alligator," Captain Simeon, afterwards Captain Canning, the son of the Prime Minister, in collecting data, and making experiments in oceanic hydrometry, for the purpose of ascertaining the influence the Mississippi, Rio Grande, and other rivers flowing into the Gulf of Mexico, had in causing the Gulf Stream, at a time when that science was little understood. This led to my being appointed, in 1828, to the command of the "Woodlark" Cutter, and entrusted with filling up the maritime details at Shetland, of the great trigonometrical survey that was then progressing over the British Isles, the successful accomplishment of which procured me a lieutenancy in the "Southampton," Admiral Sir Edward Owen's flag ship in India, where for five years I was engaged in surveying and various scientific pursuits. This, coupled with my long experience in this Colony, and the works I have produced in it, ought surely to entitle my opinion to some respect, at all events to protect me from such arrogant attacks.

It is remarkable that the most material point to be investigated, that on which all schemes depend, more particularly the Warragamba, should be entirely ignored by these gentlemen, that is, *the scientific principles on which such dams as we require should be constructed*, which I have repeatedly urged on them. I freely admit that no dam built on the plan that has hitherto been adopted in this Colony would resist the force of the Warragamba waters, and also that none of the height that is required there to bring water into Sydney by gravitation has ever been constructed. But I contend they have been formed on entirely erroneous grounds, and that if such works were properly constructed on true scientific principles, there would be no risk of their being disturbed by the heaviest floods. Are these gentlemen afraid to grapple with this question, or so strongly wedded to existing rules that they cannot see beyond? One at least is deeply interested in the present system; for if Mr. Moriarty admits what I assert to be the case, he condemns his own acts, and acknowledges he has committed fatal errors. I have repeatedly pressed this question on the Commission, and when I found it would not be entertained, moved a resolution, "*That the subject, as far as it related to scientific principles, should be referred to others qualified to give an opinion,*" but this was negatived, so that this question, which is of paramount importance in any scheme, has been systematically avoided; nevertheless, I presume no work of this nature will ever be undertaken until that is decided.

The great fault in the present system, lies in the whole force of the water being brought to bear laterally on the broadside of the dam, its weakest part. It is evident that a wall capable of bearing ten tons on the top, would not resist the same, if applied to it horizontally; and this is exactly the effect the water in a reservoir has upon the present system of building dams. It is the property of this fluid to exert its influence at *right angles* to whatever surface it is opposed; therefore, if the water rests on a perpendicular wall, its whole force acting at right angles to that wall, is directed to drive the structure off in a *horizontal direction*. Whereas if it rests on a horizontal plane, the tendency or thrust is *directly downwards* for the same reason. Consequently, by merely selecting an angle with the surface of the water on which to form a plane (or inner slope of a dam) between these two extremes, any downward direction may be given to the force exerted by the water in a reservoir. This is a very material point, for on it rests solely the capability of forming structures of this nature *to resist any amount of pressure*.

This force thus directed, would meet the bottom of the river through the intervening substance (or inner portion of the dam). The dam being in the form of a wedge answers two purposes. The upper surface receives and directs the forces downward, while the wedge supplies an unresisting medium fitted between the water and the rocky bed of the river, which is incapable of being disturbed; so that a dam thus constructed, obtains its strength solely from its inner portion, irrespective of the outer form. This is an axiom that cannot be disputed, as it is founded on the natural laws that govern all fluids. All the dams that I have examined are more or less opposed in their construction to this principle, not one of them have answered the conditions on which they were built (I do not allude to mere dikes); most have given way under pressure. And it is remarkable that the only one that is directly opposed to it, consequently, most in error, is that built at the North Rocks, near Parramatta, for to supply water to that town, by the Chief Engineer of Harbours and Works, E. O. Moriarty, Esq., C.E., as is there ostentatiously displayed on a marble slab. This, from being solid arched masonry of great strength between two rocks, one on each bank, resists the floods in that small creek; but the water drives through the stones to such

an extent, that it is quite useless for the purpose it was built. There is more water running through the joints of the masonry than enters the reservoir, excepting floods. I have said this dam is directly opposed to true principles, and therefore, it may serve as an example for comparison. The base of resistance is here obtained from the *banks*, between which an arch is curved against the stream, the inner surface of which is *perpendicular*, the outside slightly inclined inwards; no other resistance to the water being offered, therefore, it represents a dam with a perpendicular inner surface. Now, what is the effect of the fluid on that structure? The greatest depth of water in the reservoir is close to the masonry, consequently, the greatest weight or pressure is there, acting in the very worst form, that is, *horizontally*, tending to drive the work broadside out into the creek. A more defective structure for the purpose cannot exist. There it stands with the water running through it—an example of man's folly, in attempting to oppose Nature's unerring laws.

In contra-distinction, take the opposite case. By means of the long inner slope proposed, the greatest depth of water is thrown back from the highest and weakest part of the structure, and there the force, instead of acting horizontally, is directed *down into the earth*, the very shallow water resting near the top of the dam having little effect. To any unprejudiced mind I should think this must be very evident, but light may be thrown on the subject by obtaining a section and particulars of the great inundation that lately occurred at Sheffield by the bursting of a dam there. Was that dam built on correct principles?

In the papers before me, each of the members express their having given the Warragamba scheme earnest attention. As this is material to the public, I may be allowed to examine what that attention has been, for on it depends the value of their opinions. It is natural to suppose that, before making such an assertion, and placing their veto on a scheme that offers such great advantages if it can be carried out, and that has been so strongly urged by one of their number, that they would, at all events, have made themselves acquainted with the locality; but although all other places have had their attractions, but one day has been devoted to the Warragamba, and that was entirely mis-spent. It is a fact that, with the exception of taking a general view of Mulgoa from a height, visiting the site of the dam, and that of a tunnel, no other part of the proposed aqueduct has been seen by them. Before leaving Regentville on that day, I pointed out the easiest and only way we could inspect it in the time, through going by land, and returning by water; but notwithstanding, I was the only person that knew the locality, I was immediately over-ruled. From missing the boat we did not arrive at the junction until nearly 11 o'clock, when we walked a mile and a half to Mulgoa, where the Chief Engineer amused himself in trying to make a kind of level out of a crooked twig and a reel of cotton, for what purpose did not appear. This occupied more than an hour; we then returned to the boat, had lunch, and the remainder of the afternoon was spent by the three engineers and boat's crew in endeavouring to make a section of the gorge, which they entirely failed in doing, as they went the wrong way about it, which I pointed out at the time, and shewed the proper way. Throughout the day Mr. Moriarty took the lead, setting me entirely aside, so that I never was consulted, or had any opportunity of explaining, which I brought to your notice, Sir, at the time. This comprises the whole of the inspection the Warragamba scheme has had. Neither the gully through which it is proposed to divert the river, nor the sites of crossing the Nepean River and South Creek, where the main works will be, has ever been seen by them, and a survey has been refused on the grounds shewn in these papers. Does this warrant the assertion that the subject has been earnestly considered by them?

Hitherto I have endeavoured to keep to facts; but now lies before me, in Messrs. Moriarty and Grundy's papers, a mass of wild incoherent calculations, founded on false surmises that cannot possibly lead to any practical result. To discuss these would be an utter waste of time, as they are based on imaginary data, and seem to me to have no other object than mystification. No calculations of this kind are of any service until a survey produces measurements to found them on; when that is accomplished, an estimate of the cost that can be depended on may be arrived at, but not before.

I must again express my sincere regret that my colleagues would not join me in shewing the advantages of this scheme; but I cannot think their opposition will prevail. For years after laying out the Southern Railway, I was as strongly opposed, notwithstanding the line I proposed was adopted, and there is no doubt a similar result will take place in this instance.

I remain, Sir, yours faithfully,

THOMAS WOORE.

8 June, 1868.

(Memorandum referring to Mr. Woore's letter of 8th June.)

In a paper read to the Commission at its last sitting by Mr. Woore, some severe strictures were passed on the rejection of his proposal to refer the subject of the best form for dams to some scientific gentlemen, or, in his own words, "that the subject, as far as it related to scientific principles, should be referred to others qualified to give an opinion." It was broadly insinuated that the subject was not understood by engineers, and, as an instance in point, reference was made to the faulty construction of the Parramatta dam. I may, perhaps, be permitted, as the designer of that work, to offer a few observations on the subject generally and particularly. Generally, then, I would observe that, so far from the subject not being understood, the best form for masonry dams has been most carefully

carefully and elaborately investigated, both by English, and continental engineers, particularly the latter, as may be gathered from a perusal of the descriptions of the Ban and Furens dams; the latter commenced in 1861 and only just completed, the former now in course of construction. With such information before us, there could be no possible object in deputing to other scientific gentlemen an investigation which the Commission was quite competent to undertake itself. With reference to the particular branch of the subject, namely, as to the so-called faulty design of the Parramatta dam, I may observe that, inasmuch as whatever those faults may be in Mr. Woore's opinion, they are faults which it has in common with those great works to which I have referred, I can rest easily under that gentleman's condemnation. It is quite sufficient satisfaction for me to find that the most elaborate investigation of the subject has shewn the correctness of the principles on which I designed that work sixteen years ago, the only difference, which is not one of principle, being that due to the difference in the character of the material used, the Parramatta dam being constructed with the heaviest squared masonry, for which the stone on the spot was suitable, while the Ban and Furens dams are built of rubble masonry, set in mortar, and which, therefore, required a greater thickness at the base than was required with the superior kind of masonry in the Parramatta Dam.

E. O. MORIARTY.

June 18, 1868.

Mr. Bennett to the President, on Mr. Woore's proposed Dam for the Warragamba.

Department of Public Works,
Sydney, 26 April, 1869.

Sir,

In compliance with your request that I should give my opinion as to the dam proposed by Mr. Woore, and prepare a design and estimate for a masonry dam of the proportions constructed and proved in France,—drawing and estimate for masonry dam of the height proposed by Mr. Woore (170 feet) are submitted herewith; and it will suffice merely to state that I could not recommend the construction of such a work.

The section submitted is calculated from the formulæ developed by the Engineers of the Ponts et Chaussées, in their recent elaborate investigations as to the best form of masonry dams for impounding the flood waters of the affluents of the Loire and Rhone; and, in accordance with which, the dams on the Furens and Ban, used both for flood regulators and water supply, have been constructed.

The cost of the dam alone would be	£416,000	0	0
The cost of two tunnels, wells, and valves for emptying reservoir, inlet-valves, and arches, and retaining walls on down stream side of dam.....	12,000	0	0
Approximate cost of overflow to discharge about 96,000 cubic feet per second, or 29½ feet per second per square mile (21 feet per second per square mile being the measured proportion of the Hunter floods), with granite revetments and sills at the salient points.....	150,000	0	0
	£578,000	0	0
Cost of suspension aqueduct over the Nepean, on Ordish's patent (say)	50,000	0	0
	£628,000	0	0

With contingencies.....£650,000.

It is to be distinctly understood that this dam is not calculated to allow any flood waters to pass *over it*, so that the whole floods of the Warragamba would have to pass through the cutting in the side of the gorge to be made for an overflow, the depth of which would exceed 60 feet, and the width be at least 100.

Without any reference whatever to the comparative cost of the masonry dam, I could not recommend its erection, while there was the slightest possibility of obtaining an adequate supply of water from any other source, even at double the cost.

Though a similar structure to this withstood the floods of the affluents of the rivers named; I would not be prepared to risk, however remotely, the ruin to life and property which the failure of this dam would entail.

I doubt the power of the rock *in situ* to resist the force to which it would be exposed in floods. However tight the joints of the masonry may be made with cement, under such a pressure the filtration through the sandstone of which it would be constructed, with the percolation through the joints and fissures of the sides and bottom of the gorge, would more than equal the dry weather supply from the river, so that the conserving power of the dam would prove a delusion; and it is by no means certain that this leakage, combined with the increased evaporation, might not even reduce the water below the level of inlet to conduit, when of course the supply would cease.

The French dams are constructed of and in material nearly impermeable (mica slate), but notwithstanding this, the outer surface of the lower portion of dam is uniformly damp, shewing that water slowly filters through the stone and mortar.

The water was never allowed to pass over the French dams, and the rain-basin at Furens is 10 square miles—that of Warragamba, 3,247.

As this dam is the principal feature in the Warragamba project, my disapproval of it, in any shape, either as proposed by Mr. Woore, or as constructed in France, renders it unnecessary for me to enter further into the details of the conduit and other accessories of the scheme.

I have, &c.,

WILLIAM C. BENNETT.

MEMORANDUM and Estimate from Mr. Moriarty, relating to the scheme of supplying Sydney with Water from the Nepean, at Penrith.

AMONGST other sources from which an ample, unfailing, and, as regards quality, unexceptionable supply of water might be obtained, the attention of the Commission was, at an early period of our inquiries, directed to the Nepean, near Penrith, where nature has already formed a reservoir of the amplest dimensions, fed by the drainage of over 3,900 square miles of country.

Owing, however, to the inconsiderable elevation of the river above sea level at this place, the water could only be obtained from this source by pumping. An estimate has accordingly been prepared of the cost of machinery and piping requisite to supply twelve million gallons per day—four million being for the high service, and eight for the low service of the city.

The water would be pumped from the river up to reservoirs on the high ground adjoining, at sufficient elevation to allow of its flowing into Sydney by gravitation.

This project would, of course, be open to all the objections as to liability, to accidents of machinery, and the heavy annual working expenses common to all pumping schemes.

The first cost of the machinery and piping, &c., will be seen to exceed the estimated cost of bringing down the water by gravitation from higher points on the river, in addition to which would be the large annual expenses of working, repairs to machinery, labour, &c., which are not required in a gravitation scheme.

In the estimate I have not allowed anything for the present engines and pumping plant, inasmuch as they are likely to be required in connection with the sewage works, which will be found referred to in another place.

Memoranda.—Water Supply from Nepean, at Penrith.

Height of surface of water in Paddington Reservoir,	214 ft. above high-water level.
Do. Crown-street	140 "
Height of river surface at Penrith	50 "
Inclination of pipes on low level,	2.5 ft. per mile.
Do. high level,	3.0 "
Distance from Sydney,	35 miles.
Quantity to be discharged in low level =	8 million gallons.
Do. high level	4 "

LOW-LEVEL SYSTEM.

$35 \times 2.5 = 87.5$ total fall.

$(140 + 87.5 + 20) - 50 = 197.5$; but allow the river to be 2.5 lower, the lift will be 200 feet.

Engines to pump 8 million gallons 200 ft. high in 16 hours, or 500,000 gallons per hour.

$$HP = \frac{500,000 \times 10 \times 200}{33,000 \times 60} = 505$$

The diameter of main to discharge 14.7 cubic feet per second = 40 inches.

Weight of 40-inch main 1" thick = 11.57 cwt. per yard run = £12,216 per mile.

HIGH-LEVEL SYSTEM.

$35 \times 3 = 105$ total fall.

$(214 + 105 + 20) - 50 = 289$ feet.

Engines to pump 4 million gallons 289 ft. high in 16 hours, or 250,000 gallons per hour.

$$HP = \frac{250,000 \times 10 \times 289}{33,000 \times 60} = 365$$

The diameter of main to discharge 7.35 cubic feet per second = 28 inches.

Weight of 28" main 1" thick = 7.3 cwt. per yard run = £8,232 per mile.

First cost of Steam-engines, Boilers, and Pipes to supply Sydney and Paddington with Water from the Nepean, at Penrith:—

Quantities—	
Sydney.....	8 million gallons per diem.
Paddington.....	4 do.
Total.....	12

	£
HP 865, including boilers, &c., at £40	34,600
Spare engines, HP 200, at £40	8,000
High level pipes, 28" diam., 1" thick, 35 miles, at £8,232	288,120
Low level pipes, 40" diam., 1" thick, 35 miles, at £12,216	427,560
Engine and boiler houses, with chimney, &c.	6,000
Estimated cost of reservoirs to contain one week's supply, 50,000 cubic yards, at 3s.	75,000
Pipes connecting engines with storage reservoirs (assumed), 880 tons, at £13	11,440
Stop-valves, air-valves, and other contingencies	10,000
	<u>£860,720</u>

Annual

Annual working expenses :—	£
14,828 tons of coal = 8 lbs. per horse per hour, @ £1	14,828
Wages and superintendence	5,500
Repairs to machinery	5,000
Stores	1,000
	£26,328

The cost of piping laid, estimated at £12 per ton.

The foregoing figures represent the first cost, as well as the annual working expenses, for supplying the full estimated quantity of twelve million gallons per day; but as it is probable that this would not be required for many years to come, it may be well to consider what would be the probable cost of supplying half the above-named quantity, delivering it only into the low-service reservoir, and allowing the Botany engines to be employed in pumping only to the high-service reservoir; this would necessitate keeping up the two establishments, thereby incurring additional expense; the plan would be open also to very many other obvious objections which need not be enumerated here.

First cost of Steam-engines, Boilers, and Pipes, &c., to supply Crown-street Reservoir with 6,000,000 gallons of water per diem from the Nepean at Penrith :—

	£
HP. 380, including boilers, &c., at £40	15,200
Spare engines, HP 100, do., at £40	4,000
Cast-iron pipes 34 inches internal diameter, to discharge 6,000,000 gallons per diem = 9 cwt. 2 qrs. per yard = 836 tons, at £12 = £10,032 per mile × 35	351,120
Engine and boiler-house at Penrith	4,000
Cost of storage reservoir to contain one week's supply, 250,000 cubic yards of excavation at 3s.	37,500
Pipes connecting engines with storage reservoir (assumed)	6,000
Stop-valves, air-valves, and other contingencies	5,000
	£422,820

Annual working expenses for the low-level system :—	£
6,514 tons of coal = 8 lbs. per horse per hour, @ £1	6,514
Wages and superintendence	4,000
Repairs to machinery	3,500
Stores	750
	£14,764

Annual working expenses for high-level system with the present engines at Botany :—	£
Total annual expenses, as per return of the City Treasurer for 1868..	7,039
	£21,803

NOTE.—The expenses of working this system are estimated in the same proportion to those at Botany; but the greater height to which the water has to be pumped at the Nepean to allow it to flow into Sydney, appears to make the cost of pumping somewhat higher.

E. O. MORIARTY.

(Letters addressed to the President, by the Hon. Thomas Holt, M.L.C., on George's River as a source of water supply.)

"The Warren," Tempe, near Sydney,
30 March, 1869.

My dear Sir,

You informed me, when I had the pleasure of seeing you last week, that you had given instructions to have a survey made of the country between Salt-pan and Woollli Creeks (branches of George's and Cook's Rivers), as part of a scheme by which the City of Sydney and its suburbs might be supplied with an abundance of pure water.

My attention has since been called to another plan which could be combined with that of a water supply, and I think it well worthy the serious consideration of the Water Commission. There is an almost continuous line of creeks or swamps between George's and Cook's Rivers, and there is a creek, known as Shea's Creek, from Cook's River to not far from the Railway, near Redfern, which could be easily converted into a navigable canal.

If George's River were dammed at Sans Souci, and Cook's River at or near the Waterworks, a few floods would wash out all the salt water therefrom, and a canal, cut through the swamps and creeks, would convey this vast body of fresh water close to the suburbs of Sydney, without the expense of one shilling for iron pipes. Shea's Creek, which is now polluted by the drainage from the wool-washing establishments, &c., would, by deepening and widening, become thoroughly cleansed of every impurity. A dam near the Waterworks at Botany would tend to secure the present limited supply in the Botany Swamps, and the water of the united rivers (George's and Cook's), when sweet, could be pumped by the same engines that now supply Sydney.

Newtown could also be supplied with water from the same source, by merely deepening a natural creek from Cook's River to near the Railway. If the question were merely the water supply of Sydney and its suburbs, it would be immaterial where George's and Cook's Rivers were dammed. A dam at Tom Ugly's Point, or at Kangaroo Point, would

would be somewhat shorter than a dam at Sans Souci (Rocky Point), but the river is much shallower at Sans Souci, and therefore I do not think there would be much (if any) difference in the cost. The cost of damming Cook's River at the Waterworks would be greater than that of constructing a dam at Unwin's Bridge; but a few hundred, or even a few thousand pounds, are no object in a matter of such vast importance; besides, a dam over Cook's River, at the Waterworks, would probably be worth every shilling it cost, as a road to the Seven-mile Beach. But the advantages of damming George's River at Sans Souci and Cook's River, near the Waterworks, appear to me to be of inestimable value, more especially on account of the ease with which a ship's canal could be cut from George's River to within a short distance of Sydney, and the comparatively trifling cost of such a work.

There is something grand in the idea of having a canal of fresh water close to Sydney, and something equally grand, although not so useful, in having a *navigable* canal to some of the most beautiful scenery in the world. I saw no beach in Europe so beautiful as the Seven-mile Beach; yet, although only about half a dozen miles from Sydney, probably not more than ten dozen of the citizens have ever been on it. Indeed, the approaches to it, until very recently, were almost inaccessible, and at present they are exceedingly difficult. George's River would make as beautiful a lake as any to be found in Europe, if we except the high mountains by which some of them are surrounded.

Mr. Lucas' idea, to make a railway passenger station in the centre of the city, at the George-street Markets, is most excellent, and will, I doubt not, be carried out. If the citizens could start from the centre of the city for our "*New River*" (whose terminus should be close to the Railway, where of course there would be a station), and proceed thence by steamer either to the Waterworks or to the Seven-mile Beach, or to Sans Souci, or to the numerous bays and branches in George's River (or rather Lake), or to Liverpool,—the people of almost every other city might then envy Sydney as "*the Queen of Cities*."

Mr. Bell, C.E., it appears, requires £200,000, in addition to the large sums already sunk for excavating and damming, and for storing the limited quantity of water in the Botany and Lachlan Swamps. But is it not common sense that we should use the gigantic excavations nature has made for us in the immediate neighbourhood, which would contain probably ten thousand times as much as all Mr. Bell could store at Botany, if he had the use of as much of the public money as he pleased? For considerably less than £200,000, I doubt not, George's and Cook's Rivers could be dammed, and the natural creeks and swamps between those rivers made into a navigable canal, and the water brought, without the expense of a single main, to near Redfern.

This would be a work of which the entire Colony would have reason to be proud, instead of being humiliated, as at present, at the waste of large sums of money on the Botany Swamps, whilst the cry of an "insufficient supply" continues to increase.

So long as Sydney is exclusively supplied with water from the Botany and Lachlan Swamps, the chief business of the Mayor and Aldermen will be to *economize* it. They will thus *discourage* manufactories, and leave the sewers to breed a pestilence during the long droughts.

I enclose a copy of a petition presented to the Legislative Assembly, praying that the dam-head of George's River at Liverpool may be raised, as the manufactories already established there are dependent, and others which "*would at once be commenced*," must depend, they say, upon a "*pure and sufficient supply of water*." There is no question about the "purity" of the George's River water, where the sea-water is excluded; the only complaint is that "there is not a sufficient quantity," for George's River at Liverpool is little better than a creek, and therefore can store but a very limited supply. If George's River were dammed near its mouth, Liverpool and a large portion of the County of Cumberland would have an inexhaustible reservoir.

I hope you will think the subject of sufficient importance to have a survey made, and report thereon to the Government.

I remain,

My dear Sir,

Yours very truly,

THOMAS HOLT.

"The Warren," near Sydney,
4 May, 1869.

My dear Dr. Smith,

I have had some conversation, within the last two or three days, with a person who has had considerable experience in damming, embanking, &c. He told me that there could not be better materials for a dam than sand and gravel, provided there was *abundance* of them, so that the dam could be made sufficiently wide, with a slope similar to that of the sea beach. His idea of making a dam across George's River was, first to make it of stone, just as it comes out of the quarry, in order to lay a railroad thereon for the sand and gravel, which could be shot out of the trucks at the sides. He said he had constructed a dam in Tasmania of sand and gravel, and that there was a flood almost immediately after he had finished it, when the water rose 25 feet above the dam, without injuring it in the slightest degree.

I told him that there was a high mountain of sand three miles long, about four miles from Cummins' Point, where the trucks could be filled with very little labour, from the top of the mountain, by means of a shoot, and that the land from the mountain to Cummins' was on a slight decline; also, that there was abundance of stone close at hand. He said—"You have all the materials required for a dam, and, with such natural advantages, it could be constructed at comparatively little expense." Between Cummins' and Rocky Point (Sans Souci) the river is very shallow, and there is little if any mud. One-third of the river is dry at low tides. But, as you had told me that there is a great depth of mud at Tom Ugly's Point, I thought I would ask my practical informant how he would get rid of it? "Get rid of it!" he answered, "Why the weight of the stones and sand would effectually *squeeze* it out." Do not your very footsteps, on muddy roads, demonstrate to you that this is practicable? This really appears to me to be a very common-sense view to take of it. I asked him if he thought there was any fear of the sea-water oozing through the dam and making the water above it brackish? He answered, "Never." "Be sure," he said, "to make your dam wide enough—it cannot be too wide—with the natural slope, and it will become as durable and as impervious as the sea beach."

I thought the ideas of a man who has had considerable experience in constructing dams and embankments would be interesting to you. Although I had seen this huge mountain of sand hundreds of times (and I should think you can see it from the University), it never once occurred to me previously that it could be so advantageously used in constructing a dam. As sand from the neighbouring mountain could be brought to the river, on a decline, and there is such an abundance of it, there is no reason why the dam should not be made very wide—exceedingly so—as the greater the width the stronger it must necessarily become.

The sand-bank on the Seven-mile Beach, where you and I were, could be used in like manner for a dam across Cook's River, and there is also an abundance of stone close at hand.

What more could nature do than she has done to assist the citizens of Sydney in providing for themselves an inexhaustible supply of pure water? There is a watershed which could not be surpassed; there are enormous reservoirs (George's, Cook's, and Woronora Rivers, beside some creeks as large as rivers), and there are swamps almost the entire distance from George's River to the Sydney suburbs.

I look upon a ship's canal, from the Railway, near Calder House (Mr. Castle's) to George's River, or rather Lake George, and running parallel with the Seven-mile Beach at Botany Bay (one of the finest beaches in the world), as a grand idea, and I know nothing that would be so much immortalized in history as a work of this kind, or that would so much tend to promote the prosperity, wealth, and happiness of the people. Manufactories to any extent could be established on the banks of the "New River," and the refuse water therefrom could be drained into Shea's Creek. A ship's canal, through the swamps, from George's River to the Railway, near Redfern, would not cost a large amount, but a watercourse or canal capable of supplying hundreds of thousands of persons would be very inexpensive. For instance, instead of the canal being made to George's River, it need not go further than to the head of Koggurah Bay (a branch of George's River), and within 200 or 300 yards of Pat Moore's Swamp. There is a low place about a mile on this side of Sans Souci which would require very little cutting. The distance between the head of Koggurah Bay (or Townsend's Bay, as it is sometimes called) and Newtown is not more than about nine miles. A canal through the swamps, say 12 feet wide at the top and 9 feet at the bottom, would not cost more (I think) than £2 a rod, or £640 a mile. At a rough estimate, I think, Sydney might be supplied with as much water as it is ever likely to require, for less than £25,000 (exclusive of compensation for land); say—

For cutting a canal 9 miles long, at £640 a mile	£5,760
For damming George's River, say	15,000
For damming Cook's River, say	1,000
		£21,760

But if it were to cost £40,000, £60,000, or even £100,000, it would be the cheapest and most valuable work ever executed in New South Wales. I am told that the rough stones in the centre of the dams would soon settle down and become as solid as a rock, and that the large body of sand on both sides would soon fill up all the interstices of the stones. Cummins' Point is also a most excellent site for a weir—equal to Tom Ugly's or Kangaroo Point, so that not one drop of water ever need run over the dam.

If, as I firmly believe, neither piles, nor cut stones, nor cofferdams are required in making the dams, but only an abundance of materials which nature has so liberally furnished, it is mere labourers' work. There are no engineering difficulties whatever. We have merely to use the stone and sand, and separate the salt water from the fresh, deepen and widen the watercourses nature has prepared, and the numerous complaints, so frequently made, by the citizens, of a *scarcity of water*, would cease for ever.

Believe me ever

Yours very sincerely,

THOMAS HOLT.

"The Warren," Tempe, near Sydney,
10 June, 1869.

My dear Dr. Smith,

Permit me to trouble you with one more communication on the great question of the day—*our water supply*. I had no idea, until within the last few days, that the swamp between Cook's and George's Rivers was so extensive as I have ascertained it to be. It is so much surrounded by trees, that very little of it can be seen at a distance. At one place I really think it is more than a mile wide, with a depth of probably 4 or 5 feet of good water, which is now running to waste, through Muddy and other creeks, into the bay and Cook's River. These creeks could be dammed at little cost—probably not more than a few hundred pounds; and I have ascertained that the swamps could be easily united with Cook's River by means of Woolli Creek, the distance being only 76 chains of low or swamp land. I am told that with a cutting of 3 feet the two waters would meet, but of course the canal would require to be much deeper. The canal from Woolli to Muddy Creek would run at the back of Mr. Yates' house, and a short distance beyond the second toll-bar on the road to Sans Souci.

In a former letter, I suggested the construction of *another* dam across Cook's River, below the present dam; but, on further consideration, I am of opinion that it would not be at all necessary to incur this additional expense. The present dam could easily be made perfectly water-tight, and at a fractional part of the cost of constructing a new dam. The fresh water could without difficulty be conducted, by means of a culvert under the road, and by a canal along the low or swamp land on the eastern side of the Cook's River Road (at the back of the houses of Messrs. Tucker, Talbot, Lance, &c.), to Rickety-street, St. Peter's, Newtown, Waterloo, and almost as far as Redfern, with very little cutting.

This almost inexhaustible supply of water would be invaluable for manufactories, wool-washing, &c., and more especially as a considerable natural drain (Shea's Creek) would run parallel with the fresh water canal. Then, there is a natural creek in the Marrickville Municipality, extending from Cook's River to a point between Mr. S. Cook's residence and the Marrickville Council Chambers, near the Railway and the Newtown omnibus stand. I am told that when Cook's River rises 3 feet, the water spreads out nearly as far north as Camden College, in a distant but parallel line.

I have seen many wonderful works that have been constructed, and read about most of those which have been executed in all parts of the world, but I do not think there ever was a work of such incalculable utility which could be constructed at so small a cost as that of supplying Sydney, its suburbs, and a large portion of the County of Cumberland, with fresh water, by damming George's and Cook's Rivers, and uniting them by means of the swamps running parallel with the Seven-mile Beach. A water-course, or canal, about 10 or 12 feet wide at the top, and about 8 or 10 feet deep, would probably be sufficient to bring the united waters to the back of Mr. Cook's house, Newtown, and to Rickety-street (St. Peter's). A temporary weir could easily be made at Sans Souci, so that not a drop of water would ever flow over and injure the dam at Cook's River. But I am very strongly of opinion that a wide canal (say 50 or 100 feet), should be cut, in nearly a straight line, from Mr. Kingsbury's paddock, at the back of Mr. Cook's house, to Woolli Creek, and through the swamps to Sans Souci, George's River. It would run parallel with the beautiful Seven-mile Beach. The Cook's River water, which, above the dam, is brackish, would soon become perfectly sweet, after the dam was made water-tight. Woolli Creek water, and that of the swamps, is sweet, so that these waters could be used in a very short time, and the quantity is much greater than that in the Botany Swamps.

But, when George's River shall become sweet (which it would after a few floods), and an opening be made between that river, by means of the canal, it will be one of the most delightful excursions in the world, from near the Railway at Newtown to the Railway Station at Liverpool, and passengers may be landed either on the Seven-mile Beach or at any of the intermediate places.

George's River, or rather Lake, would always remain at high-water-mark. The quantity of water used would make no perceptible difference. The incessantly running creeks would more than replace that consumed and lost by evaporation. There is a natural weir of solid rock at Cummins' Point, which would not require more cutting than 18 inches to 2 feet, and almost any quantity of water could pass over it.

The dam at Cook's River is in excellent condition as a roadway. It has, however, cost very considerable sums for repairing damages caused by the floods; but if my suggestion be adopted, not one drop of water will ever run over it, and, in all probability, it will not require any repairs for very many years.

With respect to the suggested dam at George's River, I thought you smiled, when I last spoke to you, at the idea of constructing it of stones and sand. I merely mentioned, in my previous letter, what had been done in Tasmania, and how well it had answered. But, can we do better than carefully observe what nature has done? We see the sandy beaches far more durable than the rocky shores. We know that the purest water is frequently found on sea beaches, and within a few yards of the sea water. Mr. Mort told me of a lake on the Tuross River which is frequently opened by the settlers, during heavy rains, to let off the water, in order that it may not inundate their lands. The tides force up the sand again, and the water becomes perfectly sweet. Another instance was mentioned to me of a lake in Illawarra (Tom Thumb's Lagoon), which the settlers opened in like manner to let out the water, during heavy rains, and the tides closed it again, and the water became quite fresh.

The more we study nature in the minutiae of her operations, the more must we admire the inexhaustible fertility of her resources, and the simplicity by which she produces the most important results.

If

If the dam were required to be used also as a *wharf*, then, of course, there must be a *sea-wall*, so that vessels could come alongside, and this could only be constructed by means of cofferdams, sheet piling, or the diving-bell, and with cut stone, cement, &c. But, as I think, no wharf at George's River Dam is at all necessary, a beach would answer all the purposes of a wall, and be incomparably more durable, and only cost a fractional part of the money.

Macadam, in making his roads, never used anything but stones—no clay or any other material; and these stones, not exceeding 6 ozs. in weight, united in one mass like a piece of timber, and became impervious to wet. Macadam recommended a thickness of 10 inches; but a road has been taken up which had only 4 inches of stones, and the ground below was found to be quite dry.

A considerable portion of the kingdom of Holland is below the sea-level, and we know how wonderfully nature has protected that country by means of sand-banks. If Macadam could make a road impervious by means of small stones, and the Dutch can keep out the ocean by means of sand, is it not possible for us to separate the salt from the sweet water in George's River, by means of stone and sand?—I feel certain that it is, provided that a *sufficiency* be used. There is a huge mountain of sand at a short distance, from which any quantity could be brought to the river, along a gentle slope, by *gravitation*; there is abundance of stone close at hand; and, I may add that, as little skilled labour is required, nearly the whole of the work could be done by convicts.

If a dam were begun, it should of course be pushed forward with the utmost vigour, or otherwise the river would deepen as the opening became reduced, and more materials would be required.

I was reading, a few days ago, of the wonderful power of some of the Cornish engines. One of Taylor's, at the Consolidated Mines, Cornwall, lifted 63,020,000lbs one foot high, by the consumption of one bushel of coal, which cost 1s. Another engine pumped up 43,500 hogsheads of water in 24 hours, from a depth of 1,441 feet.

With facts like these before us, would it not be madness to go fifty or sixty miles, and expend millions of money for water, merely because of its coming by *gravitation*, when we can have an inexhaustible supply at our doors, and raise it, as the Cornish men do, at such a trifling cost? If it were not that water can be raised so inexpensively by means of the steam-engine, many of the first-class collieries and rich metallic mines would be abandoned.

The ancient Romans brought water to their cities by *gravitation*, at an enormous cost, but it is not to be wondered at, because at that time the steam-engine was unknown.

I remain,

My dear Sir,

Yours very truly,

THOMAS HOLT.

Memorandum by Mr. Moriarty on the proposition to supply Sydney with water from George's River.

HAVING given the most serious and careful consideration of which I am capable to the proposal which has been submitted to the Commission for supplying Sydney with water from George's River, and having had careful surveys, sections, and borings of the several sites for dams, and for the lines of aqueduct, &c., made, I have now the honor to submit them for the consideration of the Commission, with such observations as the case seems to require at my hands.

This project involves not only the withdrawal of the ordinary daily supply of water for the city from George's River, but also the storage in its channel of such quantity as may be required to preserve the surplus of wet seasons for the deficiency of the dry. As regards the former, I have taken for this the same figures as were fixed by the Commission in the other schemes which we have considered; and as for the latter, I have assumed the period of possible drought at twelve months, and have estimated that storage should be provided at the above rate for that time; this, although forming an item in the cost as well as the difficulty of executing the work, is not, after all, very material, because a few feet (2 or 3) more or less in the height of the dam would not sensibly affect either its cost or the difficulties in the way of its construction.

The supply of Sydney with water from George's River involves the construction of a dam at some point near its embouchure, and three positions have been recommended,—one at Rocky Point near Sans Souci, one at Tom Ugly's Point, and the third at Kangaroo Point; and although the construction of a dam at either of these sites would be an operation of considerable difficulty, magnitude, and cost, still, as the Kangaroo Point site presents somewhat less unfavourable features than either of the others, I shall, in the following observations, assume that it would be selected, and examine the case on that supposition.

The feasibility of the project depends wholly on the successful construction of the dam; and there can be no doubt that, owing to the great depth of the water, the nature of the bottom, which is composed of semi-fluid mud and sand, the permeability of the sand, and the fissured and open character of the rock forming the sides of the channel, to make a dam watertight in such a situation would be a work of extreme difficulty.

In reference to the dam, the first question which presents itself for consideration is, as to the character of the work of which it should be composed—whether it should be constructed of masonry carried down to and founded on the bed rock which underlies the

the

the sand at depths varying from 50 to 60 feet below high-water-mark; or, of puddle enclosed by sheet piling, and faced on either side by a stone embankment; or, of sand wholly, as has been suggested. And I must here observe, that I cannot think that any of those persons who have talked of damming George's River as if it were a trifling matter, have been at the pains to satisfy themselves as to the nature or extent of the difficulties they would have to encounter, or the inevitable expense of overcoming them.

In considering the dam, one of the main things to be determined is its height,—not the height only which would be necessary to divert the water of George's River into the Botany engine ponds, or to any others whence the water would be pumped into Sydney, but the height which would be sufficient for storage of the required supply for such period as may be considered necessary, as well as for the allowance to be made for evaporation and loss by leakage during the same period. To arrive at the first, we must commence at the engine ponds, and trace the levels thence back to George's River.

I think I am safe in assuming that the permanent level of the water in the engine ponds, say at Botany (for that would be as convenient a place to pump from as any other, and all the appliances are to be found there already), should not be less than 1 foot above high-water-mark spring tides. If below the spring tide mark, the percolation from the sea through the porous subsoil would taint the fresh water in the ponds. Starting then with an elevation of 1 foot above high-water springs at the engine ponds, we should cross the estuary of Cook's River with a syphon, which would require a mean rate of inclination in the half-mile of piping and conduit, of (say) 18 inches, such being quite small enough fall to deliver the quantity of water which would be required to pass. This would give the surface level of the water in the canal, where it enters the syphon, at 2 feet 6 inches above high-water springs, and the bottom of the canal would be about the level of high-water. The canal would be about 6 miles in length, and the fall per mile could not be taken at less than 6 inches, or 1 in 10,560, giving a total rise of 3 feet in its whole length, and bringing up the level of the water, at its inlet from the river, to 5 feet 6 inches above the high-water springs. The rate of fall might perhaps be reduced to (say) 4 inches per mile, by considerably increasing the cross sectional area of the channel; but the result would be, to render the stream so sluggish—such a mere stagnant ditch—so full of impurities, animal and vegetable, which would develop under the hot summer sun, as would make it quite unfit for human use. I do not, therefore, think it would be safe to estimate for any less rate of inclination than 6 inches per mile, which, as I have stated, gives 5 feet 6 inches above high-water, for the surface level of the canal at George's River—that is to say, the lowest permanent level to which the water in George's River could be drawn off.

We next come to consider the quantity of water which must be stored in the reaches of the river, between the proposed dam and Liverpool, to meet the consumption during a period of drought; and, assuming the same quantity in this as we have been estimating for the Nepean and other projects, namely, 12 millions daily supply, for twelve months, we should require 4,300 million gallons of storage.

And, as the area of the channel of George's River, between Tom Ugly's Point and Liverpool, may be taken at 3,000 acres approximately, we should require a depth of fully 5 feet over this area to represent the required quantity; but again, over and above the quantity of water required for consumption in the city, we should require to make provision for what would be lost by evaporation and leakage during the time the reservoir would be receiving no accessions from the river, and when the whole supply must be drawn from it. The evaporation alone would be about 4 feet in the twelve months; but, for the sake of argument, taking that figure to represent all the sources of loss, and adding it to the before-enumerated figures, we should require the water in the reservoir to stand at the height of 14 feet 6 inches above high-water at spring tides at the commencement of the dry seasons, viz. :—

Ascent of canal and syphon	ft. in.
Storage	5 6
Evaporation and other sources of loss...	5 0
						4 0
						14 6

It may be asserted that those figures are too high, that the storage of so large a quantity as 4,300 million gallons would not be required, and that to make provision for so long a period as twelve months' supply is demanding too much of any scheme; but even if half the rates above demanded for storage and evaporation be taken as sufficient, it would not materially affect the question—it would only reduce the level at which the water in the reservoir must stand by about 4 feet 9 inches, which would not appreciably diminish the cost of the dam or the difficulties in the way of its execution, which, in either view, would be most formidable. No person who has not had experience in hydraulic works can comprehend the difficulties in the way of constructing a perfectly watertight dam of the dimensions the George's River one would be, in such a great depth of water and on such a bottom. I do not hesitate to say that it would be a work of exceeding difficulty. A glance at the sections and borings which have been taken at the different sites recommended will show this, the water for a considerable distance across the channel at Kangaroo Point being over 45 feet in depth, and beneath this again there are in places unknown depths of sand and soft mud certainly not less than from 12 to 25 feet, in not many cases has the boring rod been got down to the rock.

To attempt a masonry dam in this position, it would be obviously necessary to get down to the bed rock for a foundation. This would involve coffer-damming the full width of the river; and the cost of the coffer-dam and of the dam itself, which would not be less than 70 feet in height, could not be estimated at less than about £650,000—a sum which puts this class of work out of the question. It

It has been suggested that a dam might be formed by throwing down across the river the mountain of sand near Kirranulla Beach, and making a dam of it; and it seems to have been assumed that because the mouths of many of the rivers and lakes on the coast become at times silted up by the action of the waves, that the same thing may be done artificially at the mouth of George's River; but the conditions under which this silting takes place are totally dissimilar to those which exist at George's River; the mouths of the smaller rivers and lakes are never silted up unless when exposed to the action of the waves, which at certain seasons and with certain winds throw up large quantities of sand on the beaches and bars, and then when the tidal action is weak, by reason of the insufficient back-water area, the channel at the outlet frequently becomes altogether silted up, and remains so till the first land-flow forces a passage, and restores the channel to its original dimensions. At the mouth of George's River, situated far up in a still bay, the waves have little, if any, tendency to deposit sand within the river proper, whilst the rapid floods which at times occur, would sweep away any obstacle so easily moved as sand. No one who witnessed the ravages of the floods of 1857 and 1867 could for one moment doubt this. And again, the height at which the water in the river must stand above mean tide level to afford the requisite supply would render the cases still more dissimilar, for in no instance that I am acquainted with (and I have examined many of them) does the water ever rise in the rivers or coast lakes many inches above high-water level before it commences to cut a passage for itself through the sand; whereas, as I have before shown, the level of the water in George's River would require to be kept permanently at from 11 to 15 feet above high-water springs, to be of much use, and it is quite obvious that no sand-dam could effect this.

The only kind of dam that I can see which would afford any prospect, however small, of being water-tight—and even that I should be sorry to guarantee—would be one of similar construction to the Palder Dykes of North Holland, but the circumstances here would be far less favourable to success than there. The dykes in Holland are, for the most part, constructed in positions where the water is of inconsiderable depth in comparison to what we should here have to encounter, and the bottom is composed of mud—the alluvial deposit from the Rhine and other great rivers which intersect Holland. The material deposited by them in the swamps and marshes is a rich alluvium thoroughly impervious to water—is in fact, equal in all respects to good puddle; while at George's River, the bottom consists of sand, which cannot be considered an impermeable or water-tight stratum; and if, as is the case in the Palder dykes, their leakage be very considerable, and involve constant pumping, how much more so would it be at George's River, where even if the dam itself could be made water-tight, the underlying sand would not be so. The cost of a clay-puddled dam of this kind could not be estimated at less than £297,500, say £300,000, to which must be added the cost of the canal, additional pumping, plant, &c., amounting to £115,000 more, making in all £415,000, exclusive of the annual cost of pumping.

I am far from stating that such a dam as I have referred to would be water-tight. I believe, on the contrary, it would not; but, as it is the only kind of work which appears to me to offer even a chance of being successful, I have considered the matter as if it would be.

An ordinary embankment thrown down on the natural surface of the sand, without any attempt at puddling into the sand, would not retain the fresh water under any pressure, and the least leakage would be destructive of the whole thing; because, being impossible to discover where it existed, it could not be staunched, and would go on increasing till it ruined the whole structure. The difficulty of constructing embankments on dry land, which shall be thoroughly watertight, is sufficiently understood where every part of it can be seen and carefully examined as it is carried up, and when faults and leaks, if they exist, can be got at and repaired; whereas a dam at the site under consideration, formed in 46 feet of water, and subject to a strong and unceasing tidal action, as well as to considerable risk from land floods, could never be examined from first to last; for the examination by a diver would be quite valueless under such circumstances; the clay could not be touched at all, to press or ram it in place, as any such process would merely dissolve it into mud; and, on the other hand, if merely put down and allowed to consolidate by its own weight, who can assert that it must settle into a uniform and homogeneous mass, so as to make it a perfectly watertight wall? Who can say that all the precaution in laying and punning the clay which would be considered indispensable in a dam constructed on dry land would be unnecessary in 46 feet of water? I do not hesitate to say that, so far from being so, the very opposite would be the case—far more care in every detail of the execution would be necessary in the latter than in the former case; the mere scour of the flow and reflux of the tide would of itself be a most formidable difficulty in the way of getting the puddle to settle and consolidate.

But even letting it be granted that the dam could be constructed and made water-tight, what then have we got? How far are we advanced towards the attainment of our object—the providing of an unfailing supply of the purest water for Sydney? We should, it is true, have dammed up an estuary of salt water—an estuary fringed with a vast number of bays, coves, and with deep creeks branching off it on either side, all highly impregnated with salt. Who would venture to say, under the circumstances, when this estuary would become fresh, or how many years it might take to wash all the salt water out of the bays, coves, and creeks, and out of the sand and mud which forms the bottom of the channels, and the salt marshes which abound on their margins? I do not think it is possible even to conjecture; and having besides heard the evidence of many intelligent witnesses examined before the Commission, to the effect that not only are many of the creeks falling into George's River—notably Prospect Creek, Salt-pan Creek—in fact all its tributaries which flow off the Wianamatta shales, salt, but that

even the waters of George's River itself above the dam at Liverpool become brackish during droughts,—with all these facts before us—first, the difficulty amounting almost to an impossibility, of constructing an efficient dam, and the enormous cost of such a work; and secondly, the hoplessness of ever washing the salt water not only out of the main channel of the estuary, but also from its numberless bays and indentations; and thirdly, the fact of many of the principal tributaries being themselves salt,—with all those facts, I say, before us, the conviction cannot, I think, be resisted that George's River is not the source from which we should look to drawing a supply of pure water for Sydney.

And further, if none of those, as I consider them, fatal objections existed, we should have this weighty one,—that if this source were selected, it would be necessary to remove the Benevolent Institutions which have been established at Liverpool, the drainage from which finds its way into the river, as well as the Paper Mills and Wool-washing Establishments, and close for ever the most convenient and promising outlet for the manufactories which may be expected to spring up near the city. The suitability of George's River for these purposes has been already clearly indicated, by the establishment on its banks of two of those most promising industries. If they be banished from their present abodes, I cannot very well see where they would again find so convenient a "location."

E. O. MORIARTY.

Mr. Bennett's estimate of the expense of supplying Sydney from the Grose River.

A MASONRY dam, 60 feet greatest height, and about 700 feet long, to be built across the river valley, near Mount George. Pipes to start from a small dam, 5 miles above Barton's Creek, and 425 feet over high-water; to deliver water in Sydney at 150 feet, giving a fall of 5 feet per mile.

To deliver 12,000,000 gallons per diem, with one pipe. Pipe to be 41 inches diameter; 1.3643 inch thick, for 20 miles, in depressions; remainder, 1.25 inch thick:—

1.3643 pipe weighs 1,531 tons per mile, at £11 per ton, laid = £16,841, say £17,000 per mile.

1.25 thick pipe weighs 1,349 tons per mile, at £11 per ton, laid = £14,839, say £15,000 per mile.

	£
20 miles, at £17,000	340,000
35 miles, at £15,000	525,000
	<hr/>
	865,000
Check and air valves, water-locks, man-holes, and relief-valves, say ...	30,000
	<hr/>
	895,000
Dam in the Grose Valley, and other works at Sydney end ...	150,000
	<hr/>
	<u>£1,045,000</u>

With two 31-inch mains, to deliver 6,000,000 gallons per diem each:—

1 mile of 31-inch main, 1.14 inch thick, weighs 957 tons, at £12 per ton, laid, £11,500 per mile.

	£
55 miles, at £11,500 per mile... ..	632,500
Check, air, and relief valves, man-holes, &c.	20,000
Dam at the Grose, and other works	150,000
	<hr/>

Cost of delivering 6 million gallons per diem ... 802,500

2nd pipe:—

55 miles, at £11,500	632,500
Check and air valves, &c.	20,000
	<hr/>
	<u>£1,455,000</u>

WILLIAM C. BENNETT.

27 February, 1869.

(Circular

(Circular sent by the Water Commission to the Suburban Municipalities, and replies thereto.)

Sydney Water Commission,
Public Works' Office, Phillip-street,
Sydney, 28 October, 1867.

Sir,

I have the honor, by direction of the Commission appointed to inquire into the Water Supply of Sydney and Suburbs, to invite your attention to this inquiry, and to request you will be good enough to inform the Commissioners how your Municipality is supplied with water, and whether you consider the supply sufficient, and if not, what suggestions you can offer towards improving it.

I have, &c.,

GEO. E. FAITHFULL,
Secretary to the Commission.

The Chairman of the _____ Municipality.

The Council Clerk, Balmain, to The Secretary to the Sydney Water Commission.

Council Chambers, Balmain,
30 October, 1867.

Sir,

In reference to your letter of 28th instant, requesting the Chairman of this municipality to inform the Sydney Water Commission how this municipality was supplied with water, and whether he considered the supply sufficient, and if not, what suggestion he could offer towards improving it,—I have the honor, by direction of the Chairman, to state in reply,—

1. That the municipality is supplied at present by means of some private wells, rain-water collected off roofs of houses into tanks, and from a very small creek which is rapidly becoming a second *Tank Stream*.

2. That the supply is not, even now, sufficient, and that last year application was made to the City Council for a supply from them by means of a pipe, *via* Glebe Island, or otherwise; to which they replied stating that they were not then in a position to entertain the question, and

3. That the only suggestion he can offer at present for getting a supply is the laying down of a pipe from Sydney, should there be sufficient water there to spare, or in the event of the water being brought from the Nepean or George's Rivers along the Railway line, a branch pipe from Sydenham into the municipality.

I have, &c.,

J. M'DONALD,
Council Clerk.

The Mayor, St. Leonards, to The Secretary to the Sydney Water Commission.

St. Leonards,
6 November, 1867.

Sir,

I beg to acknowledge the receipt of your circular letter to me of date the 28th ultimo, and, by request of the Municipal Council of St. Leonards, to inform you, for the information of the Commissioners, that this municipality is supplied with water from wells connected with surface springs, from tanks of various kinds attached to the roofs of houses, and from creeks, all of which modes of obtaining a supply of fresh water are inefficient and uncertain, as practically depending on *frequent* rain for their replenishment, and fail as a rule when most needed, *viz.*, in hot and dry weather.

The water of this neighbourhood is however of good quality, as that which passes through the sandy soil is thought to take up but little impurities from it; and the land at present being but sparsely occupied with people, is not artificially charged with organic or other deleterious matter, and therefore does not add anything to materially affect the quality of the water.

The creek leading to the Willoughby Falls, and some land on a portion of its banks, are reserved by Government for a supply of water for this municipality; but the gathering ground or watershed is comparatively small, and much of it has been sold as town allotments, and partly occupied with houses and their offices; and there are already two milkmen, having a number of cows, pigs, and other animals located on the alienated portion of the stream, together with several water-closets erected in near proximity to it, the filth of which is washed in by every rain; and it is not certain that the Protestant Episcopal Burying Ground does not also drain into the same creek. All these considerations, together with its want of elevation to supply water by gravitation, renders the reserve obviously unfit for the purpose intended (but nevertheless very desirable for many other purposes); nor is there, that I am aware of, any land sufficient in quantity and elevation attainable anywhere in this district to furnish a permanent and abundant supply of fresh water to this neighbourhood.

I have examined the Lachlan and Botany Swamps, with the object of judging of their capability of supplying Sydney and suburbs with water, and am willing to admit that a large quantity of that element may be obtained from them, but nothing approximating, in my opinion, to a certain and sufficient quantity for all time; besides which, the
pumping

pumping process must always be expensive and liable to accident ; and, from the position of the Botany Waterworks alone, the precariousness and uncertainty of the supply must be increased. I therefore suggest that a careful examination and survey be at once commenced, with a view of determining an eligible situation for an abundant and permanent supply of pure water by gravitation for the whole of the County of Cumberland, not only for domestic and manufacturing purposes, but for public baths, fountains, and irrigation of land, and all other requirements depending on a large and constant supply of fresh water. To carry out this suggestion of course implies the outlay of a large sum of money, and, in my opinion, the management of the water supply generally to be entrusted to Commissioners under an Act of Parliament, rather than to the Municipal Council of the City of Sydney. The first, and probably the most important consideration in this matter is, to obtain a gathering ground of sufficient extent, elevation, and purity of soil for an abundant supply to the highest levels in Cumberland ; and the second, to secure the land for reservoirs and ducts to Sydney and the principal gatherings of population, at a fair valuation as to price. In an engineering point of view, the site for the gathering ground should be one capable of extension in future years, as the demand upon it increased, and we could afford the additional outlay of money.

Force seems indispensable in supplying towns with water, as I am convinced that much water is wasted in Sydney in closets and sewers, without accomplishing the object intended, simply from the want of *force* to sweep them clear.

As regards the supply of water to the North Shore, I confess my inability to see how we may reasonably expect to procure a supply from Botany ; but if a sufficient head of water is stored at the Blue Mountains, we may, I think, confidently hope that at some future time an abundant and cheap supply may be had by way of Sydney, across the harbour or by the proposed bridge across the Parramatta River at Five Dock, thereby including Hunter's Hill Municipality, and the north side of the Parramatta River generally.

If the Commissioners desire it, I shall be most happy to attend them and afford verbally such further particulars as may be in my power to give, as I am anxious that this inquiry should be conducted to a satisfactory conclusion.

I have, &c.,

WILLIAM TUNKS,
Mayor.

The Council Clerk, Redfern, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers, Redfern,
11 November, 1867.

Sir,

I have the honor, by direction of the Chairman, to acknowledge the receipt of your communication of the 28th ultimo, in which you request information as to the sufficiency of the supply of water to this municipality, and if not sufficient, inviting suggestions towards improving it.

In reply, I am directed to state that occasionally the supply of water is very deficient, but the Chairman is unable to offer any suggestions for improving it.

I have, &c.,

THOMAS FRASER,
Council Clerk.

The Council Clerk, Cook, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers of Cook,
Camperdown, 14 November, 1867.

Sir,

In reply to your letter of the 28th ultimo, inviting the attention of this Municipal Council to the inquiry now being made into the Water Supply of Sydney and Suburbs, I am directed by the Chairman to inform you that the supply of water in this municipality is in part obtained from wells, which become dry during a continuance of drought, when water is procured from Sydney and hawked about the streets. The Council, therefore, consider that the quantity at present obtainable by the inhabitants is not sufficient for their purposes.

I am to add that, if any scheme can be carried out by which the inhabitants of this district could be supplied with water, without having recourse to wells for the same, it would be deemed a great boon, as, from the small size of the allotments in this neighbourhood, the number of cesspits in close contiguity to the wells is very large ; it is therefore thought that the water must be tainted to a very great extent. Many of the inhabitants are willing to connect with a main pipe, should one be ever laid in the district for the supply of water ; and I am informed that subscriptions towards the laying of the same would be contributed, in the event of such a work being about to be carried out.

I have, &c.,

WM. J. HOWE,
Council Clerk.

The

The Council Clerk, Paddington, to The Secretary to the Sydney Water Commission.

Council Chambers,
Paddington, 18 November, 1867.

Sir,

I have the honor, by direction of Chas. Artlett, Esq., Chairman of the Paddington Municipal Council, in reply to yours of the 28th ult., asking information for the Commissioners appointed to inquire into the Water Supply for the City and Suburbs, to state that Paddington is wholly dependent on wells and water-carts.

Various applications have been made, by petition and otherwise, to the City Corporation, to supply this locality, and promises in abundance have been given, but not kept by that body. Their first excuse was, that until the reservoir was built they could not put on pressure enough; but now, although it has been finished some time, we are as far off as ever of having the earnest desire of the inhabitants gratified, as the reservoir seems hardly capacious enough to supply the higher levels of Sydney and water many of its streets.

The annexed copy of a letter addressed by this Council to the Sydney Corporation, in March last, will clearly state our present position in this matter.

The conference referred to, as appointed by the Mayor, was not held, on account of his absence at the time appointed.

Previous to the finishing of the reservoir, the then Mayor and the Engineer promised that pipes would be laid from it down the Old South Head Road, so that the Lower Ward and the Glenmore Road might be easily supplied, instead of which the pipes are laid at the back of the Barracks.

I have also to state that the Council, having lost all confidence in the Sydney Corporation as a Water Supply Committee, are erecting public pumps for the benefit of the rate-payers.

As to a general and permanent supply of water to the city and suburbs, they believe that the Nepean is the most suitable locality for a reservoir to be constructed, where arrangements might be made for filtering the water through rubble and sand, to prevent any impurities the water might contain entering the basin supplying the pipes. Two basins holding about (30,000,000) thirty million gallons each, one filtering into the other from the dam, would give a constant supply for centuries to come.

The whole district of Paddington could be supplied if a reservoir was built on the Reserve within the Randwick Municipality, and a pump of a few horse-power placed thereon. To carry out this, permission should be obtained to borrow upon the joint rates of Paddington, Woollahra, Waverley, and Randwick, which might be supplemented by an equal amount from the general Revenue.

I am also directed to say, that both the Chairman and myself will be happy to afford any oral information the Commissioners may require in explanation or illustration of this communication.

I have, &c.,
JOHN DAVIS,
Council Clerk.

[Enclosure.]

Council Chambers,
Paddington, 14 March, 1867.

To the Right Worshipful the Mayor and Aldermen of Sydney.

Sir and Gentlemen,

I am instructed by the Chairman of the Municipality of Paddington, to remind you of the subject the Deputation was to have conversed with you upon, on Monday last, at half-past 11 A.M., but were disappointed, viz., "Water Supply to this Municipality."

In March, 1864, it was distinctly promised that when the Reservoir was finished, pipes would be laid down to supply the lower levels of Paddington; and in order to facilitate the work, the then Mayor and the Engineer asked for a plan of the municipality, with the general levels of the streets marked thereon. This was supplied in January, 1865. Subsequently, a petition for a supply to 666 rooms was sent to your office.

On the 24th February, 1866, this Council were informed that the subject was to come under consideration on the then 1st proximo; that a bond-book should be forwarded to this office, for the convenience of persons living near to the Council Chambers; and that, in order to supply the higher levels, your Council had reserved from sale the engine which was formerly used at the Swamp, for the purpose of fixing it on the reservoir to supply the higher levels to Waverley; that arrangements had already been made for attaching a 12-inch main at the head of Dowling-street, for supplying our lower levels.

The bond-book not having been forwarded, application was made for it on the 9th March, 1866. No reply being given, a deputation waited upon the Mayor, and were informed by him and the Engineer, that there was no doubt about the supply of water being granted, after the necessary inspection of the rooms.

The Inspector came, and to facilitate his work, was accompanied by our Clerk to the various houses.

Then, subsequently, we were told that as soon as the Bill extending the powers of your Corporation was passed we *should have* the water.

I have likewise to inform you, specially, now that the Bill has become law, that within the lower levels from the junction of Dowling and Botany Streets there are over 900 rooms which can be easily supplied—the highest point being the Council Chambers; which, at the usual rates, would give an interest on £2,200. Query—Would the outlay be more than *one-half* that amount?

From the city boundary at William-street East to M'Lean-street at the Darling Point Road there are 240 rooms which can be supplied if the 6-inch pipe which is laid in William-street be continued. The short length of 3-inch which is laid down at the bottom of said street would suit for the Glenmore Road. 240 rooms at the usual rates would give 10 per cent. on £600. Query—Would the outlay required amount to £400?

By

By placing the pump on the reservoir as formerly promised, Upper Paddington, Woollahra, and Waverley, could be supplied, which would no doubt give an interest of 10 per cent. on £10,000. Query—Would the required outlay amount to £8,000? Beside all this, where the mains are laid down, houses will increase in number.

Trusting this subject will be at once decided, and the Council informed thereof,—

I have, &c.,
JOHN DAVIS,
Council Clerk.

The Council Clerk, Waterloo, to The Secretary to the Sydney Water Commission.
Municipal Council Chambers,
Waterloo, 18 November, 1867.

Sir,

I am directed by the Municipal Council of Waterloo to acknowledge the receipt of your letter of the 28th ultimo, respecting the supply of water in this locality, and have the honor to state in reply, that the municipality is supplied with water from wells, that the supply is sufficient for present requirements, and that a large quantity exists within the boundaries of the district, which is used by parties engaged in the fellmongering business.

I have, &c.,
T. M. SLATTERY,
Council Clerk.

The Council Clerk, Glebe, to The Secretary to the Sydney Water Commission.
Municipal Council Chamber,
Glebe, 26 November, 1867.

Sir,

No meeting of the Council has been held since the receipt of your letter of the 28th October respecting the supply of water to this municipality. This has caused delay in sending a reply.

I have been directed by the Chairman to inform you that complaints have, in some instances, been made that the supply of water has not been regular.

The requirements of persons residing in the lower parts of the municipality have been generally met, but in some other localities the residents have been for two or three consecutive days without water. This appears to have occurred in the higher levels of the municipality, such as Arundel-terrace, Derwent-street, and the higher parts of Glebe Road.

In these parts the water scarcely ever flows during the day-time, and great inconvenience is thus experienced.

I have, &c.,
HENRY COLLEY,
Council Clerk.

The Council Clerk, Randwick, to The Secretary to the Sydney Water Commission.
Municipal Council Chambers,
Randwick, 26 November, 1867.

Sir,

I have been directed by the Chairman and Councillors of the municipality of Randwick to state, in reply to the inquiries contained in your letter of 28th October, touching the supply of water to this municipality,—

1st—That our supply is derived from wells, tanks, and surface springs.

2nd—That the supply is inadequate for present wants.

3rd—That if this municipality cannot be supplied from the Lachlan Swamp, some other more distant source must be looked for.

I have, &c.,
H. HAMBURGER,
Council Clerk.

The Council Clerk, Newtown, to The Secretary to the Sydney Water Commission.
Municipality of Newtown,
Council Chamber, 30 November, 1867.

Sir,

In reply to your letter of the 28th ultimo, requesting to be informed how Newtown is supplied with water, and whether the supply of the same is considered sufficient, and if not, what suggestions can be offered towards improving it,—I have the honor, by direction of the Chairman, to respectfully request that you will lay the enclosed Report (which has recently been adopted by this Council) before the Commissioners, for their consideration.

I have, &c.,
ROBERT BANKS,
Council Clerk.

[Enclosure.]

[Enclosure.]

Report respecting the present and future supply of Water, adopted by the Municipal Council of Newtown, 27th November, 1867.

1. Newtown is at present supplied with water chiefly obtained from the roofs of houses, and retained in wells and tanks. During the summer months one-fourth of the inhabitants have to purchase a considerable quantity of water from persons who deliver it at their houses with water-carts, and the present supply is very inadequate.

2. The City Corporation will not, it is believed, be able to supply Newtown with a permanent supply of water from the present Waterworks at Botany, in consequence of the great scarcity after a short period of dry weather. Even supposing they had a superabundant supply for the city of Sydney and suburbs, where the water-mains are already laid, it is very doubtful whether Newtown can ever look to that source for water; because the mains laid down at the Glebe and South Sydney are not connected with the high-level reservoir at Paddington, consequently they are not high enough to supply Newtown; and the City Corporation have never evinced any disposition to expend money to lay on water-mains in connection with that reservoir which would be serviceable to Newtown.

3. Newtown would be placed in a very deplorable condition in case of a fire occurring during the summer months; and the suggestions we would respectfully offer are, that steps cannot be taken too soon by the Government, in procuring a permanent supply of water for Sydney and its suburbs, from one of the rivers that arise in the Blue Mountains, so frequently of late pointed out by professional gentlemen, through the medium of the public Press, as the only means of insuring a permanent and wholesome supply of water.

The Chairman, Marrickville, to The President and Members of the Sydney Water Commission.

Municipal Council Chambers,
Marrickville, 5 December, 1867.

Sir and Gentlemen,

In reply to your communication of the 28th October last, I have the honor to state that the inhabitants of Marrickville are inadequately supplied with surface water only from wells and tanks.

Marrickville is a rapidly increasing suburb, every year an abundant supply of pure water will become of greater importance, and it seems impossible that this can be obtained by any local effort. If the city be supplied from any of the fresh water tributaries of George's River, the main or canal would probably pass through Marrickville, on account of the nature of the land; in that case, of course, the inhabitants of the district could be readily supplied.

From what I have heard, I think it likely that a supply of pure water could be brought by gravitation through Marrickville into Sydney from the upper portion of the Warrenora branch of George's River. I do not know this from my own observations; but perhaps the Commissioners would think such a supposition of sufficient importance to induce them to ascertain the fact for themselves by personal inspection.

I have, &c.,
SAMUEL PAYTEN,
Chairman.

The Chairman, Woollahra, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers,
Woollahra, 19 December, 1867.

Sir,

In reply to your letter of the 28th October, inquiring how this municipality is supplied with water, and inviting suggestions as to the best means of improving it,—I have the honor to inform you that this Council have given the subject full consideration, and I beg to submit the following as the result of the deliberations of the Council:—

At present there is no supply but what the inhabitants themselves obtain from wells or tanks; and the only modes of obtaining a proper supply that appears at all practicable are the following:—

1st. By making a reservoir on the high ground on the south side of the Old South Head Road, opposite Ocean-street, which could be supplied by having a standing engine at the Paddington Reservoir.

2ndly. By making a reservoir in the above spot, and having a separate engine at the Lachlan Swamp wherewith to keep it supplied.

3rdly. There is a locality on the eastern side of the Old South Head Road, between Rose Bay and Bondi, into which a very large watershed is drained, and where many acres are constantly covered to a depth of several feet with good water. By collecting it here, and forcing it up to a reservoir on the top of Bellevue Hill (where there is a piece of Government land sufficient for the purpose), it is believed a good supply might be obtained for the whole municipality of Woollahra, and probably Waverley also.

I have, &c.,
RANDOLPH NOTT,
Chairman.

(Queries sent to Municipalities of Sydney and Suburbs, and replies thereto.)

The Secretary to the Sydney Water Commission to The Mayor of Sydney.

Sydney Water Commission,
Public Works' Office, Phillip-street,
Sydney, 17 October, 1868.

Sir,

I have the honor, by direction of the Sydney Water Commissioners, to request that you will kindly assist them in their inquiries, by supplying them with information on the following points:—

1. The assessed annual value of city property.
2. The rate per £ levied for all purposes (except water).
3. The number of houses on which water rates are levied, distinguishing those in the city from those in the suburbs.
4. Is there any general water rate levied in addition to 5s. per room on houses actually supplied?
5. The gross amount of water rate for 1867, or for the latest financial year.
6. Total revenue from all sources on account of water supply.
7. The total amount of charges on account of water supply for the latest financial year—distinguishing working expenses, additions to "plant," and interest on debt.

I have, &c.,
GEO. E. FAITHFULL,
Secretary to the Commission.

The Town Clerk, Sydney, to The Secretary to the Sydney Water Commission.

Town Clerk's Office,
Sydney, 28 October, 1868.

Sir,

In compliance with the request contained in your letter of the 17th instant, I have the honor, by direction of the Right Worshipful the Mayor, to furnish, for the information of the Sydney Water Commissioners, the following replies to your questions, viz. :—

1. The assessed annual value of city property, on the 31st December last, was £700,000.
2. The rates levied are,—
City rate, 1s. in the £.
Watering-street rate, upon properties in the streets which are watered, varying from 1d. to 6d. in the £.
Sewerage rate, varying from $1\frac{1}{2}$ to $3\frac{1}{4}$ per cent., upon all properties which can connect with a public sewer.
3. The number of houses upon which water rates are collected are 12,900 in the city, and 2,200 in the suburbs.
4. Besides the general rate of 5s. per room, special rates are collected in all cases where extraordinary or additional supply of water is required.
5. The water rate collected during the year 1867 was £25,500.
6. The total revenue on account of the Waterworks for the same period was £28,000.
7. The detailed expenditure on account of the Waterworks, sufficient, it is hoped for the purposes of the Commissioners, will be found in the enclosed printed abstract of the accounts for the year 1867.

I have, &c.,
CHAS. H. WOOLCOTT,
Town Clerk.

The Mayor, Balmain, to The Secretary to the Sydney Water Commission.

Borough of Balmain,
Council Chambers,
21 October, 1868.

Sir,

I have the honor, in reference to the application from the Sydney Water Commission, as contained in your letter of the 17th instant, to forward, for your information, the following :—

1. The assessed annual value of the property in this borough is £1,966.
2. The number of houses on which rates are levied, 1,044.
3. The rate levied for all purposes, 1s. in the £.
4. I am of opinion that the rate-payers generally would gladly avail themselves of the opportunity of obtaining a supply of water, and that they would freely pay a reasonable additional tax for that purpose.

I have, &c.,
H. PERDRIAU,
Mayor.

The Council Clerk, Balmain, to The Secretary to the Sydney Water Commission.

Borough of Balmain,
Council Chambers,
30 October, 1868.

Sir,

In reference to the application in respect to the annual value of the property in this borough on which the assessment is made, I have the honor, by direction of the Mayor, to state that the amount as per rate-book, according to the valuation made for 1868, is £39,320.

I may state that, since that valuation was made, there has been a considerable number of houses erected in the borough, which, for the valuation of 1869, will probably bring the annual value of property for that year to £41,000.

I have, &c.,
HENRY CATT,
Council Clerk.

The Council Clerk, Camperdown, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers,
Camperdown, 3 November, 1868.

Sir,

In reply to your letter of the 17th ultimo, requesting information for the assistance in their inquiries of the Sydney Water Commission, I have the honor, by direction of the Mayor, to inform you that the assessed annual value of the rateable property, for the current year, is £2,134, the number of houses on which rates are levied are 81, and the rate per £ for all purposes 1s.

I am also to add, that the Council is of opinion that the inhabitants are willing to pay an additional rate for a pure and sufficient supply of water.

I have, &c.,
WM. J. HOWE,
Council Clerk.

The Council Clerk, Cook, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers,
Cook, 31 October, 1868.

Sir,

I have the honor, by direction of the Mayor, to acknowledge the receipt of your letter of the 17th instant, requesting information on certain points respecting this municipality; and, in reply thereto, I am to state that it is the opinion of this Council that the inhabitants generally of this district are in favour of an additional supply of water, could it be obtained, as they have at the present time frequently to purchase water brought from Sydney by water-carriers, and that they would be willing to pay an additional rate for the extra accommodation.

I am also to add, that the assessed annual value of the rateable property in the borough, for the current year, is £7,091; the rate per £, levied for all purposes, 1s.; and the number of houses on which rates are levied, 295.

I have, &c.,
WM. J. HOWE,
Council Clerk.

The Council Clerk, Glebe, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers,
Glebe, 21 October, 1868.

Sir,

Referring to your letter dated the 17th current, requesting to be informed on certain points respecting this municipality,—I have been directed by the Mayor to reply as follows:—

The assessed annual value of property within the borough, as shown by the assessment for the current year, is £31,468.

The number of houses on which rates are levied is 1,007.

The rates for the current year are 1s. 2d. in the £.

In answer to your question as to whether the inhabitants would be willing to pay an extra rate for a supply of water, I have been instructed by the Mayor to state that he is not able, at present, to offer an opinion on the subject, nothing having come under his notice calculated to assist him in forming one.

I have, &c.,

HENRY COLLEY,
Council Clerk.

The Council Clerk, Marrickville, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers,
Marrickville, 24 October, 1868.

Sir,

In reply to your letter of the 17th instant, I have the honor to furnish you with the following information:—

1st. The assessed annual value of property in the borough is £11,445 8s.

2nd. There are 219 houses on which rates are levied.

3rd. The rate per £, levied for all purposes, is 1s. in the £.

In answer to the 4th question, I am directed to inform you that the Marrickville Council are entering upon a work by which they hope to be able not only to provide an abundance of good water for their own borough, but for other suburbs adjacent, and even, if necessary, to furnish a considerable supply to Sydney.

I have, &c.,

G. C. TOMPSON,
Council Clerk.

The Council Clerk, Newtown, to The Secretary to the Sydney Water Commission.

Borough of Newtown,
Municipal Council Chambers,
Newtown, 21 October, 1868.

Sir,

I beg to acknowledge the receipt of your letter of the 17th instant, requesting information on the following points, viz.:—

1. The assessed annual value of property in the Newtown Municipality.

2. The number of houses on which rates are levied.

3. The rate per £ levied for all purposes.

4. In the opinion of the Mayor, would the inhabitants generally be willing to pay an additional rate of a reasonable amount for a sufficient supply of water?

In reply, I am instructed by His Worship the Mayor, to inform that—

1. The assessed annual value exceeds (£1,200) twelve hundred pounds sterling.

2. The number of houses on which rates are levied is (852) eight hundred and fifty-two.

3. The rate per £ levied for all purposes is 1s.

4. And that the Mayor's opinion is, that the inhabitants generally would be willing to pay an additional rate, of a reasonable amount, for a sufficient supply of water.

I have, &c.,

ROBERT BANKS,
Council Clerk.

The Council Clerk, Newtown, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers,
Newtown, 29 October, 1868.

Sir,

I beg to acknowledge receipt of your letter of the 26th instant, requesting to know the total value of property in Newtown on which the assessment is made.

In reply, I have the honor, by direction of the Mayor, to inform you that the estimated value of property in the borough is (£268,213) two hundred and sixty-eight thousand two hundred and thirteen pounds sterling.

I have, &c.,
ROBERT BANKS,
Council Clerk.

The Council Clerk, Newtown, to The President, Sydney Water Commission.

Municipal Council Chambers,
Newtown, 2 November, 1868.

Sir,

In reply to your letter of the 31st ultimo, I beg to inform you that the estimated annual rental value of property in this borough is (£26,449) twenty-six thousand four hundred and forty-nine pounds sterling.

I have, &c.,
ROBERT BANKS,
Council Clerk.

The Town Clerk, Paddington, to The Secretary to the Sydney Water Commission.

Town Hall, Paddington,
21 October, 1868.

Sir,

I have the honor to acknowledge the receipt of your letter of the 17th instant, requesting information for the benefit of the Sydney Water Commission. In reply, I beg to state as follows:—

- 1st. The assessed annual value of the various properties amounts to £19,836 5s.
- 2nd. The number of houses last February, 731.
- 3rd. The rate per £ is 1s.
- 4th. Although the Council of this borough have gone to considerable expense in erecting public pumps, yet I believe a goodly number of the inhabitants would take the water if laid on at a reasonable rate, for which the Municipalities Act of 1867 provides.

Will you kindly inform the Mayor and Aldermen of this borough, for the information of the rate-payers, what probability there is for a supply of water, and from what source?

I have, &c.,
JESSE COWLEY,
Town Clerk.

The Council Clerk, Randwick, to The Secretary to the Sydney Water Commission.

Council Chambers,
Randwick, 24 October, 1868.

Sir,

I am directed by the Mayor and Council of this borough to acknowledge the receipt of your letter of the 17th instant, and to supply you with the information asked for therein, viz. :—

Annual value of property assessed	£13,231
Number of houses on which rates are levied	146
Rate per £	1s.

I am further directed by the Mayor to inform you that, although the inhabitants are supplied from their own private wells, in his opinion there are many who would avail themselves of a supply from Sydney, and would willingly contribute thereto.

I have, &c.,
E. T. SAYERS,
Council Clerk.

The Council Clerk, Redfern, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers,
Redfern, 26 October, 1868.

Sir,

I have the honor to acknowledge the receipt of your letter of the 17th instant, addressed to the Mayor, asking information on the following points:—

1. The assessed annual value of property in this municipality.

Reply:—£1,588.

2. The number of houses on which rates are levied.

Reply:—1,125.

3. The rate per £ levied for all purposes.

Reply:—1s.

4. Would the inhabitants generally be willing to pay an additional rate, of a reasonable amount, for a sufficient supply of water?

Reply:—The Mayor is of opinion that they would, for the supply at present is very deficient, and numerous complaints have reached His Worship on the subject.

I have, &c.,

THOMAS FRASER,
Council Clerk.

The Council Clerk, Redfern, to The President, Sydney Water Commission.

Municipal Council Chambers,
Redfern, 2 November, 1868.

Sir,

I beg to express my regret at the trouble I have occasioned by copying (in the hurry of my engagements on the 26th ultimo) the amount payable as rates, instead of the assessed annual value of property in this municipality, which is £31,760.

Have the goodness to substitute this sum for the one given in error in my reply to the 1st query.

I remain, &c.,

THOMAS FRASER,
Council Clerk.

The Council Clerk, St. Leonards, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers,
St. Leonards, 22 October, 1868.

Sir,

In reply to your letter of the 17th instant, asking for certain information respecting this borough, I have the honor, by direction of His Worship the Mayor, to supply you with the same, viz. :—

1. The assessed value of all rateable property in this borough is £14,265.

2. The number of houses within this borough is 375.

3. The rate per £ levied for all purposes is 1s.

4. In the opinion of His Worship the Mayor, the inhabitants of this borough generally would be willing to pay an additional rate, of a reasonable amount, for an adequate supply of water.

I have, &c.,

GEORGE PILE, JUN.,
Council Clerk.

The Council Clerk, Waterloo, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers,
Waterloo, 21 January, 1869.

Sir,

I am directed by the Mayor to acknowledge the receipt of your letter of the 16th instant, and to inform you that the rental of property in this municipality averages from £13 to £30 per annum; that there are 562 houses in it; and that the present rate per £ is 1s.

I have, &c.,

T. M. SLATTERY,
Council Clerk.

The Council Clerk, Waverley, to The Secretary to the Sydney Water Commission.

Borough Chambers,
Waverley, 24 October, 1868.

Sir,

By direction of the Mayor of this borough, I have the honor to acknowledge receipt of your letter of the 17th instant, and beg respectfully to furnish you with all the information we can afford you.

- 1st. The assessed annual value of property within this borough is £16,906.
- 2nd. There are 242 houses assessed, and upon which rates are levied.
- 3rd. A rate of 1s. in the £ for all purposes.
- 4th. In consequence of the large extent of ground over which the house property extends, it is impossible to tell what would be a reasonable amount for an additional rate, and, in consequence of a considerable number of houses being abundantly supplied, whether the whole of the inhabitants would be willing to pay, or merely those upon whose property water for domestic purposes cannot be obtained by wells.

I shall be most happy to furnish any further information you may require.

I have, &c.,

W. MORTIMER,
Council Clerk.

The Council Clerk, Woollahra, to The Secretary to the Sydney Water Commission.

Municipal Council Chambers,
Borough of Woollahra, 1 February, 1869.

Sir,

In reply to your letter of the 16th January, I have the honor to state, for your information, that the estimated annual rental of property in this borough is £39,840, the number of houses 679, and the rate per £ 1s.

I have, &c.,

HENRY J. KILLICK,
Council Clerk, Borough of Woollahra.

NOTE.—The numbers indicating the amount of rain in the months June, July, August, September, October, and December, 1864, in this table, are different from those in the succeeding table of daily rainfall for that year; the reason being that, during 1864, the rain was entered on the day it fell, instead of at 9 a.m. on the day following, as is usual.

WATER SUPPLY OF SYDNEY AND ITS SUBURBS—APPENDIX.

WATER SUPPLY OF SYDNEY AND ITS SUBURBS—APPENDIX.

185

Return of Rainfall—continued.

Sketch illustrating Watersheds in various Schemes for supplying Sydney with Water

Engraved at the Surveyor General's Office, Sydney, June 1862.

"SYDNEY WATER COMMISSION" PLAN shewing PRESENT WATER SUPPLY and PROPOSED IMPROVEMENTS

NOTE
 All subdivisions of land shewn in black lines have been alienated.
 Subdivisions at Randwick tinted pink alienated with the condition that one residence only be erected on each.
 Proposed improvements shewn in crimson.
 Boundary of present watershed edged green.
 Boundary of additional watershed edged purple.
 Line of Sections shewn in blue.
 Dams proposed by City Engineers shewn in blue.

NEW SOUTH WALES.

AUSTRALIAN MUSEUM.

(REPORT FROM TRUSTEES, FOR 1868.)

Presented to Parliament, pursuant to Act 17 Vict., No. 2, sec. 9.

REPORT OF THE TRUSTEES OF THE AUSTRALIAN MUSEUM, FOR THE YEAR
ENDING 31ST DECEMBER, 1868.TO HIS EXCELLENCY THE GOVERNOR-IN-CHIEF,
&c., &c., &c.

1. The Trustees of the Australian Museum have the honor to submit to your Excellency this their Fifteenth Annual Report.

2. The Museum has been open to the public daily (Sundays excepted) during the past year, and has been visited by 108,727 persons.

3. The system of exchanging specimens of Natural History with the principal Foreign Museums is still maintained by the Trustees, who have received several valuable collections during the past year, a list of which is appended. (*Appendix No. 2.*)

4. Numerous donations have been received during the year, a list of which is appended. (*Appendix No. 3.*)

5. In Appendix No. 4 will be found a list of the various objects sent in exchange, together with the name of the recipients.

6. Several valuable works, purchased out of the Endowment Fund, have been added to the Museum Library, a list of which is appended. (*Appendix No. 5.*)

7. Two Taxidermists have been occupied during the year in preparing and mounting the following specimens:—

16 mammals,
195 birds,
10 reptiles,
12 skeletons of various animals,—

and in cleaning and preserving from decay the collection already displayed for public inspection.

8. The Trustees have again to draw attention to the fact that the first edition of their Catalogue is out of print, and that a second enlarged edition is urgently required; and as the Endowment Fund is much encroached upon already for the purchase of the necessary books and periodicals, they are not in a position to proceed with the printing. Under these circumstances, the Trustees recommend that application be made to have a sum put on the Estimates sufficient to cover the expenses of printing. The Trustees believe that if this was done for a few years, a publishing fund could thus be raised, which would cover the expenses of so desirable an object.

9. The new wing has been open to the public since January, and the number of visitors has largely increased, from 11,300, in 1860, to more than 100,000 persons during the past year. The collection is also much larger, in better condition, and far more valuable than it was previously; but to keep the specimens in this state, to prevent damage, and maintain order among the increased number of visitors some additional funds are urgently required.

10. The Assistant Curator, Mr. George Masters, has departed for West Australia, and collected already some valuable and interesting specimens, a list of which is appended. (*Appendix No. 6.*)

11. *Appendix No. 1* contains an abstract of the receipts and payments of the Trustees on behalf of the Museum, for the year ending 31st December, 1868.

12. *Appendix No. 2* contains a list of the specimens received in exchange.

13. *Appendix No. 3* contains a list of the various donations during the year, with the names of the donors.

14. *Appendix No. 4* contains a list of the specimens sent in exchange to various persons and institutions.

15. *Appendix No. 5* contains a list of the books purchased for the Museum Library.

16. *Appendix No. 6* contains a list of the specimens collected by Mr. George Masters, Assistant Curator.

17. The Trustees have the honor to submit this their Report for the year 1868; and in testimony thereof, have caused their Corporate Seal to be hereunto affixed, this third day of June, 1869.

(L.S.) E. DEAS THOMSON,
Chairman and Crown Trustee.

GERARD KREFFT,
Curator and Secretary.

APPENDIX No. 2.

LIST OF SPECIMENS RECEIVED IN EXCHANGE, DURING THE YEAR 1868.

From the Government Museum at Christchurch, New Zealand.

A collection of Moa bones, and two nearly perfect skeletons of extinct gigantic birds.

From Mr. C. L. Salmin, Hamburg.

A very fine specimen of a wild boar (mounted).
Skin of a crocodile, and a collection of reptiles and fishes.

From Mr. Marie, New Caledonia.

A collection of mammals, birds, reptiles, fishes, and insects, from New Caledonia.

From Professor Peters, Berlin.

A collection of Cheiroptera—20 species.

From Professor Keferstein, Göttingen.

Casts of skulls of various races of mankind—15 specimens.

From Mr. V. Fric, Prague.

A collection of glass models of various genera and species of Actinias, in their natural colours.
A collection of wood-models, illustrative of the various forms of crystals.
A collection of spiders, mounted on slides, in spirits of wine.

Australian Museum,
3 June, 1869.

GERARD KREFFT,
Curator and Secretary.

APPENDIX No. 3.

DONATIONS TO THE AUSTRALIAN MUSEUM, DURING THE YEAR 1868.

MAMMALS.

PRESENTED BY

A Deer	Captain Cadell.
A Phalanger (<i>Phalangista vulpina</i>)	Mr. J. Row.
A Tree Rat (<i>Hapalotis arboreicola</i>)	Mr. E. Dunne.
A Platypus (<i>Ornithorhynchus anatinus</i>)	Mr. J. Struth.
A South American Monkey	Mr. J. Defries.
A Dasyurus (<i>Dasyurus viverrinus</i>)	} From the Council of the Acclimatization Society, and the Botanical Gardens.
A Kangaroo (<i>Macropus major</i>)	
A Monkey	
Six Tree Rats (<i>Hapalotis arboreicola</i>)	Mr. W. Macleay, M.L.A. and F.L.S.
A Kangaroo (<i>Macropus major</i>)	} Mr. E. S. Hill.
Two Wallaroos (<i>Osphranter robustus</i>)	
A Kangaroo (<i>Macropus major</i>)	Mr. J. Oatley.
A Wallaby (<i>Halmaturus ualabatus</i>)	Mr. W. Newcombe.
A Kid—deformed	Mr. R. Richardson.
A Flying Squirrel (<i>Petaurista taguanoides</i>)	Mr. C. A. Wilson.
A Black Monkey	Mr. A. Kirschbaum.
Skeleton of Platypus (<i>Ornithorhynchus anatinus</i>)	Mr. J. F. Josephson.
A Tasmanian Opossum (<i>Phalangista fuliginosa</i>)	Mr. H. Parkes, M.L.A.
A Flying Squirrel (<i>Petaurista taguanoides</i>)	Mr. F. H. Blackstone.
A Wallaby (<i>Petrogale penicillata</i>)	Mr. J. Nuth.
A Flying Fox (<i>Pteropus poliocephalus</i>)	Mr. A. W. Scott, M.A.
A Koala (<i>Phascolarctos cinereus</i>)	Mr. G. M. Stephen.
A Dasyurus (<i>Dasyurus viverrinus</i>)	Trustees, Parramatta Park.
A Dasyurus (<i>Dasyurus viverrinus</i>)	His Honor Sir A. Stephen, C.B., Chief Justice.

BIRDS.

A Parrot (<i>Psittacus</i>)	Mr. F. H. Lewis.
A Collection of Eggs—Australian Birds	Mr. J. C. Ryrie.
A Hawk (<i>Jeracidea berigora</i>)	Mr. F. Blaxland.
An Egyptian Goose	} From the Council of the Acclimatization Society, and from the Botanical Gardens.
A White-breasted Eagle	
A Paradise Duck	
Five Pheasants	
A Pelican	
An Eagle	
A Golden Pheasant	
A Crane	

BIRDS—continued.

PRESENTED BY

A Hawk (<i>Elanus axillaris</i>)	Mr. A. West.
Two Divers (<i>Phalacrocorax leucogaster</i>)	Mr. J. H. Lewis.
A Red-bill Water-hen (<i>Porphyrio melanotus</i>)	Mr. E. S. Hill.
A Great King-fisher (<i>Dacelo gigantea</i>)	Dr. Eichler.
A Gull (<i>Xenia jamesonii</i>)	Captain Mein.
A Pigeon	Mr. A. G. Cooper.
Two Pelicans (<i>Pelecanus conspicillatus</i>)	Mr. J. A. Moore.
A small Honeyeater (<i>Ptilotis</i>)	Miss Fanny Wyatt.
A Pheasant Skin	Mr. R. Farquarson.
A Hawk (<i>Astur approximans</i>)	Mr. P. B. Rodd.
A Dove and a Magpie	Mr. Sallet.
Four Australian Birds	Mr. H. Ireland.
An Owl (<i>Athene boobook</i>)	Mr. J. B. Bossley.
A Hawk (<i>Astur</i>)	Mr. E. S. Hill.
A White Crane (<i>Ardea pacifica</i>)	Mr. J. Brown.
Two Doves (<i>Geopelia cuneata</i>)	Mr. S. C. Stuart.
A Cockatoo (<i>Cacatua eos</i>)	Miss Wyatt.
A Crane (<i>Ardetta</i>)	Captain Harley.
A Pelican (<i>Pelecanus conspicillatus</i>)	Mr. M. Gannon.
A collection of Birds from Solomon Islands	Captain M'Gregor.
A Night Heron (<i>Nycticorax caledonicus</i>)	Mr. G. A. Cheeke.
An Adjutant Bird	Trustees, Parramatta Park.
A collection of Eggs	Mr. S. Bonnett.
A South Sea Island Parrot	Mr. H. Packer.

REPTILES.

A Brown Snake (<i>Diemenia superciliosa</i>)	Mr. T. E. Newman.
A Black Snake (<i>Pseudechis porphyriacus</i>)	Mr. J. B. Holdsworth.
A Diamond Snake (<i>Morelia spilotes</i>)	Mr. Henry Williams.
A Scorpion and a Snake (<i>Diemenia superciliosa</i>)	Mr. W. E. Bones.
A Collection of Reptiles from New Ireland	Dr. J. C. Cox.
A Diamond Snake (<i>Morelia spilotes</i>)	Mr. J. E. Fassnidge.
A Black Snake (<i>Pseudechis porphyriacus</i>)	Mr. C. H. Fitzhardinge.
A Brown-banded Snake (<i>Hoplocephalus curtus</i>)	Mr. V. A. Prout.
A Tree Snake (<i>Dendrophis punctulata</i>)	} Captain E. B. Maides.
A Collection of Reptiles from Richmond River	
A Frog (<i>Hyla</i>)	Mr. Aldis.
A Lizard (<i>Pseudopus lepidopodus</i>)	Mr. Manton.
A Lizard (<i>Grammatophora barbata</i>)	Mr. Teeke.
A Snake (<i>Hoplocephalus signatus</i>)	Mr. Wallace.
A Collection of Reptiles	} Mr. H. B. Bradley.
A Collection of Snakes	
A Sea Snake (<i>Platurus laticaudatus</i>)	Mr. W. H. Alderson.
A Death Adder (<i>Acanthophis antarctica</i>)	} Captain Harley.
A Collection of Reptiles	
A Diamond Snake (<i>Morelia spilotes</i>)	Captain Stackhouse, R.N.
A Diamond Snake (<i>Morelia spilotes</i>)	Mrs. John Hay.
Two Black Snakes (<i>Pseudechis porphyriacus</i>)	Mr. J. Hickey.
Two Diamond Snakes (<i>Morelia spilotes</i>)	} Mr. Ireland.
Two Carpet Snakes (<i>Morelia variegata</i>)	
A Brown Snake (<i>Diemenia superciliosa</i>)	Mr. Chas. Hill.
A Brown-banded Snake (<i>Hoplocephalus curtus</i>)	Mr. C. J. Patterson.
A Collection of Reptiles from Ryde	Rev. G. E. Turner, S.C.L.
A Collection of Reptiles	Mr. Bell, F.R.C.S.
A Green Tree-snake (<i>Dendrophis punctulata</i>)	} Mr. G. Fitzhardinge.
A Lizard	
A Sleeping Lizard (<i>Cyclodus gigas</i>)	Mr. James Bray.
A Collection of Reptiles from Solomon Islands	Captain M'Gregor.
A Lizard (<i>Hinulia</i>)	Mr. B. Stenhouse.
A Tortoise (<i>Chelodina longicollis</i>)	Mr. John Gould.

FISHES.

A Fish (<i>Carranz</i>)	Mr. Wm. Love.
A Collection of Fishes from New Ireland	} Dr. J. C. Cox.
A Fish (<i>Diodon</i>)	
A Collection of Port Jackson Fishes	} Messrs. Fitzhardinge.
A Collection of Sharks (15) from Shell Cove	
A Fish (<i>Julis</i>)	Master Donovan.
Two Fishes (<i>Diodon</i>)	Mr. C. J. Mueller.
Specimens of Golden Carp (<i>Cyprinus aurantius</i>)	Mr. Patterson.
A Sucking-fish (<i>Remora</i>)	Mr. Willingale.
A Fish (<i>Julis</i>)	Mr. J. Hasmine.
A Fish (<i>Serranus</i>)	Mr. Geo. Packer.
Two Port Jackson Fishes	Mr. Henry Howe.
A Collection of Port Jackson Fishes	Mr. S. Brown.
A Fish (<i>Fistularia</i>)	Captain Purcell, R.A.
A Fish (<i>Julis</i>)	Mr. E. Dunne.
Two Fishes of the Genus <i>Diodon</i>	Mr. C. E. Mueller.
A Fish (<i>Julis</i>)	Captain J. S. Mein.
A Fish (<i>Saurus</i>)	Mrs. Brown.
A Golden Carp (<i>Cyprinus aurantius</i>)	Mr. C. Lemy.
A Fish (<i>Seriola</i>)	Mr. S. Brannett.
A Golden Carp (<i>Cyprinus aurantius</i>)	Mr. S. Douglas.
A Collection of Fishes from Solomon Islands	Captain M'Gregor.
A Fish (<i>Hippocampus brevirostris</i>)	Mr. J. Dingwell.
A Collection of Fishes from South Sea Islands	Mr. S. Underwood.
A Golden Carp (<i>Cyprinus aurantius</i>)	Mr. R. Thomas.
A Fish (<i>Teuthis</i>)	Mr. C. A. Thurlow.

MOLLUSCS.

MOLLUSCS.		PRESENTED BY
A Collection of Shells from Gulf of Carpentaria		Captain Edwards and Dr. Mil- dred Creed.
Twenty species of Port Jackson Shells.....		Mr. J. Brazier.
A Mollusc.....		Dr. Elliott.
Two Shells from Clarke Island, Kingsmills.....		Mr. R. Waters.
A Collection of Shells from Port Macquarie.....		Mr. E. C. Davis.
A Collection of Shells.....		Mr. W. Bell, F.R.C.S.
CRUSTACEANS.		
A Crab (<i>Pagurus</i>)		Mr. J. W. Blair.
A Crab (<i>Pagurus</i>)		Mr. E. Dunne.
A Crab (<i>Ibacus</i>)		Mr. A. H. Tofft.
A Collection of Crustaceans of Port Jackson.....		Mr. R. Rossiter.
ANALIDS.		
A Thread Worm		Mr. J. W. Jenkins.
INSECTS.		
A Phasma.....		Mr. J. Burrows.
A Collection of Insects from New Ireland.....		Dr. J. C. Cox.
A Collection of Insects from Clarence and Richmond Rivers		Captain E. B. Maides.
A Collection of Insects from Solomon Islands		Captain M'Gregor.
Four Moths		Mr. S. Bough.
RADIATED ANIMALS.		
A large specimen of White Coral.....		Mrs. J. C. Cox.
A large specimen of White Coral.....		Mr. Hen. Webber.
A large specimen of Black Coral		Mr. W. D. Gray.
GEOLOGY AND MINERALOGY.		
A specimen of Alum		Mr. B. Poole.
Mineralogical specimens		Mr. R. C. Kirkwood.
Specimens of Granite		Mr. T. S. Seller.
Specimens of Australian Rocks		Mr. J. Fassnidge.
Specimens of Gold in Quartz.....		Mr. H. Elliott.
Specimens of Lava from New Zealand.....		Mr. J. Wilson.
A fossil Bone of a gigantic Animal, from the Plains of Promise, North Australia.....		The Hon. J. Robertson, M.L.A.
A specimen of Iron Ore		Mrs. S. W. Pye.
A Collection of fossil Shells		Miss M. Walker.
Specimens of Lead from South Australia.....		Mr. W. Colyer.
Specimens of Iron Ore and Fossil Wood.....		Mr. G. M'Kay.
Lower Jaw of a species of <i>Nototherium</i>		Mr. P. E. Walsh.
Fossil remains of a gigantic Mammal		Mr. R. C. Joplin.
Anterior portion of Lower Jaw of a gigantic Marsupial, allied to <i>Nototherium</i>		Mr. Lloyd.
Specimens of Minerals from New Caledonia		Mr. H. Sinclair.
A fossil Shell.....		Mr. R. Simpson.
Specimen of Australian Cinnabar.....		Mr. Bensusan.
COINS.		
Twenty-six Silver and eleven Copper Coins.....		Mr. F. Senior.
One Silver and two Copper Coins.....		Master D. Murphy.
ETHNOGRAPHICAL SPECIMENS.		
A Collection of Stone Implements.....		Mr. George Macleay, C.M.G.
A Collection of Ethnographical Specimens from Samoa		Mr. Emberson.
A Collection of Ethnographical Specimens from Gulf of Carpentaria		Captain Edwards and Dr. M. Creed.
A Mask from New Ireland.....		Dr. Brown.
A Curtain from Fiji Islands		Mr. G. Carstairs.
A Spear.....		Mr. S. Bonnett.
A Stone Tomahawk.....		Mr. S. Robinson.
BOOKS.		
A Bible published in 1635.....	}	Mr. F. Senior.
Folkes' Book of Coins.....		
Geology of New Zealand, by Dr. Hochstetter		New Zealand Government.
MISCELLANEOUS.		
Specimens of Timber		Mr. E. D. Thomson, jun.
The Sternum of a small Whale.....		Mr. Thos. Porter.
Specimens of Natural History from Samoa.....		Mr. H. Emberson.
Specimens of Timber from Macquarie Fields		Mr. F. H. Gall.
Plan of the First Settlement, Sydney Cove.....		Mr. Grundy, C.E.

APPENDIX No. 4.

LIST OF SPECIMENS SENT IN EXCHANGE DURING THE YEAR 1868.

To Mr. C. L. Salmin, Hamburg.

BIRDS.

Haliaster sphenurus	Dicurus bracteatus	Myzomela sanguinolenta
Astur novæ-hollandiæ	Rhipidura motacilloides	Myzomela obscura
Astur approximans	Micræca macroptera	Melithreptus melanocephalus
Jeracidea berigora	Monarcha carinata	Climacteris picumnus
Falco frontatus	Monarcha trivirgata	Sittella leucocephala
Podargus humeralis	Gerygone albogularis	Cuculus opatus
Eurystomus australis	Petroica multicolor	Cuculus cineraceus
Dacelo gigantea	Eopsaltria australis	Scythrops novæ-hollandiæ
Halcyon macleayi	Psophodes crepitans	Eudynamis flindersii
Artamus sordidus	Malurus lambertii	Aprosmictus scapulatus
Pardalotus punctatus	Acanthiza nana	Aprosmictus erythropterus
Pardalotus leadbeateri	Donacola castaneothorax	Trichoglossus concinnus
Pardalotus melanocephalus	Ptilonorhynchus holosericeus	Ptilinopus swainsonii
Cracticus destructor	Ptilonorhynchus smithii	Chalcophaps chrysochlora
Graucalus melanops	Speotheres australis	Turnix melanogaster
Graucalus swainsonii	Pomatorhinus ruficeps	Synoicus diemenensis
Campephaga jardinii	Meliphaga sericea	Rallus pectoralis
Campephaga karu	Ptilotis auricomis	Scolopax australis
Pachycephala gutturalis	Anthochaera carunculata	Hiaticula ruficapilla
Colluricincla rufogaster	Tropidorhynchus corniculatus	
Falcunculus frontatus	Acanthorhynchus tenuirostris	

To Mr. Puls, Gand.

BIRDS.

Astur approximans	Monarcha carinata	Myzomela sanguinolenta
Jeracidea berigora	Monarcha trivirgata	Myzomela obscura
Podargus humeralis	Gerygone albogularis	Entomyza cyanotus
Eurystomus australis	Petroica multicolor	Climacteris picumnus
Halcyon macleayi	Eopsaltria australis	Sittella chrysoptera
Aleyone azurea	Psophodes crepitans	Sittella leucocephala
Artamus leucopygialis	Malurus lamberti	Scythrops novæ-hollandiæ
Pardalotus punctatus	Donacola castaneothorax	Eudynamis flindersii
Cracticus destructor	Estrela temporalis	Cacatus galerita
Graucalus melanops	Pitta strepitans	Aprosmictus scapulatus
Graucalus hypoleucus	Meliphaga australasiana	Polytelis barrabandi
Graucalus swainsonii	Meliphaga sericea	Polytelis melanura
Campephaga karu	Ptilotis auricomis	Platyercus palliceps
Pachycephala gutturalis	Ptilotis ornatus	Melopsittacus undulatus
Pachycephala pectoralis	Ptilotis chrysolis	Geopelia cuneata
Colluricincla harmonica	Anthochaera carunculata	Turnix melanogaster
Colluricincla rufogaster	Tropidorhynchus corniculatus	Rallus pectoralis
Dicurus bracteatus	Acanthorhynchus tenuirostris	Scolopax australis
Rhipidura motacilloides	Myzantha garrula	Anas superciliosa

To the Royal Museum, Berlin.

BIRDS.

Eurystomus australis	Sericornis frontalis	Platycercus flaviventris
Halcyon macleayi	Psophodes crepitans	Platyercus palliceps
Pardalotus melanocephalus	Anthus australis	Trichoglossus chlorolepidotus
Pardalotus affinis	Sphenæacus galactotes	Ptilonopus swainsonii
Pardalotus punctatus	Pitta strepitans	Geopelia humeralis
Graucalus swainsonii (2)	Sericulus chrysocephalus	Geopelia tranquilla
Dicurus bracteatus	Sphecotheres australis	Phaps chalcoptera
Pachycephala gutturalis	Meliphaga australasiana	Turnix melanogaster
Monarcha carinata	Anthochaera carunculata	Hiaticula nigrifrons
Monarcha trivirgata	Tropidorhynchus corniculatus	Lobivanellus lobatus
Petroica multicolor	Climacteris scandens	Scolopax australis
Petroica fusca	Sittella leucocephala	Parra gallinacea
Eopsaltria australis	Eudynamis flindersii	Spatula rhynchotis.
Malurus melanocephalus	Aprosmictus erythropterus	

A collection of Mammals, Reptiles, and Fishes, in spirits of wine.
A collection of Australian Coleoptera.

To Mr. C. A. Dohrn, Stettin.

A Collection of Australian Insects (Coleoptera).

To Dr. Mess, Munich.

A collection of Australian Insects (Coleoptera).

Australian Museum,
3 June, 1869.

1869.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SYDNEY INFIRMARY.

(CORRESPONDENCE RESPECTING THE CASE OF A YOUNG GIRL (ANNIE JESTON JESMOND) WHOSE
ADMISSION WAS REFUSED AT.)

Ordered by the Legislative Assembly to be Printed, 1 October, 1869.

JOHN E. MANNING, ESQ., to THE PRINCIPAL UNDER SECRETARY.

Sydney Infirmary,
28 September, 1869.

SIR,

I have the honor to acknowledge the receipt of your letter, dated 3rd instant, enclosing a communication from the Board of Management of the Government Asylum to yourself, in which attention is directed to the case of a young girl whose admission was refused at the Infirmary; and it is affirmed that other patients requiring active medical treatment have not been received, &c.

Your letter also contains a request from the Colonial Secretary that the matter should be brought under the notice of the Directors, with a view to their furnishing a report thereon.

Your letter, and the subject thereof, having been taken into consideration by the Board of Directors, I am instructed to report, for the information of the Colonial Secretary,—

1st. That the young woman (Annie Jeston Jesmond) presented herself for admission into the Hospital on the of August. She was examined by the Honorary Surgeon admitting for the week, who found her suffering from a slight attack of erysipelas, which was in no degree dangerous to life.

2nd. On the morning of August 21st, the Rev. G. Moreton visited the Infirmary, and personally made an application for her admission. It was explained to him that the patient was unfortunately suffering from a disease which experience had proved to be infectious and dangerous to others, and that it would be contrary to the rules of the institution for her to be admitted; but Mr. Moreton was also informed that, had her symptoms been such as *to place her life in danger, she would have been at once received and placed in a tent.*

3rd. Having, upon more than one occasion, been compelled to remove all the patients from certain wards and keep the latter unoccupied for many days, owing to the existence and extension of erysipelas, the Directors, having regard to the welfare of the patients (185) always under treatment for acute disease, have decided upon endeavouring to protect them as much as possible from the risk of taking a disease which is especially dangerous to those already suffering from severe illness.

4th. For the purpose of immediately relieving the wards of any cases of erysipelas which might arise within the Hospital, the Directors some time since applied to the Government for two tents, which the Colonial Secretary was good enough to supply. Since that time, besides using them for the accommodation of such cases, *all patients* applying for admission, and suffering from erysipelas, *attended by dangerous symptoms*, have been received and placed in the tents separate from the other inmates.

5th. In reference to a remark in the last paragraph of the Report enclosed in the Colonial Secretary's letter, to the effect that—"This is one of the numerous instances in which, for the sake of humanity, the Board has been constrained to admit to the Government Asylums for the Infirm and Destitute, patients requiring active medical treatment, who have been refused admission to the Infirmary, &c."—I am to observe that, after a full consideration of the accommodation and character of the Sydney Infirmary, the Directors have arrived at the conclusion that it is capable of receiving and of securing the efficient treatment of the acute cases of disease and accident in the community; but that the admission of incurable patients, as well as of those whose chronic ailments would require a lengthened and comparatively unskilled treatment, would very much lessen the amount of benefit they might otherwise be able to confer upon more important and severe cases of suffering. With the single intention, therefore, of affording the utmost benefit to the greatest sufferers from severe illness, the Directors have felt it their duty to select, as far as possible, patients afflicted with acute and curable disease for treatment in the Infirmary, leaving those suffering from chronic and incurable affections to be provided for in institutions where they can be equally well-treated and cared for at a less average cost.

6. I am further to mention that a limited but sufficient number of beds are always kept vacant for the reception of urgent cases of accident and disease, and I believe that no such case has for many years been refused admission.

I have, &c.,
JOHN E. MANNING,
Joint Hon. Secretary.

FREDERIC KING, Esq., to THE PRINCIPAL UNDER SECRETARY.

The Government Asylum,
Sydney, 26 August, 1869.

SIR,

Annie Jeston
Jesmond,
18 years of age.

I am directed by the Board of Management to request you to be good enough to solicit the attention of the Honorable the Colonial Secretary to the case of a young girl whose admission to this institution, while suffering from a dangerous disease, erysipelas, was forced on the Board, in consequence of the refusal, on the part of the authorities of the Sydney Infirmary, to give her shelter.

Application for her admission to the Hyde Park Asylum was made to the Chairman, by the Rev. Mr. Moreton, who stated that he had made personal application at the Infirmary for her admission, but had been informed that, as the girl was suffering from an infectious disorder, she was ineligible. This is one of numerous instances in which, for the sake of humanity, the Board have been constrained to admit to the Government Asylums for the Infirm and Destitute, patients requiring active medical treatment who have been refused admission to the Infirmary; and they desire to call the attention of the Government to the expediency of instituting an inquiry into the rules and practice of the Infirmary, with the view of causing such modification thereof as will open the doors of that institution, which is so largely supported out of the public funds, for the reception of such cases as that which they have brought under notice.

I have, &c.,

FREDERIC KING,
Secretary.

Submitted, 30 Aug., 1869.

Refer Infirmary authorities for report. JOHN R.—1 Sept., 1869.

Joint Hon. Sec., Sydney Infirmary, 2 Sept., 1869.

1869.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

HOSPITAL FOR THE INSANE, TARBAN CREEK.

(REPORTS ON GENERAL CONDITION, &c., OF)

Ordered by the Legislative Assembly to be Printed, 30 September, 1869.

No. 1.

THE SUPERINTENDENT OF THE HOSPITAL FOR THE INSANE, TARBAN CREEK, to THE COLONIAL SECRETARY.

Hospital for the Insane, Tarban Creek, 22 October, 1868.

SIR,

In taking charge of this institution as Superintendent, I feel it a duty which I owe to you, and to myself, to report to you upon its general condition. I would beg at the same time to offer a series of suggestions for its improvement. With the imperfect means at present at command, the good government of the institution and the scientific treatment of the patients are alike almost impossible.

I have, &c.,

FRED^c. NORTON MANNING.

THE Hospital for the Insane, Tarban Creek, contains at this time 650 patients—420 males and 230 females. It stands on elevated ground, fronts the south-east, and from the front building and the general grounds there is a fine and varied view. The Parramatta River is distant about a quarter of a mile.

The building (the general arrangement of which can be understood by a reference to the accompanying plan) is, with the exception of the central offices, of one story, and is spread over a large extent of ground, in the shape of a parallelogram, of which the length is 710 and the breadth 205 feet. The original structure was erected for sixty patients, and has been gradually enlarged to its present extent, when it will afford accommodation for 300 people. The central offices, which include rooms for the officers, visiting rooms, kitchen and stores, were part of the original building, and would seem to have been designed to serve for a very limited number of patients. The building is arranged for the greater number of the rooms to serve as dormitories; and the very limited amount of corridor originally set apart for the accommodation of the patients during the day, has, owing to their large number, been given up for sleeping-room. The only rooms now used during the day are the small dining-rooms, which are not large enough to contain half of the present number of inmates, and are used as dormitories at night, the beds being placed on the floor. On wet or cold days many of the patients are obliged to remain in the yards, because the rooms will not contain them. Several of the rooms originally set apart as attendants' rooms have also been given up for sleeping accommodation. The number of patients accommodated in single rooms is about one-fifth of the whole. The cubic space of the single rooms varies from 770 to 1,080 cubic feet; and as two patients are never placed in one room, it is as a rule a fair proportion for each individual. The remainder of the patients sleep in association, in rooms originally intended for dormitories, or in corridors or dining-rooms, and are so closely packed that the space allowed for each does not exceed 200 cubic feet.

The superficial area allowed is small in the extreme, since the beds are seldom or never more than one foot apart, and in many cases absolutely touch, so that the patients can (and do) roll from one bed on to those next to it on each side. Nearly 150 patients are without bedsteads, owing to absolute want of space. The height of the rooms throughout is twelve feet. There is no special hospital division, the sick being treated in the division to which they belong.

* 84—A

The

The asylum reserve consists of upwards of 300 acres, but the greater part is extremely rocky, and totally unfitted for cultivation. The general grounds—which have been enclosed by a wall of enormous solidity and strength—consist of about 50 acres, the major part of which is rocky and uncultivable land. There is no farm, and a patch of three acres is the only garden; in this, however, a considerable quantity of vegetables are grown, and there are some fine orange and other fruit trees. There is a small patch of grass land at the back of this institution, which serves as a paddock for the two horses kept for carting manure, stores, &c.

The distance from Sydney is about six miles by water and eight by land, but by the latter road the asylum cannot be reached without crossing the Parramatta River in a punt, a process which takes, under favourable circumstances, from 15 to 20 minutes.

The building is warmed throughout in winter by wood fires. There are no grates, and the simple open hearths are protected by heavy locked iron guards. The wood costs the institution 8s. 4d. a ton, and entails a considerable amount of labour to cut it into sufficiently small pieces.

The ventilation is entirely natural, by means of open windows, doors, and chimneys, with accessory openings for inlet near the floors, and for outlet through the roof of the majority of the rooms. Wherever it is possible, skeleton doors are used instead of solid ones, and the windows are kept constantly open except in bad weather; but with every care to ensure as much atmospheric change as possible, the dormitories are, as a rule, when occupied, indescribably offensive.

The windows in the outer walls are for the most part small, and placed so high as to prevent all view, and be completely out of reach of the patients. All the single rooms are, as a consequence, cell-like and gloomy. Along the front of the building, the windows are of larger size, and the patients can see out of them when standing up. The small windows to the single rooms open on a pivot longitudinally, the open space being protected with bars. The large ones are in iron frames, and are permanently closed, with the exception of a small section at the top, which opens outwards. The windows opening on to the central airing courts are of fair size, and are ordinary double-hung sashes, opening freely. Those in the divisions for the more violent classes are protected by heavy wire netting. The windows are everywhere without blinds or hangings.

There is no system of lighting. Three dismal lamps make darkness visible in the hall from which the administratives' offices and officers' quarters open, and a few small oil hand lamps are supplied for the use of the attendants. The kitchen is lighted in the evening by a big wick of rag or other material, placed in a tin dish of dripping, and serves to afford a considerable amount of smoke, and a very feeble light for the benefit of the night watchman, who makes the kitchen his resting-place in the intervals between his rounds.

The water supply is from a running stream which has been dammed up at some little distance from the asylum. Two reservoirs have been made, the upper capable of containing one and a half, and the lower half, a million gallons of water. The water passes through a filter of charcoal and gravel, and is pumped by a steam-engine to a tank near the asylum. About 60,000 gallons are used weekly from this source. The reservoirs are at present full, and contain therefore about nine months' supply. Rain-water is collected in tanks, three of which are under ground, and capable of holding an aggregate of 118,000 gallons; and the remainder are in the roof, and will contain 11,500 gallons. For the kitchen and laundry rain-water is largely used, and is obtained by means of hand-pumps. Water is laid on to the few water-closets and lavatories which exist, to the sinks and baths, and to a tap in each airing court. There is no mode of extinguishing fire, but long ladders have been provided as fire-escapes.

The water from the kitchen, laundry, sinks, bath-room, closets, &c., runs into the Parramatta River, and owing to the fall of the land, the drainage is rapid. The main sewer passes near the gate of the garden, and although it is trapped and a well is formed in this situation, very little of the sewerage is used as liquid manure. The privies, to be presently mentioned, are emptied at short intervals, and the contents, after being mixed with earth and allowed to remain some time, so as to permit of the putrefactive changes taking place, are used for manuring the garden.

The baths are placed in two rooms on the female and three on the male side, and are in the proportion of one to about thirty-five patients; about half, or ten out of the nineteen, are of cement, and have been recently made. The cocks to these are so placed as to be under lock and key, but on the male side the locks are lost or out of repair, and the hinges are loose. The remainder are of wood, very dilapidated, and with the taps unprotected. Hot and cold water are laid on to each bath-room. The hot water is heated in a furnace adjoining each room. In each bath-room is a solid-made wooden shower-bath; those on the female side are in good repair, and have bolts to the outside of the door; those on the male are out of repair—one at least is completely rotten, and one or two are without bolts. All are without locks, and one or two without hinges to the doors, and have been so for months.

Every patient is bathed once a week, two or three using the same water. There are no printed bath rules.

An excellent out-door bathing-place has been made at the bottom of the general grounds, by enclosing with piles a piece of the Parramatta River, and erecting a shed and a platform. A number of male patients go with the attendants to bathe daily in the summer mornings, and it is made a washing place for the majority in the summer, instead of using the warm baths.

There are no lavatories for the male patients. Iron basins are brought from the store rooms, and the patients wash under the verandahs in the airing courts, and dry on round towels hung in the yards. The water is obtained from the tap in each yard. In two of the divisions for women, lavatories have been provided. The basins, which are in the proportion of one to every twelve patients, are of zinc, set in wood, and fitted with a plug. The remainder of the women wash in the open air, under the verandah, in the same way as the men.

The kitchen is a small detached one-storied building, centrally placed, but offensively near the officers' rooms. It consists of two parts (the smaller of which was originally a scullery), is not open to the roof, and has no opening for the exit of steam and smoke, except the windows at each side. The ceiling is black with smoke, and the flooring is of stone slabs, which are so uneven and broken as to render cleanliness almost impossible. In the larger room the sole fittings are two old battered and begrimed dressers, and some filthy cupboards much gnawed by rats. All the roasting, as well as all the minor cookery for officers and patients, is done at an open hearth, over a wood fire. The smaller room, formerly the scullery, contains ordinary coppers for cooking meat and vegetables; but these are so small that the potatoes

potatoes are of necessity cooked at three times, and those first boiled are cold before the second and third batches are cooked. There is no scullery or vegetable room, and vegetables are prepared, and pots and pans washed, either in the kitchen, or more usually outside it.

At a little distance from the kitchen, in a small room, filthy dirty, and alive with rats, is a small and badly fitted oven.

The greater part of the meat for the patients' dinner at 1 o'clock is cooked by 10 or half-past 10 o'clock every morning. It is then roughly cut into pieces, the greater number of which are about an inch square, and the amount for each patient is placed in a circular tin dish about 2 inches deep; these dishes are arranged on and under the dressers, and as they are gradually filled, are covered with cloths to keep in as much heat as possible. The vegetables (the potatoes unpeeled) are placed with the meat in the tins. When the whole 650 tins are ready for serving to the patients, which is about half-past 12, as the meat is by this time more or less cold, hot water, or a thin watery mess made by boiling the bones of the day before, is added to each tin to impart some degree of heat. The tins after inspection by the medical officer are taken to the yard in open trays, whilst the bread previously cut into junks is carried in an attendant's apron. As many tins as can conveniently stand on the dining-room tables are placed on them, the remainder are set on window sills or in other convenient positions, and then the patients are called to dinner. As only half at the most can be accommodated in the dining rooms, those who so choose are allowed to come and take their tins into the yards and eat the contents, sitting either on the benches or on the ground. Horn spoons are supplied to convey the food to the mouth, but the fingers render important assistance. On some of the tables are placed some ragged and stained apologies for table-cloths, but even these impart some air of comfort to the tables. The trays which serve to carry in the tin dishes are placed on the ground in the yard. Each patient as he finishes, empties what he does not care to eat into these, and from them those who are unsatisfied with their allowance pick out such morsels as they please. The whole process of serving and eating the dinner is simply filthy, and more fitted for pigs than human beings. The amount of refuse daily is sufficient to fill three large tubs, and as no pig or fowls are kept, this is wastefully carted to the garden and dug in.

The cook and his paid assistant are allowed the fat as a perquisite. The sum obtained by them in this way amounts to between £3 and £4 monthly, and as might be expected under such an objectionable system, the meat is baked till the small amount of fat which the contractor supplies runs from it, and little or none reaches the patients. The circular tins which are the sole utensils used at dinner, serve for saucers in which to place the tin panikin in which the tea is served.

The tea is made by placing the leaves in boiling water, removing the fire as far as possible, and leaving it to simmer for twenty minutes or half an hour. Made in this way, it is, both in taste and appearance, a most uninviting concoction; and even when properly infused, the tea is so poor and tasteless, and the sugar so coarse and high flavoured, that the compound is not a palatable one.

The laundry is a detached wooden building, in which are two small rooms; in one all the coarser clothes, and in the other the sheets and pillow-cases, as well as all the minor articles, and the attendants' and officers' clothes, are washed. In the latter, all the mangling, ironing, folding, and sorting, are also done. In these rooms and a small lean-to room in addition, all the various washing operations are completed, though it is a puzzle to know how such a small space is made to serve for all the various operations. The washing is done entirely by hand. All drying is done in the open air. There is no receiving room for dirty clothes, which are placed in a heap in the open space in front of the laundry, and there is no separate washing room for the specially foul linen.

The only water-closets in the Asylum are four in each of two of the divisions for the females. In these the water supply is regulated from the seat, and the closets are badly arranged, unventilated, and far from sweet. In one of the divisions for males there has been an abortive attempt at introducing earth-closets. In all the remaining divisions, for both males and females, there are privies only, which open immediately from the court, are without water supply, and stink abominably. They are in the proportion, in one ward, of one to forty patients, and the remaining wards are only a trifle more liberally supplied.

The urinals are fewer in number, as primitive in shape, and only one degree less offensive than the privies.

The flooring of the rooms is of wood, except in those used for the more dirty classes of patients, which are either flagged or cemented. In several rooms the floor is so undermined by rats that small pieces of the flags break off and drop into the rat warren below. The walls are for the most part unplastered except with many coatings of whitewash, and are white throughout. Nothing in the shape of ornamentation is attempted. There are no pictures or plaster statuary, no plants, and no fern cases or aquaria. The only furniture provided for the patients, sick or well, during the day, are wooden forms fixed against the wall in the airing-courts, and two or three clumsy wooden chairs. There are plain forms and tables in the dining-rooms sufficient to seat only half or two-thirds of the patients. The tables are, in three wards for male patients, narrow, and fixed against the walls so that the patients sit back to back, in miserable unsociality, whilst they are less under the observation of the attendants than at ordinary tables. The dormitory furniture consists only of bedsteads, bedding, and chamber utensils. The bedsteads are iron, very roughly made, and the majority want repair and paint. A few of the beds are hair, but the large majority are of straw, loosely stuffed, and not matted. The sheets are very coarse, the pillow-case as a rule large enough to contain only about half or two-thirds of the pillow. The blankets are good, and the coverlets bright-coloured and warm, though somewhat coarse in appearance. Many of the bed-slips on the male side are unsewn and ragged. The majority of the men get only one sheet, on which they lie. The chamber utensils are large zinc or iron pans, one or two of which, placed in the centre of a room, and chained to a bedstead, serves for from twelve to twenty people. For the single rooms smaller ones are used. The closets and privies are inaccessible at night, and there are no night-stools. There are no wash-stands, and no boxes for clothes, but in some of the rooms the clothes are made into bundles and triced up to pegs placed at a height from the floor. The bed-clothes are folded for the day in the ordinary military fashion. There were formerly two padded rooms for each sex, but they got completely out of repair, and the padding was stripped from the walls. The walls are now bare, and just in the same condition as when first stripped. There are now no padded, and only one panelled room on each side.

There is no reading or amusement room. The library is kept in an office in the centre building, and there are no book-cases in the wards. The patients are permitted to smoke at fixed times, in the bath-rooms

bath-rooms and in the general grounds. One room, which is sixteen feet long by twelve feet six inches broad, serves as a board-room for the official visitors, as a reception-room for patients, and a visiting-room for their friends, and also as a chapel. Not more than thirty patients can be crowded into it, and this therefore is the entire number able to attend the public ministrations of the Chaplains. On visiting days this room is crowded almost to suffocation by patients and their friends. It is used at the same time for visitors to both male and female patients, and friendly and private communication between visitors and visited is almost impossible in such a crowded place. The female attendants all sleep in the house, in associated dormitories, some originally set apart for this purpose, some intended as single rooms for the patients. The only furniture provided consists of bedstead, bed and bedding, similar in character to that used by the patients; chairs even are not provided. Clothes are kept in boxes which the attendants themselves provide, and the rooms are bare and comfortless. The majority of the male attendants sleep out of the asylum; seven, however, are accommodated in the building, two in the mess-room, and five in a bare, uncomfortable dormitory. The attendants' mess-rooms are in a state of comfortless unrepair, and their dinner is served with only a small amount more nicety than of the patients. The dead-house is a small building consisting of one room, and opening at once on to the road. The windows are placed high at each side, and additional light is afforded by a glazed opening in the roof. It is completely unfurnished, and does not even contain a fit table for post-mortem examination. There are five airing yards for the male, and four for the female side, besides the general grounds. These yards are all completely enclosed, and from one only on each side can any view be obtained. All have verandahs on all four sides, and have with two exceptions been recently turfed; two or three have been planted with trees, and one is laid out in flower-beds, but the rats have undermined and destroyed many of the trees and shrubs planted. In the yards for the more quiet patients on the male side are a few parrots, &c., and on the female side a good supply of both song and plumage birds, as well as rabbits and pigeons. In one yard is a brace of wallaby. There is a small court (a dismal "air-tank") with enormously high walls, for a single violent female patient, but its floor is broken and in holes, and it is seldom used. In addition to the airing-courts there are large general grounds for each sex, and into these the patients are admitted morning and afternoon daily. These grounds consist of a fine grass lawn, consisting of five or six acres, and of fifteen to eighteen acres of rock and scrub for each sex. They contain some small stone quarries, and some natural precipices which are very dangerous. The thick scrub and bush affords opportunities for the secretion if not the escape of the patients, so that whenever they are in the grounds a line of attendants is placed along the top of the scrub, to prevent any of them straying. These grounds contain no closets, no seats, and no sun sheds.

The administrative department consists of the room which has been already mentioned as serving the purposes of chapel, board and visitors' room, four small offices, dispensary and store rooms.

The board and visitors' room is furnished with plain table and chairs; its walls are covered with dark green paint, and its utterly dismal and forlorn appearance is calculated to impress every one who enters it with an idea of desolation, and to make them imagine that the general fittings of the asylum are worse than they really are.

The offices are meanly furnished. The dispensary is of fair size, but dirty, and is in the front instead of the rear of the building, where it would be much more convenient of access.

The store rooms are miserably small, and are three in number, with a small attached office. In one room, where the rats have found their way into most of the cupboards, bread, groceries, wine, spirits, and general stores are kept; in another, tin and iron ware, tools and utensils; and in a third, clothing. The fittings of all are wretchedly inadequate. There is no store for meat or vegetables, and the store rooms are all much too small for the large number of patients.

The rooms for the Superintendent, to which the only approach is from the back, past stores and kitchen, are in the main building, and consist of dining-room, drawing-room, bed-rooms, kitchen, and cellars.

The attendant medical officer has two rooms, one near the entrance, the dimensions of which are 12 feet by 9 feet 6 inches, serves as a sitting room, is always redolent of drugs from the dispensary, placed next to it, and with which it directly communicates. The bed-room is on the upper floor.

The matron has one room only, and this is on the ground floor, serves as a passage to the wards, and is divided by a wooden screen into bed and sitting rooms. There is no attached store or office, and in this dark and scant accommodation, this important officer lives, sleeps, and works. The dispenser has two small rooms in the building. The whole of the officers' rooms are more or less out of repair.

There is no accommodation for the clerk, storekeeper, cook, porter, or engineer. The laundresses sleep in small lean-to rooms near the laundry, and away from the direct observation of the matron. The gardener's house is thoroughly out of repair, and although he is a married man with a family, consists of two small rooms only.

There is a dilapidated wooden stable with stalls for two horses, but no accommodation for horses belonging to the Superintendent, or official or other visitors. There are no farm buildings, piggeries or fowl houses. There are bells in the central hall to summon the matron and chief attendant, and the ordinary attendants can be summoned by means of bells rung in the passage separating the officers' rooms from the wards; but there are no bells to summon the servants of the Superintendent or officers; and in consequence, their privacy is continually liable to invasion by persons whose business is not immediately with them.

The keys of the wards are very large and heavy. The locks are very noisy, and frequently out of repair, and are so various in their size and kind, that no less than ten or eleven large keys are necessary to pass completely through the building. Besides these, the outer gates and others are for the sake of security (as no check locks exist), fastened with padlocks, each having different keys, so that the Superintendent must carry with him a bunch of some twenty keys, if he is to obtain access to all parts of the building. At the present time it is impossible for him to pass through the building without summoning other officers or attendants, owing to want of keys; whilst there is, from a want of system, and from the fact that keys have been lost, reissued, and re-manufactured, little or no check upon the attendants.*

The asylum is under the immediate government of the Colonial Secretary, who appoints all officers. The Auditor General and Treasurer examine into all questions of finance connected with the institution, and

* The present writer has, by way of experiment, found it easy to enter the building, and reach his quarters in the centre, without any key at all, owing to insecure fences, broken locks, and inattention of servants.

and make arrangements for the payment of all salaries and accounts. Formal requisitions are sent in for all necessary stores, and for repairs and furniture. The stores are supplied through the Store Department. Requisitions for repairs are sent, when likely to cost less than £5, direct to the Colonial Architect, and when over that amount to the Colonial Secretary, and so, in due official course to the Secretary for Works and the Colonial Architect.

The system of requisition is in many ways most unsatisfactory. The time spent in the transit of the necessary papers from one department to another is large, and those to whom the requisitions are ultimately referred are either burdened with other business, or are unable to appreciate the importance of prompt action, as the circumstances of the case do not come under their immediate inspection. Keys, urgently needed and demanded in July, /67, are yet unsupplied; cemented floors asked for twelve months since are yet unlaied; repairs to a water-closet, asked for six months ago, have never been executed; lids to the kitchen boilers, required to keep the rats from falling among the bones stewing for the patients' soup, were furnished nearly six months after the requisition had been signed and sent in. A shower-bath door, of which the hinges were off, was repaired on November 2nd, 1868, in fulfilment of a requisition dated June 11th, 1868. Drawers for stores, to replace some into which the rats have had free entry for a long time, are not yet supplied, though demanded four months since; and a requisition for a nightman to empty the cesspools of the privies has, on one occasion, at least, been a fortnight before it has been complied with.

It is no uncommon thing to find requisitions for stores cut down in amount by the Store Department—fifty of a given article being sent, when one hundred are requested: and in this way officers are not unfrequently put to great inconvenience, and necessary work hindered. At this time the ragged condition of the patients is to some extent due to a want of stores so caused. The delay caused by obtaining the clothing through the Store Department, instead of directly from the contractors, is always great; it is difficult to get the necessary alterations in the pattern or fit of the clothing carried out, and in some cases, by the time goods have been forwarded to the Store Department, and thence to the Asylum, and have there been found unsuitable, and returned by the same route, they have been paid for by the Treasury, and extreme confusion is the result.

The system of supply is by contract; and the terms on which such contracts are drawn, and the isolated position of the institution, afford a considerable amount of trouble to the officers in any case in which the supplies are not of sufficiently good quality; but a special difficulty occurs where the supplies are of a perishable nature, and intended for immediate issue to the inmates.

"In the event of a difference of opinion between the contractor and the party receiving the supplies," runs the wording of the conditions of contract, "the same is to be decided by a Board of Survey, constituted as follows, viz.:—The party objecting shall name one person as an arbitrator; the contractor or his agent, another; and these two shall (previous to any other proceeding on their part) concur in naming a third as umpire. In the event of the arbitrators not agreeing in opinion, the umpire will be called upon for his decision, which shall be final." But while this Board is being formed and is deliberating, the patients are waiting for their dinners; and, in an isolated position like Tarban, it must necessarily be late in the day before a second supply of bread or meat can be obtained. The consequence is, that the Superintendent is virtually unable to object to the supplies sent, for fear of keeping his patients dinnerless; and is, more or less, at the mercy of the contractor. He may, it is true, summarily reject articles of a perishable nature, at the time and place of delivery; but he does so under a right of appeal to the Government by the contractor, and under an almost certain knowledge that, unless owing to special alacrity on the part of the contractor himself, no other supplies can be obtained in sufficient time.

The Board of Visitors, appointed by the Government, and paid all necessary expenses, consists of three members—two medical, and one legal. Their exact powers and duties are not clearly laid down but they are charged with the general inspection of the institution and the patients, the examination of the warrants of all patients admitted, and the examination and discharge of all patients considered to be in a fit condition to leave the asylum. One medical member of the Board visits the asylum weekly, and the legal member at irregular intervals. It is necessary that both of the medical visitors should certify to the sanity of any patient before his discharge.

The Superintendent is a physician, and the head of the institution. He hires and discharges all servants, and is responsible to the Colonial Secretary for the good government of the institution.

The system of supply by requisition, which has been already alluded to, and which is carried into the smallest matters, considerably cramps both his powers and his usefulness, rendering the duties of his office difficult of fulfilment.

There is one assistant medical officer only, giving a proportion of one medical officer for 325 patients, who are for the most part of the acute and more violent class; since the chronic cases are, as a rule, drafted to Parramatta.

Officers and Servants.

The other staff for this large number of patients are—

Clerk		Gate-keeper
Matron		Labourer
Dispenser		Carter
Storekeeper		Laundress
Chief attendant		3 laundry maids
Out-door attendant		1 night watchman
Gardener		23 male
Cook		17 female
Cook's assistant		} attendants.

A clerk of works, under the orders of the Colonial Architect, superintends the execution of the repairs to the buildings, and an engineer under the same authority attends to the engine employed in pumping water.

The staff is very small, compared with that of any English asylum of similar size.

The matron has charge of the female patients, and a general supervision of the female division, the laundry, the offices, and officers' residences, and fulfils, therefore, all the duties of chief attendant as well as some of those of housekeeper. The kitchen is under the immediate charge of the storekeeper.

The

The chief attendant on the male side is charged with a general supervision of the patients and attendants of the division.

The ordinary attendants number one to about thirteen and a half patients on the female, and (counting the night watchman and the out-door attendant) one to about seventeen on the male side. These patients, it must be remembered, are for the most part acute cases, and yet the proportion is (especially for the male side) much below that in almost every large British, American, and Continental asylum in which both acute and chronic cases are maintained.

The attendants wear no uniform, and are, as a rule, untidy in appearance; the men carry their keys, which are of large size, from a somewhat heavy chain, fastened to a strap round the waist. Several of the senior attendants write very badly or not at all, and little care appears to have been taken to select persons of education.

The system of punishment for attendants is by means of fine, for leave-breaking, for allowing escape of patients, and for misconduct.

The holidays allowed are one day a month, every third or fourth Sunday from after breakfast until tea-time, and from 7 to 10 every evening for unmarried, and from 7 p.m. to 5.30 a.m. for married men.

There is a permanent night watchman, who has a general charge of the whole buildings, and attends the entrance gate; he sits in the kitchen, and makes periodical rounds. The remaining night attendants—two for the male, and one for the female side—are the ordinary day attendants, who do duty in rotation, and are excused duty on the following day. One on the male side is stationed in a corridor in which the more suicidal class of patients sleep. Most of the wet and dirty patients on the female side are raised at intervals, and conducted to the closets or utensils, and the number of wet and dirty beds is on an average from three to five. The patients on the male side are never roused and taken to the utensils and closets, and the number of wet and dirty beds, which are never changed during the night, averages twenty-four. There is no mode of checking the rounds. The door locks are so stiff and noisy that a large number of patients are awakened in every ward by the opening of the doors, and the night attendants in their rounds wear thick noisy boots.

No artisans are employed. The clothing is all bought ready made, and the greater part is worn out without mending; a large number of the patients are therefore in rags, and the cost to the institution is large. The boots made by contract or in the gaols are received from the store, worn until they are in holes, and then discarded. Until within the last year (when about twelve dozen pairs were sent to Parramatta Gaol for that purpose) none have ever been repaired. A large number of the shoes, when discarded, would serve for a long time if properly mended, and those worn by destructive patients become useless before one-fourth worn out.

There are four divisions or yards on the female side, and five on the male. The classification is made according to the power of self-control, and the extra division on the male side is devoted chiefly to sick, infirm, and elderly patients. This division contains 120 patients during the day, and 160 sleep in the rooms attached to it. The other male divisions contain 88, 90, 77, and 45 patients respectively. The latter are patients of the most violent class. The yard is small, and completely surrounded by buildings, and the difficulty of preventing quarrels among such a number so situated is, as may be imagined, great. The number in the yard set apart for the more violent class of women is 47.

The amount of labour done in the asylum is comparatively small; none of the men's clothes are made, and few repaired. The women do all the mending for their own division, but the number of new clothes made is something trifling. The bed clothes are all bought ready made.

No boot-making or mending is attempted, and no single trade is properly carried out. One or two patients perform a little rough carpenter's work, and one does a little work as a blacksmith, but unsatisfactorily, and without system.

The numbers employed will be seen by an examination of the following tables:—

<i>Women.</i>	<i>Men.</i>
Needlework 14	Gardeners 4
Laundry 11	Labourers in grounds 9
In cleaning offices... .. 2	Kitchen 5
General work of wards—cleaning, &c. 29	Stable 1
—	Blacksmith 1
56	Tailor 1
	Assistant in surgery 1
	In store 1
	Wood yard 13
	General work of wards 27
	Messenger 1
	Carpenter 1
	—
	65

There are at this time three or four carpenters, a painter, two tailors, and various other workmen who could be usefully employed, if they had some one to direct their labour; but there is a general distaste for work, which shows that it has not been the ruling principle of the institution. It is no uncommon thing, when inquiries are made as to the reason why a patient does not work, to obtain for answer, "I've not come into Tarban to work," or "Work and I quarrelled long ago."

It must be remembered also, in considering this question, that the twenty patients paid for by their friends are, as a rule, above the class supporting itself by manual labour; and if not, consider that as their maintenance is paid for, work is a superfluity.

A large number of the indigent patients are from a class unused to work—they have been in better circumstances, and they are indigent because of their malady.

The dress of the patients is almost all provided ready-made from the Store Department. The men's dress consists chiefly of blue cloth trousers, waistcoat, and jackets, with black or white felt hats. For the working men moleskin trousers are used, and a few wear serge jumpers; for summer, duck jumpers are issued. The women wear print dresses—the majority of a dark sombre blue, which parts with its colour so readily when new that the patients become almost as blue as their dresses; some are dressed

dressed in lighter prints; a few in winseys. Small bright shawls are given for winter, and out-door use, and white hoods serve instead of bonnets, are comfortable to wear, afford protection from the sun, and are sufficiently sightly.

A certain number of the patients wear dresses of strong materials, but these are, as a rule, badly shaped and often ragged. The present supply of clothing, both for males and females, is deficient in amount, variety, pattern, and material.

One of the most striking things in the asylum is the generally untidy condition of the patients—the men are especially so. The clothes are torn and dirty; there is a want of buttons and fastenings to all the various garments, and in many cases little or no care is taken about a proper fit.* The boots are almost as often without laces as with them, and the number without boots is very large.

The linen is changed once a week.

The library consists of between 300 and 400 volumes; they are, however, in woeful unrepair, and are never patched and made decent. The newspapers and periodicals for the patients are—

2 Sydney Morning Herald,	1 Blackwood's Magazine,
2 Empires,	1 Cornhill Magazine,
1 Fraser's Magazine,	1 Edinburgh Review, and
	1 Quarterly Review.

£50 a year are allowed by the Government for books and papers.

No catalogue of the library exists.

The diet for patients is sufficient in amount, though wanting somewhat in variety.

The following is the diet scale:—

FULL DIET.

On Sundays and Thursdays.

1 pound fresh mutton	$\frac{1}{4}$ ounce tea
20 ounces bread	$1\frac{1}{2}$ „ sugar
1 pound vegetables	1 gill milk

On Mondays, Wednesdays, and Saturdays.

1 pound meat	1 pound bread
1 ounce rice	$\frac{1}{4}$ ounce tea
1 pound vegetables	$1\frac{1}{2}$ „ sugar
	1 gill milk.

On Tuesdays and Fridays.

1 pound meat	1 pound bread
$\frac{1}{2}$ ounce suet	$\frac{1}{4}$ ounce tea
6 „ flour	$1\frac{1}{2}$ „ sugar
	1 gill milk

$\frac{1}{2}$ pound flour, $\frac{1}{4}$ pound of raisins, and 1 ounce of suet, on Christmas Day and the Queen's Birthday, in addition to the authorized ration.

To be substituted in cases of sickness, at the discretion of the Surgeon:—

RATION NO. 3.—HALF DIET.

2 pints tea	$\frac{1}{4}$ ounce tea	$\frac{1}{2}$ pound meat
	$1\frac{1}{2}$ „ sugar	1 „ bread
	1 gill milk	$\frac{1}{2}$ „ vegetables
		1 pint broth

RATION NO. 4.—LOW DIET.

2 pints tea	$\frac{1}{4}$ ounce tea	$\frac{1}{4}$ pound meat
	$1\frac{1}{2}$ „ sugar	$\frac{1}{2}$ „ bread
	1 gill milk	$\frac{1}{4}$ „ vegetables
		$\frac{1}{2}$ pint broth

RATION NO. 5.—FEVER DIET.

2 pints tea	$\frac{1}{4}$ ounce tea
	$1\frac{1}{2}$ „ sugar
	1 gill milk

$\frac{1}{2}$ pound bread (with sago, arrowroot, pudding, and other extras, as occasion may require.)

1 ounce pepper and 25 ounces salt for every 100 full daily rations of provisions to patients.

The allowances for attendants are as follows:—

1 pound fresh beef or mutton	} Daily.
1 „ bread, first quality	
1 ounce rice	
$\frac{1}{2}$ „ salt	
1 pound vegetables	
1 gill milk	} Weekly.
4 ounces tea	
2 pounds sugar	

Tobacco is allowed to almost all who have been accustomed to smoke or chew; and all the workers get extras, in the shape of beer, bread and cheese, &c.

Relief is granted on discharge to all who have no money to pay travelling expenses or home to go to. It varies from one shilling to one pound, but never exceeds that sum.

There

* As only certain sizes are supplied, and there is no tailor attached to the institution, very short, tall, stout, or thin men, are fitted as well as possible from the stock in store; but the result would be in some cases ludicrous if it were not also painful. Men with peculiarities of feet are, for the same reasons, allowed to go shoeless.

There are no printed regulations for the guidance of either officers or attendants; no form for reports by day, night, and chief attendants; no extra or ordinary diet rolls; no bath rules. Written reports are made by the day and night attendants, but they are not at all so complete and satisfactory as they might be made. No reports by the Superintendent or Board of Visitors are published.

The cost per head for food, medicine, medical care and attendance, is 7s. 8d. a week.

As all clothing is supplied through the Store Department, and all repairs to the building and the furniture are provided for from the office of the Secretary for Works, no data exist at the Asylum on which to calculate the cost of these items.

The shower-bath is used both as a disciplinary measure and for treatment. Prolonged warm baths are seldom employed. No form of restraint is used in the Asylum. Seclusion is practised mainly as treatment. One man is at this time temporarily in seclusion on the male side, for the sake of quiet; and two women are secluded permanently on the female side—both are very violent and indecent, and if unchecked would undress themselves and walk about in a state of nudity—one is deaf and dumb.

The amount of seclusion for short periods is not more than in most English asylums.

A very small acquaintance with the patients is sufficient to show that a certain number might be with advantage discharged to the care of their friends (if such friends were able to maintain them), because harmless, and quite unlikely to be benefited by a longer stay in the institution; but the law, as it at present stands, is a direct barrier to their discharge, and they stay in the asylum and occupy the room which might, in the present crowded state of the institutions for the insane in the Colony, be much more beneficially given to acute and more curable cases. By the 3rd section of the Act passed in June, 1846, to amend the Lunacy Act of 1843, it is provided that it shall be lawful for the Governor, if he think it fit so to do, to order the discharge of any lunatic still labouring under insanity to the custody of his or her friends, provided that no person who may have been committed as a dangerous lunatic, or a dangerous idiot, shall be so discharged, unless the friend shall enter into sufficient recognizances for the peaceable behaviour of such dangerous lunatic or idiot, before two Justices of the Peace, in the Court of Quarter Sessions, or one of the Judges of the Supreme Court. As all or nearly all the insane are admitted into the asylum under a form denominating them dangerous lunatics or idiots, whether they really are so or not, a very small number (those admitted on the application of friends) can be discharged unless a bond, which costs at least £1, is entered into; and this, in the trouble which its execution entails and in its formal character, often serves to deter friends who would willingly take charge of harmless patients. Repeated applications have been made to the asylum for the discharge of harmless patients; but the friends, frightened by the bond, and unwilling to pay the £1 duty, have declined to execute it. The bond thus acts as a direct deterrent. There can be little doubt that it is in every way to the advantage of the Colony, in a financial and moral point of view, to offer encouragement to friends who are willing to undertake the charge of their insane, instead of placing obstacles in the way of their so doing. In many cases it would be to the pecuniary advantage of the Colony, and it would increase the happiness of the patient, if direct pecuniary aid were given to such families, otherwise willing, as could not without it undertake the burden of maintaining their insane relatives. In many cases, patients now costing the Colony at least 10s. per week would be taken charge of and kindly treated by friends for half that amount, and the necessary certificate of the continuance of insanity, and of the proper provision and maintenance, might be furnished to the Government at fixed intervals by medical practitioners of the district in which they live.

SUGGESTIONS.

An examination of the foregoing Report will show that the present institution at Tarban Creek is in many ways unfitted for an hospital for the insane; its position is isolated, and, as a consequence, supply is difficult and costly, and visitation, whether by officials or friends of patients, only possible by an expenditure of time which in most cases can be ill afforded. In addition, the patients are shut out from many sources of recreation, since it is equally impossible to induce persons who would otherwise be willing to contribute to their amusement to make such a journey, or to take the patients to the exhibitions, concerts, &c., which are always attainable in town. The amount of land useful for cultivation belonging to the asylum is extremely small. The greater part of the building is prison-like and gloomy. The kitchen, stores, and other offices, are utterly unfitted for the purposes to which they are at present applied; and chapel and amusement room, important accessories to such an institution, are wanting. Under these circumstances, if the building can be usefully employed as a benevolent asylum, or a reformatory, it should undoubtedly cease to be a residence for the insane as soon as possible. If it is decided that it is necessary to retain it as an asylum for some few years to come, such alterations and additions should be made as will render it fit for the purpose; and the following suggestions are offered for the consideration of the Government.

- 1st. That the number of inmates should be as speedily as possible reduced to 300,—200 males and 100 females. The present buildings are not fitted to contain more than that number; and, taking the site and the nature of the present structure into consideration, it is obviously unadvisable to add to the accommodation already existing.
- 2nd. That an adjoining estate, which consists of 28 acres of cultivable land, and on which stands a house which would serve as a residence for the superintendent, should be purchased and added to the asylum property. The land is urgently needed as a farm for the occupation of the patients, and for the growth of produce for the use of the asylum; and the present rooms occupied by the superintendent in the asylum are required as visiting rooms for patients' friends, and as sitting and bed rooms for the other officers.
- 3rd. That new and sufficient stores be erected for meat, bread, groceries, clothing, and utensils, with office for the storekeeper, in the rear of the present building occupied for these purposes.
- 4th. That the present store be converted into a kitchen, and fitted with such modern conveniences as will suffice to cook and serve the meals with comfort for 300 patients and the necessary officers and attendants, and that a good scullery and oven be placed near the kitchen.
- 5th. That the present kitchen and scullery be made into one room, and so fitted as to serve for chapel and amusement hall.

6th.

- 6th. That a new laundry be erected near the present one, to consist of a receiving-room for dirty linen, washing-room, mangling and ironing room, folding, sorting, and mending room, the fittings to be such as to serve for washing by manual labour. In this laundry, all the linen, the sheets, pillow-cases, the clothes of officers and attendants, and all minor articles, should be washed by women.
- 7th. That a small laundry should be erected adjoining the present engine-room at the reservoir; that this should consist of two parts—one for the blankets, counterpanes, and heavy clothes; the other for the extremely dirty clothes of all kinds. For the latter an open shed is best, as affording a freer escape for obnoxious odours. In this building should be fitted simple washing and wringing machinery, to be turned by the engine which pumps the water for the supply of the asylum. The small amount of manual labour necessary may be done by male patients.
- 8th. That new stable accommodation for five or six horses be provided, with the necessary harness-room, corn-loft, &c., so as to accommodate the horses belonging to the asylum as well as those of the Superintendent and visitors.
- 9th. That piggeries should be immediately erected, and cowsheds as soon as provision is made for feeding the cows.
- 10th. That a range of buildings should be erected to contain an upholsterer's shop (in which the beds might be stuffed), tailor's, bootmaker's, blacksmith's and carpenter's shops. The buildings just commenced and intended as dormitories for male patients would serve, with a few minor alterations, for this purpose, as soon as the patients to be placed in them are removed to the buildings about to be erected at Parramatta.
- 11th. That a fence should be erected in the present grounds on both sides, to separate the part to be used as airing-ground for the patients from the garden, the patches now in process of clearing for cultivation, and the rocky woodland into which it is not safe to allow the patients to enter.
- 12th. That sun-sheds, seats, and earth-closets should be placed in the general grounds for each sex.
- 13th. That cottages should be built as residences for the storekeeper, engineer, and gardener—(the latter in place of the ruinous structure at present in use)—all placed contiguous to the place where each of these individuals works.
- 14th. That proper approaches and fences be made to the asylum. The present palings at the back are in a ruinous state and afford no security.
- 15th. That the house now occupied by the Superintendent and other officers should be thoroughly refitted and repaired; that the room now used as a board-room, visitors' room, and chapel, be set apart as a visitors' room for male patients, and also as a reading-room and library for patients of this sex; that the corresponding room on the female side, now the Superintendent's dining-room, be made a visiting-room for female patients, and a reading-room for the more quiet patients of that sex; and that both these rooms be comfortably furnished. That offices be set apart for the Superintendent, clerk, and medical officer, on the ground floor of the building, and the dispensary removed from the front to the back for convenience in distributing medicine. That the upper rooms be apportioned between the officers (giving two rooms for each) and the domestic servants of the institution; and that the centre room, now used as the Superintendent's sitting-room, be used for the meeting of the official visitors. That the room for matron, and medical, and indeed all resident officers, be substantially furnished.
- 16th. That coals should be burnt in the kitchen instead of wood; and the heavy iron guards now in use in the wards discarded.
- 17th. That such windows as are now permanently closed, except a small portion at the top, should be made to open to a greater extent.
- 18th. That the dark passage separating the 1st and 2nd divisions on each side should be removed.
- 19th. That a system of lighting by means of properly arranged kerosene lamps should be introduced throughout the kitchen, central offices, amusement hall, day-rooms, and the associated dormitories.
- 20th. That cement instead of wooden baths should be used throughout; that all those already of cement be repaired; and that locks be placed on all the shower-baths so as to prevent their unauthorized use.
- 21st. That lavatories of simple form should be constructed in each division where they do not at present exist.
- 22nd. That proper tins for conveying the food to the wards, neat crockery, knives and forks, and all the necessary appliances for serving it in a proper manner, should be provided.
- 23rd. That a ward-kitchen, fitted with a small stove, at which sago, arrowroot, beef-tea, and other comforts for the sick, could be prepared, should be made in the male and female divisions.
- 24th. That the drying yards should be enlarged and properly arranged.
- 25th. That earth-closets should be fitted for all the wards except where the water-closets exist and can be made to answer satisfactorily.
- 26th. That all necessary repairs to flooring, skirting-boards, &c., should be done, the walls of the day-rooms properly coloured, some comfortable furniture provided, and some ornamentation by means of pictures, plants, &c., introduced.
- 27th. That the bedsteads should be all painted, the majority of the beds stuffed with coir or horse-hair, and that a better and more plentiful supply of bed-linen be provided, so as to give more than one sheet to each person, and a pillow-case which will cover more than half the pillow; that earthenware chamber utensils be provided, and boxes to keep the patients' clothes in at night, and to serve as seats.
- 28th. That an additional panelled room be made for each sex.
- 29th. That proper sleeping accommodation should be provided for all attendants sleeping in the house, and that their rooms be comfortably furnished.

- 30th. That fit attendants' mess-room should be provided and made habitable.
- 31st. That the dead-house should be so fitted as to allow of proper *post mortem* examination of all patients deceased in the asylum.
- 32nd. That the room now used as both bed-room and sitting-room by the matron be used as a matron's store-room and office, and that the corresponding room on the opposite side be used for a similar purpose by the chief attendant; that a separate room be set apart as a sewing and cutting-out room, in which all the patients capable of work could assemble under the care of an attendant. The building about to be erected for fifty female patients might serve for this and other purposes.
- 33rd. That bells should be fitted in the Superintendent's office, to summon the matron and chief attendant; and that the necessary house-bells should be fitted in the central residence.
- 34th. That a complete set of asylum locks should be sent for from England; that all those at present in use should be removed, and a proper system be introduced, check-locks being placed on all the doors at which officers alone are to have the free entry. This is most important, and should be immediately carried out.
- 35th. That either a Board of control should be appointed for the government of the asylum, or that increased powers be given to the Superintendent to order all minor repairs without going through the routine of requisition. The Clerk of the Works might carry out these repairs, the orders of the Superintendent, and payment be made by voucher. Provision should be made for the expenditure of minor sums in the same way, and immense trouble would be saved, and the clothing department of the asylum placed on an altogether more satisfactory footing, if the articles were supplied by the contractor immediately to the asylum instead of through the Store Department.
- 36th. When the number of patients is reduced to 300, if those of the more chronic class be retained, the office of assistant medical officer may be abolished, and the staff otherwise reduced. If the asylum is occupied by acute and chronic cases in the usual proportion—a plan which is desirable in a well-fitted asylum, but which is objectionable in such a building as Tarban, where scientific treatment must always be difficult—one medical officer would be unequal to the duties of superintendence and medical treatment.
- 37th. That the following artisans should be immediately added to the staff of the asylum:—A carpenter and joiner, a tailor, a bootmaker, and a workwoman. For the former, at this moment, nearly a year's full employment could be found; and with a clever workman, and the assistance which could be rendered by artisan patients, the asylum might be made nearly independent of the Colonial Architect's Department in this particular. A tailor is much needed to make and repair the clothing for the male patients, many of whom are now in rags; and a workwoman is necessary to render the same service in the female division. A bootmaker is needed to repair and make boots for the patients. The tailor and bootmaker might be assisted by patients for whom it is now difficult to find useful occupation, and who are not fit to be employed at their trades without some superintendence. There can be little doubt that by the employment of these artisans a saving would be effected to the institution, the mass of the patients be better dressed and made more comfortable, and a few usefully employed.
- 38th. That the supply of newspapers and periodicals for the use of the patients should be largely increased.
- 39th. That the dress of the patients should be improved by a more liberal allowance of material, as well as a larger choice of patterns, and improvements in shape and fit.
- 40th. That pigs be at once bought, and fed on the refuse of the institution, which is now wasted; and that as soon as sufficient land is brought into cultivation to afford food, cows be purchased, and so far as is possible, the milk needed be thus supplied.
- 41st. That printed rules and regulations for the guidance of officers and servants be drawn up and submitted to the Government for approval, as soon as convenient; and that a complete system of attendants' reports be instituted.
- 42nd. That some alteration be made in the law requiring friends to enter into recognizances before harmless or chronic patients are discharged to their custody; and that arrangements be made for affording pecuniary aid in cases where it is deemed advisable.
- 43rd. That the friends of patients should be charged with their maintenance in accordance with their ability to pay. That in special cases sums as low as 5s. a week should be received, and in others 2 guineas and upwards should be charged. The sum at present charged, 2s. 2d. a day, scarcely suffices to meet all the expenses incurred for this class of patients, as extra attention is bestowed upon them and some extra diet necessary, whilst they seldom or never employ themselves for the benefit of the institution.

If these suggestions, certain of which have already been submitted for the consideration and met with the approval of the Government, are carried out, they will involve the expenditure of a considerable sum of money; it is therefore with the greatest reluctance that they are offered, but if the building is to be retained even for a short time as an institution for the *treatment* of insanity and not a mere lock-up for the insane, a number of alterations (those mentioned in the 1st, 3rd, 4th, 5th, 7th, 10th, 11th, 12th, 14th, 17th, 19th, 20th, 22nd, 24th, 25th, 26th, 27th, 28th, 29th, 34th, 37th, 38th, and 41st suggestions) are absolutely and immediately necessary; and the remainder are much to be recommended, if it should be decided to retain the building as an institution for the treatment of the insane beyond the period necessary for the erection of new asylums. It must always be borne in mind that by far the greater number of the suggested alterations, and those certainly requiring the largest expenditure of money, are of such a character that they will be useful, and indeed necessary, for a reformatory, benevolent asylum, or any other purpose for which the buildings may ultimately be destined. The massive stone buildings, the main character of which it is impossible to alter without an unjustifiable expenditure of money, will be

be useful as a dwelling for the indigent or vicious for many years yet to come; and wherever a large number are gathered together, kitchen, stores, and offices are required. If the land which it is suggested should be now purchased is not required, its position will always render it sufficiently saleable. Some part of the expense attending the alterations might be defrayed by the sale of a large part of the asylum reserve, which, although for the most part of rocky land, is finely situated for building purposes. The part capable of cultivation is too far from the asylum to be worked by the labour of the patients; and the whole, consisting of many acres, is of no service to the institution even as ensuring privacy.

FRED^c NORTON MANNING, M.D.

Tarban Creek,
October 22nd, 1868.

No. 2.

E. S. P. BEDFORD, ESQ., to THE PRINCIPAL UNDER SECRETARY.

169, Macquarie-street,
1 March, 1869.

SIR,

On behalf of the Board of Visitors, I have the honor to acknowledge the receipt of your letter requesting a report from the Board as to the present state of accommodation at the Parramatta and Tarban Asylums.

In May, 1867, the Board brought under notice the overcrowded state of the Tarban Asylum, which then had 553 inmates in a building adapted for 350 or 300; and on the 31st of January last there were 651 patients there. At Parramatta, the numbers in 1867 were 525, and on the 5th February there were 541.

The buildings in the asylum at Parramatta hold these patients, but they are very unfit, almost in every respect, for the purpose, and must give way to another asylum.

There has been increased accommodation in the criminal division, by putting another story on the building and adding separate cells; but this provides only for a particular class of patients—criminal lunatics—and it is full.

At Tarban temporary wooden buildings have been erected, to receive 100 men and 50 women in sleeping-rooms, thus relieving in part the day-rooms from being used as dormitories; and from the female side twenty-five patients have been removed to Mr. Tucker's establishment at Cook's River, thus giving further relief to that part of the establishment.

There are in the course of erection, on the Vineyard Property, temporary buildings, which will we trust be completed in two months, that will accommodate comfortably 200 male patients. This will greatly relieve the overcrowded state of Tarban, and reduce its number of patients to 451; but the imperfect day accommodation will only be for about 350 or 300, and there is no provision for the increasing numbers which goes on weekly.

While it is not desired for one moment to undervalue the great benefit of the temporary buildings, which give great relief to Tarban, and render it possible to effect improved arrangements in that asylum which otherwise would not have been possible,—it must not be lost sight of that the present permanent buildings are not fitted for the purpose, that the day accommodation is quite insufficient, and that most of the other arrangements, in both the asylums, for bathing, and the latrines, require great changes for present use, and no improvements can render the erection of fresh asylums unnecessary.

In conclusion, we would venture to suggest that it is most desirable that the Government should determine what should be the number, nature, and situation of these buildings that are necessary for the proper reception and treatment of the lunatics of the Colony; for by having a regular plan laid down, expense will be saved and efficiency ensured; whereas if from time to time provision is made, rendered absolute by pressing wants, no asylum will be well arranged, and it will always be worked at a disadvantage.

I have, &c.,

E. S. P. BEDFORD,
President of the Board of Visitors.

P.S.—In asylums provision for workshops and amusements forms an effective part of the accommodation required, and these are not yet provided.

THE COLONIAL ARCHITECT to THE UNDER SECRETARY FOR PUBLIC WORKS.

Department of Public Works,
Colonial Architect's Office,
Sydney, 13 March, 1869.

SIR,

In returning the enclosed communication respecting the present state of accommodation at the Lunatic Asylums, Parramatta and Tarban Creek, forwarded to me under blank cover on 10th ultimo,—

2. I do myself the honor to subjoin a statement showing the accommodation at these institutions, asked for in the communication referred to.

3. The accommodation is calculated at 500 cubic feet to each patient in the dormitories, excepting the temporary building at Parramatta; and the cells, irrespective of size, are intended to accommodate one patient each.

I have, &c.,
JAMES BARNET,
Col. Archt.

1869.

NEW SOUTH WALES.

UNIVERSITY OF SYDNEY.

(REPORT FOR 1868.)

Presented in pursuance of the Act of Incorporation, 14 Vict., No. 31.

REPORT of the University of Sydney, for the Year ended 31st December, 1868.

1. In accordance with the provisions of the Act of Incorporation, 14 Victoria, No. 31, the Senate of the University of Sydney have the honor to submit to His Excellency the Governor and the Executive Council the report of their proceedings during the year 1868.

2. In Lent Term, twelve (12) students passed the statutory examination and were admitted to Matriculation.

3. Dispensations were granted to the following persons who produced satisfactory evidence that there were sufficient reasons for their exemption from lectures, viz. :—1. The Reverend James White, of Singleton, who had received a Dispensation during the years 1866–1867. 2. Mr. Thomas Bowyer, late Scholar of Corpus Christi College, Cambridge, and an undergraduate of one years' standing, who was admitted "*ad eundem statum*," in this University. 3. Mr. William West, an undergraduate of this University of two years' standing. 4. Mr. George Sly—on condition that he should attend the entire University course during the second and third years.

4. Thirteen candidates presented themselves at the Public Examinations. Certificates were granted to nine. The names and order of merit will be found in Appendix A.

5. Certificates of having passed the B.A. examination were granted to ten students. The names will be found in Appendix B.

6. Three candidates presented themselves for the degree of LL.B. As the examination is still in progress, the result will not be declared before Lent Term, 1869.

7. The following Degrees were conferred, the candidates having in every case qualified themselves by passing the examination required by the By-laws, viz. :—

M.D.

Goldsbro, Charles Field, M.B.

M.A.

Faithfull, William Percy, B.A.

M'Gibbon, Rev. John, B.A.

Metcalf, George, B.A., (Melbourne).

O'Brien, Francis, B.A.

LL.B.

Garran, Andrew, M.A. (University of London).

M'Gibbon, Rev. John, B.A.

B.A.

Barton, Edmund.

Clune, Michael.

Cooper, Pope Alexander.

Crompton, William.

Dillon, John Thomas.

Dunstan, Edmund.

Garrick, Joseph Hector.

O'Meara, Michael.

Purves, William Adams.

Thompson, Joseph.

Tole, Joseph.

8. The Scholarships were awarded as follows, viz. :—

“Deas Thomson” (*for proficiency in Physical Science*) :—

Thomas Roseby.

“Barker” (*for proficiency in Mathematical Science*) :—

John Alston.

“Cooper” (*for proficiency in Classics*) :—

John Alston.

“Lithgow” (*for the best student in the second year*) :—

Robert Morris.

“Levey” (*for the student who received the Junior Scholarship in the first year*) :—

Edward Rennie.

Scholarships for General Proficiency.

Third year :—John Alston.

First year :— { Richard Meares Sly.
 { Sydney Dargin.

9. The following students obtained special prizes, viz. :—

£25 *for first class honors in Classics.*

Edmund Barton.

£25 *for first class honors in Mathematics.*

Pope Alexander Cooper.

£10 *for Chemistry and Experimental Physics.*

William Adams Purves.

Professor Pell’s Medal (*for Mathematics for incepting Bachelors*) ;—

Pope Alexander Cooper.

Professor Smith’s Prize (*for Physics*) :—

J. Alston. } *æqs.*
R. Morris. }

10. Mr. Pope Alexander Cooper, who obtained the “Barker” and “University” Scholarships in 1867, and who passed the B.A. examination in Michaelmas Term of the same year, was nominated by the Senate, on the recommendation of the Professors, in the faculty of Arts, for the “Gilchrist” Scholarship. Mr. Cooper left for England early in the year, for the purpose of entering upon his studies at the University of London, in accordance with the conditions imposed by the Trustees of the “Gilchrist” Foundation.

11. A dramatic entertainment was given in the great hall before His Royal Highness the Duke of Edinburgh. The plays performed were the “Phormio” of Terence and “Molières,” Monsieur de Pourceaugnac. The parts were sustained by members of the University.

12. A vacancy in the Senate was caused by the absence of John Bayley Darvall, Esquire, from the Colony, beyond the term of his leave. At a Convocation holden on the 6th April, the Honorable William Munnings Arnold was elected in his room.

13. The Senate have to announce with regret the resignation of his seat on the Senate by Bartholomew O’Brien, Esq., M.D., in consequence of failing health; and they desire to record their sense of the valuable services rendered by him to the Institution, with which he was connected from its foundation. At a Convocation holden on the 12th December, Charles Nathan, Esquire, Fellow of the Royal College of Surgeons, England, was elected to fill his place.

14. The Senate have been in communication with the Council of Education on the subject of the recognition by that Board of the certificates issued to successful candidates in the public examinations. It has been decided that any person producing a certificate of having passed the *Junior* Public Examination shall be entitled to admission to the Council’s Training School without further examination. The question of the practicability of substituting the *Senior* Public Examinations in lieu of certain alternative subjects of examination for teachers’ higher class certificates, is still under the consideration of the Council.

15. Considerable difficulty having arisen in determining the value of Diplomas lodged by foreigners as a preliminary to admission to examination in Medicine, the Senate placed themselves in communication with the Consul of the North Germanic Confederation, with a view to obtain through his aid, information from Germany, as to the qualifications required to constitute a legally recognized Medical Practitioner in that country.

16. At the instance of the Professors, the Senate have under consideration the question of the expediency of making certain changes in the "curriculum" of study, more especially in relation to the election of subjects for the B.A. degree by students at the commencement of their third year.

17. The report of the Receipts and Expenditure for the year, duly certified by the Auditor, is appended to this Report (C).

This Report was agreed to at a duly convened meeting of the Senate, held on the 3rd March, and ordered to be transmitted for the approval of the Government.

HUGH KENNEDY,
Registrar.

APPENDIX A.

PUBLIC EXAMINATIONS.

(Names of the *Senior* candidates who have passed, arranged in alphabetical order in the several classes.)

CLASS I.

Kelly, Samuel (Sydney Grammar School), passed in Latin, Greek, English, Mathematics, Physics.

CLASS II.

M'Phillamy, John (Mr. Savigny's School, Bathurst), passed in Latin, French, Mathematics.
Rutledge, David Dunlop (Sydney Grammar School), passed in English, Latin, Greek, Mathematics, Physics.

CLASS III.

Donaldson, George G. (Mr. Pendrill's School, Glebe), passed in Latin, Greek, French.
Fanning, William (Mr. Blackmore's School, Sydney), passed in English and Latin.
M'Lardy, William M.S. (Sydney Grammar School), passed in Latin, Greek, Physics.
Peter, William (Sydney Grammar School), passed in Latin, Greek, Mathematics.
Walker, William John (Sydney Grammar School), passed in English and Mathematics.

(The following candidates gained distinction.)

LATIN.	GREEK.	FRENCH.	MATHEMATICS.	PHYSICS.
1st Class.	1st Class.	1st Class.	1st Class.	1st Class.
None.	None.	None.	Kelly.	Kelly.

G. EAGAR, Auditor.

Sydney, 31st December, 1868.

W. CLARK, Accountant.

1869.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

UNIVERSITY OF SYDNEY.

(BY-LAWS.)

Ordered by the Legislative Assembly to be Printed, 29 September, 1869.

BY-LAWS OF THE UNIVERSITY.

[All By-laws heretofore passed by the Senate, and now in force, are hereby repealed, and in lieu thereof, the following By-laws shall be, and are hereby declared to be, the By-laws under which the University of Sydney shall henceforth be governed. Provided always, that nothing herein contained shall be deemed to revive any By-law previously repealed, or to prejudice any matter already done, or commenced, under any By-law hitherto in force.]

I.—CHANCELLOR.

1. The election to the office of Chancellor shall take place at a duly convened meeting of the Senate, to be held in the first week in Lent Term.

2. The Chancellor shall be elected for a period of three years (except as hereinafter provided) to be computed from the date of election, but shall be eligible for re-election.

3. In the event of the office of Chancellor becoming vacant by death, resignation, or otherwise, before the expiration of the full term of office herein prescribed, the election of a successor shall be proceeded with at the next ensuing regular meeting of the Senate; and the Chancellor so appointed shall hold office until the first regular meeting of the Senate in the Lent Term next after the expiration of three years from the date of such election.

II.—VICE-CHANCELLOR.

1. The election of the Vice-Chancellor shall take place at a duly convened meeting of the Senate, to be held in the first week in Lent Term, except as in cases otherwise provided for by the Act of Incorporation.

III.—SENATE.

Meetings and Rules of Procedure.

1. The Senate shall meet on the first Wednesday in every month, or on the nearest convenient day, should such first Wednesday be a Public Holiday, and may adjourn from time to time to conclude any unfinished business.

2. At any time in the interval between such monthly meetings, it shall be competent for the Chancellor, or in his absence, the Vice-Chancellor, in any case of emergency, to call a special meeting of the Senate, to be held as soon as conveniently may be, for the consideration of any business which he may wish to submit to them.

3. Upon the written requisition of any three members, the Chancellor, or in his absence the Vice-Chancellor, or in the absence of both, the Registrar, shall convene a special meeting of the Senate, to be held as soon as conveniently may be after the expiration of nine days from the receipt of such requisition.

4. Except in any case of emergency as aforesaid, no motion initiating a subject for discussion shall be made, but in pursuance of notice given at least nine days previously; and every such notice shall be entered in a book, to be kept by the Registrar for that purpose.

5. The Registrar shall issue to each Member of the Senate a summons with a written specification of the various matters to be considered at the next meeting of the Senate, whether such meeting be an ordinary or a special one; and such summons, except in any case of emergency as aforesaid, shall be issued at least seven days previously to such meeting.

6. In the event of a quorum of the Senate not being present at any monthly or other meeting, within half an hour after the hour appointed, the meeting shall lapse, but the members then present may adjourn the meeting to any convenient future day, of which seven days' notice shall be given by the Registrar in the usual manner.

7. All the proceedings of the Senate shall be entered in a journal; and at the opening of each meeting the minutes of the preceding meeting shall be read and confirmed, and the signature of the Chairman then presiding shall be attached thereto.

8. If any Fellow shall, without leave from the Senate, be absent from their meetings for six consecutive calendar months, his fellowship shall *ipso facto* become vacant.

Election to Vacancies.

9. At the first meeting of the Senate after the occurrence of a vacancy among the Fellows, a day shall be fixed for a Convocation for the election of a successor, such day to be within sixty days from the date of such Senate meeting, and to be announced at least thirty days previously to such Convocation, by notice posted at the University, and by advertisement in one or more of the daily newspapers, provided that no Convocation for the election of a Fellow be held during the month of January.

10. No person shall be eligible for election to fill any vacancy among the Fellows, unless his name shall have been communicated to the Registrar by some *legally qualified voter at least ten clear days before the time of Convocation; and it shall be the duty of that officer to cause the name of such person and the fact of his candidature to be forthwith advertised in one or more of the daily papers published in Sydney, and to be posted in a conspicuous place in the University, for eight clear days at least before such Convocation.

11. The Convocation for the election of a Fellow shall be held in the University, and shall be presided over in the same manner as if it were a meeting of the Senate. Every candidate submitted for election must be proposed and seconded by legally qualified voters. If one candidate only be so proposed and seconded, then such candidate shall be declared by the President to be duly elected, but if more than one candidate be so proposed and seconded, an election shall be made by ballot. Before proceeding to such ballot, two members of Convocation shall be chosen by the members present to act as Scrutineers, and such Scrutineers shall report the result of the ballot to the President, who shall declare the candidate having the majority of votes, to be duly elected; and in the event of an equality of votes, the election shall be decided by the casting vote of the President.

12. At the time fixed for a Convocation for the election of a Fellow, the Registrar shall prepare for the President's use a complete list of all persons entitled to vote under the provisions of the law, and a copy of such lists shall be posted in a conspicuous place in the University for two days at least before the time of Convocation.

13. None but legally qualified voters shall be allowed to be present during the taking of a Poll.

Ex-officio Members.

(24 Victoria, No. 13.)

14. The Senior Professor of Classics, the Senior Professor of Mathematics, and the Senior Professor of Chemistry and Experimental Physics, shall be "*ex-officio*" Members of the Senate, under the provisions of the "Sydney University Incorporation Act Amendment Act of 1861."

IV.—SUPERIOR OFFICERS.

(24 Victoria, No. 13.)

1. The Registrar is hereby declared to be a Superior Officer of the University, entitled to the rights and privileges conferred by the "Sydney University Incorporation Act Amendment Act of 1861."

2. The Solicitor to the University is hereby declared to be a Superior Officer of the University, entitled to the rights and privileges conferred by the "Sydney University Incorporation Act Amendment Act of 1861."

V.—REGISTRAR.

1. The Registrar shall keep all necessary records of the proceedings of the University, conduct all necessary correspondence, and keep such registers and books of account as may be required.

2. All fees, fines, or other sums received by the Registrar in his capacity as such, shall be paid over to the credit of the University, in order that the same may be applied, accounted for, and audited in such manner as the Senate may from time to time appoint.

VI.—SEAL OF THE UNIVERSITY.

3. The Seal of the University shall be placed in the charge of the Chancellor or Vice-Chancellor, and Registrar, and shall not be affixed to any document except by order of the Senate.

VII.—FACULTIES.

1. There shall be three Faculties in the University, viz. :—

1. Arts.
2. Law.
3. Medicine.

VIII.—LIMITATION OF TITLE OF PROFESSOR.

1. The title of Professor shall be distinctive of Public Teachers in the University; and no person belonging to the University or to any College within it, shall assume that title without the express authority of the Senate of the University.

IX.—PROCTORIAL BOARD.

1. The Chancellor, the Vice-Chancellor, the Senior Professor of Classics, the Senior Professor of Mathematics, and the Senior Professor of Chemistry and Experimental Physics, shall form a Board, to be called the "Proctorial Board," to which shall be confided the duty of enforcing the observance of order on the part of the Undergraduates of the University. This Board shall make such regulations as it may deem expedient for the maintenance of discipline amongst the Undergraduates, and shall have the power of inflicting or authorizing to be inflicted, all such academic punishments as are sanctioned by the present usage

* The legally qualified voters are—Fellows of the Senate for the time being, Professors, Public Teachers and Examiners in the Schools of the University, Principals of Incorporated Colleges within the University, Superior Officers of the University declared to be such by By-law, and Graduates keeping their names on the Registrar of the University, who shall have taken any or either of the Degrees of M.A., LL.D., or M.D. in this University.

usage of British Universities, including fines to an amount not exceeding Five Pounds (£5) for any one offence: Provided however that the Board shall not proceed to the expulsion of any Undergraduate, or to his suspension for a period exceeding one Term, without the express authority of the Senate.

2. No question shall be decided at any meeting of this Board, unless three members at the least shall be present.

3. At meetings of this Board, the Chair shall be occupied by the Chancellor, or in his absence by the Vice-Chancellor, or in the absence of both the Chancellor and Vice-Chancellor, by the Dean of the Faculty of Arts; and in the event of an equality of votes at any meeting, the Chairman shall have a casting vote. At meetings of this Board the Registrar of the University shall attend and record the proceedings, and it shall be his duty to collect all fines imposed by or under the authority of the Board. It shall be the duty of the Registrar to convene the Board on the requisition of any one of its Members, at such time within seven days from the date of the requisition as may be directed by the Chancellor, or in his absence by the Vice-Chancellor, on whom it shall be incumbent to give such direction on the Registrar's application. In the event of the absence of the Chancellor and Vice-Chancellor, the time of meeting shall be fixed by the Dean of the Faculty of Arts.

X.—BOARDS OF STUDIES.

1. The Professors in the subjects required for the examinations for the Degree of B.A. shall form a Board; of which the Senior Professor, being a member of the Proctorial Board, shall be President, with the title of Dean of the Faculty of Arts.

2. The Professors and Examiners in the Faculty of Law shall form a Board; of which the Senior Professor shall be President, with the title of Dean of the Faculty of Laws.

3. The Professors and Examiners in the Faculty of Medicine shall form a Board; of which the Senior Professor shall be President, with the title of Dean of the Faculty of Medicine.

4. It shall be duty of the above-named Boards to deliberate and report to the Senate upon all questions relating to the studies and examinations in their several Faculties.

5. The Chancellor, the Vice-Chancellor, and the Professors of the three several Faculties, shall form a Board, to be called the "Conference Board," for the consideration of all general questions relating to the studies of the University, or which may be referred to them by the Senate.

XI.—DEAN OF THE FACULTY OF ARTS.

1. The Dean of the Faculty of Arts in the University shall be elected by the Senate from time to time for a term of three years.

2. The first election to that office shall be held at the meeting of the Senate in the first week in Lent Term of 1868.

3. Thereafter such election shall be held at the corresponding meeting of the Senate in every third year.

4. Upon any casual vacancy, or upon a failure to make an election at the time required by the foregoing Rules, the vacancy shall be filled up for the unexpired residue of the current term of three years at some meeting of the Senate, to be held within two months from the time when such vacancy shall have become known to the Chancellor, or from the time of such failure to elect.

5. So much of the By-law in section 1 of Chapter 10 as is inconsistent with the above is rescinded, and the Dean of the Faculty of Arts to be elected as above provided shall be President of the Board of Studies in the said By-law mentioned.

XII.—TERMS.

1. The Academic Year shall contain three Terms, that is to say:—LENT TERM—Commencing on the second Monday in February, and terminating with the third week in May, with an interval (not exceeding eight days) at Easter.

TRINITY TERM—Commencing on the third Monday in June, and terminating with the last week in August.

MICHAELMAS TERM—Commencing on the first Monday in October, and terminating with the second week in December.

XIII.—FACULTY OF ARTS.

Subjects of Study.

1. Professors and Lecturers, appointed by the Senate, shall give instruction in the following subjects:—

1. Greek Language and Literature.
2. Latin Language and Literature.
3. Ancient History.
4. Mathematics.
5. Natural Philosophy.
6. Chemistry.
7. Experimental Physics.
8. Mental Philosophy and Logic.
9. Geology.
10. Mineralogy.

Board of Examiners.

2. The Members of the Board of Studies in the Faculty of Arts, together with such other persons as may from time to time be appointed by the Senate, shall form a Board of Examiners for conducting the examinations in the Faculty of Arts; and of this Board the Dean of the Faculty, or in his absence the Professor next in seniority, shall be Chairman.

3. The Board of Examiners shall, from time to time, and in accordance with the provisions of the By-laws for the time being, frame rules, and appoint times and places for the several examinations in the Faculty of Arts.

4. At the conclusion of each examination, the Board shall transmit to the Senate a report of the result, signed by the Chairman, and by at least two other Members.

Matriculation.

Matriculation.

5. Candidates for Matriculation must make application to the Registrar before the commencement of Lent Term.

6. The Matriculation Examination shall take place once a year, and shall commence on the second day in Lent Term.

7. The examination shall be conducted by means of written or printed papers; but the Examiners shall not be precluded from putting *vivâ voce* questions.

8. The names of all candidates who have passed the Matriculation Examination shall be arranged alphabetically; but it shall be competent to the Examiners to place in a separate class the names of those who may have specially distinguished themselves.

9. All Students who shall receive a *testamur* of having passed the Matriculation Examination, and shall have paid a fee of two pounds to the Registrar, shall be admitted by the Senate as Members of the University.

10. The examination for Matriculation shall be in the following subjects:—

The Greek and Latin Languages.

English Grammar and Composition.

The French or German Language,—translation from some modern Author.

Arithmetic.

Algebra, to simple equations, inclusive.

Geometry, first book of Euclid.

Lectures.

11. Lectures shall commence on the first day of Term excepting in the first or Lent Term, in which they shall commence at the conclusion of the Matriculation and Scholarship Examinations.

12. Lectures of an hour each shall be given by the Professors in Classics, Logic, Mathematics, Chemistry, and Experimental Physics, at such times and in such order as the Senate may from time to time direct.

13. Before the admission of a Student to any course of Lectures, he shall pay to the Registrar of the University such fee as shall have been appointed by the Senate.

14. The subjects of Lectures shall be publicly notified by the Registrar before the commencement of each academic year.

15. Candidates for degrees shall, during their first and second years, attend the University Lectures on the following subjects:—

1. Greek.

2. Latin.

3. Logic.

4. Ancient History.

5. Mathematics.

6. Natural Philosophy.

7. Chemistry.

8. Experimental Physics.

16. Candidates for Degrees shall, during their third year, attend the University Lectures upon those subjects in which they shall be liable to examination for the Degree of B.A., in accordance with section 41.

17. Any Undergraduate not holding a Scholarship in the University, nor being a Member of a College established under the provisions of the Act 18 Victoria, No. 37, may be exempted from attendance upon any or all of the above-named Lectures, upon producing evidence which shall satisfy the Senate that there are sufficient reasons for such exemption; provided that no such exemption shall be granted for more than one year at any one time.

Yearly Examinations.

18. Examinations of the Undergraduates of the first and second years shall be held once a year during the last fortnight of Michaelmas Term, and no Undergraduate shall absent himself therefrom except under medical certificate.

19. The Undergraduates of the first and second years shall be examined in the subjects of the Undergraduate course upon which Lectures have been given during the year.

20. No Undergraduate not exempted under section 17 from attendance upon Lectures shall be admitted to these examinations, who without sufficient cause shall have absented himself more than three times during any one Term from any prescribed course of Lectures.

21. Every Undergraduate exempted from attendance upon Lectures under section 17 shall, before being admitted to any yearly examination, pay to the Registrar a fee of Three Pounds. If any such candidate fail to pass the examination, the fee shall not be returned to him, but he may be admitted again to examination without the payment of any additional fee.

22. After examination the names of the Undergraduates shall be arranged in classes, and in order of merit.

23. Prize books, stamped with the University Arms, shall be given to each member of the first class in each year.

24. Such Undergraduates as absent themselves from the examinations, except under medical certificate, or fail to pass them in a satisfactory manner, shall, at the discretion of the Senate, on the report of the Examiners, be required to keep additional Terms before proceeding to a B. A. Degree.

25. At the end of each academic year those Undergraduates who shall have attended Lectures, and otherwise complied with the Regulations, shall receive certificates to that effect, signed by the Dean of the Faculty of Arts and by the Registrar; but no certificate shall be granted to any such Undergraduate who shall without sufficient cause have absented himself more than three times during any one Term from any prescribed course of Lectures.

26. Undergraduates who shall have passed the yearly examinations shall receive certificates to that effect, signed by the Dean of the Faculty of Arts and by the Registrar.

Public

Public Examinations.

27. Two Public Examinations shall be held every year. The one to be called the Junior Public Examination shall be open to all candidates under the age of sixteen years; the other to be called the Senior Public Examination shall be open to all candidates who may present themselves.

28. The Public Examinations shall be held at such times and at such places as the Senate may from time to time appoint.

29. The subjects of the Junior Public Examination shall be the English Language and Literature, History, Geography, the Latin, Greek, French and German Languages, Arithmetic, Algebra, Geometry, and such other branches of learning as the Senate may from time to time determine.

30. The subjects of the Senior Public Examination shall be those mentioned in section twenty-nine, together with Trigonometry, Conic Sections, Natural Philosophy, Chemistry, Experimental Physics, and Geology and Palæontology.

31. Every candidate who shall pass either of these examinations, or such portions of either of them as may be required by the Regulations of the Senate in force for the time being, shall receive a certificate to that effect, specifying the subjects in which he shall have passed, and signed by the Dean of the Faculty of Arts and by the Registrar.

32. No person shall be admitted to either of the public examinations until he shall have paid such fees as may be required by the Regulations of the Senate in force for the time being.

33. The Professors and Assistant Professors not engaged in tuition except publicly within the University, together with such other persons as the Senate may from time to time appoint, shall form a Board for conducting the public examinations; and of this Board the Dean of the Faculty of Arts, or in his absence the Professor next in seniority, shall be Chairman.

34. At the conclusion of each examination, the Board shall transmit to the Senate a Report of the result, signed by the Chairman and at least one other Member.

35. Subject to these By-laws, the public examinations shall be conducted according to such Regulations as the Senate may from time to time enact.

Admission ad eundem statum.

36. Any person may be admitted without examination as an Undergraduate Member of this University, who shall have kept any number of Terms at any of the undermentioned Universities, namely,—Oxford, Cambridge, St. Andrew's, Glasgow, Aberdeen, Edinburgh, Dublin, Durham, London, Queen's University of Ireland, or Melbourne; and shall be considered of the same standing as if he had been during the same time an undergraduate Member of the University of Sydney: Provided always, that he shall give to the Registrar, to be submitted to the Senate, evidence of having kept such Terms, and of good conduct at any such University.

Bachelor of Arts.

37. The examination for the Degree of B.A. shall take place once a year, at the close of Michaelmas Term.

38. No candidate shall be admitted to this examination unless he produce a certificate from the Dean of the Faculty of Arts of having passed the required examinations, and of having complied with the Regulations during three Academic years, or during the Terms required when, in the exercise of the powers reserved by their By-laws, the Senate may have required additional Terms, or may have allowed Students to matriculate at other than the ordinary times of examination. This certificate shall be transmitted to the Registrar before the day appointed for the commencement of the examination.

39. The fee for the Degree of B.A. shall be Three Pounds. No candidate shall be admitted to the examination unless he have previously paid this fee to the Registrar. If a candidate fail to pass the examination, the fee shall not be returned to him; but he shall be admissible to any subsequent examination for the same Degree without the payment of an additional fee.

40. The examination shall be conducted in the first instance by means of printed papers; and at the termination of such examination, each candidate shall undergo a *vivâ voce* examination, if the Examiners think fit.

41. To obtain the Degree of B.A. candidates shall pass a satisfactory examination in the following subjects, viz. :—

1. The Greek and Latin Languages.
2. Mathematics and Natural Philosophy.
3. Chemistry, Experimental Physics, Geology and Mineralogy.

Any candidate for the Degree of B.A. may, however, at the commencement of his third academic year, elect to be exempted from examination in one of the above groups of subjects, provided that he shall have obtained at least a second class place in that group at the second yearly examination.

42. All persons who have passed the ordinary examination for Degrees, shall be admissible for Honors in the Classical and Mathematical Schools.

43. The candidates in each school shall be arranged in classes and order of merit.

44. The most distinguished candidate for Honors in each of the aforesaid schools shall, if he possess sufficient merit, receive a prize of twenty-five pounds.

45. The candidate most distinguished at the ordinary examination in Chemistry and Experimental Physics, shall, if he possess sufficient merit, receive a prize of Ten Pounds.

Master of Arts.

46. There shall be a yearly examination for the Degree of M.A. during Lent Term, before the Easter recess.

47. Every candidate for this examination must have his name on the Register of the University; he must have previously obtained the Degree of B.A., and two years must have elapsed since the time of his examination for such Degree. He will also be required to furnish evidence of having completed his twenty-first year.

48. The fee for the Degree of M.A. shall be Three Pounds. No candidate shall be admitted to the examination unless he have previously paid this fee to the Registrar. If a candidate fail to pass the examination,

examination, the fee shall not be returned to him; but he shall be admissible to any subsequent examination for the same Degree without the payment of an additional fee.

49. Candidates for the Degree of M.A. shall elect to be examined in one or more of the following branches of knowledge:—

1. Classical Philology and History.
2. Mathematics and Natural Philosophy.
3. Logic; Moral, Mental, and Political Philosophy.
4. Chemistry and Experimental Physics.

The candidate most distinguished in each branch at the examination shall, if he possess sufficient merit, receive a Gold Medal.

50. The Senate shall have power to admit to examination for the Degree of Master of Arts, any person who shall have obtained at least two years previously the Degree of Bachelor of Arts, or equivalent first Degree in Arts, in any of the Universities hereinbefore mentioned as those from which Undergraduates will be admitted *ad eundem statum*. Every candidate for admission under this By-law must make application in writing to the Registrar, and supply satisfactory evidence of his qualification as aforesaid, and that he is a person of good fame and character; and upon the approval of his application shall pay to the Registrar a fee of Two Pounds, for the entry of his name in the University Register, in addition to the prescribed fee for his degree. Before the granting of the Degree, every candidate will be required to furnish evidence of having completed his twenty-first year.

Scholarships.

51. In addition to the Private Foundations, viz.:—the *Barker*, *Deas-Thomson*, *Cooper*, and *Lithgow* Scholarships, each of the annual value of £50, and the *Levy* Scholarship of the annual value of £35, there shall be five University Scholarships, each of the annual value of £50, payable out of the Public Endowment.

52. The above Scholarships, tenable for one year, shall be awarded after examination in the following manner:—

To Undergraduates of the *first* year—
Three Scholarships for General Proficiency, viz.—
Two *University Scholarships*.
The *Levy Scholarship*.

To Undergraduates of the *second* year—
Three Scholarships for General Proficiency, viz.—
Two *University Scholarships*.
The *Lithgow Scholarship*, founded in 1864.

To Undergraduates of the *third* year—
Four Scholarships, viz.—
One *University Scholarship* for General Proficiency.
Three *Special Scholarships*, viz.—

1. For proficiency in Classics the *Cooper* Scholarship, founded in 1857.
2. For proficiency in Mathematics and Natural Philosophy the *Barker* Scholarship, founded in 1853.
3. For proficiency in Chemistry and Experimental Physics the *Deas-Thomson* Scholarship, founded in 1854.

53. No Undergraduate of the first or second year shall hold more than one Scholarship; and no Undergraduate of the third year shall hold more than three Scholarships.

54. None of the above Scholarships shall be awarded except to such candidates as exhibit a degree of proficiency which shall be satisfactory to the Examiners.

55. The examinations for Scholarships shall take place at the beginning of Lent Term.

56. In the first year, candidates for Scholarships shall be examined in the following subjects:—

1. Classics.—Translation from Greek and Latin authors into English; Greek and Latin Composition, in prose and verse.
Ancient History.

2. Mathematics.—Arithmetic and Algebra; first four books of Euclid.

In the second and third years, candidates for Scholarships shall be examined in—

1. Classics.—Translation from Greek and Latin authors into English; Greek and Latin Composition in prose and verse.
Ancient History.
Philology.

2. Mathematics.—The branches enumerated for candidates in the first term, together with—
The 5th and 6th books of Euclid.
Algebraic Geometry of two dimensions.
Plane Trigonometry.
Elements of the Differential Calculus.
Statics and Dynamics.

3. Chemistry and Experimental Physics.

XIV.—FACULTY OF LAWS.

Bachelor of Laws.

1. Until Professorships are established, there shall be a Board of Examiners appointed by the Senate to test the qualifications of candidates desirous of obtaining a Degree in Laws. The examination for the Degree of LL.B. shall take place in Michaelmas Term, and the Degree shall be granted in Lent Term.

2. Every candidate for the Degree of LL.B. shall lodge with the Registrar satisfactory certificates, or furnish other satisfactory evidence of having taken the Degree of B.A. or some equivalent Degree, at least one year previously, in this or one of the Universities hereinbefore mentioned as those from which Undergraduates will be admitted *ad eundem statum*. Every such candidate shall also furnish satisfactory evidence that he is a person of good fame and character.

3. The fee for the Degree of LL.B. shall be ten pounds. No candidate shall be admitted to the examination unless he have previously paid this fee to the Registrar. If the candidate fail to pass this examination, the fee shall not be returned to him; but he shall be admissible to any subsequent examination for the same degree without the payment of an additional fee.

4. Candidates for the Degree of LL.B. shall be examined in the following subjects:—
Civil and International Law.
Constitutional History, and Constitutional Law of England.
General Law of England.

Doctor of Laws.

5. The Degree of LL.D. shall be conferred at the expiration of two academic years from the granting of the LL.B. degree. The candidate shall be required to prepare and defend a Thesis on some subject selected by himself from the Pandects, or Institutes; such Thesis shall be in the Latin or English language, and if recommended by the Board of Examiners, and approved by the Senate, may be printed. The fee for the Degree of LL.D. shall be Ten Pounds.

6. The Senate shall have power to admit to examination for the Degree of LL.D. any person who shall have obtained, at least two years previously, the degree of LL.B. at any of the Universities hereinbefore mentioned as those whose Bachelors of Arts will be admissible to examination for the Degree of Master of Arts in this University, and who shall also have obtained the Degree of Bachelor of Arts, or an equivalent first Degree in Arts, at any of the said Universities, or shall pass an examination similar to that prescribed for the Degree of Bachelor of Arts in this University. Every candidate for admission under this By-law must make application in writing to the Registrar and supply satisfactory evidence of his qualification as aforesaid, and that he is a person of good fame and character; and upon the approval of his application, he shall pay to the Registrar a fee of Two Pounds for the entry of his name in the University Books, in addition to the prescribed fee for his Degree. Before the granting of the Degree, every passed candidate will be required to furnish evidence of his having completed his twenty-third year.

XV.—FACULTY OF MEDICINE.

Bachelor of Medicine.

1. A Professor, appointed by the Senate, shall give Lectures in Chemistry.

2. Until other Professorships in the Faculty of Medicine be constituted in the University, there shall be a Board of Examiners, appointed by the Senate, to test the qualifications of candidates who may apply for Medical Degrees, to be granted in accordance with the provisions contained in the Act of Incorporation.

3. Such candidates must lodge with the Registrar of the University satisfactory certificates of having taken the Degree of B.A. or some equivalent Degree, in this or any of the Universities hereinbefore mentioned as those from which Undergraduates will be admitted *ad eundem statum*. Candidates who have not taken such Degree must pass an examination similar to that prescribed for the B.A. Degree in this University; but it shall be in the power of the Senate to dispense with this examination in the case of candidates who have been in *bonâ fide* medical or surgical practice for not less than ten years.

4. The candidate must also furnish evidence that he is of good fame and character, that he is not under twenty-one years of age, and that he has diligently pursued a course of medical studies extending over a period of four years, at some Medical School approved of by the Senate. His certificates must show that he has attended the following eight classes, each for a course of six months:—Anatomy, Practical Anatomy, Physiology, Chemistry, *Materia Medica*, Surgery, Practice of Medicine, Midwifery; and the following five classes each for a course of three months:—Botany, Practical Chemistry, Medical Jurisprudence, Clinical Medicine, and Clinical Surgery:—also that he has attended for eighteen months the medical and surgical practice of a Hospital containing not fewer than eighty beds; and that he has been engaged for six months in compounding and dispensing medicines.

5. Medical or Surgical Diplomas from regular constituted examining Boards in Europe or America, may, at the discretion of the Senate, be accepted as equivalent to the whole or part of the above-mentioned certificates.

6. As soon as the required documents have been declared satisfactory by the Senate, the Registrar shall notify to the candidate the day on which his examination will commence.

7. Before being admitted to examination, the candidate must deposit with the Registrar a fee of Ten Pounds, which will not be returned in the event of the candidate not passing the examination; but such Candidate may be admitted to any future examination without any further charge.

8. Upon compliance with the above regulations, and on the report of the Examiners that the candidate has passed a satisfactory professional examination, the Senate shall confer upon him the Degree of M.B.

Doctor of Medicine.

9. The Degree of M.D. shall not be conferred until after the expiration of two academic years from the granting of the M.B. Degree.

10. The candidate shall be required to prepare and defend a Thesis on some medical subject, to be selected by himself; such Thesis shall be in the Latin or English language, and if approved by the Senate, on the report of the Board of Examiners, may be printed.

11. The fee for the Degree of M.D. shall be Ten Pounds.

12. The Senate shall have power to admit to examination for the Degree of Doctor of Medicine any person who shall have obtained, at least two years previously, the Degree of Bachelor of Medicine at any of the Universities hereinbefore mentioned as those whose Bachelors of Arts will be admissible to examination for the Degree of M.A. in this University. Every candidate for admission under this

By-Law

By-law must make application in writing to the Registrar, and supply satisfactory evidence of his qualification as aforesaid, and also that he is a person of good fame and character. Upon the approval of his application, he shall pay to the Registrar a fee of Two Pounds for the entry of his name in the University Books, in addition to the prescribed fee for his Degree. Before the granting of the Degree, every passed candidate will be required to furnish evidence of his having completed his twenty-third year.

XVI.—REGISTER OF GRADUATES.

1. A Register of the Graduates of the University shall be kept by the Registrar in such manner as the Senate shall from time to time direct; and for the retention of his name on the Register, every Graduate must pay an annual fee of one pound, on or before the Commemoration day in each year, in default of which his name shall at once be taken off by the Registrar, but may be restored upon payment of all arrears due, at any time, except during the four days preceding the day fixed for a Convocation for the election of a Fellow.

2. The Annual Register Fee may be compounded for by a payment of Five Pounds.

3. The Register of Graduates shall be conclusive evidence that any person whose name shall appear thereon as holding the Degree of Master of Arts, Doctor of Laws, or Doctor of Medicine, at the time of his claiming to vote at a Convocation for the election of a Fellow of the Senate, is so entitled to vote; and that any person whose name shall not appear thereon at the time of his claiming to vote in Convocation is not so entitled to vote.

XVII.—SPECIAL EXAMINATIONS.

It shall be competent to the Senate, on the report of the Proctorial Board, to admit to special examination, at such time as they may appoint, any candidate who shall have failed to pass any examination provided for in the By-laws, or who shall have shown sufficient cause for having been absent from any such examinations.

XVIII.—SUBSTITUTES FOR OFFICERS.

Any Act required by the By-laws to be performed by any Officer of the University may, during the absence or other incapacity of such officer, unless otherwise provided, be performed by a person appointed by the Senate to act in his place.

XIX.—ACADEMIC COSTUME AND DISCIPLINE.

1. The Academic Costume shall be: for—

The Chancellor and the Vice-Chancellor—a robe and cap similar to those worn by the Chancellor of the University of Oxford. In undress, the silk gown worn by other Members of the Senate,—black velvet cap and gold tassel.

A Member of the Senate—the habit of his Degree, or a black silk gown (of the description worn by civilians holding Degrees from Oxford and Cambridge), with tippet of scarlet cloth, edged with white fur, and lined with blue silk,—black velvet trencher cap.

Doctor of Laws or Medicine—the gown worn by Graduates of the same rank in the University of Oxford,—hood of scarlet cloth lined with blue silk,—black cloth trencher cap.

Master of Arts—the ordinary Master's gown of Oxford or Cambridge, of silk or bombazine, with black silk hood lined with blue silk,—black cloth trencher cap.

Bachelor of Laws or Medicine—the black gown worn by civilians in Oxford and Cambridge holding Degrees, with hood of blue silk lined with white fur,—black cloth trencher cap.

An Officer, not being a Graduate—a black silk gown of the description worn by civilians not holding Degrees,—black cloth trencher cap.

Bachelor of Arts—a plain black stuff gown, with hood similar to that worn by the B.A. at Cambridge,—black cloth trencher cap.

Undergraduate—a plain black stuff gown,—black cloth trencher cap.

Scholar—the same gown, with a velvet bar on the sleeve—black cloth trencher cap.

2. Members of the University shall, on all occasions when convened for Academic purposes, appear in their Academic Costume.

3. The Undergraduates shall, on all occasions within the precincts of the University, wear their Academic Costume; and whenever they meet the Fellows, Professors, or other Superior Officers of the University, shall respectfully salute them.

XX.—NON-MATRICULATED STUDENTS.

1. Any person desirous of attending University Lectures may do so without Matriculation, upon payment of such fees as the Senate may from time to time direct.

2. Such Students are exempt from examinations, are not required to wear any Academic Costume, and are not qualified to compete for Honors, nor to proceed to Degrees.

1869.

NEW SOUTH WALES.

SYDNEY GRAMMAR SCHOOL.

(REPORT FOR 1868.)

Presented to Parliament, pursuant to Act 18th Victoria.

THE SECRETARY TO THE TRUSTEES, SYDNEY GRAMMAR SCHOOL, to THE COLONIAL SECRETARY.

Sydney Grammar School,
25 March, 1869.

SIR,

I have the honor, by direction of the Trustees of the Sydney Grammar School, to transmit to you, for the purpose of being laid before Parliament, the following Report of their proceedings and the progress of the school, during the year 1868.

At the January meeting of the Trustees, Professor Pell was re-elected Chairman of the Board for the current year. At the same meeting, a letter was read from the Head Master, informing the Trustees of the resignation of the Rev. W. H. Roberts, M.A., as Assistant Classical Master. This vacancy was filled up on the 24th January, by the appointment of Charles Orlando Helm, Esq., M.A.

At a meeting of the Trustees held on the 3rd February, the following Report was received from the Examiners for Foundation Scholarships.

“ Sydney Grammar School,
7 December, 1867.

“ Gentlemen,

“ The Board appointed by you to examine candidates for Foundation Scholarships have the honor to report as follows :—

- “ 1. The examination was held on Wednesday and Thursday, the 4th and 5th instant.
- “ 2. There were eight candidates.
- “ 3. The subjects of examination were—Latin, Arithmetic, Euclid, History, Geography, English Grammar, and Dictation.”
- “ 4. The following candidates were recommended for appointments,—

J. Jacobs, T. Coghlan, R. Fewings.

(For the Board),
A. B. WEIGALL,
Chairman.”

The Head Master informed the Board of Trustees that Mr. Jacobs had declined to apply for the Foundation Scholarship for his son.

T. Coghlan and R. Fewings having furnished the certificates required by the regulations, were appointed Foundation Scholars.

At a special meeting held on the 12th October, a letter was read from Mr. C. J. Nelson, resigning his office of Writing Master. This vacancy was filled up at the December meeting, by the appointment of Mr. T. C. Fàche.

The Trustees have the honor to report that the number of boys in attendance continues to increase ; and the high state of discipline and efficiency which has characterized the school under Mr. Weigall’s management is fully maintained.

Since the date of the last Report, the Trustees have not found it necessary to make any further regulations for the government and discipline of the school.

The account of the whole income and expenditure of the school, and the number of pupils who attended during the year, will be found in the annexed Appendix.

I have, &c.,

W. H. CATLETT,

Secretary.

APPENDIX.

RETURN of the Receipts and Disbursements of the Sydney Grammar School, for the Year 1868.

1869.

NEW SOUTH WALES.

REPORT

OF THE

COUNCIL OF EDUCATION

UPON THE CONDITION

OF THE

PUBLIC SCHOOLS

FOR

1868.

Presented to both Houses of Parliament, by Command.

By Authority :

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1869.

[Price, 3s. 9d.]

7—A

THE COUNCIL OF EDUCATION *to* HIS EXCELLENCY THE GOVERNOR,

SUBMITTING

REPORT UPON THE CONDITION OF THE PUBLIC SCHOOLS, FOR 1868.

To His Excellency the Right Honorable SOMERSET RICHARD, Earl of Belmore, a Member of Her Majesty's Most Honorable Privy Council in Ireland, Governor and Commander-in-Chief of the Colony of New South Wales, and Vice-Admiral of the same.

MAY IT PLEASE YOUR EXCELLENCY,

In accordance with the provisions of the Public Schools Act of 1866, we, the Council of Education, have the honor to submit to your Excellency this our Second Annual Report upon the condition of the Public Schools under our superintendence, with which is also included a general statement of our proceedings during the year 1868.

I.—COUNCIL.

The constitution of the Council remained unaltered during the year, the Members being those originally appointed, viz. :—

The Honorable George Allen, Esq., Member of the Legislative Council.

The Honorable William Munnings Arnold, Esq., Speaker of the Legislative Assembly.

The Honorable James Martin, Esq., Member of the Legislative Assembly;

The Honorable Henry Parkes, Esq., Member of the Legislative Assembly; and,

John Smith, Esq., M.D., Professor of Chemistry and Experimental Physics in the University of Sydney.

At a Meeting of the Council held on 6th January, 1868, Mr. Parkes was again elected President.

2. Although the reorganization of the system was nearly completed in all essential matters by the end of 1867, the rapid increase in the number of schools prevented any diminution in the amount of business to be transacted as compared with the previous year. The subsequent portions of this Report will disclose the extent and nature of the business with which the Council's attention was occupied.

II.—GENERAL STATISTICS.

3. The following table exhibits the number of schools of each kind in operation in 1868, and the number of pupils by whom they were attended, similar information for the year 1867 being included.

	Schools.		Pupils.	
	1867.	1868.	1867.	1868.
Public	288	318	28,434	34,234
Provisional.....	31	103	733	3,113
Half-time	6	38	267	593
Denominational.....	317	289	35,306	35,930
Total.....	642	748	64,740	73,920

These

These figures show an increase in the number of schools of all descriptions except the Denominational. There was also a corresponding increase in the number of pupils and, although the return of scholars is open to objection on the ground that some must have attended more than one school in that period, it is unquestionable that a large accession was made to the number enrolled in schools subject to the Council's supervision.

4. The sum of £34,164 3s. 6d. was paid as school fees, being an advance of £3,444 14s. 9d. upon the amount paid in the previous year. Notwithstanding the general distress that prevailed in many parts of the country in consequence of the protracted drought, the number of free scholars was somewhat diminished, there having been only 8,289 in 1868, or 314 less than in the previous year.

5. It might be anticipated that so large an addition to the number of schools in operation would occasion a corresponding augmentation of the number of teachers; but the actual increase in the number of teachers was not in proportion to the number of new schools. The following table will exhibit this clearly.

	1867.		1868.	
	Schools.	Teachers.	Schools.	Teachers.
Public.....	288	} 528	318	} 581
Provisional.....	31		103	
Half-time	6		38	
Denominational.....	317	443	289	433
Total.....	642	971	748	1,014

Schools, therefore, have been multiplied faster than teachers, and the latter have consequently a larger average number of pupils each. In 1867 there were 66·67 pupils to each teacher; in 1868, 72·68.

6. It may not be uninteresting to inquire, in this place, what proportion of the children of the Colony are now receiving education. From a return furnished by the Deputy Registrar General, it appears that the estimated population of the Colony, on 30th June, 1868, consisted of 456,372 persons. Assuming that the proportion of children between the ages of five and fourteen to the whole population has not altered materially since the Census of 1861 was taken, the number of a school-going age would be 100,651, or 22·03 per cent.

7. The aggregate number of children that attended schools under the Council's supervision at any time during the year was 73,920; but, inasmuch as a considerable, though unknown, proportion of these must have attended two or more schools within that period, while numerous others attended but for a brief time, it would be unsafe to regard the aggregate number as correctly representing the number actually receiving education. For the purpose in view, a more exact approximation to the truth may be obtained by taking the average number on the school rolls—51,164. To these must be added the children educated in private schools. The number of these, according to the latest information obtainable in 1867, was 11,699. While the growth of population may warrant the supposition that a larger number of children would be educated by this means, it must not be forgotten, on the other hand, that largely increased facilities for attendance at schools supported by the State have been supplied, and that these would naturally tend to diminish the demand for private schools. Allowing that these two considerations balance each other, the number 11,699 may be held to represent with sufficient exactness the aggregate of children educated in private schools.

8. But, besides the children attending schools public or private, a certain number receive their education at home. In the absence of a Census, no recent authentic information can be given upon this point. It was shown by the Census of 1861, that the number of children educated at home was 8,025, or 2·28 per cent. of the entire population.

population. There is little reason to believe that this ratio has been exceeded, but on the contrary, good grounds may be stated for supposing that it has diminished. There is consequently little danger of under-estimating, if the total number of children under instruction be thus represented:—

In schools supported by the Council	51,164
In private schools	11,699
At home	8,025
Total	<u>70,888</u>

It follows, therefore, that 15·53 per cent. of the population, or 1 in every 6·43 persons, is receiving instruction in one or other of these modes. Considering the circumstances of the Colony, the scattered nature of the population in many districts, and the difficulty of placing the means of education within the reach of large numbers of people, this result cannot be deemed unsatisfactory. In Victoria, with a more compact territory, and a population less widely scattered, the proportions are 17·93 per cent. of the population, or 1 in 5·58 persons.

9. There is, however, a dark side to the picture. Regarded in the most favourable light even, the foregoing statistics exhibit the important fact that upwards of 25,000 children are growing up destitute of education. Excepting some neglected children to be found in the larger centres of population, these will, for the most part, be found in remote and sparsely populated localities, inaccessible to the ordinary educational agencies. How to provide for them is a problem of which the importance can only be equalled by the difficulty of solution.

III.—SCHOOLS.

PUBLIC SCHOOLS.

10. The number of Public Schools in actual operation in 1868 was 318. Since 31st December, 1867, 7 schools have been closed; 36 additional schools have been opened; and one school formerly closed has been reopened on the footing of a Provisional School. Detailed statistics respecting the 318 schools will be found in a return attached to this Appendix A. Report.

11. On examining this return it will be seen that, in some instances, the average number of pupils in attendance fell greatly below the minimum required by the Public Schools Act. The Council, in all cases in which there was reason to believe that the diminished attendance would be permanent, either closed the schools so circumstanced, or reduced them to the position of Provisional Schools as regards the scale of expenditure. It is to be expected that cases of this kind will continually occur. For many years to come, the population of various portions of the Colony will be subject to considerable fluctuations, and schools will necessarily be affected by the disturbance thus produced. Calamitous floods in some districts, and excessive drought in others, have driven the occupants of land from their holdings, to seek, in localities deemed less liable to these disasters, the means of support for their families. The exhaustion of the soil for the purposes of cultivation has led to the abandonment of many localities and the removal of the people to districts hitherto unsettled, and their places have not been supplied by other persons, the proprietors having devoted the land to other uses. But perhaps the most powerful motive in causing a redistribution of the population has been the desire to take advantage of the provisions of the Lands Alienation Act, in order to become freeholders, instead of remaining in the position of tenants.

12. The Public Schools, eight in number, closed at the end of the year, were those situated at—

Avisford,
Bendolba,
Binda,
Bodalla,
Castlereagh,
Dondingalong,
Eccleston,
Hexham,

And the undermentioned were placed on the footing of Provisional Schools :—

Barrington.
Bo Bo Creek.
Carawa.
Gosforth.
Lower Hawkesbury.
Lower Macdonald.
Meadow Flat.
Millbang.
Murrumburra.
Ophir Road.
Panbula.
Pelican Point.
Seven Oaks.
Watagon Creek.
Woodburn.
Worragee.

Appendix B.

13. The annexed Schedule contains a list of the applications received in 1868 for the establishment of Public Schools, and shows further what action was taken by the Council in each case. It discloses the fact that forty-eight of such applications were received during the year, and also that 865 persons engaged to send their children to the schools, 2,315 pupils being thus promised. Of the persons joining in the applications, the number of each Denomination was—

Church of England	461
Roman Catholic	147
Presbyterian	113
Wesleyan	100
Others	44
						865
Total	865

The number of children belonging to each Denomination, whose parents guaranteed their attendance at the Public Schools applied for, was—

Church of England	1,236
Roman Catholic	382
Presbyterian	286
Wesleyan	299
Others...	112
						2,315
Total	2,315

14. The applications from Cudgegong, Ellalong, Upper M'Donald River, Tarago, and Wallaby Hill, may be regarded as representing the Denominational Schools previously existing in those localities from which certificates had been withdrawn. In the cases of Bankstown, Currajong (Bathurst District), Dural, and Kiora, which had also previously existed as Denominational Schools, applications for their conversion into Public Schools were voluntarily made by their local supporters.

The applications declined were so dealt with, either because there was no proved necessity for extending the means of education in the localities interested, or because the requirements of the Public Schools Act could not be reasonably fulfilled.

PROVISIONAL SCHOOLS.

Appendix C.

15. In addition to the Public Schools, there were in operation during the year, 103 Provisional Schools, attended in the aggregate by 3,113 pupils. The great increase in the number of schools of this kind, is an evidence of their utility in supplying a want long and urgently felt. They enable the Council to effect improvements in schools which, in their origin, are of a private character, and thus to reach a branch of educational effort hitherto unrecognized and unaided by the State. As a condition on which aid can be granted, the Council secures the right to introduce a more complete organization, more regular discipline, and a more systematic course of instruction, each

of

of which points is tested by periodical inspection. Further, by means of Provisional Schools, the means of education are introduced into localities which would otherwise remain altogether destitute, or be supplied with instruction of a very inferior character.

16. From incidental notices contained in the Inspectors' reports, it will be observed that, as was to be expected, the Provisional Schools are generally inferior to Public Schools and Certified Denominational Schools in most of the essentials of education. Still, they are capable of providing the rudiments of instruction, and are susceptible of further improvement, while in some instances they are found to be thoroughly efficient. When the amount expended on these schools is compared with the number of children attending them, the expense per head is seen to be greater than in others attended by a larger average number of pupils. Being, for the most part, situated in very sparsely populated districts, Provisional Schools can obtain but a small number of pupils; and it may be regarded as an axiom, that the cost of education per head will be augmented in proportion as the number of scholars is diminished.

17. Ninety-three applications for aid to new Provisional Schools were made in 1868, the number of pupils whose attendance was guaranteed being 2,369. The religious Denominations of the parents may be thus exhibited:—

Church of England	411
Roman Catholic	302
Presbyterian	77
Wesleyan	49
Others	15
Total					854

The number of children of each Denomination was—

Church of England	1,112
Roman Catholic	857
Presbyterian	229
Wesleyan	138
Others	33
Total					2,369

18. Thirteen of these applications were received from places in which Denominational Schools had formerly been in operation, but which had failed to supply the number of children necessary to warrant their continuance on that footing. The withdrawal of the Council's certificate in these cases did not therefore interrupt the existence of these schools, but deprived them of their sectional character, and afforded opportunity for reducing the expenditure. The manner in which each of the applications was disposed of may be seen on referring to the Schedule annexed.

Appendix D.

HALF-TIME SCHOOLS.

19. The experiment as regards schools of this class, initiated in 1867, was continued during the following year with increased success. The number of separate Half-time Schools, or schools under the supervision of Itinerant Teachers, in operation, Appendix E. was 38; and 32 applications for aid in establishing schools of this class were received. Appendix F. The establishment and proper organization of Half-time Schools requires, in most instances, the assistance of the Inspector located in the District; but as our Inspectors were unable to devote the time necessary for this purpose, some of the applications could not be dealt with in 1868. Had it been practicable for the Inspectors to spare from other duties a sufficient amount of time, many other applications would have been received.

20. The parents or guardians undertaking to send children to Half-time Schools applied for may be thus classified:—

Church of England	102
Roman Catholic	34
Presbyterian	21
Wesleyan	6
Others	3
Total					166

21. The number of children of each religious Denomination promised to attend

as—

Church of England	303
Roman Catholic	125
Presbyterian	66
Wesleyan	14
Others... ..	12
Total	<u>520</u>

22. The Special Rules for Half-time Schools to which allusion is made in our First Annual Report have been prepared, and have to some extent undergone the test of experience. The following are the more important of these rules:—

- “Aid will not be granted towards the establishment and maintenance of Half-time Schools, unless suitable school-houses and sufficient and proper furniture be provided.
- “No schoolroom will be approved unless it be 10 feet at least in width, be floored, be provided with a fire-place, and be properly lighted and ventilated.
- “Aid will be given towards the erection of suitable school-houses, provided the sites be vested in the Council, and there be a probability that the schools so established will ultimately become Public Schools.
- “Grants of school books and apparatus will be made from time to time, as may be deemed expedient; and a full supply will be granted as a first stock to all schools newly established.
- “The same registers are to be kept, and the same returns furnished, as in Public Schools.
- “In addition to the duties prescribed in article 42, section II, of the Regulations, teachers in Half-time Schools will endeavour to make themselves acquainted with the educational wants of their several Districts,—will study to acquire a knowledge of the character of the people,—and will strive to deport themselves so as to win their respect and confidence.
- “As a rule, the number of schools placed under one teacher will be limited to two.
- “Every teacher is expected to divide his time between the schools under his charge, with the view of effecting the largest amount of good. Where practicable, it is recommended that he devote the mornings to the teaching of one school, and the afternoons to the teaching of the other; but should any other arrangement be found more suitable, the teacher is at liberty to adopt it. In any case, the parent or guardian of each child is to be supplied with a time-table, showing the hours at which school will be open.
- “As regards instruction, every Half-time School is to be conducted in all respects as a Public School.
- “Teachers are required to carry out a systematic course of home lessons. Exercise books for this purpose will be provided by the Council, and these books must be retained for the information of the Inspector of the District.
- “When practicable, Boards will be appointed to supervise Half-time Schools, or the duty may be confided to a single individual.
- “In the absence of such authority, teachers of Half-time Schools will hold themselves directly responsible to the Inspector of the District.”

23. The Inspector of the Goulburn District, in which portion of the Colony Half-time Schools are most numerous, reports in the following terms:—

- “The establishment of Half-time Schools by the Council will, I am satisfied, in time, produce most gratifying results; even now, although few of them have been more than fifteen months in operation, the results are highly satisfactory. So far as I have inspected them, the teachers are painstaking

taking and energetic in the performance of their duty, and, in some cases, the progress of the pupils has surpassed my most sanguine expectations. In some of these schools I found a considerable number of children who commenced to learn the alphabet about a year or fifteen months ago, and they can now read ordinary prose, such as the Third Book, or Scripture Lessons, with tolerable correctness, write from copies or from dictation legibly, and are making some progress in the elements of arithmetic. The organization, discipline, and instruction of the schools, in many cases, admit of great improvement, but on the whole, the success so far appears to me to be truly gratifying. The results, however, are quite in accordance with the views of some of the most eminent educationists of the present day. They say that manual and mental labour combined facilitates school instruction; and it is all but the universal testimony of the teachers and Inspectors of Industrial Schools, that the boys employed in spade husbandry learn far more readily than boys not so employed; and that, although their time in school is shorter, they learn more quickly whilst there. Now I consider Half-time Schools are much like Industrial Schools; the pupils attend to rural industries at home, under the direction of their parents, for half their time, and they receive school instruction from the teacher during the other half. I fully concur in the views of Mr. Inspector Johnson, contained in his report of last year, as to the success and future usefulness of Half-time Schools. There are twenty-eight of these schools in the Goulburn District, attended at the close of the year by 474 pupils, being an average of 17 pupils for each school. The teachers report to me monthly the work done at each teaching station; and, at the close of the year, in accordance with my request, each teacher furnished an annual report, containing information as to the time he had been in charge of his schools, the number of the pupils, the subjects taught, the number of miles travelled monthly, the classification of the pupils, and the number promoted by him to an advanced reading book or higher class. On an average, the schools have not been much over a year in operation, and 523 scholars attended in 1868. During the year, 110 children were promoted to advanced reading books, and 116 to higher classes; and, at the close of the year, the classification stood as follows:—

First class	247 pupils.
Second class.....	139 „
Third class	38 „

24. Half-time Schools are found to be more expensive than even Provisional Schools, but they supply the means of education to localities in which the population is too scanty to support even schools of the latter class. If such localities are to be supplied at all with the means of instruction, it can only be at an increased cost as compared with schools more favourably situated.

BUILDINGS.

25. The great number of applications for the establishment of Public Schools received in 1868, for new buildings for existing schools, and for repairs to old school-rooms, caused the total expenditure on this head to reach the sum of £18,113 9s. 7d. In some cases the poverty of the people, owing to the long drought, was so evident that the Council did not insist upon their contributing in the usual proportion towards the cost. Such a course, indeed, would have amounted to a virtual denial of assistance. But generally speaking, the applicants for grants in aid of school buildings were required to provide one-third of the cost.

26. The concurrent testimony of educationists, in all parts of the world, proves that the success, and consequent usefulness of a school, depends, in the first place, upon the efficiency of the teacher; and, secondly, upon the nature of the school buildings. A convenient schoolroom, in a healthy situation, will frequently attract scholars who would be deterred from attending at all, if the buildings were uncomfortable and disreputable in appearance; and not only is the number of pupils thus affected, but also the health

and comfort of both teachers and scholars, the convenience of teaching, the stimulus to learning, the status and influence of the teaching profession, and, through them, the whole progress of education.

27. The new school buildings at Cleveland-street, Sydney, the foundation-stone of which was laid by Sir John Young, were completed last year, and opened for the purposes of a Public School, by your Excellency, on the 3rd of September, 1868. The necessity for increased accommodation was demonstrated by the fact that, within three months from the date of the opening, the attendance of pupils had increased 20 per cent., there being upwards of 1,000 on the rolls; while the schools situated in the vicinity maintained their usual numbers, and in some instances augmented them. The school is now attended by about 1,100 children, and is already inconveniently crowded in some departments.

28. Early in the year, arrangements were entered into for the purchase of the Goulburn School, the Trustees of which offered to dispose of the premises to the Council, for the purposes of a Public School, at a price less by one-third than the value at which it was appraised by the Council's Architect. The Council, seeing in this case an opportunity for establishing a superior school of the kind referred to in the Progress Report for 1867, accepted the offer from the Trustees. The school was accordingly opened in May, 1868, and by the end of the year was attended by 324 pupils.

29. We have been in correspondence with other localities respecting the establishment of superior schools, but the pressure of the ordinary business has prevented us from completing arrangements for this purpose.

BOOKS AND SCHOOL REQUISITES.

30. The cost of books and school requisites supplied to schools in 1868 was £3,525 Os. 7d. All the schools under our superintendence are now amply provided as regards this branch of their material equipment, except in a few cases in which the neglect of the teachers to apply for the requisite materials, or the delay in transit, had left the available stock insufficient for the actual wants of their pupils. In a very few instances, teachers have permitted their scholars to waste and destroy the school stock; but these are so rare that they do not affect to any appreciable extent the general description of the condition of the schools.

Appendix G.

31. The Council has not added to the list of books originally sanctioned for use in the ordinary instruction of schools. The names of these books may be ascertained on reference to the list hereto appended.

32. Much difficulty having been experienced by teachers in procuring correct information respecting the animals peculiar to the Colony, the Council resolved to publish for their guidance a brief text-book on this subject, and also a series of illustrative lithograph engravings. The work was entrusted to A. W. Scott, Esq., who has made considerable progress with the manual. Several of the plates have also been prepared, and are executed in such a style, both as regards artistic skill and adaptation to the end intended, as to merit high commendation. These engravings will be supplied to schools under the Council's supervision, in the usual way, and may also be purchased by the general public.

IV.—TEACHERS.

STAFF.

33. The staff of teachers in the Council's service at the end of the year comprised 1,014 persons, viz. :—

712	principal teachers.
137	assistant teachers.
165	pupil teachers.

1,014

Of these, 690 were males, and 324 females. The number of female teachers having sole charge of schools is very small, and there appears to be a very general objection, on the part of parents, to their employment in any other capacity than that of assistants. The high approval of the labours of female teachers in the United States and in Canada, renders somewhat remarkable the undervaluing of their services in this Colony.

34. The changes in the number and rank of the teachers as compared with the previous year, may be accounted for principally by the operation of the rules by which the staff of a school is adjusted. The effect of these rules has been to establish a definite proportion between

between the number of pupils in each school and the number of teachers. But this is necessarily a work of time, inasmuch as it was undesirable, on the one hand, to deprive of employment teachers against whom no complaint had been lodged, and on the other to reduce suddenly the staff of a given school.

QUALIFICATIONS.

35. Various efforts have been made to enable teachers to improve their qualifications. In Sydney and at Windsor, teachers of drawing and of singing upon the Tonic Sol-fa method, were employed to give instruction in these branches. The Inspectors of the Sydney District report that "a great impulse has been given to the teaching of drawing during the year: there is but one school in which it is not systematically taught." In furtherance of the same object, the Council employed Mr. T. P. Hill, to give a course of lessons to teachers in the art of reading. Arrangements have also been made to assist teachers in the purchase of text books for study preparatory to examination, and for the formation of teachers' libraries.

EXAMINATIONS.

36. By article 37 of the Regulations, "all teachers holding a lower classification than Class III, Section A, are required to undergo examination annually." This regulation virtually affirms the principle that, until teachers have shown themselves to possess the ability indicated by the possession of that rank, they cannot consider themselves fully qualified for their office. The necessity for requiring a high degree of practical skill in teaching, as well as attainments, has led the Council to lay down the rule that the Inspectors shall not admit teachers to examination for higher classifications, unless they possess skill of the order stated below, viz. :—

For Class I.—Excellent or Very Good.

For Class II.—Good.

The total number of teachers examined in 1868 was 337, of whom 166 were employed in Public Schools, and 171 in Certified Denominational Schools. Many of these teachers had not been previously examined, as the time at the disposal of the Inspectors in 1867 was too limited to allow of their holding examinations in every district. In some instances also, the Council had not awarded even a provisional classification, as the Inspectors not having visited the schools, were unable to supply the information requisite to enable the Council to decide in a matter of so much importance. The rank of the teachers examined, prior to undergoing the test, may be seen in the following table :—

Holding no Classification	111
Class III, Section C	84
" " B	127
" " A	13
Class II, Section B	1
" " A	1
					337

Of these, 157 failed to gain any promotion, the want of success being attributable, in numerous cases, more to defective management of the schools than to insufficiency of attainments. The classifications gained by the 180 successful teachers may be thus indicated :—

Class III, Section C	40
" " B	42
" " A	86
Class II, Section B	10
" " A	1
Class I, Section A	1
					180

The results of the various examinations may therefore be pronounced reasonably satisfactory, though the fact that forty-four teachers failed to gain any classification, cannot be viewed otherwise than with much concern.

Appendix H.

37. The nature of the examinations passed by the teachers may be seen on reference to the copies of Examination Questions appended hereto. It will be evident from an inspection of these papers that, as required by our Regulations, they have been drawn up mainly with a view to test the knowledge of teachers in the branches they are called upon to teach. The Regulations bearing upon this subject—Articles 34 to 38—embody three leading principles applicable to the examination of teachers:—1. That while extent and variety of attainments are desirable, the complete mastery of the ordinary subjects of instruction is essential to the efficiency of a teacher. 2. That if the choice lie between the two, clearness and precision within a limited range are more useful to a teacher than great proficiency in the higher branches; and, 3. That without a natural aptitude for teaching, and the skill acquired by experience in school management, teachers cannot be fully successful in practical work. In accordance with these principles, the Council is desirous to encourage teachers to render themselves proficient in the ordinary subjects, and to acquire a knowledge of them, so exact and so familiar as to be able to employ them with readiness and accuracy. By this means, it is hoped that the daily teaching in school will become more exact, pointed, and pervasive, and the results more commensurate with the time and labour expended.

These views, to some extent, influenced the decision of the Council with respect to a suggestion made by Professor Pell, of the Sydney University, with reference to the examination of teachers in the Alternative Subjects. Mr. Pell proposed that those teachers who profess a knowledge of such subjects should be required to submit to portions of the examinations provided for by the Regulations passed by the Senate for the purpose of instituting Public Examinations. It was further suggested by Mr. Deas Thomson, whether it might not be desirable that the certificates granted by the Board appointed to conduct these examinations should be considered a sufficient test of the competency of candidates who desire to obtain employment under the Public Schools Act. The Council, while willing to sanction the substitution of the Public Examinations for those hitherto passed by teachers in the Alternative Subjects, deemed it inexpedient to forego the usual examinations in elementary branches.

38. In conducting the examinations, full directions were given to the teachers as to the method of procedure, both with a view to guard against errors likely to arise through inadvertence, and to secure from the Council's Examiner an impartial revision of their papers. The Examiner was not informed of the names of persons examined, until their papers had been revised and his estimate recorded; and they were instructed, in addition to minor directions—

- " 1. To write upon the title-page of the papers the date of examination,—a distinguishing number,—name in full,—the name of the school, if in charge of one,—the present rank or classification, if classed,—the date of last examination, if previously examined,—classification sought,—and professional experience.
- " 2. To place the title-page in an envelope provided for the purpose, and forward it at once to the Secretary.
- " 3. That the time allowed for each paper could not be exceeded; that they should not consult books, maps, or notes; that conversation during examination was rigidly prohibited; and that inattention to these cautions would necessitate the stoppage of examination, the offender being reported to the Council.
- " 4. To answer every question specified.
- " 5. To write down each question precisely as it stood on the paper, before commencing to answer it; and to write down every question, whether answered or not.
- " 6. To write in a full, clear, and legible hand, and to keep the papers free from stains.
- " 7. To compose in a clear and simple style.
- " 8. To punctuate so plainly as to leave no doubt of the intended meaning.

"9.

- “9. In the Grammar papers, to arrange the words to be parsed singly in column, and to place the parsing of each word opposite. To follow strictly the order of parsing and analysis sanctioned by the Council. To use such abbreviations only as are perfectly intelligible, and contain so much of the whole word as to leave no doubt of the intended meaning.
- “10. In arithmetical processes, to shew the working fully.
- “11. In answering geographical questions, to guard against vague statements on the one hand, and guessing at measurements, distances, latitudes, longitudes, &c., on the other, especially when uncertain as to the truth of the data.
- “12. To remember that bad spelling disqualifies for classification, and that no amount of knowledge will avail when seeking promotion, if skill is wanting.”

CLASSIFICATIONS.

39. At the termination of 1868, the teachers in the Council's service, exclusive of pupil teachers and teachers of Provisional Schools, were classified as follows:—

Probationers	135
Class III, Section C	169
" " B	137
" " A	197
Class II, " B	56
" " A	26
Class I, " B	12
" " A	2
						734

EMOLUMENTS.

40. The emoluments of principal teachers depend upon their classification. The highest salary paid to the teacher of any school, other than a Model School, is £150 per annum; the lowest paid to the teachers of some small Provisional Schools is £24 per annum; but the average emoluments, calculated for all teachers except pupil teachers, is found to be as follows:—

				£	s.	d.
From salary	70	5	6
From fees	40	1	11
Total	110	7	5

This calculation includes teachers of Provisional Schools. As their salaries do not on an average exceed one-half of the rates paid to Public or Certified Denominational School teachers, the result is proportionately reduced. Excluding Provisional Schools from the estimate, the respective amounts on the average would be—

				£	s.	d.
From salary	74	0	1
From fees	44	3	5
Total	118	3	6

41. In addition to the remuneration derived from salaries and fees, teachers in a large majority of cases are provided with residences. The teachers' dwellings are not, however, all that could be desired. From special inquiries made during the year, and affecting 370 schools, it appears that 204 teachers are provided with residences that may fairly be regarded as affording sufficient accommodation, and as reasonably suitable in respect to appearance. In the case of 88 schools, no houses have been built for the teachers. In 78 others, the buildings appropriated to the teachers' use are either too small, and furnish insufficient accommodation to secure comfort, or even decency; or, are constructed of slabs, the openings between which admit rain and wind freely, to the great

great discomfort of the inmates ; or are in such bad repair as to present a disreputable appearance. As teachers are compelled to live near their schools, and as it sometimes happens that houses are difficult to obtain in the neighbourhood, it becomes a source of serious embarrassment to find a residence. In the remoter districts it is of course absolutely necessary that residences on the spot should be provided for teachers. The Council regards it as most desirable that teachers' houses should be erected in connection with schools ; and, as essential, that in point of accommodation and appearance they should be at least respectable. The influence of his surroundings upon the mind of a teacher cannot fail to be of a powerful nature ; and the estimation in which he is held by the community in which he labours will be affected by the same circumstances. Not only his self-respect, but the respect manifested by others, will depend in some measure upon the condition of his dwelling. A man content to inhabit a wretched hovel, in which he is unable to set an example of decency or respectability, will fail to secure esteem, or to exercise that influence for good which is so necessary for his full efficiency. These considerations seem to the Council to be of great moment ; and the fact that many teachers are compelled to live in this manner must be regarded with deep concern.

42. The Council does not regard the remuneration allowed to classified teachers in Public and Certified Denominational Schools as sufficiently high ; but, for the present, the Council is unable to make any advance on the scale of salaries. Some relief would be obtained, however, by amalgamating small rival schools in localities where they exist ; the fees now divided between two or more teachers might then become the property of one ; moreover, the effect of competition for scholars upon school fees is, first, to lower the rate ; and, secondly, to induce the withholding of payment by parents to an extent not justified by their pecuniary circumstances. Where, from the multiplicity of schools, parents not only have a choice, but are expressly invited to confer their patronage upon a particular institution, it is natural to expect that they will gradually lose sight of their own responsibility in the matter, and feel disinclined to pay, when they have reason to believe that they are bestowing a favour by allowing their children to be educated. Had not the various other evils arising from the existence of small schools in close proximity been already sufficiently explained, the Council would here proceed to point out the serious injury to the quality of the education given, as well as to the emoluments of teachers.

SUPERANNUATION FUND.

43. The question of a retiring allowance for teachers when no longer capable, from age or infirmity, of performing their duties, has been forced upon the attention of the Council on various occasions ; but it was specially brought under notice by a memorial from teachers and officers, in which they urged the following considerations :—

- “ 1. That, although not appointed to their respective offices by the Governor with the advice of the Executive Council, they are nevertheless as fully and directly servants of the public as the members of the Civil Service ; that the services they render are at least as important and valuable as those performed by any other body of public servants ; and that the examinations to which they are subjected form severer tests of competency than are required in any other branch of the Public Service.
- “ 2. That the remuneration awarded to teachers is insufficient to enable them to provide for old age, especially after deductions have been made from their slender incomes to meet demands arising out of sickness, and the provision required for their families after their own death.
- “ 3. That teachers are prohibited by the Regulations—article 54, section 2— from engaging in any enterprise or business which would enable them to add to their emoluments ; and that even if this prohibition did not exist, the engrossing nature of their duties would itself suffice to prevent them from adopting such course.
- “ 4. That it is desirable that teachers should be secured against the possibility of want in old age, so that, being free from anxious cares about the future, they may be at liberty to devote their whole energies to their work.

“ 5.

- “ 5. That it is desirable, even for the cause of education, that teachers who have grown old and feeble in the service should retire, so that younger and more energetic men might carry on the work of instruction.
- “ 6. That under existing circumstances, teachers, although infirmity and old age suggest that they might, with advantage to the cause of education, be superannuated, are compelled to remain in their schools, because they cannot afford to give up their living.
- “ 7. That superannuation would serve as a bond of union among the teachers ; and, by giving them a vested interest in their profession, would act as an incentive to well-qualified men to enter and to remain in the Council’s service.”

44. Being desirous to meet the wishes of the teachers, the Council employed an actuary (Mr. Robert Thomson) to prepare a scheme of superannuation. After obtaining the requisite information and making the necessary calculations, Mr. Thomson submitted a scheme, but the premiums required by it are so high as to render it impracticable. Although we can discern no prospect of establishing a Superannuation Fund at present, we venture to commend the subject to the consideration of Parliament, as an act of justice to a deserving body of public servants.

CHARACTER OF TEACHERS.

45. We have great pleasure in recording our opinion that, as a body, the teachers in our service are devoted to their work, faithful in the discharge of their duties, and desirous to carry out the provisions of the law under which they serve. The Inspectors bear testimony to the high character of the teachers, and the excellent spirit generally manifested by them. In the Sydney District, the Inspectors remark of the teachers that—

“The general body are earnest, zealous, and painstaking. A few have shown themselves to be possessed of high attainments, and gifted with rare teaching ability.”

Mr. Dwyer, referring to the Maitland District, states :—

“The teachers of this district are, as a body, respectable, anxious to fulfil their duties, and do their utmost to give satisfaction. I am happy to say that, during the past year, there was not a single case of anything tending to lower their character or lessen their moral influence.”

Mr. M’Credie’s testimony respecting the teachers in the Bathurst District is not less favourable. He reports :—

“In the majority of schools, the teachers are respectable persons, and are earnest and diligent in the discharge of their duties. In nearly every instance, I found them willing to receive and carry out suggestions for the improvement of their schools.”

Mr. Huffer, referring to the Camden District, reports :—

“The teachers are, as a body, conscientious, intelligent, and fairly well fitted for the efficient discharge of their duties. In my intercourse with them, I have also found them, in all cases, willing to receive and act upon my suggestions for the improved working of their schools.”

Messrs. Coburn (for the Albury District) and Allpass (Newcastle District) speak in similar terms of the teachers under their immediate superintendence. The report of Mr. Forbes, Cumberland District, though less eulogistic, is not unfavourable. He remarks :—

“Much need not be said about the character and general fitness of teachers for their office. The very fact of their holding office ought to be their testimonial. That such is not invariably the case is matter of regret. There are, undeniably, persons holding the office of teachers, whose fitness for that position appears never to have been seriously taken into account. They have in some manner got into that office, and the difficulty with which the Council has to contend is, how to dispose of them without treating them with any seeming harshness. The cases thus pointed to are comparatively

paratively few. The great majority of the teachers are reasonably fitted, both as regards moral character and attainments, for their part in the all-important work with which the Council of Education is charged."

PUPIL TEACHERS.

46. The valuable body of young teachers thus designated, numbered 165 at the end of 1868. Although this number, as compared with that of 1867, shows but a slight increase, the new appointments, owing to the removal of some who appeared not fully qualified, by want of natural aptitude for teaching, or inability to study successfully, were more numerous than at first sight appears.

47. The great importance of the pupil teacher system, as a means of providing for the future requirements of the Colony a staff of teachers trained to the work from their youth, has induced the Council to dwell at some length upon the subject. As in England and other countries in which this system has been tried, it will doubtless prove eminently successful in securing, in a comparatively inexpensive manner, teachers who will be the life of the educational organization of the Colony.

48. Pupil teachers are appointed at an age not less than thirteen, and not more than sixteen years. If appointed when younger, they sometimes prove physically unable to perform the duties assigned them; while, on the other hand, if their appointment be too long deferred, they arrive at adult age before the period of their engagement has expired, and they become dissatisfied with their position. It is also found that pupil teachers above the age of eighteen years are less useful for the precise service for which they are needed than those who, being younger, are more easily moulded to the fashion required. Although not bound by indentures, pupil teachers are virtually apprenticed to the teachers under whom they serve, receiving daily instruction in matters pertaining to the management of schools. The Regulations bearing upon this subject (articles 50 and 51) are intended to secure the proper instruction of pupil teachers on the one hand, and their efficiency as assistants in the actual work of the school on the other.

49. The scale of salaries paid to pupil teachers, though not fixed by the Regulations, has not varied in practice from the following:—

	Females.		Males.
Class IV.—£18 per annum.			£30 per annum.
„ III.— 24 „			36 „
„ II.— 30 „			42 „
„ I.— 36 „			48 „

These rates, though small, are found to be sufficient, together with the prospective advantages afforded by the teaching profession in the Colony, to attract a large number of applicants. In 1868, no less than 111 candidates for appointment were examined. Of these, 51 failed, and were, consequently, not deemed eligible for appointment at the time. Successful candidates are appointed in the order of merit, as indicated by the number of marks gained at the examination.

50. Pupil teachers are subjected to examination yearly, success being followed by promotion to a higher class, and a corresponding increase of salary. The number examined in 1868 was 157, of whom, as the following table shows, 109 were successful:—

Classes.	Number examined.	Number promoted.
Probationers	14	5
Class IV	78	50
„ III	32	30
„ II	15	12
„ I	18	12
	157	109

Each of the successful pupil teachers was promoted one grade. Those who failed were chiefly persons appointed several years ago, when the arrangements for their instruction were less perfect than at present, and who had since experienced some difficulty in meeting the demands upon their capacity required by the Council's Regulations.

51. The usefulness of pupil teachers, and their influence upon school work, are favourably noticed by those Inspectors who are officially brought into contact with them, and have opportunities for personally observing their conduct. Messrs. Johnson and Flannery, the Sydney Inspectors, for example, speak in the following terms of the pupil teachers (115 in number) under their superintendence:—

“They form an important part of the teaching staff of this district. They are only appointed after they have afforded evidence, during a three months’ probation, that they possess aptitude and general fitness for the office of teacher. Their work generally is of a very satisfactory kind.”

TRAINING SCHOOL.

52. No material change has been made in the organization of the Training School, which during the past year has been the scene of great activity in the preparation of teachers, 132 candidates having been admitted. The number of applicants was 243, of whom 136 were males, and 107 females. The average age of the former was 28, and of the latter, 22 years. Their respective denominations were:—

	Males.	Females.	Total.
Church of England	51	31	82
Roman Catholics	26	47	73
Presbyterians	20	12	32
Wesleyans	21	10	31
Others	18	7	25
Totals	136	107	243

In addition to the 132 admitted to the Training School, 9 were, for various reasons, directed to attend the Model Public School in Sydney, or convenient District Model Schools, and the remaining 102 either failed to pass the preliminary examination in a satisfactory manner, or were deemed ineligible upon other grounds. A few did not present themselves for examination at the appointed time. With regard to the class of persons applying for admission into training, it is found from the “personal statement” furnished by each, that, even including pupil teachers whose term of service in that capacity had expired, only thirteen per cent. had received special preparation for the office of teacher; and that thirty-four per cent. had been engaged for various periods in the work of teaching, but in most cases privately and in a desultory manner. More than fifty per cent. were entering the profession for the first time, and, in too many instances, as a last resource—from no particular love for the work, or conviction of their fitness, and, as the experience of past years proves, with the intention of quitting it in the event of any more congenial employment offering.

53. Not a few of those presenting themselves to the Training School, and failing in the preliminary examination, profess to be governesses out of employment, or persons who have been engaged in private schools. Their statements as to the length of their previous occupation in teaching may be correct; but the results disclosed by their examination papers are melancholy. The composition of the papers, and style of expression, are loose in the extreme; and the punctuation is often wholly wanting. The knowledge of grammar scarcely enables them to specify even the names of the leading parts of speech; while the details of parsing are frequently unknown. Thus, “some” is declared by one person to be an article, “payment” a verb, “persons” a pronoun, and “could” a conjunction. Another applicant describes the relative pronoun “who” as a “neuter verb,” and “to confound” as an adjective. Another gives “the” as the “article nominative plural.” With others, again, it is quite common to ascribe gender and case to verbs, and tense and mood to nouns. In the simple and compound rules of arithmetic, the most imperfect knowledge is exhibited. In “long division,” and in multiplication involving *ciphers*, failure is so common as to create little surprise. In the following question—“One-half of an article costs £37 7s. 5½d., what will 653 such articles, entire, cost? Work in as many ways as you can”—33 out of 49 failed to answer correctly. In geography the answering is even more extraordinary. One young lady, when asked to enumerate the peninsulas and islands of Europe, gave—“Formosa,” “The Hercules,” “Madras,” and “Madrid.” Another stated that “Borneo and Sumatra are

are islands in Europe, and lie across the line." Another affirmed that "Ireland is to the east of England, and that Australia is remarkable for its climate." The following is a fair specimen of the mode in which Australian geography is treated:—

"Australia may be said to be a very healthy climate. The transparency of the sky and the air refreshing. To a stranger it would appear rather different from Europe. For instance, the leaves of the trees are of a very dull colour; and are more vertical than horizontal there are the *Acicia* family and the *Eualypti* the *Banksias* which send down suckers that cling to the sides. The animals of Australia are the kangaroo, the opossum, large owls and many others."

This is by no means the worst answer. Australia is stated to be bounded on the west by the Atlantic, and on the north by the Arctic Ocean, while the Murray is placed on the east coast, and some of the eastern rivers transferred to the western plains across the Dividing Range. Serious mistakes are also made in describing the relative positions of the Colonies on the Australian Continent; and one person cites "New Zealand" and "Hobart Town" as two of the five. Among the rivers of Asia are enumerated the "Senegal," "Ammon," "Shang," "Tagus," "Amoi," and "Iadastes."

54. The above examples are among the first selected from a mass of papers even more unpromising still. Nor is this all. The spelling is frequently defective, the penmanship slovenly in the extreme, and the mode of executing the exercises so void of care and good taste, as to create painful misgivings regarding the value of much that now passes current as essential to female education. While substantial branches of education appear to have been little studied, the main results indicate, in a very decided manner, that the precision, forethought, and high interest in duty, so essential in those who assume to mould the mind of youth, formed no part of these applicants' qualifications. Many have been examined twice, some three times, and still failed to pass the comparatively simple entrance examination. In fact, it may safely be affirmed, that two years of hard work at school, under such discipline as that to which the upper classes in the best Public Schools are subjected, would barely suffice to qualify many of the applicants for a profitable use of the routine of the Training School.

55. When the large number of failures is considered, it will be evident that the applicants have been subjected to a thorough sifting; and hence it may reasonably be expected, that those who pass the preliminary examination, and satisfy the Council's Officers as to their moral fitness, should present a class of persons in a fair degree eligible for the calling to which they aspire. Speaking generally, such is the case. As regards their physical qualifications, the statements already given show that a very large majority have their prime of life before them; while the enforcement, as far as is practicable, of the provision that "candidates must be free from any bodily infirmity likely to impair their usefulness as teachers," has secured tolerable satisfaction in this particular.

56. Of the 132 candidates admitted to the Training School, 117 succeeded in gaining certificates of classification. The number to whom the several grades were awarded is exhibited in the following table:—

	CLASS III.			
	Section A.	Section B.	Section C.	Total.
Males	24	28	28	80
Females	12	8	17	37
	36	36	45	117

The remaining fifteen are thus accounted for:—Three voluntarily withdrew; the attendance of three others was disallowed, in consequence of their not exhibiting sufficient promise of future usefulness; and nine, of whom eight were females, failed to pass the final examination.

57. The results now recorded are not unsatisfactory. They show that, in respect of intellectual qualifications, the trained teachers have been fairly successful, and that the Training School has worked effectively during the past year. In one particular the information possessed by the Council concerning candidates is defective. In judging of the moral character of applicants, the Council has frequently no means of obtaining information except such as is furnished by testimonials; and however rigidly these may be scrutinized, it will sometimes happen that an improper person may be admitted. Further, the existing arrangements do not afford opportunities for discovering the real character of individuals who, on moral grounds, are not fit for the office of teacher. The difficulty and its remedy are thus stated by the Training Master :—

“Of the moral qualifications of candidates I am not in the best position to form an opinion. From the shortness of the term of training, and the fact that, except during the period in which they receive instruction, they are not under my supervision, it is apparent that the moral character, more especially when faulty, is not fully shown; and thus, vices whose existence has never been suspected, have developed themselves when the candidate, having received an appointment, is removed from immediate observation and restraint. It is not intended to imply that instances of this kind are of frequent occurrence, but rather to show the desirability of devising some means whereby, as much as possible, opportunity may be afforded of forming a correct estimate of this phase of character. The most effective plan that could be adopted for securing such an end would be the boarding and lodging of candidates on the premises, under the direct control and supervision of the Training Master, or other responsible officer; but this, for the present at any rate, may be deemed impracticable, on the ground of expense. Much good, however, would, I think, result, were the Council to select and license one or two houses in the vicinity of the Training School, as boarding establishments for candidates—a suggestion offered by my predecessor. Facilities for gaining an insight to the moral character of each would thus be afforded that are at present almost entirely wanting; while the students themselves would have the opportunity of friendly intercourse and mutual improvement.”

58. Before offering an opinion upon the Training Master's proposal, we deem it advisable to refer to other suggestions he has made, with a view to the increased efficiency of the department under his charge, and which he explains in the following terms :—

“1. The training session should occupy six months, instead of, as at present, three.

“When the fact is called to mind, that more than half of the applicants are persons that have had no previous experience in, or training for, the work of teaching, but came, as it were, fresh from the plough, the workshop, the counting-house, the gold fields—from avocations but little akin to that of the teacher, and that in the space of three months they are expected to obtain a fair knowledge of the subjects set forth in the programme of studies, the time at disposal to effect such a task must seem, and is, as far as my experience extends, altogether inadequate. But another and far more important result should attend the training received. What has just been said refers merely to the amount of information the candidate must acquire to enable him to answer the examination questions creditably. Beyond this, the term of training should be an apprenticeship to the art of teaching, during which he shall have facilities for studying the nature of the material on which he will have to operate, frequent and regular opportunities of observing the methods of instruction employed by the best teachers, and of practising occasionally himself; and be so influenced, by precept and example, as to imbibe the spirit of earnestness and enthusiasm characteristic of the true teacher. And how are both these ends to be attained in a space of time too short to accomplish either of them? If, in connection with the foregoing remarks, it be borne in mind that, on the average, the training session in
the

the principal educational establishments of Great Britain and the Continent is ten times as long as ours, the desirability of extending the period, as suggested, may be the more evident.

“II. In the second place, I think it very necessary that a Practising School should be formed, in connection with the Training Department—one that would, in its organization, &c., approximate as nearly as possible to the class of schools to which the larger number of candidate teachers receive appointment.

“Under the present arrangement, the practical training to which candidates are subjected is given in the Model School, under the direction of the Head Master and the Head Mistress; one day per week, during the session, being set apart for the purpose. While in attendance at the Model School, they are employed in observing the methods of instruction used, noting the disciplinary and other arrangements, teaching occasionally, and in receiving instruction in the art of teaching. This is without doubt good, as far as it goes; but, as results prove, it is not calculated to prepare the candidate for efficiently conducting his own school; for it is obvious that the Model School, in which his practical knowledge is mainly acquired, must widely differ in its organization from the ordinary country school. When, therefore, the time arrives for him to commence actual work, difficulties present themselves which he has neither anticipated nor fitted himself to meet. What is wanted, then, is a “Mixed” School of say forty or fifty pupils, of the character indicated above—in short, the model of a country school. In it the candidate should have, not merely the opportunity of observing the routine and of occasionally taking charge of a class or section, but the responsibility (under supervision) of conducting all its operations for a certain portion of the session. The experience thus obtained would be invaluable, and would soon manifest itself in the increased efficiency of our schools—many of the existing defects in the management being attributable to ignorance rather than to wilful neglect. The following considerations also, though of minor importance, should weigh with the Council in forming a decision on this proposal. The presence of the large number of candidates ordinarily in training must, to a large extent, exercise a distracting and injurious influence on the operations of the Model School; while the trial lessons, given in the presence of the Inspector and Head Master, upon which the future classification of each candidate in no small degree depends, are attended with difficulties that it would be but just to remove.

“III. Lastly, I would suggest that the number of admissions into training be adapted to suit the Council’s demand for teachers.

“The advantages attending this course are readily apparent. On the side of the Council it will be found that a saving of money will be effected, a better selection of material may be made, and the staff and accommodation of the training department will not be unnecessarily overtaxed; while the advantages to the candidate will be, a better training, and prompt despatch to his sphere of duty.”

59. We deem it requisite, before incurring any expense for the improvements pointed out by the Training Master, to decide what is the proper organization for a permanent Training School. This question is felt to be one of great importance, not only in this, but also in the neighbouring Colonies. Upon the answer will depend, in a great measure, the qualifications of future teachers, the status of the teaching profession, and the nature of the education to be imparted in Primary Schools supported by the State. The necessity of having teachers fully qualified in all respects for their duties may be assumed; the advantages to the country generally are apparent. But while the prospect of obtaining a sound and useful education at a cheap rate may attract large numbers to the Training School, of whom many may become most efficient teachers, the uncertainty that they will hereafter be adequately remunerated for their services, and the small inducements

to

to remain in the profession, will dispose some to relinquish teaching whenever they can obtain other employment accompanied with greater emoluments. It is probable that the class of men by whom this course would be most frequently adopted would be precisely those who were of most worth as teachers; those who remained in charge of the schools being some who, from inferior energy and intelligence, were unable to enter the more highly remunerated occupations. Thus, the very excellence of the Training School would be the means of frustrating its primary intention—that of rearing up a body of accomplished teachers. Until, therefore, the position of the teacher generally, his emoluments, and status, have been placed on a more satisfactory basis than at present, we deem it unadvisable to establish a Training School after the model of those in the mother country, but consider it preferable to continue in force the existing provisional arrangement for the training of teachers.

V.—INSTRUCTION.

COURSE OF SECULAR INSTRUCTION.

60. The course of secular instruction laid down in article 62 of the Regulations is intended (1) to define the subjects that ought, of necessity, to be included in a scheme of primary education for the Colony; and (2) to regulate the teaching, with a view to secure corresponding proficiency in all the branches taught. In the first aspect, it is a guarantee to the public that instruction of the kind needed under the peculiar circumstances of the Colony will really be provided; for, while a teacher is not prevented from introducing other subjects, he is compelled to give sufficient attention to those deemed most useful and appropriate. Regarded from the second point of view, the Course of Secular Instruction is a guide and direction to teachers, both as to the amount of time to be devoted to each subject, and as to the order in which they should successively appear upon the programmes of the various classes. The indirect uses of this regulation are of equal importance. It effectually prevents, for example, the anomalous state of things sometimes observed in schools, when the pupils may be prodigies of proficiency in some branches, while others are wholly neglected. The one-sidedness of such a mental training cannot fail to be injurious to those subjected to it, inasmuch as they are likely to grow up familiar with one department of knowledge only, and both unable and unwilling to apply themselves to the acquisition of learning in any other.

61. The propriety of defining with some fulness and precision of detail the necessary constituents of a public system of primary education has of late years been very generally recognized. The principle has indeed long been acted upon among those nations of the Continent of Europe in which education has made any noteworthy advance; and some of the American States, and Canada, have followed the same course. More recently in England, upon the introduction of what is called the Revised Code, (article 48), an attempt was made to lay down the course of instruction for schools aided by the State. That object has been but imperfectly accomplished however, the framers of the Revised Code having confined their directions to reading, writing, and arithmetic, and having expressed them rather with a view to the guidance of teachers, than as a formal declaration of the necessity of certain branches as part of the school course. In Victoria, the Board of Education have been more successful in this respect, having included in their course all the ordinary school subjects, besides affording substantial encouragement to the teaching of singing and drawing.

62. It seems desirable to notice at this point the bearing upon secondary education of the Course of Secular Instruction. Owing to the early age at which children leave school, it rarely happens that boys remain sufficiently long to receive instruction in advanced subjects. But in some localities, where the population is able to supply a class of persons whose necessities do not compel them to remove their children till they have attained an age beyond the average, and who desire to obtain for them a more extended education, it is possible and desirable to form a class in which the elements of classical and mathematical learning may be studied. In such cases, the Course of Secular Instruction provides for the extended instruction of the pupils in the primary school, and prepares them for advanced teaching in a superior school, when the numbers justify the establishment of a school of that class.

63. The reports of our Inspectors show that teachers generally evince a ready disposition to fulfil the requirements of the Course of Secular Instruction, and that their failure, in some instances, to teach all the prescribed subjects, arises mainly from want of the necessary knowledge or skill. Having been in operation for nearly two years, the course is now more fully understood by teachers. The beneficial influence upon instruction, of working in accordance with a systematically arranged course, is better appreciated, and the difficulties formerly supposed to exist in the way of its successful adoption, have in general passed away.

RELIGIOUS INSTRUCTION.

64. The provision made in the 19th section of the Public Schools Act, by which, in Public Schools, one hour daily has been set apart for the special religious instruction of the pupils, has been taken advantage of in numerous instances; and there appears to be a growing disposition on the part of some of the clergy to use the opportunity thus afforded. It has been found, however, that the hour, from 9 to 10 a.m., devoted to this subject in the Time-table (art. 73 of the Regulations), is inconvenient to many of the clergy located in country districts. The Council has therefore taken into consideration the expediency of so far modifying this regulation, as to admit of the period devoted to special religious instruction being altered in cases where the necessity for such a change is made known.

METHODS.

65. We do not gather from the reports of our Inspectors that any very decided or extensive improvement has been exhibited by teachers as regards the methods adopted in their instruction; nor could such an advance be reasonably expected, if it be borne in mind that many of the teachers have continued to use the same methods through a long period of years, and that few have enjoyed opportunities of becoming acquainted with new and improved modes of tuition, either by means of professional training, or by the observation of persons more experienced in teaching than themselves. With regard to certain radical defects in the methods employed, the Inspectors are substantially unanimous. Referring to the Albury District, Mr. Coburn states—

“One general fault in the mode of teaching is, the neglect of recapitulation of work at frequent and regular intervals; and akin to this, is the lack of examination of pupils both orally and otherwise at stated times. Too much dependence is placed on the visit of the Inspector, as a means of ascertaining the state of attainment and the progress made. Teachers who desire that their pupils should acquit themselves well at inspection should not fail to exercise them in the art of correct and ready answering as often as possible. In all classes, written examinations should be resorted to; and, in the upper classes, these should take as wide a range as possible.”

Similarly, Mr. McIntyre, in his report upon the Goulburn District, remarks:—

“Of the general style of teaching followed in many of the schools, particularly the method of questioning on the ordinary reading lessons, whether the object be to examine or instruct, I cannot speak very highly. The majority of the teachers are, however, willing to do their best, but in many cases they evince but little judgment or discretion in the mode of teaching the different matters they bring before the pupils, and the teaching is often wanting in earnestness and vigour.”

In the Maitland District, the Inspector, Mr. Dwyer, speaking of the defects of method, points out the remedy:—

“In about one-sixth of the schools the methods are from fair to good, in about one-half tolerable, and bad in nearly one-third. My remarks upon method, in the report of last year, continue still applicable to the majority of the schools. It is seldom one meets with genuine method, but it is only fair to state that my opportunities of observing it directly were very few last year, my duties having had reference principally to results. For the most part the methods in use fall under the synthetic type, which, without the
analysis

analysis to which it is correlated, is incomplete, and for children even much less suitable. But whatever the form of the method employed, its application is greatly modified, if not wholly controlled, by other circumstances, among which stand prominently forward the regularity and order of the pupils. In the absence of these, good teaching is powerless; while with them, even indifferent instruction is not ineffectual. They are the groundwork of successful teaching, and to secure them should be the great object of every teacher, as well as of all interested in the work of education. It seems to me, that before method, in the hands of most teachers, can become an intellectual instrument capable of searching thoroughly the minds of youth, a higher range of qualifications will be necessary. It may be true that, for the merely rudimentary education conferred in the majority of primary schools, attainments very little above the small proficiency sought are needed; but even for this humble aim, an enlightened teacher will be able to impart his knowledge more clearly, thoroughly, and expeditiously, than one who is unable to advance further than the elementary stages."

The Sydney Inspectors are perhaps the most precise in their statements:—

"Viewed as a whole, the methods may in point of quality be described as tolerable. Some fall below this mark, but these are practised chiefly either by untrained teachers or by those who have joined the profession late in life. The more noticeable defects in their application are—the questioning is not sufficiently individual or searching, it needs to be marked by greater vigour and earnestness, it does not aim enough at developing the intelligence of the pupils. Vigorous and intelligent questioning appears to us the main essential of any method deserving the name. It is of little use teaching, unless proper precautions be taken to ascertain that the instruction is being received; and the best proof that this is the case is, the ability of the pupils to reproduce readily and correctly the substance of their lessons. Suggestive or mechanical questioning is of doubtful value. It is calculated to mislead both teacher and pupils. The true test consists in putting the questions point-blank, framing them so that they shall appeal to the intelligence of the pupils and necessitate some amount of thinking, and in leaving no room for guesswork. The teacher who examines his work in this way will have little difficulty in discovering whether his teaching is effective or not. Much of the instruction is of small value, not merely in relation to the mode in which it is taught, but also in respect to its haphazard, poor, and scanty character. Too often, teachers neglect to prepare their lessons—an omission most commonly committed by those whose information is the least satisfactory. This want of preparation is usually accompanied by an absence of everything like a proper arrangement of lessons. Both defects are of serious moment, and go far to render sound teaching an impossibility. At the same time, it must be admitted that some advance in the art of teaching is perceptible. Greater energy is infused into the work, a more practical acquaintance with the Council's requirements is evinced, and a disposition to receive information on unknown or doubtful points is very generally apparent."

PROFICIENCY.

66. The proficiency of the pupils in the various subjects of instruction is described in the Inspector's reports. The general tenor of those reports leads to the belief that considerable improvement has been effected since 1867, although no explicit comparison is drawn, except in the case of the Newcastle District. Mr. Allpass states, with reference to the schools under his charge, that "many schools whose classes had last year to be rated as 'below the standard,' have now, through the earnest industry of the teachers, earned a more satisfactory verdict."

VI.—PUPILS.

67. The provision of school buildings and other material appliances of instruction, the appointment of well-trained and efficient teachers, and the framing of a judicious course of instruction, will be productive of little advantage to the work of education, unless children can be brought to attend school with regularity. It has already been stated that a large number of children, estimated at 25,000, are unprovided with the means of education. It may be useful further to inquire to what extent the existing means are availed of by those within whose reach they are placed.

Appendix I.

68. The returns appended hereto show that in Public Schools the average number of scholars upon the roll was 25,735. In Certified Denominational Schools the number was 25,429, and the total 51,164. The number of pupils in daily average attendance was—

In Public Schools	16,993·7	... 66·03 per cent
In Certified Denominational Schools	16,468·7	... 64·76 ,,
Total	<u>33,462·4</u>	... 65·3 ,,

It thus appears that barely two-thirds of the children professing to attend school do so in a regular manner. At the same time, allowance must be made for the derangement of the ordinary school work in the districts near the metropolis, occasioned by the visit of H.R.H. The Duke of Edinburgh to the Colony. This circumstance probably lessened the average attendance, during the first quarter of 1868, by upwards of 3,000. But the permanent causes operating against regular attendance are less felt in the neighbourhood of Sydney, being most powerful in agricultural districts.

69. In Victoria, the percentage of pupils in average daily attendance, to the average number on the rolls, was 75·38 in 1867-68, and the actual attendance given by each child equals 132 school days. Although the percentage in average attendance in this Colony amounted to 65 only, yet the length of each child's attendance compares favourably with other countries. The average number of days spent by each child at school in the several countries mentioned below has been thus estimated:—

Canada (West)...	96 days.
United States	106 ,,
England...	129 ,,
Victoria	132 ,,
New South Wales	155 ,,

When it is remembered that 1868 was a most unfavourable year for school attendance, by reason of the prevalence of drought and sickness, the result here indicated must be regarded as fairly satisfactory.

70. The fact must not be overlooked, however, that nearly 20,000 children are extremely irregular in their attendance at school. Teachers complain that their labours are rendered ineffectual by this evil, and the Inspectors find themselves unable to determine whether the blame for absence of progress among the pupils is to be attributed to the want of skill on the part of their instructors, or to the parents' neglect to send them to school. That the responsibility for the irregular attendance of pupils rests with parents is as clear as the fact that such irregularity exists. But it is not easy to decide whether the pleas set up to justify or extenuate their neglect are valid. The excuses most frequently urged by parents are, the necessity for utilizing their children's labour, and poverty which not only renders them unable to pay the school fee, but also to provide decent clothing. On the other hand, it is affirmed that, in many instances, these are mere pretexts, and that nothing but ignorance, or utter indifference to the value of education, prevents the regular attendance of children at school. For example, Mr. M'Credie (Bathurst District) reports in the following terms:—

“ The regularity of about two-thirds of the pupils in attendance is from fair to good. Many of those, however, who attend school regularly when enrolled, may be said at the same time to be regularly irregular ; that is to say, they attend

attend school regularly at certain seasons, and as regularly absent themselves at others. In agricultural districts, especially among free-selectors, and in mining communities, this continues the bane of our schools, and militates more than all other things combined, against the success of the teacher, who is utterly powerless to interpose between the children and the ignorance, caprice, and cupidity of some parents, and the needy poverty of others who are compelled to employ their offspring at certain seasons in some way or other, to save the cost of labour, or to do something for their own support."

Similar testimony is afforded by Mr. Huffer (Camden District), who remarks:—

"Although the schools are not yet satisfactory in this respect, some improvement has undoubtedly been effected, especially in the regularity of the pupils' attendance, since last inspection. From careful inquiry made at the time of inspection, I ascertained that in a number of the localities there are many children of a school age who were not in attendance at the schools established for them. In a few instances the parents profess to care little or nothing about the education of their children, and in many more instances, though professing to be anxious to send their children to school, they act as though they cared but little with regard to the matter—the children being kept from school for the most frivolous reasons, and no real interest shown in their educational progress."

Mr. M'Intyre (Goulburn District) appears to have formed a widely different opinion. He observes,—

"The irregularity of the children's attendance is often a source of complaint with teachers; but, on the whole, the attendance was tolerably regular for the last quarter of the year, being 70 per cent. daily for the number enrolled. In any individual case, however, it is unquestionable that the degree of regularity greatly depends on the character of the teacher. Excessive irregularity is frequently assigned as the cause of the low condition of a school, but experience teaches that it is generally, in reality, the result of the bad management of a teacher, for both parents and pupils naturally become indifferent when the discipline and instruction are of a worthless character. On the other hand, a good, cheerful, popular school, exerts an attractive influence over the children. They become anxious for learning, are less liable to be kept at home, attend with increased regularity and in greater numbers."

But whatever may be their difference of opinion as to the validity of the reasons assigned to justify irregular attendance, there is a remarkable coincidence in the views of Inspectors as to the remedy. All seem to admit that much can be done by teachers and Local Boards, but that a thorough cure can be effected only by means of a law rendering education compulsory. For example, Mr. Forbes reports:—

"Teachers, it is readily admitted, have many obstacles to the maintenance of effective discipline, but by firmness and consistency on their own part these obstacles may be successfully met and overcome. Even the indifference of parents, their carelessness in the all-important matter of sending their children regularly and punctually to school, and their unreasonable exactions upon their children's time—keeping them at home, often for the merest trifles—may be largely remedied by the prudence and consistent firmness of the teachers. Regularity and punctuality of attendance on the part of the pupils are tolerably reliable indications of the character of the discipline of their schools. They usually accompany each other. Regular scholars are ordinarily punctual."

Mr. Dwyer (Maitland District) states,—

"In about five-eighths of the schools the pupils and teachers are punctual to a satisfactory extent, in one-fourth tolerably so. This is an improvement upon last year's experience. The regularity, too, notwithstanding the serious obstacles by which it is opposed, maintains what may be regarded as a reasonably satisfactory level—being indifferent or bad only in one-

fifth of the schools. It has certainly improved within the year, though still very far from what it ought to be. Without compulsory education, this vital branch of discipline will be best promoted by thoroughly earnest and conscientious teachers, well qualified to impart to their labours an interest sufficiently powerful to attract the children, who would in turn strongly incline the parents to dispense with their services to a much greater extent than at present. Irregularity often arises from the caprice of children—not the will of the parents; and if all schools were conducted by really competent teachers—I mean not alone able to teach, but to exercise withal a wholesome influence on public opinion by their prudence, discretion, intelligence, and zeal—the question of compulsory education would, I think, be considerably narrowed, in a country like this, where the means of living are not, as in some European countries, the all-absorbing topic—the great object in the race of life.”

Mr. Coburn remarks :—

“ Compulsory education, in some shape or another, appears, without doubt, to be the only cure. Still, a good deal may be done by the teacher, in conjunction with the Local Board, to mitigate the evil caused, too often, by the carelessness of the natural guardians of the pupils.”

The opinion of Mr. Huffer points more positively to compulsory education. He states :—

“ Teachers and School Boards, by careful attention to their duties, may, I believe, still further improve the pupils’ regularity, and also induce more parents to send their children to school. I am strongly of opinion, however, that nothing short of an enactment dealing with the question of fees, and introducing the system of compulsory school attendance, would effectually remedy the evils of irregularity and non-attendance.”

Mr. M’Credie is still more emphatic :—

“ In an enactment to secure compulsory attendance seems to lie the only hope of extrication, partial or complete, from the present evils; and to the necessity for this, the public mind seems fast ripening. Earnest, thoughtful men are frequently heard remarking that compulsory attendance and the abolition of school fees are what should be appended to the present system, to complete and perfect the machinery for the education of the Colony. Even in England, educationists are now becoming alive to the necessity for compulsion to attain the thorough education of the people. One says, recently—‘ The Educational Conference at Manchester has already spoken with a clear, a loud, and a convincing voice, as to the compulsion needed; there is no doubt of the need—the only doubt is how to provide for it. There are many and considerable difficulties in the way, but there are none so great as not to be removable by earnest determination, by patient forbearance, and by intelligent devotion to the most important subject which in this century has risen up and taken its rightful place in the minds and hearts of the people of Great Britain.’ Another ventures to predict—‘ that twenty years afterwards, the compelling every parent to take care that his child shall learn to read and write, will be considered (as it now is in Germany) of the same order of importance and necessity as that parents shall clothe and feed their children.’”

Whatever opinions may be entertained as to the propriety of enacting a law to render education compulsory, there can be no doubt that a necessary preliminary to any practical step in that direction would be the division of the Colony into School Districts, and the establishment of a system of local rating for educational purposes. Before imposing the legal obligation to educate children, it would be incumbent upon the framers of the measure to provide the machinery required for supplying the means of instruction throughout the Colony. This work could not be accomplished by any central authority, as the provision in question would be needed in a great number of places

places simultaneously; and it must consequently be thrown upon local organizations, each limited in its sphere of action to the district in which it is instituted. It is further the opinion of the Council that the extension and maintenance of schools cannot be satisfactorily provided for in the future, unless recourse be had to the system of school districts and local rates. Teachers are frequently found to express similar views as to the necessity for rendering education compulsory.

PUNCTUALITY.

71. The further loss of time to pupils, from lateness in arriving at school, is considerable. In most cases the punctuality of the pupils depends upon the teachers. In this particular the school will reflect the teacher's character. The Inspectors generally sustain this view. Mr. Jones, for example, states of the Armidale District:—

“The punctuality of the attendance is in general fair. Where it is good or bad, the prevailing tone of the school is usually of the same character. Where schools are located on the banks of creeks or rivers it is usually faulty, but in some of these cases it might be much improved by teachers of energy, tact, and firmness of purpose. It appears to hold good in the schools of my district, as it does in the schools of Sydney, that where teachers are popular with both pupils and their parents, more particularly so with the pupils, the punctuality is satisfactory. The same remarks apply to the regularity of attendance, though with perhaps less force, the influence affecting it being to some extent peculiar.”

Mr. M'Credie reports to the like effect:—

“Where the evil exists to any great extent, the blame is generally to be about equally divided between the parents and the teacher; the former detaining their children from causes which a little forethought and care might have prevented, and the latter failing to impress the habits of his pupils, from his own want of earnestness and rigid punctuality. The teacher who does not, by example, in every respect, inculcate this habit, need not attempt to do so by precept.”

Mr. M'Intyre also states:—

“In many schools the scholars are unpunctual in the morning. I have inspected some schools where the business, according to the Time-table, commences at 10 o'clock, and the pupils came into school singly, and in groups, up to within a few minutes of 11. Among the many circumstances which are indicative of a badly managed school, the want of punctuality, when allowed to an extreme, is perhaps the most infallible. It is the consequence of indifference and the want of vigilance on the part of the teacher. Children if left to themselves will never be punctual, no matter how late the hour for commencing business. Perhaps the most effectual remedy for late comers is, to detain them in the evening for thirty or forty minutes after school hours. This, combined with the remonstrance of the teacher, never fails to ensure punctuality; but I regret that, in this district, it is not generally practised with sufficient strictness.”

VII.—SUPERVISION.

LOCAL SUPERVISION.

72. In some instances the supervision exercised by Local Boards is of a highly beneficial character. They watch over the prosperity of the school, encourage the teachers, and manifest an intelligent interest in all that concerns the well-being of the pupils. But we regret to report that in a large number of cases a different spirit is manifested;

manifested ; and that some Local Boards evince but little anxiety for the welfare of the schools under their charge. In these cases the degree of interest taken in school affairs ranges from indifference down to positive neglect. We learn from Mr. Huffer's report, for example, that—

“ No marked improvement is yet apparent in the character of the supervision exercised by the School Boards. In a few instances the supervision exercised is really effective, the Boards' duties prescribed by the Regulations being carried out with regularity and painstaking ; but, by a large majority of the School Boards, little or no interest is manifested in the progress and well-being of the schools placed under their supervision.”

Mr. M'Credie speaks in equally unfavourable terms :—

“ With some praiseworthy exceptions, the Local Boards do not appear to take that interest in the schools under their supervision which might reasonably be expected from them. Generally speaking, meetings are seldom held, and very irregular visits are paid to the schools.”

In the Armidale district, Mr. Jones states—

“ Except in a few commendable instances, the local supervision is nominal ; many teachers complaining that the members of Local Boards rarely visit their schools, or hold meetings for the consideration of matters affecting the welfare of them.”

Mr. Dwyer's observations on this point are somewhat more favourable :—

“ The Public School Boards evince, to a partial extent, a tolerable interest in the institutions with which they are officially connected. In many instances the members are not exactly the stamp of men calculated to render beneficial service ; nor are they fitted, either by education or social influence, to improve the character of the schools ; but they are the best that can be got, under the circumstances. The Local Boards of Denominational Schools continue to give, for the most part, a pretty active support to their schools ; but, in all cases, there is generally wanting a systematic procedure. The members visit the schools but seldom, examine very superficially (if at all) the records, and often put their names to documents certifying their correctness, which have afterwards to be returned to the teachers. There is something stultifying in such conduct as this ; and I am confident that, if members knew how frequently they are made to vouch for incorrect figures, they would be more cautious. It would be only right and proper for them to see the books, &c., from which the returns are made out, and satisfy themselves, as they would in ordinary accounts, that every thing was quite accurate. In this respect, indeed, the local supervision is, in all schools, far too lenient, and takes much more upon trust than would be found justifiable in private life.”

In less remote districts the local supervision appears to be more effective. In the Cumberland District, for example, the Inspector reports :—

“ This is a matter of the highest importance to the healthy, successful working of the schools. It is not as yet, almost in any case, so fully realized as it ought to be. Some Local Boards discharge their duty very fairly ; others are rather neglectful. As regards Denominational Schools generally, the clergymen are virtually the Local Boards, in so far, at least, as the supervising of the schools is concerned.”

In the Sydney District the statement of the Inspectors is still more encouraging :—

“ It is gratifying to be able to report that the local supervision of the schools of this district is, in numerous instances, of an active, intelligent, and beneficial character. Most commonly the duties of Local Boards practically devolve upon one particular member ; and whilst we heartily wish it were otherwise, the circumstance need not be taken as evidence that no interest

is

is felt by the rest of the members. One of the principal duties of a Local Board is to make regular periodical visits to the school under its supervision; and thus, by its presence, to encourage pupils and teachers in the important work in which both are engaged. This duty is performed only in few instances. Still, in the main, the good done by the agency of Local Boards during the year has been large and substantial. New buildings have been erected, not a few have been enlarged or repaired, and various other material improvements have been effected. These beneficial results have only been achieved at much personal expense of time, trouble, and money. To those who have been engaged in such self-sacrificing and benevolent labours, too much praise cannot be given. For ourselves, we have experienced a uniform courtesy from members of Local Boards; our suggestions have been received in the best possible spirit, and reasonable effort has been made to give them practical effect. The feeling thus manifested has afforded us much encouragement, and has led us to entertain the belief that our anxiety to improve the condition of the schools under our charge is correctly understood and fully appreciated."

The causes which result in the state of things described in these extracts are not difficult to discover. In the first place, it is impossible, frequently, to obtain the services of persons properly qualified by education and experience to perform the duties expected from those having local oversight. Even in cases where suitable persons can be found, it often happens that they decline to act. The complete occupation of their time in their own business is generally pleaded in excuse for thus deciding; but it is known that the desire to avoid being involved in local disputes and unwillingness to bear the expense inseparable from the office, are not less powerful influences in leading to this result. This last consideration is indeed one that may be urged with much justice. Members of these Boards are often compelled to contribute the whole of the local quota towards the necessary incidental expenditure for the schools under their charge; they feel this to be unjust, seeing that all who derive benefit from a school ought to bear some portion of the cost of its maintenance.

INSPECTION.

73. The staff of Inspectors continues the same as notified in our last Report. We have to record, however, the decease of Mr. Thomas Harris, one of the Inspectors originally appointed by the Council, after a protracted illness, from which he was suffering at the date when that Report was furnished. In general, the Council has seen no reason to alter the favourable opinion formerly expressed as to the ability and fidelity of these officers. The Council is aware that, in some Districts, the duties are so multifarious that they can be discharged only by incessant labour on the part of the Inspectors whose energies are tasked to, perhaps, an unreasonable extent. The continual accessions to the number of schools in operation tend to augment this inconvenience, and to render the proper inspection of all the schools every year still more difficult of attainment. For this reason, the Council has considered it desirable that the staff of Inspectors should be increased at an early date.

74. The general reports furnished by the Inspectors for the year 1868 are for- Appendix J.
warded herewith. These reports exhibit with considerable minuteness the results of the inspection of schools and examination of the pupils. Apart from the more general and obvious reasons for desiring that schools should be thoroughly inspected, the Council has in view several special objects to be accomplished by that means. These are,—1st, to measure the exact proficiency of the scholars in the various subjects taught, and their progress in learning, as compared with the period they have been under instruction;—2nd, to ascertain if the cultivation of the mental faculties receives due attention from teachers, and if the information communicated to the pupils is so digested as to increase the power of acquiring further knowledge;—3rd, to test the accuracy of the school work,
and

and the fidelity with which the instruction has been made to accord with the prescribed guides and the declared intentions of the teachers ;—and, 4th, to enable the Council to gauge the efficiency of the teachers in the practical work of the school. Incidentally, further information is gained respecting the moral training children receive at schools under the Council's supervision. The examinations to which they are subjected reveal indirectly, the extent to which they have acquired habits of obedience and of self-reliance, a love of truth, and a disposition to be open and candid. These qualities are of the utmost importance to the children individually, and to the community of which, it is to be hoped, they will become good and useful members.

75. It is apparent that the object before described can be effected by the employment, as Inspectors, of such persons only as are accustomed to the management of children, conversant with the nature and practice of elementary teaching, and gifted with some power of discriminating between that which is taught with an intelligent aim and mere rote-work. Besides this special preparation, the work of an Inspector seems to us to require peculiar qualifications ; of which, patience, kindness, tact, and readiness of perception, are probably the most important. Even then, the work of examination is difficult, and, in large schools, laborious.

76. The mode of conducting the examination is chiefly by means of oral questioning. This plan possesses the double advantage of occupying less time and of being less severe upon the pupils than a written examination, for which, indeed, a very large proportion are too young. The questions put relate, in general, to the lessons previously given and recorded by the teachers, and such easy deductions from the knowledge thus gained as could be made by children who understood, in a reasonable degree, what they had been taught.

VIII.—FINANCE.

Appendix K.

77. The usual Statement, exhibiting, under the various heads, the receipts and expenditure during the year, is appended hereto. The large number of new schools established in the course of the year, and the various changes which have taken place in the staff of teachers, have caused a considerable augmentation in the necessary expenditure.

78. The item £3,266 18s. 10d., derived from the Church and School Estates Revenue was apportioned, in accordance with instructions received from the Government, equally between Public and Certified Denominational Schools.

79. The total amount of school fees received during the year was £34,109 13s. 6d. and this sum would doubtless have been exceeded had the season been of an ordinarily favourable character.

80. The returns furnished from all schools under our supervision disclose the fact that, during the past year, 8,289 children were instructed gratuitously. Through our Inspectors, inquiries were made in the course of the year in 211 Public Schools, respecting free scholars. Their reports embody the following statistics :—The total number of professed free scholars was 1,073. Of these, 737 were irregularly admitted by teachers on their own authority, 267 by order of the Local Boards, and 54 by special sanction of the Council. As far as the information at their command enabled the Inspectors to judge, they were of opinion that the exemption from payment was justifiable in the cases of 923 children, on the ground of their parents' poverty, though this plea was advanced by 1,037. In addition to the 1,073 children admitted gratuitously, 1,074 others professing to pay, were virtually free scholars, inasmuch as their parents, on various pretexts, withheld payment of school fees. In 947 cases, the plea of poverty was advanced as the reason for non-payment, and the Inspectors considered the plea valid with respect to 696. There can be little doubt that, with the return of favourable seasons and more prosperous times, the number of free scholars would be greatly diminished.

IX.—SUMMARY.

81. Summing up the preceding statements, we observe,—(1) that the means of education have received considerable extension during the period covered by this Report, 136 new schools having been opened in 1868; (2) that some advance has been made in supplying competent teachers, and in improving and testing the qualifications of those already appointed; (3) that the instruction of the pupils has been systematized, and that their proficiency has been advanced, though many defects yet remain to be corrected; (4) that while greater regularity of attendance has been secured to some extent, further inducements beyond those already in force are required to prevent the continued absence of children from school; and, (5) that the local supervision of schools greatly needs improvement, the official inspection being reasonably effective.

We submit this as our Report upon the Public Schools for the Year ending 31st December, 1868; and, in testimony thereof, we have caused our corporate Seal to be affixed hereto, this twenty-fourth day of March, one thousand eight hundred and sixty-nine.

APPENDIX G.

LIST of Books sanctioned by the Council of Education for use in Public and Denominational Schools, in accordance with the requirements of Article 15, section II, of the Regulations of 27th February, 1867 :—

First Book of Lessons.....	} Published by the Board of National Education in Ireland.
Second Book of Lessons.....	
Sequel No. 1 to the Second Book of Lessons	
Sequel No. 2 to the Second Book of Lessons	
Third Book of Lessons	
Fourth Book of Lessons.....	
Supplement to the Fourth Book of Lessons	
Australian Class Book, parts 1, 2, and 3 ; published by J. J. Moore, Sydney.	
First English Reading Book (in three parts)	} "Constable's Series"; published by J. Laurie, Edinburgh.
Second English Reading Book	
Third English Reading Book.....	
Fourth English Reading Book	
Fifth English Reading Book	

APPENDIX H.

COUNCIL OF EDUCATION.—EXAMINATION PAPERS FOR THIRD CLASS CERTIFICATE.

GRAMMAR.

Three hours allowed for this paper.

*"Whatever blooms in torrid tracts appear
Whose bright succession decks the varied year
Whatever sweets salute the northern sky
With vernal lives that blossom but to die
These here disporting own the kindred soil
Nor ask luxuriance from the planter's toil
While sea-born gales their gelid wings expand
To winnow fragrance round the smiling land."*

- Punctuate the above passage.
- Arrange it in simple prose order.
- Paraphrase it.
- Parse the words in Italics.
- Analyse the last six lines.

ARITHMETIC.

*Three hours allowed for this paper. Female teachers are required to answer the first four questions only ;
Males, the last four.*

- Divide £909000919 11s. into 7777 equal portions.
- How many 5½d. are contained in 503,308,506,002, 27-shilling pieces?
- If 5 oz. and 13 dwts. cost £31 13s. 7½d., what shall I give for 276 lbs. 3 oz. 19 grains?
- What interest would £950 gain in 15 months, if £1,440 gain £60 in 10 months?
- One fifth of a day's work is valued at 6½ shillings, what is the value of $\frac{2}{3}$ of a year's service?

GEOGRAPHY.

Three hours allowed for this paper.

- Give a description of the Rivers of Asia.
- Give a full account of Belgium.
- Describe the culminating points of the New South Wales Ranges, and, in full detail, one section of the dividing chain.
- Give a geographical account of the following productions :—Coffee, Tea, Sugar, Cotton, Currants, Palm Oil, Camphor, Tapioca, Rhubarb.

SCHOOL MANAGEMENT.

Three hours allowed for this paper.

In the first three lines of your answer give Specimens of the Copylines you employ.

- What lessons are best adapted for open classes, a gallery, or regularly arranged desks?
- Describe the appliances you would require and use for teaching children Monosyllabic Reading?
- The ability to give a lesson attractively and fluently is not sufficient to constitute a good teacher.
- How may Simultaneous Teaching be profitably used, and how may it be abused?

SCHOOL BOOKS.

Three hours allowed for this paper. Answer four questions only.

- Describe the contents of the Preface to the Australian Class Book No. 1.
- What errors do you discover in the Lesson—"The Four Points of the Sky," in the Second Book? How would you rectify them?

3. What is stated under the head of "Privations and Natural Defects." Sequel No. 2?
4. Give the substance of the Lesson "Manufacture of Silk." Third Book.
5. What compound words are used in the First Book I.N.B.?

WRITING.

Two hours allowed for this paper.

1. Give specimens of the Copy lines you employ.
2. What characteristics of good writing should be constantly impressed upon children?
3. Shew, as for a Programme, the gradations of writing you would present to a Second Class in its first quarter.

DOMESTIC ECONOMY.

Three hours allowed for this paper.

1. What ready methods are there of purifying water?
2. How is it that Soap, a fatty substance, tends to remove grease stains from clothing?
3. How would you choose a carpet?
4. How should the air in a sick room be kept pure?

VOCAL MUSIC.—TONIC SOL-FA METHOD.

Two hours are allowed for this paper.

1. Why are certain tones of the Scale called *strong*, and others *weak*? By what other terms are the weak tones sometimes distinguished?
2. What is a Tetrachord? Describe the twofold arrangement of the Tetrachords of the Scale, as, *a.* Disjunct, and *b.* Conjunct.
3. In Curwen's "Standard Course" the sixth of the Major Scale is called **Lah**. It is considered preferable to call it **Lay**. State the advantages that are gained by this alteration.
4. Explain the following divisions of the pulse:—

- | | | |
|--------------|----------------|--------------------|
| 1. a . a | 2. a , a , a | 3. a . a . a , a |
| 4. a . , a | 5. a , a | 6. . a , a |
| 7. a . , a | 8. a , a | |

5. Correct the rhythm of the following tune:—

	:	:	d		d	:	r	:	t		-d	:	r	:	m		m	:	f	;	m		-r	:	d	:	r	
	d	:	t	:	d		:	s	:	s		s	:	s	:	-f		m	:	f	:	f		f	:	f	:	-m
	r	:	m	:	f.m		r.d	:	m	:	-f		s	:	l.f	:	m		r	:	d	:	—					

DRAWING AND PERSPECTIVE.

Time allowed, two hours.

1. Name the different kinds of Drawing, and the uses to which they are applied.
2. Describe the proper position of the pupil for Drawing, and mode of holding the pencil.
3. Describe the use of construction lines.
4. Describe what is Aerial and what is Linear perspective.
5. In Linear perspective, what is the difference between Parallel and Angular perspective?
6. To what points do receding lines converge in both Parallel and Angular perspective?
7. Construct the Elementary Figure, and draw a square in Parallel perspective, marking all the lines and points with their initials.

EXAMINATION PAPERS FOR SECOND CLASS CERTIFICATE.

GRAMMAR.

Three hours allowed for this paper. Write down every question throughout, and give your answers in a full, clear hand.

[*Brother be warned and know that pride
How'er disguised in its own majesty
Is littleness that he who feels contempt
For any living thing hath faculties
Which he has never used The man whose eye
Is ever on himself doth look on one
The least of Nature's works] one who might move
The wise man to that scorn which wisdom
Holds unlawful ever*

- a. Punctuate the above passage.
- b. Arrange it in prose order.
- c. Paraphrase it.
- d. Parse the words in Italics.
- e. Analyse the passage in brackets.

ARITHMETIC.

ARITHMETIC.—(Males.)

Three hours allowed for this paper.

1. 22 square yards: 7 feet: $100\frac{3}{4}$ inches, at £2 1s. $3\frac{1}{4}$ d. per square yard. Practice: Work in two ways.
2. A canal $3\frac{1}{4}$ miles long, $60\frac{3}{8}$ feet wide, and $14\frac{1}{8}$ feet deep, is dug by 119 men in $4\frac{1}{8}$ years, working 10·5 hours daily. How long will it take 150 men to dig a canal $4\frac{1}{2}$ miles long, $19\frac{7}{8}$ feet wide, $12\frac{1}{8}$ deep, working 9·75 hours daily?
3. $\sqrt[3]{31\frac{1}{4}\frac{3}{8}}$.
4. A field whose sides are 380, 420, and 765 yards, is let for £2 15s. per acre. What is the annual rental?
5. The area of a square is 2. What is its side?

ARITHMETIC.—(Females.)

Three hours allowed for this paper.

1. A draper sells goods amounting to £1,900 15s., gaining at the rate of $6\frac{3}{4}$ d. in 2s.; what are his profits for the year, allowing £27 10s. 2d. for bad debts?
2. 43 lbs. 5 ozs. 12 dwts., at £1 0s. $6\frac{3}{4}$ d. per lb. Work in two ways.
3. If three-fifths of a house are worth £90 7s. $6\frac{1}{4}$ d., and improvements are made adding one-ninth to the value of the whole, what would one-eighth of the property be then worth?
4. $17\frac{1}{4}$ lbs. of coffee cost 25·875 shillings, how much may be bought for £3·646875?

GEOGRAPHY.

Four hours allowed for this paper.

1. Describe the Lake Regions of Europe.
2. Give a full account of the Basin of the Ganges.
3. Describe fully the Vegetation of South America—noticing particularly the Slopes of the Andes.
4. Give a description of the Land and Sea Breezes, shewing fully to what extent their influence modifies Australian climate.
5. Describe the principal Commercial Emporiiums of the Pacific.

ART OF TEACHING.

Three hours allowed for this paper.

1. What should be the demeanour and character of a teacher who would secure effective order in his school?
2. How do you provide—I. for classifying pupils judiciously; and, II., for maintaining equality of attainments in a Class?
3. Give notes of an Oral Lesson which is based upon the Analytic Method.
4. What tests do you apply in order to satisfy yourself that your instruction is soundly based?

LESSON BOOKS.

Three hours allowed for this paper.

1. What lessons of a Geological character occur in the Sequel Book?
2. What is said about "Salt," in the Third Book?
3. What are the distinctive features of Book IV?
4. What is stated relative to Superstitions in the Supplement to the Fourth Book?

WRITING.

Two hours allowed for this paper.

1. Give specimens of Copy lines in three hands.
2. What oral instruction in the Art of Writing do you give your pupils?
3. Write an Official Letter to the Council describing the organization of your school.

DOMESTIC ECONOMY.

Three hours allowed for this paper.

1. How may a good wife render her home attractive to her husband?
2. What are the most common modes of adulteration practised in daily food? State the evils which arise from the practice referred to.
3. What are the advantages of cold water bathing?
4. What differences are effected upon animal food in baking, as distinguished from roasting?

DRAWING.

1. What are the different kinds of drawing, and the uses to which they are applied?
2. What is the difference between *Geometrical* and *Perspective* drawings?
3. Describe the proper position of the pupil when drawing.
4. How do you give the appearance of solidity to objects in a drawing?
5. How or by what means would you represent concave, convex, or flat surfaces?
6. Draw in outline a table or any other object. Draw and shade a box with the lid open, a hat, or basin.

Questions

Questions in Perspective.

1. What is the derivation of the word perspective?
2. Define what is meant by aerial perspective, and linear perspective.
3. What is the difference between parallel and angular perspective?
4. Why do objects appear smaller as they recede from us?
5. To what points do receding lines converge in parallel, as well as in angular perspective?
6. Draw a chess board in parallel perspective, and a cube in angular perspective.

VOCAL MUSIC.—TONIC SOL-FA METHOD.

Two hours are allowed for this paper.

1. Describe the mental effects of the tones of the scale, and give the names by which those effects are usually known.
2. Explain the various kinds of measures and their notation; dividing them into *a.* Simple, *i.e.*, those containing one accent; and *b.* Compound, *i.e.*, those containing two or more accents.
3. The times denoted by $\frac{3}{2}$ and $\frac{3}{4}$ both contain six crotchets in a measure. Explain the difference in their rhythm, and their equivalents in the Tonic Sol-fa Notation.
4. Give the rules of finding the place of **Doh** in the staff, from the key signature at the commencement.
5. Translate the following tune into the established notation, the pulse being equal to a crotchet, 1st, in the key of F, 2nd, in the key of A.

$$\begin{array}{l}
 : d' \quad | \quad s : m \quad | \quad r : -.d \quad | \quad d : m \quad | \quad .s : l \quad | \quad d : d \quad | \quad f : -.m \\
 | \quad m : - \quad | \quad r : d' \quad | \quad s : m \quad | \quad r : -.d \quad | \quad d : m \quad | \quad s : l \quad | \quad d : m \quad | \quad r : -.d \\
 | \quad d : - \quad | \quad - : m \quad | \quad f : -.m \quad | \quad f : s \quad | \quad l : s \quad | \quad d' : l \quad | \quad s : m \quad | \quad r.m : s \\
 | \quad l : - \quad | \quad - : d' \quad | \quad s : m \quad | \quad r : -.d \quad | \quad d : m \quad | \quad \widehat{s} : l \quad | \quad d : m \quad | \quad r : -.d \\
 | \quad d : - \quad | \quad - \quad |
 \end{array}$$

ALGEBRA AND GEOMETRY.

Four hours allowed for this paper.

1. $\frac{8x + 5}{14} + \frac{7x - 3}{6x + 2} = \frac{4x + 6}{7}$.
 2. $\left. \begin{array}{l} xy = x + y \\ xz = 2(x + z) \\ yz = 3(y + z) \end{array} \right\}$
 3. By selling an article for £24, I lose as much per cent. as it cost me: what did I give originally?
 4. If from the ends of the side of a triangle, two straight lines be drawn to a point within the triangle, these two straight lines shall be less than the sides of the triangle, but shall contain a greater angle.
 5. If one side of a triangle be produced, the exterior angle is greater than either of the interior and opposite angles.
 6. In any right-angled triangle, the square described upon the side subtending the right angle, is equal to the squares described upon the sides containing the right angle.
- Exercise.*—Should the side of an isosceles triangle be extended beyond the vertex, the exterior angle thus formed is double of either of the angles at the base.

EXAMINATION PAPERS FOR FIRST-CLASS CERTIFICATE.

GRAMMAR.

Four hours allowed for this subject.

*This said he paused not but with venturous arm
 He plucked he tasted me damp horror chilled
 At such bold words vouched with a deed so bold
 But he thus overjoyed Oh fruit divine
 Sweet of thyself but much more sweet thus cropt
 Forbidden here it seems as only fit
 For gods yet able to make gods of men
 And why not gods of men since good the more
 Communicated more abundant grows
 The author not impaired but honored more
 Here happy creature fair angelic Eve
 Partake thou also though thou art
 Happier thou mayest be worthier canst not be*

- a.* Punctuate the above passage.
- b.* Arrange it in prose order.
- c.* Paraphrase it.
- d.* Parse the words italicised.
- e.* Analyse the whole.
- f.* Select the derivative words, and give their roots.

ARITHMETIC.

Three hours and a half allowed for this paper.

1. A quantity of tea is sold for 4s. 2d. per lb. The gain is 10 per cent., and the total gain £12. What is the quantity of tea?
 2. Prove that $\sqrt{3}$ is equal to $\frac{3}{2}$
 3. Required the sum of the infinite series $\frac{1}{3} + \frac{1}{9} + \frac{1}{27}$.
 4. X, Y and Z start equally from the same point, in the same direction, round a tract of land 73 miles in circumference. X's rate is 6 miles a day, Y's 10 miles, and Z's 16 miles. When will they be together again?
- Show the differences between an Arithmetical and a Geometrical Proportion.

GEOGRAPHY—PHYSICAL.

Three hours allowed for this paper.

1. Describe the Prairies of America fully.
2. Give a Description of the Tides.
3. How would you show that the advancement and the pursuits of a people must to a great extent depend upon the physical features of their country.
4. Give a full account of Persia.

GEOGRAPHY—DESCRIPTIVE.

Three hours allowed for this paper.

1. Give a full description of the western slope of N. S. Wales.
2. Describe the manufactures and vegetable productions of Hindostan.
3. Give a full account of Brazil
4. Describe how longitude is ascertained. State the difference of time between Sydney and the other Capitals of Australia.

PRINCIPLES OF TEACHING.

Four hours allowed for this subject.

1. Why is an enlarged course of instruction better suited to the necessities of a Nation than a contracted one?
2. Define precision, as you understand it when applied to a system of School Training; and shew how inaccurate habits may seriously prejudice the prospects of a pupil in any walk of his future life.
3. Describe the period of life at which the Perceptive Faculty is most active; shew how you would develop it, add the subjects you would employ.
4. What evils may accrue to indolent minds from the injudicious use of modern or improved methods of teaching?
5. Describe the whole course of an Object Lesson, as to a Fifth Class, on one of the following:—

“THE DIVING BELL.”
“LIGHT.”

SCHOOL BOOKS.

Three hours allowed for this paper.

1. Describe the contents of Section I., Fourth Book.
2. What lessons on Chemistry are given in the Supplement to the Fourth Book?
3. What lessons on Mechanics are given in the Fifth Book?
4. Describe the contents and the design of the Girl's Reading Book.

WRITING.

Two hours allowed for this paper.

1. Give specimens of all the writing you can teach.
2. What amount of parallelism or relationship exists between Drawing and Writing?
3. Describe the system of Writing advanced in “Morrison's School Management.”

DOMESTIC ECONOMY.

Three hours allowed for this paper.

1. Under what circumstances may presence of mind be valuable in a house?
2. What are the advantages and uses of Salt in the preparation of food?
3. What causes induce Husbands to frequent Taverns?
4. In choosing colours for clothing, what shades are desirable, and what objectionable? Explain why.

ENGLISH LITERATURE.

Three hours allowed for this paper.

1. Why has it been said that the advent of Chaucer constitutes an era in the English Language and Literature.
2. Describe the circumstances and writings which have principally contributed to the settlement of the English Language in its present form.
3. Describe what has been called the "Augustan Age" of English Literature.
4. In what terms does the author of the "Progress of Poetry" describe the Measures of Shakespeare and Dryden?

ALGEBRA.

Four hours allowed.

1. Reduce the following expressions to their simplest forms :—

$$\sqrt{a^3 + 2a^2b + ab^2}, \quad \sqrt{a^3 \sqrt{\frac{c}{a^2 b^2}}}, \quad \sqrt{\frac{\sqrt{10}-1}{\sqrt{10}+1}}$$

2. Solve the equation $ax^2 + bx + c = 0$.
3. Solve the equations $\sqrt{x+11} + \sqrt{x-9} = 10$.

$$\frac{x+4}{x-4} + \sqrt{\frac{x+4}{x-4}} = 12.$$

$$\frac{\sqrt{1+x} + \sqrt{1-x}}{\sqrt{1+x} - \sqrt{1-x}} = \frac{x}{a}.$$

4. Form the equation whose roots are $\frac{3 - \sqrt{5}}{2}, \frac{3 + \sqrt{5}}{2}$.

5. A number consists of three digits. The digits in the tens' place is 3, and that in the units' place is twice that in the hundreds' place. If the order of the digits be reversed, the number is increased by 198. Find the number.

GEOMETRY.

Three hours allowed for the paper.

1. Equiangular parallelograms which have their sides about the equal angles reciprocally proportional are equal.
2. Without assuming Book I, Prop. 32, prove that all the interior angles of any rectilineal figure, together with four right angles, are equal to twice as many right angles as the figure has sides.
3. What kind of triangles are the following, namely :—
 - I. When the sides are as the numbers 3, 4, 5.
 - II. Do. do. 2, 3, 4.
 - III. Do. do. 7, 8, 9.
 - IV. Do. do. 1, 2, 3.
4. Through a given point within a circle, draw the least possible chord.
5. Describe a circle which shall pass through a given point, and touch a given circle in a given point.

APPENDIX I.

ABSTRACT of Returns from Public, Provisional, and Half-time Schools, under the Council of Education.

Quarter ending—	Number of Children on the Rolls.									Average Daily Attendance.			Amount of School Fees paid.	
	Boys.	Girls.	Total.	C. E.	R. C.	Pres.	Wes.	Others.	Total.	Boys.	Girls.	Total.	£	s. d.

7. Inspector's Report upon Schools in the Maitland District.
8. Inspector's Report upon Schools in the Newcastle District.
9. Inspector's Report upon Schools in the Sydney District.

ALBURY DISTRICT.—GENERAL REPORT.

INSPECTOR'S REPORT on the Public, Provisional, and Certified Denominational Schools in the Albury District, for the year 1868.

During the months of January, February, and March I was in charge of the Bathurst District ; but, for several weeks of that time, I was suffering from a very severe attack of illness, which completely incapacitated me from performing my duty. From the same cause I was prevented completing my General Report for 1867, until March ; and then the time was too short to permit me to draw up that Report in so complete a form as I could have desired.

I arrived at my head quarters at the end of April, having, in the course of my journey, visited schools in both districts.

Since my arrival, I have, in obedience to the Council's instructions, visited the southern part of the Bathurst District, for the purpose of reporting upon applications for the establishment of schools at Cunningham and Calabash Creek.

In addition to the work of inspection, I have had to conduct examinations of teachers in different parts of the district.

The number of teachers examined during the year is as follows :—Twenty, in charge of schools ; five pupil or candidate pupil teachers ; and three, candidates in the Training and Model School—making a total of twenty-eight examined.

The distance travelled amounts to 2,555 miles.

The number of schools in this district at the close of the year was :—

Twenty Public Schools,
Six Provisional Schools, and
Seven Certified Denominational Schools—

making, in all, thirty-three schools in the district.

During the year the following have been opened :—

Four Public Schools, and
Six Provisional Schools—

making a total of ten schools opened.

The Public School at Wentworth was not open during the last quarter of the year, and was not therefore inspected. The Public School at Menindie was only opened in November, and therefore was not visited. The Public School at Black Range was, after my first visit, converted into a Provisional School, but as it has, in that character, been closed for want of a teacher, it is not included in the Appendix. The C. D. Church of England School at Mulwala was, in July, converted into a Provisional School ; and, under that head, is reported in the Appendix. The Provisional School at Moorwatha and the C. D. Church of England School at Tumut are not in operation.

The applications for a Public School at Lower Adelong and for a Provisional School at Teremiah have not yet resulted in the establishment of these schools. An application for the establishment of a Provisional School at Jereelderie has been reported on ; but at the close of the year no school had been opened in that township.

From the following places inquiry has been made concerning the establishment of schools ; but, at the close of 1868, no tangible results had been brought about :—Hay, Mullengandra, Piney Range, Jindera, and Major's Plains. At all these places schools are required, as they are also at Narrandera and other places on the Murrumbidgee. I hope next year will witness their establishment.

The main causes of the non-establishment of schools at these and at other places, are two : first, a difference of opinion amongst the people as to the kind of school required ; and, second, the difficulty of securing competent teachers—the latter in the case of Provisional Schools.

The number of schools inspected during the year, or rather that part of it spent in this district, has been as follows :—

Eighteen Public Schools,
Five Provisional Schools, and
Eight Certified Denominational Schools,

making, in all, thirty-one schools inspected.

Of these, eight—viz., five Public and three Certified Denominational—were inspected *twice* ; and the rest, *once* each.

The following table shows the kind of visit paid to each class of school.

Nature of Visit.	Class of School.			Total.
	Public.	Provisional.	Cert. Denom.	
For General and Regular Inspection	4	3	2	9
For Regular and Ordinary	5	0	3	8
For Regular	8	1	3	12
For Ordinary	1	1	0	2
For Inquiry only	0	2	0	2

Character of the Inspection.—The schools which received the General and Regular Inspection were, either new schools, or—in the case of the Certified Denominational Schools—those which had not been inspected before, or had been transferred to new buildings.

The

The Regular Inspections were made with the view of ascertaining, amongst other things, the attainments of the pupils. As the latter was the main object of inquiry, this kind of inspection necessitated the direct examination of all the pupils in the whole of the subjects taught; and it occupied the time of the Inspector one or more full days, according to the size of the school. Ordinary Inspections are paid for the purpose of seeing the schools in their every-day aspect. To this end, no notice of the Inspector's visit is sent; nor, in the school, does the Inspector take any share of the school work. His time is spent in observing minutely the method of teaching and the general management, for the purpose of afterwards pointing out to the teacher any defects in the organization, discipline, and instruction that may have been noticed.

Visits of Inquiry are for the object of reporting upon applications for the establishment of schools.

In addition to the above, Incidental Visits have been paid to those schools which lie in, or near, the routes of travel; these have necessarily been brief.

ORGANIZATION.

Sites.—With scarcely an exception, the sites of all the schools are, in every respect, suitable—especially of those recently erected. Gifts of land are sometimes offered by private individuals for new schools; but, as a rule, the Government "School Reserve" is to be preferred as a site.

Buildings.—Of Public Schools, two are very good; four are good; nine are very fair; and four are moderate. Of Provisional Schools, three are very fair; and four are fair. Of Certified Denominational, one is very good; five are fair; and two are used as churches and schools.

Out of twenty Public Schools, six only are vested; and eight only have residences. Of Provisional Schools, four have accommodation, though of a rough kind, for the teacher. Of Certified Denominational Schools, four have residences, but only one of these was originally built for that purpose.

Only half the Public Schools have inscriptions outside, and of these two are incorrect.

The ventilation of the building is too often defective, many of the windows only opening from the bottom.

I am glad to see the Vested Schools are on the increase, since these are always much superior to the others.

Play-grounds.—Of the Public Schools, five only have proper play-grounds; of the Provisional, only one is so provided; and the same may be said of the Certified Denominational Schools. There is, further, almost a total absence of sheds for the protection of the pupils out of doors; and it is very seldom that any attempt is made to plant trees in the space set apart for recreation.

Furniture and Apparatus.—Of the Public Schools, eight are very well provided in this respect; four very fairly, and six moderately so. Of Provisional Schools, one is tolerably well found; the rest have hardly any. Of Certified Denominational Schools, four are very fairly off; and four fairly.

A good many schools have no teachers' desks.

As regards apparatus, most of the schools have very fair stocks; and in a short time all will be supplied. But, on account of the very high rate of carriage, and the difficulty of transport, in the greater portion of this district, considerable delay has occurred in forwarding materials.

Books.—The last remark applies with equal force to these articles. In no instance, however, is the stock so small that the school-work is completely stopped for want of materials. In the greater number of instances, where the supply is small and incomplete, it is so only in articles of very common use and of a fragile nature, and the fault rests more with the teacher than any one else. I am glad to see a better description of copy-book coming into use. This is the only book the pupils are called upon to buy; but, unless proper care is taken by the teacher, a very inferior article will be purchased by some parents.

The Registers.—Statistical and Lesson, are now generally kept with a very fair degree of care, in the Public and Certified Denominational Schools. But, in the Provisional, they are by no means so well kept, owing in a great measure, to their novelty and number. A good deal of the Inspector's time is taken up at his first visit to these schools in explaining the nature and use of these documents.

DISCIPLINE.

Punctuality.—As regards this part of discipline there is still much to be desired, especially in the purely country schools; even after making all due allowances for the want of, as well as for incorrect, time-keepers. Every school ought to be furnished with a bell, so hung as to be heard a long way off. From the absence of such, I found, in two schools, common cattle-bells had to be used. A clock is a very useful thing after the pupils have come together; what is generally wanted is the means to summon them. A teacher who is himself of punctual habits, can, however, do much to secure the same conduct in his pupils, even without the appliances just named.

Regularity.—Irregularity of attendance militates, to a greater degree perhaps than anything else, against the general progress of the pupils. And while one is fully convinced of the chief causes of irregular attendance, the remedy for this evil is unfortunately, at present, beyond the power of application. Compulsory education, in some shape or another, appears, without doubt, to be the only cure. Still, a good deal may be done by the teacher, in conjunction with the Local Board, to mitigate the evil caused too often by the carelessness of the natural guardians of the pupils. The number of pupils in the schools at the dates of inspection was as under:—

Pupils.	Public.	Provisional.	Certified Denominational.	Total.
On the Rolls	1,105	140	373	1,618
Present	906	120	285	1,311

The proportion given above is not that usually known as the "Average Attendance," as, in these instances, the pupils were (so to speak) summoned to attend.

Cleanliness.—The Ordinary Inspections, being paid at unexpected times, are the best tests of this part of discipline. Taking the results given by these as fair specimens, I am glad to be able to speak in favourable terms of the schools. Of course there are degrees of cleanliness and neatness which vary with the personal habits of the teacher as a rule; but, having had no cause of complaint against either teacher or children—except on two occasions—as regards untidiness, I think the result may be considered very favourable. And this estimate must be understood to refer, not only to the state of the person and dress, but also to that of the room and its furniture. There is, however, one matter which, in too many instances, has been overlooked; and that is, the untidy way in which slates are cleaned.

Order.—In ten Public Schools the order was very good; in five, very fair; in three, tolerable. Of the Provisional Schools, three were in fair order; the rest, only tolerable. Of Certified Denominational Schools, three were in very fair; the others in tolerable order. The size and shape of the room and furniture have considerable influence upon the order, so that, in some of the schools just reported as inferior in this respect, the fault does not wholly rest with the teachers. In too many instances, however, there is an absence of *thoroughness* in the order, the minor points being almost entirely neglected. In a few cases also, the pupils were permitted to assemble and to be dismissed, outside the school, in a disorderly fashion.

Government.—

Government.—As an almost universal rule, physical force is only used in governing when all other means have failed, and it is extremely rare to find the government unduly harsh. The Punishment-books, which I believe to be trustworthy records, do not show that extreme measures have been adopted, except the offences have been very flagrant. This book, however, is not kept in about one-third of the schools.

INSTRUCTION.

Classification.—Three of the Public Schools have, in each, four classes; eleven have three in each, and four two only in each. Of Provisional Schools, four have three classes in each, two have two each, and the rest consist of one each only. Of the Certified Denominational Schools, one has four classes, the rest three, in each.

Two of the Public Schools have double departments, namely, Albury (Model), Primary and Infant Departments; and Wagga Wagga, which has separate departments for the boys and girls. All the other schools are of one department each.

The classification of the pupils is not in all cases based, as it should be, strictly on the "Standard of Proficiency." In a few instances, the wishes of the parents have been studied; in others, pupils are found in higher or lower classes than is right. No gross example of bad classification was, however, found; and, where errors and oversights had been brought to light by inspection, they were rectified at the time or immediately afterwards.

Subjects.—With the exceptions named below, all the prescribed subjects have been taught.

It will be seen that Special Religious Instruction is given in one school only—the Model School at Albury. Here, the clergymen of the Church of England and the Presbyterian denominations attend every week for this purpose. In the greater part of the district, however, it is impossible that, at present, this kind of teaching can be attempted, owing to the want of authorized instructors.

Drawing is practised in four Public Schools, on paper as well as slates. Needlework ought to be taught wherever the teacher is a married man; but, in the cases given below, it is not so taught. The chief cause of this is the absence of residences within convenient distance of the school.

Singing is not taught at	7	Public,	4	Provisional,	5	C. D. Schools;	total,	16
Drawing is not taught at	4	"	4	"	4	"	"	12
Object Lessons are not taught at	0	"	3	"	3	"	"	6
Needlework is not taught at	3	"	0	"	0	"	"	3

The Tonic Sol-fa System of singing is taught in three Public Schools only; Special Religious Instruction in one Public School only; *extra* subjects, such as Latin, Algebra, Book-keeping, &c., in three Public Schools.

Occupation.—"Time-tables" and "programmes" of lessons are found in all the Public and Certified Denominational Schools, with one exception. In Provisional Schools they are being introduced.

As regards the construction of these documents, I may state that, in general, a fair degree of care has been displayed by the teachers. But, in respect of appearance, these documents are not uniformly attractive. Printed forms are, however, coming into use; and, therefore, one may look for an improved style in this respect. Of the skill shown in the distribution of the time and lessons in these important documents, there is, of course, a marked difference in favour of the trained teacher. But, taken as a whole, these forms may be considered as showing signs of attention and effort on the part of the teacher. In the programmes, however, some of the subjects (*e. g.*, Writing and Arithmetic) are not set down in sufficient detail.

Method.—It is here that, in a very marked degree, the benefit derived from a course of training is made manifest. As the following table shows, the classification obtained by the majority of the teachers of this district is not very high; and, as the practical skill of the teacher determines, to a large extent, the position thus taken, it follows that more than one-half of those placed in charge of schools under my supervision have not yet reached even a fair position in this respect. Further, as oral teaching is the chief means used for conveying instruction, the difficulty of attaining skill in the "art of communicating" is enhanced. It is, however, pleasing to find those teachers who have not had the advantage of being trained endeavour, by study and practice, to improve themselves. Many of these have availed themselves of the liberality of the Council, in granting aid for the purchase of teachers' text-books, to secure manuals of method and school management. One general fault in the mode of teaching is the neglect of recapitulation of work at frequent and regular intervals; and, akin to this, is the lack of examination of pupils, both orally and otherwise, at stated times. Too much dependence is placed on the visit of the Inspector, as a means of ascertaining the state of attainments and the progress made. Teachers who desire their pupils should acquit themselves well at inspection, should not fail to exercise them in the art of correct and ready answering as often as possible. In all classes, written examinations should be resorted to; and, in the upper classes, these should take as wide a range as possible.

Classification of Teachers and Assistants in the Albury District.

Section of Class.	Class I.	Class II.	Class III.	Not Classed.
A.	13	...
B.	1	2	3	9
C.	7	...

Reading.—One-fifth of the pupils examined were classed as good, one-seventh as tolerable to moderate, the rest as fair to very fair.

A very common fault is an indistinct articulation. This may be traced, in a great degree, to the fault of the teachers in standing too near their pupils, and in constantly referring to the text book in the hands of the class during these lessons. By reversing these practices, I believe the enunciation of the pupils would be much improved. I also find the aspirate too often abused; and the names and uses of the marks of punctuation are not invariably known. Increased attention is being paid to the development of the meaning of the words and sentences read; but the cultivation of a good expression is too often neglected. Another common mistake is the neglect to teach with sufficient care the elements of this subject. It is a great mistake to suppose that it is lost or ill-spent time which is bestowed upon the junior pupils. The mode of holding the books is also open to objection in some schools.

Writing.—Of those examined, one-fourth are reported as good, an equal number as tolerable or moderate, and one-half as fair or very fair. Elsewhere I have noticed the improved style of copy-book coming into use. Before, however, the slate-writing can be reported as good or very fair throughout, more attention will have to be given to it in several schools. In forming the letters on paper, and especially in text-hand, there is a lack of evenness of thickness in the down strokes, which spoils the appearance of the copy. There is also, amongst the girls, too great a use of what is called the "ladies'" hand—small, angular, and too often illegible in its character. In teaching the elements, there is too little oral instruction and an insufficient use of the black-board. Occasionally too, the slates of the first class are not ruled or are improperly ruled.

Writing

Writing from *Dictation* is very fairly done in the majority of instances; but the revision of these exercises is not, in several schools, sufficiently rigid in character, and, as the consequence, very much of the benefit of the lesson is lost. The practice of writing from *Memory* is pretty generally adopted. It is, however, too often restricted to the reproduction of prose, and confined to the upper class or classes; while, as an exercise in composition, it does not take a high rank.

Arithmetic.—Of the pupils examined, about one-eighth passed as good, less than one-half as fair or very fair, and the remainder as tolerable or moderate. From this it is evident that this subject is not so well taught as it should be, or as some of the others are. And, as the only means provided for teaching it are the black-board and abacus, it is apparent that these are either not used or not well used. I believe a defective method of teaching to be the principal cause of this falling off. There is amongst the pupils a want of intelligent knowledge of its first principles, and a lack of readiness in the application of the same. The *rationale* of the work done can seldom be obtained, and, less often, readily and clearly. In slate-work, there is too frequently a want of neatness as well as expedition.

Notation, which is set relatively high in the "standard," requires much more attention in the majority of schools. *Mental Arithmetic* is also, in general, greatly neglected. I do not mean that it is not attempted, but that these attempts are unsystematic and feeble. I trust teachers will give much more attention to so important a branch of this subject during the new year.

Grammar.—One-fifth of those presented for examination passed as good, one-half as from fair to very fair, and the rest as tolerable or moderate. Coupling the acknowledged difficulty of teaching this subject with the fact of the low classification of many of the teachers, the results obtained may be regarded as fairly satisfactory. But, with increased opportunity of teaching, greater knowledge will be expected. There is frequently a very great degree of vagueness in the knowledge of the technical definitions, which is a fertile source of blundering in the higher stages of this subject. The knowledge of the higher branches—Analysis and Composition—is by no means great or general. In the Provisional, and in three of the Certified Denominational Schools, these branches are either untaught or nominally taught only.

Geography.—Out of the pupils examined in this subject, about one-fifth passed as good, one-fourth as tolerable to moderate, and the rest as fair or very fair. This subject being more easily taught and illustrated than the preceding one ought to have produced higher results. But, in several of the schools, there were either no maps or one or two only, at the date of inspection; and, with these means of learning absent, no other result could be expected in the majority of cases. The maps supplied are found to be excellent in design and execution. In the second class, where the rudiments are learned, the line of study laid down in the "standard" has not, in all cases, been strictly followed; and, in the higher classes, the knowledge acquired is too often superficial and unintelligent. Map-drawing is not so extensively practised as it should be. In six schools, however, it is done both on paper and slates.

Object Lessons.—Of the pupils examined, one-fourth passed as good, the bulk as fair or very fair, and one-ninth as tolerable or moderate. This, however, is to be regarded as referring to the acquisition of information on specified subjects, rather than taken as a proof of an extensive cultivation and development of all the intellectual powers of the pupils. To produce the latter result, requires, on the part of the teacher, considerable skill in method. The subjects chosen for these lessons do not always accord with those prescribed; but, in general, the variation is due to the want of suitable diagrams. The reproduction of these lessons in writing is attempted in many schools; but, regarded as an exercise in composition, with only moderate results.

Singing.—Of the pupils taught this subject, the same proportions passed as in the preceding one. Vocal music is not, in the great majority of the schools, taught by note; and, therefore, the numbers given in the table below must, for the most part, be taken to represent those singing by ear only. The "Tonic Sol-fa" notation has been introduced, at present, into three schools only; and, in these, the pupils are not far advanced. A few attempts have been made to teach by the old notation, but with only slight success. As has been stated, this subject is not attempted in sixteen schools; but I hope the number will be very greatly reduced before another Report shall be due.

Drawing.—Of those examined, one-sixth passed as good, one-twentieth as tolerable or moderate, and the majority as fair or very fair.

Although it is taught in a larger number of schools, yet fewer pupils learn it than the preceding subject. Slates are used, in practising, in almost all the schools. The authorized manuals on this subject are so good that a moderate degree of skill on the part of the teacher ought to ensure high results.

Scripture Lessons.—Of the pupils studying these (that is, those of the Third and Fourth Classes), one-half passed as good, one-sixth as tolerable to moderate, and the rest as fair or very fair.

Owing to the absence of books in new schools, the number of the pupils reading these lessons—namely, those in Public and Provisional Schools only—is not so large as it ought to be. In several schools, also, the books had only recently arrived. In a few schools, the pupils of the second class voluntarily took this subject. Greater prominence should be given to the New Testament Lessons.

Needlework.—I have already stated the number of schools where this subject was not taught as required. In all these, however, it is now begun, or is about to be. I am glad to say the Model School is distinguished—as it should be—for the quality of its needlework. The Public School at Moulamein is also to be highly spoken of in this respect; and, the more so, as excellence has here been attained under adverse circumstances. In both schools, as is generally the case, plain needlework very properly obtains the larger share of the attention of teachers and pupils.

The following is the Table of Attainments referred to in speaking of the several subjects of instruction :—

Subjects.	Good.	Fair to Very Fair.	Tolerable to Moderate.	Total.
Reading :—				
Monosyllables	68	408	141	617
Easy Narrative	86	226	17	329
Ordinary Prose	86	160	23	269
Writing :—				
On Slates only	99	291	205	595
On Paper	209	319	76	604
Arithmetic :—				
Simple Rules	46	494	359	899
Compound Rules	47	165	6	218
Higher Rules	59	33	0	92
Grammar :—				
Elementary	55	167	94	316
Advanced	80	136	80	296
Geography :—				
Elementary	78	142	98	318
Advanced	46	178	48	272
Object Lessons	272	658	122	1,052
Singing	199	452	88	739
Drawing	70	335	22	427
Scripture Lessons	132	86	40	258

CONCLUSION.

Having been placed in charge of this district for part of the year only, I am somewhat at a disadvantage in attempting an estimate—at any rate, from a comparative point of view—of the year's work. I believe, however, I am justified in saying that, considering the physical nature of the district, the scattered nature and the sparseness of the population, the work of education has made, and is making, fair progress.

The Teachers (as well as the schools) are placed, for the most part, at a disadvantage, from the causes just named; and hence, there is little opportunity for social intercourse and mutual professional benefit. One very powerful means for improvement is thus shut out from the majority of them. Of the manner in which they have done their work, often under considerable disadvantages, a very favourable opinion can, on the whole, be given; and their readiness to receive and act upon hints for the improvement of their schools merits the same degree of praise.

Of the manner in which the *Local Boards* have performed their duty, I am not in so good a position to judge as if I had been longer in the district. With the important exception of regular and frequent visitation of the schools under their supervision, the Members of these Boards have, however, shown considerable interest in the cause of Public Education.

J. COBURN,
Inspector of Schools, Albury District.

Albury, 27 January, 1869.

APPENDIX.

DETAILED Statement of the Condition of the Schools inspected.

PUBLIC SCHOOLS.

ALBURY (Model—Vested) :—Visited, 14th to 18th September.

Numbers present at inspection :—Boys, 113; girls, 86; total, 199.

To complete the organization, a play-shed and some desks for the infant department are required. The discipline throughout is very effective. With the exception of the Tonic Sol-fa System, all the prescribed subjects are taught; and, in addition, Latin, algebra, and book-keeping. The teaching is earnest and skilful, and the attainments are very satisfactory. The school is quite worthy of its name.

ADELONG (Non-vested) :—Visited, 3rd and 4th August.

Numbers present at inspection :—Boys, 46; girls, 19; total, 65.

A large room in the building formerly used as the Hospital is occupied by the school. The supply of furniture is insufficient; but, in other respects, the organization is very fair. The discipline is too lax, and the teaching-power weak. The method is crude; and the results obtained range, in general, from tolerable to fair. Singing and drawing are not taught.

ADELONG, UPPER (Vested) :—Visited, 5th August.

Numbers present at inspection :—Boys, 15; girls, 7; total, 22.

A very neat and well-furnished room has been occupied since July. The room and its contents are very neat. The discipline and organization are very good. The instruction is well regulated, and very creditable results have been obtained under somewhat unfavourable circumstances. Singing is not taught.

BALRANALD (Non-vested) :—Visited, 19th November.

Numbers present at inspection :—Boys, 13; girls, 11; total, 24.

The premises are incomplete, as regards residence, furniture, fences, and out-offices. The pupils are orderly, neat, and clean; and they attend regularly. In the general management there is a want of spirit. The attainments range from fair to very fair. Singing and needlework are not taught.

BOWNA (Non-vested) :—Visited, 2nd September.

Numbers present at inspection :—Boys, 16; girls, 12; total, 28.

The room is suitable; but the organization is incomplete, from want of furniture. The attendance is very fluctuating, owing to the proximity of a rival school. In the discipline and the method there is a want of life, on the teacher's part. The demeanour of the scholars is pleasing; and, considering the irregular attendance, very fair progress has been made. No singing is taught.

BUNGOWANNAH (Non-vested) :—Visited, 24th September.

Numbers present at inspection :—Boys, 18; girls, 11; total, 29.

The building—a Wesleyan Chapel—has recently been put into good repair, and furnished for teaching. There are, however, neither residence nor out-offices. The pupils are orderly and attentive; but their attendance is very irregular. The method is earnest and fairly skilful, and the general results are satisfactory.

DENILQUIN (Vested) :—Visited, 26th to 28th September.

Numbers present at inspection :—Boys, 43; girls, 18; total, 61.

The building has been repaired, at considerable expense; and the organization is almost complete. The discipline is uneven; but it is, on the whole, fairly satisfactory. The great majority of the pupils are very young. The method is quiet but effective. In the upper classes the attainments are generally satisfactory; but the lower classes require more direct teaching from the head master. Algebra is taught to a few.

EUSTON (Non-vested) :—Visited, 23rd November.

Numbers present at inspection :—Boys, 8; girls, 17; total, 25.

The building is suitable, but it is very scantily furnished; and is not provided with suitable out-offices. There is no residence attached. The discipline is very fair, and the pupils are very clean and neat in person and dress and regular in their attendance. The method is fairly skilful, and the attainments are satisfactory. Needlework is not taught.

GUNDAGAI (Vested) :—Visited, 20th and 21st July.

Numbers present at inspection :—Boys, 23 ; girls, 32 ; total, 55.

The school and residence are in need of repair, and new out-offices require to be built. In the matter of the classification of the pupils, the organization is faulty. Since the last inspection, another teacher has been appointed, and the attendance has greatly increased. The demeanour of the pupils is fairly satisfactory. There is a good prospect of success now offered.

HOWLONG (Non-vested) :—Visited, 23rd September.

Numbers present at inspection :—Boys, 24 ; girls, 16 ; total, 40.

A more suitable building is much needed. The organization is very fair, and the discipline is mild yet sufficiently firm. The instruction is in general well-regulated, and the attainments are reasonably satisfactory. Drawing is not taught.

LAKE ALBERT (Non-vested) :—Visited, 25th August.

Numbers present at inspection :—Boys, 16 ; girls, 17 ; total, 33.

The building is only a temporary one ; a contract has been entered into for putting up a Vested School. The organization is as good as the size and shape of the schoolroom and furniture permit. The discipline is too lax ; but the method is cheerful and very fairly intelligent. On the whole, the results are creditable.

MOAMA (Non-vested) :—Visited, 3rd November.

Numbers present at inspection :—Boys, 22 ; girls, 23 ; total, 45.

The room is too small to be well adapted for teaching in. The organization is good, and the pupils are kept in good order although there is too little drill. The method indicates that the teacher wants to be trained ; but, considering this drawback, the general results obtained are praiseworthy. Singing and drawing are not taught.

MOULAMEIN (Vested) :—Visited, 16th November.

Numbers present at inspection :—Boys, 16 ; girls, 13 ; total, 29.

A few minor repairs are necessary, and the inscription should be altered. The organization is good, and the discipline is effective—the pupils rendering a willing obedience. The instruction is well regulated, and the state of the attainments is reasonably satisfactory. Singing is not taught.

THURGOONA (Non-vested) :—Visited, 3rd September.

Numbers present at inspection :—Boys, 22 ; girls, 24 ; total, 46.

The building is quite unsuited to its present purpose. A new school and residence are, however, being built. Considering the size of the room and the rough nature of the furniture, the organization and discipline are worthy of great praise. The tone of the school is pleasing, and the state of the attainments is satisfactory.

TUMBABUMBA (Non-vested) :—Visited, 10th December.

Numbers present at inspection :—Boys, 12 ; girls, 11 ; total, 23.

The building is not well adapted to its present purpose—being small, and, in other respects, inconvenient ; efforts, however, have been made to build a better school, with a residence attached. The school has only been in operation a short time. The discipline is imperfect, the method fair, and the attainments range from tolerable to fair.

TUMUT (Non-vested) :—Visited, 27th July.

Numbers present at inspection :—Boys, 14 ; girls, 10 ; total, 24.

Since the inspection better premises have been taken and occupied. The organization is now good. The pupils are clean, neat, and very orderly. The instruction is well regulated, and the attainments are in a satisfactory state. There is, in the new building, every chance of success. Singing and drawing have not yet been taught.

WAGGA WAGGA (Vested) :—Visited, 12th to 14th August.

Numbers present at inspection :—Boys, 76 ; girls, 46 ; total, 122.

In both departments the organization is good, but the room occupied by the boys is much too small for the average number in attendance. Repairs, also, are required to the building. A new schoolroom for the boys is greatly needed. The discipline, in both departments, is good. Under the present teacher and assistant, the school has considerably improved, as regards numbers—and in other respects. The attainments are, in general, very satisfactory. Latin and algebra are taught to a few.

PROVISIONAL SCHOOLS.

BRUNGLE :—Visited, 30th July.

Numbers present at inspection :—Boys, 8 ; girls, 9 ; total, 17.

The building is moderately well suited to its purpose, and it is fairly fitted up. The teacher has only just taken charge. He seems to be painstaking and intelligent, but he has not been trained. Very fair discipline is kept. There is a reasonable prospect of success for the school.

COLLENDINA :—Visited, 4th December.

Numbers present at inspection :—Boys, 7 ; girls, 8 ; total, 15.

A neat wooden structure has just been put up ; but it is not quite completed. Proper furniture is much needed. The pupils are orderly and generally attentive, but not as the result of any particular system of government. The instruction is not skilfully given, and the attainments are very meagre.

GILMORE, UPPER :—Visited, 6th August.

Numbers present at inspection :—Boys, 13 ; girls, 12 ; total, 25.

The building is rather small ; but otherwise it is suitable. The shape and the position of the furniture are not good. The pupils are clean, and they are well-behaved. Considering the teacher has not been trained, and the school only opened a short time, the attainments are very creditable. An effort will be made to convert this into a Public School.

MULWALA :—Visited, 22nd October.

Numbers present at inspection :—Boys, 8 ; girls, 9 ; total, 17.

This school was reduced from a Certified Denominational (C.E.), on account of its small attendance. The building is a good one ; but there is hardly any furniture in it. The organization is very imperfect ; and the discipline is faulty, the manners of the pupils being rough. The method is defective ; the teacher was never trained ; and the attainments are only moderate.

TEN-MILE CREEK :—Visited, 12th December.

Numbers present at inspection :—Boys, 11 ; girls, 9 ; total, 20.

This school has been opened a few weeks only. The room is of fair size and shape, but the walls are out of order. The teacher is possessed of considerable intelligence, and is a fair disciplinarian. The tone of the school is pleasing.

URARA :—Visited, 28th August.

Numbers present at inspection :—Boys, 11 ; girls, 8 ; total, 19.

The room used at present is exceedingly small and inconvenient. The stock of books, &c., is sufficient, but furniture and apparatus are wanted. The teacher is new to this kind of work, but he is zealous and painstaking. The appearance and manners of the pupils are pleasing, but their attainments are moderate.

ARMIDALE DISTRICT.—INSPECTOR'S GENERAL REPORT FOR 1868.

THE early part of the year was occupied in my duties as Assistant Inspector of the Sydney District, and in others relating to the Goulburn District. On the 31st March the Armidale District was assigned to me ; but it was not till the 7th of May that I could begin the work of inspection proper, the mean time being occupied in clerical work and in removing my family to Armidale. The subsequent part of the year was distributed as follows :—Inspection of schools, 57 days ; travelling, 52 days ; special inquiries, 11 days ; clerical work, 66 days ; examination of teachers, 15 days ; Sundays (34) and holidays (4), 38 days.

At the close of the year 1867 there were 53 schools in operation—of which 31 were Public, 6 Provisional, 8 Church of England, 2 Roman Catholic, 4 Presbyterian, and 2 Wesleyan. During this year 4 Public and 10 Provisional Schools have been established ; the Wauchope Presbyterian School has become Public, and the Huntingdon one Provisional ; the Church of England Schools at Goonoo Goonoo and Gunnedah, and the Presbyterian one at Wallaby Hills, have been closed ; and the Public School at Rocky River, as well as the Roman Catholic one at Gunnedah, re-opened. Applications, also, for the establishment of a Public School at Swan Creek and of Provisional ones at Coldstream and Blackman's Point have been dealt with ; and others for Provisional Schools at Barraba, Carroll, Limestone Creek, Rocky Mouth, Sherwood, Sancroix, and Yarrowell, and for Half-time Schools at Wollumban and Beechworth, are under consideration. Inquiries have also been made throughout my district respecting the supply of the means of education. Visits have been paid to some places, and correspondence held with teachers about others where schools of some kind are wanting ; but the results in most instances have not been satisfactory, the usual replies to my inquiries being, either that the roads, particularly in the eastern river districts, are too impracticable, and the distances of families too great, or that parents are too poor, indifferent, or wanting in unanimity of action to render the establishment of schools possible. Whatever truth there may be in these alleged difficulties, I am disposed to think that in many instances they may be overcome in a year or two by the establishment of Half-time Schools, which appear at present to be little understood. As regards the plea of poverty, I think, also, that when people are really too poor to give money towards the erection of a schoolhouse, they may be induced to give its equivalent in materials, providing the Council is willing to supplement it by the usual amount of aid.

69 schools have been in operation, 55 the whole year, and the remaining 14 a few months only. Of these, 60 have been visited for purposes of inspection. The schools at Ashford, Yamba, Palmer's Channel, Gunnedah (R.C.), Violet Dale, and Wallaby Hills were not in existence when I visited their districts ; those at Bingera and Huntingdon were not visited for want of opportunity, nor that of Nowendoc because it was placed on my list of schools too late in the year. Several visits of an incidental character have also been made, some schools being visited two or three times, according as opportunity offered.

The character of the school sites has been estimated with special reference to their healthiness, freedom from floods, and accessibility to the bulk of the population. In the first particular, the sites of all the schools are suitable, and in the second only two are indifferently so. As regards their accessibility, 35 are good, and the remaining 25 tolerable to moderate ; but the latter are with few exceptions as well chosen as the physical circumstances of the eastern river districts will admit.

The schoolhouses, viewed in relation to the accommodation they afford, as well as to their appearance and material conditions, vary much in character—from the well-designed brick edifice at Uralla to the dilapidated slab hut at Woodford Dale. Of the 60 buildings inspected, 8 are of brick or stone, 33 of weatherboard, and 19 of slabs. In most respects, those of brick or stone are suitable ; but those of weatherboard, though generally affording the requisite accommodation, are somewhat defective in appearance and structure : some requiring fire-places, others an external coat of paint, and most of them lining inside—which last defect if remedied would give the schoolrooms a neater appearance, and add, moreover, to the convenience of the teacher in his orderly arrangement of the maps, diagrams, &c. With one exception, the slab structures are occupied as Public or Provisional Schools, and are in many instances very inferior.

45 teachers out of 60 are provided with residences, which are usually of the same varying character as that of the schoolhouses to which they are generally attached. Of these, 10 are good, 21 fair, and 14 moderate or indifferent, among which last there are some of a very wretched description. In general, the teachers keep their houses in fair tenantable order ; but very few attempt to set them off with trees or flowers.

Though all the schools in my district have more or less land available to the children for recreation, yet only 35 out of the 60 inspected have properly fenced-in playgrounds, and of these 9 require clearing of long grass, stumps, or fallen timber. In no instance can I point to a school whose playground is provided

provided with a weather-shed, which is really a desideratum in the north-eastern and western parts of my district; and there is only one case of a school being provided with a lavatory. The character of the out-offices in general is not pleasing, too many of them being defective in accommodation, arrangement, material condition, or cleanliness.

The Public Schools are in general adequately supplied with good furniture. In twenty-three of them the supply is good; in six fair; and in those of Wardell, Wauchope, Rocky River, Dondingalong, Tucki Tucki, and Woodford Dale, moderate. In several instances, however, the desks are not secured to the floor, and in three only are they placed on gradient platforms—which arrangement I consider to be well suited for securing effective teaching and discipline. In the Provisional and the Denominational Schools the character of the fittings as to their arrangement, quantity, and quality, is less satisfactory. Of the former, it is good in two, fair in three, and moderate in seven; and of the latter, good in three, fair in seven, and moderate in three.

As regards books and apparatus, the condition of all the schools has much improved during the year, there being now but few which have not a sufficiency of material appliances to meet existing requirements.

In three-fourths of the schools the records are kept with neatness and accuracy; in the rest, with varying degrees of inefficiency, arising more from neglect and carelessness than from ignorance.

The following tabular form exhibits the Material Condition of the Schools:—

	CLASSER OF SCHOOLS.																	
	Public.			Provisional.			Church of England.			Roman Catholic.			Presbyterian.			Wesleyan.		
	Good.	Fair.	Mode-rate.	Good.	Fair.	Mode-rate.	Good.	Fair.	Mode-rate.	Good.	Fair.	Mode-rate.	Good.	Fair.	Mode-rate.	Good.	Fair.	Mode-rate.

The punctuality of the attendance is in general fair. Where it is good or bad the prevailing tone of the school is usually of the same character. Where schools are located on the banks of creeks or rivers, it is usually faulty; but in some of these cases it might be much improved by teachers of energy, tact, and firmness of purpose. It appears to hold good in the schools of my district as it does in the schools of Sydney, that where teachers are popular with both pupils and their parents, more particularly so the pupils, the punctuality is satisfactory. The same remarks apply to the regularity of attendance, though with perhaps less force, the influences affecting it being to some extent peculiar. It appears from the school returns that 76 per cent. of the 4,134 pupils enrolled during the year, and 69 per cent. of the 3,176 during the last quarter of it, attended regularly; and I think that the mean of these two percentages may be taken as an estimate for a fair attendance, for in the best managed schools the percentage varies from 80 to 90, whilst in those of the worst description, from 50 to 60.

The following tables exhibit, for each class of schools, the numbers and ages both of the pupils on the roll and of those present on the day of inspection; also, the numbers and religious denominations of those on the roll during the last quarter of the year.

Numbers of Pupils enrolled on the day of examination:—

Schools.	Totals.		7 years and under.		8 years.		9 years.		10 years.		11 years.		12 years.

The condition of the schools, as regards cleanliness of appearance, is in general satisfactory, but is rather less so in point of neatness. A few of them exhibit both qualities in a high degree, and are valuable proofs of what painstaking teachers can achieve even amidst difficulties which less industrious and persevering ones consider impracticable. It is gratifying to state that there are only two or three schools particularly untidy, and in these the teachers are also untidy in their own persons, thus adding to the truth of the adage—"As is the teacher so is the school." The character of the schools in respect of both neatness and cleanliness may be stated thus:—Public—12 good, 18 fair, 5 moderate; Provisional—3 good, 2 fair, 5 moderate; Denominational—6 good, 4 fair, 3 moderate.

The discipline, though less satisfactory in respect of order than of cleanliness, is in a fair degree healthy. An apparent reason for this falling off is that some of the teachers have not had the advantages of training or of witnessing the working of efficient schools. Want of training, however, fails as an excuse for teachers neglecting to comply with the simple details of school management clearly defined in the Council's Regulations; it may excuse a teacher's ignorance of school technicalities, but not his negligence of the prescribed Time-table. The reason is, moreover, rendered somewhat nugatory by the case of those schools whose teachers, though untrained, are deserving of commendation for the pleasing tone of their discipline. My experience during the year has confirmed me in the opinion, that many teachers fail to reach that attainable high standard of discipline, by not perseveringly attending to its minor details. They seem either not to see clearly, or not to have an abiding consciousness of the important bearing such details have upon the results of their teaching and moral training of the pupils. This is more or less apparent in the school arrangements and the conduct of the pupils, defects in which particulars are not unfrequently passed unnoticed, for either the apparatus and furniture are not so conveniently and tastefully arranged, and the school operations so orderly and punctually conducted as they ought to be, or the pupils not sufficiently orderly in their movements and attitudes, diligent in their work, and polite in their manners. As regards discipline, the schools may be arranged as follows:—

Public	10 good, 19 fair, 5 moderate.
Provisional	2 " 4 " 5 "
Denominational	4 " 7 " 2 "

The classification of the pupils, in accordance with their intelligence and attainments, and the standard of proficiency, is carried out with fair success in most of the schools. Fair, however, is too low an estimate for a matter of such importance, and one that might be characterized as good if teachers would but exercise more patience, judgment, and firmness. In still too many schools are the classes fruitlessly cut up into sections, and the pupils too hastily removed from one to the other. Instances sometimes occur where the first class consists of three sections, and the second class of two, thus making, with the third class six divisions, to each of which the teacher is supposed to give equal shares of his attention; but I have reason to think that the share which falls to the lowest sections is small indeed. In some schools again there seems to be an unwise anxiety on the part of the teachers to regard babies as boys, and boys as youths. This is shown in the tender years of some of the pupils in the higher classes, where they have been placed for mere mechanical proficiency in one subject or another. For example, I have seen two children of five and six years of age reading the Fourth Book, in company with boys of eleven and thirteen years of age, and when questioned on the subject matter they displayed a total ignorance of the commonest terms. Such an example is an extreme one, but it serves to show how far a teacher's judgment may err in a matter of such importance. The hasty removal of children from class to class is moreover unwise in this respect; it serves to mislead parents as to the real capabilities of their children, who, in consequence, are taken from school earlier than is prudent, both as regards their prospects in life and the educational prospects of the next generation. The character of the schools, in respect of classification, is as follows:—

Public	10 good, 18 fair, 5 moderate.
Provisional	0 " 6 " 4 "
Denominational	2 " 7 " 4 "

As regards the subjects of instruction, Reading, Writing, and Arithmetic are taught in all the schools, Grammar and Geography in all but one. The other prescribed subjects do not receive the same amount of attention, owing either to the negligence of some teachers, in respect of the Object Lessons and Scripture Lessons, to alleged want of capacity of others in singing and drawing, or to the unmarried condition of others as regards sewing. The number of schools in which these subjects are not taught may be shown as follows:—Object Lessons, 8; Singing, 27; Drawing, 15; Scripture Lessons, 8; and Sewing, 12. Of the extra subjects, Geometry is taught in three schools, Latin in two, and Algebra in one.

Except in four instances the instruction is regulated by the prescribed forms of time table and programme of lesson, and, except in twelve, it is registered daily, in two of which it is registered monthly, and in one weekly. The time table is an index of the teacher's ability of regulating the business of his school, and requires in its construction the exercise of patience and good judgment. There are, however, comparatively few good time tables in the schools of my district, those that are defective showing either that the work of the school does not move smoothly or quietly, that each class is not profitably occupied, and does not receive during the day its due amount of direct instruction from the teacher, or that each subject of instruction does not receive that degree of attention due to its importance. In the construction of programmes, however, the teachers in general are more successful, those who fail, doing so by using dots or ditto's in lieu of systematising the course of instruction under the heads more particularly of Arithmetic, Grammar, Geography, and Object Lessons. As far as I have had opportunities of judging, these documents appear to be faithfully observed, except in a few instances where I have visited schools incidentally, I have found the teachers not strictly adhering to the time table. There is one defect, however, I desire to direct particular attention to, and that is, that teachers, in too many instances, do not exercise sufficient taste in framing, or care in preserving them. The character of these documents in the various schools is shown as follows:—

Public	10 good, 17 fair, 7 moderate.
Provisional	0 " 4 " 4 "
Denominational	1 " 10 " 1 "

The

The character of the instruction is the least satisfactory feature of the schools in my district. The results of the examination show that there are too many children possessing but a moderate and even small proficiency in the subjects taught. The defect is no doubt due in some measure to the irregularity of the attendance, but more particularly to defects in the teaching. There are obvious signs that the lower classes have not received their due share of the teacher's attention; and that the teaching in the upper classes has been mechanical and ineffective. The attention of the children in general is fair; but the answering is, in many instances, partial and defective in intelligence, being sometimes even wild. The character of the teaching has shown itself, also, in the lessons given before me by the teachers. Too many of them have been defective in matter and method,—in the matter as regards its fulness and arrangement, and in the method as regards the teacher's powers of sustaining the undivided attention of his pupils, and of presenting to them a clear, practical, or scientific view of the subject in hand, with a due regard to the exercise of their faculties of observation and understanding. Though it is true that several teachers have not been trained to their profession, yet the examples of a few of them convince me that if the rest would but prepare their lessons, and study more the few excellent treatises on school management, they would, by the exercise of energy and perseverance, achieve higher results in their schools.

The quality of the reading in one-half of the schools varies from fair to tolerable; and in the other half from moderate to small. I have heard very few examples of intelligent and expressive reading—few teachers seeming to aim at higher results than fluency and correctness of pronunciation. Where the reading is fluent it is frequently defective as regards clearness, sharpness, and neatness of articulation, and sentence after sentence is read with little regard to pause, emphasis, or modulation. These defects more or less characterize the reading in all the schools, and will continue to do so until teachers give greater attention to it in the lower classes, and treat it more as an art than a mere exercise,—as an art requiring for its cultivation not only practice, but judicious instruction and the presentation of good models. The pupils in general pass a creditable examination in oral spelling; but they display but a moderate acquaintance with the meaning of words, or with the subject matter of the reading lessons. The character of the reading in all the schools may be stated as follows:—

Public	21	fair to tolerable,	14	moderate to small.
Provisional	4	"	6	"
Denominational	5	"	8	"

The writing is fairly satisfactory, being good in ten schools, fair in thirty-seven, and moderate or indifferent in eleven. As a rule, both teachers and parents attach more importance to this subject of instruction than they do to any other. With a few exceptions, where blank books are used, copy-books with head-lines are used in the upper classes of all schools; but there are instances here and there where pupils are unprovided with them on account of the poverty or indifference of their parents. Teachers in many instances have complained to me of the difficulty of procuring good copy-books, those to be obtained at country stores being both high in price and at the same time of an inferior description. In the lower classes slates are used; but they are not always ruled with indelible lines, as they ought to be. The individual method of teaching writing is the one that prevails in most schools—few teachers appearing to understand the advantages or the method of teaching it collectively, by setting progressive copies on the blackboard and accompanying them at intervals by remarks of an explanatory character. As in the reading, so in the writing—the lower classes receive less attention than the upper. This is not only unjust, but unwise, inasmuch as teachers entail upon themselves the trouble of eradicating (if they can do so) the careless habits in the latter that have been contracted in the former. Another mode of teaching writing is by the dictation lesson, which is also the most effective mode of teaching spelling as well, as means of cultivating the intelligence of children; for I have invariably found proficiency in this subject accompanied by proficiency in others. But it is of little advantage to the teacher if he does not correct the mistakes in spelling and writing, which few teachers appear to do, judging from the moderate results of the examination in this particular. In consideration, however, of teachers having to supervise the work of three classes, I have recommended them to occasionally vary the form of the lesson, by allowing the children to write from memory what has been given them to learn at home during the week—such as short interesting stories or pieces of poetry, the names of articles of food, dress, or household furniture, garden produce, implements, or operations, &c.; for experience proves that such exercises are not only interesting to children, but are also instrumental in awakening their intelligence and forming in them habits of observation and inquiry. The character of the writing in all the schools is as follows:—

Public	5	good,	27	fair,	3	moderate or bad.
Provisional	3	"	2	"	5	"
Denominational	2	"	8	"	3	"

With a view of testing the soundness of the teaching in arithmetic, I have invariably dictated questions of a simple practical character, in addition to others of a more routine description; and where I have found classes in the higher rules, I have taken them back to the more elementary ones, and proceeded upwards till I found it useless to proceed farther. I may remark, also, that all the classes have been examined in notation and numeration. The results of the examinations prove that the teaching is neither sufficiently practical nor effective: for in one school only is it good, and in fifteen fair, whilst in forty-two it varies from moderate to indifferent. They also prove that it is neglected in the lower classes, where it ought to be more efficient, and which neglect accounts for the failures in the upper. Notation is taught with fair success in the better class of schools; but only indifferently in those of inferior description, in which I have not unfrequently found third class pupils unable to write correctly numbers of three or four figures. In the third classes of thirty-three schools I find that 26 per cent. of the pupils failed in writing 1010 correctly, 46 per cent. 10,050, and 70 per cent. 1,070,006. As regards slate arithmetic, the teaching in most of the schools is neither rational nor practical. The memory is cultivated at the expense of the understanding, rules taking precedence of first principles, and the abstract of the concrete. Teachers also fail to apply the rules they teach, by not giving their pupils sufficient practice in calculation relating either to the school or play-ground, home or store, farm or station; for I have found fourth class pupils working sums in fractions, 60 per cent. of whom failed to solve an ordinary question involving compound addition and subtraction; and of the third class children, in eighteen schools, 89 per cent. failed to solve a question involving simple subtraction and addition. Again, in the third class of ten schools, 79 per cent. of the pupils failed to solve a question in subtraction where the lesser number was placed above the greater; and other examples might be adduced to show how little the intelligence of the children is exercised. The character of the arithmetic in all the schools is as follows:—

Public	1	good,	12	fair,	22	moderate.
Provisional		"	2	"	8	"
Denominational		"	1	"	12	"

Grammar is taught in all the schools but one, with degrees of efficiency varying from fair to failure. It receives greater attention in Public Schools than it does in Provisional or Denominational. Similar defects characterize the teaching of it as of arithmetic. It is not made sufficiently subservient to securing intelligent writing or reading, for I have frequently found third class children unable to point out the relations of such words as relative pronouns, prepositions, or participles. In the second, and even third class, children not unfrequently give correct definitions of the parts of speech, but fail to give examples of them—a common error being for children to present you with a slate, book, or pencil as examples of a noun, which they had just previously described as a name. Want of precision in the teaching

is also shown in the defects that characterize the spelling of grammatical terms. Analysis, though so valuable as a means of securing intelligent reading, does not receive that attention it deserves, few teachers appearing to deal with it practically and effectively. Except in a few Provisional and Denominational Schools, composition is taught with fair success; but I think that the exercises in it might be made more practical by giving the elder pupils more practice in writing letters, bills, receipts, and descriptions of matters of juvenile local interest. The condition of the schools, as regards the instruction in grammar, is as follows:—

Public.....	1 good, 13 fair, 21 moderate.
Provisional.....	2 " 7 "
Denominational.....	2 " 11 "

Geography is taught in all the schools but one; fairly in twenty-one; and moderately or indifferently in the rest. I must remark, however, that it is taught satisfactorily in the third classes of a few schools, but not so in the second, on which account I have been able to describe such schools as good in this particular. I must remark also, that the teachers of Provisional and Denominational Schools teach it less effectively than those of Public Schools. The second classes in general have but a moderate knowledge of their own localities, and but vague notions of the uses of maps, few teachers appearing to follow the effective method of drawing on the blackboard and explaining plans of the school or surrounding country. The third classes also give evidence of defective teaching, for they frequently show signs of inability to answer questions without wistfully glancing at the map, and display a better knowledge of distant countries than of their own. Exercises in map drawing from sight or from memory are given in very few schools, which is to be regretted, on account of the beneficial effects they have upon the minds of children. The character of the instruction in geography as given in the various schools is as follows:—

Public.....	17 fair, 18 moderate.
Provisional.....	2 " 7 "
Denominational.....	2 " 11 "

Object Lessons receive tolerable attention in most of the schools, but only so far as the communication of information is concerned, for many of the teachers have not a clear apprehension of their utility as means of cultivating the intelligence of children, or of training them to habits of observation and inquiry. The object lesson proper is given in few schools, those usually given being either picture lessons or lessons on some remote object that appeals more to the mental vision of the pupils than to their perceptive faculties. Pictures are useful and even sometimes necessary, but they are after all mere substitutes for real objects, with which they are unable to compete in commanding the interest, attention, and mental activity of children. Many teachers also fail in the proper mode of giving the lessons, whether they be on pictures or remote objects; for they either show a feeble command of their subject and want of energy and liveliness in their manner, or they fail to give that due admixture of questioning, explanation, and illustration the lesson requires in order to be effective. The character of the instruction in object lessons as given in the various schools is as follows:—

Public.....	20 fair, 12 moderate, 3 failure.
Provisional.....	3 " 3 " 4 "
Denominational.....	5 " 7 " 1 "

Singing is practised in thirty-one schools, in eight of which it is taught from musical notation. With a few commendable exceptions, the proficiency attained in this subject is nominal. Some teachers, failing to appreciate its high importance as a humanising agency, pay little attention to it; while others, who appear to be anxious to introduce it into their schools, offer the feeble excuse that they are unable to teach it for want of an ear for music, thus assisting to perpetuate a fallacy which they ought to feel professionally bound to ignore. I feel it desirable also to mention, that a few teachers are under the impression that third class teachers are not expected to teach music, because it is not an essential subject in their own examinations. The character of the singing in the various schools is as follows:—

Public.....	5 fair, 16 moderate, 14 failure.
Provisional.....	3 " 7 "
Denominational.....	3 " 4 " 6 "

Drawing is taught with average tolerable efficiency in forty-two schools, many teachers of which testify that their pupils in general manifest a lively interest in its exercise, which fact alone renders it a matter of regret that it is not taught in the schools generally. Similar remarks apply to this subject as to singing, as regards the excuses of teachers not teaching it. The character of the drawing in the various schools is as follows:—

Public.....	3 good, 18 fair, 6 moderate, 8 failure.
Provisional.....	1 " 2 " 7 "
Denominational.....	2 " 5 " 5 " 1 "

Sewing is taught in four-fifths of the schools with average tolerable efficiency; the remaining one-fifth of them being in charge of unmarried male teachers. The time devoted to it is from three to six hours a week. The needlework exhibited in some of the schools was of a plain and useful character, whilst in others it consisted chiefly of bead or wool mats, book-marks, crochet, and other work of a fancy description. As far as I could judge from the specimens of sewing, and the replies of teachers to my inquiries, the teaching appeared to be defective in not being sufficiently systematic. The character of the sewing in the various schools is as follows:—

Public.....	3 good, 19 fair, 11 moderate, 2 failure.
Provisional.....	2 " 1 " 7 "
Denominational.....	6 " 4 " 3 "

The number of teachers exclusive of six pupil teachers employed in the schools was seventy-one, distributed and classified as follows:—

	Classes I.		II.		III.		Probationary.
	A.	B.	A.	B.	A.	B.	
Public.....	2	1	1	17	8	6	6
Provisional.....				2	2		13
Denominational.....			2	1	4	4	1

The incomes of teachers are derived from two sources: from the Council, in the form of fixed salaries regulated according to classification, and from the school fees of the pupils, which are regulated in many instances by the School Boards with the sanction of the Council. The maximum average and minimum incomes of those teachers whose schools have been open the whole year, may be shown as follows:—

	Maximum.			Average.			Minimum.		
	£	s.	d.	£	s.	d.	£	s.	d.
Public.....	243	6	10	117	10	9	66	0	0
Provisional.....	85	10	0	54	4	0	40	0	6
Denominational.....	179	5	2	114	17	8	78	12	0

Many

Many of the teachers complain greatly of the inadequacy of their incomes; some alleging that they find it impossible to keep out of debt, even in providing themselves and their families with the necessaries of life. They complain that the school fees are not only low and precarious, but that some parents will not pay in accordance with their means, and that others will only pay in produce, which they rate higher than its market value; and they further complain of receiving no allowance in consideration of the high prices of goods, which, on account of high rates of land carriage, are 50 or 100 per cent. in advance of those current in Sydney.

In general the teachers are persons of good moral character. I found them courteous, willing to receive recommendations, and ever ready to facilitate the discharge of my duties. With few exceptions they evince an earnest desire to discharge their duties to the best of their abilities.

Except in a few commendable instances, the local supervision is nominal, many teachers complaining that the members of Local Boards rarely visit their schools, or hold meetings for the consideration of matters affecting the welfare of them.

J. S. JONES,
Inspector of Armidale District.

ARMIDALE DISTRICT.

DETAILED Statement of the Condition of Public Schools inspected in 1868.

ARMIDALE :—Visited, 1st and 2nd September, 1868.

Numbers at the examination :—Boys, 61 ; girls, 56 ; total, 117.

1. The building is, on the whole, in good condition. The schoolroom is well furnished, but is too small for the numbers in attendance. Accommodation for boarders is needed. The organization is good. 2. The moral character of the school is good. 3. The prescribed subjects are taught; the teaching is painstaking and well regulated, and the methods are applied with intelligence and effect. 4. The average proficiency and mental culture of the pupils are fair.

BALLINA :—Visited, 10th November, 1868.

This school was temporarily closed when I visited the district.

1. Repairs to the schoolhouse and fence are needed; otherwise, the organization is fairly satisfactory. 2. As regards neatness and cleanliness, the appearance of the schoolroom is not satisfactory. 3. The prescribed subjects are taught, except singing, and the lesson documents fairly arranged.

BENDEMEER :—Visited, 10th and 11th June, 1868.

Numbers at the examination :—Boys, 16 ; girls, 16 ; total, 32.

1. The material condition of the building is good, but the schoolroom is rather small, and the out-offices not decently arranged. The supply of furniture and apparatus is adequate. The organization is fair. 2. The moral character of the school is, in general, pleasing. 3. The prescribed subjects are taught, and the lesson documents and classification carefully arranged. The teaching is tolerably intelligent, but is wanting in energy and vivacity. 4. The proficiency of the first class is moderate; that of the second and third classes, tolerable.

BINGERA :—

This school was not visited for want of opportunity.

CASINO :—Visited, 27th November, 1868.

Numbers at the examination :—Boys, 27 ; girls, 26 ; total, 53.

1. Repairs are needed to the roof; otherwise, the material condition of the building is satisfactory. The organization is fair. 2. The moral character of the school is passable. 3. The prescribed subjects are taught with tolerable skill, but the classification is defective, and the teaching not equally distributed. 4. The proficiency of the pupils ranges from small to very fair.

CHATSWORTH ISLAND :—Visited, 13th October, 1868.

Numbers at the examination :—Boys, 11 ; girls, 32 ; total, 43.

1. The buildings have been recently erected, and are suitable in design and accommodation. The school is well furnished, and adequately supplied with apparatus. The organization is good. 2. The moral character of the school is pleasing. 3. The prescribed course of instruction is followed, and regulated with fair skill. The teaching is painstaking, and fairly effective. 4. The attainments of the pupils are reasonably satisfactory.

DONDINGALLONG :—Visited, 8th December, 1868.

Numbers at the examination :—Boys, 3 ; girls, 5 ; total, 8.

1. The building is unsuitable, being a small, low slab hut, badly lighted and furnished. The playground is not enclosed, and the out-office is in bad condition. The organization is indifferent. 2. The pupils are irregular in their attendance, and the discipline is somewhat injudicious; otherwise, the moral aspect of the school is fairly satisfactory. 3. With the exception of singing, drawing, and object lessons, the prescribed subjects are taught. The instruction is tolerably well regulated, but is deficient in earnestness and intelligence. 4. The attainments and mental culture of the pupils are but moderate.

EUROKA :—Visited, 10th December, 1868.

Numbers at the examination :—Boys, 18 ; girls, 16 ; total, 34.

1. The schoolhouse and residence need painting, the playground clearing of fallen timber, and the out-offices arranging more suitably; otherwise, the organization is tolerable. 2. The moral aspect of the school is pleasing. 3. The prescribed subjects are taught, except singing. The lesson documents and classification are arranged with fair skill, and the teaching is painstaking and tolerably effective. 4. The general proficiency of the pupils is tolerably satisfactory.

NORTH GRAFTON :—Visited, 21st and 22nd September, 1868.

Numbers at the examination :—Boys, 64 ; girls, 53 ; total, 117.

1. The material condition of the schoolhouse and residence is unsatisfactory. The schoolroom is too small, and, moreover, badly lighted and ventilated; the playground is not fenced in, and the out-offices are not suitably arranged. There is a good supply of working materials, but the furniture, though sufficient, is in keeping with the school building. 2. The discipline is defective in minor details; otherwise, the moral aspect of the school is healthy and fairly satisfactory. 3. The prescribed subjects are taught, and the lesson documents are arranged with intelligence, but the classification is somewhat defective. The teaching is painstaking, and fairly effective. 4. The proficiency of the pupils ranges from moderate to fair.

NORTH GRAFTON (Infants) :—Visited, 25th December, 1868.

Numbers at the examination :—Boys, 25 ; girls, 13 ; total, 38.

1. The schoolroom is suitable, but not sufficiently clean and orderly; the organization in other respects is fair. 2. The moral character of the school is fair. 3. The instruction is suitable, intelligently regulated, and tolerably effective. 4. The average proficiency of the pupils is tolerable.

SOUTH

SOUTH GRAFTON :—Visited, 23rd September, 1868.

Numbers at the examination :—Boys, 32 ; girls, 18 ; total, 50.

1. The building is small, and its material condition is not sufficiently satisfactory. The organization is, in other respects, tolerable. 2. The pupils are irregular in their attendance ; otherwise, the moral character of the school is pleasing. 3. The prescribed course of instruction is followed, and intelligently regulated ; and the teaching is painstaking and tolerably skilful. 4. The proficiency of the pupils is tolerable.

GUNDARIMBA :—Visited, 4th November, 1868.

Numbers at the examination :—Boys, 16 ; girls, 18 ; total, 34.

1. The building is too small, and also defective in structure ; the organization in other respects is passable. 2. The moral character of the school is, on the whole, pleasing. 3. The prescribed subjects are taught, except object lessons, singing, drawing, sewing, and the Scripture lessons. The classification is judicious, but the teaching, though fairly intelligent, is not properly regulated, there being no programmes or registers of lessons. 4. Considering the ages of the pupils, and the recent establishment of the school, the attainments and mental culture, though barely tolerable, are reasonably satisfactory.

INVERELL :—Visited, 24th June, 1868.

Numbers at the examination :—Boys, 23 ; girls, 9 ; total, 32.

1. Repairs to the schoolhouse and residence are needed ; otherwise the organization is fair. 2. The moral character of the school is tolerably satisfactory. 3. The prescribed subjects are taught, except drawing and singing. The instruction is imparted with fair skill, but with lack of animation and energy. 4. The average proficiency of the pupils is fair.

KELLY'S PLAINS :—Visited, 7th May, 1868.

Numbers at the examination :—Boys, 14 ; girls, 18 ; total, 32.

1. The schoolhouse and residence are in fair material condition, but the play-ground needs fencing and clearing. The difficulty of procuring water is greatly felt by the teacher. The inscription "Public School," has not yet been placed over the door of the schoolhouse. In other respects the organization is fair. 2. The general appearance and behaviour of the pupils are creditable, but the character of the attendance is unsatisfactory. The moral tone of the school is, in general, fair. 3. The prescribed subjects are taught, except the Scripture lessons. The lesson documents and classification are fairly arranged, and the teaching is characterized by industry, energy, and tolerable ability. 4. The proficiency of the pupils is tolerable.

WEST KEMPSEY :—Visited, 8th December, 1868.

Numbers at the examination :—Boys, 27 ; girls, 21 ; total, 48.

1. The material condition of the buildings, and the supply of material appliances, are fairly satisfactory. The arrangement of the out-offices is defective. The organization is fair. 2. As regards the attendance, appearance, and behaviour of the pupils, the moral character of the school is fair. The movements of the pupils require to be more strictly regulated. 3. The prescribed subjects are taught with fair skill and efficiency. 4. The attainments and mental culture of the pupils are fair.

LISMORE :—Visited, 23rd and 24th November, 1868.

Numbers at the examination :—Boys, 14 ; girls, 20 ; total, 34.

1. This school is in good material condition, and is well found in furniture and apparatus. The organization is good. 2. The discipline is lax, and the character of the pupils for politeness of manners and diligence is only moderately satisfactory. The school operations are conducted with insufficient order and punctuality. The moral character of the school is not pleasing. 3. The prescribed subjects are taught ; the classification is on the whole judicious, and the lesson documents are constructed with fair skill, but do not appear to be punctually followed. There is a lack of earnestness, energy, and animation in the teaching. 4. The general proficiency and mental culture of the lower classes are moderate, and of the third class, fair.

MACLEAN :—Visited, 14th October, 1868.

Numbers at the examination :—Boys, 18 ; girls, 14 ; total, 32.

1. The school building needs painting ; otherwise, its material condition is good. The schoolroom is too small, and is, moreover, badly ventilated. There is a fair supply of apparatus, but additional furniture is needed. The organization is tolerably satisfactory. 2. The moral character of the school is tolerable. 3. The prescribed subjects are taught, with the exception of singing, needlework, and the Scripture lessons. Though the classification is tolerably judicious, the teaching is unsystematic and deficient in power and intelligence. 4. The general proficiency of the pupils is moderate.

NARRABRI :—Visited, 3rd and 4th June, 1868.

Numbers at the examination :—Boys, 32 ; girls, 16 ; total, 48.

1. The school is conducted in a small, badly furnished, and unsuitable slab building ; but a superior brick schoolhouse and teacher's residence are in course of erection. There is an adequate supply of working materials, but the organization is only moderately satisfactory. 2. The pupils are neat and clean, but neither quiet, orderly, nor sufficiently diligent. Their regularity and punctuality of attendance is not satisfactory. The present moral character of the school is moderate ; but it is just to the teacher to mention, that the school has been but recently established. 3. The instruction is, for reasons just given, of an elementary character. The classification is too minute to be effective, and the teaching, though regulated by fairly arranged lesson documents, is deficient in energy and skill. 4. The proficiency of the first class is small, and of the second and third classes, moderate.

PALMER'S ISLAND :—Visited, 12th October, 1868.

Numbers at the examination :—Boys, 12 ; girls, 21 ; total, 33.

1. The building is suitable, but requires painting. The playground is not fenced in, nor provided with out-offices. Additional furniture is needed. The organization is moderate. 2. The discipline is lax, the schoolroom is rather untidy, and the school operations are not conducted with promptness, order, or quietness.

quietness. The behaviour of the pupils is passable, their appearance respectable, but the punctuality of their attendance unsatisfactory. The moral character of the school is moderate. 3. The prescribed subjects not taught are, sewing and singing, and small attention has been given to Scripture lessons. The classification is defective, the instruction is not properly regulated, and the teaching is only moderately intelligent and effective. 4. The proficiency and mental culture of the pupils are moderate.

PORT MACQUARIE (Boys) :—Visited, 2nd December, 1868.

Number at the examination :—Boys, 51.

1. The schoolhouse, teacher's residence, and out-offices are badly in need of repairs. Additional furniture is required; otherwise, there is an ample supply of working materials. The organization is tolerably satisfactory. 2. The moral character of the school is fair. 3. The prescribed subjects are taught; the classification and lesson documents are arranged with fair skill; and the teaching, though defective in the first-class, is, in the upper classes, painstaking and respectable. 4. The proficiency of the first class is moderate, and that of the second and third classes, fair.

PORT MACQUARIE (Girls) :—Visited, 3rd December, 1868.

Number at the examination :—Girls, 23.

1. This school, like the boys' school, is conducted in a spacious, well lighted and ventilated room, formerly used as a sick ward of a military hospital. A book-press and additional working materials are needed. 2. The moral character of the school is pleasing. 3. The instruction is well-regulated, and the prescribed subjects are taught with pleasing energy and fair efficiency. 4. The proficiency of the pupils is fair.

ROCKY RIVER :—Visited, 11th July, 1868.

No examination was held, on account of the recent re-opening of the school. Numbers on the roll :—Boys, 19; girls, 25; total, 44.

1. The schoolhouse is in a dilapidated condition, the playground is not fenced in, and the furniture is both scanty and very unsuitable. A new and suitably furnished building is badly needed.

SAUMAREZ CREEK :—Visited, 8th May, 1868.

Numbers at the examination :—Boys, 17; girls, 16; total, 33.

1. The schoolhouse and teacher's residence need painting, and the playground clearing of standing timber. The supply of furniture and apparatus is suitable and adequate. The organization is fair. 2. The moral aspect of the school is pleasing. 3. The prescribed subjects are taught with praiseworthy earnestness and tolerable efficiency; the classification is arranged with fair skill, and the lesson documents are neatly and intelligently constructed. 4. The average proficiency of the pupils is tolerable.

SEVEN OAKS :—Visited, 14th December, 1868.

Numbers at the examination :—Boys, 12; girls, 16; total, 28.

1. The building and teacher's residence are in fair condition, but they require painting to preserve them from the weather. There is a good supply of furniture and apparatus. The organization is fair. 2. The moral character of the school is fairly satisfactory, as regards the appearance and behaviour of the pupils, but unsatisfactory as regards their attendance. 3. With the exception of singing, the prescribed subjects are taught, and the instruction is regulated with fair ability. Tolerable practical skill is exhibited in the teaching. 4. The average proficiency of the pupils is tolerable.

SMITH'S FLAT :—Visited, 28th September, 1868.

Numbers at the examination :—Boys, 23; girls, 14; total, 37.

1. This school is in good material condition, and is well supplied with educational appliances. The playground needs fencing in, and the schoolroom lengthening, to admit of a proper arrangement of the furniture. 2. The moral character of the school is pleasing. 3. The prescribed subjects are taught, the instruction is well regulated, and the teaching is characterized by pleasing earnestness, diligence, and fair ability. 4. The average proficiency of the pupils is respectable.

SOUTHGATE :—Visited, 20th October, 1868.

Numbers at the examination :—Boys, 22; girls, 19; total, 41.

1. This school is conducted in a very suitable and well-furnished building, attached to which is a comfortable teacher's residence. The playground needs stumping; otherwise, the organization is good. 2. The pupils are fairly regular and punctual in their attendance; but, though clean and decently attired, they are not properly regulated in their conduct, the younger ones being particularly restless and inattentive. The school operations are carelessly conducted. 3. The instruction is elementary, and is neither properly regulated nor in strict accordance with the standard course. The teaching is mechanical, and only moderately effective. 4. The average proficiency and mental culture of the pupils are moderately satisfactory.

STRONTIAN PARK :—Visited, 19th October, 1868.

Numbers at the examination :—Boys, 19; girls, 20; total, 39.

1. The building is unsuitable for school purposes as regards size, form, and structure. The furniture is defective in quantity and quality, but the supply of apparatus adequate. The organization is moderately satisfactory. 2. The character of the attendance is unsatisfactory, and the appearance of the schoolroom untidy; otherwise, the moral character of the school is pleasing. 3. The prescribed subjects are taught, except singing. The classification and lesson documents are arranged with fair skill. Sufficient attention is not given to the first class; otherwise, the teaching is painstaking and tolerably intelligent and effective. 4. The average proficiency of the pupils is passable.

SUMMERLAND :—Visited, 15th December, 1868.

Numbers at the examination :—Boys, 20; girls, 20; total, 40.

1. The building is in need of repairs; the slabs have shrunk, and the roof admits the rain. A verandah is much needed. There is a fair supply of furniture and apparatus; but the diagrams are worn

and dirty. The organization is tolerably satisfactory. 2. The appearance and behaviour of the pupils are respectable; but the character of their attendance is unsatisfactory. The school operations are conducted with fair decorum. The prevailing tone of the school is, on the whole, pleasing. 3. The prescribed subjects are taught, except the Scripture lessons. Sufficient attention is not given to the work of the first class; otherwise, the instruction is regulated with fair skill. Tolerable intelligence and skill are exhibited in the teaching. 4. The proficiency of the first class is moderate, and of the second and third classes, tolerable.

TAMWORTH :—Visited, 23rd May, 1868.

Numbers at the examination :—Boys, 54; girls, 36; total, 90.

1. Though in good material condition, the school building is not large enough. The playground requires to be kept in better order, and the out-offices to be more suitably arranged. The supply of furniture was inadequate at the date of inspection, but the defect has since been remedied. There is a fair stock of the necessary material appliances. The organization is fair. 2. The moral character is, on the whole, satisfactory. 3. The prescribed subjects are taught, except singing. The instruction is regulated with fair skill, but the teaching, though painstaking, is deficient in elasticity and efficiency. 4. The average proficiency of the pupils is barely tolerable.

TENTEFIELD :—Visited, 3rd July, 1868.

Numbers at the examination :—Boys, 38; girls, 46; total, 84.

1. This school is conducted in a good wooden building, and is well organized. The building and adjacent teacher's residence require painting, to check further injury from the weather. 2. The moral character of the school is very fair; the discipline, though defective in minor details, is healthy; and the appearance and conduct of the pupils pleasing. 3. The prescribed subjects are taught, except singing and drawing. The classification and lesson documents, though in some particulars defective, are, in general, intelligently arranged. The teaching is conducted with earnestness and fair efficiency. 4. The average proficiency of two lower classes is tolerable, and of the upper class, fair.

TUCKI TUCKI :—Visited, 5th November, 1868.

Numbers at the examination :—Boys, 22; girls, 23; total, 45.

1. This school is conducted in a small, dilapidated, ill-furnished building, with bark roof, pervious to the rain, and wooden shutters instead of glazed windows. The organization is bad. 2. The pupils are irregular in their attendance; and, though clean and decent in appearance, are not properly regulated in their behaviour and movements. The schoolroom is neither clean nor orderly, and the school operations are not performed with sufficient quietness and order. The moral tone of the school is not pleasing. 3. The prescribed subjects are taught, except drawing and the Scripture lessons; but the lesson documents are defective, and the teaching is mechanical and moderately effective. 4. The proficiency of the first class is small, and of the second and third classes, moderate.

ULMARRA :—Visited, 30th September, 1868.

Numbers at the examination :—Boys, 23; girls, 23; total, 46.

1. The school is in good material condition, and is well found in material appliances. 2. The moral character of the school is, on the whole, pleasing. 3. The prescribed subjects are taught, except singing; and the instruction is regulated and imparted with fair skill and efficiency. 4. The average proficiency of the pupils is fair.

URALLA :—Visited, 13th May, 1868.

Numbers at the examination :—Boys, 27; girls, 12; total, 39.

1. A first-class schoolhouse, with attached teacher's residence, has been recently erected, and furnished with the necessary material appliances. The organization is good. 2. The moral character of the school is, in most respects, pleasing. 3. The prescribed subjects are taught with tolerable skill and results. 4. The proficiency of the pupils is passable.

VIOLET DALE :—Visited, 13th February, 1869.

This school being newly established, the buildings only were inspected.

1. The building is a small slab structure, in need of repair. The playground also requires fencing clearing, and furnishing with out-offices. Material appliances are adequately supplied, and the lesson documents are skilfully arranged. The teacher's residence is singularly wretched in condition and accommodation.

WALCHA :—Visited, 15th May, 1868.

Numbers at the examination :—Boys, 17; girls, 13; total, 30.

1. The building needs repairing, and the schoolroom keeping in cleaner and better order. The arrangement of the out-offices is objectionable. There is a fair supply of material appliances. The organization is, on the whole, fair. 2. The character of the pupils, as regards their attendance, appearance, and conduct, is fairly satisfactory; and the discipline, though defective in minor details, is fairly effective. The moral character of the school is passable. 3. The prescribed course of instruction is followed, and is regulated with fair skill. The teaching is marked by fair intelligence and skill, but deficient diligence. 4. The average attainments of the pupils are tolerable, and their mental culture moderate.

WALLABADAH :—Visited, 29th May, 1868.

Numbers at the examination :—Boys, 16; girls, 14; total, 30.

1. The slabs of the schoolhouse and teacher's residence need to be refitted, and the playground to be fenced in and provided with water and an additional out-office. The school is supplied with the requisite material appliances, and has been suitably furnished since the date of inspection. 2. The moral tone of the school is good. 3. The prescribed subjects are taught, the classification is intelligent, and the lesson documents are arranged with very fair skill. The teaching is painstaking, and the results reasonably satisfactory, considering the recent establishment of the school. 4. The average proficiency of the pupils is tolerable. Arithmetic, singing, and geography need more attention.

WARIALDA :—

APPENDIX.

67

WARIALDA :—Visited, 22nd June, 1868.

Numbers at the examination :—Boys, 12 ; girls, 5 ; total, 17.

1. The appearance and condition of the premises are not satisfactory, repairs to the roof and chimneys being much needed. There is a reasonable supply of apparatus, but the desks are unsuitable in design and arrangement. 2. Though clean and reasonably well-behaved, the pupils are unpunctual. The discipline, as regards the orderly performance of the school operations and appearance of the schoolroom, is moderately satisfactory. 3. The prescribed subjects are taught, with the exception of singing, drawing, and needlework. The teaching is fairly regulated, but its results are only moderate, the methods being too mechanical, and deficient in energy. 4. The average proficiency of the pupils is moderate.

WAUCHOPE :—Visited, 4th December, 1868.

Numbers at the examination :—Boys, 6 ; girls, 11 ; total, 17.

1. The building is constructed of 8-feet slabs, which, having shrunk, require refitting. The desks, seats, and flooring are rude and unsuitable. The organization is bad. 2. The moral character of the school is moderately satisfactory. 3. The subjects not taught in accordance with the Standard Course are singing, drawing, and object lessons. The teaching is feeble, mechanical, and unsatisfactory in its results. The programmes of lessons are not properly made out, the time-table is partially observed, and both lesson registers and fee account book are not kept. 4. The average proficiency of the first and second classes is small, and of the third class, moderate.

WOODFORD DALE :—Visited, 16th October, 1868.

Numbers at the examination :—Boys, 11 ; girls, 11 ; total, 22.

1. There is an adequate supply of apparatus ; but, as regards the dilapidated and ill-furnished condition of the schoolhouse, as well as the absence of playground and out-offices, the organization is bad. A new building and teacher's residence are, however, near completion. 2. The moral character of the school is, under the circumstances, respectable. The regularity and punctuality of the attendance need improving. 3. Singing and drawing are not taught ; otherwise, the prescribed course of instruction is observed. The teaching is painstaking and fairly effective. 4. The attainments range from moderate to fair.

DETAILED STATEMENT of the condition of Provisional Schools inspected in 1868.

ASHFORD.

This school was not open at the time of my visit to the district.

BRUSHGROVE :—Visited, 7th October, 1868.

Numbers at the examination :—Boys, 11 ; girls, 12 ; total, 23.

1. The building, though small, is in good condition, and adequately furnished. There is no enclosed playground, and not sufficient out-office accommodation. The organization is tolerable. 2. The pupils are pleasing in their appearance and behaviour, but only moderately punctual in attendance. The moral aspect of the school is very fair. 3. The prescribed subjects are taught, with the exception of singing and drawing. The teaching is painstaking, but only moderately effective. 4. The attainments and mental culture of the pupils are moderate.

BUNDARRA :—Visited, 15th June, 1868.

Numbers at the examination :—Boys, 13 ; girls, 12 ; total, 25.

1. The teacher pays rent for the unsuitably small and furnished room the school is conducted in. The organization is moderate. 2. The moral character of the school is reasonably satisfactory. 3. The instruction is confined to reading, writing, and arithmetic, none of which are efficiently taught. No lesson documents are in use. 4. The proficiency of the pupils is small.

CORAKI :—Visited, 6th November, 1868.

This school was not examined, on account of its recent establishment.

1. The building is a good slab structure. The playground is not yet fenced in, nor provided with out-offices. The supply of material appliances is adequate for present requirements.

DARKWATER CREEK :—Visited, 15th December, 1868.

Numbers at the examination :—Boys, 6 ; girls, 6 ; total, 15.

1. The school is conducted in a small dilapidated slab hut. Out-offices and additional furniture are needed. The supply of apparatus is tolerably sufficient. The organization is indifferent. 2. The moral aspect of the school is moderate. 3. The prescribed subjects are taught, except drawing, sewing, and the Scripture lessons. The Standard Course is not strictly followed, and the instruction is regulated and imparted with but moderate efficiency. 4. The proficiency of the pupils is low.

HUNTINGDON.

This school, though in operation, was not inspected for want of opportunity.

KENTUCKY.

This school was not in operation at the date of my visit to the district.

LAWRENCE :—Visited, 15th October, 1868.

Numbers at the examination :—Boys, 15 ; girls, 7 ; total, 22.

1. The school is conducted in a dwelling-house, and is adequately supplied with material appliances. The playground needs fencing in and furnishing with better out-offices. The organization is tolerable. 2. The moral character of the school is pleasing. 3. The prescribed subjects are taught, except sewing and singing. The classification is defective ; otherwise, the instruction is tolerably satisfactory. 4. The proficiency of the pupils is fair.

REDBANK :—Visited, 4th December, 1868.

Numbers at the examination :—Boys, 11 ; girls, 8 ; total, 19.

1. The schoolhouse is built of slabs, all of which require refitting. There is no playground or out-offices, and the schoolroom is neither adequately furnished nor orderly kept. The supply of apparatus is tolerable.

tolerable. The organization is in general unsatisfactory. 2. The moral character of the school is moderately satisfactory. 3. The prescribed subjects are taught, except singing, sewing, and the Scripture lessons. The classification is judicious; but the lesson documents are defective, and the teaching is but moderately skilful. 4. The average attainments and mental culture of the pupils are moderate.

ROSE HILL :—Visited, 26th November, 1868.

Numbers at the examination :—Boys, 14; girls, 15; total, 29.

1. The school is held in a dwelling-house part of which is occupied by the teacher. The school-room is too small for the proper arrangement of the furniture, a fair supply of which, as well as apparatus, is provided. The organization is moderate. 2. The moral character of the school is pleasing. 3. The prescribed subjects are taught, except singing, sewing, Scripture lessons, and object lessons. The teaching is painstaking and tolerably skilful. 4. The proficiency of the pupils is fair.

TYNEDALE :—Visited, 9th October, 1868.

Numbers at the examination :—Boys, 4; girls, 10; total, 14.

1. This school is conducted in the kitchen of a stockman's hut, with no other furniture than a few forms and a table. A more suitable building is, however, in course of erection. The organization is indifferent. 2. Though not properly regulated in their movements, the pupils are tolerably well behaved, besides being clean and decently attired. In other respects the moral aspect of the school is not satisfactory. 3. The instruction is very elementary and is not regulated by the prescribed lesson documents. The methods are mechanical, and the teaching apparently desultory. 4. The proficiency of the pupils is moderate.

WARDELL :—Visited, 9th November, 1868.

Numbers at the examination :—Boys, 3; girls, 4; total, 7.*

1. There is a tolerable supply of apparatus, but in all other particulars the organization is bad. 2. The character of the attendance is unsatisfactory; otherwise, the moral aspect of the school is tolerable. 3. The prescribed subjects are taught, except singing and drawing, but the instruction is regulated and imparted with but moderate ability. 4. The proficiency of the pupils ranges from small to tolerable.

WOODFORD PARK :—Visited, 9th October, 1868.

Numbers at the examination :—Boys, 7; girls, 10; total, 17.

1. The material condition of the building is tolerable; but the schoolroom, besides being small, is badly lighted and ventilated; and the playground is neither fenced in, nor provided with out offices. There is a sufficient supply of apparatus; but additional furniture is needed. The organization is moderate. 2. There are no school records to indicate the character of the attendance. The moral character of the school is moderate. 3. The only subjects taught are reading, writing, and arithmetic. There are no lesson documents; the classification is very injudicious; and the teaching is unskilful. 4. The attainments and mental culture of the pupils are low.

YAMBA.

This school was not in operation when I visited the district.

YETMAN :—Visited, 18th May, 1868.

Numbers at the examination :—Boys, 6; girls, 6; total, 12.

1. There is a tolerable supply of apparatus; otherwise, the organization is indifferent. 2. The pupils are clean and well-behaved. In other respects the moral character of the school is barely satisfactory. 3. The prescribed subjects are taught, except singing, drawing, and sewing. The teaching is moderately skilful. 4. The proficiency of the pupils is moderate.

BATHURST DISTRICT.

INSPECTOR'S Report upon the Schools in the Bathurst District, visited during the year 1868.

FOR the first three months of the year I continued in charge of the Albury District, from which I was then removed to Bathurst. It will, therefore, be understood that my work in this district began on the 1st April, 1868, since which time I have been constantly engaged in its inspectoral duties.

I.—GENERAL DETAILS.

To give an idea of the extent of country placed under the charge of the Inspector of the Bathurst District, it may not be out of place to remark that it stretches to the following places in the directions stated :—East, to One-tree Hill (Mount Vittoria); north, to Mudgee and Guntawang; north-west, to Bourke, on the Darling; west, to Condobolin, on the Lachlan; and south, to Binalong, in the neighbourhood of Yass.

With a district so extensive, and containing within it so many schools, the inspection of each school can only take place once a year, however desirable it may be to pay more frequent visits. The number of schools of various kinds in the district on the 1st April, 1868, was as follows :—

Public Schools	53
Provisional Schools	13
Half-time Schools	2
Denominational Schools	25
Total	93

Of these, four schools—two Provisional and two Half-time Schools—were transferred to the Maitland District; three Public Schools were closed from insufficient attendance; and three Denominational Schools—Burrowa, C.E.; Cudgegong, C.E.; and Currajong, Wes.—have ceased to exist as such, the two latter being now in operation as Public Schools, and steps being taken by the inhabitants to replace the first-mentioned by a Public Vested School.

At the close of the year, there were, on the list of schools, the following :—

Public Schools	59
Provisional Schools	24
Half-time Schools	2
Denominational Schools	22
Total	107

The

* NOTE :—The small attendance was owing to wet weather.

APPENDIX.

The following Table will give a comparative view of the Numbers enrolled at the dates given, and the Increase that has taken place in the number of Scholars :—

Date.	Public and Provisional Schools.	Denominational Schools.	Totals.	Increase.
Quarter ending Dec., 1867	2,766	1,501	4,267	...
" " Mar., 1868	2,773	1,515	4,288	21
" " June, 1868	3,114	1,639	4,753	465
" " Sept., 1868	3,454	1,582	5,036	283
" " Dec., 1868	3,462	1,683	5,145	109

It appears, therefore, that the increases at the close of the quarters ending March, June, September, and December, 1868, were respectively 21, 465, 283, and 109—making a total increase during the year, of 696 in Public and Provisional Schools, and of 182 in Denominational Schools, or 878 in all.

The amount of work done throughout the year is exhibited generally in the following statement :—

Number of Schools inspected	87
" Pupils enrolled	4,500*
" Pupils present	3,438*
" Visits of Inspection	93
" " Inquiry	38
" Special Investigations	8
" Teachers and Pupil Teachers examined	48
" Reports, Memoranda, &c.....	1,043
" Miles travelled	4,164

The table subjoined contains a List of the Schools not inspected during the Year, together with the cause of such non-inspection :—

Name of School.	Kind.	Cause of Non-inspection.
Bourke	Prov.	Unable to reach it before the close of the year.
Canoblas	Prov.	Insufficient time.
Colville	Prov.	Closed when visiting the locality.
Cudgegong	Pub.	Not in operation under the Council at the time of my visit.
Eglinton	Pub.	New school—opened towards the close of the year.
Fitzgerald Valley	Prov.	New school.
Ilford	Prov.	Do.
Ironbarks	Prov.	Closed for the Christmas Vacation, before reaching it.
Lagoon	Prov.	New school.
Mackenzie's Creek	Prov.	Do.
Merrendee	Prov.	Do.
Mundorama Ponds	Prov.	Do.
Nubrygyn	Prov.	Do.
Stony Creek	Prov.	Do.
Three-mile Rush	Prov.	Do.
Vittoria	Prov.	Insufficient time.
Wiseman's Creek	Prov.	New school.
Warren	Pub.	Unable to reach it before the Christmas Vacation.
Windeyer	Pub.	Closed.
Young, C. E.	Den.	Closed at the time of my visit.

Twenty schools; therefore, now in operation, were not inspected during the year, the majority of them being new schools which were opened after my visit to the various localities in which they are situated.

For the detailed statement as to the condition of the schools inspected, Annex F may be consulted.

II.—CHARACTER OF INSPECTION.

The Inspections were principally of two kinds, General and Regular, there being none of the Ordinary kind, and only eight schools incidentally inspected and reported upon. In all new schools, and in those that had not been reported upon during the previous year, the inspection was of the general kind. During inspections of this nature, much greater minuteness is observed in inquiring into the organization, discipline, and instruction, than in those styled Regular, the object being to collect data from which to form an opinion of the school in all its various aspects. As, however, I had only visited a few of these schools during 1867, it became necessary, for my own information and guidance, to make careful inquiries even when *nominally* inspecting under the Regular form. Really, therefore, the examination under both forms has been similarly careful and rigid. It is much to be regretted that the present size of this district, and the number of schools therein, entirely preclude inspections of the ordinary kind, "which are designed to exhibit the school in its ordinary state, and thus to afford the Inspector an opportunity of estimating the teacher's practical skill, and of assisting him with advice and direction." During general and regular inspections, the Inspector must himself examine all the classes; but, in those of the ordinary kind, the teacher carries on the usual routine of the school in his presence, thus affording him an opportunity of observing defects of method and manner in the general management of the school. To make up somewhat for this want, I have usually called upon the teacher to take a class for a short time during the inspection.

III.—ORGANIZATION.

ANNEX B may be consulted for a general view of the organization of the schools in this district. As there arranged, the remarks on this subject fall under the following headings :—

Situations.—Of the schools inspected, seventy-four range from fair to good. In general, care has been taken to select the school sites, so as to be convenient to the majority of the people, easily accessible in all seasons, and healthy as well as pleasant. Some of the schools occupying bad positions are conducted in premises not originally built for school purposes.

Buildings.—

* NOTE.—For an explanation of the apparent discrepancy between the numbers given above and those entered as enrolled and present in Annex A, see Annex F under Winburndale Public School.

Buildings.—About two-thirds of the Public, and nearly the same number of the Denominational School buildings, are from fair to good. The Vested buildings are generally of a superior kind. Some of the Vested, *wooden*, buildings, however,—such as those at Dubbo, Hargraves, and Wattle Flat,—are falling into decay, and need replacing. The majority of the inferior buildings are Non-vested. Two Denominational Schools—Wellington R.C., and Sofala C.E.—are in urgent need of new premises.

Two-thirds of Public Schools, and about the same number of Denominational Schools, are supplied with teachers' residences, some of which, however, are very inferior. The majority of Public Schools, without residences, being Non-vested, it is difficult to remedy this defect.

Provisional Schools, in respect of buildings, are only moderately satisfactory.

Playgrounds.—Rather over one-third of the playgrounds are in an unsatisfactory condition. A large playground, properly enclosed and suitably furnished, is invaluable to a careful and judicious teacher, and no school can be considered completely organized without it. The Bathurst Public and Roman Catholic Schools cannot be said to have any playgrounds—very serious defects in such important schools.

Playground superintendence is, so far as my observation goes, not attended to as it ought to be. More careful attention should be given to the children when out of school, so as to check improprieties of language and behaviour; prevent rude, noisy, and boisterous play; and to inculcate habits of mutual respect and forbearance, and a constant regard for the rights and feelings of others. Much too, might be done by judicious planting and laying out of the ground, to make it pleasing to the eye, and fitted to cultivate a taste for neatness and beauty in the minds of the pupils. Every teacher should strive to make the surroundings of his school as attractive as possible, and something might be done in country districts by School Boards to promote this desirable end. The cost would be small; the pleasure afforded to all concerned, great.

Furniture.—The furniture of twenty Public and nine Denominational Schools, is from tolerable to indifferent. In many it is unsuitable in kind and quality, and often insufficient and badly arranged. In several schools—Non-vested, Public, and Denominational—the desks are fastened to the walls, and the children, of course, seated with their backs to the teacher—a most objectionable position. Heavy, clumsy, double desks, too, are occasionally seen, at which the pupils sit face to face, enjoying mutual sly peeps and grimaces at each other, while they play at tapping their toes together underneath. It is to be hoped that such furniture and such arrangements may speedily disappear. In Provisional Schools, the furniture is, for the most part, clumsy and unsuitable.

Apparatus.—The supply of apparatus in the large majority of schools, whether Public or Denominational, is reasonably satisfactory. A few of the more recently established schools need black-boards, and several require diagrams.

Books.—In only eight schools was there any particular deficiency of books, and the want has since been supplied in the usual way by requisition. Sufficient care does not seem to be taken in some schools to prevent waste of books and apparatus. In connection with this, it may be as well to remark that many teachers appear erroneously to think that they have a right to demand two shillings per head for their average attendances, when applying for books and apparatus, although they are distinctly informed that "no articles should be applied for but such as are absolutely necessary for the efficient conduct of the school." Considerable trouble, annoyance, and waste of time have been caused by inattention to this matter.

Registers.—The ordinary School Records, in nearly all cases, are satisfactorily kept. Except in Provisional Schools, and in two Non-vested Public Schools the teachers of which had no experience in keeping these registers, there was not much fault to be found. The School-fee Account Book is kept by some teachers in so slovenly and careless a manner, that one cannot but question its faithfulness as a school record, and more careful attention is needed by some to the entries in the Lesson Register, which are *now made daily*. The advantage of this register is beginning to be felt and acknowledged by earnest and thoughtful teachers, though some still fail to appreciate its utility.

IV.—MORAL CHARACTER OF SCHOOLS.

Regularity.—The regularity of about two-thirds of the pupils in attendance is from fair to good. Many of those, however, who attend school regularly when enrolled, may be said at the same time to be regularly irregular; that is to say, they attend school regularly at certain seasons, and as regularly absent themselves at others. In agricultural districts—especially among free-selectors, and in mining communities—this continues the bane of our schools, and militates, more than all other things combined, against the success of the teacher, who is utterly powerless to interpose between the children and the ignorance, caprice, and cupidity of some parents, and the needy poverty of others who are compelled to employ their offspring at certain seasons in some way or other to save the cost of labour, or to do something for their own support. In an enactment to secure compulsory attendance seems to lie the only hope of extrication, partial or complete, from the present evils; and to the necessity for this the public mind seems fast ripening. Earnest, thoughtful men are frequently heard remarking that compulsory attendance, and the abolition of school fees, are what should be appended to the present system, to complete and perfect the machinery for the education of the Colony. Even in England, educationists are now becoming alive to the necessity for compulsion, to attain the thorough education of the people. One says, recently—"The Educational Conference at Manchester has already spoken with a clear, a loud, and a convincing voice as to the compulsion needed. There is no doubt of the need. The only doubt is how to provide for it. There are many and considerable difficulties in the way; but there are none so great as not to be removable by earnest determination, by patient forbearance, and by intelligent devotion to the most important subject which, in this century, has risen up and taken its rightful place in the minds and hearts of the people of Great Britain." Another ventures to predict—"that twenty years afterwards, the compelling every parent to take care that his child shall learn to read and write will be considered (as it now is in Germany) of the same order of importance and necessity as that parents shall clothe and feed their children."

Punctuality.—In sixty-seven schools the punctuality is from fair to good. In the majority of schools, therefore, there is no particular ground for dissatisfaction under this head. Where the evil exists to any great extent, the blame is generally to be about equally divided between the parents and the teacher; the former detaining their children from causes which a little forethought and care might have prevented, and the latter failing to impress the habits of his pupils through his own want of earnestness and rigid punctuality. The teacher who does not by *example*, in every respect, inculcate this habit, need not attempt to do so by *precept*.

Cleanliness.—There is little to complain of under this head in regard to the pupils, who—especially the girls—are almost always cleanly in person and dress. In one school only I had to send some of the children to the creek near by, to wash themselves before they could be permitted to enter. Some teachers, however, seem to forget that schoolrooms need sweeping, and furniture dusting *daily*; and that maps, diagrams, and windows require weekly attention. Cobwebs in corners and on windows, dusty maps, and notched and ink-stained desks tell tales. Some provision too should be made for ensuring habits of cleanliness among the children; in fact, no school should be without its bucket, basin, soap, and towel.

Order.—This is a most important feature in the discipline of a school, and without it little progress will be made. Depending as it does not merely on the organization but more especially on the personal and moral qualities of the teacher, it varies accordingly. In regard to the organization, it

supposes

supposes a proper arrangement of desks, apparatus, books, and working materials; and in the teacher vigilance, firmness and decision, and energy of character. There should be on the part of the pupils uniformity of movement, promptitude in obeying commands, a respectful demeanour, and sustained attention to work. The school operations should be carried on with *quiet* energy, and everything planned by the teacher to *prevent* disorder and noise, the faintest symptoms of which should at once be checked. "The hum of business," as some one has called it, indicates often anything but work; it is, in fact, a cover for idleness, inattention, and all kinds of disorder.

Government.—In a majority of the schools, corporal punishment is only resorted to in extreme instances, after other milder forms of punishment have proved useless in accomplishing the desired effect. Moral influence is, therefore, generally adopted as the rule of government, but with the rod in view as a salutary ultimatum in desperate cases. Such cases, however, rarely occur when the teacher possesses tact, judgment in discriminating the various dispositions and tempers of his pupils, and firmness and decision of character. The man of strong will and resolution, who pursues an even and consistent course, from day to day, in the discipline of his school, will have comparatively little trouble; while he who is vacillating and "infirm of purpose"—now holding the reins with a slack hand, and anon with a tight grasp—will ever have difficulty in the management of his school; in fact, such a person has mistaken his vocation in becoming a teacher. Spasmodic government will never produce good effects.

V.—INSTRUCTION.

Classification.—In sixty-five of the schools the classification varies from fair to good. Many teachers do not give sufficient attention to this important point in securing effective teaching. In general the number of classes is limited to three, but too little thought is given to placing the pupils in classes suitable for them. In classifying judiciously, the age and mental capacities of the pupils require consideration, besides the attainments necessary for each class as prescribed by the Council's "standard of proficiency." In some schools there is a tendency to subdivision of classes, which should be avoided as dissipating instead of concentrating the teaching power. The fault of promoting children prematurely in obedience to the wishes of parents continues to some extent. I cannot but remark that the teacher who yields to such influences is usually found weak in that self-respect, and moral force and energy of character, the want of which is nearly always apparent in his school. In a few instances, I have found, on the other hand, pupils detained in a class for months after they were clearly ready for promotion, *that the class might stand a good examination when the Inspector came, and some of them be beyond the "standard."* Remark on this is superfluous.

Occupation.—The arrangements made for the occupation of the pupils fall next to be considered in connection with the instruction. Under this is included the construction of "time-tables" and "programmes" for the several classes. The former should only be drawn up as occasion may require, but the latter must be framed at the beginning of every quarter. By the "time-table" the work should be so arranged as to give constant employment to the children—to apportion the time duly among the various subjects, according to their relative importance—and to alternate the lessons, so that the change from one to another shall take place at regular intervals. It should also arrange that the alternation of subjects may be agreeable and stimulating to the pupil, and that the teacher's time may be equitably allotted to each class. Almost all the schools in the district are furnished with a time-table of some description. In two instances, at least, I found time-tables suspended which had neither been written nor constructed by the teachers themselves, one of which was evidently more for ornament than use.

Some improvement is observable in the construction of "programmes," which now generally enter much more fully and explicitly into detail than formerly. Still, there are some who appear to have little idea of their object or bearing. One person was decidedly disappointed when he found that the programmes which he had been at such pains to copy from those of a neighbouring teacher would not always do. On the whole, however, there is an improvement in this matter.

Methods.—In about two-thirds of the schools the methods are of a suitable kind, but they often fail from the want of skill or energy in their application. To know good methods is one thing; to apply them with efficacy is another and a totally different thing. Some men will talk intelligently of analysis and synthesis, and the subjects or class of children for which each is more particularly fitted, who fail in producing satisfactory results. Hence, even in trained teachers, there is a wide diversity in the success of the same methods. However good in itself, knowledge of methods, if not associated in the teacher with energy and animation in imparting instruction, will be productive of but small results. All methods should be carefully tested by constant and vigorous examination, and by frequent reproduction and repetition of previous work.

VI.—PROFICIENCY.

For the general proficiency in the ordinary subjects, the tables under Annex E may be consulted.

Reading.—Judging from results, this subject does not, on the whole, appear to be well taught. The reading, generally speaking, is such as to afford but small pleasure to the listener, who, if trusting to his ear alone, will often have difficulty in understanding the passage read. The faults lie in the tone being too low and monotonous; in inattention to the pauses, and in consequent hurrying; and in a mumbling, indistinct enunciation. Sufficient care is not taken to enunciate each word before that which follows it is attempted; and the final consonants and syllables of words are, hence, often dropped, and words combined in pronunciation which ought to have a clear separate utterance. Such faults are to be found in mere mechanical reading; and when we rise a step higher, and look for taste, feeling, and expression, dissatisfaction cannot but be felt at the proficiency. It is rare indeed to hear a passage read thoroughly well, with distinct enunciation, correct pausation, clear emphasis, and suitable intonation and expression. The fault rests with the teacher, and I believe the root of the evil is the imperfect manner in which the First and Second Classes are taught. When the habit of firm, deliberate, distinct reading is not formed at the outset, it is seldom afterwards acquired. If specimens of good reading were frequently presented as models to the pupils, considerable improvement would probably be effected; and to do this thoroughly, previous study, and careful practice of the passage are necessary. This, combined with systematic explanation of the words, phrases, and general subject matter of the lesson, could not but produce good effects. When the importance of good reading is considered, whether as a mental discipline, or the source of future pleasure to its possessor, it is surely worth while expending some pains upon it.

Writing.—Beginners are taught to write on slates, and afterwards introduced to writing in copy-books. The teaching of this subject would be more successful than it is, if pains were bestowed by teachers in the selection of suitable words, phrases, or short sentences, and in strict supervision of the actual work. To set the pupils of a first class to imitate the copy on the black-board, without insisting on uniformity of size, slope, and distance, is not likely to produce good writing, though it may give employment and keep the pupils quiet, which is often the main object kept in view. The writing in copy-books is, on the whole, better than that on slates. The following are some of the faults which it is desirable to give attention to: blotting, writing and drawing figures on the covers of the books, writing too much and too fast, and, generally, slack supervision. The engraved head-lines in some copy-books are often very unsuitable. Where the teacher sets his own copies on the black-board or in the copy-books, geographical words or sentences are usually employed. One good plan is to select such head-lines from the geography of the current quarter.

Arithmetic.—Arithmetic is generally taught orally from the black-board, though some teachers continue to use books. Defects in the proficiency attained in this subject are generally found to arise from inattention to one or more of the following points:—Hasty and meagre explanation of principles; scanty illustration

illustration on the black-board ; the neglecting to give a large number of varied practical questions ; and the want of regular and frequent recapitulation. Regular revision might, for example, take place on Fridays. In some schools the children are not so well grounded in the tables as they ought to be. Mental arithmetic is, on the whole, not well taught. The exercises given are too much confined to the routine of prices of dozens, &c., which, with a little practice, becomes almost a mechanical exercise. As in slate work, the questions should be as much varied as possible. Rapid exercises in the simple and the compound rules should be given as frequently as practicable. Until this is done in a more thorough and effective manner than at present, the utility of mental arithmetic, in stimulating and strengthening the mental powers, cannot be seen or appreciated.

Grammar.—This subject is also taught orally, with the aid of the black-board, and in connection with the Reading Lessons. As may be seen from the Annex, the proficiency of only a small percentage of the pupils can be considered good. Generally speaking, the parsing and accidence range from tolerable to fair. In the higher classes a great deal of time is wasted by making the pupils parse each word in succession, instead of selecting words which illustrate peculiarities of idiom and syntax. To make advanced children parse "a," "an," "the," "and," &c., over and over again, as they occur, is a senseless, parrot repetition, which will certainly do little to invigorate the mental faculties. The higher parts of grammar—analysis and composition—are the most defectively treated ; in a few schools only is the proficiency attained therein respectable, while in some they have scarcely been attempted. Composition is rarely taught as an art, the common exercise in it being the reproduction of object or other lessons, which the pupil is left to do as he can.

Geography.—The elementary parts of this subject are far from being well taught ; it is generally thought sufficient to get the children to repeat by rote the common definitions, with occasional illustrations from the map. In several cases, where excellent illustrations were at hand in the vicinity of the school, I found the children knew nothing of them ; for instance, the pupils of a school situated near a creek could not tell on which bank they were, or point out examples before their eyes of peninsula, basin, watershed, &c. Teachers would do well to take pains in this matter ; it would make their teaching natural, and interesting alike to themselves and their pupils. An occasional out-door lesson would be all that would be necessary. No text-books are used in teaching this subject, the necessary information being imparted by the teacher, with the aid of the black-board.

Object lessons are generally attended to ; but, in the majority of cases, not in such a way as to produce the effects for which they are peculiarly suited. Their aim is not sufficiently understood, and consequently the mode of treatment is not intelligently adapted to secure that end. The children are told what ought to be elicited from them by judicious questioning ; and thus their minds are crammed, while their thinking powers are left unexercised. It may be said generally, that drawing and music are efficiently taught in only a few of the schools in this district. In a considerable number the former is taught, but only with moderate success.

Teachers.—The following table will show the number of teachers employed in the Public and Denominational Schools in this district. In addition to these, there are the teachers of Provisional Schools and six pupil teachers.

Class I.		Class II.		Class III.			Pro- bationers.	Total.
Section A.	Section B.	Section A.	Section B.	Section A.	Section B.	Section C.		
.....	1	1	10	26	19	14	13	84

In the majority of schools, the teachers are respectable persons, and are earnest and diligent in the discharge of their duties. In nearly every instance, I found them willing to receive and carry out suggestions for the improvement of their schools.

Local supervision.—With some praiseworthy exceptions, the Local Boards do not appear to take that interest in the schools under their supervision which might reasonably be expected from them. Generally speaking, meetings are seldom held, and very irregular visits are paid to the schools.

J. M'CREDIE,

Inspector, Bathurst District.

Bathurst, 8th February, 1869.

ANNEX F.

DETAILED Statement of the condition of Schools in the Bathurst District, visited in 1868.

PUBLIC SCHOOLS.

BATHURST (N.V.)—Infants :—Visited, 23rd November.

Numbers present :—Boys, 24 ; girls, 27 ; total, 51.

The room is only tolerably suitable, and is not furnished with a gallery. Playground accommodation is very defective, and a supply of hat-pegs is needed. The discipline is healthy, and the general spirit of the school is fairly pleasing. The instruction is careful and industrious, and the attainments range from tolerable to very fair.

BATHURST (N.V.)—Primary :—Visited, 24th November.

Numbers present :—Boys, 72 ; girls, 27 ; total, 99.

The room is suitable, and well furnished. There is no playground properly so called, but this serious defect is likely soon to be remedied. The order is good ; the government is fairly effective ; and the instruction is intelligent, and marked by industry and earnestness. Considering that the school was without an assistant for the first six months of the year, the attainments are, on the whole, reasonably satisfactory.

BINALONG (V.) :—Visited, 8th June.

Numbers present :—Boys, 19 ; girls, 15 ; total, 34.

The building having recently been improved, the organization is good. The government is mild, but firm and effective. The instruction is sound and industrious. The methods are judicious. The attainments are satisfactory.

BLANEY (V.) :—Visited, 6th May.

Numbers present :—Boys, 19 ; girls, 9 ; total, 28.

A substantial stone building, in good repair. The material condition is satisfactory. The discipline is fairly effective. The teaching is conducted with energy and earnestness, and the attainments are reasonably satisfactory. The moral tone is, on the whole, fair.

BOWENFELLS (V.) :—Visited, 8th September.

Numbers present :—Boys, 44 ; girls, 20 ; total, 64.

An excellent building, well furnished and supplied with working materials. The school is well disciplined ; its moral character is good. The instruction is intelligent and earnest ; the methods are suitable, and applied with energy. The average proficiency is very fair. The singing is especially worthy of notice.

BURRUNDULLA (N.V.) :—Visited, 23rd October.

Numbers present :—Boys, 16 ; girls, 17 ; total, 33.

Except the want of suitable furniture, there is no special defect in the material condition of this school. The government is prompt and vigorous ; the moral tone is very fair. The teaching is intelligent, and is conducted with great energy. The proficiency ranges from fair to very fair.

CARCOAR (V.) :—Visited, 11th May.

Numbers present :—Boys, 25 ; girls, 21 ; total, 46.

A good building, well furnished and supplied with working materials. The playground is too small, and the teacher's residence needs some repairs. The discipline is fairly effective, but would be improved by greater energy. The methods are intelligent and skilful. The proficiency is, in most subjects, reasonably satisfactory.

COWRA (V.) Visited, 14th May.

Numbers present :—Boys, 27 ; girls, 27 ; total 54.

With the exception of the playground, which is unfenced, the material condition is good. The government is firm and effective. The methods are marked by very fair skill, and by care and industry. The results are satisfactory.

CRUDINE (N.V.) :—Visited, 28th October.

Numbers present :—Boys, 12 ; girls, 8 ; total, 20.

The school is at present conducted in a shepherd's hut, which is neither central nor suitable, on which account the attendance is low. A new vested building is in course of erection. The discipline is effective ; the teaching is conducted with fair intelligence ; and the proficiency, in the circumstances, is reasonably satisfactory.

CULLENBONE (N.V.) :—Visited, 22nd October.

Numbers present :—Boys, 7 ; girls, 19 ; total, 26.

The furniture is neither suitable nor sufficient, and the apparatus is scanty. The playground needs clearing and fencing, and the closets are not in good condition. The teacher's residence is uncomfortable, and too small. The discipline is only moderately effective. The instruction is not well regulated, and lacks penetrative power ; and the results are moderate.

CURRAJONG (N.V.) :—Visited, 26th May.

Numbers present :—Boys, 10 ; girls, 9 ; total, 19.

The playground is not enclosed ; otherwise the material condition is satisfactory. The moral aspect of the school is fair. The instruction is careful, and the methods are judicious. The proficiency is fairly creditable.

DENNIS ISLAND (N.V.) :—Visited, 3rd December.

Numbers present :—Boys, 16 ; girls, 7 ; total, 23.

The furniture is unsuitable and improperly arranged, and the closets are in bad repair ; otherwise the material condition is fair. The discipline is tolerable ; the teaching is industrious, but the methods are defective. The proficiency is moderate.

DUBBO

DUBBO (V.) :—Visited, 17th and 18th December.

Numbers present :—Boys, 30 ; girls, 25 ; total, 55.

The premises, which are built of wood, are in bad repair. Steps should be taken to erect a building as soon as practicable. The discipline is prompt and energetic, the teaching is animated and industrious, and the proficiency ranges from fair to good.

EVANS PLAINS'S (V.) :—Visited, 4th May.

Numbers present :—Boys, 18 ; girls, 19 ; total 37.

The building is suitable, in good repair, and well kept. It is fairly organized, and supplied with necessary material. The order and moral tone are very fair, the discipline is effective, the instruction is careful and intelligent, and the attainments are satisfactory.

FISH RIVER CREEK (V.) :—Visited, 27th August.

Numbers present :—Boys, 8 ; girls, 10 ; total, 18.

The building is only tolerably suitable for school purposes. Furniture, additional apparatus, and a properly cleared playground, are needed. The government is feeble and ineffective. The teaching is mechanical and not likely to have much effect. The teacher has neither been examined nor trained. The attainments are meagre. The school has only recently been opened.

FORBES (N.V.) :—Visited, 19th May.

Numbers present :—Boys, 36 ; girls, 24 ; total, 60.

The building is unsuitable, and in very bad repair. There is no proper playground. New premises are urgently needed. The discipline is fairly effective. The methods are fairly skilful, but defective in energy, and the results range from tolerable to very fair.

GRENFELL (V.) :—Visited, 29th May.

Numbers present :—Boys, 48 ; girls, 44 ; total, 92.

In a material point of view, this school is far from satisfactory. A new building, on another site, is much needed. The government is effective, the instruction is intelligent, and the methods are appropriate. The attainments are, on the whole, satisfactory.

GULGONG (N.V.) :—Visited, 20th October.

Numbers present :—Boys, 20 ; girls, 11 ; total, 31.

The building is moderately suitable. Flooring, proper furniture, and more apparatus, are needed. The playground is unfenced, and the closets are only moderately suitable. The discipline is not effective, and the moral tone is low. The teaching is of the most desultory and mechanical character. The methods, judging from results, are profitless ; and the proficiency is very unsatisfactory. The teacher has since left the service.

HARGRAVES (V.) :—Visited, 12th October.

Numbers present :—Boys, 22 ; girls, 31 ; total, 53.

The building is only moderately suitable, and in bad repair. Steps are being taken to erect new premises. The discipline is effective ; the moral tone is fair ; the teaching is careful and industrious ; and the methods are suitable. The results are reasonably satisfactory.

KIRKCONNELL (V.) :—Visited, 1st September.

Numbers present :—Boys, 22 ; girls, 16 ; total, 38.

An excellent building, well organized. The discipline is thoroughly effective. The moral tone is fair. The instruction is intelligent, earnest, and energetic. The methods are skilful. The attainments range from moderate to fair. The present teacher has only recently taken charge. Good progress may be anticipated.

LAWSON'S CREEK (N.V.) :—Visited, 8th October.

Numbers present :—Boys, 15 ; girls, 17 ; total, 32.

The premises and furniture are moderately suitable. The playground is unfenced. The discipline is only moderately effective, and the moral tone is not good. Several of the pupils are very untidy and dirty. The instruction is earnest, but mechanical ; and the methods are not effective. The attainments are low.

LIMEKILNS (V.) :—Visited, 4th November.

Numbers present :—Boys, 6 ; girls, 5 ; total, 11.

The school has hitherto been conducted in the room of a house adjacent to the new buildings, which are now ready for occupation. The new premises are excellent. The discipline is healthy. The instruction is careful, but wanting in energy ; and the attainments are satisfactory. *For reasons known to the Council*, the attendance is small.

LITHGOW VALLEY (N.V.) :—Visited, 17th September.

Numbers present :—Boys, 27 ; girls, 32 ; total, 59.

Considering the temporary character of the school, the building and general organization are reasonably satisfactory. The government is neither sufficiently firm nor vigilant, and the moral tone is low. The pupils are restless, talkative, and inattentive. The instruction is of a mechanical character, and the methods are not suitable. The proficiency is far from satisfactory.

LOWTHER (V.) :—Visited, 16th September.

Numbers present :—Boys, 8 ; girls, 17 ; total, 25.

A good wooden building, not quite finished. When completed, the material condition will be thoroughly satisfactory. The discipline seems genial and firm. The instruction is judicious. The methods are tolerably skilful. The attainments are from moderate to tolerable. The school has only been open a few weeks.

LUCKNOW (N.V.) :—Visited, 9th December.

Numbers present :—Boys, 14 ; girls, 15 ; total, 29.

The building is only tolerably suitable, and the playground is unfenced. The organization is, on the whole, only tolerable. The government is quiet, firm, and watchful. The teaching is marked by industry and fair intelligence. The results are, on the whole, fair.

MACQUARIE PLAINS (N.V.) :—Visited, 25th August.

Numbers present :—Boys, 20 ; girls, 18 ; total, 38.

The playground is too small. Another closet and new forms are needed. In other respects the organization is satisfactory. The discipline is wanting in firmness, decision, and energy ; the teaching is earnest, but lacks penetrative power ; and the attainments are not, on the whole, satisfactory.

MAIN CAMP (N.V.) :—Visited, 15th September.

Numbers present :—Boys, 28 ; girls, 25 ; total, 53.

The organization is, on the whole, fair, and better than is usually found in schools of a temporary nature on the line of railway. The government is firm. The moral tone is very fair. The teaching is careful and intelligent, and the methods are judicious. The results are satisfactory.

MARCHVALE (V.) :—Visited, 12th December.

Numbers present :—Boys, 11 ; girls, 11 ; total, 22.

A moderately suitable schoolroom ; furniture sufficient, but only moderately suitable, and badly arranged. The playground is unfenced, and there are no out-houses. The discipline is tolerable ; the teaching is intelligent, but the methods are defective ; and the results are, on the whole, only tolerable.

MARENGO (V.) :—Visited, 12th June.

Numbers present :—Boys, 12 ; girls, 13 ; total, 25.

The material state of this school is not satisfactory, but steps are being taken by the School Board for its improvement. The government is mild, but tolerably effective. The instruction is painstaking, but wanting in impressiveness. The results are, in the circumstances, passable.

MEADOW FLAT (V.) :—Visited, 3rd September.

Numbers present :—Boys, 8 ; girls, 10 ; total, 18.

The organization is very fair, and the discipline is good. The instruction is sound and intelligent, and the methods are suitable. With one exception, the proficiency ranges from fair to good.

MIDDLE RIVER HILL (N.V.) :—Visited, 22nd September.

Numbers present :—Boys, 25 ; girls, 17 ; total, 42.

A railway school, conducted in a wretched building, without suitable furniture, apparatus, or books. The two latter have since been supplied. The pupils are neither orderly nor attentive. The moral tone is low. The instruction is not regulated. The proficiency is meagre—as might be expected in the circumstances.

MITCHELL'S CREEK (V.) :—Visited, 2nd September.

Numbers present :—Boys, 17 ; girls, 18 ; total, 35.

The material condition is fairly satisfactory. The discipline is firm and vigilant. The teaching is intelligent and earnest. The methods are appropriate. The attainments vary from tolerable to very fair. The majority of the pupils are very young.

MOLONG (V.) :—Visited, 14th December.

Numbers present :—Boys, 27 ; girls, 27 ; total, 54.

The school-house is a wooden structure in fair condition, but the furniture is not good. New desks are needed. The discipline is genial and effective ; the instruction is sound and intelligent ; and the average proficiency is fair.

MOUNT MACQUARIE (V.) :—Visited, 8th May.

Numbers present :—Boys, 13 ; girls, 22 ; total, 35.

The building is tolerably suitable. The teacher's residence is too small. The discipline is healthy, the methods are fairly judicious, and the attainments are reasonably satisfactory.

MOUNT VITTORIA (N.V.) :—Visited, 10th September.

Numbers present :—Boys, 20 ; girls, 17 ; total, 37.

At the date of inspection the building was unfinished, and the furniture had not arrived from Sydney. At that time, therefore, the material condition was not good. The government is firm, prompt, and vigorous. The instruction is intelligent, but the attainments are small. The school had only been opened ten days.

MUDGE (V.)—Infants :—Visited, 5th October.

Numbers present :—Boys, 27 ; girls, 15 ; total, 42.

A tolerable room, fairly organized for infant school purposes. The discipline is effective, and the general spirit of the school is fairly pleasing. The instruction is appropriate, and fairly regulated. The proficiency is reasonably satisfactory.

MUDGE (V.)—Boys :—Visited, 6th October.

Number present :—Boys, 44.

A good schoolroom, well furnished and supplied with materials, but badly ventilated. A new closet is needed, and the premises generally are in need of repair. The discipline is effective ; the moral tone is very fair. The instruction is sound and thorough ; the methods are appropriate. The proficiency is satisfactory—analysis of sentences in the 4th class being very good. To the ordinary subjects are added geometry and algebra.

MUDGE

MUDGE (V.)—Girls :—Visited, 7th October.

Number present :—Girls, 45.

The school-room is only moderately suited for teaching purposes, but it is fairly supplied with furniture and apparatus. The discipline is firm and effective, and the spirit of the school is pleasing. The teaching is conducted with energy and industry; and the results are reasonably satisfactory.

MURRUMBURRA (N.V.) :—Visited, 6th June.

Numbers present :—Boys, 8; girls, 7; total, 15.

The building is tolerably suitable, but is not well furnished. The discipline is tolerable. The instruction is careful, but the methods are only moderate, and are wanting in energy. The proficiency is, on the whole, tolerable.

OPHIR ROAD (V) :—Visited, 17th August.

Numbers present :—Boys, 17; girls, 12; total, 29.

The building is in bad repair, and there is no proper playground. The discipline is mild, but firm and watchful. The instruction is careful, and the methods are fairly suitable. The attainments are reasonably satisfactory.

ORANGE (V.) :—Visited, 11th December.

Numbers present :—Boys, 33; girls, 16; total, 49.

An excellent building, well organized. The discipline is firm, vigilant, and sustained. The teaching is earnest and intelligent, and the proficiency is creditable.

PEEL (V.) :—Visited, 3rd November.

Numbers present :—Boys, 7; girls, 10; total, 17.

When the repairs are completed, the material condition will be fair. The government is wanting in vigour; the moral tone is tolerable. The instruction is intelligent, but is deficient in energy and care. The results are not, on the whole, satisfactory.

PIPE-CLAY CREEK (N.V.) :—Visited, 9th October.

Numbers present :—Boys, 22; girls, 22; total, 44.

The school is at present conducted in a wretched bark hovel, with a scanty supply of books and apparatus, and no suitable furniture. A new vested building is, however, in course of erection. The maintenance of discipline, in the circumstances, is almost impossible. The instruction is intelligent and energetic, and the proficiency, for the time and place, reasonably satisfactory.

PLEASANT VALLEY (N.V.) :—Visited, 28th August.

Numbers present :—Boys, 11; girls, 15; total, 26.

Furniture and a proper playground are wanting; otherwise the material condition is passable. The discipline is mild, but firm; the tone is healthy. The teaching is industrious, and the methods are tolerable. The attainments are fair.

ROCKLEY (V.) :—Visited, 21st August.

Numbers present :—Boys, 10; girls, 15; total, 25.

The playground needs fencing, and the occupation is defective; otherwise the organization is fair. The government is tolerably firm, but wanting in vigilance. The teaching is earnest, but the methods are deficient in energy and skill. The proficiency may be estimated as tolerable.

SPRING GROVE (N.V.) :—Visited, 8th December.

Numbers present :—Boys, 13; girls, 18; total, 31.

The premises are built of slab, and are fairly suitable, but insufficiently supplied with furniture, which is badly arranged. The order is bad, and the discipline generally ineffective; the moral tone is low. The instruction is mechanical, and the attainments are meagre. Needlework is the only thing well attended to. In no respect is this school in a satisfactory condition, nor is it likely to become so under the present management.

TAMBAROORA (V.)—Visited, 24th July.

Numbers present :—Boys, 15; girls, 16; total, 31.

The schoolroom is in fair repair, but the teacher's residence is untenable. The discipline is firm and effective, and the methods are fairly suitable. On the whole, the pupils evince tolerable proficiency.

TEA-POT SWAMP (V.) :—Visited, 4th December.

Numbers present :—Boys, 11; girls, 6; total, 17.

Some slight repairs are needed, but on the whole the material condition is good. The discipline is tolerably effective; the instruction is not regulated by a programme; and the average proficiency may be estimated as tolerable. Owing to many being absent, the school did not show to advantage.

WALLEROWANG (N.V.) :—Visited, 23rd September.

Numbers present :—Boys, 32; girls, 14; total, 46.

The building is suitable, but not well furnished. The supply of books and apparatus is defective. This latter defect has, however, been remedied since the date of inspection. The government is defective in energy, firmness, and vigilance. The instruction is careful, but is deficient in animation. The methods are tolerably suitable, but more vigour is needed to make them effective. The results are unsatisfactory.

WATTLE FLAT (V.) :—Visited, 5th November.

Numbers present :—Boys, 28 ; girls, 39 ; total, 67.

The building is in a wretched condition, and quite too small for the attendance. The furniture is clumsy and unsuitable. New premises are urgently required. The discipline is moderately effective : the moral tone is low. The instruction is not properly regulated, and the attainments range from very small to tolerable. Good results will not be obtained with the present organization.

WELLINGTON (V.) :—Visited, 15th and 16th December.

Numbers present :—Boys, 23 ; girls, 12 ; total, 35.

An excellent brick building, sufficiently supplied with furniture, but requiring additional apparatus. The discipline is fairly effective, the instruction is earnest and painstaking, and the proficiency is reasonably satisfactory. The discipline and instruction would, however, both be improved by greater energy and vigilance.

WHITE ROCK (N. V.) :—Visited, 18th August.

Numbers present :—Boys, 13 ; girls, 17 ; total, 30.

The building is fairly suitable, and is in good repair. Another closet is needed. The discipline is wanting in energy and vigilance. The instruction is defective in intelligence and penetrative power. The attainments are below the average.

YOUNG (V.) :—Visited, 2nd June.

Numbers present :—Boys, 43 ; girls, 27 ; total, 70.

The material condition of the school has been considerably improved since last inspection. The discipline is firm and vigilant. The teaching is intelligent and earnest. The methods are suitable and are applied with energy. The results range from tolerable to good.

INCIDENTAL INSPECTIONS.

CADIA (V.)—Public :—Visited, 31st August.

A good brick building, well furnished and supplied with apparatus and working materials. The instructional documents are fairly regulated, and the school records are neatly and correctly kept. As my visit took place after school hours, I had no opportunity of observing the discipline or teaching ; hence this school is not reckoned in Annex A, &c.

WINBURDALE (N.V.) :—Visited, 23rd April.

Numbers present :—Boys 11 ; girls, 14 ; total, 25.

The building is only tolerably suitable, but it is in fair repair. A teacher's residence is not provided, and there is no proper playground. Tolerable order is kept, and the discipline generally appears to be fairly effective. The school records are correctly kept. This school has not been taken into account in framing the several preceding Annexes ; hence the seeming discrepancy between the numbers entered in the Annex A and those in the statement of work done throughout the year.

PROVISIONAL SCHOOLS.

CONDOBOLIN :—Visited, 22nd May.

Numbers present :—Boys, 12 ; girls, 12 ; total, 24.

The building is tolerably suitable, but there is no playground, and the furniture is neither sufficient nor suitable. The government is moderate ; the instruction is meagre ; and the methods are unskilful. The proficiency is small.

CROWTHER :—Visited, 23rd June.

Numbers present :—Boys, 2 ; girls, 6 ; total, 8.

The organization is tolerable. The government is fitful and slack, and the instruction is mechanical. The results are not satisfactory. Another teacher has since been appointed.

FIVE ISLANDS :—Visited, 7th May.

Numbers present :—Boys, 6 ; girls, 9 ; total, 15.

The building is tolerably suitable, but the furniture is indifferent. The order and discipline are bad ; the instruction feeble and mechanical ; and the attainments generally unsatisfactory.

RYDAL :—Visited, 7th September.

Numbers present :—Boys, 7 ; girls, 14 ; total, 21.

The material condition is not good. At the date of inspection, books and apparatus had not been received. The discipline is feeble and worthless. The instruction is mechanical, and suitable methods are unknown. The attainments are very meagre.

SOD WALLS :—Visited, 7th September.

Numbers present :—Boys, 6 ; girls, 6 ; total, 12.

The school is conducted temporarily in a small and unsuitable room. Books and apparatus did not arrive until a few days after the date of inspection. The discipline is mild ; the teaching seems industrious and tolerably intelligent ; and the proficiency, for the time and circumstances, is reasonably satisfactory.

SOUTH APSLEY :—Visited, 20th August.

Numbers present :—Boys, 6 ; girls, 5 ; total, 11.

The building is tolerable suitable, but closets have not been provided. The supply of furniture and apparatus is defective. The discipline is fairly effective, and the general tone is pleasing. The subjects consist principally of reading, writing, and arithmetic, which are reasonably satisfactory.

WARWICK :—

WARWICK :—Visited, 31st August.

Numbers present :—Boys, 10 ; girls, 8 ; total, 18.

The schoolhouse is moderately suitable. At the date of inspection no books or apparatus had been received. The discipline is moderately firm, but fitful. The teaching is energetic, but desultory. The attainments are moderate.

WOMBAT :—Visited, 4th June.

Numbers present :—Boys, 3 ; girls, 4 ; total, 7.

Material condition wretched. Instruction : Reading and writing indifferent ; other subjects—failure. The teacher left soon after the inspection.

CAMDEN DISTRICT.—GENERAL REPORT.

At the end of 1867 there were 111 schools—or 115 departments—on the list for this district. Of these, 6 were transferred to the Cumberland District, at the beginning of 1868. Other schools having, however, been added during the year, on the 31st December, 1868, the list contained 106 schools, or 110 departments, viz. :—48 Public, 1 Half-time, 13 Provisional, and 48 Certified Denominational Schools.

The following numerical statement exhibits the amount of work done by me, in the year, in the supervision and inspection of the schools placed under my charge :—

Number of schools or departments, on 31st December, 1868 :—Public, 48 ; Half-time, 1 ; Provisional, 13 ; and Certified Denominational, 48 ; total, 110.

Number of pupils enrolled in the year—7,413.

Number of pupils on class rolls in last quarter of the year—5,616.

Number of teachers, assistants, and pupil teachers employed—121.

Number of visits on applications for new schools—14.

Number of visits of special inquiry—23.

Number of visits for inspection—70.

Number of pupils on the rolls of the schools inspected—3,820.

Number of pupils present at inspection—2,949.

Number of teachers supervised at examination—52.

Number of pupil teachers and candidates examined—19.

Total distance travelled—2,707 miles.

INSPECTION OF SCHOOLS.

The schools not inspected in 1867 were among those first visited and inspected in 1868. 27 Public, 9 Provisional, and 29 Certified Denominational Schools—numbering in all 70 departments—have been visited for inspection in the year. Those schools newly opened, and others not inspected in 1867—22 in number—have been subjected to the General Inspection, while those visited and reported upon in 1867 have this year been subjected to the Regular Inspection only.

TABLES showing the Ages and Sexes of the Pupils enrolled (in the schools inspected), and also of those present at examination :—

1.—PUPILS ENROLLED (PUBLIC AND PROVISIONAL SCHOOLS).

CONDITION OF THE SCHOOLS INSPECTED.

I. MATERIAL CONDITION.

1. *Situations and Playgrounds.*—As a whole, the Public Schools inspected are well situated. The playgrounds are fairly satisfactory, but in a few instances suitable out-buildings have not yet been provided. The Provisional Schools are but moderately satisfactory in these respects. With two exceptions, the Certified Denominational Schools are well situated, and have tolerably good playgrounds; but, at one-third of the number inspected, out-offices are either not provided to the playgrounds, or, if provided, their condition is very unsatisfactory.

2. *Buildings and Furniture.*—Eighteen of the Public Schools visited are conducted in buildings belonging either to denominations or to private persons. In the majority of these cases the buildings are more or less unsatisfactory; and the furniture in use is, in many instances, very unsuitable for school purposes. In some cases also (where the buildings are used as churches) the furniture provided is badly arranged. Where the school property is vested in the Council, the buildings and furniture are, in most cases, good. The Provisional School buildings and furniture are, with one or two exceptions, very unsatisfactory. With regard to Denominational Schools, seven school buildings (of the thirty-one inspected) are in bad repair, or otherwise unsuitable, fourteen are badly furnished, and ten have no residence provided for the teachers.

3. *Books and Apparatus.*—All the schools in the district are now fairly well supplied with these requisites.

4. *Records.*—These are fairly well attended to by the teachers. In most cases also the necessary returns are neatly and correctly made out and furnished at the proper times.

Indifferent or bad	1	1	2	...	4

II.—MORAL CONDITION OF THE SCHOOLS.

1. *Attendance.*—Although the schools are not yet satisfactory in this respect, some improvement has undoubtedly been effected, especially in the regularity of the pupils' attendance, since last inspection. From careful inquiry made at the time of inspection, I ascertained that, in a number of the localities, there were many children of a school age who were not in attendance at the schools established for them. In a few instances the parents profess to care little or nothing about the education of their children; and in many more instances, though professing to be anxious to send their children to school, they act as though they cared but little with regard to the matter—the children being kept from school for the most frivolous reasons, and no real interest shown in their educational progress. Teachers and School Boards, by careful attention to their duties, may, I believe, still further improve the pupils' regularity, and also induce more parents to send their children to school; I am strongly of opinion, however, that nothing short of an enactment, dealing with the question of fees and introducing the system of compulsory school attendance, would effectually remedy the evils of irregularity and non-attendance. The punctuality, as regards both the pupils' attendance and the school operations, may, in the majority of the schools inspected, be considered fairly satisfactory.

2. *Cleanliness, Order, and Government.*—In thirty schools these important matters of discipline are well attended to; and in thirty-six they are fairly satisfactory. In four schools they are indifferent or bad.

III.—INSTRUCTION AND PROFICIENCY.

1. *Classification and Occupation.*—In a few schools the classification of the pupils has by no means received due attention from the teachers. There is evidence, however, of this important matter having been carried out with thoughtfulness and care in a large majority of the schools inspected. The pupils' classification and their school occupation have, in most instances, been judiciously arranged in accordance with the provisions of the "Standard of Proficiency" and other documents furnished to the teachers for their guidance. Four-fifths of the Public Schools, one-half of the Provisional Schools, and two-thirds of the Certified Denominational Schools are satisfactory in these respects.

2. *Subjects and Methods.*—The ordinary subjects, as prescribed in the "Course of Secular Instruction," are taught in all the schools visited. In about four-fifths of the Public Schools, and two-thirds of the Certified Denominational Schools, object lessons, singing, and drawing are also included (usefully) in the schoolwork. The methods in use are in many instances still very unsatisfactory; at the same time, the teachers are certainly improving in this respect, and at next inspection the report will, I think, be much more satisfactory.

3. *Proficiency—Reading.*—In many of the schools great efforts have been made since last inspection to improve the reading, and in some instances marked success is apparent. In a few of the schools where the reading was very defective the right methods of teaching have evidently been thoughtfully considered by the teachers, and hence more satisfactory results have been produced. In a large number of the schools, *much more* of the teachers' time and attention should be devoted to *teaching* this subject in the junior classes.

Writing and dictation.—On the whole, fair improvement has been made in these subjects.

Arithmetic.—In most of the Provisional Schools, in a few of the Public Schools, and in about one-third of the Certified Denominational Schools this subject is still taught very unsatisfactorily. In the majority of the Public Schools and Certified Denominational Schools however, a decided improvement is evidently going on; the pupils are not only taught to perform certain arithmetical operations, but also to apply those operations to the solution of practical questions. The average proficiency of the pupils in this subject and their intelligent apprehension of its principles are, on the whole, tolerably satisfactory.

Grammar.—The pupils are tolerably well acquainted with the elementary parts of this subject, but, except in a few instances, it has not yet taken its proper place in the schools as a means of mental training.

Geography.—This subject is professedly taught in accordance with the Standard's requirements, but, in most of the schools, only a moderate knowledge of it is displayed by the pupils. In a few instances the subject is well taught; but, taking all the schools inspected, the general proficiency can only be considered moderately satisfactory.

TEACHERS.

The teachers are, as a body, conscientious, intelligent, and fairly well fitted for the efficient discharge of their duties. In my intercourse with them, I have also found them, in all cases, willing to receive and act upon my suggestions for the improved working of their schools. Fifty-two teachers were examined in the year in accordance with the provisions in clause 37 of the Council's Regulations. Of these, twenty-two were successful in obtaining a higher classification. Eleven pupil teachers were also examined in the year.

The number and classification of the teachers in the district at the close of the year are shewn in the following table:—

Teachers.	Class I.		Class II.		Class III.			Probationers.	Pupil Teachers.	Totals.
	A.	B.	A.	B.	A.	B.	C.			
Male teachers	2	3	2	30	15	17	14	5	88
Female teachers	4	2	10	11	6	33
Totals	2	3	2	34	17	27	25	11	121

LOCAL SUPERVISION.

No marked improvement is yet apparent in the character of the supervision exercised by the School Boards. In a few instances the supervision exercised is really effective—the Boards' duties prescribed by the Regulations being carried out with regularity and painstaking; but by a large majority of the School Boards little or no real interest is manifested in the progress and well-being of the schools placed under their supervision.

Separate detailed statements for Public and Certified Denominational Schools, shewing the A., B. condition of the different schools at the time of inspection, will be found appended to this report.

J. HUFFER,
Inspector.

CAMDEN DISTRICT.

APPENDIX A.

DETAILED STATEMENT of the Condition of Public and Provisional Schools inspected in 1868.

The remarks under head 1 relate to the material condition of the schools; 2, to their moral condition; 3, to the subjects and methods of instruction; 4, to the proficiency of the pupils.

ARNCLIFFE (Non-vested):—Visited, 17th December, 1868.

Numbers present:—Boys, 19; girls, 7; total, 26.

1. The school-house is too small, and the furniture is unsuitable and badly arranged. There are no out-offices, and the playground is unfenced. 2. The discipline is tolerably healthy. 3. The instruction is carried on with earnestness and tolerable skill. 4. The proficiency, under the circumstances of the school, is fairly satisfactory.

APPIN (Vested):—Visited, 4th December, 1868.

Numbers present:—Boys, 13; girls, 10; total, 23.

1. A verandah is much needed on the west side of the building, and a supply of water should be provided; otherwise, the material condition of the school is good. 2. The discipline and prevailing tone are healthy. 3. The prescribed subjects are taught with earnestness and skill. 4. The results, considering the time the school has been in operation, are very satisfactory. (At the time of my visit a large number of the pupils were kept from school for harvest work.)

ASHFIELD

ASHFIELD (Non-vested) :—Visited, 29th May, 1868.

Numbers present :—Boys, 22 ; girls, 13 ; total, 35.

1. The school premises are central, and they have recently been put in a tolerable state of repair. The furniture is sufficient, but unsuitable. 3. The regularity and punctuality are unsatisfactory. The pupils are very clean, orderly, and attentive ; and the tone of the school is pleasing. 3. The prescribed subjects are taught—singing and drawing excepted. The methods are appropriate. 4. The results (under the present teacher) are very satisfactory.

BROUGHTON CREEK (Non-vested) :—Visited, 27th August, 1868.

Numbers present :—Boys, 13 ; girls, 21 ; total, 34.

1. The material condition of the school is fairly satisfactory. 2. The discipline is healthy. 3. The prescribed subjects are taught—drawing excepted. The instruction is carried on with earnestness and tolerable skill. 4. The proficiency is tolerable.

BOTANY (Non-vested) :—Visited, 7th July, 1868.

Numbers present :—Boys, 38 ; girls, 31 ; total, 69.

1. The premises are well situated, but in other respects they are not satisfactory. New vested buildings are now in course of erection. 2. The discipline and general tone are fairly healthy. 3. The prescribed subjects are taught with industry and care. 4. The results, considering the defective organization, are tolerably satisfactory.

BOOLONG (Non-vested) :—Visited, 1st September, 1868.

Numbers present :—Boys, 21 ; girls, 32 ; total, 53.

1. The material condition and organization are tolerably satisfactory. 2. The discipline is fairly healthy. 3. The instruction is carried on with zeal and earnestness. 4. The proficiency is tolerable.

CAMBEWARRA (Vested) :—Visited, 26th August, 1868.

Numbers present :—Boys, 18 ; girls, 16 ; total, 34.

1. The material condition is fair. 2. The discipline is tolerably healthy. 3. The teacher is intelligent and painstaking. 4. The general proficiency is fair.

COOLANGATTA (Non-vested) :—Visited, 4th September, 1868.

Numbers present :—Boys, 22 ; girls, 18 ; total, 40.

1. The building now in use is tolerably suitable, but it is badly furnished. 2. The regularity, cleanliness, and order of the pupils are fairly satisfactory. 3. The prescribed subjects are taught with industry and care. 4. The progress made since the present teacher took charge is satisfactory.

CARARAWELL (Non-vested) :—Visited, 24th August, 1868.

Numbers present :—Boys, 18 ; girls, 16 ; total, 34.

1. The material condition of the school is not good. New buildings are greatly needed. 2. The discipline and general tone are healthy. 3. The prescribed subjects are taught with intelligence and much earnestness. 4. The proficiency is fair.

CAWDOR (Non-vested) :—Visited, 15th June, 1868.

Numbers present :—Boys, 23 ; girls, 18 ; total, 41.

1. The premises are well situated ; they are in good repair, and fairly well furnished. Half the floor space in the schoolroom is occupied by church furniture, consequently the school arrangements and organization are unsatisfactory. 2. The pupils are clean, orderly, and attentive. 3. The instruction is carried on with energy and care. The methods are moderately appropriate. 4. The proficiency is fair.

CROOBYAR (Non-vested) :—Visited, 6th August, 1868.

Numbers present :—Boys, 42 ; girls, 32 ; total, 74.

1. The teacher's residence is too small. A class-room is needed, and the whole premises should be repaired and cleaned. 2. The discipline is good. 3. All the prescribed subjects are taught. The teacher is intelligent, energetic, and painstaking. 4. The proficiency is fairly satisfactory.

GLENMORE (Non-vested) :—Visited, 11th June, 1868.

Numbers present :—Boys, 18 ; girls, 25 ; total, 43.

1. The school is at present carried on in the Wesleyan Chapel, but suitable buildings and furniture (vested) are now being provided. 2. The discipline is fairly healthy. 3. The teaching is carried on with much earnestness and painstaking, but the methods are defective. 4. The proficiency is tolerable.

JAMBEROO (Vested) :—Visited, 12th September, 1868.

Numbers present :—Boys, 18 ; girls, 11 ; total, 29.

1. Slight repairs are needed to the roof of the schoolhouse, and an additional room to the teacher's residence is much required. 2. The regularity is not good, otherwise the discipline and general tone are fair. 3. The teaching is carried on with intelligence and skill. 4. Fair progress has been made during the past year.

MARRICKVILLE (Vested) :—Visited, 28th May, 1868.

Numbers present :—Boys, 80 ; girls, 34 ; total, 114.

1. The out-offices should be screened, and the playground divided for boys and girls ; otherwise, the material condition is good. 2. The discipline is fair. 3. The usual subjects are taught. The methods are fairly appropriate. 4. The results are tolerably satisfactory.

MULGOA FOREST (Non-vested) :—Visited, 8th June, 1868.

Numbers present :—Boys, 26 ; girls, 20 ; total, 46.

1. The premises are well situated, but otherwise they are unsatisfactory. Out-offices have not been provided. The teacher's residence is greatly in need of repair. 2. The discipline is tolerable. 3. The teaching is carried on with industry, but the methods are unsuitable. 4. The proficiency is only moderate.

NOWRA (Vested) :—Visited, 11th August, 1868.

Numbers present :—Boys, 18 ; girls, 25 ; total, 43.

1. A teacher's residence is needed, and the out-offices should be screened ; otherwise, the material condition is good. 2. The attendance is unsatisfactory. The pupils are fairly orderly and attentive. 3. The prescribed subjects are taught, drawing excepted. The methods are defective, and there is a want of thoroughness in the school work. 4. The proficiency is only tolerable.

NORTH BULLI (Non-vested) :—Visited, 10th December, 1868.

Numbers present :—Boys, 20 ; girls, 11 ; total, 31.

1. New buildings (Vested) are now being provided. The schoolroom at present in use is much too small, and it is otherwise unsuitable. 2. The discipline is very good. 3. The instruction is carried on with skill and much earnestness. 4. The proficiency is satisfactory.

OMEGA RETREAT (Vested) :—Visited, 15th September, 1868.

Numbers present :—Boys, 46 ; girls, 46 ; total, 92.

1. The teacher's residence is too small ; the playground should be stumped and levelled ; otherwise, the material condition is good. 2. The discipline is satisfactory. 3. The usual subjects are taught with energy and care. The methods are fairly appropriate. 4. The proficiency is very fair, in some subjects very good.

PYREE (Non-vested) :—Visited, 2nd September, 1868.

Numbers present :—Boys, 42 ; girls, 47 ; total, 89.

1. The material condition is bad, school requisites excepted. 2. The discipline is very good. 3. The prescribed subjects are taught with skill and much earnestness. 4. The proficiency is, on the whole, satisfactory.

ROSE VALLEY (Non-vested) :—Visited, 14th September, 1868.

Numbers present :—Boys, 13 ; girls, 18 ; total, 31.

1. New school buildings (Vested) are in course of erection. The temporary premises are unsuitable. 2. The discipline and general tone are tolerably healthy. 3. The prescribed subjects are taught, drawing excepted. The methods are fairly appropriate. 4. The proficiency, under the circumstances of the school, is fairly satisfactory.

SHELLHARBOUR (Non-vested) :—Visited, 16th September, 1868.

Numbers present :—Boys, 33 ; girls, 36 ; total, 69.

1. The material condition, requisites excepted, is bad. A new building is greatly needed. 2. The discipline is tolerably healthy. 3. The instruction is carried on with earnestness. 4. The general proficiency is fair.

STONY CREEK (Vested) :—Visited, 10th September, 1868.

Numbers present :—Boys, 11 ; girls, 12 ; total, 23.

1. The schoolroom needs repairs. 2. The discipline is fairly satisfactory. 3. The instruction is carried on with moderate intelligence and skill. 4. The proficiency is tolerably satisfactory.

TOMERONG (Non-vested) :—Visited, 10th August, 1868.

Numbers present :—Boys, 21 ; girls, 17 ; total, 38.

1. The material condition of the premises, teacher's residence excepted, is very fair. Since last inspection, suitable out-offices have been erected. 2. The discipline is fair. 3. The instruction is carried on with industry, but the methods are only moderately suitable. 4. The proficiency is moderate.

ULLADULLA (Non-vested) :—Visited 5th August, 1868.

Numbers present :—Boys, 28 ; girls, 11 ; total, 39.

1. There is no teacher's residence, and the schoolroom and out-offices are greatly in need of repairs. 2. The discipline is healthy. 3. The instruction is satisfactory. 4. The general proficiency of the pupils is fair.

WESTBROOK (Vested) :—Visited, 12th June, 1868.

Numbers present :—Boys, 22 ; girls, 15 ; total, 37.

1. The school premises need repairs. 2. The discipline is tolerable. 3. The teaching is carried on with industry, but the methods used are defective. 4. The general proficiency is small.

WORRAGEE (Vested) :—Visited, 31st August, 1868.

Numbers present :—Boys, 14 ; girls, 10 ; total 24.

1. The school premises are in bad repair. 2. The discipline is only moderately healthy. 2. The teaching is weak and ineffectual. 4. The proficiency of the pupils is very moderate.

WOLLONGONG

WOLLONGONG (Vested) :—Visited, 8th December, 1868.

Number present :—31.

1. The material condition is bad. Arrangements are now being made to have the premises put in thorough repair. 2. The discipline is very fair. 3. The instruction in the upper classes is efficient; in the second class moderately so. 4. The progress made is fairly satisfactory.

WOLLONGONG (Girls) :—Visited, 8th and 9th December, 1868.

Number present :—24.

1. The material condition is unsatisfactory. 2. The discipline and general tone are healthy. 3. The prescribed subjects are taught with earnestness and painstaking. 4. Fair progress has been made since last inspection.

WOLLONGONG (Infants) :—Visited, 9th December, 1868.

Number present :—44.

1. The material condition, out-offices excepted, is fairly satisfactory. 2. The pupils are clean, orderly, and attentive, and the general tone of the school is pleasing. 3. The instruction and general management are carried on with industry, and the methods in use are tolerably appropriate. 4. The proficiency is fair.

PROVISIONAL SCHOOLS.

BAMERANG :—Visited, 24th August, 1868.

Numbers present :—Boys, 14; girls, 16; total, 30.

1. The material condition is tolerably satisfactory. 2. The discipline is weak. 3. The ordinary subjects are taught with industry and painstaking, but the methods are mechanical and ineffective. 4. The proficiency is moderate.

BROUGHTON VALE :—Visited, 28th August, 1868.

Numbers present :—Boys, 12; girls, 12; total, 24.

1. The material condition is fair for the kind of school. 2. The discipline is moderate. 3. The methods of instruction are defective. 4. The proficiency of the pupils, considering the time they have been at school, is tolerable.

BROUGHTON VILLAGE :—Visited, 28th August, 1868.

Numbers present :—Boys, 13; girls, 13; total, 26.

1. A new schoolroom is about to be erected. The premises temporarily used are fairly suitable. 2. The discipline is good. 3. The ordinary subjects are taught with intelligence and zeal. 4. The general proficiency is equal to that found in a tolerably good Public School.

BOMADEERY :—Visited, 15th August, 1868.

Numbers present :—Boys, 15; girls, 20; total, 35.

1. The building and furniture are but moderately satisfactory. 2. The discipline is very fair. 3. The ordinary subjects are taught with much industry and painstaking. 4. The progress made during the year is satisfactory.

BURRIAR :—Visited, 25th August, 1868.

Numbers present :—Boys, 17; girls, 9; total, 26.

1. Furniture excepted, the material condition of the school is fairly satisfactory. 2. The discipline is moderately healthy. 3. The teacher is very industrious, but his practical skill is small. 4. The proficiency is very moderate.

JANNUNG :—Visited, 7th August, 1868.

Numbers present :—Boys, 9; girls, 10; total, 19.

1. The school is at present conducted in temporary premises, which are tolerably suitable, but not sufficiently central to the population in the locality. 2. The discipline is fair. 3. The prescribed subjects are taught, and the school work is carried on with great industry by the teacher and pupils. 4. The results, for a provisional school, are very satisfactory.

MOORFIELDS :—Visited, 9th July, 1868.

Numbers present :—Boys, 5; girls, 5; total, 10.

1. The material condition is fair. 2. The attendance is unsatisfactory, and the general tone of the school is not healthy. 3. The school work is carried on with industry, but the methods in use are very defective, rote learning being their chief characteristic. 4. The proficiency is very small.

SAGGARTFIELD :—Visited, 25th September, 1868.

Numbers present :—Boys, 6; girls, 11; total, 17.

1. The furniture is unsuitable, and the material condition of the school is otherwise unsatisfactory. 2. The discipline is bad. 3. The teacher is industrious, but little beyond rote learning is attempted. 4. The pupils' attainments are small. The progress made since last inspection is not satisfactory.

NOWEA HILL :—Visited, 21st August, 1868.

Numbers present :—Boys, 13; girls, 7; total, 20.

1. The schoolhouse and its furniture are rough and unsuitable. 2. The discipline is moderate. 3. The classification is very imperfect. The ordinary subjects are taught. The methods are inappropriate. The teacher is industrious and painstaking. 4. The proficiency is moderate.

CUMBERLAND DISTRICT.—INSPECTOR'S GENERAL REPORT OF SCHOOLS, FOR THE YEAR 1868.

THE Colony has now had two years' experience of the Public Schools Act. For the character of the Act the Legislature is responsible, for its administration the Council of Education ; but, what is really of more moment than either, the people of the Colony are interested in, and to a large extent responsible for, its successful and profitable working. How far, therefore, this Act is fulfilling expectations, and advancing the great cause for which it was framed, it will be the object of this Report to show, with respect to the Cumberland District.

I.—THE NUMBER AND DESCRIPTION OF SCHOOLS.

Within the year, eighty schools have been in operation :—

Public Schools	24
Provisional Schools	9
Half-time Schools	2
Church of England Schools.....	21
Roman Catholic Schools	14
Presbyterian Schools.....	5
Wesleyan Schools	5
Total	80

Of the twenty-four Public Schools, it is deserving of notice, that two, those of St. Alban's and Ryde, are new schools, and one, that of Upper M'Donald, is a change from a Church of England to a Public School. The Dural Church of England School also, which has been for three months closed, will be opened at the beginning of the ensuing year as a Public School. A third Church of England School, that of Upper Colo, has been surrendered ; and, with the view of better ministering to the educational necessities of the locality, two Half-time Schools have been opened in its stead.

As allowed by the Act, a Roman Catholic School, recently opened at Villa Maria, has been added to the number of schools of that denomination under the Council. One Presbyterian School, improperly so named, suspended operations at the close of the third quarter of the year—mainly through the little local support that it was receiving, which furnished evidence that its continuance was not a matter of local concern. Of the nine Provisional Schools, five have been but recently opened, and one is a school that had been in operation for a short time in 1867 but which had been closed for about a year. Before passing from the numbers and description of schools, it is of consequence to note that several applications for Public and Half-time Schools have been dealt with, and that progress is being made towards their establishment.

II.—INSPECTION OF SCHOOLS.

All the eighty schools above specified have been regularly examined once during the year, with the exception of eight. Not a few of them have been visited on other occasions. Of the eight schools not regularly examined, all but three have been visited, namely,—Lane Cove Presbyterian, and the Provisional Schools at Wright's Creek and Upper M'Donald, neither of which was in operation when the schools in their respective localities were inspected.

Of the seventy-two schools thoroughly examined, a concise history will be found appended to this Report, in the Annexes and Detailed Statement, thus :—

Annex A shows the material condition of the schools,

B shows the numbers and ages of the pupils on the rolls, and present at the examination,

C shows the moral character of the schools,

D shows the character of the instruction,

E shows the proficiency of the pupils ;

and the Detailed Statement gives a verbal summary of tables A C D and E.

From Annex B is deduced the following interesting information. Of pupils upon the rolls of the several classes of schools, the percentage present at the examination may be thus expressed :—

24 Public Schools	79·3 nearly.
4 Provisional Schools	69·8
2 Half-time Schools	80
21 Church of England Schools	73·4
13 Roman Catholic Schools.....	70·8
4 Presbyterian Schools	78·2
4 Wesleyan Schools	71·7
30 Public Provisional and Half-time Schools	76·3
42 Denominational Schools.....	73·5

The whole condition, working, and results of these seventy-two schools were carefully inquired into. One standard was applied to all ; and one mode of examination was, as far as practicable, adhered to throughout. No doubt, there were instances in which the inspection was deemed by those interested rather exacting, unnecessarily observant, and searching ; but, as the grand aim of inspection is to ascertain fairly the value of a school as an educational institution, and to suggest remedies in cases of defect, a merely superficial examination would be as dishonest as it would be valueless. The moral condition of each school was determined by a full observation of the general conduct and demeanour of the scholars ; whilst the attainments in the ordinary branches of education were tested by oral and written examination, and compared with the Council's Standard before a final estimate was made. The expectations of some teachers have been disappointed ; they counted upon their pupils making a better appearance at examination than they did ; according to their opinion they had done their very best to secure good results. It is not implied that they had not done so, but it is asserted that they have not realized the position of intelligent successful educators ; they have not, to use a current expression, made themselves "master of their position." To do this, it is imperative that they closely and constantly study the subjects to be educated—minds, their capacities, peculiarities, and developments ; the objects to be presented to them with the view of opening, enlarging, strengthening, and cultivating them ; and the best mode of bringing these subjects and objects into active contact, so that good results may be reasonably calculated upon, and without fail secured.

Three things the teacher who will command success in his profession must not merely keep in view, but make the subject of anxious study,—the educable subject, the educating objects, and the educative manner. Without an intelligent and faithful attention to these particulars, fidelity, diligence, and energy are to a large extent expended in vain.

Having

Having thus briefly indicated the extent, manner, and aim of inspection, it may be best at this point to present, in a tabular form, the rank of the teachers employed by the Council in this district during the year :—

1.—TEACHERS IN PUBLIC AND HALF-TIME SCHOOLS.

1st Class.		2nd Class.		3rd Class.			Probationers and Pupil Teachers.
Section A.	Section B.	Section A.	Section B.	Section A.	Section B.	Section C.	
.....	1	1	4	8	7	6	8

2.—TEACHERS IN DENOMINATIONAL SCHOOLS.

1st Class.		2nd Class.		3rd Class.			Probationers and Pupil Teachers.
Section A.	Section B.	Section A.	Section B.	Section A.	Section B.	Section C.	
.....	1	12	12	13	13

The teachers of the nine Provisional Schools have no classification ; they receive a salary at the discretion of the Council. A comparison of the above tables with last year's statement will show that a considerable number of teachers has been promoted. This promotion has not been attained by any single section of the teachers—it was open to, and secured by, all who diligently and effectively wrought for it ; and the consequence, no doubt, will be, to excite profitable inquiry, and to stimulate latent talent among teachers, so that the ensuing year may be more marked by progress than the past.

Much need not be said about the character and general fitness of teachers for their office. The very fact of their holding office ought to be their testimonial. That such is not invariably the case, is a matter of regret. There are undeniably persons holding the office of teachers, whose fitness for that position appears never to have been seriously taken into account. They have in some manner got into that office, and the difficulty with which the Council has to contend, is how best to dispose of them without treating them with any seeming harshness. The cases thus pointed to are comparatively few. The great majority of the teachers are reasonably fitted, both as regards moral character and attainments, for their part in the all important work with which the Council of Education is charged.

III.—ORGANIZATION.

In the great majority of the Public Schools, the organization generally ranks from fair to good. This estimate embraces the whole condition of the schools, from their situations to their internal fittings and working appliances. About one-seventh is less favourably circumstanced.

As regards the Denominational Schools, it will be observed by a reference to Annex A, that in respect of situations, buildings, and playgrounds, they compare well with the Public Schools. One drawback is deserving of notice, that many of these schoolhouses have been designed and fitted up for the double purpose of school and church ; they are thus well adapted for neither, but specially inconvenient for successful school work. In the matter of furniture, apparatus, and school documents, the comparison is less favourable to the Denominational Schools. Although a considerable improvement has taken place since last year, there are but very few schools of either class that are not in possession of a very fair supply of books ; and, as a rule, the keeping of these throughout all the schools is reasonably careful. There are a few exceptions—cases in which the teachers either do not care how the books are destroyed, or do not concern themselves about their preservation. If remonstrated with, the usual reply is, "We cannot help it, children will tear and soil their books."

IV.—DISCIPLINE.

There is still much room for improvement under this head. A great deal remains to be effected before the generality of schools can be regarded as in a truly healthy prosperous condition.

Of the Public Schools, it may be stated that five-sixths of them are under discipline ranging from fair to good ; while in the remaining sixth the discipline is about tolerable. In the Denominational Schools, the character of the discipline is represented thus :—

In Church of England Schools,	$\frac{4}{5}$ ths, fair to good.
" "	$\frac{1}{5}$ ths, indifferent to tolerable.
In Roman Catholic Schools,	$\frac{1}{3}$ rd, fair.
" "	$\frac{2}{3}$ rds, indifferent to tolerable.
In Presbyterian " Schools,	$\frac{3}{4}$ ths, fair to good.
" "	$\frac{1}{4}$ th, indifferent to tolerable.
In Wesleyan " Schools,	$\frac{3}{4}$ ths, fair to good.
" "	$\frac{1}{4}$ th, tolerable.

In all Denominational Schools, taken collectively, the proportion that reaches the description of fair to good is about one-half. This is not as it should be. It is true that in several of these schools an improvement in the description has taken place, but in some none is perceptible. In these latter, the teachers do not understand discipline, and they are totally incapable of exercising it. The character of the attendance of their pupils, and their behaviour at school, do not appear to give them much concern. Hence it is, that complaint has so often to be made respecting unsatisfactory attendance, and indifferent order. Hence it is, that the moral tone of such schools ranks low. The elevating and adjusting lever of a vigorous healthy discipline is either not employed at all, or employed without firmness, uniformity, and skill. There are teachers who are remarkably strict some days, nay even severe, on the point of regularity, punctuality, cleanliness, and order ; and, on other days, indifferent and lax. Discipline, to be healthy and profitable, must be strict and firm without harshness, steady and uniform without vacillation. Were the subject of discipline more fully understood than it is, and did it more thoroughly pervade and influence the whole being and operations of the schools at large than it yet does, their whole appearance would be marked by a beauty hitherto not theirs, their moral atmosphere would be charged with health, and cheering results would furnish abundant matter for congratulation.

Teachers,

Teachers, it is readily admitted, have many obstacles to the maintenance of effective discipline; but, by firmness and consistency on their own part, these obstacles may be successfully met and overcome. Even the indifference of parents, their carelessness in the all-important matter of sending their children regularly and punctually to school, and their unreasonable exactions upon their children's time—keeping them at home often for the merest trifles—may be largely remedied by the prudence and consistent firmness of the teacher. Regularity and punctuality of attendance on the part of the pupils are tolerably reliable indications of the character of the discipline in their schools; they usually accompany each other. Regular scholars are ordinarily punctual. This being the case, it is of consequence that, as regards these two points, the relative merits of the several sections of schools—Public and Denominational—be given in a tangible form. That this may be done fairly, the following calculation is made from the returns for the last quarter of the year. It gives therefore the attendance of pupils at the several schools, as compared with the numbers upon the rolls, for a period of three months, and shows the percentage to have been,—

In Public Schools	69.5 per cent. average attendance.		
In Church of England Schools	68.3	"	"
In Roman Catholic Schools	66.9	"	"
In Presbyterian Schools	72.1	"	"
In Wesleyan Schools	70.8	"	"

A noticeable feature here is, that in the schools where the number of free scholars is the greatest the attendance is generally the worst. This remark is, to some extent, borne out by the following particulars, deduced from the same quarter's returns:—

Schools.	Av. att. of Pupils.	School Fees paid.	Rate per Pupil.
24 Public	1,134	£317 9 5	£0 5 7
20 Church of England.....	936	270 16 11	0 5 9
13 Roman Catholic	553	93 5 4	0 3 4½
4 Presbyterian.....	166	33 6 10	0 3 11½
5 Wesleyan	204	59 15 7	0 5 10

In the matter of school fees, some teachers are to blame. Instead of commanding a good attendance at their schools by the efficiency and success of their teaching, they try to secure it by admitting children at merely nominal fees. Teachers have urged that they are obliged to do so, and even to admit without any fee, in order to keep up their number. In such cases one would not expect the moral tone to be very elevated.

In its bearing upon cleanliness and order, the discipline of several of the schools has considerably improved, and many of the teachers show a laudable desire for greater efficiency in the whole field of discipline.

V.—INSTRUCTION.

The instruction throughout the schools generally has improved, both in character and amount. A more judicious classification has been observed, the pupils have been better employed, and there has been an increased efficiency in the methods practised. In the great majority of schools one classification for all the subjects now prevails, the classes are more steadily and profitably occupied, and more tact and intelligence are displayed in the art of teaching. This is not universally the case; there are still schools in which the classification is irregular, and the arrangement of the pupils improper and unwise. In a few schools there is an unnecessary and valueless multiplication of classes, the teachers overlooking their incompetency to manage even a few classes efficiently, and being guilty of the absurdity of thus rendering their incompetency and inefficiency more apparent to all but themselves. They may in this manner deceive many parents, but to intelligent observers they merely exhibit their incapacity.

In the majority of schools the time is fairly distributed among the different classes, and in proportion to the relative importance of the subjects taught. In some instances still, the time-tables, programmes, and registers of lessons, although they have an existence, must be regarded as mere formal and unreliable documents. The time allotted to particular lessons is not adhered to, nor are the lessons proposed regularly given. Professedly, the subjects of instruction are nearly the same in all the schools, and in a very considerable majority there is a reasonable approach to the Council's requirements.

Of the methods employed little need be stated. In all the Public Schools, with only two exceptions, they range from fair to good. In the Denominational Schools, taken collectively, they range from fair to good in three-sevenths, and from indifferent to tolerable in four-sevenths. Greater precision and more penetrativeness are much wanted in the teaching generally. And here it may be given as an axiom, that that is the best method and he is the best teacher, under which and by whom the scholars are most successfully trained to teach themselves.

Reading.—In a great majority of the schools reading is taught with considerable care. The care in most cases, however, is limited to the bare pronunciation and meaning of the words, coupled with a little superficial explanation and questioning. This is made too apparent when classes are minutely examined respecting the amount of knowledge which they possess of the lessons read. The answering is generally too limited, often inaccurate, showing that the teaching has, to some extent at least, been unsuccessful. In a very small minority of schools, the teaching of reading consists in the mere listening to the children going through a few ill-enunciated sentences, and giving them a few spellings. In a fair number of schools, both Public and Denominational, a healthier state of things exists. Good, intelligent reading, with proper emphasis and expression, is aimed at, and reasonable advance is being made towards it. To be successful in this most important branch of education, teachers must not merely read and study and fully acquaint themselves with the lessons, but they need to read them aloud to themselves, in order to gain their proper expression, and thus be fitted for presenting to their classes patterns of intelligence and effective reading. In this way very much may be done to improve and elevate the department of reading in the schools at large.

Writing.—Although this is almost wholly a mechanical art, it is not the less necessary that proper attention be paid to it. This appears to be realized, for the writing in most of the schools is, upon the whole, fair; in some it is good.

Arithmetic.—Generally, this vastly important branch of education is not cultivated with that enlightened and practical common sense which is essential to its utility and value being realized by the pupils. There is still, as it were, too much following a beaten track—doing a stereotyped class of sums according to a given plan. There is no mental culture in this. Thought is not exercised, reasoning is unnecessary, and common sense is ignored. This evil has been pretty fully pointed out to many teachers, and there is good reason for expecting a beneficial change. In several schools arithmetic is intelligent in its principles and operations, so as to be available in the business of every-day life.

Grammar.—In a fair proportion of schools grammar is better taught than formerly. The patterns of parsing and analysis have been of service in directing teachers to a more exact and uniform system of studying grammar, and of teaching it in their schools. These remarks, which apply mainly to Denominational Schools, do not, by any means, apply to the whole of these schools. There are several of them in which improvement under the present teachers need hardly be looked for. Throughout the Public Schools generally, the subject of grammar is taught with fair skill and success.

Geography.—Considerable improvement has taken place in the teaching of this branch in many of the schools. This is most marked in the case of several Denominational Schools in which formerly little profitable attention had been paid to it. In too many of these schools, still, it is almost solely an exercise of memory, the children being required to learn by rote paragraphs from books, instead of

of having their mental faculties generally profitably exercised and carefully cultivated by lessons properly given. In some of the Denominational Schools, and in many of the Public Schools, frequent recourse is had to the black-board in order to illustrate and render more interesting and effective lessons in geography.

Object Lessons.—In almost all the schools object lessons are given; but, in not a few instances, they are given in such a way as to make it evident that their nature and design are not comprehended. Talking to a class about some object, or reading to it from a book on object lessons, is not an unfrequent mode of giving an object lesson. This method may lull the majority of a class into a state of drowsiness; but most certainly it will not rouse it to a state of mental activity and energy.

Drawing and Music.—There are now but few schools in which these subjects are not to some extent taught. In many, the teaching is not of much value; in several, it is very successful. There is an objectionable tendency in a few teachers to give these two subjects an undue prominence; so much is this the state of the case, that these are almost the only subjects that reflect credit upon their schools, and to the proficiency of their pupils in which the attention of visitors is invited.

In nearly all the schools, considerable attention is paid to the teaching of needlework. In all the Public Schools, and in several of the others, the Scripture lessons are regularly taught, and, in the majority of instances, fairly comprehended. Annexes D and E exhibit, in a tabular form, the character of the instruction given, and the proficiency attained by the pupils in the several classes of schools.

VI.—LOCAL SUPERVISION.

This is a matter of the highest importance to the healthy successful working of the schools. It is not as yet almost in any case so fully realized as it ought to be. Some Local Boards discharge their duty very fairly; others are rather neglectful. As regards Denominational Schools generally, the Clergymen are virtually the Local Boards, in so far at least as the supervising of the schools is concerned.

VII.—RESULTS OF INSPECTION.

Upon the whole, these are reasonably satisfactory. Perceptible progress has been made in the right direction; the means of education have been more widely diffused; many teachers have been stirred up to greater diligence and energy; and their schools give evidence of greater efficiency.

ALEXANDER L. FORBES, A.M.,
Inspector of Schools, Cumberland District.

DETAILED STATEMENT of the Condition of Schools in the Cumberland District, inspected during the Year 1868.

1.—PUBLIC SCHOOLS.

CASTLEREAGH :—Visited, 19th May.

Present at examination :—Boys, 12; girls, 9; total, 21.

1. The school building is in very bad condition. 2. The pupils are tolerably punctual but irregular in their attendance. In person and dress cleanliness and tidiness are observable, and their conduct generally is becoming. 3. The methods employed are fairly suitable and effective. 4. The results produced are very fair.

COLYTON :—Visited, 27th May.

Present at examination :—Boys, 18; girls, 24; total, 42.

1. Generally the material condition of the school is good. 2. The discipline is, upon the whole, fairly satisfactory. 3. The work of teaching is carried on with fair intelligence and earnestness. 4. The attainments and progress of the pupils are reasonably good.

DOBROYDE :—Visited, 17th September.

Present at examination :—Boys, 18; girls, 27; total, 45.

1. The material condition is very good. 2. The discipline is not so effective as is desirable—and, as a consequence, the moral aspect of the school is less pleasing than otherwise it would be. 3. The instruction is careful, but wanting in animation and force. 4. The attainments range between moderate and fair.

FIVE DOCK :—Visited, 16th September.

Present at examination :—Boys, 38; girls, 30; total, 68.

1. The schoolroom is good and well supplied with all requisites. 2. The discipline is fairly effective, and the moral aspect of the school is pleasing. 3. Fair skill and efficiency characterize the teaching. 4. Reasonably satisfactory progress has been made, and the attainments are, on the whole, fair.

FREEMAN'S REACH :—Visited, 26th June.

Present at examination :—Boys, 21; girls, 8; total, 29.

1. The schoolroom is in tolerable condition; some articles of furniture are wanting, and the necessary outside arrangements require to be made more becoming and complete. 2. The discipline is not effective to the producing of pleasing results. 3. The instruction accords with the prescribed course, and the methods employed are tolerably appropriate. 4. The proficiency ranks between tolerable and fair.

LLANDEILO :—Visited, 4th June.

Present at examination :—Boys, 21; girls, 21; total, 42.

1. The schoolroom is reasonably satisfactory, but the teacher's house is in very bad condition. 2. The discipline is tolerably effective. 3. The Standard Course is followed as regards the subjects, whilst the methods are tolerably appropriate, but wanting in animation and energy. 4. Taken as a whole, the attainments are passable.

LUDDENHAM :—Visited 28th February.

Present at examination :—Boys, 28; girls, 25; total, 53.

1. The schoolhouse is a good brick building, in fair condition, and suitably furnished. The teacher's residence requires repair. 2. The moral aspect of the school is tolerably pleasing. 3. The subjects of instruction are regulated by the prescribed standard, and the methods employed are, in the main, modern and reasonably successful. 4. The attainments, as a whole, are nearly fair.

MANLY :—Visited, 3rd November.

Present at examination :—Boys, 30; girls, 5; total, 35.

1. The school organization, as a whole, is very fair. 2. Blemishes still mar the moral aspect, showing that the discipline is not effective. 3. The methods of teaching would be of far more value were they practised with sufficient animation and persistence. 4. The proficiency is little beyond tolerable.

MCDONALD RIVER (Lower) :—Visited, 1st September.

Present at examination :—Boys, 15 ; girls, 7 ; total, 22.

1. A slab building, in tolerable condition. 2. The discipline is healthy, and the moral tone fairly pleasing. 3. The teaching is earnest and intelligent. 4. Satisfactory progress is being made.

MCDONALD RIVER (Central) :—Visited, 2nd September.

Present at examination :—Boys, 16 ; girls, 10 ; total, 26.

1. The material condition of the premises generally is very unsatisfactory ; an entirely new organization is much required. 2. The discipline is tolerably effective. 3. As regards skill, the methods in use are above tolerable. 4. The proficiency may be regarded as nearly fair.

MCDONALD RIVER (Upper) :—Visited, 7th September.

Present at examination :—Boys, 18 ; girls, 9 ; total, 27.

1. The building is reasonably good, but insufficiently and unsuitably furnished. 2. Discipline is little understood or beneficially practised. 3. The more ordinary subjects are presented to the pupils with but little skill and benefit. 4. The attainments are very low, and the progress is too imperceptible.

LOWER HAWKESBURY :—Visited, 8th September.

Present at examination :—Boys, 8 ; girls, 13 ; total, 21.

1. The building is good ; but as its main end is for Church purposes, its internal arrangement and fittings are not the most suitable or convenient for a school. 2. The moral aspect of the school is, all circumstances considered, satisfactory. 3. The ordinary subjects of instruction are dealt with in a careful and painstaking manner. 4. The attainments, though low, are, considering the circumstances of the school, tolerably satisfactory.

NORTH SYDNEY :—Visited, 30th October.

Present at examination :—Boys, 10 ; girls, 17 ; total, 27.

1. Materially considered, the school is fairly organized. 2. Healthy discipline prevails, and the moral tone is, in the main, pleasing. 3. The instruction is given with earnest care and fair effect. 4. The attainments are creditable, and the progress made is reasonably satisfactory.

PARRAMATTA :—Visited, 5th and 7th August.

Present at examination :—Boys, 108 ; girls, 56 ; total, 164.

1. In all essentials the school, materially viewed, stands well. 2. It is under healthy discipline, and its moral attitude is highly pleasing. 3. The prescribed subjects are taught with liveliness, energy, and effect. 4. The average proficiency ranks from fair to good.

PENNANT HILLS :—Visited, 27th August.

Present at examination :—Boys, 44 ; girls, 28 ; total, 72.

1. The whole material condition and arrangement of the premises are very unsatisfactory. 2. The discipline might advantageously be exercised with more decision, firmness, and permanence of effect. 3. Earnestness and care mark the teaching, which would be improved by greater regard to penetrativeness. 4. The progress is tolerably good ; and, making allowance for difficulties arising from unsuitable accommodation, the attainments are satisfactory.

PENRITH :—Visited, 19th March.

Present at examination :—Boys, 38 ; girls, 19 ; total, 57.

1. The material condition of the school is, upon the whole, fairly satisfactory. 2. The discipline is firmly exercised, and the moral tone is, in its more prominent features, healthy. 3. The prescribed subjects of instruction are taught with considerable skill and effect. 4. The progress is perceptible, and the attainments are, as a whole, fair. The present teacher has been but a short time in charge.

PETERSHAM :—Visited, 18th September.

Present at examination :—Boys, 38 ; girls, 32 ; total, 70.

1. The schoolroom is wholly unfit for its purpose. 2. The discipline is fair. 3. The teaching is, in the main, tolerably skilful and effective. 4. The attainments rank from tolerable to fair.

PROSPECT :—Visited, 21st May.

Present at examination :—Boys, 20 ; girls, 13 ; total, 33.

1. The school is kept temporarily in a building that is tolerably good and suitable, and well furnished. 2. The moral character of the school is fair. 3. The instruction is carefully imparted. 4. Reasonable progress is being made.

RICHMOND :—Visited, 13th and 14th July.

Present at examination :—Boys, 41 ; girls, 34 ; total, 75.

1. The schoolroom is good and well-furnished, but too small for the attendance. 2. The discipline is not of that steady, firm, and dignified character which naturally begets and maintains easy and ready obedience and respectful demeanour. 3. Considerable energy and fair skill mark the teaching ; at the same time there is felt the want of sufficient earnestness and effect. 4. The attainments range from tolerable to very fair.

RYDE :—Visited, 2nd and 3rd December.

Present at examination :—Boys, 90 ; girls, 81 ; total, 171.

1. This school consists of two departments—advanced and infants. The whole premises are in good condition, and well and suitably fitted out. 2. The discipline in both departments is carefully and beneficially maintained, and the moral aspect is, on the whole, pleasing. 3. The instruction, both as regards subjects and methods, is fairly satisfactory. 4. The progress made is creditable, and the attainments, for the time of the school's existence, may be accounted fair.

SMITHFIELD :—

SMITHFIELD :—Visited, 23rd July.

Present at examination :—Boys, 19 ; girls, 16 ; total, 35.

1. The whole material condition of the school is reasonably good. 2. The discipline is tolerably effective. 3. Instruction is fairly well regulated and imparted. 4. The attainments are nearly fair.

ST. ALBAN'S :—Visited, 3rd September.

Present at examination :—Boys, 16 ; girls, 10 ; total, 26.

1. The school is conducted temporarily in a small wooden building, fairly furnished. 2. The discipline wants force and firmness. 3. The teaching is marked by diligence and care. 4. The attainments are low ; but, for the time of the school's existence, the progress is reasonable.

ST. MARY'S :—Visited, 5th June.

Present at examination :—Boys, 16 ; girls, 13 ; total, 29.

1. The schoolroom is in fair condition, and the furniture has been improved in character and arrangement. 2. The moral aspect is, on the whole, healthy. 3. The ordinary subjects are taught. The methods, as such, are tolerably appropriate ; animation and energy are wanting in their application. 4. The attainments may be estimated as tolerable.

WALLGROVE :—Visited, 20th March.

Present at examination :—Boys, 16 ; girls, 13 ; total, 29.

1. The schoolroom is fairly suitable, and adequately furnished. 2. The moral tone is, on the whole, pleasing. 3. The instruction is imparted with considerable care and effect. 4. The proficiency of the pupils ranks from tolerable to fair.

2.—PROVISIONAL AND HALF-TIME SCHOOLS.

LOWER PORTLAND :—Visited, 19th June.

Present at examination :—Boys, 4 ; girls, 9 ; total, 13.

1. The building is very fair, but unsuitable, and insufficiently furnished. 2. The discipline is feeble, and the moral aspect unsatisfactory. 3. The methods are merely mechanical, and of little effect. 4. The attainments are small.

NEWINGTON :—Visited, 15th July.

Present at examination :—Boys, 14 ; girls, 12 ; total, 26.

1. The building is old, and very uninviting in appearance. The furniture is rude and insufficient. 2. The moral aspect is tolerably satisfactory. 3. The instruction is imparted with diligence and care, but the methods employed are chiefly mechanical. 4. The attainments are tolerable.

SACKVILLE REACH :—Visited, 18th June.

Present at examination :—Boys, 10 ; girls, 9 ; total, 19.

1. The material condition of the school is tolerably good, and it is fairly furnished. 2. The discipline is neither firm nor effective. 3. Mechanical teaching prevails, and the results are meagre. 4. As a consequence of the character of the teaching, the attainments are very small. There is little mental development or culture.

SHANCAMORE :—Visited, 27th February.

Present at examination :—Boys, 9 ; girls, 7 ; total, 16.

1. The schoolroom is a new slab erection, unfloored, and insufficiently furnished. 2. The discipline is worthless, and the moral tone low. 3. The teaching is fitful, and of little real value. 4. The proficiency is very small.

UPPER COLO (Half-time) :—Visited, 26th November.

Present at examination :—Boys, 6 ; girls, 4 ; total, 10.

1. The school premises are in bad condition generally, and the furniture of the schoolroom is bad, unsuitable, and insufficient. 2. The discipline is fairly healthy. 3. The instruction is imparted with fair skill and success. 4. As a whole, the progress is creditable, and the proficiency fair.

WHEENEY CREEK (Half-time) :—Visited, 25th November.

Present at examination :—Boys, 2 ; girls, 4 ; total, 6.

1. The school is conducted in a tolerably sized room of a private house. It is insufficiently and unsuitably furnished. 2. The discipline is fairly healthy. 3. The ordinary subjects are taught, and the methods employed are fairly appropriate and successful. 4. The proficiency is generally satisfactory.

A. L. FORBES, A.M.,
Inspector of Schools, Cumberland District.

GOULBURN DISTRICT—INSPECTOR'S GENERAL REPORT FOR 1868.

I BEG to submit, for the information of the Council of Education, my General Report upon the condition of the Public, Provisional, Half-time, and Denominational Schools inspected by me in the Goulburn District during the year. A statement containing a separate abridged abstract of my report upon each school is hereunto appended. The remarks chiefly relate to the material condition and organization of the schools, the general discipline and moral training of the pupils, the subjects and methods of instruction, and the general progress of the scholars in learning.

SCHOOLS IN OPERATION.

When I took charge of the district on 1st April, there were 95 schools in operation, attended by 4,565 scholars, as hereafter set forth:—

31 Public Schools, attended by 1,635 pupils: average for each school,	52
3 Provisional	21
14 Half-time	19
23 Church of England	49
23 Roman Catholic	61
1 Presbyterian	55

Now, 26th December, 1868, there are 118 schools, attended by 5,560 scholars, being an increase of 23 schools and 995 children. The following statement shows the number of each class of schools in operation in the district at the close of the year, with the attendance of pupils.

35 Public Schools, attended by 2,162 pupils: average for each school,	61
19 Provisional	30
28 Half-time	17
17 Church of England	58
18 Roman Catholic	71
1 Presbyterian	62

On 30th June, in accordance with the 29th section of the Public Schools Act, on account of the small attendance of pupils, the certificates were withdrawn from the Church of England Schools at Bungendore, Tarago, Pejar, Gundaroo, Crookwell, and Kippelaw; and from the Roman Catholic Schools at Breadalbane, Bungonia, Spring Valley, Laggan, and Michalago; but the Council granted aid to Provisional Schools at all these places, from 1st July, excepting Kippelaw, which was not in operation at the time the certificate was withdrawn, and from which no application for aid was received.

OCCUPATION OF TIME.

As already stated, I took charge of the Goulburn District on the 1st April. Immediately after entering upon my duties I was engaged receiving and examining the returns of the schools for the previous quarter of the year, compiling the abstracts, and attending to accumulated correspondence. Some time was employed reporting upon special matters relating to the Armidale District, and in making preliminary arrangements for the establishment of the Public School at Goulburn, which was formally opened to the public on the 6th May, by the Honorable Henry Parkes, M.P., President of the Council of Education, in the presence of a large assembly of citizens and others interested in educational progress. Having arranged a programme of work for the year, I commenced the inspection of schools on 27th of May; but owing to the numerous applications for new schools, the large amount of correspondence from the Council's Office requiring immediate attention, and some of which I was unable to report upon within the year, prevented me from visiting many schools which should have been inspected. I, however, visited—

15 Public Schools
9 Provisional
6 Half-time, and
19 Denominational.
31 Teachers were examined
1 Assistant
2 Pupil Teachers
7 Candidate Teachers, and
3 Candidate Pupil Teachers.
720 Communications were written on the Council's business.
1796 miles travelled.

The following places were visited, in order to report upon applications for new schools:—

Breadalbane	Currawang
Gundaroo, Upper	Gundaroo, Lower
Bungendore	Fairy Meadow
Carwoola	Foxlow
Tarago	Pejar
Middle Creek	Cottah Wallah
Woodhouselee	Tarlo
Yelbraith	Richlands
Spring Valley	Bungonia
Murrumbateman	Gap Range
Boro	Mummell
Araluen	Jembaicumbene

Elrington.

Prompt attention to the examination of the returns at the close of the quarter, supplying blank forms, and school records, with directions and information upon different matters, to the teachers of so many as 118 schools, occupy much time, when the Inspector has personally to perform all duties of detail; but as I become more fully acquainted with the educational requirements of the district, I shall be better able to report upon matters relating to the management of the schools.

CHARACTER OF THE INSPECTION.

In every school inspected, careful inquiry is made as to the observance of the Council's regulations, the kind of books in use, the character of the documents on the walls of the schoolroom, the suitability of the time-tables and occupations of the scholars, and if the school records are correctly and neatly kept. The suitability of the site, the size, repair, and cleanliness of the schoolroom, the condition and suitability of the teacher's residence, the extent of the playgrounds, condition of fencing, out-offices, sheds for protection from sun and rain, flower-borders and master's garden, are noted, together with the condition, quantity, and suitability of furniture, apparatus, and books, and classification of the pupils. As regards discipline, the punctuality of both teachers and pupils is noted, the regularity of the scholars as exhibited on the roll book, the cleanliness of the school premises, furniture, and apparatus, of the pupils in dress and person; with the order, moral tone, and government of the school, including the demeanour, manners, general conduct, and attention of the pupils under examination, and teacher's example as regards language, moral influence, and inculcation of truth, honesty, temperance, kindness, and politeness. In the next place come under consideration the subjects of instruction, the methods

methods of tuition, the individual attainments of the scholars, their time in class, the number promoted to higher classes during the year, the rate of school fees, the number of free pupils, the practical skill and usefulness of the teachers, and the efficiency of the local supervision. At the conclusion of the inspection of every school, if required, such suggestions are made to the teacher or School Board as are considered necessary to improve the schools and benefit the public; but before forming a final judgment on the state of the school, the teacher is allowed an opportunity of explaining the causes of defects in the management, and of stating any matters which may be considered of importance. Attention to all the details requires much time, diligence, and thoughtfulness on the part of the Inspector. The inspection of a Half-time or a Provisional School generally occupies from three to five hours, and an ordinary Public or Denominational School from five to eight hours; but in schools attended by a large number of pupils, or where there are two or three separate departments, the time occupied varies from two to three, and sometimes five days.

ORGANIZATION.

In almost every instance the schools inspected are centrally and suitably situated. A number is held in churches, and the buildings are generally in good repair, but in most cases they are not well furnished, without fire-places, and very cold and uncomfortable in winter. In few cases are the school-houses of a very bad description, but they are not well furnished, the furniture being either unsuitable or insufficient in quantity. Of the schools inspected, a small number is vested in the Council; and although there are a few very suitable and substantial school buildings, there are some schoolrooms too small and otherwise unsuitable for the purposes of teaching, and in some cases the necessary out-offices are wanting. In several places the residences of the teachers are not sufficiently comfortable, nor the schoolrooms in good repair, but this is in many instances owing to the protracted drought, the depressed state of the Colony, and the extreme poverty which prevails among the agricultural classes. In general the schools are fairly provided with books and apparatus, and where the stock of these articles was found insufficient, applications in most cases had been made for a supply. In several schools I found no programmes of school work in use, and in some cases when these documents were prepared they were unsuitable. Nearly all the schools are well supplied with maps, and in most cases with clocks. The classification of the pupils is tolerably judicious in most respects, and the school records, with but few exceptions, carefully kept. In some schools the promotions of the scholars, the school-fees paid, and the quarter of enrolment of the pupils were not recorded at the proper time, nor the class-roll duly closed at the end of the quarter. Excepting in a few instances, the returns of the schools have recently been furnished with correctness and despatch.

DISCIPLINE.

The schools generally admit of considerable improvement in this respect. The pupils in many instances are unpunctual, talkative, and not sufficiently attentive to their work. In the majority of the Public and Denominational Schools the cleanliness is tolerably satisfactory, but in several instances the daily inspection of the pupils is either neglected or not sufficiently strict. The irregularity of the children's attendance is often a source of complaint with teachers; but on the whole, the attendance was tolerably regular for the last quarter of the year, being 70 per cent. daily for the number enrolled. In any individual case, however, it is unquestionable that the degree of regularity greatly depends on the character of the teacher. Excessive irregularity is frequently assigned as the cause of the low condition of a school; but experience teaches that it is generally, in reality, the result of the bad management of a teacher, for both parents and pupils naturally become indifferent when the discipline and instruction are of a worthless character. On the other hand, a good, cheerful, popular school exerts an attractive influence over the children—they become anxious for learning, are less liable to be kept at home, attend with increased regularity and in greater numbers. Of course, floods, sickness, and disease frequently affect the attendance of pupils, but in these features of the case the teacher is not often to blame.

In many schools the scholars are unpunctual in the morning. I have inspected some schools where the business, according to the time-table, commences at 10 o'clock, and the pupils come into school, singly and in groups, up to within a few minutes of 11. Among the many circumstances which are indicative of a badly-managed school, the want of punctuality, when allowed to an extreme, is perhaps the most infallible; it is the consequence of indifference and the want of vigilance on the part of the teacher. Children, if left to themselves, will never be punctual, no matter how late the hour for commencing business. Perhaps the most effectual remedy for latecomers is, to detain them in the evening for 30 or 40 minutes after school hours; this, combined with the remonstrance of the teacher, never fails to ensure punctuality; but I regret that in this district it is not generally practised with sufficient strictness. As regards order, it will be admitted by all that when anything has to be done it should be done in an orderly manner. In many matters success depends upon attention to order, and among these may be reckoned the management of a primary school. Children are naturally restless and noisy, and when many of them are together it would be impossible to direct their efforts to any good end, unless kept under proper control; but by strict discipline their natural restlessness is made to contribute to their advancement. Order and uniformity of action, discipline, and strict attention to work among the pupils attending the greater number of all classes of schools in the district admit of much improvement. Strict attention to the details of marching drill is not generally observed; and even in schools where the discipline is considered the most perfect, the time is wasted which is set apart for other duties, in repeating orders which are not, when first given, promptly obeyed. A school or class under proper discipline is so trained to habits of order and obedience that the pupils, when told what to do, do it exactly as it ought to be done, without a second command; but this excellence does not obtain in many schools. In several cases more convenient arrangements are required for the children's hats, bonnets, and lunch. The attention of the teachers has, however, been directed to such improvements as are necessary; and it is to be hoped that beneficial results shall follow. In nearly all cases, I found the teachers very willing to adopt my suggestions.

SUBJECTS OF INSTRUCTION.

The course of instruction, in the majority of the schools in the district, includes reading, spelling, and explanation of words, writing from copies and from dictation, slate and mental arithmetic, grammar, composition, and analysis of the English language, object lessons on animals, vegetables, minerals, and manufactures; elementary mechanics, social economy, the laws of health, and duties of citizens; singing, drawing, Scripture; needlework for the girls; and, in some schools, book-keeping, mensuration, geometry, and algebra, with the elements of Latin, for the advanced boys. In two Half-time Schools and one Provisional, the only subjects taught are reading, writing, and the elements of arithmetic; and in five Provisional, one Roman Catholic, and one Presbyterian, there is no instruction given upon object lessons. In twelve schools, made up of Public, Provisional, and Half-time, and in six Denominational Schools, drawing is not taught; nor music in nearly the same number. Needlework is taught in all the schools, excepting six, conducted by unmarried men; but in few do the advanced boys learn the elements of mathematics or classics.

PROFICIENCY

PROFICIENCY OF PUPILS.

The following table shows the number of pupils learning the different branches at the time of inspection :—

Learning—The alphabet, and to read monosyllables	825
To read easy narrative	567
To read ordinary prose	435
To write on slates	835
To write on paper	910
To write from dictation	1,062
Simple rules of arithmetic	1,275
Compound rules	313
Advanced rules	224
Elements of English grammar	580
Advanced parts of the subject	371
Analysis and composition of English language	297
Elements of modern geography	586
Advanced parts of the subject	401
Scripture	1,102
Lessons on common things and objects	1,621
Drawing	671
Vocal music	750
Latin	24
Algebra	31
Geometry	36
Mensuration	27
Book-keeping	13
Needlework, knitting, netting, crochet, &c.	628 girls.

From this statement, it appears that of the 1,827 pupils examined, 825 are learning the alphabet and to read monosyllabic composition; but it must be remembered that 843 are not over seven years of age—that several schools have been recently opened—that many of the children have been but a short time under instruction. The following statement shews the classification of the pupils :—

First class	458 boys, 367 girls; total, 825
Second class	304 " 263 " " 567
Third class	192 " 188 " " 380
Fourth class	42 " 13 " " 55

The condition of both Public and Denominational Schools, as regards the character of the instruction and the attainments of the pupils, is much the same in most respects. In the majority of the schools, the proficiency of the pupils varies from *moderate to tolerable*; in three or four the attainments are *small*, and in a few cases *fair* or perhaps a little over that degree of progress. When a school is inspected, the answering of the pupils is carefully noted, and the teacher has the advantage of his scholars, being examined upon the subjects which he professes to have taught them. The standard used for measuring results is as follows :—When a class is undergoing examination, if each pupil answers his question correctly, the proficiency is marked *excellent*; if seven in eight answer, the progress is noted *very good*; if three in four answer, it is considered *good*, or up to the standard of attainments required by the Council; if five in eight answer correctly, the mark is *very fair*; and if half the pupils answer, *fair*; if three in eight answer the questions put to them, the progress is considered *tolerable*; but when only one in four of the scholars are able to answer upon the subjects which the master professes to have taught them, the proficiency is estimated as *small, slow, or unsatisfactory*. Now, if the general condition of the schools, as above mentioned, is compared with this standard, it will be observed that the efficiency of the instruction and general progress of the scholars admit of much improvement in a large number of both Public and Denominational Schools. In many schools the pupils read with hesitation and indistinctness, in others the enunciation is rapid and often incorrect, and it is remarkable how little attention is paid to the punctuation. In a considerable number the reading is passable, but it is evident too little attention is paid to the meanings of words and the matter of the lessons. Spelling is not well taught, although writing from dictation is common in most of the schools, but I find that sufficient attention is not given to the correction of the exercises. The penmanship in some cases is creditable, but in the majority of the schools it is not performed in a sufficiently careful manner; the errors of the pupils in imitating the copies are not corrected in due time; sometimes the copies are not of a suitable description, and many teachers do not appear to be aware that success in teaching writing depends upon effort and care on the part of the pupils, and vigilant supervision on the part of the master. As regards arithmetic, there are but few schools where it is well taught. The methods which ensure success are but little understood; the principles are seldom rightly introduced to the pupils, and the elements—such as tables, notation, enumeration, and the simple rules—are not sufficiently dwelt upon. There is too little competitive work among the pupils, and mental calculation is much neglected. In grammar, the attainments are tolerable in a considerable number of schools. The pupils in the second class can generally distinguish the greater number of the parts of speech, and in some cases can parse etymologically. In the third class, although sometimes not much in advance of the second, the pupils can generally parse syntactically, and are making some progress in the composition and analysis of the English language. There are a few schools where grammar is not taught, and in some the progress is small. About half the number of the pupils enrolled are learning geography, and a large number of these are studying the mere elements, such as the cardinal points, the topography of the school district, the uses of a map, the outlines of the geography of Australia, and the relative positions of the continents and oceans. The more advanced pupils are learning the physical geography of the globe, with Europe and New South Wales in detail. Nearly all the schools are well supplied with maps, but globes are found in few, and map drawing is not much practised. A large number of the scholars learn Scripture history, either from the Second, Third, or Fourth Book of Lessons or Scripture Extracts, published by the Commissioners of National Education in Ireland. Several applications were received during the year for a supply of the Scripture Lessons for Denominational Schools, the Local Boards having decided that they were more suitable for children than the Bible. The proficiency of the scholars in object lessons, vocal music, and drawing, admits of great improvement in nearly all the schools; and the teaching of needlework in all its details, to the girls, does not, in general, receive sufficient attention. The teachers are, however, all endeavouring to improve the condition of the schools; and there is little doubt but beneficial results must follow.

METHODS OF TEACHING.

Of the general style of teaching followed in many of the schools, particularly the method of questioning on the ordinary reading lessons, whether the object be to examine or instruct, I cannot speak very highly. The majority of the teachers are, however, willing to do their best; but in many cases they evince but little judgment or discretion in the mode of teaching the different matters they bring before the pupils, and the teaching is often wanting in earnestness and vigour. It can hardly be otherwise, when so many teachers go through their daily work as if it were a kind of mechanical routine, and come to their schools every morning without any special preparation for the business of the day—not having, perhaps, bestowed a single thought upon the lessons to be taught, nor the means by which the work can be most efficiently done. So long as teachers neglect to prepare carefully the work which daily

daily engages them, so long will it be vain to expect much improvement in the character and quality of the instruction they are employed to impart; and I am persuaded I cannot render the teachers under my supervision a greater service than by directing their attention to this matter.

"A Prussian teacher," writes Mr. Horace Mann, "no more thinks of meeting his classes without daily preparation, than a clergyman would think of preaching a sermon without special reading and forethought." Even in some good schools, the aim of the master seems to be to *instruct*, not *educate*,—to impart knowledge of a very useful kind, no doubt, but apparently without studying *so to impart it as to improve the mind of the pupil in the process of its acquisition*. The teachers are, however, aware that promotion depends upon the condition of their schools, and they have an evident desire to increase their practical skill. I have often suggested to inexperienced teachers that they must learn to distinguish between the mere child and the more advanced boy; their language must be simple, and the instruction imparted in such a manner as the youngest child can comprehend. Periodical repetitions of lessons are essentially necessary to ensure success; and satisfactory proficiency cannot be attained without thorough examination. Every error should be corrected by the pupil marking it after it has been pointed out by another, and every lesson imparted in such a manner as to improve the mind in the course of its acquisition. The three great means of instruction, are, *explanation, repetition, and interrogation*.

HALF-TIME SCHOOLS.

With regard to these schools, I am of opinion they will form a most important feature in the education of the Colony, in the sparsely populated districts. I was convinced of their utility several years ago. On 6th June, 1864, in consequence of free-selection, the dispersion of population, and the rapid settlement of the agricultural districts creating a necessity for additional schools, I wrote to the late Board of National Education as follows:—"There is no question which urges itself so much upon the Inspectors, as the immediate extension of the National system, to meet the educational requirements of the Colony more fully and satisfactorily. I am of opinion that some arrangements could be made for extending education into the isolated localities and sparsely populated districts of the interior. In order to do this, I think a number of itinerant teachers could be employed. Each teacher could attend two localities three days in each week, or three localities two days, if the places were not more than ten miles apart. The settlers at each place would be required to provide a schoolroom, furniture, and apparatus, and the Board would probably grant salaries to the teachers, and a stock of books, if sufficient funds were placed at their disposal." The late Board of National Education, however, was unable to take any action in the matter, chiefly from the want of funds. The establishment of Half-time Schools by the Council will, I am satisfied, in time, produce the most gratifying results. Even now, although few of them have been more than fifteen months in operation, the results are highly satisfactory. So far as I have inspected them, the teachers are painstaking and energetic in the performance of their duty; and in some cases, the progress of the pupils has surpassed my most sanguine expectations. In some of these schools I found a considerable number of children who commenced to learn the alphabet about a year or fifteen months ago, and they can now read ordinary prose, such as the Third Book, or Scripture Lessons, with tolerable correctness—write from copies or from dictation legibly—and are making some progress in the elements of arithmetic. The organization, discipline, and instruction of the schools in many cases admit of great improvement; but, on the whole, the success so far appears to me to be truly gratifying. The results, however, are quite in accordance with the views of some of the most eminent educationists of the present day. They say that manual and mental labour combined facilitates school instruction; and it is all but the universal testimony of the teachers and inspectors of Industrial Schools that the boys employed in spade husbandry learn far more readily than boys not so employed, and that although their time in school is shorter, they learn more quickly whilst there. Now I consider Half-time Schools are much like Industrial Schools, the pupils attend to rural industries at home under the direction of their parents for half their time, and they receive school instruction from the teacher during the other half. I fully concur in the views of Mr. Inspector Johnson contained in his report of last year, as to the success and future usefulness of Half-time Schools. There are 28 of these schools in the Goulburn District, attended at the close of the year by 474 pupils, being an average of 17 pupils for each school. The teachers report to me monthly the work done at each teaching station; and at the close of the year, in accordance with my request, each teacher furnished an annual report containing information as to the time he had been in charge of his schools, the number of pupils, the subjects taught, the number of miles travelled monthly, the classification of the pupils, and the number promoted by him to an advanced reading book or higher class. On an average the schools have not been much over a year in operation, and 523 scholars attended in 1868. During the year, 110 children were promoted to advanced reading books, and 116 to higher classes, and at the close of the year the classification stood as follows:—

First class.....	247 pupils.
Second class.....	139
Third class.....	38

The 14 teachers attending the 28 schools travel 1,922 miles monthly, or 22,864 annually, being an average of 84 miles weekly for each teacher. The total amount of the annual salaries from the Council is £978, giving an average of £70 for each master. The total school fees received for the year was £60 11s. 4d., not including 3 teachers who receive board and lodging in lieu of school fees; the average amount for such will therefore be £5 10s. 1d., making the total annual emoluments for each teacher £75 10s. 1d.

ATTENDANCE OF PUPILS.

The following table exhibits the Attendance of Pupils at all the Public, Provisional, and Half-time Schools in the Goulburn District:—

	Boys.	Girls.	Total.
Numbers of pupils enrolled in the schools inspected.. ..	639	555	1,194
Numbers of pupils present at examination	492	429	921
Numbers of pupils enrolled for the last quarter of the year.. ..	1,696	1,523	3,219
Average attendance for the same period	1,285	989	2,274
Total numbers of pupils who attended the schools in 1868	2,191	1,933	4,124

The following table shows the Attendance of Pupils at all the Denominational Schools in the district:—

	Boys.	Girls.	Total.
Numbers of pupils enrolled in the schools inspected.. ..	609	521	1,130
Numbers of pupils present at examination	504	402	906
Numbers of pupils enrolled for the last quarter of the year.. ..	1,190	1,151	2,341
Average attendance for the same period	854	777	1,631
Total numbers of pupils who attended the schools in 1868	744	1,538	3,282

By comparing the figures in the foregoing statements, it will be observed that 70 per cent. of the pupils enrolled for the last quarter of the year attended school daily, and that more than three-fourths of the scholars enrolled in the schools inspected were present at examination. If the attendance of scholars for the first quarter of the year is compared with the last quarter, it will be found that there is an increase for the year of 995 pupils.

AGES OF CHILDREN EXAMINED.

Of the 1,827 pupils present at the time of inspection—

439 boys and 344 girls were 7 years of age and under.
120 " 94 " 8 years of age.
110 " 88 " 9 "
96 " 88 " 10 "
76 " 73 " 11 "
155 " 144 " 12 " and above.

From the foregoing statement, it may be observed that about 43 per cent. of the pupils examined are not over 7 years of age, that nearly one-third are between 7 and 10 years, and that about 25 per cent. of the entire number of the children examined are above 10 years. These proportions of the different ages are much the same in the number of pupils enrolled and in all the schools examined, both Public and Denominational.

TEACHERS AND THEIR EMOLUMENTS.

There were employed in the schools of the district, at the close of the year, 107 teachers, 6 assistant teachers, and 3 pupil teachers. Of these, 86 were males and 30 females.

Employed in Public Schools.

1 teacher at £120 per annum.
4 teachers at £108 per annum each.
10 " 96 "
1 " 87 "
3 " 84 "
1 " 80 "
10 " 72 "
1 " 64 "
6 " 60 "
3 assistants at 48 "

Employed in Provisional Schools.

2 teachers at £60 per annum each.
9 " 48 "
8 " 36 "

Employed in Half-time Schools.

1 teacher at £150 per annum.
1 " 84 "
3 " 72 "
8 " 60 "
1 " 48 "

Employed in Church of England Schools.

1 teacher at £96 per annum.
4 teachers at 84 per annum each.
8 " 72 "
4 " 60 "
1 pupil teacher at £36 per annum.
1 " 30 "
1 " 20 "

Employed in Roman Catholic Schools.

2 teachers at £84 per annum each.
11 " 72 "
6 " 60 "
1 assistant at 50 "
1 " 40 "
1 " 24 "

Employed in Presbyterian Schools.

1 teacher at £72 per annum.

It appears, from the statements given above, that the annual average salary paid by the Council to each teacher in the district is as follows :—

	£	s.	d.
Teachers in Public Schools	73	3	2
Assistants	48	0	0
Teachers in Half-time Schools	70	0	0
Teachers in Provisional Schools	44	4	2
Teachers in Church of England Schools	73	8	2
Pupil Teachers	28	6	8
Teachers in Roman Catholic Schools	69	6	8
Assistants	45	10	0

From the Abstract of Annual Returns, it will be found that the average amount of school-fees paid to each teacher is as follows :—

Teachers in Public Schools	35	3	9	each.
Teachers in Half-time Schools	5	10	1	
Teachers in Provisional Schools	10	6	1	"
Teachers in Church of England Schools	40	0	0	"
Teachers in Roman Catholic Schools	32	13	0	"

The teachers have nearly all residences free of rent, and the Half-time teachers have generally some allowance for forage.

Cost of Education per Pupil.

The total number of pupils who attended all the schools in the district in the year was 7,406, and the total annual salaries of the teachers, with the cost of inspection added, amount to £8,593. From the Abstract of Returns, it appears that the total amount of school fees paid to the teachers during the year was £3,009 18s. Now, if the grants made by the Council for permanent improvements and the erection of school buildings are not taken into account, it will then follow that each pupil who attended the schools in 1868 cost the Council of Education £1 3s. 2d., and the parents or guardians, in the shape of school-fees, 8s. 1d. Total cost of education of each pupil, £1 11s. 3d. From this statement, it appears that the Council pays rather less than three-fourths of the total cost of each child's education, and the people a little over one-fourth.

FREE SCHOLARS.

A great objection to free education is, that it is never valued by parents so highly as that which is paid for. In schools where there is a large number of free pupils, the children are not so regular nor punctual in their attendance as scholars who pay fees. I am also inclined to the opinion that the teachers of such schools do not feel so much interest in the education of the scholars. A high school-fee in elementary schools is also objectionable; it is a check to popular education, and should be discouraged. Many parents object strongly to pay high fees, or to have their children's names entered on the indigent list. The educational policy of Prussia in this matter is, to exact a small school-fee for the education of every scholar, and it is perhaps the most judicious course that can be adopted. The number of free pupils educated in the schools of this district during the year is as follows:—

Schools.	Boys.	Girls.	Total.
Public	163	159	322
Provisional	37	35	72
Half-time	112	115	227
Church of England	58	66	124
Roman Catholic	220	216	436
Totals	590	591	1,181

It is difficult to define the exact limits of what may be termed "inability to pay school-fees," and it is probable that any regulation on the subject would be liable to some abuse. Children in this district are admitted to the schools free, when it is found, upon inquiry of the teacher or School Board, that the parents or guardians making the application cannot afford to pay fees. Speaking generally, there are few free scholars attending the schools whose parents or guardians are able to pay.

GENERAL REMARKS.

The discipline and instruction, in a considerable number of the schools inspected, admit of much improvement, and the furniture is seldom of a good description. The local supervision is, in general, tolerably intelligent, and, I am of opinion, as efficient as could be expected, considering that the service is gratuitous. Additional schools in various parts of the district, and increased inspection, are urgently needed to secure to the people the advantages of the Public School system, which daily increases in public favour. The Half-time Schools promise to do much for the education of the sparsely populated districts, and much good must result from the lively interest taken by the clergy of all denominations, in this district, in promoting education among the people, in accordance with the principles of the Public Schools Act.

W. M'INTYRE,

Inspector of Schools.

Goulburn, 6 February, 1869.

THE following remarks are abridged statements of my detailed reports upon the condition of the Public, Provisional, and Half-time Schools inspected from 27th May to 31st December, 1868. The remarks chiefly relate to the material condition and organization of the schools, the general discipline and moral training, the subjects and methods of instruction, and the progress of the pupils in learning. The reports are given consecutively in the order of inspection.

GUNNING (Non-vested):—Visited, 28th May.

Numbers of pupils enrolled:—Boys, 34; girls, 24; total, 58.

Numbers present at examination:—Boys, 26; girls, 22; total, 48.

The schoolroom, the lease of which will shortly terminate, is in good repair, but much too small, and there are no playgrounds nor closets, but the supply of furniture, apparatus, and books is sufficient. There is no residence for the teacher. A site was selected on the day of my visit and the Public School Board decided to take measures for the erection of suitable buildings. The general discipline is tolerably good, and the subjects prescribed by the Council for the several classes are taught with considerable intelligence and earnestness. The attainments of the pupils are fairly satisfactory.

DALTON (Non-vested):—Visited, 29th May.

Numbers of pupils enrolled:—Boys, 17; girls, 19; total, 36.

Numbers present at examination:—Boys, 13; girls, 13; total, 26.

This school is conducted in the Wesleyan Chapel. It is sufficient in size, and in good repair, but some additional furniture is required. The supply of apparatus and books is sufficient, but the teacher's residence needs some repairs. The pupils are not sufficiently punctual, clean, orderly, nor attentive to their work, and the general discipline is unsatisfactory. All the subjects are attempted to be taught, excepting vocal music; but the school work is badly arranged, and the methods of teaching ineffective. The attainments of the pupils are very unsatisfactory; but it is due to the teacher to state that he has been but a few months in charge of the school.

NORTH YASS (Non-vested):—Visited, 5th June.

Numbers of pupils enrolled:—Boys, 11; girls, 14; total, 25.

Numbers present at examination:—Boys, 6; girls, 9; total, 15.

The schoolroom is too small, and the furniture unsuitable and badly arranged. The discipline is unsatisfactory. The usual subjects of instruction are attempted to be taught, but it does not appear that the pupils have made much progress in learning. The present teacher has been recently appointed, and the proficiency of the pupils examined is small. This school was not centrally situated for the inhabitants, and it has been closed since the date of my visit.

QUEANBEYAN (Non-vested):—Visited, 25th June.

Numbers of pupils enrolled:—Boys, 42; girls, 34; total 76.

Numbers present at examination:—Boys, 31; girls, 30; total, 61.

The school is held in the Oddfellows' Hall; the room is sufficient in size, but very inadequately furnished. There is a good stock of apparatus and books. A suitable playground and closets are much needed. The discipline is tolerably satisfactory. All the subjects required are taught, and the methods of instruction efficacious. The attainments of the pupils are tolerably satisfactory. The School Board is making arrangements for the erection of suitable buildings.

BUNGENDOBE

BUNGENDORE (Provisional) :—Visited, 2nd July.

Numbers of pupils enrolled :—Boys, 12; girls, 9; total, 21.
 Numbers present at examination :—Boys, 12; girls, 9; total, 21.

The material condition of this school is good: the playground is fenced; there are proper out-buildings, and a sufficient supply of school furniture, apparatus, and books. The pupils are in general punctual in attendance, clean, orderly, and attentive to their work. The subjects of instruction are those prescribed by the Council, and the methods of teaching are moderately efficient. The progress in learning is a moderate approach to standard.

CARWOOLA AND FOXLOW (Half-time) :—Visited, 6th July.

Numbers of pupils enrolled :—Boys, 24; girls, 13; total, 37.
 Numbers present at examination :—Boys, 21; girls, 11; total, 32.

Carwoola is about six miles from Foxlow. The schoolrooms are good buildings, but a supply of furniture is much needed. Four-fifths of the pupils are regular and punctual in attendance, and they are tolerably clean, orderly, and attentive to their work. The subjects taught are reading, writing, and arithmetic. The instruction is not well arranged, nor the classification of the pupils very appropriate. The attainments of the children may be estimated as moderate.

KENNY'S POINT (Provisional) :—Visited, 8th July.

Number of pupils enrolled :—Boys, 12; girls, 10; total, 22.
 Numbers present at examination :—Boys, 12; girls, 10; total, 22.

This school is centrally situated, on the banks of Lake George. The schoolroom is rather small, but it is suitably furnished, and there is a fair supply of apparatus and books. This is one of the few schools in the agricultural districts where the number of pupils is well kept up—the average attendance being about 80 per cent. of the number enrolled. The pupils are clean, orderly, and attentive to their work. Excepting vocal music, all the subjects prescribed are taught with considerable efficiency. The progress of the pupils is fairly satisfactory.

COLLECTOR (Non-vested) :—Visited, 9th July.

Numbers of pupils enrolled :—Boys, 3; girls, 11; total, 14.
 Numbers present at examination :—Boys, 3; girls, 11; total, 14.

The schoolroom is sufficient in size, but it is not in good repair. There is a fair supply of furniture, apparatus, and books. The pupils are in most cases punctual, clean, and well conducted. The instruction is well arranged, and the teaching is conducted with considerable skill and earnestness. The attainments of the pupils are tolerably satisfactory.

GUNDABOO (Provisional) :—Visited, 5th August.

Numbers of pupils enrolled :—Boys, 15; girls, 14; total, 29.
 Numbers present at examination :—Boys, 11; girls, 10; total, 21.

The school-buildings are in good repair in most respects, the stock of apparatus and books is nearly sufficient, but some additional desks are required. About 70 per cent. of the pupils enrolled are regular and punctual in attendance; and the discipline, as regards cleanliness, order, and attention, is tolerably good. The branches of learning accord with the "Course of Secular Instruction." The late teacher, Mr. Viles, has managed the school with considerable efficiency. The present master has been very recently appointed. The progress of the pupils is tolerably satisfactory.

SPRING VALLEY (Provisional) :—Visited, 10th August.

Numbers of pupils enrolled :—Boys, 23; girls, 24; total, 47.
 Numbers present at examination :—Boys, 19; girls, 21; total, 40.

The schoolroom is too small, and in much need of repairs. There are no closets, little or no playground; the furniture is insufficient in quantity, and badly arranged. A supply of apparatus and books is much needed. The discipline admits of great improvement in all respects. The pupils are disorderly, and inattentive to their work. The instruction is not well arranged, and the organization and methods of tuition are far from satisfactory. The attainments of the pupils are small.

BUNGONIA (Provisional) :—Visited, 13th August.

Numbers of pupils enrolled :—Boys, 13; girls, 15; total, 28.
 Numbers present at examination :—Boys, 10; girls, 14; total, 24.

The material condition of this school will be passable in most respects, when the repairs in progress are complete. Some additional furniture has been ordered. The supply of apparatus and books is barely sufficient. About 60 per cent. of the scholars enrolled are regular in attendance, but in some cases they are not sufficiently punctual. They are, however, tolerably clean, orderly, and attentive. Drawing, vocal music, and lessons on objects, are not taught, and the school work is not well arranged. The average attainments of the scholars are but moderate, and admit of considerable improvement.

ROSLYN (Vested) :—Visited, 21st August.

Numbers of pupil enrolled :—Boys, 14; girls, 9; total, 23.
 Numbers present at examination :—Boys, 14; girls, 9; total, 23.

The school buildings need some repairs; and the supply of furniture, apparatus, and books, is barely sufficient. The discipline admits of considerable improvement, and the habit of attention requires much cultivation. All the ordinary subjects of instruction are taught. The attainments of the pupils are very moderate. The teacher has been but a few days in charge of the school.

LAGGAN (Provisional) :—Visited, 24th August.

Numbers of pupils enrolled :—Boys, 10; girls, 17; total, 27.
 Numbers present at examination :—Boys, 8; girls, 12; total, 20.

This school is held in the Roman Catholic Chapel. It is sufficient in size, in good repair, but not well furnished. Out-buildings, some apparatus, and books are required. The pupils are rather irregular in attendance, and very unpunctual. The general discipline admits of great improvement. The subjects of instruction are reading, writing, arithmetic, geography, English grammar, and needlework. The methods of teaching are not sufficiently efficacious. The attainments of the pupils are moderate. The teacher in charge of the school has been recently appointed, and its condition may be attributed to the labours of the late teacher.

RICHLANDS (Provisional) :—Visited, 27th August.

Numbers of pupils enrolled :—Boys, 10 ; girls, 7 ; total, 17.

Numbers present at examination :—Boys, 7 ; girls, 7 ; total, 14.

There is no playground nor closets for the use of the children. Some repairs to the schoolroom and additional furniture, are much needed. The discipline is tolerable. The ordinary course of instruction is observed, excepting drawing, object lessons, and Scripture, but the teacher is not much acquainted with the modern methods of tuition. The proficiency of the pupils is moderate for the short time the school has been in operation.

TARALGA (Vested) :—Visited, 31st August.

Numbers of pupils enrolled :—Boys, 19 ; girls, 23 ; total, 42.

Numbers present at examination :—Boys, 19 ; girls, 23 ; total, 42.

The material condition of this school is bad, but new buildings are in course of erection, and proper furniture will be supplied. Three-fourths of the pupils are regular in attendance, clean, and orderly, but they are not sufficiently punctual. All the subjects of instruction prescribed are attempted to be taught, excepting drawing. The methods of tuition are not efficacious, and the progress of the scholars is unsatisfactory.

MYRTLEVILLE (Vested) :—Visited, 1st September.

Numbers of pupils enrolled :—Boys, 14 ; girls, 24 ; total, 38.

Numbers present at examination :—Boys, 12 ; girls, 21 ; total, 33.

The fences and buildings are in much need of repairs, and the furniture is barely sufficient. The discipline is passable, but the lesson documents are not prepared with sufficient care. The teaching appears to be conducted with considerable attention and earnestness. Drawing and vocal music are not taught. The progress of the pupils may be estimated as ranging from moderate to tolerable.

NORWOOD (Non-vested) :—Visited, 24th September.

Numbers of pupils enrolled :—Boys, 18 ; girls, 19 ; total, 37.

Numbers present at examination :—Boys, 16 ; girls, 13 ; total, 29.

There is a fair supply of furniture, but the schoolroom is so small that it cannot be properly arranged. Better out-buildings, fencing for the playground, and some additional furniture, are required. The Public School Board is making arrangements for the erection of suitable buildings. The discipline is tolerably good, considering the unsuitableness of the schoolroom. Instruction is given in all the ordinary subjects excepting vocal music and drawing. The proficiency of the pupils is tolerably satisfactory.

MUMMELL (Provisional) :—Visited, 23rd October.

Numbers of pupils enrolled :—Boys, 14 ; girls, 12 ; total, 26.

Numbers present at examination :—Boys, 13 ; girls, 9 ; total, 22.

This school was opened on 5th October, 1868. The schoolroom is suitable, but the supply of furniture and apparatus is barely sufficient. A stock of books has been ordered. The discipline needs much improvement in all respects. The pupils are learning the mere elements of reading, writing, and arithmetic. The progress is small.

MARULAN (Non-vested) :—Visited, 11th November.

Numbers of pupils enrolled :—Boys, 26 ; girls, 27 ; total, 53.

Numbers present at examination :—Boys, 22 ; girls, 24 ; total, 46.

The schoolroom is much too small, and so near the main street that the noise of vehicles passing is very disagreeable. There is no suitable playground, and the supply of furniture, apparatus, and books, is insufficient. Two-thirds of the pupils enrolled are regular in attendance, but in some instances they are not sufficiently punctual. The cleanliness and order are passable, but the habit of attention requires much cultivation. Drawing and vocal music are not taught. The course of instruction includes reading, writing, arithmetic, geography, English grammar, Scripture, needlework, and lessons on objects and common things. The pupils do not answer with much accuracy, and for the time under instruction the progress is not sufficiently satisfactory.

NEW COUNTRY FLATS (Non-vested) :—Visited, 12th November.

Numbers of pupils enrolled :—Boys, 19 ; girls, 25 ; total, 44.

Numbers present at examination :—Boys, 14 ; girls, 16 ; total, 30.

This school is situated on the left bank of the Wollondilly, where it crosses the Great Southern Railway. It was established for the education of the children of the labourers employed on the railway works. The schoolroom is sufficient in size, but the roof is somewhat leaky, and the floor is made of clay. The supply of furniture is not quite sufficient in quantity, but there is a fair stock of apparatus and books. In several instances the pupils are not sufficiently punctual, but in other respects the discipline is passable. The instruction is tolerably well arranged, and the classification of the pupils appropriate. The teaching is conducted with considerable skill and earnestness. All the subjects prescribed by the Council are taught. The progress of the pupils is tolerably satisfactory for the time the school has been in operation.

TOWRANG (Non-vested) :—Visited, 13th November.

Numbers of pupils enrolled :—Boys, 20 ; girls, 19 ; total, 39.

Numbers present at examination :—Boys, 11 ; girls, 13 ; total, 24.

This school is held in the Wesleyan Chapel. The building is suitable and in good repair, but the grounds are not fenced, and there are no closets. The furniture and books are not quite sufficient, but there is a fair supply of apparatus. The pupils are irregular in attendance, but the discipline is passable in other respects. Excepting drawing, all the subjects prescribed on the "Course of Secular Instruction" are taught with considerable earnestness. The attainments of the pupils range from moderate to tolerable.

TARAGO (Provisional) :—Visited, 20th November.

Numbers of pupils enrolled :—Boys, 19 ; girls, 21 ; total, 40.

Numbers present at examination :—Boys, 16 ; girls, 14 ; total, 30.

This school is held in the English Church. It is a good building, and suitable for the purposes of teaching.

teaching. There is a fair supply of apparatus and books. Three-fourths of the pupils enrolled are regular in attendance, but they are not sufficiently punctual, and the discipline in other respects admits of considerable improvement. The habit of attention needs much cultivation. The classification is tolerably appropriate, but the lesson documents are not well arranged. All the subjects prescribed are attempted to be taught, but the teacher is not well acquainted with the modern methods of tuition. The proficiency of the pupils in reading is tolerably good, but the progress in the other branches of study is small or moderate.

BULLAMALITA AND SPRINGFIELD (Half-time) :—Visited, 1st December.

Numbers of pupils enrolled :—Boys, 19; girls, 15; total, 34.

Numbers present at examination :—Boys, 16; girls, 15; total, 31.

These schools are about 8 miles apart. There are 18 pupils enrolled at Bullamalita, and 16 at Springfield. The schoolrooms are tolerably suitable, and fairly supplied with books, but some additional furniture and apparatus are much needed. About 60 per cent. of the pupils enrolled are regular and punctual in attendance. They are tolerably clean, orderly, and attentive to their work. The subjects taught are reading, writing, arithmetic, geography, and grammar, with lessons on common things. The schools have been in operation about one year and three months, and, taking into consideration that the majority of the pupils commenced learning the alphabet, the results are very gratifying; at the same time, the instruction can be much improved. The progress in reading and writing is tolerable; in the other subjects, small.

BALLALABA AND FARRINGTON (Half-time) :—Visited Ballalaba, 11th December.

Numbers of pupils enrolled :—Boys, 25; girls, 32; total, 57.

Numbers present at examination :—Boys, 2; girls, 8; total, 10.

In the course of a recent tour upon special duties in the district, incidental visits were made to the schools held at Mrs. Clarke's and Nithsdale, and the pupils examined. These two schools are generally known as the Ballalaba Half-time Schools. They are about 2 miles apart, on the banks of the Shoalhaven, and 16 miles from Braidwood. The Farrington and Jinglemoney Schools are about 4 miles further down the river. There are 13 pupils enrolled at Nithsdale, and 8 at Mrs. Clarke's, making a total of 21. Of this number, 10 were examined. The 4 schools have been in operation for 17 months, the teacher attending at each place for 3 half days, or 6 hours in each week. The rooms in which the schools are held are tolerably comfortable, but the furniture is not very suitable. The children are clean, obedient, attentive to their work, and respectful in their demeanour. The subjects taught are reading, writing, arithmetic, geography, grammar, object lessons, writing from dictation, and drawing. The general progress of the pupils appears to me, so far as examined, very satisfactory for the time under tuition. Some of the children commenced learning the alphabet when the schools were opened, 4th August, 1867, and they can now read ordinary prose with considerable ease and fluency, write from copies and from dictation fairly, and have made some progress in Scripture, arithmetic, geography, drawing, and singing. Mrs. Clarke appears to be much interested in the education and moral training of her children.

GOULBURN (Vested)—Infants :—Visited, 15th December.

Numbers of pupils enrolled :—Boys, 80; girls, 50; total, 130.

Numbers present at examination :—Boys, 56; girls, 37; total, 93.

The organization is good, and the discipline satisfactory. The subjects prescribed by the Council are taught, and the methods of tuition are appropriate, and applied with considerable intelligence and effect. The progress of the pupils is good for the time the school has been in operation.

GOULBURN (Vested)—Girls :—Visited, 16th December.

Number of pupils enrolled :—Girls, 68.

Number present at examination :—Girls, 51.

The organization is good—the discipline judicious and effective. The methods are suitable, and applied with considerable skill. The proficiency of the scholars is good for the time the school has been in operation.

GOULBURN (Vested)—Boys :—Visited, 17th and 18th December.

Number of pupils enrolled :—Boys, 126.

Number present at examination :—Boys, 99.

The material condition of this school is good. The discipline is fairly satisfactory in most respects. All the subjects prescribed for the several classes are taught, with the elements of algebra, geometry, and Latin, to the advanced boys. The general progress may be estimated as very fair.

W. M'INTYRE,
Inspector of Schools.

Goulburn, 6 February, 1869.

MAITLAND DISTRICT—GENERAL REPORT, 1868.

DURING the past year my district was enlarged in area by an extension westward to the Castlereagh River, but only by five or six schools. The number of schools in operation at its close was,—

Extent of District and Number of Schools.

Public	33	—	containing	35	departments.

Wesleyan	1	”	1	”	”
Total	76	”	82	”	”

Summary of duties.

The Denominational Schools at Ellalong, Gresford, Millfield, and Rosebrook having failed to maintain the requisite attendance, were, on the application of their supporters, converted into Provisional Schools; and the old National School at Four-mile Creek underwent a like change. Assistance was granted to new Provisional Schools at The Bulga, Mount Wills, Somerville, and Quorrobolong. The number of schools examined was 68, containing 74 departments; of which, 20 received two visits, and 2, three. Two Denominational Schools, viz., Broke Church of England, and Muswellbrook Roman Catholic, were closed at the time of inspection; and six Provisional Schools, four of which were opened during the latter half of the year, were not inspected for want of time. The work of inspection

inspection was continued up to the 18th December, and occupied, during the whole year, 103 days; in preparing reports and conducting correspondence 143 days were consumed; the remainder were taken up in attending the conference of Inspectors and conducting examinations of teachers. There were ten public holidays, and I lost one day through illness. The establishment of Half-time Schools at Ballington and Eccleston failed, owing to the apathy of the people in the former place, and the paucity of scholars in the latter.

The inspection was chiefly of one kind, viz., what is described in the instructions to Inspectors as "General and Regular." This comprehends a minute examination into the character of each school, in its material, moral, and instructional phases—in this last with principal regard to results—and is a very searching ordeal; but, owing to the fact that previous notice is given, room is left for a considerable amount of "making up" against the day of trial, and hence this mode is incomplete in itself. Under its dictates, an Inspector has little opportunity of judging of the methods of instruction or of the ordinary conduct of a school; and he is consequently unable to detect many of the serious defects from which the working of few schools is free in their normal state. In this district, at present, it is simply impossible for an Inspector to visit all, or even the majority of schools, twice, and hence when regularly examined they are seen only in their *best condition*. What they are in their worst can only be inferred; but to render inspection complete and beneficial, this also should be known directly. To suggest a remedy is not within the scope of this report, but I shall probably advert to this matter at another time.

Organization.—The sites are, in the great majority of instances, favourable; and the schoolrooms are, for the most part, of a passable character. The Public Schools at Wollombi, Falbrook, Aberglasslyn, and Branxton, were materially improved. New Church of England and Roman Catholic Schools were erected at East Maitland. The infant department of the West Maitland Roman Catholic School was removed to a more suitable part of the premises, and the girls department enlarged; and in other cases, improvements were effected which, upon the whole, have slightly raised the character of the school accommodation. Nearly one-fifth of the number still, however, continue in a very indifferent state—some are too small, some very old and shaky, some affected both ways; while several are of the rudest material and structure, deficient in light and ventilation, and worthless for all purposes of a more tangibly practical utility. The East Maitland Public School is in a bad state, and would require a large outlay to make it effective, but these wants have been already pointed out, and need not be dwelt upon here.

Agreeably to the Council's desire, special attention was given to Teachers' Residences—fifty-eight having been reported upon since the receipt of instructions. There are ten Public Schools without any, but in most of which an allowance is made by the Council for rent. Two Church of England Schools have none; and, if the West Maitland Convent be excepted, all the Roman Catholic, the Presbyterian, and Wesleyan Schools, are similarly circumstanced. The Provisional and Half-time Schools are for the most part provided with moderate dwellings, under the circumstances; but in one of the former the schoolroom was everything, kitchen and bedroom as well. The character of this accommodation is in general moderate, and rather better in the Church of England than in other schools. The influence, direct and indirect, which the home he occupies has upon the teacher's character, is generally too much overlooked. Expected to set an example of neatness and order, not only to his scholars but to his neighbourhood, while compelled in his household arrangements to resort to every imaginable shift to secure a small share of comfort—how can he, with the thought of himself and his wants, pay the requisite attention to externals? Fortunately, society is very lenient upon the point, otherwise his efforts would be extremely painful, and too often fruitless.

Some improvement has taken place within the year in regard to the out-buildings and supply of water. In the bulk of the schools in this district, the character of the playgrounds may be described as from tolerable to fair; but it must be understood that, with very few exceptions, their condition merely enables them to pass without complaint—and that, in point of *real* efficiency, they are very defective, even in the more important schools. As regards furniture, there is no great cause of complaint, except in the case of a few, more than three-fourths being from tolerable to fair in their supply and its character. Defects similar to those noticed last year continue however, and considerable effort is still required to remove them. About one-fifth of the schools are well provided with apparatus; the same proportion indifferently and the remainder, *i.e.*, the majority, tolerably. Under the facilities afforded by the Council, there is a fair prospect of suitable and abundant appliances being soon found in all schools. With some exceptions, in which, owing to the negligence of teachers, no requisitions were forwarded, or where, from remoteness or isolation, the supplies had not reached, the schools are fairly provided with suitable books. In two or three those in use were not approved, but they were only retained for want of proper ones. The character of the books is the same as last year. In the majority of schools the records are kept with passable accuracy, but in many instances there is evident haste in their keeping, always leading to errors. Little matters of detail are also often overlooked as unimportant, and sometimes by teachers of the higher grades, who appear to think that in their case such trifles should not be noticed; as they know better, but from an apparent pressure of other work neglect to do it. Returns carelessly compiled are also received from the same class, causing considerable trouble, delay, and annoyance, which, with ordinary attention to the forms and instructions, might easily be prevented.

Discipline.—In about five-eighths of the schools, the pupils and teachers are punctual to a satisfactory extent; in one-fourth, tolerably so. This is an improvement upon last year's experience. The regularity too, notwithstanding the serious obstacles by which it is opposed, maintains what may be regarded as a reasonably satisfactory level, being indifferent or bad only in one-fifth of the schools. It has certainly improved within the year, though still very far from what it ought to be. Without compulsory education, this vital branch of discipline will be best promoted by thoroughly earnest and conscientious teachers, well qualified to impart to their labours an interest sufficiently powerful to attract the children, who would in turn strongly incline parents to dispense with their services to a much greater extent than at present. Irregularity often arises from the caprice of children—not the will of the parents; and if all schools were conducted by really competent teachers—I mean, not alone able to *teach*, but to exercise withal a wholesome influence on public opinion, by their prudence, discretion, intelligence, and zeal—the question of compulsory education would, I think, be considerably narrowed in a country like this, where the means of living are not, as in some European countries, the all-absorbing topic—the great object in the race of life. While on this subject, I may as well advert to another item of moment, viz., that of *school fees*. The Council is, I hope, in possession of sufficient information to warrant an early settlement of the question. For want of an authoritative pronouncement upon the matter, schools are competing with each other under circumstances mutually discreditable, and even promoting irregular attendance by the frequency with which children are withdrawn; and parents, interpreting the Public Schools Act their own way, positively demur to payment of the small fee charged, leaving to the teacher the unpleasant alternative of losing either the fees or the scholars. Cleanliness is well observed in the majority of schools; but not always accompanied by tidiness of person and dress, without which its value is much reduced. Order, though from tolerable to fair in nearly three-fourths of the schools, is still very far below the ideal type. I have observed that, in some schools, a stereotyped routine is pursued, to which the children soon conform, but out of which their habits are not good. In some, attention is deficient; in others, the manners of the pupils are neglected, and in almost all there prevails a want of steadiness under instruction, which is probably the most essential defect. Untrained teachers find it next to impossible to understand what the word "discipline" fully means; and their schools accordingly betray some gross irregularities. In the greater number of country schools, the pupils are generally well-behaved, and offer none of that active resistance to authority which town children are so noted for; but they offer other points of character perhaps equally puzzling to the skill of the teachers. There are few difficulties of discipline, however—even the all-important one of irregularity—which an energetic,

Government. energetic, patient, and intelligent teacher cannot overcome, to a very great extent at least; as is pretty evident from the case of inefficient schools, in which it seldom happens that the greater portion of the blame may not be, either directly or indirectly, attributed to the teacher. The government of schools is generally guided by intelligence, though, here and there, a few exceptional cases are to be found. In a few instances, there is, properly speaking, no government, the sole apparent object of the teachers being to keep the children at any sacrifice, and for that purpose cultivating their good graces to an absurd extent.

Classification and occupation. The classification is generally fair, and the subjects are, for the most part, agreeable to the requirements of the standard. The guidance on both points, laid down for teachers, is sufficiently clear and explicit to obviate any but errors of negligence or incapacity. With regard to the occupation,—although formal aids have been issued, there is observable, generally, a much less approach to uniformity. In comparatively few schools is it really good; and, considering the facilities afforded, it is bad in too many. In general, its arrangement ranges from tolerable to fair. With the different subjects prescribed, it is certainly not a matter of absolute ease to a teacher to apportion them in such a manner as that each shall receive a share of attention proportioned to its importance; indeed, it often occurs that the most essential, as reading and arithmetic, have no more time, sometimes less, devoted to them than that bestowed upon those of secondary value, while object lessons are frequently placed wholly in the background, and sometimes entirely omitted. To prepare a well-defined and judicious scheme of school occupation requires an amount of active vigilance, careful observation, frequent comparison, and constant reflection, which, I may say, few teachers bestow upon it, and fewer still are capable of bestowing. Time-tables and programmes are constructed more to satisfy the letter of the requirement, than to reduce to system and order the various and varying elements which enter into the skilful working of a good school. These documents are suspended on the walls, and afterwards seldom consulted in many schools. In about one-sixth of the schools the methods are from fair to good, in about one-half tolerable, and bad in nearly one-third. My remarks upon method in the report of last year continue still applicable to the majority of the schools. It is seldom one meets with genuine method; but it is only fair to state that my opportunities of observing it directly were very few last year, my duties having had reference principally to results. For the most part, the methods in use fall under the synthetic type, which, without the analysis to which it is correlated, is incomplete, and for children even much less suitable. But whatever the form of the method employed, its application is greatly modified, if not wholly controlled, by other circumstances, among which stand prominently forward the regularity and order of the pupils. In the absence of these, good teaching is powerless; while with them even indifferent instruction is not ineffectual. They are the ground-work of successful teaching, and to secure them should hence be the great object of every teacher, as well as of all interested in the work of education. It seems to me, that, before method, in the hands of most teachers, can become an intellectual instrument, capable of searching thoroughly the minds of youth, a higher range of qualifications will be necessary. It may be true that for the merely rudimentary education conferred in the majority of Primary Schools, attainments very little above the small proficiency sought are needed; but even for this humble aim an enlightened teacher will be able to impart his knowledge more clearly, thoroughly, and expeditiously than one who is unable to advance further than the elementary stages.

Methods.

Proficiency.—The following tables shew the Number of Pupils enrolled and present at examination:—

Reading.

From the foregoing tables, it appears that, of the entire number of pupils enrolled, 77·6 per cent. were present at examination. Of the entire number present, 77·6 per cent. were learning to read, as follows:—

Monosyllables.....	26·3 per cent.
Easy narrative	29·8 "
Ordinary prose	21·5 "

The merely mechanical portion of this most important element of education is perhaps as satisfactorily performed as could well be expected; the articulation and enunciation are, in general, clear and distinct, and the pauses fairly observed. But there is a great deficiency in expression among the more advanced scholars; and this is to be attributed to the poor knowledge of the subject-matter and of the words read, which is commonly evinced; and this great defect is mainly traceable to the insufficiency and unsuitableness of the teaching. A reading lesson very seldom extends beyond the mere utterances of the words in the book; there is no review of the subject treated of, no analysis of the matter in detail, nor always

always an inquiry into the meanings, application, and derivation of the words ; or if there be, it is of such a feeble, superficial, and intermittent nature, as to be productive of no lasting benefits either to the memory or the understanding. Without this insight into the views, opinions, or convictions of the writer, it is impossible that children can assimilate what they read, and catch the spirit of the passage, so as to deliver it with intelligence and expression. With the neglect of this lesson, teachers and pupils lose their best opportunity. Of all other exercises, a proper reading lesson affords the fullest scope to the faculties of thought and speech, which are the complement and perfection of the others, and of paramount importance in education ; it sharpens the intellect, imparts to it a power of grasp which greatly facilitates instruction in other subjects, and gives to the whole mental train an impetus, at once invigorating and progressive.

The following table exhibits the results :—

	Public Schools.	C. E. Schools.	R. C. Schools.	Presb. Schools.	Wesln. Schools.	Provl. Schools.	Half-time Schools.

The writing, in general, offers grounds of satisfaction. It is very generally practised, taught with considerable care, and with reasonably successful results. There is, however, one very prevalent error, which, in spite of previously expressed disapprobation, continues to be noticed, viz.,—that of allowing the younger children to drift into small hand, and girls, particularly, into an illegible angular scrawl, almost as soon as they are able to form the letters. And among schools otherwise bad, the writing is for the most part carefully done ; while, on the other hand, some of the best teachers appear to undervalue this branch of instruction, if one may judge by the careless productions witnessed. Were there no objection to this carelessness beyond the bad habit which it surely engenders, it should be discouraged ; but, apart from this, caligraphy in itself is an art beautiful and useful, and if deserving of attention at all, is worth the trouble of being studied carefully. I have frequently to point out the nonsense set for copy-lines in the shape of unfinished sentences. Dictation is general, and reasonably satisfactory. The results are collected in the following table :—

	Public Schools.	Church of England Schools.	Roman Catholic Schools.	Presby-terian Schools.	Wesleyan Schools.	Pro-visional Schools.	Half-time Schools.

Arithmetic.—There is a slight increase in the proportions of pupils learning the compound and higher rules of arithmetic upon last year's numbers, while the aggregate proportions remain much the same ; and the proficiency evinced shows, particularly in the case of Denominational Schools, an upward tendency. In that of Public Schools, the average is about stationary ; but here, the fact that in 1867 only about half these schools were examined, will afford some explanation of the phenomenon. In most schools during the past year the standard has been pretty well observed, but advancement continues to be the rock upon which teachers generally fall in the treatment of the subject. There is, however, evident in every division of it some improvement, though failures in notation are common, practical application of the knowledge acquired is seldom seen, and mental arithmetic is, for the most part, a failure, even in the best schools. Except from the results observed, I cannot speak much of the methods pursued ; but judged by those, they are generally crude and unskilful. Teachers cannot now complain of the want of needful appliances, for black-boards and chalk are found, or may be found, in every school ; but they are not judiciously used. Where text-books are discarded and exercises dictated or set, there is too much sameness in the *modus operandi*. The teachers fall into a peculiar habit, soon well known to the children, whose activity then quickly ceases. In many schools, also, copying is very prevalent ; and even in some, teachers are not above giving hints on the day of examination. This is a contemptible practice, and aims a fatal blow at the very root of a good education, the intellectual value of which is positively worthless, if marred by so gross a moral stain as that of untruthfulness or equivocation. I hope to see this habit henceforth and for ever abandoned, and in its stead to witness a spirit of candour and sincerity pervading every school, and mutually influencing teachers and scholars.

Grammar.—Of the pupils present, nearly one-half were learning grammar. As a rule, the subject is poorly taught, and in a few schools, entirely neglected. This occurs chiefly in Provisional Schools, and one or two others, where the teachers are, for the most part, themselves ignorant of the subject. In all others an attempt is made to meet the requirements of the standard; but in many it is only an attempt feebly made, incoherently sustained, and of very superficial character. Children are taught to repeat the definitions with passable accuracy; but in most instances they are found to have no knowledge of their meanings, and even where some explanation has been given, it is seldom the pupils know the parts of speech to be only words. If a book or a pencil is held before a class, and the question asked what it is, the answer will, almost invariably, be—"a noun." It is in this abstraction from the concrete realities, and in the formation of notions, that the knowledge and power of teachers fail. But there are also instances of superior ability on the part of teachers, and equal obtuseness on the part of scholars, arising, I must say, from want of due appreciation, by the former, of the difficulties surrounding the subject; and perhaps, also, from laziness in noting the various stages of mental growth in the latter, and in presenting at each its appropriate part. There is, moreover, too much monotony pursued in teaching parsing and analysis to allow of the thorough conception of a sentence as a whole, and of the distinct conception of its several parts and of their relations to one another. I have found, in particular, that those of subject and predicate are badly understood, and hence the whole fabric raised upon them is illusory and unsound. There is, as far as I have been able to judge, too much teaching and too little examination—a fault which, though well meant, is nevertheless vicious, as permitting and inducing utter passivity of mind among the pupils, imposing an impossible task upon the teachers, and rendering the aims of education, immediate and remote, visionary and abortive. The efforts of composition exhibited were, in general, extremely poor.

Geography.—Geography is taught to an extent nearly equal to the preceding subject, but the knowledge evinced offers even less grounds of congratulation; indeed, the proficiency, both upon the whole and in detail, must be regarded as a failure. To account for this, considering the very moderate amount professed and required to be taught, seems somewhat difficult, if the teachers be credited with having fully performed their duties. This condition, however, I believe to have been wanting in the majority of instances. Not that I mean to charge them with wilful neglect, but that they have overlooked the true nature of the work to be done, or greatly undervalued its importance. To a casual observer there is little effort required in imparting or acquiring the knowledge of a neighbourhood, the uses of a map, or the definitions of land and water, which are the portions of the subject prescribed as elementary; and so, in reality, there is—*provided* the groundwork be properly commenced. But here the error arises. The groundwork is not properly laid. Geography is not commenced from the schoolroom, nor are the natural phenomena within range of observation brought before the pupils' minds. I have witnessed instances in which a second class could not tell the name of their own locality, distinguish the features of the surrounding landscape, or shew the cardinal points without reference to a map; while if asked the technical definitions of continent, ocean, &c., they would often answer correctly, but without any idea of the reality. In the advanced portions also, questions put in a bookish manner will be often readily answered; but otherwise, not. This is a subject full of interest, and capable of being brought into actual contact with the senses to an extent sufficient, with intelligent direction, to enable children to form a moderate notion, not only of their own neighbourhood, district, and country, but of the entire globe. Maps of New Zealand and Tasmania, together with good geographies of these countries, are much needed in our schools, and require to be speedily supplied. The results are as follows—

	Public Schools.	C. E. Schools.	R. C. Schools.	Presb. Schools.	Wesln. Schools.	Provl. Schools.	Half-time Schools.
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.

Indifferent or bad	66·5	78·3	69·	100	63·	100	100

Object Lessons.—Object Lessons are now almost universally taught in this district, 93 per cent. of the pupils present having been examined in them; but, to a greater and more marked extent than any other subject, the knowledge evinced is unsatisfactory. The faults noticed in last year's report continues still in force, in the majority of schools. The lessons themselves are not popular with teachers generally; their nature and scope are misunderstood, and their results are very meagre. The names of qualities and properties are repeated and written down, but seldom understood by the pupils. The subjects chosen are also often unsuitable. One finds "Gutta-percha," "India-rubber," "Cotton," "Silk," "Mercury," &c., selected from the standard books and set down in the programmes, even for the junior classes, while there are abundant materials at hand capable of arresting the direct observation of the pupils, but which are passed by unnoticed. Generally, the lessons, even when well given, are too scientific, formal, and stiff, and fail to arouse much mental activity.

	Public Schools.	C.E. Schools.	R.C. Schools.	Presb. Schools.	Wesln. Schools.	Provl. Schools.	Half-time Schools.
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.

Drawing "	21	14	6	1	1
Needlework,,	18	16	4	1	1	1

Teachers.—The first general examination of teachers under the Council was held last year at the following centres :—East Maitland, Wollombi, Singleton, and Scone. Of 46 summoned, according to the Regulations, 36 attended; 3 sat for special examination, and 2 candidates were also examined. In all, 41 teachers and 20 pupil teachers underwent examination—but of the latter, 11 were candidates, of whom 5 passed. Of the former, 17 were successful and 7 failed. The number of teachers in the service of the Council, on 31st December last, was—

	Male.	Female.	Total.
Principals	62	21	83
Assistants	2	7	9
Pupil teachers	9	3	12
	73	31	104

Their rank is as follows :—

Teachers—Class I	0
Class II {	Section A	5
" B	4
Class III {	Section A	21
" B	23
" C	19
Probationers	20
Pupil teachers	Class I.	Class II.	Class III.	Class IV.	
	2	2	2	5	

The teachers of this district are, as a body, respectable, anxious to fulfil their duties, and do their utmost to give satisfaction. I am happy to say that during the past year there was not a single case of anything tending to lower their character or lessen their moral influences.

Local Supervision.—The Public School Boards evince, to a partial extent, a tolerable interest in the institutions with which they are officially connected. In many instances, the members are not exactly the stamp of men calculated to render beneficial service, nor are they fitted, either by education or social influence, to improve the character of the schools; but they are the best that can be got under the circumstances. The Local Boards of Denominational Schools continue to give, for the most part, a pretty active support to their schools; but in all cases there is generally wanting a systematic procedure. The members visit the schools, but seldom examine very superficially, if at all, the records; and often put their names to documents, certifying their correctness, which have afterwards to be returned to the teachers. There is something stultifying in such conduct as this; and I am confident that if members knew how frequently they are made to vouch for incorrect figures they would be more cautious. It would be only right and proper for them to see the books, &c., from which the returns are made out, and satisfy themselves—as they would in ordinary accounts—that everything was quite accurate. In this respect, indeed, the local supervision is in all schools far too lenient, and takes much more upon trust than would be found justifiable in private life.

Concluding

Concluding observations.—The mechanism of the schools under the Council of Education is now pretty well adjusted, and adapted, with considerable fidelity, to the circumstances under which it is destined to act. These institutions are in fair work, and, with very few exceptions, have evinced some improvement during the year. They have all conformed to the Regulations, as far as these were known and understood, assumed an attitude of vigor and energy, and acquired a tone of honest straightforwardness, wherever a previous policy of deviousness or secrecy had been pursued. Their present condition is such as to inspire a confident hope that their future will be productive of a large amount of good, and materially advance the true prosperity and happiness of the country. The means of education in this district are also fairly sufficient; indeed, in some places the supply exceeds the demand. There is further needed, however, more frequent inspection, to improve the quality of the education imparted, by correcting defects, encouraging deserving teachers, diffusing among them a spirit of wholesome emulation, and thus, by widening their influence and increasing the power of their efforts, to render the educational force more impressive and continuous.

Maitland, 6th February, 1869.

W. DWYER,
Inspector, Maitland District.

APPENDIX.

DETAILED STATEMENT, showing the condition of the Public Schools inspected, as regards—

1. Their material condition.
2. Their moral character.
3. The subjects and methods of instruction.
4. The proficiency of the pupils.

ABERDEEN :—Visited, 5th August.

Numbers present at examination :—Boys, 18 ; girls, 24 ; total, 42.

1. Out-offices were needed ; otherwise, the condition of the premises and the organization of the school were tolerable. 2. The moral tone was tolerable. 3. The subjects were, for the most part, judiciously arranged, and the methods were tolerably intelligent. 4. The proficiency, which was partial, ranged from moderate to tolerable.

ABERGLASSLYN :—Visited, 3rd April.

Numbers present at examination :—Boys, 19 ; girls, 14 ; total, 33.

1. Since inspection, repairs have been executed, which make the state of the premises effective. 2. The pupils were irregular and unpunctual, inattentive, and feebly disciplined. 3. The subjects were badly arranged, and the methods very mechanical. 4. A few pupils wrote well ; in all other subjects the proficiency and mental culture were very small.

BISHOP'S BRIDGE :—Visited, 9th December.

Numbers present at examination :—Boys, 23 ; girls, 15 ; total, 38.

1. The premises are insufficient and unsuitable, and the schoolroom is very badly organized. 2. The attention of the pupils was slight, and their order very poor, but their general conduct moderate. 3. The principal subjects were taught, and moderately well arranged. The methods were earnest, but mechanical, and of slight effect. 4. The knowledge and intelligence of the pupils were low.

BOLWARRA :—Visited, 13th March.

Numbers present at examination :—Boys, 17 ; girls, 21 ; total, 38.

1. The schoolroom is old and dilapidated, but moderately provided with requisites. 2. The pupils were irregular, and addicted to talking, but generally well conducted, moderately attentive, and orderly. 3. Most of the prescribed subjects were taught, but not explicitly arranged ; the methods were intelligent, but not effectual. 4. The progress was small, and the proficiency only moderate.

BRANXTON :—Visited, 6th and 7th May.

Numbers present at examination :—Boys, 25 ; girls, 31 ; total, 56.

1. The premises are in good condition, and the schoolroom is very well organized. 2. The discipline was deficient in energy and influence, and the order of the pupils unsatisfactory ; but the teacher had only been a short time in charge. 3. The subjects were appropriate, and the methods fairly intelligent, but much too suggestive in their character. 4. The general proficiency ranged from moderate to tolerable.

CAMPSIE :—Visited, 1st May.

Numbers present at examination :—Boys, 15 ; girls, 20 ; total, 35.

1. The school is too small, in extremely bad repair, and very poorly furnished, and the condition of the premises is ineffective. 2. The pupils were neither regular nor punctual ; but, under the circumstances, the moral aspect of the school was moderate. 3. Except singing, the prescribed subjects were taught. The work of the school was conducted with earnestness and tolerable skill, though the methods were very mechanical. 4. The progress of the pupils was small, their proficiency moderate, and their mental culture slight.

CESSNOCK :—Visited, 10th December.

Numbers present at examination :—Boys, 14 ; girls, 25 ; total, 39.

1. The schoolroom is small and badly situated, but otherwise moderate for the place. 2. Many of the pupils were untidy in appearance, but in general they were moderately clean, attentive, and orderly. 3. The instruction was fairly appropriate, and imparted with moderate intelligence, but without adequate preparation. 4. The proficiency and intelligence of the pupils were small, but there was some prospect of improvement.

COONAMBLE :—Visited, 11th September.

Numbers present at examination :—Boys, 18 ; girls, 18 ; total, 36.

1. The school is well situated, but small, unsuitable, and badly furnished. The erection of new premises had been decided on. 2. The school had been closed for nearly three months, and the pupils met under a new teacher for the first time on the day of inspection. Individually they were well conducted, but wholly ignorant of order. 3. The occupation had not been arranged, and the methods were not witnessed. 4. The proficiency was very small in every class and subject.

DUNMORE :—

DUNMORE :—Visited, 25th March.

Numbers present at examination :—Boys, 26 ; girls, 9 ; total, 35.

1. The ground is not enclosed, and the condition of the building is extremely wretched. The furniture and apparatus are moderate in character and amount. 2. The pupils were unpunctual, untidy in several instances, inattentive, and disorderly. 3. The subjects were appropriate, but unskillfully arranged ; the methods were inanimate and very superficial. 4. The proficiency and mental culture were very small and poor.

ECCLESTON :—Visited, 18th December.

Numbers present at examination :—Boys, 6 ; girls, 4 ; total, 10.

1. The buildings are in good repair, and the schoolroom is sufficient and adequately furnished. 2. The pupils present were regular, punctual, clean, and orderly. 3. The subjects were appropriate, and arranged with tolerable judgment. The methods were intelligent, earnest, and well applied. 4. The proficiency was tolerable, and the mental culture fair.

FALLBROOK :—Visited, 24th July.

Numbers present at examination :—Boys, 12 ; girls, 19 ; total, 31.

1. For the kind, the premises are in fair condition, and the schoolroom is tolerably suitable and moderately organized. 2. Most of the pupils were regular and punctual, clean, well-behaved, and in very fair order. 3. Except singing and drawing, the occupation accorded with the prescribed course, and was otherwise tolerably judicious. The methods were moderately intelligent. 4. In reading, writing, and arithmetic, the proficiency was from moderate to fair ; in the other subjects, less satisfactory.

FISHERY CREEK :—Visited, 28th February.

Numbers present at examination :—Boys, 15 ; girls, 5 ; total, 20.

1. The premises are in good condition, but in need of cleansing and repairs. The organization of the school is passable. 2. The moral tone was moderate. 3. The ordinary subjects, with geometry and algebra, were taught, and their arrangement, though wanting precision, was upon the whole suitable. The methods were rather suggestive. 4. Writing, arithmetic, and grammar were tolerably well understood ; the other subjects, badly.

GOSFORTH :—Visited, 8th May.

Numbers present at examination :—Boys, 5 ; girls, 7 ; total, 12.

1. The site is for the most part low ; the buildings are old and in bad condition ; the schoolroom was untidy, and the furniture badly arranged. 2. The moral character of the school was moderate. 3. The subjects were appropriate, but defectively arranged. The methods were mechanical, but earnest and perseveringly applied. 4. The few pupils present were carefully taught. The general proficiency ranged from moderate to tolerable, and in a considerable number of instances from fair to good.

HINTON :—Visited, 27th March.

Numbers present at examination :—Boys, 11 ; girls, 10 ; total, 21.

1. The premises are in a fair state of repair, and the schoolroom is fairly organized. 2. The pupils were very irregular and addicted to whispering, but punctual, well-conducted, and orderly in their movements. 3. The instruction was suitable in kind, arranged in proper guides, and imparted with fair intelligence. 4. The proficiency was small as a whole, and only tolerable in reading and writing.

IONA :—Visited, 20th March.

Numbers present at examination :—Boys, 11 ; girls, 16 ; total, 27.

1. The premises are in bad condition, but the school is moderately provided with furniture and apparatus. 2. The pupils were very irregular and unpunctual ; otherwise, the discipline was tolerably effective. 3. Singing, drawing, and needlework, were not taught ; and the occupation generally was very injudicious. The methods were verbose and ineffectual. 4. The progress and proficiency of the pupils were very small, and their general intelligence slight.

LOCHINVAR :—Visited, 2nd December.

Numbers present at examination :—Boys, 14 ; girls, 14 ; total, 28.

1. The schoolroom is badly ventilated, otherwise the premises are in all respects fairly satisfactory. 2. The moral aspect of the school was fair. 3. The classification was not throughout judicious, but the occupation was fairly appropriate. The methods were earnest, intelligent, and animated ; but tending too much to progress at the expense of thoroughness. 4. Reading, writing, and arithmetic, were fairly known ; the other subjects, poorly. The pupils evinced fair attention and tolerable intelligence.

MAITLAND, EAST (Infant) :—Visited, 2nd and 3rd March.

Numbers present at examination :—Boys, 41 ; girls, 39 ; total, 80.

1. The accommodation of the school is fairly sufficient, and the organization moderate ; but repairs and improvements are much needed, especially in the playground. 2. The pupils were regular and punctual, moderately clean, and in tolerable order. Habits of talking and unsteadiness were prevalent, but the teaching power was insufficient. 3. The subjects were fairly appropriate, and well arranged ; but the methods were not well suited to this class of children, being feeble and monotonous. 4. The general proficiency was moderate, but partial.

MAITLAND, EAST (Primary) :—Visited, 3rd and 12th March.

Numbers present at examination :—Boys, 78 ; girls, 54 ; total, 132.

1. In point of position, size, and general adaptability, the schoolroom is excellent, amply furnished, and provided with all modern appliances ; but it is in bad repair, and the playground very defective. 2. The discipline was very thorough and complete ; and the moral aspect of the school very pleasing. 3. The subjects accorded with the "Course of Secular Instruction," were skilfully arranged and effectively taught, for the most part. Geometry and algebra were studied in the highest class. 4. A satisfactory proportion of good results was evinced in reading, writing, and arithmetic ; in the other subjects the proficiency was from tolerable to fair.

MERRIWA :—

MERRIWA :—Visited, 25th August.

Numbers present at examination :—Boys, 25 ; girls, 21 ; total, 46.

1. The premises are tolerably substantial, but in need of repairs. 2. The discipline had improved within the year ; the moral tone of the school was tolerable. 3. Except singing, the prescribed course was observed ; the occupation was constant, and tolerably judicious. The methods were intelligent, earnest, and effective, but awkwardly applied. 4. The proficiency and general intelligence shewed a marked improvement, and were upon the whole nearly tolerable.

MURRURUNDI :—Visited, 18th August.

Numbers present at examination :—Boys, 25 ; girls, 13 ; total, 38.

1. The buildings are very unsuitable, in bad repair, insufficiently furnished, and altogether quite behind the requirements of the time and the growing importance of the town. 2. Under the circumstances, the moral aspect of the school was tolerable. 3. The occupation, as a whole, was moderate ; and the instruction earnest and intelligent, but not effective. 4. In the junior class, the proficiency ranged from moderate to tolerable ; in the senior classes it was small.

MORPETH :—Visited, 21st and 23rd April.

Numbers present at examination :—Boys, 74 ; girls, 46 ; total, 120.

1. The premises are in excellent condition, and the schoolroom is the best in the district, amply and appropriately furnished, and otherwise effectively provided. 2. Most of the pupils were tolerably regular, punctual, and clean ; but their conduct, attention, and order, were decidedly bad. 3. The subjects were suitable and tolerably well arranged, though rather injudiciously advanced. The methods were fairly skilful, and applied with considerable energy, but so far very ineffectual. The present master had not been long in charge. 4. With a few exceptions, the proficiency was very small.

NELSON'S PLAINS :—Visited, 24th September.

Numbers present at examination :—Boys, 28 ; girls, 22 ; total, 50.

1. The site is inconvenient with respect to water ; otherwise the condition of the premises and the organization of the school are tolerable for the place. 2. Habits of whispering, copying, and inattention were prevalent, but the moral aspect of the school was tolerable. 3. Singing excepted, the subjects accorded with those prescribed, and were tolerably well arranged. The methods were rather direct and suggestive, but reasonably skilful and earnestly applied. 4. The proficiency was, for the most part, moderate, but partial, with slight mental culture.

OSWALD :—Visited, 3rd December.

Numbers present at examination :—Boys, 15 ; girls, 14 ; total, 29.

1. The general state of the buildings, and the organization of the school, are barely moderate. 2. The pupils were unsteady, addicted to prompting and copying, and awkward in their movements. 3. The subjects were tolerably appropriate as to arrangement ; but the methods were hurried, unconnected, and ineffectual. 4. The general knowledge evinced was small, and the answering very thoughtless.

SCONE :—Visited, 7th August.

Numbers present at examination :—Boys, 18 ; girls, 11 ; total, 29.

1. The school is in good condition, and tolerably well furnished ; but the ground is not enclosed. 2. The pupils evinced some objectionable habits, but their appearance and general deportment were tolerable. 3. The instruction was appropriate, and imparted with moderate judgment as a whole, but not sufficiently connected in detail. 4. The proficiency was very moderate and partial, and the mental culture small.

SCOTT'S FLAT :—Visited, 14 December.

Numbers present at examination :—Boys, 30 ; girls, 17 ; total, 47.

1. The situation is awkward ; but the premises are in good repair for the kind. The school is sufficient for present wants, and moderately organized. 2. The pupils were irregular, and in several instances untidy ; otherwise the moral tone of the school was fair. 3. The occupation was fairly appropriate and well arranged ; the methods were tolerably intelligent, and perseveringly applied. 4. In the lower classes, a tolerable proficiency was evinced ; but in the highest, the knowledge of the pupils was small. A moderate intelligence was in general exhibited.

SINGLETON (Infant) :—Visited, 9th June.

Numbers present at examination :—Boys, 24 ; girls, 31 ; total, 55.

1. The room is much too small ; otherwise its character and organization are fair. 2. The pupils were tolerably regular, punctual, and clean ; but the discipline was, in general, neither vigorous nor effective. 3. The instruction was suitable in kind ; but the teaching wanted interest and animation. 4. One-half of the pupils evinced a tolerable knowledge of reading, writing, and arithmetic. The other comprised the youngest children and the least capable of being instructed.

SINGLETON (Primary) :—Visited, 10th and 11th June.

Numbers present at examination :—Boys, 22 ; girls, 25 ; total, 47.

1. The general condition of the premises is good ; but repairs are urgently needed in several parts. The schoolroom is sufficient, suitable, and well organized. 2. Except a habit of whispering, prevalent at intervals, the moral character of the school was fair. Singing was not taught ; but otherwise the subjects accorded with the Standard, and were judiciously arranged. The methods were intelligent, skilful, and fairly effective. 4. The general proficiency was tolerable, and in some instances very fair.

STANHOPE :—Visited, 4th December.

Numbers present at examination :—Boys, 13 ; girls, 12 ; total, 25.

1. The premises are in bad repair but neatly kept, and the school is, for the place, fairly organized. 2. The pupils were irregular, but punctual, tolerably clean, fairly attentive, and orderly. 3. The instruction was appropriate, and imparted with tolerable intelligence, earnestness, and effect. 4. The average proficiency ranged from tolerable to fair.

SUGARLOAF :—

SUGARLOAF :—Visited, 11th December.

Numbers present at examination :—Boys, 9 ; girls, 14 ; total, 23.

1. The schoolroom is in fair condition, and sufficient for the wants of the place ; it is moderately well furnished, but the playground is very deficient of shade. 2. The pupils were noisy, inattentive, and disorderly for the most part ; but the school has only just been reopened after a two-months' recess. 3. The occupation had not been revised, but was tolerable in general. The methods were moderate in all respects. 4. The proficiency and intelligence of the pupils were very low.

VACY :—Visited, 30th April.

Numbers present at examination :—Boys, 12 ; girls, 17 ; total, 29.

1. The schoolroom needs cleansing and additional furniture, and the out-offices are exposed and unfinished ; in other respects the state of the premises is tolerable. 2. The moral tone of the school was tolerable. 3. The occupation was fairly suitable, but the methods were mechanical and ineffective. 4. The proficiency and mental culture of the pupils were small and poor.

WALLALONG :—Visited, 26th March.

Numbers present at examination :—Boys, 14 ; girls, 14 ; total, 28.

1. The buildings are in good condition, and the school is fairly organized. 2. The pupils were very irregular, but tolerably punctual, clean, and tidy, attentive, and in fair order. 3. Drawing and singing were not taught ; otherwise the subjects accorded with the prescribed course, and were arranged with fair judgment. The methods were intelligent, reasonably skilful, and tolerably effective. 4. The general proficiency was nearly tolerable, and the elder pupils evinced a passable degree of intelligence.

WATAGON :—Visited, 19th June.

Numbers present at examination :—Boys, 15 ; girls, 6 ; total, 21.

1. The schoolroom is a rude slab hut, but moderately weatherproof, cleanly kept and provided with a moderate supply of requisites. 2. The discipline was moderately effective in general. 3. The occupation was moderately appropriate, and the teaching earnest and careful, but, in its general nature, mechanical. 4. The general proficiency ranged from moderate to fair, but the accompanying intelligence was small.

WOODBURN :—Visited, 17th July.

Numbers present at examination :—Boys, 9 ; girls, 20 ; total, 29.

1. The school is a roughly-constructed and rudely-furnished building, but moderate for the place, and provided with a reasonable stock of apparatus and books. 2. The moral tone of the school was moderate. 3. The subjects accorded with the Standard, but were not arranged with judgment. The methods were very mechanical, and of slight effect. 4. The proficiency was small in every class and, writing excepted, in every subject.

WOLLOMBI :—Visited, 16th and 20th June.

Numbers present at examination :—Boys, 32 ; girls, 39 ; total, 71.

1. The site is very favourable, the accommodation and organization are fair, but the teacher's residence is very insufficient. 2. The moral aspect of the school was fair. 3. The occupation was suitable, and, for the most part, well arranged ; the instruction was earnest, careful, and effective. 4. The general proficiency was tolerable, and the pupils evinced a reasonable degree of intelligence.

NEWCASTLE DISTRICT.—INSPECTOR'S GENERAL REPORT.

Inspector of Schools, Newcastle District, to the Secretary, Council of Education.

Newcastle, 11 January, 1869.

Sir,

I have the honor to submit, for the information of the Council of Education, my Report, for the year ended 31st December, 1868, on the Public and Certified Denominational Schools in the Newcastle District.

I.—NATURE OF DUTIES.

During the year I have, in addition to duties of a special character, been able to effect the regular and ordinary inspections of most of the schools in the district.

The following is a detailed summary of these duties, and the time occupied therein :—

	Days.
Inspection of schools, including time occupied in travelling to them ...	184
Clerical work, embracing Reports upon schools and special inquiries, general correspondence	88
Examinations of teachers	20
Attending Conference of Inspectors	6
Off duty (public holidays and leave of absence)	16
	314
Sundays	52
	366

II.—EXTENT OF DISTRICT.

The Newcastle District has this year been slightly enlarged, by the addition of certain schools in the locality of Brisbane Water.

The schools that have been in operation during the year are :—

Public Schools	50
Provisional Schools	3
Denominational :—	
Church of England	12
Roman Catholic	5
Presbyterian	2
	72

III.—

III.—CHARACTER OF INSPECTION.

Of the above schools, forty-seven Public, two Provisional, and eighteen Denominational Schools, have undergone the annual examination; and forty-nine Public, one Provisional, and fifteen Denominational Schools have received ordinary inspection, in addition to that of the regular or annual inspection.

The examinations of the moderate sized schools have occupied from five to seven hours, but those of the larger schools required two and three days each. The distances travelled in visiting schools amounted to 2,282 miles.

Ordinary Inspection.—This is really the most important form of visitation; it enables an Inspector to see the inner life of a school, its disciplinary influences, and the character and educative value of the teaching.

The work of the day is left in the hands of the teacher, and the Inspector is in a position to judge whether the school is *taught* by an earnest and faithful educator, or whether it *languishes* under the influences of a mere hireling.

IV.—SCHOOL BUILDINGS.

Although many buildings unfitted for school purposes are of necessity still used, a considerable number has undergone repair and enlargement. The Public School houses on the Manning River have been put into good condition. At Hanbury a handsome brick structure has displaced a slab hut, and the Public School house at Tomago has been renovated. The Church of England School premises at Raymond Terrace and Gosford have been improved; and at the Roman Catholic School, Newcastle, a considerable expense, in the erection of proper out-offices and playground improvement, has been incurred. The Public School houses at Mosquito Island, Pitt Town, Seaham, Teralba, and Wallsend are unsuitable, nearly worthless, and, in some cases, highly dangerous buildings. The only Denominational School that may be reported as unfit for use is the C. E. building at Kincumber, but there are several others much in need of repair.

V.—TEACHERS' RESIDENCES.

In those cases where schoolhouses have been repaired, corresponding improvements have been made in the masters' dwellings; but there are *ten* attached to Public Schools in a very poor condition. *Thirteen* Non-vested Public Schools have no teacher's residences attached; and although, in most cases, rented houses have been provided, they are frequently remote from the schools.

Of the nineteen Denominational Schools, *twelve* of the teachers have good houses; *five* residences are very dilapidated; and, in *two* instances, Newcastle R. C. and Newcastle Presbyterian, the teachers have neither houses nor rent allowance.

Alluding to this latter school, I am at a loss to understand why it is called a Denominational School. It bears the name of a Presbyterian School, yet the tenets of that body are not taught in it; and further, the premises in which the school is held do not belong to the Presbyterian body, but the teacher has to pay rent for them himself.

VI.—OUT-OFFICES AND PLAYGROUNDS.

In these respects about one-third of the Public and one-half of the Denominational Schools are well provided, and in about one-third of each kind of schools the provisions are positively bad. The Public Schools in which these defects exist are Non-vested properties.

I subjoin a tabulated return of the material condition of the respective schools:—

PUBLIC SCHOOLS.

	Good in supply or condition.	Fair and moderate.	Bad or not provided.
<i>a.</i>			
Schoolhouse	30	15	8
Teacher's residence	22	12	19
Playground	20	15	18
Out-offices	15	18	20
<i>b.</i>			
Furniture and apparatus.....	24	23	6
Books, maps, &c.	28	25	...

DENOMINATIONAL SCHOOLS.

	Good in supply or condition.	Fair and moderate.	Bad or not provided.
<i>a.</i>			
Schoolhouse	9	8	2
Teacher's residence	6	7	6
Playground	9	3	7
Out-offices	9	5	5
<i>b.</i>			
Furniture and apparatus.....	4	9	6
Books, maps, &c.	4	14	1

VII.—CLASSIFICATION OF PUPILS.

Under this head I can report favourably. In those schools which formerly presented defects in this feature of school organization, the teachers have succeeded in mastering, to a fair degree, its apparent difficulties, and it is rare that I have to report cases of faulty classification.

VIII.—

VIII.—DISCIPLINE.

A marked improvement has taken place in the internal discipline of the schools of this district, but there is yet room for alteration in the punctuality and regularity of the pupils. Of the numbers enrolled the average attendances in the several kinds of schools are as follow :—

Public and Provisional Schools	Two-thirds.
Denominational Schools, Church of England	Upwards of two-thirds.
" " Roman Catholic.....	One-half.
" " Presbyterian	Two-thirds.

I subjoin a tabular estimate of the discipline which prevailed in the schools at the times of inspection :—

	Good.	Fair.	Moderate.	Bad.
Public Schools.....	18	16	15	3
Denominational Schools.....	2	10	6	...

IX.—INSTRUCTION.

Throughout the schools of this district there is a uniform observance of the Council's "Standard Course." Reading, Writing, Dictation, Arithmetic, Grammar, Geography, Object Lessons, and, in a few schools, Singing and Drawing, form the items of instruction. In most schools considerable proficiency in needlework is attained. The time-tables are fairly devised for systematic instruction. The programmes of lessons do not often exhibit skill of a high order; frequently, they are diffuse and useless documents, and of them it can only be said that they professedly meet the requirements of the regulation thereon. The daily lesson registers are properly kept, and I generally find them to be serviceable aids in the examination of the classes.

Distribution of Teaching Power.—There is still a manifest weakness in this feature of school management; and, as remarked in a previous Report, the younger children receive but a minimum amount of oral teaching, excepting in those schools that are large enough to command the services of an assistant teacher, or where the teachers' wives assist with some degree of regularity.

As far as my observation has extended I am in a position to state that the schools in which the younger children have made marked progress, or exhibited cultivated intelligence, are those in which the teachers' wives systematically engage in the teaching.

I append a table shewing the class distribution of those pupils who were present at the examinations :—

	1st Class.	2nd Class.	3rd Class.	4th Class.	Total.
49 Public Schools.....	1,233	692	450	57	2,432
2 Provisional Schools.....	23	17	40
18 Denominational Schools.....	544	295	185	26	1,050
	1,800	1,004	635	83	3,522

Of those in the first or lowest class, 377 in Public and 166 in Denominational Schools receive instruction as infants from qualified female teachers.

Method.—Marked skill in teaching is a rare gift; but wherever honest effort is put forth, even the teacher of moderate ability will realize reasonably good results. Many schools whose classes had, last year, to be rated as "below the Standard" have now, through the earnest industry of the teachers, earned a more satisfactory verdict; but the prevailing modes of teaching do not, in many instances, enforce due mental activity in the pupil. The teacher does too much, and the pupil is not made to feel his own personality, or the part he should take in the school work. Modern systems of instruction profess to combine the excellencies of the *simultaneous* with those of the *individualizing* methods; but whilst I find numerous schools in which a fair share of *class* intelligence is displayed, I rarely meet with a pupil sufficiently practised to express his ideas, or to reproduce, with anything like correct composition and orthography, the substance of the simplest lesson he is *supposed* to have received. There are some schools in the Colony in which the plan of mutual questioning is used, and with great advantage, and it is surprising how sharpening are its influences.

The fact is, the pupil then knows that he is under the keen criticism of his fellows, and he feels that he *must* trust to himself for success. In connection with this matter of inducing correct individual effort, the Rev. J. Fraser, in his Report upon the Common School System of the United States, says, referring to the High School at Boston :—

"A noticeable feature in the instruction given in these schools is the extent to which the black-board is used, not, as with us, chiefly by the teacher, but almost exclusively by the pupils. All round three sides of the class-room is let into the wall a panel either of slate or covered with some plaster composition, which is the instrument understood by the 'black-board.' It is at a convenient elevation from the floor of the room, and varies from four to six feet in width * * * * * For exercise in Greek and Latin composition, for developing the paradigm of a Greek or French verb, for the analysis of a sentence, for illustrating sketches in anatomy and mechanics, as well as for the more usual purposes of geometrical demonstrations and arithmetical or algebraic examples, the black-board is called into play * * * * * One great advantage in the method is that, when the results come under the critical eye of the teacher, who generally calls upon each pupil to exhibit or explain his own performance, it enables him to contrast before the class (who by the hypothesis of a graded school are equal in their attainments, and each, therefore, competent to understand and criticise his neighbour) different styles of setting out work, besides its further action as a stimulant upon the pupils to do their best, when they know that their work will presently be exposed to the criticism of all their class-mates."

It is true that our schools are not, and perhaps for pecuniary reasons cannot be, so fitted up; but I am of opinion that if the ordinary black-board were placed in the hands of the pupils more frequently the results would be highly satisfactory, and would induce a healthy spirit of competition in the several classes.

Subjects.—

Subjects.—*Reading*.—This subject, as an art, is still a weak one, and is seldom taught in an intelligent style. In the junior classes it is too frequently given in a disjointed manner, whilst in the advanced classes it is delivered in a rapid and sleep-inducing monotone. In a few schools in the district, reading is treated in a rational way, and the teachers have succeeded in evoking a spirit of emulation among the pupils. As a result, the *school drawl* has given place to a natural and expressive style.

Writing.—I am pleased to observe that there is less discrepancy between the styles of the copy-book and slate exercises than formerly; but the defective character of the *composition* of the upper classes reveals a necessity for a greater amount of practice than has been customary. The elder pupils should be encouraged to write simple themes, and upon *unruled* paper.

Dictation.—As far as the dictation of passages from the reading lessons is concerned, the results of the examinations were, on the whole, tolerably satisfactory; but proficient spellers are rarely to be met.

In numerous instances, after a satisfactory examination in formal dictation, have I found the pupils to fail signally when required to write down the heading of a sum from dictation or to produce the substance of a recent lesson.

Arithmetic.—The results of this branch of instruction are but very moderate in comparison with the amount of time generally devoted to it. This weakness is most apparent in the first and third class, but particularly so in the latter. Of the sixty-seven schools that were examined, fifty-six have third classes; yet, of that number, *eleven* third classes only succeeded in solving such sums as the following satisfactorily:—

1. Notate 510020106 and 630010111
2. Take 7295987 from 503790047
3. Multiply 379654 by 50608.
4. Pay the following sums of money—11s. 4½d., £5 0s. 6d., and £2 15s. 6d.—out of £50; say how much remains.
5. Take 30½ cwt. from 5 tons 7 cwt. What remains?

Twelve classes did fairly, *twenty-five* tolerably, and *eight* moderately so; whilst in *eleven* the examination was nearly a failure. With the exception of the notation, the above sums were placed on the black-board. The average age of the pupils exceeded eleven years, and the average time of enrolment in the classes exceeded nine months. Some allowance must, of course, be made for the deteriorating effects of irregularity; but much of the weakness is attributable to a want of searching revision of the work presumed to have been mastered.

Grammar.—As remarked in a previous report, this subject is one in which the Public Schools give fair results, and I have this year to add that promising progress has also been made in the Denominational Schools.

Geography.—The restrictions of the Council's "Standard Course" have greatly checked the diffuse teaching of geography, and the results, as ascertained by the examinations, range from tolerable to fair. In few schools, however, is the subject treated intelligently. Constructive illustrations on the black-board are rarely used, nor could I often detect evidences of deductive teaching. The system of cramming the pupils with facts is too frequently followed.

Object Teaching.—I cannot report favourably of this branch of instruction. Few of the teachers in this district are even fairly skilled in the art. I prefer giving the words of the Rev. J. Frazer rather than comments of my own—the more so, that they so correctly portray my own experiences as an Inspector.

"The beneficial results" of Object Teaching "is admitted on all hands. But here, as elsewhere—indeed more than elsewhere—all depends on the skill of the teacher. Desultory, aimless, object lessons I conceive to be as unprofitable a way of occupying children's time as can be devised. Nor do I think they should be allowed to exclude or throw into the shade other methods—those for instance which discipline and strengthen the memory—which are no less necessary for the due and proportionate development of the youthful mind. In the hands of a lively, systematic, judicious teacher, the object lesson is an educational instrument of vast power; in the hands of one with the reverse of these qualities, it is worse than a waste of time." (Report upon Common Schools System, U. States, page 86.)

I annex tables showing the relative proficiency of the schools in all the subjects upon which I have treated.

PUBLIC SCHOOLS.

Subjects.	Good.	Fair.	Moderate.	Bad or Indifferent.
Reading	11	24	11	2
Writing	16	20	10	1
Dictation	4	20	20	3
Arithmetic	7	17	13	10
Grammar	15	13	10	9
Geography	8	14	15	10
Object Lessons	1	14	20	12
Needlework	15	20	8	4

DENOMINATIONAL SCHOOLS.

Subjects.	Good.	Fair.	Moderate.	Bad or Indifferent.
Reading	4	8	6	...
Writing	7	6	5	...
Dictation	2	7	7	2
Arithmetic	6	8	4
Grammar	1	5	5	7
Geography	1	7	6	4
Object Lessons	3	9	6
Needlework	4	7	4	3

X.—TEACHERS.

The teachers in this district, are, as a rule, faithful agents. I have found them glad to receive professional hints, and subsequent visits to their schools testify to the adoption of my suggestions. They are classified as follows :—

2nd Class.		3rd Class.			Probationers.
Sec. A.	Sec. B.	Sec. A.	Sec. B.	Sec. C.	
6	5	30	17	13	13

XI.—SCHOOL FEES.

The total amount of school fees for the year in this district is £2,520 Os. 5½d. In some localities the fees form no inconsiderable augmentation to the teachers' incomes, but in the agricultural parts of the district they are absurdly small. In *eight* schools the fees for the year range from £2 to £5; in twenty-six schools, from £5 to £10; and (omitting those schools that are very large and have two or more teachers each) in three only do the fees exceed £40 for the year. Dividing the fees received by the number of pupils enrolled, I find that the average payments *for the year* per scholar are as follows :—

Public Schools	8s. 3d.
Provisional Schools	6s. 0d.
C. E. Schools	6s. 3d.
R. C. Schools	4s. 3d.
Presbyterian Schools	6s. 9d.

The smallness of these amounts is due to the existence of a numerous body of what may be termed *nominal payers*, most of whom are in a position to pay the fees, but who, whilst sensitively shrinking from seeking admission for their children as *free scholars*, have not an equal sensitiveness about their just liabilities to the teachers.

XII.—FREE SCHOLARS.

According to the Yearly Returns, there are 779 free scholars in the schools of this district, the ostensible ground of exemption being alleged poverty. I am, however, of opinion that the exemption is frequently very injudiciously given. Excepting in cases of absolute poverty, a small fee should be exacted from each pupil if upon no other ground than that of fostering self-respect in the child.

TABULATED Return of Free Scholars.

Schools.	Pupils enrolled.	Free scholars.	Per centage of enrolment.
Public and Provisional	4475	483	10·8
Denominational—C. E.	1485	113	7·6
" R. C.	517	156	30·0
" Presbyterian	319	27	8·5

XIII.—LOCAL SUPERVISION.

As far as the Public Schools are concerned, I am unable to report favourably. In townships the members of the Boards are generally persons whose time is fully occupied in business pursuits, and in the agricultural districts the claims of the field are paramount to the active interests of the school.

In sixteen schools the members of the Local Boards were not present at the examination. Respecting the Denominational School Boards, very little interest in their respective schools is evinced by the lay members; oversight practically devolves upon the clergy. At the examination of the C. E. Denominational Schools, in one instance the clergyman and the lay members of the Board were present; in seven, the clergymen were present during the greater part of the examinations; in one, a lay member of the Board was present; and in three, the School Boards were not represented.

In the R. C. Denominational Schools the clergyman and a lay member of the Board were present in one instance, but in the other schools (three) the School Boards were not present. It is, however, right that I state that in these three places the clergy were non-resident.

In both of the Presbyterian Schools the Boards were present at the examinations.

In conclusion, I have to report that there is a growing disposition on the part of the Church of England Clergy to make systematic visits to the Public Schools in their respective parishes for the purpose of imparting special religious instruction.

Summaries of my detailed reports are appended.

I have, &c.,
J. W. ALLPASS,
Inspector of Schools,
Newcastle District.

ANNEX A.

NEWCASTLE DISTRICT.—TABULATED REPORTS FOR 1868.

PUBLIC SCHOOLS.

BANDON GROVE (Vested) :—Visited, 30th November.

Pupils enrolled :—Boys, 26; girls, 22; total, 48.
Pupils present :—Boys, 18; girls, 17; total, 35.

The school premises are in good condition. There is a proper supply of furniture and appliances. The organization is good; the discipline is effective; the methods of teaching are skilful, and the results range from tolerable to good. The Local Board's visits are rare; one member was present at the examination.

BARRINGTON (Non-vested) :—Visited, 17th November.

Pupils enrolled :—Boys, 18 ; girls, 10 ; total, 28.
Pupils present :—Boys, 14 ; girls, 9 ; total, 23.

The schoolhouse is in a tolerably fair state. The organization and discipline are moderate ; the instruction is methodless, and the progress of the pupils is small ; but the main cause of this is their great irregularity. Local supervision is tolerably frequent, but, owing to the pressure of harvest labour, none of the Public School Board were present at the examination.

BENDOLBA (Vested) :—Visited, 25th November.

Pupils enrolled :—Boys, 8 ; girls, 9 ; total, 17.
Pupils present :—Boys, 5 ; girls, 7 ; total, 12.

The schoolhouse is in but moderate repair. It is kept clean, and is sufficiently furnished and supplied with working appliances. The school management and the teaching appear to be careful. Little interest either in the prosperity or the existence of the school is manifested. The school secretary was present at the examination.

BLUE GUM FLAT (Non-vested) :—Visited, 18th August.

Pupils enrolled :—Boys, 25 ; girls, 24 ; total, 49.
Pupils present :—Boys, 22 ; girls, 16 ; total, 38.

The schoolhouse is in fair condition, is suitably furnished and supplied with working appliances. Out-offices have not been provided. The organization and discipline are fair, but the attainments of the pupils are barely moderate. Local supervision is fairly exercised. The school secretary was present at the examination.

BO BO CREEK (Non-vested) :—Visited, 26th September.

Pupils enrolled :—Boys, 18 ; girls, 12 ; total, 30.
Pupils present :—Boys, 17 ; girls, 12 ; total, 29.

The schoolhouse is much in need of repair, but it is moderately furnished and supplied with working material. The organization is correct, the discipline is fair, and, making due allowance for the detrimental influences of the very irregular attendance, fair progress has been made in the mechanical branches. Local supervision is very rare, but four members of the Public School Board were present at the examination.

BOOLAMBAYTE (Non-vested) :—Visited, 10th November.

Pupils enrolled :—Boys, 21 ; girls, 11 ; total, 32.
Pupils present :—Boys, 19 ; girls, 9 ; total, 28.

The schoolhouse is a substantial building, and the working material sufficient, but the furniture is very unsuitable. The discipline is fair, but the organization and classification of the pupils are defective. The teaching is unskilful, and the results are small. No member of the School Board was present at the examination.

BOORAL (Non-vested) :—Visited, 6th November.

Pupils enrolled :—Boys, 19 ; girls, 14 ; total, 33.
Pupils present :—Boys, 19 ; girls, 10 ; total, 29.

The schoolhouse is an excellent structure, well furnished, and is a model for a village school. The organization is correct ; the discipline is effective ; the instruction is suitable, and the progress of the pupils is very fair. The tone of this school is healthy. Two members of the School Board were present at the examination.

BROOKFIELD (Vested) :—Visited, 3rd December.

Pupils enrolled :—Boys, 23 ; girls, 23 ; total, 46.
Pupils present :—Boys, 16 ; girls, 15 ; total, 31.

The schoolhouse was blown down in the month of October, and at the time of my visit it had not been rebuilt. The teacher's house has but two rooms ; one of these and the verandah have been given up to the school children, but, as may be expected, the work cannot be effectively carried on. The results of the examination were reasonably satisfactory. One member of the School Board was present at the examination.

CLARENCE TOWN (Vested) :—Visited, 7th December.

Pupils enrolled :—Boys, 39 ; girls, 40 ; total 79.
Pupils present :—Boys, 31 ; girls, 31 ; total 62.

The material condition of this school is very good, and the appointments are all that can be desired, but the room is too small. The organization is correct, the discipline excellent, the methods of teaching are intelligent and effective, and the tone of the school is good. Local supervision is very infrequent. Two members of the Public School Board were present at the examination.

COEURUMBONG (Non-vested) :—Visited, 6th August.

Pupils enrolled :—Boys, 16 ; girls, 13 ; total 29.
Pupils present :—Boys, 5 ; girls, 6 ; total 11.

The school is held in the Catholic Church, which is in fair condition, is suitably furnished, and properly supplied with working appliances. The very small attendance was owing to the prevalence of whooping-cough. The organization is correct, and the instruction, as far as I could judge, appears to be painstaking and is fairly effective.

CROKI (Vested) :—Visited, 22nd September.

Pupils enrolled :—Boys, 31 ; girls, 33 ; total, 64.

Pupils present :—Boys, 23 ; girls, 29 ; total, 52.

The schoolhouse is in excellent condition, and there is a good supply of furniture and working appliances. The exterior appointments of the school are good. The organization is correct, the discipline healthy, and the instruction is intelligent, and produces fair results. The School Board exercises occasional supervision, and all the members were present at the examination.

CROOM PARK (Vested) :—Visited, 20th November.

Pupils enrolled :—Boys, 12 ; girls, 21 ; total, 33.

Pupils present :—Boys, 6 ; girls, 14 ; total, 20.

The material state of the school is good. The organization and discipline are highly satisfactory. The teaching is careful, and the results range from tolerable to good. Local visitation is very infrequent, but all the members of the School Board were present at the examination.

CUNDLETOWN (Vested) :—Visited, 9th September.

Pupils enrolled :—Boys, 25 ; girls, 16 ; total, 41.

Pupils present :—Boys, 22 ; girls, 16 ; total, 38.

The schoolhouse has recently undergone repair, and presents a pleasing appearance. There is a proper supply of furniture and appliances. The discipline is fairly effective; the teaching gives very satisfactory results, and the tone of the school is healthy. The school secretary was present at the examination, but local supervision is merely nominal.

DINGO CREEK (Non-vested) :—Visited, 16th September.

Pupils enrolled :—Boys, 22 ; girls, 13 ; total, 35.

Pupils present :—Boys, 20 ; girls, 12 ; total, 32.

The schoolhouse is a satisfactory building, but the rest of the premises are far from creditable. The ground is unfenced, and out-offices have not been provided. The organization is correct, the discipline moderately effective, but the character of the instruction is more mechanical than educative. One member of the School Board was present at the examination.

DUMARESQ ISLAND (Vested) :—Visited, 25th September.

Pupils enrolled :—Boys, 20 ; girls, 26 ; total, 46.

Pupils present :—Boys, 14 ; girls, 23 ; total, 37.

The schoolhouse is an excellent structure, but much too small ; it is, however, well appointed internally and externally. The ground in front of the school is tastefully laid out in flower-beds. The organization is correct, the discipline is effective, and the instruction gives very fair results. Local visitation is very rare, but the members of the Board were present at the examination.

DUNGOO (Vested) :—Visited, 23rd November.

Pupils enrolled :—Boys, 31 ; girls, 32 ; total, 63.

Pupils present :—Boys, 18 ; girls, 28 ; total, 46.

The schoolhouse is in good repair. The furniture is sufficient, and the supply of material is fully equal to the requirements of the school. The organization is correct, and the teaching gives moderate results. The tone of the school is not good, the pupils being unpunctual and far from industrious. All the members of the Public School Board were present at the examination.

EAGLETON (Vested) :—Visited, 4th November.

Pupils enrolled :—Boys, 17 ; girls, 20 ; total, 37.

Pupils present :—Boys, 16 ; girls, 18 ; total, 34.

The material state of this school is very satisfactory. The organization and discipline are effective ; the instruction is careful, and its results are satisfactory to a very fair degree. The School Board evinces considerable interest in the school, and two of its members were present at the examination.

GHINNI GHINNI (Vested) :—Visited, 10th September.

Pupils enrolled :—Boys, 23 ; girls, 26 ; total, 49.

Pupils present :—Boys, 22 ; girls, 25 ; total, 47.

The schoolhouse is small, in ill condition, and indifferently furnished, but a tender has been accepted for the erection of a new schoolhouse. The organization is correct; the discipline is judicious; the teaching is tolerably skilful and effective. All the members of the School Board were present at the examination, but the school is seldom visited by them.

GLENWILLIAM (Vested) :—Visited, 4th December.

Pupils enrolled :—Boys, 14 ; girls, 18 ; total, 32.

Pupils present :—Boys, 13 ; girls, 12 ; total, 25.

The material state of the schoolhouse is good, and it is well furnished and supplied with material. The organization and technical discipline are satisfactory, the teaching is methodical, but the results of the examination were unsatisfactory. The mental tone of the school is low, arising chiefly from the irregularity of attendance. Local supervision is not exercised ; but one member of the School Board was present at the examination.

GOSFORD (Non-vested) :—Visited, 8th August.

Pupils enrolled :—Boys, 14 ; girls, 16 ; total, 30.

Pupils present :—Boys, 14 ; girls, 15 ; total, 29.

The school is held in a portion of the Catholic Church. The premises are clean, suitable, and fairly supplied with working material, but the furniture is very unsuitable. The ground is enclosed, but the out-offices are only in moderate condition. The organization is correct, the discipline is effective, and the instruction fairly so. The tone of the school is very good. No member of the School Board attended the examination.

HANBURY (Vested) :—Visited, 28th and 29th October.

Pupils enrolled :—Boys, 120 ; girls, 129 ; total, 249.
Pupils present :—Boys, 91 ; girls, 95 ; total, 186.

The schoolhouse is an excellent and spacious structure, well furnished, and supplied with good internal and external appliances. The organization is correct, the discipline is fairly effective, and the attainments of the pupils range from tolerable to fair. The visitations of the Local Board are infrequent, but there is a very considerable interest in the welfare of the school shown both by the Public School Board and the general public. All the members of the Board were present at the examination.

LAMBTON (Vested)—Infants' Department :—Visited, 26th October.

Pupils enrolled :—Boys, 88 ; girls, 91 ; total, 179.
Pupils present :—Boys, 75 ; girls, 76 ; total, 152.

The schoolroom is a neat building, well lighted and ventilated ; but it is in great need of proper furniture. The organization is correct, the discipline is tolerably effective, and, considering the inadequacy of the staff of teachers, the progress of the pupils is tolerably satisfactory. The members of the School Board were not present at the examination.

LAMBTON (Vested)—Primary Department :—Visited, 27th and 29th October.

Pupils enrolled :—Boys, 96 ; girls, 98 ; total, 194.
Pupils present :—Boys, 81 ; girls, 96 ; total, 150.

The schoolhouse is an excellent wooden building, well furnished and supplied with appliances, but it is far too small. It was intended to accommodate 120 pupils, but the present average attendance exceeds 150 daily. The organization is correct, the discipline is healthy, the instruction is of modern cast, and is painstaking. The progress of the pupils is fair, and the general tone of the school is healthy. None of the members of the Board were present at the examination ; but the secretary evinces an unmistakable interest in the welfare of the school.

MANGROVE CREEK (Non-vested) :—Visited, 13th August.

Pupils enrolled :—Boys, 16 ; girls, 15 ; total, 31.
Pupils present :—Boys, 15 ; girls, 14 ; total, 29.

The school is taught in the Roman Catholic Church, which is suitable both as regards size and furniture. The ground is properly fenced, but there are no out-offices. The organization is correct, the government is healthy, and the teaching is methodical and intelligent. No member of the School Board was present at the examination.

MINMI (Non-vested) :—Visited, 3rd August.

Pupils enrolled :—Boys, 49 ; girls, 23 ; total, 72.
Pupils present :—Boys, 37 ; girls, 14 ; total, 51.

Excepting that the premises are somewhat small, they are suitable, and the supply of working material and furniture is sufficient. The organization is correct, the discipline is effective, and the instruction is fairly so. Local supervision is seldom exercised. The school secretary was present for a short time during the examination.

MONKEBAI (Non-vested) :—Visited, 19th November.

Pupils enrolled :—Boys, 14 ; girls, 15 ; total, 29.
Pupils present :—Boys, 11 ; girls, 10 ; total, 21.

The schoolhouse is in good repair, and, excepting the want of a black-board, there is a fair supply of furniture and working appliances. The organization is faulty, the discipline is weak, nor is the instruction effective. Local supervision is not exercised, nor were any members of the Public School Board present at the examination.

NEWCASTLE (Vested) :—Visited, 21st, 22nd, and 30th July.

Pupils enrolled :—Boys, 177 ; girls, 97 ; total, 274.
Pupils present :—Boys, 152 ; girls, 70 ; total, 222.

The school premises are in good condition, but are not large enough for the number of pupils in daily attendance. It is well furnished, and properly supplied with working material. The organization is correct, the discipline is effective, and the results of the examination are highly satisfactory. As far as supervision is concerned, the school is practically ignored by the Local Board. The school secretary was present at the examination for a short time.

OXLEY ISLAND (Non-vested) :—Visited, 11th September.

Pupils enrolled :—Boys, 26 ; girls, 33 ; total, 59.
Pupils present :—Boys, 20 ; girls, 29 ; total, 49.

The schoolhouse is substantial and suitable, but the teacher's dwelling is a wretched hovel, and the school has no out-offices. The organization is correct, the discipline is moderately effective, and reasonable progress has been made by the pupils. Local supervision is very nominal. The school secretary was present at the examination.

PARADING GROUND (Vested) :—Visited, 3rd November.

Pupils enrolled :—Boys, 17 ; girls, 22 ; total, 39.
Pupils present :—Boys, 12 ; girls, 14 ; total, 26.

The schoolroom is in a moderate state of repair, but is very dingy in appearance, and the teacher's apartments are ill-conditioned. The school is fairly furnished, but the working stock is old and worn. The organization is defective, and the discipline is fair in its mechanical features. The results of the examination were very unsatisfactory. Local supervision is valueless, but two members of the Board were present at the examination.

PELICAN POINT (Non-vested) :—Visited, 23rd September.

Pupils enrolled :—Boys, 12 ; girls, 6 ; total, 18.
Pupils present :—Boys, 12 ; girls, 6 ; total, 18.

The schoolhouse is a neat and substantial wooden building. It is fairly furnished and supplied with working appliances. The organization and discipline are fair. The results of instruction are far below the standard. Two members of the Board were present at the examination.

PITR TOWN (Vested) :—Visited, 17th and 18th December.

Pupils enrolled :—Boys, 129 ; girls, 115 ; total, 244.

Pupils present :—Boys, 93 ; girls, 60 ; total, 153.

The schoolhouse, besides being small, ill-lighted, and badly ventilated, is positively unsafe, owing to the ravages of the white ant. There is a good supply of furniture and working appliances. The organization is correct, the discipline is judicious, and the results of the instruction range from tolerable to fair. Local supervision is not exercised, nor was any member of the School Board present at the examination. The school has been recently vested in the Council.

PLATTSBURG (Non-vested) :—Visited, 22nd October.

Pupils enrolled :—Boys, 54 ; girls, 32 ; total, 86.

Pupils present :—Boys, 44 ; girls, 24 ; total, 68.

The material state of this school is tolerably good. The organization is correct, the discipline fair, and the teaching is tolerably effective. Local supervision is not exercised, nor was any member of the Board present at the examination.

PURFLEET (Vested) :—Visited, 4th September.

Pupils enrolled :—Boys, 18 ; girls, 18 ; total, 36.

Pupils present :—Boys, 15 ; girls, 15 ; total, 30.

The school premises are in good repair, and there is a fair supply of furniture and working appliances. The organization and discipline are fair, but the instruction requires to be more searching to be effective—especially in the junior class. Two members of the School Board were present at the examination.

RAYMOND TERRACE (Non-vested) :—Visited, 10th December.

Pupils enrolled :—Boys, 35 ; girls, 20 ; total, 55.

Pupils present :—Boys, 24 ; girls, 16 ; total, 40.

The school is held in the Wesleyan Chapel, which is a tolerably suitable building for a schoolroom ; but, although situated in a township, no place of decency is provided for the pupils. I have repeatedly spoken of this serious deficiency, but without effect. The organization is correct, the discipline moderate, and the instruction is methodical and moderately effective. Local supervision is not exercised, nor was any member of the School Board present at the examination.

SEAHAM (Non-vested) :—Visited, 9th December.

Pupils enrolled :—Boys, 24 ; girls, 12 ; total, 36.

Pupils present :—Boys, 13 ; girls, 9 ; total, 22.

The schoolhouse is an ill-conditioned building, inconveniently small, but moderately furnished. The organization is correct, the discipline is weak, and the instruction is not educative. Local supervision is not exercised, nor was any member of the School Board present at the examination.

TAREE (Vested) :—Visited, 3rd December.

Pupils enrolled :—Boys, 55 ; girls, 44 ; total, 99.

Pupils present :—Boys, 50 ; girls, 35 ; total, 85.

The school premises are in excellent condition, and there is a proper supply of furniture and school appliances. The exterior appointments are good, and, by means of a number of flower-beds, the appearance of the school ground is made very pleasing. The organization and classification are satisfactory, the discipline is tolerably effective, and the same may be said of the instruction. Most of the members of the School Board were present at the examination.

TELEGHERRY (Non-vested) :—Visited, 13th November.

Pupils enrolled :—Boys, 34 ; girls, 26 ; total, 60.

Pupils present :—Boys, 27 ; girls, 22 ; total, 49.

The schoolhouse is substantially in good condition ; it is fairly supplied with material, but the furniture, though sufficient, is rickety. The schoolground is unfenced, and out-offices have not been provided, but the Local Board states that both requirements shall be supplied without further delay. The discipline is moderately effective, and the teaching is careful, and moderately productive in its results. Local supervision is rarely exercised, nor were any members of the Board present at the examination.

TERALBA (Non-vested) :—Visited, 21st October.

Pupils enrolled :—Boys, 21 ; girls, 9 ; total, 30.

Pupils present :—Boys, 16 ; girls, 7 ; total, 23.

The school is held in a *bark* hut, the floor of which is of earth, and is below the level of the ground outside. The room is dark and unsuitable. In winter it is piercingly cold, whilst in summer it is oppressively hot. The furniture consists of a table and a few seats ; but it is fairly supplied with books and maps. The place is kept very clean by the teacher. The organization is correct, the discipline good, and the teaching is methodical, and moderately successful. Little interest, if any, is taken by the Board, either in the success or existence of the school, nor was any member present at the examination.

THALABA (Non-vested) :—Visited, 26th November.

Pupils enrolled :—Boys, 19 ; girls, 18 ; total, 37.

Pupils present :—Boys, 15 ; girls, 11 ; total, 26.

The schoolhouse is a tolerably suitable building, and there is a fair supply of furniture and working appliances. The organization is correct, the discipline judicious, and the teaching gives fair results. No member of the School Board was present at the examination.

TINONEE (Vested) :—Visited, 8th September.

Pupils enrolled :—Boys, 30 ; girls, 22 ; total, 52.

Pupils present :—Boys, 21 ; girls, 17 ; total, 38.

The schoolhouse is in a moderate state of repair, but it is scarcely large enough. The appointments of the school are good. The organization is correct, the discipline is fair in its effects, and the progress of the pupils is fairly satisfactory. Supervision by the School Board is frequent and effective. Two members of the Board were present at the examination.

TOMAGO (Vested) :—Visited, 2nd November.

Pupils enrolled :—Boys, 14 ; girls, 18 ; total, 32.

Pupils present :—Boys, 13 ; girls, 15 ; total 28.

The schoolhouse is in good condition, having undergone a thorough repair since the last inspection. It is fairly furnished and tolerably supplied with working appliances, but the maps are very old and worn. The organization is correct ; the discipline is judicious ; the teaching is careful, and the results are fair. The tone of the school is good. A member of the School Board was present at the examination.

WALLESEND (Non-vested) :—Visited, 19th October.

Pupils enrolled :—Boys, 91 ; girls, 79 ; total, 170.

Pupils present :—Boys, 79 ; girls, 65 ; total, 144.

The school is held in temporary premises which are in every sense unsuited for such operations. It is small, dark, and ill-ventilated. The external provisions are wretched. The room is well furnished and supplied with material. The organization is correct ; the discipline is weak ; the instruction is methodical and tolerably successful. Considerable interest in the school is professed by the School Board, all of whom intended to have been at the examination ; but owing to the detention of the notice of visitation, at the post office, for twelve days, it was not received by the school secretary until the day following the examination.

WARATAH (Non-vested) :—Visited, 29th July.

Pupils enrolled :—Boys, 27 ; girls, 20 ; total, 47.

Pupils present :—Boys, 24 ; girls, 20 ; total, 44.

The schoolhouse has undergone repair recently, and is now in a very good condition. There is a proper supply of furniture and working material. The organization and discipline are correct and effective. The results of the examination were good, and the tone of the school is thoroughly healthy. The usual notice was sent, but no member of the Board was present at the examination.

WINGHAM (Vested) :—Visited, 14th September.

Pupils enrolled :—Boys, 23 ; girls, 22 ; total, 45.

Pupils present :—Boys, 16 ; girls, 14 ; total, 30.

As a whole, the material condition of the school is good ; the furniture and working appliances are sufficient, and good also. The organization is fair ; the discipline moderately effective ; the instruction is methodical ; and the results of the examination just moderate. Local supervision is very occasional. Two members of the School Board were present at the examination.

WOOLLA WOOLLA (Non-vested) :—Visited, 7th September.

Pupils enrolled :—Boys, 20 ; girls, 18 ; total, 38.

Pupils present :—Boys, 16 ; girls, 16 ; total, 32.

The school premises are small, unsuitable, and are in very poor condition. There is a proper supply of furniture and apparatus. The organization is correct ; the discipline is healthy ; the instruction is careful ; and the results range from tolerable to good. The spirit of the school is healthy. Local supervision is satisfactorily exercised, and all the members of the Board were present at the examination.

YAYPO (Vested) :—Visited, 17th September.

Pupils enrolled :—Boys, 24 ; girls, 20 ; total, 44.

Pupils present :—Boys, 19 ; girls, 17 ; total, 36.

The material state of this school is good. The organization is correct ; the discipline, effective ; the methods of teaching are intelligent and painstaking ; and fair progress has been made by the pupils. Local supervision is very occasional. All the members of the Board were present at the examination.

J. W. ALLPASS,
Inspector of Schools,
Newcastle District.

PROVISIONAL SCHOOLS.

KURACH FLAT :—Visited, 18th September.

Pupils enrolled :—Boys, 11 ; girls, 9 ; total, 20.

Pupils present :—Boys, 11 ; girls, 9 ; total, 20.

The schoolhouse is in good repair, and is fairly suited to its uses, but the ground is unfenced, and there are no out-offices. The working material is nearly sufficient. This school has been in operation but a few weeks. The organization is satisfactory, the discipline is moderate, and the instruction appears to be careful. One member of the School Board was present at the examination.

UNDERBANK :—Visited, 1st December.

Pupils enrolled :—Boys, 10 ; girls, 12 ; total, 22.

Pupils present :—Boys, 10 ; girls, 10 ; total, 20.

The schoolhouse is a substantial and suitable building. The furniture is subordinated to the Sunday uses of the room, but in other respects the appliances are good and sufficient. There are no out-offices. The organization is correct ; the discipline is gentle, but effective ; and the results of the teaching are very satisfactory. One member of the Board came at the close of the examination.

J. W. ALLPASS,
Inspector of Schools,
Newcastle District.

INSPECTORS' GENERAL REPORT—SYDNEY DISTRICT.

INSPECTORS' REPORT upon the Condition of Public and Certified Denominational Schools in the Sydney District, for the Year 1868.

THE number of schools in this district at the close of the year 1867 was sixty, and consisted of fifteen Public and forty-five Denominational. During the year 1868, two additional schools were opened, namely, Jamison-street Public, and Sussex-street Hebrew, thus making sixteen Public Schools, and forty-six Denominational. The Public Schools comprise thirty departments, and the Denominational seventy.

All these schools, except *Kent-street, R.C. (Girls), underwent general or regular inspection during the year, besides being incidentally visited at different times. The inspection was of a minute and searching character, and, in the case of each department or school, extended over periods ranging from one to five days. The incidental visits were made at irregular intervals, without notice either to teachers or Local Boards. Their chief object was to enable us to see each school in its every-day aspect, to arrive at a correct estimate of the order and general working of each department—to ascertain, in short, whether the Council's regulations were strictly observed. Our experience leads us to attach considerable importance to this kind of inspection. Its uncertainty as to time is not its least recommendation, whilst its frequent repetition not only acts as a formidable check to keep down abuses, but renders the work of the regular inspection less difficult, and its results more reliable. The following table is intended to show the amount and character of inspection done during the year.

Material Condition.—As regards Public Schools, some improvements in their material condition have been effected during the year. The erection of new buildings in Cleveland-street is the most important of these. The necessity for this step was strongly proved by the fact that, within three months after the opening of the new schoolrooms, the average attendance rose fifty per cent. Perhaps the most noticeable feature in connection with the present premises is, the formation of a covered playground. The advantages arising from this provision are various. It economizes space—a paramount consideration in a city where land is dear; it affords a shelter from the weather; it offers facilities for the formation of lavatories; and it is very handy for class teaching. For these reasons, we are strongly of opinion that in all future erections in this district the principle of the covered playground should, if possible, be applied. At William-street School the erection of a classroom has met a twofold want—it has provided increased means for carrying on the work of secular instruction, and afforded the requisite accommodation for special religious teaching. The want of classrooms is much felt in non-vested Public Schools, and in nearly all the Denominational Schools of this district; they are rarely supplied in the first instance, and, no matter how inconveniently crowded the schoolrooms may become, seldom is any action taken to provide them afterwards. Another defect, far too common to our schools is the absence of playgrounds. The evils arising from this want cannot be lightly regarded. Whether as respects the physical education of children, their training to habits of decency, or the higher training of their moral faculties, a playground is an indispensable requisite. Its absence is a formidable obstacle to the carrying on of the business of teaching with order and decorum. For these reasons, it is a matter for consideration whether, in future applications for schools, aid should be granted in cases where playgrounds have not been provided. The proper furnishing of playgrounds is another subject that deserves special remark. In several schools the out-offices are not sufficiently private, or are otherwise in an objectionable state. In few instances have sheds or other means been provided to protect the children from the weather, and the absence of lavatories is a no less common occurrence. Material improvements have been made in the following schools since last report:—Parramatta-street C.E., Surry Hills C.E., Double Bay C.E., Balmain R.C., Kent-street North R.C., Surry Hills R.C., Waverley R.C., Erskine-street Pres., Woolloomooloo Pres. A fine commodious schoolroom has been erected in connection with Redfern C.E., and an infant schoolroom has been built at Waterloo C.E. At Botany Road P., and Pymont P., the accommodation is quite unequal to the educational wants of the localities. Both schools are inconveniently crowded, and it is with great difficulty that the business of teaching is carried on. The same remark applies with nearly equal force to Paddington P., where more roomy and more suitable school buildings are pressing needed. The following schools are either without or are deficient in suitable furniture:—Jamison-street P., Watson's Bay P., Newtown C.E., St. Leonards C.E., Waterloo C.E. (infant), Camperdown R.C., Kent-street South R.C., Newtown R.C., Paddington R.C., Parramatta-street R.C., Pymont R.C., St. Mary's R.C. (infant), Waverley R.C., York-street Wes. The

The peculiar dryness of the past year has favored a regular attendance; at the same time, special causes of an opposite tendency operated during the first six months. Speaking generally, it may be said that some improvement is noticeable in the regularity of the attendance as compared with its character given in a former report. This is best seen from an examination of the average attendances at Public and Certified Denominational Schools during the past and present years. These were as follows:—

	In 1867.	In 1868.
Public Schools	69.8	69.4
Church of England Schools..	69.9	69.2
Roman Catholic	64.4	65.3
Presbyterian	68.2	69.7
Wesleyan	64.1	65.9
Mean Average	66.1	66.3

The number of children on the roll for the quarter ending 31st December, 1867, was 16,300; the number on the roll for the quarter ending 31st December, 1868, was 16,836. This gives an increase for the year of 536, or rather more than 3 per cent. The subjoined table will exhibit how these 16,836 pupils were divided in respect to sex and religious denomination:—

	Boys.	Girls.	Total.	C.E.	R.C.	Pres.	Wes.	O. D.	Total
Total of Public Schools ..	3,824	2,960	6,784	2,851	990	894	730	1,319	6,784
" C.E.	2,603	2,085	4,688	3,794	112	267	312	203	4,688
" R.C.	2,086	1,821	3,907	63	3,830	3	10	1	3,907
" Pres.	357	287	644	268	48	183	92	53	644
" Wes.	420	313	733	175	28	52	397	81	733
" Hebrew	51	29	80	80	80
Total of all schools ..	9,341	7,495	16,836	7,151	5,008	1,399	1,541	1,737	16,836

An inspection of the foregoing table discloses the following facts:—That the number of children belonging to the Church of England who attend schools of their own denomination is 53 per cent. of the total number of Church of England children in attendance at all schools under the Council's superintendence; that Roman Catholic Schools are attended by 76 per cent. of children of that denomination, Presbyterian Schools by 14 per cent., and Wesleyan Schools by 25 per cent. Last year, the percentages were 43, 79, 14, and 27 respectively. The Church of England has, therefore, managed to secure an additional 10 per cent. of its children; Roman Catholic Schools have suffered a loss of 3 per cent. of children belonging to that denomination; Wesleyan Schools have suffered a loss of 2 per cent.; and Presbyterian Schools remain unaltered. Another feature worthy of remark in connection with the above table is, that whilst the attendance at Public Schools has increased by 1,034, or at the rate of 18 per cent., the attendance at Denominational Schools has decreased by 494, or at the rate of nearly 5 per cent.

The number of pupils on the rolls of Public Schools at the time of inspection was 5,729, and of these, 4,534 or 79 per cent. were present at examination. Of those examined—

36.9	per cent.	were	7	years	of	age,	or	under.
9.8	"	"	8	years	of	age.		
11.2	"	"	9	"				
11.8	"	"	10	"				
9.9	"	"	11	"				
20.4	"	"	12	years	of	age,	or	above.

The number of pupils on the rolls of Denominational Schools, at the time of inspection, was 8,910, and of these, 6,796 or 76 per cent. were present at examination. Of those examined—

47.2	per cent.	were	7	years	of	age,	or	under.
13.0	"	"	8	years	of	age.		
10.2	"	"	9	"				
9.6	"	"	10	"				
7.9	"	"	11	"				
12.1	"	"	12	years	of	age,	or	above.

It thus appears that whilst 42 per cent. of the children of Public Schools were of ages varying from 10 years and upwards, only 29.6 per cent. of the children in attendance at Denominational Schools were of corresponding ages. This fact, no doubt, has something to do with the disparity of attainments in the two classes of schools noticed in another part of this report.

In character, the punctuality differs little from that described in our report for last year. In some schools an improvement is discernible, in others there has been a falling off. Where the latter process has taken place, it may safely be attributed to laxity of government. Amongst other reasons advanced by teachers for the lateness of pupils, was the opening of morning school at different times. It had been the practice to open the schools of the district either at 9 a.m. or at 9.30 a.m., some teachers adopting one time and some the other. As it was thought that the want of uniformity in this matter might lead to unpunctuality, the time for opening school was fixed generally at 9.30 a.m. It still occasionally happens that time is lost through the material not being given out before the children enter school. There is no excuse for this. It is especially the duty of pupil teachers to have everything in readiness for immediate work after opening school, and it is the fault of teachers if this duty be not properly attended to. It is difficult to over-estimate the value of punctuality,—not merely in its relation to school work, but in the influence it is likely to exercise over the after-life of a child. Everything, therefore, in connection with the management of the school should afford evidence of its observance. The teachers should be scrupulously punctual themselves; the operations of teaching should be faithfully regulated by the time-table, and the whole routine of the school fixed and unvarying. The means adopted by teachers to secure punctuality differ greatly; some send written notices of lateness to parents; some detain late children in school during recess; some punish with the cane; and others employ a combination of these means. Much, however, must depend upon whether the lateness is the fault of the child or the parent, although it is true that the parent may in this matter, as in others, be reached through the child. Teachers, therefore, should be chary about receiving excuses from children unless they are written, or evidence of their genuineness is afforded in the character of those tendering them.

Increased attention is beginning to be paid to cleanliness. The inspection of pupils for this matter is, in most instances, carefully performed; in some it scarcely deserves the name. Untidiness of dress and slovenliness of appearance are fast disappearing. The addition of lavatories to several of the schools during the year has helped to effect some of these beneficial changes. The want of a supply of water in some schools, and the absence of the necessary washing apparatus in others, have prevented the realization of fully satisfactory results. As regards the school premises, much remains to be done before their condition, in respect to cleanliness, can be considered unexceptionable. It still happens that schoolrooms occasionally go unswept for days, that playgrounds and out-offices present an untidy appearance, and that the general keeping of the school property evidences carelessness and neglect.

In Public Schools the order is fair; in Denominational Schools it is much less satisfactory. The ordinary characteristics of a disorderly school are whispering and talking during the lessons, shuffling of feet, rattling of slates, a boisterous demeanour on the part of the pupils, inattention under instruction, and an indisposition to anything like mental exertion. The maintenance of order is the first care of every teacher worthy of the name, as on it mainly depends the successful working of the school. Indeed, it may be affirmed that the teacher who is unable to make order a habit of his school has mistaken his profession. Unless children are trained to yield a prompt and willing obedience, to manifest a proper respect for their superiors, to deport themselves in a becoming manner, it is mere superfluity to talk about educating them. No instruction can be worth the name where these objects are either lost sight of or only partially kept in view. In all Public Schools except two, drill forms a regular feature of the discipline. Its value as a means of promoting order can hardly be over-estimated. Precision and uniformity of movement, and a quick and ready attention on the part of the pupils, are not the least important essentials to good discipline; but these can only be realized in full, where drill forms a regular part of the school routine. It is much to be regretted that its practice is not carried out with greater minuteness, and that the instruction given therein is, in numerous instances, of so meagre, immethodic, and confused a character. Much of the disorder that characterizes many Denominational schools arises from the pupils' ignorance of drill; indeed, we do not see how it is possible to secure or maintain proper discipline without its aid. At the same time, we are aware that the whole order of the school hinges mainly on the government. If the government be feeble or vacillating, the order will be bad; if it be firm—but kind withal—there will be little in the discipline to complain of. If there is any one point which it behoves the teachers of this district to turn their serious attention to, it is the principles on which good government is based. We are painfully conscious that most, if not all, of the defects of school management that usually come under our observation, are attributable to the wide-spread indifference with which this subject is regarded. We hardly remember a case during the year where the attainments of the pupils were reported to be low, in which the government was not lax and feeble, and the order unsatisfactory. In fact, defective discipline and low attainments would appear to stand in the relation of cause and effect.

Much of the ignorance displayed in reference to classification is fast disappearing. A decidedly bad classification has been met with in very few instances. Existing faults have but a partial application. Occasionally, children are found in classes for which their attainments render them unfit—the result, most commonly, of outside pressure. Teachers who entertain a proper regard for their professional reputation are invariably proof against such influence. A fault, perhaps more frequently committed, is the detention of children in classes for unduly long periods. Few teachers seem to adopt any regular system of promotion. The usual practice has been to promote at irregular intervals, and to promote an insignificantly small number of children at a time. It seems to us that a radical change in these respects should be made. There should be at least one promotion every year, such promotion to affect not less than 50 per cent. of the pupils of each class. Teachers who fail to qualify this proportion of pupils for promotion cannot be said to be realizing satisfactory results. By the adoption of this practice, it will be impossible for any pupil to remain longer than two years in any but the highest class.

Instruction.—The documents that regulate the instruction consist of a Time-table and a Programme of Lessons. In constructing a time-table, three important considerations have to be kept in view. These are—first, to make provision for the constant and appropriate occupation of every child; secondly, to see that every subject receives its fair share of attention; thirdly, to provide for a proper alternation of silent and oral lessons. In a very large majority of schools, these considerations have been reasonably well satisfied. Some improvement is visible in the character of the programmes. They are less vague and meagre than formerly, and their arrangement indicates a better acquaintance with practical school-keeping.

Viewed as a whole, the methods may, in point of quality, be described as tolerable. Some fall below this mark, but these are practised chiefly either by untrained teachers or by those who have joined the profession late in life. The more noticeable defects in their application are,—the questioning is not sufficiently individual or searching; it needs to be marked by greater vigour and earnestness; it does not aim enough at developing the intelligence of the pupils. Vigorous and intelligent questioning appears to us the main essential of any method deserving the name. It is of little use teaching, unless proper precautions be taken to ascertain that the instruction is being received; and the best proof that this is the case, is the ability of the pupils to reproduce readily and correctly the substance of their lessons. Suggestive or mechanical questioning is of doubtful value. It is calculated to mislead both teacher and pupils. The true test consists in putting the questions point blank, framing them so that they shall appeal to the intelligence of the pupils and necessitate some amount of thinking, and in leaving no room for guesswork. The teacher who examines his work in this way will have little difficulty in discovering whether his teaching is effective or not. Much of the instruction is of small value, not merely in relation to the mode in which it is taught, but also in respect to its haphazard, poor, and scanty character. Too often teachers neglect to prepare their lessons—an omission most commonly committed by those whose information is the least satisfactory. This want of preparation is usually accompanied by an absence of anything like a proper arrangement of lessons. Both defects are of serious moment, and go far to render sound teaching an impossibility. At the same time, it must be admitted that some advance in the art of teaching is perceptible. Greater energy is infused into the work, a more practical acquaintance with the Council's requirements is evinced, and a disposition to receive information on unknown or doubtful points is very generally apparent.

Reading.—Speaking generally, it may be said that a marked improvement characterizes the teaching of this subject, as compared with the treatment it received during the previous year. In the first place, reading is viewed from a more intellectual stand-point. This is especially noticeable in the better conducted Denominational Schools. The teachers of these are beginning to see that a reading lesson should be something more than a dry, uninteresting mechanical exercise; that it comprehends something more than the mere memory of signs and sounds; and that, to be intelligently taught, due regard must be had to the cultivation and strengthening of the mental faculties. Hence, effort is now made to elucidate the subject-matter, greater attention is devoted to the explanation of the more difficult words and phrases, and, in the case of the higher classes, verbal transposition and paraphrasing are beginning to be regarded as necessary elements in a proper reading lesson. Much, however, remains to be done in these respects. Difficulties have to be encountered in the bad methods in use, crotchets and prejudices have to be overcome, and a good deal has to be unlearned or abandoned by teachers, before a healthy foundation can be laid. Still, the prospect is not altogether unpromising. Some progress has already been made, and it is confidently hoped that the gradual improvement of the material that forms the teaching staff—a process which has already begun—will do much to compass the end desired. Looking at reading as an art, there are grounds for believing that a reasonable effort has been put forth by teachers to improve upon the results recorded in the report for last year. An inspection of Table E., appended to this report, will make this manifest. Still, it cannot be said that reading, regarded from this point of view, is in a satisfactory state. The great fault seems to lie in the desultory and imperfect manner in which the elements are taught. Not only is the reading of the junior classes systematically neglected by teachers, but habits are at this stage contracted that vitiate and render nugatory much of the after teaching. Faults of pronunciation are passed unnoticed; a rapid, indistinct, and unintelligible articulation is acquired; pausation and modulation are almost wholly disregarded; and the result of all these is a monotonous, unsteady, sing-song kind of reading. Apart from these defects, however, the subject is not, in its elementary stages, taught with anything like proper expedition. The phonic method, explained and recommended for adoption in the preface to the Australian Class-book, is rarely tried, and it may be safely predicated that there is less of method in the teaching of the elements of reading than in any other subject.

Annex D.

Annex E.

subject. A very common fault committed is, the placing of books in the hands of children before they can make a proper use of them. Sometimes this is done through ignorance, sometimes to please parents, and sometimes under a mistaken idea that it saves trouble. We have invariably condemned the practice, and have recommended the use of reading-tablets and the black-board till a certain proficiency has been obtained. The two most striking defects in the more advanced reading are, rapidity of utterance and a want of proper expression. Possibly, the second fault arises to some extent from the first. Fluency in reading is not unfrequently confounded with good reading; the idea being, that to read quickly is to read well. It is hardly necessary to combat this notion. Notwithstanding the many instructions given in works on elocution as guides to good reading, it has always appeared to us that these practically resolve themselves to three, namely,—audible articulation, a deliberate and distinct enunciation, and the nearest approximation to ordinary speaking.

Writing.—We are unable to report any great improvement in the teaching of the elements of writing. This arises from several causes. The slates are frequently unrulled, the methods are haphazard and irrational, and the supervision is casual and imperfect. The results are, ill-formed letters and words, and a want of adequate progress. It not unfrequently happens that the materials supplied to children for writing consist of fragments of slates, and bits of pencil barely an inch long. The absence of a suitable, uniform copy-book in most schools is, perhaps, one of the chief hindrances to good writing. Parents and children are too commonly permitted to make their own selections, and instances occur where several kinds of books are used in the same class. There is no reason why this should be. The fault is entirely the teacher's; for where tolerable care, interest, and forethought are exhibited, there is little in this respect to complain of. In one or two essentials of good writing, some improvement is visible—greater attention is paid to neatness, and cleanliness is seldom entirely disregarded.

Dictation.—Considerable prominence is given to the teaching of dictation. It holds a position in the routine of almost every school. Occasionally it is omitted from the time-table of the first or lowest class, but this happens chiefly in schools where the general attainments are below the average. In primary schools, it should be taught side by side with reading and writing. A child of seven years of age, competent to read words of three letters, may reasonably be expected to write from dictation words of two. Dictation is now almost universally acknowledged to be the best means of teaching spelling. Although not intended to supersede entirely the teaching of spelling in connection with the reading lesson, it is rightly considered to reduce the evils inseparable from that mode to a minimum, besides offering special advantages of its own. We should be glad to see dictation on paper practised in the higher classes. Slates are universally used, and with these it is not always easy to prevent copying. At the same time, it must be distinctly understood that the value of a dictation lesson will depend mainly upon the care with which the exercises are revised by the teacher.

Arithmetic.—Of all subjects, arithmetic is perhaps the least successfully taught. Several reasons may be given for this. There is a wide-spread tendency to individualize the teaching, to ignore method and to trust too exclusively to the unaided efforts of the pupils. This is particularly true of the junior classes, in which the process of subdivision is carried on almost *ad libitum*, and oral explanation by the teacher is rarely given. To teach the elementary rules effectively, a more rational mode of procedure will have to be adopted. It is quite unnecessary to have more than two divisions in a class; each rule should be carefully and fully explained, abundance of examples given, and ample use made of the black-board. A very common fault is, to allow too much time for the working of questions—this not only leads to disorder, but affords opportunity for copying. Assuming that a class is arranged in two divisions for arithmetic,—a separate question should be dictated, or written on the black-board, for each. When a reasonable time has been allowed for its solution, the pupils of one division should be called to attention, and the question worked by the teacher, with the help of the children, on the board. Another question should then be given; and whilst it is being done the teacher proceeds with the second division as he did with the first. By adopting this mode, all the pupils will be kept actively employed; they will receive ample oral teaching; difficulties will be explained; doubts removed; and, by a vigorous and rapid questioning, the principles of each rule will become indelibly impressed on their minds. This, however, will not obviate the necessity of frequent recapitulation of work done. A good teacher will take care that his instruction is retained; that whilst he is breaking fresh ground with his pupils, a good knowledge is retained of that passed over. With this object, he will hold regular weekly examinations in the rules gone through. The foregoing remarks apply to the teaching of the higher arithmetic, as well as to the teaching of the elements. Two great faults mark the results noted in the higher rules. These are, a want of expertness in manipulating numbers, and a want of correctness in the details of work. We are inclined to attribute, in a measure, both faults to an inadequate appreciation of the value of mental arithmetic. With the increased importance which is beginning to be given to the latter branch, larger results may be reasonably hoped for. Still, it must be confessed that greater originality and versatility need to be infused into the teaching of the higher arithmetic, before the standards laid down by the Council can be fully met. Text-books are still too closely relied upon; there is a want of intelligent and lucid explanation of principles; examples are not multiplied with sufficient rapidity—they are too often superficial and aimless; the reasoning powers of the pupils are only feebly brought into play; there is a want of thoroughness in the methods used; and, whether it be the amount of mental training produced or the extent of knowledge communicated, arithmetic as a branch of school instruction is but poorly taught.

Grammar.—Some improvement is discernible in the teaching of this subject. Text-books are now very generally disused, and more rational methods of teaching are beginning to be adopted. In a large majority of schools, the principles are explained with tolerable intelligence and skill. Parsing, however, requires to be more frequently practised in connection with the reading lessons. The results disclosed by the year's examinations, so far as they affect Denominational Schools, are far from satisfactory. Analysis of sentences receives passable attention; but whether from the defective information of some teachers, or from the faulty manner in which the subject is handled by others, the progress hitherto made therein is inconsiderable. In a few of the better schools, we are glad to find that an effort is being made to impart a knowledge of English composition. We should be pleased if this effort were more general, as, after all, composition is the most important and practical form in which the value of grammatical teaching is exhibited.

Geography.—The same defects mark the teaching of this branch as were noted in our report for last year. Many teachers do not keep pace with the progress of geographical science. The information is too often culled from antiquated text-books, is frequently incorrect as to facts, and as frequently fragmentary and incoherent. The lessons lack connectedness and arrangement, and the teaching is, for the most part, desultory, and wanting in intelligent aim. Teaching the subject from outline maps on the black-board has been attempted in several schools with good results. The elements, however, are still taught mechanically as a mere exercise of the memory. There is, to quote from our former Report, "a sad dearth of intellectual questioning, of ready and appropriate illustration, and of power to make lasting impressions." Still, it must be admitted that fair progress has been made in a knowledge of the geography of the Colony, which is, no doubt, attributable to Mr. Wilkins's excellent little work on the subject. The higher physical geography—the most interesting, and unquestionably the most useful part of the science—is taught in few instances.

Object Lessons.—This subject is professedly taught in every school, with varying degrees of success, according to the methods in use. These, as a whole, may be described as crude and commonplace. There is a very general reliance placed upon stereotyped forms of arrangement, and an absence of originality and resource is too widely apparent. Certain stock subjects constantly appear on the programmes

of almost every school, and these are repeated again and again, *ad nauseam*. In a few instances, however, the aim of object lessons is viewed from higher ground. Here an attempt is made to cultivate the children's power of observation, to lead them to compare and classify, to develop and strengthen their reasoning faculties, rather than burden their memories with dry disjointed facts. With this view, common objects are selected, placed before the children, and subjected to an extensive process of examination. Their composition and properties are prominently set forth, and the connection of these, with their uses, is clearly indicated. So far as object lessons are useful in conveying mere information, very respectable results have been produced in the subject. This is especially true of Denominational Schools, in which the subject has only within the last year or two received anything like general attention.

Drawing.—A great impulse has been given to the teaching of drawing during the year. There is but one school in which it is not systematically taught. The proficiency already attained in the subject is considerable. This result is the more gratifying when the difficulties that have met the introduction of drawing, as an essential branch of school instruction, are duly estimated. Not the least of these have been the ignorance and prejudice of parents, and, in some instances, of teachers. The great value of drawing as a part of ordinary education is now very widely admitted. It is eminently a practical subject, one which, even if regarded from a parent's point of view, will equip a child all the better for the battle of life. In this sense, it is perhaps more useful than history or geography—usually regarded as indispensable to any complete school course—whilst the influence it may exercise in raising the taste of a people for the more useful arts gives to it an importance hardly inferior to that which attaches to any other subject. Much of the success that has attended the teaching of drawing is due to the zealous and active labours of Mr. Fowles, the gentleman employed by the Council specially to supervise the teaching of the subject.

Singing.—This subject, like drawing, has been placed under the supervision of a special teacher, whose duty it is to visit the schools as often as possible, and aid, by his advice and assistance, to make singing a part of the regular instruction. The Tonic Sol fa method of teaching to sing is that which has been approved and sanctioned by the Council. Some difficulties have been experienced in introducing this method, partly from its novelty, but chiefly from the impossibility of always finding teachers possessing the ability to sing. The latter obstacle, however, is being gradually overcome by a judicious disposition of the assistant teachers and pupil teachers throughout the schools of the district. Singing by ear is now very generally practised; but a knowledge of the Tonic Sol-fa method, as required by the Standard of Proficiency, is exhibited in very few instances. Indeed, the results hitherto produced in the theory of Music are far from satisfactory, and not at all proportionate to the means employed.

Scripture Lessons.—These are carefully read in almost all our Public Schools. They have also been introduced, with the approval of Local Boards, into several Denominational Schools. A fair acquaintance is exhibited by the pupils of Public Schools with the leading facts of Scripture.

Needlework.—Due prominence is given to the teaching of this branch in Public and Church of England Schools. The displays of needlework which we have witnessed in several instances have been of a very creditable description. In other Denominational Schools, needlework does not command that attention which its importance demands.

Proficiency.—The following Tables of percentages will show the relative proficiency in Public and Denominational Schools in the various branches of instruction :—

It may be useful to compare these tables with those published in last year's Report; and first, as they apply to Public Schools.

In 1867, 67 per cent. of the Reading ranged from fair to good; in 1868, 71 per cent. was of this quality.

" 63	"	Writing	"	"	81	"	"
" 36	"	Arithmetic	"	"	37	"	"
" 52	"	Grammar	"	"	55	"	"
" 53	"	Geography	"	"	44	"	"
" 54	"	Object Lessons	"	"	62	"	"

An improvement is visible, therefore, in the results produced in each subject except Geography, in which there is a marked falling off.

A similar comparison, pursued in reference to Denominational Schools, discloses the following:—
In 1867, 33 per cent. of the Reading ranged from fair to good; in 1868, 47 per cent. was of this quality.

" 37	"	Writing	"	"	39	"	"
" 17	"	Arithmetic	"	"	17	"	"
" 15	"	Grammar	"	"	15	"	"
" 14	"	Geography	"	"	22	"	"
" 25	"	Object Lessons	"	"	61	"	"

In all the subjects, therefore, except Arithmetic and Grammar, substantial progress has been made. That a corresponding improvement has not been produced in Arithmetic and Grammar may be ascribed to the more intellectual nature of these branches, and the higher demands which they make on the intelligence and skill of teachers.

Teachers.—The first general examination of teachers holding a lower classification than Class III, Section A, and of others who had failed to obtain classification, was held in July last. Some 52 attended. The examination lasted four days. The results were not of a satisfactory kind, but proved the great necessity for that part of the Council's Regulations bearing upon teachers' examinations. The number of teachers and assistant teachers employed in Public Schools is 55, an increase of 3 upon the number employed last year. The number of teachers and assistant teachers attached to Denominational Schools is 103, an increase of 4 on the number employed in the year 1867. These teachers and assistant teachers are classified as follows:—

	First Class.		Second Class.		Third Class.			Not Classified.
	Section A.	Section B.	Section A.	Section B.	Section A.	Section B.	Section C.	
Public Schools	1	7	11	8	18	4	2	4
Denominational Schools	2	12	29	22	17	21
	1	7	13	20	47	26	19	25

Changes have been made in the teaching staff of several schools during the year. Some teachers, who proved unequal to the efficient management of their schools, have been removed, and more competent persons appointed in their places. Several still remain who are deficient in the necessary skill, and who will have to be removed unless they exhibit greater energy, intelligence, and efficiency in the discharge of their duties. The general body, however, are earnest, zealous, and painstaking; a few have shown themselves to be possessed of high attainments, and gifted with rare teaching ability. The pupil teachers number 115, an increase of 5 on the number employed in the district last year. 47 of these are attached to Public Schools, and 68 to Denominational. They form an important part of the teaching staff of this district. They are only appointed after they have afforded evidence, during a three months' probation, that they possess aptitude and general fitness for the office of teacher. Their work generally is of a very satisfactory kind.

Local Supervision.—It is gratifying to be able to report that the local supervision of the schools of this district is, in numerous instances, of an active, intelligent, and beneficial character. Most commonly the duties of Local Boards practically devolve upon one particular member, and whilst we heartily wish it were otherwise, the circumstance need not be taken as evidence that no interest is felt by the rest of the members. One of the principal duties of a Local Board is to make regular periodical visits to the school under its supervision, and thus, by its presence, to encourage teachers and pupils in the important work in which both are engaged. This duty is performed only in few instances. Still, in the main, the good done by the agency of Local Boards during the year has been large and substantial. New buildings have been erected, not a few have been enlarged or repaired, and various other material improvements have been effected. These beneficial results have only been achieved at much personal expense of time, trouble, and money. To those who have been engaged in such self-sacrificing and benevolent labours, too much praise cannot be given. For ourselves, we have experienced a uniform courtesy from members of Local Boards; our suggestions have been received in the best possible spirit, and reasonable effort has been made to give them practical effect. The feeling thus manifested has afforded us much encouragement, and has led us to entertain the belief that our anxiety to improve the condition of the schools under our charge is correctly understood and fully appreciated.

Free Scholars.—In a former report allusion was made to the large number of children educated gratuitously in Denominational Schools. Having, in obedience to instructions received from the Council, made inquiries into the grounds on which exemption from payment was made, we have arrived at the following conclusions:—

1. That, as a rule, children were exempted from payment upon the individual orders of members of Local Boards.
2. That fully one-third of the total number were exempted upon insufficient grounds.

The number of free children educated in Public Schools during the year was 263, or 2½ per cent. of the total number of children on the roll for the year. The number educated in Denominational Schools was 1,530, or 10 per cent. of the total number of children on the roll for the year. In 1867, the percentages were 2½ and 14 respectively. There has, therefore, been a decided falling off—a healthy sign, and probably caused in a measure by our inquiries.

The following table will shew at a glance the approximate cost of each Child's education in Public and Denominational Schools during the year :—

	Salary or Cost to the State.	Fees or Cost to Parents.	Total.
	£ s. d.	£ s. d.	£ s. d.
Public Schools	0 16 7½	0 18 7½	1 15 4
Church of England Schools.....	0 17 11¾	0 14 5½	1 12 5
Roman Catholic Schools	0 17 9¾	0 10 0¾	1 7 10½
Presbyterian Schools.....	1 1 10	0 13 6¾	1 15 4¾
Wesleyan Schools	1 1 8½	0 15 0¼	1 16 8¾

Summary.—The results of the year's inspection may be briefly summed up as follows :—The material condition of Public and Denominational Schools has improved ; the discipline of the former is very fair, and of the latter, tolerable ; in Public Schools the proficiency is fair, in Denominational it approaches tolerable ; the local supervision in both is moderately effective ; and both exhibit, in point of general efficiency, a decided improvement upon their condition as described in last year's Report.

Sydney, 27 January, 1869.

E. JOHNSON,
E. H. FLANNERY, } Inspectors.

ANNEX F.

DETAILED Statement of the condition of Public Schools in the Sydney District, inspected during the year 1868.

The remarks under head 1 relate to the material condition of the schools,—
2 to their moral character,—
3 to the subjects and methods of instruction,—
4 to the proficiency of the pupils.

BALMAIN (Primary):—Visited, 16th, 17th, and 18th June.

Numbers present at examination:—Boys, 84; girls, 65; total, 149.

1. The schoolroom is of a superior kind, in good repair: it is well found in educational appliances. The whole property is carefully kept. 2. The attendance at examination was smaller than usual, on account of the rain. The pupils are clean, punctual, regular, and orderly. The government is rather harsh. 3. The usual branches are taught. The instruction is properly regulated. The methods are of fair average merit. 4. The attainments range from fair to good.

BALMAIN (Infants):—Visited, 16th June.

Numbers present at examination:—Boys, 31; girls, 23; total, 54.

1. The school is small, and a few desks are needed to complete its equipment; these are the only noticeable defects. An air of neatness and comfort pervades the department. 2. Sickness has latterly interfered with the attendance. The pupils are very clean, tidy-looking, and in good order. The aspect and tone of the department are calculated to impress favourably. 3. The instruction comprises appropriate subjects, and is regulated by the usual documents. The methods are suitable, and are applied with zeal, energy, and intelligence. 4. The general attainments may be regarded as very fair. The teacher has worked hard and successfully during the past year.

BOTANY ROAD (Primary):—Visited, 16th and 17th June.

Numbers present at examination:—Boys, 75; girls, 59; total, 134.

1. A good weatherboard building, but much too small for the present attendance. A supply of new and suitable furniture is required; otherwise, the school is fairly found in the necessary appliances. 2. The discipline is very fair. 3. The instruction is judiciously regulated, and the teaching is conducted with zeal and fair intelligence. 4. The proficiency ranges from tolerable to fair.

BOURKE-STREET (Primary):—Visited, 20th and 24th August.

Numbers present at examination:—Boys, 118; girls, 78; total, 196.

1. Most of the material defects pointed out in last year's report still exist. The school is awkwardly situated, and the playground is so small as scarcely to deserve the name. 2. Many of the pupils are untidy in appearance. The government is deficient in tact and firmness. Restlessness, talking, and inattention are far too prevalent. 3. Some improvement is possible in the arrangement and keeping of the lesson documents; and the methods, although of modern cast, require to be applied with greater energy and skill. 4. The attainments range from tolerable to fair. The pupils' answering needs to be more prompt, accurate, and general.

BOURKE-STREET (Infants):—Visited, 20th August.

Numbers present at examination:—Boys, 50; girls, 47; total, 97.

1. A bad schoolroom; the gallery is unsuitable, and a supply of furniture is needed. 2. The pupils are not very punctual; in other respects, the discipline is healthy, and the moral tone pleasing. 3. The instruction is very fairly regulated, and the methods are modern and applied with fair skill. 4. The proficiency varies from fair to very fair.

CAMPERDOWN (Primary):—Visited, 15th June.

Numbers present at examination:—Boys, 42; girls, 24; total, 66.

1. The fences need repair, and the walls of the schoolroom are not weatherproof. A classroom is required. There is a fair amount of furniture and apparatus. 2. The discipline is tolerable. 3. The instruction is fairly regulated, and the teaching is conducted with reasonable skill. 4. The average proficiency is fair.

CLEVELAND-STREET (Boys):—Visited, 14th, 15th, and 16th October.

Number of pupils present:—314.

1. An excellent schoolroom, but too small for the number of pupils in attendance. The organization is very complete. 2. The attendance is rapidly on the increase. The moral aspect of the school is satisfactory. 3. Algebra, Euclid, and Latin are included in the Course of Instruction. The methods are suitable, and applied with zeal, energy, and fair average skill. 4. The proficiency ranges from tolerable in the lower classes to good in the higher. The disparity in attainments is accounted for partly by a difference in the professional skill of the teachers, but chiefly by the large influx of new scholars into the lower section of the school.

CLEVELAND-STREET (Girls):—Visited, 14th, 15th, and 16th October.

Number of pupils present:—214.

1. A new schoolroom, liberally provided with the requisite appliances, and excellently organized. 2. The order is satisfactory, the government judicious, and the moral tone high. 3. The instruction is well regulated, the methods are appropriate, and applied with much intelligence. 4. The general proficiency approaches very fair.

CLEVELAND-STREET (Infants):—Visited, 13th and 14th October.

Numbers present at examination:—Boys, 148; girls, 107; total, 255.

1. A model schoolroom, fully equipped. 2. The pupils recently admitted are disposed to be troublesome; otherwise, the discipline is sound. 3. The usual infant school course is followed; the lesson documents are well compiled, and the teaching is marked by intelligence and skill. 4. All things considered, the proficiency may be regarded as satisfactory.

FORT-STREET (Boys):—Visited, 11th, 12th, 13th, 14th, and 15th May.

Number present at examination:—531.

1. The material condition and organization are very good. 2. The pupils are punctual and regular in attendance. They manifest a becoming demeanour, a ready attention, and a willing and prompt obedience. The government is vigorous and effective. 3. An appropriate classification obtains, and the instruction, which embraces Euclid, Latin, and Algebra, in addition to the ordinary branches, is judiciously regulated. The methods are skilful, and applied with energy and effect. 4. The average attainments are very fair. The pupils of the third and fifth classes acquit themselves extremely well under examination.

FORT-STREET (Girls):—Visited, 4th, 5th, 6th, 7th, and 8th May.

Number present at examination:—452.

1. The schoolroom is fully equipped with the best educational appliances, but is not large enough for the number of pupils in attendance. 2. The crowded appearance of the school detracts from its otherwise orderly aspect. The government is mild, but vigilant and effective. The demeanour of the pupils is modest and subdued, and their general behaviour unexceptionable. 3. In addition to the usual subjects, French is taught by a special master. The methods are modern, and range, in point of skill, from tolerable to very good. They are applied with vigour and much intelligence. 4. On the whole, the attainments of the classes are satisfactory; those of the upper second, third, and fifth, especially so. The pupils are attentive under examination, and answer with thoughtfulness and spirit.

FORT-STREET (Infants):—Visited, 27th and 29th April.

Numbers present at examination:—Boys, 193; girls, 167; total, 360.

1. The material condition and organization are susceptible of little improvement. 2. The pupils are clean, punctual, and regular. Good order is maintained. A cheerful and healthy spirit pervades the school. 3. The methods are appropriate, and are applied with earnestness and skill. 4. The attainments range from tolerable, in the baby department, to very fair in the senior infant school. Compared with last year, these results are satisfactory. The pupils are self-reliant, and answer with promptness and accuracy. They afford evidence of careful and judicious mental cultivation.

GLEBE (Primary):—Visited, 12th August.

Numbers present at examination:—Boys, 91; girls, 42; total, 133.

1. The fences and roof of the schoolhouse require repairs. Separate accommodation for the infants is a great desideratum. 2. The discipline has greatly improved, and is now very good. 3. The instruction comprises Euclid, Algebra, and Latin, besides the usual subjects. The methods are appropriate, and are applied with energy and skill. 4. The attainments range from fair to very good. The pupils are attentive, self-reliant, and answer with intelligence and spirit.

GLEBE (Infants):—Visited, 12th August.

Numbers present at examination:—Boys, 44; girls, 27; total, 71.

1. The business of this department is conducted in a portion of the primary schoolroom. The supply of working materials is good. 2. Considering the unsuitableness of the accommodation, the order is very fair, and the discipline is in other respects healthy. 3. The instruction is judiciously regulated, and the teaching is intelligent and effective. 4. The average proficiency is fair.

JAMISON-STREET:—Visited, 21st October.

Numbers present at examination:—Boys, 37; girls, 29; total, 66.

1. The schoolhouse is out of repair, and presents, inside and outside, a very uninviting appearance. The playground requires to be fenced, furnished with out-offices for each of the sexes, a lavatory, and a shed to protect the children from the weather. An old double desk and some chapel seats compose the furniture. The school premises are dirty and neglected. 2. The pupils are regular, but neither punctual

punctual nor clean. They are in bad order. The government is feeble and ineffective. 3. Drawing, music, and Scripture lessons are omitted from the subjects of instruction. The teacher has very little knowledge of the correct principles on which children should be classified, and is ignorant of the proper mode of compiling the lesson documents. His methods of teaching are mechanical, and but feebly applied. 4. The proficiency is small. The teacher requires training.

NEWTOWN (Primary):—Visited, 22nd July.

Numbers present at examination:—Boys, 58; girls, 35; total, 93.

1. The schoolroom is in need of whitewash, and some of the furniture is unsuitable; otherwise, the material condition of the school is very fair. 2. Wet weather and juvenile sickness have temporarily affected the attendance. Generally speaking, the moral aspect of the school is fairly satisfactory. 3. French and Latin are taught in addition to the usual subjects. The classification is appropriate. The lesson documents are compiled in a careful and intelligent manner. The methods are rational, and are applied with diligence and skill. 4. The attainments vary from fair to very fair. The pupils evince a high degree of mental culture.

NEWTOWN (Infants):—Visited, 22nd July.

Numbers present at examination:—Boys, 30; girls, 17; total, 47.

1. The schoolroom is rather small, and is unprovided with desks; otherwise, the organization is very fair. 2. The pupils are punctual, regular, and neatly attired. The order is good, and the moral tone pleasing. 3. The instruction is suitable and well regulated. The methods are appropriate, and are applied with zeal and fair intelligence. 4. The average proficiency is fair.

PADDINGTON (Primary):—Visited, 21st July.

Numbers present at the examination:—Boys, 79; girls, 50; total, 129.

1. The schoolhouse is unsuitable, and in disrepair. New buildings are much needed. The supply of working materials is sufficient. 2. The attendance is temporarily affected by wet weather. As a rule, the pupils are punctual and regular. Fair order is maintained. 3. Euclid and Algebra are included in the subjects of instruction. The methods are of fair average merit. 4. The attainments vary from tolerable to fair. The pupils are self-reliant, and evince a fair degree of mental culture.

PADDINGTON (Infants):—Visited, 21st July.

Numbers present at examination:—Boys, 43; girls, 24; total, 67.

1. The schoolroom is a detached iron building, rather low, but in other respects suitable. There is a full supply of the requisite appliances. 2. The pupils are punctual and regular. The order is good, and the moral tone healthy. 3. The instruction accords with that prescribed for infant schools. The methods are modern, and are marked by a fair degree of skill. 4. The proficiency is fair.

PITT-STREET (Primary):—Visited, 24th June.

Numbers present at examination:—Boys, 35; girls, 26; total, 61.

1. The defects noticeable in the material condition of this school are, the absence of suitable furniture, and the want of playground. 2. The discipline is healthy, and the moral tone of the school pleasing. 3. The methods are of modern cast, and are successfully applied. 4. The general proficiency approaches fair.

PITT-STREET (Infants):—Visited, 21st June.

Numbers present at examination:—Boys, 33; girls, 30; total, 63.

1. This department is conducted in the same room with the primary school. Suitable desks are wanted. There is a fair supply of working materials. 2. The government is judicious, and the pupils are punctual and orderly. 3. The methods are tolerably suitable, but are deficient in force and penetrativeness. 4. The proficiency is moderate.

PITT-STREET, SOUTH (Primary):—Visited, 18th June.

Numbers present at examination:—Boys, 21; girls, 14; total, 35.

1. The playground is small, and the size of the room prevents a proper arrangement of the furniture. There is a sufficiency of the necessary appliances. 2. The order is good, and the moral tone of the school sound. 3. The instruction is well regulated, and the methods are calculated to produce substantial results. 4. The proficiency is satisfactory, and the mental powers of the pupils are carefully cultivated.

PITT-STREET, SOUTH (Infants):—Visited, 22nd June.

Numbers present at examination:—Boys, 21; girls, 14; total, 35.

1. The furniture is very old and unsuitable, and a gallery has yet to be provided. There is an insufficiency of object cards. 2. The discipline is fairly satisfactory. 3. The classification is too individual. The teaching is painstaking and tolerably skilful. 4. The attainments are tolerable.

PYEMONT (Primary):—Visited, 10th July.

Numbers present at examination:—Boys, 55; girls, 30; total, 85.

1. The schoolroom is a weatherboard building, much too small, in indifferent repair, and inconveniently situated. The fencing is in a bad state. New and more commodious school premises are urgently needed. 2. Sickness, combined with the late vacation, has temporarily reduced the attendance. The pupils are clean, punctual, and regular. Very fair order is maintained, and the moral tone is tolerably high. 3. The classification is almost unexceptionable. As a whole, the lesson documents are arranged with fair judgment. The methods are fairly skilful. 4. The attention of some of the pupils requires to be strengthened. Their answering in Arithmetic, Geography, and Euclid, is neither sufficiently ready nor general.

PYRMONT (Infants):—Visited, 10th July.

Numbers present at examination:—Boys, 18; girls, 24; total, 42.

1. The situation is indifferent. The schoolroom is too small, and needs repairs. There is a fair supply of books and apparatus. 2. The pupils are punctual and regular, but the order admits of considerable improvement. 3. The classification is somewhat inappropriate; the instruction is fairly arranged, and the methods are of a passable kind. 4. The proficiency varies from tolerable to fair.

SUSSEX-STREET:—Visited, 14th July.

Numbers present at examination:—Boys, 47; girls, 49; total, 96.

1. A fair schoolroom, suitably furnished. The out-offices are incomplete, and objectionably arranged. There is no playground. 2. The pupils are fairly punctual, but irregular. The order is passable, and the moral tone of the school healthy. 3. The instruction is fairly arranged, and the teaching is conducted with diligence and reasonable skill. 4. The attainments are fair in the lower classes, and tolerable in the higher.

WATSON'S BAY:—Visited, 13th July.

Numbers present at examination:—Boys, 5; girls, 6; total, 11.

1. The school is unprovided with suitable furniture. In other respects, the organization is tolerable. 2. The order is indifferent, and the moral tone low. 3. The classification is faulty, the course of instruction is incomplete, and the teaching is wanting in method and energy. 4. The proficiency is indifferent.

WILLIAM-STREET (Boys):—Visited, 30th July, and 4th and 7th August.

Number present at examination:—240.

1. The organization is fairly satisfactory. 2. Measures need to be adopted to improve the punctuality. The government is harsh, and the prevailing tone of the school is not pleasing. 3. The course of instruction includes Euclid and Latin. The classification is tolerably judicious. Entries in the lesson registers require to be fuller and more explicit. The methods are fairly suitable, but need to be applied with more spirit and energy. 4. The attainments range from tolerable to very fair. Arithmetic grammar, and Scripture lessons, are the weak subjects.

WILLIAM-STREET (Girls):—Visited, 28th and 29th July.

Number present at examination:—141.

1. The drainage of the schoolground is defective. A class room is pressingly needed. The organization is, in other respects, good. 2. The pupils are regular, but unpunctual. They are restless in the classes, and disposed to be talkative and inattentive. The government is deficient in uniform firmness. 3. French is taught, along with the usual subjects. The classification is appropriate; the lesson documents are intelligently constructed; the methods are suitable, but are, owing to defective discipline, productive of only partial results. 4. The average attainments are tolerable.

WILLIAM-STREET (Infants):—Visited, 27th, 28th, and 29th July.

Numbers present at examination:—Boys, 157; girls, 140; total, 297.

1. A lavatory is needed; otherwise, the organization is very fair. 2. The pupils are unpunctual. In the junior infant school the order admits of improvement; in the senior department the discipline is excellent. 3. The instruction is well regulated, and the teaching is conducted with energy and intelligence. 4. The proficiency ranges from tolerable to good, the average being very fair.

APPENDIX K.

RECEIPTS and DISBURSEMENTS of the Council of Education, from 1st January to 31st December, 1868.

JOHN EVANS,
Accountant.

1869.

NEW SOUTH WALES.

REPORT

OF THE

COUNCIL OF EDUCATION

UPON THE CONDITION

OF THE

CERTIFIED DENOMINATIONAL SCHOOLS

FOR

1868.

Presented to both Houses of Parliament, by Command.

By Authority:

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1869.

THE COUNCIL OF EDUCATION TO HIS EXCELLENCY THE GOVERNOR,

SUBMITTING

REPORT ON DENOMINATIONAL SCHOOLS FOR 1868.

To His Excellency the Right Honorable SOMERSET RICHARD, Earl of Belmore, Member of Her Majesty's Most Honorable Privy Council in Ireland, Governor and Commander-in-Chief of the Colony of New South Wales, and Vice-Admiral of the same.

MAY IT PLEASE YOUR EXCELLENCY,

In compliance with the provisions of the Public Schools Act of 1866, section 27, we, the Council of Education, beg to submit to your Excellency this our Second Annual Report upon the condition of the Certified Denominational Schools of the Colony.

In our Report upon the Public Schools, we have fully described the general condition of all the schools under our superintendence. The statements contained in that Report apply equally to Public and to Denominational Schools, except in those cases in which remarks are expressly limited to schools of one class.

The total number of Certified Denominational Schools in operation in 1868 was 289; but of these, 25 were either closed at the end of the year, or, if continued, had changed their character and designation. The return appended to this Report exhibits the names of the schools in operation, with their respective attendances, and distinguishes those which were closed prior to the expiration of the year. Further statistical information is contained in a second return.

Appendix A.

Appendix B.

Applications for certificates to new Denominational Schools were received in 1868 from the undermentioned places, viz. :—

Appendix C.

Locality.	Denomination.
Sydney	Hebrew.
Nimitabelle	Roman Catholic.
Crown Flat, Araluen	do.
Villa Maria	do.

The Council acceded to the first of these applications, although the grant of a certificate was declined in 1867. The additional information furnished when the applicants brought the matter under notice the second time, in 1868, enabled the Council to entertain the application and issue a certificate. The reason stated for declining this application in the first instance was, that the Council could not widen the ground of support to Denominational Schools. It was represented to the Council, however, by the applicants in this case, that, except in Sydney, it would be impossible to form a Hebrew School, owing to the small number of persons of that persuasion, and that consequently there would be no probability that any further applications of this kind would be made.

The provisions of the Public Schools Act having been fully met in the application from Villa Maria, the Council granted a certificate to that school. The application from Nimitabelle was declined, because of the non-existence of a Public School within the distance prescribed by law. At the end of the year, the application from Crown Flat was still under consideration.

The Denominational Schools at Tumut (Church of England), and Lane Cove (Presbyterian), have been allowed to lapse by the respective Local Boards. It is to be remarked

remarked of these schools that they were in reality private adventure schools, their connection with the denominations to which they professed to belong being of a slight and formal nature. Their continued existence depended, therefore, upon the will of the teachers who had possession of the school premises; and as the teachers, in the cases under consideration, tendered their resignations to the Council, the schools lapsed as Certified Denominational Schools.

The buildings appertaining to the Church of England School at Sackville Reach, Hawkesbury River, having been destroyed by the flood of 1867, teaching has not been carried on there since that time. The Church of England School at Bolwarra has also been closed, on account of the dilapidated condition of the school buildings.

Applications were made for the conversion of the Church of England Schools at Bankstown and Dural, and the Wesleyan School at Currajong, into Public Schools. The Council having acceded to the applications, these schools are now in operation in their altered character.

Appendix D.

During the year, certificates were withdrawn, by notification in the form of the annexed circular, from the undermentioned Denominational Schools, on account of the number of pupils falling below that required by the 29th section of the Public Schools Act, viz. :—

<i>Church of England Schools.</i>					
School.					Average attendance.
Adaminaby	14·8
Bolong	10·3
Bungendore	15·
Burrowa	18·2
Collector	18·5
Crookwell	12·7
Cudgegong	21·
Illalong	22·
Goonoo Goonoo	8·5
Gresford	17·3
Gundaroo	18·3
Guntawang	23·
Macdonald River	22·1
Millfield	19·8
Mulwala	16·3
Tarago	20·
<i>Roman Catholic Schools.</i>					
Bungonia	18·3
Breadalbane	15·5
Gerringong	17·5
Laggan	14·8
Michalago	18·7
Spring Valley	19·7
<i>Presbyterian Schools.</i>					
Bamarang	18·6
Wallaby Hill	19·2

It must not be supposed, however, that the withdrawal of certificates from these schools deprived the localities in which they are situated of the means of education; applications for the establishment of Public Schools having been received from six, and fifteen others being now in operation as Provisional or Half-time Schools.

Certificates were also withdrawn from the following schools, which had been practically closed for some time, viz. :—

<i>Church of England.</i>	<i>Roman Catholic.</i>
Breadalbane.	Picton.
Gunning.	
Holsworthy.	
Kippelaw.	
Pejar.	
Picton.	

DENOMINATIONAL SCHOOLS.

The small attendances at the schools undermentioned during the first quarter of 1868 rendered them liable to have the certificates withdrawn, but the Council preferred to bring the matter under the notice of the Local Boards, before taking any other steps, viz. :—

Church of England.

School.	Average attendance.
Blandford	21·9
Canberra	29·7
Frederick's Valley	23·
Ginninderra	17·5
Guntawang	25·1
Hexham	21·4
Kincumber	23·
Kiora	29·
Mulgoa	20·6
Nundle	22·7
O'Connell	26·
Port Maitland	22·2
St. Leonard's	29·
Tirranna	22·4

Roman Catholic.

Bungendore	28·
Cabramatta	29·8
Greendale	21·7
Lane Cove	25·7
Liverpool	28·8
Oaks... ..	22·3
Raymond Terrace	27·6
Ryde	24·7
Wellington	23·

Presbyterian.

Dingo Creek	27·1
Lane Cove	29·2

Wesleyan.

Currajong	23·
Hornsby	24·2
Lane Cove	20·

The Local Boards were accordingly addressed by circular in the form appended. Appendix E.

The Inspectors' reports appended to our Report upon Public Schools will supply information as to the condition of the Certified Denominational Schools. Further information on this head may be obtained from the detailed statements furnished by the Inspectors on the condition of the schools visited in 1868. The Council is of opinion that, in general, the Denominational Schools have improved in efficiency during the year. Appendix F.

The number of free scholars reported by the teachers to be in attendance at Certified Denominational Schools has fallen from 5,635 in 1867, to 4,607 in 1868—a diminution of 1,028. The inquiries instituted by our Inspectors, in the case of 179 schools, showed that 2,118 professed free scholars were in attendance. The teachers acknowledged having, on their own authority, admitted 878 of these, though this course is irregular; and in 1,208 cases, the children were admitted by order of the Local Boards. A small number (32) appear to have obtained no sanction to their attendance without payment. The general excuse for non-payment was the poverty of parents. In 1,108 cases, the Inspectors report that this plea is sustained by the facts.

In addition to the free scholars already mentioned, 1,139 children attend the schools in which the inquiries were made, whose parents, though professing to pay, actually withheld payment of school fees. The reason advanced in explanation of this course was, generally, inability to pay at the time, though future payment was usually promised. In the case of 626 children, the Inspectors expressed themselves satisfied with the validity of this plea, but stated their belief that a large number of parents who could well afford to pay were obtaining free education for their children, either by misrepresenting their circumstances, or by trusting to the indifference of teachers and Local Boards for exemption from payment.

The sum of £1,633 9s. 5d., derived from the Church and School Estates Revenue, having been placed at the Council's disposal for Certified Denominational Schools, that amount was apportioned to them in proportion to the number of persons of each Denomination as disclosed by the Census of 1861. The sums allotted to the several Denominations were—

Church of England	£822 18 2
Roman Catholic	510 4 1
Presbyterian	178 9 4
Wesleyan.....	121 17 10

We submit this as our Report upon the Certified Denominational Schools, for the year ending 31st December, 1868; and, in testimony thereof, we have caused our corporate seal to be affixed hereto, this twenty-fourth day of March, one thousand eight hundred and sixty-nine.

APPENDIX D.

APPENDIX D.

Council of Education Office,
Sydney, 186 .

Sir,

I am directed by the Council of Education to invite your attention to the condition of the Certified Denominational School () at during the past

Quarters. By the provisions of the Public Schools Act, Sections 9 and 28, it is clearly contemplated that at least thirty children should be in regular attendance at a Denominational School receiving support from the Parliamentary grant. By Section 28, the Council is empowered to withdraw the Certificate from any School of this class not having thirty children in regular attendance, after the first day of January of the year 1868.

The Council has hitherto abstained from exercising this power, in order to see, for a further period, the progress of the Schools with an attendance below the minimum number. It is found that the School above referred to has had, according to the Returns certified as correct by the Local Board, for the

Quarters since the Public Schools Act came into operation, an average attendance as hereunder stated :—

		1867.
First Quarter
Second "
Third "
Fourth "
		1868.
First Quarter
Second "
Third "
Fourth "

Under these circumstances, the Council has decided to withdraw the Certificate at the close of the Quarter ending , and accordingly will not be responsible for any expense incurred in support of the School after that date.

I have the honor to be,
Sir,
Your most obedient Servant.

Secretary.

To

Chairman of the Local Board,
Certified Denominational School ()
at

APPENDIX E.

Council of Education Office,
Sydney, 186 .

Sir,

I am directed by the Council of Education to invite your attention to the condition of the Certified Denominational School () at during the past

Quarters. By the provisions of the Public Schools Act, Sections 9 and 28, it is clearly contemplated that at least thirty children should be in regular attendance at a Denominational School receiving support from the Parliamentary grant. By Section 28, the Council is empowered to withdraw the Certificate from any School of this class not having thirty children in regular attendance, after the first day of January of the year 1868.

The Council has hitherto abstained from exercising this power, in order to see, for a further period, the progress of the Schools with an attendance below the minimum number. It is found that the School above referred to has had, according to the Returns certified as correct by the Local Board, for the

Quarters since the Public Schools Act came into operation, an average attendance as hereunder stated :—

		1867.

9. Inspector's Report upon Schools in the Sydney District.

ALBURY DISTRICT.

DETAILED STATEMENT of the Certified Denominational Schools inspected.

CERTIFIED DENOMINATIONAL SCHOOLS.

ALBURY (C.E.) :—Visited, 8th September.

Numbers present at inspection :—Boys, 18 ; girls, 11 ; total, 29.

The organization is still defective in the matter of the distribution and extent of the subjects, and in the absence of some of the documents relating thereto. Maps, and a larger black-board are wanted. The pupils are orderly, but the government is too severe. Reading and writing are well taught ; but object lessons, singing, and drawing, are entirely omitted from the "Course of Instruction."

ALBURY (R.C.) :—Visited, 10th September.

Number present at inspection, 35 boys.

Since the month of August the girls have been withdrawn, and placed under the charge of teachers unconnected with the Council. Considering the double purpose the building serves, the organization is very fair. The discipline is not sufficiently even and firm. The teacher possesses fair skill, and he is zealous in the performance of his duties. The general state of the attainments is very fair.

COROWA (C.E.) :—Visited, 20th October.

Numbers present at inspection :—Boys, 36 ; girls, 26 ; total, 62.

There is still an insufficient stock of furniture, which is a serious drawback now the attendance has increased. The discipline and general management have greatly improved since the appointment of the present teacher. He has, however, been too short a time in charge to raise the standard of the attainments in an equal degree.

GUNDAGAI SOUTH (C.E.) :—Visited, 22nd July.

Numbers present at inspection :—Boys, 15 ; girls, 9 ; total, 24.

The building is unsightly, the walls being propped up. There is sufficient furniture, but it is not placed in the best position. The discipline is bad, the tone of the school low, and the state of the attainments is unsatisfactory. Since the inspection, however, another teacher has been appointed, and the school is, in every respect, improved. Singing and drawing were not taught at the date of my visit.

JUGIONG (R.C.) :—Visited, 24th July.

Numbers present at inspection :—Boys, 15 ; girls, 16 ; total, 31.

The school has not yet been provided with out-offices. The shape and position of the furniture are not good. The classification has been improved, and the discipline is fair. The authorized books are now in use, but the methods employed are defective. The attainments are not high, but the pupils are making improvement. Singing and drawing are not taught.

TUMUT (R.C.) :—Visited, 29th July.

Numbers present at inspection :—Boys, 21 ; girls, 15 ; total, 36.

The school is now held in a rented cottage, of fair shape and size. The furniture is not sufficient, but its shape is very fair. The discipline is not sufficiently firm and sustained. The method is not very skilful, but the teacher is painstaking. The supply of the proper books was only received to-day. The teacher has not had charge for any length of time. The attainments range from tolerable to fair ; but the "Course of Secular Instruction" does not include, at present, object lessons, singing, or drawing.

WAGGA WAGGA (R.C.) :—Visited, 17th August.

Numbers present at inspection :—Boys, 26 ; girls, 15 ; total, 41.

The church is still used as the schoolroom. In the matter of the classification of the pupils, the organization is defective. The discipline is not sufficiently thorough, and the method is capable of being improved. The state of the attainments is fairly satisfactory. Singing has not yet been introduced.

ARMIDALE DISTRICT.

DETAILED Statement of the Denominational Schools inspected in 1868.

ARMIDALE (C.E.) :—Visited, 3rd September, 1868.

Numbers at the examination :—Boys, 31 ; girls, 43 ; total, 74.

1. The schoolhouse is suitable and in good condition, but not neat in external appearance. The playground requires to be kept in better order. A few desks are required ; otherwise there is an adequate supply of material appliances. The organization is very fair. 2. The pupils are not sufficiently regular in attendance, and but moderately orderly in their movements. The out-door supervision of the pupils is not satisfactory. The moral tone of the school is fair. 3. The prescribed subjects are taught throughout with tolerable efficiency ; the classification and lesson documents being arranged with fair skill ; but the teaching of the lower classes too mechanical, and deficient in animation and energy. 4. The average proficiency of the pupils ranges from tolerable to fair.

FREDERICTON

FREDERICTON (C.E.) :—Visited, 14th December, 1868.

Numbers at the examination :—Boys, 23 ; girls, 16 ; total, 39.

1. This school is conducted in a church, and is supplied with adequate material appliances except diagrams. Some of the forms require altering to suit the younger pupils. The organization is fair. 2. The moral character of the school is fair. The playground needs to be kept in better order, and the discipline of the first class to be more effective. 3. The prescribed course of instruction is followed ; the lesson documents are neatly and intelligently constructed, but the classification is too minute to be effective. The teaching is earnest and painstaking ; but it is too mechanical, and too deficient in power and vivacity. 4. The attainments and mental culture of the lower classes are moderate—of the upper class, tolerable.

GLEN INNES (C.E.) :—Visited, 6th July, 1868.

Numbers at the examination :—Boys, 27 ; girls, 13 ; total, 40.

1. The building is small, ill-conditioned, and unsuitable for school purposes. The schoolroom is uncomfortable and encumbered with church furniture. The fence and out-offices are in an unsatisfactory condition. There is no residence for the teacher. The supply of material appliances is fair. 2. The children are cheerful and clean in appearance, but unpunctual in their attendance, and not properly regulated in their movements. Under examination, however, they conduct themselves with fair propriety. Sufficient attention is not bestowed upon the schoolroom, as regards neatness and cleanliness. 3. The prescribed subjects are taught, with barely tolerable skill and efficiency. The classification is defective ; but the lesson documents are, on the whole, arranged with fair intelligence. The teaching requires to be more equally distributed among the classes. 4. The attainments of the pupils in the primary subjects of instruction are moderate—in the secondary, fair.

GOONOO GOONOO (C.E.) :—Visited, 25th May, 1868.

Numbers at the examination :—Boys, 6 ; girls, 4 ; total, 10.

1. The building is suitable, but is not properly furnished. The playground is not fenced in, and the out-offices are inadequate. There is a tolerable supply of working materials, but unauthorized books are used in the school. The organization is moderate. 2. The pupils are irregular in their attendance, diffident in their manner, but clean, attentive, and well-behaved. The moral character of the school is fairly satisfactory. 3. The prescribed subjects are taught, with the exception of singing, sewing, and object lessons. The classification is very defective ; and the teaching, though regulated by tolerably arranged lesson documents, is feeble and moderately efficient. 4. The attainments and mental culture of the pupils are small.

GUNNEDAH (C.E.) :—Visited, 1st June, 1868.

Numbers at the examination :—Boys, 24 ; girls, 25 ; total, 49.

1. This school is conducted in a church, the internal appearance of which is not satisfactory as regards lighting and neatness of appearance. There are no out-offices and supply of water, and the playground is not fenced in. Additional furniture is required ; otherwise there is a fair supply of material appliances. The organization is moderate. 2. The moral character of the school is not satisfactory as regards the conduct of the pupils, the appearance of the schoolroom, and the performance of the school operations. 3. The prescribed subjects are taught with moderate efficiency ; the lesson documents, however, are on the whole arranged with fair skill. The classification is somewhat defective. 4. The attainments and mental culture of the pupils are moderate.

KEMPSEY (C.E.) :—Visited, 9th December, 1868.

Numbers at the examination :—Boys, 21 ; girls, 30 ; total, 51.

1. This school is conducted in a church, which is very suitable as regards airiness, lighting, and accommodation ; the playground is not fenced in nor provided with out-offices. Additional furniture is needed ; otherwise there is an adequate supply of working materials. 2. The moral character of the school is in most respects pleasing. 3. The prescribed course of instruction is, with the exception of singing, followed, and is also regulated with fair skill. The efficiency of the teaching is barely tolerable. 4. The proficiency of first and third classes is tolerable, that of the second class moderate.

NUNDLE (C.E.) :—Visited, 26th May, 1868.

Numbers at the examination :—Boys, 12 ; girls, 13 ; total, 25.

1. Repairs to the building are needed. The furniture is defective both in quality and quantity. The character of the organization is, on the whole, only moderately satisfactory. 2. The attendance is low, irregular, and unpunctual ; and the pupils, though well-behaved, are awkward in their movements and deficient in self-reliance. The moral character of the school is tolerable. 3. Singing is not practised ; otherwise the prescribed course of instruction is followed and tolerably well regulated, though the teaching is only moderately effective. 4. The average proficiency of the pupils is very moderate.

TAMWORTH (C.E.) :—Visited, 22nd May, 1868.

Numbers at the examination :—Boys, 26 ; girls, 29 ; total, 55.

1. The building is in good condition, but bare, dirty, and disorderly in its internal appearance. The apparatus is tolerably adequate, but the furniture is insufficient and unsuitable. The out-offices are in a very objectionable condition. 2. The moral aspect of the school is not satisfactory. 3. The prescribed subjects are taught ; the classification is judicious, and the lesson documents are intelligently constructed. The teaching is defective in energy and efficiency. 4. The proficiency of the pupils is moderate.

ARMDALE (R.C.) :—Visited, 4th September, 1868.

Numbers at the examination :—Boys, 33 ; girls, 24 ; total, 57.

1. The schoolhouse and residence belong to the teacher, and are kept in exemplary good order. A playground with adequate out-office accommodation is needed. There is a good supply of material appliances, but the desks are unsuitable both in design and arrangement. The organization is passable. 2. Sufficient attention is not paid to the out-door supervision of the pupils and to the orderly performance of the school operations ; otherwise, the moral character of the school is fairly satisfactory. 3. The prescribed subjects are taught, but not in strict accordance with the standard course. Unauthorized text-books are in use. The teaching is painstaking and tolerably well regulated, but the methods are too mechanical, and are not applied with sufficient animation. 4. The average attainments of the first class are moderate, and of the second and third classes tolerable. Moderate self-reliance and mental culture are evinced by the pupils under examination.

APPENDIX.

15

GRAFTON (R.C.) :—Visited, 24th September, 1868.

Numbers at the examination :—Boys, 24 ; girls, 16 ; total, 40.

1. This school is conducted in a spacious but rather gloomy room, formerly occupied as a store, and fitted with barred windows instead of glazed. The playground is neither fenced in nor provided with out-offices. Additional furniture is needed ; otherwise, there is a fair supply of material appliances. 2. The moral character of the school is fair. 3. With the exception of singing, sewing, and drawing, the prescribed course of instruction is followed and regulated with tolerable intelligence. The condition of the lesson documents and school records as regards neatness and cleanliness is not pleasing ; the teaching is too empirical to be properly effective. 4. The proficiency of the pupils ranges from small to tolerable.

GUNNEDAH (R.C.)

This school was not in operation at the date of my visit to the district.

KEMFSEY (Pres.)

Numbers at the examination :—Boys, 15 ; girls, 18 ; total, 33.

1. This school is conducted in a church, and is well found in material appliances. The organization is fairly satisfactory. 2. The moral tone of the school is respectable. 3. The prescribed course of instruction is followed and intelligently regulated. The teaching is painstaking and tolerably skilful. 4. The general proficiency of the lower classes is moderate, and that of the upper class tolerable.

CARR'S CREEK (Wes.) :—Visited, 29th September, 1868.

Numbers at the examination :—Boys, 17 ; girls, 14 ; total, 31.

1. The building is in fair condition, but being used as a chapel it is not suitably furnished. There is no supply of water, and, properly speaking, no playground. The organization is barely tolerable. 2. The prevailing tone of the school is tolerably satisfactory. 3. With the exception of singing and drawing, the prescribed subjects are taught, and the teaching is tolerably skilful and effective. 4. The proficiency of the pupils ranges from moderate to fair.

ULMARRA (Wes.) :—Visited, 1st October, 1868.

Numbers at the examination :—Boys, 20 ; girls, 18 ; total, 38.

1. The building is in good condition, and well furnished, pleasantly placed, and, though used as a chapel, suitable for school purposes. The out-offices are in a neglected condition. The organization is fair. 2. The discipline is mild, firm, and effective ; and the moral tone of the school is, in other respects, fairly satisfactory. 3. The prescribed subjects are taught, except singing and sewing ; the lesson documents are arranged with fair ability, and the teaching, though not equally distributed, is tolerably skilful. 4. The proficiency of the pupils ranges from moderate to tolerable.

BATHURST DISTRICT.

DETAILED STATEMENT of Denominational Schools inspected in 1868.

BATHURST (Pres.) :—Visited, 16th November.

Numbers present :—Boys, 22 ; girls, 34 ; total, 56.

A good building, but the internal arrangements awkward for teaching purposes. The furniture is not of the best kind, and the playground is much too small. The discipline is effective ; the moral tone is tolerable, but promising. The instruction is careful and industrious ; the attainments are, on the whole, only tolerable.

BATHURST (C.E.—Infants) :—Visited, 17th November.

Numbers present :—Boys, 27 ; girls, 33 ; total, 60.

An excellent building, with a good playground attached. A few desks and hat-pegs are needed. The discipline is mild, but firm and effective ; the general spirit of the school is pleasing. The subjects are suitable, and the methods are fairly appropriate. The proficiency is satisfactory.

BATHURST (C.E.—Primary) :—Visited, 17th November.

Numbers present :—Boys, 32 ; girls, 21 ; total, 53.

Hat-pegs and suitable furniture are needed ; otherwise, the material condition is excellent. The government is not effective ; the moral tone is barely tolerable. The instruction is energetic and fairly intelligent, but lacks penetrative force. The average proficiency is tolerable.

BATHURST (R.C.—Boys) :—Visited, 25th November.

Number present :—Boys, 94.

The schoolroom is suitable, but too small for the attendance, a portion of the room being partitioned off for another school. There is no playground, and the desks are not of the best description. The teaching is intelligent and energetic, the discipline is effective, and the results are satisfactory. The subjects do not include singing or drawing.

BATHURST (R.C.—Infants) :—Visited, 26th November.

Numbers present :—Boys, 18 ; girls, 100 ; total, 118.

There is no separate room for the infants, who are taught in the same room with the girls ; the teachers of both schools therefore labour under disadvantages. The want of a suitable playground for the infants is a serious defect in the organization. The order and discipline are fairly effective, the instruction is careful and industrious, and the proficiency is, in the circumstances, satisfactory. New premises are in the course of erection.

BATHURST

BATHURST (R.C.—Girls):—Visited, 27th November.

Number present:—Girls, 65.

A good building, fairly furnished, but not provided with a suitable playground. The discipline is mild, but effective; the general spirit of the school is very pleasing. The teaching is systematic, earnest, and intelligent. The results are satisfactory, and substantial progress may be expected.

BURROWA (R.C.):—Visited, 10th June.

Numbers present:—Boys, 22; girls, 28; total, 50.

The organization is fair. The discipline is healthy. The teaching is earnest and intelligent; and the methods are suitable and effective. The proficiency varies from tolerable to good.

BURROWA (C.E.):—Visited, 10th June.

Numbers present:—Boys, 17; girls, 9; total, 26.

The organization is tolerable. The government is mild, and defective in energy. The instruction is sound, and the methods suitable. The proficiency is from tolerable to fair.

FREDERICK'S VALLEY (C.E.):—Visited, 8th December.

Numbers present:—Boys, 11; girls, 11; total, 22.

The building is suitable, but not properly or sufficiently furnished. The playground, which is a good one, is unfenced. The discipline is prompt and vigorous—thoroughly effective. The instruction is conducted with great energy, and the results are, in the circumstances, satisfactory.

GUNTAWANG (C.E.):—Visited, 21st October.

Numbers present:—Boys, 13; girls, 18; total, 31.

The building is suitable, and in good repair. The furniture is sufficient, but badly arranged. The supply of books is scanty. The government is tolerably effective; the teaching is earnest, but the instructional documents are only moderately regulated. In the circumstances, the results are passable.

HARTLEY (R.C.):—Visited, 9th September.

Numbers present:—Boys, 17; girls, 19; total, 36.

The playground is unfenced, and the furniture is insufficient and unsuitable. The building itself is only tolerable. The discipline is tolerably effective. The instruction is industrious and tolerably intelligent. The pupils evince tolerable proficiency, but are wanting in animation.

KELSO (C.E.):—Visited, 1st December.

Numbers present:—Boys, 26; girls, 28; total, 54.

The material condition of this school is, on the whole, good. The discipline is effective; the general spirit of the school is pleasing. The instruction is careful and industrious; and the proficiency is, as a whole, reasonably satisfactory.

LAMBING FLAT (R.C.):—Visited, 1st June.

Numbers present:—Boys, 20; girls, 21; total, 41.

The school is still conducted in the church. It is now fairly supplied with apparatus, but the furniture is scanty. In the circumstances, the discipline is tolerable. The teaching is marked by industry, but fails in energy. The methods are suitable, and the attainments are tolerable.

MUDGE (R.C.):—Visited, 30th September.

Numbers present:—Boys, 36; girls, 25; total, 61.

The closets need repair, and the teacher's residence is quite unfit for use. New furniture has just been obtained. The government is mild, but firm. The moral tone is fair, and likely to improve. The teaching is intelligent and industrious; and the methods are suitable. The proficiency ranges from tolerable to good; the average may be estimated as fair.

MUDGE (C.E.—Primary):—Visited, 1st October.

Numbers present:—Boys, 43; girls, 27; total, 70.

An excellent building, well furnished and supplied with working materials. The playground needs fencing. The government is prompt and vigorous; the general spirit of the school is pleasing. The instruction is intelligent and well regulated; the methods are suitable, and applied with energy. The proficiency is satisfactory. In addition to the ordinary subjects, geometry and algebra are taught.

MUDGE (C.E.—Infants):—Visited, 2nd October.

Numbers present:—Boys, 22; girls, 14; total, 36.

A tolerable building, but without a gallery or suitable furniture for an infant school. The discipline is tolerable. The instruction is only moderately regulated, and lacks animation and energy. The attainments are not, on the whole, satisfactory.

O'CONNELL (C.E.):—Visited, 24th August.

Numbers present:—Boys, 16; girls, 15; total, 31.

There is a deficiency in furniture; otherwise, the organization is reasonably satisfactory. The discipline is prompt, energetic, and vigilant. The instruction is intelligent and industrious, and the methods are good. The attainments are satisfactory—substantial work is being done.

ORANGE (R.C.) :—Visited, 10th December.

Numbers present :—Boys, 30 ; girls, 53 ; total, 83.

The school is conducted in a rented building, which is tolerably suitable, but too small and not well situated. The furniture is insufficient, there is no proper playground, and hat-pegs are much needed. The discipline is effective ; the instruction is careful and industrious ; and the attainments are satisfactory.

RYLSTONE (C.E.) :— Visited, 28th September.

Numbers present :—Boys, 13 ; girls, 19 ; total, 32.

The building is not a proper schoolroom, but is tolerably suitable ; it is the property of a private person, who gives the use of it free. The furniture is bad. The discipline and moral tone are fair. The instruction is tolerably regulated ; and the methods are judicious. The proficiency is reasonably satisfactory.

SOFALA (R.C.) :—Visited, 29th October.

Numbers present :— Boys, 25 ; girls, 55 ; total, 80.

A good building, but too small for the attendance, and very imperfectly furnished. The playground is also unfenced. A supply of school materials had just been received ; previously the supply was very scanty. The discipline is tolerably effective ; the instruction is moderately regulated, but is wanting in penetrative power. The average attainments are nearly tolerable.

SOFALA (C.E.) :—Visited, 30th October.

Numbers present :—Boys, 44 ; girls, 39 ; total, 83.

Infants.—A very unfit building, without gallery or other suitable furniture. The discipline is mild ; the instruction is careful ; and the attainments are reasonably satisfactory. The general spirit of the school is pleasing.

Primary.—The school is well furnished and supplied with apparatus ; but a new building is urgently required. The discipline is thoroughly effective ; the moral tone is good ; and the instruction is well regulated. The proficiency is creditable.

WELLINGTON (R.C.) :—Visited, 16th December.

Numbers present :—Boys, 13 ; girls, 17 ; total, 30.

An indifferent building, in bad repair, and insufficiently supplied with furniture, which is badly arranged. The government is kindly, and tolerably effective. The teaching is marked by care and tact ; but the methods need improvement. The results range from moderate to fair ; the average being nearly tolerable.

J. M'CREIDIE,
Inspector, Bathurst District.

CAMDEN DISTRICT.

DETAILED STATEMENT of the condition of Certified Denominational Schools inspected in 1868.

The remarks under head 1 relate to the material condition of the schools.
2 to their moral condition.
3 to the subjects and methods of instruction.
4 to the proficiency of the pupils.

ASHFIELD (C.E.) :—Visited, 29th May, 1868.

Numbers present :—Boys, 31 ; girls, 20 ; total, 51.

1. The furniture is not suitably arranged, otherwise the material condition of the schoolhouse is good. There is no teacher's residence. 2. The discipline is good. 3. The instruction is carried on with intelligence and skill. 4. The proficiency is very fair.

CAMPBELLTOWN (C.E.) :—Visited, 25th November, 1868.

Numbers present :—Boys, 52 ; girls, 27 ; total, 79.

1. The out-offices are in need of repairs, and the teacher's residence should be enlarged and reshingled. 2. The discipline is healthy. 3. The instruction is carried on with fair skill and efficiency. The teacher is intelligent and painstaking. 4. The proficiency ranges from tolerable to very fair.

COOK'S RIVER (C.E.) :—Visited, 27th and 28th May, 1868.

Numbers present :—Boys, 51 ; girls, 33 ; total, 84.

1. Some slight repairs are needed, otherwise the material condition of the school is fair. 2. The discipline is tolerably healthy. 3. The methods are fairly satisfactory, and the teaching is carried on with earnestness. 4. The proficiency is tolerable.

COOK'S RIVER (C.E.) (Infants) :—Visited, 27th May, 1868.

Numbers present :—Boys, 37 ; girls, 23 ; total, 60.

1. The material condition of the school is good. 2. The pupils are clean, and fairly orderly and attentive. 3. The instruction is carried on with industry and tolerable skill. The methods are moderately appropriate. 4. The proficiency is moderate.

COBBITY (C.E.) :—Visited, 10th June, 1868.

Numbers present :—Boys, 15 ; girls, 18 ; total, 33.

1. A teacher's residence is needed, otherwise the material condition is reasonably good. 2. The discipline is healthy. 3. The teacher is earnest and industrious, and the methods are tolerably appropriate. 4. The proficiency is moderate.

ENFIELD (C.E.) :—Visited, 8th July, 1868.

Numbers present :—Boys, 25 ; girls, 33 ; total, 58.

1. A supply of new furniture is greatly needed, otherwise the material condition is good. 2. The discipline is only moderately healthy. 3. The ordinary subjects are taught with industry. The methods are weak and ineffective. 4. The proficiency is unsatisfactory.

FOX GROUND (C.E.) :—Visited, 11th September, 1868.

Numbers present :—Boys, 15 ; girls, 21 ; total, 36.

1. The out-offices need rebuilding. In other respects, the school premises are in good repair, and they are tolerably suitable. 2. The discipline is defective. 3. The teacher is earnest and industrious. The methods are mechanical and ineffective. 4. The results produced are small.

GERRINGONG (C.E.) :—Visited, 11th September, 1868.

Numbers present :—Boys, 22 ; girls, 16 ; total, 38.

1. The material condition is fair. 2. The pupils are clean, and fairly orderly and attentive. 3. The teacher is careful and industrious. The methods are mechanical. 4. The results are tolerably satisfactory.

JAMBEROO (C.E.) :—Visited, 9th and 10th September, 1868.

Numbers present :—Boys, 24 ; girls, 15 ; total, 39.

1. The furniture is good, otherwise the material condition is very unsatisfactory. 2. The pupils' attendance is unsatisfactory. They are, as a whole, fairly clean, orderly, and attentive. 3. The teaching, though apparently carried on with fair intelligence and skill, is not effective. 4. The proficiency is moderate.

LORD'S FOREST (C.E.) :—Visited, 17th December, 1868.

Numbers present :—Boys, 23 ; girls, 22 ; total, 45.

1. New out-offices have been erected. There is no residence provided for the teacher; otherwise the material condition is good. 2. The discipline is healthy. 3. The teacher is intelligent and industrious. The methods are fairly appropriate. 4. The progress made is fairly satisfactory.

TERARA (C.E.) :—Visited, 3rd September, 1868.

Numbers present :—Boys, 14 ; girls, 15 ; total, 29.

1. There is no teacher's residence. The playground needs fencing, and the schoolhouse should be cleaned and painted. 2. The discipline is only moderately healthy. 3. The teaching is weak and ineffective. The methods are not appropriate. 4. The results—except in the 1st class—are very moderate.

WOLLONGONG (C.E.) :—Visited, 15th December, 1868.

Numbers present :—Boys, 58 ; girls, 25 ; total, 83.

1. The material condition is fairly satisfactory. 2. The discipline is very good. 3. The instruction is carried on with earnestness and intelligence. The methods are suitable. 4. The proficiency is satisfactory.

WOONONA (E.C.) :—Visited, 10th December, 1868.

Numbers present :—Boys, 26 ; girls, 47 ; total, 73.

1. The material condition, furniture excepted, is fair. 2. The discipline is only tolerably healthy. 3. The instruction is feeble and ineffective. The classification is not judicious. The methods are inappropriate. 4. The results are unsatisfactory.

BARGO EAST (R.C.) :—Visited, 24th September, 1868.

Numbers present :—Boys, 16 ; girls, 10 ; total, 26.

1. The building is not central, and the furniture is but moderately suitable, otherwise the material condition is fair. 2. The discipline is not effective. 3. The prescribed subjects are nominally taught, but the methods used are very unsuitable. 4. The proficiency is very moderate.

CABRAMATTA (R.C.) :—Visited, 22nd July, 1868.

Numbers present :—Boys, 20 ; girls, 18 ; total, 38.

1. The playground is not fenced, and out-offices have not been provided. Additional furniture is needed. In other respects, the material condition is tolerably satisfactory. 2. The discipline is fair. 3. The teacher is earnest and industrious, and the instruction is carried on with tolerable skill. 4. The proficiency ranges from tolerable to fair.

CAMPBELLTOWN (R.C.) :—Visited, 26th November, 1868.

Numbers present :—Boys, 44 ; girls, 39 ; total, 83.

1. New closets have been erected. The material condition is very fair. 2. The discipline is good. 3. The teachers are earnest and painstaking. The methods are fairly appropriate. 4. The results produced are very fair.

CHARCOAL (R.C.) :—Visited, 11th December, 1868.

Numbers present :—Boys, 19 ; girls, 19 ; total, 38.

1. No improvement has been made in the material condition of the school since last inspection. The premises are altogether unsuitable for school purposes. 2. The discipline is moderate. 3. The teacher is energetic and industrious, but his methods are defective, and the instruction is therefore unsatisfactory. 4. The proficiency is only moderate.

COOK'S RIVER (R.C.) :—Visited, 26th May, 1868.

Numbers present :—Boys, 23 ; girls, 24 ; total 47.

1. Furniture is needed ; otherwise the material condition of the school is satisfactory. 2. The discipline is moderate. 3. The teacher is earnest, but unskilful. 4. The proficiency is very moderate.

DAPTO (R.C.) :—Visited, 14th December, 1868.

Numbers present :—Boys, 21 ; girls, 18 ; total, 39.

1. The furniture is unsuitable ; otherwise the material condition is fair. 2. The pupils are fairly regular and punctual, and their cleanliness, order, and attention, are tolerably satisfactory. 3. The methods are tolerably judicious, and they are applied with much earnestness. 4. The proficiency is fair.

JAMBEROO (R.C.) :—Visited, 9th September, 1868.

Numbers present :—Boys, 28 ; girls, 14 ; total, 42.

1. Out-offices have been erected since last inspection. The material condition is now tolerably satisfactory. 2. The discipline is moderately healthy. 3. The instruction is weak and inefficient. The methods are tolerably suitable, but more energy and tact are required in their application. 4. The proficiency is only tolerable.

IRISHTOWN (R.C.) :—Visited, 18th December, 1868.

Numbers present :—Boys, 22 ; girls, 18 ; total, 40.

1. New furniture is greatly needed ; otherwise the material condition of the school is fair. 2. The discipline is moderately healthy. 3. The teacher is earnest and industrious, but his methods are ineffective. 4. The proficiency—except in the third class—is only moderate.

THE OAKS (R.C.) :—Visited, 12th June, 1868.

Numbers present :—Boys, 15 ; girls, 21 ; total, 36.

1. There is no residence for the teacher, and the furniture is insufficient and unsuitable ; in other respects the material condition is good. 2. The discipline is fair. 3. The methods are very defective—little beyond rote learning being attempted. 4. The proficiency is very moderate.

ROCKY POINT (R.C.) :—Visited, 16th December, 1868.

Number present :—7.

1. A supply of suitable furniture is much needed. A residence has not been provided for the teacher ; otherwise the material condition is very fair. (No examination was held, nearly all the pupils having been withdrawn by their parents from the school.)

SPANIARD'S HILL (R.C.) :—Visited, 23rd July, 1868.

Numbers present :—Boys, 13 ; girls, 12 ; total, 25.

1. The out-buildings and the teacher's residence are greatly in need of repairs. The school furniture is badly arranged. 2. The discipline is fair. 3. The ordinary subjects are taught with some skill, but more systematic effort on the part of the teacher is required to render the work effective. 4. The proficiency is not satisfactory.

ULLADULLA (R.C.) :—Visited, 4th August, 1868.

Numbers present :—Boys, 25 ; girls, 15 ; total, 40.

1. There are no out-offices, the playground is not cleared, and the school furniture is very unsuitable. 2. The discipline is healthy. 3. The methods are suitable, and the teaching is carried on with care and industry. 4. The proficiency is very fair.

WOLLONGONG (R.C.) :—Visited, 9th December, 1868.

Numbers present :—Boys, 37 ; girls, 27 ; total, 64.

1. The material condition of the school—furniture excepted—is tolerably satisfactory. 2. The discipline is moderately healthy. 3. The ordinary subjects are taught with industry, but the methods are mechanical and ineffective. 4. The proficiency is only tolerable.

CHARCOAL (Pres.) :—Visited, 11th December, 1868.

Numbers present :—Boys, 20 ; girls, 24 ; total, 44.

1. The buildings are in need of repairs, and the furniture is unsuitable. 2. The discipline is fair. 3. The teacher is earnest and tolerably skilful. The ordinary subjects are taught. 4. The proficiency ranges from tolerable to fair. Satisfactory progress has been made since last inspection.

DAPTO (Pres.) :—Visited, 14th December, 1868.

Numbers present :—Boys, 32 ; girls, 16 ; total, 48.

1. The material condition is only moderate. 2. The discipline is healthy. 3. The prescribed subjects are taught with intelligence and earnestness. The methods are appropriate. 4. The proficiency is very fair. Satisfactory progress has been made under the present teacher.

SHOOLHAVEN (Pres.) :—Visited, 1st September, 1868.

Numbers present :—Boys, 24 ; girls, 13 ; total, 37.

1. The furniture has been repaired, improved, and rearranged by the teacher, but, in all other respects, the material condition is still very unsatisfactory. 2. The pupils are only moderately regular ; in other respects the discipline is good. 3. The teaching is carried on with much earnestness. The methods are fairly appropriate. 4. The proficiency ranges from fair to good.

BOTANY (Wes.) :—Visited, 6th July, 1868.

Numbers present :—Boys, 22 ; girls, 16 ; total, 38.

1. There is no residence provided for the teacher, and the furniture is unsuitable. 2. The discipline is only tolerably healthy. 3. The instruction is carried on with much earnestness, but the methods are chiefly mechanical. 4. The proficiency is very moderate.

ROCKY POINT (Wes.) :—Visited, 16th December, 1868.

Numbers present :—Boys, 23 ; girls, 13 ; total, 36.

1. There is no teacher's residence, and the furniture is unsuitable ; otherwise the material condition is good. 2. Discipline is moderate. 3. The methods are defective. The ordinary subjects are taught. 4. The proficiency is moderate.

J. HUFFER,
Inspector.

DETAILED STATEMENT of the Condition of Denominational Schools in the Cumberland District inspected during the year 1868.

1.—CHURCH OF ENGLAND SCHOOLS.

BURWOOD :—Visited, 20th August.

Present at examination :—Boys, 21 ; girls, 21 ; total, 42.

1. The schoolroom is good, but not well furnished. 2. The pupils do not attend regularly or punctually ; they are given to talking, and not self-reliant. 3. An improvement has taken place in the character of the teaching since last year ; the methods are less mechanical, and more intelligent and skilful. 4. The proficiency is now tolerable.

CABRAMATTA :—Visited, 26th February.

Present at examination :—Boys, 6 ; girls 9 ; total, 15.

1. The schoolroom is rather small, but in tolerably good condition, and fairly furnished. 2. Discipline, properly so called, is unknown ; the pupils are noisy and rude, and under no proper restraint. 3. The instruction is ill-regulated, and unskilfully imparted. 4. As a whole, the proficiency is bad. (The teacher has been removed.)

CASTLE HILL :—Visited, 30th July.

Present at examination :—Boys, 40 ; girls, 25 ; total, 65.

1. The condition of the schoolroom is in all respects fairly satisfactory. 2. The pupils are noisy, talkative, inattentive, and in some instances, rude ; the moral aspect is very unsatisfactory. 3. The instruction is unskilfully regulated, and the methods of imparting it are too mechanical and obsolete. 4. The attainments generally are very moderate.

DURAL :—Visited, 31st July.

Present at examination :—Boys, 18 ; girls, 20 ; total, 38.

1. The schoolroom requires to be lined inside ; in other respects it is in fair condition and suitably furnished. 2. The pupils in their attendance are neither regular nor punctual ; they are tolerably clean, but not orderly and industrious. 3. The ordinary subjects are taught, but not with much effect. 4. The proficiency is but moderate.

EMU PLAINS :—Visited, 18th March.

Present at examination :—Boys, 39 ; girls, 31 ; total, 70.

1. Nothing has yet been done to render the schoolroom internally more seemly and comfortable ; lining to cover the bare unfinished walls is much needed ; it is fairly furnished. 2. The discipline is not exercised in a polished, genial manner ; for this reason, it fails in developing that gentle, subdued, and respectful demeanour, coupled with cheerful industry, which should be a main result of all school discipline and training. 3. It may be readily inferred from the description of the discipline, that the instruction is not effective ; the methods are not interesting and penetrative. 4. The proficiency is but moderate as a whole.

ENFIELD :—Visited, 14th May.

Present at examination :—Boys, 20 ; girls, 24 ; total, 44.

1. The building is good, but very unsuitably furnished. 2. The moral aspect of the school is fairly healthy. 3. The methods are appropriate, and applied with considerable skill. 4. The proficiency ranges from moderate to fair.

HUNTER'S HILL :—Visited, 13th November.

Present at examination :—Boys, 24 ; girls, 4 ; total, 28.

1. The material condition and furnishing of the school are very fair. 2. The discipline is tolerably effective, and the moral tone on the whole pleasing. 3. The prescribed subjects are taught ; the methods are fairly skilful. 4. The proficiency is nearly fair.

KURRAJONG NORTH :—Visited, 21st April.

Present at examination :—Boys, 17 ; girls, 8 ; total, 25.

1. The schoolhouse is in tolerably good repair, and supplied with fairly suitable furniture. 2. The attendance is irregular and unpunctual ; the moral aspect is not so healthy, in consequence, as it should be. 3. The work of teaching is carried on with energy and tolerable skill. 4. The proficiency ranges from moderate to fair.

KURRAJONG SOUTH :—Visited, 15th May.

Present at examination :—Boys, 15 ; girls, 13 ; total, 28.

1. The building is in fair condition, but ill arranged and furnished for school purposes. 2. The discipline is aimless and ineffective. 3. The instruction is unskilfully regulated, and as unskilfully imparted. 4. The proficiency is very indifferent.

MARSFIELD :—

MARSFIELD :—Visited, 13th August.

Present at examination :—Boys, 44 ; girls, 22 ; total, 66.

1. The building is good and suitable ; it is also suitably furnished. 2. The moral tone is not entirely satisfactory. 3. The methods are tolerably intelligent, but not applied with that life and tact which are requisite to render them fully penetrative and effective. 4. Upon the whole, the proficiency is above tolerable.

MULGOA :—Visited, 4th March.

Present at examination :—Boys, 15 ; girls, 10 ; total, 25.

1. The building is in bad condition ; the furniture is fair. 2. The discipline is feeble. 3. The ordinary subjects are unskilfully and ineffectively taught. 4. The attainments are but indifferent.

PARRAMATTA :—Visited, 18th August.

Present at examination :—Boys, 51 ; girls, 43 ; total, 94.

1. The material condition of the school is very satisfactory. 2. The discipline does not realize good results ; the moral tone is not very elevated. 3. As to matter, the instruction is appropriate, but the prevailing manner in which it is being imparted is too noisy. 4. The proficiency is not satisfactory, nor are the attainments as a whole more than barely tolerable.

PENNANT HILLS :—Visited, 26th August.

Present at examination :—Boys, 36 ; girls, 27 ; total, 63.

1. The whole material organization of the school is fairly satisfactory. 2. The discipline is not sufficiently firm, but taken as a whole, the moral character of the school stands fair. The instruction is carefully and conscientiously imparted. The methods are moderately skilful. 4. The proficiency is generally about tolerable.

PITT TOWN :—Visited, 21st October.

Present at examination :—Boys, 25 ; girls, 31 ; total, 56.

1. The material appliances are fairly suitable and satisfactory. 2. The discipline is improved, and the moral character, on the whole, pleasing. 3. The course of secular instruction is followed, and the teaching is conducted with fair skill and effect. 4. The progress made is in the main reasonable, and the attainments range between tolerable and fair.

RICHMOND :—Visited, 20th May.

Present at examination :—Boys 44 ; girls, 37 ; total, 81.

1. Since the date of last examination, the furniture has been altered and improved, but it is still short of what it ought to be. The room is inconveniently small. In other respects the organization is tolerable. 2. Whilst, as regards regularity, punctuality, cleanliness, order, and self-reliance, there is room for improvement, the discipline is upon the whole carefully exercised and tolerably effective. 3. The methods are reasonably skilful. 4. The results of the teaching reach to nearly fair upon the whole ; in arithmetic attainments do not rise to this estimate.

ROUSE HILL :—Visited, 29th July.

Present at examination :—Boys, 17 ; girls, 17 ; total, 34.

1. The building is good, but the furniture is not in keeping with it. 2. The discipline is not good, and the moral tone of the school, especially as indicated by the upper class, is anything but healthy. 3. The instruction cannot be said to be either carefully or skilfully regulated, nor are the methods definite and effective. 4. The attainments range from indifferent to nearly fair.

RYDE :—Visited, 12th November.

Present at examination :—Boys, 8 ; girls, 6 ; total, 14.

1. The schoolhouse needs repairing and cleaning. There is a sufficient supply of suitable furniture and apparatus, but a deficiency of books. 2. The discipline is fair. 3. The instruction is not well regulated, nor very systematically imparted. 4. The proficiency is nearly fair.

SEVEN HILLS :—Visited, 22nd May.

Present at examination :—Boys, 30 ; girls, 19 ; total, 49.

1. The building requires some repairs ; but for this, the material organization is satisfactory. 2. The discipline is defective, and the moral tone but moderately healthy. 3. The classification is injudicious, the programmes are too general, and the teaching is devoid of earnestness. 4. Viewed as a whole, the proficiency is barely tolerable.

SOUTH CREEK :—Visited, 25th June.

Present at examination :—Boys, 32 ; girls, 30 ; total, 62.

1. The schoolhouse is fairly furnished, but too small. 2. Order is defective. 3. The instruction is tolerably well regulated, and the methods of imparting it are intelligent. 4. The proficiency is tolerable in one or two subjects, and fair in the majority.

WILBERFORCE :—Visited, 17th June.

Present at examination :—Boys, 20 ; girls, 31 ; total, 51.

1. But that a considerable portion of the furniture is unsuitable, the condition of the school materially is tolerably good. 2. The moral character of the school is fair. 3. The methods are tolerably appropriate, and the instruction is careful and earnest. 4. The proficiency ranges generally from tolerable to fair.

WINDSOR :—Visited, 11th June.

Present at examination :—Boys, 33 ; girls, 18 ; total, 51.

1. The schoolroom has been considerably improved. The material organization is now reasonably good. 2. The discipline is not sufficiently firm and effective. 3. In some of the subjects the proficiency is fair, and in others moderate.

2.—ROMAN CATHOLIC SCHOOLS.

CONCORD :—Visited, 21st August.

Present at examination :—Boys, 22 ; girls, 12 ; total, 34.

1. As a building the schoolroom is very fair, but unsuitably furnished. 2. The discipline is very feeble. 3. The instruction is not intelligently regulated—the methods are superficial. 4. The attainments are very moderate.

ERMINGTON :—Visited, 28th October.

Present at examination :—Boys, 19 ; girls, 19 ; total, 38.

1. The building is good, and fairly supplied with furniture and apparatus. 2. The discipline is moderately healthy. 3. The classification is not judicious, nor are the lesson documents profitably arranged. 4. The proficiency ranges from moderate.

GREENDALE :—Visited, 5th March.

Present at examination :—Boys, 11 ; girls, 19 ; total, 30.

1. The material organization is fairly satisfactory. 2. The pupils are tolerably regular, but unpunctual ; in other respects the moral tone of the school is pleasing. 3. The instruction is imparted with tolerable intelligence and effect. 4. The proficiency is fair, except in arithmetic, in which it is but moderate.

KURAJONG :—Visited, 13th May.

Present at examination :—Boys, 14 ; girls, 17 ; total, 31.

1. Some addition has been made to the furniture. 2. The discipline is very lax ; the pupils manifest little of a scholar-like disposition. 3. The teaching is marked by a want of skill, earnestness, and penetration. 4. Progress is small, and the attainments are very moderate.

LANE COVE :—Visited, 20th November.

Present at examination :—Boys, 14 ; girls, 11 ; total, 25.

1. The school is kept in a very uncomfortable building. The furniture is badly arranged. 2. The discipline is moderately effective. A greater regard to cleanliness and tidiness in the pupils is necessary. 3. The ordinary subjects are taught, but not with much method or skill. 4. The proficiency is nearly tolerable.

NELSON :—Visited, 28th July.

Present at examination :—Boys, 17 ; girls, 17 ; total, 34.

1. As a building the schoolroom is in good condition, but badly and insufficiently furnished. 2. The discipline is very weak, and the moral tone low. 3. The teaching is mechanical and superficial. 4. The average proficiency is very moderate.

PARRAMATTA :—Visited, 14th August.

Present at examination :—Boys, 44 ; girls, 29 ; total, 73.

1. The school is held in a tolerably good building, which, however, is neither suitably nor sufficiently furnished. 2. The discipline is ineffective, and the moral aspect is not healthy. 3. The methods, judged by results, are neither intelligent nor are they earnestly and energetically applied. 4. The proficiency, viewed as a whole, ranks as moderate.

PENRITH :—Visited, 17th March.

Present at examination :—Boys, 18 ; girls, 14 ; total, 32.

1. The material condition of this school, especially as regards furniture, is not satisfactory. 2. The discipline does not secure its legitimate end. The moral tone is but moderately pleasing. 3. In themselves the methods may be accounted tolerable, but in their application there is a want of tact and energy. 4. Moderate and fair are the extremes of the range of the proficiency.

PETERSHAM :—Visited, 15th September.

Present at examination :—Boys, 21 ; girls, 20 ; total, 41.

1. The schoolroom is inconvenient in form, and insufficiently and unsuitably furnished. 2. The discipline is very feeble, and the moral aspect is not healthy. 3. The instruction is not skilfully regulated. 4. The attainments range from indifferent to moderate.

RICHMOND :—Visited, 10th June.

Present at examination :—Boys, 17 ; girls, 30 ; total, 47.

1. The building in which the school is carried on requires several repairs. It has had an improvement in its furniture, but still the quality and quantity are imperfect. 2. The attendance is very unpunctual. The discipline is feeble, and the moral aspect unfavourable. 3. The instruction is not skilfully regulated, and the methods are mainly mechanical. 4. The proficiency is very indifferent.

RIDE :—Visited, 29th October.

Present at examination :—Boys, 24 ; girls, 13 ; total, 37.

1. The material condition of the school is reasonably good. 2. The discipline is tolerable. 3. A desire is manifest to make the instruction profitable. 4. The attainments are between tolerable and fair.

SOUTH CREEK :—Visited, 3rd June.

Present at examination :—Boys, 20 ; girls, 13 ; total, 33.

1. The schoolroom is too small, and is also imperfectly furnished. 2. The pupils are irregular, but tolerably punctual ; they are very noisy and inattentive. 3. The teaching is purely mechanical. 4. Proficiency can scarcely be regarded as other than indifferent.

WINDSOR :—

WINDSOR :—Visited, 12th June.

Present at examination :—Boys, 65 ; girls, 45 ; total, 110.

1. The schoolroom is too small, and not very suitably furnished. 2. The discipline and moral aspect of the school are fairly satisfactory. 3. The classification is improved, but the arrangement of the pupils is adverse to effective teaching. The methods are moderately intelligent and successful. 4. The proficiency on the whole ranges from moderate to fair.

3.—PRESBYTERIAN SCHOOLS.

PARRAMATTA :—Visited, 11th August.

Present at examination :—Boys, 29 ; girls, 28 ; total, 57.

1. The material character of the school is very unsatisfactory. 2. The pupils are not sufficiently regular and punctual. In person and dress they do not pay requisite attention to cleanliness and tidiness. 3. The teaching is earnest, and the methods employed are fairly suitable. 4. The proficiency of the school, as a whole, ranges from tolerable to fair. In arithmetic, the attainments of the third class are but indifferent.

PARRAMATTA JUNCTION :—Visited, 19th and 25th August.

Present at examination :—Boys, 19 ; girls, 33 ; total, 52.

1. The schoolroom is inconveniently small. 2. Strict order is not maintained. 3. The instruction is painstaking, but mainly mechanical. 4. Considering the ages of the pupils—a large majority being under eight years—the proficiency is about tolerable.

PORTLAND HEAD :—Visited, 22nd October.

Present at examination :—Boys, 22 ; girls, 12 ; total, 34.

1. The building in which the school is held is good, but ill arranged and furnished for school operations. 2. The discipline is feeble, and the moral aspect not pleasing. 3. Mechanical and superficial methods prevail. 4. The attainments, on the whole, are moderate.

WINDSOR :—Visited, 29th May.

Present at examination :—Boys, 22 ; girls, 8 ; total, 30.

1. The school premises, which are rented by the teacher, are tolerably suitable, properly furnished, and well provided with apparatus and books. 2. The discipline is healthy. 3. The instruction is well regulated, and earnestly imparted. 4. The attainments range from fair to good.

4.—WESLEYAN SCHOOLS.

CASTLEBROUGH :—Visited, 20th October.

Present at examination :—Boys, 15 ; girls, 17 ; total, 32.

1. The organization of the school, as regards building, furniture, apparatus, and books, is satisfactory. 2. The discipline is tolerably effective. 3. The instruction is earnest and painstaking. 4. The proficiency is nearly fair.

LANE COVE :—Visited, 19th November.

Present at examination :—Boys, 17 ; girls, 22 ; total, 39.

1. The building serves the double purpose of a church and schoolroom ; in consequence, it is not well arranged for school work. 2. The discipline is not effective. 3. The instruction is superficial. 4. The attainments are barely tolerable.

PARRAMATTA :—Visited, 12th August.

Present at examination :—Boys, 44 ; girls, 6 ; total, 50.

1. The school generally is well organized. 2. The discipline is effective, and the moral character healthy. 3. The instruction is imparted with fair skill and effect. 4. The proficiency ranges from fair to good.

WINDSOR :—Visited, 28th May.

Present at examination :—Boys, 33 ; girls, 34 ; total, 67.

1. The material organisation is upon the whole fairly satisfactory. 2. The discipline is fairly healthy. 3. The standard of proficiency is taken as the guide in the matter of the instruction, and the methods are fairly intelligent and effective. 4. The attainments, as a whole, are nearly fair.

ALEXR. L. FORBES, A.M.,
Inspector of Schools.

DENOMINATIONAL SCHOOLS.

The following remarks are abridged statements of my detailed Reports upon the condition of the Denominational Schools inspected from 27th May to 31st December, 1868. The remarks chiefly relate to the material condition and organization of the schools, the general discipline and moral training, the subjects and methods of instruction, and the progress of the pupils in learning. The reports are given consecutively in the order of inspection,

BREADALBANE (R.C.) :—Visited, 27th May.

Numbers of pupils enrolled :—Boys, 18; girls, 17; total, 35.

Numbers present at examination :—Boys, 10; girls, 9; total, 19.

The building is in tolerable repair, and, with the removal of a partition, would be fairly suitable for the purposes of teaching. Some additional desks and forms are necessary, but in other respects there is a fair supply of working materials. The discipline admits of considerable improvement. All the subjects prescribed by the Council are not taught, and the attainments of the pupils are elementary. The present teacher has been but a short time in charge of the school. The residents are chiefly farmers, and many of the children are irregular in attendance.

YASS (C.E.) :—Visited, 1st June.

Numbers of pupils enrolled :—Boys, 60; girls, 39; total, 99.

Numbers present at examination :—Boys, 51; girls, 34; total, 85.

The grounds need fencing. The schoolroom is a good building, but although it has been recently erected, it is not in some respects suitable, owing to the bad arrangement of doors and windows. The furniture is of an unsuitable kind, but there is a sufficient supply of apparatus and books. The discipline and attainments of the pupils are tolerably satisfactory. In addition to the ordinary subjects, the elements of algebra, geometry, and mensuration, are taught to the advanced boys.

YASS (Pres) :—Visited, 2nd June.

Number of pupils enrolled :—Boys, 37; girls, 18; total, 55.

Number present at examination :—Boys, 30; girls, 9; total, 39.

The building is in good repair, but the schoolroom is too small; and although there is a fair supply of furniture, apparatus, and books. In some instances the pupils are not sufficiently punctual, but in other respects the discipline is tolerably satisfactory. The subjects taught accord with the "Course of Secular Instruction." The present teacher has been recently appointed, and the results of the examination may be chiefly attributed to the labours of the late master. The general attainments of the scholars are tolerably satisfactory.

YASS (R.C.—boys) :—Visited, 3rd June.

Numbers of pupils enrolled :—Boys, 64.

Numbers present at examination :—Boys, 58.

The grounds are fenced, and the schoolroom is suitable and in good repair. There is a fair supply of furniture, apparatus, and books. In some instances the pupils are not sufficiently punctual, but in other respects the discipline is tolerably satisfactory. The subjects taught accord with the "Course of Secular Instruction." The present teacher has been recently appointed, and the results of the examination may be chiefly attributed to the labours of the late master. The general attainments of the scholars are tolerably satisfactory.

YASS (R.C.—Girls) :—Visited, 4th June.

Number of pupils enrolled :—Girls, 51.

Number present at examination :—Girls, 41.

The schoolroom is much too small, and badly furnished, but new furniture will be supplied immediately. The apparatus and books are insufficient, but a stock has been ordered. I understand from the Local Board that a new schoolroom will be erected shortly. Four-fifths of the scholars are regular in attendance, but in some instances they are not sufficiently punctual. The discipline in other respects is creditable. All the ordinary subjects are taught excepting drawing, and on the whole the progress of the pupils is tolerably satisfactory. Many of them are very young, but there is a considerable number of grown-up girls whose education has been much neglected in their earlier years.

GINDERRA (C.E.) :—Visited, 18th June.

Numbers of pupils enrolled :—Boys, 14; girls, 18; total, 32.

Numbers present at examination :—Boys, 10; girls, 15; total, 25.

The material condition of this school is reasonably good, and the discipline is passable, but the instruction admits of considerable improvement. The attainments of the pupils range from moderate to tolerable.

CANBERRA (C.E.) :—Visited, 19th June.

Numbers of pupils enrolled :—Boys, 30; girls, 18; total, 48.

Numbers present at examination :—Boys, 27; girls, 14; total, 41.

The schoolroom is a substantial stone building, in good repair, but rather small. A supply of suitable furniture is much needed. The apparatus and books are barely sufficient, but a stock has been ordered. All the subjects prescribed by the Council are taught with considerable earnestness and success. The discipline and attainments of the scholars are tolerably satisfactory in most respects.

QUEANBEYAN (R.C.) :—Visited, 26th June.

Numbers of pupils enrolled :—Boys, 30; girls, 30; total, 60.

Numbers present at examination :—Boys, 24; girls, 24; total, 48.

Some additional desks and forms are required, but in other respects the material condition of the school is reasonably good at present. The pupils are fairly regular in attendance, but not sufficiently punctual. The discipline and instruction admit of considerable improvement. Many of the pupils have been absent from school for a length of time, and their attainments are elementary.

QUEANBEYAN (C.E.) :—Visited, 29th June.

Numbers of pupils enrolled :—Boys, 18; girls, 19; total, 37.

Numbers present at examination :—Boys, 15; girls, 10; total, 25.

The grounds are fenced. The school building is suitable, in good repair, neat and tidy in appearance, and well supplied with furniture and working materials. The discipline admits of great improvement. The instruction is not well regulated, and the attainments of the pupils are small and unsatisfactory.

BUNGENDORE (R.C.) :—Visited, 3rd July.

Numbers of pupils enrolled :—Boys, 20 ; girls, 23 ; total, 43.
Numbers present at examination :—Boys, 20 ; girls, 23 ; total, 43.

This school is held in the Roman Catholic Church. It affords ample accommodation, and is in good repair, but there is no fire-place, and it is very cold and uncomfortable during the winter, for both scholar and teacher. The supply of furniture and apparatus is unsuitable and insufficient. As regards discipline, much improvement is necessary. The attainments of the pupils are moderate.

TARALGA (R.C.) :—Visited, 28th August.

Numbers of pupils enrolled :—Boys, 22 ; girls, 9 ; total, 31.
Numbers present at examination :—Boys, 21 ; girls, 9 ; total, 30.

This school is conducted in the Roman Catholic Chapel; the building is commodious, in good repair, and the playground fenced. There are suitable out-buildings, but the supply of school furniture and books is barely sufficient. The discipline requires much improvement. The usual subjects are taught, excepting drawing, singing, and lessons on objects. The teacher has been but a few days in charge. Many of the pupils have been absent for a considerable time, and the general proficiency is very elementary.

TIRRANNA (C.E.) :—Visited, 14th October.

Numbers of pupils enrolled :—Boys, 18 ; girls, 14 ; total, 32.
Numbers present at examination :—Boys, 13 ; girls, 11 ; total, 24.

This school is conducted in the English Church. Its material condition is passably good. The pupils are not sufficiently punctual, but the cleanliness and order are tolerable. The usual branches are taught, and the attainments of the pupils range from moderate in the lower, to tolerable in the upper classes.

NORTH GOULBURN (C.E.) :—Visited, 15th October.

Numbers of pupils enrolled :—Boys, 35 ; girls, 30 ; total, 65.
Numbers present at examination :—Boys, 24 ; girls, 25 ; total, 49.

This school is held in the English Church. The material condition is good in most respects. The order and cleanliness are passable, but in several cases the pupils are unpunctual, and in all the classes the habit of attention requires much cultivation. All the usual subjects are attempted to be taught, but the progress of the scholars is slow and not sufficiently satisfactory.

GOULBURN (C.E.) :—Visited, 19th October.

Numbers of pupils enrolled :—Boys, 48 ; girls, 35 ; total, 83.
Numbers present at examination :—Boys, 44 ; girls, 31 ; total, 75.

This school is situated in a central and picturesque position. The schoolroom is sufficient in size, in good repair, tolerably well furnished, and supplied with a good stock of working materials. There are suitable out-buildings, but the playground is not fenced. All the ordinary branches are taught, with the elements of geometry and algebra to the advanced boys. The discipline is reasonably good, and the attainments of the pupils are tolerably satisfactory.

GOULBURN (R.C.—Boys) :—Visited, 21st October.

Number of pupils enrolled :—Boys, 78.
Number present at examination :—Boys, 70.

The playground is rather small, but the schoolroom is sufficient in size, in good repair, fairly furnished, and well supplied with apparatus and books. The pupils are rather talkative and inattentive; but considering that the teaching power is inadequate to the requirements of the school, the discipline is passable. The usual subjects are taught, excepting drawing and vocal music, and the attainments range from moderate to tolerable. The present master has been but a short time in charge of the school; its condition, however, has been considerably improved under his management.

GOULBURN (R.C.—Girls and Infants) :—Visited, 26th and 27th October.

Numbers of pupils enrolled :—Boys, 17 ; girls, 85 ; total, 102.
Numbers present at examination :—Boys, 16 ; girls, 78 ; total, 94.

This school is held in a building attached to the Convent of the Sisters of Mercy. The schoolroom is rather small, and the furniture and infant gallery are not very suitable, nor conveniently arranged for the purposes of teaching. A new class-room for the infants, with a suitable gallery for the oral teaching of the pupils, is much needed; and it would add much to the comfort and convenience of the ladies who manage the school, in carrying out that strict and effective discipline which they desire to maintain. The attainments of the pupils in the junior classes are moderately efficient, and in the senior, fairly satisfactory. All the usual subjects are taught, and the teachers are much interested in the education and moral training of the pupils.

MARULAN (C.E.) :—Visited, 10th November.

Numbers of pupils enrolled :—Boys, 33 ; girls, 34 ; total, 67.
Numbers present at examination :—Boys, 23 ; girls, 21 ; total, 44.

The schoolroom needs some repairs and two additional desks, and hat-pegs are required. The discipline is healthy, and the instruction well regulated. The pupils answer with thoughtful accuracy, and, for their ages and time under tuition, their attainments are reasonably satisfactory.

JEMBAICUMBENE (R.C.) :—Visited, 8th December.

Numbers of pupils enrolled :—Boys, 37 ; girls, 43 ; total, 80.
Numbers present at examination :—Boys, 28 ; girls, 29 ; total, 57.

The schoolroom is too small, in bad repair, and not properly furnished. The discipline is unsatisfactory, chiefly as regards punctuality and cleanliness. Drawing is not taught. The proficiency of the pupils in the other branches ranges from moderate to tolerable.

REIDSDALE (R.C.) :—Visited, 9th December.

Numbers of pupils enrolled :—Boys, 30 ; girls, 38 ; total, 68.

Numbers present at examination :—Boys, 20 ; girls, 19 ; total, 39.

The schoolroom is fairly suitable, and in good repair in most respects, but the furniture is insufficient in quantity. All the ordinary subjects are taught but music. The discipline and attainments of the scholars are tolerably satisfactory.

W. M'INTYRE,
Inspector of Schools.

Goulburn, 6th February, 1869.

MAITLAND DISTRICT.

DETAILED Statement shewing the condition of the Certified Denominational and other Schools inspected, as regards,—

1. Their material condition.
2. Their moral character.
3. The subjects and methods of instruction.
4. The proficiency of the pupils.

CHURCH OF ENGLAND.

BISHOP'S BRIDGE :—Visited, 8th December.

Numbers present at examination :—Boys, 17 ; girls, 22 ; total, 39.

1. The school is in tolerable condition, fairly suitable and sufficient, but badly organized. 2. The discipline was ineffective, and the order poor. 3. The subjects were appropriate, and arranged with moderate judgment ; but the methods were hurried, thoughtless, and mechanical. 4. Except reading and writing, to a very partial extent, the proficiency was very small.

BLANDFORD :—Visited, 19th August.

Numbers present at examination :—Boys, 7 ; girls, 15 ; total, 22.

1. The school is in poor repair, and very badly organized. 2. The discipline was wholly ineffective. 3. The occupation was partial, confused, and injudicious. The methods do not deserve the name. 4. The proficiency was extremely bad.

BUCHANAN :—Visited, 27th November.

Numbers present at examination :—Boys, 18 ; girls, 18 ; total, 36.

1. For the kind, the premises are fairly effective, and the schoolroom is tolerably well organized. 2. The majority of the pupils were very irregular, and all poorly clad ; otherwise, the moral character of the school was fair. 3. Most of the required subjects were taught ; and their arrangement evinced improvement. The methods were moderately intelligent and steady, but wanting force and animation. 4. The proficiency and mental culture were tolerable.

CASSILIS :—Visited, 27th August.

Numbers present at examination :—Boys, 17 ; girls, 9 ; total, 26.

1. The buildings are in fair condition, but the out-offices insufficient, and the organization is very defective. 2. The pupils were very unpunctual, but tolerably regular ; their conduct and manners had improved slightly, but their order and attention remained especially unsatisfactory. Moral tone very low. 3. Reading, writing, and arithmetic, were the only subjects regularly professed. The classification and occupation were very injudicious, and the methods obsolete. 4. Writing in the highest class ranged from fair to good, but the proficiency as a whole was very bad.

DENMAN :—Visited, 28th July.

Numbers present at examination :—Boys, 23 ; girls, 13 ; total, 36.

1. The premises are not enclosed, but otherwise fairly sufficient and suitable. The organization of the school is moderate. 2. The punctuality, regularity, cleanliness, and order of the pupils, were tolerable, but several were untidy in dress and appearance. 3. Object lessons and drawing were omitted from the instruction, which was otherwise suitable, but without arrangement. The methods, only partially witnessed, were earnest, but exceedingly mechanical. 4. The proficiency was moderate, but very partial.

ELLALONG :—Visited, 26th June.

Numbers present at examination :—Boys, 25 ; girls, 19 ; total, 44.

1. The school is in good repair and moderately furnished, but poorly supplied with apparatus. 2. Except a habit of prompting, the order of the pupils was tolerable. 3. The occupation was appropriate, and tolerably well arranged. The methods were very discursive and unprepared. 4. The proficiency was very small.

HINTON :—Visited, 26th November.

Numbers present at examination :—Boys, 20 ; girls, 20 ; total, 40.

1. The condition of the premises and organization of the school are tolerable. 2. As a whole the discipline was ineffective, but the order moderate. 3. Except singing, the subjects were taught as prescribed, and tolerably well arranged. The teaching was earnest, but not guided by modern method. 4. In reading and writing some fair instances were observed, but general proficiency was small.

JERRY'S PLAINS :—Visited, 27th July.

Numbers present at examination :—Boys, 36 ; girls, 23 ; total, 59.

1. The school is very deficient in furniture, apparatus, and books ; but otherwise in tolerable condition. 2. The pupils were very noisy, inattentive, and disorderly ; greatly addicted to prompting, indolent, forward, and subject to very little control. 3. Most of the prescribed subjects were taught, but their arrangement was very unsystematic. The methods were tolerably intelligent, but ineffectual. 4. The general proficiency was small ; but a few fair specimens of reading and writing were witnessed.

LAGUNA :—

LAGUNA :—Visited, 18th June.

Numbers present at examination :—Boys, 9 ; girls, 11 ; total, 20.

1. The schoolroom is clean, comfortable, and in tolerable repair ; but its organization very defective. 2. The moral character of the school was tolerable. The day was very wet, and all the pupils were not present. 3. Except singing and drawing, the subjects accorded with the standard, and the occupation was moderately well arranged ; but the methods were very mechanical and ineffectual. The proficiency showed improvement, but was still far below the standard.

MAITLAND, EAST :—Visited, 14th and 16th October.

Numbers present at examination :—Boys, 55 ; girls, 44 ; total, 99.

1. The building is new, suitable, and excellent, and the schoolroom fairly organized ; but out-offices and water had not been provided, nor was the ground quite enclosed. 2. Noisy and unsteady habits were prevalent ; otherwise, the order was tolerable. The occupation accorded with the prescribed course, and was arranged with passable judgment. The methods were tolerably intelligent and effective, but betrayed a tendency to "cramming." 4. The general proficiency ranged from tolerable to fair, with a partial display of intelligence.

MAITLAND, WEST (St. Mary's) :—Visited, 22nd and 27th October.

Numbers present at examination :—Boys, 79 ; girls, 67 ; total, 146.

1. The out-offices are very badly situated, and the schoolroom needs whitewashing ; otherwise, the state of the premises and the organization were fair. 2. Punctuality was not well observed in commencing business, and a restless habit prevailed among the pupils ; otherwise, their conduct, order, and attention were fair. The occupation was suitable and tolerably judicious. The methods were earnest, fairly intelligent, and tolerably effective. 4. The general proficiency ranged from moderate to tolerable ; but in reading, writing, and arithmetic, it rose to fair and good, in a considerable number of instances.

MAITLAND, WEST (St. Paul's) :—Visited, 17th November.

Numbers present at examination :—Boys, 32 ; girls, 38 ; total, 70.

1. The premises are substantially good, but show considerable deterioration. The out-offices are objectionable in every respect, and the organization of the school is very inferior. On the day of inspection, the room was rather untidy in appearance. 2. The moral aspect of the school was low, but with some signs of improvement. The school had resumed operations only about a month preceding inspection. 3. The subjects were suitable, but too advanced to be considered judiciously arranged. The methods were fairly appropriate as a whole, but not applied and illustrated with much judgment. 4. The proficiency in reading, writing, and arithmetic, approached the standard in a limited number of instances, but, upon the whole, it was small.

MILLFIELD :—Visited, 25th June.

Numbers present at examination :—Boys, 17 ; girls, 16 ; total, 33.

1. The premises, generally, are in moderate repair, but the schoolroom is poorly furnished and organized. 2. The moral tone was tolerable. 3. The subjects and methods were tolerable in all respects. 4. The progress and proficiency were moderate.

MORPETH (Primary) :—Visited, 18th and 19th November.

Numbers present at examination :—Boys, 31 ; girls, 31 ; total, 62.

1. The condition of the premises and the organization of the school are fair. 2. In general, the discipline is lax. Bad habits were prevalent among the pupils, but their conduct and order were tolerable. 3. The occupation was appropriate and tolerably judicious ; the methods were fairly intelligent and skilful. 4. The general proficiency ranged from moderate to tolerable in several instances, fair to good in the highest class.

MORPETH (Infant) :—Visited, 19th November.

Numbers present at examination :—Boys, 18 ; girls, 24 ; total, 42.

1. The room is clean, airy, and commodious, tolerably furnished, and provided with appliances. 2. Punctuality was badly observed ; otherwise, the moral tone of the school was moderate. 3. The occupation was fairly suitable, but indefinitely arranged ; the methods were wholly mechanical. The proficiency was tolerable in a few instances, but bad in most.

MUSWELLBROOK :—Visited, 30th and 31st July.

Numbers present at examination :—Boys, 59 ; girls, 37 ; total, 96.

1. The state of the premises and the organization of the school are fair. 2. The general conduct and order of the pupils had improved, but bad habits were still prevalent among them. 3. Except drawing, the prescribed subjects were taught, and arranged with fair judgment. The methods employed by the Master were tolerably skilful, but the teaching of the Assistant was very inefficient. 4. To a partial extent the proficiency ranged from tolerable to fair, but upon the whole it was small.

PATERSON :—Visited, 16th December.

Numbers present at examination :—Boys, 16 ; girls, 15 ; total, 31.

1. The schoolroom is much too small, badly ventilated, and poorly furnished ; the playground is exceedingly limited ; the out-offices are insufficient and unfit for use. The entire premises are in a very unserviceable state. 2. Except punctuality, the moral character of the school was tolerable. 3. The prescribed subjects were taught, but not carefully arranged. The methods were rather hurried, disconnected, and without preparation. 4. With a few exceptions in reading and writing, the proficiency was small.

PORT MAITLAND :—Visited, 21st October.

Numbers present at examination :—Boys, 15 ; girls, 24 ; total, 39.

1. The building is in process of decay, and otherwise in bad condition ; very poorly furnished, and scantily supplied with requisites. 2. The discipline was very ineffective, and the moral tone low. 3. The occupation was injudicious, and extremely confused. There were, properly speaking, no methods. 4. The general proficiency was bad, and destitute of mental culture.

SCONE :—Visited, 13th and 14th August.

Numbers present at examination :—Boys, 29 ; girls, 39 ; total, 68.

1. The premises are in fair condition, and, to a partial extent, well furnished. 2. The order and moral aspect of the school were fair. 3. The occupation was fairly appropriate, and the methods were intelligent and tolerably skilful. 4. To a partial extent, a tolerable knowledge and a fair degree of intelligence were evinced.

SINGLETON :—Visited, 4th and 5th June.

Numbers present at examination :—Boys, 85 ; girls, 52 ; total, 137.

1. The school is in excellent condition, suitable, well furnished, and provided with abundant materials. 2. Except a disposition to prompt, and a tendency to unsteadiness, among the pupils, the moral character of the school was fair. 3. The subjects were appropriate, and arranged with fair judgment, and the methods evinced a considerable improvement in suitableness, preparation, and efficiency. 4. The proficiency shewed a marked improvement. To a partial extent, it ranged from fair to good, and was, in general, moderate.

WOODVILLE :—Visited, 19th March.

Numbers present at examination :—Boys, 20 ; girls, 28 ; total, 48.

1. The condition of the building is fair, but the supply of water very deficient. Hat-pegs and books are also wanting, and the out-offices need repairing. 2. The moral tone was low. 3. The prescribed subjects were taught, but injudiciously arranged. The methods were modern, but mechanical upon the whole. 4. The proficiency was bad in every class.

ROMAN CATHOLIC.

BLANDFORD :—Visited, 20th and 21st August.

Numbers present at examination :—Boys, 84 ; girls, 18 ; total, 52.

1. The school is well situated, in good repair, and tolerably organized ; but the ground is not enclosed. 2. Most of the pupils were regular and punctual, clean, fairly attentive, and orderly. 3. Singing and drawing were not taught, otherwise the subjects were appropriate and arranged with tolerable judgment. The methods were intelligent, earnest, and fairly judicious. 4. The proficiency ranged from moderate to fair.

LOCHINVAR :—Visited, 1st December.

Numbers present at examination :—Boys, 26 ; girls, 22 ; total, 48.

1. The situation is very good, and the building excellent ; the furniture and apparatus are fairly sufficient and tolerably suitable, but the playground is without shade and supply of water. 2. The moral aspect of the school was tolerable. 3. Except singing, the required subjects were taught and arranged in fair accordance with the standard. The methods were tolerably intelligent and skilful. 4. The general proficiency was partial, and, for the most part, moderate.

MAITLAND, EAST (Boys) :—Visited, 28th and 29th October.

Number present at examination :—64.

1. The schoolroom is in good repair, fairly suitable and sufficient, and tolerably well furnished, but needs a proper supply of water. 2. The discipline evinced considerable improvement, and the moral tone was tolerable. 3. Most of the prescribed subjects were taught, and arranged with tolerable judgment in the requisite guides. The methods were stiff and cumbrous, but earnest, impressive, and fairly intelligent. 4. The proficiency ranged from tolerable in the junior classes to moderate in the senior, with a reasonable degree of intelligence in all.

MAITLAND, EAST (Girls) :—Visited, 30th October.

Number present at examination :—46.

1. The schoolroom is a new building, fairly sufficient and suitable, and tolerably organized, but it needs a verandah. 2. The pupils are unpunctual, but tolerable as regards conduct, attention, and order. 3. Singing and drawing were omitted from the instruction, which was, otherwise, suitable and fairly arranged. The methods were not witnessed. 4. The proficiency ranged from moderate to tolerable, but the mental culture was small.

MAITLAND, WEST (Infants) :—Visited, 10th November.

Numbers present at examination :—Boys, 10 ; girls, 43 ; total, 53.

1. The room is fairly suitable, in good condition, and provided with a gallery. A few desks are still needed ; otherwise, the appointments are fair. 2. The discipline was fairly effective, and the moral character of the school reasonably good. 3. The occupation was appropriate, and the methods were intelligent and fairly judicious. 4. The proficiency ranged from tolerable to fair in the senior division, which comprised the bulk of the children capable of being instructed.

MAITLAND, WEST (Girls) :—Visited, 5th and 6th November.

Number present at examination :—96.

1. The schoolroom is fairly sufficient, suitable, and well organized. 2. The moral aspect of the school was very pleasing. 3. The occupation was constant, suitable, and well arranged. The methods were earnest, intelligent, and calculated to be effectual. 4. The general proficiency was fair, but partial.

MAITLAND, WEST (Boys) :—Visited, 11th and 13th November.

Number present at examination :—109.

1. The schoolroom is in good condition, but scarcely sufficient, and in need of slight interior improvements. It is in every respect fairly organized. 2. The discipline showed improvement in every particular. The conduct, attention, and order of the pupils were reasonably satisfactory. 3. The ordinary subjects, with Geometry and Algebra, were taught, and, for the most part, well arranged. The instruction was intelligent and tolerably vigorous. 4. In one class the proficiency was nearly fair ; in the others, moderate to tolerable.

MORPETH :—

APPENDIX.

29

MORPETH :—Visited, 24th and 25th November.

Numbers present at examination :—Boys, 55 ; girls, 55 ; total, 110.

1. The condition of the premises is effective, and the organization fair. 2. In general, the moral aspect of the school was fair. 3. The occupation was appropriate ; and the methods were from tolerable to moderate. 4. The proficiency was tolerable in the first class, small in the second, and partial in the third.

PHENIX PARK :—Visited, 20th November.

Numbers present at examination :—Boys, 24 ; girls, 18 ; total, 42.

1. The room is small and badly ventilated, but otherwise moderate in all respects. 2. The pupils were well-behaved, but addicted to slovenly habits, and utterly ignorant of order. 3. Most of the subjects prescribed were taught, and moderately well arranged. The work of the school was inefficient, though the methods were not unintelligent. 4. A partial proficiency was evinced in writing, spelling, and arithmetic ; but the pupils were, for the most part, ignorant of the other subjects.

SINGLETON :—Visited, 2nd and 3rd June.

Numbers present at examination :—Boys, 62 ; girls, 69 ; total, 131.

1. The house is a new and excellent structure, airy, commodious, suitable, and fairly organized. The ground is enclosed and supplied with water. 2. The good order previously noticed was well maintained, and the moral aspect very fair. 3. The occupation, as a whole, was appropriate, and arranged with tolerable judgment. The methods varied from tolerable to moderate, but were earnest and persevering. 4. The general proficiency was partial, but ranging from moderate to tolerable, and accompanied by a considerable degree of animated intelligence.

PRESBYTERIAN.

MAITLAND, WEST :—Visited, 20th October.

Numbers present at examination :—Boys, 33 ; girls, 28 ; total, 61.

1. The condition of the premises and the organization of the school continue fairly satisfactory. 2. The discipline had improved ; the moral tone was tolerable. 3. The occupation was appropriate and arranged with moderate judgment. The methods were moderately intelligent, but, as a whole, mechanical. 4. The general proficiency was moderate.

WESLEYAN.

MAITLAND, WEST :—Visited, 3rd October.

Numbers present at examination :—Boys, 22 ; girls, 14 ; total, 36.

1. The premises are fairly effective, and the organization is tolerable. 2. The moral tone was tolerable. 3. The instruction was fairly suitable, but not well understood in certain respects, and arranged with tolerable judgment. The methods were intelligent, well applied, and of good promise. 4. The proficiency was in the first class very bad ; in the others, tolerable to fair, but partial.

PROVISIONAL.

COOLAH :—Visited, 2nd September.

Numbers present at examination :—Boys, 13 ; girls, 13 ; total, 26.

1. The schoolroom is a tolerable one for the kind—clean, comfortable, and moderately well furnished. 2. The pupils were well-behaved and attentive, but wholly ignorant of order. 3. The occupation was confined to reading, writing, and arithmetic, and destitute of skilful arrangement. The methods were not witnessed. 4. The pupils were able to read and write a little, but knew nothing else.

GRESFORD :—Visited, 17th December.

Numbers present at examination :—Boys, 16 ; girls, 15 ; total, 31.

1. The condition of the premises is moderate in all respects, but the furniture is unsuitable, and the supply of books insufficient. 2. The pupils were neither regular nor punctual ; they were ignorant of order, addicted to copying, but tolerably well-behaved. 3. The occupation was not punctually conducted or well arranged, and only in partial accordance with the prescribed course. The methods were very mechanical, but earnest and tolerably careful. 4. The general proficiency was very small.

KAYUGA :—Visited, 3rd August.

Numbers present at examination :—Boys, 14 ; girls, 13 ; total, 27.

1. The schoolroom is very small, rudely and inadequately furnished, and poorly organized. 2. For the opportunities of the pupils and the facilities of the school, the moral tone was moderate. 3. Reading, writing, and arithmetic were the only subjects taught ; they were destitute of arrangement. The methods were mechanical, but well meant, and moderately effective. 4. The proficiency was very small ; but, considering the character of the school, and the previous ignorance of the children, not unreasonably low.

MUNMURRA :—Visited, 28th August.

Numbers present at examination :—Boys, 9 ; girls, 14 ; total, 23.

1. The schoolroom is tolerable for the kind and the place, and moderately organized. 2. The pupils were shy, and ignorant of order, but well conducted and attentive. 3. The classification was very injudicious, the occupation partial and without arrangement. The methods were, to some extent, intelligent, but very mechanical. 4. In reading, writing, and arithmetic—the only subjects taught—the pupils were very ignorant.

MERRYGOEN :—Visited, 7th September.

Numbers present at examination :—Boys, 4 ; girls, 11 ; total, 15.

1. The schoolroom is in bad repair, but tolerably commodious and suitable, and moderately provided with indifferent furniture. 2. The pupils were clean, well-conducted, and in tolerable order. 3. The subjects were only in partial accordance with those prescribed, and indifferently arranged. The methods were earnest, and moderately intelligent. 4. The proficiency was very small ; but the pupils were said to have been very ignorant when the teacher was appointed.

TUREE CREEK :—

TUREE CREEK :—Visited, 1st September.

Numbers present at examination :—Boys, 10 ; girls, 4 ; total, 14.

1. The schoolroom is a small, dingy hut, miserable in every respect, and almost destitute of furniture ; it was also untidily kept. 2. The discipline was utterly ineffective, and the moral tone very low. 3. Only reading, writing, and arithmetic were attempted to be taught ; and arrangement was not thought of. The methods were not witnessed. 4. The general proficiency was very bad.

HALF-TIME.
COBBOBA :—Visited, 4th September.

Numbers present at examination :—Boys, 6 ; girls, 7 ; total, 13.

1. The school was held in a dirty, dark, unwholesome room, badly furnished, and, without exception, probably the most disgraceful building it has been my lot to enter as a school. 2. The pupils evinced no acquaintance with order, either in their movements or in their work. 3. The regulations for Half-time Schools were not observed in the occupation, which was of a desultory character, and devoid of judgment. The methods were crude, mechanical, and ineffectual. 4. The proficiency ranged from indifferent to bad.

NEWCASTLE DISTRICT.—TABULATED REPORTS FOR 1863.

DENOMINATIONAL SCHOOLS.

CHURCH OF ENGLAND.

DUNGOG :—Visited, 24th November.

Pupils enrolled :—Boys, 34 ; girls, 42 ; total, 76.

Pupils present :—Boys, 26 ; girls, 35 ; total, 61.

The schoolhouse is substantially in good condition, the supply of working material is sufficient, but the furniture is inferior and insufficient. The organization is correct, the discipline is healthy, and the results of the teaching are very satisfactory. The Rev. Huband-Smith and the lay members of the Board were present at the examination.

ERINA :—Visited, 11th August.

Pupils enrolled :—Boys, 19 ; girls, 18 ; total, 37.

Pupils present :—Boys, 18 ; girls, 17 ; total, 35.

The schoolhouse is a slab erection with shingled roof ; the floor is an earthen one ; with this exception the building is a suitable one. The school is very deficient in appliances, and the furniture is insufficient and unsuitable. The ground is not fenced, nor are there any closets. The school, after being closed for seven months, has been reopened three weeks. The organization is crude, but the discipline is promising. The Rev. J. Shaw was present at the examination.

GOSFORD :—Visited, 10th August.

Pupils enrolled :—Boys, 28 ; girls, 15 ; total, 43.

Pupils present :—Boys, 26 ; girls, 15 ; total, 41.

The schoolhouse is in need of repair, but has been recently coloured and cleansed, and looks comfortable. There is a fair supply of working material, but the school is wretchedly furnished. The organization is correct, the discipline is judicious, and the instruction tolerably effective. The Rev. J. Shaw and a lay member of the Board were present at the examination.

HEXHAM :—Visited, 14th December.

Pupils enrolled :—Boys, 17 ; girls, 29 ; total, 46.

Pupils present :—Boys, 14 ; girls, 24 ; total, 38.

The schoolhouse, which is a tolerably suitable building, is in good repair. The furniture is bad and insufficient, but the supply of working material is fair. The organization is satisfactory, and the discipline has improved ; but the results of the teaching are very unsatisfactory, excepting in the junior class. The Rev. J. S. Wood was present at the examination.

KINCUMBER :—Visited, 17th August.

Pupils enrolled :—Boys, 21 ; girls, 11 ; total, 32.

Pupils present :—Boys, 16 ; girls, 9 ; total, 25.

The school premises are small, ill-conditioned, and very unsuitably furnished. The ground is enclosed, and out-offices have been provided. The discipline of the school is satisfactory, but the organization and instruction are very unskilful and unproductive.

MILLER'S FOREST :—Visited, 16th December.

Pupils enrolled :—Boys, 37 ; girls, 42 ; total, 79.

Pupils present :—Boys, 32 ; girls, 38 ; total, 70.

The schoolroom is commodious, suitable, and in fair repair. There is a sufficient supply of material, but the furniture is sadly unequal to the requirements of the school. The organization is satisfactory, the discipline is excellent, the instruction is careful and effective, making due allowance for the detriments of absenteeism. The tone of the school is very healthy. The Rev. S. Simm was present at the examination.

APPENDIX.

31

NEWCASTLE (Christ Church) :—Visited, 24th July.

Pupils enrolled :—Boys, 80 ; girls, 62 ; total, 142.

Pupils present :—Boys, 58 ; girls, 44 ; total, 102.

The school premises are in very good condition, and, excepting an insufficiency of desks, the school is well supplied with working appliances. The organization is correct, the discipline is effective, and the results of the instruction range from tolerable to good. The tone of the school is good. The Rev. A. Selwyn was present for a short time near the close of the inspection; with this exception, the School Board was not represented.

NEWCASTLE (St. John's) :—Visited, 27th July.

Pupils enrolled :—Boys, 52 ; girls, 30 ; total, 82.

Pupils present :—Boys, 50 ; girls, 25 ; total, 75.

The material condition of this school is good, the organization is satisfactory, the discipline is fairly effective, and the results of the examination range from fair to good. No member of the School Board was present at the examination.

RAYMOND TERRACE :—Visited, 11th December.

Pupils enrolled :—Boys, 51 ; girls, 36 ; total, 87.

Pupils present :—Boys, 42 ; girls, 26 ; total, 68.

The schoolhouse is an excellent structure, and it is well furnished and supplied with material. The organization is correct, the discipline fair, and the teaching is tolerably effective. The Rev. S. Simm was present for a short time, but was prevented by pressing parochial duties from remaining.

STROUD :—Visited, 12th November.

Pupils enrolled :—Boys, 21 ; girls, 20 ; total, 41.

Pupils present :—Boys, 16 ; girls, 15 ; total, 31.

The premises require some repairs, and the walls are very dingy ; otherwise, the schoolhouse is substantially good. There is a very fair supply of working appliances, and the furniture is sufficient, but badly arranged. The organization is satisfactory, the discipline is fair, the teaching is careful, but insufficiently spirited and searching ; still, however, tolerable progress has been made in the mechanical branches of instruction. The Rev. A. Shaw was present at the examination.

UPPER BENDOLBA :—Visited, 27th November.

Pupils enrolled :—Boys, 33 ; girls, 33 ; total, 66.

Pupils present :—Boys, 16 ; girls, 26 ; total, 42.

Excepting that some repairs are needed, the building is substantially good ; it is airy and clean, but it is wretchedly furnished. The organization is satisfactory, the order is good, the pupils are fairly industrious, and their progress is moderate. A lay member of the Board was present, but owing to a serious accident the Rev. Huband-Smith was unable to attend.

WALLSEND :—Visited, 20th October.

Pupils enrolled :—Boys, 88 ; girls, 76 ; total, 164.

Pupils present :—Boys, 81 ; girls, 66 ; total, 147.

The material condition of the school is good ; and, excepting a necessity for additional desks, the school is properly appointed. The organization is correct, the discipline is healthy and improving, and the attainments of the pupils are fair. The Rev. J. S. Wood was present during the whole of the examination.

ROMAN CATHOLIC SCHOOLS.

CLARENCE TOWN :—Visited, 8th December.

Pupils enrolled :—Boys, 24 ; girls, 21 ; total, 45.

Pupils present :—Boys, 21 ; girls, 19 ; total, 40.

The school building, which is also used as a church, is commodious, moderately supplied with working appliances, but it is very indifferently furnished. The organization and discipline show marks of real improvement ; the teaching is but moderately effective. The short-comings of the several classes are attributable to the irregularity and backwardness of most of the pupils. No member of the School Board was present at the examination.

MILLEE'S FOREST :—Visited, 15th December.

Pupils enrolled :—Boys, 25 ; girls, 26 ; total, 51.

Pupils present :—Boys, 20 ; girls, 21 ; total, 41.

The schoolhouse is substantially good, and fairly furnished and supplied with material. The ground is small, but it is enclosed, and proper out-offices are provided. The organization is correct, the discipline is fair, and the instruction is tolerably successful. The irregularity of the pupils depresses the average attainments of the respective classes. No member of the School Board was present at the examination.

NEWCASTLE :—Visited, 23rd July.

Pupils enrolled :—Boys, 83 ; girls, 60 ; total, 143.

Pupils present :—Boys, 88 ; girls, 30 ; total, 68

The school premises are in good condition, and there is a tolerable supply of furniture and working material ; the discipline is improving, the instruction is fairly successful, and the spirit of the school is moderately pleasing. The Rev. M. Walsh and a lay member of the Board were present during a considerable portion of the examination.

PRESBYTERIAN

PRESBYTERIAN SCHOOLS.

DINGO CREEK :—Visited, 15th September.

Pupils enrolled :—Boys, 21 ; girls, 27 ; total, 48.

Pupils present :—Boys, 13 ; girls, 15 ; total, 28.

The school building is in but a moderate state of repair. It is sufficiently commodious, but the furniture is old and clumsy. The school ground is unfenced, and there are no out-offices. The organization is fairly correct, the discipline has improved, but the instruction is unskilful and uneducative. The Rev. J. Laing and two lay members of the Board were present at the examination.

NEWCASTLE :—Visited, 28th July.

Pupils enrolled :—Boys, 97 ; girls, 64 ; total, 161.

Pupils present :—Boys, 91 ; girls, 55 ; total, 146.

The school premises are in good condition, but the room is much too small for the number of pupils in attendance. There is a suitable supply of furniture and apparatus, but not of books. Since my last visit out-offices have been erected. The organization and discipline are moderately effective ; the intelligence and industry of the pupils are tolerably satisfactory, and their attainments range from moderate to very fair. The Rev. Mr. Coutts was present during a short portion of the examination.

J. W. ALLPASS,
Inspector of Schools,
Newcastle District.

INSPECTORS' REPORT.—SYDNEY DISTRICT.

DETAILED STATEMENT of the condition of Certified Denominational Schools in the Sydney District, inspected during the Year 1868.

The remarks under head 1 relate to the material condition of schools ; under 2, to their moral character ; under 3, to the subjects and methods of instruction ; under 4, to the proficiency of the pupils.

BALMAIN (C.E.) :—Visited, 28th August.

Numbers present at examination :—Boys, 57 ; girls, 35 ; total, 92.

1. With the exception of the fencing, which has been repaired, the same material defects exist as were noted in last year's report. Some of the desks have received ill-usage from the children attending the Sunday School. 2. The order and general discipline are fairly satisfactory. 3. The school is divided into too many classes, and the classification is too high. The lesson documents are fairly arranged ; the methods are in the main modern, but require to be applied with greater energy. 4. The proficiency ranges from indifferent to tolerable. There is not the material for a fourth class, and the existence of one evidences over-anxiety on the part of the teacher to advance the children in their studies.

BALMAIN (R.C.—Boys) :—Visited, 3rd November.

Number present at examination :—67.

1. Additional desks, a lavatory, and a book-press have been provided since last inspection. The material state of the school is now fairly satisfactory. 2. The pupils are reasonably regular and punctual ; on the whole, clean and becomingly attired. They are inclined to be restless in the classes, and the operations of teaching are not conducted with sufficient order and decorum. 3. The course of secular instruction is observed. The classification is tolerably appropriate. The lesson documents are arranged with care and passable judgment. The teaching is very painstaking, but unskilful. 4. The attainments rank from moderate to fair. The pupils are tolerably attentive under examination ; but think slowly, and answer with difficulty. Their intelligence is but partially cultivated.

BALMAIN (R.C.—Girls) :—Visited, 14th December.

Number present at examination :—52.

1. The situation is good, and the building suitable. The school is fairly found in the necessary appliances. 2. The pupils are very irregular in their attendance ; the order is passable, and the moral tone healthy. 3. All the prescribed subjects are taught. The classification is appropriate, and the lesson documents tolerably arranged. More vigour needs to be infused into the teaching generally. 4. The average proficiency is barely moderate.

BALMAIN (R.C.—Infants) :—Visited, 14th December.

Numbers present at examination :—Boys, 15 ; girls, 38 ; total, 53.

1. The schoolroom is spacious, and otherwise suitable. The gallery is awkwardly constructed, and proper desks have yet to be provided. The supply of apparatus is very scanty. 2. The pupils are both unpunctual and irregular. The order is tolerable, and the government mild. 3. The instruction is very elementary, and the methods are mechanical and wanting in skill. 4. The attainments are moderate.

CAMPERDOWN (R.C.) :—Visited, 7th October.

Numbers present at examination :—Boys, 84 ; girls, 64 ; total, 148.

1. The schoolhouse is an old building, in indifferent repair. There is but one playground for both sexes. A lavatory is badly needed. There is a tolerable supply of indifferent furniture, and a fair quantity of apparatus. 2. The pupils are unpunctual and irregular in attendance. The order is bad, the government feeble and ineffective, and the moral tone low. 3. Object lessons form no regular part of the instruction ; in other respects, the prescribed course is observed. The classification is bad. The lesson documents are but poorly arranged. The methods are mechanical, and feebly applied. 4. The attainments are small. The pupils are restless, noisy, and inattentive under examination, and addicted to copying. The instruction has signally failed in developing the mental powers of the children.

CHIPPENDALE (Wes.) :—Visited, 19th August.

Numbers present at examination :—Boys, 26 ; girls, 24 ; total, 50.

1. The out-offices are not sufficiently private, and additional desks are needed. Those in use are much ink-stained. The foregoing are the most noticeable defects in the material condition of the school.
2. The small attendance on the day of examination is attributable to very rainy weather. Under ordinarily favorable circumstances the pupils are fairly punctual and regular. With few exceptions, they are clean in person and tolerably well-behaved. On the whole the discipline has decidedly improved.
3. The subjects of instruction accord with the prescribed course. The lesson documents admit of an improved arrangement, and the classification is in some respects faulty. The methods are practical rather than skilful.
4. The proficiency varies from tolerable to fair. The teacher has labored hard, and done good work during the year.

CHURCH HILL (R.C.—Girls) :—Visited, 6th October.

Number present at examination :—66.

1. The windows need repairs, the woodwork to be painted, and a lavatory provided. The school is badly situated, and the light is defective. The supply of educational appliances is sufficient.
2. The pupils are unpunctual and irregular in attendance, but reasonably clean and in pretty fair order.
3. The usual branches are taught; the methods are moderately suitable, and are, so far as observed, applied with zeal and energy.
4. The proficiency varies from moderate to tolerable; the answering, as a rule, is very partial, and the pupils' intelligence is but moderately developed.

CHURCH HILL (R.C.—Infants) :—Visited, 6th October.

Numbers present at examination :—Boys, 59 ; girls, 56 ; total, 115.

1. The situation is unfavorable, the furniture is insufficient, and the supply of apparatus scanty.
2. The pupils are fairly regular, but not punctual. The order is bad, and the government ineffective.
3. The subjects of instruction are those prescribed. The lesson documents are tolerably arranged. The methods are unskilful.
4. The proficiency is very moderate.

CHRIST CHURCH (Primary) :—Visited, 28th and 29th October.

Numbers present at examination :—Boys, 174 ; girls, 81 ; total, 255.

1. A fine commodious schoolhouse, liberally found in teaching appliances.
2. The pupils are regular, punctual, and clean. Their behaviour is marked by considerable boisterousness, and the operations of teaching are rather noisily conducted.
3. The usual branches are taught. The classification is not well defined for some subjects, and the lesson documents are poorly arranged. The methods are in some respects peculiar and obsolete, but are applied with much earnestness and industry.
4. The attainments range from moderate to fair.

CHRIST CHURCH (C.E.—Infants) :—Visited, 28th and 29th October.

Numbers present at examination :—Boys, 89 ; girls, 65 ; total, 154.

1. The schoolroom is in good repair, and, excepting the desks, which are indifferent in quality and scant in supply, is very fairly provided with the necessary educational appliances.
2. The pupils are regular, but unpunctual; the order is barely moderate, and the moral tone is unsatisfactory.
3. The instruction is fairly regulated, and the methods are diligently applied.
4. The average proficiency approaches tolerable.

DABLINGHURST (C.E.) :—Visited, 16th and 17th July.

Numbers present at examination :—Boys, 67 ; girls, 52 ; total, 119.

1. The supply of desks is limited, otherwise the material condition of the school is very fair.
2. The pupils are disposed to be restless and inattentive under instruction; in other respects the discipline is passable.
3. The instruction is tolerably regulated, and fairly painstaking.
4. The proficiency is tolerable.

DOUBLE BAY (C.E.—Primary) :—Visited, 18th August.

Number of pupils present at examination :—Boys, 31 ; girls, 27 ; total, 58.

1. Improvements have been effected in the material state of the school since the general inspection of last year. Existing defects are about to be remedied. The school is well found in suitable furniture and apparatus. The whole property is cleanly and carefully kept.
2. The moral aspect of the school is very pleasing.
3. Instruction is given in the usual subjects. The classification is appropriate. Much pains is bestowed upon the keeping of the lesson documents. The methods are suitable, and are vigorously applied.
4. The average proficiency is very fair. The pupils exhibit a becoming demeanour under examination, are self-reliant, and answer with readiness and intelligence.

DOUBLE BAY (C.E.—Infants) :—Visited, 18th August.

Numbers present at examination :—Boys, 30 ; girls, 28 ; total, 58.

1. The school buildings are substantial and suitable. The ceiling needs some repairs, and proper desks have yet to be provided. There is an adequate supply of working materials.
2. The discipline is satisfactory.
3. The instruction is judiciously regulated, and is very painstaking.
4. The proficiency is fair.

DOUBLE BAY (R.C.) :—Visited, 8th September.

Numbers present at examination :—Boys, 38 ; girls, 27 ; total, 65.

1. The schoolroom is a good weatherboard building. The supply of furniture and apparatus is meagre.
2. The pupils are punctual, fairly orderly, and neatly dressed.
3. The instructional documents are incomplete. The methods are of a passable kind.
4. The attainments are moderate. The teacher has been a very short time in charge.

ERSKINE-STREET (Pres.) :—Visited, 25th August.

Numbers present at examination :—Boys, 26 ; girls, 22 ; total, 48.

1. The situation is objectionable; the playground is extremely small, the out-offices incomplete, and a lavatory is much wanted; otherwise the school is fairly equipped.
2. Fair discipline is maintained.
3. The instruction is poorly arranged for the lower classes, and drawing is taught in a rather desultory manner.
4. The proficiency varies from moderate to tolerable. *Note.*—The defects in the organization have been remedied since the date of inspection, in so far as the situation and area would admit.

GIEBE

GLEBE (C.E.) :—Visited, 4th August.

Numbers present at examination :—Boys, 56 ; girls, 37 ; total, 93.

1. The schoolroom is commodious, otherwise suitable, and well found in requisites. 2. The pupils are fairly punctual and becomingly attired. The order is but moderate, and the government is wanting in tact and firmness. 3. The instruction is not regulated by the necessary documents ; the teaching is necessarily desultory, and is conducted with very little energy. 4. The attainments are indifferent, and the mental culture is small.

HAYMARKET (R.C.) :—Visited, 3rd and 7th September.

Number present at examination :—133 boys.

1. The accommodation for teaching purposes is insufficient. Hat-pegs, tablet-rails, additional desks, and a lavatory are needed. The school is fairly found in books and apparatus. 2. The pupils are irregular and unpunctual in attendance, untidy in appearance, and in very bad order. The government is feeble and ineffective. The moral tone of the school is low. 3. The classification is bad ; the lesson documents are imperfectly arranged ; the methods are empirical, and require to be applied with greater vigour and earnestness. 4. The proficiency is small. It is well nigh impossible to gain the attention of the pupils. Copying is openly and generally practised. The teacher has since been removed.

KENT-STREET, NORTH (R.C.—Boys) :—Visited, 2nd September.

Number present at examination :—170.

1. Several improvements have been effected in the material state of the school since last inspection. The schoolroom is still too small for the attendance. The desks are old, cumbrous, and unsuitable, and a lavatory is much wanted. 2. The pupils are regular, punctual, clean, and in very fair order. The government is firm and effective. 3. The instruction embraces the usual subjects, and is fairly regulated. Suitable methods are employed, and the teaching generally is marked by earnestness and intelligence. 4. The proficiency is fair, and the thinking faculty of the pupils has been fairly developed.

KENT-STREET, NORTH (R.C.—Girls) :—Visited, 2nd September.

Number present at examination :—118.

1. The schoolroom is a new weatherboard building. The playground is too small, and the fences need repair. Additional desks and a book-press are required ; otherwise there is a fair supply of working materials. 2. The pupils are punctual, orderly, and fairly attentive. 3. The instruction is fairly regulated, and the methods are moderately effective. 4. The proficiency approaches Tolerable.

KENT-STREET, SOUTH (R.C.—Boys) :—Visited, 21st October.

Number present at examination :—79.

1. The schoolhouse is unsuitable and in bad repair ; it has no playground. The desks are cumbrous, and much the worse for wear. These and a dilapidated book-press constitute the furniture. The apparatus is almost as scanty. The maps and books supplied by the Council have been wilfully abused. The teacher complains that he is not allowed to keep the key of the schoolhouse. 2. The pupils are tolerably regular, but unpunctual. Several are disposed to appear untidy. The order, although much improved, is not quite satisfactory. The government requires to be administered with greater firmness. 3. Vocal music excepted, the ordinary branches are taught. The lesson documents are marked by a want of fulness and explicitness of detail. Fair judgment is displayed in the classification of the pupils. The methods are tolerably suitable. 4. The proficiency is tolerable. The first class appears to have been neglected. Additional teaching power is required.

NEWTOWN (C.E.—Primary) :—Visited, 26th August.

Numbers present at examination :—Boys, 44 ; girls, 23 ; total, 67.

1. A supply of suitable desks is much needed. The boys' out-offices are incomplete, and are not cleanly kept. There is a fair supply of working materials. 2. The pupils are tolerably punctual, regular, and clean. In the upper classes the order is good, in the lower, moderate. 3. The instruction is fairly arranged, and the methods are tolerably skilful. 4. The general proficiency varies from moderate to tolerable.

NEWTOWN (C.E.—Infants) :—Visited, 27th August.

Numbers present at examination :—Boys, 44 ; girls, 45 ; total, 89.

1. A good schoolroom. Additional desks are required ; otherwise the school is very fairly equipped. 2. The order is indifferent, and the government is not sufficiently firm. 3. The instruction is tolerably regulated. 4. The attainments are moderate.

NEWTOWN (R.C.) :—Visited, 22nd October.

Numbers present at examination :—Boys, 18 ; girls, 18 ; total, 36.

1. The school is held temporarily in a dwelling-house. The situation is bad. The rooms are unsuitable, and the supply of furniture and apparatus is inadequate. 2. The pupils are punctual, but irregular ; they are tolerably clean, and the government is moderately effective. 3. The classification is injudicious ; the lesson documents are incomplete and badly arranged. The methods are mechanical and ineffective. 4. The proficiency is small. This school has been removed to new buildings, and a more competent teacher placed in charge.

NEWTOWN (Wes.) :—Visited, 23rd and 24th September.

Numbers present at examination :—Boys, 81 ; girls, 58 ; total, 139.

1. The situation is favorable ; the buildings are in very fair repair, and the school is amply found in the requisite appliances. 2. The pupils are not punctual. Fair order is maintained, and the government is effective. 3. The prescribed course is observed. The instructional documents are tolerably arranged, and the teaching is painstaking. 4. The attainments are tolerable.

PADDINGTON (C.E.) :—Visited, 3rd September.

Numbers present at examination :—Boys, 29 ; girls, 23 ; total, 52.

1. A good schoolroom. The desks need repair, and a lavatory has yet to be provided. A fair supply of the necessary requisites. 2. The discipline is passable. 3. The classification is injudicious ; the instructional documents are fairly compiled ; the methods are tolerably appropriate, but are only partially effective. 4. The proficiency is very moderate.

PADDINGTON (R.C.) :—Visited, 22nd September.

Numbers present at examination :—Boys, 25 ; girls, 53 ; total, 78.

1. The situation is good, and the schoolroom is fairly suitable. There is an insufficiency of furniture, which is badly arranged, owing to the church pews being fixed to the floor. 2. The pupils are tolerably punctual, and the order is passable. 3. The classification is faulty. The teaching is mechanical but painstaking. 4. The proficiency is moderate.

PARRAMATTA-STREET (R.C.—Boys) :—Visited, 11th November.

Number present at examination :—81.

1. The site of the schoolhouse is low, and the light is defective. New premises are urgently required. The furniture is sufficient in quantity, but old and not very suitable. 2. The pupils are restless, talkative, and noisy in school, and boisterous on the playground. Their demeanour is neither sufficiently subdued nor respectful. The government is feeble and ineffective. 3. There are too many classes, and the classification is much too high. The methods are modern, but fail, through bad discipline and defective skill, to produce satisfactory results. 4. The attainments rank from bad to moderate. With much trouble on the part of the examiner the pupils can be got to yield a tolerable attention. Their answering is very partial, and evidences a low state of mental development.

PARRAMATTA-STREET (R.C.—Girls) :—Visited, 12th and 13th November.

Number present at examination :—104.

1. The situation is unsuitable, and the schoolroom is insufficiently large. Some repairs have been recently effected, but the roof is not weatherproof. The supply of furniture is limited. 2. The pupils seem tolerably punctual, but the order is indifferent, and the government is deficient in tact and firmness. 3. The course of instruction is observed. The classification is appropriate ; the lesson documents are compiled with moderate judgment, and the teaching is conducted with like skill. 4. The average proficiency is moderate.

PARRAMATTA-STREET (R.C.—Infants) :—Visited, 11th and 12th November.

Numbers present at examination :—Boys, 57 ; girls, 45 ; total, 102.

1. The business of this school is conducted in the same room as the girls' department. The accommodation is insufficient, and a supply of suitable desks is required. 2. The pupils are clean and tolerably punctual ; the order is bad, and the government ineffective. 3. Pupils, chiefly boys, have been admitted or retained in this department, whose ages and attainments render them fit for the primary schools. The instruction is moderately arranged, and the teaching is conducted with passable industry. 4. The proficiency is very moderate.

PLYMOUTH (C.E.) :—Visited, 7th August.

Numbers present at examination :—Boys, 43 ; girls, 35 ; total, 78.

1. The schoolhouse is a substantial stone building, favourably situated. The outhouses need repairs. The supply of apparatus is but tolerable. 2. The pupils are regular and punctual ; the order is fair ; and the moral tone of the school is healthy. 3. The instruction is very fairly regulated, and the methods are suitable and reasonably effective. 4. The proficiency ranges from tolerable to very fair.

RANDWICK (C.E.) :—Visited, 1st September.

Numbers present at examination :—Boys, 25 ; girls, 11 ; total, 36.

1. A lavatory and a supply of water require to be provided ; otherwise, the schoolhouse is in good repair and is fairly furnished. 2. The order and general discipline are fairly satisfactory. 3. The classification is tolerably appropriate. The lesson documents are open to improvement in some particulars, but the instruction is not badly regulated. The methods are practical, and appear to be applied with fair industry. 4. The attainments rank from tolerable to fair.

REDFERN (C.E.—Primary) :—Visited, 10th and 11th August.

Numbers present at examination :—Boys, 112 ; girls, 82 ; total, 194.

1. The new schoolroom is a fine, commodious, building, and is liberally provided with excellent furniture and apparatus. 2. The pupils are regular, punctual, clean, and for the most part becomingly attired. The order, however, admits of great improvement. 3. Except that object lessons are omitted from the time-table of the first class, all the essential branches are taught. The lesson documents need amendment in certain particulars, and the classification requires revision. The methods savour of empiricism, but are apparently applied with earnestness and zeal. 4. The average proficiency is moderate : arithmetic, grammar, and object lessons being the weak subjects. The answering in each class seems to devolve upon a few of the pupils. Guessing is far too prevalent.

REDFERN (C.E.—Infants) :—Visited, 10th and 11th August.

Numbers present at examination :—Boys, 78 ; girls, 54 ; total, 132.

1. The school-buildings are spacious, in good repair, and otherwise suitable. There is a sufficiency of working materials. 2. The pupils are reasonably punctual, clean, and neatly dressed. The movements of the school are conducted with tolerable order, but the pupils are disposed to be restless and inattentive. 3. The instructional documents are not sufficiently specific in some respects. The methods of teaching vary in point of skill, the average being very moderate. 4. The proficiency varies from moderate in the lower classes to tolerable in the higher.

ST. ANDREW'S (C.E.—Primary):—Visited, 13th August.

Numbers present at examination:—Boys, 65; girls, 41; total, 106.

1. The present schoolhouse is used temporarily. There is an adequate supply of the necessary educational appliances, in a fair state of preservation. 2. The attendance has largely increased since the general inspection of last year. The pupils are clean, punctual, and regular. Good order is maintained. The government is effective, and the moral tone healthy. 3. The instruction, which embraces the usual subjects, is fairly regulated. There is a tendency to unnecessarily subdivide the classes, but, on the whole, the classification is intelligent and practical. In point of average merit the methods may be estimated as fair. 4. The attainments vary from fair to very fair. The pupils are attentive, tolerably self-reliant, and answer with considerable intelligence and reasonable promptness.

ST. ANDREW'S (C.E.—Infants):—Visited, 13th August.

Numbers present at examination:—Boys, 33; girls, 49; total, 82.

1. A supply of suitable furniture is needed; otherwise the school is fairly organized. 2. The order and discipline are unsatisfactory. 3. The classification is faulty, the lesson documents are incomplete, and the teaching is not very skilful. 4. The proficiency is moderate. The teacher has been only recently appointed.

ST. ANDREW'S (Pros.):—Visited, 19th May.

Numbers present at examination:—Boys, 76; girls, 49; total, 125.

1. The schoolhouse is a substantial stone building, in fair repair. The drainage is defective, the out-offices are unsuitably placed, and there is no playground. The school is fairly found in furniture and apparatus. 2. The discipline is healthy. 3. The instruction is judiciously regulated. The methods possess fair average skill, and are diligently applied. 4. The proficiency varies from tolerable to fair.

ST. BARNABAS' (C.E.—Primary):—Visited, 9th and 10th September.

Numbers present at examination:—Boys, 102; girls, 73; total, 175.

1. The playground has been recently enlarged, levelled, fenced, and divided for the sexes. New and improved water-closets have been erected, and the schoolroom has been rewhitewashed. A separate lavatory for the girls is required, in order to render the arrangements as complete as could be desired. The school is well organized. 2. The pupils are punctual, regular, clean, and in very good order. The government is mild, but firm and effective. The moral tone is excellent. 3. The instruction accords with the prescribed course. The classification is appropriate; the lesson documents are judiciously constructed; the methods are modern, and are applied with energy and skill. 4. The proficiency varies from fair to very fair. The teaching is carried on with considerable enthusiasm, and a healthy spirit pervades the school.

ST. BARNABAS' (C.E.—Infants):—Visited, 9th and 10th September.

Numbers present at examination:—Boys, 89; girls, 64; total, 153.

1. A good schoolroom, in excellent repair. The gallery is not sufficiently large. 2. The discipline is healthy, and the moral tone pleasing. 3. The instruction is judiciously regulated. The methods are suitable, and are energetically applied. 4. The average proficiency is fair.

ST. JAMES' (C.E.—Primary):—Visited, 6th, 7th, and 8th June.

Numbers present at examination:—Boys, 100; girls, 64; total, 164.

1. The schoolroom requires to be whitewashed internally. There is an abundance of the requisite educational appliances. Except that the playground is very untidy, the property is carefully kept. 2. The pupils are very punctual, and fairly regular in attendance, clean, and becomingly attired. Fair order is maintained, but the government needs to be characterized by greater firmness, energy, and decision. 3. Book-keeping is taught, along with the usual subjects. The lesson documents are compiled with very fair judgment. The teaching is carried on with industry and reasonable skill. 4. The attainments rank from fair to very fair. Arithmetic and grammar are the weak subjects. The teacher is anxious and painstaking, and has done good work during the year.

ST. JAMES' (C.E.—Infants):—Visited, 1st and 2nd June.

Numbers present at examination:—Boys, 88; girls, 76; total, 164.

1. A spacious schoolroom, suitably furnished, and well found in requisites. 2. The order and discipline are satisfactory. 3. Except in the lowest class, the instruction is intelligent, appropriate, and well regulated. 4. The proficiency is fair.

ST. LEONARD'S (C.E.—Boys):—Visited, 18th November.

Number present at examination:—58.

1. The schoolroom is too small, and the supply of furniture scanty. There is an adequate amount of working materials. 2. The pupils are punctual and regular. The order is excellent, and the moral tone of the school pleasing. 3. The instruction is judiciously regulated, and the methods are intelligent, and are applied with fair skill. 4. The proficiency of the pupils is satisfactory.

ST. LEONARD'S (C.E.—Girls):—Visited, 8th October.

Number present at examination:—35.

1. The school-buildings are in fair repair, and are otherwise suitable. A supply of furniture is much needed, together with a black-board and easel. 2. The pupils are punctual and fairly regular. The order is very fair, and the moral tone of the school is healthy. 3. The instruction is tolerably arranged, and the teaching is conducted with moderate skill. 4. The results are tolerable.

ST. LEONARDS (R.C.) :—Visited, 18th November.

Numbers present at examination :—Boys, 49 ; girls, 29 ; total, 78.

1. The playground requires to be divided for the sexes, and provided with proper out-houses. A lavatory is needed. The desks are old, unsightly, and unsuitable. 2. The pupils require to be trained to yield a prompt and willing obedience ; their manners too are susceptible of improvement. The order is unsatisfactory, and the government is wanting in tact and firmness. 3. The course of Secular Instruction is adhered to. The classification is in various ways faulty. The methods are of modern cast, and appear to be applied with diligence. 4. The proficiency is barely tolerable. The pupils yield a rather fitful attention. Their answering is partial, frequently random, and indicative of a low state of mental culture.

ST. LEONARDS (Pres.) :—Visited, 8th October.

Numbers present at examination :—Boys, 48 ; girls, 19 ; total, 67.

1. Since last inspection, the walls of the schoolroom have been whitewashed, the woodwork painted, the windows frosted, and hat-pegs provided. The playground still requires to be fenced and supplied with wash-house and urinal. The school is amply found in suitable furniture and apparatus. The general state of the property is very fair. 2. The pupils are tolerably clean, but somewhat unpunctual and irregular in attendance. The order is bad, the government feeble, and the moral tone unsatisfactory. 3. The classification is tolerably appropriate ; the lesson documents need revision in certain particulars ; the methods are practical, and but very partially effective. 4. The proficiency ranges from small to tolerable. This poverty of attainments may be attributed partly to the bad order of the school, and partly to the absence of anything like searching or intelligent examination of work done.

ST. MARY'S (R.C.—Boys) :—Visited, 9th, 10th, and 15th June.

Number present at examination :—215.

1. There is no playground attached to this school ; the closets are in a bad state ; the interior of the schoolroom requires to be whitewashed ; and more suitable desks need to be provided. 2. The pupils are more punctual than formerly ; they attend with reasonable regularity. The presence of a large number of infants interferes with the order, but this has improved, and may now be estimated as fair. 3. Except that the pupils in the first class greatly preponderate, the classification is appropriate. Algebra and Euclid are taught, in addition to the usual subjects. The methods are modern, and are applied with diligence and earnestness. 4. The average proficiency approaches fair. The pupils are fairly attentive under examination, tolerably self-reliant, and seemingly anxious to do well.

ST. MARY'S (R.C.—Girls) :—Visited, 5th, 8th, and 9th June.

Number present at examination :—103.

1. The school is held in the Temporary Cathedral, the schoolroom being separated from the body of the church by a wooden partition. There is a fair supply of furniture and apparatus. 2. The pupils are fairly regular ; the order is satisfactory, and the moral tone of the school is pleasing. 3. The instruction is fairly regulated, and is conducted with zeal and intelligence. 4. The attainments are fairly satisfactory.

ST. MARY'S (R.C.—Infants) :—Visited, 4th June.

Number present at examination :—70 girls.

1. The furniture is sufficient in supply, but cumbersome in character, and is badly arranged. The apparatus is scanty. 2. The pupils are tolerably regular, and the order is passable. 3. The instruction is indifferently regulated. 4. The average proficiency is barely moderate.

ST. PHILIP'S (C.E.—Primary) :—Visited, 5th August.

Numbers present at examination :—Boys, 56 ; girls, 63 ; total, 119.

1. The playground needs to be divided for the sexes. With this exception, the organization is reasonably good. 2. The pupils are less unpunctual than formerly. Their demeanour is forward, and their behaviour somewhat boisterous. The operations of teaching need to be more quietly conducted. A vigilance to detect the beginnings of disorder, and an energy and a determination to put them down, are qualities which the teacher will have to exercise before any great change for the better can be reasonably hoped for. 3. The instruction embraces the usual branches. The classification is generally appropriate. The methods are suitable, but need to be applied with increased earnestness and vigour. 4. The average proficiency is tolerable. The pupils answer only after repeated questioning, think slowly, and are indisposed to anything like real mental exertion. On the whole, however, the school has improved in efficiency during the year.

ST. PHILIP'S (C.E.—Infants) :—Visited, 5th August.

Numbers present at examination :—Boys, 82 ; girls, 100 ; total, 182.

1. The schoolroom is rather small ; in other respects it is suitable, and is adequately provided with the necessary educational appliances. 2. The order is fair, and the government is mild and effective. 3. The instruction is judiciously arranged. The methods are modern, and range in point of skill from moderate to very fair. 4. The average proficiency is fair.

SURRY HILLS (C.E.—Primary) :—Visited, 28th October.

Numbers present at examination :—Boys, 29 ; girls, 23 ; total, 52.

1. Some repairs and improvements have been effected in the school since last inspection. Measures are in progress to provide a lavatory. When this has been done, and the school furnished with more suitable desks, the material condition will be fairly satisfactory. 2. The small attendance is perhaps attributable to causes over which the teacher has had no control. Fair order is maintained, and the moral tone may be regarded as healthy. 3. The instruction embraces the requisite branches, and is fairly regulated. The methods are suitable, and are intelligently applied. 4. The proficiency is very fair.

SURRY HILLS (C.E.—Infants) :—Visited, 20th October.

Numbers present at examination :—Boys, 70 ; girls, 48 ; total, 118.

1. The school is favourably situated. New and suitable desks are needed ; otherwise there is a fair supply of the necessary appliances. 2. The pupils are punctual and regular. The order is very fair, and the government judicious. 3. All the subjects prescribed for infant schools are taught. The classification is on the whole fair, the instructional documents are judiciously compiled, and the methods are appropriate and effective. 4. The general proficiency is fair.

SURRY HILLS

SURRY HILLS (R.C.—Boys) :—Visited, 4th November.

Number present at examination :—155.

1. Some important alterations and improvements have been effected in the material condition of the school since last inspection. A lavatory is still an important desideratum. The school is objectionably situated. 2. The pupils are neither punctual nor regular. The discipline is in other respects susceptible of improvement. 3. All the prescribed subjects are taught. The classification is tolerably appropriate; the lesson documents are arranged with passable judgment; the methods are tolerably suitable. 4. The attainments range from small in the lower classes to tolerable in the higher. The pupils' answering is partial, and deficient in thoughtfulness, and indicates a very imperfect retention of the lessons. The teaching power is poor and indifferent.

SURRY HILLS (R.C.—Girls) :—Visited, 4th November.

Number present at examination :—108.

1. The situation is low, and the accommodation, whether as regards space or furniture, is insufficient. There is a moderate supply of apparatus and books. 2. The pupils are fairly punctual and regular. The order is unsatisfactory, the pupils being restless and noisy. 3. The instruction is tolerably regulated, and the teaching is conducted with moderate intelligence. 4. The proficiency is moderate.

SURRY HILLS (Wes.—Primary) :—Visited, 21st May.

Numbers present at examination :—Boys, 69; girls, 22; total, 91.

1. The schoolroom needs whitewashing internally. There is an adequate supply of the necessary working materials. 2. The pupils are tolerably punctual. The order admits of improvement. 3. The instruction is fairly regulated, and the methods are intelligent and tolerably effective. 4. The average proficiency is tolerable.

SUSSEX-STREET (Hebrew) :—Visited, 22nd October.

Numbers present at examination :—Boys, 40; girls, 20; total, 60.

1. The school is temporarily conducted in the Odd Fellows' Hall. The furniture is insufficient and unsuitable. The organization is in other respects very imperfect. 2. The order and general discipline are far from satisfactory. 3. The instruction is only properly regulated for one class. The methods are in part mechanical and worthless. 4. The attainments of the first class are fair, those of the second and third classes are small. The teacher wants training.

TRINITY (C.E.—Primary) :—Visited, 17th November.

Numbers present at examination :—Boys, 62; girls, 32; total, 94.

1. Some of the desks are old and unsightly; a lavatory is required, and the out-offices are not cleanly kept; otherwise, the material state of the school is fairly satisfactory. 2. The pupils are fairly regular, punctual, and clean. The order is susceptible of improvement. The operations of teaching are noisily conducted. 3. All the required branches are taught. The teaching is earnest and painstaking. 4. The proficiency varies from tolerable to fair.

TRINITY (C.E.—Infants) :—Visited, 17th November.

Numbers present at examination :—Boys, 72; girls, 74; total, 146.

1. A classroom is much needed, together with suitable desks; in other respects, the school is fairly organized. 2. The pupils are fairly punctual and regular, clean, and becomingly dressed. The order is good in the upper classes, and moderate in the lower. 3. The instruction is regulated by the necessary documents. The methods are suitable and applied with tolerable skill. 4. The proficiency ranges from moderate to fair.

VICTORIA-STREET (R.C.—Girls) :—Visited, 10th November.

Number present at examination :—82.

1. The schoolhouse is well fitted for the purpose, but is too far from the centre of population. New and more suitable desks, and some diagrams, are needed. 2. The pupils are regular, punctual, and clean. Their demeanour is subdued, modest, and respectful, and their behaviour unexceptionable. The moral tone of the school is excellent. 3. The instruction accords with the prescribed course. The methods are appropriate, and the teaching is very painstaking. 4. The attainments rank from very fair to good. The answering is prompt, thoughtful, and pretty general.

VICTORIA-STREET (R.C.—Infants) :—Visited, 10th November.

Numbers present at examination :—Boys, 44; girls, 39; total, 83.

1. The playground is too small; otherwise the material condition of the school is fair. 2. The pupils are fairly punctual, and in other respects the discipline is excellent, and the moral tone pleasing. 3. The course of instruction is that prescribed for infant schools. The methods are skilfully and zealously applied. 4. The average proficiency is very fair.

WAVERLEY (C.E.) :—Visited, 27th October.

Numbers present at examination :—Boys, 36; girls, 53; total, 89.

1. A fair schoolroom, in good repair, and suitably furnished. Since last inspection, the playground has been divided for the sexes and completely enclosed, but a lavatory and shed are still wanted. There is a fair supply of apparatus. 2. The pupils are fairly punctual, the government is effective, and the moral tone is tolerably healthy. 3. The instruction is regulated with moderate judgment. The methods are appropriate, and are applied with fair energy. 4. The proficiency varies from moderate to tolerable.

WAVERLEY (R.C.) :—Visited, 5th November.

Numbers present at examination :—Boys, 42; girls, 42; total, 84.

1. Additional desks, a lavatory, and access to the playground other than through the schoolroom, are required. The school is fairly supplied with books and apparatus. 2. The government is barely strict enough. On the whole, however, the order and moral aspect of the school may be regarded as tolerable. 3. The methods are moderately suitable, and are applied with commendable industry. 4. Tolerable results have been produced.

WAVERLEY (Pres.) :—Visited, 5th November.

Numbers present at examination :—Boys, 31 ; girls, 32 ; total, 63.

1. The schoolhouse is badly in need of repairs. The playground is unenclosed, and is not furnished with shed or lavatory. The supply of furniture is scanty. 2. The discipline is tolerably satisfactory. 3. The instruction is fairly regulated; and the methods vary in point of skill, the average being moderate. 4. The proficiency is moderate. The teacher has been only recently appointed.

WATERLOO (C.E.—Primary) :—Visited, 24th November.

Numbers present at examination :—Boys, 44 ; girls, 33 ; total, 77.

1. The schoolroom is a weatherboard building, in good condition. The fences need repairing, and a lavatory has yet to be provided. A fair supply of the necessary appliances. 2. Excepting punctuality, the discipline is healthy, and the moral tone pleasing. 3. The Course of Instruction is observed, and the teaching is painstaking and tolerably intelligent. 4. The proficiency varies from tolerable to fair.

WATERLOO (C.E.—Infants) :—Visited, 25th November.

Numbers present at examination :—Boys, 46 ; girls, 49 ; total, 95.

1. A neat weatherboard building erected since last inspection. A shed, a lavatory, and a supply of furniture are wanted. There is a sufficiency of apparatus. 2. The pupils are tolerably regular, but unpunctual. The order is but moderate, owing chiefly to the inadequacy of the teaching power. 3. The instruction is judiciously regulated. The methods are moderately skilful. 4. The average proficiency is tolerable.

WATERLOO (R.C.) :—Visited, 26th and 27th November.

Numbers present at examination :—Boys, 91 ; girls, 55 ; total, 146.

1. The playground is not divided for the sexes, and a lavatory and shed are wanted. Interiorly, the accommodation is good. Considerable additions have been made to the school furniture, and there is a fair supply of working materials. 2. The pupils are very unpunctual, the order is indifferent, and the government is wanting in tact and firmness. 3. The classification is unnecessarily minute. The methods are in part empirical, and but partially effective. 4. The attainments are very moderate.

WOOLLOOMOOLOO (Pres.) :—Visited, 2nd and 3rd December.

Numbers present at examination :—Boys, 79 ; girls, 59 ; total, 138.

1. The material condition of this school has been much improved during the past year. The want of a playground is at present the most serious defect. The furniture is not adequate to the present attendance, and some minor apparatus is required. 2. The pupils are regular and fairly punctual. In the lower classes the order is indifferent, in the upper classes it is fair. 3. The Course of Instruction is observed. The teaching is characterized by fair intelligence and reasonable skill. 4. The attainments are moderate in the two lower classes, and fair in the two higher.

YORK-STREET (Wes.) :—Visited, 19th November.

Numbers present at examination :—Boys, 31 ; girls, 26 ; total, 57.

1. The situation is low, the schoolroom badly lighted, and unprovided with playground or proper furniture. There is sufficient apparatus. 2. The pupils are unpunctual; otherwise, the discipline is passable. 3. The instruction is fairly regulated, and the methods are tolerably skilful. 4. The average proficiency is tolerable.

1869.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COUNCIL OF EDUCATION.

(EMPLOYMENT OF THE HON. GEOFFREY EAGAR, M.P., BY.)

Ordered by the Legislative Assembly to be Printed, 22 October, 1869.

Laid on Table in reply to Question No. 3. See Votes and Proceedings, No. 16, of Friday, 22 October, 1869.

THE SECRETARY TO THE COUNCIL OF EDUCATION to THE PRINCIPAL UNDER SECRETARY.

Council of Education Office,
Sydney, 22 October, 1869.

SIR,

I have the honor, by direction of the Council of Education, to forward herewith the information necessary to enable the Honorable the Colonial Secretary to reply to a question to be asked this day in the Legislative Assembly by Mr. Morrice.

I have, &c.,
W. WILKINS,
Secretary.

3. MR. MORRICE *to ask* THE COLONIAL SECRETARY,—Has the Hon. Geoffrey Eagar, M.P., been employed by the Council of Education; if so, in what capacity, what remuneration, and for what period?

In January last the Council of Education decided to employ an experienced accountant to examine the system of accounts in operation for the conduct of its business, in order to ascertain whether the books in use were sufficient, or whether it was desirable to introduce any change, to render the system more correct and satisfactory. After this decision was arrived at, the names of several professional accountants were considered, and finally the Secretary was instructed to communicate with Mr. Eagar on the subject. On this application being made to him, Mr. Eagar undertook to investigate the state of the accounts, and to embody the results of his investigations, and any suggestions for an improved system that might appear to be necessary, in a report to the Council. In the performance of his duty, Mr. Eagar attended at the office of the Council of Education on forty-nine different occasions, going carefully through the records with the Council's accountant, being occupied on many occasions several hours at a time. Mr. Eagar embodied the results of his examination of the accounts in two lengthy reports to the Council, recommending the adoption of a new system, which was introduced under his supervision. Mr. Eagar was engaged in this duty altogether more than five months. The fee charged was £100, which was paid to him.

W. WILKINS,
Secretary.

1869.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

PUBLIC AND DENOMINATIONAL SCHOOL TEACHERS.
(ALLOWANCE FOR HOUSE-RENT TO.)

Ordered by the Legislative Assembly to be Printed, 29 September, 1869.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 23 March, 1869, That there be laid upon the Table of this House,—

“ A copy of the Memorial from certain Public and Denominational School Teachers, respecting the continued omission of any allowance for house-rent to Non-vested Public, and Certified Denominational School Teachers, presented to the Council of Education on or about the 1st March, 1868 ; and also, copies of all Minutes of the Council in reference to the same subject.”

(Mr. Burns.)

PUBLIC AND DENOMINATIONAL SCHOOL TEACHERS.

THE SECRETARY TO THE COUNCIL OF EDUCATION *to* THE PRINCIPAL UNDER SECRETARY.

Council of Education Office,
Sydney, 31 March, 1869.

SIR,

In accordance with the Honorable the Colonial Secretary's request as contained in your letter dated 24th March instant, I have the honor, by direction of the Council of Education, to transmit herewith a copy of the Memorial from certain Public and Denominational School Teachers, respecting the continued omission of any allowance for rent to Non-vested Public, and Certified Denominational School Teachers, presented to the Council of Education on or about 1st March, 1868; and also, copies of all Minutes of the Council in reference to the same subject.

I have, &c.,
W. WILKINS,
Secretary.

(1.)

JOHN J. SALIER *to* THE SECRETARY OF THE COUNCIL OF EDUCATION.

Sydney, 22 February, 1868.

SIR,

I have the honor respectfully to request that you will lay before the Council of Education, at its next meeting, the enclosed Memorial, adopted at a meeting of Teachers under the Council, held at Fort-street School, on Saturday, the 22nd instant.

I have, &c.,
JOHN J. SALIER,
Chairman of Meeting.

(2.)

To the Honorable the President and Members of the Council of Education.

The Memorial of the undersigned Teachers, employed under the Council of Education,—

HUMBLY SHOWETH:—

1. That your Memorialists are in charge of schools under your Council, and have neither residences provided nor house-rent allowed, and are, on that account, at considerable outlay, ranging in Sydney from £40 to £60, and in the Suburbs from £30 upwards each annually.
2. That most of your Memorialists have made application to their respective Local Boards for house-rent, and have invariably had the reply that "they had no funds out of which such a claim could be met."
3. That your Memorialists desire most respectfully to suggest that the Church and School Estate Fund is a source from which such an allowance as the Council may deem sufficient for the above purpose might be justly paid.
4. Trusting that these premises will be taken into your favourable consideration,—
Your Memorialists, as in duty bound, will ever pray.

James Rutledge.	Marian Agnes M'Garvey.
John J. Salier.	Honoria Duffy.

W. Henry Bayley.	J. Wiley.
James Cooke.	G. O'Byrne.
M. O'Grady.	Alexander Clark.
W. Saunders.	James Maloney.
Geo. Burgess.	Thos. Buchanan.
John Andrews.	James Bardsley.

John J. Salier.

(3.)

Copy of a Minute of Proceedings of the Council of Education, dated 24th March, 1868.

The Council took the undermentioned matter into consideration.

Rent.—Teacher's Memorial, dated 22nd instant, to the Council, praying for an allowance for rent. To be informed that the Council deems it inexpedient to accede to the prayer of the Memorialists.

W. WILKINS,
Secretary.

(4.)

(4.)

THE SECRETARY TO THE COUNCIL OF EDUCATION *to* MR. JOHN J. SALIER.

Council of Education Office,
Sydney, 26 March, 1868.

SIR,

I have the honor, by direction of the Council of Education, to acknowledge the receipt of your letter, under date 22nd February last, covering a Memorial adopted at a meeting of Teachers of schools under the superintendence of the Council, held at Fort-street, praying for an allowance on account of house-rent.

2. In reply, I am instructed to acquaint you that the Council deems it inexpedient to accede to the prayer of the Memorialists.

I have, &c.,

W. WILKINS,
Secretary.

3. The Under Secretary, Colonial Secretary's Department, to the Secretary to the Council of Education. 21 June, 1869	2
4. The Secretary to the Council of Education to the Under Secretary, Colonial Secretary's Department. 26 June, 1869	3
5. The Under Secretary, Colonial Secretary's Department, to the Secretary to the Council of Education. 10 July, 1869	3
6. The Secretary to the Council of Education to the Under Secretary, Colonial Secretary's Department. 5 October, 1869	4
7. The Under Secretary, Colonial Secretary's Department, to the Lord Bishop of Sydney. 27 October, 1869	4

PUBLIC SCHOOLS ACT.

No. 1.

THE LORD BISHOP OF SYDNEY to THE COLONIAL SECRETARY.

Bishopscourt,
13 April, 1869.

SIR,

At the request of the Synod of the Diocese of Sydney, I forward to you a copy of two resolutions passed by that body on Thursday, April 8th, and respectfully solicit your attention to the matter contained in the former of them.

I venture to add the expression of my own opinion that, as the Church of England Denominational Schools are recognized by the law of the Colony, and are usefully engaged in the work of education under the Council of Education, it is not an unreasonable request which the Synod prefers, that these schools should receive more assistance than is now given, in order that they may be enabled to comply with the requirements of the Council.

I have, &c.,
F. SYDNEY,
President.

[Enclosure.]

COPY of Resolutions passed in the Synod of the Diocese of Sydney, Thursday, 8th April, 1869.

1. That, in the opinion of this Synod, it is desirable that the Public Schools Act, 1866, be so amended as to entitle Certified Denominational Schools to receive from the Council of Education the same assistance as is afforded to Public Schools.
2. That the Synod respectfully requests the Bishop, as President, to communicate the foregoing resolution to the Honorable the Colonial Secretary as to him, the Bishop, shall seem most expedient.

F. SYDNEY,
President.

Memorandum by the Colonial Secretary.

Refer to the Council of Education for any observations that to it may seem desirable to be communicated to the Government on the subject.

JOHN R.,
18 May, 1869.

The Secretary to the Council of Education, B.C., 18th May, 1869.—H.H.

No. 2.

THE SECRETARY TO THE COUNCIL OF EDUCATION to THE PRINCIPAL UNDER SECRETARY.

Council of Education Office,
Sydney, 1 June, 1869.

SIR,

I have the honor to acknowledge the receipt of your blank cover memorandum, dated 18th May ultimo, communicating to the Council of Education the minute of the Honorable the Colonial Secretary on a letter from the Lord Bishop of Sydney, transmitting copy of resolutions passed by the Synod of the Diocese of Sydney, on the 8th April.

2. I am instructed by the Council to state, in reply, that the resolutions of the Synod do not appear to apply to the administration of the Public Schools Act, but are rather directed to the re-opening of a question which that Act was supposed to have settled. It would not, therefore, it is conceived, be within the scope of the duties of the Council to offer any opinion on a change of policy in the promotion of public education.

I have, &c.,
W. WILKINS,
Secretary.

No. 3.

THE PRINCIPAL UNDER SECRETARY to THE SECRETARY TO THE COUNCIL OF EDUCATION.

Colonial Secretary's Office,
Sydney, 21 June, 1869.

SIR,

In acknowledging the receipt of your letter of the 1st instant, respecting the resolution of the Synod of the Diocese of Sydney with reference to Certified Denominational Schools, I am now directed to refer the letter of the Bishop of Sydney on that subject, which is accordingly herewith returned with its enclosure, for the further consideration of the Council of Education, in the hope that they will yet afford to the Colonial Secretary the advantage of their advice and experience, and thus assist the Government duly to consider and satisfactorily to answer the letter in question.

2. The Council will, Mr. Robertson feels sure, see that in asking such assistance he is in the only way practicable asking that the Government may have the advantage of the experience and knowledge brought within the Council's reach by means of a numerous staff of highly intelligent and valuable officers appointed and paid by the Government, but with whom it would be irregular for him to communicate directly.

Herewith
returned.

13 April, 1869.

3

3. In view of the sixth clause of the Public Schools Act, which provides that "the Council of Education shall in all matters be subject to the like control by the Governor and Executive Council as any other Department of the Public Service," the Colonial Secretary does not think that even if he asked assistance from the Council, or from any of the large staff of officers under its control, to enable the Government to prepare and satisfactorily to complete a measure for a changed educational policy, the Council could properly refuse on the ground that it does not come "within the scope of its duties to offer any opinion on a change of policy in the promotion of public education"—certainly no other department of the Government would ever think of objecting to assist the Government on such grounds.

4. But Mr. Robertson did not ask anything of the kind. He received a letter from the Lord Bishop of Sydney, conveying certain resolutions of the Synod of the Diocese of Sydney, and expressing the opinion of that distinguished Prelate as follows:—"That as the Church of England Denominational Schools are recognized by the law of the Colony, and are usefully engaged in the work of education, under the Council of Education, it is not an unreasonable request which the Synod prefers, that these schools should receive more assistance than is now given, in order that they may be enabled to comply with the requirements of the Council."

5. Here was a proposition courteously put forward by the Bishop and the Synod of the Diocese of Sydney; and it was, and is, I am to add, the Colonial Secretary's duty to answer it after careful and thoughtful consideration—not necessarily to comply with the wishes in it expressed, but certainly to avoid dealing with it lightly or disrespectfully. Mr. Robertson therefore addressed the Council as the administrative body charged (under the department for which he is the Minister directly responsible to Parliament) with the conduct and management of public education; and sought its assistance to enable him to return a satisfactory reply.

I have, &c.,
HENRY HALLORAN.

No. 4.

THE SECRETARY TO THE COUNCIL OF EDUCATION to THE PRINCIPAL UNDER SECRETARY.

Council of Education Office,
Sydney, 26 June, 1869.

SIR,

I am directed by the Council of Education to acknowledge the receipt of your letter of the 21st instant, referring, by direction of the Honorable the Colonial Secretary, the letter of the Bishop of Sydney, dated the 13th April, and its enclosure, for the further consideration of the Council.

2. It appears to the Council that some misapprehension exists, both as to the nature of its communication of the 1st instant, and its position and functions as defined by law. Upon the resolutions of the Synod of the Diocese of Sydney, transmitted to the Government by the Lord Bishop's letter, the Council considered that it could not with propriety, offer any opinion, as those resolutions merely expressed the desire of the Synod for an amendment of the Act of Parliament, which the Council had been called into existence to administer. I am desired to say that the Council will have pleasure, at all times, in affording to the Government any information in its possession relating to the working of the Act; but it must still adhere to its decision not to incur the responsibility of offering advice on matters of public policy, such as are involved in the resolutions of the Synod.

3. In thus communicating its views the Council disclaims all intention of dealing lightly or disrespectfully with the proposition of His Lordship the Bishop and the Synod of the Diocese of Sydney.

4. The letter of the Lord Bishop of Sydney, with its enclosure, is respectfully returned.

I have, &c.,
W. WILKINS,
Secretary.

No. 5.

THE PRINCIPAL UNDER SECRETARY to THE SECRETARY TO THE COUNCIL OF EDUCATION.

Colonial Secretary's Office,
Sydney, 10 July, 1869.

SIR,

In acknowledging the receipt of your further letter of the 26th ultimo, having reference to the resolution of the Synod of the Diocese of Sydney, on the subject of Certified Denominational Schools,—I am directed by the Colonial Secretary to observe that the Council of Education have left altogether out of sight in their reply the letter of the Lord Bishop of Sydney, which was quoted at considerable length in my communication of 21st June.

2. The Council states, however, that it "will have pleasure at all times in affording to the Government any information in its possession relating to the working of the Act."

3. In the present instance the Bishop claims for certain Denominational Schools more assistance than is now given to them; and bases his claim on the facts of their recognition by the law, and their value as a means of education. The Colonial Secretary will therefore be glad to be informed—

Firstly—What assistance the schools, to which His Lordship refers, have had as compared with other Denominational Schools?

Secondly—What assistance they have had as compared with Public Schools having the same, or nearly the same, number of scholars?

Thirdly—Whether they have all the assistance intended to be provided for them under the law?

4. I am to add that there does not seem to be any present necessity for prosecuting further the discussion which the Council has raised as to the amount of assistance, advice, or help that the Government is entitled to seek from it in the event of a new Education Bill becoming necessary, inasmuch as that contingency has not arisen.

I have, &c.,
HENRY HALLORAN.

No. 6.

No. 6.

THE SECRETARY TO THE COUNCIL OF EDUCATION *to* THE PRINCIPAL UNDER SECRETARY.
Council of Education Office,
Sydney, 5 October, 1869.

SIR,

I have the honor, by direction of the Council of Education, to acknowledge the receipt of your letter, dated 10th July ultimo, in which you request, with reference to the letter of the Lord Bishop of Sydney respecting the resolution of the Synod of the Sydney Diocese on the subject of certified Denominational Schools, that the Honorable the Colonial Secretary may be informed—

1. What assistance the schools to which His Lordship refers have had as compared with other Denominational Schools?
 2. What assistance they have had as compared with Public Schools having the same, or nearly the same, number of scholars?
 3. Whether they have all the assistance intended to be provided for them under the law?
2. In supplying the information requested I am instructed by the Council to remark that the expenditure of the funds placed at the Council's disposal by the vote of the Legislature may be classified under the following heads, viz. :—
1. Erection and repairs of buildings.
 2. School furniture (fixtures).
 3. Rent of teachers' residences.
 4. School books.
 5. School apparatus.
 6. Training school allowances.
 7. Travelling expenses of teachers.
 8. Salaries of teachers.
 9. Inspection of schools.
 10. Forage allowances to teachers.
3. With the exception of the erection and repairs of buildings, school furniture, rent of teachers' residences, and forage allowances, the Council has made no distinction between Public Schools and Certified Denominational Schools, but has given the same amount of pecuniary assistance to all alike.
4. With respect to the first of these matters I am to point out that section 23 of the Public Schools Act prohibits the appropriation of money in aid of building or repairing school premises, unless the site of such premises shall be vested for the promotion of Public Schools in the Council of Education.
5. As regards the supply of furniture the Council desires me to remark that the proportion of the Church and School Estates Revenue available for Denominational Schools may be devoted to this object, at the discretion of the heads of the respective denominations, upon whose recommendation the Council has allotted the amount accruing from that source. The Council has, moreover, agreed that applications for furniture, made on behalf of Certified Denominational Schools which are situated in poor localities, and supply the only means of education in their respective districts, shall be received and considered on their merits.
6. The sums formerly paid to teachers of Public Schools on account of house rent have been discontinued, the Regulation (Article 44) under which such allowances were granted having been altered in the revised Regulations of 8th March, 1869. Public and Certified Denominational Schools are consequently now placed on the same footing in this respect.
7. The forage allowances are granted to teachers of half-time Schools only. These teachers are required to itinerate between two or more localities, and are compelled to keep horses to enable them to perform their duties.
8. It is therefore apparent, from the foregoing statements, that the Certified Denominational Church of England Schools receive the same assistance as all other Certified Denominational Schools, and that they now receive the same assistance as Public Schools, except as regards aid in the erection and repairs of buildings (which is prohibited by law) and in the supply of furniture.

I have, &c.,
W. WILKINS,
Secretary.

No. 7.

THE PRINCIPAL UNDER SECRETARY *to* THE LORD BISHOP OF SYDNEY.
Colonial Secretary's Office,
Sydney, 27 October, 1869.

MY LORD,

With reference to your Lordship's letter of the 13th April last, forwarding copy of resolutions passed by the Synod of the Diocese of Sydney, affirming the desirability of so amending the Public Schools Act of 1866, as to entitle Certified Denominational Schools to receive from the Council of Education the same assistance as is afforded to Public Schools,—I am now directed by the Colonial Secretary to state, for your Lordship's information, that as the result of recent correspondence with the Council of Education, it has been ascertained that the Certified Denominational Church of England Schools receive in common with all other Certified Denominational Schools the same assistance as Public Schools, except as regards aid in the erection and repair of buildings (which is prohibited by law), and in the supply of furniture.

2. With regard to the latter item the Council of Education represent that the proportion of the Church and Schools Estates Revenue, available for Denominational Schools, may be devoted to this object at the discretion of the heads of the respective Denominations, upon whose recommendation they have allotted the amount accruing from that source, and that they have moreover agreed that applications for furniture, made on behalf of Certified Denominational Schools which are situated in poor localities, and supply the only means of education in their respective districts, shall be received and considered on their merits.

I have, &c.,
HENRY HALLORAN.

GENERAL CEMETERY AT NORTH SHORE.

No. 1.

W. TUNKS, Esq., M.L.A., to THE SECRETARY FOR LANDS.

St. Leonards,
12 March, 1867.

SIR,

In accordance with the request of the Premier and yourself, I have made inquiry about Willoughby for land suitable for a general cemetery for this district. I have not been successful in finding any Crown land, but there is abundance of (in my opinion) suitable private land to be had. I herewith forward you a letter from Mr. French, offering a site in a central situation for sale, and which I shall be happy to point out to any person authorized by Government. I am not in a position to offer an opinion as to price.

2 March, 1867.

I would beg your early attention to this matter, as it must be obvious that to convey the dead from the parishes of Willoughby and Gordon to Haslem's Creek for burial, will be inconvenient and even oppressive to many poor families.

I have, &c.,
WILLIAM TUNKS.

Surveyor General. B.C., 19 March, /67.—M.F.

Forwarded to Mr. Licensed Surveyor Armstrong, who will be good enough to confer with Mr. Tunks and examine the locality, and report what portion of Baker or Lamb Farms is offered to the Government as a site for a cemetery, its suitability for the purpose in view both as to situation and soil, and also whether the price the land is offered at is reasonable.

W.R.D.
B.C., 20 March, 1867.

[Enclosure.]

Mr. J. French to W. Tunks, Esq., M.L.A.

2 March, 1867.

Dear Sir,

I attended at the North Shore last Thursday, when I learned that you were away at the opening of the extension of the Southern Railway to Nattai. I trust you enjoyed yourself.

I beg to state that I am willing at present to dispose of the land known as Baker Farm, and the unsold portion of Lamb Farm, at £20 per acre cash, for the purpose named at our recent interview.

I am not in ignorance of the fact that the price per acre named by me is considerably less than what is demanded for land in less favourable situations.

I named this sum, however, under the impression that the land was required to cultivate and otherwise improve. Having named the price, I keep to it; but had I known at the time for what purpose the land was required, I should certainly have asked more.

Of course I shall not bind myself to keep the land open for any length of time at this low price. An early decision in the matter will therefore be necessary.

I am, &c.,
J. FRENCH.

No. 2.

MR. LICENSED SURVEYOR ARMSTRONG to THE SURVEYOR GENERAL.

Sydney, 25 March, 1867.

SIR,

According to your B.C. instructions, dated 20th March, and herewith returned, I have the honor to inform you that I called on Mr. Tunks, who accompanied me to the land offered for sale to the Government by Mr. French, near St. Leonards, as a general cemetery.

Mr. French being absent at Maitland, no one being able to show the two farms alluded to, and Mr. Tunks being unacquainted with the boundaries, I had great difficulty to fix on the spot, not being fenced in; but from one or two labourers, and a tracing in my hand, I could identify the place pretty nearly. We examined the land all round, and I have shown on the accompanying tracing*, by a blue tint, one spot, part of Baker's farm alluded to, and another, tinted green, part of two allotments lately marked out by Government for sale, but withdrawn, as the most eligible with regard to soil, the undulating form of the ground, and not too near the steeper land adjoining the creek, where some ironstone showed itself.

* Appendix A

Lamb's 25 acres is not a desirable spot for a cemetery, because the land falls more rapidly, and the wash from it towards other small farms might be objected to.

The soil at both of the spots I have pointed out roughly consists of clay and ironstone grit on the surface. I have no doubt the subsoil is also clay, and some ironstone bands through it. I have not yet dug down to try it. There is only sapling timber growing; all the large timber has been cut down.

On Mr. French's return from Maitland, I beg to suggest that he be requested to point out to me correctly the land he offers, and if he has a plan, to allow me to inspect it, Mr. Tunks being unable to define it properly.

The

The price per acre (£20 cash) is I think too much for that locality—£5 per acre is about the value. The rough forest land lying back in that part of the country is said to fetch £3 per acre. If the Government (when the land is more clearly pointed out to me by Mr. French) do not come to terms with him, I beg respectfully to submit for your consideration an *alternative*—that Mr. Berry be applied to, to sell sufficient land adjoining the present Church of England Burial Ground at A, which he gave them, to make a general cemetery.

It is to be hoped that for such a purpose he would not ask too much.

I have, &c.,
JOHN ARMSTRONG,
L. S.

No. 3.

THE CHIEF DRAFTSMAN to MR. LICENSED SURVEYOR ARMSTRONG.

Memorandum of instructions.

Mr. Licensed Surveyor Armstrong is requested at his early convenience to measure Peter Dargan's 25 acres and Humphrey Evans' 25 acres, in the positions (approximately) shown by red dots on the accompanying tracing.* A space for J. Williamson's 44 acres, and H. Asser's 30 acres, and T. Jennings' 30 acres, is also to be left in the position shown by green edging, and Mr. Armstrong will accordingly be good enough to mark off 104 acres accordingly. *Appendix B.

Mr. Armstrong will also be good enough to test the fitness of the land indicated by a green tint on the tracing furnished by his letter of 25 March for the purposes of a cemetery, and if found suitable lay out in the usual way 16 or 20 acres for the purpose.

Mr. Armstrong will also have the goodness to consult with the Chairman of the Municipal Council of North Willoughby, and lay out the usual areas for Pound—for Municipal Buildings—and, if applied for by the proper authorities, for Churches and Schools.

JOHN S. ADAM.
(For Surveyor General.)
22 April, 1867.

Replied to by my letter dated 24 September, 1867.

No. 4.

R. HARNETT, Esq., to THE SECRETARY FOR LANDS.

Gore Hill, North Shore,
20 September, 1867.

SIR,

I have the honor to enclose a petition signed by myself and 104 landowners and residents in this district, against the proposed site for a cemetery near Gore Hill on the North Shore, and recommending that a certain creek be reserved for the purposes of water supply.

I have, &c.,
R. HARNETT.

Surveyor General, B.C., 24 Sept.—M.F.

Mr. L. S. Armstrong, for report at his earliest convenience. J.S.A., for Surveyor General.—
22 October, 1867.

[Enclosure.]

The humble Petition of the undersigned residents and landowners in the parishes of Willoughby and Gordon on the North Shore respectfully sheweth:—

That your petitioners have learned with anxiety and alarm that Mr. Surveyor Armstrong, acting in pursuance of instructions received from the Surveyor General, has been engaged marking out as a site for a public cemetery about sixteen or twenty acres of land with a frontage to the main road leading from Sydney to Lane Cove, and contiguous to land on the North Shore known as "Gore Hill."

That the township of St. Leonards numbers upwards of 2,000 inhabitants, and that the parishes of Gordon and Willoughby, including North Sydney, contain upwards of 500 inhabitants.

That any general cemetery which may be opened will be the place of sepulture not merely of the immediate residents, but also of those persons residing in the township of St. Leonards and of other townships growing up in the district.

That in the nature of things, and having regard to the population, any cemetery which may be opened on this side of the Shore will receive a considerable annual percentage of burials.

That the proposed site is on the main thoroughfare between Lane Cove and Sydney, over which there is considerable traffic, and on this account alone would not be pleasant to the feelings of your petitioners, while it would be calculated to impair the public health.

That the proposed site is the centre of a populous and increasing district.

That the proposed site presents objections of a local nature.

That the ground on which it is proposed to place the cemetery abounds with springs, and is situate near the source of a fine creek of beautiful fresh water which traverses a considerable portion of the district before uniting with the "Flat Rock" and other creeks which fall into Middle Harbour.

That a considerable proportion of your petitioners are dependent upon and supplied with fresh water for the use of themselves, their families and cattle, &c., from the creek referred to and its tributaries or confluents.

That the creeks referred to are the sole means of water supply to the majority of your petitioners.

That your petitioners are all equally interested in this matter, as they feel that what is calculated seriously to impair the health of one portion of the inhabitants on this side of the Shore must necessarily affect the whole.

That it has been decided by the authority of eminent medical men that nothing is calculated to contribute more to sickness and disease than bad water.

That it has been decided by like authority that cemeteries do seriously affect the water in their neighbourhood, by *drainage* and percolation of impure and pestiferous matter.

That

That your petitioners are further supported in their views by the evidence taken in a recent inquiry respecting the burial ground at Randwick.

That there are at present no less than *four* cemeteries at the North Shore, and the one now proposed will make the *fifth*. That the creek referred to affords a never-failing stream of pure water in all seasons.

That considering its position, and that there is no similar stream within several miles upon the same line of road, your petitioners are of opinion that it would be conducive to public interests to reserve the creek for the purposes of *water supply*; and your petitioners beg leave to bring the fact under your serious consideration, in the hope that a benefit so desirable and necessary may be conferred upon your petitioners, by the creek being reserved accordingly and the cemetery put in another place.

That questions of a sanitary nature have always received mature consideration at the hands of Government, and that the recent Act of the Legislature, 30 Victoria, No. 3, prohibiting interments in the public cemetery in Sydney, and a further Bill now before Parliament having a similar object, are precedents of paternal regard in this behalf.

That your petitioners are informed and verily believe that the Government have other land at their disposal for the purposes named not having the many objectionable features presented by that of the proposed site.

Your petitioners humbly trust that in the exercise of your high and important office you will be induced to take the premises into your serious consideration; and that you will grant them such immediate relief as the exigencies of the case require. And your petitioners, as in duty bound, will ever pray.

[Here follow 104 signatures.]

No. 5.

MR. LICENSED SURVEYOR ARMSTRONG to THE SURVEYOR GENERAL.

Sydney, 24 September, 1867.

SIR,

*Appendix C.

According to your memorandum of instructions, dated 22 April, 1867, and herewith returned, I have the honor to transmit the plan* of 104 acres at North Willoughby, having surveyed and fixed the same in the positions pointed out by you. I had some difficulty in doing so, the original work having been performed by different surveyors, namely:—Mr. Mehan, Mr. Burrows, Mr. Drake, and Mr. Knapp, sen. The whole is now well marked, and the corners are staked and lock-spitted.

Not required.
Not required.

I have also examined the neighbourhood as to the fitness of a spot for a cemetery, and found it very difficult to obtain enough of suitable soil for the purpose lying altogether. I could therefore only take in, in one spot, 12 acres 3 roods 35 perches, which consists generally of good dry loam and free from rock; also of easy access, fronting the road from St. Leonards to Lane Cove. It is all strongly marked, and at the corners are lettered stakes and lock-spits. I herewith transmit a plan of it on a large scale.

I have likewise surveyed and marked out and transmit the plan of the 25-acre grant to Humphrey Evans, and the 25-acre grant to Peter Dargan, in the way directed by you, deducting the area of the public road passing through them.

I beg to add that, according to your directions, I consulted Mr. Bligh, the Chairman of the Municipality of North Willoughby, pointing out all you required me to do. He was well satisfied.

I have, &c.,
JOHN ARMSTRONG,
Licensed Surveyor.

No. 6.

MR. LICENSED SURVEYOR ARMSTRONG to THE SURVEYOR GENERAL.

Sydney, 24 October, 1867.

SIR,

According to your B.C. instructions, dated 22 October, 1867, and now returned, I have the honor to report, as directed, on the petition of certain persons on the North Shore, against the proposed cemetery at North Willoughby.

As to the site, I consider it is of easy access from every direction—the position is central. If it was any distance from the Lane Cove Road, which runs for miles most conveniently along a main ridge, it would then most probably have to be approached by some awkward by-road or over some gully. As to its being not pleasant to the feelings of the petitioners because one side touches on the Lane Cove Road, it may be remarked that other cemeteries which can be named have been so placed for the general convenience.

Although the proposed cemetery may be said to be contiguous to the cultivation paddock and cottage, &c., called "Gore Hill," it is on the other side of a ridge of land and out of sight, and no actual detriment can therefore occur to it.

See enclosure
to No. 1.

The proprietor of that place considering he had a claim to this very spot, only a short time ago, offered it to the Government at a certain sum per acre, being aware of the purpose to which it was to be applied. (*Vide* his letter and offer.)

The allegation that the spot *abounds with springs* is very incorrect; it is, on the contrary, sound ground, the soil is good loam with an occasional spot of ironstone grit, and there is fortunately no rock.

The two small insignificant gutters, or they may be called slight indentations of the surface, have no water—it is only grass or some trifling scrub. Neither of them even when they meet form themselves into a creek till a good way down.

I am confident that any unbiassed person viewing the ground would say it is a most suitable spot in every way.

The water in the creek, when you begin to meet any as you go down, is generally brackish, and I refused to drink it even as far down as "the Flat Rock" crossing-place itself. I cannot think it can be so much resorted to as alleged—I witnessed nothing of the kind. Mr. Tunks, M.L.A., pointed out this spot to the Government as the most eligible that could be found. I accompanied him to view it, and coincided in his opinion without hesitation; other intelligent persons on my application to them concurred in the same opinion, observing that there was no other spot so suitable on the Crown land, being chiefly rock and sand.

As

As to the evil apprehended of the *draining* or *percolation* from such firm soil and so nearly level with those blind creeks passing through barren unimproved and unenclosed land, I am of opinion it is too remote to be entertained.

Lastly, looking at that thinly populated part of the country, surely this cemetery will avail for a very long period; and if as alleged there are four other cemeteries laid out on the North Shore, this one will not be required to be much used for years to come.

I have, &c.,
J. ARMSTRONG,
L. S.

The report of Mr. L. S. Armstrong on the petition against the cemetery at North Willoughby is forwarded for the information of the Honorable the Secretary for Lands. From the various reasons set forth in that report, I am of opinion that the objection of the petitioners against the site as a cemetery are not valid; that the land is suitable, and should be granted for the purpose in view.

Under Secretary for Lands.

W.R.D.
B.C., 26 Oct., 1867.

No. 7.

THE UNDER SECRETARY FOR LANDS to R. HARNETT, Esq.

Department of Lands,
Sydney, 21 November, 1867.

SIR,

In reference to your letter of the 20th September, forwarding a petition signed by certain residents in the parishes of Willoughby and Gordon, North Shore, praying that the intention to appropriate for a cemetery a portion of land at Gore's Hill, on the Lane Cove Road, may be abandoned,—I am directed to inform you that, from a report which has been received from the Surveyor General, it appears that the land in question is the most suitable for the purpose that could be found, and that it is not open to any of the objections urged in the petition.

2. Under these circumstances, the Minister for Lands has decided that the land may be dedicated to the purpose contemplated.

I have, &c.,
M. FITZPATRICK.

No. 8.

W. TUNKS, Esq., M.L.A., to THE SECRETARY FOR LANDS.

St. Leonards, 23 April, 1868.

SIR,

I beg to inform you that there are persons daily cutting and carrying away timber from off the land lately dedicated for a general cemetery at the North Shore, and that I have called the attention of the Crown Lands Commissioner, Mr. James Deane, to the fact, who (I am informed by the Sergeant of Police resident here) visited the spot yesterday, but took no steps to punish or even discontinue the trespass complained of, because the persons whom he caught cutting wood were employed by a person who had, or was supposed to have, a license to cut timber on Crown Lands. I therefore request your prompt interposition in this matter, to prevent the trees from being destroyed. It surely was never intended that licenses to cut timber on Crown Lands should be issued for operating upon such places as the reserve alluded to, or the small quantity of public land adjoining to it. I am anxious, until the formal dedication is completed and Trustees are appointed, that in this cemetery the growing trees should be preserved, as a number of them, in my opinion, ought to be left standing for the purpose of shade and ornamentation; but if the indiscriminate cutting them down is permitted, it will prevent that being properly done—besides which, such trees as it will be necessary to remove can be easier rooted out while their tops remain intact than taking out the mere stumps, and the firewood thus obtained could be sold and the proceeds applied towards the expense of clearing the land; but taking out stumps only would be laborious, and the wood from them worthless. These considerations are forced upon me, as I am aware that our local exchequer is empty, and we have but slender means of replenishing it.

I have, &c.,
WILLIAM TUNKS.

Request the Mayor of North Willoughby to protect the cemetery until Trustees are appointed.

MINUTE OF THE EXECUTIVE COUNCIL.

Department of Lands,
Sydney, 18 April, 1868.

For Schedule see
Government
Gazette Notice,
19 May, 1868,
No. 13.

THE enclosed Schedule of lands set apart for religious and other public purposes is recommended for the approval of His Excellency the Governor and the Executive Council,—one month, as required by law, having elapsed since Abstracts of the same were laid before Parliament.

J. BOWIE WILSON.

Clerk of the Council, B.C., 18 April, 1868.—M.F.

The Executive Council are not aware of any objection to the dedication of the several portions of land set forth in the Schedule accompanying this Minute to religious and other purposes, and advise accordingly.

VERE HUNT,
Acting Clerk of the Council.

Minute 68/19—23 April, 1868.

Confirmed, 4 May, 1868.

Approved. B.—6/5/68.

No. 13.

NOTICE IN GOVERNMENT GAZETTE.

Department of Lands,
Sydney, 19 May, 1868.

HIS Excellency the Governor, with the advice of the Executive Council, has been pleased to dedicate the Crown Lands hereunder described to the several public purposes mentioned in connection therewith, an Abstract of such intended dedication having been duly laid before Parliament, in accordance with the 5th section of the Crown Lands Alienation Act of 1861.

J. BOWIE WILSON.

EXTRACT from Schedule of Crown Lands authorized to be dedicated to religious and public purposes, in accordance with the 5th section of the Act 25th Victoria No. 1.

Place.	County.	Allotment.	Section.	Locality.	Area.	To what purpose dedicated.
Willoughby North ...	Cumberland	Parish of Willoughby, on the road from St. Leonards to Lane Cove and Pennant Hills.	a. r. p. 14 3 24	General Cemetery.

No. 14.

W. TUNKS, Esq., M.L.A., to THE SECRETARY FOR LANDS.

St. Leonards, 1 June, 1868.

SIR,

I beg to inform you that I have applied (see copy of letter marked A enclosed) to the different denominations of religion residing at St. Leonards to nominate lay Trustees for the Crown Lands lately dedicated for a general cemetery for this district, but no names have been suggested to me. I however have received replies to my letter—copies herewith forwarded, marked respectively A 1 and A 2. I subsequently wrote to the Municipal Councils of Willoughby (see copy of letter marked B enclosed), and have received replies—copies marked respectively B 1 and B 2; and as Mayor of the Municipal Council of St. Leonards, I am authorized in stating that that Council is willing to co-operate with the other Councils as Trustees of the cemetery alluded to. I therefore respectfully request that the Municipal Councils of St. Leonards, East St. Leonards, and North Willoughby, may be appointed as Trustees for the before-named cemetery, and that the usual trust deed may be issued at once.

I have, &c.,

WILLIAM TUNKS.

[Enclosures.]

A.

W. Tunks, Esq., M.L.A., to The Rev. W. B. Clarke and others.

St. Leonards, 27 January, 1868.

Rev. Sir,

I beg to inform you that on application the Government consented to dedicate for a general cemetery about fifteen acres of land, situated at Gore's Hill, and bounded by the Lane Cove Road, at the turn opposite Mr. Parker's residence, and that a portion of the same land has been, as I understand, divided in quantity in proportion to the numbers of the principal denominations of religionists, as exhibited by the last Census, leaving however a considerable space for a "general cemetery" and a "proposed extension" within the general enclosure, and for each allotment Trustees are required. I have therefore to request you to be good enough to suggest to me the names of such number of lay gentlemen willing to act as Trustees for the land allotted as a burying place for the Church of as may be deemed necessary. I have been informed that the Government will pay the expense of the exterior fencing and permanently marking the boundaries of the interior divisions only.

The powers of the proposed Trusts are not at present I believe defined by legislative enactment, but the land is given to the Trustees in such a way as to enable each Denomination or Trust to frame its own rules; and a scale of charges, which, when approved by the Governor and Executive Council, have sufficient force to accomplish the object intended; and such rules, &c., have in many places in this Colony been found in practice to work satisfactorily.

The land alluded to is apportioned as under, viz. :—

	a.	r.	p.
Church of England	3	1	22
Church—Roman Catholic	2	0	0
„ Presbyterian	0	3	0
„ Wesleyan	0	2	0
„ Independent	0	0	20
„ Jews	0	0	8
General cemetery	3	3	18
Proposed extension	2	1	7
Dividing road, say	2	0	5
	15	0	0

I have, &c.,

WILLIAM TUNKS.

Addressed

Rev. W. B. Clarke, C.E.
 Rev. John Kenny, R.C.
 Rev. C. Atchison, P.
 Rev. Mr. Lamb, Wesleyan.
 Rev. Mr. Brown, Independent.
 Mr. John Jones, Jew.

Delivered 28th January, 1868.

A 1.

The Rev. W. B. Clarke to W. Tunks, Esq., M.L.A.

Parsonage, 31 January, 1868.

My dear Sir,

Mr. A Gordon, the Bishop's Chancellor, would be glad to see you on the subject of the letter I had the honor of receiving from you respecting the acceptance of the burial ground proposed to be allotted to the Church of England at Gore's Hill.

Believe me, &c.,

W. B. CLARKE.

A 2.

The Rev. John Kenny to W. Tunks, Esq., M.L.A.

St. Leonards, 5 February, 1868.

Dear Sir,

I have to thank you for informing me that the Government has been pleased to grant a piece of ground near St. Leonards for a general cemetery, allotting two acres for the Roman Catholics. If I knew the number of Trustees required by the Government, I would send in the names of those who would consent to act. I wish to see the ground and the portion that is set apart for the Catholics. I have been credibly informed that five acres have been appointed to the Church of England. Now, if they get five acres, I think the Catholics are entitled to three at least. Please inform me if I correspond with you in this matter in your capacity of Chairman of the Municipal Council.

I have, &c.,

JOHN KENNY.

B.

B.
W. Tunks, Esq., M.L.A., to The Mayor of East St. Leonards and North Willoughby.
St. Leonards, 11 March, 1868.

Sir,
I beg to inform you that the Government have promised to dedicate for a general cemetery about 15 acres of land, near Gore's Hill, on the Lane Cove Road, opposite Mr. Parker's residence. The land alluded to is surveyed and apportioned, I believe, in accordance with the last Census, as under, viz. :—

	a.	r.	p.
Church of England	3	1	22
„ Roman Catholic	2	0	0
„ Presbyterian	0	3	0
„ Wesleyan	0	2	0
„ Independent	0	0	20
„ Jews	0	0	8
General cemetery	3	3	18
Proposed extension	2	1	7
Dividing road, say	2	0	5
	15	0	0

The Government will, I am informed, fence in the land and permanently mark the interior boundaries of the division. I have been requested to nominate lay Trustees, and with the view of obtaining acceptable persons, have written to the heads of the different denominations of religion in this district, asking them to suggest to me names of gentlemen willing to act for them respectively, but the replies which I have received are, I regret to say, not so satisfactory as I could have desired; indeed I am now of opinion that from the sparseness of the population a practical difficulty will arise as to meeting the cost of management amongst the religious denominations, and that the general public would rather that the Municipal Councils should take the general control into their hands. I therefore request you to be good enough to ascertain whether your Council be willing to co-operate with the other Municipal Councils of Willoughby, and undertake jointly the management of the proposed cemetery. The cost (if deemed necessary to incur any) may be borne in proportion to population or to persons buried, or by some equitable plan to be hereafter arranged. I am authorized in stating that the Municipal Council of St. Leonards are willing to act in this matter, and I propose communicating simultaneously with the Mayor of North Willoughby on the same subject. I am aware that some of the religious bodies concur in the suggestion now made by me, and I have reason to believe that the majority of them will not object to it.

I have, &c.,
WILLIAM TUNKS.

B 1.
The Mayor of North Willoughby to W. Tunks, Esq., M.L.A.
Municipality of North Willoughby,
5 May, 1868.

Sir,
I beg to inform you that the Council agrees to co-operate with the other Councils of Willoughby in managing the matter referred to in your letter.

I have, &c.,
D. BROADFOOT,
Mayor.

B 2.
East St. Leonards, 16 May, 1868.

Sir,
I am directed by the Mayor of East St. Leonards to inform you that at a special meeting of this Council held on the 15th instant, it was resolved that this Council agrees to co-operate with the Municipal Council of Willoughby and St. Leonards in the management of the land dedicated to the public for a general cemetery at Gore's Hill.

I have, &c.,
HENRY CUBITT,
Council Clerk.

THE UNDER SECRETARY FOR LANDS to THE VERY REV. S. J. A. SHEEHY, V.G.
Department of Lands,
Sydney, 6 July, 1868.

VERY REV. SIR,
It having been represented by Mr. W. Tunks, M.L.A., that owing to the sparseness of the population of the district, it is desirable that the Borough Council of St. Leonards, East St. Leonards, and North Willoughby should be appointed Trustees of the land at North Willoughby dedicated for a general cemetery, I am directed to request that you will be good enough to inform whether His Grace Archbishop Polding has any objection to offer to this arrangement.

I have, &c.,
M. FITZPATRICK.

Similar to Secretary to Lord Bishop of Sydney.

THE VERY REV. S. J. A. SHEEHY, V.G., to THE UNDER SECRETARY FOR LANDS.
Vicar General's Office,
10 July, 1868.

SIR,
In answer to your letter of the 6th instant inquiring whether His Grace the Archbishop has any objection to the appointment of the Borough Councils of St. Leonards, East St. Leonards, and North Willoughby, as Trustees of land at North Willoughby dedicated for a General Cemetery,—I have the honor to state that, as it does not appear that any portion of the said cemetery is to be assigned to the use of Roman Catholics, they can have no interest in it, and His Grace, therefore, sees no reason for offering objection or approval in the arrangement proposed.

I have, &c.,
S. J. A. SHEEHY, V.G.

Inform the Vicar General that the cemetery does include the usual portion for Roman Catholics. If such had not been the case, of course he would not have been applied to on the subject.

J.B.W.—17 July.

No. 19.

THE VERY REV. S. J. A. SHEEHY, V.G., to THE UNDER SECRETARY FOR LANDS.

Vicar General's Office,
28 July, 1868.

SIR,

With reference to your letter of the 25th instant, informing me that the general cemetery at North Willoughby does include the usual portion for Roman Catholics, and stating further that if this had not been the case I should not have been applied to on the subject,—I beg you will allow me to point out that this latter consequence was by no means clear until I had the honor of receiving your assurance on the subject.

If I may be permitted to refer to your letter of the 25th March last, inviting the nomination of a Trustee for a general cemetery at the junction of the Old with the New South Head Road, you will observe that after having in my letter of the 31st March made special inquiry, and only then, I was informed that no portion had been set apart for Roman Catholics. You will see therefore that I was justified in not drawing from the mere fact of your communication a conclusion which I had already experienced not to be certain.

With respect to the proposal of Mr. Tunks for the general cemetery at North Willoughby, His Grace the Archbishop regrets that he has it not in his power to comply with a measure that seems to offer some facilities; but custom and the responsibilities of a Trustee of land for Catholic ecclesiastical purposes, do not warrant him in naming as Trustee any other than a Catholic.

I have, &c.,
S. J. A. SHEEHY, V.G.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

WILLIAM HEARD.

(PETITION OF.)

Ordered by the Legislative Assembly to be Printed, 29 September, 1869.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales in Parliament assembled.

The humble Petition of William Heard, of Dowling-street, in the City of Sydney, late Overseer of the Necropolis, Haslem's Creek,—

HUMBLY SHEWETH:—

That your Petitioner was appointed, on the 3rd November, 1862, by the then Minister for Lands, the Honorable John Robertson, as Sheep and Cattle Inspector for Corowa.

That owing to the Sheep and Cattle Act having expired in about thirteen months after, your Petitioner had to return to Sydney, and was by the then Secretary for Lands, the Honorable J. B. Wilson, promised other employment as soon as a suitable vacancy occurred.

That your Petitioner, in consideration of this promise, made application and was appointed on the 1st January, 1865, as Working Overseer and Care-taker of the Necropolis, Haslem's Creek, at a salary of £104 per annum, with a residence in the lodge.

That your Petitioner has always been attentive and diligent in the performance of such duties, as certified by Mr. Moore, the Trustees, and others visiting the Necropolis.

That, on the 19th February, 1869, your Petitioner received a notice from Mr. Moore, purporting to come from the Honorable the Minister for Lands, that his services were to be done away with on the plea of economy, and that your Petitioner was to leave and give up of his charge on the 28th day of the said month.

That your Petitioner, after he had received the said notice, was informed that a young unmarried man from the Botanic Gardens, named Robert Nicol, was nominated and afterwards appointed his successor, and was to occupy the aforesaid house and premises.

That your Petitioner, by the direction of Mr. Moore and the Honorable the Minister for Lands, gave up quiet possession of the said house and premises, tools, implements, &c., to the said Robert Nicol, on the 24th day of May, 1869.

That your Petitioner has only received salary for March, although Mr. Moore was aware that your Petitioner continued working on the premises three months under his superintendence.

That your Petitioner has been summarily deprived of his situation on the plea of economy, and his family left unprovided for, while another has been appointed in his place at the same salary.

That your Petitioner feeling that a gross injustice has been inflicted upon him as a public officer of four years and six months services, and being twenty-eight years a resident of the Colony:

Your Petitioner therefore humbly prays, that your Honorable House will take his case into your honorable consideration, and grant him such relief as your Honorable House shall seem meet.

And your Petitioner, as in duty bound, will ever pray.

WILLIAM HEARD.

1869.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

GEORGE SWINNERTON YARNTON.

(PETITION OF.)

Ordered by the Legislative Assembly to be Printed, 19 October, 1869.

To the Honorable the Speaker and Members of the Legislative Assembly, in Parliament assembled.

The humble Petition of George Swinnerton Yarnton, of Sydney, solicitor,—

SHOWETH :—

That on the 1st day of February, one thousand eight hundred and fifty-nine, your Petitioner relinquished his position as a practising solicitor in the City of Sydney, and accepted the office of Registrar of the Metropolitan District Court.

That on the twenty-eighth day of January last your Petitioner received a communication from the Secretary to the Crown Law Officers, intimating that your Petitioner had been removed from his said office, provision for his salary having ceased.

That your Petitioner has made repeated applications for compensation for the loss of office, but without success; your Petitioner being advised that it has for many years past been the invariable practice on the removal from office of a public servant, to grant a compensation proportioned to the length of his service and the amount of salary received by him.

Your Petitioner therefore prays that your Honorable House will take this case into your favourable consideration, and grant your Petitioner such relief as the justice of the case shall require and as to your Honorable House shall seem meet.

And your Petitioner shall ever pray, &c.

GEORGE S. YARNTON.

Sydney, 30 September, 1869.

1869.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MUSIC AND DANCING IN LICENSED PUBLIC HOUSES.

(PETITION—CERTAIN MOTHERS AND DAUGHTERS SYDNEY AND SUBURBS.)

Ordered by the Legislative Assembly to be Printed, 30 September, 1869.

To the Honorable the Legislative Assembly in Parliament assembled.

The Petition of the undersigned Mothers and Daughters in the City of Sydney and Suburbs,—

RESPECTFULLY SHEWETH :—

That, as Mothers and Daughters, your Petitioners take a great interest in the welfare of this community, and are deeply impressed with the conviction that much of the immorality and vice too prevalent in this City and Suburbs is to be attributed to the present state of the Law regulating Licensed Public Houses, and to the practice which is so prevalent of allowing Publicans to have Music and Dancing in their Licensed Public Houses, thereby holding out strong temptations to the youth of both sexes to dissipate their means, injure their health, and in all probability ruin themselves and families by inducing them to frequent such Public Houses and indulge in intoxicating drinks.

Your Petitioners therefore humbly pray, that your Honorable House will be graciously pleased to pass a Law prohibiting Publicans having Music and Dancing in their Licensed Houses.

And your Petitioners, as in duty bound, will ever pray, &c., &c.

Dated at Sydney, this 29th day of September, 1869.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

BASE LINE FOR TRIANGULATION OF NEW SOUTH WALES.

(PROGRESS REPORT FROM GEORGE R. SMALLEY, ESQ., GOVERNMENT ASTRONOMER.)

Ordered by the Legislative Assembly to be Printed, 29 September, 1869.

THE GOVERNMENT ASTRONOMER to THE PRINCIPAL UNDER SECRETARY.

SIR,

I have the honor to forward, for the information of the Honorable the Colonial Secretary, a Progress Report of the measurement of the Base Line at Lake George for the Triangulation of New South Wales.

1. In the Estimates for 1867 the Parliament voted £1,000 for the measurement of the Base Line for Triangulation, and a further grant of £500 made in 1868.

2. My first official instructions from your Department to act in this matter were dated 16th January, 1867; and in accordance with these instructions, I placed myself in communication with the then Surveyor General; and the result of a conference between that gentleman, his Deputy (now Surveyor General), and myself, will be shown in the copy of an appended Minute agreed to by us on that occasion.

3. The results of inquiries made by District Surveyors in different parts of the Colony fully bore out my predilections in favour of Lake George being the best site for a base line; and in July, 1867, Mr. Adams and I met Mr. District Surveyor Twynam at the lake, and after a careful examination, unanimously agreed that no better site could be conveniently selected.

4. Previous to this I had written to the Astronomer Royal for England, to obtain for the New South Wales Government the loan of two very valuable and useful instruments which had been previously employed in similar operations. With Professor Airy's usual kind readiness to forward any useful scientific work, this application was acceded to. I regret to say that these instruments were submerged when the ship "John Duthie" was scuttled in Port Jackson, and they had, at a considerable expense, to be thoroughly cleaned and set in order by Mr. Tornaghi, the optician; but I do not believe that there has been any permanent damage to them.

5. In March, 1867, I proceeded to Melbourne, for the purpose of examining the mode of carrying on the Trigonometrical Survey in Victoria, and likewise to negotiate for the loan of some apparatus, which was readily granted. At the same time I was fortunate enough in recovering some well-seasoned pine bars belonging to the Government of New South Wales, and which appear to have been sent out some thirty years ago to the Government of Tasmania, and afterwards, through some mistake, deposited at the Lands Office in Melbourne.

6. I may observe that I have long felt convinced that *well-seasoned* pine bars, with such arrangements as I have adopted for determining accurately the distance between each pair, are quite, if not more reliable than the very complicated compensation bars, which would have been an enormous expense, and required a much larger staff to work them than I have at my disposal; and this opinion is sustained by those of highly scientific and practical men. I believe that the hygrometrical and thermal changes will be almost inappreciable; but as a full account of the *modus operandi* and results will be furnished in my Final Report, I presume that I need not enter further into details on the present occasion.

7. The remainder of 1867 and early part of 1868 was employed in making the preliminary arrangements, and mounting the ten-foot standard bar of the Colony, which had been placed in my charge at the Observatory. Considerable time and expense was incurred in getting things up to the lake, so that it was not until nearly the end of May, 1868, that systematic operations were commenced.

8. The first work to be performed was the selection of the actual line, and in doing so it was necessary to keep it—

- (1.) As level as possible.
- (2.) Sufficiently removed from the swampy margin of the lake.
- (3.) To cross two creeks at the narrowest points consistent with the other conditions, so as to diminish as much as possible the expenditure of time and money in building the necessary bridges.
- (4.) It was necessary to clear the whole line of trees, so as to afford an uninterrupted view from end to end, and allow free passage for the bars and tents; also, to make extensive clearings, so as to obtain a view of the primary stations from the ends of the line.

All this has been satisfactorily effected.

9. At the commencement of operations, my force consisted of a carpenter, cook and hutkeeper, and two general workmen. It soon, however, became evident that this was quite insufficient for the purpose; so that, in August last, I had to obtain the assistance of Mr. Frank Russell to take charge of my camp, and carry out my instructions during my occasional and necessary absence. I had also to obtain the assistance of two day labourers and a boy, especially to assist in felling the heavy timber on the line and hills.

10. The length of the base line is about 5 miles 64 chains and 72 links, the ends are not liable to inundations, and the line itself is indicated by five nearly equidistant solid stone pillars, resting about $3\frac{1}{2}$ feet beneath the surface, on granite foundations—having let into the upper surface a solid brass plug with a fine platinum dot inserted—this again protected by a brass plate screwed over it, and again by a massive stone cap over the whole. These marks afford a lasting record of the operations, and will, when the final measurement is completed, be still further protected by stone structures, and I hope a moderate space around them reserved to the Crown. Doubtless these pillars and the expenses attending them have cost a great deal, but I think their value is quite commensurate with the outlay. In measuring a base line, it is of the greatest importance that in future generations some one should be able to verify it; yet this is rarely possible. I may instance La Caille's base line at the Cape of Good Hope—a fine line, but not to be identified for want of permanent records. Sir Thomas Mitchell's small base line on the Botany Sands; also his measured check line somewhere near Lake George. Now if any one, or even two of these pillars should at some future time be lost, the remainder known to have the platinum dots in a straight line, as nearly as science can bring them, and with the records of the entire work to refer to, would be quite sufficient to enable future surveyors to verify the work now in progress.

11. The next work was the selection of primary stations; and here I may observe that the necessary conditions are—

- (1.) That the triangles connecting them with the extremities of the base line should be as nearly as possible equilateral.
- (2.) That both ends of the base line should be visible from each of the primary stations.
- (3.) That the primary stations should command good secondary stations.

There was no difficulty about the one on the eastern side of the line, as the present Surveyor General, Mr. District Surveyor Twynam, and myself, were unanimously of opinion that the one selected could not be surpassed; but I had great difficulties to contend with in finding a suitable primary station on the western side of the lake. Several weeks were spent in examining the mountain ranges, and clearing intermediate hills, before I could select one answering the required conditions. Happily I succeeded in obtaining a station nearly equal to the one on the east of the line.

12. I considered it important that on each of these hills should be erected a substantial stone column, about 15 feet high, to serve not only as permanent marks, but also as being of great value in measuring the primary and secondary triangles. One of these is completed, and the other will be finished shortly. A scaffold surrounds the pillar, and on the top is formed a convenient place for observing. The whole is surmounted by a white cone, which forms a well-defined object, visible at a very considerable distance.

13. I have dwelt at some length upon these primary stations, because owing to the heavy and unforeseen expense incurred over them, especially in the extensive clearing of trees, the whole of the vote for base line measurement is exhausted, and it will be necessary to obtain a fresh supply in order to complete the work; this, with favourable weather, I trust to do within three months. It would probably have been finished now, but for the time I was obliged to devote to the boundary between New South Wales and South Australia; but even as it is, with the drawbacks there have been, I am satisfied the time occupied will not be found excessive.

14. On the Estimates for the present year there is a vote to the Lands Department of £500 for *commencement of triangulation*; and I would respectfully urge that the Minister for Lands should be moved to sanction the application of such portion of this vote as may be required to enable me to complete the work I have undertaken. I have also to request that I may be empowered to draw from the Treasury, as hitherto, an advance, from time to time, of a sum not exceeding £50, to enable me to pay current expenses—vouchers in adjustment of each being forwarded as usual.

I have, &c.,

GEORGE R. SMALLEY,

Government Astronomer.

4 June, 1869.

ROBERTS' TRUST BILL.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, for whose consideration and report was referred, on the 8th October, 1869,—“*Roberts' Trust Bill*”—“*with power to send for persons and papers*”—beg to report to your Honorable House,—

That they have examined the Solicitor for the Bill* (whose evidence is appended hereto); and the Preamble having been satisfactorily proved by the evidence of that gentleman, your Committee proceeded to consider in detail the several clauses of the Bill, in which it was deemed necessary to make certain amendments.†

*Richard Holdsworth, Esq.

†Vide Schedule of Amendments.

And your Committee now beg to lay before your Honorable House the Bill as amended by them.

JAMES HART,
Chairman.

No. 3 Committee Room,
Sydney, 12 October, 1869.

PROCEEDINGS OF THE COMMITTEE.

TUESDAY, 12 OCTOBER, 1869.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

ROBERTS' TRUST BILL.

TUESDAY, 12 OCTOBER, 1869.

Present:—

MR. DODDS,		MR. LEE,
MR. HART,		MR. NEALE,
	MR. OATLEY.	

JAMES HART, ESQ., IN THE CHAIR.

Richard Holdsworth, Esq., examined:—

1. *Chairman.*] You are solicitor for the promoters of this Bill? I am.
2. Do you produce the will of the late Joseph Roberts? I produce the probate of the will, the will itself being deposited of course in the Supreme Court.
3. Have you a certified copy of it for the Committee? (*The witness produced the same.*)
4. Has the will been proved in the Supreme Court? It has.
5. By whom, and when? It was proved on the 30th May, 1849, by Martha Roberts, widow of the testator, and James Roberts, executrix and executor therein named.
6. Are they the present trustees of the will? They are.
7. Who are the persons beneficially interested in that will, as regards the testator's residuary estate? Richard Hutchinson Roberts, Augustus Neich and Jane his wife, Alexander Houison and Fanny Eliza his wife, Mary Elizabeth Roberts, James Joseph Roberts, George John Roberts and Martha his wife, and Joseph James Roberts.
8. They are the petitioners for this Bill? They are.
9. What are the trusts of the will, as regards the testator's residuary estate? Upon trust, to be equally divided between all his the said testator's children by his wife Martha, living at his death or born in due time afterwards, share and share alike as tenants in common, their heirs and assigns for ever, the shares of such as were girls to vest at the age of twenty-one, or marriage, with the consent of his the said testator's trustees and executors for the time being, and to be settled to their respective use, and not to be anticipated or made liable to the debts, control, or interference of any husband with whom she might intermarry.
10. Were the shares of such as were sons to vest at the age of twenty-one years? Yes.
11. And in case of any one or more of his the said testator's said children dying under the age of twenty-one years, and without issue, the shares or share of such child or children was to go to the surviving child or children in the same manner as their, her, or his original share or shares? Yes.
12. When did Mr. Roberts the testator die? 7th May, 1849.
13. Have all the children attained the age of twenty-one years? They have.
14. And some of the daughters are married? Yes; three of them, Mrs. Neich, Mrs. Houison, and Mrs. George Roberts—she married a gentleman of the same name as herself. There is only one girl unmarried.
15. Is there any power in that will to sell the residuary real estate? None.
16. Have the persons you have mentioned an absolute right over the property, or a life interest only? They have an absolute right; they have the fee.

R. Holdsworth, Esq.
12 Oct., 1869.

R. Holdsworth, Esq.
12 Oct., 1869.

17. Is it desirable now that the property should be sold so that the proceeds of the property should be divided? It is desirable, and the persons interested are most anxious that it should be done. I was instructed some time ago to bring the property under the Real Property Act, for the purpose of facilitating the sale; but I was met at the outset of my application by the objection, that inasmuch as three of the daughters were married, and the will directed the property to be settled for their separate use, without power of anticipation, they could not while they were *femmes covert* join in making the application, and I was advised that the only way of getting over the difficulty was by applying to the Legislature for an Act to enable the Trustees to sell and divide the proceeds of the property.

18. Have you the consent of all the parties to the proposed Bill being passed? I have.

19. Will the shares of the married women be affected by this Bill? They will be affected in this way,—that during their coverture they will not be able to dispose of the principal of the money—they will merely receive the income during their lives, or during their coverture. If they should become widows they will be enabled to dispose of the principal which would be the case if the land remained in its present state unconverted.

20. Do you propose to affect the trusts of the will? The trusts will remain intact, but the Trustees will have power to deal with the property.

21. If a suit were entered upon for the actual division of the property, would it be desirable? The cost of a suit would be as much as the property is worth, and possibly would not affect the object in view. They are a number of small properties none of them of much value, and a commission to divide the property into six or seven shares would run away with all the purchase money.

22. *Mr. Lee.*] The will then gives the absolute fee simple to all the parties, I understood you to say? It gives it to the Trustees of the will upon trust to divide amongst all the children absolutely, subject to the restriction as to the married daughters' shares.

23. Then, by granting the power of sale the Legislature does alter the will? No, it would not alter the will, because the persons interested under the will would have the same interest in the money derived from the sale as they now have in the land.

24. Under the will the female portion of the legatees though unmarried were entitled to an absolute share in the fee simple, but now you propose to sell the property and to divide the proceeds among the male portion—to the female portion you do not give the absolute power over the proceeds? We give the interest of the money during life.

25. Not the principal? Not the power to dispose of the principal.

26. Then it does alter the will to that extent? No, because they have now an interest in the land which they cannot alienate during coverture, but when they become discoverd it may be disposed of.

27. The will provides that the property should be held and not disposed of? It provides that the shares of the married daughters should not be disposed of during coverture.

28. Does the will contain any power for the disposal of these properties? No, because the property is given out and out to the children. If none of the girls had been married they all could have concurred in selling the property and dividing the proceeds, as they are the absolute owners. The girls will have precisely the same interest in the money if the Bill should be passed as they have now in the land.

29. Will it be beneficial to the parties concerned that this power should be granted? Extremely beneficial; the property is now lying unproductive, it brings nothing in. There is no objection made, but all the parties are desirous that the Bill should pass.

30. *Chairman.*] Do you know the value of this property? I cannot form an idea. There are a number of properties scattered over the country. I should think at the outside it would not be worth over £2,000.

31. *Mr. Lee.*] Are the Trustees in this will in existence? All of them, and are all consenting parties. Mrs. Roberts is now married to Mr. Lackey, and he is also a consenting party.

ROBERTS' TRUST BILL.

APPENDIX.

(To evidence given by R. Holdsworth, Esq., 12 October, 1869.)

In the Supreme Court
of New South Wales. }
Ecclesiastical Jurisdiction. }

BE it to all men known by these presents that on the thirtieth day of May in the year of Our Lord one thousand eight hundred and forty-nine the last will and testament of Joseph Roberts late of Concord near Sydney in the Colony of New South Wales deceased a true copy whereof is hereunto annexed was exhibited and proved before this Court And that administration of all and singular the goods chattels credits and effects of the said deceased in anywise belonging was and is hereby committed to Martha Roberts of Concord aforesaid and James Roberts of Carrawang in the Colony aforesaid Executrix and Executor in the said will named they having been first duly sworn well and truly to administer the same and to pay the lawful debts of the said deceased and the legacies in the said will contained so far as the goods chattels credits and effects of the said deceased shall extend and the law shall bind them And also to exhibit unto this Court a true full and perfect inventory of all the goods rights and credits of the said deceased when they shall be lawfully called thereunto and that they believe the said goods chattels credits and effects do not exceed the value of five hundred pounds. No. 1,996.
Testator died 7th
May, 1849.

Dated at Sydney this thirtieth day of May in the year of our Lord one thousand eight hundred and forty-nine.

ALFRED STEPHEN. (L.S.)

G. P. F. GREGORY, (L.S.)
Registrar.

THIS is the last Will and Testament of me Joseph Roberts of Concord near Sydney gentleman: I give and devise unto my niece Anne Faris all that my farm and lands containing eight acres or thereabouts situate at Lane Cove her heirs and assigns for ever such farm and land in the event of her marriage to be settled to her separate use and not to be anticipated or liable to the debts control or interference of any husband with whom she may intermarry I give and devise to my son James Joseph all that my farm and land adjoining my present residence and known as Ferguson's Grant his heirs and assigns for ever I give and devise unto my son Joseph James all that my farms and lands adjoining my last-mentioned farm and purchased by me of the Waterloo-house his heirs and assigns for ever And in case either of my said sons or both shall die under age and without issue I direct that the said farms shall follow and be included in the general residuary devise hereinafter mentioned I direct that until my said sons shall attain the age of twenty-one years my Trustees and Executors hereinafter named shall receive the rents issues and profits thereof and apply the same with the rents issues and profits of my other properties in manner hereinafter mentioned I direct my said Trustees and Executors to pay all my just debts funeral and testamentary expenses as soon as conveniently may be after my decease out of my personal estate I give devise and bequeath unto my said Executors and Trustees their heirs executors administrators and assigns all the rest residue and remainder of my real and personal estate upon trust to be equally divided between all my children by my wife Martha living at my death or born in due time afterwards (J.R.) share and share alike as tenants in common their heirs and assigns for ever the shares of such as are girls to vest at the age of twenty-one years or marriage with consent of my Trustees and Executors for the time being and to be settled to their separate use and not to be anticipated or made liable to the debts control or interference of any husband with whom they may intermarry And the shares of such as are sons to vest at the age of twenty-one years and in case of the death of any one or more of my said children dying under the age of twenty-one years and without issue the shares or share of such child or children is to go to the surviving child or children in the same manner as their her or his original share or shares I direct my said Trustees and Executors during the minorities of my children respectively to receive the rents issues and profits of my personal estate and to apply as much thereof as shall be necessary in and towards the maintenance education and advancement in life of all my children by my said wife living at my decease or born in due time afterwards And to invest the surplus if any as to my said Trustees and Executors shall seem most advisable and such investments to follow the destination of the original estate (J.R.) I wish my son Richard Hutchinson Roberts to be brought up to the Church I appoint my wife Martha Roberts and my brother James Roberts Trustees and Executors of this my will and guardians of the person and estate of my said children.

In witness whereof I have hereto set my hand this twenty-sixth April, 1849.—“Joseph Roberts.” Signed by the said Testator in our presence who in his presence and in the presence of each other at his request have hereto subscribed our names as witnesses.—GEO. ROWLEY, THOS. ROBERTS.

We certify that the writing hereinbefore contained on this and the two preceding sheets is a true copy of the Original Probate of the Will of Mr. Joseph Roberts the same having been therewith examined by us this twelfth day of October, A.D., 1869.

1869.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

PROPOSED EXCURSION TO CLONTARF, MIDDLE HARBOUR.
(CORRESPONDENCE RESPECTING.)

Ordered by the Legislative Assembly to be Printed, 21 October, 1869.

Laid on Table in reply to Question No. 4. See Votes and Proceedings, No. 15, of Thursday, 21 October, 1869.

THE PRINCIPAL UNDER SECRETARY to R. O'SULLIVAN, Esq.

Colonial Secretary's Office,
Sydney, 16 October, 1869.

SIR,

I am directed by the Colonial Secretary to inform you that it is the determination of the Government to prohibit "the Grand Excursion to Clontarf, Middle Harbour, on Tuesday next, the 19th instant, under the management of the Committee of the Fund for the released Irish State Prisoners," and that he trusts that the good sense of the Committee will suggest to its members the extreme danger that would spring from a meeting of the released State Prisoners with a large body of people, such as is in contemplation; and that the Committee will, in the interests of peace, order, and good feeling in our community, be quite willing to forego their intended demonstration.

I have, &c.,

HENRY HALLORAN.

R. O'SULLIVAN, Esq., to THE PRINCIPAL UNDER SECRETARY.

Committee Rooms,
2, Park-street, Sydney,
18 October, 1869.

SIR,

In reply to your communication (69.1051) of the 16th instant, I beg leave to inform you that the Committee of the Fund for the released Irish State Prisoners have abandoned their intention of carrying out the Excursion to Clontarf, Middle Harbour, advertised to take place to-morrow, 19th instant. They have come to this resolution lest their act should be made a pretext for prolonging the incarceration of the State Prisoners yet in confinement in Western Australia and Great Britain.

I have, &c.,

RICHARD O'SULLIVAN,
Hon. Secretary, Committee of the Fund
for the released Irish State Prisoners.

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE
LEGISLATIVE ASSEMBLY.

VOTES NO. 23. FRIDAY, 15 JANUARY, 1869.

2. Land taken by Hunter River Railway:—Mr. Lee presented a Petition from Alexander Walker Scott, formerly of the City of Newcastle, but now of Sydney, Esquire, one of the Trustees of the Newcastle Proprietary Grammar School, setting forth an unsatisfied claim on account of land near Honeysuckle Point, Newcastle, taken by the Hunter River Railway, and praying for inquiry, with a view to relief, in the premises.
Petition received.

VOTES NO. 24. TUESDAY, 19 JANUARY, 1869.

6. Land taken by Hunter River Railway ("*Formal*" Motion):—Mr. Burns, on behalf of Mr. Lee, moved, pursuant to Notice, That the Petition presented by Mr. Lee, on 15th January, from Alexander Walker Scott, Esquire, relative to Land taken by Hunter River Railway, be printed.
Question put and passed.
Ordered to be printed.

VOTES NO. 4. FRIDAY, 1 OCTOBER, 1869.

2. Mr. Alexander Walker Scott—Land taken by Hunter River Railway:—Mr. Lee presented a Petition from Mr. Alexander Walker Scott, formerly of the City of Newcastle, but now of Sydney, one of the Trustees of the Newcastle Proprietary Grammar School, referring to a Petition presented by him to the Legislative Assembly during its last Session, stating certain grievances sustained by him; and praying that his said Petition may be referred to a Select Committee, with power to send for persons and papers; and that he may be heard before such Committee in person, or by his counsel or solicitor.
Petition received.
9. Mr. Alexander Walker Scott—Land taken by Hunter River Railway:—Mr. Lee moved, pursuant to amended Notice No. 5,—
(1.) That the Petition presented by him to this House last Session from Mr. A. W. Scott, and ordered to be printed 19th January, be referred to a Select Committee for inquiry and report.
(2.) That such Committee consist of Mr. Burns, Mr. Wisdom, Mr. Farnell, Mr. Wilson, Mr. J. Campbell, Mr. Lyons, Mr. R. Stewart, Mr. Forster, Mr. Sutherland, and the Mover, and have power to send for persons and papers.
Debate ensued.
Question put and passed.

VOTES NO. 26. THURSDAY, 11 NOVEMBER, 1869.

2. Mr. Alexander Walker Scott—Land taken by Hunter River Railway:—Mr. Lee, as Chairman, brought up a Progress Report from, and laid upon the Table the Minutes of Proceedings of, and of Evidence taken before, the Select Committee, for whose consideration and report this matter was referred on 1st October, 1869, together with Appendix.
Ordered to be printed.

**MR. ALEXANDER WALKER SCOTT—LAND TAKEN BY HUNTER RIVER
RAILWAY.**

PROGRESS REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 1st October last to inquire into and report upon "*the Petition presented to this House by Mr. A. W. Scott, and ordered to be printed on the 19th January, 1869,*"—with power to send for persons and papers—and to whom was referred on the 1st October, a *Petition from Alexander Walker Scott, formerly of the City of Newcastle, praying that the Petitioner may be heard before such Committee in person, or by his Counsel or Solicitor*—have agreed to the following Progress Report:—

Your Committee have taken certain evidence, but are unable to complete their inquiries.

They therefore recommend the further consideration of the subject to a future Session of Parliament.

No. 3 Committee Room,
Sydney, 11 November, 1869.

BENJAMIN LEE,
Chairman.

PROCEEDINGS OF THE COMMITTEE.

THURSDAY, 7 OCTOBER, 1869.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

MR. ALEXANDER WALKER SCOTT—LAND TAKEN BY
HUNTER RIVER RAILWAY.

FRIDAY, 21 OCTOBER, 1869.

Present :—

MR. BURNS,
MR. J. CAMPBELL,
MR. FARNELL,MR. FORSTER,
MR. LEE,
MR. R. STEWART.

BENJAMIN LEE, ESQ., IN THE CHAIR.

H. B. BRADLEY, Esq., appeared as Solicitor for Petitioner.

Philip Francis Adams, Esq., examined :—

1. *Chairman.*] You are the Surveyor General of the Colony? I am.
2. *Mr. Bradley.*] Have you the official map of Newcastle, in use in the year 1839? I produce it.
3. Will you give your attention to the part of this map which is commonly called Honeysuckle Point, in order to see if you can recognize there four allotments of land, as to which I shall put some questions to you? I see those allotments.
4. Have you the applications of James Henry Crummer for those portions of land? They cannot be traced; it is supposed in the office that the applications were verbal.
5. Can you trace without a rigid search into the records of your office in respect to what lands these applications were made? Yes, without any difficulty.
6. Will you be good enough to state to the Committee? They are the lands you called my attention to on the map.
7. Will you state the areas of those four lots respectively? No. 1, 10 acres 2 roods; No. 2, 9 acres; No. 3, 10 acres 1 rood 20 perches; No. 4, 1 acre.
8. Are those allotments particularly shown upon the small plan now lying before you? These surveys are charted on the map then in use.
9. The map that has just been marked by the Clerk is the map prepared by George Boyle White? It is a correct tracing of his original survey.
10. Do you produce the Land Sales Book used by the Government Auctioneer in and about the year 1840? I do. (*The witness produced the same.*)
11. Do you find in that book certain articles and conditions of sale of Crown Lands on the 9th September, 1840? I do.
12. Will you read the heading? "The articles and conditions of sale by public auction, at the Colonial Treasury in Sydney, on Wednesday, 9th September, 1840, commencing at 11 o'clock, by Peter Laurentz Campbell, Esquire, Acting Colonial Treasurer, acting for and on behalf of Her Majesty the Queen, of the following portions of land advertised by the notice dated 10th August, in the *Gazette* of the 12th August, under the conditions detailed in the Government order of the 1st August, 1831, No. 22, and other subsequent orders, of which those more particularly necessary to be noticed are hereinafter mentioned, namely."

P. F. Adams,
Esq.
21 Oct., 1869.

- P. F. Adams, Esq.
21 Oct., 1869.
13. Will you be kind enough to cast your eye down these Conditions, and see whether you observe any reference in these Conditions to the reservation of water-frontage on any of those lots, then about to be offered for sale? I do not.
 14. Is this a copy of those Conditions (*handing the same to the witness*)? It is.
 15. Have you a book containing the Government notice of 1st August, 1831? I have. (*The witness produced the same.*)
 16. Will you turn to the 14th clause of that notice, and read it to the Committee? "No land within 100 feet of high-water-mark on the sea-coast, harbours, bays, or inlets, is to be considered open to purchase, unless for the purposes of commerce or navigation."
 17. Is this a copy of the Government notice (*handing a paper to the witness*)? It is.
 18. Will you look at the sales book again? (*The witness referred.*)
 19. Do you see the descriptions there of the four portions of land at Newcastle, which you pointed out upon the plan? I do.
 20. Do you see who is the purchaser of those lots? J. Mitchell.
 21. Will you be good enough to read from the book the price per acre for which each lot was purchased, telling me the lot to which you refer? The first is No. 26. There is no area expressed here, by a clerical error; but the next refers to it as 10½ acres. That was purchased at £36 an acre. The next, marked here as No. 29, but 25 on the plan, has an area of 9 acres—£29 per acre. The next lot, No. 30 here, but No. 23 on the plan, contains 1 acre 1 rood 20 perches—£58 per acre. The next lot, No. 31 in the book, and 24 on the plan, 1 acre—£85 per acre.
 22. Can you identify the description in this grant from the Crown as being the description in the first lot referred to by you (*handing the same to the witness*)? This is the deed of grant referred to as No. 26, the first lot, 10 acres 2 roods.
 23. Will you say if that be the grant of the second lot (*handing the same to the witness*)? It is, for 9 acres.
 24. Will you state if this be the grant of the third portion (*handing the same to the witness*)? It is, for 1 acre 1 rood 20 perches.
 25. Will you state if this be the grant of the remaining portion (*handing the same to the witness*)? It is, for 1 acre.
 26. Have you a personal acquaintance with the locality in question? A slight acquaintance.
 27. Will you take in your hand Mr. White's original plan—From your personal knowledge, and on view of the plan, for what purpose or purposes does it appear to you that these four allotments of land are chiefly adapted—I mean, are they suitable for the purposes of commerce, or in part for purposes of commerce and in part for purposes of navigation, or for the purpose of mansions for the wealthy, or for agriculture? Part of the 10 acres portion—the frontage of it is suitable for wharfage and for navigation, and it may be a small portion of the 9 acres; but the rest is not suitable for purposes of navigation; the water is too shallow.
 28. Is the residue of these lands, or the greater portion of the residue, chiefly suitable for the purposes of trade and commerce, either in an enlarged or in a restricted sense for stores, workshops, and other shops? Quite suitable for that.
 29. Is it suitable for agriculture? Yes.
 30. Any considerable portion of it? The soil is sandy, but it might be cultivated.
 31. Advantageously? Yes, as advantageously as any land about Newcastle.
 32. I mean with reference to a comparison with Hunter's River land generally? Yes; it is sandy land.
 33. Would any man reasonably purchase that tract of country for any other purpose than the purposes of trade, commerce, and navigation? Yes, I think it was well suited for the purpose for which it was bought—for a school.
 34. *Mr. Forster.*] Is this reservation of 100 feet, which I understand to have been taken up by the railway authorities, one of a number of similar reservations, or is it the only case you know of? It is one of a very large number of cases; in fact the reservation was made in every case after the Orders in Council were issued.
 35. I think you read some order to that effect? I did—the Government notice of August, 1831.
 36. These reservations were made in consequence of this order? Yes. There is a previous order to this in August; there is one in July, 1831:—"The Crown reserves to itself all lands within 100 feet of high-water-mark on the sea-coast, creeks, harbours, and inlets; all mines of gold, silver, &c."
 37. Then, in fact, had the Government any power to alienate this land? In a legal sense I should think they had.
 38. As a matter of fact was the land alienated or not with these reservations generally made? According to this deed I think it was not. However, that is a legal question upon which I am not prepared to give an opinion.
 39. Has not this practice prevailed in regard to all lands similarly situated—have not these reservations been made ever since in all other parts of the colony? In almost all, if not in all.
 40. Have the Government consented at any time, in consequence of applications from the people who held these reserves included in the land in their possession, to rescind these reservations? They have by certain clauses in the Alienation Act, which empowered them to do so.
 41. These reservations have been rescinded? Yes.
 42. What has been the practice in regard to these rescissions—have the Government handed them over? No, the occupiers have paid for them.
 43. They have always paid for them? Yes. In paying for them the Government did not acknowledge the title of the people who held them.
 44. They sold the land to them in fact? Yes.
 45. In some cases have the applications for these rescissions been refused? Yes.
 46. On what grounds generally? That they were required for public purposes.
 47. In that case did you ever hear of the person who held the reservation asking to be paid for the reservation? I cannot call to mind any case where it has been done, but it is exceedingly likely it may have been.
 48. Do you know of any case where the Government have agreed to pay for a reservation when they held it for public purposes? I think not.
 49. On the other hand you say that where the alienation has been made, the party who took it paid for it as if he were buying it in the market? Such has been the practice.

50. Do you see any difference between this case and those other cases which have been dealt with as you describe? None whatever—the same words are used in all the deeds.
51. I presume if this be admitted as a case for compensation it is likely to create a great number of similar claims? It would be a precedent.
52. Would it have been in the power of these parties who held this reserved land to sell it apart from the rest of their land? I do not think they could give a title to it.
53. In selling their land they would sell whatever right or title they had in it? I presume so.
54. Are you aware whether in any of the cases of sale you have become acquainted with, the parties who bought the land from the original holders bought it without any knowledge of this reservation being made? I think the reservation is so well known that there could scarcely be a case in which they could purchase without that knowledge.
55. Have you dealt lately with a number of these cases of land up the Parramatta River? A few.
56. Both under the present and under the former Government? The great bulk were dealt with by the ex-Surveyor General; these cases did not come to me.
57. Scarcely any alienation of the kind is made without reference to you and the Engineer of Harbours and Rivers? None whatever; it has always been the practice to refer them for the joint report of the Surveyor General and the Engineer of Harbours and Rivers.
58. Has it ever happened in a case where they have recommended that the application has been refused? Yes, the Government have refused in several cases where they have been recommended by the ex-Surveyor General and Mr. Moriarty.
59. *Mr. Campbell.*] Was this land measured to high-water-mark and sold? Yes.
60. Has that been the general practice in all other cases similarly situated? Yes.
61. *Chairman.*] Are there many cases where one-third of a purchaser's land has been resumed by the Crown under these conditions? Few, if any.
62. You state that the whole area of that land was sold by the Government and paid for by the purchaser? Sold to high-water-mark.
63. And Government have resumed one-third of that land without compensation? It would in this case be fully one-third.
64. The grant to the purchaser states the area of the different lots sold, and that area included up to high-water-mark? Yes.
65. If the original purchaser, Dr. Mitchell, had sold to any other purchaser, would he not have sold what that represented? I suppose he would have sold his right, title, and interest, whatever that might be.
66. *Mr. Burns.*] There was nothing in the conditions of sale to lead the purchaser to suppose that the Government would resume this land 100 feet above high-water-mark? Nothing whatever.
67. The deed would not lead any purchaser to infer that the Government might resume the land 100 feet from high-water-mark? I do not think it refers to 100 feet; it refers to the whole of the land. It was customary in alienating land in such a position as this of harbours* to reserve the right to the Crown to take at any time on paying compensation.
68. This grant contains only the usual reservation in all cases, whether near water or otherwise? It gives more than that because it grants to the Crown the right to resume the whole of it at any time by paying compensation.
69. I think most old grants contain the reservation that Government may make roads without stipulating as to compensation; here they make a stipulation as to compensation? The Government can in this case resume the whole of the land on payment of compensation, which they did, except for the 100 feet.
70. There was nothing to lead them to suppose that the Government would resume the 100 feet without compensation? There was nothing either for or against that supposition.
71. Any purchaser might well assume that he was in full possession of the land, and was not liable to be dispossessed without compensation? No, any one should know that the land might at any time be resumed.
72. That would not be on the face of the conditions of sale, or on the grant itself? It is on the grant itself—taking that grant as evidence; it also contains the special right to take the whole on payment of compensation; this is more conclusive in this than in ordinary cases where there is no special clause that the Government reserved to itself the right to take the land. It makes a discrimination between the 100 feet and the rest more apparent than it would if it had been the ordinary form of deed.
73. *Mr. Farnell.*] Prior to the passing of the Crown Lands Alienation Act the Government would have had no power to dispose of this land to the owner of the original grant? No.
74. What is the date of the Orders in Council in reference to this reservation? One the 1st July, 1831—the other 1st August, 1831.
75. Prior to the issue of these Orders in Council the grants issued did not contain these reservations, except in some cases? I think there were some special cases in which they did not, but I am not sure.
76. The Crown has no power to sell any of these reserves to any one other than the occupier or owner of the original grant—they could not sell these reserves to a stranger? I am not aware of anything to prevent it.
77. If there were an owner of a Crown grant containing one of these reserves, it would not be competent for the Government to put up the reserve for sale and sell it? I know of no legal objection.
78. The Government had no power to sell this land prior to the passing of the Crown Lands Alienation Act? They did not consider they had, or they would not have pointed to the Alienation Act of 1862.
79. Does not that say to be sold to the original grantee or alienee? The wording is to that effect.
80. Do you know whether there has been any recent survey of this land? Yes.
81. And that it does contain the exact area as specified in this grant, inclusive of this reserve? I could not say whether it corroborates the old survey, but I should imagine it did. Mr. White's surveys are all very accurate.
82. It is, comparatively speaking, a recent survey? It is within the last five or six years I think.
83. Has not this matter been sent to arbitration and settled? I believe it was by the Works Department.
84. *Mr. Burns.*] Were there not some general conditions in regard to the sale of Crown Lands in 1838? None that I can trace.
85. *Mr. Forster.*] Have you ever considered what the purpose of this reservation was? For any public purpose, according to the wording of the deed.

*NOTE (on revision):—I used the terms herein reported, but I meant the "headlands approaching harbours."

P. F. Adams, Esq., 86. Then in taking it for a railway it was taken for the purpose intended? I presume so; it came under that reservation. The reservation is unconditional.

87. *Mr. Farnell.*] We have a reservation in some grants, have we not, for taking timber for naval purposes, and metal for roads? In almost all grants; this grant contains them.

88. Some of the oldest grants contain the reservation for taking timber for naval purposes? Yes, even some of the very oldest.

89. *Mr. Bradley.*] You were asked by the Minister whether this land was not taken for a public purpose when taken for a railway purpose—are you aware that in fact the land was taken by the Hunter River Railway Company—a private company? I do not know whether the Hunter River Railway Company took the land in the first instance or not—they took some of it; but whether they took the 100 feet I do not know, or on what authority they took it.

90. You have stated, in effect, that proprietors may be allowed to purchase under the Crown Lands Alienation Act 100 feet above high-water-mark? Yes.

91. Will you be kind enough to listen to a clause of the Crown Lands Alienation Act, and see whether or not there is any error in that statement, No. 9, 25th Victoria, No. 1:—"The Governor with the like advice may authorize any proprietor of land having frontage to any harbour or river to fill in and reclaim any land adjoining thereto and lying beyond or below high-water-mark or to erect a wharf or jetty on or over the same and upon paying the money consideration to be determined by appraisers for the unimproved value of land, such land, or any land that may already have become reclaimed"? I never heard that there was any reclamation made in this case.

92. Do you not gather from that clause that you have been in error in assuming that the liberty to purchase to which you referred was above high-water-mark, or, in other words, the 100 feet reservation, whereas in fact it appears from the clause that such purchase has reference not to the 100 feet reservation but to land to be reclaimed? No, I cannot see that I have made any error.

93. Do you still think that the land to be purchased under that clause is not the land out seaward from high-water-mark, but the land in above high-water-mark? No; I understand the ninth clause to refer entirely to reclamation made below high-water-mark, and in practice we deal with it in that way.

94. Can you point out any instance within your memory—if not, will you endeavour to inform yourself, to be enabled to state to the Committee at a future time—in which a purchaser of land at a price per acre has been deprived of one-third of his estate without compensation whatever. Is there any such instance within the records of the Colony? I think not. I cannot at present recollect a case where so much as one-third has been taken.

95. I must trouble you to refer again to the conditions of sale to the Government notice of August, 1831. Will you look at the conditions of sale which you have already read. I direct your attention to this portion of the heading of the articles of conditions of sale "under the conditions detailed in the Government Order of 1st August, 1831, No. 22, and other subsequent orders, of which those more particularly necessary to be noticed are hereinafter mentioned"? Yes.

96. Will you look to the 14th Article of the Government notice, 1st August, 1831. I direct your attention to the passage—"No land within 100 feet of high-water navigation"? Yes.

97. Will you take in your hand the plan used at the sale—Mr. George Boyle White's plan—look at the allotments bounded by the harbour of Newcastle? Yes.

98. Are the dividing-lines between the allotments laid out to run from the road to the water? They are.

99. Looking to the conditions of sale in which it is stated that the lands will be sold in terms of the "Government Order of 1st August, 1831, and subsequent orders of which the more particular ones are enumerated below"; looking to the fact that no mention is made of reservation in those conditions; looking to the fact that in the Government notice the public are led to suppose that for the purpose of commerce and navigation, lands within 100 feet of high-water-mark may be offered for public sale; looking to the fact that these lands were offered for public sale and sold,—would you gather, as a purchaser at that sale, that you were buying land to high-water-mark or not? I should infer so.

100. Would you consider that you were buying land and water-frontage for navigation? I should imagine the purchaser would be acquainted with the order that was issued a very short time before this sale, and would be aware of the conditions that would be in his deed.

101. Do you not conceive that that plan, these conditions of sale, and the Government notice upon which these conditions were based, was calculated to lead—I should be sorry to say mislead—to lead bidders at that sale to purchase these lands as water-side lands? It might lead some people astray, but I do not think it led Dr. Mitchell astray.

102. That is not my question—Dr. Mitchell may have been more or less wise in his generation than other children of light—Is it not calculated to lead persons bidding at the sale to suppose that in this instance the Government were doing what they said they would do in certain cases for the purposes of navigation and commerce—that they were offering for sale land valuable for that purpose;—has it not that tendency? It has that tendency, but I should scarcely be prepared to admit it in the full.

103. *Chairman.*] Would lands, such as described in the plan there, if sold without the water-frontage, have brought anything like the price paid at that time? I am sure they would not.

104. Are you aware that in 1840 and 1841 there was universal depression in almost every interest? I think there was.

105. You consider the prices paid for the land at that time high? I think they were full prices.

106. The land would not have brought any such prices without water-frontage? Nothing like it, the chances of the Government stepping in to take the land being so remote that I do not suppose it entered into the consideration of the purchasers.

107. *Mr. Campbell.*] Suppose that property had been improved—that there had been extensive wharves and stores on that 100 feet—would the Government then have felt justified in resuming it in that way? I should not like to answer that question.

108. In cases where applications have been made for rescission of water-frontage the Act states that they are to be valued without reference to improvements, but in those cases you have dealt with have they been valued at anything near what they would have brought if they had been put up for public auction, where a stranger might go in to purchase? That is a difficult question to answer, for if they were put up only 100 feet back from high-water-mark they would be almost valueless—100 feet only would be unfit for almost any purpose.

109. Except where reclamation is to be added? Yes. I think the appraisements have been pretty fair to both parties. P. F. Adams, Esq.
110. *Mr. Burns.*] Do you think the Government could sell these reservations to other parties than the original purchasers? That is really too much a legal question for me to undertake to answer, but I think if you refer to the deed itself you will see that the reservation is absolute and full. 21 Oct., 1869.
111. Do you think there was anything in the circumstances, or at the time, that would lead Dr. Mitchell, who purchased for the Trustees of this Grammar School, to suppose that Government would resume at any time any portion of the land he purchased for the Grammar School, without compensation? It is probable he never contemplated any action upon that reservation.
112. The land sale took place in 1840, and the general conditions for the sale of Crown Lands were published in 1831? Yes.
113. Do you think, having regard to the conditions of sale at the time of the sale, he would anticipate the resumption of the land without compensation? I cannot suppose that he anticipated any action upon that reservation.
114. Then as a matter of equity, without regard to law, would you not consider that where Government took land from parties, they should give compensation? I am not in a position to answer that question.

John Rae, Esq., examined:—

115. *Mr. Bradley.*] What is your office at present? Under Secretary for Works. John Rae, Esq.
116. Do you produce from the Railway Department a plan shewing the land taken by the Hunter River Railway Company about the 4th July, 1854, from Messrs. Croasdill and Scott? I will forward it to the Committee as an exhibit. 21 Oct., 1869.
117. Do you produce a letter from Mr. H. Kerrison James, written on behalf of Mr. Scott, to the Chairman of the Board of Directors of the Hunter River Railway Company, dated 29th July, 1854? I do. (*The witness handed in the same. Vide Appendix A 1.*)
118. Do you produce a letter from Messrs. Holden and M'Carthy, to the Crown Solicitor, dated 5th June, 1860. I do. (*The witness handed in the same. Vide Appendix A 2.*)
119. Do you also produce a letter from the same gentlemen, dated 6th May, 1862? I do. (*The witness handed in the same. Vide Appendix A 3.*)
120. Also one dated 2nd July, 1862? I do. (*The witness handed in the same. Vide Appendix A 4.*)
121. Do you produce a letter of H. B. Bradley, to the Chief Clerk of the Railway Branch, Department of Public Works, dated 3rd April, 1866? Yes. (*The witness handed in the same. Vide Appendix A 5.*)
122. Any letter, minute, or other notification from the Minister for Lands to the Minister for Works, dated on or about the year 1866, that the land within 100 feet of high-water-mark had been taken by the Crown? I can find no letter, minute, or other notification in reference to this matter. I made inquiry at the Lands Department, and I had a letter this morning stating that after careful search they could not find any document of the kind.
123. Did you find another letter from myself to the Commissioner for Railways, dated 27th July, 1866? I did. (*The witness handed in the same. Vide Appendix A 6.*)
124. And another dated 16th September, 1867? Yes. (*The witness handed in the same. Vide Appendix A 7.*)
125. Do you produce the appointment of Mr. George Vindin, by Messrs. Scott and Croasdill, as an arbitrator for the purpose of determining the compensation to be paid to them in respect of land taken at Newcastle? I do. (*The witness handed in the same. Vide Appendix A 8.*)
126. Also the appointment by the Commissioner for Railways of Mr. Biden? Yes. (*The witness handed in the same. Vide Appendix A 9.*)
127. Is there a plan attached to that appointment? Yes. (*Vide Appendix A 10.*)
128. Does the plan shew the land referred to arbitration? Yes, the part colored red.
129. Do you produce the award made by the arbitrators, dated the 24th June, 1868? I do. (*The witness produced the same. Vide Appendix A 11.*)
130. Will you look at this plan? (*The witness referred to the plan.*)
131. Do you see four allotments upon that plan of various contents—10 acres 2 roods, 1 acre 1 rood 20 perches, 9 acres, and 1 acre? Yes.
132. Can you identify those lands from the records in your office as being the lands taken by the Hunter River Railway Company? I could not from my own knowledge; I think the Engineer-in-Chief would be more likely to do so.
133. Do you remember my calling upon you as Solicitor for Messrs. Scott and Croasdill, about three years ago, or a little more, previously to the arbitration taking place? Perfectly.
134. Do you remember that you put forward what you assumed to be the fact, that a small portion only of the land had been taken from Messrs. Scott and Croasdill, and that the whole 21 acres had not been taken by the Hunter River Railway? I do not remember putting forward that; I do not remember making any such statement. My impression was otherwise.
135. Do you remember negotiations being entered into between yourself and myself, for the purpose of limiting the taking to land occupied by the railway line, and for the restoration of the remaining part of the land to Messrs. Scott and Croasdill? I remember there were some negotiations of that nature.
136. Do you remember some with myself? I think there were some with yourself too—I know there have been negotiations at different times on the subject. I produce copy of letter from the Chief Clerk of Railways to the Crown Solicitor, dated 6th September, 1860, on this subject. (*Vide Appendix A 13.*)
137. *Chairman.*] Were you Commissioner for Railways in 1862? Yes.
138. Have you any knowledge of any correspondence at that time from you as Commissioner, to these parties, to the effect that the whole of the land would be retained for railway purposes? Yes; I think there was a little to that effect. I believe I can produce it; I know it was written. I append copy of letter from the Chief Clerk of Railways to Messrs. Holden and M'Carthy, of date 4th August, 1862, stating that the whole of the land taken must be retained for railway purposes. (*Vide Appendix A 14.*)
139. Are you aware whether the whole area of this land was submitted to arbitration, or only a portion? My impression is that only a portion was.
140. Then in point of fact that 7 acres did not form a portion of the land submitted to arbitration? It was my impression that it belonged to the Government.
- 141.

John Rae, Esq. 141. The award therefore was based upon the other portion only? If such be the fact it must have been so.

21 Oct., 1869. 142. *Mr. Burns.*] The conditions upon which the arbitrators were to consider the question referred to them for arbitration would be in writing and ought to be produced? I should have thought the plan would have spoken for itself.

143. Your impression is that the arbitrators were only to consider the question of compensation for the land that Government could not exercise the right of reservation over? Yes.

144. Have you ever known the Government to take so large a portion—in this case a third—of a man's property, without giving compensation? I do not at the present moment remember any such case.

145. *Mr. Bradley.*] Do you see in the appointment by Mr. Byrnes of Mr. Biden as an arbitrator that he is to arbitrate on behalf of the Commissioner in respect of the land described in the plan thereunto annexed, colored red? Yes; that confirms my previous answer.

146. *Chairman.*] In answer to a question by Mr. Burns you said you were not aware of any case where one-third of a purchase of land from the Crown had been resumed by the Commissioner for Railways for railway works without payment? I do not remember a case of the kind.

147. Are there many cases where any considerable portion has been resumed without compensation? Not many; there have been some cases where land has been given; but I cannot point out a case of a similar kind to this.

148. *Mr. Burns.*] Do you know whether, with reference to the land taken for the Morpeth Railway, the Government set up against the claim for compensation the right of reservation? No such right was claimed.

149. *Mr. Bradley.*] Do you know the land of the Australian Agricultural Company, adjoining the land which formerly belonged to the petitioner? I just know it, but I know very little about the situation of any of the land there.

150. You know that part of the free grant of the Australian Agricultural Company abuts upon the land of the petitioner? Yes.

151. Do you know what quantity of land was taken by the Railway from the Australian Agricultural Company at that point? I cannot remember.

152. If I show a document of your own it will perhaps refresh your memory (*handing the witness the "Report of the Commissioner for Railways on the origin and progress of Railways in New South Wales"*)? I take it for granted this is correct, I obtained the amount from Mr. Cowlshaw, the valuator—I am now referring to the Appendix, page 25.

153. What compensation do you find was paid to the Australian Agricultural Company for less than 2 acres taken from them? £7,900.

154. That was a portion of their 2,000 acre grant? Yes, I believe so.

155. Will you look down the column of claimants—do you see that in several instances the word "Crown" has been introduced as a claimant? I do.

156. Does that denote that the Crown was the proprietor of the land? I presume so.

157. Will you look a little below that and you will find "Clergy and School"? Yes.

158. Do you see the area of land taken in that last case was 20 acres 2 roods and 6 perches? Yes.

159. Will you look upon this plan (*handing to the witness plan marked A 12*), signed "Francis Bell"—does that convey to your mind an impression of the relative positions of Honeysuckle Point, of the Australian Agricultural Company's land, and of the portions of the Australian Agricultural Company's land taken by the railway line? Yes.

160. *Chairman.*] Are you aware that in 1854 the Hunter River Railway Company (a Company incorporated by Act of Parliament) took the land for railway purposes? I am aware of the fact through the documents in the office. I do not remember the exact date; I think it was in 1854.

161. Did that Hunter River Railway Company merge into the present Government Railway? Yes, the Government purchased the property from them.

162. With all their rights and liabilities? Yes; after considerable correspondence, on the 30th July, 1855, the purchase was completed by the Government from the Hunter River Railway Company for the paid-up capital, without any premium. The Sydney Company got a bonus of 7 per cent. The sum paid to the Hunter River Railway Company was as follows:—

Paid-up capital	£54,337
Discount on raising purchase money	2,717
							Making a total of	£57,054
They also took over the liabilities to complete the line to								
Maitland	250,000
							Making a total of	£307,054

THURSDAY, 28 OCTOBER, 1869.

Present:—

MR. J. CAMPBELL, | MR. FARNELL.
BENJAMIN LEE, ESQ., IN THE CHAIR.

H. B. BRADLEY, Esq., appeared as Solicitor for the Petitioner.

Duncan M. Maitland, Esq., examined:—

D. M. Maitland, Esq. 163. *Mr. Bradley.*] You are the Government Surveyor? I am.

164. Residing at Maitland? Residing at Maitland.

28 Oct., 1869. 165. Were you employed by the Government previously to the month of June, 1868, in the survey of the Honeysuckle Point land? I was.

166. Do you know Mr. George Vindin, of Maitland? I do.

167. What is he—a merchant? A storekeeper.
168. Do you know Mr. William Downing Biden? I do.
169. What is he? The Government Surveyor in the Singleton district.
170. Do you remember being examined as a witness before Mr. Vindin and Mr. Biden in the month of June, 1868, at Newcastle, upon the arbitration in which Mr. William Croasdill and Mr. Alexander Walker Scott were claimants, and the Commissioner for Railways was the party on the other side? I do.
171. Was it in respect of the same land—the Honeysuckle Point land, of which you had been employed by the Government to make a survey, that that arbitration took place? It was.
172. Of what nature were your instructions? They were verbal.
173. In pursuance of those instructions what did you do—that land was the subject of four grants from the Crown to James Mitchell? Yes, one of 10 acres 2 roods, one of 9 acres, one of 1 acre, and one of 1 acre 1 rood and 20 perches.
174. Those were the lands you surveyed? Yes.
175. Now, if you please, tell us what you did? I made an accurate outline first of all upon the enlarged scale of Mr. White's plan of the year 1841, or whatever it might be; I do not remember the date precisely. I then surveyed the land as it is, accurately placing every house and building as it stands on the ground on the paper. I then procured an old plan by which some of these allotments are leased or sold.
176. I was alluding more particularly in asking what you did, to whether you took surveys for the purpose of ascertaining the area deductible from the total area of the grants by reason of the reservation of 100 feet from high-water-mark? I did—100 feet from high-water-mark as it existed at the date of the first survey.
177. Which you gathered from Mr. White's plan? Yes.
178. And from your own survey? My own survey, confirming Mr. White's.
179. Do you remember stating to the arbitrators at the close of your examination the respective deductions from the several grants, caused by the reservation of the 100 feet from high-water-mark? I did so.
180. Have you subsequently gone over that work again? I have, very accurately.
181. Do you find some trifling difference between the figures you then swore to and those you now find? A very trifling difference; but the aggregate amount is the same within a perch or two.
182. That is to say, the aggregate amount of the deductions from the 21 acres 3 roods 20 perches is about the same as you stated to the arbitrators? Yes.
183. Although in respect to individual grants themselves some trifling difference might exist? Yes.
184. Will you state to the Committee what you found to be the deduction upon your more accurate recent survey from the grant of 10 acres 2 roods? 1 acre 2 roods 7 perches.
185. The deduction from the 9 acre grant? 3 acres 3 roods 31 perches.
186. From the 1 acre 1 rood 20 perches piece? 3 roods 4 perches.
187. From the 1 acre grant? 3 roods 5 perches.
188. Making a total deduction of how much from the area of the whole of the four grants? 7 acres 7 perches.
189. How many years have you been in the employment of Government as a surveyor? Between twelve and thirteen.
190. Have you been intimately acquainted with the subject of railway appropriations? My experience has not been great in this country.
191. Are you aware of any resumption by the Government of lands above high-water-mark, under the reservations of any grants of 100 feet from high-water-mark? I am not aware.
192. I do not allude to reclamations below high-water-mark—I understand you to say you are not aware of any resumption of the land 100 feet above high-water-mark? No, I do not remember a case at this moment.
193. Have you had occasion to peruse Government regulations? Only as regards the conduct of my own business.
194. Are you acquainted with the Government notice of 1st August, 1831? I am not. That was long before my time.
195. I read to you from the Government regulation of 1st August, 1831, No. 22, clause 14:—"No land within 100 feet of high-water-mark on the sea-coast, harbours, bays, or inlets, is to be considered open to purchase, unless for the purposes of commerce and navigation." I read to you from the articles and conditions of sale, by public auction, at the Crown Lands Office, on 9th September, 1840:—"The following portions of land as advertised by notice, dated 10th August, 1840, in the *Gazette* of 12th August, under the conditions detailed in the Government Order of 1st August, 1831, No. 22, and other subsequent orders of which those more particularly necessary to be noticed are hereinafter mentioned." In these articles and conditions no reference is made to reservation of water frontage. Having read those passages I ask you have you seen Mr. White's original plan? I have.
196. Supposing a purchaser at the Government sale of the 9th of September, 1840, with these articles and conditions read, and the Government notice referred to and the plan exhibited, showing the dividing lines of the allotments run right down to the water-side—do you consider that an ordinary purchaser would be led to expect that he would buy the allotments to the water-side, and assume that as the Government offered it to purchase it was under the 14th clause of the Regulations open to purchase on that occasion? I should deem it so.
197. Then supposing that as the fact was, one of the conditions of sale referred to the form of the grant by which the land would be granted, and in that form we find the reservation of 100 feet from high-water-mark—Is there not to your mind something repugnant between the plans, the conditions, the Government notice, the situation of the allotments, and the form of grant by which they were to be conveyed? Yes; they were incongruous no doubt. I think that was a very great oversight of some person or persons at the time the grant was issued. Possibly the purchaser should have looked more carefully into the wording of the deed.
198. Would you not conceive, as an honest man going to a public sale held by the representative of the Crown, that you were about to buy that which the Crown offered to sell? It undoubtedly would have been my impression, because the express quantity is mentioned—10 acres and a half, 9 acres, 1 acre, and 1 acre and a fraction over.
199. Can the area of the grants having reference to the water on the one side and that road on the other by possibility be made up without the 100 feet? No, not a square inch more than I have said—14 acres and a trifle over.

D.M.
Maitland, Esq.
28 Oct., 1869.

200. It has been suggested that if the claim of the petitioner be considered with favour, a large number of other claims will arise, which the Government would have to meet, and that this case would be a precedent, if acceded to, of great inconvenience—Do you consider, with reference to that view of the case, that if the petitioner has a just claim upon the good faith of the Government and the public, the existence of any possible number of other just claims should prevent the petitioner's claim receiving attention? Certainly not.
201. Or should prevent the consideration of the other just claims? I know of no parallel claim in my district; even if there were a hundred it does not lessen the obligation to meet this.
202. *Chairman.*] You have, in answer to one of the questions, said that you thought the purchaser should have exercised more care in the examination of what he was really purchasing? I had no business to make such a statement.
203. How could the purchaser think otherwise than that he purchased what was offered? I mentioned simply that the motion would have been taken at an earlier date, for instance, at the time of the deeds being issued; the most cursory perusal would have enabled the purchaser to ascertain it. The land would have been valueless without the water-frontage.
204. Would the land, if sold without water-frontage, have brought any such sums in 1841 as £58 per acre, £85 per acre, and £29 per acre? No, it would not have been worth so much by a great deal.
205. You are not aware of any similar case in your own district, or any other, where one-third of purchased land has been resumed by the Crown? I know of no parallel case; my experience of New South Wales is limited to my district, with the exception of an occasional visit elsewhere.
206. *Mr. Farnell.*] In reference to the 10 acre grant, you have told us that the area of the reserve in that grant is 1 acre 2 roods and 7 perches? Yes.
207. The fact then is that purchasers under that reservation in the grant would purchase only 8 acres 3 roods 33 perches? Yes.
208. Of course the same principle would apply to the other grants? Yes, it would.
209. I suppose you are aware that the regulation then in force—the Order in Council—reserves to the Crown all lands within 100 feet of high-water-mark? High-water-mark in certain descriptions of estuaries—where there is any deep water, any navigable creek, such as Dorah Creek, at Lake Macquarie; and upon all the harbour waters of Newcastle we now measure any land only to within 100 feet of high-water-mark. On Mosquito Island, for instance, there have been two or three free selections within the last few years, and they are all measured to within 100 feet of high-water-mark.
210. Have you had any experience in measuring old grants issued previously to the Orders in Council—have you found any of these reservations in them? I do not recollect a case at present.
211. Of course you are aware that in some of the old grants the Crown reserved the right of cutting timber and of making roads? I am quite aware of that.
212. Did you survey this land for the purpose of sale by the Government? No; it was measured twenty years before—nearly thirty years ago; this was measured by me only in 1866.
213. You have ascertained, by a more recent survey, that this reservation was included in the area of the land sold by the Crown to Dr. Mitchell? Most undoubtedly.
214. It appears that in one of these cases there is a grant of 1 acre, and you ascertained that the reservation taken out of that 1 acre amounts to 3 roods 5 perches? Yes; leaving 35 perches only.
215. So that the person purchasing, as he supposed, 1 acre, actually had only 35 perches? Yes—less than a quarter of an acre.
216. You are connected with the Survey Department? Yes.
217. Not with the Railway Department? No.
218. *Mr. Campbell.*] Considering the then only partially developed state of the coal mines at Newcastle in 1840, do you not think that any person purchasing this land as an investment must have had regard to the water-frontage with reference to the prospective value of this land? Most undoubtedly. I myself, during the time I was with the railway, projected a railway from Honeysuckle Point to the Deep Water, which was not carried into effect.
219. Supposing you had been purchasing on your own account at that time, you would have looked for remuneration upon your outlays to the prospective value of the water-frontage? Yes, most undoubtedly.
220. *Mr. Farnell.*] Does the water-frontage give value to the land on that account? Yes, certainly; it is a frontage to the open harbour.
221. What do you think would be the value of the land resumed? At the present moment I would not venture to place a value upon it, for the value has been determined by better judges—the arbitrators.
222. *Chairman.*] Are you aware whether the arbitrators took the whole matter into their consideration in making their award? I was before them merely as a witness.
223. *Mr. Farnell.*] Could you give any idea proximately of the value of the 7 acres that have been taken? I should be sorry to say. I have not given it my attention, and could give only a haphazard reply.
224. *Chairman.*] Do you know by whom this land was taken for railway purposes originally? I was not in the colony at the time.
225. *Mr. Campbell.*] There is one portion of this land much more valuable than the rest with regard to the water-frontage? I should say the lower portion is the more valuable. By the lower portion I mean the portion nearest the coal shoots of the A. A. Company.
226. *Mr. Bradley.*] Is the situation of the Honeysuckle Point grant one suitable for the purposes of commerce for the erection of shops or stores, workshops, and purposes of that kind? There are a large number of shops upon it now.
227. Then I understand your answer to be that it is suitable for the purposes of commerce and trade? Yes.
228. Might a portion of it be made useful for the purposes of navigation as a wharf? Yes, the lower portion of it.

Alexander Walker Scott, Esq., examined :—

229. *Mr. Bradley.*] You are the petitioner in this matter? I am.
230. Do you remember, some time prior to the month of September, 1840, yourself and a number of other gentlemen and some ladies associating yourselves for the purpose of establishing a Proprietary Grammar School at Newcastle? I remember it very well.
231. Is the paper before you a copy of the list of subscribers? This is a copy of the list made by me—when I do not remember. (*The witness handed in the same.*)
232. Did you reside formerly for many years at Newcastle? I did, and at Ash Island.
233. Are you well acquainted with the situation of these lands, the subject of this petition? I am thoroughly so.
234. Was the late James Mitchell deputed to purchase this land on behalf of the subscribers? He was.
235. Was it at the time supposed that these lands were likely to be valuable for the purpose of commerce and navigation, and were therefore a good investment to be made of the funds? Dr. Mitchell bought it, deeming it an excellent place for a Proprietary School, and that it must ultimately become valuable.
236. Were these lands afterwards granted by the Crown to Mitchell, and conveyed by himself to you and William Croasdill? They were conveyed to Mr. Croasdill and myself, as trustees.
237. Did you become aware, sometime in the year 1854, that these lands were taken by the Hunter River Railway Company? Yes. Mr. Neilds, who was Secretary to the Hunter River Railway Company, came to me at Ash Island, and served me with a notice that the whole of the land would be required for the Hunter River Railway Company.
238. The whole of the four grants? Yes—the word “grants” was not mentioned—the whole of the land we had purchased from the Crown in 1840 for a Proprietary School would be required.
239. Did you direct Mr. Henry Kerrison James to make the claim put forward in his letter? Yes, Mr. Croasdill and myself.
240. Did yourself and Mr. Croasdill employ Messrs. Holden and M'Carthy to conduct the prosecution of your claim upon the Commissioner for Railways? We did.
241. Did you, in the year 1866, employ myself to proceed therein? We did.
242. Did you concur with Mr. Croasdill in the appointment of Mr. Vindin as an arbitrator? I did.
243. You have heard it stated by the witness, Mr. Maitland, that about one-third of the whole area of the lands purchased by Dr. Mitchell for your trust, has been severed in virtue of the reservation of 100 feet from high-water-mark? I have.
244. What effect, in your judgment, has that severing had, first of all upon the value of the residue of the land that was submitted to arbitration? To deteriorate the value very materially.
245. What has been a secondary effect of that in regard to expenses? In my opinion the effect has been by lessening its value to throw the whole of the arbitration costs, amounting to £650 odd, upon the trustees; because I believe there is a certain proportion fixed, which the applicants failing to attain they are liable to pay the expenses.
246. So that a double injury has been sustained by yourself and co-trustee in this respect, that the land valued has had an inferior value assigned to it from the more valuable part being taken off, and also that the expenses have been in addition cast upon you which you believe they would not have been if the whole of the land had been arbitrated upon as the whole had been taken? I think we should not have been subject to the expenses of the arbitration.
247. You have heard the 14th clause of the Government regulations of the 1st August, 1831, and the articles and conditions of sale by which this land was sold? Yes.
248. Do you think that the general effect of these conditions referring to that order was to lead bidders at that auction to suppose that the Government then intended, although they did not always intend, to offer land within 100 feet of high-water-mark; that they did then intend to open this allotment then put up to sale as open to purchase, and intended to sell? I was certainly under that impression that the whole of the land offered for sale, and for which they took payment, was our own, excepting any small portion that might be required for some particular Government purpose. I certainly never thought we were liable to have our whole frontage taken away.
249. Some evidence was elicited from the Surveyor General by the Honorable the Minister for Lands to the effect that this case might form a precedent for inconvenient claims upon the Government—do you believe that it was ever contemplated in offering waterside lands for sale, measuring the area up to the water, to take the price from the purchaser, and then to take the lands back again without any compensation? I cannot conceive it to form any precedent for other claims, for I never heard and probably never can, hear of such a claim being made again.
250. Do you believe then in fact that the Government of the day intended to sell these lands at the waterside? Certainly they did; that is my impression.
251. *Chairman.*] Were you present at the sale? I do not remember, but I think I was not; I am not sure; it is so long ago.
252. *Mr. Bradley.*] Was any demand ever made upon yourself, or to your knowledge upon your co-trustee, by Government, for this 100 feet reserve? Never; we purchased the land in 1840; it was taken from us by the Railway Company in 1854—that is 14 or 15 years after—and it then became the *bonâ fide* property of the Company.
253. *Chairman.*] When did the Government set up a claim to this 100 feet? Not until 1866—twenty-six years after its purchase; they did not make a claim upon the trustees; they made the claim upon the Railway Commissioner; they ignored us as proprietors, and yet in the arbitration we were the sufferers.
254. *Mr. Bradley.*] Did you cause a memorial by yourself and co-trustee to His Excellency the Governor in-Chief to be presented through myself in the month of August, 1868, or thereabout? Yes.
255. Is that (*handing a paper to the witness*) a letter from the Colonial Secretary of 28th August, 1868, signed “Henry Halloran”? Yes.
256. In which you are informed that the Government do not consider the memorialists entitled to any consideration in consequence of such resumption? Yes. (*The witness handed in the same. Vide Appendix B.*)
257. Do you remember the gold discovery in New South Wales, about the year 1851? Yes, perfectly.
258. Did a very large increase in value take place in landed property, particularly at Newcastle? At that time I believe it did.

A. W. Scott,
Esq.
28 Oct., 1869.

- A. W. Scott, Esq.
28 Oct., 1869.
259. Do you remember whether in 1854 the value of land in Newcastle was very considerable? Yes.⁷
260. Is the quantity of land at Newcastle available for navigation and commercial purposes large or small? The City of Newcastle proper—I use the word “proper,” for really a great deal of the City of Newcastle is unfit for commercial purposes, on the side of the hills for instance—the water-frontage is good, but as a commercial place it must stretch away from Newcastle proper.
261. In the direction of the land that belonged to yourself and co-trustee? In the direction of that land, towards Bullock Island, and stretching away towards Burwood and other coal mines, and must pass by the land in question.
262. Do you know the land of the A. A. Company adjoining this land of yours? Yes, perfectly.
263. Do you know the portion of the A. A. Company’s land taken by the railway? Yes, I know it by the plan.
264. Is that a part of their 2,000 acre free grant? Yes; they have no other land at Newcastle that I am aware of.
265. Do you remember an ineffectual attempt to arbitrate the question many years ago, in which Mr. Heslop and Mr. Merewether were named arbitrators? I do; shortly after the Government took possession of the railway from the Railway Company.
266. Did that arbitration comprise the whole area of the lands granted to Mitchell, or only a portion of them stripped of water-frontage? The whole of the land that was purchased on account of the proprietors of the Grammar School.
267. Will you look upon the plan (B 13.) showing the relative position of the Honeysuckle Point property of the A. A. Company of the allotments marked 8, 9, and 10? Yes.
268. You see the position of the Bank of Australasia? Yes.
269. You know the locality? Perfectly.
270. About what distance is there between the allotments 8, 9, and 10, and the boundary of your late property? About 500 yards.
271. Have you any acquaintance with the value of property in Newcastle about the year 1854, as to sales that had been made? Speaking in general terms, I have; I owned a good deal of property myself.
272. Do you think that the sum of £1,500 per acre, placed by yourself and co-trustee upon your estate taken by the Railway Company, was a moderate price for that land in 1854? I remember Mr. Croasdill and myself considering the subject, and we estimated the value of the land at Honeysuckle Point at £1,500 per acre as a very moderate value, and we made our demand against the Government for that amount.
273. Did you, in making that valuation, avail yourselves of the large experience you both had as old residents in Newcastle? We did, as I say, we consulted together before we arrived at that value.
274. *Chairman.*] At what do you estimate the value of the 7 acres of land resumed by the Crown under the 100 feet reservation, at the time it was resumed? I think, so far as my memory goes, our calculation was somewhat complicated—we took the area, the roadside frontage, and then the interior at a less value. According to Mr. Bingle and other people with whom we conversed I think we reckoned it as worth at least £2,000 an acre.
275. In making your valuation were you aware of any sales having taken place in Newcastle at that particular part or in that neighbourhood, where any such price had been obtained? Not at that particular place.
276. Had there been any sales of land in Newcastle where £1,500 an acre had been realized? Yes, and far more. I have known land belonging to Captain Gregory to be sold, in earlier times, at from £1,500 to £2,000 an allotment.
277. *Mr. Bradley.*] The allotments being less than a quarter of an acre? Yes, about a sixth of an acre; it had water-frontage.
278. *Mr. Farnell.*] In the City of Newcastle? Yes; at that time it had only the one wharf; now it is all wharf-frontage. I think it was £1,500 or £2,000, but I am speaking only from memory.
279. *Chairman.*] The amount awarded by the arbitrators is about £700 an acre? Yes.
280. Would you consider £750 an acre a fair value for the 7 acres—the subject of your petition? By no means; that land has greatly increased in value, as indeed has all land in Newcastle having frontage to anything like deep water.
281. *Mr. Farnell.*] After the Hunter River Railway Company had taken possession of this land how long did they hold it before Government took it off their hands? I think only a few months. I had been thinking Bullock Island would be made the main starting-point; the place was surveyed at a considerable cost from the city of Newcastle to Wallis Creek, Maitland—some £500 or £600—at my own private expense, by Mr. Cornelius C. Lundie, an English surveyor, intending to promote a railway company, and when the Hunter Railway Company came into existence they purchased these plans from me at about half the price.
282. Then under the Act of Parliament they took the whole of this land that you held in trust for the purposes of a school? Yes.
283. And held possession of it for a few months? Yes, it appears to me to have been only a few months.
284. Was any application made by the trustees of this land to the Hunter River Company for compensation? Yes, and it was proposed to submit the matter to arbitration; and Mr. Heslop and Mr. Merewether were appointed the first arbitrators, but everything was then in an unsettled state, as the railway had passed from the hands of the Company into the hands of the Government.
285. That is to say, before there was sufficient time to settle the arbitration between the Hunter River Railway Company and the trustees the property went over to the Government by some arrangement with the Company? Yes.
286. Then the trustees put in a claim for compensation from the Government for this land? That is provided for in the Act. I do not know that there was any written application on either side.
287. Mr. Henry Kerrison James’ letter was sent in by your authority? Yes.

Henry Burton Bradley, Esq., examined :—

288. *Chairman.*] You are the solicitor for the Petitioner? I am. I have been engaged by him and his co-trustee since the early part of the year 1866. Not having received the original notice of the land taken by the Hunter River Railway Company, and desiring to ascertain the fact of the relations between the petitioner and the Railway Commissioner I had, early in 1866, several interviews with Mr. Rae, then Commissioner for Railways, with Mr. Byrnes, the then Minister for Works, and with the Crown Solicitor, upon the subject of the land taken. On the 3rd April, 1866, I addressed to the Commissioner for Railways, through his Chief Clerk, the letter which I produce (*the witness handed in the same. Vide Appendix C 1*), in which I desire the Commissioner to state the amount he is willing to pay for the freehold and inheritance of the land taken, and for the damage sustained by the taking of the same; afterwards, by the Commissioner's request, I waited upon him in the presence of the Minister. At that conference the Commissioner for Railways, Mr. Rae, maintained that only some 3 or 4 acres upon the road had been taken by the railway, while I maintained that the whole estate of the petitioner had been taken. On the 16th April I had a conference with the Commissioner for Railways, when the Commissioner corrected his error as to the fact, and then stated his desire to reduce the quantity of land taken for railway purposes, the railway requiring only a small part, but that the Government desired to retain the remainder of the estate for other purposes. I derived the impression at that time that a device was developing itself for keeping the petitioner's land and dealing as cheaply as possible with the subject of compensation. On 2nd May, 1866, I had a long interview with the Crown Solicitor, who stated that he was instructed to ascertain the views of my clients upon a proposal which might be submitted to them, to limit the quantity of land taken to the portion then required for railway purposes and to restore the remainder, upon which I afterwards advised with my clients. About 16th August following I received from the Commissioner his letter of that date, from which I read the following extract :—“It is admitted that the whole of the estate of your clients has been taken, that is the whole of the Honeysuckle Point, excepting the strip of land extending 100 feet from high-water-mark, which has been reserved to the Crown in the grant, and therefore cannot be considered as taken from your clients.” (*The witness handed in the same. Vide Appendix C 2.*) In the year 1855 I prepared a conveyance (that I will observe is the year following the taking of the land) from the Honorable Alexander Warren to William Croasdill, of 20 perches of land—No. 10, on the railway plan, spoken to by Mr. Scott, the petitioner, this morning, for which 20 perches Mr. Croasdill paid the sum of £1,000. In 1860 I was solicitor for Mr. Croasdill in his arbitration with the Commissioner for Railways, in respect of the taking of portions of three lots, of which No. 10 was one, and Mr. Croasdill was paid £2,500 for 35 perches of that unimproved land. I have been intimately acquainted with the value of land in the Hunter River District since and previous to the year 1854, having the charge of large estates situated midway between Newcastle and Hexham. In that year, 1854, I obtained upon sales by auction for Hexham land not possessing water-frontage, an average exceeding £90 per acre. I have calculated the consideration money paid by Mr. Mitchell in respect of each allotment purchased by him at the Crown Land Sale, at the prices of that sale, and I find that the whole area of land contained in each grant has been paid for at the price per acre bid for the same, without any deduction or allowance.

H. B.
Bradley, Esq.
28 Oct., 1869.

THURSDAY, 4 NOVEMBER, 1869.

Present :—

MR. BURNS,		MR. FARNELL,
MR. R. STEWART,		MR. SUTHERLAND,
MR. WISDOM.		

JOHN FITZGERALD BURNS, Esq., IN THE CHAIR.

H. B. BRADLEY, Esq., appeared on behalf of the Petitioner.

Henry Burton Bradley, Esq., further examined :—

289. *Chairman.*] I understand you desire to supplement the evidence given by you to the Committee at the last meeting? If the Committee please to allow me there are two or three little matters which will take little time to state, and which will place the matter before them more simply than they can get it in any other manner. The Hunter River Railway Company's Act, assented to on the 18th October, 1853, clauses 77 and 78, required the Company, before commencing their railway, to make a plan and book of reference, and to advertise their intention in the *Government Gazette*. I look upon the original advertisement by that Company, dated 1st July, 1854, published in the *Government Gazette*, 4th July. This is the advertisement to which I refer (*handing the same to the Chairman*). It is the advertisement required by the Act, and refers to the taking of the petitioner's land for the purposes of the railway. The plan which has been produced by the Railway Department and which is now upon the table, signed “Charles Kemp, Chairman,” is the plan by that advertisement referred to. The first Government Railways Act, 18 Vict., No. 40, empowered the Government to purchase the property of the then existing Railway Companies. The subsequent Act, 22 Vict., No. 19, clause 2, enacted among other things that all the railways and lands of the said Companies should vest in the Commissioner for Railways, and that all moneys due and owing by the said Companies should be recoverable from the Commissioner for Railways, and that all questions for compensation for lands taken or injuries committed by the said Companies should be settled, and the amount paid under the provisions of this Act as if the lands had been taken and the injuries occasioned by the Commissioner for Railways. Clause 45 enacts, among other things, that “in estimating the purchase money or compensation to be paid the value of the land taken and the damages sustained should be estimated according to the value of the land at the time of the notice given that the same was required for railway purposes.” I was present at the arbitration at Newcastle, which has already been spoken to by other witnesses. Mr. James Byrnes, then the Commissioner for Railways, was examined, and stated in his evidence, among other things, that the 100 feet, by the terms of that arbitration withheld from the consideration of the arbitrators, had been taken from him by the Minister for Lands about two years before that time. Mr. Byrnes was Minister for Works at the time I am speaking of, and held the office of Commissioner for Railways in addition. This statement was made in June of last year.

H. B. Bradley,
Esq.
4 Nov., 1869.

Alexander Brown, Esq., examined:—

- Alex. Brown, Esq.
4 Nov., 1869.
290. *Mr. Bradley.*] Do you at present reside in Sydney? I do.
291. Did you reside for many years at Newcastle? Yes, over eighteen years.
292. Do you know the portion of land adjoining the Australian Agricultural Company's estate, there known as Honeysuckle Point? Yes, and lived many years close to it—adjoining it.
293. Do you see it shewn upon the plan before you? I do.
294. Do you remember the property so far back as when it belonged to William Croasdill and Alexander Walker Scott? Yes, it was in my hands many years; when it was their property I had the use of it.
295. Are you, and have you been for many years past, proprietor of property in Newcastle and its neighbourhood? Yes, and am to the present day.
296. Did you know the Honeysuckle Point property in the year 1854? Yes.
297. Was the value of land in and about Newcastle very considerable in 1854? It was very high at that time.
298. Was that year shortly after the gold discovery? Some time after the gold discovery.
299. Gold was discovered in this country in 1851? Yes; but the first rise in the price of land there was before that time, from the period when the trade with California sprung up. The value of land at Newcastle began to rise before gold was discovered here.
300. Was there a great increase in the coal trade of Newcastle between the years 1840 and 1854? A great increase; in fact it has increased every year since 1836—doubled every year, or trebled.
301. The petitioner's petition has reference to a question affecting land 100 feet from high-water-mark, extending all along the water-frontage of the 21 acres 2 roods, which formed the estate formerly belonging to Messrs. Croasdill and Scott? Yes.
302. Giving your attention to that space of land 100 feet from high-water-mark along the whole margin of these grants—can you state the value that that land would have produced in 1854, at per acre, or can you give the Committee an approximate idea of the value of that land? Being the water-frontage I should think it would be worth about £2,000 an acre.
303. Is that land suitable for the purposes of commerce and trade? It could be made so at little expense.
304. I must inform you that 14 acres or thereby of the 21 acres 2 roods, belonging to Messrs. Croasdill and Scott at one time, has been already disposed of by arbitration. With reference therefore to that 14 acres and odd, I ask you now whether the value of that 14 acres is not largely depreciated by cutting off from it the 100 feet of high-water-mark—the 100 feet reservation? Decidedly so.
305. Would not the value per acre of the 14 acres be very much greater if the 14 acres were taken on any part of the estate running down to the water instead of shut off from the water? Yes.
306. *Mr. Farnell.*] How do you arrive at it that this land is worth £2,000 an acre? I gave £1,000 an acre for land of the A. A. Company, somewhere far back, away from any road. I think the A. A. Company sold some land as high as £4,000 or £5,000 an acre, opposite the same place.
307. By selling it in small allotments? They sold it in quarter acre allotments and less.
308. You are not a land valuer by profession? No; I merely refer to what I bought myself on my own account.
309. I suppose you do not think you paid too much for your land? I never would do that.
310. *Chairman.*] In what year did you buy the acre you have now spoken of? I think it was somewhere about the latter end of 1853 or 1854.
311. Does the increase in the consumption or raising of coal at Newcastle increase the value of the land there? Yes; the coal trade has you may say altogether made Newcastle.
312. Do you know whether there has been any arbitration with reference to this matter? I was once before a Committee of this House with reference to this land, I think, but I do not recollect anything about it just now.
313. You do not know anything about an arbitration case with reference to this land? No.
314. *Mr. Bradley.*] You were asked whether you bought your land too dearly from the Company? Yes.
315. Have you made money by buying and selling land in the neighbourhood of Newcastle? Yes.

John Williams, Esq., examined:—

- J. Williams, Esq.
4 Nov., 1869.
316. *Chairman.*] Do you remember an arbitration case that occurred with reference to some land at Newcastle taken by the Government for the Hunter River Railway from Messrs. Croasdill & Scott? I know there was one—I did not attend it myself at Newcastle; I delivered a brief to Mr. Isaacs.
317. The matter was gone into at Newcastle? Yes.
318. Who was the arbitrator for the Government? Mr. Biden, a surveyor.
319. Do you know whether in dealing with the claim for compensation the arbitrators did not take into consideration this land for which compensation is now sought? I have been informed that they did. Their so doing was improper no doubt—that is to say, it caused a larger amount to be awarded against the Commissioner for Railways than would have been if they had kept within the bounds of their authority.
320. Have you any papers with reference to that authority? The submission and award will show what land they dealt with.
321. Will you look at the papers before the Committee, and see if you are correct in your first statement? It does not appear by these papers that they did.
322. What other papers are there? No others. I will explain if you will allow me: From the award it would appear that they dealt with the land only actually submitted to them, but I believe in making up the amount to be awarded the whole area taken—that is, the land referred to in the award, and also the land the subject matter of this inquiry, was included, and the amount to be paid calculated upon the gross area of the whole.
323. How do you know this? From one of the arbitrators. I inquired in what way the amount was arrived at.
324. Was that shortly after the award? Immediately after the award.
325. You speak of the party who represented the Government? Yes.

326. You have no official knowledge of the matter beyond this verbal statement from Mr. Biden? No; J. Williams, Esq. I inquired of Mr. Biden—I am not sure as to whether I did of any one else—in what way the amount was arrived at; and I was informed by him that it having been intimated to them in some way that this land should have been in the arbitration, they thought it only fair to the claimants to calculate upon the whole area. 4 Nov., 1869.
327. Would it appear to you that the award would have been excessive if they had not taken this into consideration? I cannot speak to that—I am no judge of value.
328. From the statement you made to the Committee it appears that although it is erroneously done, still the arbitrators did take into account the value of this land, and awarded the amount they thought ought to be paid in respect of it, although technically that is only an award for land excluding this 100 feet frontage? I believe so.
329. *Mr. Farnell.*] I understand that the Government did not recognize the claim of the petitioner to this 100 feet, but that the arbitrators in making the award took into consideration the whole area of the land? I so understood; and that is my present belief in the matter. Of course the only matter in dispute between the Commissioner for Railways and Messrs. Scott and Croasdill was as to the land taken from Scott and Croasdill; the land was not taken from them because it never belonged to them; it belonged we say to the Crown, and strictly speaking nothing should be awarded to them for this land so taken, as against the Commissioner for Railways.
330. *Chairman.*] Do you know that Messrs. Scott and Croasdill actually paid for the land to which you say the Crown had a right? I believe they did, looking to the description in the deed.
331. As a matter of equity, that would be a claim for consideration? Not in the way I have just heard it put by my learned friend in his examination of Mr. Brown. I did not feel that I had any right to interfere, for I am here only as a witness; but with great respect to him I should say he is basing his claim upon a wrong mode of calculation.
332. Legally? Legally, and I think equitably.
333. *Mr. Farnell.*] Even supposing the petitioners were entitled to this 100 feet reserve—upon what basis would you compensate them? I think the proper mode of compensating them would be this: They paid so much per acre for $7\frac{1}{2}$ acres of land; that $7\frac{1}{2}$ acres they did not get; the purchase money, therefore, and interest should be refunded to them; but I imagine that neither legally nor equitably have they any claim to the increased value of land which they never had. The breach of contract, in respect of which they claim compensation, was committed when the grant issued—that is, they received $7\frac{1}{2}$ acres less than they ought to have had; the breach of this contract, therefore, cannot be said to have any relation to the value of the land in 1854.
334. Can you tell me whether the Government acted upon that principle in dealing with the claims for compensation of parties at Morpeth, whose land was taken for railway purposes? I could not without reference say whether there was any such reservation in Mr. Close's grant; that is a deed of much older date than the deeds of grant of this land.
335. *Mr. Farnell.*] I think all grants issued subsequently to 1828 contained this condition with reference to the reserve? I could not answer that question, and I do not think any one can without inquiry.
336. You are aware from your experience that a great many of the old grants do not contain such a reservation? Yes. I do not know from what date the reservation was made, but I know that many old grants do not contain that reservation.
337. When the petitioners purchased that land, or whoever purchased it on their behalf—the purchasers received the grant and took the land with the conditions in the grant, subject to certain restrictions? They did so; and if the Government then committed a breach of contract in not giving them the whole of the land for which they had paid, I would submit that then in respect to that breach of contract they should have had the money and interest refunded, and that damages cannot be calculated for that breach of contract on the basis of the improved value of land at a date long after the breach of contract.
338. Are you aware that applications are made under the Crown Lands Alienation Act by persons holding original grants, for the purchase of these reserves? Yes, it is often done. There is one now with respect of land in Sydney, I think, by Mr. Butler.
339. Those persons who are now making applications to purchase these reserves, when they originally purchased the land of course thought it was granted to them to high-water-mark? I cannot say what they thought; I can only speak as to the deed.
340. However it is the fact that persons do apply to purchase these reserves? Yes.
341. Previous to the passing of the Crown Lands Alienation Act there was no power vested in the Crown by which these lands could be disposed of to the original purchaser? Not without competition.
342. Could they sell this land to any person besides the original grantee? I cannot speak to that without consideration; that involves a legal question.
343. *Mr. R. Stewart.*] I suppose the parties had no means of claiming until after the Crown Lands Alienation Act was passed? It was not their property—it was never given to them—it was never taken from them—as it was never theirs.
344. *Mr. Wisdom.*] This occurred before the passing of the Crown Lands Alienation Act? Long before that; the injury sustained was the receiving 14 acres, instead of 21.
345. *Mr. Stewart.*] In fact they only held the land upon sufferance? Yes, and the Crown never interfered with them.
346. *Mr. Wisdom.*] Mr. Vindin was the arbitrator for Messrs. Scott and Croasdill? Yes; and an attorney at Maitland, Mr. Colquhoun, was the umpire.
347. Have you had any conversation with Mr. Vindin about the arbitration? I think I had, some time after the arbitration.
348. Did you understand from him that in giving their award, this $7\frac{1}{2}$ acres was taken into consideration? I did.
349. Did Mr. Biden tell you that Mr. Vindin had also taken this matter into consideration? Mr. Biden first told me. I asked him in what way he had arrived at this sum, and he told me. I afterwards asked Mr. Vindin if it was so, and he said it was.
350. There was no reference to the umpire—the arbitrators agreed among themselves? I know we paid him his fees; I do not know whether he joined in it.
351. Was there much said in the course of the arbitration about this $7\frac{1}{2}$ acres? I was not present. Mr. Isaacs appeared on behalf of the Crown. I understood from Mr. Biden that Mr. Bradley commented very

J. Williams, Esq. very strongly on the injury his clients sustained in having those $7\frac{1}{2}$ acres withdrawn from arbitration, and that therefore the arbitrators thought it right to take it into account in making up the amount, and they did so.

4 Nov., 1869. 352. I suppose they did not tell you what amount they would have given for the 14 acres? I cannot say as to that. I think Mr. Biden has the calculations. In speaking to me he referred to some papers he had. 353. *Mr. Farnell.*] Do you not think it would be the proper course for the Committee to examine Mr. Biden and the other arbitrator? I think so; it will enable the Committee to see in what way the amount awarded was determined upon.

THURSDAY, 11 NOVEMBER, 1869.

Present:—

MR. J. CAMPBELL, | MR. FARNELL.

BENJAMIN LEE, ESQ., IN THE CHAIR.

H. B. BRADLEY, Esq., appeared on behalf of the Petitioner.

George Vindin, Esq., examined:—

G. Vindin, Esq. 354. *Chairman.*] You were appointed one of the arbitrators in the matter of Mr. Alexander Walker Scott's claim against the Commissioner for Railways? As arbitrator in the matter of the Grammar School Trustees *v.* the Commissioner for Railways, in June, 1868.

11 Nov., 1869. 355. For certain lands taken for railway purposes in the town of Newcastle? Yes.

356. What was the matter submitted to the arbitrators in that case; what was the area of land for which compensation was sought? The area of the whole of the land was 20 acres 3 roods 20 perches; but we were instructed that we were only to consider as to the value of 16 acres 28 perches, and that the disputed portion of land, being the 100 feet above high-water-mark, would be arranged for in some other way.

357. Was that award made by the umpire or by the arbitrators? By the arbitrators.

358. In making that award did the arbitrators take into consideration the circumstances outside the matter of the 16 acres 28 perches? They did not. We were instructed in the opening address of the counsel that we had nothing to do with that. Here is the award as agreed upon by us:—

16 acres 28 perches, at £375	£6,065	12	6
Interest on land, at the rate at which the Bishop said it was			
let—£100 per annum, and 8 per cent. interest added for			
fourteen years	2,240	0	0
For compulsory sale	1,576	8	2
					£9,822	0	8

359. I see here a memorandum as to the matter just referred to—"Difference between this and 16 acres 28 perches caused by reserve of 100 feet from high-water-mark?" We were told we were not to take that 100 feet above high-water-mark into consideration at all. We can only give compensation for 16 acres 28 perches, although we can go into the question of severance.

360. What do you consider the value of that remaining portion of the land—the water-frontage—the present market value? That is a matter that would require some little consideration.

361. You have a tolerably good idea of the value of property at the present time at Newcastle? I take it that the value at that time should be estimated.

362. I want to know both your idea of the value now and at the date of the arbitration? ———

363. In the evidence given before you at the time of the arbitration was it clearly shown that the Government had sold the whole area of the land to the Trustees of the Grammar School? If I recollect rightly it was shown by a printed document that Mr. Rae produced—a report of the Railway Commissioner I think it was—that the whole area, amounting to 21 acres 3 roods 20 perches, was transferred to the Commissioner for Railways, and it was then stated by the Solicitor General, I think, that the difference between this and the 16 acres 28 perches was caused by this reserve of 100 feet.

364. Then in making your final award in favour of the Commissioner, for the sum of £9,822 0s. 8d., you did not take into account all the circumstances of the case, but simply dealt with the matter placed before you? We simply dealt with the matter referred to us of the 16 acres 28 perches, leaving the 5 acres out of the question altogether.

365. *Mr. Farnell.*] You were instructed not to take into consideration this reserve, and in awarding this amount of money you did not include it at all? We did not; you will observe that the award was made at so much per acre, and that only 16 acres were taken into account.

366. *Mr. Campbell.*] Do you look upon this water-frontage as land that ultimately will become very valuable? I should fancy that ultimately it must become very valuable—water-frontage is so circumscribed at Newcastle.

367. The expenditure of a small amount in improving it would make it very valuable? No doubt it would make it very valuable in time to come.

368. *Mr. Bradley.*] It was stated by the Crown Solicitor upon the occasion of the last meeting of the Committee that you had informed him that the arbitrators had taken into account, in awarding the amount mentioned, the value of the 100 feet above high-water-mark as well as that to which your attention had been specially directed? I have no recollection of having had any conversation with Mr. Williams on the matter; I certainly could not have told him so, as I had a clear and distinct recollection of how we arrived at the decision before I turned to my notes; and in fact Mr. Biden and myself were so near in our estimate that we did not think it worth while to trouble the umpire, and agreed to the award.*

* NOTE (on revision):—I wish to add: I do remember having a conversation with the Crown Solicitor at Morpeth. He asked me if Mr. Biden and I agreed as to our award. I said, "Yes, we did not require to call in the umpire; that Mr. Biden and I put on paper the amount we deemed fair; the difference was so small we agreed to decide without calling in the umpire." My conversation with the Crown Solicitor was in general terms.

**MR. ALEXANDER WALKER SCOTT—LAND TAKEN BY
HUNTER RIVER RAILWAY.**

APPENDIX.

(To Evidence given by John Rae, Esq., 21 October, 1869.)

A 1.

H. Kerrison James to The Chairman of the Board of Directors of the Hunter River Railway Company.

Sydney, 29 July, 1854.

Sir,

Referring to the notice served upon A. W. Scott, Esq., of Ash Island, Newcastle, conformably with the provisions of "An Act to establish and incorporate a Company to be called the Hunter River Railway Company" to the effect that the Company requires the surrender, for purposes of the said Act, of—

"All those parcels of land, with houses and outbuildings, set out for the purposes of the Hunter River Railway, situated in the parish of Newcastle, in the county of Northumberland, and containing by admeasurement 20 acres 2 roods and 6 perches, or thereabouts, and more particularly delineated in the plans thereof above referred to,—"

I am authorized by Mr. Scott to inform you that the title deeds of the said estate are in my possession, and that the same may be inspected by the Solicitor to the Company at any time; and that Mr. Scott, as trustee of this estate, values the same and will claim compensation at the rate of £1,500 (fifteen hundred pounds) per acre, free and clear of all deductions whatsoever for compensation to present lessees, occupants, or otherwise.

I have, &c.,
H. KERRISON JAMES.

A 2.

Messrs. Holden & M'Carthy to The Crown Solicitor.

Sydney, 5 June, 1860.

Hunter River Railway.—In the matter of the Honeysuckle Point Land.

Sir,

Referring you to our letter on this subject of 30th August, 1859, we beg to inquire whether any decision has been arrived at as to the course of action intended to be taken by the Government to settle the claim for compensation in this case?

We have, &c.,
HOLDEN & M'CARTHY.

A 3.

Messrs. Holden & M'Carthy to The Crown Solicitor.

Sydney, 6 May, 1862.

In the matter of the Honeysuckle Point Land—Hunter River Railway.

Sir,

Referring to previous correspondence on this subject, and in particular to our letters to you of 30th August, 1859, and 5th June, 1860, we have the honor to renew the inquiries thereby made as to the course intended by the Government in reference to the award of compensation in this case.

This matter has now been pending since the year 1854, and the delay in its settlement has withheld from its proper application a considerable fund, which would have been available for the building and endowment of a Grammar School at Newcastle.

We have, &c.,
HOLDEN & M'CARTHY.

A 4.

Messrs. Holden & M'Carthy to The Commissioner for Railways.

Castlereagh-street, Sydney,
2 July, 1862.

Sir,

On the 6th May last we recalled to the attention of the Crown Solicitor a letter we addressed to him on the 24th April, 1861, on the subject of a claim of the Trustees of the Newcastle Grammar School to compensation for land appropriated as the site of the Railway Terminus at Honeysuckle Point.

The Crown Solicitor informs us in answer, that both our letters were referred to you, but that he has not been instructed to communicate with us in reply, and suggests that it may be advisable to communicate with you direct.

This we now do accordingly, referring not only to the letters above adverted to, but to our previous correspondence extending over many years, which will, we think, sufficiently show that the delay in settling this matter does not rest with us or with our clients, and that we have urgent grounds for requesting that it may not be yet further continued.

We have, &c.,
HOLDEN & M'CARTHY.

I certify that this is a true copy of the original letter, as extracted from the records of this office.—JOHN RAE, Public Works Department, 21/10/69.

A 5.

H. B. Bradley, Esq., to The Chief Clerk, Railway Branch, Department of Public Works.

Margaret-street,
Sydney, 3 April, 1866.

Sir,

Adverting to the subject of the claim of Messrs. Scott and Croasdill, upon the Commissioner for Railways, for land at Newcastle, taken for railway purposes, and herein to your letter of 4th of August, 1862, addressed to Messrs. Holden and M'Carthy, I am now instructed, as the Solicitor for Messrs. Scott and Croasdill, to request that you will have the goodness to state the amount which the Commissioner is willing to pay for the freehold and inheritance of the land taken, and for the damages sustained by the taking of the same.

The land taken is described in four grants from the Crown to James Mitchell, as being—

a.	r.	p.
10	2	0
9	0	0
1	1	20
1	0	0
21	3	20

which are in their entirety conveyed to my clients. The land taken is stated to be only 20 acres 2 roods and 6 perches. I presume the Commissioner takes the whole, and that a small triangular piece adjoining Dangar has escaped measurement or consideration by your surveyor.

I have, &c.,
H. B. BRADLEY.

Appd. 5/4/66.—J.R.
Mr. Cowlshaw. B.C., 5/4/66.

A 6.

H. B. Bradley, Esq., to The Commissioner for Railways.

Margaret-street,
Sydney, 27 July, 1866.

Sir,

Acknowledging the receipt of your letter of the 24th instant, in which you inform me that "as the readiest means of bringing the matters in dispute" between the Trustees of the Newcastle Grammar School and yourself, "to an issue, so as to ascertain the amount of *damage done to the land* in question, William Dean, of this city, Esquire, has been appointed to act as arbitrator on behalf of the Government,"—I am desirous of receiving information upon two points; the first is,—whether the arbitrator appointed is the auctioneer of that name? the second,—whether it is intended (as it is to be inferred from the language of your letter) to raise any question on the matter of fact, that the whole estate of my clients was taken for railway purposes, as it is obviously essential that the Trustees should be informed as to what they are going to arbitrate.

I have, &c.,
H. B. BRADLEY.

A 7.

H. B. Bradley, Esq., to The Commissioner for Railways.

64, Margaret-street,
Sydney, 16 September, 1867.

Sir,

In the matter of the land taken from the Trustees of the Newcastle Proprietary School for railway purposes, in consequence of the former reference having become inoperative through the decease of the late Mr. William Dean, the trustees have appointed George Vindin, of West Maitland, Esquire, arbitrator on their part, for the purpose of determining the amount of compensation to be paid to them in respect of the land taken, and for all damages sustained by reason of the exercise of the powers vested by law in the Commissioner for Railways, and have directed me to notify the fact to you and request that you will proceed to appoint an arbitrator to act on your behalf, in terms of the Government Railways Act.

I have, &c.,
H. B. BRADLEY,
Solr. for Trustees.

Wrote, notifying appl. 28/9/67.
Mr. Bradley.

A 8.

IN the matter of the land taken from the Trustees of the Newcastle Proprietary School, for railway purposes.

WE do hereby appoint George Vindin, of West Maitland, in the Colony of New South Wales, Esquire, an arbitrator on our part, for the purpose of determining the amount of compensation to be paid to us in respect of the land taken, and for all damages sustained and that may be sustained by us by reason of the execution of the Railway Works and otherwise, by reason of the exercise of the powers vested by law in the Commissioner for Railways. Witness our hands, this eleventh day of September, in the year of our Lord one thousand eight hundred and sixty-seven.

WILLIAM CROSDILL.
A. W. SCOTT.

IN the matter of the arbitration between Alexander Walter Scott and William Croasdill, Trustees of the Newcastle Grammar School and the Commissioner for Railways.

I, GEORGE COLQUHOUN, do solemnly and sincerely declare, that I have no interest, either directly or indirectly, in the property in question, and that I will faithfully and honestly, and to the best of my skill and ability, hear and determine the matters referred to me, under the provisions of an Act, intituled, "*An Act to make more effectual provision for the construction by the Government of Railways in the Colony of New South Wales, and for the regulation of such Railways.*"

GEORGE COLQUHOUN.

Made and subscribed this 8th day of June, 1868, }
before me, at Newcastle,— }

GEO. J. FRANKLAND, J.P.

In the matter of the arbitration between Alexander Walker Scott and William Croasdill, Trustees of the Newcastle Grammar School, and the Commissioners for Railways.

We, the arbitrators appointed in this matter, do hereby nominate and appoint by this writing under our hands, George Colquhoun, as umpire, to decide any matters on which we may differ, or which shall be referred to him under the provisions of the Act, intituled "*An Act to make more effectual provision for the construction by the Government of Railways in the Colony of New South Wales, and for the regulation of the same.*"

GEO. VINDIN.
WM. D. BIDEN.

In the matter of the arbitration between Alexander Walter Scott and William Croasdill, Trustees of the Newcastle Grammar School, and the Commissioner for Railways.

I, GEORGE VINDIN, do solemnly and sincerely declare, that I have no interest, either directly or indirectly, in the property in question, and that I will faithfully and honestly, and to the best of my skill and ability, hear and determine the matters referred to me under the provisions of an Act, intituled "*An Act to make more effectual provision for the construction by the Government of Railways in the Colony of New South Wales, and for the regulation of such Railways.*"

GEO. VINDIN.

Made and subscribed this 8th day of June, 1868, }
before me, at Newcastle,— }

GEO. J. FRANKLAND, J.P.

In the matter of the arbitration between Alexander Walter Scott and William Croasdill, Trustees of the Newcastle Grammar School, and the Commissioner for Railways.

I, WILLIAM DOWNING BIDEN, do solemnly and sincerely declare, that I have no interest, either directly or indirectly, in the property in question, and that I will faithfully and honestly, and to the best of my skill and ability, hear and determine the matters referred to me under the provisions of an Act, intituled "*An Act to make more effectual provision for the construction by the Government of Railways in the Colony of New South Wales, and for the regulation of such Railways.*"

W. D. BIDEN.

Made and subscribed this 8th day of June, 1868, }
before me, at Newcastle,— }

GEO. J. FRANKLAND, J.P.

A 9.

To all to whom these Presents shall come,—

The Commissioner for Railways sends, Greeting :

WHEREAS the Commissioner for Railways, for the purposes of that portion of the Great Northern Railway passing through the County of Northumberland, in the Colony of New South Wales, has taken possession of certain lands situate at Honeysuckle Point, near the City of Newcastle, in the said Colony, described in the plan hereto annexed, coloured red, of which Alexander Walter Scott and William Croasdill, both of Newcastle, Esquires (Trustees of the Newcastle Grammar School) were in possession, and claim to be entitled :

And whereas the said Alexander Walter Scott and William Croasdill claim the sum of thirty-two thousand eight hundred and twelve pounds eight shillings as compensation for the taking of the said land, and for all the damage which they have sustained, or may sustain, by reason of the said works, and the Commissioner for Railways has declined to pay the above-mentioned sum, and is desirous of appointing an arbitrator, so as that the question of disputed compensation in the matter aforesaid may be settled by arbitration, in pursuance of the provisions of the Act of the Governor and Parliament of New South Wales, 22 Victoria, No. 19: Now therefore know ye, that in pursuance of the provisions of the said Act, the Commissioner for Railways doth hereby appoint William Downing Biden, of Singleton, in the said Colony, surveyor, to be arbitrator, on behalf of the Commissioner for Railways, for the purpose of determining the amount of compensation, if any, to be paid by the Commissioner for Railways in respect of the premises: Provided always that nothing herein contained shall be taken as a waiver of the right of the Commissioner for Railways to require the said Alexander Walter Scott and William Croasdill to produce evidence of their title to the said lands, after the making of any award hereunder.

In witness whereof the Commissioner for Railways has hereto set his hand and official seal, at Sydney, in the Colony aforesaid, this twenty-seventh day of September, in the year of our Lord one thousand eight hundred and sixty-seven.

JAMES BYRNES,
Commissioner for Railways.

The Seal of the Commissioner for Railways was }
affixed hereto, in the presence of,— }

R. MOODY, Chief Clerk.

A 10.

In the matter of the arbitration between the Commissioner for Railways and the Trustees of the Newcastle Grammar School.—
(Award.)

To all to whom these Presents shall come—

We the undersigned William Downing Biden of Singleton in the Colony of New South Wales Surveyor and George Vindin of West Maitland in the said Colony Esquire send, Greeting :

WHEREAS the Commissioner for Railways for the purposes of that portion of the Great Northern Railway passing through the County of Northumberland in the said Colony some time since under and by virtue of the provisions of and subject to the enactments contained in an Act of the Governor and Parliament of New South Wales passed in the twenty-second year of the reign of Her present Majesty number nineteen intituled "*An Act to make more effectual provision for the construction by the Government of Railways in the Colony of New South Wales and for the regulation of such Railways*" took possession of certain lands at Honeysuckle Point in the City of Newcastle described in the plan hereunto annexed coloured red: And whereas Alexander Walter Scott and William Croasdill both of Newcastle claim to be entitled to the said land as trustees for the Newcastle Grammar School: And whereas the said Alexander Walter Scott and William Croasdill claimed the sum of thirty-two thousand eight hundred and twelve pounds eight shillings as compensation for the taking of the said land and for all the damages which they had sustained or might sustain by reason of the said works: And whereas the said Commissioner for Railways declined to pay the said sum: And whereas by the twenty-second section of the said Act hereinbefore referred to it was enacted that "If no agreement be come to between the Commissioner and the owners of or parties by this Act enabled to sell and convey or release any lands taken or required for or injuriously affected by the execution of any of the powers hereby granted or any interest in such lands as to the value of such lands or of any interest therein or as to the compensation to be made in respect thereof and if in any such case the compensation claimed shall not exceed one hundred pounds the same shall be settled by two Justices and if the compensation claimed or offered shall exceed one hundred pounds the same shall be settled by arbitrators as hereinafter provided": And whereas in pursuance of the provisions of and in the said recited Act James Byrnes Esquire being then the Commissioner for Railways did on the twenty-seventh day of September one thousand eight

eight hundred and sixty-seven by deed poll under his hand and seal appoint the said William Downing Biden to be arbitrator on behalf of the Commissioner for Railways for the purpose of determining the amount of compensation if any to be paid by the said Commissioner for Railways in respect of the premises: And whereas in pursuance of the provisions of the said recited Act the said Alexander Walter Scott and William Croasdill did on the eleventh day of September one thousand eight hundred and sixty-seven by writing under their hands appoint the said George Vindin as arbitrator on their part for the purpose of determining the amount of compensation to be paid to them in respect of the land taken and for all damages sustained and that might be sustained by them by reason of the execution of the railway works and otherwise by reason of the exercise of the powers vested by law in the Commissioner for Railways: And whereas the said arbitrators before they entered into consideration of any of the matters so referred to them as aforesaid respectively duly made and subscribed in the presence of a Justice duly authorized in that behalf the declaration required by the said statute: And whereas the said arbitrators before they entered upon the matters so referred to them did on the eighth day of June last in pursuance of the said statute by writing under their hands duly nominate and appoint George Colquhoun of West Maitland solicitor to be the Umpire in the matter of the said arbitration: And whereas the said George Colquhoun duly made and subscribed in the presence of a Justice duly authorized in that behalf the declaration required by the said statute: Now know ye that we the said William Downing Biden and George Vindin having taken upon ourselves the burthen of the reference and having before entering upon or taking into consideration any of the matters referred to us respectively made and subscribed in the presence of a Justice duly authorized in that behalf the declarations required by the said Acts which declarations are hereunto annexed and having been attended by the parties and their witnesses and having heard and considered the allegations and proofs of the respective parties and having viewed the said lands and buildings do make this our award in writing of and concerning the premises in manner following that is to say—We do award settle order and determine that there is due from the said Commissioner for Railways unto the said Alexander Walter Scott and William Croasdill and that the said Commissioner for Railways shall pay unto the said Alexander Walter Scott and William Croasdill the sum of nine thousand eight hundred and twenty-two pounds and eight pence as and for the purchase money and compensation for the interest of the said Alexander Walter Scott and William Croasdill in respect of the said land so taken by the said Commissioner for Railways and for all damages sustained and that may be sustained by the said Alexander Walter Scott and William Croasdill by reason of the execution of the railway works and otherwise by reason of the exercise of the powers vested by law in the said Commissioner for Railways: And whereas the said sum of nine thousand eight hundred and twenty-two pounds and eight pence which we have above awarded as such compensation is more than one-fourth less than the sum claimed by the said Alexander Walter Scott and William Croasdill whereby the costs of and incident to this arbitration are to be borne and paid by the said Alexander Walter Scott and William Croasdill: We further award adjudge and direct the said Alexander Walter Scott and William Croasdill to pay the said costs and we do further award and adjudge and settle the amount of the costs of this arbitration and incident thereto incurred by the said parties: And the amount of the costs of and incident to this award at the several sums hereunder mentioned that is to say—

Amount of law costs incurred by the said Alexander Walter Scott and William Croasdill in reference to this arbitration the sum of two hundred and twenty-four pounds nine shillings and sixpence.

Amount of law costs incurred by the said Commissioner for Railways in reference to this arbitration the sum of two hundred and eighteen pounds eighteen shillings and sixpence.

Amount of costs of and incident to this award—

William Downing Biden arbitrator's fee the sum of sixty pounds.

William Downing Biden necessary expenses incurred the sum of fifteen pounds.

George Vindin arbitrator's fee the sum of sixty pounds.

George Vindin necessary expenses incurred the sum of three pounds seven shillings.

George Colquhoun umpire's fee the sum of sixty pounds.

George Colquhoun necessary expenses incurred the sum of two pounds.

Costs of drawing and completing this award the sum of ten pounds and ten shillings.

As witness our hands and seals this twenty-fourth day of June in the year one thousand eight hundred and sixty-eight.

WM. D. BIDEN.

GEO. VINDIN.

Signed sealed and delivered by the said William Downing Biden }
and George Vindin in the presence of— }

ROBT. COLQUHOUN, Solicitor, Maitland.

The Chief Clerk, Railway Branch, Department of Public Works, to The Crown Solicitor.

Department of Public Works,
Railway Branch,
Sydney, 6 September, 1860.

In *re* Honeysuckle Point Property—Claim of Trustees of Newcastle Grammar School.

Sir,

In reference to your letter of the 9th June last and subsequent correspondence, respecting a letter received by you from Messrs. Holden & M'Carthy, requesting to know if the Trustees "will be allowed in the event" of their acquiescing in the reduction of the land taken for the Great Northern Railway, to make an entirely new claim for compensation on the merits of the case as it will then stand, &c.,—I am directed by the Commissioner to inform you, that before the proposition of Messrs. Holden & M'Carthy can be entertained by the Commissioner, it will be necessary that they should state what terms the Trustees will consent to if the Commissioner should surrender so much of the land as is not required for Railway purposes.

I have, &c.,

R. MOODY,
Chief Clerk.

A 12.

The Chief Clerk, Railway Branch, Department of Public Works, to Messrs. Holden & M'Carthy.

Department of Public Works,
Railway Branch,
Sydney, 4 August, 1862.

Gentlemen,

In reply to your letter of 2nd ultimo, respecting a claim of the Trustees of the Newcastle Grammar School to compensation for land taken for Railway purposes, and referring to previous correspondence as to the quantity of land actually required for the Railway,—I am directed by the Commissioner to inform you that he has laid the whole matter before the Honorable the Secretary for Public Works, who has decided that the whole of the land taken must be retained for Railway purposes.

I have, &c.,

R. MOODY,
Chief Clerk.

(To Evidence given by Alexander Walker Scott, Esq., 28 October, 1869.)

B.

The Principal Under Secretary to Messrs. Bradley & Son.

Colonial Secretary's Office,
Sydney, 28 August, 1868.

Gentlemen,

In acknowledging the receipt of your letter of the 12th instant, covering a Memorial from Messrs. Croasdill and Scott, Trustees of the Newcastle Proprietary Grammar School, on the subject of their having been deprived of certain land,—I am directed by the Colonial Secretary to state, that it appears on reference to the Department of Lands that the land alluded to in the Memorial has been resumed by the Government for public purposes in terms of the deed; and that the Government do not consider the Memorialists entitled to any consideration in consequence of such resumption.

I have, &c.,
HENRY HALLORAN.

(To Evidence given by H. B. Bradley, Esq., 28th October, 1869.)

C 1.

H. B. Bradley, Esq., to the Chief Clerk, Railway Branch, Department of Public Works.

Margaret-street, Sydney,
3 April, 1866.

Sir,

Adverting to the subject of the claim of Messrs. Scott and Croasdill, upon the Commissioner for Railways, for land at Newcastle, taken for Railway purposes, and herein to your letter of 4th of August, 1862, addressed to Messrs. Holden and M'Carthy, I am now instructed, as the solicitor for Messrs. Scott and Croasdill, to request that you will have the goodness to state the amount which the Commissioner is willing to pay for the freehold and inheritance of the land taken and for the damages sustained by the taking of the same.

The land taken is described in four grants from the Crown to James Mitchell as being—

a.	r.	p.
10	2	0
9	0	0
1	1	20
1	0	0
<hr/>		
21	3	20

which are in their entirety conveyed to my clients. The land taken is stated to be only 20 acres 2 roods 6 perches. I presume the Commissioner takes the whole, and that a small triangular piece adjoining Dangar, has escaped measurement or consideration by your surveyor.

I have, &c.,
H. B. BRADLEY.

C 2.

The Chief Clerk, Railway Branch, Department of Public Works, to H. B. Bradley, Esq.

Department of Public Works,
Railway Branch,
Sydney, 16 August, 1866.

Newcastle Grammar School Trustees Land Claim.

Sir,

In reply to your letter of 27th ultimo, requesting to be informed,—

1st.—Whether the arbitrator appointed is the auctioneer of that name; and—

2nd.—Whether it is intended to raise any question on the matter of fact that the whole estate was taken for railway purposes,—I am directed by the Commissioner to inform you—

1st.—That the arbitrator appointed is Mr. William Dean, of Sydney, auctioneer; and—

2nd.—That it is admitted that the whole of the estate of your clients has been taken; that is, the whole of the Honeysuckle Point, excepting the strip of land extending 100 feet from high-water-mark, which has been reserved to the Crown in the grant, and therefore cannot be considered as taken from your clients.

I have, &c.,
R. MOODY,
Chief Clerk.

**EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE
LEGISLATIVE ASSEMBLY.**

VOTES No. 16. FRIDAY, 22 OCTOBER, 1869.

10. Cumberland and Camden Bathurst-burr and Thistle Bill :—Mr. Roberts moved, “That” this Bill be now read a second time.
Debate ensued.
Mr. Lee moved, That the Question be amended, by the omission of all the words after the word “That,” with a view to insert the following words, viz. :—“this Bill be referred to a Select Committee for consideration and report.
“(2.) That such Committee consist of the following Members, viz. :—Mr. Forster, Mr. Burns, Mr. Lyons, Mr. Lackey, Mr. Roberts, Mr. Morrice, Mr. Hoskins, Mr. Farnell, Mr. Tunks, and “the Mover, and have power to send for persons and papers.”
Debate continued.
Question,—That the words proposed to be omitted stand part of the Question,—put and negatived.
Question,—That the words proposed to be inserted be so inserted,—put and passed.
Whereupon Question,—(1.) That this Bill be referred to a Select Committee for consideration and report.
(2.) That such Committee consist of the following Members, viz. :—Mr. Forster, Mr. Burns, Mr. Lyons, Mr. Lackey, Mr. Roberts, Mr. Morrice, Mr. Hoskins, Mr. Farnell, Mr. Tunks, and the Mover, and have power to send for persons and papers,—put and passed.

VOTES No. 18. WEDNESDAY, 27 OCTOBER, 1869.

2. Member of Legislative Council as Witness :—Mr. Roberts moved, *without previous Notice*, That the following Message be carried to the Legislative Council :—
MR. PRESIDENT,
The Legislative Assembly having appointed a Select Committee to consider and report upon the “Cumberland and Camden Bathurst-burr and Thistle Bill,” and that Committee being desirous to examine the Honorable Sir William Macarthur, Knight, Member of the Legislative Council, in reference thereto, requests that the Legislative Council will give leave to its said Member to attend and be examined by the said Committee, on such day and days as shall be arranged between him and the said Committee.
*Legislative Assembly Chamber,
Sydney, 27th October, 1869.* Speaker.
Question put and passed.

VOTES No. 27. FRIDAY, 12 NOVEMBER, 1869.

5. Cumberland and Camden Bathurst-burr and Thistle Bill :—Mr. Lackey, as Chairman, brought up a Progress Report from, and laid upon the Table the Minutes of Proceedings of, and of Evidence taken before, the Select Committee for whose consideration and report this Bill was referred on 22nd October, 1869, together with Appendix.
Ordered to be printed.

CUMBERLAND AND CAMDEN BATHURST-BURR AND THISTLE BILL.

PROGRESS REPORT.

THE SELECT COMMITTEE of the Legislative Assembly appointed on 22nd October, 1869,—“*with power to send for persons and papers,*—for whose consideration and report was referred the “*Cumberland and Camden Bathurst-burr and Thistle Bill,*”—have agreed to the following Progress Report :—

Your Committee beg to lay upon the Table the Evidence taken in this matter, from which it will be found that valuable information has been given as to the necessity for some legislation with a view to the destruction of the plants indicated.

JNO. LACKEY,
Acting Chairman.

*No. 3 Committee Room,
Sydney, 12 November, 1869.*

PROCEEDINGS OF THE COMMITTEE.

WEDNESDAY, 27 OCTOBER, 1869.

MEMBERS PRESENT :—

Mr. Farnell,		Mr. Hoskins,
Mr. Roberts,		Mr. Lee.

Mr. Roberts called to the Chair.

Committee deliberated.

Clerk directed to summon John M. Antill, Esq.,—J. H. Neale, Esq., M.P.,—and Mr. James H. Balsh,—to give evidence at next meeting,—and Sir W. Macarthur, Knight, M.L.C.,—Clement Lester, Esq.,—and J. Badgery Esq.,—to give evidence on Wednesday next.

Committee deliberated.

Motion made (*Mr. Farnell*), and *Question*,—"That the Chairman be requested to move the House, that a Message be sent to the Legislative Council, asking leave for the Honorable Sir William Macarthur, Knight, M.L.C., to attend and be examined by this Committee,"—*agreed to*.

[Adjourned to Friday next, at *Eleven* o'clock.]

FRIDAY, 29 OCTOBER, 1869.

MEMBERS PRESENT :—

Mr. Roberts in the Chair.

Mr. Morrice,		Mr. Lackey,
Mr. Farnell,		Mr. Burns,
Mr. Hoskins,		Mr. Lyons.

Printed copies of the Cumberland and Camden Bathurst-burr and Thistle Bill before the Committee.

Clerk submitted letter from J. M. Antill, Esq., stating his inability to attend this meeting,—which was read by the Chairman.

Mr. J. H. Balsh called in and examined.

Witness withdrew.

John Morrice, Esq., M.P., a Member of the Committee, examined in his place.

Ordered,—That J. M. Antill, Esq., be summoned for Wednesday.

[Adjourned to Wednesday next, at *Eleven* o'clock.]

WEDNESDAY, 3 NOVEMBER, 1869.

MEMBERS PRESENT :—

Mr. Lackey,		Mr. Hoskins,
Mr. Morrice,		Mr. Lyons.

In the absence of the Chairman, Mr. Lackey took the Chair.

J. A. Badgery, Esq., called in and examined.

Witness withdrew.

Ordered,—That Sir W. Macarthur and W. R. Antill, Esq., be summoned for next meeting.

[Adjourned to Tuesday next, at *Eleven* o'clock.]

TUESDAY, 9 NOVEMBER, 1869.

[In consequence of the House not sitting this day (Prince of Wales's Birth-day), the meeting of the Committee was postponed, by direction of the Chairman, until Friday next, at *Eleven* o'clock.]

FRIDAY,

FRIDAY, 12 NOVEMBER, 1869.

MEMBERS PRESENT:—

Mr. Lackey,		Mr. Farnell,
Mr. Hoskins,		Mr. Lee.

In the absence of the Chairman, Mr. Lackey took the Chair.
Sir William Macarthur, Knt., M.L.C., called in and examined.

Witness withdrew.

Committee deliberated.

Ordered,—That letter from C. Lester, Esq., referring to the Bill under consideration, and letter from W. R. Antill, Esq., also referring to the Bill, be appended. (*Vide Appendix A and B.*)

Acting Chairman submitted Progress Report.

Same read and agreed to.

Acting Chairman to report to the House.

NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

CUMBERLAND AND CAMDEN BATHURST-BURR AND
THISTLE BILL.

FRIDAY, 29 OCTOBER, 1869.

Present:—

MR. ROBERTSON,
MR. LACKEY,
MR. MORRICE,

MR. FARNELL,
MR. BURNS,
MR. HOSKINS.

MR. LYONS.

R. H. ROBERTS, Esq., IN THE CHAIR.

Mr. James Henry Balsh called in and examined:—

1. *Chairman.*] Where do you live? At Wingecarribee.
2. Are you in any business? I am a farmer.
3. I suppose you are aware that a Bill has been brought in to provide for the destruction of the Bathurst-burr and certain thistle plants in the counties of Cumberland and Camden? Yes.
4. Can you give the Committee any information in reference to the spread of the thistle in the district in which you reside, and whether the plant is a valuable forage plant or not? I consider it a plant very injurious to the district. They came first in one's and two's, but now there are acres and acres covered with thistles. I may mention one particular place in the very centre of the district, belonging to the Hindmarshes—five brothers—who selected 1,600 acres in one block. They fulfilled their three years in 1865, and since that time* the land has been almost abandoned. I dare say there are two hundred acres of thistles on the ground at the present moment, from which the seeds are spread in every direction by the wind all over the country. The roads are now getting covered with thistles, and if it is allowed to go on, the whole district will be covered. People who are residents in the district are anxious to destroy them, but the seed from these places belonging to non-residents is continually restocking the ground.
5. Do you think it is desirable there should be some legislation in the matter, in order to ensure a united effort for their eradication? I certainly do.
6. You do not consider this plant a valuable forage plant in your district? No, I consider it very injurious.
7. *Mr. Lackey.*] How long have you been in the Camden district? Seven years.
8. Do you cultivate there? Yes.
9. Were these plants spread about the district when you first went to live there? No; the first year I never saw any, the second year it was a rare thing to see a plant of them, but now you can see acres of them.
10. Are they to be found in many parts of the district, or confined to any particular part? They are spread over the district, but many people take great pains in cutting them down.

11.

* NOTE (on revision):—A portion of the land,—referring to Mr. W. Hindmarsh's property. The other brothers have some tenants on the land.

Mr. J. H.
Balsh.

29 Oct., 1869.

- Mr. J. H. Balsh.
29 Oct., 1869.
11. You allude to the Scotch thistle? Yes; there is another one there which is not so injurious—the spotted thistle.
 12. Has the result of your observation led you to the conclusion that these thistles are only destructive in cultivated land, or in cultivated and uncultivated land both? In both. They are to be found where the bush is thin, or at the edges of the bush. Wherever you fell a piece of bush the thistle will spring up; in fact, I am not now felling any for fear of the thistles. I would rather clear a piece of bush than clear the thistles.
 13. Have any steps been taken by yourself or any of your neighbours to remedy this evil? Yes, many of us have tried to destroy them. I have myself employed people to cut them up and put salt upon the roots; I find that the most effectual way of killing them. If you cut them off they will shoot from every bit of root that is left, but by cutting them down with the hoe and dropping a little salt into the heart of them, it kills them.
 14. You think if that practice were generally adopted the plant would be entirely destroyed? Yes.
 15. Does the result of your experience lead you to believe that this plant would extend into districts of a different character to your own? Yes, the seed is carried about for long distances and in every direction by the wind. On one occasion I was standing talking to a person near Mr. Throsby's mill, 10 or 11 miles from Wingecarribee, when I saw the thistle-down flying about; the person I was talking to said it came from Wingecarribee whenever the wind blew from that direction. Illawarra lies exactly under us, and whenever the westerly winds prevail it goes down there.
 16. Do you think the plant is likely to take root in drier districts than yours? In our district every seed will grow, but in Illawarra and other districts which are drier, possibly many of them may not do so.
 17. Have you the Bathurst-burr in your neighbourhood? No, I have not seen the Bathurst-burr there.
 18. Mr. Farnell.] You think legislation is necessary for the purpose of eradicating these thistles? I do.
 19. Have you seen the Bill introduced to the House? Yes, I have seen it in the newspaper.
 20. Have you paid any particular attention to the various clauses of that Bill? I did not pay any very great attention to it, but it appeared to me to be effectual.
 21. However, so far as your opinion goes, all that you would require would be sufficient legislation to compel your neighbour to keep his land clean? Yes. I do not think last year I allowed one thistle to seed on my farm, but now it is literally covered with them. This year I could have got a shovel and shovelled the seed up like snow from the ground, when the wind was blowing from the Hindmarshes' land.
 22. Do you know how long the seed lies on the ground before it germinates? I should think, judging from my own place where I felled the timber and the fire ran that it must remain some time.
 23. You have spoken of destroying the thistles by cutting them down and putting salt on the roots—Is not that a very expensive way? Not particularly expensive; it is rather tedious work, but it effectually kills them, whereas if you cut them off and do not salt them, every bit of the root will send out shoots—five or six for one.
 24. Do you know of any other weeds or plants that are injurious to cultivation? Not in that district. I have seen the cotton plant, but they are mostly destroyed.
 25. Have you any brier? No.
 26. Have you seen the brier in any other locality? I have seen them at Sutton Forest.
 27. Do you think it necessary to legislate for the eradication of the sweet-brier? I think it would be a good thing. I have them in my own garden, but I cut them down every year before the seed dries. I have the smell of them without their being any injury to the farm whatever. I never allow them to seed.
 28. Do you think it necessary to legislate with reference to all kinds of weeds, so that every man should be bound to keep his farm clean? I hardly know that I should go so far as that. I should have no hesitation about thistles, and I certainly think, from what I know, that the sweet-brier is a great nuisance.
 29. Is not a weed called the dock very injurious and hard to eradicate? Yes.
 30. Do you think legislation necessary in reference to that? I certainly think it would be. It is a very bad weed is the dock, and very difficult to get rid of.
 31. Chairman.] I believe the process you have spoken of kills it—the application of salt? Yes, I believe it does, but I never tried it.
 32. Mr. Morrice.] Do you know how many kinds of thistles there are? Only the two kinds—the Scotch thistle and the spotted thistle.
 33. Is there not a smaller kind called the milk thistle? Yes; they are very good for cattle. You mean what we call the milk or sow thistle. Cattle are very fond of it, and it is always good ground it grows on.
 34. You would not recommend that that should be destroyed? Not by any means.
 35. You are not much accustomed to the sweet-brier? No, I have not seen much of it.
 36. Your district is too young to have them? Yes.
 37. Have you seen large fields covered with them at Sutton Forest? Yes.
 38. Do you think it necessary there should be some means taken to keep them down? I think it would be a very good plan.

John Morrice, Esq., M.P., a Member of the Committee, examined in his place:—

- J. Morrice, Esq., M.P.
29 Oct., 1869.
39. Chairman.] You reside near Sutton Forest? Yes.
 40. You are a considerable landed proprietor? Yes.
 41. Perhaps you will oblige the Committee by giving them any information you possess as to the spread of the thistle and burr, or any other plant you consider noxious? The only weeds that I know of, of that kind, are what we call the Scotch thistle and the spotted thistle; there are very few plants of the Bathurst-burr in our district, and I do not think there is much danger of its spreading with us, for it is a plant that the frosts kills, and the frosts generally come upon it before the seeds are ripe.
 42. Mr. Burns.] How does it get propagated? In some parts of Cumberland it will grow. It is brought into the district by travelling sheep and cattle from the Murrumbidgee and other districts where the burr grows. The sheep carry it in their wool, and you will often see cattle with great lumps of it sticking to their tails. It is not a plant that will take any great hold of its own accord in such a district as ours.

43. *Chairman.*] Do you consider it desirable that there should be some legislation for the eradication of these plants? I think so. J. Morrice,
Esq., M.P.
44. Do you imagine that they will prove injurious to the district unless some means are taken to stop their spread? Yes, the Scotch thistle and the spotted thistle will no doubt. I saw them first at my place about three years ago, and I have been at them almost constantly, every now and then, with my men to cut them up before the seed comes on them. I think it very desirable something should be done. 29 Oct., 1869.
45. *Mr. Lackey.*] How long have you been living at your present residence? I have only been living at my present residence for about six years, but I first resided in the district in 1835, and I have been there ever since.
46. Were any of these thistles there when you first lived in the district? There were a few of the spotted thistles.
47. Any of the Scotch thistle? No.
48. How long is it since you first noticed them? About three years ago.
49. Have you any idea how they were brought there? I do not know, but I think they were brought there by cattle, from seeing them in the different paddocks where they were put. I think they were brought in the tails of cattle and the wool of sheep.
50. Have you noticed them in cultivated or uncultivated land? In both.
51. Have you had them in your own cultivated land? Not much.
52. Have you had them in your uncultivated land? Yes, in paddocks where fat cattle have been.
53. Have you taken any steps to get rid of them? Yes, every year.
54. In what way? I have always sent a man with a hoe to take them out by the roots.
55. Do you think that the best plan? I have never tried any other.
56. Did you ever try the plan recommended by the last witness? No.
57. Have these weeds spread to any large extent in your district? They will spread very much if they are allowed to go on.
58. You think it desirable some measure should be introduced to prevent their spread? I do. Where the land is rich they will grow tremendously.
59. Is it your opinion that if some legislation on the subject is not resorted to these weeds are likely to become a very great nuisance? Yes, because some people are very careless and use no exertion to keep them down; if their neighbours cut them down their labour is useless, for the wind blows the seed from one farm to another.
60. Have you noticed the clauses of the Bill that has been introduced? Yes.
61. Is there anything in them that you consider very objectionable? I think they ought to be allowed one or two years before the Bill is put into operation, because it would be ruination to some people to put such clauses into force; some persons have so much of it that it would be impossible for them to eradicate it in the time.
62. What time do you think would be the correct time? I should say twelve months or a couple of years, and if they are not eradicated in that time then put the Act in force.
63. In the meantime public notice should be given that the Act would come into force at a certain time? Yes.
64. In the part of the Camden District you live in, weeds of this sort are more likely to germinate and take root than in other parts of the Colony, from its being a moist climate? Yes.
65. Do you think the Scotch thistle would spread in warmer districts? Yes; I have seen hundreds of acres of it on the banks of the Murrumbidgee, so thick that you could neither walk nor ride through them. There are three descriptions of thistles—the Scotch thistle, the spotted thistle, and the milk thistle. The milk thistle is a smaller plant than the other two, and is a very nourishing food for cattle, pigs, and other stock. There is no necessity to destroy them.
66. Do not cattle feed on the spotted thistle also? Yes, on the banks of the Murrumbidgee, where I have been accustomed to see them mostly; the cattle eat them when grass is scarce, and when they are coming up young they get very fat upon them.
67. Have you ever heard of their being cut down and made into a sort of hay for cattle food? No.
68. Is it your opinion that the spotted thistle ought to be included in this Bill, or merely the Scotch thistle? I would include both Scotch thistle and spotted thistle. As to the sweet-brier, I think that is as bad and worse than either of the thistles, particularly in the Berrima District, excepting where they have them as hedges, when of course they can be kept down and not allowed to seed. I have seen a cultivation paddock ploughed up and allowed to remain one or two years, which has then been completely covered with them. The seed is carried about by opossums and birds. I have myself been out on a moonlight evening, and on a hedge at my own place have shot fifty or sixty opossums which were there eating the berries. Not only opossums and birds, but pigs, cattle, and horses eat them; and wherever their dung is dropped over the fields the brier comes up; one berry will contain hundreds of seeds. The brier is most difficult to eradicate, the slightest fibre left in the ground sending up shoots. An old English farmer first had the farm where I am now living, and he cultivated on the English system, planting the whole place with these brier hedges. There were hedges there of these briers nearly as high as this room. When I went there to live the fields had become covered with them, and I had to employ several men to take them all up, but I found I had to go over the same thing every year, until I saw I had no other remedy but to take these hedges down. As I said before, the opossums, pigs, and cattle eating them, spread them over the whole country. It cost me a great deal to take up all the hedges, but since then I have been able to keep the fields tolerably clear, although there are a good many yet.
69. *Chairman.*] You think it desirable to include the brier in the proposed Bill, where it is not used for hedges? Yes. I know estates that have been neglected, where the fields are covered with it. The brier does very well for hedges or fences, if kept clipped or cut down every year, so as not to allow it to seed, and may be useful to some people in that way; but they are hedges I should never cultivate. When I took mine out, I sent to Camden for hawthorn, and planted it in their places.
70. *Mr. Hoskins.*] Is it your opinion that the weeds indicated in this Bill could not be eradicated without legislation of this kind. They could be, of course, if the people would do it.
71. Perhaps you do not understand my question. Do you think such stringent legislation as this Bill provides is necessary to cause the eradication of the weeds indicated in this Bill? I think it is rather too stringent.

J. Morrice,
Esq., M.P.

29 Oct., 1869.

72. Do you think such peremptory legislation as this Bill indicates is required? I think it requires something of the kind; but I think one or two years should be allowed.
73. Do you think that self-interest would not prompt landowners and occupiers to eradicate these weeds without legislation at all? Some would do it, but not every one; for instance, people renting a farm would be careless when they were going to leave it.
74. Do you think that if this Bill became law everybody would eradicate thistles and Bathurst-burr? If you compel them to do it, of course they must do it.
75. But they would not do it unless put under the pains and penalties provided by this Bill? Not every one.
76. But if this Bill became law they would? Yes.
77. What would cause them to be more industrious? The penalties.
78. Would it be from the effect of the Bill, the knowledge that the Bill had become law, or from fear of their neighbours informing against them? I suppose from fear of their neighbours informing against them. Some would do it because the Bill had become law, and others for their own benefit.
79. You think, as a rule, the fear of penalties attached to any indifference on their part would cause them to eradicate these weeds? Yes.
80. Do you think it possible that under this Bill some persons could very seriously annoy and perhaps injure others? I think so; for instance, if the sweet-brier were included, as the Bill stands now, it would almost ruin some people.
81. Do you really believe that if this Bill becomes law all the Bathurst-burr and thistles in the counties of Cumberland and Camden will be eradicated? There would always be some, in my opinion, particularly where there were stock travelling.
82. Have you read this Bill attentively? I have.
83. I suppose you have observed one striking feature in this Bill,—what may be termed an arbitrary interference with the rights of private property? I think it is rather arbitrary.
84. Have you read the 2nd clause? Yes.
85. It provides that if, within fourteen days after having received notice, an owner or occupier of land does not eradicate these weeds, he is liable to a penalty not exceeding £20—Do you not think fourteen days too short a time? I think it is.
86. What time would you suggest? As I said before, I think there ought to be one or two years' notice before the Bill comes into operation.
87. And then? Then after that in some cases fourteen days may do, in other cases a month, in others six months.
88. Supposing an owner or occupier were away on some other business, or were not a resident, would it not be absurd to expect him to attend to the requirements of a notice in fourteen days? I think it is too sharp.
89. Would not sixty days be better? Yes, that would be quite sharp enough.
90. Do you not think it desirable that any information on which a Justice of the Peace should act in carrying out the provisions of this Bill should be given on oath? I think so. I do not think it should be left to one Justice to do it.
91. If a person can give such information not under the solemn obligation of an oath, do you not think he may do it capriciously or with a desire to injure his neighbour? It may be done.
92. From your knowledge of people in the bush do you think it would be done? I think some people would do it.
93. Do you think there would be as many cases in which that would be the cause as for *bona fide* reasons? No, not as many; there would be a good many I believe.
94. Will you be kind enough to turn to the 6th clause, which gives power to Justices to grant an order for the destruction of thistles—You will observe that the proprietor of adjacent land is to be compelled to clear half the road passing by his property—Do you think that is right? I do not think it is; I do not see why he should clear the road at all.
95. Who then is to pay for clearing the roads? Where there is not a Municipality I suppose the Government must do it, but where there is a Municipality I should say they should do it.
96. Then the cost of eradicating these thistles from the roads would be thrown upon the country? I do not see who else is to do it. One person might have his estate bounded by a road for miles and miles.
97. To carry out your view, if this Bill becomes law, would necessitate a tax upon the revenue of the country? I believe it would.
98. Do you think that if the weeds spoken of in the Bill were not eradicated from the sides of the roads, the Bill would not be efficacious in carrying out the objects intended? No; if any of these plants were left on the sides of the roads it would be of no use clearing the fields adjoining; the wind would blow the seeds upon them, and in a short time they would just be covered again. On the banks of the Murrumbidgee I have seen the flats covered with the most beautiful clover; in a year or two came a flood, and then the whole of the banks, instead of clover, were covered with Bathurst-burr, so thick that you could not walk through it; in a year or two afterwards came another flood, and then the banks became covered with thistles, which have been there ever since.
99. Have you looked at the 9th clause, which provides that when an occupier of Crown Lands in the counties of Cumberland and Camden is put to any costs in eradicating Bathurst-burr and thistles, under the provisions of this law, he may come upon the Crown, the actual owner of the land, for the cost so incurred—Do you think that just? It would be a very severe tax upon the revenue.
100. You could not give any approximation to its amount? No. I know there are Church and School Lands, for instance, on which a great deal of thistles grow, and it would cost the Government a great deal to clear them.
101. I gather from the general tenor of your replies, that that expenditure would be continuous, because the seeds are carried about by the wind? Yes. On my own property I find that the travelling cattle carry them in their tails and in their hair.
102. Do you think any amount of legislation would prevent that? No.
103. Would not that be as fertile a source of spreading Bathurst-burr and thistle as any other? Yes, quite as much so.
104. Have you remarked another feature of this Bill,—that no scale of compensation for the labour employed in extirpating these weeds has been provided—no fixed rate of wages—it is left to the discretion of

of the Justices—Do you think that is right? I do not see how you could fix any rate, because wages differ so much.

J. Morrice,
Esq., M.P.

29 Oct., 1869.

105. The 11th clause provides that if the owner of land on which burr or thistle may have been growing be absent or unknown, the Municipality of the district may let his land for a term not exceeding fourteen years, and apply the rent in payment of any penalty or compensation that may have been imposed—Do you like that clause? I think it is rather severe.

106. Do you approve of the principle of allowing a Municipality to arrange the terms on which a man's land should be let? I think that would not be fair play.

107. Do you like the Bill, after having given these replies? Not without some alteration.

108. *Mr. Burns.*] Do you not think the Bill may be made a useful measure by making the penalties lighter and introducing some other amendments? I think so.

109. Do you think it likely that Bathurst-burr, thistle, or sweet-brier, although found to be objectionable, will be eradicated if no legislation takes place? No, I think not. Too many people are careless and will not take the trouble to destroy them; and those that will do so may just as well save themselves the trouble unless all are compelled to do the same. Therefore I think it necessary to have something to make it compulsory.

110. Do you think that if the time for bringing this Bill into operation were deferred for two years after it became law, much injustice could arise? No, not with some alterations.

111. The proprietors of land within the area mentioned in the Bill can be easily reached directly or through their agents? In most cases they can, but there are cases where they cannot be found.

112. Do you not think two years would be sufficient to inform every person concerned of the passing of the Bill? I think it ought to be.

113. What do you suppose would be the cost of clearing off these weeds per acre? It would vary very much.

114. Do you think the annual expense after the first year would be much? It would come to a good deal; people would have to be kept constantly at it, for if once they were allowed to seed, what had been done before would be all undone.

115. Do not the landowners find them a great evil now? Yes.

116. It is matter of constant complaint that they are spreading? Yes.

117. And you, as a landowner, think that unless legislation takes place they will spread more? Yes.

118. *Mr. Hoskins.*] But you have given evidence that we cannot prevent the introduction of the seed? We cannot prevent the seed from being brought by travelling cattle and sheep.

119. *Chairman.*] Although we cannot prevent the seed from being brought there, we may prevent the plants from seeding within the counties? Yes. I have seen the tails of cattle clotted in lumps with seed of these plants, and sheep on the Murrumbidgee with their whole fleece covered with them, so that you could scarcely put your finger on a clean spot.

120. You admit that it is desirable there should be some legislation on this matter? I think so,—to keep down the evil at all events.

121. *Mr. Lackey.*] You are aware that this Committee has been appointed for the purpose of considering, and where necessary amending this Bill, and that one of our duties is to make the Bill as practicable as we can—Having that in view, is it your impression that we can put the Bill in such a shape as to make it acceptable to the people of your district? I think so.

122. Supposing one or two years were allowed to elapse before this Bill came into operation, do you not think the seed from these noxious plants would become very widely spread in the meantime, and that the injury the district would sustain from the spread of these plants would be very great? If the people did not try to destroy them, of course it would. But it would be ruination to some people to be compelled to destroy them at once.

123. *Mr. Farnell.*] Would it not be better to leave it to the discretion of the Justices, as to the extension of time to be granted to each individual? I would not leave it with one Justice.

124. *Mr. Lyons.*] You think the expense would be too great to some parties? Yes.

WEDNESDAY, 3 NOVEMBER, 1869.

Present:—

MR. LACKEY,
MR. HOSKINS,

MR. MORRICE,
MR. LYONS.

JOHN LACKEY, ESQ., IN THE CHAIR.

Mr. John Alexander Badgery called in and examined:—

125. *Chairman.*] You reside in Sutton Forest? Yes.

126. You are aware of the fact of a Bill having been brought before the Legislative Assembly with a view to the destruction of the Bathurst-burr and certain thistle plants in the counties of Cumberland and Camden? Yes.

Mr. J. A.
Badgery.

3 Nov., 1869.

127. You have been living for some time in the Sutton Forest district, have you not? Yes, I have lived there nearly all my life.

128. And you have had an opportunity of knowing the ravages of these thistle plants? Yes.

129. And the injury they have done to the grazing capabilities of the country? Yes, I have had a very good opportunity of observing the growth of these plants, and their effect on the country.

130. Have you noticed any particular description of thistles which you consider most objectionable? I know of two thistles which we regard as the worst.

131. What are their names? I do not know their proper names.

132. What names are they known by in the district? One is known as the "Scotch thistle," but I believe that is a mistake. I have brought samples of these thistles with me, and perhaps I had better show them to the Committee. (*Witness produced samples of thistles known in the Camden district as the "Scotch thistle,"*)

- Mr. J. A. Badgery.
- 3 Nov., 1869.
- thistle," and the "hairy thistle," respectively.) This, which we call the "hairy thistle," has been in the district only three or four years, and we consider it by far the greatest nuisance and most dangerous plant.
133. How long is it since you first noticed the "hairy thistle" in your district? I think it is five years since I noticed the first I ever saw. The seed came, I believe, in some rye-grass seed brought from Mr. Ferris, of Sydney; for the year after that was sown I noticed this thistle, which was a strange plant to me.
134. Had you noticed it in any part of the district before? I had not. That was the first plant of the kind I had ever noticed.
135. It seems to spread about the district with very great rapidity, does it not? With very great rapidity.
136. You are of opinion, I understand, that the growth of this thistle does great injury to the grazing ground generally? Yes.
137. Is it your opinion that legislation is necessary to eradicate it? I think it is quite necessary. If something of the kind is not done I am afraid it will ruin our district.
138. Experience has proved to you that if it be not checked in some such way it will do great injury to the district? Yes, it will do a great amount of injury, if it does not altogether destroy its grazing capabilities.
139. There is a great amount of agricultural land in some portions of the Sutton Forest district—in what is called Yarrowa and Wingecarribee? Yes, there is a considerable amount of agricultural land there.
140. And land which is likely to be very greatly affected by the ravages of such plants as this? Yes; the soil being suitable to their growth is one great reason—the soil is very suitable.
141. The place is favourable to the growth of these thistles, both from the character of the soil and the moisture of the climate? Yes.
142. You think that if a careful farmer were to devote ever so much trouble, and be at ever so much expense in keeping his own farm clean, it would be of little or no use unless his neighbour kept his farm clean also? It would be almost impossible. If one farmer neglected to keep his ground clear, I think the adjoining farmer would have very great difficulty—in fact it would be almost impossible for him to keep his farm clear. It would be everlasting work to do anything in the shape of clearing.
143. The seeds of these plants are very easily conveyed about and propagated? Yes; the seed of the thistle is perhaps not more than a quarter the weight of the seed of what we know as the Scotch thistle; consequently it is carried about with much greater ease.
144. Have you ever observed it as a fact being carried about in large quantities by the wind? I cannot say that I have seen it carried about in large quantities, but I have observed that when there has been a westerly wind, which would carry them one way for a time, they have afterwards come up very thick in that direction, proving that they are carried by the wind.
145. Have you noticed the Bathurst-burr in your district or neighbourhood? Only in one place.
146. Then the district has not suffered much in consequence of their growth? No.
147. Have you noticed this Bill to make provision for the destruction of the Bathurst-burr and certain thistle plants in the counties of Cumberland and Camden? Yes.
148. Have you read it? Yes.
149. Do you think it is suitable for the objects which it is proposed to carry out? Yes, I think so.
150. Do you think there are any clauses in it of a very objectionable character? I have not gone so closely into it as to be able to speak about that. I have taken into consideration the intention of the Bill—to eradicate the thistle—but I have not gone into the clauses closely. I have not inquired into that part to which you refer.
151. You are decidedly of opinion that legislation is necessary? Yes, decidedly. I have mentioned the subject to a large number of landowners in our district, and every one of them has been in favour of the Bill; also some of the tenants.
152. Mr. Hoskins.] I suppose you think it is possible that there might be a large number against it? I do not think so, without they are interested. Perhaps I may as well explain what I mean by their being "interested." If, for instance, I rented a large property from you, and I was not compelled by the terms of the lease to destroy the thistles, the passing of this Bill might put me to considerable expense.
153. Is it not possible that the freeholders may object to the Bill? I do not think so.
154. It so happens that we have letters from large freeholders objecting to it? In the counties named?
155. Yes. Will you be kind enough to look at the Bill while I refer to some of the clauses—Your opinion as to the necessity for a Bill of this kind is, I understand, based on your knowledge of the fact of the spreading of thistles about the Sutton Forest district? Yes.
156. You, of course, do not take into view what may be the effect of this Bill on other parts of the counties of Cumberland and Camden? I am acquainted with the whole of the counties of Camden and Cumberland.
157. But you have principally referred, in the evidence you have given, to the necessity for a Bill of this character, believing it would be beneficial to the residents in the neighbourhood of Sutton Forest? I believe it would be beneficial to the whole—not to the residents of Sutton Forest alone. My occupation leads me all over the counties, and therefore I have an opportunity of judging.
158. The state of the climate you say about Sutton Forest is moist? About the particular part Mr. Lackey spoke of—the Yarrowa district.
159. You said that the Bill would be suitable there? I said that the soil was particularly suitable for the growth of thistles.
160. And that therefore the Bill would be desirable for that place? Yes.
161. But what do you say about those portions of the county of Camden which are not favoured with a moist climate; for instance, Picton? I think they have a moist climate there.
162. Well, the Oaks—Do you think the people about there would benefit by a Bill of this kind being passed? I have no doubt about it.
163. I infer from what you say that the weeds to be eradicated under this Bill—the Bathurst-burr and the thistle—operate more injuriously in pastoral districts than they do in agricultural districts? I think perhaps there would be more injury done to grazing land than to agricultural land, because agricultural land is frequently ploughed, and that would keep them down during the time it was in cultivation of course.

164. Therefore, on your own showing the Oaks district being an agricultural district, there would not be such an urgent necessity for a Bill of this character to apply to that district as to Sutton Forest? I do not consider that the Oaks is an agricultural district altogether. I have been all about there lately, and I think the people are getting their living there by grazing principally. I did not see so much agriculture going on.

165. Supposing a Bill of this kind became law—is it not a fact which comes under your cognizance as a grazier that the burr is communicated to districts in consequence of the burrs adhering to the skins and hides, and especially to the tails of cattle? Yes.

166. If a Bill of this kind became law, which made it compulsory on freeholders and leaseholders to eradicate the Bathurst-burr and thistles from their runs, and if the seeds were communicated by flocks of sheep and herds of cattle brought into the district for fattening purposes, would not that necessitate a large increased expenditure amongst the residents of the district to keep it down? I think it would be a mere trifle.

167. For instance, take the case of a person in the Sutton Forest district farming, 3,000 acres, where you say there is a good soil and a moist climate—how much would the cost be per year from the causes I have indicated? Considering that the farm were once cleared?

168. Yes. What would you suppose the estimated cost would be yearly to eradicate these weeds from seeds imported by strange cattle and sheep? A mere trifle—I think it would not be over a pound.

169. A pound a year? I think it would not be over that.

170. Your evidence is very different from that given by others? It may be, but I have had a great amount of experience, and that is my opinion. We are always bringing fresh cattle, and we occasionally bring weeds with them, but when we find them growing we take them up.

171. Is it not possible that those weeds may be blown from your land to the land of other persons? Not if we take them up before they seed.

172. But when cattle and sheep are travelling, may not these weeds be dispersed over other people's land? No doubt a few seeds may drop on other people's land the same as on ours.

173. Then if the owners of land or farmers did not closely watch the travelling stock of other persons passing through the district, would it not be possible for that stock to leave some seeds on the runs? It would be quite possible.

174. Would not that entail increased vigilance, and consequently increased expense? The expense would be very trifling.

175. If a man is despatched to watch a herd of cattle travelling over a run, that will involve expense? But there is no need to watch. Some time after the cattle have gone, if they found the seeds growing they would have the plants taken up, and an end put to them for the time.

176. *Mr. Lyons.*] Have you any knowledge of how long these seeds are coming up? No; I think that, in all probability, they would lie in the ground for a considerable time. Some would lie longer than others. They contain a great amount of oil, and seeds of that kind remain longer than seeds of a different kind.

177. *Mr. Hoskins.*] Do you consider it necessary that the Government should be armed with powers to enable them to compel people to keep their land clean and freed from Bathurst-burrs and thistles? I do.

178. Of course, it must be admitted that if such a law were passed it would necessitate an increased cost to the revenue, inasmuch as the Government would have to keep a staff of employés to see that there was no evasion of the law? I do not know that that would be necessary.

179. Then how are you going to find out whether they do it or not—do you think that one person would inform against another? Yes.

180. Do you think that is a desirable state of things to bring about? Yes.

181. To set one neighbour against another? I do not think it would set one neighbour against another. My next neighbour might have a lot of these thistles on his property; if he let them go to seed they would be sure to seed my place. If this Act were passed, I should give him notice to cut the thistles; but we should not quarrel over it.

182. From your knowledge of the people who live in this and in every other country, do you not think that a Bill of this kind might be so worked as to enable one person to vexatiously annoy another? I do not think so.

183. Are you not of opinion that this Bill, which you say is desirable, admits of a very arbitrary interference with the rights of property-holders? It may be arbitrary, but I think it is necessary under the circumstances.

184. The Sutton Forest district is very highly favoured. In times of drought elsewhere, there is plenty of water there, and plenty of grass; while other portions of Camden, in the neighbourhood of Picton, and other places, are not so highly favoured. Now is there not a description of thistle which could be used for food of cattle in seasons of drought, and which would enable a stockholder to sustain the lives of his stock when he had no grass for them? I know that the cattle do eat what we call the Scotch thistle when there is a great scarcity of grass, but I understand that it does them more injury than good—it kills a great number of the cattle.

185. Assuming that there is no grass in the district in the time of drought, do you not think it would be better to have a weed growing which would preserve the life of a large number of the cattle than to eradicate it and lose the cattle altogether? I do not think the cattle ever benefit by it in the counties of Camden and Cumberland. I have travelled over the two counties for years, and I never saw the cattle eating these thistles so as to benefit them.

186. Do you think it would be better that the cattle should die of starvation than that the thistles should be kept on the ground? I can hardly understand that.

187. You will not push your support of this Bill to that point. I have received a letter from a resident in the county of Cumberland whom you know very well—and who is a large landowner (*Mr. William Antill*). It is in consequence of what he says that I am putting these questions to you. He speaks in his letter of the fact that these thistles keep the cattle alive during droughts. He says—"Many small farmers use the Scotch thistle, so-called, for feeding their cattle and pigs in winter and during a drought" ? On Maneroo?

188. This is on this gentleman's property where he resides? It would cost him something considerable to get rid of the thistle, and that may be one reason why he would oppose such a measure. When I was on Maneroo

Mr. J. A
Badgery.

3 Nov., 1869.

Maneroo a short time ago, I spoke to Mr. Ryrie, of Micalago, on the subject. He said that the cattle ate the thistles. I said to him—"If you had never had them would you like to have them?"—and he said, "No."

189. But if people had these thistles on their runs and they were subject to drought, would it not be hard to compel them to eradicate what would be the only sustenance for their cattle in seasons of drought? I do not think that would be the only means of subsistence. There are other weeds which the cattle eat to a considerable extent, as the Scotch thistle.

190. Will you look at clause 1 of this Bill—It recites that it shall be lawful for any Justice of the Peace, upon the written application of any person, to serve or cause to be served a notice to destroy the burrs or thistles—It does not provide that the person making application should do so upon oath—Do you think that a desirable state of things? I cannot go into those clauses. That is a kind of thing I am not well acquainted with. I can only speak of the injury which the thistle has done and is likely to do—the thistle and burr.

191. But this Committee has been appointed to express an opinion not only on the desirability of eradicating the Bathurst-burr and thistle plants in the counties of Cumberland and Camden, but also on the merits of the Bill—which is unusual, and confers such arbitrary power on the Government? I am not prepared to give an opinion on clauses of that kind.

192. Do you think it desirable that upon the mere statement of a person when that statement is not fortified by oath, a Magistrate should be empowered to take action against another and to saddle him with costs? I am not sufficiently up in law to understand these things.

193. You are a sensible man, and I have known you for years. I should like to ascertain from you whether you consider it right that Magistrates should take initiatory proceedings, and authorize persons to invade your property on the mere statement of a neighbour unsupported by an oath? Perhaps it would be necessary to have a statement on oath; but I do not see otherwise where there would be likely to be any injury done. It is not likely that I or any other person would go to a Magistrate and state that thistles or other noxious weeds were growing on a neighbour's property if such was not the case.

194. You entertain a better opinion of your neighbours than most people. At all events, do you not think it would enable a person who had a spite against another to seriously injure him? I do not think it likely.

195. Not if you did not compel the person laying the information before a Magistrate to make an affidavit? Perhaps it would be better to have his statement on oath, but I do not think any person would make a statement of the kind unless there was some truth in it,—unless there were some weeds of the prohibited kind existing on the land.

196. Of the "prohibited kind!" How are you going to indicate it—are we to specify in this law how many kinds there are? I thought that in all probability it would be the case.

197. Some of us do not understand them? You would have to ascertain. I think the sow thistle is indigenous, and it is not regarded as a great nuisance.

198. There are some thistles which are no nuisance? The sow thistle is no great nuisance, and I think it is a native as well.

199. If this Bill should be reported on favourably, would you suggest that the sow thistle should be exempted from its operation? I think so.

200. Is there any other thistle which, in your opinion, should be exempted? I do not know of any other.

201. You think that all other descriptions of thistles but sow thistles are noxious, and destructive to property? I do not know what may be classed as thistles—I am not up enough in botany.

202. There is the difficulty of legislation on a question of this kind? There are only two thistles in the counties of Camden and Cumberland that we know of which injure our property—these are the two [*exhibited to the Committee*], and I think it would be well if a Bill were passed compelling the destruction of them, whatever their names may be.

203. Then again, the 2nd clause provides a penalty. It says: "If any such owner lessee or occupier shall neglect or refuse to destroy all of the said plants then growing upon such land or upon the half of any public road adjacent thereto." Now I ask you whether you would consider it right that the owners or lessees of land, or small farmers, should be compelled to clear one-half of a public road of these thistles? I think so. I should have no objection to do it. I do not think any landowner having his own property clear would object to cut up the thistles along the road—it would never be a very large item.

204. Supposing, for instance, a man had half a mile frontage to a road, what would it cost him to eradicate the thistles and burrs on half the road to which his land had a frontage? I think it would be a very trifling amount.

205. How deep do the roots of these plants go into the ground? I think, in reference to this thistle, that if you go down 4 inches you get below the crown, and it will not grow again. The others go down to a greater depth; but no person cutting up thistles expects to destroy them at one cutting.

206. How many times would it be necessary for a person to go over this half a mile frontage? Two or three times.

207. And how much would that cost? I do not think it would cost much—say a pound a time. Along the road from Camden to Picton the thistles are thicker than in any other place I know of, and to go over half a mile there and cut up the thistles once would be about one week's work. It would have to be done three or four times, and would cost twenty-five or thirty shillings each time.

208. That would be six or seven pounds, on your own showing, but I think it would be remarkably expeditious working. The cutting down would have to be done three or four times in the first instance. Then, as thistles and burrs are taken from place to place by travelling cattle and sheep, the process would afterwards have to be repeated a good many times? It would have to be done occasionally. A person would have to watch, and if a thistle happened to spring above the ground it would have to be taken up. It would be no great hardship on the landowner.

209. It would be an increased expense in the management of his property? It certainly would, if he only had to bestow half an hour's labour on it.

210. And therefore it would diminish the profits derivable from the property? I suppose it would. If he devoted only half an hour to the work he would lose the value of that half-hour.

211. That is an addition to the original expense. Now we come to another portion of this clause. It is required that the party against whom information shall be laid should eradicate all these thistles or burrs within

within fourteen days after such notice shall have been given, or upon conviction of neglect or refusal be liable to a penalty of not more than twenty pounds nor less than five pounds. Do you think that fourteen days is sufficient time? I think it is sufficient time after the Act comes into force. The Act will not be brought into force in a day, but a little time will no doubt be given to those who have thistles on their property, to cut them down. After that I think fourteen days quite sufficient.

Mr. J. A.
Badgery.

3 Nov., 1869.

212. Would you suggest that this Bill should come into operation as soon as it is passed? No, I think that would be unfair.

213. How soon after, do you think? Say six months. Perhaps that might be too long, but I think the people ought to have sufficient notice.

214. But after the Act has been brought into operation, do you think that fourteen days' notice would be too short a time to enable persons to eradicate these weeds? I do not.

215. Have you looked through the Bill to see if there is any scale of compensation for persons who eradicate weeds by order of the Justices? No.

216. Do you think it desirable that Magistrates should fix the scale of compensation to persons whom they direct to eradicate weeds growing on other people's land—capriciously, it may be—one set of Justices in certain cases giving one scale, and another set of Justices under other circumstances giving another scale? I think so.

217. You think it is desirable that there should be no fixed scale of compensation? I think it would be better perhaps to leave the matter in the hands of the Justices than to fix a scale.

218. There are other clauses very remarkable, and yet scarcely any witness seems to have looked at them. I should like you to look at the 11th clause. It says: "If the owner of any such land shall be unknown or absent from the Colony and such compensation or penalty cannot therefore be recovered from him and shall remain unpaid for three years after the right to recover the same it shall be lawful for such Municipality to let such land for any term not exceeding fourteen years and may receive the rents and profits thereof and apply the same in payment of such penalty or compensation and shall pay the surplus if any to the Treasurer of the Colony to be held by him upon trust for the person or persons entitled thereto." Do you think it right that any Municipality should be empowered to farm a man's land and do what they like with it, and charge what they like as compensation, and give him what remains when he returns? I do—I think so.

219. You think it right to arm either the Government of the Colony, or any municipal body, or other body delegated for that purpose, with power to manage a man's property in his absence? I think so. How would they do otherwise, in collecting assessments in a municipality where the owners of land are absent?

220. Have you looked at the 9th clause—as to waste lands of the Crown—It provides that on waste lands of the Crown, Justices can order the eradication of these burrs and thistles. If the Surveyor General, on being served with a notice, fails to eradicate them, the Justices can do it and charge the Crown—Do you think that is a desirable provision? I do in these two counties. I am speaking particularly of these two counties of Cumberland and Camden.

221. Do you not think that would entail a very large expense on the revenue? No, I think the expense would be very trifling.

222. *Mr. Morrice.*] I suppose that in eradicating the Scotch thistle and the spotted thistle, one or two might be dropped by cattle upon a run and missed? Yes.

223. Have you not seen that? Yes.

224. And would not those grow about? Yes.

225. Which thistle do you call the sow thistle—the one they call the milk thistle? Yes.

226. You would not recommend that that should be destroyed? No.

227. There is another plant called the dock—you know that? Yes.

228. That is a troublesome plant, too, is it not? Yes, it is troublesome to agriculturalists.

229. But not so much so as the thistle? No.

230. It is a troublesome plant? Yes, and there are many others; for instance, there is the sorrell.

231. You know also that in our district there is a plant called the sweet-brier? Yes.

232. You are aware that that is a very troublesome plant? Yes, it is very troublesome.

233. The seed of that is just as easily carried and thrown about as the thistles? I think the seed is liable to be carried about, but it does not grow so freely, I think, as the seed of the thistle.

234. Birds will carry the seeds about? Yes.

235. They are also carried about by horses and cattle and pigs? Yes.

236. And by opossums? I do not know whether the opossums carry them about, but the other animals you mentioned do.

237. Is the sweet-brier a very troublesome plant to eradicate? Very.

238. The slightest bit left in the ground will grow? Yes, at certain times of the year. I am not certain that it would do so at all times. I have heard that if they are taken up when they are in blossom, and the season is dry, the roots will die; but generally speaking, if a root is left in the ground, it will grow again.

239. Would you not recommend that a provision to eradicate the sweet-brier should be introduced into the Bill, as well as that relating to thistles? Yes.

240. It is a plant that is very hard to take off old cultivation paddocks? Yes, because in old cultivation paddocks the seed has been buried by the plough, and therefore it is frequently found springing up.

241. *Mr. Lyons.*] I understand from your evidence that you are in favour of this Bill? Yes.

242. You consider that it would be a mutual benefit to the farmers and graziers living in these counties? Yes.

243. You were asked just now as to the Bill being likely to be made objectionable in consequence of vexatious action which might be taken on it. Are you not aware that almost every Act of Parliament is liable to the same construction. If you felt disposed to act vexatiously under the Impounding Act, for instance, could you not put it into operation injuriously? Quite so. That was my feeling at the time the question was asked, but I did not explain myself sufficiently.

244. In regard to nearly every Act of Parliament, is there not a way in which people can annoy their neighbours by unnecessary and vexatious interference? Yes, in nearly every Act.

- Mr. J. A. Badgery.
3 Nov., 1869.
245. I suppose you are not wedded to this particular Bill, and that all you require is that it should be so framed as to do justice to every party concerned? That is my desire.
246. And you think that if a canvass took place in those districts where the Bill would operate, there would be a majority in favour of it? I think I can say I am sure there would be.
247. I know that there is an objection to this measure, but I fancy from what I have heard, that if the measure is fairly dealt with there will be few complaints made about it? Very few indeed.
248. Your attention was called just now to the 2nd section of this Act—"Penalty for not destroying in pursuance of notice." Now I would like to direct your attention to the 3rd clause—"Power of Justices to give time to parties summoned"—Do you not think that takes the sting out of the second? It says,—“On the hearing of any matter under the last foregoing section it shall be lawful for the Justices hearing the same to decide as to the fact of such neglect or refusal. And if they shall be of opinion that due diligence has been used it shall be lawful for them to adjourn the hearing of the case to such day as they may see fit and if previous to such day of adjournment the said plants shall have been destroyed it shall be lawful for them to decline to make any order in the case?” I think that does away with the severity of the power given by the other clause.
249. How would you propose to deal with leaseholders in this matter—that seems to be the great difficulty—I do not think the objection comes so much from freeholders as from leaseholders—You would, I believe, give them a greater extension of time? I do not think a very great extension of time would be desirable, or that it would benefit the leaseholder, for this reason—if these thistles are not taken up every year they will spread about. If you had half your property cleared, and thistles growing on the other half, the half remaining would soon undo the work you had done on the first part.
250. You think that the great expense would be just clearing them the first year? That would be the great expense. There would be an annual expense for a time.
251. You think the annual expense would be greatly diminished if proper diligence were exercised? No doubt of it.
252. *Chairman.*] I did not understand your reply to Mr. Lyons' question as to how the cost of eradicating these thistles should be met in the case of tenants. Do you think it fair that tenants should be made to pay? I think it would be hard. I know of several instances where it would come hard on the tenants.
253. Then is it your opinion that the owner should pay solely? I think it would be better that the owner should pay a portion of the expense. But these are parts of the Bill I have not considered much. I have only considered it as to the desirability of passing an Act to eradicate these thistles.
254. You have not thought sufficiently of the Bill to give a decided opinion in regard to the question I have just put to you? No.
255. The operation and object of this Bill would be, I think, to make the landlord pay the whole expense of eradicating the burrs and thistle plants? That would be rather hard, I think. If the landlord were compelled to destroy them the first year, and leave the place clear to his tenant, then I think the tenant ought to be compelled to keep them down afterwards. I do not consider that hoeing them up for one year would be eradicating them.
256. *Mr. Hoskins.*] I will put a case to you. Suppose that there are persons in the counties of Camden and Cumberland who rent Crown Lands, or Church and School Lands (which are now declared to be Crown Lands), and that they are required, if this Bill becomes law, to eradicate thistles and burrs and other noxious weeds from their land,—would you not think it right that they should come upon the Crown for the expenses they incurred in eradicating those weeds? I think it would be better that they should do so than that the weeds should be allowed to grow.
257. But would you think it right that they should do so? I think if the Government was the landlord, it ought to be at their expense, the same as a private landowner. I do not see where the difference would be. The Government receives rent from the Church and School Lands, and out of the rent they received they might pay this expense the same as any other landlord.
258. Have you ever made any calculation as to what cost the Government would be put to in the event of this Bill becoming law, if the principle were embodied in it of which you are in favour? No.
259. *Mr. Lyons.*] Do you not think that this Bill is based upon something like the same principle as the Scab Act? Yes.
260. And that the Government should be called upon to pay towards eradicating a great evil? Yes. As a proof of that, I may state that I was told the other day—I think by Mr. Marks, of Kiama—that within the Municipality of Kiama they compelled people to destroy the thistles. My brother and myself lease a property from Mr. Throsby; we took it nearly two years ago, and in the lease he had a clause compelling us to keep down thistles and briers—such as we consider injurious,—therefore we are compelled by our lease to do so. He would not have done that unless he had found it necessary to keep the thistles down.
261. *Mr. Lyons.*] Could not the Government make an arrangement with their tenants—those who lease the Crown Lands—that the keeping down of the burrs and thistles should be a part of their contract? I imagine that they could do so, just the same as a private individual.
262. *Mr. Hoskins.*] Still they could not interfere during the currency of the lease? If Mr. Throsby had not bound us to destroy the thistles, and we had neglected them (as we might have done), his property would have been very much injured.
263. *Mr. Morrice.*] Do you not think it would be very hard upon a tenant, supposing he was going out of his farm—that he was in his last year? Yes, I have already said so.
264. Some tenants only rent their farms for one year at a time? If I rented a farm from year to year I should expect it clear when I went there, and the difficulty of keeping it clear would not be very great.
265. Would it not be all to the advantage of the landlord that the tenant for one year should clear out these weeds? Yes.
266. *Mr. Lyons.*] Did you not say that the duty should fall on the landlord and not on the tenant? Yes, where the thistles now exist.
267. *Chairman.*] With reference to the Church and School Lands—you think that the fact of these weeds being eradicated would increase their value materially as grazing property? Yes, there is no doubt of it.
268. And therefore the Crown would be benefited by it? Yes.
269. And as a natural consequence, they ought to pay the expense of eradicating the thistles? Yes.
270. *Mr. Lyons.*] Are you not of opinion that unless something is done, some of these lands will be perfectly useless? I would not say they will become perfectly useless, but they will be nearly destroyed.
- 271.

271. *Mr. Hoskins.*] Have you ever heard of an instance of a person giving up Church and School Lands or Crown Lands because there were so many noxious weeds growing on them? No, but I know an instance where they soon will.

Mr. J. A. Badgery.

272. Where is that? At Razorback; and I could give you the reason. The Church and School Lands were let there at a nominal rental. The party who took them let them at an increase—all he cared about was the mere profit. Had that been private property, the chances are there would not have been so many thistles.

3 Nov., 1869.

FRIDAY, 12 NOVEMBER, 1869.

Present:—

MR. FARNELL,

MR. LEE.

MR. HOSKINS,

JOHN LACKEY, ESQ., IN THE CHAIR.

The Honorable Sir William Macarthur, Knight, M.L.C., examined:—

273. *Chairman.*] You reside at Camden? Yes.

274. You have heard, I presume, that some steps have been taken towards legislation with reference to the extirpation of the thistle? I have not had an opportunity of perusing the Bill, but I am aware that there is such a Bill in existence.

The Hon. Sir W. Macarthur.

275. You are acquainted with what is called the Scotch thistle? Yes. That commonly known by the name of the milk thistle (*Carduus marianus*), is not the true Scotch thistle.

12 Nov., 1869.

276. How many descriptions of thistles have you observed? There are two here which may be called troublesome weeds, particularly one—the true Scotch thistle, the scientific name of which is *Oniscus arvensis*. A great distinction between the two is, that the one which is commonly called the Scotch thistle here is only an annual plant, and not nearly so dangerous as is the true Scotch thistle. The true Scotch thistle is a plant with perennial roots; and if cut down, fifty young plants may spring up from the extremities of the roots of that plant. I cannot say how long these roots would remain in the ground, but I know that having to extirpate a small patch, the first which was discovered in our vicinity, I think it was five or six years before we could utterly destroy them, although fire and every other means were used that we could devise. I know also from reading that it is a difficult plant to extirpate by ordinary means, and that in the north of England and Scotland it is considered one of the worst weeds.

277. Did you succeed eventually in destroying these plants? Yes. There is a very simple means of getting rid of the plant, by the use of common salt. When the plant is cut off immediately beneath the collar—the point where the stem and roots unite—if a large plant, it is also scored across with a knife, and a small portion of common salt applied, which is rapidly fatal to the plant, killing it to the extremity of the roots.

278. Have you observed the injury caused by the Scotch thistle in your district? I am aware that it is an exceedingly troublesome weed where it is neglected; but I cannot say I have much experience with it as a destructive weed, because we have never permitted it to gain head with us; we take pains to extirpate it.

279. Are your neighbours troubled with it much? I believe they are; one of my neighbours in particular, who supplies us abundantly with young plants—the lessee of the Church and School Lands—occupying the heads of several of the watercourses which traverse our land; these, in heavy rains, bring down a quantity of seed. I should have observed that the seed of the *Carduus marianus* is a heavy seed, and not so likely to be blown about as the seed of the Scotch thistle, or *Oniscus arvensis*, which is very light, and may be blown for many miles immediately it is ripe; this renders it a much more dangerous weed.

280. Do you think it desirable that legislation should be resorted to for the purpose of destroying it? I do, most certainly.

281. You say you have not examined the Bill? I have not. Such a measure would require to be carefully considered to meet the cases of particular classes of individuals; but I do not think the subject is one that need be attended with any great difficulty.

282. Do you think the eradication of these plants would be likely to cause a large amount of trouble or expense to settlers generally, if taken in time? No.

283. From your own observation you feel persuaded that legislation would be possible? I think so. In answer to a former question, I would state that we are in the habit of sending round a man on horseback early in the season, with a spud and a small bag of salt; and I think if I say that one person is so employed for about a fortnight, that is the extent of the work for the year in keeping the thistles down; therefore I should not call it a very serious business; and it is to be remembered we have large nurseries of them immediately adjoining.

284. Is it your impression that the expense of eradicating these thistle plants should be borne by the landlord or by the tenant? By the tenant as the rule; but I should think those are questions that might be decided between landlord and tenant. In our case the tenants are bound by a clause in their leases to keep such weeds down, and we have power to enter and destroy when they fail to do so, charging the expense to the tenant. In our case it would be a hardship, did the law interfere to set aside such an arrangement.

285. In your case the farms were clean when they were given into the hands of the tenants? No doubt. I cannot imagine how it would be any great hardship to require the tenant to extirpate. Perhaps in some cases it may be desirable to divide the expense between landlord and tenant.

286. In the case of Crown Lands do you think the Crown ought to bear the expense? I do, especially along the railway lines. I would point out that there is another class of weed, the common dock, that is now abounding along the railway lines, to the very great injury of the adjoining proprietary. I am now about to make representations to the Minister for Works on the subject.

287. Various descriptions of wild weeds are propagated through going to seed on the railway lines? No doubt, particularly the dock.

The Hon.
Sir W. Macar-
thur.
12 Nov., 1869.

288. Is it your opinion that the Government ought to eradicate noxious weeds on the public roads generally? I should like to consider that question. I think along the railway lines they certainly should, but I think the neighbourhoods along all but the main lines of road ought to keep them down—I think it would be too onerous upon the Government to require them to keep them down.
289. Supposing the law were to require proprietors to keep the roads clear abutting upon their own lands, do you think it would be a very great hardship? Certainly not.
290. *Mr. Farnell.*] This Bill provides for the destruction of the thistle and Bathurst-burr—Is the Bathurst-burr very injurious? It has not been so in our neighbourhood, but it might have been if we had not taken great pains to extirpate it whenever it made its appearance. For instance, if in the neighbourhood of Camden it is very troublesome we give the police a hint about it and get it put down in that way. All about our own property we keep it down for our own sake.
291. *Mr. Hoskins.*] Have the police power to interfere in the matter? In waste places they get it done, and we pay them for doing it.
292. The public do not pay? The public do not pay, but it is done. I cannot say what has taken place within the last few years, because I have not at all interfered with police duties. I speak merely of what we used to do.
293. *Mr. Farnell.*] Do people generally in your neighbourhood try to extirpate the thistle? I think not, unless they are compelled. I think there is a remarkable degree of carelessness throughout the country in permitting these weeds to propagate themselves.
294. The dock is very injurious to cultivation land? It is, especially in low moist situations. These are portions of the roots of two docks that were cut off about an inch below the collar and then treated with salt, about a fortnight ago; they were taken out of the ground last evening; they are quite killed. (*The witness produced the same.*) I cannot say the state of these plants at the extremities of their roots, because I had no opportunity of examining them. Any refuse salt is sufficient.
295. In what way does the salt affect the plant—is it by mixing with the sap? I suppose it is; it is evidently the case with the thistle. The true Scotch thistle has very long ramifying roots, and the first I saw after it was cut down, I was surprised to see young plants come up at a distance of a couple of yards from the original stem. The effect of the salt if applied in sufficient quantity, and that is not large, is to kill to the extremities of the roots.
296. Do you think that in any legislation upon this matter it would be well to include the dock? I certainly do.
297. Any other weeds? The sweet-brier and the wild cotton plant have also been suggested; they are all easily destroyed if people will only take them in time.
298. Do you know whether the wild cotton plant is a native of this Colony? It is a native of South Africa. I have heard the history of its introduction—it was sent here by the Duke of Northumberland, in the earliest period of the Colony, to Captain, afterwards Colonel Johnstone.
299. Do you not think a Bill less cumbersome than the present Bill before the Committee would serve all the purposes of legislation in this matter? I have not yet had an opportunity of examining the Bill.
300. I would call your attention to the 11th clause of the Bill? It certainly is a stringent measure.
301. Do you think it would be wise to give Municipalities the power contained in that clause? I should doubt it; the period of three years is a short period, and that of fourteen years is a very long period.
302. *Mr. Hoskins.*] The power is a very great power? Yes, still there should be some remedy. I cannot imagine there can be much land in the Colony for which the owner could not be found.
303. Do you think a Bill merely giving power to persons on adjoining lands to go on and extirpate these weeds without any pains and penalties would be sufficient? No. People are often very delicate about interfering with a neighbour with whom they may be on good terms. I have an instance present in my mind of a considerable proprietor who has been the means of propagating one of these weeds very extensively,—a person to whom every one wishes well, but who certainly has been very negligent in the matter, in spite of the warning that the weed would become a very great nuisance.
304. If we were to legislate in reference to private individuals—compelling private individuals to extirpate these weeds—that would be insufficient unless we made provision for the destruction of the weeds on railway lines and other public thoroughfares? Yes, we must provide for the destruction of weeds on the railway lines, and I do not think such legislation would affect the railway authorities in any perceptible degree—they have abundant strength for the performance of the work. The means of extirpation are simple—it is only to apply them in time.
305. The railway lines tend more to the spread of these weeds than the ordinary public roads, because they cut through cultivated land? Yes, and the loose earth in the embankments are very favourable indeed to the growth of these weeds. Anybody who travels must observe the luxuriant growth and flourishing condition of the weeds along the line. Then again, on the lines of road the weeds are kept very much under by stock travelling up and down.
306. Do cattle eat these thistles? I believe they do, but I cannot say from experience. I have no doubt the milk thistle would be eagerly eaten after it had withered—it is a nutritive plant; but I doubt whether the other could be applied to that purpose; it is a rigid hard plant, affording little that I can discover to nourish an animal.
307. *Mr. Lee.*] Is there a small thistle known in the county of Cumberland—I do not know its botanical name—which bears a small yellow flower, and does not grow very high—it is rather common in the north? I am not acquainted with it; I know only two varieties of thistle there.
308. *Mr. Farnell.*] Would you confine legislation on this subject to the counties of Camden and Cumberland at first? So far as I know, I think it is very desirable to limit legislation to the counties of Cumberland and Camden at first until a good measure has been perfected, and then it will be easy to extend it county by county.
309. Do you think it would be wise to insert a clause in the Bill empowering the Government to extend, by proclamation, the operation of the Act? I think it very desirable.
310. Do you know any other parts of the Colony besides the counties of Cumberland and Camden where this weed exists? Yes, it existed in abundance at Gundagai, in the district of the Murrumbidgee, some years ago, and no doubt it does still. They have it in abundance in other parts of the Colony also.
311. I think you have referred to one of these thistles as being nutritious to cattle—Do you know that that grows freely at Maneroo? I am not aware.

312. In the winter months, when the snow is heavy, the cattle live upon it? It is a south of Europe plant, and I think is not a native of England. I never saw it growing wild in England, but I quite recollect first meeting it when travelling in mid-Italy, in the Campagna at Rome. The Bathurst-burr you meet immediately you cross the Po, going south—not to the north of it.

The Hon.
Sir W. Macarthur.

313. Do you know a grass known as knot grass? Yes.

12 Nov., 1869.

314. Is not that a great pest in cultivation? It is.

315. Do you think it necessary to include that in the Bill? I think not. It spreads chiefly by means of its roots. I do not think it necessary to interfere with that. That is also an introduced plant.

316. Do you know how long the thistles referred to have been introduced here? No, I do not. I first recollect to have seen the milk thistle, that is the annual plant, at the huts of a road party employed to make a road across the Razorback, about the year 1830 or 1831. I do not recollect to have seen it before. The other thistle, the *Cnicus arvensis*, or Scotch thistle, is comparatively a plant of recent introduction—it is not more than eight years since I first saw it in this country.

317. The eradication of these thistles would not be very expensive to the parties? I think not.

318. It would require some attention for a few years only? That is all, in my opinion.

319. *Mr. Lee.*] Although you have not perused this Bill, you have no doubt that it is desirable to legislate in reference to this subject? I have no doubt at all that it is desirable to legislate, but I think it requires a good deal of consideration. I should be very tender in dealing with the rights of individuals.

320. You have, from your own practical experience, told us that an easy and cheap remedy is at hand, supposing legislation should insist upon the destruction of these plants, by the application of common salt? Yes.

321. It would be very inexpensive? Yes, a large plant might be destroyed by a dessert-spoonful of common salt, but I maintain the people ought not to allow them, except by misadventure, to become large plants. If they would only use their eyes at the proper time they would not find them difficult to deal with.

322. You think it desirable not to legislate in reference to agreements entered into between tenant and landlord, or landlord and tenant? I think so. The landlord might be made responsible as a last resort, allowing him to carry out the arrangement between the tenant and himself. It was foreseeing the possibility of these weeds becoming troublesome that induced us to insert the clause in our leases to which I have referred.

323. In legislating for the destruction of the Bathurst-burr and thistle, do you think it desirable to encumber the Statute Book or to harass individuals, by including a number of other weeds, as the sweet-brier, the dock, and the wild cotton plant? I do not think the plants desirable to enumerate are very numerous.

324. Will you be good enough to name them? Two species of dock, and the sweet-brier—the wild cotton plant I think of much less importance, but it is so easily destroyed that it might be desirable to include that. I do not know any others, but others may arise, and it may be desirable to give the Government the power to include others than those named.

325. *Mr. Hoskins.*] May I assume that you are not disposed to express any opinion in favour of this Bill? I cannot say, as I have never read a line of it except the clause to which I have been referred—the 11th clause; and I should not like to say a word either for or against it, excepting that I am favourable to a compulsory measure for the destruction of these plants.

326. If you are in favour of such a measure of legislation, would you propose to carry out its provisions by having persons appointed by the Government to enforce the observance of such a law? I think it would not require to have a person whose sole duty should be to see that it was fulfilled. I very much question whether there would be any such necessity.

327. Will you be kind enough to state what you consider the best way to have the provisions of such a law as you have indicated carried out? I am not prepared to state any opinion just now. I should like to read the Bill.

328. Will you be kind enough to state how, in your opinion, the law should be most efficaciously administered? That is a question to which I am not prepared to give an immediate reply.

329. May I ask would you prefer to have the law efficiently administered by the agency of disinterested persons appointed by Government, or to leave it to the action of the landlords or tenants holding contiguous lands? I am not prepared to answer that question. I presume there is some provision in the Bill appointing persons to see to the destruction of these weeds. I see no objection to the appointment of inspectors, who should be set in motion by parties feeling aggrieved. I should like to preface that remark by saying that I decline to give any opinion at present as a final opinion.

330. Then I apprehend you will admit that even through the agency of these inspectors there would be to a certain extent an interference with the rights of private property? It would be impossible, it appears to me, to enforce the destruction of these weeds unless you do interfere; you must give the power of entry to somebody.

331. Of course I presume you have reflected that, to carry out the provisions of a law for the eradication of these weeds, would necessitate the expenditure of public money in the appointment of a staff of officers? I do not think it would require an extensive staff of officers.

332. The counties of Camden and Cumberland extend over a very large area—How would you propose that these officers should be paid? I have never considered the question, and should be sorry to answer it off-hand.

333. Admitting that there may be a necessity for legislation of this kind, as I may admit, you perceive, when you reflect upon the matter, the difficulties attendant upon carrying it out? I do not think—although I will not take upon myself to point out the exact mode—there need be any great difficulty in the matter.

334. Then again there is another point—In addition to the expense which would be incurred in the payment of the salaries of officers, there would be the further expense to the public in the eradication of weeds on the highways and roads of the Colony? I do not think there can be if you make the proprietors of the lands abutting upon the roads answerable.

335. Would there not be the expense for eradicating these weeds on Crown Lands, and Church and School Lands, now declared to be Crown Lands? On Church and School Lands Government may make the tenants responsible, as we do.

The Hon.
Sir W. Macar-
thur.

12 Nov., 1869.

336. Then if the Government do as you do, and yours is a private arrangement, would it not be an alteration of the conditions under which the present lessees hold lands from the Crown? I am not so sure that there is not an inherent right on the part of the landlord to require from the tenant that the land shall be surrendered over to him in a like good condition to that in which he received it.

337. *Mr. Lee.*] You spoke of the Crown? Yes, and the Crown stands in the position of the landlord.

338. *Mr. Hoskins.*] Is it your opinion that legislation of the character you have indicated to ensure the effectual eradication of weeds in the county of Cumberland should come into operation immediately the Bill has passed both Houses of Parliament? I think not, nor do I think it would be required, because the mischief is done very nearly, that is, it will be done in the course of another month—all the mischief the season is capable of doing. If brought into operation in six months' time I think it will be sufficiently effectual.

339. Do you think six months will be a sufficient notice? I think it will, quite so—it ought to be sufficient to enable every tenant to enter into arrangements with his landlord; and really if the destruction of these weeds was only set about generally, it would cost such a trifle that it does not deserve to be considered a serious difficulty. What makes it so troublesome is, that perhaps one person in fifty destroys them and the remaining forty-nine do not.

340. It has been given in evidence that in portions of the counties of Camden and Cumberland, during seasons of drought, thistles are cut down by the tenants of farms or landowners after a time and the cattle eat them—that in point of fact they form their only means of sustenance—Would it be advisable to deprive these people of the only food for their cattle in seasons of drought? Yes, because they might then grow plants much more nutritive which would answer the purpose better.

341. Would not that entail a very considerable additional expense upon these people in the maintenance of their stock? No, all the nutriment they could get from the thistle I am quite sure might be obtained by a very little reasonable outlay.

342. *Mr. Lee.*] By turnips? By many means—I do not specify any particular plant. Wherever the thistle will grow luxuriantly other plants much more useful may be made to grow. It is the sluggard's excuse, and I certainly would not encourage such excuse.

343. I gather from your answer that you are decidedly of opinion that the spread of these noxious weeds has arisen principally from negligence? Wholly from negligence.

344. *Mr. Farnell.*] With reference to the question asked as to the expense of inspection, do not you think the police could be appointed to perform the duty—it would not entail much additional trouble on them? Very little, and really they want something to do.

345. Therefore it would involve no additional charge upon the revenue? Very little extra charge.

346. They would be employed in this duty only in one part of the year? It would only be necessary to be vigilant at one particular part of the year.

347. As it is their duty to be moving about, it would not entail any extra trouble upon them? Very little.

CUMBERLAND AND CAMDEN BATHURST-BURR AND THISTLE BILL.

APPENDIX.

A.

Clements Lester, Esq., to S. Lyons, Esq., M.P.

Denham Court,
1 November, 1869.

My dear Sir,

I have been requested by the Clerk of the Assembly to attend to give evidence on the Thistle Bill, on Wednesday next, but as it will entail considerable loss to me to attend this week, and put me to considerable inconvenience, I beg to state my objections to the Bill in writing, more particularly as I have a definite proposition to make to the Committee in lieu of the propositions contained in the Bill.

I agree with Mr. Roberts that it is absolutely necessary that something should be done to eradicate the plant, which is becoming a very serious pest, and will in a few years render thousands of acres of land in this Colony useless; but if his Bill be passed in its present shape, and carried out strictly, it will be attended with the grossest injustice and the greatest oppression to individuals, and in many cases lead to the confiscation of property.

- Objection 1st. It will place landlords completely at the mercy of their tenants—for the Bill does not give landlords power to go on to the tenant's land to eradicate the plant, but compels the tenant to do it, and gives him the power to deduct the cost out of his rent. Now an unscrupulous tenant with several sons might make an excellent living out of such a clause, for the law would allow 5s. a day for a labourer's wages, and the landlord would have no check against the tenant as to the number of days it might take to destroy the plant, for he would not be in a position to contradict him, thereby not only losing all his rent but brought into debt, and that not only for one year but for as long as the tenant's lease lasts; for they will find it too good a thing to let the plant die out too soon, and will doubtless *save a few seeds* to have something to do the following year.
- 2nd. That many estates are so thoroughly overrun with the thistle that neither the tenant or the landlord might be in a position to engage labour to eradicate it—especially within fourteen days—and probably in some cases not in several years, for I believe the seed will lie in the ground for several years without germinating, and then spring up.
- 3rd. That Courts of Petty Sessions are not the proper places to have the provisions of the Act carried out, for the Magistrates themselves in nine cases out of ten would be the parties against whom informations ought to be laid, being generally the greatest landholders in the various districts to which this Act extends—consequently the Act in many places would not be acted upon.
- 4th. The 2nd clause virtually gives the power to any two Magistrates to oppress and in many cases to ruin any individual who may have a large estate infested with this plant; for on an estate like the one I occupy, where deep gullies and rocky ravines exist, and where it would be difficult for a man to crawl into, but where nevertheless the thistle finds its way, it would be exceedingly difficult wholly to eradicate it, and it is quite possible for half a dozen men to be parading the run for a year to destroy them and then fail to do so; and this Bill renders the owner liable to a fine of £20 every thirty days, on the information of *any person* who by diligent search might spy a thistle growing, even let it be in ever so an inaccessible place.
- 5th. The 3rd clause is not sufficient to protect any person against whom any Magistrate has any ill feeling, and no Act of Parliament should put it in the power of any two men to inflict such an irreparable injury as is given in this Bill.
- 6th. There is nothing in this Bill to show on whom the fine is to be inflicted—whether on the tenant or landlord; but by the 4th clause it is to be presumed that the tenant is to be ruined first by successive £20 fines every thirty days, and having annihilated him the landlord is to be served the same way. But perhaps the most objectionable feature in the whole Bill is that no power is given to the owner to go on to the tenant's land (for he has no power by the common law) but is to be made liable to have his estate confiscated by the neglect or wilful misconduct of his tenant, who in the stead of eradicating might wilfully propagate it, knowing that the cost of destroying it would ultimately fall on his landlord.

These are my principal objections to the Bill, and to obviate them I beg respectfully to submit to the Committee the following suggestions for consideration:—

- 1st. Let a proclamation be made by the Government giving notice to all landholders to destroy the Bathurst-burr and thistle (and I would suggest the cotton plant and sweet-brier) within twelve months from the date of the proclamation.
- 2nd. At the end of that period let the Government appoint Inspectors, giving them power to employ labour to eradicate the plant.
- 3rd. Let the whole cost of this proceeding be made a rent charge on the land operated upon, to spread over a period of ten years.
- 4th. Let the owner or occupier receive a written notice from the Government of the cost incurred in eradicating the plant from his land—including Inspector's salary, interest on money, &c., &c., and demand that one-tenth part be paid into the Treasury every year for ten years, and in default make him liable to a fine of £10 per cent. on the amount due for neglect, and give the Government the power to distrain for the same as for rent; and if not sufficient distress found, let a portion of the freehold be sold—giving the tenant his remedy against his landlord for loss. By this means the obnoxious plant may be thoroughly eradicated, and the cost will fall on the parties beneficially interested, and without being oppressive to any; those who have hitherto been the most neglectful in allowing the plant to spread will be the greatest sufferers, but in no case could any injustice be done, or any hardship or oppression take place.

Yours faithfully,
CLEMENTS LESTER.

W. R. Antill, Esq., to James Hoskins, Esq., M.P.

Abbotsford, Picton,
28 October, 1869.

Dear Sir,

Being deeply concerned in the Bill now before Parliament for the destruction of the Bathurst-burr and thistle, I trust you will allow me to trouble you with a few remarks upon the subject. Should Mr. Roberts' Bill become law, it would be almost ruin to me and many others who hold land in this neighbourhood.

When I bought this place (Abbotsford), four years ago, I endeavoured to keep the thistles down, but found it quite impossible to do so, as there were hundreds of acres literally covered with them; all I could do was to have them cut up in the cultivation paddocks twice a year. Since then they have been multiplying themselves on the bush land to an enormous extent. Many parts of the bush are covered with land-slips, and on these places the thistles take such hold and increase so rapidly that it is now impossible to eradicate them. It would cost an incalculable sum to cut them up *one* year, but even cutting them up one year would be useless, as the seeds lie in the ground for years, and I am certain that if they were cut up for eight or ten years without allowing any to seed they would not then be exterminated.

I have fourteen or fifteen tenants, many of them poor men who have much difficulty in living at all, and if they were called upon to destroy them they could not possibly do it.

My brother has had them cut up on his land for ten years or more and has never allowed them to seed, yet last year it took several men two months to cut them up. There are the Church and School lands here which have many hundreds of acres of them as thick as they can grow. How could these be cleared? It must be remembered that each individual thistle must be cut up, if at all, by the hoe, so the expense either to the Government or to the tenants would be very great. To the latter it would be a great hardship, as their leases expire at the end of next year, so they would derive no benefit from the cost. It is the same with almost every holder of land about here and all the lower part of the county.

It is all very well for the people about Sutton Forest, Nattai, &c., to petition in favour of the Bill—they having perhaps a few score on their land or none at all, but with us the expense would be most oppressive. Include the sweet-brier, and some of them would alter their cry about the necessity of the Bill. This bush is more injurious than any other in the Colony except the Bathurst-burr; in some fields I have seen about different parts of the county a rabbit could scarcely pass through. The birds carry the seeds about in all directions.

With regard to the Bathurst-burrs the case is widely different. Their appearance down the country is comparatively recent, and consequently the numbers are few except in the towns of Parramatta, Campbelltown, &c. They therefore could be easily destroyed, and as very few bullock teams from up the country now visit these counties, they could at very small cost be kept down. It is by the hair of the bullocks and horses the burrs are carried about.

Many small farmers use the Scotch thistle (so called) for feeding their cattle and pigs in winter and drought.

May I request you will kindly bring these remarks before the Committee, and oblige—

Yours faithfully,
W. R. ANTILL.

1869.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

FRIENDLY SOCIETIES.
(RETURN RESPECTING.)

Ordered by the Legislative Assembly to be Printed, 19 October, 1869.

RETURN to an *Address* of the Honorable the Legislative Assembly of New South Wales, dated 10 March, 1868, praying that His Excellency the Governor would be pleased to cause to be laid upon the Table of this House,—

“ A tabular Return showing—

“ (1.) The names of all Societies certified under the Friendly Societies Act,
“ the date of certificate, the amount of fees, and to what fund placed.

“ (2.) A similar Return of all Branch Societies.

“ (3.) A similar Return of all alterations or amendments in the Rules of
“ these Societies or Branches thereof.”

(*Mr. Sutherland.*)

THE CLERK OF THE PEACE, ALBURY, to THE UNDER SECRETARY, CROWN LAW OFFICES.

South-western District,
Albury, 31 March, 1868.

SIR,

In compliance with your circular (No. 4) of 23rd instant, I have the honor to inform you that the following are the names of all Societies certified under the Friendly Societies Act whose rules have been lodged with me, viz. :—

- The Loyal Albury Lodge, No. 4963, Goulburn District, Independent Order of Odd-fellows, Manchester Unity; certified 30 July, 1861. 44 amended rules, certified 30 September, 1867.
The Loyal Southern Star Lodge, No. 34, Wagga Wagga, Independent Order of Odd-fellows, Manchester Unity; certified 14 November, 1864—and
The Loyal True Briton Lodge, No. 40, Deniliquin, of the Manchester Unity, Independent Order of Odd-fellows; certified 18 February, 1867.

I cannot supply the information required relative to fees, as no returns have ever been made to me.

I have, &c.,
H. S. ELLIOTT,
Clerk of the Peace.

Fees for Certificates.

Under 8th section of Friendly Societies Act, 17 Vict., No. 26, a fee of five guineas is required to be paid to the Attorney General or Barrister certifying; and for every certificate of rules of any branch of such Society, a fee of five guineas; for every certificate of amendment, repeal, or alteration of rules of any Society or branch, a fee of three guineas is required to be paid.—W.E.P.

A

A RETURN of the Friendly Societies in the Northern District, filed in Clerk of the Peace's Office at Armidale.

REGISTRAR GENERAL'S OFFICE.

No. 1.

MESSRS. FITZHARDINGE & SON to THE COLONIAL SECRETARY.

117, King-street East,
Saturday, 27 March, 1869.

SIR,

We complain that the Registrar General did not this day open the Office for the Registration of Deeds, &c., but closed the same, contrary to the express provision of the Act of Council establishing that office.

That Act, 7 Vict., No. 16, at section 3 provides as follows:—"And the said office shall be kept open for the transaction of the business thereof for not less than six hours, beginning at the hour of 10 in the forenoon on all days throughout the year (Sunday, Christmas Day, and Good Friday excepted)."

The Registrar General cannot plead ignorance of the law, because he has been in that office all his (official) life, and knows that his predecessor, Mr. Alfred Elyard, never closed the office except on the days allowed by the Act.

We have sustained injury by the office being closed. On Friday and this day we received deeds by the post from the country to be registered and returned this day. By same posts we also received instructions to search for incumbrances. Two gentlemen came from the country expressly to conclude a heavy mortgage,—but all business was illegally delayed by the closing of the Office for Registration of Deeds, &c.

You will be kind enough to consider this as a formal complaint, to be laid before the Executive Council, in order that, if the Honorable Members of the Council see fit, the Registrar General may be called upon to show cause why his infraction of the law should not be punished.

We have, &c.,
FITZHARDINGE & SON,
Attorneys of the Supreme Court.

No. 2.

THE REGISTRAR GENERAL to THE PRINCIPAL UNDER SECRETARY.

Registrar General's Office,
30 March, 1869.

SIR,

In reply to Mr. J. Stewart's question as to why the Registrar General's Office was closed on Saturday last, the day following Good Friday,—I have the honor to state, for the information of the Hon. the Principal Secretary, that seeing in last Tuesday's *Gazette* the notice that the Government Departments would be closed for the Easter holidays, from Friday the 26th to Monday the 29th, inclusively, and with a desire to enable the gentlemen to attend the laying of the foundation stone for the "Cook's Statue," I gave permission to close the department on those days. I might also observe, that for the past three years no business has been done in this office on the day following Good Friday. Proclaimed holidays, such for instance as the Queen's Birthday, have heretofore been observed as holidays in this department.

I have, &c.,
THEO. JAS. JAQUES,
Registrar General.

No. 3.

THE REGISTRAR GENERAL to THE PRINCIPAL UNDER SECRETARY.

Registrar General's Office,
Sydney, 28 April, 1869.

SIR,

Since my conversation with the Honorable the Colonial Secretary upon the subject of the closing of this department on other days than those mentioned in the Act 7 Victoria, No. 16, namely, Christmas Day and Good Friday, I have looked more carefully into the various Acts of Council regulating this office and for making provisions for the performance of the duties thereof, and would beg to submit for the consideration of the Chief Secretary whether since the passing of the Act 13 Victoria, No. 45, an Act to abolish the office of Registrar General and to make provision for Registration of Deeds, &c., this department as now constituted is not on the same footing as the other offices under the supervision and control of the Honorable the Colonial Secretary.

My reasons for arguing that the restrictions of the 3rd clause of the Act 7 Victoria, No. 16, are not now in operation, are on the following grounds:—In the year 1844 by Act 7 Victoria, No. 16, section 3, a public office to be called the Office of the Registrar General was established for the registration of deeds and for other duties, and the office was by the same section required to be kept open for the transaction of the business thereof for not less than six hours, beginning at the hour of 10 in the forenoon on all days throughout the year (Sundays, Christmas Day, and Good Friday excepted). In 1849 the

Act

Act 13 Victoria, No. 45, an Act to abolish the office of Registrar General and to make further provision for the registration of deeds and other instruments, was passed, and by the fourth section thereof the Registrar General was required on the 1st January, 1850, to deliver to certain officers of the Supreme Court all and singular the records, &c., which had been kept in the office of the Registrar General, and by the second section of the said Act certain officers of the Supreme Court were nominated to the duties of the office of Registrar General. The Act 19 Victoria, No. 34, passed in 1855, enacted by the second clause that the Governor may establish by notice in the *Gazette* an office in the City of Sydney for registering births, marriages, and deaths in the Colony, and to appoint a person to be called the Registrar General. This Act was passed and the office created while the registration of deeds was attached to the Supreme Court; and in 1857 (2 years after the passing of the above Act) by the Act 20 Victoria, No. 27, the duties of registering deeds, &c., were transferred to the Registrar General, and the instruments of all kinds and the indexes were delivered up to the Registrar General.

I submit that the office created under the Act 7 Victoria, No. 16, being abolished, and provisions being made for the performance of the duties by the officers of the Supreme Court (and which Court being established by Charter without restriction as to its being kept open on all days), the restriction in the Act 7 Victoria, No. 16, did not attach to those officers of the Court nominated to perform the duties of registering deeds, and that if those restrictions then ceased the transferring the duties to a new office, namely, the General Registry Office for Births, &c. (established 2 years before such transfer from the Supreme Court), did not revise the condition mentioned in the Act 7 Victoria, No. 16.

No doubt some inconvenience might arise by the constant closing of the office on proclaimed holidays; but on such days as the Queen's Birthday and the Anniversary of the Colony, solicitors would doubtless register urgent deeds on the days preceding; and as since the first closing of the office on Saturdays no inconvenience whatever has been felt, I would beg to submit, for the consideration of the Honorable the Colonial Secretary, whether the closing of the office on Saturdays at 1 o'clock might not still be continued.

I have the honor to request the favor of your laying this communication before the Hon. the Colonial Secretary, and if necessary that the opinion of the Law Officers of the Crown may be obtained as to the right of closing this office on other days than Sundays, Christmas Day, and Good Friday.

I have, &c.,

THEO. JAS. JAQUES,
Registrar General.

No. 4.

Crown Law Officers. JOHN R.—30th April, 1869.

The Under Secretary to the Law Department, B.C., 30th April, 1869.—H.H.

No. 5.

THE ATTORNEY GENERAL to THE PRINCIPAL UNDER SECRETARY.

The Registry of Deeds Office.

UPON examination of the Acts I am of opinion that the Registrar General is bound to keep the Office for the Registration of Deeds open, in accordance with the requirements of 7th Vict., No. 16.

The later Acts, though changing the officers and Office for the Registration of Deeds, makes no change in the duties of the former, or the regulation of the other, in respect of the days and hours for keeping the office open, but simply transfer all the duties from one officer and office to another.

W. M. MANNING,
Attorney General.

B.C., 11th May, 1869.—W.E.P.

Crown Law Offices, Sydney.

MEMO. relative to closing Registrar General's Department on Proclaimed Holidays.

WILL the Registrar General have the goodness to state, for the information of the Hon. the Attorney General, whether there are general provisions of transfer of duties, which include the keeping the office open for the original hours and days? See the Acts 13 Vict., No. 45, recital, sect. 1, "all the duties," secs. 2 and 5; also 20 Vict., No. 26, sec. 2, "all the duties." Papers herewith to be returned.

The Registrar General, B.C., 7th May, 1869.

W. E. PLUNKETT.

THE Registrar General is not aware of any Act in which the hours and days are enacted on which the Registrar General's Office is to be kept open, except the Act 7 Vict., No. 16.

The duties of the office are now performed under the Transfer Act 20 Vict., No. 27, sec. 2, by the Registrar General appointed under 19 Vict., No. 34, in which no hours or days are mentioned.

May 10, 1869.

T. J. JAQUES,
Registrar General.

SEE Memo. of dates on which office was closed while attached to Supreme Court. See paragraph 2 of Mr. Fitzhardinge's complaint.

THE PRINCIPAL UNDER SECRETARY *to* THE REGISTRAR GENERAL.

Colonial Secretary's Office,
Sydney, 17 May, 1869.

SIR,

In reply to your letter of the 28th ultimo, I am directed by the Colonial Secretary to inform you that under an opinion which has been procured from the Attorney General it appears that you are bound to keep the Office for the Registration of Deeds open, in accordance with the requirements of the Act 7 Victoria, No. 16.

2. Sir William Manning observes, I am to add, that the later Acts, though changing the officers and Office for the Registration of Deeds, make no change in the duties of the former, or the regulation of the latter, in respect of the days and hours for keeping the office open, but simply transfer all the duties from one officer and office to another.

I have, &c.,
HENRY HALLORAN.

No. 7.

THE PRINCIPAL UNDER SECRETARY *to* MESSRS. FITZHARDINGE AND SON.

Colonial Secretary's Office,
Sydney, 17 May, 1869.

GENTLEMEN,

In reply to your letter of the 27th March last, complaining that the Office for the Registration of Deeds was closed on that date, I am directed by the Colonial Secretary to inform you that under an opinion which has been procured from the Attorney General the Registrar General has been instructed to keep the office in question open in accordance with the requirements of the Act 7 Vic., No. 16.

I have, &c.,
HENRY HALLORAN.
