By another Juror : To the best of my belief, Wilson was on the same engine on Tuesday as he came up in from Peat's Ferry on Monday, but I don't think it was the same engine as he went down to Peat's Ferry on Monday ; neither Wilson or the fireman said anything to me on Monday night ; they were timed at 6.55 p.m., and they arrived about 9 ; I did not ask them the reason why they were late ; I did not ask the guard why he was late ; I was asked from Peat's Ferry to cancel the train due at Hornsby at 6.55 p.m., and give the line clear ; that was the reason why I did not ask why the train was late, because I knew the Sydney train had to run down ; I have seen similar carriages to the four that was on this train on this day at Hornsby before.

By the Foreman : I do not know that Wilson had to get assistance from another engine to get his train up the gradient from Peat's Ferry on Monday evening.

By Dr. Sly (on behalf of the Commissioner for Railways) : I heard that Wilson exchanged engines at Peat's Ferry on Monday, but I don't know it of my own knowledge.

GEO. STEAD.

Sworn and made before me at Sydney, }
this 30th June, 1887,—

HENRY SHIELL, J.P., Coroner.

Thomas Cavanaugh, on oath, states :—

By the Coroner : I am station-master at Peat's Ferry, and have been there since the 7th of April last, when the line first opened ; I remember Tuesday, 21st instant ; about 2.25 p.m. that day I was on the platform at Peat's Ferry, when I heard a whistle, and on looking I saw a train running in towards the station at a rapid rate ; I then called to Pointsman Proctor, who was then at the points, to stick to them ; I knew it was the excursion train from Sydney that was approaching ; she was then a little over two hours late ; the train ran in past the station at the same rate of speed, Proctor still sticking to the points ; I think she must have been going at the rate of from 50 to 60 miles an hour ; I did not see the carriages oscillating ; she dashed past the station, and into some trucks standing on the siding ; I did not notice anyone on the engine as she passed me ; I stood back just in front of my office door while she passed ; I heard the whistle continuously from the time I first heard it till the engine dashed into the trucks ; I could form no opinion, from anything I heard or saw as the train passed me, whether any of the brakes were acting or not ; I saw the dead body of the driver taken out of the water, and recognized him to be the same man who was at Peat's Ferry in charge of an excursion train on the previous day ; he left the Peat's Ferry station for Sydney at 6 o'clock on Monday evening, and returned at 7, when the guard informed me he could not get the train up the hill ; I then telegraphed to Hornsby to send the ordinary train on—that the line was clear, and after its arrival I started the excursion train again, and got the driver of the ordinary train to put his engine behind the excursion train and shove her up the hill ; he did so, and returned again the driver of the excursion train on Monday left Peat's Ferry for Sydney on the

the same engine as he arrived at the Ferry on; I cannot say if it was the same engine he had on Tuesday, but it was one of the same class.

By Mr. Rogers (in the public interest): I called to Proctor to stick to the points, as he was a stranger to me, and I was not aware whether he was acquainted with the points; supposing nothing was the matter with approaching train, it was Proctor's duty to open the points and let the train run into the same siding, otherwise she would have run into a train of passengers ready to start for Sydney; the number of the engine in the water is 178; I saw it in the water immediately after she dashed into the trucks; the engine was in the water on the right hand side of the embankment; I saw the donkey working while the engine was in the water; I know a little about the Westinghouse brake; the donkey supplies the air to it; portions of two carriages were in the water; they telescoped into one another, and lay on the bank partly in the water; that was the first and second carriages of the train.

By Dr. Sly (on behalf of the Commissioner for Railways): The carriage next the engine telescoped into the second carriage from the engine—the American car.

By Mr. Nathan (on behalf of relatives of Mr. Rennie): The train arrived at Peat's Ferry on Monday considerably late; she should have arrived at 12:20 p.m.; I did not see Mr. Rennie on the engine; I will not swear he did not come down on the engine with Wilson on Monday; Wilson did not tell me on Monday that it was his first time down that line; I had never seen him before to my knowledge; since I have been at Peat's Ferry it has been unusual to have brake-vans on the trains running there, but I cannot swear that those vans were all fitted with the Westinghouse brake.

By Mr. Rogers (in the public interest): I believe there was a brake-van on the excursion train on Monday; I don't know if that van had the Westinghouse appliances.

By Mr. Williamson (on behalf of John Pye): I did not make an examination of the taps after the accident; I don't recollect any examination being made; I saw one end of the engine out of the water; I could see the front portion of it; I did not notice the fore part of the engine next the buffers; the engine came down tender first; I recollect the 9th and 11th of April last; I recollect a driver Weir on one of those days, on arrival at Peat's Ferry, informing me he had left a portion of his train behind; he said it was too much to take up the hill again; he did not say that it was in consequence of having too much weight behind him coming down the hill.

By a Juror: I have never had occasion to put the distance signal against the down train since I have been at Peat's Ferry; I don't know if there would be difficulty in stopping a train beyond it.

By Mr. Williamson (on behalf of John Pye): I have never found the trains run past the platform till this train on Tuesday.

By a Juror: I think it is as safe for a train to come down the gradient without a brake-van as with one if she has the Westinghouse brakes working on her.

Sworn and made before me, at Sydney, }
this 30th June, 1887,—

THOS. CAVANOUGH.

HENRY SHIELL, J.P., Coroner.

Patrick Proctor, on oath, states:—

By the Coroner: I am a porter in the Railway Department; I was stationed at Peat's Ferry on the 21st instant; about half-past 2 o'clock on the afternoon of that day I was at the points and signal-gear, when I heard the whistle of an approaching train; when the station-master called out points I was there at the time, and when I saw her coming I opened the points and stuck to them till she passed me, which she did at great speed; I opened the points to let the approaching train run into the siding, and to get there she had to pass the platform; I could form no opinion, as the train flashed past me, whether or not any of the brakes were working or not; I had to keep my head back as the train passed me for fear of her striking my head; the wind from the train took the cap off my head in passing me; I should think the train was a mile away when I first heard her whistle; I could not see her then.

By Mr. Rogers (in the public interest): When I shifted the points I just held on to them as I would have done had the train come in an ordinary way; two trains of passengers were standing on the main line; I could not say when the train rushed past me, when I had my head thrown back, if any of the brakes were acting; I cannot say how fast the train passed, but I thought she would run past the platform, but I did not think she was running away; but I knew, from her continuous whistle, that there was danger—that there was something wrong; I never got my cap blown off my head when holding the points before; I think the train passed me at a distance of about 2½ feet; I stood outside the line.

By Mr. Williamson (on behalf of John Pye): The handle of the points is parallel with the line, and I was facing the approaching train; the distance from the points to the opening of the first cutting is about 500 or 600 yards; the train continued to whistle till she passed me; I did not see anyone on the engine—she passed me like a shot; I did not hear anyone on the approaching train calling out; I did not see her jumping; I did not detect any peculiar smell from the wheels as the train passed me; I have but very little experience in shunting; when the train came in contact with the trucks I ran down and went to the assistance of the passengers; I did not examine either the brakes or taps, nor did I see any examination made of either; I saw the engine in the water and the steam escaping, but I did not notice the donkey working.

By a Juror: The signals were clear for the trains to come in.

P. PROCTER.

Sworn and made before me, at Sydney, }
this 30th June, 1887,—

HENRY SHIELL, J.P., Coroner.

Henry George Perkins, on oath, states:—

By the Coroner: I reside at Peat's Ferry, and am a locomotive engine-driver, in the employ of Amos Brothers; I remember Tuesday, the 21st instant; I was at Peat's Ferry that day, and witnessed the occurrence; when I first saw the train it was about half a mile from the platform at Peat's Ferry; my attention was first attracted to it by the continuous blowing of the whistle; I was then about a chain distant from the platform—on the Sydney side—between the points and platform; the whistle caused me to look round, and I saw the train approaching at an extraordinary speed; I saw by its speed that it was from under control; I thought I saw some one waving their hands on the engine, but I did not hear any shouting

shouting from the engine; the engine passed me and immediately after I heard a crash and she collided, and I saw fragments lying about; I then went to render assistance, and did so for some time; I had seen the fireman of a train at Peat's Ferry on the previous day, and I recognised the fireman of this train to be the same; I assisted him up the bank out of the water and assisted him to the hotel, where I had a conversation with him; I asked him, referring to the train, "Where did she get away from you?" he said, about the tanks (the tanks are about 3 chains from No. 2 tunnel, and about $3\frac{1}{4}$ miles from Peat's Ferry); I did not ask him how she got away, nor did he tell me; I then went to the engine of the train and found her in the water; I found the engine reversed in forward gear and the regulator was partly open; I also found the lever of air-valve partly open, it was about half open, it did not show full on; I found the donkey working and I shut the steam off; I looked at one of the carriages, I think the third from the engine, and found two pairs of the blocks hanging loose off the wheels; I am certain it was not the first or second carriage, but I believe it was the third; my examination of the engine lead me to the conclusion that the driver had done all he could to stop the train; I did not examine the couplings; I do not know the working of the Westinghouse properly; I only found the air-valve on the engine partly open.

By Mr. Rogers (in the public interests): As the engine approached me I saw a person waving; I fancied so; I could not see the brakes of the engine while she was in the water; I cannot say from what I saw as to the condition of the brakes on the engine; the valve on the engine was partly open, showing that the air had been applied; I knew the driver Wilson from the previous day; I have heard him spoken of since as a careful good driver; I know this line from end to end; I have run over every inch of it; from the gradients there I know that we always got on better with a brake-van than without it; I don't consider the line dangerous if one has plenty of brake power; I saw the carriages attached to this train, but I did not take particular notice of them; I also saw the engine, and I think the number of carriages were too many for an engine of her class to take down there; I used to take my heavy loads down to Peat's Ferry with the hand-brake; I would have preferred blocks on the four small carriage of this train; the carriage next the engine was knocked inside the second carriage; I did not look at the air-taps on either of those carriages.

By Mr. Williamson (on behalf of John Pye): I have driven an engine a little over six years for various contractors; it is a little over ten years since I first started with a locomotive; I saw Wilson on the previous Monday night; I asked him what he thought of the road; he made some reply which I did not catch; at this time he had been up the bank with his train and had to come back; I don't know how many carriages constituted that train; I asked how he could not get up the bank; he said, "He could not get up for the slipping of the engine" (he was running tender first); I said, did you use all your sand; he said yes; I said if you put back a bit you can get a fresh supply; he told me if he had had his engine the other way instead of tender first, he thought he might have got up the hill—that he would sooner a £5-note than it should have happened; he said that he was booked to come up the following day, and was anxious to come, but on account of running so late he might be taken off the road; there is no turn-table at Peat's Ferry, and if an engine is to be taken up the bank engine first she must come down tender first, and that is the way the engine was coming down on the 21st; after the road was opened the Government supplied us with a brake-van; I found it of considerable assistance coming down the incline; all our trucks had hand-brakes; coming down the incline we had a stopping place, and we used to stop and put them down; they work with a lever; our first stopping place was on the summit on the Peat's Ferry side of Berowra, and we again stopped on the 1 in 50 to pin our brakes, that is, before you enter No. 1 tunnel; notwithstanding the hand-brakes on the trucks I found the brake-van of great assistance, and we did not require to have the brake power throughout the train; it helped the trucks considerably from getting away; some say the brake-van might hold better at the tail of the train, the drag is more, and our guard always preferred it at the tail of the train; I have come down with about 100 tons behind me, exclusive of the weight of the trucks; the total weight would be about 150 tons; every truck was under brake power as well as the brake-van; I have seen the engine that took down this train and my own engine—mine is the most powerful one, it is supposed to be a goods engine; the engine of this train is supposed to have the most resisting power with the brake; I think if a brake-van had been attached to this train, and if the Westinghouse brake was not working, it would have been of great assistance if the hand-brake only had been on the second American car; a van would have been of great assistance at the rear of the train; I did not find stopping at the present platform very easy after descending the incline; I cannot say the class of carriage I saw the blocks loose on; the whole of the blocks on one side of that carriage were loose; I did not look at the blocks on one and two carriages; I did not notice the pressure on the brake-gauge; the steam-gauge was broken; the gear of the engine was reversed; the air-valve was partly open, pulled to the driver's side, and pointing towards the tender; I don't know if that was sufficient to put the Westinghouse brake on but I think so.

By Dr. Sly (on behalf of the Commissioner for Railways): We got the brake-van from the Government after the line was opened to Hornsby; we did not find it necessary to put the brakes so hard on to trucks as we did without it, and it was in that way I found it of assistance; assuming that the driver was to put on the Westinghouse brake on all the carriages, a brake behind would be of little or no service; when a train was coming down this hill with the Westinghouse brake in proper order the hand-brake would be of no service; I know the hand-brake on the American cars; I don't think it would have the same effect as the hand-brake on a brake-van, because the brake on the American car works with a screw, and the one in the brake-van with a screw with leverage off the crank, making the brake power superior to the American car; I never worked the hand-brake on an American car, but I have on a G. truck, which is similar in construction; the heavier the car the more resisting power; I prefer in practice the van to the American car; I have never worked the brake in a brake-van going down this incline; I have often gone down this incline without a brake-van, taking eleven, twelve, and thirteen trucks, and less; the trucks were loaded with bricks; I should say one of those heavy loads would have weighed about 120 tons.

Sworn and made before me at Sydney, }
this 30th June, 1887,—

HENRY SHELL, J.P., Coroner.

H. G. PERKINS.

Inquest adjourned till 10 o'clock in the forenoon of Friday, the 1st day of July, 1887, at the Court-house, Darlinghurst, for the production of further evidence.

H.S., Coroner.

Inquest

Inquest resumed in pursuance of adjournment at 10 o'clock in the forenoon of Friday, the 1st July, 1887, at the Court-house, Darlinghurst.
Sydney, 1 July, 1887.

H.S., Coroner.

Henry George Perkins, re-called, on oath, states:—

By Mr. Simpson (on behalf of the Westinghouse Brake Company): I noticed the third carriage from the engine; I can not say that that was the one the blocks were loose on; I do not know which one the blocks were loose on; I did not examine the $\frac{1}{2}$ -inch cock; I did not see brake-blocks on the engine that day, she was under water and I could not see any; I saw a brake-block on the engine after she was taken out; the break-block which I saw hanging on the engine was a hand brake-block; so far as I know I do not think it had nothing to do with the Westinghouse brake; there is generally a Westinghouse apparatus on the engine, and if it was not connected with the brake-blocks it would materially affect the resisting power of the brake; I do not know the weight of the engine, the engine is much heavier than the tender.

By Mr. Nathan (on behalf of relatives of Mr. Rennie): There is a custom on newly constructed lines for the gentleman who superintended the construction of the line to act as pilot for the Government engine-driver when they do not know the road, if requested to do so.

By the Foreman: Supposing the driver of an engine, after applying the brakes, find they are not acting, the only other way he takes to stop his train is by reversing his engine; when I examined the engine I found the safety-valve blowing off steam; the impression I formed from my examination was that the engine had plenty of steam on when she ran past the station.

By Dr. Sly (on behalf of the Commissioner for Railways): The sand from the sand-box would assist him on a wet rail.

Sworn and made before me at Sydney, }
this 1st July, 1887,—

H. G. PERKINS.

HENRY SHIELL, J.P., Coroner.

Robert Hannsell on oath states:—

By the Coroner: I reside at Berowra, and am a builder; I remember Tuesday, the 21st of June last; I was on the platform at Berowra when the excursion train passed on that day; there is a gradient there; the train did not stop there; she was going at an ordinary rate of speed; I saw Mr. Rennie on the engine; I knew him; he was holding on by his left hand to some part of the engine, and lokoing behind, waving his hand towards the end of the train, giving the signal "Brakes down"; I could not say, when the train passed me, if any of the brakes were down; after passing the platform he got further out on the engine and waved his handkerchief towards the end of the train, giving the same signal; Mr. Rennie seemed to me to be excited, and I thought something unusual was up; the train then passed out of my sight; Berowra is about 7 miles from Peat's Ferry; I think I saw three persons on the engine.

By Mr. Rogers (in the public interests):—I thought the signal Rennie was giving was "Brakes down"; I thought he wanted the train to stop at the platform; there would be no necessity to put the brakes on there unless the train was going to stop; there is no station there; a waiting-room is being built; I have been there three weeks.

By Dr. Sly (on behalf of the Commissioner for Railways):—I knew that the waving of the hand in the manner I have described meant "Brakes down."

Sworn and made before me at Sydney, }
this 1st day of July, 1887,—

R. HANSELL.

HENRY SHIELL, J.P., Coroner.

Hugh Rohen, on oath, states:—

By the Coroner: I reside at Peat's Ferry, and am a labourer; I remember Tuesday, the 21st June last; I was at Peat's Ferry about 5 o'clock on the afternoon of that day; there was a discussion going on about a railway accident that had occurred that day, and in consequence of that discussion I went and examined the carriages, and found that the couplings between the second and third were not attached, and that they were not broken: I found there was no air connection between those carriages; they were the second and third from the engine; I have had no experience of the Westinghouse brake; I showed to one or two persons on the following morning that the connections I have mentioned had not been made; the first four carriages from the engine were off the line; I did not observe the coupling between three or four or any of the other carriages; I did not observe the condition of any of the brake-blocks on the wheels.

By Mr. Rogers (in the public interests): The two carriages I have mentioned were not coupled; I cannot swear that the iron couplings were broken, but to the best of my belief they were broken; I know how the Westinghouse brake connections are made; I have seen them connected, but I never made the connection myself.

Sworn and made before me, at Sydney, }
this 1st July, 1887,—

HUGH ROHEN.

HENRY SHIELL, J.P., Coroner.

Richard Brennan, on oath, states:—

By the Coroner: I reside at Peat's Ferry; I am an engine-driver in the employ of Mr. Amos, and was so employed on Tuesday, the 21st June last; I saw the excursion train pass me at the tanks on the afternoon of that day, $3\frac{1}{2}$ miles from Peat's Ferry; I was standing at the tanks to give the engine of the excursion train water, but she did not stop; I observed the train approaching me at a faster speed than ordinary; I saw the driver on the engine and beckoned to him to stop; he whistled twice in answer to my signal, and when he came alongside the tanks I saw that the wheels of the engine were locked; he must therefore have had the gear of the engine reversed; I could see that the side-rods were stationary, and that the wheels were skidding; I knew then that he had no control over his train, that she had run away with him; he was then descending the 1 in 40; the driver continued blowing his whistle till he got out of my hearing; I saw Mr. Rennie sitting on the tender, near the sand-box, holding his hat on with his left hand, waving with his right hand; he was facing the driver; I should think the train passed me at about the rate of 35 or 40 miles an hour; I once saw an engine pass me there before; she did so at the rate of about 15 miles an hour; I was standing on the ground when the train passed, and I don't think that the brake power was acting, or she could not have been going at such a speed.

By

By Mr. Rogers, in the public interest: The two short whistles the driver gave on passing me was a signal to the guard to put the brakes down; I don't know what Mr. Rennie's signals meant; I think if the brakes had been on the carriages the train could not have gone at such a rate; it is a descent from the tanks to Peat's Ferry; I can't say what steam the driver had on; I did not see the guard; I saw the driver on the previous day—never before.

By Mr. Williamson (on behalf of John Pye): The driver said to me, the day previous, that it was a steep gradient coming down—that was all; he stopped at the tanks and took water in, and asked what like the road was from there to the ferry; I did not observe if he had a brake-van on his train; I don't think the rails were more greasy on Tuesday than on other days; I think he was standing in his proper place on the engine when he passed me on Tuesday.

By Mr. Nathan (on behalf of the relatives of Mr. Rennie): I did not see Mr. Rennie on the engine on Monday; I swear he was not on it.

By the Foreman: I supplied the engine with water on Monday, and I knew it was the driver's first trip down; I signalled the train when she came out of No. 2 tunnel with my hand to stop; the driver applied his brakes and slackened speed when approaching the tanks on Monday; I don't think he had the same engine on Tuesday as he had on Monday; I gave the same signal to stop on Tuesday as I did on Monday.

By Mr. Williamson (on behalf of John Pye): The driver did not have much difficulty in stopping at the tanks on Monday; he overran them about the length of a waggon.

Sworn and made before me at Sydney, }
this 1st July, 1887,—

RICHARD BRENNAN.

HENRY SHIELL, J.P., Coroner.

James Makintosh, on oath, states:—

By the Coroner: I reside at Strathfield, and am an engine-fitter in the employment of A. and R. Amos; on Tuesday, the 21st June last, I was at Peat's Ferry; I was there when the railway accident occurred, and witnessed the occurrence; I was about 15 yards from the platform when the train passed it; I should think she did so at the rate of from 50 miles to 60 miles an hour; I heard the crash of the collision, and went up to where the carriages were, and examined four of them about the middle of the train, and found they had no brake-blocks on them; they were second class carriages; I next examined the engine, and found the gear reversed, and the regulator a quarter open; I did not look at the air connections.

By Mr. Nathan (on behalf of the relatives of Mr. Rennie): I was at Peat's Ferry on Monday, and saw Mr. Rennie there that afternoon; I went there by the first train in the morning, and he came by the second; he told me he had piloted that train down at the request of the driver; Rennie did not come down with Wilson on Monday; Mr. Rennie was engineer and overseer in Mr. Amos's employ; I know it is the practice, when requested to do so, for the gentlemen who superintend the construction of a line, to act as pilot to the Government engine-drivers.

By a Juror: I examined some of the carriages of the wrecked train.

Sworn and made before me at Sydney, }
this 1st July, 1887,—

JAMES MAKINTOSH.

HENRY SHIELL, J.P., Coroner.

William Hulme, on oath, states:—

By the Coroner: I reside at Macdonaldtown, and am an engine-driver in the employ of the New South Wales Government; I was at Peat's Ferry on Tuesday, the 21st June last, and witnessed the railway accident; I was standing near the points when I heard the train coming down the bank, and almost simultaneously I saw the train approaching from the cutting at a fast rate of speed; I could see that she was from under control, and in a few seconds she passed me at, I should say, fully 50 miles an hour; I followed it up; I ran after it, but a collision took place; before I reached I saw that the engine had turned over into the water, and that the first and second carriages had telescoped; on reaching the train, after the accident, I saw the brake-blocks on the third carriage from the engine hanging loose; I felt the tires of that carriage, and the one behind No. 4, and found they were as cool as they could be by running, without the brakes being applied to them; I examined the air taps on the whole of the carriages except the front one, and found they were all open; I could hear the donkey on the engine pumping while she was in the water; when I examined the tires of the wheels of the carriages mentioned, my examination led me to the conclusion that the brakes had not been applied to the wheels; I could not see the tap next the engine, but all the other taps were open, so as to allow the air to pass through the pipe to all the carriages connected with the Westinghouse brakes; the connections showed that all the carriages could be worked by the air brake that were connected with it, but my examination of three and four carriages showed that it had not been working on them; my examination showed that out of a train of nine carriages there were at least six not under brake action; had the brakes been applied to the tires of Nos. 3 and 4 carriages, coming in at the rate the train did, I would expect the tires to be quite hot.

By Mr. Rogers (in the public interest): So far as I could see, the air connecting seemed to me to be all right, although the brake was not working; I saw two of the carriages off the line; I did not notice the couplings nor the air pipe; I was on that line on Monday and Tuesday, the 20th and 21st June last; the train I took down on Monday was equal to nine carriages, the one on Tuesday equal to seven and a half; I had a brake-van on Tuesday; I can't say if I had one on Monday; I saw the engine of the wrecked train; it was a New South Wales engine; the one I drove was an English one, but both were of about the same power; the load that the wrecked engine brought down on Tuesday was equal to thirteen ordinary carriages; I had no difficulty in getting down with my train of nine carriages on Monday; I had a Westinghouse brake on, and I consider it a safe enough road to travel; I have been driving about eleven years, and I have seen this engine, and if the Westinghouse brake had been working properly she could have taken twenty carriages as well as nine; if the engine supplies the air to the carriages she is not required further than that; the carriages would go down by themselves; it is the train that holds the engine descending an incline if the brakes are working properly; if five out of the nine carriages (out of the nine) had been supplied with

with

with the Westinghouse brake, and it working properly, no matter where they were placed, there would have been sufficient brake power to hold the train.

By Mr. Williamson (on behalf of John Pye): If the driver's brake valve were found half open, it would be quite sufficient to work the train; when I saw the blocks hanging loose I came to the conclusion that the air taps had not been properly fixed to allow the air to pass through; but on examining the taps I found them all right, but I did not examine the tap on the carriage next the engine, nor the one on the engine; if the triple valve got stuck, the brakes would go on, and would not come off till released; assuming that the Westinghouse did not work, I would sooner have the guard on an American car at the end of a train with a hand-brake than to have the guard in a brake-van with a hand-brake; if there was a gauge in a brake-van attached to a train, it would assist the driver in pulling up the train.

By a Juror: I was on the railway before the Westinghouse brake was introduced; the only brake power at that time were the hand-brakes on the engine, and the hand-brakes on the guard's van.

Sworn and made before me, at Sydney, }
this 1st July, 1887,—

WM. HULME.

HENRY SHIELL, J.P., Coroner.

Inquest adjourned till 10 o'clock on the forenoon of Monday, the 4th July instant, at the Court-house, Darlinghurst, for the production of further evidence.

H.S., Coroner.

Sydney, 1st July, 1887.

Inquest resumed in pursuance of adjournment at 10 o'clock on the forenoon of Monday, the 4th day of July, instant, at the Court-house, Darlinghurst.

Sydney, 4th July, 1887.

William Hulme, recalled, on oath, states:—

By Dr. Slay (on behalf of the Commissioner for Railways): Supposing the brake-blocks were not working on No. 3 car, but were working on the other four carriages with brake-blocks on, and the engine, it would be sufficient to control the train. I am of opinion that there was sufficient hand-brake power on this train to control it if it had been taken in time. } 26

By Mr. Rogers (in the public interest): From my examination of the wheels of Nos. 3 and 4 carriages, I should say that the brake-blocks had not been acting on the tires of the wheels from the tanks down to where the wreck took place; I know where the commencement of the descent is after passing Berowra; I should say the brake-blocks had not been working on those tires from there down; I think that is about 6 miles distant from the station at Peat's Ferry.

By the Coroner: The Westinghouse brake does not act on the engine; its effect commences on the tender; there is a hand-brake on the engine; its application to the wheels hard on might or might not cause the wheels of the engine to skid descending a gradient of 1 in 40. I am quite certain that the couplings and air-coupling between carriages 2 and 3 were quite perfect when I examined them about half an hour after the accident.

By Mr. Nathan (on behalf of the relatives of Mr. Rennie): I think they had been depending on the Westinghouse brake power, and the train had got away from them before the hand-brakes were applied; I examined all the taps on the carriages except the one on the front carriage; if there was only one tap turned on between that carriage and the engine, it would make the working of the Westinghouse brake inoperative.

By Mr. Simpson (on behalf of Westinghouse Brake Company): There are engines fitted by the Government to which the Westinghouse brakes are applied to the wheels; I believe it is better to have only the hand-brake on the engine; I don't think the application of the Westinghouse brake-blocks to the wheels of the engine has any benefit in stopping the train; the simultaneous application of the whole brake power of the train would have greater effect.

By Mr. Rogers (in the public interest): The reason why I say it is better for the Westinghouse brake not to be applied to the wheels of the engine is because if anything were to go wrong with the Westinghouse brake it would be more difficult to apply the hand-brake; the small engines to which the Westinghouse brake-blocks are applied have no tenders.

By a Juror: Before the introduction of the Westinghouse brake the driver had no control over the brake power of the train further than by the hand-brake on his engine; I have had a good deal of experience on goods trains; I ran between Picton and Goulburn for close on nine years as driver; I have run the old truck goods waggons; each truck had a brake on it; we had to stop on the top of a bank before descending and pin our brakes down; it would be necessary to pin those brakes on that class of trucks descending the gradient to Peat's Ferry.

By another Juror: An assistant guard in the other American carriage would have been of great assistance in this case, in bringing the train under control.

By another Juror: I consider there was sufficient hand-brake power on the two American cars and the engine to control this train if there had been an assistant guard to work one hand-brake; I took an excursion train down on Monday, and the same on Tuesday; I had a brake-van on the latter day; I am not sure if I had one on the Monday.

Sworn and made before me at Sydney, }
this 4th July, 1887,—

WM. HULME.

HENRY SHIELL, J.P., Coroner.

James Makintosh, recalled, on oath, states:—

By Mr. Nathan (on behalf of relatives of Mr. Rennie): I searched the clothing on the body of Mr. Rennie, and found in his pockets a first-class return ticket from Ryde to Peat's Ferry for that day; I gave it to a constable.

Sworn and made before me at Sydney, }
this 4th July, 1887,—

JAMES MAKINTOSH!

HENRY SHIELL, J.P., Coroner.

John Edward Pye, on oath, states :—

By the Coroner : I reside at 21 Pitt-street, Redfern, and am a fireman in the employ of the Railway Department, and was engaged in that capacity on Tuesday, the 21st June last, on a train on the Hawkesbury line, which was timed to leave Sydney at 10.25 a.m., but we were some few minutes late in starting ; a man named Thomas Wilson was the driver ; there were nine carriages attached to the engine ; at Hornsby we made our train up again, and started ; I do not know anything about the air connections between the carriages there, it was not a part of my duty to examine them ; at Ryde the donkey-engine that supplies the air stopped working ; I spoke to the driver about it, and he said that I had better go out and give it a lubrication of tallow ; I got out and did so, and gave it a few knocks on the cylinder with a spanner, and the piston started to work up and down all right ; I took my place on the engine again, and after some time we reached Hornsby, and left it again a couple of hours late, and going up a bit of an incline we got stuck up ; we had to put back some distance, and make a fresh start, and we succeeded in getting over the incline, we had but a little distance to go ; when we got over the top of the hill (when) the driver shut off steam ; I was then at my station at the left-hand side of the engine ; the driver was at his on the right, and I saw him shut off steam, that was just as we commenced the descent ; the brake power of the Westinghouse brake was under the driver's control at the right-hand side of the engine, and the hand-brake power was under my control at the left ; at the time the driver shut off steam, we were going at the rate of about twelve miles an hour from the place we stuck up to where we shut off steam was about a mile and a half ; I did not notice anything after the steam was shut off till I saw the driver working the air-brake ; going round curves, before we entered the first tunnel, the speed seemed to be reduced by what he did ; it would not take so much to slacken speed going round curves as on the straight, and I had my hand-brake on then and had it on all the way down ; I did notice any more till we were coming out of No. 2 tunnel when I noticed the driver put the air on full, which did not seem to have any effect at all ; he then said to me, she has got away from us, and at the same time he reversed his engine and the engine wheels skidded ; I had to slacken the hand-brake off to free them again, and that was all we could do till we ran into the contractor's vans a little beyond Peat's Ferry Station ; the donkey-engine was working all the way going down the incline, the air power failed to act, but I cannot say what was the cause of it ; I saw the driver do something to the air valve on the engine which would have the effect of putting the air full on, but it did not diminish the speed, it increased ; after the driver applied the air and found it was not acting, he reversed his engine and whistled to the guard, and continued whistling all the way down ; the driver was killed, and I sustained injuries from which I still suffer ; when the driver whistled to the guard, I cannot say whether his hand-brake was applied ; after releasing the wheels I put my hand-brake on again and kept it hard on all the way down ; as near as I can judge, we passed Peat's Ferry Platform at the rate of 50 miles an hour.

By Mr. Rogers (in the public interests) : I lubricated the donkey with tallow before I struck it on the cylinder with the spanner ; it seemed to work all right, and it was working all right all the way down the hill ; when the driver was applying the air going round the curves, the speed was reduced ; I noticed that, but the connection might have only extended to two or three carriages ; I saw the driver opening the valve just before turning the two or three curves, but I could not tell on the engine if the air was working on the carriages, but I am sure it was working on the tender, and it was working on the tender when the driver told me that the train had got away from us ; and it was working on the tender within three quarters of a mile of Peat's Ferry ; I could tell that by the handle of the hand-brake on the tender being raised up by the air-pressure ; I think we had sufficient brake power on the train to control it if everything was acting properly ; I cannot in any way account for the accident.

By the Coroner : If the brake power was only acting on the tender, and not on the carriages, that would account for it.

By Mr. Rogers (in the public interests) : When the driver said to me she has got away from us, he did not assign any reason for so saying.

By Mr. Williamson (on behalf of John Pye) : I recollect the train being uncoupled between Ryde and Hornsby ; I cannot say who uncoupled the carriages there ; when we were stuck up between Ryde and Hornsby Mr. Rennie suggested to the driver to take the half of the train on to Thornleigh, and that he would stop behind and take charge of the remainder, and Mr. Rennie stayed behind with the two carriages ; he was standing on the embankment on the right-hand side of the engine when we went away with the seven carriages ; no one went in charge of those seven carriages ; we left Mr. Rennie and the guard behind ; on arriving at Thornleigh we found the siding we wanted to put the carriages into filled with trucks, and we went on, taking the porter from there with us to Hornsby ; I cannot say who uncoupled at Hornsby ; I only saw the station-master and the porter we took from Thornleigh there, and if the station-master did not uncouple the porter must have done so ; we took the porter from Thornleigh to act as guard ; I did not see the station-master at Hornsby leave the platform ; after uncoupling at Hornsby we went back for the remainder of the train, taking the same porter with us to where the two carriages were ; on our return I saw Mr. Rennie standing on the embankment ; I also saw the guard ; when we approached the two carriages the porter got off the engine ; I cannot say who coupled us to the two carriages ; the porter did not say what he was getting down to do ; I cannot say who gave the signal to start ; the driver got it ; we took the porter on to Thornleigh and dropped him there ; I saw the guard in the cutting near the two carriages, before we coupled up ; the porter made no remark after he got on to the engine ; Mr. Rennie got on to the engine when we were leaving with the two carriages ; I did not hear anyone ask him to get there ; on reaching Hornsby we were coupled on to the seven carriages which we had previously taken there with the two carriages which we brought up ; I cannot say who coupled them on to the seven ; I have no doubt Mr. Rennie stayed behind when we brought up the first seven carriages ; as soon as ever we got over the hill descending to Peat's Ferry and put on the hand-brake on the engine, that helped to steady her ; when the driver applied the air-brake he did so in the usual way ; if the valve was half open it would be sufficient ; I understand the Westinghouse brake ; when the wheels of the engine were skidding I released my hand-brake to free the wheels, and applied it again ; I did not see the wheels skid after that ; Mr. Rennie got on to the engine after we picked up the two carriages, and remained on it till we arrived at Peat's Ferry ; he got on to show us the road ; I did not hear anyone ask him to do so ; this was my second day on the road ; I asked Mr. Rennie after the train had run away how far it was to Peat's Ferry, and he replied about a mile ; I did not see him waving his hand ; I heard the driver when about a mile from the station say, " This is dreadful, we will all be killed " ; after the engine was reversed he had the Westinghouse

house brake full on ; he drew out and shut it (the valve) several times just for an instant ; when I saw he had to reverse the gear, I noticed the gauge, and found that we had about 75 lbs. pressure, but when he opened the valve full it flew round to zero, and on shutting it again I saw it run up to about 75 lbs. ; I could see the indicator ; I have had two years experience of the Westinghouse brake with heavier trains than we had on this day between Sydney and Parramatta ; when I saw the indicator showing 75 lbs. pressure I came to the conclusion that the brakes were not working somewhere ; if the brakes had been working right throughout the train, with that pressure it would instantaneously place all the blocks on the wheels, and the effect would be to lessen speed, which could be felt on the engine ; the 75 lbs. pressure did not have any effect on the speed of the train ; after the air was applied the speed increased ; if the taps had not been turned on between any of the carriages it would have prevented the air getting from one end of the train to the other ; neglecting to couple the air-pipe would have the same effect ; I know what the triple valve is ; I cannot say if it got stuck if it would apply the blocks to the wheels and stop the train ; I steadied the hand-brake all the time ; the driver stayed at his position all the time, and from what I saw he did all in his power to try and save the train ; the engine did not skid for some time after I released the hand-brake ; but I cannot say whether they skidded or not before reaching the ferry ; going down that incline it would not have been better to have allowed the wheels to skid ; the brake power would not have had so much power to pull up the train if the wheels were skidding. From the time we left Sydney till just before we got to Ryde the donkey-engine wrought all right ; I then lubricated it and it wrought all right till we got to Peat's Ferry. When we left Hornsby we had about 80 lbs. pressure of air ; we had quite sufficient to carry us to the ferry ; the air-gauge indicated the highest pressure after we left Hornsby, indicating that we had sufficient pressure to work the train if it had been passing through it all right. I cannot say when we coupled on at Hornsby if the tender brake was properly coupled ; the pressure ascended after we left Hornsby, and before we got to the descent to about 90 lbs. ; when I observed them I saw the driver easing the steam to the donkey his object was to prevent the bursting of the air-pipes between the carriages ; every precaution was taken by both the driver and myself to work the train properly and to save it, and carry the passengers to Peat's Ferry in safety ; when we coupled up at Sydney I coupled the close second to the engine ; I was not then informed that although there were brake blocks on that carriage they were not working ; I was not informed there were no brake blocks on the four open carriages ; I have not since ascertained that although there were brake blocks on the close second carriage when we left Sydney that they were not working ; when we arrived at Peat's Ferry a Redfern carriage and American car were next to the engine, and that carriage (No. 3), on arrival there, would have been No. 1 on starting from Sydney ; I was on a train running to Peat's Ferry on the previous day ; we had a brake-van on that train ; it was not so large a train as the one we had on Tuesday ; if there had been a brake-van behind the train on Tuesday fitted up with the Westinghouse brake and gauge, and the Westinghouse brake not complete, the guard could have assisted us to pull up the train ; he would have been able to pull up the train by himself ; I saw the pointsman at the points at Peat's Ferry ; no remark was made by any one on the engine beyond what I have already stated.

By Dr. Sly (on behalf of the Commissioner for Railways) : I am never, as a fireman, informed anything about the brake-blocks on a train ; before we got to the first tunnel on this day we seemed to have the train pretty well under control, and I noticed nothing wrong till after we got out of the second tunnel ; it was then the engine was reversed ; the application of the brake before that seemed to have no effect on the speed of the train ; when we left Hornsby the train started all right, and went on all right till the last gradient, in 1 in 40, when we stuck up ; I cannot say if the air-brake was on when we ran back, but I had the hand-brake on ; if the air-brake were used it would lessen the pressure ; I did not notice after we commenced the descent till we got between one and two tunnels how often the driver used the air-brake ; I know that if the air-brake is used too often it will lessen the pressure ; but the donkey will keep it up ; I do not know whether or not the donkey will supply the air as fast as it is used.

By the Foreman : The number of the engine we took down on Monday, the 28th of June, was 176, and the number of the one on Tuesday, 178 ; I knew that there were tanks between Browra and Peat's Ferry, but we did not intend to stop there for water on the Tuesday, and the driver did not shut off steam for that purpose ; I had no knowledge on leaving Sydney station as to how many carriages had brake-blocks attached to them ; I do not know if the driver knew ; the engine we had on the Monday was a colonial-made engine, and the one we had on Tuesday was the same class ; I do not know as a fact that the wheels of one of the carriages were skidding going up an incline.

By Mr. Williamson (on behalf of John Pye) : The driver made no complaint to me, or to any one in my presence, as to the weight of the train ; I don't think he knew how many carriages we had on on leaving Sydney.

By a Juror : I know that sometimes the blocks hang to the wheels after the brake is applied if there is not sufficient pressure to release them.

Sworn and made before me at Sydney, }
this 4th July, 1887,—

JOHN EDWIN PYE.

HENRY SHIELL, J.P., Coroner.

Jacob Derham recalled, on oath, states :—

By the Foreman : I was not aware when I coupled this train up at Sydney, on Tuesday, the 21st ultimo, that the half-inch pipe connecting the brakes with air connection of No. 1 carriage was broken, and the tap closed ; it was not my duty to examine the brake, it was the brake examiner's duty.

By Mr. Williamson (on behalf of John Pye) : I am coupler up of centre couplings ; I am not aware that it was written on this carriage (No. 1) copper pipe leaking ; I am not aware that on the previous day Mr. Tempest had examined that carriage and found it unfit ; if there had been anything wrong with it it ought to have been written up on both sides, and nothing was written on the side I was on.

Sworn and made before me at Sydney, }
this 4th July, 1887,—

JACOB DERHAM.

HENRY SHIELL, J.P., Coroner.

William Frame, on oath, states :—

By the Coroner : I am an engine-driver in the Railway Department ; I was at Peat's Ferry on Tuesday, the 21st ultimo, and saw the railway accident ; about half-past 2 on the afternoon of that day I was

was standing within about 20 yards (from) of the Peat's Ferry Platform, when I heard the whistle of an approaching train; I saw the train dash into the station, pass the platform, and I heard a crash, and found she had collided with some trucks; I went to where the collision took place; I walked along to where the engine was in the water; I looked at the brake blocks on the carriages as I went along, and I found none of the blocks on the wheels, and I came to the conclusion that the brakes had not been applied coming down; I then went on to the engine, and had a look all round, and saw the driver's brake-hauldle standing straight out from the boiler, showing that he had done all he could to make the brakes act; I heard the donkey working; soon after I saw Driver Perkins on the foot-plate of the engine, and he told me he had shut the donkey off; I did not examine the couplings of the carriages.

By Mr. Williamson (on behalf of John Pye): I have had five or six years' experience of the Westinghouse brake; finding the blocks off the wheels and the driver's air valve open, I should say the air connections had not been made, or the taps were not turned; from rear of the train, up to and including the seventh carriage, there were no blocks on the wheels; I mean those that had blocks on, the blocks had not been working.

Sworn and made before me at Sydney, }
 this 4th July, 1887,— }
 HENRY SHIELL, J.P., Coroner.

WM. FRAME.

Inquest adjourned till 10 o'clock in the forenoon of Tuesday, the 5th day of July instant, at the Court-house, Darlinghurst, for the production of further evidence.
 Sydney, 4th July, 1887.

H.S., Coroner.

Inquest resumed in pursuance of adjournment at 10 o'clock on the forenoon of Tuesday, the 5th day of July instant, at the Court-house, Darlinghurst.
 Sydney, 5th July, 1887.

H.S., Coroner.

George Gayleard, on oath, states:—

14 { *By the Coroner*: On Tuesday, the 21st June last, I was officer in charge at Thornleigh Railway Station; I remember the train to which an accident occurred to on that day; I remember the engine coming to Thornleigh with seven carriages; I went on with that train to Hornsby, where those carriages were left, and the engine went back to Beecroft; I went there with it, and came back to Thornleigh. I know nothing about the coupling of the train at Beecroft; I noticed at Beecroft that the brakes were hard on to the two carriages, and that there was a sprag in the wheels of one carriage; I did not notice the couplings, or air couplings, of those two carriages, nor did I take any notice of any of the couplings on the seven carriages.

By Mr. Williamson (on behalf of John Pye): I know a man named Stead who is acting as station-master at Hornsby; he did not call on me last night; I did not see him as the train passed Thornleigh last night; I did not come down with him this morning; I saw him outside this court this morning; I don't know if he went home last night; I was summoned by the police to attend here this morning; I have seen this morning's newspaper; I bought it at Strathfield; I have had no conversation with anyone about this case this morning; on arrival at Hornsby with the seven carriages Stead uncoupled the seven carriages from the engine, and give the driver the signal to go on, to the main line, and I went to see that the points fell back on the main line, when we took the seven carriages from Beecroft to Hornsby; the fireman, driver, and myself only were on the engine; when we got back from Hornsby to Beecroft I saw the guard standing in the cutting; I saw Mr. Rennie at the two carriages; I got off the engine and stood in the cutting, and saw the guard couple the two carriages on to the engine, he went in between the first carriage and the engine, but I did not see him couple up; I was not looking at him; I could not say whether he turned the air taps or not; when we left, Mr. Rennie went on the engine as far as Thornleigh.

By the Foreman: Neither the driver or guard gave me any reason for taking the seven carriages on to Hornsby; I went on to Hornsby of my own accord; I went as guard according to the rules which say that a station-master must not despatch a train without some one in charge, and there was not anyone in charge of this one on its arrival at my station.

Sworn and made before me at Sydney, }
 this 5th July, 1887,— }
 HENRY SHIELL, J.P., Coroner.

G. M. GAYLEARD.

William Rice, on oath, states:—

11 { *By Mr. Rogers*: On the 21st June last I was porter at Darling Harbour, but I went to Hornsby on that day to act as assistant to Mr. Stead; I remember the train that left Sydney for Peat's Ferry at 10.29 a.m. that day; I was on the back car as that train left Sydney; the train stuck up in the cutting a little past Beecroft, and the engine went on to Hornsby with seven carriages; the guard of the train knew I was on it; I was with him on the back car, and it was my duty to assist with the train if necessary. I knew Mr. Rennie; I think he stopped behind with the two carriages, as did I; I remember the engine coming back and taking the two carriages on to Hornsby, where those two carriages were backed on to the seven; I held the points back to allow the two carriages to be backed on to the seven; Clissold coupled them up, and Stead ran back for the iron couplings to the rear of the train; I saw Clissold turn two of the air traps, and I thought I heard the air whizzing through when he turned them; the brakes were off when the train left; I walked up and down the line, alongside the train, and I thought everything was all right before it left; I did not have anything to do with the coupling up of the train; I heard Stead ask the guard if all was right, and if he turned the taps on.

By Mr. Williamson (on behalf of John Pye): The seven carriages were standing on the siding on the opposite side of the platform; the two carriages were coupled on there; I did not see the train alongside the platform at Hornsby; all I did was to hold the points to allow the two carriages to be backed on to the seven; when they were coupled on to the seven I saw the station-master on the opposite side; I think he was watching the guard; after I held the points I ran back to see the train coupled up, or to do anything that was required to be done; I saw the station-master bring the couplings up and throw them in between the second and third carriages; I saw the guard couple up the screw and air

air connections; I saw him turn the tap of the car next the engine; I cannot say I saw him turn the tap at the end of the engine; I did not see him turn more than one tap on; I did not see the station-master turn any of the taps on; I cannot say that the station-master made any examination of the engine; I put my foot to one of the blocks on the second carriage, and found it loose; I did not examine No. 3 from the engine; I examined No. 4. and found nothing wrong with the blocks; I did not examine the blocks on the four last carriages; I did not notice whether they had blocks or not; I simply looked at the couplings and blocks; that was the whole examination made of the train so far as I am concerned.

By Dr. Sly (on behalf of the Commissioner for Railways): After I held the points open to allow the engine and two carriages to be backed on to the seven my duty at the points was done; I then went up to the train, and saw the station-master bring up the couplings and throw them in between the second and third carriages from the engine, and it was between those carriages that I saw the guard couple up the hose and turn one tap on.

By a Juror: I examined the blocks on the second carriage to see if the brake was off; when I say the second carriage I mean as the train left Sydney; it was on recoupling No. 4.

By another Juror: I don't know who held the points when the train was going off the siding; my duty was done at the points when I held them open for the two carriages and engine to be tacked on to the seven carriages; the points are self-acting going out.

By Mr. Williamson (on behalf of John Pye): It is not usual for a guard to do the coupling when a shunter is present; the shunter does so; I was not shunter that day; I was there to assist the station-master; I swear that the brakes were on one and two carriages—the carriages that were left behind; before we left Beecroft the air had to be released from them.

By a Juror: The sapling was put in between the wheels of one of those carriages before the air was tried on them; I took it out; I had not reported myself to the station-master at Hornsby when I held the points open; I went and did what I saw was required to be done.

Sworn and made before me, at Sydney, }
this 5th July, 1887,— }

W. RICE.

HENRY SHIELL, J.P., Coroner.

Joshua Everingham, on oath, states:—

By the Coroner: I reside at Peat's Ferry, and am a publican; I remember Tuesday, the 21st ultimo, and a railway accident occurring at Peat's Ferry; I saw the train approaching; I was between 80 and 100 yards from it; my attention was first attracted to it by hearing a sharp, shrill, continuous whistling, and on looking I saw the train coming in at a very rapid pace; the wheels of the engine were skidding, and I saw something like fire flying from the wheels or the rails; I do not know if the wheels of the tender were skidding, but the engine wheels were, and appeared to me to be locked; I would not say whether the brakes were acting on the wheels of the carriages; I believe the wheels of the tender were skidding.

Sworn and made before me, at Sydney, }
this 5th July, 1887,— }

JOSHUA EVERINGHAM.

HENRY SHIELL, J.P., Coroner.

William Thomas Chambers, on oath, states:—

By the Coroner: I am an engine-fitter, in the employ of the Railway Department, and reside at 12, Buckingham-street; I do not know what carriages a train was composed of that left for Peat's Ferry at 10.25 a.m. on Tuesday, the 21st ultimo; I saw a carriage that morning on one of the sidings for repairs; I was informed it was there for repairs, and I examined the brakes on it between 9 and 10 o'clock, and found a rupture of the copper pipe in connection with the air-pipe; I marked on that carriage on one side, "copper pipe"; I saw nothing more of it till about four days after; I did not notice the number of the carriage; I heard when I next saw this carriage that it came from where the smash was at Peat's Ferry; it was then in the yard at Sydney; I did not examine it then nor since; I am not able to say it is the same carriage that I examined on Tuesday; it was a close second carriage; the main brake connections went through under the carriage all right, but the brakes would not act on it; it would run the same, as, although there were no blocks on the wheels, the air could run through the main connections all right; the carriage could run all right.

Sworn and made before me, at Sydney, }
this 5th July, 1887,— }

WILLIAM THOMAS CHAMBERS.

HENRY SHIELL, J.P., Coroner.

William Frame, recalled, on oath, states:—

By Mr. Sly (on behalf of the Commissioner for Railways): I have had experience in driving on steep gradients on both the Western and Southern lines; I know the class of engine on this particular train; with such an engine, if the Westinghouse brake was acting properly throughout the train, I think I could go down an incline like the one in question and control twenty carriages; if the Westinghouse brake had been working in the four carriages of this train properly I could have kept it under control; supposing the train were fitted throughout with the Westinghouse brake, and a brake-van were at the rear of the train, fitted with brake valve and gauge, and the driver were to put the air full on, the guard could not assist him; I consider the hand-brake on an American car more powerful than the hand-brake on an ordinary brake-van, as there is more weight.

By a Juror: If there had been an ordinary brake-van at the rear of this train it would have not had so much effect as an American car in the same position; but if there had been a brake-van of equal weight to the American car the brake-van would be the most powerful; I could take a train of twenty American cars down this incline if they were all fitted with brake blocks; in going up and down the mountains the brake van is always at the rear of the train; there would be no more retarding power if the van were at the rear of the train than there would be if it was next the engine, but the drag would be greater.

By Dr. Sly (on behalf of the Commissioner for Railways): I have been stopped by the guard applying the air to the train two or three times on starting away from stations when passengers wanted to get out after he had given me the signal to start.

By

By Mr. Nathan (on behalf of the relatives of Mr. Rennie) : If the driver puts on the air full the guard cannot assist him, but if the driver only applies the air partially the guard can stop the train if he sees any necessity independent of the driver ; I never knew of a train being stopped by the guard on running past a platform where he was wanted to stop and not previously informed.

Sworn and made before me, at Sydney, }
this 5th July, 1887,—

W. FRAME.

H. SHIELL, J.P., Coroner

Frederick Sheehan, on oath, states :—

By the Coroner : I reside at No. 5, Abercrombie-street, and am an engine-driver in the Railway Department ; I took a train from Sydney to Peat's Ferry on the 24th May last, consisting of equal to fifteen and a half carriages, to the best of my belief ; I had one of Stephenson's engines, the number was 63 ; I think there was a Pitt-street brake-van behind the train, it used to run on the tram-line ; I believe it had brake-blocks on ; and, I believe, the Westinghouse-brake was acting on all the carriages right throughout the train ; I went through without any difficulty.

By Mr. Williamson (on behalf of John Pye) : I have had experience on the Western Line ; when travelling on that line I have always had a brake-van fitted with the Westinghouse brake-valve and gauge ; there are some steep gradients on that line ; in descending a gradient of 1 in 40 if the air-connections were not complete in the centre of the train, a brake-van fitted up in that manner would be of great assistance to the driver in stopping the train, the gauge would show the guard what pressure the driver had on his engine, and what pressure he put on the blocks ; the brake-van at the rear of the train would assist in keeping a train from running away if the connections were not complete in the centre of the train ; the automatic Westinghouse-brake is so constructed that it cannot fail ; I don't think that the engine I had on the 24th May was much more powerful than the one on this train ; she was a little more powerful ; the station-master never consults the driver of a train as to what weight he puts behind his engine ; I ran 176 engine, a sister one to the one that got smashed to Bathurst.

By Dr. Sly (on behalf of the Commissioner for Railways) : If I found the load too heavy, I would use my own discretion to work the traffic if at a junction station, I would ask for a pilot engine ; I had no difficulty going down to Peat's Ferry with my train on the 24th May ; I could have stopped anywhere, and I stopped at the tanks on the way down.

By Mr. Williamson (on behalf of John Pye) : The air passed through the whole length of that train.

By Mr. Rogers (in the public interest) : The air is only applied to the Westinghouse-brake to take the blocks off the wheels, and if the air becomes exhausted the blocks fall down on the wheels and stops the train.

By Mr. Williamson (on behalf of John Pye) : During the whole time the valve is shut the donkey is supplying air to the main reservoir ; if it has been sworn that, just at the time of descending, the gauge showed 90 lb. pressure, and when a mile from Peat's Ferry Station 75 lb. pressure, it showed that the driver had been working the air-brake on the engine properly, and if the air couplings had been complete he could have stopped the train on this incline in about 300 yards, providing the air-brakes had been working properly throughout the train ; if the gauge showed 75 lb. of pressure when a mile from the station it would prove that the air-connections were not complete throughout the train ; if the gauge showed 75 lb. pressure and it were opened it would go round to zero ; if the triple-valve got stuck when the train was travelling the brakes would go hard on.

28 { *By a Juror* : I consider that this train could have gone with safety down to Peat's Ferry had five out of the nine carriages had brake blocks on, if properly connected ; I do not consider it would have been safe with four ; the four carriages without brake-blocks would have been better at the centre of the train.

By Dr. Sly (on behalf of the Commissioner for Railways) : The brake-power on a heavy car would have more effect than the brake-power on a light car ; the brake-power on four heavy cars would have far more effect than the brake-power on four small ones ; the brake-power depends on the number as well as the weight ; the brake-power depends on the length of the train and how the weight is divided ; I have been to Goulburn with a train with the old hand-brakes, but we can take heavier trains with the Westinghouse-brake ; if the weight of a train is 150 tons, including the engine, going down a gradient of 1 in 40 I think all the vehicles should be under the Westinghouse-brake ; if all the carriages had blocks on it would not matter where they were placed ; I am not a skilled engineer ; I had a crowded train on the 24th May last, and I had perfect control over it ; there was a left hand screw-brake on the Pitt-street van and blocks on the wheels.

By Mr. Williamson (on behalf of John Pye) : Under the old system I have taken a train of six cars, including the brake-van, over the mountains.

By Mr. Simpson (on behalf of the Westinghouse-brake Company) : If a driver going down an incline like this were to apply his brakes full on, I don't think he would lose above 7 lbs. of air pressure after he recharges ; it is my opinion that in this case some of the taps, one or more, were left closed and the air-connection not complete through the whole train ; that is how I account for the accident.

By Dr. Sly (on behalf of the Commissioner for Railways) : I never worked the Westinghouse-brake in England ; there is the Westinghouse continuous and the Westinghouse automatic ; ours is the Westinghouse automatic ; I never read of an accident occurring in England through exhaustion of air in the Westinghouse automatic brake.

By Mr. Simpson (on behalf of the Westinghouse-brake Company) : I knew Wilson well ; he fired for me for some time ; he was a very careful experienced driver ; if he had exhausted all his air going down this incline it would not have been the act of a careful experienced driver.

By Mr. Williamson (on behalf of John Pye) : Any man who has been firing for some time can read the air-gauge ; I have read the returns of the Board of Trade, showing that this air-brake is used throughout the whole world.

By Mr. Rogers (in the public interest) : I don't know who is the Inspector of the Board of Trade ; I never heard of Colonel Yanland, Inspector of Lines to the Board of Trade, England.

By :

By Mr. Williamson (on behalf of John Pye): I have read a portion of Stratton's works; I don't know that certain railway officials are advocating the adoption of the vacuum brake.

By the Foreman: The donkey-engine would supply the air as fast as the driver used it under ordinary circumstances.

By Mr. Rogers (in the public interests): If a train was going down an incline of 1 in 30, and the air should become exhausted, the blocks would come down on the wheels and stop the train, and the donkey would fill the reservoir again in from five to seven minutes; I have been stopped on a gradient in 1 in 30 through one of the air-pipes bursting.

By Mr. Williamson (on behalf of John Pye): If the air becomes exhausted the train stops.

By Dr. Sly (on behalf of the Commissioner for Railways): If there is no air pressure in the main reservoir then you have no brakes, but it is impossible to exhaust the air in the main reservoir unless something gets broken and allows it to escape.

By Mr. Williamson (for John Pye): I recollect twice my air getting exhausted on the train through the pipe bursting; my fireman knew it as well as I.

By Mr. Simpson (on behalf of the Westinghouse Brake Company): If there is no air in the train the brakes are off; if the donkey is working it is impossible for the main reservoir to become empty unless the connection gets broken; if the main reservoir were to become empty, and there was air in the small reservoir under the carriages, it would apply the brakes to a certain extent.

By Mr. Simpson: The fact of the gauge going down to zero shows the fact that the air is all exhausted in the main pipe, but it does not show that it is exhausted in the main reservoir.

Sworn and made before me, at Sydney, }

F. SHEEHAN.

HENRY SHEILL, J.P., Coroner.

Walter Shellshear, on oath, states: I reside at Stanmore, and am District Engineer in charge of the Central District of Existing Lines.

By Mr. Williamson (on behalf of John Pye): I recollect Tuesday, the 21st ultimo; I was at Peat's Ferry; I arrived there about 7 in the evening; I arrived with the relief train; I have been examined before the Railway Board of Inquiry; the reason why I went to Peat's Ferry was in consequence of an accident happening to a train there; I examined the carriages of that train; I found a tap at the end of the first carriage, next the American car, shut; the tap was apparently not damaged in any way; Mr. Robert Scott, of the Locomotive Department, saw the tap as well as I; I don't know where it is now; I don't know who produced that tap before the Railway Inquiry Board; I saw the tap between the second and third carriages; all the others that I saw were in their proper positions only this one.

By the Coroner: This tap was in such a position as to prevent the air from passing through it.

By Mr. Rogers (in the public interests): The tap was on the end of the Redfern carriage at the end furthest from the engine; that carriage had telescoped into the American car; the tap was turned the reverse way to what is usual; it is possible for the tap to be turned in the telescoping, but from its appearance I don't think it at all probable.

Mr. Williamson (on behalf of John Pye): The tap on the end of the American car next to the engine was properly turned to allow the air to pass through; nothing was done to the taps on Tuesday night.

By Dr. Sly (on behalf of the Commissioner for Railways): The Redfern carriage telescoped in the American car, and the connection was hanging down; the handle would not necessarily be turned during the telescoping; I don't think so, as the Redfern carriage had considerably overridden the American car.

Sworn and made before me at Sydney, }
this 5th July, 1887,— }

WALTER SHELLSHEAR.

HENRY SHEILL, J.P., Coroner.

Inquest adjourned till 10 of the clock on Wednesday, the 6th day of July instant, at the Court-house, Darlinghurst, for the production of further evidence.
Sydney, 5th July, 1887.

H.S., Coroner.

Inquest resumed, in pursuance of adjournment, at 10 o'clock on the forenoon of Wednesday, the 6th July instant, at the Court-house, Darlinghurst.
Sydney, 6th July, 1887.

H.S., Coroner.

Walter Shellshear recalled, on oath, states:—

By Dr. Sly (on behalf of the Commissioner for Railways): When I say that I don't think the tap was turned in telescoping, my reasons for so saying are that the tap was not damaged, and it was perfectly horizontal with the pipe, and the pipe is thicker than the handle; if the handle had been forced up by the collision the probabilities are that the end of the handle would not have risen above the bottom of the pipe; the handle when turned down is below the level of the carriage; the hose-pipe is immediately in front of the handle, and it was not in any way injured, and if it had received a blow it must have been.

By the Coroner: From the reasons I have given I am of opinion that the tap was turned off before the collision.

By Dr. Sly (on behalf of the Commissioner for Railways): I examined the taps between the second and third carriages, and found them open and the hose-pipe separated, evidently from the force of the collision, as the second carriage was turned over on to its side; if there had been air in the reservoirs underneath carriages four and five, and the connecting-pipe had become cut between carriages two and three, the brakes would have gone on; it follows that if the brakes did not go on there was no air in the reservoirs.

By Mr. Williamson (on behalf of John Pye): If there was no connection and no air in the reservoirs the brakes would not go on, and I believe from the reason I have given, it is my opinion the tap was not turned on, and that was the cause of the accident; the pipe and tap produced I believe to be the same as I have mentioned in my evidence as not being open.

By Mr. Rogers (in the public interests): If about 60 per cent. of the brake-power was applied to the } 29

the wheels of a train descending an incline of 1 in 40, I am of opinion it would be sufficient to control the train; with regard to the four carriages without brakes it would make no difference to the retarding power what part of the train they were put.

Sworn and made before me, at Sydney, }
this 6th July, 1887,— }

WALTER SHELLSHEAR.

HENRY SHIELL, J.P., Coroner.

Edwin Faucett, on oath, states:—

By the Coroner: I am a guard on the New South Wales Railways; I had eight or nine years' experience in America before I came here; I was on four or five different lines; I was on the Pittsburg to Chicago, on the North Missouri, on the Burlington and Missouri River, and one or two others; on those lines they use cars similar to what is called in New South Wales American cars; we have no such thing as brake-vans on those lines on passenger trains; they use the American car as brake-vans; the brakes on the American cars there are similar to the brakes on the American cars here; there is no air-gauge or valves on the cars; there is no air-gauge or valves in the luggage van which is always placed next the engine; it is close on ten years since I left America; the air-brake was in use three or four years before I left.

By Mr. Rogers (in the public interests): I cannot say what the gradients are on any of the lines I have mentioned.

By Mr. Williamson (on behalf of John Pye): The Westinghouse automatic was in force for two years before I left America on the North Missouri railway; I was on that line; when I ran there we had no air-gauge and valve at the end of the train; I don't know why it was not put there; I could walk from one end of the train to the other; there were three men to look after the train besides the driver and the fireman, and the train would consist of from six to seven cars on the main line; if the automatic brake was not in operation the three men would apply a hand-brake each; I know nothing about a Board of Trade over the railways in America.

By Dr. Sly (on behalf of the Commissioner for Railways): I have seen the ordinary brake vans here, and in my opinion the hand-brake on an American car is much more effective.

By Mr. Williamson (on behalf of John Pye): The screw-brake is the most powerful, but it is more trouble to put on.

By the Foreman: All the carriages in America have brakes; I never travelled on carriages without brakes; if there were four carriages without brakes behind a train, and no brake-van behind, ascending a gradient of 1 in 40, and the couplings were to break, there would be no safety for the travelling public in those carriages.

Sworn and made before me at Sydney, }
this 6th July, 1887,— }

EDWIN FAUCETT.

HENRY SHIELL, J.P., Coroner.

Jacob Garrard, on oath, states:—

By Mr. Rogers (in the public interests): I am a Member of Parliament, and reside in Balmain; I was a passenger in a train which left Sydney for Peat's Ferry on the 21st ultimo, and I was in the last carriage leaving Sydney, a first-class American car; I know when a Westinghouse brake is applied to a train; I have no recollection of feeling the brake power on this train till arrival at Coola; the carriage became the second after leaving Hornsby; Coola is about 2 miles beyond Hornsby, on the Hawkesbury side; we stuck up at Coola, and ran back about a mile, and I am under the impression I felt the Westinghouse brake applied to my carriage to stop the train when it ran back; after getting through the second tunnel, the brake appeared to me to be applied to my carriage, but was working spasmodically.

By Mr. Williamson (on behalf of John Pye): I did not notice the guard applying the hand-brake; I saw the guard all the way to Becroft; I did not see him after leaving Hornsby on the platform of my carriage; if the guard has sworn that the hand-brake was applied by him to this carriage, and was hard on, I would be astonished to hear that the Westinghouse brake was not acting; I was not paying strict attention to the working of the brake.

By Mr. Rogers (in the public interests): I am perfectly certain as to application of a brake of some sort, and from the way it was applied and released, I am confident it was the Westinghouse brake; it was applied as if the person in charge had put it on once or twice, and released it again; I don't suppose more than three or four seconds elapsed between the time I first felt it being applied till I found it off altogether.

Mr. Williamson (on behalf of John Pye): Assuming that all the carriages were in complete communication with the Westinghouse brake the train would have been stopped.

By the Foreman: I did not feel the effect of the air-brake on the train when it was ascending the incline near Coola; I do not think it was the fireman putting on and releasing the hand-brake on the engine that I felt; we were considerably late and I thought when I entered the train at Sydney that the train was rather too heavy for the engine, and I came to the conclusion the driver was not husbanding his steam properly to meet the pinches; I saw the seven carriages detached at Becroft, and I saw them attached again at Hornsby; I did not know when leaving Sydney that five of the carriages were without brake-blocks.

By a Juror: I have had trains myself I think much heavier than the one in question; I have had I think a train of fourteen carriages with a similar engine; if there had been an assistant guard in another American car he could have assisted the guard in stopping the train; I do not think she could have been stopped after she got away by means of the hand-brake; it is possible the guard might have been on my carriage without my seeing him; a brake-van with a brake would have been of assistance.

23 { *By Mr. Simpson* (on behalf of the Westinghouse Brake Company): If the Westinghouse brake had been applied to the tender on the engine and the carriage in front of mine, I am still confident that the Westinghouse brake was applied to the carriage I was in.

By the Foreman: I felt the application of the Westinghouse brake descending the incline.

By

By Mr. Williamson (on behalf of John Pye) : I heard the engine whistling, but I did not hear the air escaping when the Westinghouse brake was applied.

Sworn and made before me, at Sydney, }
this 6th July, 1887,—

J. GARRARD.

HENRY SHIELL, J.P., Coroner.

Alfred Clissold, recalled, on oath, states :—

By the Coroner : I have heard the evidence given this morning as regards this tap being found turned off ; from the time the train left Sydney till the time the accident occurred I never touched that tap, nor had I occasion to go near it ; at Beecroft, before the train was divided, I am certain the Westinghouse brake was acting on the last car. } 10

By Mr. Williamson (on behalf of John Pye) : When the train was parted, passengers remained behind in the two cars ; I cannot say I saw Mr. Kennie on the embankment after the seven carriages went away ; the fact of the station-master at Thornleigh coming back with the engine for the two carriages slipped my memory ; after going through No. 2 tunnel I applied the hand-brake, and took up the slack of the chain ; I did not find, after taking up the slack, that I could apply more pressure ; I did swear in my examination-in-chief that the hand-brake seemed to be acting ; I cannot say how the tap in question came to be shut off ; I was a little riled by the passengers chaffing me, and I was anxious to get away ; I was not aware that the carriage next the engine on leaving Sydney was not connected with the Westinghouse ; I cannot account for the blocks acting on the wheels after we left Hornsby ; that fact did not impress it upon me that the air was not working throughout the train ; I cannot say if the blocks were hard-on going up an incline ; it proves the air connection was not complete throughout the train ; I cannot say positively from which carriage I released the blocks ; it was neither from a Redfern carriage or American car ; I believe it was a close second—that would be No. 3 ; when I put my hand on the release tap I heard the air rush out sufficiently strong to take the blocks off ; I cannot say whether or not the blocks ever operated on that carriage that day ; before I got off to release the tap I was on the last American car—No. 5 from the engine ; I ran forward, and after releasing I jumped on the train, but whether the train was going or not when I did so ; I recollect swearing that as I was going forward to the engine the driver started away ; I cannot say how far I was from the engine when he started, but I got on the rear platform of the second car ; I can give no explanation how I got on the rear platform of the second carriage if the train was going ahead.

By a Juror : The order for my going to Peat's Ferry on this day emanated from the station-master's office.

By the Foreman : I remained on the second carriage from the engine after I got on it till the accident occurred.

Sworn and made before me, at Sydney, }
this 6th July, 1887,—

A. CLISSOLD.

HENRY SHIELL, J.P., Coroner.

Francis Cox Johnson, recalled, on oath states :—

By the Foreman : The trains are despatched by me under my supervision while I am on duty, whether night or day ; this train was despatched while I was on duty ; I was not aware that the brake on No. 1 carriage when leaving the station was inoperative ; I was not aware that, so far as the brake-power of that carriage was concerned, it was inoperative ; I was not at that time aware that it was guard Clissold's first trip to Peat's Ferry ; I had no suspicion that the engine was unable to take the train to its destination ; my position does not make me acquainted with the capabilities of an engine before despatching it ; I am not aware whether an engine is sufficient or not, unless I am informed by the driver ; the two additional carriages were placed on the train by my instructions ; I do not know of any guide as to the quantity of brake-power to be attached to a train in proportion to its length ; there are, I believe, special engines for mountain traffic.

By a Juror : Nos. 1 and 2 were the carriages that were placed on the engine at Sydney by my instructions ; I was not aware that No. 1 was disabled at the time ; it is not usual for me to permit a train to go out with only five of the carriages out of nine under the influence of the brake-power without a brake-van behind ; I considered quite 80 per cent. of the dead weight of this train was under brake-power, and that the American car at the end of the train was equal to a brake-van ; the American car had no air-gauge ; all the brake-vans do not have air-gauges ; some have, others have not ; the air-gauge shows the guard the pressure in the pipes ; I believe that on this same morning, before this one, a train started for Peat's Ferry with seven carriages, having a brake-van behind ; I think it would be partially my duty to know that a guard is acquainted with the road upon which he is to travel, but I have a superior officer in that respect.

By a Juror : The driver, so far as I am aware, has nothing whatever to do with the appointing of the guard who is to accompany him ; it is the rule that the station-master whom I relieve appoints the guards for duty before I relieve him, and I found guard Clissold's name down for two trains when I went on duty a little after 7 o'clock that morning ; one of those trains was for Peat's Ferry.

By the Coroner : Clissold has been a guard in the Department for over 20 years.

By the Foreman : I don't consider it was a judicious act to place the four carriages not under brake control at the rear of the train.

By another Juror : The Locomotive Department have printed time-tables on a day like this, and they supply engines at their discretion ; if a driver refused to take away a load, I would rectify the matter ; no complaint was made on this day.

By Mr. Rogers (in the public interest) : The principal difficulties are after passing Hornsby, and there was no danger of the four carriages unprotected by brake-blocks getting away.

Sworn and made before me, at Sydney, }
this 6th July, 1887,—

F. C. JOHNSON.

HENRY SHIELL, J.P., Coroner.

Edward Andrew Laughry, on oath, states :—

By Dr. Sly (on behalf of the Commissioner for Railways): I am an engineer, and am Travelling Locomotive Inspector in the Railway Department, and have been so for about four years; I have been employed on the Railways about eight years; I came here under contract to the Government; I served my time as an engineer, and have been through all the grades; I know the working of a Westinghouse brake; on the afternoon of the 21st ultimo, after hearing of the accident, I went down to Peat's Ferry, arriving there about half-past six; I saw the train, and examined part of it that night by a hand lamp; I commenced at the rear of the train, and found the first four vehicles without brake-blocks, but with the continuous pipe all united between those carriages; the cock at the rear end of the fifth vehicle was closed; the pipes between the fourth and fifth vehicle were connected, and both cocks open; the pipes between the third and fourth vehicles were united, and both cocks open; the pipe at the leading end of the second carriage had been uncoupled, and the cock in the main pipe was open; the brakes on the third, fourth, and fifth vehicles from the engine were off; I did not examine further that night; at daylight the following morning I made a further examination, and found the brake-work of the first and second vehicles all broken up through the collision; I then examined the engine; I found her linked in full forward gear, which, running backward, would indicate that it was reversed against the train; I found the engine hand-brake hard on, tender hand-brake off, both engine hand-valves open, and drivers brake-valve in the release position, indicating brakes off; it was quite possible for it to be knocked into that position by the collision; I further examined the two carriages next the engine, and I found the tap at the rear end of the first carriage closed, and the handle pointing in the direction of the centre of the carriage; I examined it closely, and, from the position of the vehicle, I came to the conclusion that it was not possible for it to be otherwise than closed after the collision, as the floor of the vehicle had skidded some 20 feet over the floor of the other vehicle, which would tend to close it if it had been open; I searched for the tap at the leading end of the first vehicle but could not find it; I then tested the brakes on the fourth and fifth vehicles from the engine and found them to be in good working order; I connected them to an engine; I also tested the brake of the third vehicle from the engine and found it was not in working order; I found that the connection between main train-pipe auxiliary and reservoir was shut off; that would prevent the blocks being applied to the wheels; I found, on Tuesday night, that the hose connections between the second and third carriages were united and the cocks open; the tap at the leading end of the engine was also open; it was early on the afternoon of Wednesday that I tested the brake-power on third, fourth, and fifth carriages with the engine; supposing there was air in the reservoir underneath the fourth and fifth, and the driver had not put the brakes on, and the connection in front of those carriages getting broken by the collision, it would have put the brakes on; if they were found off, under the same conditions, immediately after the collision, it would show there was no air in the cylinders; the tap produced I believe is the same one I found shut; it may have been shut before the collision, but if it had been open before the collision, the collision must have shut it; I am of that opinion, even although the hose-piping is not injured in any way; the hose-piping between the engine and first carriage was broken in two or three places; I know the train that was wrecked; the amount of brake power varies with the speed, not with the length of the train; I know the actual composition of this train, and the weight, and the brake-power it had on; in my opinion, the brake-power was sufficient to control the train, and more than sufficient; the minimum of brake-force to control this train would have been 21 tons on a gradient of 1 in 40; the amount of brake force on this train was 65 tons; the hand-brake force on the engine and tender amounted to about 28 tons, and, including one hand-brake on an American car, would raise the hand-brake force to 38 tons; the failure of the engine to take the train up the incline had nothing whatever to do with the failure of the brake-force which caused the accident; an American car is heavier than an ordinary brake-van, and the brake-power of the former more powerful; if a driver puts the air-brake hard on, a guard could not assist him in stopping the train, even if he had a brake-van and air-gauge at the rear of the train; it is possible for a driver to exhaust his air descending an incline like this so as to make the brakes practically inoperative; it is also possible for a driver to exhaust his air faster than the donkey can supply it; the force of air necessary to operate on the brake would be from 10 to 20 lb, but that would operate so slightly as to be of little use.

Sworn and made before me, at Sydney, }
this 6th July, 1887,—)

E. A. LAUGHRY.

HENRY SHIELL, J.P., Coroner.

Inquest adjourned till 10 o'clock on forenoon of Thursday, the 7th day of July instant, at the Court-house, Darlinghurst, for the production of further evidence.
Sydney, 6th July, 1887. H.S., C.

Inquest resumed, in pursuance of adjournment, at 10 of the clock on the forenoon of Thursday, the 7th day of July instant, at the Court-house, Darlinghurst.
Sydney, 7th July, 1887. H.S., C.

Edward Andrew Laughry, recalled, on oath, states :—

By Dr. Sly (on behalf of the Commissioner for Railways): I have on several occasions, in course of my duty, spoken to drivers about exhausting their air too quickly while travelling upon steep gradients on the Mountains; it is part of my duty when an accident occurs to at once proceed to the spot, and try to find out the cause of it, and that is why I went on this particular day; I had about three years' experience in America as an engine-driver; the Westinghouse automatic brake, fitted on the engines as it is now, was in use there then, and I used it during the whole of that time; it was not the practice then to run brake-vans on passengers' trains; the engines used by driver Wilson on Monday and Tuesday, the 20th and 21st June last, were of the same class; they were of the 79 class, but of different numbers; those engines were capable of hauling eleven vehicles on a gradient of 1 in 40; the engine and tender would weigh about 59 tons; the reason why the same engine was not used on Tuesday as was used on Monday was on account of the driver having reported on Monday that the side-rods of that engine were slightly bent; engines of this class are used on the Mountains still; the Mountains have steeper gradients and sharper curves; the steepest is 1 in 30, and a great deal are 1 in 33; on 1 in 30 the haulage power would be less, and such a heavy train could not be put on that as on a gradient of 1 in 40; the wrecked engine was capable of hauling nine ordinary vehicles on the Mountains, which, loaded, would weigh about 75 tons; they are the closed, four-wheeled, first-class carriages; the Redfern carriage is an eight-wheeled vehicle.

By

By Mr. Rogers (in the public interest) : It is quite possible that the telescoping could have caused the tap in question to go into the position in which I found it ; I believe the concussion would cause it to go into that condition ; the piping runs about an inch below the bottom of the floor of carriage, below the bottom framing, and is not protected by the framing ; the wheels of the first carriage at the end furthest from the engine were off ; the tender and engine fell over into the water, and the end of the first carriage next the engine was resting upon a truck ; that was the result of the collision, and the engine was lying in the water in the reverse way to which she was running ; the seats and front end of the second carriage were forced away by the first carriage as far as the latter had entered the former ; that was for about 20 feet ; and the floor of the first vehicle was from 10 to 11 inches above the floor of the other at the rear end, and not so much at the front ; there were splinters of wood between the floors—the seats of the American car had iron frames, and I found them broken off near the floor ; the hand-brake force on the engine, tender, and one American car was 38 tons ; the hand-brake-force on the engine and tender, 28 tons ; the minimum brake force necessary to control this train was 21 tons ; the only way I can account for the hand-brake power not being able to stop this train is that it (the train) had been allowed to obtain too great a momentum before they were applied ; I knew that the engine on Monday had been stuck up coming up the gradient from Peat's Ferry ; the driver reported on this occurrence (*report put in, read, and marked "A."*) ; according to last part of rule 442, page 134, the driver is responsible for the coupling and uncoupling of the air connections on a main line ; when I made my examination of the carriages at Peat's Ferry on the Tuesday and Wednesday I found the air connections of three of them all perfect, and the other one not working ; from the examination I made, finding the tender hand-brake off, and the cock at the leading end of the engine open, led me to believe that air was being used up to the last moment ; I have control over the drivers ; driver Wilson was never to my knowledge taken off passenger-train running ; I don't recollect an order being issued to that effect ; I don't know that Wilson remonstrated against being sent to drive on this line on the Tuesday.

} 31

By Mr. Williamson (on behalf of John Pye) : I know rule 368, page 112 ; I have read the book supplied to the railway employees relating to the Westinghouse brake ; they are not given to the drivers ; those books are delivered to the department ; we are not guided altogether by them ; we are guided by our experience as well ; I came to this colony in 1879 ; I have not been continuously in the employ of this Government ; I was a year in South Australia ; I first came here as a tramway-motor driver ; I came under contract with the Government to teach others to drive tram-motors and locomotives ; I drove a tram-motor five or six months ; I had a superior officer of the name of Mason ; during the time I was driving the motor he did not recommend my dismissal on the grounds of incompetency ; I was not dismissed by Mr. Mason ; I resigned ; I was not asked to resign, nor was I informed I would be dismissed if I did not do so ; I resigned to go to the gold-fields ; I don't recollect having a dispute with Mr. Mason ; a complaint was not made against me before I resigned as to my incompetency, so far as I am aware ; I resigned some time during the latter end of 1880, but I cannot give you the date nor the month ; I came back to the railway sometime in 1883, and was appointed travelling locomotive inspector, and all rolling-stock ; I had three years' experience as a driver in America with the Westinghouse brake previous to that, as a railway locomotive driver ; the train run through the streets ; I call the tram-motors locomotives ; I have taken a great interest in this case ; I felt it my duty to do so, but I have not read all the evidence taken here ; I know fireman Pye ; he is a very good man as such, so far as I know ; if he swears that about a mile from Peat's Ferry the air-gauge showed 75 lb. of pressure, I should say it was very bad judgment for the driver to have indicated such pressure on the gauge, as it would prove that the brakes were off ; it would not prove that the air connections were not correct throughout the train ; it is possible for the connections to be correct, and yet throw a pressure into the gauge ; it would be one indication that the air connections were not correct throughout the train, but it does not prove beyond doubt that they were not correct ; 75 lb. of air pressure should have brought this train up, going down this gradient, in from 400 to 500 yards ; if the driver found the brakes not acting when a train is from under control, it would be injudicious on his part to relieve the valves and apply them again, as by so doing the speed of the train would increase much more ; that answer is given on the assumption that a train is descending an incline of 1 in 40, at a speed of not less than 40 miles an hour ; it would be injudicious to throw them off to try again ; when I found the carriages telescoped, I did not find any injury to the tap, which I found closed ; the telescoping would not necessarily leave any marks upon it ; the iron pipe produced is what is called an inch pipe ; if the handle was found horizontal with the inch pipe, the slightest tap would cause it to assume that position ; it is possible, if I were to strike the handle fifty times with a piece of wood, that I might once out of the fifty times knock it into that position.

By Dr. Sley (on behalf of Commissioner for Railways) : There is not the slightest shadow of truth in the assertion made by Mr. Williamson that I was dismissed from the Government service ; when I first came to Sydney I drove a tram-motor ; it was the first time they were put on the streets of Sydney ; I know the rule at page 30 in the working time-table relative to drivers satisfying themselves as to the completeness of the air connection with the engine.

By Mr. Simpson (on behalf of Westinghouse Brake Company) : Mr. Scott is at the head of my department ; he is Locomotive Engineer, and the head of that branch ; if the air-gauge shows 75 lb. on the engine, and assuming that the air connections were all correct, it shows the brakes are off, assuming the pressure in the brake pipe not to have been greater than 75 lb. ; I give that answer on the latter assumption.

By Mr. Rogers (in the public interest) : If the air was put fully on, the gauge would go down to zero, showing the brakes were full on ; 60 lb. pressure is the maximum pressure for railway working ordinarily.

By Mr. Simpson (on behalf of Westinghouse Brake Company) : A reduction of 20 per cent. would put the brakes on.

By the Foreman : I examined the main air-pipe throughout the train as far as I went, and found it complete ; I found it disconnected between the first and second carriages ; I examined the three vehicles next to the two disabled ones, No. 3, 4, and 5 from the engine ; I coupled the engine to the American car, No. 5 from the engine ; the connections between the second and third carriages were separated on Wednesday morning to get at the wreckage.

By a Juror : I have passed a local examination as an engineer ; a truck stands about 4 or 5 feet above the level of the rails, and I believe the truck was mounted by the first carriage after the engine and tender left the rails.

By another Juror : An ordinary brake-van weighs about eight or ten tons, and the brake power on an American car of that weight is equal in restraining power ; the retarding power would be the same no matter in what part of the train a brake-van was placed on the application of the brake ; the driver reported one of the side rods of his engine bent slightly ; the load on the Monday was within the power of the engine, but the driver had no sand ; it is the duty of the running foreman and inspectors in Sydney to allot the engines to the drivers.

By Mr. Williamson (on behalf of John Pye) : I do not know the rules of the Board of Trade, England ; I designed and constructed the engine on Frank Smith's merry-go-round at Botany, and started it.

By Mr. Simpson (for Westinghouse Brake Company) : A reduction of 20 per cent. would put the brake on fully generally, but in some cases it would not.

By the Foreman : The minimum brake force of twenty-one tons was sufficient to control this train if applied in time ; the aggregate hand-brake force on this train was thirty-eight tons ; twenty-five tons of brake force would have been sufficient to control this train if applied in time ; forty miles an hour is an unusual running speed down such inclines ; assuming that both the hand brake and Westinghouse brake are applied with the same force, both are of equal retarding power, but the latter as a train-stopper is superior to the former ; I know of cases where a train has met with an accident under hand-brake power, but not such an accident as this.

By Mr. Simpson (on behalf of the Westinghouse Brake Company) : Supposing there were nine carriages with hand-brakes, to apply them at the same time it would require a man at each brake ; the Westinghouse brake has the great advantage that it can be applied with equal force at the same moment throughout the whole train.

By a Juror : One man at each brake could apply the hand-brake with the same force as the Westinghouse brake ; the Westinghouse brake operates more quickly ; the screw is more powerful than is required ; it is possible to skid the wheels with the screw hand-brake with less exertion than with the chain one

Sworn and made before me, at Sydney, }

E. A. LAUGHRY.

HENRY SHIELL, J.P., Coroner.

William Farquhar, on oath, states :—

By Dr. Sly (on behalf of the Commissioner for Railways) : I am locomotive shed inspector in the Railway Department ; I remember the engine driven by Driver Wilson, on Monday, the 20th June last ; he made a report on that engine the same night on his return to town, as follows :—“ 176 coupling-rod bent ; signed, T. Wilson ” ; No. 176 was the number of the engine.

By Mr. Rogers (in the public interest) : I know the engine Wilson had on Tuesday ; it was of the same class as the one he had on Monday ; I did not know that the engine he had on Monday was unable to pull the load up the gradient from Peat's Ferry when I supplied him the engine on Tuesday.

By Mr. Williamson (on behalf of John Pye) : The driver's have a room in which a book is kept, and they have to enter in that book any remarks or repairs which they think necessary ; I examine that book ; I have charge of the casualty book ; I also peruse the casualty book and repairs book at 6 o'clock in the morning, and also at 6 at night, to see that repairs are completed ; the western train arrives at Sydney at 6.6 p.m. as a rule ; I could see Wilson's report at 6 o'clock on Tuesday morning, but I did not look at the casualty book that morning till after he had left for Peat's Ferry ; I only looked at the repair book, and saw 176 right coupling-rod bent, which I should say was occasioned through the wheels slipping, or want of sand ; I never travelled to Peat's Ferry, but I know the class of engines required on that road by the gradients on it ; I believe the gradient is 3 miles in length, but it does not matter if it were 6 or 7 miles ; the engine used on Tuesday was able to draw a maximum weight of from 90 to 92 tons up the gradient from Peat's Ferry ; when I send an engine out I have no idea what weight she will have to draw ; I know from the time-table what class of engine to send out ; if the number of vehicles are not stated, we know from the time-table whether it is a goods or passengers train, and provide accordingly ; I will not swear that I have not had complaints of engines of this class sticking up between Ryde and Hornsby ; I do not remember ; I had charge of sending the engines out on the 21st June last ; supposing that engine had to draw 90 tons, and two more carriages were put on by the station-master, I would know nothing about it ; the engine would have to pull them if she could ; but the driver might complain to the guard at the first gradient, and some of the load could be taken off ; the driver is subject to the Traffic Department until he reaches the first gradient ; I saw Wilson on Tuesday morning ; he did not make any complaint to me ; he turned his engine that morning so as he could go down tender first.

By the Foreman : I don't think the defect in the rod of the engine was sufficient to cause the delay of over two hours on the road from Peat's Ferry to Sydney ; it should not have interfered with the engine coming up the bank ; I believe she was unable to ascend the bank through want of sand when running tender first ; I am not aware that when he put back to Peat's Ferry a fresh supply of sand was offered to him ; in my opinion a heavier engine could have taken the load attached to this one up the bank ; the driver would be accountable for the delay in slipping on Monday ; he would enter an account of it in the casualty book of his own department ; I was not aware what load the driver had to take on Tuesday, when I gave him the same class of engine on Tuesday.

By a Juror : The same class of engine is sent with a train on an excursion day as on an ordinary day, unless we get orders to the contrary from the Traffic Department.

By Mr. Williamson (on behalf of John Pye) : When I saw this engine could draw from 90 to 92 tons—I mean dead weight—she could not draw 105 tons.

By Dr. Sly (on behalf of Commissioner for Railways) : Wilson was accustomed to mountain roads as fireman, not as driver ; he had been driving about six years.

WILLIAM FARQUHAR.

HENRY SHIELL, J.P., Coroner.

Inquest adjourned till 10 o'clock in the forenoon of Friday, the 8th day of July instant, at the Court-house, Darlinghurst, for the production of further evidence.

Sydney, 7th July, 1887.

H.S., C

Inquest

Inquest resumed in pursuance of adjournment at 10 o'clock in the forenoon of Friday, the 8th day of July instant, at the Court-house, Darlinghurst.
Sydney, 8th July, 1887.

H.S., C.

John Barrie, on oath, states :—

By Mr. Rogers (in the public interest) : I reside at Canley's Creek, on the Illawarra line, and am a storekeeper ; I was in a train with my wife and three of my children on the 21st June last which left Sydney for Peat's Ferry ; I was in the second carriage from the engine on arrival at Peat's Ferry ; I was amongst those left behind at Beecroft ; my carriage, which was the last one leaving Sydney, became the second one recoupling at Hornsby ; on starting from Hornsby the thought occurred to me from what I saw at the time that the driver was starting without trying his air ; I remember going along till we came to the first incline past Hornsby, when we got stuck up and ran back for about a couple of miles and made a fresh start, and ran up the incline ; on beginning to descend I did not observe anything with (the) regard to brakes, but about No. 2 tunnel I felt a shaking apparently coming from the engine ; at this time I was not aware but that the train was under perfect control ; I noticed nothing further until we were approaching No. 3 tunnel, when I noticed that the driver had lost control of the train, and it seemed to me as if the hand brake was applied to the carriage I was in ; I came to that conclusion because the brake appeared to be applied gradually and not spasmodically ; I am acquainted with the application of the Westinghouse brake through travelling, and I know the sensation felt on its application ; the hand brake is a gradual application, and the Westinghouse brake is a tightening at once ; at No. 3 tunnel I concluded that the train was from under the control of the driver, but I felt there was a brake on my carriage all the way down the hill ; I was standing on the platform at Hornsby after we had been stuck up, and I said to the guard, " I thought the driver was short of steam, but apparently he was blowing off steam." The guard replied to me, " Oh yes, he has got plenty of steam " ; when the collision occurred, I sustained some injuries, as also did two of my children, one of whom was severely hurt.

18

By the Foreman : I was aware that the train was late on arrival at Hornsby ; the driver seemed to have plenty of steam, and our late arrival at Hornsby was because the load was too heavy for the engine ; I joined the train at Strathfield ; there was no unnecessary delay stopping at stations after I joined it ; while at Beecroft, I am not sure whether it was in reply to a remark from myself, or someone else, the guard said the driver had no right to leave Sydney with a train his engine was not able to draw, or words to that effect.

By a Juror : I did not notice the guard in the carriage I was in ; I saw there was a hand-brake on that carriage.

By another Juror : I have travelled a good deal on the train ; at one time my duties took me daily on the train, and by that means I have acquired a knowledge of the application of the brake ; I cannot tell what drew my attention to the driver not trying his air ; I thought so in my own mind, as I have invariably noticed that when a train is remade the air is tried, and my knowledge in travelling was sufficient, in my opinion, to know the application of the hand brake from the air brake.

By Mr. McCarthy (on behalf of the relatives of driver Wilson) : I thought it strange of the driver to leave Hornsby without trying his air, but I did not think of looking for the guard when we got stuck up after leaving there and telling him about it ; that fact escaped my memory then.

By a Juror : I do not know who applied the hand brake to the carriage I was in ; I was sitting facing the engine.

By Dr. Sly (on behalf of the Commissioner for Railways) : The train, when it ran back after leaving Hornsby, was brought to a stand by the hand brake on the engine, or by a brake on the engine ; I mean, either on the engine or tender.

By the Foreman : I did not see any one on the engine besides the driver and fireman after leaving Ryde.

Sworn and made before me, at Sydney, - }
this 8th July, 1887, — }

JOHN BARRIE.

HENRY SHIELL, J.P., Coroner.

David Kirkcaldie, on oath, states :—

By Mr. Rogers (in the public interest) : I am assistant traffic manager in the Railway Department ; I went to Peat's Ferry on Tuesday, the 21st June last, after the accident, in the same train as Mr. Loughry, and made an examination of the carriage with him with a hand-lamp at about half-past 6 o'clock ; we examined from the rear of the train ; the first four carriages had no brake blocks, and therefore no taps on the main air-pipe ; the next vehicle was an American car, the taps at the rear end of which was shut ; from there to the front of the second vehicle on the train (an American car) all the taps were open, but the brake blocks throughout the train were hanging loose ; from the manner in which the Redfern carriage (the first vehicle) had telescoped into the American car, and also from the position of the front of the Redfern carriage upon the remains of what had been an ordinary goods' truck, it was absolutely impossible to see the taps on the Redfern carriage that night ; the screw couplings between the second and third carriages were so securely coupled that they could not be uncoupled that night ; I gave the order to uncouple those carriages about 10 minutes to 7 ; I also found the air couplings between those carriages all complete ; the taps were all open that I could see that night up to and including the second vehicle, with the exception of the one at the rear of the fifth carriage ; I found the second vehicle turned almost on its side, and the front vehicle telescoped about 20 feet inside it ; we uncoupled between the third and fourth vehicles ; I told a man to go in and uncouple, but not to turn the taps, and when he uncoupled the air-pipe no air escaped, showing there was no air in the reservoir ; if there had been the brakes would have gone hard on if the brakes had not been working ; from some cause or other the brake power had failed ; I remember Clissold saying that he released the brakes after leaving Hornsby ; if that is true it would show that the brakes were working then, and that there was air in the cylinder ; I cannot account for the absence of the air from the cylinders at Peat's Ferry only on the one theory that the air had become exhausted in going down the bank ; it could become exhausted by a too frequent use of the driver's brake valve, while he would be endeavouring to check the train, not to stop it ; I have witnessed experiments made on an engine fitted up with the Westinghouse brake, and the nature of the experiments was as follows :— The donkey going at full speed, and six manipulations of the drivers' brake-valve, the pressure of air was reduced

reduced from 88 to 40 lb. in $7\frac{1}{2}$ minutes; a further test was made with the donkey-stopped, and in two minutes the pressure was reduced from 64 to 20 lb. by six manipulations of the valve; the brake power would be practically inoperative with 20 lb. of air pressure; it would put the brakes on, but not sufficiently strong to place the blocks hard on to the wheels; 7 lb. of air would check the train, but when the brakes are put full on, the gauge falls to zero; when the pressure under the carriages in the reservoirs fall to 15 or 20 lb., the brake power is practically inoperative; I saw the positions of the first and second carriages, but I did not see the tap which has been produced here, but I have heard the evidence as to its condition and position when found, and from that, it is my opinion, had it been open before the collision, the collision must have closed it; if the air connections leaving Hornsby were not complete, the brake must have gone on if there was any air in the reservoir; and if any one walked through between the second and third vehicles at Peat's Ferry any time on the afternoon of the accident after it occurred, then the brakes on vehicles four and five must have gone in if there was any air in the reservoirs; the train getting away all right from Hornsby proves that the brakes were off; if the brakes were on any of the seven carriages before the two were added to them at that place, the train could not have got away, and it would have been discovered at once; the exact weight of the five carriages not under brake power was 26 tons 16 cwt., without the passengers; the weight of train under brake power was 123 tons 7 cwt., exclusive of passengers; there were twenty wheels without brake power, and forty-two under brake power.

By Mr. Williamson (on behalf of John Pye): I have taken a great interest in this case, and I am desirous of getting at the truth, and I have no desire to save the department from an adverse verdict either one way or another; I do not push myself forward as an expert on the Westinghouse brake, but I know something about it; I did not go to Mr. Moore for information about it; the Mr. Moore present is the one I refer to; I won't swear that the tap referred to as being found shut was not shut when the train left Sydney; if the evidence given be true that the air went through to the last vehicle before the train left Sydney the tap could not possibly be shut; I have heard it sworn that the two first carriages as the train left Sydney were never examined; I have heard it sworn that the first seven were tried before the other two went on; Werrick may have sworn that he was unable to say whether or not the whole of the brake power was in order that morning; I remember him saying that he had not time to examine the train that morning; I recollect him swearing that he only examined seven of the vehicles, and the air was in the last carriage, and I wish to add that the carriage under which the tap was found closed was the second last of those seven vehicles; I know Rohan's evidence about the connections between the second and third carriages, at 5 o'clock on the same afternoon; I have no hesitation, although I was not present in Sydney, that it is untrue; I know Mr. Shellshear, he is a civil engineer; I heard the evidence he gave as regards the position of the carriages; I will swear that his evidence as to the position of the carriages is true, but if he said it was impossible from the angle of the Redfern carriage for the tap to be turned in telescoping, I differ from him; I heard Clissold swear that after leaving Hornsby he had to get out and release the brake, that is not evidence that the air communications were not complete throughout the train; if Mr. Sheehan has sworn that it is evidence that the air was not complete throughout the train I differ from him; I have had experience in regard to the working of the Westinghouse brake on the Railways of New South Wales, and on the railways in Scotland before I came here, and I am practically, as well as theoretically acquainted with its working; if the brakes were hard on after leaving Hornsby going up the hill it would be an indication that there was air in the cylinders, nothing else; my theory is that the driver exhausted his air, and it is the only possible theory, although there is no direct evidence upon which I can base that theory; I have heard the evidence of Pye, where he said I found 75 lb. of pressure on the gauge, about 1 mile from the Ferry, and when he (meaning the driver) opened the valve it showed zero; if the driver had 75 lb. of air in his main pipe and sufficient air in the reservoir under the carriages, the brakes must have gone hard on, if connected; but if he had exhausted the air in the reservoir under the carriages very much, not having sufficient air in those reservoirs to apply the brakes, that 75 lb. pressure in the main pipe may have indicated that he had opened a communication between the main reservoirs and the carriages reservoir for the purpose of re-charging, so that 75 lb. pressure in the air pipe does not mean that there is 75 lb. in the reservoirs under the carriages; you may have 75 lb. in the main pipe, but only about 25 lb. in the reservoirs under the carriages—just sufficient to put the brakes on; the reservoirs under the carriages must be charged from the main reservoir, but the brakes must be off.

Question: If you were to apply the air-brake by reducing the pressure in the gauge, 25 lb., what time would it take before you would recharge going down this incline?

Answer: I say you could not re-charge your reservoir without releasing the brakes, and then you could re-charge; I have heard Pye's evidence as to the gauge showing about 90 lb. pressure after leaving Hornsby, and the driver having to ease the steam to the donkey to prevent the pressure rising to a much higher point for fear of bursting the pipe; that showed that he had more than sufficient air to work his train if his air connections were complete throughout the train; if the driver did not put full steam on to the donkey again it would prevent it from supplying the air so quickly; I know the donkey was found working in the river; one application of the brakes was sufficient to stop the train descending this incline; the donkey was able to supply all the air that was required, but I would not attempt to say it could make air so fast as it might be used; if the fireman has sworn the driver had 90 lb. pressure going down the incline and 75 lb. pressure within a mile of Peat's Ferry, I could not swear whether he had judiciously or injudiciously used his air, but I say, as I have already explained, that although he had 75 lb. pressure in his main pipe, it does not by any means follow that he has 20 lb. of pressure in the cylinders under the carriages.

Sworn and made before me at Sydney,)
 this 8th July, 1887,—)
 HENRY SHIELL, J.P., Coroner.

DAVID KIRKCALDIE.

Inquest adjourned till 9 o'clock on the forenoon of Monday, the 11th July instant, to be resumed at the Redfern Railway Station, to enable the jury to examine the wheels of carriage next the engine on its arrival at Peat's Ferry, and from thence to the Court-house, Darlinghurst, for the production of further evidence.

Sydney, 8th July, 1887.

H.S., C.

Inquest

Inquest resumed at 9 o'clock on the forenoon of Monday, the 11th July instant, at the Redfern Railway Station, where the jury examined the wheels of the carriage next the engine, on its arrival at Peat's Ferry, after which the inquest was resumed at the Court-house, Darlinghurst.
Sydney, 11th July, 1887.

H.S., C.

Richard Milton, on oath, states :—

I reside in Alexandria, and am a labourer in the Railway Department ; I went to Peat's Ferry on the morning of the 22nd June last, arriving there about 6 o'clock in a special train with other workmen ; when I got down there I saw the engine in the water ; I saw that the two first carriages, a Redfern carriage and an American car, were telescoped, and had a tendency to lie on their side between the second and third carriages ; the buffers were interlocked, and the screw couplings were connected ; it would be impossible for a man to walk through between the two carriages as I saw them ; one buffer had to be taken off before the carriage could be pulled apart ; I undid the screw couplings between those carriages ; I noticed the air connections between those carriages ; they were hanging down loose ; no man could have walked through between those carriages before I undid them ; it would have been impossible for anyone to do so ; I was acting under the instructions of Foreman Bingham, and he was present at the time.

By Mr. Williamson (on behalf of John Pye) : I do not know a man named Rohan ; I did not examine the taps ; I am sure the air-couplings were hanging loose ; I saw that the Redfern carriage had been driven into the American car ; I did not observe how far the rear end of the Redfern carriage was above the floor of the American car ; I did not examine the wheels ; I do not know Mr. Hulme, an engine-driver.

By the Foreman : I was sent by the foreman to uncouple the couplings between the second and third carriage, and the chain couplings were attached ; I had to uncouple them ; the third carriage was standing on its wheels, and one of the buffers of the third carriage was interlocked with one of the buffers of the second carriage.

By a Juror : The screw couplings were slightly bent.

RICHARD MILTON.

Sworn and made before me, at Sydney, {
this 11th July, 1887,— }

HENRY SHIELL, J.P., Coroner.

David Kirkcaldie, re-called, on oath states :—

By Mr. Rogers (in the public interests) : I noticed the brake-blocks loose on the third, fourth, and fifth carriages ; the main air connection was complete under No. 3 carriage, although the air was not acting on the blocks for the reason already mentioned.

By Mr. Simpson (for Westinghouse Brake Company) : From the top of the incline to Peat's Ferry the distance is about 6 miles ; if the train had gone down the incline from the tanks at the rate of 20 miles an hour, it would take it about 10 minutes to reach Peat's Ferry ; I should say that the train took about 15 or 16 minutes to descend the whole incline ; if the fireman's evidence is correct, that the driver had 90 lbs. pressure in his air gauge shortly after entering upon the descent, that fact is reconcilable with my theory ; if the driver had to ease the steam to the donkey to prevent him burst the main air-pipe, he must have had plenty of pressure then in the reservoir to control the train ; I am aware that the fireman has sworn that he saw the driver ease the donkey in order to prevent the pressure increasing to such a point as to probably cause the pipes to burst ; if that evidence is correct it is reconcilable with my theory ; I account for the driver not having sufficient air to control his train in the latter portion of the descent by a rather too frequent use of his air between the top of the hill and the tanks for the purpose of steadying his train a distance of about $3\frac{1}{2}$ miles ; that would take him 10 or 11 minutes ; the donkey would have been compressing air all the time ; before the driver could have exhausted his air in that distance he would require to manipulate his valve five or six times ; I did not hear the fireman swear that he only saw the driver use his valve once or twice in that distance ; if he had only done so once or twice, he could not have exhausted the air ; assuming that the driver had only manipulated his valve two or three times during that time, my theory falls to the ground, and the accident will have to be accounted for in some other way ; so far as the evidence in this case goes, and if my theory falls to the ground, the only other cause that could be assigned is that one or more of the taps upon the main air-pipe must have been closed ; those taps are not absolutely necessary for the working of the Westinghouse brake, but they are absolutely necessary for railway work ; the Westinghouse brake is complete without those taps, but in order to facilitate shunting and railway work they are absolutely necessary, and are put on for those purposes ; if my theory is correct, it does not show that there was any defect in the Westinghouse brake, but the accident would be caused by an injudicious use of the brake by the driver.

By Mr. Rogers (in the public interest) : The Westinghouse brake taps are recommended by the Westinghouse brake people themselves, and it is in accordance with those recommendations they are put on ; if the driver showed 75 lb. of air pressure when within a mile of Peat's Ferry it showed an injudicious use of air ; he should have only shown zero ; if a sudden application of the brakes had been made it would not, I don't think, account for the looseness of the blocks.

By a Juror : I should think the driver would have pulled up the train by means of the air brake when he ran back after leaving Hornsby, and if he had found it not working he would have got down and examined it.

By another Juror : If the tap was turned off the main pipe under the carriages near the engine, of a train, and the donkey working, would the gauge show a high increasing pressure if the driver was not using his valve ? *Answer* : Yes ; but the very same result would follow if the reservoir under the carriages were fully charged with air, no matter what the length of the train was.

By the Foreman : I cannot give you the power of the engine ; the weight of the carriages was 90 tons ; I do not think that 12 miles an hour was too fast to go down this incline ; it is possible for the donkey to have stopped of its own accord descending the incline, and the collision may have started it again.

By Dr. Sly (on behalf of the Commissioner for Railways) : Supposing the Westinghouse brake was only acting on the engine and first carriage, I would have expected to have found considerable evidence of "skidding" on the wheels of the first carriage. I have seen the wheels of that carriage, but I saw no evidence of "skidding" on them. I saw the wheels of the engine ; they show no evidence of "skidding" that was caused by the reversing gear.

Sworn and made before me at Sydney, {
this 11th July, 1887,— }

DAVID KIRKCALDIE.

HENRY SHIELL, J.P., Coroner.

By

John McCarthy, on oath, states:—

By the Coroner: I am a shunter in the Railway Department; I remember, on the 21st June last, shunting seven carriages into the platform at Sydney about twenty or twenty-five minutes past 10 in the morning; I brought them down to the station; I was on the American car at the rear of the train next the buffer stops going into the station; I was in the act of putting the hand-brake on when some one at the other end of the train put the air on, and made my hand-brake useless; I believe it was shunter Durham that applied the air; I have since learned so; that showed me that the air was working up to the carriage I was on; the carriages I refer to were the first seven that were going to Peat's Ferry.

By Mr. Williamson (solicitor for John Pye, fireman): I asked Durham why he put the air on, as it was an unusual thing to do.

By the Foreman: I shunted those carriages by order of the foreman.

Sworn and made before me, at Sydney, }
this 11th July, 1887,— }

JOHN MCCARTHY.

HENRY SHIELL, J.P., Coroner.

Alfred Vincent, on oath, states:—

By Mr. Williamson (on behalf of John Pye): I reside at Kelnworth House, Golden Grove-street, Redfern, and am an engine-driver, employed on the Government Railways; I recollect going to Peat's Ferry with the relief train on the 21st of June last; I arrived there about 6:35 p.m.; I saw a train there, that had met with an accident that day, but I made no examination of it that night; about 11 o'clock on the following morning I made an examination of carriages 1 and 2, and found the Redfern carriage, No. 114, telescoped into the American car, No. 47; I did not see the rear end of carriage 114, but I saw the leading end of No. 47 car, and the supplementary reservoirs and brake gear of that car greatly knocked about, and I saw the main through-pipe broken off nearly up to the reservoir, and with the tap closed, the flexible hose being in good condition; I took charge of the main through-pipe, and the one now before the Court is the same, and the tap is in the same position now on that pipe as it was when I found it; I cannot say if the two flexible pipes had been connected; the pipe was under the floor of the American car at its leading end, and the Redfern carriage was inside the American car; I made no further examination; from the position of the two carriages it might be possible that the tap was closed by the concussion, but very improbable; I have been on this road for some time; I ran the opening train there, and have had considerable experience of that road, having run on it frequently; going down the incline, after passing Hornsby, to Peat's Ferry, I have always had the train under the control of the Westinghouse brake; if I had 90 lb. of air pressure at the commencement of the incline and only four vehicles connected with the air-brake, it would be impossible for me to exhaust my air before reaching Peat's Ferry if the donkey was working all right; I have been four years and a half driving an engine fitted with the Westinghouse brake; I have driven between Sydney and Goulburn on the Southern line, where there are some gradients of 1 in 30, and I never knew the air to become exhausted when the donkey was working; supposing there were 90 lb. pressure and the donkey not working at the commencement of the incline it would take seven applications of the brake to exhaust that air; supposing the driver had 75 lb. pressure on his gauge about a mile from the Ferry, it would show that he had 75 lb. of air pressure throughout the train as far as his air connections extended; if the driver showed 75 lb. pressure and the driver were to open his valve and the gauge showed zero, it would prove so far as the tender was concerned, that the brakes were operating, and if the brakes had no effect on the train it would show that the air connections were not made complete; if the air communications were complete and the brakes hard on, about a mile from the Ferry, descending a gradient of 1 in 40 with the engine reversed, the driver could have pulled the train up in about 600 yards; if Mr. Kirkcaldie has sworn that if the gauge showed 75 lb. there might be only 25 lb. of air in the supplementary reservoirs or main reservoir, it is not possible; there must be the same pressure throughout the train if the taps are all open and the driver's valve in a release position; I have gone down with a heavier train than the one in question; I went down with a total of fifteen carriages with brake-power right throughout the train; I had six American cars on the train and one guard; I had no difficulty in taking that train down; if the gauge showed 75 lb. air pressure and four vehicles under air-brake control, the driver would have to release and recharge before he could bring his train up in going down a gradient of 1 in 40; that would take him about 20 seconds; supposing $3\frac{1}{2}$ miles from the Ferry the driver reversed his engine and said the train was from under his control, the air connections could not have been complete; if the driver applied his air the momentum would decrease; if the connections were not made complete, the momentum would increase; I saw Mr. Loughry at Peat's Ferry both on Wednesday morning and also on the Tuesday night; he told me to take charge of all broken pipes and I told him about the pipe produced and the condition I found it in; I told him that the pipe underneath 47 car was lying there, and that I found the tap shut—that was on Wednesday; he made no reply; having heard the evidence and from my experience as driver, and considering that the driver had 75 lb. of air when a mile from the ferry, and 90 lb. on entering upon the descent, and the gear of the engine being reversed, I attribute the accident to the incompleteness of the air connections; I think they could not have been properly made.

By Dr. Sly (on behalf of the Commissioner for Railways): I left Sydney about 4 o'clock on Wednesday morning, and reached Peat's Ferry about 6 o'clock, and I saw the pipe produced about 11; I took down a special train of workmen and from 6 to 11 they were engaged clearing away portions of the wrecked train, including those two carriages; there were over a dozen men so employed; those two carriages when I saw them on the Wednesday at 11 o'clock were in the same position as when I saw them on the previous night; the men during the morning were engaged clearing the debris from inside the American car, and I was engaged trying to pull some carriages on to the rails by means of a locomotive tire; I told Mr. Loughry about the pipe (produced), and that the tap was close, and he saw it closed; I did not tell anyone else down there; I told Mr. Downes about it when I returned from the Ferry on Wednesday; he was down at the Ferry, but I did not mention it to him there; if Mr. Loughry, Mr. Shellshear, and Mr. Kirkcaldie have sworn that tap was open on Tuesday night I will not swear it was not; at the time I found the tap open the other carriages were disconnected from the two front ones; but the men had not commenced to separate those two, they were taking debris from inside American car.

By Mr. Rogers (in the public interests):—The men had not commenced to work underneath those two carriages when I saw the tap open; I found the pipe (produced) lying under the second carriage, and the end at which the tap was at was about 18 inches off the ground at one end; the men could walk up to and about where the pipe was.

Ry

By a Juror: The leading end of 114 carriage was resting on the fore part of a "D" truck.

By a Juror: I have seen the engine of the wrecked train; the engine I took down the fifteen carriages to Peat's Ferry was a more powerful one; it was a six-wheeled couple engine.

By Mr. Williamson, solicitor (on behalf of John Pye, fireman):—I recollect the time Mr. Loughry left the Government service.

Sworn and made before me, at Sydney, }
this 11th July, 1887,—

ALFRED VINCENT,

HENRY SHIELL, J.P., Coroner.

Inquest adjourned till 10 o'clock in the forenoon of Tuesday, the 12th day of July instant, at the Court-house, Darlinghurst, for the production of further evidence.

Sydney, 11th July, 1887.

H.S., Coroner.

Inquest resumed, in pursuance of adjournment, at 10 o'clock in the forenoon of Tuesday, the 12th day of July, instant, at the Court-house, Darlinghurst.

Sydney, 12th July, 1887.

H.S., Coroner.

John Pye, recalled, on oath, states:—

By a Juror: We were stuck once after leaving Hornsby, and had to run back and make a fresh start; I put on the hand-brake to pull the train up on that occasion, but I cannot say whether the driver used the Westinghouse brake or not; we let the train run up the next incline; I could not from my position on the engine say whether the Westinghouse brake was used or not.

By another Juror: I cannot say who coupled the two carriages to the engine when we went back to the cutting for them.

By the Foreman: I do not remember making the remark, after leaving Ryde, that I thought the donkey would fail; I may have done so; I cannot say that if any of the brake blocks on either the engine or tender had got broken when descending the incline at such a high rate of speed my attention would not have been called to it.

By Mr. Simpson (on behalf of Westinghouse Brake Company): After I lubricated the donkey it worked all right after that.

By a Juror: I cannot say whether the Westinghouse brake was in working order or not after we left Hornsby.

By Mr. Rogers (in the public interest): I remember seeing the air gauge showing 90 lbs. air pressure at the brow of the hill when we were commencing the descent; I saw it afterwards showing 75 lbs.; I saw the driver apply the air-brake on rounding the curves, but I cannot say if the train was steadied by the Westinghouse brake or hand-brake; when we got over the brow of the hill we were going at the rate of 12 or 14 miles an hour, and we went down the first part of the descent at about the same rate; after we got over the top of the hill and commenced the descent, I put the hand-brake on the engine; the air brake was working on the tender after we passed No. 2 tunnel, and I saw the driver release the brake, and the air-gauge showed 75 lbs. pressure; he applied the brake again immediately after releasing it, and it was then he said the train had got away from us.

By a Juror: It was about the time he released and applied the brakes again that he said the train had got away from us, and he applied the reversing gear to the engine just after we passed the tanks, and kept it applied.

By Mr. Williamson (on behalf of John Pye): If the driver finds that the Westinghouse does not act in the first instance, I think it is his duty to apply them again; if the first application had the desired effect to either stop or steady the train it would not be necessary to apply the brakes a second time; the donkey engine was working all the time after we commenced the descent till we reached the Ferry; I have no doubt about that; the gauge showed 90 lb. pressure at the top of the hill, and 75 lb. just after we got through the second tunnel, and the donkey was working all the time; I do not think it would be possible to exhaust the air; I saw the driver apply the air-brake after we passed the brow, but I cannot say how many times he applied it before we reached the first tunnel; from the way in which he used his brake, if the air connections had been complete throughout the train, there would have been no difficulty in stopping her; on descending the incline when he applied the air-brake I did not observe any effect from the application only in rounding the curves, but whether that was attributable to the Westinghouse brake or hand-brake I am unable to say; on going round the curves I kept the hand-brake hard on, and from the time the driver reversed the engine till the accident I kept it as hard on as I could without causing the engine wheels to skid; previous to leaving Hornsby I noticed the gauge showed about 60 lb. air pressure; after we coupled up the two carriages there I saw the gauge showing an increase of air power; I cannot say what pressure of air we had between Sydney and Ryde; the air-brake seemed to work all right between those places; it pulled us up at the stations; I should think the increase in the gauge of air pressure would show that the air connections were not all right; I have been as far as Blacktown on the Western Line on a train fitted with the Westinghouse brake; I noticed before reaching the brow of the hill after leaving Hornsby that the driver had to ease the donkey to stop the increase of air pressure; the air-brake is fitted up on the tender, and every time the driver applied the air I saw the tender brake rise, which shows, so far as the tender was concerned, that the air-brake was working, and that there was sufficient pressure of air.

By Dr. Sly (on behalf of the Commissioner for Railways): I have been a fireman about three years and six months; I have been about two years on a passenger train; out of that time the furthest I have been on a passenger train was Blacktown; I have not been on them on steep gradients, and I have not been accustomed to seeing drivers use the air-brakes going down steep gradients; I saw the handle on tender brake rise after we passed through the second tunnel, and I also noticed it rise within $\frac{1}{2}$ mile or $\frac{3}{4}$ mile from the station; I never wrought the Westinghouse brake myself; after commencing the descent I applied the hand-brake on the engine, and attending to that I did not notice how often the driver applied the air-brake; I cannot tell the length of the first tunnel; I did not notice the driver applying the air-brake in it; I cannot positively say what the air pressure was after recoupling at Hornsby.

- 4 { *By a Juror*: If the engine had been stronger and able to take the train on to its journey's end without disconnecting I do not think the accident would have occurred.
- 4 { *By another Juror*: The only reason we could not get up the inclines, in my opinion, was that the engine was not strong enough for the load; we had plenty of steam; the driver reversed his engine before he said the train had got away from us; if the wheels had been skidding and the brakes were holding the train would have gone down quicker.
- 5 { *By Dr. Sly* (on behalf of the Commissioner for Railways): Assuming that all the air connections were complete, the weight of the engine would have nothing whatever to do with the accident.
- 5 { Sworn and made before me, at Sydney, } JOHN EDWIN PYE.
this 12th July, 1887,—
- HENRY SHIELL, Coroner.

William Thomas Dodds, on oath, states:—

By Mr. Rogers (in the public interests): I am foreman to Mr. T. Williams and Company, boot manufacturers, 278, George-street; on the 21st June last I was a passenger from Sydney to Peat's Ferry in the train which met with the accident; I remember two of the carriages being left behind in a cutting near Beecroft; I was in the second carriage of the original train; I got in at Petersham; after the carriages were disconnected at Beecroft, I saw the fireman Pye going along the whole length of the train examining them, the carriages, and I saw him put his hand under, I think, the third carriage from the engine and do something; the man now before the court, John Pye, is the fireman, I believe; I saw him come along from the rear of the train from behind what was the then end carriage, and went to his place on the engine; we went on to Hornsby and waited there till the two carriages that were uncoupled were brought up by the engine, when they were coupled on in front, and the carriage I was in then became the fourth from the engine; when I saw Pye do what I have stated I was standing on the left hand side of the carriage looking towards the engine; I noticed that the coupling was made at Hornsby, but I do not know who coupled; I saw the guard superintending the coupling; I saw him first standing on the permanent way; then he walked up to a carriage and stood against the buffers; I was still standing in the same place as before; I am accustomed to railway travelling; I travel daily between Sydney and Petersham; the train went on from Hornsby and stopped at the platform at Carlingford to let passengers out, I believe; that is my impression; I am certain we stopped on the other side of Hornsby, but for what purpose I do not know; I did not notice anything on stopping there; we went on again and did not stop again; I noticed nothing more after that till I observed we were entering a tunnel, which I believe we entered with steam on the engine; I noticed that steam was shut off in the tunnel; we were then running at about 30 miles an hour, and the speed kept increasing and kept on increasing; and we went through No. 2 tunnel, the train attaining greater speed as she went on; I was sitting down in passing through the tunnels, but was next the window; we came to No. 3 tunnel and we passed through the latter part of it at about 40 miles an hour, the train rocking very much; on getting out of that tunnel I got up; the speed seemed to increase much more, and the train went round one or two curves; and I saw the engine at one of them, and there seemed to me to be steam coming from underneath her and dust-coloured smoke coming from under the first and second carriages as if the wheels were skidding or the brakes were very hard on; when I first noticed the engine the wheels appeared to me to be going round with the force of the engine going down the incline; the steam coming from under the engine stopped, to the best of my recollection, before I saw the dust coming from under the first and second carriages; about a second or two after I saw the smoke from under the carriages I saw Peat's Ferry Station; I was still standing with my head slightly out of the window; I saw Mr. Hankin, who was in the same carriage as I was in, get up off the floor, make some remark to his friends and went to the door; I understand the sensation that is felt on the application of a brake to a carriage I am in; I first became aware that I was descending an incline going through the second tunnel; the brake was never applied to the carriage I was in from the time I saw steam shut off at the first tunnel till the accident took place; I did not notice its application to my carriage between Hornsby and the first tunnel.

By Mr. Williamson, (on behalf of John Pye): I did not observe any water tanks; I was looking out at the left hand side; I did not observe a man on that side as we were descending; I cannot say I heard the engine whistle in the first tunnel, but it was whistling right through the second, and continued to do so till within a few yards of Peat's Ferry Station; I saw the engine; I did not notice anyone on it; my impression is that the smoke-coloured dust that I saw was coming from the first carriage, and rolling out from under the front part of the second, but I did not see it the whole length of the second carriage; when I heard the train continuously whistling, I thought it was to clear the line, but I did not know what for; I believe I saw steam coming from the smoke-stem of the engine: I swear the steam was not coming from the steam escape-valve; I was looking out at the window before entering the first tunnel, and it was just as the engine entered it I saw steam coming from the smoke-stem of the engine; I cannot say that I saw any smoke with the steam more than usual; the steam seemed a light-coloured grey; I caught a momentary glance of the engine as she entered the tunnel, and the steam came from the top—not from below,—but I cannot say that I heard it; at no time descending the incline did I feel the brake operating upon my carriage (No. 4); I saw the fireman go to carriage No. 3 in the cutting; I believe it was No. 3, and behind it I saw four open second-class carriages, and the carriage I saw the fireman put his hand on became No. 5 going down the Peat's Ferry, after recoupling; I saw the guard leaning against the buffer when the connections were being made at Hornsby, but I was not in a position to see if it did anything; I did not see more than two persons interfering with the couplings; I know the Station-master at Hornsby by sight; I did not see him do anything to the train while it was there; I saw a man at the points; I believe it was him; I did not see him approach the couplings.

- 20 { *By Dr. Sly* (on behalf of the Commissioner for Railways): After leaving Hornsby and before entering No. 1 tunnel I did not notice either one way or another whether the brakes were applied to the carriage I was in.
- 20 { Sworn and made before me, at Sydney, } W. T. DODDS.
this 12th July, 1887,—
- HENRY SHIELL, J.P., Coroner.

John Pye, recalled, on oath, states :—

By Mr. Williamson (on behalf of John Pye) : I have heard the evidence of Mr. Dodds as to my being off the engine in the cutting ; I now recollect getting off and going down the train, inspecting the carriages, and I found one of the brakes on and I released it ; I may have looked at the blocks ; I found the blocks on the wheels of one of the carriages hard on ; that was one of the seven carriages before we left for Hornsby ; I put my hand under it to the release tap and released the blocks, otherwise we could not have started ; I could not say what class of carriages were immediately behind that carriage ; we tried to start but found the engine could not move the seven carriages, and I got off to see the cause ; we had full steam on at the time ; before I got down the driver had his air-valve released, and finding we could not start I went down and inspected the carriages myself, and as far as I went I found all the carriages released except this one on which I found the blocks hard on.

By Dr. Sly : When we stopped at Beecroft the driver put the air-brake on before separating the train, and I expect it was it that put the blocks on the wheels which I had to release. } 15

By Mr. Williamson (on behalf of John Pye) : It often happens that the blocks, after being applied by a driver at a station, won't release themselves, and some one has to release them.

By a Juror : The guard, myself, and the driver were all sober on this day.

Sworn and made before me, at Sydney, }
this 12th July, 1887,—

HENRY SHIELL, J.P., Coroner.

JOHN EDWIN PYE.

Edward Andrew Laughry, recalled, on oath, states :—

By the Foreman : I am Inspector of Rolling Stock ; I have not examined the engine and tender of the wrecked train since she was taken out of the water ; I have the wheels of both since ; I don't know of anyone who has examined the engine and tender ; I am not aware that 9 or 10 feet of a driving side road and a brake-block are missing from either the engine or tender.

Sworn and made before me, at Sydney, }
this 12th July, 1887,—

HENRY SHIELL, J.P., Coroner.

E. A. LAUGHRY.

Edward Andrew Laughry, recalled, on oath, states :—

By Dr. Sly (on behalf of the Commissioner for Railways) : I gave no instructions to Mr. Vincent about the pipe produced ; I gave him some broken pipes to place in his engine and deliver to me at Sydney, which he did ; I found the pipe produced on the night of the 21st ultimo ; it was in its place on the vehicle, with the tap open ; I also saw it on the Wednesday morning before the men commenced to clear the wreckage away ; the tap was open then ; the men commenced first thing in the morning, about 6 o'clock, to clear away the underneath gear on the two carriages which had been next the engine, and by 11 o'clock the bogies had been taken out, as also was the pipe produced.

By Mr. Williamson (on behalf of John Pye) : If Vincent has sworn that at 11 o'clock on the Wednesday morning he found the pipe suspended to the vehicle, it is untrue ; Vincent told me on Wednesday last that he found the pipe lying on the side of the road, and that when he first took charge of it, it had been loaded on a truck ; this conversation took place between us in the presence of Mr. Downes and Mr. Cobb ; there was no importance attached to the pipe, and I did not think it was necessary to produce it ; I think Vincent said the tap was closed when he found the pipe ; Vincent might have said at the conversation, "I have just mentioned that the pipe produced was included amongst the things I told him to bring from Peat's Ferry ;" the tap at the front end of the carriage, which was next the engine, is missing ; the pipe is at the Redfern Station ; I have searched all about the wreckage for the taps ; the main pipe was broken off short up against the tap ; I have seen the hose coupling ; it is at Redfern Station ; the hose-pipe belonging to the engine was still on the engine ; it went into the river with it ; the hose coupling belonging to the carriage was broken about 6 inches from the main pipe ; I did not find the portion that was broken off ; there was a diver there ; I did not think it was essential to make a further search for the broken portion than I have made.

Sworn and made before me, at Sydney, }
this 12th July, 1887,—

HENRY SHIELL, J.P., Coroner.

E. A. LAUGHRY.

William Henry Warren, on oath, states :—

By Mr. Rogers (in the public interest) : I am a Professor of Engineering at the Sydney University of Sydney, and was holder of the Whitfork Scholarship, looked on in England as one of the highest scholarships. The brake-power necessary to control a train weighing about 167 tons, including passengers, descending a gradient of 1 in 40 at the rate of 25 miles an hour, would be 26 tons, but that would not stop it, and it would require about 40 tons brake-power to control a train descending the same gradient at 40 miles an hour ; if there were a train of nine carriages, five of which were under brake-power, it would not make the slightest difference to the retarding power, no matter what part of the train those carriages were placed ; the power of the engine has nothing whatever to do with a train descending an incline, the train descends by gravity ; the engine only has to control it ; the heavier the train the more power would be required to control it ; supposing an engine weighed (say) 70 tons, with the brake-power on the engine and tender, that would have more effect in controlling a train than an engine of 50 tons with the brakes applied in the same manner ; supposing the air-gauge shows 75 lb. pressure it does not necessarily show that there is 75 lb. pressure in the reservoirs under the carriages, even although the donkey was working ; the air would not pass into the reservoirs much quicker, even if the gauge were to show 90 lb ; you could apply about 55 lb. pressure in about 50 seconds to the reservoirs.

By a Juror : The pressure would show about the same on the gauge in the guard's van as it would show on the gauge on the engine, but that would not show either the driver or guard that they had the same amount of pressure in the reservoirs under the carriages as shown on their gauges ; assuming that the driver had 90 lb. of air pressure at the commencement of a descent, and after descending about 4 miles,

miles, the gauge were to show 75 lb. pressure, would that show a judicious or injudicious use of his air supposing that were so, it would show an injudicious use of his brake; it would show that he had taken his brakes off.

By a Juror: From the weight of this train I think it had sufficient brake-power, providing everything was in good order; it is desirable that Railway Stations should be constructed at places where the roads are near level as possible.

Sworn and made before me, at Sydney, }
this 12th July, 1887,—

W. H. WARREN.

HENRY SHIELL, J.P., Coroner.

Inquest adjourned till 10 o'clock on the forenoon of Wednesday, the 13th day of July instant, at the Court-house, Darlinghurst.
Sydney, 13th July, 1887.

H. S., Coroner.

Inquest resumed at 10 o'clock on the forenoon of Wednesday, the 13th day of July instant, at the Court-house, Darlinghurst, for the production of further evidence.
Sydney, 13th July, 1887.

H. S., Coroner.

By Mr. Williamson (on behalf of John Pye): William Henry Warren, recalled, on oath, states:—When I said 26 tons of brake-power was sufficient to control this train I mean 26 tons of brake-power applied to the wheels; I have had some experience of the working of the Westinghouse-brake; I have ridden on the engine some dozen times, and the driver has used the brake under my observation; if the first vehicle weighed 17 tons 10 cwt. and 3 qrs., and had eight wheels, and the brakes were hard on (at full pressure), going at the rate of 25 miles an hour, descending a gradient of 1 in 40, it would take a total of about 22 tons brake-power to stop it in about 400 yards.

Question: What amount of brake-power would it take to stop a train weighing 170 tons descending a gradient of 1 in 40 at the rate of 25 miles an hour? *Answer*: It would require about 100 tons to stop it in about 400 yards. My first answer is over-stated, and I correct it by saying that about 20 tons brake-power would stop that carriage in about 400 yards.

Question: If the second carriage weighed 16 tons 10 cwt. 3 qrs., descending the same gradient and at the same rate, to be stopped within 400 yards, and having the same number of wheels, what amount of brake-power would it require to stop that carriage? *Answer*: Say 19 tons brake-power. I understated the brake-power necessary to stop the whole train on the same data as previously given; it would take about 120 tons to stop it in about 400 yards.

Question: If the third carriage had eight wheels, and weighed 13 tons 8 cwt. and 3 qrs., travelling down the same gradient at the same rate, what amount of brake-power would it require to stop it within 400 yards? *Answer*: Say 14 tons. If the fourth carriage had eight wheels, and weighed about the same as the second, descending the same gradient at the same speed, it would require about the same brake-power to stop it in 400 yards—19 tons.

Question: If that were the only brake-power on a train of nine vehicles descending the same gradient at the same speed, would that be sufficient to stop the train if it weighed 90 tons exclusive of the passengers in 400 yards? *Answer*: No, it would require a little more; 90 tons of brake-power would stop it in that distance.

Question: If it takes 90 tons of brake-power to stop a train weighing 90 tons, going down a gradient of 1 in 40 in 400 yards, how do you account for saying that it would take 120 tons brake-power to stop a train descending the same gradient at the same rate of speed, and weighing 170 tons? *Answer*: I am 50 tons out in proportion, it would take 170 tons to stop a train weighing 170 tons in 400 yards.

Question: If the engine and tender have fourteen wheels, and weighed 60 tons descending the same gradient at the same rate of speed, what amount of brake-power would it require to stop it in the same distance? *Answer*: 60 tons would pull it up.

Question: Supposing the first carriage as I have stated require 20 tons brake-power, the second 19 tons, the third 14 tons, and the fourth 19 tons, making a total of 72 tons on the four carriages, and the engine described requiring 60 tons, making a total for the whole train of 132 tons, would that be sufficient brake to stop a train weighing 170 tons descending a gradient of 1 in 40 in 400 yards, if travelling at 25 miles an hour? *Answer*: No.

I was five years in the North-western Railway, England; I have repeatedly travelled and seen the trains leave the stations; I have seen a passenger train leave without a brake-van, but it is not usual; I believe the Board of Trade insist upon a brake vehicle being attached to the rear of every train; the object of a brake vehicle at the rear of the train is mainly used to control it; there is no special advantage in having it at the rear of the train; I don't think it operates any better there in regard to the brakes; I am not aware that the Board of Trade, England, insist upon one brake vehicle to every four carriages; but I know they insist upon one to so many carriages, consequently the longer the train the more brake vehicles; in England, to a train of nine vehicles there would be two brake vehicles required; I have had some experience of the Westinghouse-brake.

Question: What absolute pressure of air is required in the main reservoir to enable the driver to start the train with the brakes hard on, if he had 85 lb. pressure in the reservoir underneath the carriages? *Answer*: Practically, 85 lb.

Question: How many times can the Westinghouse-brake be applied with full force with 95 lb. pressure in the auxiliary reservoirs without recharging, and the applications successive, and the reservoirs the same size as they are here? *Answer*: Five applications with full force would reduce the pressure from 90 to 30 lb.

On descending an incline of 1 in 40 the brakes would have to be taken off and put on again to graduate the speed; one application of the driver's valve with 90 lb. pressure would stop the train; if it took five applications with full force to reduce the air 90 to 30 lb., it would take ten half manipulations to make the same reduction.

Question: If the driver had 90 lb. pressure at the commencement of the descent, how many manipulations would it take during the time the trains travelled a distance of 4 miles down a gradient of 1 in 40 to reduce the pressure 75 lb.? *Answer*: Two half manipulations or one whole; one half a manipulation would reduce the pressure about $7\frac{1}{2}$ lb.; the donkey could pump that amount into the main

main reservoir in at least five seconds; I said yesterday that if the driver had 90 lb. pressure at the commencement of the descent, and after travelling $2\frac{1}{2}$ miles had 75, that he used his air injudiciously—I mean he must have reduced his pressure in his auxiliary reservoirs by more than that amount in the distance travelled on an incline of 1 in 40, and therefore an application with 75 lb. in the main pipe would take off the brakes.

Question: If the gauge showed 90 lb. at the commencement of the descent, and the air connections were incomplete between the first and second carriages, and several applications of the brake-valve had been made by the driver, and the gauge showed 75 lb. after travelling $2\frac{1}{2}$ miles, would that not show that the air connections were incomplete? *Answer*: No, the air gauge is no indication of the amount of pressure in the auxiliary reservoirs.

Question: Supposing the driver was going down a gradient of 1 in 40, and the gauge showed 75 lb. pressure, how long is he compelled to look at the gauge before he can tell that there is the same pressure in the auxiliary reservoirs? *Answer*: That will depend upon the pressure in the auxiliary reservoirs, and whether the brakes were on or off.

Question: Supposing the brakes were off and he had 25 lb. in his auxiliary reservoir, and the donkey engine working in the ordinary way? *Answer*: It would take the driver about three minutes to tell that he had the same pressure in his auxiliary reservoirs.

Question: If the driver had 25 lb. of pressure in the auxiliary reservoirs, and 75 on the air gauge, how long would it take the air to equalise itself? *Answer*: About one minute.

Question: If this train had $3\frac{1}{2}$ miles to travel, and the engine gear were reversed, and 50 lb. pressure throughout, the train travelling at the rate of 25 miles an hour down a gradient of 1 in 40, and having 170 tons to control, and the hand-brake power being 38 tons and hard on, could it be pulled up within a mile? *Answer*: Yes, certainly.

Question: If the gauge showed 75 lb., and went to zero on being applied, would it show, as far as the tender was concerned, the brakes were on? *Answer*: Yes; it would be on the tender and train, assuming the connections were complete.

Question: If the gauge showed 75 lb. pressure, and on being applied went to zero, and air brake went with full force on to the tender and engine, and not upon the train, does that not show, amongst other things, that the air connections are not complete? *Answer*: Not necessarily so, but it would be one of the indications; it might also show that the triple valves were not working properly; but if the brakes were off all the carriages, and in perfect order, it would show unmistakably that the air connections were incomplete.

By Dr. Sly (for the Commissioner for Railways): The longer the distance, the less brake force necessary to stop a train, therefore it would require less brake force to stop a train in 500 or 600 yards than it would require in 400 yards; it is possible and I have seen it so that there might be only 20 or 25 lb. of air in the carriage reservoirs while the gauge showed 75 lb. on the engine; 75 lb. air pressure on the gauge on the engine does not show that there is 75 lb. air pressure throughout the train as far as the air connections extend; it is possible to exhaust the air from the carriage reservoirs in a long descending gradient by applying the brakes too frequently.

Question: Supposing the connections (air) were severed between the first and second carriages by the accident—what effect would that have on the vehicles behind those two if there were air in the carriage reservoirs? *Answer*: If there was air, the brakes would go hard on.

Question: If the blocks were found off the uninjured carriages immediately after the accident, what would that indicate? *Answer*: It would indicate there was no air in the reservoirs, if the air connections were complete.

Question: Assuming there was sufficient in proportion to the weight of the train of brake power on the carriages and engine, the train would be easier controlled with a light engine than by a heavy one. } 7

By the Foreman.—*Question*: The train in question had a distance of 6 miles to run down a gradient part of which was 1 in 40, say at the speed of 20 miles an hour, the indicator showed a pressure of 90 lb., of air on the summit of the gradient; the driver applied all available brake power at the commencement of the descent, and finding the brake power had no control over his engine, at $2\frac{1}{2}$ miles distance from the summit he reversed his gear—would the indicator then show a loss of air, and what would be the loss? *Answer*: The indicator would show no pressure in the main pipe if his brakes were full on.

By Mr. Rogers (in the public interest): The driver's gauge is no sure indicator of the amount of air he has in his auxiliary reservoirs; to show that you would require to have a gauge connected with the auxiliary reservoirs, and to be absolutely accurate you would need to have a gauge connected with each carriage; my answers in reply to Mr. Williamson this morning, in connection with the brake power, are given but approximately in a slight degree, but, if necessary, I could work them out accurately if I had time.

By Mr. Simpson (on behalf of the Westinghouse Brake Company).—*Question*: How long would it take for the gauge to show how much air there was in the auxiliary reservoirs.

Answer: The indicator would not show the driver at any time the amount of air he has in the auxiliary reservoirs absolutely; it shows absolutely how much he has in the main pipe, and it also would convey to the mind of the practical man who knew the principle of his brake at once how much pressure he had in the auxiliary reservoirs.

Question: If the indicator shows 75 lb. air pressure in the main pipe how much air would he expend in putting his brakes hard on.

Answer: He would expend about 15 lb., leaving 60 lb., and if the donkey were still working it would be making more air, and immediately he took his brakes off the air would find its way into the main pipe, and from there to the carriage reservoirs; up to 50 lb. air is more speedily compressed than in a large pressure; assuming he had 25 lb. in the auxiliary reservoirs it would take about fifty seconds to bring the pressure up to 50 lb., and 50 lb. of air would control and stop the train; the air is speedily compressed when the donkey is working and the brakes off; my evidence given goes to support Mr. Kirkcaldie's theory; the correctness or otherwise of the theory depends upon the completeness or incompleteness of the air connections; if they were incomplete the theory falls to the ground.

Question: Assuming that there was an experienced driver in charge of this train and that the gauge showed 90 lb. of air pressure, and that he had to ease his donkey engine in order to prevent the pipes bursting.

Can

Can you reconcile it with the action of a discreet and experienced man, who was on the road the day before once up and once down, to exhaust his air before he got to the foot of the incline, a distance of $3\frac{1}{2}$ miles. *Answer*: No.

W. H. WARREN.

Sworn and made before me at Sydney, }
this 13th July, 1887,—

HENRY SHIELL, J.P., Coroner.

Thomas Philip Latter, on oath, states:—

By the Coroner: I reside in the avenue off Thomas-street, Ashfield, and am a builder and contractor; I was a passenger by the excursion train which left Sydney for Peat's Ferry on 21st June last; I joined the train at Strathfield, and all proceeded well till we reached Ryde, where we remained for a few minutes, and then started on our journey; I did not feel the air-brake between Strathfield and Ryde; from Ryde we started to go up a steep incline, failed, and had to run back, and finally we ran on to Hornsby, the train having been stuck four times before reaching Hornsby; after leaving there we stuck up once, but I am not positive as to that, and after leaving Hornsby some distance we went on at a brisk pace, and we increased our speed, but I noticed nothing particular till we emerged from the first tunnel; our speed increased, and going round a sharp curve I was thrown from my seat by the oscillation of the train; the whistle was blowing then and kept blowing till the accident at Peat's Ferry; I was not conscious of the application of the brakes to the train after it left Hornsby; I was not aware that the train had run away till the accident took place; as we ran down the hill I was conscious that the speed was increasing; I was in the fourth carriage from the engine after the train was re-made, and I was never conscious of the application of the brake to that carriage.

THOMAS PHILIP LATTER.

Sworn and made before me at Sydney, }
this 13th July, 1887,—

HENRY SHIELL, J.P., Coroner.

Inquest adjourned till 10 o'clock in the forenoon of Thursday, the 14th day of July instant, at the Court-house, Darlinghurst, for the production of further evidence.

H.S., C.

Inquest resumed in pursuance of adjournment at 10 o'clock in the forenoon of Thursday, the 14th day of July instant, at the Court-house, Darlinghurst.

Sydney, 14th July, 1887.

H.S., C.

William Henry Warren, recalled, on oath, states:—

By Mr. Rogers (in the public interest): Since giving my evidence yesterday I find that the calculations then given on brake pressure on the wheels were incorrect; I have since made calculations, and I now hand in the amended results. [*Put in and marked exhibit "B."*]

W. H. WARREN.

Sworn and made before me at Sydney, }
this 14th July, 1887,—

HENRY SHIELL, J.P., Coroner.

INQUEST on William Henry Hankin.

Finding:—Died from the effects of injuries received through jumping or falling from a runaway train on 21 June, 1887.

HENRY SHIELL, J.P.,
City Coroner.

EXHIBIT A.

RETURN of Casualty to No. 176 Engine, with Special Pass. Train, from Hawkesbury to Sydney, on the 20th day of June, 1887.

Name of driver, Thomas Wilson. Fireman, John Pye.

Nature of Casualty: Heavy bank, and being tender first, and heavy load, I got into No. 3 tunnel, and I was not able to lift them, and after trying three or four times I got back into Hawkesbury, and they brought the other train on, and we was assisted up the bank.

Remarks (Time delayed, &c.): 2.25 minutes late into Sydney.

EXHIBIT B.

To calculate the required pressure on the wheels of rolling stock, I make use of the following formula based on Captain Galton's experiments:—

Let x = percentage of retarding force required to stop train on level.

y = the pressure on the wheels found by dividing x by the co-efficient of friction.

v = equal velocity in miles per hour.

d = the number of feet travelled before the train stops, in feet;

$$\text{then } x = \frac{3.34 \times v^2}{d}$$

$$y = \frac{x}{\frac{1}{6}} = 6x \text{ for 25 miles per hour.}$$

If $v = 25$ then $v^2 = 625$.

Let $d = 400$ yards = 1,200 feet.

$$y = \frac{3.34 \times 6.25 \times 6}{1,200} \times 10.38 \text{ per cent.}$$

For a gradient, 1 in 40, we require $\frac{6 \times 100}{40} = 15$ per cent. of pressure.

Therefore the total percentage of pressure on wheels on a gradient of 1 in 40 at 25 miles per hour to stop the train in 400 yards will be 25.38 per cent.

Hence to stop a train of 170 tons under the conditions above stated we require

$$\frac{170 \times 25.38}{100} = 43.146 \text{ tons pressure on wheels.}$$

To stop a carriage of 17 tons $10\frac{3}{4}$ cwt., under similar conditions, would require

$$\frac{17.57 \times 25.38}{100} = 4.45 \text{ tons}$$

To stop a carriage of 16 tons $10\frac{3}{4}$ cwt., under similar conditions, would require

$$\frac{16.57 \times 25.38}{100} = 4.2 \text{ tons}$$

To stop a carriage weighing 13 tons $8\frac{3}{4}$ cwt., under similar conditions we require

$$\frac{13.437 \times 25.38}{100} = 3.41 \text{ tons}$$

To stop an engine and tender weighing 59 tons $5\frac{1}{2}$ cwt., under similar conditions, would require

$$\frac{59.27 \times 25.38}{100} = 15.04 \text{ tons}$$

The following calculations are made for the same vehicles and engine at 40 miles per hour on a grade of 1 in 40, in order to find the brake force necessary to stop in 400 yards. In this case Captain Gaulton found the co-efficient of friction to be $\frac{1}{7}$ between blocks and wheels.

$$\therefore y \frac{3.34 \times 2,500 \times 7}{1,200} = 49 \text{ per cent.}$$

$$\text{Add for gradient} = 15 \text{ ,, ,,}$$

$$\text{Therefore total percentage of pressure} = 64 \text{ ,, ,,}$$

To calculate the pressure on the wheels of the train before mentioned on a grade of 1 in 40, so that the train would stop in 400 yards, we have to take 64 per cent. of the weight, which =

$$\frac{64 \times 170}{100} = 108.8 \text{ tons}$$

To stop a carriage weighing 17 tons $10\frac{3}{4}$ cwt., under similar conditions, would require

$$\frac{64 \times 17.57}{100} = 11.24 \text{ tons}$$

EXHIBIT

[*Extracts referred to in Evidence.*]

EXHIBIT .

INSTRUCTIONS TO DRIVERS.

The driver must ascertain, before starting, the number of vehicles on the train, and the number working with brakes or pipes only.

Drivers must always satisfy themselves that the brake coupling on their engine is properly connected to that on the train, and *that the cocks in the brake-pipes are open.*

INSTRUCTIONS TO GUARDS.

Before leaving the terminus, after adding to a train on the journey, or on another engine being attached, the guard must ascertain whether the couplings are connected and the cocks in the brake-pipe are all open throughout the train, by applying the brakes from his van, and seeing that *they are released from the engine.*

If the brake is not in use in the whole train, or if the van is not the last vehicle, the test must be made by opening the cock in the brake-pipe at the rear of the last vehicle connected.

When guards have occasion to apply the brake from their van they must open the tap and allow the air to escape until the train is brought to a stand-still, but they should only use the brake in cases of emergency.

Guards must, in all cases, screw the *hand-brakes clear off* before starting.

STATION-MASTERS AND OFFICERS-IN-CHARGE.

Station-masters to have control of Station staff.—To see that Rules and Regulations are complied with.

171. The Station-master shall have the control of all the servants of the Commissioner who are engaged in the conduct of the traffic or trains, to whatever department they may belong, while at his station; he is to see that they comply with the rules applicable to each, and *must satisfy himself that they have each a copy of these rules and regulations.*

Report to be made of waggons left behind.

173. Station-masters and officers-in-charge shall report to the inspector of the district, each day, the number of waggons not taken forward when required by trains stopping at their stations, and assign the reason.

Allotment of duty to servants.

177. The Station-master shall see that the various duties of the station are properly allotted to the servants of the Commissioner under his charge, where not specially assigned by these rules; and *that each man thoroughly understands his duty.*

Station-masters to observe that guards obey rules.

189. Station-masters are to take care that the guards, while at the stations, carry out all instructions laid down for their guidance, and they are to report any infringement of the regulations to the proper officer.

Station-masters at intermediate stations to examine couplings.

213. Station-masters at intermediate stations must observe the state of the couplings on the arrival of the trains, and cause any that require it to be adjusted.

Examination.

214. At stations where carriage-examiners are kept, the Station-master, or person in charge, must, before starting the train, satisfy himself that the examination of it has been completed, and that, so far as the carriage-examiner is concerned, the train is all right and fit to proceed.

At stations where examiners are not kept, steps must be taken to remedy any defect that may be observed in the running of the vehicles, by supplying oil or grease to the axle-boxes of any that may require it, or removing the defective vehicles from the train, as it may be found necessary.

Limit to the number of vehicles.

228. Station-masters are *particularly instructed to limit the number of vehicles* placed on the trains, as far as practicable, having regard to the probable wants of the journey, to prevent unnecessary haulage.

Examination of train by Officer-in-charge—Carriage doors to be secured.

238. Before starting a train, whether passenger or goods, and whenever vehicles are attached, as well as at each stage of the journey, the Station-master or officer-in-charge must see that it is in all respects properly arranged and coupled, and in a perfect state for running with safety. The moment before the train starts he should closely observe each carriage, to insure the doors on the platform side being properly fastened, and that the tail and side lamps are in their places; and the vehicles should be watched closely from the farthest point of the platform as the train moves out, with the view of discerning any defect.

Examination of couplings, breaks, &c., before starting.

368. *Before starting*, every guard must satisfy himself that the carriages or waggons are properly coupled, also the air-brake and electric connections attached, where such are provided, and in their appointed situations, so as to cause the least possible amount of shunting on the journey, that they are properly oiled, and that there are proper *brakes*, in good working order on the train. *He must also test his brake* by applying it, to insure its being in perfect working condition. Any *brake*, whether in van or truck, out of order, to be reported by him, and to be stated in his daily report.

Engine-drivers and guards not to depend on air-brakes.

369. Engine-driver and guards are not to depend entirely upon the action and power of the air-break where in use; but when approaching terminal stations or junctions must have their trains well under control, so that they can be brought to a stand-still with the hand-brakes, if necessary. They must also make themselves conversant with all the rules relating to the working of the air-brake issued from time to time.

Guard

Guard to travel in each brake—Recoil in stopping to be avoided.

379. The head guard will always travel in the *brake* at the rear of the train. He must keep a good look-out for all signals in front, and closely observe them, and occasionally look along the train on either side alternately, in order that he may observe any irregularity in the running or oscillation, or any signal that may be made by a passenger or by the under guard. In stopping at a station, the guards should work their *brake* so that any recoil may be avoided after the train has come to a stand.

To apply his brake when required.

381. Every guard must *constantly* be on the look-out, during the journey, for signals ahead; and if the driver gives *two or more sharp whistles* he must immediately apply his *brake* or *brakes*, if he has control of more than one, whether he sees a signal or not, or *whether or not he comprehends the driver's reasons for making the signal*; and if he should see a danger-signal ahead, or any obstruction, he must apply his *brakes*, whether he receives a signal whistle from the driver to do so or not.

To attach engine to carriages cautiously—Enginemmen to couple engine to train.

442. Great caution should be used in placing the engine against the train, which should be done without moving a single carriage, in order to guard against injury to any passenger who may be stepping into or out of a carriage at the time. Enginemmen will be held responsible for having their engine (and the Westinghouse brake and electric connections where such are provided) attached to the trains. The coupling and uncoupling of the engines to and from the trains, and also the coupling and uncoupling of air-break connections (where such are provided), while on the main line, *are to be the fireman's duty*, under the direction of the driver.

Engine-drivers and guards not to depend on air-brakes.

443. Engine drivers and guards are not to depend entirely upon the action and power of the air-brake where in use; but when approaching terminal stations or junctions must have their trains well under control, so that they can be brought to a stand still with the hand-brakes, if necessary. They must also make themselves conversant with all the rules relating to the working of the air-brake issued from time to time.

To examine sand-boxes.

505. The engine-driver, before starting with a train, must examine his sand-boxes, and take care that they are fully supplied with dry sand, and that the delivery pipe is clear. He must freely use the sand, if necessary, to increase the effect of the brake, and when necessary to check the slipping of the driving wheels.

Fireman to put down brakes when train is divided.

507. In case of a train being divided for want of engine-power, and there being only one guard with the train, the fireman must put down all the brakes *immediately* the train stops, while the guard goes back with the danger signal.

WORKING STEEP GRADIENTS—PASSENGER TRAINS.

Precautions to be taken before leaving Picton and Penrith.

514. Before ascending steep gradients, all couplings must be carefully examined to see that they are perfectly sound and properly screwed up, the threads being quite through the nuts, and also that the side chains are properly connected.

Passenger-engines without brakes.

515. No engine is to be used for passenger trains unless it has brakes on the driving wheels.

Brake-vans.

516. The heavy brake-vans to be used with all trains, unless special brakes are provided.

Brake-blocks, &c.

517. The guards must be careful that the brake blocks and all the working parts of the brake are in good order.

THE WESTINGHOUSE AUTOMATIC BRAKE.

Described and Illustrated.

General principle of its action.

COMPRESSED air is the power employed to work the brake.

The air, compressed by an air-pump on the engine into a main reservoir, flows through the driver's brake-valve into the main brake-pipe, which extends the whole length of the train, and fills on each carriage a small reservoir by means of the triple valve attached to it. Each triple valve is also connected to a brake cylinder. As soon as the pressure in the brake-pipe is lowered, the triple valve piston on each vehicle is moved down by the greater pressure above it stored in the small reservoir, which is then allowed to pass instantly into the cylinder, force out the piston and rod, and thus cause the blocks to press against the wheels.

The brakes are released by an increase of pressure in the main pipe, produced by allowing air to pass from the main reservoir along the train. This moves up the triple valves, recharges the small reservoirs, and at the same time allows the air which had forced out the pistons to escape into the atmosphere.

General description of the apparatus.

To make this description perfectly clear two plates are given.

Plate I shows the brake complete on an engine and tender.

Plate II is a diagram showing the operation of the brake, from the air-pump to the end of a vehicle. It is, of course, not exact nor to scale, but is intended simply to show the relation which each part bears to the whole.

The engine, tender, and every vehicle of a train, is fitted with the following parts, to be found on plates I and II:—

A triple-valve, F, by means of which the instantaneous automatic action is produced, in conjunction with

A small reservoir, G, in which is stored the compressed air for applying the brakes.

A brake-cylinder, H, with pistons and rods connected to

The brake levers and blocks.

Upon the engine is also placed:—

The steam engine and pump which produce the compressed air.

A main reservoir, C, for storing the air necessary for releasing the brakes and recharging the small reservoirs.

A driver's brake-valve, D, which regulates the flow of air from the main reservoir into the brake-pipe for charging the train and releasing the brakes, and from the brake-pipe to the atmosphere for applying the brakes.

A single line of pipe, E, called the brake-pipe, extends the whole length of the train.

Each van has a valve connected to the brake-pipe, and a gauge to indicate the pressure of air. By opening his valve a guard can stop the train, even against the will of the driver, if necessary.

OPERATION OF BRAKE.—(See plates I and II)—The pump being started by admitting steam to the cylinder A, air is forced from the cylinder B into the main reservoir C, which is connected to the driver's brake-valve D.

When a train is to be charged—the hose couplings between the carriages having been united and the engine connected to the train—the compressed air stored in the main reservoir is turned into the brake-pipe E, by putting the handle of the driver's brake-valve over to the left. It then fills the brake-pipe and flows through the branch-pipe on the tender, and each vehicle, as shown by the arrows on plate II to the triple-valve F, thence by the groove a, past the piston into small reservoir G, where it remains until the brake has to be applied. Uniform air-pressure then exists throughout the train, except in the brake-cylinders, the brakes being off, and the pressure per square inch is shown on the gauge L, connected to the brake-pipe.

So long as this pressure is maintained, the brakes are kept off, as the passage from each small reservoir to its cylinder remains closed; but letting the air escape from the brake-pipe, causes the triple-valves to move down and uncover the passages to the cylinders. The air stored in the small reservoirs then flows into the cylinders, and forces out the pistons and rods, thus applying the brakes. (See description of triple-valve, p. 19).

From the foregoing it will be seen, that the driver can, by turning the handle of his brake-valve, reduce the pressure in the brake-pipe, and thus apply all the brakes. If the brakes are to be applied moderately, a small reduction of pressure in the brake-pipe is made, as indicated in the description of the driver's brake-valve, p. 17.

The brakes are taken off by re-opening the passage from the main reservoir through the driver's valve, and thus restoring the pressure in the brake-pipe; this lifts the triple-valves, and places the cylinders in communication with the atmosphere by means of the exhaust cavity, c, in each of the valves; the air used in the cylinders is thus allowed to escape, and the brake-pistons and rods are pushed back to their places by springs inside the cylinders.

N.B.—As mentioned in the description of the driver's brake-valve on page 18, it is important to run with the handle of that valve in the 2nd or feed position. This is to ensure the prompt release of all the brakes by means of the 10 lb. extra pressure, which is thereby kept in the main reservoir.

SHUNTING.—An engine or carriage may be detached from a train without setting the brakes, by first closing the cocks in the main pipe and then separating the hose couplings in the ordinary way.

If it were not for the cocks in the main pipe the brakes would, in all cases, be applied when the hose-pipes are separated by hand for the purpose of shunting.

The cocks are open when the handle stands across or away from the pipe, and shut when the handle is up or alongside the pipe.

The application of the brake on detached portions of a train through ordinary leakage is provided for, as fully explained on page 22.

It is of the utmost importance to see that the brake couplings are properly united and that the cocks in the main pipe are opened so as to make sure that pressure exists throughout the whole train. This is only ensured by opening the valve in the last van for a second or two. If there is pressure the air will escape, and the brakes will be applied. If the connection is complete the brakes will almost immediately be released by the air from the main reservoir.

If the couplings are not united, or one or more cocks not opened, the brakes will remain on those carriages which are in the rear of the point where the couplings have not been put together, or cocks are left closed.

The pressure-gauge in the van should also be observed.

When carriages are disconnected from a train, the air-pressure is retained, as above explained; hence the indication of the air-gauge is never to be relied upon to establish the fact that the couplings have been properly united, or the cocks opened. The gauge is intended to indicate the pressure which is being maintained by the driver after the couplings throughout the train have been connected.

In case of the brake-work being damaged on any vehicle, a $\frac{1}{2}$ -inch stop-cock, I, is placed on the branch-pipe leading to the triple-valve, by means of which that particular vehicle may be shut off without affecting the brakes on the rest of the train. When this cock is open the handle lies straight along the branch-pipe, as shown in the drawing.

A release-valve, J, is fitted on each cylinder for the purpose of releasing the brake direct, if applied, when an engine is not attached. Wires should be connected to the handle so that the brake may be easily released from either side of the carriage. These valves must be held open until the air has escaped.

It should be clearly understood:—

1st. That it is the air stored in the small reservoirs which applies the brakes, while the air in the main reservoir releases them; and

2nd.

2nd, That the brakes are applied by a decrease of pressure in the brake-pipe, and taken off by restoring that pressure.

So that, whether by the driver or guard operating his brake-valve, the accidental separation of the train, the breaking of a pipe, or any other means by which the pressure in the brake-pipe is suddenly reduced below that in the small reservoirs, the brake will be put on, and will remain on. It is, therefore, automatic in its action, and is a "tell-tale" as to its own condition.

When coupling up to a train not charged with air, or to one having a less pressure than that on the engine, the brakes on the latter will fly on, the higher pressure flowing into the lower, having of course reduced the pressure in the tender brake-pipe. No inconvenience will result from this if the driver has been careful to come up to the train with a high enough pressure in his main reservoir, and he will at once take off the brake when he turns the handle of the brake-valve into the charging or "release" position. In any case, the release-valves from the brake-cylinders may be opened, and these should be so arranged as to be worked from the foot-plate.

Delays have sometimes arisen from connecting portions of trains carrying different pressures; and, to avoid detentions from this cause, drivers should be careful not to leave more than 50 lb. pressure in a train, when detaching at junctions or termini. The driver who intends to couple up at such places should, as already advised, carry a high pressure, say 80 lb., in the main reservoir, for the purpose of releasing any brakes which may happen to go on.

A high pressure, in the main reservoir only, may soon be obtained by placing the handle of the driver's valve in the neutral position; the train-pipe then being shut off, the pressure is increased only in the main reservoir.

If a driver finds the air-pressure in his train too high, he can readily reduce it by applying the brake with full power, and then releasing it.

It should be understood that, as the gauge L is connected to the brake-pipe, it can never show the pressure in the brake-cylinders. When the brake is on, the brake-pipe is shut off from both the reservoirs and cylinders, and the pressure then indicated on the gauge is that left in the brake-pipe only. The force, however, with which the brakes are applied, is in proportion to the reduction made on the gauge—that is, in the brake-pipe—to the extent of 25 lb. The brakes are then "full on," and letting out more air than this would only be waste. A reduction of 5 lb. on the gauge may put 10 lb. into the cylinders. In the same way, if the brake-pipe be suddenly emptied, the gauge registers nothing, but there will be plenty of pressure left in the reservoirs. The brakes cannot be released in the ordinary way without recharging the train.

The brakes should not be applied with full power except in an emergency, and in that case all the air should be discharged from the brake-pipe.

Drivers must exercise care and moderation in applying the brakes for ordinary stops, so as to bring their trains to rest without inconvenience to the passengers.

To ensure this, it is necessary that the brakes should be applied moderately in the first instance at a distance of several hundred yards from the station. Just before coming to a stand the brakes should be released so as to avoid any jerk.

To apply the brakes lightly not less than 5 lb. of air should be let out in the first instance. This is necessary to ensure the closing of all the leakage grooves, after which the brake-power can be increased by letting out $\frac{1}{2}$ lb. or more a time. The first reduction should be made more rapidly than results from ordinary leakage, and it is important to close the driver's valve gradually, so that the pressure does not begin to run up on the gauge again.

The same reduction of pressure per square inch is required for setting the brakes with equal force on long or short trains, but the quantity of air to be discharged from the brake-pipe to make this reduction will vary according to the length of the train. With long trains the driver's valve must be left open for a greater length of time, and must also be closed with greater care.

By violent use of the very great power now placed in their hands, it is possible for drivers to cause very unpleasant shocks, especially if the screw couplings between the carriages are not screwed tight.

Drivers should always bear in mind that much less force is required for a low than for a high speed, and that it is a bad practice to put the brakes on so hard that the wheels slide over the rails. Such sliding spoils the wheels by producing flat places, is less effective in stopping, and gives a most disagreeable sensation to the passengers.

Guards can apply the brakes by opening a valve in the van for that purpose, but they cannot release them.

Where "slip" vans are provided, however, there is a cock in the main pipe of each van which the guards must shut before "slipping," to prevent the brakes going on. These vans are provided with a main reservoir and a valve similar to the driver's brake-valve, so that the guard of the slipped portion may apply and release his brakes just as the driver does, for the purpose of stopping the carriages at the station platforms.

In case it should be necessary to empty the reservoirs on a detached portion of a train, this may be done by first letting all the air out of the brake-pipe, either through the guard's valve, or by opening the cock on the main pipe, and then opening the release-valve J on each cylinder. The air in the reservoirs will then escape through the cylinders to the atmosphere.

Brake Inspectors should pay special attention to the "taking up" of the brake-blocks uniformly throughout the train; that is, the brake pistons on each carriage should travel equal distances, so far as practicable. (See instructions, p. 27.) Much better stops can be made when this point is properly attended to, and drivers should always report when it requires to be done.

Description of the Principal Parts. Plate II.

AIR PUMP.

On Plate II is shown a section of the double acting air-pump, composed of the steam-cylinder and valves, A, and the air-cylinder and valves, B—the piston of each working together on one rod.

Steam from the boiler enters the chamber, c, and also chamber, d, in connection with it. The ports from c, to each end of the cylinder are opened for supply and exhaust by the movement of the main valve,

1. This valve consists of two pistons, 1¹, 1¹, on the same stem; and as the upper piston is of greater diameter than the lower, the tendency of the pressure in the chamber, C, is always to raise the valve, unless held down by the greater pressure of the larger piston, 2, which is supplied with steam from the chamber, D. In the position shown on the plate, steam is passing into the bottom of cylinder A and forcing the main piston, 3, upwards. As the main piston completes its upward stroke, the plate, 4, pushes up the rod, 5, working in the hollow piston-rod, and with it the slide valve, 6. This closes the passage, E, from chamber, D, to the piston, 2, and at the same time opens the exhaust passage F, to the atmosphere through G, which relieves the pressure on the top of the piston, 2. The steam in the chamber, C, then raises the main valve, 1, and enters the top of the cylinder above the main piston, 3, and at the same time the steam on the lower side is exhausted. On completing its downward stroke the main piston again draws the rod, 5, and slide valve, 6, to the position shown, thus reversing the position of the main valve, 1, and consequently the stroke of the main piston, 3.

No particular description of the bottom cylinder and valves, B, is required. Each upward stroke admits air below the piston, and discharges air from above the piston into the main reservoir, C; and each downward stroke does the reverse.

DRIVER'S BRAKE VALVE.

As shown on plate II, the driver's brake valve, D, forms the connection between the main reservoir and the brake pipe. A communication between them is made through the main valve, 1, and there is also communication between the brake pipe and the atmosphere at M, through the discharge valve, 2.

There are three principal positions of the handle for working the brake. (See plan and diagram below):—

- 1st. For charging the train, and releasing the brakes.
- 2nd. For "feeding" while the train is running.
- 3rd. For applying the brakes.

Plan of main valve and positions of handle.

In the first position, a free communication is formed through the large ports, A, A, in the valve 1, from the main reservoir to the brake pipe; but

In the 2nd position the air must pass through the small valve, 3, and the whole, G, before it reaches the brake pipe.

This valve, 3, is held on its seat by a spiral spring of a strength corresponding to 10 lbs. per square inch, so that when feeding in this 2nd position, the pressure in the brake pipe is 10 lb. less than that in the main reservoir. This extra pressure is utilized when releasing the brakes.

A little further to the right the position is neutral. There is then no communication between the main reservoir and the brake pipe; neither can air flow from the brake pipe to the atmosphere; turning the handle, however, further to the right, has the effect of taking weight off the valve, 2, which is then lifted by the pressure in the brake pipe, and some of the air escapes from it into the atmosphere at M.

This escape of air applies the brakes with a force corresponding to the reduction of pressure shown by the brake pipe gauge L, connected to the branch, h.

In the 3rd position, all the weight is taken off the discharge valve, 2, thus allowing air to escape rapidly, which applies the brakes with full force.

In the first position of the handle there is a leak through the hole, C, to remind the driver, after releasing the brakes, to bring the handle to the 2nd position, where it must remain whilst the train is running.

Operation.—To apply the brakes in ordinary stops, the brake valve should be opened gently until the desired reduction of pressure is observed on the gauge, after which the handle should be moved back gently to prevent further escape of air.

If the driver's brake valve is operated in a rough way, serious inconvenience is caused to the passengers; and it may even result in the rupture of the screw couplings.

To prevent the jerk which is often experienced with all kinds of brakes at the moment when the train comes to rest, it is sufficient for the driver to release the brakes at the last revolution of the wheels in order to give the carriages time to assume their normal position. When doing so the hand-brake on the tender may be put on to advantage, so as to hold the train at the platform.

TRIPLE VALVE.

The triple valve F, plate II, is simply a small piston, 1, carrying with it a slide-valve, 2, which can be moved up or down by increasing or decreasing the pressure in the brake-pipe.

As soon as the air from the main reservoir is turned into the brake-pipe (by means of the driver's valve), the piston, 1, is pushed up into the position shown, and air is allowed to feed past it through a small groove, A, into the reservoir, G. At the same time the slide-valve, 2, covers the port, B, to the brake cylinder, and is in such a position that the air from the latter may exhaust into the atmosphere through C.

The piston, 1, has now the same air pressure on both sides, but if the pressure in the brake-pipe is decreased, the piston and slide-valve are forced down, thereby uncovering the passage, b, through which air from the reservoir, G, flows into the brake cylinder, H, between the pistons, P, thus applying the brakes. The brake-pipe is shut off as soon as the triple-valve piston, 1, passes the groove, A.

To release the brakes, the piston and slide valve are again moved into the position shown, by the driver turning air from the main reservoir into the brake pipe. The air in the brake cylinder escapes through C, and at the same time the reservoir is recharged.

To release with more certainty the driver must be careful to maintain extra pressure in the main reservoir, by keeping the handle of his brake valve in the second or "feed" position, while the train is running.

COUPLING.

The couplings K, plate II, are exactly alike, and an air-tight joint is formed between them by means of the rubber packing ring in each, which being forced together by the air pressure behind them, the joint thus becomes tighter by increase of pressure.

These couplings are united by simply placing them face to face nearly at right angles, the stop pins being on the under side, as represented below, so that the projection of the one fits the corresponding groove of the other, and then turning the coupling straight into the position shown on plate II.

No damage is done to the couplings if drawn apart forcibly by the separation of the train, as the rubber rings are forced into their respective couplings far enough to permit the projections to disengage from their grooves, and the brakes will then go full on.

Position of couplings before they can be connected.

BRAKE CYLINDER.

The figure H, plate II, represents the standard form of brake cylinder for a carriage. It contains two pistons, which are held in the position shown by the spiral springs within. When air is admitted, the two pistons are thrust outwards with equal force, and the brakes go on. When the air is allowed to exhaust, the springs expanding, push back the pistons, and release the brakes.

A leakage groove is provided to prevent the brakes from being applied when the air flows slowly from the triple valve to the cylinder as a result of a leak in the brake pipe. This groove permits air to pass the piston P, unless it is admitted suddenly, in which case the piston moves past the groove. For this reason drivers should never discharge less than 5 lbs. air pressure to apply the brake.

The following concise instructions are based upon what has been fully explained in the preceding pages. It is hoped that Drivers, Guards, and Inspectors will all take a pride in carrying them out to the best of their power.

INSTRUCTIONS.

DRIVERS must see—(1) That the top, or steam cylinder is kept well lubricated; (2) That the air-cylinder is sparingly lubricated with a small quantity of refined petroleum—other oils or tallow must not be used in the air-cylinder; (3) That the pump shall be constantly run, but never faster than is necessary to maintain the required air-pressure; and (4) that air from 50 to 60 lb. pressure for stopping trains, and from 70 to 80 lb. pressure for express trains, is carried.

For ordinary stops the brake should be applied lightly, by turning the handle of the driver's valve to the right, and gently closing it again, after a reduction of pressure in the brake-pipe of not less than 5 lb., nor more than 8 lb. has been made. If the pressure runs up on the gauge when the handle is brought back, it shows that the valve has been shut too quickly.

In ordinary working the brakes are fully applied when the pressure shown on the gauge is reduced 25 lb. Any further reduction is waste of air. In case of emergency, however, the handle must be turned so as to let all the air in the brake-pipe escape.

Long trains require more careful handling than short trains, and a greater quantity of air must be discharged from the brake-pipe to make the same reduction per square inch on the gauge.

In releasing the brakes the handle must be moved quite against the stop to the left and kept there for about ten seconds, and then moved back against the intermediate stop, which is the Feed position, and where it must remain whilst the train is running.

Drivers

Drivers must always satisfy themselves that the brake-coupling on their engine is properly connected to that on the train, and that the cocks in the brake-pipe are open.

Drivers, upon feeling that the brakes have been applied by the guard, or automatically, must at once aid in stopping the train by turning the handle of the brake-valve towards the right, thus preventing escape of air from the main reservoir.

The blocks of the driving-wheel brake should be so adjusted by turning the screw, that the pistons travel from 3 to 4 inches.

Drivers must be careful to drain the water out of the main reservoir once a week, especially in winter-time.

If vehicles having different air pressures be coupled together, the brakes will apply themselves on those which have the highest pressure. To ensure the certain release of all the brakes in the train, and also that trains may be charged quickly, the driver must carry the maximum pressure in the main reservoir before connecting to a train; and then put the handle of his brake-valve in the release position until the train is charged with air. If the brakes on the engine and tender thus apply themselves by being coupled to a train not charged, they should at once be taken off by opening the release valves from the brake cylinders, which ought to be so arranged as to be worked from the foot-plate.

After connecting the engine to the train, or after new vehicles have been added, the pipes and reservoirs are to be charged as quickly as possible. The brakes should then be applied with full force by the driver, who should not start away until the inspector or guard has signalled that the brakes are acting on all the vehicles.

GUARDS.—Before leaving the terminus, after adding to a train on the journey, or on another engine being attached, the rear guard shall ascertain whether the couplings are connected, and the cocks in the brake-pipe are all open throughout the train, by applying the brakes from his van and seeing that they are released from the engine. If the brake is not in use on the whole train, or if the van is not the last vehicle, the test should be made by opening the cock in the brake-pipe of the last vehicle connected.

Guards, when they have occasion to apply the brake from their van, must open the tap and allow the air to escape until the train is brought to a standstill, but they should only use the brake in cases of emergency.

Guards must in all cases screw the hand-brakes clear off before starting.

GENERAL.—Before detaching the engine or any carriages the brakes must be fully released on the whole train. Neglecting this precaution, or setting the brakes by opening a valve or tap when the engine is away, may cause serious inconvenience in shunting. The pipes and joints must be kept tight, and when leaks are discovered they should be corrected, if serious, before the vehicle is again used.

The brake-pipe has a tap at each end of every vehicle, all of which must be open when the hose couplings are united, except the one at the rear of the train. These taps must always be opened after connecting the hose couplings, and always closed before separating them.

If the brakes are applied by the separation of the train, or the breaking of a pipe, they can be released by opening the small release valves in the brake cylinder or pipes leading thereto. If the brakes are applied after the engine has been disconnected, they can be released as above, or by again connecting to the engine.

The brake of any vehicle can be put out of operation, without affecting the others, by closing the tap under that vehicle between the brake-pipe and triple valve.

INSPECTORS should see—(1.) That the brake connections are perfect and properly adjusted for the wear of the blocks and wheels by being uniformly taken up. The pistons of double piston cylinders should each travel not less than 2, nor more than 4 inches. Those of single piston cylinders should not travel less than 4, nor more than 8 inches. (2.) That the brake cylinders are perfect and lubricated, at least every three months, with mineral oil. (3.) That the hose couplings are united, and the cocks in the pipes are open; that is, the handles must stand across or away from the pipe, except the one at the end of the train, which must lie along the pipe in the shut-off position. (4.) That the joints are all air tight.

No. 7.

Memo. by Secretary to Commissioner for Railways.

Observations on the Verdict of the Coroner's Jury—Coroner's Inquiry—Peat's Ferry Railway Accident.

Verdict.

1st. We find that William Henry Hankin's death was caused from injuries received by jumping or falling from a runaway train on the 21st June, 1887, while passing Peat's Ferry Station, fearing danger of collision or accident, knowing the train was completely beyond control of the driver.

2nd. We attribute the accident to the great want of supervision on the part of the officials in the Railway Department in not carrying out the instructions laid down for their guidance, thereby endangering the safety of the railway travelling public. We consider the driver did all in his power to control the excessive speed of the train.

(a.) That the accident was brought about by "want of supervision on the part of the officials" is not only disputed, but is not borne out by the evidence. The only instruction admitted by the guard to have been overlooked was that which required a formal test of the air-brakes to be made before the train left Hornsby. This will be more fully dealt with in reply to the fifth finding of the jury.

(b.) It is not disputed that the driver did all that occurred to him to check the speed of the train when he found it getting beyond his control, but that he did all which was within "his power" is open to grave doubts.

According to the evidence of fireman Pye (see page 66, marked 1), the speed of the train when it ran over the top of the hill which descends to Peat's Ferry (but about 6½ miles distant from there) was about 12 miles an hour, and apart from the air-brake altogether, no difficulty ought to have been experienced in keeping it under control from that point.

The

The whole of the evidence goes to show that it was under proper control till it got between the first and second tunnels, about 3 miles from the top of the hill and $3\frac{1}{2}$ from Peat's Ferry; and according to fireman Pye (see page 66, marked 2), it was immediately after passing through the second tunnel, 3 miles from Peat's Ferry, that the driver opened his valve, "which would have the effect of putting the air 'full on,' but it did not diminish the speed—it increased," and there is no evidence that it was ever shut again; it was found open after the engine had fallen into the river (see evidence of H. G. Perkins, page 62, marked 3).

At this point Brennan (p. 15) says the train was travelling at rate of 35 to 40 miles p. hour.—J.M.

If the driver had had the presence of mind when he told the fireman that "she has got away from us" to keep his hand-brake hard on and shut his air-brake valve for not more than 50 to 60 seconds, so as to admit of the reservoir under the carriages being recharged (which was impossible so long as his valve was open), he would have allowed such a pressure of air to get into those reservoirs in that short space of time as would have enabled him, even in the last mile, to have stopped his train without difficulty.

Assuming that the train travelled from the Hawkesbury end of the second tunnel (where, according to the evidence of the fireman, the driver recognized that the train was beyond his control) at the very high speed of 60 miles an hour, which is in the highest degree improbable, the distance must have occupied three minutes, one-third of which would have been sufficient to recharge the carriage reservoirs, and the remainder would have been more than ample to stop the train.

The risk of accident could not have been increased by the adoption of the course described, for if, as is not disputed, the air-brakes were not, for some reason or other, acting upon the carriages, the hand-brakes on the engine and tender would have exercised the same amount of retarding power as the air-brakes upon the latter and the hand-brake upon the former, while an undeniable opportunity would have been afforded the driver of recharging the carriage reservoirs (and so enable him to apply the brakes on them), assuming the connections to have been complete and the taps open—in reference to which see the replies to the sixth finding of the jury.

3rd. We are of opinion that the engine was not sufficiently powerful to take that train safely to its destination.

While it is admitted that the engine had not sufficient tractive power to take the train to its destination without loss of time on the journey, there is no evidence (except that of fireman Pye—page 82, marked 4—wherein he says, "If the engine had been stronger and able to take the train to its journey's end without disconnecting I do not think the accident would have occurred, &c., &c."), nor is it possible to demonstrate that the insufficiency of tractive power contributed in any way to the accident, which was caused by a failure of the brake power on the train; indeed, in reply to Dr. Sly, Pye said (page 82, marked 5)—"Assuming that all the air connections were complete, the weight of the engine would have nothing whatever to do with the accident."

On this point see the evidence of driver William Hulme (page 64, marked 6), wherein he says, that if the Westinghouse brake was working properly "she could have taken twenty carriages as well as nine, &c."

Precisely similar evidence is given by driver William Frame (page 68). Professor Warren says (page 85, marked 7)—"Assuming there was sufficient in proportion to the weight of the train of brake power on the carriages and engine, the train would be easier controlled with a light engine than by a heavy one."

It is a matter for regret, as far as the tractive power of the engine was concerned, that the driver did not represent, either before leaving Sydney or during the journey, before starting from Ryde or Hornsby, that the weight of his train was greater than his engine could haul, because if he had done so at Sydney he would have got the assistance of a second engine in the usual course, or even if he had done so at Ryde or Hornsby one or more of the carriages would have been taken off. On this point see the evidence of driver Frederick Sheehan (page 22).

4th. We are further of opinion that the train was not properly inspected before leaving Sydney.

The only evidence in support of this finding will be found in the evidence of examiner Werrick, who says (see page 53, marked 8)—"I did not inspect the whole of the train, simply because I had not sufficient time, and I am not therefore in a position to say that the whole of the brake power of that train was in proper working order on that morning." * * * * *

"The two carriages next the engine had brake-blocks on them; I did not examine them, but I saw the blocks as the carriages were being shunted down, &c." Still, on the same page (mark), he says—"I said, 'Driver, try your air,' and he did so, and I saw that the air pressure was complete throughout the whole nine vehicles of the train; that was immediately before the train started, and I saw it start."

Then on page 54, marked 9, he adds—"I did not examine the two carriages next the engine on this train, but I know they must have been connected, or the carriage at the end of the train (the rear carriage) would not have released, &c." Hence there is indisputable proof that the air was working when the train left Sydney from the engine to the last vehicle on the train.

On this point also refer to the evidence of Jacob Derham (page 52), and of John M'Carthy (page 80).

Guard Clissold says (page 73, marked 10) that "at Beecroft, before the train was divided, I am certain the Westinghouse brake was acting on the last car."

George Gayleard (page 68) gives corroborative evidence.

5th. We are likewise of opinion that the train was not properly inspected leaving Hornsby.

The formal test prescribed by the rules—that the brakes throughout the train should be applied by means of the guard opening the rear main-pipe tap and so allowing the air to escape, and the subsequent release of those brakes by the driver from the engine—was not, according to the admission of the guard, carried out: in that respect both guard and driver were somewhat to blame, the latter rather more than the former, since the greater responsibility of controlling a train rests with a driver.

Still, although the formal test was not made, it will be seen, on reference to guard Clissold's evidence (pages 56 and 58), that when he recoupled the two divisions of the train at Hornsby he heard the air pass through, and that of itself conveyed positive proof that at that time there was an uninterrupted passage for the air between the engine and the third vehicle, at all events.

On this point the guard is corroborated by William Rice (page 68, marked 11), who says he saw the guard couple up the second to the third vehicle at Hornsby, and thought he heard the air "whizzing through" when the taps were turned. The officer in charge—Stead (page 59)—says he examined the seven carriages while they stood at Hornsby; and when the two vehicles (the 8th and 9th) were recoupled to them he called out to the guard to be sure to turn the taps. The guard admits this, and William Rice overheard it.

In

NOTE.—The engine was not attached to the train until all the nine vehicles were coupled together, so that, until the engine was attached, none of the brakes on any of the vehicles could be taken off.

In every other respect there is nothing in the evidence to support the finding that the train was not "properly inspected" before leaving Hornsby.

6th. We are of opinion the air-couplings and taps on leaving Hornsby were not complete.

Beyond the opinion of Mr. Shellshear, that the tap on the rear end of the first carriage, which was found to be shut on the day after the accident, had been closed prior to the collision, there is absolutely no evidence to support the finding of the jury; on the contrary, the whole of the evidence is opposed to it.

Mr. Shellshear said in reply to—

The Coroner: "That this tap was in such a position as to prevent the air from passing through it."
* * * * * That, "from the reasons I have given, I am of opinion that the tap was turned off before the collision."

In reply to Mr. Rogers: "That it is possible for the tap to be turned in the telescoping, but from its appearance I don't think it at all probable."

In reply to Dr. Sly: "That the handle would not necessarily be turned during the telescoping: don't think so, as the Redfern carriage had considerably over-ridden the American car."

In reply to Mr. Williamson: "That it is my opinion the tap was not turned on, and that was the cause of the accident."

That is the whole of the evidence to support the assertion of the jury that the air couplings and taps on leaving Hornsby were not complete. On the other hand, there is voluminous evidence against such a finding.

Mr. Shellshear admitted in reply to Mr. Rogers that "the tap was turned the reverse way to what is usual."

In reply to Mr. Williamson that "all the others (taps) that I saw were in their proper position"? Only this one.

In support of the assertion that this tap must have been open when the train left Hornsby there is the evidence of Jacob Derham, Andrew Werrick, and John M'Carthy (see the replies to the fourth finding of the jury) to show that the air was applied to the last vehicle before leaving Sydney, which shows conclusively that all connections were then complete, and all the taps (except the very last one, which was properly shut) open, while there is absolutely no evidence whatever that any person went between those vehicles on the journey, as must have been done in order to shut a tap; indeed, in reply to the Coroner (page 73, marked 10.) Guard Clissold says, that "from the time the train left Sydney till the time the accident occurred I never touched that tap, nor had I occasion to go near it. At Beecroft, before the train was divided, I am certain the Westinghouse brake was acting on the last car." On page 56, marked 13, he says, "when the engine came back for the two carriages I coupled them and turned the taps on between the Redfern car and the engine." On page 69, marked 12, William Rice says, "I swear that the brakes were on one and two carriages—the carriages that were left behind."

(Rice remained behind at Beecroft until the engine returned from Hornsby for the two carriages.)

On page 68, marked 14, George Gayleard says, "I remember the engine coming to Thornleigh with seven carriages. I went on with that train to Hornsby, where the seven carriages were left, and the engine went back to Beecroft. I went there with it and came back to Thornleigh. I know nothing about the coupling of the train at Beecroft. I noticed at Beecroft that the brakes were hard on to the two carriages, and that there was a sprag in the wheels of one carriage.

On page 83, marked 15, fireman John Pyc says, "when we stopped at Beecroft, the driver put the air-brake on before separating the train."

Here is the strongest possible evidence that the air-brakes were fully applied to these two carriages while they stood at Beecroft, and it is therefore conclusive that there was not a shut tap between them.

At Hornsby, while the seven carriages were in the siding, there is the evidence of George Stead, (pages 58 and 59, marked 16), to the following effect: "I left the brakes on the carriages that had blocks on when they were on the loop line. I then went and got a sprag and put it in the wheels of one carriage, first having tapped one of the blocks to see if it was acting, and found it was, &c."

He also says (page 59, marked 17), "When I returned from handing the staff to the driver I said to him (the guard), 'Clissold, don't forget the tap,' and with that I saw him put his hand up on the car and turn the tap down, and put his hand on to the other carriage on to the pipe."

William Rice says (page 68, marked 11), "I saw Clissold turn two of the air-taps, and I thought I heard the air whizzing through when he turned them. The brakes were off when the train left."

Guard Clissold says (page 56, marked 13), "When we got to Hornsby, I coupled the two carriages on to the seven, and I turned the cocks on; I heard the air go through when I turned the cocks, but only very faint." And again, "I am positive when the train was coupled up again at Hornsby that I made the connections complete so as to let the air pass through to the seven carriages behind."

Here again, it is submitted, that the brakes which were on those carriages standing at Hornsby which had blocks—the Redfern carriage and American car—were released by the driver from the engine, otherwise he could not have started the train. The evidence of Rice and Clissold that they heard the air pass through the pipe when the connections were made good readily explains how the brakes were released; and unless that of Stead, Rice, and Clissold is to be entirely disregarded, no other conclusion can be come to than that the connections were complete, and the taps all open from the engine to the rear vehicle, fitted with a tap when the train was recoupled at Hornsby.

After leaving Hornsby, Mr. John Barrie, a passenger, who was then in the second carriage from the engine, says (page 77, marked 18), "On beginning to descend (the incline towards Peat's Ferry) I did not observe anything with regard to brakes, but about No. 2 tunnel I felt a shaking apparently coming from the engine; at this time I was not aware but that the train was under perfect control; I noticed nothing further until we were approaching No. 3 tunnel, when I noticed that the driver had lost control of the train, and it seemed to me as if the hand-brake was applied to the carriage I was in; I came to that conclusion because the brake appeared to be applied gradually, and not spasmodically."

This quite agrees with the evidence of guard Clissold, who says (page 55, marked 19), "All went on right till we got through No. 1 tunnel, and between there and No. 2 tunnel I found the speed of the train increasing slightly; I then applied my hand-brake, &c. * * * * * When we got between Nos. 1 and 2 tunnels, and when the train was gaining speed, I could not feel the air-brake on the train; I believe it was on, but it was only on very slightly."

Mr.

Mr. William Thomas Dodds, another passenger, who was in No. 4 carriage from the engine after leaving Hornsby, says (page 82, marked 20) that the brake was never applied to that carriage from the time he saw steam shut off at the first tunnel till the accident took place. On the same page, in reply to Dr. Sly, he said: "After leaving Hornsby, and before entering No. 1 tunnel, I did not notice, either one way or another, whether the brakes were applied to the carriage I was in."

Fireman John Pye says (page 66, marked 21): "I saw him (the driver) shut off steam; that was just as we commenced the descent (the descent is about 3 miles before the first tunnel, where Mr. Dodds says he 'saw the steam shut off.')

Mr. Thomas Phillip Latter, another passenger, who was in the fourth carriage from the engine after the train left Hornsby, says (page 86, marked 22): "I was never conscious of the application of the brake to that carriage."

Mr. Jacob Garrard, M.P., who was a passenger in the second vehicle from the engine (the same one as Mr. Barrie was in) after leaving Hornsby (and therefore in the rear of the carriage on which the tap was afterwards found to be shut), is very positive (page 72, marked 23) that he felt the action of the Westinghouse brake on that carriage while the train was descending the incline towards Peat's Ferry. The commencement of the descent is about 7½ miles beyond Hornsby.

William Hulme states (page 64, marked 24), that on reaching the train after the accident, he saw the brake-blocks on the third and fourth vehicles from the engine hanging loose, and the tyres of the vehicles as cold as they could be, by running without the brakes being applied to them. He could not see the taps next the engine, but all the other taps were open so as to allow the air to pass through the pipes to all the carriages connected with the Westinghouse air-brakes. Again, in reply to Mr. Rodgers, he says, "So far as I could see, the air connection seemed to me to be all right, although the brake was not working."

William Frame (page 68) gives similar evidence.

Mr. E. A. Laughry (page 74) and Mr. D. Kirkcaldie (page 77), who examined the train about four hours after the accident, give corroborative evidence. The latter two witnesses examined the two wrecked carriages (those which had been next the engine) on the day after the accident, and their evidence is strongly in favour of the tap on the first carriage having been closed by the accident when the vehicles telescoped, and in that respect differs from Mr. Shellshear's.

Hugh Rohen's evidence (page 63) to the effect that he walked through between the second and third vehicles from the engine about 5 o'clock on the afternoon of the accident, and found that the couplings between those vehicles were not attached, that they were not broken, and that there was no air connection between those carriages, is uncorroborated, while it is positively rebutted by Mr. E. A. Laughry (page 74), Mr. D. Kirkcaldie (page 78), and Richard Milton (page 79).

7th. We are of opinion that the brake-power on that train was not sufficient.

No evidence will be found to support the finding that the brake-power on the train was not sufficient.

Mr. F. C. Johnson (page 51, marked 25) says: "I consider there was sufficient brake-power on 3 and 9 carriages, &c."

Driver William Hulme (page 65, marked 26) says: "Supposing the brake-blocks were not working on No. 3 car, but were working on the other four carriages with brake-blocks on and the engine, it would be sufficient to control the train. I am of opinion that there was sufficient hand-brake power on this train to control it if it had been taken in time * * * I think they had been depending on the Westinghouse brake-power, and the train had got away from them before the hand-brakes were applied."

Driver William Frame (page 69, marked 27) says: "If the Westinghouse brake had been working in the four carriages of this train properly I could have kept it under control."

Driver Frederick Sheehan (page 70, marked 28) says: "I consider that this train could have gone with safety down to Peat's Ferry had five out of the nine carriages had brake-blocks on, if properly connected. I do not consider it would have been safe with four."

NOTE.—The four carriages with brake-blocks were equal to nine ordinary-sized vehicles, and weighed 64 tons 1 cwt. 2 qr., and the five without blocks, which were only equal to one each, weighed 26 tons 16 cwt.

Mr. W. Shellshear (page 71, marked 29) says: "If about 60 per cent. of the brake-power was applied to the wheels of a train descending an incline of 1 in 40 I am of opinion it would be sufficient to control the train." Doubtless what is meant is 60 per cent. of the gross weight of the train. On the train which met with the accident there was 84 per cent. under brake-power.

Mr. E. A. Laughry (page 74, marked 30) says: "In my opinion the brake-power was sufficient to control the train, and more than sufficient; the minimum of brake force to control this train would have been 21 tons on a grade of 1 in 40; the amount of brake force on this train was 65 tons; the hand-brake force on the engine and tender amounted to 28 tons, and including one hand-brake on an American car, would raise the hand-brake force to 38 tons."

On page 75, marked 31, this evidence was repeated to Mr. Rogers, and Mr. Laughry added;—"The only way I can account for the hand-brake power not being able to stop this train is that it (the train) had been allowed to attain too great a momentum before they were applied."

	Tons.	cwt.
The train weighed, including the engine and tender	150	3
Passengers—say	20	0
Total	170	3

Professor Warren (page 137, marked 32) says that to stop a train running at the rate of 25 miles per hour in 400 yards on a descending grade of 1 in 40, 43·146 tons of brake pressure on the wheels would be necessary.

NOTE.—If it be granted that the air-connections were complete and the taps open when the train left Hornsby, no other conclusion can possibly be arrived at but that the air was exhausted, or so much exhausted as to be practically inoperative, from the carriage reservoirs between the top of the hill and the second tunnel. According to the evidence of Mr. Kirkcaldie (page 79), which was based upon that of fireman Pye (page 66), to the effect that the train topped the hill at about 12 miles an hour, and that of Richard Brennan (page 63), that it passed the tanks, beyond the second tunnel, at 35 or 40 miles an hour,

hour, it would take about ten minutes to run from the top of the hill to the tanks, while on pages 77 and 78 it is given in evidence that with the donkey working at full speed the air-pressure in the carriage reservoirs may be injudiciously reduced so as to be practically inoperative in less time than that.

Fireman Pye says (page 67) that the pressure in the air-gauge before the train got to the descent was about 90lb., and he then saw the driver ease the steam to the donkey to avoid increasing that pressure; but there is no evidence to show that during the descent the steam was put fully on again, and if it was not the exhaust must have been very much greater than the supply.

D.V.

No. 8.

Extract from *Daily Telegraph*, with marginal notes by Commissioner for Railways.

THE PEAT'S FERRY RAILWAY ACCIDENT—A REVIEW OF THE EVIDENCE—IN WHAT PARTICULARS THE TWO TRIBUNALS DISAGREED—WHICH THEORY HAS THE GREATER SUPPORT?

1. Two distinct tribunals have arrived at two distinct verdicts as to the cause of the Hawkesbury railway disaster. Both make an exhaustive inquiry; listen in a large degree to the same evidence, given by the same witnesses; both make personal examinations; yet on a matter in which the safety of the railway-travelling public is very seriously concerned the public themselves have to decide between two opposite conclusions. Two causes have been assigned for the accident. According to the Railway Board of skilled officers, it was brought about by the unskilful use of the Westinghouse brake by the driver Wilson; on the other hand, twelve certainly disinterested witnesses have decided that the driver did all in his power to control the brake.

2. The Board have affirmed that the train was furnished with ample brake power; the coroner's jury say it was not.

3. The Board, in their report, express their opinion that the brake appliances were in proper working order at Sydney and Hornsby. The jurors declare that they were not properly examined at Sydney, and not examined at all at Hornsby, and the air-couplings being incomplete, the accident followed.

4. In one thing only both agree—that the engine was overloaded.

In reflecting over these decisions the public will be inclined to wonder whether a third tribunal would have found a third cause. Placed on the horns of a dilemma, it would be well to carefully analyse the whole evidence to ascertain, if possible, which theory has the greater support.

5. It is well to remember the changes which were made in the composition of this train—that before leaving Redfern the train was detained a few minutes beyond the appointed time to allow two additional carriages to be put on, which carriages were then next to the locomotive; that at Beecroft the train was divided to allow the engine to ascend to Hornsby, and that in leaving that station the two carriages—a first-class of the Redfern type and a long American car which had formerly been the last carriages of the train—were then respectively the first and second carriages behind the engine.

6. On the condition and position of these two carriages much depends. On the morning after the accident the air-brake connection between these two carriages was closed—that is, the tap at the rear of the first carriage behind the engine was shut. If it were in that state before the accident, then undoubtedly the air-brake could only be applied to the tender and that carriage. The question then arises—Was it closed by the collision? The jury have, though not affirmed, left it to be understood that it was not; the Railway Board have declared that it was.

7. Official examinations of the wrecked train were made on the day of the accident, but this particular part of the train could not be reached. On the following morning the *débris* had been cleared away, and the tap was first found by Mr. Walter Shellshear, the central district engineer, in the presence of the engineering superintendent, Mr. Robert Scott. They say they had found the other air-connections complete, as also had the assistant traffic manager (Mr. Kirkcaldie), the travelling inspector (Mr. Laughry), and several others. Mr. Shellshear is an able engineer, who has occupied the position of president of the New South Wales Engineering Association. After a careful inspection he came to the conclusion that the tap had not been turned by the accident.

1. What is the effect of the evidence given before both the Departmental Board and the coroner's jury? The evidence is the same in both instances, although that given before the coroner is more amplified.

2. It is demonstrated beyond all question that the brake power, if used, or usable, was sufficient.

3. The whole evidence must be discredited to establish the theory that the air-couplings were incomplete.

4. Yes. The engine was asked to do more than the tractive power it possessed warranted; but still it is quite possible that a more competent and careful driver would have managed to get over the difficulty without dividing the train.

5. This is correctly stated.

6. The whole of the evidence points irresistibly to the conclusion that it was shut by the collision.

7. Mr. Shellshear's duties appertain to the permanent way, and not to the vehicles. He is not an authority upon the action of the Westinghouse brake. His theory, he said, would be supported by two circumstances—by the circumstance that the wheels of the leading carriage were hot while the remainder were cold; and by an examination of the wheels of the leading carriage, which would show marks of skidding. The authority he referred to said the wheels were cold, and an examination of the wheels of the carriage established that there were no marks of skidding. (See evidence given before the Departmental Board.)

8.

8. It was not turned in the usual way, but we believe it is optional how these taps are turned; the hose-pipe near it was not in any way injured, nor did the tap itself present any evidence that it had been struck with any force; being underneath the floor of the carriage it was protected, and the wood and iron work in its immediate vicinity showed no effects of violence.

9. On the other hand, Mr. Laughry and Mr. Kirkcaldie both affirm it as their opinion that the tap was closed by the force of the collision. Mr. Laughry points out that the floor of the American car had skidded under the next carriage a distance of 20 feet, and this might have had the effect of closing the tap; that the force of the collision had telescoped these two carriages; that the *débris* had been thrown in all directions; and that a slight blow would be sufficient to turn the tap in the position in which it was found.

10. How came the tap to be closed is a question which the volumes of evidence given do not unravel. Had the closed tap been behind the American car the presumption would be that the guard had neglected to complete the connection in recoupling the train at Hornsby. Closed was the proper condition of the rear tap of the American car up to Beecroft, when it was the last car on the train. Or had the air-tap in front of the carriage been found closed, instead of the tap in the rear, the natural conclusion would be that when the engine had been connected with the two carriages at Beecroft the guard had not turned on the air between the engine and the first carriage.

11. But the fact that it was this particular tap involves the whole matter in mystery.

12. There is evidence that the brake connection ran through the train before leaving Sydney. The brake-examiner (Werrick) and the shunter (Derham) declare that they saw that the connection was complete. Both admit that they did not examine every carriage; but if it is a fact that they saw the air acting on the last carriage, it is proof positive that it was running right through. They say they saw the driver try the brakes, and afterwards release them to start away.

13. Now, it is confessed by the brake-examiner (Werrick) that he did not make a thorough examination of the brakes. He pleads in extenuation that he only had four minutes to make his inspection, as there was another train awaiting him. But it does not require his admission to show that the train was not examined properly by Werrick or any other officer. The station-master (Mr. Johnson), the guard, the shunter (Derham), and several others, whose duty it was to attend to this train, all express their surprise to learn for the first time after the accident that on one of the carriages the brakes were inoperative, and that the words "air-pipe leaking" were marked in chalk on the carriage in two places, indicating of course that it was not to go out until repaired.

The carriage was so found, yet, strange to say, no evidence has been forthcoming as to when and by whom this notice was written. Is this not conclusive evidence that the train was not carefully examined before leaving? And if a brake-disabled carriage so marked escaped their attention, might not also the tap between the two last carriages?

The tap being at the end of the carriage, the brake-block would act on it; and had the connection been shut off at this particular carriage at that time or any time, before parting the train at Beecroft, it would have only affected the last carriage—an American car—and therefore would not be easily detected by the driver, particularly if the guard who rode in that car applied the hand-brake.

16. The only people who can speak of the air-brake acting up to Beecroft are the passengers in the American car and the guard who rode on it, and voluminous as the evidence is, sufficient attention has not been paid to the point. Mr. Garrard says he did not notice the air-brake being applied as far as Colah.

17. No other occupant of the car appears to have noticed it. The guard thinks it was acting, but one of the effects of the accident was to obliterate much that he would have otherwise remembered, and to considerably confuse his remaining impressions. In all sincerity Clissold has, upon calmer reflection, so often had reason to correct himself that it would not be well to rely on the minute accuracy of his evidence. The fact cannot be gainsaid that if the tap was turned when the train left Sydney, and the engine had managed to crawl over the grade without dividing, or if after division the position of the carriages had not been changed, no disaster would have followed. Placed where the Redfern carriage then was, eight carriages instead of one were shut off.

8. In 100 cases 90 % would show the handle turned the opposite way; this one was turned; and some of them are made with their unions so fixed that the tap will turn only one way, that is, towards the buffers.

9. Might have had the effect? If the tap were open it would certainly have had that effect, and this is distinctly sworn to.

10. The evidence points clearly and unmistakably to one conclusion only—the telescoping closed the tap.

11. The mystery, however, is solved by the explanation that the telescoping closed the tap.

12. The evidence is incontrovertible. By admitting it the writer of this summary must necessarily be thrown upon the other explanation, viz., that the collision closed the tap.

13. The writing indicated no such thing. It simply meant that the pipe connecting the copper pipe with the reservoir was to be turned off, as it was leaking. The tap was turned off, and that being the case the car was ready for use.

Evidence has been forthcoming to the effect that the words "air leaking" were seen by John Fell, and the words "copper pipe" were written by W. T. Chambers, and the evidence of these two men and of J. Hemsworth is conclusive as to the inspection and safe condition of the brake appliances of this particular carriage before it went out. It did not escape attention. (See Departmental Inquiry.)

The evidence of Werrick, Derham, & McCarthy places the fact that the tap in question was properly open when the train left Sydney beyond doubt, and Mr. Garrard's evidence on this point is convincing. He was in the last carriage, and is positive the air-brake went on between Sydney and Ryde. Well, if it did go on the theory about Shellshear's tap is upset.

But he asserts distinctly that he did notice the air-brake going on till Beecroft was reached (see evidence given to Board); and he is equally positive that it went on when descending the first part of the grade to the river (see evidence given to jury).

17. Why not? What the writer is pleased to call a fact is gainsaid. If the driver lost his air none of the brakes would act.

18. Circumstantial evidence points to the conclusion that the tap was closed before the departure of the train.

19. In disconnecting the train at Beecroft the guard would have no occasion to close this particular tap, or to interfere with it in any way whatever, simply because it was between and not at the end of the two carriages left behind. He would have no need to go near the tap while the carriages awaited the return of the engine, nor would he in recoupling the train at Hornsby.

20. It is, however, worthy of notice that he deemed it necessary to sprag the wheels of the American car. He said the brakes were left on each carriage, and he had only done this as an extra precaution against the carriages running back, as they were left standing on the incline. If he had placed the pole in one of the rear wheels of the other car it would have given rise to the suspicion that the tap might have been turned accidentally by the end of the pole unknown to the guard.

21. Though somewhat dazed and bewildered with regard to many details, Clissold was very positive that he had connected the air in making up the train at Hornsby. Stead, the officer in charge there, saw him turn one tap, and his hand raised to turn the other. Although he did not see it actually performed, from the condition of the taps after the accident the inference is that he did so. He remarked that in turning the air on from the engine the hissing sound of the air as it rushed out was not so sharp and distinct as usual. This would indicate that the force was not so great as usual.

22. The partial absence of this sound is corroborated by the guard, who also noticed it. Too little attention has been paid to the point. Nobody seems to have realised its importance.

23. If the tap was closed at that moment no sound at all could come from the hose-pipe of the American car, but in opening the tap at the end of the car, which before had been behind the engine, the air remaining in the reservoirs beneath the different carriages would be released.

24. We arrive then at several important facts. Clissold said he would honestly and candidly admit that he did not satisfy himself that the brake connection was complete. The extenuating circumstances he urges for his neglect are that the train was nearly two hours behind time, and that in the midst of a volley of satirical allusions, which passengers, especially holiday excursionists, are apt to address to a guard of a disabled train, he was very anxious to get on. Nor did the driver try the brakes on leaving Hornsby. Several remember this, amongst them the fireman. Under ordinary circumstances he would not do so, but it is the rule when a train has been remade up. It is, nevertheless, important to remember that he did not, and that if that tap at the rear of the then second carriage was closed, no means was taken at Hornsby by the guard or driver to ascertain the fact.

25. In leaving that station (Hornsby) the driver would have no necessity to put on the brakes, yet Stead stated that he noticed that the brake-blocks were on one carriage. He did not distinctly recollect which carriage, but believed it was the third from the engine; the blocks seemed to be rubbing slightly. This circumstance is corroborated by Clissold, who stated that a little way beyond Hornsby, noticing that the blocks were rubbing on the wheels of one carriage, he got off the train and released them.

26. Obviously, the blocks on one carriage only were rubbing. The position of the carriage has not been defined. The evidence is *a* that it was not the first. It could not have been the second (the American car), as Clissold could have released them from the hand-wheel without getting down. It could not have been the third *b* carriage, as it had no brakes. The brakes on the next were *c* inoperative. It must have been one of the carriages behind the fourth; and as all but the American smoking-car were second-class *d* carriages without brake-blocks, it must have been that.

27.

18. Circumstantial evidence points to quite the other fact, that the tap was open. It must have been open, or all the witnesses perjured themselves. The evidence of Wesham, Derham, and McCarthy is conclusive that the tap was not closed.

19. This is true, and the theory that the tap was closed is again contradicted by the fact that the brakes were on both the carriages left at Beecroft. (See evidence of Gaylead, Rice, &c.)

20. Clissold says that he used a sprag at the instance of Mr. Rennie; but he says it was quite unnecessary, as the brakes were on. If they were on, then the pole could not have turned the tap. It is further proved the pole did not turn the tap, because the driver sent a column of air through the pipes at Hornsby to release the brakes.

21. Still, whether the air was strong or weak, the fact that it came out upset the theory that the tap was closed at rear of first carriage. Clissold was attaching the second carriage to the third; the air must therefore have come through the first carriage.

22. As the writer says, if the tap was closed at that moment no sound at all would come from the hose-pipe. But a sound did come.

23. This shows how little the writer knows of the matter. In the first place, the tap was open: it had been opened by Stead to put the brakes on; and, in the next place, does not release air from the reservoir, but from the service-pipe. The rush of air must have been from the engine.

24. He did not try the brakes as laid down by the regulations, but the operation he made (and perhaps this was the reason he did not go further) showed clearly that connection was perfect throughout. He took off the brakes of the vehicles which were taken to Hornsby first; in so acting he demonstrated that the air-connections were complete. This is a piece of circumstantial evidence which cannot lie; it is better than personal testimony.

See Pye's evidence before Departmental Board.

It is very extraordinary that the fireman should be said to have been one of those who remembered this, seeing that the fireman states most positively that he remembers nothing about it, in fact did not know, as he was otherwise engaged. I draw attention to it as it affords another instance of the way this writer of this summary has manufactured evidence.

25. But he would require to, and did, take the brakes off, and that, as regards the air-couplings, necessitates the same condition—they must be intact from the engine to the last carriage with brakes on.

26. It could not have been the third. The third was the sixth at Sydney, and that, as we know, had the automatic portion shut off.

a. Clissold was not on the second car at this time, nor would the hand-wheel release a brake kept on by air.

b. The brakes on the fourth were not inoperative.

c. No, it was not, for Clissold was on, and got off from the fifth, behind which there were no carriages with blocks.

d. If any, it was the fourth; Clissold got off this one (the fifth).

27. Mr. Kirkcaldie says if the air had been released from the reservoirs, the brakes would have gone on. Quite so; exactly what occurred. But why only on one carriage? Simply because there was only one carriage behind the American car on which the brakes could be brought into operation, namely, the American smoking-car—the fifth from the engine. Of course no air was found in the reservoirs. Were not all the taps behind the first carriage found open?

28. Apart from the direct cause of the accident, the search for the cause has revealed culpable negligence. There is the hurried examination at Sydney, in which a disabled carriage escaped notice.

Then nine carriages are placed on an engine not powerful enough to take them over the smaller grades of the line. Undoubtedly, had the engine been sufficiently powerful, the alteration in the position of the carriages would not have been made, and the accident not have followed.

29. Then, four second-class carriages, without brake appliances, were placed in the rear of a train without a brake-van on a line of several long steep grades. The result of such an oversight in the event of the couplings parting can be easily imagined.

30. Then, the train was allowed to leave Hornsby without the brakes being tried.

Lastly, and above all, an air-tap—that behind the first of a train of nine carriages—was found closed.

31. The theory that the driver lost control of the train by an unskilful manipulation of his brake-valve and exhausted the air is almost entirely unsupported by evidence.

32. Henry George Perkins, an engine-driver for the contractors, who was on the scene of the accident, and within a few seconds of its occurrence rescued the fireman from drowning, was also one of the first to examine the engine. He found the donkey-engine with which steam is supplied to the brake working.

33. The regulator was partly open and the brake-lever applied. Although he did not examine the air-couplings, he found all the blocks of the rear carriages loose, as if they had not been operated upon, but the blocks were on the first and second carriages.

34. Hugh Rohan, engineer for the contractors, another practical man, declared that there was no brake connection between the second and third carriages, and that he drew one or two persons' attention to this fact on the following morning, but this is uncorroborated in evidence.

35. He also found all the blocks of the other carriages loose.

36. R. Brennan, another engine-driver employed by the contractors, saw the train pass 3 miles above Peat's Ferry. He, too, thought the brakes were not acting, and that the engine was reversed.

37. William Hume, a Government engine-driver waiting at Peat's Ferry, says the blocks of the third carriage were loose, and the wheels cool, as if they had been running without brakes. He examined all the taps which at that time could be got at, and found them all open. He also saw the donkey working in the water. The brake-valve on the engine was half open, and he adds that was its proper position to prevent any unnecessary wasting of air.

No; the tap at the rear end of the fifth car from engine was found properly closed.

28. It was not disabled from running, and did not escape notice and examination. (See Departmental Inquiry.)

This is assuming that the tap was closed. The accident might have followed if the carriages had remained in the same order as when they left Sydney, if it was owing to the injudicious use of the air.

29. This was no doubt a bad arrangement; if on going up the grade beyond Hornsby, or even if on leaving Beecroft, a coupling of one of these four carriages had broken there would have been no break, and nothing to prevent the detached portion of the train running back. Still, as far as the accident was concerned, it was rather an advantage than otherwise that they were at the rear of the train when it left Hornsby, because it saved the air from passing through 90 feet of main pipe, which it would have had to do if they had been in any other portion of the train, and so facilitated the exhaustion of the air.

30. No. The brakes were tried; in fact, they were taken off.

Under the circumstances it could not have been found otherwise. It was bound to be found closed, because the accident itself closed it, as the evidence clearly enough shows.

31. The accident could have been caused in no other way. The whole evidence supports this theory. If we even adopt the "shut-tap" theory it leaves the driver with 48 tons of brake-force (engine 15, tender 13, first carriage 10, Clissold's car 10), more than sufficient to have enabled him to control and stop his train after his discovery that it had got away. If he had had this the accident would not have occurred; but if he had at the time his train got away only what the Board suppose—viz., the engine hand-brake 15 tons, and Clissold's car 10—25 tons altogether—then he could not have controlled it.

32. The donkey-engine might be working, and the gauge-glass might show a pressure of 75 lb., but it would not necessarily follow that the reservoirs under the carriages were full.

33. There is not a word of evidence, either by Perkins or any one else, to this effect, viz., that blocks were on the first and second carriages. It is pure fabrication.

34. Hugh Rohan is a labourer, not an engineer; admits he knows nothing of the air-brake. His evidence is not only uncorroborated—it is distinctly denied by the evidence of Mr. Kirkcaldie, Mr. Laughry, and R. Melton.

35. What is the meaning of this? Rohan gives no evidence on the point.

36. When the engine was reversed everybody knows the blocks were not acting—the engine was reversed for that reason.

37. He does not say that any of the others were "hot." They were all cold.

The fireman is the most important witness on this point, for he alone can speak of the actual conduct of the driver. Yet from him we get nothing to support this remarkable theory. The only suspicious incident in support of it is that before the train was divided at Beecroft the piston of the donkey-engine stuck, but he states that it continued to work when lubricated. Pye saw nothing to lead him to think that the driver had extracted his air. He recollects reading the air-gauge, which showed 90 lb. pressure, 10 lb. above the maximum, soon after leaving Hornsby. The driver then took the usual course, released the surplus air pressure by easing the donkey-engine. Subsequently the gauge showed 75 lb., and this was after they realised that the train had got beyond their control. Naturally Pye came to the conclusion that the brakes were not acting on the carriages.

38. It has been asked why the train was kept under control for such a distance down the grade if the air-connection did not extend beyond the first carriage. It is answered by the fact that the grade as well as the momentum of the train increased as they descended. The first part of this long grade is 1 in 50, then 1 in 55, and it is not until emerging from the second tunnel that the grade becomes 1 in 40, and continues so to within a few yards of Peat's Ferry platform, where it eases off to a level road. Will anyone dispute that the train was under control till the 1 in 40 grade was reached? It was there that Wilson exclaimed "the train has got away from us." How remarkable that he should have exhausted the power of the Westinghouse automatic brake from that particular moment! It was here also that the guard applied the hand-brake with little effect.

39. Pye does not exactly know how often Wilson applied the brake. If he had turned it off and on as often as necessary to exhaust the air, would he not have noticed such an eccentric proceeding?

40. He knows that the donkey was working, but cannot positively say whether the air can be exhausted more quickly than the donkey can supply it. This is a point which has not been made clear.

41. Several engine-drivers are quite sure that the air cannot be exhausted by the application of the brake while the donkey is kept going. Other practical witnesses swear the opposite.

42. Frederick Sheehan, another driver accustomed to use the Westinghouse brake, has never known it to fail except when the connections are incomplete, and adds, if there had been an air pressure of 75 lb., that would alone show that the driver was working the air properly.

43. With that pressure and the connections complete, he thinks the train could have been pulled up in 300 yards. Sheehan says one full-force application of the brake on a descent of 1 in 40 would only reduce the pressure 7 lb. If correct, Wilson, without the aid of the donkey-engine, would have had to make seven or eight distinct applications before the pressure became inoperative.

44. Is it reasonable to think that the donkey-engine, which was found working in the water after the accident, was not working all the way down the hill?

45. Sheehan is also convinced that the driver could not have exhausted the air.

46. When asked to account for the accident, this witness simply replies that it must have been owing to one or more taps on the train being left closed, and the air-connection thereby rendered incomplete, and, adds Sheehan, if the air had become exhausted and the connections had been complete, the brakes would have remained on, and the effect would be to stop the train.

47. Mr. Shellshear's evidence is that if the tap was closed previous to the accident it would account for it.

48. Clissold, who was working the hand-brake in the second carriage, makes this important statement. It seemed to him that the brake was not acting on the car, as he was able to put the wheel right over, a thing he could not do when the air-brake was working.

49. Mr. Garrard, M.P., who was in the American car, was under the impression that the air-brake was working on the wheels while they were descending the grade, but he was not aware that Clissold was working the hand-brake with all his might. In fact, Mr. Garrard was astonished to learn that the guard was on the car, as he undoubtedly was. It is a pity that Mr. Garrard did not carry out his idea of rushing to the hand-brake. It is still more unfortunate that two or three passengers in the American smoking-car did not apply their utmost strength to the wheels of the hand-brake there. Had they done so, the momentum of the train would have been considerably reduced

We do get most important evidence from him. He testifies to the frequent use of the air-brake by the driver, and finally we learn from him that the driver put his valve so as fully to apply brakes, and left it so, in which position no air could get to carriage reservoirs

38. Yes, certainly—Clissold, and Pye.

He exhausted it before, not from that particular moment.

No; Clissold applied his hand-brake between the first and second tunnels, where the gradient is 1 in 50, before the 1 in 40 was reached.

39. Pye said he did use the brake frequently.

40. It can be made clear by practical test.

41. It is only those who do not understand the brake who say so. It can be tried in a few minutes if there is any doubt about it.

42. It would show no such thing. It might show that there was that amount of air in the reservoir on the engine and in the main air-pipe; but it would not show what was in the carriage reservoirs, which alone applies the brakes.

43. 15 lb., not 7 lb.

44. It might have been, but that would not put air into the reservoirs on the carriages unless the brakes were entirely released.

45. Of that, however, there can be no question.

46. This shows only that Sheehan does not know what he is talking about. How could the brakes go on if there were no air to put them on?

47. No, it would not; for, as already observed, see No. 31. Even then, the Board's theory is the only explanation that can be given.

48. I have gone through Clissold's evidence, and there is no record of his having given any such evidence as is here stated. Even if he did, however, the fact of his being able to put the brake on by hand would only imply that there was no air in the reservoir to apply it.

49. The writer ignores Mr. Garrard's evidence that when he was in the last carriage, between Sydney and Beecroft, he felt the brakes going on to that carriage. This in itself completely upsets the theory that Shellshear's tap was closed; and Mr. Garrard also is particularly positive that it was not the hand-brake he felt when descending the grade near Peat's Ferry, but the air-brake.

reduced, if the catastrophe was not altogether averted. Experts have affirmed that they could take the train down the grade with the use of the hand-brakes alone, only one of which, unhappily, in this instance, was applied.

John Barrie, another passenger in the American car, is satisfied that the brake was not applied until he saw the guard using the hand-brake. The Assistant Traffic Manager, after advancing the theory that from an injudicious use of the brake the driver had wasted the air, and thus had insufficient pressure to control the train, admitted that there was no direct evidence on which to support it. It was the only possible explanation in his mind. But then, Mr. Kirkcaldie, with the members of the Departmental Board, is convinced that the brakes were acting throughout the train when leaving Sydney, that the air-connection was complete when the train was recoupled at Hornsby, and that the closed tap was so closed by the collision. He is supported in his opinion by one or two other experts, as well as fellow-officers who compose the Board. Are these convictions formed upon or in defiance of evidence?

Here are the incidents against their theory:--

1. The finding of the tap closed.
2. Corroborated testimony that the driver's valve indicated the brake applied.
3. Brake-blocks on the first two carriages.
4. Brake-blocks loose on all others.
5. The position of the first carriage before reaching Beecroft.
6. No application of the air-brake felt after leaving Hornsby.
7. Donkey-engine working in the water.
8. Abundance of air-pressure noticed by the fireman.
9. Incomplete brake examination at Sydney.
10. No examination at Hornsby.
11. The point at which the train got beyond control.

1. Explained.
2. No air in the reservoir, nor could it be got in with the driver's valve in this position.
3. False; no evidence given.
4. False; in so far as it implies the blocks were on others.
5. Nothing in this.
6. False; see Garrard's evidence.
7. True.
8. True; but that does not prove the air had been conveyed to the reservoir.
9. Not admitted; it was absolutely complete.
10. Yes; the brake-blocks were taken off by driver.
11. What is the meaning of this? There is no meaning in it.

Extract.

[From the *Daily Telegraph*, 22/7/87.]

THE RAILWAY ACCIDENT—THE EXPLODED THEORY OF THE BOARD.

THE remarkable theory which, in the minds of the members of the Railway Board and the Assistant Traffic Manager, is the only possible explanation of the Hawkesbury railway accident is apparently entirely based on the fact that no air was found in the reservoirs of the uninjured carriages after the accident. The absence of air in these receptacles is said to be inexplicable by any other cause but the exhaustion of the brake-power by the driver. Had the air-connection been shut off at the end of the first carriage at Hornsby, then the air should have remained in the reservoirs, and the effect of its being there would be the application of the brakes, instead of which the blocks hung loosely from the wheels, and all the reservoirs, although intact, were empty. The first two carriages offer no key to their emptiness, as the reservoirs beneath them were smashed in the collision. On the other hand, it is alleged that if the driver exhausted his air by an unskilful manipulation of the brake, empty is the exact condition in which these reservoirs might be expected to be found.

But even this ground, which appears to be the only one on which the Board support their case, is cut away from under their feet. No automatic compressed-air brake has yet been invented which will retain the air in the small reservoirs for all time when the brakes are applied. Even when all the appliances are new, and the brakes are applied to one or more standing carriages, the maximum pressure of compressed air will exhaust itself through the cylinders in the course of three hours; but when the leather packing becomes worn, as it necessarily does by constant use, the air will escape in the course of half an hour; but if the pressure is below the maximum, the exhaustion is, of course, correspondingly quicker. Nothing has yet been invented to prevent this gradual escape and allow the pistons to work. It can only be minimised when the leather packing and hose and other pipes are new and in perfect order; it cannot be obviated altogether. The character of the motive power employed is the explanation, and, as everybody knows, when in a state of compression, amounting to 80 lb. to the square inch, is quicker than mercury, and will find an outlet through the smallest possible space. Examination of the leather packing in these cylinders would show, we have reason to believe, that they are well worn. It is not a serious defect if they are, nor is it a damaging feature in the construction of the Westinghouse brake that the air must leak out of the reservoirs while the brakes are on standing carriages disconnected from the source of supply. In a state of emptiness these reservoirs can be quickly refilled from the main reservoir. It would be the first duty to recharge them the moment the train was recoupled at Hornsby. Had the driver failed to place this valve in the feed position he could not have moved away, as he would have placed the brake on.

The

The question which then arises is, what evidence has been given as to exhaustion of air by natural leakage? Stead, the officer at Hornsby, who cut the engine off the seven carriages when they came up, after doing so closed the tap on the engine, and left the tap open on the train, thereby exhausting all the air in the main pipe, and applying the brakes on the carriages fitted with blocks. He noticed that the hissing sound was not as sharp as usual, and his first thought was that the pressure was low. As the driver would have no occasion to use his brake at any place between Beecroft and Hornsby, and as a very light pressure would suffice to pull up at the points, it is reasonable to believe, after Stead's statement, that he arrived at Hornsby with the pressure somewhat below the maximum, perhaps not more than 50 lb. or 55 lb. Stead saw the blocks on the wheels, but it is not certain whether he closed the tap again or not. Closing the tap would not stop the leakage through the cylinder, but leaving it open would accelerate exhaustion, as it would at once empty the main pipe, and the empty condition of the main pipe would also have an influence in assisting the escape of air through the cylinder into the atmosphere. In the opinion of men who have had years' constant experience in the working of the Westinghouse brake, half an hour would be quite sufficient to exhaust the air in the reservoirs beneath two of those seven carriages if the packing was in any degree worn, and that the air would, of course, have escaped in less time if the pressure was below the maximum. These seven carriages remained there for fully half an hour. But it would appear that all the air had not escaped from the reservoir of one carriage. Stead noticed the blocks of one carriage slightly rubbing—of one carriage only. That could not have been caused by the driver. Further on the rubbing of the blocks acting against the power of the engine in ascending a grade, and Clissold noticing it for the first time jumped down and took off the blocks of this particular carriage by turning the release valve. The exact position of that carriage has not been shown in evidence. If it was any carriage behind the first it only shows that on that particular carriage only the small air-reservoir had not at that time been completely exhausted. Stead is certain that the blocks were only rubbing slightly, indicating that the air was almost gone. Had the brakes been hard on, he, no doubt, would have drawn attention to the fact, and the probabilities are that the driver himself would have noticed it. Undoubtedly it must be plain, after this explanation, that the air had expended itself from one of the reservoirs, and not altogether from the other, and thus Wilson got away from Hornsby under the impression that the air-connection was complete.

One would really imagine from the dramatic way in which it has been shown that a driver can exhaust his air, that the Westinghouse brake in the hands of an unskilful driver can become the cause of a fearful railway accident in a few seconds. And we have a vivid picture drawn of what might possibly have happened in the darkness of the third tunnel when Wilson, in his nervous excitement, might have turned the brake off and on several times unknown to the fireman. Both suppositions are absolutely impossible. The Westinghouse brake cannot be made to act in that way, even if placed in the hands of a raving maniac. It is perfectly true that it can be applied instantly, but it cannot be released under eight seconds. A driver or madman can turn back the valve-handle as often as he likes, but eight seconds must elapse before the brakes come off. How many times could the brakes have been released while the train was rushing through the third tunnel, the distance of which is 140 yards? The act of turning the brakes on and off so vividly portrayed would only mean keeping them tightly on all the time.

If it is admitted, as it must be, that Wilson had his donkey working, he could only reduce the pressure by two or three pounds at each application at the end of eight seconds, and it would require much longer time than elapsed before the collision occurred to bring his pressure down to an inoperative force. In the absence of one tittle of evidence that he acted in this frantic fashion, and without even the most meagre trace of such conduct, no wonder that railway engineers and skilled locomotive drivers are unanimous in declaring that the theory propounded by the Board, and only suggested by two in an army of witnesses, is absolutely untenable.

Then, much is made of the evidence that the wheels on the first two carriages show no signs of skidding. True, several witnesses stated that the wheels of the first two carriages were hot and all the others cold after the accident—conclusive evidence that the brakes had been on these two vehicles alone. Yet had they skidded any distance unquestionable signs would have remained. They would have been worn at the parts brought into contact with the iron brake-blocks and rails. The answer is simply that the leverage placed on the air-brake would not allow the wheels of the carriages to skid at the maximum brake force if the train went beyond 25 miles an hour. Every witness who alluded to speed stated that it was from 50 to 60 miles an hour. Of course the brake-power which will cause wheels to skid at 10 miles an hour will be insufficient for such a purpose at a much greater speed. No good object can be attained by skidding wheels. It has been demonstrated that the momentum of a train on an incline with the wheels skidding is greater than by their revolution; more than that, the skidding of wheels means the rapid injury of wheels, therefore the leverage of the Westinghouse brake has been so adjusted that drivers have no difficulty to keep the wheels from skidding at a low speed, while at any speed over 25 miles an hour it is impossible. So much for that argument.

We venture to think that the more the air-exhausting theory of the Board is analysed the greater will appear its absurdity. It is unsupported in evidence; it can be undeniably destroyed by experiment. Experts who have had their explanation of the accident, founded on corroborated testimony, upheld by twelve disinterested jurors, and, we think, universally accepted by the public, invite experiments, if only to convince the Railway Board and others guided by their conclusions. Surely they have everything to lose and nothing to gain by these experiments.

Practically, they say: Fill the reservoirs of these uninjured carriages with air, provided the packing has not been renewed; turn off the main-pipe and leave them in the same state and for the same time as they remained at Hornsby, and see how quickly the air is exhausted by leakage. Fit up a train composed of these carriages and two others to correspond with those destroyed, and try the air-exhausting theory on a down grade, followed by a corresponding up grade where no possible accident can result; or, if accident is feared, have a train abundantly supplied with hand-brakes to be used in case of emergency. Ascertain in this practical way how the air can be wasted by unskilful manipulation of the brake-valve, or how quickly the train can be brought to a standstill. If the grade is not heavy enough, keep on steam. The challenge is made. It can be carried out without risk. Query: Will it be accepted?

Minute by The Commissioner for Railways.

Accident at Peat's Ferry.

THERE is a letter in to-day's *Telegraph* on this subject, evidently written either by an employé of the Department or by some one who has been furnished with the information he gives by an employé. The criticism upon driver evidence is sufficient to show that this surmise is correct. Put letter with this.—CH.A.G., 29/9/87. Done.—A.R., 29/7/87.

Register and put with papers. I have annotated the paper. The writer does not understand the working of the brakes. He has misstated, in fact fabricated a certain piece of evidence to serve a conclusion which he has forced. He says the fireman stated in his evidence that driver Wilson put his valve in the feed position. There is not only no evidence of this, but there is the fireman's evidence to the contrary, supported by the circumstantial evidence that the valve was found in the brake's applied position—(see evidence.)

If the unfortunate driver had had his wits about him he could have pulled up his train even after he had exhausted his air, if instead of keeping his valve in the position of "brakes on" he had reversed it to the feed position. With 75lb. of compressed air in the main reservoir and pipes, he could have got, in less than a minute, sufficient air into the auxiliary reservoir, which would, on placing the valve in the "brakes on" position, have stopped the train.

The train should not have been wrecked—would not have been wrecked in the hands of a man who had readiness of resource in times of emergency. Many drivers might lose their air (it is an inherent defect in the apparatus), but few, I hope, on our lines, would act so injudiciously as driver Wilson did.

The general public will not be satisfied till the facts I have mentioned are demonstrated by trials. A train in all respects similar to the wrecked train should be taken over the road:

1st in the position in which the "shut tap" theorists describe, and in disproof of their theory, the train shall be given a speed of 30 miles an hour at the place where she first broke away and where the driver whistled for the guard's brake, and it will be shown that the train will be brought to a stand with the engine-brake, the air-brake in the tender, the air-brake on first carriage, and the guard's-brake on second carriage.

2nd. Under the conditions which the Board say existed, and then it will be shown that by pulling the valve in the feed position, and checking the train as far as possible by the hand-brakes, (though the speed should be accelerated to 50 miles an hour) the train could be stopped.

The actual way in which the accident occurred need not be demonstrated, nor any effort made to represent it, as the risk would be too great. CH.A.G., 29/7/87.

[From the *Daily Telegraph*, 29/7/87.]

THE CAUSE OF THE PEAT'S FERRY DISASTER.

(To the Editor of the *Daily Telegraph*.)

Sir,—The conclusions arrived at by the Board appointed by the Department to inquire into the causes which led to the Peat's Ferry disaster appear to me to be quite irreconcilable, either with the probabilities of the case, or with the sworn facts as elicited at the inquest.

The first statement, to which exception may be taken, is:—"That there was sufficient hand-brake power on the train to have taken it safely to its destination." This is only true subject to two important qualifications—the first being that all the hand-brake power was available for use in an emergency. As the only two vehicles on the train which were supplied with hand-brakes were placed in different parts of the train, and there was only one guard, the statement is misleading in this most essential particular. The second condition was that the speed of the train when descending the heavy gradient would not be allowed to exceed say 15 miles an hour, it being a well-known fact that the momentum of a train, and consequently the amount of retarding power necessary to control it, increases as the square of the speed. As the driver would naturally rely on the other brake-power which he believed he had at his disposal, this condition was not likely to be carried out.

The theory of the Board, that the failure of the brake was due to injudicious action on the part of the driver in completely exhausting the air from the small reservoirs, will be received with considerable hesitation by those who are conversant with the practical working of the brake. According to the description given of the road, the first 2 miles of the descending gradient range from 1 in 55 to 1 in 50, and the evidence goes to prove that the driver lost all control over his train immediately after getting off this on to the heavier gradient of 1 in 40. Assuming as the Board does that all the brake connections were perfect, to have exhausted all the air from the auxiliary reservoirs at such an early period of the descent the driver must have applied his brake and released it seven or eight times in rapid succession. This on the part of a man who had had considerable experience in the use of the Westinghouse-brake, would have been not merely injudiciousness, but an act of madness or folly, which no one will believe the unfortunate driver could have been capable of. Again, the speed of the train on this comparatively easy gradient would be so much reduced by each application of the brake that the interval which would elapse

Not 7 or 8, say 5.

This is presupposing that it was used judiciously.

elapse before it would be again necessary to apply it would allow sufficient time for the small reservoirs to be charged with air of the same pressure as shown on the air gauge. The fireman's statement that when the driver, finding his brakes were apparently not acting on the train, placed his brake-handle in the release position in order to re-charge the small reservoirs, and that the air gauge then showed a pressure of 75lb. proves conclusively that the reservoirs were not then in the state of exhaustion, assumed by the Board. Had such been the case the gauge would have registered that pressure for an instant only and then the indicator would have fallen back rapidly, as the air stored in the main reservoir and passing through the brake-pipe expanded into the small reservoirs. Air at this pressure would have an effluent velocity into air of the ordinary atmospheric pressure of about 1,200 ft. per second, and after making due allowance for the resistance of friction, the whole train should have been charged with air of about 48lb. pressure in about 15 seconds. Professor Warren and Mr. Kirkaldie's statements as to the number of manipulations required to reduce the pressure a given amount are wanting in one important element. They do not give the number of brake cylinders in communication with the main reservoir, which in this case was only five.

I have not seen the formula on which Professor Warren has based his calculations as to the amount of brake-force necessary to stop a train at different speeds, but as in his results the percentage of retarding power increases as the square of the speed, it is evident that he has used a constant co-efficient of friction between the brake-block and the wheel. The learned professor is probably unaware that in an elaborate series of experiments, conducted by Captain Galton, on the London and Brighton railway, the remarkable fact was demonstrated that, the speed and pressure remaining the same, the co-efficient of friction diminished rapidly during the time the surfaces remained in contact. Thus, at a speed of $37\frac{1}{2}$ miles per hour, the pressure on the brake-blocks being the same throughout the experiment, the co-efficient of friction at the commencement was .152, after 5 seconds .096, after 10 seconds .083, and after 15 seconds only .069, or less than one-half the normal amount, which may be taken as .15. It was also discovered that the speed had a great influence on the result—a speed of 60 miles an hour showing at the commencement a co-efficient of .072, after 5 seconds .063, and after 10 seconds .058. A most forcible illustration of the immense difference between what can be accomplished in theory and the results obtained in actual practice is to be found in the statement made by one of the witnesses—that, with a similar amount of brake-power, he could safely take a train of twenty vehicles down the gradient. Yet this same individual when in charge of a lighter train, every carriage of which was supplied with brake-power, came into collision with the buffer stops on one of the Zig Zags.

It is difficult to see how the Board can reconcile their opinion that the air connections were complete with the evidence of Mr. Shell-shear as to the position in which he found the tap at the rear end of the first carriage. The mere fact of the brakes having apparently worked all right between Sydney and Ryde proves nothing, as it was scarcely possible for the driver to discover that the brake was not acting on the last vehicle on the train. In proof of this, it may be pointed out that neither driver, fireman, guard, examiner, nor anyone else connected with the train was aware at any time during the journey that the first carriage on the train as it left Sydney had the air shut off at the tap leading to the triple valve, thus rendering the brake on that vehicle inoperative.

The fact of the train after it was remade at Hornsby having to stop at the first gradient, and that some of the brakes then had to be released, at a time when, according to the fireman's evidence, the air pressure was steadily increasing, points unmistakably to the fact that the air connections were then incomplete. Observe with what extreme accuracy the circumstances connected with this stoppage dovetail into this theory, and the utter impossibility of accounting for them from the point of view assumed by the Board. When the train was re-coupled at Hornsby the air pressure stored in the then fourth and fifth carriages would endeavour to rush into the empty reservoir of what had originally been the last but was now the second vehicle of the train, and this of course would apply the brakes on the first-mentioned carriages. The guard, getting down, released the brake—not, as stated by him, on a close second-class, on which the brake had never been working, but on the carriages nearest to him—namely, the fourth and fifth. The fireman, going back to meet him, found the brakes apparently released by the driver; the true state of the case being that the first carriage was in communication with the main reservoir, the second had never had any air in the small reservoir, and the third was shut off at the tap leading to the triple valve, and thus the brakes on these three vehicles would be off.

This is pure fabrication; the fireman gave no such evidence; it was what the driver should have done, but he did not do it.

No more than that.

The man was right; twenty carriages could be taken down safely with the amount of brake-power on the train.

This has nothing to do with it, even if it be true. The facts are not stated correctly.

It has not been at all difficult to explain this, or to reconcile it.

Perhaps not during the journey. Had he not tried the air before leaving? But this he did, proving that it went to the last end of the last carriage.

That is no proof.

Why?

This conclusively shows that "Triple valve," with all his assumed knowledge and learned talk about "co-efficient of friction," is a mere charlatan. His ignorance, as here shown of the direction the air stored in the auxiliary reservoir takes, is evidence of his incapacity to write on the subject.

No; the fourth. He was riding at the time on the fifth, and it was another carriage he went to—transparently the fourth.

The first carriage in communication with the main reservoir—does other writer mean, "supplied direct without the aid of the auxiliary reservoir!"

After

27

After mature consideration of the facts adduced in evidence, and carefully weighing all the probabilities of the case in the light of an intimate acquaintance with the practical working of the brake, the conclusion is irresistibly forced upon us that the accident was due to the fact that the tap on the rear end of the first carriage had been closed all the time, and thus the brake was acting on that vehicle only when the train left Hornsby; and that the driver, naturally relying on what he believed to be an efficient brake, and probably worried by the repeated cases of "sticking-up," allowed the ill-fated train to acquire such a speed on the gradient that all the brake-power then available was utterly unable to control it.

July 27.

Yours, &c.,

TRIPLE VALVE.

If, for the sake of argument, the shut tap theory is admitted, the inquiry which follows immediately explodes it again. The inquiry is: Would there have been sufficient brake-power on the train to have stopped it with the tap closed? The answer is: More than sufficient at any speed.

No. 11.

Minute by The Commissioner for Railways.

Peat's Ferry Accident.

THERE is an article contributed to the *Daily Telegraph* to-day—contributed, it is obvious, from its tone, argument, and concluding challenge—by some one who has a direct interest in the Westinghouse brake, respecting what the writer is pleased to call "the exploded theory of the Board." I should like to have the report of the Board upon that article.

The writer apparently sees that the fact that the brakes were taken off the carriages at Hornsby, when the train was reunited, must be met in some way, or else the "closed-tap" theory is exploded, so he ingeniously suggests that the brakes were not taken off by the action of the driver, but "leaked off" in consequence of loose packing.

The author of the analysis published in the *Telegraph* did not explain how the brakes were taken off at Hornsby, and he, apparently, did not see how fatal to his theory of the "closed tap" the circumstance that the brakes were taken off from the engine really was. He has, perhaps, seen it since.

The experiment suggested by the writer in regard to the alleged facility for exhausting air in the auxiliary reservoir has already been made by the Board. There are tables attached to the Board's report showing the number of applications of the brake required when the donkey-engine is not working and when it is. The result conclusively supports the theory of the Board. That it is a new idea suggested to meet the special case under review is contradicted by several authorities—see book by "Hercules," and also the "Art Journal" for March last.

Ch.A.G., 22/7/87.

Report herewith.—D.V., 30/7/87.

IN compliance with the Commissioner's desire, we beg to submit the following observations upon the article referred to in his minute of 22/7/87:—

This newspaper contribution bears unmistakable evidence of having been written in the interests of the Westinghouse Brake Company, and, as might be expected, is full of inaccuracies and strained interpretations of the evidence given at the coronal inquiry.

The writer of the article commences by a transparent misrepresentation of the basis of the Departmental Board's conclusions regarding the cause of the accident, and hazards the assertion that their theory "is apparently entirely based on the fact that no air was found in the reservoirs of the uninjured carriages after the accident."

Either the *bonâ fides* or his intelligence may here be challenged; if the former be not permissible by the canons of good taste, then it can only be said that this case affords another illustration of a person's judgment being warped by self-interest.

The Board merely inferred from the fact that the brake-blocks of the two undamaged eight-wheeled carriages were found to be quite loose immediately after the accident (notwithstanding that the pipe between the first and second vehicles had been severed when they telescoped, and that all the taps between there and the vehicles in question were found to be open and the connections complete) that the reservoirs of these two carriages must have been empty, or practically so, and *it is not possible to draw any other inference*. Our critic himself sees clearly enough that the looseness of those brake-blocks and the consequent empty condition of their reservoirs is indisputable, and must, therefore, be accounted for in some way.

It was not, however, as he represents, the condition of those reservoirs at the time of the accident which alone constituted the premises of the Board's conclusions; three other circumstances were (and are still), in their opinion, fully borne out by the evidence taken both at the Departmental and Coronal inquiries, viz., that the air-brake connections were complete and the taps all open throughout the train (except, of course, the rearmost one, which was properly shut, up to the time of the accident; that the pump which supplied the air was in working order; and that, in the absence of its failure, there was abundance of brake power upon the train. It was all these facts taken together which guided the Board in arriving at the conclusions embodied in their report.

The *Daily Telegraph* contributor is simply trying to blind the eyes of the public to a defect in the Westinghouse brake, which is, no doubt, mainly noticeable on long and deep descending gradients, where the frequent application of the brake is necessary to check the speed of a train; but the safety of public life and limb is of so much more importance than the reputation of any brake, that if, in showing the unreliable character of the writer's arguments and conclusions, we shall have occasion to refer to the deficiencies of the Westinghouse brake, it will be more with a desire to ensure that object than to speak in disparaging terms of a brake which has some admirable qualities.

In his desire to save the reputation of the brake, our critic is apparently indifferent whether he attains his object at the expense of the servants of the Railway Department in relation to the performance of their duties or not.

He cannot, surely, seriously mean that it is not a defect for brakes to "leak off" in a few minutes, or even in half an hour, as he wishes us to believe must have been the case on this particular train; but having eagerly adopted the "shut-tap" theory, which precludes the possibility of the brakes having been released

released from the engine, he sees perfectly well that he must account for their release in some other way; hence he assumes (and it is purely an assumption, for there is not a shred of evidence to support it) that they must have *leaked* off.

To give some colour to his idea, he says he has "reason to believe" that the leather packing in the cylinders would, if examined, be found to be so worn that the cylinders could not retain the air. This, too, is purely an assumption, for the fittings on each vehicle were overhauled within the period recommended by the Westinghouse Brake Company themselves, and found to be in good order; and he apparently fails to see how much, under these circumstances, he imperils the reputation of the brake by urging such an argument, because if we grant that what he says be true, it necessarily follows that the difficulty and expense of maintaining it in efficient condition become so great as to make it a most extravagant brake to use.

Our critic jumps to the conclusion that the brakes on one of the vehicles taken to Hornsby in the first division of the train must have leaked off, while, to use his own words, "it would appear that all the air had not escaped from the reservoir" of the other, "for," he goes on to say, "Stead noticed the blocks of one carriage slightly rubbing—of one carriage only. That could not have been caused by the driver. Further on the rubbing of the blocks, acting against the power of the engine, and Clissold, noticing it for the first time, jumped down and took the blocks off this particular carriage by turning the release valve. * * * * * Stead is certain the blocks were only rubbing slightly, indicating that the power was almost gone. Had the brakes been hard on, he, no doubt, would have drawn attention to the fact, and the probabilities are that the driver himself would have noticed it."

We are only too glad to agree with our critic's conclusions when they are within the bounds of probability, and we readily do so as far, at all events, as the latter portion of the extract we have just given is concerned. We think it is in the very highest degree improbable that the driver would have failed to notice it if a brake had been "hard on" when leaving Hornsby, and the best proof that there was nothing of the kind is that every witness who gave evidence on the subject said that, after the two divisions were coupled together, the train got away *quickly* and *easily*. It is perfectly true that Stead said he saw the blocks on one carriage "rubbing slightly" as the train passed out of the siding at Hornsby, but it is equally true, according to the evidence, that the wheels on the carriage from which Clissold released the air about $1\frac{1}{2}$ or 2 miles beyond Hornsby were "skidding."

On the "leaking-off" theory, coupled with the existence of a shut tap between the vehicle in question and the engine, it is impossible to conceive how brakes which were only "rubbing slightly" at Hornsby could, after the train had travelled between 1 and 2 miles further, have begun to skid, even if we admit that Stead and Clissold referred to the same vehicle, which there is no evidence to show. If, by any chance, it was the same vehicle, where, upon the "leaking-off" theory, did the increased pressure of air come from, if not from the engine; and if it came from the engine, what becomes of the "shut-tap" theory.

On the other hand, it is by no means an unfrequent occurrence, after an application of the brakes by a driver, for a triple valve to "stick," and so cause the blocks to remain hard on upon that particular vehicle, even when the connections with the engine are complete. This, we think, is the only reasonable interpretation to arrive at as regards the vehicle from which guard Clissold released the brakes.

If the "leaking-off" theory cannot be established, it follows that the driver must, when he left Hornsby, have released the brakes from the engine, in which case the "shut-tap" theory is absolutely worthless; and if the "shut-tap" theory cannot be maintained, then the leakage, which our critic is so anxious to establish, would only facilitate the exhaustion of the carriage reservoirs, which the Board is of opinion took place.

Both theories must be upheld to support the case of our critic, and the difficulty of doing that, taken either in connection with the evidence or the whole of the surrounding circumstances, appears to us to be insurmountable. Certainly, the evidence, fairly considered, favours neither.

Now, bearing in mind that the only tap found improperly shut upon the train after the accident was between the first two carriages next the engine—which two carriages were at the rear of the train when it left Sydney—we shall see how the evidence bears upon the "leaking-off" and "shut-tap" theories.

Several men proved positively that from the engine (which, by the way, was not placed upon the train until the whole nine vehicles were coupled together) to the very last vehicle the air-connections were complete, and the brakes tested, consequently there could not have been an improperly shut tap when the train left Sydney. One witness, indeed, who was *hand-braking* the seven vehicles (which, when the train was finally made up, formed the rear portion from Sydney), says he was using the hand-brake upon the seventh (afterwards the ninth), and that the brake-wheel was twisted out of his hand by some one opening the tap at the first (afterwards the third) vehicle. Stronger evidence than this that there was not a shut tap, where it was found after the accident, it is impossible to get.

At Beecroft, where the train was divided, the two last carriages were left behind with brakes of *both* hard on, while the engine took the front portion of the train to Hornsby. Here we have the evidence of three other men (which was given without the slightest idea of its bearing upon the present question) that *the blocks of these carriages were still hard on when the engine returned from Hornsby for them*; the "leaking-off" and "shut-tap" theories certainly cannot be reconciled with the facts that the brakes had *not* leaked off, and that, at that time, *there could not have been a shut tap between those vehicles*.

When the first lot of carriages were left at Hornsby the air-brakes were left *hard on* upon the two eight-wheeled vehicles by Stead, the officer in charge, who uncoupled them from the engine. On this point Stead is quite certain, *for he tapped one of the blocks with a sprag to see if it was acting, and found that it was*.

The evidence also establishes in the clearest and most positive manner that when the two divisions of the train were recoupled at Hornsby the connections were properly made and the taps turned, the clearest proof of which is, not only that the train has no difficulty in getting away, but *immediately after the accident those connections and taps were found to be as stated*.

Where, then, is there anything to support the assertion that the tap which was found closed on the day after the accident must have been shut before the accident? Except, indeed, the opinion of Mr. Shell-shear, which opinion is very strongly differed from by Mr. Kirkcaldie and Mr. Laughry, as well as by the members of the Board, all of whom inspected the vehicles, as the one with the shut tap lay telescoped inside the other.

Not one witness said that the air-brake did not act upon the train after leaving Hornsby. Although one did say that he did not feel it applied to the carriage he was in—then the fourth from the engine—*after passing through No. 1 tunnel*, while another said that he did not feel it on the second carriage from the

the engine *after passing No. 2 tunnel*, both of which statements are in complete accord with the theory of the Board, that it was at the first or between the first and second tunnels that the air was exhausted and the control of the train gone.

It was, however, in the second carriage from the engine that Mr. Garrard was sitting, and his evidence—upon which all attempt to shake him during his examination at the inquest failed—was very strong to the effect that he distinctly felt the air-brake applied to that carriage after passing the top of the hill which descends to Peat's Ferry; the commencement of that descent being about 7 miles beyond Hornsby, and at least 5 from where the train had come to a stand, and the guard had released the brake from a carriage. Unless evidence of this kind is to be utterly disregarded, there is no alternative but to abandon the "shut-tap" theory, and, without it, the "leaking off" is of no avail for the purpose for which it has been suggested.

If the tap which was found after the accident to be shut was open when the train left Sydney, and when the two carriages stood at Beecroft, as the evidence incontestably proves, where was it shut if not by the concussion at Peat's Ferry? Guard Clissold said, in reply to the Coroner, that "from the time the train left Sydney till the time the accident occurred I never touched that tap, nor had I occasion to go near it," and certainly no one else had occasion to do so, as he, and he only, uncoupled the train at Beecroft, and recoupled it at Hornsby.

It was perfectly clear to the Board that although the final and formal test of the continuity of the air-connections was not gone through by the driver and guard before the train left Hornsby (which, had it been performed, would have precluded "shut-tap" and "leaking-off" theories, and its omission is to be regretted, and not excused), still the connections did, as far as can be ascertained, and according to the evidence, receive the careful attention of those concerned; and it is impossible to say that the driver may not have satisfied himself by the release of the brakes on the carriages that the air-connections were complete with the engine.

Our critic disputes the assertion of the Board that the controlling power (in the carriage reservoirs) of the Westinghouse brake can be exhausted in the hands of an unskillful driver, and so become the cause "of a fearful railway accident"; and he goes on to say that "we have a vivid picture of what might possibly have happened in the darkness of the third tunnel when Wilson, in his nervous excitement, might have turned the brakes 'off and on' several times, unknown to the fireman." We may dismiss his remarks upon the latter point by saying that there is nothing in the evidence to justify them, and that the Board never entertained such an idea, for in their opinion the air was practically exhausted from the carriage reservoirs, and, consequently, the mischief done, long before the third tunnel was reached.

But as regards the possibility of an unskillful use of the brake leading to accident, and the writer's assertion that the supposition is "absolutely impossible," and his insinuation that that theory has been suggested for the first time to meet a difficulty which, to the Board, is otherwise unexplainable, we may state that there have been approaches to very serious accidents which, in their opinion, have clearly pointed to the same cause. As a matter of fact it is no unusual thing for our own drivers over the mountains, when descending the long, steep gradients, and when they have reason to fear that their controlling power is becoming exhausted to get their trains well under control, then put on their hand-brakes as tightly as they can, and release the air-brakes for the purpose of recharging their carriage reservoirs.

As an instance in which the danger of such a thing has been recognized, we may refer to a paper read by Mr. Marshall, a member of the Institution of Civil Engineers in England (an engineer of high repute, and a gentleman who for many years was secretary to the Institution of Mechanical Engineers in England) before the Society of Arts in London in March last, on the "Railway Brakes" question, and which deals very exhaustively with the merits and demerits of the various brakes.

Mr. Marshall said, in dealing with the Compressed-air Non-automatic Brake:—"The necessity for this has arisen from the circumstance of the very steep and long inclines that have to be worked on the railways in the mountainous districts of that country (America). I have had an opportunity recently of seeing the working of these railways, and in one case of particular interest I travelled on an engine over a pass in the Rocky Mountains having 15 miles ascent on one side and 22 miles descent on the other side of the pass. This 22 miles was a continuous deep descent, averaging 1 in 40 inclination, with a portion as steep as 1 in 22, and the line was complicated by numerous sharp curves. The train was worked with a compressed-air continuous brake applied to all the vehicles, and gave an interesting illustration of the working of the two systems of automatic and non-automatic brakes. The two engines were in front in going up, and the brake was worked automatic, so that if any portion of the train happened to become detached it would be prevented from running back by the brakes being put on automatically by the act of separation of the connecting air-pipe, and the brakes would be kept on firmly until released by hand in each carriage separately. At the summit of the incline the brakes were all changed to non-automatic by reversing a cock in the brake apparatus of each carriage, which caused the brakes to be then directly controlled by the engine-driver, who kept the whole of the brakes on during the descent, partially easing or increasing their presence every minute or two by a slight movement of the brake-handle, and thus keeping the brakes constantly in gentle play; and the train was eased down the whole mountain-side at a steady uniform speed of about 15 miles an hour."

This, it will be seen, was Mr. Marshall's personal experience.

On his return to England, that gentleman wrote to the Westinghouse Brake Company, informing them what he had observed upon the line in question, and received the following answer:—

"The use of the non-automatic brake for descending long inclines is not at all necessary. On some lines in the United States *there is still the practice of using the non-automatic brake for descending grades*; but we think this is owing to the fact that the direct-pressure brake was very largely used there before the automatic form was adopted."

As this reply did not accord with what had been observed by Mr. Marshall, he applied to the locomotive engineer of the line, asking the reason for the intermediate valves being thrown out of action in descending the incline, and his answer was:—

"Auxiliary reservoirs cannot be recharged without releasing all the brakes on the train, and the train will, during the short time of release—fifteen to twenty seconds—gain such a speed on a down grade of $21\frac{1}{4}$ feet to the mile—or 1 in 25—that it is nearly impossible to regain control over it, especially when the rail is bad." For this reason the triple valves and auxiliary reservoirs are cut out on steep grades down."

All this information will be found in the *Journal for the Society of Arts*, of England, dated 11th and 18th March, 1887.

Nor is this "exhaustion" theory new to Railway Authorities in America, for at a meeting of the Western Railway Club, held at Chicago, on the 15th July, 1885, for the purpose of discussing automatic brakes, the question of "*losing of the compressed air by careless handling of the engineer's valve*" formed one of the subjects of discussion.

Notwithstanding all that the Westinghouse brake advocate may assert to the contrary, we firmly adhere to our theory as the only reasonable one; and, instead of ignoring it, and saying that it is an "impossible" theory, it would be better if the Company were to grapple with and overcome what is unquestionably a serious defect.

It will be remembered that a Board was appointed several months ago to inquire into and report upon the brakes question, and in their report, which was submitted some weeks before the Peat's Ferry accident occurred, they drew attention to the loss of power which frequently repeated applications of the Westinghouse brake would involve, as well as to the disadvantage of its high-pressure system, because of the constant liability of bursting the connections.

The terrible accident which occurred two or three months ago on one of the Melbourne suburban lines, and the more recent one at Peat's Ferry, furnish a sad confirmation of the Brake Board's opinion in both respects.

The writer of the newspaper article states that "much has been made of the evidence that the first two vehicles showed no signs of skidding," whereas, as a matter of fact, *the Board did not make the slightest allusion to skidded wheels*; and he continues to say, "True, several witnesses stated that the wheels of the first two vehicles were hot, conclusive evidence that the brakes had been on these two vehicles alone"; but he does not say who the "several witnesses" were, and, unfortunately for his argument, we cannot find that even *one* witness gave such evidence; therefore, we may say with him, "So much for that argument."

In the concluding paragraph of the article in question the writer "ventures to think that the more the exhaustion theory of the Board is analysed the greater will be its absurdity," and says "it is unsupported in evidence, it can be undeniably destroyed by experiment," to which we need only reply that while the advocate of the brake would doubtless wish it to be as he says, the members of the Board are confident that *the more their theory is analysed the more positively will its correctness be demonstrated*.

The whole of the evidence points to their conclusion, and, in the opinion of the Board, their conclusion and its feasibility and reliability have already been indisputably proved by experiments, the results of which appear in the evidence taken at the coronal inquiry.

If a more probable theory than that of exhaustion can be advanced, without ignoring or unfairly straining evidence which has been given, or manufacturing evidence which has not been given, or building upon misrepresentations in regard to certain other matters of fact, the Board will be found amongst the first to appreciate it; but as the case stands they cannot conceive what more probable theory can be brought forward, and they may fairly claim not only to have a knowledge of the subject with which they were called upon to deal, but to have given the fullest and most careful consideration to it in all its bearings, without straining a point in favour of, or against, any person or persons.

And now suppose, *for the sake of argument*, that we adopt the theory of our critic, that the tap on the rear of the carriage next the engine was shut when the train left Hornsby, and that the braked vehicles behind leaked off; let us see what it means:

Mr. Laughry said at the inquest that 21 tons was the minimum amount of brake force required to control the train on a descending grade of 1 in 40, from which we shall assume that he meant that the speed of the train should never have been allowed to exceed 15 miles an hour, a speed similar to that referred to by Mr. Marshall as having been run down the descent on the Rocky Mountains in America; and, next, let us take the evidence of Professor Warren when he said that a brake force of 43·146 tons would be necessary to stop the train in question *in 400 yards when running at the rate of 25 miles per hour* (and it should certainly not have been allowed to exceed that speed) *on a descending grade of 1 in 40*, and compare it with facts.

On the engine there was	15 tons of hand-brake power.
On the tender	13 ,, of hand or air do.
On the carriage next the engine.....	10 ,, under air-brake.
And on the American car	10 ,, hand-brake.
—	
Total	48 ,,

Here we have 48 tons to do what, according to Professor Warren, it was only necessary to have 43·146 tons on a falling grade of 1 in 40 *in 400 yards*, and yet, according to all the evidence, the train had got away *before* or immediately it reached the 1 in 40.

Why was that? It is inexplicable if the hand-brakes were at work upon the engine and the American car, as well as the air-brakes upon the tender and the carriage next the engine; *but it is not at all inexplicable if the theory of the Board is correct*—THAT THE AIR WAS NOT WORKING ANYWHERE, and that consequently *the engine and American car hand-brakes were all that were operating—the total brake force being 25 tons.*

30th July, 1887.

D. VERNON,
Chairman.

Since writing the foregoing we have seen in the *Daily Telegraph* of yesterday the letter signed "Triple Valve," and in the issue of to-day that of Mr. James Hoskins; and, although they are in the main answered by what we have already written, they contain several inaccuracies which it may be as well to correct.

Regarding the statement of the Board, "That there was sufficient hand-brake power on the train to have taken it safely to its destination," "Triple Valve" says, "this is only true, subject to two important qualifications—the first being, that all the hand-brake power was ready for use in an emergency. As the only two vehicles on the train which were supplied with hand-brakes were placed in different parts of the train, and there was only one guard, the statement is misleading in its most essential particular." "The second condition was, that the speed of the train when descending the heavy gradient would not be allowed to exceed 15 miles an hour," &c.

To this we can only say that "all" the hand-brake power which was on the train was not necessary to prevent it from getting beyond control. We have already shown that 21 tons would have controlled it if

if the speed had not been allowed to exceed 15 miles an hour, and that 26 tons would have controlled it at 25 miles an hour, while 43·146 tons would have stopped it *in 400 yards*, even if running down a grade of 1 in 40 at 25 miles an hour. Now, as we have previously stated, the speed should certainly not have been allowed to exceed 25 miles an hour on that incline, and it was not necessary to stop the train in 400 or even in 800 yards; and yet on the engine, tender, and one American car there were 38 tons of *usable* hand-brake force, and that, we still contend, was ample to control and stop the train if it had not been allowed to attain a very excessive rate of speed.

"Triple Valve" further says: "The fireman's statement that when the driver, finding his brakes were not acting, *placed his handle in the release position*, and that the air-gauge then showed a pressure of 75 lb., proves conclusively that the reservoirs were not then in the state of exhaustion assumed by the Board." This is a pure invention of the writer's. What the fireman really did say—and it is just as well to use a witness's own words whenever possible—was that "he (the driver) drew out and shut it (the valve) several times just for an instant; when I saw he had to reverse the gear I noticed the gauge, and found that we had about 75 lb. pressure; but when he opened the valve it flew round to zero, and on shutting it again I saw it run up to about 75 lb."

Now, even assuming that the fireman is correct in stating that the gauge indicated 75 lb. (although we are of opinion that on this point he is mistaken, and that, as a matter of fact, it did not show nearly so much) that fact is in no way irreconcilable with the "exhaustion" theory of the Board; for the gauge, as is well known, indicates the pressure in the main pipe, and affords necessarily no indication of the pressure in the carriage reservoirs, from which alone the air comes to apply the brakes, and which, every time he opened and shut his valve, he was exhausting.

The gist of the fireman's evidence, both at the inquest and before the Board of Inquiry, was to the effect that after passing through No. 2 tunnel the driver opened his valve, and left it open (and reversed his engine and applied the steam) until within about three-quarters of a mile of Peat's Ferry, when he again appears to have shut and opened the valve.

"Triple Valve" goes on to say, "Had such been the case, the air-gauge would have registered that pressure for an instant only, and then the indicator would have fallen back rapidly, as the air stored in the main reservoir and passing through the brake-pipe expanded into the small reservoirs."

Well, we have already seen from the fireman's evidence that the driver drew out and shut the valve several times "just for an instant," and can any reasonable person doubt that it was in one of those "instants" that he (the fireman) noticed the gauge? Did he not also say at the inquest that "he (the driver) applied the brake again immediately after releasing it, and it was then he said the train had got away from us."

That part of "Triple Valve's" remark about the air passing through the brake-pipe and "expanding" into the small reservoirs is not easy to understand, when we consider that the brake-pipe is an inch, and that the hole in the triple valves through which the air has to "expand" into the reservoirs is only *one-sixteenth of an inch* in diameter.

Then, again, "Triple Valve" says that, "after making due allowance for the resistance of friction, the whole train should have been charged with air of about 48 lb. pressure in about fifteen seconds." It is quite evident from this that "Triple Valve" knows very little of the subject he has ventured to rush into print about, for we have, for our own satisfaction, made several tests, and commencing with a pressure of 25 lb. in the carriage reservoirs, and with a high steam pressure, and the donkey going at full speed, it took from fifty to sixty seconds to increase the pressure to 50 lb.

Continuing, he says, "Professor Warren and Mr. Kirkcaldie's statement as to the number of manipulations required to reduce the pressure by a given amount are wanting in one important element. They do not give the number of brake cylinders in communication with the main reservoir which, in this case, was only five." Neither witness was asked the question; but it may not, even now, be too late to say that if Mr. Kirkcaldie had been asked he would have said that the test made under his observation was upon a train precisely similar to the one which met with the accident.

The most remarkable proposition of all, however, is contained in the sixth paragraph of "Triple Valve's" letter, which we take leave to quote *in extenso*:—

The fact of the train, after it was remade at Hornsby, having to stop at the first gradient, and that then some of the brakes had to be released at a time when, according to the fireman's evidence, the air was steadily increasing, points unmistakably to the fact that the air-connections were then incomplete. Observe with what extreme accuracy the circumstances connected with this stoppage dovetail into this theory, and the utter impossibility of accounting for them from the point of view assumed by the Board. When the train was recoupled at Hornsby, the air pressure stored in the fourth and fifth carriages would endeavour to rush into the empty reservoir of what had originally been the last but was now the second vehicle of the train, and this, of course, would apply the brakes of the first-mentioned carriages. The guard, getting down, released the brake—not, as stated by him, on a close second-class on which the brake had never been working, but on the carriages nearest to him, namely, the fourth and fifth. The fireman, going back to meet him, found the brakes apparently released by the driver; the true state of the case being that the first carriage was in communication with the main reservoir, the second had never had any air in the small reservoir, and the third was shut off at the tap leading to the triple valve, and thus the brakes on these three vehicles would be "off."

Evidently "Triple Valve" is not aware that it is a *mechanical impossibility for air stored in one carriage to pass into the reservoir of another carriage, or of the fact that when it does leave a reservoir it must pass into the atmosphere through the brake cylinder and triple valve of the same carriage.*

Nor is there a tittle of evidence to show that the fireman got down from the engine when the train came to a stand on the bank beyond Hornsby, or, indeed, after he left Beecroft with the first division of the train. And as regards the second vehicle from the engine when the train left Hornsby, "never having had any air in the reservoir," it is only necessary to refer to the evidence for overwhelming proof to the contrary. Here, it will be seen, "Triple Valve" has invented an impossible theory, and manufactured evidence in order to get his ideas to "dovetail" into each other with such "extreme accuracy."

As regards Mr. Hoskins, we feel quite sure that he will be glad to be put right on matters upon which he has evidently been misled, and we will, therefore, only point to the misapprehensions contained in the following extracts from his letter:—

(1) I believe the Westinghouse automatic brake is in general use on the Midland Railway, and that line is considered by many travellers as the best railway in England, as combining the essential merits for passengers who desire to travel—namely, punctuality in transit, speed, excellent, even luxurious, accommodation in its carriages, together with every reasonable precaution being taken to prevent accidents. The London and North-Western Railway Company used the continuous chain brake for some time after continuous brakes were first brought into general use with passenger trains; but I was given to understand in England that that Company was about to have the Westinghouse brake fitted to their passenger carriages, as they found the continuous chain brake too severe on the rolling stock.

Now,

Now, in reply to this, we may state that while the Midland Railway Company of England was the first to introduce the Westinghouse brake into that country, *it was also the first, or amongst the first, to abandon it at an enormous cost*, and to substitute the Vacuum brake.

It certainly cannot be held as speaking well for any brake that "the best railway in England" should have superseded it.

Reference to the Board of Trade returns for the latter half of last year will show that the Company in question had forty-seven engines, and 390 other vehicles still fitted with the Westinghouse brake, so that they have evidently not yet had time to finish the work of substituting one brake for the other, that work, as may be imagined, requiring much time to accomplish.

In addition to those mentioned, the Company had eighty-five Scotch joint stock vehicles fitted with the Westinghouse for the purpose of running over the Glasgow and South-Western line, which line, however, is also substituting the Vacuum for the Westinghouse, so that it would appear that the time is not very far distant when the Westinghouse brake will disappear from both lines. On the 31st December, 1886, the Midland Company had 710 engines and 3,651 other vehicles fitted with the Vacuum brake.

As regards the London and North-Western line, it is quite true that the chain brake is being superseded; but by the Vacuum, not the Westinghouse, brake.

The Board of Trade returns for the period already named show that that Company had 627 engines and 5,158 other vehicles fitted with the Vacuum, and of these there were 457 also fitted with the Westinghouse, for the purpose of running over other lines where the Westinghouse is used; but they had not one engine fitted with the latter brake.

(2.) Some years ago very exhaustive trials were made in England under the supervision of the officers of the railway department of the board of Trade, with the view of testing which brake was in their opinion the most efficient for the purposes required, in using a continuous brake controlled by the engine-driver of a passenger train, and they reported that the Westinghouse brake had been the most successful in these trials, and recommended its general adoption on the railways in Great Britain.

We do not dispute that trials of the various brakes have been made in England by the officers of the Board of Trade, but we are quite sure that they never recommended either the Westinghouse or any other brake for general use on the railways in Great Britain.

D. VERNON,
Chairman.

The Department cannot enter into controversy with writers in the Press; but if the Press would like to make use of this special report I do not see any objection to it.—CH.A.G.

No. 12.

Extract.

[From *The Daily Telegraph*, Saturday, August 6th, 1887.]

THE HAWKESBURY RAILWAY ACCIDENT—OUR REPLY TO THE BOARD.

WE have been the innocent means of exposing the besetting weakness of the Railway Board of Inquiry into the cause of the Hawkesbury railway accident. Had we been prompted in our criticisms by that delightful little nursery fable of the "Spider and the Fly," we could not have more neatly inveigled or more completely entrapped them. Lions and other wild beasts of the forest, school-books once taught us, are captured in meshes by their own rash plunging to get out. That is the picturesque position of these gentlemen, the only difference being that they have laid their own meshes. They have now plunged so madly and rashly that honorable or dignified extrication is impossible. Having annihilated what appeared to us to be the only ground on which the Board's theory of the disaster could be based, we are now informed that "This newspaper contribution bears unmistakable evidence of having been written in the interests of the Westinghouse Brake Company." Then follows the outcome of a stupendous effort to prove what the Board expected to find—that it was full of inaccuracies and strained interpretations of the evidence given at the coronial inquiry. The Commissioner for Railways, too, was convinced, from the tone, argument, and concluding challenge, that the article was contributed by some one who has a direct interest in the Westinghouse brake. Both are in absolute unison on that point. If called upon that would be their pronounced verdict no doubt, and it would be proved as humiliating to themselves as that they have given on the accident. What we have said about the Hawkesbury accident has been in accord with the great preponderance of evidence; with the verdict of twelve disinterested jurors; with, we believe, the experience of nearly every engine-driver accustomed to use the Westinghouse brake; and, above all, with public opinion. But, forsooth, it has not been in accord with the remarkable theory of the Board, supported by only two unimportant witnesses—therefore it bears unmistakable evidence of having been written in the interests of the Westinghouse Brake Company! We simply laugh at the insinuation.

Our object is to reply to the Board's exhaustive observations on our article, and in appreciation of the compliment bestowed on us by the Commissioner for Railways in instructing his principal officers to make this departure from officialism, we shall deal mercifully with them. They are more to be pitied than blamed, and although they occupy the extraordinary though somewhat unenviable position of being ridiculed by their subordinates from one end of the country to the other, it will be admitted that if they were biassed in their conclusions it was in the financial interests of the Railway Department. We even hope to win their promised appreciation by our candour and good tone. Of course, the able correspondent, "Triple Valve," will be left to hold his own; and whether he lashes them to scorn or is also merciful to this minute minority we are not responsible. Possibly confidence will beget confidence in Mr. Hoskins' reply.

We are accused of inaccuracies and strained interpretations of the evidence given at the coronial inquiry. Candidly, we admit having, though quite unintentionally, made several inaccuracies, and that the Board have done likewise. In extenuation we plead that it is beyond the bounds of human possibility to remember every detail of the evidence, the bearing of which extended over three weeks. In the main, these inaccuracies have been trivial. The most important is that several witnesses testified to the wheels of the first two carriages being hot. Upon further reference we find that this statement was made by several

several persons after the accident, but was not sworn to at the inquest. No one seems to have been examined on the point, which, like several others of importance, was omitted. Hume, the engine-driver, said he found the wheels of all the broken cars behind the first two cool, implying that he could not get at the others.

The Board will admit that much of the evidence requires interpretation, and it is quite natural to suppose that almost any interpretation made by those who believe in one theory would be regarded as strained by those who believe in the other. Unfortunately we are not in a position to know the character of the Board's interpretation of their evidence. Possibly they have most potent evidence to substantiate their "injudicious" air-exhausting theory. The continued concealment of their evidence does not, however, favour that view. This strange proceeding of producing their report, furnishing other reports, and holding back the evidence, creates the suspicion that the theory has been advanced by themselves and, is unsupported by the evidence.

Let us examine the three other circumstances besides the empty condition of the reservoirs which carried the Board to their conclusions.

The first is, the air-brake connections were complete and the taps open throughout the train up to the time of the accident. Then, does the admission of Weirick, the brake examiner, that he did not properly examine the train go for nothing? Is it evidence of the complete examination that not one man of the several who attended the train before leaving discovered the inoperative carriage on which was written in large chalk letters "air leaking," implying that the carriage was not to go out; and if such a vehicle went out unobserved might not also a small closed air-tap almost at the end of the train. Before this accident it was the practice of the officials to run down the side of the train to see if the blocks were on the wheels. Since the accident they have been carrying out the more sensible plan of turning the last tap on the train to ascertain if the air issues through. One practice required the exercise of keen sight to tell whether the blocks were on or off; the other is an easy and conclusive means of proving that the air-connection is complete. Why has the practice been altered if the theory of the Board is accepted without doubt? Surely we had some reason for dismissing this circumstance. It could not be accepted without ignoring the verdict of the jury.

That the air-pump was in working order we always regarded as evidence against the Board's theory rather than in support of it, inasmuch as it would take three or four times as long for the driver to exhaust his air with the donkey working than without it, and with it working down that incline it would be absolutely impossible for him to exhaust his air. Time and distance would not allow it.

The third ground, that in the absence of its failure there was abundance of brake power upon the train, is a nonsensical absurdity, upon which we shall have something to say.

Then we are told that *The Daily Telegraph* contributor is simply trying to blind the eyes of the public to a defect in the Westinghouse brake, which is no doubt mainly noticeable on long, steep, descending gradients, where the frequent application of the brake is necessary to check the speed of a train. It would also appear that we have been the means of compelling the Board to refer to the deficiencies of the Westinghouse brake. Such was not their first intention, but now the public safety and the unreliable character of our arguments demand it. With regret they are forced to speak in disparaging terms of the brake. And this is the way they do it. They declare there have been approaches to very serious accidents from the same cause—"injudicious manipulation"—without citing a single instance. A nice general statement, truly, which precludes any locomotive driver's denial. Then follows a long quotation from Mr. Marshall's paper on railway brakes read before the Society of Arts in London in March last. It so happens that this extract from the paper is identical with that in a circular issued and extensively circulated by another brake company during the recent inquiry. Much is made of this authority, but it would have shown better taste, if not judgment, to have taken the extract from the *Journal of the Society of Arts* instead of from the other brake company's circular. Perhaps it was taken from the journal, though we can hardly think so. If it had been, their instincts of fairness would, we feel sure, have prompted the Board to have intimated at any rate that Mr. Marshall's paper was very vigorously condemned in the long discussion which followed its reading, and a report of which appeared in the same issue of the journal.

We will supply the omission—quite innocently made, we feel assured:—Mr. G. A. Gutch said: "Although Mr. Marshall might have studied the Westinghouse brake in America, he did not think he would find any automatic vacuum brake such as he described there; he certainly would not find any working on mountain grades such as the Westinghouse worked on. He thought, therefore, that some of his information had been obtained second-hand, and that he was rather hasty in coming to the conclusion that the vacuum brake was likely to be of service on long down grades. There was no record of their having been worked on such grades. The Westinghouse was not only in America, but in Europe, on grades of 1 in 30 and 1 in 40 for 10 to 15 miles at a stretch. There seemed a deal of theory about the paper, and it would have been more satisfactory if Mr. Marshall had been able to give the practical experience of those who had worked the brakes. He said in one place that it was not within the scope of the paper to say which was the best brake, and in another place he stated that the automatic vacuum brake met all the requirements of railway work, which the Westinghouse did not, and this was rather a contradiction; the vacuum always seemed to come out the best when he was comparing the two. Again, his description of the Westinghouse was not correct. The triple valve was assumed to do certain things which it did not, and the things which it did do it did not get credit for. If he had really wanted to understand all about the triple valve, he might have gone to the company's works and seen, and he would then have found that what he had described as purely imaginary, the graduating on inclines, was really a fact. He said you could not see into the interior of a triple valve, but there was one specially constructed and shown at the Inventions Exhibition which you could see into. The graduation was most perfect. To say that it was put on intermittently in going down an incline was absurd; it was equivalent to saying that, when used to its utmost efficiency, you could stop at a certain speed in 100 yards, but you could not continue to make it stop in 200 yards or 300 yards. You could put it on as gradually as you liked. He (Mr. Gutch) maintained that in all trials which had ever been made the Westinghouse brake had never been beaten. It complied with all the requirements of the daily work of railways better than any other, could be put on quicker and taken off quicker than other.

The defect of the Westinghouse we are now told is mainly noticeable on long and steep descending gradients, where the frequent application of the brake is necessary to check the speed of a train. One would imagine from this that the Westinghouse must always be put on full, and when on must after be released

released in descending a long grade, whereas it can be applied at any degree between its minimum and maximum force, increased at will, and kept on as long as necessary. Therefore poor Wilson would have just as much reason in making frequent applications of the brake in descending the grade as he would in taking the brake off altogether.

In the succeeding number of the *Society of Arts Journal* the report of the discussion on Mr. Marshall's paper is continued. Again Mr. Marshall's paper is trenchantly dealt with. It is not our desire to lengthen this controversy with extracts: we only wish to counterbalance that prominently and somewhat unfairly submitted by the Board. We agree with the Victorian Commissioner for Railways, Mr. Speight, that there have been disputes as great about the merits of the different classes of brakes used as about the broad and narrow gauge question, but, adds Mr. Speight, "I am convinced that the weight of testimony is in favour of the Westinghouse brake." Sir Henry Tyler, C.B., M.P., said Mr. Marshall, in referring to the compressed-air non-automatic brake, "seemed to think that it had come after the automatic compressed-air brake, and he said the necessity for this had arisen on the steep lines in a certain mountainous district of America, where the non-automatic Westinghouse had to be marked. So far from that being the case, there was now only one instance, and that on a short line, of non-automatic brake working in this country. In reference to the Rocky Mountains, he took Mr. Marshall's word that it was on these inclines turned into a non-automatic brake on the descent as he had described, but if so he ventured to say it was quite unnecessary to adopt such an expedient; and with regard to the statement that the automatic form was not as well fitted for running down long steep inclines he must differ from him in toto. There was no brake so well adapted for a long steep incline, whether going up or down, as the Westinghouse automatic brake. This was not mere theory, as a good deal of the paper appeared to be, but the experience of actual practice. He could instance many long inclines in America where the automatic brake worked every day with the most perfect success, and with the result which Mr. Marshall had so well described when he said the train seemed to float smoothly and easily down the incline of the Rockies. What he saw done with the non-automatic brake on the Rocky Mountains was done every day and every hour on the Alleghenies in working the Pennsylvania railway with the automatic brake, and his glowing description would apply equally well to it. The triple valve, of which a model was placed on the wall, though it looked complicated, was the most simple device in working he had ever come across. Mr. Westinghouse was one of the cleverest mechanics he had ever met, and this valve was a masterpiece of ingenuity. Its simplicity of working was absolute."

At last we arrive at the Board's attempt to answer our simple explanation of the empty state of the air reservoirs. They are exceedingly careful not to deny it. We say plainly they dare not deny it. It was never said that it was not a defect for a brake to leak off "in a few minutes." What was said was, that when new and in perfect order the air will leak through the cylinders in the course of three or four hours, and when the packing is worn, as we believe that of these cylinders was, half an hour is sufficient. Purely an assumption, indeed! It is an absolute and universal truth. Not one man in the army of their subordinates who knows anything of the Westinghouse brake will deny it. We challenge any member of the Board to do so. Not a shred of evidence to support it, we are told. The answer is that not one witness was questioned on the subject. But if the professional members of the Board made no effort to elicit any evidence on the point, there is not so much excuse for them. Why dispute the matter by evasion? Put the same carriages together and see how quickly the air will leak away.

It is a matter of perfect indifference to us whether it is pronounced a defect in the brake or not; we only know that what we have alleged is true, and can be and has been proved at the railway sheds.

Assuming that it is a defect—which we deny—for the air to leak through the cylinders of stationary carriages, a remedy has been found in no other brake. Will not the rubber roller packing of the vacuum cylinder act in exactly the same way, and is not its leakage accelerated by hot weather? Will not the force of a steam brake, when separated from the engine, condense and thereby exhaust itself? Woods' water-brake would no doubt remain on longer than any.

Really, we did not think the members of the Board were capable of giving utterance to such nonsense as this:—And he apparently fails to see how much under these circumstances he imperils the reputation of the brake by urging such an argument; because, if we grant that what he says be true, it necessarily follows that the difficulty and expense of maintaining it in efficient condition becomes so great as to make it a most extravagant brake to use." Imperil the reputation of a brake because it will not act for all time when its source of supply has been withdrawn—when the locomotive on which the compressed air is made and controlled is absent! Such a model brake has never been invented, and it is certainly quite beyond the ingenuity of the Board to produce one.

The Westinghouse brake, when supplied, will retain the air on stationary carriages for several hours. The annual cost of keeping the leather packing in good order and general maintenance of the brake appliances, including the iron blocks, on the principal railways of England and America is 12s. 2d. each carriage fitted with the brake. An artisan can renovate the cylinder packing of a whole train in a day, and once in three months would be able. So much for their idea of extravagance. A little more of this sort of argument and the public will very much doubt whether the Board can fairly claim to have a knowledge of the subject with which they were called upon to deal.

Of Clissold, the guard, the Board, in their report, specially mentioned that the effect of the accident had been a severe shock to him, and it had evidently affected his memory of some of the events and of the order in which they took place. Albeit, they appear to gladly avail themselves of the literal interpretation of his statement that he saw one of the wheels "skidding" after the train left Hornsby, and that he went forward and released the brake from the side valve, but we can readily understand that term being applied to wheels on which the blocks were rubbing. "Skidding," as is well known, is a term often used in that sense. One would be inclined to give the Board the benefit of this, coming as it did from the confused Clissold, had they not followed it up by remarking that "it is by no means an unfrequent occurrence, after an application of the brakes by a driver, for a triple valve to stick, and so cause the blocks to remain hard on upon that particular vehicle." It will be seen by the Board of Trade returns that the two Westinghouse triple valves stuck in six months, during which 15,000,000 miles were travelled.

Assuming that the figures given of the brake force required to control the train at certain speeds given by Mr. Laughry and Professor Warren are correct, they do not affect the matter in the material degree one would at first imagine. It all depends upon the time of its application and the speed the train

had

had reached before it was fully applied. Their figures respectively apply to a speed of 15 and 25 miles an hour, while the evidence of two or three witnesses is that the speed was very great before the first tunnel was reached. Readily we admit this to be the strongest point in the Board's observations. Mr. Dodds, a passenger on the train, noticed steam being kept up at the first tunnel, and the man engaged at the tanks stated that the train passed there at the rate of some 35 miles an hour. This is clear testimony that Wilson was rushing down the hill thinking all was safe and with a desire to regain time. If so, his 30 tons of brake power would be practically useless when he applied it. Moreover, Clissold, did not use the hand brake, applying another 10 tons, until he heard the continuous whistling. The inference is that he was running with the engine brake alone until he got to the 1 in 40 grade, and when he applied the air-brake the train was beyond control simply because he had no brake-power beyond the first carriage. Was it not at this moment that he exclaimed to Pye, "She's got away from us," and immediately afterwards the whistle was heard and Rennie seen waving his hand. Had he exhausted his air at this time, would not Pye have noticed his eccentric conduct—which the Board describes as injudicious manipulation—if anything, it should be called "wilful wasting."

Let this Board nurse their pet but impossible theory as long as they please, it will have no weight whatever in the public mind. Already we have good reason to believe its impossibility on a grade of this length has been clearly proved. Will the Board be surprised to learn that a number of engine-drivers have tried the "injudicious manipulation" theory, with one result—that it is impossible. In all seriousness the Board even recommend the Westinghouse Brake Company to grapple with and overcome this defect in their famous invention—a defect which only exists in the minds of the Board and a few others they have influenced. Our recommendation is one which will settle the whole matter in a day. We repeat our challenge. It was quite ignored by the Board. Strange that they paid no heed to the two main features of the article in their lengthy report. We make it again, careless whether it will please or displease the Westinghouse Brake Company, but in the interests of the public safety. It had been laid down that the air reservoirs will leak off when new in 3 hours; in 30 minutes when the leather packing requires renewing. The answer is, try it. We have submitted that the force of the Westinghouse-brake cannot possibly be exhausted or brought down to an inoperative pressure in a grade as continuous as that at Peat's Ferry with the donkey working. Try it. Will the Board again remain discreetly silent?

Can the Board explain away these facts:—

That the engine-drivers examined at the inquest without exception believed that the accident was the result of incomplete air connection.

That Pye, the fireman, distinctly and repeatedly stated that he did not see Wilson turn the brake on and off at short intervals; that everything appeared to be going well until they reached the 1 in 40 grade; that he observed 75lb. pressure on the gauge; that the donkey was working, and that the only conclusion he could possibly arrive at was that other air couplings were not complete. In the death silence of Wilson and Rennie, must the valuable testimony of the living fireman who was on the engine beside them remain a dead-letter for the sake of the superior inductive intelligence of the members of the Railway Board? Observe how it asserts itself. Pye says he saw the gauge showing 75lb. pressure. The Board say they are of opinion that on this point he is mistaken, and that as a matter of fact it did not show nearly so much.

Is not the closed tap, which, in its protected position beneath the carriage remained uninjured and unmoved, living *prima facie* evidence of all the mischief? If the collision closed that particular tap, how was it that all the others escaped?

Is not the changed position of the train at Hornsby strong circumstantial evidence that the tap was unnoticed in its previous almost unaffected position?

Did not one passenger declare that he never felt the air-brakes on the last carriage at any part of the journey between Sydney and Beecroft? Did not another positively assert that he saw unmistakable evidence that the blocks were on the first two carriages only when descending the gradient?

Was not Mr. Garrard's statement that he left the air-brake on the American car after leaving Hornsby made under the impression that the guard was not applying the hand-brake, and has it not been clearly shown by several witnesses, including Clissold himself, that he was working the hand-brake there?

Is not Werrick's statement that he only examined the first seven carriages and made no examination of the last two carriages, evidence that he could not have made any examination at all of the completeness of the air connections when the engine was on? It has been proved that the engine which took the train away was not placed on the train until the nine vehicles were coupled.

Why have the Board not produced their tables attached to their report showing the number of applications of the brake required when the donkey is not working, and when it is to exhaust the air? The Commissioner says the result conclusively supports the theory of the Board. Perhaps they can furnish some tables of the time necessary to exhaust the air-reservoirs on stationary carriages. Perhaps, also, the Board are afraid of the production of the results taken by numerous other persons.

Extract.

[From the *Daily Telegraph*, 10th August, 1887.]

"TRIPLE VALVE" IN REPLY.

To the Editor of the *Daily Telegraph*.

Sir,

I certainly have no desire to enter into a controversy on a subject which has already been worn nearly threadbare, but I cannot refrain from making a few remarks in reply to that portion of the last report of the Departmental Board which deals with my former contribution on the Hawkesbury railway accident.

The first point raised by the Board is the question as to the sufficiency or otherwise of the available hand-brake power to properly control the train on a gradient of 1 in 40, and in support of their contention the Board refers to the evidence given by Professor Warren and Mr. Laughrey as to the minimum amount

amount of brake force necessary. As the opinions of these two gentlemen were probably—nay, I should say certainly—based on the assumption that the co-efficient of friction between the brake block and the wheel was an unvarying factor in the calculation, and as I have shown in my previous letter that Captain Galton's experiments conclusively demonstrated that this co-efficient diminished to half the normal amount after 15 seconds of contact, and that the speed had an important influence in determining its value, it is scarcely necessary to say that had these "experts" been acquainted with the facts as verified by actual experiment they would have considerably modified their opinions on the subject. I suppose it will be generally admitted that on our heavy gradients it is desirable to have as much brake force as can be used without skidding the wheels, and it will certainly interest and probably surprise the gentlemen named above to learn from Captain Galton's experiments (*see* Reynold's Continuous Railway Brakes):—"When the adhesion between the wheel and the rail equals $\cdot30$ of the weight a pressure equal to $1\cdot2$ of the weight would skid the wheel at $7\frac{1}{2}$ miles an hour, while a pressure equal to $4\cdot14$ times the weight would be required to do so at 60 miles an hour. Again, if the adhesion be only $\cdot15$, the brake force necessary to skid the wheels is $\cdot60$ of the weight at $7\frac{1}{2}$ miles an hour, and $2\cdot08$ times the weight at 60 miles an hour." Thus on this particular train, weighing 170 tons, in the former case, a brake force of nearly 204 tons could be beneficially applied at a speed of $7\frac{1}{2}$ miles an hour, and nearly 703 tons at 60 miles an hour, while with the lower adhesion at the lower speed nearly 102 tons could be used, and at the higher speed nearly 353 tons. The value of the evidence given on practical questions of this nature by a mere theoretical expert may be gathered from Professor Warren's statement before the jury that "such an engine was capable of taking such a train up a gradient of 1 in 40 at a speed of from 20 to 25 miles per hour." This cannot be accomplished either in theory or practice, and even the Departmental Board, consisting of men having a practical knowledge of the power of locomotives of all classes, admit in their first report that the engine was "slightly overloaded, and had more vehicles on than could be easily hauled up such a long gradient." Yet they unhesitatingly accept his dictum on a matter much more difficult of calculation; a question in which the influences exercised by the generated heat and the lubricating action of the finely triturated iron dust between the blocks and the wheels are practically unknown quantities.

The Board characterises as a "pure invention of the writer's" the following assertion in my letter:—"The fireman's statement that when the driver, finding his brakes were not acting, placed his handle in the release position and that the air gauge then showed a pressure of 75lb." This statement occurs several times in the fireman's evidence at the inquest, as a perusal of the daily papers will show; and even in the quotation given by the Board—"using the witness's own words"—it is twice repeated, so I leave the public to decide whether there is any "invention" in the case.

My statement that with an initial pressure of 75lb. "in the main reservoir, and making due allowance for the resistance of friction, the whole train should have been charged with air of about 48 lb. pressure in 15 seconds," is met by the Board (I pass over the personal remarks) asserting "that for their own satisfaction they have made several tests, and commencing with a pressure of 25 lb. in the carriage reservoirs, and with a high steam pressure and the donkey going at full speed, it took from 50 to 60 seconds to increase the pressure to 50lb." This test has no bearing whatever on the question at issue. The capacity of the main reservoir is about 10 cubic feet, the five small reservoirs each about 1 cubic foot, and the brake pipe about 1 cubic foot, total 16 cubic feet; and consequently in this experiment the donkey would be required to double the already existing pressure in this space against a constantly increasing resistance. In the case of the runaway train the main reservoir would contain 10 cubic feet of air at 75lb. and this being expanded to 16 cubic feet, the pressure of air being inversely at its volume, the resultant pressure would be 46·8lb., and this is independent of any work done by the donkey. As to the time occupied, the Board quotes in this very report, apparently with approval, a statement by an American locomotive engineer:—"Auxiliary reservoirs cannot be recharged without releasing all the brakes on the train, and the train will, during this short time of release (15 to 20 seconds)," &c. And it is, perhaps, fair to assume that even this estimate applied to a much larger number of small reservoirs than were on the train in question. It appears, therefore, that I have the good fortune to err in distinguished company.

Referring to another statement of mine the Board says, "Evidently 'Triple Valve' is not aware that it is a mechanical impossibility for air stored in one carriage reservoir to pass into the reservoir of another carriage," &c. Those who have read my letter carefully will see that I never asserted anything of the sort. The words I used, and which are quoted by the Board are, that it "would endeavour to rush into the empty reservoir," and this is exactly what happens. When two vehicles having different air pressures are coupled together, the brake is applied on the vehicle having the higher pressure, the reason being that, in obedience to natural laws, the fluid having the higher pressure "endeavours to rush into" the fluid of lower pressure, and forcing the triple valve down, uncovers the opening to the brake cylinder and applies the brake. The same thing occurs when a pipe bursts, or a tap is opened to the atmosphere, or when the driver opens his brake valve and allows the air to escape from the brake pipe, so that there is decidedly "no mechanical impossibility" about my statement.

But it certainly appears to me to be a "mechanical impossibility" for a pointed iron tap, $\frac{1}{2}$ in. in diameter and 6 in. long, standing at right angles to a line of piping $1\frac{1}{4}$ in. in external diameter, to be closed in such a way by two carriages telescoping as to bring it exactly parallel with the pipe, without in any way damaging the tap or pipe, and yet this is what the Board asks us to believe.

After reading the evidence over carefully, I must candidly admit that I was in error in stating that the fireman got down to release the brakes after the train left Hornsby, having been under a misapprehension as to the part of the road where this occurred; but this error in no way invalidates the conclusion arrived at as to the cause of the accident. The board apparently attaches great importance as supporting their theory to the evidence of Mr. Garrard, to the effect that he distinctly felt the Westinghouse brake being applied in a spasmodic manner to the second carriage, in which he was then sitting. The value of his evidence is considerably discounted by the fact that although he "was taking particular notice of the brake, as he was sure there was going to be an accident," he was not aware, and "would be surprised to learn," that the guard was applying the hand brake with all his power on that particular carriage.

After all that has been said and written on the subject, the stubborn fact remains that with such a train, and assuming the brake connections to be perfect, a pressure of 80lb. to commence with, and the donkey working fairly well, the air could only be exhausted from the small reservoirs by using the brake in such an erratic and idiotic manner as to attract the attention of every passenger in the train; and on a
gradient

gradient of 1 in 50, which is where the board assumes this to have been done, the train would probably be so much steadied by each full application of the brake, as to allow ample time to re-charge the small reservoirs, especially when we consider that the main reservoir still contained 75lb. air pressure.

In conclusion, I may state that my only object in "rushing into print" on this matter has been to assist in arriving at a correct solution of a question fraught with the greatest importance to the railway department and the travelling public, and I need scarcely say that I have no interest, direct or indirect, in the Westinghouse brake; and that while acknowledging its many advantages, I am nevertheless fully alive to its many grave defects as applied to everyday railway work on our lines.

August.

Yours, &c.,
TRIPLE VALVE.

No. 14.

The Peat's Ferry Railway Accident.—The Departmental Board and the *Daily Telegraph*.

To the Commissioner for Railways,—

When the Board in their report of the 30th ultimo stated that the article which appeared in the *Daily Telegraph* on the 23rd idem, and headed "The exploded theory of the Board," bore unmistakable evidence of having been written in the interests of the Westinghouse Brake Company, and that the author of it was simply trying to blind the eyes of the public to a defect in that brake, they thought, and think still, that the article itself furnished the strongest possible proof of the assertion; but if any further proof were necessary, a perusal of the article which appeared in that journal on the 6th instant, and headed, "Our reply to the Board," should remove any vestige of doubt that may exist in the mind of any reasonable person on the point.

In a matter fraught with such importance it would have been naturally thought that the only endeavour of the whole of the public press would be to render every assistance alike to the public and to the department in arriving at a true solution of the lamentable accident; but, although in one or two of its editorials the *Daily Telegraph* has professed to do this, let any unprejudiced person carefully peruse the articles in question, and say whether they are written in an impartial manner, or whether the whole of that journal's energies have not been directed to the upsetting of the theory of the Board, for no other apparent reason than that, in the opinion of the latter, the accident was caused by the exhaustion of the air in the carriage reservoirs, in consequence of which the application of the air-brakes became impossible.

The Board will not of course attempt to imitate the flippant tone adopted by the writer of the article, of the 6th inst., which is particularly noticeable in the two first paragraphs, but when he asserts that "what we (the writer) have said about the Hawkesbury accident has been in accord with the great preponderance of evidence," we differ with him entirely.

In the third paragraph the writer goes on to say, "We are accused of inaccuracies and strained interpretations of the evidence given at the coronial inquiry. Candidly we admit having, though quite unintentionally, made several inaccuracies, and that the Board have done likewise. In extenuation we plead that it is beyond the bounds of human possibility to remember every detail of the evidence, the hearing of which extended over three weeks," &c. However important or unimportant it may be, it is something to know that the author of the article in question admits having made "several inaccuracies;" but it is of more importance to know that, although he accuses the Board of having "done likewise," he has failed to specify a single inaccuracy made by the Board.

If our critic trusted to his memory when he penned his article of July 23, as, according to his own words, he appears to have done, no wonder he made many mistakes. There was no necessity, however, for him to "remember" the evidence when he could have referred to it, and whatever excuse there may have been for him on that occasion, there can be none for the inaccuracies in his later production, since, in addition to the evidence, he had the report of the Board on his previous article to refer to, and yet the inaccuracies in the article of August 6 are even more glaring than those of July 23. For instance, he says, "upon further reference we find that this statement (the statement about the wheels of the first two carriages being hot) was made by several persons after the accident, but was not sworn to at the inquest. . . . Hulme, the engine-driver, said he found the wheels of all the broken cars behind the first two cool, implying that he could not get at the others." Upon further reference to whom or what? The Board has no evidence whatever that any wheels were found after the accident to be hot, nor was any such evidence taken at the inquest, and Hulme did not make the statement imputed to him by our critic. What he did say was:—"On reaching the train, after the accident, I saw the brake blocks on the third carriage from the engine hanging loose. I felt the tires of that carriage and the one behind (No. 4), and found they were as cool as they could be by running without the brakes being applied to them." Not a word was said either by Hulme or anyone else about "having found the wheels of all the broken cars behind the first two cool;" as a matter of fact, there was only one slightly damaged vehicle behind the two that were telescoped, and that was the third from the engine, the tires of which, Hulme says, he felt. Nor is there the slightest reason to imply that the wheels of the smashed carriages could not be got at; indeed, there was no difficulty in getting at every wheel on the train, except, of course, those on the engine and tender, which were in the river.

Then our critic goes on to say:—"The Board will admit that much of the evidence requires interpretation, and it is quite natural to suppose that almost any interpretation made by those who believe in one theory would be regarded as strained by those who believe in the other. Unfortunately, we are not in a position to know the character of the Board's interpretation of their evidence." The Board does not admit that the evidence requires interpretation; it is sufficiently clear without it; and the writer must again have been trusting to his memory when he asserted that he was not in a position to know the Board's interpretation of the evidence, because if he will look at the Board's first report (dated July 1) he will find the following words:—"After the most careful consideration we think that the evidence points conclusively to certain facts from which the cause of the accident is not difficult to gather," and then those facts are clearly stated. Again, in their last report, dated July 30, he will find it stated that "It was not . . . the condition of those reservoirs (on the fourth and fifth carriages) at the time of the accident which alone constituted the premises of the Board's conclusion; three other circumstances were (and are still) in their opinion fully borne out by the evidence taken both at the departmental and coronal inquiries—

inquiries—viz., that the air-brake connections were complete and the taps open throughout the train (except of course the rearmost one, which was properly shut) up to the time of the accident; that the pump which supplied the air was in working order; and that in the absence of its failure there was abundance of brake-power upon the train. It was all these facts taken together which guided the Board in arriving at the conclusions embodied in their report." Surely nothing can be plainer than these remarks.

As far as holding back the departmental evidence is concerned, there is really nothing to hold back, although the *Daily Telegraph* seems to think otherwise. When the first report of the Board was published, the question of submitting the coroner's evidence to an expert had not been even mooted, consequently there seemed to be no reason to withhold either the report or the evidence from publication; but when the Government decided to have the verdict of the jury thoroughly inquired into and compared with the evidence, it must be evident to everyone that departmental evidence could have no bearing whatever upon that verdict, and probably the *Daily Telegraph* would have been the first to condemn its publication on the ground that it would be likely to prejudice the mind of the expert selected by the Government.

As regards the alleged insufficient examination of the train before leaving Sydney, and our critic's assertion that the words "air-leaking" written on one carriage implied that that carriage was not to go out, it is hardly necessary to say that those words implied nothing of the kind. When a vehicle of any kind is withdrawn from the traffic, the plain words "Not to go out" are written upon it.

Our critic ignores the statement in the Board's last report to the effect that one witness, who was hand-braking the seven vehicles (which when the train was finally made up, formed the rear portion from Sydney) had the wheel twisted out of his hand by some one opening the tap at the first vehicle. If, in the face of such evidence, our critic still hazards the opinion that the tap which was found to be closed after the accident was in reality closed before the train left Sydney (and his words bear no other inference), we can only say that he is evincing no desire to get at the true cause of the accident, but is, on the contrary, misleading the public.

The Board is not aware of any alteration of the practice and mode—indeed there has been none—of examining trains before they start on their journey.

The *Daily Telegraph* writer proceeds to say "That the air-pump was in working order we always regarded as evidence against the Board's theory rather than in support of it," &c. Why he should have thought that the fact of the pump being in "working order" was against the Board's theory we cannot see, but even if it were, the Board's only desire was to get at the truth. Of course, if the pump was working at full speed all the way down the incline, it would take three or four times longer to exhaust the air than if the donkey was at rest. Still it must not be forgotten that Mr. M'Kirkcaldie stated in evidence that, even with a high pressure of steam and the donkey going at full speed, he had seen the pressure in carriage reservoirs reduced from 88 to 40lb. in seven and half minutes by six manipulations of the driver's brake-valve, while it would take about ten minutes for the train to run from the top of the hill to the second tunnel, where it got beyond the driver's control; so that even under the most favourable conditions the exhaustion theory is perfectly possible. But now comes the question, was the donkey working at full speed all the way down the hill? We are strongly inclined to believe it may not have been, and our opinion is based upon the fireman's evidence, who alone is able to give any testimony on the subject. He said that he saw the driver ease the steam to the donkey before the train reached the top of the hill, but he did not say that he saw him (the driver) put on the steam again afterwards. If he forgot to do that (and whether he did or not there is no evidence to show), the exhaustion would take place all the more rapidly.

"The third ground," the writer proceeds to say, "that, in the absence of its failure, there was abundance of brake power upon the train, is a nonsensical absurdity upon which we shall have something to say." But he did not say anything, and perhaps it would be wise for him to think the matter well over before he commits himself to a "nonsensical absurdity." And then he seems to think that he has fairly demolished the Board's references to the paper on railway brakes which Mr. Marshall read before the Society of Arts in London in March last, and continues:—"It so happens that this extract from the paper is identical with that in a circular issued and extensively circulated by another brake company during the recent inquiry. Much is made of this authority, but it would have shown better taste, if not judgment, to have taken the extract from the *Journal of the Society of Arts*, instead of from the other brake company's circular. Perhaps it was taken from the *Journal*, though we can hardly think so. If it had been their instincts of fairness would, we feel sure, have prompted the Board to have intimated, at any rate, that Mr. Marshall's paper was very vigorously condemned in the long discussion which followed its reading, and a report of which appeared in the same issue of the *Journal*," and immediately following upon this we are treated to lengthy extracts from the speeches of Mr. G. A. Gutch and Sir Henry Tyler.

Now, although we know that it is a common practice for rival companies to avail themselves of every opportunity to advance their own interests at the expense of their neighbours, and we suppose the *Daily Telegraph* will admit that even the Westinghouse Brake Company is not blameless in this respect, we can positively assure our critic that every word of the extract was copied from the *Journal of the Society of Arts*, and that not one member of the Board has seen or heard anything of the circular he refers to up to the present time, and they do not even know that such a circular exists. The Board's "instincts of fairness" prevented them from quoting from any of the speeches which followed the reading of Mr. Marshall's paper, but the *Daily Telegraph* writer has no such delicacy, for he has the audacity to assert that the paper was "vigorously condemned" during the discussion which immediately followed its reading, whereas the real facts are, as may be seen on reference to the *Journal*, that while four members of the society took part in the discussion at that particular meeting, only one of them (Mr. Gutch) said a disparaging word of Mr. Marshall's conclusions, because he considered that that gentleman had not done the Westinghouse brake justice; and he (perhaps our critic is not aware of the fact) is engineer for the Westinghouse Brake Company, and a shareholder in that company as well. With regard to the only other authority quoted by the *Daily Telegraph*, viz., Sir Henry Tyler, perhaps, again, the writer was not aware that when some nine or ten years ago the Board of Trade in England determined to recommend the different railway companies to provide automatic air-brakes for passenger trains, Captain (now Sir Henry) Tyler was its senior officer; consequently the duty of preparing the required conditions would naturally devolve upon him. These conditions were such that it was thought at the time that the Westinghouse brake was the only one which could comply with them, and not long after they were adopted by the Board of Trade, Captain Tyler resigned his position to become the paid vice-president of the Westinghouse Brake Com-

pany,

pany, a position he held until a short time ago; and the share-list of that company shows that he holds shares of the value of £15,750. Does our critic seriously mean to ask us to accept as entirely unprejudiced the statements of such gentlemen as these?

That, we venture to think, would be as absurd as it would have been unfair on our part to have quoted from the speech made by Mr. Harold Brown at the following meeting, from the tone of which it was evident to the Board that he was interested in a rival brake; therefore we refrained from quoting from any speech which seemed to have the slightest taint of prejudice.

But so far as we know, Mr. Marshall has no interest, either pecuniarily or otherwise, in any brake, so that there are no grounds for believing his statement to be prejudiced; indeed, his paper, as everyone must admit who reads it, shows unmistakably how impartial he was; and, to use the words of Sir Frederick Bramwell, the Chairman, when he proposed a vote of thanks to Mr. Marshall for his paper—which, by the way, was carried unanimously—“No one acting as arbitrator in a dispute could hope to satisfy both sides, and if he dissatisfied both it was probable he had done substantial justice. No one writing such a paper as Mr. Marshall’s could hope to satisfy everyone, and as everyone seemed to think his own particular brake had not been done complete justice to, it was pretty good evidence of the impartiality of the paper.”

And since our critic has chosen to introduce the name of Sir Henry Tyler as an authority, we may perhaps be pardoned for quoting from a report of Colonel Yolland (who succeeded him as senior officer for the Board of Trade) on an accident which happened at Blackburn, in England, in 1881, when seven people were killed and sixty-four injured, and we may mention that we would not have drawn attention to it but for the introduction of Sir Henry Tyler’s name, for which the Board is not in anyway responsible. Colonel Yolland who, by the way, continued in his position in the Board of Trade until his death a few months ago, and consequently was precluded from having any pecuniary interest in any brake, says in reference to that accident that—“The Westinghouse automatic air-pressure brake is a very clever, ingenious piece of mechanism, made up of a very great number of separate parts, to give it the automatic action; but, as is well known, the greater the number of parts in any piece of mechanism, the greater is the liability of failure, and I consider that the liability to apply itself when not required and when there is no accident, and to fail to act or go on when absolutely required by an engine-driver, constitute two grave defects in its present construction.”

In another part of the same report he says: “I informed Mr. Westinghouse that I would delay making my report for ten days, as he was obliged suddenly to go on the Continent before my inquiry had finished. Ultimately I was told that they would call the persons they desired to examine at the inquiry before the Coroner, and they only called one of their inspectors before me to explain some conversation which had passed between him and the driver, Stanfield, of the Manchester express, which the latter had interpreted as a suggestion that he should go to America and avoid attendance at the Coroner’s inquest.” We agree, as readily as our critic, with Mr. Speight, that there have been disputes as great about the merits of the different classes of brakes as about the broad and narrow gauge question, and with reference to his (Mr. Speight’s) remark that he was “convinced that the weight of testimony is in favor of the Westinghouse brake,” it can only be said that if every one held the same opinion no other brake would be able to make headway against the Westinghouse, and yet it was the Midland Railway Company in England, the line on which Mr. Speight was assistant general manager before he came to Australia, which was the first to introduce the Westinghouse brake into that company, and amongst the first, if not the very first, to abandon it for another.

And now we come to that part of the newspaper article where it is stated—“At last we arrive at the Board’s attempt to answer our simple explanation of the empty state of the air reservoirs. They are exceedingly careful not to deny it. We say plainly they dare not ‘deny it.’”

It is rather difficult to know whether to be amused at this statement or surprised at its audacity, for, far from denying or attempting to deny the empty condition of those reservoirs, the Board held that the accident was caused by their being empty. Had they not been empty, or practically empty, the Board believe that the accident would not have happened.

With regard to the “leaking off” theory, we should prefer that our critic would make up his mind on the subject before making any further communication to the *Daily Telegraph*. In his first article (23rd July) he says that even when everything is in first-class order the brakes will leak off in three hours, whereas in one part of his last article he says, “three or four” hours, and in another, “several” hours; but to make out his case they must all be supposed to have leaked off in half an hour, which the evidence positively contradicts.

In a very elaborate defence of the Westinghouse brake the writer, commenting on the remarks of the Board respecting the cost of maintaining the brake in efficient condition if it requires so much attention as he stated, makes use of the following remark:—“An artizan can renovate the cylinder packing of a whole train in one day, and once in three months would be sufficient.” In reply to this we can tell him that one of the vehicles on the train was overhauled exactly three months before, another two months and seventeen days, a third twenty-four days, and the fourth nineteen days before the accident. Therefore, even on his own showing, it is exceedingly difficult to understand how they can be reasonably supposed to have leaked off.

“Of Clissold the guard,” our critic continues, “the Board in their report specially mentioned that the effect of the accident had been a severe shock to him, and it had evidently affected his memory of some of the events and of the order in which they took place. Albeit, they appear to gladly avail themselves of the literal interpretation of his statement that he saw one of the wheels skidding after the train left Hornsby, and that he went forward and released the air from the side valve, but we can readily understand that term being applied to wheels on which the blocks were rubbing. Skidding, as is well known, is a term often used in that sense.”

Skidding is not known amongst railway men in any other sense than that of wheels ceasing to rotate when a vehicle is travelling; and the Board, in their last report, would not even have made reference to Clissold’s evidence if our critic had been fair enough to have quoted it correctly. Either he (our critic) should have left Clissold’s evidence alone, or he should have taken it as it stands. He should not have taken that that only which suited him and was misleading to the public, and left out that which did not suit him, particularly when both portions of the evidence bore upon the very same point; and as regards the assertion that only two Westinghouse brake triple valves will be found, on reference to the Board of Trade returns, to have stuck in six months, it would be interesting to know from what returns

our

our critic obtained his information, for on reference to those for last year we find that thirty-three were reported to have stuck in the first and twenty-eight in the latter half of the year. And who will venture to say that they were all, or anything like all, reported? Take the evidence of fireman Pye, where he says "it often happens that the blocks after being applied by a driver at a station won't release themselves, and someone else has to release them." What is that but triple valves "sticking?" Indeed, reference to his evidence will show that when the train stuck on the bank at Beecroft, the driver was unable to get away with the first seven carriages until the fireman got down and released the air from one carriage on which the brakes were then "hard on." That could only have been caused by a triple valve sticking.

The *Daily Telegraph* writer can have no knowledge whatever of railway working, or he would not be so ready to quote the evidence of Mr. Dodds—a passenger who was in the fourth carriage from the engine—to the effect that he "noticed steam being kept up at the first tunnel." No railway man would believe such a statement, seeing that without any steam whatever the train would, by its own momentum, have attained a dangerously high rate of speed on the down grade of 1 in 50 if it had not been controlled by the brakes. Why not take the evidence of Pye who was on the engine? He says the driver shut off steam at the top of the hill, and that is about 3 miles before the first tunnel.

We can only characterise it as a misrepresentation when our critic asserts that "the inference is that he, the driver, was running with the engine-brake alone until he got to the 1 in 40 grade," because a very cursory glance at fireman Pye's evidence would have shown him that Pye said he saw the driver working the air-valve as the train was going down from the top of the hill, and that it was immediately on the grade of 1 in 40 being reached that the driver said to him, "She has got away from us." And the writer asserts that the exhaustion theory of the Board is a "pet and impossible theory." Let us see what the local agent for the Westinghouse Brake Company is reported to have said to the representatives of the *Daily Telegraph* a few days after the accident:—"It is said that the train was examined and found to be in good order before the train started. If that was so, the brake could only have been prevented from acting either by the driver totally exhausting his air, or rather, allowing it to exhaust itself, or the connections between the carriages being wrongly coupled." Surely a statement of that kind, coming from such a quarter, will satisfy our critic, since he evidently will not believe in the correctness of the tests that have been made by the Board since the accident. We repeat that drivers, when descending long steep grades on the mountains, and when they have reason to fear that their controlling power is becoming exhausted, get their trains well under control, then put on their hand-brakes as tightly as they can, and release the air-brakes for the purpose of recharging the reservoirs. For obvious reasons again, our critic chooses to take no notice of our reference to the discussion which took place at Chicago in July, 1885, on the "losing of the compressed air by careless handling of the engineer's valve." And he is evidently not aware that precisely the same difficulty was experienced on some of the Hungarian lines on grades of 1 in 40, and that it was only overcome by substituting unusually large donkey pumps and reservoirs.

The *Daily Telegraph* also chooses to take no notice of our statement that, even assuming their shut-tap theory to be correct, there was even then more than sufficient brake power to control and stop the train, instead of which the speed appears, from the evidence, to have kept on increasing, whereas, if there was no air in any of the auxiliary reservoirs, as the Board believes, the power was not sufficient, and the increasing speed of the train is at once accounted for. This is a most important feature in the case and is better than mere theorising.

The following sentence also appears in the *Daily Telegraph* article:—"Is not the closed tap which in its protected position beneath the carriage remained uninjured and unmoved, living *prima facie* evidence of all the mischief. If the collision closed that particular tap, how was it that all the others escaped?" The reply to this is, that if all the carriages had telescoped inside each other it is more than probable that all the taps would have been found closed afterwards, but as the one under which the shut-tap was found was the only one that telescoped, it will perhaps be clearer to our critic now why it was that that was the only one which was found shut.

Then the question is asked, "Is not the changed position of the train at Hornsby strong circumstantial evidence that the tap was unnoticed in its previous unaffected position?" Most decidedly not, otherwise what becomes of the evidence of (1) Werrick, that he saw the air working on the last vehicle before the train left Sydney; (2) of McCarthy, that the wheel of the hand-brake was twisted out of his hand by a man releasing the air from the main pipe seven vehicle lengths away; (3) Clissold, Gaylead, and Rice, who asserted that the brakes of both vehicles were hard on while they stood at Beecroft; and (4) of Mr. Garrard, who was most positive that he felt the action of the Westinghouse brake upon the carriage he was in (the second from the engine) while descending the hill? Mr. Garrard, it is true, said he was not aware that the guard was applying the hand-brake on that particular vehicle, but even when he was told such was the case, he maintained that it was the Westinghouse and not the hand-brake he felt; and no one who knows one brake from another could make any mistake in that respect—the sensation is too apparent.

Another question is: "Did not one passenger declare that he never felt the air-brake on the last carriage at any part of the journey between Sydney and Beecroft?" Neither a passenger nor anyone else said anything of the kind, so that we must put this down as another "inaccuracy."

Another: "Did not another positively assert that he saw unmistakable evidence that the blocks were on the first two carriages only when descending the gradient?" Of course our critic means the engine and tender as well as the two carriages.

To this we may reply that Mr. Dodds, the passenger who said he "noticed that steam was shut off in the first tunnel," while the fireman says it was shut off 3 miles before, also said that there seemed to him to be dust-coloured smoke coming from under the first and second carriages, as if the wheels were skidding, or the brakes very hard on; but as the brake-blocks on those vehicles were made of iron, will our critic consider how their rubbing on the wheels could give rise to dust-coloured smoke? And when he has done that, perhaps he will explain how it was that, if the brakes were working on the engine and tender and two carriages, which, together, represented 48 tons of brake force, the driver lost all control of the train; because it must be remembered that it was between the first and second tunnels that the guard put the hand-brake of the American car hard on, and it was not until just after passing through the second tunnel that the driver told the fireman that the train had got away.

To the question: "Is not Werrick's statement that he only examined the first seven carriages, and made no examination of the last two carriages, evidence that he could not have made any examination at all

all of the completeness of the air connections when the engine was on? It has been proved that the engine which took the train away was not placed on the train until the nine vehicles were coupled," we reply that, if the questioner was conversant with his subject, he would know that his last sentence answers his first. The very fact that Werrick did not tell the driver to try the air until the train was complete is the best proof that the air was working then from the engine to the last vehicle, since Werrick saw it working on the last vehicle. Although he did not examine the two carriages next the engine, he had practical proof that the air couplings had been made good, and that all the main pipe taps were open, otherwise the air could not have got to the last vehicle.

And to our critic's last question: "Why have the Board not produced their tables attached to their report showing the number of applications of the brake required when the donkey is not working, and when it is to exhaust the air?" we can only repeat in reply that, if he will refer to Mr. Kirkcaldie's evidence, he will find with a high steam pressure and the donkey going full speed the air pressure in the auxiliary reservoirs was reduced from 88 to 40lb. by six manipulations of the driver's valve in seven and a half minutes; and with the donkey stopped, the pressure in the same reservoirs was reduced from 64lb. to 20lb. in two minutes by the same number (six) of manipulations of the valve.

It has now been shown how unfairly the evidence has been strained and misinterpreted to suit the views of our critic, and it is to be hoped that if he again ventures to write upon the subject he will at least take some pains to be accurate in his assertions. So long as he lays his views before the public in accordance with the evidence the Board will have nothing to complain of.

In glancing over this report, we find that there is one paragraph which for the moment was overlooked. That paragraph contains the statement that Pye, the fireman, distinctly and repeatedly stated "that he did not see Wilson turn the brake on and off at short intervals." The incorrectness of this statement is truly astounding. It is simply manufactured evidence. It does not exist. Pye did not say once, much less repeatedly, that he did not see Wilson turn the brake on and off at short intervals. The whole of his evidence bearing upon that point is directly opposed to such a statement; indeed, he said at one place that "he (meaning the driver) drew out and shut it (the valve) several times just for an instant."

At another place he said, "the air-brake was working on the tender after we passed through No. 2 tunnel, and I saw the driver release brake, and the air-gauge showed 75lb. pressure. He applied the brake again immediately after releasing it," &c.

A REPLY TO "TRIPLE VALVE."

And now as regards the letter signed "Triple Valve," which appears in this morning's issue of the *Daily Telegraph*.

It may, perhaps, ease "Triple Valve's" mind to know that when Mr. Loughrey gave his evidence he was fully acquainted with Captain Galton's formulæ respecting the varying conditions of the brake-power, and it would be impertinence to assume that Professor Warren was not also fully conversant with it; indeed, it will be found that Mr. Warren's evidence on that particular point was based upon Captain Galton's formulæ. And the Board still characterises as a pure invention of "Triple Valve" his assertion with reference to the fireman's statement—that "when the driver finding his brakes were not acting placed his handles in the released position, and that the air-gauge then showed a pressure of 75lb." This was so fully replied to in the Board's last report that it is perfectly unnecessary to repeat what was then said. And the Board is as firmly convinced as ever that "Triple Valve's" statement respecting the charging of a whole train with about 45lb. pressure of air in 15 seconds is as ridiculous as it is incorrect. There is no need to go to elaborate mathematical calculations in a matter of this kind; the thing has been practically demonstrated over and over again. His reference to the American locomotive engineer who stated that "auxiliary" reservoirs cannot be recharged without "releasing all the brakes on the train, and the train will during this short time of release (15 to 20 seconds)," &c., is easily explained. Without doubt the locomotive engineer in question referred to the recharging of the auxiliary reservoirs after one application of the driver's valve. If, however, "Triple Valve" should still be in doubt about the real time occupied in charging auxiliary reservoirs, perhaps he will communicate with the Westinghouse Brake Company and get the information from them direct.

And now we come to his assertion that "when the train was recoupled at Hornsby the air-pressure stored in the then fourth and fifth carriages would endeavour to rush into the empty reservoir of what had originally been the last, but was now the second vehicle of the train, and this, of course, would apply the brakes on the first-mentioned carriages." These are his own words, and we are rather pleased than otherwise that he has repeated his assertion, for it gives us another opportunity of telling him that it is a mechanical impossibility for air stored in any carriage to find its way into the empty reservoir of another carriage; and, even if it were possible, how would air passing from one reservoir to another put any brakes on? To put a brake on, air must pass into a brake cylinder, and the only outlet from the cylinder is into the atmosphere. When the pressure in the main pipe is greater than that in the auxiliary reservoirs, the triple valve is up and the passage from the reservoirs to the cylinders closed; but when the converse happens the triple valve falls, and the air can only pass from the reservoirs to the cylinders and then only from the reservoirs to the cylinders fixed on the same carriages, not from a reservoir on one carriage to a reservoir or cylinder on another carriage.

Until "Triple Valve" thoroughly understands this he should lay aside his inappropriate *nom de plume*. There is another portion of "Triple Valve's" letter which we regard as such arrant nonsense that we think it would be merely a waste of time to reply to it. This is the gentleman whom the *Daily Telegraph* writer referred to in his article of the 6th instant as likely to "lash to scorn" the Board's reply to his first communication. Still we must give him credit for candidly admitting that he made one error in his first letter, although it is very difficult to see how he could have done otherwise in the face of the evidence. If he thinks the point on which he made the error is an unimportant one, we are quite prepared to agree with him, but it was nevertheless a point he eagerly seized upon to get his opinions to "dovetail" into each other with such "extreme accuracy."

In submitting this to the Commissioner, we have to express the hope that this report will be communicated to the press, in justice not only to the Department but to the Board who held an inquiry into the circumstances which led to the accident, and whose opinions have been so unjustifiably attacked in the columns of the *Daily Telegraph*.

D. VERNON,
Chairman.

10/8/87.

No. 15.

Extract.

[From the *Daily Telegraph*, Saturday, 13th August, 1887.]

THE PEAT'S FERRY RAILWAY ACCIDENT.

To the Editor of the Daily Telegraph.

Sir,

Pressure of other duties, and a reluctance to extend my last letter to an inordinate length, prevented me from dealing with a few points raised by the supplementary report of the Departmental Board, to which, with your permission, I shall now refer.

The evidence given at the inquest, in connection with what occurred from the time that the train was divided on the incline until it again came to a standstill beyond Hornsby, is so full of discrepancies and apparent improbabilities that any attempt to arrive at a common understanding as to the facts of the case must be abandoned as a hopeless undertaking, and, in saying this, I distinctly disclaim any wish to impute intentional inaccuracy to any of the witnesses. The adherents of either theory will implicitly accept all statements favourable to their view of the question, and reject as improbable everything tending in a contrary direction. Thus, when the train was divided the guard asserted that the brakes were left on the two vehicles which were left behind. He does not, however, state in what way the brake was applied to these carriages, nor why, having a hand-brake on the last vehicle, which he was using for the time being as a brake-van, he neglected to use it. The Station-master at Hornsby states, that when he uncoupled the engine from the seven vehicles which first arrived, he did not shut the tap on the train. This is a most unusual mode of applying the brakes, and generally only happens through forgetfulness on the part of the person uncoupling. Mr. Stead does not remember shutting the cock afterwards; yet that it must have been shut when the other portion of the train was backed on is proved by the guard's statement, corroborated by the porter Rice, that he turned both taps open, in which position they were found after the accident. Mr. Stead further states that he touched the blocks with a sprag and found they were on. Any person intentionally applying the brake in this manner would naturally examine the vehicle immediately under his eyes, and yet on this particular vehicle the brakes had never been acting. Again, the guard states the vehicle from which he released the brake when the train stopped beyond Hornsby was, he believed, neither an American car nor a Redfern carriage; but, as these were the only vehicles on the train on which the brake could be applied, he was evidently mistaken.

The Board draws attention to the fact that wheels, on which the blocks were said to be only slightly rubbing when the train left Hornsby, were found to be skidding some distance further on, and they triumphantly ask—Where did this increased pressure come from, if not from the engine? and they lead us to infer that the “only reasonable interpretation to arrive at” is that the triple-valve was sticking on that vehicle. This view of the case is untenable for a single moment. Any increase of pressure then coming from the engine—and that the pressure was increasing at this particular time is proved by the fireman's statement—would, if it moved the triple-valve at all, immediately release the brake, and if it did not move the triple-valve it could not get into the small reservoir, since it is a “mechanical impossibility” for the opening between them to be uncovered without at the same time closing the communication from the small reservoir to the brake-cylinder and opening the latter to the exhaust. A “Shut Tap” advocate could, however, account for it by explaining that it is extremely difficult for a bystander to estimate the degree of force with which blocks are pressed against the wheels, and a force not quite sufficient to skid the wheels on a straight and level road might readily do so at a low speed on a curve and incline, or at a place where the adhesion between the wheel and the rail was lower than the point started from.

Mr. Garrard's evidence that he felt the Westinghouse brake working “in a spasmodic manner” on the carriage in which he was travelling is exactly balanced by Mr. Barrie's, also a passenger in the same carriage, and “accustomed to the action of the brake,” that he knew it was the hand-brake which was working, through feeling no “spasmodic catching.”

If we examine the “exhaustion theory” in the abstract it can be conclusively demonstrated that with an air pressure of 75 lb. showing on the gauge, and therefore in the break-pipe, it involves another “mechanical impossibility.” It is, perhaps, generally known that air of ordinary atmospheric pressure flows into a vacuum at a speed of 1300 ft. per second; but many people may not be aware that air of all pressure has only this effluent velocity into a vacuum. The reasons for this are that the elasticity of air causes it to have a repellant as well as a propulsive force, and thus the escaping particles are pushed back with the same elastic force as they are urged forward with, and that, no matter how great the pressure may be, a column of air 5 miles in height and of a uniform density equal to that due to the pressure would produce that pressure. Now, let us accept the Board's statement as to the size of the feed-opening from the triple valve to the small reservoir, and in return I will ask them to admit that it is at least as large as the orifice in the triple valve, through which the exhaust air from the brake-cylinder escapes to the atmosphere. From what has been said above, it is evident that during all the time the brake-cylinder is being exhausted into the atmosphere the small reservoir is being re-charged from the main reservoir through the brake-pipe and small opening in the triple valve, and thus what is being lost in one way is being regained in the other. Any movement of the driver's brake-handle or triple valve, which stops the recharging of the small reservoir at once, stops the exhaust from the brake cylinder. So that we have only to compare the velocity with which the air escapes from the brake cylinder, and the velocity with which air enters the small reservoir. The capacity of the small reservoir is about 1,800 cubic inches; that of the brake cylinder, with the piston forced forward, about 300 cubic inches. Commencing with 75 lb. pressure in the small reservoir and applying the brakes, the pressure is reduced to $\frac{4}{5}$ ths, the original amount, or 64 lb. When the brake is released air of this pressure escapes from the brake cylinder at an initial velocity of 1,170 ft. per second, and the air of 75 lb. pressure contained in the brake pipe rushes into the small reservoir at an initial speed of 456 feet per second. It will, of course, be urged that the speed of this last-mentioned air gradually diminishes as the pressures are equalised, but the speed of the escaping air from the brake cylinder is at the same time being reduced as the pressure in the brake cylinder decreases. Continuing this calculation, when the brakes are applied with a pressure of 25 lb. in the brake cylinder, the velocity of escape is about 1,025 feet per second, and air of

75 lb. pressure would rush into the small reservoir at a speed of 970 feet per second, or nearly equal. It is, therefore, abundantly evident that so long as the gauge showed a pressure of 75 lb. when the handle was in the release position, it would be morally impossible to reduce the pressure in the small reservoirs and brake cylinders below 25 lb., and even this could only be effected by re-applying the brake as soon as the brake cylinder completed exhausting. This, of course, would be equivalent to keeping the brake on the whole time, and, given sufficient brake power, the train would be stopped over and over again before this low pressure could be reached.

The remarks of the Board as to the practice of the drivers descending the mountains when they have reason to fear that their controlling power is becoming exhausted only apply to cases in which the air-gauge shows a low pressure each time the handle is placed in the release position, and, I am confident, has never been resorted to at any time when the gauge showed a pressure of 75 lb.

Yours, &c.,

TRIPLE VALVE.

THE PEAT'S FERRY RAILWAY ACCIDENT.

To the Editor of the Daily Telegraph.

Sir,

In a letter which appeared in your paper of the 10th instant, signed "Triple Valve," it is stated that my calculations on brake pressure were based upon an assumption that the co-efficient of friction between the brake-blocks and wheels was a constant quantity for all speeds. It is also stated that I was incorrect in stating that such an engine as the one in question was capable of taking such a load up a gradient of 1 in 40, at a speed of from 20 to 25 miles per hour.

Now, sir, I am very reluctant to engage in a newspaper correspondence, as I have my time fully occupied, and I am still more reluctant to reply to a man who shields himself under a *non de plume*; but since the statements made, either ignorantly or wilfully, may tend to mislead the public, I have decided to write this one letter. I shall not, however, answer any further correspondence on this subject from anyone who is ashamed to sign his name. With regard to brake pressure. When I handed in my calculations in the witness box I stated that they were based upon experiments made by Captain Galton, and I now add that I had before me when making these calculations, not only a table of co-efficients of friction determined by Captain Galton for speeds varying from 1 to 60 miles per hour, and showing the decrease in the co-efficient due to the increase in the speed of the train, as well as for the time the brake-blocks are in action, but also the increase in the co-efficient due to the reduction in the speed of the train, which "Triple Valve" appears to have lost sight of. I have now before me a graphical representation of all the experiments made by Captain Galton on this subject, showing by the abscissa and ordinates of curves the speed and corresponding co-efficients of friction. From such diagrams it is possible to deduce the average co-efficients due to the effect of the various causes above referred to in a far more satisfactory manner than by any other means I am acquainted with. This co-efficient, taken in conjunction with the minimum retarding effect for the various cases in question, gives the necessary minimum brake pressure.

With regard to the tractive force of the engine, I stated generally that such an engine as the one in question ought to have been able to have taken such a train up a gradient of 1 in 40 at a speed of from 20 to 25 miles per hour. I have since been informed that the boiler pressure of this engine was reduced from 140 lb. per square inch to 130 lb. per square inch, so that under these circumstances the engine was slightly overloaded for the speed in question. "Triple Valve's" reference to me as a mere theoretical expert is answered by the fact that I had 16 years' practical experience in engineering before my appointment at the University, 6 years of which were spent with one of the largest railway companies in England.

Yours, &c.,

W. H. WARREN.

University of Sydney.

THE PEAT'S FERRY RAILWAY DISASTER.

In writing this article we have not the time or inclination to waste words in replying seriatim to all or even half of the statements made by the Railway Board in answer to our last article on the Peat's Ferry railway accident. Having already proved our case to our own, and we believe the public satisfaction, we shall not allow ourselves to drift any further into a discussion of the working of the Westinghouse automatic brake. Whatever we have said in defence of the Westinghouse brake was because of the unworthy condemnation it has received from the members of this Board in the attempt to shield the department from censure in connection with a deplorable disaster. Their insinuation that in our efforts to get at the truth we have been writing in the direct interests of the Westinghouse Brake Company has had as little weight with us as their exploded theory has had with the public.

As long as this Board of railway officials, through their Chairman, evade our two main points we shall not occupy our time in setting them right in small matters. In the article entitled "The Exploded Theory of the Board" we explained how it was that the small air reservoirs were found empty after the accident. That simple explanation has been verified by a number of professional men. Engine-drivers who use the Westinghouse brake every day have declared that everything stated in the article is true. We dared the Board to deny the explanation. More than that, we asked that the seven uninjured carriages on which the reservoirs were found empty should be coupled and left in the same condition as they were at Hornsby, for the purpose of ascertaining in what time the small reservoirs would leak away and the brakes become released.

Now,

Now, mark how the Board misunderstands what was explicitly stated :—

And now we come to that part of the newspaper article where it is stated that—"At last we arrive at the Board's attempt to answer our simple explanation of the empty state of the air reservoirs. They are exceedingly careful not to deny it. We say plainly they dare not deny it."

It is rather difficult to know whether to be amused at this statement or surprised at its audacity, for, far from denying or attempting to deny the empty condition of those reservoirs, the Board held that the accident was caused by their being empty. Had they not been empty, or practically empty, the Board believe that the accident would not have happened.

This is positively extraordinary. Did we ever say that the reservoirs were not empty? Was not the article written to explain how the reservoirs became empty? We might go on pointing out numerous other misconstructions. We fail to see its necessity. If the public, or engineers of acknowledged ability, or engine-drivers in daily use of the Westinghouse brake were divided on the two distinct verdicts concerning the accident, the time might be well employed. As, however, we have abandoned all hope of reclaiming the members of the Board from the mire into which they have plunged, we must allow them with Mr. Kirkaldie, the Assistant Traffic Manager, to stand alone and bear the odium attached to the persistent advocacy of an impossible theory.

It is rather difficult to state definitely whether the Assistant Traffic Manager should be classed with the Board. We would gladly rescue him, if possible. His evidence at the Coroner's Court was a remarkable anticipation of the Board's report. There he professed a knowledge of the working of the Westinghouse brake. His theory, heard for the first time at the inquest, was that the driver, by an injudicious manipulation of the brake, had not sufficient air to put the brakes on when he got on to the heavy down grade. When asked by Dr. Sly, "How do you or can you account for there being no air in the reservoirs at Peat's Ferry?" He replied: "I cannot account for it; there is only one theory—that the air was exhausted going up the bank." Then Dr. Sly asked how could the air be exhausted, and the witness answered: "By too frequent use of the brakes to stop the train," afterwards admitting that if the driver attempted to use the brake going up the bank the train would have been brought to a standstill at once.

Did the Board expect that their wonderful theory would have been proved to the jury by Mr. Kirkaldie's evidence? Did they expect the jury to believe that, because Mr. Kirkaldie saw the air pressure in the auxiliary reservoirs reduced from 88 lb. to 40 lb. at Redfern, by six manipulations of the driver's valve in $7\frac{1}{2}$ minutes with the donkey working, Driver Wilson must have done the same thing? Mr. Kirkaldie's object was to see how much the pressure could be brought down by six manipulations of the valve? Wilson's was to stop the train. Had he even acted, like Mr. Kirkaldie, for the purpose of his test, the train would have stopped long before the sixth manipulation of the valve. How was it that this exhaustion theory was never shown to the jury, who went several times to the Redfern station?

Is it any answer to the question—Why have the board not produced their own tables?—to refer us to Mr. Kirkaldie's evidence? Weeks have elapsed since the report of the Board was furnished, and yet no copy of the evidence on which that report is supposed to be based has been distributed. The Commissioner for Railways in his minute, referred to the results of experiments attached to the report; these are also still concealed from the public eye. A promise was made that when the report was published the evidence would be available. Moreover, it is invariably the custom to issue both simultaneously. Why has that practice been departed from? Will public curiosity remain satisfied by the statement "There is really nothing to hold back" without advancing the shadow of a reason for still keeping it back? Perhaps it is considered a safe thing to keep it back until Parliament re-assembles. There are people so inquisitive that they would like to know the character of the evidence on which this most remarkable theory has been based. Others there may be who think it possible that the Board elicited evidence bearing directly upon it—evidence which did not come before the jury. The holding back of what the Board thinks "really nothing" has a tendency to support the latter view. What has the submitting of the Coroner's evidence to an expert to do with the continued concealment of the departmental evidence? We respectfully request the Board to produce it, and must respectfully decline to continue this controversy until they do. Unlike the Coroner's Court, the evidence given before the Board was, so their report states, taken by a shorthand writer—questions and answers, we presume—therefore, it is all the more valuable. It is to be regretted that this was not done at the inquest, of which necessarily summarized reports were published. The depositions, too, which a legal gentleman has been engaged to analyze, were necessarily taken in a summarized form. Little wonder, then, that we have divers statements of what this and that witness really said. In all sincerity, we assure the Board that we have applied no remark to any witness without every possible inquiry, and in no instance have these statements of evidence been contradicted by the witnesses themselves.

Again we find that the two main points of our first article have been evaded. Not the slightest answer is given to our request that the carriages should be coupled together to prove the leaking off explanation. The challenge we made that a trial would prove it impossible to exhaust the air in the time at the disposal of Wilson without stopping the train, is again treated in silence. Surely nothing could afford an easier settlement of the matter. If the brakes leaked off at the Hornsby Station they will leak off elsewhere. When the brake appliances were overhauled has nothing to do with the suggestion made. It is not usual to test the pistons when overhauling the brakes. Would the Board find it "exceedingly difficult to understand how they can be reasonably supposed to have leaked off" if no appreciable quantity of air were found in the reservoirs in half an hour? Well, try it with the same carriages. Three times we have made that recommendation, and no attempt has yet been made to answer or adopt it. If the Board thoroughly believe in their theory, why not try to exhaust the air of the Westinghouse brake on a running train? We have claimed that it is impossible into the time and distance in which it is alleged to have occurred. The Board reiterate its possibility. Settle it by a trial which can be easily arranged and conducted with perfect safety. Three times, also, we have made this suggestion—each time it has been received in silence. One would think that the Board would have made some reply. Almost every other point taken up by us has been carefully, some even elaborately, answered. Much space has been occupied in matters of detail, but these two important recommendations have been treated as if never made.

This matter cannot rest where it is, for however little the public may think of the Board's theory, it is blocking the way of the Jury's rider. Its final statement is, we think, more likely to be hastened by the trials we have recommended than the controversy into which the Board have entered with ourselves.

At

At one moment we are told that we imperil the reputation of the Westinghouse brake by stating that the brakes will leak off on standing carriages; at another that the article is penned in the direct interests of the Westinghouse Brake Company. Hence, the members of this bewildered Board prove our honesty of purpose. Our judgment of the Westinghouse brake has been more from results than anything else. We found from the Board of Trade returns, the official accuracy of which cannot be questioned, that the Westinghouse brake is used more extensively in the United Kingdom than all the other brakes put together. Inquiry proved to us that it is used on over 500 railways in America, where it has an almost complete monopoly, which the company also enjoy in the greater part of the world, throughout which they have considerably over 150,000 sets of brakes in active use. Curious we were to know whether this great monopolising brake could exhaust its power in the time and distance indicated by the Board, and from anxious and minute inquiry we came to the conclusion that it was impossible. That conclusion is largely based on the experience of engine-drivers accustomed to its use. And we say, if the engine-drivers of this Colony are allowed the liberty of the Press, the great majority of them will declare that the theory of the Board is against their experience as well as evidence.

In the last article we ventured to assert that we had spoken in accord with the great preponderance of evidence, and as the Board say they differ from us entirely we take it that they are convinced that the coroner's jury gave a verdict against evidence.

We are glad to have the Board's assurance that they did not quote an extract of Mr. Marshall's paper from a circular issued by a rival brake company, but from the *Journal of the Society of Arts*, in which the paper originally appeared; but the fact that the extract was the same must either be regarded as a remarkable coincidence or that serious allegations against the working of the brake are wonderfully scarce. The Board also deny that any change has been made in the examination of the brake connections at the Redfern Railway Station, but we must prefer to believe our own eyes. When we noticed the air being turned off at the last car, and had the assurance of railway officials that this is now the practice, we admired the change as a very sensible one.

We now propose to relegate this subject to the New South Wales Engineering Association. They have already taken up the question of continuous railway brakes. We know of no association better able to discuss the Board's theory. Let them analyse it, examine it, in all its bearings, sift the evidence—that elicited by the Board, if it can be obtained—and pronounce a deliberately formed opinion as to the cause of this lamentable accident.

THE PEAT'S FERRY RAILWAY ACCIDENT BOARD AND "TRIPLE VALVE."

To the Editor of the *Daily Telegraph*.

Sir,

I have not been altogether able to divest myself of the slightly uncomfortable sensation that I have been endeavouring to knock out an opponent whose hands were practically tied behind his back, and, therefore, I had not intended to trouble you with any further comments on what has been from the beginning a most deplorable and soul-vexing business; but there are two or three points in the supplementary reports of the Board which must be dealt with.

Professor Warren's corrected estimate as to the minimum amount of brake force gives a percentage of 25.38 for a speed of 25 miles an hour and 64 per cent. for a speed of 40 miles an hour, and it will be apparent that this proportion varies almost exactly as the square of the velocity. In the Board's reply to my first letter they state: "We have already shown that 21 tons would have controlled it if the speed had not been allowed to exceed 15 miles an hour, and that 26 tons would have controlled it at a speed of 25 miles an hour." It certainly should not require any elaborate mathematical calculation to prove that, as the kinetic energy, or accumulated force of a moving mass, increases as the square of the speed, if the Board's estimate of 21 tons for a speed of 15 miles an hour be correct 58 tons would be required for a speed of 25 miles an hour. There is certainly a want of harmony about these varying statements which amply justifies my drawing attention to them, and which clearly proves that the calculations have been conducted on different bases.

I regret that the Board, in their last communication, have not emulated that candour for which they have given me credit, by unreservedly withdrawing their accusation that my assertion in reference to the fireman's statement was "a pure invention of the writer's." My assertion, it will be remembered, was, "the fireman's statement that when the driver, finding his brakes were not acting, placed his handle in the release position, and the air-gauge then showed a pressure of 75lb., &c." I have no option, under the circumstances, but to ask your readers to be patient with me while I reproduce the evidence bearing on that point. To avoid any charge of "manufacturing evidence," so freely made by the Board, I will quote from the *Echo*, of July 5, evidence given by the fireman, John Pye, on the previous day:—"After the driver applied the air-brake and found it would not act, he reversed the engine and whistled to the guard 'Brakes down' . . . After the engine was reversed the driver had the air-brake full on all the time. He shut it only for an instant. Witness took particular notice of the air-gauge" (it was a question of life or death with him), "it showed 75lb. pressure. When the driver opened the valve full it went round to zero, and when he shut it it flew up to about 75lb. . . . When he saw the gauge at 75lb. he came to the conclusion that the brakes were not working somewhere." Again, on July 12 (I quote from the *Echo* of that date), "he remembered seeing the air-gauge showing 90lb. pressure at the brow of the hill when they were commencing the descent; he saw it afterwards showing 75lb. . . . The air was working after they passed No. 2 tunnel. He then saw the driver release the brake, and the pressure gauge showed 75lb. The driver applied the brake again immediately after releasing it, and it was then the driver said the train had got away. . . . The gauge showed 75lb. just after they got through the second tunnel, with 90lb. at the top of the hill and 75lb. at the second tunnel, and with the engine reversed and the donkey working it would not be possible to exhaust all the air from the main reservoir in his opinion." If, in the face of the above, where my assertion is once literally and seven times

times substantially confirmed, the Board will not retract what I cannot regard as other than a most offensive imputation, which they have deliberately reaffirmed in their last report, I must only leave the public to judge between us. And in connection with the above, it is a fact curiously overlooked, but susceptible of immediate verification, that the momentary shutting and opening of the driver's brake-valve exert no appreciable effect on the pressure in the small reservoirs and brake cylinders after the brakes are first applied, as the interval is too short to allow any air from the brake cylinder to escape through the exhaust opening.

The Board "easily explains" away the opinion of the American locomotive engineer, whom, by the way, they first introduced to our notice, by airily remarking, "Without doubt the locomotive engineer in question referred to the recharging of the auxiliary reservoirs after one application of the driver's valve." But if recharging means, as it obviously does, a restoration of the original pressure, it would appear to the ordinary intellect that the operation could be repeated *ad infinitum* as long as the source of supply remained unimpaired.

The fact that the donkey was working the whole of the time does not merely tell against the theory of the Board; it is the withdrawal of the foundation stone on which they have reared their edifice of "exhaustion and injudicious action." Apparently recognising this the Board has made a laboured attempt to prove that the driver may have forgotten to again put the steam on to the donkey after easing it before reaching the brow of the hill. A drowning man will proverbially clutch at a straw, but the exigencies of justice require that even this frail support must be remorselessly plucked away in the present case. The fireman's evidence was to the effect that the donkey was working all the way down to Peat's Ferry, and drivers Frame and Perkins saw it working after the engine fell into the water, and the latter shut off the steam from it.

If we accept as nearly approaching the actual conditions of the wrecked train—with the important exception that we are not told if the air-gauge still showed 75lb. in the main-pipe at the end of the experiment—the test made by the Board, that "with a high pressure of steam, and the donkey going at full speed, the pressure in the carriage reservoirs was reduced from 88lb. to 40lb. in 7½ minutes by six manipulations of the driver's brake-valve," it is the strongest argument which could be adduced against their theory. It may fairly be assumed that running the 3½ miles from the top of the incline to where the train got beyond control did not occupy more than about 8½ minutes, as a speed of 25 miles an hour would be attained within 200 yards after turning the hill, and thus after working the brake in such a manner as to practically keep it on almost the whole time, there was still left in the reservoirs a fairly effective pressure. And then there is the evidence of Mr. Garrard, to which the Board apparently attaches such importance, that the brake seemed to be applied only once or twice and then taken off altogether. How do they propose to reconcile this with the fact that it required six manipulations to reduce the pressure to 40lb.?

Then, again, there is the fact that one witness believed the tender wheels to be skidding when the train ran into Peat's Ferry, and the small reservoir on the tender should have been in precisely the same condition of exhaustion or otherwise as the reservoirs on the carriages. If it be contended that this may have been caused by the fireman screwing the tender hand-brake down, it only tells more strongly than ever against the Board's theory, since, if this was the case, it would require a very effective pressure indeed in the tender reservoir to lift the handle of the brake, as the fireman states he saw done about half-a-mile before running into the station.

As I did not state at any time that air stored in one carriage would find its way into the reservoir of another, or that air passing from one reservoir to another would put any brakes on, the Board's assurance that such a thing is impossible, is, to say the least, rather superfluous. What I did state in effect was that if a carriage containing air in the small reservoir and brake-pipe were coupled to a carriage containing no air, and the taps opened, the triple valve on the first carriage would be forced down and the brake applied on that carriage through the action of the air in endeavouring to rush into the empty space. The Board may say that the triple valve falls through the pressure in the small reservoir being greater than that in the brake-pipe, but as the meaning is identical, it is scarcely worth while to quibble about the exact terms in which it is conveyed.

I cannot, of course, but feel grateful that the Board should have so magnanimously refrained from exposing what they have politely designated as arrant nonsense; but, at the same time, I have a lurking suspicion that if they had been able to prove that any portion of my second letter could be so classed, the task would have been too congenial, and the opportunity too tempting, to be lightly thrust aside.

I am quite prepared to admit that there may be more cases of triple valves sticking than are reported, but in the cases referred to by the Board, when the brake has to be taken off at stations, by opening the release valve at the back end of the brake cylinder, it is caused ninety-nine times out of 100 not by the triple valve sticking, but by the pressure in the brake-pipe being lower than that in the small reservoir.

The Board appears to labour under a slight feeling of disappointment at the absence of any attempt on my part to "lash them to scorn;" but let inform them that I consider the occasion too serious, and the questions at issue too momentous to justify any indulgence in biting sarcasm or withering irony, and that while doing them the justice of believing that they are actuated by an honest, conscientious conviction, that their view of the matter is the right one, I have a right to claim similar consideration at their hands. My only object in approaching the question has been an earnest desire to place the facts and the probabilities of the case fairly before your readers, and to assist in removing an impression which must cause considerable doubt and anxiety to prevail in the minds of the travelling public. It cannot be denied that if the theory of the Board be accepted as the true explanation of the Peat's Ferry railway accident, a widespread feeling of insecurity will always exist when descending our heavy gradients, arising from the knowledge that although there is a sufficiency of brake-power on the train and that all the brake appliances are in perfect order, a little injudiciousness on the part of an acknowledged careful driver, fairly conversant with the working of the brake, may at any moment result in a most disastrous accident, or that through an inherent defect in the principle of the brake, the same lamentable result may be brought about, despite the most careful handling of the driver's brake-valve.

Yours, &c.,
TRIPLE VALVE.

Chairman of Board to Commissioner.

THE PEAT'S FERRY ACCIDENT.

To the Commissioner for Railways,—

From a remark made in the articles which appeared in the *Daily Telegraph* on the 17th inst., we concluded that as the question of the brakes (and with it that of the cause of the Peat's Ferry accident) had been taken up for discussion in the New South Wales Engineering Association, it was not the intention of that journal to allow any further correspondence to be conducted through its medium until, at all events, the opinion of the members of the association had been expressed.

In yesterday's issue, however, there is another communication from "Triple Valve," and as we are fully in accord with him as regards the importance of the subject, we now take the opportunity of replying as briefly as possible to it, as also to his letter of the 13th inst. and the *Daily Telegraph* article already alluded to. From the outset the board of inquiry has been deeply impressed with the gravity of the subject, involving, as it does, that all-important feature, the safety of the travelling public, and throughout they have been actuated by one desire only—to elicit every circumstance which could by any possibility be regarded as contributing in any way to the cause of the accident. They feel that they cannot too often or too strongly repeat that if they could have seen any grounds whatever for adopting the "leaking off" and "shut tap" theory, so persistently put forward by the *Daily Telegraph* and "Triple Valve," their task would have been of the easiest description, for they could have fixed the responsibility without difficulty; most certainly they would not, in view of the serious loss of life which occurred, have allowed any false sentiment to deter them from expressing an opinion adverse to any officer or servant of the Department, if they could have seen any just grounds for doing so. But there is not, as was stated in a previous report, a tittle of evidence in support of this theory; on the contrary, the whole of the evidence taken by the Board (and of course it was upon that evidence alone that the conclusions of the Board were based) most strongly favours the conclusions expressed in their original report, and it is scarcely necessary to say that that opinion was only given after very full and careful consideration.

In the letter which appeared in the *Daily Telegraph* on the 13th instant, "Triple Valve" states that "when the train was divided the guard asserted that the brakes were left on the two vehicles which were left behind." But "Triple Valve" continues—"He does not, however, state in what way the brake was applied to these carriages, nor why, having a hand-brake on the last vehicle which he was using for the time being as a brake-van, he neglected to use it." "Triple Valve" appears to forget that on one of the carriages in question it was not possible to put on the brake except by air, while on the other it must of necessity have been put on by air too, if the guard did not use his hand-brake. It was therefore utterly superfluous for the guard to say (although doubtless he would have done so if he had been asked) how the brakes were put on those two vehicles; but if "Triple Valve" will refer to fireman Pye's evidence he will find it stated there that "when we stopped at Beecroft the driver put the air-brake on before separating the train." And with respect to the uncoupling of the first division of the train from the engine at Hornsby, "Triple Valve" states that the officer in charge "did not shut the tap on the train," and that that officer "did not remember shutting this cock afterwards." It is perfectly immaterial whether he shut the tap or left it open; if he shut it, it was certainly opened by the guard when he recoupled the two divisions subsequently, because it was found opened immediately after the accident; if he did not shut it, then it was not necessary for the guard to open it when he recoupled.

Again, with reference to the wheels on which the blocks were said to be only slightly rubbing when the train left Hornsby, which wheels were found to be skidding some distance further on, and to the Board's contention that this skidding must have been produced by an increased pressure of air which could only have come from the engine, "Triple Valve" pronounces the Board's interpretation to be "untenable for a single moment." Any increased pressure coming from the engine would, he says,—“If it moved the triple valve at all, immediately release the brake, and if it did not move the triple valve it could not get into the small reservoir, since it is a 'mechanical impossibility' for the opening between them to be uncovered without at the same time closing the communication from the small reservoir to the brake cylinder and opening the latter to the exhaust. A 'shut tap' advocate could, however, account for it by explaining that it is extremely difficult for a bystander to estimate the degree of force with which blocks are pressed against the wheels, and a force not quite sufficient to skid the wheels on a straight and level road might readily do so at a low speed on a curve and incline, or at a place where the adhesion between the wheel and the rail was lower than the point started from.”

Surely, however eager "Triple Valve" may be to prove the correctness of his "shut-tap" theory, he will admit that there is a very great difference in the degree of force applied when brake-blocks only rub slightly at starting and when that force is so great as to make the wheels "skid," no matter how low the speed or sharp the curve. We can characterise it as nothing short of an absurdity to assume that brake-blocks which only rubbed slightly when leaving Hornsby should cause the wheels to skid $1\frac{1}{2}$ or 2 miles further on, especially if there was a shut-tap between that carriage and the engine. Doubtless any increased pressure from the engine would, if it moved the triple valve at all, force the valve up and release the brake, but we are now dealing with a case where the valve, for some reason or other, refused to move, hence the blocks would not release; therefore to put the brakes on harder than they were when the train left Hornsby it is self-evident that the pressure in the reservoir of this particular carriage must have been increased, and if so, "Triple Valve" will not surely deny that such increase must have come from the engine. It was no doubt after this increased pressure was effected from the engine that the driver, finding the pressure in the air-gauge getting too high, opened his valve for a moment to allow some of the air to escape, and that, on its being again shut, the triple valve on the carriage stuck. That the application of the brake, which was released by the guard on the ascent beyond Hornsby, was caused by a triple valve sticking is as certain as that the fireman had to release the brake from one of the carriages of the first division at Beecroft before the engine was able to start, and owing to the same cause. It is indeed highly probable that the carriage Chssold referred to was the same as that from which the fireman had to release the brakes at Beecroft before the driver could start from there with the first seven carriages.

With respect to "Triple Valve's" acceptance of the Board's statement regarding the size of the feed opening from the triple valve to the small reservoir, and his request that the Board should "admit that it is at least as large as the orifice in the triple valve through which the exhaust air from the brake cylinder

cylinder escapes to the atmosphere," there will be no hesitation in reciprocating his generosity; but evidently he cannot or will not see that when a brake is on there must necessarily be a high pressure of air in the cylinder, and that when it is released this high pressure rushes into the atmosphere at a very much greater rate of speed than it can possibly pass through a hole even of the same size into a small vessel like a reservoir, where there is already a high pressure. Every pound requiring to be added to an already high pressure necessarily occupies very much more time than when that pressure is low, and consequently the escape of the air to the atmosphere is much more rapid than the charging of a reservoir. Indeed he admits this himself when he says that "when the brake is released, air of this pressure (60lb.) escapes from the brake cylinder at an initial velocity of 1,770 ft. per second, and the air of 75lb. pressure contained in the brake-pipe rushes into the small reservoir at an initial speed of 456 ft. per second.

Then "Triple Valve" goes on to say that "It is therefore abundantly evident that so long as the gauge showed a pressure of 75lb. when the handle was in the release position, it would be morally impossible to reduce the pressure in the small reservoirs and brake cylinders below 25lb., and even this could, only be effected by reapplying the brake as soon as the brake cylinder completed exhausting. This of course, would be equivalent to keeping the brake on the whole time, and, giving sufficient brake-power, the train would be stopped over and over again before this low pressure could be reached." He thus practically admits that it is possible to have 75lb. indicated on the air gauge while there may be only 25lb. in the carriage reservoirs, although he adds that to effect this "would be equivalent to keep the brakes on the whole time." It is needless to point out that if the brakes were kept on the whole time the train would very soon be brought to a dead stop if there was anything like 75lb. pressure in the reservoirs, but to control the train the driver would have to apply and release the brakes frequently, and of course every such application would reduce the pressure in his auxiliary reservoirs.

In the concluding paragraph of his letter of the 13th instant, "Triple Valve" states that "the remarks of the Board as to the practice of the drivers descending the mountains when they have reason to fear that their controlling power is becoming exhausted only apply to cases in which the air-gauge shows a low pressure each time the handle is placed in the release position, and he is confident it has never been resorted to at any time when the gauge showed a pressure of 75lb." Now, notwithstanding his qualifying remarks, here is a tacid admission that auxiliary reservoirs can be exhausted; therefore it is really of no importance whether the gauge shows a low pressure or not each time the handle is placed in the release position, although we contend that when the valve is placed in the release position the gauge may indicate a high pressure in the main pipe while there is only a low pressure in the reservoirs. The Board's contention was that the carriage reservoirs can be practically exhausted, and their firm belief is that such was the case on the train which met with the accident.

With respect to "Triple Valve's" letter, which appeared in yesterday's issue of the *Daily Telegraph* there is but little to say.

The Board will not, of course, be expected to deal in any way with his comments upon the evidence given by Professor Warren at the coroner's inquest; and in reply to the quotations from fireman Pyc's evidence, which are admittedly taken from an evening newspaper, we have only to say that the point at issue was fully dealt with in a previous report, in which we quoted this witness' evidence as we have quoted the evidence of all other witnesses to which we have referred, not from any newspaper, but from the Coroner's depositions, which, being the only legal documents, are undoubtedly the most reliable.

"Triple Valve" expresses regret that the Board "have not emulated that candour for which they give him credit by unreservedly withdrawing their accusation that his statement was a pure invention." The Board equally regret that they cannot withdraw the charge, for it is true, although "Triple Valve" has disingenuously left out of his last communication the assertion he made in his letter of July 29 that the brake handle was placed in the release position "in order to recharge the small reservoirs." Of course, the Board know that if the brakes were taken off at any time the handle must have been placed in the release position, but they positively dispute that it was placed in that position for the purpose of recharging the small reservoirs. If such a course had suggested itself to and been adopted by the driver, in all probability it would have prevented the accident.

As regards the Board's interpretation of the expression made use of by the American locomotive engineer, to whom reference has been made, "Triple Valve" states that "if recharging means, as it obviously does, a restoration of the original pressure, it would appear to the ordinary intellect that the operation could be repeated *ad infinitum* as long as the source of supply remained unimpaired." So it would, no doubt, but he evidently does not see this difference, that when a train is running on a practically level road the brakes are very much longer off than on, consequently there is so much more opportunity of keeping a high pressure in the carriage reservoirs; but when the train is descending a gradient, and particularly a long and steep gradient, precisely the converse is the case, for the brakes are necessarily more on than off for the purpose of keeping the train under control, and there is therefore but little opportunity of recharging the reservoirs, hence the frequent application of the driver's valve exhausts the air at a much greater rate than the donkey engine can maintain the supply. This will be very apparent when we remind "Triple Valve" that, according to his own admission, air escapes from the cylinder at about four times the velocity that it passes from the brake-pipe into the auxiliary reservoir. And this writer makes much of the fact that the donkey was found working after it fell into the water. So it was, but the man who went into the water and shut off the steam informed the Board that it was just moving. This fully accords with the Board's opinion that after easing the steam to the donkey (*see* fireman's evidence) before topping the hill, the driver did not afterwards increase the steam pressure again.

Then it is said by "Triple Valve" that "it may be fairly assumed that running the $3\frac{1}{2}$ miles from the top of the incline to where the train got beyond control did not occupy more than about $8\frac{1}{2}$ minutes, as a speed of 25 miles an hour would be attained within 200 yards after turning the hill, and thus after working the brake in such a manner as to practically keep it on almost the whole time there was still left in the reservoirs a fairly effective pressure." That gentleman's statement would be perfectly right if the speed of the train was not checked at all after running over the top of the hill, but unfortunately for his argument every witness says it was under control for at least 3 miles after beginning the descent. What kept it under control for those 3 miles if the air-brakes did not? Certainly the engine and tender brakes alone could not have done it unless the speed was kept very low, and we have it in evidence that the guard did not put on the car brake until the train was between the first and second tunnels, and it was not until after passing through the second tunnel that the driver found the train had got away from him.

And

And since "Triple Valve" persists in saying that he "did not state at any time that air stored in one carriage would find its way into the reservoir of another, or that air passing from one reservoir to another would put any brakes on," we feel compelled to quote his own words, so that the two statements can be compared: "When the train was recoupled at Hornsby, the air pressure stored in the then fourth and fifth carriages would endeavour to rush into the empty reservoir of what had originally been the last, but was now the second vehicle of the train, and this, of course, would apply the brakes on the first-mentioned carriages." Comment is unnecessary.

Now, however, that he has seen the difficulty he is in, he wishes to make out that what he did "state in effect was that if a carriage containing air in the small reservoir and brake-pipe were coupled to a carriage containing no air, and the taps opened, the triple valve on the first carriage would be forced down, and the brake applied on that carriage through the action of the air in endeavouring to rush into the empty space." Not a word was said in his previous communications about air being stored in the brake-pipe; indeed, "Triple Valve" made much of the evidence of the officer in charge at Hornsby, where he stated that he had no recollection of shutting the tap after uncoupling the first division of the train from the engine. Whether he shut it or not, the pressure in the main pipe must of necessity have been much lower (if it was not quite at zero) than the pressure in the reservoirs, otherwise the brakes would not have gone on; still the coupling of any other vehicles to those standing at Hornsby could have no effect whatever as regards air pressure passing between reservoirs or cylinders of separate vehicles.

There is just one more remark in "Triple Valve's" last letter to which we think it at all necessary to draw attention, and it runs thus:—"I am quite prepared to admit that there may be more cases of triple valves sticking than are reported, but in the cases referred to by the Board when the brake has to be taken off at stations by opening the release valve at the back end of the brake cylinder, it is caused ninety-nine times out of 100, not by the triple valves sticking, but by the pressure in the brake-pipe being lower than that in the small reservoir."

This is an absurd statement, and the best way to show its absurdity will be to take a case in point. Assuming that the pressure in the main pipe and the auxiliary reservoirs to be 60lb., we know that there must be 70lb. in the main reservoir, since the spring in the driver's valve is equal to a pressure of 10lb. With the pressure in this condition all the brakes are off, and to put them on the pressure in the main pipe must be reduced below that in the auxiliary reservoirs, so that the triple valve may fall. When this happens the air in the auxiliary reservoirs expands into the brake cylinders, thus reducing the pressure in the reservoirs by something like 20 per cent., according to the stroke of the piston, while to take the brakes off again the 70lb. air pressure (which, with the donkey working, has meantime been increasing) contained in the main reservoir is admitted into the brake-pipe. In the face of this, how can it be that in ninety-nine cases out of 100 the sticking of the triple valve is due to the pressure in the main pipe being lower than in the small reservoir? And why does it invariably happen that only one or, at the most, two triple valves stick out of a whole train of carriages? If "Triple Valve" wants us to believe that the sticking of the valve beyond Hornsby was due to the cause assigned by him it would be interesting to know why none of the others stuck as well.

And now for a few words in reply to our other critic. Undeterred by the experience he certainly ought to have gained by the exposure we have had to make of his previous inaccuracies, he has again been unwise enough to write statements even more reckless and absurd than formerly, and although we would fain be spared the thankless task, we deem it to be our duty to draw attention to every mis-statement which he has made, calculated, as each one has been, to deceive the public. For instance, he writes that "it is rather difficult to state definitely whether the Assistant Traffic Manager should be classed with the Board. We would gladly rescue him, if possible. His evidence at the Coroner's Court was a remarkable anticipation of the Board's report. There he professed a knowledge of the working of the Westinghouse brake. His theory, heard for the first time at the inquest, was "that the driver, by an injudicious manipulation of the brake, had not sufficient air to put the brakes on when he got on to the heavy down grade."

Now, this, we must say, looks remarkably like an unworthy insinuation that Mr. Kirkcaldie's evidence at the Coroner's inquest was given for the purpose of forecasting the Board's report, whereas, if our critic will refer to the *Daily Telegraph* of June 22, he will find it reported that Mr. Kirkcaldie was interviewed by a representative of that paper while returning from the scene of the accident, a few hours after it occurred; and although the account of what he said is somewhat garbled and contradictory, which is not perhaps to be wondered at, considering that the reporter was dealing with a subject which must have been strange to him, Mr. Kirkcaldie is nevertheless reported to have said: "The only surmise I have been able to form on the subject is that possibly the driver may have been a little late in applying the brake, and in his attempts to put it on subsequently may have allowed the air to escape. Every time the lever is moved there is more or less escape of air, and if this were done too often there would not be enough to work the brake, and he would not be able to make pressure fast enough to control the train." And this was precisely the nature of the evidence he gave at the inquest, having in the interim taken means to test the accuracy of his previous statement. At that time the Board had not even been appointed, consequently Mr. Kirkcaldie could not by any chance have anticipated its report.

And perhaps when we have said this our critic will admit that we have disposed of his other assertion that Mr. Kirkcaldie's theory was "heard for the first time at the inquest"; if, however, he is even yet unconvinced, we would again refer him to the *Daily Telegraph* of June 27, which contains an admission of the exhaustion theory which that paper alleges to have been made by the representative of the Westinghouse Brake Company. Then we are told that Mr. Kirkcaldie was asked the following questions by Dr. Sly:—1. "How do you or how can you account for there being no air in the reservoir at Peat's Ferry?" 2. "How could the air be exhausted?" Now, although it is not of much importance, these questions were not put by Dr. Sly, but by Mr. Rogers; but Mr. Kirkcaldie's replies were diametrically opposed to those now imputed to him by the *Daily Telegraph*. For the purpose of comparison we give side by side the answers imputed to him and those actually copied from the depositions:—

According to the Daily Telegraph writer—

- (1.) I can't account for it; there is only one theory—that the air was exhausted going up the bank.
- (2.) By too frequent use of the brakes to stop the train.

Copied from depositions—

I cannot account for the absence of the air from the reservoirs at Peat's Ferry, only on the one theory—that it had become exhausted in going down the bank.

It could have become exhausted by a too frequent use of the driver's brake valve while he would be endeavouring to check the train, not to stop it.

And our critic's assertion that Mr. Kirkcaldie afterwards admitted that "if the driver attempted to use the brake going up the bank the train would have been brought to a standstill" will not be found in his evidence at all. If the *Daily Telegraph* is so anxious to get at the true cause of the accident, as it has several times professed to be, what can be its object in misrepresenting matters in this way? Strangely enough, every misrepresentation has been in favour of its own theory, and consequently opposed to that of the Board.

With regard to the exhaustion tests which were made under Mr. Kirkcaldie's observation, our critic says that "Mr. Kirkcaldie's object was to see how much the pressure could be brought down by six manipulations of the valve, while Wilson's was to stop the train"; but it may be said that the tests which Mr. Kirkcaldie saw were made for the purpose of demonstrating whether it was possible or impossible for the auxiliary reservoirs to be exhausted on the descent towards Peat's Ferry, and those tests proved that it was not only possible but probable unless the air was judiciously used; he certainly had no idea of trying "to see how much the pressure could be brought down by six manipulations of the valve." Although that number was quite sufficient to show how readily the air could become exhausted; and Wilson's object was not to stop the train until it got to Peat's Ferry, but simply to keep it under control, which, after running about half way down the gradient, he was unable to do.

The withholding or publication of the evidence taken at the departmental inquiry does not rest with the Board, but the *Daily Telegraph* might have been generous enough to respect the reason given in our last report for its being withheld, as probably it would, under other circumstances, have been the first to condemn its publication. And here, for the very same reason, we may also state in reply to the assertion of the *Daily Telegraph* about the Board being "convinced that the coroner's jury gave a verdict against evidence," that as the coroner's evidence is being analysed by an expert, this is neither the time nor the place to refer to the verdict of the jury.

If the jury had expressed the slightest wish to see the exhaustion theory demonstrated their wish would have been unhesitatingly gratified, but the Board would certainly not think of recommending any test to be made for the satisfaction of any person who has shown such a decided prejudice as the *Daily Telegraph* writer. We said before, and we repeat again, that if our critic is not satisfied with the coronial evidence, and with the assurance of the Board on the subject, let him refer to the statement of the representative of the Westinghouse Brake Company, in the *Daily Telegraph* of June 27, which reads:— "It is said that the train was examined and found to be in good order before it started. If that was so the air could only have been prevented from acting by the driver totally exhausting his air, or rather allowing it to exhaust itself, or the connections between the carriages being wrongly coupled."

When a voluntary statement of this kind comes from such a quarter, it looks remarkably like presumption on the part of a newspaper writer to say that the exhaustion theory is an impossible theory.

And now let us, in conclusion, recapitulate briefly the various points upon which the Board based its opinions:—

1. The evidence of the three men who proved most conclusively that immediately before the train left Sydney the air was properly connected from the engine to the rearmost vehicle. The strongest proof that the brake was put hard on upon this vehicle is that the man who was hand-braking the first seven carriages into the station had the wheels twisted out of his hand by the application of the air.
2. The evidence of the fireman that before the train was divided at Beecroft the driver applied the air-brake upon the train.
3. The statements of three other witnesses that the brakes were left hard on upon the two carriages left behind at Beecroft, and found hard on when the engine returned for them.
4. The evidence of the officer in charge at Hornsby that when he uncoupled the first division of the train from the engine there he left the brakes hard on; he tapped one with a sprag, and found it was on.
5. The evidence of one witness who was in the last of the two carriages which constituted the second division from Beecroft, that he distinctly felt the action of the Westinghouse brake on that carriage as the train drew up at Hornsby. [This evidence was taken by the Board, but was not elicited at the Coroner's inquest.]
6. The evidence of two witnesses that when the two divisions of the train were recoupled at Hornsby they heard the air pass through the pipe.
7. The positive assurance of Mr. Garrard, M.P., as to the action of the Westinghouse brake upon the carriage he was in (then the second from the engine) after commencing the descent towards Peat's Ferry.
8. The fact that all the taps and air connections were found respectively open and continuous, with the solitary exception of the one tap under the only carriage which telescoped (the one near the engine), and which could not possibly have been found in any other than a closed position under the circumstances.
9. The fact that all the brake-blocks were found to be perfectly loose immediately after the accident, notwithstanding the severance of the air-pipe between the first and second carriages.

Now if we are to accept the statement that the tap found shut under the carriage next the engine on the day after the accident was in reality shut before, and is the explanation of the accident, we must, notwithstanding the evidence indicates strongly the contrary, first assume that the whole of the brakes had leaked off before the train left Hornsby, and next must entirely discredit the whole evidence referred to in paragraphs Nos. 1, 2, 3, 5, 6, and 7; and then, supposing these insuperable difficulties surmounted, what has been gained; we have no adequate explanation after all; for, as stated in previous reports, there were 48 tons of brake-force on the engine, tender, and two first carriages, while 43·146 tons were sufficient to stop the train which met with the accident in 400 yards when running down the incline at 25 miles per hour (and it ought never to have been allowed to exceed that speed) on a descending grade of 1 in 40. Yet it was on a gradient of 1 in 50 that it got beyond control, so that it could have been stopped by much less brake force.

The Board is equally satisfied with the *Daily Telegraph* that this subject has been sufficiently ventilated, and they will not therefore consider it necessary to take notice of any further communication which may appear.

August 25.

D. VERNON, Chairman.

[From the *Daily Telegraph*, Saturday, September 10, 1887.]

THE PEAT'S FERRY ACCIDENT.

UNDER cover of a reply to an article appearing in our columns on Tuesday relating to the results of the recent trials which have been made by the Railway Board, Mr. Kirkcaldie is able, in the letter which appears below, to give his version of the results obtained. He states that there were not four trials, but only two. Well, we have Mr. Adams' admission that he attended what appears to us equivalent to a third trial, and we have reason to believe that at least one other of the same character has taken place. Of course if Mr. Kirkcaldie considers nothing less than exhausting the air in the manner pursued by Mr. Laughry a trial, then there were probably only two. Perhaps it was on account of the application received from the representative of the Westinghouse brake for permission to attend the trials that the representative of the vacuum brake did not accompany the Board when the alleged results were obtained.

As to the results of the trial we have two versions. Perhaps it would be better not to accept either until these trials are conducted in a way which will enable us to arrive at the truth.

We readily accept Mr. Kirkcaldie's denial that he worked the brake. It may be that our informant is confounding what occurred some time back with that which happened a few days ago. Evidently the strongest point of Mr. Kirkcaldie's letter is this: that if the statements were true that the blocks were blue with heat after the Board's trial, but were quite cool after the accident (which Mr. Kirkcaldie admits), it would prove:—"Simply that when the tests were made the air was operating satisfactorily, causing the blocks to grip the wheels; while on the day of the accident it was not, because if it was not absolutely exhausted it was sufficiently so to make the brakes inoperative." How many times is it necessary for us to say that they were cool because the blocks had not operated on the wheels at all? Mr. Kirkcaldie does not deny our assertion that Mr. Laughry deliberately worked the brake to exhaust the air. Nor does he state that the wheels were cool, although he says they were not "blue" with heat. Surely the inference is that for the same result Wilson must have used the same means, then how were the blocks cool after the accident? The seconds occupied in running down the grade after the brakes became inoperative would not be sufficient to cool them.

The most important points of our article Mr. Kirkcaldie does not deny or otherwise deal with. That the piston stroke was 7in. on Saturday and 8in. on Wednesday is not denied. How remarkable that the Board should have used the maximum stroke. If the authorized stroke is from 4in. to 8in., common fairness should have caused the Board to use not more than a 6in. stroke, seeing that the quantity of air used at each application is regulated by its length.

Then we take it for granted that the representative of the Westinghouse brake was not allowed to attend the trials; that the representations of the engineer who examined the train used for the trials declared that it was equipped as if to obtain the worst possible results were also totally ignored.

And above all, Mr. Kirkcaldie does not deny that in exhausting the air Mr. Laughry used 12 or 14 full rapid applications—that in so doing he worked the brake as is absolutely unnecessary under any circumstances, and as is never done in any part of the world—in a manner foreign to every engine-driver in New South Wales—that as soon as he found the air recouping itself he would change the position of the valve, and that he made 12 or 14 of these nicely-timed applications. We are prepared to admit that as no mechanical invention is infallible so the air of the Westinghouse brake can be thus exhausted, but as Mr. Laughry, the Board, and Mr. Kirkcaldie himself all well know, such an action in the running of a train would be maniacal.

Letter from Assistant Traffic Manager.

To the Editor of the *Daily Telegraph*.

Sir,—Although my name has been somewhat freely made use of in your columns recently, in writing on this subject, I have not hitherto considered it necessary to take notice of any of the comments that have been made, but for pure invention the contribution in your issue of to-day so thoroughly eclipses all its predecessors that I must ask your indulgence, while I put your correspondent right, if, indeed, it is possible to put him right.

It is not the case that four trials have taken place with running trains. Only two have been made, one on Wednesday and the other on Saturday last, and in each case on the Hawkesbury line, about one-third the length of the one on which the train ran away, and in neither did the representative of any brake accompany the train.

Although there still remained plenty of air in the main reservoir on both occasions, that in the auxiliary reservoir was readily and completely exhausted in about one-third of the time and distance that the train was kept under proper control when descending the gradient towards Peat's Ferry on the day of the accident.

The statement that I manipulated the brake valve on either trial is a pure fabrication, for until yesterday afternoon I had not even been on an engine for a couple of months, but I was in the train on each occasion, and can positively assert that there is not a vestige of truth in the assertion that "the brake had a playful habit of stopping the train so suddenly as to render it quite impossible for the members of the Board to maintain a dignified equilibrium, while sitting could not be continued with any degree of comfort." On the contrary, those who were in the train did not feel the application or release of the brake one iota more than they do under ordinary circumstances when manipulated by the most experienced drivers.

The statement has been very persistently put forward by the *Daily Telegraph*, and recently by the local agent for the Westinghouse Brake Company, that it is impossible under any circumstances to exhaust the auxiliary reservoirs in the time required to run from the top of the hill beyond Hornsby to the second tunnel where the train got away—a distance of about three and a half miles. Every trial that has been made, both standing and running, has demonstrated the absurdity of such a statement.

Nor was this the only test that was made. On both the running trials it was very clearly established that the air brakes on the tender and one vehicle next to it were amply sufficient to control a train of the same weight and running at a speed of over 30 miles an hour on a gradient of precisely the same character as that on which the train ran away on June 21; and even the hand-brake on the engine was not made use of except when the train was brought to a deadstop on a grade of 1 in 40. What,

What, then, becomes of the "shut-tap" theory, seeing that the only shut tap found on the ill-fated train was on the rear of the vehicle next the engine (which, by the way, was upwards of a ton heavier than the one made use of in the tests), and that the hand-brake of a second vehicle was put on between the first and second tunnels and kept hard on?

It is equally untrue that "the brake-blocks were blue with heat after the Board trial," although it is quite right to say that they "were quite cool after the accident."

But, even if both assertions were true, what would they prove? Simply that when the tests were made the air was operating satisfactorily, causing the blocks to grip the wheels; while on the day of the accident it was not, because, if it was not absolutely exhausted it was sufficiently so to make the brakes inoperative.

And, as regards the stroke of the pistons, it is not correct to say that the usual length is from 3in. to 5in.; the Westinghouse Brake Company's own rules specify that the stroke should not be less than 6in. nor more than 8in.; and I am in a position to say that while in none of the vehicles used at the tests were the strokes more than 8in., in every or almost every cylinder it was less.

September 6.

Yours, &c.,
DAVID KIRKCALDIE.

No. 21.

Minute by The Secretary of Railways forwarding particulars of trials of brakes.

Peat's Ferry Accident.

SINCE the report of the Board was submitted there has been, as the Commission is aware, a great display of opposition on the part of the *Daily Telegraph* newspaper and the Westinghouse Brake Company, to the Board's conclusion that the failure of the brake power arose from the fact of the auxiliary reservoirs having been allowed to become practically exhausted.

It has been repeatedly stated that such a thing could not possibly be effected, and the Board have been frequently challenged to prove their case by a practical trial. Seeing, however, the Board had already made known the fact of their having satisfied themselves, by practical tests, of the feasibility of their theory; and, in addition to this, had pointed to the experience of some of our own drivers, and to the undeniable and clear testimony from railway authorities and practice in other countries in confirmation of it, I have been able to see no good reason for recommending the Commissioner to comply with our opponent's unreasonable and reiterated challenge. Apart from this, no good purpose whatever was to be gained by responding to their request, for it must be evident to all parties that it would be impossible to reproduce exactly similar conditions to those which led up to the accident, and any practical trial, to be of value, must be made under conditions approximating as closely as possible to those under which, it may be imagined, the accident occurred. It is perfectly certain that our opponents would never agree with the Board as to what these conditions may have been, and nothing therefore but further dispute and dissatisfaction could result from any attempt to comply with their desire.

In arriving at their conclusions the Board had to be guided by the evidence forthcoming at their inquiry, and any person who will fully and impartially weigh this evidence, will find that it affords no adequate support for any other conclusion than the one come to by the Board. Our opponent's contention that the air reservoirs of the Westinghouse brake cannot be exhausted under any conditions is demonstrably mistaken, and sufficient evidence has already been afforded them in this respect, although they have chosen persistently to ignore it. For the reasons already explained I would strongly advise the Commissioner to make no further concession in regard to practical trials, and, for the same reasons, it would not be of the slightest use to furnish particulars of any experiments which have been made already.

It may be as well, however, to put on record the particulars of some trials which have taken place, and with this object I have requested Mr. Laughry to let me have a report of what has been done since the inquest. This report I will attach as soon as it is to hand. From my own observation I am perfectly satisfied that the drivers on our steep inclines have long ago discovered the necessity for guarding against the exhaustion of their air, and this they do by working up an abnormal pressure and using the engine hand-brakes vigorously. Instead of working at a maximum 60 lb. per square inch, I have noticed they run it up to 90 and 100, and use the engine hand-brakes as well, so that, as a matter of fact, on the steep inclines, we find the Westinghouse brake is not depended upon to do the work by itself, and the Department has still to bear the expense of the wear and tear caused by the use of engine hand-brakes.

It must also be borne in mind that this very high pressure is likely to burst the hose-pipe connections; and if a train became suddenly pulled up from such a cause, and was run into by a following one before everything was made right, the Department would be reflected upon by the public, and the Brake Company, for working at a pressure so much above the prescribed maximum. At the same time I am satisfied that the danger of exhausting their air is practically so well known and recognized that it is questionable whether a driver could be found who would undertake to run a train down from Katoomba at anything like an even rate of speed with the stipulation that his pressure was not to exceed 60 lb. at any time, and the use of his engine brakes to be prohibited.

There is a special feature in connection with the Peat's Ferry train and accident which has not been sufficiently borne in mind by those who have argued in favour of the impossibility of the exhaustion theory, and it is this: that the train ran at a high and increasing rate of speed from the top of the incline to the spot at which the brake was discovered to be inoperative, a distance of $4\frac{1}{2}$ miles, and that during the whole of this time the speed of the train had been more or less under the control of the brake, but without any intention on the part of the driver of stopping the train, or doing more than keep it from what appeared to the driver as a dangerous rate of speed. It is precisely under such conditions that the danger of exhaustion becomes imminent, and requires to be guarded against.

One other remark before I conclude. The *Daily Telegraph* newspaper has made a most unworthy bid for the sympathy of those he terms the "living drivers," by announcing his desire and intention to defend the character of the "poor dead driver" from the unjust and un-English treatment, he would imply, it has met with at the hands of the Board. I have only to say that of the two theories that put forward and upheld by the editor would reflect, if true, more severely on the memory and character of the brave man who went to his death without flinching than does the theory of the Board of Inquiry. In the latter case it amounts to no more than an error of judgment; in the former to an act of careless neglect.

D. VERNON, 7/9/87.

Report received from Mr. Laughry, and forwarded herewith.—8/9/87.

No. 22.

No. 22.

Mr. Laughry's Report.

Government Railway, Locomotive Engineer's Branch, Redfern Station,
8 September, 1887.

I BEG to report having fitted compo. carriage No. 10 with four pressure gauges for the purpose of showing the pressures carried in the various parts of the Westinghouse brake apparatus in ordinary working. One of the gauges connects with the main reservoir on the engine, another with the main train pipe, a third with the carriage reservoir, and the fourth with the carriage brake cylinder.

On Monday, the 29th August, this carriage was run attached to the up tourist train from Katoomba to Sydney. The train consisted of equal to ten four-wheeled vehicles, and was driven by Driver Bradley (engine 373), who, beyond being aware that a record was to be taken of the brake action, had no special instructions whatever as to how the brakes should be worked.

A record of the pressure shown on each gauge was taken every thirty seconds from the time the train left Katoomba until it arrived at Emu Plains. These records show that while descending the mountains the main reservoir pressure rose to over 100 lb. on twenty-two occasions, and was on one occasion as high as 124 lb.

The main-pipe pressure rose over 80 lb. on fourteen occasions, and was as high as 100 lb. on one occasion.

The carriage-reservoir pressure rose over 80 lb. on fourteen occasions, being as high as 90 lb. on four occasions.

The records also show that when running between Wentworth Falls and Lawson the carriage-reservoir pressure was reduced from 70 lb. to 52 lb. in four minutes, this without a stoppage, and with 100 lb. pressure in the main reservoir.

An examination of the tyres at Penrith showed that the engine and tender tyres were the hottest throughout the train, with the exception of those on one six-wheeled vehicle, the brake of which must have been dragging for some distance. It would appear from this that the engine and tender hand-brakes were freely used in controlling the speed of the train down the mountains.

The air-pump in use was new and in splendid working order; the air-brakes when applied were handled in a most skilful manner.

I would specially direct attention to the extraordinary high pressure of air carried, also to the use of the engine hand-brakes for controlling the train when the train brakes were available for that purpose, thus bringing wear on to the engine tyres which properly should be transferred to those of the train.

The practice of using the engine hand-brakes for controlling passenger trains in descending the mountains is, I believe, very general, and is no doubt done for the purpose of saving the air.

On Wednesday, the 31st August, a trial was made with a special train, fitted with the Westinghouse brake, on a falling grade between Thornleigh and Ryde (Hawkesbury line), for the purpose of ascertaining to what extent the auxiliary reservoirs need be exhausted before losing control of the speed. [See attached diagrams of air pressure and section of road over which the trials were made.]

The train consisted of engine No. 166, five American cars, and brake van, the air connections on the latter vehicle being disconnected during the trials. Following are the particulars of the train and brakes:—

Particulars of Air-brake on Engine and Tender.

Size of Air-pump.		Tender Reservoir.		Size of Brake Cylinder.	Stroke of Piston.
Steam Cylinder.	Air Cylinder.	Size.	Capacity.		
Inches. 6 × 9	Inches. 6½ × 9	Inches. 29½ × 11½	Cub. in. 3,063·8	Inches. 10 × 12	Inches. 7¼

Particulars of Train and Brakes.

Carriages.		Size of Reservoirs.		Size of Brake Cylinders.	Stroke of Piston.
Number.	Weight.	Size.	Capacity.		
	Tons cwt. qrs.	Inches.	Cub. in.	Inches.	Inches.
119. 2nd-class car	16 2 0	22½ × 11½	2,336·8	10 × 12	7¼
103. "	16 2 0	29½ × 11½	3,063·8	10 × 12	8
60. Composite car	16 10 0	29½ × 11½	3,063·8	10 × 12	8
65. 1st-class car	16 10 3	22½ × 11½	2,336·8	10 × 12	8
68. "	16 10 3	22½ × 11½	2,336·8	10 × 12	8
82. Brake-van	8 5 0		Not connected with air.		

On the first trial the pump was kept working with a full head of steam, and starting with a pressure of 66½ lb. in the auxiliary reservoirs the train approached the descent at a speed of about 30 miles per hour, which speed was maintained as near as possible (by ten to twelve partial applications of the brake) for a distance of 1½ miles, at which point the brake was applied fully and remained on, but had not sufficient force to keep the speed of the train from increasing.

A few seconds later, finding the speed had increased to about 40 miles per hour, the hand-brakes, which were fully manned, were called for and the train brought to a standstill. Diagram No. 1, dated August 31st, shows the reduction of pressure in the reservoir of the fifth carriage from the engine, as indicated by a self-recording instrument on this trial.

A second trial was then made over the same section of road, and with the same object. This time the pump was worked at half speed. Starting with a pressure of 66 lb. in the train reservoirs, the descent was approached at about the same speed as on the first trial. As before, the brakes were partially applied and released ten or twelve times in a distance of 1 mile 30 chains, and in a period of two and a half minutes. At this junction the air-brake was applied fully and remained on, but, as on the first trial, had not sufficient force to keep the speed from increasing. After the speed had increased to about 40 miles per hour the hand-brakes were again resorted to, and the train brought to a standstill.

Appendix H.

Diagram No. 2, dated 31st August, shows a reduction of pressure in the carriage reservoirs on this trial.

The train was then run to Peat's Ferry, the driver having no special instructions as to how the brakes should be worked. At the top of the incline leading to Peat's Ferry the indicator showed 79 lb. of air in the train reservoirs, which pressure had fallen to 53 lb. by the time the train arrived at the Ferry.

In making the descent the brakes were applied and released from twelve to fourteen times.

On returning to Sydney a third trial was made, while descending the incline between Thornleigh and Ryde, this time for the purpose of ascertaining what could be done in the way of controlling the train with the tap closed at the rear end of the first carriage from the engine. The train on this occasion consisted of five cars, two loaded goods trucks, and brake-van, weighing in all 108 tons, and was controlled without any trouble to the foot of the incline by the use of the air-brake on the tender and one carriage, with a little assistance from the engine hand-brake. The speed averaged from 15 to 18 miles per hour.

On Saturday last, the 3rd instant, further trials were made with a special train over the same section of road, and with the same object as on the Wednesday.

The train on this occasion consisted of engine No. 166, six American cars, and one four-wheeled carriage. Two of the cars were not connected with air during the trials. The following are the particulars of the train and brakes:—

Carriages.		Reservoirs.		Size of Brake Cylinders.	Stroke of Piston.
Number.	Weight.	Size.	Capacity.		
	Tons cwt. qrs.	Inches.	Cub. in.	Inches.	Inches.
191. 2nd-class car	16 10 0	22½ × 11½	2,336·8	10 × 12	7½
40. 1st-class car	16 10 3	29½ × 11½	3,063·8	10 × 12	7¾
65. Composite car	16 10 0	29½ × 11½	3,063·8	10 × 12	7½
63. 1st-class car	16 10 0	22½ × 11½	2,336·8	10 × 12	7¼
2 cars	33 0 0		Air-brake not connected.		
10. Composite (4 wheels)	6 5 0	9½ × 20½	1,453	8 × 12	6½

Since received
Appendix I.

Three trials were made, and the results obtained were practically the same as those obtained on the previous Wednesday. The diagrams of air-pressure, time, and distances taken on these trials are not yet completed. It is worthy of note, however, that, on the third trial, viz., with the tap shut between the first and second vehicles the train descended the incline at a speed of about 25 miles per hour, and was kept under perfect control by the use of the air-brake on the tender and one carriage alone; also was brought to a standstill from that speed on the 1 in 40 grade by adding the engine hand-brakes. The train on this trial weighed 89 tons.

E. A. LAUGHRY.

Loco. Engineer,—

Sir,

Loco. Engineer's Office, Sydney, 7 September, 1887.

I beg to report that yesterday afternoon several experiments were made with the Westinghouse brake on a standing train, consisting of an engine and five large carriages.

Following are the particulars of brakes on engine and train; also results obtained:—

PARTICULARS of Air-brake on No. 166 Engine:—

Size of Air Pumps.		Tender Reservoir.		Size of Brake Cylinder.	Stroke of Piston.
Steam Cylinder.	Air Cylinder.	Size.	Capacity.		
Inches. 6 × 9	Inches. 6½ × 9	Inches. 29½ × 11½	Cubic inches, 3063·8	Inches. 10 × 12	Inches. 7¼

PARTICULARS of Air-brake on Carriages:—

Carriages.		Reservoirs.		Size of Cylinder.	Stroke of Pistons.
Number.	Weight.	Size.	Capacity.		
	Tons cwt. qrs.	Inches.	Cubic in.	Inches.	Average stroke, 6 inches.
83. composite carriages	16 10 0	22½ × 11½	2336·8	10 × 12	
107. 2nd class ,,	16 2 0	29½ × 11½	3063·8	10 × 12	
49. 1st ,, ,,	13 12 0	29½ × 11½	3063·8	10 × 12	
113. 2nd ,, ,,	16 2 0	29½ × 11½	3063·8	10 × 12	
207. 2nd ,, ,, (Redfern type)	16 3 3	22½ × 11½	2336·8	10 × 12	

135

EXPERIMENT No. 1 & 2.

TIME required to charge the train reservoirs up to a pressure of 60 lb.; commencing with a pressure of 75 lb. in the main reservoir and pump working, with full head of steam (135 lb.)

Number of Carriage.	Time.	
	With Driver's Valve in Feed Position.	With Driver's Valve in Release Position.
	Mins. secs.	Mins. secs.
83	4 27	3 13

207	45	41	39	34	30	26	22	20½	19	18	17

Pressure in main reservoir, as indicated by the driver's gauge, between the tenth and eleventh application of the brake, 60 lb.

E. A. LAUGHRY.

No. 23.

Excerpts from *Daily Telegraph* asserting the impossibility of air being exhausted from the auxiliary reservoirs while the gauge-glass shows air in the main pipe.

23RD July, 1887.—The Westinghouse brake cannot be made to act in that way, even if placed in the hands of a raving maniac. It is perfectly true that it can be applied constantly, but it cannot be released under eight seconds. A driver or madman can turn back the valve-handle as often as he likes, but eight seconds must elapse before the brakes are off. How many times could the brakes have been released while the train was rushing through the third tunnel, the distance of which is 140 yards? The act of turning the brakes on and off so vividly portrayed would only mean keeping them tightly on all the time.

We venture to think that the more the air-exhausting theory of the Board is analysed the greater will appear its absurdity. It is unsupported in evidence; it can be undeniably destroyed by experiment.

Fit up a train composed of these carriages and two others to correspond with those destroyed, and try the air-exhausting theory on a down grade followed by a corresponding up grade, where no possible accident can result; or if accident is feared, have a train abundantly supplied with hand-brakes, to be used in case of emergency. Ascertain in this practical way how the air can be wasted by unskilful manipulation of the brake valve, or how quickly the train can be brought to a standstill. If the grade is not heavy enough to keep on steam, the challenge is made; it can be carried out without risk. Query: Will it be accepted?

6th August, 1887.—Let this Board nurse their pet but impossible scheme as long as they please, it will have no weight whatever in the public mind. Already we have good reason to believe its impossibility on a grade of this length has been clearly proved. Will the Board be surprised to learn that a number of engine-drivers have tried the "injudicious manipulation" theory with one result—that it is impossible.

We have submitted that the force of the Westinghouse brake cannot possibly be exhausted or brought down to an inoperative pressure in a grade as continuous as that at Peat's Ferry with the donkey working. Try it. Will the Board remain discreetly silent?

17th August, 1887.—If the Board thoroughly believe in their theory, why not try to exhaust the air of the Westinghouse brake on a running train? We have claimed that it is impossible in the time and distance in which it is alleged to have occurred.

29th August, 1887.—Mr. Granlund writes in our columns this morning that "the representatives of the Westinghouse Brake Company never thought the exhaustion theory worthy of consideration, and now, when, after numerous trials, all attempts to establish the theory by practical tests have utterly failed, and have been given up by the Department in despair, it is less worthy of consideration than ever." This may be the mere "bluff" of a man whose machine has been discredited by an official board of inquiry, and who is determined to fight, or it may be the outspoken criticism of a man whose machine is in use on hundreds of railways, and who is convinced that the official theory as to the cause of the Peat's Ferry accident is an absurd and unjust one. After all, what the public are waiting for is the practical tests in support of the Board's theory. Over and over again we have challenged them to accept the risk of actual experiment. We are willing to expose ourselves to all the humiliation of defeat. Surely the Board should show the courage of their convictions.

See Reports. Air exhausted without any difficulty. Theory of the Board thoroughly established.—CHAS. A. G.

No. 24.

Letter from Mr. Driver Moore to The Commissioner for Railways, with marginal notes by Secretary.

Sir, Sydney, 24 July, 1887.

My object in addressing you is to assist, as far as I possibly can, in elucidating the real cause of the late Hawkesbury calamity, and in venturing to lay my opinion concerning the same before you, trust I shall not be deemed intrusive.

1st. I respectfully desire to draw your attention to the facts (proven by evidence) that the brake power on this train was sufficient, and in good working order, until the division of the train took place at Beecroft.

2nd. On the arrival at Hornsby of the first section of the train, viz., seven carriages, Stead, the officer in charge, states that he uncoupled the engine, and, in doing so, he says he applied the brakes by letting the air out of the main pipe, thereby applying the air-brakes to the two carriages (which was all there was working in this section). In doing this the air communication between the supplementary reservoirs and the brake cylinders was direct, and it is here I wish to draw your special attention to what in my opinion actually took place at that time. The brake having been applied by the force of the air contained in the supplementary reservoirs, could only be kept on by that force, but if there was a leakage at the piston, and then the air in the cylinder would become exhausted, and the communication with the reservoir being complete, I venture the opinion that the whole of the air previously contained in this section was exhausted and the brakes released by the time the engine returned from Beecroft with the second section.

1st. I am glad to see that Mr. Moore has no doubt on this point, as indeed there can be none after the evidence given.

2nd. It is scarcely reasonable to suppose this. As for the carriages which remained behind at Beecroft, they certainly had not leaked off when engine returned, and this does not argue well for the reasonableness of the supposition as regards the others.

3rd.

3rd. We have corroborative evidence of the connections between the two sections having been properly made at Hornsby, and we also find that as the train was passing Stead (who was holding the points) that he noticed the brakes rubbing on one of the carriages. The train was also afterwards stuck up on the incline by the brakes being on one of the two front carriages, and its being released by the guard.

4th. The question now presents itself, "What caused that brake to go on?"

There is an answer, and, in my humble opinion, which I herewith respectfully submit for your consideration, it was, the air connection between the engine and that carriage was incomplete, and I now advance the following evidence in support of my opinion.

Assuming that the air had exhausted itself in the first section whilst standing at Hornsby, the two carriages left behind at Beecroft would have the ordinary pressure in them, viz., between 40 and 50 lb. (there being no evidence to show the air had been applied to them while standing at Beecroft). And on the connections between the first and second sections being made complete (engine not included) what would be the result? Answer: The pressure in the main pipe of the front section being reduced would apply the brakes to that section [this is actually what did take place]; but if the connections between the front section and the engine had been complete, this reduction would have been supplied by the extra pressure in the main reservoir of the engine, and would have released the brakes in less than half a minute.

5th. We find the train was actually stuck up some distance from Hornsby by the brake remaining on at least one vehicle in the first section, although the pressure in the driver's air-gauge had risen to 90 lb., and considering the grade on leaving Hornsby is on a slight decline, I come to the conclusion that this brake was on all the way from Hornsby, and when released by the guard, and that the train was then practically empty through the connections being incomplete.

In conclusion, I wish to state that had time permitted me to give my attention to the circumstances, I should have made my views known earlier; but this is the first day I have had to myself since the accident, and I humbly and respectfully submit my views for your consideration.—I have, &c., DAVID MOORE.

Shall we reply to Mr. Moore.—D.V., 15/8/87.

Yes; point out where the evidence contradicts this theory; and express my thanks to Mr. Moore that in a matter where we are all seeking for a true solution he should have contributed his ideas on the subject, which are certainly less demonstratively wrong than the other theory offered to that of the Board which has formed the subject of discussion.—CHAS.A.G., 15/8/87.

Sir,

Railway Branch, Sydney, 18 Aug., 1887.

In acknowledging the receipt of your letter of the 24th ultimo, on the subject of the Peat's Ferry Railway Disaster, I am directed by the Commissioner for Railways to convey his thanks to you for the contribution of your ideas on a matter of which we are all seeking the true solution.

I am also to state that although your ideas are certainly less demonstratively wrong than the other theory opposed to that of the Board, and which has proved the subject of discussion, further consideration will show that the explanation of the Board is the only one consistent with the whole of the evidence given.

I have, &c.,

A. RICHARDSON,
(For the Secretary of Railways.)

Mr. David Moore, Redfern.

Memo. by Secretary of Railway's on Driver Moore's Letter.—Driver Moore's theory of the Peat's Ferry Accident.

In his letter of the 24th ultimo, Mr. Moore communicates his opinion that the accident must have been brought about by the air connections being closed between the engine and the first carriage. I may at once say of this explanation that it would adequately account for the accident if the evidence supported it, and this is far more than can be said of Mr. Shellshear's explanation. Mr. Moore considered it proved that the brake power on the train was sufficient and in good working order until the division took place at Beecroft, and he also is of opinion evidently that the recoupling of the two divisions was properly made at Hornsby.

His theory is this: When the train was divided at Beecroft the two carriages that were left behind for a time were held by the sprag or sapling through the wheels, but their blocks were not applied, the tap at either end of them being shut. In this condition, or at any rate with either one or both taps between engine and first carriage closed, they were taken up to Hornsby and recoupled to the seven carriages which had preceded them, the connection, however, between the engine and the first carriage still being left incomplete. The pressure in the service pipe of the two being let by the process of coupling into the service pipe of the other lot of carriages would reduce the pressure and bring down the triple valves of the former, and put the blocks on their wheels; the blocks, however, did not attract notice owing to the (slightly) down grade which exists leaving Hornsby, but when the train came to mount the

3rd. Mr. Moore has no doubt about this. The evidence is perfectly clear, and he has sense enough to perceive it. So far as can be gathered, it was not, however, one of the two front ones, but must have been the fourth; Clissold's testimony is certainly not clear.

This is starting with what can only be regarded as a somewhat unreasonable assumption.

The evidence (especially the Departmental, which Mr. Moore has not seen perhaps) is very clear and decisive to the contrary.

But any pressure existing there came from engine; for the brakes were, it is clearly enough shown, released at Beecroft before starting.

Rice also swears positively that the air-brake was applied by driver to the last of the two just before the recoupling took place, all of which precludes the idea of there being a shut tap next the engine, without taking into account Mr. Garrard's evidence.

If driver Moore's theory could be established, it would certainly account for the accident, which is more than can be said of Mr. Shellshear's shut-tap theory; but there are serious difficulties in the way of its acceptance. We cannot ignore positive evidence, some of which Mr. Moore may not be aware of.

the first incline Clissold found he had to go and release them, from off one carriage at any rate. The blocks of the other carriages, he assumed, must have leaked off, and therefore gave no trouble.

There are, however, the following difficulties in the way of this theory.

Clissold states that he coupled the engine to these carriages when it returned to Beecroft for them, and that he opened the taps, and his testimony is corroborated decidedly in the case of the carriage tap; and we know that the engine tap was found *open* after the accident. Clissold, Gaylead, and Rice distinctly say that the blocks *were on* these two carriages while standing at Beecroft, and as distinctly say that they were still on when the engine returned, consequently there was no *pressure carried* to Hornsby in the *service pipe* except when the *engine may have put in it* after leaving Beecroft, in which case, of course, there would have been no closed tap between it and the first carriage.

In the next place, Rice distinctly avers that the air brake was working on the last car just before going into siding to be recoupled to the first lot; and again, Stead noticed the train leaving the station, and he would surely have noticed it if any blocks had been on, whereas he says plainly that only *on one* carriage were they slightly rubbing.

It is also not in accordance with evidence to assume that the blocks had so thoroughly leaked off all the carriages save this one. And we have also to take into account the positive evidence we have that the air brake *did* work on the second car from the engine after it left Hornsby. And again, it is by no means clear that it was one of these two carriages that Clissold referred to; the evidence points rather to the fact of its having been the fourth.

On the whole the difficulties are too formidable to permit of this theory being accepted as the true one.—D.V., 19/8/87.

Seen.—CHAS. A. G., 23/8/87.

No. 25.

Mr. W. J. Adams to The Commissioner for Railways.

Sir,

15, Bond-street, Sydney, 20 October, 1887.

Herewith I have the honor to enclose you copy of a letter written by Mr. Neale, the sub-Editor of the *Railroad Gazette*, to Mr. Alfred Sacre, the Consulting Engineer to the Vacuum Brake Company in London.

It is interesting as illustrating that the practice of throttling the exhaust of the triple valves is a common one on railways using the Automatic Westinghouse Brake on steep inclines. Mr. Neale also states that some accidents have happened in America owing to the exhausting defect.

Mr. Neale was at one time Loco. Engineer to the Cape of Good Hope Government Railways, and refers to his experience there. This, however, does not bear on the subject, but I have copied his letter *in toto*.

I have, &c.,

W. J. ADAMS.

[Enclosure.]

To Mr. Alfred L. Sacre, 32, Queen Victoria-street, London, England,—

Sir,

Railroad Gazette Office, New York, 16 April, 1887.

I am much obliged for yours of the 24th ultimo, with little book of instructions.

In answer to your question, the longest heavy grade on the Pennsylvania is from Altoona to Gallitzin, crossing the Alleghanias. Roughly speaking, it is about $9\frac{3}{4}$ miles of 1 in 58. The brake on such inclines is often used as "straight air," that is to say, the cock attached to the triple valve is turned to such a position that the triple valve is inoperative, and the brake is made non-automatic. In this way the speed is more easily regulated down the long incline. When the brake is used automatically it has to be released when the train is going too slowly, and the reservoirs have to be recharged before the brake can be again applied. If the reservoirs are not recharged, the brake, after a few applications, becomes very inefficient, and will not hold the train. The process of recharging the reservoirs is a slow one, and on a steep incline it occasionally happens that a train gains too much speed while this is being done, and runs away. Some accidents, especially with long trains, have happened from this cause, and special appliances have been put, especially in freight cars, to prevent this, and to permit the automatic brake to be used to control the speed of trains down inclines. The pressure-retaining valve is most generally used for this purpose. The exhaust from the cylinders from a certain number of cars is throttled. The apparatus is put into action on as many cars as are thought convenient by the train-men at the top of the incline. The brake on these particular cars will always be on with a pressure of about 10 lb. to the square inch in the cylinders. Thus, when the engineer is recharging the reservoirs, the brake will be lightly on these cars, and will thus prevent the train from gaining an excessive speed while the reservoirs are being recharged.

I enclose exact figures as to the inclines on the Pennsylvania. They are taken from vol. 39, page 84, of the Minutes of the Institution of Civil Engineers.

Yours, &c.,

D. H. O'NEALE NEALE.

P.S.—I may mention that on the western section of the Cape of Good Hope Government Railways the worst incline (Hexy River) is 15 miles of 1 in 40, with curves of 330 feet radius, or considerably worse than the Pennsylvania grades. The tell-tale vacuum brake worked admirably on this grade. It is non-automatic.—D. H. O'N. N.

[*Daily Telegraph*, 29th October, 1887.]

THE PEAT'S FERRY ACCIDENT.

COMMENTS BY THE ENGLISH PRESS.

The Departmental Inquiry Board Condemned.

By the latest English mail copies of the English engineering journals have come to hand containing comments on the findings of the Coroner's jury and the Departmental Board in relation to the Peat's Ferry railway accident. As these journals are recognised world-wide as authorities on engineering matters, and as they are far removed from local influences and jealousies, the impartiality of their comment cannot be questioned. From one of these papers, *Engineering*, we recently took some remarks with reference to the constitution of the Departmental Board. Subsequently, the results of that Board's inquiries and the report therein reached England, and *Engineering* then published the following leading article on the subject:—

Since we made reference to this subject on the 26th ultimo, the final particulars have come to hand. We find that the whole of the points we anticipated have been fulfilled, with but one exception, which is that

that the report of the so-called "Board of Inquiry," selected, as it now appears, by the Commissioner of Railways (the chief official responsible for the safe working of the lines), has been published, in place of being, as we thought probable, and as would have been best for the reputation of the Board, torn up and thrown in the waste-paper basket. All that we foresaw as to the incapacity of a Board, constituted and selected in the way the one in question was, to adjudicate impartially on the cause of the accident, and to place the saddle of blame on the right horse, has been exemplified, and in a manner more complete and astounding than we were prepared for, even in full view of the partisan spirit and the disregard of justice which too frequently mark the conduct of such matters in the Railway Departments of our Australian Colonies.

That this case would have run the usual course, and terminated like preceding instances, had it not been for the fact that owing to the accident being attended by fatal consequences, it necessitated a public inquiry at which the evidence was given on oath, and in the light of day, may be judged from the fact that the Board arrived at a decision which is traversed in every important particular—and with ample reason, as we shall show—by the verdict of the Coroner's jury. The former puts the blame on the unfortunate, helpless, and dead engine-driver, and insinuates fault in a more general way on the Locomotive Department, while, as we anticipated, it distinctly and emphatically acquits the Traffic Department of all blame for the accident. On the other hand the jury say—

"We attribute the accident to the great want of supervision on the part of the officials in the Railway Department in not carrying out the instructions laid down for their guidance, thereby endangering the safety of the railway travelling public. We consider the driver did all in his power to control the excessive speed of the train.

"We are of opinion that the train was not sufficiently powerful to take the train in safety to its destination.

"We are further of opinion that the train was not properly inspected before leaving Sydney (*i.e.*, the station whence the train first started).

"We are likewise of opinion that the train was not properly inspected on leaving Hornsby (the station where it was shunted and remade up shortly before the place of accident).

"We are of opinion the air couplings and taps (of the automatic air-brake) on leaving Hornsby were not complete.

"We are of opinion that the brake-power on the train was not sufficient."

And the jury add the following rider:—"We earnestly request the Government, on behalf of the public generally, to appoint a commission to inquire into the management of the different branches of the Railway Department, so that an organized and more complete system be adopted."

The limited space at our command does not permit of our going more fully into the principal lessons taught by this case now, but we shall take an early opportunity of doing so; meantime, we think, a little consideration will show that the finding of the Board, in view of the evidence taken before the Coroner and published in the Sydney press, a complete burlesque of facts, and a gross injustice on the engine-driver and the Department in which he served. It is said, "Dead men tell no tales," and perhaps the Board of Inquiry thought so. Fortunately, however, for the reputation of the unfortunate driver and for the feelings of those who respect his memory, there are living witnesses and proved facts to show that he was more sinned against than sinning in the matter of this lamentable but inexcusable accident.

We shall also be able to reveal a state of disorganization and mismanagement in the New South Wales Railway Department, which we should say is without parallel in modern times. One sentence taken from the report of the Board—one specially appointed, be it noted, by the Commissioner for Railways, and of which the Secretary and Traffic Manager, as together representing the Traffic Department, were members—will suffice to show how traffic regulations affecting the safety of the public are there treated, and the complacency with which their breach is viewed by the authorities themselves when it implicates their own Department. The sentence we refer to is as follows:—"We must also observe that the formal test of the air-brake connections which, according to the rules of the Department, should have been made by both the driver and guard before leaving Hornsby, was not carried out; the operations, however, gone through (which the evidence shows were not in the slightest degree of the nature of a test) afforded undoubted proof that all was correct in this respect." Yet a fatal accident, evidently due to the neglect of this "formal test" resulted. We should like to see the faces of the chairman and directors of any railway company in this or any civilized country to which the Secretary and Traffic Manager went with such an excuse for the neglect of plain and obviously important traffic rules. This example, however, but touches the fringe of the case with which we purpose to deal fully at an early date.

Regarding the technical details of the accident we can now speak fully, as the papers containing the account of the investigations are to hand. A train of nine carriages, conveying some 400 excursionists, escaped the control of the driver when approaching its destination on a gradient of 1 in 40, and coming into collision with some trucks in a siding, the engine was flung into the river, and the driver and several others were killed. The tender and five of the nine vehicles were equipped with the Westinghouse automatic brake, but as the brake on one carriage was shut off for repairs, there remained only four upon which it was available, and the question as to how the train came to run away was, as we have seen, the subject of investigations for the Coroner as well as for the Board of Inquiry. It should be mentioned that the engine appeared to be quite incompetent for the work it had to perform, and after being "stuck up" five or six times, the driver, when about half-way, was compelled, on account of the heavy gradient, to disconnect the two rear vehicles and proceed some 4 or 5 miles to a station called Hornsby. Leaving the seven he then ran back for the remaining two, and after attaching them to the rest of the train at Hornsby, continued his journey, the two vehicles which had previously been at the rear being now at the front. After the accident the cock in the train pipe at the rear of the first vehicle was found shut, and as these two vehicles had not been uncoupled on the journey, the theory set up on the one hand was that the train left Sydney with this tap closed, and that as at that time this would only cut off the last vehicle in the train, the oversight was not detected by the driver when using the brake up to the place where the train was divided. There was no brake van on the train, as there should have been, and therefore

therefore the guard could not see by an indicator whether the connections were complete or not. On the other hand, the Railway Department, stooping to take shelter behind the smallest shred of an excuse, contended that the closing of the cock was the effect of the collision, the two vehicles having telescoped, and that the accident was due to the driver having "wasted his air by the injudicious use of the Westinghouse brake!" After an inquiry before the Coroner lasting three weeks, the jury stated their belief that the accident was attributable to great want of supervision on the part of the railway officials in not carrying out the instructions laid down for their guidance, adding the several strictures we have quoted above. On the other hand, the Departmental Board found that the train was amply provided with brake-power; that the brake appliances were complete and in good working order when the train left both Sydney and Hornsby; that the train when descending the incline was allowed to attain a very high rate; that then there was a sudden failure of the brake-power, and that this failure was owing to an injudicious use of the brake-power by the driver. As a Sydney contemporary points out, "What the Departmental Board, in effect, did was to clear—absolutely—all the living officials who had anything to do directly or indirectly with the wrecked train, by putting all the blame upon the dead driver. What the jury's finding amounts to is that the driver was one of the victims of the criminal carelessness of these very officials." The findings of the two tribunals are, therefore, diametrically opposed to one another, and what makes the matter worse is that there is absolutely no evidence to justify the Board's assumptions. Indeed, we are bound to say that the whole inquiry reveals a most reprehensible lack of system and good management, and the existence of party feeling, in the Railway Department; if such a condition of things is the result of the railways being under the immediate control of the State, we in this country have more to be thankful for than many persons would have us believe.

Against the theory set up by the Railway Board, and in favour of the finding of the jury, we have the following facts:—After the accident the brakes on the two front carriages were found on, and the tyres were hot, while those on the other vehicles were off, and the tyres cold; it was proved that the guard had applied the hand-brake on the second vehicle, in which he rode after leaving Hornsby, and which, as already stated, had up to that point been the last in the train. The fireman, who escaped, swore that within a few minutes of the collision he saw 75 lb. registered on the air-gauge on the engine, and also that he observed by the lifting of the hand-brake spindle that the Westinghouse-brake was applied on the tender at the same time. Further, the air pump on the engine was found working in the water after the accident. Under these circumstances, it is absolutely certain that the only thing which could have prevented the brake operating on all the vehicles which were fitted was a want of continuity. If there was pressure enough to work the brakes on the tender and one carriage, there was ample pressure for the other carriages also; and if the driver had wasted his air on some vehicles, he must have wasted it upon all. There is no foundation for the theory that the Westinghouse-brake is liable to become short of air, and we have ourselves had ocular demonstration that in practice it is almost impossible to exhaust the pressure, at all events when, as in this case, the air pump is running. Should the reservoir need recharging, this can be quickly accomplished before the brakes are fully released, and this has been daily proved upon inclines much steeper and longer than that of the one in question, both in America and on the Continent. It seems, further, that the train was never tested before leaving Hornsby; that it was some two hours behind time; that the driver had only once before been upon this line; that the fireman and guard were both quite strange to it, and that the engine was running tender first. It is pretty clear that the driver, galled by the long delays and mishaps, having reached a portion of the line where progress was easy, was determined to lose no more time, and therefore allowed his train to attain a very high speed before attempting to check it, and when he did so, found that the brake-power, which under any circumstances could only have acted on his tender and four carriages, was insufficient to stop the train in time. On such a gradient as 1 in 40 the unfortunate man would be run away with almost before he could, with his imperfect knowledge of the line, realise the situation.

Whenever a railway accident occurs it is generally found that the dramatic features of the disaster are greatly enhanced by the announcement that it was due to the "failure of the brakes." Sometimes, as at Penistone, this is of course literally true, but it would appear that there is in general a natural tendency on the part of everyone concerned to blame the brake appliances with a view of protecting themselves. The Blackburn accident in 1881 affords a celebrated case in point, all the Lancashire and Yorkshire officials having done their best to discredit the Westinghouse-brake, in spite of most incontrovertible evidence, of its having worked, and in reality averted, a much worse disaster; and it will be remembered that, as in the Peat's Ferry case, the brake was quite exonerated by the jury. Last week we drew attention to the recent accidents on the Baltimore and Ohio railway, which by many were thought to have been caused by the failure of the Westinghouse-brake, whereas the apparatus turns out to have been what is known as the Loughridge air-brake. The collision at Perth on August 9th last was also said to have been due to the failure of the Westinghouse-brake, whereas investigation shows that the company's servants were alone to blame; and that as in the New South Wales accident, the connections had never been completed after detaching some vehicles on the way.

How long a state of things such as that revealed by this inquiry, which fortunately appears to have outraged public opinion in Sydney, will last, it is impossible to say. Probably the Railway Department in their indecent haste to shield themselves behind the victim of their own mismanagement, have exceeded all permissible limits. Until now it has been notorious that the officials and staff of the non-politically represented, and therefore, in that sense, the weaker branches of the railway system of New South Wales have had to go to the wall when blame for a railway accident has to be allocated. The thorough exposure which a fatal accident of the most discreditable kind has brought about may, it is to be hoped, change matters.

And the well known authority, the *Engineer*, briefly comments on the same subject in a short article under the heading "Railway Management in new South Wales," viz. :—

"Particulars have just come to hand from New South Wales regarding an accident to an excursion train on the Hawkesbury railway near Sydney, by which the engine-driver and several passengers were killed, and between thirty and forty other persons were injured. The evidence given at the Coroner's inquest, which occupied nearly three weeks, reveals a condition of things in the Railway Department of the Colony in respect of mismanagement and injustice which is simply a disgrace to those responsible for
its

its existence. The facts disclosed afford conclusive proof, if any were required, of the necessity for at once placing on the statute book the measure for reorganizing the Railway Department, to which we recently referred as having been introduced in the Legislative Assembly by the present Government; but which, like the similar Bill of their predecessors, has been shelved, after reaching its second reading, by the prorogation of Parliament. But, apart from the injustice to individuals and the general mismanagement in the Department which the incidents connected with the case reveal—injustice and mismanagement intensified, in our opinion, by the finding of the board of officials selected to inquire into and to report to the Government on the subject—and which calls for serious notice, the negligence shown by the traffic officials in the making up and equipment of the train in question, and in the abuse by them of the automatic air-brake with which it was provided, and which, as the evidence shows, was the immediate cause of the accident, necessitates in the interests of the travelling public in the Colony, our dealing with the case at some length. This we propose doing at an early date."

Remarks by the Secretary for Railways.

The foregoing article does not call for any extended notice.

Notwithstanding the claim of "impartiality" made on behalf of its author by the Sydney *Daily Telegraph*, it bears to my mind unmistakable traces of strong prejudice and ill-feeling towards the Department.

In dealing with the articles which have appeared from time to time in the *Daily Telegraph*, I had repeatedly occasion to draw attention to the misquotations, fabrications, and inaccuracies generally which characterized them, all having an important bearing on the question at issue, and which, therefore, I could not afford to let pass unexposed or uncontradicted. The animus of the writer appeared to be too strong to permit of his being able to distinguish between facts and fictions; and it is much the same in the case of the writer of this article in *Engineering*. As a sample, he says that "against the theory set up by the Railway Board and in favour of the finding of the jury we have the following facts:—After the accident, the brakes on the two front carriages were found on and the tyres were hot, while those on the other vehicles were off and the tyres cool."

If these statements were true, they would most certainly destroy the Railway Board's theory, and the writer knowing this, and being carried away by his feeling of hostility to the Department, parades them as "facts" whereas they are absolute fictions.

Not only is the "impartiality" of the writer of this article open to question, but his knowledge of the principles and working of the Westinghouse-brake. He apparently does not understand either the one or the other. For example, he says:—"Should the reservoir need recharging, this can be quickly accomplished before the brakes are fully released, and this has been daily proved upon inclines much steeper and longer than that of the one in question, both in America and on the Continent."

Now, everyone who understands anything about the Westinghouse-brake knows that its release cannot be graduated, and its representatives have never claimed to the contrary. It is perfectly certain that no recharging can take place while the blocks are applied, and, as their release cannot be graduated, it is a gross misstatement to represent that the reservoirs can be speedily recharged before that release takes place.

The *Railroad Gazette*, one of the most important American journals connected with engineering and railway news, has published very full and complete accounts of the Westinghouse-brake as used at the celebrated Burlington-brake trials. In the number for June 10th, 1887, we have a further illustration and description of modifications of the Westinghouse-brake used on that occasion, and among other interesting particulars we find a description of "the pressure retaining valve," which is a special provision to meet the liability of the reservoirs to become exhausted on long and steep gradients as follows:—

* * * * *

"The pressure retaining valve for use on long and steep gradients is simply a weighted valve connected to the discharge part of the triple valve and provided with a small cock, which, in one position, permits the air to escape freely, and in the other forces it to pass under the weighted valve. In descending long grades the cock is turned to the latter position and the weighted valve retains a pressure of 10 lb., which keeps the train under control when the brakes are released to recharge the reservoirs. On slight grades, or a level, the cock must be turned to the first position, permitting the air to escape freely without raising the valve. This valve was used on the first fifteen cars in drifting down grade in two of the Westinghouse stops at the Burlington trials. The speed however rose in one case to 31 miles per hour, and in the other case to 27½."

It is perfectly evident that the writer of the article in *Engineering* could only have had a most imperfect knowledge of the working of the Westinghouse-brake in America or on the Continent, where the same difficulty has been experienced and specially provided for. So much for the *Daily Telegraph's* "world-wide recognized authority."

The writer of the article in question has doubtless before this become acquainted with the fact that the Attorney-General of the Colony has pronounced the verdict of the Coroner's jury to be unsupported by evidence. As regards the verdict itself it contains neither information nor opinion as to the direct cause of the accident. The duty of the Departmental Board was, if possible, to ascertain this. For example, when it transpired that the formal test of the continuity of the air connections was not made before the train left Hornsby, it would have been inexcusable on the part of the Board thereupon to take for granted that such continuity did not exist, and was the cause of the accident, which is very much like what both the jury and some of our critics have done. There was the strongest circumstantial evidence that the continuity, although not properly tested, still as a matter of fact was good when the train left Hornsby. The Departmental Board had to ascertain and take into consideration the whole of the facts of the case in order to arrive at a true conclusion as to the cause of the accident. Had the Coroner's jury, or some of those who have criticised adversely the Board's decision, pursued the same course they would have no doubt come to the same conclusion as the Board.

D. VERNON.

PAPER

PAPER read by the President of the Engineering Association of New South Wales, at a meeting of the Association held on the 11th August, 1887.

Particulars of trials of the Westinghouse Brake, conducted in the presence of Mr. Robert Pollock and myself, on Saturday, the 3rd of September, 1887.

THE train consisted of engine, tender, and seven carriages. Five of the carriages were fitted with the Westinghouse brake, also the tender; the other two cars being added to make up the required weight.

Weight of Train.

	tons	cwt.	qr.
Engine and tender	59	5	2
No. 40 carriage	16	10	0
" 63 "	16	10	0
" 65 "	16	10	0
" 191 "	16	14	0
" 10 "	6	10	0
" 99 "	16	8	1
" 117 "	16	2	0
Total weight of train	164	9	3

Size of Small Reservoirs.

No. of Carriage.	Description.	Length in inches.	Diameter in inches.	Contents in cubic inches.
191	2nd Class A type	22½	11½	2,337
40	1st Class A type	29½	11½	3,064
65	Compo. A type	29½	11½	3,064
63	1st Class A type	22½	11½	2,337
10	Compo. four-wheeled	20½	9½	1,453

Size of Brake Cylinders.

All 10 in. diameter and 12 in. stroke except No. 10, which was 8 in. diameter and 12 in. stroke.

Stroke of Brake Pistons.

No. 40	had a stroke of	7½ inches.
" 63	" "	7¼ "
" 65	" "	7¼ "
" 191	" "	6¼ "
" 10	" "	7 "

5) 35·25 inches.

Mean stroke ... 7·05 inches.

In one of the carriages were fitted four (4) gauges, the pipes being connected as follows:—

One to main reservoir.
 " " brake pipe.
 " small reservoir.
 " brake cylinder.

There was also an indicator and pressure gauge connected to small reservoir, which very clearly recorded the variations of pressure in reservoir, the number of applications of the brake, also the time during which it was applied. On the engine, or rather on the tender, were two gauges—one from small reservoir end, one from brake pipe.

Mr. Pollock was on the engine, and noted all the necessary particulars relating to the steam-pressure in boiler, speed of donkey pump, pressure on air-gauges, &c., while I remained on carriage watching the variations of pressure, &c., on the respective gauges. I may mention that the size of donkey pump is—steam cylinder, 6 in. diameter and 9 in. stroke; air cylinder, 6½ in. and 9 in.

The train left Redfern about 9·45 a.m., and went as far as Thornleigh, where all the trials were made. The grade was about 1 in 45, and the average time of each trial was from three to four minutes, and the distance run from 2 to 3 miles.

First Trial.

Pressure in main reservoir	80 lb. per square inch.
" main brake pipe	70 lb. " "
" small reservoir	70 lb. " "
" brake cylinder	0 lb. " "
" indicator gauge... ..	76 lb. " "

Time of trial, three minutes—approximately; 13 applications of the brake; donkey going full speed (about 60 revs.); 133 lb. steam on locomotive gauge; brake-piston pressure ranged from zero to 36 lb., while the pressure in the small reservoirs was reduced from 70 lb. to 5 lb.; the pressure in the main reservoir remained almost constant, the first application bringing it down to 70 lb., but afterwards it went up, and remained quite steady at 75 lb.; so that when all the small reservoirs were practically exhausted there was a pressure of 75 lb. in the main reservoir:

Second

Second trial.

This trial was very similar to the first, but perhaps it may be desirable to state the exact conditions.

Pressure in main reservoir	87 lb. per square inch.
" main brake pipe	70 lb. " "
" small reservoir	70 lb. " "
" brake cylinder	0 lb. " "
" indicator gauge... ..	70 lb. " "

Time of trial, three minutes fifteen seconds; then whistled for hand-brakes, and forty-five seconds afterwards came to a dead stop. Total time, four minutes. Fifteen applications of the brake. No. 99 carriage taken off; donkey going half speed; 137 lb. steam on locomotive gauge. During trial the pressure in the brake cylinder ranged from zero to 35 lb. The pressure in small reservoirs was reduced from 70 lb. to 5 lb. in less than three minutes. The main reservoir pressure ranged from 87 lb. at start to 50 lb. at finish—that is, when the small reservoirs were practically empty the gauge on main reservoir showed a pressure of 50 lb. per square inch.*

Third Trial.

Ran over the same ground, but under different conditions. In this case all the air-brakes were disconnected, excepting on tender and one carriage cock shut behind, and the couplings disconnected, also all the other brakes off. Came down same grade in two and a half minutes, and only used the air-brake on tender and one carriage until well down the incline, when the engine hand-brake was used, which brought the train to a dead stop. The conditions were practically the same as in the other trials—80 lb. in main reservoir at start, 70 lb. in small reservoirs. At the finish the pressure in small reservoirs was reduced to 25 lb., while that in the main reservoir remained almost constant, never being below 75 lb., donkey going full speed.

Fourth Trial.—Train standing.

Time taken to fill the five (5) small reservoirs with air at 70 lb. pressure, the main reservoir being full and its gauge showing 73 lb. at start and 71 lb. at finish; donkey going full speed, and 137 lb. of steam on locomotive gauges.

1st half-minute pressure rose to	35 lb.
2nd " " "	48½ "

but it took four minutes to rise from 48½ to 68½ lb.†

From the above it will be seen that about 50 lb. per square inch can be forced into the reservoirs in 60 seconds, but after that the pressure rises very slowly.‡

Fifth Trial.—Train standing.

Time taken to fill one small reservoir next tender, all the others shut off; donkey going full speed. Pressure in main reservoir, 70 lb.

1st half-minute pressure rose to	35 lb.
2nd " " "	60 "
3rd " " "	67 "

Sixth Trial.—Train standing.

Main reservoir showing 80 lb.; donkey going full speed; 139 lb. of steam; thirteen applications of the brake; and in two (2) minutes all the three reservoirs were practically exhausted from 70 lb. to 5 lb.

Seventh Trial.—(Under same conditions.)

80 lb. in main reservoir; exhausted all the air from small reservoirs in 1 min. 50 sec.; eleven applications of the brake. At the finish there was about 60 lb. in main reservoir.

This concluded the trials.

What you have just heard is a fair and straight statement of what we actually saw, and although the time and figures may not be absolutely correct, we have no hesitation in vouching for their approximate accuracy.

It is also desirable to mention that the officers in charge of the experiments were willing and anxious to carry out all the practical suggestions which, in our opinion, tended to enhance the value of the tests.

At the conclusion of the trials we *felt anything but satisfied under certain conditions*. We had seen the air exhausted without difficulty. This was done in various ways, and in a very short space of time; but being of a practical turn of mind, and pleading guilty to having a large amount of mechanical scepticism in our composition, we wanted to know how and by what means this sudden exhaustion came about.

In answer to inquiries, the officers intimated their willingness to supply any information regarding sizes, proportions, and capacities of the various parts of the Westinghouse brake, and also sent us a triple valve (in sections), which is now before you.

We are free to confess that before seeing this valve we had a very hazy idea of its action, and it was only after spending a considerable time in patiently studying its design and construction that we began to see and appreciate the rare ingenuity and admirable skill displayed, and which, as a mechanical appliance, is worthy of all praise.

In connection with this valve it is desirable to refer to Mr. Shellshear's remarks concerning it. He describes it as a very simple affair, so much so that, to use his own words, "any apprentice boy would have no difficulty in understanding it." Well, this may be so. We respectfully, but decidedly, differ from him

* The variation in main reservoir (87 to 50) was due to the fact of the donkey going half speed.

† All the small reservoirs were empty at the start.

‡ We cannot understand this, as with a constant pressure in main reservoir it should (except for the increased friction) fill five in the same time as it takes to fill one.

him—in fact, we don't feel very sure of knowing all about it now; but we have mastered it sufficiently to feel quite content to know that our want of perception and dulness of comprehension require so much development.

Even Mr. Campbell himself never even hinted that the Westinghouse people ever claimed anything for its simplicity—on the contrary, he freely admits its complexity of parts; but what he did say was something like this, that although, to those who do not understand or are prejudiced, this triple valve may appear very complicated, it is so beautifully made, the proportion and construction of its parts so accurately arranged, that its liability to go wrong is reduced to the lowest possible minimum, and that, looking at its practical working, it is justly entitled to the public confidence.

We believe Mr. Campbell has fair justification in making that statement, and the fact that thousands of these valves are in daily use all over the world, doing good work, is very conclusive evidence of its truth. Mr. Campbell evidently looks upon the triple valve as an intimate relation of a clock or a watch, which, with all their complications, we put down as of no use unless they keep accurate time for years, and we expect them to do so without much examination or repairs. Speaking personally, I wish to say that, with respect to complications in mechanical appliances, I have received some wholesome lessons, and although I admire and appreciate simplicity in machinery as much as any man, still we should hesitate and make quite sure of our ground before we condemn any appliance because of the number of its parts. In proof of this let me point out that when the compound engine was introduced a large percentage of engineers (myself included) raised the cry that the complexity of parts and the increase of pressure would, in the long run, cost more than could be gained by economy in coal, yet it has steadily made its way; and, judging from what I see, there is little doubt that the triple and quadruple engines, with even more complications and much higher pressures, will do the same.

There are many gentlemen in the room who are connected with marine engineering, and they know as well as I do that our modern machinery has reduced the cost of repairs in a very material degree. Not many years ago hundreds of mechanics were constantly and profitably employed in repairing the machinery of the numerous steamers trading to Sydney, but now such is the improvement in the soundness of design, the efficiency of construction, and the excellence of our tools, that, notwithstanding increased complications, the machinery runs from year's end to year's end at a fraction of the expense incurred in the old days; and, although it may appear a strange thing to say, I have no hesitation in stating that it is the high degree of efficiency which has been reached in complicated machinery which has caused, and is now causing, such a depression in Sydney.

It was only the other day, when examining the machinery of one of the Orient steamers, the chief engineer informed me that the vessel had steamed from the old country to Sydney, and there was nothing required but what the engine-room staff could do themselves. This was with 160 lb. of steam, and complications enough in all conscience.

This is a suggestive fact, and it is mentioned to show that in examining or criticising any mechanical appliance complication does not always justify condemnation.

Returning now to the triple valve, we find in it is contained the whole principle of the Westinghouse brake, and which, with your permission, I will try to explain in a simple manner.

Take our first trial. We started with 80 lb. in the main reservoir, 70 lb. in the brake pipe and small reservoirs, and in less than three minutes the whole of the small reservoirs were practically empty, although the pressure in main reservoir remained steady at 75 lb.

Now, here we have a train whose brake power has been purposely dissipated, and yet the driver of that train has practically the same pressure on his gauge when the small reservoirs are empty as when they were full. He has plenty of power in his main reservoir, yet his brakes are useless.

To explain this we must go to the triple valve. Anyone looking at its construction and understanding its action must be struck with the fact that it is not necessary to go on to a running train to be convinced that the air in small reservoirs can be exhausted without difficulty, for they have only to realise that the hole through which all the air must pass to charge or recharge the small reservoirs is so many times smaller than the passage for letting it out that it requires a very simple calculation to know how many full applications of the brake will practically exhaust them.

The size of the admission hole is equal to the area of a circle scarcely $\frac{1}{8}$ inch in diameter cut in two—that is, all the air has to pass through a semi-circular groove $\frac{1}{8}$ inch in diameter. The area of a $\frac{1}{8}$ inch circle is .0121, and dividing this by 2 we have the actual area of the air passage, viz., .0061. The diameter of the holes (smallest) from small reservoirs to brake cylinder is $\frac{1}{16}$ inch, the area of which is .0769; then dividing area of hole through which the air passes to put the brakes on by the area of hole through which all the air has to pass to recharge small reservoirs, we have $\therefore \frac{.0769}{.0061} = 12.57$, which tells us the hole from brake pipe to small reservoirs is $12\frac{1}{2}$ times smaller than the passage from the reservoirs to brake cylinder, and this is irrespective of friction, which in this case would vary approximately, as follows:—

Directly as the length of passage,
Directly as the square of the speed,
Directly as the density or weight, and
Inversely as the diameter.

Taking the Westinghouse book of instructions, we find, in pages 20 and 21, that “a reduction of 20 per cent. in the brake-pipe pressure causes the triple-valve pistons to move down and set the brakes at full force by means of the air in small reservoirs.” And, again, “to set the brakes with full force takes an average of $1\frac{1}{4}$ seconds, and to open the release ports about the same time. To restore the pressure in small reservoirs requires from 15 to 30 seconds after a full application.” This shows very conclusively that, taking the average time given— $15 + 30 = 45 \div 2 = 22.5$ seconds—that it takes a great deal longer time to put the air into the reservoirs than to let it out; besides, it says nothing about any particular pressure that may be in the reservoirs, and it certainly does not agree with the results we obtained on the 3rd September, where, in the 4th trial, which was for the express purpose of finding what time it took to fill the five small reservoirs (they being empty at the start and train standing), we found it took 1 minute to get the pressure up to 50 lb., but it took much longer to raise the pressure from 50 to 70 lb. Going back to the small admission hole again; and remember that if they attempted to enlarge this hole the triple valve would be useless—in fact, it would not work at all, because then the air

in

in small reservoirs would come out so fast, and the pressure fall to such a degree as would certainly destroy the efficiency of the brake.

Assume a case, and suppose there is 70 lb. in brake-pipe and 70 lb. in reservoirs, and we want to put the brakes on with full force, we, in accordance with instructions, reduce the brake-pipe pressure 20 per cent., bringing it down to 54 lb.; we have then 20 per cent. more pressure on top of triple-valve piston than we have on the bottom; this acts on the piston and brings it down; but, remember, the air is *leaking past it all the time through the admission hole, but it can't get out quick enough to prevent the excess of pressure from acting, because it is so small.* When the piston has travelled $\frac{1}{16}$, the admission port is shut; it is then all right.

The size of the exhaust hole or passage is $\frac{3}{16}$ inch in diameter, and, comparing it with the admission hole, it is $4\frac{1}{2}$ times larger; its area is .0276, and dividing the one by the other we have $\frac{.0276}{.00576} = 4\frac{1}{2}$.

It may be urged that as all the air has to pass through the exhaust its diameter should be taken instead of the passage from reservoir to brake cylinder; but it should be remembered that the pressure is always much less in the brake cylinder than reservoir, that when released it has only to contend with the atmospheric pressure, and also that the exhaust port on the valve face is nearly twice as large as the exhaust passage, thereby allowing it to remain longer open, whereas the air from brake pipe has to be forced through a very small hole against whatever pressure may be in reservoir, besides the immense friction to be overcome, and is all in favour of getting rid of your power much faster than it can be supplied.

Graduating the Pressure..

This has been a much disputed point, and, without prejudice, am of opinion it can and is graduated every day. It is true the driver can't see the graduation, but there seems to me no difficulty in educating the hand to control any train. This means of graduating the brake pressure is a very clever contrivance, and appears to perform the same function for Westinghouse as the small injector does for the Vacuum brake, but it must not be forgotten that the Westinghouse can only be graduated one way—that is, when it is being applied to put the brakes on. There is no possibility of graduating the release, as every particle of air must be discharged into the atmosphere and the brakes taken completely off before another application of the brake is possible.

There is another point in connection with the Westinghouse which, I think, has escaped notice. It is this: Mr. Campbell, when speaking against the Vacuum brake, brought it prominently forward that the injector used a very large amount of steam.

No doubt it does; but let us look at the Westinghouse from an economical point of view, and see how it stands. For every full application of the brake you have to actually waste 20 per cent. of the brake-pipe pressure, and taking their own figures, for a train of fifteen carriages you have to throw away 1,000 cubic inches of air, at a pressure of from 60 to 80 lb., before the triple-valve pistons can move their full stroke. Now this has to be done many hundred times every day, and as it takes a considerable amount of power to compress air to a high pressure, it appears to me that if the total quantity of air which is and must be wasted on applying the brakes was calculated, I feel pretty sure that the truth of a very old adage would be very fully realised, viz., "Those who live in glass houses should not throw stones."

Referring to Mr. Granlund's statement that the brake power on the New South Wales railways was only one half of what was fitted on the Victorian lines, and that for every 10 tons of brake power here they had 20 tons. This, coming from such an authority, is no doubt correct; at the same time let me direct your attention to No. 3 trial, where, in careful hands, the great efficiency of the Westinghouse brake was clearly demonstrated, for on that occasion a train weighing 164 tons came down a grade of 1 in 45 at a speed of over 30 miles an hour, the air being applied on the tender and one carriage only, the cock being shut off, and couplings being disconnected behind the first carriage.

This goes to show that although the brake power on the New South Wales lines may, in the opinion of some, be limited in amount, still there is, even in cases of emergency, quite sufficient left to control the train.

Looking at the Westinghouse brake as a whole, it appears to me that its weak point lies in the fact that, by careless handling and injudicious management, the stored power in small reservoirs may (under exceptional circumstances) be exhausted, which means that the driver may have a large quantity of power in his main reservoir, and yet the small reservoirs be practically empty, and on heavy down grades a little carelessness, inattention, and want of judgment may result in his losing control of his train.

This, I think, might be remedied to some extent by fitting another pressure gauge on every tender, which would always give him a fair idea of the amount of power at his disposal for putting on the brakes.

On the other hand, this brake is, in careful hands, a safe and reliable contrivance, and until Mr. Selfe or somebody else shows us something very much better it will continue to merit the public confidence.

Referring to the large amount of correspondence which has taken place in the public Press in arguing about the relative merits of the brakes, one thing stands prominently forward, viz., the extreme difficulty of sinking personal interests when discussing this question, and many of the statements made are to be regretted.

Where the Westinghouse people made the mistake was in claiming too much for it. Like any other human machine, it has its good qualities and its faults, which may, and no doubt will be, improved.

Let us, therefore, hope that, as in this age of progression we cannot stand still, the present discussion may be the means of making railway brakes more economical and reliable than at the present time.

[For Appendices A and B, see Plans.]

APPENDIX C.

RESULT of experiments with the Westinghouse Brake, made by the Peat's Ferry Accident Inquiry Board, for the purpose of ascertaining the time required to empty or reduce the air pressure in the carriage reservoirs below working pressure:—

1. Air-pump working:—

Start at 9.43 a.m., with	87 lb. pressure	
1st application reduced to	" "	
2nd " "	54 " "	
3rd " "	45 " "	
4th " "	36 " "	
5th " "	28 " "	
6th " "	28 " "	
7th " "	25 " "	at 9.50 a.m.

Time = 7 minutes.

Time taken for replenishing air supply, from 25lb. up to 83lb. = 5 minutes.

2. Air-pump not working:—

Start at 9.57 a.m. with	83 lb. pressure	
1st application reduced to	64 " "	
2nd " "	56 " "	
3rd " "	48 " "	
4th " "	40 " "	
5th " "	34 " "	
6th " "	28 " "	
7th " "	25 " "	at 9.59 a.m.

Time = 2 minutes.

3. Air pump working:—

Start at 10.33½ a.m., with	88 lb. pressure	
1st application reduced to	66 " "	
2nd " "	60 " "	
3rd " "	52 " "	
4th " "	50 " "	
5th " "	46 " "	
6th " "	40 " "	at 10.41 a.m.

Time = 6½ minutes.

4. Air pump not working:—

Start at 10.43 a.m., with	64 lb. pressure	
1st application reduced to	48 " "	
2nd " "	43 " "	
3rd " "	37 " "	
4th " "	30 " "	
5th " "	26 " "	
6th " "	20 " "	at 10.45 a.m.

Time = 2 minutes.

APPENDIX D.

Manager,—Be good enough to refer to Mr. Kirkcaldie on the subject of Mr. Shellshear's statement that driver Cartwright made some remarks about hot axles in his presence. Cartwright denied any knowledge of the thing, and I am aware Mr. Kirkcaldie did the same to the members of the Board of Inquiry; but it was not taken down. Return please at once.

D.V., 19/7/87.

Both Mr. Shellshear and I travelled on the engine with driver Cartwright from Ryde to Peat's Ferry on the morning after the accident, and I had some conversation with Cartwright on the way, but I am perfectly certain that he said nothing in my hearing about hot axles; if he had done so, my curiosity would have been aroused instantly, and I would not have allowed the matter to drop without inquiring carefully into it.

The first time I heard of his having been said to have made such a remark was when you told me, after Mr. Shellshear had been examined before the Board of Inquiry, that the latter had made such a statement, and, as you will remember, I at once expressed my surprise at it.

Traffic Manager.

D.K., 20/7/87.

The Secretary.—W.V.R., 20/7/87.

APPENDIX E.

APPENDIX E.

Locomotive Engineer,—Referring to certain information and calculations which Mr. Laughry went into at time of Board Inquiry into cause of accident at Peat's Ferry, but which were not taken down as evidence at the time, I should be glad if Mr. Laughry would now put some portion of it in writing.

1. I want him to state the amount of *brake force* necessary to control a train, the dead weight of which is 167 tons (say) upon a grade of 1 in 40.
2. I want to know, as a matter of fact, what amount of *brake force* this train (the Hawkesbury one) possessed.
3. The amount of *retarding power* this represents (No. 2.)
4. The amount of opposing power the 167 tons would represent.

I think, if I remember, an interesting experiment was made in connection with the Lawrence Vacuum Brake, which afforded a useful means of arriving at correct conclusions as to the margin of brake force necessary to work a train on a gradient of 1 in 30 or 33. If so, please let me have brief report of same.

I also want to know what proportion of the *weight* of the vehicles which used to constitute a load down the mountains, before we had the Westinghouse Brake, was supplied with blocks.

Also what proportion of the weight of the *nine vehicles*, which constituted the load taken out by the engine on the day of the accident, was furnished with working brakes or brake-blocks.

Mr. Laughry has all this information, and I shall be glad if I can get a reply to-morrow.

D. V., 19/7/87.

APPENDIX F.

20 November, 1887.

MEMO. in reply to Chairman's Minute of 19/7/87.

THE Hawkesbury train, including engine and passengers, weighed 167 tons.

21 tons of brake-force, judiciously applied, was sufficient to keep the speed of this train below 15 miles per hour on a grade of 1 in. 40.

With the ordinary working pressure of 60 lb. in the auxiliary reservoirs the air-brakes on the tender and train were alone capable of exerting 50 tons brake-force.

The hand-brakes on the engine, tender, and two cars (Nos. 47 and 69) were capable of exerting 48 tons brake-force.

The hand-brakes on the engine, tender, and one car were capable of exerting 38 tons brake-force.

The air-brakes on the tender and train, together with the hand-brake on the engine, were capable of exerting a total of 65 tons brake-force.

At speeds below 20 miles per hour the co-efficient of friction between the brake-blocks and wheels equals about one-fifth of the force at which the blocks are pressed against the wheels—in other words, one-fifth of the brake force exerted against the wheels is transmitted into retarding power and acts directly opposite to the force tending to keep the train moving.

The total amount of gravitating force tending to move a train weighing 167 tons down an incline of 1 in 40 is at most 9,352 lb.; this, however, becomes less as the speed increases owing to the resistance offered by friction, wind, and curves.

The total retarding power of the brakes on the Hawkesbury train was 13 tons, or more than three times that necessary to control the speed on a grade of 1 in 40.

Prior to the use of the Westinghouse brake on the Mountains, it was the practice, in all kinds of weather, and with engines of the 79th class, to run trains equal to nine vehicles from Katoomba to Penrith, the weight of which, empty, totalled 64 tons. Of this weight only $7\frac{1}{2}$ tons, or 11.7 per cent., was fitted with brakes.

The nine carriages composing the Hawkesbury train weighed, empty, 90 tons 18 cwt.; of this weight 64 tons 2 cwt., or 70.6 per cent., was fitted with brakes.

On the 5th November, 1886, a trial was made with the Lawrence Vacuum Brake (copy of trial-report herewith), and having a very limited amount of brake-power at command, we were afforded an excellent opportunity of ascertaining what amount of the brake-force exerted was transmitted into retarding-power, while the speed did not exceed 15 miles per hour. With a total of $27\frac{1}{2}$ tons of brake-force at command we were enabled to bring a train weighing $226\frac{1}{2}$ tons safely from Katoomba to Penrith.

E. A. LAUGHRY.

Government Railways, Locomotive Engineer's Branch,

Redfern Station, 11 November, 1886.

Sir,

I have to report that on Friday last, the 5th instant, the Westinghouse and Lawrence brakes which are fitted to goods trains were further tested on the Mountains.

On this occasion the two trains fitted with the above-mentioned brakes were reduced so as to make them as near equal to the automatic vacuum train as regards length and weight as possible.

Four D trucks were taken off the Westinghouse train, and one G truck off the Lawrence train, thus reducing the two trains, the first to thirteen vehicles, and the second to equal fourteen and a half vehicles.

The Westinghouse train weighed when loaded 149 tons 7 cwt., and ran from Katoomba to Penrith, a distance of 32 miles. When descending the Mountains the brake was found to work well, and to have considerably more power than was required to control the speed of the train down the steepest inclines. Only 30 per cent. of the power available was used for this purpose.

The Lawrence train weighed when loaded 148 tons 12 cwt., exclusive of engine tender and van, and was run over the same section of road. When descending the inclines of 1 in 33 the power of this brake was fully taxed in controlling the speed of the train—this without the use of the brakes on the engine, tender, or brake-van.

As mentioned in a previous report, the ejector belonging to this brake is faulty, and on this occasion, as on the last, did not do its work as well as might be expected. The highest vacuum obtained during the trial on Friday was 15 inches, representing a piston pressure of $7\frac{1}{2}$ lb. per square inch. With this ejector in proper working order we would have had at least 25 per cent. more power at our command.

The accompanying table gives particulars of the different brakes, also of the last three test trains.

E. A. LAUGHRY.

The Locomotive Engineer.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(REPORT OF MR. CRUICKSHANK, M.I.M.E., ON ACCIDENT TO EXPRESS GOODS TRAIN AT PETERSHAM.)

Ordered by the Legislative Assembly to be printed, 27 October, 1887.

[The Chief Engineer Surveyor, Marine Board, to The Secretary for Public Works.]

Marine Board Office, Engineer Surveyor's Department,

Sir,

Sydney, 24 October, 1887.

In accordance with your instructions, I have the honor to submit the following, relating to the accident which happened to the express goods train on the 9th of September, 1887:—

Have carefully and personally examined both officers and men who were likely to give such information as would assist me in coming to some definite conclusion. (Evidence attached.)

All the evidence taken goes to prove—and prove very conclusively—that the primary cause of the accident was the breaking of the axle under No. 128 C van.

This axle (made of Brunswick steel) shows a true flaw, equal in extent to about 25 per cent. of the entire sectional area.

The grain of the steel where the break took place (both ends) is very coarse, and, judging from its appearance, looked more like bad cast-iron than anything else.

It has been running seven years, being branded August, 1880.

Acting up to the letter of my instructions—that the inquiry was to be conducted entirely outside the Department—and to thoroughly satisfy myself as to the true nature of the material, I took the axle away, and gave Mort's Dock the necessary directions to prepare suitable "test pieces," cut from various parts, and which were all carefully tested by Professor Warren in my presence at the Sydney University. (See tables and particulars of tests attached.)

The results of the tests clearly prove the material to be neither harmonious nor homogeneous—some parts hard, others soft; some extending 5, others 15 per cent., others nil; in fact, everything connected with the experiments clearly shows the material to be unreliable, unworthy of confidence, and certainly unfit for the work intended.

This is prominently seen in comparing the breaking strain of two pieces cut from the same axle, representing a difference of over 9 tons in the same bar.

Again, in noting the stretching or extension of the specimens, their behaviour is anything but satisfactory. Two strips were prepared from the "flawed" end of the axle (the piece that was in the wheel boss); one was tested just as it was, the other, annealed and cooled in ashes.

The breaking strain of the first, marked A, was 82,000 lbs., equal to 36.6 tons; the contraction of area, 3.7 per cent.; and the extension in 10 inches, 5.6 per cent. The other, marked A¹, stood 89,000 lbs., equal to 39.7 tons; contraction of area, 19.4 per cent.; extension, 14.5 per cent.

Two similar specimens were taken from opposite end of axle (the piece in wheel boss), one tested as it was, the other annealed in ashes.

The first, marked B, stood a strain of 101,500 lbs., equal to 45.3 tons, the contraction and extension being 8.8 and 9.6 per cent. respectively. The other, marked B¹, went at 100,000 lbs., equal to 44.6 tons; contracted, 11.7 per cent., and extended, 11 per cent.

Four other strips were cut from the body of the axle; two were annealed in ashes and two in water, but all the results obtained are bad, being most irregular and uncertain.

I also tested two strips prepared from a Vickers' steel axle which broke under a D waggon, No. 2,454, at Lapstone, on 10/8/87.

The results obtained in this case show a most decided superiority over the Brunswick steel. The breaking strain was 30.8 and 31.2 tons respectively; the contraction of area in both cases, 49.6 per cent., and the extension, 25.5 and 21.2 per cent.

As regard suitability, this test is almost perfect, the behaviour of the material being precisely the same as what is expected and insisted upon by the Board of Trade, Lloyds, and the Marine Board, in all steel plates intended for the manufacture of high-pressure boilers.

It appears that Sir John Fowler's limit of tensional strength for steel axles is from 27 to 30 tons per square inch; anything over that would, or at all events, should, be rejected, being far too hard and brittle for the work. How it comes that the Brunswick axle went up to 45 tons is not easily explained. Of course this may be an exceptional case, but it may not, and I think the chances are they will be found far too hard to be trusted.

Again, the design of this axle is very faulty, so is "Taylor's," both having a square cut shoulder close to the wheel boss. Why this is so nobody seems to be able to explain, but everybody agrees it is a bad thing, and the principal cause of all the trouble.

There is no necessity or advantage in making an axle this way—on the contrary it simply amounts, in my opinion, to a premium to make it break, as it is in very much the same condition as a bar of iron which a blacksmith nicks on his anvil before he attempts to break it.

On the Home and Continental lines axles made in this fashion receive due consideration; they are not allowed to carry the same weight as others of superior design, although of the same material and dimensions; and on the German and other lines a very considerable reduction in the weight carried is made, viz., 25 per cent. for iron, and 33 per cent. for steel. This shows that steel, when shouldered, is more treacherous than iron—a lesson they have no doubt learnt from experience.

According to evidence the number of axles of the Brunswick brand now in use is 395, and I certainly think it highly desirable that although it is just possible this particular axle may be the only bad one amongst the lot, still there is every reason for testing some of the others—the results of which may or may not justify condemnation.

The measures taken by the Locomotive Engineer to remedy and rectify the faults in constructive design are at once sensible and commendable; they have been materially increased in size, have no shoulders at all, no keys or key-ways, and from a personal practical examination of the axles recently fitted they are entitled to all confidence, provided they are made of the best and most reliable material.

There are 16,000 axles in the service, and twenty-three have broken (when running) during the last five years. The cause of breakage is as follows:—17 by flaws, 4 by collisions, and 2 through the breaking of other axles.

As to the material, 19 were made by Taylor (of iron), 2 of Vickers' steel, 1 of Brunswick steel, and 1 by Cooper & Coy., of Leeds.

From the above it appears the average breakage in five years is about 1 in 700, and as 19 out of the 23 were "flawed," it is very clear that if soundness of material were possible, a broken axle would be a novelty, or at all events the danger of such would be reduced to the lowest possible minimum.

Respecting the most suitable material, the evidence is exceptionally strong and quite unanimous as to the superiority of Vickers' steel. This is specially so from the men who work it, both at the forge and lathe. They describe it as being by far the best and most reliable steel—a material in which they have the most perfect confidence, and which they all recommend should be used, even if the Department have to pay a higher price for it. This opinion is the outcome of a large experience, and is certainly entitled to due consideration, besides being fully borne out by the tests.

In answer to inquiries as to what means were adopted to ascertain the work done, or the mileage run by any axle, I find there is none; and the opinion is general that it is scarcely possible to do it. This may be so, and no doubt would entail some difficulty and trouble, but it is very necessary, and if attention were specially directed to it some feasible plan might be proposed by those who are thoroughly conversant with this particular branch, as I understand the mileage run by the "goods" is checked on the European lines.

The system of "numbering," which has only been introduced since April, 1886, gives the officers a good idea of the what, when, and where of the repairs done, but it does not go far enough, and can give no definite idea of the actual work done by any axle or wheel.

Respecting the instructions given to the various officers as to the examination of axles, &c., the evidence is very satisfactory; every possible care seems to be taken to prevent any defective material being used, and none of those examined had any suggestions to offer which in their opinion would have any tendency to improve the method of inspection.

I note, however, that as regards annealing, the instructions given are confined to iron axles only (Taylor's); this, in my opinion, is a mistake—it is quite as necessary—in fact, more so—to anneal the steel axles, and it is very desirable that some practical experiments should be made to determine two things:—
1. The best method of annealing. 2. The effect of annealing on the steel.

I would mention that in working steel plates for general purposes, and especially boiler work, annealing is one of the principal items, about which we are very particular, and which in all cases (when carefully and properly done) has a most beneficial effect in restoring the original ductility of the material, which is always disturbed and injured by punching, flanging, or continuous working.

Returning now to the express goods train, I find it commenced to run in May of the present year. Its speed is practically the same as the mail, and its average weight about double; the approximate weights are 100 tons and 200 tons respectively. At first it consisted of twenty-five vehicles, but it could not keep time, and the number was reduced to twenty. The brake-power, at first, consisted of engine and tender fitted with air-brake, also one brake-van with hand-brake, just the same as the ordinary goods, running about half the speed, and it was left to the engine driver and guard to find out that the brake power was insufficient, as in their evidence they distinctly state "that when the signals were against them they were unable to control the train."

In answer to my inquiry "if there was any rule or regulation in the Department for getting [out the brake-power in proportion to the speed and weight of any train?" I received the following:—"The brake-power of any vehicle must not exceed the weight of itself when empty." This is not a satisfactory reply, as there is no mention made of the weight or speed, nor the slightest reference to the road being level or having steep grades, &c.

Again, to the question, "Who is the officer that determines the amount of brake-power that has to be put on any particular train?" The answer was, "*It is the duty of the station-master, and, of course, of engine-drivers and guards, to point out if they should consider the brake-power insufficient.*" (The Italics are mine.)

It is scarcely credible that the determining of the brake-power in any train, and especially in this, should be left to the consideration of the engine-driver and guard, and yet the evidence is very conclusive on that point.

On

On the morning of the accident, the weight of the train was 192 tons exclusive of engine and tender. The weight of the mail train on the same date was 100 tons, so that here is a train nearly double the weight of the mail, running at the same speed, and its insufficiency of brake-power is only found out after the engine-driver and guard report "they can't control the train."

I must respectively submit that this system (if it can be called so) is simply dangerous, and certainly not conducive to public confidence, for it is not only possible but very probable that in exceptional cases like this, the insufficiency of brake-power would only be discovered after a serious accident.

It is therefore highly desirable that some engineer possessing the necessary theoretical and practical knowledge—one who is thoroughly acquainted with the New South Wales lines—should be instructed to prepare suitable tables for the standard regulation of the brake-power, in which the weight, speed, and road would be duly considered. This would be a guide for all station masters and guards, and would certainly commend itself as being immeasurably superior to the present method.

Regarding the amount of damage done to the train on the 9th September, the evidence is most conclusive that if it had been fitted with an automatic brake, the injury sustained, would, in all probability, have been confined to the broken axle, and also that when the train parted the brakes would have gone on and prevented the trucks from going over the embankment and bridge.

In this I concur—also in the opinion expressed by all capable of judging—that this train should be fitted with a continuous automatic brake at once.

In connection with the accident, I made a careful examination of the Petersham Bridge. The main structure has sustained no injury whatever, all the damage being confined to the charring of sleepers, decking, hand-rails, &c., which have been efficiently repaired.

Respecting the fire, all the evidence taken is mere assumption and conjecture, its true origin will, so far as I can judge, always remain unexplained.

In conclusion I beg to acknowledge with thanks the kindness and courtesy of the officers who assisted me in every possible way to obtain the necessary information.

I have, &c.,

WM. CRUICKSHANK, M.I.M.E.,

Chief Engineer Surveyor to Marine Board.

EXPLANATION of Test Tables.

Nos. 1 and 2.—Cut from a Vickers' steel axle, which broke under a D waggon, No. 2,454, at Lapstone, 10/8/87. Branded, July, 1880.

A.—Cut from "flawed" end of axle which broke at Petersham, 9/9/87; tested as it was. Brunswick steel. Branded, August, 1880.

A¹.—Cut from "flawed" end of same axle, but annealed in ashes.

B.—Cut from opposite end of same axle, but tested as it was.

B¹.—Cut from opposite end of same axle, but annealed in ashes.

C.—Cut from body of same axle (flawed end), and annealed in ashes.

C¹.—Cut from body of same axle (flawed end), but annealed in water of 80° Fahr.

D.—Cut from body of same axle (opposite end), and annealed in ashes.

D¹.—Cut from body of axle (opposite end), but annealed in water of 80° Fahr.

Vickers' specimens, 8-inch centres; all the others were 10-inch centres.

UNIVERSITY OF SYDNEY.

SPECIMEN of Steel tested for Mr. Cruickshank.

Tested October 12th, 1887.

Test number.	Description.	Original dimensions.			Strain in pounds.		Strain in tons.	Contracted dimensions.			Contraction of area per cent.	Elongation per cent.	Remarks.	
		Breadth	Thick-ness.	Area.	Total.	Per sq. in.		Breadth	Thick-ness.	Area.				
1	Cut from the axle which broke on the Petersham Viaduct.	1.00	1.00	1.00	69000	69000	30.8	.71	.71	.504	49.6	25.5	Limit of elasticity = 36,000 total.	
2		1.00	1.00	1.00	70000	70000	31.2	.71	.71	.504	49.6	21.2		" = 36,000 "

B		2.00	.50	1.00	101500	101500	45.3	1.90	.480	.912	8.8	9.6		" = 36,000 "
B ¹	2.00	.50	1.00	100000	100000	44.6	1.88	.470	.883	11.7	11.0	" = 34,000 "		

NOTE.—Specimens A¹ and B¹ were annealed in ashes;

Tested October 18th, 1887.

C ¹ D ¹ D	Cut from the axle which broke on the Petersham Viaduct.	1.50	.50	.752	64000	85106	37.9	1.34	.446	.597	20.6	15	Limit of elasticity = 35,000 total.	
		1.505	.50	.752	30000	40000	17.8	Immeasurable.						" = 35,000 "
		1.510	.50	.755	67000	88741	39.6							" = 34,000 "
		1.505	.50	.752	66500	88430	39.4	1.335	.442	.580	21.5	15		" = 34,000 "

NOTE.—1. C and D were annealed in ashes; specimens C¹ and D¹ were annealed in hot water.

2. The total elongation measured on 10 inches in specimen D¹ was not more than $\frac{1}{8}$ inch.

3. The loads recorded for specimen C¹ are in excess, as the steel-yard was not quite raised when the specimen fractured.

W. H. WARREN, Wh. Sc., M.I.C.E.,
Professor of Engineering,
University of Sydney.

Evidence of Mr. W. V. Read, Traffic Manager:—

The average weight of the express goods train? The average weight of the express goods train between Sydney and Picton, exclusive of engine and tender, is about 180 tons. The actual weight on the day of the accident was 192 tons.

The average weight of the passenger mail train running over the same ground? The weight of the mail train in the same section is about 100 tons.

The average speed of both? The speed of the goods is about $26\frac{1}{2}$, and the mail $27\frac{3}{4}$ miles an hour.

The brake-power fitted to both? Apart from the engine and tender, in each case, there are two brake-vans (one of them loaded) on the goods, while on the mail every vehicle is braked.

A list of the combustibles which were likely to explode, or by concussion cause a fire? There was a large quantity of spirits, and some gasoline, kerosene, and six tin-lined cases of vestas, and some dynamite, but there is every reason to believe that the fire was not caused either by the matches, gasoline, or dynamite. Your opinion as to whether it is desirable or necessary to have such a train fitted with an automatic and continuous brake? I am decidedly of opinion that such a train as the express goods should be fitted with a continuous and automatic brake.

Your opinion if this particular train had been so fitted would the damage done be confined to the breaking of the axle, or do you think it would have prevented the trucks from going over the bridge? I can hardly say that the damage would have been solely confined to the breakage of the axle if there had been a continuous and automatic brake throughout the train, but I quite believe it would have prevented a number, at all events, of the trucks from falling over the bridge.

Any information you may have that would tend to assist me in forming an opinion as to the origin of the fire? It is impossible to say whether the fire was caused by the combustible material which was in the trucks, or whether it was due to an explosion of gas in the carriage which was on the train.

Who is the officer that determines the amount of brake-power that has to be put on any particular train. Has it been found necessary to increase the brake-power in this express goods train since it commenced to run? It is the duty of the station-master, and of course of engine-drivers and guards, to point out if they should consider the brake-power insufficient. The train ran for some time with one brake-van only, the same as other trains, but it was pointed out to me that the brake-power was insufficient, and I therefore gave directions for another brake-van to be attached.

Evidence of Mr. Scott, Loco. Engineer:—

The number of axles which have broken on our railways during the last five years? During the last five years twenty-three axles have broken whilst in service.

The cause of breakage? Seventeen by flaws, four by collision, two by the breaking of other axles.

The material of which they were constructed? Two steel (Vickers & Sons), nineteen Taylor Bros.', one Patent Shaft and Axletree Company, and one Cooper & Co., Leeds.

The age and number of axles now in use by same maker as the one that broke? We have in use 395 axles by the same makers (Patent Shaft and Axletree Company) as the one that broke. Until about three years ago no record was kept of the service of axles.

The measures taken by the Department to reduce accidents arising from defective axles to a minimum? With regard to the measures taken by the Department to reduce to a minimum accidents arising from defective axles, I have to state that instructions have been issued to all carriage and waggon examiners and lifters that they are held responsible for the "tapping" and proper examination of all wheels, tires, axles, axle-boxes, springs, couplings, &c., and that no vehicle is to be allowed to run unless it be in a perfectly safe condition. Instructions have also been issued to the foreman blacksmith and foreman turner, that when wheels with iron axles are taken in for the purpose of having their tires or journals turned up, they must be thoroughly examined, and if the journals are found to be worn $\frac{1}{8}$ " below the original size, or any flaw detected in the axle, it must be replaced by a new one. Iron axles when taken out must be annealed before being put in the wheels again. All axles dated 1870, and prior to that year, to be stopped, the wheels pressed off, and the axles thoroughly examined and annealed before being pressed on the wheels again; any that may be found to have the slightest defect to be replaced by new ones. In April, 1886, instructions were issued that all axles were to be marked with a distinguishing number, since which time about 3,000 have been so numbered, and a careful record kept of their service. All keys were dispensed with in wheels and axles ordered during and since 1880, and the wheels have been pressed on by hydraulic power, no shoulder being allowed on the axles at the boss. Two of these have broken—one in consequence of a flaw in the centre, and the other in the journal. In ordering wheels and axles during and since 1883 provision has been made for increasing by $\frac{3}{8}$ in. the diameter in the wheel-seat and journal respectively, and by $\frac{1}{4}$ in. in the centre of the axle. Up to date none of these have broken.

The total number of axles in the service, and the means adopted (if any) of ascertaining the amount of work they do, and the mileage run—how often you lift and examine them? We have about 16,000 axles in service, and a record is now kept of when they were placed under vehicles, &c. The axles are not allowed to run for a longer period than two years before they are lifted and thoroughly examined.

The speed of this particular train as compared with the mail, its average weight and its brake-power? The average speed of the express goods train is 24.6 miles per hour, and that of the mail train 25.6. Average weight of express goods is, including engine and tender, (say) 250 tons; its brake-power amounts to 80 tons, in addition to which hand-brakes are fitted to each truck, which can be utilized if necessary.

Do you consider it a desirable thing, or is it safe, to run this express heavy goods train (say) at 40 miles per hour without being fitted with an automatic brake? I do not consider it desirable to run heavy goods trains at excessive speed without the assistance of an automatic brake.

From your knowledge of all the circumstances in connection with this mishap, do you think it would have been prevented if it had been fitted with the vacuum or Westinghouse brakes? I am not of opinion that the accident would have been prevented had the train been fitted with the vacuum or Westinghouse brakes, but think that the subsequent results might have been minimised had either been available.

As it is considered desirable to have the broken axle tested in various ways, will you kindly forward same to Mort's dock (the middle part and the two ends), as I prefer conducting the tests myself? I have forwarded the broken axles to Mort's Dock and Engineering Company, as requested. Are

Are you quite satisfied it was the breaking of the axle that was the primary cause of the accident, or do you think it possible or probable of its being due to an explosion first, the breaking of the axle following as a natural consequence? In my opinion the primary cause of the accident was due to the breakage of the axle.

Any other information you may have which would tend to assist me in this inquiry? I am not in possession of any fresh information.

What is the age of the axle that broke? The age of the broken axle is seven years, being branded August, 1880. [Photograph herewith].

Who is the officer that determines the necessary amount of brake-power in any train? The requisite brake-power in any train is decided by the Traffic branch.

Is there any rule or regulation in the Department for getting out the brake-power, in proportion to the speed and weight of the train? Rule for brake-power is, that the brake-power of every vehicle must not exceed the weight of itself empty.

What is, in your opinion, the safe load that could be put on each wheel of any goods truck? The safe load that could be put on each wheel of any goods truck is as follows:—Iron axles, with $3\frac{1}{4}$ " journals and $4\frac{1}{2}$ " diameter in nave, can have $2\frac{1}{2}$ tons gross weight per wheel; steel axles, with 4" journals and 5" diameter in nave, can have 4 tons gross weight per wheel. [See also lists attached.]

Have you any regulation limiting the weight on each wheel? Regulations limiting weight on each wheel, weight of a wagon, and carrying capacity, are printed on its side.

What is the standard practice in the old country, and in other colonies, respecting the weight allowed on each wheel of a goods truck? The accompanying list shows the standard continental practice on both State and private railways, and is made obligatory for all new rolling stock. The weights and dimensions are similar in English practice.

AXLES with journal centres not exceeding 6 ft. 6 in. must have the following dimensions at journal, and in the nave carry the undermentioned maximum gross loads per axle.

Minimum diameter of journal.		Minimum diameter in the nave.		Maximum.		Gross Loads.		Remarks.
				For Goods Stock and Tenders.		For Passenger Stock.		
				Steel axles.	Iron axles.	Steel axles.	Iron axles.	
mm.	inches.	mm.	inches.	tons.	tons.	tons.	tons.	
62	$2\frac{1}{2}$	100	4	4·3	3·6	3·44	2·88	Standard Continental practice on both State railways and private railways. The axles to be of best material of their respective kinds, and of proper design, otherwise the loads must be decreased.
66	$2\frac{3}{4}$	105	$4\frac{1}{8}$	5·0	4·2	4·00	3·36	
70	$2\frac{3}{4}$	110	$4\frac{5}{16}$	5·8	4·84	4·64	3·87	
74	3	115	$4\frac{1}{2}$	6·6	5·5	5·23	4·4	
78	$3\frac{1}{8}$	120	$4\frac{3}{4}$	7·5	6·25	6·00	5·00	
82	$3\frac{1}{4}$	125	5	8·5	7·1	6·8	5·63	
86	$3\frac{3}{8}$	130	$5\frac{1}{8}$	9·6	8·0	7·68	6·4	
90	$3\frac{1}{2}$	135	$5\frac{3}{8}$	10·7	8·9	8·66	7·12	
94	$3\frac{3}{4}$	140	$5\frac{1}{2}$	12·0	10·0	9·6	8·00	
98	$3\frac{3}{4}$	145	$5\frac{3}{4}$	13·2	11·0	10·56	8·8	

Evidence of Mr. Shellshear, District Engineer:—

Your opinion on the primary cause of the accident? I am of opinion that the primary cause of the accident was the breaking of an axle, which threw the rear trucks off the rails.

Any information you may have relating to the origin of the fire? I can give no information on this point beyond the fact that there was a large amount of combustible matter in the train, which was probably ignited either by the concussion or perhaps from direct contact with the train lamps.

The difference in speed between this particular train, the mail, and an ordinary goods train? This train is timed to run at practically the same speed as the mail train, and about twice the speed of an ordinary goods train?

What in your opinion is a safe load on the wheel of a goods truck, running (say) at 30 miles per hour? This depends very much on the design of wheel and axle, and would vary from 5 to 10 tons per axle, according to design.

In standard practice what is the maximum load allowed on each wheel? I am not aware of any standard practice limiting the maximum load, except in the case of locomotive axles, the greatest weight on which should not exceed 15 tons with our weight of permanent way. For other stock this limit is only approached in special cases, but for ordinary waggon axles the limit ranges between 5 and 8 tons, as a general rule.

What is the standard weight in other colonies and countries? The average weight in England on waggon stock is about 7 tons on an axle, but it varies from about 5 tons a minimum to 8 tons for a maximum in the case of loaded trucks.

Do you think it safe to run this express goods train without a continuous automatic brake? I do not consider it safe to run any train at the speed the express mixed train is timed to run, unless it is fitted with a continuous automatic brake, the same as our other passenger trains.

Had the train been so fitted would the damage have been confined to the broken axle, and would the brake have prevented the trucks from going over the embankment? I am of opinion that if the train had been fitted with the automatic brake, the same as other passenger trains, the damage done by the broken axle would have been greatly reduced, and that the train would have been pulled up before the trucks reached the bridge, and that they would probably not have gone over the embankment.

Who is the officer who determines the amount of brake-power required for any train? I presume this matter rests with the Traffic Manager and Locomotive Engineer.

Is there any recognized rule or regulation by which the brake-power is in proportion to the weight and speed of train? I am not aware of any such rule in the Department.

Can you suggest anything having a tendency to increase the safety of this train? The safety of this train would be greatly increased if it were fitted with the continuous automatic brake, the same as the other passenger trains.

Evidence of Mr. Pratt, Foreman of Turning Shop:—

Had many years experience in the examination and repairing of axles and wheels.

Has strict instructions from Mr. Scott to exercise the greatest care and caution when inspecting them, and if the slightest doubt exists as to their suitability or safety, to reject them.

Has no reliable means of knowing what amount of work or mileage any axle has done.

Since the 1st of April, 1886, a system of numbering has been established by means of which they could tell how, when, and where any axle or wheel was repaired. The number of axles and wheels numbered up to date is not more than 3,000 to 4,000—about 25 per cent. of the entire stock. This was done at Mr. Scott's suggestion, and thinks it a very sensible and necessary thing to do.

The original finished size of the axle journals is $3\frac{1}{4}$ inches. Have instructions when they are worn down to $3\frac{1}{8}$ inches to discard them.

The wear which takes place in the axles is almost always due to the "heating" of the journals, and but for that the axles run for years and give no trouble.

Cause of heating due principally to want of lubrication, dirt, &c.

Axles made and supplied by different makers used in the Department are—

Vickers'—Of steel.	Cooper's—Steel.
Taylor's—Double fagoted, all iron.	Brunswick Steel—(the one that broke).
Brown, Bailey, & Dixon—Steel.	

Have no hesitation in stating that Vickers' steel axles are the best suited for the work. Have more confidence in them than any other.

Many of the axles—Taylor's and the Brunswick—have a square shoulder cut in close to wheel boss; thinks it a bad plan, and has had instructions during the last four or five years to turn and round the shoulders off. They stand much better since. These instructions apply to iron axles only (Taylor's). No orders to turn the shoulders off steel axles, but thinks it would be a decided improvement if all the axles were served in the same way.

Does not think cutting key-ways in axles hurts them much, never saw any break through the key-way; but the most recent axles are forced on by hydraulic pressure, and have no keys or shoulders; they seldom or never come loose.

Considers the present method of examination the best possible, and can suggest no improvement.

Note.—Asked Mr. Pratt to make out a written statement giving a practical description of his examination.

Memorandum to W. Cruickshank, Esq., Engineer.

Sir,

Eveleigh Station, 6 October, 1887.

I beg to report to you as per request *re* instructions given me by the Loco. Engineer as regards wheels and axles under my immediate supervision, the instructions are as follows:—

To examine every wheel and axle now running on our lines as they come through the turning-shop for repairs, &c. If found to be worn small, or cut below the size stated to run, to have them taken out and replaced with new axles, and not to allow any doubt to exist whatever.

The stated size to run waggon wheels, $7\frac{1}{2}$ journals, is $3\frac{1}{8}$ " and no less.

Carriage axles, 8 in. journals, $2\frac{3}{4}$ " and no less.

Further examinations are as follows:—

When bent axles come in (iron do) we take them out, and if not bent badly we anneal them, put them through the furnace until dark hot, afterwards place them in ashes and let them remain until cool; after they are cold they go to the lathe, and are strung up and sounded, if the sound is good we turn back the shoulders and leave a good fillet, so that in the future we can more easily detect any flaw there may be in the shoulders or elsewhere.

The axles are thoroughly examined as regards the fillet of the same after they come out of the furnace.

I might state there are no new axles put in with square shoulders; all axles are left with long round fillets.

I may further state that all axles and wheels from April 1st, 1886, up to the present, have been numbered, and will continue to be so until the whole are numbered—some 15,000 pairs up to date running.

I may also remark that I am very particular in examining all wheels and axles, as I consider the wheels and axles are one of the most important items on a railway.

WM. PRATT.

Evidence of Mr. Braid, Carriage Superintendent.

Had considerable experience in the examination of rolling stock; pays particular attention to axles and wheels, and in all cases, if there is the slightest sign or indication of a flaw or defect, they are invariably condemned.

Does not know who the officer is who determines the amount of brake-power for this or any other train. Is decidedly of opinion this train should be fitted with a continuous brake; thinks it is scarcely safe to run at the speed without it.

Of opinion that the damage done would in all probability have been confined to the broken axle, and is almost sure the trucks would not have gone over the bridge if an automatic brake had been fitted.

Believes the desirability of having this train fitted with a continuous brake has been represented to the Minister.

Can suggest no improvement in the *method* of inspection; only as the work is increasing two more men are required, as the present staff have rather too much to do.

In two and a quarter years four (4) axles have broken; one of Vickers' broke in the journal, the other three close to wheel boss—don't remember the brands.

Thinks the square shoulder is very bad; it practically nicks the axle; present, that is, recent axles, are made much stronger, and are put on by hydraulic pressure, without keys or shoulders.

Considers this a great improvement; have had no broken axles since this system was adopted.

Has no doubt it was the axle which broke first; nothing to lead anyone to assume or believe an explosion took place first.

There was a considerable amount of combustible goods in the train.

Evidence

Evidence of Mr. Lennox, Foreman Blacksmith :—

Had a large and varied experience in the handling, repairing, and annealing of axles (14 years). The annealing is done by heating them in a slow furnace to a dark red, covering them with ashes, and allowing them to cool.

Has no other guide but the eye in heating them; believes this annealing restores the original structure of the material.

With continuous hard running and vibrations the axles become crystallized in places only—some parts are hard and brittle, other parts remain soft and ductile; but when properly annealed, the harmony of the particles is brought back to its original form.

Thinks the plan of annealing the best known; did not know the method adopted by the Board of Trade and Lloyd's was to heat the steel cherry-red and cool it out in water, whose temperature was 80° Fah.

Vickers' steel is by far the best supplied to the Department, and is best suited for our work. The most reliable material he has ever worked; you can depend on it.

Would always have Vickers' steel, even if he paid more money; it would be the cheapest in the end.

Large percentage of broken axles always go close to wheel-boss; the square sharp shoulder nicks the axle in a somewhat similar fashion to what a smith does when he nicks an iron bar to break it.

Thinks that all axles after doing a certain amount of work should be taken out and annealed, but can suggest no plan by which the mileage run could be ascertained.

Could never rely on Cammell's steel; has little confidence in the material—not only axles, the spring steel is bad; has often found it so.

Of opinion the system carried out by the Department is the best possible for ensuring the soundness and safety of the rolling-stock, especially as regards axles and wheels.

Could think of nothing that would be likely to improve it.

Considers the material (Brunswick steel) of which the broken axle is made, is very much inferior to Vickers'.

Has strict instructions to reject all doubtful axles; if they show the slightest defect they are condemned.

Evidence of Henry Matthews, driver of train :—

Been ten years in the service; four years driving; and has driven this train ever since it started, which was in May, 1887.

At first took twenty-five trucks, but found it too much; reduced to twenty, because they could not keep time; engine could not do it.

Average speed about 30 miles per hour—sometimes goes quicker than that when we require to make up time.

This train runs at the same speed as the mail; it is much heavier.

The brake-power was insufficient at first; had air-brake on engine and tender (Westinghouse); American engines only have air-brakes on engines; found this with one brake-van; could not control the train; but, on reporting same, another brake-van was put on at once—in fact anything for this particular train is attended to at once.

When driving other goods train the speed ranges from 18 to 20 miles per hour; this express goods goes 50 per cent. faster.

Difference between the brake-power of this and the mail train: Mail would have air-brake connected to every carriage, also tender and engine, whereas this train has only air-brake on engine and tender, and the hand-brakes on the two brake-vans.

When the train first ran, found, when the signals were against me, the power was insufficient to stop the train: hence my application for additional brake-power.

Was pretty certain it was the axle that broke first; there is no evidence which would justify anyone assuming that an explosion took place first, the axle breaking afterwards.

Think the fire was caused by concussion, but there can be no certainty about its origin.

Was of opinion that if this train had been fitted with an automatic brake the damage done would have been comparatively small, and in all probability the cars would not have gone over the bridge.

Evidence of Charles Dunn, guard of the train :—

Has had considerable experience as guard; often watches the men examining the train before it starts; they do their work carefully and well.

Examiner Selby is very attentive and painstaking in his inspection.

Tools used in examination; trusts to his eye principally; makes good use of his hammer, lamp, &c.

Was in the brake-van when the accident happened—it was lighted up with gas; the brake-vans are generally charged afresh before starting; don't know the pressure in gasholders when charged.

This train runs as fast as the mail; fastest speed from 35 to 40 miles per hour; average about 30 miles per hour.

Quite satisfied the accident was caused by the axle breaking, and that the fire took place afterwards; quite sure the explosion took place afterwards.

Only one axle broke in the train; never heard of any more than one breaking.

Of opinion that nobody can say with any certainty what caused the fire.

Had no difficulty in brakeing the train in ordinary running, but when signals were against us the brake-power was not sufficient to control the train.

When application was made for extra brake-power it was granted at once.

Of opinion that this train should be fitted with a continuous air-brake (automatic).

If this train had been so fitted the damage done would not have been so great, and think it would have prevented the cars and trucks from going over the bridge.

Twenty cars are as much as the engines can pull to keep time; took twenty-five at first, but had to discard five.

This train takes twenty trucks to Picton, then sixteen to Mittagong (with two engines), then sixteen through to Albury with one engine.

Difference between the speed of this and other goods trains? This travels about 30 miles, the ordinary goods about 20 miles per hour.

This is the only axle that has broken in any train that he had been on.

The officers take every care and precaution in making up this train.

Who determines the amount of brake-power in any train? Does not know.

Evidence of Mr. Harper, Goods Superintendent :—

Has had 17 years experience at this work ; has the entire supervision of all the loading.
 The weight of each truck is distinctly marked on it, also the maximum load it is allowed to carry.
 About 90 per cent. are marked, the other 10 per cent. are not ; but any truck is quite safe with a load of 6 tons, whether marked or not.
 Knows nothing of what axles may be under any particular truck.
 The Loco. Engineer determines the weight to be carried.
 No truck is marked to carry less than 6 tons or more than 8 tons (with four wheels).
 Double trucks, with six and eight wheels, carry from 10 to 18 tons.
 The system of weighing goods, is by making every thing pass over the weigh-bridge, when the correct weight is taken ; the weight of the cart or trolley being always deducted afterwards.
 Have special instructions to always distribute the weight as equally as possible ; every allowance is made for overhanging weight, the object being that no matter how any truck may be loaded, the maximum shall not exceed the direct load marked on the truck.
 The C van, No. 128 (under which the axle broke) was loaded with sugar (all 70 lb. bags) and weighed about 6 tons, the sugar was uniformly distributed, and there was practically the same weight on each wheel.
 Of opinion the trucks would carry more weight with safety, the tendency of the department is to under-load, but when loaded by the owners of the goods, the tendency is sometimes the other way, but strict orders are always given to prevent that.
 Can give no information as to the origin of the fire.

Evidence of Mr. Baker, Examiner in Waggon and Goods Department :—

Been 16 years at this work. Has had considerable experience in examining goods rolling stock, and pays considerable attention to the axles and wheels.
 Has all to do with the making up of the goods trains ; made up the one in question.
 Has particular and special instructions regarding this train, all the trucks, cars, brake-vans, &c., are always of the best, and no car or truck is put in that train, but what has been examined and lifted within a period of two years.
 This is done because of the great speed, weight, sharpness of curves, and length of journey, which this express goods train has to contend with.
 Axles with square shoulders are bad, they almost always break short off by them, close to wheel boss ; they are the cause of all the trouble.
 Axles seldom or never break in the journals, they sometimes get hot and cut, when they are condemned ; cause of heating is the want of oil principally, takes place more in the country than about Sydney.
 A special examination consists in selecting the very best and most reliable of the rolling stock for this train, anything that is in doubtful order is never put in it.
 The system of lifting has been in force since 1881, before that no record was kept of when or where the examination and repairs were carried out ; had nothing to guide us previous to that date, only experience.
 Do not think the method of examination could be improved, could not suggest anything. Have to trust to the eye to detect any flaw, also the sound of the hammer to detect loose wheels, &c.
 No man could have seen the flaw in the axle that broke, it was not possible to tell by sounding whether any axle was sound or not.
 Vickers' steel axles are by far the best, they never break, they are the most reliable.

Evidence of Mr. Staunton, Carriage-lifter :—

Been many years at it (27 years).
 In lifting, examines axles, wheels, &c., has instructions to be very particular, any defects or flaws are always duly marked and sent into turning shop.
 All axles that have been examined and found all right, are painted in journals. This indicates they have been inspected, are sound and fit to go to work ; they are also numbered and a record kept for reference.
 Heated journals often caused by mischief—boys and evil-disposed persons ; also by neglecting to oil the boxes ; dirt, &c. If the axle-boxes are properly attended to they will give no trouble.
 Has recently received instructions that all axles made previous to 1870 are not to be used.
 Some of the axles now in use have been running over 20 years, believes there are some dating back to 1860. The first axles sent out was in 1855—they were of iron, and made hollow, having a 1½ in. hole through them made by Wright, of Birmingham.
 Is of opinion that, considering the total number of axles now in use, the number that break is very small.
 Vickers' steel axles never break, have no doubt they are by far the best.
 Brunswick steel axles are not reliable ; some parts are hard, some soft. Think the square shoulder has a good deal to do with the breaking.
 Don't think the mode of examination could be improved.
 Consider that every possible care and precaution is taken.
 Whenever the slightest defect shows in either axles or wheels they are rejected ; the order to do so came from Mr. Braid.

Evidence of Charles Selby, Examiner of Night Trains :—

Examined the train in question ; always inspect this train ; his principal duty.
 His examination takes place after the train is made up.
 Has instructions to pay particular attention to all the gear about this train.
 All the best rolling-stock is always picked out to make it up.
 Being subjected to special inspection is owing to its weight and the great speed it runs at.
 When examining the train on the 9th September, went all round and under it ; could see nothing wrong.
 No man could detect the flaw in the axle—it could not be seen.
 Considers the method of examination as good and as complete as can be made ; does not think it could be improved.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(CABLEGRAMS, &c., RESPECTING ENGAGEMENT OF MR. E. M. G. EDDY AS CHAIRMAN OF BOARD OF.)

Ordered by the Legislative Assembly to be printed, 21 June, 1888.

Telegram from The Colonial Secretary to The Agent-General.

Sydney, 31 March, 1887.

BILL before Parliament to place railways under independent Board of management. Wish to engage able and experienced man, thoroughly acquainted with best systems of railway management, as Chairman of Board. Make full inquiries, but no agreement to be made till letter on subject has been received in May. Salary, £2,500; term, seven years.

HENRY PARKES.

The Colonial Secretary to The Agent-General.

Sir,

Colonial Secretary's Office, Sydney, 4 April, 1887.

Appended to this letter is a telegram which I sent to you on the 31st ultimo.

2. The Bill about to be submitted to Parliament creates a Board of Commissioners to manage the railways which are opened to public traffic; and this Board will have nothing to do with the construction or maintenance of railways. The Chief Commissioner will be the responsible functionary in the work of management, the other two members of the Board having no power of themselves to outvote him, even though they may dissent from his views. We therefore require for this important office not only a man of proved integrity, but one of sound capacity for the business of railway management and of good experience. It would be an additional positive qualification if he were known for tact and success in dealing with workmen.

3. It occurs to me that Sir John Fowler may probably be able to suggest some gentleman of authority in connection with the great English railways who can afford you valuable advice in your inquiries. From this side you might take into consultation Mr. Alexander Campbell as one who has a fresh knowledge of matters here, and in whose business sagacity much confidence may be placed.

4. I am sure I need not impress upon you the importance which I attach to a proper selection being made, as the success of the new system will largely depend upon the character and capacity of the officer at its head.

The salary which Parliament will be asked to approve of will be £2,500 per annum. I will write to you within a few days explaining fully the terms of engagement.

I have, &c.,

HENRY PARKES.

Telegram from The Colonial Secretary to The Acting Agent-General.

[Confidential.]

Sydney, 4 May, 1888.

RAILWAY Act just passed, by which a Board of Commissioners appointed to manage Government Railways. Term of office, seven years; only removable by Parliament (see letter 4th April, 1887). Chief Commissioner's salary, £2,500. Wish to engage thoroughly experienced man of energetic character from railway service in England. * * * * * Salary fixed by Act; prospect of increase if services satisfactory. * * * * * Inform me before finally engaging. Urgent.

HENRY PARKES.

NOTE.—The omissions represented by asterisks referred to another gentleman with whom negotiations were opened and terminated without result.

Telegram from The Acting Agent-General to The Colonial Secretary.

London, 8 May, 1888.

GIVING attention Railway Commissioner. Taking best advice before recommending.

DANIEL COOPER.

Telegram from The Acting Agent-General to The Colonial Secretary.

London, 31 May, 1888.

Most difficult to find Railway Commissioner; Allport has failed so far to name one; think I may secure Eddy, of Caledonian, at £3,000 per annum. Marindin and Allport say he is nearest your standard. Consult Speight of Victoria in confidence about Eddy, and direct me what to do.

DANIEL COOPER.

NOTE.—In consequence of the reference to Mr. Speight in preceding telegram, a letter was written to that gentleman requesting him to state anything that he might know of Mr. Eddy's railway experience, and the following letter was received in reply:—

Mr. R. Speight to The Colonial Secretary.

VICTORIAN RAILWAYS.

Dear Sir Henry,

Melbourne, 4 June, 1888.

In reply to your note of the 1st, I have no personal knowledge of the gentleman you refer to, but if it is Mr. C. W. Eddy I know he held the position of District Superintendent on the London and North-western Railway when I left home, and I have some recollection of seeing in an English railway paper that he had since taken a superior appointment on the Caledonian Railway.

I have heard him spoken favourably of in his London and North-Western position, and the fact of his transfer to the Caledonian Railway is evidence to the same effect.

Yours, &c.,

R. SPEIGHT.

Telegram from The Colonial Secretary to The Acting Agent-General.

Sydney, 5 June, 1888.

Is your Mr. Eddy the Mr. C. W. Eddy formerly District Superintendent of London and North-Western.

HENRY PARKES.

Telegram from The Acting Agent-General to The Colonial Secretary.

London, 5 June, 1888.

CONFIDENTIAL. Seen E. M. G. Eddy to-day. He was twenty years with London and North-western. Last eighteen months with Caledonian. Think he is the man you require. Under 45; open, clear countenance; six feet high; nice firm manner. Am sure he is fully qualified. Will not go for less than three thousand to commence with and promise of increase if services satisfactory. Could leave end of September. Strongly urge you appoint him.

DANIEL COOPER.

Telegram from The Colonial Secretary to The Acting Agent-General.

Sydney, 6 June, 1888.

Engage Eddy at £3,000. Question of increase must be left open in considering engagement.

HENRY PARKES.

Telegram from The Acting Agent-General to The Colonial Secretary.

London, 8 June, 1888.

EDDY has accepted Chief Commissionership at £3,000 per annum with increase if services satisfactory to Colonial Government. Can leave September next, Colonial Government to provide free passage for himself, wife, and child. Send copy of Act appointing Commissioner. I will prepare agreement.

DANIEL COOPER.

Telegram from The Colonial Secretary to The Acting Agent-General.

Sydney, 9 June, 1888.

Re Eddy.—In agreement the Colony cannot be committed to further increase of salary—must be left to justice of Government and Parliament. Passage out will be provided. Copy of Act will be sent.

HENRY PARKES.

The Acting Agent-General to The Colonial Secretary.

London, 14 June, 1888.

HAVE closed with Eddy; £3,000; increase salary left to justice of Government and Parliament. Sir Richard Moon, Chairman, and Findlay, General Manager, of London and North Western, assure me Eddy is very best man you could have selected in Great Britain.

DANIEL COOPER.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

SALARY AND HOUSE ALLOWANCE TO TRAFFIC-INSPECTORS ROBERTS AND CRAWFORD.)

Ordered by the Legislative Assembly to be printed, 15 February, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 21st December, 1887, That there be laid upon the Table of this House,—

“Copies of all papers, applications, minutes, &c., in reference to salary and house allowance to Traffic-Inspectors Roberts, of Junee, and Crawford, of Goulburn.”

(Mr. Lyne.)

SCHEDULE.

No.	PAGE.
1. Minute of Traffic Auditor to Station-master, Goulburn, re rent due by Inspector Crawford, with Departmental minutes thereon. 1 February, 1879	1
2. Application from Inspector Crawford to be allowed house at Goulburn free of rent, with minutes and Return showing names of inspectors, their length of service, &c., with Commissioner's minute recommending application, and Minister's approval of same. 28 April, 1887	2
3. Letter from Inspector Roberts making application for house allowance at Junee Junction, with minute of Commissioner and <i>précis</i> of case, together with Minister's decision. 11 June, 1887	2
4. Minute of Commissioner on above case. 2 February, 1888	3
5. Letter from Inspector Crawford to Minister for Public Works. 3 February, 1888.....	3

No. 1.

Minute of The Traffic Auditor to The Station-master, Goulburn.

RENT return for December, 1879. A. Crawford, £1 1s. 8d.; please say when possession was taken and all particulars. W.S.O., 1/2/79.

Mr. Inspector Crawford took possession of the premises known as the Old Manse on the 1st December, 1878. These premises had been previously jointly occupied by Guard Sinclair at a rental of 3s. per week, (say) 13s. per calendar month, and Guards Doyle and Maloney at 4s. 4d. per month each, in all £1 1s. 8d. per calendar month. The guards gave up possession on August 31st, after which the place was repaired. Mr. Crawford informed me that he would pay the same rent as the others, but I have seen no papers in reference to the subject.—R.R.E., 3/2/79. Traffic Auditor.

Traffic Manager for papers.—W.V.R., 11/2/79. Will Commissioner please advise as to rent to be charged to Inspector Crawford for the house referred to? He now pays the same rent as was paid by the guards.—T.C. Commissioner. What rent allowance is made Mr. Crawford? If it does not exceed £50 a year he should be allowed to occupy Manse in lieu of house rent.—C.R.A.G., 8/3/79. Mr. Crawford to note Commissioner's decision of 8/3/79.—T.C., 11/3/79.

Mr. Crawford will have to pay rent at the rate of £50 per annum since the date on which he first took possession of this house. On and after 1st April rent need not be collected, as I will arrange for the house allowance to be deducted.—T.C., 4/4/79.

Papers having reference to Crawford's rent at Goulburn, please forward.—W.V.R., 12/8/79. Chief Clerk. Herewith.—15/8/79. Mr. Rowe will please note that Mr. Crawford should pay rent at the rate of £50 per annum from 1st December, 1878, to 31st March, 1879; after this date rent is not to be charged.—W.V.R., 18/8/79.

Noted. The rent, therefore, for the four months would be £16 13s. 4d. There has been taken to debit altogether £20 16s. 8d., thus making an over debit of £4 3s. 4d., which can now only be allowed by special credit.—W.V.R., 23/8/79. Traffic Auditor.

Station-master Goulburn, to note and make a special credit entry of £4 3s. 4d.—W.V.R., 25/8/79.

When my revenue book was returned from Audit Office the amount of £22 2s. 8d. was erased, and £14 10s. substituted in its place. I have only taken the latter amount to debit.—J.W., 26/8/79. Traffic Auditor. £4

498—

[817 copies—Approximate Cost of Printing (labour and material), £2 16s. 6d.]

£4 3s. 4d. was one of the credits against the schedule.—W.V.R., 27/8/79. Station-master, Goulburn.

All that I debited Mr. Crawford with in my July outstanding list was £14 10s. Will you please inform me if I shall debit him with £2 3s. 4d. this month, to bring the amount up to £16 13s. 4d.—J.W., 28/8/79. Traffic Auditor.

Of the £14 10s. outstanding, £12 is owing by Mr. Crawford, and £2 10s. by Mr. Lewton. These amounts should be paid at once. You will, as I have before informed you, require the credit of £4 3s. 4d. against the advice note.—W.V.R., 29/8/79. Station-master, Goulburn.

Noted. Mr. Lewton owes no rent; the £14 10s. outstanding is owing by Mr. Crawford.—J.W., 3/9/79. Traffic Auditor.

No. 2.

Mr. Inspector Crawford's application.

I BEG most respectfully to make the following application, that the quarters now occupied by me at Goulburn, known as the Old Manse, be granted me free of rent, and such grant to take effect from the commencement of the current year.

In support of this application I beg to draw your attention to a length of service of over 26 years to onerous and responsible duties necessitating watchfulness and constant attendance at all hours to the supervision of a large district of over 200 miles where the bulk of the traffic on the Southern Line arises, and a difficult district to work. On these grounds, I respectfully request a favourable consideration of this application.

ALEX. CRAWFORD, 28/4/87.

Would the Traffic Manager please forward this application.—A.C., 28/4/87. For the favourable consideration of the Commissioner.—W.V.R., 3/5/87.

Please place a list with this for the Commissioner's information, showing names of Inspectors S. and W., their length of service in the Department, ditto as Inspectors, and the amount of their respective salaries and allowances.—A.R. Traffic Manager.

Statement herewith.—W.V.R., 9/5/87. Commissioner.

List showing the names of Inspectors in the Traffic Department, their length of service, &c.

Name.	Date of Appointment in Department.	Date of Appointment as Inspector.	Amount of Salary and Allowance.
H. Richardson*	June, 1866	1 January, 1877	£490 per annum.
A. Crawford	May, 1862	1 ,, 1874	£440 ,,
G. J. Roberts	1 February, 1868	14 August, 1878	£440 ,,
E. Higgs	March, 1856	23 July, 1878	£440 ,,
M. A. Hornidge	„ 1868	23 ,, 1878	£440 ,,
S. J. Watson†	31 August, 1858	1 May, 1875	£200 ,,

* Appointed Coaching Superintendent on 1st July, 1883.

† Is this Mr. Watson the Telegraph Inspector? What does he get from Telegraph Department?—CH.A.G., 19/5/87. Yes. He receives £290 per annum from the Public Telegraph Department.—W.V.R., 23/5/87.

As Mr. Crawford is occupying a railway building, I think he might be allowed to do so rent free.—CH.A.G., 31/5/87.

Approved.—J.S., 7/6/87.

Traffic Manager.—A.R., 8/6/87. If this is to date from 1 January, as applied for, the amount of £20 already paid by Mr. Crawford will require to be refunded to him. I enclose voucher.—W. V. READ, 11/7/87. The Minister has approved of Mr. Crawford's application.—CH.A.G., 13/7/87. Traffic Manager. Seen. Please forward voucher for payment.—W.V.R., 16/7/87. Secretary. Pay.—D.V., 16/7/87.

No. 3.

Mr. Inspector Roberts' application.

Sir,

June Junction, 11 June, 1887.

I beg to make application for house allowance. At the present time I am occupying a house rated at £70 per annum, for which I am also paying taxes to the amount of £3 3s. per annum.

In support of this application it may be pointed out that station-masters, &c., are either provided with residences or allowed an allowance in lieu thereof, and I respectfully submit that the district traffic inspectors have equal claims to the same consideration.

I am given to understand, too, that some of the traffic inspectors are already allowed a Government house, rent free, or receive an allowance.

Under the foregoing circumstances, I think it is but fair that all should be placed on the same footing, and I trust you will give this an early and favourable consideration.

I should be quite satisfied with an allowance of £52 per annum towards my present rent, paying the balance out of my own pocket.

I am, &c.,

G. J. ROBERTS.

I enclose application from Mr. G. J. Roberts, traffic inspector, June Junction, that he be granted an allowance in lieu of a free residence, and recommend it for the Commissioner's favourable consideration.—W.V.R., 14/6/87. Commissioner.

Mr.

Mr. Inspector Crawford, living in a public building at Goulburn, was allowed to have it rent free. This concession is made a precedent for the rent of the inspectors. Mr. Roberts' application is the first, but others will follow. There are papers about the residences of the inspectors. They had an allowance at one time in lieu of quarters. This allowance was subsequently merged into the salary. They now apply for the allowance again.—CH.A.G., 13/7/87. Make *précis*.—CH.A.G., 5/8/87.

Inspector Roberts' application for rent allowance.

11/6/87.—Inspector Roberts made application for a rent allowance, stating that he was paying, in rent and taxes, £73 3s. per annum, and basing his claim upon the circumstances of station-masters obtaining such allowance when not provided with houses, and of some of the traffic inspectors occupying Government houses rent free or receiving an allowance. Traffic Manager recommended the application.

13/7/87.—Commissioner minuted that Inspector Crawford, living in a public building at Goulburn, was allowed to occupy it rent free, and that this concession was made a precedent. Mr. Roberts' application was the first, but others would follow. The traffic inspectors formerly had an allowance in lieu of quarters, but subsequently it was merged into the salary, and now they were applying for the allowance again. *Précis* to be made.

Prior to 1883, the traffic inspectors had an allowance of £50 per annum in lieu of rent, except Inspector Roberts, to whom an allowance of £75 per annum was made because he was located in a place where rents were unusually high.

In 1883, the salaries of the inspectors were increased to £400 per annum, with the express understanding that the rent was to be included in that sum.

Inspector Crawford became the tenant of the Old Manse, at Goulburn (the property of the Department), on the 1st December, 1878. The papers are mutilated and imperfect, and it is by no means clear what rent Mr. Crawford paid at the outset, but for some years prior to January, 1887, he paid 20s. a week.

28/4/87.—In April, 1887, Inspector Crawford made application to be allowed to occupy the Old Manse, at Goulburn, free of rent from the commencement of the year. On the recommendation of the Traffic Manager, the Commissioner minuted that as Mr. Crawford was occupying a railway building, he (Commissioner) thought he might be allowed to have it rent free, and Mr. Secretary Sutherland approved.

C.A.B., 13/9/87.

I do not see my way to recommend that a house allowance be made to the traffic inspectors.—CH.A.G., 16/9/87. For Minister's information.—CH.A.G., 16/9/87. Seen.—J.S., 21/9/87. Forwarded to Mr. Roberts to see. Please return early.—D.K., 23/9/87.

Seen. Permit me to point out, however, in the hope that the Commissioner will favourably reconsider his decision, that a house being provided by the Department for the inspector at Goulburn is tantamount to increasing his salary fully £50 per annum, for I assume he would otherwise have to pay such a sum annually for a dwelling. I respectfully beg to submit that this is not equitable to the other inspectors, who are not allowed such a privilege or an allowance in lieu of residence. There are 494 miles in the district under my supervision, and if there is not a very heavy traffic over any portion of it there certainly is a fluctuating traffic which necessitates almost constant care and attention to manage economically. Next February will complete my twentieth year in the service of the Railway Department.—G. ROBERTS, 29/9/87. The Traffic Manager. Commissioner. W.V.R., 4/10/87.

No. 4.

Minute of The Commissioner for Railways.

As these papers have been called for by Parliament I must write a minute of explanation in connection with the respective positions and remunerations of Messrs. Crawford and Roberts and other inspectors of traffic, which I would, in consideration of the other inspectors, gladly have avoided doing.

Mr. Crawford is the oldest eligible officer employed as inspector, and his claims for promotion in the Department have been somewhat overlooked. I wish to place on record my opinion that of all the inspectors he is the best qualified to fill the position, and I say this without wishing in any way to detract from the services of Mr. Roberts or other inspectors.

Had the cases been reversed, had Mr. Roberts occupied a Government house, and had Mr. Crawford been in Mr. Roberts' position, I could not have supported an application made by Mr. Roberts for free residence.

I do not consider that Mr. Crawford, with his free house, is paid too much, nor do I consider the other inspectors underpaid.—CH.A.G., 2/2/88.

No. 5.

Mr. Inspector Crawford to The Secretary for Public Works.

Sir,

Goulburn Station, 3 February, 1888.

In compliance with your request I most respectfully beg leave to briefly state the chief incidents in my career prior to joining the Railway Department in this Colony.

I joined the Caledonian Railway Service in 1851 as telegraph operator (then 14 years of age), remained five years as operator and booking clerk; resigned and joined the Edinburgh and Glasgow Railway Service as guard; at the expiration of 12 months was appointed station-master, filled the latter position four years prior to arriving in this Colony in May, 1862. Joined the New South Wales Railway Service immediately on arrival, so that I had 10 years railway service and one year telegraph service prior to arriving in New South Wales.

I have, &c.,

A. CRAWFORD.

1887.
(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.
(ALLEGED FRAUDS—INFORMATION RESPECTING.)

Ordered by the Legislative Assembly to be printed, 4 November, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 24th June, 1887, That there be laid upon the Table of this House, Returns showing,—

- “ (1.) The estimated total loss, without interest, sustained by the Railway Department through the alleged illegal practices of the forwarding agents, under which they paid the said Department less than the rates for trainage set forth in the published table of rates.
“ (2.) Until what date in the past has an investigation been made, with a view to ascertain when the alleged illegal practices of the forwarding agents commenced.
“ (3.) The estimated loss to the Railway Department through the alleged illegal practices of the forwarding agents during the twelve months ending 30th April, 1886.
“ (4.) The estimated increase to the revenue of the Railway Department through the termination of the alleged illegal practices of the forwarding agents for the twelve months ending 30th April, 1887, or from time (giving date) when the alleged illegal practices ceased till the 30th April, 1887.”

(Mr. Walker.)

REPLIES.

- (1.) The loss sustained by the Department is estimated at £25,000.
(2.) The autumn of 1878.
(3.) Estimated at £3,500 to £4,000.
(4.) From the time when the alleged illegal practices ceased, viz., beginning of 1886 to 30th April, 1887, it is estimated that the increase in the revenue consequent upon the stoppage of the improper practices will be equal to the amount of loss resulting from those irregularities as furnished in reply to question No. 3.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(DISMISSAL AND REINSTATEMENT OF ENGINE-DRIVER DANIEL CORKERY—REPORTS, &c.)

Ordered by the Legislative Assembly to be printed, 28 February, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 15th November, 1887, That there be laid upon the Table of this House,—

“Copies of all reports, letters, papers, &c., in connection with the suspension, dismissal, and reinstatement of Daniel Corkery, Engine-Driver, in the “Railway Department.”

(Mr. Lyne.)

SCHEDULE.

NO.	PAGE.
1. Report by Driver Corkery against Driver Harmond ; inquiry, and dismissal of Corkery. 9 February, 1886	1
2. Application by Corkery for half-pay during absence from duty. 15 March, 1886	5
3. Letter from Mr. Williamson, M.P., to Secretary for Public Works, asking for further inquiry into Corkery's case. 22 March, 1886	5
4. Minute by Secretary for Public Works, asking for copy of depositions in Police Court case, Corkery v. Harmond ; with copy of same. 5 July, 1886.	5
5. Letter from Corkery to Dr. Renwick, M.P. ; minute by Minister ; <i>précis</i> of case, and Minister's minute, authorizing Corkery's reinstatement. 23 August, 1886.	8
6. Application by Corkery for half-pay during suspension, and reply. 17 January, 1887.....	9

No. 1.

Report by Driver Corkery against Driver Harmond.

MEMO. to Mr. Cobb,—

I went down Darling Harbour about 2 p.m., and when I was passing engine No. 40 the driver of that engine called me a ——— liar, a scoundrel, and a dog. I gave him no cause to abuse me. At about 2:30 p.m. Harmond came to where I was shunting on No. 1 main line, and he called me the same names over again, and he then challenged me to come off the engine. I told Harmond to go away. Harmond went away, but he came back again with an iron bolt in his hand, and as I was drawing a train down the main line he struck me with the iron bolt, after which he threw the bolt at me. When I was struck with the bolt I almost fell from the engine. Harmond was the worse of drink at the time. It was an axle-box keep-bolt that Harmond struck me with. I have had to leave off work owing to the pain in my back where I was struck with the bolt.

D. CORKERY, 9/2/86.

This is a serious charge, made by one driver against another, and as reference has been made to several of the Traffic Branch, I suggest that the usual joint inquiry be made.—J.C., 10/2/86. Locomotive Engineer.

Mr.

545—A

[817 copies—Approximate Cost of Printing (labour and material), £7 2s. 0d.]

Mr. J. Cobb,—

Sir,

As it has been reported that Driver Harmond was under the influence of liquor while on duty yesterday evening, I think it my duty to state that I spoke to him about 5 p.m., and I saw nothing about him from his ordinary manner, and I feel quite satisfied that he was perfectly sober.

9 February, 1886.

P. MULHOLLAND.

Sir,

Driver Corkery accuses Driver Harmond with being under the influence of drink when on duty shunting at Darling Harbour yesterday. Harmond states that you can prove he was perfectly sober. Please let me have the particulars.

Mr. Paul.

9 February, 1886.

J. COBB.

My report duly sent to Traffic Manager, and immediately Corkery came and made the complaint to me I said, "I will come and see Harmond," but Corkery said he was gone to Redfern for water and coal so I said, "I will see him as soon as he comes back," which I did. I questioned the head shunter in charge of the engine and he said he did not see any sign of drink on him, so I called Harmond off the engine. He got down and walked to me quite right and made his statement. I can say he was certainly not under the influence of drink. In fact your men at Redfern would not have let him come down with the engine had he been drunk. Corkery showed me an iron bolt which Harmond, he says, struck him with, but when I questioned the head shunter he said he never saw him do such a thing, and Harmond said he did not do so.

I must say that during the past eight months Harmond has done our work better than any driver we ever had here. I feel it my duty to mention this because during the unprecedented wool season we had and the busy time, he worked harder than any engine-driver we have ever had, and I do not know what we should have done had he been as slow as Corkery. If he had we should have had to come to a stand still, and during all that time I never saw the slightest sign of drink on him.

Mr. Cobb.

CHAS. PAUL, 9/2/86.

THIS is to certify that Mr. Corkery is suffering from an injury to his back, which hinders his attending to his usual business.

8 February, 1886.

M. LONG, M.D.

WITH reference to Driver Corkery's statement *re* me assaulting him on the 8th inst. at Darling Harbour, I beg most respectfully to state: I was shunting at Darling Harbour at about 2 p.m. yesterday, 8th inst., and when Driver Corkery was passing with his engine I called out, "How are you getting on Dan?" Corkery then made a lunar at me by placing his hands to his nose. I did not use any abusive language to Corkery whatever. Nothing else occurred between Corkery and I yesterday, and his statement is utterly untrue from beginning to end. I was not under the influence of drink. I did not strike Corkery with the iron bolt; in fact I never saw the iron bolt which Corkery says I struck him with until it was shown to me this morning by Mr. Cobb. I did not get off my engine yesterday to go for drink nor was any intoxicating drink brought to my engine. I may state that on Saturday, the 6th inst., Driver Corkery and myself had a slight altercation in consequence of Driver Corkery saying he had seen me the worse for drink.

9 February, 1886.

W. HARMOND.

I was firing for Driver Harmond yesterday, the 8th inst. I did not see Driver Harmond strike Driver Corkery with an iron bolt. If he had done so at the time stated I must have seen the result. I have heard Driver Harmond's statement read, and I certify that it is a true statement.

9 February, 1886.

A. RANKIN.

IN answer to your request, I beg to state that I saw Driver Harmond at a distance when he was going out of the running shed on his engine for Darling Harbour at 4.45 p.m. and he appeared to be perfectly sober.

9 February, 1886.

Mr. J. Cobb.

E. HARRISON.

Sir,

I have been requested to state what I both saw and heard on the 8th of the present month, at Darling Harbour, in respect to the assault committed by Driver W. Harmond on Driver D. Corkery. The facts of the case are these:—When we arrived at Darling Harbour, engine No. 40 was standing on the back shed road or siding, received a signal to proceed ahead, which signal I passed to my mate, we went from the up main line to the outside road or siding, and brought a train down for the purpose of shunting it, and while drawing it down I saw Driver Harmond on his engine for the first time, he having previously been off of it, and he began to call out, you —— dog; you —— mean tinker; you are no —— man at all; you —— liar; I will meet you at night you —— mean scoundrel. Driver Corkery never answered a single word in response to this kind of behaviour. Driver Corkery still going on with his work taking no notice whatever when Driver Harmond began the same insulting remarks as he had previously used. This time he was alongside of engine No. 193, and off his engine. He challenged Corkery down off of his engine to fight, which was not acceded to. Driver Corkery asked Harmond did he think he was sober at the time, and he (Harmond) said, "I am more sober than you are." Here we left one another till we had put the required amount of trucks on to the train for Sydney or elsewhere. There were some waggons loaded with hay or wool. We had to back them up the up main line, so as to be able to get the trucks clear of the siding points. I received a stop signal to stop, which was done. I received a hit up signal backwards, which was also done, and while stopping or holding the remainder of the train on. I saw Driver Harmond pick up a bolt of iron or box-keeper belonging to a truck, he passed through between where the waggons were cut off, and then came up to Driver Corkery, and started to curse and swear as he had done before; the train was in motion at this time, and as the weight was taking us along, Driver Harmond deliberately hit Driver Corkery in the back with this iron; I saw this myself, and

10 February, 1886.

and then threw it at him, which if it had struck him, must have caused serious injury besides the one already inflicted. To the best of my belief Driver Harmond was far from being sober at the time, or else he would never have said or done what he did do, and then when he returned from his dinner he put or extended his hands to his nose, and pooh-poohed at Corkery. Driver Corkery gave no provocation whatever to curse.

Mr. Cobb.

I remain, &c.,

W. G. PERIGO.

The Traffic Manager,—

11 February, 1886.

The following is an extract from a report received from Driver D. Corkery, engine No. 193, shunting at Darling Harbour on the 8th instant, and is forwarded for information :—

"I went down Darling Harbour about 2 p.m., and when passing engine No. 40, the driver of that engine (W. Harmond), called me a ——— liar, a scoundrel, and a dog; I gave him no cause to abuse me; at about 2:30 p.m. Harmond came to where I was shunting on No. 1 main line, and called me the same names over again, and he challenged me to come off the engine; I told him to go away; Harmond went away, but came back again with an iron bolt in his hand, and as I was drawing a train down the main line, he struck me with the bolt, and afterwards threw it at me; when I was struck with the bolt I almost fell from the engine; Harmond was the worse for drink at the time; it was an axle-box keep bolt that he struck me with; I have had to leave off work owing to the pain in my back, where I was struck with the bolt." Driver Corkery's fireman, Perigo, corroborates the foregoing statements.

Driver W. Harmond states: "I was shunting at Darling Harbour at about 2 p.m. on the 8th instant, and when Driver Corkery was passing with his engine, I called out, "How are you getting on Dan?" Corkery then made a lunar at me by placing his hands to his nose; I did not use any abusive language to him whatever; nothing else occurred between Corkery and myself on the 8th instant, and his statement is utterly untrue from beginning to end; I was not under the influence of drink; I did not strike him with the iron bolt which he says I struck him with, until it was shown to me this morning (the 9th instant) by Mr. Cobb; I did not get off my engine for drink, nor was there any intoxicating drink brought to my engine;" I may state that on the 6th instant Driver Corkery and myself had a slight altercation in consequence of him having said that he had seen me the worse for drink."

A. Rankin, firing for Harmond on the 8th instant, states: "That he has heard Harmond's report read, and can certify that it is a true statement."

Mr. Paul, Station-master at Darling Harbour, says: "That I called Driver Harmond off his engine shortly after the occurrence, and can certainly state that he was perfectly sober; I also questioned the head shunter, and he says that he never saw Harmond strike Corkery, and further substantiates Driver Harmond's statement."

Shed-Inspector E. Harrison and P. Mulholland also state that they saw Driver Harmond on the evening of the 8th instant, and he was then perfectly sober."

I shall be glad if you appoint one of your officers to inquire into the matter with Mr. Cobb.

W. SCOTT.

This is a matter in which the traffic men are not concerned, and it hardly seems necessary to hold a joint inquiry, but if Mr. Scott wishes one of the traffic officers to assist Mr. Cobb in investigating the matter, I will request Mr. Richardson to do so, and I have instructed him accordingly.—W. V. READ.—19/2/86.

To Mr. Cobb,—

27 February, 1886.

Sir,

I beg to report for your information that, on the 18th inst., Driver Daniel Corkery summoned me to appear at the Central Police Court upon a charge of assault.

The case was heard on the 25th instant, and the decision of the Court was "Case dismissed, with costs in my favour."

I have, &c.,

W. HARMOND.

In accordance with instructions contained on T.W.'s M.P. a572, and Locomotive Engineers 86-1,949, I held an inquiry, in conjunction with Mr. Cobb, at Mr. Cobb's office, this day, into the case of Driver Corkery and Driver Harmond, for being on duty in a state of liquor on 8th February last. Corkery and his fireman were examined, and adhered to their former statements, viz., that Harmond was not sober, and that he (Harmond) had assaulted Corkery. The case of assault was tried at the Central Police Court and dismissed, Corkery having to pay costs. In connection with the other charge, Harmond gives a positive denial to it, and states he had not tasted intoxicating liquor of any sort for some days previous to the 8th February, and that with the exception of the time he was off for breakfast on the day in question, he had not left his engine. He returned from breakfast at 9:30 a.m., and it was after 2 p.m. when Corkery charges him with not being sober. Fireman Rankin, a total abstainer and a non-smoker, is positive Harmond had not had any drink on the day in question; and during the four months he had been with him had always found him a very steady and sober man. Mr. Paul, the station-master at Darling Harbour, was also examined, and he says that there was not the slightest trace of drink on Harmond on the day in question, and although he had Harmond in the yard all through the late very busy wool season, and had actually been on the engine with him at day and night, had never seen the slightest trace of drink on him, and he considered him the best driver he had ever had in the yard. Head-shunter Rohan and Shunter Court also say that Harmond was sober at the time referred to. I can come to no other conclusion than that Corkery's report against Harmond is untrue, as such men as Mr. Paul and Fireman Rankin—both total abstainers—would be the first to detect the smell of drink, or notice the manner of Harmond, if he had been any way under the influence of it. The Police Magistrate must also have discredited Corkery's statement *re* the assault, to have given the decision he did, and, in the face of such decisions, I must draw attention to the danger of having such men in the Service as Corkery and his mate as would bring such unfounded charges against fellow employes.

I do not know what conclusions Mr. Cobb may have come to, but I send these papers forward to him to express his opinion as to the guilt or otherwise of Harmond.

H. RICHARDSON, 10/3/86.

Daniel Corkery, engine-driver, states: I have heard my report, marked A, read over. It is correct in every particular.

D. CORKERY, 10/3/86.

(A.)

(A.)

Driver William Harmond struck me in the small of the back with an axle-box keep-bolt, at 2:40 p.m.; at 2 p.m. I arrived at Darling Harbour, and as I passed by engine No. 40, Driver William Harmond called me a ——— liar, a ——— scoundrel, and a ——— dog; I gave him no cause to do so; at about 2:30 p.m. he came up to my engine, which I was shunting on No. 1 main line; he called me the same names over again, and challenged me to get off the engine; I told him to go away or I would put him where I would find him; he went away, and came back again with a bolt of iron in his hand, and struck me with it as I was sitting on the handrail of the engine and drawing a train down No. 1 main line; he then threw it at me, after hitting me with it; when he hit me with it I nearly fell back off the engine; I was going at a speed of about 4 miles an hour at the time, and if I fell I would have been killed; the man Driver Harmond was the worse for liquor at the time; he was not sober; I asked head-shunter Rohan to come with me to see the state Driver Harmond was in; he said it was no use making a bother about it, that he would be going away presently; I asked him where Mr. Paul or Mr. Conley were; he said that they were not there; that was at 2:45 p.m., and he, Driver Harmond, left Darling Harbour at 2:50 p.m. and came back at 5:10 p.m.; I spoke to Mr. Paul about it; I am now obliged to leave off work through the pain in my back; I have put the bolt in the office for inspection.

H. Court: Am shunter at Darling Harbour, and was employed on 8th February last; commenced duty at 2 p.m.; Corkery came on duty with his engine at same time, 2 p.m., and Harmond left Darling Harbour for Sydney in about half an hour after, and during this time I was employed with Corkery's engine, and if Harmond had called out or used any language towards Corkery I think I must have heard it; I did not see Harmond leave his engine or come near Corkery; I did not have any conversation with Harmond between 2 and 3 p.m., and cannot speak as to his condition at that time, but after 5 p.m. I spoke to him, and he was then, in my opinion, perfectly sober; Harmond has been shunting at Darling Harbour for some months, and I have always found him to be a sober man.

By Corkery: When you stopped your train to complain of Harmond striking you I was riding on a truck about two or three lengths from your engine, on same side of train as Harmond's engine; Rohan was riding on same side of train so far as I can remember when you spoke to him; you asked Rohan to come through, as you were in danger of your life; you demanded Rohan to come through; a few words passed between Rohan and yourself before he went through; I don't know what Rohan said to you; I think you had more than a dozen trucks on your train.

H. COURT, 10/3/86.

P. Rohan: I am head shunter at Darling Harbour, and was so employed on the 8th February last, commencing at 2 p.m., when Harmond was driving until a few minutes past 2; during the time Harmond was on duty with me I considered him perfectly sober, and nothing unusual in his manner; I heard no words made use of by Harmond towards Corkery; Corkery complained to me about Harmond striking him, but I saw nothing of the affair, although I rode past on Corkery's train, about 10 lengths from his engine.

P. ROHAN, 10/3/86.

A. Rankin: I am a fireman, and was so employed on Harmond's engine at Darling Harbour on 8th February last; I have heard Corkery's charge against Harmond of calling him a ——— scoundrel, a ——— liar, and a ——— dog, and also accusing him of being under the influence of liquor at the time; the charge is untrue; if such words had been used I must have heard them; he was not under the influence of liquor at the time; he had no drink of any kind (*i.e.* intoxicating) on the engine, and he never left the engine from breakfast-time; if any liquor had been about I should have seen it; I am a teetotaller myself; I neither drink nor smoke; I have been nearly four months with Harmond, and always found him sober, and never saw him under the influence of liquor.

A. RANKIN, 10/3/86.

C. Paul: I am station-master at Darling Harbour; I recollect the 8th of February last, when a report was made *re* conduct of Driver Harmond; shortly after dinner-time, between 2 and 3 p.m., Corkery came to my office and stated he was in danger of his life, as Driver Harmond had struck him with a bolt, and that he (Harmond) was in a state of liquor; I said, "I will come at once and see him"; Corkery said Harmond had then left the yard, and I told him to let me know when he returned; shortly before 5 p.m. Corkery reported that Harmond had returned; I then went towards the engine and met Shunter Rohan, and told him Harmond was reported as not being sober; Rohan remarked, "I know nothing about that, but he is able to do his work well, and you had better come and see him yourself"; I called Harmond from his engine, and he came to me; I saw nothing in his manner to substantiate Corkery's report; he appeared to be excited, however, and on my remarking it to him he said Corkery had challenged him with having assaulted him, and that had excited him; I did not smell any drink on him, and I consider I am able very quickly to detect any one under influence of liquor, and had Harmond been so affected I must have detected it; Harmond has been nearly nine months driving at Darling Harbour, and through the busy wool season I have been on his engine at all hours of day and night, and I have never noticed the slightest effect of drink on him; in fact I consider him the best driver I have ever had at Darling Harbour.

C. PAUL, 10/3/86.

G. Perigo: I am fireman, and was employed in such capacity on Driver Corkery's engine on 8th February last; I have heard Driver Corkery's statement read, and it is correct. [*Marked A attached.*] I am quite positive Harmond made use of the language complained of, and was on this account I considered him under the influence of liquor; I do not think he would have said what he did, or acted as he did, had he been sober.

In reply to Harmond: I did not see Corkery making grimaces at you; I did not see him hold up his tea can and say, "Will you have a drink of beer"? I did not have any conversation with you at the time in question.

G. PERIGO, 10/3/86.

W. Harmond: I am an engine-driver; I have heard Driver Corkery's report of 8th July read, and in reply have to say it is incorrect; on the day in question I came on duty at 5:30 a.m., and was employed up to 2:30 p.m., at Darling Harbour shunting; at about 8:15 a.m. I was relieved for breakfast for one hour, and resumed work at or about 9:30 a.m., and from this time up to the time Corkery arrived (about 2 p.m.) I was continuously employed, and never left my engine; I had not tasted a drop of any sort of intoxicating drink of any kind on that day, or any day previous, *i.e.*, for some three or four days previous to the 8th February; I did not go near Corkery, neither did he come near me on the day in question; I do not consider he was in a position to judge of my condition.

W. HARMOND, 10/3/87.

I HAVE given every attention to this matter, and at the joint inquiry held yesterday Driver Corkery was allowed to call and cross-examine any witnesses he thought proper. Both he and his fireman Perigo seemed to exhibit a most vindictive feeling against Driver Harmond. In my opinion, Corkery has utterly failed to prove the charge he made of insobriety against Harmond. The other case of assault having already been decided against Corkery at the Police Court, I must say that I quite coincide with Mr. Richardson's minute. I also consider that such men as Corkery and his fireman Perigo (who backed him up in all his untruthful statements) should not be allowed to remain in the Service. I may state that after the inquiry was finished, I called Corkery's attention to the fact that since receiving the doctor's certificate of 8th February he had not been near me to offer any explanation as to his absence, as I had seen him several times about the streets; and moreover, it had been reported to me that he was most active as a canvasser at the late election at Redfern. He admitted this, but stated that he was still suffering from the effects of the assault committed on him by Harmond, and sent the attached certificate to-day.

J.C., 11/3/86.

As

As both Corkery and his fireman Perigo have previously been adjudged as guilty of untruthfulness by the Commissioner, I consider their statements in the face of the rebutting testimony unworthy of credence, and in view of the serious consequences following on such conduct, I consider they should be dismissed the Service. However, as their previous conduct has received the Commissioner's consideration I submit the case for his decision.
The Commissioner.

W. SCOTT, 12/3/86.

Minute of the Commissioner.

THE assault case has been dealt with by the Police Magistrate; with that, therefore, I shall not interfere. I have to meet a case of an untruthful charge of drunkenness brought by one driver against another, supported by the testimony of his fireman. If the charge could not have been disproved, as it seems to me it clearly was, Harmond would have been dismissed. I must consider that the most detestable malice has been shown by Driver Corkery in urging the false charge, and I approve of Mr. Scott's recommendation that Corkery and his fireman be dismissed.

CH. A.G., 15/3/86.

Locomotive Engineer.

Driver D. Corkery and fireman W. Perigo informed.—J.C., 18/3/86.

10 March, 1886.

MR. CORKERY is still suffering from the blow he received some weeks ago, and is unable to attend to his business.

No. 2.

Engine-Driver Corkery to Mr. Loco. Foreman Cobb.

Sir,

15 March, 1886.

I beg to apply for half-pay for the time I have been off duty. I am still suffering and unable to work from the effects of the blow I received from Driver W. Harmond at Darling Harbour while on duty on the 8th February, 1886.

I am, &c.,

D. CORKERY,

Engine-driver.

Mr. John Cobb, Locomotive Foreman.

Please see previous papers. I cannot recommend Corkery's application.—J.C., 15/3/87. Locomotive Engineer. This claim cannot be entertained.—W. SCOTT. Mr. Cobb, 15/3/86. Corkery informed.—J.C., 18/3/86. Locomotive Engineer.

No. 3.

T. Williamson, Esq., M.P., to The Secretary for Public Works.

Dear Mr. Lyne,

Annexed you will find a memo.* from Mr. Goodchap *re* Mr. Corkery. Would you kindly send for the papers, and in the meantime I will forward depositions taken in the case, which will enable you to see if this man should be dismissed.

*Copy of Commissioner's decision, 15/3/86.

THOS. WILLIAMSON.

What are the particulars in this case?—W.J.L., 23/3/86. Papers herewith.—W.S., 27/3/86. The Commissioner. For Minister's information.—CH. A.G., 1/4/86. Seen by Minister, who, however, made at the time, no comment, but said he would consider matter.—CH. A.G., 1/4/86.

No. 4.

Minute by The Secretary for Public Works.

Corkery *v.* Harmond.

I SHALL be glad if a copy of the depositions are obtained in this case. They can be procured at the Central Police Office. Then resubmit, with these papers.

W.J.L., 5/7/86.

Locomotive Engineer. D. C. M'L., 5/7/86.

Sir,

9 July, 1886.

The Minister for Works has requested to be furnished with a copy of the depositions taken at the Central Police Court on 25th February last in the case of Daniel Corkery *v.* W. Harmond, in which the former summoned the latter for assault. I am directed to obtain a copy of same. Could you kindly supply me with this and oblige.

Yours, &c.

W. D. NEWMAN.

Officer-in-charge of Central Police Court.

It is necessary that you apply to the Department of Justice for copy of the depositions in the case mentioned.—C.D.E.L., 9/7/86. Wrote 10/7/86. No reply received up to date.—J.C., 22/7/86. Locomotive Engineer.

Sir,

Sir,

Department of Railways, 23 July, 1886.

I have the honor to ask that you will be good enough to furnish me at your earliest convenience with a copy of the depositions taken at the Central Police Court, on the 25th February last, in the case of Daniel Corkery v. Wm. Harmond for assault.

I have, &c.,

CH. A. GOODCHAP,

The Under Secretary, Department of Justice, Sydney.

Commissioner for Railways.

Sir,

Department of Justice, 3 August, 1886.

Referring to your letter of the 23rd ultimo, in which you apply for a copy of the depositions in the case of Corkery v. Harmond, I am directed by the Minister of Justice to inform you that a copy of the depositions in the above case was forwarded to Mr. John Cobb, of the Locomotive Department, in reply to his request of the 10th ultimo.

I have, &c.,

H. E. PLUNKETT,

C. A. Goodchap, Esq., Commissioner for Railways.

Under Secretary.

Information.—General Purposes.

New South Wales to wit.

BE it remembered that, on this 13th day of February, in the year of our Lord 1886, at Sydney, in the Colony of New South Wales, Daniel Corkery, of Sydney, appears before me, the undersigned, one of Her Majesty's Justices duly assigned to keep the peace of our lady the Queen in and for the Colony of New South Wales, and informs me that, on the 8th day of February, in the year of our Lord 1886, at Sydney aforesaid, William Harmond did unlawfully assault this informant contrary to the Act in such case made and provided, whereupon the said Daniel Corkery prays that I, the said Justice, will proceed in the premises according to law.

DANIEL CORKERY.

Sworn at Sydney, in the said Colony, on the day first above written, before me,—

W. R. STEWART, Justice of the Peace.

Summons.

To William Harmond, of Sydney, in the Colony of New South Wales: Whereas information hath this day been laid before the undersigned, one of Her Majesty's Justices of the Peace in and for the said Colony of New South Wales, for that you did, on the 8th day of February instant, at Sydney aforesaid, unlawfully assault Daniel Corkery: These are therefore to command you, in Her Majesty's name, to be and appear on Thursday, the 25th day of February instant, at 10 of the clock in the forenoon, at the Central Police Office, Sydney, in the said Colony, before such Justice or Justices of the Peace for the said Colony as may then be there to answer to the said information and to be further dealt with according to law.

Given under my hand and seal this 13th day of February, in the year of our Lord 1886, at Sydney, in the said Colony.

W. R. STEWART, J.P.

Daniel Corkery, on oath, states:—I am complainant in this case; the information just read is true, and the defendant is the person alluded to; I am an engine-driver, and so is defendant, both in the Government service; I went to Darling Harbour about 2 o'clock on the 8th instant; I stopped at the home signal; I then got a signal to go to a siding; Driver Harmond was then in truck in a shed off his engine; he began making faces at me; he was 20 yards away from me; I brought a train out from a siding; when I came down he was on his engine on No. 2 line; I was on No. 1 main line; as I passed him he called me a —— dog and a —— scoundrel; he was the worse of liquor; he afterwards got off his engine and came to my engine; he challenged me to fight; I then got a signal to go back, and went; when I came back Harmond was standing with a bolt in his hand; I was sitting on my engine; he then raised his bolt and said, "You ——, I'll do for you"; he then struck me on the hip bone and flung the bolt at me; he did not strike me a second time; I can't work since; I have been under Dr. Long since; I have not been able to do my duty; I never had any illfeeling against the man, and know of no cause for his striking me.

Mr. Bull: I have never shook my hand in defendant's face; I told men about his drinking; I have never been fined but once in the Department for not taking a signal; Harmond had no provocation; I never gave him any cause; I swear he got off his engine; I can't say how far he was away; I asked several persons to look at my back after the assault; Mr. Rohan looked at my back; I will not swear that they did not tell me there was no mark; I have been laid up with pleurisy and sunstroke; Mr. Cobb refused to let me have a bolt; I put in a report and handed the bolt the assault was committed with; it is 6 feet between the lines; my fireman was along side of me.

DANIEL CORKERY.

Sworn at Sydney, this 25th day of February, 1886, before me,—

A. MONEY FISHER, D.S.M.

Mark Henry Long, on oath, states:—I am a duly qualified medical practitioner; I know the plaintiff, and saw him on the 8th February; I examined him and found no marks, but found excessively tender circumscribed spot near the spine; I prescribed for him; I saw him next day, and once or twice since, altogether three or four times; I had attended him previously.

Mr. Bull: A blow would cause such a soreness as plaintiff complained of? A blow with a stone would cause it; I had attended him for bronchitis previously.

MARK LONG.

Sworn at Sydney, this 25th February, 1886, before me,—

A. MONEY FISHER, D.S.M.

William

William George Perrigo, on oath, states:—I am a fireman on the Government Railway; I recollect the 8th of this month; I was present when Harmond was there between 2 and 3 o'clock; he was, in my opinion, under the influence of liquor; we went down to relieve him; I saw Harmond strike Corkery with a bolt; it was similar to the bolt produced; he struck him on the small of the back; Corkery was on his engine; I did not see the bolt thrown; Corkery gave him no provocation; I saw Harmond pick up the bolt from the ground before he struck Corkery; there was no one else present.

Mr. Bull: The engine was about 150 feet away from our engine; Corkery gave no provocation; I did not report; I was not fined 1s. a day for lying.

W. G. PERRIGO.

Sworn at Sydney, this 25th day of February, 1886, before,—
A. MONEY FISHER, D.S.M.

Charles Paul, on oath, states:—I am station-master at Darling Harbour; I recollect the 8th February; Corkery came to me and made a complaint about 3 o'clock; I went at once to see Harmond, but he had gone to Sydney.

Mr. Bull: When Harmond came back, about an hour afterwards, I went to see Harmond; when I saw him he walked straight and denied the charge; I must say Harmond was not drunk; he went to Redfern and came back; he has been principal shunter for eight months at Darling Harbour; I have never seen a sign of drink on Corkery.

CHARLES PAUL.

Sworn at Sydney, this 25th February, 1886, before—
A. MONEY FISHER, D.S.M.

DEFENCE.

Andrew Rankin, on oath, states:—I am defendant's fireman, and was with him on 8th February, in the afternoon; I know Corkery; Harmond was not off his engine between 2 and 3 o'clock; I saw Corkery four or five times; he passed by us; Harmond said to Corkery, "Hallo Dan"; Corkery made faces; Harmond said nothing; defendant could not have got off the engine and struck Corkery without my knowledge; if Corkery swears Harmond struck him he says what is not true; it never occurred; I was with him all day; I have been three months with him; Harmond was not in liquor; Harmond had nothing to drink all day; we had meals together on the engine; Harmond had tea; I made it; I swear he never was off his engine.

Mr. Gannon: I first heard of the assault on the 8th; Rohan, the shunter, told me that Corkery was in danger of his life, he had been struck with an iron bar; I have been talking to Harmond several times about the case; I swear Harmond was not off his engine that afternoon; Rohan told me something about throwing a bolt; I never saw Harmond throw anything; if Harmond got off his engine he could have struck him; Harmond got the summons last Thursday; I have talked about the matter to Harmond.

A. RANKIN.

Sworn at Sydney, this 25th February, 1886, before,—
A. MONEY FISHER, D.S.M.

Patrick Rohan, on oath, states:—I am a shunter on the railway at Darling Harbour; I remember 8th February; I was in Darling Harbour; I saw the plaintiff and defendant there; complainant was on his engine, standing on the line; Corkery was drawing a train out; when he passed about 200 yards I gave him a stop signal after passing Harmond's engine; I did not see him again; I had Corkery in sight until he came and said he was struck with a bar of iron; he had no iron with him; he begged me to come over, and said he was in danger of his life, and he complained about Harmond; Perrigo got the bolt; it was near the tender of his engine, this is, 250 yards from where Harmond was; I don't think Harmond could have struck Corkery without my knowing it.

Mr. Gannon: I did not express surprise that he accused Harmond; Perrigo picked up the bolt and said "That is the bolt;" I never contradicted Corkery; I lost sight of Harmond for a few minutes. I will not swear that Corkery was not struck; I don't think it possible for Harmond to have struck him; Harmond was sober; Harmond may have been off his engine.

PATRICK ROHAN.

Sworn at Sydney, this 25th February, 1886, before,—
A. MONEY FISHER, D.S.M.

Henry Court, on oath, states:—I am a shunter at the Darling Harbour Railway; I remember the 8th February; I know the complainant and defendant; Harmond was sober; Corkery and I went to pull a train down; I went to the points; I noticed nothing until I got down, and Corkery said he was in danger of his life; he said he had been struck; I was 200 yards away when the train was pulled up; the defendant could not have struck plaintiff without my seeing it; Harmond was sitting on his engine; I gave Harmond a signal; he answered; Corkery said he was struck with a piece of iron; I was on the fireman's side; I was between the two engines; if Perrigo and Corkery swear that Harmond struck him it may be true.

H. COURT.

Sworn before me, 25th February, 1886, at Sydney,—
A. MONEY FISHER, D.S.M.

John Ausburn, on oath, states:—I am a shunter on the railway; I know complainant and defendant, and saw them on the 8th February, all the time between 2 and 3 o'clock; I saw no one strike Corkery; I did not see him all the time I went on duty; I saw Harmond on his engine; Corkery told us he was struck; Harmond was on his engine all the time; the bolt was found near Corkery's tender.

Mr. Gannon: About 10 minutes past 2 Corkery said he was hit; they picked up a bolt similar to the one produced; if Perrigo and Corkery swear that Harmond was off his engine and struck Corkery it is untrue; I have had no conversation about this case.

J. F. AUSBURN.

Sworn before me, this 25th February, 1886, at Sydney,—
A. MONEY FISHER, D.S.M.

William

William Harmond, on oath, states :—I am an engine-driver ; I remember 8th February, and know complainant ; I have heard his evidence ; I swear I never struck him with anything on the 8th February ; I have heard what Corkery says about my being drunk ; I never tasted intoxicating liquor on the 8th instant ; there is no truth in Corkery's accusation ; he reported me to Mr. Paul, and when I came back I heard of it.

Mr. Gannon : Mr. Cobb sent for me, and showed me a bolt like that next day ; on Saturday Corkery threatened to report me for being drunk.

W. HARMOND.

Sworn before me, this 25th February, 1886, at Sydney,—

A. MONEY FISHER, D.S.M.

Dismissed—Professional costs, £1 1s.

No. 5.

D. Corkery to The Minister of Public Instruction.

Dear Sir,

23 August, 1886.

I have the honor to ask you for the last time, as a representative of the Redfern electorate to kindly assist me in obtaining an interview with the Hon. W. J. Lyne, Secretary of Works, with reference to my case. I have not had an interview with that gentleman since the 15th April last, which was then granted to me on personal application. By granting this request you will confer a great favour on me.

I have, &c.,

D. CORKERY.

How does Corkery's matter stand. He is very persistent, and I should like to see his case early.—
W.J.L., 25/8/86. *Précis* herewith.—C.A.B., 27/8/86.

Prosecution of W. Harmond by Daniel Corkery for assault.

On the 8th February, 1886, engine-driver Daniel Corkery reported to the Loco. Engineer that Driver W. Harmond that day, after using foul and abusive language to him, had struck him with an iron bar, and then thrown the bar at him ; that he (Corkery) had had to leave off work in consequence of the pain he suffered where he was struck ; and that Harmond was the worse for drink at the time.

Loco. Engineer sent a copy of this report to the Traffic Manager, stating that the allegation was confirmed by Corkery's fireman, W. Perigo, but was altogether denied by Harmond, who asserted that he did not strike Corkery, and never even saw the bolt or bar until it was subsequently shown to him by Mr. Cobb, and he was not in liquor ; that Harmond's fireman certified to the truth of this denial ; that Mr. Paul testified that he called Harmond off the engine shortly after the alleged occurrence and found him perfectly sober, and that this was confirmed by Shed Inspector Harrison and Mulholland.

Would Mr. Read appoint an officer to conduct an inquiry ?

In the meantime Corkery prosecuted Harmond in the Police Court for the alleged assault. At the hearing of the case Corkery deposed to the same effect as already set forth, stating that at the time of the assault Harmond had got off his engine and was standing between the lines with the bolt in his hand. Had asked several persons to examine his back, but would not swear that they had not told him they could see no mark.

Mr. M. H. Long, surgeon, examined Corkery. Found no marks, but there was an excessively tender circumscribed spot near the spine, such as might have been caused by a blow.

W. G. Perigo, Corkery's fireman, confirmed the evidence given by that person.

Mr. C. Paul, S.M. at Darling Harbour, deposed that on the day in question Corkery made a complaint to him ; that he (Paul) went to see Harmond, but he had gone to Sydney. When Harmond came back, in about an hour, went and saw him. He walked straight, and was certainly not drunk.

A. Rankin, defendant's fireman, deposed that Harmond did not get off his engine the whole afternoon ; that he did not strike Corkery ; and that he was not the worse for liquor, having had nothing to drink all day but tea, which he (Rankin) made. He was with Harmond all day, and it was impossible for the latter to get off his engine and assault Corkery without his seeing it.

P. Rohan, shunter, deposed that on the day in question he saw plaintiff and defendant ; the former was standing on his engine on the line. Had Corkery in sight until he came and said he had been struck with a bar of iron, and his life was in danger. Perigo got the bolt which was 250 yards away from where Harmond was ; did not think Harmond could have struck Corkery without his (Rohan's) seeing it ; could not swear that Corkery was not struck, but did not think it possible for Harmond to have struck him ; Harmond was sober.

H. Court, shunter, deposed, that on the day referred to he and Corkery went to pull a train down. He (the witness) went to the points ; noticed nothing until Corkery came to him and said he had been struck and his life was in danger ; defendant could not have struck Corkery without witness seeing it ; Harmond was sober ; if Perigo and Corkery swore that Harmond struck the latter, they might be true.

J. Osborne, shunter, deposed, that he had Corkery and Harmond in sight all the time between 2 and 3 p.m., and saw no one strike Corkery ; Harmond was on his engine all the time ; about 10 minutes past 2 Corkery said he had been struck ; if Perigo and Corkery swore that Harmond was off his engine and struck the latter, it was untrue.

W. Harmond (the accused) swore that he did not strike Corkery as alleged, and that he was perfectly sober, not having even tasted any intoxicant on the day referred to ; on the previous Saturday Corkery had threatened to report him for drunkenness. The case was dismissed with costs, and professional costs £1 1s.

The

The Departmental inquiry referred to in the opening paragraphs of this paper was held subsequently, being conducted by Messrs. Richardson (Inspector) and Mr. Cobb.

The chief evidence having been already summarised in this paper, it will not be necessary to deal with it further, except as referred to in the reports of Messrs. Richardson and Cobb.

Mr. Richardson considered that the dismissal with costs by the Police Magistrate of the charge of assault made against Harmond by Corkery, fully disposed of that part of the case. As regarded the allegation of drunkenness, fireman Rankin, a total abstainer, had testified that Harmond had not had any drink on the day in question, and that he had always found him a steady and sober man. Mr. Paul, also an abstainer, had had Harmond with him day and night during the wool season, and constantly came in contact with him, but never saw the slightest trace of intoxication on him. Harmond was the best driver he had ever had. The other witnesses were equally clear that Harmond was sober. In the face of such evidence Mr. Richardson continued, especially that of Mr. Paul and Rankin, both abstainers, he could come to no other conclusion than that there was no truth in the charge.

The Magistrate had evidently discredited the assault made by Corkery as to the alleged assault, and he (Mr. Richardson) thought there was a danger in having in the service men like Corkery and his fireman, who could thus bring groundless charges against a fellow employé. Mr. Cobb reported that in his opinion Corkery had utterly failed to prove the charge of insobriety against Harmond; that both Corkery and Perigo evinced a most vindictive feeling against Harmond; and that neither of those men should be allowed to continue in the Service. Mr. Cobb added, that Corkery admitted to him that during the time he had been absent from duty in consequence of the injury alleged to have been inflicted upon him by Harmond, he (Corkery) had been taking a most active part as a canvasser for a late election at Redfern.

Mr. Scott minuted that both Corkery and his fireman Perigo had before been convicted of untruthfulness; that in this instance, in view of the rebutting evidence, their statements were unworthy of belief; and that he recommended their dismissal from the service.

Commissioner minuted that the charge of assault having been dealt with in Court he would not interfere, and that what he had to meet was a charge of drunkenness brought by one driver (Corkery) against another (Harmond), supported by the fireman of the former (Perigo). If the charge could not have been disproved Harmond would have been dismissed. The most detestable malice had been shown by Corkery in bringing this false charge. Approved of Mr. Scott's proposals to dismiss Corkery and Perigo from the Service, and they were dismissed accordingly.

Mr. Secretary Lyne now minutes on a letter from Corkery to the Hon. Dr. Renwick that he would like to have particulars of the case.

C.A.B., 27/8/86.

Minute of The Secretary for Public Works.

I have read the depositions in this case, and was it not that Corkery and his fireman (Perigo) are accused of having previously been adjudged guilty of untruthfulness, I should certainly consider an injustice had been done by the dismissal of Corkery and his fireman. As the matter now stands I should like to interrogate Mr. Paul before giving a decision.—W.J.L., 23/9/86.

Mr. Paul, I understand, waited upon the Minister this morning.—D.C.M'L., 27/9/86.

Having seen Mr. Paul, and heard all he has to say in this matter, I am satisfied Corkery was struck by someone, and the reasonable inference is, that that person was Harmond. Mr. Paul states Harmond was not intoxicated, nor had he taken sufficient drink to incapacitate him from doing his ordinary work, but he could not say he had not had a glass or two. He also states Corkery was a quiet, but rather slow—perhaps too cautious—man, and he thinks some bad feeling existed between him and Harmond. If Corkery made any mistake, which is anything but clear, he has been severely punished, and now I think should be again employed.—W.J.L., 27/9/86.

Mr. Scott to give effect to the Minister's decision.—Ch.A.G., 27/9/86. Mr. Cobb to carry out.—W. Scott, 29/9/86. Corkery has been reinstated as driver to-day.—J.C., 18/10/86.

No. 6.

Engine-Driver Corkery to The Commissioner for Railways.

Sir,

17 January, 1887.

I have the honor most respectfully to apply for payment of my wages as engine-driver from the time I was struck by Harmond to the date of my return to work, and in doing so the desire to give full justice evinced by the Minister and yourself in inquiring into the facts of my case has made me hopeful that my application will be granted.

The cause assigned for my dismissal was the bringing of a most malicious charge against Harmond, and I firmly believe that I would never have been dismissed if you had been acquainted with the case fully at the time, a belief that is borne out as correct by my being reinstated the instant fuller information was obtained. I trust that you will not think me importunate in bringing this matter before you, for the loss that I have sustained amounts to about £200.

I have, &c.,

D. CORKERY.

I can see no ground for granting request.—Ch.A.G., 28/1/87. Locomotive Engineer. Mr. Cobb to so inform Corkery.—G.D., 1/2/87. Driver Corkery informed by memo.—J.C., 2/2/87.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(INFORMATION RESPECTING TICKET-COLLECTOR EDWARD COOLE.)

Ordered by the Legislative Assembly to be printed, 28 February, 1888.

[Laid upon the Table of the House in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 29, in Votes and Proceedings No. 57, of the 23rd February, 1888.]

QUESTIONS AND ANSWERS.

1. Is there in the employment of the Railway Department a ticket-collector named Edward Coole? Yes.
2. If so, what are his duties? Coole is a ticket examiner, and he also conducts Police Court cases in the Sydney district, when it has been decided to take proceedings under the By-laws.
3. Is it a fact that during the past month he has prosecuted several persons for travelling on expired season tickets? Action has been taken in one or two cases during the past month against persons who have travelled on expired tickets, or short tickets.
4. Is it a fact that the persons (or any of them) prosecuted had ordered season tickets, or a renewal of their season tickets, prior to the date of the so-called offence? Yes.
5. Is it a fact that a man named Candlish, residing at Burwood, was fined at the instance of Coole? Yes; Coole conducted the proceedings against Mr. Candlish, but, as is usual in such cases, he acted under instructions received from his superior officer.
6. Is it a fact that Candlish's ticket was at Burwood Station on the date of the evening of his so-called breach of the By-laws? Yes; Mr. Candlish was found travelling on a ticket thirteen days after it expired. His new ticket had been at Burwood five days previously, but he failed to take it up.
7. Have any complaints been made at any time against Coole by the travelling public; if so, how many? Not that I am aware of. Coole is a very zealous and intelligent officer, and one of the best, if not the best, ticket examiners we have.
8. How long has Coole been in the service? Since the 1st June, 1883.
9. In how many cases has he been prosecutor during that time? Coole was appointed to conduct Police Court cases in January, 1887; since that time he has dealt with about five or six a month.
10. Does Collector Coole receive any remuneration for any cases in addition to his ordinary salary; if so, how much? No.
11. Is it the intention of the Secretary for Public Works to refund any of the fines? It has been decided to refund the fine in Mr. Candlish's case.
12. Is any provision made by the Railway Department to enable people to travel on the line during any delay in the renewal of season tickets? The regulations require that metal tickets should be applied for seven days, and card tickets four days, before they are required. If the Department is not able to supply them within this time, the Traffic Auditor issues a pass in lieu of them. In Mr. Candlish's case there was no delay; the application for the ticket bore office date of the 3rd January, and the ticket was ready for issue on the 8th January. A good deal of latitude is allowed to season ticket-holders. In cases where people who have not been aware of the regulations with respect to the notice required have paid fares in the interim refunds of the fares have been made.
13. Will he cause immediate inquiries to be made as to the way in which the various collectors carry out their duties? Yes.

1887-8.

LEGISLATIVE ASSEMBLY.

RAILWAYS.

(COMPENSATION TO FAMILY OF THE LATE ISAAC WERRILL, GATEKEEPER.)

Ordered by the Legislative Assembly to be printed, 24 April, 1888.

No. 1.

Minute of The Traffic Manager.

Nellie Maude Woolley and Gatekeeper Isaac Werrill, killed at Homebush level-crossing, 29/3/88.

I REGRET to inform the Commissioner that a distressing accident took place last evening at Homebush, whereby a little girl, named Nellie Maude Woolley, 7 years of age, and Gatekeeper Isaac Werrill lost their lives.

The down express passed Homebush at 5.38 p.m., and the up Parramatta train arrived at 5.39 p.m. It appears that as soon as the express had passed the level-crossing gates on the west side of Homebush, Werrill rushed behind it to save the little girl, who was then running on to the up line.

He was too late, the up train struck them both, and they were killed instantaneously. The girl had only a blow on the left temple; but Werrill was cut to pieces.

The bodies were removed to the "Horse and Jockey" Hotel, Homebush, to await an inquest, the result of which shall be forwarded as soon as possible.

30/3/88.

W. V. READ,
per W.H.C.

No. 2.

Minute of The Commissioner for Railways.

PLEASE supply plan.

What are the ages of the children of Werrill?

C.A.G., 3/4/88.

No. 3.

Minute of The Colonial Secretary.

NAME and occupation of the man who attempted to save the child's life on railway last week?

H.P.

No. 4.

Minute of The Commissioner for Railways.

ISAAC WERRILL, aged 58; employed as gatekeeper at level crossing at Homebush Station. First appointed porter at Redfern, 16th November, 1876; he was in receipt of 7s. per diem, and leaves a widow and six children.

Under the Employers' Liability Act the widow would be entitled to three years' wages, equal to £351.

Under the Departmental Regulation Scale the widow would receive £200; three first children (£75 each), £225; each of the others (£50 each), £150; total, £575. The children, however, if over 15 years of age, are entitled to nothing. Some of Werrill's children were beyond the age.

C.A.G., 3/4/88.

No. 5.

Minute of The Colonial Secretary.

I WISH to be informed further in this case as to Werrill's general character, and in particular whether there was any witness of his act when attempting to rescue the child. If it be the case that Werrill fully realized the danger of trying to save the child's life, the act was a fine instance of fidelity to the instincts of humanity.

H.P., 4/4/88.

No. 6.

Minute of The Locomotive Engineer.

Man and girl killed, Homebush.

DRIVER Edward Brennan, engine No. 37, working No. 194 passenger train, Parramatta to Sydney, on the 29th ultimo, reports as follows:—"When approaching the level-crossing gate at Homebush, at about 5.33 p.m., I saw the gatekeeper (Isaac Werrill) standing in the gateway looking towards me. When we approached within 10 or 12 yards from where he was standing, he stepped on the line in front of the engine, taking with him a little girl whom he was holding by the hand.

I immediately sounded the whistle and applied the brakes, but before we could pull up both of them were knocked down and killed. The girl's name was Nellie Maude Woolley."

Mr. Cobb reports attending the inquest, at Homebush, on the 31st, concerning the above. The verdict was that of "death from injuries accidentally received; no blame attached to anyone."

W. SCOTT, 4/4/88.

No. 7.

Minute of The Commissioner for Railways.

ISAAC WERRILL joined the Railway Service in November, 1876.

During the last fifteen months he has been employed on the Suburban Line in various capacities, and his conduct has been good.

In August last he was commended for intrepid conduct in saving a lady who had fallen between the platform and the train, and who, but for Werrill's timely assistance, would probably have lost her life.

No one can be found who actually witnessed the act in which he met with his death; but there is no doubt whatever that he sacrificed his life in full knowledge of the danger he incurred in attempting to rescue the child.

5. April, 1888.

C. A. GOODCHAP.

No. 8.

Minute of The Traffic Manager.

Gatekeeper J. Werrill, killed at level-crossing gates, Homebush, 29/3/88.

IN this case the jury returned a verdict of accidental death, and added that there was no blame attached to anyone.

I think there can be no doubt that Werrill lost his life in his endeavour to save the child, and when he made the attempt he must have been aware that the train was close upon him.

The family left by Werrill consists of his widow, Elizabeth Werrill, aged 54, and six children, viz. :—

Elizabeth, aged 34, married.	William, aged 26, married.
Caroline, " 32, "	Eva, " 22, "
Sarah, " 30, "	Amy, " 13, unmarried.

I will inquire under what circumstances his wife and unmarried daughter are, and report further. His conduct was worthy of every praise, and merits generous recognition.

(THIRD SESSION.)

CLAIM OF MRS. BUTTERLEY.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly appointed on the 21st September, 1887, "*with power to send for persons and papers to examine into and report upon the claim (if any) of Mrs. Butterley, and to whom was referred on the same date a Return to Order on this subject, laid upon the Table on the 8th June, 1887,*" have agreed to the following Report:—

1. Your Committee having examined the witness named in the margin,* * Mrs. Catherine Butterley. whose evidence is appended hereto, find,—

That Mrs. Butterley has no legal claim, but in view of her very distressing circumstances your Committee venture to express a hope that the Government will see their way to favorably consider the case.

WM. F. SCHEY,
Chairman.

No. 3 Committee Room,
Sydney, 11 November, 1887.

PROCEEDINGS OF THE COMMITTEE.

TUESDAY, 4 OCTOBER, 1887.

MEMBERS PRESENT:—

Mr. Schey, | Mr. Frank Farnell.

In the absence of a quorum, the meeting called for this day lapsed.

WEDNESDAY, 5 OCTOBER, 1887.

MEMBERS PRESENT:—

Mr. Schey, | Mr. Ewing.

In the absence of a quorum, the meeting called for this day lapsed.

THURSDAY, 6 OCTOBER, 1887.

MEMBERS PRESENT:—

Mr. Schey, | Mr. Stephen,
Mr. O'Sullivan.

Mr. Schey called to the Chair.

Entry from Votes and Proceedings, appointing the Committee, and referring Return to Order, read
by the Clerk.Papers *referred* before the Committee.

Committee deliberated.

Ordered,—That Mrs. Catherine Butterley be summoned to give evidence next meeting.

[Adjourned to Wednesday next, at *Two* o'clock.]

WEDNESDAY, 12 OCTOBER, 1887.

MEMBERS PRESENT:—

Mr. Schey, | Mr. Cooke.

In the absence of a quorum, the meeting called for this day lapsed.

WEDNESDAY, 19 OCTOBER, 1887.

MEMBERS PRESENT:—

Mr. Schey, | Mr. Cooke.

In the absence of a quorum, the meeting called for this day lapsed.

TUESDAY, 25 OCTOBER, 1887.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

CLAIM OF MRS. BUTTERLEY.

THURSDAY, 27 OCTOBER, 1887.

Present:—

MR. COOK,		MR. SCHEY,
MR. EWING,		MR. STEPHEN.
W. F. SCHEY, ESQ., IN THE CHAIR.		

Catherine Butterley called in, sworn, and examined:—

1. *Chairman.*] Your name is Mrs. Butterley? Yes.
2. You had a son some years ago in the railway service? Yes.
3. And he was killed? Yes, killed in the execution of his duty.
4. At Blayney? Yes; no signal was given, and he had no chance of escape.
5. How long was your son in the service of the Railway Department? I do not know; I forget. It was not very long.
6. Do you know whether he was in the service three months? I think it was more.
7. After his death you lodged a claim with the Railway Department? Yes.
8. What was the amount of your claim? I did not mention any certain thing; but I got £30 first, and then after I received the remainder of the £100. I paid it away to doctors, and in rent.
9. Your son was not quite 18 years of age? He wanted two months of being 18.
10. Was he the only support of yourself? The only support I ever had.
11. Was your husband alive at the time your son was killed? He was sick in bed.
12. *Mr. Stephen.*] Has he died since? He died the day after my son was buried.
13. *Chairman.*] You had two daughters at the time of your son's death? Yes; one of them had been in the Gladesville Asylum six years; she is insane.
14. And the other one? She got married without my knowledge, and I have not spoken to her for some time.
15. You do not know where she lives? She lives in Cleveland-street.
16. *Mr. Stephen.*] Does she support you? I get a few shillings sometimes from her, but she is unable to support herself. She married a useless man.
17. *Chairman.*] I believe that in 1883 you lodged a claim with the Secretary for Public Works for £2,000, did you not? Yes; Mr. Slattery said he could get me £2,000.
18. You subsequently received the sum of £100 from the Department? Yes.
19. The whole of which you expended in current expenses at the time? Yes; I had but very little, a few shillings, when a gentleman from Bathurst came and made me a present of £11 10s. Dr. Markey told me to sell lollies and fruit, and keep talking to children, not to remain by myself. I got bad with rheumatic gout, and had to go to the doctor.

Catherine
Butterley.
27 Oct., 1887.

Catherine
Butterley.
27 Oct., 1887.

20. You are aware that an inquest was held after your son's death? Yes; I was at Blayney at the time, and my brain has never been right since.
21. Are you aware that the jury brought in a verdict of accidental death, and laid no blame on anyone? Yes; but Mr. Bourke ordered my son to shunt, and the instant he put his hands to the buffers he was struck by the carriage.
22. Subsequently you addressed a petition to the Minister for Works, did you not? Yes.
23. And you are aware that several succeeding Ministers for Public Works have declined any further assistance? Some said I could not get any more, others said I could. Mr. Wright told me to get a petition drawn out and signed by as many Members as I could. I got thirty-four Members of Parliament to sign it.
24. You are aware that Mr. Wright refused any further compensation when Minister? He told me to get a petition drawn out.
25. Afterwards, I think, your case was put before Mr. Lyne, and he also refused further compensation? Well, Mr. Wilkinson said he felt very much for me and was in hopes that something would be done to assist me.
26. And afterwards you had another petition signed by a number of Members of Parliament? Yes, I was told to get another petition drawn out, and send it in.
27. And from time to time several gentlemen have brought this matter before Parliament? Yes.
28. And in each case you have met with a refusal? Yes.
29. How old are you? 64 years.
30. And you are wholly without means of support? I borrowed from one neighbour to pay another till God would help me with something from here.
31. Your only surviving relative is a daughter? A married daughter, and a daughter in the asylum; but my daughter cannot support me; she has to work for herself.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.
(LEASING OF REFRESHMENT ROOMS.)

Ordered by the Legislative Assembly to be printed, 24 April, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 17th June, 1886, That there be laid upon the Table of this House,—

“Copies of all Minutes, Papers, and other Documents having reference to
“the Leasing of the Railway Refreshment Rooms.”

(*Mr. Sydney Smith.*)

Minute of the Commissioner for Railways.

Re Leasing Railway Refreshment Rooms.

REFERRING to the leasing of the Railway Refreshment Rooms, I have to inform you that it has been agreed between Mr. Castner and myself that the present lease (herewith)* shall be cancelled, and I shall be glad, therefore, if you will prepare a release in this matter, and draw up a fresh agreement on the following terms:—

The lease to commence from the 1st July next, and to continue for a period of five years. Should it be decided to terminate the lease at the expiration of this time, six months' notice may be given by either party.

The Department is to erect buildings suitable for refreshment room purposes at the following stations:—At Goulburn, to cost about £2,500; at Yass, to cost about £2,000; at Junee, to cost about £4,000; at Mount Victoria, to cost about (the necessary alterations) £1,500; at Bathurst, to cost about £2,000; at Wellington, to cost not less than £2,500. Should it be deemed necessary by the Department to change the refreshment station from Wellington to Orange or other station, then such station is to be substituted for Wellington.

The rent to be paid to be equal to 7 per cent. per annum on the cost of the building, such rental to commence from the time of completion of the building, and to be payable in advance.

The rent of the refreshment rooms at Wellington to continue as at present; but it is to be understood that the rooms at Mittagong Station, which have been erected by Mr. Castner, will become the property of the Department at the termination of the five years now granted.

Should any alteration be made at this station, then the rent, so far as the alterations are concerned, to be at the same rate as at the station abovementioned.

A general free pass to be issued to Mr. Castner during the currency of the contract, and, if necessary, a free pass is to be issued for an Inspector.

CH. A. G., 19/3/83.

The Crown Solicitor.

The

* This had reference to an arrangement made with Mr. Castner that he should be allowed to lease for 12 years certain portions of land on which he was to erect at his own expense refreshment stations, the buildings to become the property of the Department at the expiration of the term.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 21 March, 1883.

I have the honor to return herewith the papers forwarded to me as instructions to prepare leases of refreshment rooms at railway stations, and to suggest, for your consideration, that it is desirable that the rent to be paid should be agreed upon at a named sum rather than be left to be determined by the amount expended upon the building, as it is now proposed; that is, the rent, according to the instructions, is to be 7 per cent. per annum on the cost of the building, and to be payable from the time of the completion of the building, although the term of years for which the leases are to run is said to be five years from 1st July next.

Again, though the lease is to be for five years, it is said that if it is desired to terminate it, then six months' previous notice may be given by either party; if the lease is to be for five years certain no notice to terminate it is required, the proviso for notice does not agree with the supposition that the lease is to be for a fixed term, and I do not understand why it is required that notice shall be given.

I need not point out that of the amount of the rent and the date from which it is to become payable are left open questions, to be determined by the costs of the buildings and their completion, it may be very difficult to come to an agreement with the tenant upon these heads.

I have, &c.,

JOHN WILLIAMS,
Crown Solicitor.

The rent had better be calculated thus:—A refreshment station at Goulburn is to be put up, the cost of which is not to exceed £2,500. 7 per cent. upon this amount would be £175 a year, and this sum should be mentioned as the rent; but, if during the currency of the lease, the requirements call for further additions, the rent is to be increased to the extent of 7 per cent. interest upon the cost of the additions,—

Yass	is to cost £2,000, rent £140 a year.
Junee	£4,000, ,, £280 ,,
Bathurst	£2,000, ,, £140 ,,
Wellington	£2,500, ,, £175 ,,

Mittagong to remain at present rental, £25 a year, but additions to be paid for, as in other cases.—
CH. A. G.

Can Crown Solicitor prepare agreement in the form suggested?—CH. A. G., 22/3/83. It is to be for five years certain, and thereafter terminable on six months' notice from either side.—CH. A. G., 22/3/83. The buildings are to be erected as expeditiously as possible; some of them, no doubt, will be completed before others, but the whole of them will be completed before the end of this year; the rent should take effect from the date of the notice from the contractors that the building is completed.—
CH. A. G., 22/3/83.

The Commissioner for Railways to Mr. J. L. Castner.

Sir,

Department of Railways, Sydney, 4 June, 1883.

Referring to the contract for the erection of refreshment rooms at Junee, I have the honor to inform you that the lowest tender received amounts to £6,648 4s. 9d., and before accepting this I have to request that you will inform me whether you are willing to give an undertaking that you will agree to pay 7 per cent. upon the outlay, even if it exceed the amount abovementioned.

I have, &c.,

C. A. GOODCHAP.
(Per D. V.)

The Crown Solicitor to the Commissioner for Railways.

Lease of Railway Refreshment Rooms.

Sir,

Crown Solicitor's Office, Sydney, 18 September, 1883.

Herewith I beg to forward you draft leases of the following refreshment rooms,—at Goulburn, Yass, Junee, Bathurst, Wellington, Mittagong, Singleton, and Murrurundi, for your approval.

I have, &c.,

JOHN WILLIAMS,
Crown Solicitor.

For report.—G.B. Mr. H. M'Lachlan.

Re Draft Agreements for Refreshment Rooms.

No agreement has been made out for Mount Victoria. The rent now paid for refreshment rooms at this place is £25 per annum, and it is intended to make additions to the present rooms which it is estimated will cost £1,500.

At Mittagong the rent now paid is £25 per annum, but it is to be understood the buildings are to become the property of the Commissioner at the expiration of the contract—nothing is said of this in the agreement.

The lease for the Northern refreshment rooms, Singleton and Murrurundi, are only for one year (£200 each), and they are taken under different conditions from those affecting the Southern and Western. Nothing is said in the specification, under which contract was accepted, as to the lessee having to pay 7 per cent. upon the cost of any additions, although this is mentioned in the draft agreement herewith.

In the case of Junee the rent is mentioned in the draft agreement as £280 per annum, being leased at 7 per cent. upon the estimated cost, viz., £4,000. Since the estimate was made, however, a tender has been received and accepted for the work amounting to £6,648. Seven per cent. upon this will be £465 per annum, which is to be the rental as agreed with Mr. Castner, and the alteration can be made in the draft agreement prepared.

The rents in each case are calculated at 7 per cent. upon the estimated cost of the buildings. Should the estimate be exceeded, and it has been greatly exceeded in the case of Junee, no condition is made whereby the lessee will have to pay a corresponding higher rent. Perhaps the clause respecting rent can be made to read that the rent is to be the sum mentioned in the event of the buildings costing the estimated amount; but if the estimate is exceeded then an additional rent will have to be paid equal to 7 per cent. upon the amount in excess of the estimate.
Commissioner.—G.B.

H.M'L., 3/10/83.

The draft agreements appear to be drawn out under the same condition. I have made some alteration in Junee, which will apply to the others with the exception of the Northern leases.—H.M'L.
Return the draft agreements to Crown Solicitor with the report.—CH.A.G., 3/10/83.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 30 November, 1883.

I have the honor to return herewith the draft lease to Mr. Castner, and with reference to notes on page 8 to request that you will state whether the draft now altered with respect to the rent to be paid for additions is in accordance with your intention.

With reference to the term of the lease, as mentioned in the note in red, I think it must be intended that the lease shall be for five years certain, and that the lessee shall hold afterwards, as a yearly tenant, the tenancy determinable at any time upon six months' notice.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

Draft returned to Crown Solicitor and informed above, also *re* keeping of wine, &c.—7/12/83.

The Crown Solicitor to The Commissioner for Railways.

Railway Refreshment Rooms.—You to Castner.

Sir,

Crown Solicitor's Office, Sydney, 13 December, 1883.

I have the honor to forward herewith engrossment of lease of premises at Junee, altered in accordance with the instructions contained in your letter of the 6th inst., No. 83/3,494, for your approval. On returning same will you be good enough to inform me if the other leases are to contain similar covenants and provisions, especially as to the one referring to the sale of liquor.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

It seems to me that the lease contains all the necessary conditions, but it is preferable that the rent should be stated to be 7 per cent. upon the cost of buildings instead of naming a specific sum. In other instances but Junee we can only go upon the estimate, and it may be largely exceeded. It is the Commissioner's intention that all liquor must be sold at all refreshment rooms.—H.M'L., 18/12/83.

Commissioner.—G.B.

The Commissioner for Railways to The Crown Solicitor.

Sir,

Department of Works (Railway Branch), Sydney, 21 December, 1883.

In acknowledging the receipt of the engrossment of lease in connection with the Railway refreshment premises at Junee, forwarded in your letter, No. 836-550, I have the honor to inform you that the lease in question contains all the necessary conditions, but it would be preferable that the rent should be stated to be 7 per cent. upon the cost of buildings instead of naming a specific sum. With the exception of Junee we have only the estimated cost to rely upon, and that may be largely exceeded when the work is carried out. A clause should be inserted in each lease to the effect that liquor is to be sold at all refreshment rooms.

I return the lease herein.

I have, &c.,
CH. A. GOODCHAP,
Commissioner for Railways.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 22 December, 1883.

I have the honor to return herewith your letter of date 21st inst., with fair copy leases of refreshment rooms at Junee for further information.

In your letter you state that the rent should be stated to be 7 per cent. upon the cost of buildings, without naming a specific sum.

I understood the arrangement to be that a fixed rent was to be paid in respect of the present buildings, with an additional rent at the rate of 7 per cent. for any additional buildings. From your letter, to which this is in reply, it would seem that this is not the arrangement, but that the rent is to be 7 per cent. upon the cost of the present buildings, and an additional rent after the same rate upon any additional buildings.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

The lease has been perused by Mr. Castner (returned 31/1/84), and he objects to two conditions. According to his own letter (February, 1883), he agrees to the cancellation of existing agreements and preparation of a fresh lease, which would be for a term of five years from 1st July, 1883. Mr. Castner will not now agree to the lease commencing 1st July, 1883, and wishes to make it 1st July, 1884. The Crown Solicitor has drawn up lease giving the Commissioner power, without consulting lessee, to make alterations if he deems fit. Mr. Castner wishes clause to be that Commissioner may make alterations at the request of lessee.—H. McL., 31/1/84.

See Commissioner about, and with, this.—D.V., 1/2/84. Letter to be written to Crown Solicitor *re* above. Commissioner will not concur in altered date, but sees no objection to amendment in last clause.—H. McL., 6/2/84.

The Commissioner for Railways to The Crown Solicitor.

Mr. Castner's Lease, Refreshment Rooms.

Sir,

Railway Branch, Sydney, 6 February, 1884.

I have the honor to return herein copy of lease of refreshment room at Junee, which is to be taken as a pattern for the lease of the other refreshment rooms. In regard to the question as to how the rent to be paid shall be stated, it is advisable that the rent should be stated, not as a fixed sum, but as 7 per cent. upon the cost of the main buildings, and upon any additions that may be necessary during the currency of the lease. The necessity for this arises from the fact that most of the buildings are not yet erected, and the estimated cost upon which the rent would be fixed may be largely exceeded. Further, it seems to me that under this condition one lease can be prepared to include the whole of the refreshment rooms, as all are let for the same time and under the same terms.

I may add that the lease has been perused by Mr. Castner, who objects to two conditions in the draft. Under the terms of his letter the lease is to commence from 1st July, 1884, but I cannot concur in the alteration.

Mr. Castner wishes the clause giving me power to make additions amended so as to read that the additions shall only be made by me at his request. The amendment seems reasonable, and I have no objection to its being made.

I have, &c.,
CH. A. GOODCHAP,
Commissioner for Railways.

The Crown Solicitor to The Commissioner for Railways.

You to Castner, Lease of Refreshment Rooms, Penrith.

Sir,

Crown Solicitor's Office, Sydney, 29 January, 1884.

I have the honor to forward herewith Lease of refreshment rooms, at Penrith, in duplicate.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

Ask Mr. Castner to call.—G.B., 31/1/84. Mr. Castner asked to call.—1/2/84.

The Crown Solicitor to The Commissioner for Railways.

You to Castner, Leases of Refreshment Rooms.

Sir,

Crown Solicitor's Office, Sydney, 14 February, 1884.

I have the honor to forward herewith lease and counter part of refreshment rooms at the following stations, viz., Junee, Mittagong, Bathurst, and Wellington.

Yours, &c.,
JOHN WILLIAMS,
Crown Solicitor.

The Crown Solicitor to The Commissioner for Railways.

Castner to you, Leases of Refreshment Rooms.

Sir,

Crown Solicitor's Office, Sydney, 15 February, 1884.

I have the honor to forward herewith lease and counterpart of refreshment rooms at Goulburn and Yass.

Yours, &c.,
JOHN WILLIAMS,
Crown Solicitor.

The

The Crown Solicitor to The Commissioner for Railways.

You to Castner.

Sir,
 I have the honor to forward herewith lease and counterpart of refreshment rooms at Mount Victoria, to be executed by you and Mr. Castner.

Crown Solicitor's Office, Sydney, 25 February, 1884.
 I have, &c..
JOHN WILLIAMS,
 Crown Solicitor.

Mr. J. L. Castner's Claim for Compensation in connection with the Refreshment Rooms.

In 1873 Mr. J. L. Castner took a lease of all the railway refreshment rooms then in existence, except Mittagong and Mount Victoria, for a period of five years, expiring in 1878. In 1874 he took a lease of Mittagong and Mount Victoria also for a period of five years, ending in 1879, with a clause empowering the Commissioner to terminate the lease at any time.

In March, 1878, in view of the approaching expiration of the first-named leases (of 1873), Mr. Castner made certain proposals which Commissioner, in view of Mr. Castner making a special visit to England and America with the purpose of acquiring experience in the arrangements and management of railway refreshment rooms, submitted in a modified shape to the Minister, recommending that land at Bathurst, Orange, Bowning, and Wagga Wagga should be leased to Mr. Castner for twelve years, at £25 per annum for each site, Mr. Castner to erect suitable buildings which, at the expiration of the lease, should become the property of the Government, or might be taken over with compensation at any time. Mr. Secretary Sutherland approved of the proposal, and Mr. Castner was so informed, and requested to submit plans, but no formal agreement was executed.

Plans were submitted accordingly by Mr. Castner, accompanied by a proposal that he should have authority to add a storey to the buildings at Mittagong and Mount Victoria, and that these stations should be placed on the same footing as the stations above named. Mr. Castner was informed by Commissioner's letter of 14th December, 1878, that the Minister approved of the arrangements for Bathurst, Orange, Bowning, and Wagga Wagga, and the erection of an extra storey at Mittagong and Mount Victoria, but no direct reference was made to Mr. Castner's proposal to alter the tenure and terms of the latter two stations. Nevertheless, Mr. Castner seems to have looked upon this intimation as in effect placing Mittagong and Mount Victoria on the same footing as the other four stations, and there was some show of reason for this conclusion, inasmuch as a part of the proposal was in so many words accepted and agreed to, and the remaining part was not refuted. Moreover the rent was immediately reduced from £160 per annum to £25 per annum, which was the ground rent paid for the lands in the other cases. It may be doubted, however, from what occurred afterwards, whether Commissioner took this view.

At the outset some delay as regards Mount Victoria was caused by Mr. Castner submitting plans, which Mr. Mason declared were not in accordance with the proposal which the Minister had approved.

About this time Murrumburrah was substituted for Bowning, and in October, 1879, Mr. Mason reported that he had assigned a site at that station to Mr. Castner, and that he would be prepared to do the same at the other stations as soon as Mr. Castner was in a position to commence operations.

In June, 1880, at the request of Mr. Castner, Junee was included in the arrangement, on the same terms as the other stations named, and he put up temporary refreshment accommodation then, with the understanding that under the agreement a site would be granted him adjoining the new station. In 1881 this temporary building was destroyed by fire, and it would appear from Mr. Castner's letters that he was prevented by some officers of the Department from replacing it, even on the site he had previously occupied. For some time Mr. Castner's complaints about the delay in giving him sites for buildings had been loud and persistent, the land pointed out by Mr. Mason at Murrumburrah had been appropriated by the Department to other uses, and he was losing heavily by the non-fulfilment of the agreement. These representations and complaints were not responded to by the Department, a prosecution of the arrangement being designedly delayed, and the reason why is supplied by minutes of the Commissioner. In February, 1881, on a letter of Mr. Castner's, complaining of the delay in giving him land and of the loss he was sustaining thereby.

Commissioner minutes that a consideration of the matter must be deferred until the Minister had decided whether the arrangement with Mr. Castner was to stand, and in February, 1882, Commissioner minuted on a similar letter that, at the request of the Minister, he had "stayed in every way practicable" the completion of the arrangement with Mr. Castner, but that the latter, he feared, would claim compensation, and delay would only increase the claim.

In April, 1882, it was found that the alterations at Mount Victoria, which Mr. Castner was to execute, and in consideration of which the rent has been reduced from £160 to £25, had not been commenced, and Commissioner, who was of opinion that Mr. Castner still held under the old arrangement, which gave him (Commissioner) power to terminate the agreement at any time, gave Mr. Castner notice to cancel the lease for the station. Mr. Castner, however, as already suggested, held that Commissioner's letter of 14th December, 1878, placed Mount Victoria on the same footing as the other stations, and that Mount Victoria was simply a part of a whole, and he declined to accede to any cancellation, except of the entire contract with compensation as provided by the agreement. No definite conclusion seems to have been arrived at in the matter.

Mr. Castner still continued to make representations and complaints about the delay in giving him the necessary sites, especially at Junee, and of the losses he was sustaining, and in November, 1882, Commissioner minuted that Mr. Castner by agreement had certain rights in connection with the refreshment rooms, but that Mr. Lackey did not approve of the arrangement, and it was not acted upon; that, with a view to put an end to the difficulty, he (Commissioner) was disposed to recommend that Mr. Castner should be asked to release the Department from existing agreements, and that the Department should put up suitable buildings, and give Mr. Castner a five years' lease of them at a rent equal to 7 per cent. upon the cost. The Minister approved of this arrangement, and the matter was explained to Mr. Castner by the Commissioner verbally.

On February 22, 1883, Mr. Castner addressed a letter to Commissioner, formally intimating his acceptance of the proposed terms, releasing the Department from the existing agreement, stipulating that the leases should date from 1st July, 1883, and naming the following as stations at which he wished to have

have accommodation provided :—Goulburn, Yass, Junee, Mount Victoria, Bathurst, Wellington, and Mittagong, but making no mention of Wagga Wagga. Two or three months after, 2nd April, 1883, he wrote stating the omission of Wagga Wagga was an inadvertence, and asking to be allowed to rectify the oversight, but Commissioner replied on the 16th April, 1883, declining to include Wagga Wagga in the arrangement. Mr. Castner rejoined that his letter of 2nd April must be accepted, as forming a part of his letter of 22nd February on the same subject, and there the matter rested.

About the middle of 1883 the buildings at Junee were put in hand, and many additions to and alterations of the original design have been made at Mr. Castner's request. At Yass and Goulburn temporary rooms have been provided, and Mr. Castner is paying under this arrangement 7 per cent. on the cost. Plans for these and other stations are being prepared.

In January, 1884, the draft leases were handed to Mr. Castner for perusal. He made no objection to them, but expressed a wish to Mr. McLachlan, who made a memo. of the fact, that the leases might be made to date from 1st July, 1884, instead of the 1st July, 1883, the date originally fixed by himself. He thus, at that time, clearly recognized the validity of the leases. Commissioner declined to give the additional time asked for, and the leases were prepared accordingly.

In February, 1884, Mr. Castner was advised that the leases were ready for execution, but he not absolutely refusing to sign the deeds, expressed his surprise that they had been prepared, alleging that Commissioner by his letter of 16th April, 1883 (refusing to include Wagga Wagga) had declined his (Mr. Castner's) proposal respecting the refreshment room, and hinting that the 7 per cent. arrangement referred to Junee and Mount Victoria only.

No further step has been taken in the matter.

In his letter of 31st October, 1884, Mr. Castner states that he is in a position to prove that any failure to carry out the agreement is wholly and solely due to and caused by the Department, and there might be some show of reason in this if it were the old arrangement of 1878 that we had to deal with, because, as it will be seen by this history, proceedings under that arrangement were, at the request of Minister, stayed in every practicable way; but that agreement was cancelled, and any delay in connection with it, is condoned by Mr. Castner's release to the Department, and acceptance of Commissioner's substitute proposals. Mr. Castner knows this, and that his only chance against the Department is on the old agreement and, therefore, it is that he seeks to prove that the Commissioner has vitiated the new agreement, and that he (Mr. Castner) is entitled to fall back upon the old one.

NOTE.—The question at issue in this matter, as suggested by the foregoing history, appears to me to be the following :—

- 1st. Was Mr. Castner's letter of 22nd February, 1883, a valid release of the Department from the old agreement, and a sufficient acceptance of the new arrangement, and was he bound to execute when called upon an agreement in accordance with the terms of that letter?
- 2nd. As Mr. Castner in that letter actually dictated his own terms and conditions (based it is true upon Commissioner proposals), and made his own selection of stations, was it competent to him two months after to supplement the conditions by claiming to have another station (Wagga Wagga) included in the arrangement, and, admitting that that station was embraced by the original and abandoned arrangement, can Commissioner's refusal at that advanced stage to admit Wagga Wagga be fairly interpreted as a refusal to carry out the agreement, or, as in any degree, affecting the arrangement?
- 3rd. Did not Mr. Castner, by suggesting alterations in the leases, admit their validity in the main, and was it admissible for him afterwards to repudiate them on a plea quite apart from the matter of the suggested alterations, viz., on the alleged ground that Commissioner's letter of 16th April, 1883, declining to include Wagga Wagga (written nearly a year before Mr. Castner's inspection of the draft leases) was a refusal to carry out the terms of the agreement?
- 4th. Is the erection of the refreshment rooms at Junee the provision of temporary accommodation, pending the erection of the permanent buildings at Goulburn and Yass (and at Wellington also), sufficient action and evidence of bona fides on the part of the Department, bearing in mind also that the plans for these and the other stations have for some time been under preparation? Is there under these circumstances any justification of Mr. Castner's repudiation of the leases, and does not the whole responsibility rest with him?

C.A.B., 10/2/84.

Mr. J. L. Castner, to the Commissioner for Railways.

Sir,

Castner's Refreshment Rooms, Sydney, 31 October, 1884.

It is with regret I learn that while I was in England you took upon yourself the responsibility of compelling my attorneys to pay to you the sum of £2,443 16s. 1d., which amount you assume I owe you for carriage of materials and supplies required at and for the refreshment rooms or premises leased to me,—this being done in the face of correspondence which, it appears, should have removed any doubt, if it ever existed, as to my liability for the amount you claimed that I owed for account as stated by you.

This sum I am determined you shall pay me, if it is possible to compel you to do so, and it appears to me quite opportune that I should review the existing relations between us as to the refreshment room leases, in which I shall show, from the correspondence that has passed, that any lack or failure to carry out the agreements contained therein is wholly and solely due to and caused by the Department, and that the public, as well as myself, have suffered in consequence; that I have repeatedly placed myself in communication with you without the slightest attention or recognition on your part.

I have at times been inclined to attribute this non-attention to the magnitude and press of your business. Be that as it may, the time has now arrived when some attention should be given to the subject, and that my claim for compensation, consequent upon the neglect of the Department, should be adjusted; therefore, I submit a review of the correspondence, with remarks thereon, from which you will see, if you peruse it, that what I state is correct.

In my letter dated 9th March, 1878, I asked you to lease to me land at certain stations, on which I could erect buildings for refreshment rooms.

On

On the 12th April, 1878, you write to me in answer to mine of the 9th March, 1878, and say :— “There will be no objection to sufficient land being leased to you at Bathurst and Orange on the West, and Bowning and Wagga on the South, at a rental of £25 per annum for each allotment, the buildings to be erected subject to the approval, and to become the property of, the Government at the expiration of the lease, which must not exceed twelve years, and the Government to have the right, at any time, to take possession of the building on payment of compensation.”

On the 21st October, 1878, I submitted plans for refreshment rooms and hotels to be built at Bathurst, Orange, Bowning, and Wagga. These plans were approved of by the Secretary for Public Works and yourself in my presence.

At the same time I handed you a letter, in which I asked you to be good enough to place Mittagong and Mount Victoria refreshment rooms on the same footing as Bathurst, Orange, Bowning, and Wagga, at the same rent and for the same time, from January 1st, 1879. In this letter I proposed to alter Mount Victoria and Mittagong in a similar style to plan submitted.

14th December, 1878, you write and say :— “Mr. Secretary Sutherland has been pleased to approve of the terms proposed in my letter of the 2nd October, 1878, and that the work be carried out at once.” By this you say I shall have sufficient land at Mittagong and Mount Victoria.

On the 27th December, 1878 (thirteen days after), you write asking me when I propose to establish refreshment rooms at Bowning, as proposals have been made to you *re* Cootamundra.

11th January, 1879, I reply to yours of 27th December, 1878, and say that just so soon as you give me permission to occupy the land asked for I shall at once proceed with the building of this Bowning Station.

On the 23rd January, 1879, you write and say that the matter of site for building at Bowning has been referred to the Engineer for Existing Lines, and he suggests another site. As you referred the matter to the Engineer for Existing Lines, he asked to see the plans and specifications, and I left them with him for his perusal. In a few days Mr. Mason informed me they must be altered, consequently the tenders I had invited had to be thrown aside, and so my operations were stopped. He arranged that my architect should call and see him with reference to the matter. The architect did call, the result being that the plans were altered as the Engineer for Existing Lines dictated, and at my expense. While these alterations in plans and specifications were being completed, it transpired that Murrumburrah was, by the Department, thought to be preferable to Bowning as a refreshment station. As the site at Bowning had not been decided upon, and being desirous, if I could, of meeting the views of the Department and be certain as to your determination, I wrote to you 9th August, 1879 on the subject, and on the 13th of same month you replied, saying that it had been decided to substitute Murrumburrah for Bowning.

So Bowning was disposed of, and that by the Department, it being no fault of mine this building is not erected, as tenders were received for it, but could not be accepted.

With your letter of 13th August, 1879, you send tracings for me to mark, which you requested I should return for consideration. These tracings were marked and returned 7th October, 1879, but I have not any intimation of your consideration or decision respecting them.

Twelfth November, 1879, you write to me, and say that the Engineer for Existing Lines has seen me with reference to site for refreshment room at Murrumburrah. Certainly Mr. Mason did point out to me a site on the plan in his office where I could build the refreshment room. This site was at the Sydney end of the station, and quite unsuited, as it joined the public urinals, and was hemmed in on the two sides by the workmen's w.c. I pointed out this to you personally on the ground in July, 1879, and you said the site would not do, but the site I had selected was the proper one, and I should have it. Well, Mr. Mason said he required my selection to use for a temporary station, while the new station was being built, and took it, and deprived me of the use of it.

Twelfth July, 1880, I wrote to you, and said, “I am ready to proceed to erect refreshment rooms at Murrumburrah, and that as soon as I got my reply, pointing out where the building was to be built, I shall begin the work.”

To this I have not received your reply.

Again, on 15th February, 1881, I wrote to you and said, “I should be glad if you would be good enough to put me in possession of the land I am to occupy at Murrumburrah or Harden, so I could proceed to exercise the privileges of my contract.”

To this letter I have not received your reply, nor have I been put in possession of the land I am entitled to.

So Murrumburrah is as it was, and the delay was caused by the Department.

Well, keeping to the Southern Line, the necessity for a refreshment room at Junee presented itself, and had to be met in a very short time, necessitating prompt, active, and costly operations, and on the 4th August, 1880, I wrote to you, and proposed to make the required alterations and additions to Junee Station, which, when required, I might remove with the understanding that you should provide a suitable site adjacent to the new station. The rent payable to be the same. Terms and conditions the same as at Mittagong, Mount Victoria, and other stations, and that all materials and supplies required for refreshment rooms shall be carried free by railway, thus associating and connecting Junee, Mount Victoria, Mittagong, and other stations together and under the same conditions.

On 13th August, 1880, you wrote and agreed to my proposal of the 4th instant, and compete this agreement, in which you say, I acquire no right to compensation should the station be removed to another site.

This provision was made, as it was then contemplated removing the station to what is termed the fork of the main line, where the Hay line intersects. I have complied with the conditions, and until the 26th January, 1882, the refreshment room at this station was very popular, so much so that its management was universally commended by the travelling public, and quoted in the Legislative Assemblies of the neighbouring Colonies as an example to be followed in the conduct of their refreshment rooms; in fact, it assisted largely to popularize your Southern Line with intercolonial travellers.

Twenty-sixth January, 1882, the premises were destroyed by fire. Before the ashes were cold I proceeded to make provision for another building, but was removed by your District Engineer, who put me and my men off the ground. I wrote to you and complained of this, but you took no notice of my letter.

Eighth February, 1882, I wrote to you, and asked to have the site adjacent to the new station and platform pointed out to me, that I might proceed to erect permanent refreshment rooms at Junee, but I have not received any reply to that letter.

You

You erect temporary iron buildings, which was and is simply a shed, and a poor apology for the requirements, and which, I am informed, I can occupy, but by such occupancy I shall acquire *no rights*, whatever that may mean.

About the 8th May, 1882, I wrote to you and asked my position as to this iron building, and on the 18th May, 1882, you write in reply in very peculiar terms and, I think, without reference or considering what had passed between you and myself, and I submit it was no concession on your part to permit me to occupy the building, and I have no doubt you would have been pleased if I had written and said I did not wish to continue as providore. In my letter of the 5th June, 1882, in reply to yours of the 18th May, 1882, I said the tone of that letter was, to say the least, harsh, and, I now say, uncalled for.

Again, on the 8th May, 1882, I wrote to you, asking where I can erect the permanent refreshment room. No notice taken of this letter.

On the 3rd November, 1882, I wrote to you about the site of the new building. No notice taken of this letter.

On the 20th December, 1882, I wrote again, asking for information about the site for the Junee building. No reply to this letter.

On the 10th January, 1883, I wrote again to you on this subject. No reply to this letter.

It seems to me that ordinary courtesy demands some acknowledgment of correspondence, especially in a matter where moneyed interests are in question.

I have previously intimated to you, and now repeat my determination to claim compensation from you in this matter, so that its mention here will be nothing new. See my letter, 3rd November, 1882.

As to Mount Victoria, to which you have repeatedly referred.

On the 24th October, 1878, I submitted to you plans for Mount Victoria Refreshment Room, which you took to the Secretary for Public Works, who with yourself in my presence, approved of them, and they bear the office number 78-11,822, and under date 14th December, 1878, you write and say: "Mr. Secretary Sutherland has been pleased to approve of the terms proposed by me in my letter of the 21st October, 1878, which letter accompanied and mentioned the plan for Mount Victoria station, therefore you acknowledge the plan as well as the letter and approve of the plan. Then I advertised for tenders for the alterations and had to withdraw the advertisement, as Mr. Mason, seeing them, asked who authorized them, as he knew nothing about it; and, on 28th December, 1878, you write and say I must not proceed with the work until I obtain the approval of the Engineer for Existing Lines of the steps to be taken, and refer me to that officer."

Here you stop me and say I must not proceed without Mr. Mason's consent.

I called upon the Engineer for Existing Lines with plans and specifications, your positive order gave me no option. I was obliged to act as Mr. Mason directed, in order to obtain his consent to proceed. He required so many alterations that new plans had to be prepared at extra cost to me. This occupied some time, and, when completed as directed, he approved of them, and you so endorsed the plan. I called again to inform him of your approval, and that I was prepared to go on with the building. He then informed me that a question as to room for the alterations proposed had arisen, which question must be settled before he could give permission to proceed.

The Engineer for Existing Lines in his minute to you, 30/4/79, says, "It is true Mr. Castner called at my office with drawings, but I told him I could do nothing further in the matter until he had got the Commissioner's sanction to depart from the original agreement." From this it appears the Engineer for Existing Lines was very clear on the point as to your acceptance and approval of my plan as well as letter.

19th April, 1879, I wrote to you for permission to depart from my original plan, as directed to do by the Engineer for Existing Lines, who, with myself, was anxious the work should proceed, and all that you would permit was done.

On the 9th May, 1879 you reply by saying that in your former correspondence it was stated that I would be allowed to build any storey, but that no extra land would be granted at either of these stations; that part of the correspondence has not yet reached me, and this is the first intimation I have that the land required by the approved plan would not be granted. The plan clearly shows that extra land will be required to carry out what is agreed for, hence the Engineer for Existing Lines saw the necessity of your consent being given to me to depart from the agreement. I have up to this time received only two letters from you on this subject, one, 14th December, 1878, accepting and approving of plan, which not only shows an additional storey, but additional rooms, nor does my letter of 21st October, 1878, with plans, imply that land will not be required at Mount Victoria. In this letter I ask to have Mittagong and Mount Victoria on the same footing as Bathurst, Orange, Bowning, and Wagga Wagga. When you say, 12th April, 1878, there will be no objection to my having sufficient land. 14th December, 1878, you say, "Mr. Secretary Sutherland has been pleased to approve of the terms proposed by me," this certainly warrants me in expecting sufficient land. The other letter is dated 28/12/78, wherein you say the alterations must not be undertaken without the approval of the Engineer for Existing Lines, and directs me to wait upon that officer for that purpose.

In your letter of the 9th May, 1878, you intimate that I am to submit new plans without reference to those you had already approved of, and these plans as much form part of the agreement as any part of the writing, and I could not throw them aside without your consent. Further on in the same letter you refer to the expiration of my then present lease, and that unless my proposals are proceeded with you will have no alternative but to make other arrangements. I must confess I was then, and am still, at a loss to understand this part of, or in fact the whole of, that letter. The correspondence therefore indicates that an agreement between you and myself is made. You direct me not to proceed with it under the conditions agreed upon. Then you write and say that unless I do proceed contrary to and in opposition to your express orders and those of your Engineer for Existing Lines, that you must make other arrangements. What they were to be I can only conjecture, and I maintain that up to the present time the matter as to Mount Victoria stands thus:—

21st October, 1878, I make a proposal.

14th December, 1878, you accept this proposal.

These two letters form the agreement.

28th December, 1878, you direct me to the Engineer for Existing Lines, and say I must not proceed to carry out my part of the agreement without his approval and consent.

With

With your letter of the 9th May, 1879, you enclose a copy of a report from the Engineer for Existing Lines, in which he says, "It is true Mr. Castner called at my offices with drawings, but I told him I could do nothing further in the matter until he had got the Commissioner's sanction to depart from the original agreement of raising the building one storey; until that is settled it would be useless to examine the drawings any further.

The Engineer for Existing Lines has taken this view of the case, that the plans and proposals are approved of and accepted by the Secretary for Public Works and yourself, and that it is requisite I should have your permission to depart therefrom before he can go further or give his sanction to me to proceed with the work. This I asked for in my letter of the 19th September, 1879, and which you have not so far granted to me, nor have you replied to the letter.

So far the delay as to this work it is clearly to be seen was caused by the Department, and I am the injured party. As I expected, I should have had the permission, I, in 1880, purchased the material for the building, and there it is ready to be used and represents so much money lying idle.

On 20th January, 1882, you write to me referring to the unsatisfactory conduct of the station, and in reply, January 24, 1882, with a view to learn if I could go on with the alterations or not, stated that my builder would soon be finished at Junee, and then could go on to Mount Victoria. This was with a view of bringing up the matter referred to in Mr. Mason's minute to you as to alteration of original agreement, but without the desired effect.

On 1st February, 1882, you write and say that this matter has been so long in abeyance, you must request I will not proceed until some understanding in regard to the question of refreshment rooms has been arrived at. This would imply that there was something under consideration of which I was ignorant, that some question was being debated in your mind as to whether I should be permitted to carry out my agreement or not.

On 8th February, 1882, I write to you as to this matter, and refer to the commencing of operations. A quantity of materials were on, which, representing so much cash laid out, operated much to my disadvantage. This, too, with the fact that I was cruelly punished by one of your officers, who unjustly and unnecessarily held thousands of pounds of my money, and with your full knowledge, so that I was deprived of a complete building whereby I might reap the benefit of cash customers, and deprived of my money which was held by the Department. Thinking that this reference might bring up the question of permission to go on with the building, made it, but without effect, and then ask how soon you desire me to proceed.

And as if you were determined to settle this "some understanding in regard to the question of refreshment rooms" on your own account, and without reference to the treatment I was then receiving from the Department, you, on the 25th April, 1882, write to tell me that "I hereby terminate your lease so far as it affects Mount Victoria," to which I replied, 26th April, 1882, and objected to the cancellation for Mount Victoria alone, but not to the lease being cancelled, as provided for originally, as a whole.

On 2nd May, 1882, I wrote again, and asked if the matter you referred to in your letter of 1st February, 1882, some understanding in regard to the question of the refreshment rooms, has been decided, to which I have not yet had any reply.

On the 6th November, 1882, I wrote to you again on the same subject, and under date of 23rd November, 1882, you reply to mine of the 6th, and say that I urge that some understanding should be arrived at. In this I think you misunderstand my letter. I do not urge that an understanding be arrived at. I merely quote your remarks in your letter of 1st February, 1882, when you say, "I request that you will not proceed with the alterations at that station until some understanding in regard to the question of refreshment rooms is arrived at." In the same letter you say, "For over two years you failed to proceed with the arrangement entered into with regard to this station." Why was this? Simply because you stopped me, nor have I yet any authority to proceed, although I have asked for it repeatedly, but on the contrary positive instructions not to proceed until I have the consent of the Engineer for Existing Lines, which he could not give (as he reported to you, 30th April, 1879), until you have given your consent for me to depart from the original plan. This I asked you for, but no doubt for some good reason you have not favoured me with, therefore you are responsible for the absence of proper accommodation and for the retention of a most disreputable place called a refreshment room, very much to the inconvenience of the public and my loss.

The first intimation I had of what you desired to effect or change in my agreement was on the 14th February, 1883, and on 23rd February, 1883, I handed you a letter, written as you dictated, agreeing to certain proposals for a change, and on the 2nd April, 1883, seeing that I had omitted Wagga Wagga station from my letter of the 22nd February, 1883, I wrote to you and said that as I had not received a reply to my letter of the 22nd February, 1883, this my letter of the 2nd April, 1883, should form a part, and the letter of 22nd February, 1883, and the letter of 2nd April, 1883, are one letter, to which, on the 16th April, 1883, you replied, declining my proposal, and on the 27th April, 1883, I wrote to you and stated that the two letters are to be received as, and are, one letter; therefore the letters having been declined by you, the 1878 and 1880 agreements still remain in force.

On the 14th June, 1881, I wrote to you and asked to be put in possession of land at Orange, according to the terms of my lease, to which I have not received your reply.

As to the carriage of goods, this question is understood in one way by me and acted upon in another way by you, therefore it has led to very much trouble and an expense that should have been avoided. I am quite aware of the fact that under the 1875 lease and also the 1878 lease I had no right to expect to have supplies carried free, but in the agreement made in my letter to you, dated 4th August, 1880, and your reply, 13th August, 1880, wherein it is expressly stated that all materials and supplies required for refreshment rooms shall be carried free by Railway, and you say "That the permission asked for is accorded me;" and then in yours of 2nd May, 1882, that the carriage free of provisions for passengers was never authorized; in fact, it is specially prohibited in the general contract for the lease of refreshment rooms. Certainly I fail to see that you can make the contents of your letters of 13th August, 1880, and 2nd May, 1882, agree.

If it should, for argument sake, be admitted that there is a doubt in the matter, is it at all probable that any business man would be so unwise as to take the responsibility of erecting premises at Junee at his own cost, that are liable to become useless in a few months, simply for the privilege of removing them to some other place at his own cost, and for which he has no right to compensation unless some other

condition exists whereby he may see a probability of compensating himself for the risk he takes. I took the risk of building at Junee upon the distinct understanding that all goods were to be carried free by Railway, incurring an expenditure of £1,800. This I was warranted in doing only because you had agreed to carry all the supplies I might require at the refreshment rooms free. This was the justification and the reason. The matter is very simple, very plain, and cannot be altered without my consent.

If not an actual, there is to me an apparent undercurrent, that works in opposition to my operations, and I think a careful perusal of the papers will disclose this to an unbiassed mind, and while that is the case, it is a very difficult task for me to carry out my arrangements with satisfaction and success.

The block that has been placed in my way has not in any sense brought credit to the Department or to me, but has been the cause of much dissatisfaction on the part of the public.

It is to be regretted that misunderstanding should occur. It is far better for all parties to an agreement to act in good faith one to the other, and if that cannot be done, it is better someone should interfere, and I submit the time has now arrived when I should know what you intend to do. As you say in yours of 1st February, 1882, nothing is to be done at Mount Victoria until an understanding is arrived at. What is this understanding other than that expressed in the agreement, as quoted above?

I have no doubt there are plenty who would be willing to take up the refreshment rooms now, but who was there that came forward before? Not one; I was the only tenderer for the 1875 lease. Others would not at that time risk their time and money as I did; therefore, it seems hardly fair that any obstructions should be placed in my way, nor do you hold out any inducement for one to devote his energies towards any improvement or further expenditure.

No one can deprecate more than I do the presumption that any misunderstanding should exist between the Department and myself, and I think that my conduct will bear me out when I say that I have spared no time, trouble, or expense to carry out my engagements when permitted, and that the repeated unsuccessful applications I have made to you to be permitted to carry out my arrangements which you could and did effectually block (very much to my loss) tends to discouragement and annoyance, and that I have been willing to meet the wishes of the Department where it did not interfere too much with my views.

The time devoted, and the expense incurred in England and America in 1878, the plans prepared after my return, as well as the expenditure with which the requirements were met, Junee, where the building consisting of sixteen rooms was begun and finished in twenty-one days, in order to be ready for the opening of the Southern line to Gerogery, together with the attention I have given, warrants, I think, a fair, if not a liberal, treatment from the Railway Department.

In order to substantiate the above I append correspondence referred to, that you may peruse and consider, with a view to an amicable as well as a speedy settlement of this unsatisfactory condition of things.

I also attach a statement of account showing the amounts I claim as compensation for the loss of business at the stations named for the period ending 31st October, 1884, and which amount I trust you will cause to be paid to me without delay. I may say I wish this matter dealt with in a satisfactory way, on or before the 10th November, 1884, or it will be placed in the hands of my solicitors to be dealt with for speedy settlement.

I have written to you so many times without effect, I am reluctantly compelled to adopt a course that you must reply to, although it may appear to be quite unnecessary, but, as before intimated, this seems to be the only course open to me.

I have, &c.,

JOHN L. CASTNER.

Amounts claimed as compensation for loss of business, as I have not been permitted to exercise my rights, as per agreement:—

Bowning or Murrumburrah.

This I was prepared to have completed 1st July, 1879.

Mount Victoria.

Tenders were called for this, April, 1879, and received. This could have been completed, October 1879.

Orange.

Having waited so long, receiving no acknowledgement as to approval of site marked on tracings, I ask for this, June, 1881.

Junee.

Compensation claimed from 3rd November, 1882.

	£
<i>Bowning or Murrumburrah.</i> —1st July, 1879, to 31st October, 1884,—274 weeks at £5	1,385
<i>Mount Victoria.</i> —October, 1879, to 31st October, 1884,—260 weeks at £6	1,560
<i>Orange.</i> —June, 1881, to 31st October, 1884,—173 weeks at £8	1,384
<i>Junee.</i> —November, 1882, to 31st October, 1884,—104 weeks at £25	2,600
	£6,929

Mr. G. L. Castner's claim for compensation, for loss of business alleged to be due to his having been debarred by the act of the Department from exercising his rights in connection with the refreshment rooms (£6,929).

In 1874 Mr. Castner took the lease for five years of the Mount Victoria and Mittagong Refreshment Rooms, at a progressive rent, and one of the conditions of the lease that it might be terminable at any time by a month's notice. It should be stated that Castner already held leases for five years, dating from 1873, of the other refreshment rooms.

Per letter of 9th March, 1878, in view of the approaching termination of the last named leases, Mr. Castner submitted to Commissioner certain proposals with regard to the refreshment rooms.

Commissioner

Commissioner replied (12th April, 1878), that there would be no objection to lease to Mr. Castner sufficient land at Bathurst, Orange, Bowning, and Wagga, for the erection of suitable buildings, at £25 per annum for each site, the buildings to be subject to approval, and to become the property of the Government at the expiration of lease, twelve years; Government to have the right to take possession at any time, on payment of compensation.

On the 21st October, 1878, Mr. Castner submitted plans for Orange, Bathurst, Bowning, and Wagga Wagga, and proposed that Mount Victoria and Mittagong should be placed on the same footing as these four stations, the buildings already there to be raised a storey higher.

On the 14th December, 1878, Commissioner replied that the Minister had approved of the terms proposed for the above four stations and the addition of another storey at Mount Victoria and Mittagong, and on the 28th December, 1878, Mr. Castner was informed that his plans for Mount Victoria and Mittagong must be submitted to the Engineer for Existing Lines. Mr. Castner accordingly submitted his plans to Mr. Mason, who reported that they were not in accordance with the arrangement approved by the Minister, inasmuch as they involved additional land, while the Minister sanctioned only the addition of an upper storey. Mr. Castner was so informed by letter of 9th May, 1879, and that if proper plans were submitted they would be considered, with a view to approval. It was also intimated to him upon the general question that if his proposals were not proceeded with at once other arrangements would be made.

Per letter of 13th August, 1879, intimation was made to Mr. Castner of the substitution of Murrumburrah for Bowning, and tracings were enclosed of the stations, with a request that he would mark upon them the land required for refreshment rooms.

On the 7th October, 1879, Mr. Castner wrote that he had visited Bathurst, Orange, Murrumburrah, and Wagga, with an officer deputed by the Engineer for Existing Lines, and had selected sites as marked on tracings.

Referred to Mr. Mason. That officer reported that he had seen Mr. Castner and pointed out to him a site for the refreshment room at Murrumburrah, and that sites at the other stations would be arranged for as soon as Mr. Castner was ready. Castner was so informed by letter of 12th November, 1879.

On the 4th August, 1880, in view of the opening of the railway to Gerogerie, Mr. Castner proposed to make additions and alterations at the Junee Station, on the following conditions:—That a site should be granted to him, adjacent to the new station to be built at Junee, upon the same terms as in the case of Mittagong, Mount Victoria, and other stations, and that all materials and supplies for refreshment rooms should be carried free.

Commissioner replied (13th August, 1880), that the permission asked for was acceded, but that Mr. Castner acquired no right to compensation should the station be altered or removed to another site.

On the 5th October, 1880, Commissioner informed Mr. Castner that he could occupy a room at Wagga Station, relative to which he (Castner) had made inquiry, for refreshment purposes, at a rent of 20s. Castner, however, objected to pay more than £25 a year, and some correspondence ensued. In February, 1881, Mr. Castner wrote that, in compliance with request, he had marked on tracings sent to him suitable sites for refreshment rooms at Bathurst, Orange, Bowning, and Wagga; that these sites were approved by Commissioner and Mr. Mason; that the station at Wagga being in the hands of the contractor, Mr. Mason informed him (Castner), that he could not be put in possession of the land there for the present, and that it was finally decided that the building could not be proceeded with until the new station was ready for occupation. Mr. Mason minutes that Mr. Castner's statement was correct, and Commissioner ultimately fixed the rent at the £25 a year, the rent which Castner was to pay for the land.

Per letter of 14th June, 1881, Mr. Castner pressed to be put in possession of land at Orange, It does not appear that any reply was sent.

A letter of Mr. Castner's, dated 15th February, 1881, has been omitted in its proper sequence. It states that his arrangement with Commissioner was to have rooms at Murrumburrah and Wagga; that he selected sites which were approved of, and that these sites have been occupied for other purposes; presses to be put in possession of land, and insists that he is suffering heavy loss through not having the rooms open. The consideration of this letter was deferred from time to time, until—I quote the Commissioner—"until the Minister decides whether Castner's arrangements with the Department is to stand." It was not answered.

On the 30th January, 1882, Mr. Castner wrote with reference to the fire at Junee that although his contract gave him the right to land at Junee, he had been prevented by the District Engineer from putting up temporary accommodation even on the site previously occupied by him; that he was suffering a heavy loss pecuniarily, and that he hoped the Commissioner would make good this loss. This letter was not answered.

On the 9th February, 1882, Castner wrote again, stating he was making arrangements for materials for the permanent refreshment room at Junee, asking for a site to be pointed out, and referring to the loss he was sustaining. This letter was not answered, but Commissioner minuted that no goods for the new building were to be carried except on prepayment of freight.

On the 8th May, 1882, Mr. Castner again asked for a site at Junee, and stating that he was sustaining a loss of £25 a week. This letter was not answered.

In January, 1882, Commissioner wrote to Mr. Castner, complaining of the way in which he was conducting the refreshment room at Mount Victoria, and the latter explained that he was about to make certain alterations in the rooms at that place. The Commissioner thereupon wrote to Mr. Castner (1/2/82) that, as the matter had been left so long in abeyance, the alterations must not be proceeded with until some understanding as to the refreshment rooms had been come to.

Mr. Castner replied on the 8th February, 1882, that the alteration had been commenced a year before, and would have been completed had not moneys due to him been withheld from him by an officer of the Department with the object of retarding his progress. That, moreover, Commissioner desired him to give special attention to Southern Line; that the responsibility of the delay was with the Department; that he would stop as desired for a limited period, but that he desired to lose as little time as possible in availing himself of the privileges of the contract.

Hereon

Hereon Commissioner minuted that, at the request of the Minister, he had stayed in every way possible the arrangements with Mr. Castner, and that he feared Castner would claim compensation, and delay would increase the claim.

On the 23rd April, 1882, Commissioner gave Castner notice to terminate the lease of Mount Victoria.

Mr. Castner replied on the 26th idem, asking if it was intended to terminate the whole of the leases, or Mount Victoria only. If the latter, he must object. First, because the lease made no such provision; secondly, because he had been led to believe for eighteen months that the Government had it in contemplation to make some change in his position respecting the refreshment rooms, a view which was confirmed by Commissioner's letter of 1st February, 1884, requesting him (Castner) to delay the alterations at Mount Victoria, until some understanding in regard to refreshment rooms had been arrived at; thirdly, because, at Commissioner's request, he had removed the person in charge at Mount Victoria, although there was no provision in the existing arrangements for anything of the sort. If Commissioner desired to cancel the whole of the leases, he (Castner) had no objection, provided compensation was awarded as provided in Commissioner's letter of the 12th April, 1878. Insisted that Mount Victoria was part of a whole, and saw no reason why he should consent to a division of the contract. Commissioner, per letter of 22nd May, 1883, reminded Mr. Castner that he held Mount Victoria under special lease, which provided that Commissioner could take possession at any time.

Mr. Castner replied (26/5/83), ignoring Commissioner's reference, and repeating his former objection. Commissioner minuted that the lease he referred to was that in force for Mount Victoria, but no reply was sent to Castner.

On the 3rd November, 1882, Mr. Castner wrote to Commissioner, complaining of the delay to his operations at Junee, in consequence of a site not being pointed out, and stating that he was losing at least £25 a week thereby; also stating that if the Department chose to put up the building he had no objection, and he was willing to pay 6 per cent. on cost. Commissioner minuted that this matter had been before the Minister for nearly four years; that Mr. Castner had certain rights by agreement with the previous Government, but Mr. Lackey, not approving of the arrangement, no step was taken to give effect to it; would suggest that Mr. Castner be asked to release Department from existing agreement; that buildings be erected by the Department; that Mr. Castner should have the lease of them from 1st January, 1883, he paying 7 per cent. on the capital outlay. This proposal was approved by the Minister, and was explained to Mr. Castner verbally on the 14th February, 1884.

But before the solution of the difficulty was proposed to Mr. Castner, other correspondence had passed bearing on the question. On the 6th November, 1882, he wrote with reference to Commissioner's request, that proceedings at Mount Victoria might be suspended, and to the "understanding" referred to by Commissioner, the nature of which he wished to learn.

In reply, Mr. Castner was informed (23/11/82) that his delay at Mount Victoria having vitiated the agreement, he could not be allowed to proceed with alterations there until some definite understanding was arrived at, and that Commissioner would be glad to hear from him on the subject.

Mr. Castner rejoined (29/11/84), quoting Commissioner's letter (of 1/2/82) *in extenso*, denying that he had vitiated the agreement, as he had occupied the premises, and paid rent for them, alleging that the delay in carrying out the alterations at Mount Victoria was due to the act of the Department in withholding his money from him, and expressing his willingness that the arrangement for Junee, proposed in his letter of 3rd November, should be applied to Mount Victoria also.

Commissioner minuted hereon, stating the nature of the new arrangements proposed [see Commissioner's minute upon Mr. Castner's letter of 3rd November, 1882], that for Mittagong, where Castner had put up buildings, the lease would be for twelve years from 1st January, 1882, the building then to become the property of the Government, and that as regarded Mount Victoria, the rent in consideration of the alterations to be made had been reduced from £150 to £25, but Castner had vitiated the agreement by neglecting for two years to make alterations.

On the 20th December, 1882, Castner wrote complaining of delay in assigning him a site at Wagga, and stating that a license had been granted to him conditionally upon his having the rooms ready in nine months, and, that five months of that period having already elapsed, he was apprehensive of losing the license, for which he should hold the Department responsible.

The Commissioner replied that the Department took no responsibility in connection with the arrangements.

On the 22/2/83 Castner wrote with reference to Commissioner's verbal intimation of 14th idem., formally consenting to the cancelment of existing agreement and the substitution of a new one upon the following terms:—The Department to put up buildings as under, at cost as stated. Goulburn, £2,500; Yass, £2,000; Junee, £4,000; Mount Victoria, alterations, £1,500; Bathurst, £2,000; Wellington, or Orange, £2,500; Castner to pay rent at the rate of 7 per cent. upon cost, the new lease for five years to take effect from 1st July, 1883, and Mittagong to remain at present rental.

Crown Solicitor was instructed to prepare leases accordingly.

On the 2nd April, 1883, Mr. Castner wrote that, in his letter of 22nd February, he had inadvertently omitted to include Wagga with Mittagong, and asked to be allowed to rectify this omission.

Commissioner replied (16th April, 1883) that he was unable to include Wagga.

Mr. Castner rejoined (27th April) that his letter of 2nd April formed part of his letter, dated 22nd February, on the same subject.

In January, 1884, the draft leases were submitted to Mr. Castner, and he objects (verbally) to the date, which he wished to be made July, 1884, instead of July, 1883. He also objected to a matter of detail in connection with alterations; upon the latter point the Commissioner gave way, but he refused to alter the date.

On the 18th February, 1884, Mr. Castner was notified that the leases were ready for signature.

He

He replied (28th idem) that he was at a loss to know why the leases had been prepared, as Commissioner, by letter of 16th April, 1883, had declined his proposals respecting the refreshment rooms, and that, as regarded Junee and Mount Victoria, he had at Commissioner's request written a letter to say he would pay 7 per cent. on cost.

It should be stated that about the middle of last year, in anticipation of the execution of the leases, the buildings at Junee were put in hand, and are now far advanced towards completion. Pending the erection of the new buildings, temporary accommodation had been provided at Goulburn and Yass, for which Mr. Castner is paying 7 per cent. on cost of erection, and at Wellington, for which he is paying an annual rental. Plans for these and the other stations have been for a long time under preparation, and tenders are about to be called for some of the stations.

D. V., 10/12/84.

The Crown Solicitor to The Commissioner for Railways.

You *ats.* Castner.

Sir,

Crown Solicitor's Office, Sydney, 27 February, 1885.

I have the honor to inform you that this case is down for trial on the 10th March next, in the Jury Court. I send herewith a reply of Counsel's advice on Evidence, and I shall be glad if you will furnish me with the names of witnesses on your behalf by Saturday, the 5th March next.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

The Commissioner for Railways *ats.* Castner.—Advice on Evidence.

It is admitted upon the instructions before me that the original agreement made with Castner was broken, and that he will be entitled to damages for the breach unless defendant can make out the acceptance of the new contract in lieu of the old one and in satisfaction of existing claims thereunder. At the present I have not all the correspondence before me, and therefore can express no opinion upon this point; but it is one which arises upon the documents, and must ultimately (I presume) be decided by the full Court. It is only necessary now to say that no evidence will be required to prove the substituted agreement except the various letters and documents relating thereto. Notices to produce should be served in respect of all such documents, as are in the plaintiff's possession; and they should be described in the notice as fully as possible. Those that are in the custody of the officers of the Legislative Assembly should be obtained by *subpoena duces tecum*. The evidence of the Commissioner or other officers who have had material conversations with plaintiff will however probably be required in case any erroneous version of such conversations should be deposed to by the plaintiff.

Assuming that the plaintiff's contention is held correct, and that he is entitled to damages for breach of the original agreement, it will be advisable to be prepared with any available evidence to cut down the damages which, as usual, may be anticipated will be claimed upon an exorbitant scale. I can only suggest in a general way the nature of such evidence. It should be directed, to show how far the breaches of the agreement affected plaintiff's moneys, what arrangements he made (if any) to carry on the business, notwithstanding the difficulties in his way. If plaintiff was altogether prevented from opening refreshment rooms during the time the defendant failed to provide sites, &c.

Show, if possible, in a general way the quantity of traffic and the probable amount of custom and profits derivable from the business. It is probable that no evidence of value can be obtained on these heads, but possibly some data may be obtained by comparing the relative traffic and importance of the several stations with those where plaintiff had for some time carried on business.

It might be useful to get plaintiff's books showing accounts and receipts, &c., by notice to produce.

Plaintiff's claim for gas appears to be also a question of law arising upon a construction of the letters constituting the contract. It seems, however, that plaintiff was entitled to something for the extra lights while in actual use, in accordance with a verbal contract made with him. Has this amount been paid to him? If not, ought it not to have been paid into Court? If anything is due to plaintiff on this head it would be advisable to amend the plea of payment into Court, about which no time should be lost.

With regard to plaintiff's claim for a return of the money paid for freight for supplies to the refreshment rooms, the contention is again a question of law depending upon the construction of the letters. I presume that the amount named in the particulars under this head is correct, otherwise defendant should be prepared with evidence to show what the correct amount was.

Defendant should call as witnesses those persons who are cognizant of the circumstances out of which plaintiff's claim arises for the locomotive head lamp.

I understand that they will prove that the whole thing was an experiment, conducted by plaintiff at his own cost. Any memoranda or correspondence relating to this should be produced.

Defendant should be prepared to prove, if possible, that plaintiff was not ready and willing to carry out his contract by calling those persons who know the delay or other neglect on plaintiff's part to fulfil the contract on his part.

Chambers, 26th February, 1885.

CECIL B. STEPHEN.

Minute of The Commissioner for Railways.

I think it would be well to compromise this case if possible. I do not think, from information received, that the plaintiff would be unwilling to do so.

I would be prepared to recommend the following concessions:—

In respect to refreshment rooms to give an additional year or two to present term, and to allow Mr. Castner the power to sublet or to transfer, Mr. Castner to be allowed a term of five years from date of completion of the refreshment rooms not yet finished.

This to be accepted in full satisfaction of all demands in respect of refreshment rooms either under cancelled agreement or existing agreement.

Gas.

Gas.—The sum claimed is £1,645. I would allow Mr. Castner £1,000 on this account.
 Fitting locomotive with head lamp.—Claim £40, would allow £25 on this account.
 Carriage supplies, which we have deducted from the amount awarded under arbitration for purchase of gas-works, £2,558.

It would seem that out of this amount there is really due to Mr. Castner—

Deduction made improperly for building material	£ 92 19 3
Bricks from Goulburn to Junee	90 12 7
For the carriage of water to Junee, supposed to be for gas works	791 0 1
		974 11 11

To this might be added the charge made for bricks carried from Lithgow to Goulburn, which, under legal advice, it was contended Mr. Castner was not entitled to claim, as being an unreasonable distance to require bricks to be carried

184 5 6

£1,158 17 5

There would remain under this head the sum of £1,039 16s., which I would agree to divide = £544 18s.—with Mr. Castner, but I could not consent to any allowance being made for following items:—

Supplies for Mount Victoria	£106 12 9
„ Mittagong	26 17 4
„ Yass	37 14 8
„ Wagga Wagga	23 17 11
		£195 2 8

Amount to be allowed—found to be absolutely due	£92 19 3
„ „	90 12 7

183 11 10

Assumed to be due, but liable to considerable reduction if water was not wholly used for making gas	791 0 1
Concessions made in respect of bricks, between Lithgow and Goulburn	184 5 6

1,158 17 5

Concession made of one moiety of freight for ordinary refreshment supplies, Junee	544 18 0
---	--------	----------

1,703 15 5

Head lamp to engine—£40, compromised for	25 0 0
For gas supply—claim of £1,645, compromised for	1,000 0 0

2,728 15 5

2nd March, 1885.

CH. A. GOODCHAP.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 4 March, 1885.

I have the honor to state that upon receipt (this morning) of your memo. of date 2nd March inst., marked "confidential," with reference to the settlement of the action "Castner v. you," I called upon the plaintiff's solicitors, and informed Mr. Westgarth, who has the conduct of the case, that we were desirous of settling, if reasonable terms could be made, and (without prejudice) suggested a settlement on the basis of the terms mentioned in your memo. Mr. Westgarth told me that he would submit the proposal to his client, but that he felt that it would not be accepted, as they had taken the opinion of their counsel as to their client's claim with respect to the damage he sustained by the breach of the agreement as to the refreshment rooms, which he estimates, and is prepared with evidence to show, amounts to several thousands of pounds. Mr. Westgarth said he felt convinced that nothing but an ample money payment would be accepted in respect of this portion of their client's claim.

The chance of settlement appears to be so small that it is necessary that the evidence of the defence be at once furnished to me, as I think it is certain that the plaintiff will press the case in for trial.

Will you let me know at once, therefore, what evidence you desire shall be called for the defence. At present I am without any information as to this, and the only instructions I can give to counsel will be to watch the plaintiff's case and require him to prove same strictly.

As this matter is very urgent, will you let me hear from you as early as possible.

I have, &c.,

JOHN WILLIAMS,
Crown Solicitor.

The Crown Solicitor to The Commissioner for Railways.

You *ats.* Castner.

Sir,

Crown Solicitor's Office, Sydney, 9 March, 1885.

I have the honor to forward herewith a letter I have just received from Messrs. Norton & Co., plaintiff's attorneys, declining to accept the terms of settlement proposed by you.

I have, &c.,

JOHN WILLIAMS,
Crown Solicitor.

[Enclosure.]

[Enclosure.]

Castner v. The Commissioner for Railways.

John Williams, Esq., Crown Solicitor, Sydney.

Sir,

Marlborough Chambers, 2, O'Connell-street, Sydney, 9 March, 1885.

We have submitted your offer of settlement in this action to our client, and he instructs us to decline.

We have, &c.,

NORTON & CO.

Castner v. The Commissioner.

I HAVE seen the Crown Solicitor with Castner's offer of terms of compromise, and he is of opinion that it is a most favourable and fortunate "get off," and that the offer should be accepted without delay or demur. I asked Mr. Williams if we should contest the points of half costs, and he said "certainly not," accept the offer while you have the chance, and get the case taken off the list at once.—C.A.B., 17/3/85. Secretary.

Commissioner.—G.B. Mr. Castner has expressed to me his willingness to allow Penrith and Sydney to remain under existing arrangements.—C.A.B., 18/3/85.

Mr. J. L. Castner, to The Commissioner for Railways.

Sir,

Railway Refreshment Rooms, Sydney, 16 March, 1885.

With reference to account rendered by me to you, and which is the cause of action at law, I beg to say that in order to bring about a settlement, I am willing to agree to the following, which, if concurred in by you, shall be accepted by me as full satisfaction of claim referred to, that is to say—

That you pay to me £3,500 in cash, and half costs (say) £250.

That I shall have the occupation of all refreshment stations that now are, or will, be erected or established on the Southern or Western railway lines and the branches therefrom, excepting Albury, during and upon the terms and conditions of letters forming lease made 1878, which expires 31st December, 1890, and 7 per cent. on cost of buildings erected by you for refreshment-room purposes, the plans of which should be submitted to me for approval.

That I will be permitted to have water at Junee and other stations, where any water difficulty may exist, from your tanks, without charge, when required by me.

That I shall have the liberty of subletting or disposing of any or all of the stations to parties approved of by you, and that I shall have a first-class free pass over the railways for self and an Inspector during the above term.

Upon the acceptance of your approval of this, and a cheque for the amount stated above, I will sign receipt as payment in full and withdraw the action.

I have, &c.,

JOHN L. CASTNER.

The Commissioner for Railways to Mr. J. L. Castner.

Sir,

Department of Public Works (Railway Branch), Sydney, 18 March, 1885.

I have the honor to acknowledge your letter of the 16th instant, offering to withdraw the action which you have commenced against the Department for the sum of £11,179 8s. 10d. on the following terms, viz. :—

1. A cash payment of £3,500.
2. Payment of the sum of £250 towards your cost.
3. The lease until the 31st December, 1890, of all refreshment rooms existing and to be built on South and West lines, except Albury, at a rental equal to 7 per cent. on the cost of such buildings.
4. You to have the power, subject to the approval of the Commissioner for Railways, to sublet or transfer the rooms.
5. A first-class free pass to be allowed to yourself and an Inspector during the above term.
6. A free supply of water to be given you at Junee and at other refreshment stations where natural difficulties about water supply exists.
7. On payment of the sum of £3,500 and £250 before mentioned, you to give a receipt in full of all demands to date.

In reply, I am instructed by Mr. Secretary Wright to convey to you due intimation of his acceptance of these terms, and that a cheque for the sum of £3,750 shall be paid to you.

You to sign a release indemnifying the Commissioner from any future action at law in respect of these matters.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 18 March, 1885.

I have the honor to state that I have now (quarter past 2) received your letter of this day's date, forwarding Mr. Castner's original letter offering terms of compromise in action now pending, and a copy of your acceptance thereof, both herewith, and asking whether you will be justified in paying Mr. Castner the sum which under the proposed settlement, £3,750, is to be paid to him before a formal deed is to be drawn up. You also request that I will reply to your letter this afternoon.

Upon receipt of your letter I called upon Mr. Westgarth, Mr. Castner's solicitor, who was then engaged in the Supreme Court, to know if he had been advised of the arrangement, and showed him Mr. Castner's letter and the copy of your reply. He said he has not been informed by Mr. Castner of the matter, and could not in any way stay the proceedings. As the matter is apparently settled I thought the case, without being finally withdrawn, might be struck out of the list of cases and entered for trial at a subsequent day, but Mr. Westgarth informs me that yesterday afternoon he was directed by Mr. Castner in no way to consent to anything that would delay the case being brought on for trial.

I certainly cannot take the responsibility of advising you to pay the £3,750 until a formal release or agreement has been signed by Mr. Castner. If that amount is paid before a final release is obtained it may be that difficulty will arise with Mr. Castner as to the form of release, and that the dispute with Mr. Castner will be kept open, with the additional disadvantage to you of Mr. Castner having received all that he is to receive.

Whether the £3,750 shall be paid at the present stage of the arrangement is not a question of law but of expediency, which I cannot determine.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 19 March, 1885.

I have the honor to state that Mr. Westgarth, Mr. Castner's solicitor, informed me this morning that he had received a letter from Mr. Castner to the effect that your letter of the 18th inst. was not simply an acceptance of the terms offered in his letter, but proposes other terms, which he declines to accept, and no final agreement for settlement has been come to. Mr. Castner, however, states that he is still willing, if you will write accepting the terms, mentioned in his letter without alteration or qualification, and forward a cheque for the amount, which under such an arrangement will be payable to him, to so arrange.

Mr. Castner has, it is said, left town, and will not return before Monday. If, therefore, anything is to be done in the matter, it must be before then.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

The Commissioner for Railways to The Crown Solicitor.

Department of Railways, 19 March, 1885.

I HAVE the honor to acknowledge your letter of this day's date, intimating that Mr. Westgarth has informed you that Mr. Castner was still prepared to compromise his action upon the terms (without alteration or qualification) set forth in his letter of the 16th instant.

As I have already taken occasion to intimate to you, the case is, in my opinion, one which ought to be settled, and if no better terms can be obtained than those demanded by Mr. Castner, I think they should be accepted.

I addressed a letter to you this morning on this subject, enclosing Mr. Castner's letter above referred to. The present letter must be read as a continuation of mine of this morning.

If the £3,750 be paid to Mr. Castner, care must be taken that it is accepted in full of all claims and demands, and that it is understood that the amount is intended to include any sum that may have been paid into Court, and that the proposed new leases are to be in substitution of existing agreements, which latter are to be cancelled and become null and void.

I have, &c.,
CHAS. A. GOODCHAP,
Commissioner for Railways.

The Crown Solicitor to The Commissioner for Railways.

Castner *v.* the Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 19 March, 1885.

I have the honor to return herewith your letter of this day's date, and Mr. Castner's letter of 16th March, forwarded therewith, received shortly after I had written to you this morning on the same subject.

As mentioned in that letter, Mr. Castner's attorney states that Mr. Castner will not settle upon any terms short of a complete and unqualified acceptance of the terms mentioned in his letter of 16th March instant.

With reference to the payment of £3,750, that is £3,500 as for compensation, and £250 as for costs, Mr. Westgarth states that he understood that the amount paid into Court with the amended particulars on 16th instant, £842 15s. 3d., will, if a settlement is agreed to, be deducted from the £3,500, that is as suggested in your minute, the £3,500 included in the amount as paid into Court.

I forward herewith an extract from Mr. Castner's letter to Messrs. Norton & Co.

Will you, therefore, instruct me what offer (if any) I am to make to Mr. Castner's solicitor. From the information they have given to me the question appears to be limited to whether or not you will accept the terms in his letter, and at once pay the money or not.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

Extract of Mr. Castner's letter to Messrs. Norton & Co.

RESPECTING the case between the Commissioner for Railways and myself, there has been a good deal of negotiations, but no satisfactory results have been arrived at; therefore it is my desire the case should be proceeded with, unless I receive, or you receive on my behalf, a clear acceptance of my letter of the 16th instant, and its conditions as therein stated. Copy of letter appended hereto.

The Commissioner did send to me a letter accepting in part the conditions of my letter, but in one particular it was varied, *i.e.*, he excepted Sydney and Penrith stations from the other stations, to which clause I asked to have added, "At the present rental and lease to expire with others, 31st December, 1890."

This letter was taken away to have the words added and to be initialled, but has not been returned to me, so that I am really without an answer to my letter.

Minute

Minute of the Commissioner.

Mr. Castner sues the Commissioner for £11,500.

First—For breach of agreement in respect of refreshment rooms, £6,929.

Second—For carriage of supplies to refreshment rooms, £2,885.

Third—For under-payments on account of gas supplied to Redfern Station, £1,640. And a small amount for supply of head lamps for locomotive.

The settlement of the case for £3,500, and £250, half costs, on the terms given.

Mr. Castner's letter of the 16th instant is considered by the Crown Solicitor to be a favourable settlement for the Department, and I recommend that it be settled accordingly.—CHAS. A. G., 18/3/85.

Approved.—F.A.W., 18/3/85.

The Crown Solicitor to The Commissioner for Railways.

Castner v. You.

Sir,

Crown Solicitor's Office, Sydney, 21 March, 1885.

Referring to your second letter of the 19th instant, I have the honor to state that on communicating with Mr. Castner's attorney, I find that they positively refuse to accept a release containing any reference to new leases, and insist that the release shall be simply a general lease and discharge of the action and all claims the subject of it. I have, therefore, prepared, and now forward herewith, a draft form of release with that object, which has been submitted to and approved of by Counsel, and shall be glad to know if it appears to you sufficient for the purpose, or whether you still require reference to future arrangements with Mr. Castner to be made in it.

On your returning the draft to me, and if it be approved, I will at once submit it to Mr. Castner's attorney for perusal on his behalf.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 24 March, 1885.

I have the honor, in reference to your letter of this day's date, in which, respecting the settlement of Mr. Castner's action, you state "the voucher for £3,750 has been sent forward to the Treasury for payment," to remind you that this is not the sum to be paid; the amount paid into Court, £842 15s. 3d. has to be deducted, leaving the sum for present payment at £2,907 4s. 9d.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 24 March, 1885.

I have the honor to forward herewith the draft release which has been settled by Mr. Castner's solicitor.

You will notice that they have inserted (in red ink) a statement that the settlement is also in consideration of the terms, &c., in Mr. Castner's letter to you of 16th March instant, that is, intending that the rights stipulated for in those letters shall remain. I think this is the arrangement you intended.

If this is so will you return the draft at once, and forward a pay voucher for the amount to be paid to Mr. Castner.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

THIS INDENTURE made the twenty-fifth day of March one thousand eight hundred and eighty-five between John Louis Castner of Sydney in the Colony of New South Wales gentleman of the one part and the Commissioner for Railways a corporation sole created by the Act of Council passed in the twenty-second year of the reign of Her Majesty Queen Victoria number 19 intituled "An Act to make more effectual provision for the construction by the Government of Railways in the Colony of New South Wales and for the regulation of the same of the other part Whereas an action has been lately commenced by the said John Louis Castner in the Supreme Court of New South Wales against the said Commissioner for Railways of the said Colony being number 4126 of the year one thousand eight hundred and eighty-four to recover certain sums alleged to be due and owing by the said Commissioner for Railways to the said John Louis Castner and also damages for alleged breaches of contract by the said Commissioner for Railways And whereas it has been agreed between the parties to the said action and to these presents that the said Commissioner for Railways should pay to the said John Louis Castner the sum of three thousand five hundred pounds less the sum of eight hundred and forty-two pounds fifteen shillings and threepence recently paid into Court in the said action in full satisfaction and discharge of all claims by the said John Louis Castner against the said Commissioner for Railways not only in respect of the said sums and damages in the said action but in respect of all claims of every nature or kind whatsoever which he the said John Louis Castner has or may have against the said Commissioner for Railways and the further sum of two hundred and fifty pounds for the costs of the said John Louis Castner in the said action and that upon payment of the said two sums of two thousand six hundred and fifty-seven pounds four shillings and ninepence and two hundred and fifty pounds the said action and all further proceedings therein should be wholly stayed discontinued and released to the said Commissioner for Railways Now this indenture witnesseth that in pursuance of the said agreement and

in consideration of the said two sums of two thousand six hundred and fifty-seven pounds four shillings and ninepence and two hundred and fifty pounds making together the full sum of two thousand nine hundred and seven pounds four shillings and ninepence now paid by the said Commissioner for Railways to the said John Louis Castner in full satisfaction as aforesaid the receipt whereof is hereby acknowledged he the said John Louis Castner doth hereby remise release and quit claim with the said Commissioner for Railways and the Government of the said Colony The said action now pending in the said Supreme Court and all claims for moneys compensation damages or costs therein and also further from all actions and suits cause and causes of action and suit accounts claims and demands whatsoever both at law and in equity which he the said John Louis Castner now hath or at any time hereafter can or may have or but for the execution of these presents could or might have had against the said Commissioner for Railways to the date hereof.

In witness whereof the said John Louis Castner hath hereunto set his hand and seal and the said Commissioner for Railways his common seal the day and year first before written.

Signed sealed and delivered by the said John Louis Castner in the }
presence of,— J. L. CASTNER.

I acknowledge to have received from the Commissioner for Railways abovementioned }
the sum of } £2,907 4s. 9d.
being the consideration money abovementioned to be paid by him to me. }
Witness,— J. L. CASTNER.

The Commissioner for Railways to The Crown Solicitor.

Sir, Department of Railways, Sydney, 16 April, 1885.

I have the honor to inform you that the following are the particulars of the arrangements lately made with Mr. Castner in connection with the compromise of the action which he had commenced against the Department:—

Mr. Castner to have a lease until 31st December, 1890, of all refreshment rooms, existing, or to be built or appropriated, on South and Western lines and branches (except Albury).

The plans of any new refreshment rooms to be submitted to Mr. Castner for approval.

Mr. Castner to have the power, subject to the approval of the Commissioner for Railways, to sublet or transfer.

Mr. Castner, in the case of each station, to pay rental equal to 7 per cent. upon the cost of the building devoted to refreshment purposes

The rent to be paid monthly in advance.

Water required by Mr. Castner for refreshment-room purposes at Junee and any other refreshment station, whether owing to natural difficulties in respect of the supply it has to be brought by railway, shall be supplied by the Department, and shall be carried over the Railway free of charge.

A first-class free pass for all refreshment stations on Southern and Western lines and branches shall be granted to Mr. Castner, and a similar pass for an Inspector employed by him.

I shall be much obliged by your preparing a deed embodying these conditions in such form as you may think suitable and best calculated to secure the Department against after claims.

I have, &c.,

CH. A. GOODCHAP.

Mr. J. L. Castner to The Commissioner for Railways.

Sir, Sydney, 22 March, 1887.

With respect to the Railway Refreshment Rooms Contract, or agreement, granted by you to me on the 18th March, 1885, and now operated by John Castner and Co. (Limited), I have the honor to say that the gentlemen forming that Company are desirous that you would transfer the said contract, or agreement, and its responsibilities and privileges, from me to them, and that you accept that Company as lessees in my stead, and that I shall be glad if you will be good enough to comply with their desire and accept John L. Castner and Co. (Limited), as lessees in the place of the undersigned.

For reasons which appear good the Company, which is composed of Mr. T. H. Kelly, merchant, Mr. J. Y. Mills, auctioneer, Mr. R. Jones, jun., of Harrison, Jones, and Devlin, R. Black, Esq., M.L.A., Mr. G. Durham, accountant, Mr. W. Beaumont, gentleman, Mr. J. R. Jones, of Messrs. Jones and Black, and J. L. Castner and others, believe it will be advantageous for all concerned if they communicate directly with you and the public instead of through myself, as they have been and now are operating the refreshment-rooms; and I may further say it seems to me this arrangement would be far more satisfactory. Awaiting your reply,

I have, &c.,

JOHN L. CASTNER.

I should be glad to see the Commissioner this afternoon on this matter.—J.S., 29/3/87.

I have seen the Minister, who thinks that there can be no objection to take the names of the Company instead of Mr. Castner. The Company should take a transfer from Mr. Castner I suppose. Please say what is the best way of effecting this.—CH.A.G., 29/3/87.

I saw the Commissioner and explained the nature of the deed which I thought would be necessary for the assignment of Mr. Castner's interest to the Company, and the Commissioner directed that the Crown Solicitor should be instructed and Mr. Castner informed.—C.A.B., 29/3/87.

The Commissioner for Railways to Mr. J. L. Castner.

Sir,

Railway Branch, Sydney, 30, March 1887.

I have the honor to acknowledge your letter of the 22nd instant, in which you ask that the contract or agreement granted to you in March, 1885, in respect of the lease of the Railway Refreshment Rooms may be transferred to the gentlemen now working the business under the title of John L. Castner and Company (Limited), and that they may be accepted by the Department as lessees in your stead, you being thereby relieved of all obligations and responsibilities in respect of the said refreshment-rooms, except such as will attach to you in your capacity of shareholder in the said Company.

In reply I have to inform you that Mr. Secretary Sutherland has approved of such transfer being made, and the necessary instructions have been given to the Crown Solicitor.

I have, &c.,

C. A. GOODCHAP,

(Per D.V.)

Commissioner for Railways.

Instructions accordingly were issued to the Crown Solicitor and the following form of assignment, was submitted, approved, and executed :—

In consideration of 5s. sterling to within named John Louis Castner, on signing hereof, paid by John L. Castner and Company (Limited), said John Louis Castner hereby transfers and assigns all that lease and premises, and all right and rights to a lease or leases of the premises mentioned in the within letter of the 18th day of March, 1885, to John L. Castner and Company (Limited), their successors and assigns, and John L. Castner and Company (Limited), thereby accept such transfer and assignment, and undertakes to pay all rents due or to accrue due in respect thereof as from the 18th March, 1885.

Signed, sealed, and delivered by the said John Louis }
Castner, in the presence of,— }
HENRY G. DOWNTON.

JOHN L. CASTNER.

The seal of John L. Castner and Company (Limited) was }
hereunto affixed by order of the Board of Directors,— }

[L.S.]

J. T. MILLS, }
T. H. KELLY, } Directors.

(For John L. Castner and Company Limited),
HENRY G. DOWNTON, Secretary.

Dated, Sydney, this seventh day of April, one thousand eight hundred and eighty-seven.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(CORRESPONDENCE IN REFERENCE TO SUPPLY OF COAL FOR GREAT NORTHERN LINE.)

Ordered by the Legislative Assembly to be printed, 12 June, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 27th March, 1888, That there be laid upon the Table of this House,—

- “(1.) Copies of all correspondence, papers, minutes, &c., in reference to the Contracts for the Supply of Coal by Messrs. Read and Longworth to the Railway Department from Singleton.
“(2.) Copies of all correspondence, papers, minutes, &c., between the Railway Department and Messrs. Nowland, offering to supply coal on the Great Northern Railway at much lower prices than the price paid to Read and Longworth.
“(3.) Also, copies of all contracts entered into between the Railway Department and Read and Longworth, for supply of Coal on the Great Northern Railway.”

(*Mr. McElhone.*)

SCHEDULE.

NO.	PAGE.
1. Under Secretary for Works to Commissioner for Railways, forwarding tenders for supply of coal for the Great Northern Railway, with minutes, reports, and Minister's decision. 11 November, 1879.....	2
2. Letter from Commissioner for Railways to Mr. Read, accepting tender for supply of coal during 1880, 1881, and 1882. 16 January, 1879	3
3. Letter from Commissioner for Railways to Mr. Longworth, accepting tender for supply of coal during 1880. 16 January, 1879.....	3
4. Letter from Commissioner for Railways to Mr. Longworth, accepting tender for supply of coal during 1881. 21 January, 1881.....	3
5. Letter from Mr. Gould, M.P., to Commissioner for Railways, <i>re</i> tenders called for supply of coal, with reports, &c., and Commissioner's minute. 23 September, 1882.....	3
6. Letter from Mr. Gould, M.P., to Commissioner for Railways, enclosing letter from Mr. Read, asking that tenders may be called for a three or five years' contract, with minutes, reports, &c. 20 September, 1883.....	4
7. Minute from Superintendent of Stores to Commissioner for Railways, forwarding draft advertisement and specification for supply of coal during 1884, with Minister's decision. 29 October, 1883	5
8. Under Secretary for Works to Commissioner for Railways, forwarding tenders for supply of coal during 1884, with reports, &c., Commissioner's minute, and Minister's decision. 13 November, 1883.....	6
9. Letter from Mr. Williams to Commissioner for Railways, withdrawing Mr. Stephens' tender. 27 November, 1883	7
10. Letter from Messrs. Vickery & Sons to Commissioner for Railways, <i>re</i> test of coal. 28 November, 1883.....	8
11. Letter from Government Analyst to Commissioner for Railways, with analysis and report on samples of coal, minutes, &c., Minister's decision. 8 December, 1883	8
12. Letters from Commissioner for Railways to Messrs. Read and Longworth, accepting tenders. 20 December, 1883	8
13. Bond entered into by Mr. Read for supply of coal. 18 February, 1884	9
14. Letters from Mr. Gould, M.P., to Commissioner for Railways, <i>re</i> Messrs. Read and Longworth's contracts. 28 February, 1885	10
15. Letter from Mr. Longworth to Commissioner for Railways, <i>re</i> extension of contract. 18 March, 1885	11
16. Letter from Mr. Read to Commissioner for Railways, <i>re</i> extension of contract, with minutes, reports, and decision of Minister. 18 March, 1885	11
17. Letter from Commissioner for Railways to Mr. Read, accepting offer, extension of contract. 1 April, 1885	12
18. Letter from Commissioner for Railways to Mr. Longworth, accepting offer, extension of contract, with reports, &c. 1 April, 1885	12

34. Minute of Commissioner, <i>re</i> above. 23 February, 1888	25

No. 1.

The Under Secretary for Public Works to The Commissioner for Railways.

Department of Public Works, Sydney, 11 November, 1879.

Sir, The tenders, eleven in number, for the works specified in the margin, are referred to you for report, and you will have the goodness, as early as possible, to return them to me, direct for submission to the Minister.

I have, &c.,

GERALD HALLIGAN,
(For Under Secretary.)

Locomotive Engineer for report.—Coal to be tested if necessary. It is stated that the Greta coal is now superior to what it was formerly. I think it should be specially tested again; also the coal from Alnwick mine.—CH.A.G., 13/11/79.

ANALYSIS OF TENDERS.

Name.	Colliery.	Price per ton with freight added.
For Honeysuckle Point—		
D. Williams	Alnwick	s. d. 11 6
J. Mitchell	Not stated	11 9
E. Vickery	Greta	11 11
Bingle, White, & Co.	Ferndale	12 3
For Singleton—		
H. Longworth	Not stated	11 0
H. Marshall	Thornley	11 6
E. Vickery	Greta	11 9
J. Mitchell	A new mine	12 3
R. Read	Singleton	12 6

Coal delivered at Honeysuckle Point.

As the result of the trial of the coal offered by Mr. Williams at 11s. 6d., and by Mr. Mitchell at 11s. 9d. per ton, shows them to be unsuitable for our purpose, I cannot recommend the acceptance of either of their tenders. The choice then lies between the Greta coal, offered by Mr. Vickery at 11s. 11d., and the Ferndale, by Messrs. Bingle, White, & Co. at 12s. 3d. per ton.

As the Greta coal supplied under contract in 1874 did not give satisfaction (the contract having been cancelled), and the trial of the sample submitted for testing on this occasion shows that the coal is not free from former defects, while the difference in price between it and the Ferndale is only 4d. per ton, while the latter was very satisfactory when under contract in 1878. I recommended that the contract for 1880, for the Newcastle District, be given to Messrs. Bingle, White, & Co.

Coal for the Singleton District.

Although there are four tenders lower, by 1s. 6d., 1s., 9d., and 3d. respectively, than that of Mr. R. Read at 12s. 6d., I do not think that the result of the trial of the samples supplied for testing is such as to warrant the placing of the contract for 1880, in its entirety, with any of these tenderers. I, therefore, recommend that the contract be divided, and that the tender of Mr. R. Read at 12s. 6d. per ton be accepted for the coal required for the year 1880, at Singleton, for the long-journey trains, on the condition he states, viz., that the coal to be supplied by him will be from the same mine and seam as the coal supplied by the present contractor for that district, it having given satisfaction.

I further recommend that, on account of the low price quoted by Mr. Longworth, the contract for the coal required for the goods or short-journey trains of the Singleton District be given to him, subject, of course, to its being cancelled, in accordance with the specification, in the event of the coal failing to give satisfaction.

I attach the reports on the coals tested.
The Commissioner.

R.H.B., 24/12/79.

RETURN

RETURN showing the results of tests made of coal supplied by Mr. Vickery, of Greta; Mr. Williams, of Woodford; Mr. Mitchell, of East Maitland; Mr. Marshall, of East Maitland; and Mr. Longworth, of Singleton.

Name of Colliery Company.	Date of Test—December, 1879.	Weight of Coal tested.	Approximate weight of load in tons.		Gallons of water evaporated.	Consumption of coal in lb.		Refuse.				Character of the refuse from ash-pan at finish of test.			Remarks.	
			Down journey to Murrumbidgee.	Up journey.		Per train mile exclusive of shunting.	Per gallon of water evaporated.	Weight of clinker taken out of Fire-box.	Refuse from Ash-pan.	Small cinders from smoke-box.	Total.	Percentage of refuse or waste on consumption.	Percentage of clinker.	Percentage of cinder.		Percentage of dirt.

G. NEWTON, 17/12/79.

THOS. BOAG, 18/12/79.

MR. BURNETT.

The value for locomotive purposes of the coal offered is best determined by the officer-in-charge of the Locomotive Department, and though the tenders recommended by him for acceptance are not the lowest, I think the best course will be to accept his recommendation, which has been made after a careful testing of the coal offered.—CH.A.G., 14/1/80.

Approved.—J.L., 15/1/80.

No. 2.

The Commissioner for Railways to Mr. R. Read.

Sir,

Department of Railways, Sydney, 16 January, 1880.

I have the honor to accept your tender, dated the 8th November last, to supply and deliver the engine-coal required for use at Singleton, for the long-journey trains, for the three years 1880, 1881, and 1882, on condition that the coal is supplied from the same mine and seam as that supplied by the present contractor, and that it is in all respects equal thereto.

I have to request that you will at once wait upon the Crown Solicitor, with your sureties, to execute the required bond, and to state that your tender is accepted, subject to the execution of such bond, within ten days from date thereof.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

No. 3.

The Commissioner for Railways to Mr. W. Longworth.

Sir,

Department of Public Works, Railway Branch, Sydney, 16 January, 1880.

I have the honor to accept your tender, dated the 6th November last, to supply and deliver, in accordance with specification, the engine-coal required for use at Singleton Station for the goods or short-journey trains, during 1880, and have to request that you will at once wait, with your sureties, upon the Crown Solicitor, for the purpose of executing the required bond, which must be signed within ten days from date hereof.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

No. 4.

The Commissioner for Railways to Mr. W. Longworth.

Sir,

Department of Public Works, Railway Branch, Sydney, 21 January, 1881.

I have the honor to accept your tender, dated the 2nd November last, to supply and deliver, in accordance with specification, the engine-coal required for use at Singleton Station for the goods or short-journey trains during 1881, and have to request that you will be good enough to wait, with your sureties, upon the Crown Solicitor, for the purpose of executing the required bond, which should be signed within ten days from date hereof.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

No. 5.

A. J. Gould, Esq., M.P., to The Commissioner for Railways.

Sir,

Singleton, 28 September, 1882.

I observe, by notice in the *Government Gazette* of 26th instant, that tenders are called for supply of coal to Locomotive Department, for Great Northern Railway, 12,000 tons, between Newcastle and Singleton, 2,500 tons, Singleton to termini, but no notice apparently taken of that required at Singleton, presently

presently supplied by R. Read, under contract for three years, terminating 31st December proximo. I presume tenders have not been called for this owing to some misapprehension as to termination of present contractor's contract. Will you, therefore, kindly take steps to have tenders called for same. I think estimated quantity required for Singleton when tenders were last invited was 3,500 tons.

I have, &c.,
ALBERT J. GOULD,
(Per W.W.R.)

Memo. to Storekeeper,—

Newcastle, 29 September, 1882.

By the newspaper I notice only 2,500 tons of coal are tendered for delivery at Singleton; there is some mistake in this, as Dr. Read's three years' contract terminates on 31st December, 1882, and I think 15,000 tons would be nearer the mark.

HENRY FLIGG.

For the information of the Commissioner:—I was not aware that tenders had been invited for coal.—A.R., 30/9/82. Locomotive Engineer, B.C., 3/10/82. Urgent.—G.B.

The specification herewith marked A is the only one which I saw that I can remember, and refers to the Northern Line. It will be seen I altered it from 10,000 to 12,000 tons.—THOS. MIDELTON, 11/10/82. Mr. Berner.

The three specifications, viz., for the South and West, and the two for the Northern Line were duly sent to the Locomotive Engineer's office for revision, and the tenders were invited in accordance with the specifications as returned from that office.—D.C.M'L., 17/10/82.

What does Locomotive Engineer suggest now.—G.B., B.C., 17/10/82. Mr. Boag knew the quantity required, and advised intending tenderers, so there is nothing further required, besides the quantity is only given as an approximate.—R.J.S. (per L.E.), 18/10/82. The Commissioner.

Storekeeper.—G.B., B.C., 28/10/82.

I think it is a matter of the greatest importance that we should have some degree of accuracy in the estimates of coal requirements. These are certainly approximate, but 2,500 tons instead of 15,000 cannot surely be so termed. I have only to point out the voluminous correspondence and trouble which is now taking place owing to this very want of approximation of the estimates. Might I, at the same time, respectfully ask if there is any reason why these coal matters do not come through the store branch, as do all other tenders for supplies. I think it would be well that they should do so.—A.R., 31/10/82. The Commissioner.

There should be, certainly, some approximation between the actual quantity taken of any supplies contracted for and the estimated quantity, and this should not be wider than say a difference of 12½ per cent. either way would cover. The coal supplies should go through the store, as do all other supplies.—CH.A.G., 3/11/82. Locomotive Engineer, B.C.

Seen.—T.M., 6/11/82. The Commissioner.

No. 6.

A. J. Gould, Esq., M.P., to The Commissioner for Railways.

Sir,

Singleton, 20 September, 1883.

Herewith I have pleasure in handing you letter from R. Read, one of the contractor's for the supply of locomotive coal, asking for the reasons therein that you will be pleased to call for tenders for a three or five years' contract for the locomotive coal required at Singleton; this course I trust you will adopt, as I believe it will be found on inquiry to be in the interest of the Department, and ensure the regular and full supply of coal, without the inducement of a three or five years' contract, the construction of the proposed railway most certainly would not be proceeded with.

I have, &c.,
ALBERT J. GOULD.

[Enclosure.]

Sir,

Singleton, 20 September, 1883.

As the time is approaching when fresh tenders will be called for the coal supply for the Great Northern Railway at Singleton, and all stations north, might I suggest to you the advisability of calling for the supply for three or five years.

The consumption of coal on the railway from Singleton northwards has, during the last years, increased enormously, and has overgrown the facilities for supplying the contract with regularity, the drawing of the coal from the pit to the railway siding, a distance of 1½ mile nearly, being the great drawback. Should I be the successful contractor next year, I purpose at once laying a line of rails from the Great Northern Railway to the pit screens, in order to load the trucks direct at the screens, and will deliver them on the Great Northern Railway. The advantage to the Department would be a more regular supply with facilities for increasing it should occasion arise; again the coal would be delivered much larger as it would be less broken by being but once handled, and as it is handled over again in the railway yard, this would be a consideration to the Department.

The quality of the coal cannot be surpassed for locomotive purposes.

As a contract for one year would not justify the expenditure for a railway, &c., which would amount to about £2,000, I beg to leave the matter for your favourable consideration, and would suggest that the tenders be called for early, in order that the work could be commenced and completed before the expiration of present contract.

I am, &c.,
RICHARD READ.

To the Commissioner for Railways, Sydney.

Superintendent of Stores for report.—CH.A.G., B.C., 21/9/83.

I have asked the Locomotive Engineer to furnish me with the information necessary for calling for tenders for coal. I see no objection to making the Singleton coal contract a triennial one, especially under the representation made by Dr. Read.—A.R., 27/9/83. The Commissioner.

Make the contract for three years. Should not tenders be invited early.—CH.A.G., 1/10/83. Superintendent of Stores, B.C. Yes. Please give as early as possible the information asked for.—A.R., 4/10/83. Locomotive Engineer. Urgent. Mr. Boag for estimated quantity of coal required at each depôt during 1884.—R.J.S., 8/10/83. Please see attached paper giving estimated quantities of coal required.—S.L.L. (Pro Locomotive Foreman), 13/10/83.

Memorandum

Newcastle, 13 October, 1883.

Memorandum to Locomotive Engineer,—
Sir,

Estimated quantities of coal required for engine purposes, Locomotive Department, Great Northern Railway :—

1884—	To be delivered at Honeysuckle Point	12,000
1884—	„ Singleton	16,000
1885—	„ „	17,000
1883—	„ „	20,000

I beg to suggest that a clause be inserted in the coal specifications, to the effect that all coal delivered by the contractors must be of a quality that can be used on an engine running any description of train on any part of the Great Northern Railways. Hitherto tenderers have been under the impression that coal delivered at Honeysuckle Point Works is only to be used between Newcastle and Singleton; and that Singleton coal is not to be used south of Singleton, but such is not intended, as engines running from Newcastle do not require recoaling before arrival at Murrurundi, and to coal at Singleton would cause inconvenience and delay. I do not think the Department should be restricted to use any particular coal, so long as the estimated quantity is not exceeded by more than 10 per cent., so that in the event of a contractor's coal being of such a dirty clinkering nature that it is unsuitable to run long journeys with, the Department may procure suitable coal at the contractor's expense.

THOS. BOAG.

I really do not see that the specification need be altered as Mr. Boag suggests, as if the coal is the best quality, as stipulated, it should suffice.—W.S. (*pro* R.J.S.), 16/10/83. Mr. Richardson. The quantities required on the Northern Lines are, at Honeysuckle Point, 12,000 tons; do. do. Singleton, 16,000 tons.—R.J.S., 16/10/83. Mr. Richardson.

No. 7.

Minute from the Superintendent of Stores to The Commissioner for Railways.

29 October, 1883.

I ENCLOSE draft advertisement calling for tenders for engine-coal required for use on the Great Northern Line for the year 1884.

A. RICHARDSON,
Superintendent of Stores.

For Minister's approval.—D.V., 30 3. Approved.—F.A.W., 31/10/83.

[Enclosure.]

TENDERS will be received at this office until 11 a.m. on Tuesday, 13th November, from persons willing to supply the engine-coal required on the Great Northern and North-western Lines, for the year 1884, at Honeysuckle Point, and at Singleton for the years 1884, 1885, and 1886.

Specification may be seen, and further particulars obtained, at the office of the Superintendent of Railway Stores, Eveleigh; at that of the Railway Storekeeper, Honeysuckle Point; and at the Railway Station, Singleton.

Tenders must be endorsed "Tender for supply of coal for Great Northern and North-western Lines."

Department of Public Works, Railway Branch,
Sydney, 30 October, 1883.

Commissioner for Railways.

SPECIFICATIONS for the supply and delivery of engine-coal at Singleton Station, required for use over the Great Northern and North-western Lines for the three years ending 31st December, 1886.

1. This contract shall be for the supply and delivery at Singleton Station of the following quantities of coal, required for use on the Great Northern and North-western Lines :—

For the year 1884	16,000 tons.
„ 1885	20,000 „
„ 1886	25,000 „

2. The above quantities are, however, so far approximate that the Commissioner reserves to himself the right to demand more, or accept less to the extent of 25 per cent.

3. All coal supplied must be of the best quality, free from slack, stone, schist, band, or other substance which may affect its quality and practical use on a locomotive engine. It must be thoroughly screened through a $\frac{3}{4}$ -inch iron mesh screen, to be provided and fixed by the contractor, and approved by the Locomotive Engineer.

4. All coal supplied not of sufficiently good quality will be rejected, and must, on notice in writing from the Superintendent of Stores, or other authorised officer, be removed by the contractor at his own cost, within twelve hours from the receipt of such notice; or if not so removed, it will be discharged from the trucks at the contractor's expense, and if not then removed within seven days, shall be forfeited, and become the property of the Commissioner for Railways, on behalf of the New South Wales Government.

5. Coal must be supplied in such quantities, and at such times as may be required from the 1st January, 1884, to the 31st December, 1886, but the contractor will not be called upon to supply more than a *pro rata* quantity monthly, based upon the twelve months' estimate with 25 per cent. added.

6. Payments will be made once in every month, but only on the certificate of proper officer; that the coal has been supplied according to contract.

7. Should any coal (not exceeding the *pro rata* monthly quantity based upon the twelve months' estimate with 25 per cent. added) not be promptly supplied on the usual printed order signed by the proper officer, the Commissioner may, in his discretion, purchase such coal in such manner as he may think best for the Public Service, and the excess of cost (if any) shall be deducted from any money payable to the contractor by the Commissioner.

8. The Commissioner reserves to himself the right to annul the contract at any time, on giving one month's notice in writing to that effect, should he not be satisfied with the quantity of the coal or the rate of delivery.

9. Persons tendering will be required to supply, free of cost, a quantity (not less than 5 and not more than 10 tons) of the coal, produced at the mine from which it is intended to supply coal under this contract. This coal is for the purpose of testing, and should, therefore, be a fair average sample of the produce of the mine.

10. The person whose tender may be accepted, will be required to enter into a bond with two eligible sureties, jointly and separately to be bound under a penalty of £1,500 for the due performance of this contract.

11. The Commissioner reserves to himself the right to purchase coal elsewhere than from the contractor for the 24/10/83. service of the Department during the currency of the contract, should he consider it necessary to do so without prejudice to his rights under, or in any way vitiating this contract.

A.R., 29/10/83.

No. 8.

The Under Secretary for Public Works to The Commissioner for Railways.

Department of Public Works, Sydney, 13 November, 1883.

Supply of Coal, Great Northern and
North-western Railways, 1884.

Tenders.	Per ton.
Newcastle .. C. J. Stevens ..	9-11
.. Waratah Co. ..	11/-
Singleton .. Longworth ..	11/9
.. Read ..	11/9
.. Vickery ..	9/6 & 10/-

Sir,

The tenders, five in number, for the work specified in the margin are referred to you for report, and you will have the goodness, as early as possible, to return them to me direct for submission to the Minister.

I have, &c.,

JOHN RAE.

Superintendent of Stores.—G.B., B.C., 13/11/83.

Tenders for the supply of coal at Newcastle and Singleton.

Honeysuckle Point and Newcastle—		s.	d.
C. J. Stevens	9	11 per ton
Waratah Coal Company	11	0 "
Singleton—			
Longworth	11	9 "
Read	11	9 "
Vickery & Sons	9s. 6d. and	10 0 "

Mr. Fligg will please consult with Mr. Boag and Mr. Newton, and then submit report.

The points seem to me to be these. If Stevens' coal will do for all purposes, well and good; but if other coal is required, is it advisable to take Waratah, which is indifferent, if we can get Co-operative or Wallsend for the same money.

With regard to the Singleton coal, will it not be advisable, in view of the lower prices asked for Greta coal, to make a contract for a certain quantity of that, even though it be of inferior quality.

The qualities of the coals are now well known, so that I think no further trials need be made.

Mr. Fligg; urgent.

A.R., 14/11/83.

The quantities recommended to be contracted for in each case should be stated.—A.R.

Greta coal has been tested some time ago and found not suitable for locomotive purposes. Stevens' coal likewise is not suitable for the goods or mail trains. The qualities of these coals are well known. Reports in reference to Woodford and Greta coal with the Locomotive Engineer. Mr. Boag recommends the Waratah coal for Newcastle end, as per specification, and Read and Longworth for Singleton.—H.F., 17/11/83.

This report is most feeble and unsatisfactory. No good reason, or, in fact, any reason at all has been given for the entire exclusion of coal at Honeysuckle Point, 1s. 1d. per ton cheaper than that recommended, and at Singleton, coal 1s. 9d. per ton cheaper. I must have a very full and careful report, and the course which will result in the greatest economy to the Department is that which must be taken. Mr. Fligg has not answered my question with regard to Waratah coal. I know it is inferior to Co-operative or Wallsend, and yet the price is no lower than we are at present paying for Co-operative. I am firmly of opinion that a certain quantity of both Stevens and Greta coal should be taken; if not, very good cause must be shown to the contrary. It is by no means necessary to accept one contract for the whole supply in either case. It has been proved that Stevens' coal can be perfectly well used in running certain trains, and his tender should be accepted for the quantity of coal required for running such trains, and the same with Waratah. We are told that Greta coal is unsuitable, but in view of the 1s. 9d. saving in cost, is it not possible to utilize a quantity of it either for certain trains, or mixed with Read's and other coal. I beg that Mr. Fligg will look very carefully into this matter, in conjunction with Messrs. Boag and Newton, and submit a report accordingly.—A.R., 19/11/83. Storekeeper, North.

Urgent.—Will Mr. Newton be good enough as to report upon the suitability of Greta coal for locomotive purposes, either for use separately or to be mixed with the coal supplied by Dr. Read and Longworth. Mr. Newton will notice by my memo., 17/11/83, that Mr. Boag does not approve of using Greta coal in any way. A copy of a report of his is attached when these coals were tested in 1874, and again in 1877, said report conveying Mr. Boag's opinion at the present date.—H.F., 20/11/83.

I have now looked into this coal matter carefully with Mr. Boag and Mr. Newton, and now beg to forward their opinions:—Mr. Boag says: With regard to Stevens' coal being used at Honeysuckle Point for next year for short-journey trains, my experience of the coal during 1883, as shown me, that it is not by any means a good coal for our use, and its dirtiness and clinkering qualities makes it an expensive coal at almost any price. Comparing Stevens' coal at 9s. 11d. with Waratah at 11s., is, in my opinion, all in favour of Waratah, and I feel sure that the use of the latter coal will give great satisfaction, and prove almost, if not altogether, as cheap as Stevens' coal.

Supply of coals at Singleton for three years, 1884, 1885, 1886.

Mr. Boag and Mr. Newton say with regard to Greta coal:—Our reports of Greta coal have always been adverse to its use. In the year 1874 the Greta Company held the contract, but it had to be cancelled before the end of the year owing to the coal being unsuitable. There are very few short-journey trains run out of or above Singleton, and they are run between the running of long and heavy trains. To work these trains with two classes of coal will involve the expense of separate coal stages at all the depôts, the present one being too small to keep the different coal separate, the cost of extra labour charging coal, cleaning coal-bunkers, ash-pans, fire-boxes, &c., and seeing that engines running short-journey trains will not use over 20 tons of coal per month, would, we think, prove much more expensive than paying the higher rate for coal; and seeing that the trains run on single lines, over heavy gradients, it is most desirable that they should be supplied with the best and cleanest coal procurable, otherwise, having bad coal, the enginemen's attention is so much occupied by the bad fire that other important matters respecting their duties are likely to be overlooked. Good coal mixed with bad coal does not improve the good coal, nor reduce the evils in the bad; but on the other hand the fire-bars to suit bad coal are required to be so far apart

apart that the good coal is wasted by falling through. The trains that run into Singleton and north are of such an important character, being passenger, goods, and live-stock trains, trains only running over very heavy gradients, and following each other as regulations will permit we consider it would be a mistake to use any but the best of coal.—H.F., 22/11/83.

Extract from Mr. Boag's report on coal tenders for supply of engine-coal for Northern Lines for year 1882. Mr. Vickery's (Greta Coal Company).—"I may inform you that this Company had the contract to supply the engine-coal for 1874 for this Department at Honeysuckle Point, and it was proved then that their coal was entirely unfit for locomotive use on account of the large amount of clinker made. This coal was tested by us in 1877, and the result showed that though an excellent steaming coal for open furnaces it clinkered so much that it was quite unfit for locomotives running heavy trains."

Minute to the Commissioner,—

TENDERS for the supply of engine-coal for the Great Northern Railways for the year 1884, as regards delivery at Newcastle and Honeysuckle Point, and for the years 1884, 1885, and 1886, as regards delivery at Singleton.

Tenders for one year's contract (1884).		s.	d.
1. Waratah Coal Company	at	11 0 per ton
2. C. J. Stevens	at	9 11 "

For several reasons I recommend the acceptance of the Waratah Coal Company's contract for delivery at Newcastle Station in Government trucks, or upon the Honeysuckle Point coal stage as required, the quantity of coal specified for during the year 1884, viz., 12,000 tons, more or less, to the extent of 25 per cent. at 11s. per ton.

My reasons are the following:—

1. The recent death of Mr. C. J. Stevens, the Manager of the mine, renders it highly improbable that the contract would be taken up if the tender were accepted.
2. As it has been proved that this coal can only be used for certain trains, it would be necessary to enter into another contract for a certain portion or purchase it "out of contract" as we are now doing. This is exceedingly undesirable.
3. The reports of the officer at Newcastle are to the effect that Waratah coal at 11s. is better value than Stevens' at 9s. 11d., even in the case of trains upon which the latter can be used.

Tenders for three years' contract, 1884, 1885, and 1886, for delivery at Singleton:—

		s.	d.
1. Dr. Read (half quantity)	at	11 9
2. Thos. Longworth (half quantity)	at	11 9
3. Greta Colliery (E. Vickery)	at	10 0

In this case I recommend that the tenders of Dr. Read and Mr. Thos. Longworth be accepted respectively for half the quantities required at Singleton Station during the years 1884, 1885, and 1886, and which are, as per specification, as follows:—

For 1884	16,000 tons
" 1885	20,000 "
" 1886	25,000 "

more or less to the extent of 25 per cent. at 11s. 9d. per ton.

I recommend these tenders, and pass over that of the Greta Colliery for the following reasons:—

1. The coals supplied by Dr. Read and Mr. Longworth respectively have been proved to be of good quality, and suitable for our requirements.
2. The price at which they tender is fair and reasonable (11s. 9d. per ton, as compared with 11s. 10d. the present contract price), and we could not do as well by taking Newcastle coal. If any alteration occurs in the Newcastle rate it is likely to be upwards not downwards.
3. Our experiences in 1874, and further trial in 1877, show conclusively that Greta coal is a very inferior coal, unsuitable for the heavy gradients north of Singleton. It could at most be used only on a few trains, and the report of the Newcastle officers shows that this could only be arranged at considerable expense, in the direction of extra stages, while there is nothing in the slight difference in price, 1s. 9d. per ton—some 8 per cent. only—to warrant its acceptance even to the limited extent referred to.

I thus unhesitatingly recommend—

For 1884—Newcastle and Honeysuckle Point, Waratah Coal Company, at 11s.

For 1884-85-86—Singleton, Dr. Read and Longworth, at 11s. 9d.

A. RICHARDSON,
Superintendent of Stores.

24/11/83.

For the reasons given by Mr. Richardson, I must recommend the acceptance of Waratah Company's tender and of Dr. Read and Mr. Longworth, though higher in price than Stevens and the Greta Company. I feel assured that the coal recommended will prove to be more economical.—CH.A.G., 26/11/83.

I should like a bag of each coal sent to Sydney for trial by assay.—F.A.W., 29/11/83.

No. 9.

Mr. D. Williams to The Commissioner for Railways.

Sir,

Hartley Colliery, Woodford, Newcastle, 27 November, 1883.

Referring to the tender of Mr. C. J. Stevens of the 7th instant, for the supply of coals required on the Great Northern and North-western Railway for the year 1884 from my Hartley Colliery, I hereby withdraw the said tender owing to the death of Mr. Stevens.

I am, &c.,

DANIEL WILLIAMS,
(per T. F. SMITH).
Sent

Sent to the Superintendent of Stores for the Commissioner.—H.F., 27/11/83.

This gets rid of any objection to the acceptance of the Waratah coal as recommended, but I have nevertheless included this coal in my directions to the storekeeper, Newcastle, to send a bag of each coal for analysis, as directed by the Minister.—A.R., 1/12/83. The Commissioner.

See that the coal is submitted to chemical analysis directly it is obtained. I would, however, trust to the result obtained from practical use of the coal on the locomotive rather than to the results of a chemical analysis.—Ch.A.G., 3/12/83.

Superintendent of Stores.—G.B., B.C., 4/12/83. I will send the coal to the Government Analyst directly it comes to hand.—A.R., 5/12/83. The Commissioner. See that coal is sent for.—Ch.A.G., 7/12/83. Superintendent of Stores, B.C.

No. 10.

E. Vickery & Sons to The Commissioner for Railways.

Sir,

78, Pitt-street, Sydney, 28 November, 1883.

Having tendered for the supply of coal for Government railways at Singleton, we endeavoured to ascertain at Newcastle to whom and when the sample coal (as per specification) should be sent in, and have been referred to you. We have now the honor to request that you will give us the desired information, also instruct the proper authority at Newcastle to receive the same.

We have, &c.,

E. VICKERY & SONS.

This coal is now in the hands of Mr. Watt, the Government Analyst, with others, for analysis and report.—A.R., 6/12/83. Chief Clerk.

No. 11.

The Government Analyst to The Commissioner for Railways.

Sir,

1, Albert-street, Sydney, 8 December, 1883.

In reply to a memorandum from the Store Branch, Government Railways, requesting "the relative steaming properties" of five samples of coal, marked R, L, G, S, and W, and "the percentage of pure burning matter or otherwise which they may contain," I have the honor to submit the following analysis and report:—

	R.	L.	S.	G.	W.
Hygroscopic moisture	2.1	2.2	1.9	1.9	2.4
Volatile hydrocarbonic	37.4	38.9	31.3	43.0	35.5
Fixed carbon	52.3	51.8	48.0	48.0	56.1
Ash	8.2	7.1	17.9	7.1	6.0
	100.0	100.0	100.0	100.0	100.0

Of these, W would probably be the best and S the worst for steam purposes; but, with reference to the others, so much would depend on the method of staking, construction of fire-grate, &c., that it is impossible to say which should have any decided preference.

I have, &c.,

EDWARD H. RENNIE,

(Acting for CHAS. WATT),

Government Analyst.

I think this test places the coal in the following order:—1. Waratah; 2. Read's; 3. Longworth; 4. Greta; 5. Stevens'. The tender sent in by the late Mr. Stevens has been withdrawn, and I think this analysis, taken in conjunction with the practical experience gained in the use of Read and Longworth's coal on the one hand and Greta on the other, points to the advisability of accepting the tenders originally proposed, viz., Waratah Coal Company for Newcastle and Honeysuckle Point, Read and Longworth's in equal quantities for Singleton.—A.R., 17/12/83. The Commissioner.

Waratah had better be closed for Newcastle, and Read and Longworth for coal above Singleton.—F.A.W., 19/12/83. Read and Longworth's tenders accepted for coal required at Singleton, and Waratah Coal Company's tender for coal required at Newcastle or Honeysuckle Point, 20/12/83.

No. 12.

The Commissioner for Railways to Mr. Read and Mr. Longworth. [Letter to each.]

Sir,

Department of Railways, Sydney, 20 December, 1883.

I have the honor to accept your tender, dated the 10th November last, to supply and deliver, in accordance with specifications, one-half of the quantity of the engine-coal required at Singleton, for the years 1884, 1885, and 1886, at 11s. 9d. per ton.

Your tender is accepted on condition that the coal is supplied in such quantities as may be required by the Department during the currency of the contract.

I have to refer you to the Crown Solicitor for the purpose of executing the required bond.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

P.S.—Please submit the names in full of the persons you propose as sureties, with their addresses and professions.

No. 13.

Bond.

18th day of February, 1884.

Mr. Richard Read and his sureties to the Commissioner for Railways,—

[A similar bond was also entered into by Mr. Thos. Longworth and his sureties.]

Know all men by these presents:—

THAT we, Richard Read, of Singleton, in the Colony of New South Wales, contractor, William Walker, of Singleton, in the Colony aforesaid, accountant, and William Wells Robinson, of Singleton, in the Colony aforesaid, solicitor, are jointly and severally held and firmly bound unto the Commissioner for Railways, a Corporation, sole created by the Act of Council passed in the twenty-second year of the Reign of Her Majesty Queen Victoria, number nineteen, intituled, "An Act to make more effectual provision for the construction by the Government of railways in the Colony of New South Wales, and for the regulation of the same," in the penal sum of one thousand five hundred pounds sterling, to be paid to the Commissioner for Railways aforesaid and his successors, for which payment, well and truly to be made, we bind ourselves and each of us, one and each and every of our heirs, executors, and administrators, jointly and severally, and firmly by these presents.

Sealed with our seals, dated the eighteenth day of February, in the year of our Lord one thousand eight hundred and eighty-four.

WHEREAS the above bounden Richard Read made the tender hereunto annexed, under the terms and conditions of a notice, dated the second day of November, now last passed, and published in the New South Wales *Government Gazette*, of the sixth day of November last (of which notice a copy signed by the said Richard Read, William Walker, and William Wells Robinson is also hereunto annexed) to find and provide all labour and every other thing requisite and necessary for, and provide, supply, and deliver at Singleton Railway Station one-half the quantity of engine-coal required for use on the Great Northern and North-western Lines of railway, in such quantities and at such times as may be required during the years one thousand eight hundred and eighty-four, one thousand eight hundred and eighty-five, and one thousand eight hundred and eighty-six, in accordance in all things with the annexed specification, marked "A," and at or for the rate or price of eleven shillings and ninepence per ton, as provided in the said tender. And whereas the above bounden William Walker and William Wells Robinson have severally offered to become and be bound to the Commissioner for Railways aforesaid and his successors for the due performance and fulfilment of the said tender within the time mentioned in that behalf, according to the terms and conditions of the said notice. And whereas the said tender has been duly accepted by the Commissioner for Railways aforesaid, on condition that this bond should be entered into by them, the said Richard Read, William Walker, and William Wells Robinson. Now the condition of the above-written bond and obligation is such that if the said Richard Read do and shall well and truly perform and fulfil the said tender and the contract arising out of such tender, and the acceptance thereof as aforesaid, and all and every the terms, conditions, and stipulations thereof, within the time hereinbefore in that behalf mentioned. Then this obligation will be void and of none effect, otherwise to remain in full force and virtue.

RICHARD READ.

WM. DUDDING.

Department of Public Works, Railway Branch, Sydney, 2 November, 1883.

TENDERS will be received at this office until 11 o'clock on Tuesday, the 13th November, from persons willing to supply the engine-coal required on the Great Northern and North-western Lines at Honeysuckle Point for the year 1884, and at Singleton for the years 1884, 1885, and 1886.

Specification may be seen, and further particulars obtained at the office of the Superintendent of Railway Stores, Eveleigh, and that of the Railway Storekeeper, Honeysuckle Point, and at the Railway Station, Singleton.

Tenders are to be endorsed "Tender for supply of Coal for Great Northern and North-western Lines." The Commissioner does not bind himself to accept the lowest or any tender.

CHAS. A. GOODCHAP,

Commissioner for Railways.

Witness—WM. DUDDING.

RICHD. READ.

WILLIAM WALKER.

WILLIAM W. ROBINSON.

Singleton, 10 November, 1883.

To the Commissioner for Railways, Sydney,—

Sir,

I hereby tender for the supply of one-half the estimated quantity of coal required for the Great Northern and North-western Railway for the years 1884, 1885, and 1886, for Singleton and stations north, according to specification. Coal to be in accordance with specification, delivered in the Commissioner's trucks at coal-siding, Great Northern Railway, near Singleton, at the rate of 11s. 9d. sterling per ton. Such coal to be of same quality and from the same seam as that at present supplied by me. The facilities for drawing coal from the pit to the siding, a distance of 1½ mile, do not permit me to guarantee

guarantee the delivery of a greater quantity than half that estimated. Should my tender be accepted, according to specified time (three years), I propose laying a line of rails from the pit to a point on the Great Northern Railway adjacent to the present siding, which, when completed, will enable me to deliver the quantity tendered for with regularity and certainty.

I have, &c.,
 RICHD. READ.

(A.)

SPECIFICATION for the supply and delivery of engine-coal at Singleton Station, required for use on the Great Northern and North-western Lines, for the three years, ending December 31st, 1886.

1. This contract shall be for the supply and delivery at Singleton Station of the following quantities of coal required for use on the Great Northern and North-western Lines:—

For the year 1884, 16,000 tons.
 " 1885, 20,000 "
 " 1886, 25,000 "

2. The above quantities are however so far approximate that the Commissioner reserves to himself the right to demand more or accept less, to the extent of 25 per cent.

3. All coal supplied must be of the best quality, free from slack, stone, schist, band, or other substance which may affect its quality and practical use on a locomotive engine. It must be thoroughly screened through a $\frac{3}{4}$ -inch iron mesh screen, to be provided and fixed by the contractor and approved by the Locomotive Engineer.

4. All coal supplied not of sufficiently good quality will be rejected, and must, on notice in writing from the Superintendent of Stores or other authorised officer, be removed by the contractor at his own cost within twelve hours from the receipt of such notice, or if not so removed, it will be discharged from the trucks at the contractor's expense, and if not then removed within seven days, shall be forfeited and become the property of the Commissioner for Railways on behalf of the New South Wales Government.

5. Coal must be supplied in such quantities, and at such times as may be required, from the 1st January, 1884, to the 31st December, 1886, but the contractor will not be called upon to supply more than a *pro rata* quantity monthly, based upon the twelve months estimate with 25 per cent. added.

6. Payment will be made once in every month, but only on the certificate of the proper officer that the coal has been supplied according to contract.

7. Should any coal (not exceeding the *pro rata* monthly quantity based upon the twelve months' estimate with 25 per cent. added) not be promptly supplied on the usual printed order signed by the proper officer, the Commissioner may in his discretion purchase such coal in such manner as he may think best for the Public Service, and the excess of cost, if any, shall be deducted from any money payable to the contractors by the Commissioner.

8. The Commissioner reserves to himself the right to annul the contract at any time on giving one month's notice in writing to that effect, should he not be satisfied with the quality of the coal or the rate of delivery.

9. Persons tendering will be required to supply, free of cost, a quantity (not less than 5 and not more than 10 tons) of the coal produced at the mine from which it is intended to supply coal under this contract. This coal is for the purpose of testing, and should, therefore, be a fair average sample of the produce of the mine.

10. The person whose tender may be accepted will be required to enter into a bond, with two eligible sureties, jointly and separately, to be bound under a penalty of £1,500 for the due performance of this contract.

11. The Commissioner reserves to himself the right to purchase coal elsewhere than from the contractor during the currency of the contract, should he consider it necessary to do so, without prejudice to his rights under or in any way vitiating this contract.

A. RICHARDSON,
 Secretary of Stores.

30 October, 1883.

This is the specification marked (A) referred to in our annexed bond to the Commissioner for Railways, dated the 18th day of February, A.D. 1884.

No. 14.

A. J. Gould, Esq., M.P., to The Commissioner for Railways.

Dear Sir,

Sydney, 28 February, 1885.

Messrs. Read and Longworth are desirous of seeing you in reference to their coal contracts at Singleton, and purpose calling upon you on Friday next, at 11.30 a.m., if that day will suit you. Kindly send me a line in reply, addressed to the Assembly, on Monday.

Yours, &c.,
 ALBERT GOULD.

I do not think I shall be in town on Friday next. Better postpone meeting till Friday week.—
 CH.A.G., 28/2/85. Mr. Gould informed.

Dear

Dear Sir,

Singleton, 11 March, 1885.

Replying to your letter of the 4th instant, appointing Friday next, 13th instant, for the desired interview with the Commissioner by Messrs. Read and Longworth, I find that day will not suit either them or myself. We shall be glad if the Commissioner will see us on Wednesday next, 18th instant, at, say, 11 a.m. Kindly favour me with a reply by return post, addressed to Singleton.

Yours, &c.,

ALBERT J. GOULD.

The Secretary for Railways, Sydney.

Will Wednesday, the 18th instant, suit the Commissioner's convenience to receive Messrs. Read and Longworth.—D.C.M'L., 13/3/85. Yes.—Ch.A.G., 13/3/85. Mr. Gould informed.

No. 15.

T. Longworth, Esq., to The Commissioner for Railways.

Sir,

Singleton, 18 March, 1885.

Adverting to the interview of Dr. Read and myself with you this morning relative to an extension of our respective contracts for the supply of coal to the Locomotive Department at Singleton at a reduced price, I beg to say that upon an extension of three years being granted to me of my present contract to supply one-half the coal required on the Great Northern and Western Railways at Singleton, from the 31st December, 1886, I am prepared to construct a line of railway junction with Dr. Read's to my screens, a distance of about 26 chains, by 1st July proximo, suitable for locomotive purposes, and to deliver the coal into the trucks of the Department at my screens at the rate of 10s. 6d. per ton from 1st July proximo, and to allow your Department the use of my portion of the railway, and to arrange for the use of Dr. Read's portion at all times during the contract for the haulage of coal, free of charge, and to keep my line in good and efficient working order and repair.

I shall be glad of your early reply, as, if favourable, I will have to start my line of railway.

I have, &c.,

THOMAS LONGWORTH.

No. 16.

Mr. R. Read to The Commissioner for Railways.

Sir,

Singleton, 18 March, 1885.

Adverting to the interview of Mr. Longworth and myself with you this morning relative to an extension of the respective contracts held by us for the supply of coal to the Locomotive Department at Singleton, at a reduced price, I now beg to say that upon an extension of three years being granted to me of my present contract to supply half the coal required on the Great Northern and Western Railways at Singleton, and north and north-west of that point, from 31st December, 1886, I am prepared to deliver the coal into the trucks of the Department at my screens, at the rate of 10s. 6d. per ton, such rate to commence from 1st July proximo, and to allow the Department the use of my line of railway at all times during the contract for the haulage of coal, &c., free of charge, and further, to keep my line in good and efficient working order and repair.

In conjunction with Mr. Longworth, I am prepared to pay the wages of a porter-in-charge at the junction of my line with the Great Northern Railway, should the Department erect a weighbridge at that position.

I am, &c.,

RICHD. READ.

Let me know what amount this would represent a saving of, on present price for coal, from 1st July to the end of the period stipulated for. The present price is 11s. 9d. a ton, and the saving would be equal to 1s. 3d. a ton. What quantity of coal are we likely to require within the period named?—Ch.A.G., 19/3/85.

Superintendent of Stores, B.C., 19/3/85. Can Mr. Fligg estimate our probable requirements with any degree of accuracy during the time specified.—A.R., 21/3/85. Storekeeper, Newcastle.

I beg to enclose statement showing an approximation of the quantity of coal required at Singleton.

1st—For six months, from 1st July to 31st December, 1885.

2nd—For four years, being one year to 31st December, 1886, closing the present contract with Dr. Read and Longworth, and an additional three years, showing the saving to the Department at the reduced rate from 11s. 9d. to 10s. 6d. The quantity of coal required is taken from the last six months' consumption.

3rd—15 tons a day extra from the presumed opening of the line, December, 1885, Glen Innes to Tenterfield.

And, again, the opening of the line, Glen Innes to Grafton and Inverell, may perhaps cause some increase before the additional three years' contract is closed. The approximate saving, without considering the Glen Innes branches, would be £5,843 8s. 2d.

H.F., 24/3/85.

[Enclosure.]

[Enclosure.]

						£5,843 8 2

HENRY FLIGG, 24/3/85.

I forward this with Mr. Fligg's statement for the information of the Commissioner. The figures appear to be accurate. I have just returned from Newcastle after making a coal trial (Burwood), and from observation I do not think we can do better than secure a continuance of Read and Longworth's supplies, especially on such advantageous terms.—A.R., 27/3/85. Commissioner.

Recommended. We have a difficulty in getting suitable coal for the line beyond Singleton. The coal supplied by both Dr. Read and Longworth has proved to be excellent. I should have been prepared to have recommended an extension of their contract without reduction in price, but such a reduction representing a saving of over £5,800. I do not think we can do otherwise than accept.—Ch.A.G., 30/3/85.

Approved.—F.A.W., 30/3/85.

No. 17.

The Commissioner for Railways to Dr. Read.

Sir,

Department of Railways, Sydney, 1 April, 1885.

I have the honor to acknowledge your letter of the 18th ultimo, respecting your proposal for an extension of the contracts for supply of coal held by yourself and Mr. Longworth, offering, if an extension of three years be granted (subject to the conditions specified in your communication) to supply coal at the rate of 10s. 6d. per ton from 1st July next.

In reply I have to inform you that your offer is accepted at the price quoted, and upon conditions as to delivery, &c., which will be embodied in bond to be prepared by the Crown Solicitor. Meanwhile I shall be glad if you will submit the names of two responsible persons as sureties for the due fulfilment of contract.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

No. 18.

The Commissioner for Railways to Mr. T. Longworth.

Sir,

Department of Railways, Sydney, 1 April, 1885.

I have the honor to acknowledge your letter of the 18th ultimo, respecting your proposal for an extension of the contracts for supply of coal held by yourself and Dr. Read, offering, if an extension of three years be granted (subject to the conditions specified in your communication) to supply coal at the rate of 10s. 6d. per ton from 1st July next.

In reply I have to inform you that your offer is accepted at the price quoted, and upon conditions as to delivery, &c., which will be embodied in bond to be prepared by the Crown Solicitor.

Meanwhile, I shall be glad if you will submit the names of two responsible persons as sureties for the due fulfilment of contract.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Telegram from H. Fligg, Newcastle, to Superintendent of Stores, Sydney.

9 July, 1885.

FREIGHT charged on Government line is 1s. 6d. per ton miscellaneous class; but over the Company's Road, from pit to main line, there is another charge as arranged by the Commissioner. Minimum 15s. up to 45 tons; over 45 tons, 4d. per ton is to be charged.

I cannot for the life of me understand what Mr. Fligg means by this. Surely it is not intended for a reply to my memo. If so, I can make nothing of it, and instead of time being saved in this most urgent matter it has been wasted by telegraphing. Mr. Fligg will be good enough to look at my memo. again, and answer the questions it contains. I have not asked a single syllable about freight:—

Question No. 1.—Where do Read and Longworth deliver coal under present contract?

Question No. 2.—Is it into Commissioner's trucks at the screens of contractors at respective collieries, Rix Creek?

I then state that this is what is proposed under new contract which commenced 1st July, terminable 31st December, 1889, and ask—

Question No. 3.—Does this mean extra expense to the Department?

The only conclusion I can arrive at after reading Mr. Fligg's telegram over and over again is that he implies that Read and Longworth mean to charge the Commissioner freight for coal running from Rix Creek to main line. Is this what he implies, and if it were so, would not the contract be a bad instead of a good one for the Commissioner, even at the reduced rate. This is a most important matter, and the Crown Solicitor is waiting. I will thank Mr. Fligg therefore to deal fully and carefully with the question. I avoided sending the papers on account of their great bulk, but I now detach what will be sufficient for Mr. Fligg's full guidance and information.

A.R., 10/7/85.

Storekeeper, Newcastle.

New

New coal contract for coal to be delivered at Singleton by Dr. Read and Mr. Longworth.

My telegram, 9th July, has reference to the contract ending December, 1886. I was not aware of a new contract existing from 1st July instant. What you require to know I think I understand, and the following will explain:—Read and Longworth's contract is to deliver coal from "pit to main line," at 11s. 9d. per ton; the carriage from main line to Singleton is charged to Locomotive Department.

Under the new contract the coal will be delivered at the pits at 10s. 6d. per ton, the haulage being done by the Commissioner, in both cases in the Commissioner's trucks. I am not aware of any charge to be made by contractors in either contract for the coal running from the pits, at Rix's Creek to main line.

The contract stands thus:—		s.	d.
The old contract price of coal	11	9 per ton.
The new " " " " " " " " " " " "	...	10	6 "
Loss to Commissioner of haulage charged from old contract from pits to main line, per ton	0	4
		<hr/>	
		10	10
The Commissioner gains the difference between	11	9
and	10	10
		<hr/>	
		0	11

say 11d. per ton in favour of the Commissioner.

Under present contract the coals are delivered on the main line at Rix's Creek, and the Commissioner charges 4d. per ton haulage from pits to main line.
Superintendent of Stores.

HENRY FLIGG, 11/7/85.

I presume you have now gathered from the papers particulars of the new contracts, and noted that they commenced on 1st July and are to terminate on 31st December, 1889.—A.R., 13/7/85.
Storekeeper, Newcastle. Yes.—H.F., 14/7/85.

No. 19.

Bond.

Mr. Richard Read and his sureties to The Commissioner for Railways,—

30th July, 1885.

Bond for supply of engine-coal for Great Northern and North-western Railway, from 1st July, 1885, to 31st December, 1889.

[A similar bond was entered into by Mr. Thos. Longworth and his sureties, Mr. M. Moore and Mr. W. H. Mullen.]

Know all men by these presents:—

THAT we, Richard Read, of Singleton, in the Colony of New South Wales, contractor, William Wells Robinson, of Singleton, in the Colony aforesaid, solicitor, and Albert John Gould, of Singleton, in the Colony aforesaid, a Member of the Legislative Assembly of the said Colony, are jointly and severally held and firmly bound unto the Commissioner for Railways, a Corporation, sole created by the Act of Council passed in the twenty-second year of the Reign of Her Majesty Queen Victoria, number nineteen, intituled "An Act to make more effectual provision for the construction by the Government of railways in the Colony of New South Wales and for the regulation of the same," in the penal sum of one thousand pounds sterling, to be paid to the Commissioner for Railways aforesaid and his successors. For which payment, well and truly to be made, we bind ourselves and each of us, our and each and every of our heirs, executors, and administrators, jointly and severally, firmly by these presents.

Sealed with our seals, dated the thirteenth day of July, in the year of our Lord one thousand eight hundred and eighty-five.

WHEREAS by a certain bond or obligation in writing bearing date the eighteenth day of February, one thousand eight hundred and eighty, from the above bounden Richard Read, William Wells Robinson, and one William Walker, became jointly and severally held and firmly bound unto the Commissioner for Railways aforesaid in the penal sum of one thousand five hundred pounds for securing the due performance by the said Richard Read of his contract for the supply and delivery at Singleton Railway Station of one-half the quantity of engine-coal required for use on the Great Northern and North-western Lines of Railway in the said Colony, in such quantities and at such times as may be required during the years one thousand eight hundred and eighty-four, one thousand eight hundred and eighty-five, and one thousand eight hundred and eighty-six, in accordance with the specification annexed to the said bond, and at or for the rate or price of eleven shillings and ninepence per ton, as provided by the tender of the said Richard Read to the said bond, also annexed. And whereas it has been agreed between the Commissioner for Railways aforesaid and the said Richard Read that the said contract created by the said tender of the said Richard Read and the acceptance thereof shall terminate on the thirtieth day of June, one thousand eight hundred and eighty-five, instead of on the thirty-first day of December, one thousand eight hundred and eighty-six, as provided by such contract, and that the said Richard Read shall and will continue to supply the said coal from and after the first day of July, one thousand eight hundred and eighty-five, up to and until the thirty-first day of December, one thousand eight hundred and eighty-nine, in accordance in all things with the amended specification hereunto annexed, marked "A," and at or for the rate or price of ten shillings and sixpence per ton. And whereas the above bounden William Wells Robinson and Albert John Gould have severally offered to become and be bound to the Commissioner for Railways aforesaid and his successors, for the due performance and fulfilment of the said agreement for the supply of

of said coal from the said first day of July, one thousand eight hundred and eighty-five, to the thirty-first day of December, one thousand eight hundred and eighty-nine, according to the terms and conditions of the said amended specification hereunto annexed. Now the condition of the above written bond and obligation is such, that if the said Richard Read do and shall well and truly perform and fulfil the said agreement and the contract arising out of such agreement, and all and every the terms, conditions, and stipulations of the said specification hereunto annexed, and do and shall during the said term continue to supply and deliver the said coal at the said rate or price of ten shillings and sixpence per ton, then this obligation shall be void and of none effect, otherwise to remain in full force and virtue.

(A.)

SPECIFICATION for the supply and delivery of engine-coal at Singleton Station, required for use on the Great Northern and North-western Lines, from 1st July, 1885, to 31st December, 1889.

1. This contract shall be for the supply and delivery into Commissioner's trucks at the screens of Contractor, Rix Creek, of the following quantity of coal required for use on the Great Northern and North-western Lines. From 1st July to 31st December, 1885, 4,000 tons. From 1st January, 1886, to 31st December, 1889, 43,500.

2. The above quantities are however so far approximate, that the Commissioner reserves to himself the right to demand more or accept less to the extent of 25 per cent.

3. All coal supplied must be of the best quality, free from slack, stone, schist, band, or other substance which may affect its quality and practical use on a locomotive engine. It must be thoroughly screened through a $\frac{3}{4}$ -inch iron mesh screen, to be provided and fixed by the contractor and approved by the locomotive engineer.

4. All coal supplied not of sufficiently good quality will be rejected, and must on notice in writing from the Superintendent of Stores or other authorised officer be removed by the contractor at his own cost within twelve hours from the receipt of such notice, or if not so removed, it will be discharged from the trucks at the contractor's expense, and if not then removed within seven days, shall be forfeited and become the property of the Commissioner for Railways on behalf of the New South Wales Government.

5. Coal must be supplied in such quantities and at such times as may be required from the 1st July, 1885, to the 31st December, 1889, but the contractor will not be called upon to supply more than the *pro rata* quantity monthly, based upon the estimated quantity with 25 per cent. added.

6. Payments will be made once in every month, but only on the certificate of the proper officer, that the coal has been supplied according to contract.

7. Should any coal (not exceeding the *pro rata* monthly quantity based upon the estimated quantity with 25 per cent. added) not be promptly supplied on the usual printed order signed by the proper officer, the Commissioner may, in his discretion, purchase such coal in such manner as he may think best for the Public Service, and the excess of cost, if any, shall be deducted from any money payable to the contractor by the Commissioner.

8. The Commissioner reserves to himself the right to annul the contract at any time on giving one month's notice in writing to that effect, should he not be satisfied with the quality of the coal or the rate of delivery.

9. The person whose tender may be accepted, will be required to enter into a bond with two eligible sureties jointly and separately, to be bound under a penalty of £1,000, for the due performance of this contract.

10. The Commissioner reserves to himself the right to purchase coal, elsewhere than from the contractor, during the currency of this contract, should he consider it necessary to do so, without prejudice to his rights, under or in any way vitiating this contract.

No. 20.

Mrs. M. Campbell to The Commissioner for Railways.

Sir,

Hanstead, Cook's River, 23 July, 1885.

I am the owner of the Rix's Creek Colliery, near Singleton, on the Great Northern Line, and am desirous of obtaining the following information:—

1. How many tons of coal are supplied per annum to the Railway Department at Singleton?
2. What price is given at present per ton?
3. Is the coal from Rix's Creek considered best?
4. Is it Rix's Creek coal that is now used, or that from the Singleton Coal Company's land?
5. When will the present contract expire?
6. Will tenders be called for the next one, and for how long a period, one or three years at a time?
7. Who are the present contractors?

Awaiting the favour of an early answer—

I have, &c.,
M. CAMPBELL.

Please

Please obtain this information as quickly as possible.—CH.A.G., 24/7/85. Superintendent of Stores, 24/7/85.

Mr. Fligg will please furnish careful report replying to each question in detail. I hope this may not turn out to be what it looks like, viz., that while there was a chance of competition, the Commissioner has been recommended to extend the contracts of Dr. Read and Mr. Longworth. Unless I am very much mistaken, Mr. Fligg was asked more than once if there was any chance of competition on the Northern Line beyond Newcastle, and replied in the negative; but even if this were not the case it would surely be Mr. Fligg's duty to draw attention to such a thing, or if unaware of it to seek information on the point. This would seem to furnish a reason for Messrs. Read and Longworth's anxiety to extend their contracts at a lower rate, which I confess I could not quite understand at the time.—A.R., 25/7/85. The Storekeeper, Newcastle.

I do not remember being asked if there was any chance of competition beyond Newcastle, but supposing such to be the case, I was quite right, as no other colliery did exist near Singleton at the time, although no doubt I sought for information; it appears, however, that there is a small colliery just opened by a Mr. Nowland between Glennie's Creek and Rix's Creek.—H.F., 27/7/85. Perhaps I am mistaken, but I do not think so.—A.R., 28/7/85.

No. 1. Quantity of coal supplied per annum, 14,000 tons.

No. 2. The price of coal is 10s. 6d. per ton.

No. 3. The coal used is from Rix's Creek Collieries. Read's pit and Longworth's pit; I believe there is no difference in the quality of the coals from the two pits, which are close together.

No. 4. It is Rix's Creek coal that is used; I know nothing about the Singleton Coal Company's land.

No. 5. Present contract will expire 31st December, 1889.

No. 6. I know nothing in respect to future tenders.

No. 7. Present contractors, Mr. Read and Mr. Longworth.

H.F., 27/7/85.

The Rix's Creek coal is of good quality.

Information herewith. It seems to me that if Messrs. Read and Longworth's proposal (which the Commissioner has accepted) to extend their contracts was made with a knowledge that another mine or other mines were about to be opened, the Commissioner has some cause to complain of their action. Mrs. Campbell's letter has taken me quite by surprise. I had not the slightest idea that there was any probability of another mine being opened, and have all along understood that there was no chance of securing competition in that direction.—A.R., 28/7/85. The Commissioner.

Let me see papers upon which the existing contracts were extended.—CH.A.G., 29/7/85. Herewith.

I cannot give to Mrs. Campbell the information she asks for in full. I have no objection to say that the present contract will not expire till 31st December, 1889, and that, when next tenders are invited, a contract will probably be entered into for three years at least; add that, the coal from Rix's Creek is considered to be good coal for locomotive purposes.—CH.A.G., 3/8/85.

No. 21.

The Commissioner for Railways to Mrs. M. Campbell.

Madam,

Department of Railways, Sydney, 5 August, 1885.

Referring to your letter of the 23rd ultimo, asking a series of questions respecting the arrangements of this Department for obtaining supplies of coal at Singleton for locomotive purposes, I have the honor to inform you that I cannot furnish in full the information you seek, but I have no objection to state that the present contract will not expire till 31st December, 1889, and when tenders are invited, a contract will probably be entered into for three years at least. I may add that the coal from Rix Creek is considered to be good coal for locomotive purposes.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

No. 22.

Mr. R. Read to The Commissioner for Railways.

Sir,

Singleton, 20 August, 1885.

A sum of £28 19s. has been charged against me, and deducted from my July account for coal supply for haulage from my screens during that month. This, as you are aware under my new contract, should not be charged. Will you therefore kindly give the necessary instructions on this matter, and direct the payment of this sum to me.

I further observe that the amount payable to me is calculated as £445 10s. 10d. This should be £446 1s. 4d., as the quantity of coal supplied by me during July was 849 tons 13 cwt., at 10s. 6d. I shall be glad if this also be rectified. In reference to this I have observed that on a few occasions this year the amount paid me has been a few shillings less than that actually due as per my account, and I am desirous that these monthly discrepancies should be corrected.

I have, &c.,

RICHARD READ.

Mr. Fligg for report.—A.R., 24/8/85. The difference was a clerical error, occurring at Singleton, in transmitting the weights. Dr. Read could have the matter settled without troubling the Commissioner.—H.F., 5/9/85. The Secretary, 7/9/85. Is the item £28 19s., also a clerical error.—D.C.M.L., 9/9/85. Superintendent of Stores. Mr. Fligg to say.—A.R., 10/9/85. The £28 9s. is a charge made by the Traffic Branch;—will the Traffic Manager please explain?—H.F., 11/9/85. Station-master, Singleton, for report.—J.H., 12/9/85.

With reference to the £28 19s. said to have been charged for haulage is in accordance with instructions contained in your M.P. 85-4,050:—"Inform Dr. Read that the minimum charge for the service will be 15s. a day, and every ton hauled over 45 tons, 4d. per ton." I do not remember seeing any instructions about the new contract referred to by Dr. Read.—GEO. DOWLING, 13/9/85. Traffic Manager.

Paper quoted, viz., 85-4,050 herewith, the deductions complained of are traction charges for coal drawn from mine to main line there, and free haulage thence to depôt at station.—JNO. HIGGS, 15/19/85. Station-master, Singleton.

Traction charges from mine to main line is charged on all the coal brought out. Freight from the siding to Singleton is charged only on the coal kept in the yard. The greater quantity of the coal is sent north and north-west, and that is hauled into Singleton, weighed, and taken back to Rix's Creek (free of all charge), a distance of over 6 miles for nothing; we then invoice only from Rix Creek to Murrurundi, Narrabri, Armidale, Glen Innes, or to any station it may be consigned to.—GEO. DOWLING, 16/9/85. Traffic Manager.

Charges appear in accord with my instructions, but in opposition to conditions of last contract. Please forward papers dealing with contract for coal from 1st July, 1885, to December, 1887, without them I cannot fully understand the case.—J. HIGGS, 17/9/85. The Secretary.

Papers herewith. Superintendent of Stores.

I wish Mr. Fligg would look into this and report further. If under Read and Longworth's new contract, the Department loses all haulage charges for which it was paid under the old, the advantage to be gained by the reduction of 1s. 3d. per ton is more apparent than real. I put this to Mr. Fligg on my 85/7,080, when the bond was about to be signed.—A.R., 28/9/85. Storekeeper, Newcastle.

The gain to the Commissioner is 11d. per ton, as per my memo., 11/7/85.—H.F., 1/10/85.

Sir,

Singleton, 5 September, 1885.

I have received a duplicate account for haulage of coal from Rix's Creek Siding to Singleton during month of August ultimo. As the haulage was deducted from my account for July in error, I trust you will give immediate instructions so as to prevent a repetition of the error in respect of August account.

The deduction from my July account has not yet been refunded to me.

I have, &c.,

The Commissioner for Railways, Sydney.

RICHARD READ.

Superintendent of Stores, B.C., 7/9/85. Mr. Fligg for report. Why is this?—A.R., 10/9/85.

Will the Traffic Manager please say if he knows of the deduction for haulage from the Singleton contractor's account. A claim in Dr. Read and Longworth's contract for coal from 1st July, 1885, to 31st December, 1889, is that the Commissioner hauls the trucks from the pits, without charge, to the contractors. It is a charge against the Locomotive Department.—H.F., 11/9/85.

Station-master, Singleton, for report.—J.M., 11/9/85.

The charge for haulage is made in accordance with instructions contained in your M.P. 85-4,050. I do not remember seeing any instructions to discontinue the charge.—GEO. DOWLING, 13/9/85. Traffic Manager.

Charge as hitherto, but it would appear current contract conditions differ from those of former contract. Let me have a sight of contract papers please.—J. HIGGS, 17/9/85. The Secretary. Superintendent of Stores, 29/9/85.

1. What is the rate of haulage per ton which, under the new contract, Messrs. Read and Longworth have ceased to pay? 2. What compensating benefit, other than the reduction of 1s. 3d. per ton, does the Department gain? 3. Knowing the terms of the contract, why did Mr. Fligg make the deductions from the accounts, which he admits should not have been made?—A.R., 30/9/85. Storekeeper, Newcastle.

1. 4d. per ton for haulage from pits to main line. 2. No other benefit that I am aware of. 3. I know nothing about the deductions; they were made by the Station-master, Singleton.—H.F., 1/10/85.

I cannot spare the papers at present, as I am making a special *précis* for the Commissioner's information. Will Mr. Higgs please note, however, that Read and Longworth, under contract commencing 1st July, 1885, and ending 31st December, 1889, deliver coal at their screens, so that haulage to main line will be a charge upon the cost to Locomotive Department.—A.R., 5/10/85. Traffic Manager, Newcastle.

For perusal and information Station-master, Singleton. What deductions to date require adjustment?—J. HIGGS, 7/10/85. Station-master, Singleton.

Dr. Read has been debited with amounts for haulage as follows. Locomotive coal only;—

1st to 31st July	£28	2	8	} Paid in Sydney.
1st to 31st August	21	16	4	
1st to 30th September...	26	7	4	} Not paid yet.
1st to 6th October	8	2	2	
Total	£84	8	6	

Please advise me early. Am I to continue charging this haulage to Dr. Read, or is it to be charged to the Locomotive Department?—GEO. DOWLING, 8/10/85. Traffic Manager.

Locomotive Department, as directed in minute of the Superintendent of Stores, under date 5/10/85, during currency of present contract, which, it is stated, expires on 31st December, 1889.—J.H., 9/10/85. Station-master, Singleton.

Noted. Will clear the £8 2s. 2d. by cash book and debit same to Locomotive Department.—GEO. DOWLING, 10/10/85. Traffic Manager.

The papers show that £26 7s. 4d. and £8 2s. 2d. have been credited to Dr. Read, and charged to the Locomotive Department. If not already done, the two first-named amounts, £28 2s. 8d., and £21 16s. 4d. (deducted in Sydney) must be refunded to Dr. Read, and charged against Locomotive. The whole matter will then be adjusted.—J. HIGGS, 28/10/85. Station-master, Singleton.

Noted.—GEO. DOWLING, 29/10/85. Traffic Manager.

The matter has been arranged—J. HIGGS, 30/10/85. Superintendent of Stores. For the information of the Secretary, who will, I presume, communicate with Dr. Read accordingly.—A.R., 2/11/85. Yes, if correct.—D.V., 5/11/85. Mr. McLachlan.

This

This matter evidently requires some consideration before it is acted upon, as it would appear from these papers that the Commissioner is not getting the advantage it was expected he would from the new contract. Please attach the papers with reference to the extended contract and forward to Mr. Badham, who will make a statement of the case for decision.—D.C.M'L., 11/11/85.

Without wading through this bundle of papers I do not quite know what the facts are; but is this the case. In November, 1883, tenders were invited for the supply for three years, 1884-5-6, of locomotive coal at Singleton. Messrs. Read and Longworth were the only tenderers, as they had been for the previous three years, and it seemed to be clear that no other person would tender. In March, 1885, Messrs. Read and Longworth asked that their contracts which expired on the 31st December, 1886, might be extended till December, 1889, and in consideration offered to supply the coal from 1st July, 1885, at a reduction of 1s. 3d. per ton. As this represented a saving of £5,843 during the currency of the extended contract, the Minister, upon my recommendation, approved of its acceptance.—Ch.A.G., 20/9/85.

Mr. Badham, 21/9/85.

Extension of Messrs. Longworth and Read's contracts for the supply of coal.

THE contract for the supply of coal at Singleton in the years 1880, 1881, and 1882, was obtained by Mr. R. Read, Mr. W. Longworth, however, having a part of the supply for 1880.

The papers are not clear as to how the matter was dealt with in 1883. Probably the above contract was extended for a year.

In the latter part of 1883 tenders were invited for the supply of coal at Singleton for the years 1884, 1885, and 1886. Four tenders were sent in, and on the recommendation of Superintendent of Stores, and after competitive trials of the several coals, made by desire of the Minister, the tenders of Messrs. Read and Longworth were accepted; the contract being divided between them at 11s. 9d. per ton.

Messrs. Read and Longworth, per letters of 18th March, 1885, applied for an extension of their contract to the 31st December, 1889, offering their respective sidings for the use of the Department, free of charge, and to deliver the coal from their own screens direct into the Government trucks. As a further inducement they offered to reduce the price of the coal to 10s. 6d. per ton from 1st July, 1885, and to pay the wages of a porter-in-charge of the junction if the Department decided to place a weigh-bridge there.

Commissioner recommended, stating that there was difficulty in getting good coal, that that of Dr. Read and Mr. Longworth was excellent, that he would have been prepared to recommend an extension even at existing price, but with a reduction representing £5,800 there was no choice but to accept.

The Minister approved, and Messrs. Read and Longworth were duly informed of acceptance (1/4/85).

In the foregoing I have limited myself to a categorical reply to Commissioner's minute.

C.A.B., 24/9/85.

Commissioner.

The Superintendent of Stores will know all the facts. Ask him for a clear *précis*.—Ch.A.G., 25/9/85. Superintendent of Stores, 26/9/85.

Please reply carefully by return of post to the following:—1. Is Dr. Read supplying coal from the same colliery as coal was supplied from during 1879 by Messrs. Campbell and Jones. 2. Give list of contracts, with dates and values, entered into with Dr. Read, Mr. Jarman, Mr. Longworth, showing points of delivery.—A.R., 28/9/85. Storekeeper, Newcastle.

Can Mr. Boag oblige by giving me any information in respect to the above.—H.F., 29/9/85. Can Mr. Newton give the required information.—G.B., 29/9/85.

We have been supplied with coal from four places on this field. The pit from which coal was supplied by Messrs. Campbell and Jones was used only a short time. Dr. Read has drawn from two tunnels, and another pit has been lately opened. The four places cover a distance of about 120 yards.—G. NEWTON, 1/10/85. Mr. Boag.

Mr. Fligg, 2/10/85. To Superintendent of Stores, with memo. attached of dates of contracts and values.—H.F., 2/10/85.

No. 23.

Précis.

Précis of the Department's transactions in Rix Creek coal, more especially under contract with Messrs. Read and Longworth.

THE above, asked for by the Commissioner on the 25th September (date of reaching my hands, 28th September), would have been furnished before this had I not experienced considerable difficulty in getting the history of the case complete in the absence of some of the papers.

The first dealings of the Department with coal from the Rix Creek neighbourhood appears to have been in 1869 and 1870, when about 70 tons per month were used. The coal was well suited for our purposes. After this, with the exception of a small quantity from the same neighbourhood sent in for trial in 1873, this coal was apparently not heard of till 1879, when coal submitted by Campbell and Jones from the Rix Creek Colliery was approved of, and their contract for the year accepted.

In 1880 Dr. Read first appears as a tenderer for the supply of coal to the Department at Singleton, in company with four other tenderers, Messrs. Longworth, Marshall, Vickery, and Mitchell.

Dr. Read's tender was the highest of the five, but as it was a condition of his tender that the coal to be supplied would be from the same mine and seam as that supplied by Messrs. Campbell and Jones during 1879, which had given satisfaction, his tender was accepted for long-journey trains for the year 1880, and that of Mr. Longworth for the short-journey trains for the same period.

In saying that the coal to be supplied by Dr. Read was to be from the same mine and seam as that supplied by Campbell and Jones, I quote from the Locomotive Engineer's (Mr. Burnett) report in the absence of the tender. I am inclined to think the coal was to be from the same seam, not from the same mine.

Afterwards accepted for 1880-1-2 as far as Dr. Read was concerned.

I

I judge this because it is now reported that Dr. Read is not supplying from the same mine from which Campbell and Jones were supplying in 1879, and which I take to be the mine now reopened, about which a communication was first received some two months ago from Mr. Campbell, and now from Messrs. Nowland through the Minister for Mines, but this I cannot vouch for.

8s. per ton. For 1881, Longworth's tender, being the lowest, was again accepted for short-journey trains, Dr. Read's being still in operation for long-journey trains. A Mr. G. E. Carter also tendered for coal from the same district (Rix Creek) at 8s. 6d.

7s. 11d. per ton. In 1882, Dr. Read's tender still holding good for long-journey trains, Mr. Jarman's was accepted for short-journey trains. I have failed to obtain the papers referring to Jarman's supply, so am unable to say whether other persons tendered or not.

11s. 10d. per ton. In 1883 the tenders of Dr. Read and Mr. Longworth were respectively accepted for half the Singleton coal required during the year. I believe there were no other tenderers, but cannot state positively in the absence of the papers; but this is not so material to the point as that which has followed respecting which all particulars can be clearly detailed.

11s. 9d. per ton. For the years 1884-5-6, tenders were called for delivery at Singleton, and Messrs. Read and Longworth were (again) the only tenderers for coal from the Rix Creek District. Messrs. Vickery & Co., however, tendered at a lower rate for Greta coal, delivered at Singleton. The difference was 1s. 10d. per ton in favour of the latter, but the experience of the Department was to the effect that this difference in cost was far more than compensated for by the superiority of the Rix Creek coal. In fact, Greta coal could only be used on a few of the short-journey goods trains.

The tenders, therefore, of Messrs. Read and Longworth respectively were accepted for half quantities for the years 1884, 1885, and 1886.

In March, of the present year, Messrs. Read and Longworth proposed to deliver coal at their screens at 10s. 6d. per ton, commencing from 1st July, 1885, provided the Commissioner extended their contract for three years from the date of its proposed expiration. By this the Department would gain 1s. 3d. per ton on all coal supplied during the eighteen months of the current contract, less 4d. per ton haulage, which the contractors would cease to pay from the mines to the main line, or a net gain to the Department of 11d. per ton.

Estimated saving on 29,340 tons, at 11d. per ton, £1,344 15s. 10d.; or, on the assumption that no lower tenderers would have come forward for the three years over which it was proposed to extend contract 1886-9, the estimated saving would be, on 93,494 tons at 11d., £4,285.

In July, however, of this year, Mrs. Campbell wrote to inform the Commissioner that she was the owner of the "Rix Creek" Colliery, and asked for certain information respecting the existing contracts.

Under date 12th September, covered by the Minister for Mines, 19th September, Messrs. J. & H. Nowland, of Camberwell, wrote on the same subject, with reference to a coal mine which they have opened upon their land.

With respect to this unfortunate and quite unforeseen opening up of new mines, just at the time when Messrs. Read and Longworth had succeeded in obtaining an extension of their contract, I would offer the following remarks:—

1. The circumstances seem to me to point almost conclusively to the fact that Messrs. Read and Longworth were aware of this rising competition, and took steps to stifle it. This would account for the voluntary surrender by them of some £1,300, by lowering their contract price some eighteen months before there was any necessity for them to do so.
2. The Commissioner has reserved to himself the right, however, to purchase whatever coal he likes from other sources, and if Messrs. Read and Longworth have knowingly deceived the Department, the Commissioner will not, I presume, scruple to take advantage of this clause to the letter.
3. On the other hand, the parties complaining, Mrs. Campbell and the Messrs. Nowland, have no claim to come before the Department, as vendors of coal or tenderers for coal supply before December, 1886, the date on which the original contract of Messrs. Read and Longworth, entered into under public competition, would expire.

I trust this *précis* will answer the Commissioner's purpose, although, if I had been able to obtain further papers, and could have taken a little more time for inquiry, it would have been more perfect.

5/10/85.

A. RICHARDSON,
Superintendent of Stores.

No. 24.

Messrs. A. & H. Nowland to Mr. G. Newton.

Dear Sir,

Rosedale, Camberwell, 11 August, 1885.

We would like to have our coal tested for locomotive purposes, and would give you a truck to have it tested if you will kindly let us know when it would be convenient to take it out.

Yours, &c.,
A. & H. NOWLAND.

Messrs. Nowland are the proprietors of the new coal pit, 6½ miles north of Singleton. I presume they wish to know if their coal be fit for use in our locomotives. They have a siding.—G. NEWTON, 12/8/85. Mr. Boag.

I have no objection to this coal being tried if you approve.—S.H. (for Locomotive Foreman) Locomotive Engineer. Forwarded for your consideration.—W. SCOTT, 17/8/85. Commissioner. Approved.—CH. A.G., 24/8/85. Locomotive Engineer. Locomotive Foreman.—W.S. (*per* C.A.N.), 25/8/85. Mr. Newton to carry out and report result.—P.L., 27/8/85. Report herewith.—G.N., 21/9/85. Forwarded for your information. Will Messrs. Nowland be acquainted with results of test from your office.—P.L. (*pro* Locomotive Foreman), 22/9/85. You had better inform Messrs. Nowland of result.—W.S. (*per* R.J.S.), 24/9/85. Mr. Newton will please inform Mr. Nowland.—J. D. BOAG, 25/9/85. Carried out.—G.N., 26/9/85.

Memo.

Locomotive Engineer's Office, Newcastle, 21 September, 1885.

Memo to Mr. Boag,—

I have to report that I tested the sample coal sent by Messrs. Nowland, of Camberwell, on 17th instant, on an engine running goods train, fairly loaded, from Singleton to Murrurundi and back.

The coal made steam fully throughout the journeys, not requiring the use of pricker or of clearing out the fire-box from start to finish of the 142 miles run.

The coal consumed was at the rate of 13 lbs. per gallon of water evaporated. The ashes amounted to 8.5, and the clinker to 1.8 per cent. on consumption.

The coal is harder than that now used, and will not break up into small so readily. It made a less percentage of ash, but a larger percentage of clinker. The clinker can, however, be easily dealt with, and presuming the sample to be a fair one, I believe the output from this pit will prove a good serviceable coal for locomotive use.

G. NEWTON.

No. 25.

Dr. Read to The Commissioner for Railways.

Dear Sir,

Singleton, 19 October, 1885.

The supporters of Mr. H. C. Browne's candidature for Patrick's Plains against Mr. A. J. Gould, have endeavoured to raise an electioneering scare against Mr. Gould from the fact of him introducing myself and Mr. Longworth to you on the occasion of our interview *re* extension of contract, and I have found it necessary to publish the enclosed letter, explanatory of the matter. Mr. Browne has promised the Messrs. Nowland to do all he can to break our agreement if he is returned, and is obtaining their support from this promise. Any information I can supply you with in the matter will be willingly given. Nowland's place was not opened up at the time of our interview, the outcrop was struck, but nothing was known as to quality or otherwise of the coal.

Yours, &c.,

RICH. READ, M.D.

[Enclosure.]

To the Editor of the "Singleton Argus."

Sir,

You will agree with me that election times are "stirring," and that unfortunately during those times a great amount of "dirt" is stirred up by the supporters of different candidates, and I regret to say the election contest now going on in this district is not an exception to the rule, as has been instanced within the last twenty-four hours in this electorate, in connection with the heading of my letter. And as the underhand traducers of Mr. A. J. Gould, in whose interest it is well known I have, on this as on a former occasion, taken a lively interest, have failed on a public challenge, in the midst of Mr. Browne's own supporters on last night, to place before the electors the facts of the case; and as I am well aware the untrue reports have caused some uneasiness amongst Mr. Gould's supporters, I hasten to lay the matter before the electors without fear of contradiction, and challenge our opponents to prove otherwise at Mr. Gould's meeting on to-morrow (Saturday) evening at "Nichols' Hotel."

The following correspondence which passed between Mr. Gould and Mr. Browne, after the defeat of Mr. Browne at the last election, will satisfy, I am sure the most doubting:—

"My dear Sir,

Singleton, 12 December, 1882.

Mr. Munro showed me a telegram he had received from Mrs. Browne that if I were a shareholder in Rix's Creek Colliery the election was illegal. As I had some time prior to the election disposed of the whole of my interest, I was enabled to inform Mr. Munro I was not a shareholder. I should not have troubled further in this matter but for a rumour that has got abroad that you intend taking some steps in reference to it. Although I do not believe there is any truth in this rumour, yet I have thought it well, in order that you may be acquainted with the merits of the matter, to inform you that I am not, and was not at the time of the election a shareholder in the colliery, or in any way whatever interested in it, or any contracts held in connection therewith.

With kind remembrances to Mrs. Browne and family.

Yours, &c.,

ALBERT J. GOULD.

H. C. Browne, Esq., 'Kellet House,' Upper William-st., Sydney."

EXTRACT from letter from H. C. Browne.

My dear Mr. Gould,

"Kellet House," Sydney, 13 December, 1882.

Yours of yesterday duly to hand. Like a great many other rumours there is not one scintilla of truth that I intend taking steps to try the validity of your election. You are honorably elected, and I would, as I am sure you know, be the last person to take so mean an advantage. I have to thank you for your courteous and gentlemanly demeanour to me throughout the whole contest.

So far for Mr. Gould's position, which is the same now as it was three years ago.

Now with reference to my part of the affair in securing an extension of the contract of locomotive coal, the following are the facts, viz. :—

During the currency of previous contracts I found great difficulty in securing a regular supply of coal to the Locomotive Department during wet weather, as the pit was over a mile distant from the Great Northern Railway, so I determined to construct a branch line of railway, sufficiently substantial to carry the traffic of the Government locomotive, at a cost of over £2,000. After joining partnership with the Messrs. Longworth I found that it would be necessary, to ensure proper supplies, to construct a branch line of railway, a distance of nearly half-a-mile, to connect the two pits from which the coal was obtained. But before doing this we determined to make an effort to insure an extension of the contract in order to secure some return for the large outlay incurred in the railway construction, and Mr. Longworth and I determined to interview the authorities on the matter. This was as late back as March in this year. We requested our Member to arrange for an interview with us with the Commissioner, and he, with the usual courteousness that he has at all times extended to his constituents, did so, and introduced us to the Commissioner. Matters were discussed, and after the refusal of our offer and an offer submitted by the Commissioner, Mr. Longworth and I agreed to the terms stipulated by him and secured an extension of the contract for three years at a considerable reduction in the contract price, and with this additional stipulation in favour of the Government, that the reduced price was to commence from the 1st July this year—eighteen months before the expiry of the contract obtained by tender—that we were also to complete and keep in repair the branch line, and allow the Government the free use of our railway.

Now I will ask all fair-thinking electors what has this matter to do with the election. Corruption our opponents say. Prove it in the face of the above correspondence. The matter is a simple business transaction between the Government and ourselves, and I feel confident that if Mr. H. C. Browne represented the district instead of Mr. A. J. Gould, when we solicited the interview, he would have assisted us in like manner.

Where the shoe pinches is with the Messrs. Nowland and my late Manager, who find they are, by the exhibition of a superior business tact on our part, at a sacrifice of a portion of the existing contract, and in the interest of the large expenditure we laid out on the works, thrown out from reaping the benefits which we, by our pluck in investment, will reap; and if it ever comes to a matter of competition we can meet them with good hopes of success. The Commissioner is

as

as shrewd a man of business as there is in this Colony, and he knew that he was doing a good thing for his Department and the revenue generally by securing the supply from us, and this matter has allowed party spirit to so degenerate the principles of interested individuals as to make them turn their coat, and within twenty-four hours transfer their support from one whose candidature they were active and prominent supporters of, to one of sworn antagonism. Let the electors understand that this is a private matter between the Messrs. Nowland and Minto and Messrs. Read and Longworth, and that it has been endeavoured by underhand means, and by an unanswered challenge, to work this matter to the detriment of Mr. Gould's return at the forthcoming election by endeavouring to implicate him as an interested party in the contract.

I may add that Mr. Gould will have something to say to the electors on the subject in his address from Nichols' balcony, Saturday night, and that I will be prepared to answer any questions on the subject.

"Carisbrook House," Singleton, 16 October, 1885.

I am, &c.,
RICHARD READ.

This paper is marked private, but it refers to a public matter, and therefore must be put with papers on the subject.

I certainly made good terms for the Department with Mr. Read and Mr. Longworth, but I do not think I should have listened to the proposal for extending the contract had I been aware that there was any likelihood of competition for the supply of good coal at Singleton.

CH.A.G., 21/10/85.

No. 26.

Messrs. A. & H. Nowland to The Commissioner for Railways, Sydney.

Sir,

Rosedale Colliery, Camberwell, 22 October, 1885.

We have the honor to inform you that we are now ready to supply best screened coal from our colliery, in quantities up to 20 tons per day, or 6,000 tons per annum, at the rate of 10s. per ton delivered on your trucks at Blackwall Siding, on the main line, Great Northern Railway. The quality of the coal will be the same as sample forwarded to, and tested by, Locomotive Inspector for us in September ultimo.

We would be glad if you could let us have a share of the trade to supply locomotive coal from Singleton North, in order to enable us to keep our pit working until such time as tenders are called for that contract.

We are now making arrangements to have our pit ready during next year to turn out any quantity of coal up to 40,000 tons per annum. We may add that our pit adjoins the railway line, and we have a large area of coal land, estimated to contain a practically unlimited supply of coal.

Soliciting the favour of an early reply.

We have, &c.,
A. & H. NOWLAND.

Superintendent of Stores for report. We certainly have the power to get coal at other points of the line, and it would not form a breach of contract with Read and Longworth. I would like to get coal from Rosedale Colliery, but it will depend upon its quality and price, the convenience or inconvenience it will be to us to go out to Blackwall to obtain the coal (for the Messrs. Nowland will deliver only at the junction of their line with main line), and the legal difficulty in the way (if there be any legal difficulty) in obtaining coal so close to the source from which Messrs. Read and Longworth supply. A couple of trucks a day might to be taken from the Messrs. Nowland at first, if all these conditions are favourable.—CH.A.G., 6/11/85.

I shall be glad if Mr. Fligg will look carefully and thoroughly into the matter and report. He might visit locality, if necessary. Has a trial been made of the coal? Messrs. A. & H. Nowland appear to state that there has.—A.R., 10/11/85. Storekeeper, Newcastle.

In reporting upon the facilities offered by the Rosedale Colliery, at Blackwall Siding, in supplying coal to the Government, a sketch of the locality of Messrs. Nowland's mine will go far to show the convenience or otherwise for the supply of coal. Thus it will be seen that Messrs. Nowland's mine is $3\frac{1}{2}$ miles further north than Messrs. Read and Longworth's, a $6\frac{1}{2}$ miles further run from Singleton and back, and this extra distance of $6\frac{1}{2}$ miles might be taken to mean an additional expense, but I think it is more imaginary than real, as the engine which is put in steam every day to haul Messrs. Read and Longworth's coal to Singleton could, I fancy, at no extra expense of oiling, firing, or men's wages, proceed to Blackwall Siding and pick up the trucks ready to bring away. The price asked by Messrs. Nowland of 10s. per ton, or 6d. per ton less than we pay Read and Longworth, and presuming two trucks were brought from the Blackwall Siding at a time, it would give a margin of 6s. for running the extra mileage, which, I think, would well cover the expense. As regards the quality of the coal, it was tested in September by the Locomotive Foreman, and I understand his report is favourable. The minute papers relative to the test will be found with the Locomotive Engineer. I would further state that I think if a weighbridge was put down at Muscleebrook, so that the coals, instead of taking a retrograde course in carrying to Singleton to weigh could be taken on by the goods trains, it would be a greater convenience and a saving of time and expense, now that the Railway is likely to be supplied from the coal mines about the locality of Singleton for some time to come.—H.F., 13/11/85.

Will you kindly let me have Mr. Boag's report upon the test made of the coal from A. & H. Nowland's colliery in September last, to which Mr. Fligg refers.—A.R., 14/11/85. Locomotive Engineer. Herewith.—W.S., 16/11/85.

There appears to me to be no reason why the Commissioner should not use a small quantity of this coal. (1) It seems to me to be of equal quality to that supplied by Messrs. Reid and Longworth. (2) The price, 6d. per ton less, may be said to be the same, taking the extra haulage into account. (3) Clause XI enables the Commissioner to legally use coal other than that supplied by the contractors, should he consider it necessary to do so, and, as the action taken by Messrs. Read and Longworth in securing the extension of their contract with (as it is presumed) the knowledge that other mines were about to be opened up, is, perhaps, open to question. The course may, under the circumstances, be considered an equitable one to all parties.—A. RICHARDSON, 17/11/85. The Commissioner.

What is the quantity of coal we get from Read and Longworth per week.—CH.A.G., 14/11/85. Superintendent of Stores. Mr. Fligg.—A.R., 21/11/85. 150 tons per week each, or together, 300 tons.—H.F., 23/11/85. The Commissioner.

I do not think that we can equitably take coal from a mine so near to Read and Longworth's, as this mine is. The clause in the conditions of contract was inserted to meet a possibility of its being advantageous to the Department (if coal were found some distance from the service of supply contracted for) to obtain such coal. For instance, we are getting our coal at Lithgow; if, however, good coal were found at Dubbo, we should wish to use it, as it would save us the trouble and expense of hauling Lithgow coal to Dubbo, but the clause would not give us the right to take coal from another mine at Lithgow. This case would be on all fours with the circumstances surrounding Read and Longworth's coal, and Nowland's coal.—C.H.A.G., 28/11/85.

I think the Commissioner's interpretation is correct.—W.J.L., 9/12/85. Messrs. Nowland informed, 1/12/85.

No. 27.

The Commissioner for Railways to Messrs. A. & H. Nowland.

Gentlemen,

Department of Railways, Sydney, 11 December, 1885.

Referring to your letter of the 22nd ultimo, asking that a portion of the coal required for railway purposes at Singleton may be taken from your mine, I have the honor to inform you that the matter has had careful attention, but I regret I am unable to approve of a supply of coal being taken from your colliery, as such action would be an infringement of the contract entered into with Messrs. Read and Longworth at Singleton.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways,
(Per D.V.)

No. 28.

Minute by The Secretary for Public Works.

Contract for Coal, Singleton.

I SHALL be glad to learn what action (if any) has been taken recently in connection with Messrs. Read and Longworth's contract for the supply of locomotive coal at Singleton, Northern Railway. I shall be glad to know how matter stands.

W.J.L., 2/11/85.

Papers herewith. Seen —W.J.L., 7/12/85.

No. 29.

J. P. Abbott, Esq., M.P., to The Commissioner for Railways.

My dear Sir,

Sydney, 6 November, 1885.

The bearers are Messrs. A. & H. Nowland. They are the gentlemen who desire to tender for the supply of coal for the Northern Railway from Singleton upwards, and about whom I wrote to you some time ago. As there is a clause in the contract with the Singleton Company by which you can take your coal, or a part of that required, from other sources, I shall be glad if you will give the Messrs. Nowland some assistance in opening up their mine by taking some coal from them. Of course I ask this on the assumption that their coal is as good and as cheap as what you are now getting. By helping them now you will help the Department when the time comes for competition.

Yours, &c.,

J. P. ABBOTT.

Sir,

Rosedale Colliery, Camberwell, 27 November, 1885.

Referring to our letter of 22nd ultimo, and a subsequent personal interview with you *re* obtaining a portion of the trade to supply coal to the Locomotive Department from Singleton North, we have the honor to request that you will be good enough to favour us with a reply at your early convenience.

We have, &c.,

A. & H. NOWLAND,

(Per A.N.)

The Commissioner for Railways, Sydney.

Sir,

Wentworth Court, Sydney, 7 January, 1887.

Referring to my personal interview with you in company with Mr. Nowland on the 22nd ultimo, when the latter urged you to take some coal from his pit for the supply of some of the engines in use on the Great Northern Railway, and suggested that Mr. Nowland should put his offer in writing, I have the honor now to produce such offer to you.

I hope you will be able to assist Mr. Nowland in this matter, and by doing so, at the same time benefit the Department.

I have, &c.,

J. P. ABBOTT.

The Commissioner for Railways, Sydney.

J. P. Abbott, Esq., M.P., Sydney,—

Sir,

Rosedale Colliery, Camberwell, 29 December, 1886.

Referring to our interview with the Commissioner for Railways on 22nd instant, *re* obtaining a share of trade in supplying coal to the Railway Department, we have now the honor to state that we are prepared to deliver best screened coal on trucks at Blackwall Siding, at the rate of 9s. per ton, provided the quantity be not less than two trucks per day. This will enable us to keep our pit at work until the time comes for tendering for the next contract, when we will be in a position to compete at a considerable reduction on the present contract price.

Our coal could be taken delivery of by down-trains going north in the same way that we send out our private coal, which saves the trouble of haulage to Singleton and back.

We have, &c.,

A. & H. NOWLAND.

Locomotive

Locomotive Engineer for report. This coal was, I believe, tried some time ago.—A.R., 12/1/87. Mr. Boag.—R.J.S., 14/1/87. Seen. This coal was tested in 1885.—J. D. BOAG, 15/1/87. Locomotive Engineer. The Commissioner.—W.S., 17/1/87. I do not see any report from Mr. Scott upon the proposition. This was asked for.—A.R., 19/1/87. Locomotive Engineer. Please report upon the proposal to take some coal from this mine.—R.J.S., 20/1/87. Mr. Boag. Mr. Newton.—S.L.L., 21/1/87.

I understand that a weighbridge will be put down at Muscleebrook shortly. When it is completed the coal used north of Singleton will not have to be hauled into Singleton and back; therefore, as Messrs. Nowland's Siding is $3\frac{1}{2}$ miles north of Messrs. Read and Longworth's line, and that line a mile long, there will be a saving of $4\frac{1}{2}$ miles haulage by taking coal from Messrs. Nowland for north of Singleton, in addition to the 1s. 6d. per ton less than present price they offered to supply at. The coal sent north of Singleton during 1886, amounted to 10,923 tons, so that a reduction of 1s. 6d. per ton will effect a saving of £900 per annum, supposing the coal to be as good, which at present I see no reason to doubt. The Singleton Coal-mining Company (who are known as Mr. Read and Mr. Longworth) tendered to supply coal for Newcastle District during 1886 at a lower rate (I forget what) than they now charge. It may be that, rather than lose the trade, they are prepared to serve this district at a lower rate.—G. NEWTON, 27/1/87. Mr. Boag.

Locomotive Engineer.—J. D. BOAG, 28/1/87.

It appears to be to our advantage to use this coal at depôts north of Singleton, and provided there is no difficulty likely to arise with the present contractors, I am of opinion we should use it, provided, of course, that the coal turns out equal to the sample tested.—W. SCOTT, 31/1/87. The Commissioner.

The Commissioner decided, in November, 1885, that he would not take coal from this mine, because it was too near to Read and Longworth's to allow of its being fairly used on the score of the Department's convenience, as might fairly be urged if coal were found at some distant point (say) Murrurundi or Tamworth.—A.R., 3/2/87.

I think it would be straining the condition to cease ordering from Read and Longworth, simply on the ground that the mine of Mr. Nowland is some 4 miles nearer to the northern stations. The provision was not intended to meet a case of that kind. At the same time I am not satisfied with Read and Longworth as regards the extension they got of their contract; or rather I am dissatisfied that the officers of the Department were not more on the alert. However that may be, I do not think we can ignore Read and Longworth's just rights.—CH. A. G., 7/2/87.

Gentlemen,

Department of Railways, Sydney, 16 March, 1887.

With reference to your letter of the 12th ultimo, in which you offer to supply portion of the coal required for the Great Northern Railway, I am directed by the Commissioner for Railways to inform you that after a due consideration of the matter he is not prepared to order coal from your mine.

I have, &c.,

D. VERNON,

Secretary for Railways.

Messrs. A. & H. Nowland, Rosedale Colliery, Camberwell.

Sir,

Department of Railways, Sydney, 16 March, 1887.

With reference to the offer made through you by Messrs. A. & H. Nowland, to supply the Department with coal for depôts north of Singleton, I have the honor to inform you that the rights of existing contract will not admit of coal being taken from Messrs. Nowland's mine.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

J. Abbott, Esq., M.P., Sydney.

No. 30.

Extracts from Votes and Proceedings.

LEGISLATIVE ASSEMBLY.—TUESDAY, 12TH JULY, 1887.

(5.) Coal for Railway Department, Singleton:—*Mr. O'Sullivan*, for Mr. McElhone, asked the Secretary for Public Works,—

- (1.) What are the names of the persons who got the contract to supply the Railway Department at Singleton with coal?
- (2.) What is the contract price per ton for coal, when was the contract made, and when does the contract end?
- (3.) Were tenders called for this contract, is the coal taken from the pits in Government waggons, and do the Government get paid for hauling the coal from the pits to Singleton?
- (4.) Is it his intention to cause tenders to be called for the supply of coal at Singleton when the present contract ends?

Mr. Burns answered,—

- (1.) Thomas Longworth and Richard Read.
- (2.) 10s. 6d. per ton. The existing contract was made to commence on 1st January, 1887, and terminate on the 31st December, 1889.
- (3.) Tenders were invited for the original contract, which expired on the 31st December, 1886. The price was 11s. 9d. per ton. It was extended for three years, upon the price being reduced to 10s. 6d. from the 1st July, 1885. The coal is hauled in Government waggons from the pits, at which place agreement was made for delivery.
- (4.) Yes.

No. 31.

Messrs. A. & H. Nowland to The Commissioner for Railways.

Sir,

Rosedale Colliery, Camberwell, 12 December, 1887.

Adverting to our previous offers to supply the Locomotive Department with coal, and to your promise that if we reduced the price of our coal you would let us have a portion of the trade from Singleton North, we now beg to offer you our best screened coal at 8s. per ton, delivered on the trucks at Blackwall Siding, 55½ miles from Newcastle, if you will guarantee to take 70 tons per week for the next two years.

Our coal is generally admitted to be far superior in quality for steam purposes to that now used by the Locomotive Department, and the saving to the Government would be about £1 per truck to Murrurundi, as shown by the following comparison of the cost of that now in use from Rix's Creek and ours from Blackwall:—

	£	s.	d.	
Contract price for Rix's Creek coal	0 10 6 per ton.
6 tons, at 10s. 6d. per ton	3 3 0
Freight on 6 tons, 75 miles	1 17 6
Total	£5 0 6
Nowland's coal from Blackwall—				
6 tons, at 8s. per ton	2 8 0
Freight on 6 tons, 65 miles	1 12 6
Total	£4 0 6

As the Government have to haul the coal from Rix's Creek pits to Singleton, 4 miles, and thence to Murrurundi, 71 miles, would make the total distance 75 miles, as stated.

We trust that you will take into consideration the fact that we were deprived of all chance of competing for the contract through it being extended to Messrs. Read and Longworth for three years from the commencement of the present year without tenders having been called as usual, and after our having gone to considerable expense in opening up the mine, fully expecting that tenders would be called at the proper time.

We have, &c.,
A. & H. NOWLAND.

Superintendent of Stores,—Please report carefully upon this proposition after noting previous papers and consulting with Locomotive Branch.—A.R., 13/12/87. Superintendent of Stores.

For supply at Murrurundi the offer compares favourably with price of Read and Longworth's coal, provided samples are equal. Mr. Scott has no knowledge personally of Nowland's coal but suggests that about 6 or 10 tons be obtained for test purposes.

	s.	d.	
Read and Longworth's coal, cost at Rix's Creek	10 6 per ton.
Freight to Murrurundi, 71 miles, at 3s. 4d.	4 5½ „
Cost at Murrurundi	14 11½ „

If coal from Rix's Creek is, as stated by Messrs. Nowland, hauled to Singleton first, and then forwarded to Murrurundi, the cost for 4 miles, at 3s. 4d., must be added, and cost at Murrurundi will show as 15s. 2¼d. On this point Locomotive Engineer has written to Mr. Boag:—

	s.	d.	
Nowland's coal at Blackwall Siding will cost	8 0 per ton.
Freight to Murrurundi, 65 miles, at ¼d. per mile	4 0¼ „
Cost at Murrurundi	12 0¼ „

H. CARRUTHERS,
(Pro Supt. of Stores), 20/12/87.

Assistant Secretary.

We have decided to take coal at Werris Creek from coal mine at Gunnedah. This will limit the orders to Read and Longworth. What will be left to them if we take 70 tons a week from Nowland's.—C.H.A.G., 23/12/87. Superintendent of Stores.

We now take from Read and Longworth 270 tons per week. Deduct from this, to be ordered from Mr. Porter, 70 tons, and, as suggested, from Nowland, 70 tons = 140 tons, will leave to be supplied by Read and Longworth, 130 tons per week.—H. CARRUTHERS (pro Superintendent of Stores). Assistant Secretary.

Has Nowland's coal been tested, and how did it compare with Read and Longworth's. Please say.—A.R., 31/12/87. Superintendent of Stores.

Nowland's coal has not been tested. I have written to Nowland asking him to supply 6 tons, free of cost, for test purposes. Please arrange for competitive trial.—H. CARRUTHERS (pro Superintendent of Stores), 3/1/88. Locomotive Engineer.

Please make arrangements for trial.—C.A.N., 5/1/88. Mr. Boag. Mr. Newton to test Blackwall coal and report.—J. D. BOAG, 7/1/88. Report herewith.—W. SCOTT, 22/1/88. Commissioner.

Locomotive Engineer's Office, Singleton, 16 January, 1888.

Memo. to Mr. Boag,—

I have to report that a competitive test of the coal sent by Messrs. Nowland, with that supplied by contractors, was made on goods engine running the Nos. 9 and 24 trains, on 11th, 12th, 13th, and 14th instants.

The

The first two trips were made by No. 40 engine, consuming contractor's coal. The engine was in first-class order, but, unfortunately, the trucks were not heavily laden. The consumption of coal on the two down and up trips was 3 tons 10 cwt. 2 qrs.; the gallons of water evaporated, 6,876, or 27·80 lb. of coal per mile, and 1·148 per gallon of water.

On the following two trips, with same engine and men, consuming Messrs. Nowland's coal, the consumption was 4 tons 2 cwt; water evaporated, 7,958 gallons, making the consumption per mile, 32·34 lb., and 1·156 lb. per gallon of water evaporated.

The refuse from contractors' coal amounted to 7·1 per cent. of consumption; that from Messrs. Nowland's to 8·187. The refuse from contractors' coal was principally ashes, that from Messrs. Nowland's was principally unburnt cinder, indicating that with fire-bars closer the consumption would have been less.

The clinker from Rix's Creek coal (contractors), amounted to 1·275 per cent. on consumption; that from Messrs. Nowland's to 1·1 per cent.; but the clinker of Messrs. Nowland's was larger and stronger.

I think it may be confidently assumed that these two coals are of about equal quality for locomotive use.

G. NEWTON.

Superintendent of Stores.—A.R., 24/1/88.

70 tons per week of Messrs. Nowland's coal represents 3,640 tons per annum. Including freight, at 4s. 0 $\frac{1}{2}$ d. per ton, this will cost the Department £2,191 11s. 8d. Taking the actual consumption in the recent trials as a basis, 3,129 tons of Read and Longworth's coal would be required to produce the same result. This would cost, delivered at Murrurundi, £2,376 1s. 8d., or a difference, in favour of Nowland's coal, of £184 10s. per annum. From Mr. Newton's report, however, the conditions of the trial appear to have been unfavourable to Messrs. Nowland's coal, and he states that it may be assumed that the two coals are of about equal quality for locomotive use. If this be the case then the saving would amount to £568 15s. per annum.—H. CARRUTHERS (*pro* Superintendent of Stores), 4/2/88. Assistant Secretary.

I cannot, with equity, order coal from Nowland's mine.—CH. A.G., 7/2/88. Messrs. Nowland informed.

No. 32.

Extract from Votes and Proceedings.

LEGISLATIVE ASSEMBLY.—TUESDAY, 28TH FEBRUARY, 1888.

(3.) Supply of coal for Railway Department, Singleton:—Mr. McElhone asked the Secretary for Public Works,—

- (1.) What are the names of the parties who have the contract for supply of coal for Railway Department at Singleton?
- (2.) The price paid per ton, and when does the contract terminate?
- (3.) Did Mr. Nowland, or any other person, offer to supply coal at Singleton, or at his coal-pits close by, at 8s. per ton in or about December last?
- (4.) If so, was Nowland's or other person's offer to supply coal at 8s. per ton accepted?

Mr. Sutherland answered,—

- (1.) Messrs. Read and Longworth.
- (2.) 10s. 6d. per ton. Contract terminates on 31st December, 1889.
- (3.) Yes; but subsequent to the contract made with Messrs. Read and Longworth.
- (4.) No; it cannot be, without a breach of the contract already made.

No. 33.

Mr. R. Minto to The Hon. J. F. Burns.

Sir,

Rosedale Colliery, Camberwell, 13 February, 1888.

I am writing to you complaining of a great injustice being played upon us. Myself, in company with Messrs. A. & H. Nowland, are proprietors of a coal mine. In January, 1885, we applied for a coal-siding to be put in here at a point about 6 miles north of Singleton, at the same time offering to supply the Government with coal at a much cheaper rate than they then were receiving it for. In March, 1885, the Singleton Coal Company applied for an extension of their contract for three years, which was granted by the Commissioner for Railways privately, although there was a year and nine months of the original public contract to go, and Mr. Goodchap knew perfectly well there was competition in the field.

We have offered the coal for 2s. 6d. per ton less than is at present paid for it, and taking into consideration the 10 miles less haulage, amounts to something like £1 per truck, we can supply the coal cheaper.

We have applied for 70 tons per week, which means a saving to the Government of about £600 per year, on receipt of which application, Mr. Goodchap asked for a truck of our coal at our earliest convenience for test purposes, which was supplied. He made no complaint whatever of the coal in his communication of the 10th instant, but blankly states he cannot give any order at present, at the same time never offering any reason for refusal.

As I have been, and always will be, a supporter of yours whilst representative for the Hunter, I trust you will in this, as you did with reference to my deeds for land at Greta, give me your most valuable aid in bringing justice to light. There are several of the Greta residents requested me to write to you, knowing that you will see fair play.

Trusting you will favour me with an early reply.

I have, &c.,
ROBERT MINTO.

No. 34.

Minute of The Commissioner for Railways.

THE facts of the case are as follows:—

In March, 1885, Messrs. Read and Longworth, contractors for the supply of coal, at 11s. 9d. per ton, until 31st December, 1886, offered, on condition that the Commissioner would extend their contract for a period of three years, to supply from 1st July, 1885, at the rate of 10s. 6d. per ton. This gave an immediate gain to the Department of £1,345, and the Commissioner, who could not learn that any other mines were opening in the neighbourhood, recommended the step, which was approved by the Minister of the day (Mr. Wright).

Six months later the Commissioner was informed of the opening up of Nowland's mine, which is a few miles only from Rix's Creek, and was asked to take some coal from thence, but came to the conclusion (also concurred in by the Minister, Mr. Lyne) that he could not equitably take coal from a source so near that of the permanent contract supply, notwithstanding the following clause in the specification of the contract:—

"The Commissioner reserves to himself the right to purchase coal elsewhere than from the contractor during the currency of the contract, should he consider it necessary to do so, without prejudice to his rights under or in any way vitiating this contract."

In January, 1887, the subject was again brought forward, and again the same decision was conveyed to Messrs. Nowland Bros., through Mr. J. P. Abbott, M.P., who addressed the Department on their behalf.

Recently the Commissioner, seeing an opportunity of obtaining coal at Gunnedah, from a mine recently opened up, at a considerable saving to the Department, considered that he was quite within his contract rights in taking a certain quantity of coal from that place, and reducing to that extent the supply of coal by Messrs. Read and Longworth.

This was no sooner done, than Messrs. Nowland Bros. once again requested to be allowed to supply the Department, and the Commissioner, as on previous occasions, replied that he did not feel himself justified in ordering coal from them for the reasons already given.—CH.A.G., 23/2/88.

The right reserved was to have the power to order coal, if a mine should be discovered a considerable distance up the country, for instance, at Gunnedah, which is 145 miles from Singleton, not from a mine $3\frac{1}{2}$ miles away.—CH.A.G.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(O'ROURKE & McSHARRY v. COMMISSIONER FOR RAILWAYS.)

*Ordered by the Legislative Assembly to be printed, 5 October, 1887.**[Return in further answer to Question No. 1 in Votes and Proceedings, No. 7, 4th October, 1887.]*

As to the circumstances leading to this case being referred to arbitration, at whose suggestion, and by what authority the reference to arbitration was made, I beg to state that the case was entered for trial on 13th September, 1886, before a Special Jury of Twelve, briefs were delivered, and the defendant was prepared to go to trial.

One of the issues raised on the pleadings was as to the want of certificate by the Engineer, in respect of the so-called extra works sued for in the action.

To get rid of the effect of this plea, the plaintiffs, on 7th September, filed a claim in the Equitable Jurisdiction of the Supreme Court, praying that an injunction to restrain the defendant from availing himself of that plea should be granted.

The application was made to Sir William Manning, Primary Judge in Equity, on Friday, the 10th September, and opposed by Messrs. Stephen, Salomons, and C. B. Stephen, on the defendant's behalf; but the order was granted.

A copy of the shorthand writer's notes of this application is forwarded herewith. Against this order, defendant gave notice of appeal to the Full Court, and on Monday, 13th September, made application to the Chief Justice (Sir James Martin) for an order to postpone the trial until the next sittings, on the ground that the defendant was unduly prejudiced by having his defence altered by the injunction.

The Chief Justice granted the order. Upon the application for the injunction, Sir William Manning spoke strongly as to the plea being inequitable, and these observations were reported in the daily papers.

Shortly after this, I received a note from the Engineer-in-Chief, informing me that the Minister had directed him to state that the case was to be left to arbitration, and requesting me to see the Minister on the subject.

I informed defendant's counsel that it was proposed to leave the case to arbitration. They, especially Mr. Salomons, strongly advised that this course should not be adopted, and expressed very confident opinions that we should succeed upon the appeal from Sir William Manning's order.

I, therefore, saw the Minister, Mr. Lyne, and informed him of the opinion of counsel, and stated further that both Mr. Whitton and myself thought it would be better to allow the action to be proceeded with. He, however, told me that he had made up his mind that the case should be arbitrated, and that he had so informed the plaintiff's attorney, or counsel—I am not sure which.

The matter was then proceeded with; but a formal agreement as to the terms of the arbitration was not arrived at, and it was ultimately determined that the Minister, the Attorney-General (Mr. Want), who was plaintiff's counsel, and Mr. Pilcher, who had taken Mr. Salomon's place, should meet at the Attorney-General's Chambers. This meeting, at which I attended, was held on 19th November, when the Minister adhered to his previously expressed intention. A formal agreement was assented to, and I was directed by the Minister to carry out same.

On the following day I wrote to you informing you of this.

I may here mention that the defendant's counsel then were Mr. M. H. Stephen, Mr. Pilcher, and Mr. C. B. Stephen.

The agreement to refer to arbitration prevented the appeal against Mr. Justice Manning's order for an injunction being proceeded with, and the order of reference was taken out in the usual way.

3rd October, 1887.

JOHN WILLIAMS.

1887.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY SLEEPING-BERTH.

(CASE, NASH V. COPELAND—CORRESPONDENCE AND PAPERS.)

Ordered by the Legislative Assembly to be printed, 4 November, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 12th July, 1887, That there be laid upon the Table of this House,—

“A copy of all correspondence, and other papers, between the Railway Department and Messrs. Nash and Copeland, with respect to a sleeping-berth.”

(Mr. Hurley.)

No.	SCHEDULE.	PAGE.
1.	Letter from Mr. Copeland to Station-master, Newcastle, asking for two berths to be reserved. 11 December, 1886.	1
2.	Letter from Mr. Nash, complaining of being deprived of use of berth he had reserved, and reply. 18 December, 1886.	1
3.	Reply from Mr. Nash to above, 25 December, 1886, with minutes, &c.	2
4.	Letter from Mr. Copeland, 2 April, 1887, with minutes and reply.	3
5.	Letter from Messrs. Norton & Co., asking for names and addresses of certain officers at Newcastle, 28 April, 1887, and reply.	3
6.	Letter from Norton & Co., asking for permission to obtain statements from officers at Newcastle, 11 May, 1887, with reply.	4
7.	Letter from Mr. Copeland, M.P., claiming that Department should pay cost of action, 16 August, 1887, with minutes and opinion of Attorney-General as to legality of claim.	4

No. 1.

H. Copeland, Esq., M.P., to The Railway Station-master, Newcastle.

Dear Sir,

11 December, 1886.

Will you kindly reserve two sleeping-berths in the northern train which leaves on the arrival of the steamer next Friday, 17th instant, at midnight.

Yours truly,

HENRY COPELAND.

No. 2.

A. Nash, Esq., to The Commissioner for Railways.

Sir,

Bective, Tamworth, 18 December, 1886.

I have to complain of the treatment I received while travelling on the Northern Line last Friday night. I was a passenger by the train leaving Tamworth shortly after midnight, and had secured a sleeping-berth. The train was very full, and many more wanted berths than could obtain them. While my bed was being made up Mr. Copeland, the Minister for Lands, claimed it, and thinking I must have made a mistake as to the number, I asked the conductor, a man of the name of Adams, which was my berth, showing him my ticket. He told me Mr. Copeland had taken my berth. I asked if Mr. Copeland had a ticket. He replied, “No, he has no ticket either for the train or the berth.” “Well, then,” I said, “it is your

your duty to turn him out and give me my berth." "Oh," he said, "Mr. Copeland is a Minister; I dare not." I then went to Mr. Copeland, who was lying down on my bed, and told him he had my berth, and showed him my ticket; but he, with an oath, refused to let me have it, so I was obliged to wait for some time till the conductor made me up a makeshift to lie down upon in another part of the carriage.

I wish to know if such conduct as Mr. Copeland's will be permitted by the Department, and also whether you consider the conduct of Adams in refusing to do anything to help me in obtaining my berth does not deserve censure.

I have, &c.,

AUGUSTUS NASH.

Memo. for the Commissioner for Railways.

WITH reference to Mr. Nash's letter, I desire to say that the facts are as follows:—

On Saturday, 11th instant, I wrote the Station-master, Newcastle, asking him to reserve me two berths—one for myself, the other for Mr. Fred. Gannon—for the following Friday night, and having given a week's notice I naturally expected to have the berths.

I asked the conductor which was my berth, and he pointed to the one I occupied as my berth. I then took possession, and some person, probably the writer of the letter, told me that that was his berth. I replied that the conductor informed me it was my berth, and I intended sleeping in it, which I did.

There were no cross words or oaths used on the occasion, and if any difficulties arose the blame must rest entirely with the officials at Newcastle, as they had a whole week's notice of our requiring the berths.

HENRY COPELAND.

Sir,

Department of Railways, Sydney, 24 December, 1886.

I have the honor to acknowledge your letter of the 18th instant, complaining that on the recent journey from Tamworth you were debarred the use of the sleeping-berth which you had engaged, in consequence of its being appropriated by Mr. Copeland, the Minister for Lands.

In reply, I have to inform you that Mr. Copeland has been interviewed by an officer of the Department, and has been good enough to furnish a statement of the occurrence from his point of view.

It appears that Mr. Copeland gave notice at Newcastle a week beforehand that he would require berths for himself and a friend by that particular train, and the berth in question being pointed out to him by the conductor as the one reserved for him, he very naturally occupied it.

You will see that there was no "rushing" of your berth by Mr. Copeland; you and he, owing to some misunderstanding, were simply rival claimants for the same accommodation, and Mr. Copeland succeeded in establishing himself in possession of it. He says there were no cross words or oaths used, and the difficulty which arose must rest entirely with the officials at Newcastle.

I cannot yet say who was to blame. That there was blundering somewhere is beyond dispute, and special inquiry is being made as to who it was who blundered.

In the meantime I beg you will accept the expression of my regret for the inconvenience you were put to on the occasion.

I have, &c.,

CHAS. A. GOODCHAP.

Commissioner for Railways.

A. Nash, Esq., Tamworth.

The Commissioner wishes you to make special and particular inquiry in this matter. Why was not Mr. Copeland's written application of a week before attended to? There should be no delay in dealing with this matter.—D.C.McL., 24/12/86. Mr. Higgs.

Obtain the conductor's statement.—J. HIGGS, 30/12/86. S.M., Newcastle.

It is stated Mr. Copeland, Minister for Lands, occupied a berth in sleeping-car on night of 19th December, 1886, for which Mr. Augustus Nash held the ticket. Manager wants your immediate report.—W. B. SMITH, 3/1/87. Conductor Adams.

What I have to say about the matter is, that Mr. Copeland was in a lower berth, when another gentleman, Mr. Nash, came to me with a ticket the number the same as the one Mr. Copeland was occupying, which he refused to leave when I asked him, so I made Mr. Nash an upper berth as comfortable as I could; I asked that gentleman the same morning if he slept well, and he said yes; there were three or four upper berths unoccupied, but no lower berths.—E. ADAMS, Conductor, 3/1/87.

Mr. Owen, for report.—W. B. SMITH, 3/1/87.

Mr. Copeland's letter was received in ample time for securing two lower berths, but I regret to say that I misread his letter. I understood it to read that he would leave here on the 17th instant, whereas it was he would leave Sydney on the 17th instant. I provided for Mr. Copeland's request for the 17th instant, when it was intended by him to leave here on the 18th. I explained to Mr. Copeland at the time how it occurred, and booked him two upper berths, as the lower ones were taken.—E. OWEN, 3/1/87.

Special and particular inquiry has been made, and the result is that Mr. Owen, the booking-clerk at Newcastle, made a mistake as to date of Mr. Copeland's visit to Newcastle. See Mr. Owen's explanation. I am, as may be imagined, quite unable to account for Mr. Copeland's action in taking possession of a lower berth after being informed by Mr. Owen and the conductor that the lower berths were engaged.—J. HIGGS, 4/1/87. Chief Clerk.

Mr. Copeland was in the right to a certain point, and the Department in fault. Mr. Copeland booked lower berths for the night in question, and through an oversight of the clerk at Newcastle the application was understood to be for the following night. Mr. Copeland was informed of this, and offered upper berths. He, however, took the lower ones. I think a judiciously written letter, acknowledging the Department's error, and Mr. Copeland's occupation of the lower berth in consequence of a dependence upon his orders being executed, will smooth over the difficulty.—A.R., 10/1/87.

No. 3.

A. Nash, Esq., to The Commissioner for Railways.

Sir,

Bective, Tamworth, 25 December, 1886.

I beg to acknowledge yours of the 24th instant. The attitude Mr. Copeland has taken up necessitates a reply from me at greater length than I had wished.

I

I distinctly charge Mr. Copeland with seizing and occupying my berth knowing that he had no right to it, and knowing that I had the only right to it. Though I did not hear any communication pass between Mr. Copeland and the conductor, I feel certain that my berth was not "pointed out to him by the conductor." Mr. Copeland must admit that after he had been two or three minutes on the berth I came up to him and claimed the berth, and showed him my ticket for it, and asked him to give it up to me. His words were, verbatim, "Your berth is it? Then I'm damned if you shall have it, that's all." I had previously seen him on the berth, and at once went to the conductor, not suspecting anything more than a mistake, and had asked the conductor (showing him my ticket) which was my berth. He replied, "Mr. Copeland has it." I then asked him if he had any right to it, and if he had not to turn him out; he then said, "No; he has no ticket either for the train or the berth, but he is a Minister, and I dare not remove him." Though Adams is naturally a hostile witness to me, yet I cannot believe he will deny this having taken place, nor will he deny having said to Mr. Kingscote and myself the next morning that "it was a burning shame that Mr. Copeland should have so acted, but what was he to do."

Mr. Copeland states there were no oaths or cross words. The only oath is the one I have given above. I am not accustomed to wrangling in a railway carriage with a Minister, or any one else, and therefore it is true that high words were not made use of; but I felt, and still feel, that a gross and scandalous injustice was being done, and I relied, as I still rely, on the Department to see me righted.

It is, if my story be true, absurd to talk as Mr. Copeland does of our being rival claimants for the berth. Mr. Copeland knew and admits he had no ticket; he knew I had. He was admittedly aware when he came on board the car that the tickets for the berths were all taken or he would have secured one. What pretence had he for stating that he had any claim or right to my berth. I am glad to hear that you have kept your mind in suspense pending further inquiry, which inquiry I demand as a right. You can ask Mr. T. K. Abbott or Mr. W. A. Kingscote, both of whom were passengers on the night in question, and who know at least something of what took place. I ought to mention that until that night I did not know Mr. Copeland even by sight, nor did I know what position he occupied in the Ministry. Mr. Copeland was probably in equal ignorance of me. I am not therefore suggesting or alleging that the act was one of ill-will to me—that would be of small consequence; but what I do say is that he recklessly trampled on my rights as a member of the public, who having bought and paid for the berth was entitled to it against all the world.

I have, &c.,

AUG. NASH.

No. 4.

H. Copeland, Esq. M.P., to The Commissioner for Railways.

Sir,

Legislative Assembly, 2 April, 1887.

In acknowledging the favour of a copy of the correspondence with reference to Mr Nash's complaint of being deprived of a sleeping-berth, I desire to draw your attention to the conductor's statement that he asked me to leave the berth, and I refused to do so. This statement is absolutely untrue, for after telling me the berth I occupied was to be my berth he never spoke to me on that subject, and this is borne out by Mr. Nash's statement that when appealed to by him he (the conductor) refused to interfere with me.

I wish also to state, with reference to Mr. Higgs's memo. that the reason for my taking possession of a lower berth after the booking clerk had informed me that these had all been allotted is easily explained.

I had complained to the station-master of the clerk not having reserved the two berths, as requested, and that gentlemen came a few minutes after and informed me that he had arranged for me to have a lower berth, but that Mr. Gannon would have to take an upper one. I submit therefore that having the station-master's assurance that he had arranged for a lower berth for me, and the conductor having informed me that the berth in question was mine, I was perfectly justified in taking possession as I did.

I can only describe Mr. Nash's version of the language he alleges I made use of as a pure invention of his own mind, not having the slightest particle of foundation on fact, nor did he show me the ticket for his berth, as he states, evidently with a view of getting up a case.

I am, &c.,

HENRY COPELAND.

Send to Mr. Higgs with papers for early further report.—A.R., 5/4/87.

It appears that Mr. Copeland, on finding the lower berths engaged, complained to the station-master, who, after making inquiries, informed Mr. Copeland that he had arranged with the conductor for a lower berth, but the conductor did not quite understand what was wanted. It was intended to remove a lad from lower to upper berth (the lad referred to having no objection to the upper berth), but unfortunately this was not done, hence the trouble.—J. HIGGS, 9/4/87. Assistant Secretary.

Inform.—A.R., 13/4/87.

Sir,

Department of Railways, Sydney, 16 April, 1887.

Referring to your letter of the 2nd instant, respecting Mr Nash's complaint of being deprived of a lower sleeping-berth, I have the honor to forward herein copy of the Traffic Manager's further report on the matter.

I have, &c.,

CHAS. A. GOODCHAP.

Henry Copeland, Esq., M.P.

Commissioner for Railways.

No. 5.

Messrs. Norton & Co. to The Secretary for Railways.

Marlborough Chambers, O'Connell-street, Sydney, 28 April, 1887.

Sir,

Nash v. Copeland.

Referring to our conversation with you to-day, we have the honor, on behalf of Mr. Nash, to apply to you for the names and present addresses of the persons who filled the positions of station-master and booking clerk at Newcastle on Friday night, 16th December last, and also those of the conductor of that night's train, if possible. We have been informed that the ticket officer or booking clerk is named Barrett, and the conductor or guard, Adams.

We

We shall be obliged if you can let us have the information at an early date, as the case is set down for trial.

We have, &c.,

NORTON & CO.

Has Mr. Copeland written in to say that he considers the defence should be undertaken by the Department? Attach all papers at once.—A.R., 29/4/87. Herewith submitted for the Commissioner's information.—A.R. 29/4/87.

I remember now that Mr. Copeland verbally represented to me that as we admitted in our letter of 16/4/87 that the Department was in error we should undertake the defence. The circumstances of the case, as they will be revealed at the trial, may show that the Department should pay costs incurred, but this is a question which can be settled when raised. Give the information asked for.—C.H.A.G. 30/4/87.

Gentlemen,

Department of Railways, Sydney, 7 May, 1887.

In reply to the inquiry contained in your letter of the 28th ultimo, I have the honor to inform you that the names of the station-master, booking clerk, and car conductor who were on duty at Newcastle Station on the night of the 16th December are as follow:—Wm. B. Smith, station-master, Railway Station, Newcastle; Edward Owen, ticket clerk, Railway Station, Newcastle; Ernest Adams, car conductor, Railway Station, Newcastle.

I have, &c.,

A. RICHARDSON,

(For the Secretary for Railways).

Messrs. Norton & Co., Sydney.

No. 6.

Messrs. Norton & Co. to The Commissioner for Railways.

Marlborough Chambers, 2 O'Connell-street, Sydney, 11 May, 1887.

Sir,

Nash *v.* Copeland.

We have the honor, on behalf of Mr. Nash, of Sydney, barrister-at-law, to apply to you for permission to communicate with and obtain statements from the station-master, ticket clerk, and car conductor, in reference to this case which has been commenced against Mr. Copeland for taking and declining to deliver up a sleeping-berth taken and paid for by Mr. Nash. We shall feel obliged if you could let us have an early reply, as the case is coming on for trial very shortly, and we wish to see what evidence the above can give before bringing them down to Sydney. Subpœnas have been issued for them, but have not as yet been served, pending your reply.

We have, &c.,

NORTON & CO.

Gentlemen,

Department of Railways, Sydney, 18 May, 1887.

I have the honor to acknowledge your letter of the 11th instant, in which you solicit permission to communicate with and obtain statements from the station-master, ticket clerk, and car conductor at Newcastle, in reference to the case of Nash *versus* Copeland, now pending; and, in reply, I am directed by the Commissioner for Railways to inform you that he has no objection to your obtaining the information you require from the officials referred to.

I have, &c.,

D. VERNON,

Secretary for Railways.

Messrs. Norton & Co., Sydney.

No. 7.

H. Copeland, Esq., M.P., to The Commissioner for Railways.

Sir,

Yarraville, Newtown, 16 August, 1887.

I do myself the honor to bring under your notice the final result of the Supreme Court action Nash *v.* myself, in which the plaintiff recovered one farthing damages against me for an alleged refusal on my part to give up possession of a sleeping-berth in the Northern train for which the plaintiff had previously booked.

Although a jury of four awarded the plaintiff only one-fourth of a penny as damages, the Chief Justice certified for costs as against me, and a bill for which, after taxation, has now been presented and paid by me, which, with interest added after the manner of Shylock, amounts to £127 11s. 3d.

The costs (without taxation) on my side amount to £43, though I may here state that my solicitor, Mr. F. Gannon, being personally present at the cause of action, and knowing full well the whole of the circumstances, refused to take more than costs out of pocket.

The total costs to me, therefore, amount to £170 11s. 3d., which sum I now respectfully submit should, in common justice, be repaid me by your Department, and in furtherance of this claim I beg to refer you to the official correspondence of your officers on the subject; and I should be glad if you would also call for a copy of any correspondence between Station-master Smith and the plaintiff's attorneys with reference to this case, by which I feel assured you will come to the conclusion that, without taking upon myself any assumption as a Minister of the Crown (as alleged by the plaintiff), I simply, as any private citizen would do, carried out the instructions of your officers, viz., the station-master and the conductor.

The statement by the conductor, "that he afterwards came and told me he had made a mistake, and asked me to give up the berth," is simply untrue, and the jury clearly were of that opinion or they would have awarded something more than the nominal amount of one farthing; moreover, such statement is clearly refuted by the plaintiff's correspondence with you, as well as his sworn evidence to the effect that "when he appealed to the conductor to make me give up the berth, he (the conductor) refused to do so, saying that I was a Minister, and it was more than his place was worth," which refusal was said by the plaintiff to have been made in the presence of Mr. Kingscote as well as himself.

Although perhaps outside the lines of my present contention, I desire, in support of my former correspondence, to draw your attention to the fact that, notwithstanding the plaintiff's letters and own evidence in Court that I made use of the expression, "It's your berth is it? Then I'm damned if you shall have

have it, that's all." I also submit that the jury could not have believed that any such expression was made use of, inasmuch as the Chief Justice directed them that if they came to the conclusion that any such language had been used they should award substantial damages, which they declined to do. Moreover, not one of all the gentlemen present—either his witnesses or mine—heard any such expression made use of, although the plaintiff professed this to be the chief burden of his complaint; and I put it to you that, in view of the small size of the northern sleeping-cars, and the fact of a portion of this one being blocked off for ladies, if such an expression had been used whether Mr. Kingscote, Mr. T. K. Abbot, P.M., Mr. F. Gannon, solicitor, Mr. Gracie (a stranger then to both plaintiff and myself), or the conductor, would not, some one of them—they being the only persons present, and in such a small compass—have been certain to have heard the expression had it been used, and which is one that no person would be likely to make use of in a whisper if he used it at all.

Leaving out the gross injustice which I hold has been done me in this matter, I submit that in future any person, if poor, is liable to be ruined in one act through innocently taking instructions from your officers; and I venture to think that it will be injurious to the public and discreditable to the Department if the verbal directions of the officials should be found to be so many man-traps.

I, however, desire to base my claims on other grounds, and submit that at the time the cause of action arose a contract actually existed between you and me, not only that I was to have a lower berth, but that I was to have the particular berth of which I took possession. The question as to whether I had paid or not, I take it, amounts to nothing, as you yourself voluntarily waive that question. And the same with regard to "booking," as you also waive that, not only to Members of Parliament, but to the general public, in numerous cases every night. The position therefore I submit must stand thus:—I had written for two berths a week beforehand, but through the neglect of your ticket clerk I failed to secure them. Up to and beyond that time no contract existed, but when you, through your station-master, told me on the platform that arrangements had been made whereby I was to have a lower berth, which berth the conductor would point out to me, and this without any number being given (*vide* official correspondence), then, I submit, a contract as binding as that with Mr. Nash commenced to exist between you and myself, and that subsequently when you, through your conductor, pointed out the particular berth (which the conductor fully admits doing) and I took possession—no other person at that time either being or claiming to be in possession—I submit that my title was a legal and valid one at least with respect to you.

For the above reasons, and because I am averse to resorting to law Courts, I trust you will honorably recoup me the amount of costs of the action referred to. The amount of damages awarded by the jury I am willing to defray myself.

I attach copy of plaintiff's costs herewith, but without interest, which I, at plaintiff's request, have paid. I would also mention that though I previously paid the three officials the sum of £14, as witnesses' expenses, I have again had to pay them £20 5s. prepaid by the plaintiff.

I have, &c.,
HENRY COPELAND.

Nash v. Copeland.—Plaintiff's costs in an action wherein he recovered one farthing damages and the Judge certified for costs—£124 1s. 2d.

Forward to Mr. Higgs for the purpose of obtaining copy of the letter referred to sent by Mr. Smith to plaintiff's attorneys, and also to obtain refund of £14 which Mr. Copeland alleges were paid by him, the witnesses having been paid their expenses by the plaintiff. Please expedite this, as the question of meeting or resisting claim must be referred to Crown Solicitor.—CH.A.G., 17/8/87.

Mr. Higgs.—A.R., 20/8/87.

Mr. Smith has not a copy of the letter he wrote to Messrs. Norton, Smith, & Westgarth. He says he believes Mr. Copeland has it. As to the expenses, Mr. Smith says that what he and Mr. Owen got from both sides was but sufficient for the time they were away. Adams, on his last trip, received payment only from Mr. Copeland—the other side had given notice that they did not want him, and of course gave him nothing. Mr. Smith was in Sydney, altogether, 11 days; Mr. Owen, 12 days. The former received from Mr. Nash £9, and from Mr. Copeland, £4 13s. 4d.; total, £13 13s. 4d. Mr. Owen got £1 less from Mr. Nash, and £4 13s. 4d. from Mr. Copeland. Messrs. Smith and Owen allege that Mr. Nash's solicitors were aware that Mr. Copeland had paid a part. Under these circumstances they think that it would be hard to call upon them to refund. Whatever may be said about Messrs. Smith and Owen, Adams should not, in my opinion, have to repay the £4 13s. 4d. he received from Mr. Copeland.—J. HIGGS, 5/9/87.

Now forward to Crown Solicitor, who will please advise as to Mr. Copeland's request to be allowed, his costs, and will also say whether, under the circumstances, our employes who were paid under the circumstances stated should make any refund.—CH.A.G., 8/9/87.

Dear Sir,

29 September, 1887.

I beg to forward you a copy of Station-master Smith's letter to Mr. Nash's solicitors with reference to Nash's complaint of my refusing to give him possession of a sleeping-berth, and should be obliged if you would attach same to my letter asking the Government to refund me the costs of the action Nash v. Copeland.

C. A. Goodchap, Esq., Commissioner for Railways.

I am, &c.,
HENRY COPELAND.

Gentlemen,

Newcastle, 28 May, 1887.

In reply to yours of 19th instant, I beg to state that I, on the night of 18th December, 1886, saw Mr. Copeland on the platform a few minutes before the mail train left, and he seemed annoyed about a letter he had written to the station-master about a week previously (ordering two lower sleeping-berths) not having been attended to. I mentioned to Mr. Copeland that I was not then on duty, but would see if the oversight could be remedied, and on questioning the ticket clerk (Owen) found he had made an error in the date of Mr. Copeland's order. To rectify this, I arranged with a lady who had engaged a lower berth (for two little boys) to exchange for an upper berth, so that a lower berth would be available for Mr. Copeland, and I informed the conductor (Adams) of this arrangement, and also advised Mr. Copeland to see the conductor, who would give him a lower berth, no number being mentioned by me.

I

I know nothing of what took place between Mr. Nash and Mr. Copeland after the train left Newcastle.

Enclosed please find Mr. Owen's statement, and as the conductor is away on leave I am unable to obtain his report.

I am, &c.,

W. B. SMITH.

Sir,

Crown Solicitor's Office, Sydney, 28 September, 1887.

I have the honor, in compliance with a request from your Department, to return herewith Mr. Copeland's letter of date 16th August last, requesting payment of the costs and expenses paid or incurred by him in defending the action *Nash v. Copeland*.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

The Commissioner for Railways, Sydney.

Mr. Copeland was here to-day, and wished to know what action had been taken on his letter of 16th August, 1887. He was informed that the matter was in the hands of the Crown Solicitor, who would doubtless advise upon the course which should be taken in the course of a few days. Returned to Crown Solicitor. I shall be glad to be placed in a position to give Mr. Copeland a reply.—CH.A.G., 29/9/87.

Crown Solicitor's Office, Sydney, 21 October, 1887.

Sir,

Nash v. Copeland.

I have the honor to return herewith the papers relating to the above matter which were forwarded to me from your Department on the 7th day of October instant, and to state that I have submitted them to Mr. Attorney-General Wise, copy of whose advising thereon is attached.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

The Commissioners for Railways, Sydney,

Copy of Attorney-General's opinion.

THIS case does not appear to me to involve any matter of law. If it is submitted as a legal question whether the Department is liable to pay the costs incurred by Mr. Copeland in defending an action brought against him by Mr. Nash, I am of opinion that the Department is not liable. Even assuming that a contract was made and broken by the Department, the damages which Mr. Copeland claims do not follow necessarily from a breach of this contract, and would be disallowed by a Court as too remote.—B.R.W., 18/10/87.

Inform Mr. Copeland, and send him copy of Attorney-General's advising.—CH.A.G., 25/10/87. Copy sent to Mr. Copeland.—D.C.M'L., 27/10/87.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

TENDERS CALLED FOR BY THE DEPARTMENT OF
PUBLIC WORKS.

(PARTICULARS FOR YEARS 1885-6-7.)

Ordered by the Legislative Assembly to be printed, 21 September, 1887.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 27th April, 1887, That there be laid upon the Table of this House, a Return showing,—

- (1.) The various Contracts for which Tenders have been called by the Works Department during 1885, 1886, and 1887, for which no Tender was accepted.
- (2.) The estimated cost of each such Tender.
- (3.) The amounts of the lowest Tenders.
- (4.) The names of the lowest Tenderers.
- (5.) Reasons for not accepting each Contract.

(*Mr. Matheson.*)

TENDERS CALLED FOR BY THE DEPARTMENT OF PUBLIC WORKS.

No. 1.

DEPARTMENT OF RAILWAYS.

RETURN showing the various Contracts for which Tenders were called during the years 1885, 1886, and 1887, and for which no Tenders were accepted; also the estimated cost of such Contracts, the amount of lowest Tenders, the names of the lowest Tenderers, and the reasons for not accepting each Contract.

Description.	Estimated Cost.	Amount of lowest Tender.	Name of lowest Tenderer.	Reasons for not accepting Contracts.
1885. Signal-box, Wallerawang.	£ s. d. 360 0 0	£ s. d.	No tenders received. Work done by Department. Cost of work, £482 14s. 3d.
Timber bridge over railway, Nanima, near Wellington.	526 0 0	No tenders received. Work done by Department. Cost of work, £526 7s. 2d.
Shafting and fittings for Goulburn workshops.	120 0 0	86 0 0	R. L. Scrutton & Co.	The firm proposed to import the whole of the material, but as the shafting, &c., was urgently required it was decided to have the same made in the Sydney Railway Workshops. Cost, when completed, £87 2s. 2d.
Erection of barb wire fencing, Glenfield to Picton.	2,100 0 0	1,717 10 0	Potts & Metcalfe ...	Minister directed that specification be so altered as to provide for the materials being manufactured locally. Fresh tenders invited.
House for porter-in-charge at Trangie.	476 7 2	594 5 10	Wm. H. Lewis ...	Only one tender received, and as this was far in excess of the estimate it was decided to have the work done by day labour. Cost of work, £477 0s. 7d.
Porter's residence at Blackheath.	720 0 0	748 3 9	George Donald ...	Commissioner directed that a less expensive building be erected.
Roofs, girders, and columns for shops Nos. 16 to 25 at Eveleigh.	38,495 10 0	35,384 15 0	J. F. Carson...	After tenders had been opened, Messrs. D. and W. Robertson, one of the firms tendering, offered to manufacture the work in the Colony at their tender price. Their letter was considered in the light of an amended tender, and it was decided that "fresh tenders" be invited; tenderers to state whether they proposed to manufacture in the Colony or import.
Overbridge, Milthorpe	600 0 0	1,231 10 1	Peter Catterall ...	Only one tender received, and this being far in excess of estimate fresh tenders were invited.
1886. Overbridge, &c., Guinea-street, Albury.	3,054 19 6	3,243 11 0	J. F. Carson ..	Fresh and less expensive plans were ordered by the Minister to be prepared.
Station-master's residence, Ravensworth	560 0 0	{ 728 9 6 700 19 5 }	{ Fredk. Arthur King	Tenders were invited twice: but the lowest tender being too high in each case, it was decided that work be carried out by the Department. Cost of work, £450 0s. 5d.
Overbridge, Milthorpe	600 0 0	744 12 0	Wm. Paisley ...	The lowest tender being far in excess of the estimate, and the work not being urgently required, it was decided to postpone for a time.
Locomotive offices, Eveleigh.	7,100 0 0	6,698 18 5	Frank Tucker ...	Mr. Tucker having become insolvent, fresh tenders were invited.
Locomotive offices, Eveleigh.	7,100 0 0	7,273 7 5	Wm. Robinson	It was decided to erect a less costly building of plainer design.
Gas Works, Werris Creek.	3,740 0 0	3,769 7 0	Fredk. Arthur King..	Still in abeyance. Question whether Werris Creek will be the best site; depends upon time-table of trains to be adopted when connection with Queensland railway is made.
Construction of Tramway—Waverley to Randwick.	6,066 16 6	5,277 3 9	Cowie & Duncan.....	After tenders had been received it was decided to alter the route of the Tramway in order to avoid the necessity of resuming land, and thus lessen the cost of line; cost of work, £7,900.
Custom House, Albury	1,550 0 0	1,912 11 4	W. Hy. Byrne.....	Only one tender received; and this, being considerably in excess of estimate, was declined.
Duplication of Line—Goulburn to Joppa Junction.	13,286 11 9	12,714 16 0	McSweeney & Kirwan	Several important items, not included in this contract, would have materially increased the cost of duplication, and the estimated saving in "junction" expenses would not have justified the work being carried out at the increased cost.
The supply of Coal for North Shore Tramway (at per ton).	0 17 6	Coal Cliff Company...	Tenders were invited for the supply of large coal; but trials in the meantime had proved that Wallsend slack coal was more suitable, and fresh tenders were therefore invited.
Colonial iron (at per ton)—Great Southern and Western Lines.	9 7 3	Brown & Brown	Imported iron of better quality could be procured at a much cheaper rate.
Great Northern Line..	9 14 3	N.S.W. Shale and Oil Company.	Tenders equal; but as this price was the same as that then paid for the shale ordered out of contract, nothing could be gained by the acceptance of a fixed contract for 12 months.
Kerosene shale for Gas Works (at per ton).	2 15 0	A. Kerosene Oil and Mineral Company.	Only one tender received; and this being the same as the schedule prices, fresh tenders were invited with the same result. Second tender was accepted.
Building materials for the Great Northern Railway.	Carey Brothers.....	Butler & Co. were the highest tenderers; but the amount, £156 per annum, was considered too low.
The right of advertising in the cars of the North Shore Cable Tramway.	

DEPARTMENT OF RAILWAYS—continued.

No. 3.

HARBOURS AND RIVERS.

RETURN showing the various Contracts for which Tenders have been called for by the Works Department during 1885, 1886, and 1887, for which no Tender was accepted.

Contract.	Estimated cost.	Amount of lowest Tender.	Name of lowest Tenderers.	Remarks.
1885. Wharf at King's Creek, C. Rr.....	£ s. d. 275 0 0	£ s. d. 281 4 0	C. and F. Avery.....	Amount voted for work insufficient.

No. 4.

DEPARTMENT OF ROADS AND BRIDGES.

Work.	Estimated cost.	Amount of lowest Tender.	Name of lowest Tenderer.	Reasons for not accepting Tender.
Bridge over Snowy River, at Buckley's Crossing.	£ s. d. 8,688 5 3	£ s. d. 6,500 0 0	J. McKee.....	Tenders were invited for timber bridge, but it was decided by Minister that provision should be made for an iron structure (now in progress). Contracts for iron bridge: No. 1, supply of ironwork, £3,655 19s. 7d.; No. 2, erection of ironwork and construction of timber approaches, £6,749; total, £10,404 19s. 7d.
Bridge over Wangoola Creek Road, Sheet of Bark to Mount McDonald.	280 0 0	305 0 0	R. Grant.....	Postponed until after completion of railway line, when work can be performed more cheaply, and local requirements better ascertained.
Bridge, in approach to Mehi River Bridge, Moree.	392 0 0	390 0 0	J. McEvoy	Tenders invited in 1885, but as there were no funds available—vote having been written off by Treasury—matter had to stand over. Fresh tenders were called in 1886, and that of J. Gray (£385 17s. 4d.) accepted on 17/12/86, but owing to representations made by the Member for the district, and by local residents, that bridge was not urgently required, contract was cancelled—the contractor consenting—and work arranged for in lieu thereof.
Lennox Bridge, Parramatta (widening).	742 0 0	866 18 2	T. Mills.....	Work reported as not urgent, and as the traffic has been materially decreased by the erection of the Gasworks Bridge it was considered that this matter could stand over, and the money be saved.
Bridge, Bredbo River.	2,190 0 0	2,109 15 6	E. Taylor.....	It was represented that existing old bridge could be repaired, and the Minister directed that the matter should await opening of railway line.
Bridge, Martin's Gully Main North Road.	490 18 5	797 0 0	J. Fox & Co.....	Amount of tender being so greatly in excess of estimate the outlay could not be recommended. Tenders invited on three occasions.

RAILWAYS.

No. 1.

Minute by The Commissioner for Railways.

RESOLUTION of Parliament *re* carrying, free, children to school.—Let me have resolution, with a view to its being acted upon without delay. C.H.A.G., 30/4/87.

Resolution of Legislative Assembly.

Legislative Assembly, Friday, 29 April, 1887.

Resolution :—That, in the opinion of this House, provision should be made for the issue of a free pass to any child to travel in a suitable railway carriage or van to and from any primary school, private or otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child.

Submit for Executive approval to-morrow.—J.S., 4/5/87.

Minute by The Commissioner for Railways to The Under Secretary for Public Works.

WITH reference to the resolution of the Legislative Assembly, of the 29th April last, that provision should be made for the issue of a free pass to any child to travel in a suitable railway carriage or van to and from any primary school, private or otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child.

Please procure Executive approval.

CHAS. A. GOODCHAP.

5/5/87.

Minute by The Secretary for Public Works for The Executive Council.

Railway Free Passes to Children attending Primary Schools.

FOR the reasons set forth in the accompanying papers, I have the honor to request the authority of His Excellency the Governor and the Executive Council for the issue of a free pass to any child to travel, in a suitable carriage or van on the Government Railways of this Colony, to and from any primary school, private or otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child.

5/5/87.

JOHN SUTHERLAND.

The Executive Council advises, as herein recommended, that railway free passes be issued to children attending primary schools.—ALEX. C. BUDGE, 3/6/87. Approved.—CARRINGTON, 3/6/87.

No. 2.

The Rev. H. M. Finnegan to Travers Jones, Esq., M.P.

Dear Mr. Travers Jones,

Gundagai, 3 June, 1887.

There are Catholic people at Coolac who desire to send their children to the nuns' school here. Kindly inform me can the free railway passes be available for these children from Coolac to Gundagai. There is no public or any other school between this town and Coolac. Public School is on the Muttama side of the railway station.

The wording of the Act favours, I think, railway free passes in this instance. Kindly obtain some authoritative information for me on the case.

Yours, &c.,

H. M. FINNEGAN, C.C.

The Assistant Secretary, Railway Department, to Travers Jones, Esq., M.P.

Sir,

6 June, 1887.

Referring to the letter of the Reverend H. M. Finnegan, of Gundagai, forwarded by you to this office, in which he asks whether children of Catholic parents residing at Coolac may travel free by rail to Gundagai for the purpose of attending the nuns' school there, I am directed by the Commissioner of Railways to inform you that, provided the nuns' school is the nearest school to the residence of the children's parents, the free railway passes will be available.

I have, &c.,

A. RICHARDSON.

* * * * *

I saw Mr. Budge, who told me that the Governor-in-Council had approved of the altered regulation in respect of the issue of free passes to school children, and that this Department would be correct in acting on the decision forthwith.

J.P., 6/6/87.

Assistant Secretary.

The Rev. H. M. Finnegan to Travers Jones, Esq., M.P.

Dear Mr. Jones,

Gundagai, 9 June, 1887.

I am in receipt of your letter, as well as Commissioner's letter, but the answer is not satisfactory. Kindly, therefore, send him the enclosed letter for a reply.

The railway station-master at Coolac told me that I could not get free passes.

With many thanks for your trouble,—

Yours, &c.,

H. M. FINNEGAN, C.C.

The

The Rev. H. Finnegan to The Commissioner for Railways.

Sir,

Gundagai, 10 June, 1887.

I am in receipt of your letter dated the 6th instant, addressed to Travers Jones, Esq., M.P., stating that the children of Catholic parents residing at Coolac may travel free by rail to Gundagai for the purpose of attending the convent school, provided that the nuns' school is the nearest school to the residence of the children's parents.

In reply, I beg to inform you that by the way and according to the time the train travels in the morning (about 9 o'clock) from Coolac to Gundagai the nuns' school is the nearest to the residence of the children's parents, there being no school whatever on or near the line of railway between the two townships.

I may mention that there is a Public School located about a half mile beyond the Coolac Railway Station, in the direction of Cootamundra, but trains do not travel that way until about 6 o'clock in the evening, which trains would not of course be suitable for school purposes.

In consideration of the above facts and circumstances, I respectfully ask, if Catholic children wish to travel by rail to school from Coolac Station, are free passes available for them to and from Gundagai.

I have, &c.,

HENRY FINNEGAN,
R.C. Clergyman.

J. H. Want, Esq., M.P., to The Commissioner for Railways.

12 June, 1887.

Dear Goodchap,

I hear that notwithstanding your instructions with regard to issue of free passes for school children it has been disregarded for some reason or another.

Travers Jones has sent a letter in to-day from Father Finnegan respecting it which will explain the hair-splitting nature of the objection.

I shall be glad if you can decide as soon as possible.

Yours, &c.,

J. H. WANT.

We have given what we consider a fair interpretation of the intention of the resolution passed by Parliament, but it may be that we are in error, and that the contention in this letter that the nuns' school at Gundagai is the nearest primary school, private or otherwise, to Coolac is correct. Perhaps the Under Secretary for Education will favour us with his views.—CHAS. A. G., 16/6/87.

It has been decided that on and from Monday next "provision is to be made for the issue of a free pass to any child to travel in a suitable railway carriage or van to and from any primary school, private or otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child." Please arrange accordingly.—A. RICHARDSON, Assistant Secretary, B.C., 17/6/87. Traffic Manager, Newcastle. Urgent. Instructions issued. Copy of general order attached.—J. HIGGS, 22/6/87. Assistant Secretary.

General Order 87/65.—Free passes to school children.—School children are to be allowed to travel free—second class of course—to and from any primary school, public or private, the condition of issue of free pass being that such school shall be the one nearest to the residence of the parents or guardians of the child. Certificates of attendance will be required every month to obtain passes. (This takes the place of general order 87/54, cancelled).—JOHN HIGGS, Traffic Manager.

To Manager, Redfern.—It has been decided that on and from Monday next provision is to be made for the issue of a free pass to any child to travel in a suitable railway carriage or van to and from any primary school, private or otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child. Please arrange accordingly.—A. RICHARDSON, Assistant Secretary, 17/6/87.

Seen, and all concerned will be instructed. I shall be glad to receive as soon as possible a list of the private schools to which this will apply. See attached extract from papers. Also, I shall be glad if the Educational Department could be asked to supply forms of application as enclosed to private schools, where necessary, the same as is now done in the case of Public Schools.—W. V. READ, 24/6/87.

Advertisements.

No. 1.

NOTICE TO TEACHERS OF SCHOOLS, OTHER THAN PUBLIC SCHOOLS, ON RAILWAY LINES.

Free Passes to Pupils.

1. In pursuance of a resolution of the Legislative Assembly, "That provision should be made for the issue of a free pass to any child to travel in a suitable railway carriage or van to and from any primary school, private or otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child," it is hereby notified that free passes may now be obtained from the railway station-masters at all stations.

2. It will be necessary, when application is made for a free pass that each child produce a certificate from the teacher that he or she is in regular attendance at the school, that such school is the nearest "primary school" to the child's residence, and has been duly registered in the office of the Department of Public Instruction.

3. Free passes will be issued half-yearly.

Department of Public Instruction, Sydney, June 17, 1887.

JAMES INGLIS.

No. 2.

NOTICE TO TEACHERS OF SCHOOLS, OTHER THAN PUBLIC SCHOOLS, ON RAILWAY LINES.

WITH reference to the advertisement respecting the granting of free passes, to pupils of schools, other than Public Schools, on railway lines, it is further notified that teachers of private "primary schools" containing pupils who desire to avail themselves of the privilege of travelling free on railway lines must duly register their schools in the office of the Department of Public Instruction. The name of the school, and the exact locality in which it is situated, must be clearly stated.

Department of Public Instruction, Sydney, June 17, 1887.

JAMES INGLIS.

Submitted

Submitted that the Commissioner for Railways be informed that the interpretation of this Department of the intention of the resolution passed by the Legislative Assembly respecting free passes to pupils is embodied in the foregoing advertisement (No. 1—see paragraph 2), which has been published throughout the Colony for the information of teachers of schools other than Public Schools.

As there is a Public Primary School at Coolac, the nuns' school at Gundagai cannot be regarded as the nearest primary school to the residences of the parents of the children at Coolac.

The question is not to be determined by the way the train goes, or the time it travels, but by the fact that there is a primary school nearer to the children's residence than Gundagai.

G.M., 1/7/87.

Approved.—J.I., 1/7/87. The Commissioner for Railways.—G.M., 4/7/87.

This decision seems to contradict the conclusion previously arrived at. It was concluded, I think, that the nearest primary school was the school nearest to the residence of the parents to the attendance at which of their children they had no conscientious objections. I wrote a paper* suggesting, I think, this definition, and submitted it.—CHAS. A.G., 7/7/87.

* This paper was not registered, and cannot be found.

No. 3.

The Assistant Secretary of Railways to The Acting Under Secretary, Public Instruction.

Sir,

Department of Railways, Sydney, 28 June, 1887.

It having been decided that provision is now to be made for the issue of a free pass to any child to travel in a suitable railway carriage or van to and from any primary school, private or otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child, I have the honor, by direction of the Commissioner for Railways, to ask that you will have the kindness to furnish a list of the private educational establishments to which this rule will apply.

I have, &c.,

A. RICHARDSON,

(For the Secretary of Railways).

The Acting Under Secretary, Public Instruction, to The Secretary of Railways.

Sir,

Department of Public Instruction, Sydney, 18 July, 1887.

I am directed to acknowledge the receipt of your letter, dated 28th ultimo, 87-2,420A, requesting to be furnished with a list of the private educational establishments to which the rule relating to the issue of free railway passes to pupils, in accordance with the recent resolution of the Legislative Assembly, will apply.

2. In reply, I am to state that the conditions on which free railway passes would be granted to pupils attending private schools were published in the Sydney daily papers on the 22nd ultimo, and similar advertisements were inserted in the more important papers circulating along railway lines. In response to such advertisements the principals of the undermentioned schools have registered their establishments in this Department with a view to free passes being issued to such pupils as may be entitled to them in terms of the resolution and conditions:—

1. Grammar and Commercial School, Pedrotta-terrace, Russell-street, Bathurst. Head-master, Mr. George Prosser.

2. St. Charles' Roman Catholic School, East Maitland. Taught by nuns.

3. St. Joseph's Roman Catholic School, East Maitland. Taught by nuns.

No other schools have yet been registered in this office.

I have, &c.,

G. MILLER,

Acting Under Secretary.

No. 4.

The Rev. J. Mahoney to D. O'Connor, Esq., M.P.

My dear Dan,

Penrith, 5 July.

I have just got the enclosed of to-day's date.

By it you will see the officials are yet reluctant to put a generous interpretation on your resolution.

As the writer truly remarks, the Public School at Emu is very nearly as far from Emu Station as is ours. There can't be 100 yards difference.

You see the poor people are anxious, and appeal to their pastor in true Catholic spirit. Will you please see to this at once.

Ever, &c.,

J. MAHONEY.

I wrote to Mr. Read, Traffic Manager, a week ago on this subject, but he has not replied.—J.M.

Dear and Rev. Father,

Glenbrook, 5 July, 1887.

Mrs. Wood wishes to let you know that she has applied for a free pass for May Wood, and it has been refused, owing to there being a Public School at Emu Plains, that school being the nearest.

Mrs. Wood has been advised to ask your Reverence to apply for one, stating Emu School is not the nearest by rail. Leaving Glenbrook, 3 minutes ride to Lucasville—get out of train and walking (say) about 2 miles to the school, if May go on the Emu Station, then she must walk about the same distance back to school, about 2 miles. Then there is another thing to be considered: taking May Wood away from the convent school and sending her to a lower school—that would be doing the child and school an injustice.

Trusting

Trusting you will do something in the matter, I cannot send May to school until I see what is to be done. I am writing Mr. Taylor, Member for Parramatta, on the subject, and will anxiously wait his answer. If I cannot get the pass I can but pay in the end, as I have been doing, but will try what is to be done first.

I am sorry to be troubling you so much, but if some one does not move in the matter passing the Bill in the House is of little use to our schools.

Yours, &c.,
J. M. WOOD.

Minute by The Commissioner for Railways.

Mr. O'Connor, M.P., and Roman Catholic School Children.

MR. O'CONNOR has brought the within letters under my attention. It would seem that the decision of the Government is not receiving attention, and this perhaps arises from deficient instruction.

The papers have been sent to Traffic Manager, I presume.

Let me know how the matter stands exactly, and what general orders to the railway station-masters have been issued.

CHAS. A. G., 7/7/87.

No. 5.

The Rev. T. Rogers to The Railway Station-master, Aberdeen.

Musclebrook, 8 July, 1887.

THE undersigned certifies that the under-named children are pupils of the convent primary school at Musclebrook, and requests railway passes for them:—Michael, Margaret, Bridget, and Edward Donovan, and John and Agnes Hayes.

THOMAS ROGERS.

The case is this:—There is a primary Public School in Aberdeen, but the children want to go to the denominational (R.C.) school in Musclebrook, also primary. Can pass be granted?—J. HIGGS, 12/7/87. Secretary.

Please see copy of decision of the Education Department on this matter. This must be followed until countermanded.—A.R., 21/7/87. Mr. Higgs. Noted.—J. HIGGS.

No. 6.

W. L. Davis, Esq., M.P., to The Minister of Public Instruction.

Sir,

12 July, 1887.

I have the honor of drawing your attention to a case *re* children attending a school by railway which is somewhat complicated, viz., I have a man in my employ, at Lucasville, on the Great Western Line, who has three children attending school; the nearest public school is at Emu Plains, but, being Catholics, they wish to go to the convent school at Penrith.

The Railway Department have declined to allow them to travel to Penrith, and, I think, rightly so, too; but I respectfully request that you will be good enough to allow them to travel free to and from Emu Plains (that being the nearest school of any kind). They can then walk from there to Penrith.

Trusting you will see fit to grant this privilege, which I consider they are justly entitled to,—

I have, &c.,

W. LOVEL DAVIS.

The name of the father is C. Gimbert.

Submitted that Mr. Davis's request be declined. Free passes are granted for the purpose of enabling pupils to reach the nearest primary school to the residences of their parents. This request is for a free pass to enable certain children to reach a railway station at which there is a Public School, and then to walk on to a school which is not the nearest to their residence.—G.M., 14/7/87.

Approved.—J.I., 14/7/87.

The Acting Under Secretary of Public Instruction to W. L. Davis, Esq., M.P.

Sir,

Department of Public Instruction, Sydney, 15 July, 1887.

I am directed to acquaint you that the Minister of Public Instruction has had under notice your letter of the 12th instant, requesting, on behalf of a man named C. Gimbert, in your service, that free railway passes to Emu Plains may be granted to his children to enable them to attend the convent school at Penrith.

2. In reply, I am to point out that free passes are granted only for the purpose of enabling pupils to reach the nearest primary school to the residences of their parents. The request made by you, however, is for free passes to enable certain children to reach a railway station at which there is a primary school, and then to walk on to a school which is not the nearest to their residence.

3. Under these circumstances the Minister cannot comply with your request.

I have, &c.,

G. MILLER,

Acting Under Secretary.

No. 7.

Minute by The Secretary for Public Works.

I SHALL be glad if full effect is given to the intention of this motion, viz., to arrange for free passes to be issued to children to enable them to attend the nearest private school to their residence, no matter what Public School may intervene.

JOHN SUTHERLAND, 10/8/87.

Minutes

Minutes by Mr. Assistant Secretary Richardson.

Free Railway Passes to School Children.

REFERRING to the resolution passed in the Assembly on the 29th April last, and quoted below, respecting free passes to school children, I have to inform you that the Minister has minuted that he wishes full effect to be given to the resolution, and that arrangements should accordingly be made by which free passes shall be issued to children to enable them to attend the nearest private school to their residence, no matter what Public Schools may intervene.

A. RICHARDSON,

Assistant Secretary, 10/8/87.

To the Traffic Manager, Newcastle.

"That in the opinion of this House provision should be made for the issue of a free pass to any child to travel in a suitable railway carriage or van to and from any primary school, private or otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child."

Noted, and staff informed.—JOHN HIGGS, 16/8/87. A. T. Auditor.

Free Railway Passes to School Children.

REFERRING to the resolution passed in the Assembly on the 29th April last, and copy of which is attached hereto, respecting free passes to school children, I have to inform you that the Minister has minuted that he wishes full effect to be given to the resolution, and that arrangements should accordingly be made by which free passes shall be issued to children to enable them to attend the nearest private school to their residence, no matter what Public School may intervene.

A. RICHARDSON,

Assistant Secretary, 10/8/87.

Traffic Manager, Redfern.

Mr. Inglis moved, that the question be amended by the omission of all the words after the word "House," with a view to the insertion in their place of the words "provision should be made for the issue of a free pass to any child to travel in a suitable railway carriage or van to and from any primary school, private for otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child."

Seen; all concerned informed.—W. V. READ, 23/8/87.

No. 8.

Minute by Mr. Inspector Crawford to The Traffic Manager.

Mr. Clout's Application for School Passes.

Traffic Inspector's Office, Goulburn, 10 August, 1887.

THE teacher of the convent school, Moss Vale, has written to Moss Vale, informing him that printed forms are not issued from Public Instruction Department, but from Railway. Please forward a supply.

A. CRAWFORD.

Will the Secretary be kind enough to refer this matter to the Department of Education. On Commissioner's 87-2,420A, I asked that the forms should only be supplied to private schools by that Department, after the heads of such schools had registered their schools in the Education Office. I have not yet received advice that the convent school at Moss Vale has been registered.—W. V. READ, 25/8/87.

You have since been supplied with the information, I think.—A.R., 30/8/87. Traffic Manager.

I have not yet received advice that the Moss Vale convent school has been registered in the Education Department, and should be glad if arrangements could be made for the forms of application for free passes to be supplied to private schools by that Department after the heads of such schools had had them registered in the Office for Education, the same as is now done in the case of Public Schools. I presume that only schools that have been registered in the Education Department are to be taken into account, and that only such registered schools are to be taken to the nearest private schools for the purpose of this regulation. There will no doubt be a large number of private schools which will not be registered.—W. V. READ, 2/9/87.

No. 9.

The Head Teacher, St. Joseph's Convent, to The Commissioner for Railways.

Sir,

+ J.M.J. St. Joseph's Convent, 21/8/87.

I beg to draw your attention to General Order No. 62, issued on 19th instant by W. V. Read, Esq., Traffic Manager, Railway Department, *re* free passes to children attending the nearest private school to their residence, no matter what Public School may intervene.

Furthermore, I wish to avail myself of this concession to register the private school of St. Joseph's Convent at Penrith in your office. Will you please forward the printed forms of application for free passes required for two children from Glenbrook, three from Lucasville, and five from Emu Plains.

I have, &c.,

SISTER BONAVENTURE,

Head Teacher.

Informed that school has been registered in Department. Secretary of Railways informed.—J.H.P., 24/8/87.

No. 10.

The Station-master, Aberdeen, to The Rev. Mr. Rogers.

Rev. Sir,

Aberdeen, 23 August, 1887.

In answer to your letter of 19th instant, asking me to apply for passes for children at Aberdeen to attend convent school at Muswellbrook, I beg most respectfully to inform you that the regulations will not permit of compliance with request, as there is a Public School at Aberdeen. The convent school at Muswellbrook cannot be regarded as the nearest primary school to the residence of the parents, therefore school passes cannot be issued in this case.

I have, &c.,

JOHN M'LEAN.

Has the last minute of the Minister in regard to this matter been made known to all the staff? if so, I cannot understand Mr. M'Lean's letter; he either does not understand the decision, or he is opposing its application. In either case it seems to be he is not fitted for his position. Let me know how the matter stands.—CH. A. G., B. C., 25/8/87. Traffic Manager, North.

Instructions were duly issued. Though Mr. M'Lean does not mention it, the difficulty he conceived was non-receipt of registration advice. Knowing the facts myself, I ordered the issue of the passes on 24th (the day after Mr. M'Lean wrote the letter), and waived the question of registration of school, of which I have not yet been notified. I had written to the Rev. Mr. Rogers before I got this paper, telling him that the passes had been issued.—JOHN HIGGS, 29/8/87. Commissioner.

No. 11.

The Acting Under Secretary of Public Instruction to The Secretary of Railways.

Sir,

Department of Public Instruction, Sydney, 24 August, 1887.

With reference to my letter of the 18th ultimo, I am directed to acquaint you that the principals of the undermentioned private educational establishments have registered their schools in this Department, with a view to free railway passes being issued to such pupils as may be entitled to them, in terms of the resolution of the Legislative Assembly and the published conditions.

1. Bethlehem High School, Bland-street, Ashfield. Mrs. M. V. O'Brien.
2. Roman Catholic School, Binalong. Mr. M. M. Donohue.
3. St. Joseph's Convent, Penrith. Mrs. Bonaventure.

I have, &c.,

G. MILLER,

Acting Under Secretary.

The Traffic Manager.—A. R., B. C., 29/8/87. Noted.—W. V. R., 1/9/87. Secretary.

No. 12.

Minute by The Minister for Public Instruction.

Railway Free Passes to School Children.

It has been brought to my notice that a general order has lately been issued by the Railway Department in which the recent resolution of the Legislative Assembly anent railway free passes to children other than those attending Public Schools has been so interpreted as to give permission to children to travel past Public Schools to attend private schools, although such private schools may be at great distances from the children's residences, and one or more Public Schools may intervene. I must, if this be the case, draw the attention of the Commissioner for Railways to the fact that this action may materially affect the attendance at our Public Schools, and may give rise to very grave complications and embarrassments. For instance, there is no reason, on such an interpretation, why a parent in Bourke or Tenterfield or Albury should not send his children to a school in Sydney. The interpretation also seems to me inconsistent with the wording and design of the resolution, and with the minute arrived at by the Cabinet; and I will be pleased if the Commissioner will be so good as to inform me what is really being done in the matter.

Commissioner for Railways.

JAS. INGLIS, 10/9/87.

The general order of the Traffic Manager is based upon the decision of the Honorable Secretary for Public Works, of August 10th last, which has not yet been officially communicated to the Department of Public Instruction.—A. R., 12/9/87.

Will the Minister be good enough to say what reply is to be made to the minute of the Minister for Education. The interpretation placed upon the resolution of the Assembly is one that has given much satisfaction to those concerned, and does not seem to break the spirit of the resolution.—CH. A. G., 15/9/87.

No. 13.

The Acting Under Secretary for Public Instruction to The Assistant Secretary for Railways.

Sir,

Department of Public Instruction, Sydney, 14 September, 1887.

I am directed to acquaint you that the undermentioned educational establishments have been registered in this Department, with a view to free railway passes being issued to such pupils as may be entitled to them, in terms of the resolution of the Legislative Assembly and the published conditions:—

1. St. Michael's Roman Catholic Boys' School, Church-street, Wagga Wagga. Very Rev. P. Dunn.
2. St. Joseph's Roman Catholic School, Johnston-street, Wagga Wagga. Very Rev. P. Dunn.
3. The Roman Catholic Convent Schools, Mt. Erin, Edward-street, Wagga Wagga. Very Rev. P. Dunn.
4. Roman Catholic Convent School, Muswellbrook. Rev. T. Rogers.

I have, &c.,

G. MILLER.

No. 14.

No. 14.

Memo. by The Acting Under Secretary for Public Instruction.

Free Passes to Pupils attending schools, other than Public Schools, on Railway Lines.

Department of Public Instruction, 26 September, 1887.

THE resolution of the Legislative Assembly—"That provision should be made for the issue of a free pass to any child to travel in a suitable railway carriage or van to and from any primary school, private or otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child"—was advertised in the Sydney and the principal country papers in June last. It was also notified that it would be necessary, when application was made for a free pass, that each child should produce a certificate from the teacher that the school he or she attends is the nearest "primary" school to his or her residence.

Towards the end of June the Commissioner for Railways forwarded to this office a letter from the Rev. Father Finnegan, a Roman Catholic clergyman, requesting that the children of Catholic parents residing at Coolac and Muttama might be allowed to travel free by rail to Gundagai, for the purpose of attending the convent school at that place. In reply, the Commissioner was informed that the interpretation of this Department of the intention of the resolution passed by the Legislative Assembly respecting free passes to pupils was embodied in the advertisement which was published in the newspapers, and that, as there is a public primary school at Coolac, the nuns' school at Gundagai could not be regarded as the nearest primary school to the residences of the parents of the children at Coolac; also, that the question was not to be determined by the way the train goes, or the time it travels, but by the fact that there is a primary school nearer to the children's residence than Gundagai.

On the 14th July last, Mr. W. L. Davis, M.P., requested, on behalf of Mr. C. Gimbert, that free railway passes to Emu Plains might be granted to his children to enable them to attend the convent school at Penrith. In reply, it was pointed out to Mr. Davis that free passes are granted only for the purpose of enabling pupils to reach the nearest primary school to the residences of their parents; whereas his request was for free passes to enable certain children to reach a railway station at which there is a primary school, and then to walk on to a school which is not the nearest to their residence (thus violating the terms of the resolution of Parliament). His application could not therefore be complied with.

On the 10th instant a memorandum was sent by the Minister of Public Instruction to the Commissioner for Railways, of which a copy is appended hereto.

G M.

No. 15.

Minute by The Colonial Secretary.

Colonial Secretary's Office, 26 September, 1887.

CABINET consider that the Department of Public Instruction, in the advertisements of June 17th last, correctly interpreted the resolution of the Legislative Assembly, and now learn with surprise that the Railway Department has disregarded the decision of the Minister of Public Instruction. It is now decided that the decision of Mr. Inglis, as embodied in advertisements of June 17th, including the registration of schools, be carried out in all cases.

HENRY PARKES.

For Cabinet.

The Commissioner for Railways to attend to.—J.S., 27/9/87.

Let me see copy of advertisement. Issue immediately to the Traffic Managers, who will instruct their respective staffs that passes are to be issued only in terms of that advertisement. Send copies of the advertisements.—C.P.A.G., 27/9/87.

Memo. to Traffic Managers, north, south, and west.

Minute by the Assistant Secretary of Railways.

Free Passes, School Children.

It has been decided that the following shall be the regulations governing the issue of free passes, in accordance with the terms of resolution of the Legislative Assembly, dated 29th April last, to school children:—

Free passes are to be issued to school children to enable them to attend the nearest primary school to the residences of their parents or guardians.

The terms of the accompanying advertisement (copy of which is appended), published by the Education Department, are to be strictly observed.

Please arrange accordingly.

A. RICHARDSON,

Assistant Secretary, B.C., 27/9/87.

Traffic Manager, Newcastle.

Noted, and staff instructed.—J. HIGGS, 30/9/87. A.T. Auditor. Noted.—S.D.H., 3/10/87. T. Auditor. Mr. Forsyth to see.—R.J.S., 6/10/87. Seen.—W. FORSYTHE, 5/10/87. Traffic Auditor. The Secretary.—R.J.S., 6/10/87.

Minute by the Assistant Secretary of Railways.

Free Passes to School Children.

It has been decided that the following shall be the regulation governing the issue of free passes, in accordance with the terms of resolution of the Legislative Assembly, passed 29th April last, to school children.

Free

Free passes are to be issued to school children to enable them to attend the nearest primary school to the residence of their parents or guardians.

The terms of the accompanying advertisement, published by the Education Department, are to be strictly observed.

Please arrange accordingly.
Traffic Manager, Redfern.

A. RICHARDSON,
Assistant Secretary.

Seen ; general order issued ; copy attached.—W. V. READ, 6/10/87.

[Enclosure.]

Advertisement referred to.

In pursuance of a resolution of the Legislative Assembly—"That provision should be made for the issue of a free pass to any child to travel in a suitable railway carriage or van to and from any primary school, private or otherwise, provided that such school shall be the one nearest to the residence of the parents or guardians of such child"—it is hereby notified that free passes may now be obtained from the railway station-masters.

It will be necessary, when application is made for a free pass, that each child produce a certificate from the teacher that he or she is in regular attendance at the school ; that such school is the nearest primary school to the child's residence, and has been duly registered in the office of Public Instruction.
Department of Public Instruction, Sydney, 17 June, 1887.

JAS. INGLIS.

General Order.

Great Southern, Western, and Richmond Railways.—General Order No. 75, M.P. 87-5,673D.

Free Passes to School Pupils.

ALL concerned are informed that General Order No. 62, of 19th August, 1887, notifying that free passes would be issued to children to enable them, if it were so desired, to attend the nearest private school to their residence, is hereby cancelled, and that General Order No. 42, of 30th June last, is to be acted upon.

W. V. READ,
Traffic Manager.

Military Staff Office, Sydney, 1 July, 1887.

H. D. MACKENZIE, Major,
A.A.G.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(INFORMATION RESPECTING FIRST-CLASS THROUGH TICKETS, SYDNEY TO BRISBANE.)

Ordered by the Legislative Assembly to be printed, 28 February, 1888.

[Laid upon the Table of the House, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 21, in Votes and Proceedings No. 57, of the 23rd February, 1888.]

QUESTIONS AND ANSWERS.

1. What is the cost of a first-class through ticket by rail from Sydney to Brisbane? The first-class return fare is £7 10s.
2. For how long is such ticket available, and can the holder of such ticket break his journey at any of the intermediate stations? The tickets are available for two months, and the holders can break their journey at any station for seven days.
3. What is the distance by rail from Sydney to Brisbane? 722 miles.
4. Can first-class through tickets be obtained at the Newcastle Railway Station from Newcastle to Brisbane, or at any of the other stations along the line; if not, for what reason? The through tickets to Melbourne were procurable only at Sydney until within the last few days, and the same course was followed in regard to the through tickets to Brisbane. When tickets are required at intermediate stations, or stations on the Northern line, they are telegraphed for to Sydney; but to avoid delay in obtaining through tickets at Newcastle, instructions were given some days ago to provide that station with an independent supply. On the Queensland lines the through tickets are only issued at Brisbane.
6. What is the cost of a first-class through ticket from Newcastle to Wallangarra, and from Wallangarra to Brisbane? The ordinary first-class return fare from Newcastle to Wallangarra is £5 4s. 6d. Between Wallangarra and Brisbane single tickets only are issued at £2 2s. 6d. each first-class, in all £9 9s. 6d., but a person going from Newcastle to Brisbane would purchase a through return ticket for £7 10s., or a single ticket for £5. It may be added that the same apparent anomaly exists in regard to the tickets between Goulburn and intermedial stations and Melbourne, and also to other lines, such, for instance, as Hay, or wherever there is competition with other routes or other modes of carriage.
7. How long are these tickets available for, and can passengers break their journey *en route* from Newcastle to Wallangarra? They are available for two months, and passengers can break journey.
8. What is the distance from Newcastle *via* Wallangarra to Brisbane? 620 miles.
9. What is the difference in the distance by rail from Sydney to Brisbane, and from Newcastle to Brisbane *via* Wallangarra? 102 miles.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(LIMITED EXPRESS—COMPARTMENTS ENGAGED FROM 1 NOVEMBER, 1887, TO 1 APRIL, 1888.)

Ordered by the Legislative Assembly to be printed, 17 April, 1888.

[Laid upon the Table of the Honorable the Legislative Assembly, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 3, Votes No. 77, of the 12th April, 1888.]

QUESTIONS.

1. How many first-class compartments have been engaged by the limited express leaving Sydney since 1st November, 1887, to 1st April, 1888?
2. What are the conditions under which these carriages can be engaged?
3. Have these conditions been fulfilled by the persons securing carriages?
4. The names of the Members of the Legislative Assembly or other persons who have taken the compartment referred to?

ANSWERS.

ENQUIRY has been made in this matter and a statement, giving all particulars obtainable, is attached. It is however, probable that compartments have been reserved which are not included, as it may sometimes happen that on the fulfilment of the usual conditions, viz., obtaining six ordinary tickets, compartments have been reserved at the last moment; or it has been found that there have not been sleeping berths in the cars to meet all applications, and the compartments being available they have been reserved and berths made up in them for persons taking and paying for sleeping berths in addition to the ordinary fare. This is an economical way of meeting the case, otherwise a second sleeping carriage would have to be put on, necessitating the use of another engine for the accommodation of two or three persons only. Further, a compartment is always reserved in the Friday night's express when Parliament is in session for the convenience of Members of Parliament returning home.

The following is a list of persons for whom compartments have been reserved:—

Date.	Name.	Remarks.
1887.		
November 7 ...	Mr. J. B. Donkin	In lieu of sleeping berth.
" 10 ...	Mr. Robertson	Compartment filled.
December 2 ...	Mr. J. Clarke	In lieu of sleeping berth.
" 9 ...	Mr. Wise, M.P.	" "
" 15 ...	Mr. Selway and party.....	Compartment filled.
" 20 ...	Mr. Morrice	Four passengers. One an invalid.
" 22 ...	Mr. Richardson	Compartment filled.
" 27 ...	4 Commissioners	Exhibition Commission.
" 30 ...	Mr. and Mrs. Lee	In lieu of sleeping berths.
1888.		
January 3 ...	Lady Innes	In lieu of sleeping berth.
" 3 ...	Mr. and Mrs. Biggs	In lieu of sleeping berths.
" 6 ...	Mrs. and Miss Prendergast.....	" "
" 9 ...	Premier of Queensland	Complimentary. "
" 10 ...	Hon. Mr. Dixon and two daughters.....	" "
" 11 ...	Lord Buckingham	" "
" 11 ...	Mr. Cliff	*Circumstances not remembered, but it is thought compartment was filled. To Bowral only.
" 17 ...	Mr. Jones	In lieu of sleeping berth.

Compartments reserved—*continued.*

Date.	Name.	Remarks
1888.		
January 19 ..	Reverend Mr. Watson	Compartment filled.
" 27 ...	Mr. and Mrs. Simmons	In lieu of sleeping berths.
" 30 ..	Dr. Cockburn and Mr. Bonnythorn ..	" "
" 30 ..	Hon. Mr. Bray and Mayor of Adelaide.	Returning from Centennial Celebrations.
" 30 ...	Mr. and Mrs. H. Bryant	In lieu of sleeping berths.
" 31 ...	Mr. Hamlin and party	" "
" 31 ..	Mr. C. Young and daughter	" "
" 31 ..	Mr. Orkney	In lieu of sleeping berth.
" 31 ..	Mr. McNorton and Dr. Hood	In lieu of sleeping berths.
" 31 ..	Hon. E. Barton, M.L.C.	For Burradoo. A compartment was reserved for Mr. Barton as Speaker, and the concession was not discontinued when he ceased to be Speaker; but Mr. Barton usually filled the compartment on the occasions when one was allowed him.
February 1 ...	Messrs. Burn and Gill	In lieu of sleeping berths.
" 1 ...	Messrs. Clarke and Henry	" "
" 1 ...	Bishop of Melbourne	" "
" 2 ...	Mr. Fitzgerald	In lieu of sleeping berth.
" 2 ..	M. C. H. James, M.L.A.	" "
" 2 ..	Mr. Want, M.P.	Compartment filled.
" 5 ..	Chief Justice Way	Complimentary.
" 6 ..	Mr. Thompson	Compartment filled.
" 7 ..	Mr. H. W. Venn, M.L.C.	In lieu of sleeping berth.
" 9 ..	P. L. Shepherd, M.L.C.	" "
" 9 ..	Mrs. Douglas and Son	In lieu of sleeping berths.
" 9 ...	Hon. E. Ward and Friends	Complimentary. Returning from Centennial Celebrations.
" 10 ..	Duke of Manchester	" "
" 10 ..	Sir H. Wrenfordsleigh	In lieu of sleeping berth.
" 14 ..	Mr. Dawson, M.P., and Mrs. Dawson	In lieu of sleeping berths.
" 16 ..	Mr. and Mrs. Maguire Heed ..	Compartment filled.
" 17 ...	Mr. Alderman Taylor	In lieu of sleeping berth.
" 21 ...	Messrs. Lee and Canter	In lieu of sleeping berths.
" 22 ..	Mr. and Mrs. Howe	" "
March 1 ..	Hon. S. A. Joseph, M.L.C.	Compartment filled.
" 2 ..	Mr. Wise	(Bowling)
" 2 ..	Messrs. Stephen	In lieu of sleeping berths.
" 2 ...	Hon. W. Clarke	" "
" 5 ..	Mrs. and Miss Thow	" "
" 6 ..	Mr. and Mrs. F. F. Hann	" "
" 9 ..	Party of Vocalists	Compartment filled.
" 30 ..	Mr. Griffiths	" "
" 21 ..	Mr. and Mrs. McDonald	In lieu of sleeping berths.
" 23 ...	Hon. J. F. Burns	" "
" 23 ..	Mr. Hart	Compartment filled.
" 29 ...	Mr. Wise and Party	" "
" 29 ..	Mr. Laidley and Party	" "
" 30 ..	Mr. W. W. Stephen and Mr. and Mrs Severn.	In lieu of sleeping berths.

NOTE.—4,822 season-ticket-holders are not included in the above, a great many of whom travel on Sunday.

The number of men employed include the day and night staff.

475 empty trucks were despatched by the trains leaving Darling Harbour, which were urgently required for the wool traffic.

The trains commenced their running at the following times:—

From Darling Harbour on the 6th November, 3:30 a.m. and 10:5 p.m.

„ „ 13th „ 4:0 a.m. „ 10:5 p.m.

„ „ 20th „ 1:0 a.m., 3:30 a.m., 7:5 a.m., and 10:5 p.m.

„ „ 27th „ 2:5, 2:30, 4:15, and 5:45 a.m., and 7:5 and 10:5 p.m., and the Young special left at 8:20 a.m.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(RETURN RESPECTING PASSENGER TRAFFIC ON GREAT NORTHERN AND NORTH-WESTERN LINES.)

Ordered by the Legislative Assembly to be printed, 18 April, 1888.

[Laid upon the Table of the House, in accordance with promise made by the Honorable the Secretary for Public Works, to Mr. Thompson, in answer to Question No. 10, on Votes and Proceedings No. 76, of the 11th April, 1888.]

QUESTIONS AND ANSWERS.

1. What has been the number of first and second class passengers by rail from Sydney to all Stations on the Great Northern and North-western Lines (including Queensland passengers), for the months of January, February, and March, 1888, respectively?

	1st Single.	2nd Single.	1st Return.	2nd Return.
January	484	798	796	1,859
February	545	997	631	1,017
March	646	1,242	1,027	1,790

Representing 18,952 journeys.

2. What are the fares for the single journey, first and second classes respectively, between Sydney and Newcastle?

3. The same for return journey?

1st Single.	2nd Single.	1st Return.	2nd Return.
s. d.	s. d.	s. d.	s. d.
12/6	7/6	18/9	11/3

4. The same information as under questions 2 and 3 as to the fares for single and return journeys from Sydney to East and West Maitland respectively?

	1st Single.	2nd Single.	1st Return.	2nd Return.
	s. d.	s. d.	s. d.	s. d.
East Maitland	15/1	9/2	22/8	13/9
West Maitland	15/6	9/4	23/3	14/-

5. The same information as under questions 2 and 3 for single and return journeys from Newcastle, West Maitland, and East Maitland, respectively, to Sydney?

	1st Single.	2nd Single.	1st Return.	2nd Return.
	s. d.	s. d.	s. d.	s. d.
Newcastle to Sydney	12/6	7/6	18/9	11/3
East Maitland to Sydney	15/1	9/2	22/8	13/9
West Maitland to Sydney	15/6	9/4	23/3	14/-

6. The same information as to fares for journeys from Sydney to stations on Western and Southern lines, about the same distances as Newcastle, East and West Maitland, respectively?

	1st Single.	2nd Single.	1st Return.	2nd Return.
	s. d.	s. d.	s. d.	s. d.
Fares same distance as Newcastle on South and West Lines	18/3	11/9	27/3	17/9
Do East Maitland do	20/9	13/9	31/3	20/6
Do West Maitland do	21/3	14/-	32/-	21/-

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(TRAFFIC AT NARRABRI STATION DURING 1886-7.)

Ordered by the Legislative Assembly to be printed, 15 March, 1888.

[Laid upon the Table of the House in accordance with promise made in answer to Question No. 6 on Votes and Proceedings No. 55 of the 21st February, 1888.]

RETURN of traffic to and from Narrabri for the years 1886 and 1887, showing an increase for 1887.

GREAT NORTHERN RAILWAY.

1886.											1887.											Increase for 1887.		
Coaching amount.			Goods tonnage.			Goods amount.			Bales of Wool.	Total amount, 1886.	Coaching amount.			Goods tonnage.			Goods amount.			Bales of Wool.	Total amount, 1887.	Bales of Wool.	Goods tonnage.	Amount.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(TRAFFIC TO AND FROM NARRABRI STATION, FROM 1 JANUARY TO 31 OCTOBER, 1887.)

*Ordered by the Legislative Assembly to be printed, 16 December, 1887.**[Laid upon the Table of the House in accordance with promise made in answer to Question No. 2 on Votes and Proceedings No. 29 of the 18th November, 1887.]*

RETURN of Railway Traffic to and from Narrabri Station, from 1st January to 31st October, 1887 :—

- (1.) The tonnage carried by rail to Narrabri from 1st January, 1887, to 31st October last?
6,384 tons.
- (2.) The number of bales of wool carried from Narrabri to Morpeth and Newcastle during the same period?
To Newcastle, 17,452 bales.
To Morpeth, 12,062 bales.
- (3.) A like return of quantity of live stock and other produce forwarded from Narrabri during these dates?
The numbers of live stock forwarded from Narrabri were as under :—
Horses, 61; cattle, 1,455; sheep, 80,184; pigs, 2; calves, 22.
Tonnage of produce forwarded from Narrabri Station, 5,435 tons, including weight of wool, which amounted to 5,017 tons 6 cwt.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(TRAFFIC AT MURRUMBURRAH PLATFORM DURING 1887.)

Ordered by the Legislative Assembly to be printed, 15 March, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 23rd February, 1888, That there be laid upon the Table of this House,—

- “(1.) The total tonnage of goods, inwards and outwards, received at and transmitted from the Murrumburrah platform and siding during the year 1887 (exclusive of on service and locomotive traffic) ?
- “(2.) The actual revenue derived from the Murrumburrah platform and siding from all sources during the year 1887 ?
- “(3.) The total number of passengers booked to and from Murrumburrah during the year 1887 ?
- “(4.) The number of men employed and the amount paid them respectively at Murrumburrah for the working of the said traffic ?”

(*Mr. Gordon.*)

REPLIES.

- (1.) 4,182 tons inwards, 4,817 tons outwards.
 (2.) £5,768 from all sources.
 (3.) 3,740 passengers, inwards; 5,665 passengers outwards.
 (4.) 2 men employed; £266 14s. expenditure.
 The staff at Murrumburrah has recently been increased by one junior porter.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(TRAFFIC AT HARDEN STATION, DURING 1887.)

Ordered by the Legislative Assembly to be printed, 15 March, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 23rd February, 1888, That there be laid upon the Table of this House,—

- “(1.) The total tonnage of goods, inwards and outwards, received at and transmitted from the Railway Station, at Harden, during the year 1887 (exclusive of on service and locomotive traffic) ?
- “(2.) The actual revenue derived from the Harden Railway Station, from all sources, during the year 1887 ?
- “(3.) The total number of passengers booked, to and from Harden, during the year 1887 ?
- “(4.) The number of men employed, and the amount paid them respectively, at Harden Station, for the working of the said traffic ?”

(*Mr. Gordon.*)

REPLIES.

- (1.) 909 tons, inwards ; 1,060 tons, outwards.
(2.) £5,600, from all sources.
(3.) 6,088 passengers, inwards ; 6,931 passengers, outwards.
(4.) 11 men employed ; £1,468 13s. 4d. expenditure.

There is one gate-keeper employed at Harden Station, receiving 5s. per week, not included in the above Question No. 4.

The expenditure at Harden is greater than at Murrumburrah, for the reason that it is the changing Station for passengers for and from the Murrumburrah and Blayney Line. It is also a locomotive depôt where goods trains are marshalled, and a Telegraph Repeating Station.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(RETURN SHOWING FARES AND FREIGHTS ON THE HOMEBUSH-WARATAH LINE.)

Ordered by the Legislative Assembly to be printed, 13 June, 1888.

[Laid upon the Table of the House, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 5 in Votes and Proceedings, No. 81, of the 24th April, 1888.]

QUESTIONS AND ANSWERS.

2. What goods have been brought by the Homebush-Waratah Line to Sydney, specifying quantities and descriptions?

FROM Northern Stations to Stations on Southern and Western Lines, from February 17th to April 16th, 1888.

RAILWAYS.

(RETURN SHOWING QUANTITY OF SILVER ORE CARRIED ON NORTHERN LINE OF)

Ordered by the Legislative Assembly to be printed, 23 July, 1888

[Laid upon the Table of the House in accordance with promise made by the Honorable the Secretary for Public Works in answer to Question No. 1 on Votes and Proceedings No. 114 of 11th July, 1888.]

QUESTION.

WHAT quantity of Silver Ore has been carried by Rail during each Month, for the Year ending 30th June, from the Queensland Border and the several intermediate Stations respectively, to Newcastle, Morpeth, and Sydney respectively?

ANSWER.

GREAT NORTHERN RAILWAY.

STATEMENT of Silver Ore carried by Rail during each Month, for the Year ending 30th June, 1888, from Northern Stations to Newcastle, Morpeth, and Sydney.

Months.	Quantity received at Newcastle from undermentioned Stations					Quantity received at Morpeth from undermentioned Stations					Quantity received at Sydney from undermentioned Stations.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(REBATES ON CARRIAGE OF STOCK, WHEAT, &c., DURING 1883, 1884, 1885, AND 1886.)

*Ordered by the Legislative Assembly to be printed, 27 September, 1887.**[Laid upon the Table of the House, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 7 on Votes and Proceedings of the 29th July, 1886.]*

RETURN relative to Rebates allowed by the Railway Department during the years 1883, 1884, 1885, and 1886.

SUMMARY.

REBATES granted during 1883, 1884, 1885, and 1886.

NOTE.—The amounts enumerated in the above Return of Rebates were allowed under the concession (approved by the Governor-in-Council) by which a reduction of 25 per cent. (on the schedule rates) was made on the carriage of starving stock on production of a certificate from the Stock Inspector of the district whence the stock were being removed that pasturage therein had failed, and also a certificate from the Inspector of the district into which the stock were intended to be taken that feed was procurable therein. A similar reduction was granted when the stock were being returned to the pasture lands from which they were originally removed.

LIST of Rebates granted in connection with the Carriage of Wheat and Flour.

Year.	To whom granted.	Amount.	By what authority granted.	Year.	To whom granted.	Amount.	By what authority granted.

"	Connolly	134 10 7					
"	Do	288 6 2				£ 3,323 8 5	

NOTE.—The above rebates were granted to country millers on wheat received from country stations turned into flour and forwarded in that shape to Sydney, the rebate being the difference between the two rates which under ordinary circumstances would be paid and one through rate from the original station to Darling Harbour, plus 1s. 9d. per ton terminal charge.

LIST of Rebates granted in connection with the Carriage of Wool.

Year.	To whom granted.	Amount.	By what authority granted.
1883	Wentworth	£ s. d. 45 8 4	On the 1/8/82, the Commissioner recommended that as Mr. Wentworth's station (Burrabogie) is peculiarly situated as regards facility for getting wool to our line, a special arrangement be made to take his wool at 9/- a bale, and the Minister (Mr. Lackey) approved on even date. The schedule rate was 9/5 a bale, and the rebate is therefore -/5 per bale on 2,180 bales.
"	Halliday	55 0 0	In 1883, with a view to secure traffic which would otherwise have gone to Melbourne, it was decided to convey dump wool from Hanging Rock to Sydney at 8/6 per bale (the tariff rate being 9/3 less 15% if dumped), subject if dumped to a further reduction of 15%, and it was in this connection a refund of £55 was allowed to Mr. Halliday.
"	A. Wilson & Co. ...	40 17 8	This amount represents a rebate of 10% on a consignment of wool which had been diverted to our lines, previous clips of which had gone to Melbourne.
1884	Cooper & Co. ...	27 15 11	This was a rebate granted in respect of a consignment of unscoured wool from Nevertire to Dubbo, and subsequently, after scouring, reconsigned to Sydney. The reduced rate to washing establishments was charged.
1885	Chisholm	8 8 9	These were rebates of 15% in respect of consignments of dumped wool from Bourke. Although the bales were not hooped as required by the rate-book, they were so well dumped that quite as many of them were put into a truck as if they had been hooped, and it was on this ground that the rebates were sanctioned.
1886	Lee & M'Alister ...	25 8 6

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REVENUE AND EXPENDITURE—ORANGE TO MOLONG, BATHURST TO BOURKE, AND THE MUDGEES LINES.)

Ordered by the Legislative Assembly to be printed, 17 July, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 8th February, 1888, That there be laid upon the Table of this House,—

- “ (1.) The amount of revenue and expenditure at the respective stations
“ on the Orange and Molong Railway from 1st June, 1886 (the date of
“ last Return), to the end of the year 1887, together with a list of the
“ number of passengers that have travelled to and from the various stations,
“ and the amount received at each.
- “ (2.) The number of men or officials employed at each station, and the
“ amount or tonnage of goods received and despatched therefrom respec-
“ tively.
- “ (3.) The same information with regard to the various stations on the
“ Western Railway, from Bathurst to Bourke inclusive, and also on the
“ Mudgee Line, including live-stock returns.”

(*Dr. Ross.*)

RETURN of PASSENGER and GOODS TRAFFIC for all Stations between Bathurst and Bourke, also same information for Molong and Mudgee Lines, for the years 1886 and 1887.

Table with columns: Station, No. of persons employed, Expenditure (Jan 1886, Jan 1887), Revenue (Jan 1886, Jan 1887), Passengers carried (Jan 1886, Jan 1887), Tonnage of goods (Jan 1886, Jan 1887). Rows include Bathurst, Orton Park, Perth, George's Plains, Wimbledon, Newbridge, Blaney, Lime's Siding, Millthorpe, Springhill, Huntley, Orange Meat Co, Orange, Lawrence, Mullion, Keir's Creek, Warne, Store Creek, Ironbark, Mumbil, Springs, Apsley, Wellington, Mary Vale, Ponto, Murrumbidgee, Dubbo, Narramine, Trangie, Nevettre, Kelly's, Mullengudgerie, Nyngan, Girilambone, Wilga, Glengariffe, Coolabah, Byrock, Mooculta, Bourke, Maroa, Brummagem, Cargo Road, O K, Borenore, Amaroo, Molong, Ionadale, Piper's Flat, Cullen Siding, Ben Bullen, Carlos Gap, Capertee, Excelsior, Illford, Cox's Siding, Ryistone, Lue, Bumberra, Mudgee, and Total.

Sydney: Charles Fother, Government Printer - 1888.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(TENDERS FOR ENGINES AND TESTS FOR SUITABLE TYPE OF ENGINE.)

Ordered by the Legislative Assembly to be printed, 13 October, 1887.

The Locomotive Engineer to The Commissioner for Railways.

Additional Engines required for new extensions, &c.

IN view of the number of additional miles that will be opened for traffic within the next two years, I beg to recommend tenders be invited at once for the number of engines required to work them.

On the Northern Line there are not sufficient goods engines now in stock to meet the traffic in the busy season, and when the line is opened to Tenterfield we shall have very great difficulty in meeting the increased requirements, so that it is absolutely necessary that more locomotives be supplied at the earliest possible moment for that line.

While we have sufficient engine power to meet the traffic on the Southern and Western Lines at the present time, yet when the new extensions are opened (over 300 miles) an increase to our locomotive stock will be indispensable.

In view of the many advantages accruing from as few types of engines as possible being used, I strongly recommend that the terms of the specification for the two classes now required be strictly adhered to.

The class most suitable for our passenger traffic is that provided for in the specification upon which tenders were last invited, and for which the Vulcan Foundry Company, of England, obtained the contract. The advantages gained by having even the same class made by the same makers are so considerable, and in view of the very low price at which the Vulcan Foundry Company are supplying, induces me to strongly recommend that an order for those now required be given to the same firm.

For the goods traffic I do not think that a more suitable engine than the Mogul class, specification No. 191, can be obtained. We have now had some years experience of them, and, as regards loads hauled, economy in "Running Stores," and small cost of repairs and renewals, they have given general satisfaction. I therefore strongly urge that this type of engine be adhered to.

The following are the number of engines required, and the estimated cost:—

Great Northern Railway—

4 Passenger Engines, @ £2,450 each	=	£ 9,800
8 Goods " @ £2,780 each	=	22,240

Great Southern and Western Lines—

12 Passenger Engines, @ £2,450 each	=	29,400
20 Goods " @ £2,780 each	=	55,600

Total...	=	£117,040
----------	-----	-----	-----	-----	---	----------

I intend to submit a separate paper upon the quantity and description of tank engines which will be required to meet increased requirements on our suburban lines.

W. SCOTT, 25/5/86.

I cannot concur in Mr. Scott's recommendation that for the reasons given the order for the sixteen passenger engines required be given to the Vulcan Company without competition.

We have not, I think, received the engines which the Vulcan Company obtained recently the contract for, and therefore cannot know much of the quality of the work; but even if it be all that can be desired, I do not think it right that we should depart from the approved system of inviting tenders.—CH.A.G., 28/5/86.

The system of inviting tenders should not be departed from. It is represented that it is absolutely necessary these engines should be obtained. I therefore approve of tenders being called.—W.J.L., 29/5/86.

Memo. by The Locomotive Engineer to The Commissioner for Railways.

Tenders for Locomotive Engines.

I FORWARD herewith a draft advertisement, calling for tenders for the supply of the locomotive engines, approved on your 86/8,560 herewith, which will, I trust, be inserted as early as practicable.

I also forward herewith twelve copies of each specification for Colonial-built engines and ten copies of each specification for engines to be manufactured in England or elsewhere.

W. SCOTT, 31/8/86.

Send copy of draft specification and conditions for locomotives to D. & W. Robertson, Mort's Dock, Atlas Company, Vale, Wearne, Hudson Bros., and Chapman & Company, and ask them to peruse them and let me know whether there are any alterations which, in their opinion, should be made therein to meet the reasonable requirements of Colonial manufacturers. Suggest that they have a meeting and act in concert in any suggestions which they may have to make.—CH.A.G., 2/9/86.

The Commissioner for Railways to Messrs. D. & W. Robertson and others.

Gentlemen,

Department of Public Works, Railway Branch, 2 September, 1886.

I have the honor to enclose herein for your perusal copy of our specifications for the supply of engines, for which tenders are to be shortly invited. I shall be glad if you will let me know whether there are any alterations in the conditions which you consider should be made to meet the reasonable requirements of local manufactures. I may add that a similar communication has been addressed to the firms mentioned in the margin. It would perhaps be desirable for a meeting of representatives of these firms to be held in order that any suggestion may meet with their entire concurrence.

Mort's Dock Co.,
Mr. Wearne, Mr.
Vale, Chapman
& Co., Hudson
Bros Atlas Co

I have, &c.,

CH. A. GOODCHAP,
(per D. C. M'L.)

Commissioner for Railways.

Please reply on or before the 15th instant.

The Secretary Iron Trades Employees Association to The Commissioner for Railways.

Iron Trades Employees Association, Box 256, General Post Office,

Sir,

Sydney, 14 September, 1886.

Your favour of 2nd inst., together with copies of specifications for supply of locomotives, were duly received, and the several firms having had a conference on the subject, acting under their instructions, I have the honor to request that the following alterations be made in the conditions, viz. :—

GOODS ENGINES.

1.—General arrangement, page 2.

In lieu of the contractor preparing the working drawings, the employers consider it to be the duty of the Government to supply plans and specification from which the contractor should work.

See Minister's
decision; con-
tractors to pre-
pare their own
drawings.—
CH.A.G., 25/10/86.

2.—Wheels and tires, page 4.

The Colonial manufacturers consider that as there are several English firms with quite as good a reputation for this class of work as that of Vickers, Sons, & Co. (such as John Brown & Co., Cammell & Co., Brown Bayley & Dixon), it is not fair or to the interest of the Government they should be limited to one particular firm, especially as the principal railway companies in England and elsewhere obtain their material from those and other equally good firms.

See Minister's
decision.—
CH.A.G., 25/10/86.

3.—Boiler, page 4.

The "Farnley" brand of iron to be included with Lowmoor, Bowling, or Taylor Brothers, as the makers of that iron stand on equal terms in England.

See Mr. Scott's
minute con-
ceding this.—
CH.A.G., 25/10/86.

4.—General conditions, page 11.

Alterations.—The minor alteration to be executed by contractor should be limited to £5; anything beyond that value should be paid for.

Cost of Arbitration.—The employers consider it would be more equitable for the contractor to bear expense of arbitration if he be not awarded an amount equal to one-half his claim, instead of three-fourths, as now specified.

Hoping this will meet with your approval,

I have, &c.,

JAS. CHAS. PRATT,

Secretary.

See Mr. Scott's minute conceding this.—
CH.A.G., 25/10/86.
See Minister's decision.—
CH.A.G., 25/10/86.

Mr. Scott for report. I do not see how the Colonial manufacturers can be prejudicially affected by our mentioning Vickers' steel for tires. The same condition will apply as regards the description of steel if English manufacturers compete. I strongly doubt whether the firms named by the Contractors' Association do make as good tires and axles as Vickers; our experience is the other way.—CH.A.G., 23/9/86.

The Locomotive Engineer to The Commissioner for Railways.

CONTRACTORS suggestions *re* alterations in specifications for engines proposed to be built in the Colony :—

(1.) The object of stipulating that contractors should provide their own working drawings is to obviate the necessity of employing a staff of locomotive draftsmen for which there is at present no accommodation, in addition to which we could not find permanent employment for them.

(2.) I cannot admit the contention that the other firms mentioned have as good a reputation as Messrs. Vickers have as makers of axles and tires, and in view of the importance of having the very best quality of material, I do not think the alteration suggested should be granted. I assume that provided tenderers are supplied at the prices now charged to the Government by Messrs. Vickers, they are not prejudicially affected.

(3.) I have no objection to the Farnley brand of iron being included. In fact the proviso that tenderers were to name the brand of iron they intended to use was specially inserted to meet such views.

(4.) I have no objections to the value of the minor alterations in detail being limited to £5.

W. SCOTT, 28/9/86.

In what way can it be stipulated that the contractors shall have the axles and tires at the price paid by the Government? The only way that I can see to accomplish this is to provide in the specification that the axles and tires shall be provided by the Government.—CH.A.G., B.C., 30/9/86.

Mr. Scott,—Urgent.

I had a conversation with Mr. J. N. Vickers, of Bond-street, who represents the firm in the Colonies on this subject, and he gave me to understand that they could supply contractors building engines for the Government at the same price as they are supplied to the Government, and he informed me that he intended to see you on the subject. I would suggest that he be written to so as to obtain a written offer to that effect.—W. SCOTT, 2/10/86. Commissioner.

I HAVE no doubt if the undertaking were made that the firm would carry it out, but I do not think it desirable that the Department should contract for third parties, as complications might arise.

Before, however, the question is finally decided, the contention of the manufacturers that we should take other tires and axles must be submitted to the Minister. Manufacturers will push their wares, and no doubt the Department lays itself open to ungenerous suspicion in advocating a special article made only by *one* manufacturer, but if an accident were to occur through defective axles and tires—and on our mountain lines the consequences would be perhaps exceptionally severe—those who advocate cheap axles and tires would not be held responsible, but the officers of the Department would be for weakness in not resisting the use of inferior material in such vital parts of our rolling stock.

Of course the manufacturers named would urge that their tires and axles are as good as Vickers', but the report of Sir John Fowler and our own experience are to the contrary. CH.A.G., 7/10/86.

I SEE no objection to the contractors providing their own working drawings; on the contrary I believe if it were done it would be a considerable saving to the Department.

With regard to the use of tires and axles, I deprecate any proposal to obtain these unless they are of the best quality, and obtained of makers of the highest standing. There can be no objection to the contractors arranging with Messrs. Vickers & Co. for the supply of the same class of tires, &c., as we are now using. It is undesirable that the Government should make the arrangements as they would thereby become third parties to the transaction, which might cause complications, but contractors should have direct communication with the makers, the Government reserving to itself the right to accept or reject any supplies. With reference to the use of axles and tires other than Vickers', unless experts in whom the Department and the public have confidence are prepared to recommend other makers I certainly cannot take the responsibility of authorizing any alteration.

W.J.L., 11/10/86.

WILL

WILL the Minister decide question as to cost of arbitration, as provided in specification? It reads that unless the contractor is awarded three-fourths of his claim he must pay costs; this is, of course, to prevent excessive claims being made. The contractors say "one-half," but that seems to me absurd. A contractor claims £100, and is awarded £50, which sum we may have been willing to pay, without going to arbitration, and yet we should have to pay costs.

It would be better to say that the cost of all references to arbitration shall be borne equally by both sides, or make it in proportion—that is, the same proportion as the award bears to claim and offer.

CH.A.G., 14/10/86.

If the contractor does not get an award of more than offered by the Department, he should pay all costs, and if he obtains one-half his claim (being *more* than we would pay), the Department should pay half costs.—W.J.L., 21/10/86.

COMMUNICATE to Colonial manufacturers the decision of the Minister on the points raised, and the other points which the Locomotive Engineer has conceded.

Then to Mr. Scott to have specification and conditions amended in accordance therewith. The payment of arbitration costs should be arranged as provided in the accompanying printed copy of conditions as to arbitration, clause 13.

CH.A.G., 25/10/86.

The Commissioner for Railways to The Secretary Iron Trades Employés Association.

Sir,

Department of Railways, Sydney, 3 November, 1886.

With reference to your letter of the 14th September last, suggesting certain alterations in the specifications for the manufacture of locomotives in the Colony, I have the honor to inform you that the matter has had very careful consideration, and I have to intimate that Mr. Secretary Lyne has decided as follows on the various points raised:—

First. As to drawings, that it is advisable the contractors should provide the working drawings.

Second. Wheels and Tires.—That in the interest of public safety it is essential they should be of the very best quality, and obtained from makers of the highest standing.

Relative to the use of axles and tires, other than Vickers', Mr. Secretary Lyne cannot accept any responsibility in authorizing the receipt of tires and axles, the manufacture of any other firm, but would be prepared to consider the matter if experts, in whom the Department and the public had confidence, were prepared to recommend other makers.

Third. Inclusion of the "Farnley" brand of iron; and

Fourth. Cost of alterations above £5 to be paid for. These points will be conceded.

Fifth. Cost of arbitration.—The clause relating to the costs of arbitration to be amended as follows:—

"If, upon an arbitration in respect of claims made by the contractor the sum awarded to the contractor shall be less than one-half of the amount of his said claim, all the costs, charges, and expenses of and incident to the said arbitration and award shall be borne and paid by the contractor, but if the amount awarded shall exceed one-half of the amount of the said claim, then each party shall pay his own costs and one-half of the arbitrators and umpire's fees."

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

Memo. from The Locomotive Engineer to The Commissioner for Railways.

I SHALL be obliged if you will kindly inform me when tenders will be invited for the engines to specifications, Nos. 188A and 191, which were forwarded to you on 31/8/86.

As the engines cannot be delivered for a considerable time after tenders are invited, I would point out that unless tenders are soon called for serious inconvenience may be caused in working the traffic.

W. SCOTT, 29/10/86.

The Secretary, Iron Trades Employés Association, to The Commissioner for Railways.

Iron Trades Employés Association, Box 256, General Post Office,
Sydney, 12 November, 1886.

Sir,

I have the honor to acknowledge the receipt of your favour of 3rd instant in reference to the locomotive specifications, and am instructed to say the employers acquiesce in the specification being amended in accordance with your letter now under acknowledgment.

I am further instructed to ask if you would favour the employers with the prices paid by the Government for the Vickers' wheels and axles and tires.

I have, &c.,

JAS. CHAS. PRATT,
Secretary.

Locomotive

Locomotive Engineer.—D.C.M'L., 15/11/86. The information can be supplied by the Store Branch if the Commissioner approves.—W.S., 17/11/86. The Commissioner.

This paper was sent to Loco. Branch to amend the specification. The matter mentioned in the second paragraph of Mr. Pratt's letter is being dealt with separately.—D.C.M'L., 18/11/86. Locomotive Engineer, B.C., 18/11/86.—A.R. The specifications with the alterations approved by the Commissioner are in the printer's hands.—W.S., 19/11/86. The Commissioner. In a week to see if specifications are ready. 23/11/86.

Give the fullest information of the price we pay for locomotive wheel-tires and axles. I do not think we get the wheels from Vickers. Please inquire? Be careful there is no mistake, as the tenders will probably be based on the price we name.—CH.A.G., 16/11/86.

RETURN of prices paid for tires and axles during 1885-1886.

Memo. by The Locomotive Engineer to The Commissioner for Railways.

Tenders for Locomotive Engines.

I HEREWITH forward twelve copies of specification No. 188A and twelve copies of specification No. 191, which are complete, in accordance with your directions on 86/4423, re provision for Colonial manufactures. Draft advertisement also herewith.

W. SCOTT, 23/11/86.

The specification must embody in itself, and not in the form of addenda, the alterations made to Monk bridge boiler-plate, to be included with other brands. Is it not proposed to invite tenders in Europe and America at the same time?—CH.A.G., 25/11/86. Locomotive Engineer.

I will have the specifications altered, to include the amendments referred to in their proper places; but as this will involve the reprinting of them, some delay will necessarily occur. In regard to the Monk bridge-plates I regret to say that I have not sufficient confidence in their quality to justify my including them in the specification, more particularly as regards the boilers; but I see no objection to their being used in the frame-plates, and will provide accordingly. I would, however, suggest, for your consideration, the desirability of sending a cable to the Inspecting Engineer in England, to the following effect:—"Are Monk bridge-plates considered suitable for locomotive boilers?" I assumed it was your intention to invite tenders in Europe and America, and provided for it in a separate specification.—W. SCOTT, 30/11/86.

Prepare cablegram for Agent-General.—CH.A.G., 2/12/86. Cablegram forwarded to Public Works for transmission to Agent-General, 2/12/86.—D.C.M'L., 2/12/86. Locomotive Engineer.

Eight specifications for passenger engines herewith. The specification for goods have not been received from the printer yet.—W. SCOTT, 29/12/86. The Commissioner.

Memo. by The Commissioner for Railways.

Specifications for Locomotives.

It is time the advertisement was out for locomotives.

Tenders are to be invited in the Colony, and simultaneously in England and America.

Let me have completed specifications and notices.—CH.A.G., 30/12/86.

Specifications for the passenger engines herewith; those for the goods engines have not yet been turned out by the printer. Advertisements might however be put in the newspapers saying that specifications for the latter can be obtained after (say) the 7th proximo. Please say how much notice should be given of the date for reception of tenders.—D.C.M'L., 30/12/86.

The Commissioner wishes you to submit at once the draft advertisement. I would point out that the specifications sent only provide for the engines to be made in the Colony. Where are the specifications to be tendered from in England and America? The matter is urgent, and the Commissioner wishes it attended to with the utmost expedition.—D.C.M'L., 30/12/86. Locomotive Engineer.

Draft

Draft advertisement herewith. The specifications were only received from the printer's this morning. There are ten of each description for Colonial tenderers, and twenty of each for foreign tenderers. More can be forwarded if required.—W. SCOTT, 4/1/87. The Commissioner.
The specifications have been forwarded to your office.—W.S., 5/1/87. The Commissioner.

* Specifications included in papers laid on the Table of the House, and ordered to be printed, 27 April, 1887.

ENCLOSED are papers and specifications* containing all necessary information for the invitation of tenders for the following locomotive engines :—

16 of passenger type	12 at Sydney, 4 at Newcastle.
28 of goods type	20 at Sydney, 8 at Newcastle.

The mail leaves *via* Melbourne on Wednesday next, and it is proposed to call for tenders in America, England, and the Colony, returnable in each place on the same date (April 12th). The tenders received in Sydney will not be opened until the Agent-General reports (which he will be able to do by cablegram) the result of the tendering in England, America, and on the Continent.

CH.A.G., 10/1/87.

Approved.—W.J.L., 10/1/87. Write to Agent-General at once.—A.R., 10/1/87. Draft letter to Agent-General.—C.A.B., 11/1/87.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works (Railway Branch), Sydney, 11 January, 1887.

I have the honor to inform you that, in view of the expected opening of new lines, it has become necessary to obtain a further supply of locomotives, both for passenger and goods work, and the Government have determined that tenders shall be invited for them in England, America, the Continent of Europe, and the Colonies.

The locomotives required are :—

Sixteen four-coupled outside cylinder passenger bogie engines with tenders to specification, 188A (twelve to be delivered in steam in Sydney, and four in steam in Newcastle).

Twenty-eight six-coupled outside cylinder bogie goods engines with tenders to specification, 191, of which twenty are to be delivered in steam in Sydney, and eight in steam in Newcastle.

For these engines you will please invite tenders in England, America, and on the Continent; tenders to be lodged by the 12th day of April next.

As time is now an important consideration, I will ask you to be good enough to communicate to me by cable the result of the tendering, and the recommendation of the Consulting Engineer, in order that it may be considered with the Colonial tenders. By this mail I send you forty copies of specification No. 188A, and a similar number of specification No. 191.

I have, &c.,

W. J. LYNE,

Secretary for Public Works.

The Manager, Phoenix Foundry Co., to The Locomotive Engineer.

Phoenix Foundry Company (Limited),

Ballarat, 11 January, 1887.

Dear Sir,

I notice by the papers that you will be calling for tenders shortly for the locomotive engines you mentioned some time since. When the specifications, conditions, &c., are ready, I would be obliged if you would kindly forward me a copy of same. I will remit the charge for same per return. With best wishes to yourself and Mrs. Scott for the new year,—

I am, &c.,

W. H. SHAW,

Manager.

Copies forwarded.

The Manager, Phoenix Foundry Co., to The Locomotive Superintendent.

The Phoenix Foundry Company (Limited),

Ballarat, 19 January, 1887.

Dear Sir,

Referring to the specifications for 44 locomotive engines which you have kindly sent us, we notice that the specifications state the engines are "To be manufactured in the Colony of New South Wales," and in the conditions also, "the remainder must be manufactured in the Colony of New South Wales."

Will you kindly inform me if these conditions are imperative on all tenderers, or if they are intended to apply to New South Wales tenderers only. If they are imperative on all tenderers, they of course shut us out entirely, because although we do all the work ourselves, and only import the raw materials, yet none of our work would be done in New South Wales, and, consequently, we could not comply with this condition.

We trust you will see your way to make these conditions apply to all the Colonies. Awaiting your reply,—

I am, &c.,

W. H. SHAW,

Manager.

Minute

Minute by The Locomotive Engineer to The Commissioner.

COPIES of the specifications for Colonial tenderers were forwarded to the manager upon his application. I now submit his subsequent letter, which opens up the question as to whether they must be built in this Colony. I submit that the Phoenix Foundry be treated as a foreign firm, and be supplied with the specification relating to foreign builders.

W. SCOTT, 25/1/87.

For Minister's consideration.—I think Victoria, or indeed any of the Australian Colonies, should be admitted on the same terms as the manufacturers of New South Wales.—CH.A.G., 29/1/87. The present tender is for engines to be made in the Colony, in accordance with the resolution of Parliament.—J.S., 20/5/87.

Tenders for Forty-four Locomotives.

The Agent-General for New South Wales to The Secretary for Public Works.

Sir,

5, Westminster Chambers, 22 April, 1887.

In accordance with your instructions, as conveyed to me in your letter 86-140, of the 11th January last, and the Honorable the Colonial Secretary's telegrams of the 5th March last and the 4th instant respectively, I have invited tenders from the Continent, America, and the United Kingdom for the forty-four locomotives required by the Government. Tenders were received at this office on the 12th instant, and on the 14th idem I informed the Honorable the Colonial Secretary, by telegram, as follows:—

"*Re Locomotives.*—Four tenders received from United States of America; three from Continent; twenty-two from England. Eleven according to original, and twelve to new conditions. Six informal. English tenders lowest, and very close. Neilson's lowest according to new conditions, but without design—passenger £2,375, goods £2,245. After further examination of tenders I will telegraph again."

On the 19th instant I further telegraphed as follows:—

"Tenders locomotives. Large difference between old and new conditions to cover possible rejection risks and deferred payments. Six firms not tendered under new conditions. Consider Government best served goods (Dübs) £2,165, passenger (Beyer) £2,495—payment in England as hitherto. Believe Beyer would take £100 less."

I have now the honor to forward for your information the Inspecting Engineer's letter of the 21st instant, having reference to the analysis of the tenders received, together with schedules of the tenders for each kind of engine.

I have, &c.,

SAUL SAMUEL.

[Enclosure.]

Sir,

2 Queen Square Place, Westminster, S.W., 19 April, 1887.

I have gone very carefully through the details of the tenders, plans, and specifications of the locomotives.

Of the various plans which have been sent in, six firms do not tender on the altered or new conditions, and the difference between the original and new conditions is in some cases large—namely, as much as £460 per engine. This is excessive; about £150 would perhaps represent the money value of the different modes of payment and cost of shed room. There is the interest on the deferred payment, the commission to the Financial Agent in the Colony, and the exchange in sending home the money, &c. In the instance where the large increase is made, I think the manufacturers have put down the difference to compensate for risk of rejection in the Colony.

The lowest tender under the new conditions is, as previously stated, that of Messrs. Neilson & Co.; but no plan has been sent with the tender, and before any acceptance of this tender it would be absolutely necessary to have plans and details to be approved, so that we may know what they propose; as Messrs. Neilson have not hitherto made engines for the New South Wales Government.

If it be a question of excellence of manufacture, I should recommend that the goods engines be given to Messrs. Dübs and the passenger engines to Beyer & Peacock, who have made similar locomotives for the Colony, and have always given satisfaction in their work.

Also, that payment be made in England in the usual manner, the price being respectively *£2,265 for the goods engines at Sydney, and £2,495 for the passenger engines at Sydney. The Newcastle delivery is £25 each more.

I am, &c.,

JOHN FOWLER.

The Agent-General, New South Wales Government.

* Price since been reduced by £100.

SCHEDULE

SCHEDULE OF TENDER.

Telegram from London Station to The Colonial Secretary.

LOCOMOTIVES tenderers pressing for answer; please reply.

Refer to Works.—C.W., 10/5/87. Railways.—J.R., B.C., 12/5/87. Submitted for Minister's direction.—
D.V., 13/5/87. I think we should cablegram to say: "Cannot finally decide till all the tenders are in hands of the
Government."—CH.A.G., 25/5/87. Approved.—J.S., 26/5/87.

Minute by The Commissioner to The Locomotive Engineer.

I AM informed that the engines for which tenders have recently been invited are of a different type to any that we now have in use. Our object should be to reduce and not to increase the types of engines. We have now some thirty different types. My wish is to reduce the number of types to five: An express engine, an ordinary passenger, an engine for mixed trains, a heavy goods, a tank engine, and perhaps, though this is not certain, a light mixed engine for the level lines in the interior.

Loco. Engineer. CH.A.G., B.C., 12/2/87.

Will Mr. Scott be good enough to explain why he has increased the types of engines.—CH.A.G.

It has always been my object to lessen rather than increase the number of types of our engines. I entirely agree that five types should be sufficient, and it will be found that my recommendations have been in accord with this.

The goods engines, for which tenders are now invited, are of our ordinary heavy goods class, "Mogul type," with very slight alterations to cylinders, which are increased 1 inch in diameter; the tender enlarged to hold 500 gallons more water, and an extended smoke-box provided with the view of assisting to prevent emission of sparks from the chimney.

The passenger engines are exactly the same as those now under order from the Vulcan Foundry, and will be of our ordinary heavy passenger type. The necessity for taking heavier loads required by traffic rendered it necessary to enlarge the cylinders and tender-tank. The extended smoke-boxes are also provided for in these engines.

The Commissioner.

W. SCOTT,

14/2/87.

Let me know the number of types of engines which have been introduced since Mr. Scott has been Locomotive Engineer.—CH.A.G., 18/2/87.

Memo. to The Locomotive Engineer.

I HAVE to inform you that the Commissioner wishes to be furnished with a statement, showing the number and description of types of engines which have been introduced by Mr. Scott since he succeeded to his present position.

Please forward this information early.

B.C., 22/2/87.

D.C.M'L.

41 express engines, of the Standard type.

60 goods engines, of the Mogul Standard type.

18 tank engines, for suburban traffic.

2 do for Camden Line.

12 passenger engines, of the 79 class, but with increased cylinder power and tender capacity.

The Commissioner.

W. SCOTT, 25/2/87.

Not new.
Not new.
New.

Did the enclosed paper go to Mr. Scott with this covering paper. I do not think his answer quite corresponds with the question I put.—CH.A.G., 28/2/87. No.—D.C.M'L., 1/3/87.

The Mogul goods have been altered, and also the passenger, in the recent indent for forty-four locomotives. Did not Mr. Scott propose a heavier engine for the suburban traffic?—CH.A.G., 1/3/87.

The question of providing a more powerful tank engine for suburban traffic has been under discussion, but so far the Locomotive Engineer has not submitted any design. The matter was awaiting the settlement of the question as to the maximum load a suburban engine is to haul. The decision arrived at was that the present engines have sufficient power, and that a new type of engine is not required.—D.C.M'L., 1/3/87.

Memo. by The Secretary for Public Works.

Locomotives.

TENDERS invited in England, America, and Europe for,—

Passenger engines	16
Goods engines	28
											44

Tenders are to be received up to the 12th April next. Agent-General written to, 20th January, 1887.

The conditions provide that:—

"Payment will be made for each engine as follows:—90 per cent. in cash in London on receipt by the Agent-General for New South Wales of the bills of lading, together with a certificate from the Inspecting Engineer, that the terms of this specification, as to completion, and packing, &c., &c., of the engines have been fulfilled."

I consider it desirable that this condition should be amended, both as regards inspection and payment.

The area of competition has been widened, and European and American firms, as well as English and Colonial firms, have been invited to compete. The engines if made in the Colony will be subject to the inspection of an Inspecting Officer here. If made in England the Inspecting Engineer there will be able to perform the duty, but if a Continental or an American firm should obtain the contract we shall have no Inspector in those Countries.

Under these circumstances it seems to me that the inspection should be in the Colony only, and that payment should be made in the Colony on the certificate of the local Inspector, in the following proportions:—

75 per cent. upon Inspector's certificate on the arrival of the engines, and the balance, 25 per cent., after they have run to his satisfaction, 1,000 miles.

A cablegram must be sent to the Agent-General to alter the conditions accordingly, before tenders are invited.

It is not likely that any action in this respect has been taken, as the indents have been in the hands of the Agent-General only a few days, if indeed they have yet reached him.

JOHN SUTHERLAND,
28/2/87.

Send telegram to Agent-General:—"The specifications for forty-four engines alter conditions as to payment; no inspection on your side necessary; 75 per cent. will be paid on certificate of Inspecting Engineer in Colony; balance on his certificate when they have run 1,000 miles; manufacturers must find their own workshops here for erecting engines."—CH. A. G., 28/2/87.

Locomotive Engineer to note and please return quickly.—D. C. M. L., 4/3/87. Noted.—W. Scott, 5/3/87. Commissioner. Does Commissioner wish any further action taken on this paper?—D. C. M. L., 9/3/87. Any persons representing foreign houses, either American or Continental, who have received in the Colony copies of the specification should be apprised of the change, and also firms in the neighbouring Colonies who may wish to compete.—CH. A. G., 10/3/87. Write letter to Agent-General confirming cablegram, and explaining the reason for the change more fully.—CH. A. G. The Agent-General, 15/3/87. The Locomotive Engineer.—A. R., B. C., 19/3/87. Letters written to Augustus Morris, Esq., Messrs. Carson Woods & Co., Messrs. Mason Bros., Messrs. Parke and Lacey, Mr. Shaw, Phoenix Foundry, Messrs. Gauz & Co., Messrs. Ostermeyer, Dewez, and Co.—W. S., 24/3/87. The Commissioner.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 18 March, 1887.

I have the honor to confirm my cablegram of the 1st instant, relative to the conditions of payment for the supply of forty-four locomotives.

I may say that the area of competition has been widened for this supply, European and American, as well as English and Colonial firms, having been invited to tender. Should an American or Continental firm obtain the contract there would of course be no provision for inspection before arrival in the Colony, and to place all on an equality it has been determined that the engines shall be inspected locally, payments to be made as follows:—75 per cent. upon the inspector's certificate that the engines have arrived, and 25 per cent. after they have run 1,000 miles to the satisfaction of the responsible officers.

I have, &c.,
JOHN SUTHERLAND,
Secretary for Public Works.

I wish the tank engine papers separated from these, as they have not received final action. I shall exhaust every effort to make our present engines (suburban) answer before I consent to the introduction of another type. As I have before said, five types of engines should be sufficient, but owing to the total disregard of this necessity for economic locomotive working in the early years of our railway management, we have nearly thirty-three different types of engines. I feel certain I shall have the sympathy of Mr. Secretary Sutherland in this effort to reduce the number of types of engines, as he has long been aware of the mischievous effect on our working expenses this multiplication of types of engines has had.—CH. A. G., 4/3/87.

I entirely concur with Commissioner in this matter.—J. S., 9/3/87. Locomotive Engineer to see.—A. R., 9/3/87. Seen.—W. S., 14/3/87.

Mr. C. Wood to The Locomotive Engineer.

Sir, Sydney, N.S.W., 24 March, 1887.

I beg leave to point out to you that my sole reason for troubling about the specifications for forty-four locomotives was on behalf of the Charleroi Engineering Société. Your to-day's letter, which I now have the pleasure of acknowledging, modifies you say the terms of this contract. You will please see at this late date I have no means of notifying my principal that the terms of contract are changed. I must protest on behalf of European clients who are put to immense cost and great trouble, and at the eleventh hour I am here notified, 16,000 miles from my principals, that the conditions of tender are changed.

I will enclose your letter or a copy to my principals to-day.

CARSON WOOD.

For your information.—W. Scott, 28/3/87. The Commissioner.

Telegram from The Agent-General, London, to The Colonial Secretary, Sydney.

DEPUTATION from the locomotive builders urge specification should provide for inspection in this country as hitherto, and that Government find accommodation erection Engines; charging contractors' fixed price per engine. I advise reconsideration. Last condition causing much feeling here.

Telegram from The Agent-General, London, to The Colonial Secretary, Sydney.

25 March, 1887.

LOCOMOTIVES.—Answer urgently required to my cablegram of 18th March. Contractors inquire what import duties or other Government dues will be charged locomotives on arrival and landing. Require immediate reply.

The Under Secretary, Public Works, B. C., 28 March, 1887.—C. W. Railways, B. C., 29/3/87.—J. R.

"BETTER tender at certain price, wharf and Customs duties to be added."—CH. A. G., 5/4/87.

Cablegram sent to Public Works for transmission to Agent-General, 6/4/87.

The

The chief objection seems to be that we should require English and foreign manufacturers to find their own erecting shops in the Colony instead of giving them the free use of our erecting shops as heretofore. Colonial manufacturers will not be allowed any facility of the kind, and if tenders are to be obtained on a fair competitive basis I do not see why foreign and home manufacturers should have the advantage they ask for. The condition is not prohibitory, for there will be little difficulty in obtaining conveniences for erecting engines should a home or foreign manufacturer secure the order. There is, moreover, a precedent for this course; the contractors for the supply of dump-cars were required to find premises for their erection on arrival in the Colony.

CH. A. G., 28/3/87.

I should advise the following message being sent to Agent-General,—“Amended conditions as to payment and inspection and contractors finding their own premises for erection will be strictly adhered to.”—CH. A. G., 28/3/87.

Approved.—J.S., 30/3/87. Cablegram sent to Public Works for transmission to Agent-General.—D.C.M.L., 31/3/87.

* Only tenders to supply eight engines.

Those underlined thus are the lowest offers.

Memo. by The Secretary for Public Works.

Department of Public Works, Railway Branch, Sydney, 18 April, 1887.

THE Commissioner will please send the papers and specifications to Mr. Midelton for full report. I have many reasons for desiring that gentleman's report, although he is not in the Engineering Branch of the Railways. I shall be glad to have the papers and report on Wednesday, the 20th inst.

JOHN SUTHERLAND.

Mr. Midelton accordingly.—CH. A. G., 18/4/87. Report on Commissioner's 86/8,560 and specification No. 188a and 191 herewith.—T. MIDELTON, 19/4/87. Commissioner.

Minute by The Secretary for Public Works.

Re Railway Rolling Stock, &c.

WITH reference to the specification for twenty-eight goods and sixteen passenger engines, it seems to me, from a perusal of them, that they provide for a different type of engines to any we have now running, and their adoption would, in my opinion, be a serious mistake. There are many provisions that would make the engines unnecessarily complicated and costly, and debar Colonial makers from having any success in tendering. I think we might, for instance, substitute best steel for iron; it would be cheaper, and would give the locomotive a longer life.

Three-fourths of the trade we have over the mountains, on the steep gradients, could be best and cheapest carried by one class of engines, simple in construction and powerful in action; but we have a number of engines of various designs that it would pay the Department better in the long run to put on the scrap heap, if we could be sure of replacing them by a class of engines more suitable to our requirements.

I am not in favour of any increase in the rates for passengers and produce to augment our revenue, as, I believe, by improving our rolling stock we shall be able, with economical working, to improve our returns, so as not to require any increase. We have at present a large traffic in live stock which has proved unprofitable, both to the Railway Department and the owner, the latter asserting that the loss to him through delay in transit by rail, &c., is sometimes equal to 10% on the value of the consignment, and this must be taken in a degree as adding to the railway rates. We will always have a large traffic, either in live stock or dead-meat, and I do not think a permanent improvement will come until we have improved rolling stock for this traffic, both in engines and trucks. Stock trains should be run at almost the same speed as our mail and passenger trains, and should give precedence to nothing but them.

For the purpose of obtaining opinions as to the best class of engines for this purpose, I wish an early report from Mr. Midelton, now Superintendent of Tramway Rolling Stock, Mr. Midelton having had a large engineering experience both in England and the Colonies, and has already shown evidence of his ability with regard to his plans for the Goulburn running sheds, and in regard to his advice in connection with the Eveleigh workshops. He has already designed ten locomotives which, after two years' service, have proved to be the most economical in working that we have; and for these and other reasons, although he is not now in the Railway Locomotive Branch, I should like his opinions on this question.

JOHN SUTHERLAND, 18/4/87.

Mr. Midelton.—A.R., B.C., 19/4/87. Seen.

My report was forwarded, on the morning of the 20th, to the Commissioner.—THOS. MIDELTON, 22/4/87. Commissioner.

The

The Superintendent, Tramway Rolling Stock, to The Secretary for Public Works.

Report on Additional Locomotives.

Sir,

After a careful perusal of the papers which provide for the addition of forty-eight locomotives to our present stock, I have the honor, in obedience to your command, to report as follows:—

In the original recommendations of the Locomotive Engineer, dated 25/5/86, I notice he writes there are "many advantages accruing from as few types of engines as possible being used. I strongly recommend that the terms of the specification for the two classes now required be strictly adhered to. The class *most suitable* for our passenger traffic is that provided for in the specification upon which tenders were last invited, and for which the Vulcan Foundry Company of England obtained the contract. The advantages gained by having even the same class, made by the same makers, are so considerable, and in view of the very low price at which the Vulcan Foundry Company are supplying, induces me to strongly recommend that an order for those now required be given to the same firm." Although Mr. Scott has had a very long experience here, I venture to assert that he is in error upon this question. We have had no experience of the engine which the Vulcan Foundry are now supplying, and I am at a loss to understand how Mr. Scott arrives at the conclusion that they are the most suitable for our passenger traffic. I have gone very carefully into the merits of the designs of these engines, and must express my conviction that their unsuitability will be established on trial; they cannot be successful unless they are ruinously *overloaded* on their (four) coupled wheels.

Referring to the goods engines, Mr. Scott states: "I do not think that a more suitable engine than the 'Mogul Class'—Specification No. 191—can be obtained. We have now had some years' experience of them, and, as regards *loads* hauled, economy in running stores, and small cost of repair and renewals, they have given general satisfaction. I therefore strongly urge that this type of engine be **ADHERED** to." I will at once say that my views, based on a large experience of the running of these engines, are quite to the contrary, and the records will show that I tried to improve them when the second lot was being ordered in December, 1883 (*vide* Comr's. M.P., 83/19,720), but Mr. Scott opposed it; indeed, it is evident Mr. Scott now practically admits that the principal feature—the hauling power—is deficient, for he stipulates that the power of the new engines is to be *increased* 5 lb. by making the cylinders *1 inch larger in diameter*, and by *shortening the stroke 2 inches*. I would point out in this connexion that, while the improvement as regards increased power is immaterial, Mr. Scott contradicts, by introducing it, his professed anxiety to limit the types of engines—for undoubtedly he thus introduces another class.

In reporting on Specification No. 188A for twenty passenger engines, it will be well to consider what has already been done in the matter of equipping our railways with locomotive engines. We, unfortunately, have no less than forty-two different "classes" at the present time of nearly every possible shape and dimensions, twenty-two of which are for passenger traffic, and the rest for goods traffic. This is objectionable and costly, for almost any railway could be properly worked with, at the most, six different "classes" of engine, and many lines could be worked with three.

We began in 1855 with a "class" which exerted a power of	93·10 lb.
In 1856 we had	" " 79·85 "
" 1865	" " 71·10 "
" 1867	" " 112·70 "
" 1870	" " 105·00 "
" 1875	" " 168·00 "
" 1877	" " 117·80 "
" 1877	" " 123·40 "
" 1880	" " 102·40 "
" 1883	" " 104·00 "
" 1884	" " 117·00 "
" 1884	" " 140·40 "

I have here referred to twelve "classes," but do not think it necessary to name the other passenger engines which were introduced between 1855 and 1886, as they are all *less* powerful than the above.

As we have a large stock of the class which give off a power of 117·80 lb., this would lead some people to the conclusion that they were the best engines for our lines. But such is not the case, as it often—daily, I might say—happens to be necessary to put two of these engines on many of the passenger trains to work them to schedule time. The class of passenger engine introduced by me in 1884 (*vide* Com. M.P., 83/2,350, &c.), which exerts a power of 140·40 lb., has answered our requirements satisfactorily in every respect during the past two years on all lines, and the proof of it seems to reside in the fact that the author of the Specification 188A actually describes an engine *which will exert exactly the same power, but will be of totally different design and dimension*; and not only that, it will not be such a suitable engine for the New South Wales lines generally. It will have cylinders and wheels each larger in diameter than is necessary for the power required, and the insistent weight on the wheels will be *much more*—7½ tons per wheel—as against 6 tons. This, I need not remark, will be destructive to the permanent way and to the engine itself.

The comparison between the two engines stands thus:—

Present Passenger Engine and Tender.

Cylinders—18" diameter, 26" stroke, 60" driving wheels, 6 wheels coupled, and 2-wheeled bogie
Power = 140·40 lb. as aforesaid.

Tender on 8 wheels carries 3,600 gallons of water and 6½ tons coal.

Proposed Passenger Engine and Tender.

Cylinders—19" diameter, 26" stroke, 66½" driving wheels, 4 wheels coupled, and 4-wheeled bogie.
Power = 141·14 lb., or 742 lb. more.

Tender on 6 wheels carries 2,500 gallons of water and 3 tons of coal.

We here propose to introduce another "type of engine" of practically the same power, but which will in *practice* be certainly not so serviceable an engine as the present one, but *why* it is done it is difficult to

to see. I contend it would be best in every way to go on reproducing the type which has proved to be the best, instead of further complicating matters and increasing our difficulties and expenses for no good purpose. It is more than probable that the weight on the coupled wheels of the proposed engine will largely exceed the weight specified, viz., 30 tons; if it does not, the engines will slip, and will require the use of a lot of sand, which will increase wear and tear of rails and tires, and cause other trouble. It is best to so proportion an engine that the use of sand shall be avoided, and this has been done in the engines we have; and as it is specified that each box shall hold 4 cubic feet of sand, it is evident that much is to be expected from the free use of it, if the load on the coupled wheels does not exceed 30 tons. To be a good reliable engine in all weathers there should be not less than 9 tons on each of the (four) coupled wheels, but as that weight is *too much for our rails* it is proposed to put $7\frac{1}{2}$ tons on each wheel, and that is excessive. In short, the engine *should have six* coupled wheels instead of *four* coupled wheels, and I cannot see a valid reason for proposing to have such engines. Quite the contrary, we should now reproduce in our own shops the engines and tenders we have found to answer our requirements best; and as locomotive builders only *manufacture* very little of our engines and tenders, I consider the Government should import the necessary raw material—consisting of steel plates for boilers, copper plates, boiler tubes, Staffordshire iron plates, steel tires, axles, &c., &c. (articles which cannot for some time be made in the Colony), direct from the various manufacturers of such articles, in the same way exactly that the locomotive builders do at Home, and I dare say the Government could obtain such material at the same—perhaps lower—prices than they do. Then we could, with the splendid special machine tools and new workshops at Eveleigh, fully and profitably employ our skilled mechanics and others constantly in constructing new engines and repairing old ones, under the supervision of specially trained, expert officers, on the spot, and I feel confident that the total cost of engines built in this manner, under proper discipline and control, would not exceed the highest—perhaps the average—tender which will be received for supplying the engines now under consideration, as the profit now paid the manufacturers, cost of freight, inspection, trial, dismantling, and other items would about balance the extra price of labour here. Indeed, unless this is done, I do not see how the new Eveleigh Works, which have cost about £600,000, can be fully utilized. We have only recently been able to haul, with *one* engine, mail trains, consisting of thirteen carriages, or 104 tons, exclusive of weight of engine tender and passengers, up a grade of 1 in 30, and over the 8-chain curves of the Western road; we cannot do *more* with the proposed new engine; they will not do as much, if constructed to the specification, which specification I might say is certainly a curious one. The first few lines run thus:—“Specification for a four-coupled, outside cylinder, passenger (Bogie), *with* engine and tender.” Sixteen are to be delivered in Sydney, and four in Newcastle. Now, as it is almost certain that railway connection with the Southern and Northern lines will be established long before the delivery of the engines takes place, it would have been more convenient and economical for all of them to be delivered in Sydney.

The general arrangement of the engine, it is stipulated, is to be in accordance *with a plan to be prepared by the Contractors, in which certain leading particulars are to be faithfully embodied and adhered to*. For instance, the cylinders are to be 6 feet 3 inches apart, centre to centre, and the slide bars are to be 5 inches wide, the slide blocks $\frac{1}{2}$ inch thick, the tires are all to be $5\frac{1}{2}$ inches wide. Now, if these dimensions are faithfully adhered to, I think the bogie wheels will, in radiating, rub hard against the main frames, or the slide blocks or bars, or the sharp curves of the Western road, and serious results might occur, as the “clearance” is certainly not sufficient. The said specification is not only curious, but it is incongruous and amusing as can be seen by comparing the above with the last clause on page 13, which states that “Tenderers in England or America *may either Tender to the within Specification, or if they wish to depart from it*—in almost every particular—they will be *allowed* to submit *alternate Tenders*,” provided they adhere to the general dimensions of the engine.” This practically means that the author of the specification describes an engine such as he thinks he wants, but he is so undecided in the matter that if any contractor will design and specify a better engine, he will accept it and his tender. A specification embodying such conditions could have been printed on half a sheet of foolscap, and the trouble and expense of preparing the present one entirely avoided.

I consider the engine and tender unnecessarily complicated, and consequently expensive to manufacture. To give an instance, it is specified that one of three makes of Yorkshire iron is to be used in the boilers, whereas *steel*, of far greater strength, and about half the cost, should have been used instead. The connecting rods are composed of no less than sixteen separate parts, whereas only three are necessary. The same argument also applies with equal force to the side rods, and nearly all the other details. There are to be four slide bars where two only are required. The driving and trailing axle-boxes are to be of wrought iron, well case-hardened. This is wholly unnecessary, and very expensive. Brass boxes and keeps are to be used on the bogies. Cast iron is all that is necessary, and it is of course cheaper and better.

The steam “dome” in the boiler is very expensive to make; it is ugly; not only that, but it weakens the boiler, and it is utterly useless.

The regulator is of a class which is anything but good. The spark arresters are to be of the “best design” known; that is very vague; surely something definite could have been specified.

The Roscoe Lubricator is a very old device; there are many others less expensive and far more efficient lubricators to be had. A water-jet is to be applied to each tire of each wheel of the engine and tender for the purpose of “cooling,” and it might have been added, for the purpose of causing the engine to “slip” on the rails unnecessarily, which they will do oftener than is convenient, even with a dry rail, as they have not sufficient weight on them to use up the cylinder power.

It is also difficult to see why the tender and train brakes only are to be worked by the Westinghouse gear. The engine brake is to be worked by *hand*, I notice, whereas the whole lot should be worked by one handle operating the Westinghouse gear to be thoroughly efficient and up to modern requirements.

The tender, which is to have a “well,” is a costly and inefficient design; the water and coal capacity is small, and the coal will have to be piled up very high to enable the proper quantity to be carried. This is dangerous, as it often happens that large lumps drop off and sometimes strike the men engaged in repairing the road. There are only six wheels to the tender; this is a grave error, as each wheel will be excessively loaded. There should be eight wheels (two bogies), but it would seem that six wheels are preferred.

The side-lamp brackets should be put at the front end of tender, and *not* at the back, for many good reasons.

To sum this matter up, I consider that the author of the specification has ignored the main questions, of first cost, utility, simplicity, and efficiency; and I have no hesitation in saying that a simpler, a far more efficient, and less costly engine and tender could be made in our own workshops at Eveleigh than the one proposed. I should strongly recommend the construction in our own shops of twenty-five more of the 304 class of engine, which were designed for and intended to work five different kinds of traffic, viz., mail trains, fast cattle and goods, suburban passenger, and goods traffic, and shunting generally.

Specification No. 191 for Twenty-eight Goods Engines.

THIS specification describes what is known here as the 205 class of engine; indeed if it were not stipulated that the cylinders were to be 19" in diam. and 24" stroke, instead of 18" diam. and 26" stroke, it would exactly describe the 205 class of engine, a great many of which we have been supplied with by Messrs. Beyer, Peacock, & Co.; but the author of the specification is not content with introducing another class of passenger engine, but he wishes to have another class of goods engine also, without securing any benefit. The 205 class are well known to be the most sluggish engines we have, and there are grave defects in them, as at times enormous weights are thrown on the bogie and trailing wheels, on account of the absence of proper compensating levers in the required positions, and I notice that it is not intended to remedy this defect, therefore we are not only destroying the permanent way with the engines we have, but we propose to build a still *heavier* type to expedite the destruction. The 205 class are evidently poor copies of the American consolidated engines introduced in 1877, and intended to compete with them, but they have ignominiously failed, and if the proposed engines are built further failure will take place. I consider the consolidated type have proved themselves to be the best goods engines we have: they are lightly loaded per wheel, and are therefore easy on the road; they give off 200·00 lb. of power, and the proposed engine will give off 180·5 lb., only with *more* weight per wheel. I should strongly recommend that the new design be abandoned, and that twenty-five more of the consolidated engines be built in our Eveleigh Works. Nearly all the arguments I have advanced against the passenger engines can be made to apply to the proposed goods engines.

We now have eleven engines (of the 48 class) which are lighter, and give off 195·00 lb. of power—far more than is proposed; therefore we are taking a backward step by ordering LESS powerful goods engines than we now have.

As the recommendation indicates, the passenger engines are to be made by the Vulcan Foundry Co.; and it is evident that the goods engines are intended to be made by Messrs. Beyer, Peacock, & Co.

In my opinion it would be a serious mistake to have such engines constructed. I should advocate not only what I have hereinbefore stated, but I would construct a great many new engines of a more suitable type, in place of a lot of obsolete engines we seem to be unable to utilize. We have the best appliances for the purpose, and unless this is done it is difficult to see what use the appliances can be put to; indeed, it is a huge co-operative concern, in my view, in which every railway man is personally interested, and as the railways are State properties the whole question is a national one.

I have, &c.,

THOS. MIDELTON,

Superintendent of Tramway Rolling Stock.

19 April, 1887.

The Minister wishes to know if there are specifications for the two classes of engines which Mr. Midelton recommends; if not, could engines be built to the types of engines, one of each of which could be exhibited as a model, with perhaps some modifications in regard to material to be substituted for the material used in the engines exhibited?—CH. A. G., 25/4/87.

There is a specification and there should be drawings also for the passenger engines only. Engines could be built to a model engine as proposed, and I think it would be necessary to specify (say) "British steel" instead of "steel" only, and a few other matters of a like nature.—T.M., 25/4/87. Commr.

Resolution of Legislative Assembly.

Relative to Manufacture of Locomotive Engines.

(1.) That, in view of the widespread distress amongst the iron trades, this House is of opinion that the Government should take immediate steps to call for tenders in the Colony only for the manufacture of one hundred locomotive engines, and that the following be the conditions of such tenders:—That the construction of the said engines be carried out by labour already in the Colony, and that only such material be imported as cannot be produced here.

(2.) That the above Resolution be communicated by Address to His Excellency the Governor,—put and passed.

Invite tenders for twenty-five engines of each of the above types, in accordance with recent resolution of the Assembly.—J.S., 25/4/87.

Minute by The Secretary for Public Works.

Department of Public Works, 26 April, 1887.

Tenders for Locomotives.

WITH reference to the loco. engines, tenders for which were invited in the Colony and in England before I took office, I must express my disappointment that the Loco. Engineer while professing to do so did not display that regard for minimising the number of types of engines which is so essential for the economical working of his branch of the Department. He had already in his charge and in active use on our lines two types of locomotives, which answer more satisfactorily than any other the requirements of our traffic. I allude to the consolidated goods engines which were introduced through my instrumentality when I was in office previously, and the locomotives designed by Mr. Midelton for the express service over the mountains. Instead of ordering engines to correspond with these designs, Mr. Scott proposed to introduce two other types, thus multiplying the undue number we have already on hand, and necessarily increasing thereby the working expenses of the Loco. Department.

I consider that it would be detrimental to the best interests of the Railway Department to accept any tenders which have been received for the engines in question owing to their inadaptability to our traffic requirements, and I have directed tenders to be invited in terms of the recent resolution of Parliament for fifty engines, twenty-five each of the types I have referred to. As there is no time to obtain plans and detailed specifications for these types of engines, I propose to have patterns of each exhibited in the running sheds at Eveleigh. Other material might perhaps be substituted for some of that used in regard to tires, wheels, and boiler plate, but this can be specified.

I have directed Mr. Midelton to draw up such specifications as may be necessary, and he will dismantle two engines and have them placed in the shed so that manufacturers can see the design, and I shall have the locomotives constructed under Mr. Midelton's supervision.

JOHN SUTHERLAND.

Mr. Scott to see.—CH. A. G., B. C., 26/4/87. Inform Mr. Midelton by separate memo.—CH. A. G. Done.—D. C. M' L., 27/4/87. Recvd., 28/4/87. Please see my minute of to-day's date herewith.—W. SCOTT, 12/5/87. Commissioner.

Minute by The Locomotive Engineer to The Commissioner for Railways.

IN referring to the Honorable the Minister for Work's minute, and decision respecting additional locomotives required by the Department, and the strictures on my recommendations made by the Superintendent of Tramway Rolling Stock, which have been accepted and endorsed by the Honorable the Minister for Works, I would respectfully point out that the perusal of such has given me no small degree of pain, as the action taken practically implies a want of confidence in my ability to fulfil the important duties devolving upon me as Locomotive Engineer of the New South Wales Railways.

Without any desire to enter into a controversy with the gentleman's opinions, which appears to have guided the Honorable the Minister in his action on this occasion, or even to refer to any of the circumstances of the past which led to that gentleman's services being severed from the Railway Department of this Colony, I respectfully submit that in justice to myself, considering my past career in the Department for over thirty-one years, coupled with the fact that the honorable position I now hold has been attained by untiring energy and ability displayed while filling subordinate positions to my present one, it would only have been an act of justice if, before such documents had been made public, the Honorable the Minister had submitted such to me and requested that I would reply to them. Such reply could then have been considered in conjunction with the strictures on my recommendations, and such a course would, if the Honorable the Minister had seen fit to still maintain the action he has taken, at least have given him an opportunity of judging of the correctness or otherwise of my opinions and actions.

The first intimation I had concerning this matter was from the columns of the public press; and considering the Honorable the Minister's action, without reference in any form to me, forces the conclusion that any explanation I may have to offer will not in any way (with his present views of my capabilities) have the effect of altering his decision. Still, I trust I shall not be considered as exceeding my duty in explaining such action even now that the question has been decided.

A great deal is attempted to be made of the numerous types of engines on our lines as if such a thing was unknown anywhere else, which is not the case. Several of the "types" were introduced fully ten years before we had mountain lines with heavy grades and sharp curves, and some of them even before such lines were thought practicable. It is ridiculous for any one who is unacquainted with the history of our railways to criticise the action of those who had to provide for the lines opened and proposed over twenty-five years ago. It is a matter for congratulation that all the engines ordered within the last twenty years are still performing good and profitable work, and I question very much, considering the extensions opened, the varying grades and traffic to be provided for, whether such a satisfactory result has been obtained anywhere else under similar conditions. I have always been opposed to increasing the types of engine unnecessarily, and I can confidently refer to the records of the Department in support of this. The engines recommended by me are practically the same as the Standard design of passenger and goods engines of which we have eighty-one and eighty respectively. It is absurd to say that minor alterations in the details constitute a new type, and I venture to predict that there will be many such alterations from the pattern engines if built in the Colony as proposed. I have really only introduced one "new type" of engine on our lines during the six years I have had the control of the Locomotive Branch, and these are the tank engines for suburban traffic in which service they are giving entire satisfaction.

If this gentleman was sincere in his contention that even the difference of an inch in the cylinders constitutes a "new type" it is singular that he overlooked it when he classified the engines in stock during my absence in England. If reference is made to the table framed in the Commissioner's room, signed "Thos. Midelton, Acting Loco. Engineer," it will be seen that he places engines Nos. 36, 37, 38, 39, 75, 76, 77, and 78 in one class, whereas six of them have 16-inch and two of them 17-inch cylinders with a difference of power, viz., 93-11b. as against 105-11b. Again, in the same table of classification of engines, Nos. 23, 24, 25, 26, 27, and 28 in the same class with Nos. 32, 33, 34, and 35, although the former have four coupled wheels 5' 9" in diameter, whereas the latter are four coupled wheels 5' 6" in diameter the relative power being 112-7 lb. and 132-97 lb.

The Superintendent of Tramway Rolling Stock states I have no experience of the class of engine I recommended, and therefore he is at a loss to understand how I arrived at the conclusion that they are the most suitable.

From this he would have it inferred that I have taken a leap in the dark instead of being guided by my experience. He forgets that he might have been asked the same question when he recommended the "304 class," of which we had no experience at that time. I have not the slightest doubt that the engines of the same type I recommended, now being supplied by the Vulcan Foundry Company, will draw an equal load to the "304 class," and at a much higher rate of speed, and the price of them after running our trains 2,000 miles satisfactorily, is only £2,315 each, which is considerably cheaper than any passenger or goods engines ever tendered for before; hence my reason for recommending that the order be given to the same firm, in addition to which we would secure that the several parts be interchangeable, which, I may remark, is never the case when engines are built by different makers even to the same drawings and specifications.

The

The question of which is the most suitable engines should be considered from the standpoint of how far it is desirable to sacrifice "speed" for "power," and we cannot shut our eyes to the fact that when our lines are opened to Newcastle on the North, and Kiama on the South, we shall have to compete, particularly in the former case, with water carriage served with very fast steamers. Again, the public are constantly complaining through the press about the slow speed of our trains, and unfavourable comparisons are drawn with the trains of other countries. I therefore submit that if we want fast trains we must have a different class of engine to the "304 class," which has only 5 feet driving wheel. The recent trial of one of this class with the "Fireman's special" will fully prove this. (See Commissioner's 87/3,216, with the report from the Traffic and Locomotive Officers on the subject.)

I also understand that there is a desire for increased speed with the morning train from Penrith, which can only be attained by the use of engines adapted for fast running.

The specification for the "304 class" stated that they were intended to run at a speed of from 33 to 40 miles an hour. This is altogether beyond the working speed of such a class of engine, which is more of a "mixed train engine" than a "passenger engine."

My critic expresses his conviction that the unsuitability of the engines I recommended will be established on trial. I am quite content to abide by that test, and, as four of them are now being delivered, we shall very soon be in a position to decide the point. I have no fear of the result.

Reference is next made to my recommending the Mogul class of goods engines, in which I state that after some years' experience of them they have given general satisfaction, and this type should be adhered to.

My critic asserts that his experience of them is quite the contrary; so that it comes to a question of who has most experience, and who is best able to decide. As regards experience, this class of engine first commenced to run in 1882, and I have had control of this Branch all the time, so that I ought to know what work they can do, and have done, and also whether they are expensive to keep in proper running order. He forgets that we have ten engines of the "Mogul class" with precisely similar cylinders as those recommended running on our lines for the past two years; so that I have experience to guide me, and his assertion about my introducing another class is not correct.

In reference to his comments upon what has been done in the matter of equipping our lines with locomotive engines, he asserts that there are forty-two (42) different classes at the present time of nearly every possible shape and dimension on our lines. As a matter of fact there are only twenty (20) altogether, and of these seven are odd ones which have been purchased at different times from contractors and others at very low prices, and four engines, which constitute a class, were built as an experiment upon the recommendation of Mr. James Henry Thomas, who was appointed in 1869 to supervise the construction of new engines and rolling stock in the Colony, and these had afterwards to be altered from "Tank" to "Tender" engines. When the Superintendent of Tramway Rolling Stock classified our engines in 1882, he made only twenty-nine classes, and this number has since been reduced, so that at present time there are only twenty classes, exclusive of the old ones before referred to, and of these 75 per cent. are included in four classes and as a matter of fact our orders for new engines during the past ten years for our main lines have been confined to seven types, including the two classes he takes credit for; so that there is no reliance to be placed on his statement on this subject. It is perfectly absurd to assert that such lines as ours, with different descriptions of traffic to be provided for, could be advantageously, or profitably worked with only three types of engines. Perhaps he can show where such a thing exists. The following classes will be found on all well managed lines, where such traffic as we have has to be provided for, viz. :—

1. Express engines.
2. Fast mail and passenger.
3. Ordinary passenger.
4. Mixed train.
5. Goods engines for minerals, &c.
6. Goods engines for ordinary traffic.
7. Suburban tank for heavy trains.
8. Suburban tank for ordinary trains.
9. Shunting engines.

With reference to the greater power of the "304 class" over our ordinary passenger engines, saving the use of an assisting engine, on many occasions the "304 class" has to be assisted as the load for it is twelve vehicles, and not thirteen as asserted, and as the loads are always increasing the number of times the "304 class" will require the aid of an assisting engine will increase; so that what is a slight advantage now will then become a disadvantage, as the "304 class" uses more fuel per mile. My critic says why not go on reproducing the type that has proved to be the best, while he acted entirely different when he recommended the "304 class," so that he reflects upon me for the very thing he did himself during the short time he was in this Branch, but he evidently considers that he alone is capable of judging what is best; but it would be more to the point if he would state on what railways fast passenger trains are run with six coupled wheels 5 feet in diameter, which in this respect are similar to the goods engines on the London and Brighton line. (See Mr. Stroudley's remarks, page 76, vol. 81, of the Proceedings of the Institution of Civil Engineers.)

The proposal to build the fifty engines in our new workshops at Eveleigh upon the grounds that with the appliances there they could be built at "perhaps the average" of the tenders received, shows how little he knows of the subject he is dealing with.

I am positive he could not build engines of the "304 class" for 50 per cent. over the price paid to the Vulcan Foundry Co., and bearing on this I would ask where a sufficient number of specially trained experts are to be found in the Colony who are to secure such results? No fear need be entertained about the new workshops and appliances being fully and profitably utilized without our undertaking the building of new engines and rolling stock, and I have no doubt but that the saving to be effected in our repairs and renewals will, when we get them into full operation, more than cover the interest on the capital invested in them, and as our wants increase the advantage in respect to economy and efficiency will be still more marked. When recommending that the Eveleigh shops should be built I looked beyond our present requirements, and although they are much less extensive than many of the railway shops in other countries I am pleased to say compare very favourably with any that I have seen in my tour through England and America, both in design and equipment.

I will now refer to the criticism upon my specifications, and I have no doubt I shall be able to do so satisfactorily to every one acquainted with the stipulations and conditions usually embodied in such documents.

First.—As to the provision for having a number of the engines delivered at Newcastle, my critic asserts that we shall be connected with the Northern Line long before the engines will be delivered, therefore it would be more convenient and economical to have them delivered in Sydney. I know that some of the engines are required on the Northern Line now, whereas I am informed the Hawkesbury Bridge is not likely to be finished before two years at least.

Second.—Exception is taken to my stipulating that the general arrangement of the engine is to be in accordance with a plan to be prepared by the contractors, in which certain leading particulars are to be faithfully embodied and adhered to.

The reason for such a proviso is so obvious that it is difficult to imagine how any one having any knowledge of the subject should cavil at it. When contractors make their own drawings it places the responsibility of their correctness upon them, in addition to which all locomotive builders of repute have a properly trained staff of draftsmen for the special purpose. As to the prediction that if the dimensions and distances of the several parts mentioned are adhered to the bogie-wheels will in radiating rub hard against the main frame when running round the sharp curves on the Western Line, I am sure he will be surprised, if not gratified, to find that I have provided for all this, and that nothing of the sort can occur. The provision in my specification which he terms incongruous and amusing, viz., that tenderers could send in "alternate tenders," was inserted, not as he would have it supposed, that I was undecided as to what was best, but was the result of a discussion on this subject with the Commissioner, and it was deemed advisable in order that foreign builders should not be debarred from tendering to insert the proviso. It is scarcely necessary to say that we have no experience in the suitability of the material used by Belgian and other foreign locomotive builders, some of whom were desirous of competing, so that by admitting alternative tenders to be sent in they could, of course, receive consideration if the prices were appreciably lower than those sent in strict terms of my specification. If I were undecided about what was best, I would not have specially stipulated that certain material was to be used, and his reference to my specifying for three makers of Yorkshire iron in the boilers which he takes exception to, upon the grounds that steel of "half the cost" and of "greater strength" could be used instead. It would be more to the purpose if he were to follow my example and mention the particular brands of steel that will fulfil these conditions. This point is evidently introduced for effect, but the fact remains that up to the present time the extended experience of English and foreign builders, has not yet given them sufficient data to universally substitute steel for iron in locomotive boilers, and, in reality, can only yet be considered in an experimental stage. Steel has been used, but then those who did use it made their own steel, like Mr. Webb, the Locomotive Superintendent of the London and North-Western Railway, did at the "Crewe Works." When in England in 1883, I made special inquiries on the subject, which was then being discussed by the Institute of Engineers, and the opinions I obtained from the Chief Locomotive Superintendents were adverse to the use of steel in locomotive engine boilers. As the responsible head of this important Branch of the Railways, I conceive it to be my duty to specify for material that is almost universally used, and which my own experience proves to be suitable, rather than to stipulate for steel which, as before said, may yet be considered in its experimental stage, and of which there are no generally recognised "brands" specially adapted for boiler work, that I know of, and further, considering its being in such a stage, I did not, neither do I think any experienced Locomotive Engineer would at present recommend so large an order of this material, in view of the fact that what I stipulated for is the recognised practice of all English and Colonial Engineers,—I am content to differ with him.

The driving and trailing axle-boxes which I stipulate to be of wrought-iron, well case-hardened, he designates to be unnecessary and very expensive, &c., as cast-iron is all that is necessary, and it is cheaper. This is again a matter of opinion, in which I am pleased to disagree with him. If I only considered the first cost, I should be in favour of cast-iron, but my experience tells me that "first cost" in this case is more than counterbalanced by the cost of renewals. However, as my critic has nothing to do with this responsibility, he naturally disregards it as unworthy of notice.

The comments upon my specifying for a "steam dome" to the engines, clearly shows to what an extent my critic's vanity leads him in engineering matters. He states that it "is very expensive to make, it is ugly," in addition to which, it is utterly useless. From these objections it would be supposed that such an expensive and dangerous contrivance would, if used at all, be only in some isolated part of the globe where the advance of science was unknown; but what, I may ask, is the universal practice? They are used all over the world, with scarcely an exception, and the very substitute he suggests was tried over thirty years ago. The fact of its being practically abandoned, and also that no locomotive engineer of experience has deemed it worthy of consideration since, shows that it cannot contain the advantages claimed for it unless, indeed, locomotive engineers in all parts of the globe are, like myself, unable to comprehend its value. I scarcely think any person would like to take up the position that locomotive engineers in other parts, who have retained the "dome," are unqualified for their positions; and one of the very classes (the Consolidation) which my critic now recommends has a "dome," so that he proposes the very thing he so strongly condemns in my specification—perhaps from the fear that to dispense with it would involve another *type* of which he expresses his condemnation so strongly. So much for consistency.

The comment on the terms used in my specification about the "spark arrestors," viz., that they are to be of the "best design known," is very ingenious, as it leaves it to be inferred that I did not know what is "best;" but when I explain the object sought by the introduction of these so-called "vague" terms it will be seen what grounds there are for the insinuation that they were inserted because I had not the ability to deal with the subject. It is admitted by everyone who has seen the spark arrestors in our engines, which I take credit for, that they are the best they have seen; so that I can well afford to treat it with contempt.

The sole object for stipulating for the "best known design" was to protect the Commissioner from being mulcted in heavy damages for fires alleged to have been caused by sparks from our engines, as the law as laid down in our courts is that, provided the Commissioner for Railways has in use what is "best known to science" to prevent the emission of burning matter from the engine, he is not liable; and the production of the specification in Court that the engines have been built under such a proviso has on several occasions been accepted as satisfactory evidence upon this important matter.

The "Roscoe" lubricator is an old device, but it is nevertheless a very good one, and many of those so-called improvements upon it will, I have no doubt, be found much less effective.

The reference to the "water jet" causing the engine to slip is absurd, as it is not, of course, intended to apply it to the wheels when the engine is pulling; therefore the slipping cannot occur from that cause.

The reason why I made no provision for working the engine by the Westinghouse brakes, and confine its operations to the tender and train, is because I consider it entails unnecessary expense in the wear of the tires without effecting a corresponding advantage.

The objections raised to the tender I recommend are—"it is to have a well," is "costly and inefficient in design," "the water and coal capacity is small," and "the coal will as a consequence have to be piled up high to enable the proper quantity to be carried." This is alleged to be dangerous, as it often happens that large lumps drop off, and sometimes strike men engaged in repairing the road, also that I provide for six wheels instead of two four-wheeled bogies, which is considered a grave error. Well, as regards the cost, I have only to say that it is all included in the £2,315, which is for the engine and tender complete, and I think it will be found in this respect to compare very favourably with those to be built under his specification. As regards the "design," it is of the usual horse-shoe form, which for convenience in coaling and general efficiency has given entire satisfaction, and will in these respects compare very favourably with the American pattern which he advocates. The quantity of coal and water to be carried was fully considered, and I have no fear about the capacity being equal to the requirements in these respects without it being necessary to pack the coal up as alleged. As regards the assertion about the danger to the permanent-way men through being struck with lumps of coal falling, I have no recollection of such a thing occurring on our lines, and I am confident there is no foundation for it. I prefer the six wheels to the two four-wheeled bogies, for the reason that they admit of greater controlling power being exercised by the brake upon the wheels, and our experience undoubtedly proves this. The objection raised to the position of the lamp brackets on the tender affords ample testimony of the "straits" my critic was put to in finding something on which to ground a difference of opinion.

My critic sums up his objections to the class of passenger engines I recommended as follows:—

"I consider that the author of the specification has ignored the main question of first cost, utility, simplicity, and efficiency, and I have no hesitation in saying that a far more efficient and less costly engine and tender could be made in our workshops at Eveleigh than the one proposed.

"I strongly recommend the construction in our own shops of twenty-five more of the '304 class' of engines, which were designed for and intended to work five different kinds of traffic, viz.:—
Mail trains, fast cattle and goods, suburban passenger and goods traffic, and shunting generally."

As I have already disposed of his absurd assertions as to the cost, if built at Eveleigh, as he recommends, I will not again refer to it beyond mentioning that the engines he recommends cost £2,600 each free on board of ship at New York, and that when cost of freight, insurance, shipping, wharfage, cartage, erection, &c., is added, it would bring the price up to about £2,970 each in steam, as against £2,315 for those delivered in steam under my specification. No one who has the slightest knowledge of the question would make such wild assertions unless with the view of misleading. If, as I understand, the lowest Colonial tender received for engines under my specification was over 60 per cent. higher than the lowest English tender, it is certainly a subject for grave consideration how far work done by Government labour, even allowing for our superior appliances at Eveleigh, would be economical.

As for the assertion of my ignoring the main question of *utility, simplicity, and efficiency*, I am satisfied the engines I recommend will prove satisfactory in these and every other respect. I never heard of an engine being specially designed for so many different kinds of work (from mail trains to shunting) before, and I think such a statement will be a surprise to Locomotive Superintendents who have hitherto acted in the belief that it is desirable, in the interest of efficiency and true economy, to have each class of traffic served as far as practicable by engines best adapted for it.

Specification No. 191, for twenty-eight Goods Engines.

My critic starts his comments on this specification by saying that if it were not stated that the cylinders were to be 19 inches diameter and 24 inches stroke instead of 18 inches diameter and 26 inches stroke, it would exactly describe the "205 class," so that he here practically admits that they are not a new class, as he previously said they were. As a matter of fact, ten of the "205 class" have cylinders of exactly the same size as those specified for, as I have before mentioned. He designates the "205 class" as being the most sluggish engines we have, that they are but poor copies of the Consolidation engines introduced in 1877, with which they were intended to compete, but have ignominiously failed to do so, and that if the proposed engines are built further failure will take place. From these condemnatory terms it would be assumed that they have nothing to recommend them in his opinion, but it will be seen on reference to the Commissioner's S3-19,720 that in my absence he himself suggested some improvements—that such is not the case, as in the report referred to he says:

"Generally speaking these are a good class of engine, and I consider them a marked improvement upon the 93 class, but there is still room for many improvements in them, &c., &c."

He then goes on to mention the details in which the improvements could be made, which are almost identical with those which he now says the want of renders them what he designates "failure." It is notorious of my critic that he never sees anything that he could not improve on if he had a chance. It is singular that he should suggest improvements in the "Mogul Class," which he now condemns, when he could have recommended the Consolidation engine instead, if he then considered they were best; it was clearly his duty to do so.

I am at a loss to know what he means by designating the "Mogul" as copies of the Consolidation engine, the more particularly when he repeatedly asserts that a difference in detail constitutes a "new type," for, as a matter of fact, they are of an entirely different design, as the following will show:—The Mogul is a six-coupled 4-foot wheel with a bogie; the cylinders are 19 inches diameter, by 24 inches stroke, with the usual English tender on six wheels, whereas the Consolidation is an eight-coupled 4-foot wheel with a bogie; the cylinders are 20 inches diameter, by 24 inches stroke, and the tender is of the American pattern, carried on two four-wheeled bogies.

The

The difference in power amounts to one truck on the ascending grades over the mountains in favour of the Consolidation, but the load on the descending grades is the same for both classes; but the Consolidation require an extra fireman, the expense of which in itself is sufficient to justify my not recommending them, but there is a still more important objection to the Consolidation, which is the much greater wheel base, that causes the leading bogie wheels to lift off the rails when running round the 8-chain curves on the Western Line. When this was pointed out to the Baldwin Company, who built and introduced them into the Colony, they admitted it was a defect, and upon their suggestion several schemes have been devised to effect a cure, all of which have failed to effect the desired result.

The statement that I intended the goods engines to be made by Beyer, Peacock, & Co. is evidently made with the view of having it inferred that I unduly favoured that firm. The fact that I recommended that public tenders be invited for them affords sufficient testimony, if any were needed, that such was not contemplated. It will, I flatter myself, take more than *his* insinuations to prejudicially affect my character for integrity, so I shall treat it as unworthy of further notice.

In conclusion, my critic states he would advocate, not only the building of the fifty engines before mentioned, but would advocate the construction of a great many new engines of a more suitable class in place of a lot of obsolete engines we seem to be unable to utilize. He will be surprised, no doubt, to hear that most if not all of the obsolete engines he refers to have already been replaced by others more suited to our wants, and as other engines become useles or worn out, they will be replaced in like manner. I will, for obvious reasons, refrain from alluding to his remarks about "the best appliances, &c.," being "a huge co-operative concern in which every railway man is personally interested," and the railways being "State properties, the whole question is a national one;" but I would call attention to the fact that the "best appliances" referred to were specially selected by me, and afford convincing evidence that I know what was "best" in such a very important professional matter, and that even he has to admit it. As the question of the experience of my critic has been introduced into this matter, I assume it will not be considered out of place if I state what mine has been.

After serving my apprenticeship in an engineering works in Scotland, I joined the Edinburgh and Glasgow Railway in 1845, and remained three years in the shops as a leading fitter, when I went to the Locomotive Works of the London and North-Western Railway at Wolverton, where I was employed as a leading fitter for three years. I was then promoted to the position of Locomotive Foreman of the Camden Town Depôt, which I held for three years. I was appointed by Mr. McConnell, the Locomotive Superintendent of the London and North-Western Railway, to supervise the construction of the engines and rolling stock for this Colony—he being the Consulting Engineer of the agent of the "Sydney and Goulburn Railway Co." When the engines and rolling stock were completed, I came to this Colony in charge of them, under agreement, and arrived here in January, 1855, and remained in the employ of the Company until the Railways were taken over by the Government, shortly after which I received the appointment of Locomotive Overseer, which position I held until April, 1882, when I was promoted to the office I now hold of Locomotive Engineer of the New South Wales Railways.

W. SCOTT, 12/5/87.

Minute to The Commissioner for Railways.

MR. SCOTT'S remarks, of 12/5/87 (Comr's. M.P., 87/9,852), upon Mr. Midelton's report (requested by the Honorable the Minister for Public Works) on specifications and recommendations submitted by Mr. Scott for obtaining additional locomotive engines.

To dispose of the plausible assertions and peculiar reasoning advanced by Mr. Scott, I am compelled to go into the matter at greater length than I could have desired.

Mr. Scott in the first place says, "Without any desire to enter into a controversy with the gentleman's opinion, which appear to have guided the Honorable the Minister in his action," and then he immediately writes twenty-five pages of foolscap to upset my opinions, occasionally descending to personal references of invidious nature; at one time alluding to what he terms my "vanity," then of being "notorious" for qualities which he wishes understood as baneful, and again that I make "wild" and "absurd" assertions, his great effort being directed to depreciate and cast doubt upon everything I have said in furnishing the Honorable the Minister with my conscientious opinion upon the matter which he referred to me for report.

I will however at once analyse the mass of mediocre matter, which, with a certain amount of ingenuity displayed in cloaking true facts and raising false issues, is all that Mr. Scott's remarks really represent.

It seems to me that Mr. Scott's attempt to depreciate my remarks, against adding to the already excessive number of types of engines in use on our railways, recoils upon himself. Every railway man of locomotive experience is fully aware that the great advantage in having as many engines of one type in use as possible lies in their dimensions admitting of interchangeability of the parts. This is what was in my mind when I referred to the forty-two classes of engines now on our railways, and to Mr. Scott, as a locomotive man, the justice and force of my reference must have been quite apparent. Yet, with considerable subtlety, he attempts to show that I cannot be "sincere" in my representation, because, as he says, the classification sheet of the engines bearing my signature does not show as many classes as stated in my report to the Honorable the Minister. The classification referred to is based upon the general *outline* of the engines and in regard to the description of work they are equal to, the object being to group together, as much as possible, the different engines of similar power, and within one class are included many engines of different "types;" but to prevent the possibility of misconception in the matter, there is a special column in the classification sheet distinctly describing the difference in dimensions of the engines included within each class. Of this, Mr. Scott is perfectly informed, and it is from the very details entered by me on the classification sheet that he gathers the particulars with which he seeks to belittle my remarks against unnecessarily increasing the types of engine. But he shoots very wide of the mark intended, as I will now show. Mr. Scott knows that the engines he instances as included within one class will not admit of interchangeability of parts, and indeed, Mr. Scott himself, goes on to actually prove the gravamen in my reference by quoting the dimensions of several types included in one class in my classification. Had I used the word "types" instead of classes in my report, Mr. Scott would not have had available the peg upon which he hangs his peculiar argument; but this is only a fair specimen of the disingenuous reasoning apparent throughout Mr. Scott's remarks.

If

If the fact that other railways have too numerous types of engines in use, is consoling to Mr. Scott, to me it seems only reason why we should avoid the same error. He states that he "has really only introduced one new type of engine on our lines during the six years he has had the control of the Locomotive Branch." This is incorrect, for Mr. Scott caused the introduction of the "255 class," and there are four types within that class. The American mogul engines,—the suburban tank engines in opposition to my direct proof against the suitability of those engines as shown by the papers on the subject at the time; and now he adds the Vulcan engines. At one time he preferred inside cylinders, and at another outside cylinders—thus showing his indecision. And notwithstanding his assertion that it is "absurd" to say that minor alterations in the details constitute a "new type," I affirm that it is the alterations in the details that constitute a new type of engine. I might add that the prediction upon which he ventures "that there will be many alterations from the pattern engines, if engines are built in the Colony," will not be verified should the engines be built in the Colony, as there is a special clause in the specification directed against it (*vide* specification). Indeed, I have arranged that as many parts of the passenger engine as can be made to suit the goods engine shall be so made.

In his reply to my remarks upon his want of actual experience of the "Vulcan" engines, Mr. Scott says I wish to infer "that he has taken a leap in the dark," and that I forget that I "might have been asked the same question when I recommended the 304 class."

Now, as a specimen of disingenuousness, the whole of the paragraph referring to this question stands out with perhaps greater prominence than any other portion of Mr. Scott's lengthy statements. There is no analogy between the position and circumstances in which Mr. Scott and myself were severally placed. When I designed the engine (304 class) I had the knowledge that there was not an engine on the New South Wales Railways equal to the task of taking thirteen loaded carriages over the mountain line. I also had experience of the "60 class" engine, built expressly for this work in 1875, which engine gives off a power of 168 lb., and yet could not do the work. So I designed an engine giving off only 140 lb. of power with the same sized wheels as the "60 class" engine, which has proved itself fully equal to the work I have stated. And now Mr. Scott, although possessed of the same experience as to our wants years before I arrived in the Colony, made no attempt to produce an engine equal to the service required, but when the success of my engine becomes a fact accomplished, with the latter experience, he steps in and recommends another type of engine of *exactly the same power*. (In literature this kind of action is called plagiarism.) Therefore if they will do the same work (which I very much question), he has made a serious mistake in endeavouring to increase the types of engines unnecessarily. I might add that (as I have already pointed out in my report to the Hon. the Minister) this engine must have a most injurious effect upon the permanent way of the railways.

With due deference to Mr. Scott's remarks relative to the increased speed required in running the trains, I would point out that an engine of the 304 class runs the passenger train from Penrith, which train is heavier now than it ever has been. According to time-table and reference to Commissioner's M.P. 83/23,540, will show that I anticipated all that Mr. Scott now raises, and that the "304 class" engines possess all necessary to meet the requirements of the Penrith trains, being equal to a maximum speed of 35 to 40 miles an hour, in accordance with my specification.

With reference to the "Mogul" type of engine, No. 205 class, I must again point out that Mr. Scott's representations are incorrect. I had considerable experience of these engines before Mr. Scott had. They were put together and run for some time during the period I was Acting Locomotive Engineer when Mr. Scott was in England, and at the Commissioner's request, after Mr. Scott's return, because of this very experience, to which the Commissioner makes special reference (see his M.P. 83/19,194), I reported upon these engines on the 27/11/83, intimating clearly the different direction in which improvements should be effected, and Mr. Scott agreed with my suggestion. (Reference should be made to the paper.) Again, after further experience of the Mogul engines I wrote on 23/4/84, on the Commissioner's M.P. 84-5,900, in favour of the "Consolidation" engines, and from the thirty-eight reports from different inspectors and engine-drivers *re* failures of the Mogul engines, such as slide-valves, crank-pins, and draw-bar springs, &c., breaking No. 219 engine with fifty brass tubes put in, and tube-plate bulged after eleven months' service, I had come to regard the Mogul as a costly engine to keep in repair, as well as being very destructive to the road.

Mr. Scott says, referring to myself, "He forgets that we have ten engines of the 'Mogul' class, with precisely similar cylinders as those recommended."

I do not forget, on the contrary I pointed it out at the time the type of engine of No. 295 class was introduced by Mr. Scott. (The engines of this class were made in America at the same time as my engine, No. 304 class.) The following minute on the Commissioner's M.P. 83-23,540, shows that Mr. Scott objected to my engine (304 class), and introduced the one in question with a foot smaller wheel, and which engine he stated would run 35 miles an hour and "allow a good margin," which would be ample for any mixed passenger or live stock train."

"Believing that the speeds of our mail trains must be increased, I could not think of recommending the use of such an engine as Mr. Midelton advocates for running mail trains."

Now what are the facts *re* the service rendered by the two classes of engines just referred to? Why my engines have worked the mail trains over the mountains successfully for the last two years, whereas Mr. Scott's engines have never been tested at all to ascertain if they will fulfil the condition laid down by himself.

With further reference to the too numerous types of engine Mr. Scott says:—"It is perfectly absurd to assert that such lines as ours, with different descriptions of traffic to be provided for, could be worked advantageously or profitably with only three types of engine."

Perhaps he can show where such a thing exists. First let me point out what my words referring to the necessity for avoiding too many types of engines were. "This is costly and objectionable, for almost any railway could be properly worked with, at the most, six different classes of engine, and many lines could be worked with three." I think the object sought in endeavouring to fix me to saying, "Three types of engine could properly work our railways," is not difficult to see. And now to comply with Mr. Scott's request as per the last line of the foregoing extracts. If he will refer to the *National Car Builder* of May, 1885, he will see illustrations of four types of engine used in working the traffic of the New York West Shore and Buffalo Railroad—a line of 850 miles, the equipment of which being 177 engines and 7,291 vehicles. The types of engine being A and B, passenger; C, consolidation; and D, six wheels coupled

coupled tank engines. This line is acknowledged by all railway men to be the finest and best equipped in America, even not excepting the Pennsylvania railroad—and all this equipment was being prepared during the very time that Mr. Scott was in America and had he been so inclined he could have obtained valuable information in respect thereof.

With reference to the "304 class" engines not now being *allowed to take thirteen vehicles* over the mountain line, all I can say is that such a fact reflects upon Mr. Scott's management of the Locomotive Branch, for when I had charge of the engines under Mr. Scott, thirteen vehicles *were taken* without the service of an assisting engine and the same thing can be done now.

I will meet Mr. Scott's remark "That it would be more to the point for me to state on what lines engines with 5-foot wheels run express trains," by simply pointing out that as far back as 1872 Mr. Webb, of the London and North-western Railway, ran a train from London to Liverpool, a distance of over 200 miles, in five hours, with an engine with four coupled wheels of 5 feet diameter, and that the same rate of speed has been run on our lines by my engine. If reference be made to the Commissioner's M.P.'s. 87-3,216, 87-4,076, 87-4,334, and 87-5,898, the facts revealed, if estimated correctly in regard to the special trip made by one of my engines with the firemen's train on the 22nd February last, show a performance so good that I very much doubt if anything superior is on record.

Mr. Scott's assertions on pages 11, 21, and 22 of his remarks, to the effect that he is positive that I could not build engines at the Eveleigh workshops for 50 or 60 per cent. more than the cost of the engines now being delivered by the Vulcan Co., are mere assertions, and the matter he advances to support them simply specious pretences put forward to hide his own inability to grasp this important question in all its bearings, and I am not surprised that he cannot properly appreciate the advantages to accrue to the department in dealing with it in the manner I have recommended. In his efforts to show that the position I have taken up in the matter is an untenable one, I am charged with making absurd and wild assertions; need I remind Mr. Scott that abuse is not argument. I repeat here all I have already said in regard to building new engines at the Eveleigh shops, but I do not think I am at present called upon to submit particulars of the line of detail actions I should take and consider necessary for the success of such an undertaking. I am content to simply direct attention to the fact that as yet Mr. Scott has shown no reason for his self-satisfying declaration that he has disposed of my absurd assertions as to the cost of engines if built at Eveleigh.

In reply to the remarks bearing upon the subject, I may say that I am perfectly aware that when contractors make their own drawings for engines they have to build, that it places extra responsibility upon them, and I am also aware, if Mr. Scott is not, that such course relieves the locomotive engineer of the responsibility which properly and exclusively belongs to such an officer, and forms a very important part of the special duties for the performance of which he is paid a salary.

Passing over the intervening matter, as possessing no special significance, till I come to Mr. Scott's remarks *re steel versus* Yorkshire iron for boilers of engines, I would say this: The proof of Mr. Scott's undecided tendency lies in the fact that he had two brands of Yorkshire iron for boilers printed in his specification, and he afterwards added in manuscript a third. I can import the best boiler steel made, for £8 2s. 6d. per ton f.o.b. Glasgow, whereas the Yorkshire iron preferred by Mr. Scott would cost from £30 to £39 per ton.

The following extract from the Presidential address at the N.E.C. Institute of Engineers and Shipbuilders, 1885-6, will perhaps enlighten Mr. Scott:—"The success which has attended the introduction of mild steel in the construction of marine boilers is so marked that but one opinion exists as to the suitability of this material for such purposes; and as Mr. Head says, 'One contributing cause for this development is doubtless the employment of the higher pressures now in daily use; or, perhaps to speak more correctly, the capabilities of this material have assisted to render possible such advances in pressures as would otherwise have been out of the question. But be this as it may, call it what you like, cause or effect, there can be no question as to the success of steel boilers built by the Company with which I was connected in the spring of 1878, which are now running without having cost a penny for repairs, and practically in as good a condition as ever, and doubtless other manufacturers could bear similar testimony.'" Mr. Scott could have seen lately at the Circular Quay, in some of the new Orient steamers, steel boilers 15 feet in diameter carrying a working pressure of 160lb. to the square inch. Now surely in the face of this there cannot be much that can be considered an extraordinary departure in proposing to make of steel locomotive boilers of 4 feet 6 inches diameter, carrying 140 lb. to the square inch, more especially when one considers that Mr. Scott quotes Mr. Webb as having used steel *of his own make* on the London and North-Western Railway. And here let me say that had Mr. Scott been as alive to his opportunities as he might, and ought to have been, when in America, he would have found hundreds of steel boilers in use in locomotive engines. Yet with imperturbable self confidence Mr. Scott asserts that this matter can only yet be considered as in the experimental stage. I fear that steel for boilers, as well as many other advancements in engineering science, would have *remained* in the "experimental stage" were the majority of engineers as conservative as Mr. Scott. Perhaps it may not be out of place to also point out that of ninety-seven motors in the Tramway Department of the Colony ninety-two are fitted with steel boilers, and that even the two motors built by Mr. Wearne in Sydney are fitted with steel boilers, so that if Mr. Scott had taken the trouble to watch what was passing under his eyes so to speak, he could have acquired valuable information relative to the use of steel in locomotive boilers. As he asks for it I have not the slightest objection to putting Mr. Scott on the way of obtaining a few of the best brands of steel which will fulfil the conditions I have named; they are,—

The Steel Company of Scotland (Limited), Glasgow.

The Landore Siemens Steel Company, Swansea.

The Leeds Forge Company, Leeds.

Park Bros. & Company, Pittsburgh, U.S.A.

Ohio Steel Company, Cleveland, O.

Perhaps this will suffice.

In reply to Mr. Scott's peculiar remarks *re steam domes*, I did not think it necessary to take the dome off the boiler of the pattern engine No. 133 for the mere sake of allowing the contractors to see the engine without a dome. When I mention that the engines of 304 class have run for over two years without a dome the success of the change is established.

Mr

Mr. Scott should keep pace with the times. Evidently he did not notice the domeless engines on the Great Northern, Great Western, and South-Eastern Railways in England. Yet the fact remains that such engines are largely in use, in fact exclusively so on the Great North Railway, which had over 500 engines in the year 1876.

In regard to Mr. Scott's perforated plate, which he takes credit for as a spark arrester, I see, according to the light he now throws upon the subject, that it was Mr. Scott's retiring nature which prevented him from stipulating for his own spark arrester in his specification, but as he stipulated for "the best," and as he now tells us his spark arrester is admitted by everyone who has seen it to be "the best," the inference is obvious.

My reference to the water jet acting on the wheels causing the engine to slip is not "absurd," and the attempt made to place me in a false position by explaining that it is not intended to be used when the engine is pulling is puerile.

I say that if the jet is often used on down gradients the wheels would be wet, and in ascending gradients with wet wheels, and it would happen at times the handicap on the engine would be great. I certainly think, after reflection, that this is a case where the disadvantages outweigh the advantages. I am therefore opposed to the water-jet arrangement on engine wheels.

With reference to the remarks dealing with the Westinghouse brake, I think a little reflection will make it quite clear that the reason advanced by Mr. Scott for not working the Westinghouse brake on the engine is really a reason in favour of its being so worked.

I can afford to ignore Mr. Scott's remarks about "horseshoe" *versus* "wedge" shaped tenders. I will, however, again refer to the seemingly small matter of the position of the side-lamps on the tender, as it is just one of those small matters sufficient to be important in averting or occasioning serious accident. The reason the side-lamps should be placed on the front end of the tender rather than on the back end is that the men on the engine may be enabled to see ahead or behind without having a dazzling light thrown in their eyes; indeed, the proper place for these lamps is on the side of the engine-cab, above the men's head, in which position it would help instead of hinder their range of vision.

It is quite true that my ten engines (304 class) cost £2,600 each, f.o.b. New York, but it must not be forgotten that there was no competition for supplying them—that they were built to a *special specification* stipulating wide departures from the beaten track, all of which tends to increase the cost of the first engines of a new type,—and I have no doubt whatever that if engines were tendered for now in England and America under the same specification, with the detail drawings now available, that we should obtain them for a less price than actually paid for the Vulcan engines now being delivered. I might mention, because Mr. Scott does not refer to the fact, that the ten engines (296 class) built to his specification by the same makers, and at the same time as my engines, cost exactly the same price.

In the year 1884.

And now to refer to the cost of the Vulcan engines, which Mr. Scott quotes over and over again in the course of his remarks at those points where he apparently thinks it is likely to create effect, as £2,315, and as the cheapest engine ever offered to the Government.

It will no doubt be a rude shock to the reliableness of Mr. Scott's statements when I say that reference to the invoices of the Vulcan Company will show that the amount paid, or to be paid, for their engines is very much nearer £2,500 each than the figures stated by Mr. Scott, and as to being the cheapest engine ever offered to the Government, reference to the Commissioner's minute paper 80-5,712 will show that offers were made to the department by Messrs. Beyer, Peacock, & Co. to supply goods engines of the 205 class at £2,300 each. I need not say that Beyer, Peacock, & Co. are second to none as locomotive manufacturers.

I now come to the question of goods engines, but I will not combat Mr. Scott's incorrect assertions. It is sufficient to say that I have always recommended "consolidation" engines for goods traffic ever since 1880, when I first had experience of them and of their merits, evidence of which is afforded on the Commissioner's minute paper 84-5,900 by my minute of 23/3/84, as follows:—

"* * * * * If it is decided to import goods engines I recommend that we have the Consolidation type, and to be exactly like those last imported, except as far as this specification (Spec. for 304 class engines) can be made to hold good."

This is good evidence I think that I have been consistent in endeavouring to limit types as much as possible, and make the parts of goods engines interchangeable with passenger engines. Again, Mr. Scott has purposely suppressed a very valuable report on the utility of the Consolidation engines by Driver John Jones, dated 15/11/79 (copy attached). I may mention that Driver Jones was a superior engineman, and was always selected by Mr. Scott himself to run special trial trips of engines for test purposes, therefore his remarks are entitled to great weight.

Mr. Scott makes a point of the second fireman being required on the Consolidation engine, and states "that in itself was sufficient to justify his not recommending the consolidation engine." To this I would reply that when I had the opportunity I tried by certain alterations to the arrangement of the brake gear to dispense with the second fireman, and should have succeeded had I met with proper support from Mr. Scott.

In the engines I proposed to build to the pattern consolidation engine No. 133, I have, by simply removing the cab 15 inches further back, and rearranging a few details, taken all the action necessary to dispense with the second fireman.

The best answer I can give to the sensational paragraph about the bogie-wheels lifting on the curves is that the engines have been running successfully over the Mountain line for close upon ten years.

In regard to Mr. Scott's remarks in attempted refutation of my statement that "it was evidently intended that the goods engines should be supplied by Messrs. Beyer, Peacock, & Co.," I repeat what I said, and to anyone acquainted with the favorable circumstances in which that firm stands to supply the engines in question, the reason is obvious.

In conclusion I beg to point out that it is most unsatisfactory to continue to debate the question as to the most suitable engines for our requirements, which can only be satisfactory and finally settled by actual experience of the working of the different types of engine under precisely similar conditions. And I submit that at least my engines have by their *work* during the past *two years* demonstrated beyond all question their great efficiency in all important respects, and I trust that this, with the facts I have stated in this paper, will assist the Commissioner in arriving at a sound decision upon this important, though unnecessarily rendered somewhat intricate, question.

Randwick Works.

THOS. MIDELTON, M.I.M.E.
[Enclosure.]

[Enclosure.]

Mr. Tipping,—
Sir,

Penrith, 15 Nov., 1879.

I have travelled with all the Consolidation engines on the Western line, as requested, &c. I beg to make the following statement to the several questions:—

1. Do these engines keep up sufficient steam with an ordinary load? They do since I have been with them; there has been no case of sticking up, but one or two struggles to reach the destination where the pulling has been long and severe. This, in my opinion, was caused by unskilful firing; they require more judgment in firing than the old engines, having such a large area to fire over, and sometimes inferior coal will creep in. There are instances of the old engines sticking up, sometimes for want of steam from various causes, but as a rule the Consolidation engines steam as well as the old engines, and better than some of them.
2. Do they require any more attention than any other class of goods engines? They do not, excepting in watching that bolts and nuts do not stack back through not having a split-pin in to secure them.
3. Is the present mode of firing the best, if not, can you suggest any alteration? Different men have different ways of firing, but I consider the best to be a low flat fire, so as not to choke up the arch, and fire about six shovelfuls at a time.
4. Is the quality of the coal suitable? It is, as the mountain coal makes no clinker, it is readily acted upon by the rocking fire bars.
5. Is it absolutely necessary to have a second fireman beyond Lithgow, or between Bathurst and Orange? It is at present, not altogether on account of the hard work, but the inability of the drivers to assist in breaking. If the driver was supplied with a steam-brake in his corner, or things could be brought closer together, so that the driver could assist his mate in shunting, &c., then I think the second fireman could be dispensed with on the easier lines.
6. Report on the brake power of both engine and tender. The tender brake is a good one, but takes sometime to get it on, owing to its peculiar construction. The great loss of power is in the engine brake, which should have eight blocks instead of four, and six inches longer, if it is possible to get them on owing to the great weight of the engine. The break-rod and screws of both engine and tender should be lengthened two or three inches so that they could be taken up a hole before starting, instead of having to wait until they are worn right up, and having to start the journey with about two or three threads on the screws.
7. Do the drivers take sufficient interest in these engines and give them a fair trial as to their taking the maximum load with due regard to economy in fuel and stores, keeping time, &c.? The drivers take a very fair amount of interest in them, as they must do to get along the roads, but there is not that pride and care exercised as there would be if every man had his own engine. His care and attention extends of course to the end of the trip only, as he will have another engine the next day, and so on, but generally speaking, I do not think the men appreciate them at present as they will bye-and-bye when they get more accustomed to them. The engines have power to take one or two wagons more, but I do not think the water in tender would hold out between some of the water cranes, and they are very difficult to get along with their present sand gear in greasy weather.

General Remarks.

In the consolidation engine we have, I think, the *grandest goods-engine ever placed on the Western road*; they are very heavy certainly, but they pull and run well with very little signs of heating if properly lubricated; peculiarly adapted for the Western line; runs round the curves *better*; and is in my opinion much *safer* on the curves than the *old* goods engines. The bogie in front of them is in fact a splendid idea for the goods engines for the Western road, but their break-power is not sufficient, and their sand boxes and gear should be altered to suit our requirements. As we have sand boxes and gear on some of the old engines which I think cannot be excelled, it would be a good idea to put them on these. Their sand box being placed on the top of the boiler occasions great loss of time and much labor in filling it. Two large sand-boxes could be placed on the truck in front, or bracketed on the side as on the old engines. They should have the short lever and quadrant, instead of their straight pulling handle, as a much better means for gauging it. They should be worked separately as it is impossible to catch the right and left curves, &c.

Straight Road.

I know there is an objection to sanding one rail at a time owing to all the strain coming one side but these engines are doing the same thing now, as one sand-pipe is running the sand on the ballast instead of the rail on the sharp curves, and wasting it owing to the cause above mentioned. The practice also of running these engines down the mountains, tender first, cannot be too soon put a stop to, as it is unsafe in greasy weather through not being able to get any sand under tender brake and the small brake-power of the engine, they are unable to hold the train properly. I believed the two first goods engines that arrived here are the best with the short blast pipes. They are more lively, pull better, and burn less fuel, and do not heat their smoke-box like the others; but their injectors should be horizontal, as they work much better in that position. In conclusion, I beg to say that I think all the present difficulties will disappear in the future, as the men get more accustomed to them, and the alterations which I have suggested are carried out.

I remain, &c.,

JOHN JONES.

Loco. Overseer (Mr. Scott).—JOHN TIPPING, 17/11/79.

Sent the original papers to the Commissioner on the 1/7/82, with these comments: "The attached report by driver J. Jones is, in my opinion, a very valuable document. He is a very steady, thoughtful man; and I agree with what he has written in almost every particular. My experience of these engines here, leads me to almost the same conclusions. I forward these papers for your information." The Commissioner replies thus on 10/7/82.

"I shall be glad if Mr. Midelton will make these engines as effective as possible by the additions of the improvements suggested by driver Jones, in which Mr. Midelton concurs, and will report to me the result (say) at the end of this year."

CH. A. G.

I think the original papers should be put with these, as I fancy I wrote more than is stated in my memo. above, which I have copied from my own copy of Jones' report.—THOS. MIDELETON, 20/5/87.

Minute

It was not stopped until I did it in 1882.—T.M.

Minute by The Chief Clerk to The Commissioner for Railways.

TENDERS for the manufacture of fifty Engines in the Colony.

In the advertisement for the above it is stated that particulars can be obtained at this office. One gentleman called to-day, but I was not in a position to furnish him with any particulars further than to inform him that the pattern engines would be dismantled and on view at Eveleigh running shed. To whom am I to refer intending tenderers as to the details of the engines required?

D.C.M'L., 27/4/87.

Instruct them to go to the running shed, Eveleigh, inspect No. 308 engine and tender and No. 133 engine. Any engine and tender between 304 and 313 inclusive can be inspected.—T.M., 28/4/87.

Draft specification left with Assistant Secretary for printer at 11:30 a.m. to-day.—T.M., 28/4/87.

Yes, when we receive the drawings from America and make drawings of goods engines here.—T.M.

Mr. Midelton will please say if he wishes any one in attendance at Eveleigh. If instructions were given to the employee in charge of shed to point out the engines which are to be placed there as pattern engines, I presume that should suffice for that portion of the public requirement. In the specification to be drawn up the general dimensions of the engines will be given, and also a statement of the material which is to be used. No doubt, ultimately, detailed drawings will be required, but these could perhaps be better supplied when a contract has been accepted. It will not be convenient to persons intending to compete to visit Randwick for the purpose of seeing Mr. Midelton. The skeleton specification should be at this office, and perhaps Mr. Midelton could arrange to meet those interested in Sydney at this office at stated times.—CH. A.G., 27/4/87.

Minute by Mr. Midelton to The Commissioner for Railways.

* * * I will go to Eveleigh to-day and make all arrangements respecting the pattern engines. I could attend Eveleigh daily from 3 to 6 p.m. and meet intending contractors there; they could also attend at any time to inspect the engines, and also see copy of specification here (at Randwick) and at the Phillip-street office, as above. This, I think, is all that is required. Several copies of the specification could be printed by to-night or to-morrow evening certain. I should like to see a proof copy before it is signed by the Commissioner.—T.M., 28/4/87. Commissioner.

The specification is in the hands of the printer, and we are promised a proof to-morrow morning.—D.C. M'L., 28/4/87. Seen.—I sent specification to Mr. Midelton yesterday, with some suggestions re the title of the superintending officer.—CH. A.G., 30/4/87.

The Assistant Secretary of Railways to The Superintendent Tramway Rolling Stock.

Manufacture of Engines in the Colony.

WITH reference to the resolution recently passed by the Legislative Assembly, providing for the manufacture in the Colony of 100 locomotive engines, the Secretary for Public Works has decided to invite tenders for the supply of twenty-five consolidation goods engines, and twenty-five express passenger engines similar to those recently imported, and has directed that they are to be constructed under your superintendence. I am directed to request, therefore, that you will be good enough to draw up such specifications as may be necessary for carrying out the contracts, and that, where desirable, you will arrange for the substitution in the Colonial-made engines of other material for some of that used in the pattern engines in the tires, wheels, and boiler-plate. The tenders are returnable on the 17th prox., which will not allow of sufficient time for the preparation of detailed specifications, and pattern engines are therefore to be exhibited to manufacturers in the running shed at Eveleigh to tender from. The two pattern engines should be at once dismantled and placed in the shed, where intending tenderers can see them, and I shall be glad if you will, as early as possible, arrange for all other matters which may be necessary to give effect to the Minister's decision in this matter.

27 April, 1887.

A. RICHARDSON,
Assistant Secretary.

Noted, and instructions carried out.—T. MIDELTON, 3/5/87. Commissioner.

List of Tenders received for Locomotives to be Manufactured in the Colony to Mr. Scott's Specification.

Name.	20 Goods, South.		8 Goods, North.		12 Passenger, South.		4 Passenger, North.	
	Price.	Total.	Price.	Total.	Price.	Total.	Price.	Total.

J. D. Brown.....	3,460	86,500	3,460	86,500	To be allowed space in Eveleigh workshops and use of tools.

Minute by The Locomotive Engineer.

MR. MIDELTON informs me that the two locomotives which were recently used as patterns in connection with the tenders that were recently invited are no longer required for that purpose. Will you please say if they may be taken into traffic, as they are very much required.

The Commissioner.

W. SCOTT, 12/6/87.

Memo. by The Secretary for Public Works.

Department of Public Works, Sydney, 17 June, 1887.

I UNDERSTAND that the engines exhibited in connection with the tenders for locomotives are not yet in use. I shall be glad if the Commissioner will depute someone to examine them, to see if any repairs are necessary before they go out on the road, and then arrange for their running.

Mr. Midelton might inspect, but any repairs to be carried out under Mr. Scott's orders.

JOHN SUTHERLAND.

Let this be done.—CH A.G., 18/6/87. Locomotive Engineer and Mr. Midelton, B.C. Seen. —W. SCOTT, 22/6/87.

Seen, 24/6/87. I hardly understand the Minister's meaning in this matter. Both engines (No. 307, passenger, and No. 133, goods) are now (27/6/87) standing at Eveleigh shed out of use. The tender of 307 was attached to No. 305 engine, in place of the one which was damaged last week on the morning of the trial of 305.—THOS. MIDELTON, 27/6/87. The Commissioner.

Mr. Scott.—A.R., B.C., 29/6/87. I have examined the engines and given directions as to what repairs are to be effected.—W. SCOTT, 30/6/87. The Commissioner. Mr. Midelton to see. In order to save unnecessary writing, I may inform Mr. Midelton that the Commissioner has seen his minute of the 27th June.

Minute by The Locomotive Engineer.

ON your 87-12,116 it was decided that Mr. Midelton should inspect the engines used as patterns in connection with tenders which were invited for the manufacture of fifty locomotives in the Colony, with the view of ascertaining what repairs are necessary before bringing them into use again. I have to report that Mr. Midelton has not yet inspected the engines, and as we are very short of engine-power I shall be glad if you will issue such instructions as will facilitate their being brought into use as quickly as possible.

The Commissioner.

W. SCOTT, 25/6/87.

Mr. Midelton.—A.R., B.C., 28/6/87.

The

The reason I did not inspect was because I was engaged on the Peat's Ferry "Board," and another reason is because the tender of the engine in question was taken and put in No. 305 engine, in place of her own tender, which was damaged on the morning of the 16th of June before going out on the engine trials, therefore it was unnecessary and unreasonable for Mr. Scott to apply for permission, &c., under such circumstances. I visited Eveleigh yesterday and I saw No. 307 engine; it is nearly but not quite ready for use; it has no tender and cannot have one unless another engine is deprived of a tender, which I find is being done, but I think unnecessarily, as it leaves matters where they are at present as regards quantity of engines available for traffic. No. 313 is stopped, and her tender is to be put on to No. 307; it would be better to repair 307 tender, and so use both engines. I should like to effect a slight alteration of No. 307 brake-gear before it goes out, if Commissioner approves; the counter-weights on the wheels now catch the brake-rods and it is dangerous.—THOS. MIDDELTON, 7/7/87. Commissioner.

Make it safe for running by all means.—CH. A.G., B.C., 7/7/87. Loco. Engineer.

Please have the brake-rods attended to, so that the engine may be kept running some little time longer. It will, however, be necessary to take her in for the purpose of having new axle-brasses fitted, so as to prevent the side-play which is the cause of the balance-weights striking the brake-rods. This should be done as soon as practicable. Is not 307 tender now being repaired?—W. SCOTT, 13/7/87. Assistant Loco. Engineer.

Minute by The Secretary for Public Works.

Department of Public Works, Sydney, 3 May, 1887.

Subject:—Re use of machinery at Eveleigh for supply of Locomotives.

MR. GARRARD, M.P., introduced a deputation to me to-day with reference to the alleged proposal to allow tenderers for the supply of locomotives the use of the machinery in the workshops at Eveleigh.

The deputation consisted of Messrs. Garrard, Abbott, See, O'Sullivan, Ms.P., Bloomfield, Hudson, Franki, Wearne, Morris, W. E. Mort, Sands, Hoskins, and Vale.

They represented that they understood from the public prints that the Government intended to allow contractors for the manufacture of locomotives the use of the machinery at Eveleigh workshops, and they contended that this would be an injustice to the firms who had spent large sums of money in building up private workshops.

They further considered that it should be the aim of the Government to encourage private firms. If, as suggested, the Government allowed the use of the shops, or undertook to build the engines, they would be entering into competition with private firms who had invested fully £1,000,000 in buildings and machinery, and in a sense they would be causing the manufacturers to be entering into competition with themselves, for in a degree they were part owners of the Government works at Eveleigh, as they were taxpayers. When the Government proposed to erect these works, and asked Parliament to vote the funds, it was never intended that these shops should be used for manufacturing work, as it was stated they would be devoted to the repairing of machinery and stock. They contended that it would not only be an injustice to them for the Government to enter into competition but it would be unwise, as the Government never got work done so economically as it was done in private workshops. The system had been tried in other parts, and experience showed this; in America they had no Government works, and in England they had recently decided not to extend their Woolwich works, but to allow the State requirements to be met by private firms. They thought it was an unwise policy for the Government to be adopting a large plant. A foundry had been set up at Eveleigh, but the private foundries in existence already met all requirements, and if private persons found that the Government were providing these appliances they would decline to invest capital in manufacturing industries, and this would act most injuriously upon the best interests of the Colony, as in times of danger we would have to rely largely upon our local manufactories.

It was stated that through the inducement offered by the Government some of the best mechanics in the private firms left to join the Government works, and throughout the country there was a desire on the part of young men to look for Government employment rather than take up private service or take up land for production. They thought the Government should, as far as possible, break down this system rather than increase it, by undertaking new works, and consequently employing more labour. When the motion was carried in the House to have 100 locomotives made in the Colony, it was never anticipated that they would probably be made in the Government shops.

I informed them that the Government had no intention whatever of adding anything to their present heavy responsibilities with regard to the employment of labour; they were aware they had engaged twice or three times as many men as they should and that this was prejudicial to the interests of the Colony. The farming interest was crippled because the young men of the farming class looked to the Government for employment rather than to obtain a living from the soil. The Government were aware of all this and would give the matter their best consideration. I was the medium for bringing the matter under attention, but the conditions would be altered, as it had been decided that all deputations to all Ministers would be received in the Cabinet room, when reliable press men could be present; at the present time, with divided deputations, the press writers were scattered, and to meet the exigencies some days young reporters were sent out who did not fully understand the position and were unwittingly the medium of misrepresentation.

It had been taken for granted that we were to make the locomotives in our works, but I might say at once that no such thing was intended, and no such proposal had engaged the attention of the Government. I was fully aware of the merits of this matter, and would be very careful in any representation I would make, knowing as I did what the effect would be if the Government were to increase the number of men they now have employed. I fully agreed with them that we should so seek to establish our private manufactories as to be able to rely upon them in case of emergency, and I had expressed that years ago in connection with the manufacture of torpedoes. I believed our local works should keep pace with the times, and by obtaining the best improvements be able to do any nature of work.

With regard to the offer to allow contractors the use of tools, I pointed out that we had at Eveleigh certain special tools that were perhaps not possessed by any private firm, and to facilitate the contract I had approved of tenderers being allowed the temporary use of these specialities under our supervision, but in their

their tenders they would have to state what tools they would require and certain terms would then be fixed, but the Government would entertain no speculative offers in this direction, and the whole arrangement had been made in the interests of the contractors. I was giving them every opportunity to secure this work by giving them reasonable terms and simplifying the design of the engines. I was glad to hear that masters and men had determined to do their best to secure this contract for the Colony, and if they did not take advantage of it, it would be a bad thing for the Colony. The employer and employee must agree to let the Government obtain as low a price as possible, because they might not get so good a chance again. The Government had the English prices, and they were not likely to give the colonial tender an advantage that could not be justified in giving an undue benefit to a certain class.

It had been rightly said that the Eveleigh workshop belonged to the people, and they as taxpayers should not be compelled to compete against themselves. The Government, I believed, would not attempt to do that, and so injure interests in which, as they pointed out, a million of money had been invested. I admitted that in many ways the contractors of the Colony had not had fair play, but I was trying now to give them the greatest fair play, and if they did not take advantage of it, it would be no fault of mine.

The matter would not be finally decided by me—it would be settled by the Government after full consideration, and I would submit the various points that they brought under my attention, but my sympathies were in favour of having all work, whether woodwork or iron, made in the Colony so far as it could fairly be done.

JOHN SUTHERLAND.

Locomotive Engines.

Minute by The Superintendent of Tramway Rolling Stock to The Commissioner for Railways.

In compliance with the foregoing minute I have the honor to report as follows:—The very important question of designing and manufacturing, as well as repairing, locomotive engines, tenders, and rolling stock generally, in the workshops owned by a State or by a railway company, as the case may be, has occupied my mind for over twenty years; and I may say that I have studied the matter as much perhaps as any man in the Colony in consequence of my professional training, which commenced in very large works in England owned by a railway company, where all the rolling stock they required was designed and manufactured by their own officers and men, the work being done better and at considerable less cost than it could have been done by private firms.

The company alluded to (the Great Western Railway Company), like other similar companies in England, not only did as I have said, but they rolled in their own Rail Mill nearly all the rails they required for the maintenance of lines opened for traffic and the construction of new lines. The London and North-western Railway Company do more, for they make their own boiler plates, tires, axles, &c.

When I first came to this Colony, in 1880, I was engaged by the late Locomotive Engineer (Mr. R. H. Burnett) to design the proposed new workshops at Eveleigh, but nothing was done, practically, until I became Acting-Locomotive Engineer, when you, on the 19th of January, 1883, approved and endorsed my design of the Eveleigh shops in the following terms: "May be carried out, both Engineer for Existing Lines and Locomotive Engineer concurring"; and the shops now erected and to be erected are substantially my design, and they have been expressly laid out for the purpose of *manufacturing*, as well as *repairing*, railway rolling stock, and will be equipped with the best machinery and appliances accordingly; and it is satisfactory to note that Mr. Scott, the present Locomotive Engineer, who was sent on a tour by the Government through America and England, and who had copies of the designs of these works sent to him in London to work to, reported in July, 1883, when he returned to this Colony that he was "exceedingly pleased to be able to say that our new shops will compare very favourably both in design and general arrangements with the *best* I have seen in my travels."

This I could cordially endorse if Mr. Scott had done as he promised he would do—that is, "*work strictly to the drawings I sent home* for his guidance." But he has, unfortunately, altered the overhead travelling cranes, and also the main shafting arrangements, which alterations I still contend is a serious mistake.

I also think that other mistakes are taking place at Eveleigh now, in placing the machinery, benches, &c., &c., the way it is being placed. In a new works like that, the machinery, &c., should be properly placed, so as to avoid unnecessary handling of raw material, &c., and for turning out work quickly and economically.

In round figures there will be spent on the Eveleigh works about £600,000; and I estimate that there is £120,000 worth of machine tools, exclusive of buildings, small hand tools, &c., employed in the Locomotive Department of the New South Wales Railways, at the following stations:—Redfern, Eveleigh, Newcastle, Randwick, Penrith, Bathurst, Goulburn, and Junee shops. This if properly placed and fully employed would be far more than sufficient for keeping our present rolling stock in efficient repair, and we could in addition manufacture all the locomotives likely to be required in the whole of Australasia for the next fifty years. Consequently, if we do not manufacture locomotives, &c., at least for ourselves, it is evident that the vast amount of capital invested in buildings, machinery, &c., will only be partially worked and utilized. We have, unfortunately, made the same costly mistake that many English and other railway companies have made—that is, gone in for decentralizing our repairing establishments, and large workshops have, in consequence, grown up at the stations I have named; whereas we should have built and equipped our central works at Eveleigh long ago, and do nothing but the *daily running repairs* at the out-stations referred to. All manufacturing and *heavy* repairing should be done at head quarters under the constant supervision of the chief and subordinate officers of the Locomotive Department, in whom *personal responsibility* should be centred, instead of its being divided, as at present, among a great many

many subordinate officers hundreds of miles apart. Centralization is now the recognised practice in the Locomotive Departments of all well-managed railways, and, if it is justifiable for so many of the said companies all over the world to manufacture their own rolling-stock, rails, plates, &c., &c., and many other things they use on their lines, it certainly is equally justifiable, equitable, and philanthropic for a State to do the same thing, because, in the first case, a few shareholders only are benefited, whereas, in the latter case, the whole population is benefited and interested, and it really is a benefit to every individual in the State.

It is, perhaps, not generally known that some of the Railway Companies actually *manufacture more* of the details of a locomotive than the private firms do; for instance, they manufacture steel (boiler) plates, iron and steel cranked and straight axles, steel tires, frame plates, &c., &c., whereas none of the locomotive engine builders do that. They call for prices, and they purchase that class of material from the various manufacturers of such articles; then it is forwarded to their works to be manipulated and made into a locomotive. I propose that the Government should do the same thing. They should call for prices, and then import such articles as I have named, and which cannot, for some time to come, be made in the Colony, the freight and first cost of which, delivered in Sydney, would not, I think, exceed the cost of the same material delivered in the works of a Glasgow or Manchester engine-builder; therefore up to this point the Government stand in the same position as the manufacturers, the only question now remaining for consideration being that of *control or management of the workshops, and the price of labour*; regarding the first I do not see any insuperable difficulty or reason why the Eveleigh Works could not be managed by one head upon exactly the same system, principle, or basis, as private establishments in the Colony of a similar character are controlled, books kept, and a proper half-yearly report produced. Indeed I believe the artisans would much prefer such a system of management to the present, because they would all know who was *head*, and *merit* then would predominate and rise to its proper level and be utilized, whereas now it is of no use whatever; it rather tends to hinder than advance its possessors, and unless proper discipline and control is established, I should strongly recommend that the work I suggest be never started.

The next question is the price of labour. This Colony has consented to pay a workman here on the spot about as much again for what he does, as it—through contractors—pays a similar workman for what he does in England, but the artisans here argue that they can do as much if not more work in eight hours than can be done by their brothers in England in ten hours, and I believe this to be true where proper discipline and control is practised; but of course the same quantity of work cannot be got out of *machinery* in eight hours as in ten. Therefore it is evident that a locomotive made here will cost more than it would if made, *from the same drawing*, where labour is cheaper; but this is not, under the circumstances, sufficient justification for having our engines built outside the Government workshops.

I will now proceed to show the advantages to be gained and the reasons why we should do as I propose.

We have the workshops, the tools—such as no other establishment in the Colony has—the skilled officers and men, all specially suited for manufacturing as well as repairing, and if it is justifiable to do *repairing* it is equally justifiable to *manufacture*; indeed much of the so-called repairing *is manufacturing*.

Unless manufacturing is done the shops and plant will not be fully utilized.

We should now, after the "tests" of the locomotives which were made on the 15th and 16th of June, adopt the simple and efficient class of locomotive and tender, which *we can manufacture*, and the more we simplify the details the less the cost of production will become and the nearer we shall approach the cost of the imported engine, which is usually paid for by weight, and which, however much it is simplified, only puts more profit into the manufacturer's pocket, whereas if *we supply our own engines* we profit most by it ourselves. It is clear, of course, that the simpler an engine is the less it will cost to make and keep in repair, and the more that is done in that direction the sooner we shall balance the higher price of labour here to what it is at home.

Work done by ourselves would be better done, because good work should and would be the *sole aim* of everyone engaged upon it. No *profits* having to be made, all exertions would be thrown into the *quality* and *quantity* of work to be turned out, and all difficulties of "contracts," inspection, and litigation would be avoided. Manufacturers aim chiefly at making large profits, "extras," &c., and as everyone engaged upon this work would see, or soon be caused to see, that the more he worked, and the better he worked in this cause the more he would gain. I think the success of the scheme would be near and certain, especially as there is no novelty about the matter; we should be simply following established precedents.

What is generally known as the American type of locomotive *can* be made here, and we have now lying idle hundreds of tons of good material which could be worked up at once in these proposed new engines, in the bar frames, motions, wheels, cylinders, &c., &c., whereas the English type of engine cannot be so easily made here; for instance, we should either have to import "frame plates" or erect special rolling mills for rolling them.

I have already reported that a simple, a far more efficient, and less costly engine and tender can be made here in our own shops than those proposed and recommended so strongly by the Locomotive Engineer. The correctness of this view is proved by the fact that the Colonial tenders for my passenger engines are £220 less per engine, and £290 less per engine for the goods engine I recommended than the Colonial tenders received for the English type of engine referred to, and as the *average tender* from six English houses for the passenger engines is £2,650, and £2,743 for the goods engines, I am convinced that we can produce in our own shops as good an engine as the imported one for the same price.

One of the most magnificent class of passenger engines and tenders in Great Britain is made by the Great Northern Railway Company at their Doncaster Works, for £2,025 each, and I could name no less than twenty-seven different Railway Companies, in England and America, who make their own engines in their own shops. The Great Western Railway Company made no less than twenty-four new engines during the *half year* ending 31 December, 1886, *at the cost of revenue*, at their own works. In doing this they not only *saved the profit* which would go to manufacturers, and cost of inspection, *but secured the exact type of engine which they knew best suited their requirements*.

The London, Brighton, and South Coast Railway Company have practically rebuilt the whole of their locomotive stock during the past twenty years at their works at Brighton, where they employ 1,200 hands constantly; and I notice in a recent American newspaper that the Pennsylvania Railway Company have given orders for forty new engines to be at once put in hand at their own works at Altoona.

It will be seen from the foregoing that in the building of the locomotives in the Government workshops of the colony the only serious drawback would be the extra cost of labour, for which we should have to pay about double the English price; but on the other hand, in favour of that course, we should save litigation, contractor's *profit*, the cost of inspection, &c., and at the same time secure better workmanship in every respect, and an engine made in every way suited to the special requirements of our railways.

As the latter appears to me to more than counterbalance the former, I have only to repeat my former recommendation in favour of the engines being built in the splendid new shops at Eveleigh.

Randwick Works, Sydney, July 11th, 1887.

THOS. MIDELTON, M.I.M.E.

Minute by The Secretary for Public Works to The Commissioner for Railways.

Department of Public Works, Sydney, 28 May, 1887.

PLEASE write to Mr. A. MORRIS, Agent Baldwin Company, asking him upon what terms his Company will supply twenty-five engines to Mr. Midelton's specification, and twenty-five consolidation goods engines, for delivery f.o.b., New York, and in steam in Sydney; and also to state time of delivery.

JOHN SUTHERLAND.

The Commissioner for Railways to The Agent for the Baldwin Locomotive Works.

Sir,

Department of Railways, Sydney, 28 May, 1887.

I have the honor, by direction of the Honorable the Minister for Public Works, to inquire upon what terms your Company (Messrs. Burnham, Parry, Williams, & Co.) will supply twenty-five engines to Mr. Midelton's specification and twenty-five consolidation goods engines similar to those supplied to the Department in 1879.

I shall be glad if you will state price of delivery f.o.b. in New York, and in steam in Sydney, and also mention time of delivery.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

The Agent for the Baldwin Locomotive Works to The Commissioner for Railways.

Sir,

Norwich Chambers, Hunter-street, 30 May, 1887.

I have the honor, in reply to your letter of the 28th instant (No. 3,120), to say that a cable has this day been forwarded to the Baldwin Locomotive Works, asking them to name prices and times of delivery of the two classes of locomotives referred to by you. Whatever prices may be named will include any modifications or improvements which experience may have suggested to your engineers.

I have, &c.,

AUGUSTUS MORRIS,
Agent.

The Agent for the Baldwin Locomotive Works to The Commissioner for Railways.

Sir,

Norwich Chambers, Hunter-street, Sydney, 2 June, 1887.

I have the honor to communicate the following offers from the Baldwin Locomotive Works for the supply of 100 locomotives.

The Baldwin Company are prepared to deliver f.o.b. in New York or Philadelphia 100 locomotive engines during six months, commencing with December of this year, or with January of next, or as may be preferred.

The price required for the Midelton engines, 8'30 D, is £2,600 for each, f.o.b.

The price required for the consolidation engines, 10'34 E, similar to those shipped to the Government in 1879, or according to the Baldwin Co.'s letter to the Commissioner, dated 31st May, 1884, in reference to an improved type of consolidated engine, is £2,900 f.o.b. The materials throughout to be identical with those on the Midelton engines.

If required to deliver and erect at the Eveleigh Station or Railway works under steam, £300 must be added to the price of each engine.

The terms of payment to be the same as those agreed upon when the twenty Midelton and Mogul engines were supplied in 1884.

In submitting these terms the Baldwin Locomotive Works are prepared to accept any modifications of details which experience may have suggested, but which will not conflict with the general design of the locomotives proposed, or be inconsistent with American practice.

The fullest guarantees of the goodness of the materials and the efficiency of the engines that may be desired will be given.

I have, &c.,

AUGUSTUS MORRIS,
Agent for the Baldwin Locomotive Works, Philadelphia.

Minute of The Commissioner for Railways.

REFERRING to question given in House last night, as to conditions under which the engines advocated by Mr. Scott are to be tested against those recommended by Mr. Midelton, I request that Mr. Scott will furnish me by Monday morning next with proposed conditions of test. Cn.A.G., 20/5/87.

I would recommend that one of each class be put to run the day passenger-trains between Sydney and Bathurst, and an accurate account be kept of the load hauled and the stores consumed.—W. SCOTT, 21/5/87. Commissioner.

The

The Superintendent of Tramway Rolling Stock to The Commissioner for Railways.

IN response to your letter of the 19th instant, I beg to submit the following conditions to be observed in case the 304 class of engines are tested in competition with the new engines from the Vulcan Foundry Co. :—

1. That each officer (Mr. Scott and myself) shall select his own engine, tender, and enginemen.
2. That each engine and tender shall be fairly equipped with coal and water ready for the road, and that the weight on each wheel of engine and tender shall be accurately ascertained before going out; neither engine to have any sand in sand-boxes or water conveyed to any of the wheels.
3. As much coal as may be considered safe by each officer in each case is to be put on each tender, and the said coal to be either Zig Zag or Vale of Clwydd, and to be taken from the same waggon and properly weighed in baskets and put on the tenders, the total weight to be recorded in lbs., and the coal which remains on the tender after the trial in each case shall be taken off and weighed in our presence.
4. The trial trips shall be from Sydney to Eskbank and back, and shall be run to a time-table to be made out by the Traffic Manager, each train to start and return in daylight, and to be timed the same as the Western Mail on the down and up journey.
5. The train to consist of eight of the Redfern carriages (double-bogie type), all to be coupled up as may be directed and properly lubricated and examined.
6. The general condition of each engine, the time each has been running, &c., shall be recorded.
7. The weight of train shall be accurately ascertained.
8. Water to be taken at Sydney, Linden, and Esk Bank only.
9. Each driver to record the trips in the usual manner, and no person to be allowed to ride on the engine or tender except the driver and fireman in each case.
10. Two guards to be supplied by Traffic Department—one to ride in front of train, and the other at the rear, and they shall record the trips in the usual manner.
11. A printed time-table to be supplied to those conducting the tests.
12. As these trials are of great public interest, persons concerned in the matter, to the number of about 100, could be allowed to ride in the carriages as passengers, but they must take no part in the trials or assist in any way. The number of passengers so attending to be ascertained by counting, and this duty to fall to the two guards named.
13. No brake-van to be used. The Westinghouse brake to be worked from the engine on the tender and carriages only.
14. The carriages are not to be uncoupled for any purpose whatever, and the same carriages to be used by each engine in each trial.
15. Each engine and tender shall be oiled and trimmed by each driver the night before the trials, and on the running of the trial the enginemen shall procure from the store the stores they may require on the trip, and the same to be properly weighed and issued to them, and to be duly recorded by storeman and driver on his sheet.
16. Nothing shall be done except Mr. Scott and myself are present to see what is done, and that it is done properly, and be properly recorded.
17. Brake blocks, hangers, and rods to be taken off each engine.
18. Each engine to be tested to blow off steam at 140lb., and the same gauge to be used in each case.
19. Mr. Scott to have sole control of everything the day his engine is tested.
20. Mr. Midelton to have sole control of everything the day his engine is tested.

THOS. MIDELTON, 23/5/87.

The tests proposed by Mr. Midelton are preferable. Will Mr. Scott say if he has any observation to make or any suggestion in connection with them.—CH.A.G., 25/5/87.

Minute by Mr. Locomotive-Engineer Scott.

Mr. Scott's own proposition was to test the engines between Sydney and Bathurst. Mr. Midelton suggested Sydney to Eskbank and return; but I presume there would be no objection to extend the journey from Eskbank to Bathurst.—CH.A.G., 31/5/87.

Mountains, where fast running is not possible with any engine—in fact, such a test would be more applicable to a "Bank" engine than a fast "Passenger" engine, such as mine is. As mentioned in my report of 12th instant, the engines built to my specification by the Vulcan Foundry Co. were intended to compete with fast water-carriage, and reduce the time of running of our principal mail and passenger trains; therefore to confine the trials to a portion of the lines where such advantages would be reduced to the minimum would be manifestly unfair. If it be decided to have the engines tested as to their relative merits under all circumstances, I decidedly think such tests should be conducted under the direction and

This has been arranged for.—CH.A.G., 31/5/87. supervision of properly qualified locomotive experts outside the Department, who would have no interest whatever in the result. I will now particularize some of the objections that occur to me in Mr. Midelton's conditions.

- 1, 2, and 3 I decidedly object to dispensing with anything provided for the more efficient working of the engines, and therefore protest against the sanding arrangements not being availed of, if necessary. To the other conditions I have no objections.
4. I most decidedly object to the trials being confined to this portion of the line. To be fair, they should be made to extend to Bathurst, where the engines have to run with the trains, or from Sydney to Goulburn; and, if possible, a clear run of about 30 miles between stopping-places should be arranged for, so that the speed may be ascertained.

This is not reasonable. Mr. Midelton has said that his first stipulation was, when recommending his design of engine, that his engine would take thirteen vehicles over the mountains; that they did so while he had charge of the Loco Branch, but that since the load, without reason, had been limited to twelve vehicles. Mr. Scott, in his report of 12/5/87, says that Mr. Midelton's engine will soon fail in its usefulness, as the tendency is to increase the load of trains, but if it can take sixteen vehicles its usefulness will increase.—CH.A.G., 31/5/87.

5. The load proposed is equal to sixteen, whereas the train load in regular service for the "304 class" is twelve vehicles. I therefore consider that what is proposed is simply a test of power, where a goods engine will, of course, give better results than a passenger engine, particularly over the portion of the line proposed by Mr. Midelton, chiefly mountain grades, where the running is slow. I consider the "service load" should be adhered to in the trials.

- 6, 7, and 8. As I object to the trials being made over the portion of the line proposed, the places named for watering may not answer. I therefore consider that water should be taken when each considers it necessary, but the time lost in taking it should be calculated.
- 9, 10, 11, and 12. As the engines were not designed for similar services, I think it more than probable that the opinions formed by the public would be fallacious, and therefore consider that any trials decided upon should be purely Departmental. Of course this would not apply to any locomotive experts whose opinions the Commissioner might desire to obtain. The result of the trials could be published for public information afterwards, if deemed necessary.
13. Although I do not apprehend anything occurring that would necessitate the use of a brake-van, there is the possibility of it being required, and therefore it should form part of the train.
14. I, of course, see no objection to the same class of carriages being used; however, that implies that the trials shall be made on different days, when the conditions under which they have to run may be totally different. I therefore consider that the trials should be made on the same day, so that the conditions of running should be as nearly equal as possible, or else have a number of days for each engine.
15. I see no objection to the conditions proposed, excepting as regards the time for oiling. Mr. Midelton can of course have it done when he thinks proper, and I claim an equal privilege.
16. I see no objections to Mr. Midelton, or any one whom he may select, being present to see that the proper thing is done, and I will do what I consider necessary to secure it being done.
17. I most decidedly object to the removal of the brake arrangements. They are part of the engine, and should be retained, and used if found necessary.
18. I have no objections to the pressure of 140 lb., but if the trials are to be carried out on the same day description of gauges would have to be used which could be tested previous to the trials.
- 19, 20. I scarcely see the necessity for specifying these conditions. I assume Mr. Midelton has no desire to interfere in any way with any arrangements I may make in conducting the trials. I certainly shall not in any way attempt to interfere with his.
- In conclusion, I would say that Mr. Midelton appears to be stipulating for conditions to suit as nearly as possible the type of engine he recommends. The conditions laid down should, in my opinion, approximate as closely as possible to those under which our traffic has to be worked, and which a locomotive engineer would be necessarily guided by in ordering his type of engine.

W. SCOTT, 30/5/87.

Minute by The Commissioner for Railways.

WHAT was required was an engine which would take with reasonable speed a heavy passenger train over the Mountains. It was a matter of complaint on my part that the trains could not be controlled except by the use of an assisting engine, and I asked that an engine might be designed to obviate the necessity of two engines being used. Mr. Midelton designed engine Class 304 accordingly, and up to the time of his leaving the Locomotive Branch he says the engine performed the service required—viz., the haulage of a train load equal to thirteen vehicles.

Mr. Scott says that the train load is being increased beyond that, and yet the engine he has designed is not equal to the requirements—at all events he objects to its capacity to take sixteen vehicles being tested, although Mr. Midelton is willing that his engine should be tested to that extent—a condition which Mr. Scott should not be slow to accept if he adheres to his statement that the engine will not take more than twelve vehicles.—CH. A.G., 31/5/87.

Minute by The Commissioner for Railways to The Superintendent of Tramway Rolling Stock.

I HAVE made some remarks upon Mr. Scott's paper, but, notwithstanding, I should be glad if conditions mutually agreed to could be adopted. Mr. Midelton should see Mr. Scott's observations, and, as far as possible, try and meet the objections he has raised. The conditions are numbered 1 to 20. Mr. Scott agrees apparently to 1, 2, 6, 7, 9, 10, 11, 16, 18, 19, 20; of the eleven terms objected to, four—viz., 8, 12, 14, 15—may be considered unimportant.

The remaining five terms can be perhaps modified and agreed to:—

3. Engines carrying and making use of sand.
4. Line upon which test is to be made—Sydney to Eskbank, or Sydney to Bathurst.
5. The weight of train—sixteen or thirteen vehicles.
13. Brake-van attached to train. [I assume that if brake-van is attached the number of carriages will be reduced by one.]
17. Removal of brake arrangements from engine.

CH. A.G., 31/5/87.

The Superintendent of Tramway Rolling Stock to The Commissioner for Railways.

Remarks on Commissioner's M.P. 87-10,284 herewith.

IF I understand the matter correctly, the tests are to be carried out to prove whether Mr. Scott or I have given the best advice, and provided the best class of locomotives for the requirements of the railway department.

Mr. Scott was asked to furnish "Conditions of test," and his reply was brief and unsatisfactory, viz., that each class of engine be put to run the day passenger-train between Sydney and Bathurst, and an accurate account be kept of the loads hauled, and the stores, &c., consumed."

I was also asked to submit "Conditions of test," which I supplied (see Commissioner's M.P. 87-10,450). These having been sent to Mr. Scott for consideration, he, of course, "most decidedly and emphatically protests against many of the conditions stipulated by Mr. Midelton, as they are at variance with the work for which the Vulcan engines were designed and intended to perform." Now, if these engines are not designed to eclipse the performance of all other engines in the service, what are they designed for? Why was another class introduced? Again, he objects to my conditions, but he does not propose better ones, nor give a single reason why he objects to mine. Seeing

Seeing that six of my engines have been working the day passenger-train from Sydney and Bathurst, and also the night mail-trains over the same road for about two years, they have answered that test, therefore I see no use in doing it again; and to put the Vulcan engine on the work, as proposed by Mr. Scott, would mean delay, as many months would be swallowed up before anything like accurate data could be obtained, or correct conclusions arrived at; therefore it is best to decide the question in a couple of days, as I propose, especially as we are about to obtain fifty more engines, and time is of great importance.

There are two questions to decide—one has reference to the type of passenger-engine, the other to the type of goods engine required. I should like to prove, too, that my Suburban Tank-engines are the best we have, because Mr. Scott stubbornly opposed me on that important question also.

The conditions of test I have laid down are fair and reasonable, and I desire nothing but what is strictly right and proper, and if I have "stipulated for conditions to suit as nearly as possible the type of engine I recommend," and can fulfil them, and Mr. Scott cannot, then I hold that to be proof that I provided a better engine than Mr. Scott has, and if the weather is the same on each trial day, I see nothing to reasonably object to. Of course I should select a fine day for each test, and exactly the same conditions as near as can be obtained; but if sand is to be carried and used, I must stipulate that the test shall be made on a wet day in each case. Mr. Scott's objections to my "Conditions of test" is admission that my engine is the best by a long way, otherwise he would gladly work his engine under those conditions. Again, if I alter my conditions to meet *his* views, I should virtually admit that my engine can only do the same work as his; whereas I claim that it can do more, although of the same power, and that it is the best "all round" engine and tender ever put on the New South Wales railways. He states the Vulcan engines were intended to compete with fast water-carriage, and reduce the time of running of our principal mail and passenger trains; so are mine, and not only that, but to haul the "service load" of thirteen loaded carriages up 1 in 30 at any time. This is a matter Mr. Scott overlooks altogether.

He says:—"If it be decided to have the engines tested as to their relative merits under all circumstances, such tests should be conducted under the direction and supervision of properly qualified locomotive experts outside the Department." Of course it is decided to make such tests, and I have drawn up conditions accordingly. (See Com. M.P., 87-10,480.) I state the worst possible circumstances. Nothing more can be done? I do not see the necessity for employing any experts. If Mr. Scott and I obey the same conditions, and test each engine under the same circumstances exactly, I should prefer being judged by the logical-minded men who would attend the trials rather than by "experts," who certainly cannot know more, if as much, of the details of these engines, and the conditions under which they will work on our line, than Mr. Scott or myself. In addition to the tests provided for, I am prepared to attach my engine to a train of thirteen carriages and run it over any portion of the New South Wales lines to any time-table which the Traffic Branch may think proper to (ever) work to. If Mr. Scott wants to test "speed" in preference to "utility," we can have a 34-mile run to Penrith and back for the purpose with the load I name. My reason for stating Eskbank and back was that I considered it the most severe test, and because the journey can be done in one day. I have no objection to extend it to Bathurst or to Bourke, but it will be an unnecessary expense and waste of time. It is astonishing that Mr. Scott has reduced his wheel from 72 inches to 66 to attain "speed." He seems to revel in calling my engine a "goods engine," whereas it is anything he likes to call it, because it will work *any train* which the Traffic Department choose to attach it to; and as it can be safely run at high speeds over the 8-chain mountain curves better than any other, will do 40 miles an hour on straight roads, and take good loads up 1 in 30. I think my conditions approximate as closely as possible to those under which our traffic has to be worked, and which a locomotive engineer would be necessarily guided by in ordering his type of engine. I also think that I have properly provided to have the engines tested as to their relative merits under all circumstances.

The "service load" has always been thirteen carriages up 1 in 30, even with two engines (or say 118 tons exclusive of engine and tender). I should much prefer taking sixteen, as per conditions 5 and 12. If I alter my conditions the relative merits of the two engines will not be tested by a long way, therefore it would be useless to attempt the test at all.

As I claim to have put the best class of engine on the New South Wales lines, as they have done better work than any others, and fulfil conditions which are highly beneficial to the Department, Mr. Scott should now prove with the Vulcan engine that he can do more, and do it better—in short, surpass me in every respect. Otherwise, he has made a serious mistake, and introduced another type of engine and tender without any good reason for so doing. Even if he can do all I claim to do with mine, he will still be wrong, because there was no necessity for altering the type, seeing that we had introduced and adopted a "good (s) engine."

- 1, 2, and 3. Mr. Scott objects to running without sand, because he knows now that the "adhesion" is insufficient, although it is a heavier engine than mine by about 2 tons. Does anyone consider it fair to use sand on a dry rail in starting if an engine is properly proportioned? The utility of Mr. Scott's engine entirely depends upon the use of sand; and if he runs out of sand between two stations where sand can be obtained he will delay traffic, and fail to make much "speed" even with a 66 wheel. My engines carry sand, but it is rarely used—indeed I may say never used. I need not point out the economy of this.
4. I am not at all particular where the trials take place—any part of the N. S. Wales lines will suit me—but I thought I would stipulate the worst case I could think of, and do the work expeditiously and cheaply. I willingly consent to run to Bathurst, but four days will be occupied instead of two. If Mr. Scott wants to test "speed," I will undertake to haul a greater load than his engine can, and at a higher speed.
5. As the Vulcan engine gives off 141.14 lb., and my engine 140.40 lb. of power, why does Mr. Scott object to the load I propose, for, as regards power, his is a "goods engine" as well as mine. I too "consider the service load—that is, thirteen loaded vehicles—should be adhered to" in these trials, or 8 double bogie Redfern cars, with 100 passengers.
- 6, 7, and 8. I do not object to Mr. Scott's proposal *re* taking water and coal; but, as my engine can run from Sydney to Linden (and probably to the bottom points at Lithgow) without taking water, and from Sydney to Bathurst and back without taking coal, I need not point out to the Commissioner the great economy of being able to do that.

- 9, 10, 11, and 12. If the engines are "not designed for similar services" they will be *used* in similar service, that is certain; and whether the trials are departmental and private, or entirely public, I do not mind in the least, but I prefer being judged openly by those who may see fit to attend, as well as by one or two whose duty it may be to decide the question. In my opinion it is more of a public question—than it is one for experts; and I have no fear of the public being able to correctly judge which is the best engine for our railways if they see the facts as they take place.
13. The reason I stipulated carriages only was that the continuous brake shall be worked by the driver exclusively; and, as Mr. Scott does not apprehend anything occurring that would necessitate the use of brake-van, I think the matter should stand as it is.
14. I propose to make a trial on two different occasions with the same carriages under exactly the same conditions in each case for each engine as far as it is possible, the same persons to attend each trial, &c., and nothing could be fairer.
15. Of course each driver may oil, &c., as he likes before starting, but I must see Mr. Scott's engine oiled, and he may see mine oiled, but it should be done as I say to be fair to both, and to ascertain the consumption of stores on the trial trip.
16. If Mr. Scott chooses to allow some person to act on his behalf I have no objection, but whatever he does I must see it, and it shall be binding on him, but I consider he should act himself, and not delegate his powers to any one, and that condition 16 stand.
17. I have no objection to the engine brake-gear remaining on, but it should, in my opinion, be taken off in such trials as these.
18. The steam-gauge will be the same for each engine; it will be tested before being used on each engine, and also afterwards.
- 19 and 20. The conditions were made to prevent others from interfering. I certainly will not interfere with Mr. Scott's trial; but, as he is Loco. Engineer, some one may understand that he would be in charge the day of my trial, whereas this should not be the case.

I consider the conditions as originally submitted should be printed and adhered to—they are fair and reasonable—and if properly and courteously regarded there should be no difficulty or dispute whatever. Mr. Scott appears to consider "speed" everything. I, on the other hand, think general utility the main question, and I have provided conditions of test and an engine accordingly. If he cannot comply with my conditions he must be held answerable for that. I know my engine will do all he wants. Will his engine do all I want? if so, the way I suggest will test and settle the question.

Randwick Works, June 3/87.

THOS. MIDELTON.

Minute by Mr. Locomotive-Engineer Scott to The Commissioner for Railways.

HAVING read the conditions for the trials of the two types of engine, I again most strongly protest against any portion of the engine being interfered with in any way whatever. Each engine should be fully equipped and in efficient working order, including sand in sand-boxes and all brake-gear and appliances as in ordinary train-working, so as to be available if required.

I would also again point out that equal to twelve carriages is the maximum load for the Vulcan engines on the 1 in 30 grades. If thirteen are put on I take no responsibility.

These engines are designed to work through passenger traffic, not merely for use as bank engines.

From ten to eleven carriages is the usual load from Penrith, and the Vulcan engines are quite equal to all that is required of them for general passenger trains on all lines.

W. SCOTT, 13/6/87.

It seems to me that Mr. Scott gives up the whole contention by this representation. Mr. Midelton claims that his engine will do all and more than the Vulcan engine will do. It will take as great a load and will run as fast. It was designed to take thirteen carriages over the Zigzag, and Mr. Scott's engine should do the same. If it will not, and Mr. Midelton's engine will run as fast, then it seems to be clear there was no justification for ordering another type of engine, and Mr. Scott has not consulted the best interests of the Department in doing so. Submitted for Minister's consideration. I still think the testing should be proceeded with upon the conditions named, and if Mr. Midelton's engine does the work (and it must be remembered that Mr. Scott has practically said it will not do it, for in working, he has refused to allow it to take thirteen carriages up the Zigzag without an assistant engine—an expense the engine was designed to save, then I think it will be established, even if Mr. Scott's engine also does the work, which, however, he says it was not designed to do) that Mr. Midelton's design should not have been departed from in ordering new engines.—CH. A.G., 14/6/87.

Approved.—J.S., 14/6/87.

Write separate memos. to Mr. Scott, and say that testing must take place under the conditions issued. That his engine, the Vulcan, will be tested on Wednesday, and Mr. Midelton's on Thursday. Ask traffic manager to arrange for the running in accordance with time-table for the tourists' run on holidays, that is as regards time of departure, &c., &c.—CH. A.G., 14/6/87.

Minute by The Chief Clerk to Mr. Locomotive-Engineer Scott.

WITH reference to your minute of yesterday's date on the subject of the tests to be made of the engines designed by Mr. Midelton and yourself, I am desired by the Commissioner to inform you that the testing must take place under the conditions issued.

The engine built by the Vulcan Company is to be tested to-morrow, and Mr. Midelton's on Thursday.
B.C., 14/6/87.

D. C. M'L.

Minute by The Chief Clerk to Mr. Locomotive-Engineer Scott.

THE Commissioner has written the following minute :—

“If the trials be made beyond Lithgow it will mean that four days instead of two will be consumed in the trials. The trials will not commence till Wednesday morning. On Friday we shall require all our rolling stock to meet the requirements of the excursion traffic for Jubilee.

“I must therefore decide that the tests be made between Sydney and Lithgow, and be concluded on Thursday night.”

Please note the above decision.

Telegram.

Testing relative capacity of Engines.

TELEGRAPH to Mr. Speight as under :—

“Can you allow your Acting Locomotive Engineer, Mr. Alison Smith, to come to Sydney for three days next week, or the following week, to test the relative merits of two classes of engines? The Minister for Works will be greatly obliged if you can do this.”

C.H.A.G., 19/5/87.

Telegram sent accordingly.—J.E.P., 19/5/87, 12:30 p.m.

The Commissioner for Railways to F. Roberts, Esq.

Sir,

11 June, 1887.

With reference to the trial which is to be made of the two classes of locomotive engines recommended by the locomotive engineer and Mr. Midelton respectively, I have the honor to inform you that Mr. Secretary Sutherland has approved of your appointment in conjunction with Mr. Smith, of the Victorian railways, to conduct the said test, and I enclose herein a copy of the conditions under which the relative merits of the engines shall be ascertained.

I have, &c.,
CHAS. A. GOODCHAP,
Commissioner for Railways,
(Per A.R.)

The Commissioner for Railways to The Assistant Locomotive Engineer, Victorian Railways, Sydney.

Sir,

15 June, 1887.

With reference to the trial which is to be made of the two classes of locomotive engines recommended by the locomotive engineer and Mr. Midelton respectively, I have the honor to inform you that Mr. Secretary Sutherland has approved of your appointment, in conjunction with Mr. F. Roberts, of the South Australian railways, to conduct the said test, and I enclose herein a copy of the conditions under which the relative merits of the engines shall be ascertained.

I have, &c.,
CHAS. A. GOODCHAP,
Commissioner for Railways.

The Relative Merits of Locomotive Engines belonging to Classes of Nos. 305 and 373.

Messrs. Allison D. Smith, M.E., and T. Roberts, C.E., to The Commissioner for Railways.

Sir,

Melbourne, 22 June, 1887.

In compliance with the request contained in your letter, No. 87/11,622, dated the 11th inst., and your memo. of conditions of tests, a copy of which we attach (Appendix A), asking us, by the direction of the Honorable the Minister for Works, to conduct practical experimental tests with the classes of locomotive engines recommended respectively by the Locomotive Engineer and Mr. Midelton, we have the honor to report as follows:—

The engine, No. 373, selected by the Locomotive Engineer is a new one, of a type very favourably recognized and much used in England, but following the American practice in having outside cylinders, horizontal steam-chests, and the swinging link four-wheel leading bogie.

The specification was framed by the Locomotive Engineer, but the engine was designed in England, and built by the Vulcan Foundry Company, of Newton-le-Willows, Lancashire, and had run up to the date when the tests were made 2,323 miles. It was in first-class order, although, like all new engines, doubtless a little stiff.

The engine, No. 305, selected by Mr. Midelton, is one of the well-known American "Mogul" type, fitted with De Lacy's patent balanced slide valves, and built by the Baldwin Locomotive Company, of Philadelphia, United States; it had run 41,970 miles, up to May 31st last, since it was put upon the rails, and nothing had been done to it except ordinary running-shed repairs; the tires were considerably worn, and the bearings generally very free, otherwise it was in first-class working order.

General outlines of both engines, marked B and C respectively, are attached to this Report as appendices.

Before proceeding to make the practical tests over the mountains, we accurately weighed each engine in steam, and tender fully equipped with coal and water, carefully recording the weight upon each wheel; these are detailed in Appendix D.

A comparative table below shows that, while the engines are of almost equal tractive power per lb. of effective pressure on the pistons, the "Mogul" engine, owing to the greater weight on the coupled wheels (there being six in this class as against four on the "Vulcan" engine) has a larger percentage of weight available for adhesion at the expense of a longer rigid wheel base and the disadvantage of coupling in a third pair.

The number of lb. of tractive power per ton of load on the coupled wheels in the "Mogul" is an average one, while that in the "Vulcan" engine is excessive.

No. of Engine.	Type.	Cylinders.		Wheels.		Tractive Power per lb. of effective steam-pressure.	Weight on coupled wheels.	Initial lbs. Tractive Power per ton of load on coupled wheels.	Rigid wheel base.
		Diameter.	Stroke.	No. coupled.	Diameter.				
373	"Vulcan"	in.	in.	4	ft. in.	142.2	tons. cwt.	5.05	ft. in.
305	"Mogul"	19	26	6	5 0	140.4	28 3	4.12	8 3
		18	26				34 0		15 0

As will be seen by the diagram of general outlines (Appendix B) the tender of the "Vulcan" engine is carried on six (6) wheels, having a rigid base of 11 feet 6 inches, with a water capacity of 2,500 gallons, and space for $4\frac{3}{4}$ tons of fuel; total weight loaded 29 tons 17 cwt.

The "Mogul" tender is carried on two (2) 4-wheeled bogies, the greatest rigid base being 4 feet 6 inches, with a water capacity of 2,925 Imperial gallons, and space for 5 tons of fuel; total weight loaded 32 tons 6 cwt.

On the 15th instant we made the experimental trip with the "Vulcan" engine, starting at 7 a.m., and working to a time-table specially prepared by the traffic officers to the speeds of the "Western mail." (Appendix E.) The load consisted of six (6) bogie cars, and weighed in our presence totalled, including passengers, 102 tons. The length of the cars over buffers was 273 feet. The steam-pressure gauge was carefully tested, and the safety-valves loaded to stand a pressure of 140 lb. per \square inch. Deducting allowances for stoppages and detentions on the road, the engine lost six (6) minutes between Sydney and Penrith, and eight (8) minutes from Penrith to Katoomba; but gained $18\frac{1}{2}$ minutes between Katoomba and Mount Victoria, and $7\frac{1}{2}$ minutes between Mount Victoria and Eskbank, which station was made the termination of our trials. The whole journey was run in 12 minutes less time than that allowed by the time-table.

It was a fine bright morning, but until the sun attained a considerable altitude the rails were slippery with hoar frost in the cuttings; we found it absolutely necessary to allow the free use of sand to keep the engine from stopping altogether when slipping commenced, and water was sparingly used two or three times on the flanges of the tender wheels.

We travelled on the engine together during the whole distance over the mountain, and observed that on no part of the ascent could proper advantage be taken of the large cylinder power, steam having to be cut off at $52\frac{1}{2}$ per cent. of the stroke, or thereabouts, to avoid slipping. When urged beyond this, even on a dry rail, it required all the driver's attention to prevent slipping.

The principal time lost was between Wentworth Falls and Katoomba, steam gradually falling to 105 lb. pressure per square inch till at about the $65\frac{1}{2}$ -mile-post, on a rising gradient of 1 in 33, and in an

8 and 10 chain reverse curve it finally came to a dead stop, where we remained for two minutes until steam rose to full boiler pressure, when a start was effected without difficulty. The curves were taken quite easily, and the engine was very steady on the foot-plate at all speeds, the highest rate of which we noted on any portion of the journey being 40 miles per hour, and we do not think this was exceeded.

On the day following we made the second experimental trip with the "Mogul" engine, leaving Sydney at 8.45 a.m., or 1 hour and 45 minutes late, owing to an accident in the running-shed yard. The same pressure gauge was used as on the previous day, and the safety-valves weighted to blow off at the same pressure as the "Vulcan" engine, viz., 140 lb., the same train was also taken.

Deducting allowances for stoppages and detention on the road, the time occupied in running between Sydney and Penrith was $19\frac{1}{2}$ minutes faster than allowed by time-table; between Penrith and Katoomba, $18\frac{1}{2}$ minutes were gained; between Katoomba and Mount Victoria, $18\frac{1}{2}$ minutes were gained; and between Mount Victoria and Eskbank, $11\frac{1}{2}$ minutes—equal to a total gain of 68 minutes over time-table time for the whole journey. It was a fine bright morning, and as we reached the mountains later than on the previous day, there was less frost on the rails, which was decidedly in favour of the engine. No sand or water on the wheels was used, and on this trip the engine only slipped occasionally. When working up the steepest gradients steam was cut off at $70\frac{1}{2}$ per cent. of the stroke, and the engine appeared to be thoroughly master of the work, indeed the great gain in time during the ascent shows that the load might have been increased with safety. It should, however, be observed that, in approaching the same portion of the road where the "Vulcan" engine stopped, the steam-pressure in this case likewise fell, and the driver had allowed the water to get so low that it disappeared from the gauge-glass and gauge-taps and did not again show until we had been standing at Katoomba for $1\frac{1}{2}$ minutes with both injectors full on. This engine also took the curves very easily and was quite steady at the highest speed we noted, viz., 45 miles per hour. Analysis of running given below:—

ANALYSIS OF RUNNING.

Stations.	Miles.	Minutes by Time-Table for Running.	Actual Running Time.		Time compared with Time-Table.			
			Engine No. 373.	Engine No. 305.	Faster.		Slower.	
					Engine No. 373.	Engine No. 305.	Engine No. 373.	Engine No. 305.
		h. m.	h. m.	h. m.	Minutes.	Minutes.	Minutes.	Minutes.
Sydney								
Penrith	34	1 10	1 16	0 50 $\frac{1}{2}$		19 $\frac{1}{2}$	6	
Katoomba	32	1 55	2 3	1 36 $\frac{1}{2}$		18 $\frac{1}{2}$	8	
Mount Victoria.....	11	0 40	0 21 $\frac{1}{2}$	0 21 $\frac{1}{2}$	18 $\frac{1}{2}$	18 $\frac{1}{2}$		
Eskbank.....	17 $\frac{1}{2}$	0 47 $\frac{1}{2}$	0 40	0 36	7 $\frac{1}{2}$	11 $\frac{1}{2}$		
Total	94 $\frac{1}{2}$	4 32 $\frac{1}{2}$	4 20 $\frac{1}{2}$	3 24 $\frac{1}{2}$	26	68	14	

We regret that the time at our disposal was entirely too short to enable us to take indicator diagrams, because had we been able to do so we could have stated exactly the horse-power that each engine developed at various portions of the journey.

The following table analysis shows the consumption of fuel, water, and stores, with the work executed in train miles run:—

Engine.		Train Miles.	Fuel.		Water.		Lubrication—Oil and Tallow.	
Description	No.		Total lbs.	Lbs. per mile.	Total gallons.	Lbs. evaporated per lb. of coal.	Total lbs. used.	Lbs. per 100 miles.
"Vulcan"	373	189	9,355	49.5	7,025	7.5	12.25	6.48
"Mogul"	305	189	11,751	62.17	6,141	5.22	11.25	5.95

The excessive consumption of fuel by the "Mogul" engine is probably due to the high average speed of 20 miles per hour at which the ascent was made, the difference in levels between Penrith and Katoomba being 3,247 feet, equal to a constant gradient of 1 in 52 for 32 miles, with numerous curves of very short radius; the ruling gradient was 1 in 30 for 2 $\frac{3}{4}$ miles, and the sharpest curve, 8 chains radius reverse. In descending, and throughout the trials, the Westinghouse automatic air brake, with which the cars and tenders were fitted, was used exclusively to control the speed and in station stops.

In conclusion, we are of opinion that the six-coupled engine recommended by Mr. Midelton is more suitable than the four-coupled engine recommended by the Locomotive Engineer for the particular class of traffic and road on which the experiments were made. The trials showed conclusively that the "Vulcan"

"Vulcan" engine had not sufficient adhesion on the coupled wheels to utilize its great tractive power. The specification shows that the makers were authorized to load the coupled wheels up to 30 tons in the first place, and in a letter to the consulting engineer in London, a press copy of which was shown to us, and an extract from which we attach (see Appendix F), the Locomotive Engineer subsequently authorized 32 tons as a maximum. We consider that those who were responsible for designing the engines in England should have worked to the authorized maximum of weight, or in departing from that, have made a corresponding reduction in the tractive power of the engine. Had this been attended to the engine would have been well-proportioned, although the weights on the coupled wheels would have been severe on the road. The advantage of the six coupled engine recommended by Mr. Midelton is, that it has 34 tons of distributed weight availed of for adhesion, the greatest load on any pair of wheels being 12 tons—thus making it lighter on the permanent way, and able to utilize the full amount of tractive power developed in the cylinders; it has also the advantage of greater heating surface than the "Vulcan" engine.

We desire to express our high appreciation of the great courtesy extended to us by the Locomotive Engineer and his staff, who afforded us every assistance, and cheerfully supplied us with all the information and data that we required.

We have, &c.,

APPENDIX A.

Government Railways—Minute Paper.

Subject: Condition of testing Engines designed by Mr. Scott and Mr. Midelton.

I HAVE considered the proposals and the objections raised to some of them and believe that justice will be done, and the relative merits of the engines ascertained by the observance of the following conditions:

1. That Mr. Scott and Mr. Midelton shall each select his own engine and tender and enginemmen.
2. The engines and tenders to be fully equipped, having a full complement of coal and water; if the day be fine and dry no sand to be placed in the boxes, and no water be conveyed to any of the wheels. If, in the judgment of the experts, the rails are greasy, sand may be used. The weight upon each wheel of engine and tender to be carefully ascertained before going out.
3. As much coal as may be considered safe by each officer in each case is to be put in each tender, and the said coal to be either Zig Zag or Vale of Clwydd, and to be taken from the same waggon and properly weighed in baskets and put in the tenders, the total weight to be recorded, in lbs., and the coal which remains on the tenders after the trial in each case shall be taken off and weighed in the presence of Mr. Scott and Mr. Midelton.
4. The trial trips shall be from Sydney to Bathurst and back, and shall be run to a time-table to be made out by the Traffic Manager, each train to start and return in daylight, and to be timed the same as the Western Mail on the "down" and "up" journeys.
5. The train to consist of rolling stock equal to thirteen carriages, and amount of dead weight to be added equivalent to the weight of passengers if the carriages were filled, the carriages, &c., to be coupled up as each competitor may direct, and properly lubricated, &c.
6. The general condition of each engine, the time each has been running, &c., shall be recorded.
7. The weight of train shall be accurately ascertained.
8. Water to be taken as required, the watering stations to be previously arranged.
9. Each driver to record the trips in the usual manner, and no person to be allowed to ride on engine or tenders except the drivers and firemen in each case and the experts.
10. Two guards to be supplied by the Traffic Department, one to ride in front of van and the other at the rear, and they shall record the trips in the usual manner.
11. A printed time-table to be supplied to those conducting the tests.
12. Press reporters and others, numbering not more than twenty-five (carefully checked by the guards of the trains), to be allowed to travel in the carriages only of the train; they are to be spectators only, and not to interfere in any way with the trial.
13. The train to be worked exclusively by the Westinghouse brake and by the enginemmen only; the use of the brakes on the engines to be prohibited; if a brake-van form a portion of the train all parts admitting of manipulation of the brake to be removed from the brake-van.
14. The carriages are not to be uncoupled for any purposes whatever, and the same carriages to be used by each engine on each trial.
15. Each engine and tender shall be oiled and trimmed by each driver the night before the trial, and on the running of the trial the enginemmen shall procure from the stores the stores they may require on the trip, and the same to be properly weighed and issued to them, and duly recorded by storeman and driver on his sheet.
16. Brake blocks, hangers, and rods to be taken off each engine.
17. Each engine to be tested to blow off steam at 140 lb., and the same gauge to be used in each case.
18. Mr. Scott to have sole control of everything the day his engine is tested.
19. Mr. Midelton to have sole control of everything the day his engine is tested.

The testing of these engines will be accomplished under the supervision of two (2) Locomotive experts, who may make joint or separate reports.

They will be appointed by the Minister of Public Works.

The testing to take place between Tuesday, the 14th, and Friday, the 18th instant.

This train will also stop at Emu Plains, Lucasville, Blaxland, Karaba, The Valley, Faulconbridge, Numantia, Woodford, Hazelbrook, Medlow, and Hartley Vale—allowing 30 seconds at each place.
Line must be kept clear for this train.
Acknowledge receipt by wire at once.

Traffic Manager's Office,
Sydney, 14th June, 1887.

W. V. READ,
Traffic Manager.

APPENDIX F.

Extract from letter from Mr. Scott to Mr. J. D. Baldry, dated 16 March, 1886.

WITH reference to the cable *re* the greatest weight that can be carried on the driving wheels of the twelve engines which are being built by the Vulcan Company, there is nothing in the way of (say) 16 or 32 tons on the four coupled wheels. I hope by this time the matter has been satisfactorily arranged.

Minute of The Commissioner for Railways.

Report of Messrs. A. Smith and F. Roberts, Locomotive Officers, Victoria and South Australia, on certain engines tested by them.

FORWARD copy of report to Mr. Midelton for any observations he may wish to make thereon.

I wish the report made not later than the 6th July.

CH.A.G., 2/7/87.

Minute by The Superintendent of Tramway Rolling Stock.

THE report of these gentlemen fully confirms my report of the 19th April last to the Hon. the Secretary for Public Works, and leaves no doubt whatever as to which class of locomotive is best for the New South Wales lines.

I will now only make remarks where I think it necessary to do so.

1. I do not quite understand what these gentlemen were requested to do.

2. The 373 type of engine is much more "favourably recognized and used" in America and Australia than it is in England, Messrs. Smith and Roberts to the contrary notwithstanding; the horizontal steam-chests on the tops of the cylinders are bad imitations of American practice, being so very unhandy.

3 & 4. I would point out that "up to date when the tests were made" my engine having made 40,000 more miles than the other, has, of course, more frictional resistance than a brand new engine with tires turned perfectly true.

7. It is admitted that a six-coupled engine is absolutely necessary, and that a four-coupled engine will not do for these lines (at least for the first 200 miles from Sydney in any direction), and although the rigid wheel base is long, my engine will traverse curves with less friction than No. 373 will; and the condition of the flanges of her tires proves this. I doubt if the tires of 373 nine months hence will bear favourable comparison.

I should be glad if it were shown how the same results can be better obtained without "the disadvantage of coupling in a third pair" of wheels. Mr. Roberts himself has been compelled to put a 10-wheeled *six*-coupled engine on the Adelaide and Melbourne line for working passenger trains, the said coupled wheels being 6 inches *smaller* in diameter than my engine, and it has singularly enough the same grave defect as Mr. Scott's engine, viz., not enough weight for adhesion.

8. It has but 28 tons 8 cwt. 3 qr., although the tractive force is more than either Mr. Scott's engine or mine, and the grades are 1 in 45 there against 1 in 30 here. Mr. Scott unwisely carries 16 tons 10 cwt. on his (four) bogie wheels; Mr. Roberts carries 10 tons 14 cwt. on his (four); and I carry 7 tons only on two wheels when the engine springs are properly adjusted. No. 305 now I notice carries 8 tons 15 cwt., which indicates that the springs required adjusting, and although "the larger percentage of weight available for adhesion" is obtained "at the expense of a longer rigid wheel base," it is admitted that No. 305 "took the curves very easily, and was quite steady" at a speed of 45 miles an hour; and had the judges made templates of the "treads" of all her tires as they are now worn after running 42,000 miles over 8-chain curves, and published diagrams from them, with the diagrams of "general outlines," the information would have been valuable and interesting.

9. Nothing is said about the dangerous height the coal was stacked on 373; it was quite 18 inches higher than the top of the tender, and large lumps had to be specially packed round the sides and end to enable 4½ tons to be carried at all. The weight, too, per wheel was 5 tons, and often, no doubt, exceeds 8 tons, as the springs are not compensated. My tender wheels have a constant load which never exceeds 4½ tons on any condition of road. Other advantages have been overlooked. The fact of being able to carry coal enough for a trip from Sydney to Bathurst, or Goulburn, and back is very important; this of course saves the haulage of coal to those places in waggons, and also the various loadings and unloadings. On the trial trip my tender ran from Lawson to Esk Bank and back (74 miles) without taking water. In these items alone I consider the saving will equal the first cost of the ten engines in a few years.

12. The judges should have said "we were—in opposition to the conditions of test—compelled to allow sand to be used on a dry rail a great many times with No. 373 to enable us to get the engine along." I saw sand used on a dry rail and water used at the same time on the tender tires, which lubricated them and washed the sand off for the train to run easier; I did not use sand or water on the rails, nor was it necessary with 305 engine.

13. In this paragraph it is admitted that the large cylinder power cannot be utilized, proving my words that "their unsuitability will be established on trial." The start at 65½ miles from Sydney would not have been made at all if sand had not been used freely, and at that time the sun had nearly attained its greatest altitude, and the rails were quite dry and clean.

15. I am sorry the judges do not inform you that I pointed out to them that the train was not the weight I expected it would have been, and on the morning of my trial I had another carriage put ready for attaching to the train, but this was not allowed. I then directed my driver to *make good time* at all stations, and to show that my engine could handle such a train with ease and better than it was handled on the previous day by No. 373. This was done, and *sixty-eight minutes* made in a journey which should have taken 272.5 minutes (one-quarter less time than that allowed).

16. Due allowance is not made for the serious nature of the accident in the Eveleigh yard with my engine before it started. I am not surprised that the coal consumption was greater than with 373 under such conditions. At 6:20 a.m. my engine was backing out; it ran through a pair of facing-points which had been wrongly left open; the tender was nearly upset, and the driver of course "banked his fire," and never expected to go out at all that day; there was, however, a delay of one and three-quarter hours, and in great confusion another tender was obtained, and a start made at 8:45 from Redfern with a spoiled fire, coal consumed while standing, signals against us, and stops made several times during the first 13 miles; the driver and fireman both disheartened with what had occurred—and yet, with all this and a dirty boiler (which had been in use two and a quarter years), an *odd* tender and a whole set of tires which required turning up, better speed was made than with the new engine, and considering that more work was done in the greater speed run, it is not difficult to see why more coal was consumed. I think that the coal, oil, and tallow consumption for the work done during the past two and a quarter years with my engines will compare favourably with any other engine on the New South Wales lines.

My engine "only slipped occasionally," and that was when starting from one or two wayside platforms, where the driver seemed impatient and to think it unnecessary to stop at all. The load could not only have been increased with "safety," but with advantage, and it is satisfactory to know that time was *gained* on the *heaviest parts of the road*.

19. The judges must, I am sure, admit upon reflection that the account of coal consumed and water evaporated per lb. of coal burned is most erroneous. A lot of coal was wasted in being shovelled hurriedly (some 8 feet) from the damaged tender to another tender. Indeed, no such accurate account of my coal was kept as was kept with Mr. Scott's engine. I do not see how the water evaporated per lb. of coal is to be accurately accounted for. In my case very little water was wasted by the injectors, whereas the Vulcan engine wasted immense quantities every time the injectors were used. I am not aware that the water which *entered* the boiler of either engine was accurately gauged, and unless this be done any data concerning evaporation is wrong and misleading.

The quantity of water drawn from each tender was roughly gauged, but all of it did not go into the boilers, and of course, as the Vulcan engine wasted most, the evaporation is said to be the highest. I am inclined to think that, as my boiler did the most work, the evaporation in it was highest.

The oil and tallow consumption is not accounted for in accordance with conditions of test.

21. I cannot conclude without remarking that there is to my mind evidence in the report of partiality, and a desire to tone down the defects in the Vulcan engine, so as not to reflect on the Locomotive Engineer, and this is hardly to be wondered at, seeing that Mr. Scott, some three years ago, thought fit to recommend Mr. Smith for the position of assistant to himself, and subsequently recommended Mr. Roberts for the same position, although I was his assistant at the time.

I beg most urgently to direct your attention to all I have said in my former report (dated 19 April, 1887), and compare the salient points in the report now submitted by Messrs. Smith and Roberts.

THOS. MIDELTON, M.I.M.E., 5/7/78.

REFERENCE to "Engineering" of April 15 and 29 last will show further proof of the correctness of my views. On page 407 there is an illustration of a six-coupled engine, which has 5' 2" wheels and 20" x 24" cylinders, giving off but 14 lb. of power more than my engine. This engine is used for "hauling passenger trains over the mountains, which formerly required two of the (Lehigh Valley Railroad) Company's engines of the ordinary construction." It is also said "there has been of late years a growing demand that heavy trains should be hauled at express speeds, and while anxious to comply with this demand, railway managers are unwilling to reconstruct their roads entirely with heavier rails, and to rebuild all their bridges, owing to the enormous outlay of capital that such a course would involve. The object of the design shown is to produce an engine able to cope successfully with very heavy express trains, while keeping the weight per axle much the same as it is on existing engines of the ordinary type." I need hardly say that this has been the object I have had in view for many years.

T.M.

Minute by The Commissioner for Railways.

Subject: Report of Messrs. A. Smith and T. Roberts, Locomotive Officers, Victoria and South Australia, on certain engines tested by them.

FORWARD copy of report to Mr. Scott for any observation he may wish to make thereon.

I wish the report made not later than the 6th July.

CH.A.G., 2/7/87.

Minute by Mr. Locomotive-Engineer Scott to The Commissioner for Railways.

As desired by the Commissioner, I have looked through the printed report forwarded by Messrs. Alison D. Smith and T. Roberts, the two experts appointed to test the relative merits of locomotive engines belonging to the classes Nos. 305 and 373.

I find page 3 of the printed report is confined principally to a description of the engines. This was so well known by yourself previously that comment is uncalled for.

In the first paragraph on page 4 (after describing the load taken by the Vulcan engine) deductions are drawn which are not quite correct, as will be seen by comparing the time-table prepared by the traffic branch with the "running time" shown on the "report sheets" of the driver and guard. The experts state that the engine lost 6 minutes between Sydney and Penrith. By the time-table, 1 hour 26 minutes was allowed for the run. The actual time taken (according to the statement of the experts themselves) was 1 hour 16 minutes, so that instead of losing 6 minutes the run was accomplished in 10 minutes less than the time allowed. Then the experts state that 8 minutes were lost between Penrith and Katoomba.

The

The time-table allowed 2 hours 19 minutes for the journey, but the actual running time was 2 hours 18 minutes; therefore, instead of 8 minutes being lost, 1 minute was gained. Again, the experts state that the run from Katoomba to Mount Victoria was accomplished in $18\frac{1}{2}$ minutes less than the allotted time, but seeing that the allotted time was 27 minutes, and the actual time taken was 23 minutes, it follows that the time gained was only 4 minutes, and not $18\frac{1}{2}$, as stated. The actual running time from Mount Victoria to Esk Bank was 43 minutes, and the allotted time 48 minutes, so that the journey was done in 5 minutes less than the allotted time, and not $7\frac{1}{2}$ minutes, as stated.

It will thus be seen that the Vulcan engine did the whole journey from Sydney to Esk Bank in 17 minutes less than the time allowed, and not 12 minutes, as stated by the experts.

The second paragraph describes a condition of the road which, at this season of the year, may naturally be expected as of almost daily occurrence; and I stipulated, in accordance with the universal practice, that sand-boxes should be fitted to the engines, in order that the difficulty and danger of slipping under such circumstances might be reduced to a minimum. With reference to the free use of sand, which the experts state was absolutely necessary to keep the engine from slipping, I may state only $1\frac{1}{2}$ cubic feet of sand were used.

Water was only applied once (and that was on the *up journey*), and then only for the purpose of cooling the brake-blocks after arrival at Springwood. The condition of the brake-blocks even then did not absolutely demand it.

Paragraph 3 calls for little comment beyond the fact that the engine took a load in excess of that for which it was designed at an expenditure of 7,740 cubic inches of steam in each cylinder for each revolution of the wheel.

Paragraph 4 records an important fact as to the hauling power of the engine. It is clearly demonstrated that on a rising gradient of 1 in 33, and in an 8 and 10 chain reverse curve, the engine (with a normal boiler pressure) started its load without difficulty. Want of proper care and attention on the part of the driver and fireman may have been the cause of the stoppage on the bank. This neglect, however, afforded an opportunity of testing the capability of the engine starting on a grade of 1 in 33, and it is gratifying to know that the result was so satisfactory, for it has established beyond question the correctness of my calculations as to what the engine would do.

With reference to the performance of engine No. 305 on the following day, I note that the experts state the conditions of the road were decidedly in favour of the engine, yet we are told that she slipped occasionally, and that sand was not used. I submit that if the engine slipped under such favourable conditions as regards the state of the road it may fairly be inferred that had the road been in the same state as it was on the previous day the use of sand would have been absolutely necessary. The use of sand for the prevention of slipping cannot be said to militate against the usefulness of either engine.

The steam is said to have been cut off at $70\frac{1}{2}$ per cent. of the stroke. This means that the engine took its load at an expenditure of 9,328 cubic inches of steam in each cylinder for each revolution of the wheel, or 1,588 cubic inches per revolution more than the Vulcan.

In other words, engine 305 used more steam by 440 cubic feet per mile than the Vulcan engine.

The running time of the engine, as stated by the experts, will also be found to be incorrect.

For instance, the time allowed for the run from Sydney to Penrith was 1h. 26m. The actual time occupied was 1h. 9m., but the experts in their analysis of running state $50\frac{1}{2}$ m., clearly showing that the deduction as to running is incorrect in both cases.

Each engine is stated to have taken the curves easily, and to be steady at all speeds, but the Vulcan is assumed to have run at 40 miles an hour, and the Mogul at 45 miles per hour. I may state no instructions were given by me to run otherwise than in accordance with the time-table, so that nothing can be deduced from the results of these trials to show that the Mogul is superior to the Vulcan as to speed capability.

On page 5 it is clearly shown that in the consumption of fuel the Vulcan engine is decidedly the more economical, viz., 49.5 lb. per mile for the Vulcan, as against 62.17 lb. per mile for the Mogul. I note the experts state that the probable cause of the excessive use of fuel by the Mogul engine was on account of the high average speed at which the ascent of 1 in 52 for 32 miles was made.

I scarcely think that such a deduction would be accepted as conclusive, and in justice to the experts I must say that they do not assert it definitely.

The conclusion drawn that 305 is more suitable for the class of traffic and road on which the experiment was made will, I feel sure, be disappointing, inasmuch as it does not give a decision such as was aimed at in making the trial. The length and grades selected for the test not being anything approaching the average condition of the lines of our system may, however, account for the result.

I might, in conclusion, here repeat that in recommending the Vulcan engine I did not look upon the haulage power over 1 in 30 grades for about 32 miles as forming a base on which to recommend an engine adapted to the general traffic and conditions of running on all sections. I aimed at securing an engine capable of hauling equal to twelve vehicles over the steep mountain grades, and taking heavier loads and running at higher speeds on other sections, because I saw at no distant date that much would be aimed at, not only to facilitate trade, but also, if possible, to compete with water-carriage.

I am pleased to add, for the Commissioner's information, that three of the Vulcan engines, which are now running passenger trains between Sydney and Bathurst, are giving proof of their efficiency to haul the stipulated load, equal to twelve vehicles. I feel sure, also, that in the matter of economy the results obtained by the experts will be maintained.

W. SCOTT, 7/7/87.

Minute of The Commissioner for Railways.

THE Minister wishes an experiment made with Redfern type of carriages (2nd class) on the occasion of the Volunteer Firemen special train to Albury on Monday next.

One of Mr. Middleton's engines to be used. Please see that it is in perfect order.

When change of engine is made another of Mr. Middleton's engines should be used to complete journey. Let a special account be kept of the consumption of fuel, water, &c.

Ch.A.G.,
10/2/87.

Loco. Engineer to arrange and consult with Traffic Branch.—D.C.McL., 10/2/87.

Re

Re Express Engines.

CONSUMPTION of fuel, water, and other running stores by express engines with train Sydney to Albury:—

5 tons 2 cwt. 3 qrs. 24 lbs. coal = 29'88 lbs. per mile,
8,755 gallons of water.
31½ lbs. castor, 8'8½
7¼ tallow ... 1'7

10'3¼ = 33d. per mile.

Comparative consumption in lbs. per mile if trains were of equal weight:—

American.	Express.
55'13 lbs.	45'91 lbs.

Comparative consumption in lbs. per ton weight of train for the whole journey:—

American.	Express.
180 lbs.	154 lbs.

GEO. DOWNE,
16/3/87

Report from Driver S. Campling to The Locomotive Foreman.

I HAVE to report for your information, *re* special passenger train run from Sydney to Albury on the 22nd instant as follows:—This train consisted of equal to 12½ carriages, drawn by engine No. 311. The first stop made after leaving Sydney was Picton Lakes, 59 miles, at 7'46 a.m., departed 7'52½; 6½ minutes taking water; crossed Up Express at Bundanoon, instead of Wingello, as per time table. Barber's Creek, 109 miles, arrived 9'37, and departed 9'42; 5 minutes taking water, arriving at Goulburn at 10'16 a.m.—31 minutes late—leaving Goulburn at 10'41—36 minutes late; 20 minutes being allowed for refreshments, 5 minutes more being taken to prepare the engine to go on. A stop of 5 minutes was made at the 141 mile post, in consequence of the road being lifted. Fish River tank, 160 miles; arrived 11'30, departed 11'34, taking water, and found one of the tender axle boxes had got very hot. Stopped at the 201 mile post attending hot box, 12'51 p.m., departed 12'54—3 minutes. Binalong, 1'9—1'12; 3 minutes hot box. 202½ miles post, arrived 1'38, departed 1'44; 6 minutes hot box, after which it began to get cool. Harden, 227 miles, 1'58, depart 2'4, taking water. Bethungra, arrived 3'24, departed 3'28½, 4½ minutes taking water. Junee, 286 miles, 4'0 arrived, 4'20 departed. Dinner—Wagga Wagga, arrived 5'0, departed 5'9, taking water and waiting to cross Up mail, instead of Culcairn, as per time table. Yerong Creek, arrived 5'54, departed 5'56, 2 minutes oiling, arriving in Albury at 7'11 p.m., 2 hours and 11 minutes late, delays as follows:—1 minute late leaving Sydney, 5 minutes at 141 mile post, 12 minutes through hot tender axle box; had it not been for these delays, the train would have arrived about 6'40 p.m. About one hour forty minutes was lost by locomotive, the wheel being too small to maintain a greater speed than which was run.

S. CAMPLING,
Engine Driver.

Referring to the special train which ran yesterday from Sydney to Albury with the Firemen, the Commissioner wishes to be furnished as quickly as possible with details of its running. Time of arrival at the different depôts according to Time-tables, and actual time of arrival, causes of delay, the time taken at each place for refreshment, or other stoppages, and the actual running time deducting all detentions. Please give also the approximate weight of the train, including weight of the passengers.—D.C. McL., 23/2/87, Traffic Manager.

THE following table shows the time the train was given to run the journey, in accordance with the Minister's wishes, and the time at which the special passed certain of the principal stations.

As per Time Table.	Actual running.
Sydney, dep. 6'0 a.m.	6'0 a.m.
Picton	7'28 "
Mittagong	8'39 "
Wingello, 8'55	9'28 "
Goulburn, arr. 9'45	10'16 "
" dep. 10'5	10'41 "
Gunning	11'42 "
Jerrawa	12'3 p.m.
Yass	12'23 "
Harden, arr.	2'0 "
" dep.	2'5 "
Wallenbeen	2'33 "
Cootamundra	2'53 "
Bethungra	3'35 "
Junee, arr. 2'10 p.m.	4'0 "
" dep. 2'30 p.m.	4'20 "
Wagga Wagga	5'8 "
The Rock... ..	5'40 "
Culcairn, 4'15	6'25 "
Gerogery	6'45 "
Albury, arr. 5'0	7'11 "
Which necessitated a speed of 35 miles per hour throughout, including stoppages.	Giving an actual speed throughout, including stoppages of 29½ miles per hour.

Of course I have not shown any stoppages for water which occurred at places other than those shown above. Indeed, in that respect I have given the actual running the advantage of five minutes at Harden, which I did not provide for in the special train notice, leaving it to the driver to make up the time so lost.

The only loss of time on the journey which could have been avoided was about 5 minutes, by permanent-way signal, near the 141-mile post. In every other respect it would be simply impossible to give a train a clearer road, and this, I understand the driver himself admits. Not only was there beautiful weather, and therefore a perfect rail to run upon, but every train, even the express, which was kept back 15 minutes, was made to give way to the special; and so completely was this done that not once throughout the journey had a stoppage to be made to enable the driver to sign for a "train ahead notice;" all he had to do was to pick up one staff or ticket, and deliver the other as he passed.

It will be understood that when I drew out the first time-table, giving the train 15 hours to do the journey, I had no idea that such special efforts were to be made to run it through quickly, consequently I allowed—

30	minutes	at Mittagong,	for breakfast and for an estimated 350 men.
10	"	"	Goulburn, to change engines and enable men to get out.
30	"	"	Yass, for dinner.
10	"	"	Harden, to change engines, and enable men to get out.
20	"	"	Junee, for tea.

100 = 1 hour 40 minutes, thus reducing the actual running time, and any other stoppages that might be necessary for water, to 13 hours 20 minutes.

Exclusive of the time actually taken at Goulburn and Junee for refreshments, and at Harden for water, and the time lost near the 141-mile post (55 minutes altogether), we find the actual running time to be 12 hours 16 minutes, but that, as I have said, was attained under the most favourable circumstances.

The train kept very fair time as far as Picton, but after that it lost time all the way through.

The following is the load of the train, exclusive of the engine and tender:—

		Tons	cwt.	qr.
Redfern type	Second class, No. 203	16	4	3
	" " 194	16	3	2
	" " 202	16	3	1
	" " 196	16	3	2
	" " 189	15	0	0
American car, first class,	" 53	16	10	3
		96	5	3
Estimated weight of 300 passengers at 15 to the ton.....		20	0	0
Luggage about.....		0	14	1
		117	0	0

W. V. READ,
24/2/87.

The actual stoppages for water, not embodied in the foregoing report, were:—

Picton Lakes	7	minutes
Barber's Creek	5	"
Fish River	4	"
Bethungra	5	"
Wagga Wagga	5	"

26 minutes

I should also mention that, between the 201-mile post and Harden, from ten to fifteen minutes were lost by the tender running hot.—D.K.

I have asked on other papers what engine was used. I see that Mr. Midelton's engine ran quicker to Goulburn than the express does.

Mr. Midelton's engine	4	hours	16	minutes
Express	4	"	50	"

Resubmit when Mr. Scott's report is received.—CH.A.G., 26/2/87.

EXTRACT from Traffic Manager's Minute of 10/3/87, relative to the subject of accelerating the speed of the morning train from Penrith.

"I HAVE arranged with the Locomotive Engineer to try one of Mr. Midelton's engines on the train.—W. V. READ, 10/3/87."

Hereon Commissioner minuted, 28/3/87, that he "wished the papers to be re-submitted at the end of April, to ascertain whether better time had been made by Mr. Midelton's engine."

Report of Traffic Manager.

Better time has been kept with the Midelton engine. This engine is able to make much better time up the inclines, and starts from the stations much quicker. In new table, now in hands of printer, I am taking 8 minutes off "up" journey, and 3 minutes off the "down."—W. V. READ, 20/5/87.

Minute by The Commissioner for Railways to The Locomotive Engineer.

New Engine by the Vulcan Foundry Company. * * *

LET me know as early as possible the total weight of the engine, and separately of the tender of the above class of engines, and also the weight which is upon each wheel, empty, and fully equipped for the road. Engine and tender, separately.
CH.A.G., 23/5/87.

Please arrange for the new engine now running to be weighed as soon as possible.—W. SCOTT, 25/5/87. Assistant Engineer. Mr. R. Scott to have this done, and attach result on separate paper.—GEO. DOWNE, 25/5/87. Details herewith.—W. SCOTT, 30/5/87. Commissioner.

W. SCOTT, 30/5/87.

Minute by The Chief Clerk to Mr. Locomotive-Engineer Scott.

Trial of Locomotives.

WITH reference to motion passed in the House on the 11th July, 1887, I should be glad to have a report, showing respectively the total cost to the Government of each of the two engines lately submitted to a trial test of efficiency between Sydney and Eskbank. D.C.M'L., 21/9/87.

Engine No. 373, Vulcan Foundry Company, £2,479 6s. 9d.; engine No. 311, Baldwin Company, £2,959 19s. 10d. According to information supplied by Superintendent Stores.—W. SCOTT, 21/9/87.

Minute by The Secretary for Public Works.

Manufacture of Locomotives.

Department of Public Works, Sydney, 30 September, 1887.

A DEPUTATION, comprising Messrs. Garrard, Hawthorne, F. Smith, Jeannerett, M.'sP., Hudson, Bloomfield, Franki, Henry Mort, John Morris, Henry Vale, and Edgington, waited upon me to-day with reference to the manufacture of locomotives in the Colony. They pointed out that tenders had been received five months ago for this work, but as yet no decision had been come to, and they asked that an early decision might be given. It was rumoured that, owing to the price of the Colonial tender, it was probable the work would be done in the Eveleigh workshops, as it was alleged the work could be done there cheaper than outside. They protested against this proposal as it would be an undue interference with private vested interests, as it would be an impolitic act to increase the number of Government employees unduly, and as it was the general experience that Government work was never carried out so economically as work done by private enterprise stimulated by competition.

They mentioned that at the present time many of their machines were lying idle, and large numbers of workmen were unemployed. Rather than see the work go out of the Colony, or be taken up in the Government shops, they were prepared to allow the work to be divided between them, the manufacture of the engines to be supervised by a Government employee, and the service paid for at the rate of 5 per cent. on the actual cost price of the materials. They thought the Government should encourage the

the local makers ; the cost of the first service might be high, but as they became familiar with the work, prices would go down to a reasonable limit. This had been the experience in Victoria in private workshops. They pointed out also that in Adelaide, where the cost of Government work had been examined, that the result, when compared with the cost of private working, was unsatisfactory.

I informed them that I could say little that was new. I had stated previously when they and the men waited upon me that the matter largely rested with them, and if they compelled the Government to import the locomotives on this occasion it might be a long time before they would have such an opportunity again of tendering for the supply. The Government had now to face a difficulty in this matter, and it was this difficulty that kept the question so long unsettled. So far as I was concerned, I was favourable to having this work, and in fact all work, done in the Colony, if it could be carried out at anything like the price we could import, with the addition of incidental charges. I had, when in office previously, arranged for locomotives to be made here, and only on one occasion, and then under exceptional circumstances, had I sent for engines out of the Colony ; the local manufacture had benefited the Colony, and I believed if the manufacturers had been as anxious as I had been to have the locomotives made here they would not have had any need to come before me that day. Certainly the engines could be made here as efficiently as in any part of the world, and my desire was to simplify the article we wanted as much as possible. I believed it could then be made as cheaply in the Colony as anywhere else.

It had been said that the Government were about to make the locomotives in our own workshops, but the Government had arrived at no decision whatever in this matter. We certainly would like to be in a different position, as the tenders we received were much higher than we expected and above what would justify us in having them done here if we were going to have them done by contract ; if we decided on having them done by contract they must come from the other side of the water. They had referred to work in Government shops, and a demand had been made for an inspection appointed from outside the Service to check the time and expenses. I stated I would be happy to allow such an officer to go into our shops to-morrow as I, with them, courted the fullest publicity. Some misapprehension had arisen with regard to my desire to have everything possible made locally ; some said it was protection, but in every instance since I had been in office this time the articles I had made here had been obtained cheaper than if they had been imported, and I was therefore much surprised to find the prices for these engines so much over the English price.

It was not unusual for Railway Companies all over the world to make their own rolling stock, locomotives, and carriages, and also materials, and they prove they can supply their own wants cheaper than if the work was done outside. Mr. H. Hudson here stated that I was incorrect in this statement ; he knew from personal experience that in England and America the Railway Companies obtained their supplies from outside makers, and instanced the large private workshops, such as the Baldwin Company, Beyer, Peacock, & Co., Dubs, Neilson, and others, from which the Railway Companies obtained their supplies. The most the Railway Companies did was repairs ; he knew of only one Company in England, the London and North-Western, that made its own stock.

I stated I did not speak from personal experience but from reading the leading English scientific and mechanical journals, and it was stated there that the Railway Companies of the world largely made their own supplies, and even their own rails. I did not want to have the engines made in our shops, but rather than have them go out of the Colony I would have them manufactured there so as to afford work to our own men. They had every opportunity of tendering, and were aware their prices were much in excess of the English offers, and the question simply was whether the Government would give them a large bonus over the manufacturers abroad. The matter would be for the Cabinet to settle. I would not advise the work going out of the Colony. Their offer to do the work at an increase of 5 per cent. on cost price was a new feature in the matter. They had, however, simply stated it verbally, but if they would put it in writing I would represent the matter fairly to the Government.

JOHN SUTHERLAND.

Messrs. D. & W. Robertson to The Secretary for Public Works.

Sir,

335 Pitt-st., Sydney, 3 October, 1887.

With reference to the manufacture of fifty locomotives in this Colony, as it is reported the local tenders are somewhat above the imported ones and as there are only a few firms in Sydney who can make a complete locomotive, we would respectfully suggest that fresh tenders be called on something like the following basis :—

1. Locomotive boilers.
2. Wall iron under-frames.
3. Locomotive tenders, complete.
4. Sets of boiler mountings, complete.
5. Cast iron-work, including cylinders, axle-boxes, &c.
6. Pistons, piston-rods, connecting-rods, &c., complete in sets.
7. Erecting the different parts at Eveleigh.

The whole work to be made to ten plates to be passed and approved by the Government Engineers during construction.

In getting tenders in this way it would permit of a large number of firms tendering that otherwise would not tender. We ourselves, for instance, could make the boilers and tenders at less than imported firms when it would not suit us to tender for a complete locomotive. In the same way several firms could make the brass work, loco. gear, &c., &c., and if proper supervision was employed it would give full employment for a large number of manufacturers in Sydney and District who otherwise could not share in this important work.

We are of opinion that if our suggestion is tried it will be found the work can be done in the Colony as cheap as the imported article, and thus give employment to the numerous first-class workmen now vainly seeking employment.

We have, &c.,

D. & W. ROBERTSON.

Messrs.

Messrs. Hudson and others to The Secretary for Public Works.

Sir,

33 Pitt-street, Sydney, 3 October, 1887.

We have the honor, in accordance with your request, to put in writing the verbal offer made to you by the deputation of engineering firms on Friday last the 30th ultimo.

We have now the honor to state that we are prepared to carry out the construction of 50 or more locomotives required by the Government, at the rate of £5 per centum on the cost of same.

We have, &c.,

HENRY HUDSON (for HUDSON BROS., Limited.)

MORRIS BROS.

J. P. FRANKI (for Mort's Dock and Engineering Co.)

HENRY VALE.

JOHN EDGINGTON, Atlas Engineering Co.

I should like report from Mr. Midelton.—J.S., 5/10/87.

This proposal is very different from the original one made by Capt. Broomfield, as reported in the newspapers. On behalf of Mort's Dock Co. he said he was prepared to make these locomotives under the eye of an officer of the Government, and only claim 5 per cent. profit on the cost of material and supervision. This means that he would supply machinery and labour gratis. Now we find five firms who are all prepared to execute the work "at the rate of £5 per centum on the cost." This means the more the engines cost to make the more the firms will profit by it. No Government or railway company would entertain such extravagant proposals, and I am surprised that any firm should have the temerity to make them. It goes to prove that the only object these manufacturers have in view is profit, whereas if the Department does its own work it will have no object in view but that of providing sound, good work at the cheapest rate, and work which will cost but little in maintenance. The proposal of the firms signing the paper is certainly a safe one for themselves, but most unsafe and unsatisfactory for the Government. Messrs. D. & W. Robertson seem to think that the Department require fifty locomotives made simply to give employment to seven different firms, and to all the "unemployed" hands in the Colony. This could be most completely carried out if these firms obtain the work in the way they suggest. The proposals of the combined firms, and Messrs. D. & W. Robertson's, are untenable.—THOS. MIDEルトON, 10/10/87. Commissioner.

[Two Plans.]

Sydney: Charles Potter, Government Printer.—1887.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(FURTHER PAPERS RESPECTING TESTS FOR SUITABLE TYPE OF ENGINE.)

Ordered by the Legislative Assembly to be printed, 25 October, 1887.

Mr. Acting Locomotive Engineer Midelton to The Traffic Manager.

New Engines for working Mail and Mixed Trains.

Now I have this matter in hand, I should be glad to know your views as regards the maximum number of vehicles (or total weight of train exclusive of engine and tender) you desire to work on your mail trains regularly.

As you of course know, we have been using *two* powerful engines on our mail trains for some time. I hardly think it necessary to point out how prejudicial this is in many ways, as you, of course, know that also.

If you will kindly let me know the weight of the heaviest train you desire to work, at an average speed of (say) 35 miles per hour, I should be glad, as the practice of employing *two* engines on *one* train should be discontinued as soon as possible. I am preparing designs for an engine which shall take the train I think you will propose, that is, of course, keeping within bounds as to safety on our steep grades.

Maximum height—
Southern Line, 2,280 feet;
Western Line, 3,668 feet.

I have my opinions of course, and when I have yours probably I shall find I have under-estimated your requirements. Please, therefore, let me have this as soon as you can.

THOS. MIDELTON, 20/3/83.

Memorandum to The Traffic Manager.

Locomotive Engines Branch, Redfern, 13 April, 1883.

WILL the Traffic Manager kindly return my m.p., 83-2,179, *re* new engines for working mail and mixed trains. The paper was sent to Traffic Manager on 21/3/83.

R.J.S.

The information we require from Inspectors not yet furnished. Will return the paper in the course of two or three days.—W. V. READ (*pro* J.P.), 16/4/83. I shall be glad to have your reply as early as possible; I have several important questions standing for this paper.—T.M., 17/4/83. Traffic Manager.

I return the paper herewith, and from inquiries I have made I find that an engine capable of maintaining a speed of 35 miles per hour on an ordinary road, and of drawing thirteen loaded vehicles up an incline of 1 in 30 or 33, would meet the requirements of the Department. I do not mean, of course, that a speed of that kind should be maintained upon such an incline, because that would be impossible. It will be a great desideratum if such an engine can be procured for our passenger trains, because I quite concur with Mr. Midelton, that it is undesirable to have *two* engines doing the work of *one*, as they have very frequently to do at present.—W.V.R., 25/4/83. Mr. Midelton.

Please see L.E., 84-2,946, Comrs. 84-10,352 and 84-9,134.

I am sorry it has taken two years to accomplish that which is so generally admitted to be so desirable. We now possess ten passenger engines which will do what is required, *viz.*, take thirteen vehicles over any portion of the N.S.W. lines at any time-table speed the Traffic Manager likes to decide upon. I have to-day (15/4/85) hauled a train of 101 tons (exclusive of engine and tender) from Penrith to Glenbrock under conditions which cannot be said to be *favourable*, the boiler of No. 311 engine (the one in question) being very dirty indeed, and also the water. The engine steamed freely, did not prime, hauled the load with ease, and ran perfectly cool all round. On the return journey No. 311 was attached to the up passenger train, and ran often at a speed of over 40 miles an hour for a long distance. I consider this most satisfactory, and these engines are capable of successfully working any passenger train we have, even the express, where, if one of them were used, a train of *double* the weight of the present one could be worked, but of course I should not advocate the use of a six-coupled 5-feet wheel engine where a four-coupled 6-feet wheel will do.—T.M., 15/4/85.

Traffic Manager will please note and return, so that I may forward paper to L.E. Seen.—W. V. READ (*pro* D.K.), 16/4/85.

Locomotive Engineer.—T.M., 16/4/85.

Minute by Mr. Midelton, Locomotive Overseer.

On letter received by Commissioner for Railways from Mr. W. Rhodes (of the Baldwin Company), offering six locomotives of the "Mogul" type, dated 1st December, 1883.

THIS represents the class of engine and tender I am now designing in accordance with a minute by you on a previous paper. I have ever since I came to the Colony—in 1880—argued that an engine such as here illustrated, having 18 × 26 cyls. and a set of 6-coupled wheels, 5'0 diameter, would with a suitable 8-wheeled tender to carry 3,000 gallons of water and 5 or 5½ tons of coal, be the best "all round" class of engine we could have, such as would be capable of working any passenger trains, or goods trains, or fast cattle traffic, in short it could be attached to any train and work it satisfactorily. I have already made my views known in the report and specification *re* the twenty new Mogul engines recently cabled for from England, but I regret to hear that my suggestions were *not regarded*. If the Loco. Engineer will give me his *full support* I shall have very great pleasure in preparing "Special specifications" as alluded to in the attached printed circular [extract from the *Chicago Railway Age*, May 29th and June 5th, 1879], and guarantee to have an engine which shall give equal performance, and under similar circumstances, to those named by Mr. Finney, and I recommend that such specification be prepared and submitted to the Baldwin Company for prices for six engines and tenders as suggested by Mr. Rhodes, as I am quite sure they will give us greater satisfaction than any engine we now have. It grieves me to see two engines on our mail trains when one (such as I propose) would do the work comfortably in all weathers.

T.M., 22/12/83.

The reason for this is shown in the papers.—W.S.

Mr. Midelton has my support when I consider he is right.—W.S.

The class of engine submitted by Mr. Rhodes on behalf of the Baldwin Company would be a great improvement on the Consolidation class supplied to us by this firm, and provided they undertake to build such a type of engine on our specification I recommend an order be given for six of them if the price be reasonable. The class of engine which I consider best adapted to our requirements is a 19 × 26 cylinder and a 54-inch driving wheel. This type of engine would have a tractive power of about 174, and can be run at a speed of 35 miles per hour, allowing a good margin of safety, which I consider would be ample for any mixed passenger or live stock trains. Believing that the speed of our mail trains must be increased rather than reduced, I could not think of recommending the use of such an engine as Mr. Midelton advocates for running mail trains.—W. SCOTT, 2/1/84. The Commissioner.

Will the Loco. Engineer be good enough to direct Mr. Midelton to draw up a specification to his design, and I shall be glad to receive a specification from Mr. Scott to his own design, as explained in his minute of 2/1/84. Then I think it would be well to obtain prices from Baldwin Company on a competitive basis for one or both of these engines. Let Mr. Midelton state the speed to which the engine he proposes can be run to with perfect safety.—CH. A. G., 22/1/84.

Stated 35 to 40 miles per hour on specification.

I must agree with Mr. Midelton that it is a grievous thing to see, when a train is slightly added to—(say) 40 tons added, and not weighing on the whole 120 tons (without motive power)—that two engines should be required to move it. If one engine can do such work, by all means let us have a design of it.—CH. A. G., 22/1/84.

Memo. to Mr. Midelton, 25 January, 1884. Referring to your minute of 22/12/83 on Mr. Rhodes' letter of December 1st, the Commissioner desires that you will draw up a specification of the engine you propose, and state the speed to which the engine can be run with safety.—W. SCOTT.

Specification herewith. I very much regret there is not time for preparing complete drawings also.—T.M., 26/2/84. Loco. Engineer.

Extract from Commissioner's Minute Paper, 84-10,352.

* * * * * Mr. Midelton has designed a powerful passenger engine which, when required, can be used as a goods engine. The two specifications are herewith. The latter engine is to enable us to increase the weight of our passenger trains without using two engines. * * * * *

CH. A. G., 27/3/84.

Approved.—F.A.W., 3/4/84.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(ENGINES USED BETWEEN SYDNEY, PENRITH, AND MOUNT VICTORIA.)

Ordered by the Legislative Assembly to be printed, 19 October, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 11th October, 1887, That there be laid upon the Table of this House,—

“ Statement showing the number of engines employed during the twelve months ending the 1st September, 1887, conveying goods and passenger trains between Mount Victoria and Penrith; also, the number of engines used in conveying the same trains between Penrith and Sydney.”

(Mr. Wall.)

RETURN showing the daily average number of Engines employed working Goods and Passenger Trains during the twelve months ending 1st September, 1887, between Mount Victoria and Penrith, and Penrith and Sydney.

Between Mount Victoria and Penrith.			Between Penrith and Sydney.		
Average number of Engines employed on Goods Trains.	Average number of Engines employed on Passenger Trains.	Total.	Average number of Engines employed on Goods Trains.	Average number of Engines employed on Passenger Trains.	Total.
22	4 $\frac{1}{3}$	26 $\frac{1}{3}$	9	3 $\frac{1}{2}$	12 $\frac{1}{2}$

NOTES :—The above figures are based on six days being considered as a week's work. Goods trains are occasionally run over these sections on a Sunday when found necessary to meet emergent occasions.

1887-8.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY LOCOMOTIVES.

(COST OF CONSTRUCTION OF FIFTY COLONIAL MADE.)

*Ordered by the Legislative Assembly to be printed, 6 June, 1888.**[Laid upon the Table of the House, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to question No. 4 in Votes and Proceedings No. 99, of the 6th June, 1888.]*

QUESTIONS.

1. In reference to the fifty Railway Engines ordered by the Government to be made in the Colony, what would be the difference per Engine in the cost of their construction if made with copper fire-box plates and brass tubes, as built by Beyer & Peacock, and those ordered by the Government to be made in the Colony with steel fire-boxes and tubes?
2. What is the difference in the life of fire-boxes with copper plates and brass tubes, and steel plates and steel tubes?

ANSWERS.

1. It is estimated that by the substitution of steel as material of construction in lieu of copper and brass in the fire-boxes and tubes respectively of the "Goods" Engine, a saving will be effected in these two items of at least £300. The Passenger Engine may be taken at 10% less than this. If the item of boiler shell, smoke-box, and stays be taken into consideration, there will appear a further saving in items as between best Yorkshire iron and steel of £68, thus showing a total saving in the raw material of the boiler of the Goods Engine of £368, the Passenger Engine being taken at 10% less.
2. The life of copper fire-boxes may be assumed as averaging (with repairs and partial renewals more or less costly) 7 years; that of steel fire-boxes as averaging 5½ years, averaging difference in favour of copper 1½ year. The life of brass tubes may be assumed as averaging, including two partial renewals and repairs (each costing about 6s. 6d.), 12 years; that of good steel tubes may be taken as 4 years. Average difference in favour of brass tubes, say 8 years. It is to be borne in mind that the quality of copper produced now-a-days for locomotive fire-boxes is very inferior to that manufactured 20 years ago, and that an engine whose fire-box has required heavy patching and repairs is no longer considered in first class order. The same remarks apply though in a less degree to tubes. Steel fire-boxes and tubes are cheaper and also much stronger and will bear far higher pressures than copper and brass, a most important advantage now-a-days. Modern marine boilers are made entirely of steel and they carry a much higher pressure than is usual in locomotive practice, viz, 150 to 160 lb. per square inch. There is a certain amount of prejudice in this matter which still has a firm hold upon some people who have had no experience with steel and they assume that copper gives no trouble, but that is not the case. On the 150,000 miles of railway in the United States a copper fire-box would be the exception, steel being the material used on the best roads. The vital question is which boiler will cost the least and earn the most money. Experience seems to answer steel, and as it is admitted that loco. boilers should be thoroughly examined internally once every five years it is impossible to do this without taking the fire-box out of the shell; it is therefore better to make a new steel fire-box (if necessary) to put into an old shell, than it is to put a repaired copper or steel fire-box back again into the same old shell.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY LOCOMOTIVES.
(COST OF IMPORTED.)

Ordered by the Legislative Assembly to be printed, 6 June, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 27th October, 1887, That there be laid upon the Table of this House, a Return showing:—

- “(1.) The total cost of the Locomotive Engines known as classes ‘Heavy Consolidated’ and ‘Mogul,’ of American manufacture, such cost to include insurance, freight, cost of inspection, and all other expenses incurred in placing said Engines on line in running order.
- “(2.) A like Return in regard to the Locomotives imported from England, known as the ‘Vulcan.’
- “(3.) A like Return with regard to the cost of Locomotives of the class which the Government have decided to adopt, regardless of where such Engines were manufactured.”

(Mr. Fletcher.)

1. The total cost of the Locomotive Engines known as classes “Heavy Consolidated” and “Mogul,” of American manufacture, such cost to include insurance, freight, cost of inspection, and all other expenses incurred in placing such Engines on line in running order:—

Consolidated	£2,985
Mogul	£2,960

2. A like Return in regard to the Locomotives imported from England, known as the “Vulcan.”
- £2,511 2s. 1d.

3. A like Return with regard to the cost of Locomotives of the class which the Government have decided to adopt, regardless of where such Engines were manufactured:—

Goods	£3,000
Passenger	£2,989

These engines are similar to the engines referred to in Question No. 1, and are to be made in the Colony.

[3d.]

870—

NEW SOUTH WALES.

RESUMPTION OF EDWARD IRBY'S LAND
AT BLUFF RIVER.

(PETITION FROM EDWARD IRBY, PRAYING TO BE HEARD BY COUNSEL AND ATTORNEY, BEFORE SELECT COMMITTEE ON.)

Ordered by the Legislative Assembly to be printed, 29 May, 1888.

To the Honorable the Speaker and Honorable Members of the Legislative Assembly in Parliament assembled.

The humble Petition of Edward Irby of Tenterfield, in the Colony of New South Wales, gentleman,—
SHOWETH:—

1. That your Petitioner is a gentleman, and resides at Tenterfield.
2. That your Petitioner is interested in the matter of the resumption, by the Government of certain lands, situated on the Bluff River in the Colony aforesaid, and has made certain claims in respect thereto.
3. That the matter of the said resumption has been referred to a Select Committee of the Legislative Assembly.
4. That your Petitioner desires to be represented at the meetings of the said Select Committee by Attorney and Counsel.

Your Petitioner, therefore, humbly prays that permission may be granted to him to be represented at the meetings of the said Select Committee by Counsel and Attorney.

And your Petitioner, as in duty bound, will ever pray, &c.

EDWD. IRBY.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

REPORT FROM THE SELECT COMMITTEE

ON

COMBINATION TRUCKS;

TOGETHER WITH THE

PROCEEDINGS OF THE COMMITTEE,

MINUTES OF EVIDENCE,

AND

APPENDIX.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,

20 *July*, 1888.

SYDNEY: CHARLES POTTER, GOVERNMENT PRINTER.

1888.

1887-8.

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE
LEGISLATIVE ASSEMBLY.

VOTES No. 23. TUESDAY, 8 NOVEMBER, 1887.

18. COMBINATION TRUCKS:—Mr. Hassall moved, pursuant to Notice (*as amended by consent*),—
 (1.) That a Select Committee be appointed, with power to send for persons and papers, to inquire into a report upon the question of the Combination Trucks offered to the Government.
 (2.) That such Committee consist of Mr. Brunner, Mr. Black, Mr. Dawson, Mr. Kethel, Mr. Sutherland, Mr. Lyne, Mr. Hayes, Mr. Chanter, Mr. Carruthers, and the Mover.
 Debate ensued.
 Question put and passed.
-

VOTES No. 26. TUESDAY, 15 NOVEMBER, 1887.

2. COMBINATION TRUCKS:—Mr. Frank Smith presented a Petition from George T. Evans and Ambrose Thornley, of Sydney, representing that they are directly interested in the results of an inquiry now being made respecting the Combination Trucks offered to the Government; and praying to be heard by Counsel or Solicitor before the Select Committee now inquiring into the subject, with liberty to adduce such evidence as may be advised.
 Petition received.
 Mr. Frank Smith (*by consent*) moved, without Notice, That the prayer of the Petitioners be granted.
 Question put and passed.
-

VOTES No. 27. WEDNESDAY, 16 NOVEMBER, 1887.

5. COMBINATION TRUCKS:—Mr. Waddell presented a Petition from W. B. Wilkinson, of Dubbo, representing that he is directly interested in the result of an inquiry now being made respecting the Combination Trucks offered to the Government; and praying to be heard by Counsel or Solicitor before the Select Committee now inquiring into the subject, with liberty to adduce such evidence in his interests as may be advised concerning the subject matter of the said inquiry.
 Petition received.
 Mr. Waddell (*by consent*) moved, without Notice, That the prayer of the Petitioner be granted.
 Question put and passed.
- * * * * *

9. COMBINATION TRUCKS:—*Mr. Chanter*, for Mr. Hassall (*by consent*), moved, without Notice, That the correspondence respecting the Evans Combination Truck, laid upon the Table on 14th October, 1886, and the further correspondence relating to Combination Trucks, laid upon the Table during October, 1887, be referred to the Select Committee now sitting on Combination Trucks.
 Question put and passed.
-

VOTES No. 28. THURSDAY, 17 NOVEMBER, 1887.

3. COMBINATION TRUCKS:—Mr. Hassall (*by consent*) moved, without Notice, That the Select Committee now sitting on Combination Trucks be authorized to make visits of inspection to, and hold inquiries at, Redfern and Homebush.
 Question put and passed.
-

VOTES No. 59. TUESDAY, 28 FEBRUARY, 1888.

3. PAPERS:—
 Mr. Sutherland laid upon the Table,—
- * * * * *
- (4.) Further Correspondence respecting Wilkinson's and the Evans' Combination Trucks. Ordered to be printed, and referred to the Select Committee on "Combination Trucks."

COMBINATION TRUCKS.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 8th November, 1887, "*with power to send for persons and papers to inquire into and report upon the question of the Combination Trucks offered to the Government,*" and to whom was referred on the 15th November, 1887, the "*Petition from George T. Evans and Ambrose Thornley ;*" on the 16th November, 1887, the "*Petition from W. B. Wilkinson,*" and "*the correspondence respecting the Evans' Combination Truck,*" and "*further correspondence relating to Combination Trucks ;*" on the 28th February, 1888, the "*further correspondence respecting Wilkinson's and the Evans' Combination Truck ;*" on the 18th April, 1888, the "*further correspondence respecting Wilkinson's Combination Truck,*" and to whom was granted on the 17th November, 1887, leave "*to make visits of inspection to, and hold inquiries at, Redfern and Homebush,*" have agreed to the following Report :—

Your Committee having examined the witnesses named in the List* (whose evidence will be found appended hereto), and carefully considered the whole of the evidence, find as follows :—

1. That at the time this inquiry was initiated, two patent combination trucks, viz., the "Evans" and "Wilkinson," had been definitely offered to the Government, the former for the sum of £16,000, and the latter for the sum of £5,000.
2. That in June, 1885, fourteen trucks were constructed by the Railway Department from a design furnished by Mr. Evans, which have been continuously in use for the conveyance of stock and merchandise over the railways of the Colony, and have conclusively proved their superiority over the ordinary stock waggons.
3. That by using the "Evans" truck a considerable saving has been effected in the working expenses of the Railway Department in consequence of its adaptability for the conveyance of either cattle, sheep, or goods, thereby materially avoiding the loss consequent on empty running.
4. That the Government, recognizing the advantages to be derived from the use of the "Evans" truck, had been in treaty for the purchase of the patent rights attached thereto for the sum of £16,000.
5. That your Committee are of opinion, notwithstanding the advantages claimed for the "Evans" truck, and the saving effected in working expenses which would follow its general adoption, £16,000 is an excessive sum to pay for the patent rights thereof, but that very great credit and some recognition is due to the inventor.
6. That after the "Evans" Combination Truck had been in use for over eighteen months, Mr. Wilkinson designed and patented a Combination Truck suitable for the conveyance of stock and merchandise, and also combining the system of end-loading with that at present in use.

* See List, page 14.

7. That the improved end-loading system designed and patented by Mr. Wilkinson is according to the testimony of stockowners, dealers, agents, and practical men, preferable to any system at present in use in the Colony of New South Wales, as applied to the loading and unloading of stock.
8. That several trials have taken place between the "Evans" and the "Wilkinson" trucks, in which the conditions were nearly equal, except that in converting from sheep to cattle and *vice versa* the "Wilkinson" had the advantage. The weights of the ordinary cattle waggons range from 6 tons 9 cwt. to 6 tons 15 cwt.; sheep waggons from 6 tons 15 cwt. to 7 tons 13 cwt.; whilst the "Wilkinson" weighs 7 tons 15 cwt. as against the "Evans" 6 tons 13 cwt., the cost of construction being also about £25 in favour of the latter.
9. That the principle of end-loading would prove of considerable value if brought into general use for the conveyance of stock, and your Committee recommend the patent rights referred to, to the consideration of your Honorable House, if such rights can be obtained by payment of a royalty or a reasonable sum. The adoption of this course would doubtless lead to the construction of an improved Combination Truck, combining all the excellencies and advantages of both the "Evans" and the "Wilkinson," and prove superior to anything at present in use throughout the Australian Colonies.

T. H. HASSALL,

Chairman.

No. 2 Committee Room,
Sydney, 17th July, 1888.

PROCEEDINGS OF THE COMMITTEE.

TUESDAY, 15 NOVEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall, | Mr. Sutherland.

In the absence of a quorum the meeting called for this day lapsed.

WEDNESDAY, 16 NOVEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall, | Mr. Brunner,
Mr. Chanter, | Mr. Lyne.

Mr. Hassall called to the Chair.

Entries from Votes and Proceedings appointing the Committee and referring the Petition from George T. Evans and Ambrose Thornley, of Sydney, read by the Clerk.

Committee deliberated.

Ordered,—That W. V. Read, D. Kirkcaldie, T. Braid, and W. Scott be summoned to give evidence next meeting.

[Adjourned to To-morrow, at half-past One o'clock.]

THURSDAY, 17 NOVEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Brunner, | Mr. Carruthers,
Mr. Lyne, | Mr. Chanter.

Entries from Votes and Proceedings referring Petition from W. B. Wilkinson, of Dubbo; correspondence respecting Evans' Combination Truck; and further correspondence relating to Combination Trucks, read by Clerk.

Printed copies of Petitions and Papers referred before the Committee.

Present:—Bruce Smith, Esq. (*Counsel*), and J. McLaughlin, Esq. (*Solicitor*), appeared for Messrs. Evans and Thornley. W. B. Wilkinson, Esq., appeared in person.

W. V. Read, Esq. (*Traffic Manager*), called in, sworn, and examined.

Cross-examined by Mr. Wilkinson and Mr. Smith.

Room cleared.

Committee deliberated.

Ordered,—That the Chairman obtain the necessary leave from the House to make visits of inspection and hold inquiries at Redfern and Homebush.

[Adjourned to To-morrow at One o'clock.]

FRIDAY, 18 NOVEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Chanter, | Mr. Lyne,
Mr. Kethel, | Mr. Sutherland.

Entry from Votes and Proceedings authorizing the Committee to make visits of inspection and hold inquiries at Redfern and Homebush, read by the Clerk.

Present:—Bruce Smith, Esq. (*Counsel*), appeared for Messrs. Evans and Thornley. W. B. Wilkinson, Esq., appeared in person.

Room cleared.

Committee deliberated, and then proceeded to the Redfern Railway Station, where they inspected the Evans and the Wilkinson Patent Combination Trucks.

Reassembling of the Committee to be arranged by the Chairman.

[Adjourned.]

TUESDAY, 22 NOVEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Lyne, | Mr. Dawson,
Mr. Sutherland.

Present:—Bruce Smith, Esq. (*Counsel*), appeared for Messrs. Evans and Thornley. W. B. Wilkinson, Esq., appeared in person.

Richard Hodnett, Esq., called in, sworn, and examined.

Cross-examined by Mr. Smith and Mr. Wilkinson.

Room cleared.

Committee deliberated.

Ordered,—That Mr. Evans and Mr. Wilkinson be summoned to give evidence next meeting

[Adjourned to To-morrow, at One o'clock.]

WEDNESDAY,

WEDNESDAY, 23 NOVEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall, | Mr. Lyne.

In the absence of a quorum the meeting called for this day lapsed.

THURSDAY, 24 NOVEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hayes, | Mr. Chanter.

In the absence of a quorum the meeting called for this day lapsed.

FRIDAY, 25 NOVEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Lyne, | Mr. Hayes,
Mr. Chanter.

Present:—J. McLaughlin, Esq. (*Solicitor*), appeared for Messrs. Evans and Thornley. W. B. Wilkinson, Esq., appeared in person.

Room cleared.

Committee deliberated.

Ordered,—That Mr. Wilkinson and Mr. Evans be summoned to give evidence next meeting.

[Adjourned to Wednesday next, at *half-past Ten* o'clock.]

WEDNESDAY, 30 NOVEMBER, 1887.

MEMBERS PRESENT:—

Mr. Sutherland, | Mr. Lyne.

In the absence of a quorum the meeting called for this day lapsed.

THURSDAY, 1 DECEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Lyne, | Mr. Brunner.

Present:—Bruce Smith, Esq. (*Counsel*), appeared for Messrs. Evans and Thornley. W. B. Wilkinson, Esq., appeared in person.

W. B. Wilkinson, Esq., sworn and examined.

Cross-examined by Mr. Smith.

Room cleared.

Committee deliberated.

Ordered,—That D. Kirkcaldie, A. Yeomans, and W. Scott be summoned to give evidence next meeting.

[Adjourned to To-morrow, at *Eleven* o'clock.]

FRIDAY, 2 DECEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall, | Mr. Hayes.

In the absence of a quorum the meeting called for this day lapsed.

TUESDAY, 6 DECEMBER, 1887.

MEMBER PRESENT:—

Mr. Hassall.

In the absence of a quorum the meeting called for this day lapsed.

THURSDAY, 8 DECEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Lyne, | Mr. Brunner.

Present:—Bruce Smith, Esq. (*Counsel*), and J. McLaughlin, Esq. (*Solicitor*), appeared for Messrs. Evans and Thornley. W. B. Wilkinson, Esq., appeared in person.

Allan Yeomans, Esq., called in, sworn, and examined.

Cross-examined by Mr. McLaughlin and Mr. Wilkinson.

Witness withdrew.

David Kirkcaldie, Esq. (*Assistant Traffic Manager*); called in, sworn, and examined.

Cross-examined by Mr. Wilkinson and Mr. McLaughlin.

Witness withdrew.

William Scott, Esq. (*Locomotive Superintendent*), called in, sworn, and examined.

Cross-examined by Mr. Smith and Mr. Wilkinson.

Room cleared.

Committee deliberated.

[Adjourned to Wednesday next at *Eleven* o'clock.]

WEDNESDAY,

WEDNESDAY, 14 DECEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall, | Mr. Brunker.

In the absence of a quorum the meeting called for this day lapsed.

THURSDAY, 15 DECEMBER, 1887.

MEMBERS PRESENT:—

Mr. Hassall, | Mr. Chanter.

In the absence of a quorum the meeting called for this day lapsed.

WEDNESDAY, 29 FEBRUARY, 1888.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Brunker, | Mr. Lyne,
Mr. Sutherland, | Mr. Hayes.

Present:—W. B. Wilkinson, Esq., appeared in person.

George Downe, Esq. (*Assistant Locomotive Engineer*), called in, sworn, and examined.

Cross-examined by Mr. Wilkinson.

Witness withdrew.

Henry William Larance, Esq., called in, sworn, and examined.

Cross-examined by Mr. Wilkinson.

Room cleared.

Committee deliberated.

Ordered,—That G. T. Evans be summoned to give evidence next meeting.

[Adjourned to Wednesday next, at *half-past One* o'clock.]

WEDNESDAY, 7 MARCH, 1888.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Lyne, | Mr. Hayes.

Committee deliberated.

Ordered,—That G. T. Evans and J. Harper be summoned to give evidence next meeting.

[Adjourned to To-morrow, at *half-past One* o'clock.]

THURSDAY, 8 MARCH, 1888.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Brunker, | Mr. Lyne,
Mr. Hayes.

Present:—Bruce Smith, Esq. (*Counsel*), appeared for Messrs. Evans and Thornley. W. B. Wilkinson, Esq., appeared in person.

George Trotter Evans, Esq., called in, sworn, and examined.

Room cleared.

Committee deliberated.

Ordered,—That G. T. Evans be summoned to give evidence next meeting.

[Adjourned to Wednesday next, at *half-past One* o'clock.]

WEDNESDAY, 14 MARCH, 1888.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Brunker, | Mr. Hayes.

Present:—Bruce Smith, Esq. (*Counsel*), for Messrs. Evans and Thornley. W. B. Wilkinson, Esq., appeared in person.

George Trotter Evans, Esq., called in and further examined.

Room cleared.

Committee deliberated.

MEMBERS PRESENT:—

Mr. Hassall in the Chair.

Mr. Lyne, | Mr. Brunner,
Mr. Carruthers, | Mr. Kethel,
Mr. Dawson.

Chairman laid before the Committee, for inspection, photographs of the trucks in use on the Queensland and South Australian Railways.

Chairman submitted draft report, which was read a first time, as follows:—

“The

"The SELECT COMMITTEE of the Legislative Assembly, appointed on the 8th November, 1887, 'with power to send for persons and papers to inquire into and report upon the question of the Combination Trucks offered to the Government,' and to whom was referred on the 15th November, 1887, the 'Petition from George T. Evans and Ambrose Thornley;' on the 16th November, 1887, the 'Petition from W. B. Wilkinson,' and 'the correspondence respecting the Evans' Combination Truck,' and 'further correspondence relating to Combination Trucks;' on the 28th February, 1888, the 'further correspondence respecting Wilkinson's and the Evans' Combination Truck;' on the 18th April, 1888, the 'further correspondence respecting Wilkinson's Combination Truck,' and to whom was granted on the 17th November, 1887, leave 'to make visits of inspection to, and hold inquiries at, Redfern and Homebush,' have agreed to the following report:—

"Your Committee having examined the witnesses named in the List (whose evidence will be found appended hereto), and carefully considered the whole of the evidence, find as follows:—

"1. That at the time this inquiry was initiated two patent combination trucks, viz., the 'Evans' and 'Wilkinson' had been definitely offered to the Government, the former for the sum of £16,000, and the latter for the sum of £5,000.

"2. That in June, 1885, fourteen trucks were constructed by the Railway Department from a design furnished by Mr. Evans, which have been continuously in use 'to the present time' for the conveyance of stock and merchandise over the railways of the Colony, 'during which period' have conclusively proved their superiority over the ordinary stock waggons.

"3. That by using the 'Evans' truck a 'very great' saving has been effected in the working expenses of the Railway Department in consequence of its adaptability 'for' conveyance of either cattle, sheep, or goods, 'and' thereby, 'to a great extent,' avoiding the loss consequent on empty running.

"4. That the Government, recognizing the advantages to be derived from the use of the 'Evans' truck, had 'agreed to' purchase 'from the patentee the legal' rights attached thereto for the sum of £16,000.

"5. That your Committee are of opinion, notwithstanding the 'great' advantages claimed for the 'Evans' truck, and the 'great' saving effected in working expenses which would follow its general adoption, 'the sum of' £16,000 'seems a large amount' to pay for the patent rights thereof, 'although at the same time freely admitting' that very great credit and some recognition is due to the inventor 'for having overcome the difficulty of providing a waggon equally suitable for the conveyance of stock or merchandise without materially increasing the weight over that of the ordinary stock trucks in general use.'

"6. That after the "Evans" Combination Truck had been in use for over eighteen months, Mr. Wilkinson designed and patented a Combination Truck suitable for the conveyance of stock and merchandise, and also combining 'an ingenious method' of end-loading with 'the system of side-loading' at present in use.

"7. That the improved end-loading system designed and patented by Mr. Wilkinson is, according to the 'sworn' testimony of stockowners, dealers, agents, and practical men, 'far' preferable to any system at present in use in the colony of New South Wales, as applied to the loading and unloading of 'sheep, and superior to the method which has been adopted and carried out in the Colonies of South Australia and Queensland with very satisfactory results.'

"8. That several 'competitive' trials have taken place between the 'Evans' and the 'Wilkinson' trucks, in which the conditions were 'so' nearly equal 'that no advantage could be claimed for the one over the other; but as a comparison of the weights of the respective stock waggons may be of value they are here given.' The weights of the ordinary sheep waggons range from 6 tons 9 cwt. to 6 tons 15 cwt.; cattle waggons from 6 tons 15 cwt. to 7 tons 13 cwt.; whilst the 'Wilkinson' weighs 7 tons 15 cwt. as against the 'Evans' 6 tons 13 cwt., the cost of construction being also about £25 in favour of the latter.

"9. That the principle of end-loading would 'doubtless' prove of 'inestimable' value if brought into general use for the conveyance of 'sheep,' and your committee 'are therefore of opinion that it would be advisable to secure from Mr. Wilkinson the Patent Rights attached to his invention,' which would 'doubtless' lead to the construction of an improved Combination Truck, combining all the excellencies and advantages of both the 'Evans' and the 'Wilkinson,' and prove superior to anything at present in use throughout the Australian Colonies."

Motion made (*Mr. Kethel*) and question, "That Draft Report be considered paragraph by paragraph," put and passed.

Paragraph 1 read and agreed to.

Paragraph 2 read and considered.

Amendments proposed (*Mr. Bruncker*), line 17, omit "to the present time"; line 18, omit "during which period," and insert "and."

Amendments put and agreed to.

Paragraph, as amended, agreed to.

Paragraph 3 read and considered.

Amendments proposed (*Mr. Bruncker*), line 20, omit "very great," and insert "considerable"; line 21, after "for" insert "the"; line 22, omit "and"; line 22, omit "to a great extent," and insert "materially."

Amendments put and agreed to.

Paragraph, as amended, agreed to.

Paragraph 4 read and considered.

Amendments proposed (*Mr. Carruthers*), line 24, omit "agreed to," and insert "been in treaty for the"; line 24, omit "from the patentee the legal," and insert "of the patent rights."

Amendments put and agreed to.

Paragraph, as amended, agreed to.

Paragraph 5 read and considered.

Amendment proposed (*Mr. Kethel*), lines 25 and 26 omit "great" twice occurring.

Amendment put and agreed to.

Amendment proposed (*Mr. Lyne*), line 27, omit "the sum of"; line 27, omit "seems a large amount," and insert "is an excessive sum"; lines 27 and 28, omit "although at the same time freely admitting," and insert "but"; lines 28 to 30, omit "for having overcome the difficulty of providing a waggon equally suitable for the conveyance of stock or merchandise without materially increasing the weight over that of the ordinary stock trucks in general use."

Amendments put and agreed to.

Paragraph as amended *agreed to*.
 Paragraph 6 read and considered.
 Amendments proposed (*Mr. Brunker*), line 33, *omit* "an ingenious method," and *insert* "the system";
 line 33, *omit* "the system of side-loading," and *insert* "that."
 Amendments put and *agreed to*.
 Paragraph as amended *agreed to*.
 Paragraph 7 read and considered.
 Amendments proposed (*Mr. Carruthers*), line 36, *omit* "sworn"; line 36, *omit* "far."
 Amendments put and *agreed to*.
 Amendment proposed (*Mr. Brunker*), lines 37 to 39, *omit* "sheep, and superior to the method
 which has been adopted and carried out in the Colonies of South Australia and Queensland with very
 satisfactory results," and *insert* "stock."
 Amendment put and *agreed to*.
 Paragraph as amended *agreed to*.
 Paragraph 8 read and considered.
 Amendment proposed (*Mr. Brunker*), line 40, *omit* "competitive."
 Amendment put and *agreed to*.
 Amendments proposed (*Mr. Lyne*), line 41, *omit* "so"; lines 41 to 43, *omit* "that no advantage could
 be claimed for the one over the other, but as a comparison of the weights of the respective stock waggons
 may be of value they are here given," and *insert* "except that in converting from sheep to cattle and *vice*
versa the 'Wilkinson' had the advantage."
 Amendments put and *agreed to*.
 Paragraph as amended *agreed to*.
 Paragraph 9 read and considered.
 Amendments proposed (*Mr. Lyne*), line 45, *omit* "doubtless"; line 45, *omit* "inestimable" and
insert "considerable."
 Amendments put and *agreed to*.
 Amendments proposed (*Mr. Brunker*), line 46, *omit* "sheep" and *insert* "stock"; lines 46 and 47, *omit*
 "are therefore of opinion that it would be advisable to secure from Mr. Wilkinson the Patent Rights
 attached to his invention," and *insert* "recommend the Patent Rights referred to to the consideration of
 your Honorable House if such rights can be obtained by payment of a royalty or a reasonable sum";
 line 47, *omit* "which" and *insert* "The adoption of this course."
 Amendments put and *agreed to*.
 Paragraph as amended *agreed to*.
 Motion made (*Mr. Lyne*) and question,—That the draft report as amended be the report of the
 Committee.
 Put and passed.
 Chairman to report to the House.

1887.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

COMBINATION TRUCKS.

THURSDAY, 17 NOVEMBER, 1887.

Present:—

MR. BRUNKER,		MR. CARRUTHERS,
MR. CHANTER,		MR. HASSALL,
		MR. LYNE.

T. H. HASSALL, Esq., IN THE CHAIR.

Bruce Smith, Esq., Barrister, instructed by John McLaughlin, Esq., Solicitor, appeared for the proprietors of the Evans Australian Combination Truck.

W. B. Wilkinson, Esq., appeared in person.

William Vero Read, Esq., called in, sworn, and examined:—

1. *Chairman.*] You are the Traffic Manager of the Southern and Western Railway? Yes.
2. You have had some little experience of what is termed the Evans combination truck, since it came into use? Yes; I have watched its working.
3. When were these trucks first put on the line? They were finished in May, and commenced running in June, 1885.
4. Your experience of the trucks is that they would effect a great saving in the working expenses of the Department? A good combination truck would effect a saving in the working of the traffic of the Railway Department at certain periods of the year.
5. Will you give us your opinion on the working of the Evans combination truck? The truck has been used principally for sheep on the up journey, and for goods on the down journey. The experience of the working of it in this manner has been favourable to it.
6. Have you had any other combination truck running on the lines on which you could form an opinion? No; we have not.
7. The only truck which you have had on the line on which you can form a really practical opinion, is the Evans combination truck? Yes.
8. Would it be possible to convert the trucks at present in use for the conveyance of stock into combination trucks on the Evans pattern? I would not recommend the conversion of the old trucks, but some of the new ones might be converted into combination trucks.
9. Have you seen any other designs of combination trucks? I have seen Mr. Wilkinson's design.
10. What is your opinion about that? I think the design is very good, but I do not think it equal to the last design of the Evans truck.
11. What is the difference between the last and the former design of the Evans truck? The former one had four compartments for sheep. The last one has two compartments for sheep, and it makes one open truck for cattle.
12. That means taking away part of the division? Yes; doing away with the division in the first design.
13. Without the support that this division afforded, do you think that the Evans combination truck can

W. V. Read,
Esq.

17 Nov., 1887.

W. V. Read, Esq.
17 Nov., 1887.

be perfectly safe for the carriage of stock. I see by the papers that an accident happened through the centre bar breaking, and the top deck falling upon the sheep. Is that likely to occur in the construction of the trucks on the latest principle? I believe that by strengthening the bar as it has been strengthened, it can be made to hold with safety the weight of a tier of sheep.

14. Have you had any experience of the trucking of stock? I have seen a great deal of it at stations in years gone by.

15. What is your opinion with regard to the loading of stock in the Evans truck. Do you think it would be an advantage if the trucks could be loaded by one truck being backed up to the race, and the stock run in, and then run through the train, if such an idea could be carried out? My opinion is that side loading is the best, although I hear that in South Australia they have adopted end loading, but with yards for loading a number of trucks at a time. I am of opinion that side loading is the best.

16. If I understand you aright, you would have yards to hold the number of stock. Then you would put your truck on, and load it at the side, and after it was loaded move it away for another truck? I mean having races sufficient to load a number of trucks without shifting them at the time, the same as we have at Hay, and as they have at Echuca on the Victorian line.

17. Can you give us any idea of the cost of altering your new trucks into combination trucks? I believe it would be about £90 a truck, but you could get a better answer on that point from the branch which has the carrying out of the alterations.

18. That is with regard to the Evans truck? Yes.

19. Have you taken sufficient notice of any other models to enable you to form an opinion as to the cost of altering the trucks to those models? I should say that the cost of adapting the trucks to the Wilkinson design would be quite as much, if it could be done.

20. Have you seen the Perry model? I have seen it, but I have not examined it.

21. Is there any truck built on the model submitted by Mr. Perry? I do not think so.

22. Can you express an opinion about that model? From the cursory examination which I have made of it, I am not in a position to give a decided opinion. It appears to me that to raise the floor by a compensating weight would be a mistake. It would be so much dead weight to be carried.

23. That would be a strong objection to the truck? Anything which increases the weight would be an objection.

24. *Mr. Brunker.*] The only new truck, I suppose, which you have tried on the lines is the Evans combination truck? It is.

25. You have had no experience of what the others will do, beyond the Wilkinson truck? It has never been used.

26. You say that your experience is favourable with regard to the Evans truck. What is the nature of that experience so far as the difference is concerned of carrying stock by the Evans truck and by the old style of truck? The great object in a combination truck is to get a centre deck, which will work for sheep, or may be removed for goods or cattle. So far, this centre deck has answered very well.

27. Is the ventilation good? It is.

28. Have the losses of stock been considerably lighter since you have been using the combination truck than under the old system? I do not think that there has been any difference with regard to the losses in the carrying of stock—no remarkable difference, as the number of combination trucks is fourteen against 200 or 300 sheep trucks.

29. With regard to time and labour saving conveniences—what are they? The Evans truck is not as easily loaded with sheep as our own trucks are, on account of the upper door being exactly over the lower one.

30. I understand that the Evans truck carries about the same number of stock as your old trucks? The Evans truck is slightly larger than our trucks at present in use, but any new trucks would be made to the size of the Evans truck.

31. So far as the traffic is concerned, what saving would it be to the Department to use the Evans combination truck compared with the old trucks, taking the fourteen that you have in use as a basis? That would be a most difficult question to answer, as the state of the traffic in the interior would affect the working of these trucks. It is only when there is a flow of live stock from the interior, and a small quantity of produce coming into Sydney that the benefit of the truck can be seen.

32. Would not the bulk of the advantage to be derived from the combination truck be in the carrying of merchandise into the interior and bringing stock back, not in the quantity of goods coming from the interior to Sydney? Yes; but when there is a quantity of produce coming from the interior, you would have to send ordinary trucks to bring it down; therefore it is better to load them than the combination trucks.

33. Have you not made an estimate with reference to the earnings of the combination truck and the old truck used for live stock? There is a statement published in the papers laid before Parliament, which shows the earnings of each kind of truck, not the actual saving. The actual saving can only be approximated, and that, with the greatest care, in fact it would be an immense labour to take out the saving.

34. Can you say who furnished this data to the Department; I find in one of the papers it is stated:—“The saving which has accrued to the Department from the use of the combination trucks, as an earnest of what may be expected in the future, is set forth in a return which was laid upon the Table of the House and ordered to be printed, 21st September, 1887. In commenting upon that return the Commissioner minuted that it would be seen that in the six months work the fourteen combination trucks had earned nearly 9d. a mile on the full and empty runnings, while the sheep and cattle trucks had earned something less than 3½d. a mile, and that if the latter had earned as much per mile travelled as the combination trucks the revenue would have been £145,089 more than it actually was”—Who supplied that information? That is written by the Commissioner.

35. That is a correct statement in your judgment, as far as you can get it approximately? This statement is correct.

36. That actually means then, that if you had been using the combination trucks instead of the old cattle and sheep trucks that the earnings altogether would have been £145,089 more than they actually were? No, because the fact of their being combination trucks did not result in any increase of traffic.

37. *Chairman.*] What I understand from that is that there would have been less money paid away as working expenses? That would be it. It does not follow that the traffic would be increased.

38. I understand that the saving would be in the wear and tear, and the doing away with the running of empty

- empty trucks; I take it that no truck would have brought more traffic to the railway? No. The saving would have been in the working expenses. W. V. Read,
Esq.
17 Nov., 1887.
39. With regard to the Board who were appointed to inquire into the merits of the different trucks submitted, in making their examination they really only had the Evans combination truck before them? Yes. The Wilkinson truck was only just completed before they left.
40. Then actually, when examining the rival designs, they were confined to a great extent to the Evans combination truck? They must have been.
41. Did they have the same opportunity of examining the other designs as they had of examining the Evans trucks? I do not think they had.
42. It appears that the desire has been to get a truck with smooth sides for cattle which could be converted into a sheep truck. I take it that the floor of the top deck of the Evans truck is a smooth surface, and that it would have flaps which would hang down the sides of the truck when it was not in use. Would it not be far better, especially for sheep, if there were battens nailed to the floor to enable sheep to keep their feet in long journeys? These floors are corrugated to a certain extent, and it has never been found a disadvantage as they are.
43. *Mr. Brunker.*] You say that you have seen Wilkinson's design, and you think it good, but not equal to the last design of the Evans truck; now what is the difference? I think there are too many parts to the Wilkinson truck, doors, &c. I do not think that the middle deck is as good as the Evans truck.
44. *Chairman.*] In what way? I do not think that it will be found to work in practice.
45. Do you mean as to bearing the weight? To bear the weight, and to be shifted up and down.
46. From what you have seen of the working of the two trucks is there any difference in the time it takes to put up the top deck in the Evans and the Wilkinson truck? I think they take about the same time. I may observe that I have only seen the Wilkinson truck moved about twice.
47. *Mr. Brunker.*] With regard to the cleaning, I suppose one truck is as easily cleaned as another? I am of opinion that one can be cleaned as easily as the other.
48. *Chairman.*] Can one man remove the top deck in either truck? Yes; I have seen one man do it in each case.
49. *Mr. Brunker.*] You have said with regard to the loading of the trucks that in your opinion side loading is the best; why do you think that? End loading has never been tried to any large extent. We have had all our loading hitherto on the side, and it has been found to answer very well, especially at Hay, where we have had races for loading several trucks at once. In consultation with other railway men—Victorian officers, for instance—I have ascertained that they are of opinion that side loading is the best.
50. The difference is that you now shut off as many sheep as can be conveyed in one truck, whereas if you had end loading, you would have to shut off the sheep as they were running? That would be one of the great difficulties of end loading, shutting off the proper number for each truck.
51. *Chairman.*] Do you not think that that could be obviated by having the trucks loaded from end to end. It is well known that, as a rule, sheep, when they once get stringing, will run along. That difficulty could be got over by having a man stationed at the far truck, to shut off the number coming in. The race would not be too wide to prevent one man dealing with the sheep, if the doors were fixed so that they could be closed without trouble? It appears to me that you would require a man for each truck.
52. I do not think so, because the moment the door is closed, you stop the stream of sheep into the end truck, still they would crowd into the second one, and a man coming over the top could close the door? I think the tendency would be for the whole of the sheep to rush into the end truck, and if a man were at the end truck, and he allowed the proper number of sheep into that truck, then, in practice, I am afraid it would be found that there was a greater number than there should be in the last truck but one. That would be unless you had a man at each truck to count the number of sheep as they went in.
53. *Mr. Brunker.*] I understood you to say that the cost of altering the old trucks to the Evans pattern would be about £90, and that the cost of altering them to the Wilkinson design would be as much, if it could be done—what did you mean by saying "if it could be done?" If our trucks could be altered into Wilkinson trucks. That is a mechanical question which has to be settled. I do not profess to be able to give an opinion on that mechanical question, and, therefore, I put in that proviso.
54. You have not had as much experience of the Wilkinson truck—as it has not been practically tried—as you have had of the Evans truck. From what experience you have had, which truck do you consider the most economical and the most suitable for the conveyance of stock and merchandise? I should say the last design of the Evans truck, with the top door altered.
55. *Mr. Smith.*] You were asked if some accident had not occurred to the bar which supports the upper deck of the Evans truck, is not that the only accident which has ever happened to these trucks since they have been in use? Yes, that is the only accident.
56. How long have the fourteen trucks been in use? Since June, 1885; but I should remark that the truck to which the accident happened had only been in use a few times.
57. These fourteen trucks had been in use since the time you mention, and that is the only accident that has happened? Yes.
58. They have been practically tested all over the lines? Yes.
59. Is it not a fact that when that accident was inquired into, the bar which runs fore and aft in the truck had a latent flaw in the timber? I believe it had.
60. In your opinion was that the fault of the construction, or the fault of the timber used? I think it was the fault of the timber, and the bar was too light.
61. So that, with this exception, and with one or two alterations, the trucks have answered the purposes for which they were put forward? They have answered the purpose very well for merchandise and sheep traffic, for which they have been principally used.
62. *Mr. Lyne.*] What about cattle? They have not been used very much for cattle.
63. *Mr. Smith.*] But they have never failed as cattle-trucks? No.
64. For the purposes for which they were put forward, and for which they have been used, they have proved a success? Yes, as far as I have already explained.
65. Since the accident happened, the bar which then broke, has been strengthened, has it not? It has.
66. *Mr. Wilkinson.*] I want to know the reason why the Evans trucks have not been used for cattle? There is a disinclination to use them for cattle, with a partition in the centre.

- W. V. Read, Esq.
17 Nov., 1887.
67. The only accident which has taken place in the Evans truck was in the improved truck, which you recommended? Yes; that is the one in which the accident took place.
68. It had been running only a few times when the accident took place? It had.
69. You have had no experience of end loading yourself? I might say no experience.
70. Have you seen a letter from Mr. Valentine, the Chief Inspector of Stock in South Australia? Yes.
71. If you refer to the papers you will see a letter from Mr. Valentine, dated 9th June, 1886, in which it is stated that the end-loading system had been in use in South Australia for some time, and has been found of great advantage. Is that so? It was this letter to which I referred in my evidence.
72. If you refer to the same paper you will find a letter from Mr. Bruce, the Chief Inspector of Stock in this Colony, dated 10th September, 1887. In the second paragraph of that letter he refers to end loading; I suppose you know from that that in his opinion end loading is much the best? I know that it is Mr. Bruce's opinion that end loading is the best?
73. Do you know anything of the mortality of sheep on the top decks of the Evans truck? I do not know that it is more than in any other trucks.
74. You do not know that it has been larger than in the other trucks? No.
75. You know that the Evans trucks have been constructed at the cost of the Government? Yes, they were constructed by the Department.
76. And that the alterations, the knocking out of the partitions, was done at the expense of the Government? I believe that the Government paid for the altering of a cattle waggon to a combination truck.
77. If cleats were put on Evans top deck, which hangs against the wall when used as a cattle truck, if there were wooden cleats to keep the sheep from slipping, would they not act as a sort of currycomb, and thus injure the cattle? I think they would be injurious to cattle if they project from the side.
78. You say that my middle deck is not so good as Evans'—can you explain that? I do not think that in practice it will work.
79. Were you speaking of the working of the deck, or of the deck itself, when you said it was not so good? The working of the deck.
80. Do you mean that it will not come to the roof? I think that it will strain, and that the machinery for hoisting it will jamb.
81. Which part do you think will get out of order? I think that the chains will jamb, and that the deck will strain, that it will come out of the square, and not work up and down.
82. The Evans improved truck cannot be divided into four parts? It cannot.*
83. Do you not think it is an advantage to relieve the pressure from smothering sheep to have a truck in four compartments instead of two? Only for the difficulty in loading it would be a slight advantage to have it in four compartments instead of two.
84. Therefore, if the difficulty of loading were overcome, in your opinion it would be an advantage to have a truck in four compartments instead of two? A slight advantage.
85. On looking at my partition doors, have you noticed that they may be used or not, as the party loading thinks fit? Yes; I believe that the doors can be pinned across if necessary.
86. And need not be used when the truck is loaded with cattle? No. Of course they could be pinned back when they were used for cattle.
87. Do you know that in my truck you could carry two classes of stock, or three classes of stock, in one truck? I know that you can divide it into three or four compartments.
88. Has your attention been drawn to the fact that in my truck you may carry half a truck of horses or cattle and half a truck of sheep? You can divide the truck off into two, three, or four compartments, and of course use them as you consider necessary.
89. What is the protection for goods in the Evans truck, is it not a canvas curtain? Yes.
90. Do you know how my truck is protected from the weather? By a sheet iron shutter.
91. *Mr. Smith.*] That sheet iron shutter is of some weight, is it not? Yes.
92. Is it not a fact that the tarpaulin in the Evans truck winds up on a roller in the roof, and comes down the side and fixes permanently in the corners? The Evans truck for carrying goods is protected by a tarpaulin, which is rolled up in the roof when the truck is intended for carrying live stock.
93. It is completely out of sight and out of way, but when it is down is it not as complete a protection to the goods as an iron sheet? The tarpaulin has been found an effective protection.
94. *Mr. Wilkinson.*] That is, as long as it lasts? Of course.
95. *Mr. Lyne.*] How long does it last? I understand that half the tarpaulins have been renewed since the trucks were built.
96. *Mr. Smith.*] What is the weight of the Evans truck? The first one, I believe, weighed 7 ton 7 cwt.
97. And the latter? About 6 ton 14 cwt.
98. What is the weight of the Wilkinson truck? 7 ton 14 cwt.
99. Therefore, there is about a ton greater weight in every one of Wilkinson's trucks? There is about a ton weight difference between the Wilkinson truck and the last truck supplied by Evans.
100. I presume that a ton extra to every truck is a matter of great moment when you come to calculate the traffic at the end of the year? Of course, all increase in the dead weight is a disadvantage.
101. How many doors do you think there are in the Wilkinson truck? I think there are about eighteen; but I cannot speak positively.
102. How many doors are there in the Evans improved truck? I think six or eight.
103. *Mr. Brunker.*] Is there any difference in the floor area? I think they are about the same. There is very little difference, if any, between them.
104. *Mr. Wilkinson.*] If the weight of my truck could be reduced to that of the Evans truck, that objection would fade? Of course.
105. *Mr. Lyne.*] With reference to the returns which have been published, and about which you have been questioned, respecting the Evans truck, I should like to ask you have these trucks been taken in the ordinary way, or have they in any way been specially attended to on their journey? These trucks have been specially looked after.
106. Some one has been sent with them? No.
107. In what way have they been specially looked after then? In being washed out and brought into Sydney to be loaded with goods.

* NOTE (on revision) :—I have since examined the truck, and find that provision is made for subdividing it by means of moveable wooden bars.

108. What I mean is this. If the trucks had been put on the line in the way that ordinary trucks are, without any special attention, would the returns from these fourteen trucks have been as good? No; because they had to be specially washed out and brought into Sydney, and loading was always found for them. W. V. Read,
Esq.
17 Nov., 1887.
109. Is there any trouble in the cleaning? No particular trouble.
110. The same would apply to all combination trucks? It would, because the hose has to be used on them, whereas the other trucks are simply scraped out.
111. With reference to the Hay trucking yards, am I right in supposing that there are ten yards to load ten trucks at once? Yes; there is a race which holds enough opposite the truck for each truck, and ten trucks have been loaded there in thirty minutes.
112. There is a yard opposite each truck? Yes.
113. If side loading is to be continued, and that principle is carried out generally, would not all our yards have to be altered in the same way? It would be desirable to make the alteration where any large quantity of loading would have to be done.
114. In loading at the side in the ordinary way, is it not compulsory, if you wish to load quickly, to have an engine in the yard to move the trucks where there is only one race? Yes; an engine or a horse, if there is not a fall in the siding.
115. If you have a fall then it must be done by manual labour? The trucks will move by lifting the brakes. It is done at Goulburn.
116. Where there is only one race, as is ordinarily the case at small stations, it takes a long time, does it not, unless you have an engine to move the trucks? There is great difficulty in moving them by hand labour, unless you have a fall.
117. Do you not think that there are a great many sheep killed by side loading in the trucks that are fairly filled, by pushing and squeezing them to get the doors closed? It may be so, but I have never noticed it.
118. You said that the alteration to the Evans truck would cost about £90, while I notice, in a return called for by the Commissioner, that Mr. Braid estimates the cost of converting the ordinary trucks into the Evans truck at £196 8s.? I formed my opinion from what was paid for the alteration of a cattle truck to a combination truck.
119. Was not that done by Mr. Evans himself? He got it done, I believe.
120. Is there not a great advantage in the combination trucks, no matter whose patent may be adopted, in having them distributed over the railway lines, so that persons could get them at short notice for sending stock down after goods had been taken up? It would be an advantage if there was regular traffic; but if there was no regular traffic and these trucks stood idle for a time it would be a disadvantage, as it would not be profitable to use them on the down traffic for carrying goods, on account of their weight over the ordinary trucks.
121. How much heavier are they than the ordinary trucks? The old ordinary D trucks weigh only about 4 tons 15 cwt. and carry 6 tons. The new ones weigh about 5 tons 5 cwt. and carry 8 tons. The improved Evans truck weighs 6 tons 4 cwt., and carries 6 tons.
122. According to the weights which you have given, one combination truck is 2½ tons and the other 1½ tons heavier than the ordinary truck? Yes.
123. Were you not present at an experiment which I once had at Homebush with end-loading trucks? I was.
124. Did not the sheep run in without any difficulty on that occasion. They ran through very well, but they were not partitioned off or counted?
125. The only objection you see to end loading is the difficulty in counting? That is one of the difficulties.
126. Is there any other objection? I think there would be a difficulty in getting the proper number in, and if you got the end trucks overloaded in getting the sheep out.
127. The difficulty which you raise is with regard to counting them and eventually dividing them? Yes, that is the main difficulty.
128. In connection with the Wilkinson truck, which I have not seen, I am told that the top of the truck can be lifted up? Yes.
129. Do you think that that would be an advantage in loading sheep? It would be.
130. *Mr. Smith.*] When you spoke of the difficulty of loading sheep from the end of the truck, the difficulty to which you refer is an equal distribution of the sheep among all the trucks? Yes; if the end truck were supposed to carry fifty sheep, and you find fifty-five in, you would have great difficulty in getting the five out.
131. Supposing you were loading five trucks in a line with the Wilkinson truck, how many doors would you have to open before the sheep could be run in? Thirty-two.
132. *Mr. Lyne.*] They are simply folding-doors? Yes.
133. I suppose that four of them would only be about the same size as the large door at the side of the Evans truck? About the same size.
134. How many doors would have to be opened in the Evans truck? There would be four to each truck, but you would only have to open two at one end, unless the truck were in four compartments. If there were four compartments you would have to open four at the side of each truck.
135. *Mr. Smith.*] As to the washing of the trucks, is it not a fact that if you had sheep in the upper and lower decks of one of the Evans trucks that, when the sheep were out, the upper floor would fall down to the side, when it could be hosed out, the dirt running to the bottom floor? Yes.
136. In the case of the Wilkinson truck, the doors would have to be lifted up. How could they be hosed; would not the stuff run out at the sides? The top deck of the Wilkinson truck can be hosed; but, while it is being done, the stuff will run out at the side.
137. But, in the other case, the dirt from the upper floor would fall on the ground floor, and could be swept out? Yes; but I do not think that there is anything material in that.
138. *Mr. Wilkinson.*] As to distributing the sheep through the trucks, if the Board have reported that by an arrangement of the doors, I had overcome the difficulty of distributing the sheep by end loading, your chief objection would fade? No; because I think you would still require a man on each truck to divide them off.
139. Have you read the supplementary report of the Board? I have only formed my own opinion.
140. You have not tried end loading yourself? I have seen very little of it. 141.

- W. V. Read, Esq.
17 Nov., 1887
141. If the Board had tried it, you would be prepared to take their evidence? It might influence me; but I should like to see it demonstrated myself.
142. *Mr. Brunker.*] Is there the same amount of ventilation in Wilkinson's truck as in the latest design of the Evans truck? I think there is ample ventilation in both.
143. As far as cattle are concerned, are the surfaces smooth in both trucks? No; I think the surface is rather better in the Evans truck than in the Wilkinson truck; but no doubt some angles in the latter could be taken off.
144. Take them as they are now? As they are now, I think the surface of the Evans truck is the best.

FRIDAY, 18 NOVEMBER, 1887.

Present:—

MR. SUTHERLAND,		MR. CHANTER,
MR. LYNE,		MR. KETHEL.

T. H. HASSALL, Esq., IN THE CHAIR.

Bruce Smith, Esq., Barrister, instructed by John McLaughlin, Esq., Solicitor, appeared on behalf of the proprietors of Evans Australian Patent Combination Truck.

Mr. W. B. Wilkinson appeared in person.

THE Committee proceeded to the Redfern Railway Station, and inspected the Evans and the Wilkinson Patent Combination Trucks.

The first truck inspected was an Evans patent, which the patentee stated had been in use for two years and half. The truck is in two compartments, the partition having been put in on the suggestion of the Railway Department. The truck was arranged as a cattle or goods truck, and at the request of the Committee the patentee had it converted into a sheep truck. The work was done by one man, and the time occupied was six minutes forty-five seconds.

The second truck inspected was the Evans Improved Patent, which had been recommended by a Board appointed to report on the question. This was formerly a cattle truck, such as are in use on the Government Railways. The truck is of one compartment, and was arranged as a sheep truck. It was converted into a cattle or goods waggon, one man doing the work in six minutes fifteen seconds.

The next truck we inspected was Wilkinson's patent, which was converted from a cattle or goods truck to a sheep truck, by one man, in two minutes twenty-five seconds. The truck was then reconverted to a cattle or goods truck in three minutes fifteen seconds. The patentee further demonstrated the patent by converting one half of the truck into a compartment for sheep, and the other half into a cattle or goods truck. He also explained how the truck could be used either for end or side loading, and illustrated how a train load of trucks could be loaded from one yard without moving the trucks, by an arrangement of platforms extending from one truck to another.

This concluded the inspection.

TUESDAY, 22 NOVEMBER, 1887.

Present:

MR. DAWSON,		MR. LYNE,
		MR. SUTHERLAND.

T. H. HASSALL, Esq., IN THE CHAIR.

Bruce Smith, Esq., Barrister, instructed by John McLaughlin, Esq., Solicitor, appeared on behalf of the proprietors of the Evans Australian Combination Truck.

W. B. Wilkinson, Esq., appeared in person.

Richard Hodnett, Esq., called in, sworn, and examined;—

- R. Hodnett, Esq.
22 Nov., 1887.
145. *Chairman.*] Where do you reside? At Bourke.
146. What is your avocation? I am a grazier and a dealer in stock.
147. Have you had any experience in loading stock into cattle or sheep trucks at Bourke or other places? Yes; I send stock down to market very often.
148. Have you had any experience of the Evans Combination Truck? I have used what are called combination trucks. I suppose they are Evans.
149. Will you kindly give us your experience in loading and in dealing with stock in loading those trucks? I consider that the combination truck is superior to the ordinary sheep van. It holds more, and the sheep are divided into compartments, which is safer.
150. Is it easier to load the combination truck than the ordinary truck? It is more difficult; you have to shift them from one compartment to another. After you have filled one compartment you have to slide the trucks on. It is about eight or nine months ago since I used one.
151. Do I understand you to refer to the truck with the division in the centre? Yes; I do not mean the long American cars, I mean the combination truck with the division in the centre.
152. After loading one compartment you have to move the truck along to bring the other door in front of the race to load the other compartment? Yes.
153. Have you seen any other combination truck in use, or have you seen the model of any other truck? I have seen a long American Car, known as the Humanity Car. The Department once sent me two of these cars, and they charged me at the rate of five ordinary sheep vans. I lost seven sheep out of a mob of 500, and I applied to the Commissioner for compensation. I have received only £4 for one lot, and I am going to him again for another lot. The trucks were not equal in capacity to five ordinary sheep vans. I refused to take the second lot of these trucks, but the stationmaster at Bourke said that I would have to take them, and I did so under protest.
- 154.

154. Then your opinion of that car is not favourable? The two trucks were not of equal dimensions; one was seven feet longer than the other; no one seemed to know the capacity of them, and you had to fill them according to your own judgment; they carry a great many sheep together, and this is likely to lead to smothering. As I told you, I lost seven, and I estimate that I have lost one shilling a head from crushing up in loading 450 or 500 sheep. R. Hodnett,
Esq.
22 Nov., 1887.
155. With regard to the Wilkinson truck, which you say you have seen, if it were in use on the railways the same as the truck of which you have had experience, do you think that that truck would be as good as the truck at present in use? I think so; I am certain it is as good. My object in seeing Mr. Wilkinson's truck was this: as we are a long distance from the market we have for a long time been looking out for a combination truck which would take goods up country and bring stock down; we want to get the cheapest and best truck that we can, so that the cost of sending stock to market will be smaller than it is at present; at present it costs from 2s. 6d. to 3s. to send a sheep to market on account of the back haulage.
156. Did you notice any difference in principle between the combination truck now in use and the Wilkinson truck? Yes, a very great deal of difference.
157. What was the point which struck you most? The facilities for loading are better in the Wilkinson truck; for end-loading purposes I think it would be a great advantage. There are also other advantages; a compartment can be fitted for horses or cattle and small lots of sheep. If you were sending a small lot of stud sheep from Sydney you could load part of the truck with goods, and the other part with sheep; this would be cheaper than having to hire a whole sheep van to take up a few sheep; sometimes there are only three stud sheep to be sent up country, and often enough you have to hire a whole van to carry three or four rams.
158. Do you think a train load of Wilkinson's trucks could be loaded with less trouble and with the expenditure of less labour than the Evans truck at present in use? I am of that opinion; if I had anything to do with them, and I were sending a quantity of stock away I should try to load on the end principle; I believe that they are fitted for that as far as sheep are concerned. I see nothing to prevent its being done; the trucks being all together, and there being sufficient space to walk up and down, you could load sheep just as if you were running them through a yard; after the bottom decks were loaded you could lower the top decks and raise the roofs, and then you could proceed to load the top decks in the same way as you had loaded the bottom ones.
159. From your experience in loading sheep, what is the most difficult part; is it not to get the sheep to go into the truck to commence with; do you find any difficulty in getting them in after they have once begun to string along? In the combination cars, as I have used them, the great difficulty has been in getting them in, and in getting them to stay in, more so than in the ordinary sheep van. When I have been loading, I have had to follow them in, and poke them along; then, when you have half a compartment loaded, you have to go and do the same thing in the other compartment. In the ordinary sheep van you will fill it at one loading; there is no removing. In the Wilkinson truck, as far as I can see, loading can be made a lot easier, and with less labour.
160. Your opinion is that greater facilities would be afforded in loading the Wilkinson trucks, and that there would be a saving in labour, as compared with the Evans truck at present in use? That is my opinion from what I have seen.
161. *Mr. Smith.*] Did I understand you to contend just now that an advantage would arise from loading goods at the end? No, I did not; what I said was that, in the Wilkinson truck, you could load one part of it with goods, and another part with sheep, if necessary.
162. When you speak of less labour in loading at the end, are you speaking of any particular class of yards; do you know anything about the Hay yards? I do not; I have not been at Hay for some years.
163. Are you aware that they are so constructed that there is no necessity to remove the trucks at all? No.
164. If you saw that they were so constructed that ten Evans trucks could be loaded without removing them, that would alter your conclusions? I do not think it would, because it could only be done by having a double set of races, and you would require a double set of men, or you would require to go from one race to another to do it.
165. If it could be done without removing the trucks, would that alter your conclusion? It would require more labour then; you would require two sets of men to load at the same time, or you would have to load at one yard and then go on to the next.
166. But you say you have not seen the Hay yards? I have not seen them, but I can understand the only way by which it can be done.
167. You have spoken about the ends of the trucks being thrown open so as to allow sheep to run through? The Wilkinson truck can be used for end loading. I said that I should try it.
168. Are you prepared to say that it would be a success? I am not prepared to say that; but I should try it, and I believe that it would be a success.
169. You express that opinion, although you have never tried the truck? I think that as a practical man I can express an opinion.
170. Do you think that such an opinion is worth much? I am certain that it would be a success.
171. Have you ever seen sheep run through a narrow passage such as would be constituted if five, six, or ten trucks were put in a line? Yes.
172. Where in? In an ordinary sheep yard.
173. How would you divide them off? By walking through them.
174. Do you know Mr. Read, the Traffic Manager of the Railways? Yes.
175. Do you consider him an authority on the matter? I do not know that I consider him an authority on the matter of loading stock.
176. If he said that it would require a man at each truck to divide off the sheep in order to get an equal number into each truck, what would you think of that? If you had a man at each truck the sheep would not run through.
177. Suppose it were necessary to have a man at each truck, you could not load? My idea is that it would be like a long yard along which the sheep would run, and when you got the sheep pretty well in you would commence at the top and count them, and having got the right number in you would close the door. In this way you could walk from one compartment to another.
178. *Mr. Dawson.*] It would be something like working in an ordinary yard when sheep are boxed? Yes.
179. *Mr. Smith.*] You say that you would have to move the Evans trucks along to load them, and it is, I suppose, because you would have to do this that you say that the working of one truck would be more economical than the other? Yes; I had to do it myself. 180.

- R. Hodnett, Esq.
22 Nov., 1887.
180. Have you studied the two trucks, or have you only looked at them? I have worked the Evans truck.
181. The one sold to the Government? I do not know that.
182. *Chairman.*] Have you worked the Evans truck with the partition in the centre? That is the one that I am talking about. I may say that I have no interest in the trucks.
183. *Mr. Smith.*] Have you observed the two trucks closely? I have worked the Evans truck, and I have seen Wilkinson's.
184. Did you observe any difference in the facilities for cleaning the upper decks in the two trucks? I took the trouble to notice the facilities for lowering the decks in the Wilkinson truck contrasted with the Evans truck. When I examined the truck I had no idea that I should have to give evidence here.
185. Did you see the trucks tried together? I have seen Evans truck worked, and I have seen Mr. Wilkinson lower his top deck in no time.
186. How would you propose to clean the upper deck of Wilkinson's truck, which is always on the horizontal? I have never considered that. I have only looked at the truck from my own point of view for sheep.
187. How do you propose to clean that upper deck so as to have no droppings on goods below, which you are taking up? I examined the deck. It seemed to me to be perfectly water-tight. I pointed out to Mr. Wilkinson the advisability of having a groove running along to carry away any water. As for droppings, I did not take them into consideration. Sheep generally clean that away themselves in kicking about.
188. Did you take any trouble to observe how the upper deck of Wilkinson's truck can be cleaned so as to prevent the dropping of urine on the goods below? I have told you so.
189. How can it be cleaned then? You asked me if I had noticed how it could be cleaned so as to prevent the dropping of urine. I said that the deck seemed to be perfectly water-tight; in that case the urine could not go through.
190. But you said at first that you had not observed it? I observed that right enough.
191. Did you observe that in the Evans truck the upper deck drops down to the side, so that anything on it would fall to the floor, and would not be near any goods? I know that.
192. Is it not in your experience a matter of great importance that there should be no possibility of cattle putting their feet through the sides of the truck? I do not understand you.
193. If you had a truck with nothing but iron bars, I presume that a bullock could get his foot through; would not that be a drawback? Yes.
194. Have you noticed that in the Evans truck by the upper deck falling down, the sides are closed up? Yes.
195. Do you know what is the case in the Wilkinson truck? He has a sliding door outside.
196. How far does that go along the truck—is it not a fact that the space is left open between the bars? I did not observe that.
197. I suppose that you have not considered the question from the Department's point of view? Most certainly I have.
198. Have you any idea what is the difference in the weight of the two trucks? No; beyond that I believe that the trucks could be lightened considerably—that Wilkinson's truck can be lightened considerably.
199. What would be the difference in having one truck over a ton heavier than the other? I have not considered that.
200. Do you consider that the ventilation of Wilkinson's truck is equal to that of Evans'? I think so, that is with trains passing along.
201. Have you examined the trucks sufficiently to be able to say so? I consider that there is sufficient air for anything in the world, especially when a train is moving. There are open bars. Surely to goodness there is plenty of space for air.
202. I suppose you do not offer any opinion as to the relative strength of the two trucks? No.
203. *Mr. Dawson.*] How many years have you been dealing in stock? Ten or twelve years continuously.
204. You have done a great deal of trucking? Yes.
205. As a practical man, which truck of the two do you prefer? I prefer Wilkinson's truck.
206. *Mr. Wilkinson.*] You said that it is a benefit to have the sheep trucks divided into compartments? Yes.
207. Have you seen Evans' improved truck, the one with the partition out? I have seen it at the yards, but I have never used it; it was pointed out to me.
208. Therefore the compartments would not be there for sheep? No.
209. In loading sheep at the side have you found that the great difficulty is in getting in the last four or five sheep? Most certainly.
210. Is it true that in loading sheep at the side they go in at the door and hang round the door; the decks being fixtures can a man walk in and distribute them over the deck; is it not necessary to prod them with sticks in order to get them in? I gave you my description before. I said that a man had to follow them into the compartment and poke them up.
211. Is it a fact that the difficulty is in getting in the last four or five sheep? Yes.
212. That is what occupies a great part of the time? Yes.
213. If you had a truck which a person could walk upright in, would this difficulty occur in a side or an end loading truck? No.
214. Presuming that my truck was a side-loading one, what would be the case? I consider that any man using your truck would go into it just as he would into the pens at a woolshed; he would load up exactly the same. It appears to me to be just exactly like that.
215. In the Evans improved truck, can you remember if the existing doors would tally with the existing truck-yards? No.
216. Is it a fact that the trucking yards are half a truck apart? Yes.
217. If you bring the truck up to the gangway, and one door is opposite the lower gangway, where would the next door in the truck have to be to be opposite the higher gangway? There are two races in the trucking-yard, one for the bottom and one for the top.
218. How far are they apart? I cannot say for certain, although I use them often enough; but I should say that they are nearly the length of a truck apart.

219. They are not made over one another? No; they are a considerable distance apart, because there are separate yards leading to them.
220. If the door of Evans' lower deck was opposite the lower gangway would you have to move the truck further on when you wanted to load the top deck? I always had to do that.
221. With regard to the yards at Hay, do you understand that there are separate yards or gangways, which will face each individual truck? There must be, to load a truck without shifting; there must be four races.
222. With reference to end loading in my trucks, would it be necessary to expend any further money in altering the present yards? None.
223. If I wanted to load fifty trucks on the end-loading principle, could I load my first truck on the side, with the present side-loading yards, without altering the gangways? Yes; my opinion is that I could load five hundred trucks from the present yards.
224. You know Mr. Badgery, I presume? Yes.
225. He is a man of a certain amount of experience? A good deal of experience.
226. Will you be kind enough to read what he states in this report, in page 3 of the papers. [*Question objected to by Mr. Smith. Objection sustained.*]
227. Do you believe that end loading would be a success with my system? I do.
228. You were asked about urine dropping upon the goods from the top deck in my truck. Do you think it likely that goods would be put in the trucks before the decks were cleaned; and after they were cleaned do you think there would be any urine? It would be a simple thing to wash them if you had water.
229. Would there be any urine left on the decks if they were washed properly? No; you could lower the deck down, and with a hose you could wash it instantly, and then you would clean the lower deck afterwards.
230. With reference to cattle getting their feet through the trucks, is it not a fact that besides the doors and besides the shutters outside my truck there are bars as well? I did not take particular notice.
231. As to the ventilation of my trucks, are they not ventilated at the end? Yes.
232. *Mr. Smith.*] When you say that you prefer the Wilkinson to Evans truck—you know that Evans truck has been running for two and a half years, and you have never seen Wilkinson's used? That is so.
233. *Mr. Lyne.*] Can you give any idea as to how long it would take with ordinary side-loading trucks to load a train of fourteen trucks of sheep with the present yards? It all depends how the sheep run in; sometimes they go in better than at other times.
234. But how long would it take on the average? If I have to load fourteen trucks I generally begin a couple of hours before the train starts; but I have never timed it, and I cannot speak for certain.
235. *Mr. Smith.*] If ten trucks, holding 1,000 sheep, could be loaded at Hay yards in half-an-hour would you not consider that a good result? It would be a fair result; but it would depend on the number of men you have. I am certain that as far as the Wilkinson truck is concerned, with end loading I could run them in in a third of the time, because I could run them in in a body.
236. *Mr. Wilkinson.*] Leaving end loading out of the question altogether, taking my truck as a side-loading one, as a man is able to stand upright in the truck, can it be loaded quicker than the present side-loading trucks? Yes; in loading the lower deck in Evans trucks you have to crawl in between the decks.

R. Hodnett,
Esq.
22 Nov., 1887.

THURSDAY, 1 DECEMBER, 1887.

Present:—

MR. BRUNKER, | MR. LYNE.
T. H. HASSALL, ESQ., IN THE CHAIR.

Mr. Bruce Smith, instructed by Mr. McLaughlin, appeared on behalf of the proprietors of the Evans Australian Combination Truck.

William Boyce Wilkinson, Esq., called in, sworn, and examined:—

237. *Chairman.*] What are you? I am a stock and station agent at Dubbo.
238. You are, I believe, the inventor of a combination truck? A combination end and side door loading truck.
239. Will you be good enough to state the advantages which you consider your truck possesses over the ordinary cattle and sheep trucks—I do not mean over any other combination trucks? The advantages which it has over the present sheep and cattle trucks (not including Evans combination truck), are that it can be used for sheep and cattle or goods—half sheep and half cattle, or half stock of any description, and the remaining half goods.
240. Thus, in the event of your having to take a few stud sheep up the country you could take half a load of goods with them? I could take three tons of wire, for instance, or ironmongery, or case goods. I would not propose to take sugar, or goods which could be tainted by the smell from stock. My truck has the further advantage of being a side or an end loading truck. As a side-loading truck it has a great advantage over other trucks in that the person loading may load the lower deck first with sheep, and walk into the truck and distribute them evenly over the bottom of the floor, which he could not do in the existing sheep trucks without going on his hands and knees. The great difficulty which we find we have to contend with in the side-loading trucks is that of getting the last four or five sheep into the truck; they hang round the door, they never go to the opposite side of the truck at all, and we have no means of removing them from the doorways, except by prodding them unmercifully with sticks through the bars. The last four or five sheep are generally forced in by the person trucking them holding the top bars of the upper deck with his hands and forcing them in with his feet, and the person assisting him draws the sliding door over them, and very often the last two or three sheep are left lying at the doorway, and they never get up, at any rate they are always huddled about the doorway which they have just entered, and into which they have been forced. In my system of loading the lower deck I would walk right into the truck, and so distribute the sheep evenly over the whole surface of the bottom floor. The existing trucks are not divided

divided in the centre. My truck may be either divided in the centre or not, as the party loading think best. In my opinion it is a great convenience, also a great service in hindering stock from being smothered by undue pressure to have the truck divided into compartments for sheep. This does not apply to cattle. If I were loading cattle I should not use the partition doors. In loading the top deck with sheep, I have the same means of walking about. The lower deck being loaded my top deck is lowered from the roof almost instantaneously by throwing the winding wheels out of gear. I then open the centre of the roof so that a person may walk about on the top deck without having to go on his hands and knees, as he would have to do on the existing trucks. For loading cattle, as side-loading trucks my doors have a great advantage over the existing cattle truck doors in that they are at the end of the side and not at the centre of the side as in the existing trucks. In loading the existing cattle trucks with the doors in the centre it very often happens that as one bullock is going in and is going towards the end of the truck, another bullock turns round and comes back from the opposite end, therefore they meet each other at the doorway, and this bullock then forces his way out, and forces the whole of the cattle outside in the race right back to the larger yard. Through my doors being at the corner of the truck the cattle can only turn back from one way. [Witness explained by a rough diagram the action of loading cattle in his truck and in existing trucks.] For cattle there is a further great advantage in my truck, that is, that they cannot see out of the truck. I have sliding doors on the outside made of steel plates which close up the sides of the truck so that the cattle cannot see outside. A great deal of the harm which is done to cattle is done at the shunting yards, not so much from people looking at them as from engines passing up and down. At a place like Bathurst, for instance, where stock trains are kept for an hour or two in a large shunting yard, engines are continually running backwards and forwards past these cattle trains. Very often an engine pulls up immediately opposite a cattle train on an adjoining line a few feet apart. They whistle and snort, start on, and come back to the same place. There is more injury done to the cattle through this shunting business than there is through people looking in. Another great advantage in my truck is that even the higher portion of the side of the truck is hidden from view. The cattle cannot even see the engines passing when they are being shunted up and down. My truck is walled all the way up. With regard to ventilation I have a great advantage over existing trucks in that the ends of my trucks are all louvred, and further, that my sliding shutters are some 3 inches away from the side of the truck itself, so that this creates a current of air, which comes through the ends of the truck and passes down between the shutters and the sides of the trucks. In addition to that my top side doors are also louvred. The great advantage in louvring the ends of the trucks is that when the train is in motion all the air that goes in goes through the ends, and makes its own draught. In the inside of my truck when it is used for cattle the partition doors which are used for sheep fold up within the folds of the side doors, thus presenting an even surface on the inside. From about 3 ft. 6 in. in other portions of the truck on the side to about 5 ft. 2 in. (I cannot state the exact measurement from memory) I have what are called rubbing-bars, so that the sides are of dead wood and smooth. These parts of the truck, against which the cattle always rub, have a smooth surface, extending from about the hips and tails of the cattle pretty well down to the hocks. My truck is 6 in. higher than the existing sheep trucks. As an end-loading truck, my truck has advantages over any other trucks on the line, as by being a side and end loading truck it can be used without its being necessary to spend a shilling in the alteration of any existing trucking yards. All the existing trucking yards have two gangways or races, which are half a truck apart, and my side doors are half a truck apart, so by loading the first truck on the side, and opening its end and the end doors of the other trucks I can get communication through the whole train; it does not matter whether there are fifty or a hundred trucks. Thus, practically, there will be no expense required for altering existing trucking yards, but an alteration might be made which would quicken the loading of my trucks three times. The sheep races in the existing trucking yards are only one sheep wide, for the reason that the sheep being put into one truck hang about the doors, and the sheep in the race often want to turn back. The race is made wide enough only for one sheep, otherwise the sheep might turn round and go into the yards. Not only are the present races only one sheep wide, but most of them are only 30 ft. long, and it is necessary to put a door in them in order to still further prevent the sheep from turning back.

241. *Mr. Bruncker.*] But the races are not the same width right through? Yes; they are for the 30 ft., with the exception of about 4 ft., where there is a little receiving wing.

242. Then these races contain only about twenty sheep? Yes; and as I have said, it is necessary to have a door in them to keep the sheep from turning back. In my truck the doors are something like 4 ft. wide, and instead of having the races one sheep wide they could be made wide enough for three sheep. The great advantage of end loading is, that no shifting of trucks is required. The sheep themselves travel quickly from one truck to another. The numbers are regulated by partition doors, so that really the counting is more accurate than under the existing trucking system.

243. The existing counting system is not always accurate? The reason that under existing circumstances the counting is inaccurate is this, the existing trucks are of different sizes, and before the sheep are brought into the race they are counted off to (say) fifty for each floor. But sometimes a small truck comes up to a race instead of a large one, and it is found that the truck will not hold all the sheep run into the yard. If there is one sheep over it has to be turned back, and has to be passed along through the whole of the sheep, and very often the count is lost, and in most instances the mistake made from the trucking station is that they give the number at two or three more than it actually is. In proof of my statement that with my truck you can regulate the number of sheep going in, I may state that the late Board, which was appointed to inquire into the merits of the various trucks, tested my truck with sheep at Homebush. Prior to this the Board had seen my truck, but it was in an unfinished state. They had arranged to try the truck with some end-loading trucks which had been converted by the Department on the suggestion of Mr. Lyne. On these trucks the decks were fixtures. The Board was sitting at the time when these end-loading trucks were at the Homebush yards. An order was sent to the Traffic Superintendent to have them in readiness the next day, in order to try them with the sheep. The next morning on my going to the board-room I was informed that Mr. Harper, the Traffic Superintendent, had stated that the end-loading trucks had been sent on to Albury, and that, therefore, my truck could not be tried. I then went up to Homebush, and I found that the end loading trucks were there, and I wired back to the Board stating this fact, but nevertheless these trucks were sent to Albury that afternoon. They could not be returned within three days, and Mr. Thallon, one of the members of the Board, had been called home to Queensland on account of the heavy floods, and that was the reason why my truck was not tried

by

by the Board. Three days subsequently, at the request of Mr. Thallon, the remaining members of the Board went to Homebush, and tried my truck with sheep, Mr. Thallon then being away. The trial was most successful, as per report. In addition to the report, I called upon Mr. Badgery the next morning, and asked him for a memo., and he handed me the following copy of a memo., which he had sent to the Department:—

W. B.
Wilkinson,
Esq.
1 Dec., 1887.

In consequence of the contractors not having Wilkinson's combination truck completed in time for the Board of Inquiry to have a trial of the end-loading system before the conclusion of their labors and the departure of Mr. Thallon, the two remaining members, for their own information, visited Homebush on Monday morning last, when several of the trucks, which had been opened at the ends by the Department, were placed at each end of Wilkinson's, and a number of sheep were run through. The patentee entered the truck, and showed that by loading the lower floor while fixed as a cattle truck, with doors to regulate the sheep, there was no difficulty in arranging the proper number in each compartment. The members of the late Commission were so pleased with the satisfactory trial that they have forwarded a statement to Mr. Goodchap, setting forth that, while they consider the end loading with our present trucks could not be carried out, Mr. Wilkinson has overcome the difficulty. The great advantage in end loading is that any number may be loaded without moving any of the trucks.

2/2/87.

HENRY BADGERY.

Since then I have been urging on the Department to construct from three to five of my trucks, in order to give them a fair trial, but up to the present time the only answers I have received have been similar to this:—

Sir,

Department of Public Works, Railway Branch, Sydney, 24th October, 1887.
Subject: *Re* Combination Truck.

I am directed to acknowledge the receipt of your letter of 19th instant on the subject noted above, and to inform you that it will receive due attention.

W. B. Wilkinson, Esq.,

"Aaron's Exchange Hotel," City.

I have, &c.,

A. RICHARDSON,

Assistant Secretary.

This is the sort of reply I have been accustomed to get during the last eighteen months. I have made offers to the Government with respect to my truck, as will be seen from the papers which have been referred to the Committee. A further advantage of my end-loading sheep truck is that the commonest trucking yard on the railway is as good to me as the best trucking yard in the world for loading sheep, provided it has two gangways, upper and lower, and a small race and receiving yard. The Hay yards have been constructed so that eight or ten trucks may be loaded from eight or ten yards, consequently if ten trucks were loaded there would have to be twenty races and twenty gangways, and to load them simultaneously you would want the same number of men for each yard. This arrangement certainly saves shunting, and that is all. The first cost of the Hay yards was something about £1,198, and to improve them up to eight or ten yards the additional cost has been £1,428, or thereabout.

244. *Mr. Smith.*] How do you know that? I am giving it as my evidence.

245. Is it hearsay evidence? No; I know it as a fact, I know it of my own knowledge.

246. How do you know? I object to say.

247. Do you know of your own knowledge that the cost of improving the yards has been £1,428? I do. There are something like seventy-five trucking yards in the southern and western parts of the Colony, and from twenty to twenty-five in the northern part, or about 100 altogether. At the same rate of improvement it would cost £140,000 to adapt these yards to the existing trucks. The following is a list of the trucking yards in the southern and western districts:—

CATTLE:—Albury, Bathurst, Bethungra, Binalong, Blayney, Bomen, Bourke, Bowning, Bowral, Breadalbane, Brewongle, Bungendore, Byrock, Capertree, Carrathool, Colombo, Coolabah, Coolac, Coolaman, Cootamundra, Culcairn, Darlington, Devlin's Siding, Dubbo, Ettamogah, George's Plains, Gerogery, Girilambone, Goulburn, Grong Grong, Gundagai, Gunning, Harden, Hay, Ironbarks, Jerilderie, Junee Junction, Kelso, Marulan, Mittagong, Moss Vale, Mount Victoria, Mudgee, Narrandera, Nevertire, Newbridge, Nyngan, Old Junee, Orange, Picton, Raglan, Rylstone, South Wagga, Tarago, Tarana, The Rock, Trangie, Wallendbeen, Wallerawang, Waradgery, Warne, Wellington, Whitton, Yambla, Yanco, Yass, Young.

SHEEP:—Albury, Bathurst, Benereambah, Bethungra, Binalong, Blayney, Bomen, Bourke, Bowning, Bowral, Breadalbane, Brewongle, Bungendore, Byrock, Capertree, Carrathool, Colombo, Coolabah, Coolac, Coolaman, Cootamundra, Culcairn, Darlington, Devlin's Siding, Dubbo, Ettamogah, George's Plains, Gerogery, Girilambone, Goulburn, Grong Grong, Groongal, Gundagai, Gunning, Harden, Hay, Ironbarks, Jerilderie, Junee Junction, Kelso, Lue, Marulan, Mittagong, Molong, Moss Vale, Mount Victoria, Mudgee, Narramine, Narrandera, Nevertire, Newbridge, Nyngan, Old Junee, Orange, Perth, Picton, Raglan, Rylstone, South Wagga, Tarago, Tarana, The Rock, Trangie, Wallendbeen, Wallengundgery, Wallerawang, Waradgery, Warne, Wellington, Whitton, Yambla, Yanco, Yass, Yerong Creek, Young.

With reference to the weight of my truck, on reference to the papers before the Committee, you will find a statement from me as to how the weight of my truck may be reduced. What is called the Evans improved truck is running on the old departmental under-carriage. It is something like 5 cwt. lighter than the under-carriage the Department will allow you to use now. Then the connecting gear in Evans improved truck does not go right through from end to end of the truck, but the connecting gear now used by the Department must go from end to end of the truck as mine does. The under-carriage of my truck is that which the Department will only allow to be used now, and 5 cwt. heavier than Evans'. The upright rods on the side of my truck are of solid iron, and they run through from the lower beam the main beam of the truck to the main beam of the roof. Evans' do not, and they are pipes, not solid iron. My truck is braced with hardwood from roof to floor, and Evans' is not. The arrangement of Evans' truck necessitates shifting them twice to load them, even with the improved truck. This would be necessary even if the gangways were built directly over one another to suit the Evans truck, for the reason that as the lower door is one long flap it would not come down on to the platform of the existing yards, therefore you have to drop the gangways and lower the door before you bring the truck up to the platform, and you cannot shut the doors again until you move the truck away from the platform.

248. *Mr. Brunker.*] How do you manage with cattle then? This does not apply to cattle. Referring to the loading of sheep again, you have also to open the top door before you bring the truck up to the platform, for the reason that the top door reaches about a foot below the level of the top deck—about 6 inches or a foot. If you did not open the door before you brought the truck to the gangway you could not open it at all, and the deck inside the truck itself is 6 inches higher than the bottom of the door. To get over this evil it will be necessary to have another set of doors in the bottom deck. Objection has been taken to my having so many side doors in the bottom deck. The reason that I have to have these doors is, that in order that they will suit the existing trucking yards. I divided my doors into folds, and all my doors are on a level with the decks of the existing gangways. It will take any ordinary man, unless he has had great experience in the working of Evans truck, twenty minutes to alter that truck from a cattle

W. B.
Wilkinson,
Esq.
1 Dec., 1887.

cattle to a sheep truck. In my truck, now that I have thrown out of gear the other wheel which I pointed out to the Committee the other day, I can alter it from a cattle to a sheep truck, and close all the doors in less than a minute. From my experience of the Evans truck, these flaps get out of gear. They swell with the weather, and often have to be trimmed down before they can be put into position. In one instance I know that a carpenter was at work all night in the Dubbo yard before they could bring up the trucks to work them. In the top deck of Evans' truck there are flaps which fall down against the side of the truck, and he is not able to put cleats on them to prevent sheep from falling down. He confines himself to narrow grooves in the board which really are grooves to prevent the sheep from slipping down. He cannot put cleats in for the reason that when the flaps hang down against the side of the truck they would act as a sort of a currycomb against the sides of the cattle; therefore, in the top deck of Evans' truck the sheep have great difficulty in keeping on their feet. What is called the Evans improved truck, has only been improved in this way, by taking a partition out of the truck. The partition has been a great advantage for sheep, but not for cattle. Evans' truck has been built and altered at the expense of the Department, and my truck has been built and altered at my own expense; therefore there may be small matters of detail not quite perfect in my truck, but they do not affect the principle of it. When the Committee inspected the trucks I pointed out some alterations which might be made in my trucks, and these improvements I am now having made. I have asked the Commissioner to allow me to take my truck to Dubbo next week, loading it with goods at Redfern, and coming back with (say) fifty sheep, and four or five head of cattle. I wish to have this done to give the Committee an opportunity to see how the truck does its work.

249. *Chairman.*] How long have you been loading and trucking stock? About seven years. When I started at Dubbo there were no other agents there who did any trucking with the exception of the firm of Hill, Clark, & Company.

250. It was in consequence of the difficulty which you experienced in loading stock that you set your wits to work to discover a better truck? It was. For twelve months I did the whole trucking of Sydney firms with the exception of Hill, Clark, & Company's business. That was when Dubbo was the terminus.

251. Do you claim for your truck that it saves time and avoids cruelty in loading? Yes; it saves time and avoids injury to the stock, be they sheep or cattle.

252. Would you have to move your truck in loading sheep from the side in the present yards and races? No. My truck is a side loading truck as well as an end-loading one, and it corresponds with the existing trucking yards, so that it has not to be moved at all.

253. Did the Board appointed to enquire into the matter have any opportunity of seeing your truck at work so as to enable them to form a judgment from practical demonstration? The only opportunity which they had is explained in Mr. Badgery's letter, which I have read. That was subsequent to the Board concluding its sittings.

254. Would any alteration have to be made in the existing side-loading yards, or any additional expense be incurred to arrange for trucking stock into your trucks? No. With regard to the moving of the trucks I have heard it said here that the moving has been done by horses or engines. Dubbo is a very large trucking place, and we have always had to move the trucks ourselves, and very often there is not even a shunter to help us. In moving Evans' truck there is an indirect brake, which does not come into direct contact with the wheels, and in trying to stop the truck it generally passes the gangway before the brake acts, which is a great drawback.

255. Is the truck which we inspected at Redfern the first and only one built according to your model? The only one; but I never had a model.

256. If that truck had been built on the old under carriages it would be 5 cwt. lighter? Yes.

257. If pipe rods were used instead of solid iron rods how much lighter would the truck be? I intend to call an expert to prove that.

258. What timber is your truck built of? It is hard wood, except the decks and doors, which are always made of soft wood.

259. Can you improve your truck by making it lighter without reducing the strength? Yes. I shall bring evidence as to that. In building the truck to my order Hudson Brothers have used hinges which they had in hand. I could not afford to get new hinges made. If I were getting a number of trucks made of course the hinges would all be made to pattern. The hinges which are on now are unusually heavy, and they do not quite suit the doors.

260. How long does it take to convert your truck from a sheep to a cattle truck and *vice versa*? I can do one in one minute and the other in two.

261. Have you offered the patent right in your truck to the Railway Department for any particular sum? Yes; for £5,000, and I gave them twelve months to pay it in, but after taking a number of stock agents and people interested in the trucking of stock to see the truck and hearing them speak so highly of it I thought it would be unjust to leave the offer open for twelve months, and then I offered it for £5,000. There was a question about the trial of my truck at Homebush, and I think it only fair to state that I was under great disadvantages when my truck was tried. The trucks which I had to use were end-loading trucks, the decks of which were fixtures, consequently there was no means for getting in at the sheep. My truck was placed in the centre of these trucks, and I was sent into my truck as the sheep were passing through to close the doors and to count off the number. They were stopped, and the sheep started back again the other way, and as they were passing through my truck again I entered the truck and shut the doors and counted off the numbers. This I did in a few seconds, and as Mr. Badgery says, the result was very satisfactory. I would point out that this would not be an usual thing to do. It is an unfair test for a man to have to go into the centre of the train and shut all the doors and count all the sheep off. It would be far easier to do it at the last truck.

262. *Mr. Lyne.*] What means have you for making the opening at the top of your truck water tight? I pointed out to the Committee when they saw my truck that the folding door was not as it ought to be. It hinges now six inches lower down on the roof on each side than the opening is, and it gives about an inch and a half for ventilation between the top flap and the roof. It meets in the centre of a sharp angle and is capped, so that it is perfectly water tight. I may say that with the old flaps the truck was out in the rain for something like a fortnight, and it remained watertight.

263. *Mr. Brunker.*] What has been the actual cost of your truck? Hudson Brothers told me that they would build the truck for about £170, not counting the under carriage, which I believe the Government would supply for about £40.

264. How many woolled sheep would it carry? The existing trucks carry ninety, and my truck would carry, I daresay, 100. It would carry from 110 to 115 shorn sheep.

265. What would be the average all round of woolled and shorn sheep? About 100.

266. How many cattle? From eight to ten according to size. The truck is as large as the Department will allow you to make it. The Department have a rule that you cannot make a truck more than 17 feet 6 inches long—I forget the width—unless you run it on bogie wheels; then you can make it any length you like.

267. You said just now that you noticed that in the Evans combination truck the doors swelled? What I said was that the flaps got out of gear.

268. Does that arise from the use of bad timber, or any fault in the construction? It is a little of both. The joints are too neatly made, the least thing will throw them out.

269. That would not be a defect in the truck or in the workmanship, but in the timber? I think that good timber would not warp.

270. Then virtually the defect is from the effect of the timber? Yes.

271. Then you said that there was an indirect brake on the Evans truck? Yes.

272. I suppose that applies to all brakes? They put a particular brake on this truck. The old lever brake is a far better one.

273. In running the trucks up to the platform in loading or unloading you could not run them evenly? With lever brakes you could stop them at any moment unless they were going at a great speed.

274. With reference to the cost of the yards which are being used at Hay, do you know whether there are any other yards on the same principle which have been constructed at the same cost? I do not think that there are any other. I spoke of the Hay yards because Mr. Read spoke of them as being well adapted for certain trucks.

275. Is it not a fact that there are no other yards in the colony which have been so costly as those erected at Hay? Exactly so; there are no other yards built like those. The reason why I referred to these was that Mr. Read referred to those yards as being adapted for certain trucks, and further than that for end-loading trucks any yard would do.

276. In your experience you consider that there would be a great saving of time and labour in end loading as compared with side loading? There is no comparison as to labour, time, and usage of stock. You have never to poke the sheep with sticks or anything of that sort.

277. I have not had an opportunity of seeing your truck, but I understand that it is adapted for carrying sheep, cattle, or goods? Yes.

278. Is the Evans truck equally adapted? I do not think it is as well adapted as my own. The Evans truck has been running for the last two and a half years, and it has only been used for cattle a few times.

279. With reference to the doors you were speaking about, how do your doors act in comparison with those of Evans? You say that the doors of Evans' have to be dropped before the truck goes to the platform, and that they cannot be closed again until the truck is moved from the platform? My doors are on a level with the existing platforms.

280. In loading the Evans truck with cattle what arrangements would be made for keeping the cattle in the truck until it was run to the end of the platform? It does not apply to the gangways for cattle, only to sheep.

281. How do you keep the sheep in until you get the door closed with the Evans truck? You stand in the passage and hold the top of the doors until the truck passes the platform, and then you shut the door. Then there is a space, because the top flap does not go right up to the top deck.

282. Do not the sheep frequently break out? They might if you did not stand there. There is a long depth from the truck to the ground, and the sheep themselves would be frightened of that. I may say that I was the first person to load the Evans truck. I loaded the whole fourteen.

283. Your truck has not been used by the Government? No. I have asked the Government over and over again to allow me to use it.

284. How long has it been constructed? It was not finished when the Board sat, still it could have gone to work.

285. How long has the Evans truck been working? I am not quite sure, but I think it first worked in June, 1885.

286. Do you find it any great advantage in using the Evans truck over the ordinary trucks? They are rather harder to load. I think that they are an advantage over the other trucks when loaded, because they are divided into compartments for sheep.

287. But some of the old trucks were divided into compartments? They were an advantage, but they had the same fault, that there was no communication between the compartments. They were divided with rods, which is not a good thing.

288. What is the size of the opening which you speak of in the roof of your truck? The width of it is about 3 feet.

289. What is the width of the truck? About 8 feet.

290. The fact is, that a person can only move about within that 3 feet in distributing the sheep upon the top deck. Of course.

291. *Mr. Smith.*] Will you tell me what are the particular features about your truck which you have patented? The system of end loading, the roofs, partition doors. I do not think it right that I should be asked to answer such a question. It does not seem to me to affect the matter in any way as far as the Committee are concerned.

292. What are the features of your truck that you wish the Government to buy from you? If there is anything in my patent which infringes the right of any other patentee he has his remedy.

293. Can you state in a general way what you have patented? I will wait until the patent is here.

294. What have you offered to sell to the Government? When I produce my patent I will show you. I have offered to sell the patent, which I will produce, and in which the claims are stated.

295. Is end loading a feature of your patent? I decline to give any answer to such questions until the patent is here.

[Committee deliberated, and decided that questions relating to the patents would not be admissible until the patents were produced.]

296. You say first of all that to your knowledge the Evans truck has been in use for two and a half years? I think about that.

W. B.
Wilkinson,
Esq.
1 Dec., 1887.

W. B.
Wilkinson,
Esq.
1 Dec., 1887.

297. And your truck was constructed in February of this year? Yes; it was nearly finished then.
298. Then I understand that your truck was not completed until after February, 1887? No; it is barely completed yet.
299. During the two years and a half the Evans truck has been used for goods and for sheep? Yes.
300. And for cattle in a few instances? Yes.
301. There are fourteen of them, are there not? I suppose there are. I know that fourteen were built.
302. With the exception of that accident which was reported upon do you know of a single accident which has ever happened to these trucks? That accident was not in these trucks at all; it was in the Evans improved truck. It was not in any of the fourteen trucks to which you are alluding.
303. With the exception of that accident which happened to the bar do you know of any other accident which has ever happened in any Evans truck? The only accident that I know of was in the improved truck.
304. Do you know that with regard to that accident, it was inquired into? I know by the papers.
305. And you know that the result was that it was reported to have been a flaw in the timber? I think that the beam was not strong enough. That was one of the reasons, only one of them.
306. Do you know that since that a strip of iron has been placed along these beams? I saw one the other day. There is only one truck like that, and I do not know that that truck has been used.
307. You do not know that it has not been used? No.
308. Your own truck was constructed nearly two years after you first began to use the Evans truck? No; I think it was something like twelve months in being built.
309. You say that you were the first to load the Evans trucks? Yes.
310. How long after that was it before you began to construct your own truck? I could not say without reference to the papers.
311. Within a year or eighteen months? Within a year. On December 9, 1885, I wrote to the Department:—"Re Evans trucks, I see you are thinking of utilising them for carrying out your idea of loading stock continuously; if so, I hope the above will be improved upon first. Some time since, upon the first trip these trucks made, when I loaded, I pointed out the defects, and how they could be very much improved upon. If requisite, I will lay my suggestions before the Department, but with the understanding if my plan is approved of, that I will be allowed a premium for the idea, for notwithstanding all has been said in their favour, the trucks are most unworkable at present. I would not ask anything for contributing to the success of the Evans truck, but as report is so busy with the matter of the large royalty that Hudson Brothers or Mr. Evans gets for their invention, and knowing, practically, how unworkable the trucks are, I do not see why my suggestions, if successful, should not command some return."
312. I want to know when you first began to construct your truck? It must have been some day later than this. I could not tell the date, exactly, without going to Hudson Brothers.
313. You did not begin to construct your truck until after the Evans truck had been constructed and used? No.
314. Who constructed your truck? Hudson Brothers.
315. When did you first give them the order and the plans on which to construct it? I could not tell without the papers.
316. Can you tell within six months? I think it was about eighteen months being built.
317. Will you swear that you did it before twelve months after the Evans truck was run? I think so.
318. But will you swear it? No.
319. You have referred to a Board which dealt with this question in 1887—How came it to be appointed? I am sure I do not know.
320. Do you know who appointed it? No.
321. Do you know the three men who sat on the Board? Yes; I saw them.
322. Do you know them by name? Of course I do.
323. Mr. Badgery has had immense experience of stock, has he not? I do not know about the immense. He has had experience.
324. Has he not had great experience? Not to my knowledge, but I saw it stated that through three generations his family had been engaged in stock dealing.
325. Do you know whom Mr. Thallon was? Yes; I know that he was in the Department here before he went to Brisbane, and he was in a subordinate position to Mr. Evans.
326. Do you know what position he holds in Queensland? I think he is Traffic Manager.
327. Do you know that Mr. Gill is foreman of waggon construction in Victoria? I know that he occupies a good practical position in Victoria.
328. Do you know that these three gentlemen had nine meetings? I do not know it.
329. You appeared before that Board? Yes.
330. And you gave all the information you could about your own truck? Yes.
331. And Evans gave all the information he could about his truck? Yes; but our evidence was confined solely to our own trucks. We were not allowed to say anything in disparagement of the other trucks.
332. You speak of the opinion of that Committee upon your trucks for end loading? Yes.
333. Is it a fact that out of a possible fifty marks they gave you five marks for end loading? Yes; they gave five points for a thing which they themselves condemn as unworkable. Mr. Badgery's minute to the Commissioner for Railways says that in the opinion of the Board end loading would not be a success.
334. You have impugned that report? No.
335. You say that the Commission gave five points for a thing which they condemn, and you thus practically impute either stupidity or ignorance? I object to motives being imputed to my evidence.
336. The Board gave no marks to other trucks for end loading? They were not end-loading trucks.
337. Allowing these five marks for end loading, is it not a fact that the Board gave only thirty-eight points out of fifty for the whole of the parts of your truck? That is so.
338. Is it not a fact that the Evans truck got forty-five points irrespective of end loading? Yes.
339. Have you any objection to the experience of the three men who sat on the Board? None whatever.
340. Do you take any objection to the honesty of purpose of that Board? I do not think that is a fair question.
341. Your objection is that a supplementary report overrides their finding? Yes. It was not their fault, as my truck was not finished.
342. Did you not assure that Board that your truck, which then weighed 7 tons 15 cwt. 2 lbs., could be considerably reduced in weight? I did.

W. B.
Wilkinson,
Esq.

1 Dec., 1887.

343. Since that time about ten months have elapsed? Yes.
344. During which you have been at work on your truck? No; I have been at work at my business.
345. But your truck has been going on? It has been at a standstill waiting an answer from the Department.
346. When your truck was inspected by this Committee a few days ago what did it weigh? I am sure I do not know. About 7 tons 15 cwt. I have not taken anything off the weight. It is only in new trucks that I would take any weight off.
347. You say that you do not know who appointed that Board? No; I got a notice from the Commissioner that the Board was appointed. That is all that I know about it.
348. Is it a fact that the Board found that the Evans truck was the most economical and suitable in every way for the conveyance of cattle, sheep, and merchandise? Yes; but I think that the Board had no evidence as to the cost of my truck.
349. But you had every opportunity of putting evidence before them? No; my truck was not finished at the time.
350. You had given evidence before them? Yes; some evidence.
351. You have spoken of the end-loading trials at Homebush? Yes.
352. Is it not a fact that some of the end-loading trucks were constructed by the Government? Yes.
353. When were they constructed? I could not say.
354. Before or after you had your truck patented? I do not know. They have been using end loading trucks for years in Adelaide. I stated so in my correspondence with the Minister. I enclosed a letter from Mr. Valentine, Inspector of Stock there on the subject.
355. Do you know that some months ago, when Mr. Lyne was Minister for Works the Government had some trucks altered for end loading? Yes.
356. Is it not a fact that these trucks had never been used by the Department? I should think it is very likely. In my correspondence I say that end loading with decks that are fixtures cannot be a success.
357. When you give the amount of £140,000 which you said would be required to adapt all the existing yards to the Hay principle, you multiplied the original cost of the yards and the cost of all subsequent improvements by the number of yards in the Colony? I did not multiply the original cost of the yards. I did not include the first cost of the yards.
358. Did you not arrive at that £140,000 by multiplying the expenditure on the alterations of the Hay yards by the full number of yards in the Colony? Exactly so; by multiplying the cost of the alterations.
359. And in that you assumed that all the yards in the Colony would cost the same amount to alter? I presume so, if they were altered.
360. How many doors are there in your truck, actual distinct parts on hinges? I cannot recollect.
361. How many are there at the ends? All my doors are only half doors.
362. I call half doors doors? I do not.
363. Well, how many half doors are there in each end? Four.
364. Is there not part of the door dropping down? No.
365. How many half-doors are there on the sides? There are eight in each side. These eight doors close two doorways.
366. That would give twenty-four of these doors for each truck, each distinct part on a hinge? Yes.
367. You said just now that the Evans trucks were altered at the expense of the Government? That is correct.
368. Do you not know that the Government have had the use of these trucks for two and a half years without any payment? I do not.
369. Have you ever heard of the Government paying Evans anything for the use of his trucks? No; not quite, but very nearly.
370. What do you mean by "very nearly?" There was some talk about £16,000.
371. Has your truck ever been used for practical purposes on any line in the Colony? No; it has been refused.
372. Has it ever carried sheep, or cattle, or goods? I never got an opportunity.
373. It has never been tested in any way? No. I have been denied the opportunity.
374. When this Committee examined the trucks did not the present Minister for Works offer to give you a chance of using your trucks? Yes; since the Committee sat.
375. Did you not afterwards take the truck away? Yes.
376. How long afterwards? A few days afterwards, with the consent of the Chairman of the Committee, to put in some alterations which I pointed out to the Committee when they were inspecting the truck.
377. What is the roof of your truck made of, is it of soft wood? I would not be sure what it is.
378. Did you not tell the Committee just now that your truck was of hard wood except the decks and doors? Anything that ought to be hard wood is of hard wood.
379. Is it not a fact that the roof is made of soft wood? It is very likely that it is.
380. Is it not a fact that the shutters are made of soft wood? They are made of steel.
381. Is there any wood inside them? There is a wooden frame.
382. Is that hard or soft wood? I would not be sure.
383. Are the hinges on your trucks now the hinges that were on originally? I do not know.
384. Do you not know for a fact that there were larger hinges on, and that they were taken off and the present small ones put on to reduce the weight? Nothing has been done to reduce the weight except the alteration of the deck.
385. Will you swear that the heavy hinges were not taken off and lighter ones put on? They are all heavy hinges which are now on.
386. Will you swear that the hinges which were on the truck when the Committee saw it were the original hinges? No; but I know that the hinges which are on now are not adapted to the truck.
387. You have spoken about an inch and a half of ventilation in the roof in connection with the opening flaps—is there anything to prevent sparks which fall on the roof being blown inside? There is a ledge.
388. Where is it? Running inside the flap.
389. You say that end-loading trucks have been in use in South Australia for years? Yes.
390. You are not prepared to say that the Government end-loading trucks were not constructed before yours were patented? End-loading trucks were in existence years ago.

- W. B. Wilkinson, Esq.
1 Dec., 1887.
391. Then end loading is not a new thing? It is a new thing on my principle.
 392. It is no new thing of itself? It is if you speak of my truck.
 393. Is it not a fact that end loading is a very old principle? I say that it has been in use in Adelaide for years. The combination truck is an old principle; Mr. Downes made one years ago.
 394. In the division in your truck when you propose to carry half cattle and half sheep, what is the partition made of? Inch and a half boards I think.
 395. Will you swear that the boards were not three quarters of an inch, as shown to the Committee the other day? I will not swear what they are.
 396. Are they not soft wood? The man who constructed these trucks will give you evidence on these points.
 397. Is it not a fact that if the truck were divided so as to carry half cattle and half sheep the only partition would be two soft wood doors on hinges secured by wire? No.
 398. What are they secured by? By a steel rod, which goes through the deck into the floor. The bands or hinges, as you call them, go from one side of the truck to the other, and are connected with a steel rod.
 399. Is it not a fact that the partition consists of soft wood, and that the doors are hinged on the side of the trucks. Yes.
 400. You do not seem to know anything about the construction of your truck? I do not say that. I will produce the foreman of Hudson Brothers, who made my trucks, and who makes all the trucks which the Government order, and he can give evidence as to the stability of my truck.
 401. Did he design your truck? No. It is his province to put the right sort of timber in.
 402. Did he design the division in your truck? No.
 403. Who did? I did.
 404. Apart from the nature of the wood, I ask is it not a fact that the partition for cattle and sheep consists of two doors hinged on the sides? I told you that long ago.
 405. Is it not a fact that since the truck was originally constructed you had a large part of the hard wood taken out and soft wood substituted? It is not a fact. If it has been done it has been done without my knowledge or consent.
 406. Do you know of any parts in which, with your knowledge or by your order, soft wood has been substituted for hard wood? None.
 407. When is your truck to be tried? I have asked the Commissioner to allow me to try it some day next week, but I have not yet received an answer.
 408. You propose to put four cattle in one half-truck? Yes.
 409. You say that the truck will hold from eight to ten cattle? Yes.
 410. Then why do you propose to limit the number of cattle to four in the half? It all depends upon the size of the cattle. When I see them I can tell.
 411. *Chairman.*] Do you intend to load the truck to its full carrying capacity? I have asked the Commissioner to allow me to do that. I want the Committee to see it loaded, and the state of the stock when it is unloaded.
 412. *Mr. Smith.*] Do you claim to be the first to have used what is called the horizontal floor for the upper deck? That affects the patent, and I shall make no answer as to what I claim until the papers are produced.
 413. Do you not know that it is a common thing in America to have a floor like this going up to the roof? I shall not answer that. I have not patented my truck in America.
 414. Have you patented it anywhere but in this country? I have patented it in Queensland, Victoria, and South Australia.
 415. Not in England? No.
 416. *Mr. Brunker.*] When you made your arrangement with Hudson Brothers at the outset did you arrange the price? No.
 417. What is the size of the steel rod to which you refer? I think it must be three quarters of an inch.

THURSDAY, 8 DECEMBER, 1887.

Present:—

MR. BRUNKER, | MR. LYNE.
T. H. HASSALL, Esq., IN THE CHAIR.

Mr. Bruce Smith, instructed by Mr. John McLaughlin, appeared on behalf of the proprietors of the Evans Australian Combination Truck.

Mr. Wilkinson appeared in person.

Allan Yeomans called in, sworn, and examined:—

- A. Yeomans.
8 Dec., 1887.
418. *Chairman.*] You are a grazier? Yes.
 419. Have you seen any combination trucks at work? I have.
 420. Will you be good enough to give what information you can to the Committee? I have trucked four lots of sheep in these trucks, and it seemed to me an extraordinary thing that you had to crawl about on your belly to load the sheep. I wondered why some arrangement could not be made by which a man could stand up and do the work. Another thing that struck me was why we should have to load at the side and not at the end. I once witnessed a trial of an end-loading truck at Homebush. I saw the man who was loading stand up in the truck as though he were working in a drafting yard, and the sheep were trucked just as though they were running through ordinary races. I consider that when a man can stand up to do the work he can do it properly. He cannot do so when he is crawling about on his belly.
 421. You consider that the principle of loading which you saw was like working in drafting yards at stations? Just so.
 422. Is it your opinion that that truck in which you could stand up and do the work necessary in filling a truck and arranging the sheep for transit was superior to anything that you had seen before? It was.

I remember that with one truck I had to load I had to shift it four times to get the requisite number of A. Ycomans. sheep into it, and it was necessary to have the assistance of two shunters. There were four compartments, and to fill each of these we had to shift the truck. 8 Dec., 1887.

423. What truck was that? I could not say.

424. In your opinion a truck that would combine the necessary appliances for taking goods up country and bringing stock back, and work on the principle which you have stated, where a man could stand erect and arrange the loading, would be superior to anything you have seen in use yet? Most undoubtedly I think so. The mystery to me is why this principle was not adopted long ago.

425. As a practical man who has had great experience in loading stock you consider that the fact of the person loading having to crawl about is a great drawback? Yes.

426. And involves a waste of time? A waste of time and of energy.

427. And incurs a certain amount of risk? Yes; there is a lot of risk as far as your health is concerned.

428. In loading the combination truck with four compartments with the top deck put into position before you could load the bottom one, did you not find some trouble in getting the last few head of sheep into the truck; do you not think that there was much more difficulty than there would be on the principle of end-loading, where a man could walk about at his ease? With the last lot of sheep that I trucked three could not get in. I said I would give them away to some one; I would not be bothered trying to force them in. A man there said that he would get them in, and he did so by brute strength, and in no other way. Let me say that I come here quite unprejudiced. I speak feelingly on the subject of stock trucking. I say that any man who invents a truck which will save all the swearing and cursing and the hard work involved in loading stock now will be a public benefactor. His name will be stuck up in all the trees about the district. I have not come here to advocate anyone's truck.

429. *Mr. Brunker.*] You have had long experience in connection with stock? I have had seventeen years practical experience.

430. From what you have seen, as a practical man, you think that end loading is preferable to side loading? Most undoubtedly.

431. Do you think there would be any difficulty in blocking the sheep as they passed through one truck to the other? I do not think there would be the slightest difficulty. If you put five or six trucks together, I do not think that there would be any more difficulty than there would be in blocking them when going through a race.

432. With the combination trucks at present in use you say that you had to use the same means as you had to use in the old trucks to load them properly, that is, you have to crawl in to get the sheep up to one end? In the trucks which I first loaded I had to crawl in on my belly to get the sheep up to the other end.

433. You said that you had to force three sheep in. If it is necessary to do that, is it not likely that in putting those sheep in you might destroy ten or twelve other sheep in the truck? Yes; but in the instance I am speaking of there was plenty of room. The sheep would not crowd up to the other end.

434. You think that difficulty would be overcome by end loading? The natural tendency of sheep is to go straight ahead. I am decidedly in favour of end loading, and of a truck in which you can stand up to do your work.

435. In loading the combination trucks at present in use by the Government, have you noticed any difficulty with reference to the doors when alongside the platforms? Yes; from one truck four sheep got away through the opening.

436. It has been stated in evidence that it is impossible to close the doors until the truck has been moved past the platform, that you have to stand at the doors for the purpose of keeping the sheep in? You have to stand at the doors, or hang something there to keep them from getting out. As I tell you, on one occasion four sheep got out of the doors. If we have not a man standing there we hang up a bag.

437. You say you saw an end-loading truck tried at Homebush? Yes; I saw a Wilkinson truck loaded with fifty sheep.

438. *Mr. Lyne.*] When was that? I think it was about twelve months ago, I could not say exactly. I went out with Mr. Badgery. It took one-tenth part of the time to fill that truck that it took me to fill the other truck at Nyngan.

439. *Mr. Brunker.*] Without the same amount of labour? There was no labour whatever attached to it. When the sheep got a lead on they went. It is quite easy to block sheep. Any man who understands it can block them with his handkerchief.

440. In looking over the trucks did you notice any other advantages in connection with that truck over the other one? There is a truck which I was looking at which can be made to carry half sheep and half cattle. There is no doubt that has a great advantage over any other truck, especially to small holders.

441. How about ventilation? There is plenty of ventilation, there are louvred windows, then there is a current through the grating. I should think there was plenty of ventilation in the truck.

442. Have you had any experience of trucking cattle? No; I have not trucked any, and I hope never to have anything to do with trucking cattle under the present system.

443. You have seen cattle that have been trucked? Yes.

444. You know that cattle suffer considerably from rubbing in trucks? They get chafed.

445. Do you know if either of these trucks are so arranged as to prevent the loss from cattle rubbing, especially on their tails? In the truck I was looking at yesterday, Wilkinson's truck, all the surfaces are perfectly smooth. I saw it at Hudson Brothers. When I saw it at Homebush there were a lot of projections in it. Mr. Badgery was the first to notice that. I had that in my mind when I looked at the truck yesterday, and I saw that the surfaces had been made smooth.

446. So that cattle would not be likely to suffer very much in the truck? I should not think that they could be chafed at all.

447. In these trucks would the cattle be able to see the people on the platform—can they look out as they can in the present trucks? There are sliding doors on the outside which can be closed and make the truck dark on the inside. I cannot say whether that is an advantage or not.

448. Would you mind stating which would be the most advantageous in the interest of the public for the Government to use? I could not say that. A truck which would load at the end and in which you could stand up would be as far above any other truck as the sky is above us. As to making comparisons, it is rather a difficult matter, as there are so many trucks. There was one which we had to shift four times; it was a regular killer; they said it was the something combination truck; I suppose it was the Evans truck, if the truth were known.

- A. Yeomans. 449. *Mr. McLaughlin.*] Did you state that you have to crawl about on your belly in loading every truck with sheep? I say that you must crawl about on your belly if you want to get the sheep in without knocking them about. That has been done in every truck that I have ever seen loaded. I have trucked 6,000 sheep altogether.
- 8 Dec., 1887. 450. Supposing that you were loading at the side of the end of the truck, do you still say that the sheep would enter and remain on the opposite side of the truck instead of going away to the further end? I say that they would go straight ahead, and stop at the first obstruction.
451. *Mr. Lyne.*] Unless some one got in to hunt them along? Yes.
452. *Mr. Bruncker.*] Would there not be the same difficulty in getting them out? I do not know anything about that.
453. *Mr. McLaughlin.*] Is it not usual to have an object on the opposite side to prevent them going there? No.
454. But you always send someone in? A man went in every time to hunt them up.
455. Had he to hunt up more than one? He had to hunt up the whole lot.
456. If you sent in one sheep would not the others follow? No; they would not all go up to it. Some would, but some would not.
457. Where is your station? 40 miles above Brewarrina, on the Barwon.
458. Have you come down specially to give evidence? No.
459. Did you come down to Homebush specially to see the truck tried? No; I was invited there. I was in Sydney at the time.
460. You have never seen the truck used for sheep or cattle? I have simply seen it tried.
461. Was there the same difficulty in loading under the old system as there is in loading combination trucks? Just the same trouble with all side loading trucks which have two decks, and in which the space is so low that you have to crawl about.
462. *Mr. Wilkinson.*] At whose invitation did you go to Homebush to see the truck tried? I forget whether it was you or Mr. Badgery who asked me. I saw a paragraph in the paper stating that there was to be a public trial, but I do not know whether I spoke to you or to Mr. Badgery.
463. With whom did you go? Mr. Badgery.
464. Do you remember what position my truck was in. Were there other trucks at each end of it? I do not remember. All I know is that the work was quickly done.
465. Do you know who went into the truck to shut the sheep off to the required number? You did.
466. Was the trial a satisfactory one or not? I thought it was a perfect God-send to see sheep run in so easily.
467. Do you remember whether the sheep were shut off to the proper number when the doors were closed? It was done near enough. There were three or four people there, and someone said that you could block them off near enough.
468. Looking at the truck from a side loading point of view, would it be an advantage if the man loading the bottom floor could walk right through into the truck? Of course it would.
469. In loading sheep at the present rates, is there not a great trouble in getting in the last few sheep? Yes; it is an awful bother to get them in. If I could afford it I would sooner give them away than try to get them in.
470. So that if you have to put fifty sheep into the truck, and you have got forty-five in, it is necessary to go about on your hands and knees to get in the remaining five? Yes. You can poke at them until the cows come home and they will not shift.
471. It would be a great advantage from a side-loading point of view to walk into the truck and distribute the sheep evenly? I should rather think so.
472. Did you notice that the ends of my truck are louvred? Yes.
473. Does not that give further means of ventilation? There is a lot of louvreing all about the truck.
474. *Mr. McLaughlin.*] If you were loading five trucks from the end, how many men would you require to shut off the sheep? Only one. If you were loading fifty trucks you could block the number for each truck.
475. Would there not be a risk of there being more sheep in one truck than in another? What nonsense! If you knew anything about stock you would see that one man could do the lot.
476. The last truck would be shut off first, and when the required number were in that truck would there not be more than the required number crowded up in the next truck? No. I suppose you think that if we were loading 2,000 sheep they would all go into one truck. After the last truck was shut off you would find that the full number would not be in the next truck, and you would have to hunt them down, and so on with all the other trucks.
477. Would it not be possible to get 110 sheep in one truck? Sheep will not crush to that extent. You have always to hunt them along to fill the trucks. This is a sore subject with us, as we lose about two shillings a head on the sheep owing to the way in which they are knocked about in getting them into these trucks.
478. *Mr. Wilkinson.*] If Mr. Badgery says that by my arrangement of doors the sheep can be shut off at a proper number you believe him? I say that you can do so.
479. Did anyone besides myself go into the truck at Homebush? No one else touched the sheep. That was not a fair test, inasmuch as there was only one truck load. There ought to have been three or four trucks; then you could have shown the thing properly.
480. *Chairman.*] You mean it was not a fair test to the exhibitor of the truck? Yes.

David Kirkcaldie called in, sworn, and examined:—

- D. Kirkcaldie. 481. *Chairman.*] What are you? I am Assistant Traffic Manager of the railways.
- 8 Dec., 1887. 482. How long have you had experience of the Evans combination truck? Since June, 1885.
483. Do you think these trucks will stand wear and tear in carrying both cattle and sheep as well as the old stock trucks? They will require to be faithfully built to stand the strain caused by the swaying about of heavy bullocks. There is a great strain in the surging of heavy bullocks when rushing round the trucks. If they are faithfully built of course there will be no difficulty otherwise.
484. Do you think that the combination trucks would necessitate greater expense in the repairs than the old trucks? Yes.

485. Do you think that the expense would be much greater? The greater the number of working parts the greater must be the expense of maintaining the truck. D. Kirkcaldie.
486. Have you had any experience of loading stock into trucks? Yes, but not in the combination trucks. 8 Dec., 1887.
487. Have you used the combination truck for the carriage of goods and of stock? Yes.
488. Do you find it answers those purposes? Yes.
489. Have cattle been carried in these trucks to any great extent? No; they have been principally used for conveying sheep.
490. Do you think that the hinges of the flaps which form the upper deck floors would be liable to get rusted or out of order in carrying both sheep and cattle? I believe they are liable to get out of order from corrosion by urine from the sheep. I have only heard of that within the last few days.
491. *Mr. McLaughlin.*] Have you noticed that such is the case? I have not seen it, but the Locomotive Engineer has mentioned it to me.
492. *Chairman.*] Do you think there is any combination truck of any pattern useful for the carriage of good and stock? Yes, to a certain extent; but I do not think any combination truck will be an absolute advantage in the carriage of goods and stock as well, unless the number is largely increased. The exigencies of the stock traffic are such that the trucks must be sent back as quickly as they are unloaded. Therefore, if we loaded them to a large extent with goods we should necessarily have to increase the number, otherwise we could not overtake the live stock traffic.
493. *Mr. Lyne.*] What proportion of rolling stock do you consider should be combination trucks to make them of service to overcome the difficulty to which you refer? It is difficult to say; the traffic varies so much. For instance, during the wool season, say, from September to February, we have to send empty goods trucks to the west and south, as the case may be, to bring back wool, so that there would be no advantage in loading any of the stock trucks with merchandise. Combination trucks would be very good if you could load them with stock in both directions, or with goods one way and stock the other, not otherwise.
494. *Chairman.*] The idea which you wish to convey is that it is absolutely necessary to keep a supply of stock trucks at the depôts for ordinary trucking purposes? That is so.
495. And that it would not always be convenient to wait for goods loading for the trucks? It cannot be done.
496. Would these combination trucks be of any value if convertible from sheep into cattle trucks, leaving goods out of the question? Certainly.
497. Do you at present take any goods in cattle trucks? To a comparatively small extent. Cattle trucks are not largely availed of for the conveyance of goods, simply because we could not keep pace with the live-stock traffic, and then of course there is the other reason that we are sending goods trucks down to bring back the wool, so that there is no advantage in loading stock trucks to the country during the wool season.
498. Do the combination trucks possess any advantage over the ordinary cattle trucks when they are converted for the carriage of goods? No special advantage. Of course there are the tarpaulins which are drawn down the sides of the combination truck, which to utilise the cattle trucks for goods we have to put tarpaulins over them. Otherwise we carry goods very well in the cattle trucks.
499. Do you anticipate any reduction in the live stock traffic in future in consequence of the establishment of abattoirs at various points on the railway line, and a corresponding increase in the dead meat trade? If abattoirs and chilling establishments are established in the country there must necessarily be a decrease of the live stock traffic.
500. I suppose you have noticed, through the medium of the Press, that there is great objection to the abattoirs at Glebe Island? Yes; and I observe that meetings have been held at Bourke on the subject of establishing abattoirs and chilling rooms there.
501. If these abattoirs are done away with it will be necessary to establish abattoirs along the railway lines? Yes.
502. In that case you would anticipate a large increase in the dead meat trade? Yes.
503. Would that change be beneficial to the public and to the Department, in your estimation? I think it would be beneficial to everyone.
504. Why would it be beneficial to the Department? Because it would be a better paying traffic. We do not make much out of the live stock trade, particularly on long journeys.
505. *Mr. Lyne.*] Sometimes you lose by it? Yes.
506. *Chairman.*] If killing establishments were established at various points on the railway line the trucks which would be used to bring the dead meat to Sydney could be used for carrying goods back? Yes; but that is not so much, where I think the advantage would be as in this, if a truck can be constructed, I cannot say whether it can be or not, to carry, as I think it ought to carry, about eighteen or twenty bullocks in carcase, we could carry at a proportionately cheaper rate than we carry the same quantity in two trucks with nine or ten live bullocks in each. Suppose we charge £20 for two trucks of live stock, we might carry the same number of bullocks in carcase for about £15. That would be an advantage to the producer, and it would be an advantage to us, because we should have less working expenses.
507. *Mr. Lyne.*] Would it not be an advantage to consumers as well? Yes; because they would get good sound meat, which would be properly set before being used.
508. *Chairman.*] If slaughtering establishments were established in the country districts, would there be any necessity for combination trucks at all? I think we shall always have a considerable live stock traffic.
509. Do you think the Department would be justified in going to a very great expense in building a large number of combination trucks for the carriage of live stock? Not as things are now. I think it would be desirable to wait and see whether the dead meat trade is going to be developed. Still the stock throughout the country is increasing at such a rate since we have had the good seasons that it will be necessary for us to get more trucks, unless slaughtering establishments are started in the country. We are in this position, that we can get along very well at present with the trucks we have, but I feel that in another year we must expect a large increase in the stock traffic, and unless killing in the country districts is resorted to it will be necessary for us to have additional trucks with which to cope with the traffic.
510. You have seen the Evans truck? Yes.
511. Have you seen the Perry truck? No.
512. Have you seen the Wilkinson truck? Yes.

- D. Kirkcaldie. 513. Will you state in your opinion which is the better truck of the two for the purpose required? They both have very good points, and both have what I consider objectionable points. Apart from the principle of end loading, the only objection which I can see to the Evans truck is that the two doors are over each other, which necessitates shifting the truck when loading sheep. If the partition is taken out it is not necessary to shift the truck when loading cattle, but it will be necessary to do so when loading sheep. As regards end loading, I can hardly express an opinion about it, because I have no experience of it. I was always opposed to it until I ascertained that it has been successfully carried on in South Australia. Knowing as little as I do about end loading, I should not like to say just now which truck is the best. The Wilkinson truck has the objection that it is not boarded up well enough round the sides for cattle at present. I do not say anything as to what can be done with the truck in that direction. I was a member of a Board which inquired into the live stock traffic some years ago, and we made a recommendation that the boarding up of cattle trucks to a height of 6 feet or a little more from the floor which had been introduced some short time before should be generally adopted, so that the cattle could not see out. Before that there was a space between the bars through which bullocks often got their hoofs and could not get them back again. At other times they would get their horns through and eventually would come down, and sometimes get trampled to death by the others. Mr. Wilkinson has not got rid of that objection.
514. *Mr. Wilkinson.*] Are you sure of that? I have not seen your truck recently, but you had not when I saw it last. I do not know what it is like now.
515. *Chairman.*] Your opinion is that the nearer the approach you can get a cattle truck to a horse-box, provided that there is a proper ventilation, the more serviceable it would be? Yes. Mr. Wilkinson may be able to get over that difficulty, as Mr. Evans may be able to get over the difficulty of the doors being over one another.
516. *Mr. McLaughlin.*] You say that each of the trucks has only one objection? I think so. I am talking now of the principle; I am not saying anything about the strength of the trucks.
517. *Mr. Brunker.*] You referred to the surging of the cattle in the trucks, and said that it would be necessary that they should be faithfully constructed to prevent their being strained. Is not that necessary in any truck? It is necessary in any truck; but it is more necessary in trucks in which there are a number of working parts, to provide for converting them into trucks for other purposes. It is necessary for Mr. Evans' truck, because of the flaps, and of the bar which runs lengthways in the truck; and it is equally necessary for Mr. Wilkinson's truck, on account of the top deck being raised to the roof. There is a chance of these working parts getting out of order through the straining of the trucks.
518. I suppose you mean that the trucks are weakened by there being so many doors and other things? I refer particularly to the working parts of the upper deck. The question is whether the straining of the trucks would not interfere with these working parts. In Mr. Wilkinson's truck the upper deck comes from the roof. The question is to what extent that will, in time, become permanently impaired by the straining. I repeat that the trucks will require to be faithfully built to withstand this strain.
519. I understood, from your answer to the Chairman's question just now, that if combination trucks were used generally for the traffic, the expenditure would be very much greater than if you used trucks which are in use now for ordinary traffic? It must necessarily be greater.
520. For what reason? Because of the greater number of working parts. I do not attach much importance to the cost of maintenance, however, so long as the trucks remain convertible, because a truck which would carry goods and stock to any very large extent, the question of maintenance would be trifling as compared with the increased earnings.
521. Has the combination truck any advantage over the ordinary truck for carrying cattle? I do not think there is any special advantage; I do not know of any. The Evans truck when used for cattle is practically the same as our ordinary cattle truck. It is boarded up to a height of 6 feet, the same as our cattle trucks.
522. You said just now that in anticipation of the live stock traffic decreasing you considered that it would be unwise of the Department to increase the rolling stock? Unless the construction of abattoirs in the country is going to come about fairly soon.
523. Do you think that the present stock traffic is such as to justify the Department in limiting the supply of rolling stock? We have quite enough rolling stock at present, but it will not be enough for next season, I think. I fancy we shall have a large increase of live stock traffic next season. Of course there are times when we are rushed with our live stock trucks, and there are other times when we are comparatively slack.
524. You have had no experience in the Department in the working of Wilkinson's truck? No; it has never been loaded.
525. You have had experience of the Evans truck? Yes.
526. Will you state what advantages this truck would have, as far as the Department is concerned, over the trucks ordinarily used? It has the advantage of being convertible from a cattle to a sheep truck, and *vice versa*. I look upon it as a great advantage, apart altogether from the carriage of goods, that it can be converted at any moment into either a cattle or a sheep truck. I do not attach a great deal of importance to combination trucks as goods carrying trucks, because our cattle trucks are equally well suited for that.
527. As far as losses on the way by accident are concerned, do you think there will be any more safety in the combination trucks than in the ordinary trucks? I cannot see that there will be any difference.
528. You have used the Evans truck for a long time; what is the result of your experience as far as the mortality of sheep is concerned? I do not know that there is any difference between the trucks as regards mortality.
529. With regard to the saving of time and labour in loading and unloading? The Evans combination trucks is at a disadvantage. Our present trucks are so built and the races so fixed that both decks can be loaded at the same time. As the Evans truck is now, only one deck can be loaded at a time, and then it has to be moved to load the other deck.
530. Which incurs a loss of time? Necessarily so.
531. A greater amount of labour is involved? I do not know that, unless you refer to the partition, which has been removed in the improved truck.
532. *Mr. Lync.*] You said that you have had no experience in end loading, and that until you found that they had adopted it in South Australia you were opposed to it? I was, for the reason that I never could see how they could divide the sheep properly between the trucks.
- 533.

533. Do you not know that in the trucking yards in the interior where engines are not kept it is very hard work on the persons who have to load the stock to have to move each truck up the platform and then move it away? Yes.

D. Kirkcaldie.
8 Dec., 1887.

534. Does not that take up a great deal of time? Yes.

535. Suppose that the difficulty you speak of in dividing the sheep when loading them from the end is overcome, I presume you would acknowledge that the other difficulty would be overcome? Yes.

536. The difficulty and the heavy work of shifting the trucks would be overcome if you could bring a train load of trucks up to the race and load them all at once? Yes; that is done in South Australia.

537. By that means I presume you will admit that there would be a great saving of time and labour? Of course. Still, I am told that side loading is done very quickly at some of the Victorian stations. I know that at Hay it is done very quickly.

538. Will you describe the principle of the Hay yards? I can hardly describe them without having the plans before me.

539. Are there not a number of races? Yes.

540. It is like a number of separate trucking yards? Yes.

541. In loading there each side loading truck is placed beside a race? Yes.

542. Do you consider that it would involve a large expenditure to make all the trucking yards on that principle? It would.

543. *Mr. McLaughlin.*] The only objection which you see to the Evans truck is against the top door being above the bottom one? Yes; apart from the principle of end loading, whatever the advantage of that may be.

544. Could not that be got rid of in two ways, by removing the doors and putting them in the centre as they are in the ordinary trucks? Yes.

545. Or by altering the races? I do not know about that.

546. If all the races were like the Hay races would not that objection be overcome? I do not think so.*

547. Do not the Hay yards suit the Evans truck? I do not think so. I would not commit myself, as I have not seen the Hay yards for some time, but my opinion is that the races do not fit in with the decks of Evans' trucks without moving them.

548. How long is it since you have seen them? About four years.

549. I suppose you have noticed the floor of Wilkinson's truck, and that of Evans' truck—which do you prefer? Evans', undoubtedly?

550. Is there much oscillation in cattle trucks when full of cattle in crossing the mountains to Sydney? I do not know whether there is much oscillation; there is surging.

551. Would that be increased by having the top deck carried on the top of a truck? Undoubtedly; the higher you have the centre of gravity the greater the risk of oscillation.

552. Do you not think that carrying a heavy floor on top of the truck would considerably increase it? Yes; everything which tends to increase the weight on top must necessarily tend to increase oscillation.

553. If by oscillation or surging that top floor got out of order, a very serious accident might happen if the truck was loaded with cattle? The Locomotive Engineer has told me that some arrangement has been introduced into the truck whereby the top deck cannot come down, but I have not seen it.

554. When you saw the truck the top deck was suspended only by chains, and there was a risk of its getting out of order? I do not say that.

555. Do you think it would have been safe to use the truck for cattle with a top deck suspended by chains? I should unquestionably prefer greater safety in securing the upper deck.

556. Suppose the Glebe Island abattoirs were abolished, would there not still be a considerable live stock traffic? There always will be, but nothing to what it is now.

557. The traffic is not very heavy this year in consequence of the serious drought last year? It has been very heavy this year.

558. And you expect considerable increase next year? I do.

559. Is it not desirable that the Government should at once increase their rolling-stock? Not to a very large extent, but it will be necessary to have more rolling-stock unless something is done in the meantime to establish abattoirs in the country.

560. You think that no time should be lost in getting the trucks? Live stock trucks cost a lot of money, and if there were any early prospect of abattoirs being established in the country it would be a pity to spend many thousands of pounds on new stock trucks. If on the other hand, the live stock is still to come to Sydney, it will be necessary to have more trucks.

561. In that case the sooner they are supplied the better? Yes; they ought to be supplied before next season.

562. Even if abattoirs were established in the country I assume that there would always be use for cattle trucks? I imagine that the abattoirs would be established at central places, like Bourke, for example. The great bulk of our stock traffic is coming from Bourke now. I do not mean to say that there would not be cattle carried by train, but the traffic would be very much less. It would be less in proportion to the extent of the killing in the country.

563. Still, the combination trucks will always be useful for goods? Yes, but ordinary goods trucks, which are much lighter, and consequently more economical, are even more useful.

564. Do you know the difference between the weight of the Wilkinson and the Evans truck? I have been told that there is something like a ton difference.

565. The Evans truck has been used for two and a half years, and there has been only one accident? Yes; and that arose from a flaw in the wood.

566. You know that there are fewer doors in the Evans truck than there are in the Wilkinson? Yes.

567. And that the Evans truck is less complicated in that respect? Yes; but you have to take into consideration that the Wilkinson truck is an end loading as well as a side loading one.

568. *Mr. Brunker.*] Is that the only difference? No, it is not; I think that Wilkinson's truck has five doors where there are three in the other; but Wilkinson's truck is so constructed that it fits into our races, the upper deck fits the upper race, and the lower deck fits the lower race.

569. *Mr. McLaughlin.*] Would not all the openings in the side of Wilkinson's truck tend to weaken the truck considerably? I think so. Necessarily the greater number of doors I should say the weaker the truck

* NOTE (on revision).—Since giving my evidence I have satisfied myself that the opinion expressed is quite correct.

D. Kirkcaldie. truck will be, but I do not care to express an opinion about that. It is a question for a designer or builder to answer.

8 Dec., 1887.

570. Is simplicity of construction a matter of great importance? Yes.

571. Do you consider that the Evans truck is simpler than the other? In what way?

572. As far as the doors are concerned; in getting men to understand the working of the truck? I think you could get men to understand the working of both trucks very readily.

573. *Mr. Lyne.*] Do you recollect last year whether a large quantity of wire was carried in sheep and cattle trucks to Bourke at a cheap rate? Yes.

574. That was carried as back loading after stock had been brought down? Yes.

575. By taking it as back loading you were enabled to carry it at a cheap rate? Yes; but the consigners had to wait our convenience.

576. Would not the same principle apply to combination trucks with regard to back loading, chiefly of wire? Yes.

577. *Mr. McLaughlin.*] Do you think it would be possible to apply the end-loading principle to cattle trucks? I have never heard of its being done, nor have I heard of any proposal of the kind.

578. *Mr. Brunker.*] Which gives the Department the greater amount of profit, the carriage of dead meat or live stock? That is a question which I have not gone into very fully, but I should say that dead meat would give us considerably more profit than live stock. We have not had a great deal of experience, because we have never had properly constructed trucks for dead meat.

579. But do you not carry Richards' meat? Yes; but that is a very short journey. For long journeys, we require specially constructed vehicles. I believe one is being built now.

580. There would be nothing like the same wear and tear in the trucks if you carried carcasses instead of live stock? No.

581. *Mr. Wilkinson.*] Can you tell the Committee why it is that Evans' truck has been used so seldom for cattle during the two years and a half that it has been in use? Because of the centre partition. The stock agents would not load it.

582. You have seen what is called the improved truck? Yes.

583. That has no partition? It has two moveable bars.

584. Has that truck ever been loaded with cattle? No.

585. Do you know why? No.

586. How often has it been used for sheep? I could not say exactly, but not more than three or four times.

587. And once out of the three or four times the accident happened? Yes.

588. Is it not a fact that in the country trucking yards it often happens that there are a great number of sheep trucks and no cattle trucks, or a great number of cattle trucks and no sheep trucks, and that people come with one class of stock, and find that the trucks which are required are not there. Would it not be a great advantage if they found combination trucks there? In that way it would be.

589. Do you not know that it often happens that there may be forty sheep trucks at Dubbo for four or five days and not one cattle truck? That may be sometimes the case, but not very often.

590. It would be a great convenience to have combination trucks there? Undoubtedly, if you could construct a strong combination truck useful for cattle or sheep, leaving goods out of the question altogether.

591. I suppose you know that a large quantity of goods is sent by wholesale storekeepers on the various lines? Yes.

592. It would be a great advantage to them if they were to come to Dubbo, and there were no D trucks in which to carry their goods, to find there were combination trucks? Yes, no doubt.

593. Do you know that the dead meat trade has been tried for some time by the Orange Company? Yes.

594. Do you know that that company has failed, and that operations have been discontinued? I believe so.

595. Do you know that the dead meat trade is smaller now than it was three months ago? I do not.

596. *Mr. Brunker.*] Is not the dead meat trade very much larger in the winter than it is in the summer? Yes.

597. *Mr. Wilkinson.*] You know that if you have a dead meat trade, all the offal and that sort of thing will go to waste? I cannot say, but it ought not to.

598. You say that it is a great advantage if cattle trucks are boarded up, so that the cattle cannot see out? Yes.

599. Would it not be a great advantage if the trucks were closed in altogether? Certainly, if you could get plenty of ventilation.

600. I suppose that if my truck were boarded up that objection would be overcome? Yes; as far as cattle are concerned.

601. *Mr. Lyne.*] But would there be ventilation then? I think there would be plenty of ventilation at the top and at the ends.

602. *Mr. Wilkinson.*] Is there not a great deal more ventilation in my trucks than in other trucks, through having the openings at the end? Yes; but then comes the question of ventilation for sheep. Ventilation at the ends only is not sufficient for sheep.

603. Supposing that my truck is boarded up for cattle, and that there is plenty of ventilation for sheep, and also a smooth surface for cattle, what should you say? That my objection would be removed.

604. Which is the simplest truck to convert from a cattle into a sheep truck, Evans' or mine; which has the most parts in conversion? Evans' has the greater number of parts.

605. Is it a fact that to convert my truck from a cattle to a sheep truck, you have simply to turn a handle and it carries out its own operations? Yes.

606. As a matter of fact a blind man if he were told to turn the handle, could convert my truck from a cattle into a sheep truck? If you were to lead him to the handle.

607. You have suggested two more doors in the side of Evans' truck to make them correspond with the existing trucking yards? Yes.

608. The improved truck has not been running two and a half years? No.

609. Do you not think that it would be a great advantage to stop the pressure of sheep by having the truck divided into compartments? Yes.

610. *Mr. McLaughlin.*] The partition in Evans' truck was not in the original patent, was it? I do not think it was.

611. Was it put in on the suggestion of your Board? Yes; the Board suggested that a division should be put in the sheep vans. D. Kirkcaldie.
612. What is called the improved truck is simply the same truck with that partition removed? Yes. 8 Dec., 1887.
613. And the truck is as it was when originally handed over to the Government by Mr. Evans? Yes. It is like our present cattle truck when used as a cattle truck, and like our present sheep truck when used as a sheep truck, with the exception of the doors.
614. Would it not be possible to prevent cattle looking out and seeing the engines if the curtain of Evans' truck were lowered 2 feet? I think that would take too much ventilation away from them.
615. But I mean to do it only at stations? Yes; but you would have to consider whether it would not interfere with the ventilation too much, besides there is not time at stations to attend to them.
616. *Mr. Lyne.*] Would not the cattle put their horns through the curtain? I do not think that they could get at it.
617. *Mr. Wilkinson.*] Would not the wind blow the curtain about, and thus frighten the cattle? Yes. It is a thing which might be good enough in theory, but I am afraid it would not be carried out in practice.
618. You think that in removing that partition from Evans' truck they have lost an advantage as far as the carrying of sheep is concerned? Yes; the partition is certainly an advantage for sheep.
619. *Mr. McLaughlin.*] Are there not portable bars? Yes; but I do not know how far it would be practicable to work them. I do not know how they could be run through a lot of sheep after the truck was loaded.
620. *Mr. Brunker.*] Do you not think the cattle trucks would be better without the canvas curtains. What would be the effect if they were flapping about. They would have the effect of frightening the cattle.
621. *Mr. Wilkinson.*] Are you not sure that that would be the result? Anything moving about certainly does frighten cattle. If you could board up the trucks altogether, and still give plenty of ventilation it would be better than anything you could get, but it could only be done by louvres, and open spaces must be left to admit of drivers seeing and attending to the stock.
622. *Mr. Lyne.*] You were asked whether, if there was a dead meat trade, the offal would be wasted. Do you not think that the offal would be utilized where the stock was slaughtered? I should think so.
623. *Mr. Wilkinson.*] But still the heads and horns and other things would have to be carried twice over? I went into that question some time ago pretty fully.
624. *Mr. Lyne.*] How many extra doors are there in Wilkinson's truck, without reference to end loading? I think that there are seven on each side of Wilkinson's truck, and only three on Evans'; but there is a reason for Wilkinson's truck having so many doors; he has a flap which comes on to the platform. Then there are two doors on each side above that. That makes his flap shorter, and makes it fit in with the races at the loading stations. There is a flap and four doors in Wilkinson's, and a flap and two doors in Evans' truck.
625. They cover the same space? Yes.
626. *Mr. Wilkinson.*] Practically there are only two doorways in the side of my truck? Yes.

William Scott called in, sworn, and examined:—

627. *Chairman.*] What are you? I am Locomotive Superintendent. W. Scott.
628. How long have you been connected with the Railway Department? Over 30 years. 8 Dec., 1887.
629. During that time you have had a good deal of experience of cattle and sheep trucks? Yes.
630. How long have you had experience of combination trucks? Over 2 years.
631. What truck? We have only had one design of truck in work during that time.
632. Do you know of any other designs except that one? Yes; I have seen Wilkinson's.
633. But your experience of the working of combination trucks is confined to one? Yes; Evans'.
634. From your experience do you think that the combination trucks which have been in use stand the wear and tear of carrying cattle and sheep as well as the old stock trucks? No; I cannot say that they will. They will require more repairs. There are more parts to keep in repair.
635. Do you think that in carrying stock, cattle principally, in the combination trucks there will be a tendency for the working parts to get out of order as far as the decks are concerned. I refer specially to the hinges holding the flaps? There is no doubt that the carrying of cattle will have a tendency to damage the trucks.
636. To strain them? To a certain extent.
637. Do you think that the hinges and other parts of the top deck will be liable to rust and get out of order if they are in constant use? Unless they were made of brass, or some material which would not rust.
638. Do you think that the expense of keeping them in repair would be very great? Not very great; but still it would be more costly than ordinary trucks.
639. Do you think that if many combination trucks were in use and they were left in numbers at the various stock-loading stations the expense of repairing them would be heavy? They would deteriorate if left at stations for any time without being used. If constantly used they would last longer than they would if they were left standing at stations.
640. From what you have seen do you think that the Wilkinson truck would cost as much to keep in repair as the Evans truck? There are a good many working parts in that truck, but I do not think that there would be any difference as far as repairs go.
641. Can you tell us what the present cattle trucks cost? The cost of constructing them is £114, but with everything complete the cost is £169 8s. The contract price is £114, and the wheels, springs, &c., which the Government supply, cost £55 8s.
642. What is the cost of the present sheep trucks? The contract price is £119, and £55 8s. for the wheels, &c., makes the total £174 8s.
643. Can you give us any idea of what the cost would be of converting an old stock truck into a truck on the Evans or Wilkinson pattern? If you have new cattle trucks in good condition no doubt they can be altered for £110 to make a thoroughly good job of it.
644. That £110 would have to be added to the original cost? Yes, to convert the truck into a proper combination truck.

- W. Scott. 645. Have you any idea what the Evans truck cost? It cost £260, or, with wheels, &c., £300 odd; but if there was a pattern truck of proper drawing, I think that we could get them at much less than that. I should say that they would be built for £200, or, with the cost of wheels, &c., about £250.
- 8 Dec., 1887. 646. Have you any idea what the Wilkinson truck would cost? I think it would cost much about the same; there would not be many pounds difference. I think a builder would take the contract for one as soon as the other.
647. Have you had any experience in trucking stock? No.
648. Your experience is more confined to the construction and superintendence of rolling-stock? Yes.
649. Do you think that a combination truck would be an advantage? No doubt a limited number of them would be an advantage.
650. Do you think that these combination trucks would be of value to the Department for convertible purposes of carrying sheep and cattle, leaving goods out of the question? I believe they would.
651. Do you think that a combination truck, no matter what pattern may be adopted, would be more useful for the carriage of goods and stock than the trucks at present in use? No; I do not think they would be so useful for goods.
652. Taking that view, you do not think that it would be advisable to spend any great amount of money in building combination trucks of any pattern? Only a limited number.
653. *Mr. Lyne.*] You have not much to do with the traffic? None at all.
654. *Mr. Smith.*] You spoke of the hinges of the top deck of the Evans truck being liable to rust unless they were made of brass—would it not be advisable to galvanize the iron hinges? Yes; but I have no doubt that in time the acid would penetrate through the galvanizing; of course, if they were galvanized they would last longer.
655. Galvanizing is not costly? No.
656. Do you know what the difference in the weight of the Evans and Wilkinson truck is? The difference is a few hundred weight.
657. Is it not over a ton? No. The weight of the Evans combination truck is 7 tons 9 cwt., and of the Wilkinson truck 7 tons 14 cwt.
658. Are you quite sure? Those are the figures which I have in my book; all trucks, even the same class, do not always weigh alike.
659. Do not these figures apply to the truck in which a partition was put? I believe they do.
660. Do you not know that the fact of taking the division out has been to reduce the weight from 7 tons 7 cwt. 1 qr. to 6 tons 12 cwt.? I am not aware of that.
661. Do you not know that that was stated in the report of the Board? No; I have not noticed that.
662. You are not prepared to give evidence to the contrary that it would not make a difference of 15 cwt. by taking the division out? If the truck has been weighed without the division that must be correct.
663. I will read what the Board says,—“The weights of the trucks are—with the division, 7 tons 7 cwt. 1 qr.; without the division, 6 tons 12 cwt. 3 qr.” Can you contradict that? No.
664. If that be so, then the difference in the weight of the Evans truck and the Wilkinson truck is over a ton? 19 cwt.
665. I suppose you fully recognise the extra cost which would be involved to the Department in carrying that extra ton over the thousands of miles which a truck would have to travel in the year? Yes.
666. It would be an important item of expense? No doubt.
667. I suppose that your constant effort is to reduce the weight of your plant? As much as possible, keeping sufficient strength in view.
668. You regard a plan which would make a difference of a ton in one vehicle as a matter of great importance? Yes.
669. Can you tell us what the difference in the expense would be of constructing a truck without end loading and with end loading? Approximately about £20 a truck.
670. You are competent to speak of the relative strengths of the trucks as far as construction is concerned? Yes.
671. You know that the Wilkinson truck has a larger number of doors in the side than the Evans truck has? There are a larger number of openings.
672. Would not these have the effect of weakening the strength of the body of the truck? Yes.
673. In addition to that there are the end-loading openings, would not they also weaken the truck? The more openings there are the more the framework is weakened.
674. Then in Wilkinson's truck there is an opening at the top which almost divides the whole of the roof; would not that also have an additional weakening effect? To a certain extent. You cannot get the roof-sticks right across to tie the truck together as well as you could without that opening.
675. Suppose ten big bullocks are in a truck, is it not a fact that there is an enormous strain on the ends of the truck? Yes.
676. And that, with the oscillation, in addition to the cattle moving about, great strength is required in the construction of the trucks? Yes.
677. Taking the Wilkinson truck, with all these doors, with the end openings, with a roof open almost from end to end, would you undertake to say that the truck would be strong enough, as you have seen it, to hold ten cattle? I should not like to put ten wild cattle in it.
678. From what you know of the Evans truck, would you have any hesitation in putting ten wild cattle into it? They would have a tendency to damage the flaps I am afraid.
679. But, as far as the strength of the truck is concerned, would you have any hesitation? No.
680. Have you observed the proportions of hard and soft wood in the two trucks? Yes.
681. Is it not a fact that there is a much larger proportion of soft wood in the Wilkinson than in the Evans truck? I believe there is. I saw Wilkinson's truck yesterday morning, and I observed that some soft wood was being taken out and hard wood put in to replace it.
682. What do you suppose that would add to the weight? I do not think it would add many pounds to the weight.
683. What part of the truck was it in which hard wood was being substituted for soft wood? It was in the centre of the truck, in the pillar for guiding the trays or platforms.
684. Have you noticed the method of partition in Wilkinson truck, by which two doors with hinges come out with eyes, and then a steel rod which runs from the roof through these eyes into the floor? Yes.

W. Scott.

8 Dec., 1887

685. Did you notice that these doors were of soft wood? Yes.
686. Do you consider that these doors would be fit protection for sheep or cattle, supposing the trucks were loaded half with sheep and half with cattle? For wild cattle I should have some doubt about it.
687. Would you feel that there was safety in putting stud sheep in one half and cattle in the other half, with these soft wood doors between them? I should like to see a little improvement there.
688. And a little strength? Yes.
689. Would not that require more weight? It might add a little weight, but still the framework may be made with small bars.
690. From what you can see, would you not say that the weight has been studied as closely as possible in Wilkinson's truck as it is now? I believe so.
691. Are you aware that an offer was made by a Sydney firm (Glasson & Company) to construct Evans improved truck for £140 apiece? No.
692. Are they competent people? Yes. That would not include the cost of wheels, &c.
693. *Mr. Smith.*] What would the cost of those things be? The wheels, buffers, and other fittings would cost £55.
694. Do you not consider that the Wilkinson truck has a great many parts in it; that it has a rather complicated construction? Yes; but not unnecessarily so.
695. Are there not less parts in Evans' trucks? Yes; especially the last one which was converted from a cattle into an Evans truck. There are less parts in that truck than in the ordinary Evans truck.
696. You know that there are chains at the sides in Wilkinson's truck; is it not a very undesirable thing where sheep and cattle are carried to have chains hanging down the side of the truck? Yes, but this would only occur when loaded with sheep.
697. In the Wilkinson truck, have you noticed that in the partition doors there is an opening of 1 or 2 inches through which cattle might get their horns, that is when the doors are closed to make the partition? I have not noticed any opening there.
698. Suppose there is such an opening, would not cattle be likely to get their horns through, and then begin to work their heads about and pull the doors down? They would soon do that if they got their horns in.
699. *Chairman.*] Have you had any experience of stud cattle and sheep? No.
700. Therefore you could not express an opinion as to what would happen if a mixture took place? I can imagine what would happen.
701. *Mr. Brunker.*] I suppose, if the Department are going to construct a truck to carry both stud cattle and sheep, they will find it necessary to devise means to prevent them getting together? Yes.
702. *Mr. Smith.*] Does it often occur that you want a truck to carry half sheep and half cattle? I do not know.
703. *Mr. Wilkinson.*] Have you seen the undercarriage of the Evans improved truck? It is an ordinary cattle truck converted.
704. Do you know that the undercarriage is a great deal lighter than the undercarriage allowed by the Department at present? I am not aware of that. It was a cattle waggon taken out of a number for conversion.
705. *Mr. Evans.*] One built on the last design? Yes.
706. *Mr. Wilkinson.*] You do not know that it is lighter than the undercarriages which the Department allow the contractors to use now? I believe they are all the same, that is, the last improved cattle trucks.
707. Do you not know that the axle of this improved truck is far less in diameter than the axle of any other of the trucks built? There may be a difference of a quarter of an inch in the size. The axles imported during the last three years have been increased in size.
708. Therefore they are heavier than the old axles? Yes.
709. Are not the wheels on the new trucks heavier than on those which were in use a few years since? There is not much difference, only 3 cwt. per truck.
710. Does what is called the draw-gear in Evans' truck connect one end of the truck to the other? I believe it does in the new truck, but not in the converted one.
711. If the draw-gear does not go right through the truck it would be a great deal lighter than a truck which had the complete draw-gear? A little lighter. All the new gear has increased strength.
712. And goes right through from one end of the trucks to the other? Yes; we are replacing the whole of the trucks with continuous draw-gear as fast as we can possibly get it done.
713. Do you know that the improved gear is fitted into my truck? I noticed that yesterday.
714. Do you know that in the Evans improved trucks the brake blocks are made of wood, and that the brake blocks in my truck are made of iron? I know that the brake blocks in your truck are made of iron, but I cannot say what those on Evans' improved truck are made of.
715. Do you know anything about trucking stock? I do not.
716. Suppose I were to bring down fifty sheep and five head of cattle a long distance in my truck, would not that affect your opinion as to my truck? I have my doubts about carrying wild cattle in the truck. You might do it once, but it does not follow that you could do it regularly.
717. Can you tell me the reason why the Evans truck has been loaded with cattle so very seldom? I could not say.
718. Are you quite sure that you are right in saying that some soft wood was taken out of my truck and hard wood put in its place? There was a vertical framework in which that appeared to have been done.
719. But was it originally soft wood that had been used? That I could not say.
720. Have I not put in two posts where there was only one originally? Yes.
721. And they are both hard wood? Yes.
722. Have you noticed that in my truck the partitions go from the bottom of the truck into the roof? I believe they do.
723. Do you notice that the rods are made of solid iron and not of pipes? I believe they are solid iron.
724. And do not those rods come from the bottom of the floor to the roof? I believe they do.
725. Have you noticed that my truck is braced with hard wood? I have no doubt that it is.
726. Have you noticed that where it was suggested it would be naturally weak, where there is a longitudinal flap from one end of the truck in the roof, that it is tied across with an iron bar? Yes.
727. Did you notice that it was tied at the end with cross pieces in the middle? I did not notice that particularly, but I have no doubt that it is tied in the centre.

- W. Scott.
8 Dec., 1887.
728. If it is tied in the middle with a solid iron cross bar, would not that naturally make it strong? That strengthens it no doubt.
729. Do Evans' cross pieces or his partition, with the exception of the bars which are against the door, go from the bottom floor to the roof? That I could not say.
730. Are Evans' sides braced? No, I do not think they are; but there are hollow tubes carried right through from top to bottom.
731. Are you sure of that? I am not certain of that, but I am under the impression that they are.
732. Do you not know that they only go half way up? I could not say.
733. You know that there is a plate of iron about 4 feet from the body of the truck. Is it not a fact that these pipes are screwed into that bar of iron? I am aware that the pipes are screwed in, but I do not know whether they go right through or not.
734. If they only go half way up, and the truck is not braced, would not that necessarily weaken the truck? Unless they are screwed into that plate.
735. The plate would be the only thing supporting it, and if that gave way the whole side would come out? I do not know.
736. I suppose that Mr. Bourn can give us evidence as to the construction of the trucks? Yes.
737. Do you know what sort of wood the doors of all trucks are constructed of? I think that the greater part of the frames are of hard wood.
738. What are the doors? Soft wood.
739. And the roofs? Soft wood.
740. Then in making my doors and flaps of soft wood I have not departed in any way from what the Department expect me to do? No; with the exception of hard wood frame.
741. *Mr. Smith.*] What are Wilkinson's frames made of? The dividing doors are made merely of soft wood.
742. *Mr. Wilkinson.*] But there is no frame round the dividing doors? No.
743. Do you know what sort of hinges they are hung on? I did not notice.
744. *Mr. Smith.*] What difference would there be in the weight between the undercarriage now in Evans truck and the undercarriage which would have to be put in in any subsequent ones? I should say from 6 to 7 cwt; but I cannot say positively.
745. *Mr. Brunker.*] I understand that you prepare designs? Yes.
746. Do you think it desirable, in the interests of the public, that the Department should accept either of these designs which have been offered? We should prefer making our designs if we adopted either of them.
747. Do you think that in the interest of the Department you should accept either of the designs? I do not see any reason why we should not accept them.
748. Do you think it would be any benefit to the public to accept either of them? That I could not say. If it would be a benefit to the Railway Department it ought to be a benefit to the public.
749. You said just now that some alterations were being made in the Wilkinson truck, by substituting soft for hard wood. What is the necessity for these alterations? They are considered an improvement.
750. Are they being made by the Department? No; we have nothing whatever to do with the truck.

WEDNESDAY, 29 FEBRUARY, 1888.

Present:—

MR. BRUNKER,	MR. LYNE,
MR. HAYES,	MR. SUTHERLAND.

T. H. HASSALL, ESQ., IN THE CHAIR.

Mr. Wilkinson appeared in person.

George Downe, Esq., called in, sworn, and examined:—

- Geo. Downe,
Esq.
29 Feb., 1888.
751. *Chairman.*] What are you? Assistant Locomotive Engineer.
752. I suppose that during your term of office you have had a good deal of experience of the rolling-stock of the Railway Department? I have had to do with rolling-stock.
753. Have you lately had brought under your notice some new trucks for the carriage of stock and goods? I have seen two combination trucks—the Evans and the Wilkinson.
754. Have you seen any other combination truck? I saw one several years ago.
755. Have you formed any opinion as to the relative merits of these two trucks? I have not been called upon to do so.
756. But have you not formed an opinion as to the merits of the two trucks for the purposes for which they are designed? In what way do you mean—as to the benefits of end-loading or side-loading, &c.
757. As to the benefits which would be derived by adopting one or other of these trucks in place of trucks already in use? As to a combination truck which will carry sheep and cattle one way and goods the other, there can be no question as to its advantages, provided that you have the traffic. The question of side-loading as against end-loading is one on which there is a division of opinion. Evans truck, as it is now constructed, does not provide for end-loading, therefore any opinion I may have as to the benefits of end or side loading would be valueless for comparison.
758. What is your opinion of the construction of the trucks—do you think they will do all that the inventors claim for them, that is, carry goods up country and bring stock down? I think both will.
759. Do you think that the use of these trucks would necessitate larger expenditure in repairs than is necessary to keep the present trucks in repair? I think that the combination trucks would be a little more costly in maintenance, but that is a question which would have to be tested by experience.
760. Having seen the two trucks, will you give the Committee your idea as to which you think it would be better for the Department to have? I do not think that I could form a sufficient opinion on that point without further consideration.

G. Downe,
Esq.

29 Feb., 1888.

761. Do you think that either of the trucks possess any advantage over the other? The only advantage which I see the Wilkinson possesses over the Evans truck, is that you can load it from the end, and divide it so as to make it half cattle and half sheep.

762. Has it not also a further advantage that, when loading it, you can stand erect and move the stock about? With sheep, when you are loading the bottom floor the top deck is up at the roof, so that you have room to move about. Then when the bottom floor is loaded, you lower the top deck to its place, and an opening in the roof gives you room to move about. There is no such opening in the Evans truck, but that can be arranged, if that is the only objection.

763. Can you not express an opinion as to which of the trucks possesses the greater advantage? I should require to give the subject further consideration.

764. A number of Evans trucks have been working for some time, have they not? Yes, for some years.

765. The Wilkinson truck has had no such test? No; it has only been running a few trips.

766. Do you know anything about the trials which were made between the two trucks? Nothing more than I saw in the newspapers.

767. *Mr. Brunker.*] You have had no opportunity to form an opinion as to the relative merits of the two trucks? I have not travelled with them. All that I know of them is from what I have seen in the yards.

768. Do you think there would be any difference in the cost of keeping the two trucks in repair? That could only be ascertained by experience.

769. *Mr. Lyne.*] Did you ever invent a combination truck? Yes.

770. Have you a model of the truck? I have a tracing of it at home.

771. What sort of an invention was it? It was a truck in which the intermediate floor was lifted from the bottom with screws, with sliding doors on the outside.

772. How long is it since you invented that truck? As far as I remember the Government ordered it in 1878.

773. Was it submitted to the Department? The Department ordered it.

774. In what way? The design was submitted to the Commissioner, and he ordered the truck to be built.

775. Was the invention patented? No.

776. Did you ever make any application that your invention should be considered still further? No.

777. Are either of these trucks under discussion now like yours, or anything like it? They are altogether different. The floor of my truck was framed in one, with the screws at each corner, and was worked by shafts and mitre wheels lifting the screws from underneath. There were no flaps, as in Evans truck, and no division, as in Wilkinson's truck; it was in one.

778. The reason why I asked the question was to show that you had some considerable insight into combination trucks? I do not know that you can call it considerable.

779. Having invented a truck you must have given the subject some thought? It is so many years ago, and not long afterwards I left the Railway Department and took a position in the Tramway Department, and my invention was not followed up. At the time that I speak of, Mr. Mason was Engineer for Existing Lines and Engineer for Rolling Stock.

780. You are no fool as far as combination trucks are concerned? I do not think I am.

781. Having examined the Evans and the Wilkinson truck what is your general opinion as to their relative merits? In what way would you have them compared.

782. Take them altogether—do not take any particular point, but take the whole truck—if you were going to take either of the trucks and use them on the railway, which, as a practical man, would you take? A great deal would depend upon whether we are to have end-loading or not, whether that is to be considered. If you do not consider that both will answer the purpose. It then becomes simply a matter of flaps as against lowered floors.

783. Which do you think the best? Both will equally answer the purpose.

784. Apart from end-loading, you think the trucks are about equal? I think the Evans truck as good as the Wilkinson, and the Wilkinson truck as good as the Evans.

785. You do not know anything about end-loading? It is not within my province to deal with that sort of thing. It belongs to traffic.

786. *Mr. Brunker.*] Was the truck which you made, the result of your own thought, or had you any plan furnished to you? I was furnished with no plan; I had a conversation with Mr. Mason, and out of that conversation I produced the tracing, and the Commissioner ordered a truck to be made from it. Hudson Brothers made the truck without any price being stipulated. The cost was very high. I think they charged £370 or £380 for it. Another thing was that it was considered heavy. I think it was heavier than either of these trucks, and of course the weight of a truck is always a consideration in haulage.

787. The wear and tear too? The greatest consideration is the haulage, because if you have a truck, 10 or 15 cwt. heavier than another, that is dead weight from which there is no return.

788. *Mr. Wilkinson.*] You were in the Government employ when you designed that truck? Yes.

789. Did you ask any consideration for it? I did not, in fact there was no reason to do so, it was not tried sufficiently.

790. Have you officially inspected both the trucks? If you mean by officially that I have received instructions to inspect the trucks I say "no," but I have inspected them personally.

791. Has your attention been called to something wrong in the deck of my truck through a bolt not running in the groove? I suppose you refer to the truck as it was after the last trial, when the deck was sagged. It came out of its groove.

792. What was the origin of that, and would the defect be easily remedied? There is a groove cut into the pillar for the guide to work up and down, and the cause of the sagging of the deck was that the guide came out of the groove. The guide is also the support of the deck at the bottom, so that when it came out that support was entirely gone.

793. The fact is that the guides were too short? Yes, for the side play of the truck.

794. Did you notice how they were fastened on the truck—just bolted on? They were fastened on to the deck, and worked in the groove to the side of the truck.

795. If the guides were an inch wider, or one of them, would they have come out of the groove? I do not whether there is an inch further clearance in it.

796. But it was because they were too short that they came out? That is the reason that they came out.

- G. Downe, Esq.
29 Feb., 1888.
797. What do you think would be the cost of putting in fresh guides? I do not think that your arrangement is a good one, because you cut away part of the pillar.
798. You think the groove ought to be in a different position? Yes.
799. You think that instead of taking the groove out of the pillar it should be taken out between the door and the pillar? Yes; you would keep the pillar stronger by that means.
800. Such an alteration as that would not affect the principle of the truck, it would be simply a matter of construction? Yes, you can call it a matter of construction.
801. If I were to build another truck and were to put the groove between the door and the pillar you think that would be an advantage? I think that would be an improvement.
802. Would that be a simple or a difficult matter? It is just a matter of detail of construction.
803. Would it affect the cost in any way? It would not affect the cost in any way in constructing the truck; but of course if you made the alteration now it would affect the cost of your truck.
804. *Mr. Brunker.*] The fact is that if there were defects found in either of the trucks, and the Department thought it would be an advantage to have these rectified it could be easily done? In all new things there are sure to be defects seen which science can generally rectify.
805. *Mr. Wilkinson.*] How long do you think it would take to convert my truck from a sheep into a cattle truck by raising the deck? I should think three or four minutes.
806. How long do you think it would take to convert it from a cattle into a sheep truck? Not quite so long, perhaps a minute less.
807. Have you noticed the side shutters on my truck to shelter the stock from the sun or weather and prevent them from looking out? I have seen them.
808. Are they attached to Evan's truck? No.
809. Do you think they are an advantage for goods or stock? It is a matter of opinion in travelling stock as to what excitement they get in being moved about at the stations.
810. Is there any difference in the undercarriage of my truck and that of Evans'? There is a little difference in the size of the timber.
811. And the wheels and axles? They are the same.
812. Are the axles the same diameter? Yes.
813. Are you sure of that? Yes; we are putting larger wheels and axles under Evans' truck now.
814. But I referred to the trucks as they were? The wheels and axles were lighter than yours.
815. Do you know that the draw-gear is not continuous in Evans' trucks? Yes.
816. Is it continuous in my truck? Yes.
817. Would not that make some difference in the weight of the two trucks? A little difference.
818. Do you know that the rods in my truck are all solid iron, and that those in Evans's are pipes? Yes; but do you claim an advantage on that score?
819. Would not the pipes be lighter than my rods? They would be very little lighter, because they are larger. If anything the advantage is in favour of hollow pipes as far as strength is concerned.
820. Have you noticed that my truck is braced with wood on each side from floor to top? Yes.

Henry William Larance, Esq., called in, sworn, and examined:—

- H. W. Larance, Esq.
29 Feb., 1888.
821. *Chairman.*] Where do you reside? At Orange.
822. What is your occupation? Carcase butcher and cattle dealer, combined with farming.
823. Have you had any experience in trucking stock? I have had a great deal of experience.
824. Have you trucked much in the old trucks? I have trucked in the oldest trucks of all, as well as in the new trucks.
825. Have you had any experience of what is called Evans' combination truck in trucking stock? I have trucked sheep in them, but not cattle.
826. What is your experience of the Evans combination truck? I found it very inconvenient. I could not get on with it at all.
827. What is your objection to it? You have to shift it so many times to load it. I think that you have to shift it three times, and while the shunters are moving it, you have to stand at the doorway to prevent the sheep getting out, because the doors cannot be raised until the truck has passed the platform.
828. Are there any objections as to the loading of them? I never could load them as well as I could the old sheep trucks. I had a great job with the trucks at Narromine, and I lost one or two sheep by it, they got out of the doorway while the truck was being shunted.
829. Did you not find it inconvenient to load them through the top decks being lowered—was not the space very limited? Very cramped.
830. You had to crawl about in them? You cannot get in. The only way you have is to employ a small boy or a dog. A dog is right enough for unloading sheep, but no good for loading.
831. Have you seen the Wilkinson truck? I have, but I have not loaded it; I inspected it at the Agricultural Show.
832. You overhauled it thoroughly and saw the working of it? Yes.
833. Did anything in connection with it strike you as being contrary to any other truck you had experience of? I fancy it is a great improvement on others I have seen.
834. In what does the improvement consist? For one thing you have loading sheep at the end. If you get sheep running there is no trouble to keep them going. It is sometimes very awkward to get sheep to start when you are loading half a truck, and then it is very difficult to get the last sheep in.
835. Do you think that with trucks built on the Wilkinson principle and placed in line, you would be able to save a good deal of time and trouble in loading sheep, as compared with the present system? I fancy that you could load two to one, and you would not knock the sheep about.
836. Do you think there would be any difficulty in loading up, and cutting off the requisite number in each truck? Not in the least, I think.
837. How many men would it take to do that? I think it would only take one smart man to keep count.
838. Do you think one man would be able to load each truck and shut off the sheep as required? I think so.
839. Having had a good deal of experience with stock, which truck would you prefer to deal with? I should prefer the Wilkinson.

840. It is claimed for the truck that you can carry sheep and cattle in the same truck—do you think there would be any risk of sending a consignment of valuable sheep and cattle in the one truck? Not the least. Of course, you would not think of putting many valuable cattle in half a truck. I have never trucked stud stock, but I have had a lot of experience with other stock.

H. W.
Larance, Esq.
29 Feb., 1888.

841. You know that, as a rule, stud stock are quiet, and are easily handled? Yes.

842. And that when they are put into a truck they keep pretty quiet until the end of the journey? Yes; you can put this sort of stock into almost any truck.

843. You would not hesitate about sending such a consignment? No, provided that there were not too many cattle. Three in a half truck would be quite sufficient, particularly if they were any size.

844. You think there would be no danger in conveying quiet stud sheep and cattle in close proximity to each other? Not the least.

845. Do you think if the abattoirs at Glebe Island are abolished it will be necessary to establish killing places in the country? I think it will.

846. Would not that cause a great reduction in the live stock traffic. Yes, and the meat would be far superior too. I have been sending large consignments of beef to Sydney market every winter.

847. Do you think it would increase the dead meat trade to a great extent if the Glebe Island abattoirs were abolished? Yes.

848. Do you think it would be a beneficial change in the interests of the public in their getting better meat, and in the interests of the Department in their having dead meat to carry instead of live stock? I do, because there is no comparison between the two classes of meat. If you bought a lot of cattle and killed some of them up country, and sent the meat down, and sent the other by truck to Homebush, and had them killed at Glebe Island abattoirs, when you saw the meat hanging up, you would not think the cattle had come off the same country.

849. Cannot you store more dead meat in a car than you can carry in live stock? Yes, but with dead meat you are limited to weight. You are only allowed to put 4 tons in a dead meat car, whereas a truck of cattle would weigh over 6 tons. You can put ten or twelve carcasses in one of the meat vans, and they are smaller than the cattle trucks.

850. Do you not know that stock is knocked about a good deal through being conveyed from the country to Homebush? At odd times I have run short of cattle, and I have had a few truck loads sent up from Dubbo, and it has not been like the same meat; in fact, it would not sell nearly as well as the meat from cattle which had not been trucked.

851. Have you noticed whether there is any difference between the stock conveyed by the ordinary stock trucks and those conveyed in the Evans trucks? I do not think that there is any difference in that between the Evans truck and the latest improved truck. You may get an extra bullock in the latter.

852. Have you seen cattle conveyed by the Evans truck? I have unloaded cattle from the Evans truck, but have never loaded cattle into it.

853. Do you not think there is a great inconvenience as well as danger in loading sheep under the present system, where you have to crawl about in such a limited area to get the sheep in? For my own part, I would sooner drive sheep than truck them under the present system. The latest Evans truck is an improvement on the first one I saw, which was divided, and which you had to shift five or six times to fill. In the latest truck the partition has been taken out, so that you have only to shift it half the number of times that you had to shift the other one.

854. *Mr. Hayes.*] Is there any difference in loading an ordinary sheep truck and Evans's or Wilkinson's? I have never loaded Wilkinson's truck.

855. Taking the two which you have loaded, which is the easier to load? The ordinary sheep truck, two to one over Evans's.

856. *Mr. Brunker.*] You refer to the ordinary trucks with open decks above and below? Yes, they are so constructed that you can keep two races going at once, one for the top and one for the bottom deck.

857. *Mr. Hayes.*] As far as safety in carrying sheep is concerned is there any difference? I do not think there is, but you knock the sheep about a good deal more in getting them into the Evans truck.

858. *Mr. Brunker.*] I suppose the safety depends upon the manner in which you truck the sheep, the number you put in? Yes; if you fill a truck fairly well, not crowd it too much, the sheep are a good deal safer than if you put them in pretty slack, because they get knocked down in shunting. Under loading is as great a fault as over loading.

859. How long have you been engaged in trucking stock? I have been in the butchering line 15 years, and it is about 8 years since I commenced dealing in stock.

860. The inconvenience to which you refer in loading the Evans truck arises from the door dropping between the platform and the truck? Yes; you cannot raise the door at the platform, and after you have loaded the truck you have to sit in the doorway while it is being shunted past the platform.

861. You say that you have had no experience of end-loading? None.

862. From the experience you have had in trucking stock, and from what you have seen of the two trucks you think it would be a saving in time and labour to introduce end-loading in place of side-loading? From what I can see of the Wilkinson truck you can load it from the present races almost as well. You can open the side door of one truck and open the end doors of other trucks, and then when you get the sheep on the run you can fill them all from one race. That is where I think that the Wilkinson truck is a great improvement on the Evans truck. Of course, you could load the Wilkinson truck better from the end if you had the races so constructed.

863. What I mean is that if conveniences were provided [for end-loading instead of side-loading there would be a saving of time and labour? I think so.

864. If you can carry ordinary cattle in a truck of course there can be no danger in carrying valuable stock, which are generally quiet, in a similar truck? Not in the least; if I had valuable bulls or sheep I think I should certainly have a truck to myself.

865. *Mr. Wilkinson.*] Leaving the end-loading out and considering the side-loading, do you not think that my truck has advantages over the other for the reason that you can walk about while loading the bottom deck and distribute the sheep, and that with the opening in the roof you can walk about to distribute the sheep over the top deck? I have noticed that there is much more room in your truck than in Evans's.

866. In loading sheep in the old trucks have you not found a great deal of trouble in getting in the last four or five,—have you not sometimes to force the sheep in with your foot and pull the door to; and are not

H. W.
Larance, Esq.
29 Feb., 1888.

- not some sheep often left lying there? The first and last are always the worst to get in; you sometimes have to carry them in; but I do not know that you might not have to carry them into your truck.
867. The sheep do not distribute themselves evenly all over the truck? No.
868. The only way to remove them from the door is to prod them? Yes.
869. Would not that be done away with by being able to walk through the sheep? Yes; because you could scatter them about.
870. Is it not an advantage to be able to shut out stock from view if necessary? Cattle particularly. I do not think it matters much with sheep.
871. Do you not think that the shutters on the outside of my truck are an advantage for protecting stock from the weather, and keeping them from looking out? No doubt the shutters would keep the rain and wind out.
872. Would it not be an advantage during hot weather to have the shutters closed on the sunny side and left open on the shady side? It would be an advantage if you were going in one direction, but our railways wind about, so that the position would always be shifting.
873. Take the line from Bourke to Dubbo, which is straight, would it not be an advantage there? Of course it would make it much cooler for the stock.
874. Have you seen any other truck, which has these sliding-shutters, which you can open or close at will? I fancy that the Evans truck has a blind.
875. What is it made of? Canvas.
876. *Mr. Evans.*] I suppose that if that is lowered it will answer the same purpose? Yes.
877. Would you not want a man to each truck, to lower it if wanted? When you are sending consignments of stock you usually send a man with them, and it would be his place to regulate the blinds. It is his duty to attend to the cattle, and to get them up if they are down.
878. *Mr. Wilkinson.*] Is it not an advantage to have the sides of the truck open, so that if a beast is down you can get him up? The great objection to some of the existing trucks is that there is no open space through which you can get the cattle up when they are down.
879. Have you noticed that by removing the sliding shutters in my truck you can get at the cattle anywhere? I have noticed that there is more opening in your truck, more chance of getting at the cattle.
880. *Mr. Brunker.*] You referred just now to the difficulty of loading trucks, and said that it was necessary to put in a boy or a dog. Would that occur in the Wilkinson trucks? I fancy there is much more room in that truck. You would have to go in the top deck at any rate; but I do not think it would be so inconvenient, because I fancy the truck is much higher than the Evans truck.
881. *Mr. Lyne.*] Are you not aware that the roof of Wilkinson's truck opens, so that in loading the top deck you can walk about? I have not seen it open.

THURSDAY, 8 MARCH, 1888.

Present:—

MR. BRUNKER, | MR. LYNE,
MR. HAYES.

T. H. HASSALL, ESQ., IN THE CHAIR.

Mr. Wilkinson appeared in person.

Mr. Bruce Smith appeared on behalf of Mr. Evans.

George Trotter Evans, Esq., called in, sworn, and examined:—

G. T.
Evans, Esq.
8 Mar., 1888.

882. *Mr. Smith.*] What are you? Stores Superintendent of the Railway Department.
883. How long have you been in that position? Fifteen months.
884. What were you before that? Goods Superintendent.
885. How long were you in that position? Eight years.
886. How long have you been in the service of the Railway Department altogether? About twenty-one years and two months.
887. Your experience has been very varied, has it not? Yes.
888. What did you begin at? As porter on the line.
889. You have worked your way up through different grades until you have reached your present position? I have held every position, I think.
890. Among your experience you spent some years at Sutton Forest? Yes.
891. How many? Three and a half years.
892. What were your duties there? I was first porter, and afterwards head porter.
893. As porter, what work had you to do in connection with stock? I had to assist in loading.
894. Any particular class of stock? No, cattle and sheep. Sutton Forest was then a terminus. I think I commenced there in 1866.
895. You also occupied the position of live stock superintendent? Yes.
896. For how many years? That was in conjunction with the goods superintendence—for about eight years.
897. Among your duties was that of arranging for the conveyance of live stock? Yes.
898. You had some experience of the old system of carrying stock? Yes.
899. And you had opportunities to observe its inconveniences? Yes.
900. In consequence of that experience, I believe, you set your mind to work upon establishing some improvement in the method of carriage of stock? Yes.
901. How long is it since you first began your experiments? I think about six or seven years.
902. I think that there had been other experiments before that in this Colony? I believe so.
903. Is it not a fact that the Government built a truck some twelve years ago? Yes.
904. What was it for? The conveyance of cattle, sheep, and merchandise.
905. On any new principle? Yes, as a combination truck.

906.

G. T.
Evans, Esq.
8 Mar., 1888.

906. Do you remember what that truck weighed? I am not certain, but I think about 11 tons.
907. It was very heavy, and was condemned and abandoned? Yes, after the first time that it was tried.
908. Since six or seven years ago, when you commenced making your experiments, you have been working at your truck? Yes, off and on.
909. You have a workshop of your own? Yes; I spend all my spare time there.
910. How many models did you make before you made the one which you are about to show the Committee? Three.
911. I believe that in your first model the flap went up to the roof? Yes. That was the first idea.
912. You abandoned that? Yes.
913. What was your second model like? That had a door in the centre of the side of the truck instead of at the end of the side of the truck.
914. I believe that was very heavy? Yes. [*Truck exhibited.*]
915. I believe your third model was like the one you have just produced, without the partition? Yes.
916. At whose suggestion was that partition put into the truck, making the fourth model? The Live Stock Board which was appointed.
917. The object of that was to divide the sheep or the cattle into two lots? Yes.
918. I believe that that division requires great strength? Yes.
919. The model which you have produced is your own work? Entirely; I made every bit of it with my own hands. I have done everything in the way of inventing it. I never had an idea from anyone.
920. Up to the time you constructed the model from which the trucks now in use were made, did you ever hear of Wilkinson's truck, or of Mr. Wilkinson in connection with the question of trucks? No.
921. Did you ever hear of Mulholland's truck, or of Mr. Mulholland in connection with the question of trucks? No.
922. Did you ever hear of Mr. Perry in connection with combination trucks? No.
923. The model which you have produced is a model of trucks now in use by the Railway Department with one or two exceptions? Yes.
924. The trucks of which that is the model, with one or two exceptions, have been in use by the Railway Department for how long? Two years and ten months, I think.
925. How many of them? Fourteen.
926. *Mr. Brunker.*] Have the whole fourteen been in use during that time? Yes.
927. *Mr. Smith.*] They were all ordered and started at the same time? Yes.
928. They were made by Hudson Brothers? Yes.
929. In accordance with your instructions? I superintended the construction of them.
930. Have you ever received any money whatever or any consideration whatever from the Railway Department for the use of these trucks for two years and ten months? Not a single shilling from anyone.
931. No consideration of any kind? Not from anyone.
932. I believe that an estimate has been made as to the amount per mile saved by carrying sheep and cattle in that truck as compared with the old-fashioned trucks? Yes.
933. What is the difference for each truck? I could not say from memory.
934. During the two years and ten months has anything ever happened in any way to mar the complete success of your truck as a cattle truck? No.
935. Did you ever hear of any mishap of any kind, as a cattle truck, to the truck itself or to the cattle? I have heard of a case recently where a beast got down, or something of that sort.
936. Is that the only case that you have heard of? Yes. I would not say that during the whole time there has not been a sheep or two dead in them. I do not know whether there has or has not been, but I do not think that there has been.
937. As far as cattle are concerned, with the exception of that one beast being down, you do not remember hearing of any other accidents in the fourteen trucks during the two years and ten months? No.
938. I believe that an accident did happen to one of the trucks on one occasion as a sheep truck? Yes.
939. What was that? The centre bar broke.
940. That was examined afterwards, was it not? Yes.
941. What was discovered? That it was a very faulty piece of timber.
942. That fact was duly reported? Yes.
943. What have you done to prevent a recurrence of that? I have strapped the bar with iron.
944. The bar which goes the whole length of the truck which on that occasion broke is now strapped with iron in every case? Yes.
945. With the exception of that instance which you mention, has there been any other mishap to the truck as a sheep truck? Not that I know of; I never heard of any.
946. You mentioned that there were some exceptions between your truck as now in use and the model before the Committee. What are those exceptions? There is no fixed partition or division in the model, but in the trucks there is a fixed division.
947. Which you say was placed there at the request of or on the recommendation of a Board? Yes, and at the request of the Commissioner for Railways.
948. What other exception is there? In the model there is only one door, at the end of the side of the truck, but in the truck now in use there is a door at each end of each side of the truck.
949. There was no necessity for a door at each end of each side when there was no partition? No; the extra doors are necessary because of the division of the truck.
950. Are there any other exceptions? I think those are all.
951. How many doors are there altogether in each of the fourteen trucks that are now running? Twelve.
952. Does not a part of the door when it opens form a stage from the truck to the platform? Yes, the bottom part of the door.
953. And it is corrugated for the feet of cattle? Yes, to prevent cattle slipping.
954. Does that door drop on the platform, or down to the side of the platform? It is the lower half of the door which forms the stage. But I may explain that our sheep yards are not all built alike, in fact, it is hard to find two alike.

G. T.
Evans, Esq.
8 Mar., 1888.

955. *Chairman.*] I understand that the lower half of the door forms the floor of the landing stage? Yes. At some of the sheep yards there is a flap fixed to the platform. This is necessary, because the doors of our sheep vans slide along. This flap attached to the platform is used as a stage between the platform and the truck. At no two yards, or hardly any two, is that stage the same distance from the truck. Some times it is placed within five or six inches, in some cases closer than that, in others it is a foot and a half.
956. *Mr. Smith.*] How does that bear on your truck? In this way. It is impossible to make a truck, I do not care how you design it, which would fit all the stages, because there are not two of them alike. Where the stage is very near to the trucks, and the posts of the races are consequently close to it, there has not been room for my door to drop down with the truck at the platform, and consequently it would have to be lowered before the truck was brought to the platform. At the very next station probably it would fit all right. At some of the stations I know that it has been necessary for parties trying the truck to drop the door away from the platform and use the false door attached to the platform for the purpose of loading the sheep-vans.
957. *Mr. Brunker.*] Is it not a fact that at some of the stations there are no races for loading, but simply places for unloading? I do not think we have any on the southern and western lines.
958. *Mr. Lyne.*] It has been stated by one or two witnesses that when you drop the door down there has been great inconvenience in having to run the truck beyond the platform before you can put the door up? Where the stage has been close to the truck and the posts consequently close, the door would not fall down to the stage, therefore it has to be opened before it comes to the stage, when the truck would be pushed up. When the sheep are loaded of course the truck had to be pushed past the stage to get the door up.
959. *Mr. Brunker.*] Is it not a fact that the party loading is compelled to stand in the doorway to keep the sheep in? The truck is pushed along about 3 feet.
960. *Mr. Smith.*] With your truck these flaps on the platforms would be quite unnecessary? Yes.
961. You always carry with the truck a platform, which forms part of the door? Yes.
962. *Mr. Brunker.*] But suppose it falls against the race? It may be only a matter of moving the two posts back 6 or 8 inches.
963. *Mr. Smith.*] Otherwise there would have to be hundreds of flaps all over the country instead of their being carried with the trucks? Yes. To show how absurdly some of the yards are constructed, I may mention that the flap at Dubbo, which has to convey only one sheep at a time over a space of 18 inches, weighed 190 lb., hinges and flap. I took it off for a curiosity. A flap of half-inch boards would have answered all purposes. A man would have to lower and lift that every time a truck had to be loaded.
964. How many of these flaps would there be at each station? There would be only one at each station.
965. Then each truck would have to be moved up to it? Yes.
966. You have seen Wilkinson's truck since some modern alterations were made in it, and is it not a fact that he has adopted your floor? Yes.
967. Will you explain to the Committee what that floor is and how it is constructed? I had better explain the difference between the old cattle waggons and my truck. The floor of the old cattle waggons was simply composed of big thick battens nailed or screwed to the floor of the truck, and about an inch and a half square. Of course it was impossible for a big heavy bullock to stand with anything like comfort on such a floor. He would be bound to get one trotter or other on to the cleat of wood. This floor was a great deal the cause of cattle not standing steady in the trucks. I had seen this from practical experience of many years, and was determined to make a better floor if I could.
968. What effect had that floor on the hoofs? Very frequently it made the cattle bleed between the trotters. If you looked at an old cattle waggon loaded with ten cattle you would see every beast with one or other of its feet or half a hoof resting on one of the battens, spreading the hoof out.
969. How have you obviated that? My floor is constructed of planks 3 inches wide, with half an inch space between each one to allow urine and manure, to get away as much as possible, with iron cleats longitudinally from end to end of the trucks. There is no projection above the floor of more than half an inch.
970. What is the advantage of allowing that free drainage? It permits of the urine running away and prevents the floor from becoming wet and slippery. It is a very strong floor as well as an everlasting floor. The iron cleats prevent the hoofs of the cattle from wearing the boards out. I may mention that one of the greatest difficulties to overcome was a first-class floor, and I devoted a great deal of thought to it.
971. Have you ever seen a floor of that kind before? Never in my life.
972. Everyone who has seen it has approved of it? Yes.
973. Even Mr. Wilkinson? Yes.
974. *Mr. Brunker.*] The most essential point in connection with the floor is to provide for carrying the stock safely? Yes. I devoted a great deal of time to the point, and I tried a great many plans before I hit on the one which has proved so successful.
975. *Mr. Smith.*] Do the cattle ever bleed in the hoofs now? No.
976. Have you ever known a case in your trucks in which they were bleeding? No.
977. *Mr. Brunker.*] I suppose you know from experience that if one beast had its foot injured and got down it would affect the conveyance of the whole truck-load? Yes.
978. There is likely to be a smash all through? Yes.
979. *Mr. Smith.*] Will you explain the method of the ventilation at the end of your trucks? It is by hollow ends with an opening for each deck, and there is a current of air going right through the truck at all times.
980. Is it possible for sparks to get in? Quite impossible.
981. Is it possible for rain to get in? Quite impossible.
982. And yet your method produces a splendid draught? Yes.
983. Have you ever seen that method before? Never.
984. What was the method before that in the trucks used by the Department? Some years ago we tried louvres, but we had to abandon them for sheep trucks, as there was great danger of the wool being set on fire. Wool is one of the easiest things to set on fire when the yolk is in it. When it starts to burn it burns quickly.
985. Have you ever known a case of fire in the fourteen trucks during the three years? No.
986. Have you had any reason to desire an alteration of your method? Not the slightest. It is giving the greatest satisfaction.

987. I believe that, under the old method, the ventilation was almost *nil*? Yes; the ends were completely blocked up.
988. Will you explain to the Committee what the internal sides of the truck are like when it is a cattle truck? The sides are perfectly smooth all the way round. The great point in the truck is that it is impossible for cattle to get their horns or legs fastened. The top deck comes down as it is in use at all times.
989. What is the necessity for smooth surface in a cattle truck? That is a most important thing. All the old cattle waggons were designed with bars at the bottom and right through, but we found it absolutely necessary to board them up on the inside to prevent the cattle from getting their legs and horns fastened and being thrown down. I suppose there are more cattle killed through that than through anything else. It was a common thing to have cattle killed in the trucks until we had the sides boarded down.
990. In your truck as a cattle truck, the boarding at the sides is the top deck when it is used as a sheep truck? Yes.
991. The necessity for the smooth surface is on account of the rubbing? Yes.
992. What happens if there is not a smooth surface? The cattle get fearfully bruised. It is impossible for a bullock to get fast in my truck in any way whatever. He cannot get his legs through. If he got his legs through on the diagonal braces in the old trucks it was impossible to get him out.
993. Did that often occur in the old trucks? Very frequently; so much so that we had all the trucks boarded down to prevent the possibility of it. That was done on the recommendation of the Live-stock Board.
994. Have you ever known a case during the two years and ten months your truck has been in use in which a bullock has got his feet through? No.
995. You never heard of such a case? No.
996. Will you explain to the Committee the advantage of the board above the bars at the top of the truck? That is the rubbing rump board. It is put there to have a perfectly smooth surface where the rumps of the cattle are.
997. Without such a board they would get bruised? Yes.
998. What other advantage is there about that board? It prevents the cattle looking out of the trucks.
999. What was the result of the cattle looking out of the old trucks? When cattle look out of the trucks they get frightened and knock each other about, and get fearfully bruised.
1000. Can they look out of your truck with that board there? Unless they are very big cattle they cannot.
1001. *Mr. Bruncker.*] But that board will not prevent people looking in? They can look in, but I forgot to say that I propose raising the board a little higher, not more than 6 inches. I think that would be an advantage. I should also like to point out whilst speaking about cattle waggons that there is a great advantage in having a door at the end of the side instead of having it at the centre. That was one thing which struck me when I first started.
1002. *Mr. Lyne.*] Is not that the case with the present cattle waggons? No; mine is the first truck run in New South Wales with the door at the end of the side.
1003. Have not the ordinary trucks which are being built now the doors at the ends of the sides? No, in the centre. The great difficulty with a door in the centre is that if you get a big bullock in he reaches almost across the truck, and you have to twist his tail and knock him about tremendously to get him to move to make room for others; but with a door at the end of the side the cattle rush in to the other end. They follow in in single file. There is no knocking about or jamming of the cattle.
1004. *Mr. Smith.*] I believe that with the trucks with the doors in the centre it is a common thing to twist the tails of the cattle? Yes, to break the tail of every bullock loaded, to treat them in a most brutal manner.
1005. *Mr. Bruncker.*] What is the effect of the door at the end of the side in unloading? It is a great improvement on the old system. Supposing you have one of the old trucks loaded with cattle there is always a bullock in front of the door, and directly you drop the door the cattle make a go for it, and often they get fearfully jammed against the posts. I have often seen them drop down after being jammed in unloading; they get more bruised in 2 or 3 minutes in unloading than they do during the whole journey in the trucks; sometimes half a dozen will jump over a bullock that has got down; it is remarkable to see the difference when you are unloading with the door at the end of the side; you drop the door, and the bullock opposite it comes out; the rest of the bullocks do not see the door until they begin to draw out; they remain perfectly still, and come out in single file as quietly as possible; I have never seen a beast jammed.
1006. *Mr. Smith.*] Have you seen a beast jammed in your trucks in unloading during the last three years? No; I do not believe that you could make them jam.
1007. *Mr. Bruncker.*] I suppose the reason of that is that the door is blocked by the end of the truck? Yes.
1008. *Mr. Smith.*] You say that this is the first truck constructed in that way in this Colony? Yes.
1009. Will you explain to the Committee about the strength of your truck? That is a very important thing. The centre piece and the bottom piece of my truck are made of angle iron; the sides of the present cattle and sheep trucks are all morticed and tenoned; therefore, the strength of the sides and the uprights is that of the weakest part, which is the tenon; the wood is all cut about, and there are mortices into the bottom framing, where water and urine get in and rot the wood; in my truck the angle-iron pieces run the full length of the truck; the bars are gas pipes, which are light, but still very strong; they are screwed into the angle-iron pieces, so that the side of the truck is like a solid girder; it is on the same principle as a girder bridge; you could put any weight on the top of that because it is all bound together; there is no need to have diagonal braces to prevent the truck joints from working loose, as has been proved by the three years running; there has never been a joint which has moved in all the trucks during that time. Another advantage of the side of my truck is that it gives such splendid ventilation to the sheep; you cannot beat it in that respect; it is impossible for the sheep to get their legs or horns fastened; the bars go right through, and down from top to floor; and each bar not only prevents the sheep from getting out, but it acts as a splendid brace for the truck.
1010. *Mr. Lyne.*] Is there not any difficulty about sheep's feet slipping between the bars? There is nothing to prevent them putting them back again. The advantage of my plan is that it enables me to

G. T. Evans, Esq., carry the posts the full thickness—3 by 4 inches—right through the trucks; there are no mortices or tenons, and there is no place for water to get in to rot the timber. The life of my truck must be ten times that of the present trucks.

8 Mar., 1888.

1011. *Mr. Brunker.*] Are the bars which are made of gas pipes supposed to carry as much weight as they would if they were solid? Yes, and even more; they give you lightness, which is a most important thing; splendid ventilation, and immense strength.

1012. *Mr. Smith.*] You have known cases of sides bursting out of a truck? Yes; I have known the sides to burst right out, where there is only an inch tenon; that is the strength of the truck, and when pressure comes there it must give way.

WEDNESDAY, 14 MARCH, 1888.

Present:—

MR. BRUNKER, | MR. HAYES.
T. H. HASSALL, ESQ., IN THE CHAIR.

Bruce Smith, Esq., Counsel, instructed by J. McLaughlin, Esq., appeared on behalf of the Proprietors of the Evans Australian Combination Truck. W. B. Wilkinson, Esq., appeared in person.

George Trotter Evans, Esq., recalled and further examined:—

G. T. Evans, Esq.

14 Mar., 1888.

1013. *Mr. Smith.*] Suppose, in addition to the doors at the sides, you were to put doors at the ends of your truck,—what effect would that have on the strength of the truck? A very great deal. A solid end to the truck is of the greatest importance, so much so, that we have found in our present brake-vans that the weight of the vans and the oscillation shakes all the joints, and recently we have put in iron diagonal braces across the ends of the vans from each corner. These brake-vans have solid ends, morticed and tenoned, and braced together, but owing to the large surface and the oscillation, with trains going round curves, the joints have given way.

1014. By placing doors at the end of the truck, is it not a fact that you divide the truck the whole way up from top to bottom? Yes; and you must weaken it very much indeed.

1015. From your experience are you able to say whether the carrying of the stock is a strain to these trucks? A tremendous strain.

1016. In what way, apart from the crush? The weight of ten head of cattle is enormous, and when the train is going round a curve the oscillation of the trucks throws the whole weight of the cattle against the sides, first one side and then the other. This is something enormous, apart from the straining from the cattle moving about and crushing past each other. It requires a strong truck to stand this strain for any length of time.

1017. Do you consider it possible to construct a truck to carry ten heavy cattle, the truck having two doors at each side and end doors, and yet be strong enough to do the work? I do not think it possible to build such a truck which would last twelve months.

1018. You know of no such truck which has been subjected to a twelve months' trial? No.

1019. How high is your truck as compared with the ordinary cattle truck? It is a foot higher on the sides and 18 inches in the centre.

1020. If your upper deck, instead of being lowered down to form the rump boards or sides, were lifted up into the roof, what effect would that have on the height? It must take away 6 or 8 inches; that is if you have a floor strong enough to carry sheep.

1021. You know that in Mr. Wilkinson's truck the upper deck goes up into the roof,—what effect has that upon the height of the truck? It must reduce the height for cattle.

1022. Have you measured the height of his truck? No.

1023. In your truck the whole of the upper deck, instead of being in the roof, comes down to the side? Yes.

1024. What is the advantage of the great height? It prevents the cattle knocking their heads and breaking their horns; they can keep clear of one another.

1025. Is it not a fact that in a low truck, when cattle have struck their heads once or twice, and experienced a difficulty in getting their heads up, they get into the habit of keeping them down? Yes, and they get their horns mixed up and gore each other, and a lot of injury is done.

1026. Is there sufficient height in your trucks to enable the bullocks to hold their heads up to their full height? Yes; it is impossible for a bullock to strike its head against the roof in my truck.

1027. *Mr. Brunker.*] I suppose that the greater height increases the ventilation? Yes; the more space you have the greater ventilation you get. My truck is so constructed that the foul air rises and gets out at once. I purposely designed my truck with a high roof, because in the whole of our cattle waggons there is not an inch of space on the inside of the roof which is not indented with the horns. You can see that in every truck.

1028. *Mr. Smith.*] Your trucks have been running two years and ten months; are there any such marks on the roofs of them? Not a mark at all.

1029. I want you now to treat it as a sheep truck; will you point out to the Committee how the bottom floor is adapted for sheep? It is suitable for sheep in the same way as for cattle. It is impossible for the sheep to slip in any direction, and there is plenty of space between each board for the urine and a great deal of the manure to escape.

1030. If you had adopted the plan which was adopted in the old cattle trucks, where there was a drop of nearly three-quarters of an inch between one board and the other, would that have been suitable for sheep? Not nearly as suitable as my floor is.

1031. You claim to have secured a floor which, while being better for cattle than the floor of the old truck, is at the same time equally better for sheep? Yes.

1032. Now, I want you to explain how the top floor is constructed for sheep? The first thing to consider is that you cannot have too much ventilation for sheep, especially at particular times of the year. It does

not

not matter so much immediately after shearing them, when all the wool is off the sheep, but when they are in full fleece it is of the greatest importance that in wet weather they should have the best ventilation that it is possible to give them. The movable deck in every kind of combination truck which has ever been invented in the world has always been taken to the roof, and that has been the cause of failure to invent combination trucks which would stand the wear and tear and answer the purpose for which they were intended. If you put the dead weight in the roof, that is the worst place in the truck in which you can carry it. You make the truck top heavy. No matter how closely you make the top floor to fit—and the closer you make it to fit the harder it is to work, because the manure gets round it and prevents it working—the tremendous bumping and oscillation of the truck tends to knock it all to pieces. It is on the same principle as the battering ram. These loose floors swinging in the roof must knock against the top of the frame of the truck with every surge that the truck gives, and necessarily the strain must cause the joints to give way. Apart from that the top deck is never in use except when sheep are being carried in the top part of the truck. It is of no earthly use except for that purpose, and in every combination truck ever invented it has been so much dead weight when not used for carrying sheep.

G. T. Evans,
Esq.
14 Mar., 1888.

1033. You claim to have utilised the top deck? Yes; mine is quite an original idea. There is no other combination truck in the world in which the top deck is utilised for the purposes for which I utilise it. When it is not required for sheep it is used as a side board to the truck to prevent cattle getting their horns and their hoofs through the bars. When the truck is not required for cattle the top deck goes up out of the way, and thus you have the most perfect ventilation in the bottom as well as in the top of the truck. Another advantage is that the weight is always in the centre of the truck; it never goes beyond the centre.

1034. Will you explain to the Committee the construction of the top floor, and show how it is adapted for carrying sheep? The floor is made of inch pine underneath, with half-inch on top, with grooves cut into it, forming corrugations to prevent the sheep slipping in any direction, and at the same time when it is down it forms the sides which prevent the cattle hurting themselves.

1035. Is it not a fact that these corrugations run up and down, so that when the deck is lowered all the urine runs off? Yes.

1036. There is a little difference between the way in which you arrange things for lifting the upper deck in the model and in the truck itself; you have a little chain in the model which you have not in the truck? Of course that could be applied to the ordinary trucks, if necessary. It would save perhaps half a minute in the time of altering the truck, which is very little; but in the truck I have avoided in every particular the introduction of any unnecessary machinery, because machinery always requires attention. You cannot find any simpler way of closing the door than I provide in my truck of working it with your hands, or any simpler way of raising the deck than by raising it with your hands. In the model by a simple handle you can lift the whole of the deck without the slightest trouble, it is done in a few seconds. But to avoid increasing anything in the shape of machinery, to make the truck as simple as possible, I left that part out because it is better left out.

1037. The flaps which form the upper deck are very light? Yes; one man can lift them with one hand without the slightest trouble.

1038. *Chairman.*] But in the model the flaps run the whole length of the truck? If the flap is divided into two as in the truck one part overlaps the other, so that you could apply the chain in the same way. Two men can lift the flap for the whole length, but I have divided it into two so that one man can lift it with perfect ease.

1039. *Mr. Smith.*] In the truck you have hooks which go into the roof, and which come down and hold the decks in position until the centre bar is lowered? Yes. If the members of the Committee will look at the model with the upper deck fixed they will see that there is splendid ventilation for sheep. You cannot possibly conceive anything better than that. The sheep cannot get their horns or legs fast in any way.

1040. The top deck being suitable for sheep is at the same time smooth enough to be used as a side board for cattle? Yes. As to the division of the truck as a sheep-van I may say that there are some squatters who think that it is an advantage, and others who think that it is not an advantage. Our trucks used to be divided, but on the suggestion of people who used them the divisions were taken out. The ordinary sheep-vans have no divisions, but in case anyone wished to divide his sheep I have provided a simple means of doing it in my truck. It does not interfere with the good work of the truck in any way, and it does all that is necessary. I have a couple of division bars for each floor, which are so put in that it is impossible for them to work out unless they are taken out. The advantage of having these movable division bars is that you will always have plenty of space for ventilation. If you have a fixed boarded division the whole of the sheep against that division get no ventilation, and in summer time full fleeced sheep would be bound to smother against a fixed division.

1041. What are these division bars made of? Wood.

1042. How are they fastened into the upright? That is done very simply, as you will observe, and it is impossible to take them out until they are released. When not in use they are carried in the end of the truck without any fastenings at all. They only weigh a few pounds, and they are always ready for use.

1043. We have heard a great deal about end-loading; you have had some experience of it I suppose? I have.

1044. Will you state what it has been? Thirteen or fourteen years ago, at the instigation of York Brothers, we had about sixteen trucks built for end-loading. They were tried at Wallerawang Station and at Sutton Forest, and after a few trials they were abandoned as perfectly useless. It was found that there was no advantage to be gained by them owing to the time occupied in opening the doors, fastening them open, and then closing them. Then a great difficulty was experienced in getting the sheep into the different trucks in running them through all the trucks.

1045. How was that difficulty experienced? In distributing the sheep into each truck; you could not possibly count them, you had to go right through the trucks and drag one sheep along to get the rest to follow. You were bound to drag one sheep right through unless you had a trained sheep to lead. The least thing in life at the side of the truck—a dog running past, for example—would stop the sheep running, and you would have to go through the same process of dragging another sheep through to get the others to follow.

1046. Did those fourteen trucks have a fair trial? Yes.

1047. You say that of your own knowledge? Yes.

1048.

- G. T. Evans, Esq.
14 Mar., 1888.
1048. And you say that they were ultimately abandoned? Yes.
1049. What was done with the trucks? The people would not use them. They refused to load them, and all the end doors were closed up and made secure, and the waggons converted into side-loading waggons again.
1050. Do you know of any similar experiments being made later than that? Yes.
1051. How long ago was that? I suppose it must be eighteen months ago.
1052. What was done then? We had six trucks altered first, at a cost of about £50 each.
1053. Who instigated that experiment? Mr. Lyne, who was then Minister. They were tried at Homebush, and the trial was anything but satisfactory. It was stated that it required a train load of trucks to be altered to give the system a fair and proper trial.
1054. Was that ever done? Yes; Mr. Lyne asked me to superintend the alteration of eight other trucks which would make fourteen trucks in all. He thought the cost of altering the first trucks was exorbitant, and he instructed me to buy the material for the other trucks as cheaply as possible, and to save all unnecessary expense. I superintended the alteration of the trucks, and I think that they cost about £30 each. Of course it was more temporary work than was put into the other trucks.
1055. What was done with the fourteen trucks? They were tried at Homebush.
1056. Were you present? Yes; I cannot remember exactly what was done, but the trial was a miserable failure, as far as success is concerned.
1057. Do you remember in what respect the trial failed? In the first trial of the six trucks, I remember that they put 400 sheep into the bottom decks. The sheep could not be stopped when they started to run, and there were only 200 left for the top decks. The men occupied about 40 minutes in loading the six trucks, and then they never counted the sheep or closed the door after the trucks were loaded, and some of the sheep actually stood in the spaces between each truck. They were not divided or counted.
1058. Was Mr. Lyne present? Yes; I may mention that when the trial of the fourteen trucks took place, I got two of the smartest men that we had at Homebush, and I instructed them to open the doors and have the trucks ready for end-loading, and I told them that I wanted them to do it as quickly as they could. It took these two men 50 minutes to open the doors and to get the trucks ready for loading. You must understand that in each of the fourteen trucks there were eight doors and four flaps to open, thus you would have 112 doors to unfasten, to open, and then to fasten open.
1059. You say that it took two of the smartest men you could choose 50 minutes to open the doors preparatory to putting the sheep in? Yes; but perhaps it took them a little longer on account of the doors being new. I am sure that no men could do it, even if the doors opened easily, under half an hour at the very least.
1060. You have seen Mr. Wilkinson's plan of end-loading. I want to know whether the doors in the fourteen trucks to which you have referred were any more complicated than his doors are? They are exactly the same. If they were made from the same drawing they could not be more alike, the fastenings, and everything in connection with them.
1061. End loading is not a new idea? Not at all.
1062. Were the sheep run into the trucks after the doors were opened? They started to run the sheep in, but there were several blocks.
1063. Did they ultimately fill the trucks? Yes; upper and lower decks.
1064. Did they shut the doors? I do not think they did. I really forget.
1065. Do you know how long it took them to load? I did not take a note of it.
1066. Do you know if the sheep were counted in each particular truck? They were not counted.
1067. Would it have been possible to count them and divide them equally into the separate trucks in a reasonable time? Quite impossible.
1068. *Mr. Brunker.*] Could not it be done if you had a sufficient number of men? It might be done if you had a man to each truck.
1069. *Mr. Smith.*] What was done with the trucks? They were put into traffic, with instructions that they were to be sent to stations, and kept together as much as possible for end loading.
1070. Were these instructions followed? As far as they could be, but within a week the whole of the instructions were capsize because the trucks got mixed up. After the first trip, I think it was at Nyngan Station, the parties refused to use them again. They would not take the trouble to open the doors and load the trucks from the end.
1071. What has been done with them? They are used just as the ordinary trucks for side loading.
1072. The ends have been fastened up? No; they have been just closed up and not used.
1073. *Mr. Brunker.*] Was Wilkinson's truck invented then? No; I think it was being thought of about that time. I think that Mr. Wilkinson wrote to me, stating that he had an idea about end loading, and asking if I could offer him any suggestions.
1074. *Mr. Smith.*] I want you to sum up your opinion concerning end loading. Do you consider from all the experience which you have had that any scheme which has been proposed so far, including even Mr. Wilkinson's for end loading is practicable? I do not think so. I have had a good deal of experience, and I say that if all the trucks were made for end loading now they would seldom be used.
1075. Did Mr. Lyne ever make any other experiment that you know of? I fancy that he did with Mr. Wilkinson's truck, but I was not present. I fancy that Mr. Wilkinson's truck was placed between the fourteen trucks which were used on another occasion. I am not sure that this was done by Mr. Lyne, but it was while he was head of the Department that it was done.
1076. I want you to say something about the principle of dividing the truck so as to carry half sheep and half cattle? That is impossible in my truck.
1077. Will you tell the Committee about how often it happens that a truck can carry half sheep and half cattle? It would be impossible to tell how often, but very rarely.
1078. In your experience was it required once in three months? I am quite sure it was not.
1079. *Mr. Brunker.*] With regard to the traffic, if that principle were adopted it would make no difference in the charge; a person has the option of engaging half a truck for sheep or cattle, and he pays for half a truck? That is all.
1080. If you want to send half a truck of cattle or sheep from Bourke to Sydney you can send them? Yes.
1081. *Mr. Smith.*] Supposing you wanted to send half a truck of sheep and half a truck of cattle you would take a separate truck for each lot? Yes.
- 1082.

1082. *Mr. Hayes.*] Would it not be an advantage to the Department to have a truck in which you could carry half sheep and half cattle? It would be occasionally.
1083. *Mr. Smith.*] How often would it occur—once a month? No. The only advantage of it would be in short distances. Say a farmer at Picton wants to send half a dozen calves and a few lambs to Sydney, then it would be a little advantage to the Department; but that very seldom occurs.
1084. Suppose it were practicable, and you were directed by the Department to have the necessary number of trucks built, how many trucks would it be necessary to provide for the convenience of the public in that respect? I think that half a dozen would be plenty, if there is any advantage; but it so seldom occurs.
1085. Regarding the division, is it not absolutely necessary if you are going to carry cattle in one half and sheep in the other half, that the division between them should be extremely strong? Very strong. It must be as strong as any other part of the truck for cattle. For sheep, of course, anything will do.
1086. You say that six such trucks would be sufficient to serve all the purposes of the Colony? I think so.
1087. You would not think of constructing 300? No.
1088. What do you suppose the division would add to the weight when not being used? That would depend upon what it was like. In my truck it would amount to about a quarter of a ton.
1089. Unless the truck is being used for the combined purpose that weight is being carried for no purpose? It is perfectly useless.
1090. Would you, quite apart from your patent, advocate the Department building any trucks of that kind with this division? No; certainly not.
1091. Do you think that it would be possible to construct a movable partition, something with doors against the sides, which would be strong enough to stand the force of five cattle against it every time the train stopped? They would have to be quiet cattle.
1092. I am talking of the worst cattle you could have? It would be impossible to construct a door that would stand the weight.
1093. I want you to point out the advantages of your upper deck as far as cleaning is concerned, compared with a deck going up to the roof? My truck simplifies matters very much, for the reason that when a truck arrives at Homebush the sheep are unloaded, and then the top deck is lowered. The sides fall down, and thus a man can walk into the truck and hose the whole thing down the sides at one service, without having to crawl about on his hands and knees. If the deck were horizontal it would be impossible for it to get dry within a reasonable time. All the water runs through the openings in the floor, and the truck is washed in a few minutes, and then it is perfectly clean. As soon as it is washed out at Homebush, the truck is attached to a train, and is then run into Sydney, and the action of the air, while the train is being run to Sydney, dries the truck completely, and when it arrives in Sydney it is as clean as can be. In fact these trucks are picked out at the Sydney goods shed for the most delicate class of goods, because they are so much cleaner than trucks which carry wood, coal, or sand, or anything else, as most merchandise trucks do.
1094. In the case of a horizontal roof being hosed out and the deck being raised, would it dry whilst at Homebush? It would take a long time. The water would be always dripping through the joints until the deck was perfectly dry.
1095. If goods were put in after the upper decks had been cleaned and lifted to the roof, it is quite possible that goods might be put in before it was dry, and that the water would drip on to the goods? Yes.
1096. There is no such thing as the dripping of water in your trucks? No; the water runs down almost immediately, and the whole surface is exposed to the air as the truck proceeds afterwards.
1097. Will you tell the Committee how your truck is adapted for merchandise? First of all, owing to the doors being at the end of the side, you can put in anything that is the length of the truck, for instance, if you have a piece of timber 18 feet long you can get it in, but if you had the door in the centre you could only get in a piece of timber equal in length to the distance from the door to the opposite corner. In my truck you can load timber and bars of iron the whole length of the truck without the slightest trouble.
1098. How are the floors of your trucks adapted for running trollies over them for carrying merchandise? Very well indeed. The floor is not so rough as to prevent the easy movement of the wheels over it. That is one difficulty that I had to consider in designing my truck. Owing to the big cleats of the cattle waggons it is impossible to take trollies into them.
1099. Will you show the Committee how you manage the tarpaulins? When the truck is not in use as a cattle or a sheep van, the tarpaulin is taken up underneath the roof and preserved from the weather and rough usage. It works on a roller, and comes down and makes the truck perfectly weatherproof for merchandise. As a matter of fact, ever since the trucks have been running, and they have been carrying merchandise every trip, we have never had a single complaint, or paid a single claim for damages to goods carried in them. We never lost a package out of them, or ever had any damage done by fire or by water.
1100. *Mr. Hayes.*] What special advantage is there in your truck over ordinary trucks for carrying goods? The door being in the end it is so much easier to load the truck than it is to load an ordinary cattle waggon. Then, with an ordinary cattle waggon we have to have three tarpaulins to cover it, because you have to put them over the top of the truck. The tarpaulins cost £4 10s. each, and one journey to Bourke is quite sufficient to wear the tarpaulins through the corners. Another advantage is this. With an ordinary cattle waggon, we will say it is in Sydney to-day, and you may load it for Bourke; you may not have any orders for cattle waggons at Bourke; you may have to wait two or three days for an order, or after having loaded it for Bourke you may not have any orders at all, and the result would be that you would have to bring the truck back empty. With my truck, if we sent a load to any up-country stations, we always have cattle or sheep coming from there, and you always have a truck available to bring cattle, sheep, horses, merchandise, or anything which presents itself. The result is with the ordinary cattle trucks, that you keep a lot of loading for Bourke at Sydney, in anticipation of getting orders from Bourke to Sydney. If you send the trucks to Bourke, and do not get an order there, the trucks have to be brought back empty, or else they have to be loaded with sheep, which would be ruinous to the Department at the price which is paid, because cattle trucks only carry one deck of sheep.

The

G. T. Evans,
Esq.
14 Mar., 1888.

- G. T. Evans, Esq.
14 Mar., 1888.
- The advantage of my truck is that it cannot be in a wrong place, no matter where it is. It is in the proper place wherever there is loading of any kind. If you want to send away ten head of horses or 100 sheep, or ten head of cattle, or a lot of grain, there is a truck ready for you. It saves haulage of empty vehicles, which is a great item on our railways.
1101. But what I want to know is, is there any special advantage in loading your trucks over loading the ordinary cattle trucks? In that respect an advantage in my truck is that if you have to load a lot of grain you can put it on a sack cart and wheel that into the truck, and take it right up to the end. It is impossible to do that in the ordinary cattle waggon. You have to pitch the grain down at the door, and the men then pitch it into the truck.
1102. Is your floor a patented one? Yes; another advantage is with regard to the tarpaulin, because you carry it with you, and it is put into position without any difficulty.
1103. Mr. Smith.] With the means of ventilation that you have at the ends of your trucks it is impossible for fire to come in? Yes.
1104. With the tarpaulins down it is impossible for fire to get into your merchandise trucks? Yes; we have never heard of a single complaint, or had any loss in any way.
1105. These fourteen trucks of yours have been running for two years and ten months? Yes.
1106. Have you ever known during that time of a single claim being paid or being made for damage to merchandise carried in those trucks? No.
1107. They have been constantly at work for merchandise purposes? Yes.
1108. Is there not another advantage about locking the doors? Yes; if you have the truck loaded with merchandise or sheep, by one fastening you can make it perfectly secure.
1109. As many doors as you have so many locks are required? Yes; I should like to point out that another advantage in the top deck coming down to form the sides of the truck is that it enables me to reduce the weight of the truck and make it very nearly a ton lighter than any other combination truck invented—the lightest of them being nearly 1 ton heavier than mine.
1110. Mr. Brunker.] How do you account for that? Because the whole side of my truck is composed of gas pipes, which are very light. It is like having no side, as far as weight is concerned. When it is necessary to form a closed side the top deck comes down and forms it. These sides are always in use in one way or another. That is one of the principal advantages.
1111. You remember that about two meetings ago something was said about your truck being fitted with old drawing gear, and that it was stated that if the trucks were fitted with the new gear they would be much heavier. Is it not a fact that you have now fitted your trucks with the new drawing gear? The cattle truck, which weighed 6 tons 13 cwt. 2 qrs., which was altered to a combination truck was an old truck taken from the Department, and altered by me. I took it as it was with the wheels and axles running under it as a cattle waggon, and I thought it quite suitable for any other purpose, but something having been said about the wheels and axles being light as compared with those in the new trucks, I said that I would not take the slightest advantage, and I asked the Government to put in the new wheels and the new draw gear under the truck, to have the truck in this respect as strong as any truck running on the line.
1112. What does the truck weigh now? Six tons 18 cwt.
1113. Can you tell me what is the weight of the lightest of the other combination trucks? Seven tons 15 cwt.
1114. Whose is that? Mulholland's.
1115. Is Mulholland's the lightest of the three—Wilkinson's, Perry's, and Mulholland's? Perry has never built a truck, and I think if he did it would be heavier than any of the others.
1116. What does Wilkinson's weigh? Seven tons 15 cwt. 2 qrs.
1117. Is it not a fact that in 1887 20,000 trucks of live stock were carried, principally from distances of from 400 to 500 miles? Yes.
1118. What would be the effect, supposing that you had an additional ton upon every one of the trucks? Suppose you had to take a truck of stock 500 miles that truck would have to be hauled 1,000 miles; that means the haulage of an extra ton of dead weight 1,000 miles to enable you to carry a truck of stock 500 miles.
1119. Did you make this calculation: that in two years and a half at this rate 70,000 tons would be carried some hundreds of miles for nothing? Yes.
1120. Did you not lately make an application to the Accountant's branch of the Railway Department for some figures as to the difference which a ton weight would make? I sent a letter to the Commissioner, from whom I received a reply. (Mr. Wilkinson objected to this letter being produced.)
1121. Mr. Brunker.] What is the weight of an ordinary cattle truck? Six tons 9 cwt. Some weigh 6 tons 12 cwt.; some sheep vans weigh as high as 6 tons 18 cwt.; and one or two 7 tons.

THURSDAY, 12 APRIL, 1888.

Present:—

MR. KETHEL, | MR. LYNE.
T. H. HASSALL, Esq., IN THE CHAIR.

Bruce Smith, Esq., Counsel, instructed by J. McLaughlin, Esq., appeared on behalf of the proprietors of Evans Australian Combination Truck. W. B. Wilkinson, Esq., appeared in person.

George Trotter Evans, Esq., recalled and further examined:—

- G. T. Evans, Esq.
12 April, 1888.
1122. Mr. Smith.] What was the weight of your truck as it was seen by the Committee when they visited Redfern Station? Six tons 13 cwt. 2 qrs.
1123. You remember that some objection was taken to your truck then, on the ground that the draw-gear was of the old-fashioned pattern,—that the old-fashioned designs were lighter than those which are now used? Yes.
- 1124.

1124. What did you do in consequence of that? I did not wish to take any advantage from that as to weight, and I applied to have the newest and heaviest of everything put under my truck—new wheels, new draw-gear, and everything else, just as they are now being used on live-stock vehicles.
1125. Is it not a fact that the draw-gear which is now used by the Railway Department other than that which is not allowed to be used in new trucks is much heavier than the old-fashioned draw-gear? Yes.
1126. To how many of your trucks has the heavier gear been applied? Only to one since then. It was on all the rest before.
1127. What does the truck weigh now that the heavy draw-gear has been fixed to it? I have not seen it weighed, but I believe its weight is 6 tons 18 cwt. 2 qrs.
1128. You have no reason to doubt that? None.
1129. What is the weight of an ordinary cattle truck? No. 151, which is one of the latest new ones, weighs 6 tons 15 cwt. I have the weight of fifteen, and they go from 6 tons 10 cwt. to 6 tons 15 cwt.
1130. That is the ordinary cattle truck without any modern appliances? Without anything.
1131. What is the least weight that the Wilkinson truck has reached? Seven tons 15 cwt. 2 qrs.
1132. And it is upon the difference between the weight of your truck and that that the calculation which has been made as to the saving is based? Yes.
1133. What is the weight of the present sheep vans? There are some as high as 7 tons 13 cwt. They go down to 6 tons 15 cwt.
1134. Those are trucks for carrying sheep on two floors? Double decked sheep vans.
1135. When it was first contemplated to make fourteen of your trucks, what arrangements were made as to the cost? The Government gave an order for the trucks to Hudson Brothers, or to me, and I gave it to them.
1136. Had any arrangements been made as to the cost prior to that order being given? Yes. They saw the model and the plans of the truck, and I asked the principal of the firm to give me an estimate of what the cost would be to build the truck.
1137. Was that estimate given in writing or verbally? In writing.
1138. Have you the letter? Yes.
1139. Did you not lose that letter? I mislaid it and could not find it for some time.
1140. After you had lost it what steps were taken about making out the account for the cost of the fourteen trucks? Hudson Brothers sent in their account for the trucks.
1141. Do you know what they charged for each truck? I did not know for some days after they sent in their account. They charged £295 each.
1142. Was that amount paid? No. I believe it was reduced to £265 for each truck.
1143. Then £265 was the actual amount paid to Hudson Brothers for each truck? Yes.
1144. Did you see the accounts at all? No.
1145. Were they ever submitted to you? No.
1146. At the time you had not the letter referred to? I could not find it then, but I found it a few months afterwards.
1147. After the estimate was given to you in writing was there any alteration made in the form or construction of your truck which would have justified the increased charge? No.
1148. None whatever? No.
1149. Is this the letter which you received?—

Mr. George Evans,—

Dear Sir,

Redfern Works, Sydney, 3 December, 1883.

I have gone into the matter of cost of the combination waggon, and estimate it to be worth, complete, £174. This, of course, includes wheels and axles and bearing springs, which at present are supplied by the Government, deducting the value of these, say £40, the waggon will be worth £134; this is exclusive of royalty, which you must add.

Yours truly,

H. HUDSON.

Yes. The letter was written by Mr. Hudson, in my presence.

1150. And the Government paid £265 for each truck? Yes.

1151. Would it involve an extra expense to build a truck according to your present model—any expense beyond what would have been required when they gave you that price? No; it could be built for much less now.

1152. If £174 was a good price then, what would be a fair price now? £150.

1153. Have you not had a price from another firm for making these trucks? Yes.

1154. What is the name of the firm? Glasson & Co.

1155. Are they well-known people? Yes; they are large waggon builders.

1156. When did you obtain that price from them? Some twelve months ago, I suppose.

1157. What price did they offer to make them for? £145 or £150 each. I think it was £145.

1158. Was that offer made in writing? Yes.

1159. Have you the letter? No; I think the offer was made to the Government.

1160. When Glasson & Company gave you that price, what particulars had they to work upon? They had the trucks to look at.

1161. When the Board sat to inquire into the relative merits of your truck, Wilkinson's truck, and other trucks, how long had your fourteen trucks been running? Over two years.

1162. *Mr. Wilkinson.*] The improved truck without the partition? No; the partition was put in at the request of the Board.

1163. *Mr. Smith.*] You say that, with the exception of this division, your trucks had then been run for two years? Yes.

1164. Was that division put in at the request of the Board? A previous Board.

1165. I believe that the Board considered your own, Wilkinson's, Parry's, and Mulholland's trucks? I think that they took evidence on each.

1166. *Mr. Lyne.*] But Mr. Mulholland had not a truck built until the other day? He gave evidence before the Board, but I do not think the Board gave marks to it, because they had not sufficient evidence respecting it.

1167. *Mr. Smith.*] At all events they had evidence on the truck respecting which Mr. Mulholland is about to submit evidence to this Committee? Yes.

1168. Who were the members of the Board? Mr. Badgery, Mr. Thallon, and Mr. Gill.

1169.

- G. T. Evans, Esq.
12 April, 1888
1169. To your knowledge, Mr. Badgery has had great experience of stock? Yes, ever since I have been in the country.
1170. Who is Mr. Thallon? Traffic Manager of the Queensland railways. He was formerly Assistant Traffic Manager of one of the English railways.
1171. Was he not brought to Sydney for the express purpose of sitting on the Board? Yes; the Queensland Government allowed him to come.
1172. Who is Mr. Gill? He is the inspector of the waggon shop in the Victorian Railway Department.
1173. He was brought here for the same purpose? Yes, as an expert.
1174. Can you tell us how long that Board sat? Three or four weeks.
1175. They held something like nine meetings? I should think more; I am not sure.
1176. How many witnesses did they examine? I do not know, but there were a great many.
1177. What kind of witnesses were they? Everybody they could think of who would be likely to throw some light on the question as to which was the best truck for the conveyance of stock. I know that they had several people from Homebush to give evidence, loaders of stock.
1178. I believe that after all these sittings, and after examining all these witnesses, the few words in which they report their decision are that your truck is the most economical and suitable in every way for the conveyance of sheep, cattle, and merchandise? Yes.
1179. As to the steps which you have taken with the Government, I believe that the Government were approached regarding your truck through Mr. Halloran, as agent for the proprietors and patentees? Yes.
1180. I believe that after considerable correspondence between Mr. Halloran and the Commissioner a letter was drawn up, in which the Department agreed to purchase your rights for £16,000? Yes.
1181. In the printed papers there is the following letter:—

Sir, Department of Railways, Sydney, 8 September, 1887.

With reference to your letter of the 5th instant, stating that the proprietors of the Evans' Australian Combination Truck design will accept the sum of £16,000 for their legal right therein, I have the honor to inform you that the Secretary for Public Works has approved of the acceptance of the terms named in your communication; but, before final settlement is made, it is necessary that an agreement should be drawn up and executed, conferring upon the Government patent rights for the use of the invention.

Instructions will be at once given to the Crown Solicitor for the preparation of the necessary document.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

- Was that the last letter which you received? Yes.
1182. Since you received that letter have you received from the Government any document for signature, or have you been asked to go to the Government offices to sign any document? No.
1183. You have asked the Government to submit the necessary documents for your signature? Yes.
1184. You have received no satisfactory answer? No.
1185. *Chairman.*] Then the agreement has not been executed? No agreement subsequent to that letter.
1186. *Mr. Smith.*] I believe that some time ago you wrote a rather lengthy letter bearing on the subject? Yes. I went to the Crown Solicitor's Office, and they told me that the document would be ready on the following morning after I received that letter. I called the following morning, and then they told me that the papers had been returned to the Attorney-General.
1187. You contend that there is a complete legal contract? Yes.
1188. You have always been ready to execute the transfer of your rights? Yes.
1189. You have been unable to get any satisfaction? Yes.
1190. Did you not write to the Department asking for information as to the saving which would be effected by a difference of a ton weight in each truck? Yes, and I received a letter from the Commissioner.
- [Mr. Wilkinson objected to the letter being read, on the ground that it would be better to examine Mr. Goodchap respecting the calculation, and the objection was sustained.]
1191. I believe that, quite apart from the desire that you have that the Government should complete the contract, by paying the money you have other objects in taking a great deal of trouble about the evidence to be put before the Committee? Yes.
1192. Is it not a fact that you are now in negotiations with other colonies for the purchase of your rights? Yes.
1193. And these negotiations are in abeyance in consequence of the appointment of this Committee to inquire into the merits of the trucks? Yes.
1194. I believe that you have patented your truck in all the colonies, in England, and in America? Yes.
1195. And you have spent a great deal of money in doing so? Yes.
1196. I believe that you were in the country the other day, and that you had some conversation with Mr. Bishop Lyne about your truck? Yes.
1197. Who is he? I think that he is a brother of Mr. W. J. Lyne, M.L.A., and that he is a squatter.
1198. Did you approach him, or did you know him? No; he asked a friend of mine to introduce him.
1199. Did he enter into a conversation with you about your truck? Yes; but the conversation was private, and I would not care to repeat it.
1200. I believe that, subsequently to that, you unexpectedly received from Mr. Wilkinson a letter which Mr. Lyne had sent to him? Yes.
1201. Have you that letter here? Yes, and it is a mystery to me why that letter, being a confidential one, should be sent to me. I feel degraded that a private letter should be treated in that way. I asked Mr. Wilkinson why he sent it to me, and I got no answer.
- [Mr. Wilkinson objected to the production of the letter.]
1202. You remember that during some part of the evidence something was said as to the unsuitability of your doors to many of the present sheep-trucking yards? Yes.
1203. And you referred then to the Hay yards as being constructed upon a principle which was adapted to your trucks? Yes.
1204. I believe that you have a model of yards on the principle which has been adopted at Hay, with some improvements of your own? Yes.
- [Model exhibited, and witness explained the working of the yards in conjunction with the Evans truck.]
1205. How many sheep can you load in an hour with these yards and your trucks? You can load 1,000 sheep in half-an-hour with perfect ease under this system. The Traffic Manager of the Deniliquin and Moama railway has informed me that 17,000 sheep were loaded in eleven hours at Deniliquin from similar yards. The yards are constructed in an inexpensive way.
- 1206.

1206. Is it necessary to move the trucks backwards and forwards to load them? No.
1207. The ten trucks can be placed beside the races without any movement at all? Yes; and the present sheep vans, about 400, can also be loaded from these yards without ever moving the trucks or making any alteration at all. My trucks can be worked at these yards in conjunction with the present sheep trucks, but if we had end-loading trucks, and they got mixed up with the present vans, they could not be worked. The Hay yards are the same as the yards which the Deniliquin and Moama Company have at Deniliquin. The total cost of each set of yards is £25.
1208. Then if you had yards for loading ten trucks the cost of them would be £250? Yes.
1209. How many stations are there from which large quantities of stock are trucked? I think that at the outside we should not require more than five or six yards with sets for ten trucks. At smaller stations you could load from one, two, or three sets of yards, as the case might be.
1210. You say that there are only five stations in the whole Colony at which ten yards for ten trucks would be required? Yes; such places as Bourke, Dubbo, Nevertire, and Nyngan. For many of the others four, five, or six yards would do.
1211. How many of these? I could not say from memory. There might be twenty; but it is almost a matter of indifference how many there are, because the yards are so inexpensive, and the convenience to the public is so great. The land alongside the line costs nothing, as it is lying idle. The enclosure is a cheap five wire fence, and the gates are made of hardwood battens.
1212. You have carefully estimated the cost of the yards? I advertised for prices for my own satisfaction, to know what the yards would cost, and I found that I could get each set of yards built for £25.
1213. *Chairman.*] Would these yards be of any use for loading cattle? No; they are merely for sheep. We have separate sheep and cattle yards at every station now.
1214. *Mr. Smith.*] When were the Hay yards constructed on the present principle? I think four or five years ago.
1215. When were the Deniliquin yards constructed? Some time before that.
1216. Have any sheep yards been built since then? Yes; small ones at little stations.
1217. But no large ones? I am inclined to think that large yards have been built at Bourke.
1218. On what principle have they been constructed? On the old-fashioned principle of moving every truck when loaded.
1219. *Mr. Kethel.*] Are the yards at Hay those constructed when the railway was finished? No; the yards were altered. The system which has been adopted was found to answer very well at Deniliquin, and permission was obtained to adopt it.
1220. *Mr. Smith.*] The form of yards at Hay is the more modern system? Yes.
1221. Do you know whether the Railway Department has arrived at any conclusion as to these being the proper kind of yards to construct in the future? Our experience teaches us that they are. The combination truck question has been keeping all matters of the kind back. It has prevented any alterations being made. It was on the strength of that that I did not adapt my truck to the present trucking yards, because I knew that they must be superseded by something better, and it was no good constructing a truck to suit these yards particularly.
1222. *Mr. Wilkinson.*] I suppose that a proof copy of your evidence was sent to you? Yes.
1223. Did you expunge any of your evidence from it? I did make some alterations, but not many. I did not find it necessary to do so, because the evidence was so well reported.
1224. Could you tell me what alterations you made? I could not.
1225. Was there anything expunged from the answer to question 1103? I am not aware.
1226. Did you strike out any portions of your evidence? If it was incorrect I did.
1227. Did you not make some statement with reference to the end louvreing of my truck? I do not remember.
1228. Did you not say something about wool being of an inflammable nature? I believe that I did.
1229. Is that recorded in the evidence? I do not remember.
1230. Were you not asked by Mr. Smith why you did not louver the ends of your truck? I have a faint recollection of some question of the sort.
1231. Will you tell us what your answer was? Because I knew very well the danger of having the ends of the truck open, owing to the inflammable nature of wool when the yolk is in it.
1232. *Chairman.*] In answer to question 984 you gave an answer to a question asked with reference to the inflammability of wool? Yes.
1233. Therefore it has not been expunged from the evidence? No.
[Mr. Wilkinson apologised, and withdrew any imputation that he might have made.]
1234. *Mr. Wilkinson.*] Do you know what the cost of the alteration of the Hay yards was? I do not.
1235. Do you not know that the additional cost on the improved plan was £1,428? I believe that it cost that amount to alter the yards.
1236. Do you know that there are 100 sheep-trucking yards in the Colony? There are a good many,—about seventy or eighty; that is including everything—little pens at different stations.
1237. Do you know that the Government advertise 100 trucking stations? We receive and deliver stock in many cases; we do it anywhere where we can possibly load or unload, to suit the convenience of the public.
1238. But how many stations are there set apart by the Department for the loading and unloading of stock? There is provision for it at almost every station.
1239. But how many stations are there where there are conveniences? It all depends upon what you call conveniences. For instance, we have a little bit of a pen at Ashfield station, about 12 feet square, where we receive and discharge say, a milch cow. There is no pretence of a trucking yard at all.
1240. Is Ashfield station one of those at which sheep and cattle are loaded and unloaded? We can do it there in a small way.
1241. How long have you been goods superintendent? About eight years.
1242. You must know then pretty well what the stations are? I know that we can receive or discharge a certain amount of stock at the Ashfield station,—a milch cow, or anything of that sort; but, of course, we should not receive a thousand sheep there.
1243. Are there not 100 trucking stations? I do not think that there are nearly so many as that; there may be that number of stations at which we receive or discharge stock.
1244. Are not Albury, Bathurst, Blayney, and Bourke important stations? Yes; but do you mean to convey that they are of equal importance.

- G. T. Evans, Esq., 1245. Are they not generally recognized as large stations? The stations range first, second, and third class, as far as live-stock is concerned. I do not suppose that we have a couple of trucks of stock a week from Blayney, but at Bourke perhaps we have 200, so there is no good in mentioning stations in that way.
1246. You say that there are five stations of the first class? If you like, we will say there are ten where it is necessary to have provision to load 1,000 sheep at once. I think it would be quite sufficient if we had this accommodation at five or six stations.
1247. Would you require ten sets of yards at Albury? I do not think so. I think that five or six would do there, because we do not often truck sheep from there.
1248. At Kelso? Five or six would do there.
1249. Does not a great deal of stock come from there? Very little; 200 or 300 sheep at a time.
1250. Dubbo—I suppose you would consider that an important place? I would put ten yards there.
1251. What about Goulburn? A great many sheep come from there.
1252. I suppose you consider Hay an important station? Yes, and also Nevertire and Nyngan.
1253. Would you put Wagga Wagga in the same category? No, I would not put more than five or six yards there.
1254. How many would you have at Nyngan? Ten.
1255. At Bourke? Ten.
1256. At Wellington? I think that four or five would do there.
1257. Trangie? I think that five or six would be plenty.
1258. Are not a great number of sheep trucked there? Sometimes there are. We might have 10,000 in one month, and none at all for the remainder of the year.
1259. Suppose you wished to alter the whole of the yards, or half the yards, in accordance with the Hay standard, what would it cost? I would not be such a fool as to attempt to alter them to that pattern, because they are built strong enough to load bullocks from. They are unnecessarily strong and unnecessarily expensive.
1260. Have you had much experience of sheep? Yes.
1261. Did you ever know of sheep drafting yards or sheep trucking yards being constructed with wire fencing? I have not been about the squatters' stations very much.
1262. Do you not know that wire is considered objectionable for sheep drafting or trucking yards? I do not.
1263. I presume that you have seen a great many yards? Yes.
1264. Have you ever seen a drafting yard or a trucking yard of wire? I believe I have.
1265. Where? At Yando or Jando, the other side of Bourke.
1266. Is not timber very scarce there? I do not know the reason.
1267. Have you seen any other sheep drafting or trucking yards of wire? Yes, one at Yarraberg, in Victoria.
1268. To load five trucks at a time you would want five of these yards? Yes.
1269. And five sets of men? No. We would only want a man and a boy; one man would do.
1270. Could one man put the sheep in and close the doors? Yes, without the slightest trouble.
1271. And keep the sheep running up the races? There is no running. When they start they keep on going.
1272. They do not want any easing off at the doors? That can be easily done.
1273. Do you say that one man could load a truck of sheep? Yes, or ten trucks of sheep. He can go from one truck to the other, and I will guarantee that every sheep is counted into the truck.
1274. Did you ever see one man load a truck of sheep? I have done it myself many times.
1275. Without any assistance? Yes.
1276. How long did it take you? I do not know.
1277. Can you shut the stop door without shutting the gates and removing the platform? No.
1278. Then there is nothing to prevent the sheep getting out while you are doing that? You can stand there.
1279. What is the width of the platform from the gangway to the trucks? The width of half a door, 2 feet from the posts.
1280. Do you know the average distance from the posts to the trucks? I do not know, the yards vary very much.
1281. But what would be about the average? I should think 2 feet.
1282. Can you give any idea as to the average distance between the trucking yard fence and the trucks? I should think 20 feet.
1283. To construct a fence as you have it in the model, to have a gangway within 2 feet of the truck, would you not have to make up the roadway on the railway line? In some places, but as a rule the trucking yards are built on an embankment level with the floor of the truck.
1284. Are not the embankments cut away some distance from the truck? In some places they are. There, of course, it would be necessary to fill up the intervening space.
1285. In making your estimate as to the cost of yards, have you taken into consideration the cost of making up the ground in this way? It would be so little that it would not be worth while taking it into consideration. I am sure that yards can be built with all the making up of ground that is necessary for £25 each set of yards.
1286. In explaining the working of the yards in connection with your truck, you said that the sheep going through the top deck could see the sheep in other races, and that would lead them on? Yes.
1287. But if the trucks were 20 feet away from the fence of the races what the sheep would see would not be of much service? It would not be.
1288. Presuming that it would take one man to load a truck, it would take ten different men to load ten trucks simultaneously? Yes, but then you could load the trucks in about 3 minutes.
1289. To do this simultaneously it would take two men to load each truck, and therefore it would take twenty men to load ten trucks? Yes, but in that case you must not forget that it would only take 2 or 3 minutes to load the whole of the trucks; but it is childish to talk of doing that.
1290. Is it childish to imagine that it takes two men to load a truck? No.
1291. Is it childish to imagine that if ten trucks were to be loaded at once it would take twenty men? It is not necessary to load ten trucks at once. One man can do it by walking from one truck to another. Of course, if you had the men there, and they had nothing to do, that could be done, but it would be absurd.

- absurd to do it. Two men can load 1,000 sheep in half-an-hour, and ten men would do it in 2 or 3 minutes. G. T. Evans,
Esq.
1292. Presuming that we had an end-loading truck, we could load the first truck from the side, and with end doors leading into the other trucks, one platform would be sufficient? Yes; but I might explain that while you are opening your doors and getting ready before you start to load at all, I will finish the loading of 1,000 sheep in my trucks. 12 April, 1888.
1293. Have you not to open your doors to load the trucks? Yes, but they can be opened in a second; they are very different from your doors.
1294. If we had one of these platforms at the smallest trucking yard on the line, and a big lot of store sheep came there and had to be removed quickly, as is the case in times of drought, this one platform would serve the whole purpose of ten of your platforms? Yes, you could load them.
1295. So that really, as far as this yard is concerned, one platform, with end-loading trucks, is as good as ten different platforms? Not half as good; there is no comparison at all.
1296. With end-loading, is not one platform as good as ten with the other system? No; because it is absurd to talk about end-loading sheep.
1297. Presuming that end-loading was adopted, one platform would be sufficient to load any number of sheep into end-loading trucks? It would not be as good as ten platforms.
1298. *Chairman.*] Granting that one platform would be sufficient to load sheep by the end-loading system would it not be necessary to have a large receiving yard to hold the sheep in order to truck them? Yes.
1299. You must have room for the sheep? Yes.
1300. *Mr. Wilkinson.*] In that case you would not require in the large receiving yard all the partitions which are shown in the model which you have exhibited? Certainly not.
1301. If you had 10,000 sheep to truck it would not be necessary to have them all yarded at once? Not if you had shepherds to mind them outside. Generally there are a couple of men in charge of the sheep. As a rule the shepherds load the sheep.
1302. I suppose that there are fifty yards in the Colony which hold from 3,000 to 5,000 sheep? I suppose there are.
1303. Therefore no further outlay in receiving yards would be required for your truck or that of anyone else? I think that the yards ought to be altered; better accommodation ought to be given.
1304. You mean that the receiving yards ought to be larger? No; I mean the accommodation for loading. I think that the system which I have shown in the model is the best known system for loading sheep, and it ought to be adopted.
1305. Do you not know that there is often a lot of trouble in getting in the last few sheep, that they will stop in the doorway? There is a little trouble sometimes.
1306. With this platform of yours I presume that the loading is done at the entrance to the truck? Yes.
1307. Would not the fact of the moveable race for the top deck, being within 2 feet of the truck and on a level with the top deck immediately over the lower gangway, greatly impede a man in loading sheep into the bottom of the truck—would he not have to stoop there, and would there not be the same objection as there is in loading the existing trucks? No, he would not have to stoop. The moveable race is 4 feet above the bottom deck, and a man could work on the outside of it.
1308. If you have to enter the truck have you not to stoop under the moveable race to get in? No; we can get through a little gate at the side.
1309. Did you see the truck that Mr. Downe built twelve years ago? Yes.
1310. How often has your improved combination truck been used? I could not tell you. Not very often.
1311. It is your improved combination truck that you recommend the Department to adopt? Yes. I have sold my truck with all improvements to the Government.
1312. How long has that truck been built? Nearly twelve months. It is an old truck which has been altered.
1313. Not longer than that? I do not think so; it may have been.
1314. How often has it been used? I cannot say. I am not in the Traffic Department now.
1315. How often has it been used for cattle? I do not know.
1316. Has it been used three times for cattle? I do not know.
1317. Has it been used five times for sheep? I do not know.
1318. Did not the centre beam in your improved truck break once? Yes.
1319. Were not twelve sheep killed on that occasion? I forget the number. There was no one with the truck to prop the beam up when it gave way.
1320. It is quite possible then for any truck to have an accident on the road? That was the first trial of the truck. I do not think that it is possible for there to be an accident if the truck is properly constructed. It was through a faulty piece of wood that that accident occurred.
1321. Then if the truck is not properly constructed it will give way? Yes.
1322. *Mr. Smith.*] The bottom of a truck might drop out if it were not properly constructed? Yes.
1323. *Mr. Wilkinson.*] Although your fourteen trucks have been running for three years your improved truck has only been run about twelve months, and you do not know how often it has been run? It has been kept in the yards a great deal of the time for different Committees to examine it. It is now standing idle, in case the Committee want to see it.
1324. With the existing trucking yards can you shut the doors of the bottom and top decks of your truck without moving the truck? At some of the yards you can.
1325. Is it not a fact that your top door comes a foot or two below the level of your top deck? I think it is about 10 inches.
1326. Therefore, if the gangway is on the same level as your deck you cannot open the door until you move the truck past the gangway? At some of the stations you can, because the top race is far enough away to enable you to do so. Where the race is built close to the truck you cannot do it without moving the truck ahead.
1327. What is the width of your door? One foot 10 inches.
1328. If the gangway ran up within 1 foot 10 inches or 1 foot 9 inches of the truck you would have to move the truck before you could close the door? Yes.
1329. With you bottom door does the bottom flap cover the whole of the bottom opening? No; it is within about 10 inches. 1330:

- G. T. Evans, Esq.
12 April, 1888.
1330. In a great many trucking yards, if not all, can you use your present flap on the bottom floor? Yes; but in one or two places the posts are ridiculously close to the siding.
1331. What is the height of the bottom flap? About 3 feet.
1332. So that if the posts were less than 3 feet from the truck you could not shut the door without passing the truck on? That is the fault of the posts being too close to the trucks.
1333. The gangways in the existing trucking yards are about half a truck apart, are they not? About one-third of a truck.
1334. If there was a door or two side doors in your truck they could be made to suit the existing trucking yards? Yes.
1335. In the method you propose of loading the trucks, a door on the side would be of no service for these platforms? Not a bit; it would be more expensive in construction, and it would be a source of weakness.
1336. With the present trucking yards and the present trucks, people can load the top and bottom decks at the same time? Yes.
1337. But you cannot do that with your trucks at the present time with the present yards? Not at present.
1338. How could it be done with yards built according to the model which you exhibited? Very easily.
1339. Would not the effect of the top platform being down effectually stop the sheep from going through? No.
1340. You think that the sheep could be induced to run under that platform? Yes, without any trouble.
1341. How many parts are there in your top deck? Six.
1342. Are there not three at each side? Yes.
1343. And one at each end? No.
1344. In your improved trucks how many flaps are there? Six altogether; two at each side and one at each end.
1345. Is there no other part of the truck connected with the deck? There is the bar which goes down to support the deck.
1346. Then there are seven parts? Yes; but it can be made in five parts without any difficulty at all; there are only five parts in the model.
1347. In your existing trucks with the seven flaps you have to raise them to a certain angle before the centre bar can come down past them? Yes.
1348. And each flap is hung up by a hook? Yes; or a chain.
1349. How many parts are there in my deck? I do not know since it has been broken.
1350. But before that? I think there were two then.
1351. Are you sure that it is broken? Yes; and it will break every time that you use it.
1352. Will you swear that it has been broken, or is broken? I will swear that it collapsed. I do not know what you call broken. You had to put props under it to keep it up; it collapsed; it must have broken; at any rate it bent.
1353. Yours did not bend, it broke? It broke.
1354. Is it not a fact that mine can bend, but cannot break? If you had not put props underneath it, it would soon have broken and collapsed altogether.
1355. Do you know how many miles the truck ran without props underneath the deck? I do not.
1356. To speak the candid truth, do you not know that my deck may bend, but cannot break? I am quite sure that it would break, and that it would have broken if you had not put props underneath.
1357. Is it not a fact that yours did not bend, but that it broke? Mine did bend, and then broke, but I was not there to put props under it. My beam cannot break or bend now.
1358. If I strengthened my deck it would not bend? You can strengthen it by adding a ton weight in it.
1359. When your flaps are down what is the height of the closed surface from the floor upwards? It goes up to within 2 feet of the roof.
1360. There is no opening between the bottom floor and 2 feet of the roof? No.
1361. If any cattle are lying down in your truck is it possible to poke them up, except through the opening on top? No, there is plenty of room to do it there. With the closed surface it is impossible for cattle to get their legs through.
1362. If a beast is down you cannot see it? Yes, we can see it anywhere in the truck.
1363. How could you see it, except by looking through the top opening? You can look underneath if you like.
1364. You have stated that wool is one of the easiest things to set on fire when the yolk is in it? Yes.
1365. Are you quite sure of that? I speak from experience. We have had a great many trucks of wool burnt in transit, and we could never put it out, once it had started to burn.
1366. Is it more likely to burn in wool or when on the sheep's back? I cannot say, I never tried.
1367. Do you think there would be any difference? I do not know.
1368. Do you think the wool would burn at all on the sheep's back? I think so, very easily.
1369. Can you burn a sheep's skin easily? I have never tried.
1370. I presume that there is yolk in the wool when the fleec is freshly skinned? Yes.
1371. Do you think it would burn easily? I should think so. We have had to pay many claims for wool burnt in transit.
1372. Is it not generally thought that wool is anything but inflammable? A truck load of wool got on fire at Newtown, and the whole lot was destroyed before we could save any of it.
1373. You have stated that the danger of louvering would be that sparks would fly in? Yes.
1374. Will not the same objection apply to trucks that are open at the side? The sparks are not so likely to fly in at the side.
1375. Do you know the difference between an open-woolled sheep and a close-woolled sheep? Yes.
1376. Which would be the most apt to burn? I do not know. I have not tried the experiment. I might say that I have known the wool on sheeps' backs to get on fire through sparks getting into the trucks.
- [Mr. Wilkinson here produced parts of two fleeces, and asked that the witness should be requested to try to set fire to the wool, but the Committee decided not to comply with the request.]

1377. Were you present when my truck was tried before the Commission at Homebush? No.
1378. Was my truck finished when the Commission, of which Mr. Badgery was Chairman, sat? No; I do not think it is finished now. It is always undergoing alteration.
1379. Do you know what witnesses were called by that Commission? No.
1380. Were any witnesses called besides people in the Department and those who had patents? I do not know. I know that I was called. I believe that some drovers were called. I believe that the Commission advertised for anyone who desired to give evidence to come forward.
1381. Did that advertisement bring forth any witnesses? I do not know.
1382. Have you seen the evidence? No; I have only read my own evidence.
1383. Were you not in the room, or in the next room, during the whole time the Commission sat? It was my office.
1384. You would have good reason to know who were called as witnesses? I would not have the slightest idea. I did not stand at the door to know who was being examined. On many days when they were sitting I was not there at all.
1385. Were you there when I was examined? I saw you always knocking about.
1386. Did you see Mr. Perry there? No.
1387. Have not heavier wheels and axles and draw gear been put into your trucks? Yes; the wheels and axles are heavier than yours.
1388. You say that they are heavier? Yes, because yours have been running, and mine have not.
1389. Have not these heavier wheels and axles been put in since the trials took place? No, it was done during the trials.*
1390. How many trials were there? Three or four.
1391. Were these new wheels and axles in your truck when any of these trials took place? I believe so. I am nearly sure that the wheels and axles in my truck are the same class as those in your truck.
1392. Are you sure that one of the axles was not of steel and the other of iron in your truck? I am sure it is not.
1393. Are you sure that it was not so during the trials? Yes. I found it out afterwards.
1394. When were they put in? I am sure I do not know. I think prior to the trials, but I am not sure.
1395. Steel axles have since been substituted? Yes. You made some complaint about the gear under my truck being lighter than that under your truck, and not wishing to take any advantage over you in that respect I applied to have exactly the same wheels and axles put under my truck as were under yours.
1396. But were they put in? I do not know.
1397. Do you know that in your trial trips the axles ran hot on nearly every occasion? If it is so I suppose it was on account of the wheels and axles being new. It is a common thing for new wheels and axles to run hot.
1398. Is it not a fact that your truck has been loaded with goods so as to have the heaviest part of the loading in one part in order to ease the front axles? I do not know.
1399. Is your draw-gear continuous? Yes.
1400. Was it continuous during the trials? I believe it was. I am not sure.
- [Mr. Wilkinson here put questions to the witness as to the cost of carriage of stock in half truck loads and otherwise, but the questions were disallowed.]
1401. What have you to say about the principle of carrying half truck loads of sheep and half of cattle? I have admitted that it would be a slight, but a very slight, advantage in some cases to put half a truck load of sheep and half a truck load of cattle into one truck, but it would so seldom happen that this would be done that it would not be worth while altering a truck for it.
1402. Is it not a fact that the rates charged prohibit people from ordering half trucks? It is to their advantage to use full trucks.

WEDNESDAY, 18 APRIL, 1888.

Present:—

MR. KETHEL, | MR. LYNE,
MR. SUTHERLAND.

T. H. HASSALL, Esq., IN THE CHAIR.

Bruce Smith, Esq., Counsel, instructed by J. McLaughlin, Esq., appeared for the Proprietors of the Evans Australian Combination Truck. W. B. Wilkinson, Esq., appeared in person.

George Trotter Evans, Esq., recalled and further examined:—

1403. *Mr. Wilkinson.*] You have some knowledge of the trial of my truck at Homebush? I was not present, therefore I could not have much knowledge.
1404. In your evidence you said that the trial of end-loading trucks took place on the orders of Mr. Lyne as Minister? The first trial did.
1405. The trial of my truck at Homebush was undertaken by Messrs. Badgery and Gill, the other member of the commission not being present? I do not know. I have no means of knowing, as I was not present.
1406. Were not you Goods Superintendent at the time? Yes.
1407. Do you not know that some trucks constructed for end-loading at the order of Mr. Lyne were sent to Homebush to give my truck a trial? Yes, I believe they were.
1408. Do you know that the trial took place? I do not know of my own knowledge, but I believe it did.
1409. Do you not know that Messrs. Gill and Badgery were present at the trial? I believe they were.
1410. I suppose you know that Messrs. Gill and Badgery have sent in a report with reference to that trial? I believe so.

1411.

* NOTE (on revision):—I have since ascertained that these wheels and axles were put under the truck subsequent to trials.

- G. T. Evans, Esq., 18 April, 1888.
1411. In your previous evidence you did not wish to convey the idea that it was Mr. Lyne who authorised the trial of my truck? No.
1412. With reference to Mr. Badgery, is it true that he and yourself some time ago went to Bourke, and that you took a model of your truck? I went to Bourke.
1413. Was Mr. Badgery there? I met him there.
1414. Did Mr. Badgery speak in favour of your truck at a public meeting? I believe he said something about my truck, but I forget what it was.
1415. How long since is that? Two or three years ago.
1416. Do you know anything about an advertisement in a Bourke paper, stating that you and Mr. Badgery would attend a meeting and give evidence as to live-stock matters? I will tell you what I remember. There were complaints in the paper about the conveyance of live-stock by train, and as I was superintendent the Commissioner asked me if I would attend a meeting and see what the grievances were, and ascertain if there was anything in them, and I went for that purpose. I took the model of my truck so as to be able to satisfy the people that the Government of the day were doing everything possible to assist them, and were taking every precaution to convey live-stock in the best possible manner.
1417. Did the Commissioner know that you took your model? He did not tell me to take it; but I took it.
1418. Do you know anything of this advertisement:—"A meeting of all persons interested in the carriage of live-stock will be held at the 'Royal Hotel' to take into consideration the means of improving on our present unsatisfactory system. Mr. Evans, Superintendent of live-stock traffic, and Mr. Henry Badgery, will be present and explain their views on this vital question?" I did not know anything about that before, but a meeting was called by some Pastoralists' Association there for other matters, and one of the grievances was the consideration of the live-stock traffic. I was asked to be present.
1419. You spoke at the meeting? Yes, I spoke in answer to the complaints made.
1420. Is it true that subsequent to that meeting a Committee was formed to urge upon the Government the adoption of your truck? I do not know.
1421. It is a fact that the model was there, and that Mr. Badgery spoke with reference to it? He spoke with reference to the truck.
1422. You do not know that a Committee was formed then and there to urge the adoption of the truck? I do not.
1423. Mr. Smith.] You were asked the other day how many trucking stations there were throughout the country. Can you give me that information now? I have had a return prepared. The number of trucking stations is about seventy-five, that is, we have conveyed sheep from seventy-five stations during the year 1887.
1424. That number of stations includes not only stations from which sheep have been sent in large numbers, but every station from which sheep have been sent? Yes.
1425. What is the smallest number of sheep which have been loaded at some of these stations? Fifteen trucks in the year, or 1,500 sheep.
1426. Were these fifteen trucks sent at once? No, at different times; one or two trucks at a time, perhaps.
1427. What is the largest number sent from any station during the year? The number sent from Bourke station is the largest—126,700. The following is the complete return:—

RETURN showing number of sheep vans loaded at Stations for year ending 31st December, 1887.

Stations.	No. of Sheep Vans.	No. of Sheep.	Average No. of Vans per week.	Stations.	No. of Sheep Vans.	No. of Sheep.	Average No. of vans per week.

SUMMARY.

G. J. Evans,
Esq.
18 April, 1888.

	Vans.	Number of Sheep.
Western Line	6,174	617,400
Mudgee Line	1,990	199,000
Molong Line.....	314	31,400
Southern Line	2,256	225,600
South-Western Line	1,669	166,900
Murrumburrah to Blayney Line	489	48,900
Gundagai Line.....	156	15,600
Jerilderie Line.....	671	67,100
Cooma Line	661	66,100
Grand Total, Sheep Vans	14,380	1,438,000

1428. How many trucks at a time would be necessary to provide for the loading at Bourke stations? Some lots of sheep number 1,000, some 1,500, and some 2,000, but generally speaking about 1,000.

1429. What do you think would be a sufficient yarding accommodation there all the year round? I think that yards for ten or twelve trucks would be quite sufficient there, and that is the most important live-stock station; I mean provision for loading ten or twelve trucks without moving them.

1430. You say that the average from Bourke is twenty-four and a quarter trucks per week. What would they contain? About 2,400 sheep. That would be the average per week for the whole year, but it might vary. We might bring 5,000 or 10,000 sheep one week, and perhaps none the next week.

1431. You consider that accommodation for loading ten or twelve trucks without moving them would be ample for that station? Plenty. I calculate that from the fact that at Deniliquin, where they have accommodation for loading ten trucks at a time, they have loaded as many as 17,000 sheep in eleven hours—full woolled sheep, which are always slower than shorn sheep.

1432. Have you ever heard any complaints about insufficient yards at Deniliquin? Never.

1433. How many stations are there in the whole Colony where, in your opinion, it would be requisite to have yarding accommodation to load ten trucks at a time? I should think about six.

1434. What is the next number of yards which you think would be required at some of the stations of lesser importance than those? I should think that the next would be about seven.

1435. At how many stations in the Colony would it be requisite to have yard accommodation to load seven trucks at a time? Perhaps eight or ten—that is, speaking from general observation; but I should like the Committee to understand that it is not absolutely necessary that any of these yards should be built.

1436. Next to seven trucks, what would be the quantity you would put? Five.

1437. How many stations would require that accommodation? Perhaps six or eight.

1438. *Chairman.*] I notice that the return which you have put in does not include stations on the Northern Line? No; it relates only to the Southern and Western Lines. If you include the stations on the Northern Line probably five or six more would have to be added to that list.

1439. *Mr. Smith.*] Are there any important stations on the Northern Line? There are the terminal stations, where large quantities of sheep are trucked.

1440. At how many of these stations on the Northern Line would it be necessary to have yarding accommodation for loading ten trucks? Perhaps two.

1441. That would make about eight tens for the whole Colony? Yes.

1442. Would any come among the sevens? I should think about five or six.

1443. Would any come among the fives? Perhaps three or four.

1444. Next to the fives what would be the next size of trucking yards that would be required? For all new yards, even if there was only to be accommodation for one truck, I should say that they should be built on the principle shown in my model.

1445. I am talking now of the necessities of the stations, and I want to know how many trucks you would think it necessary to provide for after these fives? I do not think it would be necessary to provide for any, with the existing yards. We can get on very well with them where there are less than five; loading is then a mere nothing.

1446. Summing up your figures they amount to this,—that it would be necessary to have appliances for loading ten trucks at a time at eight stations, which would mean eighty yards, twelve of seven, which would mean eighty-four, and ten at five, which would be fifty, or a total of 214? Yes.

1447. And these yards would cost only £25 each? That is all.

1448. So that these thirty stations could be provided with these improved yards at a cost of £5,350? Yes, and I maintain that with my trucks and these yards our sheep trucking system would be as complete as anything in the world, from all the knowledge I can get.

1449. In submitting a model of that yard to the Committee as a suggested improvement, I understand that you do not submit it as indispensable to your truck? Not at all.

1450. It simply amounts to this, that by having that yard there would be no occasion to move any truck whatever in loading? Yes.

1451. That one man not only could, but has loaded ten trucks himself? Yes.

1452. He could do it with these yards and with your truck? Yes; there is absolutely no necessity for more than one man, even where there are ten yards.

1453. But suppose there were only five yards, and there were ten trucks to load, one man could do the work, and there would only be a necessity to make one movement of the train? The engines would put the trucks in their place.

1454. Suppose an engine was not there, I suppose the train could be moved? Yes, it could be easily moved.

1455. But you propose to have ten yards where ten trucks are likely to be loaded, therefore that would not be likely to occur? In that case it would not; but in nearly every case there is an engine at the stations where large quantities of sheep are loaded.

1456. You were asked the other day, as bearing on your evidence concerning the cost of the yards, whether you did not know that the Hay yards had cost a certain sum? Yes.

- G. T. Evans, Esq.,
18 April, 1888.
1457. Do you consider that the money expended on those Hay yards is any criterion as to what is necessary for future yards constructed on this principle? Not the slightest criterion, because the yards at Hay are strong enough to load bullocks from, instead of sheep. They are big, strong, heavy, fences.
1458. Is there anything else which is unnecessary? The deck is raised, instead of being on a level with the ground.
1459. So that there is the cost of an extra deck above the ground? Yes.
1460. Speaking generally the yards are much stronger than there is any necessity for? Yes.
1461. You were asked by Mr Wilkinson, whether it was not possible with his truck to do away with the internal arrangements of the yard as shown in your model—to have one yard to hold the whole of the sheep to be trucked, and to truck them by running them into the end of one of the trucks? Yes.
1462. Is it not possible to have one large yard in the same way, and to load ten trucks by moving them up one at a time? Yes.
1463. And thus would obviate all the labour which has been found necessary in every case in dividing the sheep throughout the different trucks by end-loading? Yes.
1464. By the system of yards which you suggest, you can count every sheep before loading them, and if you find one too many for a truck in any of the yards, you can easily draft it into another lot? You can depend upon having exactly the same number of sheep in every truck.
1465. In that way you will avoid crushing? Yes; you would have a great advantage in being able to see before you started to load, whether the sheep were too much crowded or not in the yard. With any other kind of truck, you must put the sheep in before you can tell whether there are too many or not.
1466. Would not that be an advantage to people discharging sheep at a terminus? Yes, they would know that each truck contained the same number of sheep. But the great advantage would be at the loading station, because the pens being the same size as the trucks you could see at a glance whether they were too much crowded. But with our present system, or any other system, you cannot ascertain that until the trucks are loaded, and then if you find that there are too many sheep in one truck, you will have a terrible job to get them out, and put them into other trucks.
1467. If you did away with the internal arrangements of your yard and had only one large yard, it would be the same as end-loading? Yes; but it would be necessary then to move each truck.
1468. The moving of the truck would simply be a set off against dividing sheep in the truck by the end-loading system? Yes.
1469. We have evidence that it requires men constantly in among the sheep with the end-loading system? Yes. I should like the Committee to understand that with the present trucking yards we can load 1,000 sheep in an hour, but with the yards which I suggest we could do it in half-an-hour.
1470. Where has that been done in half-an-hour? At Deniliquin, and at Hay; it can be done any day.
1471. You have the authority of the Traffic Manager of the Deniliquin Railway for that statement? Yes, Mr. Steers, who is connected with the firm of Permewan, Wright, and Company, promised to get the information for me, and Mr. Tennant, the Traffic Manager of the Deniliquin Railway sent him the following telegram:—"Largest number woolly sheep trucked one day, Deniliquin, 17,000, 11 hours loading, could do faster if wanted; shorn sheep faster."
1472. *Mr. Lyne.*] You say it has been done at Deniliquin. Have you had your truck on the Victorian Railways? No. These sheep have been loaded in the ordinary vans.
1473. *Mr. Smith.*] With this system of yards loading is exceptionally and unprecedentedly quick? Very quick indeed.
1474. And when the combination of these yards and your truck is brought about it will be infinitely quicker? There will be no labour at all, it will be as simple as possible.
1475. By putting another door in your truck you could load at that fast rate even with the present trucking yards? 1,000 an hour.
1476. That would be without any alteration of the yards at all? You could do that by putting another door in my truck, but I would prefer a slight alteration to the races, which would be the same thing. The alteration which I would suggest would not cost more than £10 for each yard. I would have a moveable race, so that there would be no necessity to move the truck after you started to load. That would save weakening the truck, which is a great consideration. The less doors you have in the truck the better.
1477. You know that in pursuance of a request by Mr. Wilkinson his truck has undergone certain trials? Yes; one from Byrock to Sydney, one from Carrathool I think, and one from Bourke.
1478. You know that Mr. Harper reported on those trials? I believe so. (*Mr. Harper's report handed in. Vide Appendix A.*)
1479. *Mr. Wilkinson.*] You know that when Mr. Lyne was Minister for Works he authorised the alteration of some trucks? Yes.
1480. You have stated that my end doors are exactly similar to those which were put in the trucks which were so altered? Yes.
1481. Is that the case? I think it is.
1482. Are not my end doors louvred on top? I think they are.
1483. Are the doors in the trucks which were altered louvred on top? No.
1484. Is there an upright beam running down the centre of my end doorways? I do not think so.
1485. Is there not an upright beam running down the centre of the doorways of the trucks that were altered? I am not sure. The draftsman who prepared the plans for the alterations of the trucks told me that he was quite sure that the doors of the two trucks were made from the same drawing. He said, "I am prepared to prove that they are from the same drawings as were used for the trucks which were altered." That is the reason why I said I believe they are exactly the same. I still think that the principle is exactly the same. I do not think that there is any difference at all.
1486. Your reason for saying that my doors are similar to those in the trucks which were altered on the authority of Mr. Lyne is that some person has told you that they were taken from the same drawings? Yes, and from my general observation.
1487. Did you carry out the alteration of the trucks? Not of the first lot, but of the second lot I did.
1488. Are not the doors of the first and second lot similar. Not at all; they are not at all the same.
1489. Which of the two doorways then does mine resemble? The first lot, the lot which was altered by Hudson Brothers, and your truck was built by Hudson Brothers; and this draftsman says the doors are exactly the same.

G. T. Evans,
Esq.
18 April, 1888.

1490. What is his name? I will produce him; but I do not think I will be justified in using his name without his permission. He told me that he would have no objection to come here.
1491. Do you know how my doors are constructed? I have an idea.
1492. How is the framework put together? It is morticed and tenoned.
1493. What is the size of the timber? I cannot exactly say it may be 3 x 2 or 3 x 3.
1494. Is there any frame in the doorways of the trucks which were altered on the order of Mr. Lyne? Yes, they are framed together as yours are; I do not remember any difference.
1495. Only that they are not louvred as mine are? I think that is the only difference.
1496. Do you know that when my truck was first inspected the end doors were in one, and that they were old doors? So many alterations have been made in your truck that it would be impossible for me to remember.
1497. Are there not two half doors now? I believe so.
1498. Do you not know that they were made for a certain object, so that the doors might overlap in case of the engine bumping up? It is impossible for me to tell what object you had.
1499. You do not know what my doors are like now? Oh yes, I do. As near as I can see, they are exactly like those in the first six trucks that were altered.
1500. *Chairman.*] In giving the weights of the various waggons now in use, you told us that the weight of the sheep vans ranged from 6 tons 15 cwt. to 7 tons 13 cwt.? There are a few as high as that.
1501. Why do they vary so much in weight? They are old vans, and the Department has been all the time trying to lighten them as much as possible, because weight is of so much importance.
1502. Is it likely that, in constructing trucks on your pattern or Mr. Wilkinson's, that they would vary so much in weight as that? No; my trucks would not weigh more than 6 tons 10 cwt.
1503. With the improved method of construction now in vogue, you can make a lighter truck equally as strong as the original trucks, which weighed 7 tons 13 cwt.? Yes.
1504. You told us that Hudson Brothers sent in an account for £295 for each of the fourteen of your trucks, and that finally they accepted £265 each? Yes.
1505. How do you account for their charging such a sum as that, when the estimate quoted by Mr. Henry Hudson to you was for £174? I never could understand it. I could not find the letter which I read to you to prevent their getting the money. It has been a mystery to me. I showed the letter to my father-in-law, Mr. Forsyth, and in spite of all I could do, he moved the adjournment of the House, and made a great noise about the business. He thought a great injustice was done to me and my truck by the exorbitant price which was charged for it.
1506. *Mr. Wilkinson.*] Was not Mr. Henry Hudson a partner of yours at the time that he wrote that letter? No.
1507. Did he never have a share in the truck? It was patented in his name, and that was the only interest he had in it in any shape or form.
1508. *Mr. Lyne.*] But he told me that he was a partner? He never had a penny of interest in it. He was never a shareholder in it in his life.
1509. Why does he refer to the question of royalty in his letter? He said that I must add what I wanted as royalty.
1510. *Mr. Wilkinson.*] Did you never ask Hudson Brothers for a royalty on the manufacture of trucks? Never.
1511. Did not you have to give up a portion of your interest in your truck because he sold a share to some person for £800? Never. He never had a share to give up.
1512. *Chairman.*] You say that, after examining your truck, Glasson & Company quoted the price at £145 or £150? Yes.
1513. Do you know that they are prepared to construct your trucks at that price now? I believe they are. Further, I believe that my truck can be built for £125. I think that Glasson and Company would build it for that.
1514. *Mr. Lyne.*] As affecting your evidence relating to Mr. Henry Hudson, how does this letter bear on it? [*Mr. Lyne was proceeding to read letter No. 5 in papers ordered to be printed on the 14th October, 1886, Mr. Smith objected to the letter being read; objection allowed.*] Have you read the papers before the Committee? All but the recent ones.
1515. Have you seen letter No. 5 in the papers ordered to be printed on the 14th October, 1886, signed by Henry Hudson? Yes.
1516. Are you aware that that letter makes a certain offer or suggestion to the Government for building your trucks? Yes.
1517. Are you aware that that letter is signed by Mr. Henry Hudson "for self and colleagues?" I see that it is. But he was simply acting as my agent. He had no right of any kind. He never put a penny into the truck.
1518. If he never had any interest in the truck why should he sign himself in that way? I cannot say. I can say that Mr. Henry Hudson's name was used amongst others to patent the truck, only his name was used. He had no right or title to any part of my truck. On the day after I found out that they sent in an account for such an exorbitant charge for building the trucks I instructed my lawyer to go to the firm and demand that the three brothers should assign back their right, title, and interest, if any, in the truck. They were simply acting as my agents.
1519. *Mr. Smith.*] Did they do so? Yes.
1520. Without demur? Yes.
1521. *Mr. Lyne.*] How could they assign their right, title, and interest to you if they had none? I said "if any;" but they never had any. Although it was patented in their name I paid the money out of my own pocket.
1522. *Mr. Smith.*] Did you ever have a single copper, or any coin of the realm, or anything representing money, from Hudson Brothers, in connection with the truck? Never.
1523. *Chairman.*] What would the result as affecting the stock traffic on the railways if the Glebe Island abattoirs were abolished? It just depends if others were substituted for them.
1524. Do you think that in case of their being abolished it would reduce the live-stock traffic on the railways considerably? If they were abolished altogether it might reduce it a little, but we should still have a tremendous live-stock traffic from different places.

- G. T. Evans, Esq. 1525. You think that in the event of the abattoirs being abolished it would be necessary to establish killing stations and depôts in various parts of the country? Yes.
1526. In the event of that being done could your trucks be converted into trucks for the conveyance of chilled meat? Yes.
1527. Have you any idea what it would cost to do that? I do not know what it would cost, but I may mention that I intend to give to the Government another improvement in my truck, which I think will be a splendid one in connection with the conveyance of meat.
1528. You say that your trucks could be used for the conveyance of chilled meat? Yes, with great advantage, and at very little cost.
1529. *Mr. Smith.*] The new improvement which you speak of is one by which you utilize the motion of the wheels for the ventilation of the chamber? Yes. I have been working at the idea for twelve months.
1530. *Chairman.*] You think that under any circumstances, whether Glebe Island abattoirs are abolished or not, there would always be a good deal of live-stock traffic? Yes.
1531. And that a combination truck would be useful? Yes; of the greatest value.
1532. *Mr. Lyne.*] When you referred to the trucking of sheep at Deniliquin, are you aware that the Victorian vans are divided into four compartments? Some of them are. I have seen a lot of them without partitions.
1533. Are you aware that the trucks which are now being made by the Victorian Railway Department are all divided into four compartments? I am not.
1534. You make a suggestion for the alteration of the yards pretty well throughout the Colony? I think that it would be a very good thing, but not all the yards.
1535. Have you loaded many sheep yourself? A great many.
1536. Have you actually loaded them? I have worked at the loading myself.
1537. I understood you to say that there would be no occasion to alter the yards where there were not more than five trucks required? I do not think it would be necessary.
1538. Did you ever move five trucks to and from the races? Yes; a good many times.
1539. Did you not find it hard work? Yes, it is pretty hard work, but in some cases it is easy. It was this which caused me to give the matter some thought, with a view to devising some means to remedy the evil. I think that the improvement of the yards as I have suggested would be the simplest and best means.
1540. At what station is it always possible to obtain an engine when required for loading sheep? At most of the sheep-loading stations where there are any number to be loaded there is always an engine waiting to take them away.
1541. Do you know anything about the Albury station? Yes; but very few sheep are conveyed from there, that is comparatively speaking. The total number conveyed from Albury in 1887 was 12,200.
1542. How many would there be the year before? I do not know.
1543. Do you think there were 100,000? I should not think so.
1544. Do you think there were 200,000? I should not think so.
1545. Do you not know that during the dry seasons sheep were bought in Victoria by hundreds of thousands and brought by rail to Wodonga, unloaded there, driven to the Albury yards, and retrucked there to be taken to different places in the country? I remember that during the dry years they were taking sheep from every station on almost all the lines.
1546. Do you know how many stations there are on the Northern Line? I do not.
1547. Does not the list issued by the Department show that there 100 trucking stations altogether? Yes.
1548. I suppose that some of the stations on the Northern Line are important? Yes, the terminal stations would be important for sheep.
1549. How many? Two or three. I think it would be madness to think of constructing a large number of these yards at all the stations, because they never would be used. But where new stations are being built, I think that the principle which I suggest ought to be adopted. If we were only to have accommodation for loading two trucks at a time I should adopt this principle.
1550. Have you had any experience in end-loading sheep? I have seen it tried.
1551. How many times? I could not say. I saw it tried when some trucks were altered some years ago.
1552. Are you aware that in South Australia they load trucks from the end? Some of them. The principal reason is because they carry the sheep over two different gauges, and they put the trucks end on and run the sheep from the narrow gauge to the wide gauge. They do not take the trouble to count them, or care how they are loaded. They are just run in anyhow—the owners taking the risk.
1553. Then you mean to infer that they do things in a slipshod manner there? That is the way they carry live-stock. They do not bother about counting them at all.
1554. Are you aware that they load from the end in New Zealand? It has been done very recently, if at all. I am quite sure that they did not do it two years ago, because I was there. There was a locomotive engineer from New Zealand here five or six months ago and he said then that they did not load from the end.
1555. When you were examined on the 14th March you were asked some questions with reference to the last experiment which was tried, and you were asked:—
1051. How long ago was that? I suppose it must be eighteen months ago.
1052. What was done then? We had six trucks altered first, at a cost of about £50 each.
1053. Who instigated that experiment? Mr. Lyne, who was then Minister. They were tried at Homebush, and the trial was anything but satisfactory. It was stated that it required a train load of trucks to be altered to give the system a fair and proper trial.
1556. Do you still say that the trial was unsatisfactory? I do.
1557. Then you were asked:—
1054. Was that ever done? Yes; Mr. Lyne asked me to superintend the alteration of eight other trucks which would make fourteen trucks in all. He thought the cost of altering the first trucks was exorbitant, and he instructed me to buy the material for the other trucks as cheaply as possible, and to save all unnecessary expense. I superintended the alteration of the trucks, and I think that they cost about £30 each. Of course it was more temporary work than was put into the other trucks.

G. T. Evans,
Esq.
18 April, 1888.

1055. What was done with the fourteen trucks? They were tried at Homebush.
1056. Were you present? Yes; I cannot remember exactly what was done, but the trial was a miserable failure, as far as success is concerned
1558. Do you still say that? Yes.
1559. Who superintended that trial? I think you did.
1560. How do you reconcile that with the statement that you did so? Acting under your instructions I had the doors opened and fastened, and I got the sheep for you.
1561. Then you were asked:—
1057. Do you remember in what respect the trial failed? In the first trial of the six trucks, I remember that they put 400 sheep into the bottom decks. The sheep could not be stopped when they started to run, and they were only 200 left for the top decks. The men occupied about 40 minutes in loading the six trucks, and then they never counted the sheep or closed the door after the trucks were loaded, and some of the sheep actually stood in the spaces between each truck. They were not divided or counted.
- Do you know that they were not sufficient sheep there to fill the top decks? That arose because too many sheep were put into the bottom decks. You could never fill the trucks properly. There were 600 sheep to fill the six trucks, 400 were run into the bottom decks, and only 200 were left for the top decks.
1562. You still repeat that? Yes; I can bring forward half-a-dozen witnesses to corroborate it.
1563. Did not I get into the trucks and load the sheep? Yes.
1564. Did not I send away the men whom you put there, as they were no good at all? I did not put any men there at all to load the sheep. I superintended by getting the trucks ready, having the doors opened, and borrowing the sheep, that is what I mean by superintending.
1565. Then you were asked:—
1058. Was Mr. Lyne present? Yes; I may mention that when the trial of the fourteen trucks took place, I got two of the smartest men that we had at Homebush, and I instructed them to open the doors and have the trucks ready for end loading, and I told them that I wanted them to do it as quickly as they could. It took these two men 50 minutes to open the doors and to get the trucks ready for loading. You must understand that in each of the fourteen trucks there were eight doors and four flaps to open, thus you would have 112 doors to unfasten, to open, and then to fasten open.
- That was not done when I was there? That was done before you arrived.
1566. You say now absolutely that it took half-an-hour to open the doors of these six trucks? Yes, I am quite sure.
1567. Are the trucks still in existence? I believe they are. I will guarantee that in my truck we can load 1,000 sheep in the time you are opening the doors and fastening them open, with the present system that we have for loading. I can satisfy the Committee with evidence on that point which cannot be questioned.
1568. How long were we putting the sheep in? I cannot remember particularly, but I should think over half-an-hour. I think 40 minutes.
1569. Was it not 20 minutes? I think it was more than that.
1570. Do you not know that there is an official statement that it was done in 20 minutes? I do not know, but I am sure that it was more than 20 minutes. The doors were never closed, or the sheep taken from between the trucks. The sheep were run into the trucks and that was all that was done.
1571. Do you say that none of the doors were shut? Yes.
1572. Were not the doors of two trucks shut? I will not swear that they were not, but I did not see them. It was after the trial was finished that they were shut, if they were shut. The time taken was that occupied in running the sheep in. The doors were not interfered with in any way at all.
1573. Had you anything to do with the loading? I assisted by frightening the sheep, and seeing that there was no delay. At the time I was anxious to get all the information I could, and I wanted to see if there was really anything in the end-loading system.
1574. You say that 400 sheep were put into the bottom decks? Yes.
1575. And yet you say they were not counted? The top lot were counted after they were unloaded, and then we knew how many sheep were put into the bottom decks.
1576. Were all the sheep in the yard put in? Yes, all the 600 that I brought were put in.
1577. Were there none left in a back yard? The 600 were put in. The man in charge at Homebush counted 180 or 220 in the top decks, and there were quite two-thirds of the sheep put in the bottom decks.
1578. I should like you to reflect a little over your statement that all the sheep were loaded? I should not make the statement without being able to prove it. I have had my opinion corroborated, and I can bring witnesses to prove that what I say is correct.
1579. You still adhere to your statement that the whole of the sheep you brought there were put into the trucks? That is my impression.
1580. You are altogether opposed to end-loading? I do not think that there is anything to be gained by it. If there was anything to be gained by it, I should be as much in favour of it as any one, but I think that there is much to lose by it.
1581. Have you had any experience on stations? I have had no experience except in the loading of sheep into trucks. Here I may say that I know some men who could do as much with stock in half-an-hour as others could do in two or three hours. We had a man at Goulburn who could load 1,000 sheep in half-an-hour, without a dog or a boy, or any assistance of that kind, while half-a-dozen men at the next station might not be able to do it in six hours.
1582. When at Homebush on the occasion referred to, did you not tell me that the reason you could not open and shut the doors more quickly was that the flaps were too heavy? I did. They were ridiculously heavy. But if you have an end-loading system you must have strength; you must have big heavy doors; you must have doors and flaps as heavy as those were. You must not have doors which would be strong enough for sheep, because they must be strong enough to carry cattle. I do not believe in end-loading, for the reason that it costs £40 or £50 more to construct a truck for end-loading that will be strong enough to carry cattle as well as sheep, and the truck would have to be a ton heavier than it would be otherwise. The doors help to make the truck heavier, and they weaken it tremendously. I am sure that if your experience was as great as mine, especially with cattle, you would agree with me that the less doors you can have in a truck the better it is, and end doors would weaken a truck so much that it would last no time or cattle.

- G. T. Evans, Esq.
18 April, 1888
1583. Leaving out of the question details as to strength of doors, I want your opinion as to the principle of end-loading generally? I do not think that there is anything to be gained by it. It is almost impossible to introduce it now. We have 300 trucks, and before we could introduce the system we must alter all these trucks, and that would mean a cost of £30,000 or £40,000. Further, I think it would be impossible. You cannot regulate the number of sheep in a truck as you can with the present system.
1584. Can Mr. Wilkinson's truck be used at the present yards without altering them at all? I believe that it can.
1585. *Mr. Smith.*] Referring to Mr. Lyne's question as to your having moved trucks yourself, is it not a fact that you have worked your way up to your present position from that of porter? For three years I was a railway porter.
1586. You have gone through every phase of railway work up to your present position? Everything.
1587. You have moved trucks personally; you have loaded sheep personally; and you have done all the hard as well as the easy work in connection with the different positions? Yes.
1588. About how often would it occur out of a dozen occasions that you would have to move trucks by hand in consequence of there being no locomotive at the station under the present system? Very rarely; not more than three or four times. I should like to explain that in Victoria all the live-stock is loaded by the Department. They have not the slightest difficulty in loading there, because they have men who are accustomed to the work, and know how to do it; but here we have loading done by people who are not accustomed to it.
1589. *Mr. Lyne.*] Are you sure that at Wodonga the loading is done by the Victorian Department? The Department are supposed to load the stock. They undertake to do it; I have seen it done at Sandhurst and other places repeatedly.
1590. *Mr. Smith.*] If the yards are fitted up, as suggested by you, at a cost of £5,300, is it not a fact that it will only be necessary to move the trucks where the quantity of sheep to be trucked is unusual? That is all.
1591. Because, where the number was usual and provision was made in the yards, there would be no moving of the trucks necessary? No moving at all.
1592. Would it not be possible at new stations where the quantity of the stock traffic was great to erect one set of yards to start with in such a way that as the traffic increased you could add yard after yard? Yes, without the slightest trouble; you could increase the yards according to the amount of traffic.
1593. In all the evidence which you have given before bearing upon the capabilities of your truck and these yards, and all the difficulties which are to be met with at present, you speak from actual practical knowledge gained in the service of the Department? Yes, and I say further that I have not had the slightest assistance or wrinkle from anyone. The whole thing is my own idea. The two models that you see before you are my own work entirely.
1594. *Mr. Lyne.*] The Chairman has asked you some questions with reference to the probable stock to be carried supposing the Glebe Abattoirs were to be done away with? Yes. I say there would still be a good deal of stock traffic.
1595. I suppose you base that statement on the assumption that the number of stock in the country is increasing to such an extent that in any case there must be a large traffic of life-stock over the railways? You could not have killing places everywhere, and you would have to travel stock perhaps 100 or 150 miles, and so on.
1596. You do not altogether calculate the carriage of stock upon the carriage of fat stock? No, we carry a lot of store stock.
1597. You are aware that in bad seasons there is not sufficient rolling stock to carry the store stock away? That is one of the reasons which induced me to go in for a combination truck, so that instead of having to take empty trucks away to take starving stock from one place to another we should be able to utilise the trucks for other traffic.
1598. What do you conceive would be the saving to the Department in the carriage of goods and live-stock if the whole of the trucks were combination trucks? I would not have nearly the whole of them combination trucks. As nearly as I can calculate, giving the benefit, if any, against the combination trucks, I am quite sure that £80,000 or £90,000 a year would be saved to the Government.
1599. Suppose there were 100 trucks running what percentage in saving do you think there would be in having combination trucks which could be used for sheep as well as stock, that is, in dead running? I think about about 50 per cent. I think that instead of carrying live-stock at a loss as we do now we should carry it at a profit because the live-stock traffic would be natural back loading, and the return from it would be clear profit, as compared with the present state of things.

THURSDAY, 19 APRIL, 1888.

Present:—

MR. HAYES, | MR. LYNE.
T. H. HASSALL, Esq., IN THE CHAIR.

Bruce Smith, Esq., Counsel, instructed by J. McLaughlin, Esq., appeared on behalf of proprietors of the Evans Australian Combination Truck. W. B. Wilkinson, Esq., appeared in person.

William Boyce Wilkinson, Esq., further examined:—

W. B. Wilkinson, Esq.
19 April, 1888.

1600. *Chairman.*] I understand that you are desirous of giving some further evidence—will you state what it is? In the first place, I desire to hand in some letters which I wrote to the Commissioner for Railways, and which have not been included in the papers laid before Parliament. (*Letters handed in. Vide Appendix B.*) The reason why I put in these letters is that I received no replies to them.

1601.

W. B.
Wilkinson,
Esq.
19 April, 1888.

1601. *Mr. Smith.*] How did you send them? I delivered them myself at the Works Office, in order that there might be no mistake. I wish now to refer to a trial of my truck which took place, in compliance with a request made by the Chairman of the Committee, in December, 1887. I loaded my truck at Dubbo with fifty sheep and five bullocks. These sheep and cattle were supplied by Mr. Baird at Dubbo. I had no opportunity of seeing the sheep or cattle to judge of their size until they were brought to the trucking yard. The sheep were trucked in the presence of Mr. Henson, the Traffic Inspector at Wellington. I travelled with the sheep as far as Orange, 80 miles. It was one of the hottest days of the summer. From Orange I came on in the mail train to Penrith. I waited at Penrith until the truck arrived there, and then I came on to Granville with the truck, and from there to Homebush. The truck was twenty-six hours in transit, but I only travelled with it some five or six hours. The truck was attached to four different trains. It eventually came in to Homebush behind a coal train. The screw coupling was not attached; it was hung by the three long links, so that the truck got more than the usual average knocking about that a truck would get on such a journey. The sheep and cattle were unloaded; they looked well. The truck had sustained no injury; there was not a scratch on it. The sheep and cattle were sold at good average prices at the Homebush yards, on the Monday following. The cost of the carriage of that truck of fifty sheep and five bullocks in my truck, from Dubbo to Flemington, was £7 6s. 8d. I exhibit the railway voucher, with a minute attached to it, written by Mr. Warden Harry Graves, as follows:—"This was a consignment of fifty sheep and five bullocks consigned to me by Mr. T. Baird, Dundullimal, Dubbo, and they all arrived here fresh and good." At the rates given in pages 39, 40, and 41 of the rate-book of the Department the carriage of the same number of sheep and cattle in any of the trucks in existence in the Colony would have cost about £13 16s.

1602. They would have to be brought in two trucks, which would cost that amount? Yes. Half a truck of cattle, or one deck of sheep, would cost 6d. a mile. The distance from Dubbo to Flemington is about 267 miles.

1603. *Chairman.*] From your experience in trucking stock, do you think that any man residing as far away as Bourke or Dubbo would send a consignment of half a truck of sheep or cattle? Yes. Since my truck has been constructed several applications have been received by me for the use of it in that way.

1604. Do you not think that instead of paying at the rate now charged a man who wished to send half a truck of stock would make arrangements with his neighbour to make up a full truck? He might make arrangements with his neighbour, but in that case, with the present trucks, he could only send the same one class of stock, but if my truck were available he could send fifty sheep and five bullocks, or any two, or even three, classes of stock.

1605. Are small consignments of half trucks often sent? No; because the present prices are prohibitory. I should also like to point out that with the present trucks the cost of carrying a horse from here to Dubbo would be £6 1s. I exhibit a railway voucher, showing that I have paid that amount. With my truck you could send a consignment of 4 or 5 tons of goods at one end, and a horse could be taken in the other end. At present we are almost debarred from sending horses from Dubbo to Sydney, or *vice versa*, except by truck loads, owing to the prohibitory rates. By utilising my truck in the way I suggest you could carry a horse for a quarter of the present price.

1606. *Mr. Lyne.*] How many horses could you send in one end of your truck? Four, five, or six, and 3 or 4 tons of goods in the other end. If I wanted to send a horse from Dubbo, by using my truck I could send it in one compartment, and sheep or cattle in the other.

1607. *Chairman.*] Would you care to put horses in one compartment and wild cattle in the other? I should prefer putting them into my truck to putting them into an ordinary truck, because in my truck they are shut out from the weather, and from the view. My truck is nearly as good as a loose box in a stable. The truck was afterwards sent to Bourke, and loaded with cattle, as per Mr. Harper's report, number four of the papers ordered to be printed 28th February, 1888. I accompanied the truck as far as Nevertire. All was going on well then. Up to that period my truck was 2 degrees cooler than Evans' truck. Mr. Harper does not mention the temperature in his report, as he says one of the thermometers was detached from a truck. Nevertheless we kept a record. The thermometer which was not broken was taken from one truck to the other, and the temperature registered. In his report Mr. Harper refers to cattle being down in my truck. My objection to the report in this particular is that although the cattle were down no steps were taken to get them up. This is shown by Mr. Harper himself, because he admits that they got up themselves between different stations. The second public trial took place on January 8th. I take objection to the 4th paragraph in Mr. Harper's report respecting this trial. "Before loading the 'Wilkinson' truck that gentleman objected to a large and rather wild and sulky bullock, which in the ordinary course would have been loaded in his waggon, and at his request the beast was returned to the main mob." I state that this is untrue. Mr. Harper tried to get this particular bullock into Evans' truck three different times. It was a large horned bullock. They made the bullock sulky by knocking him about, and then they wanted to insist upon my taking him, and because I objected—that is represented as being detrimental to my process of loading. I also take exception to the latter part of the 6th paragraph of the report:—"During this part of the journey on several occasions the horns of the cattle in the Wilkinson truck became entangled amongst the bars and had to be released." This is not true. There was one very large horned big stag in the truck. When the shutters were closed he could not put his horns right through. I removed the shutters, and allowed him to put his horns through, and he had his horns through in that same position nearly half the journey. He never moved, and was unloaded at Homebush without a scratch. One of the advantages of my truck is that a bullock can put his horns through the bars without being entangled. The space is large enough to allow him to withdraw them again. There is no comment in the report as to the state of the cattle on their arrival at Homebush, but cattle were down in nearly all of the trucks, Evans' included, and they had been down throughout the whole journey except mine. The cattle came out of my truck just as they were when they left Byrock, and Evans' truck had been unloaded twice. The cattle were some thirty-six hours on the road, and those that were in my truck were not hurt in any way.

1608. *Mr. Hayes.*] I would point out that in his report Mr. Harper says that the whole consignment of the thirty-three trucks arrived at Homebush with about twenty-four head down? I did not notice before that he mentioned that specially; but I may say that I never saw so many cattle down in a consignment before. The reading of the thermometer given by Mr. Harper at Byrock is not true. The following are the

W. B.
Wilkinson,
Esq.

19 April, 1888.

the readings of the thermometer taken in the presence of Mr. Anderson, of Bourke, and Mr. John Little, the owner of Curraaveena station:—

Time.	Place.	Evans' Patent.		Wilkinson's.		Guard's van.	Remarks.
		Thermom-eter.	Number of cattle in truck.	Thermom-eter.	Number of cattle in truck.	Thermom-eter.	
9:40 a.m.	Byrock	97	—	95	—	Not taken	Both trucks stationary.
12:35 p.m.	Byrock	101	—	99	—	Not taken	All shutters closed in Wilkinson's truck.
3 p.m.	Coolabah ...	102	8 head	102	9 head	96	All shutters closed in Wilkinson's truck.
4 p.m.	Girilambone	103	8 "	101	9 "	97	Shutters open in Wilkinson's truck on north side only.
5 p.m.	Nyngan.....	100	8 "	99	9 "	96	Both sides closed in Wilkinson's truck.
6 p.m.	Nevertire ...	96	8 "	94	9 "	90	Shutters open on north side only.
9:30 a.m.	Bathurst and Kelso.	84	8 "	84	9 "	80	Shutters closed on both sides in Wilkinson's; one bullock taken out of Evans' at Kelso.
12:45 p.m.	Wallerawang	83	7 "	83	9 "	78	Shutters closed (Wilkinson's).
2:50 p.m.	Zigzag siding	88	7 "	90	9 "	80	Shutters closed (Wilkinson's).
1:30 a.m.	Flemington	79	7 "	82	9 "	Not taken	Shutters closed (Wilkinson's).

I also object to the last paragraph of Mr. Harper's report respecting the second trial, in which he says—"The Evans truck arrived intact, and was not touched. The Wilkinson truck had a new louvre placed in it, the working parts oiled, decks raised and adjusted, and sundry alterations to the shutter fastenings." It is correct to a certain extent, but it is put in such a way that it is liable to give a wrong impression. The facts are that when my truck arrived at Flemington I got a man to lower the deck and raise it to see if it was still in good repair. There was no adjustment, as Mr. Harper says. The alterations to the shutter merely consisted of taking the pin out of the side of the shutter and putting it in the bottom, so that the shutter was fastened at the bottom instead of at the side. To read Mr. Harper's report you would think that the truck had undergone a number of alterations. I now come to trial No. 3, which took place at Carrathool. I take exception to the 3rd paragraph, in which Mr. Harper says, "Evans' truck was altered by myself, and 112 sheep loaded, the time occupied being 27 minutes." The Evans truck was altered by Mr. Harper from a cattle truck to a sheep truck, and it took him 13 minutes to make this alteration. The truck was then brought up to a race and the loading of it occupied 14 minutes. My truck was brought to the sheep yard as a cattle truck. I loaded the bottom deck first, which enabled me to walk into the bottom deck and distribute the sheep evenly. I lowered my deck from a cattle truck into a sheep truck while the sheep were being loaded. The alteration, the conversion, and the loading of my truck took 14 minutes. The time was taken by Mr. Roberts, traffic inspector, at June. I take exception to the 5th paragraph of Mr. Harper's report, in which he says:—"On reaching Darlington (24 miles from Carrathool) it was found that both of the upper decks in the Wilkinson truck had given way some 5 or 6 inches, being completely twisted and strained, and threatening at any moment to fall altogether. At Mr. Wilkinson's request, and in the interests of humanity, a wire was sent to Narrandera to provide screw-jacks and timber to support the decks." The facts are that there is a nut which runs in a slot which is fastened to the side of my deck. This slot runs in a groove, and this particular slot was about an inch shorter than any other slots, therefore it did not reach into the groove. It has not been altered. I have left the truck as it was so that the Committee may see the cause of the depression of the deck. With regard to the weights of the truck, I would point out that they have been weighed several times, and that on no two occasions have they weighed the same. There was a difference of cwts. in some instances. I also take exception to Mr. Harper's report where he states:—"The upper decks of the Wilkinson truck after all the gear had been adjusted took 7¼ minutes to raise." Messrs. Scott, Downe, and Kirkcaldie were there at my request, to see what had really happened to my truck, and Mr. Downe has given evidence as to that. It will be seen from a minute by Mr. Kirkcaldie that we had no knowledge that the time was being taken by Mr. Harper. I asked the man to raise the deck, and after he had raised it a certain distance I ordered him to stop. We then got inside the truck, and I pointed out to Mr. Downe how the slots were short. This examination took a minute or two, and then the man was told to wind the deck up to the top. The time that we were in the truck is included in the time which Mr. Harper says it took to convert the truck. The time taken in lifting my deck is 2 minutes. I also take exception to the last paragraph, in which Mr. Harper says:—"The Wilkinson truck is 7 tons 15 cwt. 2 qrs. in weight; has had most unremitting attention, such as could never be paid to ordinary stock vehicles; has been repaired, and is to-day unfit to carry sheep." I say that my truck has had no more attention than should be given to any other truck that was conveying stock. It is an advantage that you can bestow attention on it, whilst you cannot with other trucks. The statement that the truck was being repaired is absolutely incorrect. No alteration has taken place since the trial, and the necessary repairs could be made for £1. It was in its present state when it was sent to the Exhibition and judged there. I now come to Mr. Harper's further report, included in papers ordered to be printed, 4th April, 1888, in which he says, "Mr. Wilkinson's truck has carried stock four times, but not in competition, nor in any sense under the supervision of myself, nor, as well as I am aware, under that of any other office of the Department." I take exception to this, as the truck was loaded in the presence of and under the superintendence of traffic inspector Henson, and it was unloaded in the presence of Mr. Harper. On reference to the Commissioner's minute, page 2 of the papers ordered to be printed 28th February, 1888, it will be seen that the Commissioner refers to the first trial, so that there must have been some official report respecting it. I take exception to the next paragraph, in which Mr. Harper says, "The Evans truck will carry as many or more stock as compared with the Wilkinson. The measurements of the two vehicles are my authorities for saying so." Reference to the measurements will show that as a cattle truck there is more floor area in my truck than there is in Evans' truck, and as a sheep van my truck has the same floor area as Evans'. It is the floor area which regulates the number of stock to be carried, but Mr. Harper has been basing his calculations on the total area. I also take exception to the concluding paragraph of Mr. Harper's previous report, in which he says:—"With reference

reference to the number of operations necessary to alter the waggons I may state that they have no value in relation to the practical working of them. The Evans truck has seventeen to convert it to a sheep-van, the Wilkinson eight, but in each case they are principally of a minor character. At the conclusion of the trials the Evans truck was altered in $4\frac{1}{2}$ minutes, the Wilkinson truck in $7\frac{1}{4}$ minutes." I say that the seventeen conversions referred to in connection with the Evans truck are important. As to the model of the trucking yards which Mr. Evans has exhibited, I will point out that all trucking yards are, and must be, from 10 to 20 feet from the main line, and I would point out that yards similar to those indicated in the model could not be constructed except on a made road. It is proposed to put a platform within 2 feet of the trucks, and therefore the top platforms from the yards to the trucks would need to be 40 or 50 feet long, and they would need to be enormously heavy. The gangway or movable platform would have to be carried 20 feet beyond the level of the trucking yards themselves. With my truck the side and end-loading doors are so situated that it can be used without there being a necessity to spend a shilling on existing trucking yards. Any ordinary trucking yard along the line with a common receiving yard is as good for my purpose in loading 100 or five trucks as the best trucking yards in the Colony. Since my truck has been tried, further advantages than I have claimed for it have manifested themselves. By the movable shutters you can shut out the sunlight, and protect the stock from the weather. Mr. Harper's report bears this out, but he turns it to my disadvantage. I can close the shutter on one side and protect the stock from the rays of the sun, if necessary, and I can open the shutter on the shady side. To test whether my truck was any hotter with the sides closed than when opened, I tried the temperature during the trials, and I found that there was no difference. The draught which runs between the side shutters and the sides of the truck and also the end louvred kept the truck quite as cool with the shutters closed as it was when they had been open. Another great advantage which I found in travelling the stock was that by moving the shutters I could see whether or not any beast was down, and I could get at him anywhere from the floor of my deck up to the roof. In the existing trucks and all models of trucks that I have seen the sides are all dead wood from the floor to within something like a foot or 18 inches of the roof. Further, if a bullock is down in any other truck the only means you have of getting at him is by putting your hand over the top of the dead wood near the top and trying to poke him up. At night time I found that I could walk along my truck, and with a hand lantern I could put a light through the truck and see if all the beasts were standing. It is a great advantage for the man who travels in charge of cattle to be able to go along the trucks in this way and see that the cattle are standing, because if one bullock is down the chances are that with the first shunting that takes place he will bring three or four others down. With reference to the loading of stock I may say that I have been trucking stock for a number of years. When Dubbo was the terminus, and previous to the Mudgee line being opened, it was the largest trucking depôts in the Colony. At that time I trucked for all the leading agents in Sydney except Hill, Clarke, & Company. I say that it is almost impossible for one man to load a truck of sheep. It might be done, but the Department would never allow it, because it would throw all the trains late, and the person trucking would have to be continually walking up and down the races, going to the mouth of the trucks to make the sheep enter, and then coming back to the mouth of the races to make them start again. It takes three men at least to truck sheep. The shunting at all the principal stations has to be done by manual labour. Throughout all the years that I have been trucking at nearly all the principal stations on the Western Line we have never been assisted by a horse or an engine in the shunting of trucks, except on three occasions. With reference to my end doors, as far as I know, they resemble those of no truck or patent in any way whatever. The ends of my truck are louvred, but there is no danger from sparks falling and burning the sheep, as wool on the sheep's back is not at all inflammable. I have put five matches alight at one time on an open skin and it would not burn. As showing that I apprehend no danger in this way I may say that in my trip from Hay to Sydney I left the roof of my truck open all the way.

1609. *Mr. Smith.*] With the exception of those points in Mr. Harper's report to which you have drawn attention do you admit the truth of the rest? No. There are other points in his reports which I mean to bring out when I cross-examine Mr. Harper.

WEDNESDAY, 25 APRIL, 1883.

Present:—

MR. KETHEL, | MR. LYNE.

T. H. HASSALL, ESQ., IN THE CHAIR.

Bruce Smith, Esq., Counsel, instructed by J. McLaughlin, Esq., appeared on behalf of proprietors of the Evans Australian Combination Truck. W. B. Wilkinson, Esq., appeared in person.

John Harper, Esq., called in, sworn, and examined:—

1610. *Chairman.*] What are you? Goods and Live-stock Superintendent, Railway Department.
 1611. Have you any knowledge of any trials which took place between combination trucks? I have.
 1612. You were requested to furnish a report of the running of the different trucks? Yes; of the Evans and the Wilkinson trucks.
 1613. How many journeys did you make with the trucks? Three.
 1614. And the substance of your observations is contained in a report which you furnished to the Commissioner, and which is now before this Committee? Yes.
 1615. Will you swear that the statements you have made in that report are true in every particular? The oath that I subscribe now I subscribe to that report.
 1616. How long have you been connected with the Railway Department? Seventeen years.
 1617. I presume that during that time you have had large experience in the trucking of stock? I have been connected with the goods and live-stock traffic the whole of the time, with the exception of twelve months when I was in the office of the Engineer-in-Chief.

J. Harper,
Esq.

25 April, 1883.

J. Harper,
Esq.

25 April, 1888.

1618. You have had means of observing the transit of stock by rail during the whole of that period? The whole of the correspondence relating to the traffic has passed through my hands, directly or indirectly. I have had every opportunity of judging the various complaints and suggestions which have been made in connection with the live-stock traffic.

1619. In the event of the Glebe Island Abattoirs being abolished, and it being necessary to establish killing depôts in various parts of the country, do you think these trucks could be made available as chilled trucks for the conveyance of dead meat? I see no reason why they should not. I may say, in explanation, that as far as I have been able to glean the most modern truck which is suggested for use for the dead meat traffic is the Tiffney car, which is simply a box truck like these combination trucks. These combination trucks could be made available for all the purposes of the dead meat trade by boxing them up in the same manner as the Tiffney car is boxed up. From what I have seen of both these trucks, I think they can be made available for the chilled process carried out in the Tiffney car.

1620. Do you think that the cost of alteration would be great? No. You would simply have to box up the trucks and make them air-tight.

1621. So that in the event of these combination trucks being constructed on either of the patterns submitted and in the event of the live-stock traffic falling off and a dead meat traffic superseding it, the trucks could be made available for that traffic? Yes; at a small cost. The information which I have is of the latest character; I got it the other day from Mr. Bruce, who has been making inquiries about the Tiffney car, and I gathered from him that that is the car at present in use in the United States.

1622. *Mr. Smith.*] In carrying dead meat, the carcasses would have to be suspended from the roof of the truck? Not necessarily in the Tiffney.*

1623. But in these trucks? The meat could be suspended from the roof in the Evans truck, on account of the structure of that truck.

1624. Speaking, generally, of combination trucks, the carcasses would have to be carried hanging from the roof? Yes.

1625. In the Evans truck what substance would there be to put the hooks into? It is a solid roof.

1626. It would hold as much meat as you could hang in the truck? Yes; it would hold $4\frac{1}{2}$ tons, which is the quantity of meat we ordinarily carry.

1627. What would there be to fasten the hooks into in the Wilkinson truck when the upper deck is up? I do not know what there would be to support the bars; the opening in the roof would be a serious detriment to hanging the carcasses from the roof.

1628. Suppose hooks were put into the deck when it was up, to correspond with hooks in the roof of Evans' truck, would that deck, in your opinion, hold 4 tons of meat? Decidedly not.

1629. Then, as at present constructed, you do not think that the Wilkinson truck would be as suitable for the carriage of carcasses as the Evans truck is? I am sure that bars could not be put in the lower portion of Wilkinson's middle deck.

1630. It has been imputed that throughout the trials of the trucks you displayed a preference for the Evans truck—is that true? It is not true; I simply did my duty as an officer of the Department.

1631. Were you perfectly impartial in the treatment of the two trucks for the purpose of ascertaining their capabilities? I made the conditions as nearly equal as I possibly could for the trials, and I reported the results with all the impartiality which I felt due to my position in the Department.

1632. Did you say or do anything throughout the trials which would justify an imputation of that kind? I am sure that I did not.

1633. You have no feeling one way or another in the matter? None whatever.

1634. You simply did your duty as an officer of the Department? Yes.

1635. If you turn to paper number four, referring to the first trial, you will see that you state that "the trucks weighed empty, as follows:—Evans' truck, 6 tons 13 cwt. 1 qr.; Wilkinson's truck, 7 tons 18 cwt." Have you any doubt as to the truth of this clause in your report? None whatever. They were weighed in the presence of myself and Mr. Braid, the locomotive carriage foreman. They were standing on the bridge at Sydney uncoupled. I wish to explain that the trucks were weighed after heavy rain had fallen, two days after, and probably that will explain the discrepancy which you will notice further on in the weights. The effect which the rain would have on the trucks would depend upon the quantity of soft wood in them.

1636. You also state that "they were loaded on 29th December with the following weight of goods for Bourke:—Evans', 5 tons 0 cwt. 1 qr.; Wilkinson's, 4 tons 17 cwt. 2 qrs." You say that is correct? Yes.

1637. Further on you state that "after leaving Bathurst the cattle began to slip about considerably in the Wilkinson truck, and at Katoomba one bullock got down. At Lawson two were down but were able to get up again, as at Glenbrook they were all on their feet. On reaching Penrith three head were down." Have you any alteration to make in that statement? None whatever.

1638. You are perfectly certain about it? Yes.

1639. Are we to infer from the fact of your omitting to say that there were any down in the Evans truck that there were none down? There were none down. The cattle in Evans' truck were on their feet the whole journey.

1640. Further on you state that on reaching Homebush "two of the cattle had regained their feet, the remaining one being in a very exhausted condition." Do you reiterate that? Yes.

1641. Then you state that "the whole of the cattle in the Evans truck were on their feet throughout the journey, and were unloaded in $2\frac{1}{2}$ minutes. Those in the Wilkinson truck, exclusive of the beast that was down, were $14\frac{1}{2}$ minutes unloading, a fact which the unloaders attribute to the van being too close to enable them to work the cattle. The remaining bullock had to be assisted to his feet." Have you any doubt as to this statement? None whatever.

1642. In your report as to the second trial, you state that "before unloading the Wilkinson truck that gentleman objected to a large and rather wild and sulky bullock, which in the ordinary course would have been loaded in his waggon, and at his request the beast was returned to the main mob." Is that so? That is perfectly correct.

1643. Is it a fact that you tried to get the animal into the Evans truck three times, and that it refused to go in? In explanation, I may say that we had ten head of large cattle drafted from the mob into the crush

* NOTE (on Revision) :—I have since ascertained that the meat is suspended in the Tiffney car.

crush pen. There was one bullock which had very large horns indeed. We started loading them, and eight of them ran into the Evans truck; then Mr. Anderson, the agent, said that the truck would hold no more. This big red bullock was then the second in the race, and we had to turn the two of them back. He would not go through the posts of the crush on account of his horns. After he was turned back Wilkinson's truck was brought up, and Mr. Wilkinson then said, "I object to that bullock being loaded in my truck;" and he was turned back into the main mob.

J. Harper,
Esq.
25 April, 1888.

1644. Then you say that there is no truth in the statement that three efforts were made to put that bullock into the Evans truck? No. He was one of the last two that we started for that truck. You may call that an attempt to put him in, if you like.

1645. There was no other refusal made by the bullock to go into the truck? No; but he could not get past the post at the time as his horns were too wide.

1646. In another part of your report you state, "During this part of the journey, on several occasions the horns of the cattle in the Wilkinson truck became entangled amongst the bars and had to be released." Is that so? Yes.

1647. If Mr. Wilkinson says that it is untrue, are you prepared to say that it is true? I am prepared to swear to all that I say in my report.

1648. Would there be any truth in the statement that the bullock was knocked about more than other cattle? The bullock was sulky before he went into the race. He was not knocked about more than usual in getting into the race.

1649. Mr. Wilkinson, in his evidence, says, "They wanted to insist on my taking him, and because I objected that is reported as being detrimental to my system of loading." What do you say to that? I have not said that at all. I simply said that the bullock was turned back into the main mob.

1650. Mr. Wilkinson says, "That it is not true that on several occasions the horns of the cattle in his truck became entangled in the bars and had to be released?" I say it is true.

1651. Mr. Wilkinson says, "There was one very large-horned big stag in the truck. When the shutters were closed he could not put his horns right through. I removed the shutters, and allowed him to put his horns through?" The trouble with that bullock occurred subsequently to that, after we passed Orange. I am referring to the cattle in the western end of the truck. This bullock was in the eastern end of the truck.

1652. Mr. Wilkinson goes on to say, "He never moved, and was unloaded at Homebush without a scratch. One of the advantages of my truck is that a bullock can put his horns through the bars without being entangled. The space is large enough to allow him to withdraw them again." You say that the facts which you have stated is an illustration that the cattle do get entangled? I think they clearly prove that cattle can get entangled in his trucks, as they did in the old type of trucks.

1653. That is a difficulty which you experienced in past times with old trucks? Yes; before they were boarded up.

1654. Mr. Wilkinson complains that "There is no comment in the report as to the state of the cattle on their arrival at Homebush. Cattle were down in nearly all the trucks, Evans' included, except mine." What do you say to that? There was a bullock down in the Wilkinson truck when it reached Homebush.

1655. Is it true that cattle were down in nearly all the trucks? Yes. It was about the most fatal trip that we have ever had with cattle; there were many dead.

1656. *Mr. Lyne.*] What was the cause of that? They were over-driven. They were driven to Byrock to save mileage, and they were watered at 2 o'clock the previous afternoon, and they were five hours yarding them. There were twenty-four head down. I forget how many were dead, but a great number were.

1657. Mr. Wilkinson says, "The cattle came out of my truck just as they were when they left Byrock";—is that so? With the exception of the bullock which was down, which got up when we got to Homebush.

1658. What was the reason of its being down? I think that it was sore-footed, like the rest.

1659. *Mr. Smith.*] Mr. Wilkinson says, "That the reading of the thermometer given by you at Byrock is not true?" I say it is.

1660. You saw that for yourself? I did.

1661. You had no reason to find fault with or be dissatisfied with the thermometers which you had? None whatever. We used thermometers of the same standard in the two trucks, and they were tried and adjusted before use.

1662. The thermometer in Mr. Wilkinson's truck was thrown down? That was on the first trip.

1663. Mr. Wilkinson has given a number of readings of the thermometer, which he says were taken in the presence of Mr. Anderson and Mr. John Little; have you seen these? I saw them in the *Daily Telegraph*, in a letter written by Mr. Wilkinson.

1664. *Mr. Kethel.*] Was the reading at Byrock taken before the stock was trucked? Yes.

1665. *Mr. Smith.*] Does Mr. Wilkinson's letter give a correct account of the readings of the thermometer? No. I maintain that my readings are correct.

1666. Mr. Wilkinson also objects to the statement in your report in which you say, "The Evans' truck arrived intact, and was not touched. The Wilkinson truck had a new louvre placed in it, the working parts oiled, decks raised and adjusted, and sundry alterations to the shutter fastenings." Have you any reason to depart from that statement? None whatever.

1667. Mr. Wilkinson says, "It is correct to a certain extent, but it is put in such a way that it is liable to give a wrong impression. The facts are that when my truck arrived at Flemington I got a man to lower the deck and raise it to see if it was still in good repair. There was no adjustment, as Mr. Harper says";—is that true? I regard the lowering and raising of the deck and oiling it as adjusting it.

1668. Is anything analagous to that done with the ordinary trucks in the ordinary carriage of cattle? No.

1669. Are there opportunities for it? No.

1670. *Mr. Lyne.*] But there are no trucks in existence in which the decks are lowered? Evans' truck is the only one analagous to it in that respect.

1671. *Mr. Smith.*] Does Evans' truck require any alteration of that kind in lowering, raising, or altering the decks? They are oiled just as it occurs to the Locomotive Department to oil them. They are not specially oiled after each trip.

1672. They do not have careful attention on the journey? None whatever.

1673. Do you regard that as an infirmity if a truck requires it? I do.

- J. Harper, Esq.,
25 April, 1888.
1674. Mr. Wilkinson says, "The alterations to the shutter merely consisted of taking the pin out of the side of the shutter and putting it in the bottom, so that the shutter was fastened at the bottom instead of at the side";—what do you say to that? That is quite right.
1675. Is it true that a louvre was broken in Wilkinson's truck, and that a new louvre was put in? Yes.
1676. How was it broken? I imagine by the kick of a bullock; but that is merely a matter of conjecture. We found it broken when we reached Orange in the morning.
1677. Was the louvre made of thin stuff? Of pine.
1678. *Mr. Lyne.*] Do the louvres go right to the bottom? No; there is about a 3-inch board right at the bottom of the truck, and then louvred for about 18 inches or 2 feet up in the end. The louvre which was broken was 14 or 15 inches up.
1679. *Mr. Kethel.*] Was it the slot or the frame which was broken? The slot was broken right out.
1680. *Mr. Smith.*] Referring to the passage in your report in which you say, "Evans' truck was altered by myself, and 112 sheep loaded, the time occupied being 27 minutes." Mr. Wilkinson says, "The Evans truck was altered by Mr. Harper from a cattle truck to a sheep truck, and it took him 13 minutes to make this alteration. The truck was then brought up to a race, and the loading of it occupied 14 minutes. My truck was brought to the sheep yard as a cattle truck. I loaded the bottom deck first, which enabled me to walk into the bottom deck and distribute the sheep evenly. I lowered my deck from a cattle truck into a sheep truck while the sheep were being loaded. The alteration, the conversion, and the loading of my truck took 14 minutes";—is that true? No; it took 23 minutes, as I have stated in my report, to alter and load Mr. Wilkinson's truck.
1681. Mr. Wilkinson says, "That the time was taken by Mr. Roberts, traffic inspector at Junee?" Yes; and I have corroborated my statement since by comparison with Mr. Roberts' memorandum.
1682. Then you deny that the results were obtained as stated by Mr. Wilkinson? Yes; I took the time right through from the start until the finish of the loading, and that was 23 minutes.
1683. Then Mr. Wilkinson says, "I take exception to the 5th paragraph of Mr. Harper's report, in which he says:—'On reaching Darlington (34 miles from Carathool) it was found that both of the upper decks in the Wilkinson truck had given way some 5 or 6 inches, being completely twisted and strained, and threatening at any moment to fall altogether. At Mr. Wilkinson's request, and in the interests of humanity, a wire was sent to Narrandera to provide screw-jacks and timber to support the decks.' The facts are that there is a nut which runs in a slot which is fastened to the side of my deck. This slot runs in a groove, and this particular slot was about an inch shorter than any other slots, therefore it did not reach into the groove. It has not been altered. I have left the truck as it was so that the Committee may see the cause of the depression of the deck." What do you say to that? I attribute the collapse of the deck to the weakness of the deck itself.
1684. Did the deck bend? Yes.
1685. Would the effect of that bending be to draw the bolt out of the slot? Yes.
1686. Because it only fits in when it is perfectly horizontal? Yes.
1687. Is it your opinion, based upon your experience and observation, that the deck is not strong enough to carry a quantity of sheep? It is.
1688. Mr. Wilkinson says, "With regard to the weights of the trucks, I would point out that they have been weighed several times, and that on no two occasions have they weighed the same. There was a difference of cwts. in some instances";—what do you say to that? That is easily understood by anyone who has had experience.
1689. What was the difference? I think there was a difference of $2\frac{1}{2}$ cwt. in the Wilkinson truck; but that was when it was weighed after having run a trip through all the dry country.
1690. Was the difference of weight confined to the Wilkinson truck? No; there was a difference of $\frac{1}{2}$ of a hundredweight in Evans' truck.
1691. However great the differences may have been under different circumstances both trucks would be effected more or less alike? It would depend upon the class of timber in them; but I think that the Wilkinson truck would be more effected than the other, owing to there being more pine in it; and it is well known that pine will absorb moisture from the atmosphere without rain.
1692. What proportion of the Wilkinson truck consists of pine? I could not say; but a large proportion of it, on account of the louvres and the doors being made of pine.
1693. You do not attribute the difference to defective scales? I think we have fair average scales.
1694. Are they tested frequently? They are tested regularly once a month right throughout the lines.
1695. If they are found "out" to any appreciable extent they are adjusted? Yes. I may explain, with reference to the weighing at Junee Junction, that the bridge is in an awkward position. It will hold about four trucks between the bridge and the buffer stops. In weighing the trucks we had to keep the engine attached, and this jammed one of the trucks on to the bridge. With the buffers jammed it is impossible to weigh the trucks correctly. The only way of weighing them quite accurately is to have them unattached on the bridge. This accounts for the difference in the weights given at Junee and the weight at Granville.
1696. Mr. Wilkinson also says, "I also take exception to Mr. Harper's report where he states:—'The upper decks of the Wilkinson truck after all the gear had been adjusted took $7\frac{1}{2}$ minutes to raise.'" That was the time taken by yourself? Yes, after Mr. Wilkinson and others had been duly notified that I was going to alter it, and after the middle doors had been closed and adjusted.
1697. You did not include that in the time? No. The end doors were also adjusted. Mr. Wilkinson was inside the truck showing Mr. Downe where the break occurred.
1698. Who were present? Messrs Scott, Downe, and Kirkcaldie, my foreman, and about half-a-dozen shunters.
1699. By whose request were they there? By mine. I particularly asked them to be there in order that they might see the trucks after the trial.
1700. If Mr. Wilkinson says that Messrs. Downe and Kirkcaldie were there at his request;—that is not true? I distinctly deny that Mr. Kirkcaldie knew that the trucks were there until I invited them to go and see them. Whoever may have seen him afterwards I do not know, but I say that I was the first to give information on the subject.
1701. You say that the time— $7\frac{1}{2}$ minutes—was taken by you and noted? Yes.
1702. Mr. Wilkinson says, "We had no knowledge that the time was being taken by Mr. Harper";—is that true? Mr. Wilkinson was in the truck pointing out to Mr. Downe where the accident happened. I passed

passed a remark to him, "I am going to have the truck altered." He said, "Are you ready to alter it?" and I said yes. He said, "You had better get someone to alter it." Then I called a loading-porter, about one of the strongest men we have in the Department. Mr. Downe got out of the truck after being cautioned by Mr. Kirkcaldie that we were going to alter it. This man whom I specially selected got on top and wound the deck up while Mr. Wilkinson was adjusting the decks inside.

J. Harper,
Esq.
25 April, 1888.

1703. Mr. Wilkinson says, "I asked the man to raise the deck, and after he had raised it a certain distance I ordered him to stop. We then got inside the truck, and I pointed out to Mr. Downe how the slots were short. This examination took a minute or two, and then the man was told to wind the deck up to the top. The time that we were in the truck is included in the time which Mr. Harper says it took to convert the truck. The time taken in lifting my deck is 2 minutes";—is that a true statement? No; it occupied $7\frac{1}{4}$ minutes that morning, and the time that Messrs. Wilkinson and Downe were in the truck was not in any way included in that time.

1703 $\frac{1}{2}$. Mr. Wilkinson.] They helped to do part of the work in the truck? He adjusted the chains while there.

1704. Mr. Smith.] Then you say that his statement that they had no knowledge that you were going to take the time is untrue? Whether Mr. Wilkinson heard me I do not know, but I am satisfied that the others did, because Mr. Downe left the truck in order that the trial might be conducted.

1705. Mr. Wilkinson says, "I also take exception to the last paragraph, in which Mr. Harper says, 'The Wilkinson truck is 7 tons 15 cwt. 2 qrs. in weight; has had most unremitting attention, such as could never be paid to ordinary stock vehicles; has been repaired, and is to-day unfit to carry sheep';—do you reiterate that? I still maintain it.

1706. Mr. Wilkinson says, "I say that my truck has had no more attention than should be given to any other truck that was conveying stock";—what do you say to that? I say that it did.

1707. In what respect? In adjustment of the shutters and in keeping the stock on their feet. You could not get the most careful drover to work as hard as he did.

1708. Did he visit his truck frequently? Both trucks were visited frequently by both of us to inspect them during the journey.

1709. Mr. Wilkinson says, "The statement that the truck was being repaired is absolutely incorrect. No alteration has taken place since the trial, and the necessary repairs could be made for £1." Did you ever say that any alteration had taken place since the trial? I say that the deck was straightened and, if I am not mistaken—I will not say positively—a piece of timber was put on the deck. The screw-jacks and the weight of the sheep in the first instance straightened it, and since then it has been straightened still further, but how, I cannot say.

1710. I thought that the sheep bent it? The screw-jack being applied underneath and the weight of the sheep being on top would have the effect of straightening the dip in the truck. A prop was put underneath.

1711. With reference to a paragraph in your report which says, "Mr. Wilkinson's truck has carried stock four times, but not in competition, nor in any sense under the supervision of myself, nor, as well as I am aware, under that of any other office of the Department." Mr. Wilkinson says, "I take exception to this, as the truck was loaded in the presence of and under the superintendence of traffic inspector Henson";—is that true? He had no directions in the matter. I have ascertained, as a matter of fact, that if he was there he was not there officially.

1712. Mr. Wilkinson says, "The truck was unloaded in your presence?" I was at Homebush, but not in my official capacity. I had no instructions to report on the truck and I made no report about it.

1713. Did Mr. Wilkinson request that anyone should be at the loading or the unloading? No; I had no instructions.

1714. Referring to the paragraph in your report in which you say, "The Evans truck will carry as many or more stock as compared with the Wilkinson. The measurements of the two vehicles are my authorities for saying so." Mr. Wilkinson says, "Reference to the measurements will show that as a cattle truck there is more floor area in my truck than there is in Evans' truck";—what do you say to that? Three feet, I think.

1715. Mr. Wilkinson goes on to say, "And as a sheep van my truck has the same floor area as Evans'," 6 feet less. The flaps of Evans' truck being down decreases the area as a cattle truck. The measurements of the trucks as cattle trucks are—Evans' 7 feet 8 inches, Wilkinson's 7 feet 9 inches. The lengths are—Evans' 17 feet 3 inches, Wilkinson's 17 feet 6 inches. As a sheep van, Evans' truck is 7 feet 11 inches wide; the Wilkinson 17 feet 6 inches by 7 feet 9 inches.

1716. Mr. Wilkinson says, "That there is more floor area in his truck than there is in Evans'?" It is $6\frac{1}{2}$ feet less superficial floor area.

1717. Referring to the paragraph in your report in which you say, "With reference to the number of operations necessary to alter the waggons I may state that they have no value in relation to the practical working of them. The Evans truck has seventeen to convert it to a sheep van, the Wilkinson eight, but in each case they are principally of a minor character. At the conclusion of the trials the Evans truck was altered in $4\frac{1}{2}$ minutes, the Wilkinson truck in $7\frac{1}{2}$ minutes." Mr. Wilkinson says, "I say that the seventeen conversions are important";—what do you include in those conversions? There are six flaps to be raised, a bar to be lowered, and four bars to be put in to divide the sheep and the opening of the doors.

1718. In the number of operations which you mention you do not include the division at all? I include the shutting of the middle doors.

1719. You have spoken about the usefulness of the combination truck for dead meat carriage. You consider both of the trucks an improvement on the old-fashioned method and as good as the patent American method? I say that both can be readily converted to the Tiffney type of truck.

1720. You say that the difference would be in the roof; that whereas the roof of Evans truck would be of sufficient strength to carry 4 tons of meat the upper deck of Wilkinson's truck, as at present formed, would not hold 4 tons? That is so.

1721. How many tons of actual dead weight were there on the upper deck of Wilkinson's truck when it collapsed? About 2 tons 3 cwt.

1722. In order to use that truck for the purpose of carrying dead meat it would have to stand nearly double that weight hung from the roof by hooks? More than double the weight, as the weight would be below instead of above. It would be a dragging weight instead of a pressing weight.

1723.

J. Harper,
Esq.
25 April, 1888.

1723. Are you capable of speaking as to the facilities for loading these two trucks at the present yards? As far as that is concerned both have disadvantages on account of the difference in the distances between the posts and the flaps of different yards for loading purposes.

1724. Is the Wilkinson truck adapted in every way to the present yards for loading sheep? Not more than the Evans truck. It is not adapted to some of the yards.

1725. Why? Because he requires to move his truck to close his doors when loading from the side. He has the same half doors at the end as Evans has.

1726. Why have the trucks to be removed? In order to clear the posts, because the races are too near to allow the doors to swing to until the truck is moved away.

1727. *Mr. Lyne.*] Are you sure of that? It occurred at Carrathool.

1728. Is that an ordinary platform? An ordinary sheep loading race.

1729. *Mr. Smith.*] Then it is not true that one of the chief merits of the Wilkinson truck is that it is perfectly adapted to the present yards? It is not.

1730. What has to be done to adjust it as it is at present formed? I do not think that the bottom flap will fit over the flap of the lower race.

1731. What had you to do with the truck? We had to remove the truck three or four times; that was at Carrathool.

1732. Is not a large quantity of stock trucked from there? I think that Carrathool was about the fifth largest loading station last year.

1733. How many conveniences are there there for loading? Only one yard and two races.

1734. Had you to move the Evans truck as often as the Wilkinson truck? The Wilkinson truck was moved oftener than the other.

1735. Was it necessary to move it? Yes, otherwise it would not have been moved.

1736. So that whatever other merits Wilkinson's truck may have it requires just as much moving as the Evans truck? It did at that yard; that is all that I have seen of its working in that respect.

1737. *Mr. Kethel.*] In your report you state, "The whole of the cattle in the Evans truck were on their feet throughout the journey and were unloaded in 2½ minutes. Those in the Wilkinson truck, exclusive of the beast that was down, were 14½ minutes unloading, a fact the unloaders attribute to the van being too close to enable them to work the cattle." What is the meaning of that? About half of the Wilkinson truck is boarded up or occupied by doors, and the other half is occupied by perpendicular bars, crossed by horizontal wooden bars, with intervals of 3 or 4 or possibly 6 inches between them. In unloading cattle the unloaders have to poke them up so as to start them running out of the truck, and if there was an obstinate beast in one corner of the truck we could not get at it. I have conveyed the expression of opinion of the people who unloaded the truck.

1738. *Mr. Wilkinson.*] In one part of your report you state, "Those in the Wilkinson truck, exclusive of the beast that was down, were 14½ minutes unloading, a fact the unloaders attribute to the van being too close to enable them to work the cattle." Lower down you say, "The time occupied in unloading was—the Evans truck, 7 minutes; the Wilkinson truck, 5 minutes." Is it not a fact that in the Evans truck there were seven cattle and in my truck nine? Yes.

1739. And in that instance I beat the Evans truck by 2 minutes in the unloading? Yes.

1740. You make no remark in that instance about the truck being too close? No remark was passed by unloaders.

1741. According to your own showing, the first statement which you have recorded must have been a fallacy? I have drawn no deductions. I merely repeated what the unloaders said.

1742. You say that you were present in your official capacity when the five cattle and fifty sheep were unloaded from my truck? Yes.

1743. You know that Inspector Henson was present at the loading, but not officially? I do not know; but I know that he had no instructions, because the papers came through my office. The instructions which were given were that you were to be allowed to make the trial.

1744. Would the instructions necessarily go through you? Yes; he takes all his instructions with reference to stock from me.

1745. Did you give special instructions with reference to the cattle in transit as to what trains they were to be sent by? In all probability I gave instructions that they should come on by the first train; that is all that I did. Such an instruction as that may have been sent from the office in the ordinary course.

1746. You say that no special instructions were given with reference to the first trial? I say distinctly that I personally gave no instructions.

1747. Do you know whether any were given? That I cannot say. I know that Inspector Henson received no instructions.

1748. Do you know whether Mr. Kirkcaldie or Mr. Read gave special instructions with reference to this trial? I do not know, but I do not think so.

1749. Is it not a fact, with regard to the wide-horned bullock to which I took exception, that you tried to get it into the Evans truck, and could not? I have already explained that there were ten bullocks in the yard, and that only eight could get into the truck, and that this bullock was one of the two left behind.

1750. Is it not a fact that his horns were so broad that he could hardly go through the race? Most decidedly.

1751. Is it not a fact that he passed into the race three times and passed back again whilst you were loading the Evans truck? Yes.

1752. A bullock which had been put into a race three times, and which had forced his way back again, would naturally be sulky? I think he was sulky before he went into the race.

1753. *Mr. Smith.*] No one refused to receive him for the Evans truck? If he had gone through he would have gone in.

1754. *Mr. Wilkinson.*] Is it a fact that on the first trial I left you close to Nevertire? Yes.

1755. Up to that time the cattle were getting on well in both trucks? Yes; and so they did all the way through to Bathurst.

1756. Is it a fact that on the journey down, between Katoomba and Homebush, cattle which had been down got up themselves unassisted? Yes.

1757. Is it not usual for people in charge of cattle to try to get them up when they are down? It all depends upon the position that they are in. If they are in a dangerous position the men would get them up.

up. If the cattle were foot-sore or tired the persons in charge would leave them down if they were not in the way of others.

1758. Would any man in charge of cattle think of leaving three head down without trying to get them up? Most decidedly not.

1759. Did you make any remark on the passage down after I left you with reference to the heat in my truck and in Evans' ? I may have done so.

1760. Did you ever state, on different occasions after I left you, that the heat in my truck was 10 degrees higher than it was in Evans' truck? I did not. I said that the thermometer in one of the trucks was destroyed at Nyngan, and there was only one thermometer available between the two trucks, which was shifted from one to the other. Between two stations on the road we found that the thermometer had changed 6 degrees, and a remark may have been passed about that.

1761. Did you state to anyone that my truck was 10 degrees hotter than Evans' truck? I never did.

1762. Is this declaration by Mr. Robert Allen Fraser, Superintendent of Roads, true? No; it is not. Whatever expressions I may have used to any of our officers, I refuse to have them considered in that way.

[Mr. Smith objected to the production of the declaration, and the Chairman ruled that it was inadmissible.]

1763. You made a remark with reference to my truck, that it received more attention than should be given to it? More attention than would be given to an ordinary truck.

1764. If a person was in charge of a consignment of stock, would he not give all the attention that he could to them? He should do so most decidedly; but unfortunately our experience is that this is not done.

1765. Is it not a fact that the Department allow a pass for a certain number of trucks, and that the person who has that pass is supposed to devote his attention to the consignment? Yes.

1766. You say that you have no official knowledge of the first trial. Have you noticed a minute from the Commissioner as to some of the sheep conveyed on that occasion being small and others large? I have.

1767. How did the Commissioner get that knowledge? I cannot say. I say most emphatically that he did not get it directly or indirectly from me, nor did he ask me for it.

1768. After thinking over the matter, do you say that Messrs. Downe, Kirkcaldie, and Scott inspected the truck on your invitation? Most decidedly I do.

1769. Did you see Mr. Downe come there? Of course I did. You and I were waiting there until they arrived.

1770. You are quite certain of that? Positive.

1771. Do you not think it an extraordinary thing that, if they were there, they did not notice you taking the time? I do not know what to think or to say about it. They all knew that I was taking the time. Mr. Kirkcaldie cautioned you and Mr. Downe to get out of the road, and Mr. Kirkcaldie looked at my watch and saw the time.

1772. Have you seen a minute in which Mr. Kirkcaldie states that he had no knowledge that the time was being taken? I see it now.

1773. Do you think it at all consistent that these two gentlemen should be there and should not remember these things? I know that it is perfectly consistent, because both gentlemen have told me that they have an indistinct recollection, but they are not sufficiently clear to speak with confidence.

1774. Do you know that my side doors fit the existing sheep trucking yards? At some of them they do, and at some of them they do not. I do not know that they would fit all of them, but I would not speak with confidence.

1775. In carrying dead meat in the Tiffney car the meat is not hung from the roof by hooks? No.*

1776. *Mr. Smith.*] It appears by the report that there were nine cattle in the Wilkinson truck, whereas there were only eight in the Evans. Can you tell me whether the nine weighed as much as the eight? The nine weighed less than the eight.

1777. *Mr. Wilkinson.*] But only seven out of the eight head of cattle in Evans' truck arrived at Homebush? Yes.

1778. *Mr. Smith.*] As to the difference of a ton in the weight of the two trucks, do you regard that as being of much importance to the Department? It is the most important feature of the whole lot.

1779. Have you calculated what difference in the expenditure that ton would make to the Department in the year? It costs 301d. per mile for every ton we haul.

1780. How many miles do the trucks average in the year? From a return prepared the other day, I find that the mileage of live-stock vehicles in the year was about 12,000,000 miles.

1781. *Mr. Wilkinson.*] If my truck were reduced to the same weight as Evans' there would be no discrepancy? None.

1782. *Mr. Smith.*] If it were altered to an exact copy of Evans' it would be as good? Yes.

1783. The floor is now the same? Not altogether.

1784. What would be the saving of 1 ton in the mileage amount to in the year? About £15,000.

1785. So that if the Government were to pay £16,000 for Evans' patent it would pay for itself in one year compared with Wilkinson's truck? That would be so.

1786. *Chairman.*] If you refer to page 4 of your report you will see a discrepancy in the weights of Wilkinson's truck. In one case it is given at 7 tons 8 cwt., and in another at 7 tons 18 cwt. How do you account for that? It is a misprint.

1787. *Mr. Smith.*] Speaking from your experience of the Department, do you think there can be any question as to combination trucks being an advantage to the Department? There can be no question whatever about it. It would save us thousands of pounds.

1788. From your experience of that particular Department, and from what you have seen of the two trucks, are you in a position to say which you consider the best, the one which is likely to be most profitable to the Department, quite apart from the weight question? I consider that Evans' truck is the best combination truck that I have seen, including Wilkinson's and Mulholland's.

1789. Even apart from the weight consideration altogether? Yes.

1790. *Mr. Lyne.*] Then you have formed an opinion as to Mulholland's truck? I have seen the working parts of it, and formed an opinion on them; and I have seen it after two trials. I have formed no official opinion,—I have made no official report.

1791. *Mr. Smith.*] You have seen the Perry truck? No; I saw a model of it, but I paid no particular attention to it.

1792.

* See note to answer No. 1,622.

- J. Harper, Esq.
25 April, 1888.
1792. Do you think that the principle of the floor of Wilkinson's truck is a good one? I do not consider any horizontal floor a good one.
1793. Speaking of horizontal floors generally, quite apart from Wilkinson's truck, does your experience lead you to approve of or object to them? I object to them, because you cannot get power enough to raise them after they have been used. My first experience of them was with Mr. Downe's truck ten or eleven years ago. That truck had a horizontal deck which was lowered to the floor. It was raised by gear from below. It made one or two trials, but we were never able to raise the deck, and the truck was put by.
1794. Why were you not able to raise the deck? It had gone out of adjustment. It is a difficult matter to keep a horizontal deck of such length and width in correct adjustment.
1795. Was that experience of such a nature as would lead you to condemn horizontal floors generally? Yes; and I have heard since of the experience of horizontal floors in Victoria.
1796. Leaving out of consideration what you heard, from what you saw then you formed this objection to horizontal floors? Yes.
1797. After seeing Mr. Wilkinson's horizontal floor do you think that he has got rid of these objections? I do not think so.
1798. I understood you to say that the flaps of Wilkinson's trucks might fit some of the present yards, but would not fit all? They would not fit all. It would be impossible to get a truck which would fit all of them. The present sheep vans are the only ones which are adapted to them all, because those vans have sliding doors.
1799. *Mr. Wilkinson.*] What position did you hold in the office prior to taking the position of goods superintendent? I was clerk-in-charge of the Sydney goods department.
1800. Who was the officer-in-charge? The goods superintendent was Mr. Evans; but I was as independent of him as I was of anyone.
1801. You have succeeded Mr. Evans in that position? Yes.
1802. Is it not a natural sequence that his influence was great when he was in charge of the stores? Not necessarily.
1803. *Mr. Lyne.*] Mr. Evans was over the Department in which you were clerk? Yes.
1804. *Mr. Smith.*] You know what this means, what the imputation is: that having been under Mr. Evans, you are biassed in his favour. I ask you whether you were under Mr. Evans in the sense of being amenable to his orders? In no way whatever. He had no more to do with me than the members of the Committee have.
1805. Had he any power over you in any official position except with express authority? No more than he had over any other station-master on the line.
1806. *Mr. Wilkinson.*] Were you station-master? Yes; and before Mr. Evans was appointed goods superintendent.
1807. Were you head clerk under Mr. Evans? Never.
1808. Were you never head clerk in the goods office? I was station-master, and goods clerk-in-charge of the goods office.
1809. Who was your superior officer? My immediate superior officer was the goods superintendent.
1810. Who was he? Mr. Evans.
1811. *Mr. Lyne.*] Just now you made an emphatic statement that combination trucks were superior to ordinary trucks? Yes.
1812. Are you aware that Messrs. Kirkcaldie and Read have said the reverse? I do not know what they have said.
1813. Suppose they have said so, you think they are mistaken as to the advantages to be derived from combination trucks? I distinctly say they are.
1814. Have you had any experience of the end-loading of sheep? None whatever.
1815. Do you know whether it is an advantage or a disadvantage? I cannot say. I will give you an instance of what occurs almost every day, to show you the advantage of a combination truck. We had to shift forty-five trucks of sheep from Bungendore for Mr. Rutledge. We had to send forty-five empty trucks from Homebush. On the road at Goulburn we passed thirty cattle waggons, as there were no orders in that district. The sheep were taken across country to Nevertire, and were discharged there. We loaded ten of the trucks back again from Nevertire. We were loading cattle at Bourke and Nyngan, and we had to send cattle trucks from Homebush to those places. As there were heavy truckings of sheep at Mudgee, Dubbo, and Kelso, we had to bring the remaining sheep vans back to these stations empty. The result was that there were 16,000 miles of empty running with forty-five trucks. Had the thirty trucks at Goulburn been combination trucks, they could have been used to convey Mr. Rutledge's sheep to Nevertire, and then could have been used for cattle on the return journey.
1816. You stated that at one place Wilkinson's truck had to be moved backwards and forwards to load it with sheep? Yes; at Carrathool.
1817. Why is there such a difference in the various yards? I do not know. There is a difference in the races, and in the flaps, and in the height of the races. You can scarcely find two or three races alike.
1818. That being so, if end-loading was an advantage all the difficulty of moving the trucks would be overcome? There would be no difficulty in this respect in loading the trucks if they were loaded from the end.
1819. Is it not hard work to move the trucks backwards and forwards when you have not an engine to assist you? It depends upon the road, and the number of men you have. A couple of men can move them.
1820. You know from experience that the way in which the trucks are usually loaded is to run them up to the race, load them, and then hand-spike them away, and bring other trucks up? Yes.
1821. Does that not involve great labour? Yes.
1822. And it would be a great advantage if that could be overcome? Yes.
1823. You will agree that with end-loading there would be no necessity for that? That I cannot speak of.
1824. Supposing that an engine shunts the trucks up to the race, and that one truck is put at the race to admit the sheep, and they are run through from the whole of the trucks to the end without moving at all, would not that be a great advantage and saving? It would if the sheep could be properly distributed.
1825. You said that when the upper deck of Wilkinson's truck got out of repair coming from Carrathool the

the weight of the sheep and the use of the screw-jack straightened it. How do you explain that? You understand that there is a truss-rod running through the centre of the truck, this was bent, and the deck itself was bent. The sheep were on the dock, and the screw-jack was applied underneath, and the pressure being applied to the middle straightened up the edges.

J. Harper,
Esq.
25 April, 1888.

1826. I suppose there is a certain amount of springiness or elasticity in the deck? I do not think so. There is too much iron in it.

1827. You think that it would readjust itself to a certain extent when the weight was taken off? I do not think it would.

1828. You are aware that there is a discrepancy in the weights of the trucks at various points? Yes.

1829. You are aware that the trucks weigh differently according to the atmosphere in all cases? Yes.

1830. It does not matter much what the trucks are or where they are weighed, but in different weathers they will weigh different weights in consequence of the absorption of moisture? Yes.

1831. *Mr. Smith.*] The instance which you have mentioned of there being so much dead travelling is only one of a great many? It occurs every day; but the case to which I referred came under my notice a day or two ago, and it almost startled me when I saw the empty running made over that particular transaction.

Henry Hudson, Esq., called in, sworn, and examined:—

1832. *Chairman.*] What are you? A contractor.

1833. Have you had anything to do with the manufacture of combination trucks as submitted to you by the inventors? I have.

H. Hudson,
Esq.
25 April, 1888.

1834. Will you explain to the Committee why, in the face of a letter from yourself to Mr. George Evans, in which you estimate the cost of the complete manufacture of his combination truck at £174, including the wheels, axles, and bearing springs; which are supplied by the Government, and which you say cost £40, the Government afterwards paid you £265 for each of these trucks constructed, or a difference of £80 or £90 each as compared with your estimate? It is so long ago that I forget. Perhaps I made the estimate from a model; I do not know. In fact it is new to me that I did write such a letter. I did not know that I had written such a letter, but I suppose I did. As the letter has been produced, it is evident I wrote it; but I have not the slightest recollection of having written it.

1835. Can you give the Committee any idea how it was that the cost was so largely increased? The cars were built entirely under Mr. Evans' own inspection, and, as Mr. Evans is here, he will admit that I demurred several times to putting in so much work. I urged that it was not necessary, that it was aggravating the cost of the truck without anything as a recompense for it. I can remember that.

1836. Can you give us any idea what would be the cost of the construction of the present Evans truck, and the present Wilkinson truck? I should say that the present Evans truck would be worth £200. That estimate of £174 is too low; I have no doubt about that. We are all apt to make mistakes, and I made a mistake in this instance.

1837. At that time you had not constructed any trucks on that model? I entirely forget how that letter came about; whether I estimated from the model, a description, or what. Had it not been that the letter was here, I should have said that I had not written it.

1838. What do you think that the Evans truck can be constructed for at present? £200.

1839. And the Wilkinson truck? It will cost rather more; £25 or £30 more.

1840. Then you think that the Evans truck can be constructed for £200, and the Wilkinson truck for £225 or £230? That is my belief.

1841. *Mr. Kethel.*] Would that be for the manufacture of one or two trucks, or a quantity? It makes a difference if you manufacture a quantity; but I say, estimating approximately, that if we got an order for, say, twenty trucks, we could build them at those rates.

1842. Suppose you got an order for 200 trucks? The cost would be reduced considerably, because we would then make dies of all the work, and stamp it instead of making it by hand. This would apply particularly to the blacksmith work, which is very expensive.

1843. *Chairman.*] Have you constructed each of these trucks? Yes.

1844. Therefore you are in a position to offer an opinion as to the relative cost? Yes.

1845. Have you any interest, direct or indirect, in the Evans or the Wilkinson patent? I have not in the Evans, but I have in the Wilkinson.

1846. *Mr. Smith.*] Glasson and Company are a firm who manufacture this sort of work, and I am told that they have given an estimate, after seeing the Evans truck, that they will undertake to make them at £140 apiece. I presume that they have gone into a calculation. Would you be in a position to say that they could not make it pay at that? I should say certainly they could not make it pay. I know that we cannot, and I think that we have as good appliances to do the work as they have.

1847. Up to what amount would you feel justified in saying that they could not do it to make it pay; suppose we say £160? What I mean by making it pay is that the manufacturer should certainly get 20 per cent. profit. I should say that £160 would be about the net cost.

1848. So that £200 would leave about 20 per cent. profit? Yes.

1849. *Mr. Kethel.*] In the amount paid to you by the Government for the manufacture of these trucks—namely £265—was the whole of that your charges, or did it include royalty? That amount represented our charges. There was no royalty paid. We got that sum.

1850. *Mr. Smith.*] Have you ever paid Mr. Evans any money whatever in connection with his trucks? Never a brass farthing.

1851. Or given him a valuable consideration of any kind whatever? None whatever.

1852. Are you indebted to him anything on them? Not that I am aware of.

1853. *Mr. Wilkinson.*] Were you ever a partner with Mr. Evans in his patent? I am not now, of course; the inducement held out to me at the time when the patent was taken out was that we were to have the sole right of manufacture, and if the thing turned out successfully we should afterwards confer with Mr. Evans and those jointly with him, and be recognized in a nominal way; that was the extent of our interest.

1854. Was not the patent taken out in your name in conjunction with others? I think it was taken out in my name to the best of my recollection; it is so long ago that I do not remember; but Mr. Evans had all to do with it.

1855.

- H. Hudson, Esq.
25 April, 1888.
1855. Can you recollect whether in December, 1883, you had an interest in the truck? I really cannot connect 1883 with the trucks.
1856. Do you recollect Mr. Evans writing a letter with reference to the cost of construction of the trucks? No; the letter giving the estimate of the cost was the first letter written on the subject I presume.
1857. Was the patent in your name at that time? I do not know; I do not know whether it was patented then.
1858. Were you ever asked at any time by Mr. Evans to give up a portion of your interest? Yes.
1859. Did ever a dispute occur between you and Mr. Evans with reference to the royalty on the truck? No; Mr. Evans asked me if I would forego my interest in it, because the cost was so much that the other parties interested felt sure that they could not get anything out of it; of course I said that I had no objection.
1860. Did anything occur between you and Mr. Evans with reference to the sale made by him of a share in his truck for £800?
- [Mr. Smith objected to the question.]
1861. *Chairman.*] You said that you were asked to give up a portion of your interest in the truck; what did that interest consist of? The right to manufacture, and as I said before, an indefinite interest which was to be arranged at some future date, when the success of the thing was established.
1862. *Mr. Smith.*] You never paid any money, nor ever gave any consideration whatever for it? None whatever.
1863. Is it not a fact that Mr. Evans represented to you that, being in a public position, he did not care to patent it in his own name, and that he asked you to patent it in your name? That is so.
1864. Is it not a fact that you afterwards conveyed back to him whatever interest (if any) you ever had without any consideration whatever? Just so.
1865. You did that on the request of his solicitor? Yes.
1866. *Mr. Wilkinson.*] Was it not through some sale that Mr. Evans made that he asked you to forego a portion of your share? That is more than I can say; to the best of my recollection Mr. Evans said that the cost of the truck was so much in excess of what was anticipated that the people who were associated with him did not see any chance of getting any profit, and he wanted to know if I would forego my interest, and I said yes.
1867. Have I ever received any consideration from you for the share you held in my truck? Not a brass farthing.
1868. *Mr. Smith.*] What is the arrangement between you and Mr. Wilkinson; what shares have you? We have not defined that exactly; it has to await development.
1869. *Mr. Lyne.*] Do I understand you to say that you have the same arrangement with Mr. Wilkinson as you had with Mr. Evans? We are to have the sole right of manufacture, and when the thing is developed we are to arrange what the proportions shall be.
1870. That is exactly the same interest as you had with Mr. Evans? Yes; the only difference is that one arrangement is rescinded and the other is in force.

WEDNESDAY, 2 MAY, 1888.

Present:—

MR. BRUNKER,

MR. KETHEL.

T. H. HASSALL, ESQ., IN THE CHAIR.

J. McLaughlin, Esq., Solicitor, appeared on behalf of the proprietors of the Evans Australian Combination Truck. W. B. Wilkinson, Esq., appeared in person.

Warden Harry Graves, Esq., called in, sworn, and examined:—

- W. H. Graves, Esq.
2 May, 1888.
1871. *Chairman.*] What are you? A stock and station agent, residing in Sydney.
1872. Have you had large experience of the trucking of stock? I have not put many in the trucks myself, but I have had great experience in everything pertaining to stock, including trucking.
1873. As a man of business have you received thousands of cattle and sheep consigned by rail to your firm for sale? Yes; hundreds of thousands.
1874. Consequently you have had exceptional opportunities to judge of the condition of the stock as conveyed by these trucks? Yes; I have been engaged in this business for thirty years, I have been nearly ten years selling in Sydney. I was about seven or eight years in Melbourne, and I was at Deniliquin.
1875. Have you any knowledge of the new combination trucks which have lately been in use on the railways? I have seen the Evans and Wilkinson trucks, but I have not seen any others.
1876. Have you examined them carefully? Yes.
1877. As a practical man what is your opinion as to the merits or the demerits of the two trucks? In my opinion Wilkinson's is very much the better of the two. Here I would observe that I consider that Mr. Evans is a greater friend of mine than Mr. Wilkinson is. I met Mr. Evans in the street one day, and he asked me if I had seen the trucks, and, if I had, which I considered the better of the two. I replied, "You are a great friend of mine, but I am bound to say that I consider Mr. Wilkinson's the better of the two." He said, "I like a man to speak straightforwardly." I mention this fact to show that I am no partisan.
1878. You are giving your evidence as a practical man? Yes, for what it is worth, based on my experience.
1879. In what do you think the excellence of Wilkinson's truck consists? I think its chief recommendation is the end-loading; that is the vital difference between the two trucks. I consider end-loading very much preferable to side-loading. I have not seen many stock loaded at the end, but I can see how it would work. I know, as a matter of fact, that end-loading must be the better system of the two.
1880. Once you get stock moving in one direction in a race in a yard or in a race in a truck, it naturally stands to reason that they will follow each other, and lead up as long as you can guide them and put the requisite

requisite number in the trucks? Yes, you can do that without any stoppage. I do not think there is the slightest comparison between the two systems. I do not see how any practical man can possibly say anything different from what I say.

1881. *Mr. Brunker.*] You think that there would be a saving of time and labour by adopting the end loading system? Yes; and you would save knocking the sheep about too. As to the saving of labour, I will give you an instance. On the Jerilderie and Narrandera line there is a station called Colombo, and frequently we have stock from there, and, as I am informed and as I verily believe, there has never been an engine there to shift the side-loading trucks. Of course, you know that as each of these trucks is loaded it has to be shifted. I had to send men from Narrandera for the purpose of shifting these trucks, and I have had to pay their railway fare; the Department would not allow me to send them without. If they had been end-loading trucks of course that would have been all avoided. With the side-loading trucks you have to shift each truck as it is loaded, and the loading may take two, three, or four hours, according to the number of sheep, whereas, if you had end-loading trucks the sheep would go in in a string. Of course there would be occasional interruptions from one cause or another. I am sure the end-loading must knock the sheep about less. It is obvious that this must be the case.

1882. *Chairman.*] In that essential requisite, facility for loading stock and obviating the necessity for knocking them about, you are in favour of the end-loading system? Decidedly.

1883. *Mr. McLaughlin.*] Have you ever seen any trucks loaded from the end? No.

1884. Then your idea is simply a speculation? Not at all; it is a positive certainty. I can see that if sheep go in in a continuous stream there must be much less knocking about of them.

1885. But that is a speculation? I will swear to it positively. There is no speculation about it.

1886. Is there not a possibility of getting a block in the gangways between the trucks as the sheep are passing through? Of course, there is every chance of their getting temporarily stopped, but a man can walk right through the truck and free them. But the sheep might jam just as readily in the other truck. I should say that there was ten times as much knocking about of sheep in side-loading as there is in end-loading. With loading at the side you may get one sheep in and it may run back, you may get another in, and then there may be a rush of three, four, or five all at once, and they may jam in the doorway exactly as they might jam in the inside doorway in the end-loading truck. The advantage of the end-loading truck for loading sheep is that the sheep can see daylight through, and they rush ahead. But with the side-loading truck there is very great difficulty in getting them in. They are obstinate, stupid, animals, and you have to force them in. When you get them in a certain distance there is the greatest trouble to get them on to the other portions of the truck, and a man has to squeeze himself in the best way he can to try to ease them off; and when it comes to the last few, to get them in you have to use almost violence, and shove them in anyhow on top of one another to get the door shut. In the end-loading system a man can go from one end of a truck to another, and if the sheep halt on the platform between the trucks he can go and send them along, as he would in the yard. They are not more likely to jam in the trucks than they are in any race. If you were racing sheep in a race half as wide as this table they would be just as likely to stop in that as they would in the gangway between the trucks. When each truck is loaded, that is when the full number is in, you can shut it off, and load the next one in the same way, and so on.

1887. *Mr. Brunker.*] There would be less difficulty in breaking a block at the end of a truck where sheep were running than there would be in forcing them in at the side of a side-loading truck? Very much.

1888. *Mr. Wilkinson.*] Is it an advantage, in your opinion, to have a truck which will carry two classes of stock if necessary, say half cattle and half sheep? It will be an advantage to have it, but it may not be often required. I suppose that as the small railways go into the interior it will be an advantage. It cannot be an injury, and it must occasionally be an advantage. It will be an advantage to small settlers who may have two or three fat bullocks and a few sheep to send to market.

1889. Is it an advantage to be able to shut the cattle out from the view, if you do not interfere with the ventilation? It is decidedly better if they cannot see out. They do not get frightened when the train is being shunted at stations.

1890. Is it an advantage to have open flaps in the roof of the truck so that people can walk through in loading sheep? That is one of the advantages of the truck which I have been explaining.

1891. You have some knowledge of a consignment of half sheep and half cattle which came down in my truck? Yes. It came to me from Mr. Thomas Baird. I saw the stock come out of the truck.

1892. In a minute written by Mr. Goodchap he says,—“I learn that the sheep sent were very small, recently shorn, and that the cattle were of the smallest and tamest”;—is that so? It is not the case; they were not recently shorn, and they were not small. They were medium quality fair sized sheep. As to the cattle being small and tame, I did not see anything tame about them. It being an off day when they arrived I had Mr. George Turner, the butcher, there, with a view to sell the cattle to him, and I found that they were just as wild as any other cattle.

1893. *Chairman.*] I suppose that they were an ordinary consignment? Most decidedly.

1894. *Mr. Brunker.*] The sheep were not shorn specially for the truck? Not at all. They were an ordinary consignment in every shape and form.

John Brown, Esq., called in, sworn, and examined:—

1895. *Chairman.*] What are you? Designer and inspector of rolling stock for the Government.

1896. In your capacity have you had an opportunity of examining the Evans and the Wilkinson trucks? Yes. I have examined both, but I have not closely examined Wilkinson's because it was taken out before I had time to go fairly through it. I examined it sufficiently to know its general features.

1897. Do you know that the Evans truck has been in use for something like two years? Nearly three, I think.

1898. Has it during that time borne the strain of the conveyance of stock in a fair manner? Yes.

1899. Equally as well as the ordinary cattle trucks in use previously? Taking the general construction of the truck, I think better.

1900. Has it cost less in repairs? It has only had minor repairs. It has never cost anything for large repairs at all.

1901. You think that it has answered the purpose for which it was designed in conveying goods and stock? Yes.

- J. Brown, Esq.
2 May, 1888.
1902. You say that you have not inspected the Wilkinson truck closely? I have inspected it as to its general build, but not sufficiently to give an exact estimate of its cost.
1903. Speaking approximately, what do you think would be the cost of it compared with the cost of the Evans truck? I should think that there would be about £60 difference in the cost of the original construction of the truck in favour of the Evans.
1904. Have you any knowledge of end-loading? Not in trucks. I have had a good deal of experience of sheep in pens and shearing sheds.
1905. Judging from your experience do you think that end-loading is an advantage as applied to trucks? I certainly do not think so. We have closed up eighty-five *trucks which were provided with openings for end-loading years ago. I have been employed at that for a long time, closing the doors, in fact removing them altogether.
1906. *Mr. Brunker.*] What are your objections to end-loading? I think that when sheep start to run they will run to the furthest end in a body, and it is very difficult to stop them when they are fairly started.
1907. You think it would be difficult to block them? That is my experience.
1908. You do not think it possible to load them up by a man standing in the gangway? You might stop them if you stood in the gangway, but it would be very troublesome, I have seen a sheep jump on top of a man and knock him down, and the other sheep continue to jump over him; I have seen them jump into water when they have started to run.
1909. *Chairman.*] As a designer and constructor what is your opinion as to the respective merits of the two trucks? I have an objection to the Wilkinson truck on the ground that the top deck has to be removed into the roof, and it requires hand-power sufficient to lift the whole floor into the roof. I think that that is more than one man could do if the deck was heavy enough to bear the weight of the sheep.
1910. You think that the deck would have to be of such strength to carry a consignment of sheep that it would be almost impossible for one man to raise it? Yes; by manual power.
1911. Does the Evans truck labour under that disability? No; there is only a beam to lift. The floor forms the sides. It is utilised for two purposes.
1912. *Mr. Kethel.*] What is the reason that the Wilkinson truck will cost £60 more in original construction than the Evans? There is such a number of hinges, which I could not put down at less than £10 a ton more than the Evans ironwork, and the nature of the ironwork is worth £10 more. There is fully half a ton more of it. Then there are about 100 feet more of timber required and more labour would be necessary for the building of it. Taking it altogether, as at present constructed, it would cost £60 more than the Evans truck.
1913. Have you any idea as to the weight of the upper deck of the Wilkinson truck. I think that as a whole it would weigh a little over 6 cwt.
1914. When you said just now that it would be impossible for one man to lift the upper deck do you mean with the appliances at present fixed on the truck? I mean that a man might raise the present deck; but it is not strong enough. It should be heavier; and then a man could not lift it. I do not think the deck is strong enough to undergo the strain which would be put upon it in carrying a load of sheep.
1915. *Mr. McLaughlin.*] How many doors are there in Wilkinson's truck? Thirty-six that I might call doors proper. Then there are other fastenings which are hinged which require to be considered in the cost of the truck. Then there are sliding doors. I think there are about forty altogether.
1916. Would not the end doors have the effect of weakening the truck? Certainly, very much.
1917. Is it not necessary sometimes to brace the ends of ordinary cattle trucks? We have not done so, but it is necessary in many cases. We have not done so because there are so many cross-bars which interlock with the uprights in the ordinary cattle trucks, but these are cut in two in the Wilkinson truck.
1918. The brake vans have been braced up? Yes, and our "C" vans have been braced. I think that the bracing will come to the cattle trucks next.
1919. With the end-loading doors could you possibly brace up these trucks? Not sufficiently. The space between the doors and the side is too narrow for a sufficient brace.
1920. *Mr. Wilkinson.*] How long have you been in the Government Service? About ten years.
1921. Are you the designer of a new truck? I am the designer of a new "D" truck which is about to be built.
1922. Have you patented it? No.
1923. In what employ were you before you entered the Government Service? Glasson's, Harvey's, and Hudsons', in Sydney.
1924. How many parts are there in Evans' deck? Eight, I think.

Edward Andrew Loughrey, Esq., called in, sworn, and examined:—

- E. A. Loughrey, Esq.
2 May, 1888.
1925. *Chairman.*] What are you? Travelling Locomotive Inspector in the Government Service.
1926. *Mr. McLaughlin.*] Are you acquainted with the Evans' combination truck? Yes.
1927. How long has it been running on the railways? About two years.
1928. Have you always found it answer the purpose of a merchandise as well as a cattle and sheep truck? Yes; I have found it very suitable.
1929. As suitable as the ordinary cattle and sheep trucks? More so.
1930. Is it more substantial—does it cost less for repairs than the ordinary trucks? I could not say anything about that.
1931. Have you seen Wilkinson's truck? Yes.
1932. Do you think that it is as suitable as Evans'? It is not, in my opinion.
1933. Will you give your reasons? Comparing one with the other, Evans' truck is the simplest in design and the most strongly constructed. It is lighter; it would cost less to make and keep in repair, and it affords better facilities for cleaning. The top decks are lowered to the sides. They stand on end, and a man can wash the top decks and the bottom at the same time, and the droppings fall away much better and quicker than in the other truck. It affords better ventilation for live-stock, and there is less chance of the beasts injuring themselves by getting their legs or horns fast during transit.

1934.

*NOTE (on revision):—I think about eighty-five.

1934. Can they get their horns and legs fastened in Wilkinson's truck? They can.
1935. What difference would there be in the haulage? On our ordinary grades of one in forty, of which we have a great many, it would make a difference of about a truck in a train; that is to say, there would be one more of Evans' trucks in the train than there would be of Wilkinson's.
1936. How much is a train load? An ordinary train load over a grade of one in forty, made up of Evans' trucks, would consist of eleven trucks and a van; if it consisted of Wilkinson's, there would be about ten trucks and a van. The weight of such a train would not vary to the extent of the weight of one truck, but it would be so near it that we could not divide it in any other way.
1937. When Wilkinson's truck is fitted up for cattle with the top deck in the roof what effect would that have on the oscillation of the train? It is objectionable in so far as it brings a great strain upon the elevated portion of the truck when running at high speeds. We have found it necessary to brace many of our trucks diagonally at the ends in order to resist this rapid oscillation due to high speeds.
1938. Would it be possible to brace Wilkinson's truck? Not with end openings.
1939. Are you in favour of end-loading or side-loading? I have no practical experience, therefore I cannot express an opinion.
1940. *Mr. Wilkinson.*] Do Evans' side rods run from the floor to the roof? I think so.
1941. Do you know whether mine go from the floor to the roof? I do not know.
1942. Do you know if my pillars go from the floor to the roof in one solid piece? Yes.
1943. Is my truck braced on the side? Yes; but that is where it is not wanted.
1944. Is Evans' truck braced on the side? I could not say, but it is end bracing that is wanted. On looking at the model I see that the rods in Evans' truck do not go from the floor to the roof. They are screwed into an angle-iron beam which runs the whole length of the truck.
1945. Do you know if there are rubbing bars inside my truck? Yes.
1946. And do they not go from end to end? I believe so.
1947. Do they not help to strengthen the truck? They may do so.
1948. Is it impossible to put two diagonal braces on each side of the end of my truck? Not to be of any value. You may get them in, but they would be so upright that they would not be of much effect. The braces should go from corner to corner.
1949. Could not four diagonal braces be put in the end? Yes; but they would not have much effect.
1950. Do you maintain that there is better ventilation in Evans' truck than in mine? Yes.
1951. Then you think that the temperature would be higher in my truck than in Evans'? That would depend on circumstances.
1952. Not on the ventilation? Not altogether.
1953. *Mr. McLaughlin.*] Do not the upright bars which are screwed into the angle-iron beam act as a brace in the Evans truck? Yes.
1954. Do you not think it strengthens the truck very much? Yes; but it is in the ends that the bracing is most wanted.
1955. *Chairman.*] Because the strain is from side to side? Yes.
1956. You think it is absolutely necessary that the end of the truck should be the strongest part? Yes.
1957. *Mr. Wilkinson.*] If the iron beam which runs fore and aft in the Evans truck were to give way all the rods and pillars must give way too? No.
1958. Does not the whole strength depend upon that beam? No.
1959. *Mr. McLaughlin.*] Do you think it possible to build a truck open at the ends strong enough to carry a load of cattle? I do not, unless you go to unreasonable expense in the construction.
1960. *Mr. Wilkinson.*] Do you know whether there are cattle trucks with end doors in any of the other colonies? I do not know.

E. A.
Loughrey,
Esq.

2 May, 1888.

THURSDAY, 3 MAY, 1888.

Present:—

MR. KETHEL, | MR. LYNE.
J. HAYES, ESQ., IN THE CHAIR.

Bruce Smith, Esq., Counsel, instructed by J. McLaughlin, Esq., appeared on behalf of the proprietors of the Evans Australian Combination Truck. W. B. Wilkinson, Esq., appeared in person.

Andrew Johnstone, Esq., called in, sworn, and examined:—

1961. *Mr. Wilkinson.*] What are you? Salesman for Brown Bros.'
1962. How long have you been connected with stock? Fifteen or twenty years.
1963. With the trucking of stock? For the last fifteen years.
1964. What firms have you been in? Bruncker and Wolfe and Brown Brothers. I was with Bruncker and Wolfe for seven years.
1965. You have had a great deal of practical knowledge as to the trucking of stock? Yes.
1966. With regard to side-loading is it your experience that there is a difficulty in getting the sheep into the trucks? Sometimes. Many times it is very hard work, and a good deal of force has to be used to get the sheep in.
1967. *Chairman.*] Have you had any experience of end-loading? I have never seen an end-loading truck loaded or unloaded.
1968. *Mr. Wilkinson.*] Will you state what difficulties you have experienced in trucking with side-loading trucks? All I have objected to in loading sheep up country is the delay in shunting. It takes more time to shunt the trucks than it does for us to actually put the sheep into the trucks.
1969. From your knowledge of stock what is your opinion of end-loading? I say that I have never seen an end-loading truck loaded or unloaded.
1970. Is it an advantage to be able to walk into a truck and distribute the sheep over the surface either with side or end loading? No doubt it is.
1971. Does that apply to both top and bottom decks? Yes.
1972. Would it be an advantage to any class of your constituents to be able to carry two classes of stock in one truck? I should think that that would be an advantage.

A. Johnstone,
Esq.

3 May, 1888.

1973.

- A. Johnstone, Esq.
3 May, 1888.
1973. Is there not cruelty attached to the side-loading of sheep in trying to force them into the trucks or up the races? If a person is hurried and wants to get his stock away he has to force them in at times.
1974. You say that you have had a good deal of experience among sheep? As much as most people about Sydney.
1975. Judging from your experience of the penning and yarding of sheep, and the general movements and habits of sheep, can you form any idea as to end-loading? It is patent to anyone that a lot of sheep will run through a lot of trucks more easily than they can be forced in against a wall, as it were.
1976. *Mr. Smith.*] In the whole course of your experience you have never seen sheep loaded by the end of the truck? No.
1977. Then you have no experience of the way in which sheep would run into a series of trucks put on end? Practical experience would tell you that.
1978. How do you think you could get the sheep in and divide them into different quantities? Much more easily than by forcing them into one single truck.
1979. You say that, although you acknowledge that you have never seen a truck loaded from the end? Yes; that is my opinion.
1980. *Chairman.*] You base your opinion on what you have seen of sheep running through ordinary races? Yes. I have seen many hundreds of trucks loaded at the side, and my opinion is that sheep will run better through the trucks than they would in side-loading trucks.

Mr. John Wilkins called in, sworn, and examined:—

- Mr. J. Wilkins.
3 May, 1888.
1981. *Mr. Wilkinson.*] What are you? Waggon-builder,—foreman for Hudson Brothers.
1982. How many years have you been waggon-builder? Thirty-six.
1983. Have you been in other employ? All about in the railway-waggon building—in most shops. I have followed the railway-waggon work for thirty-six years now.
1984. Were you ever chosen by any company out of a number of men as a builder? In 1858 I was picked out of 150 waggon-builders from Wright's in Birmingham, to go to Brazil.
1985. You built the truck known as the Wilkinson combination truck? I was the foreman over it; it was built under my supervision.
1986. Has not my truck been altered several times in the course of construction? It has been altered several times since I first built it.
1987. In building any other trucks on the same pattern would they be stronger? They would be stronger and lighter.
1988. As to general construction, would a truck built on the same lines, without alterations, be sufficiently strong to carry all classes of stock? It will carry anything that you can put into it.
1989. Have you any doubt about that? Not the slightest.
1990. Do you supervise the construction of other railway trucks? All that are made by Hudson Brothers.
1991. Have they not the right for a certain number of years to construct the rolling stock required by the Railway Department? They had a five years' contract, which is up next Christmas.
1992. Should there be any oscillation from the deck when in the roof of my truck? No; because it is wound tight up.
1993. It is said that the oscillation of the deck would be detrimental to the strength of the truck? That cannot be so, because it is wound tight up, and it cannot get away from it.
1994. Is there any oscillation at all when it is wound up? There is no oscillation in it.
1995. Is it not a fact that some meat waggons have lately been constructed which are louvred all round? Yes.
1996. Is that truck not arranged so that the meat has to be hung from the roof? Yes. It has to be hung from iron bars from the roof.
1997. What is the weight hanging from the roof? I should say it would be a ton.
1998. How many quarters of beef would the truck carry? I do not know.
1999. They are louvred trucks without braces? Yes.
2000. Then if any truck would suffer in oscillation that truck would? You would think so, but it is not so; it is a very good truck.
2001. You say that it is possible to build my truck lighter than it is at present? Yes.
2002. *Mr. Brunker.*] Would not that depend on the material used? There is a lot of ironwork in it which is useless. I was never spoken to about the weight when I first started the truck.
2003. *Mr. Wilkinson.*] Why do you say that a new truck would be stronger? Because the present truck has been weakened by being altered so many times. I have had to cut it away so many times.
2004. How much could it be reduced in weight without affecting its strength? I can take about 10 cwt. off it.
2005. *Mr. Kethel.*] Would you curtail the quantity of material to lessen the truck by that amount? There is a lot of ironwork which is useless; there are hinges which are too heavy. There are solid iron bars right through from top to bottom; and I would put tubing in place of these bars, and I would not require so many of them. Hinges half the weight of the present ones would do.
2006. Do you think the fact of my having openings for doors in the ends will weaken the truck so as to make it unfit to carry all classes of stock? It is strong enough to carry anything. It is all tied together with braces at the side.
2007. Do you think that the machinery in my truck would be likely to get out of gear? No; it would not.
2008. *Chairman.*] What are the meat trucks, to which you have referred, supposed to carry? Five or 6 tons.
2009. What would be the weight of the meat hanging from the roof? I should say one of the "C" trucks would carry a ton.
- [Mr. Hassall here took his seat.]
2010. *Mr. Kethel.*] Would there not be oscillation caused by the weight of the deck even though it were wound close up to the roof? No; the roof cannot sway with it. It is all held together with an iron beam. It cannot sway; it is all fastened down to the bottom sole-line.
2011. *Mr. Hassall.*] You do not think that the truck would oscillate through the weight of the deck being up in the roof? No; it would not make any difference.

Mr. J.
Wilkins.
3 May, 1888.

2012. *Mr. Kethel.*] Is it sufficiently braced at the end, notwithstanding the doors at the end, to resist all the effects of oscillation caused by the extra weight in the roof of the truck? The end is not braced at all; it is braced from the side.
2013. *Mr. Smith.*] Is it not an ascertained fact in the construction of waggons, as well as everything else, that the greater the weight you get on top the greater is the tendency to oscillation of the whole body? If you did not make the bottom in proportion to hold it.
2014. *Mr. Hassall.*] You mean that if you have a heavy top weight you must have a heavy bottom to balance it? Yes.
2015. *Mr. Smith.*] Have you never noticed when travelling in a tram that the more people there were on the top the more oscillation there was? I never noticed that.
2016. Do you know that the floor of Wilkinson's truck was like the floor of Evans' truck? No.
2017. Have you ever seen the Evans truck? I have never examined it closely.
2018. You say that one of the further alterations which you would make would be to substitute gas pipes for the iron bars? Yes.
2019. Do you know that that is a feature of the Evans truck? No.
2020. Who suggested to you putting gas pipes instead of iron bars? A draftsman whom we have.
2021. *Chairman.*] Have you ever tested the time that it takes to convert the Wilkinson truck from a cattle to a sheep truck? I have tried it myself in the shop; and to convert the truck from a cattle to a sheep truck takes about $1\frac{1}{2}$ or 2 minutes.
2022. You remember the exact time? To a second or two.
2023. Was that done in the workshop before the truck was used? Yes.
2024. How long does it take to convert it from a sheep to a cattle truck? Two and a half or nearly 3 minutes.
2025. *Mr. Smith.*] Have you seen it since the trial, when the deck had to be supported by a screw-jack? Yes.
2026. How do you propose to alter it? The way in which Mr. Wilkinson first wanted to have it done, that is to put two pieces of angle-iron into it.
2027. Could it not be altered by simply altering a bolt at the side? Of course.
2028. Would that make it substantial? It would carry the weight then if the bolt was made longer.
2029. Is it not the tendency of the deck to bend. Did it not bend in this case and cause the bolts to come out? The bolts were too short.
2030. When the deck was level were not the bolts chock up into the end of the groove? No.
2031. How far off? Three-eighths of an inch on each side.
2032. Then you intend to make them $\frac{3}{8}$ of an inch longer? Yes.
2033. Is that all that you propose to do? No; in addition to that I intend to put in two pieces of angle-iron underneath the T iron, and rivet it through. These pieces will be of $1\frac{1}{4}$ or $1\frac{1}{2}$ -inch angle-iron.
2034. What will they weigh to make it a substantial job? I could not tell you exactly.
2035. Will they weigh a cwt.? Oh, no.
2036. *Mr. Kethel.*] Would that small sized angle-iron be sufficiently strong for the purpose desired? Yes.
2037. *Mr. Wilkinson.*] Mr. Smith in asking you a question inferred that the deck bent and caused a bolt to come out of the groove; is that the case? No; the bolt was too short for the studs.
2038. *Mr. Lyne.*] What proportion of the Wilkinson truck is of soft wood? All the top framing and under framing is of hardwood—tallow wood chiefly; the cantrils and corner pillars are all hard wood; the floors, the doors, the louvres, and the sheeting are of soft wood. The roofs of all waggons are made of soft wood.
2039. Do you put the same proportion of soft wood in other trucks as in this? Yes.
2040. *Mr. Smith.*] In any alteration which you have made have you substituted soft wood for hard wood? No.
2041. *Mr. Wilkinson.*] Have you ever had any instructions as to the weight—have any instructions been given to reduce the weight? Nothing was ever said to me about the weight.
2042. Was there any model when the truck was built? None whatever.
2043. Has not the truck been constructed entirely from my own suggestions? Yes.

Charles Lindsay Nicholson, Esq., called in, sworn, and examined:—

2044. *Mr. Wilkinson.*] What are you? I am a grazier, residing in the Berrima district. I have resided there for forty years.
2045. Do you send any quantity of stock to the Sydney market? I send a considerable quantity, and have done so ever since the railway was opened.
2046. Do you think it would be any advantage to the people in your district to have a truck which would carry two classes of stock? I have advocated it for a number of years. I think it would be very serviceable to the small farmers. Parties who have small consignments of calves, lambs, and pigs are put to a great amount of inconvenience through not being able to get trucks at a reasonable rate, because they have not enough to fill a truck.
2047. *Mr. Smith.*] I understand you to say that the chief use of a truck which would carry half-and-half would be for the conveyance of calves and sheep? I think it would be an advantage for the conveyance of small consignments of stock.
2048. Would there be any case in which you would want to carry half a truck of cattle and half a truck of sheep? Frequently.
2049. Taking your own district, how many trucks do you think would be required to satisfy the wants of the public in that respect? I should say two a week. There are a large number of small settlers in my district. It is exceptional in that respect.
2050. How many trucks would be wanted twice a week for the purpose? I have taken little notice of the stock going away recently, but I should think that it would be easily ascertained from the returns.
2051. Do you think that two or three such trucks would find constant employment all the year round from your district? I am inclined to think they would.
2052. Would you go any higher than three? Not from Moss Vale station alone.

C. L.
Nicholson,
Esq.
3 May, 1888.

- C. L. Nicholson, Esq.
3 May, 1888.
2053. Is it not a fact that the district is peculiar on account of the large number of small stock-holders resident in it? Yes; I think it would take a larger number of such trucks than any other district that I know of on the Southern line. The trucks would also be useful at such places as Tarago and Goulburn.
2054. Suppose there are two individuals, and each has half a truck load of stock, would it not be an easy matter for them to fill one truck? If they met; but I might be 10 miles away, and you on the spot. I have advocated a combination truck for the advantage of small consumers for years. If I were a large farmer and took a truck load of calves to the station, and I found a small man coming in with four or five calves, it would be at my disadvantage if you had combination trucks, because I would not be able to speculate and buy the calves from the other man. I do not think that the idea of mixing the consignments works well; the parties are often dissatisfied. They do not like to trust each other, and they would sooner send the stock on their own account and pay the extra money.
2055. *Mr. Wilkinson.*] Are not the charges prohibitory for half truck loads? You have to pay nearly the same for a half truck load as for a full load.
2056. *Mr. Smith.*] Is it not a fact that only four or five trucks a week of sheep and cattle leave Moss Vale? That may be the average taking the whole year.
2057. How many trucks are required for small stock? I think there are two or three trucks every week for pigs, calves, &c.
2058. *Mr. Wilkinson.*] I suppose the combination trucks would be an advantage in other districts as well as yours? I take it that they would be an advantage in any district where there are small farmers.
2059. It would be an advantage to find a truck which you could convert to any use when wanted? I have always advocated combination trucks. I think I suggested them to Mr. Evans fifteen years ago.
2060. Do you think that end-loading of sheep would be a success? I think it would be a very great advantage if it could be done; but I have had no experience of it.

THURSDAY, 7 JUNE, 1888.

Present:—

MR. HAYNES, | MR. LYNE.
T. H. HASSALL, ESQ., IN THE CHAIR.

J. McLaughlin, Esq., Solicitor, appeared on behalf of the proprietors of the Evans Australian Combination Truck. W. B. Wilkinson, Esq., appeared in person.

Alexander Bruce, Esq., called in, sworn, and examined:—

- A. Bruce, Esq.
7 June, 1888.
2061. *Chairman.*] What are you? Chief Inspector of Stock, residing in Sydney.
2062. *Mr. Wilkinson.*] You have brought certain documents with you; will you tell the Committee what they are? I submit a portion of my report for 1870 which shows that I then recommended end-loading. I believe that I was the first person to suggest the idea here. I also submit two letters which I have received from Mr. Valentine, the Chief Inspector of Stock in South Australia, and also copy of a report which I made to my Minister respecting the Wilkinson truck. [*Documents handed in.*]
2063. *Chairman.*] Have you had any experience of end-loading? No experience of the working of the system.
2064. Have you superintended any experiments, or ever been present when end-loading has been tried? No. In 1870 there were several trucks made for end-loading on my recommendation. They were used for some time, but I believe that the Department were against them, and they were dropped.
2065. *Mr. Wilkinson.*] What is your own idea about end-loading? I believe that it is the best system. I have no actual practical knowledge, but my idea has been confirmed by the experience of the system in South Australia and on the Northern railways in Queensland, where the system has been in use for some time.
2066. *Chairman.*] You have had communications from the Inspectors of Stock in those Colonies stating their opinion as to end-loading? Yes.
2067. *Mr. McLaughlin.*] You have never seen end-loading done in South Australia? I have never seen it done in any place.
2068. I notice that in 1870 you recommended end-loading for cattle? Yes, because at that time there were no cattle carried by train, and I pointed out to the Minister for Works the large amount of traffic which might be got.
2069. Are you still in favour of end-loading for cattle? I am not.
2070. How long did you continue in favour of it? Until I saw that cattle could be loaded the other way.
2071. Don't you know that it would be impossible to load cattle at the end? It would be quite possible, but it is a question as to whether it is not as well the other way, perhaps better.
2072. Are you sure that there were no cattle carried by train in 1870? I could not say that there were no fat cattle carried, but if any were carried they were very few. I know that at that time neither sheep nor cattle were carried by train to the extent that they ought to have been even up to 1876. There were only something like about fifty sheep trucks on the Southern and Western Lines.
2073. You were under the impression that, if end-loading was introduced, there would be more cattle carried by train? That was my opinion at the time.
2074. *Chairman.*] Have you seen Evans', Wilkinson's, and Mulholland's trucks? Yes.
2075. What is your opinion with regard to the facilities for loading the different trucks? I am altogether in favour of the end-on system.
2076. In looking at the two trucks, in which that principle has been adopted—Wilkinson's and Mulholland's—do you think that either of them possesses any advantage over the other? The question, as far as my judgment goes, is whether Mulholland's is a practical truck. It seems to me that he is attempting too much, and that his truck is, too, made complicated by the raised floors. I believe that Wilkinson's is the more serviceable of the two end-loading trucks.
- 2077.

2077. Are you of opinion that, by adopting the system of end-loading, the loading of stock can be carried on more expeditiously, and with less cruelty to the animals than under the present system? Decidedly.

A. Bruce,
Esq.

2078. *Mr. Lyne.*] Have you any photographs showing the end-loading system in operation in South Australia? No; but I have the working plans of the Department.

7 June, 1888.

2079. *Mr. Wilkinson.*] Do you think that the opening in the roof of my truck will improve the facilities for loading? Very much.

Norman Selfe, Esq., called in, sworn, and examined:—

2080. *Chairman.*] What are you? Civil Mechanical Engineer, member of the Institute of Civil Engineers of London, and member of the Institute of Mechanical Engineers of London.

N. Selfe, Esq.

2081. *Mr. Wilkinson.*] Have you seen my truck? I have.

7 June, 1888.

2082. Will you state from your practical knowledge what you think about the truck, as to its strength, utility, and working parts? I do not pretend to give any evidence which would be of the slightest value in connection with stock. I know nothing about that; but, as a practical mechanical engineer, accustomed to designing engineering and other structures, I say that the Wilkinson truck may be so constructed as to withstand all the strain that can well be put upon it in the ordinary course of railway traffic.

2083. As to the movable deck or its parts, do you think that they are likely to get out of order? They are not likely to if they are properly made.

2084. Is it a simple system of moving the deck up and down? It is a very simple system.

2085. Evidence has been given here as to the strength of the truck being reduced by the opening for the end doors. Do you think that with that opening the truck is sufficiently strong to carry stock? It is not so strong with the door out of the middle of the end as it would be with the end in one piece, unless compensation is made in other ways; but, that compensation can be made, the two separate divisions of the end may be made so strong as to compensate for the cutting out of the door.

2086. Have you seen the truck which I have had constructed to send to Victoria? I have.

2087. Though it is the same in principle as the other truck, does it not embody some improvements? It is better in several ways.

2088. *Mr. Lyne.*] Have you seen Evans' truck? Only the model which Mr. Evans showed me some time ago.

2089. I suppose that you consider it perfectly strong too? There is nothing from what I saw to prevent it.

2090. *Chairman.*] Do you think that it is as strong as, or stronger, than the Wilkinson truck? That is merely a matter of degree. You can make each as strong as you like. I would not say, without further examination, which would be the strongest for a given weight. You can make either of them strong. That is merely a question of putting material in the right place.

2091. From your practical knowledge will you say whether the Wilkinson truck can be made as strong as the Evans at the same weight, taking into consideration the different principles of construction? I would not say that without going further into it; but there is no difficulty in making compensation for the cutting out of the doors. You see it is a very important thing that the truck, having the weight in the roof it will have an easier rolling motion; it will be like a ship with the cargo well distributed and a high centre of gravity. A ship loaded in that way always rolls a great deal easier than a ship with all the ballast in the bottom.

2092. *Mr. McLaughlin.*] But does not the ship roll more when the cargo is distributed as you say? Yes, but there is less wear and tear on the ship.

2093. How would you make compensation for the cutting out of the end doors? That can be done very easily.

2094. *Mr. Wilkinson.*] There is a report before the Committee which states that my patent is very ingenious, but that it is unworkable. Is there anything about it which you consider unworkable? I have not seen the truck used, but looking at it from a mechanical point of view, I do not think it is unworkable.

2095. *Mr. McLaughlin.*] Do you know that there are thirty-eight doors in the truck? There must be something like that number.

2096. Don't you think that that will weaken the truck a great deal unless extra iron is put in? There are fifty-two doors in my house, and only three people live in it.

2097. *Mr. Wilkinson.*] Do you know how many parts the Evans deck is in? No. When I saw the model I thought that the centre beam was perhaps a weak point.*

2098. *Mr. McLaughlin.*] You cannot say anything about the relative merits of the trucks? No; my evidence is simply this—the Wilkinson truck can be made to stand the wear and tear of railway traffic.

2099. Will it not have to be very much heavier? Very often a flat bar of iron weighing 2 or 3 lbs. will add immensely to the strength of a structure if put in the right place.

TUESDAY, 12 JUNE, 1888.

Present:—

MR. LYNE, | MR. SUTHERLAND.
T. H. HASSALL, Esq., IN THE CHAIR.

John McLaughlin, Esq., Solicitor, appeared on behalf of the proprietors of the Evans Australian Combination Truck. W. B. Wilkinson, Esq., appeared in person.

Henry Septimus Badgery, Esq., called in, sworn, and examined:—

2100. *Chairman.*] What are you? Stock and station agent.

2101. *Mr. McLaughlin.*] What experience have you had in the trucking of cattle and sheep? I first commenced at Pictou when the railway was opened there, then at Mittagong, and Moss Vale.

H. S.
Badgery, Esq.

2102. How many years? Twenty-five or twenty-six—ever since trucking has been carried on. I was one of the Committee which submitted plans to the Government of yards at Moss Vale. Those were about the first yards of any size that were put up in the Colony.

12 June, 1888.
2103.

*NOTE (on revision):—This is not an important matter, as there are several ways in which this beam could be strengthened.

- H. S. Badgery, Esq.
12 June, 1888.
2103. What is your experience of the end-loading system as far as cattle are concerned? I do not think it can be used for trucking cattle. I do not think it possible especially for the unloading.
2104. Do you approve of the end-loading system for sheep? I approve of end-loading for sheep; but not with all classes of trucks.
2105. You have seen the Evans and the Wilkinson trucks? Yes.
2106. Do you think the Evans truck could be converted into an end-loading truck if it were thought necessary to do so? I think so.
2107. Do you think it would be as suitable as Wilkinson's for end-loading? No; and I will explain why. The difficulty which has always presented itself in connection with end-loading is that the men could not get through the trucks so as to regulate the sheep. That difficulty has been overcome in the Wilkinson truck, but not in the Evans truck, at least not to the same extent. I consider the Wilkinson truck a better truck for end-loading than the Evans.
2108. *Mr. Lyne.*] How has the difficulty been overcome in the Wilkinson truck? If you have a fixed deck, the man working the sheep will have to be in a stooping position, and will not be able to count the sheep or to regulate them. But in the Wilkinson truck the upper deck is raised to the roof while the lower deck is being loaded, so that the men can walk about. Then, when the top deck is being loaded, there is an opening in the roof which enables the men to go about and regulate the sheep.
2109. *Mr. McLaughlin.*] Has it not struck you that it would make the truck much weaker by having the openings at the top and in the end? Of course it has.
2110. You cannot say how it will operate in practice? What I speak of is with regard to the facility for loading and unloading. As to whether using the truck would injure it, or whether it would get out of repair, is a matter upon which I could not give an opinion.
2111. *Chairman.*] We understand that you do not offer any opinion as to the construction or stability of the trucks? I merely offer an opinion as regards loading and unloading; but common sense will tell you that the openings at the end and the top must weaken the truck.
2112. *Mr. McLaughlin.*] Do you think that a truck open at the top and the ends would be sufficiently strong to carry cattle without being braced with iron? It would require very strong bracing because cattle are very heavy.
2113. The top deck of Evans' truck could be loaded in the same way if there was an opening in the top? Yes.
2114. You were Chairman of a Board appointed by the Government of which Mr. Lyne was a member to report upon the trucks? Yes.
2115. The Board consisted of yourself, Mr. Thallon, and Mr. Gill? Yes.
2116. The Board reported on the 28th January, 1887? Yes.
2117. In your report you give the relative merits of the trucks, and you report that the Evans truck has 45 points in its favour; Perry's truck 34, and Wilkinson's 38. Do you still adhere to that? Yes. I do not desire to add anything to that report in my present state of mind, nor to give away any point of it.
2118. I believe that you spent three or four weeks in considering the matter? I do not know exactly how long; but we spent a good deal of time.
2119. Who is Mr. Thallon? Traffic Manager of the Queensland railways.
2120. Do you know whether he has had considerable experience? I should think he was one of the best experienced men we have in any of the colonies.
2121. Who is Mr. Gill? He is one of the heads of the waggon construction department in Victoria.
2122. One of the points claimed for Wilkinson's truck is that you can carry in it half a load of sheep and half a truck load of cattle. How often do you think a truck of that description would be likely to be required? It would be very hard to say. It might be used a little near Sydney, but not much.
2123. Is it not your experience, as one who receives consignments of cattle and sheep, that if two or three persons have small lots to send to market they club together and take a full truck? I do not know of any instance of people clubbing together; it seldom happens. I do not think it is of much account at all. If you ask my opinion I will put it in this way: I would not recommend the Government to have many trucks constructed for that purpose, as I do not think that the trade is likely to require many of them.
2124. Have you had any experience of the actual working of the Evans truck? I have never travelled with it; but I have seen it loaded and unloaded.
2125. Will you tell me whether in your opinion it has been a success as a cattle waggon? The Evans trucks which were in use had a partition. I do not approve of the truck with the partition in it for cattle for the reason that you have to load the cattle through two different doors, and you lose so much room in the corners; but without the division it is a first-class cattle truck.
2126. Have you seen anything better? No.
2127. I believe that without a division its weight is 6 tons 12 cwt. 3 qrs.? The weights are given in the report.
2128. How does it work as far as the carrying of sheep is concerned? Very well; I look upon it as being a better sheep truck than any other we have at present. It gives the sheep more room, more head room particularly, and more ventilation.
2129. Are the floors suitable for both cattle and sheep? Yes; I do not know of any objection to the floors.
2130. Can you remember the difference between the floors of Wilkinson's and Evans' trucks? No.
2131. From your experience after all your investigations, do you consider the Wilkinson as good a cattle truck as the Evans? No; if you look at the opening part of our report you will see that there is a paragraph in which we speak of the requirements of the different classes of trucks, and of the difficulties which have to be overcome. For a sheep truck you must have perfect ventilation, and for a cattle truck you must have a smooth surface at the side, and have the truck boarded up.
2132. You say that the Evans truck has these requisites? Yes.
2133. Is it a truck which can be easily washed out? Yes; more easily than a truck with two decks.
2134. *Mr. Wilkinson.*] In your report you state the great difficulty in providing a truck suitable for sheep and cattle lies in the fact that for sheep in upper and lower decks there must be abundant ventilation, and for cattle, as near as possible, a perfectly smooth surface inside to avoid injury, and to prevent cattle from seeing out. Do you think it a great essential that the cattle should not be able to see out? I am quite sure of it.

2135. Do you know that cattle cannot see out of my truck at all? Of course, if it is boarded in all round they cannot.
2136. Do you know that when my sliding doors are shut cattle cannot see out? Yes.
2137. When this report was written was not my truck in an unfinished state? We inspected it two or three times. We went to the works to see it. It was not finished.
2138. At that time the inside of the truck had not a smooth surface? No.
2139. Do you not know that it has a smooth surface now? I do not know. The last time I saw the truck it had iron rods inside, and they were only protected on the outside.
2140. Do you not know that they are protected on the inside now? No.
2141. You do not know that there are rubbing boards on the inside of the truck now all round? No.
2142. If there are rubbing boards in the truck now it must have been altered since you saw it? Certainly.
2143. In your report you state "The Board was desirous of testing Mr. Wilkinson's truck as to end-loading, and arrangements were made with the Department, stockowners, and others to have the end-loading trucks now in use, and a sufficient number of sheep at Homebush, on Wednesday, 26th instant, but in consequence of Mr. Wilkinson's truck not being sufficiently advanced this had to be abandoned?" Yes.
2144. Subsequent to Mr. Thallon leaving the Colony was there not a trial of my truck? Yes.
2145. After that trial did you and Mr. Gill send in a supplementary report? Yes.
2146. Did you speak in favour of my truck? I expect we did.
2147. Do you know anything about this letter:—

H. S.
Badgery, Esq.
12 June, 1888.

In consequence of the contractors not having Wilkinson's combination truck completed in time for the Board of Inquiry to have a trial of the end-loading system before the conclusion of their labours and the departure of Mr. Thallon, the two remaining members, for their own information, visited Homebush on Monday morning last, when several of the trucks, which had been opened at the ends by the Department, were placed at each end of Wilkinson's, and a number of sheep were run through. The patentee entered the truck, and showed that by loading the lower floor while fixed as a cattle truck, with doors to regulate the sheep, there was no difficulty in arranging the proper number in each compartment. The members of the late Commission were so pleased with the satisfactory trial that they have forwarded a statement to Mr. Goodchap, setting forth that, while they consider the end-loading with our present trucks could not be carried out, Mr. Wilkinson has overcome the difficulty. The great advantage in end-loading is that any number may be loaded without moving any of the trucks.

HENRY BADGERY, 2/2/87.

I remember that letter.

2148. You then had a practical test of my truck? That is how I give my opinion now.
2149. Suppose at little extra cost, a merely nominal cost, we could get a truck which was capable of carrying half cattle and half sheep, would it be an advantage to have such a truck? That would be a question for the Department to answer, inasmuch as they would have to keep the truck standing somewhere to be at call.
2150. Presuming that any truck could be converted by partition doors into a sheep and cattle truck, but which need not necessarily be used in that way, would it be an advantage to have such a truck? It would be an advantage.
2151. *Mr. McLaughlin.*] Does it not appear from your report that in January, 1887, the balance of your opinion was against end loading? Decidedly so. But subsequently we went and saw that the difficulties which stood in the way of end-loading had been removed by Mr. Wilkinson's invention. You will remember that at the commencement of my evidence to-day you asked me if I approved of end-loading, and I said that I did; but if you ask me if I prefer end-loading to side-loading, that is a different question.
2152. *Mr. Lyne.*] When you witnessed a trial of end-loading of ordinary trucks some time before that, was not the great objection which you had as to the difficulty of dividing the sheep and regulating the numbers? That was the great objection.
2153. *Mr. McLaughlin.*] Which do you prefer—end-loading or side-loading? I have not had as much experience of end-loading as of side-loading; but I think that if I were to give an opinion from what experience I have had, I should say that a truck can be loaded more rapidly with end-loading than with side-loading.
2154. You have not seen any end-loading done? No; and I do not know much about it, and I give my opinion on what little experience I have had.
2155. You have formed that opinion since this report of yours was written? Since I have seen Mr. Wilkinson's truck at work. Of course, there is the question of altering trucks, which has to be taken into consideration. As to loading or unloading, I think it can be done more rapidly with trucks on the Wilkinson plan than with side-loading trucks, unless there is some plan of yards that I do not know anything of.
2156. Have you seen the yards at Hay? No; but I have heard them spoken of very highly.
2157. Have you heard that they can load and count 1,000 sheep in half-an-hour there? Yes.
2158. If we had all our yards built on the same principle would you still prefer end-loading? I do not say that I prefer end-loading. I say that I think it can be done more rapidly than side-loading, unless there is some plan of yards which I have not seen.
2159. Was it not your opinion, and was not that opinion backed up by Mr. Gill, who has had great experience, that the opening of a truck at the top and the ends would weaken it and make it dangerous for use? By all means.
2160. *Chairman.*] Do you think that there would be a considerable saving of time as well as saving of labour in adopting the end-loading system when applied to sheep? It depends upon how long it takes to fix the trucks.
2161. There would be a continuous stream, and from your experience you know that when one sheep leads the others will follow. This being the case do you think that there would be a saving of time and trouble in adopting the system of end-loading as applied to sheep? I think there would.
2162. But with cattle you do not think there would be any advantage? I do not think that you could use it for cattle. I would not let my cattle go in and out by the end. If you had openings at the end for cattle, I do not care how you brace them, the cattle would smash the truck and themselves too.
2163. I suppose that you have seen a stockyard fence burst out bodily by the crush of cattle? Yes.
2164. *Mr. McLaughlin.*] If you used trucks for end-loading for sheep you would not advise that they should be used for cattle afterwards? I do not see any objection to their being used for cattle, but not on that same principle.

- H. S. Badgery, Esq.
12 June, 1888.
2165. If there were openings at the end and at the top would not the truck be so weak that you could not recommend the Government to use it? I cannot give an opinion about what the Government ought to do; but my common sense tells me that the openings at the ends and the top must weaken the truck.
2166. If you thought it was possible to count into a truck 1,000 sheep in half-an-hour with side-loading trucks, would you recommend a change from side-loading to end-loading? Certainly not. We get on very well now.
2167. *Mr. Wilkinson.*] Do you know that the roof of my truck is bound on top by a heavy band or archway of angle-iron, tied together in the centre? I do not know anything about that; but I know that there is a good deal of iron bars about it.
2168. You have had no practical experience of my truck of any consequence? No.
2169. You do not know that the rubbing boards are there? No. I do not understand how you are going to have it open for sheep, and then close it for cattle with a smooth surface. It is essential that there should be plenty of ventilation for sheep.
2170. Do you know which is the cooler truck mine or Evans'? I do not.
2171. *Mr. Evans.*] If you had to open all the doors, 108 doors, and fix them open, and then load the sheep from the end, and count the sheep in each compartment, and then close up the doors, do you think it would be possible to load 1,000 sheep in the same time as you can load them now with the old-fashioned yards? It is hard to give an opinion on that.
2172. Do you think it could be done in half-an-hour? No.
2173. *Mr. Lyne.*] Do you know whether they load from the end in South Australia and Queensland? No.
2174. *Mr. Wilkinson.*] For end-loading you would only want one gangway? Yes.
2175. *Mr. McLaughlin.*] What about the gangways between the different trucks. Would there not be a difficulty in moving sheep from there and counting and dividing them? That has always been a great difficulty. It has always been the objection which I have had to end-loading.
2176. *Mr. Wilkinson.*] But you say that objection has been overcome by me? Very largely.

Mr. John Shaw called in, sworn, and examined:—

- Mr. J. Shaw.
12 June, 1888.
2177. *Chairman.*] What are you? I reside at Wallerawang. I am a hotel-keeper and a contractor.
2178. Have you had any experience of the trucking of stock? I believe more than any other man in the Colony. I have been engaged in the work since the railway was opened to Wallerawang.
2179. You have had a great deal of experience of the old-fashioned stock waggons apart from the Evans trucks? Yes.
2180. Have you had any experience of the Evans truck? Yes.
2181. Have you had any experience of any other combination truck? I have not loaded them. I have simply looked at the Wilkinson truck.
2182. Have you assisted in loading any quantity of stock into the Evans truck at Wallerawang? Yes.
2183. Do you think the Evans truck is superior to the ordinary stock truck in general use? Very much so.
2184. Why do you come to that conclusion? The reason is this: You know that ordinary stock trucks are run daily from Homebush to Bourke, a distance of 500 miles. They are sent there empty, and they are brought back loaded with stock. If they are loaded with cattle the charge is £11 3s. Taking into consideration the two journeys which the truck has to make I consider that this must be a considerable loss to the country. With the other truck, you can load it with 6 tons of merchandise to Bourke, which would realise from £30 to £50, and then you would have the load of stock back, which would bring £11 3s.
2185. You say that you have examined the Wilkinson truck? I have not seen the latest improvements on it.
2186. Have you had any experience of end-loading? Yes. The first seven stock trucks were not end-loading trucks, but trucks from seven to forty-five were built for end-loading. At that time I was loading almost night and day, as Wallerawang was the only station in the west. I found that I could load the stock into each ordinary side-loading truck singly, in about half the time that I could do it with end-loading. The great trouble was in regulating the number of sheep in a truck. There would be a rush of sheep in, and you would not know how many you had got into the truck, and the result was that a considerable number used to be smothered. But if they had been properly regulated, as far as numbers are concerned, they would not have been smothered.
2187. Did you ever try end-loading with cattle? No. We have no end-loading trucks for cattle. In loading cattle the fewer you can handle at a time the better.
2188. In the end-loading trucks to which you refer were there facilities for closing the sheep off as you got each truck filled? The job was after you got the sheep to run to ascertain when you had to close off.
2189. Had you not a man stationed in the truck to count them? You might count them; but if you let them run sometimes they would block half-way in the truck, and you would have just as much difficulty to get them to start from there as you would from the yards. The experience of the system was so unfavourable that the end-loading was abolished altogether, and the ends of the trucks were closed up.
2190. Have you any experience of how the thing is worked in the Wilkinson truck? I could not say exactly. But I am very sure that side-loading is preferable for the reason that you can regulate the number of sheep in each compartment better. You may run the sheep quicker into end-loading trucks; but the question is is there any advantage in that, seeing that you cannot regulate the number. With side-loading trucks I can with perfect ease load 10,000 sheep in eight hours with four men. There are not many stations where it often happens that 10,000 sheep have to be loaded in a day.
2191. *Mr. Lyne.*] With side-loading trucks if you have not an engine in the yards, do you not find it a great labour in moving the trucks up to the race? None whatever. We had new yards built at Wallerawang about seven years ago. The Traffic Manager asked me if I thought it would be advisable to build new yards there, considering that the railway was being extended further west. I said, "Yes. It will simply amount to this, that stock will come to Wallerawang in great numbers when the markets are low; but in high markets they would be trucked further west." It has turned out as I said. There is a great quantity of stock being trucked there now. In building the new yards I got him to put the siding in with a slight grade, so that the truck is simply held by the brake while being loaded, and after it is loaded you simply have to raise the brake and the truck goes away gently as far as you like.

2192. Was there not a difficulty before that grade was put there? Yes; we had to handspike the trucks away after they were loaded. I think that all the new stock-yards are made that way now. Mr. J. Shaw.
2193. *Mr. McLaughlin.*] Are you aware that the Wilkinson truck weighs a ton more than the Evans? Yes. 12 June, 1888.
2194. *Mr. Wilkinson.*] Are you sure of that? I am perfectly aware of it.
2195. *Mr. McLaughlin.*] Would that in your judgment give a great preference to the Evans truck as against the Wilkinson truck? I say that a great number of our trucks are too heavy. I can give you a good example of that. In the old sheep trucks (7 to 45), which have been running now about seventeen years, the upright bars are not any thicker than my little finger. These trucks had been run a number of years, and notwithstanding that they had worked satisfactorily, the department in building new trucks put in $\frac{3}{4}$ -inch bars. I reckon that in the new sheep trucks there are 2 tons more iron than there ought to be; bolts, nuts, bars, and everything else are heavier than is necessary.
2196. Do you think that the weight of the truck is of great importance? It is a great consideration.
2197. *Mr. Wilkinson.*] What is the weight of my truck? I am not exactly sure.
2198. What is the weight of the Evans truck? I cannot tell you. All the knowledge that I have about the weights is what I have read in the papers.
2199. Do you think that Mr. Badgery is qualified to give an opinion on the question? I think so.
2200. Do you think that if he states that a trial of my trucks demonstrated that there was no difficulty in arranging the proper number of sheep in each compartment that this is to be relied upon? I speak for myself. I have had more experience of end-loading than Mr. Badgery has had. I am very confident in what I state, that I can load more sheep by the side than you can at the end. At any rate, I prefer side-loading.
2201. Have you any knowledge of what Mr. Badgery's experience is? I know that he has had a good deal of experience in the loading of stock; but I have had more.
2202. You state that the difficulty is in arranging the number of sheep in each truck? Yes.
2203. Is it not a fact that in the trucks which you have seen the decks are fixtures and the man loading cannot walk about in the trucks? That is so.
2204. Do you know that in my truck you can walk about either in the bottom or the top deck? I have not had great experience of your truck; but if you say that men can walk about in the bottom deck as well as in the top deck the truck must be 16 feet high.
2205. If a person could walk through the stock would it not overcome a great deal of the difficulty with regard to end-loading? A little; but I am confident that you could not load as quickly as I can by the side.
2206. You do not know the actual working of my truck? I say so; but still I am confident that side-loading is quicker than end-loading.
2207. *Mr. McLaughlin.*] Supposing there is an opening of about 2 feet or 2 feet 6 inches in the roof of a truck, which enables you to walk through, your head and shoulders being in the air, would you have much control over the sheep? No; you want to be able to look at the sheep.
2208. The difficulty is not overcome of getting the exact number into each truck? No.
2209. Would not the same difficulty exist in closing the doors, locking them up, and counting the sheep? Yes.
2210. *Mr. Lyne.*] You said that Evans' truck was of great advantage, because it could be utilised to carry merchandise into the interior. Would not that apply to all combination trucks? Yes.
2211. *Mr. Evans.*] But if one truck weighed a ton more than another, would not that be a great disadvantage? It would be additional haulage.

Mr. William Alexander Herkes called in, sworn, and examined:—

2212. *Chairman.*] What are you? I am a live-stock porter on the railways.
2213. *Mr. McLaughlin.*] What experience have you had of loading cattle and sheep? Thirteen years. Mr. W. A. Herkes.
2214. How long does it take you to truck 1,000 sheep? Half-an-hour. 12 June, 1888.
2215. With what assistance? Three men besides myself.
2216. Is that with the side-loading system? Yes.
2217. Would you recommend the Government to change side-loading for end-loading? No.
2218. Why not? Simply because I think the side-loading system much easier and better both for cattle and for sheep. As for sheep, they do not get knocked about so much as they would in end-loading.
2219. Can you give any other reason? No.
2220. Do you know anything about the Hay yards? Yes; I have worked there for four and a half years.
2221. They are improved yards? Certainly.
2222. You can load 1,000 sheep there without moving the trucks? Yes.
2223. Could similar yards for sheep be erected at nearly all the stations, or the present yards be altered to the same style at very little expense? Yes.
2224. The Hay yards are very strong? Yes.
2225. You say that you can load 1,000 sheep there in half-an-hour? I have done it more than once.
2226. Are they counted accurately? They are counted into pens as they run through the races. As soon as ten trucks are loaded the engine pulls them away, and ten other trucks take their place. If we have not an engine there we have to do it by hand-shunting.
2227. If there was a slight inclination in the yards the moving would be still more simple? We could move the trucks easier if we had an incline.
2228. Are not all the yards on an incline? No.
2229. *Mr. Wilkinson.*] The sheep are all counted into different pens before you commence to load? Yes.
2230. Have you had any experience of end-loading? None.

Mr. William Green called in, sworn, and examined:—

2231. *Chairman.*] What are you? Porter-in-charge at Flemington. Mr. W. Green.
2232. *Mr. McLaughlin.*] Do you think that there is any necessity for a change from side-loading to end-loading? No. 12 June, 1888.
2233. Would you recommend it? No. 2234.

- Mr. W. Green.
12 June, 1888.
2234. Will you state your reasons for not recommending end-loading? With the poor appliances that we have at Homebush now I can load from 1,000 to 1,200 sheep in an hour.
2235. And count them too? Yes.
2236. And distribute them equally in the trucks? Yes. Last Friday I loaded 1,320 sheep in about an hour and three-quarters. Then, of course, we were taking our time, not hurrying at all.
2237. How many men? Four.
2238. Do you think it would be possible to load and count the sheep as rapidly with the end-loading system? I do not, not even in daylight.
2239. Why? If we had end-loading trucks all the stages would have to be fixed. I know that at a trial of end-loading trucks which we had it took me and another man half-an-hour to fix the trucks, and then we loaded some 400 out of 600 sheep over the bottom decks. I should like to know how you are going to divide them and count them from truck to truck.
2240. Mr. Lyne.] To what trial do you refer? It was one made some time ago with Mr. Lyne's end-loading trucks.
2241. Why do you call them Mr. Lyne's trucks? They were ordinary trucks which were altered by your orders.
2242. Mr. McLaughlin.] Do you think that the Evans truck is a suitable one for the Government to continue using? I do, from what I have seen of the others, and I have seen then all. The Evans truck has been in use now for some years. It seldom carries less than 100 sheep, and it can carry 120 shorn sheep with great ease, and 100 sheep with the wool on, allowing plenty of ventilation and plenty of room. It is seldom that we have a dead sheep in any of these trucks.
2243. Have you seen the Wilkinson truck? Yes.
2244. You know that the top deck goes up to the roof? Yes.
2245. Would not that heavy floor being suspended in the roof cause great oscillation in the train? I can hardly tell you that.
2246. Would not the Wilkinson truck be more difficult to clean than the Evans truck? I can hardly tell you, because we have not had it to do. This is the third truck of that sort that we have had. They worked very well at first, but by-and-bye they became so clogged that it was a moral impossibility to shift them at all. We have had two other trucks with the tops going to the roof.
2247. Mr. Wilkinson.] On the same principle as mine? With the exception that in yours you throw it out of gear to lower it. They worked very well when they were new and clean.
2248. Mr. McLaughlin.] Do you think that the opening in the roof is any great advantage? I fail to see how it can be. It is very well for a man to be able to walk along through the sheep; but I fail to see how he can get in among the sheep when he is up there.
2249. Is it not a fact that his legs would be down among the sheep and his head and arms out of the truck? Yes.
2250. Chairman.] Have you had any experience of end-loading? Thirteen years ago we had some end-loading trucks. They were tried on several occasions, but we could make nothing of them, and consequently they were condemned.
2251. Mr. Lyne.] At the trial which took place to which you have referred, is it not a fact that I loaded the sheep myself? I assisted you. I went through with the first sheep.
2252. You said that 400 out of 600 were put in the lower decks; were they not put in purposely? As far as I know they were.
2253. It was not through any mistake that 400 were put in the lower decks? No. You did not intend to try any more; you seemed satisfied with what was done.
2254. Mr. Evans.] During that trial the doors were all arranged before the trial commenced? Yes.
2255. And the doors were not closed until after the sheep were out of the trucks again? No.
2256. Mr. Wilkinson.] Are not the doors generally opened before you bring the trucks to the yards? Under the present contracts the men have to have the doors closed.
2257. Do you know anything about trucking stock in the country? No.
2258. You have a travelling gangway? Yes.
2259. Do you know that in the country they have none? No.
2260. Instead of your moving the truck you move the gangway? Yes.
2261. You have not to shunt every truck? Yes; we have to shift every truck by a horse or by our shoulders.
2262. If the difficulty of arranging the proper number of sheep is got over, the difficulty of end-loading will be overcome? I am afraid it will not be got over.
2263. Mr. McLaughlin.] With the end-loading trucks which you tried had you to drag down the first sheep to the end? Yes; I had to do that to make the others start.

TUESDAY, 19 JUNE, 1888.

Present:—

MR. HAYES,

MR. LYNE.

MR. KETHEL,

T. H. HASSALL, ESQ., IN THE CHAIR.

John McLaughlin, Esq., solicitor, appeared on behalf of the proprietors of the Evans Australian Combination Truck. W. B. Wilkinson, Esq., appeared in person.

Charles A. Goodchap, Esq., Commissioner for Railways, called in, sworn, and examined:—

2264. Mr. McLaughlin.] Did you receive the following letter from Mr. Evans in March last? Yes.

Dear Sir,

Sydney, 7 March, 1888.

As I expect to be examined by the Select Committee on the relative merits of combination trucks, and as the Government, as purchasers of my patent, will naturally be anxious to elicit all the facts, I shall be glad to be in a position to state the estimated cost of hauling 1 ton of additional tare per vehicle during twelve months' work of our present stock waggons.

C. A. Goodchap, Esq.

GEORGE T. EVANS.

2265. I believe you made a calculation? Yes; from the official records.

2266.

C. A.
Goodchap,
Esq.

19 June, 1888.

2266. And the result of your calculations is contained in this letter? Yes.

Sir,

Department of Railways, Sydney, 12 March, 1888.
In reply to the inquiry made in your letter of the 7th instant, I have the honor to inform you that the working expenses per ton per mile on the railways of this Colony were 305d. for the year 1886 (see railway report, page 139 of appendix). For 1887 the details are not yet worked out to give this information, but the difference will not be material.

On the south and west lines the mileage run for the year 1887 by live-stock vehicles was 11,127,868, and this mileage multiplied by the cost of running as given above (making allowance for certain standard expenses, which would not be affected by the increased weight) shows that if each vehicle had weighed 1 ton additional the extra cost to the Department for working that traffic would have been £11,521.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

C. A.
Goodchap,
Esq.
19 June, 1888.

G. T. Evans, Esq., Supt. of Stores, Eveleigh.

2267. *Mr. Lyne.*] Have you not some photographs in the Department showing the system of end-loading stock in South Australia or Queensland? I believe we have.

2268. Are there any means by which the Committee can see them? I will send them to you.

2269. Have you made any calculation as to the cost of the haulage of a ton over the whole of our railways? Yes; it will be found in the Railway Report for 1886. It is 305d. per mile for every ton taken over the lines.

2270. What would be the mileage per truck? It varies. Live-stock trucks run more than other trucks. Taking the trucks all round, I think 7,000 miles would be about the average.

2271. What is the difference in the cost of the haulage between an ordinary truck and a combination truck—take Evans', for instance, as being the lightest? It all depends on the weight. Live-stock trucks and ordinary D trucks are employed in different services, and the mileage is different in each case; but I think, putting them altogether, the average mileage would be about 7,000 miles.

2272. You say that the cost per mile per ton is about one-third of a penny? Not quite. I have given 250d. as representing the proper amount, because there are certain standard expenses which would not vary—the superintendence, signals, and all these things along the line, the cost of which would not vary whether the trucks used weighed 10 tons or 1 ton. Therefore, I make a reduction for that, and put it down at ¼d. per ton per mile.

2273. *Mr. Hayes.*] That is the actual cost of haulage, excluding the standard expenses? Yes.

2274. *Mr. Lyne.*] The net cost is about ¼d. per ton per mile, and, taking into consideration the difference in the weight between an ordinary D truck and a combination truck, it would be about £7 5s. extra haulage per annum? I do not see why you make a comparison, because the trucks are used in such different services.

2275. *Chairman.*] According to your report you are perfectly satisfied that the combination trucks have effected a great saving in the expenses of the Department? I am certain that they have; but they do not do all that is claimed for them.

2276. But they have, to a great extent, saved expense? They will effect a great saving.

2277. Have you had any experience of end-loading? I have seen it done.

2278. Not in New South Wales? Yes. Some years ago we attempted it.

2279. Can you give an opinion as to whether it would be a success or not? Our experience was rather against it; but where it has been brought into use they tell me it is very effective. They speak very highly of it in South Australia. I believe it is in use in Queensland.

2280. *Mr. Hayes.*] What does the saving consist of—is it in the conversion of a truck from a cattle to a sheep truck? It is saved in empty running. If we send these trucks to the country full of goods, and get them back loaded we save an immense amount of empty running. We shall not save the amount of empty running that has been claimed for these trucks. That has been given at a very outside figure, on the assumption that we should always be sending goods to particular places where trucks were required for sheep or cattle.

2281. What advantage is there in sending goods by a combination truck over sending them by an ordinary cattle truck? There is better shelter in the combination truck than there is in the cattle truck, and the cattle truck may be going to a place where sheep are coming from.

2282. What I want to know is is there any special advantage in a combination truck for the carriage of goods over an ordinary cattle truck? I should think that with good tarpaulins the cattle trucks might be nearly as effective as combination trucks.

2283. *Chairman.*] In sheep trucks you cannot load goods? No. You might load exceptional traffic, such as rabbit wire-fencing, or something like that; but, as a general rule, sheep trucks are not available for ordinary loading.

2284. So that it would be an advantage to the Department to have trucks built on the combination pattern? No question about it; that is, assuming that is a good truck, that its parts work evenly and are not likely to get out of order or break down. If we got a truck which was ineffective in this respect it might be more expensive than it was worth.

2285. From your knowledge of the Evans combination truck, do you think it will cost more to keep in repair than an ordinary truck? I am not aware that it will. I have made some inquiries in that direction, and I find that all the working parts have answered admirably during the time we have had the trucks in use, and that the trucks are not under repair as often as ordinary trucks.

2286. Evidently they answer the purpose for which they were intended? I should think so.

2287. Without putting the Department to extra expense for their repairs? Yes.

2288. Do you think that the Government would be justified in paying such a large price as £16,000 for the patent, in view of the saving which would be effected? I do not know what is the value of a patent—how it is to be calculated. For my part, I consider that £16,000 is a very large sum indeed to pay for the patent, viewed in regard to the amount of skill and the amount of thought involved in making the design; but if it is to be viewed from the standpoint of the benefit which it confers, then I am clearly of opinion that it is worth £16,000, and many £16,000 to the Department.

2289. *Mr. McLaughlin.*] Suppose the patentee had spent six or seven years, working night and day, preparing models and improving the design, until at last he brought it to its present state, do you think that that would be too large an amount then? I always thought that these things came as a sudden inspiration.

2290. *Mr. Wilkinson.*] If my truck were reduced to the same weight as Evans', there would be no need for the calculation as to the difference of the cost of hauling the two trucks? No.

2291. The conversion of the cattle truck into an Evans truck, and the building of fourteen of Evans' trucks were done at the expense of the Department? Yes.

2292. Has the Department contributed anything towards the construction of my truck? I believe not.

Mr.

Mr. Joseph Wilkins, junior, called in, sworn, and examined :—

- Mr. J. Wilkins, jun.
19 June, 1888.
2293. *Mr. Wilkinson.*] What are you? A waggon-builder, in the employ of Hudson Brothers.
2294. How long have you been in their employ? Six years.
2295. Does your father occupy any position there? He is foreman of the waggon department.
2296. Do you work under your father? Yes.
2297. Do Hudson Brothers construct certain rolling stock for the Government? Yes.
2298. What is the rolling stock? All covered goods and sheep vans, and cattle trucks.
2299. You constructed the truck known as Wilkinson's combination truck? I helped to construct it.
2300. Is it constructed in such a way as to conform as far as possible to the regulations of the Government with respect to other trucks? It is.
2301. How are the sides of the truck constructed? They are braced from floor to roof, and the upright bars go from the floor to the roof, which is not the case in any other trucks that are running.
2302. *Mr. Kethel.*] Are the braces diagonal? Yes.
2303. *Mr. Wilkinson.*] How many pillars are there? Five on each side.
2304. How many in the end? Two, besides the corner pillars.
2305. Are they tennoned? They are fastened into the headstock in the usual way, and to the arch rail.
2306. What is the size of the pillars? Four and a-half by three.
2307. Do they go from floor to roof? Yes.
2308. How is the roof of the truck tied? It is tied across the middle with an iron T beam, three by a half inch.
2309. Is the truck tied together as strongly as existing trucks in the roof? I think so.
2310. Are any existing trucks tied by an iron beam? No.
2311. Is the deck which goes up into the roof fixed tight when there? Yes.
2312. Is there any oscillation in the deck itself when in the roof? No.
2313. Do you know anything about the louvred meat vans? I helped to build most of them; they are louvred all the way round.
2314. Are there any braces in them? No.
2315. Do not they carry meat in the roof in these louvred vans? There are four bars running from one end of the truck to the other, on which meat is carried. I suppose they carry from 2 to 3 tons of meat in the roof in these vans.
2316. What would be the weight of the deck in the roof of my truck? Between 5 and 6 cwt.
2317. You say that they carry between 2 and 3 tons of meat in the meat vans which are not braced, but which are louvred all round? Yes.
2318. Does the meat hang from the roof? Yes.
2319. Then if there was any oscillation it would be bound to work? Yes.
2320. Was there any model or plan when my truck was being constructed? There was no model or plan; it was built from your idea.
2321. Was the weight of the truck considered when it was being constructed? No.
2322. The truck was built according to my instructions, and was altered at certain times when I saw an improvement could be made? Yes.
2323. Can you say anything about the hinges which were used? They were a lot heavier than was necessary.
2324. And the upright rods? They were of solid iron from floor to roof.
2325. You are now building a similar truck for the Victorian Government? Yes.
2326. In the construction of this new truck have you reduced the weight in the iron-work alone? Yes, by 9 cwt.
2327. Is the truck as strong as the original one? I think it is stronger.
2328. You state this of your own knowledge, having ascertained the weight of the two trucks? Yes.
2329. Do you know anything about the construction of Evans' truck? I had nothing to do with it. I have looked at it.
2330. Do you know whether there are any braces in it? None to the best of my knowledge.
2331. Do you know what the centre rail in Evans' truck is composed of? I think that it is a piece of angle-iron.
2332. If the Department allowed me to construct my truck in the same way, without braces, would that make my truck any lighter? Yes.
2333. Presuming that there is no advantage in a combination truck at all, or very little, has my truck any special advantage over the existing sheep trucks? Yes. One advantage is that the decks in the present sheep trucks are fixtures, whereas, in your truck, the deck goes to the roof; therefore, it would be a goods truck as well as a sheep truck. It also has provision for end-loading, which the existing trucks have not. It is better ventilated than the present trucks. With the deck raised to the roof you have the advantage of being able to walk about in the truck when loading the bottom deck. Then when you lower the deck you can open the roof, and walk about upright on the top deck.
2334. It has the advantage, as a natural consequence, that is a goods truck as well? Yes.
2335. If it were made merely a sheep truck would it be any lighter? Yes.
2336. Presuming that it were only a cattle truck, would it have any advantage over the existing cattle trucks? It has the advantage that it is better ventilated, and another advantage is that if a beast gets down you can see it from any part of the truck, whereas in the present trucks the sides are practically dead wood nearly to the roof, and you cannot look into the trucks without looking over the top. In the Wilkinson truck if a beast is down you can get at it anywhere.
2337. *Mr. Lyne.*] How does the ventilation in the Wilkinson truck compare with that in the Evans' truck? The Wilkinson is the better ventilated of the two.
2338. *Mr. Wilkinson.*] Are there many doors in my truck? There are a lot of doors—thirty I believe—but they are put there as a convenience.
2339. How many doorways are there? Two on each side and one on each end.
2340. Are these doorways put there as a convenience, or are they necessary in the construction of the truck? They are put in as a convenience. Some of them, I believe, can be done away with, if necessary.
2341. Are they essential as far as the system of the truck is concerned? They are not. They are there, not as a necessity, but as a convenience.

Mr. J.
Wilkins, jun.
19 June, 1888.

2342. Do you know why the two doorways are put in the side of the truck? They are put there to suit the present trucking yards, so that you can load the truck at the bottom at one place and at the top at another, or *vice versa*.
2343. How many doors are there in the side of the Evans truck? One at each corner.
2344. Could they put another door in the side conveniently if they wanted it? I do not see that they could, seeing that the flaps of the deck are hinged to the side.
2345. Is it not a fact that in the Evans truck some of the flaps have to be taken away and hung up in the ends of the truck? Yes.
2346. Would not the same thing occur if they were to put in another side door? Yes. They would have to make room for it somewhere else; they could not hang it on the side.
2347. In one of the trials of my truck something went wrong, will you state what it was? There is a groove in each side, in which the deck works, and in building the truck we did not put in a stop sufficiently long; therefore, when the way was on the truck the deck came out of the slot, and came down, and could not get back again.
2348. *Mr. Lyne.*] How much longer should the stop have been? About $\frac{3}{4}$ of an inch.
2349. *Mr. Wilkinson.*] You effected the repairs at Eveleigh? Yes.
2350. What did you do? I had the stops taken off and made longer, and I had a piece of angle-iron put across the middle deck just opposite the stops.
2351. Ought not that piece of angle-iron to have been in before? It would have been there if the truck had been constructed according to your orders.
2352. You have hauled the deck up and down a great many times? Yes.
2353. How long does it take you to haul it up, on an average? About 3 minutes.
2354. How long does it take you to lower it? Inside of a minute.
2355. *Mr. Kethel.*] With reference to the louvres in the present meat trucks, are they capable of being used as braces, are they bradded into the slots at the end, or are they simply fitted in without any brads? They are bradded in.
2356. In that case the louvres would act as braces? They are knocked in and nailed in.
2357. Being bradded in do they not help to strengthen the truck? Being continuous all round they would a little.
2358. I suppose you have a fair knowledge about the hardwood used in the construction of the frames of the various trucks? Yes.
2359. What kinds of wood are generally used? Mostly tallow-wood, blackbutt, and stringy-bark. Sometimes we use ironbark. There is a mixture.
2360. Suppose you were to use discrimination in selecting choice descriptions of timber, longer in the fibre and stronger than others, would it not be possible to reduce the weight of the frames of the trucks without decreasing the strength? I think it would.
2361. *Mr. Wilkinson.*] Is there any light wood in my truck which ought to be hardwood? None at all.
2362. *Mr. McLaughlin.*] Can you tell me the date when Wilkinson's truck was constructed? I cannot.
2363. Was it constructed from verbal instructions? Yes.
2364. How long was Mr. Wilkinson at the works? He came up in the morning perhaps, and stayed half-an-hour or an hour, and then went away.
2365. You say that you had no plan and no model, but that you made the truck from verbal instructions? Yes.
2366. Then, as far as the Committee are concerned, there is nothing to satisfy them that the invention is not as much yours or your father's as anyone else's. Did you not all assist in the manufacture of the truck? The idea is not mine. It is Mr. Wilkinson's all through.
2367. You cannot give us the slightest idea when the truck was built? I cannot tell you when we commenced it. I should think it was about twelve months ago when we first started it.
2368. Do you know how long the Evans truck had been running before that? I do not.
2369. Had you seen the Evans truck at that time? I had seen one of the patterns of Evans truck.
2370. I suppose that your fellow-workmen had seen it? I cannot answer for them.
2371. Was it not a fact that you tried to make an improvement on Evans truck, if possible? No.
2372. *Mr. Wilkinson.*] Is there anything in my truck like Evans'? Nothing at all.
2373. *Mr. McLaughlin.*] This new truck that you speak of is being made for exhibition purposes, is it not? It is being made to run on the Victorian lines, and it is to be sent to the Exhibition.
2374. Will you tell me in what way you have reduced the weight by 9 cwt. in the iron-work? In the hinges, in the running gear, on the side for the shutters, and in the iron-work generally. Then, in the place of solid bars on the sides, we have put in gaspipes.
2375. Did you ever hear of gaspipes being used in trucks before they were put in Evans' truck? I never used any before.
2376. Did you ever see gaspipes used in that way? No, not in any of the trucks.
2377. I suppose you approve of them? Yes.
2378. You say that the use of them affects a great saving in the weight? Yes.
2379. Do you know what the cost of construction per truck according to the Wilkinson pattern would be? I do not.
2380. Would it be as cheap as Evans'? I know nothing about the cost.
2381. *Chairman.*] You say that you have been connected with the construction of Wilkinson's truck from the time that it was initiated? Yes.
2382. How many times has it been altered or repaired since the commencement of this inquiry? A good many times.
2383. Have these alterations reduced the weight? They have not reduced the weight a bit.
2384. *Mr. Wilkinson.*] Do you know when this inquiry commenced? No.
2385. Did you not say in reply to the Chairman just now that the truck had been altered a good many times since the inquiry commenced? What I understood the Chairman to ask me was, if the truck had been altered many times since it was constructed.
2386. Do you remember when Mr. Badgery and two other gentlemen inspected the truck at the Clyde works? Yes.
2387. Was it complete then? No.

WEDNESDAY, 27 JUNE, 1888.

Present:—

MR. HASSALL,

MR. SUTHERLAND.

MR. BRUNKER,

T. H. HASSALL, ESQ., IN THE CHAIR.

John McLaughlin, Esq., appeared on behalf of the proprietors of the Evans Australian Combination Truck.

Hugh M'Lachlan, Esq., called in, sworn, and examined:—

H.
M'Lachlan,
Esq.
27 June, 1888.

2388. *Chairman.*] You are chief clerk in the Railway Department? Yes.

2389. Have you any papers relating to the combination trucks offered to the Government? The Commissioner received a summons from the Committee, but as it was not marked "personal attendance," he asked me to get out particulars of the different combination trucks which have been offered to the Government at various times, and I have prepared a brief statement showing the different designs of trucks submitted to the Department, not only up to the date of the appointment of this Committee, but also up to the present date. This statement which I have prepared is as follows:—

THE first of the combination trucks brought under notice (if we except one constructed by the Department in 1878, which was not a success) seems to have been that designed by Mr. Evans; it came prominently to the front at the time the Board was sitting on the carriage of live-stock by railway in 1884. This Board inspected a model of the truck, and were so impressed with the merits of the principle that the members recommended the Department to have a number of trucks built to practically test it.

The next is the Wilkinson truck. It seems to have been the outcome of the trial of the Evans truck, and at first Mr. Wilkinson's object seemed to be merely to suggest improvements on the original design. He first brought his ideas under notice in December, 1885, when he was asked to submit his suggestions. Subsequently he submitted plans and had a truck built to his design.

The Perry truck next submitted seems also to have been the outcome of the trials of the Evans design. There is no official notice of the Perry design prior to November, 1886, when the inventor submitted a model to the Commissioner.

The three above mentioned were those primarily referred to the Combination Car Commission, which reported in favour of the Evans design.

There is a record of a design for a combination truck having been received from Victoria in November, 1886, the inventors being Brazenor and Valentine. The truck was designed for either sheep or goods, but was not favourably received. The Chairman of the Board investigating the merits of the combined trucks wrote "that as it was only for sheep and merchandise, the truck does not meet the requirements of a combined stock and goods truck," and the General Traffic Manager of the Victorian railways also wrote "that after a fair trial my experience of Messrs. Valentine and Brazenor's convertible truck is not satisfactory."

A second Victorian design—inventor, Mr. D. Anderson, of Stawell—was also submitted to the Department. It was first brought under notice in January, 1887, but does not appear to have had much attention. The plan was submitted to the Board appointed to inquire into combination trucks, but too late apparently for them to consider it.

A Mr. Fowler also submitted, January, 1887, a design to the Combination Truck Commission, but they apparently thought little of it, as it receives no special mention, and it would be included in their remark. "That a number of other models and plans were submitted, but none of them possessed such improvements as would warrant the Board in suggesting the adoption of their principles."

The next is the "Mulholland," but it is doubtful if it comes within the category of combination trucks offered to the Government prior to 8th November, 1887. It was first brought under notice by the members of the Combination Car Commission, who sent in their report on 23rd January, 1887. They were asked to report on the relative merits of the three designs first offered to the Government, viz.; the Evans, Wilkinson, and Perry, but the Board widened the scope of their inquiry, and permitted any persons who had models or plans of new inventions pertaining to combination trucks to exhibit them. Amongst them was the design of Mr. Mulholland, and concerning it the Board stated—

"Mr. Mulholland submitted an imperfect model of a combination truck, available for sheep and cattle, embodying an ingenious system of end-loading, but inasmuch as he had made no provision for the smooth inside surface required for cattle, we considered his design defective."

The matter seems to have rested until 30th November last, when Mr. J. L. Barker wrote that he was desired by Messrs. Korff and Mulholland, to apply for two pairs of wheels and axles. These were supplied for model truck, which was built by Mr. Thomas Hearne. The truck would appear to have been completed in March last, as on the 16th March Mr. Hassall, M.P., Chairman of the Combination Truck Commission wrote, saying that Mr. Mulholland had invented a truck, and was anxious the same privileges should be granted to him as to other inventors, and desired a practical test, which was allowed.

A letter was received from Mr. Chanter on the 26th November last, submitting that a Mr. John Treacy, of Victoria, had invented a combination truck, and wanted it considered before any definite decision was arrived at. Mr. Chanter was asked to forward design, but nothing further has been done. On the 23rd April last a Mr. John M'Cook wrote, stating that he had an improved design of combination truck. He had taken out letter-patent, and submitted model; he was referred to the Select Committee, but in an interview with the Commissioner, he stated that the Chairman declined to have anything to do with his truck. He wrote, 15th instant, asking for Commissioner's opinion of his truck, and was asked to send in particulars and it would be reported upon. On the 6th June instant, another invention came to the front, viz., a sheep and goods truck, designed by Messrs. Sutton of Victoria. They intimated that they would forward models of truck if desired. They were informed that the Department was not at present prepared to consider any fresh designs.

2390. You say that the letter from Mr. Barker with reference to Mulholland's truck was received on the 30th November? Yes.

2391. That was after this Committee was appointed? Yes.

2392. There was no offer of sale of the truck to the Government? None.

2393. Have there been any definite offers to the Government of combination trucks, other than the Evans and the Wilkinson trucks? Those are the only two which have been offered. Designs have been submitted by other persons, but, as far as I can trace, they have made no definite offer.

COMBINATION TRUCKS.

APPENDIX.

[To the Evidence of G. T. Evans.]

A.

No. 1.

Sir,

"Adams' Exchange Hotel," 30 November, 1887.

I have the honor to apply to you for permission to run my truck to Dubbo next week and return with a consignment (say) of fifty sheep and four or five head of cattle to Homebush in the one trip.

In order that I may prove what it is capable of doing I have arranged for the stock to meet me at the Dubbo trucking yard.

I may state that the Minister for Works, in a conversation with me, stated that he would be glad to give my truck an opportunity of running on the railway lines.

I would prefer loading the truck up with goods to Dubbo.

Awaiting your reply,

I remain, &c.,

W. B. WILKINSON.

The Commissioner for Railways.

Inform Mr. Wilkinson that I am prepared at once to give his truck a trial in the way in which, if it belonged to the Department it would be practically used; but I do not see the use of testing it with a few cattle and a few sheep—a mode of use which will not be a practicable one. If he will hand over his truck to the Department I will test it in the same train and with the same loading, or similar loading, conveyed over the same length, with the "Evans" truck.—CH.A.G., 1/12/87.

No. 2.

Sir,

Department of Railways, 1 December, 1887.

In reply to your letter of the 30th ultimo, I have the honor to inform you that I am prepared at once to give your truck a trial in the way in which if it belonged to the Department it would be practically used; but I do not see the use of testing it with a few cattle and a few sheep—a mode of use which will not be a practicable one. If you will hand over your truck to the Department I will test it in the same train and with the same loading, or similar loading, conveyed over the same length with Evans' truck.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

W. B. Wilkinson, Esq.

No. 3.

Sir,

Gresham-street, 17 December, 1887.

My patent combination truck is now at Homebush, having delivered its freight of fifty sheep and five head of cattle all sound. I am willing that the patent should have further trial. In a letter to me a short time since you proposed that it should be run beside Evans' with similar loads or under similar circumstances, in answer to which I may state that you are at liberty to give it any trial that you wish, and I am anxious that it should be thoroughly tested.

I will be glad if you can let me know on Monday if you will permit the above, and the truck for the time being can be under the sole control of the Department (say) for four trips.

Before its going out again I would like to alter my half doors into whole doors, as I find the whole door is a great advantage for trucking cattle.

Yours, &c.,

W. B. WILKINSON.

The truck could be at your disposal (say) next Friday.
The Commissioner for Railways.

I learn that the sheep sent were very small, recently shorn, and that the cattle were of the smallest and tamest. I do not consider such a trial is convincing proof of the efficiency of the truck, nor do I think even if the stability of the truck is established by further test that the conclusions arrived at by the Board will be invalidated. I have no objection to the truck being tested in the way I first suggested. Evans' new truck to be on the same train, both trucks to be weighed empty and loaded. I should like also recorded the number of operations each truck requires to fit it for use and to convert it again. I understand that numerous alterations have been made in the Wilkinson truck since it was reported upon by the Board; even after the trial which Mr. Wilkinson refers to in his present letter some further alterations are found to be necessary, and it seems the nearer it can be brought to Mr. Evans' design the greater are its perfections. The floor I understand has now been made similar to that adopted by Mr. Evans originally.—CH.A.G., 20/12/87.

Mr. Wilkinson to be informed that if he will hand truck over to Traffic Branch it will be tested in accordance with conditions stated in our letter of 1/12/87.—D.C.M'L., 20/12/87.

Sir,

Department of Railways, 20 December, 1887.

In reply to the request contained in your letter of the 17th instant, I have the honor, by direction of the Commissioner for Railways, to inform you that if your truck be handed over to the Traffic Manager for the purpose of being tested this will be done in the manner described in my communication of the 1st instant.

I have, &c.,

A. RICHARDSON,

(For the Secretary of Railways.)

W. B. Wilkinson, Esq., "Aaron's Exchange Hotel," Sydney.

No. 4.

Trial reports of Messrs. Wilkinson's and Evans' Trucks.

I HAVE the honor to report, for your information, the results of the first trial of the Evans' and Wilkinson's combination trucks, carried out as directed by the Commissioner.

The trucks weighed empty, as follows:—

	Tons.	cwt.	qr.
Evans' truck	6	13	1
Wilkinson's truck	7	18	0

They were loaded on 29th December with the following weight of goods for Bourke:—

	Tons.	cwt.	qrs.
Evans'	5	0	1
Wilkinson's	4	17	2

They

They were unloaded on 2nd and reloaded at 6:30 a.m. on 3rd instant with nine head, each of weighty but rather quiet cattle. They would have each held another bullock, but as the load limit had not been definitely settled I considered it unwise to exceed the nine head.

The loading in both trucks was accomplished with wonderful celerity, occupying 5 minutes only for the two trucks, and the result conclusively proves the advantage of the doors being placed in the ends of the sides instead of in the middle. The weather was remarkably cool during the whole of the time the trucks were in transit, ranging between 70° and 80°, and in that respect the test as to ventilation, &c., was of no particular value. One of the thermometers having been detached before reaching Nyngan, I was unable to thoroughly settle the question as to its range in each truck, but I have made provision to secure them from interference on the next trip.

The trucks left Bourke at 7:40 a.m., and with the exception that the axle of the Evans' truck ran hot through a defective lubricator, which was remedied at Byrock, nothing of any particular moment occurred until reaching Bathurst, when the trucks were weighed with the following result:—

	Tons.	cwt.	qrs.	Tons.	cwt.	qr.	Tons.	cwt.	qrs.			
Evans' truck	Gross,	12	6	2;	tare,	6	13	1;	net,	5	13	1
Wilkinson's truck	"	13	8	2;	"	7	18	0;	"	5	10	2

After leaving Bathurst the cattle began to slip about considerably in the Wilkinson truck, and at Katoomba one bullock got down. At Lawson two were down but were able to get up again, as at Glenbrook they were all on their feet. On reaching Penrith three head were down. From Penrith to Homebush the run was made in 1 hour and 27 minutes, and on reaching the cattle-yards two of the cattle had regained their feet, the remaining one being in a very exhausted condition. The whole of the cattle in the Evans' truck were on their feet throughout the journey and were unloaded in 2½ minutes. Those in the Wilkinson truck, exclusive of the beast that was down, were 14½ minutes unloading, a fact the unloaders attribute to the van being too close to enable them to work the cattle. The remaining bullock had to be assisted to his feet.

It is of course premature to express any opinion on the facts disclosed, and I trust that three features, which it was impossible this time to secure, viz., hot weather, wild cattle, and a registration of the temperature will be available in the next trial.

I propose, with your approval, to load cattle again at Bourke and then sheep at Hay.

JNO. HARPER, 6/1/88.

Traffic Manager.

COMBINATION TRUCK TRIALS.

No. 2.

Cattle.

ON January 8th the two trucks were each loaded with 6 tons of goods for Bourke. A favourable opportunity occurring of obtaining heavy Queensland cattle at Byrock, I decided to load at that station. The cattle in question was a mixed lot, many being very large and weighty, while others were about medium size and quality.

They had been nine weeks travelling, and were hurried to Byrock in time for trucking. Nearly five hours were spent in yarding them, and the result was that with the thermometer at 101° in the shade they entered the trucks very much knocked about and footsore. At my request the trucking agent, Mr. Anderson selected as many as he could of the largest bullocks for the two trucks.

In the Evans truck eight of the largest cattle were loaded, and completely filled it. No reservation was made as to the condition of the stock, those that entered the race being allowed to load in precisely the same manner as with an ordinary cattle-waggon.

Before loading the "Wilkinson" truck that gentleman objected to a large and rather wild and sulky bullock, which in the ordinary course would have been loaded in his waggon, and at his request the beast was returned to the main mob.

This caused the balance of the heavy cattle which had been drafted to become mixed, and as we were late, four heavy cattle and five medium ones were loaded.

On reaching Narramine it was observed that a very large and prime bullock had laid down in the Evans truck and after attempting to get him up it became apparent that he was too footsore to stand and too sulky to get up. As his position did not endanger the other cattle he was left alone. During this part of the journey on several occasions the horns of the cattle in the Wilkinson truck became entangled amongst the bars and had to be released.

When Orange was reached, the bullock already referred to in the Evans truck was still down, and had got into such a bad position during the night that he would certainly have brought others down. We therefore unloaded the truck and got him on his feet, but he laid down again before we left the station.

It was observed at Orange that one of the pine louvres in the Wilkinson truck had been knocked out, and as it was probable that a bullock's horn might get into the space left and destroy the remainder, a batten was nailed over it.

At Bathurst the trucks were weighed with the following result:—

		Tons.	cwt.	qrs.
Evans truck, 8 cattle—Gross		12	17	0
Tare		6	13	1
	Net.....	6	3	3
Wilkinson truck, 9 cattle—Gross		13	17	2
Tare		7	18	0
	Net.....	5	19	2

As the same bullock was again down in a bad position in the Evans truck, and it was evident he would not stand up, and as in coming over the Mountains he would probably endanger the other cattle, I decided to take him out, which was done at Kelso, and he was subsequently sent on in another train. I may mention that owing to the condition of the cattle when trucked they were unable to stand, and that at Orange, Kelso, Wallerawang, and Mount Victoria we were compelled to unload the ordinary cattle-waggons to get cattle up, and the whole consignment of thirty-three trucks arrived at Homebush with about twenty-four head-down.

At Wallerawang another bullock had laid down in the Evans truck, but on being disturbed resumed his feet and remained standing till the end of the journey.

At Flemington the cattle were all standing in the Evans; one had laid down in the Wilkinson.

The time occupied in unloading was—

The Evans truck	7 minutes.
The Wilkinson truck	5 minutes.

During the whole journey thermometers were in two trucks, and I give the readings at different stations. It should, however, be stated that Mr. Wilkinson constantly adjusted his shutters, according to the direction of the sunlight. The Evans truck was in no way altered, but treated as I have already said as it would be in actual traffic, that is, as one of our cattle-waggons.

Thermometer Reading.

	Evans Truck.	Wilkinson Truck.
Byrock	101°	101°
Coolabah	102°	102°
Girilambone	103°	101°
Nyngan	100°	99°
Neverfire	96°	95°
Bathurst.....	84°	84°
Zigzag.....	88°	90°
Flemington	79°	82°

The Evans truck arrived intact, and was not touched. The Wilkinson truck had a new louver placed in it, the working parts oiled, decks raised and adjusted, and sundry alterations to the shutter fastenings.

JNO. HARPER, 17/1/88.

Traffic Manager,

COMBINATION

COMBINATION TRUCK TRIAL.

No. 3.

Sheep.

THE two trucks were loaded each with 6 tons of goods for Hay and Carrathool, being the only stations for which vans were ordered, the trucks were reloaded with sheep at that station. I have previously stated that the working parts of the Evans truck were in no way tried or oiled from the commencement of the first trial; those of the "Wilkinson" were attended to by a fitter from Hudson Brothers. The sheep provided were of medium quality, with about three months wool.

The Wilkinson truck was altered from a merchandise to a sheep waggon by Mr. Wilkinson, and 112 sheep having been drafted, 23 minutes were occupied in the whole process of altering and loading it.

The Evans truck was altered by myself and 112 sheep loaded, the time occupied being 27 minutes. The doors of each truck did not fit the race, and hence it was necessary to move them. Of the two less difficulty was experienced with the Evans truck than with the "Wilkinson," but the substitution of a different flap at the races would enable each to be worked with far less difficulty. The sheep were divided into four lots in either truck by means of the rails in the Evans truck and the doors in the Wilkinson.

The trucks left some two hours after being loaded and attached to the same train as sheep van 116, carrying 104 of the same class of sheep.

On reaching Darlington (34 miles from Carrathool) it was found that both of the upper decks in the Wilkinson truck had given way some 5 or 6 inches, being completely twisted and strained, and threatening at any moment to fall altogether. At Mr. Wilkinson's request, and in the interests of humanity, a wire was sent to Narrandera to provide screw-jacks and timber support the decks.

At Narrandera the jacks were used to lift and strenghten the decks, and two timber shores were placed underneath, taking the weight of the sheep.

At Junee Junction two additional shores were placed underneath, as the decks gave evidence of collapsing in the middle. At Junee the three trucks were weighed, coupled on the engine, with the following result:—

Evans, 112 sheep—Gross	Tons cwt. qrs.
Tare	11 2 1
Net.....	6 13 1
Wilkinson, 112 sheep—Gross	4 9 0
Tare	12 9 2
Net.....	7 8 0
Sheep-van 116, 104 sheep—Gross	4 11 2
Tare	10 13 3
Net.....	6 9 1
	4 4 2

I did not regard this weighing as a satisfactory one, owing to the trucks being coupled, and as I was anxious to ascertain what weight the sheep would lose in transit, I subsequently reweighed the trucks, standing uncoupled, on the bridge at Granville, with the following result:—

Weight at Granville.

Evans truck, 112 sheep—Gross	Tons cwt. qr.
Tare	11 0 0
Net.....	6 13 1
Wilkinson truck, 112 sheep—Gross	4 6 3
Tare	12 5 2
Net.....	7 18 0
Sheep-van 116, 104 sheep—Gross	4 7 2
Tare	10 10 3
Net.....	6 9 1
	4 1 2

The sheep were unloaded from each truck at Flemington in good order, the time occupied in doing so being—

- Evans truck, 10 minutes.
- Wilkinson truck, 11 minutes.
- Sheep van truck, 13 minutes.

Thermometers placed in the two trucks registered alike throughout the journey, ranging from 86° to 56°. Mr. Wilkinson, as in previous trials, adjusted the shutters of his truck as he chose. The Evans truck was left untouched.

The trucks were brought to Sydney, and, on Monday, morning, Messrs. Scott, Downe, and Kirkcaldie saw and examined them.

The upper deck of the Wilkinson truck, after all the gear had been adjusted, took 7¼ minutes to raise. The Evans truck was converted in 4½ minutes. The former was subsequently placed in the hands of mechanics to patch up the damaged decks, preparatory to being sent to the Centennial Show. The Evans truck was in as good condition as when it started, and was available for any class of traffic without a tool being used on it, or a drop of oil being applied to any of its working parts.

The empty trucks were reweighed on the Sydney bridge, with the following result:—

Evans truck	Tons cwt. qrs.
Wilkinson truck	6 12 2
	7 15 2

Traffic Manager.

JNO. HARPER, 25/1/88.

As directed by the Commissioner three trials have been made with the Evans' converted cattle-waggon and the Wilkinson combination truck, and I attach reports of the results of each of them. Mr. Rhodes representing the Evans truck, and Mr. Wilkinson his own, accompanied the waggons in their three trips; on the first one the latter gentleman left the train at Belaringah.

I have in reporting confined myself to stating the facts as observed without instituting any comparison as to the relative merits of the trucks upon which subject any impressions I had, may after seeing them running together nearly 3,000 miles, place me in a position to speak with conviction.

Briefly summarised the results are:—

The Evans truck is 6 tons 12 cwt. 2 qrs. in weight; will carry as many if not more stook than the other. It requires no particular attention, as is shown by the fact that it was not in any way nursed or attended to during the trials, and it is to-day as fit to run as when it started.

The Wilkinson truck is 7 tons 15 cwt. 2 qrs. in weight; has had most unremitting attention, such as could never be paid to ordinary stock vehicles; has been repaired, and is to-day unfit to carry sheep. My observations respecting it have of course extended beyond the range of my reports, but with your permission I will at present refrain from giving them in detail.

With reference to the number of operations necessary to alter the waggons I may state that they have no value in relation to the practical working of them. The Evans truck has seventeen to convert it to a sheep-van, the Wilkinson eight, but in each case they are principally of a minor character. At the conclusion of the trials the Evans truck was altered in 4½ minutes, the Wilkinson truck in 7¼ minutes.

Traffic Manager,

JNO. HARPER, 25/1/88.

[To the Evidence of W. B. Wilkinson.]

B.

Sir, 14 October, 1887.
Re my conversation this morning and my application to you to be allowed to run my truck into Redfern Railway Station or to a siding and your reply—I think that in the hurry of my application you must have misunderstood my motive in asking. You reply to me that you could not be a party to my manœuvring, or lend the railway premises for that purpose, I think must be placed as before stated to your not understanding the nature and object of my request. I, when asked by you for what purpose I required to bring the truck to Redfern, was in order to show the truck to people interested in stock—in answer to which you gave me the reply stated.

Now, sir, in justice to myself, I think I ought to point out to you that I was only asking for what was reasonable under the circumstances—in order to give my patent (which has cost me a great deal of money to develop) a fair criticism by those interested, and in submitting to such public inspection it was throwing the whole thing open to the criticism of the Department and public.

For this (I may point out) Mr. Evans in his patent was allowed the free use of the Government Railway Lines, not only to use his fourteen trucks, but they were built and altered at the Government expense, whereas my truck and the improvements suggested by members of your Department have been carried out at mine own.

I trust therefore that you will reconsider your decision, and allow me to run my truck into some side line on the railway premises at Redfern for forty-eight hours.

Yours, &c.,

W. B. WILKINSON,

"Aaron's Exchange Hotel."

C. A. Goodchap, Commissioner for Railways.

Sir, 15 October, 1887.
 Not hearing from you *re* your decision or rather reconsideration of your decision—"not allowing use of siding at Redfern railway premises"—I have now made arrangements with Messrs. Hudson Bros., who will allow me the use of their Redfern siding.

The truck will be there on Monday, and will be open to the inspection and criticism of all interested. I hope, sir, that you will find an opportunity to inspect it. It has now been considerably altered to meet the suggestions of members of the Stock and Works Department.

Yours &c.,

W. B. WILKINSON.

The Commissioner for Railways.

Sir, "Aaron's Exchange Hotel," 30 November, 1887.
 I have the honor to apply to you for permission to run my truck to Dubbo next week and return with a consignment (say) of fifty sheep and four or five head of cattle to Homebush in the one trip.

In order that I may prove what it is capable of doing, I have arranged for the stock to meet me at the Dubbo trucking yard.

I may state that the Minister for Works, in a conversation with me, stated that he would be glad to give my truck an opportunity of running on the Railway Lines.

I would prefer loading the truck up with goods to Dubbo.

Awaiting your reply,

I remain, &c.,

W. B. WILKINSON.

The Commissioner for Railways.

Sir, 2 December, 1887.
 In reply to yours of to-day, I have the honor to point out that in the request I made to be allowed to run my truck to Dubbo and return with a consignment of sheep and cattle, I am putting the patent to the severest test possible. I am aware that it is a test that is not practicable in any existing truck or patent, but in mine it is both practicable and useful, and it is for the information of the Select Committee now sitting that I ask it. *Re* the stock, I have secured them, and they will be carried at my own risk. I am quite satisfied that my truck will stand any ordinary test, and the lengths of distance will not affect it. And after the Committee have finished their sitting I shall be happy to hand my truck over to the Department, but at present it is at the disposal of the Committee, and it is with their approval I give it the practical test suggested. Of course any test that it can get under existing circumstances can only be from a side-loading point of view, carrying out the very important one of end-loading.

The Commissioner for Railways.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

COMBINATION TRUCKS.

(PETITION TO BE REPRESENTED BEFORE SELECT COMMITTEE—G. T. EVANS AND
AMBROSE THORNLEY.)*Received by the Legislative Assembly, 16 November, 1887.*To the Honorable the Speaker and Legislative Assembly of the Colony of New South Wales, in Parliament
assembled.The humble Petition of George T. Evans and Ambrose Thornley, of Sydney, in the Colony of New South
Wales,—

RESPECTFULLY SHOWETH:—

1. That a Select Committee of your Honorable House was, on Tuesday, the 8th day of November instant, duly appointed by your Honorable House, with power to send for persons and papers, "to inquire into and report upon the question of the combination trucks offered to the Government."

2. That the said combination trucks offered to the Government are constructed in accordance with a patent granted to Henry Hudson, William Hudson, Robert Hudson, and Ambrose Thornley.

3. That the said Ambrose Thornley assigned his right and interest in the said patent to the aforesaid Henry Hudson, William Hudson, and Robert Hudson.

4. That the said Henry Hudson, William Hudson, and Robert Hudson assigned their respective rights and interests in the said patent to George T. Evans and Ambrose Thornley, the present proprietors, and that therefore your Petitioners are directly interested in the results of such inquiry.

Your Petitioners therefore humbly pray as follows:—

That your Petitioners may be heard by counsel or solicitor before the said Select Committee, with liberty to adduce such evidence as may be advised concerning the subject matter of the said inquiry in the interests of your Petitioners.

And your Petitioners, as in duty bound, will ever pray.

Dated this 15th day of November, A.D. 1887.

GEORGE T. EVANS.
AMBROSE THORNLEY.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COMBINATION TRUCKS.

(PETITION TO BE REPRESENTED BEFORE SELECT COMMITTEE—W. B. WILKINSON.)

Received by the Legislative Assembly, 16 November, 1887.

To the Honorable the Speaker and the Legislative Assembly of the Colony of New South Wales, in
Parliament assembled.

The humble Petition of W. B. Wilkinson, of Dubbo, in the Colony of New South Wales,—

RESPECTFULLY SHOWETH:—

1. That a Select Committee of your Honorable House was on Tuesday, the 8th day of November instant, duly appointed by your Honorable House with power to send for persons and papers to inquire into and report upon the question of the combination trucks offered to the Government.

2. That the said combination truck offered to the Government is constructed in accordance with a patent granted to W. B. Wilkinson and another.

3. That your Petitioner is directly interested in the result of the inquiry.

Your Petitioner therefore humbly prays as follows:—

That your Petitioner may be heard in person, or by counsel or solicitor, before the Select Committee, with leave to adduce such evidence as may be advised concerning the subject matter of the said inquiry in the interest of your Petitioner.

And your Petitioner, as in duty bound, will ever pray, &c.

Dated this 16th day of November, A.D. 1887.

W. B. WILKINSON.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(PARTICULARS OF SERVICE OF COMBINATION TRUCKS.)

*Ordered by the Legislative Assembly to be printed, 21 September, 1887.**[Laid upon the Table of the House in accordance with promise made in answer to Question No. 11 on Votes and Proceedings No. 115 of 24 August, 1886.]*

A RETURN of the Earnings and Mileage of the Combination Trucks now in use, from the 1st January to 30th June, 1886, distinguishing goods freight and live stock freight as compared with ordinary trucks.

EARNINGS and Mileage of the Combination Trucks as compared with other Live Stock Trucks during the period ended 30th June, 1886.

I ATTACH a return giving the information in as complete a form as it is possible to give it, without entailing a very great amount of extra time and labour to render it more complete.

The particulars supplied in regard to the combination cars, of which there are only fourteen, took a considerable time to compile, but it can readily be seen what labour was involved to get less complete information in regard to 272 sheep-vans and 300 cattle-wagons, while it must be apparent that the separation of the mileage run by these vehicles with live stock and goods traffic means an enormous amount of additional work.

W. V. READ, 24/8/87.

FOR the six months ended the 30th June, 1886.

No. of Trucks in use.	Live Stock.		Goods Traffic.		Totals.		Loaded Mileage. Per Mile.
	Loaded Mileage.	Earnings.	Loaded Mileage.	Earnings.	Loaded Mileage.	Earnings.	
Combination cars 14	55,232	£ 1,131 s. 11 d.	63,227	£ 4,203 s. 10 d.	118,459	£ 5,334 s. 12 d.	10½d.
Sheep-vans..... 272	39,767 7 0	1,764,491	39,767 7 0	5½d.
Cattle-wagons 300	36,311 11 4	2,949 0 3	1,560,238	39,260 11 7	6½d.
	77,210 0 3	7,152 10 7	3,443,188	84,362 10 10	

Empty mileage run by combination cars ... 24,629, making gross 143,088 miles.

 " " sheep-vans ... 1,400,911, " 3,165,402 "

 " " cattle-wagons ... 1,250,794, " 2,811,032 "

2,676,334

6,119,522

It is impossible to give the separate mileage run by cattle-wagons and sheep-vans with live stock and goods traffic without entailing a very large amount of labour and time to do so.

The information was asked for in a question. No resolution was passed. Will Commissioner please say whether it is to be laid upon the table?—D.C.M'L., 26/8/87.

I do not know whether it is necessary to lay it upon the table, but the document itself tells a significant story in favour of the combination trucks. For empty and full running mileage they have earned nearly 9d. a mile, while the cattle and sheep trucks have earned only something less than 3½d. per mile for six months' running. The empty running with the combination trucks was 19 per cent. of the full running, while the empty running was 44 per cent. in the case of the other live stock wagons. If the ordinary live stock wagons had earned as much as the combined wagons per mile travelled, the revenue would have been, instead of £79,027, no less than £224,116, or £145,089 more. It is not likely, of course, that the traffic would have been so adjusted as to admit of this large extra amount being earned, but I think 20 per cent. of it would have been; and that is a very low estimate. Even this would show a profit of £29,018 in six months.—CH.A.G., 26/8/87.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(CORRESPONDENCE RESPECTING COMBINATION TRUCKS DESIGNED BY MESSRS. WILKINSON, PERRY, ANDERSON, AND BRAZENOR & VALENTINE.)

RAILWAYS.

. No. 1.

Memo. by The Chief Clerk.

WITH reference to the Minister's memo. of this morning on the subject of the papers alleged to be missing from the Return laid upon the Table of the House, referring to the Evans Combination Truck, I have to explain that on the 29th September, 1887, Mr. Lyne, in his place in the House asked certain questions relative to the Evans Combination Truck. The Minister replied to those questions, and promised that the papers should be laid upon the Table of the House.

The papers were prepared accordingly; every available document bearing, however remotely, on the question of "the Evans Combination Truck," was copied, and the papers were laid upon the Table of the House. In the course of copying the papers it was discovered that a paper was missing from the series (as a fact two other papers were deficient, but this was not discovered until afterwards). Every inquiry was made for the missing paper, but without success.

Subsequently Mr. Lyne stated in the House that other papers were missing. This led to further inquiry, and it was then found that owing to an unaccountable irregularity in the records of the Department two papers had been diverted from the proper channel and were not to be found, and the most exhaustive search for them has proved unavailing.

Yesterday Mr. Lyne again stated that papers other than those admitted to be deficient had not been laid upon the Table, and I am now informed that he refers to papers which are in existence relative to the Wilkinson and other combination trucks—a supplementary report alleged to have been made by the Board appointed to examine and report upon the designs of combination trucks, and a letter from Mr. Bruce, the Inspector of Stock, &c., &c.

But if these are the papers referred to by Mr. Lyne I would point out that the terms of that gentleman's questions and the Minister's undertaking did not embrace these particular documents. Mr. Lyne asked for information relative to the Evans combination truck, and the Minister promised to lay the papers relating to that particular truck on the Table of the House. That promise was fulfilled. As already stated, every paper bearing directly upon the Evans truck was copied and submitted.

Undoubtedly there are papers referring to other combinations trucks—Perry's, Wilkinson's, Anderson's, &c.—but to submit papers referring to those trucks would have been going beyond the terms of Mr. Lyne's inquiry and the Minister's promise, which was limited to the Evans truck.

As regards the supplementary report of the Board (or rather of two members of such Board, for the Board as a Board had already submitted their report and broken up), I may point out that that document (the supplementary report) did not in any way refer to the Evans' truck, nor even to the combination question, which alone was remitted for the consideration and report of the Board.

The supplementary report has reference purely to the Wilkinson truck—not to the combination features of it, but to an end-loading arrangement, which was a matter not coming within the scope of the action of the Board, and having nothing to do with the question at issue. This document, therefore, having, as here shown, no relation to the Evans' truck, nor even to the principle which was under inquiry, was not included with the papers submitted.

In like manner the letter from Mr. Bruce, the Inspector of Stock, referred exclusively to the Wilkinson truck, and having no connection with the Evans truck was properly, I submit, excluded from the submission.

I beg leave to state in conclusion that every paper recorded in our register having relation to the Evans' truck (except those admitted to be deficient) was copied and laid upon the Table.

D. C. M'LACHLAN, 19/10/87.

If possible I should like all papers referring to any combination truck. It is clear now that Mr. Lyne desires the papers respecting the Wilkinson truck, which, however, he has not asked for. If possible have them ready to lay upon the Table on Tuesday.—JOHN SUTHERLAND, 21/10/87.

No. 2.

Mr. W. B. Wilkinson to The Secretary for Public Works.

Dear Sir,

Re Evans' Trucks.

Dubbo, 9 December, 1885.

I see you are thinking of utilising them for carrying out your idea of loading stock continuously; if so, I hope the above will be improved upon first.

Some time since, upon the first trip these trucks made, which I loaded, I pointed out the defects, and how they could be very much improved upon. If requisite I will lay my suggestions before the Department, but with the understanding if my plan is approved of that I will be allowed a premium for the idea, for notwithstanding all has been said in their favour the trucks are most unworkable at present.

Yours, &c.,

W. B. WILKINSON.

I would not ask anything for contributing to the success of the Evans truck, but as report is so busy with the matter of the large royalty that Hudson, Brothers, or Mr. Evans gets for their invention, and knowing practically how unworkable the trucks are, I do not see why my suggestions if successful should not command some return.

I have asked Mr. Wilkinson to submit suggestions. No promise of remuneration.—W.J.L., 7/12/85. Has Mr. Wilkinson replied?—D.C.M'L., 4/1/86. Nothing further has been received from Mr. Wilkinson, 5/1/86.

No. 3.

No. 3.

Minute by The Secretary for Railways.

Mr. W. B. Wilkinson, of Dubbo, looked into my office yesterday and informed me that the Minister wished him to be informed when a certain test or experiment with the Evans trucks was to come off.

I cannot ascertain that anything of the kind has been arranged for.

Mr. Wilkinson further stated that he had a plan for arranging a sheep-truck superior to the "Evans" truck, and that the papers and plans were with the Minister. Mr. Wilkinson also expressed his willingness to hand over the right to his patent to the Government, provided he was allowed to protect himself in the other Colonies, and he would be quite content with any recognition the Department thought fit to make in the event of his plans being adopted.

Under these circumstances perhaps the Commissioner would prefer to postpone any further action for the present in the matter of purchasing the right to "Evans" patent.

D.V., 16/3/86.

The only thing yet authorised is to learn what price is demanded for "Evans" patent. That information is required prior to the question being considered in any way, and it must not be accepted as implying that the Department will purchase the patent, even if the price asked be very moderate.—C.A.G., 17/3/86.

No. 4.

Messrs. H. S. Badgery and J. Gill to The Commissioner for Railways.

Sir,

Sydney, 1 February, 1887.

We have the honor to report to you that we this day made arrangements to see Mr. Wilkinson have a trial of the end-loading system with his combination truck.

Several of the Department's trucks altered to the system were placed at either end of the new truck, the sheep were driven through, and every thing worked well, smoothly, and rapidly, and though we are of opinion that end-loading with the present trucks would be next to impossible, we believe Mr. Wilkinson's provisions for getting through the sheep, and regulating the numbers in each truck, will remove this objection. Another important point is that trucks have not to be moved till all are loaded.

Attached please find a note from Mr. Thallon, also one from Mr. Wilkinson.

We have, &c.,

HENRY S. BADGERY.
J. GILL.

Dear Mr. Badgery,

A.S.N. Co.'s Steamship "Eurimbla," 27 January, 1887.

As explained to you to-day, I have already remained longer in Sydney than I at first anticipated would be necessary, and considering the state of the weather in Queensland and condition of railways, I feel it incumbent upon myself to take the first opportunity of returning to my duties now that the Report of the Board has been submitted. I regret exceedingly that Mr. Wilkinson's truck was not sufficiently advanced to admit of the trial we had arranged for, and I shall only be too glad, even although impossible for me to be present, if other arrangements can be made to try it as we wished to do, and hear the result from you.

Yours, &c.,

J. F. THALLON.

H. S. Badgery, Esq.

Sir,

The "Exchange Hotel," Sydney, 31 January, 1887.

Re my "combination truck" and the trial this morning. In the matter of cattle-loading I believe the only defect lies in one of the sides (not covered by the partition doors) not presenting an even surface. I have the matter under consideration, and find, after consulting the builders, that I can alter my truck so that the outside sliding doors shall slide on the inside of the truck, thereby remedying the evil, and also giving the truck additional width of 2 inches on each side for sheep, and about 1 inch for cattle on each side. *Re the weight.* I may state that I can undertake to run the truck at a weight of not more than 6 tons 15 cwt. to 7 tons, instead of its present weight.

Yours, &c.,

W. B. WILKINSON.

H. S. Badgery, Esq., Chairman of the Combination Truck Commission.

P.S.—Will you please attach this letter to the papers connected with your Report.—W.B.W.

No. 5.

Mr. W. B. Wilkinson to The Minister for Mines.

Sir,

Dubbo, 14 February, 1887.

I have the honor to enclose a copy of a letter to your colleague, the Minister for Works, *re* my truck. Not knowing Mr. Sutherland personally, I cannot write to him as I do to you. But knowing your love of fair play, I am sure you will give me any assistance you can. And as the matter, to a certain extent, comes under your Department—viz., the Stock Branch—you will give it due consideration when the elections are over. I can get substantial assistance from Mr. J. T. Kelly, Mr. Waddell, Mr. Wilson, Mr. Wilkinson, Hon. W. Clarke of Orange, and others. But I am afraid that the Department may give their decision before my patent gets thoroughly represented.

Yours, &c.,

W. B. WILKINSON.

Will the Commissioner be good enough to state how this matter stands.—F. ABIGAIL, 19/2/87.
C. A. Goodchap.

No. 6.

Mr. W. B. Wilkinson to The Secretary for Public Works.

Sir,

Dubbo, 14 February, 1887.

I have the honor to draw your attention to a matter that perhaps may have in some degree been brought already under your notice. I allude to the result of the inquiry by the Commission appointed by the late Government to inquire into the relative merits of the various new patents which have been laid before the Works Department, viz., combination cars for the carriage of goods and live stock.

Owing to my patent truck not being finished when all the Board were sitting, and owing to the construction of the invention being so different to others (I refer to end loading), the Board took no evidence except my own as to the capabilities of the invention until, to a certain extent, their labors had ceased owing to the Queensland Commissioner having to leave this Colony before my truck got a practical test; but subsequently the Chairman of the Commission and the other member of the Board (Mr. Gill, of Victoria) tried my invention at Homebush, and they sent a subsequent report to the Commissioner for Railways, speaking in the most favourable terms of the trial and of the construction and utility of the patent. Mr. Badgery was also good enough to give me a memorandum to the daily papers—which speaks for itself—a copy of which I enclose.

Therefore, Sir, my object in writing is that the matter may receive your consideration, and that I may have a fair trial of my patent before the Government commit themselves to any particular invention.

I do not ask that my truck may be taken before all others, but I ask that the Department may see fit to order the construction (say) of six or more of them, and try them by putting them to a practical test for that term. When Mr. Evans laid his combination car before a previous Government, the latter ordered fourteen, which constitutes a train-load, and these trucks have been running for twelve months.

I say nothing derogatory of the Evans' patent, but only ask that mine may be granted a fair trial.

If you will delay your decision for a short time I can bring strong and influential representations before you as to the value of my system of loading.

But as a great number of these gentlemen and most people are so engaged over the elections, I have been obliged to wait until they have an opportunity of attending with me to lay the matter before you. I may say that all the stock agents in Sydney have signified their willingness and desire to petition you that a number of my trucks may be used. But I think it better to leave the matter entirely in your hands, believing, sir, with you at the head of the department, I will be treated fairly, and have the honor to be

Yours, &c.,

W. B. WILKINSON.

For report.—J.S., 15/2/87.

No. 7.

Mr. W. B. Wilkinson to The Commissioner for Railways.

Sir,

Dubbo, 16 February, 1887.

I have the honor to inform you that I can supply three to six of my Patent Trucks to the Department with my patent improvements and reduction of weight of about 1 ton at a figure not exceeding £170 per truck, perhaps less, and exclusive of the wheels and springs.

Yours, &c.,

W. B. WILKINSON.

No. 8.

Mr. W. B. Wilkinson to the Secretary for Public Works.

Sir,

Dubbo, 16 February, 1887.

I have to excuse myself for again troubling you, but as an important item to myself is at stake—and what I know will have more weight with you—an important matter for the stock-owning public, I hope you will pardon my importunity. I have heard this morning that the late commission of inquiry (as to the relative merits of certain combination trucks) appointed by the late Minister for Works have decided that the Evans' patent has a superiority over any others. I do not think, in justice to myself, that I ought to delay longer in advancing my views and facts. I have always refrained from saying anything derogatory of Mr. Evans' truck up to the last moment and while the matter was *sub judice*, even at my examination before the Commissioners I did not, though I could have done so, give most damaging evidence against them.

In the first place *re* the evidence taken by the Board, I most respectfully call your attention to the fact that not a single stock agent or stock owner gave evidence, who, I submit, are the most interested. The great fault lay I think in the composition of the Commission, and although a circular was sent by Mr. Badgery (the Chairman), to all his brother commission agents, not one responded. Not that they are not interested, but that I think they did not quite like the appointment of Mr. Badgery without their being consulted, seeing that by the appointment it was stated Mr. Badgery was to represent the stock agents and owners. I do not say this in any disparaging way of his ability, for I think had the owners and agents the choosing of their representatives they would have chosen Mr. Badgery. Then again, the evidence taken was not upon oath, and the Commission had not the power to compel witnesses to attend. Consequently the only evidence adduced was from officers in the railway department who could not give any valuable evidence from a stock point of view—further—to a certain extent their evidence was constrained on the one hand, and too pointed on the other as for or against Mr. Evans' truck. Mr. Evans being an officer holding a high position in the railway department, it became a case of quarrel right out, as some have done (notably) some officers on the railways, who, I believe, are now asking for a commission of inquiry on the very matter) or else a guarded manner in giving their evidence, lest they incur their displeasure. I have this fact from one of the members of the Commission. Further, Mr. Evans' trucks have been running for some time under the personal supervision of himself, who was

Traffic

Traffic Superintendent, and in the words of one of the Commission to me, they have been "nursed." As against this, my truck is a new idea; and so much prejudiced was the Department, even Mr. Badgery, the Chairman, against the end-loading system that up to the last moment prior to the trial of my invention at Homebush all were against it, and the evidence taken at the inquiry, which was all prior to my trial—a very important fact—went to show that end-loading was not a success, although it has been in use for years in Adelaide and Northern Queensland. And a statement of the Adelaide Inspector of Stock is appended to the papers of the Commission. Consequently, my trial, which in Mr. Badgery's own words worked "smoothly, rapidly, and satisfactorily," only appeared in a subsequent report, and after the departure of Mr. Thallon, one of the Commissioners, so that my invention cannot possibly have had due justice at their hands, neither can it have without a trial. Even the trial I did get was in great measure hampered, as I had to use trucks to try mine with, that I don't think would ever be a success from an end-loading point of view.

Further, my truck has advantages that until proved by a fair trial could not possibly transpire at any inquiry. I allude to the advantage in my truck by carrying half a load of any stock. For instance, if any small settler, of which class there are many, had, say fifty fat sheep and five head of cattle, he would only need order one of my trucks. Taking the serious consideration of the case, I think you will, Sir, agree with me it merits, I only ask that you will not come to any decision without giving me a further opportunity of proving my truth. I can, as before stated bring an influential deputation before you, as soon as the elections are over.

Praying that my truck may have a fair trial. The whole of the stock agents in Sydney are willing to sign a requisition to that effect. But I did not care to get their assistance just at the time, as I did not know what the Commission had done, nor did I want to step between them and the Commissioner for Railways, who I am sure is anxious to adopt the best truck and system. I know for a fact that the whole of western agents from Bathurst to Bourke are petitioning the Commissioner against the adoption of the Evans truck, which petition will, I understand, be presented in a few days. I have no doubt, Sir, that you will consider there is a good deal of selfishness in my letter to you, and I admit it. But my truck has cost me twelve months worry and thought and great expense. And being a practical man and having great faith in my invention, I don't like to see it go without a trial. I can supply three to six of the trucks, which will be enough to give the system a fair trial, at £170 each, exclusive of the under carriage, that is the wheels, &c., which I think the Government always supply.

Again apologizing for trespassing upon your time.

I remain, &c.,

W. B. WILKINSON.

No. 9.

Mr. W. B. Wilkinson to The Secretary for Mines.

Sir,

Dubbo, 4 May, 1887.

Re my combination truck: You have always taken some interest in the matter, and as it is more essentially in your Department, although it has to go through the Works Branch, I think you will do what you can in the interests of carriage of live stock. As far as the Works Department proper is concerned, they care very little how stock is carried as long as the wheels go round and traffic is not impeded. At the late Commission appointed by Mr. Lyne to consider the best truck for purposes of carriage of stock and goods not a single individual gave evidence outside the Works Department. No one interested in the carriage of live stock whatever gave any evidence, and as the Board had not the power to call witnesses they only called those in the Government employ and connected with the Railway Department, so that the evidence adduced was of very little use practically, and it was further hampered by the fact that one of the patentees of a truck now in use by the Government is an official high in the Department. As far as the evidence as to my truck was concerned, it was not finished by the contractors in time for the Board, and they only examined it in an unfinished state; but they suggested some improvements which I propose carrying out in any trucks I may have built for the future. My truck was finished the day the Commission broke up through one of its members, Mr. Thallon, of Queensland, having to return home. However, he requested the other members of the Board, viz., Mr. Badgery and Mr. Gill (of Victoria) to give my truck a practical trial with stock, and supplement the report they had sent in. This was done at Homebush the following day. I had to use some end-loading trucks Mr. Lyne, late Minister for Works, had converted by simply opening the ends. This, of course, did not do my truck the justice that it would have received if I had (say) four or five similar trucks to my own to use; but notwithstanding this the trial was a complete success, and Mr. Badgery reported that my truck had been tried, and it worked "satisfactorily, smoothly, and rapidly," and that "I had overcome all difficulties with regard to end-loading." This appears in the supplementary report.

Mr. Bruce, the Inspector of Stock, can also show you a report from the Chief Inspector of Stock in Adelaide, where they have been using the end-loading system for years, in which he states it is a great success. I think this in itself is sufficient reason why my plan should have a trial. Nothing could be more satisfactory than the practical tests it stood at Homebush. The only objection was the weight of the truck. This was a matter that was overlooked in the building of the truck; but after consulting the engineer I found I could reduce the weight a ton, doing away with this objection.

I have offered to build four or five trucks, improved on the last one, for £170 each, perhaps less, not including the under carriage, which the Government supply, and I think I do not ask too much. Even take away the end-loading system, my patent also loads from the sides, and as a side-loading truck I contend that mine is a more convenient sheep, cattle, or goods truck than any combined truck in use. Further, it does not entail the alteration of any of the existing cattle or sheep yards now used, which is a very important consideration.

When Mr. Evans showed the Government his patent, they ordered fourteen of them, to give them a fair trial. There are also in the yards at Eveleigh stock trucks and designs from all parts of the world, so it is not too much to ask for the same consideration on a smaller scale. The patent has cost me a great deal of money to perfect, and it was only in the course of construction I saw how many alterations were needed.

Your

Your colleague, Mr. Clarke, Minister for Justice, is a friend of mine, and has promised me to do what he can for me. Would you see him on the matter, and lay your ideas before the Minister for Works. I was in Sydney, and had arranged for a deputation and petition from the stock agents, but my health completely broke down, and I have had to return home, and am too unwell to take any other steps than leave the matter in the hands of the Ministry.

I will write to the Minister for Works to-morrow—I am not able to-day; and will you make inquiries on the matter, and I know you will do me justice. Will you also see Mr. Clarke?

Yours, &c.,

W. B. WILKINSON.

No. 10.

Mr. W. B. Wilkinson to The Commissioner for Railways.

Sir,

Dubbo, 5 May, 1887.

I have to-day written to the Minister for Works asking that the Government would build four or five of my trucks on trial. I regret that I am not well enough to write out a copy for you, but have no doubt that it will be laid before you, and trust for your favorable consideration. I have been in Sydney to push the matter but have been forced to return home through ill health.

I am, &c.,

W. B. WILKINSON.

W. B. Wilkinson to The Secretary for Public Works.

Sir,

Dubbo, 5 May, 1887.

Some little time since I had the honor of drawing your attention to a patent combination truck of mine. At that time I refrained from making any distinct request, as I thought I would have been enabled to present a petition to you in person, but my health has been so bad that I have had to relinquish any really personal application in the matter. A number of the leading stock agents were willing to petition you that a few of my trucks might have been built in order that the "end-loading" system might have a fair trial. These gentlemen are now willing to co-operate with me, but owing to my health I am quite helpless in the matter. I think you may be aware that a Commission was appointed by the late Minister for Works to inquire into the merits of the relative patents that might be laid before them. Unfortunately my truck was not finished by the builders prior to the Commission closing its sittings, which were brought to a close rather suddenly, owing to one of its members, Mr. Thallon, Queensland Traffic Manager, having to leave for Queensland owing to disastrous floods occurring in his Colony, requiring his attention. My truck was completed and ready for trial the day he left. He therefore requested the two remaining members of the Commission to give my patent a practical trial at Homebush, with stock, and furnish a supplementary report. (You will please bear in mind that the report of the Commission had then gone in.) This they did, and although I labored under a great disadvantage in the trial, inasmuch that the only trucks I could try mine with were some end loading trucks converted by Mr. Lyne. These trucks, I think myself, could not be a success. However, my patent was placed in the centre of these trucks, and sheep were passed through both ways, with the result that the Commission were well satisfied with the trial, and in a copy of the supplementary report the chairman showed me, they stated that it worked smoothly, rapidly, and satisfactorily, and that I had overcome all difficulties as to end loading. This in itself I think should merit my patent having a chance of asserting itself. You will see that with one of my trucks I could not take advantage of all the benefits I attribute to my invention—that is, as regards the end loading; I therefore ask that the Government would see fit to order (say) four or five of them, and run them together so that they may be tried upon their merits. Hudson Brothers offer to build them for myself or the Government at £170 each, exclusive of under carriage, which I think the Department always supply. I may here state that although I have made my invention an end-loading one it is also a side-loading truck, and I claim for it that it is more convenient, even as a side-loading car, for sheep, cattle, or goods, than any now in use, for then it has the advantage that no alteration is required for any of the sheep or cattle yards now in existence, either to load from end or side. The previous Minister for Works made me a promise that if I built a truck the Department would take it off my hands, so I presume that I could fall back upon his promise; but, as I before stated, one truck does not prove the end-loading system. In the trucks I have built no regard was paid to weight, and in any others I build the builders say they can reduce this 1 ton. There are a few minor alterations I would make that were suggested by the Commissioner, and some I propose myself. So the present truck does not do my patent full justice. You will be aware it is an expensive operation for a private individual, and I have spent all the money I can afford, otherwise I would build the five trucks at my own cost, and make them a present to the Government, so satisfied am I of the success of my invention.

Re the end-loading system: The chief inspector of stock (Mr. Bruce) has a report from the South Australian Inspector, where they have been end-loading for years, in which he states that it is a great success, and no one would revert to the side-loading after using the former. I don't know, Sir, what more I can say. I leave the matter in your hands, and hope that you will give it your consideration. I do not want an answer hurriedly. I have no doubt but that your time being so much engaged that you will leave the whole matter to the Commissioner for Railways. I think I may state that in the Evans patent the late Government on a late model ordered fourteen trucks. There are also in the yards patents from all parts of the world. So what patents, if any, will receive consideration? If the Department want any for their information I can refer to the truck now in the Clyde yards and point out the improvements I suggest.

I have devoted twelve months' thought, work, and money to the invention, and I have had years practical experience in loading of stock, so that I am no theorist. Neither do I ask for any exorbitant sum should the Government eventually accept the patent, but am content to reap my principal reward in the other Colonies. Trusting that I may be fortunate to enlist your sympathy,

I have, &c.,

W. B. WILKINSON.

For

For report.—Minister, 6/5/87.

Mr. Wilkinson's truck, if end-loading is to be adopted, has advantages over every other form of truck which we have cognizance of. I should like to see Wilkinson's truck.

I shall go early to-morrow morning to Clyde to look at it. Ask Traffic Manager to make arrangement for my seeing it. I will leave Sydney by 11 a.m. train.—CHAS. A. G., 6/5/87.

Submitted.—A.R., 9/5/87.

I have seen the truck—it is ingeniously designed, but the faults for practical working are very great:—1. There are too many working parts. 2. The bar is very heavy.—CHAS. A. G., 10/5/87.

No. 11.

Mr. W. B. Wilkinson to The Secretary of Railways.

Sir,

Dubbo, 22 May, 1886.

I have heard that the Government are about to give £8,000 to Evans for his patent. I sincerely hope this is not the case, not in any antagonism to Evans, but that the Government should not commit themselves before they have seen our truck tried. We are prepared to build a combination truck at once, and only ask that the matter be left in abeyance until we can submit ours in working order. If necessary I could get a petition signed by every stock agent in the western districts against the use of Evans' patent.

Knowing that you take an interest in the matter, I have taken the liberty of addressing you.

I am, &c.,

W. B. WILKINSON.

No. 12.

Mr. W. B. Wilkinson to The Secretary for Public Works.

Sir,

Dubbo, 23 May, 1886.

I have heard indirectly that the Department contemplate giving Evans £8,000 at once for his patent. I sincerely trust that this is not the case—not in any antagonism to Evans, but in order that our trucks may first be exhibited.

We are prepared to build a truck at once, and will push the matter on if the Government will await the issue.

I am, &c.,

W. B. WILKINSON.

No. 13.

The Chief Inspector of Stock to The Under Secretary for Mines.

Department of Mines, Stock Branch,

Sydney, 10 September, 1887.

Re Mr. Wilkinson's new truck for carrying sheep.

As it was Mr. Wilkinson's wish that Mr. Kirkcaldie, Assistant Traffic Manager, should accompany me in inspecting his improved Stock Truck, we yesterday visited Mr. Hudson's works at Granville, and made the required inspection together. Mr. Kirkcaldie will, however, make a separate report to the head of his own Department.

As regards the principle of "end on" loading, which is the leading feature in Mr. Wilkinson's truck, there can be no question but that, so far as sheep are concerned, it is very much the best, and it will be seen by my annual report for 1870 that I, at that time, strongly recommended its adoption for the reasons there given. In fact a few trucks were then made by the Railway Department on that principle, but it was not after all adopted, the reasons, so far as I could gather, being:—(1) That its adoption would entail an alteration of the sidings; (2) That the stock traffic was not then considered of much importance; and (3) That there was a difficulty in keeping a correct account of the sheep as they ran into the trucks, thereby causing some compartments to be overcrowded and others only partially filled.

With respect to these objections I would say, so far as the first, that provided the alteration was an improvement it was of no weight. The same might also be said with respect to the second objection, for the live stock traffic, if properly conducted, was bound to increase, as I then pointed out it would do, and as we see it has done. With the exception of coal, the live stock traffic is by far the heaviest (as it is also the most general) traffic on our railways, and that which mainly enables the railways to be extended into the interior. With respect again to the third objection, there appeared at the time some grounds for this objection, but we now see that this arose mainly, if not wholly, from the manner in which the loading was done, and not from the principle, for we find by Mr. Chief Inspector Valentine's letter on this subject (herewith) that the sheep in that Colony have for five or six years been loaded in this way in trucks constructed open at the ends exactly as ours were in 1870, with ease and despatch.

When suggesting the "end on" loading, however, I foresaw the objection under this head, and proposed that some arrangement, such as that now successfully carried out by Mr. Wilkinson (a movable upper floor and roof), should be adopted to allow the men to go into the trucks to assist the loading, and to see that while the compartments were not overcrowded they were properly filled.

If the alteration in Mr. Wilkinson's truck suggested by Mr. Kirkcaldie were made it would, I think, so far as sheep loading and carrying is concerned, be everything that could be desired, and with the movable upper floor would, if properly cleaned, be quite fit to carry back a good many kinds of goods, whereas it may be said that the sheep trucks, as now built, can carry none.

Mr. Wilkinson's truck can, as he claims, be also converted into a cattle truck, and if the Railway Department consider that it is in all its parts sufficiently strong for that purpose, when altered, I think it will also answer for that purpose, and its being convertible in that way would prove of great advantage to the Department and the public. Should it fail, as now constructed, to effect this, I have no doubt but it can eventually be made to answer for both cattle and sheep, as well as for a good many kinds of goods.

ALEX. BRUCE,

Chief Inspector of Stock.

[Enclosure.]

[Enclosure.]

Dear Sir,

South Australia, 9 June, 1886.

Re your inquiry as to loading trucks with sheep from the end, on the railways. Such a system has been in force for five or six years on our railways and has succeeded admirably. Indeed I can hardly understand any person accustomed to working sheep who would not adopt the system in preference to loading every truck separately. The sheep run in and out in one continuous stream, and the numbers can easily be regulated. It saves a great deal of trouble, and prevents the sheep from being knocked about, as they must be, if fresh trucks are continually being loaded from the side.

I am inclined to think that an improvement might be made to the advantage of the sheep by having a light partition running up the centre of the trucks, of battens, which would prevent sheep crushing each other.

I was pleased to see that your Railway Managers had determined to try the system, and am sure they will find it a success.

I am, &c.,

C. J. VALENTINE,

Chief Inspector of Sheep.

I would suggest that the Chief Inspector's report be forwarded for the information of the Department of Works.—W.H. Approved.—F.A., 13/9/87. Under Secretary for Works.—W.H., 13/9/87.

No. 14.

Mr. W. B. Wilkinson to The Commissioner for Railways.

Sir,

Dubbo, 13 September, 1887.

I enclose a copy of a letter I have sent to the Minister for Works *re* my truck. I hope it will meet with your approval.

Yours, &c.,

W. B. WILKINSON.

Mr. Wilkinson is not justified in saying that I approved of his truck in the sense that I approved of it on a competitive basis with other trucks. I concur with the conclusion arrived at by the Board in this matter.—Ch.A.G., 14/9/87.

Inform.—J.S., 22/9/87

[Enclosure.]

To the Hon. J. Sutherland, Minister for Works,—

Sir,

13 September, 1887.

Re my truck. It has now been inspected by Messrs. Goodchap, Kirkcaldie, Henson, and Mr. Bruce, the Chief Inspector of Stock, with the result that they have, I believe, approved of the truck with certain improvements they suggest and others I have suggested. It has been suggested to me by Mr. Kirkcaldie that I should alter my truck at once to conform to their ideas. This I am prepared to do if necessary; but I would respectfully submit that the Government would order some of my trucks to be built—say three to five—for this reason: that my truck is an end-loading one as well as side, and that one truck does not give any idea of the facility of loading, although the trial at Homebush with Mr. Lyne's primitive end-loading trucks was very successful. Then again, to alter the truck to my own view and those of the department, it would be narrower and more inconvenient than any new ones, so that it would only be a model, or serve the purposes of a model, and the suggestions offered do not alter the principle of the patents, but are just matters of detail that could be carried out in any new trucks, and it would be a pity to incur so much expense when it might be expended on new trucks. I will do anything that the Department have suggested, and include my own improvements too.

At the same time, if the Department do not see their way to do this, I will alter my truck at once. But I have been at very great expense already, and I would ask that I may receive some assistance, or rather, if possible, be saved some additional expense. Hoping the matter may receive your consideration,—

I remain, &c.,

W. B. WILKINSON.

In Mr. Bruce's office I saw a diagram of a movable deck in use in America, but I do not think it comes up to mine; it is not so simple, and it also debars one from using the truck as an end-loading waggon. I mention this as Mr. Bruce has included the diagram in his report on my truck.—W.B.W.

The Hon. William Clarke, Esq., Minister for Justice,—

Sir,

Dubbo, Sept. 13th, 1887.

Re my truck. It has been inspected by Mr. Goodchap, Mr. Kirkcaldie, Bruce, Henson, and several Members of Parliament, with the result that we deem the truck a very good one with a few suggested alterations. They have suggested to me my getting these alterations made at once. But I think the best plan would be for the Government to order (say) three, embodying all these suggested improvements and my own. One truck will not be of much service, especially from an end-loading point of view; and it would scarcely be fair for the Government to expect me to build any at my own expense. The present one has cost me a great deal, and I can improve on it greatly, for if I altered the present it would only be a model of the truck, as it would not be so wide or convenient as the new one. I want you to use your influence for me in getting the order for (say) three to five trucks built. I have made application to the Minister. Mr. Abigail and the Stock Department are all in my favour.

W. B. WILKINSON.

Hon. J. Sutherland. Submitted.—W. CLARKE. Seen by Minister, 22/9/87.

Sir,

Department of Railways, Sydney, 26 September, 1887.

With reference to your letter of the 13th instant, enclosing copy of a communication addressed by you to the Honorable the Minister for Public Works, respecting your truck, I have the honor, by direction of the Commissioner for Railways, to inform you that he does not consider you are justified in stating that he approved of your truck on a competitive basis, as he concurs with the conclusion arrived at by the Board in that matter.

I have, &c.,

D. VERNON,

Secretary of Railways.

W. B. Wilkinson, Esq., Dubbo.

To the Hon. J. Sutherland, Minister for Works,—

Sir,

Dubbo, 27 September, 1887.

I enclose letter from the Secretary of Railways, and my answer thereto. May I ask you to attach same to the papers.

Yours, &c.,

W. B. WILKINSON.

Sir,

Sir,

Dubbo, 27 September, 1887.

Your favour of yesterday to hand. I have not a copy of my letter to the Minister for Works beside me, but I am sorry if I inadvertently included the Commissioner for Railways' name as one who considered my truck on a competitive basis as superior to others. The mistake occurred in my mentioning the Commissioner's name amongst those who had inspected and those who had approved of my truck. Of course, never having interviewed the Commissioner on the subject, I could not say what his views are; neither having seen the report, could I say what the Board's, you mention, views were. I only know that the Board had finished its sittings, and one member left for Brisbane, when some members of it had a practical test of my truck at Homebush, and were satisfied with the results; and any report of theirs must necessarily be only a supplementary one, and confined only to those members who were present; and that those whom I have interviewed—namely, Messrs. Kirkcaldie, Bruce, and Henson, and others outside the Departments—have given my truck the preference, provided I carry out their suggestions in minor matters, and also the suggestions I have tendered myself.

Those improvements I have asked to be carried out in my new trucks; or, if the Department insists, then I will alter my present truck up to their views and my own.

And, in the meantime, pray that no decision be given either way until either the present truck is altered, or (say) three to five trucks after my patent, with the suggested improvements, are built.

Yours, &c.,

W. B. WILKINSON.

No. 15.

T. Waddell, Esq., M.P., to The Secretary for Public Works.

Sir,

Sydney, 18 September, 1887.

I have the honor to state that I have twice inspected Mr. W. B. Wilkinson's new model of a sheep truck, with the result that I can confidently recommend it as a great improvement on those now in use.

I would suggest if the alterations recommended by the officers of your Department and Mr. Bruce could be made by the Government in two or three new trucks—without putting Mr. Wilkinson to the great expense of building a new model—it would be well, as Mr. Wilkinson (like many who have introduced valuable inventions) is a man of limited means.

I have, &c.,

T. WADDELL.

No. 16.

Mr. W. B. Wilkinson to The Secretary for Public Works.

Sir,

Dubbo, 24 September, 1887.

I have the honor to again draw your attention to my truck; I am aware that the Department must shortly build some trucks; therefore I am anxious that I should know if the Government will build some of mine on the improved principle I have pointed out to Mr. Kirkcaldie, and with his suggestions also embodied, or whether I must alter the present truck now at the Clyde. Of course I prefer building others, as the present would only serve the purpose of a model.

Yours, &c.,

W. B. WILKINSON.

No. 17.

The Minister for Lands to The Secretary for Public Works.

Dear Mr. Sutherland,

Mr. Wilkinson, of Dubbo, who is the son of a very old personal friend of mine, has written asking me to submit the enclosed testimonials to you, referring to his truck for stock, which I do with the expression of a hope and belief that you will consider them in coming to a decision upon the matter in a manner fair to him and the public.

26/9/87.

Yours, &c.,

THOS. GARRETT.

Please let me see papers.—J.S., 26/9/87.

[Enclosures.]

Dear Wilkinson,

Parliament House, 17 September, 1887.

I have again inspected your truck, and am much pleased with it.

I will again recommend its adoption to the Government, also that they do not put you to the expense of making the alterations recommended, but that they do as you suggest.

Yours, &c.,

T. WADDELL.

Dear Sir,

Animals Protection Society,

53 Elizabeth-street, 15 September, 1887.

In reference to yours of July 8, re "Improved Sheep and Cattle Truck," our Committee have directed me to inform you that, in compliance with their instructions, our Inspector, Mr. G. Webber, recently visited Clyde and inspected your "Improved Truck," which he has very favourably reported on.

As far as lies in the power of our Society, you shall have our cordial co-operation in furthering the adoption of it on our railways, in the place of the old trucks, to which it is so much superior.

Yours, &c.,

J. SIDNEY, Secretary,
per T.P.

W. B. Wilkinson.

No. 18.

Mr. W. B. Wilkinson to The Secretary for Public Works.

Re Combination Truck.

Sir,

Gresham-street, 6 October, 1887.

I have decided to alter my combination truck at once to the views of Mr. Kirkcaldie and the officers who inspected also; I will carry out the alterations that I suggested to the Department some time since, and those also suggested by the Board who tried the car at Homebush. I shall have it finished by Tuesday or Wednesday next for inspection. I have decided to take this course as the Department are so long in giving me the answer I sought, of whether I should alter the present truck, or they would order the construction of say three to five on the improved plan, or rather with the suggested improvements, and I shall be happy at any time to learn that the Department will carry out what I request.

Yours, &c.,

W. B. WILKINSON.

No. 19.

Mr. W. B. Wilkinson to The Secretary for Public Works.

Sir,

Aaron's Exchange Hotel, 7 October, 1887.

I have just returned from Clyde, and the men there are now at work at my truck so as to embody the slight suggestions of Mr. Bruce, the Chief Inspector of Stock, and Messrs. Kirkcaldie and Henson of your Department. The whole matter I hope to have on Tuesday next, and I am so satisfied with the result that I have the honor to offer, if your Government will accept, to hand over the truck together with the patent and all rights thereto in this Colony. I will leave matter as to what it is worth entirely in your hands and as to what you may be inclined to pay me. Neither do I expect any payment for twelve months from this date, presuming that in that time your Department will then be well able to judge if it is of any value or not. As before stated, I have every confidence in its success from my practical knowledge in the trucking of stock and backed up by the opinion of practical men.

I have, &c.,

W. B. WILKINSON.

P.S.—On reconsideration of the above offer, lest the Government should think they would be placed in a false position in accepting my patent without my mentioning a price I consider the invention is worth, I may state that if the truck proves itself to be all I say that I consider £5,000 would be a fair price.—W.B.W.

No. 20.

Mr. W. B. Wilkinson to The Secretary for Public Works.

Re Combination Cars.

Sir,

Sydney, 19 October, 1887.

I have the honor to enclose letters received from various firms of Stock Agents in Sydney, also report from the Inspector of Cruelty to Animals Society to his Board, also letter from Mr. J. de V. Lamb, of Sydney, who is Chairman of the Metropolitan Stock Board, and also one of the Committee of the Agricultural Society, Sydney. All the above speak in the highest terms of my patent. There is also a report from the Chief Inspector of Stock, of September 10th, to his Department that I can refer you to; also I would draw your attention to the supplementary report of the late Board, signed by Mr. Badgery and Mr. Gill, after a trial of my truck at Homebush with sheep in January or February last.

I think with such weighty testimony my truck will naturally recommend itself, and as I am not inclined to leave the offer open I made to your Department last week to give the Government twelve months to pay for the patent if they decide to take it, I will now take £5,000 cash upon acceptance, and for that sum will assign the patent in this Colony to your Government.

Yours, &c.,

W. B. WILKINSON,

Dubbo.

[Enclosures.]

Dubbo, 18 October, 1887.

WE, the undersigned Stock and Station Agents of Dubbo, hereby state, that in our former petition against Evans' stock truck, signed in our own names, we merely used the names of Sydney firms to show the amount of stock trucked by us, thereby showing we were qualified to give an opinion on the subject.

WILSON & DE LAURET.

JAS. HEAM.

Dear Sir,

5 Spring-street, Sydney, 19 October, 1887.

I have inspected your combination truck; I consider it is the best that I have seen. Its advantages are that you load stock from the end, and can thus fill up a train load of ten or fourteen trucks without pushing and labour with the trucks, also that part can be loaded with cattle and part sheep—a part stock and part goods all at same time. It appears to me to be about perfect.

W. B. Wilkinson, Esq., Dubbo.

I remain, &c.,

WARDEN HARRY GRAVES.

Pastoral Exchange, 91, Pitt-street, Sydney, 20 October, 1887.

I YESTERDAY inspected Mr. W. B. Wilkinson's "Combined Sheep, Cattle, and Goods Truck," and carefully examined its capabilities for carrying, loading, and unloading stock. The facilities for loading sheep quickly and continuously into all the trucks, without the usual drudgery and labour of filling each truck separately, appear to have been worked out and perfected with such skill and knowledge in all details that only a practical man could have accomplished, or that men accustomed to yarding and working among stock could appreciate.

The arrangements for dividing the trucks will be found useful, but the division doors might be made of round iron bars, so as to give better ventilation.

The facilities for expeditiously converting the truck to receive stock of either kind or goods, appear to be all that is desirable.

P. N. TREBECK.

Dear

Dear Sir,

Your Combination Truck would be a great boon to those actually engaged in loading sheep, and the divisions prevent destruction to the animals by reducing the pressure upon them. It seems well ventilated, and carrying different classes of stock must give it great value in providing accommodation for small consignments. Whether the gear for lowering the top deck is of proper construction I cannot determine.

I think the truck should commend itself to the authorities.

Sydney, 19 October, 1887.

Yours, &c.,
J. DE V. LAMB

The end-loading is the great feature in your truck.

W. B. Wilkinson, Esq., Sydney.

Dear Sir,

I have pleasure in stating that I have inspected your combination stock and goods truck, and I consider it the best stock truck that I have yet seen, and particularly useful for small consignments. It has many advantages over the trucks at present in use, one of the most important being end ventilation.

Sydney, 20 October, 1887.

Yours, &c.,
T. J. WEAVER.

I believe that end-loading trucks for sheep will be found to answer well in practice.—T.J.W.
W. B. Wilkinson, Esq., Dubbo.

Dear Sir,

I have inspected the stock truck made under your patent, and now at Messrs. Hudson's works, Redfern. I have much pleasure in stating that in my opinion it embraces everything that we require for mixed trucks of stock, a want that has been long felt, especially by the senders of small lots of cattle, sheep, lambs, calves, and pigs, along both the Southern and Western lines of railway. The fittings are strong, and so arranged that the stock can be carried with safety. I particularly admire your system of slides on the outside to prevent stock from being frightened and rushing in the trucks when standing at any station. The opening in the tops of the truck is a great advantage, as it can be utilized in hot weather for ventilation.

244, Pitt-street, Sydney, 20 October, 1887.

I am, &c.,
WILLIAM INGLIS,

Mr. W. B. Wilkinson, Sydney.
Sir,

Stock Agent.
Sydney, 6 September, 1887.

I have the honor to report that on the 9th August last, in accordance with your instructions, I proceeded to Clyde for the purpose of examining the cattle and sheep truck invented by Mr. Wilkinson, and was very much pleased with the design.

There can be no question about its being a vast improvement on any of those in use at the present time, so far as trucking sheep is concerned, but am not prepared to give an opinion as to cattle, and would like to see two or three loaded together before in any way advising the Committee.

The truck is loaded from a side corner, and the rest of the train being attached, a door is dropped in the centre of the end, and another opens at the side of each truck, forming a race or run throughout. The mode of loading is to fill the lower part of the train first, the capacity of each floor being calculated to accommodate fifty sheep, divided by doors on hinges, which are closed on each twenty-five head as they are loaded. This having been completed, the upper floors throughout the train are dropped, and the same process is gone through.

There are no projections inside to injure the animals; and the ventilation is provided for at the end of each truck, curtains being provided at the sides to prevent annoyance to the animals while in transit.

I have, &c.,
GEORGE WEBBER,
Inspector.

E. Fosbery, Esq., Chairman, Animals Protection Society.

No. 21.

Minute by The Commissioner for Railways.

Messrs. Brazenor and Valentine's Combined Sheep-truck and Goods-waggon.

Has Traffic Manager seen this model. He might make some inquiries about it.—CH. A.G., B.C., 5/9/86.

I have not seen the model. Write Mr. Anderson for particulars.—W.V.R., 11/9/86.

I have not seen the model referred to, but have communicated with the Traffic Manager of the Victorian railways, who informs me that this convertible truck has been built under the supervision of the patentees, Messrs. Valentine and Brazenor, and will be put in use on trial for a period of six months, until which time he does not care to pass an opinion on it. I will forward to the Commissioner any information I receive.—W.V. READ, 2/11/86.

Commissioner.—Shall we write to the patentees for a drawing of this car.—A.R., 11/11/86. Yes, please.—D.V., 12/11/86. Messrs. Brazenor and Valentine written to on 15/11/86.

Gentlemen,

Department of Railways, Sydney, 15 November, 1886.

With reference to the working model of your newly-invented combined sheep-truck and goods-waggon, exhibited at the wool warehouses of the Australasian Mortgage and Agency Company in August last, I shall be glad if you can make it convenient to send me a drawing of the design.

I have, &c.,
CHAS. A. GOODCHAP,
Commissioner for Railways.

Messrs. Brazenor and Valentine,
Care of Australasian Mortgage and Agency Co., Melbourne.

Charles A. Goodchap, Esq., Commissioner for Railways, New South Wales.

Sir,

Ballarat, 25 November, 1886.

We have the honor to receive your letter of the 15th instant, requesting us to send you a drawing of our Patent Convertible Sheep and General Merchandise Railway Wagon.

We have great pleasure in sending you the two accompanying lithograph sheets; and if you desire it, we will bring over the working model, and wait upon you at your convenience in Sydney.

The trial wagon recently built by order of the Commissioners of the Victorian Railways has been in active use, having performed four journeys between Melbourne and Echuca with sheep and goods alternate. Also, with 8 tons of sugar and other goods from Melbourne to Ballarat, and from thence up and down to Murton, and to-morrow will bring sheep from Dunkeld.

We

We may mention that, in carrying sheep, the flooring keeps perfectly clean, the sheep themselves assist in doing so, making a great contrast to the old sheep-waggons. Our waggon having been used both for sheep and goods without being washed, and we find it will only require the ceiling under the lifting floor to be occasionally cleaned.

We shall be glad to hear from you again on this matter, and shall be most happy to furnish you with any further particulars you may require.

We have, &c.,
BRAZENOR & VALENTINE.

Send to Mr. Husk for the information of Live Stock Comb. Truck Board.—A.R., 21/1/87.

Memo. of Chairman of Board:—This being only sheep and merchandise, truck does not meet the requirements of a combined stock and goods truck.—H.S.B., 28/1/87.

Ballarat, 5 February, 1887.

C. A. Goodchap, Esq., Commissioner for Railways, Sydney.

Re Brazenor and Valentine's convertible sheep and merchandise railway-waggon.

Dear Sir,

In November last we sent at your request drawings of the above waggon with an offer to send the model of same for your further inspection.

We saw in the papers that a Commission had been appointed by your Government to report on designs for waggons of the same character as ours.

We sent on Monday, 24th ultimo, a telegram to Mr. Badgery, Sydney, asking for information, and received reply, signed "Chairman of the Commission," stating "he hoped to send in report on the following day of all models of trucks submitted by Commissioner."

If we had been aware in time we should certainly have sent our model and been in attendance to have given any further information that the Commissioners may require.

The waggon built by the Victorian Railway Commissioners is in constant work, and we have closely watched its working, and can confidently affirm "it is a perfect sheep waggon," carrying the sheep clean and in comfort at the same time. One man in four minutes converts it into a suitable goods-waggon for grain, wool bales, and general merchandise.

We should have communicated with you before if we had received a report from the Victorian Railway Commissioners anent truck. We have not been able to get one yet, but have made application for same.

Several stock owners, stock agents, and others interested in the carriage of sheep, and who have observed the working of the waggon, are prepared to give certificates of the superior advantages the waggon possesses both for the carriage of sheep and goods.

We again offer to send the model of waggon to Sydney for your further inspection.

We are, &c.,
BRAZENOR & VALENTINE.

Combined Sheep Truck and Goods Waggon.

MR. ANDERSON, General Traffic Manager of the Victorian Railways, writes me under date of 25th April, as follows, viz., "I beg to inform you that, after a fair trial, my experience of Messrs. Valentine & Brazenor's convertible truck is not satisfactory."

For the Commissioner's information.
Commissioner.

W. V. READ, 29/4/87.

No. 22.

Mr. T. Perry to The Commissioner for Railways.

Sir,

Dubbo, 3 November, 1886.

I wish to state that the dimensions of truck will be as under as near as possible:—

			ft.	in.
1st.	Length of body in the clear... ..		18	0
	Width do do		8	0
	Height do do (centre)		7	6
	Do do in the sides... ..		7	0
	Do do over all in centre		8	0

2nd. The timber to be used in the construction of truck will be hardwood framing, with the exception of the eight top folding doors, which framework will be pine; also the bottom floor, deck, and all lining boards will be pine, the same as now being used. The bottom of the deck will be covered with light sheet iron to catch the droppings from top sheep. The under frame, also the top framing of truck, will be slightly lighter.

3rd. By mounting the truck on the Ashbury principle we save something like 6 cwt., by doing away with the side spring scroll, irons and fixings attached to same, and by using the new style of buffer. Having noticed that some of the present cattle-waggons weigh from 6 tons 1 cwt. to 6 tons 10 cwt. I consider that by allowing our deck to weigh 5 cwt., and the end blinds or weights to weigh another 5 cwt., which makes (say) 10 cwt., and by us saving the 6 cwt., as mentioned, that, after taking everything into consideration, our truck, when ready for use, will not weigh more than 6 tons 15 cwt.

4th. The estimated cost of truck I consider to be about £175. I can only get at this by seeing in the paper what the present cattle-waggons cost—£165 each; and by us saving in the mounting on the Ashbury principle, which does away with both labour and material, and allowing say £20 for cost of deck and end blinds, I have every reason to believe that we will be within bounds in saying that it will not cost more than we say, £175.

5th. The advantages we claim for our truck are, that it can be loaded at both top and bottom compartments at the same time without having to be moved from the sheep races, which means a great saving of time to the Department in getting trains away to time.

Also

Also the present sheep races will not be required to be altered for loading or any other purpose. As to the time it will take to convert it from sheep to cattle waggon I need not dwell, as the model shows itself. There are several advantages in the truck, such as the floors to prevent stock from slipping down, and also the droppings getting away out of trucks.

Having considered everything in connection with our truck, I don't think that I can improve on what I have said as to cost, &c., which I hope will meet with your favourable consideration.

I have, &c.,
THOS. PERRY.

Are there not other papers about the "Perry" truck?—D.C.McL., 11/11/86. No other papers re "Perry" truck.—L.P.I., 25/11/86. It appears that this truck is to weigh 6 ton 15 cwt. when ready for use. Evans' weighs 6 ton 12 cwt. 3 qr.—A.R., 25/11/86. The Minister said he would inspect the model. It is in my room.—Ch.A.G., 27/11/86. I will examine it to-morrow.—W.J.L., 29/11/86.

No. 23.

Mr. D. Anderson to The Secretary for Public Works.

Sir, "Fairview," Stawell, Victoria, 22 January, 1887.

I have the honor to submit plans and description of my convertible sheep, cattle, and goods truck, and shall be glad if you will look carefully over them yourself before handing them to the Board recently appointed to look into the matter.

Permit me to point out that by my plan *no new stock* is required, and that my frame for carrying the floors and screws will cost very little.

A variety of circumstances which I need not detail here prevented me taking out my patent in your Colony sooner, but I can with perfect confidence hand my plans to you.

I have, &c.,
DAVID ANDERSON.

D. Anderson's Combination Truck.—Although this truck is not included in the list of competitive trucks now under the consideration of the Board, I see no objection to the plan being forwarded to the Board to be considered with the others.—Ch. A. G., 25/1/87.

Forward at once please.—A.R., 27/1/87. Minute of Chairman of Board:—Seen; but too late to embody in report.—H.S.B., 28/1/87.

No. 24.

Mr. D. Anderson to The Commissioner for Railways.

Sir, "Fairview," Stawell, 14 April, 1887.

The Victorian Railway Commissioners are here to-day and to-morrow, I am to submit to them drawings of my truck, altered to carry cattle as well as sheep and goods. Did you receive the tracings of my convertible sheep and goods truck, sent through Mr. A. D. Hunter, and which I wished to be submitted to the Board of experts appointed to decide upon the merits of competing combination trucks? I learnt to-day from Mr. Ford and Mr. Anderson, our General Traffic Manager, that this Board has reported upon the trucks, and, at the suggestion of the former, I beg you to favour me with a copy of the report at your earliest convenience.

I have, &c.,
D. ANDERSON.

No. 25.

Mr. J. A. Fowler to The Commissioner for Railways.

Sir, 5 Elsie-street, Burwood, 8 February, 1887.

A short time ago I saw that a Commission was sitting to decide the merits of the different combination trucks, with a view to select the most efficient, with a view to reducing what is considered by stock-owners as excessive rate. I communicated with the Board, stating that I had an easy, inexpensive floor that could be easily attached to existing stock-trucks, and would make but little difference in the cost of new, and a tarpaulin as now would make them a goods. Of course, I was keeping economy in view. I received an invitation to attend with a model, which I did, and while they were watching the working of the model I was watching the working of their faces, and I could see as plain as if they had spoken, why the deuce did not somebody else think of this before; however, I was plied with a lot of side questions such as how I intended to drain it, how clean and so forth, also that for the future all cattle trucks must be smooth inside and comparatively dark, winding up with what I considered at first as an impossibility, *i.e.*, they wanted a truck with the following attributes for cattle—smooth inside, well ventilated, and comparatively dark; for sheep, the two decks as well ventilated as the bird-cage sheep truck now in use, and perfectly water-tight for goods, without tarpaulins. Possibly, this was a witty way of getting rid of me, but it takes a lot to extinguish a Scotch pedler, when he knows his wares are good and he has a chance of a buyer. I therefore went to work and designed a truck that more than fulfilled these demands, and which I am sure, if I am not superseded by some one else, will yet become the favoured truck of the day; its cost of construction over the others would be but trifling. This truck comprises a thorough open sheep truck, a smooth well-ventilated dark cattle truck, a goods truck as close as a "C" van, end or side entrance for sheep (place blunt eye-bolts in beams for hooks), and as a dead meat, farm or dairy produce van, it would be unequalled—in fact, I call it the universal truck. When I had finished it, I communicated to Mr. Badgery the fact, but so far he has not noticed it. I was at Homebush and saw the Wilkinson truck, and as a cattle and goods truck it is good, although it is not perfectly smooth inside; as a ventilated sheep truck it is a failure, being much more confined than the

the "Evans," I was present at the launch of it and that was the fault a great number of practical men had to it; and now, I find by the Press, that two of the Commissioners have recommended the truck to your notice, at the same time knowing there is far better in the Colony if they only got a chance to develop. This is no time to waste money on what, at a future day, will be condemned, or cost the country a lot of money in compensation for dead sheep, which undoubtedly would be the case if the Wilkinson is extensively used for that purpose. I possibly write strongly on the matter, but what with political influences and prohibitory patent laws, it makes an inventor, possessed of neither, feel keenly. You will observe in the Press that the Commissioners refer only to the end loading—that was introduced by Mr. Lyne when Minister for Works. Well, history repeats itself—when one Minister went out of power they sold his bed; in this case they give away his tail-board across the Hume. If you want a fair impartial opinion *re* the Wilkinson truck, interview the expert truckers at Homebush. Trusting that this will meet with your favourable consideration, and possibly lead to business,

I remain, &c.,

J. A. FOWLER.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(FURTHER CORRESPONDENCE RESPECTING WILKINSON'S COMBINATION TRUCK.)

Ordered by the Legislative Assembly to be printed, 4 April, 1888.

Mr. W. B. Wilkinson to The Secretary for Public Works.

Sir,

Gresham-street, 28 February, 1888.

My attention has been drawn to a report by a Mr. Harper, successor to Mr. Evans as Goods Superintendent. I should not have taken any notice of it, but that it has become public property, as the *Herald* of to-day publishes it *in extenso*. As your personal remarks to me have led me to believe that you are solely guided by a desire to do justice to all concerned, and only have at interest the Department you have the honor to represent, I have taken this opportunity of affirming that the report now laid before the House is not an impartial relation of facts that have occurred, but a plea of a member of the Department on the behalf of a superior officer.

In so far as the report goes, I may state that I have had four trials—not three.

2. The Evans truck will not carry more stock than mine.

3. The weight of the trucks is not correct.

4. The Evans truck required more attention than mine, notably when I had to unload it twice on a trip from Byrock. I say "I" advisedly, as those travelling in charge of the Evans truck (Mr. Harper and another) were practically helpless.

5. The time of alteration named is only known to the writer of the report.

The Select Committee themselves knew in how much less time (than Evans') mine can be altered.

I have the honor to request that you will lay this correspondence on the Table of the House.

Yours, &c.,

W. B. WILKINSON.

I should like immediate report.—J.S., 29/2/88. Traffic Manager, B.C., 2/3/88.

I send Mr. Harper's report herewith. It is quite true that Mr. Scott, Mr. Downe, and I were present and examined the Evans and Wilkinson trucks after they returned from their last trial, particularly the latter, the upper deck of which had given way during transit, but I cannot recall to mind the time being taken in the alteration of the trucks from cattle to sheep vehicles, nor can Mr. Downe, to whom I have spoken on the subject. I have no doubt that Mr. Harper took the time of converting each vehicle, although our attention was not drawn to it. I am informed that since the trucks were last weighed, wheels, axles, and journal-boxes, equal in weight to those under the Wilkinson truck, have been put under the Evans truck.—D.K., 5/3/88. Commissioner.

Report by Mr. J. H. Harper.

I HAVE the honor to state, in reply to the several matters brought under the notice of the Minister by Mr. R. B. Wilkinson,—

That the impartiality or otherwise of my report on the trials of the combination waggons is purely a matter of opinion, which I am content to leave to that sense of justice to which the writer appeals.

My instructions were to conduct three trials with the trucks under absolutely similar conditions. Mr. Wilkinson's truck has carried stock four times, but not in competition, nor in any sense under the supervision of myself, or, as far as I am aware, under that of any other officer of the Department. It was, therefore, not my business to refer to the first occasion on which it was loaded.

The Evans truck will carry "as many or more stock" as compared with the Wilkinson. The following measurements of the two vehicles are my authority for saying so.

As a cattle truck the several dimensions of the Evans truck are—Length, 17 feet 3 inches; width, 7 feet 8 inches; height, 7 feet 7 inches; giving a floor area of 132 feet, and a space of 1,002 cubic feet.

The Wilkinson truck is—Length, 17 feet 6 inches; width, 7 feet 9 inches; height, 7 feet; giving a floor area of 135 feet, and a space of 949 feet.

The latter truck has thus 3 feet more floor area as a cattle waggon than the Evans. But taking nine cattle as the load it will be seen that 15 feet is required for each beast, so that this 3 feet difference is practically valueless as affecting the carrying capacity of the vehicles.

As a sheep-van the Evans truck measures—Length, 17 feet 6 inches; width, 7 feet 11 inches; height, 3 feet 5 inches, and 4 feet 1 inch; giving a floor area of 277 feet, and a space of 1,039 cubic feet.

The Wilkinson truck measures—Length, 17 feet 6 inches; width, 7 feet 9 inches; height, 3 feet 10 inches, and 3 feet 5 inches; its floor area is 271 feet, and cubic space 983 feet. The Evans truck has 6 feet more floor area, and as a sheep requires but 2½ feet it is evident it must carry at least two more.

The weight of the trucks given in my report is that arrived at on our weigh-bridges by competent weighers. The first tares are those obtained by weighing, carefully standing, on the Sydney goods bridge. The weigher was Foreman Carlisle, and Mr. Braid of the Locomotive Department was present with me when the weights were taken.

The final retaring was performed by Weigh-clerk Farrell under precisely similar conditions. The Acting Manager and Mr. Wilkinson were both present.

It is, of course, a matter of opinion as to which trucks received most attention. I still hold to mine.

The reference made by Mr. Wilkinson to the valuable assistance he rendered at Orange and Kelso in assisting to unload and reload the animal in the Evans truck is beside the mark.

I willingly admit that he did assist very effectively, and I have no hesitation in saying that his large practical experience in trucking stock enabled him to suggest and carry out a plan for raising the beast referred to.

He will, however, surely admit on reflection that this was attention paid to the beast and not to truck, and that he extended the same willing aid in getting up cattle in other wagons during the journey.

The alteration of the trucks was effected in the presence of Mr. Wilkinson and Messrs. Kirkcaldie, Scott, and Downe, and if none of these gentlemen took the time that is not my fault. It was my duty to do so, and I did.

I am not aware in what time or under what conditions the trucks were altered before the gentlemen of the Select Committee, but I can safely assert that the one I made was the most actual one, as it occurred after the trucks had completed their journey with sheep, and without any oiling or adjusting of parts, and I am firmly satisfied the result would be the same to-morrow under the same conditions.

Traffic Manager.

J.H., 3/3/88.

Mr. W. B. Wilkinson to The Secretary for Public Works.

Sir,

Dubbo, 10 March, 1888.

I have heard that you have stated in the House that my last letter to you, *re* Mr. Harper's report of trial of combination trucks, is not to hand. I think there must be some mistake, as I presented the letter myself at the door of your room, and it was taken in by your messenger, and I waited some time to see if you desired to see me on the matter.

While on the subject I may state that I overlooked that portion of Mr. Harper's report, *re* the present condition of my truck and its present unfitness to carry stock.

The only repair my truck needs is a new bolt, or slot, an inch longer than the present, and strengthened by a cross-piece of angle iron, all of which can be done at the cost of 20s.

The first trial that the Evans truck made, the top deck broke and killed twelve sheep, so surely a small matter like mine did not need such a sweeping condemnation.

The truck is now at Redfern in the state that it was in when Mr. Harper reported, and I will ask the Select Committee to inspect it.

Will you please lay this letter on the table, with the other correspondence.

I think, sir, you will see the justice of what I ask. A certain report has been published which I state is untrue, or with only just enough truth in it to do me harm, and I can prove the writer was biassed, by several witnesses.

W. B. WILKINSON.

I informed Mr. Wilkinson that I had received the letter and would lay it on the Table when I obtained Mr. Harper's report. I should like report *re* statements contained in this letter.—J.S., 12/3/88. Traffic Manager.—A.R., 13/3/88. Mr. Wilkinson's letter, respecting Mr. Harper's report on his truck: Please peruse the enclosed letter from Mr. Wilkinson, and let me have your report upon it as early as possible.—W. V. READ, 15/3/88.

Report by Mr. J. Harper.

IN compliance with the instructions of the Minister, I have the honor to reply to those portions of Mr. Wilkinson's letter which have reference to my report. In doing so I desire to enter a strong protest against the position assumed by the writer.

I understand the whole question of these trucks is being investigated by a Select Committee of the House. I am summoned as a witness to give evidence before this body, and I respectfully submit that it is unfair to myself and disrespectful to the Committee that one of the interested parties should endeavour to anticipate my evidence in the manner Mr. Wilkinson is doing.

Surely he will have ample opportunity of obtaining my opinion and the value of that opinion when the proper time arrives, and he will also be in a position, if he can, to disprove the facts represented by me in the report.

The Department has not called upon me for an opinion, and I purposely refrained from expressing one, strictly confining myself to recording various tests as between the two trucks. I am not aware of having passed "a sweeping condemnation" on Mr. Wilkinson's truck; I at all events did not originate the expression, and if he considers the fact of my report stating that his truck was unfit to carry sheep at the conclusion of the trials as conveying that impression, he has at least admitted its truth by saying his truck will carry sheep after certain repairs and alterations are made.

I

I said it would not at the time of my report, and it is purely a matter of opinion as to whether it would with the alterations he suggests. I think it will be granted that in my position as a witness before the Select Committee I should not be required by Mr. Wilkinson to express what I think or why I think it. I will there place on record whatever my impressions are and whatever my observations may have been, unless the superior officers of my Department think it best in the interests of the Service to do it sooner.

Mr. Wilkinson has again seen fit to insinuate bias towards the inventor of the rival truck as actuating my report. He says he can prove it by several witnesses. Would it not have been more satisfactory and more manly had he proved this to the Minister by the evidence of these witnesses. I should then be called upon again to fight a shadow. As it is, I can only refer any impartial judge to the report in question, and absolutely deny the allegation of Mr. Wilkinson. I am not aware of any interests I have in settling this question beyond those of the Department, but that gentleman may rely upon it that I regarded these as of sufficient importance to call upon me to place the whole facts gathered during these trial trips before the head of it. If they involve "a sweeping condemnation" of Mr. Wilkinson's truck, his course is surely to disprove them. Any honorable man would at all events think so.
