The Lodes.—A detailed description of the lodes will be given in the special report. The following general remarks may be made with reference to the tin lodes:—Out of a total of some fifty tin lodes and leaders, of which about thirty are sufficiently large to deserve attention, the majority promise to be intermittently tin-bearing to considerable depths. A few only, however, are of sufficient width and richness to be worked to advantage at present. As a proof of the permanence of the lodes, it may be stated that at the Dutchman Mine a lode has been proved to be tin-bearing to a depth of 200 feet; and as tin-bearing veins occur on an adjoining hill at 100 feet above the surface of the preceding lode, the tin lodes here may be considered permanent to a depth of at least 300 feet.

The tin ore in the veins occurs in shoots, which pitch generally to the N.E. It must not be supposed, therefore, that a vein has necessarily ceased to be tin-bearing because the particular shoot of ore which is being followed becomes poor or dies out. Other shoots of ore may underly the upper one, as proved at the main shaft on the Gulf Lode, at Butler's Reef, and elsewhere.

The silver lode discovered in the Little Plant Creek in July last has given a great impetus to prospecting, and led to the discovery lately of another promising silver vein on Pye's Creek, parish of Annandale, county Clive. The richest silver ore in this vein, as in that at the Little Plant, consists of silver fahlerz. One sample of this ore, assayed by the Government Analyst, yielded 1,238 oz. of silver per ton, and four other of the richer specimens assayed returned fine silver at the rate of over 200 oz. per ton.

The occurrence near Ashford of a thick seam of coal, some of which is of good quality, adds permanency to the fuel supply of the district. I have already reported on this coal-seam and the Little Plant silver lode.

Summary.—The present depression in mining at Vegetable Creek appears to be due—

1. To the low price of tin.
2. To the fact that the shallow leads are being exhausted more rapidly than the deep leads can be developed to take their place.
3. To a want of confidence in the lodes, arising chiefly from an imperfect knowledge of the mode of occurrence of the ore bodies, and the best methods of working and treating them.

The depression may, therefore, be only temporary, and, although the richer and more easily worked stream-tin deposits have been to some extent exhausted, the falling off in supply of tin from this source will be partially compensated by an increased output from the deep leads; and when the latter have been worked out, which cannot be for many years hence, the tin lodes of the Mole Tableland and Tent Hill, and possibly the silver veins of the Little Plant and Pye's Creek, promise permanent employment to a large mining population.

I have, &c.,
T. W. EDGEWORTH DAVID.

The Geological Surveyor in Charge.

APPENDIX E.

Report of the Curator of the Mining and Geological Museum.

Sir, Mining and Geological Museum, Department of Mines, 31 December, 1884.

I have the honor to hand you herewith the returns of assays and analyses of samples from new and untried deposits, &c., made by the Department of Mines during 1884, with a view of promoting mining interests. Though the majority of the samples have proved worthless in themselves, yet, taking into consideration the valuable information thus afforded prospectors, this view has been fulfilled; for the value of an assay must not be estimated only by the richness of the result, but also by the guidance it affords in the following up of indications revealed in the different varieties of materials forming deposits, or in the saving of capital otherwise expended in profitless labour.

The excitement consequent upon the discovery of payable silver deposits in different parts of the Colony, notably at the Barrier Range and Emmaville, and the success attending the treatment of similar deposits at Mitchell, infused fresh vigour into prospectors, and as a result the number of applications to the department for assays has largely increased. During the year 664 samples were tested, against 243 for the previous year, and these represent but a portion of the number submitted for examination.

Many samples of argentiferous ores from the Barrier Range have proved of great richness, yielding up to 16,294 oz. of silver to the ton, being composed chiefly of rich veins of chlorobromide of silver.

Payable samples have also been tested from the Emmaville, Mitchell, Rockley, Goulburn, O'Connell, Lachlan, and Bellinger River districts.

Assays

Assays of auriferous ores have yielded up to 127 oz. of gold per ton, and payable samples have been tested from new deposits in the Adelong, Bathurst, Upper Hunter, Dungog, Tarcutta, Tuena, Muttama, Moruya, Silverton, and Glen Innes districts.

Payable samples from new discoveries of copper, tin, antimony, lead, iron, &c., have been tested from various localities in the Colony, likewise samples of coal, shale, limestones, &c.

I have also the honor to hand you the returns of the donations and other additions to the Mining and Geological Museum and Library during the same period, together with the following particulars of the progress made in the accumulation of specimens and publications :—

130 donations received for the Museum have considerably augmented the number of specimens previously in hand, many of them consisting of large collections of public interest and scientific value, notably amongst them being a collection of minerals from Canada, presented by A. R. C. Selwyn, Ph. D., F.R.S., Director of the Geological Survey; collections of nickel, cobalt, and chrome ores from New Caledonia, presented by Messrs. Martin Thomas and A. Oppenheimer; Miocene fossils from Adelaide, by Professor Tate; minerals from Ravenswood, Northern Queensland, by Messrs. A. H. Cooper and Parish; collection of bones of extinct animals, including *Diprotodon*, *Macropus*, *Phascolumys*, crocodiles, &c., from Cuddie Spring, Bogan district, by Mr. J. H. Yeomans, of Gilgoon; collection of blocks of tin-stone and samples of stream-tin, from various lodes and leads in the Emmaville district, by Mr. John Reid, managing partner, on behalf of the Glen Smelting Company, Tent Hill; specimens of gold richly impregnated in serpentinite and mispickel, and metallic antimony in calcite, from the new Reform Gold-mining Company's mine, Lucknow, by Mr. J. H. Newman, manager; collections of silver ores from Barrier Range, by Messrs. A. H. Bray, L.S., and M. Barlow, L.S.; collections of Pliocene fossil fruits and fossil wood, from the Great Extended Gold-mining Company's mine, Forest Reefs, by Mr. C. J. Graham, local director, and Mr. E. O'Shea, manager; collection of antimony ores, and specimens illustrative of the metallurgy of antimony, from the Carangula Antimony Smelting Works, by Mr. E. H. Becke, manager.

The Museum has been further enriched by collections, by yourself, Mr. Geo. Sur. T. W. E. David, Mr. W. H. J. Slee, Inspector of Mines, and Mr. Charles Cullen, Collector, illustrative of the geology and mineralogy of the districts inspected, notably the Barrier Range, Mitchell, Berrima, Mittagong, Goulburn, Cudgegong, Singleton, Maitland, Greta, Vegetable Creek, Melrose, Gwydir, and Bingera districts.

The number of specimens registered amounted to 4,393, making the total to date 13,762.

215 donations to the Library were received, embracing many valuable works of reference, chief amongst them being the large number of volumes of progress reports presented by the Directors of the Geological Surveys of India, Canada, and the United States. The Danish Government forwarded through their Consul a number of scientific publications. The General Lands Office, Washington, United States, contributed a number of useful works compiled at that office. The Directors of the Academy of Freiberg presented a large number of their publications. Whilst donations of progress reports, &c., have been received from Victoria, New Zealand, &c.

In addition to the foregoing the library has received a valuable acquisition in 132 volumes of scientific works of reference purchased by the Department through the Agent-General in London.

During the year a collection (numbering 369 specimens) of fossil leaves, &c., from the Lower Tertiary stanniferous deposits of New England, was forwarded to Professor Dr. Constantin, F. Von Ettingshausen of Graz, Austria, to be figured and described.

A small educational collection of typical minerals and fossils was prepared for the Technical Board, for the use of the itinerant lecturer on geology. Also a collection of economic minerals for the Honorable J. Macintosh, M.L.C., for transmission to Scotland.

The Committee of the New South Wales Wealth and Industrial Exhibition having requested the Department to furnish an exhibit, a fair display has been made of blocks of ores on a trophy stand, together with a general collection of minerals and fossils in glass cases, while the wall space allotted is occupied by geological and mining maps, photographs, &c.

A number of exchange and promised collections are still to be prepared, but owing to the want of room for sorting, such work cannot be proceeded with at present.

No space has been available for displaying any of the specimens now stored in the iron store room in Bridge-street and in the cellars of the present offices; but as a temporary structure to serve as a Mining and Geological Museum has been commenced between the Head Office and the Geological Survey Office, we may hope early in the coming year to commence the sorting and arrangement of a typical collection of minerals and fossils, to serve as a guide to miners, prospectors, and others, the want of which has been long felt and often expressed.

The Geological Surveyor in Charge.

I have, &c.,
JOSEPH E. CARNE,
Curator.

APPENDIX F.

ON the fossil pine-forest of Kurrur Kurrán, Awaaba Inlet, or Lake Macquarie, on the east coast of Australia. By the late Rev. W. B. Clarke, M.A., F.G.S., F.R.S.

The following is a copy of MS. left by the late Rev. W. B. Clarke. An abstract only was published in the "Proceedings of the Geological Society of London," vol. IV, part I, No. 94, 1843 :—

"The Inlet of Awaaba, or, as it is called, Lake Macquarie, is the largest of the shore lakes or inlets between Port Stephens and Broken Bay. Others occur at intervals along the east coast of New South Wales.

"The term lake is generally applied to them from their having a narrow opening seaward which is usually very blocked up by sand.

"Awaaba is situate in the midst of the series of sandstones, and conglomerates and lignite beds which supply the Australian coal, extending from the river Hunter along the coast southwards towards Brisbane Water.

"Very recently coal works have been opened about 4 feet above the level of the water in Tirabeenbah Mountain, and it is about this level that immediately over and under the lignite there occur beds of fossilized wood.

"Awaaba,

"Awaaba, or Lake Macquarie, consists of a series of bays running up amongst these beds, which being divided by nearly vertical joints afford regular longitudinal and transverse lines of coast. The water of the lake is very deep, and the cliffs are steep at the water's edge. Fine bays running out like fingers pass up the country, a low coast range of the coal series, shutting out the sea, except at the before-mentioned entrance which may be considered as the wrist of the hand.

"The new coal works are at the south end of Tirabéénbah; the part under discussion is at the north end. The general condition of the locality is this: The mountain of Tirabéénbah ends abruptly to the north-west, being cut off by a fault, and forming a lofty though not very abrupt escarpment, where the range turns round towards the west and south-west. A wide valley intervenes between it and the next range on the north-east, and the face of the mountain swells out into a hill of low elevation and abuts upon a bay of inconsiderable size.

"Between the slope and the water occurs a level alluvial flat, about a foot above the lake, composed of black sandy vegetable mould, and detritus thickly interspersed with roots of plants and grasses; the length of this flat cannot be much less than half a mile, and its average breadth is 63 paces or about 50 yards. Trees of large growth, eucalypti and casuarinae, and some smaller shrubs stud this flat at intervals, and even grow close to the water. This flat is called by the aborigines Kurrar Kurrán. The lake here is very shallow, and it would appear as if the alluvial flat extended some distance further under the water. (*See Fig. 1.*)

"Bounding the river to north-north-east a conical hill rises behind the forest that clothes a long point running out in front, and on the south-west the slopes of Tirabéénbah come down to the water, so that the bay is perfectly land-locked, having an opening only in front of the alluvial flat, and the quiet character of the place and the sombre wood-clad low lines of the coast do not of themselves lead to any idea of great geological interest. The whole is a pretty lake-like picture, whilst on points at the distance of from 80 to 200 feet from the shore numerous water birds, cranes, gulls, and pelicans, are often seen sitting and standing upon what appear at the distance to be points of a reef of rocks just peeping above the water. The black swan also occasionally sails across the bay, giving an idea of natural security to the inhabitants of this otherwise unoccupied and secluded spot. It is there that by far the most curious instance of the freaks of nature which have met my notice in this singular country is seen to occur. Throughout the whole of the flat, and for the distance named in the lake, and perhaps further, stumps and stools of fossilised pines stand out of the ground and water. If the present forest were cut down at a certain level nothing could give a better idea of the effect than this fossil forest presents. The trees are of various sizes, from 2 to 4 feet above the surface of the ground, but one stump in the lake must be at least 4 feet above the water and 5 or 6 feet in diameter.

"The colour of the fossils varies from grayish white to clouded gray within, and sections of them have the identical appearance of slices of modern pine wood, the rings of growth being as distinctly marked and the fibrous transverse matter between seen under the microscope, and even without it, has the glossy appearance of the recent wood. Veins of chalcedony also traverse the fossils between the annular rings and also in the radial lines, in this respect, as in others, affording an instance perfectly analogous to that of the fossil trees of the Isle of Portland. Indeed, after comparison of the Australian with English specimens, I can see no material difference in their fossil structure, and it is evident that the two examples are but distinct proofs of the same kind of phenomenon.

"The surfaces of the trees where they have been exposed to the air have acquired a yellowish hue, and lichens have grown over some of them, giving the wavy appearance which living trees now present in the bush.

"These trees appear to have been fossilised whilst they were growing, since no process of fracture in the living state could have given such clear and horizontal sections. Moreover, in one or two instances a very large stem has been broken apparently by some recent cause, and two or three fragments all perfectly clear and horizontal in the fracture have fallen off from the stump and lie beside the lower part, whilst occasionally portions have been further removed and lie upon the surface of the alluvium or are entangled in it. The general direction of the fallen portions is from north-east. That this is the result of some modern cause is clear from the fact that the surfaces of the sections are clean, whereas the summit of the stump is overgrown and meteorologically affected. It is possible that some of the fractures may have originated in the blows they have received from the blacks.

"A few of the stumps have a hollow in the middle, but others are firm throughout. In several about the same diameter I counted 60, 70, 80, and 120 concentric rings of growth; and in one case the bark of the tree was about 3 inches thick.

"At the distance of 3 feet from the shore I found one standing out of the water with portions of the root imbedded in the rock below; and of those on the flat many had remains of the roots still in the rock under the alluvial matter; and the greater part were all standing erect. Such too is the case with those in the lake, and their situation is marked by the birds before alluded to, which thus sit in the water on trees that once grew upon dry land, but now converted into stone, remain *in situ* as marine rocks. The modern casuarina is also seen occasionally to grow on the flat out of the spot where the fossil tree appears, and one large modern tree has actually by its roots upset the stool of a fossil tree which lies about the foot of the recent plant as if that had turned it out of its burial ground.

"The train of thought which is excited by this scene is highly curious, and in few places in the world can the quiet and daily processes of natural growth and decay, the forms of living and dead things, and the successive changes and reproductions of matter, owing to the operations of most powerful though secretly evolving causes be so prominently displayed, as in this singular picture of the past and the present.

"The rock in which these trees are rooted is a sandstone of a compact and semi-crystalline character, approaching to flint or chert, and undoubtedly of the same level as that which may be noticed under Tirabéénbah at the south head of Awaaba and Nobby's Island at the mouth of the Hunter. This case is but a larger expansion of what occurs there; and instead of a few we have here at least 500 trees exhibited in the character of fossils. We cannot doubt that such being the case this is the real geological horizon of that great silicified forest which has furnished the enormous quantities of fragments of similar fossil wood which are spread over the surface and embedded in the sandstones above and under the coal. Tasmania as well as Australia exhibits this abundance, and, so far as I can learn, it is a distinguishing characteristic of Australasia generally. In "The Tasmanian Journal," vol. I, p. 24, is an account of fossil wood from Macquarie Plains, Tasmania, by J. D. Hooker, M.D., assistant surgeon of H.M.S. "Erebus," from which it appears

appears that Tasmania is in this respect in perfect agreement with Australia; and Flinders, writing of the islands in Bass' Straits, says:—"Some of the trees on Preservation Island had partly undergone a peculiar transformation. The largest of them were not thicker than a man's leg, and the whole were decayed; but whilst the upper branches continued to be of wood the roots of the surface and the trunks up to a certain height were of a stony substance resembling chalk. On breaking these chalky trunks, which was easily done, rings of the brown wood sometimes appeared in them, but in the greater number nothing more than circular traces remained. The situation in which these trees were principally found is a sandy valley near the middle of the island, which was likewise remarkable for the quantity of bones of birds and small quadrupeds with which it was strewed. The petrifications were afterwards more particularly examined by Mr. Bass, who adopted the opinion that they had been caused by water."—Flinder's *Voy.* I, cxxx1.

"A partial petrification of wood is not altogether unknown in other and more distant countries, and not to allude to Trajan's Bridge (already considered by Dr. Buckland), I may mention the occurrence of such examples in Antigua. I have seen a plant from that island having a stem of natural wood with an attached bulb converted into silica. A specimen of this kind was in the year 1833 in the collection of the late Rev. T. Barkett, Rector of Swanage, in the county of Dorset.

"An interest is excited for the Australasian petrifications by the circumstance of their being generally found associated with igneous rocks. Preservation Island, for instance, is composed of granite and plutonic schists, the latter traversed by granite veins and trap dykes; and Awaaba and its vicinity, especially Nobby's, and the cliffs near Newcastle, are also powerfully affected by intrusive rocks.

"Keignalan" also, according to Dr. M'Cormick, of the "Erebus" (*"Tasmanian Journal,"* vol. I, p. 279), exhibits the phenomenon of silicified wood in association with and imbedded in trap-rocks. But to return to Kurrar Kurrar, the rock as before observed, as well as the trees is silicified; the conclusion therefore is, that the silex must have been held in suspension or solution in the original soil which was probably moist. That some change has been induced upon the rock is evident from the fact that where it lies round the roots, which is the case with that tree about 3 feet from the shore, piled up, exactly as the rocks at Portland, described by Professor Henslow (*see* fig. 3), numerous white spots, so frequent as to give the stone a mottled character, containing powdery silex, present themselves. I see no other solution for this phenomenon than the supposition that the specks mark the site and passage of the fibres of the roots and that the cavities have been filled by it, unless they represent points of imperfect silicification. The case is in some degree analagous with that of common chalk flint (to the white varieties of which the rock is not dissimilar) in which similar white patches of powder frequently appear. That this substance is more decomposable than the rest is evident from another fact that the surface of the rock above the water is worn into little holes by the decay of this powder presenting an appearance externally as if it had been pierced by lithophagous animals.

"In one of the fragments I found the silicified impression of part of the leaf of a *glossopteris*, proving distinctly that the siliceous character is of posterior date to that of the deposit itself. How this flinty or cherty semi-crystalline action has taken place may not be easy to explain, but received in connection with the trap dykes at Nobby's (of which this rock is a continuation) and the singular markings of iron upon them there, may we hazard the conjecture, suggested by Dr. Buckland, as to the origin of flint from the water of hot springs, and suppose that after the growth of the trees in their natural soil they either descended to a lower level and into an ocean heated by plutonic fires, or an inundation of heated water enveloped them and saturated the earth to a great depth. Howsoever it may be explained the phenomenon is one which involves much conjecture, and as at the south head of Reid's Mistake, similar beds contain trunks of trees passing vertically through them and others lying horizontally in them, at a higher level than the sea, the trunks probably rising from roots at that level, it is clear that whether the soil was heated or not the enveloping matter similar to that in which the roots are fixed, must have been almost as much charged with silex as true flint itself.

"That the semi-crystalline action took place after the entanglement of the trees seems plain from a curious fact that lines of division, apparently contraction joints (*see* fig. 4) pass through both the fossils and their matrix, and must, therefore, have been subsequent to the latter occurrence.

"At the same time it must be admitted that though my own impression is these trees grew where they now stand, their roots do not extend (so far as has been yet examined) very far into the rock, nor is there any appearance of a drift-bed as at Portland, though the roots evidently may run down to the bed of lignite immediately under the flinty strata. It is also true, that immense quantities of broken fragments (apparently of branches) are found embedded in the sandstone and conglomerates above this horizon, which were undoubtedly drifted; but a similar fact has been noticed by me at Lytchett and Longfleet in Dorsetshire, where, in the borough of Poole, amongst the diluvial chert that covers the chalk and plastic clay-beds, portions of Portland Island coniferæ lie loose in the surface soil. In the same way, whatever the real soil of these Lake Macquarie fossils may have been, portions may also have been drifted with the pebbles and sand comprising the upper beds.

"Fragments lying in the sandstone over the fossiliferous rock at Munniwarrie and Wollongong, and at Mulibimba (Newcastle), as well as on the surface at Wollon Hills and at Holworthy Downs, River Clyde, and elsewhere in this Colony, are of precisely the same appearance and nature of those fragments which I have found in Dorset, and in both cases I do not remember to have seen any of such drifted fragments but those which had lost their bark, whereas many of the trunks and stools of trees at Kurrar Kurrar have the bark fossilised, and one or two in such a way as to show that it was torn partly from the tree whilst it stood, as if the tree had been broken down and the bark rent by the fall. In general, however, the bark where it can be traced is firmly fixed upon the trunk (*fig.* 2).

"If we might assume that the lower lignite bed represent the soil, and the trunks and boughs to have been gradually enveloped by sinking down, as the siliceous rock was poured in in the condition of wet sand; then the upper lignite bed might be supposed to represent the level of the upper branches, and in that case if the trees grew near the edge of a lagoon, or on the banks of an estuary, it is clear that the phenomena of two lignite beds and the overlying conglomerates containing fragments of fossil boughs are capable of satisfactory explanation and their present position would result from vertical changes of level.

"A similar explanation has been adopted by Mr. Witham (observations of fossil vegetables, p. 7) quoted by, De La Beche (*Manual*, p. 444) respecting the stem of erect *sigillariae* near Newcastle-on-Tyne, the roots being 'imbedded in a small seam of coal under the sandstone while they are all truncated on the line of the high main-coal bed to the formation of which their higher ends have in all probability partly contributed.'

"Respecting

"Respecting the true character of these trees reference may be made to the distinction pointed out by Dr. Buckland (B.T. Vol. I, p. 486) after Mr. Nichol, between the true pines and other coniferous trees. The structure of ordinary pines (he says) occurs in wood from the coal formation of New Holland; but in a note he adds, that a section of a tree from the same coal-field was like that of an Araucaria. Now if this distinction holds good, the Lake Macquarie trees are pines, exhibiting the concentric and radial and longitudinal structure with remarkable precision. As, however, it appears that both pines and araucarian trees occur both in the transition coal and oolitic beds of Europe, no inference can be drawn as to the geological era of these Lake Macquarie trees. In Jamieson's Journal, January, 1833, p. 155, is given an analysis by Mr. W. Nichol of fossil woods from Newcastle Signal Hill, 200 (?) feet above the sea, to which are assigned the hardness of flint and specific gravity of 2.759. It is said to be of a coniferous tree.

"This wood, I know, is like that of Lake Macquarie, and therefore the description and analysis of one may be assumed as that of the other. The colours are named as red, dark grey, and brown; there are also others composed of hydrated carbonate and red oxide of iron. Similar examples of these occur not far from the lake, but not at Kurrar Kurrân. As this locality affords the greatest abundance of these fossils, so the history of it seems to offer the fittest occasion for observing how completely the occurrence of these trees exhibits an inference similar to that exhibited by the somewhat different features at the Isle of Portland—the alternate depression and elevation of a country.

"If it be admitted that these trees grew where they are now rooted, it follows, of necessity, that notwithstanding there is no evidence of an alternation of fresh water and marine strata as at Portland, the dry land must have been submerged with its forests by a slow and gradual depression, till the siliceous bed had formed above it; and upon it not only had there accumulated a bed of vegetable matter (whether derived from drift or not), composing the upper lignite, but that the depression must have continued till the now partially denuded conglomerates and sandstones had been formed above them.

"That they have arisen from that depression is proved by the fact that the upper bed of lignite is now at a considerable height above the level of the lower; and that the process of rising may still be going on is inferred from the fact that some of the fossil trees still remain in and under the water, and that the accumulation of alluvial soil is evenly spread over the edge of the lake by the action of the water under which it must more recently have been deposited.

"Moreover, since very large eucalypti now grow upon this flat, and also large casuarinæ at the very water's edge, it is clear that the flat is of a considerable age, and not altogether of yesterday's formation. The usual occupier of new alluvial land—the mangrove tree—does not appear to be present, but on the other hand there is no visible proof of modern trees of previous growth, and these facts in connection with the fossil trees being partly in the water and partly out, point to a gradual and programmatic change of level. The trees could not have grown in the water where they now appear, and admitting that the alluvial flat does not prove what has been supposed just before, still, though lignite might have been deposited in a lake far above the sea, the trees proving the site of the dry land, even if never elevated, establish the fact of a deposition. Viewed, however, in connection with the dislocations and faults all round them, and with numerous other well-established phenomena of that class, which cannot here be further alluded to, these trees distinctly establish the inference of which, however, I possess even stronger evidence, that numerous alternations of level and mutual risings, and fallings have taken place to a great extent in New South Wales.

"The argument is not much strengthened by the occurrence of the *glossopteris* in the sandstone surrounding the roots of the trees, for if the one was drifted so might the other have been, and if the one had grown there so might the other; but if in the case of the fossil trees near Manchester, described by Mr. Hawshaw (G.T. VI, p. 177), it be considered difficult to suppose how six trees could have been drifted vertically with their roots downwards, how much greater is the difficulty in supposing, perhaps, 60,000 (for along the coast of New South Wales they are innumerable) to have undergone a similar process of transportation in Australia!

"Surrounded, as the roots are in some instances by an undoubted collection of the sandy matter, which has remained higher than the rest of the surface of the stratum, this could not have been so accumulated by the action of drifting. Moreover, there, as under the cliff at the South Head, we see similar examples with stems lying beside the stumps, and nearly all pointing the same way, the difficulty which was great before becomes incapable of any other solution than that the bed in which they occur was that in which they grew.

"Though not necessarily connected with the preceding remarks, it may be observed here that about the same geological horizon, large stools, and stems and branches of trees occur both at Nirritimbah (Mutton-bird Island) off the sea entrance of Awaaba Inlet, and also along the beach at Newcastle and Red Head, and in Nobby's Island close to the coal or lignite beds. In the former case they are mineralized by a pudding-stone (which lies immediately over the coal in Australia), and the fossils are, therefore, casts of trees in conglomerate. In the latter they are imbedded in a very pebbly grit passing into a pudding-stone, and are mineralized by hydrate of iron. Trees of this mineral are there seen from 10 to 150 feet in length; and one remarkable example occurs of what is by some persons called a boat converted into iron, being the bark of an enormous tree so fossilized. It is 16 feet long, and in the widest part 6 feet 5 inches across.

"At the time I inspected the last-named example, there lay a large pile of eucalypti and other trees upon the shore, the products of a violent flood in the Hunter; they had been washed out to sea and thrown up 5 or 6 miles to the southward by the current and tides; and amongst them was a mass of bark of about the same size and general features, stripped from a tree. I cannot doubt, therefore, that some of our Australian fossils are drifted.

"W. B. CLARKE."

"Parramatta, 29th August, 1842."

APPENDIX G.

COLLECTIONS made by Officers of the Department of Mines during 1884.

Name.	Description.	Locality.
C. S. Wilkinson (Government Geologist).	Collection of iron ores	Mittagong District.
Do	do do	Goulburn District.
Do	do of coal	Bundanoon, Berrima, and Ringwood.
Do	do of minerals and fossils	Singleton.
Do	do of silver ores and associated minerals.	Barrier Range.
Do	Bismuth and tin ores	do
T. W. E. David (Geo. Sur.)	Collection of tin ores and other specimens ..	Vegetable Creek District.
Do	Tin ores associated with beryl, tin-stone (lode and stream).	Old Gulf lode, Vegetable Creek District.
Do	Collection, numbering 300 specimens, illustrative of the geology and mining industries of the Vegetable Creek District.	
J. Mackenzie (Examiner of Coal-fields).	Coal and magnetic iron	A. A. Co.'s shaft, Newcastle and Mt. Wingen.
W. H. J. Snee (Inspector of Mines).	Collection of silver and copper ores	Melrose, Lachlan District.
Chas. Cullen (Collector) ..	Collection of fossils	Fish River Caves.
Do	do of Carboniferous fossils	Wollombi and E. Maitland.
Do	do do	Greta and Harpur's Hill.
Do	do of Miocene fossils	Aldinga, South Australia.
Do	do of fossils	Pallat, Gwydir River.
Do	do of diamondiferous wash-dirt, &c.	Bingera Diamond-fields.
Do	do of minerals	New England.
Theodore Ranft (temporary Collector).	do of Silurian fossils	Bowning.
Do	do of iron ores	Binalong.

DONATIONS to Mining and Geological Museum during 1884.

Donor.	Donation.	Locality.
Mr. P. Ahearn	Samples of auriferous quartz	Elliston, Upper Hunter.
Mr. H. G. Brown	Smoky quartz crystals with adherent crystals of felspar.	Meadow Flat, near Rydal.
Mr. T. F. De Courcy Browne	Gem sand	Near Bingera.
Mr. A. H. Bray, L.S.	Collection of silver ores	Silverton.
Mr. Beazley	Copper ore	Herberton, Queensland.
Do	Pumice	Sunda Straits.
Mr. F. Baedle	Asbestos, oxide of manganese, garnets, and hornblende.	Tintin Hull.
Messrs. W. H. Bond & Co.	Auriferous mispickel	Eureka Mine, Hargraves.
Mr. E. H. Becke	Collection showing different stages of antimony smelting.	Carangula Antimony Smelting Works.
Mr. M. Barlow, L.S.	Collection of silver ores	Silverton.
Mr. J. B. Bassetti	Collection of auriferous ores	Solferino.
Mr. H. Y. L. Brown (Government Geologist, S. A.)	Incisor of <i>Diprotodon Australis</i>	Millicent, South Australia.
Mr. F. H. Burslem	Copper ore	Near Wellington.
Mr. Blackett	Carboniferous marine fossils	Reservoir, West Maitland.
Mr. H. Blackiston	Drift tin ore	New England.
Mr. W. B. Christie	Asbestos	Briar Park, Rockley.
Mr. A. Cooper	Collection of minerals	Ravenswood, Queensland.
Do	Iron ore	Joppa and Lake George.
Do	Silver ores	Selheim Silver-mines, Northern Queensland.
Do	<i>Lepidodendron Volkmanianum</i>	Mount M'Connell, Northern Queensland.
Dr. J. Cox, F.L.S.	Stalactitic iron ore	Mitchell's Creek.
Mr. A. Cadell	Nuggets of tinstone	Nuggetty Gully, The Gulf, New England.
Mr. J. Cropper	<i>Lepidodendron nothum</i>	Barraba.
Do	Stanniferous cement	Rose Valley, Emmaville.
Mr. N. Colreavy	Silver ores	Barrier Range Silver-mining Company's Mines, Lake's Camp.
Mr. H. Copeland, M.P. ...	Carboniferous sandstone	South Head of Shoalhaven River.
Mr. M. Davidson	Fossiliferous limestone	Capertee.
Mr. E. C. Davis	Auriferous antimony ores	Hillgrove, near Armidale.
Mr. H. Dennis	Silver ore	Barrier Range.
Mr. Darley, C.E.	Shell (fusis)	28 feet below low water, Newcastle Harbour.
Mr. W. Davis	Steatite	Goulburn District.
Mr. Dunstan	Chloride of silver	Mount Gipps.
Mr. J. Deitz	Favosites	Upper Temora.
Mr. Fremlin, M.P.	Oxide of manganese	New England.
Mr. H. W. Ford	Cretaceous fossil shell	422 feet level, Bore D, beyond Bourke.
Mr. W. B. Faithfull	River sand, residue after treatment of 1,000 loads for gold and diamonds.	Macquarie River, near Ironbarks.
Mr. O. Fish	Petrified wood and glossopteris	Wollongong.
Mr. C. J. Graham	Section of fossil tree	Great Extended Gold-mining Company's shaft, Forest Reefs.
Do	Pliocene fossil fruits, <i>Pentene Clarkei</i> , <i>Phymatocaryon Mackayi</i> , <i>Rhytidocaryon Wilkinson</i> , <i>Illicites astrocarpa</i> , <i>Phymatocaryon angulare</i> .	do
Do	Fossil wood	do
Mr. J. R. Garland	Dendrites in slate	Barnedman.
Mr. Hamilton Gordon	Felspathic rock, containing galena, iron and copper pyrites, blende, gold, and silver.	Strathbogie, New England.

APPENDIX G—continued.

Donor.	Donation.	Locality.
Mr. R. G. Graham	Talc	Barrier Range.
Mr. G. Hemsworth	Argentiferous lead ore	No. 3 shaft, depth 34 feet, Bull Dog Range, Mitchell's Creek.
Mr. Herborn	Concretionary limonite.	
Mr. Harkness	Stilbite and magnetite	Tenterfield District.
Mr. R. D. Hale	Silver ores from various silver-mines	Silverton.
Mr. C. Hodson	Stibnite, crude antimony, and antimony regulus.	Gara Falls, Armidale.
Mr. Hanson	Polished marble	Macleay River.
Mr. S. Isenberger	Graphite	Gympie, Queensland.
Mr. A. Johnson	Iron and manganese ores, and auriferous quartz and baryta.	Glanmire, near Bathurst.
Do	Devonian fossils	6 miles west of Capertee.
Do	Goethite	do
Mr. R. L. Jack (Government Geologist, N.Q.)	Collection of fossils from the Marine Division of the Bowen River Coal-fields.	Northern Queensland.
Mr. Jones (Director of Water Conservation, S.A.)	Samples of strata in water-bores at Eucla, Tarkanna, and Hergott Springs.	South Australia.
Mr. C. Knowblanche	Cinnabar, and tailings containing cinnabar, magnetic iron, iron pyrites, sapphires, zircons, &c.	Cinnabar deposits, near Rylstone.
Mr. F. Kennedy	Fossil wood, with marcassite, from a depth of 200 feet, in well.	Yandama Downs, Albert District.
Mr. Kenway	Samples of cement from materials procured.	Goulburn District.
Professor Liversidge	Collection of duplicate samples of assayed auriferous tailings, waste products, auriferous and argentiferous copper ores, tin tailings, and certain other metalliferous ores.	From various localities in the Colony.
Mr. F. C. Levinge	Cinnabar	Cudgegong.
Mr. A. J. M. Lloyd	Aboriginal's stone implements.	
Mr. J. P. Lawson	Quartz crystals	12 miles north-east of Mount Gipps.
Mr. C. G. Lewis	Fossil wood with marcassite	Tamworth District.
Mr. G. W. Lander	Magnetic pyrites, copper pyrites, garnets, molybdenite, and quartz.	6 miles north of Tarana.
Mr. C. P. Laurence	Collection of minerals	Fish River Creek District.
Mr. H. Moss	Fossil wood, rocks, fossils, &c.	Shoalhaven.
Do	Carboniferous fossils	Nowra.
Mr. C. S. M'Glew	Chromite	Near Armidale.
Do	Tourmaline	Giant's Den, Bendemcer.
Do	Chalcopyrite	Nowra.
Do	Manganese oxide	Near Bendemcer.
Mr. W. Frazer Martin	Diamond Drill Core	Colo Coal Company's Bore.
Do	Coal	Gippsland, Victoria.
Mr. J. M'Kenzie (Examiner of Coal-fields).	Coal from centre of seam worked	A. A. Company, Newcastle.
Do	Magnetic iron ore	Mount Wingen.
Mr. D. Mackintyre	Veins of galena in quartz	Near Round Hill, Barrier Range.
Mr. G. M'Culloch	Silver ores	Mount Gipps.
Mr. J. M'Lean	Carboniferous fossils	Shoalhaven.
Mr. T. M'William	Cabinet containing 150 specimens of European rocks.	Europe.
Professor Nicholas	Upper Silurian fossils	Last Chance Gold-mine, Reedy Creek, Victoria.
Do	Zeolites	Brunswick, Victoria.
Do	Zeolites, from Wesley's deep shaft	Vegetable Creek.
Mr. W. H. Nalder	Recent shells, from a depth of 15 feet	Parish Kempsey, county Macquarie.
Mr. W. Neville	Cobaltiferous manganese ore	Parish Livery, county Argyle.
Mr. H. W. Newman	Gold in serpentine, gold in mispickel, metallic antimony in calcite, specimens of amalgam.	New Reform Gold-mine, Lucknow.
Do	Serpentine impregnated with gold	do
Mr. F. G. C. Nichols	Coral	Lord Howe Island.
Mr. Edmund O'Shea	Fossil fruits, wood, &c.	Great Extended Gold-mining Company's shaft, Forest Reefs.
Do	Silurian fossiliferous limestone	Forest Reefs.
Mr. Orr	Chloride of silver	Pluck Up and M'Isaac's mines, Silverton.
Mr. M. O'Farrell	Bismuth ores	Near Mount Gipps.
Mr. A. Oppenheimer	Silicates of nickel and ironstone concretions	New Caledonia.
Do	Chromite, nickel, and cobaltiferous manganese ore.	do
Mr. Parish	Collection of minerals	Ravenswood, Queensland.
Mr. W. O. Pomeroy	Specimen of bed rock, with stream tin and leader of quartz and lode tin attached.	From channel of the Wesley Tin-mining Company's lead, parish Hamilton, county Gough.
Mr. W. Partington	Asbestos	Near Rockley.
Mr. D. A. Porter	<i>Lepidodendron</i> specimens	Goonoo Goonoo.
Mr. A. Porter, Manager (presented on behalf of the shareholders).	Specimens of gold in quartz, No. 5 claim	The Young Australia, Upper Bingera.
Mr. Proctor, M.P.	Manganese ore	20 miles from Armidale.
Mr. C. Quick	Scheelite and antimony ore	Near Armidale.
Mr. J. Rossiter	Collection of marine shells and specimen of wood.	From strata passed through in Stockton shaft.
Dr. Ross, M.P.	Common opal	Orange.
Mr. J. Reid	Collection of blocks of lode tin, samples of stream tin, photographs of workings, &c.	From various lodes and mines in the Vegetable Creek District.
Mr. A. C. Ross	Portion of shoulder-blade of <i>Diprotodon Australis</i> .	M'Donald's Creek Station, near Doughboy Hollow.
Do	Copper ores	Nymagee and Dungowan.
Do	Petrified wood	do
Do	Aboriginal's stone hatchets	Miller's Creek, county Buckland.

APPENDIX G—continued.

Donor.	Donation.	Locality.
Mr. R. Saunders	Ripple marks in sand-stone, and sand-stone enclosing coal.	Pymont Sandstone Quarries.
Mr. J. Seaver.....	Kerosene shale, calcite, tourmaline, petrified wood, mica, schist, and glossopteris.	Capertee.
Do	Carboniferous and Devonian fossils	do
Mr. T. A. Smith (Warden)	Fossil wood and sample of underlying strata	Depth, 79 feet, near Trunkey.
Mr. G. F. Smith	Galena, from lode in por. 15	Parish Belaira, Mount Gipps.
Mr. R. Scott.....	Calcite in iron ore	Reservoir, East Maitland.
Do	Fire-clay from Burwood seam	Near Newcastle.
Dr. J. Storer	Nickel ore	New Caledonia.
Mr. A. R. C. Selwyn, Ph.D., F.R.S. (Director of Geo. Sur. of Canada).	Large collection of minerals.....	Canada.
Mr. Martin Thomas.....	Chromite, cobalt ore, nickel ore, and lime-stone, containing concretions of copper carbonates	New Caledonia.
Professor Tate	Collection of Miocene fossils	Adelaide.
Mr. J. H. Twiland	Carbonaceous shale and common opal	Young district.
Mr. Weeks	Cubes of limonite, showing gold on faces.....	Gundagai.
Mr. Chas. White	Silver ores	Black Prince Minc, 18 miles N.E. of Silverton.
Mr. T. B. Wilson.....	Red coral.....	Lord Howe Island.
Messrs. Williams & Arthur	Lode stuff from various lodes	Bathurst district.
Mr. S. Wolfson.....	Sulphides of iron and zinc	Yalwal.
Do	Doubly terminated quartz pyramids	Fiji.
Captain Williams.....	Auriferous quartz	Upper Bingers.

SUPERINTENDENT OF DRILLS' REPORT.

The Superintendent of Drills to the Under Secretary for Mines, reporting on the working of Diamond Drills and Water Augers, during the year 1884.

Sir, Department of Mines, Diamond Drill Branch, 4 April, 1885.
I have the honor to submit herewith my report on the working of Diamond Drills and Water Augers during the year 1884, with the following Appendices:—

Diamond Drills.

- Appendix A.*—Return showing the number of feet bored, the locality, purpose, cost, percentage of core obtained, and average rate bored per hour.
Appendix B, Nos. 1 to 55.—Detailed sections of borings during the year, finished and in course of progress.
Appendix C.—Longitudinal section showing positions of bores put down, beginning at Newcastle and ending at Wollongong.
Appendix D.—Section of a tool recently invented for the recovery of detached or fractured diamonds lost in the bore-hole.
Appendix E.—Section of reverse gauge recently invented for setting diamonds in crown-head of drills.
Appendix F.—Sections of improved bits for use in boring dense rocks.

Water Augers.

- Appendix G.*—A return showing the number of feet bored, the locality, cost, and the rate bored, &c.
Appendix H., Nos. 1 to 23.—Detailed sections of borings, during the year, finished and in course of progress.
Appendix I.—Plan of the Colony of New South Wales, showing positions of wells and bores and the qualities of water tapped.
Appendix J.—Index to wells.
Appendix K.—Longitudinal sections between parallels of latitude in New South Wales, showing sections of wells and bores, depths, and level, and quality of water tapped.
Appendix L.—Section showing position of bores at Gunnedah.
Appendix M.—Longitudinal section, showing strata and water struck in bores between Bourke and Wanaaring.
Appendix N., Nos. 1 to 7.—Engineers and Foremen-in-charge, reporting on water met with in boring, with certificates bearing on the accuracy of such reports.
Appendix O.—Consensus of reports on the quantity of water pumped from mines at Ballarat.
Appendix P.—Report *re* water-boring machinery, furnished to the Queensland Government.
Appendices Q 1 and Q 2.—Tabulated statements of the cost of plant and work performed by boring machines in this Colony and South Australia.

DIAMOND DRILLS.

Having in last year's report dealt with minute details showing the amount of work done by each drill and the forms and uses in general practice, the cost per foot, days occupied, &c., &c., the object of this year's report is to condense details of work by confining to general results.

By the report of the previous year there were nine drills then in hand. There are now thirteen, and this number is fully employed, bearing out my then opinion that the public demands for the use of drills would keep increasing. This fact is, I think, satisfactory evidence of public appreciation; more so when it is taken into consideration that the public is charged with the cost of working the drills.

The increased number of drills now in use considerably taxes my time to keep up the necessary supervision required in this class of work.

The Engineers-in-charge have, with praiseworthy efforts, assisted me greatly.

The system of promotion by merit introduced, I find, helps greatly to the success which I have the pleasure to report as above. All the men employed in the field are thus enabled to raise themselves according to their several merits; this I find essential when good work is the object in view.

The diamond drill in hard rocks (the size of the crown-head suited to the different classes of rock) is unequalled for prospecting purposes.

The core brought to light, the colour of return water, the cuttings from the crown head, careful measurement, men reliable and protected in their work under the régime of efficient control and exactitude, makes the diamond drill a test perfectly reliable.

Most of the borings have been of moderate depths, averaging about 600 feet. At this date one bore has penetrated to a depth of 1,548 feet, still in course of progress.*

156 feet of coal has been cut through in the aggregate.

A total of 10,743 feet 5 inches has been bored during the year, chiefly in search of coal in the coast districts. Of this total, 879 feet 2 inches has been bored by hand through surface alluvium, at shallow depths, preparatory to the drills taking up the borings when on to firm ground.

This shows the drills to have bored 9,864 feet 3 inches, which was done at a working or field cost of 12s. 10d. per foot, equal to a total of £6,326 6s. 8d.

Working cost includes wages, diamonds, carriage, fuel, and, at times, purchase of water to work the drills, besides all renewals, such as worn-out parts of the drills, drill-connections, bits, springs, oils, ropes, camp equipments, and travelling expenses of those employed in the field.

Hand boring cost 8s. 4½d. per foot, equals £369 0s. 2d.

The total working or field cost therefore amounts to £6,695 6s. 10d.

The earnings during the year for the use of drills was £6,656 7s. 10d; for hand-boring, £369 0s. 2d., or together, £7,025 8s.

Office salaries and store wages and rents amounts to £1,046 14s. 8d.

Revenue

* By latest reports, on coal at 1,703 feet.

Revenue other than from drill earnings, viz., inspection fees and sections supplied, amounts to £39 18s.

79·37 per cent. of the core has been saved from the number of feet bored. Average rate bored per hour equals 12·4 inches.

This rate of boring is within a fraction of the rate during the previous year, the percentage of core obtained being also wonderfully close, and compared with boring in England shows remarkable similarity, favourable to this Colony, circumstances considered.

Owing to the renewals of worn parts being made a charge to working expenses, the plant is not allowed to depreciate in value as much as is the case with most classes of machinery. My object is to keep the plant highly efficient and not to have it worn out.

The cores from borings in most cases have been preserved, compared with sections, classified, and laid by for public information. This adds to the cost, but nevertheless is a necessary and useful part of the work.

The year's work will compare favourably with the previous year's so far as relates to successful finds; in short, discoveries of coal during the year are of such frequent occurrence that it is not looked upon as unusual.

The underground drills imported last year have been employed, one at the Great Cobar Copper Company's Mine, and one at Bingera. There is not, however the demand for this class of work as there is in the search for coal, the coal interests standing foremost.

The sections and tabulated statements herewith annexed will be found to give full details of the work.

The year closes with a steadily improving demand for the use of drills.

It will be seen by *Appendices D, E, F*, that important inventions have been added during the year. The tool for the recovery of fractured or lost diamonds will alter the cost of drill-working materially, probably to the extent of 2s. a foot saving.

It has been a matter of study with experts since the earliest history of drill work to endeavour to combat effectively with the loss occasioned by fractured diamonds in deep bore-holes. The tool here shown has been put in practice and found to work most successfully.

Instructions as to the working, as well as further details, are necessary to fully appreciate its saving of diamonds.

A statement made out by the Department prior to the use of this diamond saving tool showed that the average cost per foot for diamonds used was 3s. 8d. this year, and since the introduction of the tool the cost is 2s. 0½d.

9,864 feet have been bored during the year, so that the invention may be set down as of practical and direct gain to drill working.

Conglomerates are the most difficult boring met with, being extremely destructive on diamonds. As an instance, six bores in conglomerate, aggregating 2,464 ft. 6 in., cost 4s. 5½d. per foot for diamonds, while nine bores in the silurian, aggregating 1,034 feet 6 in., only cost 4½d. per foot for the same item.

The dryness of the seasons has affected and added to the cost of drill work considerably, water in many instances having to be purchased to work the drills, the usual rate paid being 10s. per 400 gallons. A drill requires from 800 to 1,200 gallons per day clear water. Taking days when reaming and cementing bores, when in fact nothing was added to the depth, it can be readily seen the enormous cost it entails to purchase water for requirements nearly all of which would have been saved in ordinary seasons.

WATER AUGERS.

Nine water augers are now at work over various parts of the Colony in search of water, as under:—

Three between Bourke and Wanaaring; three between Wilcannia and Silverton; one between the Narran and Collarindibri; one at Gorian Station near Walgett; one *en route* for Goodooga.

Between Bourke and Wanaaring two artesian supplies have been tapped, with every probability of further success as work progresses and borings are carried deeper. (*See Appendix H, Nos. 6 and 8.*)

The first augers sent out were on this line of road, but the seasons have been so severe that work could not be carried out as wished. There was no water to be had latterly, unless carted, even for the domestic use of the party. Carting water is a matter of impossibility beyond a given distance, that is to say, horses will drink a given number of gallons of water and draw a given number, but they will drink more than they can draw beyond a certain number of miles, more or less as the state of the road is good or bad.

This was the position on this line of road: horses had ultimately to be driven to where water was, and to keep them alive, and within reach of water, feed had to be brought from the coast districts of the Colony, and the work of boring meantime carried on as best could by manual labour.

Under such difficulties the expenditure of money in horseflesh, or forced expenditure otherwise, would be of no utility—in fact a waste. Consequently the most that could be done under such circumstances was resorted to.

I have no doubt of meeting with exceptional success on this line, and now, as the season has fortunately changed for the better, I believe we shall carry out more work in five months than has been done for the previous fifteen.

On the line Wilcannia to Silverton work has been but recently started; so far little encouragement has been met with at the Silverton end. Towards Wilcannia end, up to recent dates, good stock water has been met in one bore. In another, some 12 miles west of Wilcannia, sand drifts have been carried down nearly 300 feet deep, water as salt as the ocean; but this is no reason, in my opinion, why a different quality of water may not be met with by attaining depth. The bore will require to be telescoped with the object of passing through these immense sand drifts.

The drifts met with are most difficult to pass through, and without the proper class of tubing could not possibly be shut off.

The force of the drifts is such as to rise up and choke the tubes 60 or 80 feet above their lowest point. No boring in the ordinary sense of the word is done—it is tube driving throughout, friction only overcome by process of telescoping tubing.

There are excellent proved men in charge of this difficult work, picked men with exceptional, varied, and nearly a lifelong experience of boring. Anything short of such experience coupled with colonial bush knowledge would be a failure in such sand drifts. I mention this, as it is due to good men to acknowledge their able assistance rendered to their work and to me. The

The difficulties on this line have, up to recent dates, been greater than on that of Bourke to Wanaaring. Water had to be purchased for the party's domestic use, at £3 per 400-gallon tank. It was out of question, therefore, to think of employing horses or steam; not a blade of grass, and water at such a price.

This did not, however, stop work; the man in charge applied his experience to fit up the horse-works of the machinery so as to work it by manual labour, and in this manner succeeded in boring some 500 feet.

At latest dates, there being grass and water, horse-power has been applied, which is a great saving when time and the cost per foot bored are taken into consideration.

The auger at work between the Narran and Collarindibri has so far been unsuccessful in striking fresh water, work having been delayed for the reasons already mentioned (bad seasons). The machine is not up to the power necessary to go the required depth, and will have to be supplemented by more powerful machinery, when I have little doubt of meeting with good stock water, probably fresh water fit for domestic use. The boring at this point is particularly good, but the strata indicate very deep ground, requiring more powerful appliances than those in hand.

At Gorian Station good water has been tapped, giving 7,344 gallons per day in the first bore put down. (See Appendix N, Nos. 3 and 4, herewith). A second bore is in course of progress.

The remaining auger *en route* for Goodooga.*

During the year, 1,533 feet 3 inches have been bored by water-augers, at a working cost of £1 7s. 7½d. per foot, carriage excluded.

This has been all on Crown Lands along stock routes, &c.

In addition to the above, 1,069 feet 9 inches have been bored for private persons, the total cost of which I have been unable to obtain accurately, as part of the labour has been supplied by those employing the machines, but the working cost to the Department has been 11s. 5d. per foot.

Working cost includes wages, rations, horse-feed, purchase and cost of hauling water, making of service-tanks (containing 1,740 cubic yards), travelling expenses, repairs to machines, and sundry petty cash expenses.

Borings carried out on Crown Lands, it will be observed, have all been in distant parts of the Colony—looking for water where there was little or none, even for supplying the domestic use of the parties engaged.

This is a very different matter from boring in settled districts. The carriage cost in instances has been exceptionally high; in fact at times carriage was unobtainable, keeping work often at a standstill.

It took 173 days to carry a boring plant from Sydney to 12 miles west of Wilcannia, via Nyngan, and 52 days for material to reach Goodooga from Narrabri, distances 723 and 321 miles respectively.

By referring to the official returns supplied by other Colonies, herewith given, it will be found by comparison that this class of work has been carried out in this Colony at a surprisingly small cost, circumstances considered.

At the commencement of work further delays arose through having to import certain tubing from Glasgow, of a particular pattern. Without this tubing all boring operations would have been in vain in alluvial ground.

There is now in stock 8,919 feet of artesian tubing, from 7-inch diameter down to 2½ inch, 5,000 feet of which have been added to stock during the year. Fortunately prices have been unusually low during the year, 40 per cent. in cases under former rates.

The stock in hand is therefore a great gain, the more so when it is considered that a rise has recently taken place in the iron markets at home.

REVIEW OF WORK IN SEARCH OF WATER.

In submitting this my first annual report on boring machines other than diamond drills, known as water augers, I think it necessary for me to enter somewhat fully into their working, more so as the uses they are put to are by me deemed of first importance, even more so than that of diamond drills.

The area of the Colony suitable for water augers is larger and the vital subject of water supply is greater, less developed, and harder to deal with than are the interests for which diamond drills are used; besides, the public is generally much in need of disinterested advice as to the special kind of machine best adapted to cope with the immense inland alluvial plains of the Colony.

In my report for 1883 I explained the reason why diamond drills, as at present constructed, are unsuitable for inland work in soft alluvial delta formations.

In my present report I endeavour to show from practical experience what sort of machine in lieu of the diamond drill would be most suitable for such formations.

I may state briefly that the best machine yet in use is not perfect, and fails to meet the special nature of the strata, in main, met with inland, but, in stating so, perfection is within reach, and I am confident will be attained at no distant date. To secure perfection practical application alone must be the guide,—not that acquired in foreign countries but within our own territory.

The most perfect machine known imported from foreign countries would be a failure inland in the delta formations of Australia, simply through being unadapted to the strata and the circumstances of the country.

Percussive motion will not suit in boring alluvial formations in the inland plains, rotatory motion will act best. A machine that would act well (say) in the vicinity of Sydney; Temora, or Gulgong, and such inland districts where strata are firm, would be a huge failure on the Darling plains in delta of drift formations.

It is not altogether the kind of strata but its density or adhesive properties, its freeness from boulders, running drifts, swelling clays, superincumbent weight; forces existing in inland Australia such as I never saw or heard of even in print.

It is the combating with these peculiar forces met with in boring that has proved the failure of many of the imported machines. An Australian-made machine is now the best adapted to meet the extreme difficulties of strata met with inland, and hence I expect Australian workmen to have the first and best chance of meeting their own special wants.

Books,

* Tapped water since in two bores, fresh, excellent quality. Supply equals 900 gallons per hour in No. 1 bore.

Books, trade pamphlets, and such references of boring executed in other parts of the world are not only misleading and worse than useless, but possibly paving the way for people to purchase experience at a very high rate, minus any practical results.

I refer you to a report (*Appendix P.*) supplied to the Queensland Government, *re* boring machines.

I anticipate gigantic extension ere long by the public in searching for subterranean water inland by means of boring; it may, however, be well to mention that tubing and deep well pumps must be a necessary part of any boring plant. Such tubing has at present to be imported from Germany or Britain.

I would specially call your attention to the sections of bores and wells on the Water Maps (*Appendices I, J, K.*)

I am indebted to the Chief Inspector of Stock for most of the information regarding wells.

The bores shown on Water Maps have, however, been all put down under my own supervision, and most careful records kept of the nature of the strata passed through, and the quality and quantity of water tapped. This has added to the cost of working somewhat, but the object has been more to provide correct data than rush work without method or utility. I have not only kept records of water tapped, but samples of the water have been preserved and are now to be seen in this office—as many as six qualities, different in color and taste, taken from the one bore.

One notable fact is shown on these sections, *viz.*, the different layers of water tapped have generally a different rising level. This opens the field to scientific and thinking minds as to the cause of the different rises in the levels of water found in one bore, and will no doubt in time lead to practical results as to when and how to find underground supplies.

Another most important fact is shown by these sections, *viz.*, that meeting with salt water in most instances need not cause any well-grounded fear of not finding fresh water, provided the bore is carried deeper.

It will be seen from sections (*Appendix H*) that fresh and salt water are found in the same bore; and not only this, fresh water and sea fossils are each in turn found, denoting a rising and sinking of the interior of the Colony at different ages. It will also be seen, by the lines shown on sections, the different levels to which the water tapped rises.

I may also observe that past experiences are in favour of deep borings, and that a great many bores now in course of progress have not attained the depth to ensure them the success which I anticipate will be met with when they are carried deeper.

I deem practical application by deep borings is required and should be encouraged in every way, and that we know little or can know little without practice; that theory in such an unproved field as Australia should follow practice, as borings already executed prove that the best means to find water inland is by penetrating the earth's surface and so prospecting in search of it, leaving theory alone.

The following table is an instance to encourage search for water, accompanied by deep borings:—

Victoria has put down to 18th June, 1883, 330 bores in search of water; average depth of bores, 73 feet 11 21-55 inches; fresh water struck in 56, salt and brackish in 167, no water in 106.

South Australia has put down to 31st September, 1883, 21 bores, average depth 297 feet 4 4-21 inches; fresh water was struck in 6, salt and brackish in 11, no water in 2, quality not stated in 2,

New South Wales has put down to 31st October, 1884, 42 bores, average depth 144 feet 3 97-168 inches; fresh water was tapped in 29, salt and brackish in 11, no water in 2.

Thus Victoria gives 16½ per cent. fresh water, South Australia 28½ per cent., New South Wales 70 per cent.

I account for the difference in favour of New South Wales over South Australia by the nearness of the borings in New South Wales to the mountains or Alps of the Continent (the main source of underground supply). Victoria has not bored deep enough, in my opinion, to meet with success equal to that of the other Colonies named.

New South Wales is further specially favoured by an underground water supply which is absorbed from the flow of Queensland watercourses southward. There is a large watershed in the south-west of the Colony of Queensland pouring its water over generally impervious rocks and clays, which sinks and disappears underground in the north-west portion of this Colony—a tract of country where, I think, the ancient drainage or water outlet existed.

There is evidence of this north-west trend in following the courses of the old river beds taking their rise from the main ranges, now basalt-covered, and which, in the course of mining works carried out under my supervision, I have proved to contain immense supplies of pent-up water at levels under the present watercourses.

There is one such ancient river bed starting near Uralla, which I have partly traced, bearing north-west as far as Bingera, a distance of about 150 miles, there disappearing under the existing plains. Several such old river beds exist, taking rise from different points along the main range, the course of which, I think, might be traced by survey to great advantage as a guide to future search for water underground in the western plains.

As an evidence of what success might be met with by looking for water in such basalt-covered old river beds, I refer you to *Appendix O*, where it will be seen what immense quantities of water are pumped from a few mines at Ballarat, situated on or near the dividing watershed of that Colony. Some single mines there pumped water enough to nearly supply a city having requirements equal to Sydney.

Two mines on the Thames gold-field, New Zealand, jointly have pumped about 2,400,000 gallons daily for the last ten years without any signs of diminishing; formation trachite, intersected with quartz veins, depth below sea-level about 600 feet; in one of the mines the water contains a large proportion of sulphate of lime, but it is not in the sense brackish.

If the ancient river outlet of this Colony passed (as I think there is strong evidence of its so doing) north-west instead of as now the south and west, it would be an important point to prove it.

Such an opinion would mean that the Murray and Darling Rivers are but the recent water outlets, and that they only carry the surplus water that reaches their beds after absorption by old watercourses much deeper is satisfied.

The question of outlet of such ancient watercourses may not be difficult of solution, if careful surveys and analyses of the water were made at certain points on the west sea-coast of Australia.

A register of bores put down by the adjacent Colonies might be kept to obtain very useful data; sea-level taken as the one point, primitive rocks met with in the several borings the other. This would practically cost nothing, but would place reliable knowledge in reach for scientific investigations.

It will be found, I think, from the information already in hand, that the primitive rocks are hundreds of feet lower under sea-level in the north-western portion of this Colony than in Victoria, and still lower again in the north-west of South Australia than in New South Wales.

A geological map showing the outlines, heights, and indentations of the primitive rocks met with in all borings put down by the several Colonies would prove, I think, both an interesting and useful work. It would reveal the various gorges and mountain peaks now hidden from our view by the superincumbent alluvial formations, and assist humanity in determining where supplies of water could almost of a certainty be met with.

Concentrated action of the different Colonies would, I think, be of benefit individually and to the whole, that is to say, if the respective chief officers interested in carrying out the field works would meet, say annually, discuss their several experiences, and issue a joint report on stated points strictly within practical work. Such a report could then be dealt with separately by each geological office in the respective Colonies. I think the results would be productive of mutual gain.

There is, in my opinion, a want of useful information respecting borings for water, there being no intercolonial collection of data so far.

There is a general need of educating the public on the question of underground water supply; from a many-sided and erroneous view, to one practical and plain. I find that the unpractical opinions are the ones most readily believed and resorted to by the public.

I find, and know from experience, that water will penetrate through all classes of rocks, and can so be found in rocks high up or low down in quantity more or less according to the density and fracture.

The great question of fracture is only solved after piercing the earth's crust.

Rocks will alter the quality of water in many cases to saline or mineral, but water will percolate through all more or less.

There are forces to my knowledge, unknown and unnamed in science, that act a very large part in the distribution of water through the earth's crust on to the surface.

Gravitation or capillary force is well understood; but anyone observing the curious currents—hither and thitherwards directed, differing in quality, trend, and temperature, in wielding the miner's pick hundreds of feet under surface—sees a force or forces, but having no recognised name. It is those nameless forces, the arteries of the earth, flowing from a central heart force, that science should and no doubt could find a useful field to work upon. The subject is little understood, little known, and the public would benefit largely by such class of knowledge being handled scientifically and made widely known.

It may not be generally known or readily credited that during the past five years, five different artesian supplies of water have been tapped by diamond drills along the sea-coast in the carboniferous formation, between Jervis Bay and Newcastle.

A bore put down by the Department last year at Burwood, 5-inch diameter, 218 feet deep, tapped water that rises to within 6 feet of surface, and which supplies the requirements of a large tannery works; being close to the works, a suction pipe is laid direct from the engine power into and down this 5-inch bore, and pumping at the rate of 10,000 gallons per diem, they fail to lower the water below 20 feet. It supplies their whole wants, and fills the dams when required. (See Appendix N. Nos. 6 and 7.)

Within a radius of 8 miles of the Sydney Post Office the owner of a boring plant has alone bored 2,023 feet, 8 bores, 5 inch diameter, depths varying from 160 to 314 feet, water reported to be discovered in each bore.

It is, however, in the interior that the question is of first importance. I hold more firm opinions than ever that large underground supplies of fresh water exist inland, and that the main bodies of such are yet to be found.

I have, &c.,

W. B. HENDERSON,

Superintendent of Drills.

 " " 31 ft. 3 in. " "
 " " 32 ft. 6 in. " "
 " " 45 ft. 6 in. " "
 " " 53 ft. 6 in. " "
 " " 55 ft. 6 in. " "
 " " 198 ft. 3 in. " "

Rate, 10,000 gals. per day.

APPENDIX II—continued.

SECTION OF BORE No. D (IN COURSE OF PROGRESS).
No. 1 Water Auger, at 57 miles west of Bourke.

Thickness of Strata.	Nature of Strata	Borehole.	Height water rose above point of tapping.	Quality.	Depth water tapped.	
ft. in.		Surface.			ft. in.	
19 0	Sand, with gypsum and clay.....					
20 0	Grey clay, with gypsum					
12 0	Grey clay, with sand layers					
60 0	Tough blue clay					
44 0	Blue and yellow clay					
7 0	White copri or gypsum					
76 0	Blue and yellow clay					
66 0	Blue and yellow shale					
46 0	Blue shale, sandstone, and clay					
11 6	Blue sandstone and shale					
19 0	Blue sandstone					
25 6	Blue sandstone, with hard bars and clay seams					
20 9	Blue sandstone and shale, with fragments of fossil plants					
14 3	Hard sediment and black clay					
12 6	Black clay and rock					
6 6	Hard rock					
14 0	Hard sediment and clay.....					
474 0	To 31st December, 1884.					

REMARKS.

Salt water tapped from 23 feet to 110 feet; stands at 23 feet from surface.
 Brackish water tapped at 349 feet; rose to 3 feet over surface. Rate, 720 gallons per day; increased to 2,500 gallons.
 Fresh water " 427 " 3 feet 3 inches over surface. Rate, 4,320 gallons per day.
 During course of testing the supply of water met with, the salt and fresh water were made to flow over the surface each distinctly, the fresh issuing from the 4-inch tubes, and the salt from the 5-inch.
 At 452 feet passed through large quantities of decomposed shells (one shell petrified).

APPENDIX H—continued.

SECTION SHOWING STRATA AND WATER STRUCK IN BORES BEYOND BOURKE

(Sig 5-2e)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,
SYDNEY, NEW SOUTH WALES.

APPENDIX N, No. 1.

Telegram from Mr. H. W. Ford to The Superintendent of Drills.

Bourke, 20 May, 1885.

Just received your telegram re bores B 3 and D. I gauged water when coming from 75 mile, found bore D giving supply of 3,240 gallons stock water per day. Bore B 3 6,480 gallons fresh water 10 feet over surface. Shall gauge water in presence of witness as soon as possible.

H. W. FORD,
Foreman of Water Augers.

APPENDIX N, No. 2.

Letter from Mr. H. W. Ford to The Superintendent of Drills.

I HAVE this day gauged water flowing from bores B 3 and D at 51 and 57 miles from Bourke on Wanaaring Road, and find that there is a discharge of 270 gallons per hour from B 3 and 106 gallons per hour from D over the surface in each case.

H. W. FORD,
Foreman of Water Augers.

I witnessed gauging of above, by Mr. Ford, which is correct.

ROBT. MORELAND,
Overseer, Goonery.

APPENDIX N, No. 3.

Mr. Charles Capel to The Superintendent of Drills.

Sir, I hereby certify to the supply of water obtained by the use of No. 9 water auger at depth of 218 feet 7 inches, and tested by O. Petterson, Foreman-in-charge of auger on my run (Gorian Station) viz., 306 gallons per hour, as being correct.

Gorian Station, Narrabri, Sept., 1884.
I have, &c.,
CHARLES CAPEL.

APPENDIX N, No. 4.

Mr. O. Petterson to the Superintendent of Drills.

Sir, I have the pleasure to give you the information respecting the water at No. 1 Bore. On September 3rd, 1884, the water stood at 78 feet from surface, tested same at the rate of 306 gallons per hour; lowered water 17 feet 6 inches in 15 minutes, it rose again to the level (78 feet) in nine minutes. The pump that is now in is down 98 feet from surface, the bottom of suction pipe being 20 feet below level of water, leaving 2 feet 6 inches below the pressure of water. Have tested the supply to 500 gallons per hour with the deep well pump, that being all the pump is capable of drawing, but Messrs. Capel and Bros. are of the opinion that the bore would give at least 1,000 gallons per hour if a larger pump were put in and the suction pipe carried lower. At the present depth of pump it has drawn at the rate of 500 gallons per hour continually for four hours, showing that if the suction pipe were lower it would give a much larger supply, providing the pump were capable of drawing it.

OLAF PETERSON,
Foreman-in-charge.

I believe the above to be correct.

CHARLES CAPEL.

APPENDIX N, No. 5.

I HEREBY certify that the quantity of water reported to have been pumped from the bore put down here, viz., rate of 960 gallons per hour, is correct.

Maitland Prison, June, 1885.
HENRY HARRIS,
Pro Goaler.

APPENDIX N, No. 6.

Messrs. Farleigh, Nettheim, and Co. to The Superintendent of Drills.

Dear Sir, We just received the following report from Concord:—"20th June.—Close upon 8,000 gallons were pumped from the bore yesterday (19th). To-day (20th) we gave the bore a severe test; at 7:45 a.m. the water was 8 feet 6 inches from the surface; started to pump and filled the three tanks (1,200 gallons) in 25 minutes; stopped the pump then; the water was 14 feet 6 inches from the surface then; at 12:30 p.m. the water was 10 feet 9 inches from the surface; started the pump and filled the tanks in 27 minutes; we stopped again and the water was (at 12:57 p.m.) 16 feet 3 inches from surface; at 2 p.m. the water was 13 feet from surface; started the pump and continued till 4:30; at 2:25 the water was 19 feet 8 inches from surface; at 3:35, 22 feet 3 inches; and at 4:30, 23 feet 10 inches from surface. I think as near as possible we took 10,000 gallons from the bore on 20th June; I also think there must be a lot of water from the surface* (surface drainage) that gets into the bore. I have my doubts that there will be such a supply in the dry weather; of course I only fancy that. Yours, &c.,

W. ROWLES."

* No drainage from surface into bore can exist, as the bore is lined with iron-tubing fixed into the rock under level of the surface soil. Dry weather since above was written proves no diminution in the supply.—W.B.H., 4/4/85.

APPENDIX N, No. 7.

Messrs. Farleigh, Nettleim, and Co., to The Superintendent of Drills.

Dear Sir,

16, York-street, Sydney, 7 July, 1885.

Replying to your inquiry as to the quantity and quality of the water discovered in the bore, put down by the boring-machine under your supervision, on our tannery property at Concord, Burwood, we take much pleasure in giving you the following particulars :

We are for the greater part of the year wholly dependent upon the bore for our supply of water, and but for it we should have been at a standstill for nearly the whole six months, since December last. We have tested the bore to the extent of 12,000 gallons per day of 10 hours, and could not reduce it below 20 feet from the surface; this quantity is the most we require any day with our present turnout, and we are so confident of its yielding considerably more that we would not hesitate to double our works while depending on the same supply.

The bore is 5 inches in diameter, and the water rises to within 6 feet of the surface and no higher. Pumping from it is carried on by steam-power belonging to the tannery. The quality of the water is well fitted for tanning, though rather hard for other purposes. The find has been of incalculable service to us, as on it we entirely depend.

In conclusion we beg to testify to the thorough practical manner you carried out the work, so successfully, yet at comparatively trivial cost.

We remain, &c.,

FAIRLEIGH, NETTHEIM, & Co.

APPENDIX O.

Consensus of Reports on Water Supply received from various Mining and other Companies at Ballarat, at dates as under, viz. :—

From J. H. Thompson, Esq., Consulting Engineer to the Ballarat Company, Victoria.

26 September, 1884.

Average quantity of water pumped (the body of water being at its maximum) was from 2,500 to 3,000 gallons per minute, or from 3,600,000 to 4,320,000 gallons per diem. This enormous supply was pumped steadily for over two and a half years without showing any signs of abatement; mine was at work for twelve years; main body of water did not decrease to any perceptible extent during the two and a half years it was contended with, but it was stopped back by a scheme he devised and put in operation. (*Vide* Report Chief Inspector of Mines published in 1877, by the Department of Mines, Victoria, for the year 1876, pp. 9, 10.) Area of mine was 1,243 acres; shaft sunk to 570 feet; main body of water occurred at 360 feet in the honeycombed basaltic formation noted in that Colony for carrying large volumes of water; quantity of water at time of leaving off work was about 800 gallons per minute, increasing and decreasing as the mine was opened up; average between 700 and 800 gallons per minute. Mining operations were being carried on at some 1,000 feet from shaft when work was stopped.

He acted as Consulting Engineer to a Company at Ararat which had great difficulty in contending with water. Maximum pumped, 4,000 gallons per minute, or 5,760,000 gallons per diem; since fallen off to 1,000 gallons per minute, and still likely to decrease.

Pumping in this instance was from shallow depth of 180 feet. Geological formation of the country greatly affects the supply of water, as instanced that of the Duke Company, Timor, near Maryborough. Pumping operations have been carried on for the last ten years; average quantity pumped during this time being about 3,000 gallons per minute; country subject to percolation, no doubt accounting for the steady supply experienced.

From Robert Sharp, Esq., Ararat.

25 September, 1884.

Maximum number of gallons pumped per day, 5,010,400; pumping has been continued for twelve months; present quantity per day, 1,060,400; mine has been at work three years; no perceptible increase takes place as more ground is opened up.

Area of mine, 200 acres. In this locality the yearly rainfall increases our water. In the City of Ballarat Company, where he was formerly employed, the water in the basalt was tapped at 150 feet; after eight years pumping the shaft was eventually sunk to 450 feet, when bottom of basalt was reached; water was then puddled back, and very little decrease took place until work was resumed in deep ground, with basalt overhead, where as the ground was opened the water gradually increased every foot that was driven.

From Isaac Wheelden, Esq., Drummond-street, Ballarat, Victoria.

29 September, 1884.

Average number of gallons pumped daily was 2,880,000. Mine was at work eight years, water being pumped about six years. Area of mine, $2\frac{1}{2} \times 3$ miles square. An account of work done may be found in p. 479 of "Gold-fields and Mineral Districts of Victoria," by R. B. Smyth.

From R. M. Sergeant, Esq., Manager, Band of Hope and Albion Consols (no liability), Ballarat.

10 October, 1884.

Area about $1\frac{1}{4}$ mile long by $\frac{1}{2}$ -mile wide; 20,000 gallons of water per diem were raised, during which the three shafts were connected with galleries below and crossed the gutter in every direction, the water flowing freely for twenty years, but drained at the rate of about 2 per cent. per annum. Have sunk 914 feet for purposes of quartz-mining, and found the water comparatively light and not good for sanitary purposes.

From J. M. Mackay, Esq., Manager of the Duke Company, Ballarat, Victoria.

13 October, 1884.

For twelve months 5,000,000 gallons per diem were raised from a depth of 350 feet.

During the years 1881, 1882, 1883, and 1884, the volume of water gradually eased, until at the date of writing 2,650,000 gallons of water per diem were raised. Area of mine, 293 acres 2 roods $3\frac{1}{2}$ perches; area worked, 140 acres; area actually taken out, 45 acres; area unworked, 153 acres.

WM. B. HENDERSON.

APPENDIX P.

Boring Machinery—Report of Hydraulic Engineer with reference to.

To the Honorable the Colonial Treasurer,—

Sir,

Water Supply Department, Engineer's Office, Brisbane, 24 October, 1884.

Adverting to my letter of 19th August last, recommending the purchase of boring plant at an estimated cost of £1,600, and my recent visit to Sydney, undertaken with your sanction, for the purpose of obtaining fuller information respecting the various machines in use in New South Wales, I have the honor to report that I passed three days in Sydney, the greater portion of the time in consultation with Mr. W. B. Henderson, Government Superintendent of Diamond Drills, who, by permission of the Honorable the Minister for Mines, gave me such information as I wished.

From Mr. Henderson I learned the following :—

That the Government have three descriptions of machine in use, viz.—the diamond drill, the Tiffin machine, and the Wright and Edwards' Australian Water Auger, of older construction.

The diamond drills are in use under the control of the Department's officers, chiefly in the coast country, where the rocks are hard and dense, in search of coal and other minerals, mostly for private Companies, who pay the Government all expenses incurred, and I saw one of the diamond drills at work at a depth of 640 feet in sandstone strata, prospecting for water at the Maitland Gaol.

This class of machine cannot be surpassed for efficiency, speed, and economy for boring in hard rocks, if sufficient water for its use is readily obtainable; and it is undoubtedly also of great scientific value, as a core showing the geological structure and the dip and strike of the strata pierced can be obtained by its aid, but it is quite unsuitable for boring in alluvial or other soft ground. As I have seen it used in the western plains, a shaft has first to be sunk through the soft strata to the rock.

Exclusive of the diamond drills, the Government have nine other boring plants at work, chiefly in the western country, in search of water, the greater number of these being the Tiffin. Satisfactory results, however, have not been obtained with this class of borer. It is considered inefficient and unsuitable, especially for quick and economical work—particularly at greater depths than 200 feet, and it is seriously contemplated to reduce their number as speedily as possible.

Mr. Henderson gave me full particulars of an improved Australian water auger, two of which are now in course of manufacture, or have just been constructed, by Messrs. Wright and Edwards of Melbourne, for the New South Wales Government, for use in prospecting for water in the back blocks of that colony. Mr. Henderson spoke very highly of this class of machine, and strongly advised the purchase of at least two for Queensland.

I entered fully into the subject discussed with him; the merits of the various machines known to us were fully considered, particularly those ascribed to the new water auger now referred to, and I am favourably impressed with the latter as a very suitable one for this Colony, although it will not lift a core of scientific value; but after all, this is of minor consideration when the object is to obtain water. I pointed out to Mr. Henderson the benefits that would accrue to the Colonies by the construction of a boring plant that would combine the speedy action and other good qualities possessed by the diamond drill with those of the Tiffin, Wright and Edwards, and other machines now in use. With the view of diminishing weight for inland carriage I suggested the use of mild steel for the derrick, tubes, tools, &c., and, for facilitating quick transport from bore site to bore site; that the machine should be fitted on to a frame extended from that of a traction engine, which would move itself, draw a load consisting of the tubes, &c., and supply the motive power for driving the borer when at work. These suggestions he considered quite practicable, and I feel confident of their being carried into practice at an early date.

I regret that time would not permit my visiting Melbourne to see Wright and Edwards' improved machines at work. It would have been much more satisfactory could I have done so, and it would enable me to make my recommendation with greater confidence; however, I learned enough to cause me to wholly withdraw my recommendation already referred to, in favour of now asking your authority to purchase in the meantime—

One Wright and Edwards' improved Australian Water Auger, with patent sand pump, complete...	£465
Tubes, from 6 to 3 inches in diameter, and rods to the value of	635
Total	£1,100

Considering the large measure of success and the beneficial results to the public that have already attended boring operations conducted hitherto on a small scale by this Department, I am firmly of opinion that this alone, apart from the large and growing importance of the subject, will justify Government in directing a greater share of attention to, and expending a larger amount than hitherto in prosecuting with vigour this means of obtaining a supply of water, especially in the western districts of the Colony; and if I do not now recommend the purchase of three or four at least of Wright and Edwards' machines, it is not from any want of confidence in them, but because not having examined them nor seen them at work I deem it more prudent to make a few trials with one first, after which others may be obtained, combining such improvements as may suggest themselves from time to time in working, and as men become experienced in their use. Mr. Henderson, as well as myself, finds great difficulty in procuring overseers and men of this stamp.

I enclose photographs and correspondence which has passed between Mr. Henderson and this Department, also correspondence and quotations from Wright and Edwards, of Melbourne, with reference to the class of machine the purchase of which I now recommend.

I have, &c.,

J. B. HENDERSON, Hydraulic Engineer.

P.S.—Since writing the above, I have had an opportunity of perusing a pamphlet by C. W. Darley, on drilling and boring Artesian Wells as practised in the United States, and I did not find anything therein that would lead me to modify or amend in any way my recommendation in favour of the Australian Water Auger.

J.B.H., 25/10/84.

[Enclosure

[Enclosure No. 1.]

Sir,

Water Supply Department, Brisbane, 25 August, 1884.

I have the honor to enclose an extract from a memorandum I lately addressed to the Honorable the Colonial Treasurer here, requesting his authority to purchase four Tiffin boring machines for prospecting in search of deep underground water on the western plains.

I will be glad if you can send me some particulars of those in use for similar purposes under your superintendence, and also furnish me with sketches or full information and suggestions upon the machines which, in your opinion, are best for the purpose. In doing so, please state price in Sydney, and the depth to which they are capable of boring.

I should like to lay your reply before the Minister as soon as convenient for you to let me have it.

I have, &c.,

J. B. HENDERSON,

Hydraulic Engineer.

W. B. Henderson, Esq.,
Superintendent of Diamond Drills, Sydney.

[Enclosure No. 2.]

Sir,

Department of Mines, Diamond Drill Branch, Sydney, 29 September, 1884.

Referring to your communication of the 25th ultimo, requesting that you might be supplied with information respecting the water-boring machines in use by this Department, I have the honor to state that there are nine boring machines (other than diamond drills) in use under my supervision in search of water throughout the Colony. I have the honor to attach returns of the work done by each class of these machines up to March 31, 1884.

I may here observe that the rule adopted is to place a machine of each class under one person; a reliable and fair test of the respective machines is therefore obtained. As the machine known as the Australian Water Auger follows the Tiffin machine in the one bore, it must be noted that the deepest and consequently the most costly portion of the work is done by the former. Taking this fact into consideration, the results obtained are decidedly in favour of the Australian Water Auger, whose work has been carried out chiefly in the back country distant from settlement.

In the settled districts the Tiffin water auger would show results somewhat more favourable in boring to shallow depths—say, not exceeding 200 feet. Where the object sought is prospecting for water or minerals in alluvial deposits, the Tiffin machine is, in certain cases, preferable to the Australian Water Auger as it was first constructed; but for inland country, distant from settlement and workshops, I condemn the Tiffin auger as totally unsuited, its connections being so numerous, complicated, and of so flimsy a character as to require constant repairs; in a change of strata its rotary motion also allows a deflection of the bore to occur, in many instances resulting in the total loss of the work done.

I have the honor to refer you to the opinions expressed in a report furnished by me in 1883 to the Honorable the Secretary for Mines (extracts of which I herewith annex) as to the requirements of boring machines suitable both for the inland as well as the coast districts of Australia. I hold the identical opinions at the present time that I held then—one of which is, that machines can be made in these Colonies more fitted for boring in the inland plains of Australia than any machine yet imported.

The machine nearest the ideal requirements for boring in the inland portion of Australia is the Australian Water Auger, lately improved by Messrs. Wright and Edwards, capable of putting down bores from 3 inches to 6 inches in diameter to a depth of 1,000 feet. A photograph, together with particulars as to cost of this machine, is herewith annexed.

This machine, though constructed by Messrs. Wright and Edwards with all their latest ideas, still leaves room for improvement; but I think if your Government decide on ordering any of these machines, it would be better for you to have these improvements effected under your own supervision. You will find that the percussive motion at present applied can be substituted for rotary motion, using diamonds when required to cut through boulders, in lieu of the steel cutters at present used.

In primitive or close hard rock—provided that the water required is available—the diamond drill surpasses all other boring appliances, and in this class of boring I would recommend the Chicago Diamond Drill, manufactured by the M. C. Bullock Company of that city—the power of machine and size of drill-bit to be in accordance with the locality and purpose to which the machine is to be applied.

In conclusion, I would direct your attention to one point of a practical nature which should be taken into consideration before work by any class of machinery for boring is undertaken, viz., the weight of the machinery and the cost of carriage. Where the cost of carriage of a boring machine and its connections would cover, or nearly do so, the sinking of a shaft, then such machinery should not be used; as a shaft of ordinary size gives the means of getting at water by bailing, steam-pumps, or otherwise, which bore-holes put down by machinery do not give, excepting in the case of an artesian supply, when the force of nature removes the necessity of using any of these appliances.

Any further information you may deem necessary, and which is in my power to afford, I shall be glad to supply.

I have, &c.,

WM. B. HENDERSON,

Superintendent of Drills.

J. B. Henderson, Esq., Hydraulic Engineer, Water Supply Department, Brisbane.

WM. B. HENDERSON,
Superintendent of Drills.

[Sub-Enclosure 2 in No. 2.]

EXTRACTS from a Report furnished by the Superintendent of Drills, June 30, 1883, to the Honorable the Secretary for Mines, Sydney, as to the requirements of Water-boring Machines.

I CONSIDER certain principles of rotary motion contained in the Australian Water Auger, made in Melbourne, covered by patent, to be worthy of special notice, and am perfectly convinced that by following up such principles a borer can be produced within the Colonies more effective by far and at less cost than any machine imported, either American or European.

I refer to a class of machines or borers adapted to our inland plains. As to hard rock formations, or in search of minerals, the diamond drill far surpasses any known appliance. The machine that is to become universal over the greater area of Australia will have to adopt certain mechanical features of the diamond drill; certain of the Australian and Tiffin water augers, rotary in all cases in methods of boring; a combination of the good points of the three systems, adapted to be driven either by steam, horse, or manual power, as the case of circumstances may exist in the locality where intended to set to work.

Such machines can be made to penetrate to depths of 1,000 feet if required, portable, and adapted to be conveyed over the back country where heavy plants would only get helplessly bogged, and so be useless to search for water over our arid plains.

There would be no difficulty to put bores down from 6 inches to 18 inches diameter. The matter of combating with brackish water is a matter of the merest simplicity with a supply of artesian tubing.

I may mention that the use of gems other than diamonds will be found to cut the softer class of rocks as exist inland.

I have also proved that special prepared steel used instead of diamonds as cutters do astonishing work.

Department of Mines,
Diamond Drill Branch, Sydney.

WM. B. HENDERSON,
Superintendent of Drills.

APPENDIX Q 1.

STATEMENT showing the cost price, working cost, time occupied, depth bored, and cost per foot of the Boring Machines employed by the Government of South Australia in search of Water; taken from a Return printed October 18th, 1883.

NEW SOUTH WALES.

DEPARTMENT OF MINES.

(STOCK AND BRANDS BRANCH.)

(REPORT OF THE CHIEF INSPECTOR OF STOCK, FOR THE YEAR ENDING 31st DECEMBER, 1884.)

Printed in accordance with Resolutions of both Houses of Parliament.

TO THE HONORABLE JOSEPH PALMER ABBOTT, ESQ., M.P., MINISTER FOR
MINES, &c., &c., &c.

Sir,

In submitting the Report for the year 1884 upon the Stock and Brands Branch of this Department, I have the honor to invite attention to the remarks of the Chief Inspector of Stock upon the following points:—

1. Upon the breeding of saddle and light-harness horses.
2. The inoculation of cattle for pleuro-pneumonia and other diseases.
3. The carriage of sheep by railway over level country in times of drought at reduced rates; and
4. *Post-mortem* examinations of sheep that are found dead.

Though the losses of stock from drought have been very serious, they are scarcely so great as were anticipated.

The decrease in the clip of wool has been greater considerably than is accounted for by the number of sheep lost, showing that the drought affected the growth of wool to the extent of at least 3,384,062 lbs.

The fact that in seventeen districts the Commons are reported to be used for purposes other than grazing commoners' stock, indicates the necessity for amendment of the Act 36 Vic. No. 23.

The Chief Inspector and his staff in the head office have been most assiduous in the performance of their duties during the year; and the field staff appear to have performed a very large amount of work with satisfactory results.

The public tanks and wells are now assuming considerable importance, both on account of their value to travelling stock and travellers, and the large amount of capital invested in them. Their utility will doubtless be enhanced by the legislation of last year, but the work of administration will be increased, not only by the provisions of the Act, but also by the increasing importance of the works.

I have, &c.,

HARRIE WOOD,
Under-Secretary for Mines.

Department of Mines,
Sydney, 15th June, 1885.

The Chief Inspector of Stock to The Under Secretary for Mines.

Sir,

Department of Mines, Stock Branch, Sydney, 1 June, 1885.

I have the honor to submit for your consideration my Report on the working of this Branch, for the year ending 31st December last, which is as usual based very much upon Inspectors' estimates, the owners still showing very little inclination to furnish data.

I.—INSPECTORS AND THEIR WORK.

1. *The Inspectors.*

There are now forty-two Inspectors, having charge of fifty-five Sheep Districts.

2. *The Inspections made.*

The inspections made during the year were as follows:—

Of Stock	11,881
Of Reserves	2,854
Of Pounds	355
Of Pastures	3,664
Total	18,754

This would give an average of 457 inspections made by forty-one Inspectors.

3. *Horses, Cattle, and Sheep inspected.*

Horses.—The number of horses inspected during the year was 59,725, by forty-one Inspectors.

Cattle.—The number of cattle inspected during the year was 622,910.

Sheep.—The number of sheep inspected during the year was 23,623,809. This is an excess of 4,376,052 on last year's inspection.

4. *Distance travelled by Inspectors during the year on duty.*

The total number of miles travelled by forty-one Inspectors was 168,482, being an average of 4,109 each per annum.

5. *Prosecutions and Convictions.*

The prosecutions instituted during the past year were as follows:—

Under Sheep Act	122
„ Lands Act, trespass on reserves	1
„ Brands Act	2
„ Pastures Act	173
Total	298

The number of convictions were—

Under Sheep Act	109
„ Lands Act	1
„ Brands Act	2
„ Pastures Act	160
Total	272

II.—HORSES.

1. *The number.*

By returns the number of horses in the Colony during the twenty-four years previous to and including 1884 was as follows:—

Year.	No.	Year.	No.
1861	251,497	1873	328,408
1862	233,220	1874	334,462
1863	273,389	1875	357,696
1864	262,554	1876	366,703
1865	284,567	1877	328,150
1866	282,587	1878	336,468
1867	278,437	1879	360,038
1868	280,201	1880	395,984
1869	280,818	1881	398,577
1870	280,304	1882	328,026
1871	337,597	1883	326,964
1872	304,100	1884	337,172

This shows an increase during the year of 10,208. This increase arises from the metropolitan returns being more complete than previously.

2. *The different breeds.*

Draught.—The number returned under this head is—ordinary, 74,158; thoroughbred, 10,194; total, 84,352.

Light-harness.—The number returned as ordinary is 84,302; thoroughbred, 8,066; total, 92,368.

Saddle.—The number of ordinary is given as 143,872; thoroughbred, 16,580; total, 160,452.

3. *Horses introduced.*

From other districts.—The number of stud horses introduced was 149, and stud mares 377; ordinary mares, 1,080; and horses, 1,317.

From other Colonies.—The number introduced by sea was—Stud horses, 77; stud mares, 156; and ordinary horses and mares, 4,146.

The number introduced overland was 69 stud mares and 78 stud horses; and ordinary, 107 mares and 122 horses.

From England and other Countries.—The numbers introduced under this head was 40 stud mares and 75 stud horses; and ordinary, 35 mares and 44 horses.

4. *Horses fit for sale.*

The number returned as being fit for market during the present year is 10,512 draught, 12,258 light-harness, and 20,514 saddle.

Of this number it is estimated that 8,604 are suited for the India and China markets.

There were sent from four districts 1,085 horses to be shipped from Sydney, and from four districts 532 horses for Melbourne for Foreign Countries.

5. *Improvement.*

In thirty-two districts the horses are said to be improving. The principal reasons given are—introduction of superior stud horses, breeding from choice mares, and more attention to the rules of breeding, and better prices obtainable. In five districts the breed of horses is, so far as regards improvement, reported as stationary. In four districts deteriorating—the reasons given are—too much light blood introduced, and breeding from weedy mares for racing purposes.

6. *Diseases.*

In twenty-seven districts the horses are reported to be free from any disease; and in fourteen districts there were slight cases of strangles, sore eyes, &c.

7. *Losses.*

The losses from drought, starvation, wire in chaff, and other accidents as reported, amount to 8,545. This must be considerably under the actual loss.

8. *Wild horses.*

The number of wild horses in the Colony is estimated at 10,094, which shows a decrease on the previous year of 5,345.

9. *The breeding of saddle and light harness horses.*

I would once more call attention to the deterioration which is going on in our saddle horses. Twenty-five or thirty years ago, the saddle-horses of this Colony, taken as a whole, were the best in the world; and now it is universally allowed that comparatively few really first-class saddle and light harness horses are to be met. This is the opinion of Colonel Ben-Williams, who lately visited this Colony from India; and his opinion is corroborated by the trouble it took to find horses of the proper stamp for the Sudan.

Even fairly useful saddle-horses for ordinary work are not readily procurable in any considerable number, while horses suitable for the cavalry or police are scarce; and a purchaser looking for a stout up-standing well-bred town-hack, or hunter, is often months before he can meet with one. These remarks, so far as size, style, breeding, and scarcity are concerned, apply in a considerable degree also to light-harness and carriage-horses; and so much is this the case, that horses of both these stamps (as well as heavy draught) are being sent over to this Colony from New Zealand in considerable numbers.

I mention these facts with the view to give weight to the suggestion I again make that some of our breeders possessing the means and ability should devote their attention to founding a confirmed breed of true Australian saddle-horses, with the size, shape, style, and fire which a good hack or cavalry horse ought to possess; and that others, again, might establish a confirmed breed of stylish, powerful light-harness and carriage-horses.

To suit the different kinds of country and different climates, as well as for different purposes, we have the different breeds of Short-horn, Hereford, Devon, Black-polled, Ayrshire, and Alderney cattle—all distinct and pure of their kinds and for like reasons we ought to have distinct pure-bred saddle, and distinct pure-bred light-harness horses of confirmed breeds.

The present practice of breeding—it cannot be called a system—under which the race-horse is put to half or three quarter bred, or more properly speaking mongrel mares, cannot lead to anything but deterioration and disappointment, for it is breeding directly contrary to all the rules and principles of breeding. It is in fact a continual cross, the outcome, as we see, being weeds and mongrels; and if our Short-horn, Hereford, or Devon cattle had been bred in the same way, their owners would have been ruined, and if our Merino sheep had been so bred, the Colony would have been beggared.

By putting, as we now do, the race-horse to cross-bred mares, we get, if the mare is light and small, comparatively useless weeds, and if the mare is large with most likely a good dash of cart-horse blood, the progeny may be of fair size, but most probably plain and coarse, with an ill-fitted combination of the shapes and parts of sire and dam.

The fact is, breeding as we have done, we have bred ourselves out of the right stamp of mares, and the race-horse of the present day is quite a different animal to what the thorough-bred of thirty years back was. He was the beau ideal of a hack; he had size, strength, style, and fire, and could carry a man (not a feather-weight of 6 or 7 stone, but a full-grown able-bodied man) safely and well a hundred miles a day at a pinch, while the race-horse of to-day is as a rule light and weedy, and of little or no use to any-one but the gambler and bookmaker.

At one time it could be said, but it certainly can be so no longer, that "racing improved the breed of horses." That idea is now an utter fallacy. What with early training and running, and a universal system of handicapping, the stout weight-carrying race-horse of the early days of the Colony has for ordinary use completely disappeared.

There

There are of course a few powerful thoroughbreds, but their value for racing purposes puts them altogether beyond the reach of those who breed hacks.

Until therefore some of our breeders take up the business in a systematic and practical manner, by purchasing a thoroughbred sire, whose stock runs large and stout, with plenty of bone below the knee,—selecting mares of the right stamp, carefully mating the progeny, exchanging all the mares where stock do not turn out sound, strong, shapely and stylish, for others; and when stock of the right stamp are bred, continuing to breed strictly within his own lines, even though comparatively close at first, until the breed is thoroughly established and confirmed, and jealously preserving it when once it is so.

That horses of such a stamp as here contemplated will eventually pay, even better than thoroughbreds, large though the prices obtained for them sometimes are, there is no doubt: for not only is the demand for our own ordinary use,—to say nothing for cavalry and police—large, and good prices are now paid for horses of the right stamp, but India and China will always be buyers for far more horses of this description than we or the other Colonies can breed; and there is no part of the world better adapted for breeding horses of this stamp than Australia, and no part of Australia better than New South Wales.

Mr. Andrew Town, of Richmond, one of the best judges and most successful breeders of horses in Australia, has commenced to breed light-harness horses and if he bestows the same attention on this class of horse which he has on draught and race-horses, the result will no doubt be the establishment of a good breed of light-harness and carriage-horses, which will be of incalculable benefit to the Colony.

III.—CATTLE.

1. Number.

The returns of cattle in the Colony during the twenty-four years ending 31st December, 1884, stand as follows:—

Year.	No.	Year.	No.
1861	2,271,923	1873	3,794,327
1862	2,620,383	1874	2,856,699
1863	2,032,522	1875	3,134,086
1864	1,924,119	1876	3,131,013
1865	1,961,905	1877	2,746,385
1866	1,771,809	1878	2,771,583
1867	1,728,427	1879	2,914,210
1868	1,761,411	1880	2,580,040
1869	1,795,904	1881	2,597,348
1870	2,195,096	1882	1,859,985
1871	2,014,888	1883	1,640,753
1872	2,287,660	1884	1,425,130

This shows a decrease during the year of 215,623.

2. Different Breeds.

Shorthorns.—The number of pure-bred and stud Shorthorns is estimated at 30,693; and ordinary, 543,334; total, 574,027.

Herefords.—Pure and stud, 14,211; ordinary, 118,032; total, 132,243.

Devon.—Pure and stud, 4,826; ordinary, 29,521; total, 34,347.

Black-pollad.—Pure and stud, 85; ordinary, 640; total, 725.

Ayrshire.—Pure and stud, 532; ordinary, 1,210; total, 1,742.

Crosses.—Pure and stud, 3,246; ordinary, 678,565; total, 681,811. The crosses are estimated as follows:—Shorthorn and Hereford, 338,366; Shorthorn and Devon, 89,064; Hereford and Devon, 28,759; Shorthorn and Black-pollad, 140; the balance, 223,642, being unrecognizable.

Alderneys.—Pure and stud, 104; ordinary, 71; total, 175.

Cross-bred Alderneys.—40; Shorthorn and Ayrshire, 1,800.

3. Stock introduced.

From other Districts.—Stud bulls, 148; stud cows, 365; total, 513; ordinary cattle, 37,541.

From other Colonies by Sea.—Stud bulls, 151; stud cows, 120; ordinary bulls, 21; ordinary cows, 122; total, 414; fat stock, 3,601.

Overland.—Stud bulls, 46; stud cows, 95; ordinary cattle, 3,407.

From England and other Countries.—Stud bulls, 32; stud cows, 20; total, 52.

4. Increase and decrease of cattle.

This shows a decrease of (say) 235,623 in the number of our cattle during the year 1884; and of 1,768,356 during the last ten years, principally through the cattle runs being converted into sheep stations, but lately also to a very considerable extent through the severe drought; nor is it at all likely that the number of cattle will ever again be made up to any great extent until there is a large increase in agricultural settlement. At any rate, the greater part of those owners who have lost their cattle during the late drought are stocking up with sheep; and sheep have both paid better and suffered proportionately less than cattle.

Our supply of fat cattle will therefore in future come largely from Queensland; and as the long journey and want of food on the road must lead to deterioration in the quality of the meat as well as to loss in weight,—it is to be expected that good fresh short-travelled cattle fattened in this Colony will bring good prices.

As this is the case, it is probable that owners, while keeping the greater part of their runs stocked with sheep, will find it pay them to devote those portions of them which are peculiarly adapted for the purpose to fattening store-cattle,—especially as cattle give the grasses a better chance of seeding and renewing themselves than sheep.

5. The "cast" of fat and store cattle.

The estimated "cast" of fat cattle to be sent to market during the coming year is 161,571, and store cattle, 129,275. From ten districts the fat cattle are principally sent to Melbourne; from four districts they are principally sent to Adelaide, and the remaining districts supply the markets of Sydney, Maitland, Mudgee, Bathurst, Orange, and Tamworth. The principal demand for store cattle comes from Victoria, and for breeding stock from Queensland and the far north, where new country is being taken up

6. How kept.

The number of cattle kept wholly in paddocks is returned as 1,083,926; on open runs, 255,516; and the balance, 85,688, are dopastured both ways.

7. Improvement and deterioration.

In nineteen districts the cattle are said to be improving; in fourteen districts they are stationary; in nine districts are deteriorating. The principal reasons given for the improvement are—introduction of good stud stock, care in selection, and in culling and keeping in paddocks. The reasons given for the deterioration are—inattention to breeding, owners getting rid of cattle, and substitution of sheep for cattle.

8. Their diseases and ailments.

In twenty districts, on eighty-four runs, the cattle were reported as affected slightly with pleuro-pneumonia; and in twenty-two districts the cattle are reported as being free from that disease.

In ten of the infected districts the disease was caused by contagion, in eight districts its cause could not be traced, and in two districts the disease was said to be latent in the herds.

On three stations it is reported inoculation checked disease, on fifty-seven stations it was adopted with satisfactory results, and on twenty-four stations inoculation was not performed.

The number of owners in favour of inoculation is given as 2,719; against, 1,440; undecided, 1,076; and 1,856, opinions not known.

The number of owners in favour of compulsory inoculation in the case of infected herds is given as 1,986; against it, 2,042; undecided, 950; and 1,820 opinions not known.

9. Losses from disease and drought.

The number of cattle reported to have died from Cumberland disease is 335; from blackleg, 32; from swelling in jaw or throat, 635; from ophthalmia, 277; from tuberculosis, 415; from red water, 800; from poisonous weeds, 15; total, 2,509. Cancer has not been so prevalent as in the previous year. Besides these, 40,000 are reported to have died from starvation during the drought.

10. Inoculation for Pleuro-pneumonia.

The efficacy of this treatment is now, it may be said, fully confirmed and accepted by every veterinary authority of standing in Europe; and not only is this the case in regard to pleuro-pneumonia, but the practice of inoculation for preventing the spread of disease is being adopted in regard to other ailments in animals.

It has been so in France with marked success for splenic apoplexy (Cumberland disease), by Pasteur, one of the leading scientists of the day; and he has also, it is said, inoculated successfully for rabies.

So far as inoculation for pleuro-pneumonia is concerned, the practical experience of a large majority of stock-owners in all the Colonies has long ago fully established its efficacy; and now that the principle of the treatment is allowed by the profession to be a sound one, there does not appear to be any reason why a measure should not be passed making inoculation compulsory in the case of all herds or even mobs of cattle infected with that disease.

If this course were taken in all the Colonies, and the actually diseased cattle destroyed, as noticed, there are good grounds for believing that pleuro-pneumonia would be completely eradicated in Australia in the course of five or six years.

IV.—SHEEP.

1. The number.

The numbers of sheep in the Colony during the twenty-four years ending 31st December, 1884, stand as follows:—

Year.	No.	Year.	No.
1861	6,119,169	1873	18,990,595
1862	6,550,896	1874	22,797,416
1863	7,169,126	1875	25,353,924
1864	9,082,463	1876	25,269,755
1865	9,650,106	1877	21,521,662
1866	11,644,593	1878	25,479,484
1867	15,066,377	1879	30,062,910
1868	16,000,090	1880	35,398,121
1869	16,848,217	1881	36,591,946
1870	16,218,325	1882	36,114,814
1871	16,766,012	1883	37,915,510
1872	17,873,696	1884	31,660,321

Return

RETURN of Sheep to Clerks of Petty Sessions.

The number of sheep in the Colony at 1st January, 1885, as returned to the several Clerks of Petty Sessions for 1884, and the increase or decrease for the year is as follows:—

District.	No. of Sheep on 1st January, 1884.	No. of Sheep on 1st January, 1885.	Increase.	Decrease.	District.	No. of Sheep on 1st January, 1884.	No. of Sheep on 1st January, 1885.	Increase.	Decrease.

3. Sheep introduced.

From other districts.—Stud, 6,327; ordinary, 1,071,807; total, 1,078,134.
 From other Colonies by sea.—Stud, 2,584; ordinary, 850; total, 3,434. (See Appendix.)
 Do do overland.—Stud, 14,613; ordinary, 134,880; total, 149,493.
 From England and other countries.—Stud, 268.

4. Long-woolled sheep.

Amongst the long-woolled sheep the Lincoln is said in a large majority of the districts to give the best returns in wool and in weight of mutton, the cross-bred sheep being second.

5. The "cast" of fat and store sheep.

The annual "cast" of fat sheep for the ensuing season is estimated at 2,541,506, and store sheep 2,643,226.

6. How Sheep are kept.

Paddocked	28,927,580
Shepherded	2,330,989
Both ways	401,752
					31,660,321

7. Condition of the flocks.

In twenty-eight districts the sheep are said to be improving; the principal reasons given being—careful breeding and paddocking, introduction of high-class rams, and more careful classing and culling.

In seven districts they are said to be stationary, and in seven districts they are deteriorating. The reasons given are—severe drought, bad season, country not suitable, breeding from inferior ewes, and bad management.

8. The lambing.

The general average for paddocked-sheep is returned by inspectors at 54½ per cent., and shepherded sheep at 51 per cent.

With the exception of fourteen districts the lambing was very low, the reasons given being—Bad season, drought, and starvation.

The paddocked sheep shows an increase over the shepherded sheep of 3½ per cent.

9. The clip.

Lambs.—The number of lambs shorn in the grease was 3,010,553; the number washed, 80,990; total lambs shorn, 3,091,543.

Sheep.—The number of sheep shorn in the grease was 24,110,459; hot water and spout-washed, 306,908; creek-washed, 801,408; and scoured, 307,950.

The average weights of the clip are estimated as follows:—

		Lambs..		Sheep.	
		lb.	oz.	lb.	oz.
Grease	...	1	13	5	0
Washed	...	1	6
Hot water and spout	3	3
Creek-washed	2	15
Scoured	2	14

Condition

Condition of clip.

In seven districts the clip is reported as good and sound ; in eight districts, poor, unsound, and wanting in yoke ; in thirteen districts, light but sound ; and in the remaining districts, fairly grown and sound.

Average per sheep.

The total clip in the Colony for the year 1884, according to the number of sheep, would be 24,110,459 sheep, shorn in the grease, average clip 5 lb. per sheep = 120,552,295 lb. ; 306,908 sheep, hot water and spout washed, average clip 3 lb. 3 oz. per sheep = 978,269 lb. ; 801,408 sheep, creek-washed, average clip 2 lb. 15 oz. per sheep = 2,354,136 lb. ; 307,950 sheep, scoured, average clip 2 lb. 14 oz = 885,357 lb. Lambs,—3,010,553 lambs, shorn in the grease, average clip 1 lb. 13 oz. per lamb = 5,456,628 lb. ; 80,990 lambs, washed, average clip per lamb 1 lb. 6 oz. = 111,361 lb. ; total clip, 130,338,066 lb.

Exportation of clip.

The clip grown in the Colony of New South Wales is shipped to England, America, France, and other countries, from the principal ports of the three border Colonies, as well as from Sydney. The portion of our clip thus shipped from the other Colonies is often mistaken as the produce of those Colonies.

The following is an estimate of the clip shipped at Sydney, and also the proportion sent across the borders and shipped by the other Colonies at Melbourne, Adelaide, and Brisbane, for the years 1883 and 1884 :—

Port of shipment.	1883.			1884.		
	Greasy.	Washed.	Total.	Greasy.	Washed.	Total.
	lb.	lb.	lb.	lb.	lb.	lb.
Sydney	110,789,090	5,223,804	116,012,894	88,054,235	3,281,142	91,335,427
Melbourne	39,664,312	1,018,164	40,682,476	30,042,541	778,338	30,820,879
Adelaide	13,899,151	13,899,151	7,216,407	209,987	7,426,394
Brisbane	551,532	551,532	695,690	59,676	755,366
	164,885,335	6,241,968	171,146,053	126,008,923	4,329,143	130,338,066

Classing the clip.

In twenty-six districts the clip is reported as being well classed, and in the other districts it is not considered so, the reasons being that owners do not think it pays, and the difficulty of obtaining competent woolsorters.

Wool-presses.

A great number of different kinds of presses are used : those most in favour are Williams and Robinson's ; rack, screw, and pinion presses, are used. There is still room for improvement in the mode of pressing, especially by small owners.

Woolpacks.

The woolpacks used are mostly Calcutta and Dundee, of various sizes, from 4 ft. 6 in. × 2 feet 2 in. to 5 ft. 3 in., and the weight from 10 to 12 lb.

On twenty-nine stations the wool is dumped before leaving.

Ear-marking.

In most districts the system of ear-marking sheep is now properly carried out, and nearly all the owners approve of it.

Tattoo-marking.

This system of marking is mostly used by owners of stud sheep, but where used in the general flocks it has been found to act as a good preventive to sheep-stealing.

X.—DISEASES IN SHEEP.

Outbreak of Scab.

On the 14th February, 1884, it was found that 205 Vermont Merino sheep, imported from America in the end of 1883, and then in the Carcoar district, were affected with scab.

The sheep were immediately destroyed, by order of the Minister for Mines—the yards and fences of the paddocks and the grass in the paddocks were burned—the district was placed in quarantine—and all the sheep to which there was the least suspicion attached of their having in any way come into contact with the infected sheep received two thorough dressings with tobacco and sulphur.

Under these prompt and effective measures the disease was eradicated ; and it is believed that the infection never spread to any of the sheep in this Colony, at least none of them ever showed the slightest symptom of the disease.

As the facts connected with this outbreak are fully stated in the able and exhaustive Report of 20th August last, by the Royal Commission appointed to inquire into the Quarantine Regulations for Stock, and the circumstances under which the sheep referred to passed through quarantine without the existence of scab being discovered, it is not necessary that the subject should be further dealt with here than to state that the principles, and to a large extent also the details of the regulations recommended by the Commission in regard to the introduction, importation, and quarantine of stock from other Colonies or countries have been carried out ; and that the outbreak and the circumstances connected with it brought to light by the inquiry are such as to show the necessity for Inspectors possessing a thorough practical knowledge of disease, and exercising the greatest vigilance and care, coupled with the utmost strictness in all matters relating to the inspection, quarantine, and treatment of stock seeking admission into this Colony, more especially when they arrive by sea.

By taking advantage of the passing of the Imported Stock Act Amendment Act of last Session, the recommendations of the Royal Commission have been carried out, by prohibiting the importation of all stock from colonies or countries other than the Australian Colonies and New Zealand. The importation of sheep from New Zealand and Western Australia has also been prohibited, on account of the existence of scab in these Colonies.

Foot-rot.

In five districts the sheep have been slightly affected with foot-rot during the year; the reasons given being—swampy ground, country not suitable. The remedies principally used were arsenic and bluestone, carbolic acid and oil, paring, &c., with satisfactory results.

Fluke.

In eleven districts the sheep were affected with fluke slightly; the reasons were—a want of salt herbage, unsound country, dry seasons, and partly inherited. The remedies used were—removing to sound country, salt, tar and turps, sulphate of iron, and salt and sulphur—with good results.

Worms.

In two districts the sheep were affected with worms. The cause given was dry indigestible food. The remedies used were salt, tar, and turps, with favourable results. For lung worm, a mixture of turpentine, carbolic acid, and tincture of opium injected into the windpipe has been tried with success.

Losses through Drought.

The losses in stock, as recently shown by the Honorable the Minister for Mines at Hay, amount through deaths, bad lambing, deficiency in the number of fat stock, deficiency and deterioration in the clip, without counting the loss arising through waste of condition in the stock which remain, to more than £4,000,000 sterling; and it is generally believed that this estimate is rather under than over the mark.

Such fearful waste of animal life and capital affects, as he said, all classes of the community, and every possible effort should be made to alleviate, if we cannot prevent, such suffering and ruinous losses in future.

A good deal has already been done by the Government, by the notification of reserves and providing water on the different droving roads, and by carrying starving stock on the railways at reduced rates; and it is hoped that by the time another drought occurs all these different means will be extended and increased.

It is to be expected also that the experience of the terrible seasons from which owners have lately suffered will lead them to make better provision on their runs; and where they cannot do so, and begin to get short of grass or water, that they will adopt the safe course of either reducing their stock or securing additional pasture for them at once, and not as it is feared many owners did during the late disastrous drought, delay moving their stock until they had become too weak to travel, without heavy losses.

With the view to induce owners to move their stock in time, I would suggest that a scale of differential but paying railway rates for stock should be established where they are carried over level country such as that between Wagga Wagga and Hay, Dubbo and Bourke, and Warrah and Narrabri, and where of course the haulage is light.

Over such country I believe it would pay the Railway Department to carry large lots of stock for (say) one-third of the charge now made for their conveyance from Orange or Yass to Sydney; and if it did, the traffic would be very largely increased, as store and breeding stock in the districts mentioned would then be largely sent by railway whenever it could be conveniently reached.

If stock making for the mountains in times of drought were moved in this way over the flat country they would be saved the terrible starvation to which they are now subjected in passing through what is simply then a desert, and when they reached the points mentioned they would have comparatively good food and only a short way to go to their grazing grounds among the hills and mountains.

With even the present length of lines, this course if adopted would be of immense benefit; and as the railways are extended westward and northward, the scope of the advantages alluded to would be vastly increased, and if the Colony is again affected with drought such an arrangement would be the means of saving millions of sheep.

Post-mortem Examinations.

It is very essential, when stock are found dead, that the cause of the death should be ascertained. The animal should therefore in every case when the outward symptoms do not clearly indicate the cause of the death, be opened, and such an examination made of the internal organs as will settle the question, due care being exercised that the person making the examination runs no risk in making it.

This is necessary, not only for the sake of preventing the spread of infectious and contagious diseases where they are found to exist, but also for preventing the serious and even fatal cases which are frequently occurring through people in ignorance handling animals which have died of blood poison, and getting inoculated with the virus.

With the view therefore of making these examinations in an effectual manner, and without risk to those who make them, Mr. Edward Stanley, F.R.C.V.S., Government Veterinary Surgeon, has furnished brief descriptions of the more common causes of death among stock, and directions for making safe and correct diagnoses of the cases as they arise, which forms Appendix B to this Report.

XI.—TRAVELLING STOCK.

1. *Trespass on the Reserves.*

In thirty districts the reserves and driftways for travelling stock are reported to be frequently trespassed upon by the neighbouring squatters and selectors; in eleven districts they are free from trespass; and from one district there is no report. Inspectors suggest various remedies, viz.—fencing in the reserves, and the adoption of more stringent measures, and the appointment of caretakers, &c. Inspectors had not sufficient power under the Sheep Act to protect these Reserves, but they will now be able to do as under "The Watering Places Act."

2. *Grass on reserves and driftways.*

In eighteen districts the Inspectors report that as a rule there is not sufficient grass on the reserves and driftways in their districts to enable fat stock to reach the markets in good condition; in thirteen districts there is only sufficient in good seasons; in eight, as a rule, there is sufficient grass; from one district there is no report; and one district they were not inspected.

3. *New roads for travelling stock.*

In ten districts new roads for travelling stock are required; in thirty districts they are not required; and in the remaining two districts the Inspectors report that there are no Crown Lands available.

4. *New reserves for travelling stock.*

In six districts new reserves for travelling stock are required; in twenty-eight districts there are sufficient; and in the balance there are no more Crown Lands available.

5. *Travelling charges for stock.*

In twenty-one districts travelling charges for stock have been collected on forty separate occasions, the total amount collected being £3,576 5s. 8d.

6. *Laws relating to travelling.*

In forty districts the Inspectors report that the provisions of the Amended Sheep Act relating to travelling stock are working well, and have almost put an end to loafing.

7. *Sheep travelling for grass and water.*

Sheep to the number of 7,348,045 passed through twenty-six districts in search of grass and water. Of this number, 64,824 were described as loafing sheep; the balance, 7,283,221, were compelled to travel on account of the drought.

XII.—REGISTRATION OF HORSE AND CATTLE BRANDS.

1. *Brands registered.*

The number of horse and cattle brands registered up to 31st December, 1884, is 50,962. The number of brands registered during the year 1884 were:—Horse brands (alone), 395; cattle brands (alone), 241; and horse and cattle brands, 841; making a total of 1,477, being a decrease of four applications on the previous year.

2. *Brands transferred.*

The brands recorded during the year 1884 as transferred were:—Horse brands, 6; cattle brands, 17; horse and cattle brands, 36; total, 59.

3. *Brands cancelled.*

The brands cancelled (horse and cattle) in 1884 were 17.

4. *Addresses changed.*

The number of addresses of owners changed in 1884 was 55.

5. *Compliance with the Act.*

In thirty-nine districts the provisions relating to registration and other requirements of the Act are reported as being duly carried out; and in the remaining three districts fairly so.

6. *Benefits of the Act.*

In thirty-eight districts the Inspectors report that the Brands Act prevents "duffing," stealing, and persons from using the same brands; facilitates identification, assists in recovering lost stock, and otherwise is a great protection to stock-owners.

XIII.—POUNDS.

1. *Number and inspection.*

There are 321 Pounds in the Colony, some of which are at present closed for want of Poundkeepers. The whole of the Pounds are inspected periodically by the various Inspectors of Stock.

2. *State of yards.*

Forty of the Pound-yards are reported to be old, some very bad and require renewing; the remainder are said to be in fair and good condition.

3. *Keeping and depasturing Pound stock.*

The provisions made for the proper sustenance of impounded stock, according to the reports received, are satisfactory. As a rule Poundkeepers have now paddocks for the stock.

4. *Management of Pounds.*

The Poundkeepers are reported to be performing their duties in a satisfactory manner, and the appointment of Inspectors of Stock as Inspectors of Pounds has had a beneficial effect.

XIV.—NOXIOUS ANIMALS.

1. *The districts in which the Pastures and Stock Protection Act is in force.*

The Act has been brought into operation in fifty-three districts out of fifty-five, and steps are being taken to compel the districts in which the Act is not in force to bring it into operation.

2. *Receipts and expenditure under the Act.*

The amount of assessment paid by stock-owners during the year 1883 was £37,612 7s. 2d., and the amount expended £52,869 18s. The amount of assessment raised by stock-owners in 1884 was £48,069 15s. 8d., and the amount expended was £60,954 15s. 6d.; the difference being the amount of subsidy granted by the Government to the several Boards.

The difference in the total amount of assessment collected and expended for 1883, as compared with amounts published in last Annual Report and those given above, is owing to the fact that money due for 1883 has since been collected, and accounts outstanding for that period have been paid.

In twenty-three districts full rates were paid, in eleven districts half rates were paid, in fifteen districts less than half rates were paid, and in four districts no rates were levied.

3. *Estimated number of noxious animals.*

The aggregate of the returns by Inspectors of the estimated numbers of noxious animals in their districts shows that there are supposed to be 3,006,994 kangaroos, 2,765,774 wallabies, and 23,330 native dogs in the Colony.

4. *Increase and decrease.*

The decrease of noxious animals during the past year has in thirty-eight districts been reported as considerable; in twelve districts it is slight; in one district they are reported as increasing; and from two districts there are no returns.

5. *Number destroyed.*

The number of kangaroos destroyed during the past year was 1,403,233, of wallabies 473,609, and of native dogs 7,336.

6. *Steps taken for their destruction.*

In the majority of the districts, hunting with dogs, drives, shooting, and trapping, have been tried with satisfactory results. In several districts poison has been used with good results, and from two districts no report is given.

7. *Amendments suggested in the Act.*

It is suggested that the Government should administer the Act; that uniform rates be levied; that one rate be fixed for the payment of scalps; and that its provisions be such as to secure general, vigorous, and simultaneous action.

8. *Losses from tame and native Dogs.*

The losses for the past year from the ravages of native dogs were 90,435 sheep, valued at £40,432; and from tame dogs, 47,621 sheep, of the value of £20,050; amongst which were some valuable stud sheep.

XV.—COMMONS.

1. *Number and extent.*

The number of Commons in the Colony is 150, with an average extent of about 1,250 acres each. The number of temporary Commons is 146, with an average extent of 2,000 acres each.

2. *Number of Commoners, stock, &c.*

The average number of Commoners to each Common is estimated at 160, and the average number of stock kept on each Common is 269.

In seventeen districts the Commons are reported to be used for other purposes than that of grazing Commoners' stock.

XVI.—GENERAL.

1. *Artificial Grasses.*

In twenty districts artificial grasses have been sown during the year to a small extent, in eight districts to a large extent, and in remaining districts none,—the most successful being lucerne, prairie, and rye.

2. *Number and division of Runs.*

The number of open or unenclosed runs in the Colony is 947; the number enclosed is 14,305; the number partially subdivided is 4,496; and the number properly subdivided is 7,478.

3. *Improvements, fencing, dams, tanks, and wells.*

The number of miles of fencing throughout the Colony is estimated at 776,239, at an average cost of £51 per mile, amounting to £39,588,189.

The number of dams used for stock purposes is estimated at 12,845, at an average cost of £114 10s., amounting to £1,470,752.

Number of tanks, 19,573; average cost of each, £188; and the number of wells used is estimated at 2,648, at an average cost of £258 each, amounting to £3,679,724.

Cost of fencing, £39,588,189; cost of dams, £1,470,752; cost of tanks, £3,679,724; cost of wells, £683,184; making a total of £45,421,849 as representing the amount expended by way of improvements &c.

4. Noxious plants and weeds.

In twenty-five districts the land is reported as being slightly infested with Bathurst burrs, and in eight to a large extent; in eight the land is not infested, and one district not stated.

In twenty-one districts the land is slightly infested with trefoil burr, in fourteen districts to a large extent; in six districts the land is not infested, and from one district no return is given.

In nineteen districts variegated thistle is reported to a slight extent; in thirteen, to a considerable extent; nine districts are reported as free from it; one, no return.

In fifteen districts black thistle is reported to a slight extent; in sixteen, to a great extent; ten districts are reported to be free from it; and from one district no return is given.

Other noxious weeds are reported to a slight extent from seventeen districts; to a great extent from fourteen districts; ten districts are said to be free from them, and from one district there is no return.

5. Cost of Clearing Commons, Reserves, &c., of Weeds.

The cost of clearing the Commons of noxious weeds throughout the Colony is estimated at £18,035; the temporary Commons, £8,720; the police paddocks, £5,697; the travelling stock reserves, £43,355; and the droving roads throughout the Colony at £32,205; making a total lump sum for clearing the lot of £108,012.

6. Public Tanks and Wells.

As will be seen on reference to the Report of the Inspector of Public Tanks and Wells, which forms Appendix 1 to this Report, the work of watering the stock-routes in the dry country is being steadily and actively carried out; and considering the severity of the season and extreme difficulty of getting work done during the disastrous drought from which the Colony has been suffering, very good progress has been made.

The following brief abstract, taken from Mr. Chief Inspector Gilliat's report, will show how this work stands:—

	Tanks.	Wells.	Dams.	Springs.	Total.
In charge of the Department	35	7	4	10	56
Notified as ready to be handed over to this Department by the Department of Works... ..	22	3	25
In course of construction	16	12	28
Recommended for construction... ..	19	9	28
	92	31	4	10	137

Besides the new works in course of construction, extensive repairs, and improvements, more particularly in the watering appliances, are being carried out by the Department of Public Works; and when these are completed, the leases enclosed, and cottages for the accommodation of the lessees erected, there is no doubt the watering-places will all find suitable tenants at rentals which will to a large extent repay the cost of outlay, while providing a sufficient supply of water for teamsters, travellers, and travelling stock.

The management and protection of the works are now also put on a satisfactory footing, through the passing of the Public Watering Places Act and the issue of the necessary regulations.

Windmills would be of very great service in raising water if found to answer the purpose, and it is encouraging to find that Messrs. Jones and Russell, on their Glenariff Run, in the Bourke District, have, during the past summer, watered without a hitch 20,000 sheep in two paddocks from two wells at which they have galvanized iron service tanks of 10,000 gallons; the water in the one case being raised from a depth of 45 feet, and in the other of 133 feet. They have since sunk another well and erected a mill on it.

7. Fresh Legislation.

During the year two measures in connection with this Branch have been passed by Parliament, namely;—"The Imported Stock Act Amendment Act of 1884," and "The Public Watering Places Act of 1884."

Both these measures were urgently required, and will enable the work to which they refer to be efficiently carried out.

Some of the advantages which will accrue from their passing have been pointed out under the portions of this Report to which these measures respectively refer.

8. Examination of intending applicants for appointment of Inspector.

With the view to improving the efficiency of the staff, the Honorable the Minister for Mines, in the beginning of the year, decided to alter the mode in which nominations for the office of Inspector were made, and regulations were issued, providing for the appointment of a Board of Examiners, consisting of the Chairman of the Board of Sheep Directors, Sydney, the Chief Inspector of Stock, and the Government Veterinarian, and that no person should be eligible to apply for an appointment who did not hold a certificate from the Board that he possessed the necessary qualification for filling the appointment.

Acting on these regulations, a code of rules for conducting the examination of intending applicants for the office of Inspector of Stock have been framed and issued by the Board; and the following statement shows examinations held and certificates granted by the Board to 31st December last.

Date of Examination.	No. of Candidates.	Names of successful Candidates.	Nature of Certificate issued.
1884.			
September 19	1	Alfred Sharp, M.R.C.V.S.	1st Class.
December 9	6	Thos. W. Medley	2nd Class.
		James Yeo	2nd Class.
„ 19	1	Edward Stanley, F.R.C.V.S. ..	1st Class.

From the above it will be seen that eight candidates were examined last year, two receiving first class, and two second class certificates.

THE MEAT TRADE.

1. *The Export Trade.*

The export trade in frozen meat is now thoroughly established. The experience of this Colony, New Zealand, and Victoria proves beyond all question that with ordinary care in freezing and keeping the meat frozen during the voyage, the risk in sending it to London is infinitesimal; and although the trade has not been so profitable to those directly engaged in it, it has been much more so than most enterprises of the kind usually are in their initiation; while indirectly it has been of the greatest service, for it has not only raised the minimum price of meat considerably above "boiling prices," but it has opened such a certain and extensive outlet for the surplus meat of these Colonies as will enable our markets to be at all times cleared; and in this way the serious gluts of fat stock which some five or six years ago caused owners such heavy losses (and which we would certainly have had again with the return of ordinary good seasons if this outlet had not been found) will not again occur. Besides, it is to be expected that the cost of freezing, freight, and charges will be reduced, and in this way also the producer will be benefited.

2. *Meat Market.*

It cannot have escaped attention that the New Zealand frozen meat always brings a better price than that sent from this Colony.

This is to some extent accounted for, so far as the mutton is concerned, through their sheep being cross-breeds, and therefore better suited to the English market; but it is so also to a very large extent through the stock in New Zealand not suffering as those in this and the neighbouring Colonies from the lengthened travelling on foot and by railway, and from the starvation to which they are subjected before being slaughtered.

The erection by the Government of the extensive meat market and chill room now in the course of construction at Darling Harbour—one of the most convenient and central sites which could be got—will when completed go a great way to remedy the disadvantages here pointed at, as well as to provide first-class meat for Sydney and the suburbs; for when the market is opened, which it is expected to be by the end of the year, for the reception, keeping, and sale of meat, killing and cooling establishments will be erected at the principal centres of the stock traffic on the railway lines; stock will be killed near their own pastures, or where they can be rested and left till the fever brought about by travelling has left them; the meat will be chilled, and when cooled down to just about freezing sent in non-conducting meat-vans to Sydney for sale, export, or storage in the cool room, as the circumstances require.

The outcome of this will be that meat of first-class quality will be supplied to the citizens at reasonable rates; tinning, salting, and freezing establishments will be erected near the market,—(all can go on without the least nuisance) and, as the market will always be cleared (there will most likely be settled prices at which the tanners and salters will always purchase the meat which is left) the ruinous gluts of fat stock which have in by-gone years so frequently affected the pastoral interest will no longer occur, while Sydney will become the centre of a large export trade in meat,—it ought to be by far the largest in the Australian Colonies.

I have, &c.,

ALEX. BRUCE,

Chief Inspector of Stock.

APPENDIX 1.

Annual Report for the Year 1884.

I HAVE the honor to submit for the information of the Honorable the Secretary for Mines the following Report for the past year.

1. The Officers on the Field Staff are one Inspector and seventeen Stock Inspectors, acting as Overseers of Public Watering-places for their respective districts.

2. The distance travelled by the Inspector during the year is 7,923 miles, an average of 660 miles per month.

3. Thirty works were inspected and reported upon, and reports covering recommendations for the construction of thirteen new works on the following roads were submitted for the consideration of the Honorable the Secretary for Mines:—

4. Whitton to Euabalong (additional)	3
Breeza to Coolah	4
Warialda to Inverell	1
Grenfell to Forbes	1
Coolaman	1
Tomingley	1
Warren to Coonamble	1
Illabo	1
	13

5. Although the exceptional severity of the drought during the past three years has made it difficult to obtain contractors to undertake works in the interior unless at exceptional rates, the Department of Public Works has transferred during the year six new watering-places to this Department, and refitted with pumps, service tanks, and troughing four old ones, and have notified twenty-five new and four of the old watering-places as completed and ready for immediate delivery.

6. In addition to these, thirty-eight are in a more or less advanced state, and twenty-eight remain recommended for construction during the current year, making, with the forty-six now in charge of this Department, 137 public watering-places. In addition to these are ten springs and one waterhole under the charge of the Department. These, averaging the distance between each at 15 miles, usually accepted as the standard, will provide water for 2,000 miles of road.

7. The survey and fencing of the special leases at these works have in many instances been inconveniently delayed by the severity of the season, but it is anticipated the late rains will enable this necessary work to be completed without delay.

8. A vote has been granted by Parliament for the construction of huts at 130 watering-places, for the residence of caretakers or lessees. These, when completed and the leases fenced, will it is expected materially enhance the value of the leases by inducing a more suitable class of men to compete for them.

9. In addition to this marked advance in the direction of inland water supply, an important step has been made in the passing by Parliament of the Bill framed by the Honorable the Secretary for Mines, "The Public Watering Places Act of 1884."

By this Act and its Regulations provision is made for the construction, administration, and protection of the public watering-places and their reserves; and in future these valuable works will be legally protected from trespass, damage, and pollution, while the difficulties hitherto experienced in preventing these offences may be considered at an end.

10. In the Report for 1882 I submitted for the consideration of the Honorable the Secretary for Mines a suggestion for the preliminary traverse, if not survey, of those roads upon which water supply was considered necessary, with the view of shortening as far as practicable the distance, and thus reducing the number of works; and I may add that in determining sites for watering-places prior to survey, or at least of a traverse, it is subsequently necessary for the survey to be made from one watering-place to the next, instead of from township to township.

The expense of traversing, straightening, and erecting mile-posts on stock routes would not be great, while the saving of freight and mileage upon each ton of goods and head of stock passing over them would be immense.

11. Waiting the repairs and alterations to be made at many of the watering-places, and anticipating the passage of the "Public Watering Places Act," no special effort was made to obtain lessees, consequently twelve only were leased during the year, at an average rental of £30 stg. each.

12. Complete lists of the public watering-places, the roads on which they are situated, locality, and capacity, and whether completed, in course of construction, or to be constructed during the current year, are submitted in Schedules A, B, C, and D; Schedule E gives a list of works leased and rentals.

I have, &c.,
HARRY GILLIAT,
Inspector Public Tanks and Wells.

1st April, 1885.

SCHEDULE A.
WATERING-PLACES in charge of Mines Department.

District.	Road.	Locality.	Tank.	Capacity.	Well.	Depth.	Water.	Length of Road.	Remarks.

APPENDIX 3.

ANNUAL SHEEP SALES.

THE following lots of Sheep, bred by the several New South Wales, Victorian, Tasmanian, and South Australian owners, were disposed of at the Annual Stud Sales held in July last.

Names of Breeders.	Address.	Number of Rams.	Number of Ewes.
Sold by Messrs. Raleigh, Aitken, & Co. (in conjunction with Messrs. Fisher, Gibson, & Co.), on account of :—			
NEW SOUTH WALES.			
Messrs. Hebden & Sons	Gogeldrie	10	
George R. Drysdale, Esq.	Bynya	4	
VICTORIA.			
Sir Samuel Wilson	Ercildoune	14	
"	Mount Bute	18	
Honorable Robt. Simson	Langi Kal Kal	10	
Messrs. Thos. Dowling & Sons	Jellalabad	25	
" J. J. Currie & Co.	Larra	12	
John Wilson, Esq.	Gala	15	
H. H. Wettenhall, Esq.	Carr's Plains	16	
Colonel Buchanan	Titanga	40	
Edwd. Willis, Esq.	Koolonnort	8	
Wm. Lewis, Esq.	Stoneleigh	20	17
Ex. late John Cumming	Terrinallum	18	
Messrs. Thos. Russell & Co.	Barunah Plains	14	12
" Strachan, Murray, Shannon, & Co.	Barriyalloak	16	
George Cumming, Esq.	Mount Violet	16	
Messrs. W. Cumming & Son ..	Mount Fyans	20	
Chas. Ayrey, Esq.	Warranooke	30	
Thos. Bath, Esq.	Ceres	20	
SOUTH AUSTRALIA.			
J. H. Angas, Esq.	Hill River	10	
Sold by Messrs. Bruncker & Wolfe, on account of :—			
TASMANIA.			
Messrs. Wm. Gibson & Son	Scone	223	16
Thos. Gibson, Esq.	Esk Vale	35	19
Robert Taylor, Esq.	Valleyfield	53	
Robert Viney, Esq.	Fernhill, Lymington	19	6
C. B. Grubb, Esq.	Strathray	30	
R. Mackenzie, Esq.	Clyne Vale	20	20
H. Gatenby, Esq.	Rhodes	37	
Sold by Messrs. Mort & Co., on account of :—			
NEW SOUTH WALES.			
A. L. Faithful, Esq.	Springfield, Goulburn	9	
Stephen White, Esq.	Bethungra	11	
Honorable E. Webb	Bathurst	3	
VICTORIA.			
A. M. Campbell, Esq.	Ellingerrin	10	
TASMANIA.			
James Gibson, Esq.	Bellevue	120	12
David Taylor, Esq.	St. Johnston	34	25
W. H. Gibson, Esq.	Fairfield	21	
Thos. Parramore, Esq.	Beaufront	38	8
J. D. Toosey, Esq.	Cressy	38	12
Geo. Parramore, Esq.	Wetmore	32	11
Robt. Jones, Esq.	Riccarton	17	16
W. A. Kermode, Esq.	Mona Vale	46	
G. W. Keach, Esq.	Chiswick	4	8
Chas. Field, Esq.	Woodfield	20	
W. Gatenby, Esq.	Woodbourne	17	12
E. D. Finlay, Esq.	Douglas Park	24	
W. H. Bennett, Esq.	Bloomfield	60	25
Joseph Archer, Esq.	Panshanger	35	
D. M'Kinnon, Esq.	Dalness	21	5
James Cox, Esq.	Clarendon	3	
E. Dowling, Esq.	Quorn Hall	8	
M. Weston, Esq.	Shene	43	13
H. S. Smith, Esq.	Harland Rise	6	6
W. H. Ralston, Esq.	Woolmers	10	
Thos. Gatenby, Esq.	Lake River	5	
Jas. Taylor, Esq.	Stewarton	5	
J. B. Gibson, Esq.	Perth	32	8
Sold by Messrs. Hill, Clark, & Co., on account of :—			
Messrs. Sanders, James, & Co.	Canowie, South Australia	24	20
Total		1,449	271

APPENDIX 4.

CUMBERLAND DISEASE.

Anthrax.

A contagious and infectious disease attacking sheep, cattle, many other animals, and mankind, caused by germs (Bacteria) in the blood.

When any stock has died suddenly, or after a very few hours' illness, and Cumberland is thought to be the cause of death, the external signs are often—not always—a frothy bloody oozing from the mouth, nose, and anus.

In black-leg, another form of the same disease, a crepitating crackling sensation can be felt on passing the hand over the skin of the swollen affected parts. To decide the nature of the disease *post mortem* examination is necessary.

In consequence of the poisonous nature of this complaint the following precautions should be observed, to prevent inoculation with the blood, which is likely to cause malignant pustule in mankind:—Do not attempt to skin an animal, even the wool is infectious; take a long fork or flesh-hook, fix it in the belly, with the other hand push the point of a knife into the skin and cut away the length of the body, separate the cut edges with hooks or forked sticks, and draw out the entrails with another. The spleen or melt will be found very much engorged with deep-red, almost black, thick blood, even bursting the small blood-vessels and staining the surrounding tissues; blood-shot, stellate spots and patches may be found on the intestines; yellow jelly-like masses also are often seen about the throat and intestinal glands. It is unnecessary to handle the parts, and safer not to.

Should any scratch occur during the examination wash it thoroughly—do not suck it—and apply caustic at once, the hot iron, acids, blue vitrol, or nitrate of silver.

Burn and bury the remains of a carcass, all litter, food, and everything that has been in contact with it or its blood, at least 4 feet deep under ground. As the soil it has lain upon is contaminated it should be dug over and spread with lime or salt, and all stock kept off it, because the germs eaten on grass are fatal.

PLEURO-PNEUMONIA.

Contagious and Infectious Disease of Cattle.

Several animals will be ill in a mob. Symptoms: Breathing quickly, husk or cough on being made to move, muzzle dry and often coated with dry adherent discharge from the nose.

Some get very ill and die in a week or ten days; others linger on for several days or weeks, and either die or partially recover.

There is no danger of human infection from pleuro-pneumonia; *post mortem*, disease confined to the thorax. Open the chest by sawing or chopping the ribs from one side, when usually a quantity of straw-coloured fluid will be found, the covering of the lung bright, pale, and smooth, or patches may adhere to the ribs; then the lung will be rough and coated with lymph or false membrane, which peels off, leaving a raw sore surface.

The lung is swollen much larger than the natural size, and hard (but is free from lumps, nodules, or abscesses). Cut a gash into the solid lung, and its characteristic features, streaked, marbled, or mottled appearance, is unmistakable. The white lines are from one to two eighths of an inch thick, running in all directions, oozing with yellow lymph, with well-defined patches, half to an inch in size, from a bright scarlet to a deep dark red colour, in various stages of colouration; occasionally part of a lung only is affected, frequently one lung or the margin of a lung remain healthy. Pleuro lung will sink in water; healthy lung will float.

It is well to notice the healthy condition of the liver, spleen, kidneys, stomach, and bowels, which is usual in pleuro.

Flesh from a well-nourished animal is considered good food, although the lungs are affected with this epizootic disease.

In common inflammation of the lungs or pleuro the distinctly marbled appearance of the cut lung is absent, the lungs are dark red, in parts greenish black, and gangrenous; cases of this kind occur singly, or one or two in a mob.

Tuberculosis is an hereditary disease, also contagious and infectious; it is frequently found in the lungs of cattle, and the symptoms resemble pleuro-pneumonia in many particulars, in an infected mob.

Distinction.—Lingering illness, and is not fatal in the early stages, associated with swellings and sores about the jaws and throat, with general unthrifty appearance. The disease is not virulently infectious, but may be conveyed by inoculation.

Post mortem.—The lungs are irregularly studded with nodules, massed or isolated, from the size of mustard seed to a marble, or may be larger, or pendulous from the surface. In the earlier stages the lumps may be felt (like shot) on passing the hand over the surface of the lung; when cut into the lung shows the nodules in various stages of growth and size; some are hard, gray, and fibrous; others soft and degenerating, containing grumous bloody matter; others a creamy pus; and some calcined, feeling gritty to the knife. (Nothing of this kind is found in pleuro-pneumonia.) Usually both lungs are diseased, more or less, and similar tubercular deposits are frequently found on the ribs, in the abdominal glands, the liver, under the jaw, &c.

It is a constitutional blood disease, attributed to parasitic germs, and many excellent authorities agree that the flesh from such animals is unfit for food.

It is of an insidious subtle nature, and highly destructive, and the enormous losses it causes are not sufficiently recognized, or measures would be taken to control its spread.

PARASITIC DISEASES.

Symptoms.—Animals affected get thin, weak, pale, dropsical. *Post mortem*.—Examine for worms in the bronchial tubes of the lungs, worms in the stomach, worms in the intestines. Careful washing will often show these in the ingesta or adhering to the viscera. Worms are found in the liver; the brain and flesh are the home of bladder-like parasites.

Worms

Worms vary in shape and colour ; some are small like red maggots, some like a large needle, some large as a lead-pencil, some are like white threads, some dark like whiskers. The fluke is short, flat, broad, and brown ; the tape-worm flat, jointed, and many yards long. In certain seasons parasitic diseases assume an epizootic form and occasion great losses.

ELECTRICITY—LIGHTNING.

Destroys all kinds of Cattle and Stock suddenly.

Post mortem.—Sometimes of a negative character ; often the hair, wool, or skin is singed or burned in streaks or patches ; on removing the skin the parts struck look bruised. Decomposition sets in very early, animals lie grouped in peculiar attitudes, showing death had been instantaneous, without a trace of struggling ; a shattered tree is often the only evidence of the electric fluid.

Poisonous plants may cause death after short illness. Symptoms will entirely depend on the action of the special poison, and they are very numerous.

Ordinary.—Frothing at mouth, sore throat, retching, abdominal pain, diarrhoea, giddiness, paralysis, &c.

Post mortem.—Appearances are not well marked in cases of vegetable poisoning. Inflammation of the mucous membranes, throat, stomach, bowels, kidneys, &c., are not easily determined by ordinary observers. More reliance may be placed on local circumstances and the absence of any other pathological alterations.

EDWD. STANLEY, F.R.C.V.S.,
Government Veterinarian.
