* Includes a private line of Railway, 45 miles in length. ^b For the year ended 30 June, 1878. ^c The taxation levied by the general Government was less in 1877-8 than in the former year, in consequence of four-fifths of the wharfrage rates amounting in 1877-8 to £85,249 having been transferred to the Melbourne Harbour Trust. ^d This has been calculated according to the mean population of the financial year ended 30th June, 1878 (859,235).
^e There are five districts for which the returns are deficient—Blackall, Bowen, Bourke, Cunnamulla, and Marathon; the whole number of stations not included being fifty-five. ^f Not including 133 miles of telegraph line belonging to the Tasmanian Main Line Railway. ^g On 30 June, 1879. ^h Includes 1,236,100 acres in grass after having been broken up, including such as in hay; but exclusive of 1,501,651 acres of grass-sown lands not previously ploughed, including such as in hay, and 263,353 acres broken up but not under crop. ⁱ Accrued Sinking Fund, 1,678,127. Nett debt, 20,930,184.

STATISTICAL REGISTER.

1878.

1878	24	62	58	364	41	243

NOTE.—The Public Examinations are similar to the *Middle Class* Examinations of Oxford and Cambridge. They are held annually, in November, and are intended to test the qualifications of boys attending schools or being instructed privately. They are divided into Senior and Junior, and certificates of competency in the *several* subjects of examination are given to the successful candidates. These examinations are *distinct* from the examination for the Civil Service.

		26 Vict., No. 16.	20 Dec., 1862.

Act of Council under which levied.	SPECIFICATION OF TAXES, DUTIES, &c.— <i>continued.</i>	Authority under which originally established.	At what Period.																																																																																																																								
<p>Governor and Executive Council. (To take effect from 1st Oct., 1876.)</p> <p>26 Vict., No. 5 (13 Oct. 1862.)</p>	<p align="center">BRANCH ROYAL MINT, SYDNEY. RECEIPT AND COINAGE OF GOLD.</p> <p>Deposits of gold in dust or bullion will be received at the Mint for coinage on the following terms:— In respect to gold, the produce of New South Wales— (1.) A deposit of which the standard weight is less than one thousand ounces troy, at the rate of eight-pence per ounce (standard); eight shillings being charged for any deposit under twelve ounces. (2.) An undivided deposit of which the standard weight is one thousand ounces and under five thousand ounces troy, at the rate of six-pence per ounce (standard). (3.) An undivided deposit of which the standard weight is five thousand ounces troy, and upwards, at the rate of four-pence per ounce (standard). In respect to gold certified to be the produce of any other Colony or Country— (4.) A deposit of which the standard weight is less than one thousand ounces troy, at the rate of five-pence per ounce (standard); five shillings being charged for any deposit under twelve ounces. (5.) An undivided deposit of which the standard weight is one thousand ounces troy, and upwards, at the rate of three-pence per ounce (standard). (6.) An undivided deposit of which the standard weight is five thousand ounces troy, and upwards, at the rate of two-pence per ounce (standard). Light Gold Coin of the Realm will be received for re-coinage without any charge whatever. All fine silver over and above two per cent. contained in refinable gold, will be paid for at a rate to be from time to time notified in the <i>Gazette</i>, and exhibited at the Mint. Gold bullion, in ingots or bars of any fineness, can be obtained at the Mint, at £3 17s. 10½d. per ounce standard. When the gold is required to be alloyed with silver, the silver will be charged for at the purchase rate. Gold imported, 1s. 3d. per oz. Troy of standard fineness, as declared after the said gold shall have been assayed and brought to the standard of 22 carats fine at the Mint.</p>	<p>20 Vict., No. 17.</p>	<p>12 Feb., 1857.</p>

	FITZ ROY DRY DOCK, COCKATOO ISLAND.																																																																																																									
	<p style="text-align: center;"><i>Conditions.</i></p> <p>All vessels belonging to H. M. Navy, the Colonial Government, and men-of-war of other nations, will be admitted to repair in the Fitz Roy Dock, Sydney Harbour, free of any dock dues or rates, but they will be required to repay all actual expenditure of stores, wages, and material.</p> <p>All other vessels will be liable to a minimum dock-rate of 6d. per ton per diem, if of 1,500 tons register or upwards, and an additional $\frac{1}{4}$th of a penny per ton for every decrease of 50 tons or portion of 50 tons down to a maximum rate of 9d. per ton for a vessel of 300 tons, and all below, as set forth in the scale attached hereto.</p> <p>Double rates will be charged for the day of docking.</p> <p>The Dock dues will include and cover the cost of pumping, shoring, wedges, and blocking, and the cost of all labour connected with opening and closing the Dock, and all incidental labour connected with the actual operation of docking a vessel.</p> <p>No vessel will be permitted to enter the Dock with gunpowder or combustible ammunition on board.</p>																																																																																																									
	Governor and Executive Council ..					<p style="text-align: center;"><i>Workshops and Machinery.</i></p> <p>Vessels in Dock and private engineering establishments will be permitted to avail themselves of any portion of the machinery of the Dockyard workshops on payment of a rate per hour; preference being always given to the requirements of a vessel in Dock. These charges will be in addition to Dock dues, and in accordance with the rates mentioned in the subjoined Schedule.</p> <p>The rate for the machinery will include the cost of putting and maintaining the machine in motion, the use of the 20-ton overhead traversing crane, and all tools belonging to the Machine in use, but nothing further.</p>	Governor and Executive Council ..	30 Aug., 1861.

1878.

NEW SOUTH WALES.

VITAL STATISTICS.

TWENTY-SECOND ANNUAL REPORT

FROM

THE REGISTRAR GENERAL, ON VITAL STATISTICS.

Presented to Parliament by Command.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1878.

1878.

VITAL STATISTICS.

THE REGISTRAR GENERAL TO THE HONORABLE THE COLONIAL SECRETARY,

TRANSMITTING ABSTRACTS OF

MARRIAGES, BIRTHS, AND DEATHS,

FOR THE YEAR 1877.

WITH PREFATORY REPORT.

Registrar General's Department,
Sydney, 1 May, 1878.

Sir,

I have the honor to submit the Statistical Tables relating to Marriages, Births, and Deaths, for the year 1877.

The estimated population of the Colony on the 31st December, 1877, was 662,212 persons, which makes an addition during the year of 32,436 persons, or 5.15 per cent. The estimated number of the sexes was as follows:—Males, 367,323, females, 294,889, so that the former were 72,434 in excess of the latter. The percentage of males to total population was 55.47, and of females 44.53, showing a difference of 10.94 in favour of males, which figures are 0.46 higher than those for the previous year. The proportion of males per 1,000 of population was 555, and of females 445. The following figures show the increase for each half year:—

Half-year ending 30th June, 1877.

Births	11,457	Deaths	5,502
Arrivals by sea	18,255	Departures by sea	10,574
Total.....	29,712	Total.....	16,076

showing a net increase of 13,636 persons, and bringing the estimated population to 643,412 persons.

Half-year ending 31st December, 1877.

Births	12,394	Deaths	4,367
Arrivals by sea	20,373	Departures by sea	9,600
Total.....	32,767	Total.....	13,967

showing a net increase of 18,800 persons, and making our estimated population to number 662,212 persons

The

Marriages,
births, deaths.

The registers show that during the year 1877 there were 4,994 marriages celebrated, being an increase of 364 on the previous year. The number of births registered was 23,851, as against 23,298 in the year preceding, giving an addition of 553 births to the year under consideration. Registered deaths numbered 9,869, which are fewer by 1,324 than those for the previous year.

(A.)

TABLE showing the number of MARRIAGES, BIRTHS, and DEATHS, registered in the Colony of New South Wales, during each Quarter of the Year 1877.

Marriages.

From the number of Marriages celebrated during the year 1877, we find that the rate per 1,000 of estimated population was 7.76, which figures show that the average for the previous nine years has been a little more than fully sustained. Marriages celebrated in the City numbered 1,343, which gives a rate of 13.81 to estimated population. The number of Suburban marriages was 556, which amount to 7.21 per 1,000; and 3,095 was the number for the Country Districts, making 6.58 per 1,000. The City rate is 1.18 lower than the average of the previous nine years; that for the Suburbs is higher by 2.19 than the previous nine years' average, and also higher by 0.95 than any single year of the same period. The Country Districts show a rate of 1.08 in excess of the average of the previous nine years. Of the total number of marriages we find that the Church of England celebrated 37.42 per cent.; Roman Catholic, 19.82; Presbyterian, 17.10; Wesleyan, 10.19; Primitive Methodist, 2.20; Congregational, 4.86; Baptist, 1.40; and Registrars, 6.07.

TOTAL	4,994	4,484	4,435	509	556	1	3

The number of those who were married under the age of 21 years during the year 1877 was 1,682, or 16.84 per cent. of the total number married. From the total number of minors married we find that males numbered 170 or 10.11 per cent., and females 1,512, or 89.89 per cent. From the total number of persons married in Sydney, it will be found that 10.68 per cent. were minors; the Suburbs and Country Districts showing 12.86 and 20.22 respectively.

TOTAL	12	152	164

Looking

Looking now to the number of those who were unable to affix their signatures to the marriage registers, we find that from the total number of persons married (9,988), there were 422 males and 553 females, in all 975. In my Report for the year 1876, I showed that this class of persons were 2 per cent. less than those for 1875, and now I have to report a further reduction of 0·71 per cent. on the percentage of 1876. Out of the 975 persons who were compelled to signify their assent by marks, we find that 164 or 16·82 per cent. were minors, who were distributed as follows:—Sydney, 13; Suburbs, 3; Country Districts, 148.

	No. of Marriages.	Full Signatures.			Marks.			Marks per cent.

BIRTHS.

BIRTHS.

During the year 1877 we find that the total number of Births registered in the Colony was 23,851, viz., 12,292 males and 11,559 females, or 51·54 and 48·46 per cent. respectively. There were then 733 more male than female children. In the previous year the excess of male over female children was 1·22 per cent. ; for the year under consideration it is 3·08 per cent. Of the total number of births 14·25 per cent. occurred in the City, 13·61 per cent. in the Suburbs, and 72·14 per cent. in the Country Districts. The birth rate of the Colony per 1,000 of estimated population for the year 1877 was 37·05, which is 0·70 lower than the previous year, and 2·16 below the average of the previous nine years. On referring to the decennial tables it will be seen that, with the exception of the year 1873, the birth rate of the Colony has been gradually on the decrease year by year. The City shows a birth rate of 34·95, which is lower by 0·53 than the preceding year, and 1·69 under the average of the nine previous years. In the Suburbs the birth rate for the year was 42·15, which is 0·76 higher than the previous year, but 1·61 lower than the nine previous years' average. The Country Districts show a birth rate of 36·67. Here again we find a decrease of 0·95 on the previous year, and 2·29 on the average of the previous nine years.

From

From the Table following we learn that the number of children born in the Colony out of wedlock during the year 1877 was 989, or 4.14 per cent. of the total number of births. This proportion is slightly in excess of that for the previous year. The illegitimate birth rate of the Colony was 1.53. For Sydney it amounted to 3.13, for the Suburbs 0.98, and for the Country Districts 1.29. The high rate for the City can to some extent be accounted for by the large number of these births registered from the Benevolent Asylum, which institution no doubt accommodates many cases from all parts of the Colony :—

(E.)

I now come to the decennial table showing the number of triplets and twins born in the Colony, from which we see that during the year 1877 no case of triplets is recorded. There were 209 cases of twins, consisting of 222 male and 193 female children; in all 415, or 1.74 per cent. of the total number of children born. One case of quadruplicate birth occurred, consisting of 2 male and 2 female children.

(F.)

DEATHS.

From the death registers for the year 1877, we learn that the rate of mortality was considerably lower than for the two preceding years. The number of deaths registered in the Colony was 9,869, as against 11,193 in the previous year. The percentage of male deaths to total deaths is 59.55, and of female deaths 40.45; the former being 19.10 per cent. higher than the latter. The death rate for the Colony per 1,000 is 15.34, which is 2.79 lower than the previous year; but 0.32 over the average of the nine years preceding. The average of daily rate of mortality is about 27. The rate for Sydney, for the year 1877, was 20.57, which is under the figures for the previous year by 6.13, and also for the average of the previous nine years by 2.42. The average daily rate for the City was 5.48. The Suburbs show a death rate of 17.15, and here we find a difference of 5.66 in favour of the year under consideration, as compared with the previous year, and 0.82 lower than the nine years' previous average. For the Country Districts the death rate was 13.95, which is lower by 1.64 than the previous year, but 1.06 higher than the average rate of the previous nine years. The consideration of these figures indicates that the past year has been an unusually healthy one, and that the greatest improvement is to be noticed in the City of Sydney.

INFANTILE MORTALITY.

The number of deaths of children under 5 years of age, recorded in the Colony during the year 1877, was 4,293, which gives a percentage of 43'49 to total number of deaths. Comparing this with the previous year we see an increase of 1'77 per cent.; and it is also 0'72 per cent. higher than the average of previous nine years. The percentage for Sydney was 40'75, which is lower by 0'35 than the previous year, and as much as 4'13 under the average of the preceding nine years. Infantile mortality for the Suburbs was 54'73, which closely approximates to the percentage of the previous year, and to the average of the previous nine years. In the Country Districts the percentage to total deaths was 42'07, being 3'18 higher than the previous year, and also 2'63 in excess of the previous nine years' average. Thus it will be noticed that during the year 1877 the general health of Sydney was meliorated, and that the death of children under five years of age had greatly decreased.

From the decennial table now following, which shows the percentage of deaths from various causes, we find that during the year 1877 the class of Zymotic Diseases constituted 23·27 of total deaths. Of these diseases we find a decrease of 6·26 per cent. on the previous year, but 0·43 higher than the preceding nine years' average. Constitutional Diseases had increased from 11·41 in 1876 to 12·45 in 1877, showing a rise of 1·04, and also of 0·24 on the average of the preceding nine years. The percentage for Local Diseases was 37·87, being 2·66 in excess of the previous year, but a decrease of 0·38 on the previous nine years' average. Under Developmental class of disease we find the percentage to be 17·90, which is 1·98 under the preceding year, and closely approximates to the average of previous nine years. The percentage of Violent Deaths was 7·55, which is 0·18 lower than the average of previous nine years.

The mean average monthly number of deaths in Sydney for the last ten years was 158. On reference to the decennial table below it will be seen that in the city the greatest number of deaths are recorded in the months of January and December, the mean temperature for these months being 71·6 and 70·7 respectively. The two months in the year which show the lowest mean mortality are September and October, when the mean temperature was 58·4 and 63·5 respectively. The greatest mean rainfall during any month in the ten years was in May, when we have a record of 8·52 inches, and the lowest in August, with 1·86 inch.

(L.)

Period.	No. of Deaths.	Mean Temperature.	Mean Height of Barometer.	Rain.		Mean Amount of Ozone.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

LETTERS OF REGISTRATION OF INVENTIONS.

(DESCRIPTIONS, SPECIFICATIONS, &c., ACCOMPANYING APPLICATIONS FOR.)

Ordered by the Legislative Assembly to be printed, 4 June, 1879.

RETURN (in part) to an *Address* of the Honorable the Legislative Assembly of New South Wales, dated 10 May, 1861, A.M., praying that His Excellency the Administrator of the Government would be pleased to cause to be laid upon the Table of this House (in addition to the Return already upon the Table),—

“(1.) A copy of the Descriptions and Specifications accompanying any
“applications for Letters of Registration of Inventions under the Act of
“Council 16 Victoria, No. 24, together with the date of application for such
“Letters of Registration, and when granted; also, copies of the Plans or
“Sections annexed, and of the Report, in each case.

“(2.) That His Excellency will cause similar Returns to be laid before
“Parliament annually.”

(*Mr. Hart.*)

A.D. 1876, 3rd January. No. 501.

FURTHER IMPROVEMENTS IN APPARATUS FOR COOLING AND FREEZING WATER AND OTHER BODIES.

LETTERS OF REGISTRATION to Jehosophat Davy Postle, for further Improvement in Apparatus for cooling and freezing Water and other bodies.

[Registered on the 5th day of January, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS JEHO SOPHAT DAVY POSTLE, of Sydney, in the Colony of New South Wales, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "further Improvements in Apparatus for cooling and freezing Water and other bodies," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Jehosophat Davy Postle, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Jehosophat Davy Postle, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Jehosophat Davy Postle shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this third day of January, in the year of our Lord one thousand eight hundred and seventy-six.

HERCULES ROBINSON.

Further Improvements in Apparatus for cooling and freezing Water and other bodies.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, JEHOSEPHAT DAVY POSTLE, of Sydney, in the Colony of New South Wales, send greeting :

WHEREAS I am desirous of obtaining Letters of Registration for securing unto me Her Majesty's special license that I, my executors, administrators, and assigns, or such others as I or they should or may at any time agree with, and no others, should and lawfully might from time to time and at all times during the term of fourteen years, to be computed from the day on which this instrument is left at the office of the Colonial Secretary, at Sydney, make, use, exercise, and vend within the Colony of New South Wales an invention for "further Improvements in Apparatus for cooling and freezing Water and other bodies"; and in order to obtain the said Letters of Registration, I must, by an instrument in writing under my hand and seal, particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed :

Now know ye, that I, Jehosophat Davy Postle, do hereby declare the nature of the said invention, and the manner performed to be particularly described and ascertained in and by the following statement and description, reference being had to the drawings hereunto annexed, and to the letters and figures marked thereon, which indicate the parts there referred to, and herein particularly explained, that is to say :—

My invention consists in certain improvements in my previous invention for "Improvements in Apparatus for cooling and freezing Water and other bodies," and will be best understood by reference to the drawings, figures 1, 2, and 3 :—

FIG. 1.

AAAA are the moulds for receiving the water to be frozen ; they are identical with the moulds in my previous invention.

B is a circular piece of wood, rather smaller in diameter than the bottom of the dissolving chamber G ; it rests on the coil of pipe C.

C is a coil of pipe through which the cold water flows to be cooled.

D is the outlet pipe for the solution, provided with a plug for stopping the flow when necessary.

E is the inlet of the coil C ; it is connected when necessary with any vessel containing the water to be cooled.

F is the cover of the moulds.

G is the dissolving chamber.

The operation of the apparatus is very simple. The moulds AAAA are first filled with water nearly to the top, and the cover screwed down. The chamber G is then nearly filled with nitrate of ammonia, or any suitable salt or compound. A sufficient quantity of water is now poured in to effect the dissolution of half the salt. The solution, on the plug in D being removed, passes in the direction of the arrows under the circular piece of wood B, cooling the contents of the coil C, till it finds its way out at D, at the same time the water to be cooled for effecting the complete dissolution of the salt in G is caused to flow through the coil C, entering at E and leaving at C. The solution in flowing out of the apparatus follows the course of the pipe C. The water thus cooled is then poured in among the remaining salt, and rocking is proceeded with for about twenty minutes, when the water in the moulds will be found frozen. After the ice is made, the cold solution can be utilized for cooling water, &c.

The rockers are placed on the machine in such a manner as to intersect the plane of the moulds, that is to say, the plane of the moulds is not parallel with the plane of the rockers, consequently when rocking takes place, the solution has a tendency to strike the moulds obliquely ; after striking the mould obliquely it has its direction altered, and at the return rock strikes the next mould in the same manner, and so on, the solution circulating round the apparatus, the length of time occupied in doing so depending upon the number of moulds and the speed of rocking. This arrangement of the rockers and moulds I specially claim. The moulds need not necessarily be parallel to each other, though I prefer their being arranged in that manner. In large machines it may be found convenient to have the moulds fitted singly in the top of the apparatus.

FIG. 2.

This is a section of an apparatus for cooling water. It may be used in conjunction with the rocking apparatus already patented by me, for utilizing the cold left in the solution after it is drawn from that apparatus, or it may be used in conjunction with any of the ordinary ice-making machines in use where the ice is made, or supposed to be made, in one operation. In this case the solution from the ice-making machine employed is poured into the space I, and water is cooled in sufficient quantity to dissolve the second charge of salt. This apparatus may also be used independently of any apparatus of any kind for cooling water. To do this, the vessel I should be filled with salt, and the chamber H with water poured in through the opening P. Upon water being poured into I, amongst the salt, it dissolves a portion of it, and flowing in the direction of the arrows, passes down the spiral space formed by the helix wrapped round the cylinder J, till it escapes at K. At the same time the water from H flows down the pipe L, and ascends the annular space, which may also be provided with a helix corresponding with that on J, and escapes at N cooled. The salt in I can occasionally be stirred up through the opening O. This method of cooling water is very economical, since only a portion of the salt in I need be dissolved at a time, and the quantity dissolved can always be made proportionate to the quantity of water to be cooled. The apparatus can stand on a counter, the pipe K fitted with a piece of india-rubber tubing which may be led to an earthen jar to receive the solution. The pipe N should be provided with a cock for regulating the flow of water ; an india-rubber tube leading from this cock may lead the cooled water wherever it is required. The apparatus is thus always ready to act, and will produce cooled water in a few seconds. The cylinder J may be made of wood painted, and the helix may be formed of a strip of india-rubber wrapped round it. The cylinder J, when the helix is on it, should fit rather tightly in the cylinder I ; it is provided with a handle, so that it can be lifted out to be cleaned when necessary. The apparatus, except where conduction is required, can be of wood.

FIG.

Further Improvements in Apparatus for cooling and freezing Water and other bodies.

FIG. 3.

Figure 3 represents the method I employ for fastening the india-rubber down for the purpose of joint-making:—

- No. 1. *a* is the india-rubber.
b is a tin shoe.
c the woodwork to which the india-rubber is attached.
- No. 2 is a section of the above.
- No. 3 shows the india-rubber and tin shoe when employed in one continuous length, that is when the tin shoe forms a trough in which the india-rubber is placed.
- No. 4 shows a modified form of the shoe. The shoe, which may be made of tin, is nailed or rather tacked down to the woodwork, and the india-rubber placed in position. The upper part of the tin shoe is then nipped in with a pair of pincers, so that the upper edge of the shoe is forced into the india-rubber. The way in which the india-rubber is held by the shoe is shown in figure 3, No. 2.

CLAIMS.

I claim, 1st, the arrangement of the pipe C, as shown in figure 1, in connection with the real bottom and the false bottom B of the apparatus.

2nd. The method of attaching the rockers to the apparatus in such a manner that the plane occupied by them forms an angle with or intersects the plane occupied by the moulds.

3rd. The relative position of the waterholder H to the cylinder I, in which the frigorific mixture or solution is placed.

4th. The form and construction of the cylinder J for the purpose specified.

5th. The general arrangement of the apparatus shown in figure 2, and its application to cooling purposes generally.

6th. The method of attaching the india-rubber strip to the apparatus wherever it may be necessary, as shown in figure 3.

In witness whereof, I have hereunto set my hand and seal, this twentieth day of October, in the year of our Lord one thousand eight hundred and seventy-five.

JEHOSOPHAT DAVY POSTLE.

REPORT.

SIR,

The application of Mr. J. D. Postle for Letters of Registration for "further Improvements in Apparatus for cooling and freezing Water and other bodies" having been referred to us, we have examined the specifications and drawings accompanying the same, and have now to report that we see no objection to the issue of Letters of Registration as prayed for.

IMPROVEMENTS IN APPARATUS FOR RECOVERING SALTS FROM THEIR SOLUTIONS.

LETTERS OF REGISTRATION to Jehosophat Davy Postle, for Improvements in Apparatus for recovering Salts from their solutions.

[Registered on the 8th day of January, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS JEHOSOPHAT DAVY POSTLE, of Sydney, in the Colony of New South Wales, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Apparatus for recovering Salts from their solutions," which is more particularly described in the specification and sheet of drawings which are hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Jehosophat Davy Postle, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof : to have, hold, and exercise unto the said Jehosophat Davy Postle, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Jehosophat Davy Postle shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of January, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Apparatus for recovering Salts from their solutions.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, JEHOSEPHAT DAVY POSTLE, of Sydney, in the Colony of New South Wales, send greeting :

WHEREAS I am desirous of obtaining Letters of Registration for securing unto me Her Majesty's special license that I, and my executors, administrators, and assigns, or such others as I or they should or may at any time agree with, and no others, should and lawfully might, from time to time, and at all times during the term of fourteen years, to be computed from the day on which this instrument is left at the office of the Colonial Secretary, at Sydney, in the Colony of New South Wales, make, use, exercise, and vend within the said Colony, an invention for "Improvements in Apparatus for recovering Salts from their solutions"; and in order to obtain the said Letters of Registration, I must, by an instrument in writing under my hand and seal, particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed; now know ye that I, the said Jehosophat Davy Postle, do hereby declare the nature of the said invention and the manner performed to be particularly described and ascertained in and by the following statement and description, reference being had to the drawings hereunto annexed, and to the letters and figures marked thereon, which indicate the parts there referred to and herein particularly explained (that is to say), the principle on which my invention is based is as follows:—When water is heated to 212° , or any temperature above the ordinary temperature at the time and removed from the source of heat, the vapourization that results is chiefly due to the excess of temperature above the ordinary temperature at the time, that is to say, if the temperature is 70° and the water is heated to 212° the evaporation that ensues in a saturated atmosphere will be due to the 142° of sensible temperature above 70° . This 142° of sensible heat in evaporating the water becomes latent in it, and the quantity of water evaporated by it will be found indicated by the fraction of which 142° is the numerator and the latent heat of water is the denominator. If a piece of sheet metal be dipped into boiling water and removed, a portion of the boiling water will adhere to it and will rapidly evaporate, and in all probability will entirely disappear. The disappearance of the whole of the water in this case is due partly to the temperature of the water above 70° , and partly to the heat which is communicated to the water by the sheet metal. The sensible heat of the metal, together with the 142° of sensible heat of the water, make up a quantity of heat sufficient to supply the heat rendered latent when water is converted into vapour. Upon dipping a piece of sheet metal into boiling water, removing it, and permitting the evaporation of the water adhering to the metal to take place, the following phenomena occur:—The piece of sheet metal is heated to 212° ; on removal the water adhering evaporates, and the sheet of metal is cooled. If the thickness and quantity of the sheet metal is just sufficient to communicate sufficient heat to effect the evaporation of the water in a saturated atmosphere, the metal, when the water is all evaporated, will be at the atmospheric temperature. If the piece of sheet metal be now dipped into a solution of nitrate of ammonia, at about the boiling point, the same phenomena occur. An additional element however is introduced, since the salt in solution as well as the sheet metal communicate their heat to the water to supply the heat rendered latent. The cooling of the salt and the metal results, as in the case when the metal was dipped in water. This is exactly what is required in the recovery of a salt from its solution. The absorption of heat from the salt and the metal permits the former to crystallize on the latter, from which it can be removed. This is the principle of my evaporating apparatus, and the following description and the drawings attached show one method of carrying my principle into effect. I may here state that the specific heat of the solution can be greatly increased, or rather the total quantity of sensible heat of the solution, by saturating it at a high temperature. The increased quantity of salt will give out an increased quantity of heat, which is rendered latent by the vapourization of the water. As a set-off against any advantage that may be derived from saturating the solution, it must be remembered that a reduction of temperature follows the addition of any fresh salt to a heated solution.

Fig. 1 is a section of the apparatus taken through it transversely.

A is a revolving disc mounted on a shaft, B, on which a pulley is keyed in the ordinary way; a portion of this disc always hangs in the solution D.

B is the shaft carrying the disc A.

C is the steam coil of tin, for the purpose of communicating heat to the solution D. This coil is lined with copper, to give strength.

D. The solution to be evaporated.

EE. Troughs for receiving the salt removed from the disc as it revolves. The edges of these troughs are fitted with some soft substance such as india-rubber, which is constantly pressed against the disc D.

Fig. 2 is a plan of the apparatus.

Fig. 3 is a side elevation.

The method of working the evaporator is as follows:—The solution is placed in the apparatus and steam is turned into the coil C, or a heated solution is passed through it. When the solution D is heated the disc A is caused to revolve. A portion of the solution adheres to it, of which the water rapidly evaporates. That portion of the disc out of the solution is cooled and the salt speedily crystallizes on it. Upon passing between the troughs EE, the salt adhering to the disc is removed, falling into the troughs, and can be removed when required, or can slide direct into the freezing apparatus if a cold-producing salt. It will be seen that by my process of evaporation the whole of the heat above the ordinary temperature at the time is utilized in evaporating the solution. Thus, if the temperature is 70° the last portion of water evaporates at that temperature. In the case of ordinary boiling the vapour leaves at about 212° or higher, the temperature between 212° and the temperature of the air at the time is consequently so much loss, the vapour carrying off 140° of heat, which is utterly wasted. The apparatus can be used for concentrating purposes only; when employed for this purpose the troughs with scrapers attached should not touch the disc or discs. It can be used for concentrating syrup.

The principle of my invention, already explained can be carried into effect in a variety of ways. A metallic drum, for instance, could be arranged so that a portion of it would come in contact with a heated solution. Upon the drum being caused to revolve, the solution would evaporate on its surface, cooling it

Improvements in Apparatus for recovering Salts from their solutions.

in doing so; crystallization of the salt would result for the reasons already given. In the method I have illustrated in the drawings attached and described in this specification, the shaft B could have several discs, A, mounted on it, and the evaporation could be greatly facilitated by the aid of a fan. To recover and condense the water of evaporation the apparatus should be closed in, and a current of air be caused to pass over the surface of the disc or discs. The air charged with moisture can be led through metallic passages surrounded with water—salt water if at sea, or it can be caused to ascend a cylinder down which there are descending jets of water; the excess of moisture (that derived from the evaporation of the solution on the disc) will be condensed and will mingle with the fresh water jets before referred to. These jets may consist of the same water pumped up over and over again. It should be kept cool by sea-water or other cooling water passed through a coil immersed in it. The same air can be used over and over again.

CLAIMS.

I claim, 1st, the method of effecting the evaporation of a hot solution on a thin metallic or other surface, by causing such surface to be alternately immersed in and removed from such solution, the evaporation of the solution adhering to the metal or other surface being due partly to the sensible heat of the solution and partly to the sensible heat of the metal itself.

2nd. The method of recovering the moisture from the air after it has passed over the evaporating surface, by causing it to pass through or ascend a cylinder down which there are descending jets of water, the air entering at the bottom and leaving at the top, where the coldest water is descending.

3rd. The general form and combination of the apparatus as described, and its application for the purposes specified.

In witness whereof, I have hereunto set my hand and seal, this twentieth day of November, in the year of our Lord one thousand eight hundred and seventy-five.

J. D. POSTLE.

REPORT.

Sydney, 2 December, 1875.

SIR,

The application of Mr. J. D. Postle for Letters of Registration for "Improvements in Apparatus for recovering Salts from their solutions" having been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

IMPROVEMENTS IN TREATING HIDES, SKINS, AND FELTS, &c.

LETTERS OF REGISTRATION to Henry Malcolm Caldwell, for Improvements in treating hides, skins, and felts, and removing the hair or wool from the hides and skins, and making the felts into white or tawed leather.

[Registered on the 21st day of January, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS HENRY MALCOLM CALDWELL, of Sydney, in the Colony of New South Wales, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of "Improvements in treating hides, skins, and felts, and removing the hair or wool from the hides and skins, and making the felts into white or tawed leather," which is more particularly described in the specification which is hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Henry Malcolm Caldwell, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Henry Malcolm Caldwell, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Henry Malcolm Caldwell shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twentieth day of January, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in treating hides, skins, and felts, &c.

SPECIFICATION of HENRY MALCOLM CALDWELL, of Sydney, in the Colony of New South Wales, Gentleman, for an invention of certain "Improvements in treating hides, skins, and felts, and removing the hair or wool from the hides and skins and making the felts into white or tawed leather."

THE invention consists essentially in the employment and use, for the abovenamed purposes, of petroleum shale oil or other liquid hydrocarbon.

1st. In treating hides and skins I stove them in the usual manner, and I employ petroleum shale spirit or other liquid hydrocarbon to preserve the hides or skins from tainting or decomposing by painting the flesh side (or even by dipping) previously to introducing them into the stove or by otherwise applying the liquid hydrocarbon thereto either before or after they have been hung up in the stove, but I prefer to paint the hides or skins over with the petroleum or other liquid hydrocarbon first, and then fold them up and fill them in heaps, and allow the same to stand for several hours before hanging up in the stove, so that the hydrocarbon can thoroughly penetrate and saturate the skin; or I take off the hair or wool by painting the skins over with sulphide of lime, as mentioned in the specification of Letters Patent, No. 2540, granted to Arthur Granville and Edwin Eli Johnson, dated 25th July, A.D. 1873. As is well known the hair or wool becomes loosened either by the application of the sulphide of lime or by the sweating process in the stove, and may then be removed in the usual manner, and the application of the petroleum shale spirit or other liquid hydrocarbon in the sweating process as above described will preserve the hide or skin from tainting or decomposing.

2nd. After the hair or wool has been removed from the hide or skin in this or any other convenient manner I treat the pelts with petroleum shale spirit or other liquid hydrocarbon (either by painting or by immersion) instead of employing the present method of "liming," "puring," and "drenching," and I use petroleum shale spirit or other liquid hydrocarbon either in connection with sulphide of lime or other sulphide, or by itself; the great benefits arising therefrom are increased pliability and strength.

I apply the above substances when convenient under pressure either by hydraulic, atmospheric, or other mechanical means. I find that the strength of the pelts is increased to such an extent, by the use of the substances hereinbefore mentioned, that "lashing laces" sufficiently strong for ordinary use can be made from sheep instead of from hides as heretofore.

I claim the employment of petroleum shale oil or other liquid hydrocarbons in all its forms to the preparations of hides, skins, and pelts, and making the same into white or tawed leather.

H. M. CALDWELL.

This is the specification referred to in the annexed Letters of Registration granted to Henry Malcolm Caldwell, this twentieth day of January, A.D. 1876.

HERCULES ROBINSON.

REPORTS.

SIR,

We do ourselves the honor to return to you the documents transmitted to us under your B.C. communication of the 5th instant, No. 75/6843, which relate to Mr. Henry Malcolm Caldwell's Petition; and we have to suggest that the Petitioner be required to affix a specific claim to his specification stating precisely the hydrocarbons he desires to secure by Letters of Registration, in particular with reference to the treatment of seeds, nuts, &c., as certain hydrocarbons have already been in use in connection with this industry.

We have, &c.,

GOTHER K. MANN.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

Sydney, 14 October, 1875.

SIR,

We do ourselves the honor to report that we see no objection to the issue of Letters of Registration in accordance with Mr. Henry Malcolm Caldwell's revised specification and claim, transmitted to us under your B.C. communication of the 3rd instant, No. 75/7761, securing to Mr. Caldwell the exclusive enjoyment of an invention for "Improvements in treating hides and skins, and making the pelts into white or tawed leather."

We have, &c.,

A.D. 1876, 28th January. No. 504.

NICOLLE & MORT'S CONCENTRATOR, REFRIGERATOR, AND TEMPERATOR.

LETTERS OF REGISTRATION to Eugene Dominique Nicolle and Thomas Sutcliffe Mort, for an invention for refrigerating and purifying air in rooms or spaces, for refrigerating liquids and other substances, and for restoring the refrigerific salts employed in such refrigeration to their solid state again.

[Registered on the 29th day of January, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS EUGENE DOMINIQUE NICOLLE and THOMAS SUTCLIFFE MORT, both of the City of Sydney, in the Colony of New South Wales, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for refrigerating and purifying air in rooms or spaces, for refrigerating liquids and other substances, and for restoring the refrigerific salts employed in such refrigeration to their solid state again, which said invention in its combined form is styled "Nicolle and Mort's Concentrator, Refrigerator, and Temperator," and which said invention is more particularly described in the specification, marked A, and the four sheets of drawings, marked B, C, D, and E respectively; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-eighth day of January, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Nicolle & Mort's Concentrator, Refrigerator, and Temperator.

A.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME: We, EUGENE DOMINIQUE NICOLLE and THOMAS SUTCLIFFE MORT, both of Sydney, in the Colony of New South Wales, send greeting:

WHEREAS we are desirous of obtaining Letters of Registration for securing unto us Her Majesty's Special License that we, our executors, administrators, and assigns, or such other as we or they should at any time agree with and no others, should or lawfully might from time to time and at all times during the term of fourteen years, to be computed from the day on which this instrument is left at the office of the Colonial Secretary in Sydney, make, use, exercise, and vend within the Colony of New South Wales an invention for refrigerating and purifying air in rooms or spaces, for refrigerating liquids and other substances, and for restoring the frigorific salts employed in such refrigeration to their solid state again, and which invention in its combined form we style "Nicolle and Mort's Concentrator, Refrigerator, and Temperator"; and in order to obtain the said Letters of Registration we must by an instrument in writing under our hands particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed:

NOW KNOW YE, that we, the said EUGENE DOMINIQUE NICOLLE and THOMAS SUTCLIFFE MORT, do hereby declare the nature of the said invention and the manner performed to be particularly described and ascertained in and by the following statement and description, reference being had to the drawings hereunto annexed, and to the letters and figures marked thereon, which indicate the parts therein referred to, and herein particularly explained (that is to say):—

Our invention is to obtain artificial cold under the greatest simplicity and economy, by the use of frigorific salts in consolidated shapes or blocks, instead of in the ordinary crystallized form, and by which method very large advantages are obtained.

To put the salt in this condition, we use a concentrator, which effects its object at a minimum consumption of fuel without loss of any of the component parts of the salts, and which is so worked as to avoid the use of pumps in the passing of the liquor from vessel to vessel, its whole construction especially fitting it for use on board ship.

The machines we employ for producing artificial cold with these salts are shown in three forms.

1st. As used for domestic and minor purposes.

2nd. As employed for refrigerating on a large scale, by acting upon a liquid vehicle by conduction. This is especially applicable for cargoes of meat.

3rd. Where we use air as the medium, and which we cool by direct contact with the freezing agent.

Our modes of refrigerating may be adapted to every purpose for which cold is required. Churches, theatres, ships, railway cars, living rooms, and other spaces may be cooled, and the air purified at the same time. Hospitals and sick rooms may be disinfected, odorated, or medicated; and by introducing a heating agent into the apparatus instead of a cooling one, they may be warmed instead of cooled, purification being effected at the same time. Water and other substances may be refrigerated, cargoes of meat and stores of food preserved, or their frozen condition maintained,—in fact, for purposes of refrigeration their application is universal.

Figure 1 is a sectional elevation of our concentrator.

Figure 2 is a sectional elevation of our refrigerating apparatus as applied to domestic purposes.

Figure 3 is a sectional elevation of our refrigerating apparatus as applied to more extensive requirements, and where the cold is carried through the medium of a fluid.

Figure 4 is a sectional elevation of our refrigerating apparatus as arranged for cooling air and other gases, by direct contact with the refrigerating agent.

We now proceed to describe the various portions of the "concentrator," reference being made to the plan hereunto attached.

FIGURE 1.

A is a vacuum pan for concentrating the salt solution by evaporation.

This pan is fitted with an internal heating coil with admission and emission cocks. It is also fitted with steam pet cock connected with main steam pipe, for the purpose of forcing the air out of the pan by jet of steam.

At the bottom of it is a delivery valve for letting off the concentrated solution, and on the top is a stop-valve. The latter is for connecting with or shutting off communication with A'. There is also a connection at the side of this vessel fitted with a cock for leading the fluid from the evaporator B into itself.

A' is the priming vessel, the object of which is to receive any of the solution which may be lifted by the vapour during concentration. This vessel is connected with pan A by downward pipe and with the coil and the vessel B by upward pipe, as indicated in the plan.

B is a heating and vacuum evaporator, fitted also internally with heating coil, a branch of which leads into the vapour space of the vessel itself, the coil being connected by pipe and stop-cock with similar coil in vessel B'. This vessel B is also connected at the bottom by pipe and stop-cock with the vessel B'.

B' is also a heating and vacuum evaporator, similarly constructed to vessel B, and having in addition a steam pet cock connected with the main steam pipe. It is also connected with the surface condenser C by a pipe fitted with a stop-cock, and also with the solution tender E by a siphon pipe fitted with a stop-cock. These vessels B and B' are continuations of the pan A; their object being to utilize the waste heat coming from the pan A in further evaporating, and in preparing the liquor for finishing in the pan.

C is a surface condenser fitted with internal coil, or other substitute, for passing refrigerating water through. This vessel is connected with the distilled liquid receiver D by pipe and stop-cock, and it is also provided with a vacuum gauge.

D

Nicolle & Mort's Concentrator, Refrigerator, and Temperator.

D is the distilled liquid receiver, fitted at top with pet steam cock and pipe, which connection leads to the main steam pipe. At the bottom of this vessel are fitted an air cock and a delivery cock, the latter leading into the exchanger in the refrigerator.

E is a solution tank to which the air has access, into which the siphon pipe from vessel B is conducted near to its bottom. This vessel is also connected with the priming vessel A', and the solution supply pipe coming from the exchanger of the refrigerator; each provided with a stop-cock. This vessel has an exchanging coil in it, which is connected with the delivery valve of the pan A at one end, and by delivery pipe and cock with the mould F at the other.

F is a mould to receive the concentrated solution. This mould is by preference circular, having a hole through its centre, and fitted with side guides corresponding with the slots into which they have to drop in cylinder H, fig. 2.

G is a tank for receiving the condensed water resulting from the steam or other condensed liquid which passes through the coil in the vacuum pan. The various vessels are fitted with level gauges.

MODE OF WORKING THE APPARATUS.

Preparations for charging.

The tank E having been filled with the saturated solution to be evaporated, by preference nitrate of ammonia and steam, or other heating agent, by preference steam, being at command, open the stop-cock of the vessel A, and see that all the cocks communicating from that vessel to the distilled liquid tank D are open, including the air cock in that vessel, so as to form a free passage through the apparatus. See that all the other cocks are shut, and then let in steam by the pet cock, which is situated immediately above the heating coil in vessel A, until all the air is expelled through the air cock. Now shut off the steam, and shut the air cock. Open the cold water supply cock leading into the bottom of the surface condenser C, so as to allow the water to pass upwards through the coil. Open the cock at the vacuum gauge, and see that a vacuum has been established.

Charging.

Open the siphon cock leading into the solution tank E, also the feed-cock between B and A', and allow the liquor in tank E, which will ascend by the external atmospheric pressure, to flow into the vessels B and B', and on to the pan A, until the liquor has reached the point marked on the level gauge. Now shut that stop-cock, and regulate the amount of liquid in B and B' according to the level indicated in plan, or thereabout, and then shut the two siphon cocks between B and E, and open the coil stop-cock leading from the coil in B to that in B'.

Evaporating.

Now begin work by opening the steam cock leading into the heating coil in pan A, and also the cock at the end of the coil leading into the condensed liquid tank G; on the application of the heat to the solution, it will begin to evaporate at a low temperature, under the influence of the vacuum. The hot vapour resulting therefrom will pass through the priming vessel A', and enter into the heating coil of B, through which it will find its way to the coil in B', whence it is led into the surface condenser, where it is immediately condensed by contact with the refrigerating coil, therein eventually finding its way into the distilled liquid tank D.

Should the heat be applied too quickly and priming result, the downward pipe in the vessel A' will lead the mixed vapour and solution into the bottom of that vessel, where by the level gauge its presence will be seen, and its removal must be effected by applying steam pressure through the steam pet cock, and opening the purging cock into that vessel E. During this operation the cock between the vessels B' and C must be temporarily closed. The hot vapour in passing through the heating coils in B and B' causes the liquid in those vessels to evaporate, and which vapour is drawn by vapour pipes connected with each heating coil, mixing with the vapour from vessel A, eventually finding its way into the vessel D, as before described.

When the proper amount of water has been abstracted from the liquid in the vessel A to produce the desired concentration, and which will, after a short experience, be ascertained by the amount of liquid recovered in the vessel D, by the level gauge on that vessel,—this being accomplished, shut the stop-valve of the concentrating pan A, also shut the steam off, and open the pet steam cock until a slight pressure is established in the pan A, when, on opening the delivery cock leading into the mould E, the concentrated solution will flow through the coil placed in the tank E, imparting its heat to the solution in that vessel, and which is the next to be acted upon. When one mould is filled, replace it with an empty one, and continue drawing off until the pan is empty. Now shut the delivery cock, and open the stop-valve at the top of the vessel A, and the vacuum will be again obtained. This done, open the stop-cock between the vessel B and the concentrator A, and the liquid in B will, by gravitation, fall into the concentrator A. When B is empty, shut the stop-cock and also the vapour coil cock between B and B' together with the cock between B' and condenser C. Now open the pet steam cock on the dome of the vessel B', and the pressure of steam will force the liquid in B' into the vessel B. When that is effected, shut the pet steam cock, and open the two cocks previously shut, and the vacuum will be restored, upon which the vessel B' will be refilled by opening the siphon cock leading into the tank E. Proceed as before by opening steam cock into heating coil, and so on in manner herein described.

Although we have described the manipulation by steam, which we use by preference, the same object may be effected by atmospheric air or other medium. Although we obtain the vacuum under which we work by preference in the manner described, we produce the same effect where steam is not at command, by dry heat applied under the use of an air pump connected with the vessel D, and which, in order to secure continuity in our operations in the mode herein described, and which might be interrupted by leakage in the pipes or vessels, we ourselves complete our apparatus by attaching an air pump, in order to abstract the air which would enter through the leaky places.

Having

Nicolle & Mort's Concentrator, Refrigerator, and Temperator.

Having fully described the mode by which we obtain the concentrated salt which on cooling solidifies, it is now converted into our cold-producing agent, occupying only half the bulk of that obtained by crystallization in the mother liquor in the usual way. In this state the salt possesses a larger freezing power, and less affinity for atmospheric moisture, absolutely protected as it is, except on its upper surface. In this solid form it is introduced in its own mould into the vessel H.

We now proceed to describe the various portions of the "Domestic Refrigerating Apparatus," reference being made to the plan hereunto attached.

FIGURE 2.

- A is the refrigerating well.
 B is an agitator for disturbing the salt.
 C is a dome through which the shaft worked by the handle passes.
 DD is a circular channel fitted with india-rubber, fitting air-tight on the top of well A.
 E is a turned pin on which a shaft revolves.
 F is a socket into which the pin E is tightly fitted.
 H is an outer cylinder made of wood or other non-conducting substance.
 II are ice moulds made of good conducting substance.
 J is a fine strainer for the double purpose of admitting the air and straining the spent liquor.
 N.B.—The air might be made to pass in by pipes leading from the top to the bottom of the well, instead of by strainer.
 K is a flexible pipe for passing the spent liquor from the well A into the spent liquor tank O.
 L is a flexible pipe connecting the exchanger with the cold water tender T.
 M is the outer pipe of the exchanger N; one end of it receiving the solution from the well A, and discharging it at the other into the vessel O by the pipe K.
 N is the temperature exchanger, and which consists of one or more pipes coiled within another pipe or pipes, in which the colder liquor is made to pass in through one set of pipes in an opposite direction to the warmer fluid in the other pipes.
 O is a vessel into which the saturated salt solution flows after having done its work. This vessel may, for convenience, be an evaporating pan.
 PP are handles to the evaporating pan.
 Q is a fresh water tender.
 R is a cock which when opened allows the water to flow from the water tender Q through the exchanger coil on its way to the vessel T.
 S is a flexible pipe connecting the water tender Q with the inner coil of the exchanger.
 T is the cold water tender for receiving the water from the vessel Q after it has passed through the exchanger.
 U is a flexible tube connected with the tank T for filling the ice moulds II.
 V is the inlet pipe or channel through which the air is propelled when the apparatus is used for cooling that gas.
 V' is an outer channel surrounding the well A leading the air to the perforated portion of that vessel.
 W is the outlet pipe or channel through which the air passes after having been refrigerated.
 X is a frame fitted with one or more divisions of metallic or other gauze. This gauze is for the purpose of arresting any particles of solution which may pass with the air.
 Y is a receiving vessel fitted with a draining pipe, which latter is connected with the frame X. This vessel is fitted with a stop-cock for removing any fluid which may find its way there.
 Z is a chamber or vessel fitted with wire or perforated trays resting upon each other, for the purpose of holding loosely chloride of calcium or other moisture-absorbing substance. This vessel is fitted with an air-tight cover at the top and at the bottom with an air-tight drawer, the latter to catch droppings or drainings. There is a space between the drawers and the bottom tray, and open communication with Z', by which the air passes into that vessel.
 Z' is a vessel similarly constructed, for the purpose of holding pieces of quick or slacked lime. A fine perforated bonnet fits over the top tray in this vessel, and also in the vessel Z.
 Z'' is a close chamber in which are one or more frames of flannel, or other good water-absorbing substance, each supplied with water from above, or dipping in water contained in a drawer or tank at the bottom. This is only required when refrigerating mixtures are not used.
 Z''' is the pipe or channel through which the air passes out. A cap is fitted on this when the apparatus is not at work, to prevent the air getting in. This outlet pipe is connected with the space desired to be cooled, and that space again connected with the air-propeller, so as to complete the continuous circuit. It is also to this outlet pipe that meat safes, vessels, or chambers requiring to be cooled must be connected either to be acted upon by direct contact or by transmission through metallic substances. The exit pipe going to the suction valve of the air propeller.

MODUS OPERANDI.

We will first describe the way in which we should use our domestic apparatus for the production of ice.

Preliminary Cooling Charge.

Having arranged the water tender Q about 4 feet above the machine on a shelf or bracket, and made the connection with the machine by flexible tube S, first see the water cock R and regulator K are closed, then fill the water tender Q with the water intended to be used for freezing and drinking. (This tender Q should always be kept full.) Then open the cock R, and allow the water to flow into the vessel T up to the bottom of the mark 9 on the inside of that vessel. Now remove covers G and H, fill the ice moulds within 2 inches of the top by the tube U, replace cover H, to prevent the salt falling into the moulds, then allow the remainder of the water in vessel T to flow into the well A. This done, put on the funnel, and introduce into the refrigerating well A about six pounds more or less of the salt, say nitrate of

Nicolle & Mort's Concentrator, Refrigerator, and Temperator.

of ammonia, according to the temperature and the climate, which will fill the well A up to the lead ring W inside. (Note that whatever quantity of salt by weight is used, where the salt is nitrate of ammonia, the same quantity by weight also of water must be used; and to obtain the greatest amount of cooling power it is essential that the salt should be absolutely dry, or as near thereto as possible.) Now replace the cover G, and put the agitator moderately in motion by turning the handle B, and the whole of the salt will be quickly dissolved, and the water in the ice moulds reduced to the temperature of the solution. (Note.—Should it be found difficult to move the agitator, raise the ice moulds slightly, turning the handle B at the same time from left to right, which is the proper direction to move in.) Allow this charge to remain in, giving an occasional turn of the handle for about ten minutes if the weather be hot, or fifteen if cool, then proceed to the freezing charge.

Freezing Charge.

Have your next charge of salt ready, remove cover G, put on funnel, open water-cock R, and observe when the water begins to flow into vessel T; then open the regulator K to the first notch, and as the solution in well A falls, owing to its passing by the tube M into the tank O, keep adding salt until the whole is introduced, care being taken not to raise the solution above the ring W, lest it might get into the moulds. By this process the salt will be cooled to the temperature of the solution. When the whole of the charge of salt is introduced into the well A, open the regulator K to the second or third notch, taking care to have the flow by cock R and at the notch K so regulated as to ensure the water in vessel T reaching the mark 9 at the same time as the solution in well A has drained off, which latter will be easily perceived by taking out the plug M, and applying the ear to the opening, or by moving the handle, which will become set if the draining is properly effected. Now shut first the regulator K and then the cock R, then introduce by the tube U the water from vessel T into the well A up to the bottom of ring W, same as before, put on cover G, and agitate by handle B for two or three minutes, which movement repeat occasionally, and in half-an-hour the water in the moulds will be frozen. With the water remaining in vessel T, fill the second spare set of moulds ready to replace immediately the first set when frozen and taken out; allow the second spare set of moulds to remain in the solution ten to fifteen minutes, then proceed with another freezing charge as before. This may be repeated until the requisite quantity of ice is obtained. Much time will be gained where continuous work is the object, by taking the ice moulds out of the well before the centres of the cakes are quite frozen, as the inherent cold in the ice will finish them if the moulds as taken out are put together and plunged in sawdust; the second set of moulds (being ready filled with the water next to be frozen) must of course immediately replace those removed. In this way the quantity of ice may be increased, and the cold left in the solution utilized up to twenty-eight degrees, which temperature the liquor in the well must attain before it is allowed to exchange with the salt and the water for the next charge. To get the ice out of the moulds readily, dip them in a little water at the ordinary temperature of the atmosphere. The solution ought not to be allowed to leave the well to exchange with next charge below a temperature of twenty-eight degrees Fahrenheit, otherwise there is a risk of freezing the pipes.

To refrigerate Water.

When only refrigerated water is required, the ice moulds should not be put in, the charge of salt should be increased, the well A filled up to the top, and agitated till all the salt is dissolved, the water should then be allowed to flow into the vessel T, by opening cock R and regulator K. (If the flow of water and solution is carefully adjusted, the exchange of temperatures will be perfect.) Should the water vessel T become full before the well A is drained, the cold water must be taken off by the tube U into another vessel, as the regulator K must be shut down tight before the cock R is stopped, otherwise the water in pipe will be frozen. This charge will refrigerate about twenty pounds, or two gallons of water. Should a smaller quantity be required, the charge must be reduced in proportion.

Cooling Air.

Where we use the machine for cooling and purifying air rapidly, we place equal portions (if nitrate of ammonia be used) of the salt and water into well A, filling the trays in the vessel Z with fragments of chloride of calcium, or other moisture-absorbing substance, and the vessel Z' with pieces of quick or slacked lime, or other substance capable of taking up carbonic acid gas. Care must be taken that the covers and drawers of the various vessels are firmly replaced, so as to prevent escape of air, and the bonnet removed from the exit pipe. We now connect the exit pipe with the space or chamber intended to be cooled, and the suction pipe of the air-propeller with the same space or chamber, so as to ensure circulation. It is scarcely necessary to say that the space to be acted upon should be as perfectly closed as may be against the admission of the external air.

We now set the air-propeller in motion, and which may be a fan, pump, blower, bellows, or other air-propeller, by preference a pump, and worked by hand or other motive power, and at the same time turn the handle, so as to allow the air to pass through and amongst the salt and water. The effect will be an immediate reduction of temperature to the extent of the refrigerating power of the solution, and which will be found to be about fourteen pounds of salt for 750 cubic feet of air, starting at 80° and reducing to 32°.

Noiseless and frictionless Air-propeller.

We use in preference an oscillating cylinder with piston fitting the cylinder sufficiently near to propel the air, and loose enough to prevent friction by rubbing internally. The arrangement of the air-propeller enables us to work at high speed without producing heat resulting from friction. It is made to act single or double effect, and capable of overcoming deep seal of fluid.

Having

Nicolle & Mort's Concentrator, Refrigerator, and Temperator.

Having exhausted the source of cold in the first charge, we proceed to place fresh salt in well A, and to exchange the temperature of the water, &c., as in the case of ice-making before described. Again, we set the air-propeller in motion, at the same time turning the handle of the propeller B, and an intensified cold is the result, which may be increased up to the refrigerating power of the salt, when exchanged or iced water and cooled salt are used.

Having described the cooling action of the apparatus, we now explain the uses of the chloride of calcium and lime. It is well known that the former has a great affinity—when either in the fixed or crystallized condition—for water, as well as a large destructive power over miasm or germs of infection, whilst lime, owing to its great affinity for carbonic acid gas and moisture, completes the purification of the air passed through these agents.

The foregoing will show that, whilst we have cooled the air, we have also purified and desiccated it, the balance of oxygen being supplied by the inevitable fissures in windows, doors, fire-places, or other openings.

The description given thus far has reference simply to cooling and purifying rooms or spaces; but it will be obvious that chambers such as Z, Z', and Z'', may be added to suit any special requirements. In the ordinary cooling of a room where only a moderate reduction of temperature is sought, it will not be worth while to use the exchanger or the refrigerating salt, as by passing the air through the empty well A, thence through the chloride of calcium and lime chambers, and on through the wet flannels in the chambers Z', a sufficient reduction of temperature will be obtained, particularly when the suction pipe is made to draw from the space which is being cooled. Where ice is at command, it may be advantageously used to increase the cold either in the refrigerating well with the salt, or in the cold water supply in the chamber Z''. It will of course be unnecessary to use the water chamber Z'' when the refrigerating well is used with refrigerating salt, unless for the purpose of imparting odours to the air, such as Eau-de-Cologne, or for medicating the air with sulphurous or carbolic acid, &c., when this chamber will be found useful, as the water space may be made a convenient receptacle for adding the substances sought to be mixed with the air passing, as they will be taken by capillary attraction into the blankets through which the air will pass.

It may be well also to state at this point that where it is desired to heat a room or space, boiled water or boiled salts and water may be introduced into the refrigerating well, in lieu of the frigorific salt, and by a simple contrivance the water may be kept hot by spirit or other lamp burning underneath.

Our machine is capable of various applications where the air-propeller is sought to be avoided. We will describe a few of them. On board ship the lower end of the windsail may be made to conduct the air to the inlet channel V. For the cooling of railway cars and meat vans, we affix as many of the compartments as we require in or under the car or van, and attach a trumpet-mouthed funnel covered with gauze to the opening to the air channel V, taking care that the funnel is at the going end, so as to take in the full air, as the vehicle goes along. Of course the vehicles to be cooled should be kept as well protected against the admission of the outer air as may be—a small outlet only being required to create current. Rooms, meat safes, or spaces, may be kept cool by carrying a funnel-mouthed pipe to the top or other exposed part of the house, and connecting the pipe with the space to be cooled or ventilated, the outlet from such space being made to lead into the chimney or other warmest part of the room or space. The funnel or hood which receives the wind must of course be made to move with the wind, so as always to face it.

Having described figures 1 and 2, we now proceed to describe our refrigerating apparatus as applied to more extensive requirements where the cold is carried through the medium of a fluid.

FIGURE 3.

H is a vertical internal cylinder surrounded by another cylinder, the spaces between the two being protected by a non-conductor. These vessels are fixed upon another vessel marked H'. The lower portion of the cylinder H is a corrugated cone, underneath which is a bracket through which the vertical shaft J revolves. At each side of this vessel is a slot corresponding with the depth of the salt mould F. H' is a cylindrical vessel, also surrounded by a non-conducting substance.

I is a hollow base upon which the cylinders H and H' rest, through the centre of which the upper portion of the vertical shaft rotates in a stuffing-box, and revolves in a bearing fitted in a bracket at the lower portion.

J is a vertical shaft or spindle for giving motion to the several parts attached to it.

K is a driving pulley.

LLLLL are stirrers having several corrugated blades, and fixed on to the shaft J.

M is a conical corrugated disc, upon which the knives which cut the salt are secured. This disc is fitted on to the shaft. By preference the knives are serrated, in order to increase their cutting surface.

F is the concentrated salt mould as described in connection with fig. 1.

N is a self-compensating lever for regulating the pressure of the salt upon the knives affixed to disc M. This lever is fitted with a balance weight, pulleys, and suspending chains.

OOOOO. These are hollow corrugated discs; three of which are flat, and two conical, and are connected by suitable pipes. The flat discs are fixed in the cylinder H at intervals, and the conical ones form a close joint against the cylinder. In lieu of these hollow discs, pipes coiled in spiral or other form may be used, the medium flowing through the pipes, and the salt and solution going over their surface; indeed we use these pipes by preference. Each of these coils is made to rest in a tray of sufficient depth, to insure their immersion. When we use pipes instead of hollow discs, we place them by preference parallel to each other and horizontally, the shaft passing through their centre in the same way as in the discs. When the pipes are used, brushes affixed to the stirrers are by preference employed to spread the salt and solution. These discs or coils may be increased or diminished in number or surface; the object being to cool fractionally, and thereby ensure that the vehicle or medium shall gradually give off its heat, and be enabled to leave the upper disc or coil at the temperature which the solution gives at that point, and which will be its extremest cold.

Nicolle & Mort's Concentrator, Refrigerator, and Temperator.

P is the water regulator, composed of an oscillating lever fitted at one end with a perforated vessel, and in the middle with a rod connected with the balance lever of the water delivery cock.

Q is a supply water pipe leading into the injector, fitted with the regulating cock, and immediately below the regulating cock is a stop cock.

R is a water injector. This is composed of a circular pipe fitted with several jets.

S is the ice and cold water box, and which is placed on an incline.

T is the temperature exchanger, composed of one or more pipes in one or more channels open or closed, made of good conducting material, by preference metal, and placed in other pipes or channels made of bad conducting material, by preference india-rubber, gutta-percha, or wood; the inlet or inlets to one or more of the pipes or channels being where the outlet or outlets of the other or others is or are. The object of this exchanger is to exchange temperatures between two liquids flowing in opposite directions without mixture of the liquids, and at the same time to reduce to a minimum the loss caused by radiation and conduction.

U is a salt cooler placed above the level of the refrigerator, in order to obtain gravitation power.

V is a distilled liquid tank; when nitrate of ammonia is used this liquid will be water.

MODE OF WORKING.

Having filled the tank Y with the distilled water obtained during the concentration, it will pass through the temperature exchanger T by gravitation, and rise after exchanging temperature with the spent liquor to the injector R. We now invert the mould F containing the solidified salt, and place it in its inverted position on to the shaft J, which latter passes through the hole in its centre, the ribs on the sides of the moulds fitting into the vertical slots of the cylinder H. In this position it rests upon the knives. We now hook the chains on to the mould, which brings the compensating lever N into a horizontal position, and so balances the mould as to ensure an equal and constant pressure on the knives during the process of cutting.

Water must be placed in the moulds fitted in the ice box S, and the refrigerating medium having been prepared, by preference, liquor of ammonia of a strength which will not congeal at the temperature required to be obtained, and the necessary connections having been made with the suction and delivery ends of the circulating pump, the pump is set in motion, and circulation takes place through the hollow discs or pipes, as indicated by the arrows on the plan, and thence through the rooms or troughs or spaces where the cold may be required to act. Where the cooling of the rooms or spaces by air is the object desired, the connections with the liquid pump must be removed, and the cooling medium withdrawn from the hollow discs, and connection made at same points with the air pump, fan, or other contrivance for forcing in air, the air being made to enter by the lower pipe and to pass out by the upper one. Much better results will however be obtained by cooling air by direct contact as in figure 4. We now cause the shaft J to revolve by the pulley K, which latter may be moved by hand or other motive power, and open the distilled water stop-cock underneath the regulator, which causes the water to flow from the distilled water tank V through the exchanger and the injector R, which latter causes it to divide to a spray, and to play against the face of the solidified salt, which, by the rotation of the disc M on to which the knives are secured, causes the salt to be cut or scraped into fine particles, which particles coming in contact with the spray, causes the first step to take place in the dissolution of the salt, and consequent production of cold. This mixture of salt and solution is carried by gravitation and current on to the conical disc M; the corrugations in which, fitting as they do into like corrugations on the lower portion of the cylinder, assisted by the rotatory motion, cause a continuous movement of the particles, and so promote further dissolution.

This solution and the undissolved particles of salt having attained their maximum degree of reduction of temperature, are now conveyed by the cone to the centre of the hollow disc O, where by the stirrer L they are spread and conducted to the outer rim of the disc, whilst by the circulation of the medium within the disc, heat is supplied, which causes further dissolution of the salt, and a consequent further reduction in the temperature of the circulating medium.

This process goes on as the solution and the salt pass over each of the hollow discs, meeting the medium as it ascends in an opposite direction.

The solution having reached the bottom disc is led through a pipe into the perforated vessel wherein any undissolved particles are arrested. The accumulation of this salt disturbs the equilibrium, and causes the regulating water cock to admit an increased flow into the injector by which an increased dissolution of the salt takes place, and so an exact adjustment of water and salt is secured. The solution having been strained through the perforated vessel, escapes into the ice and cold water box, where its cold is mainly absorbed; thence passing into the temperature exchanger T, it imparts the remainder of its cold to the water coming from vessel V on its way to the injector, the spent liquor itself passing through the salt cooler U, depositing itself at last in the solution tank E.

We may here mention that in the event of the ammoniacal solution employed by us in preference as our medium for carrying the cold passing by accidental leakage into the nitrate of ammonia solution, which we also use by preference, it will be necessary to restore the solution to its original condition by neutralizing the distilled water given off during evaporation by the addition of nitric acid, thus reforming it into nitrate of ammonia.

Having described fig. 3, with its *modus operandi*, we now proceed to give a description of the refrigerating apparatus as arranged for cooling air and other gases, by direct contact with the refrigerating agent.

FIGURE 4.

Those portions of the machine which are similar to those in fig. 3 are explained by the description given under that figure, and the other portion we now proceed to describe.

P. The salt regulator, but varied from that described in connection with fig. 3, as, in connection with the refrigeration of air, it is necessary to seal the delivery pipe in the strainer to an extent in excess of the resistance offered by the passage of air through the refrigerating plates, which will necessitate the delivery of the spent liquor being on the level marked in plan as P'

Nicolle & Mort's Concentrator, Refrigerator, and Temperator.

1 is the inlet pipe or channel through which the air is propelled. The outlet of this pipe is under the centre of the sealed dome in which the cold solution flows.

2 is a dome, on the upper portion of which is a cap into which the liquor from the upper plate falls, and as it rises above the edge of the cup overflows, meeting the current of air which passes through it, thus commencing its refrigeration of the air, and finally passing out by the pipe P into the ice box S.

33333333 are evaporating plates, each of them being minutely perforated over the whole surface, so as to allow a passage of air to be forced through them. A delivery pipe is fitted upon each at alternate ends, projecting upon the upper surface of the plate to the desired amount of seal or depth of liquid, say about $\frac{1}{2}$ inch; on the lowest plate is fixed a pipe immediately over the cup at the top of the dome 2. The plates may be increased or diminished in number or surface, as also the depth of seal.

4 is the exit pipe through which the refrigerated air passes to the space it is intended to refrigerate. In reference to the working of this portion of the apparatus, it is only necessary to say that air is forced in by the propeller at the inlet pipe 1, and goes out to do its work at the exit pipe 4, having passed through the various plates, and thus being fractionally refrigerated. The applications of the additional compartments for desiccating, purifying, deodorizing, as also for cooling, by evaporation of water, may of course be added to this apparatus, as in fig. 2, and the directions therein followed generally, and the pipes may be connected with the spaces to be acted upon at one end, and with the suction pipe at the other, by flexible or other tube or channel, or in either apparatus they may be made to draw from the outer air, and to discharge into the space to be acted upon. The use of the temperature exchanger must also be availed of to accomplish extreme cold, as in the domestic machine; indeed the temperature exchanger is the soul of the apparatus where intensity of cold is sought, and without loss of the cold which would otherwise be wasted. Although we have shown certain forms of vessels, &c., and arrangements of same, we do not confine ourselves to such forms or arrangements, as it is obvious that other forms and other arrangements might be employed, which would effect the same purposes, but, by preference we use them as shown in the plan and described in the specification. Some of the vessels might be avoided, as in the evaporator for instance, but only at a loss of economy; and where desiccation or purification was not the object, the chloride of calcium and lime chambers for instance might be left out, and in lieu of the well A, a simple vessel might be substituted to hold the cooling agent into which the air was propelled, but of course the same advantageous results would not be ensured at all points. It is necessary to be understood that the whole of the vessels or pipes which come in contact with the salts employed must be made of material which will not be affected thereby; by preference we use pure tin or enamelled iron.

We would mention that although we have only spoken of using moulded salt in the vessels described in figs. 3 and 4, loose crystallized salt may be used, by removing the mould F and substituting a feeder or other form of salt distributor. In the evaporator also we speak of evaporating to a point at which the salt will solidify in the mould, but our evaporator is equally applicable to the making of the ordinary crystallized salt, by drawing off the evaporated liquor at an earlier stage into cooling pans.

We may mention also that when we use our apparatus on board ship, we place it by preference on a swinging floor, so as to overcome the oscillations of the vessel, connecting it with the place or spaces to be cooled by flexible pipes or tubes.

Having described under each figure our several machines and the mode of working the same, we would have it understood that what we claim is the general arrangement of the several machines substantially as herein described and set forth, separately or in combination, and we specially claim:—

1st. The concentration of salt, such as nitrate of ammonia under vacuum, whereby we obtain the following advantages:—

- 1st. We avoid the production of mother liquor.
- 2nd. We evaporate with rapidity without risk of loss of component parts; this latter being due to the low temperature at which we work, as compared with that at which the same point of concentration could be reached in open pan in same time without loss.
- 3rd. We obtain reduction of bulk to its minimum upon cooling.
- 4th. Absorption of moisture after consolidation is mainly prevented, owing to the comparatively small surface exposed.
- 5th. The full refrigerating power of the salt is secured.
- 6th. We recover the whole of the salt in solution in condition for immediate use, *i.e.*, in those solid blocks or forms suited to our requirements.

2nd. The use of concreted or consolidated salt in connection with the reduction of cold in shapes or blocks, or other consolidated form, resulting from the concentrated liquor being run into shapes or moulds after concentration whilst in a state of fusion.

3rd. The use of dilute liquor of ammonia as a medium for conveying the cold to the rooms or spaces to be acted upon when nitrate of ammonia is employed; as, in case of leakage, we prevent the introduction of any foreign agent which might decompose the salt, and so interfere with the refrigerating power, and by neutralization with nitric acid we convert the fluid which has got in by leakage into nitrate of ammonia itself.

4th. The arrangement for refrigerating liquids, as also air and other gases, by fractional cooling, by passing it through a series of (by preference horizontal) sealed perforated plates or discs or coils, the liquids in the discs or coils, and the air and other gases meeting the cooling agent at the bottom at its warmest, and gradually ascending, and as they ascend being as gradually cooled, passing out at the top where the refrigerating agent is the coolest.

5th. The temperature exchanger T which enables us to exchange the temperature of two liquids with the minimum of loss arising from radiation and conduction.

W. EDYE MORT,

(For EUGENE DOMINIQUE NICOLLE and THOMAS STUTCLIFFE MORT).

Sydney, N.S.W., Dec. 24, 1875.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 6 January, 1876.

In the matter of the application of Messrs. Nicolle and Mort for Letters of Registration for an invention styled a "Concentrator, Refrigerator, and Temperator," which has been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,
J. SMITH,
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

A.D. 1876, 20th January. No. 504A.

PROCESS FOR THE PRESERVING AND TREATING OF MEAT, &c.

LETTERS OF REGISTRATION to Henry Baldock, for a process for the preserving and treating of Meat and all animal substances or matter.

[Registered on the 22nd day of January, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS HENRY BALDOCK, of Sydney, in the Colony of New South Wales, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of a "Process for the preserving and treating of Meat and all animal substances or matter," which is more particularly described in the specification which is hereunto annexed; and that the said Petitioner hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Administration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons, appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Henry Baldock, his executors and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof, to have, hold, and exercise unto the said Henry Baldock, his executors, administrators and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Henry Baldock shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this 20th day of January, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Process for the preserving and treating of Meat, &c.

SPECIFICATION.

THE invention consists in treating meat, hides, fish, flesh of animals and birds, butter, lard, tallow, fat, and any other animal matter whatever, in order to the preservation for food, or for any other purpose, and generally for the prevention or arresting of putrefaction, fermentation, or decay in such animal matter, by applying boric or boracic acid dissolved in water, the effect of such application being that such animal matter as aforesaid is preserved, and putrefaction, fermentation, or decay prevented or arrested.

What is claimed and desired to be secured as this invention, is the exclusive use of boric or boracic acid, or any other borate or matter of which boron or oxide of boron forms a part, for any of the purposes herein set forth.

HENRY BALDOCK.

This is the specification referred to in the annexed Letters of Registration granted to Henry Baldock, this twentieth day of January, A.D. 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 26 August, 1875.

In the matter of the application of Messrs. Henry Baldock and Frederic King, for Letters of Registration for a "Process for the preserving and treating of Meat and all animal substances or matter," which has been referred to us, we have examined the specification accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration, as prayed for.

We have, &c.,

J. SMITH.

CHAS. WATT.

IMPROVEMENTS IN DREDGING-BOATS, &c.

LETTERS OF REGISTRATION to Ernest Bazin for improvements in Dredging-boats or Apparatus for rapidly and economically extracting the mud, ooze, and sand from the river, &c.

[Registered on the 4th day of February, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS ERNEST BAZIN, of the City of Paris, in the Republic of France, civil engineer, and Chevalier of the Legion of Honor, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for improvements in dredging-boats, or apparatus for rapidly and economically extracting the mud, ooze, and sand from the river or even at great depths at distances from the shore or in the midst of the sea from foulered vessels or ships which are to be recovered, whether for dredging or cleansing ponds, canals, watercourses, or for the maintenance of straits, ports, harbours, or havens, or for the extraction of auriferous or metallic sand and so on in fixing tubular piles of bridges, or in other hydraulic or excavating operations, which said invention is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Ernest Bazin, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Ernest Bazin, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Ernest Bazin shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantage whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this third day of February, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Dredging-boats, &c.

SPECIFICATION of ERNEST BAZIN, of the City of Paris, in the Republic of France, civil engineer and Chevalier of the Legion of Honor, of an invention for "Improvements in dredging-boats or apparatus for rapidly and economically extracting the mud, ooze, and sand from the river or even at great depths from the shore or in the midst of the sea from foundered vessels or ships which are to be recovered, whether for dredging or cleansing ponds, canals, watercourses, or for the maintenance of straits, ports, harbours, or havens, or for the extraction of auriferous or metallic sand and so on, in fixing tubular piles of bridges, or in other hydraulic or excavating operations.

NOW KNOW YE, that I, the said ERNEST BAZIN, do hereby declare the nature of the said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement or specification and drawings thereof (that is to say) :—

THE object of this invention is the "Improvements in dredging-boats or apparatus for rapidly and economically extracting the mud, ooze, and sand from the river or even at great depths at distances from the shore or in the midst of the sea from foundered vessels or ships which are to be recovered, whether for dredging or cleansing ponds, canals, watercourses, or for the maintenance of straits, ports, harbours, or havens, or for the extraction of auriferous or metallic sand and so on, in fixing tubular piles of bridges, or in other hydraulic or excavating operations.

This I effect by establishing at the bottom of the hold of a floating body or dredging-boat, a water entry, thus creating an hydraulic pressure or a natural force, the result of the difference of level between the floating line and the water entry, and providing that water entry with a tube long enough to reach the bottom of the sea or other water; when an admitting tap is opened, the water enters the vessel charged with sand, mud, or slime, as the case may be, a current being established in the interior of the tube by the head of water. The rapidity of ascension of the current will be regulated by the height and diameter of the tubes as well as by the differences of the levels of the water line of the vessel and that of the orifice of entrance of the liquid into the interior of the vessel. This is a unique form admitting naturally and gratuitously of dredging and raising the mud, ooze, and sand from any depth and depositing it in the bottom of the boat, when it is discharged to any convenient place by aid of rotary pumps or other efficient means or engines which receive the mud and sand directly from the water entries, and possessing on account of being placed below the floating line the advantage of the action resulting from the hydraulic pressure.

Having now explained the nature of my invention, I will proceed to describe it more fully by aid of the accompanying drawings.

Fig. 1 and 2 represent a dredging vessel fitted for and destined to remove mud and sand and gravel.

Fig. 1 is a longitudinal view, and fig. 2 a plan showing the arrangement and position of the various organs or parts contributing to the dredging.

Fig. 3, 4, 5, 6, 7 show the various forms and shapes of the pipes forming the nozzle or commencement of aspirating tube.

On each side of the vessel and below the water level or line I pierce the wall or hull of the vessel with two holes which constitute my water entries. In these holes the tubes *aaaa* pass and are solidly fixed to the boat and in the hold are connected with the rotary pump *pppp* and outside are firmly united to the frame *bb*.

In certain cases I cause the tubes *aaaa* to penetrate the boat by making them traverse a stuffing box which gives them the facility of turning on themselves a little.

A lifting machine, crane, or otherwise arranged on the deck, supports the tubes *aaaa* and facilitates their displacement.

The tubes *aaaa* are connected parallelly at their other ends to the suction tubes.

A desaggregator D sometimes works at the forepart of the vessel and may be lifted or lowered from a lifting machine, crane, arranged on the deck or otherwise.

The rotary pumps *pppp* which are in direct communication with the tubes *aaaa* are established in the hold of the vessel, but they may be fixed at the same level outside the boat or against a pile or wall or other support.

In this case it is unnecessary to pierce the hull, for in uniting them directly with the conduits *aaaa* a benefit is also gained by the hydraulic charge or pressure as in the first case, the pumps only have to convey away the matter conducted to the pipes *aaaa* by the natural effect of the hydraulic charge existing on the water entries; the tubes *hhhh* empty the mud and ooze either in boats or barges or on the banks of the river; in a word, in any suitable direction by lengthening the tubes.

If the discharge is made in barges, they are provided with valves easily worked by windlasses placed on the deck and which allow the barges to be rapidly emptied.

The rotary lift and force pumps *pppp* or other system are actuated by the propelling machine as shown in the drawings or by a separate motor disposed in the same manner to cause them to work together or separately by isolating the one from the other by the valves *kkkk*.

I have mentioned that these pumps are lift and force pumps as by reason of their connections with the tubes *aaaa*. I can in certain cases assist the delivery of these conduits by a suction which in no manner interferes with the ascensional action of the tubes *hhhh*.

For any stuff to be dredged, I reserve to myself the right of employing special organs; whether those designed fig. 3, 4, 5, 6, 7, or others that practice may suggest. As will be seen in fig. 3, 4, 5, 6, 7, I provide every sucker with longitudinal apertures, the object of which is, by allowing the pure water to be sucked even when the openings of tubes *aaaa* are obstructed to prevent these tubes *aaaa* being choked at their entry by the stuff, the result either of the consistency of the fluid or of the imbedding of the tube in the sand.

By the examples of these suction tubes I wish to show as much as possible the practical means which produce good results, but I reserve to myself the right of employing them separately or in combination in any desirable manner.

Having

Improvements in Dredging-boats, &c.

Having now described the nature of my said invention and in what manner the same is to be performed, I declare that I claim:—

Firstly.—The improvements in boats and apparatus as and for the purposes set forth, and substantially as shown in the drawings.

Secondly.—The application of the hydraulic pressure or head of water to dredging or to the raising of stuff or materials lying at the bottom of the water by means of one or several tubes of which the inferior extremity is in contact with the bottom, and the top end is connected with centrifugal or other pumps placed beneath the surface of the water and which expulse as a force pump the substances brought to them by the rapid ascending current produced by this head of water.

Thirdly.—The employment at the ends of tubes either a flexible pipe or nozzles (according to the case), having openings, slots, or apertures, the form of which may be variable and by which the clean water may be sucked into the pipes so as to prevent obstruction as described.

Fourthly.—The employment of a desaggregator kind of cylinder provided with teeth, actuated with a rotary motion, and proceeding the suction tubes, thus preparing the ground by desaggregating the soil so as to render more easy the absorption or suction of the rubbish or stuff as set forth.

Paris, this seventeenth day of September, one thousand eight hundred and seventy-five.

ERNEST BAZIN.

IMPROVEMENTS IN LOCOMOTIVE ENGINES, &c.

LETTERS OF REGISTRATION to Henry Handyside, for Improvements in Locomotive Engines, and in Apparatus for accomplishing the safe ascent and descent of steep inclines, and for facilitating the passage of sharp curves.

[Registered on the 9th day of March, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS HENRY HANDYSIDE, of Saint John's Wood, in the County of Middlesex, England, engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Locomotive Engines and in Apparatus for accomplishing the safe ascent and descent of steep inclines, and for facilitating the passage of sharp curves," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Henry Handyside, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Henry Handyside, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always that if the said Henry Handyside shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of March, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Locomotive Engines, &c.

SPECIFICATION of HENRY HANDYSIDE, of St. John's Wood, in the County of Middlesex, England, engineer, for "Improvements in Locomotive Engines and in apparatus for the accomplishing the safe ascent and descent of steep inclines and for facilitating the passage of sharp curves."

THIS invention relates to certain peculiar constructions and arrangements of Locomotive Engines and apparatus to be applied thereto and to the carriages or waggons of a train, whereby the safe and easy ascent of trains up steep inclines is accomplished and their passage round sharp curves is facilitated. According to this invention the locomotive engine is coupled to the train or other load to be hauled up an incline by a rope or chain which is wound on a drum mounted in the framing of the engine. The axis of this drum is placed horizontally, and is driven or rotated direct or by gearing from a separate pair of cylinders distinct from the cylinders which propel the engine along. On each side of the engine framing, and on each side of one or more carriages or waggons of the train, there is or are suspended one or more self-acting gripping struts, which when let down on to the rails by the driver or other person in charge of the train will firmly grip the sides of the rails and hold the engine or train or portion of the train stationary on any part of a steep gradient. I prefer to construct these struts each of two iron arms, the upper ends of which are made with one eye for the purpose of suspending them from the most convenient part of the engine or waggon, and the lower ends of the said arms are fitted into or over the side-plates of the shoe and secured thereto by a through bolt; these side plates are also fitted with a number of steel or iron links, the other ends of which are likewise joined together with a steel or iron bolt passing through the whole number of links. On lowering the free end of the strut, which should project downwards at an angle contrary to the direction in which the train is travelling, the jaws of the struts immediately grip the opposite sides of each rail, and effectually prevent any retrograde motion of the engine or carriages when on a steep gradient. On arriving at the foot of a steep incline the engineer will release the hauling drum on the engine and will, without stopping or retarding the engine, run it up the gradient to any desired distance, having previously lowered the arresting struts. On stopping the engine the struts immediately come into action and maintain the engine firmly in its place. The hauling drum is now started (the rope or chain having been paid out as the engine ascended), and the entire train, or any part of the train, is hauled up by the sole power of the cylinders which work the winding-drum. The struts on the train act as before described to prevent any retrograde motion thereof when required, or in case of an accident to the hauling apparatus they also allow the engine to start again without the train and complete the ascent of the incline, the train being then hauled up after it by the winding-drum as hereinbefore described.

And in order that my said invention may be fully understood I shall now proceed more particularly to describe the same, and for that purpose shall refer to the several figures on the annexed sheet of drawings, the same letters of reference indicating corresponding parts in all the figures.

Figure 1 of my drawings represents a side elevation partly in longitudinal section of so much of a locomotive engine as is requisite to illustrate the application of my invention thereto.

Figure 2 is a plan of a portion of the same corresponding to figure 1. Figure 3 is a rear end elevation of the engine, and figure 4 is an enlarged detail of a self-acting gripping strut constructed in accordance with my said invention.

According to my invention I couple the locomotive engine to the train or other load to be hauled up an incline by a rope or chain, A, which is wound on a drum, B, mounted on a framing, CC, of the engine. The axis or shaft, D, of this drum works horizontally in bearings at *aa*, in the main framing, and is driven or rotated direct or by gearing as found most convenient from a separate pair of cylinders, EE, distinct from the usual cylinders which drive the locomotive in ordinary cases. These cylinders, EE, may be secured to any convenient part of the locomotive and transmit a rotary motion to the gear shaft, J, by connecting rods, FF, coupled to cranks, GG, secured to the ends of the gear shaft as clearly shown in figures 1, 2, 3, or coupled to the shaft of the drum direct. The drum or windlass barrel if driven direct is loose upon its shaft and is coupled therewith when required for hauling purposes by means of a sliding clutch provided with projections or teeth by preference inclined or bevilled off at the back, which teeth engage into corresponding holes or recesses in the end of the drum.

Or if driven by the gearing, K, the clutch is made to engage into recesses in the side of the pinion as shown at M.

A clutch lever, N, shown in my drawings, which should be conveniently placed to the hand of the driver, is provided for throwing the hauling drum into or out of action as required.

If the drum is driven direct the circumference of one or both flanges or end plates of the drum should be made to receive a powerful brake strap applied by a lever or screw power. But in the arrangement shown in the drawing, in which the drum is represented as driven by gear wheels, the driver may release or retain the drum by a brake strap on the pinion barrel. The eccentrics and eccentric rods for working the valves of the cylinders, EE, may be mounted on the shaft of the drum or on the gear shaft, J, as required. On each side of the engine framing, and also on each side of one or more of the carriages or waggons of the train, there is or are suspended one or more self-acting gripping struts, L, shown detached in the enlarged detail view. Figure 4, which when let down on to the rails, *g*, by the driver or other person in charge of the train will firmly grip the sides of the rails and hold the engine or train or portion of the train stationary on any part of a steep gradient. I prefer to construct these struts each of two iron arms, *hh*, hinged at their upper ends at *ii*, to the main framing of the engine or waggon, and having their lower ends made to fit into or over the side pieces of the shoe, O, and retained by a through bolt, P, which gives the side pieces a certain amount of play. Into the lower part of each side piece are fitted curved links, *kk*, and these links are hinged to the side pieces, and to each other with through bolts, *mm*, of steel or iron.

To the heel of each side piece is attached one end of a connecting rod, Q, the other end of which is attached to short lever arms, RR, mounted on a through rocking shaft, S; on this rocking shaft there is keyed a longer arm, T, which receives the screw of the upright screw brake shaft, U, the upper end of which is fitted with a special arrangement in the form of a tube, V, which enables the brakeman to hold or release the struts at will. On lowering the free end of the strut, which should project downwards at an angle of rather less than 45°, and in a direction contrary to the direction in which the train is travelling,

Improvements in Locomotive Engines, &c.

travelling, as shown in figure 1, the jaws, *kk*, of the struts immediately grip the opposite sides of each rail, and effectually prevent any retrograde motion of the engine or carriages when on a steep gradient. On arriving at the foot of a steep incline the engineer will release the hauling drum on the engine, and will without stopping the engine run it up the gradient to any desired distance, having previously lowered, by the means of the brake screw shaft, *S*, the arresting struts, *JL*.

On stopping the engine the struts immediately come into action, as shown in figures 1, 3, and 4, and maintain the engine firmly in its place.

The hauling drum, *B*, is now started by throwing the clutch, *M*, into gear therewith (the rope or chain, *A*, having been paid out as the engine ascended), and the entire train is hauled up by the sole power of the cylinders, *EE*, with the winding drum.

The struts on the train similar to those shown at *L* act as before described to prevent any retrograde motion thereof when required, or in case of an accident to the hauling apparatus, they also allow the engine to start again without the train, to take another length of the incline, and so on until the complete ascent of the incline has been effected,—the train being hauled up by the engine by the aid of the winding drum as hereinbefore described.

On descending steep inclines the grip may be used as a brake, and to provide for wear the three bearing surfaces of the grip are fitted with renewable plates made of malleable cast iron, or of any other metal which may be found effective for braking purposes.

On level sections, or on comparatively light gradients, the locomotive acts precisely as an ordinary locomotive engine. It is obvious that this arrangement of hauling drum and separate winding engine carried on the framing of the locomotive will also be found most serviceable in facilitating the hauling of heavy trains by light locomotive engines round sharp curves.

In order to prevent exposure and consequent injury to the tubes and fire-box roof by reason of the displacement of the water level when ascending or descending steep inclines, I provide two steam domes or chambers on the top of the boiler at or near the opposite ends thereof, and I connect these two chambers by what I designate an "equalizing" steam pipe, opening at both ends into the said chambers, but I make no claim separately to the said equalizing steam pipe. The water level should stand sufficiently high in the said chamber to admit of the displacement caused when ascending or descending the steepest gradient without exposing the boiler tubes or roof of the fire-box. The steam, as fast as it is generated, enters either or both these chambers, and its pressure in both is equalized by the before-mentioned equalizing pipe, or a large-sized steam dome, *W*. Figure 1, placed on the centre of the boiler, may be employed in lieu of the two steam domes before-mentioned, as it has the advantage of being a simpler arrangement than the latter.

The steam-pipes for supplying the cylinders of the locomotive engine and of the winding engine may be connected with either or both the said chambers, as found most convenient, in practice or from the centre dome, *W*, as in the arrangement shown in the drawing.

CLAIMS.

- 1st. The combination with any ordinary locomotive engine of a separate and distinct cylinder or pair of cylinders for driving either direct or through the intervention of gearing a winding drum mounted in the framing of a locomotive engine, in conjunction with self-acting gripping struts, the whole being arranged and caused to operate together substantially in the manner and for the purpose hereinbefore described, and illustrated by the drawings annexed.
- 2nd. The construction and use of self-acting gripping struts made with hinged jaws which grip the top and two sides of a rail substantially in the manner and for the purpose hereinbefore described, and illustrated by figure 4 of the drawings annexed.

In witness whereof, I, the said Henry Handyside, have to this my specification set my hand and seal this twelfth day of October, one thousand eight hundred and seventy-five.

HENRY HANDYSIDE.

Signed and sealed in the presence of HENRY L. JONES, Kensington Villa, Stapleton Road, Bristol.

This is the specification referred to in the annexed Letters of Registration granted to Henry Handyside this seventh day of March, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 8 February, 1876.

The application of Mr. Henry Handyside for Letters of Registration for his invention for "Improvements in Locomotive Engines and in apparatus for the accomplishing the safe ascent and descent of steep inclines and for facilitating the passage of sharp curves," having been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report that we see no objection to Letters of Registration being granted as desired.

We have, &c.,

JOHN WHITTON.
GOTHER K. MANN.

THE PRINCIPAL UNDER SECRETARY.

IMPROVEMENTS IN MACHINERY FOR WORKING AND LOADING COAL, &c.

LETTERS OF REGISTRATION to William Firth for Improvements in Machinery for working and loading Coal, and for sinking shafts or pits, and for driving or cutting tunnels.

[Registered on the 9th day of March, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS WILLIAM FIRTH, of Burley Wood, near Leeds, in the county of York, England, Esquire, hath by his humble Petition represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Machinery for working and loading Coal, and for sinking shafts or pits, and for driving or cutting tunnels," which is more particularly described in the specification marked A, and the seven sheets of drawings marked B, C, D, E, F, G, and H, respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty-Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said William Firth, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said William Firth, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said William Firth shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court of the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of March, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Machinery for working and loading Coal, &c.

A.

SPECIFICATION.

TO ALL TO WHOM IT MAY CONCERN: BE it known that I, WILLIAM FIRTH, of Burley Wood, near Leeds, in the County of York, England, Esquire, am in possession of an invention for "Improvements in machinery for working and loading coal, and for sinking shafts or pits, and for driving or cutting tunnels," and I, the said William Firth, do hereby declare the nature of the said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement thereof, that is to say:—

THIS invention has for its object improvements in machinery for working and loading coal, and for sinking shafts or pits, and for driving or cutting tunnels.

In order to give a self-acting forward motion to coal cutting machines in which the cutter receives a reciprocating motion from an air-engine, I lay a chain or rope along the line of work and fix it at both ends, I mount chain wheels on the machine to gear with the chain, and these chain wheels are driven by a ratchet wheel on the axis of one of them acting with a pawl which receives a to-and-fro motion.

The forward motion of the machine takes place when the cutter is out of the coal, but only when the cutter at the previous stroke has penetrated to the full depth, as it is during the last portion of the effective stroke that the pawl is drawn back sufficiently to take another tooth of the ratchet.

Figures 1 and 2 show a machine for working coal, arranged according to my invention.

a, a^1, a^2 , are the frame and other parts of the machine; they are mounted upon a pair of axles bb , which have at their ends the eccentrics b^1b^1 , and flanged wheels c are mounted upon the eccentrics; dd are the rails upon which the machine stands. The height of the frame from the rails can be varied by turning the axles b , which for this purpose are provided with arms b^2b^2 , coupled together by connecting rods, ee . On one side of the machine the connecting rods ee carry a trunnion-nut f , and a screw f^1 which works with the nut is held by a bracket a^1 projecting from the side of the cylinder a^2 . The cylinder a^2 is furnished with a piston and piston rod g , to which the crosshead h is fixed. At the fore corners of the frame are mounted the levers ii , by which the motion of the piston rod is communicated to the pick; these levers turn upon fixed axes i^1i^1 , and one only of them is in use at a time. The lever which is in use is connected with the piston rod by a double connecting rod k ; there are two holes in the lever either of which may receive the joint pin according to the angular position in which it is desired that the pick should work. Each lever i has a square boss upon it to receive the pick box or socket l , which is rendered fast upon it by the key l^1 . The pick box may be placed on the square in different positions, and so a further control is obtained over the position of the arc in which the pick works. The pick box may also be put on either way up, and so further control is obtained of the height of the pick. h^1 is a swivelling pin on the cross head h , through it the lever m passes. This lever is fixed on an axis m^1 which has an arm m^2 . The connecting rod n is jointed to the arm m^2 , and this at its further end is jointed to links o^1o^2 . The link o^1 is connected with the arm p , which is on the axis of a semirotary valve which controls the admission and exhaust of compressed air to and from the cylinder a^2 . The link o^2 is connected with the arm q^1 on the hand lever q , so that by shifting the hand lever the rod n and link o^1 can be thrown into a more or less inclined position, thereby altering the position of the valve in relation to the piston so as to obtain an earlier or later exhaust as may be required. The axis m^1 is provided with another arm m^3 which through the rod r actuates the lever s carrying the pawl s^1 . This pawl works with the ratchet wheel t , taking a fresh tooth each time that the piston reaches the outer end of its stroke and the pick strikes home.

On the axis of the ratchet wheel t is a bevelled wheel t^1 , gearing with a pinion u . The pinion u has on its axis a hand wheel u^1 , and also a worm u^2 . The worm drives a worm wheel v , and gives motion to a chain wheel v^1 on the same axis. This wheel is cupped on the periphery to receive the links of a chain the ends of which are securely fixed before and behind the machine. ww are guide pulleys for the chain; they keep it in contact with the wheel v^1 around the greater part of its circumference. x is the hand lever which actuates the starting valve.

Sometimes I find it necessary after the pick has penetrated to the full depth into the coal to allow the machine to travel a short distance backwards, so that the pick may the more easily release itself from the bed of the coal.

I construct the pick with movable cutters having stems entering into sockets, and there secured by binding screws which are inserted in such a direction as to lie in the cut or groove.

This method of securing the tools allows of the groove in the coal being cut narrower than heretofore, and no wider than is requisite to admit the stem of the tool and a socket of adequate strength. I sometimes make the cutting tools with points of a V form.

Figure 2^a is a side elevation, and figure 2^b is a front elevation, showing the pick and cutting tools which I employ—other detail views are also shown; a is the pick box, b the pick arm, b^1b^1 the tool sockets, and c the cutting tools. dd are the binding screws.

To work coal by drilling, and afterwards pressing or forcing it down, I employ an air engine mounted on a carriage running on rails parallel to the working face. On the carriage is a standard constructed in the manner of a screw-jack. When the machine is in operation this standard is jammed against the roof of the working. In the head of the standard, as close to the roof as is convenient, are bearings in which a ratchet brace is mounted. In the socket of the brace a drill cutter is placed; it is turned and fed forward into the coal by levers connected with the cross head of the piston rod. The levers thus receive a pendulous motion, and they carry pawls working with the ratchet pinions of the brace. The two ratchet pinions are rotated at a somewhat different speed, and as the one gives motion to a nut and the other to a screw, the forward feed motion is obtained.

Drills of different lengths are employed to complete the whole to its full depth.

Figure 3 is a side elevation, figure 4 is an end elevation, and figure 5 is a plan of a machine constructed according to my invention for drilling coal.

a is a frame of the carriage mounted on four wheels b running on rails c . d is a standard in construction like a screw-jack so that its head can be jammed fast against the head of the working. The head

Improvements in Machinery for working and loading Coal, &c.

head carries a screw *e* with a socket at the end to receive the drill *f*. The screw with the drill can be rotated and advanced after the fashion of a ratchet drill. The screw passes through the sleeve *g*, which is rotated by a ratchet pinion and a pawl and lever *h*.

There is a longitudinal groove in the screw and a feather within the sleeve, so that the screw is compelled to rotate.

The screw also passes through the nut *i*, which is similarly rotated by a ratchet wheel, pawl, and lever *k*, but at a slightly different speed from the screw, so that the drill receives a slow forward motion. The levers *h* and *k* take their movement from an air engine *l* upon the carriage. *l'* is the fly wheel and eccentric shaft of the air engine.

To press down the coal I employ an hydraulic apparatus consisting of a tube made in two lengths screwed together, and of a size to enter the hole produced by the drilling machine. The portion of the tube which penetrates to the bottom of the hole contains water, and receives a plunger which enters through cupped leathers, and can be forced forward by a screw acting with a nut formed within the outer end of the plunger which is hollow and receives the screw within it. The outer length of the tube which forms a guide for the plunger (in which it can slide, but is prevented from turning) carries the bearing and abutment for the screw. The stem of the screw receives on its outer end a ratchet pinion and a hand lever and pawl by which it can be rotated, and so the plunger is forced forward and pressure is applied to the water contained in the inner end of the tube. This portion of the tube terminates in a chamber in the side of which are three holes in which three small rams working through cupped leathers are fitted. These are forced outwards as the plunger enters and by the pressure which they apply to the side of the hole the coal is forced down. The rams receive cap pieces to distribute their pressure over a sufficient area of the coal, and these cap pieces can be readily changed to adapt the machine to work in holes of varying sizes.

Figure 6 is a longitudinal section, quarter size, of hydraulic pressing down apparatus constructed according to my invention. The barrel of the apparatus is made in two lengths screwed together at *a*, and cupped leathers *b* are inserted in the joint. The ram *c* works through the cupped leathers *b*. *d* is a chamber formed at the end of the portion of the barrel which penetrates to the bottom of the hole. Into the side of the chamber *d* the small rams *ee* are inserted, they work through cupped leathers. The chamber *d*, and the portion of the barrel on which it is formed, are filled with water or other liquid so that when the ram *c* is forced forward the pressure is conveyed by the liquid to the portion of the side of the hole against which the caps on the plungers *e* abut.

The ram *c* receives within it the screw *f*, which although free to rotate is securely held in the outer end of the barrel of the apparatus, the screw having upon it a collar which is confined by a screw cap *h*, as the drawing shows. On the outer end of the stem of the screw a ratchet pinion is fixed, and motion is given to it by a hand lever *i*, free to turn on the screw stem and carrying a pawl which engages with the teeth of the ratchet wheel.

For sinking shafts or pits, and for driving or cutting tunnels, I employ a mining machine. This machine consists of a carriage on which is mounted a compressed air-engine giving motion about an axis to a pick so as to cause it to strike upon the working face of the rock. In applying such a machine for sinking shafts or pits I mount it upon a circular table with guide rails upon it. The machine is able to travel around the table, and as it travels it cuts a circular ditch or groove. In order that it may do this the machine is so made that the pick arm works in a vertical plane on the outer side of the machine.

The table is suspended by tackle by which it, with the machine upon it, can be lifted and lowered at pleasure. Before setting the machine to work the table is lowered to the bottom of the pit or shaft, brought to a level bearing and wedged or otherwise secured so that it cannot shift. The circular ditch or groove is then cut by the machine as already described, isolating a central block of rock. The table with the machine upon it is then lifted, and the central block is blasted from a central hole, or from several holes if necessary. In this operation there is no risk of shattering the rock forming the wall of the pit, as must occur more or less where blasting is carried on without first isolating the mass to be blasted.

When the debris has been cleared away the table is again lowered and secured and the machine set in operation, so the work goes on.

A tunnel of circular section may be produced in a similar manner, the table being then set upright and being furnished with appliances to hold the machine upon the guide rails in the altered position. Where, as will generally be the case, the form which it is desired to give to the tunnel is not circular, I make the upright table or shield to the form required, and to be able to work into the angles I arrange the machine so that it can work either right or left handed, or separate machines may be employed. The floor of the tunnel may be cut by machines similar to my mining machine hereinbefore referred to.

In some cases to produce circular tunnels, pits, or shafts, I employ a machine which can turn around a central pivot, and which acts with a pick producing a ditch or groove, isolating as in the former cases a central block, which is then blasted.

I sometimes dispense with the use of the pick and use the direct force of air or other fluids.

Figure 7 is a section of a pit in process of being sunk by machinery arranged and combined according to my invention.

aa are circular rails fixed upon a strong table somewhat smaller in diameter than the pit. The table rests when at work on the bottom of the pit, or on chocks inserted to give a more level bearing.

The mining machine consists of a carriage *b*, mounted on wheels running on the rails *a*, and there are also claws not shown in the drawing which descend beneath and hold the machine down to the rails. *c* is a compressed air engine on the bed of the machine giving motion by means of a connecting rod to a lever on the horizontal shaft *d*, on which is fixed the pick *e*. An elevation of a portion of the construction is shown at figure 8. The valve of the engine is arranged and worked as in the machines which cut horizontally, and the forward motion is obtained by rotating one or more of the carrying wheels by means of a worm and worm wheel. If desired one of the rails and one of the carrying wheels may be cogged on the face.

When the circular ditch has been cut to the required depth the table is lifted by means of the winding apparatus at the surface and the isolated central block is broken up by blasting or otherwise. Only small blasting charges will be required.

Figure

Improvements in Machinery for working and loading Coal, &c.

Figure 9 is a horizontal section, figure 10 is an elevation, and figure 11 is a transverse section of another arrangement, differing from that above described, in that the mining machine works beneath the table which is carried by beams let into the sides of the pit; jam screws pressing against the pit sides are also employed to steady the table, as is seen in figure 11, as beforementioned. A circular tunnel, either horizontal or inclined, may be cut by means of similar mechanism, the table then being set up on edge.

Figure 12 is a side elevation and figure 13 a rear elevation, both partly in section of tunnelling machinery adapted to cut a large tunnel of ordinary form. *a* is the table or shield built of wrought-iron; it is carried upon two pair of wheels *bb* running on rails *cc*, one on either side. The rails are mounted upon girders which are fixed upon the lining of the tunnel, the table or shield is suspended from the wheels *b* in such a manner that it can be raised and lowered at pleasure to give to the mining machines *dd* a command of every portion of the working face.

In addition to the machine or machines *d*, which cut the sides of the tunnel, are other machines *d*¹, traversing on horizontal guides across the shield to groove the face at such intervals as may be considered desirable; the lowest machine of this series cuts the floor of the tunnel. The machines are all supplied by flexible tubes with air under pressure drawn from an air main. Figure 14 is a side elevation. Figure 15 is a plan. Figures 16 and 17 are end elevations of a machine for cutting small tunnels or headings by means of a machine which can be carried around a central pivot. The machine shown is adapted to cut a square heading, but it will be obvious that a machine of similar design, but simpler construction, may be made to cut a circular heading, or a shaft, or pit. *a* is a heavily loaded waggon with the stiff shaft *b* projecting from it in front. Around the shaft *b* the table *c* can be rotated by means of a worm and worm wheel, not shown in the drawings. On the table is a slide *d*, it can be traversed by means of a hand wheel and screw *e*. The slide carries an air engine working a pick *f*, which can be set to work either about the centre *g*, as the drawings show, or about the centre *h*. Thus the pick can be made to operate either to the right or left hand. Each side in turn is worked as far as the pick can get at it without being taken out and reversed, the traverse or feed motion being given by means of the screw *e*, and the change from side to side by rotating the table *c* about the shaft *b*. When each side of the heading has been partly cut the pick is reversed and the cutting is finished, the waggon and machine is then drawn back and the isolated block is wedged down or otherwise removed. For a circular heading or pit a similar rotating motion about the shaft *b* will suffice without the table *c* and slide *d*.

In loading coal into railway waggons from a screen or shoot, in order to obviate or lessen the fall into the waggon, I raise and incline the platform on which stands the waggon into which the coal is being loaded by hydraulic or other mechanism. As the waggon fills it is lowered, and so the fall from the lower end of the screen or shoot into the waggon is obviated or lessened.

Figure 18 is a front elevation and figure 19 is a side elevation of the apparatus I employ. *a* is the lower end of the screen or shoot. *b* is the railway waggon. *c* is the platform on which the waggon stands; it is able to turn about trunnions *c*¹. *d* is an hydraulic cylinder the ram of which sustains the platform on one side.

When the empty waggon is first brought under the shoot it is tipped by admitting water under pressure into the hydraulic cylinder until it assumes about the position indicated by the red lines, and as the waggon fills the water is gradually drawn off from the cylinder until the waggon again stands upright.

Having thus described the nature of my said invention, and the manner of performing the same, I would have it understood that I do not confine myself to the details of the arrangements described, but I claim the construction of coal cutting machinery substantially as described.

I also claim the construction of the pick and cutting tools substantially as described.

I also claim the construction of machinery for drilling and pressing down coal substantially as described.

I also claim the combination of machinery for sinking shafts or pits, consisting of a table with a mining machine arranged to cut a circular ditch whilst traversing around the table substantially as described.

I also claim the combination of machinery for driving or cutting tunnels, consisting of a table or frame with a mining machine arranged to cut a groove whilst traversing around the table or frame substantially as described.

I also claim the combination of machinery for sinking shafts or pits and for driving or cutting tunnels, consisting of a central pivot with a mining machine arranged to turn around the said pivot and to cut a groove around it substantially as described.

I also claim the construction of machinery for avoiding breakage in loading coal into waggons substantially as described.

In witness whereof, I, the said William Firth, have hereunto set my hand and seal this twenty-fifth day of September, in the year of our Lord one thousand eight hundred and seventy-five.

WILLIAM FIRTH. (L.S.)

This is the specification referred to in the annexed Letter of Registration as marked A granted to William Firth, this seventh day of March, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 16 February, 1876.

We do ourselves the honor to return to you the documents transmitted for our report under your B.C. communication of the 8th instant, No. 76/866, which have reference to the Petition of William Firth, praying for a grant of Letters of Registration for his invention for "Improvements in machinery for working and loading coal and for driving or cutting tunnels," and we have to state that we see no objection to the issue of Letters of Registration securing to Mr. Firth his invention in terms of his Petition, specification, and drawings.

IMPROVEMENTS IN CLOTHES-WASHING MACHINES.

LETTERS OF REGISTRATION to Mr. Hans Echberg for Improvements in Clothes-washing Machines.

[Registered on the 9th March, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of St. Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS HANS ECHBERG, of Russell-street, Melbourne, in the Colony of Victoria, cabinet-maker, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Clothes-washing Machines," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Hans Echberg, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Hans Echberg, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Hans Echberg shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of March, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Clothes-washing Machines.

SPECIFICATION of HANS ECHBERG, of Russell-street, Melbourne, in the Colony of Victoria, cabinet-maker, for an invention, intituled "Improvements in Clothes-washing Machines."

THIS invention of improvements in clothes-washing machines consists in the use of boxes or troughs lined throughout with half columns corrugated crosswise, so placed as to present the corrugated semicircular faces to the inside of the box or trough. This box is made by preference longer at the top than the bottom, and is suspended by gudgeons resting in bearings supported by a suitable framing on each side. The box has a lid sufficiently large to admit of the clothes being supplied. When charged with water and clothes the lid is fastened down and the machine swung to and fro on its gudgeons. In a short period the clothes are washed and removed. A plug fills a hole at the bottom for discharging the dirty water.

The drawing hereto annexed clearly illustrates my invention. Figure 1 showing perspective of my machine, and figure 2 a representation (half size) of the half columns corrugated crosswise with which the machine is lined.

My machines are cheap and effective, requiring only a very small amount of power to work them.

Without confining myself to precise details, so long as the nature of the said invention be retained, I claim the improvements in clothes-washing machines herein described and explained, the essential feature in which is the half columns corrugated crosswise with which they are lined.

This is the specification referred to in the annexed Letters of Registration, granted to Hans Echberg, this seventh day of March, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Having, in attention to your B.C. minute of the 29th ultimo, examined the plans and specification accompanying the application of Hans Echberg, praying for a grant of Letters of Registration for his invention for "Improvements in Clothes-washing Machines," we have now the honor to state that we see no objection to the prayer of the Petition being complied with.

Sydney, 7 February, 1876.

A.D. 1876, 7th March. No. 513.

IMPROVEMENTS IN MACHINERY FOR PRINTING.

LETTERS OF REGISTRATION to Elijah Beech, for Improvements in Machinery for Printing.

[Registered on the 9th day of March, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS ELIJAH BEECH, of the city of Manchester, in the county of Lancaster, in the Kingdom of Great Britain and Ireland, printer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Machinery for Printing," which is more particularly described in the specification and the two sheets of drawings, marked A and B respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Elijah Beech, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise, unto the said Elijah Beech, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Elijah Beech shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of March, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S)

HERCULES ROBINSON.

Improvements in Machinery for Printing.

SPECIFICATION.

My invention has for its object machinery whereby subject matter and progressive numbers may be continuously printed upon rolls or strips of paper, card, or other suitable material, which may be also perforated or divided by the machinery into suitable lengths for cheques or other documents. I am aware that machinery for this purpose was described in the specification of British Letters Patent granted to Simeon Sampson, dated the 25th day of March, A.D. 1873, and numbered 1,097, but the arrangement and combination of mechanism therein proposed is imperfect and objectionable in practice, and cannot be worked satisfactorily. My invention consists, firstly, in an improved combination and arrangement of the mechanism in which the drums for the front impression of subject matter or type, the first and second impression cylinders, the perforating cylinder, and perforators, are all placed with their axis in the same horizontal plane. The face-plate, wheel, or disc, carrying the numbering discs, is placed over the first impression cylinder, and the drum for the subject matter or type, for the back impression, under the second impression cylinder. The drum from which the unprinted strip is drawn, and that upon which the printed and numbered strip is rolled, are placed—the former on one side, the latter on the other side of the machine, below the level of the axis of the first-named drums and cylinders, and rotate upon studs fixed in brackets secured to the frame of the machine. The strip or roll of material to be printed and numbered upon passes from the drum over one and under another guide roller under and between the first subject matter drum and the first impression cylinder, then over the latter and between it and the numbering mechanism, then between the first and second impression cylinders and under the latter, and between it and the second subject matter cylinder; then between the second impression cylinders and the perforating cylinder over the latter, and between it and the perforator, under the latter to the drum upon which the printed strip of paper is wound. The two subject matter or type drums and the numbering mechanism have separate inking arrangements formed by a roller working in contact with the ink in the trough; a second roller working in contact with the latter and the two other rollers which work in contact with the second roller and with the type, there being also a roller having end motion to distribute the ink working in contact with the second roller. Each set of inking rollers is geared together, and with the type drum which they have to ink. The shaft of the numbering mechanism and subject matter drums are arranged in slides, and have screws for adjusting them in relation to the impression cylinders. The numbering mechanism is formed by ten sets of numbering discs arranged in a circle; each set of discs is placed on a stud forming its axis which is secured on a disc or face-plate, the axis of each set of discs being parallel to the axis upon which the face-plate rotates, and not at a right-angle thereto, as hitherto proposed. Each set of discs is actuated to change its number once for each revolution of the face-plate by a pawl similar to that used for ordinary paging fixed on a stud in the framing, and as the face-plate rotates the ratchet-wheel of each set of discs in passing comes in contact with the said pawl, and this causes the ratchet-wheel to move one tooth, this motion being communicated to the numbering discs in the ordinary manner.

The second part of my invention relates to the arrangement of the figures of the numbering discs, when two or more sets are carried round on the same face-plate or wheel, and consists as follows:—When making single impressions, that is, one impression of each number, I make the ten figures of the units disc, of the first set of discs, all of the figure 1, and the ten figures of the units disc of the second set, of the figure 2, and so on, the ten figures of the units disc of the tenth set of discs, all of the figure 0; when so made the units disc is secured to the tens disc, which moves with it and with the ratchet-wheel. All the discs of each set of discs, except the units, are figured in the ordinary manner. For printing duplicate numbers, that is, two impressions in succession of the same number, my invention consists in arranging so that the units discs of the ten sets of numbering discs have each ten figures arranged as follows:—For the first and second sets the figures 1 and 6 alternately, for the third and fourth sets the figures 2 and 7 alternately, for the fifth and sixth sets the figures 3 and 8 alternately, for the seventh and eighth sets the figures 4 and 9 alternately, and for the ninth and tenth sets the figures 5 and 0 alternately. The discs of each set, except the units disc, are numbered in the ordinary manner; the units disc is geared or arranged to move the tens disc at each alternate figure or movement of the units disc, that is when the figures 5, 6, 7, 8, and 9, upon the units disc have printed, and the next movement of the units discs takes place they carry forward the tens discs one figure. For printing numbers in triplicate, that is repeating the same number three times in succession, I employ fifteen sets of discs carried upon the plate or wheel with the figures on each units disc, arranged as if for duplicate numbering, viz.:—The 1st, 2nd, and 3rd sets of discs with the figures of the units disc engraved with the figures 1 and 6 alternately, and the 4th, 5th, and 6th sets of discs with the figures 2 and 7 alternately, and so on; there being three sets of discs in succession with the figures engraved in the same order, instead of two sets as for duplicate printing. I also number consecutively by placing on the plate or wheel five sets of discs with the figures of the units discs engraved as for duplicate numbering, namely,—with the first, third, fifth, seventh, and ninth, of the ten sets of discs above mentioned, as used for duplicate numbering. I also number in duplicate or triplicate, and so on, by fixing upon the plate or wheel carrying the discs—two sets for duplicate, or three sets of discs for triplicate numbering, and so on for other repetitions of the same number. The sets of discs last named have their figures arranged the same as for ordinary consecutive numbering. I also accomplish triplicate numbering by three, six, or nine sets of discs carried round upon a face-plate, drum, or wheel, with the units discs figured as follows: with three sets of discs the figures are as for ordinary consecutive printing; when six sets of discs are used, the units disc (having ten figures each) of the 1st, 2nd, and 3rd sets of discs are figured 1, 3, 5, 7, 9, 1, 3, 5, 7, 9, and the 4th, 5th, and 6th sets of discs are figured 2, 4, 6, 8, 0, 2, 4, 6, 8, 0. The units disc moves the tens after printing the figure 9 in 1st, 2nd, and 3rd sets, and after figure 8 in the 4th, 5th, and 6th sets of discs. When nine sets of discs are used on a face-plate or wheel for triplicate numbering the units disc of each set has ten figures as follows: 1, 4, 7, 0, 3, 6, 9, 2, 5, 8, and the tens disc is moved the first movement after printing the figures 7, 8, and 9, and in commencing to number the first three sets of discs are set at the figure 1, the second three sets of discs are set at the figure 2, and the third three sets of discs are set at the figure 3. I also accomplish triplicate numbering by ten sets of discs placed upon a drum or face-plate, the units disc having three, six, nine, or twelve figures upon it (repeated if more than three figures) in the following order, viz.: the units for the first set, 1, 4, 7; second set,

Improvements in Machinery for Printing.

set, 1, 4, 8; third set, 1, 5, 8; fourth set, 2, 5, 8; fifth set, 2, 5, 9; sixth set, 2, 6, 9; seventh set, 3, 6, 9; eighth set, 3, 6, 0; ninth set, 3, 7, 0; and tenth set, 4, 7, 0. The units disc moves the tens disc at the first movement after printing the figures named, as follows, viz.: in the 1st, 9th, and 10th set of discs at the figure 7; in the 2nd, 3rd, and 4th at the figure 8; in the 5th, 6th, and 7th at the figure 9; and in 8th set of discs at the figure 6.

Thirdly, my invention consists in arranging the sets of discs when used singly so as to be mounted on an axis with a small amount of eccentricity (the axis of the discs being parallel to the axis of rotation); and my invention also consists in combining to work together several sets of discs, each on a separate axis of rotation, so as to print upon the same strip or roll of paper or other material as it passes round or partly round the same or a separate impression, cylinder, or cylinders, either numbers in consecutive duplicate or triplicate, or so on, order or series; and the discs are or may be arranged so that one will print if three sets are used, say Nos. 1, 4, 7, 10, and so on (every third number); and another, Nos. 2, 5, 8, 11, and so on; and another, Nos. 3, 6, 9, 12, and so on, as well as duplicate and other numbers in the same manner. By this means several numbers can be consecutively printed on the length of strip or roll in the space between the numbers printed by one set of discs, and thus shorter documents may be made with sets of discs of comparatively large circumference, and the numbers can be arranged to come on any required part of the lengthway of the roll or strip being printed.

When two, three, or more sets of discs are employed as above described under the third head of my invention, the units discs are moved two figures at a time; when two sets of discs are employed, three figures at a time; when three sets of discs are employed, and so on; but the units disc need only be moved one figure at a time, if the figures are arranged in the following order, namely: for numbering consecutively with two sets of discs, the units disc of one set is figured 1, 3, 5, 7, 9, 1, 3, 5, 7, 9; and the other 2, 4, 6, 8, 0, 2, 4, 6, 8, 0, and the tens disc is moved twice during each revolution of the units disc, that is during that movement which takes place immediately after printing the figure 9 by one set of discs, and after printing the figure 8 by the other set of discs. When three sets of discs are used for consecutive printing the units discs are figured as follows: 1, 4, 7, 0, 3, 6, 9, 2, 5, 8, and in starting to number, one set of discs is set at 1, the next at 2, and the next at 3. The units disc of each set is arranged in this case to move the tens disc when the movement takes place immediately after printing the figures 7, 8, and 9. In numbering consecutively with four sets of discs, each set rotating on a separate axis, the units disc of the first and third set of discs is figured in the following order, 1, 5, 9, 3, 7, 1, 5, 9, 3, 7, and the units disc of the second and fourth sets of discs is figured 2, 6, 0, 4, 8, 2, 6, 0, 4, 8; and in commencing to number, the first set of discs is set at the figure 1, the second set at the figure 2, the third set of discs at the figure 3, and the fourth set of discs at the figure 4; and the units disc of each set of discs is arranged to move the tens disc in the first and third set of discs at that movement taking place after printing the figures 7 and 9, and for the second and fourth sets of discs after printing the figures 6 and 8. Duplicate or triplicate, and so on, numbering, when the impressions are printed in the same line simultaneously or thereabouts, is accomplished by two or more sets of discs arranged side by side to revolve on the same axis or shaft, each set of discs in a different rotating plane, the figures of each set of discs being arranged the same as for consecutive numbering by a single set of discs.

The figures on sheet 1 illustrate the improvements forming the first part of my invention. Fig. 1 is a front elevation, fig. 2 a back elevation, and fig. 3 a plan view of the machine. The other figures on sheet 1 show more clearly the construction of the details, and will be referred to in course of the following explanation:—The machine illustrated by the drawings is intended to operate upon narrow strips or webs of paper or other material, but it is obvious that machines may be constructed to operate upon wide webs of paper or other material upon the same principle; and instead of the shafts being carried on one side frame only as illustrated by the drawings, two side frames may be used, one upon each side of the operating parts, suitable bearings being formed for each shaft in both side frames especially when the machine is intended to operate upon wide webs of material. A is the side-frame or plate upon which the mechanism and operating parts are mounted. *a* is the drum upon which the type or stereotype or subject matter for the front impression is mounted; *b* and *c* are the first and second impression drums covered with blanket, india-rubber, or other suitable material as understood; and *d* is an intermediate drum covered with india-rubber or other elastic material for the perforating drum *e* to act against; *f* is the drum for the type, stereotype, or subject matter, for the back impression, and this drum acts against the second impression cylinder *c*; *g* is the face-plate which carries the sets of discs that imprint the numbers in passing the front impression cylinder *b*. The two subject matter drums *a* and *f* are each mounted in a bearing which is arranged to slide in the frame, and to be adjusted by a screw; the arrangement of such slide, screw, and drum, in each case is illustrated; in reference to the drum *a*, fig. 4, which is a detached section on the line 1-1, fig. 1, where A is part of the frame; *a*² is a slide fitted in a slot in the frame. In the slide a hole is formed as a bearing for the shaft *a*¹, which has a collar, *a*³, at that end of the shaft at the back, and the drum *a* and its connected driving wheel *a*⁴ is secured on the shaft by a key; and the wood to which the stereotype is secured by screws is secured to the drum by a washer and a screw *a*⁵ at the front end of the shaft *a*¹. The adjusting screw *a*⁶ screws through the frame part A, and its end passes into a hole in the slide *a*² and has a collar, *a*⁷, fixed to it as shown. Fig. 5 is a section upon the line 2-2, fig. 1, showing the construction and mode of securing the impression drums *b* and *c* and the drum *d* to their respective shafts, illustrated in reference to the drum *b*; *b*¹ is the shaft to which the drum is keyed, and *b*² is the elastic material secured by a washer, *b*³, in front by the screw *b*⁴ at the front end of the shaft *b*¹. The shafts for the drums *b*, *c*, *d*, and *e* work in fixed bearings in the frame A. Fig. 6 is a detached section on the line 3-3, fig. 1, showing the mode of mounting the face-plate *g* for the numbering discs and its driving-wheel *g*² upon the shaft *g*¹; the face-plate *g* and wheel are keyed upon the front end of the shaft *g*¹, which is mounted in a sliding bearing *g*³, adjusted by a screw, *g*⁴, arranged as described in reference to fig. 4. The perforating drum *e* is secured by a pin or key upon the end of a shaft, *e*¹, as shown by fig. 7, a section on line 4-4, fig. 1, the shaft *e*¹ working in a stationary bearing in the frame-plate A. The machine may be driven by a handle, *x*, as shown in figs. 1, 2, and 3, or by a belt working in the ordinary manner upon fast and loose pulleys upon the shaft *b*¹, when the machine is to be driven by steam or other power. The shafts *c*¹, *d*¹, and *e*¹, of the drums *c*, *d*, and *e*, are all in gear with each other, and with a wheel *b*⁵ on the shaft *b*¹ of the drum *b*; these wheels, *c*², *d*², and *e*², being at the back of the frame-plate A, as shown. The subject matter drums *a* and *f* and the face-plate *g* are geared together by wheels on the shafts *a*¹, *f*¹, and *g*¹, in front of the frame-plate

Improvements in Machinery for Printing.

frame-plate A; a wheel on the shaft b^1 of the drum b gears with a wheel on the shaft a^1 of the drum c , also with a wheel on the shaft g^1 for the face-plate g , and may also gear with a wheel on the shaft e^1 of the drum c , which latter wheel gears with a wheel on the shaft f^1 upon or connected with the drum f . The two subject matter drums a and f and the figures of the numbering discs are each inked by a similar arrangement of rollers, except that the apparatus for the front subject matter cylinder has an additional transmitting roller. The construction and mode of mounting and driving the inking rollers is illustrated by reference to fig. 8, a detached section in the line 5-5, fig. 1. The inking roller h^1 is secured upon the long boss of the wheel which rotates upon a stud secured in the frame-plate. One of the inking rollers h^2 of each set is constructed as shown by fig. 9, a detached section upon the line 6-6, fig. 1. In the boss of this wheel or roller there is a cam slot in which the end of a pin h^3 enters, secured to the frame so that as the roller revolves it is moved to and fro endways at the same time to distribute the ink laterally. Each set of inking apparatus consists of a cistern h for ink, in which a roller h rotates so as to take the ink upon its surface, the thickness of the layer of ink taken by the surface of the roller being regulated by a bar which passes the lengthway of the roller, and can be brought close to its periphery the distance of the bar from the surface of the roller, and thus the depth of the layer of ink being regulated by the screw h^2 . The roller or rollers h^3 are carrying and distributing rollers, and the rollers h^4 come in contact with the type; the roller h^5 is the lateral distributing roller, and h^6 is the pin which enters its cam slot. The inking rollers gear with each other and with the wheel upon the drum carrying type to be inked. The inking cistern for the back impression cylinder has a thin metal cover h^* over it, as shown to protect the web of paper or material operated upon from being smeared by accident and matter from the passing web from falling into the ink. Each set of the numerical discs g^5 is constructed in a manner similar to those of the ordinary paging machine, and they are each mounted upon a stud which is secured into the face-plate g , as shown in figs. 1, 3, and 6, as illustrated by the drawings; there are supposed to be six rings or discs for figures which will number from 1 to 999,999, but any required number of rings or discs may be employed. The ratchet for actuating the rings or discs is secured to the outer disc or ring in front. When ten sets of discs are used for consecutive numbering, I make the ten figures of the units disc of each set all of the same figure, such figure being one in first set, 2 in the second set, and so on, the 10th set being 0. When the figures are thus arranged the ratchet and the unit and tens ring or disc are secured and move together. The various modes for engraving the figures for consecutive duplicate and triplicate numbering and so on, have been herein before described under the second head of my invention. The ten figures are engraved upon the edge of each ring, a line passing from top to bottom of the figures, being at a right-angle to the axis upon which the rings revolve, and the axis of each set of rings or discs is parallel to the axis of the face-plate g , which carries them round. The ratchet wheel g^* of each set of rings or discs has ten teeth, and is actuated to be moved one tooth at each revolution of the face-plate g by a pawl p , which is shown detached by fig. 10; p^1 is a stud secured in the frame-plate, A, and the pawl p is placed to oscillate upon the end of this stud, and is forced towards the teeth of the ratchet by a spring, p^2 , one end of which is secured to the stud p^1 and coils round it, the other end acting upon a projection from the pawl p . The movements of the pawl are limited by a stud, p^3 , secured in the frame-plate A, the end of which passes through a slot in the pawl as shown. The web of paper or material to be operated upon is wound upon a drum, i , placed upon a shaft, i^1 , in a bearing carried by a bracket, i^2 , secured to the frame-plate A, and friction to resist the unwinding of the roll to give the required tension to the web is regulated by the screw-nut i^3 , the end of which screws against the shaft or a clip on the shaft i^1 . The flanges of the drum are separate, and are screwed together by the wing nut i^4 . The web on leaving the drum i passes over the roller j placed on a stud in the frame-plate under a similar roller j^1 , between the drums a and b , where the front impression of subject matter is given over the drum b , and between it and the sets of numbering discs or rings on g , where the numbers are impressed, then under the drum c and between it and the drum f , where the subject matter is impressed on the back over the drum d , and between it and the perforating drum e , which carries T-pieces, e^2 having rows of points, these T-pieces being forced outwards by the cam e^3 formed on the end of a bent stud e^4 coming into the centre of the drum e , the bent stud being secured in the frame-plate A as shown in fig. 7; the springs e^5 upon the stem of each T-piece withdrawing the points from the web (the shape of the cam allowing this) after each row of perforations have been made. The printed numbered and perforated web passes under the roller j^2 and on to the drum k . The end of the web is first secured to the drum k by being passed round a pin, k^2 , which passes through the boss of the front flange of the drum and across its width. The flange of one side of the drum is formed with a boss, and is separated from the other flange of the drum to which it is secured by a wing screw nut k^4 upon the end of the drum shaft k^1 as shown, the other flange of the drum being connected with the driving shaft by a pin or key. The shaft k^1 rotates in a bearing which can be slid to and fro in a slot formed in a bracket, k^5 , secured to the frame-plate A, and this shaft has a pulley, k^6 , upon it, which is driven by an endless cord, k^7 , working upon a pulley, b^6 , keyed upon the first motion shaft b^1 . By means of the screw k^3 the tightness of the endless band k^7 upon the pulleys can be regulated. The sizes of the pulleys k^6 and b^6 are such that they give more winding-up speed than is required, but as the slip of the endless band is regulated by the screw k^3 the web is wound up sufficiently tight and only as fast as it travels through the printing and perforating apparatus. The second part of my invention, and also so much of the third part of my invention as relates to the arrangement of the figures of the numerical discs and of actuating them, is carried into effect by arranging the sets of discs and engraving figures upon their rings to accomplish the objects referred to in the order hereinbefore described, and by arranging the spring and pin, or two or more springs and pins, to be carried by the units disc to move the tens in each case at the figures hereinbefore mentioned. In some cases there need be only one spring pin in each units disc (as in ordinary numerical discs), but this spring-pin is acted upon by several separate cam surfaces; there being one cam surface for each time the units disc is to act upon the tens disc during one revolution of the units disc, such cam surfaces being placed at those points in the revolution of the units disc at which its spring-pin is to act upon the tens disc. For instance, in consecutive numbering with five sets of discs, or duplicate numbering with ten sets of discs, or triplicate numbering with fifteen sets of discs, when the units disc of one set is numbered 1 and 6 alternately, and 2 and 7 alternately, and so on, there are five cam surfaces, and a space between each cam surface, so that the spring-pin of the units disc is acted upon every alternate movement of the units disc to move the tens disc. In numbering in consecutive order with two sets, duplicate

Improvements in Machinery for Printing.

duplicate order with four sets, and triplicate order with six sets of discs, when the units discs of the set or sets having odd figures are numbered 1, 3, 5, 7, 9, 1, 3, 5, 7, 9, and the units discs of the set, or sets of discs having even figures are numbered 2, 4, 6, 8, 0, 2, 4, 6, 8, 0, one spring-pin may be used and two cam surfaces. For consecutive numbering with 4 sets of discs with the units discs of the sets of discs with odd figures, viz.: 1, 5, 9, 3, 7, 1, 5, 9, 3, 7, and the units discs of the sets of discs having even figures, viz.: 2, 6, 0, 4, 8, 2, 6, 0, 4, 8, one spring-pin only may be used with two cam surfaces. But in using sets of discs with the units disc numbered with odd and even numbers, viz.: 1, 4, 7, 0, 3, 6, 9, 2, 5, 8, three pins must be used in each units disc, all actuated by passing one cam surface. The manner of carrying the third part of my invention into effect is illustrated by the figures on sheet 2. Fig. 11 is a front elevation, and fig. 12 is a plan view of a machine according to the third part of my invention, and fig. 13 is a front view, and fig. 14 a longitudinal section, and fig. 15 a cross section of parts detached hereinafter described. i is the drum for the web of paper or other material to be printed, j guide roller under which the paper passes before going to the subject matter drum a , a' shaft for same, b large impression drum, and b' its shaft, c shaft, and c second impression drum, d shaft, and d elastic surfaced drum for perforating drum e to act against, f shaft, and f drum for back subject matter, h^1 shaft, h^1 screw, and h drum for winding up the printing and perforating web, and h cistern, h^1 , h^2 , and h^3 , inking rollers, and h^3 lateral distributing inking roller. All the parts above referred to from the drum i to the last-named roller are constructed, mounted, and arranged substantially as hereinbefore explained under the first head of my invention, except where modified as hereinafter described. The axis of the drums a , b , c , f , and h , are each fitted to rotate in a bearing formed in an eccentric fitted in the frame-plate, and the axis of the drums for the numerical discs are arranged in like manner. The eccentrics for these bearings are each formed at one end with six sides so as to be turned when adjustment is required by a screw key, and are secured when adjusted in each case by a set screw. The eccentrics are marked a^2 , b^2 , c^2 , f^2 , and h^2 respectively, and their set screws, a^3 , b^3 , c^3 , f^3 , and h^3 respectively. Three sets of numerical discs carried by drums l are shown, but one, two, or more may be used. The axis upon which the numerical discs rotate are placed parallel but eccentric to the axis by which they are carried round for printing. Fig. 13 is an end view, fig. 14 a longitudinal section, and fig. 15 a cross section, showing the arrangement of one set of numerical discs. The discs g^5 are placed on an axis in the cavity of a drum, l , so that the line of figures to be printed will come in a line with the periphery of the drum l . The drum l has a shaft, l^1 , which fits a hollow shaft, l^2 , that has the driving wheel l^3 upon one end, and the drum l and wheel l^3 are secured together by a screw, l^4 , at the end of the shaft l^1 , which screws against a washer l^5 at the end of the hollow shaft l^2 . By means of the screw l^4 a cone formed upon the drum l is drawn tightly into a cone cavity formed into the wheel l^3 . By this arrangement the drum l can be readily turned round to adjust it exactly as required without un gearing the wheel l^3 . This arrangement for adjustment is also used for the two subject matter cylinders a and f and for the perforating drum e , except that the hollow shaft in that case does not pass through the bearings. The ratchet-wheel g^* for each set of numerical discs is actuated by a pawl m jointed upon a frame, n , secured to the frame-plate A. One half of the end of the pawl m is shaped like an ordinary pawl to enter ratchet teeth, the other half is rounded to rest against the outer edge of the drum l , which is shaped to act as a cam; a spring m^1 , secured to the frame n and acting upon a tail from the pawl keeps the round half of the end of the pawl against the cam surface, which is shaped to allow the ratchet half of the pawl to approach and take hold of and turn the ratchet one or more teeth as required and then to withdraw it from the ratchet. The periphery of the drum or partial drum l is either not cylindrical, or if a perfect circle is not concentric with the axis of rotation, but is either of smaller radius than the line in which the figures print or is of smaller radius and eccentric or of cam-like shape so that no part of the drum surface except the outside rings at the printing line will touch the impression drum b when rotating. It will be seen in fig. 11 that the third numerical drum is supposed to be printing, and is shown in contact with the impression drum b , but the first and second numerical drums do not touch the impression drum, as they are not supposed to be printing at the same time as the third numerical drum. The figures of the discs carried by the numerical drums l are supposed to be inked by a roller, h^1 , which rest upon the numerical drum l . The middle part of the roller h^1 receives the ink, which is distributed evenly by contact with the middle portion of the drum l , the entire circumference of the middle part of which acts as a distributing surface, except that segment which is cut away to make room for the numerical discs g^5 . There are grooves cut in the numerical drums l and the inking rollers h^1 , as shown in figs. 13 and 14, which grooves prevent the ink from accidentally spreading to the side on each side of the middle parts of the drums and rollers. The inking rollers h^1 are carried by resting upon the surface of the drum l , but where this is cut away the two end parts of the rollers rest upon the ring of the drum at each side of the numerical discs g^5 as shown, the surface of which is made slightly below the surface of the figures to be inked, so that the inking surface of the roller will come fully in contact with the figures when they pass the inking rollers. The inking rollers as shown rotate in slotted bearings in the frame n , and are supposed to be rotated by frictional contact with the drum l and its end rings, but to make the driving positive the rollers may be geared same as the inking rollers for the subject matter drum. The ink is conveyed to the numerical drums and rollers from a cistern, h^* , shown in fig. 11, but which is not shown in plan fig. 12. This cistern is fixed on the framing as shown, and the ink is conveyed from the roller h^1 by the roller h^2 to a roller h^3 which inks the figures and also inks the drum surface that gives it to the intermediate rollers h^3 placed between the drums, which rollers ink the figures of the drums l with which they are in contact, and transmit the ink from such drums l and to their rollers h^1 . The distributing surface of the drums l may be dispensed with, and the inking rollers may rotate in bearings or upon studs, and the ink may be conveyed to the inking rollers shown in fig. 11 by intermediate rollers or a separate inking cistern, and carrying rollers may be used for each numerical drum. With one numerical drum in use, consecutive numbers or consecutive series of numbers with numbers omitted, such as 1, 3, 5, and 7, or 1, 4, 7, 10, and so on, may be printed at each rotation upon each length of web equal to the circumference in which the surface of the printing line of figures rotate, and with two numerical drums l in use duplicate numbers may be printed, and with three numerical drums triplicate numbers and so on may be repeated within the length of web above mentioned. But in the same length of web above mentioned two, three, or more consecutive numbers

may

Improvements in Machinery for Printing.

may be printed, and in duplicate or triplicate according to the number of numerical drums employed, giving their impression upon any desired part of the lengthway of web being printed. As shown by figs. 11 and 12, the three numerical drums are supposed to be printing consecutive numbers, three numbers in a length of web equal to the circumference described by the face of the printing line of figures at each rotation of the drum l , which length may thus be formed into three separate tickets or documents, which may be made as small as desired by using a sufficient number of numerical drums, which need not be of small diameter. As shown in fig. 11, the third numerical drum (that furthest from the entering side of the web being printed) is supposed to be in the act of printing, and by the time this drum is advanced one-third of a revolution the second drum l will be in the act of printing, and by the time the second third of a revolution of the third drum has been completed the first will have printed, and on completion of the revolution of the third drum l it will print again. The third drum l prints 1, 4, 7, and so on, the second 2, 5, 8, and so on, and the first 3, 6, 9, and so on. The axis of each numerical drum l rotates in a bearing formed in an eccentric, l^s , as described in reference to the drums a and f ; by partly rotating this eccentric bearing the figures may be made to press more or less upon the web passing over the impression drum b , or the numerical drum l may when required be withdrawn clear of the impression drum b , which can also be withdrawn from all the numerical drums at the same time if required. Instead of rotating eccentric bearings sliding bearings with screw adjustment may be used if desired. The studs for the inking rollers for each subject matter cylinder and the ink cistern may all be secured to or upon or in a plate or bracket which may be secured so as to be adjustable to the frame-plate A by a bolt or bolts passing through a hole or slot in the frame-plate. The perforating drum e is formed with a hollow centre and with radiating slots for thin pieces e^2 of steel (one in each slot) with the outer ends formed into teeth and their inner ends to come against a cam stud, e^1 , and with projections at each side to come into cam grooves, the groove is formed on one side in a collar, e^* , upon the stud e^1 , and for the other side into a groove formed between the stud e^1 and a disc, e^s , with a projecting boss secured upon a square upon the end of the stud e^1 by a screw, e^7 , as shown. The stud passes through the eccentric bearing e^s , and is secured to it by a screw nut, e^4 , and thus remains stationary while the drum e rotates round the stud e^1 , and the cam or eccentric shaped body of the stud pushes the end of the slides outward when the perforates are coming towards the drum d , against which they act, and the cam grooves draw the perforates inwards. The disc e^s keeps the perforates e^2 in their places in the drum e . q are the fast and loose driving pulleys for driving the machine by a belt; b^6 is a pulley upon the shaft b^1 for driving by a band, k^7 , the pulley, k^8 , secured on the winding up drum shaft k^1 , by turning the eccentric bearing k^8 of which the tightness of the band k^7 may be regulated. The web to be printed passes from the drum i , under the guide roller j , between the subject matter drum a , the numerical drums l , and the impression drum b , under the impression drum c , and between it and the second subject matter drum f , over the drum d , and between it and the perforating drum e , and on to the winding up drum k .

I have now particularly described the nature of my invention, and the mode of carrying the same into effect, and claim as my invention:—

Firstly. The arranging of two or more sets of numerical discs or rings upon a face-plate or wheel, or upon an axis with the axis of the numerical discs or rings parallel to the axis of the face-plate or wheel upon which they are carried, substantially as hereinbefore described and illustrated by the figures upon sheet one of the drawings.

Secondly. The arrangement of the bearings of the shafts for the face-plate or wheel carrying the sets of numbering discs and the subject matter drums in slides to be adjusted by screws in the combination and arrangement of numbering and subject matter printing mechanism, substantially as hereinbefore described and illustrated by the figures 1, 2, and 3, of the drawings.

Thirdly. The combination and arrangement of the mechanism for printing subject matter, numbering and perforating webs or rolls of paper, or other material, as described and illustrated by the figures upon sheet 1 of the drawings.

Fourthly. The novel arrangement of the figures on the sets of numbering discs and the novel arrangements for giving movement from the units to the tens discs for numbering consecutively in duplicate, triplicate, and so on, when such sets of discs are carried by a rotating face-plate drum or a rotating wheel with their axis either parallel to or at right-angles to the axis of the rotating face-plate drum or wheel, substantially as described under the second head of my invention.

Fifthly. The arranging of one set of numerical discs or rings, or the arranging and combining of two or more sets of numerical discs or rings, each carried round upon an axis separately; the axis upon which the sets of discs rotate in each case being parallel to the axis upon which they are carried round but eccentric thereto, substantially as hereinbefore described under the third head of my invention, and illustrated by the figures on sheet 2 of the drawings.

Sixthly. The arranging and combining of the numerical discs with the drum and the inking arrangements, and the arrangements for adjusting and securing the drums to the wheels, substantially as hereinbefore described and as illustrated by the drawings.

Seventhly. The arrangement of the drums a , b , e , f , and k , in eccentric bearings, to allow of adjustment, substantially as hereinbefore described, and illustrated by the drawings.

Eighthly. The mode of giving motion to the ratchets of the numerical discs by pawls, actuated by a cam surface, substantially as hereinbefore described and illustrated by the figures upon sheet 2 of the drawings.

Ninthly. The construction of a perforating drum with a double-acting cam to both push out and withdraw the perforators, substantially as hereinbefore described and illustrated by the drawings.

Tenthly. The combination and arrangement of mechanism for printing subject matter and numbers, and perforating, as described under the third part of my invention, and as illustrated by the figures on sheet 2 of the drawings.

Eleventhly. The novel mode of engraving or forming the figures upon the numerical discs in the order and the actuation of the tens disc by the units disc for consecutive duplicate printing and so on, as described under the third head of my invention.

Twelfthly.

Improvements in Machinery for Printing.

Twelfthly. The combination of two or more sets of discs, side by side, with their axis in the same line or parallel to each other, and also parallel to the axis by which they are carried round to print, each set of discs rotating in a different plane for duplicate, triplicate, or other numbering, substantially as hereinbefore described.

In witness whereof, I, the said Elijah Beech, have hereunto set my hand, this twenty-sixth day of October, 1875.

IMPROVEMENTS IN RECEPTACLES FOR FÆCES OR EXCREMENT.

LETTERS OF REGISTRATION to Hugh Bell, for Improvements in receptacles for fæces or excrement, including earth-closets, in appliances for getting rid of the urine or liquids.

[Registered on the 17th day of March, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS HUGH BELL, of Brisbane, in the Colony of Queensland, medical practitioner, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in receptacles for fæces or excrement, including earth-closets, in appliances for getting rid of the urine or liquids," which is more particularly described in the specification which is hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Hugh Bell, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Hugh Bell, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during the term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Hugh Bell shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court of the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this sixteenth day of March, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in receptacles for fæces or excrement.

SPECIFICATION.

THE following arrangements or inventions of HUGH BELL, of Brisbane, for improvements in receptacles for fæces or excrement, including earth-closets, in appliances for getting rid of the urine or liquids :—

- (1a.) The application of the urinal (receptacle for urine) of whatsoever material, with or without a tube, with or without a strainer, fixed or not, inside or outside, in the front of any receptacle for fæces or excrement, one form and arrangement of receptacle for fæces being commonly called an "earth-closet," so that on a person sitting over or on an ordinary seat with the appliance described and voiding urine or fæces, one or the other or both, all or most of the urine will pass into the urinal, and all or most of the fæces or excrement will drop into the receptacle or earth-pot.
- (2b.) The application and using of perforated material or materials of earthenware, china, parian marble, glass, metal, wood, or other material, or sieves of any form, viz., diaphragms, plates, tubes, &c., in receptacles of whatsoever material, including "earth-closets," for the purpose of separating and of conducting away the urine or other liquid from the more or less solid excrement or fæcal parts, and running the urine or liquid off through an opening or openings in the receptacles fitted with cock, plug, or tube and tap, &c. The urine to be dealt with by deodorizing and utilizing it, or to be forwarded to a receptacle or into a drain. These receptacles for fæcula or excrement may be of any size from 5 to 50 gallons, more or less. The small ones may be fitted with pail-handles, the larger ones with box handles on the sides or ends, and both kinds or all should be fitted with covers or lids.

A.

Section of elevation of general arrangement under closet seat :—

1. Ordinary closet-seat with its opening.
2. Front panel of closet-seat.
3. Receptacle or pot for fæces or excrement.
4. Urinal.
5. The tube for exit of urine.
6. Catch for attachment of urinal.

B.

Instances of some of the modes of application :—

Section of elevation.

1. The bottom part of receptacle.
2. Diaphragm or plate perforated, or a sieve.
3. Space for urine to drain into and from.
4. Outlet.

*Vertical view of a square receptacle.*

1. Receptacle for excrement or fæces, and may be for urine.
2. Diaphragm or plate perforated, or a sieve, placed in corner of receptacle the whole length or depth of the receptacle. This perforated diaphragm or perforated plate may be applied anywhere.
3. Outlet of tube.

Vertical

Improvements in receptacles for faeces or excrement.

Vertical views of round pots.

1. Receptacle.
2. Perforated plate or sieve or diaphragm.
3. Outlet.

- (1a.) Inside view of bottom of pot.
- (1b.) Section of elevation of receptacle part only.
2. Showing the perforated tube of any material, viz., glass, earthenware, china, wood, metal, &c.
3. Outlet.
4. Socket for tube to fit in or on.

Large receptacle adapted for large establishments or where the water-closet system is in part used so as to receive both liquids and solids suddenly in any quantity.

1. Receptacle of any material.
2. Sieve or perforated diaphragm or plate.
3. Outlet or outlets.
4. Cover or lid.
5. Showing a tube or cylinder, of which there may be two or more, in place of perforated diaphragm 2.

Front view.

Elevation.
Side view of section.

Elevation. Side view of section, showing application of perforated tube or cylinder.

HUGH BELL, F.R.C.S., England.

This is the specification referred to in the annexed Letters of Registration granted to Hugh Bell, this sixteenth day of March, 1876.

HERCULES ROBINSON.

REPORT,

Improvements in receptacles for fæces or excrement.

REPORT.

SIR,

We do ourselves the honor to return to you the documents transmitted for our report under your B.C. communication of the 28th January last, No. 76/382, which have reference to the Petition of Hugh Bell, praying for a grant of Letters of Registration for his invention of "Improvements in receptacles for fæces or excrement, including earth-closets, in appliances for getting rid of the urine or liquids"; and we have to state that we see no objection to the issue of Letters of Registration securing to Mr. Bell his invention in terms of his Petition, specification, and drawings.

**IMPROVEMENTS IN THE METHOD OF WORKING THE SLIDES OF STEAM
OR WATER PRESSURE ENGINES, &c.**

LETTERS OF REGISTRATION to Henry Davey, for Improvements in the method of working the slides of steam or water pressure engines and apparatus for that purpose.

[Registered on the 22nd day of March, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS HENRY DAVEY, of Leeds, in the County of York, England, engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the method of working the slides of steam or water pressure engines and apparatus for that purpose," which is more particularly described in the specification, marked A, and the three sheets of drawings, marked B, C, and D respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Henry Davey, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Henry Davey, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Henry Davey shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-first day of March, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in the method of working the

A.

SPECIFICATION.

TO ALL WHOM IT MAY CONCERN: BE it known that I, HENRY DAVEY, of Leeds, in the County of York, England, engineer, do hereby declare the nature of the said invention for "Improvements in the method of working the slides of steam or water pressure engines and apparatus for that purpose," and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement thereof, reference being had to the accompanying sheets of drawings, and to the figures and letters marked thereon, that is to say:—

THIS invention relates to a method of working the slides or valves of steam or water pressure engines by means of apparatus acting without the use of eccentrics, cams, or other rotating parts, the movement of the main piston being employed to move the main slide through a part of its stroke and also to move the slide of a subsidiary cylinder, and the rest of the stroke of the main slide being effected by the movement of the piston of the said subsidiary cylinder. The speed with which the strokes of the main slide is completed or effected is governed by a "cataract," that is the resistance of a liquid in a cylinder to a piston moving therein. This mode of working the slide, although peculiarly applicable to direct acting engines such as those which are employed to work pumps without connecting rods, cranks, or flywheels, is applicable also to engines working rotating shafts, and either to simple or compound engines and either in combination with or without expansion valves or slides.

In order that my improvements may be the better understood I will refer to the accompanying three sheets of drawings and to the figures and letters marked thereon. These drawings represent several modified forms in which my invention may be carried into practical effect, the same letters being employed in the several figures to indicate corresponding parts of the apparatus. Fig. 1, sheet I, of the accompanying drawings, represents a longitudinal section, and figure 2, sheet I, represents a transverse section of a steam engine cylinder and slide with means of working the latter according to my invention. G is the main cylinder of the engine with its piston F and piston rod F', of usual construction. On the piston rod F' is fixed a head D, having on each side a vertical slot in which works a slide carrying a pin D' to which is jointed a forked lever E. This lever works on a pin E' as a fulcrum, and its shorter end E'' is connected to a slide rod A'', which works two slides A and B, facing opposite ways within a jacket A', supplied with steam by the inlet A''. The fulcrum E' of the lever E is a crosshead connecting two levers H which work upon pins H' on the framing of the engine on each side of the piston F'. The upper parts of the levers H are connected by a crosshead H'' to the rod of a piston C working in a subsidiary cylinder C', and by a crosshead H''' to the roof of a piston M, working in a cataract cylinder M' charged with water or other liquid, and having a communicating passage M'' from the one end of the cylinder to the other, which passage can be more or less closed by stop-cocks or valves M'''. The slide A is of the ordinary D kind, governing the ports to either end of the cylinder G and the eduction passage B''. The slide B is of similar description, governing the ports of the subsidiary cylinder C', and its eduction passage B', which communicates with the main eduction B'. In figure 1 the slides A and B are shown in their middle position and the main piston F approaching the extreme of its instroke, and the operation of the mechanism in this condition is as follows:—A farther movement of the piston F and of the head D attached to its rod by drawing in the end D' of the lever E causes the opposite end E'' to move a little outwards and thereby moves the slide B towards the right so as to open its back or left hand port. Steam from the jacket A' then enters the subsidiary cylinder C' behind its piston C and forces it forwards so as to cause the lever H to move towards the right; by this movement the fulcrum E' of the lever E is moved to the right, and its lower end D' being then almost stationary, its upper end E'' is moved forwards drawing the rod A'' and the slide A so as to admit steam behind the main piston F. This piston then makes its forward stroke carrying with it the end D' of the lever E, and thereby gradually moving back the slides A and B. As the piston approaches the extreme of its forward stroke, the slide B being again about the middle of its stroke is moved a little farther back, so as to admit steam in front of the piston C, whereby the slide A is moved back so as to admit steam in front of the piston F, causing it to make its back stroke. The rapidity with which the piston C is moved forwards or backwards is controlled by the resistance of the liquid in the cataract cylinder M' to the motion of the piston M, and thus the slide A can be made to open the port to either end of the main cylinder more or less rapidly according as the passage M'' by which the liquid can flow from the one end of this cataract cylinder M' to the other end thereof is of greater or less area, as determined by the adjustment of the cocks or valves M''' in its course. By this means a pause of greater or less duration is made to take place between the consecutive strokes of the main piston. The cylinder M', instead of being truly bored, may be made of somewhat larger diameter at the ends or at the middle, so that while the piston M is travelling along the enlarged part a portion of the liquid may leak past it and the resistance to its movements may be thus diminished in those parts of its strokes, the movement of the slide A being thereby varied while it is in the act of opening one of the ports of the main cylinder.

The figures on sheets II and III, and figure 9, sheet I, represent a modified form of the apparatus adopted to work the slides of a compound pumping engine having a high pressure and a low pressure cylinder with means of effecting a pause at the termination of each stroke of the engine, and of working a double beat expansion valve for the high pressure cylinder. In those sheets figure 3 represents a side view and figure 4 a plan of the two cylinders with adjacent parts. Figure 5 is a longitudinal section through the upper parts and slides of the two cylinders. Figure 6 is a plan of the slide levers and their connections; the subsidiary cylinder and its slide and the cataract cylinder being shown in sectional plan. Figure 7 is a transverse section through the low pressure slide and cataract cylinder, and figure 8 is a transverse section through the high pressure slide and subsidiary cylinder, and figure 9 is a part vertical section on the line ++, figure 4. The figures 5 to 9 inclusive are drawn to an enlarged scale. The piston rod P of the front or high pressure cylinder G and the two piston rods P' of the hinder or low pressure cylinder G' are secured to one crosshead O connected by connecting rods O'' to the levers for working the pump rods. An arm O' projecting down from the crosshead O is connected by a rod N''' to a long arm N'' of a rocking shaft N mounted in bearings on the framing of the engine. A short arm N' on this rocking shaft

slides of steam or water pressure engines, &c.

shaft is connected by a rod L to the end E' of a pair of horizontal levers E, which have their common fulcrum at E'' on a rod C'' connecting the piston C of the subsidiary cylinder C' with the piston M of the cataract cylinder M'. At E'', about the middle of the levers E, they are jointed to the rod A''', which connects the steam slides A and K of the two cylinders G and G'. A pin E^{iv} secured in the levers E is connected by a link H^{iv} to the end H'' of a lever H having its fulcrum at H'', which may be a fixed point, but which, as shown in the drawing, is capable of being moved by means of a worm as will hereafter be described. This fulcrum may however be considered as being stationary during the ordinary working of the engine. The lever H is connected at H' to the rod B'' of the slide B, commanding the ports of the subsidiary cylinder C'. It will be seen that the connections from the crosshead O to the lever E are such that the end E' of the latter is made to move in time with the former and with the main pistons, but always in the opposite direction and through a considerably shorter stroke. As the pistons make their outstroke or towards the left the lever E is caused to oscillate towards the right hand. The secondary lever H is thus caused also to oscillate towards the right, drawing the slide B in the same direction so as to uncover the left hand port of admission to the subsidiary cylinder C'. Steam then enters this cylinder from the jacket A' and pressing on the piston C propels it towards the right with a speed which is controlled by the resistance offered to the piston M by the liquid in the cataract cylinder M'. This resistance is regulated by adjusting a screw plug M'' so as to interrupt more or less the passage M' from the one end of the cylinder M' to the other. The movement of the piston C carrying the end E'' of the lever E towards the right causes the middle E'' of that lever also to move towards the right, and thus the slides A and K are moved so as to admit steam to the left hand ends of the main cylinders G and G'. The pistons of those cylinders being now propelled backwards, the lever E is caused to oscillate towards the left, moving the slide B in that direction, whereby the piston C is caused to make its back stroke, shifting the points E'' and E' towards the left, and moving back the slides A and K. In order to work the high pressure cylinder G expansively a double beat valve I in the steam supply of the jacket A' is worked in accord with the movement of the slide in the following manner:—The slide rod A'' prolonged through a stuffing box beyond the front of a slide jacket works a lever R having two arms R' and R'' which have pins working in slots P' of two oblique rods P. These rods are jointed to one arm of a lever Q the other arm of which is jointed to the rod of the valve I. When the slide A is moved as above described either to the right or to the left the pin of R' or of R'' being brought to bear on the lower end of the slot P' in which it is engaged draws down the rods P, and thereby causes the valve I to be raised for the admission of steam to the jacket A'. When, however, by the retreat of the slide A effected by the backward movement of the lever E during the stroke of the main pistons the pin of R' or of R'' is made to rise, the valve I closes and cuts off the steam supply. The length of the rods P can be adjusted by screw handles P'' so as to regulate the lift of the valve I. An eccentric lever Q' mounted on the valve rod can be turned up by hand so as to render the stroke of the lever Q ineffective for raising the valve I, and the valve in that case remaining closed, the engine is stopped. In the preceding description of the action of the levers E and H on the slides it was assumed that the fulcrum H'' remained stationary. That action may however be rendered more or less rapid, so as to give a shorter or longer pause at the end of each stroke, such as is found useful in pumping engines, by means of a contrivance which I will now describe for giving the fulcrum H'' a movement, and thereby causing the slide B to be moved at an earlier or later period of the strokes, and so producing an earlier or later movement of the main slides A and K. The rocking shaft N has an arm N''' connected by a rod U to one end of a lever V, the other end of which is connected to a lever working the slide of a small cylinder Z, similar in construction to the subsidiary cylinder C', and like it fitted with a piston the rod of which is connected to the rod of a piston in a cataract cylinder Y provided like the cataract cylinder M' with a screw plug for regulating resistance. The piston rod X of the cylinders Y and Z continued upwards carries a rack which gears with a pinion W fixed on a sleeve mounted on the round bar W' so that it can turn thereon, but is prevented from sliding longitudinally. On this sleeve is a screw or worm W'' embraced by a nut in which is fixed the pin H'' forming the fulcrum of the lever H. The shaft N being caused to rock by its connection with the crosshead O the lever V is also caused to oscillate and to move the slide of the cylinder Z, admitting steam alternately at the top and bottom thereof. The rod X being thus made to descend and ascend with a speed determined by the resistance in the cataract cylinder Y causes the sleeve and worm W'' to be partly turned in the one direction and in the other and so to move the nut and fulcrum H'' alternately to right and left, thus accelerating more or less the movement of the slide B and the consequent shift of the main slides A and K.

Although the description given above has been confined to means of working the valves of steam engines, it may be readily understood that similar arrangements are applicable for working the valves of engines worked by water pressure.

Having thus described the nature of my invention and the best means I know of carrying the same into practical effect, I claim:—

First. The method substantially as herein described of working the slide of a steam or water pressure engine by the differential movement of a lever, one end of which is worked from the main piston, and the other end from the piston of a subsidiary cylinder.

Second. For the purpose of working a slide in the manner referred to above, the combination consisting of the lever E connected at its one end to the main piston and at or near its middle to the main slide, and having its opposite end or fulcrum on a secondary lever H or on a rod C'', worked by the piston C of the subsidiary cylinder, the slide B of which subsidiary cylinder is worked by the movement of the lever E, substantially as herein described.

Third. The method of regulating the speed of movement of a slide worked in the manner referred to above by connecting the piston of the subsidiary cylinder to a piston in a cataract cylinder subject to the adjustable resistance of a liquid, substantially as herein described.

Fourth. The combination with the subject matter of the preceding claims of a second subsidiary cylinder Z and cataract cylinder Y, rack X, and sleeve and worm W'' for shifting the fulcrum of the secondary lever H so as to regulate the pause of the main piston at each stroke, substantially as herein described.

Fifth.

Improvements—slides of steam or water pressure engines, &c.

Fifth. The method substantially as herein described of working a double beat shut off valve I from the main slide rod A''.

In witness whereof, I, the said Henry Davey, have hereunto set my hand and seal, this second day of October, in the year of our Lord one thousand eight hundred and seventy-five.

HENRY DAVEY. (L.S.)

Witness—JOHN A. D. TELFORD.

This is the specification, marked A, referred to in the annexed Letters of Registration granted to Henry Davey, this twenty-first day of March, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 28 February, 1876.

It appearing to us on examination of the documents transmitted for our report under your blank cover communication of the 12th instant, No. 76/860, that Mr. Henry Davey is the author or designer of "Improvements in the method of working the slides of steam or water pressure engines and apparatus for that purpose," we have the honor to recommend that Letters of Registration be issued in terms of Mr. Davey's petition, drawings, specification, and claim, securing to him the exclusive enjoyment of his invention for a term of fourteen years.

We have, &c.,

**IMPROVEMENTS IN THE SPECIFIC ARRANGEMENT OF GEARING IN
WOOL-PRESSES.**

LETTERS OF REGISTRATION to Thomas Denny, for Improvements in the
specific arrangement of Gearing in Wool-Presses.

[Registered on the 29th day of March, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS THOMAS DENNY, of Bathurst, in the Colony of New South Wales, engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the specific arrangement of Gearing in Wool-presses," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Thomas Denny, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Thomas Denny, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Thomas Denny shall not register the same in the proper office of the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-eighth day of March, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in the specific arrangement of Gearing in Wool-presses.

SPECIFICATIONS.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, THOMAS DENNY, of Bathurst, in the Colony of New South Wales, engineer, send greeting:

WHEREAS I am desirous of securing by Royal Letters Patent Her Majesty's Special License, that I, my administrators, executors, and assigns, or such others as I or they should at any time agree with, and no others, should and lawfully might from time to time, and at all times, during the term of fourteen years (to be computed from the day of which this instrument shall be left at the office of the Chief Secretary), make, use, exercise, and vend within the Colony of New South Wales and its Dependencies, an invention for pressing wool and other material by means of bevel gear, screw, and nut in sections, as more particularly described in specifications hereunto annexed.

Specifications of Press for Wool and other material.

The sill piece A is morticed for receiving the tennon of the column B, and the first horizontal piece C is tennoned and fitted into mortice in column. The top or cap-piece is morticed and fitted on to tennon top of column B; the frames for carrying top box are bolted on to column B, as shown on plan. The winch handle, spindle E, is fitted into bearings which are securely bolted on to column B, and has one bevel wheel F keyed on to same for giving motion to vertical spindle G by means of bevel wheel H, which is geared into F. On the top of spindle G, another bevel wheel, which is keyed on for giving motion by means of bevel wheel I to horizontal spindle J, which has a pinion keyed on for giving motion to large crown wheel K, which is prevented from travelling up the screw by friction rollers LL; said crown wheel is fitted into the box L, which turns with the wheel, thereby giving motion to the nut for pressing the screw down. The nut is made of brass, and is in two sections, RR; it is fitted into the box, leaving room for each section to glide back, so as to disengage themselves from the screw M. This sliding back is effected by an ingenious arrangement, though simple in itself insures rapidity of motion and reliability of action.

DESCRIPTION.

Two wrought-iron pins P are turned to run in a hole R in the back of the nut box, one pin for each section of nut; the other end of pin runs in a corresponding hole in the cover S of nut box. The middle part of each pin has an eccentric throw T of three-quarters of an inch, so that the ends being fixed in their holes when turned must of necessity shift each section of the nut back, as shown in plan. In order to effect this and insure the sliding back of each section at the same time, the eccentric pin ends are allowed to project, U, outside the cover of box, so as to admit of a small cog-wheel, V, being keyed on each of them. To give motion to these a third wheel, W, is keyed on to a stud fitted into a hole in the middle of box cover, and allowed to turn in same. On the outside end of this stud pin a crank handle, NN, is keyed on, and the stud pinion is so geared into the eccentric pinions that one half revolution of the stud pinion has the effect of disengaging both sections of the nut, one of the eccentric pins moving upward and the other downward, which is particularly shown in section on plan. The screw M when disengaged from nut is balanced by the balance weights N, causing the monkey MM, which is keyed on to screw and screw itself to return into position, immediately for pressing on being released from nut.

The working of the press is as follows:—The wool is put into the top box BB, the back door SS being let down for that purpose, it having a false bottom O; this is done when the box is pushed back on frame which has iron rails for wheels to run on, as shown in plan. Assuming that a pressed bale is in the bottom box, and that it is being sewn during the filling of the top box, as soon as the pressed bale is pushed out the men fill the bottom box, then the top box being full and running on wheels is pushed forward into position over the bottom box; the false bottom is drawn out, and the men wind away at the winch handles DD, when, in twelve minutes, a bale weighing 5 cwt. may be pressed; then the front door, HH, of the top box is opened, and it is pushed back ready for filling again. The men sew the bale, and when finished the stud handle is turned, the nut thereby being released from its engagement the screw flies up into position ready for the next bale.

I claim that through the economy of time thus effected one-third more bales per day can be pressed. Having thus described the nature of this invention, and the manner in which the different parts are connected so as to insure the greatest effect from the power applied, I would have it understood that I do not bind myself to the precise details herein mentioned, as they may be varied or altered without departing from the nature of my invention; neither do I claim the whole of the parts separately as my invention, but I do claim the general arrangement of gearing and connections as shown on plan and described in specifications, more especially the revolving box for carrying the two sections of nut, which, of course, compels the nut to revolve in place of screw, thus simplifying the connections and considerably lessening the friction.

The general arrangement of course embraces the gearing of eccentric pins, the attachment of friction rollers for taking off the friction of the upward tendency of the screw, and the arrangement of the first motion gearing, it being a better application of power, insuring a considerable saving of labour as compared with all other presses at work at the present time.

Several of the above presses were made and worked this season, and have given the greatest satisfaction in all cases. The average rate of bales pressed at one shed being $5\frac{1}{2}$ cwt. each bale fleece wool: And I do hereby for myself, my heirs, executors, and administrators, covenant with Her Majesty, her heirs, and successors, that I believe the said invention to be a new invention, as to the public use and exercise thereof; and I do not, or believe that, any other person than myself is the true and first inventor of the said invention, and that I will not deposit these presents at the office of the Chief Secretary with any such knowledge as aforesaid.

In witness whereof, to these presents I have hereunto set my hand and seal, this 6th day of November, one thousand eight hundred and seventy-five, at Bathurst, in the Colony aforesaid.

Witness—ROBERT M. POTTER.

THOMAS DENNY. (L.S.)

This is the specification referred to in the annexed Letters of Registration granted to Thomas Denny, this twenty-eighth day of March, 1876.

HERCULES ROBINSON.

REPORTS.

SIR,

Sydney, 29 November, 1875.

With reference to Mr. Thomas Denny's application for Letters of Registration for his invention of a Press for Pressing Wool and other materials, we beg to report that there is nothing new in any of the separate parts of his plan, and nothing therefore which the applicant can claim to have invented, whether as regards the split nut, bevelled gearing, screwed shaft, or counterbalanced weight, frames or boxes for holding wool, &c., but, as far as we are aware, the arrangement of the whole is novel, and may be considered the invention of the applicant, and we would accordingly recommend that Letters of Registration be issued to him for the specific arrangement of gearing shown on the plan, and described in the accompanying specification.

We have, &c.,

GOTHER K. MANN.
E. O. MORIARTY.

THE PRINCIPAL UNDER SECRETARY.

SIR,

Sydney, 6 March, 1876.

We do ourselves the honor to return Mr. Thomas Denny's revised specification for a "Press for Pressing Wool and other materials," and to state that we are of opinion that Letters of Registration may be issued in accordance therewith, it appearing to us that Mr. Denny claims thereby to be the author or designer only of the general arrangement comprised in the plan, and not of any of the separate parts.

We have, &c.,

GOTHER K. MANN.
E. O. MORIARTY.

IMPROVEMENTS IN THE CONSTRUCTION OF WOOL-PRESSES.

LETTERS OF REGISTRATION to James Mentiplay, for Improvements in the construction of Wool-presses.

[Registered on the 25th day of April, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS JAMES MENTIPLAY, of Invercargill, in the Colony of New Zealand, merchant and engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the construction of Wool-presses," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council to grant, and do by these Letters of Registration grant unto the said James Mentiplay, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said James Mentiplay, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said James Mentiplay shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-fourth day of April, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in the construction of Wool-presses.

SPECIFICATION

Of JAMES MENTIPLAY, of Invercargill, in the Colony of New Zealand, merchant and engineer, for an invention intituled "Improvements in the construction of Wool-presses."

THIS invention of improvements in the construction of wool-presses may be divided into three parts, the first having reference to the method of opening and closing the two halves of the screw-nut through which in screw presses the screw must necessarily work, the second to certain contrivances connected with the raising and lowering of the screw, and the third having reference to certain contrivances for lowering the upper box to the level of the lower one in order to be filled, and raising it again when it is so filled.

Each half of the screw-nut has a hollow chamber behind it through which a spindle passes carrying an eccentric or cam which pushes the half-nut either backwards or forwards as required. On one end of each of these spindles is a toothed sector which gear into each other. On the boss of each of these sectors I affix the end of a lever by operating one or other of which the two halves of the screw-nut open or close simultaneously. When open the screw can be lifted straight up and down. I prefer to do so by means of a spur wheel gearing into the thread of the screw assisted by counter-balance weights attached to the upper side of the monkey. When closed the screw must be rotated in the ordinary way.

Near one end of the main driving shaft I affix a chain pulley, the chain on which passes over a chain wheel below fitting on to a horizontal shaft running quite across the press and carrying a reel near each end. On each reel there winds a rope or chain attached to one side of the upper box. This upper box has two legs, hinged at their base to the foundation plates of the press, so that by pulling it out from the framing it describes an arc of a circle, and finally deposits itself on the floor of the woolshed. When filled it is replaced in position by winding the ropes over the reels. A clutch connection throws this portion of the press in or out of gear at pleasure.

In order, however, that my invention may be clearly understood, I will proceed to refer to the drawings hereto attached, where figure 1 shows front elevation; figure 2, side elevation; and figure 3, plan of a wool-press constructed according to this invention; figure 4, being section of the screw-nut and the adjacent parts.

Adverting now to the method of opening and closing the two halves of the screw-nut A (see figure 4), I would observe, that the cam, which pushes each half backwards, or forwards, is marked A¹, and it is carried by a spindle A², at one end of which is toothed sector A³ (see figure 1). These gear into each other as shown. When the two halves are required to be opened the handle A⁴, attached to cord A⁵, is pulled, the result of this is that the lever A⁶ attached to the spindle of the toothed sector on the right hand side is pulled to the right, thus operating both spindles A² by reason of the toothed sectors gearing into each other. When the screw-nut is required to be closed again the handle A⁷ attached to cord A⁸ is pulled so as to bring the sectors back again to their original position. When these two halves of the screw-nut are separated the screw B is free to be lifted straight up and down. This I prefer to do by means of spur-wheel C, gearing into the thread of the screw counterbalance weights B¹, relieving it to a great extent. This wheel C is near the end of short shaft C¹ which carries another toothed wheel C². When C² is in gear with wheel C³ the screw can be raised, or lowered, by operating the driving shaft C⁴. In order to throw it in and out of gear I provide a slotted arm C⁵, one slot fitting over the driving shaft C⁴, and the other over short shaft C¹, these slots being made as shown, so as to admit of the latter shaft being drawn away from the former and the wheels C² and C³ thus thrown out of gear with each other. In order to this, said slotted arm is attached to one end of upright rod C⁶, connecting it to lever C⁷, pivotted at C⁸, and having a slotted extremity C⁹ to receive a crank pin on disc C¹⁰, fitted on to the end of one of the spindles of the toothed sectors, so that when they are operated for the purpose of opening the two halves of the screw-nut the toothed wheel C² is by the same movement thrown into gear with C³, and the short shaft C¹ and the spur-wheel C thereby revolves with the motion of the driving shaft.

The descent of the screw B is effected by the revolution of driving shaft C⁴, carrying bevel wheel D, which gears into crown wheel D¹ on the screw.

Referring to the method of raising and lowering the upper box, I would observe, that immediately the wool is pressed clear of it the front side of the upper box is thrown back on its hinges so as to enable it to pass free of the screw which remains pressing on the wool in the lower box. The handle of the lever E is pulled outwards, thus throwing the two halves E¹ and E² of the clutch connection into gear with each other. That half which is marked E² is formed on the boss of chain pulley E³, the chain on which gears over another chain pulley E⁴ on shaft E⁵, carrying two reels E⁶, on which are wound two cords E⁷ connected to the upper ends of two legs F, hinged to the foundation plate as shown, and carrying an iron bracket at the top in which are bearings F¹ for journals E⁸ attached to either side of the upper box. When thus thrown into gear it is evident that the rope or chain on the reels can be wound or unwound by the revolution of the handle H. When it is to be unwound, the upper box must be pushed gently forward until it is free of the lower one so as to prevent its canting, the cord being meanwhile gently unwound as required. After it is thus free it may be lowered more rapidly. When lowered, and being filled, the false bottom G is placed in it and withdrawn again as soon as it is in its place over the lower one. When thus raised to its original position the lever E is pushed inwards again and the two halves of the clutch connection E¹ and E² thrown out of gear prior to the descent of the screw B which has been raised again after the bale in the lower box has been sewn.

Having

Improvements in the construction of Wool-presses.

Having thus described the nature of this invention, and the manner of performing same, I would have it understood that I do not claim the use of either screw-nuts made in halves, or of movable upper boxes, as I am aware that such things have been used before, but

I claim—

First.—The toothed sectors marked A³ in combination with the other devices marked A to A⁸ inclusive, for the purpose of opening and closing the two halves of the screw-nut A.

Second.—The contrivances for throwing toothed wheel C² into gear with toothed wheel C³ for the purpose of operating spur-wheel C and so raising and lowering the screw as described.

Third.—The construction of wool-presses in which the upper box swivels on hinged legs or levers for the purpose of raising and lowering it as described.

This is the specification referred to in the annexed Letters of Registration granted to James Mentiplay, this twenty-fourth day of April, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 14 March, 1876.

We do ourselves the honor to return to you the documents transmitted for our report under your B.C. communication of the 8th instant, No. 76/1,667, which have reference to Mr. James Mentiplay's application for Letters of Registration for his invention for "Improvements in the construction of Wool-presses," and to state that we see no objection to the issue of Letters of Registration asked for in accordance with Mr. Mentiplay's petition, specification, drawings, and claim.

We have, &c.,

IMPROVEMENTS IN RAILWAY POINTS AND SIGNALS.

LETTERS OF REGISTRATION to John Saxby and John Stinson Farmer, for Improvements in the means and apparatus employed in interlocking and securing the safe working of Railway Points and Signals.

[Registered on the 25th April, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS JOHN SAXBY and JOHN STINSON FARMER, both of Canterbury Road, Kilburn, in the county of Middlesex, England, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the means and apparatus employed in interlocking and securing the safe working of Railway Points and Signals," which is more particularly described in the specification, marked A, and the four sheets of drawings, marked B, C, D, and E, respectively, which are hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for the period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said John Saxby and John Stinson Farmer, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said John Saxby and John Stinson Farmer, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said John Saxby and John Stinson Farmer shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-fourth day of April, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

*Improvements in Railway Points and Signals.*A.
SPECIFICATION.

TO ALL WHOM IT MAY CONCERN :

BE it known that we, JOHN SAXBY and JOHN STINSON FARMER, both of Canterbury Road, Kilburn, in the county of Middlesex, England, do hereby declare the nature of the said invention for "Improvements in the means and apparatus employed in interlocking and securing the safe working of Railway Points and Signals," to be particularly described and ascertained in and by the following statement thereof, reference being had to the accompanying sheets of drawings, and to the figures and letters marked thereon, that is to say :—

Our invention relates to improvements in the construction and arrangement of apparatus whereby when any one lever of a system of levers employed for working the points and signals of railways is moved, or about to be moved, other levers of the system are prevented from being moved, and when the said lever has been fully moved over some other levers of the system are released so that they may be moved, and to a mode of rendering the action of such of those levers as are employed for bolting the points dependent on the position of the lever that works the points, and of relating the action of switch locks when such are employed to that of the point bolts. The object attained by these improvements is safety of traffic on railways, so far as it can be secured by complete and effective interlocking of the point and signal levers by bolting and locking of the points or switches during the passage of a train over them, and by the detection of error or incompleteness in the shifting of points even when they are at a distance from the man who works them.

We will first describe our improvements in the interlocking apparatus of the point and signal levers, which are of the following description :—We mount in front of each lever of the system which has to be interlocked a vertical rocking shaft which we connect to the lever, or to its spring-catch, in such a manner that when the said lever is moved, or when its spring catch is raised to permit it to be moved, the rocking shaft is caused to turn partly round on its axis, and when the lever is pulled over, or when its spring catch is let down to hold it in the position to which it has been pulled, the said rocking shaft is turned farther round. From each such rocking shaft projects an arm which engages with a horizontal bar mounted so as to slide longitudinally along the row of levers in face of the successive vertical rocking shafts thereof, so that when the rocking shaft is partly turned the bar thus connected to it is caused to slide. These sliding bars have projections or hollows in their edges, and the vertical rocking shafts have hollows in their circumference, and these projections or hollows of the sliding bars are arranged in such relation to the hollows of the several rocking shafts as to effect the required interlocking in the following manner :—When the vertical rocking shaft of any lever has no projection of any of the sliding bars engaged in the hollow of its circumference, and when its own sliding bar is free to move, that rocking shaft is free to turn, and the lever connected to it may be moved, or the spring catch of that lever may be raised, with a view to the movement of that lever. When the movement of the lever is begun, or when its spring catch is raised before beginning the movement of the lever, the vertical shaft being thereby turned partly round withdraws the hollow of its circumference from facing projections on some of the sliding bars, and so presents an obstacle to the movement of those bars. As those bars are respectively connected, as above described, the rocking shafts belonging to other levers of the system, the levers so connected to them are thus locked. When the movement of the lever is completed, or when its spring catch is let down, its rocking shaft being farther turned still presents the obstruction to the bars already obstructed by it, and so maintains the locked condition of the levers connected to those bars, but by its farther revolution presenting hollows in its circumference to the projections of others of the sliding bars permits them to be moved, and so releases the levers with which they are respectively connected. Moreover, when by the movement of any lever or its spring catch a projection on the bar connected therewith is brought into the hollow of any of the vertical rocking shafts, those shafts being thereby prevented from turning the levers to which they are respectively connected, are thereby locked. Any of the rocking shafts may be made to work several sliding bars, and the projections and hollows on the bars can be arranged so as to effect the interlocking, as above described, according to the requirements of the particular system of points and signals to which the apparatus is applied. And in order that this general description may be better understood, we refer to figs. 1 to 12 inclusive of the accompanying drawings, showing constructive details suitable for carrying this part of our invention into practical effect. Fig. 1 represents a transverse section of a frame of point and signal levers, showing one of the hand levers A connected by an obliquely slotted bar B, a plan of which is shown by fig. 1^a, to the pin of a crank, C, on a vertical rocking shaft, D. The bar B has a slot with oblique terminations, such that at the first part of the stroke of the lever A, the crank C and rocking shaft D are turned partly round, and at the last part of the stroke it is turned farther round in the same direction. Fig. 2 represents a like arrangement, the rocking shaft D being in this case mounted horizontally, and its crank C worked by a vertical rod, E, the pin of which travels in the slot of B. Some of the rocking shafts D, of which there is one to each hand lever, work sliding bars, F, having on them projections which either obstruct or are obstructed by others of the rocking shafts, as will be more fully explained hereafter. Instead of working these rocking shafts by the movement of the hand levers A, as shown in figs. 1 and 2, they are preferably worked from the movement of the spring-catches of the levers, so that on closing the spring-catch handle before moving any lever the necessary locking of some of the other levers is effected, and the unlocking of others of the levers is not effected till after the lever has been fully moved over and its spring-catch let go. For this purpose the movement of the rocking shafts is effected by connecting them to the rockers which are worked by the movement of the spring-catches, as described in the specifications of British Patents granted to the said John Saxby on the 17th June, 1871, No. 1601, and the 23rd June, 1871, No. 1655. Fig. 3 represents a transverse section; fig. 4, an elevation; and fig. 5, a plan of a system of four levers having their interlocking effected by the movement of vertical rocking shafts worked in this manner; fig. 8 represents a transverse section; fig. 9, an elevation; and fig. 10, a plan of a like system of four levers having horizontal rocking shafts worked in a similar manner. Figs. 6 and 7 show to an enlarged scale sectional plans of the vertical rocking

Improvements in Railway Points and Signals.

rocking shafts in two of their attitudes; and figs. 11 and 12 in like manner show to an enlarged scale longitudinal sections through the horizontal rocking shafts in two attitudes. We will first describe the mode of communicating motion from the spring-catches to the rocking shafts, whether they be mounted vertically or horizontally, referring to figs. 3, 4, 5, 8, 9, and 10, in which the same letters are employed to mark corresponding parts. The sliding rod K of the spring-catch of each of the hand levers A has at its lower end a stud, *k*, which works in the slot of the rocker G, so that when the rod K is raised by grasping the handle of the spring catch the rocker G is caused to oscillate vertically, the front end being raised. The lever A being then pulled over the stud *k* travels along the slot in G, and when the lever has attained the end of its stroke the spring catch rod K being allowed to descend, its stud *k* descending gives a farther oscillation to the rocker G in the same direction as before, that is to say, causes its front end to rise farther. To prevent the shifting of the rocker G while the stud *k* is passing along its slot over or near its fulcrum, we attach to the rocker a vertical rod L which passes through a slot in a horizontal bar M connected to and moving with the hand lever A. A plan of this slotted bar M is shown at fig. 13; the slot is narrower along the greater part of its length but is widened out at the ends, and the rod L is made with a thinned part presenting shoulders which can pass through the wide parts of the slot in M, but cannot pass through the narrow part. Thus, when the front end of the rocker G is raised, as above described, the upper shoulders of L are brought over the bar M through the widened end of its slot, and the lever now being moved the narrow part of the slot in M being thereby made to travel along the thinned part of L so that there are shoulders above and below M, the rod L cannot move vertically, and consequently the rocker G is kept steady until the terminal widened part of the slot in M is brought to face the rod L, whereupon the lower shoulders can rise through the widened slot, permitting the rocker to make its farther stroke on the descent of the catch rod K. The rocker G is connected by a rod H to the crank C of the rocking shaft D. In the case where the rocking shaft D is mounted horizontally, the connecting rod H¹ is jointed in two planes to allow for the vertical and horizontal circular movements of the rocker G and crank C respectively. The rocking shaft belonging to each lever being thus partly turned round by the first part of the lever's movement when it is worked from the lever, as in figs. 1 and 2, or before the commencement of the lever's movement when it is worked from the rocker G, as in figs. 3, 4, 5, 8, 9, and 10, and being farther turned round in the one case by the last part, or in the other case after the termination of the lever's movement, the interlocking is effected by the agency of these rocking shafts in a manner which will be understood in reference to figs. 6 and 7, and to figs. 11 and 12. Two of the rocking shafts D³ and D⁴ have arms, *d*³ and *d*⁴, which, by means of studs entering gates on sliding bars, F³ F⁴, cause these bars to slide to and fro longitudinally when the rocking shafts are turned on their axes. These bars have on them projections, *f*¹ *f*² *f*³, and the rocking shafts are made with hollowed and flattened parts in their peripheries, in such manner that in some cases the sliding bars are obstructed by the rocking shaft so that they cannot slide, or that they obstruct the rocking shafts so that the latter cannot turn. It will be seen, for example, that the bar F⁴ in fig. 6 is obstructed by its projections *f*¹ and *f*² bearing against the solid parts of the shafts D¹ and D², and consequently the rocking shaft D⁴ which works the bar F⁴ cannot be turned, whereby the lever or spring catch which should move D⁴ is locked. Also the projection *f*³ on the rod F³ catching in a hollow of the shaft D² prevents that shaft from turning, and consequently locks the lever or the spring-catch which works D². When however by the movement of D³ which is free the projection *f*³ is withdrawn from D², as shown in fig. 7, and when D¹ and D² are turned partly round, as shown in the same figure, then the projections *f*¹ *f*² are free to be moved along the hollowed out parts of D¹ and D², and if they were so moved with the bar F⁴ by the partial turning of D⁴ they would in their turn obstruct the shafts D¹ and D², and consequently lock the levers or spring-catches connected to those shafts. In like manner, on referring to fig. 11, it will be seen that *f*¹ locks D¹, and that *f*² and *f*³ are locked by D² and D³ respectively; but that on D² being partly turned, as shown in fig. 12, on *f*¹ and *f*² being moved with the bar F³ by turning D³, and on *f*³ being moved with the bar F⁴ by partly turning D⁴, then D² and D³ become locked, and D¹ is free and may be turned into the position indicated by the dotted lines, thus locking *f*¹, the bar F³, and the shaft D³.

Although in the figures we have shown the interlocking of four levers only, it is to be understood that by repetition of the sliding bars F with stops or projections on them like those above described, placed in suitable positions, any number of levers can be interlocked in a similar manner, according to the requirements of the system of points and signals which those levers may have to work.

We will now describe our improvements in the construction and arrangement of the apparatus for bolting and locking a set of points applicable in cases where one of the levers of the system is appropriated not to the actual movement of the points nor to the movement of a signal, but simply to bolting the points in position when they have been shifted, and to unbolting them as a preliminary to shifting them, such bolting lever being like those which work the points and signals connected by rods extending from the signal box to a bolt situated at the points. The leading feature of our improvements in respect to the use of such a point-bolting lever is that it is always moved in the same way for the purpose of bolting the points whichever way they may be set, and that it is moved always in the opposite direction for unbolting them, so that the attendant has not in the action of bolting to consider the position of the points, the effect of the movement of the bolting lever being automatically determined by the attitude of the lever that moves the points. Thus this bolting movement is made to serve as a test of the efficiency of the point lever in moving the points, showing when it is obstructed that the points through a failure of the connections to them have not moved, or have only partially moved in obedience to the point lever, and the bolting lever being interlocked with the signal levers the obstruction to the movement of the former prevents the giving of a signal contradictory to the actual position of the points. And furthermore, when a switch lock is used in combination with the bolting apparatus, the bar of the switch lock, according to our arrangement, when such a bar is employed, remains clear of passing trains, both when the points are bolted, and also when they are unbolted, but the act of unbolting the points being always accompanied by the movement of the switch lock the unbolting is rendered impossible while a train is passing the switch lock. For the purpose of attaining these objects, I place the lever for bolting the points preferably next in the frame to the lever for moving them, and I so arrange the connection from the bolting lever to the rods by which its movement is communicated to the bolt at the points, and so connect the point lever to these rods, that when the point lever stands in one attitude, as for example, in the position which would set the

Improvements in Railway Points and Signals.

the points right for the main line, the movement of the bolting lever causes its rods to be pulled, but when the point lever stands in its other attitude, as for setting the points right for the branch line, the same movement of the bolting lever causes its rods to be pushed. This may be effected in various ways, as for example, by making one of the rods worked by the bolting lever with a pin sliding in a curved slot extending on both sides of the fulcrum of a lever, and connecting this rod to the point lever in such manner that when the point lever is in the one attitude the sliding pin is on the one side of the fulcrum, and when the point lever is moved to its other attitude the pin is slid to the opposite side of the fulcrum. Or the rod of the bolting lever may be made to work the one or the other of two rods, each made with a gab, one of which in one position of the point lever engages with a pin on the one side of the fulcrum of a lever, and the other of which in the other position of the point lever engages with a pin on the opposite side of the fulcrum. Or the bolting lever may be connected to a duplicate bell crank provided with a clutch moved by the point lever, so that in one position of the point lever one arm of the bell crank is made to operate on the bolting rods, and in the other position of the point lever the opposite arm is made to operate, the bolting rods extending from the bolting lever to the bolt at the points being thus made to move in the one direction when the points are, or should be, in the one attitude, and to move in the opposite direction when the points are, or should be, in the other attitude, are connected to a slide fitted to cross the rod of the two switch rails. On this slide are fixed two bolts or plungers directed opposite ways, one on each side of the tie rod, and holes are provided in the tie rod, into which the one or the other of these plungers can be inserted when the points are home in the one direction or the other, but the two plungers and their respective holes are so placed that neither plunger can be inserted into the hole appropriated to the other. In the middle position of the bolt slide corresponding to one position of the bolting lever, neither plunger being inserted into its holes, the points are free to be moved; but when the points have been shifted by the point lever to the one attitude then the movement of the bolting lever by pulling its rods causes one of the plungers to be inserted into its hole in the tie rod so as to lock the points. And when again the points have been shifted to their other attitude, the same movement of the bolting lever having in that case the effect of pushing its rods causes the other plunger to be inserted. Should the movement of the point lever fail to shift the points, or to shift them sufficiently far, then the proper plunger being unable to enter the hole in the tie rod the movement of the bolting lever will be obstructed, and such obstruction will serve as an indication of failure in the connections from the point lever to the points. And farther, when the bolting lever is interlocked with the signal levers the obstruction to the movement of the former will prevent the giving of a signal in contradiction to the actual position of the points. In cases where a switch lock is employed, consisting of a bar mounted by the rail to move on radii like the blade of a parallel ruler, as described in the specifications of English Patents granted to Livesey, Edwards, and Jeffreys, on the 27th February, 1867, No. 547, and to us the said John Saxby and John Stinton Farmer, on the 25th February 1870, No. 569, we connect by a toggle joint one of its radii to the bolt slide, or to one of the bolting rods worked as above described, in such manner that when the bolt slide is in its middle position, leaving the points free, the toggle joint is then in its middle or straight attitude, and the switch lock is at the extreme of its stroke in one direction clear of the wheels of passing trains; and when the bolting slide is moved in either direction, so as to insert the one or the other of the plungers into the tie rod, the toggle joint being thereby moved to the one side or the other of its middle position moves the switch lock to the other extreme of its stroke, where also it is clear of the wheels of passing trains, the points being then bolted; and farther, as the movement of the bolting lever for withdrawing either bolt from the tie rod is communicated through the toggle joint to the switch lock, such movement cannot be performed while any wheel is passing over the latter, and thus the points are kept locked during the passage of a train. Instead of connecting the bar of the switch lock by a toggle joint to the bolting gear it may be connected thereto directly, providing it with a set of duplicate slotted radii crossing each other, so that when the bar is moved in either direction it works on one set of the radii, the slots of the other radii allowing them to slide on their pivots. Constructive details suitable for carrying these improvements into practical use are shown in figs. 13 to 29 inclusive of the accompanying drawings. Fig. 13 represents a side view of a point lever A, and a switch bolting lever B set side by side, with means, according to our invention, of making the one movement of the lever B in the direction of the arrow effect the bolting of the points, whether by a push or a pull of the rods worked by it according as the lever A is in the position shown in fig. 13, or in the position indicated by the dotted line *a*. For this purpose the lever A is extended below its fulcrum, and its lower end is provided with a pin entering a slot in a rod C. The upper end of this rod has a pin which enters a curved slot, B¹ B², formed in a piece attached to the lever B, and its lower end is connected to a bell crank, D, which by means of rods, E, is connected to the switch bolting apparatus that will hereafter be described. When the lever A is in the position shown (which position it may be understood is that corresponding to the points being set for the main line), then on pulling over the lever B the rod C will be pushed downwards as indicated by the arrow, and the switch bolt connected to D will be moved by a push of the connecting rods E. When on the other hand the lever A has been moved over to the position *a* (thus having shifted the points from the main line to the branch) its lower end A¹ will have caused the rod C to sweep towards the left, thereby bringing it to the position dotted *c* with its upper end at the end B² of the slot. On now pulling over the bolting lever B in the same direction as before, the rod C will be drawn up, and the bell crank D will be made to act by a pull of the rods E connecting it to the bolting apparatus.

Fig. 14 represents a side view of a modified form of this apparatus. In this case the point lever A is linked to two rods, C¹ C², which are both jointed to the bell crank D, and have gabs near their upper ends. The bolting lever B has cross arms, each carrying a stud, B¹ and B², on opposite sides of the fulcrum.

It will be seen that when the lever A is in the one position the gab of one of the rods C² is engaged on the stud B², but if the lever A were moved over to the left the gab of C¹ would be engaged with B¹, and the action of the lever B on the bell crank D and rods E would be reversed. It is obvious that instead of arranging the reversing gear shown in figs. 13 and 14 immediately at the levers themselves, gear of the like description might be arranged in other positions, the point lever A being connected to a rod C or to rods C¹ C² in any convenient manner, so as to determine by the position the movement of the bolting rods E to be as a push or a pull.

Fig.

Improvements in Railway Points and Signals.

Fig. 15 represents a side view of another modification of this apparatus, fig. 16 being a front view of the lower part, and figs. 17 and 18 showing to a larger scale details which we will presently explain. In this case the point lever A coming in front of the bolting lever B hides the latter, except its bell crank end, which is connected by a rod C to two lever arms, D^1 and D^2 . At the side of each of those arms is another arm, d^1 d^2 , respectively, each pair being mounted on pins, a^1 a^2 , and the arms, d^1 d^2 being both jointed to the rod E connecting to the bolting apparatus. The two pins a^1 a^2 are fitted to slide in sockets, and are swivelled to opposite arms of a lever, A^2 , worked by a rod, A^1 , from the point lever A. The pin a^1 swivelled to the upper arm of A^2 , and passing through the bosses of D^1 and d^1 is shown in the longitudinal section, fig. 17, and a transverse section of the pin a^1 and boss d^1 is shown in fig. 18. From the latter fig. it will be seen that on the pin a^1 there is a clutch projection a^3 which enters a notch in the interior of the boss of D^1 , and also of d^1 when the pin a^1 is in the position shown in fig. 5, thereby clutching together the two arms D^1 and d^1 , but if the pin a^1 be drawn towards the right then the projection a^3 will be drawn out of the notch in D^1 , and the arm D^1 will then be unclutched from d^1 and can be moved independently thereof. It is to be understood that the lower pin a^2 is fitted in like manner with respect to the arms D^2 and d^2 . Now as the longitudinal position of the pins a^1 a^2 depends on the position of the point lever A, the one being drawn out and the other pushed in, according as that lever is pulled the one way or the other, the clutching of D^1 to d^1 , or of D^2 to d^2 , is thereby made to depend on the position of A, and thus if for example D^1 and d^1 are clutched together, while D^2 and d^2 are disengaged, the pulling up of the rod C will, through D^1 and d^1 acting for the time as a solid bell crank, pull the rod E, but if by moving the lever A, and consequently moving A^2 and the pins a^1 a^2 , the arms D^1 and d^1 become unclutched while D^2 and d^2 become clutched, then the pulling up of the rod C, the same action as before will now acting through D^2 and d^2 push the rod E.

Fig. 19 represents a plan, and fig. 20 a longitudinal section of part of a line of railway in close proximity to a pair of points, P P, with the bolting apparatus for these points arranged to operate according to our invention, in conjunction with any form of the apparatus which we have already described in reference to figs. 13 to 18 inclusive, and with a switch locking bar S, such as is described in the specifications of English Patents granted to Livesey, Edwards, and Jeffreys, on the 27th February, 1867, No. 547, and to us the said John Saxby and John Stinson Farmer, on the 25th February, 1870, No. 569, mounted by the side of one rail or radii, R R, as more clearly shown to an enlarged scale in the part side view, fig. 21, and section, fig. 22. The rod E, fig. 19, is supposed to be the distant termination of the rod B in figs. 13, 14, and 15, which as already described is pulled or pushed by one and the same movement of the bolting lever B, according as determined by the attitude of the point lever A. This rod E is by a bell crank E^1 and rod E^2 connected to one limb T of a toggle joint. This limb is the one arm of a bell crank, the other arm of which is connected by a rod, T^1 , to a sliding bolt, F, an end view of which is shown at fig. 23, and a plan to an enlarged scale at fig. 26. This bolt is fitted to slide across a bar P^1 , which connects the pair of points PP, through which bar are cut two holes of different shapes or at different levels fitting respectively two projecting ribs, f^1 f^2 , on the sliding bolt F. In the fig. these projecting ribs are shown to form with the slide F bolts of T shape, one being in an inverted position in relation to the other; one of the holes as p^1 , fig. 23, is fitted to receive the rib f^1 , the other hole being inverted to receive f^2 . The distance of these holes apart is equal to the throw of the points, so that when the points are home on the one side, as shown in fig. 19, to make the road good (say) for the main line, then by a push of the rod E, and consequently of the rod T, the rib f^2 will be thrust into its hole p^2 in the bar P^1 , but a pull of the rod E could not draw the rib f^1 into the hole p^1 , because the hole does not fit it. Again, if the points were moved over to the other side, then the hole p^2 would be moved away from facing f^2 , but the other hole p^1 would be brought to face f^1 . In that case a pull of the rod E would draw the rib f^1 into the hole p^1 , but a push of the rod E could not thrust f^2 into that hole, which it does not fit. Now as the position of the points P P is determined by means of the point lever A, and as the movement of the rod E whether to pull or to push is determined by the same lever A by the means already explained, the following consequences flow from the connections which we have described. If the points be not home to either side the bolt F cannot be shot in either direction, because neither of its ribs will find its hole in the bar P^1 facing it, consequently the bolting lever B will be obstructed, and the operator will know that the points are not home. Again, if the pointsman intended to shift the points, but owing to some yield or severance of the connections failed to do so, then having moved his point lever for this purpose he would have so altered the action of the rod E from a pull to a push, or *vice versa*, that he would be unable to move the bolt F, the wrong hole being presented to one of its ribs. Thus, by the obstruction to his bolting lever he would be apprised that the points had not obeyed him. When, however, the points completely obey the point lever, the operator can then by the same movement of the bolting lever shoot the one or the other of the bolts f^1 or f^2 , and so hold the points firm, preventing them from being moved until they are unbolted. And it is readily seen that by interlocking the bolting lever with the other point and signal levers of the system, the unbolting of the points may be made to depend upon the proper condition of all or any of the other levers of the system. The second limb T^2 of the toggle joint fig. 19, is connected by a lever T^3 with the switch locking bar S^1 , which, as explained in the specifications above referred to, is for the purpose of keeping the points from being moved during the passage of a train. When the toggle joint is in its middle or in either of its extreme positions (indicated by the dotted lines in fig. 19) the bar S is in its extreme position to right or to left, but the movement of the rod E, whether it is pushed or pulled by moving the toggle joint, T^2 , from one or other of those positions, has the effect of pulling the bar S over from the one extreme to the other, causing it to rise in its traverse as determined by its radii R. If then while any wheel of a train is passing over the bar S it were attempted to unbolt the points by either the push or the pull of the rod E, as the toggle joint would in obedience to such movement have to pass from its extreme to its middle position, and so would have to raise the bar S, the flange of the passing wheel preventing S from rising would effectually obstruct the movement, and so prevent the points from being unbolted. At the same time while the bolts on F are both withdrawn the points can be moved, the bar S remaining down.

Fig. 24 represents a plan, and fig. 25 a longitudinal section of part of a railway at a pair of points with connections acting in the same manner on the switch bolt and locking bar, but in a somewhat modified form, figs. 27 and 28 showing to an enlarged scale side views of the locking bar and its mountings

Improvements in Railway Points and Signals.

in one of its extreme positions and in its middle position respectively, and fig. 29 being a section through the rail and bar. In this case while the bolting of the points is effected in the manner already described, the toggle joint connection to the locking bar is dispensed with by providing the said bar S with a duplicate set of radii R with slotted holes as shown in figs. 27 and 28, and connecting it directly to an arm, T², of the lever T. The slots in the radii R permitting the bar to travel in either direction from its middle position, either the push or the pull of the rod E will cause it to rise in its traverse to one or other of its sets of radii, and when this rise is prevented by the flange of a passing wheel the unbolting of the points is consequently prevented.

Having thus described the nature of our invention, and in what manner the same is to be performed.

We claim—

First.—The use in the interlocking gear of railway point and signal levers of rocking shafts having hollows or flattened parts in combination with sliding bars having projections, these shafts and bars being worked by the movement of levers of the system, or of their spring catches in such a manner as to obstruct or release each other, substantially as herein described.

Second.—Connecting the lever which works a pair of railway points to the rods or connections worked by the lever which bolts those points in such manner that the one movement of the latter lever is made to act on the bolting apparatus by a pull or a push of its rods according to the position of the point lever, substantially in the manner and for the purposes herein set forth.

Third.—The combination of apparatus operating as described in the preceding claim with a switch lock bar, in such manner that when the movement of the said bar is prevented by wheels of a passing train, the rod from the bolting lever, whether it be subjected to a push or a pull, is also prevented from moving, and thus the unbolting of the points is likewise prevented, substantially as herein described.

In witness whereof we the said John Saxby and John Stinson Farmer have hereunto set our hands and seals, this twenty-eighth day of July, in the year of our Lord one thousand eight hundred and seventy-five.

JOHN SAXBY. (L.S.)
JOHN STINSON FARMER. (L.S.)

A.D. 1876, 28th April. No. 522.

IMPROVEMENTS IN PRINTING AND EMBOSSED MACHINES.

LETTERS OF REGISTRATION to Edward Hely, for Improvements in Printing and Embossing Machines.

[Registered on the 29th day of April, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS EDWARD HELY, of the city and county of Dublin, in the Kingdom of England, envelope manufacturer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Printing and Embossing Machines," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions or improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Edward Hely, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof, to have, hold, and exercise unto the said Edward Hely, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Edward Hely shall not, within three days after the granting of these Letters of Registration, register the same in the proper office of the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-eighth day of April, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Printing and Embossing Machines.

SPECIFICATION.

TO ALL TO WHOM IT MAY CONCERN :

BE it known that I, EDWARD HELY, of the city and county of Dublin, in the Kingdom of Ireland, have invented new and useful improvements in printing and embossing machines, which improvements are fully set forth in the accompanying specification.

This invention relates to improvements in printing and embossing machinery, for printing or embossing rapidly and accurately, and at a very small cost for plant, bill heads, letter paper, envelopes blanks, et cetera, and in such manner that several different colours can, if desirable, be combined in the device with perfect accuracy.

In the drawings hereunto annexed similar letters of reference indicate like parts. In these A is the bed-plate, BB⁴ vertical guides, adjustable thereon, and attached thereto by means of bolts, for firmly securing the pile of cut envelope blanks or other stationery requiring printing; CC¹ the framework of the machine; D lever, connecting it with a treadle for working it; E sliding piece, working vertically in bearings, so as to secure rigid accuracy of descent; F stirrup, continuation of slide, carrying the machinery; G a metallic cylinder, preferably brass, rigidly connected to the stirrup, F, by axle, J, and pin, H, and carrying in a recess in its lowest part the block of type or other device to be set off on the paper; II are frames at opposite ends of the cylinder, G, outside the stirrup, F, and free to rotate on the main axle, J, subject to the restricting action of the pin, K, in the slot, L, of the subsidiary frame or bracket, C¹; M is another pair of frames inside the stirrup, F, but rigidly screwed to the frames, II at N. O is the ink trough securely fixed to the cylinder, G, and containing metallic roller, P, upon which is keyed the ratchet arrangement, Q. The machine is so weighted as to stand naturally in the position shown in the drawing. The treadle being depressed, the slide, E, and stirrup, F, descend, carrying the axle, J, along with them, but the pin, K, being obliged to traverse the slot, L, causes the frames I and M to revolve round the cylinder until the pin, K, reaches the vertical part of slot, L, when all motion ceases, except the vertical one. At this point the frames, M, have rotated far enough for the first inking roller, Q, to touch the feed roller, P. The treadle being released the whole flies back to the normal position. The tappet, S, now comes in contact with the wheel, R, and is depressed thereby, causing the ratchet to revolve through the space of one tooth, and thus place a fresh portion of the inky feed roller uppermost to be touched on the next stroke by the roller, Q. In this way the roller, Q, at each stroke takes up a fresh quantity of ink, and spreads it as it revolves over the polished surface of the cylinder, G. Rollers Q¹ and Q² continue the operation of spreading. The next roller, T, is placed slightly askew, and tends still further to spread the ink evenly. It is again followed by the rollers, U U, which ink the type in the block shown in dotted lines in fig. 2 at V. The various rollers, Q, T, U, et cetera, have bearings sliding in slots in the frames, and to keep them firmly bearing against the cylinder, G, and block, W, wire rings or hooks are placed round the continuations of the axles, and are fastened to the pins, V V, by means of elastic bands (these latter are omitted in the drawings, except in the case of roller Q¹ in fig. 2, so as not to unnecessarily complicate the drawings). I make the slot in which the roller, Q, works larger in breadth than the axle, and adjust the pawl, X, bearing against it by means of the spring, Y, so as to allow a little play and insure the contact of the two rollers Q and P every time, even when they have become worn. All the rollers are made of the usual composition of which inking rollers are composed, and with a metallic core, except in the case of the metallic feed roller, P, which is entirely brass. A metallic plate, Z, is placed on the trough, O, almost in contact with P, and adjustable so as to regulate the thickness of ink taken up by roller, P, and also to keep dust, et cetera, from falling into the ink trough. The ratchet pawl, S, is prevented from rising higher than the horizontal position when not in contact with the pulley, R, by means of two catches, a and b, on the ratchet, S, and the ink trough, O, and shown in figs. 1 and 3. If at any time too much ink is being fed to the machine, the supply can at any time be temporarily cut off, by placing the ratchet catch in a vertical position, the end, S, being lowest. Before commencing printing operations, a pile of blanks to be printed, d, fig. 2, all cut to exactly the same size, is so adjusted that the block of type or device shall print in the right place; the 4 guides, BB, fig. 2, are then screwed down, so as to prevent the possibility of lateral motion in the pile of blanks and the attendant works, the treadle pulling off the top paper printed after each stroke. To use the machine for a different colour, all that is wanted is to clean or change the block, wipe the cylinder, G, and put a fresh set of rollers and ink trough on. It is found, however, in practice that a fresh machine for each colour is the best plan; and in printing a device of several colours all that is required is to get the first impression for each colour to exactly fit, and all future ones will do so. Whenever the pile of blanks gets low, the attendant puts a lot more on, so as always to have a pile sufficiently thick to be slightly compressible, and when all the blanks but the bottom ones are printed a few of the already printed ones can be placed below the remaining ones to raise them up. I sometimes arrange the machine to print two or more colours at the same time on different parts of the same sheet. This is effected by putting divisions in the ink trough, and dividing the rollers into two or more lengths, by means of cuts or grooves extending nearly to the metal core. In each division of the trough a different coloured ink is placed. I claim as my invention—

1. The combination in a printing machine of a cylindrical inking table, G, with the block, W, and the rollers, P, Q, T, U, et cetera.
2. The combination in a printing machine of a cylindrical inking table, G, with the vertical slide, E, causing the block, W, to descend vertically.
3. The combination of the axle, J, the pin, K, traversing slot, L, with the frames, M and I, so as to give to the said frames the requisite circular and vertical motion.
4. The combination of the guides, B, with the bed-plate, A, and the printing block or type, W, obliged always to descend in the same vertical line for printing envelope blanks, bill heads, and other stationery, previously cut to a uniform shape.
5. The combination of the metallic inking roller, P, the ink trough, O, the ratchet arrangement, S, and the roller or stop, P.

Improvements in Printing and Embossing Machines.

6. The mode of keeping the rollers, Q', et cetera, continually against the inking table by means of elastic connections and pins, V, for the purposes described.
7. The mode of ensuring contact between the roller, Q, and the inking roller, P, by means of the pawl, X, and the spring, V.
8. The combination in a treadle worked printing machine of the sliding piece, E, with the lever, D, projecting backward to connect with the treadle below, so as to leave the table, A, unimpeded, to allow free range for the operator's arms.
9. The mode of printing with two colours at the same time, as shown in the paragraph immediately preceding the claims.

Witness my hand and seal this second day of December, 1875.

EDWARD HELY. (L.S.)

Witness—F. C. BARKER, Abbeyview, Dalkey, County Dublin.

This is the specification referred to in the annexed Letters of Registration, granted to Edward Hely, this twenty-eighth day of April, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 5 April, 1876.

We do ourselves the honor to return to you the documents transmitted under your B.C. communication of the 20th ultimo, No 761/1,953, for our report, and which have reference to Mr. Edward Hely's application for Letters of Registration "for an invention for Improvements in Printing and Embossing Machines," and to inform you that on examination of Mr. Hely's petition, drawings, specification, and claim, we see no objection to the issue of Letters of Registration in accordance therewith.

We have, &c.,

ANGUS'S SHAFT OR POLE DETACHER.

LETTERS OF REGISTRATION to William Thomas Angus, for an Invention or Improvement in the construction of vehicles, and for the more rapid and easy detaching of the shafts of vehicles.

[Registered on the 4th day of May, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS WILLIAM THOMAS ANGUS, of Castlereagh-street, in the city of Sydney, in the Colony of New South Wales, coachbuilder, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention styled "Angus's Shaft or Pole Detacher," which is more particularly described in the specification and drawing which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said William Thomas Angus, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said William Thomas Angus, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said William Thomas Angus shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this third day of May, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Angus's Shaft or Pole Detacher.

SPECIFICATION.

WHERE the shafts are usually attached to the vehicle, two bolts are passed through secured by nuts. The petitioner's plan is to pass a steel rod, marked A on plan, of one length through the usual place of the connecting bolts, as well as through two other eyes, B on plan, fixed to the front axle bed; the steel rod, A, has shoulders, C, bearing on one side of shaft connection, and two other shoulders, D, to give a bearing for two pieces of indiarubber, E, that it passes through, to give the requisite force to keep the rod, A, in its place; in the centre of the rod, A, a stay, F, is fixed at a right angle and passing up through a hole in an arm, G, that is fixed to the perch or king bolt, H, in front and between the two beds, which bolt is lengthened so as to pass up a few inches into the front part of the body of the conveyance, just where the feet of a person using it are placed, and having a square end, to which is fitted an iron lever, I, six inches or more long (which can be removed whenever desired). By pressing the foot against this lever, I, the perch or king bolt, H, is turned, and the arm, G, forces the bolt or rod, A, clear out of the shafts or pole, which are then free.

The petitioner claims for this plan the great advantage of easily detaching the horse from the vehicle, when running away or unmanageable, giving a greater security from risk of serious accident on such occasions; also, the advantage of simply and instantaneously removing the shafts or pole when it is desired to substitute the one for the other, or where the coachhouse is small; also, a greater security against accidents arising from the bolts being improperly fastened, and in consequence falling out. The expense also will be but trifling, and, with very slight modifications, the invention or improvement can be applied to any vehicle.

W. T. ANGUS.

This is the specification referred to in the annexed Letters of Registration, granted to William Thomas Angus this third day of May, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

In the matter of the application of Mr. William Thomas Angus for Letters of Registration for an invention or improvement in the construction of vehicles, and for the more rapid and easy detaching of the shafts of vehicles, which has been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

Sydney, 12 April, 1876.

IMPROVEMENTS IN APPARATUS FOR WASHING COAL SLACK.

LETTERS OF REGISTRATION to Edward Taylor, William Brown, and Peter Langwill, for Improvements in Apparatus for Washing Coal Slack.

[Registered on the 4th day of May, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS EDWARD TAYLOR, of Melbourne, in the Colony of Victoria, engineer, WILLIAM BROWN, of Melbourne aforesaid, engineer, and PETER LANGWILL, of Melbourne aforesaid, merchant, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Apparatus for Washing Coal Slack," which is more particularly described in the specification and sheet of drawings which are hereunto annexed ; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria number twenty-four ; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Edward Taylor, William Brown, and Peter Langwill, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof : to have, hold, and exercise unto the said Edward Taylor, William Brown, and Peter Langwill, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always that if the said Edward Taylor, William Brown, and Peter Langwill shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this third day of May, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Apparatus for Washing Coal Slack.

SPECIFICATION for an invention intituled "Improvements in Apparatus for Washing Coal Slack."

WE, EDWARD TAYLOR, of Melbourne, in the Colony of Victoria, engineer, WILLIAM BROWN, of Melbourne aforesaid, engineer, and PETER LANGWILL, of Melbourne aforesaid, merchant, do hereby declare that the nature of our said invention, and the manner in which the same is to be performed, to be particularly described and ascertained in and by the following statement, that is to say:—

This invention relates to apparatus for washing coal slack for making coke, and consists of certain improvements upon the machinery or apparatus at present employed for washing such slack, by means of a current of water forced upwards by the aid of pistons or plungers through perforated sieves.

In the first place, we provide the said pistons or plungers with clacks or valves to prevent the back suction as the pistons rise. Secondly, we carry the water supply pipes round the sides of the "bashes" underneath the sieves, and perforate the same so as to distribute the water and keep the sides of the "bashes" clean. Thirdly, we make the slides or valves for removing the dirt from the bottom of the "bashes" self-acting, by connecting them to cranks by means of rods in such a manner that any one or more of the slides can be disconnected or connected at pleasure; or in some cases we work them by hand, by means of levers so placed that the operator can work them without moving from his position near the sluice. Fourthly, we attach to the interior of the door of the "bashes" a scraper which can be worked from the outside, by means of which the dirt or sediment at the bottom of the "bashes" may be stirred, and the quantity and condition thereof ascertained or felt from the outside of the "bashes" without opening the same. Fifthly, we cover or protect the wire sieve on the overflow shoot through which the water escapes with a perforated shield or cover, to prevent the slack passing over from rubbing and wearing the same. When the perforated cover becomes worn it can easily be replaced. Sixthly, between the sieves and the overflow shoot we place sluices, sliding between two planed surfaces, and raised and lowered by means of a hand wheel and screw at each end. Seventhly, we provide each sieve with a scraper, by means of which the heavy dirt which is too large to pass through the sieve can be drawn or scraped off the surface of the sieve towards the sluice when required to clear the sieve. Eighthly, instead of running the water from the overflow shoot (which contains a large amount of coal dust) into filter beds, we pump it up into a cistern, where it passes through a filter plate or division, whence it flows into the supply shoot, and is returned with the fresh slack into the "bashes" above the sieve; and it is thus used over and again, whilst the clear water only that passes through the filter partition is supplied to the "bashes" beneath the sieves.

Such being the nature and object of our said invention for "Improvements in Apparatus for washing coal slack," we will now proceed to describe more in detail the manner in which the same is to be or may be performed or carried into practical effect; and in order that the same may be clearly understood, we have annexed hereunto a sheet of drawings illustrative thereof, and have marked the same with figures and letters of reference corresponding with those in the following explanation thereof:—

In the annexed drawing figure 1 is a sectional elevation, and figure 2 a plan view of so much of the coal slack washing machine as is necessary to illustrate the application of our improvements thereto. *aa* is a framing of the apparatus, *bb* the "bashes," *cc* the sieves, *dd* the cylinders, and *ee* the pistons or plungers. We provide the latter with clack, *ff*, in order to prevent their suction when rising from drawing slack down through the sieves *cc* with the dirt. *gg* are the water supply pipes, which are perforated and carried round the sides of the "bashes," so as to keep the sides of the "bashes" clean, and distribute the supply in such a manner as to cover the whole of the under surface of the sieves with water moving in the required direction, but without too much force on any particular part. At the bottom of the "bashes" are the slides or valves, *hh*, for drawing off the dirt. These slides may be made self-acting by connecting them to a revolving crank shaft, *ii*, by the rods *kk*, which latter are hinged and provided with notches so that any slide can be disconnected at pleasure by raising its rod on the hinge as shown at figure 3, and reconnected by merely lowering the rod. If the slides *hh* are not required to be self-acting, we work them by rods, *mm*, attached to levers, *nn*, the handles of which are within reach of the operator as he stands beside the sluices, as shown at figure 1. *oo* are the agitators attached to the man-hole doors *pp* of the "bashes," and provided with winch handles, *qq*, for ascertaining the quantity or condition of the dirt or sediment in the "bashes" without opening the doors. *rr* is the overflow shoot. The fine wire sieve *ss*, of which we protect with a perforated plate, *tt*, to prevent the large pieces of slack from damaging the sieve, and thus lessen the waste of slack which always takes place on the slightest injury to the wire gauze. *uu* are the sluices which work between two planed surfaces, *vv*, to prevent the slack from passing away or the grit from getting between the working surfaces, and we employ two screws, *ww*, so that either end of the sluice can be raised or lowered separately (see front view, figure 4). *xx* are the scrapers raised about two inches above the surface of the sieve, by means of which the operator can, with comparatively little trouble, keep the dirt accumulating on the sieve at the desired minimum (see figures 8 and 9). The water from the overflow shoot *rr* is pumped up into a cistern, *yy*, placed above (see detached views, figures 5, 6, and 7). This water, which carries with it a considerable amount of fine coal dust, enters the chamber *zz* of the cistern by the pipe 1 1, and the clear water passes through the filter plate 2 2 into the outer part of the cistern which supplies the perforated pipe *gg* below the sieves, whilst the other portion of the water which contains the coal dust passes by the pipe 3 3 into the shoot which conducts the unwashed coal slack to the machine, and thus the necessity for the filter beds usually employed for this purpose is dispensed with. In some cases instead of having a filtering plate 2 2 we make the sides of the chamber *zz* lower than those of the cistern, and the water passing downwards under the division plate 4 4, the thicker part remains at the bottom of the chamber, and the clear water overflows the sides of the chamber into the cistern.

Having now described the nature and object of our said invention for "Improvements in apparatus for washing coal slack," together with the manner in which the same is to be or may be performed or carried into practical effect, we wish it to be understood that we claim as our invention the several improvements in coal slack washing machines hereinbefore described and illustrated in the accompanying drawings, or any mere modification or imitation thereof, constructed and operating in substantially the same or a similar manner.

In

A.D. 1876. No. 524.

75

Improvements in Apparatus for Washing Coal Slack.

In witness whereof, we, the said Edward Taylor, William Brown, and Peter Langwill, have hereunto set our hands and seals, this third day of April, one thousand eight hundred and seventy-six.

EDWARD TAYLOR. (L.S.)
WILLIAM BROWN. (L.S.)
P. LANGWILL. (L.S.)

Signed, sealed, and delivered by the said Edward Taylor, William Brown, and Peter Langwill, in the presence of—

ALFRED FORD, Notary Public,
Chancery Lane, Melbourne.

This is the specification referred to in the annexed Letters of Registration granted to Edward Taylor, William Brown, and Peter Langwill, this third day of May, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 18 April, 1876.

We do ourselves the honor to return to you the documents transmitted for our report under your B.C. communication of the 10th instant, No. 76/2540, which have reference to the Petition of Messrs. Edward Taylor, William Brown, and Peter Langwill for Letters of Registration for "an invention for Improvements in Apparatus for Washing Coal Slack"; and we have to state that we see no objection to the issue of the Letters of Registration asked for in terms of their Petition and claim.

MACHINE FOR PRESSING AND CUTTING TOBACCO.

LETTERS OF REGISTRATION to Hugh Dixson, the younger, for a Machine for the purpose of pressing and cutting Tobacco.

[Registered on the 4th day of May, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS HUGH DIXSON, the younger, of number 193, York-street, in the City of Sydney, in the Colony of New South Wales, tobacco manufacturer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of a machine for the purpose of pressing and cutting Tobacco into what are variously called nips, brakes, plugs, and cakes, of any required area and thickness, which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Hugh Dixson, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Hugh Dixson, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if he, the said Hugh Dixson, shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this third day of May, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Machine for the purpose of Pressing and Cutting Tobacco.

TO ALL TO WHOM IT MAY CONCERN, I, HUGH DIXSON, the younger, of 193, York-street, Sydney, in the Colony of New South Wales, tobacco manufacturer, send greeting :

WHEREAS I am in possession of an invention for improvements in manufacturing what is technically called nips, brakes, plugs, and cakes of tobacco, and have petitioned His Excellency the Governor of the Colony of New South Wales to grant unto me, my executors, administrators, and assigns, Letters of Registration for the same: Now know ye that I, the said Hugh Dixson, the younger, do hereby declare that the following specification fully describes and ascertains the nature of the said invention, and the manner in which the same is to be worked, that is to say:—

The chief object of this invention is for the purpose of pressing and cutting tobacco into what is variously termed nips, brakes, plugs, and cakes, of any required area and thickness. For this purpose a pair of rollers are provided, between which the tobacco passing is pressed into a continuous ribbon, being fed on the one side by a belt or belts working in a trough; the tobacco then, having passed between the rollers, is on the discharging side of the rollers cut into the lengths required by knives set there for that purpose, and which lengths or pieces are what are designated above nips, brakes, plugs, and cakes of tobacco.

Description of plans of machine for the manufacture of tobacco above described.

In the sheet of drawings attached, where the same parts are shown, the same letter is used to identify the same part.

Power is applied to pulley H and pinion I, which together work loose on shaft G; pinion I gears into spurwheel K, whose shaft has the pinion L on the other end, and which gears into spurwheel M and N; M is keyed on to shaft G, which carries the roller B and spurwheel O, and so gives motion to both rollers, O gearing into spurwheel P, which is keyed on to shaft carrying roller C; N is a spurwheel upon the same shaft, with which is an armed boss carrying revolving knives F.

Bolted on to the arms of spurwheel M is a bevel wheel Q, gearing into pinion upon rod RR, which gives motion by bevel gear to the three pulleys S1, S2, and S3, which give motion to the belts or bands working in trough A.

A is a trough with movable sides, the distance apart of which is varied according to the width of tobacco required.

In A are three bands or belts, one on each side and one at the bottom, continuously moving towards rollers B and C; in the space between or trough thus formed by the belts the tobacco is fed by hand and carried to the rollers B and C. B is a flanged or female roller.

C is a plain roller working between flanges of B. Tobacco after leaving the belts is carried forward by and between the rollers B and C, by which operation it is pressed into a ribbon of the necessary width and thickness. The pressure is regulated by the levers D and sliding weights E operating on slide blocks, U, working in frame of machine, and which slide blocks support the spindle on which roller C is carried.

Tobacco in the ribbon state is forced forward by the rollers under revolving knives F, which cut the tobacco to the length required, and which cut pieces are the nips, brakes, plugs, or cakes required.

For making different widths of tobacco, either a separate roller B is required, or it can be made as shown in figure 4 with a movable flange. Roller C is made most conveniently the width of the narrowest tobacco required, and increased in width for the wider sorts by rings bolted on to the side; but it may also be solid the full width of each sort, that is to say, a separate roller. Figure 5 shows loose ring for roller C to increase the width as above.

Figure 6 shows distinctly the way the knives are fixed, and according to length of tobacco required so the number of knives used.

T. Figures 1 and 3 is a roller, preferably of india-rubber, upon which the knives cut the tobacco, and which can be set up as the knives wear.

Though I prefer to have three feeding belts, yet it may be fed with one bottom belt only, in which case it is advisable to continue it between the rollers and return it underneath the lower roller.

A convenient surface speed for the rollers B and C would be 6 to 9 feet per minute.

In figures 1, 7, and 8 are shown two scrapers, *a* and *b*, which relieve any tendency the ribbon of tobacco has to adhere to the rollers B and C; they are fastened to the bed of the machine between the knives and the rollers; the ribbon of tobacco passes between *a* and *b* from the rollers to the knives; V is a supplementary scraper.

What I claim as new is—1st. The combination of pressing rollers and machinery for continuous feeding and cutting for the purpose of manufacturing plug tobacco, substantially as herein described and explained. 2nd. The combination of such contrivances with the other mechanical devices herein described and shown in my drawing, producing thereby a complete machine for making plug tobacco.

HUGH DIXSON, JUN.

This is the specification referred to in the annexed Letters of Registration granted to Hugh Dixson, the younger, this third day of May, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

The application of Mr. Hugh Dixson, junior, for Letters of Registration for a machine for "Pressing and Cutting Tobacco," having been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

IMPROVEMENTS IN FILTERS.

LETTERS OF REGISTRATION to Richard Gervase Elwes, for Improvements in Filters.

[Registered on the 11th day of May, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS RICHARD GERVASE ELWES, of Westminster Chambers, in the city of Westminster, England, civil engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Filters," which is more particularly described in the specification and sheet of drawings which are hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Richard Gervase Elwes, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof : to have, hold, and exercise unto the said Richard Gervase Elwes, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Richard Gervase Elwes shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eleventh day of May, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Filters.

SPECIFICATION of RICHARD GERVASE ELWES, of 7 Westminster Chambers, in the city of Westminster, England, civil engineer, for an invention intituled "Improvements in Filters."

My invention relates to filters in which animal or other charcoal, or other filtering material, in powder or granules is employed, and has for its object the construction and arrangement of filtering apparatus in such a manner as to combine the process of upward filtration with the means of admitting continuously, or from time to time, fresh charcoal or filtering material at or near the point of egress of the filtered liquid, and removing spent or exhausted charcoal or filtering material at or near the point of ingress.

The apparatus is so constructed that by the employment of upward filtration the most exhausted portion of charcoal (that is to say the portion which is nearest to the point where the liquid to be filtered enters) may be continuously or from time to time removed, and fresh charcoal may be added at the part of the apparatus where the liquid escapes, so that the liquid may always be brought in contact with fresh charcoal before it leaves the filter.

The particular form of apparatus for removing the exhausted charcoal, or for supplying the fresh charcoal, may be varied, but I prefer to employ the arrangement hereinafter described, more especially when employed for the decolourization of sugar.

DESCRIPTION OF THE DRAWINGS.

Fig. 1 is an elevation and fig. 2 a vertical section (at right angles to fig. 1), showing the top and bottom of the apparatus; the intermediate part consisting of a cylinder between them so as to form a continuous apparatus throughout its entire length. A is a vertical vessel of cylindrical or other convenient sectional form, having below it one or more conical or tapered prolongations, B, leading to one or more discharging chambers, C, which may be of any convenient sectional form. At the upper end of the discharging chamber, C, is a door or valve, D, and at the lower end of the same is a second door or valve or cover, E.

By means of the upper valve, D, a communication can be opened from the vessel A into the discharging chamber C, and the lower valve or door E opens from the discharging chamber C into the air. F is an air-cock, fitted at the upper part of the discharging chamber for the admission and escape of air as may be required. G is an inlet pipe fitted to the same, for the admission of warm water to wash the exhausted charcoal as required. At the bottom of this chamber is a flexible exit pipe, T, communicating with other pipes leading respectively to a syrup or juice tank, a sweet water tank, and an outlet for waste water, and indicated by the three arrows H I K. The entrance to the pipe T is protected by wire gauze and filter cloth, or other suitable means, to prevent the charcoal from passing into it.

The filtering vessel A is fitted at the upper part with an enlarged portion, L, in which the filtered liquid may collect and be drawn off by an exit pipe, M. The filtering vessel is also fitted with an inlet pipe, N, for water with which to wash the whole contents of the filter when desired. O is a hopper at the top of the apparatus, through which the fresh charcoal is introduced as required. The lower end of this hopper is continuous with the sides of the filtering vessel A, in which are formed apertures, P, within the enlarged portion, L; such apertures being covered with wire gauze and one or more thicknesses of filter cloth, through which the filtered liquid can pass out into the enlarged portion L, without any charcoal or dust passing out with it. This part of the apparatus is represented in section on an enlarged scale at fig. 3.

The liquid to be filtered is introduced at the lower part of the apparatus by means of a pipe, Q, terminating in a perforated pipe which runs round the inside of the filtering vessel, but any convenient form of inlet pipe may be used. The pipe Q leads from a tank, placed above the level of the point where the filtered liquid leaves the filtering vessel, so as to obtain the pressure or head required to force the liquid up through the charcoal.

At fig. 4 is shown in vertical section, and at fig. 5 on plan on an enlarged scale, the valve or door E, which is adapted to open by turning on a pivot at E*, being moved thereon as required by means of a handle, R, and fixed by set-screws, SS.

The method of working the apparatus is as follows:—On the valve D, at the top of the discharging chamber C, being closed, the filtering vessel A is filled with charcoal through the hopper O, and the liquid to be filtered is admitted by the entering pipe Q, at the bottom of the said vessel, under a liquid pressure or head sufficient to force it up through the charcoal, and out through the apertures PP, into the enlarged portion or collecting chamber L, whence it will flow away by the pipe M.

As soon as the liquid ceases to run quite colourless, the entry pipe Q is closed, also the valve or door E at the bottom of the discharging chamber C. The valve D at the top of this chamber is now opened, and the lowest portion of charcoal, which will be the foulest and most exhausted, is allowed to fall into the discharging chamber C. As soon as the discharging chamber is full, the valve D is closed, the inlet pipe Q is re-opened, and the filtering process is resumed.

In the meantime a fresh supply of charcoal has been introduced from the hopper O into the top of the filtering vessel A, falling downwards by gravity as the whole column of charcoal descends, when the valve D is opened. The escaping liquid now comes in contact with this fresh charcoal, and is completely decolourized as before.

The exhausted charcoal removed from the filter contains a quantity of adhering liquid, which may be drained off from it while in the discharging chamber by the pipe T, and pumped up again to the tank whence the filtering vessel is supplied.

In the case of sugar, the syrup or juice is first drained off by a pipe (indicated by the arrow H) leading to the syrup or juice tank; the charcoal is then washed with warm water, admitted through the pipe G (the resulting sweet water being led away to the sweet water tank by the pipe indicated by the arrow I). When all the syrup or juice has been extracted, the charcoal may be further washed if desired, the foul water being led away to waste by the pipe indicated by the arrow K.

The charcoal or other filtering material is finally removed from the discharging chamber by opening the valve or door E at the bottom of this chamber, and taken to be reburnt or revived in the usual manner when required.

On a cessation of operations, the whole contents of the filter can be drained of syrup or juice and washed by means of the pipes connected with the filtering vessel and discharging chamber. The advantages resulting from the foregoing process are as follows:—

First—

Improvements in Filters.

First—The filtering operation is continuous, or nearly so, instead of being only intermittent, whereby a smaller number of filters are required, and the process can be carried on day and night if desired.

Secondly—There is a saving in the quantity of charcoal required to be kept on hand at one time.

Thirdly—The full useful effect can be got out of each portion of charcoal before it is reburnt, whereas under existing systems much of the charcoal when removed from the filters is only partially exhausted. In this manner a saving is effected in the cost and waste of reburning.

And lastly—The whole of the liquid filtered can be as completely decolourized as the first portion, whereas under existing systems of intermittent filtration the last portion of liquid passed through the filter leaves it in a more highly coloured state than the first portion.

What I claim as new in my invention is the combination of upward filtration under liquid pressure, with means for removing the exhausted charcoal from the bottom of the filter where the liquid enters, and means for supplying fresh charcoal at the top of the filter where the liquid escapes, by which the process of filtration and decolourization is rendered continuous and complete as described.

In witness whereof, I, the said Richard Gervase Elwes, have hereunto set my hand and seal, this fifth day of January, one thousand eight hundred and seventy-six.

Witness—R. W. MARRIOTT, Draughtsman,
7, Westminster Chambers, London, S.W.

R. GERVASE ELWES. (L.S.)

This is the specification referred to in the annexed Letters of Registration granted to Richard Gervase Elwes, this eleventh day of May, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 21 April, 1876.

In the matter of the application of Mr. Richard Gervase Elwes for Letters of Registration for "Improvements in Filters," which has been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration for the Filter as figured and described.

We have, &c.,

J. SMITH.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

NICOLLE & MORT'S ARTIFICIAL STONE AND TILE APPARATUS.

LETTERS OF REGISTRATION to Eugene Dominique Nicolle and Thomas Sutcliffe Mort, for an Invention for producing and utilising Artificial Stone, Tiles, &c.

[Registered on the 12th day of June, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS EUGENE DOMINIQUE NICOLLE and THOMAS SUTCLIFFE MORT, both of Sydney, in the Colony of New South Wales, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for producing and utilising artificial stone, tiles, &c., and styled "Nicolle and Mort's Artificial Stone and Tile Apparatus," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that they, said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twelfth day of June, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Nicolle & Mort's Artificial Stone and Tile Apparatus.

SPECIFICATION of an invention styled "Nicolle and Mort's Artificial Stone and Tile Apparatus," being an improved method of producing and utilising artificial stone, tiles, &c.

By this process we are enabled to produce a more durable material than any like material yet manufactured, and of any colour natural to stone, or of almost any shape, accurate in form, uniform in texture, incapable of expansion, contraction, or warping, impervious to moisture, which may be used in its green state without the application of heat or other chemical process, and to supply it at a price below the cost of ordinary stone or brick.

In all plans hitherto adopted the compacting of the material has been accomplished by ramming or pressing portions only of the surfaces at one and the same stroke, which mode by allowing the lateral movement of the particles not only prevents a perfect felting of the mass as admitted into the mould but more or less disintegrates the portion already compacted, the non-rigidity of the mould operating in the same direction; and in other than the present plans the compacted substances have to rest in the moulds for a time sufficient to allow of the setting of the material, thereby entailing the necessity of a multiplication of moulds and a largely increased amount of labour and storage room and consequent increase of cost, besides delay in the progress of work. Baking or drying, or other chemical process, is also in many modes of manufacture commonly employed, all of which are avoided in our plan.

By our mode of using the stone as pressed under our plan, we obviate these objections, and are also enabled by our means of bringing the particles into more intimate and close contact to reduce to a minimum the quantity of lime or other binding material commonly employed, thereby combining economy and durability, besides bringing into action the natural power of cohesion between the particles, and consequent production of a more impervious substance than has hitherto been produced in any substance in which sand has been the leading ingredient and which has not been subjected to heat or other chemical process.

An important feature of our manufacture is the accuracy of the faces of the forms we produce, by which we are enabled to dispense with the skilled labour of the mason and bricklayer, and also with the use of mortar or cement, as the surfaces being perfectly true only require the application of a brush dipped in lime-water to fix them in position as fast as manufactured. This accurate fitting and consequent uniting of the faces, coupled with the hydraulic and non-conductive qualities of the stone, overcome the necessity for the ordinary binding, and permits of walls of much less than the ordinary thickness. The hydraulic character which our artificial stone may be made to almost immediately assume absolutely prevents the rising of moisture at the basement, and the same substance when used for the floors of course prevents damp and gases passing there also. This, we believe, is not the case in any other artificial stone.

Another important feature in our plan of moulding and compressing is, that the inside faces of the walls being perfectly true and smooth, the necessity for plastering or papering is avoided. And another still more important is that if the floors of a building be built with the stone in a slightly arched form no timber need enter into their construction; indeed, where "anchor rods" are used the whole structure may be built without wood, except in the window sashes and doors, nor need any roofing be required.

Another application of the important property that the stone made by our plan possesses when green, is the making of tiles that overlap each other at every edge, but still lie in the same plane, whose lapped surfaces can be made to unite and so form a roof composed practically of one solid tile, through which it is impossible for the water to penetrate, avoiding at the same time the necessity for so overlapping tiles as to have two or three thicknesses of tile lying one over the other, enabling us thereby to produce a roof that is not only much cheaper and lighter than any hitherto constructed of similar materials, but also one which may be constructed at almost any angle.

The novelty of these tiles consists in their capability of being so fitted upon a roof as to afford a wind and water tight covering, even at the angles of repose, as the top and bottom edges overlap and are overlapped by the adjacent tiles by half of their thicknesses, whilst one of their side edges having upon it a groove under a raised projection fits on to a corresponding projection on the side edge of the adjacent tile, thus forming when associated in position a covering, the under surface of which is flat, whilst the upper surface when the tiles are constructed in their simple form presents a plane divided by rolls or ribs, which latter, in addition to their special use, gives strength to the resulting structure.

Figure 1 is a sectional elevation of a pug-mill.

A is a shaft carrying the driving pulley and two bevel wheels, which act on the corresponding bevel wheels on the shafts BB.

BB are perpendicular shafts which carry the arms CC.

CC are rotary cycloidal arms, furnished with perpendicular flanges, which work between similar flanges on the stationary arms DD.

DD are stationary arms, similar to the rotary arms CC, but fixed to the cylinders EE.

EE are the cylinders which form the casing for the arms CC and DD.

F is a conical adjustable bearing to support the perpendicular shaft B, furnished with an oil chamber, which is fed from a cup attached to the side of the cylinder E, to which it is connected by a pipe and with a hole which passes through the shaft to the conical steel bearing, thereby connecting the oil-chamber with the latter. It is also provided with a leather flange, which is kept in position immediately under the cylinder by a collar on the shaft B to prevent the grit from working out of the cylinder into the bearing, and lastly, with an adjusting screw to regulate the height of the perpendicular shaft B.

G is a door for the withdrawing of the material, which is raised or lowered by a screw between two guides.

Figure 2 is an elevation of the steam-hammer, pressing block, mould, frame for raising the same off the block, and feeder and hopper.

A is a steam cylinder, provided with valves capable of being worked both mechanically and by hand.

B is a piston working in the cylinder, carrying the ramming head C.

C is the ramming head fixed to the piston B, provided with a sliding face, D.

Nicolle & Mort's Artificial Stone and Tile Apparatus.

D is the sliding face of the ramming head C, which corresponds with the mould, and slides laterally from one side of the mould to the other alternately, the motion being imparted to it by cams, levers, straps, or hand.

E is a guide fixed to the piston B, which runs on the slides FF.

FF are slides for the guide E to run on, fixed to the frame G.

G is the frame for the cylinder, piston, guides, &c.

H is a feeder which swings from the hopper K to the mould L by means of the swinging arm I.

I is a swinging arm, carrying the feeder H and rotating on the standard J.

J is a standard on which the swinging arm I rotates.

K is a hopper, provided with an opening at the bottom governed by a sliding door.

L is a mould having a false bottom, which is fixed to the pressing block N, and furnished with sides that are hinged together at three corners, and fastenings at the fourth capable of disconnection.

M is a false bottom to the mould L fixed to the pressing block N.

N is a pressing block on which the mould L and its false bottom M rest.

OO is a frame actuated by the cam P, for raising the mould L from off the false bottom M.

P is a cam which when actuated by the lever Q raises or lowers the frame OO.

Q is a lever which actuates the cam P.

Figure 2a is a sectional elevation of the feeder H.

aa are shutters, made by preference of brass, which form the false bottom of the feeder.

bb are levers fixed to the shutters aa, and connected to the principal lever e by the connecting rod d.

c is the frame.

d is a connecting rod that connects the levers bb to the principal lever e.

e is the principal lever which actuates the levers bb, by means of the connecting rod d.

f is the handle which actuates the principal lever e.

gg are corrugated plates placed under the shutters aa, and fixed to the frame c.

By preference we work the above feeder by hand.

Figure 3 is a sectional elevation and plan of the turning over and lifting apparatus.

AA is a mould containing the compacted stone BB.

BB is the compacted stone.

CC are bolts passing through the compacted stone BB, and screwed into the plates DD.

DD are plates, made by preference of wood, into which the bolts CC are screwed, and which fit into recesses in the stone BB.

D'D' is a screwed bolt passing through the stone BB.

EE are axles furnished with wheels and grooved collars FF.

FF are grooved collars fitted to the axles EE in which the pivots GG rest.

GG are pivots on which the mould AA rests, and which rest in the grooved collars FF.

HH are clasps fixed to the sides of the mould AA, which fit into the axles EE.

I is a tree which catches the heads of the bolts CC, and is connected to the hoist J.

J is a hoist to which the tree I is connected.

KK is a tramway on which the wheels of the axles EE run.

L is a post on which the mould AA rests when turned over.

Figure 3a is a sectional elevation and plan of a pneumatic sucker lifting apparatus.

AA is a flange, made by preference of rubber.

BB is a hook by which the sucker is lifted, which is fastened to two plates between which the rubber flange is securely held.

CC is the pipe connecting the apparatus to the vacuum chamber.

DD is the stone to be lifted.

Figure 4 is a sectional elevation of an hydraulic press for compacting tiles, diaper, &c.

A is a cylinder for the ram B, furnished with the usual force pumps and valves worked mechanically or by hand.

BB is a ram provided with a head which works between the standard rods FF.

CC is a mould, made by preference of brass, for containing the material to be pressed.

DD is a presser, made by preference of brass, which corresponds with the mould CC.

EE are frames connected together by the standard rods FF.

FF are standard rods connecting the frames EE.

G is a table fixed to the ram-head BB, provided with a slide, H.

H is a slide fitted to the table G and the ram-head B.

I is a top view of the compacted tiles.

J is a cross section of the same.

K is a longitudinal section of the same.

The foregoing are made by preference of iron, except where specially mentioned as otherwise.

MODUS OPERANDI.

The several ingredients, viz., sand, lime, and silicate of alumina, are mixed in the required proportion by means of the pug-mill. The lime and silicate of alumina, by preference in the form of a paste made by mixing with water, are put into the pug-mill with a portion only of the sand, and as the mixing progresses the remaining sand is gradually added till the whole is pretty well incorporated. The mixture is then, by preference, withdrawn by the door G, fig. 1, and transferred to the second mill to be more perfectly mixed, whilst the first operation is being repeated in the other mill.

The mixing is effected by three sets of cycloidal arms, having perpendicular projecting flanges, C, fig. 1, being carried round between the fixed similar arms D, fig. 1, by the rotation of the perpendicular shaft

Nicolle & Mort's Artificial Stone and Tile Apparatus.

shaft and bevel wheel B, fig. 1, which are actuated by the bevel wheel on the horizontal shaft A, fig. 1, on which is fixed the driving pulley, thereby squeezing the ingredients against the surfaces of the arms, the inside of the cylinder E, fig. 1, and against each other, with immense force in every conceivable position, yet without crushing of the particles, which action when continued for some time spreads the plastic binding materials in an even but fine film over the entire surfaces of the sand.

The resulting pug (the plastic material produced by the above ingredients when mixed) is withdrawn and placed in the hopper K, fig. 2, which being provided with an opening, having a sliding door, allows the convenient discharge of any desired quantity of the pug into the feeder.

The feeder H, fig. 2, when charged from the hopper by means of the sliding door (which charge is spread in an even layer by traversing the surface of the frame with a striking stick) is swung into position over the mould by means of the swinging arm I, fig. 2, to which it (the feeder) is fixed, that rotates on the standard J, fig. 2, and is then opened by moving the handle F, fig. 2a, which actuating the principal lever e, fig. 2a, moves the strap or connecting rod d, fig. 2a, that connects all the levers b, fig. 2a, fixed to the shutters a, fig. 2a, which form the false bottom of the feeder and the pug falling down through the corrugated plates g, fig. 2a, is dispersed and deposited in an evenly spread layer in the mould. The feeder H, fig. 2, is then swung back under the hopper to be re-charged.

The mould L, fig. 2, is placed in position on the pressing block N, fig. 2, by being run on the tramway K, fig. 3, by means of the wheels and axles E, fig. 3, which are provided with grooved collars, F, fig. 3, in which the pivots G, fig. 3, on which the mould is supported, rest, the mould at the same time being kept in position by the clasps H, fig. 3, on to the cam-frame O, fig. 2. The frame is then lowered by actuating the cam P, fig. 2, by means of the lever Q, fig. 2, till the mould rests on a false bottom, which is fitted to the top of the pressing-block N, fig. 2, and the axles on which it rested are clear of the clasps, &c., and any fastenings that may be required to secure the mould to the false bottom or the pressing block.

The moulds may be filled direct from a hopper capable of being shifted to and fro, provided with a suitable door to deliver measured portions into the mould, or a frame may be interposed to catch the charge and distribute it in an even layer, or a frame similar to the one illustrated may be made to rest alternately under the hopper and over the mould by running on slides or wheels, or moved by levers or cams. Any of these arrangements can be worked by machinery or by hand, but by preference we use the plans we have described.

When an even layer of pug has been spread in the mould as above, it is by preference pressed with a rapid succession of blows by means of the steam-hammer, of which D, fig. 2, is the face, which corresponds to the shape of the mould, and slides laterally on the head C, fig. 2, which is fixed to the piston B, fig. 2, worked by the steam cylinder A, fig. 2, which is supplied with steam by valves arranged to produce the required blow, and worked mechanically or by hand levers.

The blow is, by preference, very gentle at first, in order to avoid the dispersing of the particles whilst in a loose state, and afterwards, when the material has commenced to felt, with sufficient force to bring the particles as closely together as may be desired. This operation is repeated till the mould is filled to the depth of the required stone, or in some instances it may be found necessary to place a frame on top of the mould to which it fits, and to fill it with the compacted material as already mentioned. It is then removed; the part that projects beyond the mould is cut off, and the consequent broken surface is made true by one or more blows of the hammer, thus ensuring the production of a stone, the back of which is equally well pressed as the face. The air is allowed to escape from under the face of the hammer by the latter being made slightly smaller than the surface operated on to allow a space for its passage, the face being at the same time slid from side to side alternately to ensure the equal pressing of the entire surface.

The pressing or compacting of the pug may also be accomplished by hand rammers, or rammers actuated by levers, cams, or screws, driven by steam, hydraulic, or pneumatic power. The air may also be allowed to escape by means of holes in the rammer, or grooves at its sides, but by preference, we use the plans we have described.

The mould, when filled, is raised off the pressing block N, fig. 2, by the cam P, fig. 2, to the level of the tramway, in the same manner as it was lowered, leaving the false bottom behind and consequently exposing the corresponding face of the stone. We use this face, by preference, for the weather surface in consequence of its being the most perfectly compacted face of the stone and the convenience of imparting to it the desired shape or pattern.

The mould A, fig. 3, is then run on the tramway to a convenient place and is turned over on the pivots G, fig. 3, which rest in the grooved collars F, fig. 3, on the axles E, fig. 3, till the exposed face of the stone is in a perpendicular position and the mould partly rests on the post L, fig. 3. The bolts C, fig. 3, and the plates D, fig. 3, or one or two of the bolts D', fig. 3, are inserted in their places through openings in the mould; the fastenings are undone and the sides of the mould are turned back on their hinges. The tree I, fig. 3, is then connected to the bolts and to any hoisting appliances that may be found necessary to convey the stone to the position required.

The moulds may have their false bottoms attached to their sides by hinges, bolts, or other fastenings, instead of the pressing block; they can also be turned over if fitted with a suitable frame to run on wheels or slides to which the mould may be fastened, or the mould could rest in a swinging cradle capable of being moved in the same manner, or it might be turned over on its side direct off the block and the stone canted on to a frame suitable for carrying it away. The moulds may also be made wholly or partially of iron, wood, stone, or plaster of Paris, but by preference we use the plans we have described.

The mould may also be lifted off the pressing block by merely turning it over on its side, which may be provided with wheels, or may be vertically lifted off by means of screws, levers, racks, or tackle working on the mould direct or on the frame supporting the mould.

The frame, as illustrated, may have any number of cams to suit the size of work, but by preference we use the plans we have described.

The compacted stone may be lifted by bolts, screwed for the whole or part of their length, when the use of the plates is avoided, or the plates when used may be placed in the body of the stone instead of under the bottom face; or again, the bolts may pass outside the work to a suitable plate or table on which the

Nicolle & Mort's Artificial Stone and Tile Apparatus.

the stone may rest, as in hollow vase or pipe work, or even simple bands may be used for the same purpose. Any number of these appliances can be used, according to the work being produced, and the plates if used may be of wood, metal, natural or artificial stone, but by preference we use the plans we have described.

Another mode of manipulating the stone when compacted is by using our pneumatic sucker lifter, fig. 3a, when the stone is in a position ready for lifting, the sucker, which by preference we make to correspond to the shape and size of the work, is laid in position, communication is made to the vacuum chamber by means of the pipe C, fig. 3a, and the rubber flange A, fig. 3a, being sucked down to the face of the stone to which it adheres, while the vacuum under the middle plates is preserved. The stone is then raised by means of the hook B, fig. 3a, and placed in the desired position, and the communication with the vacuum chamber being shut off, the sucker immediately loses its hold of the stone.

These suckers can be made of any shape to suit the work, and may consist of a chamber with a pierced bottom, having an india-rubber projection either outside or under its edges, or the vacuum-pipe of a sucker may be of metal and may be the means by which the sucker is lifted.

For pressing the tiles the mould C, fig. 4, is charged from a hopper or by some other suitable plan with a measured amount of pug, and being placed on the table G, fig. 4, over the slide H; fig. 4, which fits into a groove in the bottom of the mould, is then readily pushed into its place under the presser D, fig. 4, which corresponds with the mould, where it is kept in position by angle pieces or any similar suitable arrangement. The ram B, fig. 4, is then raised by means of the force-pump till the pug in the mould is sufficiently compacted; the ram is then lowered, and the mould withdrawn and emptied. The tiles may be pressed in this manner, or by any of the means mentioned, for pressing ordinary work in any number of moulds at one time, the moulds standing horizontally or vertically; and the hydraulic ram may work horizontally or vertically, but working downwards, or the mould or moulds can be so placed between levers or cams as to enable the pug to be compacted by squeezing, or if the hydraulic press is used the top-presser may be arranged to be brought down to the mould on to the pug and to be rigidly held there while pressure is applied to the ram, and to be lifted back again while the ram is lowered by a suitable arrangement of levers, wedges, or screws. This plan would in some instances much reduce the time taken up by working the ram in the usual manner. The tiles also may be of any size or pattern so long as the principle of the tile illustrated is preserved, but by preference we use the plans we have described.

Having thus described our apparatus, &c., and our mode of working the same, we proceed to claim our mode of producing artificial stone, and our plan of utilising the same in its "green" state, in combination or separately, substantially as herein described and shown; and we specially claim,—

- 1st. The mode of effecting the cohesion of the particles employed in the manufacture of artificial hydraulic stone by compressing them during the process of "felting" within rigid substances, and without the application of heat or other chemical process.
- 2nd. Our feeder (fig. 2a) for feeding the mould.
- 3rd. Our mode of effecting the escape of the air from under the felting hammer by making the face of the latter move alternately from side to side as it falls upon the material.
- 4th. Our mode of lifting the stone by pneumatic suckers, and of fitting the stone with bolts, screwed or not to plates, whereby we are enabled to use it in its "green" state without waiting for it to set or dry.
- 5th. Our arrangement for turning the stone out of the mould.
- 6th. The form of our artificial stone tile, as herein shown and described.

(For E. D. NICOLLE & self),
THOS. S. MORT.

This is the specification referred to in the annexed Letters of Registration granted to Eugene Dominique Nicolle and Thomas Sutcliffe Mort, this twelfth day of June, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

The application of Messrs. Nicolle and Mort for Letters of Registration for an "Artificial Stone and Tile Apparatus," having been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.
JAMES BARNET.

BALDOCK'S SMOKE-PREVENTER AND FUEL-ECONOMIZER.

LETTERS OF REGISTRATION to Henry Baldock, for a Smoke-preventer and Fuel-economizer.

[Registered on the 21st day of June, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same,

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS HENRY BALDOCK, of Sydney, in the Colony of New South Wales, has by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention termed "Baldock's Smoke-preventer and Fuel-economizer," which is more particularly described in the specification and sheet of drawings which are hereunto annexed ; and that he, the said Petitioner, has deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria number twenty-four ; and has humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Henry Baldock, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof : to have, hold, and exercise unto the said Henry Baldock, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Henry Baldock shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this nineteenth day of June, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Baldock's Smoke-preventer and Fuel-economizer.

SPECIFICATION of Baldock's Smoke-preventer and Fuel-economizer.

My invention consists in passing a current of steam through a hollow box, bridge, or pipe, made of iron or fireclay, or of a combination of such materials, such box, bridge, or pipe to be made of any convenient size and shape, so that it may be adapted to the size and shape of the steam boiler or furnace to which it is to be applied to or connected with, and to be filled or partly filled with turnings, borings, filings, scraps, or other small pieces of iron or other oxidizable metal or matter.

The improvement I claim, and which I desire to be secured to me as my invention, is the substitution of turnings, borings, filings, or other small pieces of iron or other oxidizable metal for the singular arrangement of pipes connected by elbows, L, T's, T's, and joints or unions, as described in Letters of Registration granted to George Clinch, dated August seventh, one thousand eight hundred and seventy-five, the same being numbered 482.

The effects of such improvement as herein described and claimed as my invention are as follows, viz. :—

- 1st. Cost of manufacture is reduced, as the expense of pipes, T's, and elbows and unions is avoided, as well as the large amount of labour necessary to fit and connect the same.
- 2nd. Durability and security are increased, as the risk of leakage or breakage from so large a number of joints, and the wear and tear of pipes is avoided.
- 3rd. Efficiency is increased, as in its passage through my improved apparatus the steam filtering slowly through the turnings, borings, filings, scraps, or other small pieces of iron or other oxidizable metal, comes in contact with a largely extended surface of metal which, being kept at a very high temperature, deprives the said steam of the oxygen or part of the oxygen it contains, thereby converting it into an inflammable gas, or into a mixture of inflammable gases.
- 4th. Repairs, if necessary, can be easily effected, as the metal turnings, borings, filings, scraps, or other small pieces of metal can be taken out when oxidized or otherwise rendered inoperative, and may be replaced with fresh ones, when the decomposition of the steam will go on as at first, whilst the joints and unions of the singular arrangement of pipes before-mentioned, after being for some time exposed to the action of any great heat, cannot be repaired.

The necessary plans with explanations accompany this specification.

HENRY BALDOCK.

This is the specification referred to in the annexed Letters of Registration granted to Henry Baldock, this nineteenth day of June, 1876.

HERCULES ROBINSON.

REPORTS.

SIR,

We do ourselves the honor to return to you the documents transmitted for our report, under your blank cover communication of the 28th ultimo, No. 2,902, which have reference to Mr. Henry Baldock's application for Letters of Registration for his invention, to be known as "Baldock's Smoke-preventer and Fuel-economizer"; and we have to state that we see no objection to the issue of Letters of Registration securing to Mr. Baldock his arrangement for the object specified, in accordance with his petition, drawings, specification, and claim.

We have, &c.,

GOTHER K. MANN.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

Sydney, 9 May, 1876.

SIR,

We do ourselves the honor to return to you the documents transmitted for our reconsideration, under your blank cover communication of the 29th May.

After again carefully examining and comparing Mr. Clinch's and Mr. Baldock's specifications, drawings, and claims, we see no reason why Letters of Registration should not be granted to Mr. Baldock, securing to him his arrangement for the object specified, as stated in our letter of the 9th of May last.

We have, &c.,

GOTHER K. MANN.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

A.D. 1876, 17th July. No. 531.

HEATHERINGTON'S PATENT ORE-SEPARATOR AND AMALGAMATOR.

LETTERS OF REGISTRATION to Alexander Heatherington, for an Improved Apparatus for separating metals, ores, or precious stones, from earth or other impurities.

[Registered on the 19th day of July, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS ALEXANDER HEATHERINGTON, of Fleet-street, in the City of London, England, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of "An improved Apparatus for separating metals, ores, or precious stones, from earth or other impurities," which is more particularly described in the specification marked A, and the two sheets of drawings marked B and C respectively, and the photograph of drawing, fig. 7, marked D, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Alexander Heatherington, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Alexander Heatherington, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Alexander Heatherington shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventeenth day of July, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

*Heatherington's Patent Ore-separator and Amalgamator.*A.
SPECIFICATION.

HEATHERINGTON'S PATENT ORE-SEPARATOR AND AMALGAMATOR.

FIGURE 1 in the annexed drawing represents a vertical section through the centre of the apparatus.

- a.a.* being the bottom.
b.b. the delivery or receiving end (so-called).
c.c. the discharge end. (" ")
d.d. a strong grating forming one-half of the top or cover, and
e.e. a door forming the other half of the top or cover (locking into or on to *d.d.*) of a chest of wood or other suitable material, having doors at the sides which can be securely fastened by locks, bolts, or bars.
f.f. is a slanting board extending from side to side of the apparatus.
g.g. is a fine sieve resting against *c.c.* and *f.f.*
h.h. are alternately inverted inclined planes, trays, or sluices of wood or other suitable material, of which the higher end, called the "head," must be fitted close to the inside face of the apparatus, the lower end, called the "tail" or overflow, does not quite reach the opposite inner face of the apparatus, but rests upon it by pins, pegs, bolts, or other suitable contrivance fitting into spaces or holes cut for the purpose in the inner face of the apparatus, or of a false end.
m.m. a small hole in the delivery end of the apparatus, underneath the lowest sluice but one, through which steam may be introduced by a pipe in cold weather.
n.n. outlet for waste.

Figure 2 represents a tray or sluice of wood, or other suitable material.

- h.h.* is the surface, which may be plain, corrugated, or stepped, or covered with hides or blankets, or with amalgamable metal plates.
i.i. a space for the head to fit on to a shoulder-piece, false end, or any other suitable stay or support which shall keep it close to the face of the apparatus.
j.j. pins, bolts, or pegs fitting into holes or other suitable support in the face or false end of the apparatus, by which space is obtained for the overflow.

Figure 3 represents a suitable false end for the inner face of the apparatus to support the sluices.

- k.k.* acting as a support for the head, and
i.i. (holes) for the bolts, pegs, or pins which uphold the tail.

Figure 4 is an isometrical view of the front, top, and discharge end, showing the doors *o.o.*, which may be made to fold on hinges when the amalgamators stand near together, or they may be divided horizontally to facilitate frequent examination of the upper trays or sluices.

Figure 5, the same as the preceding, only that it shows the delivery instead of the discharge end.

Figure 6 is a horizontal section through the centre of the apparatus, showing—

- p.p.* a partition extending from end to end of the apparatus when employed as an amalgamator, and which may consist of sheet copper amalgamated, or of wood or metal with an amalgamable surface. When used simply as a concentrator, this partition is unnecessary.

Figure 7 is a photograph from a small model of the apparatus, showing the doors and lids open. (In trying to secure a view of the interior, the sluices fell out of position, and the photographer did not know how to arrange them again properly.)

The method of operating with the apparatus is as follows:—

When set in front of a stamp-battery or crusher rolls, the tailings or crusher material and water are conducted by means of a short sluice or launder on to the grating *d.d.*, through which they pass to impinge against the inclined board *f.f.*, and strain through the fine sieve *g.g.*, dropping then on to the head of the uppermost trough, or tray, or sluice *h.h.*, over which they flow on to the head of the next inclined trough, and so on until the undermost trough or tray is reached, which conducts the current to the outlet *n.n.*, where there should be a launder to receive and guide it to settling pits, or, if wholly valueless, to a waste heap.

The inclination of the several sluices, troughs, or trays must depend upon the quantity of water at disposal, and their number upon the height available and inclination given.

The greater the frequency of the steps the more thorough will be the separation. In practice, three or four inches will be a good interval, and one-sixteenth to one-eighth of an inch sufficient depth.

The space for overflow need not be more than one or two inches from the tail end of the sluice to the face or false end, which receives the supporting pins, pegs, or bolts.

The depth of fall between the tail end of one sluice and the head of the next need not be greater than will admit of ready inspection of the underlying sluice, and removal of plates, blankets, or hides when required.

When used for saving gold, the surface of the sluices may be covered with baize, blankets, hides, or amalgamable metal plates.

When used simply for washing substances of small intrinsic value, or where the contents are never left unguarded, the doors and top may be dispensed with.

The whole of the interior of the apparatus may be lined with amalgamable metal when used for saving gold.

What

Heatherington's Patent Ore-separator and Amalgamator.

What I claim as my invention is:—

1. The chest, *a, b, c, d, e*, in combination with all its parts, substantially as and for the purposes described, and shown in the drawing.
2. The inclined planes, troughs, or sluices arranged one above the other, and consisting of movable or immovable planes, trays, or troughs of wood or other suitable material, with stepped, corrugated, or plain surfaces, and intended to carry amalgamable metal plates, hides, or blankets, when the apparatus is used for saving gold, substantially as and for the purposes described and shown in the drawing.
3. The partition *p.p.*, consisting of one or more metal plates, or of wood or metal lined with an amalgamable metal surface on one or both sides when used as an amalgamator, substantially as and for the purposes described and shown in the drawing.

Halifax, N. S., 4 August, 1875.

ALEXANDER HEATHERINGTON.

This is the specification marked A, referred to in the annexed Letters of Registration granted to Alexander Heatherington, this seventeenth day of July, A.D. 1876.

HERCULES ROBINSON.

REPORT.

SIR,

The application of Mr. Alex. Heatherington for Letters of Registration for an "Improved Apparatus for separating metals, ores, or precious stones from earth or other impurities," having been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration in accordance with the Petition, specification, and drawings submitted.

Sydney, 19 June, 1876.

IMPROVEMENTS IN THE MANUFACTURE OF PRESERVED MEAT.

LETTERS OF REGISTRATION to Friedrich Leybold, for Improvements in the manufacture of Preserved Meat.

[Registered on the 22nd day of July, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS FRIEDRICH LEYBOLD, of Santiago, in the Republic of Chili, chemist, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the manufacture of Preserved Meat," which is more particularly described in the specification which is hereunto annexed, and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Friedrich Leybold, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Friedrich Leybold, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Friedrich Leybold shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-first day of July, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in the manufacture of Preserved Meat.

SPECIFICATION of FRIEDRICH LEYBOLD, of Santiago, in the Republic of Chili, chemist, for an invention intituled "Improvements in the Manufacture of Preserved Meat."

THIS invention relates to the manufacture of condensed meat in such a manner that it may be preserved for a very long time in a perfectly sound condition, and without depriving it of any of its nutritious properties.

The real alimentary substances contained in meat are as follows:—Albumen, glutine or gelatine, the extractive matters, as creatine and the like, which form, in fact, the so-called Leibig's extract of meat, the fatty matters, and the soluble salts.

Now, it is well-known that Leibig's extract of meat does not contain either albumen or glutine or fatty matters, and their absence is the reason why such an extract cannot and does not form an efficacious nutriment, since it is by no means a former of blood.

All salted meats, that is, all those meats which are preserved by means of strong brine, as, for instance, chloride of sodium, sulphurous oxide of lime, ca. s., acetate of lime, or acetate of soda, or others, are objectionable, for the reason that, besides their considerable cost, the very salts and liquids which ought to preserve the meat tend instead rather towards its injury, for the obvious reason that these liquids dissolve and extract the albumen, glutine, all the creatine and its allies, and the soluble salts, leaving in the end only the mere fibre and the fatty matters; moreover, salted meats of various descriptions are injurious to health when used frequently, as is proved by that terrible scourge, the scurvy.

Canadian pemmican is only dried meat, afterwards coarsely ground and mixed with melted grease or fat; but in this process the meat undergoes a rapid decomposition on account of the fatty matter becoming rancid and rendering the whole nauseous, and it is, moreover, attacked by insects at once, and thereby rendered utterly worthless.

Boiled meat enclosed and soldered up in tin cannisters or the like is comparatively very costly, and its great bulk prevents its use on all occasions in which time and space are matters of great consideration.

This invention, which has had a fair trial in many long voyages by sea and by land, combines in itself all the requisites which can be desired in a thoroughly wholesome nourishing food. Shaped in the handiest form and smallest compass possible, invulnerable against the deleterious influence of air, the attacks of insects, and even to a certain extent against humidity or moisture, it is extremely cheap, its cost being much below that of all other systems, and it affords the very best substitute for flesh meat hitherto known.

The following is the method or process of preparing condensed meat according to this invention:—

The meat or muscular flesh is deprived mechanically of the fatty parts; then it is cut into very thin slices or shreds. I prefer that the meat should be cut transversely across the muscular fibre, producing a broad sheet or flake which will dry very quickly. Thick strips take a very long time to dry, and then only dry imperfectly. These flakes or slices of meat, either salted or unsalted, are hung up to dry in dry open air, or are laid down to dry on hurdles made of cane or wickerwork, which will allow the air to pass through them.

The process of drying must be effected, except in dry climates, in sheds arranged for this purpose, with a certain temperature and a constant draught of warm air sufficient to carry off the moisture. When the flakes or slices are air-dry they are placed in a room or large case, in which the temperature can be elevated to such a degree as will well nigh roast them. About the same result may be attained by carefully roasting the slices or flakes on a gridiron; but great care must be employed in order that excessive heat shall not destroy or alter the nourishing contents. The material once arrived at this state is then allowed to cool and immediately taken to a mill, grindstone, cylinder, mortar, or other machine which may be found suitable to break the brittle fibres into a sort of coarse meal. If the drying and roasting process has been carried on with the necessary care and attention, this meat-flour, as we now may call it, will then be ready for compression; but if overheated, or if very fat, this meat-flour in the final heating is apt to become brittle, and the partially dried up or overheated glucy and extractive matters will become so much enveloped by the fatty substances that the pemmican, instead of combining properly, or caking as it were under the pressure, will never obtain the cohesion required. To obviate this difficulty it is necessary, besides using the greatest watchfulness, that the heat should never rise much above 212° Fahrenheit, to add a material the tendency and result of which are to augment the cohesion of the particles and render them impermeable to atmospheric air, and thus bind and protect the condensed meat so effectually that it will bear handling as well as the external attacks of air and insects.

These objects are accomplished by adding to the meat-flour, after the coarser parts of shreds of the tendons have been withdrawn by means of sieves or other similar contrivances proper for this purpose; from three to six per cent. of finely powdered glutine or gelatine.

When the meat-flour is mixed with its proper proportion of gelatine powder it is introduced into a large closed and heated vat or vessel, and a jet of steam is injected into the warm meat-flour whilst it is being stirred by an apparatus fixed in the said vessel. This jet of steam pervading through the powdered material in motion for a very short time only has the effect of dissolving enough of the gelatinous matter it contained in such a manner that the mass when taken out hot and pressed in proper moulds will cohere and form a tough and solid block.

I have obtained a very similar result by sprinkling over the mass in the mixing vat a solution of gelatine, but the product is not so firm and well combined as when heated in the manner above described.

These blocks are now exposed for some hours to a draught of warm and dry air, and then once or twice coated with a hot solution of gelatine and glycerine. The presence of glycerine in the coating I deem advisable, because it gives to the gelatine a certain elasticity which will prevent the cracking and crumbling of the otherwise too brittle coating or rind, a fact which is highly important. Lastly, if the blocks or cakes are to be exposed to extreme moisture they ought to be covered by a coating of collodion, which can easily be removed by cutting open the cake and immersing it in water.

It

Improvements in the manufacture of Preserved Meat.

It is obvious that by introducing into the mass during the final mixing with gelatine ingredients such as salt, pepper, marjoram, curry powder, amyllum of various kinds, or bread or biscuits in small fragments, a variety of highly palatable and thoroughly wholesome dishes can be made in an instant from this pemmican.

If the albumen of the blood of cattle is separated in the serum from the fibrine and hematosin by means of a centrifugal beater in a closed vat, and then dried at a low temperature not exceeding 125° Fahrenheit, it may be powdered, and when added to the meat-flour will become a highly nutritious constituent of the pemmican, and help to lessen considerably the waste and loss of the slaughterhouse.

This improved product or "Pemmican Leybold" can be eaten in case of necessity just as it is prepared. If a soup is required, all that has to be done is to dissolve the pemmican in hot water. If a stew or hash is needed, the quantity of water added is simply reduced according to taste. It serves also very well for pies and puddings and the like.

Claims.

First. The improved method or process of preparing condensed meat, so that it may be preserved for a great length of time with unimpaired nutritious properties as above described.

Second. The improved product consisting of the condensed meat or "Pemmican Leybold," prepared and formed into blocks or cakes, with a protective coating or covering as above described.

—

This is the specification referred to in the annexed Letters of Registration granted to Friedrich Leybold, this twenty-first day of July, A.D. 1876.

HERCULES ROBINSON.

REPORT.

SIR,

In the matter of the application of Mr. Friedrich Leybold for Letters of Registration for "Improvements in the manufacture of Preserved Meat," which has been referred to us, we have the honor to report that we have examined the specification accompanying the same, and see no objection to the issue of Letters of Registration as prayed for.

Sydney, 16 June, 1876.

IMPROVEMENTS IN ROASTING FURNACES, &c.

LETTERS OF REGISTRATION to Henri Herrenschmidt, for Improvements in Roasting Furnaces and an Apparatus connected therewith.

[Registered on the 22nd day of July, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS HENRI HERRENSCHMIDT, late of Costerfield, but now of Melbourne, in the Colony of Victoria, civil engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of "Improvements in Roasting Furnaces and an apparatus connected therewith," which is more particularly described in the specification and sheet of drawings, marked respectively A and B, which are hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Henri Herrenschmidt, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof : to have, hold, and exercise unto the said Henri Herrenschmidt, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Henri Herrenschmidt shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-first day of July, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Roasting Furnaces, &c.

A.

SPECIFICATION of HENRI HERRENSCHMIDT, late of Costerfield, but now of Melbourne, in the Colony of Victoria, civil engineer, for an invention intituled "Improvements in Roasting Furnaces and an Apparatus connected therewith."

My invention consists chiefly in the use of a conical revolving purifying chamber with its smaller end leading to the chimney stack or sulphur chamber, and so set as that a horizontal line will strike the centre of both entrance and exit. The cone should only be of such a degree as that when thus set the lower side of the discharge end of a forty feet chamber will be about eighteen inches below the lower side of the entrance or smaller end, provision being made for the supply of air as required. This chamber requires a fire-place, ash-pit, and roasted ore receptacle at one end, and a chimney stack at the other, in order to be a complete roasting furnace; but in addition to this, I sometimes introduce (as in the case of antimony ores) a hydrogen gas generator between the fire-place and the conical chamber, and a fan and sulphur chamber between the upper end of such chamber and the stack as hereinafter more particularly described and explained. The fire-place and roasted ore receptacle I prefer to make movable, as shown in the drawings.

The revolving chamber is made of iron lined with brick or brick earth. It has a series of projecting stops on its inner periphery to keep the material under treatment well stirred up. At either end it is made tolerably air-tight by fitting close to the fire-place at one end and against the brickwork of the stack at the other. It is supported on friction rollers, resting on bearings sustained by a series of brick or wooden piers, and is revolved by means of a belt passing quite around it. The material to be treated is supplied to its smaller end.

The hydrogen gas generator consists of a bed covered with iron or iron ore. Into this steam is conducted through one or more pipes, the atmospheric air supply pipe being meanwhile closed. The oxygen of the steam combines with the iron, thus setting the hydrogen free, which then passes away into the revolving chamber, and combines with the remaining sulphur in the charge nearest to it.

The fire-place is of the ordinary kind, except that it is made movable, and the fan in the sulphur chamber may be of any suitable construction.

The air supply pipes are made straight and conical, with the larger end outwards, and so placed as to allow of the interior of the revolving chamber being seen through them.

Referring to the drawings hereto attached, figure 1 shows side elevation of a roasting furnace constructed according to this invention, the dotted lines showing how the sulphur chamber is added when required; figure 2, longitudinal section thereof; figure 3, horizontal section on the line *ab* in figure 1; figure 4, front end elevation; figure 5, back end elevation; figure 6, cross section on line *cd* in figure 3, and figure 7, part of a longitudinal section of furnace when supplied with a hydrogen gas generator. A is the fire-place; B the revolving conical purifying chamber having door B¹ at its further extremity; C the receiving chamber for the purified ore, consisting of a truck travelling on rails C¹; DD the atmospheric air flues; E the ash-pit; F the hydrogen gas generator, into which steam is conveyed through pipes F¹; B¹B¹ are the stops, and B²B² the respective charges in the conical chamber B; B³B³ are the friction rollers, and B⁴B⁴ the piers, B⁵ being the belt which drives it; D¹ is the damper which regulates the supply of air to the chamber B; G is the sulphur chamber.

The mode of operation is as follows:—A fire having been lighted in the fire-place and the whole furnace heated, a charge is supplied to the upper end of the conical chamber through door B¹, which is then closed. This is then set in motion, making, in the case of antimony ore, about one revolution in five minutes, and in about two hours the charge will have travelled about one-fifth of the length of the chamber. Another charge is then supplied through the door to the chamber as before, and so on, charge after charge as long as it is considered desirable to continue work, the roasted ore being discharged into the truck C, and from thence carried to any required spot for further treatment. In treating antimony ore, after about eight hours the charge reaches the position B² which is nearest the hydrogen generator, the air to the fire-place is then cut off, and the damper D¹ closed; steam is admitted to the hydrogen gas generator, and the hydrogen produced passing into the conical chamber comes into contact with the first charge, and combining with whatever sulphur may remain carries it off in the shape of sulphuretted hydrogen. The fan, which has previously emptied the furnace of its oxygen carbonic acid and other gases, drawing this fresh product and discharging it into the outer chamber G. After this has been proceeding for about twenty minutes, I reopen the air supplies to fire-place and purifying chamber, and cut off the steam from the gas generator, allowing the whole of that charge to discharge itself into receiving chamber C, as shown in figure 2. When this is accomplished, I reclose the air supplies and generate fresh hydrogen as before. The air supply pipes I also use for the purpose of inspecting the interior of the revolving chamber from time to time, whilst in the event of its becoming necessary, I remove the fire-place and gas generator so as to leave the end of this conical chamber quite open.

The heat produced by the fuel must be of such a degree as is needful to drive off the sulphur, et cetera, from the crushed ores under treatment, without volatilizing the material itself, and the entrance into the purifying chamber for the heated gases should be at such a height as to admit of their passing over the nearest charge which, having been longest under treatment, does not require it, but is being meanwhile cooled by the atmospheric air supplied through the air flues. In the event of sulphide of antimony being the material treated, the product would be grey oxide of antimony slightly impregnated with metallic antimony. The whole of this would have to be taken away, further purified, smelted, and cast into ingots.

What I have called a charge means about five or six hundred weight of crushed ore, but of course this, as well as the time during which it is under treatment, and the speed at which the revolving chamber must be driven, will vary with the size of the furnace and the nature of the material treated.

Having thus described the nature of my invention and the manner of performing same, I would have it understood that I do not confine myself to precise details so long as the nature of my said invention be retained; but

Improvements in Roasting Furnaces, &c.

I claim—

First. The use of a conical revolving purifying chamber in roasting furnaces, substantially as herein described and explained.

Second. The combination and arrangement of a fire-place and hydrogen generator at one end of the purifying chamber of a roasting furnace with a fan for exhausting it at the other, as described.

Third. The use of a movable fire-place A and receptacle C in combination with a conical revolving purifying chamber B, in the manner and for the purposes herein described and explained.

This is the specification marked A, referred to in the annexed Letters of Registration, granted to Henri Herrenschildt, this twenty-first day of July, A.D. 1876.

HERCULES ROBINSON.

REPORTS.

SIR,

We do ourselves the honor to return to you the documents transmitted for our report under your B.C. communication of the 13th ultimo, No. 76/1,871, which have reference to Mr. Henri Herrenschildt's application for Letters of Registration for his invention for "Improvements in Roasting Furnaces and in Apparatus connected therewith"; and we beg to state that we see no objection to the issue of the Letters of Registration applied for in terms of Mr. Herrenschildt's Petition, drawings, specification, and claim.

Sydney, 13 April, 1876.

We have, &c.,
GOTHER K. MANN.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

SIR,

In returning to you the documents transmitted for our further report, under your blank cover of the 19th instant, we do ourselves the honor to state that we see no objection to the substitution of Mr. Henri Herrenschildt's amended specification for that originally deposited, which amended specification, in conjunction with Mr. Herrenschildt's drawings, confines his claim definitely to a conical revolving chamber.

Sydney, 27 June, 1876.

INVENTION FOR THE ECONOMIC PRODUCTION OF ARTIFICIAL STONE.

LETTERS OF REGISTRATION to Eugene Dominique Nicolle and Thomas Sutcliffe Mort, for an Invention for the economic production of Artificial Stone.

[Registered on the 5th day of August, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS EUGENE DOMINIQUE NICOLLE and THOMAS SUTCLIFFE MORT, of Sydney, in the Colony of New South Wales, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an "Invention for the economic production of Artificial Stone," which is more particularly described in the specification which is hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort shall not, within three days after the granting of these Letters of Registration, register the same in the proper office of the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this fourth day of August, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Invention for the economic production of Artificial Stone.

TO ALL TO WHOM THESE PRESENTS SHALL COME, we, EUGENE DOMINIQUE NICOLLE and THOMAS SUTCLIFFE MORT, both of Sydney, in the Colony of New South Wales, send greeting:

WHEREAS we are desirous of obtaining Letters of Registration for securing unto us Her Majesty's Special License that we, our executors, administrators, and assigns, or such other as we or they should at any time agree with, and no others, should, or lawfully might, from time to time, and at all times during the term of fourteen years, to be computed from the day on which this instrument is left at the office of the Colonial Secretary, in Sydney, make, use, exercise, and vend within the Colony of New South Wales, "An invention for the economic production of Artificial Stone," and, in order to obtain the said Letters of Registration, we must, by an instrument in writing under our hands, particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed. Now know ye, that we, the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort, do hereby declare the nature of the said invention, and the manner performed, to be particularly described and ascertained in and by the following statement and description, that is to say—

SPECIFICATION.

Our invention consists of an improved method of producing artificial stone without the aid of any of the more costly cements commonly used in the manufacture thereof, such as Portland, &c., natural hydraulic lime.

The substances we employ in the manufacture of artificial stone for ordinary purposes are sand, lime, and clay, and by preference in the following proportions, viz.:—

Clean sand	22½ lbs.
Lime	1¼ "
Silicate of alumina	3 "
Hydraulic lime as made by our plan	6 ozs.

Having described the materials we ordinarily and by preference employ in our manufacture, and the proportions in which by preference we use them, we now proceed to describe the way in which we deal with the same—

- 1st. We make lime into a fine paste by perfectly slacking it, grinding it or not according to the nature of the lime.
- 2nd. We calcine silicate of alumina at a red heat, and then grind it into a fine powder. The finer the grain of the clay the better, and the finer the powder the better.
- 3rd. We again take lime and silicate of alumina, by preference in about equal proportions, and ultimately mix the same either in a wet or dry state, by preference wet, which, after putting in convenient form, we dry and then roast, thus forming our hydraulic lime.
- 4th. The quantity of sand will of course be determined by the amount of material decided to be made in a batch, and of this sand a portion is introduced into a pug mill, say a fourth or a fifth of it, according to the moisture in the sand, together with the whole of the required proportions of hydraulic lime, calcined clay, and common lime, the latter being brought into a fine paste by slacking with as little water as possible, and the clay into as fine a powder as may be, the finer the better. The whole must be well mixed in the pug mill, and then the remaining portion of the sand must be added, and the mixing continued until the surfaces of the sand are coated by the lime and clay. Should the sand be wet the paste lime must be stinted of water proportionally—if dry made more moist, and in the event of the materials showing an excess of moisture, a little more powdered clay or hydraulic lime must be added to absorb it.

The proportions specified may be varied by increasing the quantity of sand or clay, either or both, or by diminishing the lime; but for all practical purposes we prefer the proportions hereinbefore named. Any tone may be given to the material by the introduction of finely powdered colour, or it may be faced with granite or marble, by using those materials in a powdered state in a layer at the bottom or side of the mould, but such material must be first treated in the same manner as the sand.

Columns or blocks of granite or marble, or the like substances, for statuary or other purposes, may be made by grinding the material and using it instead of the sand, provided it be treated after the same manner in respect to coating it with the lime and clay.

It may be made so as to take the highest polish by extra felting in thin layers in the mould. Although sand has been spoken of as the chief ingredient employed with lime and clay, various substances may be substituted, such as slag, marble, and stonemason's chippings, quartz tailings, &c., and in place of lime and clay, as preferred by us, natural hydraulic lime may be substituted, or cement, such as Portland, but we use the binding materials described on account of their cheapness and unlimited supply, and for other reasons detailed in our claim hereinafter mentioned.

The materials having been properly mixed in the pug mill, the resulting pug is gradually passed into moulds of the required shape, by preference metal, and as introduced compacted by felting with a rammer or hammer, by preference within rigid surfaces, as effected by our patented apparatus under Letters of Registration, dated 12th June, 1876.

Having thus described the ingredients of which our artificial stone is composed, and the mode of preparing and mixing the same, as also the way of compacting them into stone, we now proceed to claim our invention (substantially as described and set forth herein) whereby we secure the following advantages, viz.:—

- 1st. We are enabled to dispense with the more costly binding materials now employed, such as Portland cement, natural hydraulic lime, &c., and so to effect a great economy.
- 2nd. We can determine with precision the amount of hydraulicity and other qualities which will be given to the stone we wish to make, by regulating the proportions between the lime and the clay, whereby we are enabled to accelerate or delay the initiative combination of the lime with the silicate contained in the clay, and to command stone of even quality, and of any standard, and which will improve with age.

In

Invention for the economic production of Artificial Stone.

In addition to these advantages we avoid the uncertainty which now attends the manufacture of similar material, to say nothing of the large saving effected by avoiding the more expensive hydraulic lime, and the costly analysis consequent upon its use, which latter necessity is imposed by the irregularity of the character of natural hydraulic lime, and the uncertainty of its supply.

(For E. D. NICOLLE, and self),
THOS. S. MORT.

This is the specification referred to in the annexed Letters of Registration, granted to Eugene Dominique Nicolle and Thomas Sutcliffe Mort, this fourth day of August, A.D. 1876.

HERCULES ROBINSON.

REPORT.

SIR,

The application of Messrs. Nicolle and Mort for Letters of Registration for an "Invention for the economic production of Artificial Stone" having been referred to us, we have examined the specification accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

Sydney, 5 July, 1876.

We have, &c.,

IMPROVEMENTS IN APPARATUS FOR THE CONVERSION OF HEAT INTO MOTIVE POWER.

LETTERS OF REGISTRATION to Jehosopht Davy Postle, for Improvements in an Apparatus for the conversion of Heat into Motive Power through the medium of water and gases, such apparatus at the same time being suitable for the condensation and rarefaction of gases and vapours.

[Registered on the 24th day of August, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS JEHO SOPHAT DAVY POSTLE, of Newtown, Sydney, in the Colony of New South Wales, engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Apparatus for the conversion of Heat into Motive Power through the medium of water and gases, such apparatus at the same time being suitable for the condensation and rarefaction of gases and vapours," which is more particularly described in the specification, marked A, and the two drawings, marked B and C respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Jehosopht Davy Postle, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Jehosopht Davy Postle, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Jehosopht Davy Postle shall not within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-third day of August, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Apparatus for the conversion of Heat into Motive Power.

A.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, JEHOSEPHAT DAVY POSTLE, of Sydney, in the Colony of New South Wales, send greeting :

WHEREAS I am desirous of obtaining Letters of Registration for securing unto me Her Majesty's special license, that I, my executors, administrators, and assigns, or such others as I or they should or may at any time agree with, and no others, should and lawfully might, from time to time and at all times during the term of fourteen years, to be computed from the day on which this instrument is left at the office of the Colonial Secretary at Sydney, make, use, exercise, and vend, within the Colony of New South Wales, an invention for "Improvements in Apparatus for the conversion of Heat into Motive Power through the medium of water and gases, such apparatus at the same time being suitable for the condensation and rarefaction of gases and vapours," and in order to obtain the said Letters of Registration I must by an instrument in writing under my hand and seal particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed : Now know ye, that I, Jehosophat Davy Postle, do hereby declare the nature of the said invention, and the manner performed to be particularly described and ascertained in and by the following statement and description ; reference being had to the drawings hereunto annexed, and to the letters and figures marked thereon, which indicate the parts there referred to and herein particularly explained (that is to say) :—My invention consists of an apparatus for producing motive power by the action of changes of temperature on confined air or other gases saturated with the vapour of water and also holding water mechanically in suspension in a finely divided state, such apparatus at the same time being suitable for other purposes hereafter to be described, and also suitable for obtaining motive power by the action of changes of temperature on atmospheric air or dry gases only.

In the apparatus hereinafter to be described, the confined moist air is moved alternately to opposite ends of a vessel to which a cylinder fitted with a piston is attached, connected with a crank shaft carrying a fly wheel, &c. This motion of the confined air is effected by a displacer having a reciprocating movement in the vessel referred to. The opposite ends of this vessel are kept relatively hot and cold. The air carrying the water in a finely divided state is in its passage from the cold end of the vessel to the hot end caused to pass over and between a series of thin metallic plates. On arriving at the hot end the water carried by it is converted into steam ; pressure is the result, which, acting on the piston of the cylinder before referred to, produces motion. The pressure depends upon the temperature, density of the air, and quantity of water converted into steam. At the end of the stroke of the piston any excess of pressure over the external atmosphere is destroyed by air charged with moisture being allowed to escape through a valve. Upon the displacer being moved to the hot end of the vessel already mentioned, the heated air and steam are moved to the cool end of the vessel, in their passage flowing between the thin metallic plates already mentioned. If the surface of these plates is sufficiently large, the air is cooled and the steam is condensed by coming in contact with them ; at the same time water in a finely divided state is introduced into the cool end and effects a still further cooling of the air. A diminution of pressure is the result, and the pressure of the external atmosphere exceeding the pressure in the interior of the vessel before-mentioned, the piston is moved inwards, communicating motion to the crank shaft. If at the termination of the stroke the external pressure is still greater than the internal pressure, air is admitted through a valve. At the next stroke of the displacer towards the cool end, the fresh air and that which remained at the termination of the last stroke are moved to the hot end, carrying with them the water in a finely divided state. As the air and water pass between and over the surfaces of the plates the air is heated and the water converted into steam ; the heat to effect this having been communicated to the plates by the heated air and steam on the last motion of the displacer. The thin metallic plates here act the part of a regenerator, and absorb from the steam flowing in one direction over their surfaces that heat which is necessary to liquefy it and subsequently give to succeeding currents of air carrying water flowing in an opposite direction sufficient heat to effect the conversion of the water into steam. The ends of the copper plates nearest the hot end of the vessel before referred to are hot, whilst the ends nearest the cold end of the vessel are cool ; the intermediate portions of the plates vary in temperature according to their relative positions.

The leading and prominent feature in my invention is the principle of regenerating steam from water resulting from the condensation of steam, or the method of generating steam from fresh unused water, by using in either case what is termed the latent heat of the steam last used in the engine—that is, the heat abstracted from the steam last used, in order to liquefy it or reduce it to water. The principle involved in this method of utilizing the latent heat of steam is, I claim, entirely original and novel. In the best marine engines the latent heat of the steam condensed in the condenser is communicated to the condensing water, which is discharged overboard and got rid of as quickly as possible ; considerable ingenuity and talent from the time of Watt to the present day having been exercised for this purpose. I, on the other hand, arrest this heat in the regenerator and give it back to a succeeding quantity of water, which, when it is converted into steam and has done a portion of its work, is made to give up its latent heat to another succeeding quantity of water through the regenerator, and in doing so completes its work, since a diminution of pressure is produced in the engine analogous to the vacuum in a condensing steam-engine, which diminution in pressure is utilized to produce motion. The air acts an important part in the engine, since it is a medium for carrying the water in a finely divided state to the hot end of the vessel before referred to, and at the same time, though an open communication exists between the hot and cold ends of the vessel, prevents the condensation of steam that would occur if the vessel were filled with steam only. Air at any density can be used ; an artificial atmosphere can be produced by compressing air into a receiver and connecting it with the inlet and outlet valve of the engine. A considerable advantage is derived from the use of air at a great density. Thus, if the pressure of the air employed is 100 lbs. pressure to the inch, its pressure will be doubled by the addition of 490 degrees of heat F., giving a maximum available pressure of 100 lbs. for purposes of motion. On the other hand, the same quantity of heat with air at the atmospheric pressure would only give about 15 lbs. pressure to the square inch for purposes of motion, *i.e.* for producing motion, &c. The engine can be worked as a hot air engine only, no injection water being used, the cold end of the vessel referred to being kept cool by water circulating in a jacket. The engine can also be used for blowing purposes or for compressing air or other gases and vapours without the intervention of an ordinary pump.

Having

Improvements in Apparatus for the conversion of Heat into Motive Power.

Having described the leading principles of my invention, I now proceed to explain the details and general combination of the engine, which is constructed of suitable materials.

A, the furnace. The arrows showing the draft and the direction taken by the gaseous products of combustion downwards along the spiral course of the flue.

BBBB, the vessel for receiving the air, &c., and water acted on. It consists principally of two metallic cylinders, one placed on the other.

CCCC, the displacer. It moves freely in the vessel LL, which is turned up to fit it accurately. It is attached to the rod D working inside the piston rod E.

DD, a rod attached to the displacer CCCC working through the piston rod E and the stuffing-box F. It has tappets, GG¹, attached to it, and works in the guide H.

E, the piston rod attached to the piston I. Upon the down stroke of the piston rod E, the rod D with the displacer attached is carried down with it owing to the friction of the packing in the stuffing-box F. When the tappet G touches the guide H, the motion of the displacer and rod D is stopped, though the piston rod E with its piston I moves on to the end of the stroke.

F, a stuffing-box attached to the piston rod E; the rod D works in it. The packing may consist of one or more steel rings together with the usual stuffing-box and gland; the steel rings exert a continuous pressure on the rod D, giving the necessary friction to cause the rod D to move with the rod E till the former is stopped by the tappets GG¹.

GG¹ are tappets for arresting the motion of the rod D. That side of the tappet nearest the guide H is fitted with a disc of indiarubber to deaden the blow.

H is the guide through which works the rod D. The tappets attached to the rod D strike the guide H at each stroke.

I is the piston working in the cylinder JJ.

JJ is a cylinder; the end in the vessel BBBB is open.

KK is the cover of the cylinder JJ; it is provided with a stuffing-box and gland for the rod E to work in it.

LL is a cylinder bored out to receive the displacer CCCC, which works in it.

M is the port or passage leading from the interior of the vessel BBBB to the valve N.

N, a slide valve permitting the ingress and egress of air or vapour; it opens at the termination of each stroke.

O, a pipe connecting the valve chest P with the receiver Q.

P, the valve chest.

Q, a receiver for holding the injection water and also for holding air at any density. The injection water occupies about one-third of the space of the receiver, and is kept cool by the coil R.

R, a coil through which cold water is passed for cooling purposes.

S, a pump with a self-acting arrangement for regulating the pressure of the air, &c., in the receiver

Q. This self-acting arrangement is a novelty, and can be used for any similar purpose where it may be required. The pump S is fitted with an ordinary plunger *a* working in the cylinder *b*¹. For regulating the compression of the air there is a cylinder fitted with a plunger *c*. This plunger, *c*, is loaded by the pressure of the lever attached at one end to a spring, the head of the plunger forming the fulcrum, the lever being one of the first order. The plunger is hollow, the air being allowed free access to the interior through the holes *dd*. Assuming the pressure in the receiver Q to be not more than that of the atmosphere, the plunger *c* will occupy the position shown in the drawing. If it is desired to pump and maintain a pressure of air in Q of 20 lbs. on the square inch, the plunger *c* is loaded to that pressure, and upon the plunger *a* being set in motion, air through the opening *e* will be drawn in and discharged at the end of the stroke of the plunger *a*. This will go on till the pressure per square inch in Q equals the pressure per square inch on the plunger *c*. Upon more air being pumped in, the plunger *c* will move upwards, shutting up the inlet *e* and opening the aperture *f*. As this aperture *f* is below the plunger *a*, air will be drawn in at the up-stroke, but it will also be discharged at the down-stroke through the same opening without being compressed, consequently no power is wasted when air is not being pumped into Q except that necessary to overcome the friction of the plunger. If, through any leakage occurring, the pressure in Q should become less, the plunger will descend and open *e* and close *f*, compression will then take place and air will be forced into Q. The plunger *c* is prevented from moving higher than a certain point by the pin *g*.

TT is the water supply pipe. When the pressure in the cylinder BBBB is less than the pressure in the receiver Q, the water is forced up and out through small openings in the pipe in the form of fine spray, saturating the air with moisture and causing small particles of water to be suspended in it. The pipe TT is provided with a stop-cock, U, for regulating the supply of water, and a check valve, V, for preventing the backward flow of water when the pressure in BBBB exceeds the pressure in Q.

UU, regulating cocks.

V, a check valve opening upwards.

V¹, a check valve opening downwards.

W is a pipe provided with a stop-valve; it affords when the valve is open a free communication between the vessel BBBB and the vessel Q. When the engine is working this valve is shut. To stop the engine the valve should be opened; when it is open the pressure in the receiver Q and the vessel BBBB is the same, consequently there can be no motion.

X is a pipe forming a communication between the receiver Q and the vessel BBBB; it is fitted with a valve, Z, which is acted on by the lever *hh* of the governor Y. At a high velocity the valve Z is opened, when the same results are obtained that occur on opening the stop-valve on the pipe W. When the velocity diminishes the valve closes. The valve can be set to open at any velocity.

Y is the governor. Motion is given to it by the bevelled gearing off the crank shaft *l*.

Z, the valve acted on by the governor.

Z¹Z¹, the regenerator, formed of thin concentric cylinders of sheet metal.

H¹H¹ is the connecting rod.

hh is the governor lever, connected with the valve Z, and moves it by means of a lever connected with the valve spindle.

Improvements in Apparatus for the conversion of Heat into Motive Power.

i is a pulley for transmitting the power of the engine by belting, &c.

j is the fly-wheel.¹

kk are plummer blocks for carrying the crank shaft *l*.

l is the crank shaft.

m is the crank disc, which has holes bored in it to receive the crank pin in two different positions.

n is the eccentric for working the pump.

*n*¹ is the eccentric for working the slide valve.

o is the standard for supporting the lever of the governor.

p is a pipe forming a constant open communication between the underside of the piston I and the receiver Q.

*p*¹ shows the port in the cylinder JJ connected with the pipe *p*.

q, the opening through which the oil is injected for lubricating the piston I; the oil forms a layer an inch deep, and the bottom of the piston, which is cup-formed, dips into it at each downward stroke and carries upwards the oil lubricating the sides of the cylinder JJ, which are always kept cool by the cold water injected.

rr, the space under the displacer CCCC when it is at the end of the upward stroke.

ss, openings in the cylinder LL to admit the passage of air to and fro.

ttt, a pipe connecting the vessel BBBB with the receiver Q. This pipe is fitted with a stop-cock and a retention valve opening upwards. This pipe is to conduct the excess of water in the bottom of the chamber BBBB to the receiver Q; the water is forced down the pipe when the pressure in BBBB is greater than in Q, but when the pressure in Q is greater than in BBBB the water is prevented from passing upwards by the retention valve. The cock should be adjusted so that a small quantity of water is always retained in the bottom of the vessel BBBB.

The action of the machine is as follows: The receiver Q being about one-third filled with water, the fire in A being lighted, and the stop-valve on the pipe W being shut, the piston I, if at about half stroke, will commence to move downwards, being caused to do so by the pressure resulting from the air being heated in the space between the top of the cylinder L and the displacer CCCC. At the end of the stroke the valve N opens, and any excess of pressure in the vessel BBBB over that in the receiver Q is destroyed by the air, &c., escaping through the pipe O into the vessel Q. At the commencement of the up-stroke the valve N shuts, and the piston, together with the displacer CCCC, moves upwards, the hot air in the space above the displacer CCCC is forced through the opening *b*, shown in the drawing. The piston I, however, carrying with it the piston rod E, continues to move upwards to the completion of the stroke, when the valve N opens, and if the air, &c., in the vessel BBBB is of less pressure than in Q, air from Q rushes through the valve opening and mingles with the air already charged with moisture in the manner described under the displacer CCCC. Upon the commencement of the down-stroke the air and water pass through the space S, over the regenerator plates, when the air is heated and the water is converted into steam by contact with them. Both are further heated by passing through the annular space before-mentioned; pressure is the result, and the piston moves downwards. When the tappet G¹ comes in contact with the guide H its motion is arrested. The bottom of the displacer CCCC will now be almost close to the cover of the cylinder LL. The piston, as before described, moves outwards to the end of the stroke, being impelled to do so by the pressure generated by the steam. At the termination of the stroke any excess of pressure is destroyed in the manner already described. This reciprocating motion is continued and the same water is used over and over again; it is cooled however by being brought in contact with the surface of the coil R. Should any loss of water occur the supply may be restored to its original quantity by means of a pump worked off the crank shaft. For the purpose of starting a large engine a lever, capable of being connected or disconnected at will with the rod D, may be fitted to it. By the aid of this lever, when the engine is worked with the tappet motion, the displacer CCCC may at certain parts of the stroke be moved up and down without the piston rod E being moved. As the displacer is thus moved, it will, at the pleasure of the mover, cause an increase or decrease of the pressure on the piston I. The engine is also worked without the tappet motion by a slight adjustment of the crank pin, in the following manner. In this case the stroke of the displacer CCCC will be the same as the piston. If the stroke of the former is (say) 5 inches and the stroke of the piston 15 inches, the crank pin must be fitted into a suitable hole in the crank disc 2½ inches from the centre of the disc. As this hole is bored out ready for this adjustment when the engine is manufactured in its entirety, the operation of taking the pin out of one hole and putting it in another is very simple. The tappet G¹ can also be adjusted so as not to touch the guide H. When the engine is worked in this manner the action is extremely smooth, and a very high rate of speed can be obtained without much noise. At the same time there is a considerable loss of power compared with the results obtained when the tappet action is used, since the greatest and least pressures in the vessel BBBB occur respectively at the end of each stroke. This circumstance however renders the engine, when adjusted this way, especially suitable for compressing or exhausting gases or vapours, or for purposes of ventilation, or for any purpose where the compression and rarefaction of a gas or vapour would be useful. The mode of applying the engine for this purpose I will explain when I show how the engine can be worked without the receiver Q. The engine when required in a cheap form and of small power only can be used without the receiver Q. In this case the machine works at the ordinary atmospheric pressure, that is at varying pressures alternately above and below the atmospheric pressure. To use the engine in this way the following adjustments should be made: The bottom parts of the pipes X, O, *p*, and W should be disconnected with the receiver Q, and be open to the atmosphere, the stop-cock and valves being retained. The bottoms of the pipes TT and *ttt* should also be disconnected with Q, and connected with two ordinary water tanks, the tank connected with the pipe TT being kept supplied with water; the stop-cocks and check-valves in these pipes, TT and *ttt*, should also be retained. The engine when adjusted this way can be worked in the manner already described, the ordinary external atmosphere performing the same office as the artificial atmosphere formed in the receiver Q, the water being admitted and discharged exactly in the manner above described. When the engine is adjusted to work without the receiver Q and the tappet action, it can be employed for compressing or rarefying gases or vapours. The operation is very simple, the vessel holding the air, &c.,

to

Improvements in Apparatus for the conversion of Heat into Motive Power.

to be rarefied and that in which the air is to be compressed should each be connected with the pipe O; the vessel in which the air &c., is to be rarefied being provided with a valve opening outwards, whilst that vessel in which compression is to take place is provided with a valve opening inwards. On starting the engine the work of a pump will be performed by the mere expansion and rarefaction of the air, gas, or vapour acted on. When, however, a vapour or gas other than atmospheric air is to be compressed or rarefied the engine should be worked as a hot air engine only. This is easily done by simply closing the water pipes TT and ttt, and jacketing the lower end of the vessel BBBB, water being caused to circulate between the jacket and the vessel BBBB, being admitted at the lower end of the jacket and leaving at the top of the jacket. The engine thus jacketed at the cold end could also be used for ordinary motive power purposes with or without the tappet action, and with or without the receiver Q, and either with air or other gases at a high pressure in conjunction with the receiver Q. Its position also might be inverted and the fire made below the vessel BBBB, the mechanical arrangements of the governor, the furnace, &c., being varied to suit the alteration. In the furnace A, it will be seen that the greatest heat is applied to the upper end of the vessel BBBB, and that this heat diminishes gradually as the gaseous products of combustion travel in the direction of the arrows, it being absorbed by the vaporous air in BBBB. This distribution of the heat of combustion is very important, since the upward current of air and moisture in the annular space between the vessel BBBB and the cylinder LL, on one side of the vessel BBBB, meets the descending products of combustion on the other side of the vessel BBBB. The consequence is that the air or steam is gradually heated till it receives its maximum heat just as it enters through the opening b to the space above the displacer CCCC. In certain situations, in place of the furnace the upper end of the vessel BBBB can be jacketed and a fluid at a high temperature passed through it, being admitted at the upper part of the jacket and permitted to pass out at the lower part of the jacket, so that the greatest heat of the fluid will be communicated to the upper end of BBBB, where it is most wanted.

The heating fluid medium in returning should enter the furnace at that point where the gaseous products of combustion are escaping into the atmosphere, the pipe or coil containing the heating medium travelling or placed in the flue to meet them. The coil should be caused to leave the furnace at the hottest part and conducted to the jacket of the engine. If this arrangement is managed properly, the gases of combustion will leave the furnace at about the same temperature that the heating medium enters it. The circulation of the medium can be effected by the revolution of a screw revolving in a vertical position connected with that part of the pipe where the heating medium is about to enter the furnace. The vertical spindle of the screw can revolve in a long vertical stuffing-box, the bottom part of which is fitted to receive the packing and which can be kept cool by a water jacket. The stuffing-box containing the spindle, though being in a direct line with the passage in which the medium circulates, does not form part of it, and will have but little tendency to become heated, and can be easily kept cool in the manner described. Superheated steam or heated gases could be used to circulate through the jacket of the vessel BBBB, in the same manner under circumstances where their employment would be convenient.

CLAIMS.

I claim,—

1. The generation of steam by the direct action of the latent heat of the steam last used.
2. The system of using air or other gases at a higher pressure than the atmosphere for the purposes herein specified.
3. The application of a regenerator for the purpose of storing up and absorbing the latent heat of the steam last used in the engine, as it with the air passes over its surface in one direction, and for giving up again the heat so stored to the water to be converted into steam carried by the air travelling in the opposite direction.
4. The method of applying the heat as described to the vessel BBBB, holding the air and water acted on.
5. The system of working the engine in the four following modes :—
 1. In conjunction with the receiver Q at any atmospheric pressure with the tappet motion.
 2. In conjunction with the receiver Q at any atmospheric pressure without the tappet motion.
 3. The method of working the engine without the receiver Q, with or without the tappet motion.
 4. The method of working the engine as a hot air engine only, with or without the tappet motion, and at any pressure.
6. The application of an injection of water into the cylinder BBBB, for the purpose of cooling the air and charging it with water mechanically suspended in it, and for cooling the interior metallic parts of the cold end of the vessel BBBB by the direct contact with water, together with the plan of using the same water over and over again, and causing the injection into the vessel BBBB and the discharge from it to occur through variations of pressure in it.
7. The self-regulating pump S, and its application for any purpose similar to that described in this specification.
8. The relative motions and positions of the displacer CCCC and the piston I, together with the tappet action, as herein described.
9. The mode of regulating and stopping the engine, viz. :—
 1. Stopping the engine by opening a valve, thereby forming a direct open communication between the vessel BBBB and the receiver Q when the receiver is used, and by making a direct open communication with the atmosphere when the receiver Q is not used.
 2. Regulating the engine by causing the centrifugal force generated in the governor balls to open a direct communication with the receiver Q when it is used, and with the atmosphere when it is not used.
10. The system of having the upper end of the vessel BBBB hot and the lower end cool, whereby the difference of temperature between the ends is more easily maintained.

Improvements in Apparatus for the conversion of Heat into Motive Power.

11. The method of constructing the regenerator Z of concentric cylinders of thin metal in sufficient number to effect the desired purpose.
12. The method of rarefying and condensing gases and vapours by the direct intermittent expansions and contractions of portions of the gases and vapours themselves, such intermittent expansions and contractions resulting from the alternate action of heat and cold or changes of temperature.
13. The application of air, or of any other gas or gases of any density, as a medium for carrying the water in a finely divided state to the heating surfaces of the regenerator Z'Z' and the vessel BBBB, as set forth in this specification.

In witness whereof, I have hereunto set my hand and seal, this thirteenth day of July, Anno Domini 1876.

J. DAVY POSTLE. (L.S.)

This is the specification, marked A, referred to in the annexed Letters of Registration granted to Jehosophat Davy Postle, this twenty-third day of August, A.D. 1876.

REPORTS.

SIR,

We do ourselves the honor to return to you the documents transmitted for our report under your blank cover communication of the 18th instant, No. 76/5047. After hearing Mr. J. D. Postle's explanation of the claims as set forth in his application, we are still of opinion that the claims Nos. 1, 12, 13, cannot be recommended in their present form; we therefore suggest that the documents in question should be returned to the applicant for the modification of the claims specified.

Sydney, 26 July, 1876.
We have, &c.,
GOTHER K. MANN.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

SIR,

We do ourselves the honor to return to you the documents transmitted for our report under your blank cover communication of the 27th ultimo, No. 76/5395. We see no objection to the issue of Letters of Registration securing to Mr. Jehosophat Davy Postle his invention for "Improvements in Apparatus for the conversion of Heat into Motive Power through the medium of water and gases, such apparatus at the same time being suitable for the condensation and rarefaction of gases and vapours," in accordance with Mr. Postle's drawings, petition, specification, and revised claims.

Sydney, 1 August, 1876.
We have, &c.,
GOTHER K. MANN.
CHAS. WATT.

IMPROVEMENTS IN PNEUMATIC SIGNALS FOR RAILWAYS.

LETTERS OF REGISTRATION to Austin Chambers, for Improvements in
Pneumatic Signals for Railways.

[Registered on the 24th day of August, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS AUSTIN CHAMBERS, of Marylebone Road, in the county of Middlesex, England, signal engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Pneumatic Signals for Railways," which is more particularly described in the specification and sheet of drawings which are hereunto annexed, and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Austin Chambers, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Austin Chambers, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Austin Chambers shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-third day of August, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Pneumatic Signals for Railways.

SPECIFICATION.

TO ALL WHOM IT MAY CONCERN: Be it known that I, AUSTIN CHAMBERS, of Marylebone Road, in the county of Middlesex, England, signal engineer, have invented new and useful "Improvements in Pneumatic Signals for Railways," and I do hereby declare that the following is a full and exact description thereof, reference being had to the accompanying drawings, and to the letters of reference marked thereon.

THIS invention has reference to signalling apparatus in which the signalling objects or bodies are moved pneumatically, and has for its object to combine simplicity of construction with ease and rapidity of working, and to preclude the assumption of the "safety" or "pass on" position by the signalling object or body, in the event of breakage or failure of intermediate parts of the apparatus.

To expedite the operation of moving over the lever or handle to the necessary extent for changing the position of the signalling object or body, I employ a compressor so constructed and connected with the actuating lever or handle as that, by the compression of the elastic fluid, effected by moving over the lever or handle, the resistance shall be overcome of a portion of the compressor, the capacity of the compressor being thereby temporarily augmented beyond that which obtains when the operation of compression has been completed,—the latter capacity being attained by the automatic return to the original position or nearly so, of the part or parts of the compressor whose resistance to outward or extensible movement shall have been temporarily overcome by the movement of the lever. To prevent (when the compressor and the collapsible vessel respectively are collapsed) too sharp a fold of and consequent injury to the flexible material of which the compressor and collapsible vessel are constructed, I interpose distance pieces between the rings, so that the rings cannot approach each other beyond a predetermined limit. It will be evident that flanges formed with the rings may be substituted for such distance pieces.

Instead of actuating the signalling objects or bodies by compression of elastic fluid, it may be done by rarefaction, for which purpose apparatus as above described may be arranged to operate inversely.

The compressors, rarefiers, and collapsible vessels, I by preference construct mainly of flexible material, such as sheet india-rubber, and in order to guard against failure through leakage, whilst at the same time securing a maximum amount of flexibility, I use thin sheets of such flexible material, which I fasten together in two or more layers by the interposition of suitable adhesive substance, the layers of flexible material being so arranged as that the joint or junction of the inner thickness or layers shall be amply covered, strengthened, and protected by one or more superposed layers of the same material.

One sheet of flexible material may be so wound around a block or cylindrical object as to cause one part of such sheet to overlap another, and so to form the several layers without breakage of the continuity of the material.

I so arrange and dispose the weight of the signalling object or objects that they shall have to be drawn down when required to assume the "safety" or "pass on" position, and that when the normal pressure of the external atmosphere prevails in the pipes, tubes, and vessels of the apparatus, the signalling objects shall automatically resume the "danger" position.

I provide the following arrangement, where necessary, for indicating, at any required place, when the signalling object has resumed or occupies the "danger" position.

A U-shaped liquid gauge, or other pressure gauge, placed in the situation at which the indications are required, is connected by a pipe, tube, or passage with a valve chamber fixed to the collapsible or expanding and contracting vessel constituting the means of actuating, by changes of fluid pressure, the signalling object or body. A passage is formed between the valve chamber and the interior of the collapsible vessel, the orifice of which passage is provided with a valve pressed against its seat by a spring or weight.

When the collapsible vessel is expanded, the signalling object being in the "safety" position, the valve will be closed; but when the collapsible vessel is collapsed, the valve will be moved from its seat, thus establishing communication between the interior of the collapsible vessel and the gauge, and, by the change of pressure, effecting the required indication. In juxtaposition to the above-named gauge, I arrange a second gauge, which I place in communication with the interior of the compressor or air pump, whereby the changes of pressure are effected so that the showing of different pressures by the two gauges shall indicate that the collapsible vessel has not returned to the "danger" position.

The two gauges must show the same pressure when the collapsible vessel has opened the valve by returning to the "danger" position, and has thus established free communication between the two gauges.

In cases where it is desired that the concurrence of two or more persons stationed at different places shall be an essential preliminary to the moving of the signalling object or body into the "safety" or "pass on" position, I provide in some convenient elastic fluid containing portion of the apparatus, an escape opening furnished with a balanced valve, lid, or closure, arranged to be fastened in its closed position by means of a locking or holding arrangement operated by electricity from the place whence it is required to govern the moving of the signalling object into the "safety" or "pass on" position.

The locking arrangement may be in the form of a catch, or the armature of an electro-magnet may be connected to the valve, lid, or closure, and so be made to serve for holding it in the closed position when required.

By this arrangement, assuming the lever whereby the compressing or rarefying apparatus (as the case may be) is worked, or by which communication is, when required, established between the collapsible vessel and a reservoir of compressed elastic fluid (or a vessel in which a partial vacuum is maintained) to be moved into the position for "taking off" a signal, or, in other words, into the proper position for moving the signalling object or body into the "safety" or "pass on" position, such movement of the said lever will exercise no influence upon the signalling object or body unless the valve or closure has been previously locked or fastened in its closed position, because, by reason of the arrangement of the apparatus, so long as the valve or closure remains unlocked the pressure within the elastic fluid containing apparatus cannot be made to differ sensibly from the normal pressure of the external atmosphere, and whilst that pressure prevails within the apparatus the signalling object or body must of necessity be in the "danger" position.

It

Improvements in Pneumatic Signals for Railways.

It will be evident that this part of my invention may be so applied as to make the concurrence of any desired number of persons, stationed at different places, an essential preliminary to the moving of a signal into the "safety" position.

The valve lid or closure, and locking or holding arrangement, may be enclosed in a suitable casing, arranged to admit of the circulation of elastic fluid, but so as to preclude tampering with the apparatus.

Where I in this specification use the words "signalling object or body," I desire it to be understood that I mean those words to include also any single set of signalling objects or bodies, as, for example, a semaphore arm with its lenses operating in conjunction with a lamp, or other well-known appliances for signalling on railways.

In order that others skilled in the art may be enabled to make and use my invention, I proceed to describe particularly the manner in which I prefer to carry it into practical effect. In the accompanying sheet of drawings—

Fig. 1 is a longitudinal vertical sectional elevation of apparatus embodying my improvements; and fig. 2 is a horizontal section, showing the mode of constructing the flexible portions of the collapsible vessels.

a is the lever for actuating the signals. Its arm *a*¹ carries a rod, *b*, which enters a tube, *c*. This tube is open at its lower end, which is fastened to the lower end of the compressor, into which the tube projects, the upper end of the tube being closed as shown, with the exception of a small hole to admit air for the purpose hereinafter mentioned. The upper end of the rod *b* serves as a valve to close the small hole. The central portion of the compressor consists, in the present instance, of a fixed flanged metal ring, *d*, having an opening through it and communicating by a pipe, *e*, with the collapsible vessel *f*, by whose motions the semaphore arm is actuated. The lateral portions of the upper part *d*¹ and lower part *d*² of the compressor are formed of flexible material, such as sheet india-rubber, fastened by the ordinary cement, but wrapped round in the novel manner shown in figure 2, rigid rings, *d*³, being introduced at suitable intervals, as well understood, to ensure the collapsing of the compressor as required. The ends or covers *d*⁴ *d*⁵ are made heavy; the upper cover *d*⁴ carries a couple of rods, *d*⁵¹, working in guide tubes, *d*⁶, carried by a plate or cross-piece, *d*⁷, resting upon an internal ledge of the central portion or ring *d*. The plate or cross-piece *d*⁷ also carries a central tube, *d*⁸, for guiding the tube *c*. The collapsible vessel *f* is made of flexible material in the same way as, and with rings similar to the compressor, and is suspended from a bracket attached to the signal post, a part of which bracket forms the upper end of the collapsible vessel, whose lower end may consist of a metal plate, as shown. To the lower end of the collapsible vessel is secured a frame, *g*, connected by a forked rod, *h*, to the longer arm *i* of the semaphore, whose fulcrum is at *i*¹. The shorter arm of the semaphore carries a danger lens, *i*², and a safety lens, *i*³. The drawing shows the positions of the parts when the signal is at "danger." If the lever *a* be now moved over in the direction indicated by the arrow, the lower portion *d*² of the compressor will be collapsed; the air within it being compressed will cause the upper portion *d*¹ to suddenly expand, but the weight of the end or cover *d*⁴ and its attachments will cause the upper portion *d*¹ to move back towards its original position. The air within the compressor and tube *e* being compressed by the downward movement of the end or cover *d*⁴, will expand the collapsible vessel *f*, thereby drawing down the longer arm *i* of the semaphore into the position indicating that a train may proceed. On then moving the lever *a* back into the position shown in the drawing, the rod *b* will be caused to move partly out of the tube *c*, the movement of the lever being more rapid than that of the lower end of the compressor, which, however, will gradually follow (expedited by air entering through the small hole in the end of the tube *c*) until it has resumed the position shown, and by restoring the pressure within the compressor and pipe *e* to the normal or external atmospheric pressure, will have caused the partial collapse of the vessel *f* into the position shown in the drawing, thus restoring the signal to the "danger" position. It will be evident that instead of the small hole in the end of the tube *c*, a suitable valve may be arranged either on the top or bottom of the compressor, or upon the air pipe leading to the collapsible vessel *f*, which valve shall act automatically by the partial vacuum formed in the compressor, or may be so arranged as to open and close as required by the action of the compressor itself.

When the apparatus is to actuate the signal by rarefaction, I connect the arm *a*¹ of the lever *a* to the upper end *d*⁴, and for the tube *c*, in the lower part *d*², I substitute a simple guide rod. I invert the collapsible vessel *f* with its valve chamber and valve, and connect what then becomes the upper end of the vessel *f* to the arm *i*. By this arrangement, assuming the lever *a* to be moved over so as to expand or move up the upper portion of the rarefier, the lower portion will, by the pressure of the external air, be temporarily collapsed, but will automatically resume its normal position, or a position approximating thereto, almost immediately, thereby completing the rarefaction of the elastic fluid, and by causing the collapse or partial collapse of the vessel *f*, drawing down the signal arm *i*.

k is a liquid pressure gauge placed in the situation at which the indications are required, and connected by a pipe *l* with a valve chamber *m*, containing a valve *n*, kept by a spring *o* over and against a seat around an orifice leading into the collapsible vessel *f*; *p* is a rod fixed to the lower end of the vessel *f*, which rod, when the vessel is in its collapsed or partially collapsed position, raises the valve *n* from its seat as shown, thus establishing communication between the interior of the collapsible vessel and the gauge *k*; *q* is a second gauge, communicating with the interior of the compressor through a pipe, *r*. Should the collapsible vessel not at the proper time return to the "danger" position, the fact will be indicated by the difference between the two gauges.

*e*¹ is an escape opening furnished with a valve *s*, carried by a lever *t*, having its fulcrum at *t*¹, and carrying an adjustable weight at *t*², which all but counterbalances the valve *s*; *u* is the armature of an electro-magnet, *u*¹, arranged in the same circuit (*u*²) as the ordinary telegraphic indicator *w*, so that the same operation which changes the position of the indicator pointer, will also positively control the valve *s*, and consequently the moving of the signal into the "safety" or "pass on" position. The telegraph indicator will show the man in charge of the lever *a* when he may move over that lever to draw the signal down into that position.

The drawing assumes the electric current for the time being passing through the electro-magnet, to be such as to attract the armature, thus holding the valve in its closed position, so that should the lever

Improvements in Pneumatic Signals for Railways.

lever *a* be moved over, the air in the compressor pipe *e* and vessel *f* will be compressed, so as to bring down the signal. Assuming that the apparatus at the controlling station be operated so as to reverse the current, the armature *u* will be released, so that the slightest increase of pressure in the pipe *e* will raise the valve *s* and permit the escape of fluid from the pipe *e*, thus rendering it impossible to draw down the signal by moving over the lever *a*. A stop is provided to prevent the lever being tilted too far.

It will be evident that the arrangements shown in the drawing may be modified to suit circumstances.

To meet cases where the signal is drawn down by rarefying the air in the pipe *e*, I invert the opening *e'*. I form around the aperture an internal seat for the valve *s*, which valve I arrange above the lever *t*, to which lever I connect the valve by a stem or equivalent means.

It will be evident that in this arrangement, when the armature is free, if the pressure in the pipe *e* be reduced in the slightest degree below that of the external atmosphere, the valve *s* will at once rise from its seat in the pipe, thus admitting air and maintaining in the pipe *e* and vessel *f* the normal pressure at which the signal is invariably in the "danger" position.

Having described the nature of my said invention, and explained the manner of carrying it into practical effect, I hereby declare that I claim—

1. In a pneumatic signalling apparatus for railways: The combination with a hand lever or handle, a pipe, tube, or passage charged with elastic fluid, and a collapsible vessel connected to the signalling object, of a compressor so constructed that as one portion of the compressor is collapsed by moving the lever or handle to move the signal another portion shall temporarily expand to receive the displaced fluid, and afterwards complete the compression of fluid and move the signal by automatically resuming its original position, or a position approximating thereto.

2. In a pneumatic signalling apparatus for railways: The combination with a hand lever or handle, a pipe, tube, or passage charged with elastic fluid, and a collapsible vessel connected to the signalling object, of a rarefier so constructed and connected to the lever that as one portion of the rarefier is expanded or drawn out by the movement of the lever or handle to move the signal, another portion shall temporarily collapse to partially occupy the space vacated by the displaced fluid, and afterwards complete the rarefaction of fluid and move the signal as required by automatically resuming its original position, or a position approximating thereto.

3. The mode of constructing the flexible portions of the compressors, rarefiers, and collapsible vessels of pneumatic signalling apparatus for railways, by fastening together by interposed adhesive substance two or more layers of thin flexible material in such manner that the joint or junction of the inner thickness or layer of flexible material shall be covered, strengthened, and protected by a superposed layer or layers of the same material, substantially as described with reference to figure 2 for the purpose specified.

4. In pneumatic signalling apparatus for railways: The combination with a collapsible vessel or chamber connected to the signalling object, a pipe, tube, or passage charged with elastic fluid and apparatus for changing the pressure or density of said fluid, of two gauges or indicators in juxtaposition, one connected by a pipe, tube, or passage, *l*, with a chamber, *m*, communicating with the interior of the collapsible vessel or chamber by a hole or passage governed by a valve, *n*, operated by a rod or projection, *p*, and the other gauge or indicator communicating through a pipe, tube, or passage, *r*, with the compressor or rarefier, so as by the relative indications of the two gauges to show the position of the collapsible vessel that operates the signal.

5. In pneumatic signalling apparatus for railways: As means for controlling from a distance the moving of the signalling object, the combination with an opening in a fluid containing portion of the apparatus of a valve, lid, or closure, in conjunction with a locking or holding device operated by electricity from the point or station whence the moving of the signalling object is governed.

6. The combination with a hand lever *a* *a'* of a rod, *b*, operating in conjunction with a tube, *c*, carried by the compressor end *d*², said tube having a hole at one end of smaller diameter than the tube itself, as above set forth, for the purpose specified.

7. The compressor consisting of the collapsible parts *d*¹ and *d*² united by a central rigid flanged ring, *d*, and provided with guide rods or their equivalents *c* and *d*³, working in tubes *d*⁴ and *d*⁵ carried by a plate or cross-piece *d*⁷, as hereinbefore described and illustrated, for the purpose specified.

8. In combination with a compressor constructed as shown, the pipe *e* with its opening *e'*; valve *s*, lever *t*, weight *t*², armature *u*, and electro-magnet *u*¹, said pipe communicating with the collapsible vessel *f* connected to the semaphore arm *i* as described and shown, for the purpose specified.

AUSTIN CHAMBERS.

Signed by the said Austin Chambers, in the presence of—

F. J. BROUGHAM,

Clerk to Mr. W. Lloydwise,
Patent Agent, London.

This is the specification referred to in the annexed Letters of Registration granted to Austin Chambers, this twenty-third day of August, A.D. 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 2 August, 1876.

Having examined and considered the application of Mr. Austin Chambers for a grant of Letters of Registration for his invention for "Improvements in Pneumatic Signals for Railways," we have the honor to report that we see no objection to the protection sought for being granted.

We have, &c.,

JOHN WHITTON.

**A MACHINE AND PROCESS FOR PREPARING RAMIE AND OTHER FIBRE
FROM THE STALK.**

LETTERS OF REGISTRATION to Charles Carson Coleman, for a Machine and Process for preparing Ramie and other fibre from the stalk.

[Registered on the 29th day of August, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS CHARLES CARSON COLEMAN, of the city and county of San Francisco, State of California, in the United States of America, machinist, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "A Machine and Process for preparing Ramie and other fibre from the stalk," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling for defraying the expense of granting these Letters of Registration as required by the Act of Council, sixteenth Victoria; number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Charles Carson Coleman, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Charles Carson Coleman, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Charles Carson Coleman shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-eighth day of August, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

A Machine and Process for preparing Ramie, &c.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, CHARLES CARSON COLEMAN, of the city and county of San Francisco, State of California, in the United States of America, machinist, send greeting :

WHEREAS I am in possession of an invention for a machine and process for preparing ramie and other fibre from the stalk, and have petitioned Her Majesty to grant unto me, my executors, administrators, and assigns, Her Royal Letters Patent for the same, and have made solemn declaration that I really believe myself to be the first and true inventor thereof :

Now know ye that I, the said Charles Carson Coleman, do hereby declare that the following complete specification under my hand and seal fully describes the nature of my said invention, and the manner in which the same is to be performed, that is to say :—

My invention relates to an improved machine and process for preparing the fibre of ramie, flax, and other textile substances directly from the stalk so that it shall be presented in marketable form by one single operation.

My machine consists of a series of alternate fluted and plain rollers, through which the stalks are passed to be crushed, being led by suitable belts from one set of rollers to another.

From these rollers the crushed material is passed between belts which carry it into and through a tank or bath of hot water or steam, for the purpose of freeing the fibre of the glutinous or gummy substance contained in it, after which it is again passed between pressing rollers which press out the gummy substance. From these rollers it passes to a second tank and rollers, the solution being varied if desired by the introduction of certain chemicals. After a final washing and pressing, the fibre is passed into a drying chamber, and lastly between heated rollers, which deliver it free from all gummy matter and nearly free from stalks,—the fibre being quite white and in a marketable condition.

In order to more fully explain my invention, reference is had to the accompanying drawings, in which figure 1 is a plan or top view ; figure 2 is a side elevation in section, showing the relative arrangement of the tanks and rollers.

AA are a pair of rollers of suitable length, having their periphery fluted or corrugated in regular curves, this form of corrugation being the most effective for breaking up the stalk or envelope. From these rollers the fibre is passed between a pair of plain faced rollers, BB, which press it and deliver it to another pair of fluted rollers, AA, from which it is passed between two or more final pairs of plain rollers B'B'.

Suitable supporting or carrying belts, C, are arranged between each set of rollers as shown, and these receive the material from each set of rollers and deliver it to the next.

From the final pressing rollers B the material is received in a sheet between two belts, D, which are caused to run over pulleys so that they move close together into a tank or receiver, E, where the mass of material is exposed to the action of boiling water or steam.

This may be effected in various ways, but at present I prefer to pass the belts up and down, over two or more sets of rollers or pulleys, so as to expose the mass thoroughly to the action of the hot water or steam.

As the mass rises for the last time from the tank it is delivered by the belts D so as to pass between a pair of smooth squeezing rollers, F.

The gummy matter which is incorporated in the fibre having been softened and partially dissolved by the action of the hot water or steam, will be partially pressed out by the rollers F, after which another pair of belts, D', receive the mass and again carry it through another tank, E', in a manner similar to that which takes place in the first tank.

Another set of pressing rollers, F', again compress the mass, and this operation is repeated by placing as many tanks and rollers continuously as may be needed.

I have found it beneficial to introduce alkaline or other solutions into one or more of the intermediate tanks, as this assists in freeing the fibre of its gummy and colouring matter.

If these baths are employed, a final steam or hot water bath and pressing rollers will finish this part of the process, after which a pair of belts, G, receive the mass and carry it through a hot air receiver, where it will be dried.

A final pair of hot rollers or cylinders, H, may be employed to finish the drying of the fibre, which will be delivered at the end of the process entirely free from its gummy or other foreign matter, and nearly all the woody husk or stalk, so as to be a merchantable article. My belts are made preferably of short links at either end, these links being united by wooden or other slots which extend from side to side, thus making up the width of the belt, which will be sufficiently open to allow free access of steam, hot water, and air to the mass. In some cases it may be found sufficient to employ horizontal belts, carrying the fibre from one set of rollers to another, and the hot water, steam, or other solution can be applied by passing perforated pipes across, above, and below the belts ; but I have found the use of tanks to be more efficient for this purpose. Suitable gear or belt wheels will serve to transmit the power to drive the machine, these being merely mechanical details which any machinist can supply.

Having thus described my invention, what I claim and desire to secure by Letters Patent is,—first, the continuous process of freeing textile fibre from its gummy matter and stalk, the same consisting in first disintegrating the stalk by means of crushing rollers, and then subjecting the mass alternately to hot water or steam and the action of pressing rollers, together with a final drying device, substantially as herein described. Second, the apparatus consisting of the fluted and plain rollers A B in combination with the tanks E, pressing rollers F, and final drying vessel and cylinders, H, when constructed to operate substantially as herein described.

And I do hereby, for myself, my heirs, executors, and administrators, covenant with Her Majesty, Her Heirs, and Successors, that I believe the said invention to be a new invention, as to the public use and exercise thereof, and that I do not know or believe that any other person than myself is the true and first inventor of the said invention, and that I will not deposit these presents at the office of

IMPROVEMENTS IN THE PRESERVATION OF ANIMAL SUBSTANCES.

LETTERS OF REGISTRATION to Charles Hubert de Castella, for Improvements in the Preservation of Animal Substances.

[Registered on the 29th August, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS CHARLES HUBERT DE CASTELLA, of St. Hubert's, near Lilydale, in the Colony of Victoria, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the preservation of animal substances," which is more particularly described in the specification and sheet of drawings which are hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Charles Hubert de Castella, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof, to have, hold, and exercise unto the said Charles Hubert de Castella, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Charles Hubert de Castella shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-eighth day of August, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in the Preservation of Animal Substances.

SPECIFICATION of CHARLES HUBERT DE CASTELLA, of St. Hubert's, near Lilydale, in the Colony of Victoria, gentleman, for an invention intituled, "Improvements in the preservation of animal substances."

THIS invention has reference—first, to the process by which the animal substances are to be preserved; and second, to the mechanical arrangement for carrying out such process.

My process consists in first expelling the atmospheric air, carbonic acid, and other gases, from the substances to be preserved and from the package containing them; then subjecting them to the action of oxygen gas under the pressure of several atmospheres, and finally withdrawing such pressure and hermetically sealing the package when containing only about one atmosphere of oxygen.

My improved mechanical arrangement consists principally of an adjustable casing in which the package is placed whilst its contents are undergoing the process above described, so as to enable it to withstand such pressure during the operation.

The substances to be preserved are cut up into reasonably sized pieces and placed in tin packages of any convenient shape and size, leaving one or more small pin-holes near the bottom and an orifice of (say) an inch diameter about the centre of the top. The full package is placed in a very strong casing made adjustable so as to fit the package with perfect accuracy. Before it is so fitted oxygen is forced into the orifice at the top and pressed quite through the meat, driving before it the carbonic acid, atmospheric air, and other gases contained therein, and expelling them through said pin-holes. As soon as all the carbonic acid and air are expelled these pin-holes are closed, and the casing fitted tightly around the package. The oxygen is then forced into the package until the pressure therein equals that of about thirteen atmospheres, or say one hundred and eighty-six pounds to the square inch. When this point has been reached the pressure is withdrawn and the oxygen allowed to escape through the orifice at the top into a receiver which may be either part of or separate from the machinery for imparting the necessary pressure. The connection between the package and receiver is then cut off. When this has been accomplished the package is disconnected from the oxygen supply pipe and released from the casing in which it has been imprisoned. The orifice at the top is then closed as speedily as possible, and the package is secure.

The top is the only fixed part of the casing, the sides, ends, and bottom being adjustable so as to accommodate themselves to packages of varying size, and the bottom being supplied with friction rollers to facilitate the removal of the packages when required.

In order, however, that my invention may be clearly understood by those skilled in the art, I will proceed to refer to the drawings hereto annexed, where figure 1 shows vertical section of my apparatus; figure 2, elevation of side of casing; figure 3, elevation of end of casing; figures 4, 5, and 6, plan, section, and cross section of top of casing; figure 7, view of package.

A is the oxygen supply pipe conveying the gas through pressure pipe B to open top cylinder C in which is piston D; E and F are pipes leading to oxygen receiver G; H is an adjustable pressure foot; I, a washer; J, a collar screwed on to the neck K of package L; M is the top of casing, having a slot in which is sliding piece M¹; NN are the sides, and N¹N¹ the wedges which cause them to accommodate themselves to and press evenly against the sides of the package; P is the bottom, supported on friction rollers P¹, which travel on platform P², resting on wedges P³; QQ are the ends, each of which has lugs, Q¹, passing through brackets, Q²; B¹, B², E¹, and F¹ are cocks; L¹ is one of the pin-holes.

The mode of operation is as follows:—Before the top is placed on the package it is filled with the substances to be preserved, the top is then soldered down (supposing it to be made of tin, which I prefer), the collar J screwed on, and the package placed on the bottom plate P of the casing. It is then pushed under pipe B to receive the oxygen supply, the piece M¹ slid into its place, the washer I placed in position, and the presser foot H screwed down so as to press tightly upon it. The cocks B¹ and B² are then opened, the piston D pressed down, forcing the oxygen in the lower part of cylinder C through pipe B into the package L, through which and through the contents of which it passes, driving before it the atmospheric air, carbonic acid, and whatever other gases may be therein, expelling them through pin-holes L¹, the pressure up to this time being only just sufficient for the purpose. The pin-holes are then soldered up, the sides and bottom of the casing tightened up to the package by wedges N¹ and P³, and the pressure of the oxygen increased until it reaches about thirteen atmospheres. As soon as this has been reached the cock B¹ is closed, cock E¹ opened, cock F¹ remaining closed. The surplus oxygen then rushes through pipe E into receiver G, leaving only about one atmosphere in the package. Cock E¹ is then closed, the wedges N¹ and P³ loosened, the ends of casing removed, the washer I relieved of the pressure of presser foot H, the sliding piece M¹ removed, and the lower plate P travelling on rollers P¹ rolled out from the casing, carrying the package with it. The orifice in neck K is then securely closed, and the package is complete.

Before the next package is ready for the reception of the oxygen I open cock F¹ and raise piston D, thereby drawing out the gas from receiver G into cylinder C. I then close said cock F¹, and (when the package is in position) open cock B¹, allowing the oxygen to pass from said cylinder into said package. If any additional pressure is needed to expel the carbonic acid, et cetera, as before described, a slight downward movement of the piston D will be sufficient for the purpose.

The oxygen may be generated by any of the processes at present known, such as the Bousingault process.

I do not confine myself to the size, shape, or materials of which my apparatus may be constructed, as it may be altered or varied in these particulars without departing from the nature of my invention, but I prefer to make the packages of tin and the adjustable casing of iron. The other parts of the apparatus shown in the drawing are of an ordinary character, and may be constructed in the ordinary way. I claim—

- 1st. Preserving animal substances by a process in which the three following features are combined:—1st. Expelling the carbonic acid atmospheric air and other gases from the substances to be preserved and from the package in which they are contained; 2nd. Subjecting said prepared substances to the pressure of several atmospheres of oxygen gas, by preference thirteen atmospheres; and 3rdly, withdrawing said pressure with the exception of about one atmosphere and then hermetically sealing the package.

2nd.

A.D. 1876. No. 540.

123

Improvements in the Preservation of Animal Substances.

2nd. The use of an adjustable casing for supporting the package whilst it and the substances contained therein are being subjected to said pressure of oxygen gas, substantially as herein described and explained.

This is the specification referred to in the annexed Letters of Registration granted to Charles Hubert de Castella, this twenty-eighth day of August, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

The application of Mr. Charles Hubert de Castella for Letters of Registration for "Improvements in the preservation of animal substances" having been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

A.D. 1876, 30th August. No. 541.

IMPROVEMENTS IN SEWING-MACHINES.

LETTERS OF REGISTRATION to George Livingston Du Laney, for Improvements in Sewing-machines.

[Registered on the 31st day of August, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS GEORGE LIVINGSTON DU LANEY, of the city, county, and State of New York, in the United States of America, sewing-machine manufacturer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Sewing-machines," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said George Livingston Du Laney, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said George Livingston Du Laney, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said George Livingston Du Laney shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this thirtieth day of August, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Sewing-machines.

SPECIFICATION.

TO ALL TO WHOM IT MAY CONCERN: Be it known that I, GEORGE LIVINGSTON DU LANEY, of the city, county, and State of New York, United States of America, sewing-machine manufacturer, have invented or discovered new and useful "Improvements in Sewing-machines," and I, the said George Livingston Du Laney, do hereby declare the nature of the said invention and in what manner the same is to be performed to be particularly described and ascertained in and by the following statement thereof, that is to say:—

THE nature of my improvements relates more particularly to the means and arrangement of parts for imparting to the needle and looping-hook relatively to each other a differential variable velocity; also to the peculiar construction and arrangement of the spool-case holder; also to the peculiar means for producing the ornamental cable-stitch and chain-stitch; also to the peculiar construction and manner of securing the presser foot to the bar; also to the hard rubber spool-case and spool or thread guard; also to the peculiarity of the groove in the needle; also to a novel tension device.

In the accompanying drawings figure 1 is a vertical side view or elevation of the machine with a portion of the box covering removed or broken away, showing a cross section of the spool-case holder. Figure 2 is an elevated cross section or end view of the machine showing the feeding mechanism, a portion of the disc being broken away for that purpose, and the relative positions of the spool-case holder and looping-hook. Figure 3 shows a top view of the head of the machine with a portion of the main arm and needle arm broken away, showing a horizontal central view through the tension device and adjusting levers. Figure 4 is a bird's-eye view of the spool-case holder and looping devices. Figure 5 is a longitudinal central view of the needle enlarged. Figures 6, 7, 8, 9, 10, 11, 12, 13, and 14 are detail views of the several parts. Figures 15 and 16, modifications of the tension devices.

The base plate A is formed with a circular opening in its front end sufficiently large to admit of the free action of the parts as hereinafter specified. The main arm or standard B is secured to the bed plate A by means of a large screw which passes through the central portion of the bed plate and enters the base of the arm. The needle arm C is secured to the main arm by means of a screw formed with the journal bearing in the usual manner. The box D is made in two parts, and of such size and shape as to conform to that of the open end of the bed plate A, and has one side or half secured to the bed plate by means of screws. The other side is secured in position by means of a joint or hinge, which is supplied to the rear of the parts, thus providing a convenient means of access to the working parts within the box. The cloth plate F is also made in two parts and is secured angularly in position on the box by means of screws. The main shaft E, to which are attached the slotted discs 1 and 2, is suspended by hangers, *cc*, which are secured to the under side of the bed plate A by means of screws. The independent short shafts or journals HH' find their bearings in other and independent hangers, *ab*, cast solidly to the under side of the bed plate, and at such relative position to the main shaft as to bring one journal above and one below the line of the main shaft, said independent journals being severally provided with cranks and crank-pins, 33, which pins severally engage the radial slots in the main discs 1 and 2, as shown more clearly in figure 6. These discs are so placed upon their shaft E that their slots radiate in the same direction, and as one short shaft H is below the shaft E and the other H' is above said shaft, it follows that when the crank pin which works in the slot or groove of disc 1 is moving away from the axis of shaft E, and therefore causing an accelerated rising movement of the needle, the crank pin of H is moving in its slot of disc 2 towards the axis of shaft E and therefore causing a gradually retarding movement of the looper, thus producing an alternate variable velocity to said independent journals. By this means the needle is withdrawn from the fabric with an accelerated movement, while that of the looping hook is retarded, and *vice versa*. In this way the chafing of the thread against the needle, which would otherwise occur, is entirely obviated. The thread is also by means of this variable motion carried back over the heel of the spool case and out of the way of the point of the needle in its next descent by the increased motion of the hook after the needle has been withdrawn from the fabric, and is in its turn retarded in its downward movement.

The journal H which has its bearing in the end of the hanger *b* is provided with an eccentric, 14, which actuates the needle arm C by means of the connecting rod J. The journal H which passes through the end of the hanger *a* is provided with a disc, O, which carries on its crank-pin the looping-hook P. As it rotates the lower end of the hook being provided with a screw and bearing is supported and guided in its upward and downward movement by means of the slotted hanger *s*, which hanger is secured to the lower end of the stationary hanger *a* as shown.

The feed dog L is formed of a single piece of metal, and its upward half is curved in such shape as to carry it back of and out of the way of the spool-case holder *d*, and it is provided about its fulcrum with an elongated slot which receives the fulcrum screw 9, which secures it in position to the hanger *a*. The slot admits of its free upward and downward movement as it is actuated by means of the eccentric 10, which is formed on the hub of the disc O as it is rotated. The means for effecting the forward and backward movements of the feed dog L are provided for as follows:—A receptacle or socket, *l*, is formed in the dog L at or near its centre, which receives the bent end of the pendent lever *e*, the lower end of which bears against and is actuated by the eccentric 10 as it is rotated. The letter *r* indicates an adjustable elbow-shaped slide fulcrum against which the pendent lever plays at any given point, as it is adjusted upward or downward to give the desired length of stitch at the will of the operator. The letter *u* indicates a bracket secured by means of screws to the hanger *a*, beneath which the slide fulcrum plays. A yielding pressure may be provided beneath the slide by means of a spring (not shown in the drawings). The upper end of the bracket *u* is provided with a horizontal projection which extends at right-angles across the feed dog L at or near its middle, such projection serving to support the feed dog adjustably in position. A spring secures a proper bearing of the feed dog and lever against the eccentric 10.

The spool-case holder is formed of two pieces of metal, and of such shape as is hereinafter described. The main portion of the concaved holder G, which forms the support for the outer jaw, is secured to the bed plate *a* in position relative to the needle and hook by means of screws which pass through the flange provided to the back of the holder for that purpose (see figure 1). The jaw *d* is formed from sheet

Improvements in Sewing-machines.

sheet steel in proper shape, and receives its proper form by being compressed in a die of suitable shape, and is secured in position by means of a screw *t* to the rear of the standard portion G. The jaw *d* is extended backward, as shown in figure 4, to a point beyond that traversed by the point of the hook which controls the loop of thread, as the latter is carried over and back of the spool to a point where the loop is released from the hook as shown.

By reference to the illustration it will be seen that the backward projection of the jaw *d* is extended across the path of the hook at such an angle as will cause the loop of thread as it is carried upward by the hook to glide along the inclined edge of the jaw *d* to a point out of the way and beyond the path traversed by the hook in its passage around the spool-case holder, thus precluding the possibility of the hook engaging the loop of thread left at the heel of the spool-case in case the hook fails to take the thread at the eye of the needle in the next succeeding stitch. The shield *j* which is applied to the rear of the jaw *d*, as shown by the dotted lines, serves as an additional protection to the thread.

The spool-case M is made of hard rubber, and in its construction a rib or shoulder is formed at the conical part of its point on the inside to prevent the spool wedging in the cone, and is further provided with a thread guard, 12, the rear end of which guard projects backward to a point that will bring it in such proximity to that of the inside projection of the spool-case holder as will prevent the loop of thread falling back and underneath the spool-case holder after being released from the looping-hook P. The guard is also continued upward to a point that will admit of its entering the aperture between the inner and outer jaws of the spool-case holder G, thus serving to keep the spool-case holder and thread guard in proper position, and at the same time providing a ready means of adjusting more or less tension on the under thread by passing the thread more or less times around the guard. The spool-case is secured in position by means of the latch 4.

The presser foot I is provided with a slot 8 of V shape at its rear end, as shown figure 7, which shape corresponds to that of the end of the bar N, on which is mounted a solidly fixed washer 13 and an adjusting nut K. By this means a more perfect and ready adjustment is had, and any slack by wear or otherwise is readily taken up, which cannot be done when the sides of the slot are parallel to each other, as is the case in all other devices of a similar nature as used heretofore, and for such parallel slot I make no claim. The foot I is secured in position by being passed back on the end of the bar N and between the washer 13 and the nut K, the latter being then set down tightly upon the foot, thus securing it in position.

The peculiarity of my improved needle consists in providing the same with a shoulder groove, 21, 22. This construction ensures a more perfect and positive loop being formed in the thread immediately opposite the shoulder in the bottom of the groove. The shoulder causes the thread to be thrown off from the needle just at the point where the hook enters the loop formed in the thread by the withdrawal of the needle from the fabric, as shown in figure 5. By extending the groove above the shoulder a ready means of protecting the thread against undue friction is provided, and the thread is thus allowed much more freedom of action than with needles as ordinarily constructed.

My improved tension device is constructed in the following manner,—The disc O' is formed of a circular piece of metal of any suitable diameter, the hub of which projects out sufficiently to admit of a ready and convenient means of turning the disc with the thumb and finger when threading the needle. The tension wheel or disc is secured to the hanger V, which is suspended beneath the main arm by a screw formed with a journal bearing under the head of which is formed in the disc a cavity for the reception of a yielding pad or packing, against which the head of the screw is set down sufficiently to prevent any backward action of the disc during the backward motion of the clutch *mm*. The rim of the disc is formed with a feather edge or bevel flange which, in conjunction with the metallic ring *oo*, which is pressed over the shoulder of the disc, forms a wedge-shaped channel around its circumference, which channel receives and feeds off the thread as the disc is rotated. On the back face of the disc is formed an annular groove that receives the bent end of the grip lever *mm*, which lever by the vibrating action of the needle bar C and lifter *z* causes the disc to rotate and feed off the thread with the proper degree of tension to the needle.

The length of the stroke imparted to the feed lever by the needle bar is graduated in the following manner:—To the main arm B is secured by means of the screw 15 the adjusting lever 3, to which is pivoted by means of the fulcrum screw 14 the graduating lever 40. This lever engages at its slotted end with the stud or spur carried on the end of the yoke 8', which is connected rigidly to the presser bar N. At the opposite end of the lever 40 projects transversely a horizontal stud or spur, X, on which the clutch lever *m* rests at any given point to which it is adjusted. Thus it will be observed that in the same proportion as the presser bar N is affected upward or downward by the varying thickness of goods passing beneath the foot, is the graduating lever 40 and spur X affected; consequently more or less motion is imparted to the clutch *m* and disc O' by the needle-bar C, which causes more or less thread to be fed off to the needle to suit any thickness of goods. The degree of tension is fixed by adjusting the lever 3, which changes the relative position of the lever 40 up or down to suit any length of stitch or thickness of goods. Once adjusted no other changes are required, no matter how varied or irregular the thickness of goods.

The spring *m*² serves to keep the lever *m* in contact with the edges of the annular groove when being actuated by the bar C. Two small discs, 5, are provided at the end of the needle-bar between which the thread passes to the eye of the needle, for the purpose of controlling, by a gently yielding pressure, the slack thread about the eye of the needle.

Figures 11, 12, 13, and 14 show the parts 3, 40, 8, and *mm* detached.

A novel device is provided for producing what I call the "ornamental cable-stitch" and also the common chain-stitch, which is as follows:—On the upper front edge of the jaw *d*, and just in advance of the path of the needle, is formed a neck together with a small point 7, which co-act in the formation of the loop with the slotted thread guard *g* as hereinafter described.

The guard *g* is blanked from sheet steel in the ordinary way, and is in its construction provided with a thumb-like projection 6, extending out from the main body of the guard. The guard is secured adjustably by means of a screw and pin to the top face of the spool-case holder G in such position as when in action to engage and retain the thread in loop form on the points 6 and 7, as shown in figure 4, as it is carried by the hook around the spool-case.

By

Improvements in Sewing-machines.

By this means the loop which has been formed in the thread is held at rest in such position as will insure the needle entering the same in its next descent, said loop being drawn up by the hook at the next succeeding stitch and at the same time interlacing it with the under thread, thus forming the ornamental cable-stitch. The chain-stitch is made in the same way after removing the under thread from the spool-case. The thread guard *g* is brought into action only when these two kinds of stitches are made, the guard being withdrawn when the lock-stitch is being made to the position shown by the dotted lines in figures 2 and 4.

In the modification of the tension devices shown in figures 15 and 16, figure 15 is a rear view and figure 16 a top view, both fragmentary. The piece *a*¹ is blanked from sheet steel in the form shown. The piece *b*¹ is also blanked from sheet steel, and is secured adjustably to the piece *a*¹ as shown. The stud *c*¹ is attached to the piece *b*¹ transversely as shown, and against it the clutch lever is graduated in the same manner as hereinbefore described, except that the action is reversed, and the lever is pressed down instead of lifted up. The action of the needle-bar and presser-foot are thus communicated directly to the pin *c*¹ through the agency of *a*¹ and *b*¹, thus controlling the motion of the lever which actuates the tension wheel. The joint serves to adjust the length of stroke to deliver thread as required. The thread is shown at *d*¹*d*¹ passing from the top of the wheel to the eyelet and thence up over and between the discs 5, as before described.

I claim as follows:—

- First—The combination with the main shaft E and with the needle-operating mechanism and a looper of the discs 1 and 2, provided with radial slots, the cranks and crank-pins 3 3, the shaft H¹ above the shaft E, and the shaft H below it or on the opposite side, as and for the purpose set forth.
- Second—The spool-case holder G constructed as described and provided with the jaw *d*, having a thread projection 7 located on its upper edge at a point slightly in advance of the path of the needle, substantially as and for the purpose specified.
- Third—The shield or guard *j* in combination with the jaw *d* as shown, and for the purpose set forth.
- Fourth—In combination with the hard rubber spool-case M, the spool-guard 12, constructed with the rearward extension as shown, and applied to the spool-case and operating as and for the purpose set forth.
- Fifth—A sewing-machine needle provided with a shoulder groove 21, 22, substantially as shown and for the purpose specified.
- Sixth—The combination for joint operation of the following devices, viz., the tension wheel O¹, ring OO, lever *mm*, spring *m*², lifter *z*, spur *x*, adjusting lever 3, graduating lever 40, and yoke 8¹, these parts being constructed substantially as shown and set forth.
- Seventh—In a sewing-machine the combination with a thread tension device adapted to feed out automatically the quantity of thread for a stitch and with the needle of the discs 5 when used for controlling the slack thread above the eye of the needle as and for the purpose specified.
- Eighth—The adjustable slotted thread-guard *g* in combination with the jaw *d*, provided with the point 6, substantially as described and for the purpose set forth.
- Ninth—The combination of the wheel O¹, lever *mm*¹, spring *m*², lifter *z*, spur *x*, adjusting lever 3, graduating lever 40, yoke 8, and bar N, the several parts being constructed substantially as and for the purpose specified.
- Tenth—The combination with the feed dog L of the eccentric 10, the pendent lever *e*, adjustable fulcrum slide *r*, and bracket *u*, substantially as set forth.
- Eleventh—The combination of devices for producing tension on the thread, substantially as described, and illustrated in figures 15 and 16.

In witness whereof, I, the said George Livingston Du Laney, have hereunto set my hand and seal, this day of , in the year of our Lord one thousand eight hundred and seventy-six.

This is the specification referred to in the annexed Letters of Registration granted to George Livingston Du Laney, this thirtieth day of August, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 10 August, 1876.

We do ourselves the honor to return to you the documents transmitted for our report under your blank cover communication of the 2nd instant, No. 76/5503, which have reference to Mr. George Livingston Du Laney's application for Letters of Registration for "Improvements in Sewing-machines." We beg to state that we see no objection to the issue of the Letters of Registration asked for in terms of Mr. Du Laney's Petition, specification, drawings, and claims.

We have, &c.,

HARRISON'S HYDROGEN PROCESS.

LETTERS OF REGISTRATION to William Henry Harrison, for an Invention for reducing Oxides of Tin, Antimony, Lead, and Copper by means of Hydrogen.

[Registered on the 1st day of September, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS WILLIAM HENRY HARRISON, of Macleay-street, Potts Point, Sydney, in the Colony of New South Wales, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention termed "Harrison's Hydrogen Process," which is more particularly described in the specification and sheet of drawings which are hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said William Henry Harrison, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof : to have, hold, and exercise unto the said William Henry Harrison, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said William Henry Harrison shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this thirtieth day of August, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Harrison's Hydrogen Process.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, William Henry Harrison, of Sydney, in the Colony of New South Wales, send greeting:

WHEREAS I am desirous of obtaining Royal Letters Patent for securing unto me Her Majesty's special license that I, my executors, administrators, and assigns, and such others as I or they should at any time agree with, and no other, should and lawfully might from time to time, and at all times during the term of fourteen years, to be computed from the day on which this instrument shall be left at the office of the Colonial Secretary, make, use, exercise, and vend within the Colony of New South Wales and its Dependencies an invention for reducing oxides of tin, antimony, lead, and copper by a chemical and mechanical contrivance, to be designated "Harrison's Hydrogen Process for the reduction of oxides of tin, copper, lead, and antimony"; and in order to obtain the said Royal Letters Patent, I must by an instrument in writing, under my hand and seal, particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed, and must also enter into the covenant hereinafter contained. Now know ye, that the nature of the said invention, and the manner in which the same is to be performed, is particularly described and ascertained in and by the following statement, that is to say, the process and contrivance for which this patent is claimed by me I designate "Harrison's Hydrogen Process for the reduction of oxides of tin, copper, lead, and antimony," and is the application of certain chemical and mechanical contrivances by which the reduction of tin, antimony, lead, and copper is to be effected. The details of the mechanism and the method of the action of the within claimed patent are as follows:—I erect an ordinary gas-retort, or bench of retorts, each of which I provide with a pipe marked B in the drawings accompanying this specification; the said pipe I insert through either end of the retort, but I prefer it as low down as possible, so that it may lay on or near the retort bottom; such pipe is about 1 inch bore, and pierced at intervals of 6 inches or thereabouts, with holes about $\frac{1}{8}$ of an inch. I prefer the said pipe marked B to be continued along the whole course of the retort; the said pipe is for the purpose of inducting hydrogen or carburetted hydrogen gas into the retort in which the ores to be operated upon are placed; the pipe is continued from the retort to a gas-holder, and is provided with a stop-cock, or I insert the end only of a similar sized gas-pipe into either end of the retort; but I prefer it as first described. The retorts may be placed in the furnace either vertically or in a horizontal position. I prefer them to be about 7 feet long and 15 inches diameter; they may be round, oval, D shaped, or square, the shape being of no immediate consequence in the action of the process; I prefer them to be of clay. When I erect the retorts horizontally, I prefer to have a fall from the mouth-piece to the opposite end of about 6 inches, more or less, to enable the metals which are fusible on reduction to flow to the siphon or tapping-hole to be described hereafter. At the lower part of the end opposite the mouth-piece I pierce a hole about $1\frac{1}{2}$ inch more or less diameter, and insert in it an iron or clay tube, which may be either straight or bent into the form of a siphon, as shown in the plans, at K; I prefer the latter, as by that form the retort is sealed from access of air, and serves an important function in enabling a pressure of hydrogen or carburetted hydrogen gas being brought to bear on the ores under treatment at a high temperature, for which purpose I draw the said gas from a holder of the ordinary kind, and thence, by means of a force pump (under a pressure of from $\frac{1}{2}$ lb. to 4 lbs. to the square inch), force the gas as described amongst the ores in the retort, where the oxygen of such ores combines with the hydrogen and carbon of the said gas, and as steam, carbonic acid, and carbonic oxide escape by means of an ordinary escape valve placed on the mouth-piece of the retort and shown at I in the plans; or the said steam, carbonic acid, carbonic oxide may be inducted into condensing pipes, the size and shape of which are immaterial for the purposes of this invention, as the rapid removal of the said gases is the only object in view. In the adoption of the vertical retort I provide a straight tapping-hole and channel in the bottom side of the retort, continued through the walls of the furnace, whence the metals on reduction are tapped off; the latter position is only suitable for metals fusible at the temperature of the furnace, being tin, lead, and antimony. The horizontal position is preferable for treating copper-ores as described. The tapping-hole alluded to in the vertical retorts is shown at K, fig. 5. In treating copper-ores when the abstraction of the combined oxygen by means of the gas is effected, I withdraw the contents of the retort by a rabble, and melt the whole in either a suitable melting furnace or crucibles, these latter being no part of this patent. I also pass a fine stream of steam over incandescent carbon for the purpose of procuring hydrogen gas; I prefer to do this over the coke (whilst hot in the gas retorts or ovens) resulting from the manufacture of gas from wood or coal, the object being by such means to decompose such steam, its oxygen being conveyed by the ordinary ascension pipes and mains into the holder. I do not confine myself to the number, size, or shapes of the retorts as described for the reduction of oxides of the metals herein mentioned by means of hydrogen or carburetted hydrogen gas.

One sheet of drawings accompanies this specification with reference thereto, as follow—the letters referring to the same parts in each figure:—A, retort; B, pipe for inducting gas; C, walls of furnace; D, pipe of mouth-piece with safety-valve; E, mouth-piece; F, flue's ashpit; G, gas generator; H, pipe from gas generator; I, escape valve; K, tapping hole and siphon.

I claim for the use and reduction of oxides of tin, lead, antimony, and copper by heating them in the arrangements set forth herein, and conveying hydrogen or carburetted hydrogen gas amongst the said oxides with a view to abstract the oxygen therefrom. I claim the application of such said gases under pressure as an important aid in the reduction of ores of tin, lead, antimony, and copper. I claim the application of the siphon tapping hole, placed as described in retorts, with a view to providing a continual running of fusible metals herein named as reduced and to seal the retort from access of air. I claim the use of a force-pump for the purpose of forcing gas into the retorts as described. I claim the use and application of passing steam and incandescent carbon for the production of hydrogen gas for the purposes of this invention.

And

A.D. 1876. No. 544.

133

Harrison's Hydrogen Process.

And I do hereby, for myself, my heirs, administrators, executors, and assigns, covenant with Her Majesty, her heirs and successors, that I believe the said invention to be a new invention as to the public use and exercise thereof; and that I do not know or believe that any other person than myself is the true and first inventor of the said invention; and that I will not deposit these presents at the office of the Chief Secretary with any such knowledge or belief as last aforesaid.

In witness whereof, I have hereunto set my hand and seal, this seventh day of August, one thousand eight hundred and seventy-six.

WILLIAM HENRY HARRISON. (L.S.)

This is the specification referred to in the annexed Letters of Registration, granted to William Henry Harrison, this _____ day of _____ 1876.

REPORTS.

SIR,

Sydney, 2 August, 1876.

We do ourselves the honor to return to you the documents transmitted for our report under your blank cover communication of the 22nd ultimo, No. 76/5215.

Having heard Mr. W. H. Harrison's explanation in support of his specification and claim, we are still of opinion that his application for Letters of Registration cannot be recommended in its present form. We therefore suggest that the papers be returned to Mr. Harrison for revision.

We have, &c.,

GOTHER K. MANN.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

SIR,

Sydney, 10 August, 1876.

We do ourselves the honor to return to you the documents transmitted for our report, under your blank cover communication of the 7th instant, No. 76/5744, and now beg to state that we see no objection to the issue of Letters of Registration in terms of Mr. William Henry Harrison's Petition, drawings, and amended specification and claim.

We have, &c.,

IMPROVEMENTS IN TANNING, AND IN APPARATUS CONNECTED THEREWITH.

LETTERS OF REGISTRATION to Phillippe Joseph Dussaud, of the firm of P. & J. Dussaud, Frères, and Joseph Duchez, of the firm of Duchez & Bendinger, of Bordeaux, France, merchants, for Improvements in Tanning, and in Apparatus connected therewith.

[Registered on the 7th day of September, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS PHILLIPPE JOSEPH DUSSAUD of the firm of P. & J. Dussaud, Frères, and JOSEPH DUCHEZ, of the firm of Duchez & Bendinger, of Bordeaux, France, merchants, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Tanning, and in Apparatus connected therewith," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling for defraying the expense of granting these Letters of Registration as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Phillippe Joseph Dussaud and Joseph Duchez, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Phillippe Joseph Dussaud and Joseph Duchez, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Phillippe Joseph Dussaud and Joseph Duchez shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this sixth day of September, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

225—2 P

SPECIFICATION.

Improvements in Tanning, and in Apparatus connected therewith.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME: We, PHILIPPE JOSEPH DUSSAUD, of the firm of P. & J. Dussaud, Frères, and JOSEPH DUCHEZ, of the firm of Duchez & Bendinger, of Bordeaux, France, merchants, send greeting :

WHEREAS we are desirous of obtaining Letters of Registration for the Colony of New South Wales securing unto us Her Majesty's special license that we, our executors, administrators, and assigns, and such others as we or they should at any time agree with, and no others, should and lawfully might from time to time, and at all times during the term of fourteen years next and immediately after the date of the said Letters of Registration, make, use, exercise, and vend within the said Colony of New South Wales an invention for "Improvements in Tanning and in apparatus connected therewith." And whereas, in order to obtain such Letters of Registration, we must, by an instrument or specification in writing under our hands and seals particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed: Now, know ye, that the nature of the said invention, and the manner in which the same is to be performed, is particularly described and ascertained in and by the following statement in writing, and on reference to the accompanying sheet of drawings, that is to say:—

The object of this invention is to abridge considerably the time occupied in the tanning of hides and skins as effected by the ordinary process of maceration in pits, by forcing the tanning material to penetrate through the entire thickness of the hides in a rapid and complete manner.

This new method of tanning comprises a series of operations, which will be described in their order.

First operation: The hides having been unhaired and washed are placed in vats containing a weak tanning liquor, they are frequently agitated, and they remain therein from twelve to seventy-two hours, according to their thickness and quality, care being taken to increase the strength of the liquor every twenty-four hours for thick skins.

Second operation: The hides being withdrawn from the vats are placed in a closed vessel of suitable form capable of supporting a pressure of 8 kilogrammes, and rendered unattackable by tannic acid; they are arranged as in an ordinary vat, that is to say, in layers, interposing between them an inactive material; spent bark which is deprived of its tannin answers this purpose best. The vat is then filled with tanning liquor stronger than that used in the first operation. Pressure is then applied, and the hides or skins are left under pressure from two to five days according to their quality.

Third operation: After this delay the vessel is entirely emptied and cleansed, the liquor, the inactive material, and the hides being withdrawn. The hides are then placed back again into the vat, arranged as before, replacing the inactive material by bark or tanning matter containing all its tannin.

The vessel is filled with the liquor used in the second operation, or with liquor of the same strength; it is then again put under pressure at once for very thin hides, and at the end of four days for thicker ones. In cases where the tanning matter is liquid, in order that the hides may remain always isolated from each other, care must be taken at the commencement of this third operation only to remove the liquor without disturbing the hides or the matter which isolates them. According to the thickness and quality of the hides remaining under pressure, for from two to five days will suffice for tanning thin hides or skins.

Fourth operation: For hides of medium thickness, after remaining fifteen days under pressure in the third operation they should be removed from the vessel, and the bark or tanning matter which has parted with its tannin should be replaced with fresh material containing all its tannin, the hides being always arranged as before.

The vessel is filled with the liquor of the preceding operation, or with liquor of the same strength, and at the expiration of from four to six days, according to the thickness and quality of the hides, the pressure is applied.

From fifteen to twenty days under pressure suffices for the entire tanning of this class of hides.

Fifth operation: For hides of great thickness, at the expiration of twenty days under pressure in the fourth operation they should be removed from the vessel, and the bark or tanning matter which has parted with its tannin should be replaced with fresh material containing all its tannin, the hides being arranged always in layers as before.

The vessel is filled with the liquor of the fourth operation, or with liquor of the same strength, and pressure is applied at the end of twelve days. Twenty-five days under pressure is sufficient to complete the tanning.

The pressure should be a few kilogrammes only in the second operation, and should be gradually increased at each operation until finally it reaches about 8 kilogrammes.

In cold weather, for tanning in the time abovenamed, it is necessary that the place containing the closed vessel should be kept at a temperature not less than 10 degrees above zero (centigrade).

The series of operations above described may be carried on in a closed vessel of any form, but the vessel or apparatus hereinafter described has given good results, although we do not wish to confine ourselves exclusively to its use.

The accompanying drawing shows clearly the construction and operation thereof.

Figure 1 is an external elevation of the apparatus, and figure 2 is a corresponding plan view. Figure 3 is a vertical section through the line 1-2, and figure 4 is a horizontal section through the line 3-4.

This vessel or apparatus is composed of a large cylinder closed at its two ends by spherical caps. At the upper part is an opening for charging the same, firmly closed by a cover; towards the lower part is fitted a screen or false bottom, S, intended to support the hides. This false bottom is in three pieces, and covered with metallic wire-cloth, so that it can be easily raised and replaced.

Along the vertical walls of the cylinder are arranged metallic tubes, R, pierced all over with holes, and intended to facilitate the distribution of the liquor in the apparatus and its flowing away during the emptying.

The false bottom being put in its place, the workman who is in the cylinder spreads out a layer of material, T, either inactive or having all its tannin, according to the operation which he is carrying on; then he spreads the hides and arranges them in horizontal layers, separating them from each other by the said material T, as above described. The tanning liquor is then admitted by the tube I into the apparatus, and

A.D. 1876. No. 545.

137

Improvements in Tanning, and in Apparatus connected therewith.

and when the latter is filled, pressure is given by means of the tube J, a tap, H, allowing the air to escape during the filling. A manometer, G, indicates the pressure at any period of the operation, and a weighted safety valve, P, prevents the pressure from exceeding a certain limit. At the lower part a tube terminated by a rose, V, and provided with the tap L, allows the tanning liquor to be drawn off from the vessel into a tube, M, outside the apparatus.

Having thus particularly described our said invention, and the manner in which the same is or may be performed, we have to state, in conclusion, that what we believe to be novel and original and claim as our invention is—

The mode of tanning in a closed vessel under pressure as above described, together with the various operations comprised, and also the apparatus employed to attain this result, without limitation to any special form, but reserving the right to employ closed vessels of any shape capable of applying the principles on which this invention is based.

In witness whereof, we, the said Phillippe Joseph Dussaud and Joseph Duchez, have hereunto set our hands and seals this twenty-third day of May, in the year of our Lord one thousand eight hundred and seventy-six.

Signed and sealed in the presence of me,—
Pro H. B. M. Consul, P. A. DUCROS.

PHILLIPPE JOSEPH DUSSAUD. (L.S.)
JOSEPH DUCHEZ. (L.S.)

This is the specification referred to in the annexed Letters of Registration, granted to Phillippe Joseph Dussaud and Joseph Duchez, this sixth day of September, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 16 August, 1876.

We do ourselves the honor to return to you the documents transmitted to us under your blank cover communication of the 31st ultimo, No. 76-5386, which have reference to Mr. Phillippe Joseph Dussaud's and Joseph Duchez' application for Letters of Registration for their invention for Improvements in Tanning, and in apparatus connected therewith.

Having examined Messrs. Dussaud's and Duchez' specification and drawings, we have to report that we see no objection to the issue of Letters of Registration in accordance with their petition, drawings, specification, and claim.

We have, &c.,

IMPROVEMENTS IN THE PREPARATION OF MANURE OR FERTILISING MATERIAL.

LETTERS OF REGISTRATION to Bernard Ackerman, for Improvements in the preparation of Manure or fertilising material.

[Registered on the 4th day of October, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS BERNARD ACKERMAN, of the City and State of New York, United States of America, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the preparation of Manure or fertilising material," which is more particularly described in the specification which is hereunto annexed, and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Bernard Ackerman, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Bernard Ackerman, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Bernard Ackerman shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this third day of October, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in the preparation of Manure or fertilising material.

SPECIFICATION of BERNARD ACKERMAN, of the City and State of New York, United States of America, for an invention entitled "Improvements in the preparation of manure or fertilising material."

THIS invention relates to the preparation of stable manure by a cheap and expeditious process in bales or packages by compression, and by securing the compressed bales with wire or other bands, as hereinafter set forth.

The importance to the community of economically utilising the immense amount of manure or fertilising matter now wasted in cities and towns has long been appreciated. Expensive processes of forming manure into bricks have been employed in countries where labour is cheap, and analogous methods have been practised in other countries, but none have come into general use, and stable manure still continues to be treated in loose masses, in which condition it is offensive to the senses and loses much of its value in transportation.

It is well known that in stables the excrementary matter is usually mixed with straw; I esteem this straw a valuable element of the manure, and make it available in aiding to hold the mass together. It serves as an absorbent of the liquid matter, and by its silicious qualities contributes to the value of the manure or fertiliser. I have discovered that after sufficiently powerful compression and tying with stout wires or other bands the bales of mingled excrementary matter and straw dry rapidly upon the outside, while the densely compacted interior maintains its original condition, with only a very slight tendency to heat, and the whole mass may be transported and handled with greatly increased convenience, and without losing its ammonia, or being more than slightly offensive.

In carrying my said invention into practice, I use a suitable press, which may be placed on or below the stable floor, and the bales are tied by bands, preferably of iron-wire, and whose ends are secured by hooks or other strong fastenings. The said press should have a box or receiver of rectangular shape, and the loose material may be pitched fresh from the stalls into this box.

The compression should be such that the finished bales occupy only about one-fourth of the ordinary bulk of the uncompressed material. I prefer that they should be of a square or nearly square shape. In some instances I place strips of wood along the edges of the bales, and pass the wire or other bands over the said strips. The said bales may be stored near the press, or at other convenient parts of the stable, and removed after longer or shorter intervals at convenience.

The same class of cheap labour may be employed as heretofore, both in the stable and in the transportation of the material.

The ordinary labourers employed in stables have sufficient skill to operate the press, and to apply and secure the bands upon the bales; and successive charges of the manure can be baled and compactly stowed away with this ordinary stable help with such rapidity as to prevent nearly all the disengagement of ammonia which is so destructive to the varnish of carriages.

The said invention obviates the necessity for the dung-pit heretofore indispensable to a stable, and for the filthy carts ordinarily employed, and the dropping and scattering of the material over the floors and side walks. The removal may, if preferred, be performed in similar carts and by the same men; but when the manure is prepared as above described, its removal may be conducted without littering the ground or causing any offensive smell in the neighbourhood through which it is carried; and its carriage or transport will be effected with a degree of economy and convenience hitherto unattainable.

The area over which the manure or fertilising matter obtained in towns and cities may be economically utilised is greatly extended by my invention, as the manure prepared according to the said invention is free from the objections attending other methods of preparing manure for such purposes.

Having thus described my said invention, and the manner of performing the same, I wish it understood that I claim—

The preparation of manure or fertilising matter by compressing and baling the mixed excrementary matter and straw in such a manner that the manure will retain the whole or nearly the whole of its valuable properties or qualities during storage or transportation substantially as above set forth.

In witness whereof, I, the said Bernard Ackerman, have hereunto set my hand and seal this eighth day of May, in the year of our Lord one thousand eight hundred and seventy-six.

BERNARD ACKERMAN. (L.S.)

This is the specification referred to in the annexed affidavit of Bernard Ackerman, this third day of October, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 6 September, 1876.

In the matter of the application of Mr. Bernard Ackerman for Letters of Registration for "Improvements in the preparation of manure or fertilising material," which has been referred to us, we have examined the specification accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,
J. SMITH.
CHAS. WATT.

**INVENTION FOR A COMBINED SIPHON TAP AND STOPPER FOR
AERATED WATERS.**

LETTERS OF REGISTRATION to Henry James Cole, for an Invention for a
Combined Siphon Tap and Stopper for Aerated Waters.

[Registered on the 12th day of October, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS HENRY JAMES COLE, of Wandsworth Road, in the county of Surry, England, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an "Invention for a combined Siphon Tap and Stopper for Aerated Waters," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty-four Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matter stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Henry James Cole, his executors, administrators, and assigns, the exclusive enjoyment and advantage of said invention or improvement for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Henry James Cole, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Henry James Cole shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eleventh day of October, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Invention for a combined Siphon Tap and Stopper for Aerated Waters.

SPECIFICATION of HENRY JAMES COLE, of Wandsworth Road, in the county of Surry, England, of an Invention for a combined Siphon Tap and Stopper for Aerated Liquid Waters.

NOW KNOW YE, that I, the said Henry James Cole, do hereby declare the nature of the said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement or specification and drawings thereof, that is to say:—

THIS invention relates to a combined siphon tap and stopper for aerated liquid bottles, and consists of a tube attached to another tube which passes through the bottle neck, the latter tube being surrounded by a short length of rubber tube, which can be expanded by impinging against a cone at one end, and by abutting against a cap which carries it at the other. The cap is capable of being forced down by a screw button or plate, which rests upon the cap, and the rubber tube which is expanded acts as a stopper, and hermetically closes the neck of the bottle against escape of the liquid or the gas with which the liquid is charged.

The second tube referred to is surmounted by a head, in which is a valve capable of being removed from its seating by turning a button on the outside of the head, either from above or from the side, in order that the liquid can pass out through a nozzle into any vessel placed to receive it.

Instead of the valve being in the head of the tap it may be in the bottom of the second tube, the first-mentioned tube in that case being dispensed with, as also the head.

My invention is clearly shown in the accompanying drawings.

a, figures 1, 2, and 3, is the first-mentioned tube, and *b* the one above, forming an extension thereof; *c* is the rubber tube, which when in the neck of a bottle, *d*, as in figures 2 and 4, impinges against the cone *e* and the bottle neck *f* when the cap *g* is forced down by the screw button or plate *h*, whereby the rubber tube *c* is expanded and caused to act as a stopper, and hermetically close up the neck of the bottle. I fit a rubber ring, *i*, in the button or plate *h* to prevent any escape of gas should there be any chance by an imperfection in the rubber tube; *j* is the head surmounting the tube *b*, and is fitted with a valve-seating, *k*, against or upon which the valve *l* is caused to impinge to close the passage through the tubes *a b*, which lead to the nozzle or outlet *m* when the outside button *n* is screwed home.

The tube *a* can be screwed into a metallic cork or other suitable packing, *p*, placed in the tube *b*, as in figure 1, or it may be screwed direct into the tube *b*, and the valve *l* may be flat on the face, as in figure 1, or of rounded form, as in figures 2 and 3, so long as the passage through from the bottle to the outlet be effectually closed by it.

Figure 4 represents a bottle, *d*, with the appliance in another form, the tube *a* and the head *j* being in this case dispensed with, and the valve *l* fitted to act against the bottom of the tube *b*, which valve, *l*, can by a partial rotation of the button *n* and a depression of it be removed from its seating, as shown in figures 5, 6, 7, and 8. The button *n* may in this form be a flat plate to cover the top opening of the tube *b*, or it may be simply a ring at the end of the wire *r* through which the valve *l* is operated for opening the passage. The plate or the ring *n*, when turned over the mouth of the tube *b*, prevents the valve being accidentally opened, the pressure of gas within the bottle being at all times sufficient to keep it to its seating.

In figure 5 I have shown the valve *l* as flat, with a bulb in the centre, and in figure 6 as a sphere, to insure a close touch on the seating, which may be of rubber or other soft yielding material. Figure 7 is a section of figure 8, the valve *l* in this being of half-round form, and guided within the base of the tube *b*. The wire *r* may be outside the tube *b* and through the cone, as in figure 5, or through the wall of the tube, as in figures 6 and 7, as desired, the wire by this means being kept vertical.

What I claim as my invention is—

Firstly. The combined siphon tap and stopper described, and as shown in figures 1, 2, and 3 of the accompanying drawings.

Secondly. I claim the modified form of siphon tap and stopper described, and as shown in figures 5, 6, 7, and 8 of the accompanying drawings, when used as and for the purposes set forth.

In witness whereof, I, the said Henry James Cole, have hereunto set my hand and seal this second day of June, one thousand eight hundred and seventy-six,—

HENRY JAMES COLE. (i.s.)

Witnesses,—

THOS. HOLME DAVIS, } 166, Fleet-street, London, England.
H. GARDNER, }

This is the specification referred to in the annexed Letters of Registration, granted to Henry James Cole, this eleventh day of October, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 13 September, 1876.

We do ourselves the honor to return to you the documents transmitted to us under your blank cover communication of the 28th ultimo, No. 76/6,330, which have reference to Mr. Henry James Cole's application for Letters of Registration for his invention for "a combined Siphon Tap and Stopper for Aerated Waters"; and we have to report that we see no objection to the issue of Letters of Registration applied for in compliance with Mr. Cole's petition, specification, drawings, and claim.

We have, &c.,

HAYES'S OIL FOR LUBRICATING MACHINERY AND OTHER PURPOSES.

LETTERS OF REGISTRATION to Patrick Hayes, for an Invention for the manufacture of an oil to be called "Hayes's Oil for lubricating Machinery and other purposes."

[Registered on the 13th day of October, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS PATRICK HAYES, of the North Shore, near the City of Sydney, in the Colony of New South Wales, hath by this Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for the manufacture of an oil to be called "Hayes's Oil for lubricating Machinery and other purposes," which is more particularly described in the specification which is hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Patrick Hayes, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof: to have, hold and exercise unto the said Patrick Hayes, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Patrick Hayes shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this thirteenth day of October, in the year of our Lord one thousand eight hundred and seventy-six.

(I.S.)

HERCULES ROBINSON.

Hayes's Oil for lubricating Machinery and other purposes.

SPECIFICATION of an invention for the manufacture of oil to be called "Hayes's Oil for lubricating Machinery and for other purposes."

THIS oil is made in the following manner:—I take a quantity of oil obtained from shale, coal, or tar, and add to it ten per cent. (more or less) of a solution of caustic soda, potash, lime, or sulphuric acid. I then boil the ingredients for from two to three hours (more or less). After this I add water, and boil and wash the product, say for two hours (more or less). This done, I draw the liquid from the oil, which oil I mix with an equal part of resin (more or less). I place such oil and resin in a retort or still (heated by means of fire or superheated steam, or by both) and distil them into oil, which I term "Hayes's Oil for lubricating Machinery and for other purposes."

Having thus described the nature of my invention, and the mode of carrying the same into effect, I would have it understood that what I claim as my invention is the manufacture of oil in the manner as above substantially described.

This is the specification referred to in the annexed Letters of Registration, granted to Patrick Hayes, this thirteenth day of October, 1876.

REPORT.

SIR,

Having, in attention to your B.C. minute of the 5th instant, examined the specification accompanying the application of Patrick Hayes, praying for a grant of Letters of Registration for his invention for the manufacture of an oil to be called "Hayes's Oil for lubricating Machinery and for other purposes," we have now the honor to state that we see no objection to the prayer of the petition being complied with.

We have, &c.,

E. O. MORIARTY.

IMPROVEMENTS IN LIFE PRESERVING APPARATUS.

LETTERS OF REGISTRATION to William Haspery Jeavons and William Walker,
for Improvements in Life Preserving Apparatus.

[Registered on the 13th day of November, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS WILLIAM HASPERY JEAVONS and WILLIAM WALKER, both of Botany-street, Waterloo, near Sydney, in the said Colony, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an "Invention which has for its object the preservation of lives of persons swimming, and more especially for use in all cases of accident arising from any sudden immersion in the water, whether from the fearful disaster of shipwreck, or when enjoying the pleasures of boating, or in healthful recreation of bathing," which is more particularly described in the specification and drawing which are hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said William Haspery Jeavons and William Walker, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said William Haspery Jeavons and William Walker, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said William Haspery Jeavons and William Walker shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eleventh day of November, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Life Preserving Apparatus.

SPECIFICATION of WILLIAM HASPERY JEAVONS and WILLIAM WALKER, of Sydney, in the Colony of New South Wales, gentlemen, for an invention of a certain apparatus for preserving life in case of shipwreck or any sudden immersion in the water.

1. THE invention consists of a cuff or covering open at both ends, and, when intended for use, to be worn on both arms, between the elbow and wrist. This cuff or covering is made of india-rubber, with an elastic band at each end. There is a valve made of brass affixed to the cuff, to which is joined an india-rubber tube and a spring made of steel. The valve being placed in the mouth of the wearer and the india-rubber tube drawn down by the hand, the apparatus being then blown into by the wearer immediately becomes inflated. The wind is emitted by drawing the valve and pressing the apparatus.

2. The figure of a hand and part of an arm, with the word "Empty" printed over the same, on the plans sent herewith, shows the invention uninflated; and the figure of a hand and part of an arm, with the word "Inflated" printed over the same, shows the apparatus inflated. The other figures, "A" and "B," represent the apparatus affixed to the arms, inflated and ready for immediate use.

3. The apparatus may be fixed, inflated, and ready in one minute, and is a sure preventive against drowning.

WILLIAM HASPERY JEAVONS.
WILLIAM WALKER.

This is the specification referred to in the annexed Letters of Registration, granted to William Haspery Jeavons and William Walker, this eleventh day of November, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Having, in attention to your B.C. minute of the 16th ultimo, examined the plans and specification accompanying the application of William Haspery Jeavons and William Walker, praying for a grant of Letters of Registration for their invention for improvements in a Life Preserving Apparatus, we have now the honor to state that we see no objection to the prayer of the Petition being complied with.

We have, &c.,

FRANCIS HIXSON.
E. O. MORIARTY.

THE PRINCIPAL UNDER SECRETARY.

A.D. 1876, 23rd November. No. 553.

IMPROVEMENTS IN STEAM PUMPS.

LETTERS OF REGISTRATION to Charles Ernest Clarke and William Clarke,
for Improvements in Steam Pumps.

[Registered on the 24th day of November, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of St. Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS CHARLES ERNEST CLARKE and WILLIAM CLARKE have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Steam Pumps, to be called the Pulsometer Pump," which is more particularly described in the specification marked A and the three sheets of drawings marked B, C, and D, respectively, all of which are hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Charles Ernest Clarke and William Clarke, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Charles Ernest Clarke and William Clarke, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Charles Ernest Clarke and William Clarke shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, this twenty-third day of November, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

The Pulsometer Pump.

A.

TO ALL TO WHOM THESE PRESENTS SHALL COME, We, CHARLES ERNEST CLARKE, of the city of Melbourne, in the Colony of Victoria, and WILLIAM CLARKE, late of Victoria, but now of parts beyond the seas, brokers and agents, send greeting :

WHEREAS we are desirous of obtaining Royal Letters Patent for securing unto us Her Majesty's Special License that we, our executors, administrators, and assigns, and such others as we or they should at any time agree with, and no others, should and lawfully might from time to time, and at all times during the term of fourteen years (to be computed from the day on which this instrument shall be left at the office of the Registrar General) make, use, exercise, and vend within the Colony of New South Wales and its Dependencies an invention known as "Clarke's Improvements in Steam Pumps, to be called the Pulsometer Pump"; and in order to obtain the said Letters Patent we must, by an instrument in writing under our hands and seals, particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed, and must also enter into the covenant hereinafter contained: Now know ye, that the nature of the said invention, and the manner in which the same is to be performed, is particularly described and ascertained in and by the following statement, that is to say:—

Our invention relates to that class of steam pumps in which the steam is caused to act by direct pressure upon the water, and is directed alternately upon two chambers having a common steam and delivery pipe controlled by tilting valves, in such manner as to direct the steam alternately upon each chamber, one being filled with water while the other is being emptied. It is well known that in pumps of this class their successful operation depends largely upon the rapid condensation of steam in each chamber after the water is expelled to produce a vacuum sufficient to close the steam valve, cause the water to rush in, and direct the steam upon the opposite chamber; when the chamber becomes heated, however, condensation becomes more difficult in proportion to the degree of heat. Hence, in the operation of pumps of this class, much difficulty is experienced, and hot water cannot be pumped.

Our invention has for its object to produce a pump free from such objections which shall be rapid and effectual in its operation, simple in construction, and require comparatively little steam. To this end the invention consists—

First—In connecting an air chamber or reservoir (or chambers or reservoirs) to the suction and discharge pipes of the pump.

Second—In the construction of the suction valves.

Third—In the sectional construction of the pump-casing, the same being adapted to be readily taken apart.

Fourth—In the construction and arrangement of the valves and their seats, and the parts in connection therewith, in such a manner as to admit of the valves and valve seats being removed and replaced by others of a different construction, to suit the nature of the liquid to be elevated, and for any other required purposes.

Fifth—The invention also embraces other improvements in the before-mentioned apparatus designed to increase its efficiency (as hereinafter described). It may also be applied to other apparatus of a similar character in which steam exerts its pressure upon the water or other liquid directly or without the intervention of a piston, diaphragm, or other moving part; and parts of the invention are also applicable to valves to be employed for other purposes independently of pumps of this description.

Sixth—In the general construction and arrangement of the parts, as we will now proceed to describe more in detail by aid of the accompanying drawings.

DESCRIPTION OF THE DRAWINGS.

The drawings on sheet No. 1 are intended to show the construction of the pump, and the working of the same.

The drawings on sheets Nos. 2 and 3 are intended to show various modifications in various parts of the pump, to be used as circumstances may require.

Figure 1 of sheet 1 is a vertical section of our improved pump; figure 2 is a section through line *xx* of figure 1.

Similar letters of reference are employed to indicate corresponding parts wherever they occur in sheet 1.

The upper portion of the pump-casing is composed of the tapering chambers AA¹, made in one casting, separated by a partition, A², and coming together at the top, where they open into a recess, B, in which a revolving ball, C, works and closes the entrance to the chambers A and A¹ alternately.

The lower portion of the casing is composed of a base, A³, containing the suction valves and discharge valves, presently to be described. At the bottom of the chamber BB¹ in the case A³ are the suction valves EE¹, resting on inclined seats F, in which are the ports G-G communicating with the suction pipe H. The suction valves E and E¹ and the delivery valves S and S¹ are held in place by casings I, and are provided with lugs, J, on their outer sides, which strike against said casings, and prevent the valve from opening too far, as shown in figure 1.

The valves EE¹ and SS¹ are provided with rounded lower edges, or journals, trunnions, or pivots, which serve as the fulcrum on which said valves open or close, which rest in correspondingly shaped seats, K, or in movable seats, as hereinafter described and shown in the second sheet of the drawings. The seats K are not fixed, but merely rest in corresponding recesses in the case of the pump, and may be readily removed for repairs, or fresh one substituted.

In the casing L is a reservoir or air chamber connecting with the suction and discharge pipes, as shown in figure 2, sheet 1; but this chamber may be also divided (as shown by figure 16 of sheet 3 of the drawings) by a vertical partition, S, into two compartments, O¹ and O² (figure 16), one of which, namely, that,

The Pulsometer Pump.

that, O^1 , is in communication with the suction pipe P, whilst the other, O^2 , is in communication with the delivery pipe T of the pump. A reservoir of water under the pressure of compressed air is thus constantly maintained in connection with the delivery pipe T, whereby the continuing of the discharge proceeding from the two pump chambers in succession is constantly insured. N is a screw-plug in the top of the reservoir L; O is a valve for regulating the admission of air into the chamber L; P represents the discharge passage connected with ports RR^1 with the chambers AA^1 , said ports opening into the seats of the rocking valves S, and being closed in turn by the latter.

The operation is as follows: To start the pump it is necessary to remove the screw-plug N from the reservoir L, and fill the latter, together with the chambers AA^1 , with water, the valves EE^1 permitting its free ingress, and a suitable check valve in the suction pipe preventing it from escaping. The chambers AA^1 being thus filled, and the valve C being tilted, so as to cover the opening into the chamber A^1 , steam is admitted into the chamber A, as shown by the arrow, and pressing powerfully on the water contained therein, instantly expels it through port R into the discharge pipe P, the valve S closing the port R^1 . The expulsion of the water from the chamber A is so sudden that a momentary vacuum is produced in the chamber A, which causes the revolving ball C to tilt in the opposite direction, and direct the steam into the chamber A^1 , while water rushes in from the suction pipe, raises the valve E, and refills the chamber A. Meanwhile the contents of the chamber A^1 are discharged in like manner through the port R^1 , the valve S being tilted so as to cover the port R by the pressure of the water at the moment that steam is admitted above. Hence the operation of the revolving ball C and valve S is simultaneous. While the water is being discharged from the chamber A^1 , the chamber A, previously emptied, is filled from the suction pipe H, as above-mentioned, and the moment the chamber A^1 is exhausted another momentary vacuum is produced, and the valve C again is shifted, and steam redirected into the chamber A. The action of the pump is therefore constant, and cannot be effected by the temperature of the chambers, as the condensation of steam is not relied on to produce a vacuum, the rapid discharge from the chamber producing the desired result. The air chamber L connecting with the mouth of the suction and discharge pipes enables the pump to discharge a steady stream, and the air-cocks or valves 5 relieve the action of the suction valves, and prevent them from knocking too hard against their casings.

The sectional construction of the pump-casing enables it to be readily taken apart for repairs; and it will be readily seen that as the suction and discharge valves are all contained in the case A^3 , they can be inspected and repaired by simply removing that portion of the casing. It has been found by practical operation of this pump that it will throw 3 feet for every pound of steam pressure; and its operation is so rapid that one hundred and twenty (120) strokes per minute have been reached. We can operate with either hot or cold water, thereby conclusively proving that no condensation of steam is necessary in the operation of our pump—indeed, condensation is impossible in pumping hot water; we can therefore use it successfully for feeding boilers and other purposes when hot water is desired. The construction is so extremely simple that particles of sand, gravel, and other obstructions can pass readily through it without injuring the working parts; this we have also found by experience. The seats of the valves EE^1 and SS^1 are chilled in casting to prevent them from being cut and worn by gravel and other foreign matters passing through.

To improve the working of the valves E and E^1 , and S and S^1 , and increase their durability, either the valves or the inclined seats F on which they rest, or both, are provided with a lining or surface of wood, or other soft material (shown on the plans by shaded lines), so that the contact of metal with metal is prevented. For attaching this wood or other lining or packing to the valve or seat, a recess is formed therein slightly dovetailed, in which the wood or other soft material is tightly fitted, and secured in such manner as to project above the surface of the metal of the valve or seat. This packing or lining will last for a long time, and when worn may be readily removed and replaced by a new piece.

The lugs J, or the large bearings I on which they rest, or both, may also be lined in the same manner, so as to prevent wear and noise in working. The small projections or bearings I project over the journals or pivots of the suction and discharge valves, and keep the same properly in place, and also prevent any displacement of the seats of the said trunnions, and by removing the covers D free access can be had to the valves and parts connected therewith.

The delivery valves S and S^1 are placed back to back, so that when one is closed the lug forms a stop or seat against which the other valve strikes on opening, as shown in the drawings. The upper part of the chambers A and A^1 containing the revolving ball C is made detachable, so that it can be readily removed and replaced without injury or disturbing the body of the pump.

By the foregoing description it will be seen that no part of the body of the pump is subject to wear, and that if any of the valves, or their bearings, or parts connected therewith, should be worn or injured they may be readily and conveniently removed and replaced.

Another part of the present invention consists in constructing and arranging the bearing pieces and the valve seats in such a manner as to render not only the bearing pieces but also the whole of the seat capable of removal, whereby facility is afforded for the substitution for a valve of one construction for a valve of a different construction in the same apparatus, as and when required. Figure 1, sheet 2 of the accompanying drawings, represents a vertical section (taken through the suction valves) of a pump with this part of the invention applied thereto; and figure 2 of sheet 2 represents a vertical section of that portion of the pump which contains the delivery valves, illustrating more clearly their arrangement. In the latter figure the valves are both represented in their closed position. According to this part of the invention, detachable shoes, A, B, are employed, which are fitted in dovetailed or other grooves formed in the body C of the pump, or attached in any other suitable manner. These shoes may be either constructed of metal, wood, india-rubber, or other suitable material, and form the valve seat itself; or they may be constructed of metal, and be fitted with a movable lining of wood, india-rubber, or similar packing, inserted in dovetailed grooves formed therein; and the valve itself may be provided or not with a detachable lining of leather, india-rubber, wood, or like material, inserted in a similar manner.

In

The Pulsometer Pump.

In figures 1 and 2, sheet 2 of the drawings, several modifications in the arrangement of the valves and their seats are illustrated. D are the suction valves; and E are the delivery valves; and *a* the trunnions of the valves. The shoe A on the left-hand side of figure 1 is shown provided with a renewable lining or packing, *b*, which may consist of wood, india-rubber, or other suitable material, and forms the seat proper for the valve D, and is held in its place by a metal ring, *l*. The shoe A on the right-hand side of figure 1 is shown solid; and the valve D is fitted with a lining or packing, *c*, of wood, india-rubber, leather, or other suitable material, held in its place by a metal plate 2, or other suitable means. On the left-hand side of figure 2 the shoe B and the valve E are both shown provided with linings or packings, *b*, *c*, respectively, whilst on the right-hand side of that figure the shoe B and the valve E are represented in direct contact without any intervening lining or packing. It is preferred to form the detachable bearing pieces which form the trough for the trunnions *a* in one with their respective shoes as shown, but they may be made separately removable if desired.

In the case of the delivery valves, when two are employed arranged back to back as described, the two shoes B B for the valves may be made in one piece, as shown in figure 2, sheet 2, so as to admit of their being slid into their place, and removed together bodily; but the shoes may be constructed separately, the one from the other, if desired. The shoes are maintained in their place either by wooden or other wedges, *d*, as shown, or by bolts, or other suitable means; and the whole of the parts are enclosed by covers, F, detachable at will, and which are provided with projecting lips, *e*, overlapping the trunnion *a*, in order to retain the valves in their place, and also with projecting horns or guards, *f*, for limiting the range of motion of the valve. The valves may be further secured by hinge-pins, if desired.

Another part of the invention relates to improvements in the arrangement of ball-valves and their seats, when valves of that description are employed as suction or delivery valves.

Figures 3 and 4 (sheet 2) represent vertical sections of portions of the pump—the former showing a suction valve, D, and the latter a delivery valve, E, with their seats arranged according to this part of the invention; and figure 5 represents an elevation of the valve and seat detached, corresponding to figure 3.

The valve seats consist of detachable shoes A¹, B¹, composed either of metal or wood, or (as shown and adopted by preference) of metal fitted with renewable linings or packings, *b*, of wood, india-rubber, or other like material. The shoes A¹ are each provided with a projecting horn or guard, *f*¹, by preference of a concave form, on its under side, and which forms a stop by limiting the range of motion of the valve.

The projecting horns or guards *f*¹ with which the detachable shoes A¹ are provided may be formed with slots or perforations, *g*, as shown in figures 3 and 5, in order to admit of the water which is left remaining above the valve issuing in the form of jets as soon as a partial vacuum is produced, and thereby suddenly increasing the vacuum by the further condensation of the steam previously to its complete condensation by the influx of the body of liquid which is admitted through the valve.

Another modification of the invention is illustrated by the detail section and plan, figures 6 and 7 respectively (sheet 2). It consists in the employment for suction and delivery valves of discs, D, of india-rubber, or similar flexible material, each of which is attached by a bolt, *h*, at or near the centre, either, as shown in the drawings, to a horn or carrier, *f*¹, above projecting from a detachable shoe, A¹, or to cross-bars formed on such shoe, or otherwise, so as to admit of their being readily removed with the shoes when required.

The shoes may be composed of metal or other rigid material, as before-mentioned, and may be fitted with renewable linings or packings of wood, india-rubber, or other like material. The india-rubber discs may also be removed from the shoes and replaced by new ones when worn out, without the necessity for renewing the shoes themselves. These rubber discs open out from their seats at their periphery, as shown by the dotted lines in figure 6, under the action of the suction and the pressure of the liquid, and close again on to their seats by the force of their own elasticity, assisted by the back pressure.

Another modification of the invention is illustrated in figures 8, 9, and 10 (sheet 3), of which figures figure 8 represents a vertical section of a portion of the pump, the section being taken through a suction valve; figure 9 represents a plan of the valve detached; and figure 10 represents a vertical section of a portion of the pump, the section being taken through the delivery valves. This modification illustrates the application of the description of valves known as the "Perreaux Valve," consisting of a hollow disc or ring, D or E, of india-rubber, or similar flexible material, carrying a tube, *i*, which in its normal condition is closed at its outer extremity, assuming a triple, flattened, or wedge shape, as shown by the full lines in figure 9, but is caused to expand, and form an open mouth for the passage of the water, as shown by the dotted lines in that figure, and then again to close by the force of its own elasticity, in which condition it is maintained by the back pressure of the liquid. These valves are fitted in detachable shoes, A, B, similar to those hereinbefore described as applied to other descriptions of valves.

The arrangement of detachable shoes may also be applied to any other description of valve employed with the pump to which such arrangement may be adapted.

Valves having detachable shoes constructed and arranged in accordance with either of the before-mentioned modifications may be employed as foot-valves when a foot-valve is required to be used with the improved pump, or in any other description of pump or apparatus requiring the employment of a foot-valve.

Figure 11 (sheet 3) illustrates in vertical section one mode of applying the invention to foot-valves. In this example the valve consists of a disc or plate, G, working on a trunnion, *k*. B² is the detachable shoe, fitted with a renewable lining or packing, *b*¹. The valve may be throttled, or in its lift be regulated as required, by means of an adjusting screw, *l*, working through the detachable cover F, and provided with a horn, *f*, wheel, *m*, for manipulating it from the exterior. The horn *f* on the cover F is made tubular, for the reception of a sliding cylinder or block, *n*, formed on or attached to the screw *l*, and by the protrusion or recession of which to a greater or less degree the range of motion of the valve, and consequently the effective area for the passage of the liquid, may be varied as required.

The Pulsometer Pump.

A similar arrangement suitably modified may also be employed for throttling the passage when valves of a construction different from that lastly hereinbefore described are used as foot-valves; and the arrangements for throttling the passage may be further applied to the suction and delivery valves, if found desirable.

The detachable shoes may also be employed in the construction of back pressure valves, and valves to be used for other like purposes.

The invention further relates to a modification of foot-valve adapted more particularly for use on board ships in connection with the pumps or apparatus for drawing off the bilge-water.

In apparatus of this description, as ordinarily constructed and arranged, two valves are employed, which work in connection with pipes situate one at each side of the keelson. When the vessel inclines either to one side or the other, and the opposite valve becomes uncovered, air is drawn in through such valve at each stroke of the pump to the detriment of the working parts, which are thereby exposed to unnecessary wear and tear, and diminishing the duty of the pump.

Now, according to this part of the present invention, this defect is obviated in the following manner, reference being had to figures 12 and 13 (sheet 3), which represent respectively a vertical section taken through one of the valves, and a sectional plan of the same: To the lower end of the spindle H of each of the valves, of which the valve I is an example, there is fitted a boss, *o*, carrying radial arms, *p*, which support an annular trough, K, surrounding the valve-box L. This trough is arranged at such an elevation that when the valve-box L is immersed to a sufficient depth in the water, the trough itself shall be submerged, and the valve being then relieved of a certain amount of weight will open under the action of the suction. When however the vessel rolls on one side, the trough of the valve at the opposite side will become uncovered, whilst at the same time remaining filled with water, the weight of which, by acting upon the valve spindle, closes the valve, and maintains it closed until the trough is again relieved of its weight by its submersion by the vessel rolling to the opposite side or otherwise. The valve-seats are formed by preference in detachable shoes B², as shown.

Another part of the invention, which is illustrated by figure 13^a (sheet 3), relates to the steam-valve M, of a V or wedge shape, rocking or working on a pivot or axis, 9; and it consists in providing such valve with a detachable or renewable seat, consisting of a cone, N; slotted for its reception, and fitted in a recess of a corresponding form in the upper part of the pump-body C. The seat is furnished with a pendent projecting screw-bolt, *r*, for the reception of a nut, *s*, by means of which the seat is maintained in its place; or it may be secured in any other convenient manner, so as to admit of its being readily removed and replaced by a new one when worn. This arrangement of detachable or renewable shoe suitably modified may also be applied to ball-valves when used as steam-valves in the pump, or to any other description of steam-valves employed in the said pump to which such arrangement may be adapted.

Another part of this invention has reference to a peculiar construction and arrangement of valves for the admission of air to the pump.

According to one modification of this part of the invention, which is illustrated by figure 14, sheet 3, the air-valve consists of a ball, *t*, which is caused to rise from its seat for the admission of air from the orifice *t'*, to be supplied to the chamber, as before-mentioned, through the conduit *t*₂. The ball is embraced or enclosed on its upper hemispherical surface by forked arms, or a hemispherical cover, *u*, having a screw-spindle, *v*, which passes through a hole tapped with a screw-thread in the top of the air-valve box R, and carries a button or thumb-screw, *w*, for facilitating the turning of the screw, in order to adjust the height of the forks or cover *u*, and those regulate the lift of the valve as required.

According to another modification of this part of the invention, which is illustrated by figure 15, sheet 3, the air-valve consists of a conical or button valve, *t*, carrying at its upper end on an apex or knife-edge a lever-arm, *x*, which is mounted on a fulcrum at its end, *y*, in the valve-casing R, and is provided at its opposite end with a float, *z*, entering the chamber of the pump. The valve is fitted at its lower end with a spindle, *v*, passing through the bottom of the valve-box R, and formed at its extremity with a screw-thread for the reception of a thumb-nut *w*. This nut by coming into contact with the bottom of the valve-box R forms a stop for limiting the lift of the valve, the range of motion of which is capable of adjustment by varying the position of the nut upon its spindle. The valve in its normal condition is maintained closed by the weight of the float *z*; but when the water attains a sufficient height to raise the float, the valve is opened, and air is admitted as before-mentioned.

The invention lastly consists in enclosing the pump in an outer vessel or casing, so as to admit of the entire apparatus being immersed in the liquid to be pumped, whereby the necessity for obtaining a vacuum is obviated, the water rising alternately or successively as the steam-valve is moved in the several chambers of the pump under the action of gravitation; and facility is afforded for pumping liquids of an elevated temperature whilst the apparatus may be caused to float in the liquid to be elevated, thus dispensing, if desired, with the means of suspension usually adopted.

The pump may be attached to the vessel or casing in various ways, but the method shown in the vertical section figure 17, sheet 3, is a convenient arrangement. C represents the pump; U is the vessel or casing, the bottom of which is bolted to a flange 3, formed on the suction pipe P of the pump, and it may also have bolted to it an inlet tube or nozzle, V, for conducting the liquid to the suction pipe P.

Hand-holes fitted with suitable covers are formed in the vessel or casing for affording access to the valves.

Having thus described our invention, and the means by which the same may be carried into effect, we would have it understood that we do not confine ourselves to the exact details shown and described, as the same may be varied without departing from the peculiar character of our invention; but what we do claim is—

First—The chambers A, A' (sheet 1 of the drawings), in combination with the suction valves E, E', and discharge valves S and S' and revolving ball C, all arranged and operating substantially as described.

Second—

The Pulsometer Pump.

- Second—The combination of the air chamber L (sheet 1) divided as hereinbefore described, having the screw-plug N and spring-valve O with the suction space M of the pump substantially as described.
- Third—The suction and delivery valves and their seats constructed and provided with wood or other lining in the peculiar manner shown, and so arranged that the said valves operate to admit and discharge the water as herein set forth.
- Fourth—The loose or detachable bearing pieces for the valve journals or trunnions, and also the detachable shoes fitted in the body of the pump in such manner as to admit of the valves and seats being removed and exchanged for others of either the same or a different construction, as herein set forth, and for the purposes specified.
- Fifth—In combination with the said valves and detachable bearings or bearing pieces the curved or other pieces for keeping the said valves and bearings in place as herein set forth.
- Sixth—The detachable part at the top or apex of the pump containing the ball-valve, and with the valve-seat formed therein, so that the said valve governs the admission of steam to both chambers of the pump as herein set forth, and for the purposes specified.
- Seventh—The pump or apparatus with the chambers, the hinged suction and delivery valves and their seats, and detachable bearings and devices connected therewith, the ball-valve fitted to its seat in the detachable part or apex of the pump, and the other portions of the said pump or apparatus constructed and combined as shown in the drawings and as herein set forth, for the purposes specified.
- Eighth—The sectional casing of the pump, substantially as and for the purposes specified.
- Ninth—Providing the steam-valves when made of a V or wedge shape, or otherwise, with renewable or detachable seats or shoes, constructed, arranged, fitted, and secured substantially as hereinbefore described.
- Tenth—The employment as an air-valve of a ball arranged in such a manner that it is caused to rise from its seat into contact with a stop or cover for the admission of air, but that the position of such stop or cover, and consequently the lift of the valve, shall be capable of adjustment from the exterior by the aid of a regulating screw, substantially as hereinbefore described and illustrated by the accompanying drawings.
- Eleventh—The employment as an air-valve of a conical or button valve carrying a float mounted on a fixed centre or fulcrum, and arranged in such a manner that the valve is nominally maintained closed by the weight of the float, but that it shall be opened for the admission of air by the rise of the water in the pump chamber, the lift of the valve being controlled by an adjustable stop-nut, substantially as hereinbefore described and illustrated by the accompanying drawings.
- Twelfth—Dividing the central chamber by means of a vertical partition into two compartments, one of which is in communication with the suction pipe whilst the other is in communication with the delivery pipe, substantially as and for the purpose hereinbefore described.
- Thirteenth—Enclosing the pump or apparatus in an outer casing immersed in the liquid to be pumped, for the purpose of wholly or partially dispensing with the necessity for obtaining a vacuum, and of utilising the action of gravitation for promoting the rise of the liquid being pumped in the chambers of the apparatus, substantially as hereinbefore described.

We also claim generally—

First—The application and use in the construction of valves and valve-seats of detachable shoes, formed and fitted in such a manner as to admit of the valves and seats being removed and exchanged for others of either the same or different construction, as and when required, substantially as hereinbefore described.

Secondly—The combination with the foot-valves, for the purposes herein set forth, of troughs, arranged in such a manner that the valve shall be opened during the submersion of the trough, and closed on its emersion, substantially as hereinbefore described.

And we do hereby, for ourselves, our heirs, executors, and administrators, covenant with Her Majesty, her heirs and successors, that we believe the said invention to be a new invention as to the public use and exercise thereof; and that we do not know or believe that any other person than ourselves is the true and first inventor of the said invention; and that we will not deposit these presents at the office of the Registrar General with any such knowledge or believe as last aforesaid.

In witness whereof the said parties hereto have hereunto set their hands and seals, this seventh day of September, one thousand eight hundred and seventy-six.

INVENTION FOR BORING POST-HOLES.

LETTERS OF REGISTRATION to George Wilkins, for an Invention for Boring Post-holes.

[Registered on the 24th day of November, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS GEORGE WILKINS, of Coonamble, in the said Colony, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Boring Post-holes," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good; and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said George Wilkins, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said George Wilkins, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said George Wilkins shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-third day of November, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Invention for Boring Post-holes.

SPECIFICATION of GEORGE WILKINS, of Coonamble, in the Colony of New South Wales, fencer, of an Invention for Boring Post-holes.

I, the said GEORGE WILKINS, do hereby declare to all to whom it may concern the nature of the said Invention, and in what manner the same is to be performed is particularly described and ascertained in and by the following statement thereof, that is to say,—

THIS Invention has for its object the boring of post-holes with facility and rapidity.

For the purpose of boring the holes I use a steel cast-iron or wrought-iron auger of varying pitch and diameter, according to the nature of the ground or soil to be excavated; the auger is mounted on the end of a vertical shaft, as shown in the drawing attached to this specification as A.

The vertical shaft J is caused to rotate by means of the bevel wheel and pinions DD'D", the shaft being square in section, and passing through a square eye in the wheel D, or having a similar provision for causing it to rotate with the wheel while it is at liberty to move upwards and downwards through the same.

Motion is to be communicated to the abovementioned wheel and auger by means of the bevel pinions D'D", actuated by men working the handles shown in the wheels CC'.

The auger being in motion circumferentially, a vertical and downward motion is to be imparted to it by means of the wheel and pinion at E, and thence through the intermediate gearing to the pitch-chains and pitch-wheels BB'.

The pitch-chains are attached to a cross-head, in which rotates the head of the cutter-bar, and the ends of the cross-head embrace vertical guide rods at each side, thus causing the top of the cutter-bar to move in a truly vertical direction, upwards or downwards, accordingly as the cross-head is directed by its attachment to the pitch-chains.

An upward motion can also be communicated to the cutter-bar; this is performed by moving the transverse shaft, carrying the pinion H, by means of the lever F, so as to disengage the wheel and pinion E and to engage the wheels G. The intermediate gearing and the pitch-chains and cutter-bar will then move in a reverse direction with increased velocity.

The lever I is for the purpose of engaging with the surface of the earth and enabling the operators to move the machine from point to point.

Sydney, 25 September, 1876.

GEORGE WILKINS.

Witness,—

WILLIAM DEANE,
Solicitor, Sydney.

This is the specification referred to in the annexed Letters of Registration, granted to George Wilkins, this twenty-third day of November, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

In returning to you Mr. George Wilkins's Petition for Letters of Registration of an invention "for Boring Post-holes," we do ourselves the honor to report that we are of opinion that the Letters of Registration applied for may be granted, provided it is distinctly understood that Mr. Wilkins cannot in any way deviate from the detail as set forth in his specification and drawings herewith returned.

We have, &c.,

GOTHER K. MANN.
JAMES BARNET.

THE PRINCIPAL UNDER SECRETARY.

A.D. 1876, 13th December. No. 555.

AN IMPROVED APPARATUS FOR EXTRACTING CORKS FROM BOTTLES.

LETTERS OF REGISTRATION to Peter Tyrer, for an improved Apparatus for extracting Corks from Bottles.

[Registered on the 15th day of December, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS PETER TYRER, of the City of Melbourne, in the Colony of Victoria, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "An improved apparatus for extracting Corks from Bottles," which is more particularly described in the specification which is hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Peter Tyrer, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof : to have, hold, and exercise unto the said Peter Tyrer, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Peter Tyrer shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this thirteenth day of December, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

An improved Apparatus for extracting Corks from Bottles.

SPECIFICATION of PETER TYRER, of No. 425, King-street, Melbourne, in the Colony of Victoria, engine-driver, for an invention intituled "An improved Apparatus for extracting Corks from Bottles."

THIS invention of an improved apparatus for extracting corks from bottles is constructed as follows:—I take two strips of flat steel wire, say about twenty-eight inches long, and place them cross-wise, one on top of the other. Where they cross each other I solder them together, and then strengthen each of the four arms by whipping them with thin wire for say three-eighths of an inch. I then gather up the four ends and bring them all into a small hole made through a piece of round rod iron, about three-eighths of an inch diameter. This is the handle. I then force a wedge into the centre of them, so as to hold them tight, and finally solder the ends so as to close up the hole and complete the apparatus. The wire may be round or flat, tinned or not, as preferred, and the handle may be painted, japanned, or polished.

The use of my invention is to extract corks which have been forced through the neck into the body of the bottle. I first push the wires through the neck into the bottle, and (if it is empty) I turn it upside down, so as to shake the corks into or about the bottom of the neck. I then pull the handle downwards, when the apparatus brings the cork or corks with it, and out of the bottle. If the bottle be full, or have any liquid in it, I do not turn it upside down, but allow it to stand on its bottom, and in this position extract the corks by an upward pull through the neck.

Sketch No. 1 shows a view of my apparatus by itself. No. 2 shows it in the act of insertion into the bottle. No. 3 shows it as it is about to extract the cork from an empty bottle, and No. 4 shows how it may be expanded (after being frequently squeezed through the neck of a bottle) in order that it may regain its original shape.

I do not confine myself to any particular size or quality of wire or rod iron, nor to their dimensions, but I claim my improved apparatus for extracting corks from bottles, substantially as herein described and explained.

This is the specification referred to in the annexed Letters of Registration, granted to Peter Tyrer, this thirteenth day of December, 1876.

REPORT.

SIR,

Having, in attention to your B.C. minute of the 18th instant, examined the plans and specifications of Peter Tyrer, for Letters of Registration for his invention for an improved apparatus for extracting corks from bottles, we have now the honor to state that we see no objection to the prayer of the petition being complied with.

THE PRINCIPAL UNDER SECRETARY.

IMPROVEMENTS IN EXPLOSIVE COMPOUNDS.

LETTERS OF REGISTRATION to Alfred Nobel, for Improvements in Explosive Compounds.

[Registered on the 16th day of December, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS ALFRED NOBEL, of Paris, in the Republic of France, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Explosive Compounds," which is more particularly described in the specification which is hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Alfred Nobel, his executors, administrators, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Alfred Nobel, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and until the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Alfred Nobel shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney; in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this fourteenth day of December, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Explosive Compounds.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, ALFRED NOBEL, of Paris, in the Republic of France, send greeting :

WHEREAS I am desirous of obtaining Letters of Registration under the sign manual and seal of the Colony of New South Wales, for exclusive enjoyment and advantage for a period of fourteen years of an invention for "Improvements in Explosive Compounds," of which I am the first and true inventor : Now, know ye, that the nature of the said invention, and the manner in which the same is to be performed, is particularly described and ascertained in and by the following statement, that is to say :—

The object of this invention of improvements in explosive compounds is to convert nitro-glycerine and analogous explosive liquids (of which nitrate of methyle ranks next in power) from their liquid state to a solid or semi-solid consistency. The liquid state is found to be dangerous in regard to storage, transport, and, in some cases, use, whereas the solid state is found to be highly conducive to safety, and offers great facility for use, storage, and transport.

The invention consists in incorporating these liquid explosive substances with another substance which is capable of gelatinising or thickening them, and for this purpose a substance is chosen which will detract little or nothing from their explosive power. Nitro-glycerine, which is the most powerful of explosive liquids, may be gelatinised by dissolving in it nitrated cellulose, such as the nitrated cotton which is known as collodion gun-cotton. The explosive compound becomes more and more gelatinous in proportion to the quantity of nitrated cellulose which is dissolved therein, and it forms (when 7 to 8 per cent. of the nitrated cellulose have been incorporated) a solid jelly, which is very safe and highly suitable for every purpose to which very powerful explosives can be applied. I do not, however, confine myself to that exact proportion, since it must be suited to the degree of hardness or consistency required for each special object in view.

In some explosive liquids (such as nitrate of methyle) collodion cotton readily dissolves at the ordinary temperature, and forms a thick explosive gum or jelly. In the case of nitro-glycerine, however, the incorporation of the abovenamed gelatinising substance is facilitated by means of a special treatment, which consists in adding a small quantity of a substance which promotes the solubility upon which the gelatinisation depends. Such substances are the acetic ethers of glycerine, ethyle, methyle, acetic acid, a mixture of alcohol and ether, acetone, nitrobenzol, dinitrobenzol, the nitrates of ethyle, methyle, and other analogous substances. The quantity of the solvent which has to be added depends upon the nature of the substance chosen, but as a rule about 10 per cent. of the weight of nitro-glycerine which has to be gelatinised will be found in practice to be amply sufficient. I have found, moreover, that by gently treating nitro-glycerine (in a water bath or otherwise) it acquires the property of dissolving nitrated collodion cellulose without the addition of a promoting solvent as above-described. That property admits of dispensing entirely with the addition of the promoting solvent, or when it is found advantageous to use the promoting solvent, the application of heat will enable the quantity used to be reduced to two per cent., or even less, of the weight of the nitro-glycerine. Since nitrated cellulose is rarely, if at all, of a homogeneous composition, and therefore its solubility in nitro-glycerine, even when aided by the heat of a water bath, will be found to vary, it must needs be left to the judgment and experience of the manufacturer whether to add or not a predisposing or promoting solvent, as above-described, and the necessary proportion will be readily ascertained in practice after a little experience.

In carrying out my invention I make use of ordinary collodion cotton, which I find readily dissolves in and gelatinises nitro-glycerine. I find, however, that commercial collodion cotton varies considerably in composition, and that it is necessary, in order to obtain a nitrated cellulose readily soluble in nitro-glycerine, to test from time to time samples of the cotton immersed in the nitro-sulphuric acid, taking care to remove it from the acid bath when its solubility in nitro-glycerine is found most perfect. As a rule, one part by weight of dry cotton kept immersed during one hour and a half in a bath of ten parts by weight of nitric acid of 1.44 specific gravity and ten parts by weight of sulphuric acid of 1.835 specific gravity, the bath being kept at a temperature of from 30 to 40 degrees centigrade, yield a nitrated cellulose very suitable for gelatinising nitro-glycerine.

The above-described process of gelatinising necessitates—1. That the explosive liquid shall contain no impurity or foreign matter capable of counteracting its power of dissolving nitrated cellulose or other substance possessed of the same property, as hereinbefore described. 2. That only such nitrated cellulose, or other analogous substance, is to be used which readily dissolves in and gelatinises the explosive liquid. 3. That the solution of the nitrated cellulose, or other analogous substance (especially if that substance is twisted or compressed), shall be facilitated by mechanical stirring or kneading, so as to allow of the necessary access to all the parts of the nitrated cotton intended to be dissolved.

The explosive jelly obtained by the above-described process can be easily pressed into cartridges or any other forms convenient for use. For certain purposes, and especially for military use, it is of importance to be able to dilute or modify the explosive sensitiveness of gelatinised nitro-glycerine in a measure exactly suited to the purpose in view. This is done by adding more or less of a non-explosive or sluggishly explosive substance, possessed of the property of dissolving both nitro-glycerine and the substance which serves to gelatinise it. Such are the acetic ethers of glycerine, methyle, ethyle, and acetone, acetic acid, nitrobenzol, dinitrobenzol, the nitrates of methyle and ethyle, or other solvents of an analogous character. An addition of the abovenamed or of any analogous substance serves not only the purpose of rendering the gelatinised nitro-glycerine less sensitive to concussion but also reduces its quickness of explosion, facilitates, as above-described, the process of gelatinisation, and lowers the temperature at which nitro-glycerine becomes hardened or congealed. The least volatile substances, such as the acetic ethers of glycerine, nitrobenzol, dinitrobenzol, deserve preference, inasmuch as they cannot become inactive through evaporation.

The exact proportion of the substances above referred to to be added to the nitro-glycerine in process of gelatinisation will depend entirely on the object in view.

It should be understood that the addition of any of the above-mentioned bodies to nitro-glycerine lowers the per centage of oxygen, and raises the per centage of carbon and hydrogen, contained in the explosive mixture. To make up for the loss of power resulting therefrom, such quantity of finely pulverised nitrate of soda, or nitrate of potash, or chlorate of potash, or other suitable oxidiser, may be kneaded into the

Improvements in Explosive Compounds.

the material as is required to complete combustion of all the carbon and its conversion to carbonic acid and all the hydrogen to vapour. The exact proportions are easily computed by means of well known chemical formulae.

It is unnecessary to specify the endless number of mixtures which might thus be produced, and I will therefore simply describe four kinds of mixtures, which may be taken as indicating the classes that will answer the purpose:—

1. Nitro-glycerine gelatinised by dissolving therein, as above-described, 7 to 8 per cent. of nitrated cellulose, or other substance of a like character, or more or less, according to the consistency required for the resulting gelatine. In some cases as small a proportion as 4 per cent. would be found to answer, as for torpedo purposes.
2. The gelatine described in 1, with an addition of from $\frac{1}{2}$ per cent. to 30 per cent. of acetic ether of glycerine, nitrobenzol, or dinitrobenzol, or analogous substance. The wide range between $\frac{1}{2}$ per cent. and 30 per cent. is given because a very sensitive explosive is required for some purposes and a very sluggish explosive for others.
3. The composition described in 2, with the addition of an oxidising nitrate or chlorate in such proportions as will secure complete combustion on the principles hereinbefore described.
4. The compositions described in 1 and 2, with the addition of cheaper though less powerful explosives or semi-explosives which may be readily kneaded or combined therewith, such, for instance, as common gunpowder, various mixtures of pulverised nitrates or chlorates, with coal-dust, sulphur, sugar, starch, saw-dust, rosin, fatty matters, and other analogous substances. Further, all nitrated organic compounds, with or without the addition of oxidising agents, such as nitrate of soda, saltpetre, or chlorate of potash; in fact every explosive mixture hitherto known and capable of being incorporated with gelatinised nitro-glycerine. Such admixtures are chiefly of use when the reduced concentration of power which they occasion is compensated by cheapness of cost. Practically, therefore, available admixtures will consist of say 85 parts by weight of nitrate of soda, or 101 parts of nitrate of potash, or 200 parts of nitrate of ammonia, or 101 parts of chlorate of potash, with 15 to 30 parts by weight of charcoal (15 parts are needed for complete combustion to carbonic acid, and 30 parts for complete combustion to carbonic oxide), or an equivalent quantity, which with the aid of chemical formulas is easily computed, of any combustible organic matter. The abovenamed ingredients when well pulverised and intimately mixed are then carefully kneaded together with from 20 to 60 per cent. (more or less, according as a stronger or weaker explosive is required) of gelatinised nitro-glycerine. In order still more fully to elucidate the operation, I give here subjoined a few illustrating examples of compositions suitable for practical purposes, but without restricting myself to them:—

A—93	parts by weight of nitro-glycerine.		
7	do.	do.	soluble nitrated cellulose (gelatinised).
B—91	do.	do.	nitro-glycerine.
2	do.	do.	acetic ether of glycerine, or nitrobenzol, or dinitrobenzol, or acetic ether, or analogous suitable substance.
7	do.	do.	soluble nitrated cellulose (gelatinised).
D—80	do.	do.	nitro-glycerine.
10	do.	do.	dinitrobenzol, or nitrobenzol, or ether of glycerine, or analogous suitable substance.
10	do.	do.	soluble nitrated cellulose (gelatinised).
E—80	do.	do.	the D mixture.
20	do.	do.	nitrate of soda, or an equivalent quantity of other suitable oxidising agent, such as nitrate of potash, nitrate of barium, nitrate of ammonium, chlorate of potash, intimately mixed.
F—30	do.	do.	one of the mixtures A, B, or D.
70	do.	do.	ordinary gunpowder, or analogous substance, intimately mixed.
G—30	do.	do.	one of the mixtures A, B, or D.
59	do.	do.	nitrate of soda, or an equivalent quantity of other oxidiser as named sub. E.
11	do.	do.	charcoal, or equivalent proportion of other combustible substance.

The mixtures A, B, and D are best suited for blasting very hard rock; F and G will do for milder rock. The other compositions abovenamed are especially useful for military or other purposes which require a reduction of the sensitiveness of gelatinised nitro-glycerine to concussion, or a reduction of its tendency to rapid explosion.

Gelatinised nitro-glycerine when properly confined is capable of exploding when fired with a common fuse, but as a rule the explosion is quickened and facilitated by using detonators, which are caps of a special character, containing a strong charge of fulminate, and are now largely used for firing dynamite. When hardened in cold weather, gelatinised nitro-glycerine explodes more readily than frozen dynamite; still it is a good precaution always to head the charge with a primer consisting of a small cartridge of gunpowder, or gun-cotton, or dynamite, or uncongealed gelatinised nitro-glycerine, or analogous substance.

Gelatinised nitro-glycerine to which a considerable portion of acetic ether of glycerine, or nitrobenzol, or dinitrobenzol, or analogous substance, as above-described, has been added not only requires to be fired by a strong detonation, but also requires to be confined as in a shell, in order to be able to make it exert its full power.

Having now described my invention of "Improvements in Explosive Compounds," and having explained the manner of carrying the same into effect, I claim—

First—Solidifying or thickening liquid explosive substances, such as nitro-glycerine, nitrate of methyle, and other analogous substances, by gelatinising them in the manner and for the purpose herein set forth.

Second—

Improvements in Explosive Compounds.

Second—The employment of non-exploding or sluggishly exploding substances (soluble in nitro-glycerine) for the purpose of modifying (as required) the sensitiveness to concussion or the tendency to rapid explosion, and also for lowering the freezing point of the abovenamed explosive gums, as herein set forth.

Third—Incorporating with the said explosive gums or gelatinised compounds various other explosive mixtures, with a view to lessen the cost or to reduce the explosive force of the compound, as herein set forth.

In witness whereof, I have set my hand this 5th day of July, 1876.

A. NOBEL.

This is the specification referred to in the annexed Letters of Registration, granted to Alfred Nobel, this 14th day of December, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

In the matter of the application of Mr. Alfred Nobel for Letters of Registration for "Improvements in Explosive Compounds," which has been referred to us, we have the honor to report that we have examined the specification accompanying the same, and see no objection to the issue of Letters of Registration as prayed for.

Sydney, 28 October, 1876.

A.D. 1876, 27th December. No. 557.

AN IMPROVEMENT IN FURNACES FOR TREATING ORES.

LETTERS OF REGISTRATION to Alexander Borthwick, for an Improvement in Furnaces for treating Ores.

[Registered on the 29th day of December, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS ALEXANDER BORTHWICK, of number 36, Market-street, Melbourne, in the Colony of Victoria, oil and colour man, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "An Improvement in Furnaces for treating Ores," which is more particularly described in the specification and sheet of drawing which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Alexander Borthwick, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Alexander Borthwick, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Alexander Borthwick shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-seventh day of December, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

An improvement in Furnaces for treating Ores.

SPECIFICATION of ALEXANDER BORTHWICK, of No. 36, Market-street, Melbourne, in the Colony of Victoria, oil and colour man, for an invention intituled "An improvement in Furnaces for treating Ores."

THE improvement which constitutes this invention relates to that description of furnace for treating ores in which the ore-bed consists of a tubular chamber revolving or partially revolving on its own axis. Such furnaces are now used for roasting ores, and the revolving motion is given for the purpose of effecting two objects—first, to expose the whole surface of every particle of ore to the action of the heat; and secondly, to convey it slowly from the feed to the discharge end. The first of these objects is only imperfectly effected, although stops have been used for the purpose of assisting the revolving motion to break up the mass of ore and present a continuously changing surface. Now, my invention has been designed for the purpose of more certainly exposing the whole surface of each particle of ore to the action of the heat. It consists in the introduction of continuous ridges or lifters running in straight, irregular, or spiral lines, parallel to each other, and attached to or forming part of the inner periphery of such tubular chambers, which, as they revolve, lift the ore under treatment until having reached a certain point the lifted ore slips or falls off, discharging itself in a shower across the area of the chamber, thus repeatedly exposing the whole surface of each particle to the action of the heat.

These lifters may be of any practicable shape, size, and material, either recessed in or projecting from the inner periphery of the fire bricks or clay with which such chambers are commonly lined. They may run in continuous parallel lines, straight, irregular, or spiral. And further, although I have stated that my lifters are applicable to revolving tubular chambers when used for roasting ores, I desire to add that my lifters are equally applicable if such chambers be used either for drying or for smelting ores.

The method of feeding such chambers forms no part of my present invention, although under some circumstances I contemplate using a blast for this purpose. This blast may be used for blowing either ore or fuel or both into the furnace, the supply passing through one hopper in which the ore and fuel are mixed, or through separate hoppers in which they are kept distinct. In any case the material so fed must be reduced to small particles.

In order that my invention may be more perfectly understood by those skilled in the art, I will now refer to the drawings deposited herewith, in which figure 1 shows longitudinal section of a revolving tubular roasting chamber with my lifters applied in parallel straight lines, and consisting of wedge-shaped fire-brick. Figure 2 shows cross-section thereof—A being the fire-place, B the fire-bars, C the fire-bridge, D the lifters in the tubular chamber E, F friction rollers, G driving ring for revolving the chamber, H the feeding-hopper, I the chimney-stack.

Figures 3 and 4 show respectively cross and longitudinal section of a tubular chamber with the lifters made in the same form as in figure 1, but running in spiral instead of straight lines; DD are the lifters.

Figures 5 and 6 show respectively longitudinal and cross section of a tubular chamber with the lifters D set in a different line to those in the other figures.

Figures 7 and 8 show respectively plan and side elevation of the mechanical arrangements for imparting an oscillating motion to the chamber whenever so required, and figure 9 shows elevation of the pulleys and the contrivances for changing the belts thereon which form part of these arrangements; J is the crank-shaft of an engine, K is a barrel, L belts, M fast pulleys, N loose pulley, O fork for changing the belts, P stem thereof working in cam groove Q in barrel Q, R chain-pulley, R¹ chain. By these contrivances the fork O removes the belt from the loose pulley to the fast pulley, which has previously been stationary, and from the fast pulley, which has been previously moving, to the loose pulley, and so on backwards and forwards to produce each oscillation of the cylinder.

The mechanical arrangements shown in figures 7, 8, and 9 form no part of my invention, and are only illustrated to show a practical method of giving an oscillating or partially revolving motion, which is so common as to need no description.

Having thus described the nature of my invention and the manner of performing same, I would have it understood that I do not claim to be the inventor of revolving tubular chambers in ore-furnaces or of stops therein, as I am aware that such are now in use, but

I claim only,—

The introduction of continuous parallel ridges or lifters into revolving or partially revolving tubular chambers for treating ores substantially as herein described and explained.

REPORTS.

SIR,

Sydney, 17 October, 1876.

In returning to you the documents transmitted to us under your blank cover of the 10th instant, No. 76/7,239, which have reference to Mr. Alexander Borthwick's application for Letters of Registration for "an improvement in Furnaces for treating Ores," we do ourselves the honor to report that we see no objection to the issue of the Letters of Registration applied for, provided it is distinctly understood that Mr. Borthwick's claim does not include or give him any right to the use of any portion of the machinery shown in his drawing or described in his specification beyond the continuous parallel ridges or lifters on the inner periphery of the revolving chamber.

SIR,

Sydney, 23 November, 1876.

In returning to you the documents transmitted to us under your blank cover communication of the 20th instant, No. 76/8,533, we do ourselves the honor further to report that we see no objection to the immediate issue of Letters of Registration in accordance with our previous report of the 17th ultimo, securing to Mr. Borthwick his "Improvements in Furnaces for treating Ores."

We beg further to state, that as Mr. Borthwick's claim is now distinctly understood, we are of opinion that no alteration of the original specification and drawings is necessary.

INVENTION FOR KEEPING MEAT, FISH, BUTTER, MILK, VEGETABLES, AND ALL OTHER KINDS OF PERISHABLE ARTICLES.

LETTERS OF REGISTRATION to James Shaw, for an Invention for keeping Meat, Fish, Butter, Milk, Vegetables, and all other kinds of perishable articles.

[Registered on the 29th day of December, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS JAMES SHAW, at present residing in the City of Sydney, in the Colony of New South Wales, a Member of the Royal College of Surgeons of England, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "keeping Meat, Fish, Butter, Milk, Vegetables, and all other kinds of perishable articles," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that the said Petitioner hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said James Shaw, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said James Shaw, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said James Shaw shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-seventh day of December, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Invention for keeping Meat, Fish, Butter, Milk, Vegetables, &c.

SPECIFICATION of Patent for preserving Meat, Fish, Butter, and other perishable articles.

THE purpose of my invention is to preserve and retain perfect the abovenamed articles by means so simple that it could be adopted by all classes of the community for their own households, and also employed to preserve meat and other perishable articles while on a voyage to any part of the world.

The process itself may be thus briefly described:—

A chamber, box, cupboard, ship's hold, or any part of a ship, is padded with sheep's wool or cotton (without any lining of wood or iron, excepting for the purpose of cleanliness) of sufficient thickness to accomplish the object required to be obtained. For an ordinary family ice-chest a thickness of 3 inches of wool would be quite sufficient, while for more extensive operations a greater thickness of wool would be required. The state of cold is obtained by means of ice, or by any other means of producing cold; and it will be found that a chamber space, or whatever it may be, so lined with wool or cotton is unaffected by external influences to a greater extent than by any other known or used process, and the thermometer in the chest will register the same while passing through the Tropics as it would at the North or South Pole.

By means of this arrangement butchers, fishmongers, and families could not only keep but hang their meat and fish for any reasonable time, and obtain a supply of fresh provisions from other colonies, which cannot be done by any other process now in use.

Having thus described my invention, what I claim as new, and desire to secure by Letters of Registration, is to render any chamber or space impervious to heat by padding or lining it with sheep's wool or cotton, substantially as hereinbefore described; and I claim this as my own invention, which has not hitherto been used, to the best of my knowledge and belief.

JAMES SHAW.

This is the specification referred to in the annexed Letters of Registration, granted to James Shaw, this day of December, 1876.

HERCULES ROBINSON.

REPORTS.

SIR,

Sydney, 11 November, 1876.

The application of Mr. James Shaw for Letters of Registration for an "invention for keeping meat, fish, butter, milk, vegetables, and all other kinds of perishable articles," having been referred to us, we have examined the specification and drawing accompanying the same, and have now the honor to report thereon as follows:—

This so-called invention consists simply in placing the articles "in an enclosed space of any kind covered or lined inside with any non-conductor," and then cooling the space by means of blocks of ice.

This description would apply to the chambers used for preserving meat, &c., on board many Atlantic and other steamers, and even to an ordinary ice-chest.

We are unable to recommend that the prayer of this petition be granted.

We have, &c.,

JOHN SMITH.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

SIR,

Sydney, 17 November, 1876.

The application of Mr. James Shaw for Letters of Registration for an "invention for preserving meat, &c.," having been referred back to us, with an amended specification, wherein he simply claims the padding or lining of any space with sheep's wool or cotton, in order to render it impervious to heat, we have the honor to report that with this amended specification we see no objection to Letters of Registration being granted.

We have, &c.,

J. SMITH.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

- a. Outside of enclosed space.
- b. Nonconducting Material.
- c. The enclosed Space.
- d. Ice.

This is the Sheet of Drawings referred to in the annexed Letters of
 Registration granted to James Shaw, this day of December, 1876.

A.D. 1876, 27th December. No. 559.

LETTERS OF REGISTRATION to Frederick Settle Barff, for Improvements in Preserving Animal and Vegetable Matters, and in the means and apparatus employed therein.

IMPROVEMENTS IN PRESERVING ANIMAL AND VEGETABLE MATTERS.

[Registered on the 29th day of December, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS FREDERICK SETTLE BARFF, of Kilburn, in the county of Middlesex, England, Professor of Chemistry, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Preserving Animal and Vegetable Matters, and in the means and apparatus employed therein," which is more particularly described in the specification which is hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Frederick Settle Barff, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof : to have, hold, and exercise unto the said Frederick Settle Barff, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and until the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Frederick Settle Barff shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-seventh day of December, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in Preserving Animal and Vegetable Matters.

SPECIFICATION of FREDERICK SETTLE BARFF, of Kilburn, in the county of Middlesex, England, Professor of Chemistry, for "Improvements in Preserving Animal and Vegetable Matters, and in the means and apparatus employed therein."

THIS invention relates to the preservation of animal and vegetable substances, whether for use as food or for other purposes, so as to preserve the food, meat, fish, vegetables, and fruit, either in transit from foreign countries to this country, or *vice versa*, or from one country to another. It further relates to the preservation for a longer or shorter time of such animal and vegetable substances as are usually contained in butchers', fishmongers', poulterers', fruiterers', and greengrocers' shops; also to the preservation of such or similar substances either in private houses, in suitable safes, or in public institutions; and also to the preservation of vegetable and animal substances or products when employed for other purposes than food, such, for example, as flowers for sale or for decorative purposes; also, skins, either in the dry or the wet state; also specimens in zoological or in pathological museums, or in botanical collections,—and consists in the employment and use of chemical compounds, or of elements which are able to absorb oxygen gas when existing in the atmosphere, or when in a free state, such, for example, as soluble metallic salts or compounds, which are capable of absorbing oxygen or salts of metallic or other oxides, which, when decomposed, set free an oxide which is capable of assuming a higher state of oxidation, and in consequence readily taking up the oxygen from the air, or when existing in a free state, that is to say, for example, proto-salts of metals, such as the proto-chloride of manganese, also such salts as, for example, pyrogallate of potash or of soda, which, as is well known, readily absorbs oxygen; also of elements such as sodium or potassium, being likewise capable of absorbing oxygen. Any or all of these salts or compounds I employ either in solution or otherwise.

When I employ the proto or lower salts or lower oxygen compounds of the metals, as, for example, in the case of manganese, I prefer to employ the hydrated protoxide or lower oxides of the same, either alone or in conjunction with an absorbing material, so that such oxide or oxides may be more readily capable of absorbing oxygen.

When I employ other metallic salts or compounds, such, for example, as the proto-sulphate of iron, or the protoxide obtained by means of a base therefrom, I employ them in conjunction with an absorbent material; and in order to effect this object I mix the metallic salt and precipitant, either in solution or in a solid condition, with a substance which shall act as a diluent, which has been before described as an absorbent, because by keeping the particles of metallic oxide as under it assists as an absorbent, and virtually acts as a diluent.

In order to obtain such before-mentioned protoxides or lower oxide, I prefer to precipitate such oxides by means of lime or of soda-lime from their salts, which lime or soda-lime I use in sufficient quantity to completely decompose the proto-salts employed; I prefer in every case to add an excess of precipitant. The same preservative effect may be obtained by the conservative maintaining materials in a state of agitation by mechanical means. I also use any other precipitant capable of effecting the liberation of the proto-oxides, or of the lower oxides, such, for example, as caustic soda or caustic potash, or hydrate of baryta, or carbonate of lime or of baryta, or mixtures of the same.

By the use of one or more of the before-mentioned substances or compounds, or mixtures of the same, either in solution or in a divided state, I absorb the oxygen contained in air-tight vessels in which the substances to be preserved are placed; and, moreover, in the case of cellular substances from the cells of which the residual gases do not at once escape on the absorption of the oxygen in the vessel containing them, I absorb the oxygen of the residual gases as it diffuses out, by using an excess of its absorbent, and until the absorbent is exhausted or has been oxidised any air entering the vessel will be deprived of its oxygen; and by means of a suitable apparatus attached to the containing vessel such ingress will be indicated, and thus give timely notice for the addition of a further supply of the absorbing substance, and also for rendering the vessel perfectly air-tight.

As diluents, I employ either bran or cork, or oak-bark or oak-sawdust, or any other vegetable substance containing tannic, gallic, or other analogous acids, as these when employed either alone or in conjunction with a solution of caustic soda or potash absorb oxygen, and these I use either alone or in conjunction with the before-mentioned metallic salts or compounds.

I thus avail myself of the absorbent action as before-mentioned of potassic and of sodic pyrogallates.

In carrying out this invention I prefer to produce and to effect the mixture of the preservative agents with the diluents in the vessel containing the substances or materials to be preserved. This I do by having a rake, the handle of which passes through an air-tight stuffing-box, and is connected with a vessel which can be so arranged as to be capable of inversion, and at the same time permitting the impregnation of the oak or cork bark without the admission of air, or other methods may be adopted.

Having now described and particularly ascertained the nature of my said invention, and the manner in which the same is or may be used or carried into effect, I would observe, in conclusion, that what I consider to be novel and original, and therefore claim as the invention, is—

First. The employment for effecting the preservation of animal and of vegetable matters of the lower oxides of manganese, such oxide or oxides being capable of absorbing oxygen and becoming converted into higher oxides.

Second. The employment for effecting the preservation of animal and of vegetable substances of the lower oxides of manganese and of iron, in conjunction with a diluent, in the manner hereinbefore described.

Third. The employment for effecting the preservation of animal or of vegetable matters of organic salts or compounds which are capable of absorbing oxygen, such, for example, as the tannates, gallates, pyrogallates, or analogous bodies, either employed alone or when contained in vegetable or other matter.

A.D. 1876. No. 559.

171

Improvements in Preserving Animal and Vegetable Matters.

In witness whereof, I, the said Frederick Settle Barff, have to this my specification set my hand and seal, the second day of August, one thousand eight hundred and seventy-six.

Signed and sealed in the presence of—

FREDERICK SETTLE BARFF. (L.S.)

CHAS. MILLS,

47, Lincoln's Inn Fields, London.

This is the specification referred to in the annexed Letters of Registration, granted to Frederick Settle Barff, this day of December, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

Sydney, 8 November, 1876.

The application of Mr. Frederick Settle Barff for Letters of Registration for "Improvements in Preserving Animal and Vegetable Matters, and in the means and apparatus employed therein," having been referred to us, we have examined the specification accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.

A.D. 1876, 27th December. No. 560.

IMPROVEMENTS IN THE MANUFACTURE OF GAS FOR BURNING.

LETTERS OF REGISTRATION to Thomas Boverton Redwood, for Improvements in the manufacture of Gas for burning.

[Registered on the 29th day of December, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS THOMAS BOVERTON REDWOOD, of Fairlawn, Finchley, in the county of Middlesex, England, chemist, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the manufacture of Gas for burning," which is more particularly described in the specification which is hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Thomas Boverton Redwood, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise unto the said Thomas Boverton Redwood, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Thomas Boverton Redwood shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-seventh day of December, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in the manufacture of Gas for burning.

TO ALL TO WHOM IT MAY CONCERN: Be it known that I, THOMAS BOVERTON REDWOOD, of Fairlawn, Finchley, in the county of Middlesex, England, have invented or discovered new and useful "Improvements in the manufacture of Gas for burning"; and I, the said Thomas Boverton Redwood, do hereby declare the nature of the said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement thereof, that is to say:—

The first part of this invention has for its object the production of a permanent gas, rich in carbon, from petroleum and other hydrocarbon oils, including the oils obtained from coal, shale, peat, and other sources. As met with in commerce, these oils often contain solid hydrocarbon, such as paraffine; they are mixtures in various proportions of several proximate constituents, differing in density and volatility, but consisting for the most part of carbon and hydrogen, in proportions which in some of their constituents accord with, and in others differ but slightly from, those in which the same elements exist in olefiant gas or other permanent hydrocarbon gases, which are the most valuable light producing constituents of the richest and best description of coal-gas, or of gas suitable for burning as a source of light. I produce from this class of oils a permanent gas, not a mere vapour, which gas is rich in carbon, and well suited for burning as a source of light when it has been diluted with other combustible gases that are less rich in carbon, or that do not themselves burn with a sufficiently luminous flame.

It has long been known that by the application of heat the hydrocarbon oils such as I have alluded to may be made to yield a gas tolerably rich in carbon, but hitherto the processes adopted for that purpose have not afforded uniform and satisfactory results, the gas produced being generally deprived of part, and sometimes of the principal part, of the carbon contained in the oils by the action of the heat applied in the process.

The principal difficulty experienced in getting a good permanent gas, rich in carbon, from hydrocarbon oils has been that of so regulating and applying the heat as to ensure the conversion of the oils or their vapours into permanent gas without at the same time causing much of the carbon, which is the true source of light, during the combustion of gas to be deposited in a solid state. It is necessary to apply a temperature above that of visible redness in order to change the vapour of the oil into permanent gas, and there appears to be but a small range of temperatures through which that change can be effected in contact with most solid substances without converting part of the oil into a species of tar, and at the same time causing a deposition of solid carbon from the gaseous product.

Now my invention consists of a method or methods by which the liquid hydrocarbons alluded to, or their gaseous products, may be subjected to a higher temperature than it has hitherto been found practicable to apply to them without causing a deposition of solid carbon, and the range of temperatures at which the conversion of the oils into permanent gas without loss of carbon takes place is thus enlarged, so that a more uniform and satisfactory result may be practicably obtained, and an important economy effected.

I have found that the liquid hydrocarbons or their vapours when heated in contact with metallic copper, or an alloy of copper, such as brass or gun-metal, will bear the application of a higher temperature than can be applied to them by contact with other substances without depositing solid carbon, and on this fact partly my improved processes for the production of gas for burning are founded.

I have also found that if the liquid hydrocarbons or their vapours be introduced into a hot chamber together with a permanent gas, such as water-gas, which is either previously or immediately heated to a temperature which in a metal or other solid body would be represented as that of bright redness, the vapours of the hydrocarbon oils may under these circumstances be subjected, in contact with copper or an alloy of copper, to a cherry-red heat, and will thus be more completely and satisfactorily converted into a permanent gas than would otherwise be the case.

My improved processes for the manufacture of gas for burning are founded upon the foregoing facts.

I produce a permanent hydrocarbon gas, rich in carbon, from petroleum or other liquid or solid hydrocarbon, such as I have described, by subjecting the vapours of such hydrocarbons to a bright red heat, applied through the medium of copper, or an alloy of copper, such as brass; and this is effected by introducing the hydrocarbon oil or its vapour gradually and continuously as the conversion takes place into a red hot cylinder or converting chamber, composed of copper, or an alloy consisting principally of copper filled with scraps or turnings, or wire, or wire-gauze of the same metal, so arranged as to conduct the heat as equally as possible to every part of the chamber, and to present as large a heating surface as possible to the vapour. In this way a temperature of bright redness may be applied without causing any material deposition of carbon from the gas produced, which will consist largely or principally of olefiant gas, or of other gas or gases rich in carbon, and which may be diluted with water-gas or other gas which is not rich in carbon, to render it suitable for use as a gas for burning as a source of light. But although the vapours of liquid or solid hydrocarbons such as I have described may, if due care be exercised, be converted into permanent gas with little or no deposition of carbon by the method already described, I prefer to effect the conversion with the intervention of water-gas by the following method: The water-gas I use is obtained by the well-known process of passing superheated steam over the surface of incandescent carbon at a high temperature, when a mixture of hydrogen gas and carbonic oxide is produced, together with some carbonic acid, which is removed by means of slaked lime before using the gas. The purified water-gas so produced is introduced simultaneously with the hydrocarbon oil, or its vapour, into the cylinder or converting chamber, constructed, filled, and arranged as already described in the process for making gas without the intervention of water-gas; but in this case the cylinder and its contents may be maintained at a higher temperature, usually called a cherry-red heat; and in order to prevent too great a reduction of temperature by the introduction of the water-gas, I convey this gas through red hot tubes before it enters the cylinder or converting chamber. The proportion of water-gas used in this process in relation to the hydrocarbon oils may be regulated by suitable valves or taps, so as to yield a mixed gas having an illuminating power such as may be required for burning as a source of light; or otherwise, it may be further mixed with a richer gas made without or with a smaller quantity of water-gas, or with water-gas itself.

The

Improvements in the manufacture of Gas for burning.

The gas produced by this or by the previously described method should be passed through a condenser or scrubber, or both, for the purpose of removing the visible vapour of unconverted oil, a portion of which will be carried over in the process; and as this unconverted oil may constitute a material part of the oil used in the process, it is important that efficient means should be adopted for recovering it, so that it may be reintroduced into the hot cylinder, and finally converted into permanent gas. I have found that the oily particles, the presence of which gives to the gas the character of visible vapour, are retained in suspension in the gas, and carried to a considerable distance while the gas is rapidly flowing through the pipes, but they soon subside when the gas is at rest, as occurs in the gasometer.

It will be found advantageous as a means of promoting the separation and collection of the suspended oil particles after passing the gas through the ordinary tubular condensers, such as are used at gas-works, to allow it to pass in small jets through water or petroleum, using in the latter case one of the less volatile varieties of petroleum, and avoiding the renewal of the water or petroleum unnecessarily, as these liquids when used in excess, and before they have become saturated by contact with the gas, would dissolve out some of the most valuable constituents of the gas.

After having deprived the gas of suspended particles of unconverted oil, it should be passed through a dry lime purifier, to ensure the absence of carbonic acid; but no other purification will be necessary, except when a crude hydrocarbon oil, which may contain a little sulphur, has been employed in the process, in which case the lime purifier should have a layer of oxide of iron at the bottom for the removal of sulphuretted hydrogen.

The general arrangement of apparatus required for conducting the process by either of the methods described need not differ much, excepting in its greater simplicity and much smaller extent from that adopted in the manufacture of coal-gas. The water-gas may be made by passing superheated steam through a cylinder filled with charcoal, or other form of carbon, such as coke, breeze, or peat charcoal, kept at a full red heat. An ordinary gas-retort may be used for this purpose, but there is some advantage in having the cylinder set in a vertical position, and the steam made to enter at the bottom while the water-gas passes off at the top. If the carbonaceous matter used should contain any sulphur, a little sulphuretted hydrogen would be formed, which, as well as any carbonic acid that may be present, must be removed from the water-gas; and for this purpose it will be desirable to have a layer of oxide of iron, such as is commonly used in gas purification, at the bottom of the lime purifier, by which the carbonic acid is to be taken out. The water-gas thus produced and purified may be used at once, or stored in a gasometer for use.

The conversion of hydrocarbon oils into permanent gas, either with or without the intervention of water-gas, may also be effected in a gas-retort, if this be lined inside with copper, or an alloy of copper, filled with scraps, turnings, wire, or wire-gauze of the same metal, and provided with the means of introducing a regulated supply of the hydrocarbon oils, and, when required, of water-gas. The exit pipe by which the gas is conveyed away from the hot cylinder or retort, to the extent to which such pipe is exposed to a strong heat, should be of the same material as the cylinder or its inner surface, or otherwise some of the gases richest in carbon may be decomposed when subjected to a high temperature and deprived of part of their carbon, and to a corresponding extent of their light producing power.

If the arrangements of existing gas-works be not utilised or adopted, cylinders may be used of any convenient size or form, in which, however, it is desirable to provide for the means of heating them throughout to the required extent; and these cylinders may be either made entirely of copper, or an alloy of copper, or they may have an outside covering of other material to protect the metal within from the destructive effects of the fire.

When previously heated water-gas is used in the process, the fire by which the cylinder or converting chamber is heated may be made to heat pipes through which the water-gas is conveyed to the hot chamber, and it will be found advantageous for the preservation of these pipes that they should be embedded in and surrounded by powdered lime to prevent their oxidation and destruction from this cause.

In fitting up apparatus specially for the purpose of making gas by the processes herein described, it will be found advantageous to have the condensing and oil separating arrangements at a higher level than that of the converting cylinders, so that the oil that is condensed and separated from the gas after leaving the converting cylinder may be brought back to the cylinder by its own gravity.

What I claim as respects this, the first part of my invention, is the manufacture of a permanent gas, rich in carbon, by bringing the vapour of a suitable hydrocarbon into contact with copper, or an alloy of copper, kept in a highly heated state, and arranged so as to expose a large extent of surface, substantially as described.

I also claim the manufacture of a permanent gas, rich in carbon, by bringing the vapour of a suitable hydrocarbon, together with water-gas, into contact with copper, or an alloy of copper, kept in a highly heated state, and arranged so as to expose a large extent of surface, substantially as described.

The second part of this invention has for its object to improve the quality and increase the quantity of gas obtained by distilling coal in retorts, as now usual. For this purpose I cause the gas as it issues from a retort, or whilst it contains a portion at least of the condensable vapour which is generated together with the gas, to come into contact with heated copper, or an alloy of copper, so arranged as to expose a large extent of surface to the gas. I prefer to pass the gas immediately as it issues from the hydraulic main through a heated retort, packed full of copper tubes, say of an inch diameter, so that an extended heated surface may be exposed to the gas without materially obstructing its passage. I prefer that the tubes should be short lengths, say 1 foot; and in packing them in the retort I take care that the different lengths do not butt truly together, but are arranged so as to subdivide the current of gas as far as practicable.

By this means the volume of the gas is increased, and its quality, both as regards illuminating power and also freedom from an undue quantity of sulphur in other form than that of sulphuretted hydrogen, is at the same time improved.

The

Improvements in the manufacture of Gas for burning.

The converting retort should be heated externally by a fire, by which it can be kept at a cherry-red heat, and the gas, after passing through the converter, should be conveyed to the condensers and purifiers through a pipe of ample size, so that it may pass off freely without back pressure.

In cases where it may be desired to get a larger quantity of tar than would be produced by operating in the foregoing way, the gas may be carried not only through the hydraulic main, but also through the condensers before it passes to the converter; but in this or any case in which most of the aqueous vapour, as well as tar, would be separated from the gas before it reaches the converter, it will be desirable to introduce water, or the vapour of water, with the gas into the converter, which may be done in any convenient way, to the extent of about a pint of water, or an equivalent quantity of steam, for every thousand cubic feet of gas.

When the coal employed in the process yields a gas of very high illuminating power, such as cannel coal, I cause a stream of water-gas to pass through the retort in which the coal is distilled, and then lead the combined products through the converter arranged and heated as already described.

What I claim in respect to the second part of my invention is—

First. Causing gas obtained by distilling coal, together with vapours generated with it, to come in contact with copper, or an alloy of copper, kept in a highly heated state, and arranged so as to expose a large extent of surface, substantially as described.

Second. Causing a stream of water-gas to pass through retorts in which coal is being distilled, and leading the combined products into contact with copper, or an alloy of copper, kept in a highly heated state, and arranged so as to expose a large extent of surface, substantially as described.

In witness whereof, I, the said Thomas Boverton Redwood, have hereunto set my hand and seal, this 24th day of July, in the year of our Lord one thousand eight hundred and seventy-six.

T. BOVERTON REDWOOD. (L.S.)

This is the specification referred to in the annexed Letters of Registration, granted to Thomas Boverton Redwood, this day of December, 1876.

HERCULES ROBINSON.

REPORT.

SIR,

The application of Mr. Thomas B. Redwood for Letters of Registration for "Improvements in the manufacture of Gas for burning" having been referred to us, we have examined the specification accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

Sydney, 8 November, 1876.

We have &c.,

**IMPROVEMENTS IN THE MANUFACTURE OF ILLUMINATING GAS, AND
IN THE APPARATUS EMPLOYED THEREFOR.**

LETTERS OF REGISTRATION to James Keith, for Improvements in the
Manufacture of Illuminating Gas, and in the Apparatus employed therefor.

[Registered on the 29th day of December, 1876, in pursuance of the Act 16 Vic. No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS JAMES KEITH, of Arbroath, in the county of Forfar, North Britain, gas and water engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the manufacture of Illuminating Gas, and in the Apparatus employed therefor," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said James Keith, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof: to have, hold, and exercise, unto the said James Keith, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and until the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said James Keith shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-seventh day of December, in the year of our Lord one thousand eight hundred and seventy-six.

(L.S.)

HERCULES ROBINSON.

Improvements in the Manufacture of Illuminating Gas, &c.

SPECIFICATION of JAMES KEITH, of Arbroath, in the county of Forfar, North Britain, gas and water engineer, for "Improvements in the manufacture of Illuminating Gas, and in the Apparatus employed therefor," hereunder detailed.

I, JAMES KEITH, of Arbroath, in the county of Forfar, North Britain, do hereby declare the nature of the said invention to be for "Improvements in the manufacture of Illuminating Gas, and in the Apparatus employed therefor."

The particulars are as follows:—

This invention relates to the manufacture of illuminating gas from crude mineral oils, such as shale, American petroleum, or other similar oils, whereby the gas is more thoroughly extracted from such oils than hitherto.

The apparatus employed in carrying out this invention consists of an improved arrangement of furnace, retort, "retort-setting," and "washer," constructed and connected as hereinafter described.

This furnace is of circular form, constructed of brickwork and fire-clay, and is provided with a heavy circular metal grate and water-pan of brick, built into the masonry beneath; and the fuel for the furnace is fed into it by means of a slanting shaft entering the furnace at the bottom side of the fire instead of at the top, in order to prevent the ingress of cold air, and consequent cooling of the retort or lining, as by this arrangement of the feeding-shaft any air getting in while the furnace door is open has to pass upwards through the whole body of the fire before it reaches the "retort-setting," by which time it has become sufficiently heated or burned in its passage through the fire.

This retort is made of metal of an equal thickness throughout, and is flat-bottomed, with circular or rounded sides and top, its outline being in the form of an inverted bowl. The retort may also be constructed, if desired, of fire-clay. It may have a horizontal perforated partition in the centre, dividing it into an upper and lower division, either or both of which may, when desired, be filled with coke or charcoal to give greater heating and distilling surface. Or otherwise, and by preference, the retort may have a flue or pipe division carried down through its centre, by which the flame and smoke pass directly through the centre of the retort, thus giving a double heating surface,—that is, a heating surface inside as well as outside of the retort. The flue or pipe arrangement through the centre of the retort divides it, as it were, into an upper and lower annular space or division, both of which, when desired, may be filled with coke or charcoal to give greater heating and distilling surface. Two slanting shafts or door-pipes are cast one on each side of the retort—one sloping into the lower part or division, and the other from off the upper part of the said annular internal distilling space. When the retort is properly heated the oil is run in in a thin continuous stream from a contiguous metal cistern through a "pipe-trap" into the lower shaft, and passes off in the form of gas through the upper shaft into the upright pipe, where the gas gets "fixed" and partly condensed, after which it passes along the horizontal pipe, and finally enters the washer, from whence it may be passed direct by suitable connections into the gas-holder without purification; or, if desired, for greater purity, it may be passed through an intermediate vessel of any desired form containing a layer of coke or charcoal for the purpose of clarifying it. Before entering the gas-holder the gas can be passed through any form of atmospheric or water condenser or purifier as usual, if desirable. This retort can very easily be cleaned being provided with suitable doors, clamps, and screws fixed on the extremities of the slanting branches or shafts before referred to; doors are also arranged round the "setting" of the retort to enable the attendant to watch the heating operation. The retort being itself flat-bottomed rests upon an arch with flat roof, thus insuring great durability, as in no part is the heat of the furnace allowed to impinge directly upon the retort.

The "washer" is of a circular or cylindrical form, with flat top and bottom, and is composed of metal, or it may also be made in any other form suitable. It is provided with both an overflow and discharge pipe, and is also fitted with a cleaning out door and plugs on top. The connections or pipes between the retort and washer are fixed, and pass from the retort directly through the top of the washer, no "luting" or movable connections being required.

The retort, furnace, and "setting" are enclosed in a metal casing, and are surmounted or covered with a metal top plate, through which the smoke-pipe passes to the chimney or other exit. This arrangement of apparatus is peculiarly adapted for the manufacture of gas on board ship, and when so used the only alteration necessary is the application of a swinging instead of a fixed washer.

It will be obvious that when desired a series of the different apparatus herein described may be arranged side by side where increased production of gas is desired. One or more of these can be utilised for making hydrogen by passing a thin stream of water or steam through them while hot, the hydrogen being then passed with the oil through other producers alongside, in a usual manner, or a stream of water or steam can be run into one producer along with the oil, together or separately, to give the same result.

And in order that the nature and mode of performing my said invention may be properly understood, I now proceed to describe the several figures on the sheet of drawings which I have hereunto appended for that purpose—the same reference letters indicating the same parts in all the figures where seen.

The apparatus employed in carrying out the said invention consists of a new or improved construction, arrangement, and combination of furnace, retort, retort-setting, and washer, all as hereinafter more particularly described.

Figure 1 is a sectional elevation of the gas producer and washer; figure 2 is a plan of a duplex arrangement of the same at right angles to figure 1, showing the first producer in transverse section of one construction and arrangement of the parts of my new or improved apparatus, with its connecting pipes complete, for producing or distilling, and "washing" or cleaning, gas from the said crude mineral oils for illuminating purposes, all illustrative of and in accordance with the nature and objects of my said invention.

Figures 3 and 4 are, respectively, a transverse vertical section and a horizontal section of the gas producer and furnace part—the former taken through the exhaust pipe and damper and feeding furnace mouth, and the latter on the line 1—1 in figure 1, to show the construction of the arch and flat circular fire-brick part above the furnace for the retort to rest on, and the openings in the same for the flame and heated products of combustion to pass up through.

The

Improvements in the Manufacture of Illuminating Gas, &c.

The furnace H is of a circular form, constructed of brickwork and fire-clay bricks, *s*, and is provided with a circular cast-iron grate or bars, J, and water-pan or recess of brick, K, built into the masonry beneath, which keeps the ash-pit cool, and prevents the fire-grate or bars from being burned, shown at figures 1 and 3; the furnace H being surmounted by a cruciform brick arch, I, with circular flat part at I', carrying the retort resting on them, and having openings, H', through or between the arches for the heated products of combustion to pass up into the annular space or chamber R round the retort A. The fuel for the furnace is fed into it by means of the slanting shaft or mouth *p* entering the furnace H at the bottom side of the fire, as shown in section figure 3, in order to prevent the ingress of cold air, and consequent cooling of the retort or lining, as by this arrangement of the feeding shaft any air getting in while the furnace door *o* is open has to pass upwards through the whole body of the fire before it reaches the retort-setting, by which time it has become either sufficiently heated or burned in its passage through the fire to assist combustion.

The retort A is preferably made of cast-iron, as shown (but it may be made of other metal, or of fire-clay, or other suitable material), of an equal thickness throughout, to provide for the contraction and expansion of metal, and is flat-bottomed, with circular or rounded sides and top, as seen in figure 3, its outline being in the form of an inverted bowl. The retort A has a flue or pipe duct, C, carried down through its centre, by which the heating flame and smoke pass directly through the centre of the retort, and out by the lateral exit continuation or duct C' and mouth-piece E, fitted with the improved key-damper S, actuated by the handle S' on its outer end or lid, as seen particularly in figure 3, thus giving a double heating surface,—that is, a heating surface inside as well as outside of the retort. Two slanting shafts or door-pipes are cast on each side of the retort—the one marked B for charging the material to be distilled into the lower part of the retort, and the other, marked D, for drawing off the gases from the upper part of the retort, as seen particularly in figure 1.

When the retort A is properly heated, the oil which is contained in the metal cistern *i* is run in by the pipe and valve *jj'* to the filler *k*, and through the siphon trap pipe *l* into the mouth of the retort shaft B at L, and passes off around the hot flue division C in the form of gas up through the shaft or outlet duct D into the upright pipe P, where the gas gets "fixed" and partly condensed, after which it passes along the pipe V, and finally enters the washer Z at X, where any tarry matter held in solution is washed out of it. The gas now passes off thoroughly pure and cool into the gas-holder direct by the pipe *z*, shown in figures 1 and 2. This oil-gas requires no purification, but, if desired, it may be passed through an intermediate vessel before entering the gas-holder containing a layer of coke or charcoal for the purpose of clarifying the gas still more; or otherwise, before entering the gas-holder it can be passed through any ordinary form of atmospheric or water condenser or purifier as usual, if found desirable.

In making gas from the said mineral oils with this retort, A, no charging or drawing in the ordinary sense is required, there being little or no residue; but at considerable intervals after making the gas the retort can very easily be cleaned out through the doors M and O, provided for that purpose at the extremity of each shaft, B and D; and improved movable clamps and screws, *g* and *h*, are also fixed on the mouth-pieces B' and D' of the slanting branches or shafts B and D for properly fastening the doors M and O, which may be hung on pins in front, at *g'*, the joints of which are made gas-tight by luting with a mixture of fire-clay and salt, or other cement suitable for that purpose. Doors, *n, n*, are also arranged in the setting *s*, or flue R, round the retort to enable the attendant to watch and regulate the heating operation.

The retort A being itself flat-bottomed rests upon the arch I with flat roof, I', as shown in section and plan, figures 1, 3, and 4, the pieces of fire-brick marked I' fitting into spaces in the arch I, to form the round central part, which thoroughly protects the bottom of the retort A. This mode of setting insures great durability, as in no part is the heat of the furnace allowed to impinge directly upon the retort, so that its bottom cannot get burned or out of shape, and the arched or angled part K' of the heating chamber R round it reverberates the flame or heat back on to the upper surface of the retort; and this heating chamber may be covered in by a central portable fire-clay, tile, or brick door, for the easy cleaning out of this chamber, R; and the whole may be made of specially sized and numbered fire-clay bricks and blocks for easy transit and fitting up in foreign countries, as in figures 3 and 4.

The washer Z is of a circular or cylindrical form, with flat top, Z', and bottom, Z'', and is composed of metal, and provided with both an overflow pipe, *a*, and discharge pipe, *b*, and cap, *b'*, and is fitted with a cleaning out door, *f*, and plugs, *d'*, in the pipe *a*. A cooler, *c*, is fixed on the top of the washer around the pipe V, and is kept full of water up to the level line *d* and top of the overflow pipe Y, which acts as a filler to pour or run in cold water occasionally into the washer Z, the lower end of the pipe Y dipping down under the level of the water-line *e* in the washer Z. The washer may also be made in any other suitable form.

The connections or pipes P and V between the retort A and washer Z are fixtures, and made extra large to prevent chokage, and pass from the top of the shaft D directly through the top of the washer Z, to which the pipe V X is fixed by the flange forming the bottom of the cooler *c*, no lutings or movable joints or connections being required. These pipes or connections are furnished with movable doors and clamps, U and W, for cleaning out purposes.

The retort, furnace, and setting are enclosed in a metal casing, *v*, and covered in with a metal top plate, N. The smoke-pipe or chimney T is fitted by a spigot or metal connection at F, of the branch or mouth-piece E, the connection of the retort flue with this metal branch, E, being at C', and is formed inside the fire-brick lining *s*. A hollow cylindrical damper, S, is fitted inside the branch connection E, like the key of a cock, the flame and smoke as it were coming up the inside of the key, so that by simply turning the handle S', fitted on the outside or end of the damper S, the draught is either shut off or put on as required, giving great power of controlling this, and, as a consequence, the regulation of the heat of the retort. These furnaces, H, will burn either coke, coal, charcoal, wood, or any other convenient fuel that will give flame, burn, or raise heat for heating the retorts. This combined arrangement of apparatus is peculiarly adapted for the manufacture of gas on board ship, and when so used the only alteration required is the hanging of the outer vessel or case of the washer containing the water on a set of "jimbles," in the same manner as a ship's compass or lamp, so that the water would always maintain or keep the same level above the lower end of the dip-pipe, V X, notwithstanding the rolling of the ship.

For

Improvements in the Manufacture of Illuminating Gas, &c.

For transportation or other special purposes these gas producers can be made, built, and bolted together with tie-rods completely self-contained, compact, and portable, ready for setting down complete when necessary or desirable; and it will be obvious that when desired a series of the different apparatus hereinbefore described may be arranged side by side when increased production of gas is required, as shown in figure 2, connected to the same pipe, *t'*, leading to the gas-holder Q. One or more of these producers can also be utilised for making hydrogen, by passing a thin stream of water or steam through them while hot, the hydrogen being then passed with the oil through other producers alongside, in the usual manner; or a stream of water or steam can be run into producers direct along with the oil, together or separately, to give the same result. The two gases thus being thoroughly and chemically mixed by passing through the heated retort together, the product will be a more non-condensable gas.

Although the retort A, with its slanting shafts, B and D, and flue, C, C', have been more particularly described for the production of illuminating gas from crude mineral oils, it is to be understood, and will be apparent to the practical gas engineer, that it is equally applicable for the production of gas from coal, shale, or other bituminous substances, with slight modifications, to admit of the charging of such material, and the withdrawal of the coke, ash, or other residues, in which case the retorts may be made of various sizes, to suit the particular mineral or material being distilled in them.

Having now described the nature of my said invention, and the manner in which the same is to be performed, I have to state that I do not restrict myself to the precise details herein described or delineated; neither, on the other hand, do I desire to claim all the parts separately, or by themselves, of such retorts for the manufacture of illuminating gas; but what I believe to be novel and original, and therefore claim as the invention secured to me by the herein-before in part recited Letters Patent, is—

First: The production of illuminating gas from or by the distillation of crude mineral oils, either for use on land or on board ship, and in apparatus (or furnace, retort, retort-setting, and gas cleaner or washer combined) of the construction and arrangement all substantially in the new or improved manner herein described and shown in the accompanying drawings, or any mere modification thereof.

Second: The construction and use of furnaces and fittings for the heating of retorts for producing illuminating gas from crude mineral oils, or coal, shale, or other bituminous or oleaginous substances, all substantially as herein described and shown in the accompanying drawings, or any mere modification thereof.

Third: The construction and use of retorts with domed upper and flat-bottomed ends, with a central heating division flue, C, C', for the production of illuminating gas from crude mineral oils, or coal, shale, or other bituminous or oleaginous substances, all substantially as herein before described and shown in the accompanying drawings, or any mere modification thereof.

Fourth: The construction and use of a washer or cleaner for illuminating gas produced from crude mineral oils, substantially as hereinbefore described and shown in the accompanying drawings, or any mere modification thereof.

In witness whereof, I, the said James Keith, have hereunto set my hand and seal this ninth day of June, in the year of our Lord, 1876.

JAMES KEITH. (L.S.)

This is the specification referred to in the annexed Letters of Registration, granted to James Keith, HERCULES ROBINSON.
this day of December, 1876.

REPORT.

SIR,

Sydney, 7 October, 1876.

The application of Mr. James Keith for Letters of Registration for "Improvements in the manufacture of Illuminating Gas, and in the Apparatus employed therefor," having been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report thereon as follows:—

We see no objection to the issue of Letters of Registration for the apparatus as described and figured for the production of illuminating gas by the distillation of crude mineral oils, but the wording of the first "claim" in the specification is such as to set up a right to these oils themselves independently of the apparatus. This we think cannot be allowed; and it will be necessary to make such an alteration in the specification as to show that these oils are claimed only in conjunction with the apparatus described. The simple omission of the word "and," before the words "in apparatus," in the second line of the first "claim," would be sufficient to obviate an objection.

We have, &c.,

J. SMITH.

CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

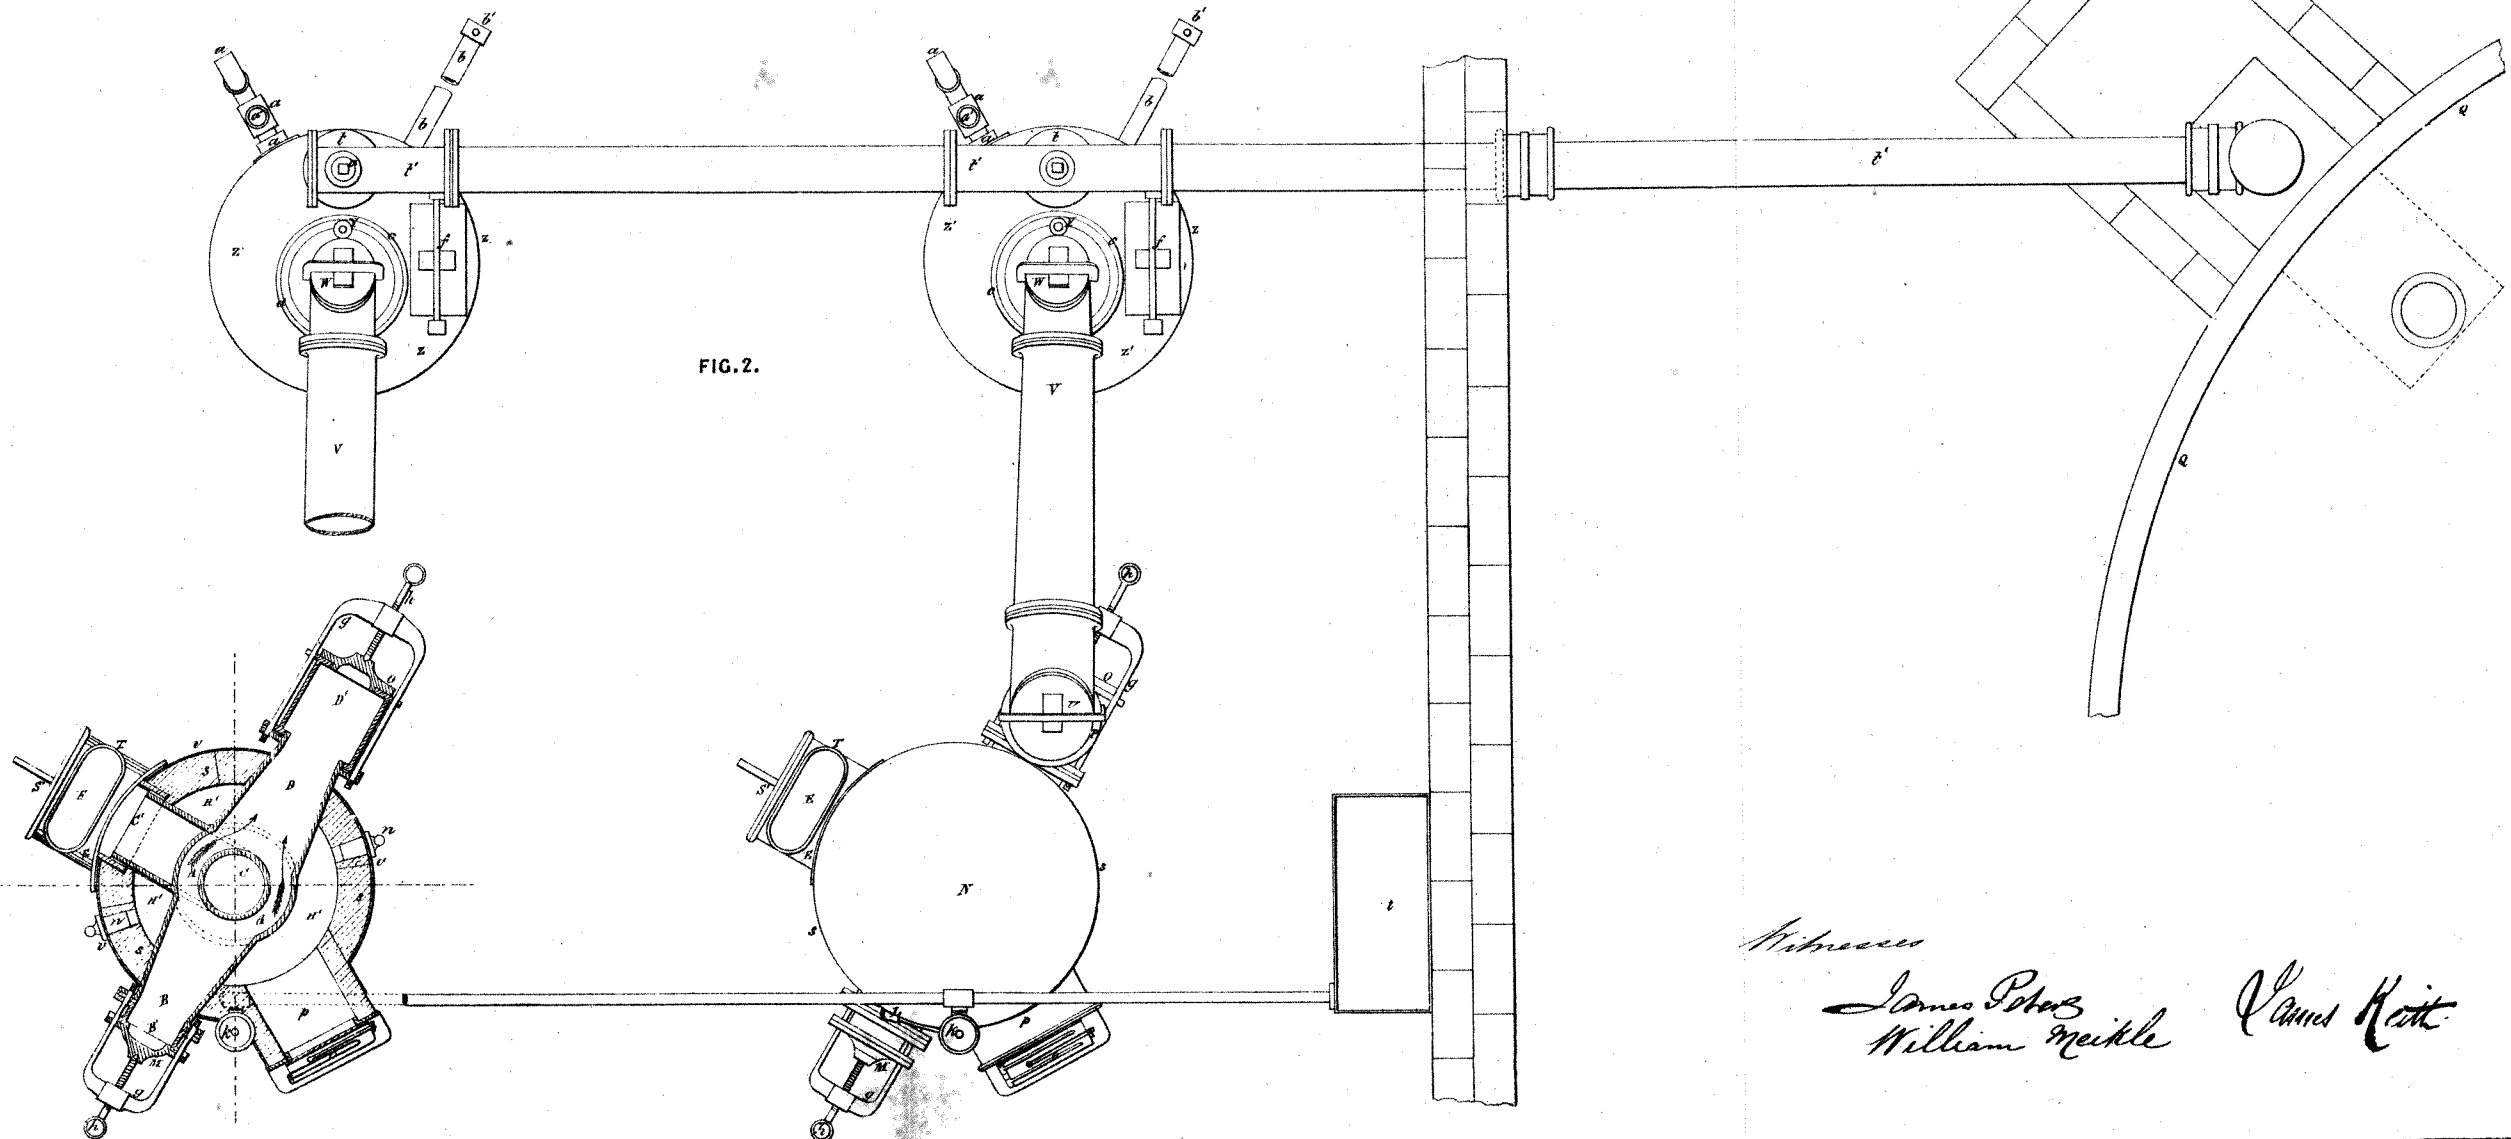

P.S.—The alteration indicated above is of such a simple and obvious character that to save trouble we have taken it upon ourselves to make it. With this alteration in the specification, we recommend that the prayer of the petition be granted.—J.S., C.W.

them nominate and appoint by writing under their hands an umpire to decide any matters on which they shall differ or which shall be referred to him under the provisions of this Act and if such umpire shall die or become incapable to act or refuse or for *seven* days neglect to act after being called upon to do so by the arbitrators they shall forthwith after such death incapacity refusal or neglect appoint another umpire in his place and the decision of every such umpire on the matters so referred to him shall be final.

41. If in either of the cases aforesaid the arbitrators shall refuse or shall for seven days after request of either party to such arbitration neglect to appoint an umpire it shall be lawful for any Judge of the Supreme Court on the application of either party to such arbitration to appoint an umpire and the decision of such umpire on the matters on which the arbitrators shall differ or which shall be referred to him under this Act shall be final.

One of the Judges of the Supreme Court to appoint umpire on neglect.

42. If when a single arbitrator shall have been appointed such arbitrator shall die or become incapable to act before he shall have made his award or shall refuse or for fourteen days neglect to act the matters referred to him shall be determined by arbitration under the provisions of this Act in the same manner as if such arbitrator had not been appointed.

In case of death of single arbitrator the matter to begin *de novo*.

43. If where more than one arbitrator shall have been appointed either of the arbitrators refuse or for seven days neglect to act the other arbitrator may proceed alone and the decision of such other arbitrator shall be as effectual as if he had been the single arbitrator appointed by both parties.

If either arbitrator refuse to act the other to proceed *ex parte*.

44. If where more than one arbitrator shall have been appointed and where neither of them shall refuse or neglect to act as aforesaid such arbitrators shall fail to make their award within twenty-one days after the day on which the last of such arbitrators shall have been appointed or within such extended time if any not being greater in the whole than six months as shall have been appointed for that purpose by both of such arbitrators under their hands the matters referred to them shall be determined by the umpire appointed as aforesaid.

If arbitrators fail to make their award within twenty-one days the matter to go to the umpire.

45. The said arbitrators or their umpire may call for the production of any documents in the possession or power of either party which they or he may think necessary for determining the question in dispute and may examine the parties or their witnesses on oath and administer the oaths necessary for that purpose.

Power of arbitrators to call for books &c.

46. Before any arbitrator or umpire shall enter into the consideration of any matters referred to him he shall in the presence of a Justice of the Peace make and subscribe the following declaration that is to say—

Arbitrator or umpire to make a declaration.

I do solemnly and sincerely declare that I have no interest either directly or indirectly in the property in question and that I will faithfully and honestly and to the best of my skill and ability hear and determine the matters referred to me under the provisions of the "Water and Sewerage Act of 187 "

A.B.

Made and subscribed in the presence of

And such declaration shall be annexed to the award when made and if any arbitrator or umpire having made such declaration shall wilfully act contrary thereto he shall be guilty of a misdemeanour.

47. All the costs of any such arbitration and incident thereto to be settled by the arbitrators shall be borne by the Board unless the arbitrators shall award the same or a less sum than shall have been offered by the Board in which case each party shall bear his own costs incident to the arbitration and the costs of the arbitrators shall be borne

Cost of arbitration how to be borne.

borne by the parties in equal proportions but if the sum awarded shall be one-fourth less than the amount claimed the whole costs of and incident to the arbitration and award shall be borne by the claimant and the arbitrators shall direct the payment of the same accordingly. Provided that if either party shall be dissatisfied with the costs allowed by the arbitrators as aforesaid the costs may be taxed by the Prothonotary or other proper officer of the Supreme Court and the amount allowed by such officer shall be the amount to be paid. 5

Award to be delivered to the Board.

48. The arbitrators shall deliver their award in writing to the Board and the Board shall retain the same and shall forthwith on demand furnish a copy thereof to the other party and shall at all times on demand produce the said award and allow the same to be inspected or examined by such party or any person appointed by him for that purpose. 10

Submission may be made a rule of Court.

49. The submission to any such arbitration may be made a rule of the Supreme Court on the application of either of the parties. 15

Award not void through error in form.

50. No award made with respect to any question referred to arbitration under the provisions of this Act shall be set aside for irregularity or error in matter of form.

Power to refer back award.

51. In any case where reference shall be made to arbitration as aforesaid the Supreme Court or a Judge shall have power at any time and from time to time to remit the matters referred or any or either of them to the re-consideration and re-determination of the said arbitrators or umpire as the case may be upon such terms as to costs and otherwise as to the said Court or Judge may seem proper. 20

Questions of compensation in certain cases to be decided by jury.

52. If the compensation awarded by the arbitrators shall exceed the sum of *three hundred* pounds and either party shall be dissatisfied with the award and shall desire to have the compensation settled by a jury and shall within fourteen days after making the award and notice thereof signify such desire by notice in writing to the other party then no steps shall be taken to enforce performance of the award but the party claiming compensation shall proceed by action in the Supreme Court in the usual manner to recover from the Board the compensation to which he may be entitled under the provisions of this Act and if upon the trial of the said action the verdict shall be for a greater sum than the sum previously offered by the Board and awarded by the arbitrators all the costs of the said action and of the arbitration and award shall be borne by the Board and if the verdict be given for a less sum than the sum so awarded all the costs of the said action and of the arbitration and award shall be borne by the claimant but if the verdict of the jury shall be for the same sum awarded by the arbitrators all the costs of the said action and of the arbitration and award shall be paid by the party requiring the same to be referred to a jury and in every such case the costs of the arbitration and award shall be added to and be recoverable as the costs of the action. 25

Compensation to absent parties to be determined by a surveyor appointed by two Justices.

53. The purchase money or compensation to be paid for any lands to be purchased or taken by the Board from any party who by reason of absence from the Colony is prevented from treating or who cannot after diligent inquiry be found and the compensation to be paid for any permanent injury to such lands shall be such as shall be determined by the valuation of a competent surveyor and valuator nominated for that purpose as hereinafter mentioned. 45

Two Justices to nominate a surveyor.

54. Upon application by the Board to two Justices and upon such proof as shall be satisfactory to them that any such party is by reason of absence from the Colony prevented from treating or cannot after diligent inquiry be found such Justices shall by writing under their hands nominate a competent surveyor and valuator for determining such compensation as aforesaid and such surveyor shall determine the same accordingly and shall annex to his valuation a declaration in writing subscribed by him of the correctness thereof. 50
