I presume the Minister does not desire me to reply to that portion of the letter referring to the breaking of the bar in the Evans truck some two years since. If I am not mistaken that matter was fully gone into and reported upon by the Commission on Combination Truck. Their opportunities were necessarily far greater than mine of learning its causes and judging of its effect on the value of the truck.

As, however, their decision, despite this incident, was in favour of the Evans truck, I presume it was not considered of much importance. My report simply covers the ground of the three trials. The bar did not break, and whatever sheep might have been killed by the giving way of Mr. Wilkinson's truck floor were saved by the timely use of screw-jacks and props. Possibly, if the same means had been adopted when the Evans bar broke, the record of sheep killed might have been less.

Mr. Wilkinson says that his truck is in the same condition as it was when the trial was finished, and that it is his intention to show it to the Select Committee. I distinctly deny that it is in the same condition, and if the gentleman of that body require proof I will undertake to find it.

I have no desire to impute any motives in the matter, but I desire in justice to and in protection of myself to state that, on or about the 5th of the present month, the truck was adjusted and oiled preparatory to a visit of the Committee. When it had completed its third trial I took the precaution of seeing that neither it nor the Evans Truck were oiled or adjusted, and I have reported the result of that trial. I knew the Department did not want a truck for show purposes, and endeavoured to make the test as thorough as possible, and this, in my opinion, is one of the most important features in a combination vehicle. If the members of the Select Committee view and test the trucks, I only ask that it shall be under the same conditions.

JNO. HARPÈR,
Traffic Manager.

17/3/88.

[The previous Correspondence was laid upon the Table of the House, and ordered by the Legislative Assembly to be printed, 14th October, 1886.]

No. 1.

The Locomotive Engineer to The Commissioner for Railways.

Centre-bar of Combination Truck No. 15—broken.

I HAVE to report, for your information, that combination truck No. 15 arrived at Dubbo by No. 68 up, on the 16th instant, loaded with sheep. When examining the train, it was discovered that the centre-bar, which hold the flaps of top deck, was broken, which allowed the flaps and top sheep to fall to the bottom.

The truck was taken to the cattle-yards, and the sheep unloaded, when it was found that twelve sheep were dead. The remaining sheep were loaded into sheep-van No. 220, and went on by No. 70 up on the same day.

W. SCOTT, 18/11/86.

Do nothing to the van till it is returned to Sydney.—CHAS. A. G., 18/11/86. I wish a searching investigation to be made into the cause of this failure.—CHAS. A. G. Loco. Engineer.—D.C.M'L., 19/11/86.

Accident—Combination Car 15.

THIS car arrived at Dubbo from Bourke at 7:30 p.m. on the 16th instant, loaded with sheep, and it was observed that the main support of the top deck had broken in two, and the flooring resting on the sheep below, which were released as quickly as possible, but twelve of them were dead. The remainder were reloaded into a spare sheep-van and forwarded to destination.

I shall be glad to be informed when the inquiries are completed what caused the breakage.

There were sixty sheep on each deck when despatched from Bourke.

This is the vehicle that was a cattle-truck and was altered under Mr. Evans' supervision into a combination truck.

W. V. READ,
(Per D.K.,) 18/11/86.

Loco. Engineer.—D.C.M'L., 19/11/86.

MEMO.

MEMO.—This is the truck that was altered under Mr. Evans' supervision, at a cost of £95.—W.S. (per R.J.S.), 18/11/86.

Minute of Secretary for Works.—Should like a thorough examination to be made of this truck by some disinterested person outside the Department.—W.J.L., 20/11/86. Who can be recommended?—21/11/86. Locomotive Engineer.—CHAS. A. G.

Two gentlemen occur to me as qualified, viz., Mr. Ritchie and Mr. Brodie, both of whom have had experience of rolling-stock work, but at present have nothing to do with the Department in any way.—W. SCOTT, 23/11/86. The Commissioner.

Mr. Ritchie is, I think, managing for Hudson Brothers—the rival firm. To appoint him would be out of the question. Ask Mr. Brodie to see me.—CHAS. A. G., 25/11/86. Mr. Ritchie is not now managing for Hudson Brothers. He severed his connection with the firm some time ago.—D.C.M'L., 25/11/86.

I have seen Mr. Brodie. He used to manage for P. N. Russell & Co., and built for us the first railway carriages made in the Colony. Mr. Brodie afterwards, on his own account, constructed a large number of D trucks for the Department. He is not now engaged in the business, but has taken to bricks and mortar. He is well qualified to conduct this inquiry.—CHAS. A. G., 29/11/86.

Minute of Secretary for Public Works.—Approved.—W.J.L., 29/11/86.

Letter to Mr. Brodie. Send copy, with these papers, to Mr. Scott, and ask him to give Mr. Brodie every facility for the examination of the car.—CHAS. A. G., 30/11/86. Attended to. Locomotive Engineer.—D.C.M'L., 1/12/86. Assistant Locomotive Engineer.—W. SCOTT, 3/12/86. Arrangements made, and every facility was rendered Mr. Brodie.—G.D., 4/12/86.

The Commissioner for Railways to Mr. D. Brodie.

Sir,

Department of Railways, Sydney, 30 November, 1886.

With reference to your recent interview with me, I have the honor to request that you will be good enough, at your earliest convenience, to make an examination of a truck known as combination truck No. 15, now standing in the Redfern yard, and to report thereon.

The following statement of facts is necessary to enable you to comprehend fully the nature of the duty which I ask you to perform, and the direction which your inspection will have to take.

There is in existence, as you are doubtless aware, a patented truck, styled the "Evans Combination Truck." The proprietors of this truck have been pressing the Department to purchase the patent, and, with a view to show the adaptability of the design to our present stock, and how easily and cheaply the stock could be converted, they some time ago obtained permission to alter one of our cattle-vans to the combination type, the understanding necessarily being that it should be made *in all respects* like a combination truck. The alteration was carried out by Mr. Wearne, under the supervision of Mr. Evans; and it is the altered truck which I now ask you to report upon.

The truck in question made its first journey, laden with sheep, on the 16th instant; and, on being examined on arrival at Dubbo, it was discovered that the centre bar, which supports the upper deck, was broken in two, causing that deck, with the sheep upon it, to fall down upon the sheep beneath, no less than twelve of which were killed.

It is highly important that the real cause of the accident should be discovered, and it is in this view that I have asked you to inspect the truck.

I shall be glad if you will subject it to a searching examination, and let me have your independent and unbiassed opinion as to the origin of the accident. In the event of your requiring any evidence, Mr. Scott, the Locomotive Engineer, will no doubt furnish it. Mr. Wearne, who made the alterations in the truck, Mr. Evans, who superintended the work, and Mr. Braid, who inspected the truck when completed, might perhaps be called; but in this you will of course exercise your own judgment.

I have, &c,

CHAS. A. GOODCHAP,
Commissioner for Railways.

Mr. D. Brodie to The Commissioner for Railways.

Sir,

Anmandale, 8 December, 1886.

In accordance with your instructions of 30th ultimo, I went to Redfern Railway Station and examined the truck known as "Combination Truck No. 15," and find the centre bar, which was broken, the cause of the accident. This bar, being 17 feet 4 inches in length, and only 4 in. x 4 in. square of Oregon pine, without any supports between the ends, was, in my opinion, too weak for the purpose. Added to this, I find a flaw in this centre bar which may have escaped the notice of Mr. Wearne or his men, but which tended to make it still weaker. I may state, in company with Mr. Scott, I saw the combination truck No. 13, and find, had No. 15 truck, when being altered, have had a partition similar to the one in No. 13 combination truck which acts as a support of the longitudinal bar, the accident would not have occurred. I may, in conclusion, state that I consider No. 13 combination truck, in certain details as to flats, hinges, &c., a superior truck, and that the workmanship in No. 15 truck was badly done.

I have, &c.,

DAVID BRODIE.

For the Minister's information.—CHAS. A. G., 17/12/86. Seen.—W.J.L., 18/12/86. What is to be done with this waggon? It is useless in its present form. I propose that it be strengthened, so as answer the purpose for which it was constructed.—CHAS. A. G., 20/12/86.

Minute of Secretary for Works.—Yes; let it be repaired and strengthened.—W.J.L., 24/12/86.

Locomotive Engineer.—D.C.M'L., 29/12/86. To Assistant Locomotive Engineer.—W. SCOTT, 30/12/86. Instructions given for the work to be done. Locomotive Engineer.—GEO. DOWNE, 5/1/87.

No. 2.

Minute by The Commissioner for Railways.

THE Minister is desirous of having an independent investigation into the merits of the various stock-cars that have been submitted for adoption on our railways. They are—

1. The Evans' car.
2. The Wilkinson car.
3. The Perry car.

The Minister considers that if a good traffic man, an experienced waggon builder and designer, and a practical stock agent were appointed a Board to investigate the question and report upon the designs of car under offer, the real merits of the case would be ascertained.

For this purpose, as regards two of the three members of the Board, he wishes telegrams sent to the Commissioner for Railways, Queensland, asking for the services of Mr. Thallon, Traffic Manager, and to the Board of Commission, Melbourne, for the services of their Chief Designer of Rolling Stock.

Please send telegrams accordingly.

CH. A. G., 7/12/86.

Telegrams sent.—D.C.M'L., 7/12/86.

Combination Stock and Goods Trucks.

ON 7th December, 1886, the Commissioner directed that an independent inquiry should be made respecting the relative merits of the various trucks of the above design submitted to the Department—

1. Evans.
2. Wilkinson.
3. Perry.

And to this end suggested the appointment of the following gentlemen:—

- Mr. Thallon, Traffic Manager, Queensland Railways.
Mr. Badgery, Stock and Station Proprietor.
Mr. Gill, Foreman of Waggon Shops, Victorian Railways.

The services of these gentlemen have been secured, and arrangements have been made for their first sitting on the 20th instant, of which the parties interested are to-day being duly advised.

A. RICHARDSON, 11/1/87.

For Minister's information.—CH. A. G., 11/1/87.

Minute of Secretary for Works.—Approved.—W. J. L., 11/1/87.

Combination Car Commission.—Report of Board, Friday, 28th January, 1887.

THE Board held nine meetings from the 19th to the 28th January inclusive. Fifteen witnesses were examined, comprising the inventors, men experienced in loading and unloading and travelling with stock, as well as officers of the Railway Department skilled in the construction of rolling-stock.

The Board visited the unloading station at the saleyards, Flemington, on the 19th instant, to witness unloading of stock and examination of Evans's truck, which is the only combination truck in use.

On the 22nd instant the Board visited the works of Messrs. Hudson Brothers, at Clyde, to inspect a truck in course of construction, the invention of Mr. W. B. Wilkinson, of Dubbo; and on 27th instant the same truck was again inspected at Flemington.

The instructions to the Board by the Commissioner for Railways were:—To inquire into the relative merits of three designs of combined stock and goods trucks for use on the Railways of this Colony, to take evidence thereon, and to make a report and a recommendation; but the Board, believing the great object in view was to recommend the truck most suitable for the conveyance of all classes of stock, as well as merchandise, permitted a number of persons who had models or plans of new inventions pertaining to combination trucks to exhibit them, and explain the mode of working and advantages they claim for their inventions. The great difficulty in providing a truck suitable for sheep and cattle lies in the fact that for sheep in upper and lower decks there must be abundant ventilation, and for cattle, as near as possible, a perfectly smooth surface inside to avoid injury, and to prevent cattle from seeing out.

The Board desires to express an opinion that it will not be possible to adopt a combined truck to thoroughly answer all the requirements of a stock truck, and at the same time possess the advantages of a merchandise waggon to such an extent as to supersede the present D trucks; but the models submitted prove that it is possible to construct a waggon suitable for both sheep and cattle, and, to some extent, for merchandise as well, thus enabling the Department to utilize it for up-country loading, instead of returning it empty, as has been the practice hitherto with the ordinary sheep-trucks.

The trucks and models submitted may be briefly described as follow:—

No. 1.—*Mr. George T. Evans* submitted two combination trucks, both of which he claimed were suitable for sheep, cattle, or merchandise. In one truck there is a division in the centre, thus forming four compartments for sheep, or two for cattle, and the other having no division; otherwise the chief features in these trucks are the same, viz.: that the top deck necessary for the sheep-van is formed of several parts, and supported by a beam lowered from the roof, and by hinges at the sides of the truck which admit of the top deck, when not required for sheep, being lowered so as to form the sides of a cattle or merchandise waggon.

The weights of the trucks are—with the division, 7 tons 7 cwt. 1 qr.; without the division, 6 tons 12 cwt. 3 qr.

No. 2.—*Mr. Thomas Perry* submitted a model of a combination truck, the principle of which was that the upper deck required for sheep was balanced by weights on the outside of each end, and lowered to the middle of the truck, or raised to the roof as required, for sheep or cattle; no alteration being made in the sides of the truck in either case. Mr. Perry claimed certain advantages in the under-frame of his truck which would reduce its weight, but it appeared this did not affect the combination principle, as the same, if considered an advantage by the Department, was equally applicable to all classes of waggons. It was impossible to arrive at the weight of the truck from the model submitted; but we are of opinion the movable floor and balance-weights could not be less than 16 cwt., which would have to be added to the weight of the cattle-truck. It appeared also that as the truck was necessarily close for cattle sufficient

sufficient provision could not be made for ventilation in the case of sheep. A commendable feature in this truck is that provision is made for draining the top deck, and also the rapidity with which the top deck can be raised or lowered.

No. 3.—*Mr. W. B. Wilkinson* submitted a combination truck, the chief feature of which was its adaptability to the system of end as well as side loading. Although the bulk of the evidence taken goes to show that end-loading is not the great advantage its advocates claim for it, we desire to point out that the witnesses examined have had only a very limited experience, and even that has been confined to trucks of the present pattern with fixed floors. In *Mr. Wilkinson's* truck provision has been made for the loader to walk from end to end of the train in an upright position on both floors, thus giving him control of the sheep, and a better opportunity of regulating the number in each truck. On the other hand, he has not overcome the difficulty of providing ample ventilation for sheep, or a smooth surface for cattle, and we consider his invention defective in these respects.

The weight of this truck is 7 tons 15 cwt. 2 qr.; the floor area is 270 feet, or 65 lb. per square foot for sheep, and 135 feet for cattle.

Mr. Wilkinson stated in his evidence that the weight could be greatly reduced, but making every allowance for the alterations he mentioned, the truck must still remain very considerably heavier than the present sheep-van. It is impossible to say what the expense of this truck, if adopted, would amount to; but the Board is of opinion, judging from the number of parts, that the cost must be excessive compared with the present design of sheep-van or cattle-truck, and considerably higher than either of the other two combination designs.

The Board was desirous of testing *Mr. Wilkinson's* truck as to end-loading, and arrangements were made with the Department, stockowners, and others to have the end-loading trucks now in use and a sufficient number of sheep at Homebush on Wednesday, 26th instant, but in consequence of *Mr. Wilkinson's* truck not being sufficiently advanced this had to be abandoned.

No. 4.—*Mr. Mulholland* submitted an imperfect model of a combination truck, available for sheep and cattle, embodying an ingenious system of end-loading, but inasmuch as he had made no provision for the smooth inside surface required for cattle, we considered his design defective.

A number of other models and plans were submitted, but none of them possessed such improvements as would warrant the Board in suggesting the adoption of their principles.

The Board intimated to the principal stock and station agents in the city the purpose for which it was sitting, and invited them to come forward with any suggestions they had to offer, but no one took advantage of the opportunity.

After inspecting the trucks, models, and plans submitted, and after carefully considering all the evidence, the Board is unanimously of opinion that the converted truck, without division, submitted by *Mr. Evans*, combines more advantages than any of the others. As a sheep-truck it gives more head room than the present pattern, while the ventilation at the sides and ends is all that could be desired. Compared with the sheep-trucks now in use, it gives a floor area of 280 feet for 6 tons 12½ cwt., or one square foot for every 53 lb.; whereas the sheep-truck has a floor area of 241 feet for 6 tons 17 cwt., or 1 square foot for every 63½ lb.

As a cattle-truck it gives considerably more head room, which is a decided advantage, as can be seen by the marks of the cattle's horns on the roof of the present trucks; on the other hand, it is 8½ cwt. heavier than the cattle-truck now in use.

As a merchandise truck it certainly is much heavier than the ordinary goods-waggon; but the evidence of the Department goes to prove that it has been largely used for the conveyance of all classes of goods to stations beyond Dubbo, and gives every satisfaction.

Another special advantage this truck possesses over other trucks is the fact that the floor of the upper deck, instead of being raised to the roof, thereby increasing oscillation, and straining the frame of the truck by unnecessarily adding to the top weight when the waggon is used for merchandise or cattle, is lowered, and forms a smooth side for cattle or merchandise. None of the parts, with the exception of the beam for supporting the top deck, are out of use at any time in the conveyance of sheep, cattle, or merchandise.

It is a question with the Board whether the flaps forming the top deck would be strong enough to withstand the tear and wear they would be subjected to if largely used for cattle; but in any case instructions should be given to all concerned, in the event of this truck being adopted, to lower them steadily, instead of allowing them to fall, when converting from a sheep to a cattle waggon.

The Board is also of opinion that the longitudinal beam should be supported by a prop fitted into a socket in the bottom floor when the truck is used for sheep, and which, when not required, could be carried up by the beam, to which it should be attached by hinge and loop.

A drawback to this design is the position of the doors for sheep, one being directly above the other, which necessitates the two decks being loaded or unloaded separately; but this would be overcome by inserting a door for sheep in the centre of the top deck.

Another disadvantage mentioned by several witnesses is that the floor of the top deck is higher than the present sheep-races, but this could easily be met by a movable board in the race.

To place the relative merits of the three best designs of combination cars more clearly before the Department the Board submits the following table:—

	Points considered separately.	Evans's Truck without division.	Perry.	Wilkinson.
Compared with the trucks now in use in the Department, and assuming their value at 10 points each.	Cattle-truck	9	7	5
	Sheep-van	12	4	8
	Goods-van	7	4	6
	Cost of combination parts	4	5	3
	Simplicity and strength of combination parts.	4	5	4
Considerations of secondary importance, assuming 5 points as the maximum.	Weight per foot of floor area.....	5	4	3
	Facility for converting.....	4	5	4
	For end-loading	5
			45	34

The Board desires to express its opinion that the division inserted in Evans's Combination Truck is a decided disadvantage in the case of cattle or merchandise; while in the case of sheep the advantage, if any, is very questionable, and causes great inconvenience and loss of time in loading and unloading. The workmanship upon the truck without division is certainly inferior in some respects, but that could be remedied without materially adding to the weight or cost, and in no way affects the design.

The question of cost of the different models could not be accurately ascertained; but Mr. Evans's Combination Truck without division is, in the opinion of the Board, the most economical and suitable in every way for the conveyance of sheep, cattle, and merchandise, and we recommend accordingly.

HENRY S. BADGERY.
J. F. THALLON.
J. GILL.

The Hon. John Sutherland,
Minister for Public Works, Sydney.

No. 3.

H. Halloran, Esq., to The Commissioner for Railways.

Sir,

54, Wentworth Court, Sydney, 3 March, 1887.

I have the honor, on behalf of the proprietors of the patent for Evans' Australian Combination Trucks, and with reference to my letter of the 18th December last, to request to be favoured, at your earliest convenience, with a settlement of the important matter therein involved.

As I understand that the Board appointed by the late Government reported in favour of the Australian Combination Truck to which I refer, I would suggest that a decision may be speedily arrived at.

I have, &c.,
HENRY HALLORAN.

Minute of the Commissioner for Railways.—There is some considerable doubt as to what the Board did recommend. I think it would be well to send a copy of the Board's report to the press in the first instance, before any final action is taken.—CHAS. A. G., 8/3/87.

No. 4.

H. Halloran, Esq., to The Commissioner for Railways.

Sir,

54, Wentworth Court, 18 April, 1887.

I do myself the honor to invite your attention to my letter of the 3rd ultimo, in the matter of Evans' Australian Combination Truck, and the purchase by the Government of the right of patent for the same, and to say that the gentlemen whom I represent in the matter are very desirous of a settlement of the important question now before you.

I have, &c.,
HENRY HALLORAN.

No. 5.

H. Halloran, Esq., to The Secretary for Public Works.

Sir,

Wentworth Court, 16 August, 1887.

On behalf of the proprietors of the patent for Evans' Combination Truck, and with reference to the correspondence which has taken place, extending over a great many months, to the personal interview with which you favoured me, and the decision which I had hoped it might have been possible for you thereafter to arrive at, the report of a Board appointed and continuing at a very considerable cost, absolutely in favour of the Evans' Combination Truck over the other inventions of a similar character, I have now the honor to express a hope that you may be in a position soon to come to a decision in the matter.

Knowing how strongly interested you have shown yourself to be in matters of progress and public prosperity, and that the adoption of the offer of the patent belonging to the gentlemen whom I represent herein will be to the advantage of the public, and a saving to the revenue and a great general convenience—a matter in which I personally feel no small interest as a colonist and a citizen—and knowing, further, that the gentlemen concerned in the patent, though they have stated a price, are quite open to meet the Crown by the acceptance of such a price, equitable and considerate, as may be offered to them, for the great advantage which the legal use of their patent will secure to the Department, the revenue, and the public, I beg to express a hope that the question may be soon decided in such a way as may appear to you fair to all interests involved under the circumstances.

I have, &c.,
HENRY HALLORAN.

Minute of the Secretary for Public Works.—I require all the papers on this subject, with a *précis* of the whole case, by Monday next, that the Commissioner and I consult on what is best to be done in this important matter.—J.S., 17/8/87.

REPORT of the Committee appointed to inquire into the relative merits of certain designs of combined Goods and Live Stock Trucks.

WHEN the Live Stock Board was sitting in 1884, the Evans Combination Truck was brought under the notice of the Board, and in their report they referred to it in terms of commendation, and recommended that four of the trucks should be built for trial.

The Commissioner had already formed a favourable opinion of the truck, and he, with a view to a perfect trial being made, recommended that fourteen trucks should be obtained, which Mr. Secretary Wright approved.

In due course the fourteen trucks were put into use, and after trial were reported upon by the Traffic Manager in terms which, on the whole, were favourable.

In

In March, 1886, Mr. Halloran, on behalf of the patentee, offered the entire patent of the truck to the Government for the sum of £17,000.

The merits of the truck, however, were not so well established as to warrant so large an expenditure at present, and moreover the enormous cost of introducing new stock, or altering the existing stock, was a point which required grave consideration.

Subsequently, Mr. Halloran intimated that the patentees were open to an offer.

Mr. Halloran made an offer to convert our existing stock of trucks to the Evans' pattern at the following prices:—For the old narrow trucks, £140 each; for the wide trucks, £130 each.

About this time, Mr. T. Perry and Mr. W. B. Wilkinson brought rival designs of combination trucks under the notice of the Commissioner, and on the 9th December, 1886, the Minister decided that a Board, consisting of a traffic expert, an experienced waggon builder, and a practical stock agent, should be appointed to inquire into and report upon the relative merits of the three designs; and Mr. Thallon, Traffic Manager of the Queensland Railways, Mr. Gill, of the Waggon Department, Victorian Railways, and Mr. H. S. Badgery were appointed accordingly.

It appears that the only one of the competing trucks the Board had an opportunity of seeing in actual use was the Evans' truck, and this was due to the circumstance of a number of them having been built by the Department.

After examining a large number of witnesses, the conclusion arrived at by the Board was that the Evans' improved truck was the most economical and the most suitable in every way, and they made their recommendation accordingly.

Mr. Thallon (being urgently required at home) quitted Sydney immediately after signing the report.

Mr. Halloran has written from time to time, pressing the Minister to come to a speedy decision with regard to the offers made on behalf of the patentees of the Evans' truck.

He now again writes, referring to the decision of the Board in favour of the Evans' truck, and to the offers made by the patentees to the Government. He says that although a definite sum has been asked for the patent, the persons interested are prepared to accept such a price, equitable and considerate, as may be offered them, and he (Mr. Halloran) hopes that a decision will be speedily arrived at.

Mr. Secretary Sutherland asks for the papers, with a *précis*, in order that he and the Commissioner may consult as to what is best to be done in this important case.

C.A.B., 19/8/87.

No. 6.

Mr. A. Wilson to The Secretary for Public Works.

Dear Sir,

7, Bent-street, 27 August, 1887.

As I believe it will shortly be necessary to build a number of stock-waggons, and also probably to improve some of the old ones, I wish to bring under your notice the fact that on several occasions my firm have been requested to secure the use of those known as Evans' Combination Truck. On all sides I have heard the most encouraging reports as to their general convenience.

You have doubtless at your command a mass of information referring to various patents, but I feel sure the merits of that referred to speaks for itself.

I have, &c.,
ALEX. WILSON.

No. 7.

Mr. A. Wilson to The Secretary for Public Works.

Sir,

"Asche's Royal Hotel," Sydney, 29 August, 1887.

I beg to address you on the Evans' Combination.

I have been asked by many large and practical stockowners to bring under your notice the above-mentioned truck, and ask you if there is any likelihood of its being adopted by your Department.

They know I am one of the shareholders, and advise me to push the matter, saying that the work done by the fourteen now in use (two years) speaks for itself. Mr. Samuel M'Caughey, one of our largest stockowners and most practical men, was positive of its success the first day he saw it. He wrote several letters to this effect to the daily prints some time ago when the matter was before the Department, he being absolutely disinterested. His opinions should carry weight, as also will the fact that many stockowners instruct their agents to secure these trucks instead of the old ones. It is the only real combination truck before your Department.

I have, &c.,
A. C. WILSON.

No. 8.

Phillip, Somer, & Co. to The Commissioner for Railways.

Sir,

Nevertire, 4 September, 1887.

We, the undersigned Stock Agents, seeing by the *Daily Telegraph* of the 3rd instant that there is a likelihood of the truck known as "Evans' Patent Combination" being accepted by the Department as the truck for carriage of live stock throughout the Colony, hereby enter a protest, upon the grounds that we have used the truck for both sheep and cattle, and find the patent inconvenient and impracticable, and not so good as the present sheep or cattle trucks now in use.

PHILLIP, SOMER, & CO.,
Agents for Nevertire.

No. 9.

Railways.—Particulars of Service of Combination Trucks.

A RETURN of the Earnings and Mileage of the Combination Trucks now in use, from the 1st January to 30th June, 1886, distinguishing goods freight and live stock freight as compared with ordinary trucks.

EARNINGS and Mileage of the Combination Trucks as compared with other Live Stock Trucks during the period ended 30th June, 1886.

I ATTACH a return giving the information in as complete a form as it is possible to give it, without entailing a very great amount of extra time and labour to render it more complete.

The particulars supplied in regard to the combination cars, of which there are only fourteen, took a considerable time to compile, but it can readily be seen what labour was involved to get less complete information in regard to 272 sheep-vans and 300 cattle-waggons, while it must be apparent that the separation of the mileage run by these vehicles with live stock and goods traffic means an enormous amount of additional work.

W. V. READ, 24/8/87.

For the six months ended the 30th June, 1886.

No. of Trucks in use.	Live Stock.		Goods Traffic.		Totals.		Loaded Mileage. Per Mile.
	Loaded Mileage.	Earnings.	Loaded Mileage.	Earnings.	Loaded Mileage.	Earnings.

Sheep-vans..... 272	39,767 7 0	1,764,491	39,767 7 0	5½d.
Cattle-waggons..... 300	36,311 11 4	2,949 0 3	1,560,238	39,260 11 7	6½d.
.....	77,210 0 3	7,152 10 7	3,443,188	84,362 10 10	

Empty mileage run by combination cars ... 24,629, making gross 143,088 miles.

„ „ sheep-vans ... 1,400,911, „ 3,165,402 „

„ „ cattle-waggons ... 1,250,794, „ 2,811,032 „

2,676,334

6,119,522

It is impossible to give the separate mileage run by cattle-waggons and sheep-vans with live stock and goods traffic without entailing a very large amount of labour and time to do so.

The information was asked for in a question. No resolution was passed. Will Commissioner please say whether it is to be laid upon the table?—D.C.M'L., 26/8/87.

I do not know whether it is necessary to lay it upon the table, but the document itself tells a significant story in favour of the combination trucks. For empty and full running mileage they have earned nearly 9d. a mile, while the cattle and sheep trucks have earned only something less than 3½d. per mile for six months' running. The empty running with the combination trucks was 19 per cent. of the full running, while the empty running was 44 per cent. in the case of the other live stock waggons. If the ordinary live stock waggons had earned as much as the combined waggons per mile travelled, the revenue would have been, instead of £79,027, no less than £224,116, or £145,089 more. It is not likely, of course, that the traffic would have been so adjusted as to admit of this large extra amount being earned, but I think 20 per cent. of it would have been; and that is a very low estimate. Even this would show a profit of £29,018 in six months.—CH. A. G., 26/8/87.

NOTE.—The above was submitted to Mr. Secretary Sutherland, together with all the papers bearing upon the offer of the patentees of the truck to confer their rights upon the Government, in consideration of the payment of the sum of £17,000. In view of the highly satisfactory results disclosed in this statement, in respect of economy from working the traffic with this truck, the Minister minuted to ask the patentees if they were prepared to accept the sum of £15,000.

The Commissioner for Railways to Henry Halloran, Esq., C.M.G.

Sir,

Department of Railways, Sydney, 3 September, 1887.

With reference to your letter of the 16th ultimo and previous communications, offering, on behalf of the proprietors of the patent of "Evans' Australian Combination Truck," to sell to this Department the legal right to such invention, I have the honor, by direction of the Honorable the Minister for Works, to inquire whether the proprietors will accept the sum of fifteen thousand pounds (£15,000) for the right to use their patent and all improvements effected therein.

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

Henry Halloran, Esq., C.M.G., to The Commissioner for Railways.

Sir,

54, Wentworth Court, 5 September, 1887.

I have the honor to acknowledge the receipt of your letter of the 3rd instant, inquiring, with reference to previous correspondence, whether the proprietors of the patent of Evans' Australian Combination Truck are willing to accept the sum of fifteen thousand pounds (£15,000) for the right to use their patent and all improvements effected therein; and in reply I am directed to submit, for the consideration of the Honorable the Minister for Public Works, that considering the great superiority of this invention over any other of the like sort, as unanimously reported by the Board appointed by the Government to investigate, and who strongly recommends its adoption, and the great financial saving which its adoption will secure—considering also the time that has elapsed since the patent was put under offer to the Government, and that the loss thereby occasioned to the proprietors—the offer of £15,000 appears an

an inadequate one; but that, as the Government bore all the cost of the Board appointed to test its superiority, they are willing to split the difference, and to accept the sum of £16,000, a sum which it is hoped, in the interests of the public, may be allowed to them, and which sum I am authorized to accept, and do hereby formally accept on their behalf, if the Government concur therein without further delay, for the legal right of patent and all improvements hereafter made therein in the Colony of New South Wales.

I have, &c.,

HENRY HALLORAN,

Agent for the Proprietors of Evans' Australian Combination Truck.

If the Minister approves of this amount being paid for the patent, I would recommend that no time should be lost in having our present live stock vans converted into combination trucks, and that tenders for this service be invited.—CH.A.G., 6/9/87.

Approved. I understand there are some eighty trucks lying at Wallerawang sidings, and others which have been condemned which require reconstruction. Let these first be taken in hand, if they can be reconstructed. There are documents in the Department to show which trucks require to be done, but whether new or old trucks are taken in hand they must be made according to the model now in the contractor's yard (Mr. Glasson). This truck should now be taken out and placed in the railway yard as a sample.—J.S.

The Crown Solicitor to draw up agreement for use of patent for New South Wales Railways; the consideration money, £16,000.—CH.A.G., 7/9/87. The Crown Solicitor.—A.R. (for Commissioner for Railways).

The Commissioner for Railways to H. Halloran, Esq.

Sir,

Department of Railways, Sydney, 8 September, 1887.

With reference to your letter of the 5th instant, stating that the proprietors of the Evans' Australian Combination Truck design will accept the sum of £16,000 for their legal right therein, I have the honor to inform you that the Secretary for Public Works has approved of the acceptance of the terms named in your communication; but, before final settlement is made, it is necessary that an agreement should be drawn up and executed, conferring upon the Government patent rights for the use of the invention.

Instructions will be at once given to the Crown Solicitor for the preparation of the necessary document.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Mr. A. Richardson to The Crown Solicitor.

THE HONORABLE the Minister for Public Works having decided to accept a proposal made to him by the proprietors of the Evans' Australian Combination Truck to purchase the patent for New South Wales of that vehicle for the sum of £16,000, I have to request that the Crown Solicitor will be so good as to prepare, at his early convenience, the necessary deed of assignment of the patent.

The proprietors are to assign to the Government the patent right in the truck and any improvements which may hereafter be made in it.

I enclose the Letters of Registration in favour of Henry, William, and Thomas Hudson and Ambrose Thornley; assignment by Thornley of his right in the patent to the Messrs. Hudson; and final assignment of the patent by the Messrs. Hudson to G. T. Evans and A. Thornley, the present proprietors; also, letter of 5/9/87 from Mr. Halloran.

A. RICHARDSON, 12/9/87.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 21 September, 1887.

In compliance with your verbal request, I have the honor to return herewith Mr. Halloran's letter to you of date 5th September instant (S7-3,757 D-59) with reference to the proposed assignment to the Government of the invention entitled, "Evans' Australian Combination Truck."

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, 23 September, 1887.

I am directed by the Honorable the Attorney-General to return the papers referring to the purchase from Messrs. Evans & Thornley of the "Evans' Australian Combination Truck" to you, as it is understood that they are to be laid before the Cabinet for further consideration.

I therefore return the papers herewith.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(FURTHER PAPERS IN REFERENCE TO EVANS'S COMBINATION TRUCKS.)

Ordered by the Legislative Assembly to be printed, 13 October, 1887.

Evans's Combination Truck.

Précis.

WITH the view to avoid the empty running, which is so serious a drawback upon the profits of a railway, the attention of the Department was given many years ago to the question of the production of a vehicle which would answer for the conveyance either of sheep or cattle or goods, as the exigencies of the traffic might require, the object in view being to obtain a truck which could be used for the conveyance of stock to Sydney, and which, instead of being sent back empty, could be utilised in the conveyance of general merchandise going from Sydney to the country.

So far back as 1878 a truck was constructed by the Department to effect this object, but it failed of its purpose.

In 1883 Mr. Wilkinson, M.L.A., carried a resolution in the House that a Board should be appointed to inquire into the live stock traffic, for the purpose of finding out and removing the causes of the existing irregularities and delays in such traffic.

To this Board a model of a combination cattle truck, sheep van, and goods truck, designed by Mr. Evans, was submitted, and although it was perhaps outside the limits of the enquiry remitted to the Board, they dealt with this model in their report, speaking of it in strong terms of approval, as likely to effect the object the Department had so long been endeavouring to attain, and they recommended the construction of four or five of the trucks, with a view to their capabilities being tested in practice.

The Commissioner had already made a critical examination of Mr. Evans's model, and had formed so favourable an impression of the design that he endorsed the recommendation of the Board with an amplification. He recommended that a sufficient number of the trucks to form a train load (fourteen) should be built, as in that way only could an effectual trial be given to them.

The Minister (Mr. F. A. Wright) approved of fourteen trucks being constructed, and they were built accordingly, and for two years have been exhibiting their capabilities in working the traffic of our railways.

The success of Mr. Evans's invention brought out a number of imitators, or perhaps it would be more correct to say rivals. Several inventions having the same object in view were brought under the notice of the Department, but only two of them were of sufficient merit, or were presented in such a shape as to justify a consideration of them.

These were designs (1) by Mr. Wilkinson, (2) by Mr. Perry.

The matter was brought by the Commissioner (who, after his experience of the Evans car, was anxious that the best of the rival designs should be selected for use on our railways) under the notice of the Minister.

The Minister was fully alive to the importance of the subject, and he decided that a Board should be appointed to inquire into and report upon the relative merits of the Evans truck, the Wilkinson truck, and the Perry truck, and that the Board should consist of a good traffic man, an experienced waggon builder and designer, and a practical stock agent, to be selected (with a view to secure strict impartiality) from outside the Department.

The following gentlemen were appointed accordingly:—Mr. Thallon, Traffic Manager of the Queensland Railways; Mr. Gill, Waggon Constructor of the Victorian Railways; and Mr. H. S. Badgery, Stock and Station Agent of Sydney.

The Board, after careful consideration of the rival designs, and taking the evidence of the inventors and other witnesses, arrived at the following decision:—"Mr. Evans's truck is * * * the most economical and suitable in every way for the conveyance of cattle, sheep, and merchandise, and we recommend accordingly."

The saving which has accrued to the Department from the use of the combination truck, as an earnest of what may be expected in the future is set forth in a return which was laid upon the table of the House and ordered to be printed, 21st September, 1887. In commenting upon that return the Commissioner minuted that it would be seen that in the six months work the fourteen combination trucks had earned nearly 9d. a mile on the full and empty runnings, while the sheep and cattle trucks had earned something less than 3½d. a mile, and that if the latter had earned as much per mile travelled as the combination trucks the revenue would have been £145,089 more than it actually was. The Commissioner admitted that it was not likely that the traffic could have been so adjusted as to admit of that large extra amount being earned, but he thought that at a very low estimate 20 per cent. of it would have been, which would show a profit of £29,018 in six months. The price asked for the patent of this truck (£16,000) would therefore be recouped to the Department nearly four times over by the traffic of a single year.

If the whole of our stock of sheep and cattle trucks were altered to the combination pattern—the cost would be, say, £110,000—the interest on which at 4 per cent. would be £4,400.

The certain saving by the use of the combination truck would, as shown by the Commissioner, be, per annum, at least	£58,036
If from this we take the interest, as above	4,400
It leaves	£53,636
From that deduct sum to be paid for the patent	16,000

Leaving a net profit on the year's working of £37,636

while for succeeding years, interest on capital would be the only charge on the extra earnings of the truck.

It must not be forgotten that empty running, which, while involving the same cost as full running, gives no return, is an increasing evil, and that in the same proportion as the traffic augments, such empty running increases, and that any measure which tends to diminish this empty running means an addition to the revenue.

Railways.—Particulars of Service of Combination Trucks.

A RETURN of the Earnings and Mileage of the Combination Trucks now in use, from the 1st January to 30th June, 1886, distinguishing goods freight and live stock freight as compared with ordinary trucks.

EARNINGS and Mileage of the Combination Trucks as compared with other Live Stock Trucks during the period ended 30th June, 1886.

I ATTACH a return giving the information in as complete a form as it is possible to give it, without entailing a very great amount of extra time and labour to render it more complete.

The particulars supplied in regard to the combination cars, of which there are only fourteen, took a considerable time to compile, but it can readily be seen what labour was involved to get less complete information in regard to 272 sheep-vans and 300 cattle-waggons, while it must be apparent that the separation of the mileage run by these vehicles with live stock and goods traffic means an enormous amount of additional work.

W. V. READ, 24/8/87.

				2,676,334		6,119,522.	

It is impossible to give the separate mileage run by cattle-waggons and sheep-vans with live stock and goods traffic without entailing a very large amount of labour and time to do so.

The information was asked for in a question. No resolution was passed. Will Commissioner please say whether it is to be laid upon the table?—D.C.M'L., 26/8/87.

I do not know whether it is necessary to lay it upon the table, but the document itself tells a significant story in favour of the combination trucks. For empty and full running mileage they have earned nearly 9d. a mile, while the cattle and sheep trucks have earned only something less than 3½d. per mile for six months' running. The empty running with the combination trucks was 19 per cent. of the full running, while the empty running was 44 per cent. in the case of the other live stock waggons. If the ordinary live stock waggons had earned as much as the combined waggons per mile travelled, the revenue would have been, instead of £79,027, no less than £224,116, or £145,089 more. It is not likely, of course, that the traffic would have been so adjusted as to admit of this large extra amount being earned, but I think 20 per cent. of it would have been; and that is a very low estimate. Even this would show a profit of £29,018 in six months.—CH. A. G., 26/8/87.

Précis of Case—Re Combination Truck.

THE question of obtaining a live stock waggon which would be suitable for the carriage of either sheep, cattle, or goods, has been under the consideration of the Department for years. So far back as 1878, a truck was constructed by the Department to effect this object, but it failed of its purpose. The conduct of the live stock traffic had become a matter of serious complaint, and at length, in December, 1883, Mr. R. B. Wilkinson, M.P., carried a Resolution in the Legislative Assembly—"That, in the opinion of this House, it is desirable that the Government should, without delay, appoint a Board to inquire into the live stock traffic on the Railways, for the purpose of finding out and removing the causes of the existing irregularities and delays in the transit of live stock."

The Board appointed by the Government consisted of—Mr. R. B. Wilkinson, M.P.; Mr. A. Gee, General Manager, Sydney Meat-preserving Company (Limited); Mr. D. Kircaldie, Assistant Traffic Manager, New South Wales Railways; Mr. T. Midelton, Locomotive Overseer, New South Wales Railways; Mr. F. M. Avern, M. Inst. C.E., and District Engineer, Western Railway, New South Wales.

The Board amongst other things stated that:—

"77. The Board had submitted to it a model, with description of a combined cattle-truck, sheep-van, and goods-truck, designed by Mr. Evans, the Goods Superintendent of the New South Wales Railways. In this truck the boxing-in of the sides is made as flaps hinged half-way up the sides, and capable of being raised into a horizontal position so as to form an upper deck for sheep. The flaps in this position are supported in the centre by a beam the length of the truck, which is lowered by means of a handle at the top of the truck, working a worm wheel and screw.

"78. The Board believes that the invention of a good and simple convertible sheep-van and cattle-truck is of the greatest importance and worthy of every encouragement by the Department, as being likely to materially economise the quantity of rolling stock, and as offering greater facilities for the conduct of the stock traffic.

"79. The Board considers Mr. Evans to be deserving of great credit for having gone far towards realizing the idea, and for the display of considerable ingenuity in his proposed truck.

"80. The Board recommends the construction by the Department of four (4) or five (5) of Mr. Evans' trucks."

The Commissioner for Railways in dealing with this report endorsed the recommendation, with the addition that a sufficient number of these trucks should be built to form a train load (say, fourteen trucks), as in this way a more effectual trial can be given to them; and he added—"It seldom happens that there is a large cattle and sheep traffic at the same time, and a suitable combination truck would therefore effect an immense saving to the Department; indeed, some years ago, so satisfied was I on this point that I obtained the Minister's approval for the construction of a combination car, designed by an officer of the Engineer for Existing Lines Branch; but it failed, owing to the imperfection of some of the working parts. Mr. Evans, in his design, seems to have overcome this difficulty."

The Minister approved of fourteen trucks of Mr. Evans' design being constructed, and they have been running on the Railways for a period of about two years. During that time several designs of combination trucks were brought under the attention of the Department, and the Secretary for Public Works, with a view of determining which of them was best entitled to be adopted, appointed a Board to inquire into the matter. The following minute was then written by the Commissioner for Railways on the subject:—

"The Minister is desirous of having an independent investigation into the merits of the various stock cars that have been submitted for adoption on our railways. They are:—

"1. The Evans car.

"2. The Wilkinson car.

"3. The Perry car.

"The Minister considers that if a good traffic man, an experienced waggon builder and designer, and a practical stock agent were appointed a Board to investigate the question and report upon the designs of car under offer, the real merits of the case would be ascertained.

"For this purpose, as regards two of the three members of the Board, he wishes telegrams sent to the Commissioner for Railways, Queensland, asking for the services of Mr. Thallon, Traffic Manager, and to the Board of Commissioners, Melbourne, for the services of their Chief Designer of Rolling Stock. Please send telegrams accordingly."

The services of these gentlemen having been secured, Mr. H. S. Badgery was added, as carrying out the condition that a practical stock agent should be included. The Board made their report on the 28th January last, and stated that "Mr. Evans' combination truck is, in the opinion of the Board, the most economical and suitable in every way for the conveyance of sheep, cattle, and merchandise, and we recommend accordingly."

As has already been stated, fourteen trucks on Mr. Evans' design had been in use on the railway lines, and a return was asked for in the Legislative Assembly, on the 24th August, 1886, to show the earnings and mileage of these trucks from the 1st January to 29th June, 1886, distinguishing goods from live stock freight, as compared with ordinary trucks. The return was laid upon the Table of the House on the 21st September last, and the Commissioner for Railways said, in his report thereon—"The document tells a significant story in favour of the combination trucks. For empty and full running mileage they have earned nearly 9d. a mile, while the cattle and sheep trucks have earned only something

Mr.
F. A. Wright.

Mr. W. J. Lyne.

Board appointed
by Mr. Secretary
Lyne, December,
1886.

something less than 3½d. per mile for six months' running. The empty running with the combination trucks was 19 per cent. of the full running, while the empty running was 44 per cent. in the case of the other live stock waggons. If the ordinary live stock waggons had earned as much as the combined waggons per mile travelled, the revenue would have been, instead of £79,027, no less than £224,116, or £145,082 more. It is not likely, of course, that the traffic would have been so adjusted as to admit of this large extra amount being earned, but I think 20 per cent. of it would have been; and that is a very low estimate. Even this would show a profit of £29,018 in six months."

When this matter came before the Minister, he had then under attention an offer from the proprietor of Evans' patent to convert our trucks into combination trucks at an average of £135 each—which would include the royalty—or to sell the patent to the Government for £17,000. As the contract would involve the expenditure of over £100,000, the Minister thought that a work of such magnitude should be open to public tender, and, therefore, his determination was necessarily confined to the proposal for purchasing the patent rights. He directed that inquiry should be made as to whether the patentees were willing to accept £15,000 for the patent. In reply, their agent pointed out the great superiority of the invention over any other of the kind, as unanimously reported by the Board appointed to investigate the question, who strongly recommended its adoption; and, secondly, the financial saving its adoption would secure. He further referred to the lapse of time since the patent was put in offer to the Government, and the loss thereby occasioned to the proprietors. He considered, under these circumstances, the offer of £15,000 was inadequate; but, as the Government had borne all the costs of the Board appointed to test its superiority, they were willing to split the difference, and to accept £16,000 if it were agreed to without further delay.

The Minister thought it desirable to at once close with the offer.

Combination Car Commission.—Report of Board, Friday, 28th January, 1887.

THE Board held nine meetings from the 19th to the 28th January inclusive. Fifteen witnesses were examined, comprising the inventors, men experienced in loading and unloading and travelling with stock, as well as officers of the Railway Department skilled in the construction of rolling-stock.

The Board visited the unloading station at the saleyards, Flemington, on the 19th instant, to witness unloading of stock and examination of Evans's truck, which is the only combination truck in use.

On the 22nd instant the Board visited the works of Messrs. Hudson Brothers, at Clyde, to inspect a truck in course of construction, the invention of Mr. W. B. Wilkinson, of Dubbo; and on 27th instant the same truck was again inspected at Flemington.

The instructions to the Board by the Commissioner for Railways were:—To inquire into the relative merits of three designs of combined stock and goods trucks for use on the Railways of this Colony, to take evidence thereon, and to make a report and a recommendation; but the Board, believing the great object in view was to recommend the truck most suitable for the conveyance of all classes of stock, as well as merchandise, permitted a number of persons who had models or plans of new inventions pertaining to combination trucks to exhibit them, and explain the mode of working and advantages they claim for their inventions. The great difficulty in providing a truck suitable for sheep and cattle lies in the fact that for sheep in upper and lower decks there must be abundant ventilation, and for cattle, as near as possible, a perfectly smooth surface inside to avoid injury, and to prevent cattle from seeing out.

The Board desires to express an opinion that it will not be possible to adopt a combined truck to thoroughly answer all the requirements of a stock truck, and at the same time possess the advantages of a merchandise waggon to such an extent as to supersede the present D trucks; but the models submitted prove that it is possible to construct a waggon suitable for both sheep and cattle, and, to some extent, for merchandise as well, thus enabling the Department to utilize it for up-country loading, instead of returning it empty, as has been the practice hitherto with the ordinary sheep-trucks.

The trucks and models submitted may be briefly described as follow:—

No. 1.—*Mr. George T. Evans* submitted two combination trucks, both of which he claimed were suitable for sheep, cattle, or merchandise. In one truck there is a division in the centre, thus forming four compartments for sheep, or two for cattle, and the other having no division; otherwise the chief features in these trucks are the same, viz.: that the top deck necessary for the sheep-van is formed of several parts, and supported by a beam lowered from the roof, and by hinges at the sides of the truck which admit of the top deck, when not required for sheep, being lowered so as to form the sides of a cattle or merchandise waggon.

The weights of the trucks are—with the division, 7 tons 7 cwt. 1 qr.; without the division, 6 tons 12 cwt. 3 qr.

No. 2.—*Mr. Thomas Perry* submitted a model of a combination truck, the principle of which was that the upper deck required for sheep was balanced by weights on the outside of each end, and lowered to the middle of the truck, or raised to the roof as required, for sheep or cattle; no alteration being made in the sides of the truck in either case. Mr. Perry claimed certain advantages in the under-frame of his truck which would reduce its weight, but it appeared this did not affect the combination principle, as the same, if considered an advantage by the Department, was equally applicable to all classes of waggons. It was impossible to arrive at the weight of the truck from the model submitted; but we are of opinion the movable floor and balance-weights could not be less than 16 cwt., which would have to be added to the weight of the cattle-truck. It appeared also that as the truck was necessarily close for cattle sufficient provision could not be made for ventilation in the case of sheep. A commendable feature in this truck is that provision is made for draining the top deck, and also the rapidity with which the top deck can be raised or lowered.

No. 3.—*Mr. W. B. Wilkinson* submitted a combination truck, the chief feature of which was its adaptability to the system of end as well as side loading. Although the bulk of the evidence taken goes to show that end-loading is not the great advantage its advocates claim for it, we desire to point out that the witnesses examined have had only a very limited experience, and even that has been confined to trucks of the present pattern with fixed floors. In Mr. Wilkinson's truck provision has been made for the loader to walk from end to end of the train in an upright position on both floors, thus giving him control of the sheep, and a better opportunity of regulating the number in each truck. On the other hand, he has not overcome the difficulty of providing ample ventilation for sheep, or a smooth surface for cattle, and we consider his invention defective in these respects. The

The weight of this truck is 7 tons 15 cwt. 2 qr.; the floor area is 270 feet, or 65 lb. per square foot for sheep, and 135 feet for cattle.

Mr. Wilkinson stated in his evidence that the weight could be greatly reduced, but making every allowance for the alterations he mentioned, the truck must still remain very considerably heavier than the present sheep-van. It is impossible to say what the expense of this truck, if adopted, would amount to; but the Board is of opinion, judging from the number of parts, that the cost must be excessive compared with the present design of sheep-van or cattle-truck, and considerably higher than either of the other two combination designs.

The Board was desirous of testing Mr. Wilkinson's truck as to end-loading, and arrangements were made with the Department, stockowners, and others to have the end-loading trucks now in use and a sufficient number of sheep at Homebush on Wednesday, 26th instant, but in consequence of Mr. Wilkinson's truck not being sufficiently advanced this had to be abandoned.

No. 4.—*Mr. Mulholland* submitted an imperfect model of a combination truck, available for sheep and cattle, embodying an ingenious system of end-loading, but inasmuch as he had made no provision for the smooth inside surface required for cattle, we considered his design defective.

A number of other models and plans were submitted, but none of them possessed such improvements as would warrant the Board in suggesting the adoption of their principles.

The Board intimated to the principal stock and station agents in the city the purpose for which it was sitting, and invited them to come forward with any suggestions they had to offer, but no one took advantage of the opportunity.

After inspecting the trucks, models, and plans submitted, and after carefully considering all the evidence, the Board is unanimously of opinion that the converted truck, without division, submitted by Mr. Evans, combines more advantages than any of the others. As a sheep-truck it gives more head room than the present pattern, while the ventilation at the sides and ends is all that could be desired. Compared with the sheep-trucks now in use, it gives a floor area of 280 feet for 6 tons 12½ cwt., or one square foot for every 53 lb.; whereas the sheep-truck has a floor area of 241 feet for 6 tons 17 cwt., or 1 square foot for every 63½ lb.

As a cattle-truck it gives considerably more head room, which is a decided advantage, as can be seen by the marks of the cattle's horns on the roof of the present trucks; on the other hand, it is 8½ cwt. heavier than the cattle-truck now in use.

As a merchandise truck it certainly is much heavier than the ordinary goods-waggon; but the evidence of the Department goes to prove that it has been largely used for the conveyance of all classes of goods to stations beyond Dubbo, and gives every satisfaction.

Another special advantage this truck possesses over other trucks is the fact that the floor of the upper deck, instead of being raised to the roof, thereby increasing oscillation, and straining the frame of the truck by unnecessarily adding to the top weight when the waggon is used for merchandise or cattle, is lowered, and forms a smooth side for cattle or merchandise. None of the parts, with the exception of the beam for supporting the top deck, are out of use at any time in the conveyance of sheep, cattle, or merchandise.

It is a question with the Board whether the flaps forming the top deck would be strong enough to withstand the tear and wear they would be subjected to if largely used for cattle; but in any case instructions should be given to all concerned, in the event of this truck being adopted, to lower them steadily, instead of allowing them to fall, when converting from a sheep to a cattle waggon.

The Board is also of opinion that the longitudinal beam should be supported by a prop fitted into a socket in the bottom floor when the truck is used for sheep, and which, when not required, could be carried up by the beam, to which it should be attached by hinge and loop.

A drawback to this design is the position of the doors for sheep, one being directly above the other, which necessitates the two decks being loaded or unloaded separately; but this would be overcome by inserting a door for sheep in the centre of the top deck.

Another disadvantage mentioned by several witnesses is that the floor of the top deck is higher than the present sheep-races, but this could easily be met by a movable board in the race.

To place the relative merits of the three best designs of combination cars more clearly before the Department the Board submits the following table:—

	Points considered separately.	Evans's Truck without division.	Perry.	Wilkinson.
Compared with the trucks now in use in the Department, and assuming their value at 10 points each.	Cattle-truck	9	7	5
	Sheep-van	12	4	8
	Goods-van	7	4	6
	Cost of combination parts	4	5	8
Considerations of secondary importance, assuming 5 points as the maximum.	Simplicity and strength of combination parts.	4	5	4
	Weight per foot of floor area.....	5	4	3
	Facility for converting.....	4	5	4
	For end-loading	5
		45	34	38

The Board desires to express its opinion that the division inserted in Evans's Combination Truck is a decided disadvantage in the case of cattle or merchandise; while in the case of sheep the advantage, if any, is very questionable, and causes great inconvenience and loss of time in loading and unloading. The workmanship upon the truck without division is certainly inferior in some respects, but that could be remedied without materially adding to the weight or cost, and in no way affects the design.

The question of cost of the different models could not be accurately ascertained; but Mr. Evans's Combination Truck without division is, in the opinion of the Board, the most economical and suitable in every way for the conveyance of sheep, cattle, and merchandise, and we recommend accordingly.

HENRY S. BADGERY.
J. F. THALLON.
J. GILL.

The Hon. John Sutherland,
Minister for Public Works, Sydney.

Minute by The Commissioner for Railways.

I SEE by the newspaper that representation is made, that in the *précis* drawn up no reference is offered to the adverse criticism of these trucks made by persons outside the Department. Such side issues it was not necessary to introduce into the *précis*. No letters commenting upon the value of the truck from outsiders were referred to either, but the correspondence laid upon the table should contain everything. If anything has been omitted it must be supplied to-day. Please see to this at once.

CH. A. G., 7/10/87.

Please see explanation herewith.—D. C. M'L., 8/10/87.

Minutes by The Chief Clerk.

Parliamentary Return respecting Evans' Combination Trucks.

BEFORE this Return was checked by me and submitted to the Commissioner I took the precaution to send the whole of the originals to the Record Branch to have them compared with the entries in the books, with a view to secure that the papers were complete. They were checked by Mr. Hayman, who reported that they were complete, with one exception, viz., the paper which is explained in a footnote on the Return, showing the earnings of these trucks, and upon receiving this assurance the papers were finally made up and submitted. Upon observing the paragraph in this morning's paper I caused the records to be again searched, when Mr. Hayman discovered (see his explanation herewith) that two papers had been separated from the file, and had consequently not been included in the return. I have made a most exhaustive search for the missing papers throughout all the offices, but I regret to say it has ended resultlessly.

D. C. M'LACHLAN, 7/10/87.

Evans' Combination Trucks.

I ASKED Mr. Hayman to check the papers with the Record Books before the Return was finally made up, and was assured by him that every paper on the subject had been included. It is stated in a paragraph in this day's *Sydney Morning Herald* that several letters sent to the Department objecting to the truck have been omitted. I wish Mr. Hayman to check the papers with the books again, and say whether the statement is correct as to any paper being missing from the return.

D. C. M'L., 7/10/87.

I very carefully checked the papers with the Record Book as desired by you, and found that the file of papers exactly agreed with the Register. On being again urged by you this morning, I made a further search, and discovered in another book two letters—protests from stock owners and stock agents against the adoption of this vehicle—which, by some inadvertence, were not connected in the books with the main and larger file of papers. They were not put with the papers proper referring to these combination trucks, and not being connected by numbers in the Record Book I did not observe they were missing when I first checked the papers. A most thorough search has been made for these protest papers but they cannot be traced. It was solely owing to the oversight referred to that the two letters in question were not produced with the rest of the correspondence which was submitted to Parliament the other evening.—W. HAYMAN, 7/10/87.

Minute by The Chief Clerk.

THE two missing papers are—

1st. Messrs. Coulson & Naylor, Orange, writing as agents for Messrs. Pitt, Son, & Badgery, Goldsborough & Co., P. Burke & Co., A. Jones (trucker), and H. Lawrence (dealer), protesting against the use of the Evans Truck; and

2nd. Stock, station, and trucking agents, Dubbo, also protesting against the use of the truck for the carriage of either cattle or sheep.

The Commissioner is under the impression that some of the persons whose names are attached to the first quoted document were affixed without their knowledge or consent; he feels confident that Mr. Badgery communicated with the department to this effect. If he did so the letter must be attached to the two missing papers. Some one should interview Mr. Badgery to see if it be a fact that he sent in such a communication. Mr. Husk, who acted as Secretary to the Board, should do so at once.

D. C. M'L., 11/10/87.

Minute by A. J. Husk to The Chief Clerk.

IN accordance with your directions I called upon Mr. Badgery with reference to the copy of the letter he sent to the Department, respecting his signature being attached to a protest against the use of the "Evans' Truck." He was good enough to hunt up the matter high and low, but could not find any copy. He believes no press copy was taken by his copying clerk at the time the original was sent. However, he assured me that he would look up his papers to-day if possible, to see if by any chance he may have an impression of the paper required.

A. J. HUSK, 11/10/87.

I again waited on Mr. Badgery this morning as directed, and after a deal of trouble on his part he found a rough draft which he wrote at the time, a copy of which I now attach.—A. J. H., 12/10/87.

[Copy.]

[Copy.]

I have the honor to make the following remarks regarding documents which have been forwarded to you protesting against Evans' Combination Truck.

It seems to me that some of those persons who are protesting have signed as agents for a number of stock firms, and as none of those have any permission so to use the name of Pitt, Son, and Badgery, it may be that they have taken a similar liberty with others. It appears to me also that the Petitioners are opposed to the Evans' Combination Truck of which there are some fourteen in use,* and as the Board did not recommend the adoption of that truck it would be advisable to publish the report furnished to you by the Board. No date given
to letter.

I wish also to add that as the petition presented to you and alluded to above has been written under a misapprehension, it is unnecessary for me to further refer to any remarks therein.

I have, &c.,

H. S. BADGERY.

The above is a rough copy that I have found, and may not be an exact one in accordance with the original letter.—H.S.B.

* NOTE.—The Board recommended the "improved" Evans' Truck, which is a design somewhat different to that to which the fourteen trucks were built.

Memo. by The Chief Clerk.

In the report of the proceedings in to-day's newspapers of the Parliamentary proceedings of last night, Mr. Lyne, in referring to the papers laid upon the Table on the subject of the Evans' combination truck, mentions that some reports made by you have been omitted from the Return.

We have searched the records, but no document or report written by you on the subject can be found. The Commissioner wishes you to examine the copies of the printed papers herewith, and say whether any document written by you has been omitted.

The Assistant Traffic-Manager.

D. C. M'L., 12/10/87.

I have looked carefully through the original as well as the printed papers, and can only conclude that the minutes to which Mr. Lyne referred in the Legislative Assembly are those in the printed papers which I wrote for the Traffic Manager, and to which his initials are affixed. I am not aware of the existence of any Minute of mine which is not with the printed papers.—DAVID KIRKCALDIE, 12/10/87.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(FURTHER CORRESPONDENCE RESPECTING WILKINSON'S AND THE EVANS' COMBINATION TRUCKS.)

Ordered by the Legislative Assembly to be printed, 28 February, 1888.

SCHEDULE.

NO.	PAGE.
1. Letter from Mr. Wilkinson to Commissioner for Railways, requesting that a trial be made of his truck, with Commissioner's minute. 30 November, 1887	1
2. Letter from Commissioner for Railways to Mr. Wilkinson in reply to above. 1 December, 1887.....	1
3. Letter from Mr. Wilkinson to Commissioner for Railways agreeing to conditions named by Commissioner for test of truck, with Commissioner's minute and letter to Mr. Wilkinson. 17 December, 1887	2
4. Trial reports (3) of Messrs. Wilkinson's and Evans' trucks, with Goods-Superintendent's minute thereon. 25 January, 1888	2

No. 1.

W. B. Wilkinson, Esq., to The Commissioner for Railways.

Sir,

"Adams' Exchange Hotel," 30 November, 1887.

I have the honor to apply to you for permission to run my truck to Dubbo next week and return with a consignment (say) of fifty sheep and four or five head of cattle to Homebush, in the one trip.

In order that I may prove what it is capable of doing I have arranged for the stock to meet me at the Dubbo trucking yard.

I may state that the Minister for Works, in a conversation with me, stated that he would be glad to give my truck an opportunity of running on the railway lines.

I would prefer loading the truck up with goods to Dubbo.

Awaiting your reply, .

I remain, &c.,

W. B. WILKINSON.

Inform Mr. Wilkinson that I am prepared at once to give his truck a trial in the way in which if it belonged to the Department it would be practically used; but I do not see the use of testing it with a few cattle and a few sheep, a mode of use which will not be a practicable one. If he will hand over his truck to the Department I will test it in the same train and with the same loading, or similar loading, conveyed over the same length, with the "Evans" truck.—CH. A. G., 1/12/87.

No. 2.

The Commissioner for Railways to W. B. Wilkinson, Esq.

Sir,

Department of Railways, 1 December, 1887.

In reply to your letter of the 30th ultimo, I have the honor to inform you that I am prepared at once to give your truck a trial in the way in which if it belonged to the Department it would be practically used; but I do not see the use of testing it with a few cattle and a few sheep—a mode of use which will not be a practicable one. If you will hand over your truck to the Department I will test it in the same train and with the same loading, or similar loading, conveyed over the same length, with Evans' truck.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

No. 3.

No. 3.

W. B. Wilkinson, Esq., to The Commissioner for Railways.

Sir,

Gresham-street, 17 December, 1887.

My patent combination truck is now at Homebush, having delivered its freight of fifty sheep and five head of cattle all sound. I am willing that the patent should have further trial. In a letter to me a short time since you proposed that it should be run beside Evans' with similar loads or under similar circumstances, in answer to which I may state that you are at liberty to give it any trial that you wish, and I am anxious that it should be thoroughly tested.

I will be glad if you can let me know on Monday if you will permit the above, and the truck for the time being can be under the sole control of the Department (say) for four trips.

Before its going out again I would like to alter my half doors into whole doors, as I find the whole door is a great advantage for trucking cattle.

Yours, &c.,

W. B. WILKINSON.

The truck could be at your disposal (say) next Friday.

I learn that the sheep sent were very small, recently shorn, and that the cattle were of the smallest and tamest. I do not consider such a trial is convincing proof of the efficiency of the truck, nor do I think even if the stability of the truck is established by further test that the conclusions arrived at by the Board will be invalidated. I have no objection to the truck being tested in the way I first suggested. Evans' new truck to be on the same train, both trucks to be weighed empty and loaded. I should like also recorded the number of operations each truck requires to fit it for use and to convert it again. I understand that numerous alterations have been made in the Wilkinson truck since it was reported upon by the Board; even after the trial which Mr. Wilkinson refers to in his present letter some further alterations are found to be necessary, and it seems the nearer it can be brought to Mr. Evans' design the greater are its perfections. The floor I understand has now been made similar to that adopted by Mr. Evans originally.—C.N.A.G., 20/12/87.

Mr. Wilkinson to be informed that if he will hand truck over to Traffic Branch it will be tested in accordance with conditions stated in our letter of 1/12/87.—D.C.M'L., 20/12/87.

Sir,

Department of Railways, 20 December, 1887.

In reply to the request contained in your letter of the 17th instant, I have the honor, by direction of the Commissioner for Railways, to inform you that if your truck be handed over to the Traffic Manager for the purpose of being tested this will be done in the manner described in my communication of the 1st instant.

I have, &c.,

A. RICHARDSON,

(For the Secretary of Railways.)

W. B. Wilkinson, Esq., "Aaron's Exchange Hotel," Sydney.

No. 4.

Trial reports of Messrs. Wilkinson's and Evans' Trucks.

I HAVE the honor to report, for your information, the results of the first trial of the Evans' and Wilkinson's combination trucks, carried out as directed by the Commissioner.

The trucks weighed empty, as follows:—

	Tons	cwt.	qrs.
Evans' truck... ..	6	13	1
Wilkinson's truck	7	18	0

They were loaded on 29th December with the following weight of goods for Bourke:—

	Tons	cwt.	qrs.
Evans'	5	0	1
Wilkinson's	4	17	2

They were unloaded on 2nd and reloaded at 6.30 a.m. on 3rd inst. with nine head, each of weighty but rather quiet cattle. They would have each held another bullock, but as the load limit had not been definitely settled I considered it unwise to exceed the nine head.

The loading in both trucks was accomplished with wonderful celerity, occupying 5 minutes only for the two trucks, and the result conclusively proves the advantage of the doors being placed in the ends of the sides instead of in the middle. The weather was remarkably cool during the whole of the time the trucks were in transit, ranging between 70° and 80°, and in that respect the test as to ventilation, &c., was of no particular value. One of the thermometers having been detached before reaching Nyngan, I was unable to thoroughly settle the question as to its range in each truck, but I have made provision to secure them from interference on the next trip.

The trucks left Bourke at 7.40 a.m., and with the exception that the axle of the Evans' truck ran hot through a defective lubricator, which was remedied at Byrock, nothing of any particular moment occurred until reaching Bathurst, when the trucks were weighed with the following result:—

	Tons	cwt.	qrs.	tons	cwt.	qrs.	tons	cwt.	qrs.
Evans' truck... ..	Gross, 12	6	2;	tare, 6	13	1;	net, 5	13	1
Wilkinson's truck	„ 13	8	2;	„ 7	18	0;	„ 5	10	2

After leaving Bathurst the cattle began to slip about considerably in the Wilkinson truck, and at Katoomba one bullock got down. At Lawson two were down but were able to get up again, as at Glenbrook they were all on their feet. On reaching Penrith three head were down. From Penrith to Homebush

Homebush the run was made in 1 hour and 27 minutes, and on reaching the cattle-yards two of the cattle had regained their feet, the remaining one being in a very exhausted condition. The whole of the cattle in the Evans' truck were on their feet throughout the journey and were unloaded in $2\frac{1}{2}$ minutes. Those in the Wilkinson truck, exclusive of the beast that was down, were $14\frac{1}{2}$ minutes unloading, a fact the unloaders attribute to the van being too close to enable them to work the cattle. The remaining bullock had to be assisted to his feet.

It is of course premature to express any opinion on the facts disclosed, and I trust that three features, which it was impossible this time to secure, viz., hot weather, wild cattle, and a registration of the temperature will be available in the next trial.

I propose, with your approval, to load cattle again at Bourke and then sheep at Hay.

Traffic Manager.

JNO. HARPER,
6/1/88.

COMBINATION TRUCK TRIALS.

No. 2.

Cattle.

On January 8th the two trucks were each loaded with 6 tons of goods for Bourke. A favourable opportunity occurring of obtaining heavy Queensland cattle at Byrock, I decided to load at that station. The cattle in question was a mixed lot, many being very large and weighty, while others were about medium size and quality.

They had been nine weeks travelling, and were hurried to Byrock in time for trucking. Nearly five hours were spent in yarding them, and the result was that with the thermometer at 101° in the shade they entered the trucks very much knocked about and footsore. At my request the trucking agent, Mr. Anderson, selected as many as he could of the largest bullocks for the two trucks.

In the Evans truck eight of the largest cattle were loaded, and completely filled it. No reservation was made as to the condition of the stock, those that entered the race being allowed to load in precisely the same manner as with an ordinary cattle-waggon.

Before loading the "Wilkinson" truck that gentleman objected to a large and rather wild and sulky bullock, which in the ordinary course would have been loaded in his waggon, and at his request the beast was returned to the main mob.

This caused the balance of the heavy cattle which had been drafted to become mixed, and as we were late, four heavy cattle and five medium ones were loaded.

On reaching Narramine it was observed that a very large and prime bullock had laid down in the Evans truck, and after attempting to get him up it became apparent that he was too footsore to stand and too sulky to get up. As his position did not endanger the other cattle he was left alone. During this part of the journey on several occasions the horns of the cattle in the Wilkinson truck became entangled amongst the bars and had to be released.

When Orange was reached, the bullock already referred to in the Evans truck was still down, and had got into such a bad position during the night that he would certainly have brought others down. We therefore unloaded the truck and got him on his feet, but he laid down again before we left the station.

It was observed at Orange that one of the pine louvres in the Wilkinson truck had been knocked out, and as it was probable that a bullock's horn might get into the space left and destroy the remainder, a batten was nailed over it.

At Bathurst the trucks were weighed with the following result:—

				Tons.	cwt.	qrs.
Evans truck, 8 cattle—Gross	12	17	0
Tare	6	13	1
Net	6	3	3
Wilkinson truck, 9 cattle—Gross	13	17	2
Tare	7	18	0
Net	5	19	2

As the same bullock was again down in a bad position in the Evans truck, and it was evident he would not stand up, and as in coming over the Mountains he would probably endanger the other cattle, I decided to take him out, which was done at Kelso, and he was subsequently sent on in another train. I may mention that owing to the condition of the cattle when trucked they were unable to stand, and that at Orange, Kelso, Wallerawang, and Mount Victoria we were compelled to unload the ordinary cattle-waggons to get cattle up, and the whole consignment of thirty-three trucks arrived at Homebush with about twenty-four head down.

At Wallerawang another bullock had laid down in the Evans truck, but on being disturbed resumed his feet and remained standing till the end of the journey.

At Flemington the cattle were all standing in the Evans; one had laid down in the Wilkinson.

The time occupied in unloading was—

The Evans truck	7 minutes.
The Wilkinson truck	5 minutes.

During the whole journey thermometers were in the two trucks, and I give the readings at different stations. It should, however, be stated that Mr. Wilkinson constantly adjusted his shutters, according to the direction of the sunlight. The Evans truck was in no way altered, but treated as I have already said as it would be in actual traffic, that is, as one of our cattle waggons.

Thermometer

Thermometer reading.

	Evans Truck.	Wilkinson Truck.
Byrock	101°	101°
Coolabah	102°	102°
Gerelambone	103°	101°
Nyngan	100°	99°
Nevertire... ..	96°	95°
Bathurst	84°	84°
Zigzag	88°	90°
Flemington	79°	82°

The Evans truck arrived intact, and was not touched. The Wilkinson truck had a new louvre placed in it, the working parts oiled, decks raised and adjusted, and sundry alterations to the shutter fastenings.

JNO. HARPER, 17/1/88.

Traffic Manager.

COMBINATION TRUCK TRIAL.

No. 3.

Sheep.

THE two trucks were loaded each with 6 tons of goods for Hay and Carrathool, being the only stations for which vans were ordered, the trucks were reloaded with sheep at that station. I have previously stated that the working parts of the Evans truck were in no way tried or oiled from the commencement of the first trial; those of the "Wilkinson" were attended to by a fitter from Hudson Brothers. The sheep provided were of medium quality, with about three months wool.

The Wilkinson truck was altered from a merchandize to a sheep waggon by Mr. Wilkinson, and 112 sheep having been drafted 23 minutes were occupied in the whole process of altering and loading it.

The Evans truck was altered by myself and 112 sheep loaded, the time occupied being 27 minutes. The doors of each truck did not fit the race, and hence it was necessary to move them. Of the two less difficulty was experienced with the Evans truck than with the "Wilkinson," but the substitution of a different flap at the races would enable each to be worked with far less difficulty. The sheep were divided into four lots in either truck by means of the rails in the Evans truck and the doors in the Wilkinson.

The trucks left some two hours after being loaded and attached to the same train as sheep-van 116, carrying 104 of the same class of sheep.

On reaching Darlington (34 miles from Carrathool) it was found that both of the upper decks in the Wilkinson truck had given way some 5 or 6 inches, being completely twisted and strained, and threatening at any moment to fall altogether. At Mr. Wilkinson's request, and in the interests of humanity, a wire was sent to Narrandera to provide screw-jacks and timber to support the decks.

At Narrandera the jacks were used to lift and straighten the decks, and two timber shores were placed underneath, taking the weight of the sheep.

At Junee Junction two additional shores were placed underneath, as the decks gave evidence of collapsing in the middle.

At Junee the three trucks were weighed, coupled on the engine, with the following result:—

				Tons	cwt.	qrs.
Evans, 112 sheep,	gross	11	2	1
	Tare	6	13	1
	Net	4	9	0
Wilkinson, 112 sheep,	gross	12	9	2
	Tare	7	8	0
	Net	4	11	2
Sheep-van 116, 104 sheep,	gross	10	13	3
	Tare	6	9	1
	Net	4	4	2

I did not regard this weighing as a satisfactory one, owing to the trucks being coupled, and as I was anxious to ascertain what weight the sheep would lose in transit, I subsequently reweighed the trucks standing uncoupled, on the bridge at Granville, with the following result:—

Weight at Granville.

				Tons.	cwt.	qrs.
Evans truck, 112 sheep,	gross	11	0	0
	Tare	6	13	1
	Net	4	6	3
Wilkinson truck, 112 sheep,	gross	12	5	2
	Tare	7	18	0
	Net	4	7	2
Sheep-van 116, 104 sheep,	gross	10	10	3
	Tare	6	9	1
	Net	4	1	2

The

The sheep were unloaded from each truck at Flemington, in good order, the time occupied in doing so being—

Evans truck, 10 minutes.
Wilkinson truck, 11 minutes.
Sheep van truck, 13 minutes.

Thermometers placed in the two trucks registered alike throughout the journey, ranging from 86° to 58°. Mr. Wilkinson, as in previous trials, adjusted the shutters of his truck as he chose. The Evans truck was left untouched.

The trucks were brought to Sydney, and, on Monday morning, Messrs. Scott, Downe, and Kirkcaldie saw and examined them.

The upper decks of the Wilkinson truck, after all the gear had been adjusted, took $7\frac{1}{4}$ minutes to raise. The Evans truck was converted in $4\frac{1}{2}$ minutes. The former was subsequently placed in the hands of mechanics to patch up the damaged decks, preparatory to being sent to the Centennial Show. The Evans truck was in as good condition as when it started, and was available for any class of traffic without a tool being used on it, or a drop of oil being applied to any of its working parts.

The empty trucks were reweighed on the Sydney bridge, with the following result :—

						Tons	cwt.	qrs.
Evans truck...	6	12	2
Wilkinson truck	7	15	2

Traffic Manager.

JNO. HARPER, 25/1/88.

As directed by the Commissioner three trials have been made with the Evans' converted cattle-waggon and the Wilkinson combination truck, and I attach reports of the results of each of them. Mr. Rhodes, representing the Evans truck, and Mr. Wilkinson his own, accompanied the waggons in their three trips; on the first one the latter gentleman left the train at Belaringah.

I have in reporting confined myself to stating the facts as observed without instituting any comparison as to the relative merits of the trucks upon which subject any impressions I had, may after seeing them running together nearly 3,000 miles, place me in a position to speak with conviction.

Briefly summarized the results are :—

The Evans truck is 6 tons 12 cwt. 2 qrs. in weight; will carry as many if not more stock than the other. It requires no particular attention, as is shown by the fact that it was not in any way nursed or attended to during the trials, and it is to-day as fit to run as when it started.

The Wilkinson truck is 7 tons 15 cwt. 2 qrs. in weight; has had most unremitting attention, such as could never be paid to ordinary stock vehicles; has been repaired, and is to-day unfit to carry sheep. My observations respecting it have of course extended beyond the range of my reports, but with your permission I will at present refrain from giving them in detail.

With reference to the number of operations necessary to alter the waggons I may state that they have no value in relation to the practical working of them. The Evans truck has seventeen to convert it to a sheep-van, the Wilkinson eight, but in each case they are principally of a minor character. At the conclusion of the trials the Evans truck was altered in $4\frac{1}{2}$ minutes, the Wilkinson truck in $7\frac{1}{4}$ minutes.

JNO. HARPER, 25/1/88.

Traffic Manager.

(CORRESPONDENCE, &c., IN REFERENCE TO CONTINUOUS BRAKE FOR GOODS TRAINS.)

*Ordered by the Legislative Assembly to be printed, 23 July, 1888.**[Laid upon the Table of the House in accordance with promise made by the Honorable the Secretary for Public Works in answer to Question No. 4 on Votes and Proceedings No. 120 of the 23rd July, 1888.]*

The Commissioner for Railways to The Secretary for Public Works.

Continuous Brake for Goods Trains.

BEFORE determining finally the question of referring to a Board of two engineers outside the Department the matter of the best brake for goods trains, I think it would be desirable to consider whether the subject could not be satisfactorily dealt with by Officers *within* the Department.

It is partly an engineering question and partly—and perhaps the greater part—a question for practical railway men (not necessarily engineers), possessing sound knowledge of traffic requirements, and the peculiarity of our roads.

I think a Board of Officers, consisting of Mr. Vernon, the Secretary, who was for many years Traffic Manager of the South and West Lines, and during that time went fully into and discussed the brake question, Mr. Scott, the Locomotive Engineer, and Mr. Read, the Traffic Manager, would be able to deal with the question in all its aspects.

CH.A.G., 31/12/86.

Re brake trials it seems to me that two—Mr. Thallon and Mr. Gill—of the three gentlemen who have been appointed a Commission to inquire into the best design of combination truck, might at the same time extend their inquiries and report as to the relative merits of the brakes submitted for goods-trucks, Mr. Pritchard assisting them in the latter matter.—W.J.L., 13/1/87.

If the Commissioner finds Mr. Pritchard a suitable person for the purpose of the above Commission, let him be appointed with the other two gentlemen named.—W.J.L., 14/1/87.

I HAVE seen Mr. Pritchard; he is not an engineer, but has had considerable practical experience as a Contractor for railways and other public works; is a carriage builder by trade, and has a good knowledge of the purposes and advantages of continuous brakes.

If Mr. Secretary Sutherland endorses Mr. Secretary Lyne's decision, that Mr. Pritchard and Mr. Thallon, Traffic Manager of Queensland, and Mr. Gill, of the Victoria Railway Department (Rolling Stock Department), are to form the Board, telegrams should be sent to Queensland and Victoria, asking that the services of Mr. Thallon and Mr. Gill should be allowed to extend to the investigation of the relative merits of the brakes submitted to test.

I am of opinion that the officers of the Department are as well qualified as those named to make the test and recommendation. (See my minute of 31/12/86.)

CH.A.G., 24/1/87.

Mr. Thallon returns to-day to Queensland, and Mr. Gill to Victoria on Monday. I still think the inquiry should be conducted by the officers of the Department, as proposed in my Minute of 31/12/86 herewith.—CH. A.G., 28/1/87.

I concur with the Commissioner, and wish the Board to deal with the matter as early as possible, reporting fully as to the relative merits of the brakes, their relative cost and efficiency, and the saving in wear and tear and safety that would be effected over our present practice.—J.S., 18/2/87.

Report of the Board appointed to inquire into the question of Continuous Brakes for Goods Trains.

IN accordance with instructions conveyed by Commissioner's M.P. 87/3,386, the subject of continuous brake-power for our goods trains has received the fullest and most careful consideration at our hands, and we have now the honor to submit the result.

In dealing with this very important question it may be as well, in the first place, to offer some remarks upon the advantages to be gained by the introduction and use of a continuous brake in connection with our goods rolling stock.

The special conditions under which our lines of railway have to be worked, particularly in regard to the frequency and steepness of the inclines, render the question of brake-power a peculiarly important one. The amount of loading, or the number of trucks a driver can take, depends in many instances entirely upon the extent of the brake-power he has at his disposal. With an efficient continuous brake he would have the maximum supply of this power, and could consequently take a much heavier load than it would be possible for him under other circumstances to control on descending inclines. The advantage to be gained in this respect would be particularly felt for instance between Penrith and Katoomba on the Western line, upon which section with a continuous brake no greater number of engines would be required to bring the traffic down to Penrith than would be necessary to work the same traffic up to Katoomba. It is otherwise at present.

A second advantage to be gained by the provision of an effective continuous brake would be the saving of many a collision between goods' trains or engines.

Another advantage would be a considerable saving in wear and tear; at present the brake power on our goods trains cannot, as a whole, be put on or released at the will of the driver, or to the exact extent it may be required. Pinned-down brakes oftentimes unnecessarily, although unavoidably, retard a train, and cause extra work for the engine, as well as injury to tires and rails. A continuous brake is, however, immediately and at every moment under the control of the driver, who can consequently apply it when, and just to the extent, it is actually required. Again, the engine and tender brakes have at present to bear the constant and principal strain in working down our gradients, whereas with a continuous brake the power would be evenly distributed throughout the train, and the engine would be, as a rule, entirely relieved of this undue strain. This brake-power being evenly and equally distributed throughout the train, its application does not result in that knocking together of the trucks which arises from the application of brake-power when it exists only on the engine and tender, or at one end only of a train. This would save not only the damage which must be caused to the rolling stock by such a process, but that which must also be more or less sustained by the contents of the waggons. In the case of live stock, for example, the gain would be very great.

Another advantage to be derived from the use of this large and distributed brake-power would be a saving in time. We could considerably increase the speed of our goods trains, and this means not only the promotion of public convenience but a saving to the department of fuel and wages. It is generally admitted that it costs less proportionately to travel at the rate of 20 miles an hour than at 12 or 14. And besides this the perfect control over a train which a large brake-power gives to a driver would enable him to utilise the momentum acquired by the train to an extent which in many instances would be impossible under other circumstances, all of which means saving of fuel.

And further, it must not be overlooked that the quicker the speed at which trains can be run the greater the number that can be put on the road, and this means an increase of the capacity of a line of railway.

As previously observed, the possession of a maximum amount of brake-power, providing it be always available and is to be relied upon, will furnish the means of preventing many a collision or other accident, but on the other hand it will also be perceived that if either the load or the speed of a train be increased on the strength of such a provision, and the brake appliances should fail when most required, then the consequences might be all the more disastrous; and this brings us to a question which is perhaps the first which calls for determination in attempting the work of selecting the most suitable continuous brake.

Continuous brakes may be divided into two classes—non-automatic and automatic. All the advantages in the way of economical working which we have previously enumerated may be reaped from the use of a reliable *non-automatic* brake, but there are emergencies which such a brake does not provide for. Should the means, whether in the shape of an air-pump or an ejector, &c., provided for creating the motive power, fail, or should the pipe connections provided for the conveyance of this power throughout the train fail in any one place, then a *non-automatic* brake becomes useless, and those in charge of a train may suddenly discover that it has got beyond their control. The accidental severance of a train through the failure from any cause of the couplings is a contingency that must not be overlooked. Should such a thing occur to a train with a non-automatic brake when ascending one of our continuous and steep inclines the result might be very disastrous, and a following passenger train might be involved in it. Several instances have occurred within our recollection in which a train has thus parted, with more or less serious results; and it may occur again, in which case a *non-automatic* brake would be found useless. Under the circumstances, and in view of the special conditions under which our lines have to be worked, and which place them on a different footing to that of the more easily graded English lines, we are unanimously of opinion that a brake which makes no provision against such emergencies cannot be considered safe. In fact safety might rather be imperilled than subserved by its introduction; and we cannot therefore recommend the adoption of any continuous brake which is *non-automatic*.

We turn, therefore, at once to the *automatic* class of brakes, and may remark in the first place that the special object of the introduction of the automatic principle was to provide against these very emergencies, and if this has been successfully accomplished by the automatic principle, then to the other advantages already enumerated as derivable from the use of a continuous brake we may add with confidence that *greater safety is secured*.

The difference in principle between the non-automatic and the automatic brakes may be said to be this: In the case of the former the normal position of the brake-blocks is off and clear of the wheels, and the driver has the means of putting them on when he requires to do so; but should these means fail the brake-blocks are still of course off and remain so. In the case of the automatic brake it is the reverse of this; the driver may be said to have the means of taking and keeping the brake-blocks off the

the wheels when and for as long as he requires, but if these means fail the blocks will fly on and remain on till otherwise released. So that the failure of the means in one case involves danger, and may mean disaster, while in the other case it need only mean inconvenience, and may mean positive immunity from accident. For example: In each of the several instances before alluded to as within our own experience of trains parting with more or less serious results, these consequences would have been avoided had an automatic brake been in use. It must also be stated that an additional and, at times, a very great advantage in respect both of public convenience and safety, is presented by the automatic principle in the fact that the guard as well as the driver has it in his power to apply the brakes and bring the train to a stand. If, then, we are to reap fully the advantages to be gained from the use of a continuous brake, it is essential, *we consider, that it should be automatic.*

We consider that we have the following five continuous brakes properly under our notice at the present time:—The Westinghouse Non-Automatic, the Vacuum Co.'s Non-Automatic, the Laurence Vacuum Non-Automatic, the Westinghouse Automatic, and the Vacuum Co.'s Automatic.

We have already fully stated the grounds upon which we reject the first three (non-automatic), and will now deal as briefly as possible with the individual merits of the two automatic brakes.

THE WESTINGHOUSE BRAKE.

Our own Department has had several years' experience in the case of the "Westinghouse," with which the greater portion of our passenger stock is now fitted. On a too hasty consideration this fact might be deemed sufficient to settle the question of which brake ought to be chosen, but the matter is one of great and far reaching importance, and should not be decided on such grounds only. Before dealing further with the individual merits of these brakes it may be as well to give a brief description of the principal features of each of them.

The "Westinghouse" is worked by compressed air. An air-pumping machine, consisting of a small engine and pump, is attached to each engine by means of which air is pumped into a main cylinder or reservoir, also attached to the engine, and thence into auxiliary cylinders or reservoirs, one of which is fixed underneath each vehicle. Each vehicle is also provided with a second cylinder in which a piston works. This piston, by means of a strong spiral spring which surrounds the piston-rod, is kept at one end of its cylinder. The end of the piston-rod is attached to the gear working the brake-blocks, which are off or on as the piston is forced and kept to one end of its cylinder by the spring or driven back to the other end by the introduction of compressed air from the auxiliary air reservoir. The following rough sketch will serve to illustrate the principle of the thing:

Diagram No. 1.

When the brakes are off air is pumped or finds its way, it will be seen, to the auxiliary reservoir; but the communication between this reservoir and the brake cylinder is closed. At the same time, the air being free to escape from the latter, the spring operates and the brakes are kept off. With brakes on, on the contrary, it will be represented thus—

Diagram No. 2.

The communication between the brake cylinder and the open air is closed, as also is that between the service-pipe and auxiliary air reservoir, the only open communication being now between the two cylinders. The compressed air, therefore, drives the piston towards the other end of its cylinder, and the brakes are put on.

To provide for these communications, viz., between the two cylinders; between the auxiliary cylinder and the service-pipe; and between the brake cylinder and the open air; and their opening and closing, as the case may require, we have what is called the "triple-valve," the working of which will be understood from the following rough sketch. [See diagrams 3 and 4. See Appendix A.]

It consists, in fact, of a miniature cylinder in which a piston works with a slide-valve attached to its rod. When air is being forced from the engine through the service-pipe the small piston is pushed up and a communication between it and the auxiliary reservoir established. By means of the slide-valve which the piston-rod carries with it the communication between the two cylinders is at the same time closed, and an escape provided or opened from the brake cylinder to the open air, and the brakes are off. The effect is illustrated in diagram No. 3.

On the contrary, when the driver, or an accidental fracture of the pipe, releases air from the service-pipe, the compressed air in the reservoir immediately forces the small piston downwards, closing the communication with the service-pipe, opening that between the reservoir and the brake cylinder, and at the same time, by means of the slide valve, closing the escape from the latter to the open air, and the brakes are on. [See diagram No. 4.] There is another part of this ingenious piece of mechanism, viz.,

a smaller valve introduced into the slide-valve already mentioned, but to which we need refer no further than to say that it is for the purpose of graduating the application of the air pressure and consequently of the brake blocks.

In passing, however, it may be observed that, as will be seen, the driver does not operate through the service-pipe positively and directly upon the piston of the brake cylinder, but *via* the triple-valve and auxiliary reservoir. The important part which the triple-valve plays in this system will therefore be easily understood.

THE VACUUM BRAKE.

The Vacuum Company's Automatic Brake is worked by external atmospheric pressure only, brought into play by the creation and preservation of a vacuum. Underneath each vehicle a cylinder and vacuum chamber (in one) is fixed, the former being open at the top into the latter. In the cylinder a piston works, the rod of which, by means of gearing connected to it, works the brake shoes. Upon the engine an air-ejector is placed, connected with and running from which throughout the train is a continuous piping, with which again each combined cylinder and vacuum chamber is connected. The principle of the system will be understood from the following rough diagram, No. 5:

When the ejector is working the air is drawn out by means of the service-pipe and through openings 1 and 2 both from the vacuum chamber and from below the piston, and the brakes are off. When the ejector is shut off the air rushes in, closing immediately, by means of a valve, No. 1 entrance, and entering through No. 2 (which is always open) destroys the vacuum below the piston which is at once drawn as well as driven upwards, and the brakes are on. The same effect would of course follow the accidental fracture of the service-pipe. To release the brake blocks the air, by means of the ejector, has again to be drawn out when the piston falls from gravitation. The vacuum in the chamber above and around the cylinder in which the piston works is, it will be observed, *always preserved*. The means by which the opening No. 1 is worked will be understood by figures I and II, diagram 6 [*Appendix B*], and will be seen to

consist simply of a small rolling ball which is drawn off or pressed against the opening as the air is drawn off from or passes into the service-pipe. It will also be perceived that the driver operates, comparatively speaking, directly upon the piston of the brake-cylinder, and without the intervention of such elaborate mechanism as the triple-valve of the Westinghouse system.

GENERAL.

In deciding which of these brakes is the more suitable there are three principal questions to be considered: general efficiency, cost of maintenance, and first cost.

Under the head of general efficiency we may remark that both of these brakes are powerful and effective, and we consider, practically, equally prompt in action.

Under the Vacuum Co.'s system the action upon the brake is more positive and direct, *any number of rapid applications may be made without loss of power*; its action can be regulated with the greatest nicety, and its working parts are much simpler as well as fewer in number. In all these respects, and as bearing upon the question of general efficiency and reliability, it may be said that the Vacuum Co.'s brake has the advantage.

The next consideration is the cost of maintenance. This phase of the question turns principally upon which of the two systems, by its greater simplicity and by fewness of its working parts, involves the least examination and care, and is most easily maintained and kept in order. And here it may be pointed out that the goods stock, from the circumstances of the case, cannot be so closely and frequently examined as passenger stock. Without going further into detail than necessary, we may refer to the pumping-engine and the air-ejector required by the Westinghouse and the Vacuum Companies, respectively, to create the motive power. The former has a large number of working parts, requires continuous attention from the driver, as well as careful lubrication, while the latter may be said to have hardly any working parts, requires, after being once turned on, little or no attention from the driver, and wants no lubrication. Seeing that the success of the whole thing depends upon the proper working of these parts, this difference in favour of the Vacuum Co.'s brake is a very important consideration. With the Vacuum Co.'s brake, again, we have no such elaborate mechanism as the Westinghouse triple-valve intervening between the service-pipe and the brake cylinder. The effective application, or release of the Westinghouse brake, is dependent upon the proper working of this intermediate and somewhat complicated contrivance, and to this fact may be traced, we think, the cause of the difference in the respective systems, as regards the power of graduating their action. As bearing upon the question of cost of maintenance in an important degree we must also observe that with the Westinghouse *everything is under high pressure, which has a tendency to create leaks, and especially fractures in the pipe connections*, whereas in the case of the vacuum everything is under compression, from external atmospheric pressure only however, and hence the tendency is in an opposite direction. We may also remark that in our opinion the liability to the introduction of gritty particles into the apparatus is greater, as the consequences are more serious with the Westinghouse than with the vacuum brake. We need say no more perhaps under this heading in support of the opinion we have arrived at, viz., that as regards fewness and simplicity of working parts and the necessity for examination and repair, the Vacuum Co.'s brake has a very decided advantage over the Westinghouse.

We come now to the question of first cost, and this we may deal with briefly. The following statement of figures will sufficiently explain itself:—

STATEMENT of cost of fitting Engine and Train of fourteen trucks (Goods Stock) with the undermentioned Brakes.

Description of Brake.	Fittings for fourteen trucks supplied by Brake Co.	Fittings for engine as supplied by Brake Co.	Departmental estimate of fixing fittings supplied by contractors to engine.	Brake Co.'s offer to fix fittings supplied by them to fourteen trucks.	Departmental estimate of manufacture and fixing standard undergear, levers, shoes, rods, &c.	Total.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
Vacuum Automatic	155 16 0	22 0 0	6 0 0	28 0 0	140 0 0	351 16 0
Westinghouse do	182 0 0	35 4 0	8 0 0	10 10 0	140 0 0	375 14 0

We must remark, however, that we consider the Westinghouse Co.'s offer to fix the fittings for £10 10s. under the mark. We are satisfied that the work could not be done for the amount, but as the agent has tendered this figure we have allowed it to stand. Under any circumstances the advantage is still on the side of the Vacuum Co.'s brake.

We are, therefore, unanimously of opinion that the Vacuum Co.'s automatic brake is the best that can be selected for application to our goods rolling stock.

There still remains a question of vital importance to the Department to be considered: Can we afford to incur the expense of introducing this brake, or, in other words, will it pay?

Our goods rolling stock consisted, at the end of last year, of 8,371 vehicles, and the number of our goods engines amounted to 198. According to the estimate previously quoted the cost of fitting each vehicle with the automatic brake and necessary gearing would amount to at least £23, and the cost per engine would be £28. Multiplying these figures by the number of waggons and engines respectively we have:—

For fitting waggons	192,533	0	0
Do engines	9,194	0	0
Total ...							£201,727	0	0
Less value of old material at price of old iron...							4,185	0	0
Being a total of ...							£197,542	0	0

as the first cost for equipping our present goods stock.

In estimating the worth of the advantages previously enumerated to be gained it is very difficult to translate it into pounds, shillings, and pence, but after a very careful consideration we think the following figures may be relied upon as under rather than over the mark:—

Train-running saved	5,350	0	0	
Fuel saved through increased speed and shortening of time of journey	3,200	0	0	
Wages, through saving in time	1,800	0	0	
Engines, repairs by minimised braking	1,300	0	0	
Expenditure saved through avoidance of annually recurring mishaps...	500	0	0	
							£12,150	0	0

This amount would give a small return on the outlay after making allowance for the cost of maintenance, and it must not be overlooked that greater safety in regard to passenger trains would result from the safer working of our goods trains, to say nothing of the convenience to the public which would be effected by expediting the speed of the latter. No difficulty of any moment will be caused by the necessity of running a few mixed trains. It will merely be necessary to fit up the carriages used either with the brake itself, or simply to provide them with pipe connections.

We may draw attention to the fact that about three-fourths of the estimated saving of £12,150 would be effected on the Western Line, to work which we should require about 65 engines and 4,000 waggons. The cost of fitting these with the brake would be as follows:—

4,000 waggons, at £23 per waggon	92,000
65 engines, at £28 per engine	1,820
Total ...						93,820
Less value of discarded material at price of old iron						2,050
Making a total of ...						£91,770

We should save about £9,000 per annum, which would leave us an excellent return on the outlay, after making a liberal allowance for cost of maintenance, which may be estimated (say) at $2\frac{1}{2}\%$.

There have been three other descriptions of automatic brakes under our notice, and they have received, so far as the degree to which they were placed before us permitted, the most careful consideration. They are Woods' hydraulic brake, Barker's hydraulic brake, and Hanscom's straight-line air-brake. We do not consider it necessary to enter into a description of the relative merits of each of these brakes, as we are satisfied that they cannot compare advantageously as regards simplicity, reliability, general effectiveness, and economy in working with the Vacuum Company's automatic brake, which, on the grounds just named, we have no hesitation in recommending as the best that can be chosen.

D. VERNON, Chairman.
W. SCOTT, Loco. Engineer.
W. V. READ, Traffic Manager.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(RETURN SHOWING VARIOUS SCHEMES FOR PROPOSED CITY EXTENSION.)

Ordered by the Legislative Assembly to be printed, 13 June, 1888.

[Laid upon the Table of the House, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 10 in Votes and Proceedings No. 101, of the 13th June, 1888.]

RETURN showing Routes suggested for City Railway,—

1. Have any fresh routes for a railway from Redfern into the city been submitted to the Government?
 2. If so, what are those routes?
 3. What were the routes previously under consideration?
-

[842 copies—Approximate cost of printing (labour and material), £7 4s. 3d.]

VARIOUS SCHEMES proposed for bringing the Railway into the City of Sydney.

By whom suggested.	Description of route.	Suggested advantages of route.	Remarks.
The Department	<p style="text-align: center;">A.</p> <p>From Redfern Terminus over Devonshire-street, through Carter's Barracks, over Old Burial-ground Road, over Belmore Park, over Elizabeth-street at junction of Hay and John Streets, over Campbell-street, Exeter-place, and Market-lane, crossing Goulburn-street, entering tunnel on the south side of Liverpool-street and emerging about 130 yards south of William-street, crossing the last-named street, and having a passenger station at King-street (running from Liverpool-street to King-street parallel with Elizabeth-street, and distant from it about 45 yards), thence to Circular Quay, on the west side of Phillip-street, by tunnel emerging at Bridge-street, for goods or passengers, if required.</p>	<p>The advantages of this line are,—It would be central for all the business places in the city and Woolloomooloo, and easy of access from any part. Would give the most direct access to the harbour for goods or passengers, as a station could be formed at Bridge-street, which would be central for all the public offices and other most important places of business, as well as being close to the North Shore Ferry. It could be constructed and the property obtained at a less cost than under any other scheme, and would have no underground stations.</p>	<p>This line, as far as St. James' Road, where it stopped, and took up some portion of Hyde Park as a Railway terminus, was proposed to Parliament in 1876. No division was taken, but the sense of Parliament appeared to be against the line on account of the resumption of the Park. The appropriation of any portion of Hyde Park for the station is not involved, as the station would be on site of present Land Titles Office and Supreme Court. A strip of the Park, 100 feet wide from William-street to St. James' Road, would be required.</p>
The Department	<p style="text-align: center;">B.</p> <p>Same as A to Elizabeth-street, where it diverges, crossing all the streets named in A between Elizabeth and Liverpool Streets; thence by tunnel through Hyde Park, east of Immigration Dépôt, under Outer Domain, east of Bourke's Statue, mid-distant between the Government Stables and Macquarie-street; thence direct on the west of Government House to the terminus for goods at Fort Macquarie. A branch from the above joins at Liverpool-street by tunnel to William-street; thence to the proposed passenger station at King-street (see A).</p>	<p>This scheme possesses the same advantages as A as far as the passenger station at King-street is concerned, but the branch for goods to Fort Macquarie would not be so advantageous, as the terminus would be too far away from all the existing stores and places of business; and there would be nothing gained in the cost to compensate for this.</p>	

By whom suggested.	Description of route.	Suggested advantages of route.	Remarks.
The Department	<p style="text-align: center;">C.</p> <p>From Redfern Terminus over Devonshire-street, through Carter's Barracks (over Old Burial-ground Road), crossing Hay, Campbell, and Goulburn Streets, entering tunnel south of Liverpool-street, thence direct to the terminus at Hunter-street, between Pitt and Castlereagh Streets, about 40 yards from the latter, having a passenger station on the surface between King and Hunter Streets.</p>	Would give direct communication to a central part of the city, but at much greater cost than the line A.	
The Department	<p style="text-align: center;">D.</p> <p>Same as A and B to Old Burial-ground Road, thence crossing Hay-street, through St. Francis' R. C. Church, and running about mid-distant between Elizabeth and Castlereagh Streets to a passenger terminus extending from King-street to Hunter-street. A branch from the above commences between Market and King Streets, running thence through the centre of Elizabeth-street, across Hunter and Bligh Streets, between the Colonial Secretary's Office and Lands Department, crossing the public Reserve at Macquarie-place, crossing Reiby-lane, through property known as Rolph's timber-yard, crossing Pitt-street, through the centre of the block of buildings known as the Government Commissariat Stores, crossing Argyle-street between, and equidistant from, George-street and the Circular Wharf, through the Sailors' Home, and terminating at the Mariners' Church.</p>	Would give direct communication with city and Circular Quay, at very great cost, a portion of which, however, would be recouped by resale of frontages.	
Mr. Sutherland	<p style="text-align: center;">E.</p> <p>This line will follow the one marked A as far as the House of the Good Shepherd, then diverge in a curved line over Belmore Markets and block of buildings between Castlereagh and Pitt Streets, and thence by a curved line to Castlereagh-street. The line will run under Castlereagh-street to Hunter-street, and curving in and out of Bligh-street to Elizabeth-street, will follow that street to the Circular Quay in a line with the Custom House. It will then diverge in two directions east and west, the first by the line of Quay, to Fort Macquarie, and the second by the line of Quay also as far as the A.S.N. Co.'s property, then through that property by New George-street at the rear of the Company's stores to and round Dawes' Battery. From this line there is ultimately to be a branch line under George-street to near the intersection of Cunningham's property with Dawes' Point Reserve, and thence by the water frontage to Darling Harbour. Platforms and Stations are to be erected at the following places <i>en route</i>—Platform at Bathurst-street, School-house in Castlereagh-street near King-street, Hunter-street, Dawes' Point, and Fort Macquarie. Passenger station at Custom House, Circular Quay, and goods and passenger station at the Commissariat Stores, Circular Quay.</p>	The suburban line, instead of forming its junction with the main line near William-street and having its terminus at the Circular Quay, would be continued under the Park, and join the main line at the proposed station near the School-house in Castlereagh-street.	

By whom suggested.	Description of route.	Suggested advantages of route.	Remarks.
<p>Mr. Wakely.....</p>	<p style="text-align: center;">F.</p> <p>From Redfern Station on to the Pymont line, then curving north on to the east end of the iron wharf at the head of Darling Harbour, then traversing a proposed line to the front of Russell's Wharf, thence curving to the Baltic Wharf on to the Corporation's block of ground at Market and Sussex Streets, which position would be well available for goods and passengers. Thence, commencing a tunnel at the north-east corner of said block, under Sussex, Kent, King, and York Streets, to south-west corner of Wynyard-square, here a city passenger station, with two spiral staircases; also tunnel from George-street, and one from Sussex-street, as side entrances to underground station; and also a tunnel from the Post Office for delivery of mails. The said railway line continuing on by tunnel to Dawes' Point, passing under Church-hill, Cumberland-street, Argyle-cutting, between Cumberland and Prince Streets, thence curving at the end of Cumberland-street, under George-street, out on the south-west corner of Dawes' Point, as a goods and passenger station, commanding the whole of Sydney Cove from Fort Phillip, where another goods station could be erected, from whence a tramway could traverse the whole of the northern wharfs to Miller's Point, at which point another goods station should be erected, and also a tramway could be connected at the back of the present wharfs to starting point, <i>i.e.</i>, Market and Sussex Streets goods, &c., station. There could also be a branch line to curve from Essex-street and Cumberland-street to south-west corner of Globe-street, across George-street to the Commissary Stores, &c., Queen's Wharf.</p>	<p>.....</p>	<p>No proper survey has been made of this route; and Mr. Wakely's estimate of the cost of the line (£40,000) to Wynyard-square is transparently inadequate.</p>
<p>Mr. John Young</p>	<p style="text-align: center;">G.</p> <p>From Darling Harbour Branch, at the rear of the wharfs and buildings alongside Darling Harbour, through a tunnel under the base of both Miller's and Dawes' Points, and with a fifteen-chain curve to Circular Quay; thence through Inner Domain to Woolloomooloo Bay, up the lower part of William-street, by the rear of the Museum, under Oxford-street, and along the valley beyond to the Redfern Station. Also, a Branch in the direction of Paddington, Waverley, Randwick, &c.</p>	<p>Government to resume the whole of the water frontages from the head of Darling Harbour to the Circular Quay. It would clear away all the foul abominations that exist on the margin of Darling Harbour, providing in their place commodious warehouses. Cargoes of large ships could be unloaded into the railway trucks, and thus prevent the heavy traffic of goods through the city. It gives the advantage of communication to the centre of the city, as stations could be run up to King, Market, or Barrack Streets. The resale of the land for business premises would repay the cost of compensation.</p>	<p>This proposal has not got beyond the region of "general idea" for a line. No surveys have been made, nor the practicability of the route in any way ascertained.</p>

By whom suggested.	Description of route.	Suggested advantages of route.	Remarks.
896—B Mr. John Lucas	<p style="text-align: center;">H.</p> From Darling Harbour Branch across head of Darling Harbour, crossing Sussex, Kent, Clarence, and York Streets, and terminating in underground station at the Markets in George-street.	Terminates at a central part of the city; and can be constructed without great cost.	This proposal has not got beyond the region of "general idea" for a line. No surveys have been made, nor the practicability of the route in any way ascertained.
By a Petition to the Legislative Assembly, signed by 127 persons.	<p style="text-align: center;">I.</p> Starting from the present Railway station at Redfern, crossing Devonshire-street and the Old Burial-ground, skirting Belmore Park, crossing the Markets, till reaching a point between Pitt and George Streets, on a viaduct, thence by an incline cutting or tunnel under Liverpool, Bathurst, and Park Streets, right by the Post Office (to go through the same when finished), crossing Hunter and Bridge Streets, passing between the old Commissariat Store and Guard-house by a short incline sweeping round the Circular Quay to Milson's Ferry, or by turn-tables so as to take goods from one or half-a-dozen ships as the case may require	This route, the promoters say, would supersede the necessity of a large central station, as each street could accommodate its own business. Every traveller could get out where it best suited his convenience, in the heart of the city, or right through to the Circular Quay. Besides its enormous importance to the mercantile and shipping interests, it would create an immense business and distribute it fairly among the citizens. Being 15 or 20 feet above the ground, compensation could not be heavy, as the proprietor would be an immense gainer by having the line so close to his business, using the arch, and getting a good wall to his premises, and being entirely out of the way of ordinary traffic, with a substantial bridge and station at each street, and splendid iron span crossing the courtyard of the Post Office; mounted on polished pillars, it would supplement its usefulness by giving a look of noble grandeur to our city, and improve the property over which it passed. By bringing the line down to the Circular Quay a vast amount of accommodation would be given to the large and increasing population on the northern shores of the harbour.	Do. do.

By whom suggested.	Description of route.	Suggested advantages of route.	Remarks.
<p>Proposal submitted to Parliament by Stuart Government.</p>	<p style="text-align: center;">J.</p> <p>This Railway is 2 miles 12 chains in length, and is designed for a double line of rails throughout. The line commences at the Quay wall, at a point on the eastern side of Sydney Cove; passes near the centre of Fort Macquarie, and enters the Government House grounds at the eastern end of the Tarpeian Way. It passes 33 feet to the east of the Guard-house at the entrance to Government House, and then sweeping round through the upper Gardens, and under the site lately occupied by the Garden Palace, it crosses a corner of the outer Domain; thence under the Infirmary grounds and the Mint till Hyde Park is reached, at a point near the Albert Statue. After following a curve for a few chains the centre line traverses the Park in a direction parallel to Elizabeth-street, passing under Park-street and Liverpool-street. The line is then continued in a direction to reach Belmore Park, Goulburn-street, Wexford-street, Exeter-place, John-street, and Campbell-place, and Elizabeth-street being crossed on the way. The line enters Belmore Park at its north-east corner, and after traversing the Park and crossing Belmore-street it passes through the Police Barracks and Benevolent Asylum grounds, cutting off a corner of the cemetery, crossing Devonshire-street, and enters the present Railway Station at Redfern.</p>	<p>It is considered that, by following the route indicated, the line could be constructed at a comparatively small expense, as the cost of land resumption would not be great, but if the line passed the entire length of Phillip-street, as originally proposed, the whole of the land will have to be resumed, which would cost an immense sum. The route suggested is thought to be one of the most favourable, cost and convenience considered, that it is thought can be proposed. The total expense will be a little over half a million, while it is anticipated the traffic will at first be equal to £60,000 per annum.</p>	<p>Referred to Select Committee by the Legislative Council.</p>

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(CORRESPONDENCE IN REFERENCE TO ERECTION OF A SUBWAY TO CONNECT EASTGROVE WITH GOULBURN.)

Ordered by the Legislative Assembly to be printed, 16 May, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 17th April, 1888, That there be laid upon the Table of this House,—

“Copies of all correspondence, minutes, documents, and other papers having reference to the erection of a subway or footbridge across the railway, to connect Eastgrove with Goulburn.”

(*Mr. Teece.*)

SCHEDULE.

NO.	PAGE.
1. Letters from Messrs. Topham and Blackshaw, Finlay & Co., and petition from residents of Goulburn respectively, to Minister for Works, <i>re</i> closing of railway crossings, and replies thereto. 11 August, 1868	1
2. Petition presented by Mr. Teece, M.P., from Municipal Council and residents of Goulburn, <i>re</i> construction of a bridge over creek near Conolly's mill, with minutes, &c. 29 August, 1874	3
3. Memorandum from Resident-Engineer Futh to Engineer-in-Chief, <i>re</i> construction of bridge, with decision thereon. 21 July, 1875	3
4. Letter from Mr. Teece, M.P., to Engineer for Existing Lines, <i>re</i> providing means to cross railway line. 9 July, 1883	3
5. Minute of Minister for Works <i>re</i> deputation for subway or overhead bridge to be provided with reports, minutes, &c. Mr. Teece, M.P., informed of decision. 13 July, 1883	3
6. Letter from Captain Blackshaw to Minister for Works, asking for a special permit to cross line, with official minutes, reports, &c.; letter from Mr. Teece, M.P., with Commissioner's decision; Mr. Teece, M.P., informed accordingly. 7 July, 1883	5
7. Questions asked in Legislative Assembly by Mr. Teece, M.P., and replies thereto. 2 July, 1884	6
8. Letter from Mr. Teece, M.P., to Commissioner for Railways, <i>re</i> construction of bridge; Commissioner's decision, and letter to Mr. Teece, M.P. 11 July, 1885	7
9. Minute of Chief Clerk for Works, with Inspector Crawford's report. 28 April, 1888	7

No. 1.

Messrs. Topham and Blackshaw to The Secretary for Public Works.

Sir,

Goulburn, 11 August, 1868.

We, the owners of the property on the Towrang side of the Mulwarree Creek, and from which the main supply of water for the township is derived, most respectfully beg to state that we see with surprise that one of the principal accesses to our property is being taken by the railway for the goods terminus; and that we were informed by the Inspector of Works (Mr. Suttor), that it is most likely that the other crossing, the one nearly opposite the "Commercial Hotel," would also be closed, and that the only access to our property would be by the crossing near the Scots Kirk.

Now, we beg to show that if this is carried into effect it will be a very great injustice to us, and most seriously deteriorate the value of our property. If both those crossings are closed there will be no access to the pumps excepting by the crossing near the Scots Kirk, which will make a great and material difference in the income derived from the pumps, as it is not likely that the water-carriers, and those who

794—

carry

[842 copies—Approximate cost of printing (labour and material), £5 3s. 8d.]

carry their own water, will go from one end of the town to the other, as they will have to do to get supplied at our pumps if both the central crossings are closed, but get it elsewhere. We have always understood that there would be two crossings; and Mr. Twynam, the Government Surveyor, said there would be a road a chain wide to our property; but if both those crossings are to be closed (the one opposite the Court-house, and the one nearly opposite the "Commercial Hotel"), we may as well be without any access to the pumps at all, as by closing them will make our property almost valueless. We have been at very great cost, building, sinking wells, and erecting the pumps, besides purchasing the land, and they bring in a very good income, but if we are deprived of a central access to the pumps the income will be materially affected, and we respectfully beg that you will take this matter into your serious consideration; and if the crossing opposite the Court-house is required for the terminus, that there may be a crossing to our property at the present crossing, nearly opposite the "Commercial Hotel," or that you will please bring the matter before the Government for the purchase of the property. It would be a very hard and unjust act if we should have to suffer by being deprived of a good income by the depreciation of the value of our property by any injury caused to it by the railway.

Hoping you will have the kindness to give this matter due consideration,

We are, &c.,

GEORGE TOPHAM.
JOHN BLACKSHAW.

Engineer-in-Chief for Railways.—J.B., 12/8/68. (See report on 68-2104, dated 17/8/86.)
Messrs: Topham and Blackshaw informed in terms thereof, 27/8/68.

Gentlemen,

Department of Public Works, Sydney, 27 August, 1868.

In reference to your letter of the 11th instant, complaining that access to your property, from which supplies of water are obtained on the Towrang side of the Mulwarree Creek, Goulburn, will be closed by the proposed railway works, I am directed by the Honorable the Secretary for Public Works to inform you that the Engineer for Railways has reported that a level-crossing, in addition to the one at 120 miles, can be given at 120 miles 47 chains, nearly in the direction of Clinton-street; but no intermediate crossing can be permitted.

Messrs. George Topham and John Blackshaw, Goulburn.

I have, &c.,

JOHN RAE.

To the Honorable James Byrnes, Commissioner for Railways,—

Sir,

Goulburn, 13 August, 1868.

We have the honor to bring under your notice the following, which we feel satisfied will meet with your kind consideration.

The railway line now under construction, and which is situated immediately opposite the south corner of the Market-square, severs entirely the agistment paddocks of the late Wm. Bradley, Esq., from the town, and from the want of an approach renders them in a great measure valueless; further than this, it in a like manner cuts off Blackshaw's pumps, six in number, which are the principal source for supplying the town with water.

We would with great respect suggest that a crossing be left immediately opposite Blackshaw's, for the purpose of obviating these serious difficulties.

The railway fence will, in a day or two, cause the severance, and possibly you may instruct that a panel be left down for the purpose referred to until you give the matter more mature consideration.

We have, &c.,

FINLAY & CO.,

Agents for the Executors of the late Wm. Bradley, Esq.

Engineer-in-Chief for Railways.—J.B., 14/8/68. A level-crossing in addition to the one at 120 miles can be given at 120 miles 47 chains, nearly in the direction of Clinton-street; but no intermediate crossing can be permitted.—J.W., 17/8/68. Inform.—J.B., 18/8/68. Level-crossing to be made at 120 miles 4 chains instead of 120 miles as previously arranged.—J.W., 5/9/68.

To the Honorable James Byrnes, Commissioner for Railways,—

The Petition of the undersigned residents of Goulburn,—

RESPECTFULLY SHOWETH:—

1. That they are entirely dependent on the Mulwaree Ponds for their supply of water, and that the formation of the railway has cut off all their usual means of access to the said ponds.

2. That it is of the utmost importance to have easy and uninterrupted approaches by night and day to water, for the purpose of extinguishing fires, and that to limit these approaches to the level-crossings at 120 miles and 120 miles 47 chains, will leave the whole of Centre Ward, in this Municipality, without any supply of water to extinguish fires.

3. That the land now occupied by the station and approaches thereto was originally granted for and dedicated to public use, and that the Government in resuming this land are at least bound to protect the material interests of the citizens in so vital a matter as the water supply.

4. Your Petitioners therefore respectfully pray that in addition to the level-crossings sanctioned a bridge may be erected over the line at 120 miles, about the centre of section 60, and opposite the junction of Clifford and Sloane Streets, with proper approaches thereto, as such a road to the Mulwaree Ponds will, in their judgment, afford the best access to water for the use of this Municipality.

WILLIAM DAVIES, Mayor.

(Then follow other signatures.)

Engineer-in-Chief for Railways to report.—J.B., 2/10/68. It was explained to Mr. Alexander, and a gentleman accompanying him, that two level-crossings only could be given—one at 120 miles 4 chains, and the other at 120 miles 47 chains.—J.W., 24/10/68. Commissioner. Inform.—J.B., 27/10/68. Written, 28/10/68.

No. 2.
Petition.

To the Honorable the Minister for Works, Sydney,—

Goulburn, 29 August, 1874.

The Petition of mayor, aldermen, storekeepers, water-carriers, and other residents in the city of Goulburn,—

SHOWETH:—

That when the railway was completed to Goulburn the main supply of water derivable from the pumps known as Blackshaw's, was cut off, access being, however, afforded thereto by means of a level-crossing near the Manse in the North Ward of the city, and by a road round the south end of Goulburn terminus, in the South Ward.

That by the extension of the line to Yass this latter means of access has been stopped, and the only available road to the pumps is by the level-crossing.

That great inconvenience is thereby occasioned to your Petitioners, particularly in parts of the Centre and in the South Ward, as the necessity of going round by the level-crossing entails a double journey of over a mile.

That a promise was made that when the extension of the line was commenced suitable provision should be made to maintain both means of access.

Your Petitioners would therefore respectfully urge upon your consideration the necessity of at once making the necessary arrangements for constructing a bridge over the creek running by Conolly's mill parallel with the railway, thereby connecting the reserve with the road from Teece's tannery and the deanery across the railway line into Sloane-street.

And your Petitioners, as in duty bound, will ever pray.

Presented by Wm. Teece, junr.

FREDK. HORN, Mayor.
(Then follow other signatures.)

Mr. Whitton for report.—J.S., 19/9/74. I recommend the Commissioner to build the bridge referred to by the Petitioners as the cheapest and most satisfactory way of settling this matter. Mr. Cowlshaw agrees in this view.—J.W., 16/10/74. Approved.—J.R., 20/10/74. Mr. Teece, M.P.—Informed, 23/10/74. Mr. Firth instructed to carry out.—J.W., 31/10/74.

No. 3.

Memo. from Mr. Resident-Engineer Firth to The Engineer-in-Chief.

Yass, 21 July, 1875.

SOME time since you stated that the residents of Goulburn wanted a bridge across the creek near Mr. Teece's tannery. I then suggested that approach roads made into the creek (which has a good gravel bottom) might answer as well, and save the traffic from crossing the line at the level-crossing by going under the railway bridge. This can be done at all times excepting during floods. At your request I saw Mr. Teece, and he agreed with my suggestion, but said he had very little voice in the matter, and it would depend upon the Municipal Council, to whom he would refer the matter. Mr. Teece has since informed me that the Council are of opinion that the bridge should be erected.

I forward under separate cover a plan of the ground, with sections of the several lines of road that will be required if the bridge is built. If it is put above flood-level, and the approaches made to it, the cost will be very heavy and to a certain extent money wasted, as the only traffic, or nearly so at present, is carting water.

THOMAS R. FIRTH.

This matter may stand over for the present. I think this bridge perfectly unnecessary.—J.W., 5/8/75.

No. 4.

W. Teece, Esq., M.P., to The Engineer for Existing Lines.

Sir,

Sydney, 9 July, 1883.

Referring to our conversation concerning the necessity of providing means whereby the residents of Eastgrove may be enabled to cross the railway line to and from Goulburn, I have now the honor respectfully to request that the subway which it is proposed to construct at the passenger station may be made available for pedestrians. Should the levels be inadequate to admit of this work being utilised as indicated, I would suggest that a footbridge be erected from the new platform in course of construction across the lines about to be laid down. Either of these courses would be suitable to the requirements of the public. The public have hitherto been in the habit of crossing the line, and since Eastgrove has been sold the want of such a work as I advocate has become evident. Several allotments have been purchased by railway employes. In view of a recent order issued to prevent persons from having access over the line, and a Police Court case which has ensued upon such order, the matter upon which I write is of urgent importance, as the public are anxious to be relieved from the great inconvenience to which they are now subjected.

I have, &c.,
WM. TEECE.

No. 5.

Minute by The Secretary for Public Works.

A DEPUTATION waited upon me to-day, asking that a subway or overhead bridge might be given in the vicinity of the Goulburn Station (north side), to lead from the main part of Goulburn to the suburb of Eastgrove. Foot passengers had been allowed for many years to cross the railway near the station, but this privilege had recently been withdrawn and very many persons are inconvenienced, viz., persons from Eastgrove having to go north to near the gas-works or south to Landsdowne Terrace to reach the station and the business part of the city.

Informed

Informed the deputation that I thought their request was a reasonable one. I promised to have a report made in the matter, and unless there were strong objections on the part of the Department, I would authorise either a subway or overhead bridge for pedestrians.—F.A.W., 13/7/83.

Railways.—J.R., 14/7/83. If a subway is constructed, can sufficient fall be obtained for drainage?—G.C. (*per G.L.*), 17/7/83. Mr. Stephens. Yes; but please see report attached.—R.D.S., 23/7/83. Mr. Cowdery.

Office of Engineer for Existing Lines, Goulburn, 23 July, 1883.

Proposed Subway at Goulburn Station.

G. Cowdery, Esq., Engineer for Existing Lines, Sydney,—

PLEASE see accompanying tracing.

The subway for railway purposes (coloured red, and 65 feet in length) is absolutely required. The drainage of this, which of course would be but trivial if this only be carried out, can easily be arranged by means of a sump and a small pump.

As far as the communication by means of a subway with the Eastgrove property is concerned, this is a far more difficult matter. It would never do to allow the public free access both day and night to the railway premises; and the only way of dealing with this matter is to make a subway the whole length from Sloane-street (point A to point B), a distance of 578 feet, which of course would be most expensive and would independently of this be most objectionable. The lighting thereof would also be very troublesome. I would not venture to state what the cost would be without first making careful drawings. The drainage of this could, in ordinary weather, be rendered pretty complete; but in anything like a freshet in the Mulwarree, even a very small one, this subway would be impassable.

On the whole, I deem this subway for road purposes to be—I will not say impracticable—but totally inadvisable.

The natural, and, in fact, the only practicable approach to the Eastgrove Estate from this side of Goulburn is by Goldsmith-street level-crossing.

There is a good surveyed road leading therefrom to the road bridge crossing the Mulwarree. An accurate tracing of this surveyed road accompanies my report of July 3rd, 1883, on Mr. Barbour's application to lease 2 acres of railway land.

If deemed advisable, the Traffic Inspector's report on this matter might be called for.

R. D. STEPHENS.

Tracing herewith, from which it will be observed that a sufficient fall cannot be obtained for the construction of a subway. Nor can I recommend the erection of a footbridge, as it would be giving the public access to the yard at all times, both by day and night.—G.C. (*per G.L.*), 25/7/83. Commissioner.

But could not the footbridge and the approaches thereto be cut off by fencing from the yard, so that the people could not get into the yard, nor inconvenience to our traffic arrangements result?—CH.A.G., 31/7/83. Mr. Cowdery.

Please furnish reply at once to Commissioner's minute of 31/7/83.—G.C. (*per G.L.*), 1/8/83. Mr. Stephens.

An overhead footbridge could be constructed so as to avoid interference with station regulations. Length 464 feet of which there would be three 80 feet spans. Objections thereto are—great expense—(I cannot precisely state how much without going into complete calculations), and also interference with clear sight of signals. The latter objection is more important than would at first appear. Altogether I deem it totally inadvisable to accede to the request. The Goldsmith level-crossing is quite sufficient, besides a great number of the Eastgrove inhabitants are railway employes who would have no difficulty in crossing the line.—R.D.S., 5 August, 1883. Mr. Cowdery.

Mr. Stephens report herewith.—G.C. (*per G.L.*), 9/8/83. Commissioner.

I cannot recommend the construction of either a subway or a bridge, and to allow people to cross the line on the level in the midst of shunting operations would be endangering life. "Eastgrove" has been cut up and sold recently only, and the purchasers of the land must have known of the difficulty of approach from the other side of Goulburn. The Goldsmith level-crossing is said to be sufficient, but it must be admitted that it means a considerable detour, 700 yards. Eastgrove, however, is chiefly occupied by railway men, and they of course can be trusted to cross the line on the level.—CH.A.G., 13/8/83.

Inform in terms of Mr. Stephens' report.—F.A.W., 14/8/83. Mr. Teece, M.P.—Informed, 17/8/83.

Sir,

Railway Branch, Sydney, 17 August, 1883.

With reference to your letter of the 9th ultimo, addressed to the Engineer for Existing Lines, respecting the necessity of additional means being provided to enable the residents of Eastgrove to cross the railway line to and from Goulburn, I have the honor, by direction of Mr. Secretary Wright, to inform you that it is not deemed advisable under the reports received to make any alteration in existing arrangements. It would be a difficult matter to make a subway to afford communication with Eastgrove, and to erect a footbridge would be to give free access both by day and night to the railway premises. The only way of dealing with the matter would be to construct a subway from Sloane-street for a distance of 578 feet, but not only would this be a most expensive work, but the lighting would be most troublesome. The drainage, moreover, would be difficult, and in the event even of a small freshet in the Malwarree, it would become impassable.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

W. Teece, Esq., M.P.

No. 6.

Captain Blackshaw to The Secretary for Public Works.

Sir,

Volunteer Office, Goulburn, 7 July, 1883.

I have the honor to make application to you for a special permit to cross the railway line near the station, owing to the public not being allowed to cross the line except at the proper crossing, which is a considerable way round and a bad road. My residence is across the river opposite the station. As I frequently have to attend Volunteer duties at night, it would be a great convenience to cross at the station. Trusting you will grant me this privilege (on service).

I have, &c.,

H. BLACKSHAW,

Capt. Commanding 4th Corps V.I.

Mr. Cowdery.—G.B., 13/7/83. I see no objection.—G.C. (*per* G.L.), 17/7/83. Commissioner.
Traffic Manager.—Ch.A.G., 20/7/83.

Inspector Crawford for report. Is this the same place that we were prosecuting two men for trespassing over? If not, is there any objection to the Volunteers crossing?—W. V. READ (*per* D.K.), 21/7/83.

Captain Blackshaw has a saddler's shop, and his daughter keeps a small fruit shop in Auburn-street. Captain Blackshaw and his family live in Eastgrove on the opposite side of the line from Goulburn. This permission, although asked for to allow him to attend to his Volunteer duties, is, in reality, to allow him and his family to cross and recross to their meals, &c. To give Captain Blackshaw permission would be making a dangerous precedent. Where he wishes to cross there are six sidings, two loops, and main line to cross. The shunting engine is constantly at work shunting in the yard night and day, and if it was only for Captain Blackshaw's personal safety this privilege should not be given. The level-crossing at Goldsmith-street is about 700 yards from the station. I cannot see where there is any hardship in compelling all to use this crossing. Captain Blackshaw is asking for permission to cross the lines at the same spot as we are prosecuting people for doing so.—A. CRAWFORD, 24/7/83.

That being so the permission asked for should not be granted. We have already prosecuted two persons for persisting in crossing the line at the place where Captain Blackshaw wants to cross, but the case was dismissed. (The papers are in the Commissioner's office.) A number of new sidings have been laid down at the place in question, and during the last two or three months (in fact since the work commenced) no one who has been seen has been allowed to cross. A suburb is coming into existence on the opposite side of the line from the town so that if permission is given to any one all those persons who wish to pass and re-pass between there and the town will want to cross at this place, and as shunting will be almost continually going on there will be great risk of persons getting injured.—W. V. READ (*per* D.K.), 1/8/83.

I certainly think we shall have to provide some means of allowing a crossing. It is a reasonable requirement on the part of the public.—D.V.

What would be the cost of a footbridge? There are other papers, I think, dealing with the question of bridge or under-way. The Inspector says that the crossing is 700 yards only from station, but if a person's residence is immediately opposite to the station, to compel him to use the crossing would necessitate his taking a detour of 1,400 yards.—Ch.A.G., 13/8/83. Mr. Cowdery.

Mr. Thomson for estimated cost of footbridge to cross all the lines.—G.C. (*per* G.L.), 16/8/83. A footbridge to cross all the lines will be about 195 feet long, exclusive of four stairways. The estimated cost of bridge and stairways is about £3,900.—M.T., 23/8/83. Engineer for Existing Lines. There are other papers; the most recent one is from Mr. Teece, M.P., showing that a second crossing was promised. Submit with this.—Ch.A.G., 25/8/83. Herewith.

Sir,

Sydney, 22 August, 1883.

Referring to your letter of the 17th instant, declining to make a subway or erect a footbridge to enable the inhabitants of the city of Goulburn to have access to the Mulwarree and Eastgrove, I desire to direct your attention to the following promises made by the Engineer-in-Chief and Secretary for Works some years since. I may point out that the land resumed for railway purposes originally formed part of a reserve for public recreation. The balance of this reserve has frontage to the Mulwarree Ponds, and from this vicinity the city is and has been for many years mainly supplied with water. In 1868—the year when the resumption of land took place—the inhabitants petitioned the Government, and a deputation waited upon Mr. Whitton to urge that two crossings should be provided. Mr. Whitton, it is stated, informed the deputation that two crossings should be provided at 120 miles 4 chains and 120 miles 47 chains respectively, and the Petitioners, W. Davies, Mayor, and others, were written to on the 28th October, 1868 (68-699), and informed by J. Moody “that, as the Engineer-in-Chief reports, he has already explained to Mr. Alexander that only two crossings can be given at 120 miles 4 chains and 120 miles 47 chains.” Similar communications were also sent to many interested parties in Goulburn, and notwithstanding these repeated promises but one crossing has been provided, that at 120 miles 4 chains. The level-crossing intended to extend from Clinton-street, and which would have been accessible for the largest number of people, has not been supplied.

In connection with this business, I desire further to state that in 1874 I presented a Petition from the Municipal Council and residents of Goulburn praying that a bridge may be erected over the creek near Conolly's mill to enable the inhabitants to have access to Blackshaw's Water Reserve, and received a reply from Mr. Rae on 23rd October, 1874 (74-1328), stating:—“I have the honor to inform you that the request of the Petitioners is complied with, and instructions to build the bridge have been issued accordingly.”

The necessity of supplying a second crossing is now urgent, since a population is settling down at Eastgrove, where an application has been made for a public school. I enclose plan showing the alienated land in this locality, and shall be glad if you will give this matter your serious attention, with a view to provide means for crossing the line, which will be available from the more populous portion of the city, and thus avert the inconvenience to which people are subjected in being forced to cross near Goldsmith-street.

The Commissioner for Railways.

I have, &c.,

WM. TEECE.

Have

Have not the crossings, promised in 1869, been given?—CH.A.G., 29/8/83. Mr. Cowdery. Mr. Stephens to say if crossings exist at the mileage stated; the mileage given by Mr. Teece is from Granville.—G.C. (*per* G.L.), 31/8/83.

There is only one level-crossing, the one at Goldsmith-street, 120 miles 4 chains (old mileage); the other proposed crossing at Clinton-street, 120 miles 47 chains, was commenced, approaches made, but was subsequently abandoned. Though I have made numerous inquiries I have been unable to ascertain the reason why.—R.D.S., 28/10/83. Mr. Cowdery.

Only one crossing has been laid in.—G.C., 5/11/83. Commissioner. What will the cost of completing the second crossing be, and will it meet the public want?—D.V., 8/11/83. Mr. Cowdery.

Report from Mr. Stephens herewith shows that the level-crossing originally proposed opposite Clinton-street could not be constructed, as it would run through our present shops, beside crossing several lines of rails. I would strongly recommend that if any access is to be given to Eastgrove, that it be under the railway bridge, as shown on tracing attached.—G.C., 25/2/84. Commissioner.

REPORT.

Goulburn level-crossing originally proposed opposite Clinton-street, 120 miles 47 chains (old mileage). ON 18th December, 1883, I forwarded you a tracing referring to this, but it would seem that the accompanying report was not sent in by me. I now forward you a duplicate tracing which, I think, will sufficiently explain matters.

You will perceive that the level-crossing in question is simply impossible. If absolutely insisted on it could only be used by foot passengers by means of an overhead footbridge (estimated cost, £3,400), and then would be comparatively useless. To render it of any avail it ought to be a crossing fit for carts, and that you will at once perceive is totally impracticable.

As stated in one of my previous reports, it was evidently the original intention to put in a level-crossing as portion of the approaches were made up; but, although I have made all inquiries, I cannot ascertain why the idea was abandoned.

I have carefully gone into this question of giving easy access to the Eastgrove population, and I think that the alternative measure sketched out on same tracing (*viz.*, roadway under railway bridge) presents the fewest objections. This creek is always dry except in flood time, and that does not occur once in five years. I have been here for two and a-half years, and I have never seen any water in it; and supposing a flood did come down the present bridge over the Mulwarree would be under water as well, so that this would not affect the question.

In other respects I cannot see any valid objection to my proposition. The cost would be but trifling, and since the roadway passes underneath the railway it would in no wise affect the railway traffic. The level-crossing as originally proposed if constructed now would not meet the public want.

R. D. STEPHENS, 20/2/84.

Nothing can be done at present.—CH.A.G., 28/2/84.

Inform Mr. Teece.

Sir,

Railway Branch, Sydney, 10 April, 1884.

With reference to your further representations respecting the necessity for the construction of a subway or level-crossing to enable the inhabitants of Goulburn to have direct access to Mulwarree and Eastgrove, I have the honor to inform you that the matter has been further and fully considered, but no work of the kind can be undertaken by the Department at present.

I have, &c.,

CHAS. A. GOODCHAP,

(*Per* D.V.),

Commissioner for Railways.

Wm. Teece, Esq., M.P., Sydney.

No. 7.

Questions in Legislative Assembly, Wednesday, 2 July, 1884.

Mr. TEECE asked the Secretary for Public Works,—

1. Were two level-crossings promised to the inhabitants of Goulburn across the railway line in 1868—one at Goldsmith-street (120 miles 4 chains), and the other at Clinton-street (120 miles 47 chains); and have both these crossings been provided?
2. Was a Petition presented from the Municipal Council in 1874, praying for the erection of a bridge over the creek near Conolly's mill, to afford access to Blackshaw's Water Reserve?
3. Was a communication sent to the Mayor or other person in October, 1874, stating that the prayer of the Petition was complied with, and instructions had been given to build the bridge, and has such bridge been built?
4. Is it the intention of the Government to provide means whereby the inhabitants may cross the railway line at or near Clinton-street?

Mr. DIBBS answered,—

1. Yes; one crossing only has been provided.
2. Yes.
3. Mr. Teece was informed on the 23rd October, 1874, that a bridge would be erected; but it was subsequently found that the expense of the work would be much greater than the convenience to be afforded would justify, and the proposal to erect the bridge was subsequently abandoned.
4. The question of affording some additional means of crossing the line is under consideration.

No. 8.

W. Teece, Esq., M.P., to The Commissioner for Railways.

Sir,

Sydney, 11 July, 1885.

I desire to direct your attention to the delay which has taken place in providing the necessary accommodation to enable the inhabitants of the city of Goulburn to have access to and from Eastgrove. The previous papers will show the repeated promises which have been made in this matter, and more than twelve months since the Minister favourably replied to a deputation that urged the construction of a subway or footbridge. The length of the footbridge may be advanced as a reason against its adoption, but it must be remembered that many, and some more lengthy, than that which it would be necessary to erect at Goulburn have been built at (say) from Parramatta to Sydney. A causeway beneath the bridge opposite Conolly's mill would be but an indifferent substitute for either a subway or footbridge, and moreover, the roadway would traverse low flooded land and hence be always costly in maintainance. I hope that this matter may receive the early attention of the Department.

I have, &c.,
WM. TEECE.

There is no immediate necessity for this.—CH.A.G., 31/8/85. Mr. Teece informed.

Sir,

Railway Branch, Sydney, 8 September, 1885.

Referring to your letter of the 11th July last, complaining of delay which has taken place in providing the necessary accommodation to enable the inhabitants of the city of Goulburn to obtain increased facilities of access to and from Eastgrove, I have the honor to inform you that the matter has had consideration, but the work cannot be undertaken at present.

I have, &c.,
CHAS. A. GOODCHAP,
Commissioner for Railways,
(per G.B.)

Wm. Teece, Esq., M.P., Sydney.

No. 9.

Minute by the Chief Clerk.

THE Minister, when on his recent tour of inspection at Goulburn, had his attention drawn to the necessity for an overhead bridge to meet the wants of the people of Eastgrove, and would like to know how the matter stands on an early date.—D.C.M'L., 28/4/88.

Traffic Manager first.—A.R., 30/4/88. Please see the enclosed, and let me have your early report upon the matter.—W. V. READ, 2/5/88. Inspector Crawford.

The people of Eastgrove have agitated for some time for means of communication between the city and this suburb other than the road *via* Braidwood Road Crossing and the Goldsmith-street Crossing. In connection with using the new platform, a subway or overbridge connecting the two platforms was suggested. The Eastgrove people apply that this overbridge or subway be carried from Verner-street across the railway on to the reserve, and that they be allowed to use it. This would be a most expensive arrangement. To meet their wants provision is now being made for a road under the new bridge now in course of erection under the line near Clinton-street. This will be available for vehicular and foot traffic.—A. CRAWFORD, 5/5/88.

Commissioner.—W. V. READ (per W.H.C.), 10/5/88.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REPORTS IN CONNECTION WITH THE DUPLICATION OF THE LINE FROM GOULBURN TO COOMA JUNCTION.)

Ordered by the Legislative Assembly to be printed, 3 July, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 1st March, 1888, That there be laid upon the Table of this House,—

“Copies of all papers and reports in connection with the duplication of the
“line Goulburn to the Cooma Line Junction.”

(Mr. Walker, for Mr. O'Sullivan.)

SCHEDULE.

NO.	PAGE.
1. Minutes of District Engineer, recommending construction of line, with official and Ministerial minutes. 14 November, 1882	2
2. Letter from Topham, Angus, & Co. to the Commissioner for Railways, applying to lease portion of land at Goulburn, with reports, minutes, and Minister's, decision to have line constructed. 28 August, 1883	2
3. Letter from Mr. K. Mackenzie to Engineer for Existing Lines to survey line, with Minister's approval and official minutes, together with estimated cost of line. 2 January, 1884	3
4. Minutes respecting interlocking apparatus to be provided. 18 July, 1884	4
5. Letter from Under Secretary for Public Works, enclosing tenders for the superstructure of girder bridges on Goulburn and Joppa Line. 19 May, 1885	4
6. Letter from Commissioner for Railways to Messrs. Appleby Bros., accepting their tender for above work. 29 May, 1885	5
7. Letter from Mr. T. J. Appleby to Commissioner for Railways, asking that contract might stand in his name. 2 June, 1885	5
8. Letter from Mr. T. J. Appleby to Commissioner for Railways, stating that he will not be able to take up contract, with minutes, &c., and letter in reply. 6 June, 1885	5
9. Letter from Commissioner for Railways to Under Secretary for Finance and Trade, asking that deposit of £50 received with Mr. Appleby's tender be placed to the Suspension Account. 30 June, 1885	6
10. Letter from Messrs. Mason Bros. to Minister for Public Works, respecting their tender sent in, and reply thereto. 16 June, 1885	6
11. Letter from Under Secretary, Public Works, enclosing fresh tenders for superstructure of girder bridges. 7 July, 1885	6
12. Letter from Commissioner for Railways to Messrs. Tulloch & Co., accepting their tender for above work. 14 July, 1885	7
13. Minute of Engineer for Existing Lines, forwarding draft, advertisement inviting tenders for duplication of line. 1 December, 1885	7
14. Letter from Under Secretary for Public Works, enclosing tenders for duplication of line, official minutes, reports, &c., and Minister's decision. 19 January, 1886	7
15. Minute of Minister with Commissioner's reply. 25 March, 1886	8
16. Letter from Messrs. Tulloch & Co. to Commissioner for Railways, applying for an extension of time in connection with their contract, with Commissioner's reply. 22 March, 1886	8
17. Letter from Mr. Teece, M.P., to Minister for Works, <i>re</i> deputation. 1 April, 1886	9
18. Minute of Minister, &c., <i>re</i> deputation with minutes, reports, &c. 4 April, 1886	9
19. Extract from Minute of Minister, <i>re</i> duplication of line. 11 March, 1887	9
20. Letter from Messrs. M'Sweeney & Kirwan to Minister for Public Works, pointing out that they were the lowest tenderers for the work, with minutes, &c. 30 March, 1887	10
21. Minute of Minister for Public Works <i>re</i> deputation, with Ministerial minutes and Cabinet's approval for work to be carried out. 6 April, 1887	10
22. Letters from Mr. Matheson, M.P., to Minister for Public Works, <i>re</i> tender sent in by Messrs. Kerwin & M'Sweeney, minutes, &c. 25 June and 12 July, 1887	10
23. Letter from Mr. J. Clarke, drawing attention to excessive cash security required for bond, minutes and with reply. 16 August, 1887	11
24. Letter from Under Secretary for Public Works, forwarding tenders for duplication of line. 23 August, 1887	11
25. Letter from Commissioner for Railways to Messrs. Kerr & Taylor, accepting tender for above work. 30 August, 1887	12
26. Questions asked by Mr. O'Sullivan, M.P., in the House, with answers to same, with minutes, reports, &c. February, 1888	12
27. Letter, G. W. Townsend to Commissioner for Railways, <i>re</i> preparation of estimate, Goulburn to Joppa Junction. 1 March, 1888	13

RAILWAYS.

No. 1.

Minute by Mr. District-Engineer Stephens.

Proposition to double the Lines between the Cooma Junction and Goulburn.

THIS, I am fully assured, is essentially necessary, and ought, I consider, to be ready for opening at the same time as the opening of the first section of the Cooma Railway.

Attached sketch will explain matters. The junction, as at present arranged, is very awkwardly situated, being at the foot of a 1 in 40 gradients, on a bank, and close to the Run of Water Creek Bridge. I would suggest that there be no station, or even points, but that the Cooma Line should run direct into Goulburn; but attached sketch will more fully explain what I beg to bring under your notice.

R. D. STEPHENS.

Engineer Existing Lines, 14/11/82.

I have to report, for the Commissioner's information, that in my opinion it would be of great service to the Department in working the Cooma branch, a saving of time, much safer, and eventually more economical, if this line were doubled from this junction to Goulburn, at the distance of about $3\frac{1}{4}$ miles—or, in other words, make Goulburn the junction—the expense would not be great, and I understand the engineering difficulties are nil. In the first place, if it is intended to keep the junction at mileage 137 $\frac{1}{4}$, the cost will be considerable; a platform, station buildings, siding, signals, and two cottages will be required, and there will be the wages of at least two men. It appears to me that the cost of all this would about cover the expense of doubling the portion of the line indicated, apart from the question of greater safety, which is a very important consideration. I shall be glad if the Commissioner will kindly take the matter into consideration, and if he approves of my recommendation, have it carried out as soon as possible, as there is now no time to lose.—W.V.R., 10/8/83.

I would strongly advise that the line be doubled from proposed junction into station at Goulburn. It will be in every way better, and in the long run less expensive.—C.A.G., 14/8/83. How does this affect the question of land resumption; that is, have we land belonging to the railway to enable us to carry out this work?—F.A.W., 24/8/83. Ask Mr. Cowdery to see me about this with plan. I think we have land.—C.A.G., 24/8/83. Mr. Leggatt for plan.—G.C., 26/8/83. I am informed that this plan was burnt. Will Mr. Stephens' sketch attached be sufficient? If not we will have to compile one.—A.L. Mr. Cowdery.

No. 2.

Topham, Angus, & Co. to The Commissioner for Railways.

Sir,

Joppa Camp, Goulburn, 28 August, 1883.

We have the honor to apply for a lease of that piece of land belonging to the Commissioner for Railways, situated on the northern side of the Great Southern Railway, and commencing about 250 feet south of the Braidwood road railway crossing, having a frontage to the railway of about $3\frac{1}{4}$ chains, with an average depth of 100 feet, and containing about half an acre. Our reasons for applying for a lease of this land are that we find it to be the most conveniently situated for the purpose of storing railway plant and timber in connection with our railway contracts and saw-mill, it being in every way suitable for laying in a siding from the railway, and for which we are willing to pay any reasonable rent, say £20 per annum. We have the honor to enclose a tracing showing the land in question.

Should you favourably entertain this application we may mention that the Traffic Department may expect a considerable amount of business, as we have a large quantity of stuff of various description which requires immediate removal.

Trusting to your early and favourable attention.

We have, &c.,
TOPHAM, ANGUS, & Co.

Mr. Stephens for early report.—G.C., 31/8/83. Report attached to Mr. Cowdery.—R.D.S.
12/9/

Messrs. Topham and Angus' application to have some of Commissioner's land near Goulburn.

Railway Department, Sydney, 12 September, 1883.

I wish I could recommend this, as not only would it be of considerable advantage to the contractors, but would also indubitably swell the traffic returns.

The objections are: 1st. The introduction of a new set of facing points which would be rather difficult of control—though certainly they could be kept locked, and none but the Station Master be allowed to open them, and 2nd. Probably also the Traffic Department might require these points to be protected by signals. There is one way out of the difficulty, and that is to run the siding alongside existing train line and join it to the sidings at the station. This would do away with all objections, and would not be so costly as would at first sight appear, as it would form the first step or position towards doubling the line between Goulburn and Cooma Junction as explained to you in my letter dated November 14th, 1882, your M.P., 82-7,094.

This will most undoubtedly have to be done shortly; in fact, it would have been most desirable if this could have been done before the opening of the first section of the Cooma Railway. With the exception of the question of the facing points, I do not see any objections to Messrs. Topham, Angus, and Co.'s application being granted.

R. D. STEPHENS.

Forward

Forward tracing showing scheme you propose, and also estimated cost in each case.—G.C., 21/9/83. Mr. Stephens.

Complete sketch of scheme proposed forwarded to you, November 14th, 1882, *i. e.*, as far as the doubling of the line is concerned. I attach copy of tracing and copy of letter, I now attach tracing of line as actually surveyed. What I endeavoured to show was that, if you would allow this to form part of the original scheme proposed, no extra expense of any consequence need be entailed. Estimated cost, to join on to existing line, £165. Estimated cost to form part of the future scheme which must be carried out sooner or later, £1,100. This includes widening the bridge and widening the level crossing, but it must be remembered that this £1,100 is part and parcel of the doubling of the line.—R.D.S., 18/10/83. Mr. Cowdery.

Will the Commissioner kindly reply to my minute of the 10 August last relative to the desirability of doubling the line between Cooma Junction and Goulburn.—W.V.R., 16/11/83. Mr. Cowdery.—D.C.McL., 20/11/83. The Commissioner has sufficient land for doubling the line from Goulburn to Cooma Junction.—G.C., 29/11/83. Commissioner. See my recommendations of 14/8/83, and the Minister's minute of 24/8/83.—C.A.G., 1/12/83. Minister. I find we have the land and therefore approve of work being done.—F.A.W., 11/12/83. Mr. Cowdery—Noted.—D.C.McL., 2/1/84. G.C., 2/1/84.

No. 3.

Mr. K. Mackenzie to The Engineer for Existing Lines.

Sir,

Croydon, 2 January, 1884.

For making a survey and doing other work in connection therewith, required in respect of duplicating $3\frac{1}{2}$ miles of the Great Southern Railway from Goulburn, I beg to offer to do the same on the following terms, *viz.*—To supply a four chain plan showing proposed double line of rails with lines of cross sections thereon. Take all necessary cross sections, plot same, calculate quantities and make disposal of earthwork sheet (labour, &c., being supplied), for the sum of £110. Deduction or addition to this amount to be made if the quantity of cross sections exceed or are less in number than 200, such addition or deduction to be calculated at 5s. each.

The amount mentioned I estimate on the following basis:—

	£	s.	d.
Setting out and surveying	25	0	0
200 Cross sections (including plotting and calculations)	40	0	0
Plotting and making finished plan	25	0	0
Expenses	20	0	0
	£110	0	0

I have, &c.,
K. MACKENZIE.

I recommend that Mr. Mackenzie's services be accepted as I consider the work well worth the money, the Department finding labourers and paper.—G.C., 2/1/84. I think this will be an economical way of getting the work done.—C.A.G., 7/1/84. Approved.—F.A.W., 8/1/84. Noted and Mr. Mackenzie informed.—G.C., 9/1/84. Commissioner.

Surveying for proposed double line of rails, Goulburn to Joppa Junction.

Railway Department, 6 February, 1884.

Will you please inform me to what Schedule the above is chargeable.
Engineer Existing Lines.

R. D. S.

Will Commissioner please say if the work of doubling the line from Goulburn to the junction of Cooma line is to be charged to Schedule G.—G.C., 7/2/84. Commissioner.

It does not matter much whether it be charged to Schedule G or the vote for the Cooma line; properly speaking, it should have been included on the estimate of that line, as it is rendered necessary by its construction. If, however, the balance of the vote will not admit of it being so charged, it can be debited against Schedule G.—C.A.G., 4/3/84. Mr. Cowdery.

Will Accountant please say what balance there is on the vote, Goulburn to Cooma, available for this work.—G.C., 10/3/84. Accountant.

The balance on the book is £1,181,000, out of which the amounts required by the Engineer-in-Chief will have to be met; of those amounts I have no information.—F.W., 11/3/84. Engineer Existing Lines.

As it cannot be ascertained whether there will be any balance on the vote, Goulburn to Cooma, on the completion of the work, will Commissioner please say if an estimate had not better be submitted so that a loan vote may be taken.—G.C., 27/3/84. Commissioner.

Prepare estimate, and then it can be seen whether it is necessary to take an extra vote.—C.A.G., 29/3/84. Mr. Cowdery.

The estimate cost of this work will be about £13,300.—G.C., 26/4/84. Commissioner.

What is the balance on the votes for Schedule G? Accountant,—Deducting what has been authorized and not yet paid. This information, if not with Accountant, can be obtained from Engineer Existing Lines.—C.A.G., 29/4/84. Accountant.

Existing Lines please state amounts required to complete work authorized and not yet paid.—F.W., 30/4/84. Existing Lines.

	£	s.	d.
Balance due on existing contract... ..	61,013	3	2
Works being carried out by Department	34,118	11	5
Works authorized, but not yet contracted for	137,530	0	0
Fixing and interlocking apparatus	21,060	0	0

£253,721 14 7

Accountant.

G.C., 14/5/84.

Double

Double Line of Rails.—Goulburn to Joppa Junction.

Estimated cost of above, £13,300.

Balance on vote for alteration and additions, £86,233 16s. 9d., against which it appears there are liabilities, as per Mr. Cowdery's statement, viz. :—

Balance due on contract	£61,013	0	0
Works being carried out by Department	34,118	0	0
Works authorized not contracted for	137,530	0	0
Fixing interlocking apparatus	21,060	0	0
	<u>£253,721</u>	<u>0</u>	<u>0</u>

Secretary.

F.W., 25/5/84.

Will the Commissioner please say.—F.F., 30/5/84. Acting Secretary.

I recommend that this expenditure be charged to the vote for the extension to Cooma, for the traffic on which line the double line has been rendered necessary. Should the vote be unequal to the charge upon it, it can be supplemented. I do not see how the expense can be charged to the capital vote under Schedule G, as it is not an addition to meet increasing traffic. Besides, the vote under Schedule G is well nigh exhausted. It will have to be supplemented to meet the expenditure already authorized. An estimate is being prepared for this purpose.—C.A.G., 3/6/84.

Approved.—G.R.D., 10/6/84. Mr. Cowdery, 12/6/84. Noted.—G.C., 12/6/84. Commissioner.

No. 4.

Minutes respecting Interlocking Apparatus.

Interlocking, Goulburn.

Railway Department, 18 July, 1884.

It has been approved to double the line from Joppa Junction (Cooma line) into Goulburn Yard. As this will affect the interlocking at southern end of yard, will you please say :—

1st. Has any provision been made in alteration of roads, Goulburn, to suit working of new line?

2nd. Will the present Joppa Junction remain, and all main line and branch trains run on up and down lines into Goulburn, or will it be worked as two single lines, and Joppa Junction points taken out?

J. PARRY,

18/7/84.

1st. No. Make provision. 2nd. Arrange for up and down lines.—G.C., 26/7/84. Mr. Parry.

If the double line between Goulburn and Joppa Junction is worked as two single lines, one for the main and the other branch, the junction points and signals at Joppa could be dispensed with, and thereby effect a considerable saving of men's wages, &c., to attend to it. I would recommend it be worked as two single lines into Goulburn, as the present junction is in a very awkward position.—J.P., 1/9/84. Engineer Existing Lines.

Approved.—G.C., 1/9/84. Mr. Parry.

Tracing herewith showing alterations necessary for working the single lines into Goulburn station, and for working double line through station yard, and I recommend these be carried out at once so that the interlocking may be complete.—J.P., 11/9/84. Engineer Existing Lines.

Approved.—G.C., 19/9/84. Mr. Parry.

Plan herewith for District Engineer to carry out work.—J.P., 29/9/84. Engineer Existing Lines. Mr. Stephens with plan.—G.C., 6/10/84.

This will involve considerable expense and useless expense, until such time as these are actually required. Please direct me whether I am to do so at once or to wait for such instructions as may befit the times.—R.D.S., 7/10/84. Mr. Cowdery.

The carrying out of the work at present would seem to involve no useless expenditure. nor should it be more considerable than if left to be done hereafter. As, however, little could be actually done until the bridge is widened, which work comes within the contract for duplicating the line to Joppa. The work may stand until the bridge is widened, which should be done directly the contract is let.—G.C., 10/10/84. Mr. Stephens.

This shall be attended to. Leaving things as they are will materially facilitate the turning of the engines. I suppose this will be charged to Schedule G. Please inform me.—R.D.S., 19/10/84. Mr. Cowdery.

This refers to interlocking at Goulburn in connection with doubling line from Goulburn to Joppa Junction. Will Commissioner please say how the work is to be charged.—G.C., 24/10/84. Commissioner.

Schedule G.—C.A.G., 28/10/84. Mr. Cowdery. Mr. Stephens to note and charge.—G.C., 29/10/84. Noted.—R.D.S., 31/10/84. Mr. Cowdery.

No. 5.

The Under Secretary for Public Works to The Commissioner for Railways.

Sir,

Department of Public Works, Sydney, 19 May, 1885.

The tenders, six in number, for the work specified in the margin are referred to you for report, and you will have the goodness, as early as possible, to return them to me direct for submission to the Minister.

I have, &c.,

JOHN RAE.

Mr. Cowdery.—G.B., B.C., 19/5/85.

Draft advertisements inviting tenders herewith.—G.C., 23/4/85. Commissioner. Insert.—C.A.G., 29/4/85.

To make present junction a station an annual outlay would be incurred of not less than £300 a year, perhaps more, and the erection of residences, &c., would be required. Altogether the duplication must necessarily be more economical.—C.A.G., 29/4/85. Superstructure.

Estimated cost, £1,395 10s. Tender, £1,714 8s. 1d. Superstructure of girder bridges for duplication of railway crossing Goulburn to Joppa Junction.

Superstructure of Bridges for Duplication of line Goulburn to Joppa Junction.
Analysis of Tender.

J. T. Carson.	1,881	17	6
McSweeney & Kirwan.	1,904	0	0
Robert Tulloch & Co.	2,104	5	0
D. & W. Robertson (to be made in the colonies).	2,234	0	0

The tender of Appleby Brothers is the lowest and I recommend it be accepted.—G.C., 23/5/85.
Commissioner.

Mr. T. Wearne to C. A. Goodchap, Esq., Commissioner for Railways.

Sir,

Sydney, 22 May, 1885.

I have the honor to inform you that I have made a mistake in estimating the price of the ironwork for bridges Goulburn to Joppa Junction. The amount should be £176 more. I should feel extremely obliged if you will kindly allow me to amend the tender or to withdraw it, as it will be quite impossible for me to complete the work at the price named. Trusting to have your favourable consideration.

I am, &c.,
T. WEARNE.

See Mr. Wearne's letter since received, representing that he had made a mistake in his offer, and wishing his tender increased by the sum of £176=£1,924. Even now Mr. Wearne is not 11% above Appleby Brothers tender, and probably the Minister, looking to his desire to give encouragement to the local manufacturer, would have, had the tender been so received in the first instance, directed its acceptance, but he will not probably consent to the acceptance of an amended tender, and therefore I recommend that the tender of Appleby Brothers be accepted.—C.A.G., 27/5/85.

Approved.—F.A.W., 28/5/85. Mr. Cowdery for specification.—D.C.McL., 29/5/85. Noted, and specification herewith.—G.C., 2/6/85. Commissioner.

No. 6.

The Commissioner for Railways to The Messrs. Appleby Brothers.

Gentlemen,

Department of Railways, 29 May, 1885.

I have the honor to accept your tender, dated 19th instant, for the construction and supply of the whole of the cast and wrought ironwork required for the superstructure of three double-line girder bridges for the duplication of line, Goulburn to Joppa Junction, in accordance with plan and specification, and to the entire satisfaction of the Engineer for Existing Railways.

Please forward deposit receipt for cash security mentioned in the specification in order that the bond may be prepared by the Crown Solicitor.

Please furnish me with the names in full of the members of your firm in order that the bond may be prepared.

I have, &c.,
C. A. GOODCHAP.

No. 7.

Mr. F. J. Appleby to The Commissioner for Railways.

Sir,

Albury, 2 June, 1885.

I have the honor to acknowledge receipt this day of your valued favour No. 85-3,527c, instructing me to proceed with certain bridgework for the duplication of line, Goulburn to Joppa Junction. I am the accredited agent in this Colony for the firm of Appleby Brothers, London, but I venture to submit that it would simplify matters if the contract stood in my own name, and hope this proposition will meet with your approval. I return to Sydney to-morrow and will then at once attend to the matter of security as required by the specification.

I have, &c.,
F. J. APPLEBY.

No. 8.

Mr. F. J. Appleby to The Commissioner for Railways.

Sir,

Sydney, 6 June, 1885.

With further reference to your valued favour No. 85-3,527c, it is with regret that I now have to inform you that it will not be possible for me to take up the contract for bridgework for the following reasons:—

1st. That the specification may be interpreted to cover work which I omitted to allow for in estimating.

2nd. That although the ironwork would be manufactured in England, the first payment on account would only be made sometime after its arrival here. In tendering I presupposed that the same terms would prevail as in the case of similar work which my firm has had the honor to carry out for other departments of the Public Works in this Colony.

In conclusion, I desire to tender my sincere apologies for any inconvenience I may hereby cause to the Department.

I have, &c.,
F. J. APPLEBY.

Was there any deposit with tender? Mr. Cowdery to say if the bridge work is urgently required, if so perhaps Mr. Carson's tender £1,831 17s. 6d., being £117 in excess of Appleby's might be accepted; if not it would be well to invite fresh tenders.—C.A.G., 8/6/85.

The specification provided for a deposit of £50. As Mr. Carson's tender is less than my estimate I recommend it be accepted.—G.C., 9/6/85. Was the £50 deposited with tender? Is the work so urgent as not to admit of the delay required in inviting fresh tenders?—C.A.G., 10/6/85. Take this specially down to Mr. Cowdery and get his answer to-day.—C.A.G. The work is not of such an urgent character but that it could be delayed and fresh tenders invited, but I do not think we are likely to get a lower tender.—G.C., 11/6/85. Commissioner. I recommend that fresh tenders be invited, that money deposited be forfeited.—C.A.G., 12/6/85. Approved.—F.A.W., 16/6/85.

Sir,

Department of Railways, Sydney, June 17, 1885.

I have the honor to acknowledge the receipt of your letter of the 6th instant, intimating your intention to give up your contract for bridge work in connection with the duplication of the line Goulburn to Joppa Junction.

Your failure in this matter has put the Department to some inconvenience, and the deposit lodged with your tender will, under the conditions of contract, be forfeited.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

Mr. F. J. Appleby, 37, Castlereagh-street, Sydney.

Mr. Cowdery.—H.McL., 18/6/85. Noted on draft inviting fresh tenders herewith.—G.C., 20/6/85. Commissioner. Accountants, 24/6/85.

Money deposited is not with me. From memo. at foot of Mr. Appleby's tender it is with the Treasury, and the amount, £50. That Department might be requested to place the sum to Suspense Account. This is another case in which I think the amount should be used in reduction of the cost of the work should an increased tender have to be accepted.—F.W., 25/6/85. Secretary.

No. 9.

The Commissioner for Railways to The Under Secretary, Finance and Trade.

Sir,

Department of Railways, 30 June, 1885.

I have the honor to inform you that tenders were invited for the supply, &c., of ironwork in connection with the bridge required for the duplication of the line Goulburn to Joppa Junction. Mr. Appleby's tender was accepted, but he subsequently wrote in declining to carry out the contract. The deposit (£50) lodged in connection with his tender has therefore, under the conditions of the contract, been forfeited, and I shall be glad if you will place the amount to "Suspense Account."

I have, &c.,

C. A. GOODCHAP,
Commissioner for Railways.

No. 10.

Mason Bros. to The Secretary for Public Works.

Sir,

14, Spring-street, Sydney, 16 June, 1885.

On the 19th May we tendered for construction and supply of ironwork required for bridge in *re* duplication of line Goulburn to Joppa, but the tender of Mr. Thomas Wearne was accepted. Subsequently, he having thrown up the contract, the tender of an English firm, Appleby Brothers, was accepted and Gazetted.

We have learned that they have refused to carry out the contract too, and as the next lowest, we beg to apply for our tender to be accepted.

We have, &c.,

DAVID WILSON, Director.
(For Mason Brothers).

Inform that fresh tenders have been invited.—F.A.W., 17/6/85.

Sir,

Department of Railways, Sydney, 19 June, 1885.

Referring to your letter of the 16th instant, asking that your tender for the construction and supply of bridgework in connection with the duplication of railway line, Goulburn to Joppa, might be accepted. I have the honor to inform you that it has been decided to invite fresh tenders for the work.

I have, &c.,

C. A. GOODCHAP,
Commissioner for Railways.

David Wilson, Esq., care of Messrs. Mason Brothers, 14, Spring-street, Sydney.

No. 11.

The Under Secretary for Public Works to The Commissioner for Railways.

Sir,

Department of Public Works, Sydney, 7 July, 1885.

The tenders, three in number, for the work specified in the margin, are referred to you for report, and you will have the goodness, as early as possible, to return them to me direct for submission to the Minister.

I have, &c.,

JOHN RAE.

Mr. Cowdery.—G.B., B.C., 7/7/85.

Duplication

Estimated cost,
£1,895 10s.
Tender,
£1,864 7s. 6d.
Superstructure
of three double-
line girder
bridges, Goul-
burn to Joppa
Junction
Railway.

Duplication of line Goulburn to Joppa Junction, Supply of iron bridges. Analysis of tender:—					
Robert Tulloch & Co.	£1,864 7s. 6d.
Mason Bros., Limited	£1,875 17s. 6d.
D. & W. Robertson	£2,097 15s. 0d.

The tender of Robert Tulloch & Co. is the lowest, and I recommend it be accepted. G.C., 9/7/85.
Commissioner.

For Minister's approval.—C.A.G., 11/7/85. Approved.—F.A.W., 13/7/85.

No. 12.

The Commissioner for Railways to Tulloch & Co.

Gentlemen,

Department of Railways, Sydney, 14 July, 1885.

I have the honor to accept your tender, dated the 7th instant, for the construction and supply of ironwork, for the superstructure of three double line girder bridges, for the duplication of line from Goulburn to Joppa Junction, in strict accordance with plans and specification, and to the entire satisfaction of the Engineer for Existing Lines, for the sum of £1,864 7s. 6d.

Kindly supply names in full of the members of your firm, and also forward deposit receipt for security, in order that bond may be prepared by the Crown Solicitor.

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

No. 13.

Minute by The Engineer for Existing Lines.

Duplication of line Goulburn to Joppa Junction.

I FORWARD herewith draft advertisement inviting tenders for duplication of the Great Southern Railway Line from Goulburn to Joppa Junction, for insertion in the *Government Gazette*, &c.

A tender has already been accepted for the supply of ironwork superstructures of the bridges.

To Commissioner.

G.C., 1/12/85.

For Minister's approval.—C.A.G., 3/12/85. Approved.—W.J.L., 7/12/85.

No. 14.

The Under Secretary for Public Works to The Commissioner for Railways.

Sir,

Department of Public Works, Sydney, 19 January, 1886.

The tenders, eleven in number, for the work specified in the margin, are referred to you for report, and you will have the goodness, as early as possible, to return them to me direct, for submission to the Minister.

I have, &c.,

J. R.

Mr. Cowdery, 19/1/86.

Duplication of line, Goulburn to Joppa Junction.—Analysis of tender:—

	£	s.	d.
M'Sweeney & Kirwan	12,714	16	0
John George Gatty	13,109	14	4
Angus & Co.	13,883	19	0
John Ahearn	13,889	9	6
Donohoe & Bell	13,993	18	8
M'Ardill & Thompson	14,803	6	0
Nightingale & Foord	14,956	1	4
Murray & Lewis	15,165	14	9
Paisley & Morgan	15,349	5	0
Blunt & Co.	16,111	2	0
A. Johnston & Co.	17,959	0	0

The tender of M'Sweeney & Kirwan is the lowest, and I recommend it be accepted. There are a few inaccuracies in the Schedule which Messrs. M'Sweeney & Kirwan will require to correct if their tender be accepted.—G.C., 21/1/86. Commissioner.

I wish to have the papers, and at once, please, upon which the duplication of the line was approved. The above prices do not, I presume, include rails, &c., which will swell the expense by over £2,000. There will have to be great advantages shown to justify this outlay.—C.A.G., 25/1/86. Mr. Cowdery.

At the time this work was approved of it was estimated that it would cost about £9,000 to £10,000. It was subsequently stated that it would cost £13,500, and that was allowed to pass, because in addition to the saving that would be effected in working expenses—equal to the interest upon a capital outlay of £8,000—there would be the advantage of safer working, rendered more expedient by the almost dangerous site of existing junction forming the basin of two assents; but even the second estimate has been exceeded, and the question now arises whether it is desirable to proceed at any rate for the present. Let me know the whole cost incurred to date, and what will be required to complete, if this tender is accepted. Also, what it will cost to make the junction on the Goulburn side of the bridge, including removal of signals, &c.—C.A.G., 28/1/86. Mr. Cowdery.

Full report, with detail statement attached.—G.C., 8/2/86. Commissioner.

Duplication

Duplication of the Line from Goulburn to Joppa Junction:—In reply to the Commissioner's minute of 28/1/86. By carrying out this duplication two great advantages are secured; firstly the junction of the two lines is removed from Joppa to Goulburn by which the necessity for a staff and signalling station will be dispensed with, which will represent an annual saving in working equal to the interest on a sum of £8,000 at 4 per cent., in addition to the greater facility for working the traffic by having it under the control of the Station-master at Goulburn. The second advantage is the avoidance of a junction on an incline of 1 in 40, which at any time might be the site of a serious accident. The estimate of £13,286 11s. 9d. was prepared by Mr. Townsend,* and in looking through the estimate, I see no provision was made for the following items: the bridge at Goulburn, which will have to be reconstructed for a double line, the substitution of a subway for the over bridge at Mrs. De Lauret's land, this work being necessary on account of the sidelong nature of the ground preventing the widening of the existing over bridge; there was also no provision for the removal and re-erection of pumper's house, and platform and shed at Joppa Junction. Moreover some of the large items were quoted too low. The cost incurred up to date is Robert Tulloch's contract for the ironwork for bridges—£1,864 7s. 6d.

The cost of completion will be as follows:—

Ironwork for bridges (as per contract 1)...	£1,864	7	6
Carriage of do.	150	0	0
Rails and fastenings, 3½ miles	3,500	0	0
Earthwork, brickwork, &c., as per contract 2 (lowest tender)	11,205	0	0
Alterations to roads at Goulburn points, crossings, &c.	400	0	0
		£17,119 7 6		

If the junction is removed to the level land on the Goulburn side of Run of Water Creek Bridge the cost of the alteration, including removing signals, would be approximately £8,500, but a staff and signalling station would still be required and the subway at Mrs. De Lauret's land would have to be constructed as the material to make the embankment at Joppa would have to come from the cutting where the over bridge is at present, and the removal of this material would destroy the access to the over bridge. The ironwork for the bridge is approaching completion.—W. SHELLSHEAR, 4/2/86.

For Minister's decision. No doubt the present junction is far from being a safe one, although if care is taken no accident should occur. Under ordinary circumstances the outlay to carry the Cooma line direct into Goulburn would not be justified at the expense which it seems will be necessary, and, even under the exceptional circumstances of the case, the question arises whether this large expense should be incurred.—C.A.G., 8/2/86.

This work can very well stand over for a time, and I must express my astonishment that this work (the approval of which was based on an estimate of £8,000 or £9,000) will now cost nearly £20,000.—J.G., 17/2/86. Write to each tenderer simply declining their tender.—D.C.McL., 19/2/86. Mr. Cowdery *re* Minister's minute, 20/2/86. Noted. The estimate £13,300 was made by Mr. Townsend.*—G.C., 23/2/86. Commissioner. Traffic Manager to see.—D.C.McL., 25/2/86. Seen.—W.V.R., 27/2/86. Commissioner.

*This is deemed to be inaccurate (See letter No. 27.)

No. 15.

Minute by The Secretary for Public Works.

WHAT is being done in connection with the duplication of railway, Joppa Junction to Goulburn? W.J.L., 25/3/86. Commissioner. The expense was found to be too heavy—far in excess of convenience afforded—and the work stopped for the present; might be done when traffic increases and justifies outlay.—C.A.G., 25/3/86. Seen.—W.J.L., 25/3/86.

No. 16.

R. Tulloch & Co. to The Commissioner for Railways.

Sir,

Sydney, 22 March, 1886.

With reference to our contract, iron bridges on duplication of line, Goulburn to Joppa Junction, we beg to apply for an extension of time to 22 May next, on the following grounds, viz.:—

Immediately we received notification of the acceptance of our tender we ordered the iron from our agents in England, instructing them to forward it at once by fast mail steamer, as we wanted the material urgently, irrespective of cost of freight, &c. Instead of sending it as directed they kept it back for a slow cargo steamer, and we did not get it until the first week in January last, making it utterly impossible to have the work done in proper time. We regret the delay exceedingly, and trust that you may see fit to grant us the extension of time now asked for.

We are, &c.,

R. TULLOCH & CO.

(Per J.A.)

Engineer Existing Lines, 22/3/86. As it has been decided that the work of duplicating the line is to be postponed, I think this application may be granted.—G.C., 25/3/86. Commissioner. Approved.—C.A.G., 26/3/86. Inform Messrs. Tulloch & Co.

Gentlemen,

Railway Department, 29 March, 1886.

In reply to your letter of 22 instant, applying for an extension of time until 22 May for the completion of your contract for iron bridges, duplication of line Goulburn to Joppa Junction, I have the honor to inform you that I have approved of a compliance with your request.

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

Messrs. R. Tulloch & Co.,
Phoenix Iron Works, Sydney.

No. 17.

W. Teece, Esq., M.P., to The Secretary for Public Works.

Dear Sir,

Sydney, 1 April, 1886.

A deputation desire to interview you to-morrow to urge the acceptance of a tender for the duplication of the Cooma line of railway from Joppa to Goulburn. The deputation will consist of the members for Cooma, Queanbeyan, Braidwood, Goulburn, and Argyle, and I shall be glad if you can name the time when you will be prepared to receive us.

Truly yours,
W. TEECE.

Let me have the papers in this case for to-morrow,—W.J.L., 1/4/86. Herewith.

No. 18.

Minute by The Secretary for Public Works.

THE deputation accompanied by Messrs. Teece, Tait, O'Sullivan, Dawson, Stephen, and Ryrie waited upon me to-day with reference to the duplication of the line Goulburn to Joppa. It was urged that as tenders had been called and opened for the work something should be done in justice to the tenderers. Further that some bridges were being built which were of no value except for the duplication, and also that the doubling of the line would do away with the necessity of a staff station and reduce current expenses. The traffic it was represented warranted the work, and as it was a service that would be paid from capital, the working expenses would not be affected. I informed them that the work had been postponed as it was found the cost was too great in view of the convenience that would at present be afforded thereby. No doubt the cost would come out of "capital," but I had to consider the "loan" vote as well as working expenses, as we had to pay the annual interest on loans besides having to redeem the capital borrowed. If the traffic were found to be on the increase, I would reconsider the matter and if the business to be done justified it, I would then approve of the work being gone on with.—W.J.L., 4/4/86.

In three months when traffic might be ascertained.—H.McL., 7/4/86. Traffic Manager.—D.C.McL., 9/6/86. Will Mr. Seale please let me have a statement of the traffic from the opening of the line up to date.—W.V.R. Acting Traffic Auditor. Return attached.—T.H.M.C., 5/7/86. Herewith a statement showing the traffic up to the end of April, which I presume will be sufficient for the purpose required.—M.S., 5/7/86. Traffic Manager. Commissioner.—W.V.R., 5/7/86.

Return of traffic on the Cooma railway from date of opening (3 January, 1884) to 30 April, 1886.

		1884.				£	s.	d.
Coaching-tickets issued, 10,978...	11,391	13	5
Goods, 12,010 tons.	19,682	3	5
		1885.						
Coaching-tickets issued, 13,050...	17,371	4	0
Goods, 24,839 tons	42,807	14	1
		1886.						
Coaching-tickets issued, 5,313.	6,319	16	6
Goods, 9,399 tons.	14,866	18	8
						M. SEALE, 5/7/86.		

Traffic on Cooma Railway.—Return herewith the receipts for the four months ending the 30th April, 1886, only show a slight increase over the average receipts for the corresponding period of the previous years.—W.V.R., 7/7/86. Commissioner.

Seen; put by for the present.

If the question is revived I shall want to know the particulars of this traffic—probably contractor's material and plant form a good deal of it, and that is traffic which will be lost when the line to Cooma is completed. The earnings per mile of line should also be given. There was more mileage opened in 1885 than in 1884.—C.A.G., 12/7/86.

No. 19.

Extract from Minute of Minister.

11 March, 1887.

THAT the duplication at the Goulburn-Joppa Line might be at once proceeded with. Minister replied that the matter must stand over for the present.

No. 20.

Messrs. M'Sweeney and Kirwan to The Secretary for Public Works.

Sir,

53, Hunter-street, Sydney, 30 March, 1887.

We have the honor to inform you we were the lowest tenderers for the duplication of line from Goulburn to Joppa Junction, the acceptance has been delayed owing to want of funds. We should be glad to know if there is any likelihood of your accepting our tender.

We have, &c.,
M'SWEENEY & KIRWAN.

Minister would like report.—H. M'L., 30/3/87. The Minister decided on the 11th ultimo that this application must stand over for the present.—A.R., 1/4/87.

If the Joppa line was extended into Goulburn could the men now at the Junction be dispensed with, and what would their wages amount to?—W.V.R., 18/4/87. Inspector Crawford.

Joppa Junction.—If the Cooma Line was extended into Goulburn the staff at Joppa could be dispensed with.

	£	s.	d.
Officer-in-charge, per annum	130	0	0
Allowance in place of house	26	0	0
Night Officer, per annum	136	17	6
Stores for twelve months	13	5	1

This could all be saved.—A. CRAWFORD, 21/4/87.

£306 2 7

No. 21.

Minute by The Secretary for Public Works.

Duplication of Line Goulburn to Joppa.

Mr. TEECE, M.P., introduced a deputation to me to-day with reference to the duplication of the line Goulburn to Joppa Junction. It was urged that this work should be proceeded with at an early date. As part of the material had already been obtained—no extra land would be required. It would be an economical work, as the existing staff at the Junction could be done away with. It would be carried out of loan votes, and it would be greatly required when the line was open to Cooma. It was stated further, that the tenders showed the work could be done for less than the amount estimated.

I informed them that the last statement was hardly accurate, as from what I could learn the work was authorized under the belief that the cost would not exceed £8,000 or £9,000, but on taking out the quantities, &c., in detail, after authority was given, it is found the cost will be nearer £20,000; and this was a heavy expense for adding to 3 miles of line. No doubt it would be paid out of the capital, but I thought we should be as careful of our capital outlay as our working expenditure, and it had been a disregard of this that had led to extravagance in the past, in submitting new lines of railway. I was not sanguine either that the increased traffic would be so great. They overlooked the fact that with the completion of the line the carriage of railway materials would cease, and the new traffic would not counterbalance the loss. There might be a saving in working expenses effected by a reduction of the staff at the Junction, and I promised to make inquiries on this point, and also to call for a report to ascertain whether any fresh circumstances were likely to arise to warrant the immediate commencement of this work.

6/4/87.

JOHN SUTHERLAND.

Traffic Manager.—A.R., 15/4/87. The saving to this Department for wages and stores would amount to a little over £300 per annum.—W.V.R. I feel satisfied that the further the Cooma line is extended the less the net return will be. The interest upon outlay for this line into Goulburn will be £800 a year; the saving in junction expenses will be only some £300.—C.A.G., 30/4/87.

Duplication of line from Goulburn to Joppa Junction.—The papers are enclosed relative to the duplication of the Southern Railway from Goulburn to Joppa Junction. The cost of the whole work is estimated at about £20,000 and in the interest of public safety I recommend that it be at once carried out. The work was originally approved by a previous Government and portion of the material required has been obtained. There will be a saving in working expenses of £300 per annum by carrying out this work.—J. SUTHERLAND, 23/6/87.

Cabinet approved.—H.P., 27/6/87. Let fresh tenders be invited at once.—J.S., 25/6/87.
Engineer for Existing Lines.—A.R., 1/7/87. Specification is now in the hands of the printer.—G.C., 15/7/87. Secretary.

No. 22.

G. M'L. Matheson, Esq., M.P., to The Secretary for Public Works.

Sir,

Sydney, 25 June, 1887.

I was astonished to learn from the Commissioner for Railways, that it was proposed to call fresh tenders for the duplication of Joppa-Goulburn line.

I understood from you that Kirwan & M'Sweeney's tender was to be accepted, and I think that under the circumstances, it is only fair that it should be.

Tenders have not been advertised, and I trust you will at once recall instructions to have it done.

I am, &c.,

G. M'L. MATHESON.

Minister informed Mr. Matheson verbally that Cabinet's decision was to call for fresh tenders.—H.M'L., 27/6/87.

Dear

Dear Sir,

Sydney, 12 July, 1887.

I have to thank you for your letter of yesterday regarding my recommendation that M'Sweeney & Kirwan should have the contract for the duplication of the line to Joppa. I willingly admit that most satisfactory reasons exist for refusing to carry on the four works for which they were the lowest tenderers, and I will also admit that they were not actually the lowest for the fifth I mentioned in my letter; but I would point out to you that they were under the expense of getting out their tenders, and as I cannot prove to you that they were the lowest tenderers in the fifth contract without a great deal of explanation, I withdraw that one and submit another, viz., Brewarrina-Bole Contract. This makes my statement correct, so that I trust you will see your way clear to carry out your implied promise that if you found my statement correct as to the expense this firm had been put to they would receive the Joppa-Goulburn Contract.

Yours, &c.,

G. M'L. MATHESON.

P.S.—In the case of the Wagga Wagga Foot Bay, M'Sweeney & Kirwan treated your Department with great consideration.

Acknowledged by Minister, who stated matter would have consideration.—H.M'L., 13/7/87. Engineer Existing Lines.—A.R., 15/7/87. Previous papers herewith.—G.C., 15/7/87. Secretary. How does matter stand.—A.R., 16/7/87. Engineer for Existing Lines. Proof copy of specification has been received and returned to printer to supply the number required.—G.C., 18/7/87. Secretary. Mr. Matheson's letter can be considered when the advertisement inviting tenders is received. When will this be ready?—D.C.M'L., 19/7/87. Mr. Cowdery. Draft advertisement inviting fresh tenders herewith with copy of specification.—G.C., 21/7/87. Secretary. Please report upon Mr. Matheson's proposition.—A.R., 22/7/87. Engineer for Existing Lines. I do not think we are likely to get a lower tender than that of M'Sweeney & Kirwan, as their tender is very low.—G.C., 25/7/87. Commissioner. For Minister's consideration.—C.A.G., 26/7/87. M'Sweeney & Kirwan's tender was £12,715. The Engineer estimates, £13,844. Average of all the tenders received, £14,750.—C.A.G. Fresh tenders to be called.—J.S., 27/7/87. Insert.—A.R., 27/7/87. Engineer for Existing Lines.—J.P., 29/7/87. Noted.—G.C., 30/7/87. Secretary.

No. 23.

Mr. J. Clarke to The Under Secretary for Public Works.

Sir,

"Carrington Hotel," Sydney, 16 August, 1887.

I have the honor to draw your attention to the very excessive bond in cash required by the existing railways for duplication Goulburn to Joppa, viz., £200 with tender and the final of £1,500.

Seeing that this job will not reach £20,000 it does appear somewhat strange that the deposit should be so high. The deposits on railways amounting to over £100,000 have only been £5,000 in Mr. Whitton's Department (Gundagai and Railways.)

I do trust you will see your way to mitigate this large deposit so as to enable men of fair average means to tender for same. This also means a less cost to your Department. Tenders close 23rd August (next Tuesday.)

I notice sureties are now taken for station buildings where cash was originally required in Existing Lines Department.

Yours, &c.,

J. CLARKE.

Reduce cash security from £1,500 to £500.—J.S., 16/8/87. Has security been lodged yet?—A.R., 17/8/87. Accountant. No; a tender has not been accepted.—A.H. Secretary. Engineer for Existing Lines.—A.R., 17/8/87. The security has been altered from £1,500 to £500 as directed.—G.C., 17/8/87. Secretary. Inform, 18/8/87.

Sir,

Department of Railways, Sydney, 20 August, 1887.

I have the honor to acknowledge your letter of the 16th instant, addressed to the Secretary for Public Works, in which you complain of the excessive amount of security required in connection with the contract for duplicating the line from Goulburn to Joppa. In reply, I am directed by Mr. Secretary Sutherland, to inform you that the matter has been considered, and he has approved of the cash security being reduced from £1,500 to £500 for this work.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.
(Per A. R.)

J. Clarke, Esq., Pitt-street, Sydney.

Should not publicity be given to this for information of all tenders?—A.R., 20/8/87. Engineer for Existing Lines. Too late for this, as tenders close to-morrow. I have verbally informed some of the tenderers.—G.C., 22/8/87. Secretary.

No. 24.

The Under Secretary for Public Works to The Commissioner for Railways.

Sir,

Department of Public Works, Sydney, 23 August, 1887.

The tenders, fourteen in number, for the work specified in the margin, are referred to you for report, and you will have the goodness as early as possible to return them to me direct for submission to the Minister.

I have, &c.,

JOHN RAE.

Duplication of
Great Southern
Line from Goul-
burn to Joppa
Junction.

Engineer for Existing Lines.—A. R., B.C., 24/8/87.

Duplication

Duplication of line, Goulburn to Joppa Junction.—Analysis of Tenders :—

	£	s.	d.
Kerr & Taylor	11,205	4	0
Walter Kirlle	11,433	15	10
J. G. Gatty & Co.	11,445	16	8

The tender of Kerr & Taylor is the lowest, and I recommend it be accepted.—G.C., 26/8/87. Commissioner.

Estimated cost, £13,844; lowest tender (of old date), £12,715; lowest present tender, £11,205. Recommended.—C.A.G., 26/8/87. Approved.—J.S., 27/8/87.

No. 25.

The Commissioner for Railways to Messrs. Kerr and Taylor.

Gentlemen,

Railway Department, Sydney, 30 August, 1887.

I have the honor to accept your tender, dated 23rd instant, for the construction, in accordance with plan and specification, of a duplicate line of railway from Goulburn to Joppa Junction, to the entire satisfaction and approval of the Engineer for Existing Lines.

I shall be glad if you will at once forward deposit receipt for cash security mentioned in the general conditions of contract, and wait upon the Crown Solicitor for the purpose of executing the necessary bond.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

(Per A.R.)

Railway Department, Sydney, 1 September, 1887.

DUPPLICATION of Line, Goulburn to Joppa Junction.—Please inform me how the cost of the above work is to be charged. R.D.S., 1/9/87.

Engineer for Existing Lines.

Will Commissioner please say how this work is to be charged.—G.C., 2/9/87. Commissioner. "Capital."—C.A.G., 8/9/87. Engineer Existing Lines. Noted. Vote "Goulburn to Cooma." Mr. Stephens to note.—G.C., 8/9/87.

No. 26.

Questions and Answers.

LEGISLATIVE ASSEMBLY.

Mr. O'SULLIVAN to ask the Secretary for Public Works :—

- (1.) What was the original estimate for duplicating the line Goulburn to the Cooma Line Junction?
- (2.) What officer under the Engineer for Existing Lines prepared the estimate?
- (3.) What has been the cost of the work up to date and what will it cost to complete?

Answers :—

- (1.) £13,287.
- (2.) Mr. Richard Watkins prepared the estimate for all works on this service, with the exception of the estimate of the bridges, which was prepared by Mr. Townsend; but the design of bridge he estimated for was not adhered to.
- (3.) Cost to date, £10,200; to complete, £6,409.

The answers furnished are £13,286, and the actual cost, say £18,000. In Mr. Townsend's estimates was the cost of a bridge, which was not carried out. Another bridge was substituted. What was the estimate of Mr. Townsend's bridge, and what the cost of the substituted bridge?—C.A.G., 28/2/88. Mr. Cowdery.—D.C.McL., 28/2/88. Urgent. The estimated cost of the bridge designed by Mr. Townsend was £1,080 for the superstructure. The cost of the substituted one for superstructure was £1,366.—M.T., 29/2/88. Commissioner. I should like to see Mr. Townsend's detailed estimate and a statement of the quantities. I see that the contract is for £11,205, to which add cost of bridge superstructure, £1,366; per way ———? How is the balance, to make £18,000, made up?—C.A.G., 29/2/88. Very urgent.

See Mr. Shellshear's report of 4th February, 1886, herewith. The estimate was prepared by Mr. Townsend*, and on looking through the estimate I see no provision was made for the following: the bridge at Goulburn which will have to be reconstructed for a double line, the substitution of a subway for over bridge at Mrs. De Lauret's land, pumper's house to be removed and re-erected, platform and shed at Joppa Junction; however some of the large items were quoted too low. Let me see the estimate in detail, the prices which are being paid under contract for the work estimated, and what is being paid for the work for which the estimate was made.—C.A.G., 29/2/88. Engineer for Existing Lines.—A.R., 1/3/88. Please see detailed statement attached.—M.T., 5/3/88. Secretary.

* This is not correct. (See letter No. 27.)

No. 27.

Mr. G. W. Townsend to The Commissioner for Railways.

Sir,

Railway Survey Office, Sydney, 1 March, 1888.

I subjoin copy of letter from Mr. R. Watkins, *re* estimate for Existing Lines.

I have, &c.,

G. W. TOWNSEND.

My dear Mr. Townsend,

City, 1 March, 1888.

In reply to your letter of even date, *re* estimates for duplication of line between Joppa Junction and Goulburn, and Parramatta and Penrith, I have to say that, with the exception of the bridges, I prepared the estimates for the above contracts on quantities and necessary information supplied to me in the office, and that they were ample for the various works then proposed to be done. Mr. Cowdery knew I had done the work, and that, after due examination of the estimates in his own office, he signed them.

I am, &c.,

RICHARD WATKINS, A.M.I.C.C.

G. W. Townsend, Esq., C.E.

1887.

No. 2.

Messrs. Surveyors Carter and Harwood to The Engineer-in-Chief.

Narrabri, 14 November, 1884.

Sir,

By same mail the field plan of the Narrabri to Walgett Railway has been returned, with a section of the blue line plotted thereon to a scale of 10 chains to an inch.

The flood-level shown on this section has been ascertained only after considerable trouble, and may be relied upon as being correct, much valuable information in connection therewith having been given by the owner of the property through which this line passes, and who has resided in the vicinity for the past thirty-five years.

It will be seen that several swamps and creeks have been crossed by this line, which were not shown on the trial plan.

The best possible section between the Namoi River and Narrabri Creek will be obtained by adopting the *dotted* pencil line shown on plan which line follows the highest ground (free from flood or surface water) between those streams, the drawback to the line being the necessity of crossing Narrabri Creek slightly on the skew.

JOHN CARTER.
H. T. HARWOOD.

No. 3.

Mr. Surveyor Harwood to The Engineer-in-Chief.

Railway Survey Camp, near Narrabri, 28 November, 1884.

Sir,

I have the honor to inform you that the plan, section, field and level books, &c., of the trial survey, Narrabri to Walgett, have, by the same mail, been forwarded to your office.

Enclosed is a list of the bridges, timber, openings, &c., that are likely to be required; also some information about the means of supplying timber and ballast for a railway between the above places.

I am, &c.,

HAMILTON T. HARWOOD.

Appendix.

No. 4.

No. 4.

Report by Mr. Surveyor Harwood.

Trial Survey, Narrabri to Walgett.

TIMBER.

Ironbark.—There would be no difficulty in obtaining any quantity of this timber, suitable either for fencing, sleepers, or bridges. For the latter it would have to be drawn a few miles, as the trees near the line are mostly pipey, and of no great length in the barrel. In Robertson's Forest Timber Reserve No. 1,104, there is an unlimited amount of this kind of timber.

Belar.—Very plentiful along the line. Suitable for fencing rails.

Pine.—Can be obtained at many places close to the line. There are fine forests near the Round Swamp and near Pilliga.

BALLAST.

Stone.—Procurable only in the neighbourhood of Narrabri where there are knolls of porphyritic basalt. The distance from these to the Railway Station would be about 6 miles.

Shingle.—In the bed of the Namoi River, near Mollie Station, there are some long but superficial shingle beds.

Burnt clay.—There would be no difficulty in getting clay from the banks of several of the creeks, and the scrub between the fence widths could be used for burning it.

H. T. HARWOOD.

H. T. HARWOOD.

No. 5.

Mr. Surveyor Carter to The Engineer-in-Chief.

Sir,

Narrabri, 28 November, 1884.

Having now completed the plan and section of my portion of the trial survey from Narrabri Appendix. to Walgett, namely, from the town of Walgett back to a junction with Mount Harwood, 35 miles from my point of commencement, I have the honor to report as follows:—

The district traversed by this portion of the line consists entirely of plains, for the most part destitute of timber, what little exists being of a stunted growth, and quite useless for any practicable purpose.

No streams are crossed, but water can be obtained at Walgett from the River Namoi, on which the town is built.

At "Come-by-Chance," a small settlement 30 miles from Walgett, a supply of water could also be obtained, at a little cost, from a lagoon half a mile to the west of the line.

No ballast is procurable in any part of this district, nor, do I think, from any place nearer than Narrabri.

The surface of these plains, in a rainy season, is, I am informed by very old residents, covered for many miles by flood-water from the Namoi River, and by surface water, to a depth of 2 or 3 feet (but without any perceptible current), to provide against which would entail considerable expenses.

A considerable portion of this district is leasehold land, and is, therefore, resumable without cost.

I am, &c.,

JOHN CARTER.

No. 6.

Mr. Surveyor Carter to The Engineer-in-Chief.

Sir,

Narrabri, 28 March, 1885.

Referring to the receipt of memo. 85/67, respecting the absence of a report upon my portion of the trial survey from Narrabri to Walgett, I have the honor to inform you that the usual report was forwarded by post from Narrabri on the completion of the plan and section of the above survey, in or about the last week of November, 1884.

In the event of this report being still missing, I herewith enclose another, which, though perhaps not exactly correct in the matter of dates, is quite so in other respects.

I am, &c.,

JOHN CARTER.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COBAR RAILWAY.

(CORRESPONDENCE, &c., RESPECTING.)

Ordered by the Legislative Assembly to be printed, 21 September, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 14th June, 1887, That there be laid upon the Table of this House,—

“Copies of all Correspondence and Reports on the proposed Cobar Railway.”

(*Mr. Wilson*).

Minute by The Secretary for Public Works to The Engineer-in-Chief.

Department of Public Works, Sydney, 15 June, 1885.

I SHOULD like the permanent plans of line Nyngan to Cobar pushed on as fast as possible, so that plans and book of reference may be laid before Parliament during next session. F.A.W.

Mr. Deane.—W.H.Q., 18/6/85. The above will be ready to lay before Parliament.—H.D., 22/6/85.
Engineer-in-Chief. Under Secretary, B.C., 24 June, 1885.—J.W. (*p.* W.H.Q.) Submitted.—J.R.,
25/6/85. Seen.—F.A.W., 25/6/85. Railways, B.C., 26 June, 1885.

Minute by The Engineer-in-Chief to The Secretary for Public Works.

Engineer-in-Chief's Office, Sydney, 7 September, 1885.

HEREWITH I have the honor to forward, for the approval of Parliament, the Parliamentary plan, section, and book of reference of the proposed line from Nyngan to Cobar.

JOHN WHITTON.

Railways, B.C., 8/9/85.—J.R. Prepare notice for laying on table.—CH.A.G., 11/9/85. The documents were laid upon the table of the House on 16/9/85.—W.M., 29/9/85.

Minute by The Under Secretary for Public Works.

Department of Public Works, Sydney, 10 September, 1885.

Railway, Nyngan to Cobar.

MR. BARTON, M.P., will wait on the Minister with a deputation to-morrow on the above subject.

Will Mr. Whitton kindly give the necessary information to enable the Minister to reply. J.R.
B.C., 10/9/85.

The plan, section, and book of reference have been forwarded for the consideration of Parliament. J.W. (*p.* W.H.Q.), 10/9/85. Under Secretary, B.C.

Minute by The Secretary for Public Works.

THE deputation, accompanied by Messrs. R. Barton and Machattie, M's.P., waited upon me to urge that tenders might at once be called for the construction of the railway, Nyngan to Cobar. It was said that the present was an exceptionally good time to let the work, as the contractors for the Bourke extension had just finished, and could utilise their plant for the Cobar line, undertaking it at a cheap rate in consequence. I informed them that the plans for this line would probably be laid upon the table of the House on Wednesday next. It was impossible to call for tenders for the work at once, as three or four months must necessarily elapse before the working drawings could be got ready, but I promised that no unavoidable delay would occur in carrying out this matter to its completion.

F.A.W., 11/9/85.

Please

Please see that plans, &c., are laid upon the table on date promised.—D.C.M'L., 14/9/85. Plans, &c., have been submitted to Minister with notice for laying on table.—H.M'L., 16/9/85. Engineer-in-Chief.—G.B., 16/9/85.

Railway from Nyngan to Cobar:—Mr. Wright laid upon the table (as exhibits only) a plan, section, and book of reference of a proposed railway from Nyngan to Cobar. There has not yet been an opportunity of bringing these plans under the attention of the House, nor is there now. Resubmit in fourteen days. 10/12/85. Are we now to prepare a notice for Parliament approving of the above plan, &c. ?—D.C.M'L., 15/2/86. End of month.—CH. A.G., 16/2/86. Resubmitted. Have not the plans been laid upon table ?—CH. A.G., 10/3/86.

Yes; they were laid upon the table by Mr. Wright, when Minister for Works in the Stuart Government, but before he had an opportunity of moving their adoption the Government resigned, and nothing further has been done. At the same time the plans for the railway—Orange to Forbes *via* Cudal (new line) and Narrabri to Moree—were laid on the table, but approval was not obtained.—H.M'L., 13/3/86.

Commissioner.—G.B. This is a policy for the determination of the Minister.—CH. A.G., 15/3/86. To be considered with railway policy.—W.J.L., 16/3/86.

Minute by The Commissioner for Railways.

Probable traffic on railway line—Cobar to Nyngan.

I wish the Traffic Manager to furnish me with an estimate of the probable traffic on this line. No doubt the railway extension will aid in the development of the resources of the districts through which it will pass, and will command the trade of good areas beyond. CH.A.G., 2/10/85.

Please inquire fully into this and report. Ascertain the number of people living in the district who will make use of the line, the products of the surrounding country, and what roads are now used to send raw material to markets, and to obtain supplies, and what proportion of the traffic will probably be sent by the new railway line.—W. V. READ, 5/10/85. Inspector Hornidge.

Minute by The Traffic Manager to The Commissioner for Railways.

If, as many people allege, the mining industry of the district will never again be what it has been, I am inclined to think it would be a mistake to construct a line from Nyngan to Cobar, because, apart from the mines, it will pass through nothing but pastoral country, and the whole of that trade will find its way to Sydney by the present main line.

Of course, if mining revives in the district and becomes a large and permanent industry, there would, no doubt, be good justification for constructing the line, and, once at Cobar, perhaps the best plan would be to continue it to Wilcannia, seeing that the distance will be very much less from Cobar than from Forbes.

On the other hand, if the line is not constructed to Cobar I am decidedly of opinion that the route from Forbes to Wilcannia is the best one, because it would be the most central between the main Western line and the Murrumbidgee, and I am strongly inclined that it would attract a considerable trade that is now done with Melbourne *via* Balranald.

W.V.R., 9/11/85.

Commissioner.

Mr. Read has dealt with a question of railway policy. I may or may not share his opinion on the subject, but the Government presented the scheme to Parliament after, I presume, due consideration, and the Parliament, in its wisdom, voted the money for the construction of the line. No doubt when the plans come before Parliament the question of policy can be again reviewed, and perhaps a different conclusion to that already adopted may be arrived at; but the information asked for by my minute of 2/10/85 is not affected by this consideration, and I will feel obliged if the Traffic Manager will furnish me with it.—CH.A.G., 13/11/85.

Mr. Hornidge had better take a run as far as Cobar and ascertain as nearly as possible what traffic would probably be carried over the line, from there to Nyngan, if constructed. Show separately the probable extent of the traffic the new line will attract, either in the shape of new traffic or traffic drawn from the existing main line, and the new traffic by itself.—D.K., 16/11/85.

Report by Mr. Inspector Hornidge to The Traffic Manager.

I DISCOVERED that very little information was to be obtained at Cobar that could not be as readily at Nyngan. At the former place I should have been obliged to seek it from interested parties, whereas I was able to collect statistics from our own records and also gather information from other sources.

Report herewith. One fact I may mention, I have not gone into the question of what the Wilcannia traffic consists, because I understand that full information on that point has already been obtained. That, however, is all the new traffic that can be looked for.

M. A. HORNIDGE, 3/12/85.

[Enclosure.]

[Enclosure.]

REPORT by Mr. Inspector Hornidge of probable traffic on proposed Railway, Nyngan to Cobar.

THE amount of down traffic that might be expected, were the line now ready for opening, amounts to, in round figures, 10,000 tons per annum. Two-thirds of this would consist of general merchandise, and the balance of breadstuffs and forage.

Although the above gives a tolerably good idea of the traffic from Nyngan, not more than two-thirds of the whole could be relied on as traffic to Cobar. One-third at least would go to Hermitage Plains, about 26 miles from Nyngan, where the road from Nymagee branches off.

Reduced to truck loads, and omitting Sundays and holidays, it gives us an average of four trucks a day to Cobar, and two to Hermitage Plains.

The outwards or up traffic for twelve months may be expected to amount to 4,250 tons of copper, 15,000 bales of wool, and 500 tons of general goods. The bulk of this would come from Cobar. This gives an average of five trucks per day.

The passenger traffic would probably amount to 300 per month, or an average for the whole route of twelve a day. The present parcels traffic hardly amounts to six packages a day. Horses and carriages average fourteen of each per month.

In the above I am not taking the total traffic of Nyngan Station, but that portion of it that can (allowing a liberal margin for error) be credited to the Cobar Road.

It is next to impossible to arrive at any computation of the probable live stock traffic. About 1,500,000 sheep are depastured in the country that would be tapped by the proposed railway; but it is difficult to say how many of these would be trucked, the traffic varying greatly with the seasons; thus, three months ending November, 1884, gives a little over 9,000 sheep, whereas the corresponding period for this year shows 21,000 as trucked at Nyngan for Homebush. The bulk of these came from the North however.

So far as I can learn, no considerable increase of traffic on that already existing is possible, excepting timber for building purposes.

The country is purely pastoral (except the mineral deposits at Cobar and Nymagee), and varies from fair to bad, middling and poor preponderating.

The proposed line will not compete with any portion of the existing line. The only quarter from which increase of traffic is to be looked for is Wilcannia. The distance from thence to Cobar is about 150 miles; good travelling country, with grass and water in most seasons; very much better than the Hay route which is now being used extensively for the conveyance of Wilcannia wool.

In fairly good seasons we should have to compete with the river; so that, unless substantial concessions were made, we could hardly hope for any great accession of traffic from the Wilcannia District.

The most conflicting statements are made as to the future of the copper industry at Cobar and Nymagee. I am not, therefore, in a position to express an opinion as to whether a decrease or total suspension of the traffic, as some assert, is to be feared, or as to whether nothing is required but the advent of the railway, as others hold, to revive it to even far beyond its former output. At the present time the industry is decidedly dull.

M. A. HORNIDGE.

3/12/85.

On the last page of his report Mr. Hornidge says, "The proposed line will not compete with any portion of the existing line." Am I to understand from this that the tonnage mentioned on the first page would be all *new* traffic. If so, how does it get into the district at the present time? Then as regards the up traffic, he estimates the copper at 4,250 tons, and general goods at 500 tons per annum. I have been under the impression that for some time past there has been no output of copper at all. Is it not so? and are the figures quoted the result of the output when the mines were in full work? What do the 500 tons of general goods principally consist of?—D.K., 4/12/85. Mr. Hornidge.

The traffic that now comes to Nyngan will still come through Nyngan by rail instead of by road; I mean that the proposed line will not divert traffic from Nevertire, Byrock, or Trangie. It will not be new traffic, excepting so far that it will be new railway traffic when there is a railway to put it on from Cobar to Nyngan, but it will not be new from Nyngan to Sydney. I have taken as the copper traffic the total amount received for twelve months ended 30th November instant. I am not in a position to say positively that the Cobar mine is used up; it is still working, though very short-handed, going over, it is said, old stuff that formerly was passed as not worth the smelting; how far all this is true I cannot say, but it cannot be difficult for the proper authorities to send an expert to report on the present condition and future prospects of the mine; if that is in the bad state that many assert it is, the railway is out of the question. The 500 tons of goods referred to consist chiefly of skins, hides, and tallow, with personal effects and sundries of every description.—M. A. HORNIDGE, 8/12/85. T. Manager.

Mr. Hornidge's reports bear out my impression that the construction of a line to Cobar will not create any new traffic. All it will carry will be the traffic that goes by way of Nyngan at the present time, and that traffic it is rather difficult to estimate, because in past times the copper mines have yielded us a large traffic, but rightly or wrongly, there is a strong belief amongst many people that these mines are pretty well worked out, or that at all events they will never again be anything like what they have been. For further particulars be good enough to refer to Mr. Hornidge's report of the 3rd inst.—W.V.R., 11/12/85. Commissioner. End of year.—CH.A.G. Resubmitted, for Minister's consideration.—CH.A.G., 10/3/86. Resubmit with railway policy.—W.J.L., 16/3/86.

Petition.

Cobar.

To the Honorable the Minister for Works, Sydney,—

Sir,

The humble petition of the residents of the Cobar district, respectfully sheweth,—

That a Railway from Sydney to Cobar is urgently required for the further development of this quickly-growing and important district, and in support hereof we beg to bring under your notice the following statistics:—

The Great Cobar Copper-mining Company, (Limited) at present in actual work has produced during the last ten years upwards of 19,050 tons of refined copper, equal to 1,905 tons per annum, the value

value of which was £1,444,500 sterling. The wages paid for raising same during this time was an amount of £960,000. The supplies required to carry on this work cost £110,000.

That the carriage by teams paid by this Company reached to the amount of £150,000, and the additional expenses by railway was £55,000, making a total of £205,000 for carriage expenses only.

For the use of the smelting works belonging to this Company, firewood was required to the extent of 70,000 tons per annum, equal to a cost of £24,700 annually, and during this time the mine has employed fully 600 hands regularly.

Timber now becoming somewhat scarce, and the consumption increasing, coal to reduce the copper ores will have to be used in a short time, and the coal traffic may be assumed at 28,000 tons annually.

In addition to firewood, most of the building timber has to be procured from Sydney, and the amount of carriage paid makes a considerable sum.

There are in addition to the Cobar copper-mine many other promising ores, of which the working is delayed by the difficult access to market.

With respect to the advantage that would accrue to the pastoral lessees, your petitioners humbly state that upwards of 10,000 bales of wool have yearly been sent from this district, and through this town, and if railway communication was obtained, the number of bales of wool would be materially increased, which would otherwise be forwarded *via* Wilcannia and Louth to South Australia.

This represents a tonnage of 2,000 per annum, and at the present rate of carriage, about £16,000.

The indirect advantages to the pastoral lessees would be almost as great as the saving obtained by a certainty of prices of carriage, and give them an opportunity of improving their leaseholds, and by this means employing more labour.

The town and district of Cobar has a population exceeding 3,000, nearly all of whom have fixed their places of abode here, and have expended considerable sums in permanent improvements (buildings and otherwise, all of which inhabitants are ratepayers), the district having been incorporated two years.

The Government outlay in the said town has been considerable in this town of Cobar, in the way of public buildings and water supply, the value of which improvements entirely depend upon the mining and squatting industries, and the said industries depend upon a cheap and certain means of obtaining supplies, and forwards products, and this is only to be arrived at by railway communication.

The route from Nyngan to Cobar has been already surveyed, and books of reference and plans approved of.

The cost need not be necessarily great, and the advantages to a large district certain.

The railway once completed to Cobar would place this town within 120 miles of Wilcannia on the Darling River, and in consequence would bring the whole of the middle Darling and Barrier range traffic through Cobar and Nyngan to Sydney.

And your Petitioners, as in duty bound, will ever pray.

[Signed by H. LEWIS, Mayor, and 572 others.]

Minute by The Secretary for Public Works.

Department of Public Works, Sydney, 18 May, 1886.

MESSRS. Barton and Sawers, M's.P., waited upon me to-day with reference to the above proposed railway, and presented the petition enclosed in favour of the construction of the line.

It was mentioned that Cobar was primarily known for its copper-mines, which during the last ten years have produced 19,050 tons of copper, equal to 1,905 tons per annum, and valued at one and a half million pounds. That nearly one million has been paid in wages, and over £100,000 for supplies, while about £250,000 has been paid for carriage. These mines would furnish a heavy annual traffic, as there is ore in sight that will last for centuries, and even at the present low rates the mine is worked at a handsome profit, a sum of £5,000 being available last year; in fact it was mentioned the Cobar and Nymagee were the only paying copper-mines in Australia, and they produced ore and copper at a lower price per ton than any mine in the world.

The firewood in the neighbourhood of the mine was nearly worked out, and the haulage of fuel would form a large item of traffic for the proposed railway.

Further, the district was a pastoral one, and there would be a large traffic from this interest, 10,000 bales of wool being annually sent away in addition to hides, &c., and the receipt of station supplies, while there would also be considerable live stock.

The town also had a population of 3,000, and the carriage of general goods would form a considerable item of traffic.

I stated I recognised the importance of the interests they represented, and the value of the railway to Cobar. I had already laid the plans, &c., for the proposed line on the table of the Assembly, and would, as soon as opportunity permitted, move their adoption, along with the plans for other lines which had been submitted.

W.J.L., 18/5/86.

R. B. Wilkinson, Esq., M.P., to The Secretary for Public Works.

Sir,

Sydney, 7 August, 1886.

I have the honor to bring under your notice a resolution passed at a large public meeting held at Nymagee relative to the proposed line of railway from Nymagee to Cobar, and to request that immediate action be taken in the matter.

I have, &c.,

ROBT. B. WILKINSON.

RESOLUTION.

THAT this meeting, recognising the fact that the proposed line of railway from Nyngan to Cobar would be beneficial to the best interests of the district and the Colony generally, urge upon the Government the necessity for proceeding with the same as speedily as possible.

Please inform that plans, &c., are now on the table of the House.—W.J.L., 11/8/86.

The

The Commissioner for Railways to R. B. Wilkinson, Esq., M.P.

Sir,

Department of Public Works, Railway Branch, 14 August, 1886.

I have the honor to acknowledge the receipt of your letter of the 7th inst., bringing under attention a resolution passed at a public meeting held at Nymagee, urging the early construction of the proposed railway from Nyngan to Cobar. In reply, I am directed by Mr. Secretary Lyne to inform you that the plans and book of reference of this railway are now on the table of the House.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

Petition.

From residents of Cobar and district, presented by Mr. Barton and Mr. Sawers, M's.P.

To the Hon. the Minister for Public Works, Sydney,—

The petition of the undersigned residents of Cobar and district, in public meeting assembled, at Cobar, on the 3rd day of August, 1886, humbly sheweth,—

1. That the petitioners are extremely desirous of railway communication with the metropolis by the extension of the line from Nyngan, on the Great Western Railway, to Cobar.

2. Your petitioners learned with regret, from your reply to our Member, Mr. Barton, in answer to a question of his, submitted to you from his place in the Assembly, that it was impossible for him to specify at present when the Nyngan-Cobar Railway would come under consideration.

3. That your petitioners have been promised railway communication by every Government in office since 1879.

4. That the Government in office in 1881 declined to grant permission to a syndicate to construct this line, but agreed to construct one themselves at once.

5. That a large traffic will be immediately available on completion of the railway, it being now estimated at for Cobar and district, within a radius of 40 miles, at £25,060 per annum, and this estimate in no way including any traffic to come from Nymagee (at a point on the railway 40 miles from Cobar), or to be induced by the advent of a railway.

6. Your petitioners, relying on repeated promises from the Government to construct the Nyngan-Cobar Railway, and the fact of the Government expending upwards of £30,000 in public buildings and works at Cobar, have invested large sums of money in property improvements and otherwise, besides incorporating themselves.

7. That the necessary loan for the construction of the Nyngan-Cobar Railway was authorized in 1884, and the plans and books of reference have been on the table of the House since September, 1885.

8. That upon the advent of a railway here many copper lodes known to exist in the district would be developed, and thus create at Cobar a central smelting depot, thereby considerably augmenting the quantity of copper for export.

9. That your petitioners are of opinion that the inland lines have been neglected, and not looked upon with sufficient importance.

10. That very shortly all the contracts now in hand will be completed, and the immediate commencing of this line will in fact help to absorb a large amount of labour, even now too plentiful for the benefit of the Colony without additions.

11. That in the event of a railway not being immediately constructed it will be imperative for the Government to expend a large sum of money for the macadamising of the road between Nyngan and Cobar, it being now, and for the greater portion of the year, in an almost impassable condition. Teams are at present unable to travel, and the town is now reduced to a fortnight's supply of flour, with a like scarcity of other supplies.

12. That your petitioners, in view of all the circumstances, would respectfully ask you to move the adoption of the plans and books of reference of the Nyngan-Cobar Railway without delay, to permit of the construction of this line immediately, and thus to do justice to this large and very important district. And your petitioners, as in duty bound, will ever pray.

HOPKIN LEWIS,

Mayor,

Chairman of the Railway League, on behalf of the inhabitants, in public meeting assembled, at Cobar, on the 3rd day of August, 1886.

Memo. by The Chief Clerk.

Railway from Nyngan to Cobar.

MR. LACKEY presented a petition from certain residents of the Cobar district, praying that the House will speedily confirm the already adopted plans and book of reference of the Nyngan and Cobar Railway Obtain copy of the petition. D.C.M'L., 27/9/86.

Copy of petition herewith.—F.V., 11/10/86. The plans have been approved by both Houses.—
Ch.A.G., 11/10/86.

RAILWAY FROM NYNGAN TO COBAR.

PETITION FROM CERTAIN RESIDENTS OF THE COBAR DISTRICT.

[Presented by MR. LACKEY, 15 September, 1886.]

To the Honorable Members of the Legislative Council, in Parliament assembled.

The humble Petition of the residents of the Cobar district,—

RESPECTFULLY SHOWETH :—

That a railway from Sydney to Cobar is urgently required for the further development of this quickly growing and important district, and in support hereof we beg to bring under the notice of this Honorable House the following statistics :—

The Great Cobar Copper-mining Company (Limited), at present in actual work, has produced during the last ten years upwards of 19,050 tons of refined copper, equal to 1,905 tons per annum, the value of which was £1,444,500 sterling. The wages paid for raising same during this time amounted to £960,000. The supplies required to carry on this work cost £110,000.

That the carriage by teams paid by this Company reached to the amount of £150,000, and the additional expenses by railway was £55,000, making a total of £205,000 for carriage expenses only.

For the use of the smelting works belonging to this Company, firewood was required to the extent of 70,000 tons per annum, equal to a cost of £24,700 annually, and during this time the mine has employed fully 600 hands regularly.

Timber now becoming somewhat scarce and the consumption increasing, coal to reduce the copper ores will have to be used in a short time and the coal traffic may be assumed at 28,000 tons annually.

In addition to firewood most of the building timber has to be procured from Sydney, and the amount of carriage paid makes a considerable sum.

There are, in addition to the Cobar Copper-mine, many other promising ones of which the working is delayed by the difficult access to market.

With respect to the advantage that would accrue to the pastoral lessees your Petitioners humbly state that upwards of 10,000 bales of wool have yearly been sent from this district and through this town, and if railway communication was obtained the number of bales of wool would be materially increased, which would otherwise be forwarded *via* Wilcannia and Louth to South Australia.

This represents a tonnage of 2,000 per annum, and, at the present rate of carriage, about £16,000.

The indirect advantages to the pastoral lessees would be almost as great as the saving obtained by a certainty of prices of carriage, and give them an opportunity of improving their leaseholds, and thus employing more labor.

The town and district of Cobar has a population exceeding 3,000, nearly all of whom have fixed their places of abode here, and have expended considerable sums in permanent improvements (buildings and otherwise), all of which inhabitants are ratepayers, the district having been incorporated two years.

The Government outlay in the said town has been considerable in the way of public buildings and water supply, the value of which improvements entirely depend upon the mining and squatting industries, and the said industries depend upon a cheap and certain means of obtaining supplies and forwarding products, and this is only to be arrived at by railway communication.

A railway once completed to Cobar would place this town within 120 miles of Wilcannia, on the Darling River, and in consequence bring the whole of the Middle Darling and Barrier Range traffic through Cobar and Nyngan to Sydney.

The plans and books of reference for the Nyngan and Cobar Railway have just been approved of by the Legislative Assembly, and with a view of securing the adoption of the same in this Honorable House at an early date, your Petitioners humbly beg to bring under the notice of this Honorable House the facts embodied herein as an additional proof of the necessity for railway communication between Nyngan and Cobar.

Ballast for the construction of this line is easily obtainable, there being a large quantity immediately upon the railway line, about midway between Cobar and Nyngan; and some hundreds of thousands of tons at the Cobar end being slag from the copper ores, which is eminently suitable for ballast purposes.

The cost of resumption of land by the Government for the construction of this line would be little or nothing, there being no freehold after leaving the township of Nyngan, the whole of the distance being Crown Lands, thus making this line one of the cheapest in construction in the Colonies, throughout which there are no cuttings or gradients.

There is no surveyed stock road at present existing between Nyngan and Cobar, the same being withheld on account of the long promised railway.

That your Petitioners view with alarm the concerted action which is reported to be taken by some graziers in this district for the purpose of delaying or preventing the construction of this line; such objection, in the opinion of your Petitioners, arises out of selfish motives, and is not in the interest of the majority of the classes in this neighbourhood, and if such obstruction is entertained the only effect that can follow will be the retention by the squatters of their resumed areas, whereas by rail communication the present lessees must anticipate settlement by selectors and others who will be of more benefit to the State, but whose presence are not at all palatable to one or two large runholders whose leaseholds are situate immediately around Cobar. The objections offered by such interested parties are of the most frivolous nature when considering the large benefits that must accrue by the construction of the railway to this district, which will not only be a boon to a large number of inhabitants resident here and in the immediate vicinity, but also to the Colony at large.

Having brought under the notice of this Honorable House the aforesaid requirements, your Petitioners pray that you will take into your favorable consideration the requests embodied herein, and will give effect thereto by the speedy confirmation of the already adopted plans and books of reference of the Nyngan and Cobar Railway.

And your Petitioners, as in duty bound, will ever pray, &c.

[Here follow 514 signatures.]

Minute by The Engineer-in-Chief to The Secretary for Public Works.

Engineer-in-Chief's Office, Sydney, 25 October, 1886.

HEREWITH I have the honor to forward the plan and book of reference of the proposed railway from Nyngan to Cobar, for the approval of His Excellency the Governor and the Executive Council, and for proclamation in the *Government Gazette*, in terms of clause 13 of the Government Railways Act of 1858.

Description for Proclamation.

Commencing at a point marked A at 378 miles 22 chains, and terminating at a point marked B at 458 miles 59 chains, being a length of 80 miles 37 chains.

JOHN WHITTON.

Railways.—J.R., B.C., 26/10/86. Governor and Executive Council.—W.J.L., 28/10/86. Draft proclamation herewith.—D.C.M'L., 29/10/86.

Government Railways—Extension, Nyngan to Cobar.

THE Commissioner for Railways, appointed by Act of Council, 22 Victoria, No. 19, hereby gives notice that His Excellency the Governor, with the advice of the Executive Council, deems it expedient to make and complete a railway between Nyngan and Cobar, and to erect certain works and conveniences in connection therewith; that for that purpose certain parcels of land, lying and situate between Nyngan and Cobar respectively, which are particularly set out and coloured red in the map or plan and book of reference, to be seen at the Office of the Commissioner for Railways, Phillip-street, Sydney, and at the Police Offices, Dubbo and Cobar: Commencing at a point marked A at 378 miles 22 chains, and terminating at a point marked B at 458 miles 59 chains, being a length of 80 miles 37 chains, are required to be taken by the Commissioner for Railways, and that all parties interested in the said land, or affected by the said works, are hereby required to set forth in writing to the said Commissioner within one month from the publication of this notice in the *Government Gazette* any well grounded objection that may appear to them to exist to the making of the said railway, or to the erection of the said works.

Dated at Sydney this 18th day of November, in the year of our Lord 1886.

CHAS. A. GOODCHAP, Commissioner for Railways.

The Seal of the Commissioner for Railways was affixed hereto, at Sydney, } this 18th day of November, 1886, in the presence of,—

D. C. M'LACHLAN.

Minute for The Executive Council.

Department of Public Works, Sydney, 30 October, 1886.

I HAVE the honor to submit, for the approval of His Excellency the Governor and the Executive Council, in terms of the Act 22 Victoria, No. 19, the plan and book of reference of the proposed line of railway from Nyngan to Cobar, commencing at a point marked A at 378 miles 22 chains, and terminating at a point marked B at 458 miles 59 chains from Sydney, being a length of 80 miles 37 chains.

A draft proclamation is also submitted for the approval of the Governor and Council.

WILLIAM JOHN LYNE.

The Executive Council approve of the plan and book of reference of the line of railway from Nyngan to Cobar herewith. Submitted.—A. C. BUDGE, Clerk of the Council, 11/11/86. Confirmed, 13/11/86. Approved.—CARRINGTON, 11/11/86.

Government Railways—Extension, Nyngan to Cobar.

Notice of confirmation of Plan and Book of Reference.

WITH reference to the notice of the Commissioner for Railways, dated the 18th day of November last, relative to the taking of certain lands required for the purpose of making a railway between Nyngan and Cobar, being a distance of 80 miles 37 chains, and to make and complete certain works and conveniences in connection therewith, notice is hereby given that, no valid objection having been made to the taking of the lands referred to, the said plan and book of reference have been duly confirmed by His Excellency the Governor, with the advice of the Executive Council, in accordance with the Act of Council, 22 Victoria, No. 19.

CHAS. A. GOODCHAP, Commissioner for Railways.

The seal of the Commissioner for Railways was affixed hereto at Sydney, } this 20th day of December, 1886, in the presence of,—

D. C. M'LACHLAN.

Minute by The Secretary for Public Works to The Engineer-in-Chief.

Re Nyngan to Cobar Railway.

THE draft specification which I desired might be prepared, so that, as far as possible, effect might be given to the suggestions made by Sir John Fowler in favour of "cheap railways," does not seem to me to contain any very decided alterations on existing specifications to accomplish the object sought.

The line will be about 80½ miles in length, and it appears 62 miles will be of surface formation, leaving 18½ miles where there would have to be excavation, &c.

I cannot find that any alteration has been made in the number of sleepers to be used, or in the class or size of sleepers, and for a cheap line it seems to me that sleepers, both square and half-round, should be provided for. In clause 6 the difference between formation and rail-level is described as 1 foot, which would be a reduction upon other lines, but in clause 84 it is said to be 15 inches. This must be an oversight, and, I presume, the lighter formation is intended. Although

Although it may be thought well to insert clauses 132 to 144, to provide brickwork or masonry, as it may be required, to a small extent; but both, if possible, should be entirely excluded on this extension.

Clause 54 is very specific as to the necessity for squared timber. I think this should be modified. Clause 68 refers to gates; but the provision proposed, seems too expensive for a pastoral country; and probably locked slip-rails could be given as an alternative. Clause 74 contemplates a greater thickness of ballast than 3 inches; but I think it would be undesirable to have more than 3 inches.

The fencing is, I think, of too expensive a character, and for a sheep country it seems to me wire fences without a top rail will be quite sufficient, the posts being made of the best local timber obtainable, and they need not be so near as 8 feet 3 inches. Were it not that the law compels fencing, I would suggest that no fencing should be provided at present.

Clause 111 provides for posts for marking the mileage and gradients; but where there are so many grades as on this line, it is unnecessary to provide the marks, and the mileage might be shown on the posts.

I notice that it is proposed the work shall be done at so much per chain. For the 62 miles I think the work might be subdivided into sections, so as to bring in a number of small contractors, thereby distributing the work, and at the same time expediting it.

It might be arranged for the formation to be first done by separate contracts ready for plate-laying, the sleepers and rails to be laid subsequently. As the country is comparatively level, without any extensive water-course, there will be few culverts or bridges, and these might be of timber obtained locally.

I understand there is plenty of ballast about Cobar, and between that place and Nyngan, so that it will be unnecessary to go to Narramine for a supply, as had to be done in the case of the extension to Bourke.

There seems to be no provision in the specification for the contractor to have the use of rails—I presume this is an oversight.
Engineer-in-Chief, B.C.

W.J.L., 15/12/86.

Minute by The Engineer-in-Chief to The Secretary for Public Works.

Re Specification for construction of Railway Line—Nyngan to Cobar.

THE draft specification sent to the Minister on 17th November last was prepared hurriedly, and has since, to a great extent, been remodelled.

Sleepers. Sir John Fowler's suggestion was that the sleepers for light railways should be similar to those on the existing railways, and the Minister instructed me to prepare the specification on the lines of Sir John Fowler's report. I found, however, on preparing a careful estimate that sleepers of the dimensions and description named by Sir John Fowler could not be provided for the amount voted, and before the receipt of the Minister's memo. of yesterday's date I had prepared a revised specification, which is now at the Government Printer's, providing for "half-round" sleepers, instead of the rectangular sleepers as used on the main lines, and making the length 7 ft. 6 in. instead of 8 feet.

The sleepers have also been spaced differently, the number now being 1,760 per mile, instead of 2,020.

Formation level. The drawings and the working sections provide that the difference between the rail and formation levels shall be 12 in., and the error in the printer's proof of 15 in. was corrected in the revised specification.

Brickwork, &c. "Brickwork," "masonry" are inserted in the schedule for the purpose of obtaining prices, should they be required, but it is not intended to use either on this contract.

Timbers. Round timbers will be used in every instance for piles, and squared timbers only where large sills are required to act as sleepers for the special description of waterways on this contract.

Gates. Gates have been provided for the purpose of keeping sheep off the line, which could not be done by slip-panels unless placed very close together. These, however, can be adopted if considered desirable.

Ballast. The quantity of ballast provided for is $\frac{3}{4}$ of a cubic yard per lineal yard, which will give about $\frac{3}{8}$ in. of ballast under the sleeper.

Fencing. Two descriptions of fencing have been provided—one with two rails and three wires, and the other with seven wires without top rail; the cheaper fence will be ordered. The distance of the posts apart might be increased, but it would make an inferior fence, and I do not advise it.

Gradient and mile posts. In the revised specification, which (as before stated) is in the hands of the printer, the gradient and mile posts have all been struck out.

I strongly advise the Minister to let this contract in one length, as the works upon it are exceedingly light, and no responsible contractor would undertake the important portions of this contract, such as granite cuttings, waterways, laying of permanent way, and ballasting, if the easy portions of the work were divided into small contracts. Besides, if the small contractors had to provide plant and tools for each separate section, the work would not, in my opinion, be executed so cheaply or satisfactory or so quickly as if the whole were let in one contract.

I do not think small contracts could be carried out satisfactorily by the department, unless the Government placed itself in the position of a contractor, and provided plant and all managers and officers necessary to superintend and measure the works, the same power being given to the officers of the department as is given by contractors to their agents.

Temporary materials on loan. Rails for temporary purposes were intentionally omitted, as there will be no necessity for them, as the heads of the cuttings will not justify their use. As "temporary" materials are always shamefully used by contractors, I intend in all cases to refuse to lend them in future, unless absolutely necessary.

With reference to Sir John Fowler's estimate of the cost of light railways, viz., £2,500 per mile, it should be distinctly understood that this amount does not include "the railway charges on existing lines for the conveyance of materials."

According to the present rates-sheet, the cost of haulage from Sydney to Nyngan will be £4 18s. 1d. per ton, or somewhat more than the cost of the rails in England and their conveyance to the Colony, or about £500 per mile.

I have frequently protested against what I consider to be the exorbitant charge for the carriage of permanent way materials by railway, and I again repeat that the capital votes are made use of, in my opinion, to produce a fictitious revenue.

The

The cost of railway carriage charged against capital account for the conveyance of permanent way materials for the conveyance of permanent way materials for the undermentioned lines was as follows:—

Railway.	Railway carriage.		Cost of line per mile, exclusive of railway carriage and land.
	Amount charged.	Rate per mile.	
	£	£	£
Junee to Narrandera	32,752	538	4,944
Narrandera to Hay	53,781	503	4,532
Gunnedah to Narrabri	23,505	422	4,632
Dubbo to Nyngan... ..	59,992	605	4,647
Wagga to Albury	36,532	473	5,388
Narrandera to Jerilderie	34,522	531	8,556

16/12/86.

JOHN WHITTON.

No higher price is charged for the carriage of rails than is charged for the carriage of other descriptions of iron—in many cases not so much. Since I have been Commissioner the rate for the carriage of rails has been greatly reduced, especially for long distances.—CH.A.G., 22/12/86.

Minute by The Secretary for Public Works.

FROM this minute it would appear that almost all the points I raised are being provided for in the amended specification, with the exception principally of the clause dividing the line into shorter sections, and in this instance the Engineer-in-Chief gives strong reasons to show that subdividing the line in this way would cause it to be dearer proportionately than if it were let in one contract.

The specification should provide, however, for a limited time for completion, so that the contractor will be compelled to employ a large number of hands.

If the forms, &c., are ready, I should like the tenders to be invited in the next *Gazette*.

The question of the railway freight charges is one that can be dealt with hereafter.

W.J.L., 22/12/86.

Engineer-in-Chief, B.C., 22/12/86.

Notice inviting tenders for the Cobar line was forwarded on the 15th instant; plans, &c., to be on view on 15th January, and tenders to be received on 22nd February, 1887. With reference to the Commissioner's memo., "*Vide* my remark *re* exorbitant charge for conveyance of permanent way materials," I think he must have forgotten that 1d. per ton per mile was charged for conveyance of rails to or from Lithgow, and recently a special rate of 2s. per ton per mile has been authorised for the Eskbank Company.—J.W., 22/12/86. Under Secretary, B.C.

Seen.—Please inform Mr. Barton of date proposed for opening of tenders, &c.—W.J.L., 23/12/86. Tenders invited, and Mr. R. Barton informed.—D.C.M'L., 30/12/86.

The Commissioner for Railways to R. Barton, Esq., M.P.

Sir,

Department of Public Works, Railway Branch, 30 December, 1886.

Referring to the construction of the Nyngan to Cobar Railway, I have the honor to inform you that tenders for the work are now being invited, and will be received at this office until Tuesday, the 22nd February next.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

The Under Secretary for Public Works to The Engineer-in-Chief.

Sir,

Department of Public Works, Sydney, 22 February, 1887.

The tenders (seven in number) for the work specified in the margin are referred to you for report, and you will have the goodness, as early as possible, to return them to me direct for submission to the Minister.

I have, &c.,

JOHN RAE.

Construction of
Railway Line—
Nyngan to
Cobar.

SCHEDULE of tenders opened 22nd February, 1887, for the construction of a railway line from Nyngan to Cobar, including station buildings, &c.

No.	Tenderer.	Amount.	Remarks.
		£ s. d.	
1	Carey & Maund.....	182,838 10 0	Recommended for acceptance.
2	Fishburn & Co.....	144,048 1 0	
3	Hardy & Morton	121,799 8 4	
4	Angus & Co.	133,747 6 8	
5	Halliday, Owen, & Co.	150,154 5 4	
6	Fergus & Blair	159,457 5 0	
7	Salmond, Denne, & Co.	153,344 4 6	
	Engineer's estimate	126,579 0 0	

No. 3 tender, £121,799 8s. 4d., by Messrs. Hardy & Morton, being the lowest tender and otherwise eligible, I recommend its acceptance.—J.W., 23/2/87. The Under Secretary for Works, Railways, B.C., 23/2/87.—J.R.

Minute by The Commissioner for Railways to The Traffic Manager.

TENDERS have been received for line Nyngan to Cobar; before they are finally decided upon some fresh statistics of the traffic should be prepared.

I should like to know what tonnage of goods have gone to and been received from that part of the country which the railway line will affect during the last twelve months?

What prospect is there of additional traffic?

A mixed passenger and goods train three days a week will serve the traffic probably—the Permanent way expenses will be £10,000 per annum, and 500 miles a week, at 2s. 6d. for locomotive and traffic, equals £63 a week, or £3,200 a year, in all (say) £13,000 for working expenses. Our earnings would have to be at least 10s. a train mile to cover the working cost. The interest upon capital will probably be another £10,000 a year, so that the traffic returns will have to be about £23,000 a year to cover working expenses and interest.

The calculation of returns must be made on that portion of line between Nyngan and Cobar. We already have the traffic on the main line, or nearly all, unless the opening of the line will develop additional traffic.

Please have the return carefully prepared by a good officer upon whose figures reliance can be placed.

Let me have this back in one week from date.—
Traffic Manager, B.C.

CH.A.G., 25/2/87.

Minute by The Commissioner for Railways.

A STATEMENT is being prepared of the probable revenue to be derived from this extension. It will be ready in a day or two. Would it not be well to await this information before deciding upon the recommendation of the Engineer-in-Chief that Hardy & Morton's tender be accepted? CH.A.G., 25/2/87.

I estimate that the working expenses and interest upon money will amount to £23,000 a year, perhaps £30,000, if we run more than three days a week. I will ascertain what the probable revenue will be.—CH.A.G.

Minute of The Secretary for Public Works.

SUBMIT with the information.—J.S., 28/2/87.

Please see Assistant Traffic Manager's report herewith.—D.C.M'L., 5/3/87. The Commissioner.

Assistant Traffic Manager's Report.

BOTH Mr. Harper, the Goods Superintendent, and Mr. Hornidge, the District Inspector, have been making very careful inquiries into this matter, and from them I gather that there is not an acre of country under cultivation along the whole route of the proposed line, or indeed in the district.

The population of Nymagee is about 1,500 altogether, and it is said to be very steady; but that of Cobar, which two years ago was about 4,000, is now under 3,000, and I am informed that a further decrease is a certainty—that indeed many people would leave the district at once, and are only remaining in the hopes that the railway will be constructed, and so cause a circulation of money in the town.

From our books at Nyngan (the station to and from which Nymagee and Cobar traffic is sent) I find that during the year 1886, 1,565 tons of smelted copper were received from Cobar, and assuming the distance between Nyngan and Cobar to be 80 miles, it follows that the revenue to be derived from that distance (the difference between 377 and 457 miles) will be 8s. per ton = £626 per annum. Wool from Cobar during the same period, 663 tons at, (say) 10s. = £332.

To Cobar we carried during the same period—

1,280 tons of A class traffic which at	4/- per ton would yield...	£256
231 " B	8/- " " " " " "	92
92 " 1st	16/- " " " " " "	74
284 " 2nd	20/- " " " " " "	284
512 " 3rd	28/6 " " " " " "	730
18 " 4th	35/- " " " " " "	31

And assuming that we were to get 20,000 tons of firewood to carry an average distance of 20 miles, the revenue derivable therefrom at 2s. 1d. per ton would amount to £2,083; hence the total estimate of the Cobar traffic, exclusive of passengers and parcels, £4,508.

As regards the Nymagee traffic the revenue to be derived from it will depend entirely upon the point at which it is to be received and delivered.

I learn that a petition has been sent by the owners of the Nymagee Mine and their workmen to the Roads Department that a road should be made from a place called Budd's Gap (about 50 miles beyond Nyngan) to Nymagee, and it is variously estimated that such a road would be from 38 to 51 miles in length. I have been told, however, that the present road, which branches off about 12 miles beyond Nyngan, cost £7,000, and that the Roads Department will strenuously oppose the making of another. The distance from this place to Nymagee is 54 miles, and is liberally supplied with water.

If by chance the petitioners should be successful, and we got the traffic to carry the greater distance, we would, upon the traffic of 1886, derive the following revenue:—

Copper, 1,260 tons at	5/- per ton	= £315 per annum.
Wool, 653 "	7/- " " " " " "	= 229 "
A traffic, 941 "	2/6 " " " " " "	= 118 "
B " 50 "	5/- " " " " " "	= 12 "
1st class, 18 "	10/- " " " " " "	= 9 "
2nd " 212 "	12/3 " " " " " "	= 130 "
3rd " 313 "	17/6 " " " " " "	= 274 "
4th " 12 "	22/6 " " " " " "	= 13 "

Total = £1,100

But if the traffic were carried the shorter distance by railway then our revenue from it would be only £300.

I am given to understand that the live stock traffic will be very small indeed, and should say that it will not yield a revenue of more than £300 a year at the outside.

The passenger, parcel, and mail traffic I feel sure would not exceed £1,000 a year.

To recapitulate, I estimate the Cobar merchandise traffic as likely to yield £4,508 a year; the Nymagee merchandise traffic from £300 to £1,100 a year, according to distance; live stock traffic, £300 a year; passengers, parcels, and mails, £1,000 a year; or a total of from £6,108 to £6,908 per annum.

This includes, as well as can be gathered, all the traffic that is likely to be attracted to the new line, and the estimates are derived from the most reliable source I can think of.

I am perfectly certain that, unless the mines show any wonderful development, the line will never pay anything like the interest upon the capital.

Commissioner.

D.K., 4/3/87.

The Minister will see from Traffic Manager's report that after liberally estimating the traffic the gross revenue to be derived therefrom will not exceed £7,000 a year. The working expenses at the lowest computation (providing for only three trains a week—mixed passenger and goods) will be £13,000 a year, while the interest upon the capital outlay will be £10,000, in all £23,000 a year. The net loss upon this line will therefore be £16,000 a year.

I would submit that the construction of this line be postponed until it is decided whether the proposed line to Wilcannia is to be taken, *via* Cobar. I believe that in that case the line would pay, if not directly, at least indirectly, as we should obtain the greater part of the traffic which now reaches Wilcannia by way of the Rivers Murray and Darling. This traffic would not alone feed the line from Nyngan, *via* Cobar, to Wilcannia, but would contribute a new traffic to the line between Sydney and Nyngan.

CH.A.G., 5/3/87.

Minute by The Secretary for Public Works.

Re Nyngan to Cobar Railway.

MESSRS. Waddell and Wilson, M's.P., with Mr. Barton, waited upon me to day with reference to the above railway. They intimated that they understood there was a probability of the line not being proceeded with owing to unfavourable reports submitted by the officers of the department as to the probable traffic. They wished to point out, that, in their opinion, the probable traffic had not been fairly estimated, they believed it was based on the traffic at Nyngan, but this afforded no criterion, as the traffic from much of the back country that now went by other routes would be diverted to Cobar if the line were made. In addition a great increase would take place in the present sources of traffic in the way of firewood and coal to the Cobar mine, and produce to pastoralists, while new mines would be opened up. They believed the line would be directly or indirectly a remunerative one, and, in addition, it offered the shortest route to Wilcannia, and very many persons were in favour of its ultimate extension there.

I informed them that the Commissioner, as he was bound to do, had made a report as to this line, and his conclusions were unfavourable to its construction. We had a number of lines now that were a drag upon the revenue, and we had therefore to be careful not to construct any line which did not show a reasonable prospect of paying. At the same time I wished to be in possession of all information before submitting the line to the Government, and would be glad to have any figures they could supply. No doubt the line had passed Parliament, but I did not regard that as imperative that we should proceed at once with the construction of the line, and this question would have to be decided by the Government when full information was available.

I promised to wait a fortnight so as to give them time to collect particulars before submitting the line for the consideration of Cabinet.

J.S., 11/3/87.

The Traffic Manager for report as to alleged incompleteness of statistics of probable traffic, and what additional traffic to that given can reasonably be anticipated.—CH.A.G., B.C., 15/3/87.

I have no reason to believe that the information already furnished is in any way incorrect. I might perhaps have put down the wool rate between Nyngan and Cobar at 20s. instead of 10s. per ton, but even that would only give £332 more, but if the station for the Nymagee traffic were fixed at the point 12 miles west of Nyngan we would not get my estimate of 7s. per ton for wool, so that upon the whole my gross estimate cannot be far out. I shall not say that the line might not attract some more traffic, but I am very strongly inclined to believe that such traffic would be drawn from the main line, and that is not what we want. I do not know what more I can do in the matter, but rather think that those who are taking such an interest in having the line constructed should state what traffic they expect, and from what sources.—W. V. READ, 16/3/87. Commissioner.

There is a subsequent paper upon which Commissioner has asked whether the Traffic Manager has included in his estimate the amount likely to be derived from carriage of mails. Obtain please.—D.C.M'L., 16/3/87.

Minute by The Commissioner for Railways to The Traffic Manager.

Cobar Traffic.

ON looking over the estimate furnished by Traffic Manager I see that £1,000 is put down for coaching traffic. The amount allowed for carriage of mails seems to have been omitted. The Post Office pays us £12 a year per mile for branch lines, which alone would for the 81 miles realise £972. It will not be satisfactory to find that any large item has been omitted.

CH. A.G., 15/3/87.

Traffic Manager—Very urgent.

I did not forget the mails, as will be seen by my minute, but I regret that instead of putting down £2,000, as I intended, I only put down £1,000. My estimate of revenue should therefore be increased by £1,000. As far as I have been able to ascertain, no large line of traffic has been omitted. I am, however, making further inquiries, and will be able to report by the beginning of next week. I thought the distance from Nyngan to Cobar was only 80 miles. If it is 81 it will make a little difference, but not much.—W. V. READ, 17/3/87. Commissioner.

J. Cox, Esq., to The Secretary for Public Works.

Dear Sir,

Oxford-street, Sydney, 12 March, 1887.

Reading in to-day's paper of a deputation waiting on you for the immediate construction of a railway from Nyngan to Cobar, a thought struck me whether the Government were aware of the present and future prospects of the Cobar Copper-mine. I have been living in that part of the country for these last four years, being interested in that part when I first went to Nyngan and Cobar.

I made all sorts of inquiries concerning the Cobar mine of practical miners; they all, without one exception, told me personally that as soon as the grey ore was worked out the mine was done, having sunk through the grey ore on to the yellow ore, and the latter will not pay apart from the former. For the last twelve months, to my knowledge, they have been working out the old pillars from the upper portions of the mine, which at the present time are almost exhausted. So soon as the pillars are done the mine is done at any minute.

The deputation referred to the railway carrying firewood for the mine. The Company has had a tramway laid on to the bush for this purpose for years.

Again the deputation referred to the agricultural character of the route of railway. This present season is the best ever known in the back country. I have travelled hundreds of miles from Nyngan back, and could not see a blade of grass anywhere, sheep and cattle dying in all directions for the want of grass and water.

The deputation also stated about £20,000 worth of copper lying at the mine which could not be carried away in consequence of the bad roads. They have always been able to manage in the past to send away their copper when the railway was a great deal further away from their mine than it is at present, and their output a great deal larger than at present.

I think they have about five or six teams of their own, or which they let to their carriers, who do all the work. The £20,000 worth of copper would not take long to carry to Nyngan if the weather would clear up. There is a large number of carriers, both horse and bullock teams, camped about Nyngan and Cobar, to whom it would be a charity to give a job. The Company would soon get their copper shifted on to the railway. The deputation also referred to the bad state of the roads; it is not long since the new road was opened to Cobar—a fine open clear road, right through from Nyngan to Cobar.

Dear sir, it is not because the railway will make the slightest difference to me that I am writing those lines, but it is the opinion of every man that I have conversed with that it is a pity to see public money wasted in such a way. No doubt it would benefit a few shareholders in the mine and property-holders at Cobar if they could get the railway through.

Sir, I think we had one if not more interested in the above mine in our last Ministry. Trusting these few lines will help you to make further inquiries into the present and future prospects of the Cobar Copper-mine and railway scheme,

Yours, &c.,

J. COX,

Oxford-street Post-office, Sydney.

Railways, B.C., 15/3/87.—J.R.

The Traffic Manager to The Commissioner for Railways.

Estimate of traffic on proposed line to Cobar.

On the Commissioner's M.P. 87-4,210 I showed that the traffic which would have been carried on this line during last year would have yielded a revenue of from £4,025 to £4,825, according to the point at which the Nymagee traffic would be received and delivered, and that, allowing £2,083 for the conveyance of firewood (20,000 tons an average distance of 20 miles) to the Cobar Mines, the figures would be increased to £6,108 and £6,908, respectively.

When the Commissioner pointed out to me that I had only estimated £1,000 for the conveyance of passengers, parcels, and mails (see his M.P. 87-5,592), I admitted at once that a mistake had been made, and that I should have put down £2,000, which would bring the figures up to £7,108 and £7,908.

I have again been assured that the information upon which these figures were based is quite correct, as extracted from the books at Nyngan; but since my minutes of the 4th and 17th instant were written, I have ascertained that a certain amount of traffic has gone by way of Girilambone, Coolabah, and Byrock, and assuming that the whole of it for the year 1886 had been sent to and from Cobar (over the whole length of the proposed line), I find that in respect of live stock and merchandise we would not have earned more than £354 more than we did earn at the stations named, and the passenger and parcels traffic might perhaps yield £150 additional, but I should say certainly not more.

The estimate of the 1886 traffic would therefore be amended as follows:—

Nymagee traffic (goods, &c.)	£300 or £1,100
Cobar do do	3,079 3,079
Passengers, parcels, and mails	2,150 2,150

£5,529 £6,329

Estimated conveyance of 20,000 tons to Cobar Mine, an average distance of 20 miles

£2,083 £2,083

From £7,612 to £8,412

I have allowed nothing for an increase of traffic; on the other hand I have estimated that all traffic not for Nymagee will be carried the whole length of the line to Cobar, and of course a certain proportion of it will be for intermediate places which will not pay Cobar rates.

Then, again, it is the Cobar and not the Nymagee mines which are decreasing in importance, and will in all probability become of even less importance than they are now. The question is whether the construction of a railway to the place would give the mines a fresh impetus. I very much doubt it, because so far as the copper itself is concerned the proprietors of the mine would only save 37s. to 42s. per ton, that being the difference between team carriage and the rate per rail.

W. V. READ,

23/3/87.

Minute

Minute by The Secretary for Public Works.

Re Nyngan-Cobar Railway.

MR. WILSON, M.P., introduced a deputation to me to-day with reference to the above and presented the statistics enclosed in favor of the line.

They point out that their statement is based on the actual traffic at the present time, taken from official and reliable sources; they make no allowance for the increased traffic that would be certain to follow the opening of the railway.

Their statement shows the traffic to be equal to £21,629 per annum, and they contend that after paying working expenses this should leave a fair dividend to pay interest on capital.

The development of the district is retarded by the want of a reliable means of transit; in wet weather the roads are impassable, and they have now 800 tons of refined copper at the mine waiting transit. The Cobar Company produces on the average 2,000 tons of copper per annum, and even with the low price of copper and expense of haulage the mine paid £3,000 profit last half year. There is ore in sight that will keep the mine going for years, and if the railway were made they could afford to treat low-priced ores by sending them to the nearest coal-mines to be smelted, the trucks returning with coal to treat other ores. They believed a traffic in this item alone of 20,000 tons per annum would be carried.

Regarding the passenger traffic, goods, and wool, their statement was based upon the present return and on the present conditions, but the railway would widen the area of country which would transact business through Cobar, and it was also pointed out that this would be the nearest route to Wilcannia and Silverton. The district was rich in mineral resources, and the railway would cause other mines to be opened. The mining industry was now so hampered by the excessive cost of carriage, &c., that unless the railway were made the directors of the mines were seriously thinking of closing the mines, and this would affect 3,000 persons who were depending on them.

I informed them I was glad to have their statements, and I would take an early opportunity of laying the matter before the Cabinet for decision.

I should like to have all papers.

JOHN SUTHERLAND,
29/3/87.

Traffic Manager.

COBAR Statistics—Summary as per attached:—

	£	s.	d.
Wool, stock, wool	8,889	6	0
Goods—Nyngan to Cobar and stations distant	4,355	2	11
" "Gap Inn" and stations for Nymagee	1,200	4	5
" Cobar to Nyngan, including copper, &c.	1,741	14	9
" "Gap Inn," including Nymagee copper	863	9	0
" Hermitage and stations	56	3	4
Passengers and parcels traffic to and from Cobar	2,194	5	0
Mails contract for 1886, ending December	997	0	0
Passenger and parcels traffic, Nymagee	1,175	18	8
Wool omitted, "Gap Inn," as per report Stock Inspector	156	4	3
	<u>£21,629</u>	<u>8</u>	<u>4</u>

ESTIMATED quantity of wool to be trucked at Cobar, "Gap Inn," and Hermitage Plains, including stock to be trucked at Cobar, and firewood required by Great Cobar Copper-mining Company (Limited), at Cobar:—

	£	s.	d.
Wool estimated to be loaded at Cobar, 2,311 tons 10 cwt., at 6s. 9d. per ton	780	0	0
Stock to be trucked, Cobar—			
600 trucks sheep, at 22s.	660	0	0
166 trucks cattle, at 26s.	216	0	0

Report by The Traffic Manager to The Commissioner for Railways.

It is rather unfortunate that the deputation did not inform the Minister from what source or sources the statistics they furnished were obtained, so that I might have had a chance of checking them. I know, of course, that the Cobar Railway League were allowed access to our books at Nyngan and several other stations, but whether they had any other source of information I cannot say.

My statistics, as I stated in my previous minutes, were obtained solely from the station books at Nyngan, Girilambone, Coolabah, and Byrock, and they represented the traffic actually carried to and from those stations during 1886, which would have been carried upon the Cobar line if it had been constructed.

There is such an enormous difference between us that perhaps the best plan will be to send an officer to meet one or more of the gentlemen who compiled the information for the Cobar Railway League and let them decide which of the two is right as regards tonnage, although I must say that a very cursory glance at the value of the traffic shows where a very large portion of that difference lies, and substantiates the correctness of my figures.

That all the wool, copper, and other produce which leaves the district by rail will come to Sydney, and the whole, or very nearly the whole, of the general goods for the district will be sent from Sydney is, I think, undeniable; hence, in calculating the value of the traffic, I took, as the additional revenue to be derived from the new line, the difference between the 377 (Nyngan) and the 458 (Cobar) mile rates, and that I think there can be no doubt whatever was the proper method to adopt.

It is not, however, the course which the compilers of the statistics for the Cobar Railway League have adopted. They have calculated the trainage on the 82-mile rate, and in addition have, as far as I can make out, largely overstated the weight as well.

In the matter of the Cobar copper, for example, they state the traffic to be 2,318 tons, which, at 14s. 2d. per ton, would yield £1,641 18s. 4d.; and the firewood required for smelting the ore, presumably to produce that weight of copper, is put down at 70,543 tons, which, at 2s. per ton, would yield £7,054 6s. According to this estimate it takes between 34 and 35 tons of wood to produce 1 ton of refined copper.

Now,

Now, when I wrote my previous minutes I had nothing to guide me as regards the quantity of firewood that would be required, but I knew that during 1886 we carried 1,565 tons of copper from the Cobar mines, and I estimated that the wood traffic conveyed by railway would be 20,000 tons, and that it would be carried an average distance of 20 miles.

On inquiry at the Mines Department I am informed that the ore which has now to be treated requires to go through so many processes that it takes about 20 tons of firewood to produce 1 ton of copper. If therefore we multiply 1,565 by 20 on the assumption that every ton of wood would be conveyed by railway, we find that it would amount to 31,300 tons, which, on an average distance of 20 miles, would yield £3,260, as against £2,083 named by me. Of course, if they smelted 2,318 tons, as is stated in the statistics, it would take 46,360 tons of firewood, which would yield a revenue of £4,829 3s. 4d.

But the estimated revenue put forward by the Railway League is £7,054, on a quantity of 70,542 tons of wood. Now, according to what I have been informed, this wood is procured from the surrounding country by means of the Copper Company's portable tramway, which is laid down wherever the timber can be most conveniently obtained, and the timber is cut down for miles on each side of the tramway. This tramway cannot, I should think, be very difficult to remove or expensive to maintain, and it can be run in any and every direction, as circumstances require. Is it at all probable that the company will practically abandon this, or any other means they may have, of obtaining their firewood, and pay the Railway Department £7,054 a year for haulage alone—£24 a day? My own opinion is that the chances are very greatly against it, and I am not yet prepared to believe that the railway revenue from firewood would exceed my original estimate of £2,083, even if it reached that amount.

Then it is a question whether the country through which the railway is proposed to pass has not already been denuded of timber within a considerable distance of Cobar. That is not a question I am in a position to answer, but, admitting it to be all timbered, even 50,000 tons a year would soon clear the whole of it for miles on each side of the line, and what would the company do then, for a railway cannot be moved about like a tramway?

I merely mention these matters to show that, in my opinion, the Company is not likely to abandon its tramway in favour of the railway. I could sooner believe that they would discontinue the use of firewood altogether and use coal from the Dubbo or Eskbank mines instead.

I understand that 1 ton of coal is equal in its heating properties to 2½ tons of wood, so that assuming their own estimate of 70,000 tons of the latter to be correct, it follows that 28,000 tons of coal would produce the same results, and it appears to me that it would be more economical for the Company to use the latter than the former. This, it may be said, is a matter for the Company's own consideration; still I think it is one which we can hardly lose sight of in an important question of this kind, but rather look at all sides of the question.

Coal could be obtained at the Eskbank mines for 5s. per ton, probably a little less. Added to this there is the trainage of 19s. per ton (£5 13s. 9d. per truck) or 24s. altogether delivered at the Cobar Copper Mines, or a total cost on the 28,000 tons of £33,600. According to this latter amount their estimated 70,000 tons of firewood would only cost them 9s. 7d. per ton, including our trainage of 2s. or 2s. 1d. per ton. Unless I am misinformed it costs the Company a good deal more than that, and if that be so then it is very probable that they would use coal exclusively.

Now 28,000 tons of coal could, and doubtless would, be put in 4,667, say 4,700 trucks—would only earn £3,779 more to Cobar than they would to Nyngan, although the distance is 81 miles greater, therefore it would not be a very profitable traffic to the Department, being only equal to 0·4 per ton per mile or 0·5 per ton per mile on the through journey to Eskbank, and if the trucks were loaded back to the mines with ore the earnings would not be greater.

Of course I have not lost sight of the fact that it would mean a considerable increase to the main line, but only on a traffic which would leave but little profit.

Proceeding to the other sources of revenue, I notice, from the statistics handed to the Minister by the deputation, that the general goods traffic for Cobar is put down at 2,231 tons 4 cwt.; and the trainage is estimated at the second class rate for 82 miles, viz., 34s. 11d. per ton = £3,894 19s. 3d., whereas, according to our books we only carried 1,037 tons 9 cwt.; of Cobar distinct traffic of the 1st, 2nd, 3rd, and 4th classes to and from Nyngan, Girilambone, Coolabah, and Byrock, during 1886, and, calculating the weight under each class at the difference between the trainage, we actually got and what we would have got if the line had been open to Cobar, the increased revenue to the Department would only have been £1,187, or a difference of £2,708.

The wool and live stock traffic are also greatly over estimated unless we are going to secure a very great deal of traffic which, it is assumed we will not get unless the line is constructed.

Then, as regards the Nymagee traffic, I find that the copper is put down at 1,778 tons, although, during 1886, we only carried 1,260, and the general goods are put down at 882 tons, although our books only show 555, and I see the estimated revenue from the copper is £844 11s., and from the general goods £904 4s. Now I wish to draw attention to the fact that in this estimate it has been assumed that Budd's Gap will be the point at which Nymagee goods will be received and delivered, although, why that place (being 50 miles west of Nyngan) has been selected, I have no means of knowing.

The present Nymagee road, upon which something like £7,000 has I understand been spent, branches off the Cobar road about 12 miles west of Nyngan, and from there it is about 54 miles to Nymagee, while from Budd's Gap the most ardent promoters of the construction of the line admit it to be 38, and others, who declare themselves to be equally well informed, pronounce it to be 50 miles, and that too over a very bad road.

I should think therefore that the point 12 miles west of Nyngan would be the most economical for the Nymagee district as regards cost of conveyance.

Still, assuming that Budd's Gap were decided upon the additional trainage to be derived from 1,260 tons of copper and 555 tons of general goods would only be £741, as against £1,748 15s. named in the statistics; if the traffic were delivered 12 miles west of Nyngan the difference would be very much greater.

And so on with every description of merchandise traffic.

With respect to passengers, parcels, and mails I notice that the estimate of the Railway League is £4,367 3s. 8d., and that means £3,395 3s. 8d. for the conveyance of passengers and parcels, after deducting £972 for mails, equal to between £32 and £33 per day on three days per week. In my opinion it would be very difficult indeed to make anyone who knows the country believe that the revenue from that source would be much if any in excess of my estimate of about £1,200.

One coach runs between Nyngan and Cobar daily, and is as I am informed not particularly well patronised, while another, which runs between Coolabah and Cobar three times a week, is scarcely worth taking into consideration.

No doubt Cobar would be the nearest route to Wilcannia and Silverton, but a railway to the former town would be of no benefit whatever as far as securing the trade of these districts is concerned.

W.V.R., 2/4/87.

Minute by The Secretary for Public Works.

INFORM those who waited upon me that the large discrepancies between their statistics of traffic and those of the officers of the Department cannot well be reconciled without a conference between the compilers of the two. I have therefore directed the Assistant Traffic Manager to meet the compilers of the statistics furnished by the deputation, with a view to the differences being explained. They arose probably from a misconception of the trainage rates, which a little mutual explanation will set at rest.

6/4/87.

JOHN SUTHERLAND.

The Commissioner for Railways to A. Wilson, Esq., M.P.

Sir,

Department of Public Works, Railway Branch, 16 April, 1887.

With reference to the deputation introduced by you to the Secretary for Public Works on 29th ultimo, submitting statistics in favour of the construction of the Nyngan to Cobar Railway, I have the honor, by direction of Mr. Secretary Sutherland, to inform you that the large discrepancies between those statistics of traffic and those of the officers of the Department cannot well be reconciled without a conference between the compilers of the two, and he has therefore directed the Assistant Traffic Manager to meet the compilers of the statistics furnished by the deputation, with a view to the differences being explained. They arise probably from a misconception of the trainage rates, which a little mutual explanation will set at rest.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

A. Wilson, Esq., M.P., to The Secretary for Public Works.

Sir,

7, Bent-street, Sydney, 15 April, 1887.

I shall be glad to be informed if the Government have come to any decision *re* the Nyngan to Cobar railway.

I think it is altogether out of place that such a matter should be left over at the convenience of any Member so long.

If no answer is available I must take an early opportunity of bringing the present state of affairs before the House.

I am, &c.,

ALEX. WILSON.

Please inform Mr. Wilson of action taken. I should like complete information however this day week, as I wish to submit the matter for Cabinet.—J.S., 18/4/87.

The Commissioner for Railways to A. Wilson, Esq., M.P.

Dear Sir,

Department of Public Works, Railway Branch, 19 April, 1887.

Referring to your letter of the 15th instant, which appears to have crossed mine of the 16th ultimo, *re* the proposed Nyngan to Cobar Railway, I may state that Mr. Secretary Sutherland has directed that the Traffic Manager further report in the matter. After having conferred with the compilers of the statistics furnished, must be in within a week from this day in order that a decision may be at once arrived at.

I am, &c.,

CH. A. GOODCHAP.

Minute by The Secretary for Public Works.

MR. WADDELL, M.P., with Mr. Howard, waited upon me to-day with reference to the Nyngan-Cobar railway. They represented that the people were anxious for something to be done, and asked that the question might be decided quickly. They pointed out that in the event of the Government determining not to go on with the line the people were prepared to undertake the making of the line if the Government granted them land, or they would pay a certain percentage upon the cost if the Government made the line. They represented this would absorb the unemployed.

I informed them that the Government had not yet decided this matter, as I was waiting for the full and compared statistics to submit to the Cabinet, an officer of the Department now being in the district compiling information, &c. I could at present give them no answer pending the receipt of information, but promised to obtain it, and I shall be glad to have all particulars quickly.

27/4/87.

JOHN SUTHERLAND.

Traffic Manager.—A.R., B.C., 27/4/87.

The Assistant Traffic Manager's Report.

Estimated revenue from the proposed line to Cobar.

I MET by arrangement Mr. Grainger Barton and Mr. Morrison of Cobar, and also Mr. Leah (Wright, Heaton, and Co.'s representative) at Nyngan, on Monday last, and, with them, went carefully into this question with the result that, although the details differ slightly, the correctness of our estimate is fully demonstrated.

As pointed out in the Traffic Manager's minute of the 2nd instant, the estimate submitted to the Minister by the deputation which interviewed him on the 30th March, was arrived at by calculating a much greater tonnage than appears in our books as having been carried at the 82-mile rate, instead of upon the differences between the 377 and 459 mile rates, in the case of traffic conveyed between Sydney and Cobar, and corresponding differences between Cobar and other stations.

This error had, however, been discovered before I met the gentlemen named, consequently it was only necessary to go into the question of tonnage, and endeavour to ascertain as nearly as possible the additional revenue which would be derived therefrom in the event of the line being constructed; and I now beg to submit the result of our investigations.

As the representatives of the Cobar Railway League informed me that the great bulk of the special and miscellaneous class traffic for the Cobar district came from stations between Dubbo and Bathurst, and that consequently it would not be fair to the proposed line to credit it merely with the difference between the 377 and 459 mile rates, I consented to take Orange as the starting point, and estimated the revenue from that source at the differences between the Orange to Nyngan and Orange to Cobar rates.

In the case of 1st, 2nd, and 3rd class traffic I also, with the concurrence of the gentlemen in question, took Orange as the starting point of one-fourth and Sydney for the other three-fourths of the gross tonnage, while with respect to fourth class traffic I took Sydney as the starting point.

This will explain the rates which I shall quote.

It would, of course, have been perfectly possible to have got at the revenue with greater exactness, but it would have taken much time and labour, and the result which has been arrived at is sufficiently accurate for all purposes. If anything I consider it is to the advantage rather than to the disadvantage of the promoters of the line.

The following tonnage was extracted from our books, and is a faithful record of the traffic carried during 1886 :—

<i>Cobar—Inwards Traffic.</i>						£	s.	d.	
A Class,	1,229	tons to Nyngan,	at 4/4	=	266	5	8
" "	91	" to Coolabah,	at 1/9	=	7	19	3

						£5,307	15	6	
Add 10 per cent. for probable increase						...	530	15	6
						£5,838	11	0	

It is but right for me to state that the gentlemen assured me that the output of copper from the Cobar mine last year was 2,318 tons, but that in consequence of the bad roads, caused by the wet weather, a large quantity had to be kept at the mine until the roads improved. (I notice from the petition submitted to the Legislative Council in September last that the output of copper for ten years had been 19,050 tons, equal to 1,905 tons per annum.) I am not, of course, in a position to say what the output of copper really was, although I see from the Minister's minute of the 30th March that the deputation informed him that it amounts to about 2,000 tons per annum.

Admitting that 2,318 tons was the output, and that that quantity would have been forwarded if the roads had been good, the additional revenue which would have been derived from the balance (615 tons) would have been £269 1s. 3d., and from 1,263 tons of A Class traffic, which they asserted was sold at Nyngan and taken to the Cobar district, the revenue, calculated upon the rate from Orange, would have yielded £273 13s., making £542 14s. 3d., which, added to my estimate of £5,338 11s., shows a probable revenue of £6,381 5s. 3d.

Then again, on the assumption that the passenger traffic would be double that carried by the coaches in 1886, it was asserted that the revenue which might be expected therefrom would amount to £1,688; but from other sources I was informed that that estimate is too sanguine, and I prefer to adhere to my own of £1,000, with 10 per cent. added.

It

It was also said that our estimate of the wool and live stock traffic is considerably under the traffic which may be expected. That would very probably be the case if seasons like the present were to continue; but I feel confident that, taken as an average, my estimates are not very wide of the mark.

It will also be noticed that I have based my estimates on the assumption that all traffic other than that for Nymagee (which I shall refer to presently) will be carried the full length of the line, although, as a matter of fact, a certain quantity of it in the shape of station supplies, wool, and possibly live stock, would be picked up and put down at intermediate places.

I have also calculated all traffic at the tonnage rates under all classes, notwithstanding the probability, I might say the certainty, that a considerable quantity of A and Miscellaneous class traffic, as well as sugar, wire, and galvanized iron, were carried at truck rates, in which case the revenue derived therefrom would be less than I have shown.

And as regards the mails, although I have credited the line with £984, I think it necessary to state that the present mail services between Nyngan and Cobar and Nyngan and Nymagee only cost the country £825 altogether—Cobar £460, and Nymagee £365. If the railway is constructed it is probable that the cost of the Nymagee service will be reduced to something like £200; hence the Postal Department would be paying £1,184 or thereabouts for a service (undoubtedly a very much better service as far as Cobar is concerned) which now only costs £825.

But a more important consideration than either of these is, that while at Bourke (whither I had gone to make inquiries concerning the trade of the district) I ascertained from a reliable and disinterested source that a quantity of supplies have come up the river to Louth for Cobar, and that more were advised.

Mr. Barton and Mr. Morrison assured me that my information was only very partially correct—that, in fact, no goods had come up the river for Cobar, with the exception of a small consignment for Mr. Barton's own firm; but I have again been assured of the correctness of the information I got at Bourke, and think there can be little doubt that if the supplies did not actually go into the town of Cobar, they at least went into the district; so that when the river is navigable the railway would either have to carry at reduced rates, or lose a quantity of the very class of traffic from which the greatest revenue is derived.

With respect to the firewood traffic it was maintained that the Cobar mines consume 70,000 tons a year, and that the whole of that quantity would be conveyed by railway. In conversation with the gentlemen I made use of the arguments mentioned in the Traffic Manager's minute of the 2nd instant, and while they recognized the force of the reasoning, they asserted that the Copper Company's experience of their present tramway was such that it is extremely improbable they will construct another.

The revenue from this source is, in my opinion, very speculative. I cannot, of course, say that it will not be realized, but I am very doubtful of it. I cannot help thinking that, despite their first experience, the Copper Company could construct and maintain a tramway (even 20 miles long) very suitable in every way for their purpose for a good deal less than £7,054 a year, rolling stock included, and unlike the railway line, the tramway could be moved from one direction to another as circumstances require.

Admitting, however, that the company were to get all their wood by rail, the time must come when the whole country on either side of the line will be denuded of timber for such a distance that the cost of landing it at the mines will be greater than the cost of coal from Eskbank or Dubbo; and as pointed out by the Traffic Manager, the revenue to be credited to the line in respect of the coal traffic would be little more than half the estimate of £7,054.

Moreover, I am informed that, so far, the country is only cleared of timber for a distance of about 10 miles from the mines, so that, unless by special arrangement, instead of a revenue of 2s. per ton we would only get 1s. 6d. from the commencement up to a distance of 15 miles, and that would reduce the estimate of £7,054 by 25 per cent.

3rd " 80 " Orange, " 20/ ...	= 80 0 0	At 5/8 = 22 13 4
" " 235 " Sydney, " 18/3 ...	= 214 8 9	At 4/3 = 49 18 9
4th " 12 " " " 23/5 ...	= 14 1 0	At 5/5 = 3 5 0
Wool, 653 to " " 6/9 ...	= 220 7 9	At 3/ = 97 19 0
Copper, 1,260 " " " 5/2 ...	= 425 10 10	At 1/2 = 73 10 0
Parcels	= 15 0 0 = 5 0 0
Passenger traffic	= 500 0 0 = 100 0 0
	£1,771 13 0	£433 2 3

The gentlemen who met me claimed that my estimate of the wool traffic is too low in this case also; and, as in the case of the Cobar traffic, I would readily admit their statement if good reasons could be depended upon.

Experience, however, teaches us that the estimate I have given will be tolerably correct.

They also contended that as 1,777 tons of copper is the output of the mine, the line should be credited with that quantity. Even that, however, would only increase the above estimate by £133 11s. 2d., or £30 3s. 2d., which would bring it up to £1,905 4s. 2d. in the event of the traffic being delivered at Budd's Gap, 52 miles, and £463 5s. 5d. in the event of its being delivered at Dawson's, 12 miles, west from Nyngan. I found it very difficult to obtain anything like disinterested information respecting the best road, but it is quite clear that the one from Dawson's, even if it is longer, is well watered, while the other is not.

For

For the purposes of this report it will perhaps suffice if I take the mean,—

£1,905	4	2
463	5	5
<hr/>		
£2,368	9	7
<hr/>		
£1,184	4	10
To which add for estimated increase, 10 per cent.,	118	8 6
<hr/>		
£1,302	13	4

It will thus be seen that, even taking the volume of traffic now admitted by the Cobar League, and allowing for the exceptions to which I have drawn attention, the probable additional revenue which might be expected from the line in the event of its being constructed would be—

From Cobar traffic (except firewood)	£6,326	12	8
Firewood (estimate of Railway League)	7,054	0	0
Nymagee traffic	1,302	13	4
<hr/>			
Total	£14,683	6	0

nearly half of which is to come from firewood.

The Traffic Manager's estimate, including £2,083 for the conveyance of firewood, but exclusive of the probable increase of 10 per cent., and two or three other items, amounting in the aggregate to about £1,200, was £7,600 to £8,400, according to the point at which delivery of the Nymagee traffic might be made.

As far as the Railway Department is concerned, I can come to no other conclusion than that there is no probability of the line paying now or for many years to come, unless some unforeseen development of the district takes place.

The only favourable consideration that suggests itself to me regarding its construction is that there is an enormous quantity of Crown Lands along the proposed route, upon which a certain amount of settlement would doubtless take place, and although the line would result in a loss to the Department it would probably benefit the general revenue to a considerable extent in the shape of increased rental from those lands.

That, however, is a question with which I am not in position to deal, nor am I called upon to do so.

DAVID KIRKCALDIE, 28/4/87.

Traffic Manager.

Since writing the above I have received the attached communications from the Manager of the Nymagee Copper Mine respecting the most suitable road from the line to that town. Evidently he and others are in favour of Budd's Gap, while the *Nyngan Times*, which has persistently spoken in favour of the construction of the line, condemns that road in the most unqualified manner; and, unless my memory misleads me, the Commissioner received a petition against it some time ago.—D.K.

The Manager, Nymagee Copper-mining Co., to The Assistant Traffic Manager.

Sir,

The Nymagee Copper-mining Co. (Limited), the Mine, 27 April, 1887.

By this morning's mail I have a letter from Mr. Grainger Barton asking me to send you any articles or letters that may have been written advocating the opening up of a new road to Budd's "Gap Inn," as the nearest road to the Nyngan-Cobar railway.

I enclose three cuttings from the local paper and a copy of resolution passed at a meeting of the Nymagee Progress Committee on the 8th November, 1886.

On completion of the line to Budd's the Nymagee traffic will undoubtedly go there, as it is the shortest and best road available.

There are three possible roads, viz., to Budd's, to Hall's, and to Nyngan, and the distances are, in the order named, 40, 50, and 65 miles.

Yours, &c.,

W. BLAKEMORE,

Manager.

[Enclosures.]

Nymagee, 27 April, 1887.

Extract from Minute-book, 8 November, 1886.

PROPOSED by A. C. Daws, seconded by Mr. Henessy, that a petition be presented by Messrs. Wilkinson and Barton, praying that a road be surveyed and opened from Nymagee to the nearest point on the Nyngan-Cobar line.

ALFRED COOK,

Secretary, Nymagee Progress Committee.

Extract from *Nymagee and Cobar Star*, Saturday, 22 January, 1887.

To the Editor.

SIR,—It is only a short time since that the road from Nymagee to the "Gap Inn" was always considered 50 miles in distance. The Government map shows the distance, in a bee line, as between 38 and 39 miles. Yet two or three disinterested parties have found a beautifully level road—no hills at all, and some few miles shorter. Now I, being individually interested, felt an inclination to see this new road, and therefore inspected their discovery, and, as I supposed, found, as I have often heard it described, the roughest and most damnable in the back country, passing over hills, up and down rotten gullies at the foot of hills, the road acting as a conductor for the rush of water, which has worn out gutters, and almost ravines—particularly tempting for any vehicle at night to camp in, bottom-side upwards—finishing off with a hill named "The Gap," which I should like to see some of our 6 and 8 ton copper teams tackling, with a distance in all, I imagine, of about 46 miles. I judge the distance by the ground my horses can cover in a given time, as they are no "wasters," and are not easily killed or knocked out of it with a little extra fast travelling. Hearing that a numerously-signed—without respect to persons—requisition had been signed for a survey of this particularly short and good road, I inquired who had signed it, and found one of the leading business men in Nymagee who had done so. On my asking him if he had ever travelled the road, and his reason for signing such a thing, he admitted that he had not, but that the discoverers had, and they had assured him that it was only between 35 and 37 miles, and "superbly level." Now I should like to know if these parties worked for the interest of the shareholders

shareholders of the Nymagee Copper Mine, and the benefit of the public, or for self alone. Facts will show. The distance from Hermitage Plains to Nymagee by survey is $42\frac{1}{2}$ and $44\frac{1}{2}$ miles, through an undeniable country, the latter survey being adopted and resumed by the Government for the use of the public. Will the extra cost of trainage from here to the "Gap Inn," a distance of $23\frac{1}{2}$ miles (with perhaps extra carriage, as it is impossible to bring anything like the load along the "Bowling Green" that can be carried along this road) be a matter of any moment to those who have to pay the shot; or will the fact that the mails can be delivered at Nymagee an hour and a half sooner from here be of any importance to the people of Nymagee. No doubt the people of Nymagee love the promoters much, but it is only human nature to love the pocket more, which fact, I believe, time will show. I give the promoters great credit for the pluck they have shown in trying to carry this forlorn hope, but I fear it is a forlorn log that will never roll. The interest I take in the public's well-doing—not in my own—must be my apology for trespassing so much on your space.

Yours truly,
H. F. HALL.

Hermitage Plains, 17 January, 1887.

EXTRACT from *Nymagee and Cobar Star*, Saturday, 29 January, 1887.

To the Editor.

SIR,—In your issue of the 22nd January appears a letter, presumably from Mr. Hall, of the "Pigeon Holes," a wayside hotel on the Cobar and Nyngan road, of which place, I believe, he is the owner. Bearing this fact in mind may help your readers to arrive at a very different opinion as to Mr. Hall's object than the one given in the concluding paragraph of his letter. He begins by saying that the road from Nymagee to Budd's was (till lately) always considered to be 50 miles. Such an idea never existed except in Mr. Hall's very fertile brain. This, with some other misstatements, and the bogus plea as the end of his letter call for some explanation. Had Mr. Hall allowed the utility, or otherwise, of opening the new road to rest on its merits, or had stated the case fairly, no one would have had reason to complain. This he has not done, hence this letter.

He says some "disinterested persons," discovered a "beautifully level road," no hills at all, and a few miles shorter than the bee line between the two places. Nobody ever said anything of the kind. What they did say was this: Half a mile after passing the Frenchman's a level road, and a sound one, could be open to Budd's, and that the distance would be under 40 miles. It is quite evident from Mr. Hall's letter that he did not see, or go anywhere near the line of the proposed new road, or he would never have written about the hills and rotten gullies forming the most "damnable," road in the back country. It strikes me Mr. Hall has lived so long in the level western country that the sight of a molehill has terrors for him, that appear ridiculous to more experienced travellers; or is it that he is grieving over the prospective demand on his sympathy for the poor teamsters that may have to travel the new road. Further on he says he should like to see some of our teams, with 6 or 8 tons of copper, attempting this road. Well, however much it may surprise him, such loads have been taken over the particular part of the road he describes "most damnable," and which is still used by the mail coach from Cobar, and any other vehicles travelling in that direction. During the early part of 1881 all the copper and regulus made in Nymagee was sent to Cobar, and fire-clay brought back from the Limekilns, over this very road. The carriage rate was much lower than is being paid now from Nyngan. The weights of various loads, with the names of the carriers I append for Mr. Hall's special benefit, which I trust may save his digestion, render his sleep lighter, and prevent him wasting his sympathy on undeserving objects. These are the names and weight:—

	Carrier.	Weight of load.			
		Tons.	cwts.	qr.	lb.
March, 1881.....	Harlow.....	7	15	3	15
April, ".....	Ralph.....	7	1	0	10
".....	Elvard.....	5	12	1	5
".....	Ryan.....	7	1	3	13
".....	Bourke.....	6	6	2	17

These instances are, I think, sufficient to show that even the "old road," still in use, is not what Mr. Hall wishes to make it appear. Personally, I consider it to be, without exception, the best piece of road I have seen this side of Orange, and for this season. From the foot of the Gap to the extreme end of the hills the road crosses the foot of every low spur, and, as they are all granite, the teamster has a road under him which he can travel on in any weather. Once across this piece of road the teamster is on the flat red soil country (of exactly the same description as the 'undeniable' country between Nymagee and Hermitage Plains), which is impassable for heavily loaded teams in wet weather, as are all other roads in this district without exception.

In case any one may not know, I may here say that the road to Cobar and to Budd's are identical as far as the "Rock-holes," from which place Budd's lies almost north, and Cobar nearly west.

Now as the "disinterestedness" of those people who took the trouble to ride through the bush on a hot day for the purpose of seeing if a new and better road could be found. Does Mr. Hall imagine that a number of sane business men would throw away two days on such an errand, unless they had good reasons for so doing? Their reasons were, as I have stated, to get a short road to the railway, with subsequently a reduction in the rates of carriage. Unlike himself, I am afraid few of them can lay claim to such lofty motives as, according to his letter, prompted Mr. Hall to write. The object of the journey was attained, and the result will be, if the road is opened, of which I have little doubt, that Nymagee will be one day nearer Sydney, with carriage rates proportionately lower. Another statement concerning the length of the road from Nymagee to the "Pigeon Holes," or "Hermitage Plains." Mr. Hall gives it as $4\frac{1}{2}$ miles. This cannot be correct, as it is $43\frac{1}{2}$ miles in a bee line as shown on the Government plan. Taking a similar line to Budd's from Nymagee, the distance is 38 miles, and I am quite sure the new road can be made under 40 miles. The present road is no more.

There is one other matter I must refer to, and that is the delivery of the mails in Nymagee. I believe the new road will be certainly not less than 10 miles shorter than to Hall's. It follows then that the coach would be two hours less on the road. One of these two would be lost by the train traversing the distance between Hall's and Budd's. The time lost in delivering the mail would be the same in both places, so that there would be a clear gain of one hour, and that is worth consideration, two hours less on the road for mail coach passengers, who could be comfortably in bed after seven or eight hours travelling, instead of being all night on the road as they are now.

The next time Mr. Hall favours you with a letter I trust he may exercise a little self denial, and give some of us in Nymagee a little credit for honesty of purpose, but if he should unfortunately claim a monopoly of that particular virtue we will try to forgive him, when we remember that it is for the "public" good, and not his own, that he is taking so much trouble.—Yours, &c.

W. BLAKEMORE.

Mr. G. Barton to The Assistant Traffic Manager.

Dear Sir,

Cobar, 2 May, 1887.

Herewith I beg to hand you full statement of the quantity of sheep depastured in the Cobar district, with the quantity of wool shorn last year, and the estimated cost of stock for 1887. You will see that the stock have been left out on some of the stations, as we could not get the necessary information in time. However, we have got the correct quantity of sheep, and hence the correct quantity of wool. The stations that sent their wool by river this year were Booroondara, Wittagoona, Pullpulla, Gidgee, Barnoto, Paddington, Bulla Bulla, Tielhour, Nekator, Marfield, Mount Manari, Baden Park, Kew, and Keewong.

The greater part of all the above wool went by Darling river steamers, and some to Hay, and thence down river to Melbourne, while some of them sent some *via* Nyngan, and if the Railway were constructed here, all of it would have come this way, and gone to Sydney, and as to this statement I challenge contradiction.

There

There was also a portion of Eremeran and Overflow wool went to Orange. As regards the stock to be trucked,—this item was estimated early in the season, and since the season has turned out so good there will be more fat stock to go to market than was estimated earlier in the season.

The stations that have sent their wool by Coolabah and Byerock, are Coronga Downs, Tindary, Moguilambo, Buckwaroon, and Amphitheatre. I think all these went to Coolabah, and as I said before, it was simply a matter of choice that they did not go to Nyngan. The fact is, there is a contractor living on the Coolabah road, who was out of work, and he entered into a contract to remove all this wool, and as he lived on the road it suited him to take it to Coolabah, which may probably never happen again, as he is about to remove from the district, so it will not be fair to estimate these stations as sure to send to Coolabah, and thus only give the proposed Cobar line credit for a few miles of the traffic. It certainly should have credit for the lot.

Re your statement as to being able to land goods here from Adelaide, and that a large quantity had been received here from that place, you have simply been misinformed. There has been only 5 tons of goods come from Adelaide during the last five years, and since seeing you I have gone fully into the matter, and I find we could not buy goods nearly as cheap in Adelaide, nor can they be landed here at the price you were informed, viz, £6 5s, as by estimating insurance, agency, land carriage, &c., it would cost at least £8 for all classes of goods, so there is nothing to be gained, as we can land A. B. special and 1st class goods here from Sydney very much lower, which would more than make up the difference. For instance, flour at Milong, S.A. is £9 per ton; say freight to Louth, £2 10s.; by drays to Cobar, £3; insurance, commission, &c, &c, say 10s. per ton,—which equals £15, landed here.

Now, to take the other side, Wellington price is £9 15s., say freight to Coolabah, 13s. per ton, and carriage from there by bullock teams, £1 5s., which equals £11 13s. per ton, which shows a saving of 67s. per ton, as against Adelaide, which would more than make up for the small saving on other goods.

In thinking over your statements that the Bourke people informed you that had the squatters not have entered into definite arrangements to forward their wool by rail before the river rose, it would have all gone by river. Now with all due deference to the Bourke people that statement is utterly untrue; as a matter of fact M'Allister and Lee are agents for nearly all the station-holders in the Bourke district, and as a matter of fact they do not contract for wool at all, but act simply as agents for the squatters, and in most cases at a fixed salary per annum to do all their agency work, and where they don't get a salary they get 6d. or 1s. per bale for shipping by steamer or train, so in no case would the squatters be bound to send by train as against river owing to previous arrangements. And as to Wright, Heaton, and Company, and Permewan, Wright, and Company, they contract for wool near the river. The squatters always have a proviso in the agreement, that in the event of the river rising they shall be at liberty to send the wool away by steamer if it suits them.

These are statements I am prepared to prove if necessary. Their statements to you were about as truthful as their sworn testimony as to the carrying capabilities of this country, and were only made to gain their point, and all they can say will not make this district anything but a first class agricultural country.

Yours, &c.,

GRAINGER BARTON.

Acknowledge receipt and say that my report had been sent in before the communication arrived, but I shall send it forward to put with the other papers.—D.K., 5/5/87.

There is nothing in this letter which would induce me to modify my report in any way. As regards Mr. Barton's statement that only 5 tons of South Australian goods have gone into Cobar during the last five years, I can say that from a very reliable source I was informed that at least 60 tons of general goods have come up the river to Louth for stations between there and Cobar, within the last few months, which would have gone by railway if the river had not been navigable.—D.K., 5/5/87.

Commissioner.—W. V. READ, 6/5/87.

Minute by The Commissioner for Railways.

It will be seen that crediting the line with £7,054 for the carriage of firewood (an estimate, however, as to the realization of which grave doubts are expressed) and calculating the traffic on a liberal basis the revenue is increased to £14,683.

The local committee estimated it at £21,629.

We ought to realize, to pay working expenses (estimated on a low scale) and interest upon capital, at least £23,000 a year.

We cannot raise the rates because we have the river traffic to contend with at Louth.

CH.A.G., 3/5/87.

For Minister's information.

J. Penzer, Esq., M.P., to The Secretary for Public Works.

Re Cobar Railway.

A GENTLEMAN forwards me the following reasons why the line should be made:—

- 1st. That several more copper mines would be opened out and worked if a railway was made.
- 2nd. The hardwood sleepers proposed in the specification would have to be brought from Dubbo, about 140 miles, while pine of the best quality all along the line can be had for one-third the cost. The cost of fencing should not be more than £50 per mile.
- 3rd. One train per day would satisfy the people of the district.
- 4th. People who now send their wool down the river would find it cheaper to send it to the railway on account of the high rate of the marine insurance.
- 5th. The most expensive and deepest cutting on the line could be entirely avoided by a detour of 15 chains, and the grade reduced from a very steep and difficult one to a very easy one.

J. PENZER, 31/5/87.

The Manager, Great Cobar Conper-mining Co., to The Secretary for Public Works.

Great Cobar Copper-mining Company (Limited),
131, Pitt-street, Sydney, 9 June, 1887.

Sir,

My Board have instructed me to write you anent proposed railway from Nyngan to Cobar.

By way of inducement to proceed with the immediate construction of the line, I am desired to state that the Company would, if it were deemed desirable by the Government, be prepared to enter into a bond which should embrace the following stipulations, viz.:—

- 1st. That assuming an addition to the present rate of £2 9s. 2d. per ton for carriage of copper from Nyngan to Sydney, 378 miles, at 9s. per ton for the extra 90 miles, Cobar to Nyngan, which would make the rate from Cobar to Sydney £2 18s. 2d., the Company should be charged on all copper despatched from the mine to Sydney, instead of £2 18s. 2d., the rate of £3 7s. 2d., an increase of 100 per cent. on the rate of the increased mileage.
- 2nd.

2nd. The same scale of increased carriage to apply to all goods forwarded from Sydney to Cobar for the use of the mine.

3rd. Firewood, which will likely be required to be brought in large quantities to the mine for a distance of 5, 10, 15, or 20 miles, more or less, to be exempted from this suggested abnormal increase of carriage rate.

4th. That the arrangement thus contemplated should have a currency of five years from the opening of the railway from Nyngan to Cobar.

I may add, that my Board consider it not unlikely that were storekeepers, squatters, and others interested in the district surrounding Cobar invited to come under similar obligations their assent would be obtained, and thus ensure beyond doubt the remunerativeness of the line.

I have, &c.,
JAMES WATT,
Manager.

The Manager, Great Cobar Copper-mining Co., to The Secretary for Public Works.

Great Cobar Copper-mining Company (Limited),

131 Pitt-street, Sydney, 10 June, 1887.

Sir,

My Board have instructed me to write you anent proposed railway from Nyngan to Cobar.

By way of inducement to proceed with the immediate construction of the line, I am desired to state that this Company would—if it were deemed desirable by the Government—be prepared to enter into a bond which would embrace the following stipulations, viz. :—

1st. The Company, in addition to the present rate of carriage, £2 9s. 2d. per ton from Nyngan to Sydney, should be charged for the additional mileage from the nearest point to Nymagee of the proposed railway line, where the company would deliver copper, in addition to the proportionate rate 100 per cent. more for carriage to Nyngan.

2nd. The same scale of increased carriage to apply to all goods forwarded from Sydney to said point for the use of the mine.

3rd. That the arrangement thus contemplated should have a currency of five years from the opening of the railway from Nyngan to Cobar.

I may add that my Board consider it not unlikely that were storekeepers, squatters, and others interested in the districts surrounding Nymagee invited to come under similar obligations their assent would be obtained, and thus ensure beyond doubt the remunerativeness of the line.

I have, &c.,
JAMES WATT,
Manager.

Barton Brothers to The Secretary for Public Works.

Sir,

Cobar, 9 June, 1887.

As we are by far the largest storekeepers at Cobar and Nymagee, we beg to state that we are agreeable "if it would be any inducement to the Government to construct the railway from Nyngan to Cobar," to enter into a bond with the Railway Department to pay double freight upon all goods between those places for the time of five years from the opening of the line for traffic—always providing that such extra freight shall be the regulation charge for all goods to all people.

We have, &c.,
BARTON BROTHERS.

Minute from The Engineer-in-Chief to The Secretary for Public Works.

Department of Public Works, Railway Branch,

Engineer-in-Chief's Office, Sydney, 5 January, 1887.

Intermediate Stations on the Nyngan-Cobar Railway.

I ENCLOSE two applications for stations on the railway from Nyngan to Cobar, and suggest that an officer of the Traffic Branch be instructed to inspect the country and report on the most suitable positions for stations or platforms, and the extent of accommodation required in each case. There is a public water tank at Hermitage, 18 miles from Nyngan, another at Muriel, 20 miles beyond, and a third at Booroomugga, 20 miles further, from which it is intended to obtain water for locomotive engines, and it would be advisable to place the stations or platforms near these tanks if possible.

J. WHITTON.

Peele, Borradaile, & Co. to The Commissioner for Railways.

Proposed Line of Railway from Nyngan to Cobar.

Sir,

Sydney, 17 November, 1885.

We have the honor to address you on behalf of Messrs. Alison & Son, of Meryula station, near Cobar, and to submit to you the advisability of making a siding at the following point of the proposed lines, viz., at the peg marked ^{4.4.5}, opposite Ross Tank, and about 5 chains from the hotel on the north side of the road.

In support of the above recommendation, we are informed that the traffic from this proposed siding will embrace between 3,000 and 4,000 bales of wool during the wool season, and the goods for all the surrounding stations throughout the year, also considerable passenger traffic.

Trusting you will give this matter your favorable consideration,

We have, &c.,
PEELE, BORRADAILE, & CO.

Forward to the Engineer-in-Chief.—CH.A.G., 20/11/85.

Mr.

Mr. H. B. Hall to The Commissioner for Railways.

Sir,

Hermitage Plains, 28 December, 1886.

I beg to intimate that Hermitage Plains is $26\frac{1}{2}$ miles from Nyngan, on the Nyngan to Cobar railway line; that there are three woolsheds—one 10 miles distant, one 7 miles, and one 8 miles, the latter being a leasehold of six 10-mile blocks, held by Messrs. B. J. Fink & Co., all their sheep being shorn at this shed; that this is the nearest practicable point of the line for the Nymagee and Southern Districts, and I therefore trust you will take the matter into your favorable consideration with the view of having a station erected at this point, and take the liberty to refer you to the Hon. John Lackey and Mr. Russell Barton, M.L.A., who are both aware of this necessary convenience.

I am, &c.,

HENRY B. HALL.

Engineer-in-Chief.—CH.A.G., 31/12/86. Railways.—J.R., 6/1/87. Traffic Manager to obtain report.—CH.A.G., 9/1/87. Please see report attached from the Goods Superintendent, and in connection with the whole subject be good enough to refer to my minute of this date on your 87-4,210.—D.K., 4/3/87. Commissioner. End of month to ascertain decision of Government in regard to this railway.—CH.A.G., 10/3/87.

Report of Mr. Goods-Superintendent Harper.

As directed by you I visited Nyngan for the purpose of inquiring as to the most suitable site for station and siding accommodation on the projected line to Cobar.

The whole of the intervening country between Nyngan and Cobar is of course purely pastoral, and the only settlement outside the employees of the pastoral tenants are the four or five roadside public-houses, and consequently the only traffic of any real importance will be to Nymagee, which is distant 36 miles in a direct line from the nearest point of the line. The present average tonnage carried from Nyngan to Nymagee by road is, to Nymagee 90 tons per month, and from Nymagee 50 tons per month; and the number of bales of wool for the whole district tapped by the Nyngan station, 14,000 bales. It will thus be seen that very limited and inexpensive appliances should meet the demand in the shape of station buildings.

The most important point to settle is of course the location of a site for the station to receive the Nymagee traffic, and I found local opinion very strongly divided on the subject.

The present route is from Nyngan to a public-house on the Cobar road 12 miles from that town, thence *via* a road 53 miles in length to Nymagee, along which three tanks have been constructed by the Roads Department at a cost of £7,000. This road is naturally favoured by the Roads Department, and it is stated that the worst portion of it is that between Nyngan and Dawson's, and there is no doubt that it will continue to be used to a certain extent even should another route be selected. My impression is that at least temporary accommodation should be supplied at this point until a good practicable road for heavy loading is elsewhere provided for. Six miles beyond this is Hermitage Tank, which it is intended to use for watering purposes. At $27\frac{1}{2}$ miles is Hall's public-house, from which point a surveyed road joins the Nymagee Road, the distance from Hall's to Nymagee being 46 miles. By many people this route is favoured, but it is not provided with Government water, and is not viewed as a good one by the Roads Department. A road from Girilambone crosses the line at this point, and, as stated, there are three wool-sheds in the immediate vicinity, which would warrant, I think, its being made a stopping-place, awaiting the development of traffic to provide siding accommodation. At a point 38 miles from Nyngan is Muriel Tank, which it is proposed to use for watering purposes, and I understand that a petition is being extensively signed to locate the station for the Nymagee traffic at this point. If this is so, and there is no difficulty in the way of constructing a road, I need scarcely say that it will suit the Department admirably, as we shall obtain an increased mileage as against Dawson's of 26 miles.

At 50 miles from Nyngan is another hotel called Budd's, and this is the nearest point on the line to Nymagee, the distance in a direct line being about 36 or 37 miles. The country, however, is somewhat broken, and opinions differ as to whether a practicable road can be made, and strong exception will be taken to it by several Crown tenants. The Nymagee people petitioned the Roads Department some time since with a view to having this road made in anticipation of the railway, and there is a quantity of correspondence on the subject. Of course the argument as to increased mileage applies with more force in this case than with Muriel, but there is at present no water supply. At 58 miles is Burrumugga Tank (a watering-place), where, I think, a siding should be put in to receive wool from the country lying between that point and Cobar (81 miles), whilst at Ross's, 67 miles, I think a stopping-place would meet the requirements. As a matter of fact, Ross's is closer by some 6 miles to Messrs. Alison and Sons' home station, but I think we should consider the fact that at Burrumugga we have water available, and the cost of carrying wool some 5 miles further would scarcely outweigh this consideration. I do not suggest any other siding accommodation on this line, as I have no doubt you will agree with me that it is far more desirable to await the development of the traffic. I do not expect, from what I gathered, that we shall carry much stock from any intermediate points, and the question of trucking-yards might be allowed to stand.

I would strongly urge in conclusion that whatever station buildings or platforms are erected should be of the simplest and most inexpensive character.

J. HARPER, 21/2/87.

The Traffic Manager.

Memo. by The Chief Clerk.

* * * * *

SINCE the above reports were written, it has been decided to re-survey and cross-level portions of the present line, and get the best possible section with gradients, if practicable, of not less than 1 in 100. This work is now in progress. D.C.M'L., 15/9/87.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY, HOMEBUSH TO WARATAH.

(RETURN IN REFERENCE TO.)

Ordered by the Legislative Assembly to be printed, 29 November, 1887.

[Laid upon the Table of the House in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 8, on Votes and Proceedings of 26 October, 1887.]

QUESTIONS AND ANSWERS.

- (1.) What amount has been paid to the contractors for the railway bridge at Peat's Ferry? £116,552 11s. 6d.
- (2.) What security is held for the due performance of the work? £10,000, and ten per cent. retention money.
- (3.) In what state is the work now? Caisson No. 1 has been sunk to a depth of 53 feet below the bed of the river, and is within a few feet of its proper depth. Caisson No. 2 has been floated out and moored, but not yet placed in position. Caisson No. 3 has not yet been placed in position. Caisson No. 4 has been founded to its proper depth, and the masonry pier is in progress. Caissons Nos. 5 and 6 are in progress, as are also the abutments, and the superstructure for one span has been delivered at Dangar Island.
- (4.) Is it true that on sinking the cylinders it has been found necessary to go to a greater depth than was contemplated by the Engineer-in-Chief? No.
- (5.) Is it true that the cylinders put down are resting on water-worn boulders, and not on solid rock? The Caissons were not intended to reach solid rock, and no water-worn boulders have been met with in sinking them.
- (6.) Did any officer of the Railway Department inspect the foundation upon which the cylinders have been placed; if so, when, and who was the officer? As the proposed level of the foundations is about 125 feet below the bed of the river, it goes without saying that no officer of the Railway Department did inspect them.
- (7.) Is there any Inspector continually employed for the purpose of overlooking this work as it proceeds? There are five Inspectors continually employed under the District Engineer in charge of the works.
- (8.) Is it specified in the contract for this work that the iron to be used should stand a certain test; if so, has that test been made; and when, where, and by whom? The steel for the superstructure is tested by the Inspecting Engineer in England.
- (9.) What is the height of the stone embankment across the shallow channel to Dangar's Island, above ordinary spring tides? There is no embankment to Dangar Island. The height of the embankment to Long Island varies from 8 to 28 feet above high-water level.
- (10.) Is there any reliable record in the Railway Department of the height to which flood-waters have reached in that channel? Yes, a little over 3 feet.
- (11.) Is the present embankment to be allowed to remain at its present height? Yes.
- (12.) Was the wharf at Dangar's Island, at which the Gosford steamer calls, put up at the expense of the Government; if so, for what purpose, what did it cost, and from what fund was it paid for? The wharf at Long Island, at which the Gosford steamers call, was constructed at the expense of the Railway Department, and will be paid for from the Vote for the Homebush-Waratah Railway. It was built for the accommodation of the traffic coming to the railway from the Hawkesbury River. The cost cannot be stated at present, as the final measurement has not been made.
- (13.) Has any representation been made by the Commissioner or other officer to the contractors for the bridge, that the work is not being proceeded with as speedily as is required by the contract? No, as the rate of procedure is not provided for in the specification. The whole of the work is to be completed in 2½ years from the 20th May, 1886, the date on which the contract was signed, under a penalty of £250 per week, with a bonus of £250 for every week the bridge is completed before contract date.

- (14.) Has any extra cost (above the contract price) been incurred, or is such cost likely to be incurred in connection with the bridge works; if so, how much, and from what cause? Some extra cost has been, and more may be, incurred, but the total amount cannot be ascertained until the bridge has been finished.
- (15.) What causes the delay in the completion of the contract for the construction of the line from the Hawkesbury to Gosford? Extra lining to the tunnel, and the bad foundations of the embankment along Mullet Creek.
- (16.) Has any extra cost been incurred on that line? (17.) If so, what has been the cost? (18.) Is that cost likely to be increased, and to what extent, and from what cause has it arisen or is it likely to arise? Yes; the total amount cannot be ascertained until the works have been completed and measured.
- (19.) What has been the cost of running the train to Peat's Ferry? The cost of running the train between Strathfield and Peat's Ferry, from the 5th April (date of opening) to 30th September, 1887, was £3,966 14s. 9d. *Note.*—The expenditure which will be caused by the accident at Peat's Ferry, in June, 1887, is omitted from this statement.
- (20.) Has there been any loss on the running; and if so, how much? There has not been any loss on the running, but the line has not paid both working expenses and interest on the capital invested. The exact figures cannot be given until the accounts are balanced at the close of the year.
- (21.) What have been the earnings? £9,392 8s. 3d.
- (22.) The same information with regard to the train from Hamilton to Gosford as in three previous questions? (A.) The cost of running the train between Hamilton and Gosford, from 15th August (date of opening) to the 16th October, 1887, is calculated at £1,350 2s. (B.) There has not been any loss on the running, but the line has not paid both working expenses and interest on the capital invested. The exact figures cannot be given until the accounts are balanced at the close of the year. (C.) The total earnings for the same period amounted to £2,203 17s.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(INFORMATION RESPECTING DUPLICATION OF LINE GRANVILLE TO PENRITH.)

Ordered by the Legislative Assembly to be printed, 4 April, 1888.

[Laid upon the Table of the Honorable the Legislative Assembly, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 2, Votes No. 63, of the 7th March, 1888.]

QUESTIONS AND ANSWERS.

1. What officer in the Railway Service compiled and prepared the estimate of cost of duplicating the Railway Line Granville to Penrith? Mr. G. W. Townsend prepared the original estimate.
2. What was such estimate, and what the actual cost? The amount of Mr. Townsend's estimate was £84,203, and the actual cost of the works provided for by him and included in his original estimate was £98,493 3s. 3d., a difference of £14,490 3s. 3d., of which £9,900 was for extra earthworks. Additional works, principally new station buildings and platforms, which were not included in Mr. Townsend's estimate, made the total cost £126,505 12s. 8d.

RAILWAYS.

(DUPLICATED LINE, PARRAMATTA TO PENRITH—INSTRUCTIONS TO PROFESSOR WARREN TO INSPECT.)

Ordered by the Legislative Assembly to be printed, 3 May, 1888.

[Laid upon the Table of the House, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 2, Votes and Proceedings No. 86, of the 3rd May, 1888.]

COPY of the Instructions issued to Professor Warren to inquire into and report upon the condition of the Iron Bridges between Parramatta and Penrith.

Sir,

Railway Branch, Sydney, 5 April, 1888.

In view of a difference of opinion which exists with regard to the design and construction of certain bridges on the duplicated line between Parramatta and Penrith, the Commissioner for Railways considers it desirable that an independent report in the matter should be obtained.

To that end, I am desired to ask that you will be good enough to inspect such bridges as are reported to be defective, viz., those between Parramatta and Blacktown, and report upon the girders and abutments of such structures.

I have, &c.,

D. VERNON,

Secretary of Railways.

Professor Warren, University.

1887-8.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

ST. PETERS-LIVERPOOL RAILWAY.
(PETITION IN FAVOUR OF--T. A. DAVIS, CHAIRMAN OF PUBLIC MEETING, CANTERBURY.)

Received by the Legislative Assembly, 11 October, 1887.

To the Honorable the Speaker and the Honorable the Members of the Legislative Assembly.

The humble Petition of the residents of Canterbury, in Public Meeting assembled,—

SHOWETH:—

1. That at the present time there is a population exceeding four thousand (4,000) souls in the Municipal District of Canterbury.
 2. That your Petitioners living within six miles of Sydney are compelled to lose upwards of two hours in daily transit to and from the city.
 3. That your Petitioners are living midway between Illawarra and Southern and Western Railways.
 4. That the construction of the St. Peters-Liverpool Railway will open up a large suburban area, the carrying profits of which will help to subsidise some of the non-paying lines in the interior.
 5. That the construction of proposed railway will shorten the distance between Sydney and Liverpool about six miles.
 6. Your Petitioners would also point out that nearly all the landowners have signed a bond undertaking to transfer land required for above railway free of cost to the Government.
 7. Your Petitioners would also point out that in the event of any accident or block occurring on the present suburban line, the construction of above railway would not only relieve the present line of all the southern traffic but leave another road open to Sydney.
 8. Your Petitioners humbly submit that living in a large suburban area they have been unjustly treated in being debarred from railway communication with the city.
- Your Petitioners therefore humbly pray that your Honorable House may be pleased to authorize the early construction of the St. Peters-Liverpool Railway.
- And your Petitioners, as in duty bound, will ever pray.

THOMAS AUSTEN DAVIS,
Chairman.

Canterbury, 30 September, 1887.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

ST. PETERS-LIVERPOOL RAILWAY.

(PETITION IN FAVOUR OF—BENJAMIN TAYLOR, CHAIRMAN OF PUBLIC MEETING, BELMORE.)

Received by the Legislative Assembly, 18 October, 1887.

To the Honorable the Speaker and the Honorable the Members of the Legislative Assembly.

The humble Petition of the residents of Belmore, in Public Meeting assembled,—

SHOWETH:—

1. That at the present time there is a population exceeding five thousand (5,000) souls in Canterbury, Belmore, and Salt Pan.
2. That your Petitioners living within ten (10) miles of Sydney are compelled to lose upwards of four hours in daily transit to and from the city.
3. That your Petitioners are living midway between the Illawarra and Southern and Western Railways.
4. That the construction of the St. Peters-Liverpool Railway will open up a large suburban area, the carrying profits of which will help to subsidise some of the non-paying lines in the interior.
5. That the construction of the proposed railway will shorten the distance between Sydney and Melbourne about six miles.
6. That your Petitioners would point out that nearly all the landowners have signed a bond undertaking to transfer land required for above railway free of cost to the Government.
7. That your Petitioners would also point out that in the event of any accident or block occurring on the present suburban line, the construction of above railway would not only relieve the present line of all southern traffic but leave another road open to Sydney.
8. Your Petitioners humbly submit that living in a large suburban area they have been unjustly treated in being debarred from railway communication with the city.

Your Petitioners therefore humbly pray that your Honorable House may be pleased to authorize the early construction of the St. Peters-Liverpool Railway.

And your Petitioners, as in duty bound, will ever pray.

Belmore, October 4th, 1887.

BENJAMIN TAYLOR,
Chairman.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY TO INVERELL.

(PETITION FROM RESIDENTS OF ARMIDALE, GUYRA, TINGHA, STANNIFER, &c.)

Received by the Legislative Assembly, 20 October, 1887.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in
Parliament assembled.

The humble Petition of the undersigned residents of Armidale, Guyra, Tingha, Stannifer,
Wandsworth, and Inverell,—

RESPECTFULLY SHOWETH:—

1. That it would be greatly to the advantage of the whole of the northern districts if a railway is to be constructed from the Great Northern Railway to Inverell, and thence to the north-western districts of the Colony—that the shortest and cheapest route should be chosen, and one that passes through the most fertile country.

2. That a flying survey of the suggested route branching off from Guyra, and passing by Wandsworth and Tingha, made by Mr. Railway-Surveyor Hogg, it has been ascertained beyond doubt that this line would be the shortest, most level and cheapest, and in every way preferable to that from either Glen Innes or Uralla, avoiding, as would be the case on the Glen Innes route, having to pass over the Ben Lomond mountain, and the serious engineering difficulties of construction caused by the Waterloo Ranges, and avoiding an immense outlay for construction on the Uralla route.

3. That a line branching off from Glen Innes at right angles to the Northern line would cost more than double that from Guyra, and would make the journey from Inverell to Newcastle about 25 miles longer than that from Inverell by Tingha to Guyra, in addition to the heavy haulage over the Waterloo Ranges and Ben Lomond mountains, both of which obstructions would be avoided on the Tingha-Guyra route.

4. That the Glen Innes route would necessitate a backward journey by team to the rich tin-fields of Tingha and Stannifer, and that in fact the two last-named places would prefer sending their goods by teams to meet the line at Guyra, rather than adopt the circuitous route by team and railway by Glen Innes.

5. That one effect of the Glen Innes route would be to drive the north-western trade of the Colony to Queensland.

Your Petitioners therefore earnestly pray that your Honourable House will order a trial survey of the route by Guyra, Wandsworth, and Tingha, before any line be determined upon.

And your Petitioners, as in duty bound, will ever pray.

[*Here follow 151 signatures.*]

1887-8.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY TO INVERELL.

(PETITION FROM CERTAIN RESIDENTS OF TINGHA IN FAVOUR OF ROUTE FROM GUYRA.)

Received by the Legislative Assembly, 20 June, 1888.

To the Honorable the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned residents of Tingha and district,—

SHOWETH:—

That your Petitioners thoroughly endorse the policy of the Government in their Railway scheme regarding this district, and pray that your Honorable House will sanction the route from Guyra to Inverell in preference to any alternative route.

And your Petitioners, as in duty bound, will ever pray.

[*Here follow 347 signatures.*]

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY FROM YOUNG TO DUBBO.

(PETITION FROM CERTAIN INHABITANTS OF GRENFELL IN FAVOUR OF.)

Ordered by the Legislative Assembly to be printed 29 May, 1888.

To the Honorable the Members of the Legislative Assembly of New South Wales in Parliament assembled.
HONORABLE GENTLEMEN:—

When the Government Railway Policy of the country is submitted for debate, we, the undersigned, inhabitants of the town and district of Grenfell, petition your Honorable House to consider favourably the projected cross line, and that it may be constructed from Young as the starting point south, thence to Grenfell, Forbes, Parkes, and Dubbo, for the following reasons:—The large and important commercial centres this line would pass through, the enormous amount of tonnage carried at the present time by horse and bullock teams, the fabulous number of sheep and cattle travelled, the prodigious quantity of produce grown, the immense number of bales of wool sent to Sydney, the excellent quality of the soil throughout the whole of this particular route, and also a very important matter in railway communication, the country this particular line would pass through is of such a character that the cost of building would be inexpensive in comparison with other routes. We, your humble petitioners, do pray that this line be constructed at as early a date as possible, as the great traffic which undoubtedly exists warrants the payment of good interest on the expenditure.

The country all along the line Young to Dubbo, has a very large population principally farmers of small holdings, but whose prosperity is painfully retarded for want of a more expeditious and less expensive means of conveying their produce to market than the existing old fashioned method.

Many industries are prevented from being established owing to want of rapid and less costly means of obtaining plant from Sydney, and sending manufactures to market.

Tons upon tons of fruit are simply allowed to rot as it cannot be sent to the already under supplied markets.

The prosperity of the whole district is materially retarded in consequence of having no direct and speedy communication with the metropolis.

Your humble petitioners sincerely pray your Honorable House will be pleased to take the foregoing into favourable consideration.

And your petitioners, as in duty bound, will ever pray.

[Here follow 545 signatures.]

[A similar petition was received from certain inhabitants of the town and district of Parkes, and from certain inhabitants of the town and district of Dubbo. 593 signatures.]

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(PETITION FROM CERTAIN INHABITANTS OF YOUNG FOR CONSTRUCTION OF—FROM YOUNG TO DUBBO.)

Received by the Legislative Assembly, 6 June, 1888.

To the Honorable the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

Honorable Gentlemen,—

When the Government Railway policy of the country is submitted for debate, we, the undersigned inhabitants of the town and district of Young, petition your Honorable House to consider favourably the projected cross-line of railway, and that it may be constructed from Young as the starting point from the south, thence to Grenfell, Forbes, Parkes, and Dubbo, for the following reasons :—

1. That the line advocated is direct, and being almost straight, as the Government map will indicate.
2. That the country through which the proposed line would traverse is rich agricultural soil, and is thickly populated with *bonâ fide* settlers along the whole route, but whose prosperity is retarded for want of a market for their agricultural and pastoral produce. We would also point out that the country referred to is rich in minerals, gold-bearing quartz reefs having been recently discovered and reported to the Mines Department. A new industry in the timber trade would also be opened up, as iron bark and cypress pine grow in abundance along the line, and which are comparatively useless without railway communication to populous centres. As a further proof of the producing capabilities of the soil through which this line would pass, Grenfell District alone (which is comparatively a new place) produced last year 145,000 bushels of wheat, besides a considerable quantity of other cereals.
3. Your Petitioners would further point out that a large tract of country lying west of Young, Grenfell, Forbes, and Dubbo, would be tapped, which up to the present has been almost without a market, owing to the extreme difficulties attending transit; but the richness of this tract of country for pastoral and agricultural pursuits is well known to many honorable Members of your Honorable House.
4. And further beyond all benefits accruing to the inhabitants surrounding the proposed line, it would be a great national benefit, as it would open up immediate communication between the Great North-Western and Great Southern lines.
5. Your Petitioners could produce volumes of substantial evidence in favour of the proposed line, but we think the above is sufficient to command your honorable consideration.

Your Petitioners, therefore, pray that this Honorable House will, in view of the above statements, favourably consider the proposed line of railway.

And your Petitioners, as in duty bound, will ever pray.

[87 signatures.]

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(TRIAL SURVEY COOMA TO BOMBALA—PAPERS, &c.)

Ordered by the Legislative Assembly to be printed, 15 February, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 18th October, 1887, That there be laid upon the Table of this House,—

“Copies of all papers and correspondence in connection with the Trial
“Survey of the Extension of the Railway—Cooma to Bombala.”

(Mr. O'Mara for Mr. Dawson.)

SCHEDULE.

NO.	PAGE.
1. Petition from residents of Monaro to the Minister for Works, urging construction of line. 6 June, 1882	1
2. Mr. Tooth, M.P., to the Minister for Works, referring to above, and asking that survey be made, with remarks. 11 August, 1882	2
3. Mr. Badgery, M.P., and Mr. Tooth, M.P., to the Minister for Works, asking that discontinued survey be completed, and remarks. 21 March, 1884.....	2

No. 1.

Petition from Residents of Monaro.

To The Honorable the Minister for Works.

The Petition of the undersigned residents of Monaro,—

RESPECTFULLY SHOWETH :—

1. That a line of railway is about to be constructed from Goulburn to Cooma, the centre of the northern portion of Monaro. The expenditure for this purpose was submitted by the Government to the Parliament and sanctioned by the latter upon the basis of Statistics, showing the actual population, the products, wealth, and resources of Monaro.

2. Monaro is of such geographical extent that it has a northern and southern centre of activity. The northern centre finds its outlet mainly through Goulburn, while the southern or Bombala portion has always been connected with Sydney through Merimbula or Twofold Bay; and unless Bombala is brought in connection with the Great Southern Railway, *via* Cooma, it must continue to depend for an outlet upon the uncertainty of coastal import and export.

497—A

[817 copies—Approximate Cost of Printing (labour and material), £3 16s. 5d.]

3. The area of that portion of Monaro, which necessarily lies along the coast, and which will be precluded (by the fact of distance) from the Bombala trade to and from the Railway, while Cooma remains the terminus, embraces over one third the advantages of the Southern Railway; and your petitioners desire the material basis upon which Parliament has voted the railway to Cooma; and your petitioners desire the material basis upon which therefore, the fact that without a connection by rail between Bombala and Cooma, the scheme will be only a partial one, and lose a great deal of its advantages.

4. Your petitioners submit that from the generally level nature of the country between Cooma and Bombala, and the absence of any considerable engineering difficulties, besides the abundance of material lying along the line of the proposed railway, the line would not involve any further expenditure than would be warranted by the present traffic, exclusive of prospective increase.

5. The road from Cooma to Bombala has been raised to the rank as first class, but being in a comparatively unmade condition, in order to render it efficient for the traffic as a feeder to the railway, if the terminus were at Cooma, there would certainly be involved a very large expenditure, and one which, if applied to the making of a line of light railway instead, would go far to construct the same.

Your petitioners, therefore, respectfully pray that a sum of money be placed upon the estimates for the purpose of constructing a line of railway from Bombala to Cooma to connect the former with the main Southern line of the Colony.

(And others.)

H. M. JOSEPH, J.P.,
Maharatta.

No. 2.

R. L. Tooth, Esq., M.P., to The Secretary for Public Works.

Sir,

I have the honor to refer to the petition presented by a deputation in June last, for the extension of the proposed railway line from Cooma to Bombala, and to suggest that in order to obtain some definite and reliable information upon the matter, a trial survey be made, in order that the nature of the country through which the proposed line will run may be ascertained.

Sydney, 11 August, 1882.

I have, &c.,

ROBERT L. TOOTH.

Mr. Palmer to say what has been done in this matter.—J.W., 31/8/82. A trial survey from Cooma to Bombala has been completed, and an approximate estimate can be prepared when required.—H.P., 1/9/82. This must stand over until other very important work has been completed.—J.W., 11/9/82.

No. 3.

H. S. Badgery and R. L. Tooth, Esqs., M's.P., to The Secretary for Public Works.

Sir,

We have received a communication from the Bombala Progress Committee, stating that the trial railway survey between Bombala and Cooma, which has been commenced, has now been discontinued, the survey being still incomplete.

We have the honor, therefore, to ask in view of the above, when it is proposed to send surveyors to complete the survey.

Sydney, 21 March, 1884.

We have, &c.,

HENRY S. BADGERY,
ROBERT L. TOOTH.

Engineer-in-Chief for report.—F.A.W., 24/3/84.

Mr. Palmer.—W.H.Q., 26/3/84.

This survey was discontinued by Mr. Morris some time ago, when he reported that he could not proceed with it, on account of the severity of the climate, but when the permanent staking of the extension to Cooma was completed, the trial survey from Cooma towards Bombala was resumed, and is now in progress.—H.P., 27/3/84. The Engineer-in-Chief.

Inform Messrs. Badgery and Tooth.—28/3/84.

No. 4.

Mr. Surveyor Carver to The Engineer-in-Chief.

Sir,

Camp Curry Flat, Cooma, 19 April, 1884.

I have the honor to submit the following for your information and decision, relative to the route of trial survey, "Cooma to Bombala." As Mr. Morris did not level the last 9 miles of the part of the route, *via* Nimitybelle, that he surveyed, I have done so, and by same post forward you the completed section, together with a tracing of his plan. They give very little idea of what a practicable line would be like over the part of this route they represent, for in such country, had the standard, 1 in 40, been the ruling gradient instead of 1 in 20, the plan and section would have appeared entirely different. Beyond the crossing of the M'Laughlan River (as shown in part) a long tunnel is necessary, the line must then rise several hundred feet, and be much cramped for distance to do so, through a steep, sidelong, and broken country.

To obtain the easiest practicable and least costly line between Cooma and Bombala advantage must be taken of the descending country to Bombala, immediately the watershed range is crossed, dividing the Murrumbidgee from the Snowy River water. If, after crossing that, the highest necessary level between the two places, any route is taken near Nimitybelle, the line must rise about 200 feet more in 9 miles, and then descend to the M'Laughlan River, thus losing command of 1,000 feet in levels, and the advantage that gives in a choice of crossing the M'Laughlan River, the real difficulty to be overcome.

The

The country is more broken and disturbed by trappean outbursts the nearer to the coast range. The Nimitybelle route takes a distance from the range the country is more rounded off and favourable near its summit. At a further distance from the range the country is more rounded off and favourable for railway construction, and presents little difficulty in surveying a practicable line through it without any exceptional severe agents of heavy earthworks. I therefore respectfully suggest that instead of adopting the Nimitybelle route I survey the more favourable one indicated to Bombala.

In that the distance to connect with Mr. Morris' work, near Nimitybelle, need not be surveyed, and fit 16 miles of additional trial line would complete a useful survey to Bombala.

I reply at your earliest convenience would oblige.

I have, &c.,

N. P. CARVER.

Mr. Palmer.—W.H.Q., 22/4/84. Tracings returned to Mr. Carver with instructions.—H.P., 23/4/84.

No. 5.

Petition from Residents of Bombala.

To the Honorable the Minister for Works.

The humble Petition of the undersigned Residents of the district of Bombala,—

SHOWETH:—

1. That at a public meeting of the residents of Bombala, held on the 6th day of August, 1884, it was resolved that a petition be presented to the Hon. the Minister for Works, praying that a sum of money be placed on the estimates sufficient to defray the expense of the construction of a line of railway from Cooma to Bombala, and (2) That the survey of the said line be at once proceeded with and completed, and (3) That the specifications of the said line be forthwith prepared and tenders called for the construction of the said line of railway.

2. That a railway to Bombala is absolutely necessary for the development of the resources of the district.

3. That the business of the district is almost at a standstill owing to the great difficulties at present experienced through not having any outlet for the product thereof.

4. That a majority of the population of the Bombala district are holders of very small areas far too small to return anything like a living except by the production of grain, and at the present time the production is largely in excess of the local consumption, and the cost of carriage to the coast alone is much too great to admit of farmers growing their produce for other markets, and even now some thousands of acres, which have in the past been cultivated, are lying neglected for the above reasons.

5. That a railway appears to your petitioners to be the only means of overcoming the present difficulties, and that it would be the means of fully developing the resources of the district.

6. That if railway communication between Bombala and Sydney were completed an area of some 50,000 acres of land would be placed under cultivation, and an immense amount of produce would be annually forwarded to Sydney, as also not less than 20,000 head of cattle and 150,000 sheep.

7. That the district is very rich in minerals, and your petitioners believe that a line of railway would cause fuller development thereof in every way.

8. That there are annually shipped at Eden and Merimbula not less than from 8,000 to 9,000 bales of wool, such wool being grown in the Bombala district.

Your petitioners therefore humbly pray that the survey of the said line be at once proceeded with and completed; (2) That the plans and specifications of the said line be then forthwith prepared and tenders for the construction thereof called; (3) That a sum of money sufficient to defray the cost of such line be placed upon the estimates.

And your petitioners, as in duty bound, will ever pray, &c.

Dated this 6th day of August, 1884.

Signed on behalf of the meeting,

JNO. CRUICKSHANK,

Chairman.

I should like Mr. Whitton to give instructions for the completion of the Cooma to Bombala survey line as speedily as possible, and a second surveyor may be employed to expedite the work.—G.R.D., 10/8/84.

No. 6.

H. S. Badgery, Esq., M.P., to The Engineer-in-Chief.

Dear Sir,

Sydney, 20 August, 1884.

If you intend, as we hope you do, to send a surveyor to push on the survey of the line Cooma to Bombala, I would take the liberty of suggesting Mr. Jones, now in your office.

I must admit some delicacy I feel in presuming to mention this to you, but I am prompted to do so because some of my Bombala friends are anxious for this gentleman to go, and because he has given great satisfaction in the district of Braidwood when surveying that line.

I remain, &c.,

H. S. BADGERY.

I have to express my regret that I cannot comply with Mr. Badgery's request.—J.W., 21/8/84.

No. 7.

The Engineer-in-Chief to Mr. Palmer.

Cooma to Bombala Trial Survey. Sydney, 20 August, 1884.

PLEASE push forward the trial survey from Cooma to Bombala to completion, & surveyor should be despatched to assist in the work as soon as possible.—J.W. (per which purpose another H.Q.)

I lately found among tracings of field plans copies of the original plan and section of 15 miles of Mr. Simpkin's trial survey from Bombala towards Cooma. As Mr. Carver's survey at the end of last month was within 7 miles of this point, I have forwarded copies of Mr. Simpkin's plan and section to Mr. Carver, informing him that he may connect with this original survey unless he is able to find a better route. If Mr. Simpkin's line is used, it could hardly be necessary to send up another surveyor.—H.P., 21/8/84.

Approved.—J.W., 26/8/84. I expect to have a through plan and section—Cooma to Bombala—very shortly.—H.P., 22/9/84.

No. 8.

Mr. Surveyor Carver to The Engineer-in-Chief.

Sir,

Camp Wangellic, 26 August, 1884.

I have the honor, in reply to memo. No. 84-162, to inform you that if the town of Bombala has to be entered, the approach to it by a middle course—between Mr. Morris' line, which enters the town on a descending gradient of 1 in 25 for $1\frac{1}{2}$ miles, and that of Mr. Simpkin's, which has to rise considerably to the level of the town—would be a material improvement, and which I intended to adopt. Since, however, I know the surrounding country, I look upon it in a different light—as follows. If a get-away from Bombala towards the coast has to be taken into consideration, it is extremely doubtful if the town should be entered at all, for the line must pass through it—in the direction indicated—which leaves no alternative but to adopt the "Cathcart Pass route" through the coast range, and that pass may be reached by a line many miles shorter if Bombala is not closely approached. I have shown this generally on sketch enclosed.

The only other get-away from Bombala, or from close to it, is that *viâ* the "Maharatta Pass route," and to have it open, it would be necessary to cross the Bombala River below, and not to enter the town. In this case it would be as well to adopt Mr. Simpkin's line, for it admits of a choice of river crossing at any future time along a considerable distance of its course. This (Mr. Simpkin's line) will require restaking throughout, and a great portion of it resurveying to replace the number of survey pegs that are either completely rotted off, or are laying about the surface. I may also state that, if the "Maharatta Pass route" is practicable on the coast side of the range—and, from what I have been able to learn, it would seem to compare favourably with any other—I think the pass could be reached from this side with but little difficulty; and it certainly appears to me the best possible route to serve the interests of Bombala, as also those of Delegate and the valley of the Snowy River.* I respectfully request instructions by which route to proceed.

I have, &c.,

N. P. CARVER.

* If you desire it, a little extra work would show a favourable crossing of the Bombala River, as well as a line through the town.

Mr. Palmer.—W.H.Q., 1/9/84. Instructions sent to Mr. Carver.—H.P., 1/9/84.

No. 9.

D. Ryrie, Esq., M.P., to The Secretary for Public Works.

Sir,

Cooma, 10 December, 1884.

I have the honor to request you will have the goodness to inform me when the final survey for the line of railway from Cooma to Bombala will be completed.

I have further to request that you will cause a trial survey for a continuation of that line to be made as early as practicable from Bombala *viâ* Mahratta, Bondi, and Toowomba, to join the coast line at Eden, thereby uniting the rich table-lands of Monaro with the seaboard.*

I have, &c.,

D. RYRIE.

* What has been done in this case?—F.A.W., 21/12/84.

The Cooma and Bombala trial survey has been completed and the route of trial survey between Bombala and Eden, as indicated in these papers, has been commenced. The surveyor has been instructed to report generally, after a thorough examination of the country, on the route throughout, before proceeding further with the survey.—H.P., 30/12/84.

Inform.—F.A.W., 7/1/85.

No. 10.

Mr. Surveyor Carver to The Engineer-in-Chief.

Sir,

Bombala, 16 December, 1884.

I have the honor to acknowledge the receipt of memo. No. 84-279.

I hope to be able to forward plan, sections, &c., of the trial survey Cooma to Bombala, by the end of this month.

I have, &c.,

N. P. CARVER.

No. 11.

No. 11.

Petition from Residents of Nimitybelle.
Public Works.

The Honorable The Minister of Public Works, at and near the town of Nimitybelle, in the district of Coomangire to bring under your notice:—

Most respectfully at the railway route from Cooma to Bombala, as the first trial survey, has been marked out—same nearly 6 miles distant from the above-named town, going westward instead of east of One-tree hill.

1st. That this town, if the present route is adhered to, will be totally destroyed, both public buildings and private enterprise, inasmuch as that in natural course of events another town will be expected to grow in the vicinity of the Railway Station upon private property.

2nd. We believe that a much better route could be found coming nearly, if not quite through this town, and which would tend to the advancement of; and also, by coming near the coast range, this is the nearest town to which excellent roads are made, and, until the railway is connected between coast and Monaro districts, the principal traffic to the Monaro railway comes through here.

3rd. That by the railway coming through or near adjacent to this town, it will not only serve the interests of us inhabitants, but also the residents of the Bega district, being quick and convenient for farm and dairy produce as well as travelling to and from Sydney.

Your memorialists, therefore, pray that you will take the above into your serious consideration, and direct that the railway route comes through or near adjacent here as requested, and your humble memorialists will, as in duty bound, ever pray.

S. M'DONALD, J.P.

(And others.)

No. 12.

Mr. Surveyor Carver to The Engineer-in-Chief.

Sir,

Bombala, 30 December, 1884.
I have the honor to acknowledge the receipt of Memo. No. 84-284, and will carry out my instructions directly I forward plan section, &c., of the "Cooma to Bombala" trial survey, which will be ready in a few days.

I have, &c.,
N. P. CARVER.

No. 13.

Mr. Surveyor Carver to The Secretary for Public Works.

Sir,

Camp Bombala, 14 January, 1885.
I have the honor to inform you that by the same post I forward you the plan section and reference sheets of the trial survey, Cooma to Bombala. The field and level books will be posted to-morrow.

I have before informed you that I was unavoidably backward with my drawing, and finding it impossible to pull the work up and keep my party employed in the field, I temporarily disbanded them last month, with the exception of one man, and worked myself throughout the holidays and up to this date on the drawings.

To-morrow I proceed to examine the country between this and Eden, upon which I will report without delay.

I have, &c.,
N. P. CARVER.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COLO VALLEY RAILWAY SURVEY.

(REPORTS, PAPERS, &c., CONNECTED WITH.)

Ordered by the Legislative Assembly to be printed, 22 March, 1888.

RETURN (*in part*) to an Order of the Honorable the Legislative Assembly of New South Wales, dated 28th February, 1888, That there be laid upon the Table of this House,—

“Copies of all Reports, Papers, &c., connected with the Colo Valley Survey, including Mr. Surveyor G. W. Townsend’s final Report, and the Engineer-in-Chief’s Report on the plan and estimate.”

(*Mr. Frank Farnell.*)

SCHEDULE.

NO.	PAGE.
1. Engineer-in-Chief for Railways to Secretary for Works, recommending appointment of Mr. J. R. Firth as Assistant Engineer for Trial Surveys, and Minister’s Minute appointing two high-class Trial Surveyors. 1 February, 1888	1

No. 1. .

Minute by The Engineer-in-Chief to The Secretary for Public Works.

Department of Public Works, Railway Branch,
Engineer-in-Chief’s Office, Sydney, 1 February, 1888.

Subject :—Recommending appointment of Mr. T. R. Firth as Assistant Engineer for Trial Surveys.

THE office of Assistant Engineer for Trial Surveys has been vacant since Mr. Palmer retired from the service in February last, but in consequence of several proposed railway lines now being resurveyed and staked, it is absolutely necessary that some one should be appointed to this office who is not only a good surveyor but who has a thorough knowledge of construction.

Mr. Thomas Rhodes Firth has full knowledge of both these branches, and I strongly recommend him for this office.

The salary received by the late occupant of this office, Mr. Palmer, was £750 a year, with an allowance of £150 a year for equipment.

I propose that Mr. Firth’s salary for the same duties should be £700 per annum, with no allowance for equipment, thus effecting a saving of £200 a year.

Mr. Firth is now in charge of the works on contract No. 2 of the Illawarra Railway, but as there will shortly be several District Engineers at liberty, I can place one of them to superintend the completion of the work on this contract.

I also recommend that Mr. Firth’s appointment takes effect from the date of commencing duties.

JOHN WHITTON.
B.C.,

558—A

B.C., Railways.—J.R., 2/2/88.

I do not think it desirable to fill the vacancy caused by the resignation of Mr. Palmer, and as regards Mr. Firth his services may be continued in his present position of District Engineer for construction. I propose to have two high class trial surveyors, one for the lines on the south and west, and one for the lines in the Northern District, who, under the direction of the Engineer-in-Chief, will take charge of the field parties engaged upon the surveys, and whose special duty it will be to survey such routes as will best carry into effect the determination of the Government, to have light and inexpensive railways for opening up the country and developing its resources. For one of the positions I have named I select Mr. Townsend, and I think the officer who conducted the resurvey of the line from Nyngan to Cobar should be entrusted with the duties of the other portion. Each of these officers should be paid £600 a year, with £100 a year for equipment.—J.S., 6/2/88.

The Engineer-in-Chief, B.C. Memo. to Minister, No. 88, herewith.—J.W. *pro* W.H.Q., 15/2/88. Under Secretary, B.C.

No. 2.

The Engineer-in-Chief to The Secretary for Public Works.

Department of Public Works, Railway Branch,
Engineer-in-Chief's Office, Sydney, 14 February, 1888.

Appointment of an Assistant Engineer for Trial Surveys.

I REGRET that the Minister should have considered it advisable to refuse to carry out my recommendation for the appointment of Mr. Firth to fill the office of Engineer for Trial Surveys, left vacant by the retirement of Mr. Palmer.

My proposal was to have one Engineer for Trial Surveys who had a thorough knowledge both of construction and surveying in all their branches, the salary to be £700 per annum.

The proposal of the Minister, in his memo. of the 6th instant, is to have "two high class surveyors"—one for the lines on the South and West, and one for the lines in the Northern District—and to take charge, under the Engineer-in-Chief, of the field parties engaged upon the surveys. These officers are to have salaries of £600 a year each, with £100 each for equipment, making a total payment for superintendence of £1,400 a year.

I fully admit the right of the Minister to make any appointment he may think desirable in my Department; but as I have not been consulted in this matter, I may be pardoned if I offer some remarks as to the qualifications of these gentlemen for the positions which have been assigned to them.

It may not be within the knowledge of the Minister that Mr. Townsend was, some years ago, a surveyor directly under me in this Department; that he resigned those duties for an appointment in the Existing Lines Branch, under the Commissioner for Railways, at, of course, an increased salary; that he obtained leave of absence from the Commissioner to explore the country between Emu Plains and Rylstone, through the Colo Valley, for the purpose of discovering a line to facilitate the working of the traffic of the Western Railway; that his report of this line was so favourable as to cost and gradients that the Commissioner advised the Minister, Mr. Secretary Wright, to have a survey of this route made by Mr. Townsend.

The Minister consequently ordered this survey to be made, nominally under me, but practically under the Commissioner.

Inspired reports frequently appeared in the newspapers, particularly after a visit of Mr. Townsend to Sydney (but never to see me, as I was entirely ignored by him), on the splendid discovery made by him of a cheap line, with no gradient worse than 1 in 100; and, in fact, so great was the enthusiasm of the public generally, and the newspapers in particular, that it was alleged that, had this line only been discovered earlier, the absurd and costly blunder of making the existing railway over the Blue Mountains would never have been perpetrated. The following is Mr. Townsend's first rough estimate of the cost of this line:—

6½ miles of tunnelling, in short lengths	£600,000
12 miles, at £15,000 per mile	180,000
25 miles, at £10,000 "	250,000
60 miles, at £5,000 "	300,000
Bridges and culverts, including Grose River Bridge	100,000
							<u>£1,430,000</u>

Mr. Townsend has been employed upon this survey for three and a half years, at a cost, up to the present time, of nearly £8,000, and his plans and estimate are not yet finished; but sufficient has been done to show that instead of 6½ miles of tunnels there will be 20½ miles, which he estimates to cost £1,293,400 instead of £600,000. The estimate now submitted for tunnels being doubled only, although the length is trebled.

In the first estimate the bridges and culverts were to cost £100,000; in Mr. Townsend's revised estimate they are stated to cost £435,340.

The quantity of earthwork has not yet been furnished to me in a shape in which I can deal with it, but I am expecting it shortly.

The first estimate was made without any plans or sections, which is a doubtful way of giving reliable information. The second estimate purports to have been based on a correct survey. The first amounted to £1,430,000, and the second is £2,695,000. The total length of this line is stated to be about 104 miles, and nearly one fourth . . . or 25 miles, will consist of bridges, tunnels, and viaducts.

Before offering a positive opinion as to the cost of this line, I must be in a position to check Mr. Townsend's survey, quantities, and prices, as I have little doubt that the amended estimate is far below the expenditure which would have to be incurred should the work ever be undertaken.

The

The tunnels alone would cost at least £3,247,000, and I may safely say that the line could not be constructed for less than £5,000,000.

In consequence of Mr. Townsend's original report the survey was no doubt carried out, and by the newspaper paragraphs the interest in it was kept alive, and the speedy completion of the railway confidently predicted. The result, however, must be disappointing to the country, as the relief promised to the overcrowded traffic on the Western Railway (if it ever existed) will have to be found in some other channel.

I therefore suggest that the cost of this survey is so much money thrown away.

I was strongly opposed to this survey from its inception, as I knew, and explained, that this country had been previously explored under my directions.

As the Minister has proposed the employment of Mr. Townsend and Mr. Simpson, instead of Mr. Firth—recommended by me—I have considered it my duty to place him in possession of some facts connected with Mr. Townsend's engineering antecedents with which he could hardly have been acquainted.

As to Mr. D. C. Simpson, I can only say generally I should not have selected him for so important a work, as I do not think he has had sufficient experience either in surveying or construction to warrant his appointment.

If two surveyors be placed on the surveys for proposed extensions merely to superintend the surveyors in the field, I doubt not that for a large portion of their time they will have little to do; but other important work will have to be done.

I should feel no confidence in either of the gentlemen named to take out quantities, lay down gradients, and prepare estimates for submission to me.

The field work would only represent a part of their duties, but the other work would be necessary as the surveys came into the office.

Mr. Firth, from his long experience, both of surveying and construction, is fully competent to discharge all the duties required, and the cost of his employment would only be £700 per annum, as against the employment of the two surveyors named at a cost of £1,400 per annum, and the work, in my judgment, would be far more efficiently performed.

The head of any particular branch should be a man of superior intelligence and great experience, to whom the surveyors could look for information and guidance.

Such an officer is Mr. Firth; but, should he not be appointed, I have in my Department surveyors of greater experience and much longer service than either of the gentlemen named by the Minister, and to appoint Messrs. Townsend and Simpson would not, in my opinion, be utilizing to the best purpose the officers now in the Department.

In all professional appointments for thirty-one years I have, with one exception (Mr. Townsend), selected my assistants, and my sole desire has been to obtain the services of the best men available. I have done so in this instance, and I must claim to be permitted to express my regret that it has not met with the favourable consideration of the Minister.

JOHN WHITTON.

Railways.—J.R., B.C., 15/2/88.

The information now furnished by Mr. Whitton is certainly new to me, and, in the meantime, I wish no further action taken until the matter is further considered. I know, as Mr. Whitton mentions, that Mr. Townsend was an officer at one time under the Engineer-in-Chief, and I was always under the impression that Mr. Whitton entertained a very high opinion of Mr. Townsend's qualifications, and had so expressed himself. Let a copy of this report be furnished to Mr. Townsend for reply should he desire to do so.—JOHN SUTHERLAND, 18/2/88.

Engineer-in-Chief.—CHAS. A.G., *per* D.C.McL., B.C., 20/2/88. Mr. Townsend.—W.H.Q., 21/2/88.

No. 3.

Mr. G. W. Townsend to The Secretary for Public Works.

Railway Survey Office, 22 February, 1888.

Sir,

I have to-day received Mr. Whitton's minute, with your minute thereon. Permit me to thank you sincerely for giving me an opportunity of replying.

On page 3 of his minute Mr. Whitton says:—

Page 3 of minute: "Mr. Townsend was some years ago a surveyor directly under me in this Department; that he resigned those duties for an appointment in the Existing Lines Branch, under the Commissioner for Railways, at, of course, an increased salary."

The facts of this matter are as follows:—In 1880 my services under Mr. Whitton were dispensed with, as the work on which I was engaged was finished. In the early part of 1882 I was re-appointed, under Mr. Whitton, at the same salary that I had formerly received, viz., £350 per annum, with a special note on the letter appointing me that the employment was only temporary. Previous to this re-appointment I had been engaged by the people of Carcoar to make a trial survey in opposition to the survey then being made by the Department, the departmental survey passing about a mile from the town of Carcoar, while the people of Carcoar wanted the line brought through the town. My survey made for the townspeople proved that a practicable line could be obtained through the town, although Mr. Whitton was said to have stated that this was impossible. On my re-appointment I was instructed to permanently stake for the Department the trial line I had run for the townspeople. While engaged on this work I was informed by a friend that, owing to the turn affairs had taken, Mr. Whitton would take the first opportunity of getting rid of me again, for he was very much annoyed at having to accept my survey; therefore, as soon as I had finished the work upon which I was engaged, I resigned, and obtained employment under Mr. Cowdery (Mr. Palmer having

Page 3 of minute: "At, of course, increased salary; that he obtained leave of absence from the Commissioner to explore the country between Emu Plains and Rylstone, through the Colo Valley, &c."

Pages 3 and 4 of minute: "That his report of this line was so favourable as to cost and gradients that the Commissioner advised the Minister, Mr. Secretary Wright, to have a survey of this route made by Mr. Townsend."

Page 4 of minute: "The Minister consequently ordered this survey to be made nominally under me, but practically under the Commissioner."

Page 4 of minute: "Inspired reports frequently appeared in the newspapers, particularly after a visit of Mr. Townsend to Sydney (but never to see me, as I was entirely ignored by him)."

Page 4 of minute: "(But never to see me, as I was entirely ignored by him.)"

Page 5 of minute: "The following is Mr. Townsend's first rough estimate of the cost of this line."

Total, £1,430,000.

Page 5 of minute: "Mr. Townsend has been employed upon this survey for 3½ years, at a cost up to the present time of nearly £8,000."

Page 6 of minute: "The estimate now submitted for tunnels being doubled only, although the length is trebled."

having spoken very warmly on my behalf to Mr. Cowdery), at the same rate of pay that I had been receiving, as the Blue Book for 1882 will show; date of appointment, June 5th, 1882. In October, 1883, I obtained leave of absence to explore the Colo Valley, as I stated to the Commissioner that from observations made while employed on the trial survey for the Mudjee line I believed a line with easy grades could be obtained. The result of this exploration is known. In the early part of 1884 I was appointed district engineer, at a salary of £500, eighteen months after joining the Existing Lines Branch. I am sure no one would be more sorry than Mr. Whitton should a wrong construction be put upon any portion of his minute, I therefore have explained at some length *the facts* which Mr. Whitton has merely glanced at in this portion of his minute, and from which an inference might be drawn that I had been bribed by the Existing Lines Branch to leave Mr. Whitton's branch for the purpose of undertaking the Colo Valley survey.

I have a copy of my first report now before me. As to gradients, the plan and sections bear out all that I said therein, namely, that no gradient need be heavier than 1 in 100, and no curve sharper than 20 chains radius. As to cost, the difference between what I now estimate and what I first thought would cover the cost is mainly due to the large extra amount of tunnelling that I have thought it advisable to recommend to avoid a recurrence of the inconvenience, expense, and danger that we are already suffering from on the Mudjee and Illawarra lines from landslips, and from the extra amount of flood-opening I have proposed.

This paragraph I take to be a matter between the then Minister for Works and the Commissioner for Railways, but I must distinctly deny the inference to be drawn therefrom, that I ever received instructions from any one regarding the survey but Mr. Whitton, through Messrs. Deane and Palmer.

As this survey was of great public interest, I have frequently been asked for information on the subject, and as there was an evident strong feeling both against me and against the work I was carrying out throughout the whole of Mr. Whitton's branch, I frequently gave information so far as I could without infringing the rules of the Department on this subject. As to my not going to see Mr. Whitton, I may say that no subordinate officer in Mr. Whitton's branch dares to think of going to see Mr. Whitton. There are men who have joined the Department under Mr. Whitton, have been for years under him, and have left the Department without having ever seen him. I have not seen Mr. Whitton to speak to for about twelve years, and when I was instructed to report myself to Mr. Whitton at the time of my transfer to his branch of the Department for the purpose of carrying out the Colo Valley survey under him, I was told by Mr. Whitton's clerk, in the most uncivil manner, "Go to Mr. Palmer, Mr. Whitton won't see you." I have frequently seen Mr. Palmer on the subject, and once Mr. Deane, who was acting for Mr. Palmer, but the treatment I have always received from Mr. Whitton's branch regarding this matter has not been such as to invite confidence, but has been harsh in the extreme, and peculiarly painful to a man of a nervous timid disposition, as I unfortunately am; still, I have reported fully, every month, in writing to Mr. Whitton as to the progress of the work.

This rough approximation to an estimate was made from a mere examination of the country without any survey.

The items on which cost has been increased are tunnels by reason of increased length to avoid landslips, and giving greater height and capacity to bridges, as I found the floods were much more serious than I at first supposed.

Mr. Whitton should state that a track along the river which cost £3,000 is included in the sum of £8,000.

My first idea was to make the tunnels for double line, but on mature consideration of the fact that by the design for single-line tunnel submitted by me to Mr. Whitton, the cost of single-line tunnel is just half of that for double-line, and that it is very unlikely that the traffic on this light-grade line will be sufficiently heavy for many years to need a double line of rails being laid, I think it will be better to make single-line tunnels now and second single-line tunnels parallel or nearly so to those first made for the second pair of rails. The interest saved by this method would amount to the price of the second tunnel in twenty years, hence the reason for the amount of estimate for tunnels being only doubled while the length is trebled.

Page 6 of minute: "In the first estimate the bridges and culverts were to cost £100,000; in Mr. Townsend's revised estimate they are stated to cost £435,340."

Page 6 of minute: "The quantity of earthwork has not yet been furnished to me in a shape in which I can deal with it."

Page 6 of minute: "The first estimate was made without any plans or sections, which is a doubtful way of giving reliable information."

Page 7 of minute: "The total length of this line is stated to be about 104 miles."

Page 7 of minute: "The tunnels alone would cost at least £3,247,000, and I may safely say that the line could not be constructed for less than £5,000,000."

Page 8 of minute: "I therefore suggest that the cost of this survey is so much money thrown away."

Page 9 of minute: "I have considered it my duty to place him (the Minister) in possession of some facts connected with Mr. Townsend's engineering antecedents with which he could hardly have been acquainted."

The increase in cost of bridges is due to my having, as above stated, found that the floods on the Colo and its tributaries were much more serious than I at first supposed. I lay no claim to infallibility, and must acknowledge my indebtedness to Mr. Whitton for the large amount of experience I have gained by having carefully noted his serious errors in the matter of lines liable to landslips, and having allowed insufficient waterway. Bridges are for double line. (See note on last page.)

The whole of the quantities of earthwork are written on the section, and Mr. Whitton was in a position to have dealt with the whole matter on the 11th of January last had he felt so inclined, and had he chosen to send for me to explain my work he might have dealt with the whole matter last October.

Quite so, and yet Mr. Whitton presumes to pronounce me incompetent, because my first rough approximation to an estimate does not agree with my final one. I should be much surprised, in view of the increased works recommended in my survey beyond what I first proposed, if it did, and I only made that first rough estimate at the urgent request of Mr. Wright, then Minister for Works, to whom I stated that it was a most unusual and risky thing to do.

The length of the line is by survey within a few links of 104 miles, within a mile of the length I first stated in my first report, viz., 103 miles, but at that time I purposed joining the Mudgee line nearer Penrith.

£3,247,000 for (say) 21 miles of single-line tunnel—the modest sum of £154,500 per mile. At that rate Mr. Whitton "may safely say that the line could not be constructed for less than £5,000,000. Mr. Whitton is in possession of a memo. from me, giving answers to a series of questions made by him, in which I state "the tunnels are for single line."

As to whether the expenditure on the survey for this line is money thrown away, I can safely leave for the Minister for Works to decide.

With regard to this matter of my engineering antecedents, there is one item that Mr. Whitton can scarcely have forgotten, and which I think it well the Minister should know. In, I believe, 1876, while I was engaged upon a survey for railway extension into the city, I formed the idea that the shipping accommodation at Circular Quay could be largely increased by means of a floating pier extending down the centre of the basin as far as the extreme end of the tongue of land on which Fort Macquarie is situated. In my own time I made a design and estimate for the work, and as at that time Mr. Whitton had always treated me in a friendly manner, I asked permission to show my work to him, which was granted. I was astounded by the anger shown by Mr. Whitton at my having dared to think of such a thing, alleging as a cause for his anger that "I was interfering with Mr. Moriarty's work." After cooling down a little he condescended to look at the drawing and estimate, apparently taking great interest therein, and discussing the value of the idea in a most friendly manner, finally remarking, "Yes, if anything is done in this direction, this is the sort of thing that will have to be adopted; but mind I have set my face against anything being done in this direction, and I will do all in my power to prevent it."

Since that time I have never been allowed to speak to Mr. Whitton, and he took the first opportunity of a reduction in the staff of surveyors for getting rid of me.

Further, I will give the prices of the iron bridges on brick piers and abutments designed by me for the duplication of the line between Parramatta and Penrith. These bridges have spans of 44 feet centre to centre, and are for *double line*, and cost per lineal foot £23. I have taken from some final certificates, given by Mr. Whitton, the following prices of recently constructed *timber* bridges of 40-foot span for *single line*.

Beardy iron bridge—9 spans of 40 feet each.

Cost £8,815, equal to £24 9s. per lin. foot.

Severn River Bridge—13 spans of 40 feet each.

Cost £12,600, equal to £24 4s. per lin. foot.

Bluff River Bridge—10 spans of 40 feet each.

Cost £10,947, equal to £27 6s. per lin. foot.

Average cost, £25 9s. 4d.

I will now give for comparison two examples of iron viaducts from other countries.

The Kinzna viaduct, on the New York and Erie line, for single line, built of iron with alternate spans of about 60 feet and 40 feet, on Phoenix column trestles; maximum height, 301 feet; average height, 178 feet; tested with a whole train of consolidation engines on 4 feet 8½ inch gauge.

Cost under £25 per lin. foot.

Nairn viaducts, S.A., for single line, carry consolidation engines, on 5 feet 3 inch gauge; maximum height of viaducts, 100 feet; average height, 53 feet in 30 feet spans, with discontinuous plate girders, rolled iron cross-girders and bracketed plate deck carrying a ballasted road, built on a curve of $10\frac{1}{2}$ chains radius, and on a grade of 1 in 82, which will materially add to cost of construction.

Cost about £27 14s. per lineal foot, while Mr. Whitton's perishable timber bridges, with an outside life of twenty-five years, for single line, recently constructed on Cobb & Co.'s contract on the Northern Line, cost an average of £25 9s. 4d. per lineal foot.

Page 10 of minute: "I should feel no confidence in either of the gentlemen named to take out quantities, lay down gradients, and prepare estimates for submission to me."

Page 11 of minute: "In all professional appointments for thirty-one years, I have, with one exception (Mr. Townsend), selected my assistants, and my sole desire has been to obtain the services of the best men available."

In the adjoining paragraphs Mr. Whitton makes a direct charge against me of incompetency, yet I am not aware of any outside influence having been used to procure my re-appointment under Mr. Whitton when I rejoined his branch of the Railway Department in 1882, the circumstances of which re-appointment are as follows:—

At the end of 1881 I saw Mr. Palmer, at the request of the Carcoar Railway League, when he came to Carcoar to inquire into the practicability of an alternative line through the town. I explained the matter to him, and offered him a horse that he might ride over the proposed deviation with me the next day. His reply was, "If you have surveyed it, I am satisfied." He then asked me how I was getting on; I said, "Not any too well." He proposed that I should rejoin Mr. Whitton's branch, and I gave him an application for re-employment. I was re-appointed within about a fortnight of date of application, yet from Mr. Whitton's remark, it would appear that I had always been forced upon him.

Again thanking you sincerely for having adopted the somewhat unusual course of allowing a subordinate officer the right of reply to any of Mr. Whitton's charges, and leaving the matter in your hands with full confidence that I shall receive justice,—

I have, &c.,

GEO. WM. TOWNSEND.

NOTE (see page 7).—Bridges are designed for double line, as the extra expense of duplicating large bridges is very much greater than the difference between the cost of a large bridge for double line and that for single line. The viaducts are all designed for single line, as they can easily be duplicated for about the difference in cost between double and single line.—G.W.T.

Railway Survey Office, 28 February, 1888.

The Honorable the Minister for Works,—

Sir,

I have the honor to forward, herewith, copy of supplementary report supplied to Mr. Whitton at his request.

I have, &c.,

GEO. WM. TOWNSEND.

P.S.—To my memo. of 17th instant I have received no reply.—G.W.T.

Railway Survey Office, Sydney, 17 February, 1888.

The Engineer-in-Chief,—

Sir,

I have the honor to forward herewith, plan, section, and supplementary report, giving information on various points that I am informed you have asked for. The quantities of banks are now written on the section as well as mentioned in estimate.

The cross-section sheets I will forward as soon as ready, also disposal-sheets in preparation, of which I have the honor to request that you will allow me the assistance of two draughtsmen so that I may get this work out of hand, as I am in bad health, and the medical man who is attending me informs me that the complaint from which I am suffering may become chronic unless I am able to get away for a change.

I have, &c.,

GEO. WM. TOWNSEND.

P.S.—To this I have received no reply.—G.W.T., 29/2/88.

Railway Survey Office, Sydney, 15 February, 1888.

The Engineer-in-Chief,—

Sir,

I herewith, in accordance with a memorandum shown to me by Mr. Thomas, purporting to be from you, supply information on the various points mentioned in the memorandum in question:—

1. Whether estimate is for double or single line? Single, except the bridges which are designed for double line.
2. Width of formation and gauge? Cuttings, 15 feet; banks, 17 feet; gauge, 4 feet $8\frac{1}{2}$ inches.
3. Weight of rails? Steel rails, 70 lb. per lineal yard.
4. Slopes of cuttings? 1—1, excepting when the cuttings are certain to be in solid rock, when $\frac{1}{4}$ —1 is adopted as stated in report.
5. Quantities in embankment? 4,887,785 cubic yards.

6. Cross-sections to be furnished? Are written on plan; but sheets of cross-sections are being plotted.
 7. Disposal-sheets to be furnished?
 8. Proper estimates of quantities and prices to be furnished? Sent herewith.
 9. Also, section of tunnels showing thickness of lining and length proposed to be lined in each tunnel? Section herewith, also list of tunnels with length of each lined and unlined.

I have, &c.,

GEO. WM. TOWNSEND.

COLO VALLEY LINE—List of Tunnels on first 104 miles.

No.	Length in lineal yards.	Lineal yards lined.	Lineal yards unlined.	No.	Length in lineal yards.	Lineal yards lined.	Lineal yards unlined.

GEO. WM. TOWNSEND.

Copies

Copies of Mr. Townsend's Testimonials.

Double Bay, 24 March, 1874.

To John Whitton, Esq., C.E., Engineer-in-Chief for Railways, New South Wales,—

Sir,

I have the honor herewith to make application for employment in your Department on any extension surveys that you may have at present in hand.

I enclose memo. of railway employment and testimonials.

I have, &c.,

GEO. WM. TOWNSEND.

Memo.—Entered the East Indian Railway Co's. service in June, 1858, as sub-assistant engineer; left that employ at my own request in November, 1860. Was employed on the following works, Central Rajmahal District:—

Seetapahar; length, heavy cutting, 60 feet, and 9 miles of filling with several 12-foot openings, and one 28-feet.

In Head Office, Calcutta, and in District Office, Howrah.

On the Singaruu Valley extension, a line of about 9 miles, to a coal-field near Raneegunge, with Assistant Engineer M'Clure completed the whole of the surveys for this line.

Burrackur extension, a line of about 30 miles, to coal-fields in various positions along the line of the Grand Trunk Road from Raneegunge; set out the side width on 11 miles at the Barrackur end of line; entered the Calcutta and South-Eastern Co.'s service as assistant engineer and left in September of the same year, as I was suffering from fever and ague; was employed on this line principally on the Piallee or lower length between the Piallee River and terminus on the Umtlah River. I put in permanent-way levels for 20 miles and formation levels for 12 of that 20; put in levels for filling for station platform at Untlah; I also set out afresh all the curves on the lower length (12 miles) where a low bank had been thrown up and had been washed down by the rain, hereby obliterating the original stakes; it was on this length (low and swampy) that I caught the fever and ague, or jungle fever as it is there called, which led to my leaving the country, whence I went to England, taking with me all professional papers I had. While in England a gentleman, then at Home from British Columbia (Mr. Muldrum), promised to get me an appointment on the line that was then projected to be run between Canada and British Columbia; I handed to Mr. Meldrum all my papers, and he afterwards told me that he had obtained for me the appointment of assistant engineer.

I then left for Calcutta, where I had left my wife, and proceeded from Calcutta to Melbourne, where I presented a letter I had from Fernie Brothers, of Liverpool, to Messrs. Lorimer, Marwood, & Rome, in which they were requested to give me a first-class passage in any of Fernie's ships that might be going to Callao; thence I should have proceeded to San Francisco, thence to Vancouver Island, but on reading accounts of the projected line I found that it had been stopped, so I remained in Melbourne and obtained employment in the Roads and Bridges Department, there being at that time no extension railway work going on in Victoria (1862).

GEO. WM. TOWNSEND.

I HAVE been employed for the last twenty months in New England, by Messrs Elder, Smith, & Co., of South Australia, and for twelve months previously by the same firm in South Australia, in the erection of various mining works. Mr. J. B. Watt, of Gilchrist, Watt, & Co., Sydney, can say what I have been doing.

GEO. WM. TOWNSEND.

Recommended for an appointment, memo. 24-174 of 2 April, 1874.—W.H.Q.

I recommend that Mr. G. W. Townsend be appointed as a surveyor in this Department, with salary at the rate of £250 per annum, and the usual allowance of £200 per annum for equipment and travelling expenses when actually employed in the field.—J. WHITTON, 2/4/74. Commissioner.

Approved—J.S., 8/4/74. Mr. Townsend informed as per letter, 74-177, of 9th April.—W.H.R. Commissioner. J.W., 9/4/74.

Sir,

9 April, 1874.

I am directed by the Engineer-in-Chief to inform you that the Hon. the Minister for Works has been pleased to appoint you a Railway Trial Surveyor in this Department, with salary at the rate of £250 per annum, and the usual allowance of £200 per annum, for equipment and travelling expenses when actually engaged in the field.

Mr. G. W. Townsend, Double Bay.

I am, &c.,

W. QUODLING.

I recommend that the salary of Mr. G. W. Townsend be increased from £250 to £300 per annum from the 1st of August.—J. WHITTON, 14/7/74. Commissioner. Approved.—J.S., 22/7/74. Mr. Whitton—J.R., 23/7/74.

The Engineer-in-Chief to The Commissioner.
Surveyors' Salaries.

13 October, 1874.

I RECOMMEND that the salaries of the undermentioned Surveyors be increased from the 1st instant, viz:—

First Class.

Mr. Jamieson, from £350 to £400.

Mr. Kennedy, from £350 to £400.

Mr. Stephens, from £300 to £400.

Mr. Stack, from £350 to £400.

Mr. Mann, from £350 to £400.

Second Class.

Mr. Townsend, from £300 to £350.

Third Class.

Mr. Hardy, from £250 to £300,

I

I have felt it to be my duty to make this recommendation to avoid losing all the best surveyors in the Department. Several have already left, and as good surveyors are much wanted in this and the neighbouring Colonies, I fear that unless they are more liberally remunerated I shall lose all those whose services are worth retaining.

JOHN WHITTON.

Approved.—J.S., 20/10/74.

My dear Sir,

University of Melbourne, 6 March, 1888.

It gives me very great pleasure to certify that I have had the privilege of your acquaintance for very many years. First of all, in the Victorian Water Supply Department, where we were engaged more than twenty years ago upon the plans of large schemes of water supply, and more recently in Sydney, where I have for several years past constantly met you, and discussed with you many questions connected with engineering practice. On all these occasions I have been greatly struck with the energy, intelligence, and enthusiasm you have always evinced, whether in the carrying out of experiments to settle debatable points in hydraulic science in Melbourne long since, or in devising new and economical forms of girders, and exploring and surveying new lines of Railway in New South Wales in recent years. I must also express the utmost admiration for the perseverance and endurance you displayed in the first exploration of your proposed Colo Valley Railway, and also for the thorough and scientific system of adjusting the grades in accordance with the curvature of the line, so as to minimize the traction resistance that you adopted in the final survey. I regard this proposed railway as of the utmost commercial importance to the Colony of New South Wales, supplying as it will a direct route to the great interior, possessing grades and curves of the most unusually favorable character which will permit of high speeds, and large loads, and will enormously reduce the wear and tear of both rails and rolling stock as compared with the present Blue Mountain line with its almost impracticable grades, and its endless curves of most undesirable severity. I feel sure that this great scheme of yours must sooner or later be carried into execution, and that its completion will be of incalculable value to Sydney, which will thereby be brought into the most direct and effective communication with Central Australia.

With best wishes for your future success, and assuring you of my high appreciation of the energy and talent you have shown in this your last great scheme,

I remain, &c.,

H. C. KERNOT, M.A.C.E.,
Professor of Engineering.

G. W. Townsend, Esq., C.E.

VICTORIAN ENGINEERS' ASSOCIATION.

THIS is to certify that Mr. G. W. Townsend is a member of this Society. Elected, October 6, 1886.
W. C. KERNOT, President,
J. E. SHERRARD, Hon. Sec.

My dear Townsend,

Urana, 6 March, 1888.

I see that opposition is being raised to your Colo Valley project, and I suspect that this opposition is not prompted by purely patriotic motives. The very fact that a man has done distinguished service to the country as you have done in this matter is sufficient to raise up enemies against him, especially among his seniors in the Public Service. I trust, however, that no opposition to your project will affect your appointment to the charge of the railway surveys in the north and north-west of the Colony. From what I know of your experience as an engineer and as an engineering surveyor, I am certain that the Government could not find a better man for the appointment, and I am equally certain that they could not find one whose claims are anything like equal to yours. Your resignation of a fine appointment in Sydney, and your voluntarily undertaking all the hardships of a survey through the Blue Mountains in order to solve one of the most important problems which this Colony has to deal with, should alone ensure your appointment. You were, I believe, the first to place in a clear light the enormous cost of working the present line over the Blue Mountains, and you were certainly the first to bring forward a feasible scheme for providing for the great and growing traffic of the north-west and west of the Colony. In short, I feel confident that your claims cannot be overlooked, no matter what influences are brought to bear against you.

The appointment which I noticed had been promised to you is one in which your long and valuable experience of railway survey work in India and this Colony, as well as your extensive general experience in engineering, and your intimate knowledge of the Colony, will be just the qualifications you require. It must be a matter of great satisfaction to you, especially at a time when you are taking up a new office, to think that you have been so successful in keeping pace with engineering progress as to earn the professional as well as the personal regard of such a man as Professor Kernot.

I hope matters will be so arranged that the railway surveys will be directly under the new Commissioners. That would be another step in decentralization, and I think a good one.

Yours, &c.,

H. G. MCKINNEY,
M.E., M.I.C.E.

I, ARTHUR BEVAN COOPER, Deputy Surveyor-General of the Province of South Australia, having been applied to by George William Townsend, of Adelaide, licensed surveyor under Act No. 13 of 1859, for a special license under Act No. 22 of 1861, intituled "The Real Property Act of 1861," do hereby specially license the said George William Townsend as a surveyor under the provisions of the said "Real Property Act of 1861," to act so long as he the said George William Townsend shall be a licensed surveyor under the said Act No. 13 of 1859, and no longer.

As witness my hand this 16th day of August, 1869.

ARTHUR B. COOPER.

South Australia.

THIS is to certify that George William Townsend, having satisfactorily proved his qualifications as a surveyor, is hereby licensed for the survey of waste lands of the Crown, either for the purpose of the adjustment of the boundaries of runs, or for the survey of new claims, or for the survey of claims for mineral leases.

16 August, 1869.

ARTHUR B. COOPER,

Deputy Surveyor-General.

Railway Department, Office of Engineer for Existing Lines,

Sydney, 18 August, 1884.

Sir,

The Hon. the Acting Minister for Public Works has, on my recommendation, approved of your appointment as District Engineer, Sydney District, at a salary of £500 per annum, to date from the 1st March last.

G. W. Townsend, Esq., Sydney Station.

I am, &c.,

GEORGE COWDERY.

Recommendation of Mr. G. Townsend for the appointment of District Engineer.

7 August, 1884.

MR. G. TOWNSEND having satisfactorily performed the duties of District Engineer in the Sydney District since the resignation of Mr. Hyndman in February last, I have pleasure in recommending to your favourable consideration that he be appointed permanent District Engineer, and that his appointment and its emoluments should date from that of Mr. Hyndman's resignation.

Commissioner.

GEORGE COWDERY.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office,

Sydney, 20 January, 1882.

Sir,

I have the honor to inform you that through the recommendation of the Engineer-in-Chief, the Honorable the Minister for Works has been pleased to reappoint you as surveyor in this Department, at a salary of £350 per annum, with the usual allowance when employed in the field.

I am, &c.,

Mr. Geo. Wm. Townsend, Camp Walli, P.O., Canowindra Road.

W. H. QUODLING.

You will please note that as the appointment is for temporary services only, it will be terminable by this Department at any time on one month's notice.—W.H.Q.

Department of Public Works, Railway Branch, Engineer's Office,

Sydney, 12 July, 1880.

Sir,

I am instructed by the Engineer-in-Chief to inform you that in consequence of the approaching completion of the railway survey upon which you are engaged, the Honorable the Minister for Works has decided to dispense with your services on 31st August next.

I have, &c.,

W. H. QUODLING,

Chief Clerk.

G. W. Townsend, Esq., Canowindra.

Department of Public Works, Railway Branch, Engineer's Office,

Sydney, 9 April, 1874.

Sir,

I am directed by the Engineer-in-Chief to inform you that the Honorable the Minister for Works has been pleased to appoint you a Railway Trial Surveyor in this Department, with salary at the rate of £250 per annum, and the usual allowance of £200 per annum for equipment and travelling expenses when actually engaged in the field.

I am, &c.,

W. H. QUODLING,

Chief Clerk.

Mr. G. W. Townsend, Double Bay.

Dear Sir,

43 King William-street, Adelaide, 3 April, 1871.

On your leaving the Stirling Reef Company, the Board of Directors think it only justice to you to express their satisfaction at the manner in which you have carried on the work in the capacities of manager, contractor for erection of machinery, and tributer for working claim—the whole extending over a period of nine months.

By order of the Board,

JOHN B. MALEY,
JOHN MORPHETT, } Directors.
JOHN LINDSAY, }

HARRY TURNER, Secretary.

G. W. Townsend, Esq., C.E., Stirling East.

Engineer-in-Chief's Office, Adelaide, January 6, 1869.

THE bearer, Mr. George William Townsend, brought letters of introduction to me from two professional friends in Melbourne, in which they speak very highly of his qualifications, and I shall be glad to hear that he has succeeded in obtaining some suitable engagement. His testimonials, which I have seen, will speak for themselves.

H. S. MAIS,

Engineer-in-Chief.

Victorian Water Supply, Resident Engineer's Office,

Melbourne, 26 November, 1868.

Dear Sir,

I have great pleasure in stating that during the period that you have been engaged as draughtsman under my direction in this Department you have given me every satisfaction, and I have reason to believe that you given every satisfaction to your other employers in this Colony, and I hope that you may be successful in obtaining the appointment which you seek in the survey of the Northern Territory. I should judge that you were well suited for such professional engagement.

I am, &c.,

CLERMONT WILKS,

Mr. G. W. Townsend, Licensed Surveyor, Melbourne.

Overseer.

Sir,

Sir,
 I have the honor to inform you, in reply to your letter of the 30th ultimo from Camperdown, that in the performance of the various surveys allotted to you during the present year in this district you have given me perfect satisfaction, and in the event of your returning to the district I will be glad to avail myself of your services.

Survey Office, Hamilton, 1 November, 1867.
 I have, &c.,
LINDSAY CLARKE,
 District Surveyor.

G. W. Townsend, Esq., Contract Surveyor, Melbourne.

My dear Sir,
 I have great pleasure in bearing testimony to the zeal and ability you have shown during your engagement with me, in carrying out my contract work in the Hamilton District. I regret very much parting with you, and trust that you may speedily find a profitable field for the exercise of your high professional qualifications.

Camperdown, 30 October, 1867.
 I remain, &c.,
R. THORNLEY.

G. W. Townsend, Esq.

Dear Sir,
 At your request we have to state that during the time you were employed at the Potosi Mining Company's (Limited) works you gave great satisfaction, and your services were only dispensed with on account of there being not more work for you to do.

Adelaide, 28 June, 1869.
 Yours, &c.,
CHAS. J. BARRY,
 Chairman.
ISAAC ROWLEY,
 Superintendent.

G. W. Townsend, Esq.

Sir,
 I have much pleasure in bearing testimony to the very creditable manner in which you passed as a Contract Surveyor before the Board of Examiners appointed by this department to inquire into the professional qualifications of gentlemen proposing to undertake surveys for the Government under contract.

Lands and Survey Office, Melbourne, 13 November, 1867.

The surveys subsequently executed by you for the department having received the unqualified approval of the Inspecting Surveyor, conclusively prove your thorough acquaintance with the principles and practice of surveying.

I have, &c.,
A. J. SKEUL
 (For Surveyor-General.)

G. W. Townsend, Esq., &c., Contract Surveyor.

Sir,
 In answer to your letter of yesterday I beg to state that I shall have much pleasure in replying to any reference, which may be made to me concerning you.

Roads and Bridges Office, Melbourne, 11 January, 1867.

Mr. Geo. W. Townsend, "Gloucester Hotel,"
 East Collingwood.

I have, &c.,
JOHN STEAVENSO,
 Assistant Commissioner of Roads and Bridges.

Sir,
 I have the honor, in reply to your letter of the 18th instant, to state that I was favourably impressed with the ability displayed by Mr. Overseer Townsend whilst in this district, and I found him attentive to his duties and perfectly reliable in any statements he had occasion to make.

Wangaratta, 20 January, 1864.
 I have, &c.,
F. RYLEY,
 Road Engineer.

The Assistant Commissioner of Roads and Bridges, &c.

Dear Sir,
 I have yours, dated 26th February (I presume it means April), and am sorry at Mr. M'Crae's report. You had better not return to this district, and I will to-day write to Mr. Turnbull to advise and request that he will appoint you to one more healthy.

East Indian Railway, Central Myrumbed Division, 29 April, 1859.

Yours truly,
FRANK DIGHT,
 Resident Engineer.

To G. W. Townsend, Esq.

DATE of service in East Indian Railway Company's employ:—From September, 1858, to March, 1860, as sub-assistant engineer. Date of service in Calcutta and South-eastern Railway Company's employ as assistant engineer, April, 1860, to November, 1861, when my health completely broke down. I then went to England, and was engaged as assistant engineer by Mr. Meldrum for the Canadian Pacific Line, to to whom I gave all papers I had relating to Indian service. I went back to Calcutta for my wife; on reaching Melbourne, *en route* for British Columbia, I found all work had been stopped, so I remained in Melbourne friendless and unknown.

48, York-street, Lumeah Hill, 15 December, 1862.

I TAKE much pleasure in stating that the bearer, Mr. George William Townsend, has been strongly recommended to me by an old friend of mine residing in Calcutta, who informs me that Mr. Townsend was assistant engineer on the Calcutta and South-Eastern Railway, and is every way deserving of respect and confidence. I may mention that my correspondent is cashier on the same railway.

Mr. Townsend, my friend states, left Calcutta on account of ill-health, intending to proceed to British Columbia.

WILLIAM HAIG, M.D.
 Colony

Colony of Victoria.

WE, the Board of Examiners for the Survey Department of Victoria, having duly inquired into Mr. George Wm. Townsend's qualifications as a surveyor, find him to possess all the requisite field experience and mathematical knowledge, with skill in the adjustment and manipulation of the ordinary modern surveying instruments, and proficiency in details of plotting and construction of maps.

We therefore grant Mr. George William Townsend this certificate, and hereby license him to act as a contract surveyor, in the Colony of Victoria.

CLEMENT HODGKINSON, } Members
A. J. SKEUL, } of the Board.
RALPH SOUL, } Secretary.

Department of Lands and Survey,
Melbourne, 9 April, 1867.

No. 4.

Minute by The Secretary for Public Works.

Department of Public Works, Sydney, 27 February, 1888.

I SHOULD like to have a copy of Mr. Firth's history in the Department, and also Mr. Simpson's.

JOHN SUTHERLAND.

For to-morrow (Tuesday) morning. Mr. Quodling.—Urgent. Information herewith.—J.W.,
pro W.H.Q., 28/2/88. Under Secretary. B.C., Railways—J.R., 28/2/88. A.R., 29/2/88.

In answer to Minister's memo. of 27/2/88, Mr. T. R. Firth entered this Department on 3rd March, 1863, as district engineer, at £500 per annum and allowances; on the 1st September, 1872, he was appointed to take charge of the surveys in the Southern District at £500 per annum and 30s. per day expenses; on the 1st December, 1873, he was placed as district engineer on the Goulburn-Yass Extension, at £500 a year and allowances; and on the 1st January, 1875, was appointed resident engineer, at £700 per annum, allowances, and 30s. a day expenses when absent from district. He took charge of the Great Southern Railway No. 2 extension, on 23rd October, 1876, *vice* Mr. M'Kenzie suspended; and on the 30th June, 1878, Mr. Firth resigned; on the 1st September, 1880, he was reappointed district engineer, which position he now holds. Mr. D. C. Simpson entered this Department as a surveyor, at £300 per annum and allowances, on the 1st June, 1881, and on the 24th December, 1881, he resigned; on the 20th February, 1882, he was appointed district engineer, at £500 per annum and allowances, which position he now holds.—JOHN WHITTON.

Career of D. C. Simpson, A.M.I.C.E. (Communicated.)

Education training completed, 1878. Scotland.

FOUR years at the Aberdeen University. Three years with William Boulton, M.I.C.E.,—works in progress, Aberdeen sewerage and waterworks, and Beith railway. Six months assistant engineer to Easton Gibb, A.I.C.E.; contractor for 18 miles of the Callander and Oban railway, and Dundee waterworks. Thirteen months assistant engineer to Messrs. Blyth and Cunningham M.M.I.C.E., Engineers for all new works on the Caledonian railway system. (Glasgow Central and Carlisle Citadel stations were then in hand, besides a number of extensions.)

January, 1875, to January, 1881.

Appointed a resident engineer for the New Zealand Government, during which time he had charge of 74 miles Napier-Wellington railway, 40 which were constructed and 34 surveyed; the Christchurch-Greymouth railway (East and West Coast) three routes were explored and surveyed—about 300 miles; Greymouth to Nelson railway—explored and surveyed 100 miles; Blenheim to Christchurch railway—100 miles surveyed; Wanganui to New Plymouth railway—surveyed 30 miles; Little River to Akaroa railway—explored 60 miles, surveyed 30 miles, and constructed 18 miles; Canterbury interior main line of railway—surveyed 25 miles and constructed 15 miles.

New South Wales. April, 1881. February, 1882.

Appointed a railway surveyor, and laid out 30 miles of the Homebush-Waratah railway. Appointed a district engineer; constructed the Albury to the River Murray extension and the Cootamundra to Gundagai railway; improved the Nyngan to Cobar railway, not yet constructed.

Passed, at the request of the Government of New Zealand, the examination for authorized surveyors—J. T. Thomson, Surveyor-General.

Minute by The Engineer-in-Chief to The Secretary for Public Works.

Department of Public Works, Railway Branch,
Engineer-in-Chief's Office, Sydney, 1 March, 1888.

Subject:—Report on Mr. Townsend.

I OBSERVE from a paragraph in the public press that Mr. Townsend has replied to my remarks on his survey and estimate of the proposed Colo Valley Railway.

The papers in reference to that matter were sent by me to Mr. Townsend, and under the regulations of the Service they should have been returned through me, and not sent direct to the Minister.

I shall feel obliged if the Minister will permit me to see Mr. Townsend's remarks, as, judging from the newspaper paragraphs the Minister is not in possession of all the facts connected with this subject.

JOHN WHITTON.

Railways.—J.R., B.C., 2/3/88. A.R., 3/3/88. For Minister.—CH.A.G., 5/3/88. I have not yet received all papers in this matter.—J.S., 6/3/88. Place all papers with this.—7/3/88.

I have now been supplied with Mr. Townsend's report and particulars in this matter, and will lay papers on the Table in accordance with the resolution of Parliament. Regarding Mr. Whitton's remarks that Mr. Townsend's reply should have come through him, I did not request that it should come through any other channel, but I claim the right of being above all departmental regulations and red-tapeism. I forward the report as requested, and wish it returned by 3 o'clock, so as to enable me to carry out the wish of Parliament.—J.S., 8/3/88. Received 1.15 p.m.—W.H.Q., 8 March, /88.

As the Minister did not forward these papers to me until 1.15 o'clock p.m. to-day, and requested that I should return them at 3 o'clock, it is evident that no reply from me was wanted by him, although the resolution of Parliament asks for the Engineer-in-Chief's report on Mr. Townsend's plan and estimate. I therefore return the papers.—JOHN WHITTON, 8 March, /88, 1.55 p.m.

Minute

Minute by The Secretary for Public Works,

Subject:—Colo Valley Survey, &c.

Department of Public Works, Sydney, 9 March, 1888.

In the press of business I misunderstood the intention of the motion. The Engineer-in-Chief may have the papers; my desire is to have the whole matter in as complete a shape as possible. I return papers, but wish to have them again on Wednesday morning, the 14th instant.

JOHN SUTHERLAND.

Received 10.30 a.m., 10 March, 1888 (Saturday).—W.H.Q. Report herewith, No. 88-219.—
J.W. (p. W.H.Q.), 15/3/88.

Minute by The Engineer-in-Chief to The Secretary for Public Works.

Subject:—Mr. Townsend's Report on the Colo Valley Survey.

Department of Public Works, Railway Branch,

Engineer-in-Chief's Office, Sydney, 13 March, 1888.

As there is nothing in Mr. Townsend's introductory remarks calling for special attention, I will proceed to deal with his estimate of the proposed railway from Emu Plains to Rylstone.

The following is Mr. Townsend's first rough estimate for this line:—

" 6½ miles tunnelling in short lengths	£600,000
12 miles at £15,000 per mile	180,000
25 miles at £10,000 "	250,000
60 miles at £5,000 "	300,000
Bridges and culverts (including Grose River Bridge)	100,000

£1,430,000

" Bridges and tunnels estimated for double line; the road for single line; 37 miles formation double line."

It must be remembered that the estimate as detailed above was made after an inspection of the line, and before any plans or sections had been taken.

Any one less imaginative than Mr. Townsend would be struck with astonishment at the marvellous manner in which he could profess, on a mere inspection, to prepare a detailed estimate for a railway through one of the roughest portions of New South Wales.

Had this report and estimate been sent to me by Mr. Townsend, I should have at once recalled him, as the absurdity of it was apparent.

After Mr. Townsend had returned from his survey and plotted the section of this line, he forwarded the following amended estimate:—

Tunnels	£1,293,409
Bridges	225,000
Viaducts	184,555
Culverts and other openings	25,785
Level crossings	1,000
Fencing	8,000
Earthworks	667,251
Permanent-way	208,000
Side drains and diversions	15,000
Tramway	62,000
Platforms and sheds	5,000

£2,695,000

Cubic contents, as given, show that single was intended.—J.S., 26/3/88.

In this estimate nothing is mentioned as to any alteration being proposed by Mr. Townsend to make the tunnels for a single line as afterwards stated by him, and my estimate for tunnels was therefore for a double line.

In Mr. Townsend's first estimate provision is made for 6½ miles of tunnels for a double line to cost £600,000. In the second estimate the length of tunnels has been increased to 20½ miles, to cost £1,293,409.

Mr. Townsend has now made three estimates of the cost of this line:—

1.—Including 6½ miles of tunnels	£1,430,000
2.—20½ miles	2,695,000
3.— Do. with a rearrangement of other items	2,695,000

In the first estimate the cost per yard of tunnels was £52.

I learn from Mr. Townsend that his estimate was £52 per yard double line to Mr. Whitton's section, but not bricked throughout.

Estimate

£36 single line to Mr. Whitton's section, which Mr. Townsend considers extravagant, and bricked throughout.

Line to a section proposed by Mr. Townsend, and which he considers adequate for the purpose, and bricked only where required. (See section attached).*—J.S., 26/3/88.

Quantities will show that this was not the case.—J.S., 26/3/88.

It would be well if all engineers were to do this. It would show them whether the gradings of the line which they proposed were the best to meet the exigencies of the traffic. The omission of this important duty in the past has undoubtedly been detrimental.—J.S., 16/3/88.

As the cost of each is given I do not see that this assumption is a fair one.—J.S., 26/3/88.

The advisability of indiscriminate lining may fairly be questioned.—J.S., 26/3/88.

Mr. Townsend informed me that his viaducts are single, not double; that in estimating £9 a foot he is well within the limit of cost. The average height of his viaduct is about 65 feet. The cost of the Nairne viaduct, £27 14s., is abnormal, and is explained by the published correspondence on the subject; but Mr. Whitton does not quote the other instances given by Mr. Townsend. The Kinzua viaduct, which with

Estimate No. 2, 20½ miles, £36.

Estimate No. 3, 20½ miles, £26.

If any other estimates are to follow it will be difficult to imagine to what amount the tunnels will be reduced. No saving has, however, been effected thereby, as the amount taken off the tunnels has been used to increase the cost of other items.

The first and second estimates were intended no doubt for double line tunnels, and it was not until I asked Mr. Townsend whether the line was intended to be a single or double one, principally with regard to earthwork and permanent-way (as the tunnels had been stated as for a double line), that he realized the desirability of making the tunnels for a single line.

I have never before had submitted to me such marvellous reports as those of Mr. Townsend; they are, to say the least, and without being unnecessarily emphatic, very peculiar, and exhibit such a wandering disposition that there is really nothing tangible about them.

Judging from my own experience, which has been considerable, I can say that such inconsequential documents I had never previously seen.

Not content with mystifying in every possible way the things he attempted to explain, he has mixed up with the Colo Valley estimate his ideas of the cost of working the traffic likely to be obtained, and the profit to be derived from it. And, as if this were not sufficient mystification, he introduces an imaginary line from Rylstone to 10 miles beyond Dubbo, being a length of 110 miles for which no surveys have been made, and which he declares can be constructed at £7,000 a mile, and makes an average between the cost of the Colo Valley and this imaginary line, extending over a total length of 214 miles, being £16,192 per mile.

It is obvious why these are averaged. It is simply to make an apparent reduction in the cost of the Colo Valley line; but as one portion is very much under-estimated, and the cost of the other portion is acknowledged as a guess, it is somewhat difficult to say which is the more reliable.

I give below an approximate estimate of the cost of the Colo Valley line on the assumption that the quantities furnished by Mr. Townsend are correct.

20½ miles tunnels, double line, as originally stated by	£
Mr. Townsend, at £90 per yard	3,247,200
6,860 ft. bridges, double line, at £60 per foot	411,600
20,193 ft. viaducts, double line, at £36 per foot	726,948
20 level crossings	1,000
18,824 rods fencing, at 8s. 6d.	8,000
5,338,008 cubic yards earthworks, at 3s.	800,701
104 miles permanent-way, at £2,500	260,000
180,000 side-drains and diversions, at 1s. 8d.	15,000
Station arrangements, and sidings, &c.	40,000
	<hr/>
	5,589,449
Contingent and engineering expenses, 10 per cent. ...	558,944
	<hr/>
	£6,148,393

I believe the prices I have given above are fair and reasonable; and I have assumed that the tunnels will have to be lined throughout, as this has been done to all tunnels carried out under my direction in the Colony.

In Mr. Townsend's report (after survey), he states that "the whole of the viaducts proposed will be under £9 per foot, in position. The heights, as will be seen from the list, vary from 10 feet to 243 feet." These viaducts are for double line.

From Mr. Townsend's report, dated 22nd February, 1888, I extract the following:—"The Nairne Viaduct (South Australia), for single line, carries consolidation engines on 5-ft. 3-in. gauge; maximum height, 100 feet; average height, 53 feet; cost, about £27 14s. per lineal foot." In the face of this statement of the actual cost of the Nairne Viaduct (which I know to be about correct), Mr. Townsend states that the viaduct on the Colo Valley Line can be erected for £9 a foot for double line, while the Nairne Viaduct, for a single line, has actually cost £27 14s. per foot. Mr.

* See Appendix.

an average height nearly three times in excess of the average height of his viaduct cost only £25 per foot. If they could build (with iron at £29 per ton) at £25 per foot, with an average height of 178 feet, Mr. Townsend is quite sure that with iron at £20 a ton in position he could build viaducts at £9 per foot, with an average height not exceeding 65 feet. As I have said the quantities given by Mr. Townsend in his two last estimates show that in both he estimated for single viaducts.—J.S., 16/3/88.

This may be all very well as a contrast between Mr. Whitton's estimate and Mr. Townsend's estimate; but this is not what the Government require. If Mr. Whitton can show that single line viaducts and single line tunnels are inadequate, then of course we must have them both doubled, but for the mere purpose of swelling Mr. Townsend's figures such calculations are useless not to say mischievous.—J.S., 26/3/88.

As a pure piece of official doctrine, this announcement of what should be the controlling principles is absolutely unanswerable, but it has no application to the present case. Indeed, the safety of the inferior officer, and not the superior officer, is in question. Mr. Whitton has branded Mr. Townsend as an incompetent officer, and I have permitted Mr. Townsend, under the peculiar circumstances of the case, to show cause, if he could, against such assumption. The safety of the superior officer is not in question, and even if it were I must take occasion to say that in a matter of this kind, affecting as it does the general interests of the country, the safety of either superior or inferior officer is comparatively unimportant.—J.S., 26/3/88.

In the copy of the document which Mr. Whitton sends me with this report, I see that Mr. Townsend says in paragraph 9, referring to the documents and plans forwarded, "also section of tunnel showing thickness of lining, &c." It is therefore clear that the design was forwarded to Mr. Whitton, and his statement, that Mr. Townsend is trusting to his imagination, falls to the ground.—J.S., 26/3/88.

Mr. Townsend is so reckless that no dependence can be placed upon his statements. His first estimate was for double line tunnels, bridges, and viaducts. Nothing is said in his second estimate to disturb this arrangement, except an increased cost in the total estimate. In his third estimate the total amount is the same as the second with a considerable shuffling of the various items, and an alteration from double line tunnels to single line, with bridges for double line and viaducts for single line. I am not disposed to permit him to wander about in this manner. I have therefore made my estimate of the cost of this line on his previous statements, of double line tunnels, bridges, and viaducts.

With reference to Mr. Townsend's remarks about my refusing to see any subordinate officers, and "that no subordinate officer in Mr. Whitton's branch dares to think of going to see Mr. Whitton," I may be permitted to say that if all the surveyors I have had interviews with had so misrepresented what I said, as Mr. Townsend has done, I consider that I would have exercised sound judgment in refusing to see them. If Mr. Townsend means that I have never encouraged a subordinate officer to make complaints against his superior officer, he is quite right. I have never promoted or fostered insubordination, and I never will; but I have never refused to entertain a complaint from any subordinate officer if brought before me in a proper way. The most certain way to destroy a department is to encourage insubordination, and no superior officer is safe if such a vicious system be permitted.

Mr. Townsend says, in his report of 22nd February to the Minister: "My first idea was to make the tunnels for double line, but on mature consideration of the fact that by the design for single line tunnel, submitted by me to Mr. Whitton, &c." I am not in the least surprised at this statement, but I merely wish to remark that no such design was ever submitted to me; but, as I have previously stated, there is no limit to Mr. Townsend's . . . imagination.

Mr. Townsend says the Engineer-in-Chief has been in possession of all information for making an estimate of this line since December. In his report of February 17th he acknowledges that the cross sections are not ready, and without them no earthwork quantities in such rough ground can be correctly estimated, nor without the disposal sheet, which was asked for from Mr. Townsend but not supplied, can it be seen whether the banks will be made up with excavations from cuttings or tunnels, or whether the leads will not be so long as to demand a higher price for the excavation.

With

Copy has not been attached as stated, but it is not important.—
J.S., 26/3/88.

In no way attributable to Mr. Townsend.—J.S., 26/3/88.

This is new matter introduced by Mr. Whitton, and cannot be dealt with here. He is wrong in the figures he gives, and I understand that the real expenditure was swelled by several items which were not included in the original estimate.—J.S., 26/3/88.

I do not see how Mr. Whitton reconciles this statement of what Mr. Townsend would have preferred with Mr. Townsend's actual report, which Mr. Whitton had before him when he was writing this paragraph. Mr. Townsend says:—"I have been careful to adopt solid piers wherever they are liable to be exposed to drift from floods, and have only used the light open trestle work in country on which the trestles cannot possibly be exposed to floods."—J.S., 26/3/88.

The present Western line will have quite sufficient to do in a few years if its traffic is confined to that developed between Penrith and Orange.—J.S., 26/3/88.

With reference to Mr. Townsend's statement about an interview he had with me as to his proposal to construct a floating jetty at Sydney Cove, I can merely repeat that the imaginative faculty, which never deserts him, has been at work again, but fortunately I have the correspondence on the subject, and append a copy of it. This hardly bears out Mr. Townsend's detailed account of our interview.

Mr. Townsend has called my attention to some iron bridges which, he says, were designed by him for the duplication of the Western line between Parramatta and Penrith.

I have been told that these bridges have not been erected in accordance with Mr. Townsend's design, but were considerably strengthened, and even now they are not considered satisfactory.

The abutments also to some of these bridges have shown signs of weakness, and additions and repairs are being made to them.

Mr. Townsend, I understand, made the estimate for duplicating the line from Parramatta to Penrith, which was about £75,000, and the actual cost was about £160,000.

Full particulars of these matters can be obtained from the Existing Lines Branch.

In comparing the cost of bridges erected by me on the railway from Glen Innes to Tenterfield with the iron bridges said to have been designed by him on the line between Parramatta and Penrith, Mr. Townsend is not only insubordinate but impertinent, and he would have found himself more usefully employed in defending his estimate of the Colo Valley survey.

With his usual want of perception he suggests that iron bridges, supported on iron trestles, would have been better and cheaper. But as the bridges he refers to as built by me are over rivers in which very heavy floods occur, carrying large trees and brushwood at great velocities, it is certain that the first flood would have carried away the skeleton-like supports of the iron bridge recommended by him.

The iron bridges referred to by Mr. Townsend have no doubt been erected under very different circumstances and conditions.

I think I have now wasted sufficient time over Mr. Townsend, and will only give one more quotation from his report.

He says, "That it is very unlikely that the traffic on this light grade line will be sufficiently heavy for many years to need a double line of rails being laid; I think it will be better to make single-line tunnels," &c. So that the original and second estimates for double tunnels having been found to be absurdly insufficient, Mr. Townsend suggests that, as the traffic will be small for many years, single line tunnels only will be required.

But it was to relieve the heavy traffic over the Western line that this work was suggested and insisted upon, and to avoid what are considered the heavy grades between Rylstone and Mudgee it was proposed by him to make a new line of railway in connection with this Colo Valley route from Rylstone to 10 miles beyond Dubbo, which would of course provide two lines for the traffic of the far West, but would not relieve the Western line of the local traffic between Dubbo and Sydney, and instead of providing for the alleged congestion of traffic between Penrith and Bathurst, this line would, if constructed, simply be used for the comparatively small amount of traffic beyond Dubbo.

I have had so little time given me to reply to Mr. Townsend's report to the Minister that I may have overlooked some important matters which require explanation, but if the Minister will kindly point out any omission on my part, I shall have pleasure in supplying any further information on the subject.

JOHN WHITTON.

[Schedule of papers attached to Mr. Whitton's minute laid on Table of Legislative Assembly on 26 March—See Further Return.]

No. 7.

Minute by The Secretary for Public Works.

Alleged incompetency of the Officers nominated by the Secretary for Public Works to superintend and conduct, under the Engineer-in-Chief, the future Railway Trial Surveys—Minute of the Engineer-in-Chief of 14th February, 1888.

HAVING before me now the reply of Mr. Townsend to Mr. Whitton's minute, charging him with incompetency, based upon the ascertained discrepancy between Mr. Townsend's rough estimate before survey of the Colo Valley Railway, and his detailed estimates after actual survey, I am in a position to deal with Mr. Whitton's representations.

And first with reference to my decision that two high-class surveyors were to be entrusted with the surveys of trial lines, instead of one as proposed by Mr. Whitton, and to that gentleman's statement that an extra expenditure is involved by my proposal, of £700 a year. We

We have expended on the railways of this Colony some thirty millions of money in a period of as many years. It will not be denied that in the location of the lines many mistakes have been made; it is probably unnecessary to particularize them, but I may mention one notable error, and that is the line between Picton and Mittagong: The maximum grade on the route chosen is 1 in 30 for nearly 3 miles, limiting the train load to some 70 or 80 tons, while recent surveys have shown that in a less distance, and at a less cost, a route was in existence with grades not exceeding in severity 1 in 60, and admitting of the haulage of a train load of 160 tons. Instances of this kind can be multiplied, they are known to many, and while such errors in a large system of railways, admirably carried out in many respects, may be inevitable, it must be admitted that, if by an expenditure of £700 a year, or even a larger sum, in strengthening the capacity of the staff entrusted with the trial surveys, such errors may be removed or even mitigated, the outlay would be not only a justifiable one but the refusal to incur it would be indefensible.

It was with the conviction that better located lines could have been secured for our railways if the talent employed to make the trial surveys had been of a higher order, that I suggested a new departure in this respect. I, of course, make no reference in this remark to the individual abilities of the Engineer-in-Chief. That portion of his duties he has entrusted to others, and I believe I am right in saying that, with almost immaterial exception, Mr. Whitton has supervised the survey of trial lines in no other way than by an examination and revision, in the office, of the surveys and plans submitted to him by his subordinates. Mr. Palmer, was the engineer for trial surveys, and to him was entrusted the duty of supervising the surveyors in the field, but, owing to the number of miles of country under exploration and survey, it was impossible that one officer could give that individual supervision of the surveyor's work which was indispensable to the obtaining of the best results, and carry on at the same time the supervision of a large office staff in Sydney, in which latter service he was engaged nine months out of the twelve. If Mr. Palmer was unable to do this I am quite sure that Mr. Firth, whom Mr. Whitton recommended for the post, would be unable to accomplish it. Mr. Palmer was comparatively a young, active man, possessing energy and perseverance and with physical power to resist fatigue very much greater than that possessed by Mr. Firth, who, from age, and from the indulgence of late years in a life of ease and comparative leisure, is unfitted to undertake the active duties appertaining to the exploration and survey of new country—often inaccessible, except to those possessing untiring energy and indomitable perseverance, and who can endure the exposure and hardships inseparable from such a calling.

Mr. Townsend has given evidence, by his successful survey of the Colo Valley (previously unexplored because it was deemed to be impenetrable), that he possesses in a high degree these qualifications. It was at his own instance that this arduous undertaking was carried out. That he possesses constructive ability is evidenced by the fact that he is the designer of girders for bridges, which are admitted by competent authority (Professor Kernott, of the Melbourne University, and Professor Warren, of our own University) to be in every sense admirable for lightness and strength and economy in cost. I am satisfied that his able reply to the charges of incompetency preferred against him by Mr. Whitton will be accepted as convincing proof of his ability to faithfully carry out the duties which I have proposed to entrust to him, and he has vindicated his claim to be recognized as a competent and valuable officer of the Government.

Mr. Whitton asks me to brand Mr. Townsend as an incompetent and unreliable officer, because his first rough estimate of the cost of the Colo Valley Railway has, after actual and detail survey, been exceeded. He infers that this survey would not have been authorized by Mr. Secretary Wright but for Mr. Townsend's representation that the line could be constructed for £1,500,000. Mr. Townsend explains the circumstances under which the estimate was made, and also the reasons why it has been exceeded; but, as a matter of fact, it was not Mr. Secretary Wright who authorized the survey. I find that it was authorized by Mr. G. R. Dibbs, who was acting for Mr. Wright during that Minister's absence on account of ill-health extending over several months, and in the minute which authorized the survey Mr. Dibbs gives very good reasons for his action, and makes no reference whatever to the estimated cost of the line. The minute is as follows:—

“Now that the railway proposals of the Government contain a proposed line to Wilcannia, and as heavy extensions will no doubt be sanctioned out westward, it becomes more than ever desirable that a trial survey of the route indicated herein should be made. This survey will of course be made in Mr. Whitton's Department, but Mr. Townsend is to be placed in charge of it under the Engineer-in-Chief.—G.R.D., 15/8/84.”

Mr. Townsend explains that his rough estimate has been exceeded chiefly because he has found it necessary to provide for 21 miles of single tunnel instead of $6\frac{1}{2}$ miles of double tunnel, as originally contemplated by him. He says that the substitution of tunnelling for open cutting has been proposed for the purpose of escaping from the risks of slips from a treacherous formation, which have proved so disastrous through a disregard of this precaution on the Mudgee line of railway. If I am to condemn Mr. Townsend for this alteration in his plans, and for the discrepancy between his two estimates, amounting to 87 per cent., what am I to do in the case of the North Shore Railway? Estimates for both these works were given under like circumstances—that is, without previous survey. £140,000 was placed on the Estimates, and voted as the cost, at all events, the part cost, and presumably the approximate cost of this line of railway, but after survey and detailed plans had been prepared, Mr. Whitton's estimate was over £700,000, not 87 per cent. in excess, as Mr. Townsend matured estimate of the Colo Valley Railway turns out to be, but 400 per cent. in excess. Mr. Whitton's explanation of this discrepancy has been made, but I think his first estimate must have been deemed by the Government of the day to have been approximately correct, or the amount would not have been placed upon the Estimates in the shape it was. It was subsequently voted by Parliament without any explanation or correction by Mr. Whitton at the time.

If I am to accept at Mr. Whitton's instance the discrepancy between Mr. Townsend's rough and matured estimates as evidence of his incompetency, how am I to justify my consistency if I ignore such evidence in other cases? I have before me now Schedules of quantities of some of the Railway contracts, which

which have been completed, not approximately estimated before survey, but after detailed survey, and subsequent to the staking out of the line for contract, and I find such discrepancies as the following :—

Estimated quantities.		Quantity for which Contractor was paid.	
Ironbark timber	150,000 cubic feet	83,925 cubic feet.	
Hardwood in piles	78,000 lineal "	37,486 lineal "	
Do. do.	20,000 " "	5,117 " "	
Wrought-iron work in bolts	435,000 lb.	273,389 lb.	
Painting bridges	80,000 sup. yards	57,579 sup. yards.	
Ballasting permanent way	62,000 lineal "	114,041 lineal "	
Laying permanent way	68,000 " "	121,611 " "	
Excavations	2,040,000 cubic yards	2,480,000 cubic yards.	
Do. diverting watercourse	5,000 " "	13,458 " "	
Brickwork to culvert	14,000 " "	6,270 " "	
Ironbark timber	41,000 " feet	59,674 " feet.	
Hardwood planking	12,000 " "	27,916 " "	
Ironwork	132,000 lb.	238,352 lb.	

Mr. Whitton draws attention to the expenditure incurred on the Colo Valley survey, which he says is nearly £8,000. £3,000 of this amount has, however, to be debited to the track made to enable provisions, tools, and materials to be conveyed, leaving a balance of £5,000 for the actual survey and the preparation of plans, &c. Mr. Whitton considers this money thrown away. But by this expenditure we have the existence of a practicable route demonstrated. It would be interesting to know how much money was expended in trying, unsuccessfully, to find a route by the Grose Valley. The surveyors were beaten back by the difficulties they met with. Whether they possessed the indomitable energy, the continuity of effort and determination displayed by Mr. Townsend, who almost single-handed has accomplished that which they failed to accomplish, I do not know, but I know their labours bore no fruit, and that they cost the country over three times the sum which Mr. Townsend's surveys have cost, with such a different result.

It is not necessary that I should dwell further upon this aspect of the case, except to express my belief that when Mr. Whitton completes his investigation of the survey and works of construction proposed for the Colo Valley line, he will see reason to modify the opinion he expresses of its probable cost. Such a difference as there is between £2,695,000, estimated by Mr. Townsend, and £5,000,000, estimated by Mr. Whitton, is unexplainable, except on the assumption that there is a misapprehension of the character and cost of the works proposed. Even if Mr. Townsend's figures should swell from £2,695,000 to over £3,000,000, the saving that would be effected on the *present* costly running over the severe grades of the Blue Mountains, would represent a sum in excess of the sum to be paid for interest on the larger amount, and especially so if to meet the growing traffic the line from Penrith to Bathurst has to be doubled. I would remind Mr. Whitton that, owing to the limited load that can be taken over the Blue Mountains, we have to run for present traffic fifty-two trains daily. I see by Mr. Townsend's report on his survey of the Colo Valley line that while thirteen loaded trucks is the maximum load over the mountains, by the grades and curves which he has secured for the Colo Valley routes sixty trucks will be the load. If twelve trains would do the present work instead of fifty-two, as would seem by this calculation to be the case, the saving in working expenses would be enormous, and in ten years from this, when we may reasonably expect the present traffic to be doubled, the necessity for this Colo Valley line will be imperative. The interest upon the capital, even if the line cost £5,000,000 (an estimate which there is reason to believe is excessive), would be under £200,000 a year, and the saving effected on working expenses by the adoption of the easier graded line would annually exceed that amount.

I have now to deal with my nomination of Mr. Simpson for one of the positions referred to: I selected this gentleman because of his proved capacity, as evidenced by his resurvey of the line from Nyngan to Cobar, and the improvements he effected therein. It will be in Mr. Whitton's recollection that his first estimate for this line was £263,500 without land, and that amount was voted. Subsequently he made an estimate by which the cost was shown to be £241,661. It was understood that every exertion had been made to make this a cheap line. To this end Mr. Secretary Lyne insisted upon a modified specification, and when that Minister pointed out discrepancies in the specification submitted, Mr. Whitton had to explain that it had been prepared hurriedly, and had since been remodelled to a great extent. The line as finally submitted had gradients of 1 in 40, and there were 60,000 cubic yards of excavation, exclusive of side cutting. After an interval of some months, during which tenders were invited and received, and the question of the reproductive character of the line discussed, it was determined to resurvey and cross level portions of the line to get the best possible section with lighter gradients. After there had been expended upon this line the engineering talent of the Department to secure the most economical route, it was rather surprising to find that Mr. Simpson, who was detached for this service, managed to get a line with improved gradients, the maximum of which did not exceed 1 in 50, and this without any increase in the cost of the line, but actually with a small reduction on that cost. The importance of this improvement can best be estimated by the reply which the Assistant Locomotive Engineer has given to the inquiry made by the Commissioner for Railways, as under:—

"Send copy of original grade of this line and the grades as now submitted to Mr. Scott, and ask him to say what difference in the load in tons the improved grades will admit of being hauled?"

The reply of the Assistant Locomotive Engineer is as follows:—

"It will increase the hauling capacity of the engine fully 60 per cent.—that is, if an engine can haul 100 tons on original grade, it can haul 160 tons on proposed reduced grades."

It was for this reason, and because I had received very favourable testimony of Mr. Simpson's general ability, and of his willingness to give effect in every way in his power to the desire of the Government for cheap railways—in connection with which light as opposed to heavy grades, are such an important factor, that I recommended him for the position of Engineer of Trial Surveys for one of the two subdivisions—to take charge of the surveyors in the field, and to actively superintend their work.

I cannot admit that Mr. Whitton's minute of 14th February has weakened my conviction that in selecting Messrs. Townsend and Simpson for this special service I was utilising to the best purpose the resources of the Department, and I am convinced that I have obtained the services of the best men available.

3rd March, 1888.

JOHN SUTHERLAND.

SINCE writing the above I have read Mr. Whitton's reply to Mr. Townsend's report. I may say that a good deal of Mr. Whitton's paper is simply repetition of what he has said in previous reports. Where it has been necessary to comment upon any new matter which he has introduced, I have annotated my remarks in the margin. It is unnecessary to extend the correspondence, and if Mr. Townsend suffers thereby, he must be content to know that he has already been allowed a good deal of latitude which is not usually given to subordinate officers.

16th March, 1888.

JOHN SUTHERLAND.

No. 1.

Memo. from The Engineer-in-Chief to Mr. E. R. Thomas.

Department of Public Works, Railway Branch,
Engineer-in-Chief’s Office, Sydney, 24 October, 1887.

I RECEIVED from Mr. Townsend, on the 21st instant, an extraordinary document, which he calls a report upon the cost and works of the proposed Colo Valley Railway, which he has surveyed from Emu Plains to Rylstone, and of a railway, *which he has not surveyed*, from Rylstone to 10 miles beyond Dubbo.

I also received the section of the Colo Valley line, which is only in pencil, and affords little information which can in any way justify the conclusions arrived at by Mr. Townsend as to its probable cost.

I desire to have the section properly finished, showing gradients, cuttings, with cross sections, tunnels, bridges, and viaducts, so that something like an approximate estimate can be made.

Mr. Townsend should confine his remarks to facts, which are alone wanted, and the imaginative portion of his report might, with obvious advantage, be struck out.

625—A

[905 copies—Approximate Cost of Printing (labour and material), £10 18s. 0d.]

The

The section, when finished, should have the quantities carefully taken out of all cuttings, viaducts, tunnels, bridges, and culverts, so that I can have them checked, and satisfy myself, not only as to Mr. Townsend's calculations, but also of the sufficiency of the prices he has adopted for each separate work, and be in a position to give my own report to the Minister as to the probable cost of this line before its submission to Parliament.

The report is now forwarded to Mr. Townsend for revision, to be returned when the information asked for has been prepared and can be furnished.

Mr. Townsend's report in its present state is of no value whatever.

JOHN WHITTON.

An amended report has been furnished by Mr. Townsend, which appears from your memo. of the 11th instant to be still very incomplete.—E.R.T., 12/1/88. Engineer-in-Chief.

No. 2.

Mr. G. W. Townsend to The Engineer-in-Chief.

Sir,

Railway Survey Office, Sydney.

I have the honor herewith to forward my report on the Colo Valley survey, and exploration of extension therefrom westward.

The plan and section are finished, and will, I presume, be sent over by the officer in charge of this office.

I have, &c.,

GEO. WM. TOWNSEND.

Received, 3/1/88, 1 o'clock p.m.—W.H.Q. Additional information asked for by memo. 87, 11/1/88. Plan and section returned to Branch Office.

[Enclosure.]

The Engineer-in-Chief,—
Sir,

Sydney, 8th October, 1887.

I have the honor to forward herewith report on the Colo Valley Railway survey.

Length of Line.—The survey of the above line leaves the Western Line at 36 miles 2,564 links, and, as at present staked, touches the Mudgee line near Rylstone at 140 miles 25 chains by the Colo Valley line, against 156 miles 5,230 links by the Mudgee line,—both distances being reckoned from Sydney. The length of line to be constructed being 103 miles 7,936 links.

Tunnelling (see p. 5, &c.)—To ensure safety from landslips, which are dangerously prevalent on some portions of the Colo River, I have increased the aggregate length of tunnels from 12 miles (as I first estimated it) to 20 miles 5,714 links; thus largely, but, I am sure, judiciously adding to the first cost of the line. (See further remarks on pages 5 and 6.)

Grades (and on p. 9, &c.)—Summit Level.—The ruling gradient is 1 in 100, and the highest point on the line, which occurs at the Rylstone end of the tunnel through the dividing range, is 2,228 06 feet above high water-mark, Sydney.

Radius of Curves.—The sharpest curve adopted is 20 chains radius, which I consider is the smallest radius admissible on a light grade line on which high speed will be obtainable.

Survey.—In many places the survey is merely a traverse along the only foothold obtainable, and the proposed line is put on the plan and section in such parts in blue, the levels being deduced from cross sections, which have been carefully taken at every traverse station. The traverse is well staked and marked, bench marks at each $\frac{1}{2}$ -mile.

Bridges and viaducts.—The cost of bridges and viaducts is prepared from designs that I have from time to time made for the work, the limit strain on any portion of these structures in no case exceeding 4 tons in tension and 3 tons in compression, with the heaviest working load that can be brought upon them in practice added to the fixed load. The viaducts are composed of light iron and steel girders, carried on trestles formed of rectangular columns well braced together, each column

being formed of four parts  of shallow trough section iron rivetted together through the flanges, similar to the manner in which the Phoenix columns are formed of  segmental section iron. No column will be exposed to a working strain exceeding 2 tons per square inch of sectional area (see p. 6).

Culverts.—There are no expensive culverts; but I have allowed ample water-way in every gully or depression in which water can collect to the possible injury to the line; in spans exceeding 3 feet where the banks are shallow I propose using rolled girders for superstructure, carried on brick or concrete abutments. Where openings of considerable width occur in high banks, in which expensive retaining walls would be needed to carry the superstructure, or in which very long culverts would be needed by reason of the great extent of the slopes, I propose to put in viaducts of sufficient length to keep the toe of the bank clear of the highest flood level in the creek or water-course in question. Estimated cost, 50s. a cubic yard.

Earthwork.—There will be a large amount of earthwork—viz., 5,338,008 cubic yards from cuttings, and 1,486,700 cubic yards—including outlets from gallery tunnels—from tunnels. The slopes of cuttings, I have in every case taken at 1 to 1 (one to one), excepting where there is a certainty of solid rock, and have put the price at 2s. 6d. per cubic yard. I see the Mudgee line was let at from 2s. 8d. to 2s. 7½d. per cubic yard; and in this case, owing to the facilities given for carrying on work by the proposed tramway, there is no doubt that the earthwork will be taken for 2s. 6d. per cubic yard, or under that amount, for the sandstone worked on a face in heavy cuttings can be worked just as cheaply as earth. The stuff excavated from the tunnels will, in many instances, be available for filling when required. I estimate tunnel excavation at 8s. 6d. per cubic yard.

Tramway.—For the purpose of transporting contractors' plant and material along the rough portion of the line, it will be necessary to make a narrow-gauge tramway (say) 2-foot gauge from the wharf at the deep water on the Colo River, to which ocean steamers can come, to about the Old Main Camp at the running stream on the Capertee River, a distance of 62 miles, at a cost of £1,000 a mile, including rolling stock (say) £62,000. By this means, all difficulty of transport will be eliminated, and the rough portions of this supposed inaccessible country will be more easily reached than are many apparently more accessible places. The crossings of the various creeks will be by inexpensive temporary structures, and the distance given (62 miles) allows for running round all bends of the river, while the narrow gauge proposed allows the use of curves of 50 links radius, by which means the sharpest points on the river can be easily and cheaply worked round. A maximum grade of 1 in 20 may safely be adopted on a temporary line of this sort by using suitable engines, thus allowing an easy, inexpensive track to be obtained, the survey for which can be carried on by the contractor simultaneously with the works, for no plans or sections will be needed for such a work, which will follow closely the traverse along the river.

Tunnelling.—To ensure safety from landslips, which are dangerously prevalent on some portions of the Colo River, I have deemed it judicious to increase the aggregate length of tunnelling from 12 miles, as I first estimated it, to 20 miles 5,714 links, thus largely, but I am sure, in view of future saving in maintenance, judiciously increasing the first cost; wherever I have noticed during two years close observation a tendency to landslips, I have, though in some cases in positions in which a good section could be shown at a moderate cost, thrust the line back into tunnel regardless of the necessity of considerably

considerably exceeding my first rough approximation to an estimate given after my first examination of the Colo River. Many places that, at a first glance, looked safe have proved, on further examination, to be liable to heavy landslips, owing to heavy masses of rock embedded in a red cloggy soil having the appearance of solid rock; again, in some parts of the river, what at first appeared to be solid cliffs of sandstone to the water's edge, proved, on closer examination, to be in their lower parts composed of the upper portions of the coal measures which fret away with the weather, and allow the superincumbent rocks to fall in sometimes enormous masses, but having during two years carefully examined this part of the line, I feel confident that if I have erred it is on the side of safety in putting too much tunnelling. In many parts of the tunnels the rock will be found solid and sound enough to stand without lining as is the case with one short length of tunnel used as an over-bridge on the Blue Mountains, in which the pick-marks are as clean and sharp to-day as when they were first made in dressing the surface.

In some cases the tunnels will require lining throughout, but I do not think inverts will in any portion be needed. I have estimated the cost of tunnelling at £62,485 a mile, lining and facing 50s. a cubic yard.

Viaducts (continued from page 2).—The total length of viaducts will be 20,390 feet, built of iron and steel, somewhat on the pattern of the Ringera Viaduct on the New York and Erie line in the United States of America. Each trestle will be

formed of four columns of a rectangular section,  thoroughly well braced together. The greatest strain upon any

column will be 2 tons per square inch of sectional area. These viaducts are easily and cheaply constructed, can be carried to a great height (the maximum height of the Ringera structure being 301 feet), are very strong in proportion to their weight and cost, and, from the low unit strain adopted, will be very durable. I have paid great attention in these designs to lateral bracing, both as regards rigidity against swaying and wind pressure. I have been careful to adopt solid piers wherever they are liable to be exposed to drift from floods, and have only used the light open trestle work in country in which the trestles cannot possibly be exposed to floods. The average cost per lineal foot of the whole of the viaducts proposed will be under £9 per foot in position. The height (as will be seen from the list) varies from 10 feet to 243 feet, and the length from 40 feet to 2,240 feet, which last occurs at the crossing of the Bogie River, in the Capertee Valley, the average height of this structure being 70 feet. The columns forming the trestles will be set in concrete beds.

Bridges.—The bridges on this line will be as follows:—

At 46 miles 15 chains, a bridge over the Grose River, consisting of one 300 feet and four 100 feet spans. The foundation for this bridge will be inexpensive, as the river on both sides is near the surface. The long span will be clear across the river, and the four short spans are flood openings.

At 64 miles 150 links, a high-level bridge over fully 220 feet span. In this the abutments will consist of merely a small amount of retaining wall on each side, and the girders will be underneath the roadway.

At 67 miles 6,240 links, a bridge over Blacksmith Creek, consisting of three spans of 150 feet, one 60 feet, and two 40 feet spans. The foundations of the piers and abutments of this bridge will be inexpensive and of no great height.

At 70 miles 5,300 links, a bridge over the Wollangambe River, consisting of one 300 feet span and two 60 feet. In this, as in the foregoing, the piers and abutments will be small and inexpensive.

At 72 miles 6,350 links, a bridge over the Colo River, consisting of one 300 feet span and two 150 feet. The above remark applies to abutments and piers.

At 75 miles 26 chains, a bridge over the Colo River, consisting of one 300 feet span; low abutments.

At 79 miles 20 chains, a bridge over the Colo River, consisting of one 300 feet span, three 150 feet spans, one 100 feet span. Good rock foundation; low abutments; piers 60 feet high.

At 81 miles 4,040 links, a bridge of one 150 feet span.

At 83 miles 26 chains, a bridge consisting of seven 100 feet spans; piers and abutments about 60 feet high.

At 85 miles 8 chains, a bridge over the Walgon River, consisting of three 150 feet spans.

At 87 miles 18 chains, a bridge over the Capertee River, consisting of one 300 feet span, one 150, one 100; low piers and abutments.

At 87 miles 36 chains, one 300 feet span and two 60 feet spans; low abutments.

At 98 miles a bridge over the Capertee River, consisting of three 100 feet spans. In this bridge the foundations will not be deep, probably 25 feet from surface to rock, but they will be wet and difficult to secure while sinking; piers and abutments estimated at 50s. per cubic yard.

Gradients.—The ruling grade adopted is 1—100 or 52·8 feet rise per mile. In the face of the very much heavier grades that have been used on most of our lines hitherto, some explanation appears necessary as to why so light a grade has been adopted in this instance at the cost of at least 1½ million cubic yards of earth-work that could be saved by introducing heavier grades, besides a large saving that could be effected in the cost of viaducts by the same means, certainly £80,000, equal altogether to over a quarter a million of money.

The object in view of which this line with easy grades has been proposed, is to do away with the necessity of breaking up the long goods trains that one engine can draw from Sydney to Penrith, and from Narromine to Bourke, an easy grade could have been obtained from Dubbo to Narromine, but it has been deemed advisable to carry the line over the point of a range instead of going round it, which could have been done without greatly increasing the length or cost of the line. So also between Wellington and Dubbo by keeping along the Macquarie River an easy grade could have been obtained throughout the whole length without greatly increasing the distance or cost, but as it is useless now reverting to what might have been done, I will confine myself to what can be done.

I am informed that the maximum loads that one engine of the "Mogul" class will take on different sections of the Western Line are as follows:—

	Loaded trucks.	Limiting grade.	
Sydney to Penrith	50	1—80	There is a down grade of 1—66 from 33 miles to 34 miles; but that cannot limit the load from Sydney to Penrith.
Penrith to Mount Victoria	13	1—30	
Mount Victoria to Lithgow	13	1—33	
Lithgow to Bathurst	17	1—33	
Bathurst to Orange	17	1—40	
Orange to Wellington	17	1—40	
Wellington to Dubbo	17	1—40	
Dubbo to Narromine	28	1—50	Heavy grade to 292 miles.
Narromine to Bourke	60	1—80	
Penrith to Bourke, by Colo Valley route, may safely be estimated	60	1—100	Excepting a short length of 1—80 at 406 miles, and several of 1—88 up to 424 miles.

From the above table it would appear useless to connect the proposed light grade line at any point east of the heavy grades between Dubbo and Narromine—say about 14 miles west of Dubbo, or 292 miles from Sydney; by the Colo Valley line, 250 miles from Sydney, will reach the same point, showing a saving of 42 miles. The bridge at Dubbo can be made use of; then a detour made, following more nearly the course of the river than is done by the present line, to the proposed point of junction, viz., 292 miles from Sydney. From a fair knowledge of the intervening country, I have no hesitation in saying that I can obtain a line with no grade heavier than 1—100, with no curve sharper than 20 links radius, from near the terminus of my present survey to 292 miles from Sydney by present line, within the distance above given, viz., 250 miles from Sydney, at a cost not exceeding seven thousand pounds (£7,000) a mile, equal to £770,000 (seven hundred and seventy thousand pounds) for 110 miles, making in all £3,465,000. From Emu Plains (36 miles) to beyond Dubbo (292 miles), a total length of line to make of 214 miles, at a cost of £16,192 a mile. The advantages to be gained by this somewhat large outlay are, first, a saving of distance of 42 miles, equal to 17 per cent. of the distance by present line from Penrith to Dubbo. This, together with the saving effected in haulage, in maintenance of road and rolling stock, in saving in traffic expenses by avoiding the necessity for the number of men at present employed in making up trains at points where change of ruling grade occurs, in interest on extensive running sheds, only a small proportion of which will be fairly chargeable to the light-grade line, in releasing a large quantity of rolling stock from what will then be needless but is now unavoidable detention, will in the aggregate amount to at least half the present working expenses.

I find, by referring to the Railway Report for 1886, the gross receipts for all traffic between that portion of the Western Line from Wellington westwards and Sydney amounted to £360,474. I also find in the same report the gross receipts from Rylstone to Mudgee (inclusive) amount to £48,102. Total gross receipts for 1886 from the abovenamed places, £408,576. Of this sum the report gives 72 per cent. for working expenses, leaving 28 per cent. to pay interest on capital, &c. The traffic from Wellington will certainly be carried over the Colo Valley Line, as by that route it will be 12 miles nearer to Sydney than by the present line. I therefore allow 28 per cent. of the gross receipts from Wellington to Murrumbidgee, as at present goes to pay share of interest on the whole line made use of, to pay interest on the 30 miles in question. Following is a sheet showing how working expenses and interest can be paid.

Sheet showing how interest and cost of construction of existing and new lines will be paid from gross receipts for traffic from those portions of the Western Line, between Wellington to Bourke and Rylstone to Mudgee, taking the receipts for 1886 as a basis for calculation:—

Cost of line, Dubbo to Bourke, including Dubbo bridge, less cost of 14 miles of line to be reconstructed	£1,196,600
Purchase of land	20,000
	<hr/>
Interest at 4 per cent on above	£1,216,600
28 per cent interest on gross receipts, Wellington to Murrumbidgee	48,664
Share of interest on existing line, Penrith to Sydney, running sheds and other works chargeable to new line	6,353
4 per cent interest on 3½ millions	10,000
	140,000
	<hr/>
Total interest on construction chargeable against gross receipts from Wellington to Bourke and from Rylstone to Mudgee inclusive—gross receipts for 1886	£205,017
	408,576
	<hr/>
Available balance ..	£203,559
Working expenses for the above amount of traffic when carried on new line with easy grade and reduced length.....	151,500
	<hr/>
Showing a profit of ..	£52,059
Equal to 12·975 per cent. of gross receipts.	
This capitalized at 4 per cent in forty years gives £4,945,605.	

GEO. WM. TOWNSEND.

Working expenses on the Colo Valley Line under such of the present traffic as may be considered available, viz., that which is at present paid for between Wellington and Bourke and between Rylstone and Mudgee, amounting in gross receipts to £408,576:—

Twenty-four engines, including running expenses, repairs, and allowance for depreciation ..	£28,800
Maintenance of road ..	67,200
Maintenance of rolling stock, including interest and allowance for depreciation ..	10,000
Traffic charges.....	40,000
General expenses.....	5,500

Total working expenses for present traffic that may be reckoned as available £151,500

Working Expenses.—The working expenses on this line will necessarily be small, and I arrive at an approximation to the amount in the following manner. Allowing six engine-stations from Penrith to Bourke, one goods train and one passenger train each way each day will occupy twenty-four engines on this length of line, so that running shed accommodation for four engines will be needed at each station of which there are already four on the existing line, two requiring to be built. I find that a fair allowance per annum for each engine, including running expenses, repairs, and allowance for depreciation is £1,200, amounting as shown to £28,800. The maintenance of road, allowing three men to 4 miles, and a fair amount for material, painting bridges, repairs to stations, fences, and other works, amount to £67,000; maintenance of rolling stock other than engines, £10,000. Traffic charges, including stationmasters and all other traffic officials. General expenses include share of salaries of the higher officials of the Department. That further extensions will be carried on from Dubbo, and that the traffic will largely increase on the present line beyond Dubbo as well as east of Dubbo cannot be reasonably doubted, there is therefore contained in the above figures strong evidence in favour of the immediate construction of the Colo Valley Railway. A fertile country will be passed through between Mudgee and Dubbo which will furnish a large amount of traffic. Many thousands of acres of the Capertee and Cudgegong Valleys will be put to agricultural purposes when this line is commenced. Coal-mining will be opened on the Capertee and Cudgegong Rivers, and in the range between Mudgee and Rylstone, and large quantities of kerosene will be made available for market, all of which may be safely taken to largely increase the present traffic, so that the Colo Valley Line may be considered as likely to be the best paying railway in New South Wales.

Appended hereto please find lists of bridges, culverts, viaducts, and tunnels, also general estimate.

I have, &c.,

GEO. WM. TOWNSEND.

TOTAL cost of Colo Valley Line, from 36 miles 2,564 links, Western Line, to 140 miles 28 chains on Mudgee Line, near Rylstone; length to be constructed, 103 miles 7,936 links—say 104 miles.

Tunnels	£1,293,409
Bridges	225,000
Viaducts	184,555
Culverts and other openings	25,785
Level crossings ..	1,000
Fencing ..	8,000
Earthwork ..	667,251
Permanent-way ..	208,000
Side drains and diversions ..	15,000
Tramway	62,000
Platform and sheds.....	5,000
	<hr/>
Total ..	£2,695,000—£25,914 per mile from Emu to 140 miles.
Extension from Rylstone to 292 miles, 14 miles beyond Dubbo	770,000
	<hr/>
Total to 292 miles.....	£3,465,000—£16,192 per mile from Emu to 292
Purchase of land	15,000 miles—total distance to construct,
Contingencies.....	20,000 214 miles.
	<hr/>
	£3,500,000

All masonry, whether brick, concrete, or rubble set in cement, estimated at 50s. a cube yard, which prices, considering the facilities for transport of material afforded by the proposed tramway, are ample.

JNO. WM. TOWNSEND.

No. 3.

Memo. from The Engineer-in-Chief to Mr. Thomas.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office, Sydney, 11 January, 1888.
Colo Valley Survey.

THE report received from Mr. Townsend is incomplete in many respects, and he should furnish without delay information on the following points:—

1. Whether estimate is for double or single line.
2. Width of formation and gauge.
3. Weight of rails.
4. Slopes of cuttings.
5. Quantities in embankments.
6. Cross sections to be furnished.
7. Disposed sheets to be furnished.
8. Proper estimate of quantities and prices to be prepared.
9. Also, sections of tunnels, showing thickness of lining and length proposed to be lined in each tunnel.

The

The report gives little or no information on the above subjects, and still includes the guessed estimate of the cost of an imaginary line from Rylstone to beyond Dubbo, which has nothing whatever to do with the estimate of the Colo Valley line from Emu Plains to Rylstone, which was all Mr. Townsend was asked for or expected to give.

JOHN WHITTON.

The plan and section are returned herewith.

Mr. Townsend instructed to furnish the information required.—E.R.T., 12/1/88. Engineer-in-Chief.

No. 4.

Mr. G. W. Townsend to The Engineer-in-Chief.

Sir,

Railway Survey Office, Sydney, 15 February, 1888.

Herewith, in accordance with a memo. shown to me by Mr. Thomas, purporting to be from you, I supply information on the various points mentioned in the memo. in question.

1. Whether estimate is for double or single line? Single; except bridges which are designed for double line.
2. Width of formation and gauge? Cuttings 15 feet; banks 17 feet; gauge 4 ft. 8½ in.
3. Weight of rails? Steel rails 70-lb. per lineal yard.
4. Slopes of cuttings? 1 in 1, excepting when the cutting is certain to be in solid rock, when ½ to 1 is adopted.
5. Quantities in embankments? 4,887,785 cubic yards.
6. Cross sections to be furnished? These are written on plan, but sheets of cross sections are being plotted.
7. Disposal sheets? Will be ready shortly.
8. Proper estimate of quantities and prices to be furnished? Sent herewith.
9. Also section of tunnel, showing thickness of lining and length proposed to be lined in each tunnel? Section herewith, also list of tunnels with length of portions lined and unlined.

I have, &c.,

GEO. WM. TOWNSEND.

No. 5.

Mr. G. W. Townsend to The Engineer-in-Chief.

Sir,

Railway Survey Office, Sydney, 17 February, 1888.

I have the honor to forward herewith plan, section, and supplementary report, giving information on various points that I am informed you have asked for. The quantities of bank are now written on the section as well as mentioned in estimate. The cross-section sheets I will forward as soon as ready, also disposal sheets in preparation, of which I have the honor to request that you will allow me the assistance of two draughtsmen, so that I may get this work out of hand, and I am in bad health, and the medical man who is attending me informs me that the complaint from which I am suffering may become chronic unless I am able to get away for a change.

I have, &c.,

GEO. WM. TOWNSEND.

[Enclosure.]

COLO VALLEY LINE.

List of Tunnels on first 104 miles.

No. of Tunnel.	Length in Yards.	Lineal Yards, Lined.	Lineal Yards, Unlined.	No. of Tunnel.	Length in Yards.	Lineal Yards, Lined.	Lineal Yards, Unlined.

No. 6.

Mr. H. Palmer to The Engineer-in-Chief for Railways.

Sir,

7 August, 1886.

I have the honor to inform you that I have visited the Colo Valley and have examined some of the most important portions of the Trial Survey now being made by Mr. Townsend. There is still a considerable length to be surveyed, but I see no reason why it should not be completed about the end of the present year, and I recommend that Mr. Townsend be allowed to employ two additional chainmen, as he can work a double party with advantage.

The survey from the Penrith end has been carried into the Colo Valley, and must now follow the course of that valley till it joins the surveyed line from Rylstone, which has been completed for a distance of 50 miles. The operations of the remaining length of survey are entirely dependent on the track which has been cut at great expense from Upper Colo along the precipitous slopes above the southern bank of the Colo River, and it is positively necessary that this track should be properly maintained while the survey is in hand. The work of packing all supplies along this track is a most arduous one, and the difficulties of this kind will increase as the survey progresses, and the distance to travel is thereby lengthened.

There are at present nine men in Mr. Townsend's employ, two engaged in packing, one cook, one man constantly engaged in repairing the track, leaving five for work on the survey, two out of which number have often to be despatched to assist on the track. Two additional men, as before stated, may be usefully employed.

At the commencement of this survey seven horses were purchased, four of this number have died, two are mares in foal, and will not be fit for work till near the end of the survey, leaving one only of the original number now on the work. Mr. Townsend has at various times purchased nine more horses, at a cost of £66, and has now ten horses in constant work. Barring accidents, this number should be sufficient to complete the work, but they will require great care and constant feeding.

I have, &c.,

HERBERT PALMER.

No. 7.

The Engineer-in-Chief to Mr. H. Palmer.

WHAT I wanted to know was the probability of a practicable line being found up the Colo Valley, which is in no way touched upon by Mr. Palmer. Mr. Townsend should be severely censured for making the surveys of the two ends of this line, about which there was no question as to their practicability, and leaving the difficult portion until the last.

If the middle length should turn out either impracticable or absurdly expensive, the time employed in surveying the two ends will have been lost and the money expended thrown away. Mr. Palmer must make another inspection of this work, and I desire to have from him an expression of opinion as to the practicability of this route for railway purposes, and the desirability of continuing this survey.

J.W.,

10/8/86.

I

I made a most careful inspection of this surveyed line as far as the junction of the Wallargambie River with the Colo, having walked over all the roughest portions of this length; but I purposely abstained in this report from making any comments as to its practicability, as I have been under the impression from the time this survey was commenced that Mr. Townsend was authorized by the Minister or Commissioner to complete a survey throughout from Penrith to Rylstone, in accordance with his report on his first exploration, and quite regardless of its cost. With reference to the survey of the two ends having been made first, and the centre and most difficult length being left to the last, I think under the circumstances this arrangement of the work was necessary. When Mr. Townsend first reported that he could survey a practicable line with no grade steeper than 1 in 100 throughout, I was very doubtful whether he would succeed in showing a descent from Rylstone through the main dividing range into the Colo Valley with that grade, and I think previous papers will show that the commencement of the survey at that end was authorized. Another reason why the middle length could not be commenced first was that no work could be done on that portion until a track had been cut, and this was not completed till the commencement of this year, about 60 miles, I think, having been made at a cost of over £2,000. When the survey was completed for 50 miles from Rylstone down the Colo, Mr. Townsend was instructed to commence the survey from Emu Plains, so that there could be no doubt about the correctness of the through levels, and it was uncertain how he would succeed in surveying a line from that end into the Colo Valley. The practicability of getting into the Colo Valley at either end, with a grade of 1 in 100, was, I think doubtful, and if the Engineer-in-Chief considers that censure is due to Mr. Townsend I must accept it instead, as I think his instructions were to make the survey as it has been done.

As to my opinion as to the practicability of the route for railway purposes, I have, from the time the subject was first mooted, considered that a survey was a waste of money only. A reference to maps then in the possession of this Department, showed, as I pointed out at the time, that there must be at least a dozen miles of tunnelling, and since I have inspected the country, I think the amount of tunnelling will be nearer 14 miles. Added to this, there will be many miles of railway to be constructed along extremely steep sidings, similar, but on a larger scale, to the descent from the Peat's Ferry Road to the Hawkesbury, on the Homebush and Waratah line, where, until a final survey is made, it will be impossible to say what the quantity of excavations or expense of retaining walls and viaducts will be. The practicability (leaving out cost) of this route can hardly be condemned, for at most of the worst parts of the proposed line the formation is sound sandstone; but, as far as I can judge, the cost of its construction must be so great that the chances of its being seriously entertained are most remote, while an approximate estimate of its cost might have been arrived at when the route was first spoken of almost as well as it will be when this survey (a trial one only) has been completed. I assume that if this line were made it would be constructed as a double line of railway, for, if made a single line, it would be impossible at any future time to duplicate it. Granting that it could be a double line, 14 miles of tunnelling at £80 a yard, is in round numbers two millions; and say 100 miles of railway at £15,000 a mile (a very low estimate in such country for a double line), including all bridges, &c., would give a total of 3½ millions, which could only be submitted with a proviso that a final survey only would show whether such an estimate would be greatly exceeded or not.

Whether such an expense for an alternative line of railway will ever be entertained, it is not for me to say, or even whether this survey should be completed, as it was undertaken without reference to this Department, and almost, I think I may say, in opposition to it.

Engineer-in-Chief.

H.P., 10/8/86.

This survey was undertaken on the suggestion of the Commissioner, and by order of the Minister, Mr. Secretary Wright, in direct opposition to my views. I always looked upon the survey as an absurdity, and waste of public money; but it will, no doubt, be desirable to finish it as quickly as possible. The extra men required may be employed.—J.W., 11/8/86. Mr. Palmer.

Mr. Townsend informed.—H.P., 12/8/86. Engineer-in-Chief.

No. 8.

Mr. H. Palmer to The Engineer-in-Chief for Railways.

Sir,

10 December, 1886.

In compliance with your instructions dated the 1st instant, I have the honor to report that I left Sydney on the 4th to make a further inspection of the trial survey now being made *via* the Colo Valley, from Emu Plains to Rylstone. Mr. Townsend has now completed his survey throughout, from Emu Plains to the Colo River, and thence to the junction of the Wolgan with the Colo. The length from this point to the open country on the Capertee River will be completed by the end of the present month, after which Mr. Townsend will be employed for a further period of about two months in working up portions of what he had merely made a preliminary survey, through the Capertee Valley, to the proposed tunnel through the main dividing range. When this trial survey was commenced it was considered advisable to prove the practicability of obtaining the ruling grade of 1 in 100, from the Capertee Valley through the main range to Rylstone, before undertaking the more expensive portions of the survey on the Lower Colo; and, as this was merely a preliminary survey, it is now necessary to carry forward from the Colo the turnings, traverse, and levels.

Mr. Townsend having been without assistants in this work, the plotting of the through plan and section is not in a forward state, and on completing the field work he should, I think, return to this office, and finish his plan and section.

Until this has been done, nothing further can be said than is supplied in previous reports as to the practicability or otherwise (taking into consideration the probable cost of construction) of this route for railway purposes.

I have, &c.,

HERBERT PALMER.

Mr. Townsend must not return to Sydney to plot out any portion of this work until the whole of the field work is completed.—J.W. Mr. Palmer. This is as it has been already arranged.—H.P., 22/12/86. Enc., 23/12/86. Mr. Palmer.—W.H.Q., 1/2/87.

625—B

My

My report mentioned that Mr. Townsend would not complete his field work until the end of February, and from his January report I gather that it may be further delayed for a short period, owing to the great amount of wet weather.—H.P., 8/2/87.

End of March.—9/2/87. Memo. 87. Mr. G. W. Townsend, 31/3/87. Copy forwarded to Minister with memo. 88, of 14/3/88.

No. 9.

Mr. G. W. Townsend to The Engineer-in-Chief.

Sir,

Sydney, 13 July, 1875.

While making the City surveys on which I have lately been engaged, a scheme for a pier at Circular Quay suggested itself to my mind. I worked, ignorant of the fact that such a work, when used for railway purposes, was beyond the duties of this Department. Having gone so far with the matter, I am unable to let it drop, so if you have no objection I purpose putting it into the hands of one or two people in Sydney to make what they can of, my share in the concern being simply the credit, or the reverse, of initiating the scheme.

I have, &c.,

GEO. WM. TOWNSEND.

I have seen Mr. Townsend on this matter, and have instructed him to go no further with the scheme. It forms part of my proposal for extension of the railway into Sydney, but it is a direct interference with the work of another Department.—J.W., 13/7/75.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(OSRIC-STREET, GUNNEDAH—CORRESPONDENCE RESPECTING FLOODING OF.)

Ordered by the Legislative Assembly to be printed, 4 November, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 27th September, 1887,—That there be laid upon the Table of this House,—

“ Copies of all correspondence between the Mayor of Gunnedah and the
“ Commissioner for Railways or the Under-Secretary for Works, in
“ reference to the flooding of Osric-street, in the town of Gunnedah, by a
“ railway drain; together with copies of all reports, communications,
“ plans, and other papers relating to the same.”

(Mr. Goodwin.)

RAILWAYS.

No. 1.

Mr. T. McPhillips to The Secretary for Mines.

Dear Sir,

Gunnedah, 20 April, 1883.

I am the owner of a couple of houses situated in Conadilly-street, and I suffer great damage from a drain that is cut down from the railway line almost in contact with my houses. This drain extends for some 10 or 12 chains from the line, and crosses the main road coming from Breeza to Gunnedah. It is, of course, the drain is, only troublesome to me in wet weather, and has put me to great expense the last rain we had. I would feel extremely grateful to you if you could manage to have this drain inspected to see the damage I sustain through it in wet times. I do not know if I have done right in asking you, but you being our Member I thought it best.

The drain comes through Osric-street, facing Conadilly-street, and passes through allotment 7, which my houses are built on.

Hoping you will advise me of the matter,

I remain, &c.,

T. MCPHILLIPS.

Will the Commissioner for Railways be good enough to have this complaint attended to.—J. P. ABBOTT, 23/4/83. The Under Secretary for Public Works.—B.C., 23/4/83. H.W. Railways.—B.C., 26/4/83. J.R. Mr. Cowdery.—B.C., 30/4/83. G.B. Mr. Bewick for report.—G.C., 2/5/83.

Railway Department, Office of Engineer for Existing Lines,

Memorandum to Mr. G. Barrack,—

Newcastle, 3 May, 1883.

SEE enclosed letter from Mr. McPhillips and report particulars early as practicable.

G. BEWICK,

Superintendent of Way and Works,—

Sir,

Gunnedah, 5 May, 1883.

I beg to report that this drain will be a rather difficult matter to deal with. I could alter the course of it, but some one else must suffer even much more than Mr. McPhillips suffers now in regard to damaging his property. He has thrown up a small embankment, and I do not think that it will do much more damage. This drain comes from a 4-foot culvert under the railway line and runs in a straight line for the main road, which is about 10 chains distant from railway. It is about 3 feet deep at commencement, and just runs itself out at main road. The damage done is very trifling, and with the precaution he is taking in forming a small embankment I do not think he will suffer much more. The drain must remain. There is no way of stopping it or diverting it that I can see without doing serious injury to some one else.

I remain, &c.,

G. BARRACK.

I may state I have not seen Mr. McPhillips. He is not at home; but I found the two houses, his property.—G.B.

From the Inspector's report herewith it will be seen that this drain has caused some little injury to McPhillips' property, but that there is no practical remedy without injuring other property to a greater extent. I suggest that some little compensation be offered to McPhillips for the damage done and expense incurred. Probably £10 will satisfy him.—G.B., 11/5/83. Engineer for Existing Lines.

Can nothing be done to permanently abate the nuisance complained of.—G.C., 17/5/83. Mr. Bewick. I don't think so.—G.B., 23/5/83. Engineer for Existing Lines. Commissioner.—G.C., 29/5/83.

Offer him £10 in satisfaction of all claims past and future.—CH.A.G., 31/5/83.

Sir,

Department of Railways, Sydney, 4 June, 1883.

In reply to your letter of the 20th April last, respecting a drain which you allege caused damage to your property in Conadilly-street, I have the honor to inform you that from inquiries made, I find that the drain in question cannot be diverted conveniently, and I learn that such steps have been taken as will minimise the inconvenience complained of. I understand that some little damage has been or may be done, and in consideration of this, I am prepared to sanction to you the payment of £10 sterling, without prejudice, in full settlement of all claims past and future.

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

T. McPhillips, Esq., Gunnedah.

No. 2.

Memo. from Mr. G. Barrack to Superintendent of Way and Works.

Sir,

Gunnedah Station, 12 May, 1883.

It may be advisable to send Mr. Manly up here about the drain complained of in Mr. McPhillip's letter to Mr. Abbott. I have seen Mr. McPhillips since reporting on the matter; he, like myself, allows that if I turn the water's course, some one else must suffer, and he seems determined, if something is not done, he will sue the Commissioner for damages.

Yours obediently,

G. BARRACK.

At

At present I do not see any necessity for sending Mr. Manly up. From your report there can be no doubt McPhillips has sustained some damage, and perhaps has incurred some expense for which I have no doubt the Commissioner will allow him compensation.

Do you think £10 would satisfy him? Do not put the question to him in direct terms.—G.B., 15/5/83. Mr. Barrack.

I have seen Mr. McPhillips to-day. He has put his case into the hands of his solicitor, and unless he receives £40 compensation, he intends to let the case take its course at law.—G. BARRACK, 2/6/83. Mr. Bewick.

Government Railways, Office of Engineer for Existing Lines,
Newcastle, 4 June, 1883.

Memo. to Engineer for Existing Lines,—

FROM the attached paper it will be seen that Mr. McPhillips intends to ask for £40 as compensation for damages to his property, alleged to be caused by a railway drain.

Under these circumstances, I have decided to send Mr. Manly to make a survey of the place, and will then forward you full particulars.

GEO. BEWICK.

Government Railways, Office of Engineer for Existing Lines,
Newcastle, 13 June, 1883.

Memo. to Engineer for Existing Lines,—

HEREWITH I beg to hand you a plan* showing the culvert and drain at Gunnedah, which has been com- *Appendix A.
plained of, as having caused damage to private property, and from what I can learn, it is the intention of several owners of these properties to claim compensation from the Commissioner for the alleged damages.

As will be seen from the plan an open drain has been made nearly in the centre of a street for a distance of about 12 chains to form an outlet from the culvert.

From the end of this drain the water flows over the surface of the land, and of course finds its way to the lowest ground which happens to be in the direction of McPhillip's property. It is therefore clear to me, and I may say I have made a personal examination of the place, that this must have been the natural course of the water before the railway existed. Hence, although the cutting of the drain may have injured the public street (which has not been formed), I cannot see that it has damaged private property in any way.

GEO. BEWICK.

No. 3

Mr. T. E. Nash to The Commissioner for Railways.

Sir,

Gunnedah, 7 June, 1883.

With reference to yours of the 4th instant, numbered 83-8,058, Mr. McPhillips has instructed me to state that the lowest he could dream of taking would be £40. As you are doubtless well aware, property is greatly improving in value, where not interfered with, throughout the Colony. Mr. McPhillips' land was in one of the best positions in the town for a small homestead until the drain you refer to was made. He has since sustained considerable damage, and from my own knowledge of the matter the sum he asks is not unreasonable. If you will not accede to his demands, please let me know the name of a solicitor who will accept service on your behalf.

Yours, &c.,
T. E. NASH.

Mr. Cowdery, is not this an excessive amount?—CH. A. G., 16/6/83. Mr. Bewick for report.—G.C., 19/6/83.

In my opinion the amount asked is very excessive. I learnt at Gunnedah the other day that this was a kind of test case, and if successful, several other claims of a similar kind would be made. I have already sent you a plan and report, showing exactly how the matter stands, from which I think it will be seen that, although damage has been sustained, it has not been caused by construction of the railway.—G.B., 21/6/83. Engineer for Existing Lines.

I consider the amount excessive. Plan and report herewith.—G.C., 21/7/83. Commissioner. Inform cannot pay the amount demanded.—CH. A. G., 24/7/83.

Sir,

Department of Railways, Sydney, 30 July, 1883.

Referring to your letter of the 7th ultimo, claiming the sum of £40 as compensation in respect of damage alleged to have been sustained by Mr. McPhillips, through a drain being constructed near his property at Gunnedah, I have the honor to inform you that I cannot authorise the payment of the amount claimed, and the Crown Solicitor will accept service on my behalf.

I have, &c.,
CH. A. GOODCHAP,
Commissioner for Railways.

T. E. Nash, Esq., Solicitor, Gunnedah.

Crown Solicitor, B.C., 31/7/83.—G.B. (*pro Comr.*)

No. 4.

Mr. T. E. Nash to The Commissioner for Railways.

Sir,

Gunnedah, 2 August, 1883.

I am in receipt of yours of the 30th ultimo, and have seen my client upon the subject. "Without prejudice," as my client is a poor man, and does not wish to rush into unequal struggles as far "as money is concerned," I will accept, on his behalf, the sum of £20.

I have, &c.,
T. E. NASH.

We offered £10 in full of all demands past, present, and prospective. I think we might pay £20 rather than go to law. Will Crown Solicitor, who has the papers, do what is necessary, B.C., 8/8/83.—C.A.G.

No. 5.

The Crown Solicitor to The Commissioner for Railways.

Crown Solicitor's Office, Sydney, 21 August, 1883.

Sir,

T. McPhillips to you.

I have the honor to return herewith the papers you sent me in this matter, and to state that, in accordance with your instructions, I informed Mr. Nash, of Gunnedah, solicitor, that you accepted his client's terms of settlements of all claims. At the same time, I forwarded a release and voucher for execution by Mr. McPhillips. These documents have been returned to me, duly completed, and I send herewith the voucher for £20, which directs the payment of the money to the Commercial Bank, Sydney, for transmission to their Gunnedah Branch. The money may, of course, be now paid, as directed.

I have, &c.,
JOHN WILLIAMS,
Crown Solicitor.

Pay £20.—Ch.A.G., 29/8/83. Accountant. Voucher at Treasury, Mr. Nash advised.—F.J.W., 7/9/83. Secretary.

No. 6.

Mr. A. Treacher to The Commissioner for Railways.

Sir,

Gunnedah, 30 January, 1886.

On behalf of my client, G. C. Richardson, of this town, the owner of allotment No. 10 of section No. 49, township of Gunnedah, and situate in the vicinity of the railway line, near Marquis-street, in the said town, I beg to state that, in consequence of a culvert having been placed at a point on the railway line, opposite the allotment aforesaid, very considerable and serious damage has ensued, cutting up and rendering useless the land in question.

On every occasion of rain falling, the water from the culvert, owing to want of proper drainage, rushes in considerable force over the land, guttering it, and has rendered it unfit for building purposes, and has prevented my client fencing. In some places gutters have been made to a depth of 3 feet, and on Monday last 8 inches of water were standing on the ground. Owing to the delay and the damage caused, my client has sustained a loss of certainly not less than £40, and, on his behalf, I must now request that the Department will recoup him this sum.

I have, &c.,
JOHN A. TREACHER.

Mr. Cowdery, B.C., 4/2/86.—G.B. Mr. Bewick for report.—G.C., 6/2/86.

Herewith I beg to hand you a tracing, showing the position of Mr. Richardson's land and of the culvert complained of. The natural course of the water has not been diverted in any way, but it is, necessarily, concentrated at the culvert. I, therefore, cannot see that he is entitled to compensation, even if his property had sustained damage, which it certainly has not. There is no building of any kind on the land; it is not even fenced in.—G.B., 24/2/86. Engineer for Existing Lines.

Report and tracing,* herewith.—G.C., 25/2/86. Commissioner. Reply accordingly.—D.V., 27/2/86.

Sir,

Department of Railways, 2 March, 1886.

Referring to your letter of the 30th January last, claiming, on behalf of Mr. G. C. Richardson, of Gunnedah, compensation for damage said to have been done to his land by the action of this Department, in placing a culvert under the railway line, opposite Mr. Richardson's property, I have the honor to inform you that inquiry has been made, and I find that the natural course of the water has not been diverted in any way, neither has Mr. Richardson's land sustained any injury.

I am unable, therefore, to entertain any claim for compensation.

I have, &c.,
C. A. GOODCHAP,
Commissioner for Railways.

John A. Treacher, Esq., Gunnedah.

No. 7.

Mr. T. E. Nash to The Commissioner for Railways.

Sir,

Gunnedah, 1 February, 1886.

I am directed by Mr. Thomas McPhillips, of this town, to call your attention to the damage done to his property in this town during a late storm, in consequence of the diversion by the Railway works of the natural flow of the water, and, in the event of your not feeling inclined to make amends, must ask you to make known to me your solicitor's name so that I may cause service to be made on him. I shall do nothing for a week to enable you to obtain a report.

I have, &c.,

T. E. NASH.

Please furnish particulars.—D.C.McL., 2/2/86. Mr. Cowdery. Mr. Bewick for report.—G.C., 3/2/86.

Some three years ago Mr. Thos. McPhillips made a claim, similar to this, for damage done to the same property. I forwarded a plan and reported on the matter at the time and recommended that the claim should be resisted. I did so under the impression that the Commissioner was not liable, and that other claims would be certain to follow. Plan herewith will, I think, shows clearly how the matter stands. The water has not been diverted from its natural course further than it has been necessarily concentrated by the culvert beneath the railway. After leaving the culvert it has cut a channel for itself nearly in the centre of Osric-street for a distance of about 10 chains, when it commences to spread as shown, and flows in the direction of Mr. Thomas McPhillips' property, and it is clear to me that the water would have taken the same course if the culvert had never existed, I therefore strongly recommend that the claim be resisted. Besides, now that the town is incorporated, it seems to me that the question is one for the consideration of the Municipal authorities.—G.B., 16/2/86. Engineer for Existing Lines.

Report and plan herewith which clearly show that the Commissioner is not liable.—G.C., 17/2/86. Commissioner.

We paid £20 in 1883 for similar damage, and a release was taken which is probably in possession of Crown Solicitor. I do not know whether it was stated that the amount was in payment of past and any future damage which might be done, but even if no mention was made of any prospective damage it would seem from Mr. Bewick's report and plan* that the Department is not liable. Will Crown Solicitor please advise.—C.A.G., 18/2/86. *Appendix C.

The Commissioner for Railways,—

Gunnedah, 17 May, 1886.

Re McPhillips.

Sir

Referring to yours of the 3rd February last, I have to point out you stated therein that the matter would receive due attention. Since then I have received no offer of any sort, and it seems to me that ample time has elapsed.

I trust, therefore, that you will let me have some offer, and may inform you "without prejudice" that my client is willing to accept any reasonable amount, so as to repair the damage done, although the injury to the property is one of a permanent nature.

I have, &c.,

T. E. NASH.

Write to Crown Solicitor.—G.B., 20/5/86. Crown Solicitor, 22/5/86. Inform Mr. Nash how matter stands.—D.C.M'L., 25/5/86.

Letter from Commissioner to Mr. Nash, dated 27th May, 1886.

Sir,

In reply to your letter of the 17th instant again applying on behalf of Mr. McPhillips for compensation in respect of damage done to his property at Gunnedah during a late storm, in consequence it is alleged, of the natural flow of the water being diverted by the railway works, I have the honor to inform you that the matter has been referred to the Crown Solicitor, on receipt of whose reply a further communication will be sent to you.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

T. E. Nash, Esq., Gunnedah.

Sir,

Crown Solicitor's Office, Sydney, 12 August, 1886.

I have the honor to return herewith the papers relating to Mr. Nash's application on behalf of Mr. Thomas McPhillips for compensation in respect to injury said to have been occasioned by the construction of a drain in connection with the railway works, and to state that if the construction of the sewer has had the effect of concentrating the water, or diverting its course, and thus causing it to flow upon Mr. McPhillips' land, you are liable for any injury so occasioned.

I have no doubt that the £20 paid to Mr. McPhillips in 1883, and the release obtained was in satisfaction of all past and future damage, and as this claim was also made by Mr. Nash, as Mr. McPhillips' attorney, he should be reminded of this.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

The Commissioner for Railways, Sydney.

Claims for damages alleged to have been sustained through flood waters from the Railway Line, near Gunnedah.

Will Mr. Badham please have a *précis* made of the several papers enclosed.—D.C.M'L., 19/8/86. Urgent.

Précis herewith.—C.A.B., 21/8/86.

Claims

Claims for damage alleged to have been caused by flood-waters from the Railway at Gunnedah.

THERE are here three distinct allegations of damage, and as they are quite independent of each other, although assignable to the same cause, I propose to deal with them separately. There is—

(1.) *Mr. McPhillips' claim.*

Under date of 20th April, 1883, Mr. McPhillips wrote that considerable damage was done to his property in Conadilly-street, Gunnedah, by a drain brought down from the railway almost in contact with his houses.

Mr. Bewick reported that the drain had caused some little injury to McPhillip's property, but there was no remedy without doing greater injury to other property. Some little compensation (say £10) might be offered him.

Commissioner accordingly, by letter of 4/6/83, offered McPhillips the sum of £10.

On the 7th July, 1887, Mr. T. E. Nash, solicitor, replied that £40 was the smallest amount McPhillips would accept.

Commissioner asked if this was not an excessive claim.

Mr. Bewick reported that the claim *was* excessive, that the drain which had been cut followed the natural course of the water, and although it might have injured the street, down the centre of which it ran, it could have done no more damage to private property than the latter had always been liable to.

Commissioner thereupon (30/7/83) informed Mr. Nash that if he intended to sue, the Crown Solicitor would accept service.

Mr. Nash replied (2/8/83) that rather than go to law his client would accept the sum of £20.

Commissioner minuted (8/8/83) that we had offered £10 in full of all demands "*past, present, and prospective,*" and that we had better pay £20. This to Crown Solicitor.

Per letter of 21/8/83, Crown Solicitor advised that he had taken a release from McPhillips, and the £20 was paid.

Per letter of 1st February, 1886, Mr. Nash again claimed compensation for damage done to McPhillips' property by flood-water as before.

*This is not quite in accordance with the facts.—C.A.B.

Mr. Bewick minuted that in 1883 he reported on this matter, and recommended* that the claim should be resisted, under the impression that the Commissioner was not liable. The water "had not been diverted from its natural course further than it had been necessarily concentrated by the culvert beneath the railway." Beyond this it had cut a channel for itself nearly in the centre of Osric-street, for about 10 chains, and then commenced to spread, and flowed in the direction of McPhillips' property, as it would have done if the culvert had never existed. Besides, the town was now incorporated, and the question was for the consideration of the municipal authorities.

Commissioner minuted (18/2/86) that we had paid £20 for similar damage in 1883, when a release was taken. Did not know if the release covered past and future damage, but even if prospective damage was *not* included, it would be seen by Mr. Bewick's report that the Department was not liable. Would Crown Solicitor advise.

Crown Solicitor now (12th August, 1886), advises that if the construction of the drain had had the effect of concentrating the water and causing it to flow on to Mr. McPhillips' land, Commissioner was liable for any injury thereby caused. Had no doubt the £20 and the release were in satisfaction of past and future damage, and Mr. Nash should be reminded of this.

(2)—*Mr. Richardson's claim.*

Under date of 30th January, 1886, Mr. Treacher wrote to Commissioner, stating that much damage was done to Mr. G. C. Richardson's land by a culvert under the railway, which, in consequence of the want of proper drainage, caused the water during rain to rush with much force over the land, guttering it, and rendering it unfit for building purposes; and that Richardson had sustained damage to the extent of £40, which amount he claimed as compensation.

Mr. Bewick reported that the natural course of the water had not been diverted, although it had been concentrated by the culverts, that Mr. Richardson's land was not even fenced, and had not been damaged, and that he was not entitled to compensation.

Presumably Mr. Richardson was so informed.

(3)—*The Borough Council.*

Under date of 25th June, 1886, the Mayor of Gunnedah wrote drawing attention to the damage and inconvenience caused by the flow of water from the railway culvert through Osric-street. A dangerous excavation had been formed, and the nuisance should be abated. On the same day the Council Clerk communicated on the subject with the Roads Department, and asked why the water could not be carried along Osric-street into a lagoon in the locality. (This suggestion does not appear to have been noticed.)

Mr. Bewick referred to, and repeated the substance of his former reports.

Commissioner minuted that he was not at all sure that we were not liable. No more water might flow on to the land than would have spread over it if the culvert had not been constructed, but it might not flow in the same even manner. Being concentrated by the culvert it might be poured, as it were, on to the land and street, causing a dangerous obstruction, and possibly injury to the land.

C.A.B., 21/8/86.

(1.)—As regards McPhillips' claim, that has been settled by the release of 1883, and Mr. Nash should be informed, if not informed already.

(2.)—As regards Richardson's claim,—under the report of Mr. Bewick it cannot be admitted. He should be so informed—if no action has been taken.

(3.)—The complaint of the Council about the ploughing of Osric-street. The suggestion about taking the water to the lagoon should be inquired into—cost ascertainable.

CH.A.G., 26/8/86.

Sir,

Sir,

Department of Railways Sydney, 30 August, 1886.

With reference to your letter, dated the 1st February last, claiming compensation for Mr. McPhillips, for damage alleged to have been done to his property by flood-water from the railway culvert, I have the honor to remind you that Mr. McPhillips has already received compensation for present and prospective injury from the cause referred to, and that he has executed a full release in that respect.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

T. E. Nash, Esq., Solicitor, Gunnedah.

Mr. Badham, 26/8/86. Mr. Cowdery. Will you please obtain a report with reference to the proposal to carry the water into the lagoon, cost, &c.—D.C.M.L., B.C., 28/8/86. Mr. Bewick for report and cost.—G.C., 31/8/86.

The distance between the railway and the lagoon is about 700 yards, and the only means I can see of carrying the water from one point to the other—without damaging the street—will be to construct an underground culvert, and, as the railway culvert is 5 feet, this should be the same,—the cost of this will be about £3,000. I am under the impression that the Council would be glad to take the matter into their own hands and relieve the Commissioner from all liability for less than a fourth of that sum. I think this idea is deserving of consideration.—G.B., 7/9/86.
Engineer for Existing Lines.

Report from Mr. Bewick herewith.—G.C., 8/6/86. Commissioner. To construct the culvert at a cost of £3,000 is out of the question. The papers should be put by for the present.—CH.A.G., 11/9/86.

No. 8.

Report by Mr. G. Bewick.

Railway Department, Existing Lines Branch,
Office of Superintendent of Way and Works, Newcastle, 3 February, 1886.

Re Flooding of Station yard, Gunnedah.

Memorandum to Engineer for Existing Lines.

ON two or three occasions lately the station yard at Gunnedah has been flooded to a very serious extent, the rails throughout the yard having, on one occasion, been covered with water to a depth of 4 inches.

I instructed Mr. Manly to proceed to the place to ascertain the cause of this, and herewith enclose his report together with tracing,* from which it would appear that Marquis-street has recently been raised a foot or more by metalling, which has had the effect of blocking the water from pursuing its natural course and throwing it into the railway at a level crossing, from whence the bulk of it flows through the station yard, and a portion into private property, the proprietors of which may, some time or other, make a claim on the Commissioner for damages. *Appendix D.

I believe the improvements of Marquis-street are being carried out by the Roads Department.

I therefore suggest that the officer in charge of the work be requested to make adequate provision for carrying away the water and preventing it flowing on to the line. If something is not done in the matter, the traffic may be interrupted.

GEO. BEWICK.

North Western Railway—Gunnedah Station yard.

THE flooding of the station yard is caused by the Roads Department having put about one foot of metal at an average of 20 feet wide on the centre of Marquis-street and Wondobah Road, previous to this the rain water distributed itself as it fell, but now the metal on the road acts as a dam, and causes the water to make for the level crossing and thence down the railway, which is in cutting. There are two 18-inch drain pipes under the newly metallated portion, which are quite inadequate to carry off any sudden rainfall. Except some precaution is made, this station yard will always be subject to flood in the case of a heavy downpour.

I would suggest that the road be lowered, at the place shown on plan, about 1 chain wide, and pitched with an easy slope on both sides from the centre, and an open ditch to be cut close to the south boundary fence of Wondobah Road (say 10 feet wide and from 2 to 3 feet deep), through the racecourse paddock, and to lead thence when clear of the station yard into the Namoi River. Plan herewith furnished.

WM. M. MANLY,

Resident Engineer, G.N.R.,
3/2/86.

Forwarded to Commissioner. I recommend the attention of the Commissioner for Roads be called to this matter.—G.C., 4/2/86. Under Secretary for Works, B.C., 8/2/86.—CH.A.G. Roads, B.C., 9/7/86.—J.R.

Mr. Laurensen for inquiry and report. Was the station yard flooded before making of Marquis-street; does this water flow under railway; if so, what provision is made for it? It is stated there are two 18-inch pipes under the road; is it meant that they are together—a double pipe in fact? if so, Mr. Laurensen must be aware it is contrary to regulations.—W.C.B.

Report herewith.—R.R.L., 23/2/86.

Flooding

Flooding of Railway yard, Gunnedah.

Tamworth, 23 February, 1886.

IN reply to the Commissioner for Road's memo. attached, I may state that I am informed that long before I metalled this part of Marquis-street, as well as I remember three years last December, the railway line was flooded to an equal extent to the flooding that has taken place since this work was done, which is stated as the cause of the flooding. When making this road I was reminded by the trustees of the racecourse, that if I brought any extra water on to the racecourse they would object, so I took particular care to let the water have its natural course. The water at A flows under the railway, and in its natural course through Gunnedah does not again touch the railway yards, so in place of this work flooding the railway it has actually done the opposite, as the raised road would naturally throw more water to the point A, where it would be harmless as far as hurting the station is concerned. The pipes are not double, but a single line at C and D. The railway yards will be flooded until the proper course suggested by Mr. Manly is adopted, that is, during heavy storms. There is a good large water-shed. And this drain will, as well as protecting the railway, intercept the water from having any possible chance of hurting the town for some length. I really cannot see that our work has thrown any more water on to the line.

ROBERT R. LAURENSEN,
Superintendent of Roads and Bridges.

The Commissioner and Engineer for Roads.

P.S.—I might also state that, before putting in the pipe at D, I had an interview on the ground with Mr. Barrack, Permanent Way Inspector. The pipe of same size at C was put in by Mr. Stilwell, I think.—R.R.L.

Mr. Laurenson, while stating that road bank does not cause flooding, concurs in recommendation that it be lowered, and a channel made through racecourse. By what Department should this be done, what will it cost; what will the trustees of the racecourse say to it?—W.C.B., 24/2/86. Mr. Laurenson.

I think the road should be lowered where etched in red, in case the pipes would not carry a heavy storm water; besides it will relieve the railway culvert at A, and keep water off the middle of the town. We have nothing to do with the channel through the racecourse. It is entirely a Railway drain, and that Department must deal with the trustees. I am not exactly sure of length of drain required, but think it would cost £55.—R. R. LAURENSEN, 27/2/86. The Commissioner for Roads.

Before sending this on I wish to be sure that the proper course is recommended. Should not the pipe at D be enlarged? Was B plate culvert substituted for it?—W.C.B., 1/3/86. Mr. Laurenson.

The pipe at D is, in my opinion, quite sufficient. It was put in substantially in December, 1884, at the small price of £5. It has a proper fall, and does not silt up. An iron buckle-plate culvert would cost £150, while there is neither traffic nor heavy flow of water to warrant it. The only work necessary is the work shown in red on tracing.—R. R. LAURENSEN, 13/3/86. The Commissioner for Roads.

Do the work shown in red.—W.C.B., 16/3/86. Mr. Laurenson.

Mr. Cox will please have this causeway done with gentle inclines as proposed, but the drain through the racecourse is entirely the work of the Railway Department. Note these papers and send on to head office at once, and they will have to go on to Railways.—R. R. LAURENSEN, 19/3/86.

Noted and forwarded to head office.—A.D.C., 23/3/86. Under-Secretary, for transmission.—W.C.B., 24/3/86. Railways.—J.R., 26/3/86. Mr. Cowdery.—CH.A.G., 31/3/86. Mr. Bewick, for further report.—G.C., 1/4/86.

Railway Department, Existing Lines Branch,
Office of Superintendent of Way and Works, Newcastle, 2 April, 1886.

Memorandum to Mr. G. Barrack,—

I ENCLOSE a tracing prepared by Mr. Manly, showing the proposed alteration to roads near Gunnedah Station, for preventing water flooding the line.

It is proposed to make a depression in the road at the point marked red, which work is probably now in hand. This will unquestionably relieve the railway at the point, but Mr. Manly thinks it will be necessary to construct a drain parallel with the road on the racecourse which will cost perhaps £50.

Could not this drain be dispensed with either by making the depression in the street at the point marked B or a second depression in the road at the point C, and thus throw the water within the railway fences. The question then is, can this water then be conveyed to the creek without interfering with the racecourse or private property without much expense?

Let me have your report on this matter as early as practicable.

GEO. BEWICK.

In order that you may clearly understand this matter, I enclose herewith the whole of the papers in connection therewith, and wish for your reply to the first paragraph in Mr. Laurenson's report.—G.B.

Sir,

Gunnedah, 5 April, 1886.

In compliance with your request, I now try to answer your memo. 86-714. The depression in Marquis-street is not yet in hand. It will, if carried out well, no doubt relieve the level crossing of a good quantity of water. I should suggest to let drain in racecourse stand over until we see how the depression will answer. Undoubtedly the drain would be the greatest advantage, but it would most likely be always a source of trouble, as it would keep increasing in size after storms.

The depression at C, as suggested by you, is unnecessary, I think, as we get the water inside our fences a few chains further north where we have a large drain to convey it away.

We have a drain large enough to convey the water away when the depression at point marked B is completed, but I still think a much larger opening is required at D opposite hospital than an 18-inch pipe. My impression is this: if means are taken to give the water a passage either under or over the metalling on Marquis-street it would do the railway no harm; as it is at present the water must make for the level crossing.

District Engineer.

Yours, &c.,

G. BARRACK.

From

From this report, and my own personal knowledge of the locality, I am of opinion that when the alteration suggested by Mr. Laurenson is carried out there will be no necessity for making a drain within the racecourse, as one already exists within the railway fences, which, I think, will be sufficient to take all the water away.—G.B., 7/4/86. Engineer for Existing Lines.

Full report from Mr. Barrack herewith.—G.C., 8/4/86. Commissioner. Approved.—CHAS.A.G., 12/4/86.

Reply to first paragraph of Mr. Laurenson's report.

I beg to state that, from the best information I can obtain, the station-yard was never known to be flooded to the same extent as it was last January: In November and December, 1882, I was here, and we had two very heavy storms; but they did no damage nor brought any silt down into yard. They certainly moved a few ashes, that was all. After this last storm I took twenty waggons of silt and muck out of grips deposited there by storm water.

I cannot better describe this than this way, I think. Imagine a dam or tank at level crossing, and you wished to get it filled; the plan would be to raise a mound of earth just in the same position as the metalling on Marquis-street is at present, and about the same length of it, and the first good storm you would have your dam filled.

Mr. Laurenson may remember that when starting this job I informed him we had all the water we could manage in storms, and to try and relieve us if possible in laying out his work.

Yours, &c.,

G. BARRACK,

5/4/86.

District Engineer.

No. 9.

The Mayor of Gunnedah to The Commissioner for Railways.

Sir, The Municipal District of Gunnedah, Council Chambers, Gunnedah, 25 June, 1886.

I have the honor to draw your attention to the damage and inconvenience caused by the flow of water through the railway culvert along Osric-street, Gunnedah. Quite a dangerous excavation is now being formed in the centre of that street, and I would respectfully draw your attention to the fact, with a view of having the nuisance abated.

I have, &c.,

ALFRED BACON,

Mayor.

Mr. Cowdery for report.—D.C.McL., 19/7/86. Mr. Bewick for report.—G.C., 21/7/86.

I beg to refer you to your 83/4,220, 83/4,302, 86/724, and 86/801, from which you will be able to see exactly how this matter stands. It will be seen that no additional water has been thrown on the street by the construction of the line; but the water has been necessarily concentrated by the construction of the culvert, and has caused a gully to be formed in the centre of the street for a distance of some 5 or 6 chains, from which point the water spreads and takes precisely the same course as it must have done before the construction of the railway. As the railway has not been improperly constructed in any way, it does not appear to me that the Commissioner is liable.—G.B., 30/7/86. Engineer for Existing Lines.

Report herewith.—G.C., 31/7/86. Commissioner.

I see that some of the papers are with Crown Solicitor. Is any action threatened on the part of Mr. Richardson, a claimant for compensation for injury done by the culvert?—CH.A.G., 4/8/86. Mr. Cowdery.

Mr. Richardson's solicitor claims £40 compensation, but has not yet, so far as I am aware, threatened legal proceedings.—G.C., 6/8/86. Commissioner.

There are two claims,—1. Mr. Richardson for injury to land, 2. Municipal Council, Gunnedah, for injury to street. I am not at all sure that the Department is not liable, for though no more water may flow over the land than would have spread over it if the culvert had not been constructed, it does not flow in the same even manner; but being concentrated by the culvert is, as it were, poured upon the land and street, and has formed a course which is an obstruction to the street, and perhaps an injury to the land. The papers in Richardson's case, which are said to be with Crown Solicitor, should be obtained.—CH.A.G., 7/8/86. Herewith.

The Secretary, Department of Public Works, Railway Branch, Sydney.

Sir, Council Chambers, Gunnedah, 22 October, 1886.

Referring to my letter of June 25th, to the Commissioner for Railways, and acknowledged by you on July 20th, I shall be glad to hear what decision you have come to in regard to the railway culvert, running along Osric-street, Gunnedah, and which in time of rain proves such a fruitful source of annoyance and injury to a large number of our townspeople.

Hoping for an early and favourable reply,

I have, &c.,

ALFRED BACON,

Mayor.

Inform that the Department is not prepared to admit any liability; it has not interfered with the natural flow of the water, and no more water flows upon the street than was the case prior to the construction of the railway.—CH.A.G., 28/10/86.

NOTE.—Although I give this answer, which is the substance of the Engineer's report, I am bound to say that if the Council press the matter, it will be difficult to resist the claim.—CH.A.G., 28/10/86.

Sir, Department of Railways, 2 November, 1886.

With reference to your letter of the 22nd ultimo, inquiring what decision had been arrived at in respect of your Council's claim for damage alleged to have been caused by flood-water from the railway at Gunnedah, I have the honor to inform you that I am not prepared to admit any liability.

The Department has not interfered with the natural flow of the water, and no more water flows upon the street than was the case prior to the construction of the railway.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

The Council Clerk, Gunnedah.

No. 10.

Mr. Road-Superintendent Cox to The Commissioner for Roads.

Gunnedah, 5 July, 1886.

Report *re* water running from Railway culvert, Gunnedah.

I ATTACH herewith letter from the Gunnedah Municipal Council in *re* water running from railway culvert at about junction of Baker and Osric Streets; the water from same runs through town, as marked in red on plan under separate cover. Before the railway embankment was made there was never any trouble caused by this water, and I think that as that Department has made the trouble they should deal with it and not this.

HARLEY D. COX,
Road Superintendent.

This is a question which should be dealt with by the Railway Department, to which this paper should be sent.—W.C.B., B.C., 10/7/86. Under Secretary. Railways.—B.C., 13/7/86.

Municipal District of Gunnedah.

H. Cox, Esq., Road Superintendent, Gunnedah,—

Sir,

Council Chambers, Gunnedah, 25 June, 1886.

I have the honor, by request of the Council, to respectfully inquire from you if the water coming through the railway culvert, and running along part of Osric-street, could not be run right along that street into a lagoon situated in the locality.

I have also the honor to inform you that the said water which now runs down Conadilly-street, causes considerable damage and inconvenience to a great many householders.

I have, &c.,

R. R. PRITCHARD,
Council Clerk.

Mr. Cowdery.—D.C.M'L., 14/7/86. Mr. Bewick for report.—G.C., 17/7/86. Please see report on another paper herewith.—30/7/86. Engineer for Existing Lines.

No. 11.

Memo. to The District Engineer.

Sir,

Gunnedah, 16 December, 1886.

I beg to report a thunder shower of about thirty minutes duration, occurred here last Tuesday, the 14th instant; as near as I can get information, about an inch and a quarter of rain fell in this thirty minutes. Gunnedah station-yard again got a quantity of silt brought down and deposited on ballast, caused by the formation of road leading to hospital. I have not been able to see Mr. Cox, Road Superintendent yet. He is not about here at present. I am waiting anxiously to see him, to see whether he can do anything to assist us, as something must be done, as every heavy shower that falls helps to spoil our ballast—and yard has to be examined. Debris moved away from switches.

I remain, &c.,

G. BARRACK.

This is caused through the action of the Roads Department in raising a street, which throws a considerable quantity of water on to the line which previously went in a different direction. I believe the Commissioner for Roads promised to remedy the evil, but nothing has yet been done in the matter. Please see the Commissioner's M.P., 86-2,024.—G.B., 17/12/86. Engineer for Existing Lines.

Commissioner to see. I recommend the attention of the Commissioner for Roads be drawn to this matter.—G.C., 18/12/86. Under Secretary for Public Works.—B.C., 22/12/86. A.R. Roads, B.C., 23/12/86.—J.R. Let me have the papers in this case. I think Mr. Nardin dealt with it in a recent report.—W.C.B., 24/12/86.

Government Railways, Gunnedah Station, 18 December, 1886.

Telegram to District Engineer.

ROAD Superintendent has promised to put depressions in hospital road at once to relieve Gunnedah Station yard of storm-water.

G. BARRACK,
Gunnedah.

For your information this refers to my 86-2,730, *re* flooding of Gunnedah yard, sent to you on 7/12/86.—GEO. BEWICK, 20/12/86. Engineer for Existing Lines. For Commissioner's information previous papers were forwarded 18/12/86.—G. C., 22/12/86. Commissioner. Attach when returned.—A.R., 3/1/87. This work has been satisfactorily carried out by the Roads Department.—J.B., 1/3/87. Engineer for Existing Lines.

I append copy of last report of Mr. Nardin on this. The streets of the town are now in charge of the Municipal Council, so that this Department has nothing whatever to do with the question.—W.C.B., 7/1/87. The complaint should be directed against the Council, it seems.—A.R., 13/1/87. Engineer for Existing Lines. Mr. Bewick to see.—G.C., 14/1/87. Mr. Nardin's report has no connection whatever with the subject of these papers.—G.B., 15/1/87. Engineer for Existing Lines.

Extract from Mr. Nardin's Report on Road District of Gunnedah, dated 4th October, 1886, No. 86-6,750.

Main Road through Gunnedah.

THIS is in exceptionally good order, but the open causeways at the intersections of the streets are much complained of, as it is impossible to cross them on foot during heavy rains.

It is suggested that pipe-drains or iron-topped culverts should be substituted; but, apart from the question of cost, it is doubtful if there is depth enough or sufficient fall for the purpose. The evil is caused through the water from the higher ground on the south side of the railway embankment being collected

collected and forced through two brick railway culverts. It is possible that a remedy for this may be found by means of contour drains being cut to intercept and more evenly distribute the water from this catchment area. This should form the subject of further inquiry by Mr. Cox, who will ascertain whether it can be done without interfering with suburban allotments, or whether the desired effect cannot be produced by making use of some of the back roads or streets. It seems to me, however, that the ultimate settlement of the question more properly rests with the Railway Department, to whose action the mischief is certainly attributable. The damage done by the late rain through this cause was considerable at the intersection of Osric and Conadilly Streets, the metalling was torn up for a considerable distance and water-tables cut into deep gullies, involving a somewhat heavy expense in their restoration; until a remedy is applied the same thing will occur during every heavy rain.

Destruction was only done to several private properties, and I am given to understand that in one case compensation was awarded by the Railway Department, with the promise that some steps should be taken to prevent a recurrence.

Gunnedah has been formed into a Municipality; it is, therefore, desirable to settle whether the Roads Department is still to maintain the numerous lengths which it has constructed within the Borough boundaries; in other cases the Government has refused to do so, and I think that Mr. Cox should be definitely instructed on the matter.

E. A. NARDIN,
Assistant Engineer.

Sir,

Department of Railways, Sydney, 27 January, 1887.

I have the honor to inform you that it has been reported to me that, consequent upon the defective formation of Marquis-street, within the Municipality of Gunnedah, the Station yard is flooded on the occasion of every heavy rainfall to a very serious extent, the rails having frequently been covered with water, and the ballast washed away. It would seem that the raising of the street during the time it was under the control of the Roads Department, has had the effect of blocking surface drainage from its natural course, throwing it on to the railway line at the level crossing. I have, therefore, to request that you will be good enough to bring the matter before your Council, with the view of making adequate provision for carrying away the water, and preventing the recurrence of an evil which may cause interruption to traffic.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

The Council Clerk, Gunnedah.

Sir,

Department of Railways, Sydney, 23 March, 1887.

I have the honor, by direction of the Commissioner for Railways, to draw your attention to his letter of the 27th January last, respecting the flooding of the Station Yard at Gunnedah, and to ask that a reply thereto may be given at your very earliest convenience.

I have, &c.,

A. RICHARDSON,
For the Commissioner for Railways.

The Council Clerk, Gunnedah.

The Municipal District of Gunnedah,
Council Chambers, Gunnedah, 30 March, 1887.

Chas. A. Goodchap, Esq., Commissioner for Railways, Department of Railways, Sydney.

Sir,

I have the honor, on behalf of this Council, to acknowledge the receipt of your communication of the 27th January last, No. 86-23,360, and 23rd instant, No. 87-23,360, and have been instructed to inform you the Works Committee of this Council report that the flooding of the station yard is caused by your drain between South-street and the railway line having silted up. Cleaning out, and attention to the drain will remedy the evil complained of.

I have, &c.,

R. R. PRITCHARD,
Council Clerk.

Paper to Mr. Cowdery, for further report.—A.R., 4/4/87. If this is a railway drain, have it cleaned out and attended to.—G.C., 6/4/87. Mr. Bewick. If this refers to my memo. of 3rd February, 1886, the evil has been remedied in a very satisfactory manner.—G.B., 7/4/87.

I saw the Mayor of Gunnedah this morning, and he informed me that this matter referred to the same subject as reported in your memo. of 3rd February, 1886. Please say when the evil was remedied, and in what way.—G.C., 12/4/87. Mr. Bewick. This work was satisfactorily carried out by the Roads Department, as reported in my minute of 1/3/87. Please see report from Sub-Inspector Pickin herewith, who has seen four of the Aldermen, and they assure him that they are not aware of any complaint being made.—G. BEWICK. This matter has been satisfactorily attended to by the Roads Department.—G.C.

Railway Department, Existing Lines Branch,
Office of District Engineer, Newcastle, 13 April, 1887.

Memorandum to W. Picken,—

SOME time ago the Gunnedah yard was occasionally flooded through water flowing into the line at the Marquis-street crossing, during heavy rainfall.

This was found to have been caused by the street having been raised, throwing the water, which had previously found its way along the drain on the southern side of the line, on to the railway. The remedy proposed was to make a depression in the road near the line of the railway fence, in order that the water might take its natural course.

Mr. Barrack reported a few weeks ago that this work had been carried out by the Roads Department in a satisfactory manner, and that the water would give us no further trouble. I presume Mr. Barrack has made no mistake in the matter.

The Council are now making some complaint about this place, which I cannot clearly understand. See some of the Municipal authorities, and let me know exactly what it is they complain of.

G. BEWICK.

District

Boggabri, 16 April, 1887.

District Engineer,—
Sir,

I had an interview with four of the members of the Gunnedah Municipal Council concerning Marquis-street. These members assure me that they have no knowledge of any complaint being made.

The depression in the road has been carried out as reported to you by Mr. Barrack.

W. PICKIN.

Engineer for Existing Lines.—G.B., 18/4/87.

No. 12.

Report by Mr. A. P. Wood.

Gunnedah Streets—Flood waters.

Sydney, 8 February, 1887.

On the 26th ultimo, in company with Mr. Cox, I examined the streets in Gunnedah, which are injured by flood-waters crossing the railway line.

* Appendix E.

By reference to the sketch attached* it will be seen that the railway culvert through which the waters complained of are discharged is situated at the intersection of Barrier and Osric Streets. The water flows through a deep defined channel for some chains down Osric-street, and near the intersection of Conadilly-street. When this channel runs out the main body of the water spreads and turns down that street, gutting out the water-tables, scouring the gravelled road, and breaking across, damages properties on the lower side.

To remedy this a pitched and covered channel should be made down Osric-street, as shown, to discharge the water into the lagoon; but I do not think that this Department is in any way called upon to interfere in regard to this work, as, after a careful examination of the locality, it appears to me that the damage done is due to concentration of water by the Railway Department.

The existing works have not increased in any way the area of the catchment from which the water complained of is gathered; but there can be no doubt that the rainfall which used to be discharged over a scattered area is now concentrated at one point, hence the damage. For this, as I have stated, the Railway Department is responsible, and I do not consider this Department is called on to take any action.

ARTHUR P. WOOD.

I forwarded this report from Mr. Wood, which is conclusive that this Department is not in any way responsible for the flooding here.—W.C.B., 8/2/87. Mr. Cowdery, for report.—D.C.M'L., 15/2/87. Mr. Bewick.—G.C., 17/2/87.

I do not clearly understand what is meant by a pitched and covered drain, but it must mean a culvert of some kind which will be very costly. It is a very difficult matter to deal with, and as the Commissioner is clearly liable, I am of opinion that the best course to pursue will be to make an offer of a certain sum (say £500) to the Council, and let them carry out the work in their own way.—G.B., 18/2/87.

The papers show that several recommendations and suggestions have been made to remedy the flooding; the last one, to hand over £500 to the Corporation, is rather startling. Do we not complain that our ballast is injured and our yard damaged by the water, &c., which is sent on to them through the raising of street. Is it by any means certain that we should provide a remedy for this, and would the handing over of £500 to the Corporation affect it if we should? Please make a clear statement of the case.—CH.A.G., 26/2/87. Mr. Cowdery. Mr. Bewick for full reply to Commissioner's minute. 28/2/87.

My minute of 18/2/87 has no reference to the flooding of the Gunnedah yard, but to damage done in Osric-street. The papers have got mixed, which I have separated. My reason for suggesting that £500 be offered to the Council was that the Crown Solicitor had decided that the Commissioner was liable, and to put in a culvert, as suggested, the cost would be near £3,000.—G.B., 1/3/87. Engineer for Existing Lines.

Report from Mr. Bewick herewith.—G.C., 2/3/87. Commissioner.'

Seen.—I am not satisfied that the Department is liable, and if it be so I do not see how the Council would be satisfied with £500 if it will cost £3,000 to effectually deal with the drainage, unless indeed they have a means of draining the land which has not occurred to our engineer; if not, the existence of the evil will not be removed, and future claims will be made, if not by the Council, by other persons interested, *i.e.*, the owners of private property in the neighbourhood.—CH.A.G., 5/3/87.

No. 13.

T. H. H. Goodwin, Esq., M.P., to The Secretary for Public Works.

Sir,

"Imperial Hotel," Wynyard Square, Sydney, — March, 1887.

The Worshipful the Mayor of Gunnedah forwarded the accompanying letter to me on the 1st instant. Upon perusal it will be seen that he complains of the water discharged through one of the railway culverts being allowed to flood the town, thus doing incalculable damage to properties fronting the main street.

From personal observation I know that all the flood-waters are concentrated by a system of drainage on the south-west side of the railway line, and discharged through a culvert (the approximate position of which is shown on tracing herewith down Osric-street. They flow down this street to its intersection with Conadilly-street) thence down that street, flooding all the properties in six sections of the town, and doing great damage to them and the road generally.

By

By the judicious expenditure of a reasonable sum of money the flood-waters could be diverted from Conadilly-street, carried down Osric-street, and discharged into a natural swamp between Bloomfield and Maitland Streets, which would convey thence to the river without injury to any property.

May I suggest that this necessary and very urgent work be proceeded with at once.

I have, &c.,

THOMAS H. H. GOODWIN.

For inquiry.—J.S., 11/3/87. Railways.—J.R., 14/3/87. Engineer for Existing Lines.—A.R. From previous reports on this matter it will be seen that the only remedy for this nuisance is to construct a culvert along Osric-street, the cost of which will be about £3,000.—G.C., 19/3/87. Secretary. See Commissioner's minute of the 5th instant.—A.R., 22/3/87. For Minister's information.—D.V. (*pro* Commissioner), 24/3/87.

[Enclosure.]

Council Chambers, Gunnedah, 1 March, 1887.

T. H. H. Goodwin, Esq., M.L.A., Sydney,—
Sir,

You may recollect when here I pointed out to you the volume of water that swept through the town after every fall of rain, caused by construction of a railway culvert at the top of Osric-street, and which you were of opinion should receive immediate attention by the Railway Department.

The matter under complaint has been referred to the Roads Department, who replied that the Railway Department should deal with the matter. The latter Department in reply stated they could not entertain the complaint, not having diverted the natural flow of the water.

I enclose tracing,* showing the position of the culvert, also, by red lines, the flow of the water. The culvert is 5 feet by 5 feet opening, and the drainage of hundreds of acres pour through it with such force that a gully has been cut across Barber-street, averaging 12 feet wide, 6 feet deep, and increasing in size, blocking the traffic at that street, from Breeza to the town, to bridge which would cost £100 or more. The drain continues, as shown, down Osric to its junction with Conadilly-street. At this point provision should be made for flow of water across Conadilly-street and down Osric-street. As the red lines show, the water sweeps down the principal street to the heart of the town, carrying away road-metal, &c., increasing size of gully, and flooding properties situate on sections 30, 31, 32, and the Police Barracks, and Wesleyan Church and Parsonage properties. Considerable damage to the road has been done at the corner of Henry and Conadilly Streets, and at the intersection of Conadilly-street and Poe-street, a causeway has been considerably damaged, and a deep drain cut near the Court-house in Poe-street. At this point you cannot get along Conadilly-street in ordinary wet weather without walking knee-deep in water. Heavy storm-waters continue in their course to Elgin-street.

When it is understood that the main body of the water referred to comes through this culvert named, destroying our streets, cutting a deep channel down Osric-street, and opening a large chasm across Barber-street, and flooding our town, the Council is justified in demanding the attention of the Railway Department, who has caused the nuisance and damage. I may also state that an owner on section 32 received compensation from the Railway Department, for damage caused by the flow of water from the culvert. Irrespective of the damage sustained between the culvert and Conadilly-street in Osric-street, the flow of water has damaged the main street of the town to such an extent that the Council will be placed to considerable expense repairing, &c. I was informed a few weeks since by a railway official here, that the Department would probably construct a brick covered drain from the culvert to Conadilly-street, and that the work had been estimated. Such a drain is the only remedy, and I hope to hear of the work being started shortly.

The Council is very desirous of avoiding litigation, but we feel in duty bound to demand attention to the matter herein, otherwise action will be taken for damages to a considerable amount.

Trusting you will be able to place this matter before the proper authorities sufficiently clear that the work will be undertaken at once.

I have, &c.,

JOHN J. SMYTH,
Mayor.

No. 14.

Minute by The Commissioner for Railways.

LET me have papers respecting the damage done to Osric-street, Gunnedah, by Railway culvert.—CH.A.G., 27/3/87

Now herewith.—A.R., 29/3/87.

There can be no question that the Railway Department is liable for concentrating the water at one particular place; the damage done to Osric-street, and in less degree to the streets beyond, is most serious. The Municipal Council, however, if the railway had never come there, would have had the same volume of water to deal with, and to have kept it off their streets, would have had to construct large and expensive water tables, but they would have had perhaps a dozen such water-courses, whereas the railway embankment and the solitary culvert gives only one. It would seem that, to take the water right away to the lagoon by means of pipes, would cost some £3,000. Mr. Cowdery obtained from the Officer of the Roads Department at Gunnedah a litho. of the towns. I should like to see him with it.—CH.A.G., 29/3/87.

I have gone carefully into this matter, and do not see my way clear to conduct this water through the town except by continuing the culvert the whole way, which is estimated to cost £3,000. However, as the 5 feet culvert under the railway was put in when the line was constructed over the outlet, cut down through near the centre of the street, I would recommend that Mr. Whitton be asked to suggest a remedy. Another alternative would be to construct a wide pitched water-table on each side of the street, but I am afraid this would not be acceptable to the Council, at the same time it would cost some £2,000.—G.C., 5/4/87. Commissioner.

This means a very serious outlay.—CH.A.G., 8/4/87. Forward to the Engineer-in-Chief, B.C., 4/5/87.—CH.A.G.

The Engineer-in-Chief advises that no responsibility be admitted, but if they think that the water is too much concentrated by the culvert, he considers that there would be no objection to put in a few extra openings under the railway.—H.D., 12/5/87.

What would extra culverts cost—sufficient in number to admit of the water flowing as it used to flow prior to the making of the embankment, or as near thereto as possible, it would require the railway to be built on piles at this place to restore the natural flow; I am afraid that to refuse to admit liability, and then to put in culverts would be construed as our admission of liability.—CH.A.G., 14/5/87. Engineer for Existing Lines, B.C.

Mr. Bewick for reply to Commissioner's minute.—G.C., 16/5/87.

I am afraid it will be impossible to put in openings that will carry the water in exactly the same direction that it went before the construction of the line, except by making a bridge nearly the length of the embankment. I enclose a tracing herewith showing the levels at different points, from which it will be seen that the point marked A is in about the same level as the culvert, and therefore, if openings were put in at that point, they would certainly take a great portion of the water from the culvert. I suggest that a timber structure be erected at this point, say 50 feet in length, the cost of which I estimate at £400. The cost of filling up the gully in the street will be about £100, but whatever we may do, even if we move the embankment, I am of opinion that the water will still take the course it now does after getting a few chains from the railway.—G. BEWICK, 26/5/87. Engineer for Existing Lines.

Report and tracing herewith.—G.C., 27/5/87. Secretary. I should like to see Mr. Cowdery about this.—CH.A.G., 29/5/87.

I see no good in making fresh openings through the embankment, as the present culvert is capable of carrying all the water; were the whole length of the embankment to be bridged, it would not remedy the evil, as the water would concentrate a few chains below the line in consequence of the forming of the water tables in the streets. The great difficulty is that the bottom of the culvert is about 4 feet 6 inches below the roadway or street, and the outlet of the culvert has been cut down the street which (outlet) has very much increased in size. I see no way of conducting the water through the town other than by extending the culvert, which is very expensive.—G.C., 1/6/87. Commissioner.

If the evil will not be remedied by the construction of additional waterways, I see nothing but wasteful extravagance in the proposal to make them. It is impossible to deny that the streets of Gunnedah have been greatly injured by the concentration of the water. The Engineer-in-Chief advises that responsibility be not admitted. The preferable course will be to spending £500 uselessly as proposed, to offer that amount to the Municipal Council to aid them in getting rid of the water.—CH.A.G., 4/6/87.

Approved.—J.S., 4/7/87. Engineer for Existing Lines.—A.R., B.C., 4/7/87. Secn. I presume the Council will be informed, and will carry out work.—G.C., 5/7/87.

Sir,

Department of Railways, Sydney, 7 July, 1887.

Referring to correspondence which has passed, relative to damage done to streets in the township of Gunnedah, through storm-water being collected and discharged thereon through a railway culvert, I have the honor, by direction of Mr. Secretary Sutherland, to inform you that the Government is willing to contribute the sum of £500 to assist the Municipal Council in getting rid of the water.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

T. H. Goodwin, Esq., M.P., Legislative Assembly, Sydney.

No. 15.

Mr. T. H. H. Goodwin, to The Secretary for Public Works.

Sir,

Sydney, 9 May, 1887.

I beg to enclose herewith a letter from the Mayor of Gunnedah *re* damage done to streets in that town through storm-waters being collected and discharged through a railway culvert.

I wrote to you on this subject last March, and may I now ask to be informed what action you purpose taking to remedy the subject complained of.

I have, &c.,

THOMAS H. H. GOODWIN.

The Municipal District of Gunnedah.

T. H. H. Goodwin, Esq., M.L.A., Sydney,—

Sir,

Council Chambers, Gunnedah, 5 May, 1887.

Referring to our letter of the 25th February last, *re* the dangerous drain in Osric-street, will you kindly ascertain from the Commissioner for Railways what steps are being taken to have the damage repaired and remedied.

I have, &c.,

JOHN J. SMITH,
Mayor.

For attention.—10/5/87. Perhaps Mr. Quodling can expedite papers.—A.R., B.C., 11/5/87. Report was furnished on 12th instant.—W.H.Q., 14/5/87. Mr. Richardson.

No. 16.

J. P. Abbott, Esq., M.P., to The Under Secretary for Public Works.

Dear Mr. Rae,

Wentworth Court, Sydney, 4 August, 1887.

Will you let me know when the Minister can receive a deputation from the Borough Council of Gunnedah, in reference to the overflow of water from the railway line into Osric-street. It would not be convenient for the deputation to attend this week, but any day after would suit.

Yours truly,

J. P. ABBOTT.

Inform that Mr. Sutherland cannot, at present fix a day for receiving deputation. Might not a letter from Mr. Abbott, or the Council, explaining the matter, suffice.—J.R., 5/8/87.

Sir,

Sir,

Department of Public Works, Sydney, 5 August, 1887.

In reply to your letter of the 4th instant, requesting an interview for a deputation from the Municipal Council of Gunnedah, in reference to the overflow of water from the railway line into Osric-street, I am directed to inform you that the Secretary for Public Works regrets that he is unable, at present, to appoint a day upon which to receive the proposed deputation; but, if the Council will clearly state, in writing, the circumstances of the case, the matter will receive every consideration, and a reply will be furnished to the Council.

I have, &c.,

JOHN RAE.

J. P. Abbott, Esq., M.P.

Sir,

Department of Public Works, Sydney, 25 August, 1887.

Referring to my letter to you, of the 5th instant, with respect to alleged flooding of Osric-street, Gunnedah, I am directed to inform you that the Municipal Council has not yet given the particulars of the case, as requested in the communication referred to above.

I have, &c.,

JOHN RAE.

J. P. Abbott, Esq., M.P., Sydney.

6 and 7, Wentworth Court, Sydney, 31 August, 1887.

John Rae, Esq., Under Secretary, Department of Works,—

Sir,

Referring to your letter of the 25th instant, 20,87/7,147, I am desired by the Municipal Council of Gunnedah to inform you that a reference to the papers in the case will show that the Council long since gave all the information now asked for in reference to Osric-street.

I have, &c.,

J. P. ABBOTT.

Roads, 2/9/87.—J.R. Might be informed that this is with the Railway Department. Most likely last action is based on their report.—W.C.B., 5/9/87.

Sir,

Department of Public Works, Sydney, 8 September, 1887.

In reply to your letter of the 31st ultimo, with respect to the flooding of Osric-street, Gunnedah, I am directed to inform you that the papers referred to in your communication are with the Railway Department, but as soon as a report shall be received from the Commissioner for Railways a further communication will be made to you.

I have, &c.,

JOHN RAE.

J. P. Abbott, Esq., M.P., Sydney.

The Commissioner will doubtless remember, and the papers show, that £500 was offered to the Gunnedah Council to aid them in getting rid of the drainage water from the Railway into Osric-street. They are, it is assumed, dissatisfied with this, and request the Minister, through Mr. Abbott, M.P., to receive a deputation on the subject.—A.R., 13/9/87.

For Minister's decision.—CHAS. A.G., 15/9/87. Better arrange deputation.—J.S., 24/9/87. Friday, 30th instant, at 11:30.—J.R., 24/9/87. The deputation has been postponed.—D.C.M'L., 29/9/87. The papers have been called for by the House, I think. Please let me have the resolution.—D.C.M'L., 29/8/87.

Sir,

Department of Public Works, Sydney, 26 September, 1887.

Referring to the correspondence which has taken place respecting the flooding of Osric-street, Gunnedah, I am directed to inform you that in compliance with the request contained in your letter of the 4th ultimo, the Secretary for Public Works will receive the deputation from the Municipal Council of Gunnedah on Friday, the 30th instant, at 11:30 o'clock a.m.

I have, &c.,

JOHN RAE.

J. P. Abbott, Esq., M.P.

Sir,

Legislative Assembly, Sydney, 28 September, 1887.

In reply to the accompanying letter, which was handed to me last night by Mr. J. P. Abbott, I respectfully beg to inform you that sufficient time has not been allowed to permit a deputation from the Municipal Council of Gunnedah to wait upon the Secretary for Works on the date specified *re* the flooding of Osric-street.

Gunnedah is situated some 300 miles north of Sydney, and most of the gentlemen connected with the Municipal Council are actively engaged in business pursuits, therefore four days notice is not nearly sufficient to enable them to make arrangements for leaving their business with a view of waiting upon the Minister in connection with the above matter.

I have adopted another course with a view of bringing the case under reference to a close speedily; but should the residents of Gunnedah still desire an interview with the Minister, I will communicate with you, and in the event of my doing so may I request that at least fourteen days notice be given as to the date upon which the deputation will be received.

I have, &c.,

THOS. H. GOODWIN.

John Rae, Esq., Sydney.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(ADDITIONAL ACCOMMODATION, WHITTINGHAM PLATFORM—CORRESPONDENCE.)

Ordered by the Legislative Assembly to be printed, 7 February, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 17th November, 1887, That there be laid upon the Table of this House,—

“Copies of all correspondence, petitions, minutes, and other documents
“having reference to desired additional accommodation at Whittingham
“Platform, on the Great Northern Railway, since the year 1882.”

(Mr. Gould.)

NO.	SCHEDULE.	PAGE.
1.	Letter from Mr. A. J. Gould, M.P., to Minister for Works, asking that a Porter be placed in charge, and trucking yards erected at Whittingham Platform, with Traffic Manager's report and minute of Commissioner. 22 March, 1883	2
2.	Letter from Mr. Gould, M.P., to Commissioner for Railways, respecting above matter; Traffic Manager's report and decision of Commissioner to have yards erected; Mr. Gould informed. 25 April, 1883	2
3.	Letter from Mr. Gould, M.P., to Commissioner for Railways, requesting that increased accommodation for trucking stock be provided; approved, and Mr. Gould informed. 23 October, 1883	3
4.	Letters from Mr. Gould, M.P., to Minister for Works, urging the erection of a goods-shed at platform, with traffic reports and decision; Mr. Gould informed. 10 and 24 November, 1883	4
5.	Letter from Mr. D. F. Mackay to the Hon. F. A. Wright, with further reference to above work being carried out; minutes thereon. 16 January, 1884	5
6.	Letter from Mr. Gould, M.P. (enclosing communication from Mr. D. F. Mackay) to Commissioner for Railways, urging that above work be carried out; report of Traffic; Mr. Gould informed. 15 January, 1885	5
7.	Letters from Mr. D. F. Mackay to Minister for Works, <i>re</i> above, with Minister's reply. 29 April and 4 May, 1885	6
8.	Letter from Mr. D. F. Mackay to Commissioner for Railways, <i>re</i> above, with Commissioner's minute. 24 June, 1885	7
9.	Letter from Mr. Gould, M.P., to Commissioner for Railways, for crane and shed to be erected, with Commissioner's reply. 17 September, 1885	7
10.	Letter from Mr. Gould, M.P. (enclosing one from Mr. Faulkner) to Commissioner for Railways, again urging work to be carried out; Traffic Manager's report; Commissioner's minute thereon; Mr. Gould informed. 30 August, 1886	7
11.	Letters from Mr. Gould, M.P. (with enclosures from Mr. Mackay) to Minister for Works, <i>re</i> above; Commissioner's minute; Traffic Manager's report; Mr. Gould informed. 28 February and 30 March, 1887	8
12.	Letter from Mr. Gould, M.P., to Minister for Works, asking that a return of traffic be obtained before final decision is given with regard to the work; minutes by Commissioner, and Minister's decision; Departmental minutes, &c. 21 April, 1887	10
13.	Letter from Mr. Gould, M.P., to Commissioner for Railways, <i>re</i> erection of loading stage, &c., at platform; Minister's minute; Mr. Gould informed. 25 October, 1887	11

RAILWAYS.

No. 1.

A. J. Gould, Esq., M.P., to The Secretary for Public Works.

Sir,

Legislative Assembly, Sydney, 22 March, 1883.

I am desired by a number of my constituents, resident at Whittingham, Vere, Bourke, and neighbourhood, to call your attention to the desirability of making better provision for the accommodation of passenger, and especially goods and cattle, traffic, at the Whittingham platform, south of Singleton, and at the intersection of the railway with the road to Vere and Bourke, and to ask that you will be pleased to place a porter in charge, and cause to be erected yards for trucking stock. With reference to this latter convenience, I enclose you a letter I am in receipt of from Mr. D. F. Mackay, of Dulcahmah, showing the desirability thereof. In addition to this gentleman, I may remind you there are the Messrs. Dangar, Faulkner, Blaxland, and many others, who all have extensive transactions with stock, and to whom these yards would doubtless be of great convenience. In support of my request that a porter may be placed in charge at this platform, I learn that during the year 1882 the coaching traffic represented £266, while the goods traffic, exclusive of wool, represented £75 in and £12 out, in all £341, and this in the face of the great drawback to the platform not having any person in charge, and the unavoidable departmental regulations in respect thereof, which are not calculated to ensure anything like the traffic obtainable if a porter were placed in charge. I may remind you that there is a siding at this platform, and the locality has been considered of sufficient importance to warrant the establishment of a post office, with a daily despatch and receipt of mails. Upon referring to returns showing the traffic at Doughboy Hollow, for the year 1882, at which place there is a porter in charge, I find that the coaching traffic represented £274, and the goods, exclusive of wool, £178, thus showing return of Whittingham, without a porter in charge, against those of Doughboy Hollow, with a porter in charge, exclusive of wool, to be—

	Coaching.	Goods.	Total.
Whittingham	266	75	341
Doughboy Hollow	274	171	445

I trust you will give this matter your early and I hope favourable attention, as I have no doubt the returns would be materially enhanced by the granting of the convenience desired. Your colleague, the Minister for Mines (Mr. Abbott), with whom I have had some conversation relative to this matter, is acquainted with the locality, and can vouch for the desirability of acceding to my request.

I have, &c.,

A. J. GOULD.

[Enclosure.]

My dear Sir,

Whittingham, 6 March, 1883.

In reply to your inquiries about the traffic in connection with the Whittingham platform, I beg to inform you that I am now stocking Dulculmach with about 10,000 sheep, principally wedders, for fattening purposes. The wool of same will go by rail from Whittingham, and if suitable yards, &c., are erected there for trucking stock, the greater portion (if not all) the fat sheep would go by rail also.

I remain, &c.,

D. F. MACKAY.

Railways, 28/3/83.—J.R. Mr. Higgs, for report, 28/3/83.

In my opinion the traffic is not sufficient to justify the employment of a man in charge. There is no comparison between the places named by Mr. Gould. Doughboy is on a heavy gradient; and again, it is a staff and ticket station, which necessitates the employment of a man.—J. HIGGS, 31/3/83.

Minute by The Commissioner for Railways.

THE HON. J. P. Abbott saw me, with Mr. Gould, on this matter.

Mr. Abbott expressed his opinion that there was no justification for any outlay for additions at Whittingham, unless it could be shown that small stockyards would be useful.

To my reply that Singleton was only a short distance away, and the stockowners could drive to the stockyards there, it was stated, both by Mr. Abbott and Mr. Gould, that stockowners drove their cattle, &c., to West Maitland from Whittingham, and did not truck at Singleton, but would truck at Whittingham if they had the facilities.

If we are losing a good traffic by there being no stockyards at Whittingham, that is a matter which requires looking into. Mr. Higgs will try and ascertain the quantity of live stock sent from the neighbourhood which, if there had been stockyards at Whittingham, would have been sent from there.

CH.A.G., 5/4/83.

No. 2.

A. Gould, Esq., M.P., to The Commissioner for Railways.

Sir,

Singleton, 25 April, 1883.

Following my letter of 22nd March ultimo, asking that you would be pleased to put a porter in charge at the Whittingham platform, on the Great Northern Railway, and cause to be erected yards for the trucking of stock, and the interview of Mr. J. P. Abbott, M.P., and myself with you in reference to the same matter, I have pleasure in handing you the enclosed letter, received by me from Mr. R. T. Blaxland, J.P., of Murinbrie, near Broke, on the same subject, who appears to consider it very desirable that such porter

porter should be placed in charge and the yards erected for the trucking of stock. I shall be glad if you determine to accede to my request, as I am convinced it will be of great convenience to a very large population at Whittingham, Vere, Broke, and elsewhere, and believe it will be found to pay well.

I have, &c.,
A. GOULD.

[Enclosure.]

Dear Sir,

Murinbri, Whittingham, 17 April, 1883.

Referring to yards for trucking stock at the above place, which I hear you are about applying for, I beg to state that, in my opinion, they are much required, and I, for one, would frequently use them in preference to sending stock by road to Maitland, particularly calves and sheep. Also, with reference to its being made a platform, with a man in charge, I think this is much needed, as quantities of produce and timber, now very inconveniently sent to Singleton, would be trucked there; in fact, the whole of the wheat and corn and hay grown in that portion of the valley of Wollombi, between Broke and Wollombi, would go to Whittingham. Trusting you may be able to obtain this boon for us,

A. J. Gould, Esq., M.P., Singleton.

I remain, &c.,
R. BLAXLAND.

Re Stockyards, Whittingham.—From inquiries made I am under the impression that Messrs. A. A. and W. J. Dangar, Blaxland, Mackay, and a few others would send stock from Whittingham if suitable stock-yards were provided. I think it would be much used for sheep and pigs; but I am not so sure that the accommodation would create so much additional traffic, that is, to any great extent. I have no doubt that some traffic would be diverted from Singleton. Mr. Bewick informs me that even to provide small yards would be very costly.—J. HIGGS, 30/4/83.

Let me know what the estimated cost is for small yards.—CH.A.G., 4/5/83. Mr. Cowdery. The cost will be about £50.—G.B., 11/5/83. Engineer, Existing Lines. Estimated cost, about £50.—G.C., 15/5/83. Commissioner. Have the yards erected.—CH.A.G., 21/5/83. Mr. Cowdery. Inform Mr. Gould, 25/5/83.

The Commissioner for Railways to A. J. Gould, Esq., M.P.

Sir,

Department of Railways, 25 May, 1883.

Adverting to your letter of the 25th ultimo, and previous communications and interviews on the subject of constructing yards at Whittingham, to facilitate the trucking of stock, I have the honor to inform you that it has been decided to erect a suitable yard at that place, and directions will be given for the work to be carried out as early as possible.

I have, &c.,
CH. A. GOODCHAP,
Commissioner for Railways.

Mr. Bewick to have yard erected and charge to Sch. G.—G.C., 26/5/83. Noted.—G.B., 30/5/83 Engineer, Existing Lines. Accountant to see cost.—G.C., 31/5/83. Accountant. Noted.—J.W 19/6/83. Engineer, Existing Lines. Commissioner.—G.C., 21/6/83.

No. 3.

A. J. Gould, Esq., to The Commissioner for Railways.

Sir,

Sydney, 23 October, 1883.

I understand that no provision has been made at the small yards at Whittingham, on the Great Western Railway Line, for trucking stock, for the loading and unloading of sheep into the upper floors of the sheep-trucks, nor is there at this platform any accommodation for the loading and unloading of ordinary merchandise and produce. I shall be glad therefore if you will give this matter your favourable attention, and have these matters attended to, as also the erection of a suitable goods-shed. I may remind you that the traffic at this platform is considerably larger than at other more favoured platforms.

I have, &c.,
A. J. GOULD.

Mr. Higgs for report.—D.C.M.L., 26/10/83.

Return herewith showing the goods and live stock for three months, ending 30th September. I would suggest that Mr. Bewick be instructed to provide a portable stage whereby the upper tier of the trucks can be used. I scarcely think it advisable at present to erect a goods-shed at this place.—J. HIGGS, 31/10/83.

Approved and informed.—D.V., 3/11/83.

The Commissioner for Railways to A. J. Gould, Esq., M.P.

Sir,

Department of Railways, 6 November, 1883.

With reference to your letter of the 23rd ultimo, directing attention to the necessity for providing conveniences for trucking stock at Whittingham, and asking that a suitable goods-shed may be erected at the same place, I have the honor to inform you that a portable stage will be provided to load the upper tier of the trucks, but the traffic is not sufficient to warrant the erection of a goods-shed.

I have, &c.,
CH. A. GOODCHAP,
Commissioner for Railways.

Mr. Cowdery, 7/11/83. Mr. Bewick for report.—G.C., 7/11/83.

There is very little room for increasing the accommodation at this place; but I think a kind of portable stage for the purpose of loading sheep into the upper tier might be made for about £10.—G.B., 12/11/83. Engineer, Existing Lines.

Approved.—G.C., 13/11/83.

No. 4.

A. J. Gould, Esq., M.P., to The Secretary for Public Works.

Sir,

Sydney, 10 November, 1883.

I am in receipt of letter from Commissioner for Railways, intimating, in reply to my request that a suitable goods-shed might be erected at Whittingham platform, on the Great Northern Railway, "that the traffic is not sufficient to warrant the erection of goods-shed."

May I draw your attention to the fact that the goods traffic at this platform for the year 1882 amounted to £88, while that at Allandale amounted during same period to £81, and yet a goods-shed and other improvements, costing £621 6s. 4d. to the end of August last, were provided at this latter place, and to ask upon what principle the Department acts in these matters. The gross traffic at Allandale was (1882) £327, as against £354 at Whittingham, £27 less; yet the Department spends £621 and places a porter in charge, and deny the same advantages to Whittingham and Glennie's Creek, at which latter place traffic receipts (1882) were £378, £51 more than Allandale.

I have, &c.,

A. J. GOULD.

Mr. Higgs for report, 19/11/83. Report herewith.—J. HIGGS, 22/11/83.

Traffic at Allandale.—In reporting on matters of this kind it is not the traffic that we do in all cases that guides me in recommending the erection of goods-shed, &c., but it is principally the traffic which we anticipate by affording additional accommodation. Again, the population and the localities tend to influence me in such matters.—J. HIGGS, 22/11/83. Commissioner.

Be good enough to report on the allegations contained in Mr. Gould's letter.—D.V., 23/11/86.

Mr. Higgs.

It will be seen by enclosed returns for the portion of 1883 ending 31st October last, that the goods trade at each of the places named was as follows:—

Allandale, in and out	£194
Whittingham, in and out	86
Glennie's Creek, in and out	124

These figures show an increase at Allandale which it is confidently hoped will justify the naming of that platform before either of the others named for a porter-in-charge to be placed there. It might be added that the bulk of the business done at Whittingham and Glennie's Creek is of a class that does not call for any shed, while that of Allandale is mainly general merchandise, requiring shed accommodation. I have now in hand the preparation of returns which will show the class of business in the goods branch of each of the three places named, which will, I am convinced, prove this, and which I will send on as soon as prepared. If the decision can conveniently be postponed for Mr. Higgs' further report, I am satisfied good and sufficient grounds can be advanced by that gentleman for deferring, at least for the present, any outlay on buildings or on account of wages. There is already ample siding room at both Whittingham and Glennie's Creek.—F. R. NIELD, 29/11/83. Commissioner.

A. J. Gould, Esq., M.P., to The Secretary for Public Works.

Sir,

Singleton, 24 November, 1883.

Following my letter of the 10th instant, receipt of which is acknowledged, relative to my request for a goods-shed at Whittingham platform, Great Northern Railway, I beg to enclose letter I have received from Mr. Mackay on the subject, in which he points out certain accommodation required for loading sheep, and platform for loading trucks. These very reasonable requirements, I trust, will be at once acceded to, and that the goods-shed and porter in charge, not alone here, but at Glennie's Creek platform, will follow at an early date.

I have, &c.,

A. GOULD.

[Enclosure.]

My dear Sir,

Dulcahmah, Whittingham, 19 November, 1883.

Speaking to you yesterday, I understood you to say that there was not sufficient traffic at Whittingham platform to induce the Government to give us more accommodation there for loading and unloading stock, hay, wool, &c. The reason is that we have no accommodation, except for loading sheep in the lower portion of trucks. There should be a second rail at a higher elevation leading into the top trucks. There should also be a platform on a level of the trucks for loading hay, buggies, horses, &c., so that a dray could be backed up to it, and hay rolled off the dray into the truck, so that one man could do it. As it is at present the sheep have to be lifted into the top trucks, and three men have to be sent with every load of hay or wool to load or unload, and the farmers from Broke, Vere, and this neighbourhood, Dangars and myself prefer sending loading into Singleton, a distance of 4 extra miles, which means 8 there and back, rather than load at Whittingham as it is at present. The whole affair would not cost £150, and if properly done would last for the next twenty years. That portable platform or plank which you spoke of will not do, the incline would be too steep, and sheep will not walk up it. So I hope you will do your best to get the necessary additions made.

I remain, &c.,

D. F. MACKAY.

Commissioner for report.—F.A.W., 27/11/83. Mr. Higgs to see and expedite the reports alluded to.—D.V., 7/12/83.

In reporting again on this matter I have but little to add. I think the figures already given show that the business conducted at Allandale is much more extensive than that done at either of the other places, but with a view of showing that a shed was required, that for the ten months ending October, 53 tons of wire was sent from Allandale, I think it will be admitted that this alone would almost justify the erection of a shed; but would it not be as well to let the matter stand over for a few months, then if it is found that the traffic at Glennie's Creek and Whittingham would justify increased accommodation, I would be prepared to recommend it.—J. HIGGS, 18/12/83. Commissioner.

Acknowledge letter and inform of effect of Traffic Manager's reports.—D.V., 21/12/83.

The

The Commissioner for Railways to A. J. Gould, Esq., M.P.

Sir,

Department of Railways, 28 December, 1883.

Referring to your letters of the 10th and 24th ultimo (the latter covering a communication from Mr. D. F. Mackay) addressed to the Hon. the Minister for Public Works, on the subject of increased shed and loading accommodation at Whittingham platform, I have the honor to inform you that I have caused a full report (including a return of the traffic, inwards and outwards, up to the 31st October last) to be furnished in the matter, but there appears to be no warrant for further provision being made at the places named at present. Comparing Whittingham with Allandale and Glennie's Creek, I find that for the first ten months of this year the traffic amounted to only £88 at the first-named platform, as against £194 and £124 respectively. The bulk of the business, moreover, at Whittingham is of a class that does not require shed accommodation, and the Traffic Manager reports that with the present traffic he is not prepared to recommend the accommodation asked for.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

No. 5.

D. F. Mackay, Esq., to The Secretary for Public Works.

My dear Sir,

16 January, 1884.

On the strength of old acquaintance I take the liberty of writing you a private letter, and enclose one of mine cut out of the *Singleton Argus*. I need say very little, as it explains what we require, and I hope that you will give us the necessary accommodation both at Whittingham and Ravensworth platforms. The trucking yard at the latter place is now quite useless. Mr. Hill, my manager there, informs me that the last time he attempted to truck some calves at Ravensworth they broke the yard down and several of them got astray on the line, so that we cannot now truck stock there of any description without the danger of their getting away. A man who was sent up to repair it after a few hours work left it in much the same condition that it was in before.

Yours, &c.,

D. F. MACKAY.

Commissioner for report.—F.W.W., 17/1/84.

Remark on newspaper paragraphs.

Mr. Mackay's argument goes simply to show that by supplying facilities at Whittingham we should take the traffic from Singleton, where appliances already exists. The matter is at present standing over for a few months to see how the traffic will show at the end of that time.—D.V.

Let matter stand for a time as proposed.—CH.A.G., 7/2/84.

No. 6.

A. J. Gould, Esq., M.P., to The Commissioner for Railways.

Sir,

Singleton, 15 January, 1885.

Referring to previous correspondence, urging the appointment of a porter-in-charge, and erection of necessary accommodation for the traffic at Whittingham platform, on the Great Northern Railway, I beg to hand you enclosed letter from Mr. D. F. Mackay on this subject, complaining of the inconvenience suffered by him through the absence of the necessary facilities for the required traffic. I may remind you that this platform is much used and of great convenience to the public resident in the neighbourhood, and at the village of Vere and Broke, and that they really have cause of complaint at the scant accommodation afforded. I do not know whether Mr. Wright, during his recent visit of inspection, made any inquiries relative to the requirements of this platform, but I am sure if he did so he must have found abundant evidence as to the need and advisability of appointing a porter and giving the necessary accommodation, similar to that at Allandale.

I have, &c.,

A. J. GOULD.

Traffic Manager, North, for report.—19/1/85. Report herewith.—J. HIGGS, 29/1/85.

[Enclosure.]

Sir,
I hope you will not forget to remind the Government of the necessity of having better means provided for loading and unloading stock at Whittingham. We can load sheep there, but there is no provision for loading cattle, horses, or buggies. A shed should also be built, and porter appointed. I had 240 bulls to truck to Newcastle on Tuesday morning last. These bulls, with four horses, had to be sent to Singleton and put into the trucks on Monday evening at 4 p.m., and had to remain without either feed or water until 8 a.m. on Tuesday morning, when they arrived at Newcastle. If they could have been loaded at Whittingham, they could have remained in my paddock until 1 a.m. on Monday night, and then trucked in time to leave Whittingham by the 4 a.m. train on Tuesday morning. As we cannot load horses or cattle at Whittingham, many that now go by road would go by rail if I can get them on board there. You will see by this that Singleton gets a great many stock that ought to be trucked at Whittingham.

I remain, &c.,

D. F. MACKAY.

A. J. Gould, Esq.

Referring to M.P. 85-432, dated 17/1/85, wherein Mr. Gould, M.P., applies for additional accommodation at Whittingham platform, it will be seen by the enclosed return that there has been a small increase in the traffic from this place, but, in my opinion, the increase is not sufficient for any great outlay; in fact, as the platform is within 3 miles of Singleton, which has the necessary accommodation for doing a large business, I think it would be unwise at present to expend any more money at this platform.—J. HIGGS, 29/1/85.

J. HIGGS, 29/11/85.

The Commissioner for Railways to A. J. Gould, Esq., M.P.

Sir,

Department of Railways, 4 February, 1885.

With reference to your letter of the 15th ultimo, asking that additional accommodation may be provided at Whittingham platform, I have the honor to inform you that inquiry has been made, and under the report of the Traffic Manager I am unable to sanction any further expenditure at this platform.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

No. 7.

D. F. Mackay, Esq., to The Secretary for Public Works.

My dear Sir,

Dalcalmah, Whittingham, 29 April, 1885.

I hope you will pardon the liberty I take in writing to you privately on the following subjects, but I have sent in so many petitions, and written to the head of the Department without any results, that I now think it best to write to yourself. We have a siding at Whittingham platform, but no facility for loading or unloading horses, buggies, &c. We can load sheep, but everything else has to go either to Singleton or Branxton, which is very inconvenient for all residents of Whittingham and Broke, as it incurs, from Singleton, an extra carriage of 6 miles (3 miles to Singleton and 3 miles back). For instance, I had 250 bulls to truck to Newcastle, and instead of being able to load them at Whittingham I had to send them on to Singleton, thus incurring extra expense and loss of time. Goods also have to go through to Singleton and then back to Whittingham, thus incurring extra freight.

In a reply to former application to head of Department it was said that there was not sufficient traffic to warrant expense of additional works at Whittingham, but the reason is that we have no facility for loading or unloading, and therefore have to send goods to Singleton that ought to start from Whittingham.

Hoping you will give this matter your favourable consideration,

I remain, &c.,

D. F. MACKAY.

The Secretary for Public Works to D. F. Mackay, Esq.

My dear Sir,

Department of Public Works, 30 April, 1885.

In reply to yours of yesterday, asking that accommodation might be provided at Whittingham for loading and unloading vehicles, I have to inform you that I have given the matter consideration, but regret I cannot comply with your request. Were I to do this it would mean that this place would be ranked as a station, with all the accompanying expenses of station hands, &c., and this the traffic would not justify; and further, there is no great necessity for the accommodation, as there is a carriage deck, &c., existing on a station only 3 miles distant.

Yours, &c.,

F. A. WRIGHT.

D. F. Mackay, Esq., to The Secretary for Public Works.

My dear Sir,

Dalcalmah, Whittingham, 4 May, 1885.

Yours of the 30th April to hand. I am sorry you cannot see your way to give us better accommodation at Whittingham. You say the traffic is not sufficient for further expenditure there, but if you only give us one porter with a shed to receive goods, and platform to load and unload, the traffic will soon increase, which it cannot do until we get these conveniences. Only a few days ago I had to go on to Singleton instead of being let out at Whittingham, which I was ill able to do, being in a very delicate state of health, incurring extra expense and 6 miles additional travelling for myself, horses, two carriages, and servants, and as I have already pointed out to you, with the exception of sheep alone, we have to send our cattle, horses, &c., to Singleton to be trucked, or by road to Maitland. The farmers from Broke lose a day by having to go to Singleton with a load of hay, whereas if we had the shed and porter at Whittingham they could get back on the evening of the same day. The Government has given sheds and porters at Glennie's Creek and other places on the line not so important as Whittingham. Only give us the facilities for loading and unloading, and you will soon have sufficient traffic.

Yours, &c.,

D. F. MACKAY.

Mr. Mackay informed that no further accommodation can be given.—F.A.W., 11/5/85.

No. 8.

No. 8.

D. F. Mackay, Esq., to The Commissioner for Railways.

Sir,

24 June, 1885.

I am surprised at you opposing our application for a goods-shed and porter at Whittingham platform, when the same has been given to other places on the line, of much less importance, such as Glennie's Creek and other places further up. Your reply to all our petitions has been not sufficient traffic to warrant the expense, but if you will only give us the necessary appliances, such as a shed, porter, and facilities for loading and unloading, you would very soon find the traffic would so increase that it would not only pay, but pay well. As it is now we have to pay extra carriage on goods from Whittingham to Singleton, and then back to Whittingham, incurring not only extra expense but also loss of time, and sometimes loss of goods also, as when they are left at Whittingham they are left on the platform with no one in charge and open to the weather, and sometimes lost altogether. Some goods of mine that ought to have arrived several days ago have not turned up yet. The people from Broke and surrounding neighbourhood must either send three men to load and unload hay, &c., at Whittingham, or else send an extra distance of 6 miles to Singleton (3 miles there and 3 miles back), thus incurring extra expense in labor or time, for if they could load at Whittingham they could truck their produce and return home the same day with their supplies. Now, by going to Singleton it takes two days, besides the additional expense of a night in town with man and team. We can truck sheep at Whittingham, and on a few occasions were allowed to truck horses there, but the latter has been stopped. I, myself, had 500 bulls to ship at Newcastle for Queensland, and had to send them to Singleton, and of course incurring extra expense and trouble, and it is the same with all stock, everything must go to Singleton. Instead of encouraging traffic you are obstructing it. Only this morning, although it is pouring rain now, I have sent sixty head of fat cattle to Maitland by road, where they will arrive hollow and foot sore. If I could truck them from Whittingham they would remain quietly in my paddock to-night, start at daylight in the morning by 4 o'clock train, and arrive fresh and full at the sale-yards. I could say a good deal more on this subject, but think I have said enough, and trust that you will see the necessity of giving us what we have so long asked for, viz., a goods-shed and porter, crane and other appliances necessary at Whittingham.

I remain, &c.,

D. F. MACKAY.

The Minister has so recently decided that no further accommodation can be given at Whittingham that it seems unnecessary to prolong the correspondence. The papers may therefore be put by for the present.—CH.A.G., 29/6/85.

No. 9.

A. J. Gould, Esq., M.P., to The Commissioner for Railways.

Sir,

Singleton, 17 September, 1885.

Great dissatisfaction continues to be evinced by numbers of persons who are desirous of availing themselves of the facilities that should exist at Whittingham platform on the G.N.R. for goods traffic.

Newcastle Department appear disinclined to grant the very just and reasonable applications for a porter-in-charge. I am desired to ask that at least a platform with a crane be erected at the siding at this place for the loading and unloading of goods, together with a covered shed for the protection of such goods in wet weather.

I have, &c.,

A. J. GOULD.

The Commissioner for Railways to A. J. Gould, Esq., M.P.

Sir,

Department of Railways, 19 September, 1885.

Referring to your letter of the 17th instant, asking that a platform and crane may be provided at Whittingham siding, together with a weather-shed, I have the honor to inform you that this matter has been under the consideration of Mr. Secretary Wright, who decided that no further accommodation can be given at Whittingham.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

No. 10.

A. J. Gould, Esq., M.P., to The Commissioner for Railways.

Sir,

Sydney, 30 August, 1886.

I have again to draw your attention to the need of additional railway accommodation at the Whittingham platform, near Singleton, on the Great Northern Railway, and enclose a letter received by me on the subject from Mr. R. Faulkner. Many residents in the locality are constantly complaining of the lack of accommodation and inconvenience experienced by them. If returns are called for, I am confident it will be found that a considerable amount of business is done in spite of the lack of convenience provided, and I am further sure that the appointment of a porter-in-charge, the erection of a small goods-shed, and providing conveniences for the loading of hay and other goods, and unloading, and the prompt despatch of sheep and cattle will tend not only to the convenience of the public and the prevention of loss in the way indicated and suffered by the Messrs. Faulkner, but also to the receipts at this platform.

I have, &c.,

A. J. GOULD.

Mr. Higgs for report.—D.C. M'L., 2/9/86. Report herewith.—J. HIGGS, 27/9/86.

[Enclosure.]

[Enclosure.]

Dear Sir,

Lairmount, Singleton, 24 August, 1886.

Enclosed you will find a letter I have had from Mr. M'Kay about getting a proper convenience placed at Whittingham platform. I think myself, the place is due for a shed and one porter at any rate. There is a great deal of business done there, and I am sure a lot more would be done if the proper convenience were placed there. On last Thursday my brother and myself had thirty-seven head of fat cattle to truck to Maitland for sale on that day. We ordered trucks the night before, and they were sent by 20 to 8 train in the morning, which was the train the latter were to go by. We had the cattle in the yard ready to truck, waiting for the trucks, but the train would not let us truck them. It would not have taken 10 minutes, so had to take the cattle back and send them by Monday's train. The trucks stayed there from the Tuesday until the Monday following. When we used them we lost fully £1 per head on our cattle, through not having the trucks on the Thursday, for cattle had fallen fully that much between the two days. There is no fault to be found with the officials at Singleton, for the Station-master is very obliging as far as he can go, but if they can leave trucks there from Thursday until Monday, why cannot they have trucks left there for the public to use as they require them. If you want trucks for there you have to give at the least 24 hours' notice before you can have them at Whittingham, and that is not always convenient; for instance, the auctioneer wires up in the evening, send your cattle or sheep for to-morrow, a good market; we near Whittingham platform have no chance of doing so.

I think there is quite sufficient traffic forwarded to Whittingham to justify the Minister in putting a small shed and one porter there. Mr. M'Kay thinks two porters, but I think one would be sufficient.

Hoping you will see to the matter,
A. J. Gould, Esq., M.L.A.

I am, &c.,
R. FAULKNER.

In replying to the letter referring to the wants of Whittingham platform, it will be seen by the annexed return that the traffic at this platform is growing, and it is only a question of time when we must place a man there in charge by affording additional facilities at this place; I feel sure it will add to the traffic, but I am afraid it will draw the traffic from Singleton; still I think increased accommodation should be provided. As to the loss sustained by Mr. Faulkner, he has no one but himself to blame. He should order the trucks in sufficient time.—J. HIGGS, 27/9/86. Commissioner.

In the first six months of 1885 the revenue from coaching and goods amounted to £235. For the past six months of this year, £294. Increase, £59. The increase is not very large. A porter-in-charge will be £130 a year. Residence, £26 = £156. Interest at 6 per cent. upon (say) £500 outlay for goods-shed, &c., £30 = £186. Will the increase traffic justify this outlay.—CH. A. G., 30/9/86. Mr. Higgs. I am under the impression the traffic will increase, and something should be done, I think.—J. HIGGS, 5/10/86. Commissioner.

I cannot recommend compliance with the recommendation that a man be placed in charge of Whittingham platform and siding and a goods-shed be erected. The annual outlay will not be less than £200 a year. I will visit this place shortly.—CH. A. G., 10/10/86. Inform.—W. J. L., 13/10/86.

The Commissioner for Railways to A. J. Gould, Esq., M.P.

Sir,

Department of Railways, 16 October, 1886.

Referring to your letter of the 3rd August last, with enclosure from Mr. Robert Faulkner, representing the use of a small goods-shed and siding at Whittingham, Great Northern Railway, and the appointment of a porter in charge, I have the honor to inform you that, under the reports received, I am unable at present to recommend a compliance with your wishes; but when I go north, shortly, I will visit the place and ascertain if the traffic facilities can be increased at a reasonable expenditure.

I have, &c.,
CH. A. GOODCHAP,
Commissioner for Railways.

No. 11.

A. J. Gould, Esq., M.P., to The Secretary for Public Works.

Sir,

Singleton, 28 February, 1887.

Referring to my interview with you on Thursday last, when I drew your attention to the urgent need of additional railway facilities at Whittingham platform, near Singleton, I now beg to hand you letter received by me from Mr. D. F. Mackay, on the subject, a similar letter having been addressed you or the Commissioner, as I am informed by Mr. A. A. Dangar. Whittingham platform will naturally command an increased trade if proper facilities are offered for public convenience. I have repeatedly addressed the Department on this subject, but without any satisfaction. I do however venture to hope that

that the past consideration so long denied to my representations will no longer be withheld. The only accommodation afforded the public is a small platform, a siding, and stage for loading sheep. What is required is the appointment of a porter-in-charge, a platform for loading and unloading goods, facilities for trucking stock, a crane, weigh-bridge, and small goods-shed. That a large traffic exists, spite of the discouragement afforded the public, cannot be gainsaid, and, with the conveniences sought, these would be largely increased; and I cannot more strongly urge than does Mr. Mackay in the enclosed that the railways were built and are, presumably, maintained for the convenience, and not the inconvenience, of the public.

I have, &c.,
A. J. GOULD.

[Enclosure.]

Dear Sir,

11 February, 1887.

I must again address you *re* Whittingham platform, and the troubles we are put to in railway matters there. Since the recent alteration of time-tables there is only one train per diem which can put a truck into Whittingham (as all the others are ticket and not staff trains), and this truck cannot go out till the same train next day, thus causing unnecessary delay. The chief reason why graziers here prefer to truck stock to market instead of travelling them by road, is because they are or should be enabled to get stock promptly to market on short notice from agents, and with sensible management this could easily be done, but if we are obliged to give at least two days previous notice to railway authorities it will facilitate matters to send stock by road, as this only takes one day.

It is a pity to see income driven away from the railways thus, simply through clumsy mismanagement, which would not for a moment be tolerated by any director of a Company. If this be a fair example of the managing capacity of the Railway Department there is little to wonder at that railways do not pay in New South Wales. Another trouble is concerning goods consigned to Whittingham. In order to get delivery of these their freight has to be paid in Singleton, as there is no one at Whittingham authorized to receive money.

Hitherto this has been partially obviated by the Singleton Station-master consenting to hold an advance fund to meet freight, thus saving delay and inconvenience, but I am informed that the authorities have vetoed this. This appears to me an unreasonably piece of despotism. I imagine our railways were built by the people for their own use to the best advantage, and not for a ring of apparently incompetent men to practise mismanagement on. I have written so repeatedly on this matter to the various members of the Department without result that I am tired of doing so, and trust you may do something for me. Surely some improvement could be made, if only to permit the gate-keeper, Mr. Cousens, who is thoroughly reliable, to receive freight payments, and also to put up signals to permit ticket trains putting in trucks.

Yours, &c.,
D. F. MACKAY.

For inquiry.—J.S., 1/3/87. Please see papers herewith. The Commissioner is to visit the place on the first opportunity.—D.C.M'L., 3/3/87. I propose visiting the northern line about the middle of this month.—CH.A.G., 3/3/87.

Seen.—J.S.

A. J. Gould, Esq., M.P., to The Secretary for Public Works.

Sir,

Sydney, 30 March, 1887.

Referring to my interview with you some short time since, and my letter to you forwarding a communication from Mr. Mackay on the subject, I shall be glad to learn whether it is in contemplation to place a porter-in-charge at Whittingham platform on the Great Northern Railway, and proceed with the several requirements of the platform as desired in my many letters, enclosures, and interviews on the subject. The recent visit of Mr. Goodchap to the line has, I trust, convinced him of the reasonable nature of the requests so often preferred by me.

I have, &c.,
A. J. GOULD.

For report.—J.S., 31/3/87.

I visited this place and could see no indication of any traffic beyond the wants of the two admirable private properties of Mr. Dangar and Mr. Mackay. They are as pleasing to the eye as the evident absence of nearly all but most trifling traffic is disappointing to the expectation of a railway manager. Although this is only a platform with limited means of loading stock, I do not see that any more outlay, if outlay is to be justified by corresponding returns, can be justly sanctioned. Obtain for me the returns: passenger, goods, and stock of such traffic as there is, and the revenue derived from it. One or two of the matters referred to in Mr. Mackay's characteristic letter might be attended to.—CH.A.G., 29/3/87.

Mr. Higgs for attention.—D.C.M'L. Mr. Higgs.—A.R., 31/3/87. In my opinion the traffic is not sufficient to justify the appointment of a man. I would suggest that the platform be lengthened, and that signals be provided so that ticket trains could stop and attach and detach trucks when necessary.—J. HIGGS, 7/4/87. Assistant Secretary. Inform Mr. Gould.—A.R., 13/4/87.

The Commissioner for Railways to A. J. Gould, Esq., M.P.

Sir,

Department of Railways, 18 April, 1887.

With reference to your letter of the 30th ultimo, and your previous interview with the Secretary for Public Works, relative to the expediency of placing a porter-in-charge at Whittingham platform, G.N.R., and of effecting certain improvements there, I have the honor to inform you that the whole subject has had careful attention, and it is not considered that the traffic would justify either the appointment of a porter or the outlay involved in carrying out your other recommendations.

I have, &c.,
CH. A. GOODCHAP,
Commissioner for Railways.

No. 12.

A. J. Gould, Esq., M.P., to The Secretary for Public Works.

Sir,

Sydney, 21 April, 1887.

Referring to the eminently unsatisfactory letter of 18th inst., intimating that it is not considered that the traffic at Whittingham platform on the G.N.R. would justify either the appointment of a porter or the outlay involved in carrying out my other recommendation, may I request that you will obtain a return of the receipts and traffic done with this platform before arriving at a final determination.

The present system of management is scandalously inefficient and unsatisfactory, and the repeated refusals of additional accommodation at this platform are alike unjust to the public and well calculated to destroy every semblance of traffic. As an evidence of the inefficient management to send a truck load of stock to Maitland necessitates a notification to the station at Singleton not later than two days previous, so that practically the convenience (?) is worthless.

I have, &c.,

A. J. GOULD.

Let me have the papers on this subject.—J.S., 23/4/87.

The letter to Mr. Gould, to which this is a reply, should not have been sent without Minister's approval. I asked in my minute of 29/3/87 for a return of the traffic. This has not been furnished. Be good enough to have it supplied.—CH.A.G., 27/4/87. Mr. Higgs.

Return herewith.—J. HIGGS, 4/5/87.

The traffic is greater than I thought it was. The revenue for six months was £350. Is there a gatekeeper at this place, and if signals were erected and the platform lengthened could he attend to the platform, issue tickets, &c. How far is the gate away?—CH.A.G., 5/5/87. Mr. Higgs.

G. N. Railway.

RETURN of in and out traffic at Whittingham from October, 1886, to March, 1887, inclusive.

The gatekeeper is the wife of one of the permanent way men. If tickets are to be issued it will be necessary to appoint a man, and also provide an office, &c. The gate-house is quite close to the platform.—J. HIGGS, 7/5/87.

What is the wife of the fettler paid?—CH.A.G., 4/6/87. Mr. Higgs. 15s. per week.—J. HIGGS, 7/6/87. Commissioner.

For Minister's consideration. A man might be appointed to attend to gates and platform Signals should be put up, and the platform lengthened slightly.—CH.A.G., 13/6/87. Approved.—J.S., 14/6/87. Mr. Higgs.—A.R., 14/6/87.

The Commissioner, in his notes on inspection on the north, directed the closing of Woodford, and I think it would be a good opportunity to utilize the officer-in-charge's services and the station plant by removing them to Whittingham, giving the public, of course, ample notice of closing. The platform at Whittingham should be lengthened about 80 feet, and authority is required for erection of office and waiting-room. Signals have been erected.—J. HIGGS, 15/6/87. Commissioner.

Mr. Cowdery to note authority for lengthening platform, and report lowest cost of office and waiting accommodation necessary.—A.R., 16/6/87. Mr. Bewick to note approval, and carry out and report as to lowest cost of office and necessary waiting accommodation.—G.L., 17/6/87.

Mr. Higgs suggests that a waiting-room and a ticket-office be erected; also closet and urinal accommodation be provided, and the platform lengthened by 80 feet. The total cost of these works will be about £250. Please say how to be charged.—G. BEWICK, 24/6/87. Engineer.

The lengthening of platform is already approved. What will be the cost of office and necessary waiting accommodation.—G.L., 25/6/87. Mr. Bewick. Estimated cost of ticket-office and waiting-room, about £170, and closet and urinal accommodation, about £30; total, £200.—G. BEWICK, 28/6/87. Engineer, Existing Lines. The estimated cost of ticket-office, waiting-room, and closet accommodation will be about £200.—G.L., 29/6/87. Secretary. Does Mr. Higgs recommend so large an expenditure?—A.R., 30/6/87. Having decided to put a man in charge, the accommodation suggested, and the cost, are on the lowest scale. I am therefore obliged to recommend.—J. HIGGS, 7/7/87. Assistant Secretary. For Minister's approval.—CH.A.G., 11/7/87. Approved.—J.S., 15/7/87. Engineer for Existing Lines.—A.R., 16/7/87. Mr. Bewick to carry out.—G.L., 18/7/87. Noted. Please say how to be charged.—G. BEWICK, 19/7/87. Engineer, Existing Lines. Please say how work is to be charged.—G.L., 20/7/87. Commissioner. Schedule G.—CH.A.G., 23/7/87. Engineer for Existing Lines.

No. 13.

A. J. Gould, Esq., M.P., to The Commissioner for Railways.

Sir,

Singleton, 25 October, 1887.

I am glad to observe that some of the much-needed work at the Whittingham platform, near Singleton, viz., lengthening of platform and erection of ticket office and waiting-room, &c., have at length been completed.

I must, however, direct your attention to the need of a loading stage and crane and small goods-shed, as also platform for loading stock. The traffic will, I am convinced, amply justify the erection of these conveniences, which are anxiously desired by a large section of the public.

I have, &c.,

A. J. GOULD.

Mr. Higgs.—A.R., 27/10/87.

I find the traffic is improving at this place. I think a loading stage or a crane should be provided, but I am afraid the erection of a shed for goods would be too costly; therefore I am unable to recommend it. We have stock-yard accommodation already, although on a small scale,—still it serves the purpose for which it was intended.—J. HIGGS, 8/11/87. Assistant Secretary.

What would a loading stage and crane cost?—D.C.M'L., 17/11/87. Engineer, Existing Lines. Mr. Bewick for estimated cost.—G.C., 19/11/87. The cost will be about £200.—G.B., 25/11/87. Estimated cost, £200.—G.C., 26/11/87. Secretary. Not at present.—CH.A.G., 28/11/87. Mr. Higgs to see.—A.R., 29/11/87. Noted.—J. HIGGS, 2/12/87. Assistant Secretary. I have made inquiry in this matter. I think amount (£200) might be expended.—J.S., 5/12/87. Inform Mr. Gould, then Mr. Cowdery.—D.C.M'L., 6/12/87.

The Commissioner for Railways to A. J. Gould, Esq., M.P.

Sir,

9 December, 1887.

Referring to the representations contained in your letter of the 25th October last, I have the honor to inform you that the Secretary for Public Works has approved of a loading stage and crane being provided at Whittingham platform, and the necessary directions have been given in the matter accordingly.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Mr. Bewick to carry out.—G.C., 9/12/87. Noted.—Please say how to be charged?—G.B., 10/12/87. Engineer, Existing Lines. Please authorize charge.—G.C., 12/12/87. Commissioner. Schedule G.—CH.A.G., 13/12/87. Accountant.—A.R., 14/12/87. Engineer, Existing Lines.—J.V., 20/12/87. Mr. Bewick to note.—G.C., 29/12/87. Noted.—G.B., 30/12/87.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(PURCHASE OF BLUE METAL—TENDERS, MINUTES, &c.)

Ordered by the Legislative Assembly to be printed, 4 November, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 5th October, 1887,—

“Copies of all tenders, minutes, and papers relating to the purchase of 3,000 tons of blue metal for the Railways and Tramways, called for on the 20th September.”

(Mr. O'Sullivan.)

SCHEDULE.

NO.	PAGE.
1. Minute by the Engineer for Existing Lines, forwarding advertisement calling for tenders for 3,000 tons of blue metal. 19 July, 1887	1
2. Telegram from Colledge Bros. & Collins, asking that acceptance of tender be delayed.....	2
3. List of tenders, with analysis and acceptance of Lewis Litton's. 9 August, 1887	2
4. Letter from L. Luttan, declining to go on with contract, and advertisement for fresh tenders, &c. 28 August, 1887	4
5. List of fresh tenders, with analysis of same, and acceptance of H. E. Russell's. 20 September, 1887	4
6. Letter from Mr. T. R. Smith. 21 September, 1887	6

No. 1.

Minute by The Engineer for Existing Lines.

Department of Public Works, Railway Branch, Existing Lines,
Sydney, 19 July, 1887.

Subject:—3,000 tons of blue metal required for maintenance of tramways.

I FORWARD herewith draft advertisement, inviting tenders for the supply of 3,000 tons of blue metal, to be delivered in trucks at Darling Harbour or Botany Road Siding, for insertion in the *Government Gazette*, &c.

The metal is required for maintenance of tram lines.

GEO. COWDERY.

The Commissioner.

Insert.—CH.A.G., 22/7/87. Advertised.—F.V., 22/7/87.

[Enclosure.]

Department of Public Works, Railway Branch,
Sydney, 19 July, 1887.

TENDERS will be received at this office, until 11 o'clock on Tuesday, the 9th August, from persons willing to contract for the supply and delivery, in trucks, at Darling Harbour or Botany Road Siding, of 3,000 tons of blue metal.

Form of tender and further particulars may be obtained on application to the District Engineer, Redfern.

Tenders are to be endorsed "Tender for 3,000 tons of Blue Metal."

The Commissioner does not bind himself to accept the lowest or any tender.

CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 2.

No. 2.

Telegram from Colledge Bros. & Collins to The Secretary for Public Works.

Brisbane, 8 August, 1887.

KINDLY postpone acceptance of tender blue metal until you hear from me. See Reuben Woods, Lloyd's Chambers, George-street; he has hundred tons sample from here.

COLLEDGE BROS. & COLLINS.

No. 3.

The Under Secretary for Public Works to The Commissioner for Railways.

Sir,

Department of Public Works, Sydney, 9 August, 1887.

The tenders, fourteen in number, for the work specified in the margin, are referred to you for report, and you will have the goodness, as early as possible, to return them to me direct, for submission to the Minister.

I have, &c.,

JOHN RAE.

Supply of 3,000 tons of blue metal at Darling Harbour or Botany Road Siding.

[Enclosures.]

Form of Tender.

I HEREBY agree to supply and deliver in trucks, at Darling Harbour Railway Station, 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions, that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 150 tons per week, for the sum of 6s. 1d. per ton.

LEWIS LUTTAN,
Gravel Pits, 9 August, 1887.

To the Commissioner for Railways.

Form of Tender.

I HEREBY agree to supply and deliver in trucks at Botany Road Railway Siding 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 150 tons per week, for the sum of 9s. per ton.

JNO. MORRISON,
Emu Plains, 9 August, 1887.

To the Commissioner for Railways.

Form of Tender.

I HEREBY agree to supply and deliver in trucks at Botany Road Siding, 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 150 tons per week, for the sum of 9s. 4d. per ton.

ANDREW TURNBULL,
Emu Plains, 9 August, 1887.

To the Commissioner for Railways.

Form of Tender.

I HEREBY agree to supply and deliver in trucks at Botany Road Railway Siding 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 150 tons per week, for the sum of 9s. 6d. per ton.

BARCLAY & CO.,
180, Pitt-street, 9 August, 1887.

To the Commissioner for Railways.

Form of Tender.

I HEREBY agree to supply and deliver in trucks, at Botany Road Railway Siding, 3,000 tons of good sound blue metal stone, broken by hand to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 150 tons per week, for the sum of 11s. 5d. per ton.

GEORGE WATTS,
Prospect, 6 August, 1887.

Sureties,—William Higgins, William Bishop, Wemyss-street, Marrickville.
To the Commissioner for Railways.

Form of Tender.

I HEREBY agree to supply and deliver in trucks, at Botany Road Railway Siding, 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 150 tons per week, for the sum of 12s. per ton.

The tender of Lewis Litton is the lowest, and I recommend it be accepted.—G.C., 11/8/87. Commissioner. For Minister's consideration: 6s. 1d. is a very low price.—CH.A.G., 12/8/87. Approved.—J.S., 18/8/87.

Department of Public Works, Railway Branch,
Sydney, 22 August, 1887.

Sir,

I beg to inform you that I accept your tender of date the 9th August instant, to supply and deliver in trucks at Darling Harbour Railway Station three thousand tons of good, sound blue metal stone, broken to a gauge of 2½ inches,—that is, no stone shall in any way exceed 2½ inches, and must be of such dimensions that it can be passed through an iron ring of 2½ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 130 tons per week, for the sum of 6s. 1d. per ton, upon the understanding that I have the option of terminating this Contract, by notice in writing, at any time, without being called upon to pay any sum of money beyond the amount then due for work actually performed, and that in no case shall I be required to pay for work done hereunder, until the Engineer for Existing Lines has certified that the work in respect of which payment is to be made, has been completed to his entire satisfaction, and it is to be considered as part of the contract created by this acceptance of your Tender that the obtaining a certificate from the Engineer for Existing Lines, that the work done by you has been satisfactorily executed, or completed, and that all materials supplied hereunder have been supplied to his satisfaction, shall be a condition precedent to your having any cause or right of action in respect, or on account of any work done by you, or materials provided, or to any payments in respect thereof.

Before any money can be paid, a shilling duty stamp must be forwarded to this Office to be affixed to your Tender.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

Mr. Lewis Luttan, Gravel Pits.

No. 4.

Mr. F. Luttan to The Commissioner for Railways.

28 August, 1887.

The Emu Gravel and Road Metal Company, (Limited).

Dear Sir,

Your acceptance of my tender came duly to hand. I am sorry to inform you that the price was made-up, delivered in trucks at Emu, the same as the contract for screenings the Company is now delivering at Botany Road.

The price given in is only just about cost price without the freight. I must therefore decline to go on with it.

I am extremely sorry that this mistake should have happened or cause any trouble to the Department.

I have, &c.,

L. LUTTAN.

I recommend the cancellation of Luttan's contract, and that fresh tenders be invited; but, as some metal is very urgently required, I recommend that 250 tons be ordered from Mr. G. Hill, at his former price, 10/6 per ton.—G.C., 1/9/87.

Approved, as regards fresh tenders—why not order the 250 tons from John Morrison at 9/-?—CHAS.A.G., 3/9/87.

Draft advertisement inviting fresh tenders herewith. I have instructed Mr. Shellshear to order 250 tons of metal from Morrison.—G.C., 5/9/87. Advertised, 7/9/87.

As per Commissioner's minute of 3/9/87, I instructed Mr. Shellshear to order 250 tons of metal from Mr. John Morrison of Emu Plains; but, although every inquiry has been made no such person can be found—and as the metal is urgently required, I recommended it be obtained from Mr. George Hill, at 10/6 per ton.—M.T., 13/9/87. Commissioner.

Approved.—CHAS.A.G., 16/9/87. Noted and instructions given to order from Mr. Hill.—G.C., 16/9/87.

Department of Public Works, Railway Branch,
Sydney, 5 September, 1887.

FRESH tenders will be received at this office, until 11 o'clock on Tuesday, the 20th September, from persons willing to contract for the supply and delivery in trucks at Darling Harbour or Botany Road Siding of 3,000 tons of blue metal.

Form of tender and further particulars may be obtained on application to the District Engineer, Redfern.

Tenders are to be endorsed "Tenders for 3,000 tons of Blue Metal."

The Commissioner does not bind himself to accept the lowest or any tender.

CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 5.

The Under Secretary for Public Works to The Commissioner for Railways.

Sir,

Department of Public Works, Sydney, 20 September, 1887.

The tenders, seven in number, for the work specified in the margin, are referred to you for report, and you will have the goodness, as early as possible, to return them to me direct, for submission to the Minister.

I have, &c.,
JOHN RAE.

Supply, &c., in
trucks, Darling
Harbour or
Botany Road
Siding of 3,000
tons blue metal.

[Enclosures.]

Form of Tender.

I HEREBY agree to supply and deliver in trucks at Darling Harbour, 3,000 tons of good sound blue metal stone, broken to a gauge of 2½ inches,—that is, no stone shall in any way exceed 2½ inches, and must be of such dimensions that it can be passed through an iron ring of 2½ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 250 tons per week, for the sum of 9s. 6d. per ton.

To the Commissioner for Railways.

GEORGE HILL,
31, Cowper Wharf, 20 September, 1887.

Form

Form of Tender.

I HEREBY agree to supply and deliver in trucks at Darling Harbour or Botany Road Siding, 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 250 tons per week, for the sum of 9s. 6d. per ton.

THE EMU GRAVEL AND ROAD-METAL COMPANY
(LIMITED),

To the Commissioner for Railways

H. E. RUSSELL, Secretary,
Norwich Chambers, Hunter-street, 20 September, 1887.

Form of Tender.

WE hereby agree to supply and deliver in trucks at Darling Harbour or Botany Road Siding, 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 250 tons per week, for the sum of 9s. 10d. per ton, in trucks at Darling Harbour, or in trucks at Botany Road siding at 10s. 10d. per ton.

To the Commissioner for Railways.

WM. SYMOTT & CO.,
15, Bond-street, 20 September, 1887.

Form of Tender.

I HEREBY agree to supply and deliver in trucks, at Botany Road Siding, 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 250 tons per week, for the sum of 10s. 9d. per ton.

Sureties—William Higgin, William Bishop, Wemyers-st., Stanmore.
To the Commissioner for Railways.

GEORGE WATTS,
Post Office, Prospect, 20 September, 1887.

Form of Tender.

I HEREBY agree to supply and deliver in trucks, at Botany Road Siding, 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 250 tons per week, for the sum of 11s. per ton.

To the Commissioner for Railways.

WILLIAM HENRY SMITH,
Seven Hills, 20 September, 1887.

Form of Tender.

I HEREBY agree to supply and deliver in trucks at Darling Harbour or Botany Road Siding, 3,000 tons of good sound Melbourne blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions, that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 250 tons per week, for the sum of 12s. 6d. per ton.

To the Commissioner for Railways.

JOHN O'SULLIVAN,
Messrs. H. Simpson & Co., Newcastle, 17 September, 1887.

Form of Tender.

I HEREBY agree to supply and deliver in trucks at Darling Harbour or Botany Road Siding, 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions, that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 250 tons per week, for the sum of 13s. 9d. per ton, or 7s. delivered on the trucks at Bowral.

To the Commissioner for Railways.

F. CASS,
122, Elizabeth-street, Sydney, 20 September, 1887.

SUPPLY and delivery in trucks at Darling Harbour or Botany Road Siding of 3,000 tons of blue metal.

Analysis of Tenders.

	Rates per ton.	Amount.		
		£	s.	d.
George Hill	9/6	1,425	0	0
Emu Gravel and Road Metal Co. (Limited)	9/6	1,425	0	0
Wm. T. Synnott & Co.	9/10	1,475	0	0
George Watts	10/9	1,612	10	0
Wm. Henry Smith	11/-	1,650	0	0
John O'Sullivan	12/6	1,875	0	0
F. Cass	13/9	2,062	10	0
F. Cass (delivered in trucks at Bowral).....	7/-	1,050	0	0

The tenders of George Hill for delivery at Darling Harbour, and the Emu Gravel and Road Metal Co. (Limited) for delivery at Botany Road Siding, being equal, and as the metal is urgently required, I recommend their tenders be accepted for the supply of 1,500 tons each.—G.C., 23/9/87. The Commissioner.

Which is cheaper to the Department, to take the metal from Darling Harbour or from Botany Road Siding?—CHAS. A.G., 26/9/87. Engineer for Existing Lines.

The metal delivered at Botany Road Siding would be the cheaper; but as we are completely run out of metal I thought it better to divide the contract in order to get a quicker supply.—G.C., 26/9/87. The Secretary.

For Minister's consideration. I think the metal should be taken from the Emu Company. They can supply within a week or ten days; besides, delivery at Botany Road being cheaper, we gain on the freight from Emu to Sydney.—CHAS. A.G., 26/9/87.

Approved.—J.S., 27/9/87.

Department of Public Works, Railway Branch,
Sydney, 27 September, 1887.

Sir,
I beg to inform you that I accept your Tender of date the 20th instant, to supply and deliver at Botany Road Siding Railway Station, 3,000 tons of good sound blue metal stone, broken to a gauge of $2\frac{1}{2}$ inches,—that is, no stone shall in any way exceed $2\frac{1}{2}$ inches, and must be of such dimensions that it can be passed through an iron ring of $2\frac{1}{2}$ inches diameter, in any direction; the whole to be of the best quality, and subject to the approval of the Engineer for Existing Lines, and to be delivered at the rate of not less than 250 tons per week, for the sum of 9s. 6d. per ton, upon the understanding that I have the option of terminating this Contract, by notice in writing, at any time, without being called upon to pay any sum of money beyond the amount then due for work actually performed, and that in no case shall I be required to pay for work done hereunder, until the Engineer for Existing Lines has certified that the work, in respect of which payment is to be made, has been completed to his entire satisfaction, and it is to be considered as part of the Contract created by this acceptance of your Tender that the obtaining a certificate from the Engineer for Existing Lines, that the work done by you has been satisfactorily executed, or completed, and that all materials supplied hereunder have been supplied to his satisfaction, shall be a condition precedent to your having any cause or right of action in respect, or on account of any work done by you, or materials provided, or to any payments in respect thereof.

Before any money can be paid, a shilling duty stamp must be forwarded to this Office to be affixed to your Tender.

H. E. Russell, Secretary,
Emu Gravel and Road Metal Co., Sydney.

I have, &c.,
CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 6.

Mr. T. R. Smith to The Secretary for Public Works.

Dear Sir,
I understand we are the successful tenderers for metal delivered at Granville, and we are the same price as some other contractors for Sydney—9s. 6d. per ton. As our metal is carried a long way by train, and your Department gets 3s. 6d. out of every ton, I think, in justice to your Department, we are entitled to the Contract.

Sydney, 21 September, 1887.

Yours, &c.

T. R. SMITH.

Previous papers returned to Commissioner to-day.—G.C., 23/9/87.

1887-8.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(COMPENSATION FOR LAND RESUMED FROM 1880 TO 1886.)

Ordered by the Legislative Assembly to be printed, 10 February, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 27th October, 1887, That there be laid upon the Table of this House, a Return showing,—

- “(1.) The amount of compensation paid by the Government for land resumed
“for any purposes connected with Railways and Tramways (for any period
“not less than the last seven years), to be in the form of annual statements.
“(2.) The persons or companies to whom such compensation has been paid,
“and the amount paid in each individual case.”

(Mr. Schey.)

RETURN showing the amount of compensation paid for land resumed for Railway purposes during the years 1880, 1881, 1882, 1883, 1884, 1885, and 1886, and the names of the persons to whom such compensation has been paid.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(AUTOMATIC ELECTRIC CARS—CORRESPONDENCE RESPECTING.)

*Ordered by the Legislative Assembly to be printed, 11 April, 1888.**Re Automatic Electric Cars.*

Sir,

5, Westminster Chambers, Westminster, S.W., 30 September, 1887.

I have the honor to draw your attention to an Automatic Electric Car for Tramways and Railways, patented by Messrs. Immisch & Company, Electric Works, Malden Crescent, Prince of Wales Road, Kentish Town, London.

The particulars of the car, and system, will be found in the pamphlets which I transmit herewith. On the 24th instant, in conjunction with a number of gentlemen, and accompanied by Mr. H. C. Russell, Government Astronomer, I witnessed at Brighton a trial of the car, and, for the distance run, it was a great success; I send herewith, for your information, a newspaper report thereof. As I deemed it desirable to direct your attention to this system, I procured from Messrs. Immisch & Company an approximate estimate for one electric tram-car and dynamo, and this estimate I enclose. The Company are willing to send out to your Government, on trial, one of their cars, upon the understanding that you should not be bound to take it over unless it was approved by you. They would further be prepared to send out a competent electrician to superintend the running of the car. I send letter from Messrs. Immisch making this offer. If several cars or locomotives were required there would be a reduction in the price.

In addition to the estimate for the car, I enclose rough estimate furnished by the Company for transmitting power to a distance, namely:—

“A” for 20 or 25-horse-power, 10 miles; and “B” for 50-horse-power, 10 miles.

I am informed that the motors used by the Immisch system are the best yet adopted.

Should your Government decide to accept the proposal herein submitted, you will doubtless be good enough to cause me to be informed by telegraph, and I will instruct the Company accordingly.

I have, &c.,

SAUL SAMUEL.

[Enclosures.]

THE Electrical Car Company's System of Automatic Propulsion for Tram-cars and Railways with Extracts from Press Notices.

AUTOMATIC ELECTRICAL CARS.*

* PLATE 1.

MAJOR-GENERAL HUTCHINSON, on behalf of the Board of Trade, having given his approval of the system of Electrical Traction for Tram-cars and Railways, inaugurated by the Electrical Car Company, the direction have pleasure in pointing out the advantages, claimed for their system of electrical propulsion. Each car, being “self-contained,” or carrying its own power on board, can be sent out to do its day's work independently of all electrical cables or other direct connection with the depot or works. This system avoids the necessity of a third line or groove in the streets occupied by the tramways; such third line or channel being so objectionable as to be fatal to the application of electrical propulsion of cars in public thoroughfares, when the power is dependent upon the electrical current direct from the dynamos. Further, if the lead or cable be tampered with by any person during its entire length or is accidentally injured, the whole organization fails, the cars being left at intervals along the road without motive power. This state of things has frequently happened on lines so constructed. The self-contained car is free from any such disadvantages. When the current is supplied direct from the dynamo there is considerable leakage along the conductors, varying according to changes of temperature and the seasons of the year. Again, owing to the consumption of fuel (which is the largest item of maintenance) going on uselessly in the meantime, there is great loss of power during the descent of the cars down gradients, and while stopping for passengers or at termini.

In this Company's system there is no appreciable loss from leakage; one of their cars has been charged and run at intervals during three months without any recharging. Thus the method adopted by this Company avoids all the objectionable features, and has produced a car which, under a long series of severe tests, has been found to associate the maximum of convenience and the minimum cost of maintenance and working.

Roughly, the car may be described as of four parts: first, an ordinary tram-car body; secondly, a set of electrical accumulators in which the power is stored, so stowed away under the seats as to be out of the way of passengers; thirdly, the motor, which converts the electrical energy into mechanical power; and, lastly, the gearing between the motor and the wheels of the car by which it is driven along the road. There is one great advantage of the system, that ordinary cars may be converted into electrical cars at comparatively small cost. The motors are of the well-known Immisch type, built expressly for this Company with a view to particular work they have to do. These machines are remarkably light for their power, with high efficiency. This motor is so far ahead in design of any others known, that the Company have finally adopted it in their work.

† PLATE 2.

In general appearance the automatic electrical car is like an ordinary tram-car without horses, nothing unusual being observed in outward form. The effect while running on the road is very odd, and a source of much astonishment to those wayfarers who have not hitherto seen one, for without any apparent reason the car speeds along at any pace up to twenty miles an hour. In crowded thoroughfares, of course the speed may be regulated to suit the traffic, and it has been found that the most perfect control exists in pulling up, stopping and starting, even on the most severe gradients yet attempted; one, on the road between Brighton and Shoreham, being one in twenty. The driving is controlled by a switch-handle so simple that any unskilled labourer may drive the car.

The Electrical Car Company also build large electrical locomotives for the purpose of drawing trains of carriages. The power developed by these machines is extraordinary; they are more suitable for either railway work or street tramways: These locomotives can be built to develop any power that may be required, and would be of immense advantage on underground railways.

When compared with horse and steam traction, the advantages of electrical power include the greatly reduced cost of traction of tram-cars as against horse traction, as demonstrated by the trials during the competition between steam, compressed air, and horses for tramway traction, at the Antwerp Exhibition, in 1885; the less room occupied in the streets in consequence of absence of horses; no wear and tear of the roads by horse traffic; reduction of cost of street-sweeping; great reduction of stable-space, but one-third the room of horses being required for the charging-machinery; reduction of labour of horse-keepers and cost of horse-infirmary (so large an item in the expenses of tramway companies); and lastly the absence of all pain, and wear and tear of horse-flesh, as well as setting free for other purposes somewhat over 24,500 horses, now occupied in drawing tram-cars in the United Kingdom.

In comparison with steam, the advantages are absence of smoke, soot, dirt, escape of steam, and other noises which are liable to frighten horses on the roads, besides perfect absence of all chance of explosion; objections which are seriously detrimental to the use of steam-engines for hauling tram-cars in public streets. Further, being ordinary tram-cars having the power "self-contained," they take up only half the space in the streets, and obliterate the objection of the train-like appearance of steam-engine and car attached, as well as avoiding the necessity of taking two rolling loads over the line to convey one car-load of passengers, as well as saving wear and tear of the metals. The automatic electrical car can be controlled by a mere labourer. There are no parts about the car which cannot be speedily and easily replaced.

So far as concerns the average of horses and steam, the comparative cost of tram-car traction, based upon the Board of Trade returns on tramways for the past year, may be taken as follows:—Horse and steam traction, sixpence per car-mile run; electricity, fourpence per car-mile—thus showing a saving of one-third on either power now used in tramway haulage. This will be better understood when it is stated that the horse-cars of the North Metropolitan Tramway Company of London last year ran the enormous mileage of 5,927,451 miles.* A saving of (say) even one penny per mile on that amount would realize no less than £24,697 per annum, available for dividends or extension of system. It must be further borne in mind that the tendency of electrical traction will be towards economy; whilst horses and provender now being cheaper than ever remembered in modern times, the tendency will be in the direction of increased expense for horse-traffic, especially if some great continental war breaks out or other cause puts up the price of horses and provender.

The system under notice has been carefully matured and demonstrated on the Brighton District Tramway Company's line running between Brighton and Shoreham; and has been approved and adopted by several of the leading companies.

EXTRACTS FROM PRESS NOTICES.

THE following are extracts from a few of the many leading papers which have noticed this system of Electrical Traction, as demonstrated by the Syndicate from which this Company evolved. The notices having been generally very lengthy, are considerably reduced to avoid repetition:—

Times, 29 July, 1887.

A NUMBER of gentlemen visited Southwick, near Brighton, yesterday, at the invitation of the Directors of the Electrical Traction Syndicate, for the purpose of witnessing a demonstration of the application of electricity to the propulsion of tram-cars or railway carriages. The system of the Electrical Traction Syndicate has been approved by Major-General Hutchinson, on behalf of the Board of Trade, and the system has also met with the approval of several of the leading tramway companies of this country. By this system of propulsion each car is provided with a set of electrical accumulators, in which the power is stored. There is a motor, which converts the electrical energy into mechanical power, and there is also the gearing between the motor and the wheels of the car, by which the car is driven along the ground. Each car, therefore, is "self-contained," and can be sent out to do its day's work independently of electrical cable or other direct connection with the depôt or the works. Various kinds of accumulators have been tried, the Tatham cells being at present in use. The motors are of the Immisch type, and have been built expressly for the Syndicate with a view to the particular work they are intended to perform. This automatic electrical car resembles an ordinary tram-car in appearance. There are, of course, no horses, and the car apparently runs of its own accord and without any propelling power. A speed of twenty miles an hour can be attained; but the speed may be regulated to suit the traffic, and the driver possesses perfect control over the car. The work of driving the car is very simple, and it is therefore unnecessary to employ skilled labour for this purpose. An electrical locomotive for the purpose of drawing a train of carriages has also been constructed by the Electrical Traction Syndicate. Trips were made yesterday by an automatic electrical car, and also by the electrical locomotive, and very satisfactory results were obtained. Indeed, it is evident that the difficulties which formerly surrounded the problem of electric traction are being overcome. In addition to other advantages which the system of the Electrical Traction Syndicate possesses over horse and steam traction of tram-cars, it is estimated that the cost will be very much less. The work in connection with this system has been going on for nearly two years, and it was initiated by Lord Bury. The engineering department is at present under the management of Mr. Thomas Fraser.

Daily News, 29 July, 1887.

THE little Sussex fishing village of Southwick was the scene yesterday of a novel experiment in the use of electricity for locomotive purposes—novel in the sense that it brought on to a public road a kind of vehicle not yet at work in any other part of Great Britain, but experimental only so far that it showed on a limited scale the application of a principle which it is only reasonable to suppose will sooner or later make considerable progress in being employed from tram-car traffic. The experiment, if such it can be called, was made by the Electric Traction Syndicate, who for some time past have had at Southwick several tram-cars fitted on their "self-contained" principle. Most people are aware that the use of electricity in the place of horse or steam power is by no means a recent idea; but in most of these cases the motive force is supplied from a stationary engine at the terminus of the tram-line. A car on this method has been running at Brighton for several years past. The essential difference between that and similar systems and the system shown in working order yesterday is that, instead of being dependent on a stationary engine, the car is complete in itself, being, in fact, put on the rails with batteries, motor, and other appurtenances in a state of perfect equipment, as independent of extraneous assistance as is a locomotive with its tender on the railways. But, just as a locomotive has to stop to take in water, so this improved car has to stop to take in a fresh supply of electricity, which is provided easily enough by means of accumulators. The comparison between the steam locomotive and the electric tram-car is not quite complete, inasmuch as the accumulators and motor are placed out of sight, the former under the seats and the latter suspended under the body of the car, so that all appearances the car is without encumbrance and differs very slightly, if at all, from the ordinary tram-car. The moving power being concealed, it starts, stops, reduces or increases speed seemingly of its own accord, though in reality controlled by the small switches placed at each end of the driver's platform. The rails upon which the car was placed were laid a year or two since by the Brighton District Tramways Company, a distance of something over 4 miles. The car, having been brought from Southwick to West Brighton, was run along the full length of rails and back again, and made the journey in a quick and easy fashion, which was regarded as very satisfactory, especially where the car had to mount gradients, some of which were rather steep, as much as 1 in 20. The motive-power was furnished by eighty cells, or accumulators, connected with an Immisch motor, which operates on the second pair of wheels, the car being a four-wheeled vehicle of the usual pattern, and giving seating-room for twenty passengers. On passing the depôt the occupants of the car

* These figures are taken from the Official Board of Trade "Returns of Street Tramways" for the year ending June, 1886.

car were taken to see a large locomotive, estimated at 30 horse-power, for drawing three or four loaded cars at a time; it being suggested that such might be used on the Underground Railway, though it is rather felt that when a train of cars is used each car could carry its own propelling power. The accumulators used in the ordinary car are reckoned to contain a store of electricity sufficient for a journey of 30 miles, and the "leakage" being next to nothing the supply is available for use within any reasonable time. When it is exhausted, a fresh set of accumulators has to be inserted, and this, it is claimed, can be done in a few minutes, quite as quickly as horses can be changed under the system now familiar. There was no opportunity of seeing this done yesterday, as the appliances on the spot are of a more or less temporary character; but under working conditions the plan would be to have two sets of accumulators for each vehicle, one set being charged whilst the other is being used, by which means practically no time would be lost at the terminus. So far as speed is concerned, the car could be run at a rate far in excess of that permitted by the Board of Trade (whose inspector examined and approved of it on Monday), but for street traffic speed may be looked upon as a secondary consideration. Whilst, however, it can travel faster than it is likely to be required to do, the car is kept in hand in a thorough manner. Virtually the driver has four methods to rely upon. In the first place there is a switch worked by a handle on a disc, which regulates the rate of movement or brings the car to a stop. A second switch worked by a key breaks the current instantaneously, and so effects the same end in a prompter fashion; whilst such momentum as may be left can be reduced by the application of an ordinary crank-brake. Finally, if need be, a lever can be used which will reverse the motor, and so not only stop the forward movement of the car, but send it in an opposite direction; but this last method is one reserved for emergencies. A car fitted in this fashion can be used on any ordinary tram-line, while some of the advantages claimed for the "self-contained" electrical system are that the roads are subjected to no wear and tear, that the cost of scavenging would be reduced, and that, as the team used in the ordinary cars takes up nearly as much space as the cars themselves, a car which has no team and only covers the space actually required for the use of the passengers is a decided gain. The trial trips of yesterday can be taken as a fair specimen of practical work, and how far the problem has been solved of applying electricity to meet one of the most pressing demands of every-day life.

Standard, 29 July, 1887.

A SPECIAL testing trial was made yesterday at Brighton of a 20-passenger tram-car fitted by the Electrical Traction Syndicate of London. * * * The road is a very trying one, having curves as sharp as a 30-ft. radius, and inclines of 1 in 20. Nevertheless, the journeys were performed with admirable speed, and under perfect control. The homeward run from Shoreham to Hove was accomplished in 27 minutes, being at the rate of 10 miles an hour, the speed at times reaching 14 miles. * * *

Daily Chronicle, 29 July, 1887.

A NEW electrical motor for driving tram-cars was tried with success yesterday on the ordinary tram-lines between Brighton and Shoreham. The trial-car travelled smoothly at from 12 to 20 miles an hour. It was stated that the cells, which contain sufficient force to last for 35 miles, take less time to replace than would be occupied by changing horses, and that the cost per car per mile is less than that of steam or horse-power. The cells are hidden beneath the seats, and no machinery is visible.

Observer, 31 July, 1887.

A SATISFACTORY demonstration of the practical utility of a new system of propulsion by electricity, as applied to the purposes of passenger traffic, was witnessed on Thursday last, at the invitation of the Electrical Traction Syndicate at Southwick, near Brighton. * * * Of the efficacy of the system convincing proof was given during the trial trip over the Brighton District Tramways Company's route from the western extremity of the town, *via* Portslade and Southwick, to Shoreham, a distance of $4\frac{1}{2}$ miles. The route chosen is of a very tortuous and undulating nature, with extremely abrupt curves, and gradients in some cases of 1 in 20; but the car took the curves and surmounted the ascents without sensible diminution of speed, and in a safe and satisfactory manner. The journey to and from Shoreham was accomplished at a good pace. The exhausted accumulators can be replaced by fully-charged ones in the same time as is now occupied in changing horses, and the advantages of the electrical over the usual means of traction are undoubted. The frequent repairing and cleansing of roads is obviated, and a considerable saving of stabling is effected. Major-General Hutchinson, on behalf of the Board of Trade, has signified his approval of the system. * * *

Globe, 29 July, 1887.

A NEW application of stored electricity to the traction of an ordinary tram-car was yesterday experimentally shown to a few gentlemen interested in electricity and engineering on the tram-line between West Brighton and Shoreham, a distance of $4\frac{1}{2}$ miles. The attempts to attain satisfactory results with stored electricity in the propulsion of tram-cars have been many, and several of the most notable have already been fully described in these columns; but while great strides have undoubtedly been made in this direction * * * the most noticeable feature in this electrical tram-car is the remarkable facility with which it may be started and stopped, the car being brought to a standstill within its own length when going full speed, and the high rate of progress which it attains—the maximum being 20 miles an hour. As witnessed yesterday, the new invention is in every way a success.

Engineering, 29 July, 1887.

AMONG those who have spent time and money in working out the best means for driving and manipulating tram-cars by stored electricity is the Electric Traction Syndicate (Limited), who on Tuesday last carried out a number of trial runs between Southwick and West Brighton, to show the progress they had made. The runs, which were highly successful, were made on a line which presented many difficulties, and therefore offered the better proof of the efficiency of the apparatus which was submitted to demonstration. The metals are laid on a macadam road without pitching, and consequently the grooves are often filled with gravel, while the gradients are steep in parts, and the curves very sharp. The entire distance is $4\frac{1}{2}$ miles, and was covered on Tuesday at an average speed of $11\frac{1}{2}$ miles an hour, the car passing all the vehicles on the road with ease, and making the entire journey without any hitch. It is said to be capable of running 25 to 30 miles, or for about half a day, without replenishing the batteries, so that the entire length of the line might have been traversed five or six times without need to go into the depôt for fresh cells.

The car, which has served as the *corpus vile* for a long course of experiments, has under the seats eighty cells, arranged in two series of forty each. Each cell weighs 41 lb. complete, and is rated at 150 ampère-hours, the whole weighing 3,280 lb. The total weight of the car was:—Car, 1 ton; motor, frame, &c., 1 ton; cells, 1.5 ton; twenty passengers, 1.5 ton; equal 5 tons.

The motor is of the Immisch make, and weighs $5\frac{1}{2}$ cwt. At full load it has an efficiency of conversion of over 80 per cent., while its average working efficiency is said to be 70 to 80 per cent. It is capable of exerting a pull of over 100 lb. on the periphery of the armature without risk, and for a short time may be worked to two or three times its nominal capacity of 10 horse-power without risk of overheating. It runs at 1,000 revolutions per minute, with a current of 160 volts and 40 amperes. The speed is reduced in the proportion of 10 to 1 at the wheels, the gearing being by means of two chains and a countershaft. The somewhat high speed of the motor has been chosen, after experiment, as it enables a lighter machine to be used, and a better economy to be gained, in spite of the additional weight of the countershaft and its bearings. The chains have steel links united by cast steel distance-pieces, and they work well, although at times one of them has to run at over 2,000 ft. a minute. The driver's gear includes two switches and a reversing lever. The first switch turns the entire current on and off, while the second alters the grouping of the cells from 80 in series to 40 in series and 2 in parallel, according as much or little power is required. It also puts a resistance in circuit when the car is being started. The reversing lever operates the two sets of armature brushes, taking one set off, and locking the other set on, when it is desired to make the motor revolve in the contrary direction to that which it has been following.

In addition to the car an electric locomotive or "electromotive" was exhibited last Tuesday. This is designed to haul the heavy bogie cars in use on some lines, and weighs in itself some 12 tons. The motors, which are of the Immisch type

type, are geared directly to the wheels by spur pinions and internally toothed wheels, the arrangement being peculiar. Each motor is pivoted to one of the axles by a collar or bearing at its end, and carries on its spindle a steel pinion; the teeth of this pinion gear, with an internally toothed gun-metal ring, bolted to the inside of the car-wheel. When the current is turned on the motor has a tendency to rotate around the axle, but this tendency is resisted by a rod which ties the motor to the framing of the car. Consequently the motor pulls or pushes directly at the frame, and the only medium by which the jar of the teeth can be communicated to the passengers is through the connecting bar. There is to be motor at each axle, but at present only one is in place; it was demonstrated that the motor could pull the wheels round on the rail so that it will utilize the entire adhesion of the vehicle, and of any passengers which it may carry.

The electromotive carries 168 cells, each weighing 60 lb., and capable of a discharge of 70 ampères. The mean working discharge for a load of 20 tons, *i.e.*, electromotive and bogie cars together, at 8 miles per hour, is about 40 to 35 ampères per cell, and the electromotive under these conditions accomplishes 25 to 30 miles in distance without requiring to be recharged.

The Engineer, 29 July, 1887.

For some time experiments, with a view to electric tram-car propulsion, have been carried on at Southwick, near Brighton, by the Electric Traction Syndicate, which has for the purpose had the use of the tramway between Southwick and Hove, and the premises of Southwick for the purpose. Within the last few months tangible results have been arrived at, and the present time the Syndicate has at work an electromotive and an electrically propelled car.

The tram-car, which may be seen running between the places mentioned—sometimes at from 12 to 15 miles per hour—is one of the smaller size without roof-seats, and is capable of carrying about twenty passengers in all. It is a one-horse car, and weighs, according to figures given us, approximately 1 ton. It is driven by an Immisch series-wound motor, supplied with current by eighty secondary cells, weighing each about 40 lb. * * *

The Immisch motor is specially designed to give a powerful torque for work of this kind, and no motor which will not do this can be of any use for the purpose, considering the heavy resistance of tram-cars on some roads, and the occasional necessity for starting on an incline, a contingency, however, which the careful driver avoids by refusing to stop on an up-gradient. The car is driven by means of straight link-chain gearing. * * *

On Tuesday the car was shown at work to a number of those interested in the subject. The road is for the greater part straight, but there are some very sharp curves upon it, one being of only 30 feet radius, and it was noticed that the Ampère-meter showed double the current on this curve that was shown immediately before on the straight. A large portion of the road is level, but there are two rather long gradients, stated to be of about 1 in 30, and a short one of about 1 in 20. The road is not in a good condition in one respect, namely, that it is covered with coarse sand and grit, and the grooves are, to a large extent, filled up, so that the resistance even on the level is probably as much as 40 lb. per ton, and more in some parts. The car gear worked well, and was perfectly under control. The motor is not covered in at all, and yet gives no trouble by sparking. The heating on the runs made, sometimes reaching a speed of 12 to 14 miles, was barely perceptible, and no doubt keeping the machine uncovered is an advantage in this respect. A small quantity of vaseline is occasionally rubbed on the commutator. The absence of sparking at the commutator is to a great extent due to the Immisch arrangement of brush spring which prevents the brushes from dancing upon the commutator without pressing heavily upon them.

The results attained are very encouraging and very favourably commented upon by Major-General Hutchinson, who inspected and tested the car for the Board of Trade. Some of the leading tramway companies intend, we are informed, to adopt it. The success so far obtained opens up the possibility of extensive applications. The Southwick experiments show that there seems to be no difficulty that cannot be surmounted. * * *

The Electrician, 29 July, 1887.

ON Tuesday last, upon the invitation of the Electric Traction Syndicate, the representatives of the technical journals were present at "a private demonstration of electric traction" on the line between Shoreham and West Brighton. The line itself was built by a local company some years ago, and has been in the hands of the syndicate for experimental purposes during the past twelve months, during which period an elaborate series of tests have been carried out. The total length of the line is about 4½ miles, and presents features which are of considerable value for the purpose in view. The gradients are numerous and in some cases exceptionally severe, rising to 1 in 20 where the road crosses a bridge at Southwick, and there are two sharp curves of about 28 yards radius, one of which is on an incline of 1 in 100. When to this it is added that the road has not been maintained in very first-rate order, it will be seen that the line is particularly well adapted to test the capabilities of any system of traction. Indeed, it may be remarked that Messrs. Aveling & Porter, the engine-builders, have been experimenting with a new type of steam-engine upon the same line concurrently with the electric trials. The average coefficient of traction has been found to vary between 42 lb. and 55 lb. per ton, according to the state of the metals; upon a well-laid London line this coefficient does not usually exceed 30 lb. to 35 lb. per ton.

The engineers of the syndicate are of opinion that electric traction upon lines where the cars follow one another at short intervals is best applied upon the cars themselves. * * * The trials upon Tuesday last began with a short run upon an electric locomotive car weighing about 12 tons, and designed to draw a bogie car, with seats for sixty persons, at a mean speed of 8 miles an hour, additional accommodation for fourteen persons being provided upon the locomotive itself. The motive power is obtained from a set of 168 cells, discharging at 50 to 60 ampères, with a capacity of 200 ampère-hours. The motor, which is of the Immisch type (SM9 on their list), series-wound, runs at 650 revolutions. The armature is 9 inches in diameter, and is geared direct to the driving wheels by pinions at each end of the spindle, which mesh with internal teeth upon a circular rack on the wheel. The ratio of the teeth is 10 to 67. The motor is suspended by sleeves on journals cut in the axles, which are of steel, and has a tension bar from the centre of the fields to the end framing, to act as a fulcrum. * * *

Returning to the engine-house at Southwick a self-contained car was next tried, upon which the party made the journey to Shoreham. The car traversed the whole length of the line to West Brighton, attaining a mean speed of slightly over 11 miles an hour; the maximum speed probably approached 16 or 18 miles an hour on some of the inclines. * * *

The cells, which are eighty-four in number, have a normal discharging rate of 45 to 50 ampères, and a capacity of 150 ampère-hours. They are divided into two separate batteries, each battery being again divided into two halves. By means of a suitable switch, designed by Messrs. Immisch & Co., the two halves of each battery can be connected either in parallel or in series, and the two batteries can also be connected in parallel or in series with each other. Out of these four possible arrangements it will be seen that two amount to the same thing electrically, so that three different speeds are obtainable by this means. In actual practice it has been found that these three speeds fulfil all requirements.

The gearing runs with great smoothness and an almost entire absence of noise; in fact, the car runs without more noise than a horse-car.

The motor is again of the Immisch type (SM7), series-wound, and runs at 1,000 revolutions, with 160 volts and 40 ampères. * * *

The motor weighs about 5½ cwt., and has an efficiency of conversion at full load of 85 per cent. Its average working efficiency probably lies between 75 and 80 per cent. By winding the armature with smaller wire this could probably have been increased without reducing the normal output; but the element of safety which exists in an armature capable of taking an excessive current would be reduced in proportion. In this case the factor of safety, as regards the sectional area of the wire, is so great as to admit of the car being stopped and started upon an incline of 1 in 20.

The readings of the ammeter taken during the run showed that under an E.M.F. of 80 volts the current averaged 35 ampères on the level at a speed of 8 to 10 miles an hour, rising to 40 ampères on an incline of 1 in 20. When the cells were placed in series, giving a terminal E.F.M. of 170 volts, the mean speed increased to 12 or 14 miles on the level with a current of 45 ampères. On the incline of 1 in 20, and going round the sharp curves, the current increased to 80 ampères. These figures are little more than approximate, but were taken as a rough verification of the results obtained by more careful tests made at leisure by the engineers of the Syndicate. The limits of our space do not permit us to give a specimen of these tables in our present issue, but we shall probably return to the subject at an early date.

The Electric Traction Syndicate is certainly to be commended for the careful and thorough manner in which they have proceeded to work out the numerous problems connected with the details of the subject, and especially for their determination not to come before the public until a long series of trials of a thoroughly practical character had enabled them to undertake business with perfect confidence in their ability to carry it to a successful issue.

Electrical Review, 29 July, 1887.

OPERATIONS of a most important character in the electrical equipment of tram-cars have for many months been carried on by the Electric Traction Syndicate (Limited), at Southwick, near Brighton. Though Southwick runs a tram-line which was constructed by the Brighton and District Tramway Company, and extends to the western boundary of Hove to Shoreham, a distance of $4\frac{1}{4}$ miles. The use of this line has been acquired by the Syndicate for its experimental trials, and owing to the road being about as bad as it could possibly be, and having a variety of curves and gradients, the engineer considers it an excellent bit for the purpose. The sharpest curve is one of 30 feet radius, and the steepest incline 1 in 20. So completely have all practical difficulties now been surmounted that the Syndicate are giving public demonstrations of it, and are prepared to arrange with tramway companies on the principle of working their cars with electric traction in place of horses, at a saving to the companies of at least a halfpenny per mile run, the Syndicate taking all risk and responsibility. The system adopted is that of working by accumulators. At a special demonstration on Tuesday last, illustrations were given of two distinct methods of traction. The first was by means of an electro-locomotive specially built to meet certain requirements, and called by the owners "The Electromotive." It consists of a frame of rolled angle iron, strongly braced and stayed, supporting three platforms, on which accumulators are lodged in sliding cradles. The springs and axle-boxes are designed upon the waggon pattern, to carry about 13 tons per wheel. The motors, which are of the Immisch type, series-wound, having a speed of 650 revs. per minute, and armatures 9 inches in diameter, gear direct by pinions at each end of the armature spindle into internal tooth gearing, fixed on the inner surface of the wheels, which are three feet in diameter, the proportion being ten teeth of the pinion to sixty-seven teeth of the wheel. * * *

The present design of the electromotive is surmounted by a canopy, which in practice would be superseded by sitting space for fourteen people, making a passenger load with the bogie car of seventy-four seats.

The gross weight of the electromotive is about 12 tons, the accumulators each weighing 56 lb., inclusive of connections, and being capable of a discharge of 70 ampères, having a capacity of about 200 ampère-hours. The mean working discharge for draft of 20 tons—that is, electromotive and bogie car together, at 8 eight miles per hour—is about 40 to 55 ampères per cell, and the electromotive under these conditions accomplishes 25 to 30 miles in distance (practically half a day's work) without requiring to be recharged.

The other form in which the application of the system was shown consisted of an ordinary one-horse tram-car, the sides of which have been altered so as to allow of the package of the accumulators under the seats from the outside, and the flooring reconstructed to allow of the motor being fixed in position. The weight of the car was stated to be 1 ton, the motor and gearing 1 ton, the accumulators $1\frac{1}{2}$ ton, and estimated weight of twenty passengers $1\frac{1}{4}$ ton, making a total rolling load of $4\frac{3}{4}$ tons. The motor is an Immisch series-wound, and runs at 1,000 revolutions, with 160 volts and 40 ampères. The high speed has been determined upon after experiments which showed that a light motor running at a moderately high speed is superior to a heavy motor running at a low speed. The motor weighs $5\frac{1}{2}$ cwt., and has an efficiency of conversion at full load of over 85 per cent. Its average working efficiency is probably about 75-80 per cent. It is capable of exerting a pull of 1,000 lb. on the periphery of the armature without risk. This enormous torque does away with fear of the motor sticking at starting, and the car has been stopped and started on an incline of 1 in 20.

The reversing gear comprises two sets of brushes, and is worked either by lines or levers; it is of first-class mechanical design and locks the brush frame positively in either direction.

The car has eighty cells. They are arranged in two groups of forty cells each, and can be coupled in series or parallel. The arrangement of coupling is necessitated by the condition of running, *viz.*, a fixed maximum speed and a variable load. A resistance is inserted in the circuit, and is used when starting or when it is necessary to run very slowly. A charge is sufficient for a run of about 30 miles, but it is not proposed to exceed 25 in practice.

The gear is a double tram transmission by chains and wheels. The intermediate shaft was found necessary owing to the large reduction of speed—1,000 revs. on the motor to about 100 on the rolling wheels. If a single tram transmission had been used, the pinion would have been so small that the chains would have been seriously strained and its life materially shortened, and moreover it would have been more noisy.

Iron, 29 July, 1887.

ELECTRIC traction on tramways is a branch of electrical engineering which has put to the test the ingenuity of many an electrical engineer. Various systems have been tried; but it cannot be affirmed that perfect practical success has as yet attended the application of any of them. Exception should be made, however, to the experimental tram-car which is being run by the Electric Traction Syndicate on the West Brighton and Shoreham Tramway. We use the term "experimental" advisedly, because the line on which the car now runs is at present being worked by horse traction, and has been selected for experiment on account of the exceptional difficulties—steep gradients, sharp curves, &c.—which it presents. The perfect success, therefore, which attended a special demonstration of electric traction as applied to tram-cars under such conditions on the line mentioned on Tuesday last is all the more significant. The car was an ordinary tram-car converted for the purpose. * * * The motor series-wound, and runs at 1,000 revolutions per minute with 160 volts and 40 ampères. * * * Its average working efficiency is probably about 75 to 80 per cent. It is capable of exerting a pull of 1,000 lb. on the periphery of the armature without risk. This enormous torque does away with fear of the motor sticking at starting, and the car has been stopped and started on an incline of 1 in 20. The reversing gear comprises two sets of brushes, and is worked either by lines or levers. It is of first-class mechanical design, and locks the brush frame positively in either direction.

Each cell weighs about 40 lb. when charged, and has a capacity of 150 ampère-hours with a fall of potential of 10 per cent., admitting a sustained discharge of 50 ampères. The car has eighty cells. These are arranged in two groups of forty cells each, and can be coupled in series or parallel. This arrangement of coupling necessitated by the condition of running a car, *viz.*, a fixed maximum speed and a variable load. A resistance is inserted in the circuit, and is used when starting or when it is necessary to run very slowly. A charge is sufficient for a run of about 30 miles. As has been stated, the road is one of the worst in England, and was chosen on this account by the engineers; so that the figures given above—30 miles—may be looked upon to be increased materially in a well-constructed tramway even as much as 20 per cent. It must further be noticed that the Tatham cell used, being the first adapted, is shown by experience to be open to an improvement of at least 25 per cent. in weight efficiency. The average coefficient of traction throughout the line, including grades, has been found to vary between 42 and 55 lb. per ton, according to the state of the metals. The average coefficient of a well-laid London line is about 30 lb. per ton. The difference of the mean traction between Brighton and Shoreham, and Shoreham and Brighton, is about 7 per cent. The gear is a double transmission by chains and wheels. The intermediate shaft was found necessary owing to the large reduction of speed, 1,000 revolutions on the motor, to about 100 on the rolling wheels. If a single transmission had been used, the pinion would have been so small that the chain would have been seriously strained, and its life shortened, and moreover, would have been noisy.

The gross weight of the electromotive is 12 tons, the accumulators each weighing 56 lb., inclusive of connections, and being capable of a discharge of 70 ampères, having a capacity of about 200 ampère-hours. The mean working discharge for draught of 20 tons, *i. e.*, electromotive and bogie car together, at 8 miles per hour is about 40 to 35 ampères per cell, and the electromotive under these conditions accomplishes 25 to 30 miles in distance without requiring to be recharged. * * * The figures given are in cases the result of very careful records and experiments which have been made, and tabulated by the engineers conducting the trials and extending over the greater part of the last twelve months. In its short experimental trip on Tuesday, the electromotive proved a very powerful traction engine, capable of doing an immense amount of work.

A short trip from the dépôt at Southwick to Shoreham was then made with the automic car. The tramway line from West Brighton to Shoreham has a total length of $4\frac{1}{4}$ miles, its steepest gradient being 1 in 20, besides two of 1 in 30; the sharpest curve having a radius of 30 feet. The rise of 1 in 20 was accomplished at a speed of 7 miles an hour, that being about the mean speed at which the tram-car is permitted to run, although a speed of 15 miles can easily be accomplished, as was subsequently demonstrated. The curves were turned without even materially slackening the speed. The final run of the day was made from Shoreham to West Brighton. A start was made punctually at 4 p.m. The first mile was made in 8 minutes, the second mile in 15 minutes, the third mile in 20 minutes, the fourth mile in 25 minutes, and the whole distance of $4\frac{1}{4}$ miles in 26 minutes. Deducting the stoppages which had to be made on account of traffic and to meet the regular tram-cars, and which amounted altogether to 3 minutes, the whole distance was covered in 23 minutes, which gives a mean speed of 11.6 miles an hour. This was very good, considering the state of the road, and notwithstanding which

which everything worked satisfactorily. * * * Leaving out of the question the saving effected by substituting electric for horse traction, the absolute safety and nicety with which the new electric tram-car can be worked, stopped, and restarted at any speed desired up to 15 miles an hour, fully demonstrated by Tuesday's experiment, should commend its adoption to tramway companies. We understand that Major-General Hutchinson, for the Board of Trade, has given his certificate for the running of the electrical tram-car, being fully satisfied and greatly pleased with its working during his recent official inspection.

Industries, 29 July, 1887.

NEW ideas, even if supported by experimental evidence, are slow to make headway, and electric propulsion of street cars is no exception to this rule. Whatever may have been the causes which have delayed the development of electric tramways, a certain scepticism on the part of the public, and we fear even on the part of many engineers, was one of the most important. Many doubts arose as to the economy and efficiency of the system, and unless these points can be satisfactorily disposed of by the results of actual work on a large scale, it is hopeless to expect that the average surveyor or local board engineer, or even the engineer to a tramway company, would take upon himself the responsibility of recommending electric traction. Nor would this be desirable, for an indiscriminating adoption of new methods must include both bad and good, and in some cases lead to failures, the moral effect of which cannot easily be effaced. We have seen this process in full operation during and after the electric light "boom" of a few years ago, and electrical engineers are still suffering from the effects of it. There is not much probability that a similar thing will happen with electric traction. We have entered into a period of sober and conscientious work, and, although the development may seem slow, it is very sure.

In this respect some excellent work has been done quietly by the Electric Traction Syndicate (Limited), of which Viscount Bury, Lord Egerton of Tatton, Mr. R. Macpherson, Mr. M. Immisch, and many other men of high standing, are members. The members of the Syndicate have set themselves the problem of finding by actual trials, on a large scale, the best battery, motor, and gear for automotor cars, and, having done so, to introduce electric traction on tram lines. So far as may be judged from a visit to their line at Southwick, they have succeeded with the first part of their programme, and there is little doubt that they will succeed equally well with the second part, and that through their instrumentality electric tram-cars will become familiar objects on some of the metropolitan lines. Those who are still sceptical about this method of propulsion cannot do better than pay a visit to the Shoreham and West Brighton line, and watch the behaviour of the electric cars. This line has been chosen on account of the great difficulties it offers to electric, and in fact to any kind of traction; the Syndicate rightly judging that if they can succeed on a road having curves of only 30 ft. radius, and gradients as steep as 1 in 20, they will succeed on any other line. On Tuesday last we had an opportunity of inspecting the line and riding on the electric cars. The work of the Syndicate began in April last year, and included experiments with a large variety of batteries, motors, and gearing. It is perhaps too much to say that a stage of finality has already been reached, but the present plan is sufficiently developed to answer its purpose in a thoroughly practical manner, and, as we said above, the technical part of the problem may now be considered solved. * * * The electric locomotive has been built with the object of hauling exceptionally large passenger cars, and is able to move a paying load of 64 passengers, viz., 50 on the car and 14 on the locomotive. * * *

The most important for ordinary tramway work are, however, the automotor cars, of which several are ready for service. These are of the type known as summer cars, seating twenty-one people—ten in a central cabin and five at each end, besides the driver. * * *

During a run from Shoreham to the dépôt at Southwick, and from there to West Brighton, we took frequent readings of pressure and current, and found that the energy supplied to the motor with the two halves of the battery in parallel averaged about 5 h.-p., and with the whole battery in series about 13 h.-p., the speed during the first portion of the run being 9.4, and during the second portion 11.6 miles an hour. The most remarkable performance of the car was its taking a long gradient of 1 in 20 at a speed considerably faster than walking pace. The current on this occasion was 85 ampères and the pressure 140 volts, corresponding to 16 h.-p. electrical energy supplied to the motor. The car appears to be under perfect control, and can be worked from either end. The reversing is done by sending the current through the armature in the reverse direction, there being two pairs of brushes, one for going forward, the other for going backward. Either pair when in position is automatically locked, so as to prevent jarring off and sparking from vibration. The electric cars were inspected and passed by General Hutchinson on the 18th instant. In concluding this brief account of our visit to the Shoreham-Brighton line, we are glad to be able to congratulate the Syndicate upon the results they have achieved.

Electrical Review, 29 August, 1887.

THE Electric Traction Syndicate is to be congratulated on the result, thus far achieved, of its researches for the purpose of determining the best methods to be pursued for solving the problem of electric traction on a commercial scale. The operations of the Syndicate, which have been quietly progressing for some time past in the neighbourhood of Brighton, were given at some length in our last issue, and we hope that the work already accomplished will give local board surveyors and engineers such faith in the value of electricity as a motive power that new or projected lines may be provided with electrically propelled cars. We should be glad to learn whether any steps have yet been taken to introduce the system of the E.T.S. into the streets of London or other large towns of the United Kingdom.

Graphic, 20 August, 1887.

DIFFERENT systems of electrically-worked tram-cars have appeared during the past few years, and, after trials which promised much, they have sunk into oblivion. We earnestly trust that this may not happen to the system which was tried near Brighton the other day, under the auspices of the Electrical Traction Syndicate of London. The car is perfectly self-contained. It does not rely upon the rails for its supply of electricity, as is the case with some systems, but carries its own store in accumulators. These accumulators feed a motor, which is geared to the driving-wheels, and, once charged will afford energy enough to drive the car a distance of thirty miles. This new car certainly behaved well on its trial. It carried twenty passengers, and its speed was sometimes as high as 14 miles an hour. On the same occasion an electric locomotive, designed to drag a train of carriages, was also tried with hopeful results. * * * Let us hope—for the poor horses' sake, at least—that that time may soon come.

Plate 3.

HIGHEST award for Electric Motors at International Exhibition, London, 1885, and International Exhibition, Antwerp, 1885. The Immisch Electric Motors are the most efficient for tram-cars, launches, lifts, cranes, ventilating fans, pumping, hauling, and winding in mines, collieries, and ironworks. Special attention paid to fitting up factories with electric power. Estimates given for electrical transmission of power for all industrial purposes. Makers—Messrs. Immisch & Co., Malden Electric Works, Prince of Wales Road, Kentish Town, London, N.W. Telegraphic address, "Immisch, London." A.B.C. code, telephone No. 7585.

THE following is an extract from the Report of the Directors of the Telpherage Company (Limited), submitted to the shareholders at the General Meeting, held on Wednesday, 8th June, 1887, at the Company's Offices, 50, Old Broad-street, London, E.C. :-

"The difficulty of obtaining suitable electromotors for driving trains has been mentioned on previous occasions. The Board has watched the progress of invention in this direction with much anxiety. The motors of Mr. Immisch attracted its attention at the Inventions Exhibition, and some time ago experiments were tried with an Immisch motor, which, while having great merit, was unfortunately not found quite suitable for the special requirements of the case. Mr. Immisch expressed well-founded confidence that all difficulties could be overcome, and supplied another motor last winter, which gave very good results. The Company has now been supplied by Mr. Immisch with a complete set of still further improved motors, which do all the work of the line, and have run for some time without a hitch. They require less than half the current taken by the old motors and are much lighter. The company is greatly indebted to Mr. Immisch for this important improvement."

THE

THE "Immisch" motors have now been finally adopted by the Telepherage Company on their line at Glynde. The following letter has been received from the Engineer to the Company, Mr. C. S. E. Crakanthorp:—

The Telpherage Company (Limited), 56, Old Broad-street,
London, E.C., 12th May, 1887.

Dear Sir,

The motors which you have supplied to this Company are working to our entire satisfaction, and have solved a difficulty which, up to the period of their introduction, had given us serious trouble.

We have three trains running in all weathers regularly 51 hours per week, propelled by your 4-in. one-horse-power motors, each of which takes an average current of 6 amperes, with an average E.M.F. over the whole Telpher Line of 170 volts.

In my opinion the working of the brushes is practically perfect, adjustment being required but once a week. This I believe to be due to your form of balanced brush-holder, and the total absence of sparking at the commutator.

Another advantage is its lightness compared with other machines developing the same power.

Yours truly,
C. S. E. CRAKANTHROP,
Engineer.

M. Immisch, Esq.

THE "Immisch" motors were first exhibited in public at the International Inventions Exhibition, London, 1885, where they received the highest award.

The same year they also took the highest award at the International Exhibition at Antwerp.

They have since held the first position in the world for lightness, power, and efficiency.

The chief features of the "Immisch" Electric Motor may be summed up in a few words:—A fixed position of brushes and an entire absence of sparking, even when the motor is temporarily strained to double its normal output.

These qualifications are absolutely essential in motors used in driving machines that are subject to rapid and frequent change of load, as in tram-cars. The "Immisch" Motors are wound in shunt or series. The E.M.F. recommended for the various sizes will be seen in the accompanying table.

Messrs. Immisch & Co. have supplied motors for use in factories, launches, lifts, tram-cars, pumping machines, printing machines, stamping mills, drilling and riveting machines, also for general purposes of transmission of powers by electricity.

There are now in course of completion several large transmissions of power, including pumping in mines, ventilating in mines, and quartz crushing in gold mines.

PRICE List of Immisch's Series-wound Motors.

THE IMMISCH ELECTRO-MOTOR AND DYNAMO.

ALTHOUGH the history of practical electrical lighting does not extend back many years, it is dotted with instances of brilliant successes of dynamos experimentally and of their utter failure practically. We have known several machines which slumber peacefully in this category, simply because their respective inventors rushed into the market directly they made a dynamo that would work, not caring to wait and see how it would work. There are, however, those who, as Longfellow puts it, could "learn to labour and to wait," and amongst these successful, because sensible, labourers in practical electricity is Mr. M. Immisch, whose works are situate in Malden Crescent, Kentish Town. This gentleman devoted some five years to perfecting his electro-motor and dynamo, and to our mind one of the most interesting and suggestive sights in his works—which we recently visited—was a heap of motors which represent the various stages through which his invention passed from its inception to its present perfected condition—the rounds in his ladder of success. Before proceeding to describe the machines we purpose briefly noticing the factory, which consists of four floors, each 100 ft. long by 53 ft. wide. On the ground floor are the heavy machines, one planing machine weighing 16 tons, and being capable of working over a space 12 ft. in length, 5 ft. 6 in. in width, and 4 ft. 6 in. in height. Here we found the manufacture of dynamos for charging accumulators going briskly on. Adjoining this shop is the engine-house, in which is one of Marshall's semi-portable engines of 35 horse-power nominal, working up to 100 horse-power. This engine drives the machinery on the ground and first floors. On this latter floor are the lighter engineering tools, comprising lathes, slotting, drilling, milling, and planing machines. The armature cores are built up and the coils wound on the second floor, the latter process being carried out in lathes, notwithstanding that the armatures are of the drum type. On this floor also is the constructing shop for dynamos and motors. The third floor is devoted to the manufacture of switches and commutators and an ingenious regulator for tram-car motors on the Immisch principle. On this floor also is the brass finishers' shop, containing some eighteen machines, which are driven by an Immisch 6-horse series-wound electro-motor, which also drives the machines on the second floor. The electro-motor is placed on the third floor, and derives its current from a storage battery on the ground floor. On the third floor is likewise the pattern shop, whilst above all is a large flat, which is partly used as a store, and which offers great facility for the extension of the works.

Turning to the production of these works, we may premise that the transmission of power by electricity comprises four distinct factors of equal importance; firstly the prime motor—water, wind, or steam-power; secondly, the dynamo; thirdly, the line; and fourthly, the motor. Each must in its way be perfect, or the efficiency of the whole system will suffer. The prime motor, whether water or steam, falls within the province of the mechanical engineer, and therefore we need not enlarge upon it here. The construction of the dynamo and motor and the erection of the line are the work of the electrical engineer, and these are the points to which Messrs. Immisch & Co. have successfully given their attention. On page 3 of our present issue we illustrate at fig. 1 the Immisch motor, and at fig. 2 the Immisch dynamo. The present type of series-wound motor, which is used for driving machines of from 1 to 40 horse-power, has been slowly developed, and is an example of the survival of the fittest. The chief peculiarities of this machine lie in the winding of the armature, which is wound either as a cylinder or as a drum. The drum type is usually adopted for low or medium electromotive forces, and the cylinder for large differences of potential. The armature coils are so connected to a commutator, of special construction, and which will be described later on, that the coils lying along the diameter joining the brushes are cut out of the main circuit by being closed on themselves. The reason for this is, that these coils, if active, would tend to make poles in the armature at right angles to the resultant axis of magnetism, and so decrease the total magnetic moment. This would further mean a weakening of the field, for in the motor the field and armature tend to strengthen each other.

Another very important result of this cutting out of a portion of the armature wire is that the lead is fixed, and the brushes require no adjustment for varying loads, as is frequently the case with ordinary dynamos when used as motors. Sparking is almost entirely done away with at any load. The importance of fixing the lead in a motor, which has its load continually varied, cannot be overestimated. For instance, a tram motor, which makes on an average one stoppage every two minutes, will be subjected to continued and rapidly-varying changes of load, the strains fluctuating between the starting torque and that of full speed on level ground. An Immisch series motor, with a 7-in. armature used in a similar manner, showed practically no signs of sparking, although the current at starting was 200 per cent. greater than that for which the motor was designed. Indeed, these motors have, we understand, been pushed to the point at which they were in danger of burning from excess of current, and yet they sparked but little. The torque of the Immisch motor is very great in proportion to its weight, and the risk of burning out an armature through the motor sticking is stated to be practically *nil*. An armature 6 in. in diameter will, at its normal output, lift and sustain a weight of 14 lb. at the end of a lever 2 ft. long. This is equal to a pull of 112 lb. at the periphery of a 6-in. pulley. The greatest torque the motor could momentarily exert without damage would be about five times as much.

The commutator, to which we have already referred, consists of two insulated rings side by side. Each ring is divided into segments, as in a Gramme collector; and the insulated divisions of the one ring are placed opposite the centre line of the segments in the other. The coils are connected in series, but each coil is joined to both rings. The coils are thus alternately short-circuited in pairs, as the segments to which they are severally joined pass beneath the brushes. Shunt motors are also made by the firm for use where weight is of no importance, but where the desideratum is a constant speed.

Messrs. Immisch also manufacture dynamo machines, specially designed both to drive their motors and also for arc and glow lamp lighting, electro-plating, and charging accumulators. These machines have a high efficiency of conversion, are sparkless at all loads, and, like the motor, have a fixed lead. A special type is also made for giving very large currents at low potentials. These dynamos are suitable for electroplating and charging accumulators in parallel. Their chief feature is the double commutator, one at either end of the armature. This arrangement gives large bearing surface for the brushes, without unduly lengthening the commutator. Since the two commutators are insulated from each other, the two windings may be coupled in either series or parallel. This gives two different E.M.F.'s for the one dynamo. We may add that the firm was awarded a silver medal for improvements in electro-motors at the Inventions Exhibition, 1885, which was the only award made in this department. In the same year the firm also received the highest award for electro-motors at the International Exhibition at Antwerp. On the occasion of our visit to Messrs. Immisch's works we saw one of these motors in an adjoining printing establishment, where it was driving a Lafitte polychromatic machine of large size with ease and showing a good surplus of power. From our inspection of the working of this motor and that in Messrs. Immisch's works, we consider that the firm may be congratulated on having made an important advance in the practical application of electricity.

Electrician, 11 March, 1887.

THE IMMISCH ELECTRIC MOTOR.

ON Saturday last, on the invitation of Messrs. Immisch & Co., a party of mechanical and electrical engineers visited their works at Kentish Town, and witnessed the performance of the Immisch motor under various practical conditions. We have so recently described at length the construction of this motor that at present we shall content ourselves with little more than a bare enumeration of the several applications which were here exhibited.

The first set to be examined consisted of a plant which had just been completed to the order of an Australian Gold-mining Company for the purpose of delivering about 10 horse-power to drive stamping machines at a distance of a mile and a-half from the water-side, where power is originally obtained. The dynamo was designed to give 300 volts, with 30 amperes, at 700 revolutions, and the motor runs at 1,000 revolutions. The machines are each simply series-wound, but effective regulation has been obtained by an application of the method described by Mr. Kapp in his "Electric Transmission of Energy," p. 178. This method consists in designing the machines so that on plotting the characteristic of the motor, and adding at each point an ordinate representing the total loss of E.M.F., with the given current in the entire circuit, we shall obtain the characteristic of the dynamo. This method is therefore applicable to all series motors driven by series-wound dynamos, when the total resistance of the circuit remains a fixed quantity. We were unable on Saturday to carry out a complete test of the regulation attained, because the machines were coupled terminal to terminal, and the $1\frac{1}{2}$ ohm which has been allowed for the resistance of the line was not represented. Under these circumstances the following figures, which show that a regulation within 7 per cent. was actually given, can only be considered highly satisfactory:—

Speed.		Volts.	Amp.	E.H.P.
Dynamo.	Motor.			
680	1,070	155	12	2.5
640	1,000	280	31.5	11.8

The

The variation in the E.M.F. of the dynamo was effected by means of a variable shunt on the field-magnets. Other series of tests gave similar results. The motor was employed to drive a second dynamo, and the load was varied by shunting the field of this machine and varying the resistance of the shunt. This method is very convenient, but it has the disadvantage of rendering it impossible even to estimate the horse-power actually transmitted. Other tests carefully made by Mr. Snell have, however, enabled an efficiency of 90 per cent. to be claimed for the motors and 90 per cent. for the dynamo; the loss in transmission in this case (45 watts) is negligible. The brushes were all fixed throughout the trial, and the entire absence of sparking in all three machines (even, in respect to the third, under the very unceremonious treatment it received) was particularly noticeable. It should be added that the dynamo weighs 17·25 cwt., and the motor 6·25 cwt., or 70 lb. per horse-power.

Among other machines shown we may mention a 5-unit shunt-wound incandescent dynamo, giving at 100 revolutions 108 volts and 48 ampères, and weighing 6 cwt.

The party next inspected some tram-cars and electric locomotive gearing, constructed for the Electric Traction Syndicate, and driven by Immisch motors. Gearing of several different types was shown running on absorption brakes. For heavy work a sun and planet gearing has been devised, and is intended more especially for employment with separate locomotives. For lighter work a worm and wheel gear running in an oil-bath is preferred; this is somewhat similar to that introduced by Mr. Reckenzaun for the same purpose. In each case the motors and dynamos were series-wound, and excellent speed regulation was obtained, as before. The practical conditions of electric railway working on a large scale are, however, obviously unsuited to the immediate application of this simple method of regulation, because the loss of E.M.F. in the line must be continuously varying with respect to every machine. It remains to be seen whether these difficulties cannot be overcome.

The visitors next made their way to an adjoining factory, where a Lafitte polychromatic printing press, and also a type-cutting machine, are in daily use, driven by an 8-horse-power motor. This arrangement has been working with unqualified success for the last six months.

Returning to the Immisch Factory, the mechanical engineers present were much interested in the performance of Mr. F. J. Rowan's electric riveter, a machine for riveting ships' plates *in situ*. The apparatus is slung over the side of the ship, and, being supplied with current from a dynamo by means of two powerful electro-magnets, it readily holds itself in any required position over the rivet to be closed up. The workman then turns a switch, and a small motor, acting by reducing gear upon a cam, draws back the hammer against the pressure of a very powerful spring, which is placed between the magnets. Coming to the top of the cam the spring is liberated, and a very powerful blow is delivered upon the rivet. This action can be repeated at the rate of 150 times a minute, and the tension of the spring can be adjusted with great nicety. The whole apparatus is under the most complete control; but on account of its necessarily considerable weight, although one man can operate it, it requires two men to shift its position. We hope shortly to be able to give some further information, with drawings, of this interesting machine. Now that all large steamers carry their own dynamos, it may be expected that machines of this class, which are capable of materially expediting the work of repairs, will find a large field of usefulness.

Industries, 11th March, 1887.

ELECTRO-MOTORS AND ELECTRIC TRACTION.

THOSE members of the Institution of Mechanical Engineers who availed themselves of Messrs. Immisch & Co.'s invitation to inspect their works at Kentish Town, on Saturday last, had a good opportunity of judging for themselves how simple and easy is the application of electricity to mechanical purposes. It is to be feared that many engineers who have not yet had an opportunity of becoming practically familiar with the conversion of electrical into mechanical energy are disposed to regard electricity as a somewhat unreliable agent, not to be compared in certainty of action with such absolutely positive agents as steam, compressed air, water under pressure, belting or other gear, and would consequently prefer any of the latter, with all their admitted drawbacks and imperfections, to new and unknown methods, no matter how excellent they may be in theory. There is also the popular notion that electricity is as yet in its infancy, and that the improvements of to-morrow will make the machines of yesterday obsolete; and these opinions operate to retard the application of electro-motors, even in cases where their superiority over every other means of converting and applying energy is indisputable. Matters are very different in the United States. There the use of electro-motors for domestic industries, for the propulsion of vehicles, and for many other purposes, is rapidly extending, and many of the electric light companies derive now a handsome income from the hiring out of motors, the power which can safely be contracted for being about double that provided at the central station. Nothing is more calculated to illustrate the thoroughness and perfection with which English engineers do their work, and the spirit of enterprise with which American engineers apply new inventions, than the development of heavy electrical engineering here and on the other side of the Atlantic. The dynamo, although not an English invention originally, has almost become so by reason of the many improvements made here, and it is not too much to say that the lead of English electricians and engineers in dynamo construction is now, with very few exceptions, followed all the world over. And yet we have no central electric lighting stations at all comparable with those which were established in America years ago, and at a period when the dynamo was far from being the perfect machine it now is. The same with motors. Whilst we are striving to construct motors a few per cent. higher in efficiency, or a few pounds less in weight, than our rivals in America and in other countries, they take whatever motors are ready to hand, and use them up in a variety of ways hardly dreamt of by the majority of our electricians, who seem to devote all their energies to making each motor, if possible, a little more perfect than the last. Practical business men will agree that the time has now arrived when further improvements in the machines themselves are of much less importance than a more extended application of them, and the makers and designers of motors would certainly not object to an altered state of business affairs, under which they might invent less but sell more. To bring about this salutary change, it is, however, necessary that the engineering world in general should be educated so as to duly appreciate and acquire confidence in the capabilities of electricity as applied to mechanical purposes.

Viewed in this light, the practical demonstration given by Messrs. Immisch & Co., on Saturday, to a number of eminent mechanical engineers cannot fail to have a beneficial effect, and we would strongly recommend other firms to follow their example; information of a practical character cannot be too widely diffused. Broadly speaking, the experiments shown were illustrative of three different applications of electricity, viz., the transmission of energy to a distance, electric traction, and the working of machine tools. The set of generator and motor which was used to illustrate the first application was one built to the order of Messrs. Laing, Wharton, and Down, for an Australian mining company; but, owing to want of proper foundations, could not be shown working at full power. The generator is of the single magnet type, placed horizontally, and weighs 17½ cwt., the maximum output at 750 revolutions being above 25-horse-power. Formerly, Mr. Immisch built his dynamos with vertical magnets of the Edison type; but he has abandoned this design, because he found that the loss of lines by leakage through the bed-plate, even when the pole-pieces were raised above the latter to a distance of two-thirds the diameter of the armature, was too great. A further advantage of the horizontal arrangement is that the armature can be exposed for inspection or slight repairs, without removing it from the machine, simply by lifting the upper magnet off. The motor is also a horizontal machine, but of the double horse-shoe type, and is intended to develop 10 horse-power at 1,000 revolutions, its weight being 6½ cwt. It is wound for 300 volts and 30 ampères. All the machines built by the company have armatures (whether of the cylinder or drum type) wound on a special plan, by which the coils at the neutral points are cut out, the object of this arrangement being to keep the brushes exactly at the neutral points, and avoid sparking, even if the field be weakened for the purpose of regulation. Practically, Mr. Immisch employs a double circuit on the armature, and the arrangement is, in effect, equivalent to the differential compound winding employed by Mr. Sprague on the field of his motor. Electric traction was represented by two systems of gearing, the one intended for an electric locomotive, and the other for application to a passenger tram-car. In the former case the motor, which has a 6-inch armature, is rated at 8 horse-power, and speeded at 500 revolutions, is suspended from underneath the floor of the locomotive car, and hinged by a bracket to the axle of the driving wheels; the motor spindle is provided at each end with a pinion of phosphor bronze gearing into spur wheels with internal teeth, also of phosphor bronze, which are bolted to the driving wheels. The pinions have ten and the wheels sixty-seven teeth, giving a reduction of speed of 6·7 to 1. In the latter case, the reduction is somewhat greater, viz., 10 to 1, and is effected by a worm and wheel, on the plan which, if we rightly remember, was first used by Mr. Reckenzaun three or four years ago, and has since then also been adopted by Mr. Holroyd Smith. This gear works quite noiselessly, and is, for this reason, particularly suitable to passenger-cars. Both

gears have been tried by the Electric Traction Syndicate on a tramway line near Brighton; and a third gear, consisting simply of a double chain wheel and two link chains, transmitting power direct from the motor spindle to the two car axles, is now being tried on that line. Another modification, in which the speed of the motor spindle will first be reduced by a nest of sun and planet gear, and then transmitted to the car axles by link chains, will be the next to be tried. The Baille rope gear, in which the grip of the rope on the small sheave is obtained by india-rubber plugs set alternately on the right and left, thus forcing the rope into a sinuoidal line, has completely failed, the plugs wearing out very fast if once the rope begins to slip. Iron sheaves with sinuoidal grooves and steel ropes, have answered very little better; but in this case the difficulty lies probably in the small size of the sheave as compared to the diameter of the rope.

The engineer to the syndicate, Mr. W. D. Gooch, gave an interesting account of the various experiments undertaken with a view to test the capabilities of motor, gear, and accumulators, and he laid particular stress on the fact that with electrical propulsion it is possible to keep a continuous record of the energy required at every point of the road; whereas to do this with steam traction would necessitate the continuous use of the indicator, and is, therefore, hardly practicable. From the records of current and potential, and previous brake tests of motor and gear, the actual horse-power of traction can be calculated all over the line, and it will probably surprise most readers to learn that Mr. Gooch found 40 lb. to 45 lb. as the tractive force required per ton weight on some portions of the line. This is exclusive of the traction due to gradients, and considerably exceeds the average given by Mr. Kinnear Clark in his book on tramways, and is about double the figure found in Tresca's and Holt's experiments, although it is yet within the limits found by Perrett for very dirty roads. The application of electricity to the working of machine tools, especially of the lighter and portable types, was certainly more of a novelty than the other experiments. Rowan's electric drills and riveting machines are most interesting, and, as far as can be gleaned from a casual inspection, highly efficient tools. The riveter, which was shown in action, is fastened to the piece to be operated on by means of a strong electro-magnet, excited by a shunt current. The magnetic grip is so great that it is impossible to tear the machine off by hand, nor does the machine shift under the jar of the hammering. The hammer is brought against the rivet head by the action of a spring, and it is worked by a cam, which receives motion through a double set of bevel gear from a $\frac{1}{2}$ horse-power Immisch motor attached to the machine, but, for protection, completely enclosed in a tin box. As the cam revolves the hammer is drawn back, compressing the spring until the highest part of the cam is passed and the spring released. The machine works with great rapidity, and we saw it close up a 1-in. rivet in about ten seconds. The drills, as far as the electro-magnets and gear are concerned, are similarly constructed. Two have been delivered about nine months ago to Messrs. McMillan & Co., in Dumbarton, and are said to give every satisfaction. As we did not see a drill in action we cannot speak from personal experience; but the makers state that, with a 1-in. drill running about one hundred revolutions a minute, the machine is capable of drilling through $1\frac{1}{2}$ -in. of iron in one minute and twenty seconds.

Electrical Review, 1 April, 1887.

THE IMMISCH MOTOR.

WHEN in November last we gave some details of the construction of the motor patented and manufactured by Mr. Immisch, we promised to return at another time to the subject of their applicability to tramway purposes, a field in which we are convinced there will be within a very short time an immense development. We were pleased to hear, on paying a second visit to the works recently started at Kentish Town, that, even during the few months they have been in operation, there has been a steady increase in inquiries for motors for a variety of purposes, and also that with respect to certain types the demand is even in excess of the present resources of the establishment. In fact it has been found necessary to increase the machinery to a considerable extent, the whole of which it is proposed to drive with a 40 horse-power motor now in process of construction.

Experiments have for some time been conducted here in relation to tramway requirements, such as improved reducing gear, simpler reversing arrangements, the increase of the efficiency of the motor, the reduction of its weight and dimensions, and its more perfect regulation. With respect to gearing, two systems have been tested in various ways, each appearing to possess certain advantages of its own calculated to lead to its preference over others in special circumstances. In one case the motor spindle is terminated at each end by a phosphor bronze pinion, which gears into a spur-wheel of the same metal attached to the driving-wheel with teeth on its inner side, the pinion having ten teeth and the wheel sixty-seven. The other system is that of a four-threaded worm on the motor shaft working into a corresponding wheel on the driving axle, similar to the arrangement illustrated on page 570 of the nineteenth volume of the *Review*.

Mr. Reckenzaun has advocated the latter kind of gearing for this particular purpose, contending that, with clean and well-fitting bearing surfaces, together with multiple threads so as to render the angle of the teeth proportionately large, it will furnish a durable, efficient, reliable, and silent mode of transmission such as is required for tramway propulsion. On the contrary, he considers tooth-wheeled gearing out of the question on account of the noise and vibration inseparable from it.

As far as one could judge under the circumstances, the examples at Mr. Immisch's works appear to bear out these contentions, and the fact that Mr. Holroyd Smith has lately adopted the worm and wheel gearing would tend to indicate that practical experience has led him also to give it a preference over others.

Mr. Immisch has recently contrived a new reversing gear in connection with his motors for tramway work, possessing novel points, and calculated to reduce the operation to the utmost possible simplicity.

With reference to the relation of efficiency to weight, it is claimed for these motors that they are unsurpassed. A motor developing 10 horse-power at 1,000 revolutions weighs $6\frac{1}{2}$ cwt., about 70 lb. per horse-power.

The Electrician, 17 June, 1887.

THE TELPHER LINE AT GLYNDE.

THE telfer line at Glynde has now been in operation for a period of over two years, and the time has certainly arrived when the question as to the success or non-success of this system of transport should receive a final answer. The question is admittedly one of no slight importance. If telferage can be demonstrated to be both technically and commercially practicable under the conditions of everyday service, it is not too much to assert that "the resources of civilization" will have been appreciably widened, while the electrical industries will be materially benefited to an extent which no one can at present foresee.

But is the Glynde line a success? So little definite information having appeared in the public prints on the subject, it is natural that remarks of an unfavourable character have not been altogether wanting. When, therefore, we received an invitation from the Telpherage Company to "come and see for yourselves what we are doing at Glynde," we did not hesitate—notwithstanding the torrid heat of the season—to undertake the expedition. Arriving at Glynde, after two hours' stewing on the London, Brighton, and South Coast Railway, we found the genial engineer of the Telpherage Company (Mr. C. S. E. Crakanthorp), who accompanied us on our tour of inspection. That the telfer line is by no means in a state of inanition was soon apparent. Scarcely had we crossed the fence by the side of the railway when a gentle rumbling announced the approach of a telfer train. On it came at a perfectly uniform speed over the river, round by the bend at the end of the first field, and on to the loop which brings the skips over the railway trucks, into which their contents are tilted. To one who has not seen it before, the first sight of a telfer train presents a very singular appearance. The peculiar cat-like way in which the skip in front climbs over the top of the poles and walks steadily over the inclines, while the wire rope sags beneath the weight of the train, is very striking. What is actually being done at Glynde may be summarised as follows:—Three trains are running continuously, each consisting of ten skips, and making on the average about fifteen journeys daily. Each train carries rather over 1 ton of clay, so that the total weight moved is about 270 tons per week. The engine plant and the capacity of the line itself are equal to a service of four trains, so that 360 tons per week could be carried with very little increase on the present working cost. That cost is at present £6 per week, a figure which enables the Telpherage Company to carry out their contract with the Sussex Portland Cement Company of Newhaven under remunerative conditions, even at the low contract weight of $7\frac{1}{2}$ d. per ton.

We have incidentally alluded to the fact that the trains run upon wire ropes; it will probably be remembered that the original plans (or, more strictly, one of the original plans) of the inventors of the system (the late Prof. Jenkin and Profs. Ayrton and Perry) contemplated the use of steel rods stretching from span to span. Until experiment had actually been made upon a working scale, it was confessedly difficult to determine which of these two methods would prove the

the better. On the one hand, the employment of rods on the "cross-over parallel" system necessitated the use of spans all of the same length, or at least not exceeding a certain length, and there was also the difficulty of jointing and insulation. On the other hand, that system of connection did not readily lend itself to the employment of wire-ropes, owing to the difficulty of securing it to the post-heads. It was therefore determined, in the first instance, to employ steel rods. The details of the construction of the line, together with the wonderfully ingenious devices for insuring the safety and regularity of the service, were fully described by Prof. Perry in a lecture delivered at the London Institution, and reported in this journal in February, 1886.

The "cross-over parallel" system, beautiful in conception as it is, has, however, one defect, which was pointed out by Prof. Perry in this lecture. Each time that the collecting wheel of the motor passed from one conductor to the other—that is to say, at every post—the current through the motor is reversed, a reversal which necessarily entails sparking at the bushes. It remained to be seen how far this drawback would in practice counterbalance the advantages of the system in the matter of economy, arising from the fact that only two (inter-crossed) conductors are required for both up and down lines.

After some experience, it became apparent that the motors at first adopted were unsuited to this particular class of work under the then existing conditions, and it unfortunately happened that the gentleman by whom the motors were originally designed was unable at the time to give his personal attention to the matter. We think it right to mention this fact because we are anxious not to give an unnecessarily unfavourable impression as to the merits of this particular motor, which, as Mr. Crakanthorp was himself careful to point out to us, has scarcely been able, under the circumstances, to receive a fair trial.

At this juncture, however, an Immisch motor was placed upon the line in parallel with one of the older type, and it at once became apparent that the former did the same work with exactly one-half the energy supplied—that is, one-half the number of ampères at the same volts. It is not therefore surprising that the Immisch motor has been finally adopted by the Telferage Company. The type at present in use has a 4-inch armature, weighs 105 lb., and develops one horse-power running at 1,700 revolutions.

Concurrently with the change of motors it was decided to make such alterations to the line itself as would allow a simple parallel system to be adopted, principally in order that steel wire-ropes might be substituted for rods, which were found to have a very much shorter life than had been anticipated. This has been carried out with great success. The steel ropes are $2\frac{1}{2}$ in. in circumference, and are anchored to cross-beams buried in the soil, with tightening screws for straining up when required. The alteration necessitated, however, the employment of a second wire on both up and down lines in order to convey the current. This wire, which also takes the form of a steel wire-rope of $1\frac{1}{2}$ in. circumference, is insulated throughout its length. The current is taken off by a jockey pulley made in copper with wide flanges, and the wire upon which the train runs is earthed throughout, as also is the negative terminal of the dynamo. The system, in fact, has now reverted very nearly to that described in one of the earlier patents of Profs. Ayrton and Perry.

The conditions under which a motor running upon a telfer line is worked are necessarily such as to submit the apparatus to an extremely severe test. The protection which can be given against the weather is very slender at the best.

It is under such conditions that the Immisch motors at Glyde are now working with complete success. This satisfactory result has not, however, been attained without a good deal of painstaking attention to matters of detail both on the part of the Immisch Company and of Mr. Crakanthorp. The Immisch Company at one time sent one of their representatives (Mr. A. Snell) to stay for some time upon the spot in order to study the working conditions as completely as possible. The results now attained will be appreciated from the statement that the motors frequently run for a fortnight without even having their brushes readjusted. The commutators receive a touch of vaseline from the switch-man at the end of every journey.

The average E.M.F. along the whole line is 170 volts, there being only a volt or two difference between the engine-house and the extremities of the line. The total current taken by the three trains amounts to 20 ampères; but owing to the admirable action of the automatic circuit-closers governing the speed of the trains (a feature which is due to the late Prof. Fleeming Jenkin) it is comparatively seldom that the full current is taken for more than a very short interval. The variations of current between 8, 14, and 20 ampères, as shown in the engine-room ammeter, follow one another in rapid succession. The loss by leakage is 2 ampères. The governors, it will perhaps be remembered, act by centrifugal force, entirely cutting off the current when the speed of the armature exceeds a certain point. The break is made first on carbon and afterwards on copper contacts. Although the gradients on the line are very slight, the trains sometimes run over 100 yards without taking current. The speed of the trains, as judged by the eye, is remarkably uniform, a velocity of about 4 miles per hour being maintained throughout the whole line, both by empty and by full loads. The trains are started at either end, through a set of resistances, which are cut out in four sections, so that the start is effected with great smoothness.

In the engine-house the Ruston and Proctor semi-portable engine and the Crompton compound-wound dynamo both look good for many years to come, although, owing to the continuous variations of the load (through the action of the motor governors), it may be assumed that the work is of a somewhat trying character.

We will only add, in conclusion, that the result of our visit has been to impress forcibly upon our minds the fact that, upon the technical side, telferage must no longer be looked upon as a scientific toy, but has become a thoroughly practical and efficient system of transport, combining the qualifications of cheapness, simplicity, and certainty—a system which, while not intended to compete with steam for heavy traffic, is yet capable of affording a complete solution of an important class of problems in the industrial development of old countries as well as of new colonies and of semi-civilized lands. We do not, however, anticipate, nor is it on the whole desirable, to see "a boom" in telferage; but that, under capable management, the business of the Telferage Company will steadily grow into industrial importance we regard as a certainty.

The Electrician, 15 July, 1887.

CONSTANT CURRENT MOTOR-WORKING.

ON the occasion of Mr. Wharton's lecture at Bath an Immisch motor was run on the arc circuit lighting the theatre and part of the city. The circuit was composed of thirty arc lamps, two batches of incandescent lamps in parallels of six, and the motor. The dynamo was a Thomson-Houston one, giving about 2,000 volts and 6.8 ampères. The motor was coupled by a belt to a 2-foot circular saw. The saw cut through some 4 in. deals with ease, and 2 in. and 3 in. cuts were made as fast as the wood could be fed. The torque of the motor was regulated by a centrifugal governor, which varied the ampère turns in the field. The motor weighed 350 lb., and absorbed about 350 volts at full load. This is, we believe, the first time a constant current motor has been run successfully on this side of the Atlantic.

MOTORS AND AIR PROPELLERS AT WHITELEY'S.

AT Whiteley's, in Westbourne-grove, where there is a large electric lighting installation, some trials of electric motors of the Immisch type have lately been carried out with results of such a satisfactory character that it is probable that extensive use will be made of these machines. The new buildings in Queen's Road are already partially ventilated by means of a large Blackman air propeller, and we understand that it is in contemplation to make use of these propellers in connection with small motors instead of the punkahs which are at present at work in some of the departments. During the last few days a half-horse-power Immisch motor has been in use for driving an ice-making machine, previously worked by hand. In six minutes the same amount of ice is turned out as previously required half an hour's grinding. The motor has so far been kept continually running from 6 a.m. to 7 p.m., and great satisfaction is expressed at its performance.

THE SOCIETY OF ARTS.

THE Society of Arts have recently laid down an "Immisch" series-wound motor for lecture and general purposes. The machine is one of the well-known "Immisch" type. The field connections are arranged so that the coils can be coupled in series or parallel. This arrangement is necessitated by the variety of work which the motor has to do. The maximum output is 3 brake horse-power at 950 revolutions per minute. The E.M.F. required is 110 volts, and so the motor can be run in parallel with the incandescent lamps used to light the large hall. It is found to be a valuable addition to the Society's plant, and enables many lectures to be illustrated in a very practical way.—*Electrician*, 13 May, 1887.

ELECTRIC MOTORS FOR POWER PURPOSES

THE various recent discussions of the electric motor question have already been remarkably beneficial, says the *New York Electrical World*. They have arrested attention on the fact that the motor is to day a practical, efficient, and economical machine, and they have led many people to consider their use who but a month or two ago had not the least idea that there was any such useful apparatus in existence. We speak on this point with full knowledge, having been ourselves applied to by a number of power users—principally printers—for information as to the manner in which they could avail themselves of the electric motor. On inquiry we find that most of them had not, until the present year, entertained any idea that their special necessities could be met by electricity, but having now satisfied themselves from what they have heard and seen they were anxious to get the services of a power so cheap, handy, and docile. We have ourselves spoken with a great many users of electric motors, and have yet to meet the man who did not prefer them to anything else he had tried—*Electrical Review*, 8th April, 1887.

APPLICATIONS OF ELECTRICITY TO MINING OPERATIONS

A VERY interesting paper was lately read before the Mining Institute of Scotland, by Mr F. J. Rowan, C. E., of Glasgow, in relation to the above, in which several instances of electrical haulage, winding, and pumping in mines and collieries were given. In this paper Mr Rowan, speaking of the "Immisch" motor, says—

A modern form of motor, which has so far proved superior to most of those which have been made. Mr Immisch has departed from the ordinarily received ideas on the subject of motor construction. He does not admit that the best dynamo is necessarily the best motor, but while admitting fully the theory of reversibility, he says that an efficient dynamo must from the nature of things be an inefficient motor. The dynamo in ideal has an enormously powerful field and a very weak armature, or in other words, the magnetic moments of the field and armature are as widely different as possible. This principle is carried out fairly well by all the best dynamo makers. Mr Immisch has, however, pointed out that the motor should have an armature and field with relatively equal magnetic moments—that is to say, that the armature and field should do equal work. This result can only be obtained by making the armature much larger in proportion to the total weight of the machine than is considered advisable in a dynamo. Strong evidence that this theory of motor construction is correct is derived from the high efficiency which the Immisch motor gives—an efficiency very nearly double that of motors made on the dynamo type. On a recent occasion an Immisch motor was tested against one of these others by a well known maker, when it was found that for the same work the Immisch motor used exactly half the current at the same E. M. F., thus giving double the efficiency of the other, and causing the commercial cost of the power developed to be reduced by one half.

Another point of great importance upon which Mr Immisch lays considerable stress, is that in his motors there is an absence of what is technically called "lead." From this it results that the motor may be run at any load within that for which it is designed without the brushes being adjusted and without sparking. The importance of this can readily be estimated for all cases in which the load varies rapidly.

This fixed position of the brushes is arrived at by a special method of winding the armature, which is applicable to either drum or cylinder armatures. The drum type is used for low tensions, and the cylinder for high tensions or extra low speed. The coils of the armature are so connected to a commutator of suitable construction that the coils lying along the diameter joining the brushes are cut out of circuit by being closed on themselves. The reason for this construction is that these coils, if active, would tend to induce poles in the armature at right angles to the axis of magnetism. This would weaken both the armature and the field, because in the motor the field and the armature tend to mutually strengthen each other. The chief advantage gained by this arrangement of coils is that the resultant axis of magnetism is formed beneath the short-circuited coils, and induced currents in these coils tend to keep it in a fixed position.

By following out these principles of design, Mr Immisch has succeeded in producing a motor which, with reference to weight, power, efficiency, or durability, is most successful.

Fig 1 shows an elevation of a 6 inch "Immisch" motor. Its weight is about 350 lb., and it will give 8 brake horse-power at a speed of 1,400 revolutions per minute. The efficiency, as tested by a Pony brake or dynamometer, averages 85 per cent. between 4 and 8 horse-power.

The

* The Telpherage Company experienced very considerable trouble on their line before "Immisch" motors were used, and were never able to get one continuous week's run. Now the whole line is operated by "Immisch" motors, cost of repairs is reduced to nil, and consequently the company have considerably increased their profits in working.

The efficiency of these machines ranges from 70 per cent. in a 1 horse-power motor to 90 per cent. in one of 20 horse-power. Measured by what is technically called "torque," which is the effort exerted to cause rotation, they show a very large amount of power in proportion to their weight. Mr. Immisch's electrician informs the writer that a machine of the same size as is shown will lift and maintain at its normal torque a weight of 14 lb. at the end of a lever of 2 ft. This is equivalent to a torque of 176 lb. ft., and is equal to a pull of 112 lb. on the periphery of a pulley of the same diameter as the armature, viz., 6 in. At the same time the motor could momentarily exert a maximum torque of about five times that amount without damage.

After giving an exhaustive *résumé* of electrical work already done in mines, Mr. Rowan says: The data given shows that electrical methods have no cause to fear competition either as to cost or efficiency. The longer the distance and the greater the amount of power to be transmitted the more favourably does electrical transmission compare with other systems, but for this reason it has had a worse chance in early attempts than it would have had if its efficiency were greater on a small scale of distance and power.

The methods of working which are adopted in each case must of course suit the circumstances of the mine. The naked conductors of the Zaukerode pit would not suit a fiery locality, and they are not necessary. An electrical locomotive can be worked by means of storage batteries carried on the engine, and the danger of sparks from exposed conductors when short-circuited can be thus abolished. For stationary motors the conductors can readily be so protected that nothing short of a fall of the roof would cut them, and the sparking at commutators is rendered quite harmless by surrounding the commutators with wire gauze, practically running them inside the case of a safety lamp. The sparks, being at any rate very different from a continuous flame, give much less opportunity for any ignition of gas, even if unprotected.

Since the foregoing was written, Mr. W. W. Mordey has communicated to the South Wales Institute of Engineers (Vol. XV, p. 125) some interesting experiments, undertaken to investigate the effects produced by breaking incandescent electric lamps in an explosive atmosphere, and also by the production of sparks at a contact-breaker or switch under similar conditions. An incandescent lamp of 10 candle-power showed that where the lamp was broken by a blow which broke the filament no explosion ensued. If the glass bulb merely was broken, and the glowing filament was exposed to the gases, an explosion was produced. Where the lamp was protected by water surrounding the bulb no explosion could be produced. No explosion was produced by sparks from a contact-breaker unless an induction coil was used in order to increase considerably the length and tension of the sparks. These experiments go far to prove that with ordinary electrical apparatus likely to be used in mining operations, no danger is to be apprehended which cannot be avoided by very simple precautions.

The Daily Telegraph, Monday, 26 September, 1887.

ELECTRIC LOCOMOTION.

For practical purposes it may be regarded as settled that an electric locomotive is one which, like the steam-engine, carries its motive power along with it; and the question whether it can compete with the iron horse or the living quadruped depends upon the amount of inevitable loss first in storing the electricity, and next in transmitting it from the accumulators to the wheels of the moving machine. The Electric Car Company, after a series of rather costly experiments, in which they have battled with difficulty at every stage, now claim that they have demonstrated the superiority from the financial point of view of electric over either horse or steam traction. On Saturday a small number of gentlemen representing America and the Australian Colonies accepted the invitation of Lord Bury, the Chairman of the Company, to inspect the experimental car running between Shoreham and West Brighton. Included in this party were Sir Saul Samuel, Sir Arthur Blyth, Sir Graham Berry, and the Hon. Adye Douglas—the Agents-General respectively of New South Wales, South Australia, Victoria, and Tasmania; the Hon. W. Forrest (Queensland), Mr. H. C. Russell (Government Astronomer, Sydney), Mr. A. W. Robertson, (Melbourne), Mr. Grosvenor Lowry, and Mr. Stetson (of New York), Sir H. Malet and Mr. L. M. Wynne. Starting from Shoreham the visitors were run in the electrically-propelled car to Southwick at the rate of about 12 miles an hour; then, as a further illustration of the principle, a heavily-weighted traction car, similarly propelled, was run towards Shoreham at a speed of from 15 to 20 miles an hour; and finally there was a smart trip to West Brighton. The automatic or self-contained car carries eighty cells stowed beneath the seats, and, as with the motor and the gearing beneath, all the apparatus of the invisible and mysterious agency that whirls it along is out of sight. Briefly, it may be said that starting and stopping are effected as rapidly as could be done with any conceivable species of traction. On these points the visitors on Saturday expressed themselves completely satisfied; but the inspection was made with the eminently practical view of discovering not only the efficiency of the apparatus, but its comparative cost, and upon these points Lord Bury himself, technically familiar with recent electrical progress, entered into careful explanations, stating exactly and frankly the conditions of the problem. At the present time horses and steam on tramways cost 6d. per car-mile. This, his Lordship said, they had taken as their basis, and they were actually running at 4d. per mile. The engineers stated the cost at even less. In order to be on the safe side he would not pledge himself to 4d., but he would assert that they could run at less than 6d., and that every improvement in motor or accumulator would be so much to the good. The Immisch motor, to which much of their success was due, was within 3 per cent. of theoretic perfection, and therefore they could not expect much advance upon that; on the other hand the accumulators would admit of amendment in some particulars. He claimed, as a net result, that working on a bad line, with a gradient amounting to 1 in 20, they had yet come considerably below the cost of horse or steam power. What is the significance of even a fractional saving in the car-mile will appear from the fact that last year the North Metropolitan Company's cars ran 5,927,451 miles, so that the economy of 1d. per mile would make a difference of £24,697 in the profits. In an interesting conversation which followed these explanations, Sir Saul Samuel expressed himself so satisfied with the demonstration that he should recommend the adoption of the car to his Government for use in Sydney, where steam propulsion has been found open to serious objections. Mr. Adye Douglas pointed out that in Tasmania, where a splendid water-power is at hand, stored electricity could be obtained cheaply, and doubtless applied to locomotion at a great advantage. The car actually in use at Shoreham is to be sent out for service in New Zealand.

Sir Arthur Blyth struck a note which awoke the entire sympathy of all present when he suggested that electricity on the Underground Railway would be an unmixed blessing to Londoners. It is now proved that trains might be driven on the Metropolitan system at not more than 10 per cent. extra cost in the item of propulsion alone than is now spent on steam power, and it is an open question if the added outlay would not be made up in extra traffic. The directors are fully alive to the loss arising from the foul and suffocating atmosphere that now fills their tunnels, and the experiment is at any rate likely to be made ere long of an electric train. Meanwhile, the new system is about to have a fair trial in London. A section of the North Metropolitan Tramway from Canning Town to Barking is to be equipped within the next two months with electric cars, and an experiment so made can scarcely fail to be decisive, and may have economical results of high importance. In London no car may have more than 2½ tons weight on a single wheel. The car used at Shoreham, with a load of twenty passengers, did not exceed 5 tons, including about a ton and half of the accumulator and machinery. A single charge supplied it with energy equal to 7 h.-p. over 35 miles of ground, and the accumulators can be taken out and put in as expeditiously as horses are changed or engines supplied with water.

APPROXIMATE Estimate for one Automatic Electric Tram-car.

Car	...	1 car, 40/46 passengers	£200	0	0
Accumulators	...	2 sets of 96 cells per car, 2 × 96 = 192 cells, 25s.	240	0	0
		24 battery trays, 10s.	12	0	0
Motor	...	1 S.M., 7	110	0	0
		Gearing switches, wiring, and instruments	60	0	0
								£622	0	0

1 dynamo for charging accumulators would cost £60.

Sir Saul Samuel, K.C.M.G., C.B., Agent-General, New South Wales.

Sir,

Sir,
 Electric Works, Maldon Crescent, Prince of Wales Road, London, 29 September, 1887.
 With reference to the conversation which we had with you when you honored us with a visit to our works, we now beg to confirm the proposal made to you as to sending out to your Government, on trial, an automatic electric car on our system. It is perfectly understood that your Government is not bound to take over the car unless it is approved of by them. We shall also be prepared to send out a competent electrician to superintend the running of the car. You are already in possession of the estimate for the car, but we beg to point out to you that in tendering for one car the price must necessarily appear high; but if a large number of cars were ordered we should be able to make a reduction in price. We need not point out the merits of our system, as you have witnessed the demonstration yourself. We take the liberty to enclose you two rough estimates for transmitting electrical power to a distance.

Trusting we may have the honor of entering into business relationships with your Government,
 We remain, &c.,
 IMMISCH & CO.
 Sir Saul Samuel, K.C.M.G., C.B., Agent-General in London for New South Wales, 5, Westminster Chambers.

[Sub-Enclosure.]

Sir,
 3 Spring-street, 11 April, 1888.
 I have the honor to forward herewith memorandum for a suggested plan for electric tramways for Sydney and the suburbs, handed to me before my departure from London by Mr. H. Lee Smith, M.I.C.E.
 To the Honorable the Colonial Secretary.
 I have, &c.,
 SAUL SAMUEL.

[Enclosure.]

Electric Tramways suggested for the Suburbs of Sydney,
 5, Victoria Chambers, Westminster, London, S.W., 5 January, 1888.

TRAMWAYS worked by horses are open to many objections. Speaking of them as in London, the leading engineering journal says—"Tram-cars are a bye-word for want of speed, and will probably never be admitted into the city or west end of London, so that, except for local and suburban uses, they must land their passengers half a mile short of their destination." They are sometimes a danger and always an obstruction to all the other wheel traffic, and are cruelly severe on the horses.

On the other hand, electric traction, though still in its infancy, has already a great deal to recommend it. On the 28th July last a very successful trial was made at Southwick, near Brighton, of an automatic electric car, which made a run over a line 4¼ miles long at an average speed, out and in, of about 11 miles an hour.

The line is a trying one, having some sharp curves and stiff inclines, and another serious impediment resulted from the clogging of the grooves in which the wheel-flangers travel, with gravel, mud, &c.

The latter objection being inseparable from all lines laid on the surface of the ordinary roads, it is suggested for a city like Sydney, which is believed not to be pledged to any particular system (?) that it would be a great boon, in all the future, to the ordinary vehicular traffic, which has really the first claim to consideration if all the tramway rails were kept entirely clear of the ground surface by being suspended from 10 to 14 feet above it. Each tram-car would thus be suspended from the axles of its wheels, whilst its floor would be just such a height above the road surface (say 7 or 8 inches), as to give the easiest entrance and exit. It is not pretended here to specify the simplest method of fixing the suspended rails, as it might be different in each road or street in accordance with its width. In a new and wide suburban road it would be a trifling encroachment to make the supports a double line of cast iron columns about 10 feet apart, whereas if required to run down an existing and narrow street, the columns could be placed at the edge of the kerb, just as the lamp posts.

It ought not to be, as objected, that this project is somewhat akin to the overhead railway in New York. On that are run heavy trains, with all the noise and vibration inseparable from steam traction, the locomotive alone weighing at least four times as much as the electric tram-car with its full load of passengers.

Here may be mentioned a special advantage of the overhead system, viz., that it admits of the electric current being taken from a "lead" thereby dispensing with the weight of "accumulators."

A very high authority, the late Sir Wilham Siemens, has given it as his experience, that "rail conductors should never be placed upon the level of the ground, elevated railways alone being permissible on this system, whereas by employing the rails as conductors a greater locomotive force may be used."

Now in accordance with this ruling the use of the "lead" overhead is not only unobjectionable but beneficial. The rails being well insulated the current could be taken in at one set of wheels, and go out at the other, and in this manner the weight of the stored electricity (accumulators) may be entirely dispensed with.

In the Brighton car above alluded to, the weights were as follows :—Car, 1 ton ; motor, frame, &c., 1 ton ; twenty passengers, $1\frac{1}{2}$ tons ; cells, $1\frac{1}{2}$ tons ; total, 5 tons. One and a half tons for cells, *i.e.*, accumulators, may be looked upon as a trifle, but it is nevertheless 30 per cent. of the total moving load.

The weight, however, of these accumulators is justified upon the ground that it is required for adhesion,—of that more anon.

The conditions under which tramways are required or may be wanted in Sydney being unknown to the writer he must admit to be writing in ignorance of that subject. If therefore his premises are incorrect, this memo. will be best put in the fire, but before doing so it may be worth while to state the impression under which it has been written, *viz.*, that Sydney as regards its suburban expansion is still in its infancy, and that an immense amount of comfort and convenience which will otherwise be costly or impracticable may be secured to future generations by regulating the width and alignment of new streets and avenues, and by keeping constantly in view the certainty that at no very remote date, any one of them may be required to accommodate a railway or tramway of some sort, be it underground, overhead, or on the surface.

The cleanness, smoothness, noiselessness of electric traction have been proved, and seem to render it peculiarly tempting to any great city not already pledged too far to any other system ; whilst, in Sydney for example, the lightness of the moving load point to it as being so economical as to render a crossing to the North Shore from (say) Dawes' Point to Milson's Point within measurable distance.

Time will not permit of a description of the means by which adhesion can easily be obtained on overhead lines without the weight of accumulators.

If any further particulars are required they will gladly be supplied, and, if required, an examination made on the spot.

H. LEE SMITH, M.I.C.E.

THE GOVERNMENT TRAMWAYS.

(CORRESPONDENCE, &c, IN REFERENCE TO LEASING OF)

Ordered by the Legislative Assembly to be printed, 10 April, 1888

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 29th February, 1888, That there be laid upon the Table of this House,—

“(1.) A copy of all minutes, letters, correspondence, documents, &c., between the Government and the Melbourne Tramway Company, or any other Company, or person or persons, in reference to leasing the Government Tramways of this Colony.

“(2.) Also, copies of all correspondence, minutes, &c., between the Government and any Company, or person or persons, in reference to using electricity or any other motive power to work the Tramways of this Colony.”

(Mr. McElhone.)

No. 1.

Mr. A. Mackay to The Commissioner for Railways.

Town and Country Journal and Evening News Office,
148 and 150 Pitt-street, Sydney, 21 August, 1882.

Dear Sir,

I called at your office several times to-day. The object was to ask you if the Government would entertain a proposal such as the following—On behalf of a number of gentlemen of ample means, and who are desirous of seeing proper tram-cars and Tramway business in Sydney, I have to ask if the Glebe line, or any other line, would be leased to them. They would at their own cost put on the rolling stock, and provide the horses, &c, doing the business in the manner Tramway business is done in London—they paying a fair rent for the use of the road, and conforming to regulations that could be made with your Department.

I will be glad to afford you all further information necessary; meantime shall feel indebted for a reply to the question whether the Government are likely to entertain such a proposal as that stated. If so, formal application will be made without delay.

Respectfully yours,
ANGUS MACKAY,
Editor *Town and Country Journal*.

This is a question for the consideration of the Minister and may be forwarded to the Under-Secretary for submission. The Government have power to lease the Railways and constructively the Tramways also.—CHAS. A. G., 23/8/82.

Acknowledge receipt also and say his letter will be submitted to the Secretary for Public Works. Done, 24/8/82.

No. 2.

Mr. A. Mackay to The Commissioner for Railways.

Town and Country Journal and Evening News Office,
148 and 150 Pitt-street, Sydney, 12 September, 1882.

Dear Sir,

Has anything transpired touching letter to you *re* Tramways on August 21st. The gentlemen with whom I am connected in this matter are very much in earnest, and feel sure that arrangements could be made that would prove advantageous to the public, the Government, and themselves.

Would you please therefore give a reply whether the Government are disposed to lease one or more of their lines, in order to introduce a better system of carrying on the traffic, as proposed in previous communication to you.

Respectfully yours,
ANGUS MACKAY,
Editor *Town and Country Journal*.

Inform that I have submitted the matter for the Minister's consideration. He will consider the question.—CH. A. G., 13/9/82. Done. The question cannot be entertained at present. Let Mr. Mackay be informed.—H.C., 26/1/83.

No. 3.

The Secretary for Public Works to Mr. A. Mackay.

Sir, Department of Public Works, Sydney, 29 January, 1883.
Referring to the proposal contained in your letter of the 21st August last for the leasing to a Company one of the lines of the Government Tramways, I am directed to inform you that the question cannot be entertained at present.

I have, &c.,

JOHN RAE.

No. 4.

Mr. A. Mackay to The Secretary for Public Works.

Sir, Sydney, 15 January, 1885.
On behalf of a number of gentlemen, several well acquainted with Tramway business, as developed in European and American cities, and men of means ample to carry out the after-mentioned proposal, I have the honor to offer to take over from the Government (on fair and equitable terms to be arranged) the Glebe or other tram line or lines, and work it or them upon the London system.

Similar rolling stock to that used in London would be employed, and such a system introduced in Sydney as would carry all the passengers who offered, and at rates certainly not higher than the rates now charged.

If the Government should be disposed to entertain this proposal, and an interview were arranged, such information would be given as I feel assured would convince you that the tramways could be worked by the gentlemen referred to, in a manner that would relieve the Government of all further trouble with them, and afford the rapid and ample facilities for street traffic which is characteristic of the Tramways of London, New York, and other great cities.

Trusting, therefore, you may entertain the proposal hereby made, and grant an interview at your earliest convenience,

I have, &c.,

ANGUS MACKAY.

I have written semi-officially to Mr. Mackay informing him that the only offer that would be taken notice of would be one to lease the entire Tramway system.—F.A.W., 10/2/85.

No. 5.

Mr. A. Mackay to The Secretary for Public Works.

Dear Sir, Sydney, 3 February, 1885.
In reply to yours of January 29, the changes contemplated by the gentlemen mentioned in former note is the adoption of the London system, with horses and light cars in the streets of the city. As a system it is the most perfect yet devised for street traffic purposes. The change could be made gradually, and all the requirements of the public met without break or hitch. We could commence with (say) the Waterloo line, and would put on a service with 2½-minute intervals to the railway station; thence to toll-gate, a 5-minute service, or oftener if the traffic required; from the toll-gate to Botany motors might be used with advantage.

Were the Government agreeable, this service could be commenced at very short notice, and it would solve the problem, and give time for taking over all the other lines.

The situation has been considered very carefully in relation to the engineering aspect, what is necessary to make the business effective, popular, and remunerative; and also looking to the substitution of the London system for what Sydney has now.

We would require permission to lay down a line from the Railway Station to York-street, to Wynyard Square; from there we could connect, *via* Circular Quay, with Elizabeth-street, and then work out the whole into a complete system.

Such is our scheme, and it could be made as effective as Tramways are in other cities. We would hope to develop the street traffic in the true sense, which has never yet been done in Sydney.

The matter is in strict confidence so far as the gentlemen with whom I am co-operating are concerned. Trusting for favourable consideration of our proposals,

Very truly yours,

ANGUS MACKAY.

I cannot advise any leasing of the Tramway by piece-meal in the way proposed; if it be the pleasure of the Government that the lines should be leased, the whole should be leased. As regards the proposal to have a combined horse and motor service, I am satisfied it would not answer public requirement; but I believe that a cable road inside city boundaries and motor service outside would do. Mr. Mackay's scheme for having a circular line to run round Circular Quay, joining the present system at Parramatta-street bridge, is my scheme, which the Minister thinks it unwise to carry out. I am satisfied that it is a good scheme, and the only one to meet—as Mr. Mackay points out—the requirements of the street traffic as distinguished from through traffic.—CH. A. G., 6/2/85.

My dear Sir,

7 February, 1885.

In reply to yours of the 3rd instant, *re* leasing trams, I have to say that it will be impossible for the Government to sanction any partial lease, as it would to a certain extent unhinge the present system, and I doubt if the steam and horse service could be run satisfactorily in conjunction, because the kind of cars you would use for horse-traction would be altogether useless for the steam service.

If the Company you represent should be disposed to go into the whole matter, and will submit proposals to lease the entire system as at present existing, and to work the traffic under a fixed schedule of rates, I shall then have something to go upon.

Personally, I should be disposed to recommend the proposal, if fair and equitable, to my colleagues, as I am under the impression that a private Company could work the trams more satisfactorily than the Government.

Of course this is my private opinion, and should not be made public; but I am satisfied were the trams in the hands of a private Company, who would be free from political influence in dealing with their staff, and who would not be influenced so much by the pressure of public opinion, the whole thing could be made a great success.

Believe me, &c.,

A. Mackay, Esq., *Town and Country Journal*.

F. A. WRIGHT.

No. 6.

Messrs. A. Mackay and W. Fleming to The Secretary for Public Works.

Sir,

13 February, 1885.

In accordance with understanding come to with the Minister for Works, at interview in Works Office this morning, we make the following offer to the Government:—

To take over all the Sydney Tramway, permanent-way workshops, &c., mentioned in the Commissioner for Railways' Report, under the heading "Construction," and such portions of the rolling-stock as may be efficient for City tramway business, and to pay the Government for the same:—

For the first ten years from date of delivery to us, 4 per cent. per annum; for the ten years following, 5 per cent. per annum. And such payments for extension of time beyond twenty years as may be arranged.

Also, to pay 5 per cent. per annum upon the cost for any additional permanent-way laid down by the Government, in order to make the service as efficient in Sydney as Tramways are in London, New York, and other cities.

To carry out the service, in order to make it really effective, we are prepared to put on at least 50 per cent. additional cars, thus materially shortening the time between the passing of cars at all points in the City.

To arrange for the due maintenance of the permanent-way, rolling-stock, &c.

To arrange for a time schedule for passing of cars at all points on the lines now laid down and to be constructed.

To arrange for schedule of fares which shall not exceed the rates now charged, but possibly be much less.

To give sufficient guarantee for the due fulfilment of contract based on the foregoing.

We have, &c.,

ANGUS MACKAY.
WM. FLEMING.

No. 7.

Messrs. A. Mackay and W. Fleming to The Secretary for Public Works.

Sir,

10 April, 1885.

In accordance with suggestions made yesterday by the Commissioner for Railways, Mr. Goodchap, in interview with him *re* leasing the Sydney Tramways as per our proposals to you on the subject, we have the honor to further explain the said proposals.

Our intentions are, should proposals be accepted, to lower the fares, at least, to the rates charged before the recent advances in fares were made.

For some sections, and in order to increase the numbers of short distance passengers especially— as we would have more cars running—we would have still lower fares, and sections on which one penny would be the amount charged.

We are quite prepared to incorporate this feature of the fares with our proposals as made to you, and now in the hands of the Commissioner.

We have, &c.,

ANGUS MACKAY.
WM. FLEMING.

Will Commissioner let me have his report on paper at an early date.—F.A.W., 11/4/85.

The proposal is to lease the Tramways for twenty years at least; the power to lease is given by the Act, but the time is limited to three years; before the question is discussed it might be well to ascertain whether Messrs. Fleming and Mackay would consent to the lease being limited to three years.—CH.A.G., 21/5/85.

No. 8.

Mr. W. P. Walker to The Secretary for Public Works.

Sir,

22 January, 1886.

I herewith, on behalf of myself and others, offer to lease from the Government the Tramways and all connected therewith, for a term of twenty-five years, on the following conditions:—

1st. That the rent be equal to 4 per cent. interest per annum on the capital expended.

2nd. That 2 per cent. per annum be paid as liquidation of the said capital.

If you think the above offer worthy of attention I shall be glad to arrange details with you on an equitable basis. Waiting your reply,

I am, &c.,

W. P. WALKER.

Railways for report. Is there any record of similar offer?—J.G., 23/1/86.

Yes. Mr. Fleming made an offer, but on learning that, under the provisions of the Act, the Government could not lease the Tramways for a longer period than three years, he proceeded no further with the proposal. Papers herewith.—CH.A.G., 27/1/86.

No. 9.

Mr. J. Woods to The Secretary for Public Works.

Dear Sir,

Fairlight, Manly Beach, 28 January, 1886.

From a paragraph in this day's *Telegraph* I am led to believe that an offer has been submitted to you to lease the Tramways. Will you please inform me if you are prepared to dispose by sale, or to lease the Tramways, and upon what, or as near, conditions as may be equitable, and I, with others, will be and are prepared to make you an offer.

Yours, &c.,

JOHN WOODS.

Inform Mr. Woods that I am prepared to give due consideration to any proposal he may make for the purchase or lease of the Tramways.—J.G., 28/1/86.

No. 10.

The Commissioner for Railways to Mr. J. Woods.

Sir,

Railway Branch, Sydney, 29 January, 1886.

In reply to the inquiry contained in your letter of the 28th instant, I have the honor, by direction of Mr. Secretary Garrard, to inform you that he is prepared to give due consideration to any proposal you may make for the purchase or lease of the Tramways belonging to this Department.

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

No. 11.

LEGISLATIVE ASSEMBLY.—THURSDAY, FEBRUARY 4TH, 1886.

(2.) Tramways:—Mr. W. J. FERGUSSON (for *Mr. Melville*) asked THE SECRETARY FOR PUBLIC WORKS,—

(1.) What are the names of the Syndicate who have made the offer to purchase or lease the Tramways?

(2.) What amount have they offered?

(3.) What are the terms on which they offer to purchase or lease?

(4.) What security for the payment of rent, &c., do they offer?

Mr. GARRARD answered,—Three separate offers have been received at various times during the last twelve months. If it be determined to sell or lease the Tramways, tenders will be invited, and the conditions will be drawn up by the Government. Until the question is finally settled it is not considered fair to those who have submitted offers to make known their terms.

No. 12.

Mr. J. Woods to The Commissioner for Railways.

Sir,

Fairlight, Manly, 15 February, 1886.

Referring to your letter of the 29th January, it would be undesirable at this time for me to make any definite offer, as I am at present without information as to what there is to purchase.

If you can supply me with an inventory of the plant, the mileage of Tramways laid, divided into routes, the cost to date and the returns, and will indicate the nature of the offer you would be willing to negotiate upon, I will at an early date submit proposals.

I am, &c.,

JOHN WOODS.

Acknowledge receipt, and say that if the Government determine to lease or sell the Tramways the fullest information will be afforded.—CH. A. G., 19/2/86.

No. 13.

The Commissioner for Railways to Mr. J. Woods.

Sir,

Department of Railways, 22 February, 1886.

With reference to your letter of the 18th instant, respecting your offer to lease the Government Tramways, and asking that you may be supplied with particulars regarding the plant, roads, &c., I have the honor to inform you that if the Government determine to lease or sell the Tramways the fullest information will be afforded.

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

No. 14.

Mr. M. Bury to The Commissioner for Railways.

Sir,

Sydney, 27 January, 1886 (Box 899).

You may perhaps remember my name in connection with the North Shore cable tramway. As I am still in hopes that your Government may see that the adoption of the cable system is the only method whereby the Sydney trams can be made to pay, and being fully convinced that the system in which I am interested, viz., the duplicate cable system, is the only one the Government can adopt with any degree of reliability and safety, considering the heavy traffic on the Sydney trams, I have much pleasure in giving herewith copy of minutes of the Directors of the Third Avenue Railroad Company, New York, as to the working of the duplicate cable which has been constructed by Mr. Miller, and which you requested the consulting engineer (Mr. Towle) to advise you upon more than twelve months ago.

The money that is proposed to expend on a new permanent way would, I believe, be sufficient to convert the whole, or at any rate a very large proportion, of your existing tram lines into the cable system. My friends, Findlay and Miller, would be prepared to come to Sydney and advise the Government generally on the system if they were secured against loss. If anything is likely to be done with your tram system I would beg to offer you their services.

I am, &c.,

MAXWELL BURY.

Copy of Minutes.

Office of the 3rd Avenue Railroad Company,
3rd Avenue, 65th and 66th street, New York.

EXTRACT from the Minutes of the meeting of the Board of Directors, held Monday, November 9, 1885.

"Findlay and Miller's duplicate cable system.—Whereas the 3rd Avenue Railroad Company, of the city of New York, have constructed a cable railway on 10th Avenue, in this city, and whereas said road has been running steadily and uninterruptedly since the opening of the same on the 31st August, 1885, therefore be it resolved that we, the Board of Directors of said Company are highly pleased with the system of cable railroads which it represents, and express our entire satisfaction with the same.

ALFRED LAZARUS, Secretary."

The estimate given for reforming the Tramways was £200,000. Surely Mr. Bury is in error in stating that this amount would be sufficient to convert the whole, or at any rate a very large proportion, of our existing tram lines into cable system.—CHAS. A.G., 2/2/86. Mr. Cowdery, B.C.

Yes; Mr. Bury must be in error.—G.C., 3/2/86.

Mr. Bury has since written to say that he and his friends are prepared to purchase or lease the Tramways. This communication may be placed with the offer.—CHAS. A.G., 5/2/86.

No. 15.

Mr. M. Bury to The Secretary for Public Works.

Sir,

Sydney, 4 February, 1886, G.P.O. Box 899.

Having lately received letters from England and America with reference to leasing and working the Sydney trams, I have the honor, on behalf of myself and some gentlemen in London and New York, to state our views and make proposals on the subject, trusting that business may result therefrom.

In the first place I have to state that in the event of the Government leasing or selling the lines to us, we purpose laying down cable trams on the routes named herein, on the system patented in this Colony by Messrs. Findlay and Miller, of London and New York. The system is that known as the "Duplicate Cable System," which is working most satisfactorily on the 3rd Avenue, 65th and 66th streets, New York. This system is considered by leading American engineers to be the most efficient, economical, and safe method yet constructed for working tram lines where the traffic is heavy and continuous.

It is proposed to confine the cable system for the present to the following sections, viz. :—

From Bridge-street to the Railway Station.

From Liverpool-street to Queen-street, Paddington.

From Darlinghurst to Randwick Tram Workshops.

From Oxford-street along Crown-street to terminus.

The tram service to Leichhardt, Glebe Point, Forest Lodge, Newtown, Marrickville, and Botany to be worked by the present steam motors, which will be timed to run in connection with the cable tram, terminating at the Railway Station.

A grand terminus station and waiting-room is also to be erected contiguous to the Railway Station for the accommodation of passengers who there change for their several points of destination.

The Randwick and Coogee section is likewise to be worked by steam motors starting from the tram workshops to Coogee.

From Queen's-street, Paddington, the Woollahra line and the Waverley line and the new section on to Randwick, as also the Bondi section, are also to be worked by the present steam motors.

At the Queen's-street junction a commodious waiting-room will be erected for the accommodation of passengers who have to change here to the motor lines.

It will thus be seen that by adopting our plan for working the tram service the steam motors will work only in the outlying districts.

It is hardly necessary to say, as it will be evident, that if the trams are worked in the manner indicated, a very great saving will be effected in the cost of wear and tear to the permanent way and the steam motors. It is believed that the first year's working on this plan will show a very handsome return on the outlay, and by removing the steam motors from the crowded streets a great boon will be conferred on the general public. I therefore beg to make the following proposals for the consideration of the Government :—

1. The syndicate agree either to lease or purchase the entire tram system, workshops, sheds, &c., &c., subject—
 - (1.) In case of leasing, the terms and conditions of lease to be framed on a basis which will induce capitalists to invest their money.
 - (2.) In the event of a purchase, the price to be paid for the line, plant, rolling-stock, shops, &c., to be arrived at by duly qualified valuers.
2. If a lease be determined upon, the term to be twenty-five years.
3. If a sale is effected, the Government to have the option of repurchasing the lines at any time within twenty-one years from date of sale, on due compensation being paid for the goodwill—if any—and the line, plant, rolling-stock, &c., to be taken over at a valuation arrived at as per sub-section 2, clause 1.
4. The Government to supply the syndicate with a plan of the city and suburbs served by the present tram system, and also to supply a section of the streets showing the gradients.
5. If a lease or a sale is concluded, the syndicate to be at the entire cost of converting those portions of the tram system named into cable trams.
6. In the event of the Government assenting to the foregoing method of working the tram system, the syndicate will immediately give instructions to have plans and specifications prepared for constructing the cable trams, which plans shall, if possible, be in readiness for the consideration of Parliament before the close of the session.

7. In the event of Parliament not agreeing either to sell or lease the trams, the syndicate will be prepared to enter into a contract to construct and equip the cable lines in accordance with the plans and specification which they submit for adoption, and will enter into a bond to keep the system in efficient working order for a period of three years, or forfeit the sum of £20,000.
8. In the event of Parliament deciding against either leasing or selling the tram lines, and the Government do not conclude a contract with the syndicate for the construction of the cable trams, then the Government to pay the costs and charges incurred in preparing the plans, specifications, and estimates, which plans and specifications shall then become the property of the Government.

Waiting the favour of an early reply,—

I have, &c.,

MAXWELL BURY.

Will the Commissioner for Railways please report on these propositions?—J.G., 4/2/86. Please let me have all the papers, especially the offer made recently by Mr. Bury to transform our roads into cable-ways.—CHAS. A.G., 6/2/86. (Papers herewith.) Make a *précis* of each offer received.

No. 16.

Minute by The Commissioner for Railways.

Let me have papers about leasing the Tramways. I think some reference must be made in the report to the various offers in this respect, without perhaps disclosing names and prices, but stating generally that the negotiators for the lease or purchase of the lines quite recognized the fact that the country was to be at no loss.

CHAS. A.G., 7/7/86.

Papers herewith.—12/7/86.

I have inserted a paragraph in the report as under:—"That the Tramways are considered to be a source from which large profits may be made is evidenced by the fact that more than one responsible offer has been received to purchase them from the Government at cost price, or to lease them on terms which would not only pay interest upon the capital invested but realize a profit beyond."

No. 17.

Mr. M. Bury to The Secretary for Public Works.

Sir,

6, Norwich Chambers, Hunter-street, Sydney, 18 March, 1887.

I notice by the papers that Sir Henry Parkes, as well as other members of your Government, have expressed a desire to introduce the cable system of tramway. This is a matter that I have repeatedly urged upon the Government at various times, and have made proposals to the Government of the day on the subject, but hitherto I have not been able to induce the departments to give the matter that consideration which the subject merits. As the present Government appear desirous of dealing with the trams in a manner to make them pay, I will state what I have repeatedly stated before, that I and my friends in New York and London are prepared to lease or purchase the Sydney trams, and immediately commence constructing several lines of cable trams, and otherwise so reorganize the working of the lines that they shall return a fair interest on the capital invested, and no longer be deemed a public nuisance.

I may say that I have lately secured the concession for constructing a cable tram in the borough of Balmain, and I am the owner of a patent cable tram system, known as Miller's Duplicate Cable System which is largely used in America, and that it is the most perfect cable tram system yet invented, as no breakage of a cable or injury to the machinery affects the working of the tram.

I beg to draw your particular attention to the enclosed printed matter.

If the Government are disposed to entertain the question of leasing or purchasing, or the adoption of a cable system, I shall be glad to meet you and discuss the several points connected therewith, and point out generally the manner in which it is proposed to alter and work the system with the minimum of inconvenience to the public.

I have, &c.,

MAXWELL BURY.

[Enclosures.]

(Extract from an article entitled the "Balmain Tramway.")

In connection with the above, a special interest attaches to the latest and most perfect development of the cable system, known as the "Miller" or duplicate cable system, which is to be adopted here for the first time in Australia. In this plan the motive power is duplicated. Two cables run side by side under the track, propelled by a double set of winding machinery, driven by double engines. Both engines and both sets of machinery can be used together or separately; and the gripping apparatus on the cars is so arranged as to take either cable at will. While it may seem at first sight an unnecessary outlay to duplicate the system for the emergency of accident to a single cable, which might never occur, the advantages are obvious on explanation. The greatest wear and tear is of course on the cable, and constant inspection and repair are necessary. A slight bruise or wear, if not attended to at once, will work into a serious injury in time. In the duplex system, while one cable is working the other can be inspected at leisure in the daytime and any needed repairs made, and the life of the cable is thereby indefinitely prolonged; while in case of accident to the engine or winding machinery of one, the other is ready at a moment's notice. For purposes of inspection, a pair of small engines moves the idle cable along at a slow rate.

The duplicate system has made its way rapidly. First introduced in Chicago, a line $3\frac{3}{4}$ miles long was laid in 10th Avenue, New York City, a line $2\frac{1}{2}$ miles long in Kansas City, and during 1886 the system has been adopted by eight railroad companies.

With a view of presenting the latest information on a number of points of interest a representative of this paper waited on the contractor, and by the courtesy of his agent, Mr. Montgomerie Severn, the following information was elicited.

Mr. Maxwell Bury, the contractor, is an engineer of world-wide experience, and he has the sole control of the agency for the colonies of the Miller duplicate cable system.

* * * * *

CABLE TRAMWAYS.

The *Mining and Scientific* press of San Francisco, in which city the cable road was first introduced, in speaking of cable trams, says:—"Once in operation these roads are run much more cheaply than when operated by horse, although the first cost of the road is greater with the cable system. These cable roads, without exception, have been profitable from the beginning,

beginning, no cable road yet built having been a losing operation. In every instance the stock is worth from 25 per cent. to 60 per cent. more than it cost, which is a very important point for capitalists. All those portions of the city which the road or its branches tap have already felt the good influences of rapid communication. In the cable road the bed is solid, and the rails so well jointed that the whole road is smooth. The cars are well lighted by end and centre lights, and brilliant head lights are used in front which light up the street far ahead."

Cable cars can travel at the rate of 10 miles per hour, or they may be made to slowly press and inch their way through a crowd in sympathy with all its movements.

The advantages of the cable system of trams may be briefly enumerated as follows:—

1. Steep grades are as easily worked as levels.
2. The cars can be stopped instantly or gently slowed at any point of the line, and can be started with promptness, ease, and gentleness.
3. Any desired rate of speed can be obtained, and varied on any portion of the road to accommodate it to obstructions in the way.
4. Perfect cleanliness is secured.
5. The working of the road is noiseless and even, and no annoyance whatever is experienced.
6. And as a further advantage, when operated upon by the duplex method it is impossible for delays to be occasioned by a break anywhere in the system, as the duplicate cable immediately takes up the work of the disabled cable, or the duplicate engine does the same service for its mate.

Please acknowledge and submit with papers. I should like to see him in about ten days or so.—
J.S., 19/3/87. Acknowledged.

No. 18.

Mr. M. Bury to The Secretary for Public Works.

6, Norwich Chambers, Hunter-street, Sydney, c/o A. M. Severn,
or Box 899, G.P.O., 8 May, 1887.

Sir,

I have the honor, on behalf of myself and a Sydney syndicate, to address you respecting the reconstruction and working of the Sydney tram system.

I am led to take this step from the fact that the Government have expressed a desire to make some change in the working of the trams by adopting the cable system.

We also learn that overtures, having this object in view, have been submitted to your Government by gentlemen or syndicates outside this Colony.

As I feel convinced that local men and local capital can execute this work as well, if not better, than others outside the Colony, I beg to submit proposals to this end, which please find appended to this letter.

Having stated this much, I have to mention that the local syndicate have identified themselves with the best known system of constructing and working cable trams, viz., "Miller's Duplex System," a system which is in great favour in America, and is being largely adopted in that country; and where the traffic is heavy and continuous, as in Sydney, it is the only reliable mode of working cable trams.

The duplex system means double machinery and duplicate cables. By way of explanation I may say that those who are intimately connected with cable trams have found, from practical experience, that the breakage of, and damage to, cables is the chief objection urged against this mode of traction, as a broken or damaged cable means the stoppage of traffic, and consequently serious inconvenience to the public. This liability to interruption in the traffic, where single cables are used, has hitherto prevented the more general adoption of the principle to street traffic. This particular defect in the cable system was brought prominently before Mr. D. J. Miller (who has built more cable trams than any other engineer living) whilst constructing and working cable trams in Chicago. Mr. Miller, after studying the subject, and experimentalizing for two years, invented the double-cable system.

The Tenth Avenue line, New York, was the first line built on his principle, and it has worked for twenty-two hours out of the twenty-four without stoppage for nearly two years, and no single-cable line can or has worked for that number of hours per day the year round.

With the duplex system all requisite inspection and repairs are made leisurely during the day. With the single cable these have to be effected at night.

If a breakdown occurs in the machinery of the duplex system, the disabled engine is at once disconnected, and its duplicate put into service. Likewise, when a cable in that system shows signs of weakness the second rope comes into service, and the weaker one is repaired at leisure and then put into use till it shall break down again, to be again patched up; and this process is continued till the rope is absolutely worn out.

Having given a short outline of some of the peculiar merits of Miller's system, I beg to draw your attention to the terms appended, and on which the syndicate are prepared to enter into an agreement with the Government to reconstruct and work the Sydney trams on Miller's duplex system.

I have, &c.,

MAXWELL BURY.

THE SYDNEY TRAMWAYS.

THE following are the terms on which the syndicate referred to in my letter dated 8th May, 1887, are prepared to take over the trams:—

The syndicate are prepared—(A) To purchase the Sydney Tramway rolling stock, &c.

(B) To lease do do do

1. In the event of a purchase, the syndicate will pay the sum of £ for the same, which sum is to include the permanent way, rolling stock, land, buildings, &c.

2. In the event of a lease, the syndicate will pay 5 per cent. on the sum of £ for the first twenty years, and 6 per cent. for remainder of term.

3. In the event of a purchase or lease being granted, the Government to assign all the powers and privileges held by them under the Tramway Act.

4. The syndicate agree, within six months after purchase is effected, or lease granted, to commence the construction of cable tramways, and within sixteen months from commencement of such works to have cable

cable trams substituted for the steam motor system on the lines running within the city boundaries. They also agree to maintain (under conditions to be agreed upon) the existing traffic undisturbed during the construction of the city cable tramways.

5. The syndicate to have the exclusive right, if the trams are purchased or leased, of laying down cable trams within the city, on requisition from inhabitants, and the same receiving the sanction of the Government, or Municipal Councils, as the case may be.

6. The maximum fares not to exceed 2d. per mile.

7. If a purchase is effected, the Government, on giving six months' notice, shall have the right of resuming the tramways, rolling stock, &c., together with any new works executed by the syndicate, on the Government repaying the purchase money, together with all outlay in the construction of new works, with 25 per cent. added thereto.

8. If the Tramways are leased, the Government shall have the option of resuming the same at any time on giving six months' notice, and on recouping the syndicate all outlay on the Tramways, with 33 per cent. added thereto.

9. If the Government grant a lease for fifty years, at the rate of 5 per cent. for the first twenty years, on the sum of £ and 6 per cent. on the same amount for the remaining thirty years, the syndicate will reconvey the Tramways to the Government, together with all new works, rolling stock, land, &c., free of cost or charge to the Colony.

10. The syndicate are prepared to take over the Tramways immediately, and commence reconstructing them on the cable system, on the Government granting them a lease for as long a period as they legally can, and agreeing immediately to submit a Bill to Parliament authorizing the leasing or the selling of the Tramways to the syndicate on the foregoing basis.

11. As a guarantee of the *bona fides* of the syndicate, on the Government agreeing to sell or lease the trams to them, they will deposit the sum of £20,000 with the Treasurer, which sum shall be forfeited in case they fail to perform all they hereby agree to in the reconstruction and conversion of the motor system within the city into cable tramways, on Miller's duplex or any other approved cable system.

MAXWELL BURY.

8th May, 1887.

To be put with other papers on this subject for Cabinet.—J.S., 28/5/87.

No. 19.

Mr. M. Bury to The Secretary for Public Works.

Sir,

Sydney, 10 May, 1887.

I am desirous, on behalf of a Sydney syndicate, to lay before you certain proposals with reference to taking over, reconstructing, and working the Sydney trams; I shall therefore feel obliged if you will kindly name a day and hour when Mr. Rutter and myself can see you on the subject.

I have, &c.,

MAXWELL BURY.

The Minister will see Mr. Bury on Wednesday, at 11 a.m.—H.M'L. (Mr. Bury asked to call.)
Mr. Bury called and saw the Minister. Papers can be put by for the present.—H.M'L., 19/5/87.

No. 20.

Mr. M. Bury to The Secretary for Public Works.

Sir,

Sydney, 28 June, 1887.

Box 899.

On the 8th May I addressed you, on behalf of myself and a syndicate of wealthy and influential local gentlemen, on the question of the purchase or lease of the Government trams.

From the daily papers we learn that the Government have decided not to lease the trams, and from the same source we find that some particulars are given as to the nature of our offer. We had hoped that unless the Government had been prepared to open negotiations with us that our terms would have been considered private.

The syndicate, however, are still prepared to treat with the Government for the purchase of the trams, and the introduction of the duplex cable system within the city boundaries on the terms contained in clauses 4 and 7 of our offer.

The working of the trams has been carefully considered, and estimates have been prepared (which amount to nearly £250,000) for the partial introduction of the cable system. This amount, if added to the price to be paid for the trams and rolling stock, will make a total of over £900,000, upon which amount interest will have to be earned. On that capital we have calculated that by careful and businesslike management the interest we offered to pay on the public money invested may be secured. We feel certain, however, that the rate of interest named is dependent solely upon good management.

Should your Government determine not to sell the trams, I am authorized to say that some members of the syndicate are prepared to lay down the duplex-cable system for the Government under contract, and should they be allowed to take the management of the tram system when thus improved they will earn the return named.

You will oblige myself and the syndicate by favouring us with an early reply to this second communication.

I have, &c.,

MAXWELL BURY.

To be placed with Mr. Bury's letters.—H.M'L., 30/6/87.

Saturday, September 4.

MR. HOLROYD SMITH, of Halifax, then read a paper on "The Blackpool Electric Street Tramway," of which he has been the engineer. He stated that the difficulty of applying electricity for Tramway working lies in the fact that other vehicular traffic passes over the same road, and therefore the necessary conditions of safety to the public, and practical and economical efficiency, have to be considered. This is accomplished by constructing an underground channel in the centre of the track, having a narrow slit or opening in its surface for communication between the electric motor on the car and electric conductors within the channel. The general conditions are three—(1) safety to the public, (2) efficiency, (3) economy. With some reservations the first condition may be accomplished by the employment of secondary batteries, which are destined to play an important part in the progressive development of electricity for tractive purposes; but it must be admitted that they occupy only a secondary place when it is shown that electricity can be used direct, and then can not only fulfil the first condition but the other two conditions also. The employment of rails as lead and return conductors is out of the question, for in all installations it must fail in regard to all three conditions. Side fence rails or overhead conductors, though fulfilling the conditions of efficiency and economy, are inadmissible for street purposes. There seems, therefore, but one course, and that is to place the electric conductors underground. Many carefully worked-out details are necessary to carry this into effect. The channel is formed strong enough to support the ordinary traffic of the road, and so as to be easily flushed and cleansed. Its surface consists of steel troughing filled with wooden paving blocks, and forms a good roadway; the sides of the channel are partially formed of creosoted wood, holding porcelain insulators, which carry electric conductors of specially drawn copper, so formed that they can be readily and securely fixed, and the different lengths secured by expansion joints. Two conductors are supplied—(first) that they may be hidden under either side of the surface and so be protected from injury by any substance falling through the slit in the surface of the channel; and (secondly) to make it possible to deal with points, loops, and crossings. Only the positive electricity passes along these conductors; the return is made by means of the rails, which are electrically connected one with the other. Communication is made with the cars by means of a collector which runs upon the copper conductors within the channel. Insulated copper bands, protected by steel plates, pass through the slit or opening in the surface of the road, and by a flexible insulated cord attached to an electrical terminal underneath the car, so that when the car moves the collector is drawn along with sufficient force to clear away any ordinary obstruction; but should an absolute block occur, then a special clip releases the collector, and a breakage is avoided. From the terminal underneath the car the current passes to the switch-box, where the quantity and direction of the electricity to and within the motor is regulated, and thereby the speed and direction of the car is controlled. Switch-boxes are placed at each end of the car, and are provided with removable handles, without which it is impossible to operate them. The driver, who has charge of these handles, can cause the car to move backwards or forwards at will. From switches the current goes to the motor, and there produces mechanical energy. The motor running at a high speed, a combination of spur and chain gear is employed to communicate the power to the wheels and drive the car. The gear is specially designed to run smoothly and silently; from the motor the current passes by way of adjustable clips to the axle, and by them through the wheels to the rails and back to the station, where the electricity is generated. The electricity is generated at a station situated near the centre of the line. The engines and dynamos are in duplicate, and are capable of supplying a force of 250 volts and 300 amperes when required. The arrangements are such that the supply is equal to the demand, viz.—If one car is running, enough current to drive it, and no more; if ten cars, sufficient for them. The practical success of the undertaking is proved by the continued working of the line. Nine cars run daily during the present season; they are always crowded, and most of the passengers ride the full 2 miles. Over 42,000 have been carried in one week of six days, there being no Sunday traffic. The cost of coal burnt being under £5, gives thirty-five passengers carried the mile for a half-pennyworth of coal.

MR. R. HORSFALL, the Chairman of the Blackpool Company, said that for the last four weeks their receipts had been £330 per week, and the cost of working had been £45. They hoped to pay the cost of working during the winter, and to make a nice profit for the shareholders during the summer. He believed there was a great future for electric tramways in this country if they were properly constructed; but the misfortune of the Blackpool line had been that it had cost for the 2 miles as much as £30,000.

CAPTAIN DOUGLAS GALTON, speaking with reference to the Brussels and Antwerp tramways, said that they were worked by accumulators on the cars, and at first sight that system, if it could be shown to be economical, seemed to be preferable to others, because it did not involve a large outlay in the plant or maintenance. But as yet the experiment in neither city gives much light.

PROFESSOR PERRY said that the most valuable thing a mechanical engineer could go in for was the construction of a motor which should have no mechanical defects. The electrical engineer made his motor perfectly electrical, but its nuts and keys were always getting loose.

MR. GUIBERT KAPP and other gentlemen having also spoken, MR. SMITH replied. He denied that accumulators could be economically carried, on account of their weight, and mentioned that the cost of working of the Blackpool cars was 3s. 1d. * per car mile.

Register this. Mr. Larsen, from England, has recently brought this system under my attention.—
CH.A.G., 2/12/86.

* This must be a misprint—3s. 1d. per car per mile. More likely 3½d. The road is 2 miles long. At 3s. 1d., each journey would cost 6s. 2d. The return journey the same, equal 12s. 4d. a double journey. The expenditure, the Chairman said, was £45 a week. Well, at 12s. 4d. the double journey, this expenditure would be reached on seventy-five double journeys, or 150 single journeys. The cars will hold thirty-five passengers, and in 150 single journeys 5,250 passengers would be carried, but they say they carried eight times that number in a week. The cost of working was probably 5d. a car mile. I offered

offered to consider a proposal from Mr. Larsen to supply the motive power for 7d. a car mile for vehicles carrying sixty passengers, and for a guarantee of that he would make any lines to run on an electric principle. We could run 1,500,000 per annum, which, at 7d., would give £43,650 a year. This would pay for his working expenses, and give probably 20 per cent. on his outlay. We would have to expend about £150,000 to £180,000 to get the lines remade.—CH. A. G., 2/12/86.

See Mr. Larsen's letter of 3/12/86. I must have misunderstood him, or he does not express in that letter what I gathered at our personal interview. I do not know what the cost of running tram-cars worked by electricity up grades 1 in 20 would be. Mr. Larsen puts it down at 9d. for grades 1 in 25, while it is 6½d. on the level. Nor does he explain what the 9d. includes. If he will lay down the apparatus complete, that is the underground conductor, the proposal might be worthy of consideration. He says it does not include rolling stock, or engine-house, or land.—CH. A. G., 8/12/86.

No. 22.

Mr. J. D. Larsen to The Commissioner for Railways.

Sir,

Reform Club, Sydney, 3 December, 1886.

Referring to my interview I had the honor to have with you on the 1st instant, I beg to offer some further remarks relating to the working of Tramways by electricity, direct from the dynamo or direct system, with underground conductors.

There is also a system by which the current can be transmitted through the rail, or by a third lighter rail, but this can only be adopted where the rails and road are not interfered with by the public or otherwise. It is the least expensive in regard to first cost of all the electric systems for propelling tram-cars.

The storage battery system, which is very good where the direct current cannot be applied to the road, but it is more expensive and liable to get out of order, and the same installation would be required as in the first-named direct system for the number of cars required.

I would also mention that the underground conductors can be laid in a wooden channel, which would reduce the first cost considerably, and would answer very well for a time.

The cost to propel a car constructed to carry 40 passengers, and a dummy to carry eighteen, at 6 miles an hour, will be at the following rates per car mile:—

On a level road	6½d.
On a road of 1 in 50	7¼d.
On a road of 1 in 25	9d.

The cars not to exceed 35 cwt. empty, and the dummy 18 cwt. The above rates are based on the installation for 35 cars, whereby 30 will always be at work, and 5 in reserve, and each car not to do less than 75 miles per day.

The above mentioned prices do not include cars, dummies, land, or engine-house. Should there be any other information required I shall be pleased to give same.

Yours truly,

J. D. LARSEN.

Acknowledge and resubmit early.—CH. A. G., 6/12/86. Aekd., 7/12/86. Mr. Larsen makes no proposal, as I understand.—CH. A. G., 8/12/86. Mr. Larsen merely says what can be done, but makes no definite proposal. Are we to ask him to make one?—D. C. McL., 8/12/86. No; he will probably communicate further with the department.—CH. A. G., 9/12/87.

No. 23.

Mr. J. D. Larsen to The Commissioner for Railways.

Sir,

Sydney, 29 December, 1886.

Being for some time in Sydney, and having observed the Tramways and their working, in the city and suburbs, and, from this observation, I have been able to form an opinion that they could be made a benefit to the Government instead of a loss, which I have been given to understand they are now; but this benefit can only be obtained by a considerable outlay of further capital, and, in consideration of this, and my knowledge of construction and the working of Tramways, and being in communication with parties in London, whose knowledge of this business is well known to the public, and able to find capital for any legitimate undertaking, I take the liberty to offer to lease the Government Tramways in Sydney and suburbs, on such conditions and terms as may be agreed on, should the Government feel disposed to lease same.

In the first instance, on behalf of others and self, I beg to offer to the Government to lease the Sydney and Suburban Tramways for a period of twenty-one years or longer, at a rental of 7 per cent. per annum on the capital expended up to the end of the last financial year, 1885.

It is further proposed that a capital of £300,000 should be expended (principally in Sydney) for the reconstruction of the lines, for the working of same by cable or electricity, this capital to be repaid to the lessees at the termination of the lease; also the Government to provide land for the erection of buildings and machinery necessary for working the lines, but the lessees to erect all buildings and machinery at their cost.

An undertaking as this, where a capital of at least £400,000 would be required, could not be undertaken by a few. It is proposed to form a Company in London, with a directory and secretary of the leading Tramway Companies, who have experience and confidence of the public.

I should also mention that no promotion will be paid to anybody.

I am, &c.,

J. D. LARSEN,

Mem. I.M.E. Asso. M.I.C.E.

The

The capital referred to herein is £708,109, which, at 7 per cent. will return £50,000 a year. We are paying for interest about £28,000 a year, and consequently the balance, £22,000 a year for twenty-one years, invested at 4 per cent., would realize £757,000, out of which £300,000 would have to be returned to the Company, showing net £457,000, and a Tramway handed over at the end of twenty-one years very much better than the one we have now. If the Government are disposed to lease the Tramways, I think the terms offered are certainly the best that have been made.—CH. A. G., 31/12/86.

No. 24.

Mr. J. D. Larsen to The Commissioner for Railways.

Sir, Sunnyside, Woolwich Road, Hunter's Hill, 1 March, 1887.

Allow me to call your attention to my letter of 29th December last, regarding my offer to lease the Sydney and Suburban Tramways, and I should be much obliged if you will bring the said letter under the notice of the Hon. the Minister for Public Works at your earliest opportunity.

I would also mention, that from further observations, I find it will be necessary to have four cables in the main lines to carry the traffic, and to give the public the benefit for which Tramways are intended. By adopting the four cable system an unlimited traffic can be carried on.

It should also be mentioned that in reconstructing the Tramway for cables, I propose to construct the tubing or channel in cast-iron, and to adopt other improvements, which experience has proved to be necessary.

Considering the Tramways and the state they are at present, in and about Sydney, that the Government will soon have to expend a large capital for repairs, without being of any permanent benefit for the future, it would be better to at once take such steps as to lead to the reconstruction of the lines of a permanent and durable system.

There is another matter you will allow me to call attention to. There is at present a large number of men out of work, and as the year advances their number will, I should say, increase. Now, by reconstructing the Tramways, a large number of hands would find employment for at least 18 months, and Sydney will have as good a Tramway as any in the world, if not better.

Yours, &c.,

J. D. LARSEN, C.E.

See my minute of 31/12/86, on papers herewith. If it be decided to lease the Tramways for twenty-one years, a Bill would have to be passed through Parliament; the present law permits only of a lease for three years. I should not advocate the acceptance of any private offer, but when the Bill is passed specification and conditions of lease for twenty-one years should be prepared, and tenders publicly invited. These private offers are useful as showing that remunerative prices could be obtained.—CH. A. G., 8/3/87.

I concur with Commissioner, but matter must stand over for the present.—J.S., 12/3/87.

No. 25.

Mr. J. D. Larsen to The Commissioner for Railways.

Sir, Woolwich Road, Hunter's Hill, Sydney, 29 March, 1887.

On the 29th of December last I presented an offer to the Commissioner for Railways to lease the Sydney and Suburban Tramways. I also forwarded a further communication to Mr. Goodchap on the 1st instant relating to the same matter. I take the liberty to ask you if those letters have been laid before you and the Cabinet; if not, I would ask you to call for same and take same under your consideration and lay them before your colleagues. I would also ask you to grant me an interview at your earliest convenience.

Yours, &c.,

J. D. LARSEN.

Please inform Mr. Larsen that I have received letters and am gathering information on the whole subject to submit to Cabinet.—J.S., 30/3/87.

No. 26.

The Commissioner for Railways to Mr. J. D. Larsen.

Sir, Department of Railways, Sydney, 31 March, 1887.

I have the honor, by direction of Mr. Secretary Sutherland, to acknowledge your letter of the 29th instant, and to inform you that your communications offering to lease the Sydney and Suburban Tramways have been duly received, and as soon as certain information which he has called for is available the whole subject will be submitted to the Cabinet.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 27.

Farmer Bros. to The Secretary for Public Works.

S'r, 313 George-street, Sydney, N.S.W., 15 March, 1887.

By this morning's papers we learn that the Cabinet gave protracted consideration to the question of abolishing steam motors and the substitution of "cable tramways."

We had intended some time since approaching your predecessor upon this subject, but owing to the election we deferred our correspondence.

As

As the representatives of the firm of Messrs. Bullivant & Co., the largest firm of wire-rope manufacturers extant, we have given this question of cable trams a great amount of consideration, the rope now running at the North Shore line being one of Bullivant's make, while the firm will not be unknown to several eminent Colonial visitors who were in England last year and witnessed the operation of making one of the largest ropes ever turned out in one length without splices; amongst the visitors were the Hon. T. Garrett, the Hon. G. Coombes, Mr. R. Burdett Smith, Mr. R. H. D. White, Major P. B. Walker, and others, any of whom could give you information as to the extent of our friend's works and their capability of carrying out any works of this class.

They would be prepared to take over the existing stock, lines, &c., &c., and to substitute cable lines and to lay in any additional roads that may be necessary.

Our Mr. Bullivant, senior, is chairman of the Cable Tramways Co. of England, and he would be the head of any Company undertaking the Tramway construction, working, and maintenance in this city, through ourselves.

May we ask the favor of an appointment at an early date.

We are, &c.,
FARMER BROTHERS.

I shall be glad to see these gentlemen when they can make it convenient to call.—J.S., 16/3/87.

Dear Sir,

Sydney, 23 March, 1887.

We have to acknowledge your favor of 21st instant, *re* Sydney Tramways.

Our Mr. Wm. N. Farmer, who has lately returned from England, will do himself the pleasure of waiting upon the Minister at 10:30 a.m. to-morrow. If this hour is convenient we ask you to let us know by our messenger.

We are, &c.,
FARMER BROS.

Commissioner for Railways.

No. 28.

Farmer Bros. to The Secretary for Public Works.

Sir,

313, George-street, Sydney, N.S.W., 21 June, 1887.

Referring to our letters of March 15, 1887, and March 23, 1887, also to the interview our Mr. W. N. Farmer had with you on the behalf of our friends, Messrs. Bullivant & Co., cable-rope manufacturers, we trust that you will include Messrs. Bullivant's name amongst those who are to be permitted to submit propositions for the carrying out the alterations in the Sydney tramway system.

As mentioned in ours of 15/3/87, Messrs. Bullivant, in conjunction with a wealthy English syndicate, representing about one and a quarter millions sterling, would be prepared to take over the existing lines, stock, plant, &c., &c., at a valuation, and to lease the roads laid down by them for a term of years to be arranged.

So far as we can gather, the scheme to be submitted to you by Messrs. Bullivant & Co. would be the gradual substitution of cable tramways throughout the existing steam lines, combined with extensions into such districts and streets as may be necessary from time to time, and the whole system proposed to be submitted for approval by the Government.

We are, &c.,
FARMER BROTHERS,
Sole Agents for BULLIVANT & Co.,
72, Mark Lane, London, C.E.

No. 29.

Messrs. A. Towns & Co. and A. Morris to The Commissioner for Railways.

Sir,

Sydney, 22 February, 1886.

We have the honor to submit to you on behalf of A. S. Hallidie, Esq., of San Francisco, and others, the accompanying memoranda of inquiries in relation to the Government system of Tramways within the city of Sydney and its suburbs.

Mr. Hallidie is willing, in conjunction with resident capitalists, to entertain your proposition for the sale of the Government Tramways, but desires to receive replies to the accompanying memoranda of inquiries, and also such other information in respect to the same as may be in your power to give.

It is requisite that you should clearly state that the steam motors are to be removed from the populous streets of the city, and that the cable system or some system equally as good be substituted.

In any offer the Government propose to make or entertain for the purchase or sale of the Tramways now existing, the syndicate should have power to lay new lines on routes they may deem desirable, and of changing existing routes to meet the public demands.

If the inquiries which are herewith submitted are satisfactorily replied to Mr. Hallidie and his friends will be prepared at once to entertain the proposal for the purchase of the Government Tramways, and to construct within the city within one year, 2 miles, and within three years 8 miles of a double line on the cable system.

An early reply is respectfully requested.

We have, &c.,
R. TOWNS & CO.
AUGUSTUS MORRIS.

At what periods are interest and sinking fund to be paid ?
 What time will be given for consideration and completion of purchase of the Tramways ?
 Will the Government receive and invest the sinking fund so as to compound at same or better rate of interest than the 4 per cent. to be paid by the syndicate as interest on purchase ?
 Will the Government permit payments on account of the sinking fund at option of the syndicate ?
 Will the Government pass Bill so soon as the purchase money is paid ?

No. 30.

The Commissioner for Railways to Messrs. R. Towns & Co. and A. Morris.

Gentlemen,

Department of Railway, Sydney, 22 February, 1886.

In reference to your letter of this day's date, submitting, on behalf of Mr. A. S. Hallidie, of San Francisco, and others, a memoranda of inquiries in relation to the Government system of tramways within the city and suburbs, and stating that Mr. Hallidie is willing, in conjunction with resident capitalists to entertain "my proposition" for the sale of the Government Tramways, I have the honor to inform you that there is some misapprehension in this matter. Mr. Hallidie and Mr. Augustus Morris had an interview with me on the subject of the Tramways, and Mr. Hallidie, as I understood, wished to know whether the Government would entertain a proposal for the laying down of cable lines within the city boundaries.

In reply, I stated that propositions had been made to the Government to lease or purchase the Tramways, and that the Minister for Works had intimated to those making the propositions that he would be prepared to have stated to him, in detail, what the proposals were. I added that Mr. Hallidie, if he desired to do so, could submit, in common with others, any proposals he had to make, but I could not say what the intention of the Government was in the matter.

The memoranda of inquiries submitted extend far beyond the scope of the information which could be afforded, and converts an intimation given by me, that Mr. Hallidie would be at liberty to submit his proposition, into suggested terms and conditions upon which the Government would be prepared to dispose of the Tramways.

Upon that head I can only say that Mr. Secretary Garrard intimated, in reply to a question asked in the House of Assembly,—“That if it be determined to sell or lease the Tramways, tenders will be invited, and the conditions will be drawn up by the Government.”

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

No. 32.

Messrs. C. F. Stokes and A. Morris to The Secretary for Public Works.

Sir,

Sydney, 24 March, 1887.

Referring to our interview with you respecting the purchase or lease of the Government Tramways, we have now the honor, on behalf of Mr. A. S. Hallidie, of San Francisco, to submit, for the consideration of the Government, the following propositions:—

First,—

1. To purchase from the Government the whole of the present tramway system of engines, cars, &c., with all plant appertaining thereto, at such price and upon such terms as to privileges, &c., as may be agreed upon.
2. Mr. Hallidie to pay to the Government interest upon the agreed price at the rate of 4 per cent. per annum.
3. Also to pay not less than 2 per cent. each year upon the amount of principal which may be due to the Government at the end of each year—which payment of 2 per cent. the Government shall receive and place to the credit of the purchaser on compound interest at the rate of 4 per cent. per annum, and shall apply in liquidation of the purchase money.
4. The purchaser to have the option of paying in liquidation such further sums as he may from time to time see fit, such sums to be held and applied in like manner by the Government.
5. So soon as the whole of the purchase money shall be paid off then the Government shall transfer to the purchaser the whole tram system of the city and suburbs, which shall then become the property of the purchaser, with a proper transfer also of the tramway lines and roads upon which the tram lines may be then or thereafter laid, the purchaser having the right to use such roads for tramway purposes only.
6. The Government to grant a full franchise to the purchaser to lay cable tramways, or tramways upon any other improved and approved system, wherever he or they may in their discretion choose.
7. The purchaser not to exceed a fixed maximum rate of fare to be charged on the various lines, and to substitute “in the city” within one year from completion of purchase two miles (2 miles), and within three years eight miles (8 miles), of a double line, on the cable or other approved or improved system, and the present motors to be used in the suburbs only until the cable or other system can be adopted.

Second,—

1. To lease from the Government, on a capital value to be agreed upon, for a period of (say) fifty years, the whole of the present tramway system in city and suburbs, paying on such capital value as may be fixed upon interest at the rate of 4 per cent. per annum.
2. The Government to grant to the lessee a full franchise to lay cable or other tramways wherever he may choose, as in condition 6 of first proposition.
3. The lessee not to exceed a fixed maximum rate of fare to be charged on the various lines, and to substitute in the city the cable or other approved system as in first proposal.
4. At the expiration of the term of fifty years the whole of the tramway system to be subjected to a valuation by valuers mutually appointed in the usual way, and should the Government decide to take it, they are to have the option to do so upon paying to the lessee such amount as may be awarded to him under such valuation,—payment to be made in such manner as may be mutually arranged.
5. In the event of either of the above propositions being accepted by the Government, six months to be allowed the purchaser or lessee to complete arrangements to purchase or lease, as the case may be.

We wish you to understand that we make the above propositions as a basis upon which Mr. Hallidie will be prepared to purchase or lease the Tramways, and that these propositions are open to modification on either side; or should the Government themselves deem it desirable to formulate conditions for sale or lease, we shall be glad to hear from you.

We have, &c.,

CHAS. F. STOKES, } Attorneys for
AUGUSTUS MORRIS, } A. S. Hallidie.

The Minister wishes this to be acknowledged and put with other papers.—H.M.L., 29/3/87:
(Acknowledged.)

No. 33.

No. 33.

Mr. H. Bastings to The Secretary for Public Works.

Sir,

Molesworth Chambers, 75, Little Collins-street, Melbourne, 25 April, 1887.

On behalf of the Cable Tramway Construction Company of New South Wales I have the honor to submit the proposals hereinafter noted for the purchase and reconstruction of the Sydney Tramways.

At the interview I had with you on the 24th March ult., when introduced by Mr. Slattery, the Company's proposals were indicated by me in a general way, and they are now formulated and presented to you for the favourable consideration of your Government.

The proposals are as follows:—

First,—

- (a) To purchase at a valuation fixed on an equitable basis the whole of the Tramway lines now constructed and running, inclusive of equipments.
- (b) To remodel the existing system of Tramways in regard to the city routes, permanent ways, equipments, and substituting the cable system of traction where practicable; together with the providing of a frequency of car-service which shall meet the present and future requirements of the city and suburbs of Sydney.

Second,—

2nd. The Government to grant to the Company the sole right of running tram-cars in the city and suburbs for a term of years, which shall be determined on the following basis:—

- (a) On the amount of capital which the Company guarantee to expend in the purchase and remodelling of the existing lines, and the completing of the system noted in No. 1 proposal.
- (b) The annual payment required by the Government for the sole right of running the cars.
- (c) The terms on which the complete system, in full working order, shall be handed over to the Government when the concession shall cease, *i.e.*, with or without valuation.

3rd. An alternative proposal, whereby the Government can provide all the necessary capital.

- (a) The Company to design, remodel, and construct a complete system of cable tramways at a price per mile to be arranged, or any other equitable basis.
- (b) The Company to work the lines for a period of years, guaranteeing a minimum annual payment of seven (7%) per cent. on the total amount expended on the construction of cable tramways.

The Consulting Engineer to the Cable Tramway Construction Company, Mr. G. S. Duncan, is the Engineer to the Melbourne Tramway Trust, and he has designed and supervised the whole of the works connected with the Melbourne scheme of tramways, which has been so successfully inaugurated. This will be a guarantee of the capacity of the Company to carry to a successful issue any works undertaken.

In the event of your Government deciding to accept either of the proposals submitted, I am prepared to give a substantial bond for the fulfilment of such obligations, and I shall be glad to know your decision at an early date.

I have, &c.,

HORACE BASTINGS,
Chairman.

Acknowledge and submit with papers.—J.S., 26/4/87. Done.

No. 34.

Mr. W. Shenstone to The Secretary for Public Works.

Sydney Tramway and Omnibus Company (Limited),

Sir,

No. 66, King-street, Sydney, 10 May, 1887.

In view of the contemplated alterations in the administration of the Government Tramways, I have the honor, on behalf of the Sydney Tramway and Omnibus Co., Limited, to intimate that they are prepared to negotiate for purchasing or taking over the said Tramways and working the same.

I may state that this Company, prior to the Government determining to construct and work tramways, introduced a Bill into Parliament for the same purpose, involving a large outlay, and that the routes therein laid down were identical with those adopted by the Government; this, together with the large experience possessed by the Company of the requirements for the street traffic of Sydney and the suburbs in connection with their long-established business, and the large resources at their command, will be some guarantee of their ability to maintain and carry out the undertaking.

It would be premature to attempt to set forth any proposition in a letter, but I trust you will be pleased to recognize our claim to some consideration, and favour us with an opportunity of discussing the matter in detail.

Awaiting your reply,—

I have, &c.,

WM. SHENSTONE,
Secretary.

Please acknowledge, and include in schedule of offers.—J.S., 11/5/87.

No. 35.

LEGISLATIVE ASSEMBLY, THURSDAY, 17 MARCH, 1887.

Mr. MELVILLE asked the SECRETARY FOR PUBLIC WORKS,—Is it the intention of the Government to introduce the cable system on our Tramways?

Mr. SUTHERLAND answered,—The Government have called for information on the subject, and as soon as it is obtained the whole question will be considered by them.

Please see Mr. Secretary Sutherland's reply. Is any further action to be taken?—D.C.McL. 28/3/87. Mr. Bury has been asked to call upon the Minister; we must await his reply.—A.R., 29/3/87.

No. 36.

Précis.

SALE OR LEASE OF THE TRAMWAYS.

So long back as August, 1882, Mr. Angus Mackay made a proposal to take over the Glebe Point or any other section of Tramway on such terms as might be agreed upon, with a view to work it on the London system. MESSRS. MACKAY AND FLEMING.

The Commissioner referred the proposal to Mr. Secretary Copeland, remarking that the Government had power to lease the Railways, and therefore, constructively, the Tramways also.

The Minister minuted that the offer could not be entertained for the present.

Under date of 15/1/85, Mr. Mackay, on behalf of a syndicate, addressed Mr. Secretary Wright, making a somewhat similar proposal, and on the 3rd February furnished fuller details of his scheme.

The Commissioner minuted that he could not advise the leasing of the Tramways, except as a whole; that the proposal made by Mr. Mackay to have a combined horse and motor service would not answer, but he believed a cable-road inside city boundary, and a motor service outside, would be the proper thing, and that the proposal to run round Circular Quay and join the present system at Parramatta-street bridge was his (Commissioner's) own scheme, and was the only one to meet the requirements of the traffic.

The Minister minuted that the only offer which would be accepted would be to lease the entire system of Tramways.

A few days after Mr. Mackay had an interview with Mr. Secretary Wright on the subject of the leasing of the Tramways, and on the 13th of that month Messrs. Mackay and Wm. Fleming addressed the Minister, proposing to take over the Tramway permanent-way and workshops, and such portions of the rolling-stock as might be required for the city tramway business, they paying Government for the same. For the first ten years they proposed to pay 4 per cent. on capital expended, for the succeeding ten years 5 per cent., and thereafter such percentage as might be agreed upon.

Messrs. Mackay and Fleming subsequently had an interview with the Commissioner, and under date of 10/4/85 they again wrote to the Minister urging the matter, and stating that if their proposals were accepted they would reduce the fares, and incorporate this as a condition of any arrangement that might be entered into. The fares at this time had been increased; they have since been reduced.—Ch. A.G., 3/3/86.

Hereon the Commissioner minuted that the proposal was to lease the Tramways for at least twenty years, that the Act limited the power to lease to three years, and that before taking action it would be well to ascertain if Fleming and Mackay would accept the lease for three years.

What action, if any, was then taken the papers do not disclose, but there is a minute by Mr. M'Lachlan to the effect that the papers were found in the Minister's room after that gentleman relinquished office.

UNDER date of 28 January, 1886, Mr. John Woods addressed Mr. Secretary Garrard stating that he had been led to believe that an offer had been received to lease the Tramways, and that he would be glad to know if Government would sell them, and if so upon what terms. MR. JOHN WOODS.

Mr. Woods was informed (20/1/86), by direction of the Minister, that the latter was prepared to give due consideration to any proposal that might be made to lease or purchase the Tramways.

On the 15th February Mr. Woods wrote to the Commissioner stating that he could not make a definite offer, as he did not know what there was to purchase, and asking to be supplied with an inventory of the plant, the mileage laid, the cost, and the returns.

The Commissioner replied, by letter of 22/2/86, that if the Government determined to lease or sell the Tramways the fullest information would be given.

UNDER date of 22/1/86, Mr. J. P. Walker addressed a letter to the Minister proposing to lease the Tramways, with all plant and appliances, for twenty-five years, on the following conditions:— MR. J. P. WALKER.

1. Rent, a sum equal to 4 per cent. on capital expended.
2. A payment of 2 per cent. for liquidation of capital (sinking fund).

The Minister called for a report, and asked if there were any other similar offers.

The Commissioner replied that Mr. Fleming made an offer, but that on learning that Government could not lease for any period over three years he did not proceed with the proposal.

UNDER date of 27th January, 1886, Mr. Maxwell Bury wrote to the Commissioner stating that the cable system was the only one under which the Sydney Tramways could be made to pay, advocating the introduction of the duplicate cable system invented by Mr. D. J. Miller, and now in successful operation in New York, and expressing a belief that the money which it was proposed to expend in renewal of permanent-way would be sufficient to meet the cost of converting the whole, or a large proportion, of the existing lines to the cable system. MR. MAXWELL BURY.

The Commissioner minuted that the estimate for reforming the Tramways was £200,000, and that Mr. Bury must be in error in stating that that sum would suffice to convert all the lines to the cable system.

On the 4th February Mr. Bury wrote to Mr. Secretary Garrard proposing on behalf of a syndicate in London and New York, and giving the following details of the scheme they had in view:—

1. The trams to be laid on the duplicate cable system patented in this Colony by Messrs. Findley and Miller.
2. The cable system to be confined for the present to the following sections:—
 - Bridge-street to Redfern Station.
 - Liverpool-street to Queen-street, Paddington.
 - Darlinghurst to Randwick Workshops.
 - Oxford-street along Crown-street to terminus.
3. The service to Leichhardt, Glebe Point, Forest Lodge, Newtown and Marrickville, and Botany to be worked by the steam motors timed to run in connection with the cable trams. The following also to be worked by the motors:—Randwick and Coogee, from Queen-street the Woollahra line, the Waverley line, the new section to Randwick, and the Bondi section. It will be seen that the motors will work only in the outlying districts.

4. A grand terminal station and waiting-room to be erected at Redfern for the accommodation of passengers changing there.
5. A commodious waiting-room to be erected at the Queen-street junction for the accommodation of passengers changing to or from the motor lines.
6. The syndicate will either lease or purchase the entire Tramway system, workshops, sheds, &c., &c. If leased, the terms and conditions to be such as will induce capitalists to invest. If purchased, the price to be paid to be arrived at by valuation. If leased, the term to be twenty-five years. If a sale be effected, the Government to have the option of repurchasing at any time within twenty-one years, with compensation for goodwill (if any), and line, plant, &c., to be taken, as before, at a valuation.
7. The Government to supply the syndicate with a plan of the city and suburbs served by the present tram system, also a section of the streets showing the gradients.
8. If a lease or a sale be effected, the syndicate to bear the entire cost of converting the portions named into cable-trams.
9. In the event of Government accepting the foregoing proposals the syndicate will have plans and specifications prepared for constructing the cable-trams, and have them ready, if possible, for the consideration of Parliament this Session.
10. In the event of Parliament not agreeing to sell or lease the trams the syndicate will be prepared to enter into a contract to construct the cable-lines, and will bind themselves in £20,000 to keep them in working order for three years.
11. In the event of Parliament so deciding against the sale or lease of the Tramways, and the Government does not conclude a contract with the syndicate, the Government shall pay the expenses incurred in preparing the plans, specifications, and estimates, which plans, specifications, and estimates shall thenceforth become the property of the Government.

C.A.B., 22/2/86.

Since the foregoing was written the following further offer has been received.

Under date 22/2/86, Messrs. R. Towns & Co. and Augustus Morris wrote to the Commissioner submitting on behalf of Mr. A. S. Hallidie, of San Francisco, certain memoranda of inquiries in relation to the New South Wales Tramways, stating that Mr. Hallidie, in concert with a syndicate, is prepared to entertain the Commissioner's (assumed) proposal for the purchase of the tramways, that it is necessary that it should be clearly stated whether the motors are to be removed from the streets of the city proper and the cable or other system substituted, that it is essential if an arrangement be made that the syndicate should have power to lay new lines and to change existing routes; and that if their proposals are entertained they will construct within the city within one year two (2) miles and within three (3) years (8) eight miles of double-cable Tramway.

The Commissioner replied, 23/2/86, stating that there was some misapprehension, that when Mr. Hallidie and Mr. Augustus Morris had an interview with him, they, as he (Commissioner) understood, wished to know whether the Government would entertain a proposal for laying down cable lines within the city, that he told them that inquiries had been made whether the Government would lease or sell the Tramways, and that the Minister for Works had informed those who inquired that he was prepared to receive proposals; that he (Commissioner) further told Mr. Hallidie that he did not know what the intention of the Government was, but that Mr. Hallidie could submit any proposal he might have to make. The Commissioner further wrote that the memoranda of particulars extended far beyond the scope of the information which could be afforded, converting Commissioner's intimation that Mr. Hallidie would be at liberty to submit his proposition into suggested terms and conditions which the Government might entertain; and that Mr. Secretary Garrard, in reply to a question asked in the House, had stated that in the event of the Government deciding to sell or lease the Tramways, tenders would be invited and conditions drawn up.

C.A.B., 27/2/86.

MINUTE Paper on Sale or Lease of the Tramways.

IN continuation of the *précis* which is on the file respecting the several proposals which have been submitted to either lease or purchase the Tramways, the following additional offers have been received, viz. :—

On the 29th December, 1886, Mr. Larsen, in conjunction with some gentlemen in London, offered to lease the Government Tramways in the city and suburbs on such conditions and terms as may be agreed on, and submitted the following proposals for the consideration of the Government :—

“To lease the Sydney and Suburban Tramways for a period of twenty-one years or longer at a rental of 7 per cent. per annum on the capital expended up to the end of the last financial year, 1885; and further, that a capital of £300,000 should be expended principally in Sydney for the reconstruction of the lines, for the working of same by cable, this capital to be repaid to the lessees at the termination of the lease; also, the Government to provide land for the erection of buildings and machinery necessary for working the lines, but the lessees to erect all buildings and machinery at their cost.”

Mr. Larsen stated that in the event of these proposals being entertained by the Government, a Company would be formed in London with a directory composed of gentlemen of experience and possessing public confidence, for the purpose of carrying the project into effect.

On the 31st idem the Commissioner calculated that the capital referred to herein is £708,109, which, at 7 per cent., will return £50,000 a year, that we are paying for interest about £28,000, and that consequently the balance, £22,000 a year for twenty-one years, invested at 4 per cent., would realize £757,000, out of which sum £300,000 would have to be returned to the Company, showing net £457,000, and a Tramway handed over at the end of twenty-one years very much better than the existing one, and that if the Government are disposed to lease the Tramways he (Commissioner) thinks the terms offered herein are certainly the best which have been made.

On the 1st March, 1887, Mr. Larsen again wrote respecting the above proposals, and stating that from further observation he found it would be necessary to have four cables in the main lines to carry the traffic, which system would admit of an unlimited traffic being maintained, and that in reconstructing the Tramways for cables he proposes to construct the tubing or channel in cast-iron, and to adopt the improvements

improvements which experience has proved to be necessary. In his (Mr. Larsen's) opinion it will soon be necessary for the Government to expend a large sum for repairs without being of permanent benefit, and that for the future it would be better to take such steps as to lead to the reconstruction of the lines of a permanent and durable system.

Hereon Commissioner stated (referring to his previous minute of 31/12/86) that if it be decided to lease the Tramways for a period of twenty-one years a Bill for the purpose would have to be passed by Parliament, as the existing Act limits the time for which the lines can be leased to three years, and that under such amended Bill specifications and conditions of lease for twenty-one years could be prepared and public tenders invited, as he was not an advocate of the acceptance of private offers, which however were useful as indicating that remunerative prices could be obtained.

In the views expressed by the Commissioner Mr. Secretary Sutherland concurred.

Subsequently Mr. Larsen again addressed Mr. Secretary Sutherland on the subject, and was informed that information relating to whole matter was being collected, and would be submitted to Cabinet for consideration.

Messrs. Farmer Bros.—as representatives of Messrs. Bullivant & Co., wire-rope manufacturers—FARMER BROS intimated that they would be prepared to take over the existing stock, lines, &c., &c., and substitute cable lines, and lay in any additional roads that may be required, but no specific or formulated terms have been submitted.

Mr. Bullivant, senr. (Messrs. Farmer Bros. state), of the Cable Tramway Co. of England, would be the head of any Company undertaking the Tramway construction under this representation.

Mr. Bury (whose previous proposals for the purchase or lease of the Tramways will be found in *précis* on file) addressed Mr. Secretary Sutherland on the 18th ultimo relative to the introduction of the cable system of Tramway and to proposals submitted to the previous Government on the subject, to either lease or purchase the Sydney trams and immediately commence constructing several lines of cable trams and otherwise reorganise the working of the lines, so that they will return a fair interest on the capital invested; that he is the owner of a patent cable tram system, known as "Miller's" duplicate cable system, which is largely used in America and which he represents is the most perfect cable tram system yet invented, as no breakage of cable or injury to the machinery affects the working of the line, and that if the Government are disposed to entertain the question of leasing or selling the trams, or the adoption of the cable system, he will be glad to meet Mr. Secretary Sutherland and discuss the several points connected therewith and point out generally the manner in which it is proposed to alter and work the system with the minimum of inconvenience to the public. MR. MAXWELL BURY.

Mr. Bury was then requested to call on Mr. Secretary Sutherland.

On the 24th March, 1887, Messrs. Stokes & Morris, on behalf of Mr. A. S. Hallidie, of San Francisco, addressed Mr. Secretary Sutherland relative to the lease or purchase of the Tramways, and submitted for the consideration of the Government the following propositions:—CHAS. F. STOKES AND AUGUSTUS MORRIS

First,—

1. To purchase from the Government the whole of the present Tramway system, engines, cars, &c., with all plant appertaining thereto, at such price and upon such terms as to privileges, &c., as may be agreed upon.
2. Mr. Hallidie to pay to the Government interest upon the agreed price at the rate of 4 per cent. per annum.
3. Also to pay not less than 2 per cent. each year upon the amount of principal which may be due to the Government at the end of each year, which payment of 2 per cent. the Government shall receive and place to the credit of the purchaser on compound interest at the rate of 4 per cent. per annum, and shall apply in liquidation of the purchase money.
4. The purchaser to have the option of paying in liquidation such further sums as he may from time to time see fit, such sums to be held and applied in like manner by the Government.
5. So soon as the whole of the purchase money shall be paid off then the Government shall transfer to the purchaser the whole tram system of the city and suburbs, which shall then become the property of the purchaser, with a proper transfer also of the Tramway lines and roads upon which the tram-lines may be then or thereafter laid, the purchaser having the right to use such roads for Tramway purposes only.
6. The Government to grant a full franchise to the purchaser to lay cable Tramways or Tramways upon any other improved and approved system, wherever he or they may in their discretion choose.
7. The purchaser not to exceed a fixed maximum rate of fare to be charged on the various lines, and to substitute in the city, within one year from completion of purchase, 2 miles and within three years 8 miles of a double line, on the cable or other approved or improved system, and the present motors to be used in the suburbs only until the cable or other system can be adopted.

Second,—

1. To lease from the Government on a capital value to be agreed upon for a period of (say) 50 years, the whole of the present Tramway system in city and suburbs, paying on such capital value as may be fixed upon interest at the rate of 4 per cent. per annum.
2. The Government to grant to the lessee a full franchise to lay cable or other Tramways wherever he may choose, as in condition 6 of first proposition.
3. The lessee not to exceed a fixed maximum rate of fare to be charged on the various lines, and to substitute in the city the cable or other approved system, as in first proposal.
4. At the expiration of the term of fifty years the whole of the Tramway system to be subjected to a valuation by valuers mutually appointed in the usual way, and should the Government decide to take it they are to have the option to do so upon paying to the lessee such amount as may be awarded to him under such valuation. Payment to be made in such manner as may be mutually arranged.
5. In the event of either of the above propositions being accepted by the Government six months to be allowed the purchaser or lessee to complete arrangements to purchase or lease as the case may be.

These

These propositions are submitted (Messrs. Stokes and Morris state) on the understanding that they are to be a basis upon which Mr. Hallidie will be prepared to purchase or lease the Tramways, and that such propositions are open to modification on either side. Or should the Government deem it desirable to formulate conditions for sale or lease they will be glad to be advised.

The particulars of the previous proposals, made on behalf of Mr. Hallidie by R. Towns & Co. and Mr. A. Morris, in respect of the lease or purchase of the tramways, are contained in the *précis* already referred to.

PROPOSAL TO LEASE THE KOGARAH TO SANS SOUCI TRAM-LINE, ETC.

Mr. D. E.
BLACKE.

UNDER date of 28 March, 1887, Mr. Blacke addressed Commissioner, wishing to know whether the Government are disposed to lease the above Tramway for a term of ten years at 4 per cent. per annum, all the outlay in the matter, and if so would Government furnish him with a statement of the cost incurred in connection with the line.

SYDNEY TRAMWAY
& OMNIBUS CO.
(LIMITED).

Mr. Blacke was informed that the question of leasing the Tramway has not yet received the consideration of the Government. G.A.S., 16/4/87.

For proposal to lease Tramways see summary on file.

SUMMARY of proposals to lease or purchase Tramways.

Name.	Proposal in brief.
J. D. Larsen	To lease tramways for 21 years or longer, paying 7 per cent. per annum on capital expended to end of 1885. £300,000 to be expended on reconstruction, for working lines by cable system, such sum to be repaid to lessees on termination of lease. Government to provide land for erection of buildings and machinery, but lessees to erect buildings and machinery at their expense.
Farmer Bros.....	On behalf of Mr. Bullivant, rope manufacturers, are prepared to take over existing stock, lines, &c., &c., and substitute cable lines, and lay down any necessary additional roads. No formulated terms submitted.
Maxwell Bury ...	Will either lease or purchase tramways, and immediately commence constructing several lines of cable trams on the duplicate cable system, which at present would be confined to the following sections :— Bridge-street to Redfern station ; Liverpool-street to Queen-street, Paddington ; Darlinghurst to Randwick workshops ; Oxford-street, along Crown-street, to terminus ; and other lines to be worked by motors in conjunction with the cable system. A grand terminal station to be erected at Redfern, and a commodious waiting-room at Queen-street junction. If leased, terms and conditions to be such as will induce capitalists to invest—terms, twenty-five years. If purchased, price to be arrived at by valuation ; Government to have option to repurchase at any time within 21 years, with compensation for good-will, to be arrived at by valuation. If purchased or leased, syndicate to bear entire cost of converting sections named into cable trams. Or the syndicate will construct the cable lines for the Government and keep them in working order for three years.
Messrs. C. F. Stokes and Morris, on behalf of Mr. Hallidie.	Will purchase or lease the Tramway system, engines, cars, &c., and all plant. If the former, the lessees to pay 4 per cent. per annum upon price agreed upon, and 2 per cent. per year on principal due to Government at end of each year to be placed to credit of purchasers on compound interest at 4 per cent. per annum, and shall apply in liquidation of purchase money. The purchaser to have option of paying in liquidation such further sums as they may see fit to hold, and applied in like manner by the Government, who shall hand over to the purchasers, when the whole purchase money is paid, the whole tram system of city and suburbs which shall become the property of the purchasers, the purchasers having the right to use roads, &c., for tramway purposes only. Purchasers not to exceed a fixed maximum rate of fare to be charges on various lines. To lay within one year from completion of purchase 2 miles, and within three years 8 miles of double line, on the cable or other approved or improved system. The present motors to be used in the suburbs only until the cable or other system can be adopted. 2. If leased on a capital value to be agreed upon (time fifty years), paying on such capital value interest at the rate of 4 per cent. per annum, with similar powers and limitations in respect of laying lines and fares to be charged as mentioned in conditions of purchase. After the expiration of the term of lease (fifty years), the whole system to be subjected to a valuation, and should Government decide to take it, they are to have the option, paying the lessees such amount as may be awarded. These proposals are open to notification on either side.
Mr. D. E. Blacke.	Is prepared to lease the Kogarah to Sans Souci Tramway for a term of ten years at 4 per cent. per annum on the outlay.
Messrs. Mackay and Fleming.	Offered to take over the tramway, permanent way workshops, and such portions of rolling-stock as may be required, paying Government for same. For the first ten years they propose to pay 4 per cent. on capital expended, for succeeding ten years 5 per cent., and thereafter such per centage as might be agreed upon. The lessees would reduce the fares.
Mr. John Woods.	Per letter of 28 January, 1886, wished to know if Government would sell the tramways, and if so, upon what terms, but could not make a definite offer as he did not know what there was to purchase. Mr. Woods was informed that if Government determined to lease or sell the tramways, the fullest information would be given.
Mr. J. P. Walker	Under date of 22/1/86 proposed to lease Tramways, with all plant and appliances, for twenty-five years, on the following conditions, viz. :—To pay 4 per cent. on capital expended, and a payment of 2 per cent. for liquidation of capital (sinking fund).
Sydney Tramway and Omnibus Co. (Limited.)	Intimate that they are prepared to negotiate for purchasing or taking over the Government Tramways ; that it would, they state, be premature for them to set forth any proposition in a letter, but trust the Secretary for Public Works will be pleased to recognise their claim to some consideration, and favor them with an opportunity of discussing the matter in detail.

No. 37.

Report of interview accorded by the Cabinet to Mr. Rowan, Mr. Cain, and others, with reference to a proposal to take over the Sydney Tramways.

SIR HENRY PARKES said that in any statement made by Mr. Rowan with regard to any change that might take place it would be best to keep in mind the question of affording tram accommodation to the whole city of Sydney—what he meant was having tram accommodation, not merely along one street from north to south, or two or three streets, but at the right-angular sections from east to west. He would also like to know whether Mr. Rowan would be prepared to take the trams as they exist, gradually changing the present system to one of wire cable, or other form of tramway ; what length of time would be required to complete the conversion of the one system to the other, and whether, in the plan proposed by Mr. Rowan, he would be identified with capitalists in Sydney.

Mr.

Mr. ROWAN said:—In the first place I may tell you that I was one of the five original promoters of the Melbourne Tramway Company, which up to the present time has spent about a million of money in completing that system. The same promoters are still in Melbourne, and hold together as a party. We see that you contemplate some change here, and it occurred to us that we might be of some service to you, and to ourselves. We are now prepared to undertake this work, but it will be necessary for us to associate ourselves with some local people in Sydney, and we think that the assistance of the people who control the traffic of your streets here, such as the Omnibus Company, would be essential to us during the transition from the present system to the cable tramway system, which we find much better and cheaper to work. We purpose—if you deem it desirable—to let the Tramway system pass into the hands of private people, as a preliminary step to buying the present system right out.

Sir HENRY PARKES: When you say you would buy it right out, would you be prepared to pay cash for it?

Mr. ROWAN: Yes. It would be necessary for us to get the control of your trams at once, or as soon as we can enter into arrangements, and gradually convert it from its present form into the new form. It would be necessary in the interests of the community that we should have control of the other Tramways, so that we could run from east to west, and have new streets running in the same direction as the present trams, and thus ease off the traffic. The cable trams, with the aid of the Omnibus Company, would, we think, take the people out to their present destinations without greatly disturbing the traffic. We contemplate a capital of at least one million shares of £1 as a first issue, and after we had made our issue we would pay you whatever we agreed upon. In the meantime, however, we would like a little more information from you as to the cost of constructing the present Tramways, the value you put upon them, whether you would expect to be paid the cost of construction, and whether you would charge what has been expended on construction and maintenance. But as regards the price we contemplate entering into, I may tell you at once that £40,000 or £50,000 would not be allowed to stand in the way of an agreement. We also contemplate that this Government should grant power to municipalities and shires to make light country lines of railways as feeders, otherwise the present motors would be simply useless to any party who might purchase the tramways. We think that if a system of light railways were authorised under the Local Government Act, it would give us a market for this material, and we might be able to offer you more for the trams than otherwise, while we would be prepared to go to work at once. If you grant permission for the scheme to pass into private hands we will give you our *ultimatum* very quickly. We do not contemplate dealing with this entirely in Melbourne. It would be in the interests of all concerned to have five promoters in Melbourne and five in Sydney.

Sir HENRY PARKES: Do you represent English capital?

Mr. ROWAN: To some extent. It would be necessary for some of the leading men here, such as the directors of the Omnibus Company, to co-operate with us for the purpose of regulating the traffic during the period of transition. We contemplate working from the two centres.

In reply to various questions, Mr. Rowan said:—We would like to take all the land the Government may own for the purpose. We would have to purchase sites for the engines, and probably some other sites.

It would, we estimate, require two years to convert the present lines into the cable system.

We hold the Melbourne streets under a lease of 30 (thirty) years, but we had no land to buy there. We formed a Tramway's Trust; that represents the city and the surrounding municipalities. That Trust borrowed money in London, and guaranteed the amount. We have a sinking fund of 1½ per cent. for the first ten years; 2½ per cent. for the second ten years; and 3½ per cent. for the third period. We have the use of the Tramways for thirty years. In the case of New South Wales, we propose a very long lease, of perhaps fifty years, and at the end of that time the Tramways would revert to the Government.

The gentlemen in Melbourne with whom I am connected are Mr. Clapp, Manager of the Tramway and Omnibus Company, Mr. Caine, Mayor of Melbourne, Mr. Collier, Mr. A. W. Robertson, Mr. Wm. McCulloch, and myself. There is another way of managing if you take the place of the Tramways Trust in its executive capacity. Much would depend upon the price asked for the present system.

This is the first intimation the Government has received from any of our party. I may say that when we first commenced we were set upon on all hands by bogus Companies trying to get an interest in us, but we refused; and you will find the same thing here if the scheme once becomes known. Can you give me any idea of the cost of the Tramways?

Sir HENRY PARKES: We could not do that now; but we will, after you leave us, consider the matter, and will give you an answer within a very short time, stating whether we are disposed to fall in with your views.

June 24, 1887.

No. 38.

Minute by The Secretary for Public Works.

Sydney Tramways.—Various proposals made for the management of the Tramways passing into private hands, with a view to their conversion into Cableways, &c.

Minute for Cabinet.

BEFORE considering any of the offers submitted for purchasing or leasing the Tramways, it will be proper that we should correctly ascertain what it is we have to dispose of, and what the difficulties are that are in the way of the Government dealing with the matter.

The Tramways have been constructed under an Act of Parliament which gives the Government the power to lease them for a period not exceeding three years. No power is given to sell the Tramways.

It is therefore clear that any negotiations entered into at the present time must be subject to the passing of a Bill through Parliament, enabling the Government to lease the Tramways for a longer period than three years or to sell them right out.

The Tramways in the city and suburbs of Sydney (omitting the North Shore cable line and the motor line from Kogarah to Sandringham) have cost the capital sum of £742,112 to the end of 1886.

There

There has been some additional expenditure, in 1887, in the construction of the line from Waverley to Randwick, and incidental capital outlay, but £13,000 will cover that outlay. This expenditure, to the end of 1886, has been distributed as follows :—

Construction of 27 miles of Tramway	£468,342
Erection of workshops, supply of machinery, &c.	62,023
Tramway rolling stock	211,747
Total	£742,112

The Government has taken the use (upon which no money value has been fixed, but which would have to be valued in the event of the Tramways being sold) of several portions of land, for instance :—

- The portion of land forming the terminus station in Bridge-street.
- The portion of land in Pitt-street known as the Tramway cleaning-yard.
- The land at Randwick, upon which the workshops, &c., have been erected.

The Tramway transactions for 1886 give the following results as regards the city and suburban lines referred to :—

Gross revenue	£226,367
Working expenditure	203,247
Net revenue	23,120
Capital expended	742,112
Return which the net revenue gives to the capital invested,		3·12 per cent.

The following is the return made to capital for the past four years :—

Year.	Capital.	Interest upon capital.
1883	£544,105	2·22
1884	643,111	0·76
1885	708,109	2·17
1886	742,112	3·12

It will thus be seen that year by year the Tramways have been approaching closer to a self-supporting result, and I am informed by the Commissioner for Railways that the transactions of the present year will, if certain amended time-tables which are now before us are adopted, return a profit in excess of the interest upon which the capital has been borrowed.

This being the case, it does not seem imperative that the Government should surrender the management of the Tramways into private hands because of its inability to make them profitable.

It seems, however, to be generally admitted that the motive power employed in working the Tramways should be some other power than that of steam, especially within the city boundaries.

When the Tramways were first inaugurated in Sydney in the year 1879, there were only two powers in general use for such services, viz., animal power and steam. Since that date cableways have been introduced, and also Tramways worked by electric power.

It is one or other of the two systems referred to, which those who seek to take over from the Government the city and suburban Tramways, proposed to convert them to the use of.

The first question to be determined is whether the requirements of the travelling public will be better met by the substitution of either cableways or electric tramways for Tramways worked by steam power.

By either of the systems proposed to be substituted the average number of passengers that will be taken by any single tram will be thirty. As there are at the lowest computation 26 millions of passengers travelling on the cars between Bridge-street and Liverpool-street, 13 millions on the up and 13 millions on the down journeys annually, it follows that if either cableways or tramways worked by electricity be adopted, other approaches to the terminus than that given by Elizabeth-street must be afforded. If not, to accommodate the travelling public, a tram would have to leave Bridge-street every twenty seconds, and more frequently during the busy parts of the day, and even if the traffic could be worked with such precision that an equal distance between each car could be kept, the interval of space would be only 28 yards. The stream would be so continuous that it would be almost an impossibility for vehicles to cross Elizabeth-street at right angles. It may be mentioned that the average number of passengers to the mile of line on the Tramways of Great Britain does not exceed per annum, 450,000, while on the city and suburban Tramways of Sydney the average is 1,127,000 per mile, and on the particular mile of Tramway between the points mentioned the number travelling is simply unprecedented.

It is true the difficulty might be met by continuing the line in Phillip-street by that street to King-street, and from thence down College-street to Oxford-street, and so take the eastern Tramway traffic out of Elizabeth-street altogether; but, with the exception of one, the applicants who seek to purchase or lease the Tramways contemplate only the working of the present routes, and their conversion from steam lines into cableways, &c.

America is the mother country of Tramways. At first, of horse tramways, then steam, then cableways, then electric ways, or Tramways worked by electric power; though this last seems to have taken, as yet, a stronger hold in some of the cities of the continent of Europe than it has on the American continent. Rumours, however, are prevalent that cableways in America have been condemned, and in some places have been abandoned—that recourse is again being had to steam-power.

A few more months will, I understand, determine this particular question. By private enterprise the merits of the electric system as applied to Tramways is to be practically tested in the neighbourhood of Sydney. As there would seem to be no immediate necessity for an alteration in the present system of working the Tramways, I would suggest to my honorable colleagues that the question be postponed for twelve months. In the interval we shall be acquiring information which will enable the Government to determine it with riper judgment and experience.

If, however, the Cabinet decide that a measure should be prepared at once for submission to Parliament taking powers to lease the Tramways for a longer term than is now provided or to dispose of them altogether, it will be necessary to make provision that before this great monopoly is handed over to a private Company certain restrictions be introduced for the protection of the general interests of the public.

One of the reasons given at the time for the construction of tram lines by the Government was that a Company would not construct a line unless assured that it would yield an immediate return upon its outlay, and thus tramway accommodation would be denied to many places, the future prosperity of which might be dependent upon increased means of communication.

There can be no question that several such lines have been constructed in the past, and it has been only by degrees, as the population increased, that they have recovered from the non-paying stage of their existence—indeed many of them are not yet self-supporting, and it may take some years to make them so. Unless, therefore, provision be made to the contrary this condition of affairs might offer a temptation to a private Company to abandon these non-paying lines, and by depriving residents of the localities to which they have been extended of Tramway communication depreciate the value of their properties, which they were perhaps led to acquire by reason of the existence of this means of conveyance. If not abandoned altogether the amount of accommodation afforded might be so limited as to practically deprive the residents of their benefit. It will therefore be necessary to provide that all Tramways made over to the Company shall be worked, and the service of trams bear some reasonable proportion to that in operation at the time of transfer.

Again, the benefit of Tramway communication might in a large measure be neutralized by the infliction of higher rates of carriage than those now obtaining. If, as with the Tramways of Melbourne, the minimum charge were made 3d., the purchasers of the Sydney and Suburban tramways would, to the injury of the travelling public, obtain a return which would give a very large per centage of interest upon the whole capital outlay; it will therefore be necessary, I think, to stipulate that the present fares shall be the maximum fares chargeable by the Company who may acquire the right to control the Tramways.

The wages of the employes and their hours of labor are matters which should be regulated by the market conditions of supply and demand; but it is proper to point out that if the lessees or purchasers of our Tramways should adopt the wages ruling on the Melbourne Tramways, the amount of saving effected would represent a sum equal to 4 per cent. per annum upon the purchase money.

It would be contrary to sound public policy to legislate for the retention of the present, or any rate of wages which, as I have said, should be regulated by the condition of the labor market; but the probability of a large class of public servants, who have grown with the tramway service, suffering a diminution in their wages should not be left unconsidered in determining the question of the transfer of the management of the Tramways from Government to private control.

Having placed all aspects of this question thus fully before the Cabinet, I will now leave it to their determination.

JOHN SUTHERLAND.

6th July, 1887.

No. 39.

Mr. A. Armstrong to The Colonial Secretary.

Sir,

Land Agency Office, 26, Bridge-street, Sydney, 28 March, 1887

Understanding that your Government has in contemplation the abolition of existing system of steam tramway-motors, I respectfully beg to submit for your consideration the advisability of adopting the Julian Patent Electric Tramway, which has the following advantages:—

1. All cars have powers self-contained.
2. Light grooved rails may be used, exercising no interference with ordinary street traffic.
3. The patent can be adopted to existing cars and rails.
4. Accumulators (fitted under seats, and consequently occupying no space) can be adopted to existing cars at a cost of £40 each.
5. Electric power sufficient to run light cars up a grade of 1 in 15 can be provided.
6. Cars, including a double set of accumulators, can be supplied at a cost of £600 each.
7. Speed up to 20 miles per hour obtainable.
8. If adopted on Government lines, no change necessary in existing roadway.
9. System could be adopted on existing lines using present cars.
10. New lines could be laid down and furnished with rolling stock at £6,000 per mile.

The patent rights to all Australia are secured by a Sydney syndicate, of which I am the agent, and, in order to obtain full opportunity of demonstrating the advantages, Parliament will be invited to pass a private Bill, allowing construction of a line up William-street, Woolloomooloo; and I have the honor to request that your Government will delay effecting any important change in existing Tramway system, pending full opportunity of seeing the Julian Tramway system demonstrated.

I have, &c.,

A. ARMSTRONG.

Secretary for Public Works.—H.P., 5/5/87. Under Secretary for Public Works.—C.W., 5/5/87.
Railways.—J.R., 9/5/87.

[NOTE.—Although this paper bears date prior to the date of *précis*, immediately preceding, it was not received in the Railway Department till May, 1887, when *précis* had been written in ignorance of the existence of this proposal.]

No. 40.

Mr. J. Chaplin to The Colonial Secretary.

Sir,

Brown-street, Paddington, 10 June, 1887.

This evening I have received a cable from Europe to the effect that my correspondent has purchased the entire right for the colonies to use Julian's patent electric tram motor and car. One will be shipped for Sydney in five weeks from date, and I would ask you to use your influence to prevent the trams in and around the town being leased or other way disposed of until you have seen the electric tram motor and car tried here. It is an immense success in Germany, France, and America, and will entirely

entirely supersede steam and horse power, it being much cheaper and free from noise or dirt. I trust you will excuse my troubling you, but any change in the proprietorship of the trams might so complicate things that it would be impossible to come to any satisfactory arrangement for its use.

I have, &c.,

JOHN S. CHAPLIN.

This should be referred to the Engineer-in-Chief for Railways for report.—C.W., 16/6/87. Secretary for Public Works.—H.P., 18/6/87. Under Secretary for Public Works.—C.W., 18/6/87. Railways.—J.R., 23/6/87.

The Julian method of working is not, I believe, the best of the electrical processes. I understand, however, that Mr. Armstrong, who, with others, is the proprietor of the Gordon Tramway, North Shore, proposes to adopt the Julian system on that line, and we shall gain our knowledge of its usefulness by that experiment.—CH.A.G.

For Minister's information. Seen.—J.S., 24/7/87.

No. 41.

Mr. L. Könneritz to The Commissioner for Railways.

Sir,

St. Cloud, Glenmore Road, Paddington, 7 July, 1887.

With reference to a paragraph which appeared in yesterday's papers, concerning a French system of electric tramways, which Mr. Pritchard intends to submit for the consideration of the Government here, I venture to inquire whether a German firm, who have made electric tramways a speciality, would be allowed to compete also?

I have, &c.,

L. KÖNNERITZ.

In a week.—A.R., 9/7/87. Submitted, 18/7/87. Inform that this must be left to their own discretion. Mr. Pritchard has asked for no assistance or support.—CH.A.G., 18/7/87.

No. 42.

The Commissioner for Railways to Mr. L. Könneritz.

Sir,

Railway Department, 21 July, 1887.

I have the honor to acknowledge the receipt of your letter of the 7th instant, relative to the leasing of the Government Tramways, and asking that a German firm, who have made electric tramways a speciality, may be allowed to compete.

In reply, I have to inform you that it has not been decided that the Tramways are to be leased to private firms; but if any arrangement is made in this way, the question of sending in a proposal must be left to the discretion of the firm you represent. Mr. Pritchard, who has submitted an offer, and who is referred to in your letter, has asked for no assistance or support in the matter.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways,
(per A.R.).

No. 43.

Mr. L. Könneritz to The Commissioner for Railways.

Sir,

St. Cloud, Glenmore Road, Paddington, 22 July, 1887.

I have the honor to acknowledge the receipt of your letter of the 21st instant, informing me that it has not been decided that the Tramways are to be leased to private firms, but if any arrangement is made in this way the question of sending in a proposal must be left to the discretion of the firm I represent; also that Mr. Pritchard, who was referred to in my letter, has asked for no assistance or support in the matter.

In reply, I have to inform you that the only question I wished to determine in forwarding to you my letter of the 7th instant was whether the Government intended to have the trial of the electric tramways to which the papers of the day referred confined exclusively to the engine, &c., shipped by Mr. Pritchard, or whether there would be no objection on their part of permitting a German firm to enter into competition with a train of their own make. In doing this I scarcely could imagine that my words would tend to impress you with the suspicion that I was asking for assistance or support.

I have, &c.,

L. KÖNNERITZ.

Let me see letter.—CH.A.G., 29/7/87. Herewith.

Write a letter to Mr. Koennertz explaining matter, expressing regret, and say that he will be allowed the same facility for demonstrating on our tram-line the merits of the system he represents as Mr. Pritchard will be.—CH.A.G., 8/9/87.

No. 44.

The Commissioner for Railways to Mr. L. Könneritz.

Sir,

Department of Railways, Sydney, 10 August, 1887.

I have the honor to acknowledge the receipt of your letter of the 12th ultimo, in which you point out that our communication of the 21st was not a direct reply to yours of the 7th idem.

I regret that there is good ground for your representations. Through a clerical error made in the press of business, your letter was misapprehended as referring to the leasing of Tramways, a question which was then being freely discussed in the daily newspapers, and which was under consideration by the Department, a reply being sent accordingly.

With

With regard to the inquiry contained in your communication of the 7th instant, as to whether the Government intend to have the trial of Electric Tramways confined exclusively to the engine, &c., shipped by Mr. Pritchard, I have now to say that you will be allowed the same facility of demonstrating on our tram lines the merits of the system you represent, as Mr. Pritchard will be.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 45.

Mr. F. C. Brown to The Commissioner for Railways.

"Grand Hotel," Sydney, 4 August, 1887.

Dear Sir,

On Tuesday last I had the honor of an interview with you, respecting electric tramway motors, but was unable to fully explain as you were called away by the Minister. Would you, therefore, be good enough to grant me another interview at your earliest convenience?

I am desirous, on behalf of the Electric Locomotive and Power Co. (limited), of London, of obtaining permission to place one or more of their electric motors on the Government Tramways here, by way of trial, at the cost of the Company, and of ascertaining under what conditions such permission would be accorded; and also, in the event of such trials proving perfectly satisfactory to your Department, whether the Company could reasonably receive such an order as would warrant their undertaking such preliminary trials here.

Your attention is specially invited to the following special advantages of this Company's system:—

1. This motor has been adopted by the North Metropolitan Tramways Co.—the largest in London—after months trial on their lines, and in preference to all other systems, and is now in actual operation in the most densely populated portion of London.
2. It meets the requirements of the Board of Trade, and has passed inspection by Major-General Hutchison and Major Hornstrong, the Board's official advisers.
3. It requires no alterations whatever to existing permanent way and rolling stock, needs one attendant only, who need not be an electrician, and is always perfectly under control.
4. Cars can be illuminated and brakes applied by the same current that actuates the motor.
5. Entire absence of noise, smoke, steam, dirt, and smell.
6. Absolute safety—the low tension current employed being perfectly harmless.
7. These motors are much lighter than steam ones of similar power.
8. Cost of haulage is only 3½d. to 4d. per car per mile—nearly 50 per cent. under cost of horses.

I have, &c.,

FRED. C. BROWN.

The test of an electric motor will be to take (beyond its own weight, which must not exceed 8 tons) 20 tons up a gradient of 1 in 17 at a speed of 8 miles an hour. If he can meet this condition with the electric power at his command I shall be glad to see him to further discuss question.—CHAS. A.G., 14/8/87.

No. 46.

The Secretary for Railways to Mr. F. C. Brown.

Sir,

Department of Railways, Sydney, 18 August, 1887.

With reference to your letter of the 4th instant, stating that you are desirous, on behalf of the Electric Locomotive and Power Company of London, of placing one or more of their electric motors on the Government tram lines in this city, I have the honor, by direction of the Commissioner for Railways, to inform you that the test for an electric motor will be to take (beyond its own weight, which must not exceed 8 tons) 20 tons up a gradient of 1 in 17 at a speed of 8 miles an hour.

I am to say that if you can meet this condition with the electric power at your command, the Commissioner will be glad to see you to further discuss the question.

I have, &c.,

A. RICHARDSON,

(For the Secretary of Railways).

No. 47.

Mr. F. C. Brown to The Secretary for Railways.

Dear Sir,

Australian Chambers, Queen-street, Brisbane, 17 September, 1887.

I am in receipt of your letter, 87-3,081, having reference to Elieson's Patent Electric Tram Motors, and in reply thereto have the honor to state that there would be no difficulty in building these motors to comply with the prescribed tests and conditions. I am of opinion, however, that it would be desirable to slightly increase the weight of the motor above 8 tons to ensure sufficient adhesion to rails in greasy weather, and for this purpose only since the requisite power can be electrically obtained on even less weight. I shall be glad to wait on the Commissioner at any time for the purpose of further discussing this matter, and shall be greatly obliged if favoured with an early interview.

I may add that I have been accorded several interviews with the Hon. Sir Henry Parkes, K.C.M.G., on this subject, and at the last he was glad enough to inform me that he had placed my proposals before the Cabinet, and that they had been favourably entertained.

I have, &c.,

FRED. C. BROWN.

Inform that all questions affecting the use of electricity are reported upon for the information and guidance of this Department by the Superintendent of Electric Telegraphs, and therefore I think it would better serve his purpose if he were to place himself in communication with Mr. Cracknell, to whom his letter has been forwarded.—CH. A. G., 23/9/87.

Mr. Brown informed.—R. D., 28/9/87. The Superintendent of Electric Telegraphs, B. C., 28/9/87. Urgent.

No. 48.

The Secretary for Railways to Mr. F. C. Brown.

Sir, Department of Railways, 28 September, 1887.

With reference to your letter of the 17th instant, further respecting the subject of electric tram motors, I have the honor, by direction of the Commissioner for Railways, to inform you that all questions affecting the use of electricity are reported upon for the information and guidance of this Department by the Superintendent of Electric Telegraphs, and he thinks, therefore, that it would better serve your purpose if you were to place yourself in communication with Mr. Cracknell, to whom your letter has been forwarded.

I have, &c.,

D. VERNON,

Secretary of Railways.

No. 49.

Ganz & Co. to The Superintendent of Telegraphs.

Imperial Chambers, 77, Collins-street West,
Melbourne, 27 October, 1887.

Sir,

Your favour of the 18th instant came duly to hand.

It is our intention to submit to you description of our system of electric tramways, together with prices, and for this purpose we would like to have all particulars of what is wanted to send them to our head office, where all estimates for such work are being prepared.

We have, &c.,

GANZ & CO.

Previous papers. The Department have not any proposals to make.—E. C., 31/10/87.

Copy of Reply.

1 November, 1887.

In reply to your letter of 27th ultimo, I have the honor to inform you that it will be better for the proposals having reference to electric tramways to emanate from your firm.

I do not think that it is the intention of the Government to make any proposals in that direction, but I have no doubt that the most careful consideration will be given to any plan put forward by you for the introduction of electric tramways to this Colony.

I have, &c.,

E. C. CRACKNELL.

No. 50.

Ganz & Co. to The Commissioner for Railways.

Sir, Imperial Chambers, 77 Collins-street, Melbourne, 22 September, 1887.

Having noticed that it is the intention of your Government to construct an electric tramway, we have the honor to inform you that we would like to submit estimates for the necessary plant if this intention is to be carried out. To enable us to prepare estimates we would require plans and specifications.

The system we are offering has received the highest award at the International Exhibition at Antwerp, and is undoubtedly the best which has up to date been brought out in Europe. There is at present an electric tramway on this system being constructed in Budapest in consequence of the trials which were made being very satisfactory.

Should our offer be eventually accepted, fullest guarantees would be given with regard to efficiency, &c.

Awaiting the favour of your reply,

We have, &c.,

GANZ & CO.

Shall this gentleman be referred to Mr. Cracknell in the same way that Mr. Brown was recently so referred by the Commissioner?—A. R., 28/9/87. I should like to see papers. I do not think the cases can be identical.—CH. A. G., 28/9/87.

I do not think it necessary to refer this gentleman to Mr. Cracknell, as his proposal refers to a system which seems to be well known, and no doubt the Superintendent of Telegraphs is acquainted with the system. But this paper may be forwarded to Mr. Cracknell, who will perhaps be good enough to favor me with his views in the matter.—CH. A. G., 5/10/87.

B. C., Mr. Cracknell to Ganz & Co.:—Your letter, under date of 22nd ultimo, addressed to Mr. Goodchap, having reference to the introduction of electric railways to this colony, has been referred by that gentleman to me, as all electric matters connected with the Government are placed in my hands. I shall be glad to receive any particulars of the system advocated by you, and to furnish you with any information in my power with regard to it.—E. C. C., 17/10/87.

No. 51.

LEGISLATIVE ASSEMBLY, TUESDAY, 11 OCTOBER, 1887.

- (6.) MR. CAMERON (for *Mr. Thompson*) asked the COLONIAL SECRETARY,—
- (1.) Have any offers been made to the Government for the supply of electric motors for tramway purposes?
 - (2.) If so, by whom, and at what price?
 - (3.) Has the Government any intention of purchasing any of these motors for trial?
 - (4.) If so, is it intended to call for tenders, even though the motors are intended to be used for experimental purposes only?

Sir HENRY PARKES answered,—The question of working the electric motors has arisen before the Government, and there have been some propositions made to us, but as yet the Government are not committed either to purchase or do anything else beyond granting permission to the owners of some of these motors to try them on our lines at their own expense.

No. 52.

Mr. L. Könneritz to The Commissioner for Railways.

Sir,

"St. Cloud," Glenmore Road, Paddington, Sydney, 17 October, 1887.

Referring to your communication of 10th August last, in connection with my letters of the 7th and 22nd of July, I have the honor to request information as to whether the firm I had in view when making the application would be allowed to pass the necessary conductors, such as telegraph wires, through the streets, also where the engines and machinery would have to be erected in the event of the Government fixing upon a particular section of the tramway system to be singled out for conducting the experiments, when I would respectfully request to be furnished with some details of the section, such as gradients, &c.

I have, &c.,

L. KÖNNERITZ.

Pending Cabinet decision as to electric motors being obtained, it will not be possible, I imagine, to answer these questions.—A.R., 19/10/87.

Inform that all information on the subject will be supplied to all applicants when the question is decided by the Government.—CH.A.G., 19/10/87.

Mr. Koermertz informed.—20/10/87.

No. 53.

The Secretary for Railways to Mr. L. Könneritz.

Sir,

Department of Railways, Sydney, 20 October, 1887.

In reply to your letter of the 17th instant, in which you ask whether, in the event of portion of the tramway system being selected for a trial of electrical motor-power, the person or firm conducting the experiment will be allowed to pass the necessary conductors (telegraph wires) through the streets, and further soliciting data as to length of the section, gradients, &c., I am desired by the Commissioner to inform you that full information on the subject will be supplied to all applicants when the question is decided by the Government.

I have, &c.,

A. RICHARDSON,

(For the Secretary for Railways).

No. 54.

Mr. W. Prince to The Secretary for Public Works.

Sir,

Dunedin, New Zealand, 6 October, 1887.

With reference to the trial of my electric tram-car, at which (from recent cablegrams from London) Sir Saul Samuel, with other Agents-General, was greatly pleased and convinced, I beg to say that I shall be happy to furnish you with any particulars and details if honored with a request to do so, and if furnished with some idea of the particulars needed.

I have, &c.,

WALTER PRINCE.

Please inform of conditions under which others interested have sent in offers.—J.S., 20/10/87.
Mr. Prince informed.—27/10/87.

No. 55.

The Secretary for Railways to Mr. W. Prince.

Sir,

Department of Railways, Sydney, 27 October, 1887.

I have the honor to acknowledge your letter of the 6th instant, relative to the recent trial in England of your electric tram-car, and in which you offer to furnish particulars of the invention.

In reply, I am desired by the Commissioner for Railways to inform you that no decision has been arrived at in regard to the adoption of electricity as a motive-power; but as soon as a determination has arrived at you will be allowed the same facility for demonstrating on our tram lines the merits of the system you represent as other patentees will be.

I have, &c.,

A. RICHARDSON,

(For the Secretary of Railways).

No. 56.

No. 56.

Mr. B. James to The Secretary for Public Works.

EXTRACT from Commissioner's 88-1038, letter signed Benjamin James, of the Anglo-Australian Investment Finance and Land Company, Limited, 24, Hunter-street, city, dated 9 January, 1888.

* * * * *

Electric Tramways, Denver.

A "SERIES" system, which is claimed as the only principle that promises permanent reliable success as an electric motive-power.

The invention of Professor Short, of Denver University, and John W. Nesmith.

The patents number twenty, and are the property of the United States Electric Company.

The first car ran 1st July, 1866, and is now the longest electric railway in successful and regular operation in the world. From my observation the working is not satisfactory.

BENJAMIN JAMES.

Of what use is this—does Mr. James propose to move in the matter? Where is his letter?—A.R., 20/1/88. His letter. Commissioner's 88-1038 sent up-stairs for a letter to be written yesterday.—J.T.W., 20/1/88.

Sir,

Department of Railways, Sydney, 20 January, 1888.

I have the honor, by direction of the Honorable the Minister for Public Works, to acknowledge the receipt of your letter of the 9th instant, on the subject of railway and tramway communication in America, and to convey to you his thanks for the information afforded.

I have, &c.,

D. VERNON,

(Pro Commissioner for Railways).

Benjamin James, Esq., Anglo-Australian Investment Co.,

No. 57.

Mr. E. Pritchard to The Commissioner for Railways.

Dear sir,

Sydney, 10, Victoria Chambers, Castlereagh-street, 18 February, 1888.

Will you kindly let me know when I can have an interview with you. If you will appoint any day but Monday next, 20th instant, I shall wait upon you.

Yours, &c.,

E. PRITCHARD.

Will see Mr. Pritchard on Friday morning at 11.30.—C.A.G., 23/2/88. Write to-day.—A.R., 23/2/88. Done, 23/2/88. I have seen Mr. Pritchard.—C.A.G., 24/2/88. He will have his electric cars ready in a short time.

No. 58.

Mr. H. Craig to The Secretary for Railways.

California Branch.

New Zealand Fire and Marine Insurance Company of Auckland, New Zealand.

Dear sir,

San Francisco, 12 January, 1888.

I have had occasion to make some inquiries recently for friends in New Zealand as to the practicability of using electricity as motive-power for street railroads, in place of horse-power and cables.

In the course of my inquiries I have received a report from Mr. F. M. Speed, the patentee of the telpherage electric-railway system. It has occurred to me that possibly you may be making inquiries towards changing your Sydney street-car system from steam to electricity, and that the information obtained by me may be of service to you. With that in view, I have the honor to enclose a copy of Mr. Speed's report to me, and will also send diagrams which will make the matter more clear; and am authorized by Mr. Speed to say that in the event of your entertaining the matter favourably he would be prepared to proceed to Sydney, at your expense, and remain there at a salary of £1,000 per annum, and construct for you an experimental road of 1 mile in length, showing the advantages of his system, and its ability to do what he claims, and sell to you the right to construct a road at a royalty of £100 per mile. He stated to me recently that on close comparison of the power conveyed to the cars by his system and that by storage batteries he shows that the direct current as applied by him gives 32% against 16% furnished by the storage system, and that comparing power obtained from electricity with that by steam cable the percentage is as follows:—In Chicago, 18½% of the power conveyed to the movement of the car; in San Francisco, 32% by the most improved cable process, against 54% shown to be available by the telpherage system for the movement of cars. I am requested by Mr. Speed to ask you to consider this information confidential, and that it may not be used for the purpose of obtaining patents in the Colony of New South Wales, which he may at some future time feel disposed to make application for. I shall be glad at all times to serve you in this matter, and refer you to the Manager, in Sydney, of the New Zealand Insurance Company; the Manager of the New Zealand Loan and Mercantile Agency Company; Messrs. Amos and Taylor, railway contractors; Mr. Griffin, United States Consul.

Yours, &c.,

HUGH CRAIG,

Manager.

Telpherage Electric Railway Co., San Francisco, California, U.S.A.

Series System.—Speed & Jenkins' Patents.—Diagram of Circuit.

THE conductor on channel irons (shown in cross-section G.H.I.J.), placed in a conduit between the rails, in the relative position shown, and correspond to the line G.H.I.J. of the diagram below.

A is the dynamo for generating the current which operates the motor on cars CC.

B

B is the dynamo for generating the current operating the electro-magnetic switches for bringing the cars in series.

FF are electro-magnets with armatures and closing points pp $p'p'$ and c .

EE are the collector brushes, connecting the motors on the cars CC with the conductors, as the cars travel along the road.

The operation is as follows :—

- 1st. When no cars are on the road the current from the dynamo B passes by the conductor I through the coils of the electro-magnets FF and C (them, and drawing down their armatures closes the points pp $p'p'$ $p''p''$ and c) and then by return wire L in a single back road. The current from the dynamo A passes by the conductor G through the closed points of the switches PP and C by return wire K.
- 2nd. When there are two cars on the road the metal plate D of the collector establishes a shunt around the electro-magnets FF, the armatures are drawn up by the springs, and the points $p'p'$ and $p''p''$ are opened. Then the current from dynamo A will pass through the motors on the cars CC in series.

1.

The question of a more economical and acceptable method of street-car propulsion is agitating street-railway Companies in this country to an extent which clearly indicates thorough dissatisfaction with animal power, and timid reluctance to adopt cable. Gas, soda, and compressed-air engines are no longer considered. As between electric power and cables the issue is indirect. In some cases, where the traffic is congested, as on the Market-street lines of this city, and in cases where the grades exceed 7 per cent., the cable is supreme. Experience teaches that more than ordinary foresight and judgment is required to certainly foretell where cable will be remunerative. It is evident that there must be a certain initial amount of travel, as the cost of running a cable is the same for one car as for any greater number. Climatic conditions must be considered, as the cost of running the cable and maintaining the integrity of the slot varies very materially. For instance, the average absorption of engine-power on all the cable lines of this city, San Francisco (Hanscom's report), is 68 per cent.; in Kansas city, 75 per cent.; in Chicago, 81½ per cent. Here and in Chicago the cable lines are paying, while in Philadelphia, having three times greater population than San Francisco, they are reported to be losing money.

I am not arguing for or against cable roads. The above facts are given to emphasize the statement that there is an increasing hope and belief that electricity can perform better service than animals, and equal service to cables, at less cost.

It must be admitted, however, at the outset, that as yet no more than a few cars have been moved simultaneously on either electrical system, not, as electricians firmly believe and assert, that it is impossible or impracticable to do so, but solely for the reason that capital prefers waiting the outcome of smaller undertakings. This much can be specifically and certainly asserted, that electric railways have demonstrated their ability, beyond a doubt, to propel a few cars, heavily loaded, on steeper grade, at less cost and at greater speed than on railways worked by horses. The following roads, in daily operation, give incontestible evidence of the truth of this :—

2.

Location.	Miles.	Cars.	Power.	Cost of power per day of eighteen hours.
Windsor, Ont.	2	2	Steam	\$4
Detroit, Mich.	2	8	Steam	6
Appleton, Wis.	5	5	Water	4.50
Port Huron, Mich.	5	5	Natural gas	2
Binghampton, N.Y.	5½	6	Steam	10
Lima, Ohio	4	6	Steam	4
St. Catharine, Ont.	6	6	Water	3
Montgomery, Ala.	13	18	Steam	4
Baltimore, Md.	5	3	Steam	1.80 per day per car.

This list does not comprise all the electric railroads in operation in this country; but similar data of those not mentioned is not at hand. A road under construction in Richmond, Virginia, is to have forty cars. Three electrical cars are equal in service to four horse cars.

Though the greatest number of cars on any of the roads given is eighteen, it does not follow that the number is limited by inability to run more if warranted by the traffic.

The electrical and mechanical principles would be the same for a large as a small number. It is a question of first cost. About one half the cost of a first-class cable road would equip an electrical road with suitably arranged boilers and engines, duplicate dynamos and electric conductors to handle an equal traffic with as little probability of interruption.

There are two general methods of application :—

- 1st. By overhead wires supported on poles at short intervals. The poles and arms, derisively called gibbit, are unsightly, in fact inadmissible in the streets of a city, though available in small towns and on suburban lines. This method is used more than any other because it is cheaper for one thing, and the certainty of maintaining insulation without special attention. The conductors and supports cost from \$1,000 to \$1,500 per mile.

- 2nd. Conduits similar in construction and outward appearance to cable railways, containing electrical conductors connected with the car above through the slot.

An iron conduit of sufficient strength to withstand heavy vehicle traffic costs in San Francisco about per mile laid (in addition to track and paving).

3.

The only serious argument against the conduit system is the extra cost and the extreme care necessary to insulate the conductors. From ignorance of the subject and disinclination to incur the necessary expense to perfect and protect the insulation, several conduit roads have not been successful, notably one in Denver, Col. One of the very first conduit roads ever put down was the Blackpool, England, which is carrying 42,000 passengers per week at a cost of £45 (at 1d. each £175).

The

The transmission of electric energy from one source to a number of motors in the same circuit, each working independently, may be made on the parallel or series system.

In parallel the electro-motive force or pressure between the positive and negative conductors must be kept constant, the passing current being divided between all the motors at work.

In series the current in the conductors must be kept constant, and the pressure increased as the number of motors at work is increased, the passing current, traversing each motor at work. At constant pressure the weight of the conductors increases almost as the square of the current, so that to distribute electrical energy over any considerable area, or in other words operate a number of motors at considerable distances from the dynamo, it is absolutely essential to work at high pressure, otherwise the cost of the conductors will be inadmissibly large.

It is the prevailing delusion with electric companies that to gain public confidence they must offer a system. I know of no such thing, correctly speaking, as an electrical system except as above stated. Separate from these two methods of electrical transmission all the rest is good engineering. Success depends very much upon the men who plan and carry out the work.

The efforts of this company have been directed to the perfection of the details of a series high pressure system, having as a basis the patents of the late Fleming Jenkins, of Edinburgh, Scotland. We have devised practical electrical and mechanical means of carrying out his inventions from the point where he left them incomplete. All our trials on a road laid down for the purpose have convinced us that the directions indicated by him was the correct path to success.

We have gone further than any of our predecessors in securing insulation of conductor, and provision for the care of them in conduits.

This of course involves a greater outlay; the accompanying drawings show the form of the conduit and one method of laying in connection with the track. These general features may be varied subject to the conditions of the locality where put down. They show an iron tie which is an extension of the castings supporting the channel irons and conductors. Evidently the ties may be of wood and the rails laid on stringers in the usual form if preferred. Proper drainage of the channel-way must be maintained, a matter of no difficulty where access can be had to sewerage; experience proving that a small channel-way with frequent openings will answer.

I have here given a fair statement of the present condition of electrical railways. The number of electrical roads in the United States is increasing faster than any other kind, except those operated by horses, showing that confidence in them is well established. We are making motors of 30-horse power, under guarantees of commercial efficiency of 84 per cent. and actually attaining 90 per cent. For smaller sizes the efficiency is somewhat less; but we know that with a steam-engine of 100-horse power, driving a generating dynamo, we can deliver within a radius of 2 miles an aggregate of 60-horse power at six or sixty different points. This much being certain of accomplishment it remains only to perfect the mechanical details of application to ensure a like result in railway propulsion.

We are confident of having already done this, and unhesitatingly stand ready to equip a road of any magnitude when the opportunity presents itself.

Our trial line in Oakland was operated for some months. With the experience gained of the value and practicability of our appliances we know of no reason why we should not accomplish in every day service all that we promise.

I enclose drawing showing cross section of conduit. The Stevenson cars can be adapted to electric motors without material alteration.

We cannot furnish exact estimates of cost of construction and operation without full particulars of the road. We will require a map and profile of the route, plans of existing roads, size, weight and carrying capacity of cars, location of power station, contemplated extensions, present maximum number of cars and passengers at any hour of the day, and probable increase due to extension of the line. Having these presumably it would be preferably to submit plans to English manufacturers for estimates.

F. M. SPEED,

General Manager for the Telphorage Railway Company,
No. 405, Montgomery-street, San Francisco.

This is not being recorded because it is marked confidential.—A. R., 10/2/88.

Acknowledge receipt with thanks. Say that we shall be glad to get plans, &c., and he may rely upon no advantage being taken in regard to patent rights, &c. Say that we do not, owing to electricity as applied as a motive power for tramways, being in the experimental or initial stage, offer any inducement to patentees and others to bring their appliances to this Colony beyond this, that if they bring them at their own expense and demonstrate to us that electrical power for tramway working is the best system to adopt—for which purpose trials on the Government lines are given free of charge—we should be prepared to take the best of such systems. Add that on these terms persons interested have recently imported appliances to test the Julian system of working tramways by electricity, and a test of them will shortly be made. With regard to the statement that electric power cannot be made effective on 7 per cent. grades, or (say) 1 in 15, although none of our present grades are so steep, the steepest being 1 in 17, still there are some parts of the City requiring Tramway accommodation where the grades are 1 in 9 for a short distance. Our tramways are present worked by steam (30 miles). We have a short line, not 2 miles in length, worked by the cable; and there is to be a change in the system, the majority at present favouring cable lines, because the power of electricity, as applied to Tramway working, is not so established as to justify its adoption without further proof of its efficacy.—C.H.A.G., 10/2/88.

Mr. Craig written.—20/2/88. Put with other papers on the subject of electric tramways.—20/2/88.

No. 59.

The Commissioner for Railways to Mr. H. Craig.

Sir,

Department of Railways, Sydney, 20 February, 1888.

I have the honor to acknowledge your letter of the 12th ultimo, enclosing copy of Mr. Speed's Report on the Telphorage Railway System, and offering to furnish diagrams to make the matter more clear.

In conveying to you my thanks for your thoughtful attention, I may say that I shall be glad to receive the plans referred to, and you may rely upon no advantage being taken in regard to patent rights.

We

We do not, owing to electricity as applied as a motive power for tramways being in the experimental or initial stage, offer any inducement to patentees and others to bring their appliances to this Colony, beyond this, that if they bring them at their own expense and demonstrate to us that electrical power for tramway working is the best system to adopt—for which purpose trials on the Government lines will be given free of charge—we should be prepared to take the best of such systems. On these terms, persons interested have recently imported appliances to test the Julian system of electricity, and a test of them will shortly be made.

With regard to the statement that electric power cannot be made effectual on 7 per cent., or (say) 1 in 15 grades, although none of our present grades are so steep, the steepest grade being 1 in 17, still there are some parts of the City requiring Tramway accommodation where the grades are 1 in 9 for a short distance. Our Tramways are at present worked by steam (30 miles). We have a short line, not 2 miles in length, worked by the cable, and there is to be a change in the system, the majority at present favouring cable lines, because the power of electricity as applied to tramway working is not so established as to justify its adoption without further proof of its efficiency.

I have, &c.,
CHAS. A. GOODCHAP,
Commissioner for Railways.

No. 60.

Messrs. Stokes & Morris to The Secretary for Public Works.

Sir,

Jamieson-street, Sydney, 17th January, 1888.

On the 24th March last we had the honor, on behalf of Mr. A. S. Hallidie, of San Francisco, to submit to you, for the consideration of the Government, certain propositions for the purchase or lease of the whole tramway system. To these propositions we are as yet without reply.

As we are anxious to write to Mr. Hallidie on the subject, we would be glad if you can inform us if there is a probability of the propositions made by us, or which may be made by others, being entertained by the Government; or if, in the event of the Government determining to sell or lease the tramway system, public competition will be invited.

We have, &c.,
CHAS. H. STOKES,
AUGUSTUS MORRIS,
Attorneys for A. S. Hallidie.

Please inform that the whole matter is having consideration, but nothing definite has been decided.—
J.S., 19/1/88. Messrs. Stokes & Morris informed, 21/1/88.

No. 61.

Mr. W. H. Jennings to The Secretary for Public Works.

Dear Sir,

Barker-street, opposite Barker-street,
Sydney, N.S.W., 8 February, 1888.

In reference to the expressed intention of the Government to sell or lease the present lines of Tramways in Sydney, may I request that when the terms and conditions are fully matured you will favour me with an early copy of same. I have the patent in my possession for the latest and most approved system of cable trams, and purpose making an offer for either purchase or lease of same.

I have, &c.,
W. H. JENNINGS.

Please acknowledge and put with papers.—J.S., 8/2/88.

No. 62.

Mr. M. Bury to The Secretary for Public Works.

Sir,

Box 899, General Post Office, Sydney, 22 February, 1888.

On the 8th of last May I had the honor, on behalf of myself and others, of addressing you on the subject of the Sydney trams, and enclosing in that letter certain proposals with reference to leasing or purchasing the same. On the 28th of June I again addressed you on the subject. We now learn through the public press that the Government contemplate making some change in the working of the Trams. Should such be the case, I beg to say that my syndicate are still prepared to treat with the Government on the basis of the proposals referred to. I addressed the Hons. F. A. Wright, W. J. Lyne, and Garrard during their terms of office on the subject of working the trams, and requested to be allowed to lay the peculiar features and requirements of the Sydney trams before my friends in New York, who are experts in tramway construction and management. If your Government apprehend difficulties in the way of leasing the Trams, I ask, through you, their consent to allow my friends in America to make an independent and impartial report on the whole question, for I am assured that, on my laying before them full particulars, and otherwise making them conversant with the present condition of the traffic, together with the existing wants and future requirements of the service, they will submit a full, comprehensive, and satisfactory scheme for overtaking the traffic and working the trams, and will also supply correct plans and estimates for any new work that they might consider necessary, either for cables, electric, or steam motors, or a combination of all those systems. They would also provide the Government with experienced and efficient traffic managers, who would give satisfaction to the Government and make the Trams pay if the alterations they might make were carried out.

I have, &c.,
MAXWELL BURY.

Please acknowledge and put with papers.—J.S., 22/2/88.

No. 63.

Minute by The Commissioner for Railways.

Electric Cars for Tramways.

MR. CRACKNELL, the Superintendent of Telegraphs, wishes to bring under the notice of the Minister, some electric cars for the Tramways, two or more of which he wishes to import for trial on these lines.

He would be glad if the Minister would appoint some day this week to see him, with plan and descriptions.

CHAS. A. G., 15/8/87.

I will see him on Tuesday, after lunch.—J.S., 27/8/87. Mr. Cracknell informed.—D.C.M'L., 29/8/87. Mr. Cracknell is at present out of town and will not return for ten days.—D.C.M'L., 29/8/87. In ten days.—A.R., 30/8/87. Mr. Cracknell had an interview with the Minister to-day, and he is to submit a proposal.—CHAS. A. G., 10/9/87. Resubmit with proposal. Proposal not yet received in records.—16/9/87. Since registered and sent on to Minister. Attach on return.—A.R., 16/9/87.

Minute by The Superintendent of Telegraphs.

I HAD the honor to submit to you in November, 1886, a report on Electrical Tramways, which, in my opinion, could be worked with great advantage on the existing tramway lines in this Colony. I now add some further information, which will serve to show that tramways, driven by electrical power, are now a pronounced success, both in Europe and America; and so far as I have been able to gather from authentic statistics, I believe would prove more economical in the working expenses per tram mile than the existing system here. The efficiency of tramways operated by electricity being thus placed beyond a doubt, the only question to be determined is, which system is the best adapted for this Colony. Whether the system which is based upon the production of the current by fixed dynamos at the end of the line and transmitted by means of the rails to the motor on the car, or that system which provides for accumulators to be carried in the cars.

It will be seen by the accompanying reports that I have dealt fully with each of these systems; the "Spragne" and other trials representing the former, and the "Reckengaum," at Antwerp experiments, representing the latter.

In view of the fact that by the adoption of the accumulator (storage) system the necessity for any alteration in the rails is obviated, I cannot but think that this system is the better one for use here, and as the "Reckengaum" system has now passed its experimental stage, I recommend that say eight or ten cars be ordered from the company at say £1,100 per car complete for the road, including steam engines, boilers, dynamos, motors, gearing and accumulators, fixings &c., and contingencies.

It may be added that the light cars might be admirably adapted for the smaller traffic during the middle of the day in the City.

There is a lighter car than the one I have recommended which could be obtained at a cost of £835, but I consider this too small for the requirements of the Colony.

E. CRACKNELL, 13/9/87.

The Commissioner for Railways.

Minute by The Superintendent of Telegraphs.

November, 1886.

I THINK I cannot do better in this direction than submit the following *resumé* of the competition carried out at the late International Exhibition at Antwerp, between different forms of mechanical motors on tramways for use in towns, &c.

The experiments were made on a specially constructed line 2,795 metres (2 miles 1,500 yards) long. Of this 2,295 metres were in a straight line, 189 metres in curves of $1\frac{3}{4}$ chains radius, and 313 metres in curves of one chain radius.

The experiments lasted four months, and there were five competitors. Of these, three systems were based on the direct action of steam, the "Krauss" locomotive, separate from the carriage; the "Wilkinson" locomotive, also separate from the carriage; and the "Rowan" engine and carriage combined. The fourth was the "Beaumont" compressed air engine, and the last a single electrical car.

A regular service was established according to a fixed time-table, to which each motor was required to conform.

The speed was fixed at about 9 miles an hour, and the motors were required to work four days out of six, and on one of the four days to draw a supplementary carriage.

In the electrical car the haulage was effected by means of accumulators, of which there were thirty-six, having a total weight of 1,584 lb. The process of charging occupied twelve hours, and, when complete, the batteries were able to work for fifteen hours and drive the car 46 miles, not counting stoppages.

The accumulators actuated a Siemens dynamo, having a normal speed of 1,000 revolutions, fixed on the frame of the carriage. The motion was conveyed from the pulley on the dynamo by means of a belt passing round a shaft fixed on moveable bearings; to regulate its tension, and thence to the axles by means of a flat chain of phosphor bronze. The chain was adopted as the means of moving the axles on account of its simplicity and facility of repair by unskilled labour.

The speed—about 9 miles an hour—was regulated by cutting out a certain number of accumulators. By breaking the circuit entirely the motive power ceased, and the vehicle might either be stopped by the brakes or allowed to run forward by gravity if the road were sufficiently inclined. The reversal of the motor was effected by means of a lever which reversed the position of the brushes of the dynamo. The dynamo could be set in motion and the carriage worked from either end as desired.

The weight of the tram-car was 5,654 lb.; the weight of the accumulators, 1,584 lb.; the weight of the machinery, including the dynamo, 1,232 lb. The car contained room for fourteen persons inside and twenty outside.

It was found that from 35 to 40 per cent. of the work given out by the steam engine must be taken as the utmost useful effect on the rail. It was estimated that to draw the carriage on the level 714-horse power was required, or if a second carriage were attached 848-horse power would draw the two together. This would mean that (say) 2-horse power on the fixed engine would be employed to create the electricity for producing the energy required to draw the carriage on the level. The

The electrical tram-car was quite equal in speed to those driven by steam or by compressed air, and was marked by its noiselessness and by the ease with which it was manipulated.

The original programme of the conditions which were laid down as those upon which the adjudication of merit would be awarded contained twenty heads, to each of which a certain value was attached, and in addition to these special heads there was also to be weighed the following general considerations, viz. :—

(a). The defects or inconveniences established in the course of the trials. (b). The necessity or otherwise of turning the motor or the carriage with the motor at the termini. (c). Whether one or two men would be required for the management of the engine.

As regards these preliminary points the compressed air motor, as well as the Rowan engine, required to be turned for the return journey, whereas the other motors could run in either direction.

In regard to this the electrical car was peculiarly manageable as it moved in either direction; the handle by which it was worked was always in front close to the brake.

All the motors were managed by one man.

The several conditions of the programme may be conveniently classified in three groups under the letters A, B, C.

The conditions under "A" were :—

- (1). Absence of steam.
- (2). Absence of smoke and cinders.
- (3). Absence, more or less complete, of noise.
- (4). Elegance of aspect.
- (5). The facility with which the motor can be separated from the carriage itself.
- (6). Capacity of the brake for acting upon the greatest possible number of wheels of the vehicle or vehicles.
- (7). The degree to which the outside covering of the motor conceals the machinery from the public, whilst allowing it to be visible and accessible to the engineer.
- (8). Facility of communication between the engineer and the conductor of the train.

In deciding upon the relative merits of the motors under these eight points, the electrical car, except possibly, as regards No. 3, surpassed all others.

Under letter "B" considerations of maintenance and construction are classed.

- (9.) Protection of the machinery against the action of dust and mud.
- (10.) Regularity and smoothness of motion.
- (11.) Capacity for passing over curves of small radius.
- (12.) The simplest and most rational construction.
- (13.) Facility for inspecting and cleaning the interior of the boilers.
- (14.) Dead weight of the train compared with the number of places.
- (15.) Effective power of traction when the carriages are completely full.
- (16.) Rapidity with which the motor can be taken out of the shed and made ready for running.
- (17.) The longest daily service without stops, other than those compatible with the requirements of the service.
- (18.) Cost of maintenance per kilometre.

It was assumed that, for the purpose of this sub-heading, the motor or carriage which gave the best results under the conditions relating to the paragraphs 9, 10, 12, and 13 would be least costly for repairs.

As regards the first of these, viz., protection of the machinery against dirt, the electrical car had no protection. It was not found in the experiments at Antwerp that inconvenience resulted from this; but it is a question whether in very dry localities, and especially in a locality where there is metallic dust, the absence of protection might not entail serious difficulties.

In respect of the smoothness of motion and facility of passing curves, the cars did not present any material differences.

In the case of simplicity of construction, it is evident that the simplest and most rational construction is that of a car which depends on itself for its movement, which can move in either direction with equal facility, which can be applied to any existing tramway without expense for altering the road, and the use of which will not throw out of employment vehicles already used on the lines. The electric car fulfilled this condition best, as also the condition numbered 13, as it possessed no boiler.

In respect to No. 14, viz. : The ratio of the dead weight of the train to passengers, if we assume 154 lb. as the average weight per passenger. The following is the result as regards the three cars in which the power formed part of the car :—

Electric car	$\frac{9,350 \text{ lb.}}{154 \times 34} = 1.78$
Rowan	$\frac{15,950 \text{ lb.}}{154 \times 34} = 2.30$
Compressed air	$\frac{22,000 \text{ lb.}}{154 \times 34} = 2.55$

The detached engines gave, of course, less favourable results under this head.

Under head No. 15 it was found that the tractive power of all the motors was sufficient; but, as the line was practically level, this question could only be resolved theoretically, and the table given before affords all the necessary data for theoretical calculation.

As regards the rapidity with which the motors could be brought into use from standing in the shed, the electrical car took place No. 1, followed by the compressed air engine.

The result under No. 17, viz., the fewest interruptions to the daily service, class the motors thus :—

Krauss
Electric
Rowan
Wilkinson
Compensation.

Under letter "C" are classed considerations of economy in the consumption of materials used for generating the power necessary for working.

Description of Motor.	Total number of Train Miles run.	Total Consumption of Fuel.	No. of lb. per Train Mile.
Electric	2,358.9	14,786 lb.	6.16
Rowan	2,616.9	14,498 "	5.42
Wilkinson	2,473.3	22,000 "	8.82
Krauss	2,457.8	22,726 "	9.10
Compressed air	2,259.1	90,420 "	39.48

Description of Motor.	No. of places indicated on the cars per mile run.	Consumption of Fuel.	No. of lb. of Fuel consumed per places indicated per mile run.
Electric	80,203.5	14,786 lb.	.18
Rowan	148,399.6	14,498 "	.09
Wilkinson	119,085.1	22,000 "	.18
Krauss	108,983.9	22,726 "	.20
Compressed air	128,189.3	90,420 "	.69

Description of Motor.	No. of Seats per mile run.	Consumption of Fuel.	No. of lb. of Fuel consumed per seat per mile run.
Electric	61,591.2	14,786 lb.	.23
Rowan	135,928.8	14,498 "	.10
Wilkinson	93,965.6	22,000 "	.23
Krauss	86,039.9	22,726 "	.25
Condensed air	132,732.7	90,420 "	.66

19. Minimum consumption of fuel (either coke or coal) in proportion to the number of kilometres run, and to the number of places, assuming for the seats a width of at least 16 inches for each person seated.

The conditions of the competition required that a second car should be periodically drawn by the motor. The above calculations include the total number of miles run, the total amount of fuel, &c., consumed, and the total number of passengers which could be conveyed by each motor during the total time that the experiments were being carried on.

As regards the figures in these tables, it is to be observed that the consumption of fuel for the electric car is to a certain extent an estimate, because the engine also supplied electricity for electric lights as well as for an experimental motor which was running on the lines of tramway, but was not brought into competition.

20. Minimum consumption of oil, or grease, tallow, &c. (The same condition as No. 19.)

Description of Motor.	Total number of miles run.	Total consumption of Oil, Tallow, &c.	Consumption of Oil, Tallow, &c., per train mile run.
Electric	2,358.9	99.0 lb.	.038
Rowan	2,616.9	106.7 "	.038
Krauss	2,457.8	188.5 "	.073
Wilkinson	2,473.3	255.4 "	.101
Compressed Air	2,259.1	585.2 "	.255

Of the electrical tramways already running in different parts of the world the Porttrust Giant's Causeway Line may perhaps be regarded as the most important. This line is 6 miles long, the gauge is 3 feet, the curves are very sharp, and the gradients as follows, viz., 1 in 44, 1 in 40, 1 in 33, 1 in 35, 1 in 30, and 1 in 45. The cars carry twenty persons each. Prior to the turbines being finished the dynamos were temporarily driven by a steam-engine. To provide the necessary force to propel the electrical car drawing a second carriage behind it 18 lb. of coke per mile were consumed on a 312-miles trial.

Then there is the Baltimore-Cleveland Line, where the electrical car hauls a full car 4 miles in twenty-five minutes, mostly up hill, and some of it steep. It has been calculated that the annual saving of electrical over horse power is 72,000 dollars, and of electricity over cables 40,000 dollars.

In the Bessbrook to Newry (Ireland) line the motive power is produced by electricity created by stationary dynamos driven by a turbine. A maximum speed of 15 miles an hour is easily attained. The gross load carried is 26 tons, the electrical loco. weighing 8 tons, and capable of carrying thirty-four persons. This load can be brought up inclines averaging 1 in 85 at 7 miles an hour, and can be started at any point of the line, even where there is a gradient of 1 in 50.

The Blackpool Tramway, worked by electricity, is a pronounced success, and has been leased to a Company, which will pay the Corporation 6½ per cent. on the total outlay, besides keeping the roadway over which the line passes in repair.

The

The Brighton Electric Railway has also been very successful, and during the six months ending February, 1885, the distance run by the cars amounted to 15,600 miles, and 200,000 passengers were carried, the total cost of traction being less than two pence a mile.

It will not be necessary to refer to the tramways of Berlin and Brussels, as they are well-known and successful systems.

Dr. Siemens, F.R.S., in a paper published in the Electrical Review of 1 September, 1883, says:—"The advantages of electrical propulsion are that the weight of the engine, so destructive of power and of the plant itself in starting and stopping, will be saved, and perfect immunity from the products of combustion will be ensured. For tramways within populous districts it will be more advantageous to resort to accumulators forming a store of energy carried under the seats of the car itself, and working a dynamo connected with the moving wheels."

In conclusion, whilst electrical tramways are still going through the process of development, and will, as time goes on, be largely improved, yet, there can be no doubt, they are already sufficiently advanced to justify their introduction into this colony.

I have received the following telegram having reference to the electric cars of Mr. Reckenzaum, of Berlin, viz.:—"Reckenzaum willing supply eight electric cars within three months from date ordered, complete outfit consisting of dynamos, motors, accumulators, three sets each, switches, mountings, transmission gear, complete tramcar, £835, for one horse car carrying thirty persons; this is calculated for gradients one in fifteen. Two horse cars 30 per cent more. Price understood f.o.b., London.

I am of opinion that electric tramcars could be run here at a cost of about twelve pence per mile run.
29/11/86. E. C. CRACKNELL.

Subject of communication:—Some further remarks as to Electric Tramways.

SINCE the foregoing was written advices continue to be received of the increased development of electric tramways in various parts of the world, more particularly in America, where the Bently-Knight system and the system of Mr. F. J. Sprague have been very successfully operated. On the 28th December last some severe trials of the latter system were carried out in New York in the presence of a large number of railway authorities, and as a practical evidence of the applicability of electricity in this direction the following condensed account of the trials will be interesting:—

Before making the experiments Mr. Sprague explained that they would be run over the road making ordinary trips, then a variety of experiments would be performed, and finally the machines would be put to some severe and very exceptional strains. At about 8:30 p.m. the stations at the Second and Third Avenues were brilliantly illuminated with a large number of Edison lamps, the current for which was supplied from the same source as supplied power for operating the car. Connection was then made with the track, and immediately car No. 293, which was standing in a pocket, became brilliantly illuminated. The switches being thrown over, the car was rapidly run out of the pocket on to the siding and switched over to the main track. It was then run toward Third Avenue, while the regular engine and car, which had been on duty, was run off the main track on to the siding. The first trips were uneventful. The car was smoothly and easily run between the ferry and Third Avenue, sometimes stopping at the Second Avenue Station. At this latter point there is a 95-foot grade, which is the maximum grade that occurs at any station on the elevated railroad.

After several trips had been made Mr. Sprague began to show some of the exceptional possibilities of his method of handling a car, the first of these being the starting and stopping without shock or jar on the 95-foot grade at the Second Avenue station, the car being controlled solely by the motors, and without the use of any hand or shoe brakes whatever. After some running of this character the speed of the car was increased until, when it was running on the upper grades, it was moving at about 10 miles an hour, and occasionally, when coming on the down grade, Mr. Sprague would allow the car to run at about 18 or 19 miles an hour.

The track on which the experiments were made presents difficulties, not only in that the middle station is on a heavy grade, but that just above this station, between it and Third Avenue, there is a double curve, on which the car leaves the straight track and runs into the Third Avenue Station. The curve is likewise on a grade. Notwithstanding this fact, the car ran smoothly and easily on every part of the trip. On one trip, in coming down, Mr. Sprague stopped the car at the Second Avenue Station, and then allowed it to creep at variable speeds down to the lowest perceptible rate of motion—a movement so slow that it would almost have been feasible to have gotten off the car and cracked a nut under the wheels, removing it before the wheels passed over it.

Later in the evening the car was run rapidly past the Second Avenue Station on the down track, and between the station and the ferry was brought to a speed of about 21 miles, and while on the maximum down grade the car was suddenly slowed down and brought to a rapid sharp stop in a distance of about 120 feet. In another experiment the car was run rapidly up the grade, the current was shut off, and the car allowed to run backward, when it was immediately stopped and run forward again, solely under the operation of the current.

On several trials the time was taken from starting to stopping between the ferry and the Third Avenue Station, a distance of nearly a third of a mile, and taking in the 95-foot grade and the double grade. On the down grades the time averaged 1 minute 14 seconds, and on the up grades 1 minute 25 seconds. The speed of the car was timed on the grade going up by counting the beats of the track on the rails, and it was found to be running at 12 miles an hour, which is the normal rate of speed on the elevated road on a like grade.

Just before the close of the experiments some very sharp strains were put upon the motors. These consisted in braking the car to its full motor capacity, which was done in going down grade and at the ferry end of the station. With his regulating switch in one position, Mr. Sprague threw over the brake lever, and instantly the car was brought up sharply and suddenly, with such a rapid gradation that the wheels on the trucks "skidded" in rotation on the tracks, and the car stopped in a fraction of its own length. These experiments were repeatedly tried, Mr. Sprague feeling that since this was the last of the present set of experiments it mattered little if the machines were actually wrecked. He would at least, he said, find out what was in them.

Similar experiments were made at starting. The car, when standing at a dead rest at the ferry station, had the current suddenly given to it. There was an instant continuous "skidding" of the wheels, and the car actually jumped away from the station with such suddenness of acceleration as to nearly take a person off his feet.

The

The whole experiment was a great success in every way, notwithstanding the extraordinary character of some of the experiments, and the sudden and great strains which were put upon the apparatus, there was not a hitch of any description. The commutators of the machines at the close of the run were bright and clean, the gears were in perfect condition, and the whole apparatus was in proper shape for another run.

By way of supplementing the foregoing, and to bring the information down to the present time, I have made some extracts from a paper read by Mr. Reckenzaum before the Society of Arts, London, on the 20th April last.

Speaking of the Berlin Electrical Tramway, he says that the "cars although in continuous operation for a period of six years, have exhibited no signs of deterioration, and there have been no mishaps worth mentioning." He had not been able to ascertain the working expenses of the line, but they must be very low since the engines and dynamos are in the house which also contains the pumping machinery of the district waterworks. One engineer and one stoker attend to both the hydraulic and electrical apparatus—the same boiler serving both purposes—and these men find time to attend to minor repairs. About 100,000 passengers are carried annually.

Referring to the Brighton line he says that the motive power is a 12 h.-p. gas-engine placed at one end of the line, driving a Siemen's compound dynamo. The average distance made by each last year was 23,475 miles, and the expenses per car mile amounted to only 2d. The number of passengers last year averaged 8.51 per car mile, and the total expenses amounted to 55 per cent. of the gross receipts.

Mr. Reckenzaum proceeds to say that the line between Moedling and Hinterbruehl, in Austria, over 2 miles in length, has been running since 1884, at an average cost of 3.42d. per car mile, inclusive of every item of expense. The generating station is situated at the Moedling terminus; it contains three portable engines each 12 h.-p. (nominal) and six Siemen's compound dynamos. When two loaded cars are running *i.e.*, one electric car to which is attached an ordinary car, the indicated h.-p. of one engine varies between 12 and 20 h.-p. according to the position of the vehicles relatively to the line during the outward journey. The track is not an easy one. It consists almost entirely of curves with radii of from 60 feet and upwards; moreover the terminus at Hinterbrenhl lies 120 feet above that of Moedling; thus the line consists of a series of gradients so that for the outward journey a considerable amount of tractive power is necessary, whilst on the return journey the cars run almost entirely by the force of gravity. The average speed is 9½ miles an hour.

The Frankfort Offenbach line, 4 miles, has been in operation since April, 1884. Last year 990,233 passengers were conveyed, and 292,269 car miles were run at a cost of 3.83d. per mile, including the following items:—

Wages, salaries of directors, clerks, &c.	d.
Fuel, 7.54 lb.; coal per mile	2.23
Oil, waste, &c.65
Repairs of machinery, cars, and permanent way13
	.82

The Portrush and Benbrook Lines have both been referred to, in the earlier part of my paper on this subject, so that it will not be necessary to add anything further with regard to them beyond giving Mr. Reckenzaum's figures of the working costs, which he puts at 3d. per car mile for the former and 4d. for the latter. As, however, water power is used in both cases, they are perhaps not applicable to the circumstances of this Colony.

The Blackpool Line, 2 miles, is worked by two steam-engines, each 25 h.-p. (nominal), driving Elwell Parker dynamos. It is quite a successful line, and is run at a cost of about 4d. per car mile.

Amongst the tramways run by means of accumulators, that of Mr. Elieson appears to be coming into favour, and is likely to be the first electric tram system to be adopted in London.

In America great progress has been made, and I think the subjoined list, showing the number of electric railways now running and in course of construction in that country, will form an appropriate conclusion to this paper.

* Extending line or increasing rolling stock. † No specific details received, line not being yet in regular operation. ‡ The cars in constant use all day; the loads averaging 10 tons per trip, and each trip averaging 5 minutes.

NEW ROADS.—Electric railways are now in course of construction, or under contract, at Pittsburgh (3 roads); Los Angeles; Binghamton, N.Y., 4 1/2 miles, 8 motor cars; Lima, O., 3 miles, 6 cars; San Diego, Cal., 9 miles, 4 40 horse-power motor cars; Ansonia, Conn., 3 1/2 miles (water power); New York city (for Fulton-street); St. Joseph, Mo., 20 cars; Mansfield, O.; Ithaca, N.Y.; Harrisburg, Pa.; Woonsocket, R.I.; Richmond, Va., 40 cars, 11 miles of track.

Companies have been formed or steps taken to build and operate electric roads at Flushing, L.I. (2); Lincoln, Neb.; Brookline, Mass. (2); East Cambridge, Mass.; Newton, Mass.; Boston, Mass.; Ashbury Park, N.J.; Pelham Park, N.Y.; New Brunswick, N.J.; Plainfield, N.J.; Bayonne, N.J.; Worcester, Mass.; Scranton, Pa.; Carbondale, Pa.; Philadelphia, Pa.; Reading, Pa.; Bangor, Me.; Biddeford, Me.; Westfield, Mass.; Chicopee, Mass.; Muncie, Ind.; Gratoit, Mich.; Tiffin, O.; Cincinnati, O.; Brooklyn, N.Y.; Coney Island, N.Y.; Rockaway, N.Y.; Winston, N.C.; Jacksonville, Fla.; Pensacola, Fla.; Birmingham, Ala.; Selma, Ala.; Atlanta, Ga.; Fort Smith, Ark.; Wichita, Kan.; San Francisco; San Jose, Cal.; Newton, Kan.

We want additional rolling-stock for the Plattsburg Tramway line, and also for the Kogarah and Sandringham line. A supply of eight of these electric cars will meet the requirements of both lines. The use of them on those lines will demonstrate whether it would be desirable to order them for all our lines. CH.A.G., 13/9/87.

Make short statement for Cabinet.—J.S., 22/9/87.

Electric Tram Cars.

Minute for the Cabinet.

Department of Public Works, Sydney 26 September, 1887.

I HAVE ascertained that tramways driven by electrical power are being used in Europe and America, with very great success and economy as compared with other means of locomotion.

There are two systems, the "Spragne" system which provides for the production of the current by fixed dynamos at the end of the line, and its transmission by means of the rails to the motor on the car; and the "Reckengaum" system which provides for accumulators being carried in the cars.

In view of the fact that by the adoption of the accumulator (storage) system the necessity for any alteration in the rails is obviated, I cannot but think that it is the better one for use here, and as the "Reckengaum" system has now passed its experimental stage. I am inclined to recommend the purchase of eight or ten cars from that Company, at (say) £1,100 per car, complete for the road, including steam-engines, boilers, dynamos, motors, and accumulators, fixing, &c., and contingencies.

Additional rolling stock is required for the Plattsburg Tramway, and also for the Kogarah and Sandringham line, and a supply of eight of these cars will meet the requirements of both lines.

The use of them on those lines will demonstrate whether it would be desirable to order them for all our lines.*

* This minute though prepared for Cabinet, was not signed by the Minister, and consequently was not submitted to Cabinet.

No. 64.

Minute by The Chief Secretary.

Re proposals for new routes of cable-ways and terms for leasing existing lines of tramways, &c.

From George-street, via Park-street.

William-street to South Head.

Dawe's Point to Newtown Road Junction, thence to Petersham, Leichhardt, Annandale, and to Five Dock; also to Newtown, Enmore, and Marrickville; also to Glebe Point.

From Hunter-street, along Castlereagh-street to Railway; thence to Redfern, Waterloo, and Botany.

Foot of King-street, via College-street, Oxford-street to Randwick, Coogee, and Bondi.

Balmain, via Harris-street to George-street.

Balmain to Field of Mars.

THESE

THESE suggested lines are only given as an indication ; but an experienced officer, who thoroughly knows the City and the tendency of traffic, must make a careful report suggesting for approval a complete system of lines.

The tenders must be invited not only for the right to construct wire tramlines, but for taking from Government the present rolling-stock on the steam-motor lines, together with the lines now existing.

The present system to be continued so as not to cause public inconvenience, until the new lines are open for traffic. The existing trams to be gradually taken off as the traffic is absorbed by the new system.—H.P., 8/2/88.

The Commissioner at once.—J.S., 8/2/88. Prepare skeleton map showing present routes, and how the proposed routes will intersect, and take over the traffic.—CH.A.G., 9/2/88. See minute of Commissioner for Railways dated 15/2/88. See also draft conditions of lease, maps, inventories, and specifications. Draft of Act also herewith.—CH.A.G., 18/2/88.

No. 65.

Minute by The Commissioner for Railways.

QUESTION of Leasing the Tramways under an undertaking for their gradual conversion from the motor system into the cable system, with certain modifications as to routes, and an increase in the number of main arteries or lines.

THE question upon which I am asked more particularly to give an opinion is as to whether the cable routes proposed can be improved upon. They are as under:—

1. From George-street, *via* Park-street, William-street, to South Head.
2. Dawes' Point to Newtown Road Junction; thence to Petersham, Leichhardt, Annandale, and to Five Dock; also to Newtown, Enmore, and Marrickville; also to Glebe Point.
3. From Hunter-street, along Castlereagh-street, to Railway; thence to Redfern, Waterloo, and Botany.
4. Foot of King-street, *via* College-street, Oxford-street, to Randwick, Coogee, and Bondi.
5. From George-street, *via* Harris-street, to Pyrmont, Balmain, and thence over the Bridges to Field of Mars.

The routes appear to me to have been carefully and judiciously selected, and those which supplement the existing routes are just those which seem necessary to complete the Tramway system, and give that full convenience to the travelling public which is at present lacking, owing to there only being one main line, and that through a thoroughfare removed, comparatively speaking, from the business centre of the city.

These remarks do not apply to such proposed extensions as those to Five Dock, Field of Mars, and South Head. I do not think such lines should be constructed under so expensive a system as the cable, as they can hardly be expected to return even a fair remuneration upon the outlay. We are not altogether without experience of cable lines, and our North Shore line should, I think, serve as a useful warning against the construction of such lines through sparsely populated districts. North Shore is not, comparatively, a thinly peopled suburb, and yet, up to the present time, this line has done little more than pay for the expenses of working.

Route No. 1.

George-street, *via* Park-street, William-street, to South Head. This line should, I think, either terminate at Woollahra at Ocean-street in a dead end or return by circular line from present 'bus terminus at Ocean-street through Point Piper Road, joining the existing line (if it be determined to convert that into a cable route), at the intersection of that road with the South Head Road. (The line to South Head can be otherwise provided for as will afterwards appear.)

The main objection to this line is that the Sydney terminus at Park-street would not be sufficiently central. The present Ocean-street omnibus traffic comes into the centre of the city by way of King-street, and the failure of the cable route to do this would probably keep alive the present 'bus system in competition.

If the existing motor route to Waverley, Woollahra, &c., be not interfered with, the remedy would be simple, and it would be to run this service from the foot of King-street, *via* College, Boomerang, William streets, &c., to Woollahra.

Route No. 2.

Dawes' Point to Newtown Road Junction, thence to Annandale, Petersham, and Leichhardt and Five Dock, also Newtown, Enmore, and Marrickville; also

Route No. 5.

may be included with this—George-street, *via* Harris-street, to Balmain, and Field of Mars.

I believe a cable line from Dawes' Point to the Railway Station, and thence by way of Harris-street to Pyrmont would give an excellent return. I could not, however, recommend the laying of a cable route beyond Pyrmont. The distance to Balmain and the Field of Mars is too great, and the prospect of traffic too small, and it would be impossible to compete successfully against the boat service for the bulk of the traffic from Balmain. With regard to the route between Dawes' Point and the Railway, it may be doubtful if at certain points of George-street there will be sufficient width for the laying of the necessary double line with due consideration for the safe conduct of the ordinary vehicular traffic, and if this be so the route could deviate from George-street at Charlotte-place, and pass along Church Hill by "Petty's Hotel," through York-street as far as the Town Hall, where it should re-enter George-street. In connection with this proposal, however, I may point out that when a double motor line was proposed some years ago for York-street, there was much agitation against it on the ground that York-street was specially devoted to large warehouses, against the entrances of which drays, carts, &c., were backed during the whole day for loading purposes and that there would not be room for a horse and cart so placed to stand clear of the tram track. Under these circumstances, and seeing that the Service would be a very frequent one if the existing lines were

were converted to cable ways, I am not sure that the making of the line through the entire length of George-street would not create less public risk and inconvenience. The traffic in George-street is essentially a light and fast traffic, and therefore that street could better accommodate a tram service than York-street; but, on the other hand, the tram service, if the motor line is to be abandoned, would be almost continuous.

Route No. 3.

Hunter-street, along Castlereagh-street to Railway, thence to Redfern, Waterloo, and Botany.

It will be well for this line to start at the Circular Quay, pass along Pitt-street to Hunter-street, Castlereagh-street, to Belmore Park.

I am not clear as to the direction which it is proposed that this line shall take on arriving at Belmore Park, whether it is intended that it shall take up the running of the existing route and reach the Railway Station by way of Pitt-street, and thence by Devonshire-street, through Castlereagh-street to Redfern and Waterloo, or that it shall cross Belmore Park in the other direction, and continue its course along Elizabeth-street through Castlereagh-street, or as far as Redfern-street, nor do I know that this is a matter of very great importance.

If the existing motor lines were not interfered with, this line would, I think, be almost unnecessary. It would be unwise in any case to extend the cable system beyond Waterloo.

Route No. 4.

Foot of King-street, *via* College-street and Oxford-street, to Randwick, Coogee, and Bondi.

There is nothing to be said against this route, if it be intended to substitute cable lines for the existing motor lines. I must, however, express my conviction that a cable line to Coogee will not pay expenses, and point out that the traffic on the first part of these lines (for it is presumed Paddington is to be included) is very great, and will involve a cable service in Oxford-street of a tram per minute nearly during the business hours.

If it be determined to take a line to the South Head, I think the best route will be from Bondi. The line to the beach at Bondi is already approved of; from thence to Rose Bay is an easy route; and if the present motor line is retained, the service can be better accomplished by that route than by way of Double Bay.

I have now done all that I was really asked to do; but the interests involved in this question are so large, and the determination of it so important—not only as affecting the terms to be realised by the Government in connection with the proposed leasing of the Tramways, but also as affecting the public convenience—that I shall no doubt be pardoned if I deal with the question in its larger and wider significance.

In doing this I propose to consider briefly the following aspects of the case:—

1. As to the suitability of Sydney for the general application of the cable system.
2. As to its great costliness, when added to its own cost is that of the waste of material and labour in converting the motor system to it, and the extreme difficulty of making such conversion without an actual stoppage of traffic on one or more of the routes.
3. A consideration of the feasibility or otherwise of applying the cable system to the City boundaries, and retaining the present motor system beyond; and
4. As an alternative proposition, the making of certain cable ways required for the better accommodation of the travelling public and for affording relief from the already overgrown and congested traffic of the main line of the present (motor) system, and the retention in its entirety of the present motor system.

I think no one who has given any attention to the subject will deny that Sydney is singularly ill adapted for the application of an entire system of Cable Tramways. Among several difficulties to be contended with is the narrowness of the main arteries of traffic through which such lines should pass in order to satisfactorily secure the traffic, and a still greater objection is the want of continuity of nearly all the main streets which should constitute these arteries. Beginning with the western boundary we have Sussex, Kent, Clarence, and York Streets, all incapable of carrying any line of communication to a satisfactory distance without the aid of (by merging into) George-street. Then eastward of George-street is Pitt-street, which merges into George-street before reaching the railway; Castlereagh-street terminating at Belmore Park; Macquarie-street, lost first in Hyde Park and later in Strawberry Hills by cross streets; while Elizabeth-street, which, after George-street, is the most continuous thoroughfare in Sydney, is bounded on the north by Hunter-street, and is not continued beyond that street.

I think this demonstrates the singular unsuitableness of Sydney from north to south at any rate for a general application of the cable, or, in fact, any tramway system, for not only is it desirable that tram routes should pierce several centres of population, but it is necessary, in order that the traffic should not become congested and liable in case of breakdown to complete collapse, that there should be several main lines or arteries.

The difficulty is greatly increased when the purpose is to convert the system already existing, and more especially when no cessation of traffic is to be caused thereby.

In the lines proposed, so far as those from Daves Point to the Railway Station, Harris-street to Pymont, and King-street to Oxford-street, Park-street to Double Bay, Castlereagh-street to Railway are concerned, no added difficulty of the kind obtains, as all the ground is new, but it is not easy to understand how the existing motor lines can be converted into cable ways without serious interruption to if not actual cessation of traffic.

To obviate this we are brought to a consideration of the feasibility of applying the cable system as far as the City boundary only, and retaining the existing motor system beyond that point. A careful consideration of the question, however, leads to the rejection of the scheme as impracticable, in view of the public convenience. The difficulty of working such a plan has been drawn attention to in the "*Herald*" in a very sensible and practical letter signed "John Williams," but I will give an example so that the inconvenience and delay which would be caused may be fully realized. I will take the populous suburb of Newtown. Residents leave that place in the morning at the busy times in tram-loads averaging 140 persons every 10 minutes. Would it be tolerated that 100 of these 140 passengers should be left standing at the junction until a sufficient number of cable trams should arrive to take them

to

to their destinations in the city; or on the return journey, as put by Mr. Williams, is the motor car to wait at the junction until sufficient cable trams, say, three or four, have arrived on the scene? The proposition unfortunately will not bear second consideration,—the inconvenience to the public would be intolerable.

This brings me to the alternative proposition to which I have referred, viz., that of retaining the present motor system, and applying the cable system to certain new routes only, say—

1. Dawes Point, *via* George-street, to Railway Station (if we are to have a motor service to the Field of Mars, it will be better to junction it with present motor service, and therefore the proposal for a cable way down Harris-street should be abandoned.)
2. King-street, *via* College, Boomerang, William Streets, and New South Head Road to Ocean-street, Woolahra; and perhaps—
3. From alongside Circular Quay, *via* Pitt and Castlereagh Streets, Belmore Park, crossing present tramway to Elizabeth-street, and on to Mount Lachlan Estate, Waterloo.

At the risk of propounding views which are opposed to that which is apparently in contemplation, I feel it incumbent upon me, as the officer under the Government who has been chiefly instrumental in introducing the present system, and who knows its advantages, its disadvantages, and its capabilities, to express my conviction that this alternative proposal is the one best adapted to meet the interests of the Government, whether as lessors or holders of the lines, and those of the travelling public. I cannot think that cable lines to such remote points as Coogee, Marrickville, Balmain, Field of Mars, Five Dock, or South Head would give even a moderate return upon the capital invested, to say nothing of the waste to be incurred in the abandonment of the present system. Neither do I think the cable service will be found adequate for the enormous traffic with which our present system with its large carrying capacity is frequently unable to cope. Take a Randwick race day, a cricket match, or a gala day at Coogee, Botany, or Bondi, and calculate if possible the number of cable trams which would be necessary to carry the people who would desire to be carried and (in the case specially of races and cricket) to be carried *at one time*. In addition to the enormous expense, I predict failure and public inconvenience far in excess of that experienced under the existing system.

Neither Melbourne nor any other City served by cable tramways, furnishes as far as my knowledge goes, anything analogous to such traffic as that to which I have referred.

As an exemplification of what the cable system as applied to our suburban traffic really involves, I have had a table prepared showing the number of cable trams which will be required during the busy hours to run on the various routes, and further, the number which will have to run on various main arteries, such as George-street and Oxford-street, and, I think, a perusal of this will point to the wisdom of giving most careful consideration to this important question, before launching upon a scheme which may be attended with loss, disappointment, and public dissatisfaction.

In the draft conditions of lease of the Tramways, which I submit with this, I have left it optional with the Government to retain the present motor system—that is to say, the routes which are now worked by it are to be converted into cable ways, only as the Government may from time to time determine. I believe that by adopting the new cable lines suggested in the alternative proposal to supplement the present motor-line service the Government and the lessees of the Tramways will find that the requirements of the travelling public will be better met than by determining to conduct the whole service by a cable system; at all events the proposal permits of the change being made tentatively, after experience has been obtained of the efficacy or otherwise of the combined system, and I respectfully submit it for consideration.

CH. A. GOODCHAP.

15 February, 1888.

STATEMENT showing the Tram intervals which will occur on the various lines under the proposed Cable system in order to give a service equal to that of the existing one.*

ROUTE I.

Dawes' Point to Harris-street, Balmain, and Field of Mars.				Dawes' Point to Newtown, Marrickville, etc.				Dawes' Point, Leichhardt, Annandale, and Five Dock.				Dawes' Point to Glebe Point.			
Up Journey.		Down Journey.		Up Journey.		Down Journey.		Up Journey.		Down Journey.		Up Journey.		Down Journey.

1181

LEASE OF GOVERNMENT TRAMWAYS.

Conditions of Lease.

PROVIDED an Act is passed by the Legislature authorizing the measure, the lease shall be for the right to work the existing Tramways in the City of Sydney and its suburbs (subject to such arrangements, if any, as the Government may ultimately make for the abandonment of a portion of these routes), and to construct and work all other Tramways which the Government may determine to establish in the City of Sydney and its suburbs.

The lease shall be for a term of forty years, at the end of which term the Tramways, with all the machinery, plant, and appliances, shall revert to the Government.

The price to be paid for the existing Tramways shall be the book cost of the same, and shall include the lines, the rolling-stock, and workshops, with the machinery, coke-sheds, waiting-sheds, and watering-places.

It will be optional with the lessee to pay the amount in cash or to pay in cash 25 per cent. of the amount and to give a bond bearing interest at the rate of 4 per cent. per annum, and such further interest (to be paid to a sinking fund) as shall suffice to extinguish the capital sum in twenty-five years.

Each person or Company making an offer must set forth in their letter of proposal the means which they possess of carrying out the conditions of this arrangement.

Each Tenderer shall deposit in the hands of the Treasurer security in the sum of £50,000, as a guarantee that if his Tender be accepted he will faithfully carry out the terms of his engagement. It will be optional with the persons tendering to pay the whole sum of £50,000 in cash, or to pay £10,000 in cash, and give a bond, executed by five persons of approved position and responsibility, in the sum of £40,000.

So soon as a proposal shall have been accepted the security deposits of the unsuccessful Tenderers shall be returned to them.

The person or Company whose Tender shall be accepted shall enter into an agreement with the Government which shall be based upon these conditions.

Within one month of the acceptance of a Tender the successful Tenderer shall pay over to the Treasurer the capital cost of the existing Tramways, and £40,000 of the security deposit (if the whole amount have been deposited in cash) shall be accepted as part payment of such capital cost.

The lessee shall take over at book value the stock of stores and materials in the Tramway Stores at Randwick, and shall pay the amount in cash. At the termination of the lease the then stock of stores shall be taken over at a valuation.

The balance of the deposit (£10,000) shall remain in the hands of the Treasurer as security for the due fulfilment of the terms of the Contract, and in the event of the lessee committing any breach of the conditions the above amount shall be forfeited to the Government of New South Wales.

Immediately on the payment of the money the lessee shall take over the existing Tramways (which are described on Schedule A hereto annexed), and shall work the traffic thereof subject to the following special conditions:—

The Trams shall be run for the convenience of the public, and an efficient service shall at all times be maintained to the satisfaction of the Railway Commissioners. The Railway Commissioners, or an officer deputed by them, shall from time to time examine the lines, rolling-stock, plant, buildings, and machinery, with a view to ascertain that all the appliances are being maintained in an efficient condition.

In the event of its being found that the line, or rolling stock, or machinery, or other appliances are not maintained in a satisfactory condition, or are in any degree inefficient, the Railway Commissioners may call upon the lessee to do the necessary repairs, or to provide efficient substitutes for any defective appliances, and if the lessee shall neglect or refuse to do so, the Railway Commissioners may do what is necessary at the cost of the lessee.

The lessee shall, at his own expense, maintain in good order so much of the ordinary roadway through which the tram-lines pass as it now devolves upon the Government to keep in repair.

The lessee shall, at his own expense, carry out such lawful orders and requirements of property-holders and local or municipal bodies through whose property or jurisdiction the tram-lines may pass as the Government would have been bound to carry out had this lease not been executed; and the lessee shall defend all actions and bear all expenses and penalties that may accrue from differences or disputes with such property-holders or local or municipal bodies.

The lessee shall be amenable in every legal respect to all persons during the term of the lease as the legal owner for such term of the railways and everything connected therewith.

* The fares on the present tram-lines or sections of tram-lines shall not in any way be increased.

All existing privileges granted to members of the Legislature shall be maintained.

The concession of reduction of fares now made to children proceeding to or from the schools which they attend shall be maintained.

In the event of any difference of opinion arising as to the interpretation to be placed upon these or any other of the conditions of the lease, the Railway Commissioners shall be the sole arbiters, and their decision shall be final.

Within twelve months of the execution of the agreement the lessee shall, at his own cost, convert so much of the existing Tramways as the Government shall determine into Cable Tramways, according to the plans to be approved of by the Government.

As stated in Clause 1 of these conditions, the lease will include the sole right to make Tramways and work them during the continuance of the lease in the City of Sydney and its suburbs, but the Government will decide the route which any new tramways shall take, and the order in which they shall be undertaken; and no new tramway shall be constructed except upon authority in writing under the seal of the Railway Commissioners.

Schedule B hereto annexed contains a list and description of the tramway lines which the Government propose should be established, but with the consent of the Government any one or more of these lines may be abandoned, and other lines may be substituted and carried out.

Such

* I am not certain that the fares should be limited to present fares; it would be well, I think, to allow a little latitude, say, that the fares shall not exceed 1d. a mile, nor the minimum be above 3d.—CH. A. G.

Such tramways shall be constructed on the cable principle, and shall be completed to the satisfaction of the Railway Commissioners, under the inspection of an officer deputed by them.

Upon the completion of each of these lines of tramway it shall be opened and worked by the lessee, subject to the same conditions as the existing tramways, that is to say:—

The trams shall be run in such a way as to afford to the public all reasonable convenience by the maintenance of an efficient service to the satisfaction of the Railway Commissioners.

The Railway Commissioners, by an officer appointed for the service, may at any time examine the lines and appliances with a view to secure that they are maintained in an efficient condition; and in the event of any defects being found the Railway Commissioners may call upon the lessee to execute the necessary repairs or make necessary renewals. If the lessee refuse or neglect to comply with the order, the Railway Commissioners may do what they consider necessary, at the cost of the lessee.

The Company shall not abandon its undertaking or any part of the same, or take up any tramway or any part of any tramway belonging to it except by the consent of the Government in writing, and thereupon it shall, with all convenient speed, and in all cases within six weeks at the most (unless the Government otherwise consent in writing) fill in the ground, and make good the surface, and, to the satisfaction of the Government and the local authorities, restore the portion of the road upon which such tramway was laid to as good a condition as that in the adjacent portion of the road shall then be, and clear away all surplus paving or metalling, material, or rubbish occasioned by such work; and the Company shall in the meantime cause the place where the road is opened or broken up to be fenced and watched, and to be properly lighted at night. Provided always that if the Company fail to comply with the provisions of this section, the Government, or the local authority if it think fit, may itself, at any time after seven days' notice to the Company, open and break up the road and do the works necessary for the repair and maintenance or restoration of the road to the extent in this section above mentioned, and the expense incurred by the local authority in so doing shall be repaid to them by the Company.

The Company shall be at liberty to connect any tramway with any engine-house, warehouse, stable, carriage-house, or workshop belonging to it on the routes, and used for the purposes of such tramway.

The local authority on the one hand, and the Company on the other hand, may from time to time enter into and carry into effect, and from time to time alter, renew, or vary contracts, agreements, or arrangements, with respect to the metalling or paving and keeping in repair of the whole or any portion of the roadway, or any road on which the Company shall lay any tramway, and the proportion to be paid by either of them of the expense of such metalling or paving and keeping in repair.

For the purpose of making, forming, laying down, maintaining, repairing, or renewing any of the tramways, the Company may from time to time, when and as far as it is necessary or may appear expedient, for the purpose of preventing frequent interruption of the traffic by repairs of works in connection with the same, alter the position of any mains or pipes for the supply of gas or water, or any tube, wire, or apparatus for telegraphic or other purposes, subject to the provisions of the Act, and also subject to the following restrictions (that is to say):—

Before laying down a tramway in a road in which any mains or pipes, tubes, wires, or apparatus may be laid, the Company shall, whether it contemplates altering the position of any such mains or pipes, tubes, wires, or apparatus or not, give seven days' notice to the Department of Government concerned, or to the corporation or Company, persons or person, to whom such mains or pipes, tubes, wires, or apparatus may belong, or by whom they are controlled, of its intention to lay down or alter the tramway and shall at the same time deliver a plan and section of the proposed work. If it should appear to the Government or to any such corporation, Company, or person that the construction of the tramway as proposed would endanger any such main or pipe, tube, wire, or apparatus, or interfere with or impede the supply of water or gas or the telegraphic or other communication, the Government or such corporation, Company, or person (as the case may be) may give notice to the Company to lower or otherwise alter the position of the said mains or pipes, tubes, wires, or apparatus, in such manner as may be considered necessary.

The Company shall make good all damage done by it to property belonging to or controlled by the Government, or by any such corporation, Company, or person, and shall make full compensation to all parties for any loss or damage which they may sustain by reason of any interference with such property or with the private service pipes of any person supplied by the Government, or by any such corporation, Company, or person, with water or gas.

If by any such operation as aforesaid the Company interrupt the supply of water or gas in or through any main or main pipe, it shall be liable to a penalty not exceeding fifty pounds for every day upon which such supply shall be so interrupted.

LEASE OF TRAMWAYS.

Specification.

THE tramways to be constructed by the Company shall consist of a double line, and shall be constructed and maintained as nearly as may be in the middle of the road, and at no part thereof shall the tramway be so laid that for a distance of 30 feet or upwards a less space than 9 feet 6 inches shall intervene between the outside of the footpath on either side of the road and the nearest rail of the tramway. Provided that the Company may, with the consent of the Government and of the local authority, construct the tramway elsewhere than in the middle of the road.

The tramway shall be constructed on the gauge of 4 feet 8½ inches, and shall be laid and maintained in such manner that the uppermost surface of the rail shall be on a level with the surface of the road. The tramway shall be constructed in the best and most approved manner, as to design, material, and workmanship to the satisfaction of the Government, and should any dispute arise as to the sufficiency of the tramway in the above particulars it shall be referred to the arbitration of three engineers or surveyors—one appointed by the local authority interested, one appointed by the Company, and one by the New South Wales Government—and the decision of the majority shall be final.

The

The Company from time to time for the purpose of making, forming, laying down, maintaining, and renewing any Tramway by this Act authorized, or any part or parts thereof respectively, may open and break up any road, subject to the following regulations :—

- (1.) It shall give to the local authority notice of its intention, specifying the time at which it will begin to do so, and the portion of road proposed to be opened or broken up, such notice to be given fourteen days at least before the commencement of the work.
- (2.) It shall not open or break up any road except under the superintendence and to the reasonable satisfaction of the local authority, unless that authority refuses or neglects to give such superintendence at the time specified in the notice, or discontinue the same during the work.
- (3.) It shall pay all reasonable expenses to which the local authority is put on account of such superintendence.
- (4.) It shall not alter the level of any road without the previous consent in writing of the local authority, and it shall be responsible for any and all damages and claims in regard thereto which may arise in consequence of any such alteration.
- (5.) Whenever the local authority shall decide to alter any level of any road, the Company shall at its own cost raise or lower the rails and so much of the roadway maintained by the Company as shall be necessary to suit such altered level.
- (6.) It shall not, without the consent of the local authority, open or break up, at any one time, a greater length than one hundred yards of any road which does not exceed a quarter of a mile in length, and, in the case of any road exceeding a quarter of a mile in length, the company shall leave an interval of at least a quarter of a mile between any two places at which it may open or break up the road, and it shall not open or break up at any such place a greater length than 100 yards.
- (7.) Where the carriageway over any bridge forms part of, or is, a road within the jurisdiction of a local authority, but such bridge is vested in some person, corporation, or Company distinct from such local authority, any work which the Company may be empowered to construct, and which affects or in anywise interferes with the structural works of such bridge, shall be constructed under the superintendence (at the cost of the Company), and to the reasonable satisfaction of such person, corporation, or Company, unless after notice to be given by the Company fourteen days at least before the commencement of such work, such superintendence is refused or withheld.
- (8.) Where the carriageway in or upon which any tramway is proposed to be formed or laid down is crossed by any railway or tramway on the level, any work which the Company may be empowered to construct, and which affects or in anywise interferes with such railway or tramway or the traffic thereon, shall be constructed and maintained under the superintendence (at the cost of the Company) and to the reasonable satisfaction of the Government, person, corporation, or Company owning such railway or tramway, unless after notice to be given by the Company fourteen days at least before the commencement of such work, such superintendence is refused or withheld.

In all cases the Company shall be responsible for the sound, safe, and proper mode of carrying out the works, which by the Act it is empowered to perform.

When the Company has opened or broken up any portion of any road it shall be under the following further obligations, namely :—

- (1.) It shall with all convenient speed, and in all cases within six weeks at the most (unless the local authority otherwise consent in writing), complete the work on account of which it opened or broke up the same, and subject to the formation, maintenance, or renewal of the tramway, fill in the ground and make good the surface and to the satisfaction of the local authority restore the portion of the road to as good condition as that in which it was before it was opened or broken up, and clear away all surplus paving or metalling material or rubbish occasioned thereby.
- (2.) It shall in the meantime cause the place where the road is opened or broken up to be fenced and watched, and to be properly lighted at night.
- (3.) It shall bear or pay all reasonable expenses of the repair of the road for six months after the same is restored, as far as those expenses are increased by the opening or breaking up.
- (4.) It shall in no case, unless the local authority otherwise consent in writing, keep any road wholly closed and unavailable for traffic.

If the Company fail to comply in any respect with the provisions of the present section, it shall, for every such offence, without prejudice to the enforcement of specific performance of the requirements of the Act, or to any other remedy against it, be liable to a penalty not exceeding twenty pounds, and a further penalty not exceeding ten pounds for each day during which any such failure continues after the first day on which such penalty is incurred.

The Company shall at its own expense at all times maintain and keep in good condition and repair, with such materials and in such manner as the local authority shall direct, and to their satisfaction, so much of any road whereon any tramway belonging to it is laid, as lies between the rails of the tramway, and (where two tramways are laid by the Company in any road in parallel lines, at a distance of not more than four feet from each other) the portion of the road between the two lines of such tramway, and also the portion thereof which may exceed four feet, where a greater deviation from the parallel lines than four feet shall occur at curves or divergencies, and in every case so much of the road as extends 18 inches beyond the rails of and on each side any of such tramway. The material of every road (opened or broken up by the Company) may be used by it in reconstructing the road so far as the same shall be applicable to that purpose, and all such material not so used and not required by the local authority shall be removed and retained by the Company.

- The lessee shall, at his own cost, maintain in good order so much of the ordinary roadway through which the tram-lines pass as now devolves upon the Government to keep in order; and he shall, at his own expense, carry out such lawful orders and requirements of persons and local or municipal bodies through whose property or jurisdiction the tram-lines may be carried as the Government would have been bound to carry out had not this lease been executed.
- The lessee to defend all actions and bear all expenses and penalties which may accrue from differences or disputes with such property holders or local or Municipal bodies.
- The fares on the proposed Tram lines or sections must not exceed the fares charged upon existing through lines. All existing privileges enjoyed by Members of the Legislature to be maintained.
- The reduction of fare now granted to children proceeding to or from the schools which they attend to, be maintained on the new routes.
- The Railway Commissioners to be the sole arbiters of the construction to be placed upon these conditions.

SCHEDULE A.

LIST OF EXISTING TRAMWAYS.

Railway Station to Circular Quay.
 Liverpool-street to Randwick and Coogee.
 Darlinghurst Junction to Waverley, Woollahra, and Bondi.
 Crown-street Junction to Cleveland-street.
 Devonshire-street Junction to Botany.
 Glebe Point.
 Forest Lodge.
 Newtown and Marrickville.
 Leichhardt.
 North Shore.
 Randwick to Waverley.

SCHEDULE B.

SCHEDULE C.

LEASING OF GOVERNMENT TRAMWAYS.

APPLICATIONS will be received at this Office until 11 a.m. from persons willing to lease the existing Tramways, and to construct and work such other Tramways as may be determined upon.

Specification, conditions of lease, and all further particulars may be obtained on application at the Office of the Commissioner for Railways, Phillip-street.

Tenderers will be required to state the amount of premium they are prepared to pay for the right to lease the Tramways in the terms stated in the conditions.

The acceptance of any tender will be dependent upon the passing of an Act through Parliament for leasing the Tramways.

Secretary for Public Works.

Department of Public Works,

Draft

51^o VICTORIÆ, 1888.

A BILL

WHEREAS it is expedient that the tramways of Sydney and the suburbs, for the more profitable working of the same, and with a view to place them on a purely commercial footing, shall be worked and managed by a body of private proprietors. Be it therefore enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the Legislative Council and Legislative Assembly of New South Wales in Parliament assembled, and by the authority of the same, as follows :—

This Act shall be called and may be cited as the "Sydney Tramway Company's Act of 1888."

Subject to the provisions of this Act the Government may call for applications from persons prepared to work the existing tramways, and to construct and work new lines of tramway, and may lease to a person or Company at such a price as may be agreed upon the whole of the tramways at present constructed within the city of Sydney and the suburbs thereof as described in Schedule A, with the rolling-stock, waiting-sheds, coke-sheds, and watering places, but if from any cause any portion of the land or premises shall cease to be necessary for the conduct of the traffic of the tramways, such portion of the land or premises may forthwith be resumed by the Government, and may be applied to such uses as the Government may determine.

As soon as may be after the an inventory of the tramway rolling-stock, plant, and machinery to be so leased as aforesaid shall be made, and signed by or on behalf of the Railway Commissioners, and shall be delivered to the Company.

The lease to be for a term of forty years, at the end of which time the lines, rolling-stock, buildings, &c., shall revert to the Government.

The price to be paid for the existing tramways and appliances shall be the book cost of the same with the addition of such per-centage as the tenderer may be prepared to offer; and it shall be optional with the lessees to pay the whole sum in cash, or to pay in cash twenty-five per centum thereof, and to give a bond for the balance, bearing interest at the rate of four per centum per annum, and such further interest (to be paid to a sinking fund) as shall suffice to extinguish the capital sum in twenty-five years.

Each tenderer shall deposit in the hands of the Treasurer security in the sum of fifty thousand pounds as a guarantee that if his tender be accepted he will faithfully carry out the terms of his engagement.

It will be optional with the persons tendering to pay the whole sum of fifty thousand pounds in cash, or to pay ten thousand pounds in cash, and give a bond, executed by five persons of approved position and responsibility, in the sum of forty thousand pounds.

On

On the completion of the lease and the payment of the purchase money the Company shall forthwith enter into possession of the Tramways aforesaid, and shall work the same for the conveyance of passengers from point to point, subject to the following special conditions:—

- On the _____, or so soon thereafter as may be, the Company shall accept and take over for the purposes of the undertaking all stores and materials belonging to the Tramway Department that may be in hand or in course of delivery, and the Company shall pay the amount of the book value thereof in cash.
- The Company shall, at their own expense, maintain the tramway lines, and so much of the ordinary road as the tramway authorities are bound to keep in repair, in good order and condition, to the satisfaction of the Engineer or other officer appointed by the Government.
- The Company shall, at their own expense, carry out promptly the lawful orders and requirements of property-holders and local or municipal bodies through whose property or jurisdiction the tramway lines may pass.
- The lessee shall be amenable in every legal respect to all persons during the duration of this lease, as the legal owner for such period of the Railways and everything connected therewith.
- The trams shall be run for the convenience of the public, and an efficient service shall at all times be maintained, to the satisfaction of the Railway Commissioners.
- The Company shall keep the lines, rolling-stock, buildings, plant, and machinery in good repair, in good working condition, and fully supplied with rolling-stock, plant, and machinery, to the satisfaction of the Railway Commissioners, and the Railway Commissioners, or an officer deputed by them, shall, from time to time, examine the lines, rolling-stock, plant, buildings, and machinery, with a view to secure that all the appliances are maintained in an efficient condition; and in the event of its being found that the lines or rolling-stock or other appliances are out of repair, or otherwise in any degree inefficient, the Railway Commissioners may call upon the lessee to do the necessary repairs, or to provide efficient substitutes for any defective appliances; and if the lessee shall neglect or refuse to do so, the Railway Commissioners may do what is necessary at the cost of the lessee.
- The Railway Commissioners may from time to time require the Company to carry out any alteration or improvement in the working of the undertaking that may, in their opinion, be necessary for the safety of passengers, or for the safety of the public, or for the safe and effectual working of the undertaking.
- The Company shall from time to time make such returns and furnish such statistics relating to the undertaking in such form and under such heads and divisions and with such details as the _____ may from time to time require. The cost of preparing such returns and statistics and incidental thereto shall be treated as part of the working expenses of the undertaking.
- The fares on the present tram-lines shall not, in any case, be increased.
- All existing privileges granted to the Members of the Legislature shall be maintained.
- The concession of reduction of fares now made to children proceeding to or from the schools which they attend shall be maintained.

The

The Company shall, if required by the Railway Commissioners, maintain and manage a Provident Fund for the benefit of the persons employed upon the undertaking, upon such terms and under such rules and regulations as shall from time to time be approved by the

Within twelve months of the execution of the agreement the lessee shall, at his own cost, convert so much of the existing tramway as the Government shall determine, into cable tramways, according to plans to be approved by the Government.

The lease shall include the sole right to construct tramways within the city of Sydney and the suburbs thereof, and such lease may be granted to the Company for a period of years, and under this concession they shall, with the consent of Parliament, lay down the lines which are described in the Schedule hereto annexed.

The Company may lay down such other lines of tramway as they in their own discretion may deem a public convenience and capable of being worked at a profit, provided such lines are approved by Parliament, and are sanctioned by the Railway Commissioners under seal.

Schedule B contains a list and description of the tramway lines which the Government propose shall be established, but with the consent of the Government any one or more of these lines may be abandoned, and other lines may be substituted and carried out.

All such tramways constructed by the Company to be worked on the cable system (or by electric motors), and shall be completed to the satisfaction of the Railway Commissioners.

All tramways constructed by the Company shall be held and worked by the Company for their own profit for a period of forty years, at the end of which time the tramways, with the rolling stock and appliances, become the property of the Government of New South Wales.

At the expiration of the lease the Government shall take over from the lessee the stock of stores and materials, provided they be found suitable for the work of the tramways, and provided the value thereof does not exceed the value of the stores taken over by the lessee from the Government.

In respect of the working of the tramways constructed by the lessee, they shall be subject to the same terms and conditions as are prescribed in clause for the working of the existing tramways.

If in the opinion of the Railway Commissioners any land for the time being in the possession of the Company shall not be required for the purposes of the undertaking, the Railway Commissioners shall certify such opinion to the Company. Upon receipt of the said certificate, or so soon thereafter as may be, the Company shall state in writing whether they acquiesce in the opinion of the Railway Commissioners, or whether they object thereto, and if so the grounds of their objection. If no objection is stated by the Company, or if the grounds of their objection, if any, are not, in the opinion of the Railway Commissioners, sufficient, the Company shall, upon the requisition of the Railway Commissioners, go out of possession of the land in question, and the Railway Commissioners shall be exclusively entitled to possession thereof.

If the Railway Commissioners and the Company shall fail to agree touching any matter with respect to which their agreement is required by the terms of the lease, or if in any case not herein specially provided for any dispute, question, or controversy shall at any time arise between the Railway Commissioners and the Company touching these presents, or any clause or thing therein contained, or the construction thereof, or any matter connected with these presents, or the operation thereof,

thereof, or the rights, duties, or liabilities of either party in relation to the premises, then and in every such case the matter as to which the Railway Commissioners and the Company shall fail to agree, or the matter in difference as the case may be, shall be referred to two arbitrators or their umpire, pursuant to and so as with regard to the mode and consequences of the reference, and in all other respects to conform to the provisions in that behalf of Act

or any subsisting statutory modification thereof, and upon every such reference the arbitrators and umpires shall respectively have power to examine witnesses upon oath or affirmation, and either to fix, settle, and determine the amount of costs of the reference and award respectively or incidental thereto to be paid by both parties or by either party, or to direct the same to be taxed either as between solicitor and client or otherwise, and to direct and award where and by and to whom such costs shall be paid; and every or any such reference may be made a rule of Her Majesty's Supreme Court of Justice on the application of the Railway Commissioners or of the Company, and either the Railway Commissioners or the Company may instruct counsel to consent thereto for the other party.

The tramways to be constructed by the Company shall consist of a double line, and shall be constructed and maintained as nearly as may be in the middle of the road, and at no part thereof shall the tramway be so laid, that for a distance of thirty feet or upwards a less space than nine feet six inches shall intervene between the outside of the footpath on either side of the road and the nearest rail of the tramway. Provided that the Company may, with the consent of the Government and of the local authority, construct the tramway elsewhere than in the middle of the road.

The tramway shall be constructed on the gauge of four feet eight and a half inches, and shall be laid and maintained in such manner that the uppermost surface of the rail shall be on a level with the surface of the road. The tramway shall be constructed in the best and most approved manner, as to design, material, and workmanship, to the satisfaction of the Government, and should any dispute arise as to the sufficiency of the tramway in the above particulars it shall be referred to the arbitration of three engineers or surveyors, one appointed by the local authority interested, one appointed by the Company, and one by the New South Wales Government, and the decision of the majority shall be final.

The Company from time to time, for the purpose of making, forming, laying down, maintaining, and renewing any tramway by this Act authorized, or any part or parts thereof respectively, may open and break up any road, subject to the following regulations:—

- (I) It shall give to the local authority notice of its intention, specifying the time at which it will begin to do so, and the portion of road proposed to be opened or broken up, such notice to be given fourteen days at least before the commencement of the work.
- (II) It shall not open or break up any road except under the superintendence and to the reasonable satisfaction of the local authority, unless that authority refuses or neglects to give such superintendence at the time specified in the notice, or discontinue the same during the work.
- (III) It shall pay all reasonable expenses to which the local authority is put on account of such superintendence.
- (IV) It shall not alter the level of any road without the previous consent in writing of the local authority, and it shall be responsible for any and all damages and claims in regard thereto which may arise in consequence of any such alteration.

-
- (v) Whenever the local authority shall decide to alter any level of any road, the Company shall at its own cost raise or lower the rails and so much of the roadway maintained by the Company as shall be necessary to suit such altered level.
- (vi) It shall not, without the consent of the local authority, open or break up, at any one time, a greater length than one hundred yards of any road which does not exceed a quarter of a mile in length, and, in the case of any road exceeding a quarter of a mile in length, the Company shall leave an interval of at least a quarter of a mile between any two places at which it may open or break up the road, and it shall not open or break up at any such place a greater length than one hundred yards.
- (vii) Where the carriage-way over any bridge forms part of, or is a road within the jurisdiction of a local authority, but such bridge is vested in some person, corporation, or Company distinct from such local authority, any work which the Company may be empowered to construct, and which affects or in anywise interferes with the structural works of such bridge, shall be constructed under the superintendence (at the cost of the Company) and to the reasonable satisfaction of such person, corporation, or Company, unless after notice to be given by the Company fourteen days at least before the commencement of such work, such superintendence is refused or withheld.
- (viii) Where the carriage-way in or upon which any tramway is proposed to be formed or laid down is crossed by any railway or tramway on the level, any work which the Company may be empowered to construct, and which affects or in anywise interferes with such railway or tramway or the traffic thereon, shall be constructed and maintained under the superintendence (at the cost of the Company) and to the reasonable satisfaction of the Government, person, corporation, or Company owning such railway or tramway, unless after notice to be given by the Company fourteen days at least before the commencement of such work, such superintendence is refused or withheld.

In all cases the Company shall be responsible for the sound, safe, and proper mode of carrying out the works, which by the Act it is empowered to perform.

When the Company has opened or broken up any portion of any road it shall be under the following further obligations, namely:—

- (i) It shall with all convenient speed, and in all cases within six weeks at the most (unless the local authority otherwise consent in writing) complete the work on account of which it opened or broke up the same, and subject to the formation, maintenance, or renewal of the tramway, fill in the ground and make good the surface, and to the satisfaction of the local authority restore the portion of the road to as good condition as that in which it was before it was opened or broken up, and clear away all surplus paving or metalling, material or rubbish occasioned thereby.
- (ii) It shall in the meantime cause the place where the road is opened or broken up to be fenced and watched, and to be properly lighted at night.
- (iii) It shall bear or pay all reasonable expenses of the repair of the road for six months after the same is restored, as far as those expenses are increased by the opening or breaking up.
- (iv) It shall in no case, unless the local authority otherwise consent in writing, keep any road wholly closed and unavailable for traffic.

If

If the Company fail to comply in any respect with the provisions of the present section, it shall, for every such offence, without prejudice to the enforcement of specific performance of the requirements of the Act, or to any other remedy against it, be liable to a penalty not exceeding *twenty* pounds, and a further penalty not exceeding *ten* pounds for each day during which any such failure continues after the first day on which such penalty is incurred.

The Company shall at its own expense at all times maintain and keep in good condition and repair, with such materials and in such manner as the local authority shall direct, and to their satisfaction, so much of any road whereon any tramway belonging to it is laid, as lies between the rails of the tramway and (where two tramways are laid by the Company in any road in parallel lines, at a distance of not more than four feet from each other) the portion of the road between the two lines of such tramway, and also the portion thereof which may exceed four feet, where a greater deviation from the parallel lines than four feet shall occur at curves or divergencies, and in every case so much of the road as extends eighteen inches beyond the rails of and on each side any of such tramway. The material of every road (opened or broken up by the Company) may be used by it in reconstructing the road so far as the same shall be applicable to that purpose, and all such material not so used and not required by the local authority shall be removed and retained by the Company.

The Company shall not abandon its undertaking or any part of the same, or take up any tramway or any part of any tramway belonging to it except by the consent of the Government in writing, and thereupon it shall, with all convenient speed, and in all cases within six weeks at the most (unless the Government otherwise consent in writing) fill in the ground, and make good the surface, and, to the satisfaction of the Government and the local authorities, restore the portion of the road upon which such tramway was laid to as good a condition as that in the adjacent portion of the road shall then be, and clear away all surplus paving or metalling, material, or rubbish occasioned by such work, and the Company shall in the meantime cause the place where the road is opened or broken up to be fenced and watched, and to be properly lighted at night. Provided always that if the Company fail to comply with the provisions of this section, the Government, or the local authority, if it think fit, may itself, at any time after seven days' notice to the Company, open and break up the road and do the works necessary for the repair and maintenance or restoration of the road to the extent in this section above-mentioned, and the expense incurred by the local authority in so doing shall be repaid to them by the Company.

The Company shall be at liberty to connect any tramway with any engine-house, warehouse, stable, carriage-house, or workshop belonging to it on the routes, and used for the purposes of such tramway.

The local authority on the one hand, and the Company on the other hand may from time to time enter into and carry into effect, and from time to time alter, renew, or vary contracts, agreements, or arrangements with respect to the metalling or paving and keeping in repair of the whole or any portion of the roadway, or any road on which the Company shall lay any tramway, and the proportion to be paid by either of them of the expense of such metalling or paving and keeping in repair.

For the purpose of making, forming, laying down, maintaining, repairing, or renewing any of the tramways, the Company may from time to time, when and as far as it is necessary or may appear expedient, for the purpose of preventing frequent interruption of the traffic by repairs of works in connection with the same, alter the position of any mains or pipes for the supply of gas or water, or
any

any tube, wire, or apparatus for telegraphic or other purposes, subject to the provisions of the Act, and also subject to the following restrictions (that is to say):—

Before laying down a tramway in a road in which any mains or pipes, tubes, wires, or apparatus may be laid, the Company shall, whether it contemplates altering the position of any such mains or pipes, tubes, wires, or apparatus or not, give seven days' notice to the Department of Government concerned, or to the Corporation or Company, persons or person, to whom such mains or pipes, tubes, wires, or apparatus may belong, or by whom they are controlled, of its intention to lay down or alter the tramway, and shall at the same time deliver a plan and section of the proposed work. If it should appear to the Government or to any such Corporation, Company, or person that the construction of the tramway as proposed would endanger any such main or pipe, tube, wire, or apparatus, or interfere with or impede the supply of water or gas or the telegraphic or other communication, the Government or such Corporation, Company, or person (as the case may be) may give notice to the Company to lower or otherwise alter the position of the said mains or pipes, tubes, wires, or apparatus, in such manner as may be considered necessary.

The Company shall make good all damage done by it to property belonging to or controlled by the Government, or by any such Corporation, Company, or person, and shall make full compensation to all parties for any loss or damage which they may sustain by reason of any interference with such property or with the private service pipes of any person supplied by the Government, or by any such Corporation, Company, or person, with water or gas.

If by any such operation as aforesaid the Company interrupt the supply of water or gas in or through any main or main pipe, it shall be liable to a penalty not exceeding *fifty* pounds for every day upon which such supply shall be so interrupted.

Nothing in this Act shall take away or abridge any power to open or break up any road along or across which any tramway is laid, or any other power vested in any local authority, for any of the purposes for which such authority is constituted, or in any Department of Government, or in any local authority, Corporation, Company, body, or person, for the purpose of laying down, repairing, altering, or removing any pipe for the supply of gas or water, or any tubes, wires, or apparatus for telegraphic or other purposes, or for constructing, altering, maintaining, and repairing any works for sewerage, drainage, or other purposes, but in the exercise of such power the Government and every such local authority, Corporation, Company, body, or person shall be subject to the following restrictions (that is to say):—

They shall cause as little detriment or inconvenience to the Company as circumstances admit.

Before they commence any work whereby the traffic on the tramway will be interrupted, they shall (except in cases of urgency, in which cases no notice shall be necessary) give to the Company notice of their intention to commence such work, specifying the time at which they will begin to do so, such notice to be given eighteen hours at least before the commencement of the work.

They shall not be liable to pay to the Company any compensation for injury done to the tramway by the execution of such work or for loss of traffic occasioned thereby, or for reasonable exercise of the powers vested in them as aforesaid.

The Company may use on the said tramway, carriages with flanged wheels, or other wheels, suitable only to run on the rails thereof, such carriages, with their fittings and appliances, to be subject to approval of the engineer or other officer appointed by Government.

If

If at any time after the opening for traffic of any tramway or branch authorized by this Act, the Company discontinue the working thereof, or any part thereof, for the space of three calendar months (such discontinuance not being occasioned by circumstances beyond the control of the Company, for which purpose the want of sufficient funds shall not be considered a circumstance beyond its control), and such discontinuance is proved to the satisfaction of the Government, the Government, if it thinks fit, may, by order, declare that the powers of the Company in respect of such tramway or the part thereof so discontinued shall, from the date of such order, be at an end, and thereupon the said powers of the Company shall cease and determine. Where any such order has been made, the Government may, at any time after the expiration of two months from the date of such order, remove such tramway or the part thereof so discontinued, and the Company shall pay to Government the cost of such removal and of the making good of the road; and if the Company fail to pay the amount so certified within one calendar month after delivery to it of such certificate, or a copy thereof, the Government may, without any previous notice to the Company (without prejudice to any other remedy which they may have for the recovery of the amount) sell and dispose of the materials of the tramway, or part of tramway removed, either by public auction or private sale, and for such sum or sums and to such person or persons as the Government may think fit, and may, out of the proceeds of such sale, pay and reimburse themselves the amount of the cost and of the cost of sale, and the balance (if any) of the proceeds of the sale shall be paid over by the Government to the Company.

The Company may demand and take for every passenger travelling upon the tramway, or any part thereof, including tolls for the use of the tramway and the carriages, and for motive power and every other expense incidental to such conveyance any tolls not exceeding the fares specified in the Schedule.

The Company shall, on being served with a requisition in that behalf by the Government, run upon any line of tramway open for public traffic, and specified in such requisition, two or more carriages every morning (except Sundays and public holidays) between the hours of six and seven o'clock, and two carriages every evening between the hours of half-past five and half-past six for workmen at an uniform fare (of three half-pence) for each journey. Provided always that the tolls herein specified shall be subject to revision by Act of Parliament at any time after the lapse of ten years from the completion of fifteen miles of the extra lines of tramways to be constructed under this Act, without the Company or the person or body corporate replacing the Company being entitled to any compensation in consequence of such revision.

A list of all the tolls and charges authorized by this Act to be taken by the Company shall be exhibited in a conspicuous place inside each of the carriages used by the Company upon the tramway.

The tolls and charges by this Act authorized shall be paid to such persons and at such places upon or near to the tramways, or in such manner and under such regulations as the Company shall by notice be annexed to the list of tolls appoint.

Subject to the provisions of this Act, the Company may, from time to time make regulations:—

For preventing the commission of any nuisance in or upon any carriage, or in or against any premises belonging to it.

For regulating the travelling in or upon any carriage belonging to it.

And for better enforcing the observance of all or any of such regulations, it shall be lawful for the Company to make by-laws for all or any of the aforesaid purposes, and from time to time to repeal or alter such by-laws and make new by-laws. Provided that such by-laws be not repugnant to the law.

Notice

Notice of the making of any by-laws under the provisions of this Act shall be published by the Company by advertisements to be inserted once at least in the *Government Gazette* and once at least in each of two successive weeks in all the daily newspapers published in Sydney, and unless such notice is published as aforesaid, such by-law shall be disallowed by the Government.

No such by-law shall have any force or effect which shall be disallowed by the Government within one calendar month after a true copy of such by-law shall have been laid before the said Government, and a true copy of every such proposed by-law shall not, less than one month before such by-law shall come into operation, be sent to the Government.

And any such by-law may impose reasonable penalties for offences against the same not exceeding *forty* shillings for each offence, with or without further penalties for continuing offences not exceeding for any continuing offence *ten* shillings for every day during which the offence continues, but all by-laws shall be so framed as to allow in every case part only of the maximum penalty being ordered to be paid.

In addition to and not in substitution for any provision contained in this Act with reference to the publication of by-laws, all by-laws made under the authority of this Act shall be painted on boards or printed on paper, and posted on boards and hung up and affixed and continued on the front or other conspicuous part of every office, station, or waiting-room belonging to the Company, and such board shall from time to time be renewed as often as the by-laws thereon or any part thereof shall be obliterated or destroyed, and no penalty imposed by any by-law shall be recoverable unless the same shall have been published and kept published in manner aforesaid.

Such by-laws, when so published and affixed, shall be binding upon and observed by all parties, and shall be sufficient to justify all persons acting under the same, and for proof of the publication of any such by-laws it shall be sufficient to produce a copy of the newspapers in which the notice of having made such by-laws is advertised, and to prove that a printed paper or painted board containing a copy of such by-laws was affixed and continued in manner by this Act directed, and in case of its being afterwards displaced or damaged, then that such paper or board was replaced as soon as conveniently might be.

If any person wilfully obstructs any person acting under the authority of the Company in the lawful exercise of its powers in setting out the authority of the Company in the lawful exercise of its powers in setting out or making, forming, laying down, repairing, or renewing a tramway, or defaces or destroys any mark made for the purpose of setting out the line of the tramway, or damages or destroys any property of the Company, he shall for every such offence be liable to a penalty not exceeding *five* pounds.

If any person without lawful excuse (the proof whereof shall lie on him) wilfully does any of the following things, namely:—

Interferes with, removes, or alters any part of the tramway or of the works connected therewith;

Places or throws any stone, dirt, wood, refuse, or other material on any part of the tramway;

Does, or cause to be done, anything in such manner as to obstruct any of the Company's carriages, using the tramway, or to endanger the lives of persons therein or thereon;

Obstructs or impedes any officer, agent, or servant of the Company in the execution of his duty;

Refuses to quit the tramway, or any station, office, stable, or other premises connected therewith, upon the request to him made by any officer, agent, or servant of the Company;

Or

Sydney Tramway Company's.

Or knowingly aids or assists in the doing of any such thing ;
He shall for every such offence be liable (in addition to any proceedings, by way of indictment, or otherwise to which he may be subject) to a penalty not exceeding *five* pounds.

If any person travelling, or having travelled, in any carriage on the tramway, avoids, or attempts to avoid payment of his fare, or if any person having paid his fare for a certain distance knowingly and wilfully proceeds in any such carriage beyond such distance, and does not pay the additional fare for the additional distance, or attempts to avoid payment thereof, or if any person knowingly and wilfully refuses or neglects, on arriving at the point to which he has paid his fare, to quit such carriage, every such person shall, for every such offence, be liable to a penalty not exceeding *forty* shillings.

It shall be lawful for any officer or servant of the Company and all persons called by him to his assistance to seize and detain any person discovered either in or after committing or attempting to commit any such offence as in the next preceding section is mentioned, and whose name or residence is unknown to such officer or servant, until such person can be conveniently delivered to a constable, who shall convey him with all convenient despatch before some Justice without any warrant or other authority than this Act, and such Justice shall proceed with all convenient despatch to the hearing and determining of the complaint against such offender.

No person shall be entitled to carry or to require to be carried on the tramway any goods which may be of a dangerous nature, or which may be or are calculated to injure the furniture of the carriages or the clothing of any passenger therein, and if any person take by the tramway any such goods he shall be liable to a penalty not exceeding *five* pounds for every such offence, and it shall be lawful for the Company to refuse to take any parcel that it may suspect to contain goods of a dangerous nature, or to require the same to be opened to ascertain the fact.

Every passenger travelling upon the tramway may take with him his personal luggage not exceeding twenty-eight pounds in weight without any charge being made for the carriage thereof. The Company shall not be bound to carry, unless it think fit, any dogs or other animals, parcels, goods, articles, or things other than passengers' luggage exceeding twenty-eight pounds in weight.

The Company may use, or upon such terms as they shall think fit, allow to be used any of their omnibuses, carriages, cars, or other conveyances for the purpose of publishing notifications or advertisements upon the inside thereof, any statute or by-law to the contrary notwithstanding.

If any person (except by agreement with the Company) uses the tramway, or any part thereof, with carriages having flange-wheels or other wheels suitable only to run on the rail of the tramway, such person shall, for every such offence be liable to a penalty not exceeding *twenty* pounds.

It shall be lawful for any officer or agent of the Company, and all such persons as he may call to his assistance, to seize and detain any driver of horses, cars, or waggons, guard, porter, servant, or other person employed by the Company upon the Tramway ; or in repairing and maintaining the works of the tramway, who shall be drunk while so employed, or who shall commit any offence against any of the by-laws, rules, and regulations of the Company, or who shall wilfully or negligently do or omit to do any act whereby the life or limb of any person passing along or being engaged, or being in or upon such tramway or the works thereof, shall or might be injured or endangered, or whereby the passage of any horses or carriages shall or might be obstructed or impeded, and to convey every such person so seized and detained,

detained, and any person counselling, aiding, or assisting in any such offence, with all convenient despatch before any two Justices, without any other warrant or authority than this Act, and every such person so offending, and every person counselling, aiding, or assisting therein as aforesaid, when convicted upon the oath of one or more credible witness or witnesses before such Justices (who are hereby authorized and required upon complaint to them made upon oath, without information in writing, to take cognizance thereof, and to act summarily in the premises) shall, in the discretion of such Justices, be imprisoned with or without hard labour for any term not exceeding three months, or, in the like discretion of such Justices, shall, for every such offence, forfeit to Her Majesty any sum not exceeding *twenty-five* pounds, and, in default of payment thereof, shall be imprisoned with or without hard labour, as aforesaid, for such period not exceeding three months, as such Justices shall appoint.

The Company shall be alone answerable for all accidents, damages, and injuries happening through its act or default, or through the act or default of any person in its employment, by reason or in consequence of any of its works or carriages, and shall save harmless all local and other authorities, companies, or bodies, collectively and individually, and their officers and servants from all damages and costs in respect of such accidents, damages, or injuries.

All tolls, penalties, and charges under this Act, or under any by-law made in pursuance of this Act, may be recovered and enforced before a Justice in manner provided by the provisions of the "Justices of the Peace Statute, 1865." Part VI.

Notwithstanding anything in this Act contained, the Company shall not acquire or be deemed to acquire any rights other than that of user of any road along or across which it shall lay any tramway

It shall be lawful for the Company from time to time to enter into any contract with any other Company, being the owners or lessees or in possession of any other tramway for the passage across or along the tramway by this Act authorized to be made (for a distance not exceeding thirty chains) of any carriages of such other Company, or for the passage over any other line of tramway for such distance as aforesaid of any carriages of the Company, upon the payment of such tolls and charges and under such conditions and restrictions as may be mutually agreed upon, or if the parties shall fail to agree, then on such terms as may be determined by the Government, and for the purpose aforesaid it shall be lawful for the parties to enter into any contracts for the division or apportionment of the tolls and charges to be taken upon their respective tramways.

The days of labour of any person employed by the Company as a driver or conductor of any tramcar or of the animals working any tramcar shall be eight hours, but any person so employed may work for the Company overtime for special payment. Provided that no person so employed shall in any case work for the Company more than sixty hours in any one week, and the Company shall be liable to a penalty not exceeding *five* pounds for each and every breach of this section.

When any line of tramway constructed under this Act shall lead from or to or past any suburban railway station, tramcars shall be run to and from such station along such line of tramway so as to connect with such and so many trains arriving at or departing from such station, either from or to Sydney, as the Government may approve.

If the Company offend against the next preceding section, it shall, on conviction before Justices, be liable to a penalty not exceeding *ten* pounds for every day during which such offence continues.

SCHEDULE A.

Railway Station to Circular Quay.
Liverpool-street to Randwick and Coogee.
Darlinghurst Junction to Waverley, Woollahra, and Bondi.
Crown-street Junction to Cleveland-street.
Devonshire-street Junction to Botany.
Glebe Point.
Forest Lodge.
Newtown and Marrickville.
Leichhardt.
North Shore.
Randwick to Waverley.

SCHEDULE B.

[2s.]

508—H

Sydney : Charles Potter, Government Printer.—1888.

1887.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

GOVERNMENT TRAMWAYS.

(AMOUNT EXPENDED ON EACH LINE, AND ON ROLLING STOCK.)

Ordered by the Legislative Assembly to be printed, 23 November, 1887.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 27th September, 1887, That there be laid upon the Table of this House,—

“A Return showing the amount expended in the construction of Tramways, “giving the cost of each line separately, also the amount expended on “rolling stock and machinery.”

(Mr. Frank Farnell.)

GOVERNMENT TRAMWAYS.

Lines opened for Traffic.	Total Amount expended to 31st December, 1886.
	£
Railway Station to Circular Quay	61,218
Liverpool-street to Randwick and Coogee	105,791
Darlinghurst Junction to Waverley and Woollahra and Bondi	68,969
Crown-street Junction to Cleveland-street	31,666
Campbelltown to Camden	37,868
Newtown (Glebe Junction) to Marrickville	53,405
Glebe Point and Forest Lodge	38,021
Railway Station Junction to Botany	78,162
Forest Lodge Junction to Leichhardt	31,111
North Shore Cable	69,625
Total cost of construction	£ 575,836
Tramway workshops for all lines	54,710
Rolling stock	216,130
Machinery	5,471
Furniture	2,113
	£854,260

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

TRAMWAYS.

(RETURN SHOWING TOTAL COST OF CONSTRUCTION OF, WITHIN THE COLONY.)

Ordered by the Legislative Assembly to be printed, 19 June, 1888.

[Laid upon the Table of the House, in accordance with promise made by the Honorable the Secretary for Public Works, in answer to Question No. 5, in Votes and Proceedings No. 100, of the 7th June, 1888.]

1. The total number of miles of Government Tramways in the Colony?
2. The total cost of the Tramways to date?
3. The total cost of Tramway Rolling Stock?
4. The total cost of Tramway Workshops and Sheds in (a) Sydney and Suburbs, (b) Newcastle and Suburbs, (c) Camden?

Date	The total number of miles of Government Tramways in the Colony.		The total cost of Tramways constructed.			The total cost of Tramway Rolling Stock.	The total cost of Tramway Workshops and Sheds, inclusive of all Waiting Sheds and Buildings.		
			Lines open for traffic.	Expenditure in connection with Lines not constructed.	Total Expenditure.		Sydney and Suburbs.	Newcastle and Suburbs.	Campbelltown to Camden.
