Motion made (<i>Mr. Buchanan</i>) setting forth the qualifications essential to the Chairman or Speaker, that the present occupant of the Chair is deficient in the knowledge essential in anyone holding the office, and that his frequent interference is the cause of much disorder, and negatived, 579.		
RULINGS OF :—		
Motion made to dissent from, and negatived, 4, 24, 49, 156, 565.		
That it is not in order, on the motion for the adoption of the Address in Reply, to speak of any private transactions between a Minister and any person outside, that the matter was not relevant, and that any charges should be made on a specific motion, 4.		
That, on the question "That the question be now put," when there are no voices for the Noes, and when the Chair is satisfied there are forty Members present, it is not necessary to take a division, 24.		
That the Albury Cattle Sale-yards Bill, notwithstanding that the Select Committee to whom it was referred had decided at one sitting against a motion to report the Bill with amendments to the House, was not out of order, 42, 43.		
That language reflecting on the Chief Commissioner of Insolvent Estates, now an Acting Judge of the Supreme Court, infringes the rules of Debate, 49.		
That a motion adjudging a Member ("named" by Mr. Speaker) guilty of contempt can be put from the Chair, notwithstanding that the question "That the Question be now put" has been put from the Chair and is undecided, 156.		
That Registered Medical Practitioners Bill contains provisions not authorized by the Order of Leave, 192.		
That to challenge the action of the Chair under cover of a Motion for Adjournment of the House would be out of order, 224.		
That Notice of Motion to rescind appointment of Speaker was not out of order, and that motion submitted "That no Resolution reflecting upon the Speaker be entered on Votes and Proceedings" could not be put as one of Privilege, 252.		
That the Public Works Bill did not contain provisions beyond the Order of Leave, 259.		
Discussing Bill in detail on second reading, 315.		
That Councils amendments in Government Railways Bill, do not infringe on Rights of Assembly, 426.		
That Estimates were properly before the House, notwithstanding the Salaries therein shown were lower than those provided by the Civil Service Act, 433.		
That Schedules A, B, and C on Estimates are not open to discussion, as they are already provided for by Acts of Parliament, 433.		
Declines to overrule the opinion of the Chairman in reference to words used by Mr. McElhone in Committee of Supply, 452.		
That clause 3, of Chinese Restriction and Regulation Bill was not beyond order of leave, 455.		
That amendment made in Land Tax Bill was in order, 587.		
That Church of England Property Bill, although introduced in the Council as a Private Bill, should, under the 69th Standing Order, be treated as a Public Bill in the Assembly, 599.		
That by a previous decision of the House he had been relieved of the responsibility of determining whether, on a motion of adjournment, the matter stated in the notice was of urgent public importance, and that the objection should have been taken before the question was stated, 635.

1887.

NEW SOUTH WALES.

RAILWAYS OF NEW SOUTH WALES.
(REPORT FOR 1886.)

The Commissioner for Railways to The Honorable the Secretary for Public Works.

Department of Public Works,
Railway Branch,

Sydney, 20 July, 1887.

Sir,

I have the honor to submit a statement of the transactions of the Department for the year 1886. My acknowledgments are due to the officers who have aided me in the compilation of the various Tables and Returns which illustrate our operations.

No. 1.—RAILWAY CAPITAL AUTHORIZED.

The total amount which has been authorized to be raised by loans is £42,195,161. At the close of 1886 the total value of Debentures issued was £33,537,944. The amount still to be raised is £8,657,217. Railway Debt. Appendix Nos. 8 and 9, pp. 62 and 68.

The Railway capital bears interest at the rate raised and to be raised, as follows:—

£7,062,300—5 per cent.	annual interest	£353,115
£12,053,100—4	„	„	£482,124
£14,422,544—3½	„	„	£504,789
£8,657,217—3½	„	...	(still to be raised)	...	„	£303,002

2.—RAILWAY CAPITAL EXPENDED.

At the close of 1886 there had been expended on lines open for traffic £24,079,555* and on lines in course of construction £3,274,024; in all, £27,353,579, of which amount the sum of £2,390,608 was expended in the year 1886, as under:— Capital expended. Appendix Nos. 10 and 11. pp. 69 and 80.

Construction	£2,029,208
Rolling stock and machinery, &c.	356,386
Trial surveys	5,014
					£2,390,608

The sources from which the money expended on Railway Lines open for traffic have been obtained, are:—

From Loans	£23,313,567
„ Revenue	757,887
					£24,071,454†

3.—

* Includes cost of old Pitt-street Tramway, taken up in 1867, and £3,223 cost of rolling stock used on Camden Tramway.
† Excludes do do do do

3.—LINES OPEN AND IN PROGRESS.

Of the sum of £2,390,608 expended in 1886 for construction, the sum of £933,445 was expended on lines open for traffic, and the balance £1,457,163 invested in unproductive lines in course of construction.

Additions to Capital Account—Lines open for traffic.

In the year 1885 the capital invested in lines open was £21,831,276.* During 1886 a further sum of £2,240,178 was added, making the total capital invested £24,071,454.

Additions to
Capital
Account.

The amount of £2,240,178 was made up as follows, viz.:—

Amount transferred from Construction	
Account, &c.	£1,437,482
Expenditure during 1886 on construction, &c.	294,649
Additions and Improvements to Works and Stations, &c.	151,661
Additional Rolling Stock, Machinery, and Workshops, &c.	356,386

See detail in
Appendix 10a,
page 7.

Lines open.
Appendix No.
4, page 40.

The year 1886 opened with the mileage divided into the various lines as under:—

Southern.

Main Southern Line—Sydney to Albury... ..	Miles	388
South-Western Line—Junee to Hay, and Narrandera to Jerilderie ...		232
Darling Harbour Branch		1
Cooma Branch		40
Illawarra Branch		15
Junction Line between Southern and Western Systems		18
		<hr/>
		694

Western.

Main Western Line—Granville to Bourke	490
Richmond Branch—Blacktown to Richmond	16
Mudgee Branch—Wallerawang to Mudgee	85
Orange to Molong	22
	<hr/>
	613

Northern.

Main Northern Line—Newcastle to Glen Innes	323
North-Western Line—Werris Creek to Narrabri	97
Branches—Morpeth, Bullock Island, &c.	5½
	<hr/>
	425½
	<hr/>
Grand total	1,732½

The

* Excludes cost of the old Pitt-street Tramway, and cost of rolling stock used on the Camden Line, for which latter see Tramway Returns.

The following extensions were opened during the year 1886 :—

Extensions opened during 1886.

SOUTHERN.	Dates of Opening.	Miles.
Sutherland to Waterfall (Illawarra Line)	9 March, 1886	9
Cootamundra to Gundagai... ..	1 June, 1886	34
Homebush to Hornsby (Junction Line between Southern and Northern Systems)	17 September, 1886	14
Young to Cowra (Junction Line between Southern and Western Systems)	1 November, 1886	43
NORTHERN.		100
Glen Innes to Tenterfield	1 September, 1886	57
Total	157

Making together a total of 1,889½ miles in operation at the close of the year.

The average mileage in operation for the whole period was 1,790.

Since the close of the year the following extensions have been opened, making a total of 1,916½ miles in operation at the present date :—

7th April, 1887—Hornsby to Hawkesbury	15 miles.
21st June, 1887—Clifton to Wollongong... ..	12 „
—————	
	27 miles.

On the 1st July, 1887, the tender of E. Pritchard & Co. was accepted for the construction of the railway from Pearce's Corner to the North Shore, a distance of 10 miles 69 chains; the amount of their tender is £112,768. The contract provides for what is known as the passenger line,—the branch to Ball's Head, which was originally proposed, and which was to allow of coal, &c., being taken to the water side, having been omitted.

At the present time the following lines are under construction :—

Lines under construction.

Extension.	Sections.	Length.	Date for Completion.	Remarks.
		Miles.		
Illawarra Line	Second Section	10	31 Dec., 1887	Part opened, 11 miles. " " 12 "

North Shore	North Shore to Pearce's Corner ...	11	31 „ 1888	
		251½		

In

Lines
authorized.

In addition, the estimated cost of the following lines has been voted, but, with the exception of the line from Nyngan to Cobar, the plans, &c., have not yet been approved by Parliament :—

Extension.	Miles.	Extension.	Miles.
SOUTHERN.		WESTERN.	
City Extension	1	Perth to Rockley	17
Tarago to Braidwood	31	Forbes to Wilcannia... ..	340
Gundagai to Tumut	33	Nyngan to Cobar	82
Goulburn to Crookwell	25	Orange to Forbes	60
Galong to Burrowa	18		
Wagga Wagga to Tumberumba	68	Total, Western	499
Culcairn to Corowa	45	NORTHERN.	
Kiama to Jervis Bay	41	Musclebrook to Cassilis	70
Bega to Eden... ..	40	Glen Innes to Inverell	45
Total, Southern	302	Grafton to Glen Innes	103
		Grafton to the Tweed	165
		Narrabri to Moree	61
		Total, Northern	444

The subjoined statement shows the position of the several railway schemes referred to above :—

Line.	Plans, &c., approved by Legislative Assembly.	Dealt with by Legislative Council.	Remarks.
City Extension.....	9 Sept., 1886	8 Oct., 1886	Referred by Legislative Council to a Select Committee which on the 21st October brought up a Progress Report, but had not completed its labours when Parliament was dissolved.
Tarago to Braidwood ...	16 Sept., 1886	14 " 1886	
Gundagai to Tumut.....	16 " 1886	14 " 1886	Plans, &c., approved by Legislative Assembly, but referred by the Legislative Council to Select Committee, which had not dealt with the matters when Parliament was dissolved.
Narrabri to Moree	14 " 1886	14 " 1886	
Glen Innes to Inverell...	15 " 1886	14 " 1886	
Grafton to The Tweed...	15 " 1886	14 " 1886	
Orange to Forbes.....	9 " 1886	8 " 1886	
Nyngan to Cobar.....	9 " 1886	8 " 1886	Plans, &c., approved by Legislative Assembly, but Legislative Council carried a motion for the making of a new trial survey along a fresh route.
Culcairn to Corowa	14 " 1886	14 " 1886	Approved by both Houses. Tenders were invited and received, but none has as yet been accepted, another route having been suggested.
			Plans approved by Legislative Assembly but not approved by Legislative Council.

Goulburn to Crookwell	} Plans laid on the Table of House as exhibits only.
Galong to Burrowa	
Kiama to Jervis Bay	
Wagga Wagga to Tumberumba...	} Plans not yet submitted to Parliament.
Perth to Rockley... ..	
Forbes to Wilcannia	
Bega to Eden	
Muswellbrook to Cassilis	
Grafton to Glen Innes	

The following is a summary of the Railways open, under construction, and authorized :—

Lines open	1,916½ miles.
Under construction	251½ "
Authorized by Vote of Funds	1,245 "
Total	3,413 miles.

4.—LAND TAKEN FOR RAILWAY PURPOSES.

The particulars of the whole of the land resumed to 31st December, 1886, for Railway purposes, will be found in Appendix No. 5, page 42.

Land resumed. Appendix No. 5, page 42.

The claims outstanding on the 31st December, 1885, were 549, to which 105 were added during 1886, making a total of 654 claims; of these 271 were settled in 1886, leaving at the close of the year 383 in various stages of adjustment; a large number of which have been settled during the present year.

5.—IMPORTATION OF RAILWAY MATERIAL.

In the Appendix will be found a return of the Permanent-way materials, locomotives, and miscellaneous articles imported during the year under review.

Appendix No. 6, p. 45.

The following is an abstract of the returns :—

Number of Ships employed.	Number of Tons of Goods shipped.	Value of Goods Shipped.	Amounts paid for Freight and Insurance.	Average rate of Freight and Insurance per Ton.
128	27,181	£ 298,327 s. 4 d. 2	£ *20,125 s. 12 d. 10 †2,361 s. 17 d. 8	s. 14 d. 9 $\frac{3}{4}$ 1 9

* Freight. † Insurance.

In the foregoing are included :—

	Weight in Tons.	Value.
Permanent-way materials for Authorized Extensions...	16,549	£ 110,635 s. 10 d. 5
" " Renewals	2,179	16,643 17 1
" " Duplication of Lines	489	2,945 16 8
" " Tramways	852	6,178 19 1
Miscellaneous items	7,112	161,923 0 11
	27,181	298,327 4 2

6.—EXISTING LINES.

Maintenance of Ways and Works.

During the year a large number of works were carried out. Those charged to the Capital Account have been scheduled, and the cost of each is shown in Appendix No. 10a.

Maintenance of ways and works. Appendix Nos. 1 and 10, pp. 1 and 69.

The report of the Engineer will be found in Appendix No. 1. He states that the whole of the works were maintained in good condition.

Several extensive works were carried out during the year. The Redfern Tunnel, which was widened to admit of four lines of rail running through it from the Illawarra Junction to the passenger station at Redfern, was completed, as was also the new viaduct over Long Cove Creek, near Petersham. The duplication of the line from Parramatta to Penrith was also completed during the year under review.

Locomotive and Carriage Division.

A considerable addition to the rolling stock was made in 1886, 496 vehicles having been added, particulars of which are given below:—

ABSTRACT of Rolling Stock on hand on 31st December, 1885, and the number and description of Vehicles supplied in 1886.

Locomotives.		Passenger.												Goods.												Total of all Vehicles.																	
Tank.	Passenger.	Goods.	Total.	State Carriages.												Waggons.												Vans.															
				Dining.	Sleeping.	First-class.	Composite.	Second-class.	Mail-vans.	Prison-vans.	Hearse.	Workmen's Vans.	Horse-boxes.	Carriage Trucks.	Brake-vans.	Total.	Accident Vans	A.	B.	C.	D.	E.	Water-trucks.	F.	G.		Loco. Coal.	Powder.	Sheep.	Cattle.	Meat.	Refrigerating.	Ballast-waggons.	Brake-vans.	Dump-cars.	Combination.	Total.						
Rolling Stock on hand, 31st December, 1885.

The Locomotive workshops at Eveleigh are progressing favourably. Four of them, each 300' × 60', were occupied at the end of the year 1886, and during the present year a larger portion of the buildings has come into use, with the result that both convenience and economy have been secured in carrying out repairs and renewals.

The supply of water for the locomotives for some years previous to 1886 was surrounded with many difficulties owing to the dry seasons that prevailed. The necessity for running water-trains to keep up the supply added very considerably to the expense of this service, but the copious rains that have fallen have filled the railway dams, and during 1886 no trouble was occasioned by short supplies.

The Locomotive Engineer renews his statement that more engines are required for the economical working of the traffic. The statistics show that the engines in use on the lines of New South Wales are, with one exception, more heavily worked than are the locomotives of any other country. The average mileage per engine in the various countries is as under—

Germany	11,870
Austria	12,842
Belgium	13,335
France	16,798
Italy	15,118
Great Britain	18,395
India	19,606
United States	22,583
New South Wales	20,362

During the year 1886 fifty-two of our locomotives ran between 30,000 and 40,000 miles, and three over 40,000.

The necessity for additional locomotives cannot therefore be questioned, and a further supply will have to be obtained as early as possible.

7.—REVENUE AND EXPENDITURE.

Gross and net earnings and working expenditure.

The gross earnings in 1886 were £2,160,070, the working expenses, £1,492,992, and the net earnings, £667,078.

To earn the above amount 151,886 trains were run 6,479,265 miles. The number of trains averaged 485 per working day. In

In the following tables are given the particulars of the Revenue and Expenditure for 1886 compared with 1885:—

Particulars of coaching traffic.

Total	67·50	65·45	67·06	69·07	69·28	69·12	

The total working expenditure, compared with 1885, increased—
 £30,571, or 2·65 per cent., for South and West lines.
 £4,268, or 1·39 „ North line.
 £34,839, or 2·39 „ all lines.

The expenditure per average mile of line open—
 Decreased £52 for South and West lines.
 „ £21 for North line.
 „ £43 for all lines.

The expenditure for train mile shows as follows—
 An increase of 2·27d. for South and West lines.
 „ 4·01d. for North line.
 „ 2·58d. for all lines.

The proportion of expenditure to gross receipts from all sources shows—
 An increase of 1·57d. per cent. for South and West lines.
 „ 3·83d. „ North lines.
 „ 2·06d. „ all lines.

Net Earnings.

The percentage of net earnings to capital expended in 1886, as against 1885, was as under:—

	1885.			1886.		
	No. of Miles.	Capital invested.	Percentage of interest.	No. of Miles.	Capital invested.	Percentage of interest.
South and West	1,307	16,765,769	3·43	1,407	18,163,089	3·01
North	425½	5,065,507	3·19	482½	5,908,365	2·55
All Lines	1,732½	21,831,276	3·37	1,889½	24,071,454	2·90

The subjoined abstract furnishes the percentages which the gross earnings, the working expenditure, and the net earnings bear to the capital expended on lines in operation for 1886, as compared with 1885.

		1885.			1886.		
		S. & W.	North.	Total.	S. & W.	North.	Total.
Net receipts from all sources ...	£	554,749	161,466	716,215	529,567	137,511	667,078

Do of net receipts to capital.	„	3·43	3·19	3·37	3·01	2·55	2·90

The net earnings from all sources for the year show as follows—

£25,182 decrease South and West.
 £23,955 „ North.
 £49,137 „ all lines.

The net earnings per average mile of line open show—

A decrease of £54 for South and West lines.
 „ £69 for North lines.
 „ £58 for all lines.

The proportion of gross earnings to capital—

Decreased 0·81 % on South and West lines.
 „ 0·94 % on North lines.
 „ 0·83 % on all lines.

The proportion of net receipts to capital—

Decreased 0·42% on South and West lines.
 „ 0·64% on North lines.
 „ 0·47% on all lines.

The following is a summary of the gross earnings, working expenditure, and net earnings of the Railways for 1886, as against 1885 :—

Summary
of gross
earnings,
working
expenditure,
and net
earnings for
1885 and 1886.

	South and West.	North.	Total.

8.—DIVISION OF THE RAILWAY LINES INTO SECTIONAL AREAS.

Sectional
returns.

In the following statements are given the capital expenditure, the gross earnings, the working expenditure, the net earnings, and the return which the net earnings give to the capital invested in each section.

It will be observed that the section from,—

Sydney to Granville, which for 1885 returned 7·57 per cent. on its capital, returned for the past year 7·73, an increase of ·16 per cent.

The Illawarra Line, which in 1885 returned 1·74 per cent., returned for the past year 3·18, an increase of 1·44 per cent.

The Southern Line and Branches, which in 1885 returned 3·56 per cent., returned for the past year 3·48, a reduction of ·08 per cent.

The Western Line and Branches, which in 1885 returned 3·96 per cent., returned for the past year only 2·81, a sensible decrease of 1·15 per cent. on a capital of £6,703,044.

The Great Northern Line and Branches, which in 1885 returned 3·86 per cent., returned for 1886 2·93, a decrease of ·93 per cent.

The following are the sections which did not pay their working expenses :—

Section.	Loss on working.	Capital expended.	Total loss in working and interest upon capital at 4 per cent.
	£	£	£
Strathfield to Hornsby	723	300,566	12,746

Strathfield to Hornsby.

10.—WOOL TRAFFIC.

From returns received by the Chief Inspector of Stock, it appears the Colony has more than repossessed itself of the sheep that were lost in the last disastrous drought, and that there are now in the Colony more sheep than were ever recorded at any previous time. At the end of 1883 there were 37,915,510 sheep, but this number was reduced in 1884 to 31,660,321; during 1885 the number rose to 37,820,906, and at the end of 1886 the total was 39,169,304, an increase over the previous year of 1,348,398. The returns of the wool traffic for the season 1885-1886, as compared with the returns for 1886-7, show that almost the same quantity was carried in both seasons, the totals being respectively 344,697 and 342,609 bales, a decrease of 2,088 bales (little more than $\frac{1}{2}$ per cent.) for the present season. The detailed returns show a large decrease in the Southern Line, no appreciable difference on the Western Line, and a well-sustained increase all along the Northern Line. The respective totals are as follows:—

Wool traffic
Appendix 31,
page 109.

	1885-6.	1886-7.	Increase.	Decrease.
	Bales.	Bales.	Bales.	Bales.
Southern Line and Branches	88,838	81,309	7,529
South-western Line	42,387	37,176	5,211
Western Line and Branches to Dubbo ...	40,591	39,548	1,043
Dubbo to Bourke	89,769	90,611	842
Northern Line	83,112	93,965	10,853
Totals	344,697	342,609	11,695	13,783

It might fairly be assumed that with the larger number of sheep and the stronger hold over the trade our newly-opened extensions should have acquired in the remote districts the quantity of wool carried would have been appreciably greater during the present year; but it must be remembered that the copious rainfall which so benefitted our production opened the inland rivers, and caused the diversion of a larger portion of our wool and produce to the other Colonies. The Stock Department reports that during 1886, as compared with 1885, a much larger quantity of wool grown in New South Wales passed into the neighbouring Colonies of Victoria and South Australia; and during the present year, as the circumstances have been so favourable for river navigation, the returns, when completed, will no doubt show a still further increase in the wool and goods river-borne.

The wool, the product of New South Wales, carried to the different markets was as under:—

	1885.	1886.
	lbs.	lbs.
Sydney	121,831,226	118,316,151
Melbourne	32,767,538	37,199,377
Adelaide	9,515,486	14,562,809
Brisbane	980,999	155,134
	165,095,249	170,233,471

11.—COAL TRAFFIC.

Coal traffic.

The coal traffic on all the lines during the year has been almost uniform with that for 1885, the return showing a decrease of 6,726 tons on the Northern Line (on a total traffic of over one and a half million tons) and an increase of 2,546 tons on the Southern and Western Lines), or a decrease on the whole traffic of 4,180 tons. The total quantity of coal and shale carried, irrespective of that carried for Departmental purposes, was 1,842,505 tons, and the freight received £148,906 3s. 1d.

The quantity carried on the Northern Line was—

				Tons.	Freight.
1885	1,640,601	£77,603
1886	1,633,875	£78,349
	Decrease	6,726	
	Increase	£746

And the quantity shipped from Newcastle for Intercolonial and Foreign parts :—

				Tons.	Value.
1885	1,552,136	£832,495
1886	1,544,494	£828,189
	Decrease	7,642	£4,306

The largest shipments to any one place were to the Colony of Victoria, which took 628,141, as against 544,005 tons for the previous year.

The largest foreign shipments were to San Francisco, India, and Hongkong; San Francisco, our largest foreign customer, took 154,332 tons in 1886, as against 118,053 tons in 1885.

The coal and shale traffic on the Southern and Western Lines show little difference, the diminished output at some mines being balanced by the increased supply at others. The total quantity carried was as under :—

				COAL.		SHALE.	
				Tons.	Freight.	Tons.	Freight.
1885	184,750	£63,010	21,293	£7,142	
1886	182,369	61,757	26,230	£8,786	
	Increase...	4,937	1,644
	Decrease		2,381	1,253	

In addition there were 166,833 tons of coal carried for Departmental use, the freight on which would have amounted to £75,162; but as this was used for railway purposes, no credit for it has been taken in the railway earnings.

12.—RETURNS.

In addition to the Returns given and referred to in the Report, several others will be found in the Appendix which serve further to illustrate the Railway transactions for the past year.

Annexed to the Appendix are thirteen coloured diagrams showing the particulars of the capital invested, the revenue received, the working expenditure, the net revenue, and the return which the net revenue gave to the capital invested for each of the thirty-one years, from 1855 to the end of 1886.

A Railway map of the lines constructed, under construction, and authorised, is appended, and also a map of Australia, showing in the same way the Railways of the various Colonies.

13.—RECAPITULATION.

The transactions during the year are thus summarized :—

The total expenditure for construction was £27,353,579, of which the sum of £24,071,454 was expended for lines opened for traffic.

At the close of the year 1,889½ miles of line were opened for traffic, and 268 miles were in course of construction.

The rolling stock consisted of 406 locomotives, 940 coaching, and 8,364 goods, vehicles.

The value of the railway materials, in the conveyance of which 128 vessels were employed, amounted to £298,327, including freight and insurance.

During the year 151,886 trains were run a distance of 6,479,265 miles; the earnings amounted to £2,160,070, and the working expenditure to £1,492,992. The number of passengers who travelled was 14,881,604, of whom 2,679,750 were first class, 6,586,656 second class, and 5,615,198 season-ticket holders.

The merchandise traffic consisted of 2,130,747 head of live stock. 323,946 bales of wool, 1,983,077 tons of coal, and 1,100,759 tons of general merchandise.

The earnings per mile open were £1,207, the expenditure was £834, and the net earnings were £373.

The net earnings were £667,078, yielding 2·901 per cent. to the capital invested on lines in operation.

I have the honor to be,

Sir,

Your most obedient servant,

Commissioner for Railways.

The Honorable John Sutherland, Esq.,
Secretary for Public Works,
&c., &c., &c.

TRAMWAYS OF NEW SOUTH WALES.

Department of Public Works, Railway Branch,
Sydney, 20 July, 1887.

Sir,

I have the honor to submit a report of the Tramway transactions for the year 1886, and at the outset must express my satisfaction that they have proved more satisfactory than has been the case for some years past, due to the methods adopted for more economical working. In this connection it may be interesting to give a statement of the mileage opened, the capital expended in each year the Tramways have been in operation, and the return which the net results have given to the capital invested.

Year.	Mileage.	Capital Expenditure.	Interest Returns on Capital per cent.
		£	
1880	4	60,218	12·34
1881	9½	169,450	6·16
1882	22	412,561	6·80
1883	25	544,105	2·22
1884	27½	643,111	0·76
1885	27½	708,109	2·17
1886	27½	742,113	3·32

It will be observed that the mileage now is the same as it was in 1884, while the capital expenditure is considerably more. The increase is due to the additions made, in 1885 and 1886, of works of a permanent value, and the cost of additional rolling-stock that had to be obtained to meet the growing traffic. Notwithstanding this the return which the net revenue gives to the capital invested is 3·32 per cent. in 1886, as against 2·17 in 1885, an increase for the year of 1·15 per cent.

Capital Expenditure.

The details of the expenditure to the 31st December, 1885, and subsequent expenditure to 31st December, 1886, are as follows:—

Lines and Sections.	Total Expenditure to 31 December, 1885.			Amount expended in 1886.			Total expended to 31 December, 1886.		
	£	s.	d.	£	s.	d.	£	s.	d.

Total Tramways	£ 1,883,723	10	10	101,878	10	9	985,602	1	7

* This amount appears in Return of 1885 as £5,371 9s. 3d.; it is now reduced by £1,123 11s. 5d., transferred to authorised Extensions and marked thus † † Reduced by £7,000 credit of 1886.

Of the above expenditure, the City and Suburban Tram Lines opened for traffic are debited with the sum of £742,113, the balance—£243,489—being distributed as follows:—

Tram Line—Campbelltown to Camden	£41,417
North Shore Cable Line	70,730
Newcastle to Plattsburg	20,716
Circular Quay to Kent-street—Land, &c., taken for proposed Tramway	100,217
Waverley to Randwick	4,862
Newtown to Cook's River... ..	297
Harris-street to Pyrmont	276
Trial Surveys	4,974
	£243,489

REVENUE AND EXPENDITURE.

The total earnings derived from the City and Suburban Tramways during the year were £226,367, an increase of £3,027 over the earnings of 1885; the expenditure was £201,737, a decrease of £6,258 upon the expenditure of the previous year. The net earnings were £24,630, as against £15,345 in 1885; and the return to capital invested increased from 2·17 to 3·32 per cent.

The Tramway capital bears interest at the rate of 4 per cent., so that the transactions of 1886 show a loss of 0·68 per cent., equal to a sum of £5,046; the loss in 1885 was 1·83 per cent., and represented the sum of £12,979.

It is expected that the transactions of the present year will return a net profit equal to the amount paid for interest upon the capital invested, and thus the City and Suburban Tramways will be self-supporting.

It will be seen from the sectional returns which follow that the Lines worked at a profit are:—

	Gain per cent. on Capital expended.
The Line to the Railway	4·23
Randwick and Coogee Bay Line	3·05
Waverley, Woollahra, and Bondi Line	10·04
Newtown and Marrickville Line	8·16
Leichhardt Line	2·19

And the Lines worked at a loss are—

	Loss per cent. on Capital expended.
Crown-street Line	2·80
Waterloo and Botany Line	1·70
Glebe Point and Forest Lodge	5·56

It will be observed that the Leichhardt Line, which for 1885 was worked at a loss of 3·47 per cent. on its capital, has so prospered that in 1886 this loss was converted into a gain of 2·19 per cent.; the loss on the Crown-street Line, which in 1885 was £1,154, was increased in 1886 to £1,247; the loss on the Waterloo and Botany Line was reduced from £2,948 in 1885, to £1,906 in 1886; and the loss on the Glebe Point and Forest Lodge Lines was reduced from £8,457 in 1885 to £3,464 in 1886.

In

In the following statements are given the capital expenditure, the gross earnings, the working expenditure, and the return which the net earnings give to the capital invested in each section :—

Lines in operation 12 months.

NORTH SHORE CABLE LINE.

The cable line of tramway adopted for the North Shore was opened for traffic on the 22nd May, 1886. The transactions to the close of that year show that the earnings were £4,043, while the expenditure was £4,716—a loss of £673 in the seven months it was in operation, besides interest upon the capital invested, which represents a further sum of £2,828 per annum.

A large portion of the working expenditure was due to an accident which occurred on the line shortly after it was opened. The payments for compensation for personal injuries amounted to £1,118, and for repair to damaged rolling stock to £60, in all £1,178.

I said in my report of last year that it will be only by the exercise of rigid economy in the working expenditure, and by the liberal patronage of the residents of the North Shore of the facilities the tramway affords, that this, the first constructed cable-road in the Colony, can be made self-supporting. To induce a more liberal support of this means of conveyance, the fares have recently been reduced by 25 per cent.

The following table gives the particulars of the capital expenditure, the revenue, and working expenses of this line of cable-road :—

Expenditure.				Earnings.

CAMPBELLTOWN AND CAMDEN TRAMWAY.

Campbell-
town to
Camden.

The subjoined return of the transactions of the Campbelltown and Camden tramway shows a progression which is gratifying. In 1883 the loss incurred upon this line, with interest upon capital, was £4,100. In 1884 the loss was reduced to £700; in 1885 this was further reduced to £405; and for the year under review the total loss, interest included, does not exceed £286.

* Includes £3,223, value of Railway rolling stock used on Camden line,

ACCIDENTS.

The following were the accidents for the years 1885 and 1886, together with the number of passenger fares collected :—

Accidents.

years.	Accidents.						Total.		Number of Passenger Fares
	Servants.		Passengers.		Other than Passengers.		Killed.	Injured.	
	Killed.	Injured.	Killed.	Injured.	Killed.	Injured.			
1886	9	3	8	4	17	7	34	52,977,578
1885	1	6	2	7	3	9	6	22	39,594,753
Increase	3	1	1	1	8	1	12	13,382,825
Decrease	1

It must be pointed out that the large increase in the number of passenger fares is not attributable, except to a very small extent, to an increase in the number of persons travelling, but to the fact that penny tickets have been

been substituted for the 2d. tickets; the number of passengers represent about 60 per cent. of the number of fares collected—equal to nearly thirty-two millions of persons carried on the city and suburban tram lines. This number averages over 1,155,874 passengers to the mile of line, forming a volume of traffic which is without parallel in any part of the world.

I have the honor to be,

Sir,

Your most obedient servant,

Commissioner for Railways.

The Honorable John Sutherland, Esq.,
Secretary for Public Works,
&c., &c., &c.

APPENDIX

TO THE

REPORT ON THE RAILWAYS AND TRAMWAYS

OF

NEW SOUTH WALES,

1886.

CONTENTS OF APPENDIX.

APPENDIX TO REPORT ON RAILWAYS—1886.

No. 1.

The Engineer for Existing Railways and Tramways to The Commissioner for Railways.

I HAVE the honor to submit my Annual Report from January 1st to December 31st, 1886, on the condition of the Existing Railways and Tramways under my charge.

SUBURBAN RAILWAYS.

Sydney to Granville Junction—Double Line—Length, 13 miles 16 chains.

GREAT SOUTHERN AND SOUTH-WESTERN RAILWAYS.

Granville Junction to Albury—Single Line—Length, 373 miles 4 chains.

Junee Junction to Hay—Single Line—Length, 167 miles 29 chains.

Narrandera to Jerilderie—Single Line—Length, 64 miles 49 chains.

Joppa Junction to Bungendore—Single Line—Length 39 miles 10 chains.

Murrumburrah to Young—Single Line—Length, 17 miles 57 chains.

Young to Cowra—Single Line—Length, 43 miles 77 chains—Opened for public traffic, 1st November, 1886.

Cootamundra to Gundagai—Single Line—Length, 33 miles 15 chains—Opened for public traffic, 1st June, 1886.

The permanent-way and several works on these sections have been maintained in good order during the year.

From Sydney to Granville the iron rails are much worn and will require to be replaced by steel rails at an early date. A portion of the ballast on this section is undergoing renewal, the old ballast having become perished.

Between Granville and Goulburn the permanent-way is in good order with the exception of a few places where, owing to the late heavy rains, the road is rather rough. The renewals of rails and sleepers on this length have been heavy. The wooden bridges, buildings, &c., have been kept in good repair, and at three places the substitution of iron and brick structures for the old wooden bridges has been completed during the year.

From Goulburn to Albury the cost of maintenance has been largely increased by the necessity for the renewal of the sleepers, no less than 50,000 of which were replaced during the year, and the quantity of ballast used has also been large. The road is in good running order with the exception of a few knotty places, more especially between Bowning and Cootamundra, where the renewals of sleepers have been heaviest, and the old sleeper-bed consequently most disturbed.

Many sleepers still require renewing on this section, which, of course, will for some time to come swell the expenditure for maintenance, but it is a matter for congratulation that in the centre of the section, viz., at Cootamundra, the best ironbark sleepers are to be procured at a very reasonable figure. Therefore, whilst for the present the maintenance expenses are exceptionally high, economy in this direction may be confidently looked forward to.

The timber bridges, buildings, and other works are now in good order, several of the bridges having had extensive repairs effected throughout the year.

The permanent way, from Albury to the River Murray, is in good order.

The South-western and Jerilderie Lines have been maintained in good order during the year, the latter at a reduced cost, the number of men engaged in the maintenance of it having been sensibly diminished.

The road from Joppa Junction to Bungendore is well ballasted and in good condition. The sleepers, however, are showing signs of decay between the junction and Tarago.

On the section, Demondrille Junction to Young, the permanent way has been found extremely difficult to maintain, the banks having gone down very much, and from Young to Cowra, where the line has only recently been opened for traffic, the heavy rains have severely tried the permanent way. Several of the banks have been scoured a good deal and require to be made up, and in some instances the cuttings have slipped. Some time must elapse before the maintenance of this line can be carried on as economically as could be desired.

The Gundagai line, also opened for traffic this year, passes through several cuttings which require and have received most careful attention, all of them having been carefully gone through, and any loose material removed. The banks, too, have settled down considerably.

CULVERTS, &c., constructed during the year.

ILLAWARRA LINE.

Eveleigh to Hurstville—Double Line—Length, 9 miles 40 chains.

Hurstville to Waterfalls—Single Line—Length, 14 miles 60 chains.

National Park Branch Line—Single Line—Length, 1 mile 15 chains.

Opened for public traffic, 9th March, 1886.

These sections have been kept in good order and condition during the year.

Several of the embankments between Sutherland and Waterfalls have subsided considerably, necessitating their being made up and the road lifted and reballasted. More ballast is required on the National Park Branch.

The following sidings have been laid in during the year:—

<i>Hurstville—</i>		feet.
Double compound cross-over road		61
<i>10 miles 58 chains—</i>		
Siding for Hurstville Brick Company and slip points to ditto		438
<i>Heathcote—</i>		
Slip points to loop siding		20
<i>Waterfalls—</i>		
Siding and slip points to ditto		325
Total		844

Sidings relaid with steel rails during the year:—

At Hurstville—Through road to main lines shifted and relaid 96

The following sleepers have been used in new sidings laid in during the year:—

Siding at Oatley's for Hurstville Brick Company 140

Siding at Waterfalls 90

Total 230

The following quantity of ballast has been used on main lines during the year:—

Eveleigh to Waterfalls	cubic yards.
	2,338

HOMEBUSH TO WARATAH LINE.

Strathfield to Hornsby—Single Line—Length, 14 miles 25 chains.

This section was opened for traffic on 17th September, 1886. The formation of a portion of the line—the banks especially—being of a soft nature, the expense of maintaining it has been high. From about 4 miles to Hornsby the road required lifting and reballasting on account of the settlement of the banks.

Several slips have taken place in the cuttings, and the work of removing them is now in hand.

MISCELLANEOUS.

Main lines and siding at Strathfield shifted and relaid. This work was rendered necessary by the arrangements for junction of the Homebush to Waratah Line with the Main Southern Lines.

The following sidings have been laid in during the year :—

<i>Strathfield—</i>	Feet.	<i>Thornleigh—</i>	Feet.
Arrangement for junction with Main Southern Lines	3,662	New siding, down side and slip points to ditto	553
<i>7 miles 57½ chains—</i>			
Siding for Messrs. Amos Bros. ...	90	Total	4,305

The following sleepers have been used in new sidings laid in during the year :—

Junction with Main Southern Lines at Strathfield	1,319
Siding at Thornleigh	200
	1,519

The following quantity of ballast has been used on main line during the year :—

Strathfield to Hornsby	Cubic yards. 644
-------------------------------	---------------------

GREAT WESTERN RAILWAY.

*Granville Junction to Penrith—Double Line—Length, 21 miles 25 chains.**Penrith to Bourke—Single Line—Length, 469 miles 10 chains.**Wallerawang to Mudgee—Single Line—Length, 85 miles 18 chains.**Orange to Molong—Single Line—Length, 22 miles 50 chains.*

The maintenance of the permanent way and works on these lines has received careful attention during the year, and they are all now in good order.

From Granville Junction to Penrith large numbers of the old iron rails have required to be replaced by steel rails. The new "up" line between Parramatta and Penrith increased the maintenance cost for this section to some extent, the banks which were constructed during prolonged drought having sunk very much under the influence of the heavy rains which fell during the year.

During the year about 6½ miles of road has been relaid with steel rails between Penrith and Bathurst, and numbers of sleepers have also been renewed.

From Bathurst to Dubbo the renewals of sleepers and fencing have formed a considerable item in the cost of repairs, &c., for the year. The permanent way is in good order, but is soft in places between Wellington and Dubbo.

Between Dubbo and Bourke the permanent way has been well attended to, but the recent heavy rains have made some of the banks soft, and the road slightly rough in consequence.

The Mudgee line has received the most vigilant attention, the nature of some of the cuttings rendering a night patrol of the line in stormy weather essential to the safe conduct of the traffic. The embankments in places have settled during the heavy rains, making the road rough and knotty. Generally speaking, however, the permanent way is in good running order, although the sleepers between Wallerawang and Capertee are decaying very rapidly.

The permanent way on the Molong line is in fair order. A good deal of settlement has taken place in the embankments, which require making up.

RICHMOND LINE.

Single Line—Length, 16 miles 11 chains.

The permanent-way on the portion of this line laid with steel rails is in good order. From 25½ miles to 37½ miles, where the light rails are in use, the road has been kept in fair running order, but the rails and sleepers are wearing out, and will need renewal at an early date.

Several of the timber culverts have been renewed in brick during the year.

The following sidings have been laid in during the year:—

Blacktown—

	feet.
Extension of lines at junction	1,618
Dead end siding to coal stage	270
No. 1 siding extended	773
Through roads to main line coal stage siding, and sidings Nos. 1 and 2	457

Capertee to Rylstone	0·79
Rylstone to Mudgee	0·85
Orange to Molong	0·80
Blacktown to Richmond	0·93
Strathfield to Hornsby	0·70

GREAT NORTHERN RAILWAY.

Newcastle to West Maitland—Double Line—Length, 20 miles 18 chains.

West Maitland to Tamworth—Single Line—Length, 161 miles 28 chains.

Tamworth to Glen Innes—Single Line—Length, 142 miles 49 chains.

Glen Innes to Tenterfield—Single Line—Length, 57 miles 40 chains—Opened for public traffic 1st September, 1886.

Bullock Island Branch—Double Line—Length, 1 mile 43 chains.

Morpeth Branch—Single Line—Length, 4 miles.

North-western Line—Single Line—Length, 96 miles 45 chains.

The permanent way, bridges, buildings, and other works on these lines have been maintained in satisfactory condition throughout the year.

The fencing at places between Newcastle and Murrurundi will shortly require renewal, having decayed through age ; and the timber bridge over Black Creek will also need to be replaced at no distant date.

From Murrurundi to Tamworth the work of renewing the iron rails has been proceeded with, and must be continued until steel rails have been substituted for all the iron rails now in the road on that section.

A large slip at Ben Lomond caused much anxiety and expense towards the close of the year, but it is now hoped that very little further outlay will be necessary on its account

On the section Glen Innes to Tenterfield, opened for public traffic this year, the permanent way and works have been kept in first-class order at a comparatively small cost.

The permanent way and several works on the branch lines are in good order throughout.

Werris Creek to Narrabri	0 79

GENERAL REMARKS.

RAILWAYS.

VERY heavy works have been carried out during the year, notably the Redfern tunnel for quadrupling the line into the Redfern Station; the new viaduct over the Long Cove Creek, both of which structures required great care in carrying out so as not to obstruct the traffic, and which I am pleased to say have been successfully completed; the duplication of the line from Parramatta to Penrith, with the renewal of all the wooden bridges under the old line with brick and iron, and many other less important bridges, &c.

The permanent way on all the lines has been kept in good running order, except in a few places, chiefly on the newly-opened lines, which are rather rough in consequence of the late rains. Many thousands of sleepers have been renewed, and many more will be required in 1887, and I have no doubt that steel sleepers, although a little more costly to supply, would be cheapest in the end.

Nothing that I am aware of has yet been settled for the disposal or shipping of coal, &c., from Sydney. This arrangement should be made and works completed by the time the Illawarra and Northern Lines are ready for opening, unless these lines are intended for passenger traffic only.

The repairs to all the bridges on all the lines have been well kept up, excepting those reported on by the Royal Commission, which are still in need of repair and painting.

The Locomotive Workshops at Eveleigh are progressing favourably, four of them, each 300' × 60', are in full working order; eleven more are approaching completion. The iron roofing, &c., has commenced to arrive for ten others, the foundations of which are all in. The paint-shop, the walls, &c., of which have been carried out by the Department, is approaching completion, and will be handed over to the Locomotive Department during 1887.

The number of stations, sidings, &c., interlocked has been increased from fifty-one open at the end of last year to eighty-two places now worked under the system. This year attention has been given chiefly to the by-sidings on the Southern Line, at which no one is placed in charge, and which are worked by the guards of trains. The interlocking of points and signals at these sidings is so arranged as to practically ensure perfect freedom from risk at the facing points, which is a matter of the utmost importance where a large and fast passenger traffic requires to be conducted.

I have, &c.,

GEORGE COWDERY,

Engineer for Existing Railways.

North Shore Tramway (Cable Line)	22nd May, 1886	1	31	1	31
	Total	15	34-35	20	60-59	36	14-94

Metropolitan Lines.—During the year these lines have been well maintained, and from Bridge-street to Hunter-street both roads have been relaid with 70-lb. T rails with a new design of *Guard and Fish Rail* screwed together with Ibbotson's patent screw bolts. The guards are fixed to break joint with the rails, and appear to make a good, sound road. It is proposed to relay the remainder of the road to Redfern Station, and from the junction at Liverpool-street to the wood blocking in Oxford-street early in the new year, which, when completed, I have no doubt will materially lessen the cost of maintenance.

North Shore Cable-Tramway.—This line has been completed this year and is working satisfactorily.

The Department is saddled with a great deal more expense on these roads than can be considered maintenance. In many places the sides of the streets are kept in such bad repair that all the vehicular traffic is thrown on to the lines; then there is the cleaning and watering of the streets, none of which the Department should be charged with, as the trams do not contribute to the dirt and dust.

Waverley to Randwick.—This line is being carried out by the "unemployed" at task work.

Plans for the line from Kogarah to Sans Souci are completed.

The tram line from Newcastle to Plattsburg, a distance of about 8 miles, is making good progress towards completion.

I have, &c.,

GEORGE COWDERY,
Engineer for Tramways.

No. 2.

The Locomotive Engineer to The Commissioner for Railways.

Department of Public Works, Railway Branch,

Locomotive Engineer's Office, Sydney, 22 July, 1887.

Sir,

I have the honor to report as follows on matters connected with the Locomotive Branch for the year ending 31st December, 1886:—

SHOP ACCOMMODATION.

Depôt.	Remarks.
Eveleigh ...	During the year we have been able to occupy shops Nos. 1 to 4. The whole of the machinery, &c., has however not been erected therein. We hope to have entire possession of shops Nos. 1 to 15 by the end of 1887. The delay in the completion of the carriage, waggon, and paint shops has caused us considerable inconvenience.
Newcastle ...	Contrary to our expectation the new boiler-shop has not been completed, and the demand for a new running-shed becomes more urgent every day.
Nyngan ...	A new running-shed is required, as it has been decided to remove the "depôt" from Dubbo to this place.

ADDITIONAL ENGINES and other ROLLING STOCK received during the year.

Classification.	No.	Remarks.
Engines	19	3 of these were to replace worn-out Engines.
Passenger stock	90	2 of these were to replace vehicles destroyed at Cootamundra.
Goods stock	427	35 of these were to replace worn-out.
Total	536	

NOTE.—The cost of replacing these engines and stock—worn out or destroyed—was charged to working expenses, less as in the case of the engines alone, the value of the old material.

ENGINES under order.

No.	Description.	Contractors.
12	Passenger	The Vulcan Foundry Company.
6	Tank	Henry Vale.
18		

ABSTRACT of ROLLING STOCK with Average per Mile open for Traffic, on 31st December, 1886.

Classification.	Total in Stock.		No. under Repair.		No. awaiting Repairs.		No. available for Traffic.		Average No. available per mile open for Traffic.	
	Pas-senger.	Goods.	Pas-senger.	Goods.	Pas-senger.	Goods.	Pas-senger.	Goods.	Pas-senger.	Goods.
Engines	208	198	18	24	6	6	184	168	·097	·089
Vehicles	940	8,364	40	354	900	8,010	·476	4·234

Total mileage of engines for the year = 8,266,988 miles.
 Total number of engines = 406.
 Average mileage per engine (all engines) = 20,362 miles.
 Available for traffic = 23,486 „

THE mileage of engines under steam during the year was as follows:—

Number of Engines.	Mileage Run.
9	Nil (under or awaiting repairs).
41	Under 10,000 miles.
133	10 to 20,000 „
168	20 to 30,000 „
52	30 to 40,000 „
3	Over 40,000 „
406	

NATURE of principal repairs to Engines, Passenger and Goods Stock during the year.

Engines.

Thoroughly overhauled.	Extensively repaired.	Boilers thoroughly examined and repaired.	New Boilers.	New Pistons.	New cylinders.	New Crank Axles.	New slide valve faces fitted.	New tyres fitted.	New spark arresters fitted.	Fitted with Westinghouse Brake gear.
160	370*	45	6	37	3	7	20	198	90	6

NOTE—Six new express engines were erected at the shops during the year.

* Some under repairs more than once during the year.

Passenger

Passenger Stock.

Thoroughly repaired in Woodwork.	Minor Woodwork Repairs.	Thoroughly painted.	Improved Draw-gear fitted.	Continuous Draw-gear applied.	New Turton Buffers fitted.	Turned-up Tyres put under.	New Tyres put under.	New Wheels put under.	New Axles put under.	New Brasses fitted.	New Cushions.	New Iron Brake Blocks fitted.	New Westinghouse Brake gear complete, fitted.	Trough Air-pipes and Hose connections fitted.	Cocks fitted in Brake Vans.

WATER SUPPLIES.

Depôt.	Nature of Additions and Improvements during the year.
Rockdale	Additional water tank, crane, and dam.
Blackheath	New dam and line of suction pipes.
Eskbank	New watering station (temporary—permanent arrangements in hand).
Bathurst	Pumping machinery and house raised to level of surrounding yard.
Wellington	New well—pumping machinery removed to new site.
Dubbo	Two additional water cranes.
Trangie	New well.
Menangle	Additional water crane.
Wingecarribee	Engine and boiler thoroughly repaired.
Muttama	New watering station.
Darlington	” ”
West Maitland	New Tangye boiler and pump.
Deepwater	New watering station.
Tenterfield	” ”

GAS WORKS.

Depôt.	Gas manufactured for lighting station, yards, sheds, shops, &c.	Do. for lighting carriages.	No. of vehicles fitted with gas apparatus during the year.	No. of vehicles fitted with improved lamps during the year.
Sydney	c. ft. 8,000,000	c. ft. 4,320,000	48	95
Bathurst	2,236,000	1,183,000
Junee	1,176,000	1,026,400
Newcastle	775,000	21

GENERAL REMARKS.

The locomotive, carriage, and waggon stock, and machinery have been maintained in good working order.

All our stock of patterns was destroyed, and a number of machines were damaged by fire in August last, but no very serious hindrance to the carrying on of the work resulted therefrom as a temporary pattern shop was at once provided at Eveleigh, and the damaged machinery was repaired and put in working order.

Owing to the sufficiency of the rainfall during the year, we have felt less inconvenience in maintaining our water supplies in a state of efficiency than has been the case for several years.

The drought having broken up there is every probability of increased traffic on our lines during the present year, and as in the past great difficulty was experienced in supplying motive power for the traffic, I would again urge upon the Commissioner the necessity for increasing the number of passenger and goods engines with as little delay as possible.

I have &c.,
W. SCOTT,
Locomotive Engineer.

LIST OF MACHINERY ADDED TO STOCK DURING THE YEAR 1886.*

No.	Description.	Remarks.
GREAT SOUTHERN AND WESTERN LINES.		
302	6-in. screw-cutting lathe	In running shed, Eveleigh.
303	10-in. do	do do
305	4-ft. wheel turning lathe	In machine shop, Junee.
306	Overhead crab-winch	do do
307	Double circular saw	In temporary pattern-shop, Eveleigh.
308	Vertical drilling machine	In running shed, Eveleigh.
309	12-in. wood lathe	In temporary pattern-shop, Eveleigh.
310	Emery machine	
311	Band saw	
312	6-in. wood lathe	In machine shop, Sydney.

No. 3.

The Superintendent of Tramway Rolling Stock to The Commissioner for Railways.

Sir, New South Wales Government Tramways, Randwick Works, 30 May, 1887.

In reporting upon the working of the Rolling Stock Branch of the Tramways for the year 1886, I preface my remarks by pointing out that I did not assume control as Superintendent till 5th October, so that my personal experience of the working and maintenance of the stock, shops, &c., covers the last three months of the year only.

At the beginning of the year, the total number of vehicles in stock consisted of 95 locomotives, 108 cars (94 with double, and 14 with single floors), 16 service trucks, and 2 water tanks used for watering the streets. During the year the rolling stock was added to by 1 engine, built by Mr. Thomas Wearne, and 21 single floor cars each capable of seating 60 passengers. Eleven of these were built by Messrs. Stanfield and Carcy, and 10 by Messrs. Hudson Bros., Ltd., both of Sydney. Two cars, Nos. 12 and 16, which were lent to Mr. C. E. Jeanneret, of Parramatta, in 1885, were purchased by that gentleman in June last.

When I took charge, there were 38 unserviceable engines standing in the Randwick yard, all requiring such extensive repairs that there was no prospect of their being made available for traffic for some time to come. There were also 25 boilers standing in the said yard, all of which require new fire-boxes and other heavy repairs. This I need not say is serious, and although every effort will be made to make use of this idle stock by first putting it into good order, I do not see how it can be done without increasing the working expenses to a larger extent than I could have wished. I may state that fair progress is being made with the work at the present time, two boilers having been thoroughly repaired already, and the number of unavailable motors reduced.

I also found several cases of new machinery lying in the Randwick yard; this has been unpacked, cleaned, and put together ready for use, and fair progress is being made with the new shafting, pulleys, &c., which I intend putting up in the present machine shop for driving this additional machinery.

The average number of unserviceable engines throughout the year was equal to 31 daily, thus rendering the locomotive stock only equivalent to 65 engines, about 75 per cent. of which were in fairly efficient condition, and of this number the average in steam daily was 50.52. The engine mileage for the year was 1,389,555 miles, which is equal to 21,377 miles per serviceable engine, or 27,505 miles per engine in steam, which I consider extraordinary work, considering the muddy state of the streets in wet weather, and their very dusty state in dry weather.

In directing attention to the unserviceable condition of so large a percentage of the locomotive stock, I do so in justice to myself, as it is only right that the facts should be recorded to admit of subsequent efforts to bring the whole of the 97 locomotives in stock to a state of efficiency, being properly gauged and compared.

The cars have been maintained in good working order. In pursuance of the decision arrived at in 1885, to remove the top "deck" or floor of the 90 passenger cars as they came into the shops for extensive repairs, 7 cars were so altered during the year, the seating accommodation being thereby reduced to 70 passengers each. Therefore, to maintain the carrying capacity of the stock, more new cars must be constructed.

The whole of the machinery in the workshops here, and at Pitt-street, has been kept in good order, and the new boiler shop and smithy—recently erected—were occupied in December, and the extra accommodation afforded is producing beneficial results.

I think if economy in working is to be secured, that the Running Department must be conducted at a central spot in the city, and I beg to draw your attention to my recommendation, of 1883, and December, 1886, respecting increased accommodation at Pitt-street yard for the whole of the running engines.

Although every effort will be made to economise, I fear the working expenses will increase on account of employing more men and increasing our shop accommodation, &c., here at Randwick, and I take this opportunity of remarking that it is most discouraging to see locomotives which are put into good working order running through the very dirty and sloppy streets of the city, and unless the roads are kept dry and better drained generally, I do not see how the efforts of the Locomotive Department can reduce working expenses.

The North Shore Cable Tramway was opened on the 22nd of May, and the whole of the rolling stock and machinery has been kept in good order. The wire rope made by Messrs. Bullivant & Co., having now been in constant use for over twelve months, shows that it has done good service.

Attached are detailed returns as usual.

I have, &c.,

THOS. MIDELTON,
Superintendent of Tramway Rolling Stock.

Minute

Minute by The Commissioner for Railways.

REPORT ON TRAMWAYS FOR 1886.

MR. MIDELTON in the above report says:—"When I took charge there were thirty-eight unserviceable engines standing in the Randwick yard, all requiring such extensive repairs that there was no prospect of their being made available for traffic for some time to come. There were also twenty-five boilers standing in the said yard, all of which require new fire-boxes and other heavy repairs. This, I need not say, is serious, and although every effort will be made to make use of this idle stock by first putting it into good order, I do not see how it can be done without increasing the working expenses to a larger extent than I could have wished. I may state that fair progress is being made with the work at the present time, two boilers having been thoroughly repaired already, and the number of unavailable motors reduced.

"I also found several cases of new machinery lying in the Randwick yard; this has been unpacked, cleaned, and put together ready for use, and fair progress is being made with the new shafting, pulleys, &c., which I intend putting up in the present machine-shop for driving this additional machinery."

I shall be glad to have any observations which Mr. Downe may have to make upon these representations.—CHAS. A. G. Reply herewith.—GEO. DOWNE.

Mr. Assistant-Locomotive Engineer Downe to The Commissioner for Railways.

IN reference to the paragraphs referred to, I dare say there were thirty-eight engines requiring overhaul at Randwick at the time Mr. Midelton took charge, and there were many boilers with steel fire-boxes that required renewal.

With regard to the number of engines requiring overhaul, the number is not so excessive as at first sight appears, for steam companies using motors have found from experience that after a few years working it must allow for 25 per cent. to be in the repairing shop; the percentage represented by thirty-eight under repair is thirty-nine of the total number in stock. This leaves a difference of 14 per cent. against the Department. The want of proper facilities, pointed out from time to time, and referred to in previous Commissioner's annual reports, fully accounts for the difference.

Further on Mr. Midelton says the average for the year was thirty-one, which represents just 31 per cent., only 6 per cent. above what is expected by other companies, thus proving that the utmost was done with the facilities at command to maintain them in an efficient state; and as Mr. Midelton did not take charge until October, the paragraphs which appear to reflect in some degree upon previous management have not on examination much weight.

With regard to the machinery lying unpacked, Commissioner will remember this was ordered for the new machine shop, but from various reasons its erection was deferred from time to time.

In my report for 1884 I followed up previous representations for further workshop accommodation. In addition to the cleaning-shed at Randwick, the only other building available for a considerable time was a car-shed, and in it I had to employ machinists, fitters, smiths, carriage repairers, and painters. It was not until 1885 a second car-shed was completed. In this I had to transfer the carriage repairers and painters, and make it a temporary repairing-shop for these branches.

Subsequently the erection of a boiler and a smiths' shop was approved, but these were only completed and occupied since my transfer to the Railway Department.

Finding that further delay would take place with regard to the machine-shops, I began to anticipate the additional space that would be at my disposal in the temporary building by the removal of the smiths to their new shop, and had, before I left, commenced to put down additional driving power, and was preparing to fix the machines referred to as in cases, directly the smiths took possession of their new shop.

It is unnecessary to go into the causes of delay in these matters respecting non-erection of proper facilities for executing repairs, so many things have operated to prevent same—expenditure, changes of government, alternate proposals put forward, &c., &c.

I notice Mr. Midelton asks that the fact of the number requiring overhaul should be recorded to admit of his efforts to bring the whole into a state of efficiency may be gauged. This certainly calls for remark from me.

Mr. Midelton takes charge of the department just as proper facilities for dealing with smith and boiler works are about ready to be availed of, and also at the same time he finds I was preparing to utilise the machinery I had ordered for engine and carriage repairs; he therefore takes charge with greater facilities for keeping down repairs, will have the use of £3,000 worth of additional machinery beyond what I had, and asks that his action with the additional advantages and facilities at his command, may be compared with the difficulties and inconvenience experienced for want of same, and that his management may receive credit of any reduction in the number of engines requiring overhaul, and not the provision made of additional machinery, &c., for doing the work before he took charge.

I can only say I shall be pleased to see Mr. Midelton (with the additional plant at his command) succeed in his efforts to maintain the motive power in a more efficient condition.

The foregoing will I trust be considered an explanation such as desired by Commissioner.

GEO. DOWNE.

Live Stock Rates and Conditions—1 February, 1884.

SMALL CONSIGNMENTS

$\frac{1}{4}$ Truck, <i>ie</i> , 4 Cows or Oxen, or 10 Calves, 1 Deck of Sheep, or 30 Pigs	$\frac{1}{2}$ Truck, <i>ie</i> , 2 Cows or Oxen, or 5 Calves, or 20 Sheep, or 15 Pigs	Single Cow or Ox	Sheep or Pigs, when less than $\frac{1}{4}$ Truck	Calves, when less than $\frac{1}{4}$ Truck
6d per mile	4d. per mile	3d per mile	$\frac{1}{2}$ d each per mile	1d each per mile
Minimum, 10s	Minimum, 7s 6d	Min, 7s 6d each	Min, 1s. 6d each	Minimum, 2s each.

When the number of animals or the space occupied exceeds the limit for $\frac{1}{4}$ or $\frac{1}{2}$ truck, each one in excess will be charged at the mileage rates enumerated above for single animals until the $\frac{1}{2}$ or full truck rate, as the case may be, is reached.

In ascertaining what portion of a truck is to be charged for, *ie*, $\frac{1}{4}$, $\frac{1}{2}$, or full truck, regard will be had to the space actually occupied more than to the number of animals, but in no case must the number of animals stated above be exceeded.

Mixed stock will be carried together in the same truck, provided the whole consignment belongs to one person, and the Commissioner is relieved of all responsibility. When mixed stock cannot be loaded together, each kind will be charged for separately, with the following exception—On Thursdays single animals conveyed to Sydney in the same trucks, although belonging to different owners, will be charged at a proportion of $\frac{1}{4}$, $\frac{1}{2}$, or full truck rate, plus 25 per cent, for example, should there be two cows, each owner will be charged half of the $\frac{1}{4}$ truck rate, plus 25 per cent, and should there be three animals, the owners will be charged the $\frac{1}{2}$ truck rate equally between them, plus 25 per cent. It is absolutely necessary that each animal be legibly addressed.

When the charge per head for live stock exceeds that for $\frac{1}{4}$ truck, or when the charge for a part truck exceeds that for a full one, only the lesser amount will be collected.

BULLS.

The charge for bulls is 7d each per mile up to 100 miles, and 4d for every additional mile, plus the charge for 100 miles, if more than one in a truck, 4d each per mile, for $\frac{1}{2}$ truck and upwards, cattle rates. Minimum, 12s 6d.

VALUABLE RAMS AND EWES

If less than $\frac{1}{2}$ a truck load, will be charged 2d each per mile, for $\frac{1}{2}$ a truck and upwards, sheep rates. Minimum, 5s.

HORSES

See full truck rates. No less charge than for a full truck load will be made for any number.

When live stock is returned from Sydney or Homebush to country stations, in those neighbourhoods to which cattle trucks and sheep vans are being sent empty, half the above rates will be charged, provided the owners wait the requirements of the Department, but not otherwise.

Live Stock Rates and Conditions—1st October, 1885.

Herds, Flocks, &c, when in consignments of not less than one full truck load

For single decked trucks, same rates to be charged as on page 180

No. 53—*continued.*Live Stock Rates and Conditions—1st October, 1885—*continued.*

GREAT SOUTHERN, WESTERN, AND RICHMOND, AND NORTHERN LINES.

HORSES.

The Commissioner will carry horses in cattle trucks if requested to do so, but only under special contract, relieving him of all responsibility. The charge for horses so carried will be the same as for cattle in full truck loads.

For the rates for horse-boxes see Coaching Rate Pamphlet.

Pigs—same as cattle.

(When a double-decked waggon is occupied, 50 per cent. will be added.)

Minimum, 15s.

GENERAL CONDITIONS AND REGULATIONS.

The Commissioner will not receive live stock for conveyance on Sunday, Good Friday, Christmas Day, or any proclaimed holiday.

Live stock will be conveyed only from and to such stations as have accommodation for loading and unloading (see following page), and herds and flocks only at convenient times to be previously arranged with the Traffic Manager.

The number of animals must be so limited that the gross weight in any one truck shall not exceed 6 tons.

The Commissioner does not guarantee arrival at any particular time or for any particular market.

All orders for conveyance of live stock per stock or goods trains are to be made to the Traffic Manager on the printed form provided for that purpose. Those sent by telegram, letter, or through a station-master or other railway officer, will be subject to the same conditions as if made on the printed form.

Each order must be accompanied with a deposit of 20s. per truck ordered.

An order once lodged with the Department can only be withdrawn or the number of trucks reduced at any time (not being less than four clear days before the date of conveyance) by forfeiting the deposit of 20s. for each truck so withdrawn:

An order cannot be withdrawn or reduced or altered within four days of the date of conveyance.

All trucks ordered and not used on the date and at the station specified in the order will be charged for as if used.

Trucks must be loaded and ready for despatch at a time fixed by the Traffic Manager, which will be ascertained on application at the Traffic Manager's Office, or the station-master at the loading station, two clear days before the stock is to be loaded. If not loaded by the time specified, the Department reserves the right to remove the waggons, and charge full rates.

Sundays are not included in the number of days to be reckoned.

All live stock must be loaded and unloaded by the senders and consignees respectively, by whom also the truck doors must be secured and opened, fastenings attended to, &c.

All live stock must be unloaded within three hours after arrival, otherwise it will be unloaded by the Commissioner, and a charge made of 2s. per truck.

All live stock must be removed from the railway premises immediately after unloaded; or if left, will remain at the owner's risk and expense, and may be sent to agistment or livery, the cost of which shall be paid by the owner, and such cost must be paid on demand as part of the authorized charges; and such stock, if not removed within seven days, may be sold by auction, by order of the Commissioner, within the railway premises, and the proceeds applied in payment of all expenses incurred, and the balance thereof handed over to the owner on demand.

When a truck is only partly occupied by a consignment, the Commissioner will have the right to fill it up to its full carrying capacity with other stock.

One *bond fide* drover will be allowed to accompany each consignment of not less than three full trucks, travelling distances over 60 miles, to give the stock whatever attention may be necessary during transit. He will be furnished with a return free pass, available for three days for distances over 60 and under 200 miles, for four days for distances over 200 and under 350 miles, and for six days for distances over 350 miles, and must ride either in the guard's van or a 2nd class carriage. In cases where the stock is conveyed by more than one train, a pass will be issued for each train. The drover must travel by the same train as the stock, otherwise a pass will not be issued.

The following are the rates at which live stock can be insured:—

NEAT CATTLE (including Bulls).

1 to 50 miles,	2 per cent. on the declared value above £15.
51 to 100 "	3 " " "
101 to 150 "	4 " " "
151 and upwards,	5 " " "

The same percentage charge to be made for Pigs and Sheep (including valuable Rams and Ewes) on the declared value above £2.

Under no circumstances will the Commissioner be responsible for loss or injury to live stock, insured or uninsured, occurring during loading or unloading, whether such services be performed by either the servants of the Department or the owner. Nor will he under any circumstances be responsible for loss of or injury to any live stock during transit, arising from fear or restiveness, or through any of the animals being suffocated or trampled upon.

No 53—continued.

A rebate of 25 per cent. will be allowed on all wool from the district from Buckambi Station and all stations below having a frontage to the Darling River on the eastern side, and on the western side, including Marra and the whole district south and south-west thereof, and stations lying wholly to the west of the Paroo River

Scoured wool properly dumped will be allowed a rebate of 10 per cent off scoured wool rate

From stations not enumerated in the Schedule a charge at the rate of 3d per ton per mile will be made in addition the rate from the nearest station, shown on the up side, but in no case will the charge be in excess of the rate from the station immediately beyond that from which a rate is quoted

No. 53—continued.

Rates for Carriage of Wool—continued.

Wool from up-country stations consigned to woolwashing establishments within 25 miles of Sydney and Newcastle will be charged Sydney and Newcastle rates respectively.

To all other stations for woolwashing purposes, 1st class rates.

The Wool delivery will commence at 6 a.m., and close at 4:30 p.m., at Redfern Wool Shed ; and all Wool not accepted within fifteen minutes after same has been tendered at Consignee's Stores or Offices by the Commissioner, will be stored at Owner's risk and expense, and will be liable to charges for re-cartage in addition. The place for delivery must be stated on delivery order.

Smaller quantities charged actual weight at First-class rates.

The charge per truck for distances not shown in this table will be one-fifth of the difference in rate between every 5 miles.

A pro rata charge will be made for distances not shown above, and six or eight-wheeled trucks will be charged for as two ordinary trucks.

If consigned at Commissioner's risk the charge for Insurance will be 5 per cent. upon the trainage rate—minimum, 9d. per truck.

Special Class A Traffic.

In Truck Loads (not exceeding 6 Tons).

4 OCTOBER, 1882—(Unaltered, 1 October, 1885)

See General Regulations relating to insured parcels.

Fresh meat, fish, poultry (dead), dairy produce, eggs, fruit, vegetables, and game, under 1 cwt., 25 per cent. reduction on parcel rates; minimum charge, 3d.

Bread, half parcels rates.

Musical instruments, packed in cases, 25 per cent. added to above rates.

Pictures in frames, packed or unpacked, double rates. Mirrors, double rates.

Furniture and sewing-machines, packed in cases, ordinary rates, but when unpacked double rates will be charged.

Bath chairs, perambulators, velocipedes, and bicycles, requiring a carriage truck for their conveyance, will be charged as for a two-wheeled carriage (see page). Bath chairs and perambulators (adults) carried in Break Vans will be charged double the rate for children's perambulators.

Corpses, 1s. per mile; minimum charge, 5s.

Newspaper parcels, one-quarter parcels rates; minimum charge, 3d.

Passengers' excess luggage, parcels rates.

Commercial travellers' excess luggage, parcels rates on down journey and free on up journey, on production of Railway receipts certifying that full trainage has been paid on down journey.

Gunpowder and other explosives will not be conveyed by Passenger Trains.

The maximum rates for the conveyance of parcels between Sydney and any Station on the Southern and South-western Lines are as follows:—

3 lb. and under.	Over 3 lb. to 7 lb.	Over 7 lb. to 14 lb.	Over 14 lb. to 28 lb.	Over 28 lb. to 56 lb.	Over 56 lb. to 84 lb.	Over 84 lb. to 112 lb.	Every additional 28 lb. or part thereof.

Perambulators

No. 53—*continued.***Parcels Rates—*continued.***

Perambulators (children's) and velocipedes will be conveyed in Guard's Vans, at the following rates:—

When conveyed as passengers' luggage—

		s. d.			s. d.
Not exceeding 15 miles		0 9	Not exceeding 125 miles		3 0
30 "		1 0	150 "		3 6
50 "		1 6	200 "		4 0
75 "		2 0	250 "		4 6
100 "		2 6	300 "		5 0

When conveyed as parcels 50 per cent. additional will be charged.

Ice will be conveyed by Passenger Trains as under:—

Miles.	10 lb. and under.	For each additional 10lb.	Miles.	10 lb. and under.	For each additional 10lb.
Distance not over—	s. d.	s. d.	Distance not over—	s. d.	s. d.

250.....	0 5	0 2½			

Exchange of Parcels, &c., Traffic between New South Wales and Victorian Lines.

Parcels, excess luggage, and commercial travellers' samples are booked through between New South Wales and Victorian Stations at the undermentioned rates:—

For those parcels booked through between Sydney and Melbourne the rates are—

		s. d.
Over 3 but	Not exceeding 3 lb	2 0
" 7 "	" 7 "	3 0
" 14 "	" 14 "	4 6
" 28 "	" 28 "	6 0
" 56 "	" 56 "	10 0
" 84 "	" 84 "	12 0
" 112 "	" 112 "	14 6

and 2s. 6d. for every additional 28 lbs. or part thereof.

All other parcels, &c, from New South Wales Stations to Victorian Stations are booked to Wodonga, and those from Victorian to New South Wales Stations are booked to Albury at the rates named below.

Between Albury and Victorian Stations the ordinary Victorian rates are charged (189 miles from Melbourne), and, in addition, the following charges for the New South Wales Department are added:—

		s. d.
Over 3 "	Not exceeding 3 lb	0 3
" 7 "	" 7 "	0 4
" 14 "	" 14 "	0 6
" 28 "	" 28 "	0 8
" 56 "	" 56 "	0 10
" 84 "	" 84 "	1 0
" 112 "	" 112 "	1 2

and 3d. for every additional 28lb. or part thereof, and for the purposes of charging parcels, &c., from New South Wales Stations to Wodonga, the latter station is regarded as 388 miles from Sydney, and the charges calculated accordingly, *plus the rates named above.*

Parcels between Albury and Wodonga are charged double the above rates.

Press parcels are charged one-fourth the above rates—minimum, New South Wales Line, 3d.

Packed parcels in hampers, crates, bags, cases, or other packages are charged quadruple the above rates, and the onus of proving that parcels are not packed rests with the consignors or consignees.

When two or more parcels are consigned to one person the above rates are charged on each parcel separately.

Bicycles, feathers, furniture, glass, hats, bonnet or hat boxes, cases of millinery, straw bonnets, mirrors (loose), musical instruments, perambulators, sulkies in pieces, pictures, sewing-machines, wicker-work, wire cages (loose), or other articles light or fragile, are considered admeasurement goods, and are charged 50 per cent. additional on the above rates. Parcels containing articles and property of a description not mentioned or specified in the following clause, such articles and property being over £10 in value, are, in addition to the amount chargeable by the foregoing scale of rates, charged a further sum equal to 1 per centum upon the declared value thereof.

Parcels containing any of the following articles are charged the following increased rates, viz. :—Over £10 and under £50 in value, double, and over £50 in value, quadruple, parcel rates, viz. :—Gold or silver coin of this realm, or of any part of Her Majesty's dominions, or of any foreign state, or any gold or silver in a manufactured or unmanufactured state, or any precious stones, jewellery, watches, clocks, or time-pieces of any description, trinkets, bills, notes of any banks in Her Majesty's dominions, or of any foreign bank, order, notes, or securities for payment of money, whether foreign or otherwise, stamps, maps, writings, title-deeds, paintings, engravings, pictures, gold or silver plate, or plated articles, glass, China, silk in a manufactured or unmanufactured state, and whether wrought up or not wrought up with other materials, furs or lace or any of them contained in any parcel or package.

The trainage on all parcels conveyed under bond must be prepaid.

Horses, carriages, and dogs from New South Wales to Victorian stations are booked to Wodonga at Albury rates, and from Victorian Stations to Albury at Wodonga rates, plus the following charges:—

	s. d.
One horse	2 0
Two horses	3 0
Three horses belonging to same owner	4 0
Carriages, gigs, dog-carts, and vehicles of a similar description	4 0
Dogs	0 6

Corpses are booked in a similar manner, with 4s. added for conveyance between Albury and Wodonga.

Rates for conveyance of Library Exchanges.

Books forwarded for exchange to and from subscribers to recognized Circulating Libraries only will be carried at one-fourth parcels rates, under the following conditions, viz. :—

1. The sender's name must be legibly inscribed on each parcel.
2. Each parcel must be open at both ends.
3. Each parcel must be declared on the consignment-note to contain books only.

Gold

No. 53—*continued.*Parcels Rates—*continued.*

Gold Dust and Bullion, and Gold and Silver Coin.

The Commissioner for Railways will not be responsible for the safe conveyance of Gold Dust and Bullion, Bank-notes and Bills, Orders, Notes, and Securities for the payment of Money, and Gold and Silver Coin, or any of the other articles mentioned above, as the following charges are made, and the Gold Dust and Bullion and Coin carried, on condition of its being in charge of owners and at their risk.

	Distance not over 55 miles.	Distance not over 100 miles.	Distance not over 150 miles.	Distance not over 200 miles.	Distance not over 250 miles.	Distance not over 350 miles.	Distance over 350 miles.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.

PIGS.

Same rates per truck as cattle. Minimum, 15s.

Under the foregoing rates for cattle, sheep, horses, and pigs, no less charge than for one full truck will be made for each and every truck used.

SMALL CONSIGNMENTS.

$\frac{3}{4}$ Truck, i.e., 4 Cows or Oxen, or 10 Calves, or 1 deck of Sheep, or 30 Pigs.	$\frac{1}{2}$ Truck, i.e., 2 Cows or Oxen, or 5 Calves, or 20 Sheep, or 15 Pigs.	Single Cow or Ox.	Sheep or Pigs, when less than $\frac{1}{4}$ Truck.	Calves when less than $\frac{1}{4}$ Truck.
6d. per mile	4d. per mile	3d. per mile.	$\frac{1}{2}$ d. each per mile.	1d. each per mile.
Minimum, 10s.....	Minimum, 7s. 6d.....	Min., 7s. 6d. each.	Min., 1s. 6d. each.	Min., 2s. each.

Bulls.

The charge for bulls is 7d. per mile up to 100 miles, over 100 miles 4d. per mile. Minimum, 12s. 6d.

Valuable Rams and Ewes.

If less than half a truck-load, will be charged 2d. each per mile; for half a truck and upwards, sheep rates. Minimum, 5s.

When live stock is returned from Sydney or Homebush to Country Stations in those neighbourhoods to which cattle trucks and sheep vans are being sent empty, half the foregoing rates will be charged, provided the owners wait the requirements of the Department, but not otherwise.

Rates for Fresh Meat in van loads.

To be loaded and unloaded by Owners.

In the case of beef, the van-load will be limited to 12 carcasses, but this number may be increased provided that a van-load shall not be held to consist of a greater total weight than 4 tons. Where a consignment of beef does not amount to 4 tons, senders will be allowed to make up the van-load with carcasses of mutton, pork, or veal. Any weight above 4 tons, whether the number of carcasses be more or less than 12, will be charged for at the rate of $\frac{3}{4}$ d. per cwt. per mile.

Smaller quantities properly packed charged actual weight at 3rd class rates. Minimum charge for use of van, 10s.

Goods Trucks.

100 miles	£2 10 6
150 "	3 2 9
200 "	4 3 4
300 "	6 5 0

In the event of the Commissioner not being able to supply sheep trucks they do not undertake to provide goods trucks for carriage of sheep.

Every sheep or lamb, up to 3, carried any distance not exceeding 24 miles, by goods trains only

And for each mile beyond that distance.....

Over 3 and up to 10 sheep or lambs, half sheep truck rate; over 10 animals, full truck rate.

Minimum Charge:—Sheep truck, 40/-; goods truck, or half-truck, 20/-; exclusive of a terminal charge of 2/- per truck for sheep trucks, and 1/- per truck for goods trucks.

Store sheep in lots of not less than two truck loads, to be carried from Newmarket to country stations at $\frac{2}{3}$ published rates, and store cattle in lots of not less than two truck loads at $\frac{1}{2}$ published rates, full terminal, provided the trucks are required to load again from the Line to which such store cattle and sheep are consigned.

NEW SOUTH WALES.

RAILWAYS OF NEW SOUTH WALES.

(REPORT FOR 1887.)

*The Commissioner for Railways to The Honorable the
Secretary for Public Works.*

Department of Public Works,
Railway Branch,

Sydney, 20 July, 1888.

Sir,

I have the honor to submit, for the information of the Government, a statement of the transactions of the Department for the year 1887. Attached to the Report will be found the usual Appendix, containing complete accounts and returns of the cost of construction of the various lines to the close of the year under review, together with the revenue and working expenditure and other information, compiled with great care by the officers of the Department, to whom my acknowledgments are due.

1.—RAILWAY CAPITAL AUTHORIZED.

The total amount which has been authorized to be raised by loans is £42,195,161. At the close of 1887 the total value of Debentures issued was £33,537,944. The amount still to be raised is £8,657,217.

Railway Debt,
Appendix
Nos. 8 and 9,
pp. 55 and 61.

2.—RAILWAY CAPITAL EXPENDED.

At the close of 1887 there had been expended on lines open for traffic £26,532,122 * and on lines in course of construction £2,379,102; in all £28,911,224, of which amount the sum of £1,568,136 was expended in the year 1887, as under:—

Capital
expended.
Appendix
Nos. 10 and 11,
pp. 62 and 70.

Construction	£1,260,479
Rolling stock and machinery, &c.	299,085
Trial surveys	8,572
...	
...	£1,568,136

The sources from which the money expended on Railway Lines open for traffic have been obtained, are:—

From Loans	£25,765,499
„ Revenue	766,623

£26,532,122

3.—

* Excludes the cost—£4,878—of old Pitt-street Tramway, taken up in 1867, and £5,613, cost of rolling stock used on Camden and Sans Souci Tramways.

3.—LINES OPEN AND IN PROGRESS.

Of the sum of £1,568,136 expended in 1887 for construction, the sum of £688,634 was expended on lines open for traffic, and the balance £897,502 invested in lines in course of construction.

Additions to Capital Account—Lines open for traffic.

At the close of the year 1886 the capital invested in lines open was £24,071,454.* During 1887 a further sum of £2,460,668 was added, making the total capital invested £26,532,122.

Additions to
Capital
Account.

The amount of £2,460,668 was made up as follows, viz. :—

Amount transferred from Construction Account, &c.	£1,772,034
Expenditure during 1887 on construction, &c.	309,291
Additions and Improvements to Works and Stations, &c.	80,259
Additional Rolling Stock, Machinery, and Workshops, &c.	299,084

Railway Lines
opened.

At the close of 1886 the mileage opened was as under :—

Southern System.

	Miles.
Main Southern Line—Sydney to Albury... ..	388
South-Western Line—Junee to Hay, and Narrandera to Jerilderie	232
Darling Harbour Branch	1
Cooma Branch	40
Illawarra Branch	24
Junction Line between Southern and Western Systems	61
Cootamundra to Gundagai	34
	<hr/>
	780

Western System.

Main Western Line—Granville to Bourke	490
Richmond Branch—Blacktown to Richmond	16
Mudgee Branch—Wallerawang to Mudgee	85
Orange to Molong	22
	<hr/>
	613

Northern System.

Main Northern Line—Newcastle to Tenterfield	380
North-Western Line—Werris Creek to Narrabri	97
Branches—Morpeth, Bullock Island, &c.	5½
North Coast Line—Homebush to Waratah	14
	<hr/>
	496½

Total 1,889½

The

* Excludes cost of the old Pitt-street Tramway, and cost of rolling stock used on the Camden Line, for which latter see Tramway Returns.

The following extensions were opened during the year 1887 :—

	Dates of Opening.	Miles.	Extensions opened during 1887.
SOUTHERN SYSTEM.			
Clifton to Wollongong	21 June, 1887 ...	12	
Bungendore to Queanbeyan	8 September, 1887 ...	17½	
Wollongong to North Kiama	9 November, 1887 ...	22	
Queanbeyan to Michelago	7 December, 1887 ...	30	
NORTH COAST LINE—HOMEBUSH TO WARATAH.			
Hornsby to Hawkesbury	7 April, 1887 ...	15	
Gosford to Waratah	15 August, 1887 ...	50	
Total	146½	

Making together a total of 2,036 miles in operation at the close of the year.

The average mileage in operation for the whole period was 1,936.

Since the close of the year the following extensions have been opened, making a total of 2,102 miles in operation at the present date :—

16 January, 1888—Mullet Creek to Gosford	10 miles.
16 „ 1888—Tenterfield to Wallangarra, junction- ing with the Queensland Railways	11 miles.
13 February, 1888—Cowra to Blayney	45 miles.

At the present time the following lines are under construction :—

Extension.	Sections.	Length.	Date for Completion.	Remarks.
		Miles.		
Illawarra Line	Second Section	10	Time expired...	Balance of section.
„ „	Third Section	2	„ ...	„ „
Homebush to Waratah.....	Hawkesbury and Mullet Creek. ...	4	19 Nov., 1888	„ „
Goulburn to Cooma	Michelago to Cooma	39	30 June, 1888	
North Shore	North Shore to Pearce's Corner ...	11	31 Dec., 1888	
		66		

Lines under construction.

The following is a summary of the Railways open up to the present date and under construction :—

Lines open	2,102 miles.
Under construction	66 „
Total	2,168 miles.

The

REPORT OF THE COMMISSIONER FOR RAILWAYS—1887.

Lines
Authorized.

The estimated cost of the following lines has been voted (under the Act 48 Vic. No. 26, assented to 1st November, 1884), but, with the exception of the line from Nyngan to Cobar, the plans, &c., have not yet been approved by Parliament :—

Extension.	Miles.	Amount Voted.
SOUTHERN.		
City Extension	2	£ 450,000
Tarago to Braidwood	31	310,000
Gundagai to Tumut	33	500,000
Goulburn to Crookwell	25	259,500
Galong to Burrowa	18	144,000
Wagga Wagga to Tumberumba	68	710,000
Culcairn to Corowa	45	210,000
Kiama to Jervis Bay	41	804,000
Bega to Eden	40	606,000
Total, Southern	303	3,993,500
WESTERN.		
Perth to Rockley	17	195,000
Forbes to Wilcannia	340	1,050,000
Nyngan to Cobar	82	263,500
Borenore to Forbes	60	705,500
Total, Western	499	2,214,000
NORTHERN.		
Musclebrook to Cassilis	70	700,000
Glen Innes to Inverell	45	578,000
Grafton to Glen Innes	103	2,000,000
Grafton to the Tweed	165	1,980,000
Narrabri to Moree	61	336,500
Total, Northern	444	5,594,500
Grand Total	1,246	11,802,000

The subjoined statement shows the action taken with regard to the several Railway schemes referred to above :—

Line.	Plans, &c., approved by Legislative Assembly.	Dealt with by Legislative Council.	Remarks.
City Extension	9 Sept., 1886	8 Oct., 1886	Referred by Legislative Council to a Select Committee which on the 21st October, 1886, brought up a Progress Report, but had not completed its labours when Parliament was dissolved in October, 1886.
Tarago to Braidwood	16 „ 1886	14 „ 1886	
Gundagai to Tumut	16 „ 1886	14 „ 1886	
Narrabri to Moree	14 „ 1886	14 „ 1886	
Glen Innes to Inverell	15 „ 1886	14 „ 1886	
Grafton to The Tweed	15 „ 1886	14 „ 1886	
Orange to Forbes	9 „ 1886	8 „ 1886	Plans, &c., approved by Legislative Assembly, but Legislative Council carried a motion for the making of a new trial survey along a fresh route.
Nyngan to Cobar	9 „ 1886	8 „ 1886	Approved by both Houses. Tenders were invited and received on the 22nd February, 1887, but the question of the unremunerative character of the line was raised, and has since suspended further action.
Culcairn to Corowa	14 „ 1886	14 „ 1886	Plans approved by Legislative Assembly but not approved by Legislative Council.

Goulburn to Crookwell	} Plans laid on the Table of House as exhibits only.
Galong to Burrowa	
Kiama to Jervis Bay	
Wagga Wagga to Tumberumba... ..	} Plans not yet submitted to Parliament.
Perth to Rockley	
Forbes to Wilcannia	
Bega to Eden	
Muswellbrook to Cassilis	
Grafton to Glen Innes	

The railway policy in regard to the extension of lines indicated in the above projects may, however, be considered to be, to a large extent, abrogated, for although Parliament has passed a Loan Act giving authority for raising the money to meet the estimated cost of the construction of these extensions, it has not given its approval to the plans and sections of the routes proposed, and the Railway Act 22 Victoria No. 19 prohibits the commencement of any line of railway until such authority has been given.

A new railway policy moreover has been projected by the present Government, the particulars of which, however, have not yet been finally announced.

4.—LAND TAKEN FOR RAILWAY PURPOSES.

The particulars of the whole of the land resumed to 31st December, 1887, for Railway purposes, will be found in Appendix No. 5, page 41.

Land resumed. Appendix No. 5, page 41.

The claims outstanding on the 31st December, 1886, were 383, to which 132 were added during 1887, making a total of 515 claims; of these 200 were settled in 1887, leaving at the close of the year 315 in various stages of adjustment, a large number of which have been settled during the present year.

5.—IMPORTATION OF RAILWAY MATERIAL.

In the Appendix will be found a return of the Permanent-way materials, locomotives, and miscellaneous articles imported during the year under review.

Appendix No. 6, p. 44

The following is an abstract of the returns :—

Number of Ships employed.	Number of Tons of Goods shipped.	Value of Goods Shipped.	Amounts paid for Freight and Insurance.	Average rate of Freight and Insurance per Ton.
115	25,225	£ s. d. 211,194 11 11	£ s. d. *13,736 9 0 †1,411 11 11	s. d. 10 10 ³ / ₄ 1 1 ¹ / ₂

* Freight. † Insurance.

In the foregoing are included :—

	Weight in Tons.	Value.
Permanent-way materials for Authorized Extensions...	16,725	£ s. d. 100,230 16 6
" " Renewals	4,659	30,979 7 9
" " Tramways	1,152	7,893 1 1
Miscellaneous items	1,238	35,488 17 4
Bridgework	757	9,606 7 8
Locomotives	694	26,996 1 7
	25,225	211,194 11 11

6.—EXISTING LINES.

Maintenance of Ways and Works.

Maintenance of ways and works, Appendix 1.

In the Appendix will be found the report of the Engineer for Existing Lines, on the condition of the Lines of Railway in his charge. The whole of the Works have been maintained in good working order during the year, and large additions have been made to improve the accommodation, and to facilitate the conduct of the traffic. Those charged to the capital account have been scheduled, and the cost of each is shown in Appendix No. 10*a*.

Locomotive and Carriage Division.

A considerable addition was made in 1887 to the rolling stock, 521 vehicles having been added, particulars of which are given below :—

ABSTRACT of Rolling Stock on hand on 31st December, 1886, and the number and description of Vehicles supplied in 1887.

Locomotives.		Passenger.													Goods.													Total of all Vehicles.										
Tank.	Passenger.	Goods.	Total.	State Carriages.			First-class.	Composite.	Second-class.	Mail-vans.	Prison-vans.	Workmen's Vans.	Horse-boxes.	Carriage Trucks.	Brake-vans.	Total.	Waggons.							Vans.														
				Accident Vans.	A.	B.											C.	D.	E.	Water-trucks.	F.	G.	Loco. Coal.	Powder.	Sheep.	Cattle.	Meat.		Refrigerating.	Ballast-waggons.	Brake-vans.	Dump-cars.	Combination.	Total.				
Rolling Stock on hand, 31st December, 1886.

6	12	2	20	...	1	9	2	8	6	15	3	23	67	35	300	10	50	...	6	31	2	434	521		

In my Report for 1886 I drew attention to the necessity for the supply of additional locomotives for adequately meeting the requirements of the traffic, and supported the statement by a reference to the statistics of locomotive work performed in Great Britain, in the various countries forming the Continent of Europe, and in America, which showed that with one exception the locomotives in use on the lines of New South Wales were more heavily worked than the locomotives of any other country. The twenty additional engines supplied during 1887 afforded some relief, but more are required, and it is questionable whether the fifty engines recently ordered from Colonial manufacturers will be supplied in time to meet the demand.

In May, 1886, the Locomotive Engineer, Mr. Scott, recommended, in view of the additional mileage that would be opened within the succeeding two years, that more locomotives should be obtained for working the traffic. He estimated that 44 engines would be required.

Tenders were thereupon invited for the supply of these engines from European and American, as well as English and Colonial firms.

The

The Tenders were opened on the 12th April, 1887, when the following offers were received :—

SCHEDULE OF TENDERS.

English and Foreign.

28 outside Cylinder Bogie Goods Engines, with Tenders.

Firm.	Original conditions—Pay in England.		Altered conditions—Pay in Colony.		Informal conditions.	Place of delivery.
	Price each for 20 Sydney engines.	Price each for 8 Newcastle engines.	Price each for 20 Sydney engines.	Price each for 8 Newcastle engines.	Price each for the 28 engines.	
Dübs & Co.	£ 2,265	£ 2,290	£ 2,725	£ 2,750	20 in steam, Sydney.
Beyer, Peacock, & Co.	2,345	2,370	2,495	2,520	8 " Newcastle.
Stephenson & Co.	No tender	No tender	2,135	20 " Sydney.

Société de Construction	3,150	3,250	" ..	"	12 in steam, Sydney.
						4 " Newcastle.
						12 " Sydney.
						4 " Newcastle.

* Price given by weight.

COLONIAL OFFERS.

Goods.	20 Goods South.	8 Goods North.	12 Passenger South.	4 Passenger North.
	Price.	Price.	Price.	Price.
Thos. Wearne	£ 3,750	£	£ 3,750	£
Mort's Dock Company	3,995	4,185	4,375	4,555
Atlas Company	4,040	4,225	4,405	4,585
Henry Vale	3,785
Hudson Brothers	3,680	3,760	3,820	3,970

These engines were to be built to Mr. Scott's design ; those for the passenger service were to be somewhat similar to those built by the Vulcan Company, twelve of which are running on the lines of the Colony ; and those for the goods' service to be of the class known as the English "Mogul" type.

Before deciding upon the acceptance of any tender it was deemed desirable to inquire into the merits of the designs proposed, and at your instance very full consideration was given to the question of the classes of engine that would be most suitable for our requirements. It was thought an engine might be obtained which would be simpler in its parts and less costly in construction, and ultimately it was decided to obtain tenders from Colonial makers for engines to designs suggested by Mr. Midelton. The decision to invite tenders from Colonial makers only was determined by the resolution passed by the Legislative Assembly on the 25th of April, 1887, that,—

In view of the widespread distress amongst the iron trades, this House is of opinion that the Government should take immediate steps to call for tenders in the Colony only for the manufacture of one hundred locomotive engines, and that the following be the conditions of such tenders :—That the construction of the said engines be carried out by labour already in the Colony, and only such material be imported as cannot be produced here.

Tenders were invited for fifty engines (twenty-five goods and twenty-five passenger) and offers were received on the 17th May, 1887, as follows :—

Name.	25 Goods.	25 Passenger.	Dates of delivery.	
	Price.	Price.	Date of delivery of first engine.	Date of completion of contract.
	£	£		
Hudson Brothers	4,050	3,698	16 July, 1888 ...	30 May, 1890.
G. A. Key	3,960	3,705	16 July, 1888 ...	30 April, 1891.
H. Vale	3,960	3,650
Mort and Company	4,080	3,702	17 Aug., 1888 ...	17 Aug., 1890.
Atlas Company	4,010	3,715	30 Nov., 1888 ...	31 Dec., 1890.
J. Monday	2,874	2,874	1 Sept., 1888 ...	— Sept., 1894.
T. Wearne	3,980	3,714
Morris Brothers	3,990	3,800
J. D. Brown	3,460	3,460

The matter remained undecided for some time, endeavours being made by the manufacturers to induce their workmen to accept a lower rate of wages, so as to admit of the engines being made in the Colony at more reasonable prices than those tendered at, and some consideration was also given to the suggestion that the locomotives should be made at the Railway Workshops at Eveleigh. It was finally determined, however, to call for fresh tenders. The tenders were opened on the 20th December, 1887, when the following offers were received :—

<i>Passenger Engines.</i>						£
Mort & Co. (associated with Hudson Brothers, H. Vale, and Morris Brothers)	3,552
Thos. Wearne	3,450
Atlas Company	3,263
<i>Goods Engines.</i>						£
Mort & Company	3,920
T. Wearne	3,700
Atlas Company	3,840

Although

Although these prices were considerably below those previously asked, the Government felt that it could not, in the face of the prices offered by English and Foreign firms, accept any of the amended offers. With the desire, however, to meet the spirit of the resolution of Parliament to provide work for the large number of skilled artizans out of employment, the Government finally determined to accept an offer for the manufacture of the locomotives in the Colony if the price did not exceed £3,000 per engine.

Fresh tenders were accordingly invited, the engines in regard to details of construction being simplified as far as possible without interfering with the structural parts, and on the 16th May, 1888, offers were received as follows:—

1. Albert Leahy, for 50 engines (25 of each class), each	... £3,150
" 25 " " "	... 3,240
2. Atlas Engineering Company, 25 passenger engines, each	... 2,989
3. H. Vale & Sons, 25 goods engines, each	... 3,275
3. " 25 passenger engines, each	... 3,150
4. Mort's Dock Company, 25 goods engines, each	... 3,250
" 25 passenger engines, each	... 3,130
5. Thomas Wearne, 25 engines, passenger or goods, each	... 3,000
6. Hudson Brothers, 25 passenger engines, each	... 3,120
" 25 goods engines, each	... 3,250

As the tender of the Atlas Company for the passenger engines, and of Mr. Thomas Wearne for the goods, were within the limit of price stipulated by the Government, they were accepted, and the engines are now in course of construction in the Colony. The Atlas Company are to complete their contract in 3 years. Thos. Wearne in 5 years. The first engine under each contract to be delivered at the expiration of 12 months from the date of acceptance of tenders.

7.—REVENUE AND EXPENDITURE.

The gross earnings in 1887 were £2,208,294, the working expenses, £1,457,760, and the net earnings, £750,534.

Gross and net earnings and working expenditure.

To earn the above amount 153,954 trains were run 6,472,107 miles. The number of trains averaged 492 per working day.

The gross revenue earned in excess of that for 1886 was £48,225. The whole of the increase was due to the wool traffic, which earned an additional £63,000, so it follows that but for this source of revenue there would have been a falling off in the gross earnings of £14,755. The detailed statement below shows that the falling off was in the revenue derived from the carriage of general merchandise and live stock.

Notwithstanding that 146 miles of additional railway line were opened for traffic during the year, and 2,068 more trains were run, the working expenses for 1887, as compared with 1886, were less by the sum of £35,232. Had the rate of expenditure per mile of line been continued the increase would have been, owing to the additional mileage opened, £156,816, so the constructive decrease in the working expenditure of the railways for 1887 may be set down at £192,048.

The actual saving being £35,232, and the additional revenue £48,225, the net revenue in excess of that for 1886 amounts to £83,457. The interest upon the new capital brought into the account, viz., £2,460,668, nearly absorbed the whole of this amount.

In

Particulars of coaching traffic.

In the following tables are given the particulars of the Revenue and Expenditure for 1887 compared with 1886:—

COACHING TRAFFIC.

			1886.			1887.

^a Includes 1,771,620 journeys made with workmen's tickets. ^e Includes £12,973 for workmen's tickets.
^b " 1,714,980 " " ^f " £12,695 " "
^c " 9,984 " " ^g " £63 " "
^d " 1,724,964 " " ^h " £12,758 " "

The number of first-class passengers carried shows—

An increase of ...	24,265	for South and West lines.
A decrease ...	11,814	„ North line.
An increase of ...	12,451	„ all lines.

The number of second-class passengers carried shows—

A decrease of ...	345,316	for South and West lines.
„ ...	82,690	„ North line.
A decrease of ...	428,006	„ all lines.

The number of season tickets (journeys)—

Decreased ...	40,836	for South and West lines.
Increase ...	26,090	„ North line.
A decrease of ...	14,746	„ all lines.

The total decrease in the number of passengers carried on all lines was 430,301. With an annually increasing population this falling off in the number of journeys taken during 1887 calls for remark. In no previous year since 1872 has such a thing taken place, the returns always showing a large increase. The wet weather, which was abnormal in the past year, and the depressed state of trade and commerce probably account for the decrease.

The receipts for coaching traffic—

Decreased ...	£10,319	for South and West lines.
Increased ...	11,615	„ North line.
An increase of ...	£1,246	„ all lines.

The receipts from coaching traffic per average mile of line show—

	£	s.	d.	
A decrease of ...	40	0	2	for South and West lines.
„ ...	12	16	9	„ North line.
„ ...	35	2	9	„ all lines.

The receipts per train mile show—

A decrease of ...	1·07	for South and West lines.
„ ...	3·44	„ North line.
„ ...	1·40	„ all lines.

The proportion of percentage of classes of passengers shows—

An increase of ...	0·62	for 1st class.
A decrease of ...	1·64	„ 2nd „
An increase of ...	1·02	„ season tickets.

The proportion of percentage of receipts—

Increased ...	0·05	for 1st class.
Decreased ...	0·66	„ 2nd „
Increased ...	0·61	„ season tickets.

The

Particulars of
goods traffic.

The goods traffic, compared in the same way, is shown as under:—

REVENUE.—GOODS TRAFFIC.

	Total	69·07	69·28	69·12	67·11	61·99	66·01

The total working expenditure, compared with 1886, decreased—
 £19,009, or 1·61 per cent., for South and West lines.
 £16,223, or 5·23 „ North line.
 £35,232, or 2·36 „ all lines.

The expenditure per average mile of line open—
 Decreased £ 67 for South and West lines.
 „ £112 for North line.
 „ £ 81 for all lines.

The expenditure for train mile shows as follows—
 A decrease of 0·88d. for South and West lines.
 „ 2·73d. for North line.
 „ 1·25d. for all lines.

The proportion of expenditure to gross receipts from all sources shows—
 A decrease of 1·96 per cent. for South and West lines.
 „ 7·29 „ North lines.
 „ 3·11 „ all lines.

Net Earnings.

Percentage of
net earnings
to capital.

The percentage of net earnings to capital expended in 1887, as against 1886, was as under :—

	1886.			1887.		
	No. of Miles.	Capital expended.	Percentage of interest.	No. of Miles.	Capital expended.	Percentage of interest.
South and West	1,407	18,163,089	3·01	1,503½	19,262,349	3·10
North	482½	5,908,365	2·55	532½	7,269,773	2·59
All Lines	1,889½	24,071,454	2·90	2,036	26,532,122	2·96

Percentage of
gross earn-
ings, working
expenditure,
and net earn-
ings to capital.

The subjoined abstract furnishes the percentages which the gross earnings, the working expenditure, and the net earnings bear to the capital invested in lines in operation for 1887, as compared with 1886 :—

		1886.			1887.		
		S. & W.	North.	Total.	S. & W.	North.	Total.
Net receipts from all sources ...	£	529,567	137,511	667,078	570,320	180,214	750,534
Do per average mile...	£	394	310	373	398	359	388
Do per train mile ...	d.	24·27	26·59	24·71	26·12	35·09	27·83
Proportion of gross receipts to capital.	%	9·73	8·29	9·40	9·90	6·92	8·72
Do of expenditure to capital.	„	6·72	5·74	6·50	6·29	4·29	5·76
Do of net receipts to capital.	„	3·01	2·55	2·90	3·10	2·59	2·96

The net earnings from all sources for the year show as follows—

£40,753	increase South and West.
42,703	„ North.
83,456	„ all lines.

The net earnings per average mile of line open show—

An increase of £ 4	for South and West lines.
„ £49	for North lines.
„ £15	for all lines.

The proportion of gross earnings to capital—

Increased 0·17 %	on South and West lines.
Decreased 1·37 %	on North lines.
„ 0·68 %	on all lines.

The proportion of net receipts to capital—

Increased 0·09 %	on South and West lines.
„ 0·04 %	on North lines.
„ 0·06 %	on all lines.

The following is a summary of the gross earnings, working expenditure, and net earnings of the Railways for 1887, as against 1886 :—

	South and West.	North.	Total.
	£	£	£
Gross earnings, 1887	1,734,106	474,188	2,208,294
Do 1886	1,712,362	447,708	2,160,070
Increase for 1887	21,744	26,480	48,224
Working expenditure, 1887	1,163,786	293,974	1,457,760
Do 1886	1,182,795	310,197	1,492,992
Decrease for 1887	19,009	16,223	35,232
Net earnings, 1887	570,320	180,214	750,534
Do 1886	529,567	137,511	667,078
Increase for 1887	40,753	42,703	83,456

Summary of gross earnings, working expenditure, and net earnings for 1886 and 1887.

Sectional
returns.

8.—DIVISION OF THE RAILWAY LINES INTO SECTIONAL AREAS.

In the following statements are given the capital expenditure, the gross earnings, the working expenditure, the net earnings, and the return which the net earnings give to the capital invested in each section.

It will be observed that the section from,—

Sydney to Granville, which for 1886 returned 7·73 per cent. on its capital, returned for the past year 7·93, an increase of ·20 per cent.

The Illawarra Line, which in 1886 returned 3·18 per cent., returned for the past year 1·54, a decrease of 1·64 per cent., but the capital account was increased from £437,408 to £1,064,297 by the opening of 34 miles of additional railway extension.

The Southern Line and Branches, which in 1886 returned 3·48 per cent., returned for the past year 3·11, a reduction of ·37 per cent., but the capital was swelled by the sum of £414,792 by the opening of 47 more miles of railway.

The Western Line and Branches, which in 1886 returned 2·81 per cent., returned for the past year 3·49, a sensible increase of ·68 per cent. on a capital of £6,940,932: No additional mileage was opened on this system during the year under review.

The Great Northern Line and Branches, which in 1886 returned 2·93 per cent., returned for the past year 3·18, an increase of ·25 per cent. No additional mileage was opened on this system.

The North-Western Line, Werris Creek to Narrabri, which for 1886 showed a loss on working of £2,408, earned for the past year £9,463 in excess of working expenditure, which gave a return to capital of 1·55 per cent.

The following are the sections which did not pay their working expenses:—

Section.	Loss on working.	Capital expended.	Total loss in working and interest upon capital at 4 per cent. per annum.	Remarks.
	£	£	£	
Strathfield to Hawkesbury, and Gosford to Waratah.	3,981	1,312,181	56,468	In 1886, on a capital of £300,566, the loss was £12,746.
Junee to Hay and Jerilderie	4,908	1,445,054	62,710	In 1886 the loss was £66,630.
Mudgee Line	5,593	1,002,517	45,693	The corresponding loss in 1886 was £44,792.
Murrumburrah to Cowra ...	4,385	524,945	25,382	In 1886 the loss was £21,396.
Totals	£ 18,867	4,284,697	190,253

9.—WOOL TRAFFIC.

The wool traffic on our Railways for the past season, notwithstanding that the rivers inland were generally very favourable to navigation and allowed a large quantity of wool to be diverted to the other Colonies, was the largest ever recorded, exceeding that for the season 1886-87 by 64,620 bales, no less than 407,229 bales having been carried during the past season. This very satisfactory result has been due to the great natural increase in the number of the sheep depastured in the Colony. The Chief Inspector of Stock reports an increase of nearly eight millions during the year 1887; the number of sheep at the close of the year was 46,965,152, more than double the number depastured in 1877.

The season 1887-88 has been regarded as one of the most favourable ever experienced in the Colony. The advantages of good seasons are most felt in the outlying districts, where, if the conditions allow it, the largest number of sheep can be depastured. The favourable seasons for the last two years have enabled pastoralists in these districts to maintain a large number of stock on their runs. That this is the case is revealed by the district returns
published

published by the Chief Stock Inspector. Bourke district shows an increase from 2,184,680 in 1885 to 2,635,519 in 1887; Cobar, from 1,044,443 in 1885 to 1,573,484 in 1887; Hay, from 1,035,905 in 1885 to 1,485,731 in 1887; Walgett, from 899,917 in 1885 to 1,571,061 in 1887; Wilcannia, from 2,039,344 in 1885 to 2,792,946 in 1887.

The detailed returns of the wool forwarded from each station will be found in the Appendix 30 to this Report, page 100. There was an increase in the total quantity carried on the Southern Line of 27,980 bales, the most favourable returns being those from the stations between Wagga Wagga and Albury, the border station showing a considerable increase.

On the Western Lines there were 25,061 additional bales carried, the greater part of which was due to the increase on the Bourke section.

On the Northern Line there was an increase of 11,579 bales, due principally to the north-western branch. From stations between Tamworth and Tenterfield there was a slight decrease, but in explanation of this it may be pointed out that there was, instead of an increase as in other parts of the country, an actual diminution in the number of sheep in the districts of Armidale, Glen Innes, and Tenterfield during the year 1887. The number in 1886 in these districts was 2,139,085, and in the past year, 2,109,408, owners, probably, taking advantage of the favourable season to move the stock further inland.

The wool traffic may be summarised as follows:—

Section.	1886-7.	1887-8.
	Bales.	Bales.
Sydney to Goulburn	27,363	25,325
Goulburn to Albury	29,159	39,967
Cooma Line	6,917	10,492
Gundagai Line	4,991	4,831
Cowra Line	12,844	21,231
South West Line	37,176	44,593
Camden	35	26
Total, South	118,485	146,465
Parramattato Orange	9,877	9,410
Orange to Bourke	95,031	118,491
Richmond Line	1,786	2,125
Molong Line	12,653	15,512
Mudgee Line	10,812	9,682
Total, West	130,159	155,220
Newcastle to Tamworth	31,431	35,677
Tamworth to Tenterfield	23,086	21,518
North-west	39,448	48,349
Total North	93,965	105,544
Grand total	342,609	407,229

From the Customs returns it would appear that, during 1887, a much larger quantity of wool was diverted to the other Colonies than was the case in 1886, due to the fact that the rivers were favourable to navigation, and to there being a large increase in the sheep shorn in districts which have the advantage of river navigation.

The

The following is an estimate of the clip sent to Sydney, and also the proportion sent across the borders and to Melbourne, Adelaide, and Brisbane, for the years 1886 and 1887 :—

Port of Shipment.								1886.	1887.
								lb.	lb.
Sydney	118,316,151.	128,151,154
Melbourne	37,199,377	47,012,987
Adelaide	14,562,809	16,054,563
Brisbane	155,134	348,856
								170,233,471	191,567,560

The prospect of an extremely heavy clip of wool during the approaching season, is very encouraging. It is estimated that the quantity which will be sent by railway for the season 1888-9, if the conditions continue as favourable as they are at present, will not fall far short of half a million bales.

10.—COAL TRAFFIC.

The coal traffic for the year has been very active. In 1886 I had to record a small decrease in the total quantity carried when compared with 1885; but this year the satisfactory increase of nearly 100,000 tons is shown.

Since the commencement of the year the coal trade has been very heavy. The carriage on the Northern Line from 1 January to 30 June, 1888, was increased by 20,000 tons in comparison with the similar period of 1887. The opening of the Gosford-Waratah Extension has admitted of communication being had with the extensive coal-field about Lake Macquarie, and several new mines have since been connected by branch lines with our railway.

Summarizing the returns furnished it may be stated that the quantity carried on the Northern line was—

					Tons.	Freight.
1886	1,633,875	£78,349
1887	1,733,381	£80,942
Increase					99,506	£2,593

And the quantity shipped from Newcastle for Intercolonial and Foreign parts :—

					Tons.	Value.
1886	1,544,494	£828,189
1887	1,658,386	£886,921
Increase					113,892	£58,732

The largest shipments to any one place were to the Colony of Victoria, which took 708,559, as against 628,141 tons for the previous year.

The largest foreign shipments were to the United States, India, and Hongkong; the United States, our largest foreign customer, took 248,325 tons in 1887, as against 178,168 tons in 1886. The

The coal and shale traffic on the Southern and Western Lines show little difference, the diminished output at some mines being balanced by the increased supply at others. The promised opening of several new mines, and the connection of the Illawarra Line will probably considerably augment the returns for the present year. The total quantity carried in 1886 and 1887 was as under:—

		COAL.		SHALE.	
		Tons.	Freight.	Tons.	Freight.
1886	182,369	£61,757	26,230	£8,786
1887	180,704	£60,689	26,141	£8,720
Increase
Decrease		1,665	£1,068	89	£66

In addition there were 165,559 tons of coal carried for Departmental use, the freight on which would have amounted to £72,447; but, as this was used for railway purposes, no credit for it has been taken in the railway earnings.

11.—ACCIDENTS.

The year, unhappily, did not pass away without accident, but only one of a serious character occurred—the so-called “Peat’s Ferry Accident.”

This accident was one of the most disastrous which has marked our history, and the Administration had to deplore a terrible sacrifice of life.

On the 21st June, on the occasion of Queen’s Jubilee, a special train was despatched from Sydney for Peat’s Ferry, properly provided with the usual hand-brakes, in addition to the Westinghouse automatic continuous brake. In descending one of the many steep grades which characterize that line, the train, despite the efforts of those in charge, got beyond control, and rushed at a high speed into the Peat’s Ferry Station, where, but for the courage and presence of mind displayed by the pointsman, it would have run into a waiting passenger train, with results fearful to contemplate. Turned by the pointsman into a siding, the fugitive train ran into some trucks standing there, the engine being capsized into the water by the force of the collision, and several carriages being wrecked. The engine-driver—who, with great intrepidity, stuck to his post—and four passengers were killed, a fifth dying a few days after from the effects of the injuries received, and seventy-three persons were more or less injured.

An exhaustive inquiry was held by a Board specially appointed for the purpose with a view to arrive at the causes of the accident. The evidence of the witnesses and all the attendant circumstances pointed to the inexpert use of the Westinghouse brake as the true cause of the catastrophe, and this was the conclusion arrived at by the Board.

12.—RETURNS.

In addition to the Returns given and referred to in the Report, several others will be found in the Appendix which serve further to illustrate the Railway transactions for the past year.

Annexed to the Appendix are thirteen coloured diagrams showing the particulars of the capital invested, the revenue received, the working expenditure, the net revenue, and the return which the net revenue gave to the capital invested for each of the thirty-one years, from 1855 to the end of 1887.

A Railway map of the lines constructed, under construction, and authorised is appended, and also a map of Australia, showing in the same way the Railways of the various Colonies.

13.—RECAPITULATION.

The transactions during the year are thus summarized :—

The total expenditure for construction was £28,911,224, of which the sum of £26,532,122 was expended for lines opened for traffic.

At the close of the year 2,036 miles of line were opened for traffic, and 132 miles were in course of construction.

The rolling stock consisted of 426 locomotives, 1,007 coaching, and 8,798 goods, vehicles.

The value of the railway materials, in the conveyance of which 115 vessels were employed, amounted to £211,195, including freight and insurance.

During the year 153,954 trains were run a distance of 6,472,107 miles; the earnings amounted to £2,208,294, and the working expenditure to £1,457,760. The number of passengers who travelled was 14,451,303, of whom 2,692,201 were first class, 6,158,650 second class, and 5,600,452 season-ticket holders.

The merchandise traffic consisted of 1,986,663 head of live stock, 437,680 bales of wool, 2,079,644 tons of coal, and 1,112,263 tons of general merchandise.

The earnings per mile open were £1,141, the expenditure was £753, and the net earnings were £388.

The net earnings were £750,534, yielding 2·96 per cent. to the capital invested on lines in operation.

I have the honor to be,

Sir,

Your most obedient servant,

Commissioner for Railways.

The Honorable John Sutherland, Esq.,
Secretary for Public Works,
&c., &c., &c.

TRAMWAYS OF NEW SOUTH WALES.

Department of Public Works, Railway Branch,
Sydney, 20 July, 1888.

Sir,

I have the honor to submit, for the information of the Government, the Report upon the Tramway Branch of the Public Service for the year 1887.

RETURN showing the capital expended on the New South Wales Government Tramways to 31st December, 1886, and subsequent expenditure to 31st December, 1887. Capital Expenditure.

Lines and Sections.	Total Expenditure to 31 December, 1886.	Amount expended during 1887.	Total expended to 31 December, 1887.

Total Tramways	£ †965,475 1 5	58,160 5 8	1,023,635 7 1

* This amount appears in Return of 1886 as £4,973 11s. 2d.; it is now reduced by £359 17s. 10d., transferred to Sans Souci Extension.
† Reduced by £20,127 0s. 2d. as follows, viz.:—Credits of 1887, £15,673 0s. 1d.; written off to working expenses, £4,454 0s. 1d.

In the above return is included the capital invested in lines other than what are known as the City and Suburban Tramways.

Confining my observations for the present to the capital expenditure upon the latter system of Tramways, I have to report that the amount expended to the close of 1886, as shown in my Report for that year, was £742,113.

During

During 1887 several causes combined to lessen this sum, the chief of which were:—

1. The transfer from the stock used upon the Sydney Tramway of 8 motors and 15 cars, which were required to work the Plattsburg Tramway. The value of these vehicles was £17,816. Of this cost £4,454 was written off to working expenses for depreciation, and £13,362 transferred to the cost of the Plattsburg line.
2. The debit of £15,628 to the City Council to meet their proportion of the cost of wood-paving Crown-street, Surry Hills, along which street the tram-line is constructed.

It is an unusual course in railway practice to write any sum off specially to depreciation account, but the value of this rolling stock was decreased by the removal of the upper decks on the cars, thereby reducing their carrying power, and it was considered fair to write off the amount stated. The adoption of this course necessarily decreased the return which the net revenue gives to the capital invested.

There were, in addition, some minor sums refunded on account of construction, and the expenditure to end of 1886—£742,113—must therefore be reduced by the sum of £33,489.

During the year there was expended the sum of £22,958, making the capital value at the end of 1887, £731,582, as under:—

Expended to end of 1886, as per report...	742,113
Less credits as shown above	33,489

Adjusted amount, 31st December, 1886 ... £708,624

Amount transferred for cost of lines opened	
during the year	4,875
Additions and improvements to the existing lines..	12,232
Additional rolling stock, workshops, and	
machinery	5,851

Total to end of 1887 £731,582

This expenditure, distributed among the various lines included in this system, is shown in the subjoined statement:—

Lines opened for Traffic.	Length in miles.	Total Cost.	Cost per mile.
		£	£
Railway Station to Circular Quay	1 $\frac{3}{4}$	61,707	35,261
Liverpool-street to Randwick and Coogee	5 $\frac{1}{4}$	105,791	20,150

Rolling Stock	194,202
Machinery	10,317
Furniture	2,113
Average cost, all charges	29 $\frac{1}{2}$	731,582	24,800

The extensions opened during 1887 were :—

Line from Waverley to Randwick, $1\frac{1}{2}$ mile, opened June 4th, 1887.

Line from Kogarah to Sans Souci and Sandringham, 5 miles, opened September 10th, 1887.

Line from Newcastle to Plattsburg, $7\frac{1}{2}$ miles, opened July 13th, 1887.

Line from Bondi Beach to Aquarium, $\frac{1}{2}$ mile, opened September 28th, 1887.

WAVERLEY TO RANDWICK AND BONDI BEACH TO THE AQUARIUM.

These extensions form an addition to the line from Darlinghurst Junction to Waverley, Woollahra and Bondi, and the returns are therefore included with those shown under that branch of the City and Suburban system.

REVENUE AND EXPENDITURE.

The total earnings derived from the City and Suburban Tramways during the year were £214,125. The expenditure was £201,468. The net earnings were £12,657; giving a return to capital invested of 1·76 per cent.

As compared with the transactions for the year 1886, the returns show a decrease in the total earnings of £12,242, a decrease in the working expenses of £269, and in the net earnings of £11,973; causing a fall in the return to capital from 3·32 per cent. to 1·76 per cent.

While this large falling off in the gross takings is to be regretted it is not difficult to account for it. That it was gradual throughout the year will be seen from the following comparative statement of the earnings per month for 1886 and 1887 :—

EARNINGS STATEMENT.

Months.	1887.	1886.	Increase—1887.	Decrease—1887.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.

November	16,331 1 5	18,668 8 9	2,337 7 4
December	19,624 10 2	20,608 2 3	983 12 1
Miscellaneous... ..	1,895 8 0	1,883 9 7	11 18 5
	214,125 5 4	226,366 18 0	205 13 9	12,447 6 5
Deduct increase	205 13 9
				£12,241 12 8

The unfavourable weather will account for the larger portion of the decrease. The whole year was exceptionally wet as compared with 1886. During 1887 there were 190 wet days as against 152 in the previous year, while the difference in the rainfall was even more striking. The returns of the Government Astronomer show that the rainfall in the Metropolitan District was 60·164 inches for 1887, while it was only 49·049 for 1886.

A separate return was kept of the number travelling on the public holidays, many of which, it will be remembered, were persistently wet. The earnings upon public holidays during 1887 were less by the sum of £2,276 than they were in the year 1886.

Another cause of the diminished returns was unquestionably the large increase in the number of omnibuses running on or near some of the tram routes. As this omnibus service has been established chiefly in directions in which the Department has increased the facilities and lowered the tram fares, it is difficult to account for the increased patronage given to the omnibuses. It may be conjectured that the chief reason is that the tram service is not run sufficiently near to the business centres of the western side of the city, the importance of which, in regard to the volume of trade and traffic, is largely on the increase.

Again, the extension of some of the sections, particularly on the Paddington-Waverley line, materially assisted in decreasing the revenue. The percentage return to capital on this line was reduced from 10·04 per cent. in 1886 to 3·30 in 1887.

Had it not been for this unexpected falling off in the revenue, and the decision to debit the working expenses with the amount of depreciation of the rolling stock sent to the Plattsburg line, the return to the capital invested would have been equal to 4 per cent.

It will be seen from the sectional returns which follow that the Lines worked at a profit were :—

	Gain per cent. on capital expended.
The line to the Railway	2·64
Randwick and Coogee Bay lines	2·11
Waverley, Woollahra, and Bondi lines	3·30
Newtown and Marrickville lines	6·89
Leichhardt line	6·13

All other lines worked at a loss are—

	Loss per cent. on capital.
Crown-street line	0·59
Waterloo and Botany lines	3·69
Glebe Point and Forest Lodge lines	5·34

NORTH SHORE CABLEWAY.

The capital cost of this cableway, including rolling-stock and machinery, amounts to the large sum of £71,504, a considerable portion of which, however, will be recouped when the surplus land at Milson's Point (resumed in connection with the undertaking) is sold, and the proceeds credited to the vote.

Notwithstanding that the cable had to be renewed during the year, the cost of which (£825) was charged to the working expenses, the operations for 1887 resulted in a return to capital of 0·55 per cent., in place of a loss incurred in 1886, of 1·63 per cent. As the population on the North Shore increases this line of cableway will become gradually remunerative.

The following table gives the particulars of the capital expenditure the revenue and working expenses of the line :—

NORTH SHORE CABLE LINE.

Expenditure.				Earnings.		
Miles open	1½	Cost per train mile.	Per cent. to earnings	Miles open	1½	Earnings per train mile.

			£71,504	Per cent. per annum return on capital	0·58
Line in operation 12 months.						

KOGARAH AND SANDRINGHAM TRAMWAY.

The capital cost of this Tram-line, which is 5 miles in length and connects the Illawarra Railway at Kogarah, with the popular water-side pleasure grounds of Sans Souci and Sandringham on the George's River, stands in the Tramway books at £9,427 for construction and £3,826 for rolling-stock, in all, £13,253; but to this amount has to be added the sum

sum of £6,000, subscribed by the residents as an inducement to the Government to construct the line. At the close of 1887 it had been in operation a little over three months, and the returns for that period show that it was worked at a loss of £98; the total revenue was £396, and the cost of working—without interest upon capital—£494.

At the same time while the line itself may not pay it must not be forgotten that it is a valuable feeder to the Illawarra Railway Line.

It would be premature, after an experience of three months only, to express an opinion upon the remunerative prospects of the line, but it seems probable that a larger residential traffic than it now possesses will be necessary to make it self-supporting—the excursion traffic is too infrequent to justify the expectation of a large return from that source.

The following table gives the return of Revenue and Expenditure :—

Expenditure.				Earnings.		
Miles open	5			Train mileage—		
Train miles	5,821	Cost per train mile.	Per cent. to earnings	Coaching	4,967	Earnings per train mile.
				Goods	854

			£13,253			
Line in operation, 3½ months.				Loss per cent. per annum on capital ...		2·42

Kogarah to San Souci and Sandringham.

NEWCASTLE AND PLATTSBURG TRAM LINE.

This line was constructed to connect the City of Newcastle with the coal-mining townships of Lambton and Wallsend. The capital cost of the line—which is 7½ miles in length—has been £62,104, inclusive of rolling stock. At the close of 1887 it had been in operation five and a half months only, and the working expense for that time amounted to £4,128, while the revenue was only £3,949, showing a loss on working of £179.

The net earnings of this tramway must be annually £2,484 to make it self-supporting.

In the following table are given particulars of the revenue and expenditure :—

Expenditure.				Earnings.		
Miles open	7½	Cost per train mile.	Per cent. to earnings	Miles open	7½	Earnings per train mile.
Train mileage.....	35,040			Train mileage.....	35,040	
	£	d.			£	d.

Construction	£47,397			
Rolling stock	14,707			
			£62,104	Loss per cent. per annum on capital ...		0·63
Line in operation, 5½ months.						

CAMPBELLTOWN AND CAMDEN TRAMWAY.

The subjoined return of the transactions of the Campbelltown and Camden Tramway is very satisfactory; the net revenue for 1887 gives a return to the capital invested of 4·29 per cent. as against 3·36 per cent. for 1886 :—

RETURN OF EXPENDITURE AND EARNINGS.

Expenditure.				Earnings.		
Miles open	7½	Cost per train mile.	Per cent. to earnings	Train mileage—Coaching.....	12,475	Earnings per train mile.

			£45,165	Per cent. per annum return on capital... ..		4·29
Line in operation 12 months.						

ACCIDENTS.

The following were the accidents for the years 1886 and 1887, together with the number of passenger fares collected :—

Years.	Accidents.						Total.		Number of Passenger Fares on Metropolitan Tramways.
	Servants.		Passengers.		Other than Passengers.		Killed.	Injured.	
	Killed.	Injured.	Killed.	Injured.	Killed.	Injured.			
1887	1	1	2	6	6	20	9	27	50,108,256
1886	9	3	8	4	17	7	34	52,977,578
Increase	1	3	1	2	3	2	
Decrease	8	1	2	7	2,869,322

In concluding this *résumé* of the transactions of the Tramways for the year 1887, I must express my disappointment with the results. It is my intention to submit to you, in a few weeks, a return of the operations for the year ending the 30th June, 1888, and I have every reason to believe that I shall be able to place before you a more encouraging statement of our Tramway affairs.

I have the honor to be,

Sir,

Your most obedient Servant,

Commissioner for Railways.

The Honorable John Sutherland, Esq.,
Secretary for Public Works,
&c., &c., &c.

APPENDIX

APPENDIX TO REPORT ON RAILWAYS—1887.

No. 1.

The Engineer for Existing Railways and Tramways to The Commissioner for Railways.

I HAVE the honor to submit my Annual Report from January 1st to December 31st, 1887, on the condition of the Existing Railways and Tramways under my charge.

SUBURBAN RAILWAYS.

Sydney to Granville Junction—Double Line—Length, 13 miles 16 chains.

GREAT SOUTHERN AND SOUTH-WESTERN RAILWAYS.

Granville Junction to River Murray—Single Line—Length, 374 miles 4 chains.

Junee Junction to Hay—Single Line—Length, 167 miles 29 chains.

Narrandera to Jerilderie—Single Line—Length, 64 miles 49 chains.

Murrumburrah to Cowra—Single Line—Length, 64 miles 55 chains.

Cootamundra to Gundagai—Single Line—Length, 33 miles 15 chains.

Joppa Junction to Bungendore—Single Line—Length, 39 miles 10 chains.

Bungendore to Queanbeyan—Single Line—Length, 17 miles 32 chains.—Opened for public traffic, 8th September, 1887.

Queanbeyan to Michelago—Single Line—Length, 30 miles 19 chains.—Opened for public traffic, 7th December, 1887.

The permanent way and works on these sections have on the whole been kept in good order during the year, but the maintenance of the permanent way has involved considerable trouble and expense on account of the extremely wet weather which prevailed during the greater part of the period.

From Sydney to Goulburn the road is in good running order, but the heavy traffic on the suburban line combined with the unfavourable weather necessitated the greatest attention, and occasionally the employment of extra hands, to keep up the permanent way of that section.

From Goulburn to the river Murray the road is in fair order, with the exception of places between Goulburn and Binalong, and Illabo and Junee, which are rough on account chiefly of the bad condition of the sleepers. Renewals of sleepers have been largely carried out during the year from Goulburn southwards, and must be continued as rapidly as practicable until the entire section has been re-sleepered. The rails between Bowning and Junee have also begun to wear very badly.

The timber bridges have received careful attention and in some instances have undergone extensive repairs. They are generally in good order but a few will require renewal at no distant date.

The South-western and Jerilderie Lines are in very fair running order, and no repairs of any magnitude have been required to the bridges or other structures during the year.

Between Demondrille Junction and Cowra the road is not in a satisfactory state, the heavy rains having caused the banks to subside very much, making the permanent way consequently rough and knotty. Considerable quantities of ballast have been required on this section and large expenditure has been incurred in cleaning out cuttings which, in many instances, were filled by slips up to rail level.

The Gundagai Line has continued in very fair running order during the year.

From Joppa Junction to Bungendore the permanent-way has stood the severe weather very well and the sections Bungendore to Queanbeyan, and Queanbeyan to Michelago, which were opened for public traffic during this year, are also in very fair running order. The sleepers between Joppa and Tarago have, however, continued to wear out rather rapidly. More ballast is needed between Bungendore and Queanbeyan.

CULVERTS, &c., CONSTRUCTED DURING THE YEAR.

ILLAWARRA LINE.

Eveleigh to Hurstville—Double Line—Length, 9 miles 40 chains.

Hurstville to Waterfalls—Single Line—Length, 14 miles 60 chains.

National Park Branch Line—Single Line—Length, 1 mile 15 chains.

Clifton to Wollongong—Single Line—Length, 12 miles 27 chains.—Opened for public traffic, 21st June, 1887.

Wollongong to Kiama—Single Line—Length, 21 miles 43 chains.—Opened for public traffic, 9th November, 1887.

As far as Hurstville the road has been kept in good order during the year, but its maintenance has been attended with difficulty on account of the soft nature of the formation between Eveleigh and Marrickville, and the subsidence of the banks south of Hurstville. At these places the heavy rains severely tried the permanent way.

On the sections Clifton to Wollongong, and Wollongong to Kiama, which were taken over during the year—the former in an unfinished state—the road is in fair order, but is slightly down on some of the banks and at bridge ends, and there is an insufficiency of ballast.

CULVERTS lengthened during the year.

GREAT WESTERN RAILWAY.

Granville Junction to Penrith—Double Line—Length, 20 miles 71 chains.

Penrith to Bourke—Single Line—Length, 469 miles 38 chains.

Wallerawang to Mudgee—Single Line—Length, 85 miles 18 chains.

Orange to Molong—Single Line—Length, 22 miles 50 chains.

From Granville Junction to Penrith the new second line has been found difficult to keep up, in consequence of the action of the heavy rains on the banks which were made up during a prolonged drought.

From Penrith to Bathurst the road is in good order with the exception of a few rough places from Eskbank westwards. The rails on this section are wearing very badly, and renewals of sleepers are required on the sharp curves on the mountains.

From Bathurst to Wellington the permanent way is in fair order, except in one or two places where the heavy rains and decayed condition of the sleepers have caused roughness.

Between Wellington and Bourke the road is generally in fair order, but has been found difficult to maintain at places from Dubbo westwards in consequence of the effect of the extremely heavy weather on the soft formation; and from Wellington to Dubbo and near Bourke the road is rough on the banks from the same cause.

The timber bridges, culverts, fencing, and other works have received careful attention during the year.

The Mudgee Line is in fair running order so far as the permanent way is concerned, except between Carlos Gap and Ilford, where rough places are met with in consequence of the settlement of the banks under the influence of the heavy rains. More ballast is needed on the Molong Line to make up banks which have also suffered from the general rainfall.

The following sidings have been laid in during the year :—

<i>Parramatta—</i>	feet.	<i>Bathurst—</i>	feet.

HOMEBUSH

HOMEBUSH-WARATAH LINE.

Strathfield Junction to Hornsby—Single Line—Length, 13 miles 67 chains.

Hornsby to Hawkesbury—Single Line—Length, 14 miles 62 chains—Opened for public traffic, 7th April, 1887.

Gosford to Hamilton Junction—Single Line—Length, 50 miles—Opened for public traffic, 15th August, 1887.

The sections to the Hawkesbury River have proved difficult and expensive to maintain, the heavy rains which fell during the year having affected the soft formation so that additional labour and considerable quantities of ballast were required to keep the road up. From Gosford to the junction with the Great Northern Railway the line has not been so troublesome, and is in good running order. The timber bridges on the latter section have been attacked by white ants.

The following sidings have been laid in during the year:—

<i>Ryde—</i>										
Loop points at north and south ends of bridge	Fect. 333
Slip points at Ryde Station	20
<i>Eastwood—</i>										
Slip points	68
<i>Awaba—</i>										
New siding	259
Total										680

The following quantity of ballast has been used on the main line during the year:—

Strathfield Junction to Hawkesbury	Cubic yards. 1,511
------------------------------------	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----------------------

The following sleepers have been used in new sidings laid in during the year—

Sidings at Ryde	200
Do at Awaba	95
Total										295

The following shows the number of men per mile of single line engaged in maintenance of the permanent way:—

Strathfield Junction to Hawkesbury	Men per mile. 0·84
Gosford to Hamilton Junction	0·70

Hornsby to Hawkesbury.....	14 62	7 April, 1887	0 9
Gosford to Hamilton Junction	50 0	15 Aug., 1887	0 4½
Strathfield to Hamilton Junction, exclusive of section Hawkesbury to Gosford	78 49

GREAT NORTHERN RAILWAY.

Newcastle to West Maitland—Double Line—Length, 20 miles 18 chains.

West Maitland to Tamworth—Single Line—Length, 161 miles 28 chains.

Tamworth to Tenterfield—Single Line—Length, 200 miles 9 chains.

Bullock Island Branch—Double Line—Length, 1 mile 43 chains.

Morpeth Branch—Single Line—Length, 4 miles.

North-western Line—Single Line—Length, 96 miles 45 chains.

The maintenance of these sections has, generally speaking, not been troublesome during the year, and the permanent way throughout is in good order, but the continuous heavy rains found some soft spots between West Maitland and Murrurundi; and from Murrurundi to Tamworth—always a difficult piece of road to keep up—the wet weather and the necessity for extensive renewals of rails and sleepers have not improved the condition of the permanent-way.

The bridges, buildings, and other works are in a satisfactory state, with the exception of the fencing between West Maitland and Singleton, which is in need of early renewal, and the wooden bridge over Black Creek about to be replaced by a structure in brick and iron.

CULVERTS constructed during the year.

Tamworth to Glen Innes	0.74
Glen Innes to Tenterfield	0.68
Werris Creek to Narrabri	0.78

GENERAL REMARKS.

RAILWAYS.

THE permanent way on all the lines has, with few exceptions, been kept in good repair, but in consequence of the very wet season we have passed through, some portions at times could only be kept up by employing extra hands; and I should strongly recommend that the Suburban Line be ballasted with blue metal, as the constant packing on this heavily worked line pulverises the sandstone very quickly and soon chokes the drainage, which is a great drawback to keeping a good road. A considerable amount of relaying with steel rails has been done, and in most cases new sleepers have been put in, but a very considerable amount of this work will have to be continued through 1888 to keep the road in good running order.

The Mudgee line has given a very considerable amount of trouble and annoyance in the way of slips, and boulders becoming detached in the wet weather and falling on to the line, making it dangerous to the running of trains. This I hope to minimise by several short deviations, which is the only way I see out of the difficulty, as no amount of time will make the slopes of these cuttings safe.

Some renewals have been carried out to some of our underbridges; some of the timber tops have been renewed with iron girders, and some that were entirely timber structures have been renewed with brick and iron; and I shall have to recommend more of this work in 1888. Our large iron bridges have been neglected for a very long time, but I hope before the end of 1888 to have them in fair repair and condition.

Nothing as yet has been settled as to the shipping of coal, &c., from Sydney. All the lines will now soon be completed, and there is still no provision made for the outlet of our valuable minerals. In my opinion this provision should have been made simultaneously with the making of the lines, and before the lines can be expected to be worked to advantage it must be done.

The locomotive workshops at Eveleigh will soon all be completed, and, although they are all good, sound, roomy buildings, they have not been extravagantly costly, and for convenience and appearance may be compared with any in the world of their size.

The interlocking at the several stations and sidings has been increased from 78 last year to 103 this year, and I have no doubt with very beneficial results; and I shall be glad to see this work completed throughout the lines.

I have, &c.,

GEORGE COWDERY,

Engineer for Existing Railways.

Metropolitan Lines.—All the lines have been well maintained, but nothing but a heavy road will stand the traffic we have. That portion in Devonshire-street, and that from Hunter-street to the Terminus, which are laid with 70-lb. rails and strong guards, are the only portions in the city at all adequate, and these have stood the traffic very well. I hope soon to have the whole of this road from Hunter-street to the Railway relaid, when the cost of maintenance will be reduced considerably.

The North Shore Cable Line is working satisfactorily.

No improvement has been made with regard to the expenses imposed on the tramways by the several municipalities in the way of repairs to sides of streets outside the lines, and the watering and cleaning of same.

The Waverley to Randwick, and the Kogarah to Sans Souci Lines have both been completed and opened for traffic, also the Newcastle to Plattsburg.

I have, &c.,

GEORGE COWDERY,

Engineer for Tramways.

No. 2.

The Locomotive Engineer to The Commissioner for Railways.

Department of Public Works, Railway Branch,

Locomotive Engineer's Office, Sydney.

Sir,

I have the honor to report as follows on matters connected with the Locomotive Branch for the year ending 31st December, 1887:—

ADDITIONAL ENGINES and other ROLLING STOCK received during the year.

Classification.	No.	Remarks.
Engines... ..	20	
Passenger stock	70	1 of these to replace 1 destroyed at Cootamundra.
Goods stock	506	74 of these to replace others worn out.

NOTE.—The cost of replacing this stock—worn out or destroyed—was charged to working expenses.

ABSTRACT of ROLLING STOCK with Average per Mile open for Traffic, on 31st December, 1887.

Classification.	Total in Stock.		No. under Repair.		No. awaiting Repairs.		No. available for Traffic.		Average No. available per mile open for Traffic.	
	Pas-senger.	Goods.	Pas-senger.	Goods.	Pas-senger.	Goods.	Pas-senger.	Goods.	Pas-senger.	Goods.

Newcastle	861,000

REMARKS.

GENERAL REMARKS.

The locomotive, carriage, and waggon stock and machinery have been maintained in good working order.

We have been able to occupy the whole of Nos. 1 to 15 shops at Eveleigh during the year, but are still greatly inconvenienced by the non-completion of the carriage and waggon repairing shops.

The water supplies have been maintained in a state of efficiency owing to the copious rainfall.

It is of vital importance that my previous recommendations for increasing the number of passenger and goods engines should receive due and timely consideration.

I have, &c.,
W. SCOTT,
Locomotive Engineer,
19/5/88.

LIST OF MACHINERY ADDED TO STOCK DURING THE YEAR 1887.

No.	Description.	Remarks.
GREAT SOUTHERN AND WESTERN RAILWAYS.

No. 3.

The Superintendent of Tramway Rolling-stock to The Commissioner for Railways.

Sir,

Tramway Works, Randwick, 1 June, 1888.

I have the honor to submit the following report upon the working of the Tramway Locomotive Branch for the year 1887:—

The total rolling-stock available for working the traffic of the city and suburban tramways at the beginning of the year consisted of:—96 engines, 127 cars, 16 service trucks, and 2 travelling water-tanks. One travelling water-tank has been added since.

During the year the rolling-stock was reduced by the following vehicles transferred from the city lines to the Newcastle-Plattsburg tramway:—8 engines, 13 cars, and 2 service trucks.

The whole of the machinery and rolling-stock has been maintained in good working order, and strenuous efforts have been put forth to bring the engines up to a thoroughly efficient condition, and it is with some considerable degree of satisfaction that I am able to report that although it was found necessary to maintain a staff of about forty workmen more during the year than in 1886—the wages cost being thereby increased by nearly £4,000—yet the total expenditure of the branch has been kept within the limits of that of the previous year. I indicated in my last report that the staff would probably have to be added to, to cope with the large arrears of work in the shape of engines lying idle for the want of necessary repairs, as large a number as thirty-eight “dead” engines and twenty-five boilers, in addition to about sixteen engines actually undergoing repairs, being stacked on one side in Randwick yard in October, 1886, when I was placed in charge of the Tramway Locomotive Branch. What I mean by “dead” engines is, engines in such a bad state for want of proper and timely repairs that there could be no immediate prospect of their being made available for service. That considerable improvement has taken place, however, may be gauged from the fact that the “dead” engines were reduced from thirty-eight in October, 1886, to twenty-one in December, 1887; and although the total engine stock was reduced during the year by the eight engines transferred to the Plattsburg tramway, no difficulty has been experienced in supplying ample motive power to work the increased traffic.

* * * * *

North Shore Cable Tramway.

The rolling-stock and machinery on this line have been maintained in good working order. It was found necessary to put in a new wire rope (by Whitecross Co.) in September, the original rope (by Bullivant & Co.) supplied by the contractors for this line having become too much worn for further service. This rope, however, has given very good results, it having commenced work in May, 1886, and been continuously in use till September, 1887, running in traffic within that period 52,414 miles. During the year the third wire rope for this line was obtained through Messrs. Drysdale & Co., of Sydney.

Attached are the usual detailed returns.

I have, &c.,

THOS. MIDELTON.

* The portion of this report, which is represented by asterisks, has reference to certain errors made by Mr. Downe in his minute replying to Mr. Midelton's report of 30th May, 1887, both of which appeared in my 1886 report. Mr. Midelton's criticisms are of a hostile and acrimonious nature, and I cannot consent to correspondence of this kind appearing in my report. At the same time I must state, in justice to Mr. Midelton, that Mr. Downe did fall into error in assuming that 31 and 38 engines respectively were to be accepted as representing the numbers in the repairing shops on each occasion referred to. These numbers represented engines requiring such extensive repairs as to be actually lost to the traffic. The number which Mr. Downe should have taken as representing the percentage of engines laid aside for repairs is 45·58, and on his assumption that 25 per cent. of the total stock is a fair proportion to be under repairs, the comparison against the Department would be 21·58 instead of 6 and 14 respectively, as represented by Mr. Downe.—CH.A.G.

No. 3—continued.

"	53.	1	Small punching and shearing machine on wheels.
"	54.	2	Large size shaping machines.
"	55.	1	Flexible shaft, and tools for boring and tapping.
"	56.	1	14-h.p. vertical boiler and engine complete.
"	57.	1	20-h.p. semi-portable engine complete.
"	58.	1	Surface plane.
"	58.	1	Band saw setting and filing machine.
"	60.	5	Band saw blades, extra.
"	61.	1	Band saw machine.
"	62.	1	Automatic knife grinder.
"	63.	1	Standard saw bench.
"	64.	1	Emery grinder.

- No. 65. 16 Emery wheels.
 „ 66. 1 Morticing and boring machine.
 „ 67. Chisels and bits, extra.
 „ 68. 1 Moulder and shaper.
 „ 69. 1 Four side planing machine.
 „ 70. 1 Set knives, extra.
 „ 71. 1 Steam travelling crane.

MACHINERY IN PITT-STREET WORKSHOPS.

- No. 25. 1 6-h.p. vertical boiler, with engine attached.
 „ 27. 1 Screw-cutting lathe, 7½" centres, 8 feet bed, with gap and change wheels complete.
 „ 28. 1 do 6" do 6 do do do
 „ 29. 1 Shaping machine, 6" stroke.
 „ 30. 1 vertical drilling machine, 15" space, with round movable table.
 „ 31. 1 Grindstone on wooden frame.
 „ 33. 1 Screw-cutting lathe, 8" centres, 10 feet bed, with gap and change wheels complete.

LIST OF PUMPS, CRANES, &C., ON TRAMWAY LINES, 31ST DECEMBER, 1887.

Bridge-street ...	1 Stand-pipe, 1 crane.	Newtown Road ...	1 Tank and connections.
Botany ...	1 Pump and boiler and tank.	Railway ...	3 Stand-pipes.
Crown-street ...	1 Hydrant.	Randwick Yard...	1 Tank and connections.
Coogee ...	1 Tank and connections.	Racecourse ...	1 do do
Enmore ...	1 Hydrant.	Waterloo ...	1 Crane.
Forest Lodge ...	1 Stand-pipe.	Trafalgar-street...	1 Hydrant.
Glebe Point ...	1 Crane.	Waverley Line ...	1 Tank and connections, 1 stand-pipe, and 1 crane.
Leichhardt ...	1 Crane, tank, and connections.	Woollahra ...	1 Crane.
Moore Park ...	1 Stand-pipe.	Bondi Junction...	1 Stand-pipe.
Cricket Ground...	3 Stand-pipes.		

All the above are in good order.

NORTH SHORE CABLE TRAMWAY.

RETURN OF ROLLING STOCK AND MACHINERY ON HAND ON 31ST DECEMBER, 1887:—

- 8 4-wheeled cars, to seat 16 passengers each.
 8 „ dummies, to seat 22 passengers each.
 1 pair H.P. horizontal engines, with boilers, driving gear, and shafting, complete.
 1 steel wire rope (in use), by Whitecross Co.
 1 „ „ (in reserve), by Ryland Bros., Warrington; obtained from Briscoe, Drysdale, & Co.
 Cars numbered 1, 2, 3, and 4 were imported from America by the contractors for the line, and those numbered 5, 6, 7, and 8 were built in Sydney by Mr. T. Wearne.
 1 truck for removing cables.

TRAIN MILEAGE YEAR ENDED 31ST DECEMBER, 1887:—

		4,073,661	
Average cost per mile, including all charges	2,035 $\frac{1}{2}$	26,542,613	13,038

In rolling stock the cost of the Carriages and Waggons used on the Camden Line, and the cost of two Locomotive Engines used on the Sans Souci Line, is included, as the vehicles were those originally provided for Railway service. Total value of stock so used: Camden Line, £3,223; Sans Souci Line, £2,390—£5,613.

Between Sydney and Granville, including the Darling Harbour Branch, there are 52 $\frac{1}{2}$ miles of sidings, the cost of which is included in the amounts shown.

On the Bullock Island Branch there are 8 $\frac{1}{2}$ miles of sidings, the cost of which is included.

No. 12.

TABLE showing the number of MILES OPENED per annum, and the annual and average daily MILEAGE of TRAINS, from the commencement, on 26th September, 1855, to 31st December, 1887.

No. 51—*continued.*

Live Stock Rates and Conditions—1887.

SMALL CONSIGNMENTS.

$\frac{1}{2}$ Truck, <i>i.e.</i> , 4 Cows or Oxen, or 10 Calves, 1 Deck of Sheep, or 30 Pigs.	$\frac{1}{4}$ Truck, <i>i.e.</i> , 2 Cows or Oxen, or 5 Calves, or 20 Sheep, or 15 Pigs.	Single Cow or Ox.	Sheep or Pigs, when less than $\frac{1}{4}$ Truck.	Calves, when less than $\frac{1}{4}$ Truck.
6d. per mile.....	4d. per mile.....	3d. per mile	$\frac{1}{2}$ d. each per mile.....	1d. each per mile.
Minimum, 10s.....	Minimum, 7s. 6d.	Min., 7s. 6d. each.....	Min., 1s. 6d. each.....	Minimum, 2s. each.

When the number of animals or the space occupied exceeds the limit for $\frac{1}{4}$ or $\frac{1}{2}$ truck, each one in excess will be charged at the mileage rates enumerated above for single animals until the $\frac{1}{2}$ or full truck rate, as the case may be, is reached.

In ascertaining what portion of a truck is to be charged for, *i.e.*, $\frac{1}{4}$, $\frac{1}{2}$, or full truck, regard will be had to the space actually occupied more than to the number of animals; but in no case must the number of animals stated above be exceeded. Two calves will count as one cow or ox.

Mixed stock will be carried together in the same truck, provided the whole consignment belongs to one person, and the Commissioner is relieved of all responsibility. When mixed stock cannot be loaded together, each kind will be charged for separately, with the following exception:—On Thursdays single animals conveyed to Sydney in the same trucks, although belonging to different owners, will be charged at a proportion of $\frac{1}{4}$, $\frac{1}{2}$, or full truck rate, plus 25 per cent.; for example, should there be two cows, each owner will be charged half of the $\frac{1}{4}$ truck rate, plus 25 per cent., and should there be three animals, the owners will be charged the $\frac{1}{2}$ truck rate equally between them, plus 25 per cent. It is absolutely necessary that each animal be legibly addressed.

When the charge per head for live stock exceeds that for a $\frac{1}{4}$ truck, or when the charge for a part truck on market days exceeds that for a full one, only the lesser amount will be collected.

BULLS.

The charge for one bull is 7d. per mile up to 100 miles, and 4d. for every additional mile, plus the charge for 100 miles; such charge not to exceed herd rates. Minimum, 12s. 6d. If more than one bull in a truck, herd rates will be charged.

VALUABLE RAMS AND EWES.

If less than $\frac{1}{2}$ a truck load, will be charged 2d. each per mile; for $\frac{1}{2}$ a truck and upwards, sheep rates. Minimum, 5s.

HORSES.

See full truck rates. No less charge than for a full truck load will be made for any number.

GOATS.

Same as sheep.

When live stock in waggons is conveyed by passenger train the charge will be as for a full horse box for every truck. 20 per cent. will be added to these rates, for the distance which live stock is carried on the Homebush-Waratah line beyond mileage 12 from Sydney, and beyond mileage 20 from Sydney on the Illawarra line.

Herds, Flocks, &c., when in consignments of not less than one full truck load.

GREAT SOUTHERN, WESTERN, AND RICHMOND LINES.

CATTLE

Will be conveyed from the undermentioned Stations to Homebush, at the following rates per Truck:—

Other distances to be charged—For the first 80 miles, 8d. per truck per mile; from 80 to 100 miles, 6d.; from 100 to 150 miles, 4½d.; from 150 to 200 miles, 4d. Every additional mile, 3½d. Minimum charge, 15s. per truck.

When open single-decked trucks are loaded with sheep, two-thirds of the above rates will be charged in all cases, but it is optional for senders to wait for sheep-vans; if cattle waggons are ordered cattle rates will be charged. When, in order to complete a consignment, a half-waggon load is sent, the charge for such will be two-thirds of the above rates.

GREAT SOUTHERN, WESTERN, AND RICHMOND, AND NORTHERN LINES.

HORSES.—The Commissioner will carry horses in cattle trucks if requested to do so, but only under special contract, relieving him of all responsibility. The charge for horses so carried will be the same as for cattle in full truck loads. For the rates for horse-boxes see Coaching Rate Pamphlet.

PIGS—same as cattle. When a double-decked waggon is occupied, 50 per cent. will be added. Minimum, 15s.

BEARS—same as cattle. GOATS—same as sheep.

GENERAL CONDITIONS AND REGULATIONS.

The Commissioner will not receive live stock for conveyance on Sunday, Good Friday, Christmas Day, or any proclaimed holiday.

Live stock will be conveyed only from and to such stations as have accommodation for loading and unloading (see following page), and herds and flocks only at convenient times to be previously arranged with the Traffic Manager.

The number of animals must be so limited that the gross weight in any one truck shall not exceed 6 tons.

The Commissioner does not guarantee arrival at any particular time or for any particular market.

All orders for conveyance of live stock per stock or goods trains are to be made to the Traffic Manager on the printed form provided for that purpose. Those sent by telegram, letter, or through a station-master or other railway officer, will be subject to the same conditions as if made on the printed form.

Each order must be accompanied with a deposit of 20s. per truck ordered.

An order once lodged with the Department can only be withdrawn or the number of trucks reduced at any time (not being less than four clear days before the date of conveyance) by forfeiting the deposit of 20s. for each truck so withdrawn.

An order cannot be withdrawn or reduced or altered within four days of the date of conveyance.

All trucks ordered and not used on the date and at the station specified in the order will be charged for as if used.

Trucks must be loaded and ready for despatch at a time fixed by the Traffic Manager, which will be ascertained on application to station-master at the loading station. If not loaded by the time specified, the Department reserves the right to remove the waggons, and charge full rates.

Sundays are not included in the number of days to be reckoned.

All live stock must be loaded and unloaded by the senders and consignees respectively, by whom also the truck doors must be secured and opened, fastenings attended to, &c.

All live stock must be unloaded within three hours after arrival, otherwise it will be unloaded by the Commissioner and a charge made of 2s. per truck.

All live stock must be removed from the railway premises immediately after unloaded; or if left, will remain at the owner's risk and expense, and may be sent to agistment or livery, the cost of which shall be paid by the owner, and such cost must be paid on demand as part of the authorized charges; and such stock, if not removed within seven days, may be sold by auction, by order of the Commissioner, within the railway premises, and the proceeds applied in payment of all expenses incurred, and the balance thereof handed over to the owner on demand.

When live stock is returned from Homebush to country stations in those neighbourhoods to which cattle trucks and sheep vans are being sent empty, half rates will be charged for the respective class of stock trucks required, provided the owners wait the requirements of the Department, but not otherwise. It will be necessary for senders to give satisfactory proof that the stock has previously arrived at Homebush by rail from the country.

When a truck is only partly occupied by a consignment, the Commissioner will have the right to fill it up to its full carrying capacity with other stock.

One *bona fide* drover will be allowed to accompany each consignment of not less than three trucks at full rates, travelling distances over 60 miles, to give the stock whatever attention may be necessary during transit. He will be furnished with a return free pass for himself and dog, available for three days for distances over 60 and under 200 miles, for four days for distances over 200 and under 350 miles, and for six days for distances over 350 miles, and must ride either in the guard's van or a 2nd class carriage. In cases where the stock is conveyed by more than one train, a pass will be issued for each train. The drover must travel by the same train as the stock, otherwise a pass will not be issued. In computing the time for which a pass is available, the day of issue is included; but if the pass expire on a day upon which a train does not run, it will be available till the next day upon which a train does run.

The following are the rates at which live stock can be insured:—

NEAT CATTLE (including Bulls).

1 to 50 miles,	2 per cent. on the declared value above £15.
51 to 100 "	3 " " "
101 to 150 "	4 " " "
151 and upwards,	5 " " "

The same percentage charge to be made for Pigs and Sheep (including valuable Rams and Ewes) on the declared value above £2.

Under no circumstances will the Commissioner be responsible for loss or injury to live stock, insured or uninsured, occurring during loading or unloading, whether such services be performed by either the servants of the Department or the owner. Nor will he under any circumstances be responsible for loss of or injury to any live stock during transit, arising from fear or restiveness, or through any of the animals being suffocated or trampled upon.

No. 51—continued.

Wool Rates—continued.

Minimum charge, same rate as for "Smalls."

Wool put on the rail at Bourke for Sydney from the district from Buckambie and all stations below having a frontage to the Darling River on the eastern side, and on the western side, including Marra and the whole district south and south-west thereof, and stations lying wholly to the west of the Paroo River, will be charged at the rate of £4 3s. 8d. per ton for undumped wool, and £3 7s. per ton for greasy wool.

Dumped scoured wool (except from stations between Narrandera, Jerilderie, and Hay inclusive), measuring not more than 20 cubic feet each bale, will be allowed a rebate of 10 per cent. off undumped scoured wool rate.

From stations not enumerated in the Schedule of Sydney, Newcastle, or Morpeth rates, a charge at the rate of 3d. per ton per mile will be made in addition to the rate from the nearest station, shown on the Up side, but in no case will the charge be in excess of the rate from the station immediately beyond that from which a rate is quoted.

Greasy wool from Sydney to Bowenfels tweed factory, £1 3s. 5d. per ton.

On the Camden tramway, and between stations not provided for in the rate sheet, wool, whether greasy or scoured, will be charged at first-class rates.

TO AND FROM WOOLWASHING ESTABLISHMENTS.

To and from Sydney and Newcastle :—	Greasy: To Washing Establishments.		Scoured: From Washing Establishments.

" 26 " 30	7	11	13	4
" 30 " 35	8	9	14	8
" 35 " 40	9	8	16	0

Re-packed greasy wool consigned from Liverpool to Sydney, 8s. 4d. per ton.

Greasy wool consigned from up-country stations to woolwashing establishments situated within 25 miles of Sydney or Newcastle will be charged the full rates to those stations respectively. When consigned to a washing establishment in the interior the *mileage proportion of the through rate* for greasy wool to Sydney or Newcastle, plus 2s. 6d. per ton will be charged; and when the wool is re-consigned to Sydney or Newcastle, after having been scoured, the *mileage proportion of the scoured wool rate from starting point to Sydney or Newcastle* will be charged.

The wool delivery will commence at 6 a.m., and close at 4:30 p.m., at Darling Harbour wool shed; and all wool not accepted within 15 minutes after same has been tendered at consignee's stores or offices by the Commissioner, will be stored at owner's risk and expense, and will be liable to charges for re-cartage in addition. The place for delivery must be stated on delivery order.

200 "	4	7 4	305 "	5	13 11	410 "	6	16 0			

Any quantity over 6 tons in one four-wheeled truck will be charged *pro rata*. Six or eight-wheeled trucks will be charged a minimum of 12 tons, unless it be cheaper to charge the first 6 tons at the four-wheeled truck rate, and the balance at Special A mileage rate. Loads may be made up with hay, straw, or chaff.

One-fourth will be added to above rates for sawn timber over 2 inches in thickness, and not exceeding 14 feet in length (including Railway sleepers), and one-third when over that length. One-half will be added for boards and battens not exceeding 2 inches in thickness, and not exceeding 14 feet in length, and two-thirds when over that length.

The charge per truck per mile for distances not shown in this table will be one-fifth of the difference in rate between every 5 miles.

Fruit by Passenger Trains.

Fruit by passenger trains, in quantities of less than 2 cwt., will be charged parcels rates, less 25 per cent. ; minimum charge, 3d. Quantities of 2 cwt. and upwards will be charged half parcels rate, provided such charge is not less than as for 1 cwt. 3 qrs. at the former rate.

Exchange of Parcels, &c., Traffic between New South Wales and Victorian Lines.

Parcels, excess luggage, and commercial travellers' samples are booked through between New South Wales and Victorian Stations at the undermentioned rates :—

For those parcels booked through between Sydney and Melbourne the rates are—

	s. d.
Not exceeding 3 lb.	2 0
Over 3 but " " 7 "	3 0
" 7 " " " 14 "	4 6
" 14 " " " 28 "	6 0
" 28 " " " 56 "	10 0
" 56 " " " 84 "	12 0
" 84 " " " 112 "	14 6

and 2s. 6d. for every additional 28 lb. or part thereof.

All other parcels, &c., from New South Wales Stations to Victorian Stations, and those from Victorian to New South Wales Stations, are booked to Albury.

Between Albury and Victorian Stations the ordinary Victorian rates are charged (189 miles from Melbourne), and, in addition, the following charges for the New South Wales Department are added :—

	s. d.
Not exceeding 3 lb.	0 3
Over 3 " " " 7 "	0 4
" 7 " " " 14 "	0 6
" 14 " " " 28 "	0 8
" 28 " " " 56 "	0 10
" 56 " " " 84 "	1 0
" 84 " " " 112 "	1 2

and 3d. for every additional 28 lb. or part thereof. No junction charges are made for Press parcels.

Parcels between Albury and Wodonga are charged at the above rates.

No. 51—*continued.***Parcels Rates—*continued.***

Press parcels are charged one-fourth the above rates—minimum, New South Wales Line, 3d.

Packed parcels in hampers, crates, bags, cases, or other packages are charged quadruple the above rates, and the onus of proving that parcels are not packed rests with the consignors or consignees.

When two or more parcels are consigned to one person the above rates are charged on each parcel separately.

Bicycles, feathers, furniture, glass, hats, bonnet or hat boxes, cases of millinery, straw bonnets, mirrors (loose), musical instruments, perambulators, sulkeys in pieces, pictures, sewing-machines, wicker-work, wire cages (loose), or other articles light or fragile, are considered admeasurement goods, and are charged 50 per cent. additional on the above rates. Parcels containing articles and property of a description not mentioned or specified in the following clause, such articles and property being over £10 in value, are, in addition to the amount chargeable by the foregoing scale of rates, charged a further sum equal to 1 per centum upon the declared value thereof.

Parcels containing any of the following articles are charged the following increased rates, viz. :—Over £10 and under £50 in value, double, and over £50 in value, quadruple, parcel rates, viz. :—Gold or silver coin of this realm, or of any part of Her Majesty's dominions, or of any foreign state, or any gold or silver in a manufactured or unmanufactured state, or any precious stones, jewellery, watches, clocks, or time-pieces of any description, trinkets, bills, notes of any banks in Her Majesty's dominions, or of any foreign bank, order, notes, or securities for payment of money, whether foreign or otherwise, stamps, maps, writings, title-deeds, paintings, engravings, pictures, gold or silver plate, or plated articles, glass, China, silk in a manufactured or unmanufactured state, and whether wrought up or not wrought up with other materials, furs or lace, or any of them contained in any parcel or package.

The trainage on all parcels conveyed under bond must be prepaid.

Specie is carried between Sydney and Melbourne at the rate of 3s. per £100.

Horses may be booked from Sydney to Melbourne at the following rates :—	£	s.	d.
One horse	9	9	5
Two horses	15	19	2
Three horses (or one stallion)	20	14	10

Horses from New South Wales to stations other than Melbourne, and *vice versa*, are booked to Albury, and re-booked there to destination, plus the following junction charges :—

	s.	d.
One horse	2	0
Two horses	3	0
Three horses belonging to same owner.....	4	0

Carriages and dogs from New South Wales to Victorian stations are booked in the same manner as horses for Victorian stations other than Melbourne, plus the following junction charges :—

	s.	d.
Carriages, gigs, dog-carts, and vehicles of a similar description	4	0
Dogs	0	6

Corpses are booked in a similar manner, with 4s. added for conveyance between Albury and Wodonga.

Rates for conveyance of Library Exchanges.

Books forwarded for exchange to and from subscribers to recognized Circulating Libraries only will be carried at one-fourth parcels rates, under the following conditions, viz. :—

1. The sender's name must be legibly inscribed on each parcel.
2. Each parcel must be open at both ends.
3. Each parcel must be declared on the consignment-note to contain books only.

Gold-dust and Bullion, and Gold and Silver Coin.

The Commissioner for Railways will not be responsible for the safe conveyance of Gold-dust and Bullion, Bank-notes and Bills, Orders, Notes, and Securities for the payment of Money, and Gold and Silver Coin, or any of the other article mentioned above, as the following charges are made, and the Gold-dust and Bullion and Coin carried, on condition of its being in charge of owners and at their risk.

	Distance not over 55 miles.	Distance not over 100 miles.	Distance not over 150 miles.	Distance not over 200 miles.	Distance not over 250 miles.	Distance not over 350 miles.	Distances over 350 miles.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
Gold-dust and Bullion, per 100 oz.	2 0	3 6	4 3	5 0	5 6	6 0	6 6
Gold Coin and Bank-notes, per £100 ...	0 6	0 10	1 3	1 8	2 0	2 3	2 6
Silver Coin, per £100.....	1 0	1 9	2 6	3 3	3 6	3 9	4 0

Fractions over 100 and under 50 will not be charged, but fractions of 50 and over will be charged as 100.

If conveyed at Commissioner's risk the following Insurance Rates will be charged in addition :—

1 to 100 miles.....	1s. 6d. per cent. on declared value.
101 to 200 "	1s. 9d. " " "
201 to 300 "	2s. 0d. " " "
301 to 400 "	2s. 3d. " " "
401 to 500 "	2s. 6d. " " "

Rates for Milk.

15 miles and under.....	½d. per gallon.
40 " "	1d. " "
90 " "	1½d. " "
Beyond 90 miles ..	2d. " "

Minimum charge, 6d.

The full capacity of the cans will always be charged for.

RETURNED EMPTIES.

Returned empty milk cans will be conveyed free; but they must be legibly branded with sender and consignee's name and Stations from and to which carried. All other returned empties will be charged double the rates shown in merchandise rate book, except otherwise arranged. Only small empties will be accepted for conveyance by Passenger Train.

COMPARATIVE STATEMENT of the RATES charged for Goods in New South Wales, Victoria, Queensland, and South Australia, 31st December, 1887.

PIGS.

Same rates per truck as cattle. When double-decked waggon is occupied 50 per cent. will be added. Minimum, 15s.

Under the foregoing rates for cattle, sheep, horses, and pigs, no less charge than for one full truck will be made for each and every truck used.

SMALL CONSIGNMENTS.

$\frac{1}{2}$ Truck, i.e., 4 Cows or Oxen, or 10 Calves, or 1 deck of Sheep, or 30 Pigs.	$\frac{1}{4}$ Truck, i.e., 2 Cows or Oxen, or 5 Calves, or 20 Sheep, or 15 Pigs.	Single Cow or Ox.	Sheep or Pigs, when less than $\frac{1}{4}$ Truck.	Calves when less than $\frac{1}{4}$ Truck.
6d. per mile	4d. per mile	3d. per mile.	$\frac{1}{2}$ d. each per mile.	1d. each per mile.
Minimum, 10s.....	Minimum, 7s. 6d.....	Min., 7s. 6d. each.	Min., 1s. 6d. each.	Min., 2s. each.

Bulls.

The charge for bulls is 7d. per mile up to 100 miles, and 4d. for every additional mile, plus the charge for 100 miles. Minimum, 12s. 6d.; if more than one bull in truck herd rates.

Valuable Rams and Ewes.

If less than half a truck-load, will be charged 2d. each per mile; for half a truck and upwards, sheep rates. Minimum, 5s.

When live stock is returned from Sydney or Homebush to Country Stations in those neighbourhoods to which cattle trucks and sheep vans are being sent empty, half the foregoing rates will be charged, provided the owners wait the requirements of the Department, but not otherwise.

Rates for Fresh Meat in Van loads.

To be loaded and unloaded by Owners.

In the case of beef, the van-load will be limited to 12 carcasses, but this number may be increased provided that a van-load shall not be held to consist of a greater total weight than 4 tons. Where a consignment of beef does not amount to 4 tons, senders will be allowed to make up the van-load with carcasses of mutton, pork, or veal. Any weight above 4 tons, whether the number of carcasses be more or less than 12, will be charged for at the rate of $\frac{1}{2}$ d. per cwt. per mile.

Smaller quantities properly packed charged actual weight at 3rd-class rates. Minimum charge for use of meat-van, 10s.; to be loaded and unloaded by owners.

Goods Trucks.

101 miles £2 10 6
150 " 3 2 9

Over 150 miles, 5d. per truck per mile for the whole journey.

In the event of the Commissioner not being able to supply sheep trucks they do not undertake to provide goods trucks for carriage of sheep.

Over 3 and up to 10 sheep or lambs, half sheep truck rate; over 10 animals, full sheep or truck rate, according to order.

Minimum Charge :—Sheep truck, 40/-; goods truck, or half-truck, 20/-; exclusive of a terminal charge of 2/- per truck for sheep trucks, and 1/- per truck for goods trucks.

Store sheep in lots of not less than two truck loads, to be carried from Newmarket to country stations at $\frac{2}{3}$ published rates, and store cattle in lots of not less than two truck loads at $\frac{1}{2}$ published rates, full terminal, provided the trucks are required to load again from the Line to which such store cattle and sheep are consigned.

Fresh Meat.

Fresh meat, in truck load, -/9 per truck per mile up to 101 miles; over 101 and up to 150 miles, -/3 per truck per mile added to the 101-mile rate; over 150 miles, -/7 per truck per mile for the whole journey, with 2/- per truck terminal added in all cases; minimum, 22/- per truck, including terminal. To be carried strictly at owners' risk, and consigned on Form 86A, otherwise second-class rates to be charged. Less than truck loads to be charged as truck loads, or else second-class rates.

Loading and unloading to be done by owners.

Horses.

IN BOXES:—Full horse-box (3 horses, one owner), 1s. per mile; minimum charge, 15s.; one horse, 6d. per mile; two horses, 9d. per mile; minimum charge, 7s. 6d. each; stud horses, 1s. per mile each; but owner has privilege of loading another horse belonging to himself in same box, at his own risk, without extra charge; minimum charge, 15s. each. Mares, with foal at foot, rate and a half.

A reduction of 20 per cent. on the above charges will be made on every mile beyond 150 and up to 200, and over 200 miles, 33½ per cent. per mile will be allowed.

FOR AGRICULTURAL SHOWS.

To the Show, ordinary rates, and the same from the Show if sold. Unsold exhibits returned free.

FOR RACE MEETINGS.

To the Races, ordinary rates, and the same from the Races if sold. If unsold they will be returned free of charge.

HUNTING HORSES AND DOGS.

Horses going to the Chase, single fare for the double journey. Dogs, ½d. per mile each to 50 miles, and 4d. additional for every 30 miles or part of 30 miles thereafter; minimum charge, 6d.

Carriages.

Carriages, gigs, and dog-carts, 6d. per mile, each; two vehicles, one owner, if on one truck, 9d. per mile; 4-wheeled waggons and bullock drays (empty), 8d. per mile; minimum charge, 7s. 6d.

A reduction of 20 per cent. on the above charges will be made for every mile beyond 150 and up to 200; and over 200 miles, 33½ per cent. per mile will be allowed.

Dogs.

50 miles, 2/1; 150 miles, 3/5.

Gold-dust and Bullion, and Gold and Silver Coin.

The Commissioner for Railways will not be responsible for the safe conveyance of gold-dust and bullion, or gold and silver coin, &c., as the following charges are made, and the gold-dust and bullion and coin carried, on condition of its being in charge of owners and at their risk.

	Distance not over 55 miles.	Distance not over 100 miles.	Distance not over 150 miles.	Distance not over 200 miles.	Distance not over 250 miles.	Distance not over 350 miles.	Distance over 350 miles.
Gold-dust and bullion, per 100 ozs.	2/-	3/6	4/3	5/-	5/6	6/-	6/6
Gold coin, per £100	-/6	-/10	1/3	1/8	2/-	2/3	2/6
Silver coin, per £100	1/-	1/9	2/6	3/3	3/6	3/9	4/-

Fractions over 100 and under 50 will not be charged, but fractions of 50 and over will be charged as 100.

Horses.

Each mare, gelding, or filly, or entire under 2 years, 6d. per mile; min. 20/- each. Each entire horse, 2 years or over, 1/- per mile; minimum 20/- " Horse-box (three horses), 1/3 per mile; minimum 40/-

In goods trucks and by goods trains on either up or down journey, cattle rates. By passenger trains, 1/6 per truck per mile.

Mares, with 6 months' foal at foot, rate and a half.

Carriages.

Carriages, gigs, dog-carts, and vehicles, of a similar description will be charged for at the rate of -/6 per mile, subject however that the sum of 20/- shall be the minimum charge in any case. Two vehicles belonging to the same owner, and loaded on one truck, -/9 per truck per mile, if owner accepts all risks; three vehicles on same terms, 1/- per truck per mile; minimum, 20/-. For vehicles sent for repair, return tickets available for four weeks will be issued at 50 per cent. additional on rates.

Dogs.

50 miles, 2/2; 150 miles, 6/3; minimum charge, -/6. In truck loads, 1/- per truck per mile; minimum, 20/-.

Gold-dust, Gold and Silver Coin.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY ACCIDENT AT PEAT'S FERRY

(REPORT AND EVIDENCE TAKEN BEFORE BOARD OF INQUIRY.)

Ordered by the Legislative Assembly to be printed, 23 July, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 8th November, 1887, That there be laid upon the Table of this House,—

“Copies of all reports, letters, correspondence, evidence, opinions, findings, recommendations, and all and every attainable information related to or connected with the late Peat's Ferry Accident.”

(Mr. Schey.)

No. 1.

Memo. from Mr. Loco.-Foreman Cobb to Mr. Assistant Loco.-Engineer Downe.
Government Railways,

Locomotive Engineer's Branch, Redfern Station, 22 June, 1887.

I VERY much regret to have to report that a most serious accident occurred yesterday at Hawkesbury to a special passenger train, which left Sydney at 10.25 a.m., consisting of equal to 13½ vehicles; engine, No. 178; driver, Thomas Wilson; fireman, John Pye. From the latter's statement, attached, it appears that all went well until the train reached Ryde, when the air-pump stopped for want of lubrication; this was soon rectified. When the train reached a mile past Ryde station the engine came to a stand, the load being too heavy. A second attempt was made, when the train again came to a stand, near Thornleigh, where the train was parted, and one half taken on to Hornsby, the engine returning for the other half. The train was then coupled up again. The air-brake was not, however, tested. The brake appears to have worked all right until the second tunnel was reached, when the fireman states that he noticed the train was going too quickly, the driver saying, at the same time, “The train has got away from us.” The fireman had previously applied his hand-brake on the top of the incline. The driver at this time appears to have put the air on full, but the brakes seemed to have no effect whatever on the train. He sounded the whistle for the guard to apply his car-brake, and reversed the engine, and seems to have done everything in his power to avert the collision, but all to no purpose, the engine running into some trucks and turning over into the river, causing the death of driver Wilson, Mr. Rennie, and others; the fireman was not much hurt.

The air-brake appears to have failed from some cause.

The engine was in good order and condition.

Wilson has been eleven years in the service, five of which he has driven various passenger and goods trains; he was a most efficient driver, and every confidence was placed in him.

JOHN COBB.

22 June, 1887.

JOHN PYE states:—I am fireman to driver Thomas Wilson; I have been with him about eighteen months; during that time we have run all kinds of trains fitted with the Westinghouse air-brake; on Monday last we left Sydney with engine No. 176 with a special train at 10.25 a.m. for Hawkesbury; no difficulty was experienced in getting there; we had nine and a half vehicles on.*; we were engine first leaving Sydney; when we left Hawkesbury we had eight and a half vehicles on, and had some difficulty in getting up the incline, and another engine had to assist us; the air-brake worked very well, but on arrival at Sydney driver Wilson found that the left coupling-rod was bent, and this he reported, and another engine, No. 178, was provided for Tuesday; we left Sydney with the same special at 10.28 a.m. on the 21st with what Wilson reckoned was equal to fourteen vehicles; we reached Ryde about eight minutes behind time; while stopping there Wilson told me that the air-pump had stopped working; I put some tallow into the lubricator and the pump started again at once, and did not stop again to my knowledge; about a mile from Ryde the engine came to a stand, the load being too heavy; Mr. Rennie, of Messrs. Amos & Co., came on the engine and advised that we set the train back to Ryde, which we did, and made another attempt, but came to a stand again near Thornleigh; Mr. Rennie advised that we should part the train and take half of it to Thornleigh; this was done, but on arrival there it was found that the siding was full, and the half train was then run on to Hornsby, the engine returning for the other half; the train was then coupled up at Hornsby, the latter part of the train being then next the engine; the air-pump

* Not quite sure whether ten and a half down and nine and a half up.

was then working all right; we did not test the air-brakes after the train was coupled up; after leaving Hornsby, Mr. Rennie told Wilson to go quicker, in order to get up the next incline; I cannot say for certain whether we stopped on this bank or not, when we got to the top of the long incline leading to the river; the air-brake worked all right until we got to the second tunnel; we had then 80 lb. air pressure; I noticed then that the train appeared to be going too quickly; just at this time the driver applied the air full on, and said to me, "The train has got away from us"; when he said this we had then got through the tunnel; I had previously applied my engine-brake at the top of the incline; the driver also kept applying the air on and off until we reached the tunnel, when he put it full on and left it so for a couple of minutes; the brake appeared to have no effect whatever on the train; I cannot say whether the air-pump was working or not at this time; he still kept on applying the brake, and whistled for the guard to apply his brake, reversing the engine at the same time; the engine wheels then skidded; I slacked my engine-brake a little and put it on again—the tender-brake, which was connected with the air, the wheels of which were also skidding at this time; we kept on increasing in speed until we came into collision with the trucks at the station; I cannot say whether driver Wilson tested the air-brake before we left Sydney; he may have done so unknown to me; the reason Wilson ran the engine-tender first on this occasion was that he thought he would get up the incline from the Hawkesbury better; Wilson was perfectly sober—I never knew him otherwise; previous to being with driver Wilson, I was nearly two years with driver James Smith, running suburban passenger trains; I have a thorough knowledge of the Westinghouse air-brake; I had not previously been on this line until the 20th instant.

JOHN PYE.

Witness—F. J. PYE, 22/6/87.

No. 2.

Minute from Mr. Locomotive-Engineer Scott to The Commissioner.

Peat's Ferry Accident, 21/6/87.

I BEG to report for your information that Mr. Cobb interviewed the fireman (John Pye) at his residence yesterday, and took down the attached statement, which was witnessed by his father.

Mr. Downe informs me that a strong gang of men, with the necessary appliances, have been employed in clearing away the wreck, which they have accomplished, with the exception of the two telescoped carriages; also that the body of the late driver Wilson has been got out from under the engine.

W. SCOTT, 23/6/87.

Seen by Minister, 23/6/87.—CH.A.G. Put with papers. Forward to Board of Inquiry.—
CH.A.G., 23/6/87.

No. 3.

Minute by the Commissioner.

Subject :—Accident at Peat's Ferry.

Department of Railways, Sydney, 22 June, 1887.

IN connection with the deplorable accident which happened yesterday at Peat's Ferry, I appoint the following gentlemen to inquire into the causes which have led to the accident:—

Mr. D. Vernon (Chairman)	Secretary of Railways.
Mr. Max. Thompson	Assistant Engineer.
Mr. T. Midelton	Tramway Engineer.
Mr. W. V. Read	Traffic Manager.

I wish the inquiry commenced at once and completed as early as possible, consistent with the due investigation of the causes of the disaster.

CH. A. GOODCHAP.

No. 4.

Report of the Board appointed to inquire into the Peat's Ferry Railway Accident.

IN accordance with the instructions contained in the Commissioner's minute of the 22nd instant we beg to submit at the earliest possible moment the result of the inquiry which we have held respecting the cause of the lamentable accident which occurred at Peat's Ferry Station on Tuesday afternoon, 21st instant.

A list of the witnesses who have been examined, together with a complete copy of the whole of the evidence taken, is forwarded herewith. Every care has been taken to make a thorough and impartial investigation. Each witness has been allowed as far as possible to tell his own tale in his own way, and no effort has been spared in endeavouring to elicit the whole of the facts and circumstances connected with the unhappy event in order to arrive at a true solution of the matter.

After the most careful consideration we think that the evidence points conclusively to certain facts from which the cause of the accident is not difficult to gather.

The

The first fact which is established by the evidence is *that the train was amply provided with brake power*. The total weight of the train—exclusive of passengers—amounted to 150 tons 1 cwt. 3 qrs., and it consisted of eleven vehicles—reckoning the engine and tender as two.

Of this number six weighing 123 tons 5 cwt. 3 qrs. were provided with efficient brakes, and we do not hesitate to say that, apart from the Westinghouse appliances altogether, the hand-brake power alone was more than sufficient to admit of the train being braked down from Hornsby to Peat's Ferry.

The second fact which we consider the evidence conclusively establishes is *that the brake appliances were complete and in good working order when the train left Redfern Station*.

The testimony of the shunters, Derham and M'Carthy, as well as of examiner Werrick, together with the fact of the frequent use which was made of the brakes of the train, which stopped at all stations as far as Ryde, place this matter beyond all dispute.

The third fact which in our opinion the evidence clearly points to is *that these same brake appliances were in the same condition when the train—after being divided and recoupled—left Hornsby Station*. The testimony of the guard, corroborated by that of porters Stead, Rice, and Galead, as to the coupling-up, &c., and that of fireman Pye and others, as to the subsequent use of the appliances admit of no other conclusion.

The fourth fact established by the evidence is *that the train, which appears to have been under control until after it emerged from the first tunnel, was allowed to attain a very high rate of speed, and the driver, for some reason or other, was unable to control it*.

The fifth fact which may be considered to be established, by the testimony of all those who were able to give evidence on the matter, is *that immediately after the accident the brake-blocks were found to be off all the wheels of the carriages, the tyres of the same were all cold, and the brake connections of the carriages, excepting those between the engine and the first car, and those between the first and second cars which telescoped, were all correct*.

From the foregoing facts it clearly follows *that the accident arose from a sudden failure of the brake power*; that this failure was not owing to either the insufficiency or imperfect condition of the brake appliances, but (and this is the only conclusion consistent with the whole of the facts) to an injudicious use of them on the part of the unfortunate driver. *The air reservoirs of the carriages became exhausted, in which condition the application of the brake was impossible; and there was not time enough for driver Wilson to recharge the reservoirs and bring them into use before the accident took place*.

It will be seen from the evidence that when, on the morning following the accident, it became possible to examine the brake connections between the two cars which telescoped, the tap at the rear end of the first one was found closed.

There is, in our opinion, however, not the slightest room to doubt, from the position in which the tap was found, that it was the telescoping which turned it. In fact, under the circumstances, the handle could not have been found otherwise; it was turned just in the direction which the act of telescoping was bound to effect, being the reverse of the position in which it would have been found had it been closed by hand; added to which it was in a part of the train where there had been no interference during the journey either with the coupling or brake connections.

It was also discovered on the day after the accident that the branch pipes connecting the main service pipe and the triple valve was broken under second-class carriage 73.

The tap shutting off the pipe was found properly closed, and from evidence obtained it is perfectly clear that the carriage was in the same condition when it left Sydney. It did not interfere in any way with the completeness or efficiency of the brake appliances.

With regard to the fact of the train being without an ordinary luggage or brake van, we may state that such a vehicle was perfectly unnecessary either for carrying luggage or to subserve safer working; in fact, the American car at the rear of the train when it left Sydney was, owing to its greater weight, *better* than the brake van.

Although

Although a guard is empowered to make use of the air brake in cases of emergency—as, for instance, when he finds it necessary to stop the train for some reason *unknown* to the driver—there can be no question that when the connections of a train are complete and the driver is working his brakes it would be simply mischievous for a guard to interfere. The driver had charge of the brake, and necessarily must have been the first one to recognise that the train had got beyond his control, and, presuming he had not up to that time exhausted his reservoirs, had just the same power to apply the brakes as the guard.

In working a driver requires to use his power of *releasing* as well as his power of *applying* the brakes, and any attempt on the part of the guard to use his valve would only thwart the driver's action.

It must be admitted, we think, that the engine was slightly overloaded, and had more vehicles on than could be easily *hauled up* a long incline of so steep a grade as 1 in 40.

In accordance with the rule and practice of the Department, it was the duty of the driver, if he had any doubt of his ability to take his train through to its journey's end to have intimated the fact to the proper officer, and to have asked for assistance.

The following is a copy of instructions which appear at the back of all driver's daily reports-sheets:—

“Drivers are expected to use great discretion in deciding what load they can safely take over the different parts of the railway system, fully considering the state of the road, the weather, and the condition of their engines, also the great importance of taking as great a load at all times as possible, consistent with keeping good time.”

It is evident that driver Wilson did not anticipate any difficulty in taking his train to the Ferry, although he expressed a doubt before leaving of his being able to bring it *out* from the same station. This, however, would not necessarily have been required of him, as on such holiday occasions passengers do not return by the same trains, or in the same numbers, as those in which they may leave in the morning, and the return engines would no doubt have been arranged as suitably as possible. We are, notwithstanding, of opinion that there is room for better provision being made against an engine being despatched with too heavy a load, as such a thing can only result in delay and inconvenience to the public.

Still it must be distinctly understood that a reduction in the weight of the load of this particular train would in no way have prevented the accident.

With respect to driver Wilson's selection and qualification for the work allotted to him on the day of the accident we are of opinion that a careful consideration of Shed-Inspector Farquhar's evidence is sufficient to show that there is no ground for censure. Apart from the fact that upon the day in question the resources of the Department were most severely taxed it must be remembered that driving upon a line with a gradient of 1 in 40 would not appear to be a very formidable task to a Loco. Inspector; also, that Wilson was a driver of some years' standing; that he had a long acquaintance with the working of the Westinghouse brake; that it was all *daylight* work; that his brake appliances were ample, and he had been over the road the previous day.

Although it is against the rules for any one other than an authorized officer of the Department to ride on an engine we are of opinion that the presence of Mr. Rennie on the engine beyond Ryde, for which unauthorized action he paid the penalty of his life, should not have been disadvantageous to the driver.

We must also observe that the formal test of the air-brake connections, which, according to the rules of the Department, should have been made by both the driver and guard before leaving Hornsby, was not carried out; the operations, however, gone through afforded undoubted proof that all was correct in this respect.

The fact of the guard not having been over the road previously has no bearing in the present case. It is only where a guard has to share with a driver the responsibility of braking a train, *under the system of hand brakes*, that a previous knowledge of the road is really necessary on the guard's part. With the Westinghouse air-brake in use a guard has nothing to do with the ordinary braking of the train, and therefore any trained man with or without a knowledge of the road may safely be sent under such circumstances.

There are two or three discrepancies in connection with the evidence of one or two witnesses which perhaps we need hardly specially refer to beyond mentioning that

that the effect of the accident has been a severe shock to guard Clissold and it has evidently affected his memory of some of the events, and of the order in which they took place.

Before closing our report we may briefly refer to porter Proctor's action at the points. It is not the case, as originally reported, that he held these over on his own responsibility to prevent the runaway train colliding with two other trains which were standing on the second road; he merely did what he was told-off to do; but he did it well, and is deserving of great commendation for his firmness in sticking to his post.

We desire to draw attention to the manly and steadfast conduct of the late driver Wilson and of fireman Pye.

These men must have known for two or three miles before arriving at the Ferry that certain disaster, if not death, was before them, notwithstanding which both men stood to their post of duty.

D. VERNON (Chairman),
MAX THOMSON,
THOS. MIDELTON,
W. V. READ.

The Commissioner for Railways.
July 1st, 1887.

Departmental Inquiry Board.

PEAT'S FERRY RAILWAY ACCIDENT.

MINUTES OF EVIDENCE.

First Day.—Thursday, 23 June, 1887.

PRESENT:—

DONALD VERNON, Esq., Chairman.
THOMAS MIDELTON, Esq., | W. V. READ, Esq.,
MAX THOMSON, Esq.

Alfred Clissold called in and examined:—

The Chairman.] You were the guard of the excursion train that met with the accident at the Hawkesbury A. Clissold.
on Tuesday, were you not? Yes, sir.

Now will you be kind enough to give us in your own words an account of what took place from the time you left Sydney until the accident occurred? I left Sydney four minutes late. Our correct time was 10:25 a.m., but we did not leave Sydney until 10:29. We stopped at all stations to Strathfield, and then went straight on to Ryde. After leaving Ryde, before we reached the top of the first incline after leaving Ryde Station, the engine-driver came to a stand on the bank and could not proceed. I went forward to him, and spoke to him about the stoppage, and he said that he was afraid he would not be able to get up, and that the water was running short. We then backed down the hill, and stopped on the bank and took water. Then he ran back again and started a second time. When the train arrived at Beecroft, we did not stop at the platform. The engine-driver tried to get up the hill, and came to a stand in the cutting beyond Beecroft platform. I again went to him, and he told me that he did not think that he would be able to lift the train from where it was. We then parted the train. } h

At the cutting? Yes, at the cutting; and we secured that part.

Now be very particular in telling us all you did. I want you to minutely describe everything that you did? Yes sir. The driver said that he thought he would not be able to lift the train from where it was. I then got a sapling and put it right through the wheels. We parted the train after the driver told me that he could not succeed in getting it up.

Whereabouts did you part the train? I parted the train in the cutting at Beecroft.

But what I mean is, whereabouts did you part the train—what part of it did you separate from the other? We parted the train at about the centre. } c

Describe exactly how you uncoupled the train? I got underneath and detached the air-pipe, and shut off the taps.

That's right. I want you to be particular in telling us everything you did. Now, after you had uncoupled the air-pipes and the general couplings and shut off the taps, what did you do next? Well, there was this inspector, Mr. Rennie; he was on the bank at the time, and he went on with the first portion of the train. I remained with the portion that was left behind, and the first portion they put into a siding at Hornsby.

Oh; but you did not see them do that. Tell us exactly what your own movements were? Yes sir. I did not of course see them put the train into the siding.

Mr. Midelton.] I presume that was done at the station?

Mr. Read.] No; near the cutting, at Beecroft.

Mr. Midelton.] Was the tail of the train left on the main road? Yes sir; there was no siding there.

The Chairman.] Just continue your narrative now.

Witness.] After remaining there for some little time they came back for the train, and I attached the engine on to the remaining portion of the train. } c

The Chairman.] How did you attach it—describe it as minutely as you can? I fastened the air-couplings and opened the tap. I then released the breaks, and I removed the sapling out of the wheel.

What do you mean by releasing the breaks? As soon as you backed the engine ———

I know all about that. What I want to know is what happened. You coupled up the air-brakes and opened the taps. Did the driver release the breaks? On the engine he did.

Were the breaks on or off? They were off, and the sapling was holding them.

Now

A. Clissold. Now go on? They took the train into the siding at Hornsby, and I made good the connection between the two parts.

c { Describe exactly how you made this connection good? I attached the air-pipes and opened the taps, and turned the taps downwards. This was done in the presence of a young man who has charge of the station. I do not know his name. He was standing by when I did it. As soon as it was done he said "all right; get away." I gave the signal and the train started. After leaving Hornsby—

Wait a moment. When you got up to Hornsby with your rear portion of the train, how did you find the breaks of the first part of the train which preceded you? I think they were off.

Don't think? Well, I can't say positively whether they were off or on. I did not examine them.

But in making good the two portions of the train, do you remember exactly what you did with the taps?

Yes, but I can't say positively what I did with the taps.

But did you open the taps? Yes, I opened them.

Of the rear portion of the train? Yes, of the rear portion of the train where I got between.

c { Did you open the taps on the portion of the train which you found standing at Hornsby on your arrival there? Yes. I put the taps downwards.

Then you put down the taps on the last carriage of the part that you took up, and you opened the taps of the carriage to which you attached it? I did, sir.

Describe what followed? After we left Hornsby station, going up the first bank from that station the train stopped.

What bank do you refer to? The first bank after leaving Hornsby station. I do not know the name.

d { How far beyond Hornsby? I should say about half-a-mile or better. I was going forward to see what was the matter, and I found that the air had not worked on one of the Redfern composite cars. I found the break on, in consequence of the air not having released itself. I released the air and the driver started away, and did not stop again. And going down I found that all went right until we got through the first tunnel. There were no other stops, and after passing through the first tunnel I found that the speed was increasing.

Do you remember noticing whether the break was applied by the driver before you arrived at the first tunnel? I cannot say positively, sir.

That is all I want. Now continue your own description. Which carriage were you on? I was on the car next to the engine or the second one from the engine at the time. Yes, it was the second car from the engine. I was on the rear end of the American car. I noticed the speed of the train was increasing, and I applied the hand-brake with all my might. The engine driver then opened his whistle, and kept it open all the way, and I hung on to the brake with all my might. This was as we passed through the first tunnel, between No. 1 and No. 2 tunnels. There is a water-tank near the place.

What did you understand by the whistle? I thought that there must be something wrong by the driver's continuous whistling.

It was continuous whistling? Yes, not sharp whistling, but an open whistle, and he kept at it continuously all the way down.

Was that after he emerged from the tunnel? That was after he was going from No. 1 tunnel, as near as I can remember.

And how long was that whistling kept up? Until such time as the engine and the driver went over the bank.

Do you remember noticing whether any application of the brake was made about the time that he commenced to whistle? I cannot say positively.

Then you do not remember any application of the Westinghouse brake after leaving Hornsby? No, sir.

I want you to be careful, and to try and remember? Yes, sir; I will give truthfully what I know.

I don't mean that; I know you speak truthfully. What I mean is in regard to your memory—try and be careful and recollect? Yes, sir; as far as my memory goes, I will give you the truth.

h { What I want is for you to do your best to remember what really took place. The Inspector, Mr. Rennie, was riding on the engine from Hornsby, and was with the driver. The driver never made any remarks to me about the end of his train after the time that I spoke to him. The fireman made a remark to me, in the presence of the Inspector, that he was afraid the brakes would not act, that the donkey would not act, and he then stepped out on the foot-plate, and began to rap the cylinder with a piece of iron to show what he meant.

Where did that take place? I think that was after we left Ryde. He ran back twice, and made two attempts, after leaving Ryde. The first time he was stopped.

Mr. Midelton.] He was going with the tender first? I don't really know, but I believe he was.

Were you on the fireman's side of the engine? No; on the driver's side. Then we were all standing in company, and I was standing close by when he made the remark.

And he went out on the driver's side to object to the donkey? Yes, before the piston would work.

The Chairman.] I understand you to say that the fireman expressed his fears that the donkey would not work? Yes, in the presence of the driver.

The fireman did not complain that the donkey had failed up to that time? No, he merely expressed a fear that it might fail.

Now, then, will you finish your account? Yes, sir. I then hung on to the break with all my strength, until such time as the train turned over at the river. One portion of the car that I was standing on telescoped into a car of the Redfern type. And the first person I saw when I recovered myself was the inspector. He was the first man I saw, and he was to all appearances dead. He was lying on the bank. I then rendered all the assistance I could in getting the injured out of the train. I helped to carry one young man who was taken out quite dead. His name I cannot now tell. I then rendered all the assistance I could in getting out the wounded.

Did you make any examination of the train after it was wrecked? I did; I looked around and examined it as Mr. Kirkcaldie did when he came down.

Never mind Mr. Kirkcaldie—tell us what you did? I examined it, and found that it was all complete.

In what way complete? That the taps were alright and open.

The train never parted, then? The only portion that parted was the engine from the first carriage.

And it was all as it was at first—just coupled together? There was no portion of the train parted except the engine from the carriage.

I think, if you recollect a moment, you will see that some of the cars telescoped into one another? No; the car telescoped into one of the Hudson type. Well,

Well, and were they not uncoupled or separated by that cause? I did not notice.

A. Clissold,

But it was inevitable, was it not? Oh, yes; they could not have telescoped into each other without becoming uncoupled. It was an impossibility.

Yes, and the couplings must have been broken in that case? I should think so.

Mr. Thomson.] Have you any idea as to what speed the train came down that incline? I hardly know. All I know is that we came down at a very great speed. I was slung off my feet several times, and had all I could do to hold on.

Could you not make a rough guess—were you going 20 miles or 40 miles an hour? I should imagine that we were going at least 40 miles an hour, but I really could not possibly say. It was a very great speed, and I had all that I could do to keep on my feet.

The Chairman.] What cars were those that were cut off at Beecroft, and with which you remained behind, while the driver took the other portion up to Hornsby? It was a Redfern type of car.

The two? Two only.

Mr. Midelton.] One was a new car? Yes; one of them was quite a new car.

The Chairman.] And when you recoupled the train at Hornsby these two cars were in front? Yes, sir; near to the engine.

Mr. Midelton.] The American car was the rear car when you left Sydney? Yes, sir; and I remained upon it as guard up to the time that its position was changed.

The Chairman.] Did you put on your brake before the driver whistled or after? I put on my brake after the engine-driver whistled.

After he whistled? Yes, sir.

Did you notice whether you really applied the brake or whether you were only screwing it up tighter—did you put the brake on, or did you merely work your wheel? I applied the brake, Then the brake was off immediately preceding the time that you worked your wheel? Yes, sir. I put the brake on.

Mr. Midelton.] Would you describe again the action which you took at Hornsby—just tell us exactly what you did when you got the two front cars on to the second portion of the train—did you couple the train yourself? I did.

Now describe in your own way what you did? The first thing I did was to couple the air-pipes together. I then turned the taps and afterwards attached the side chains. This was done in the presence of the young man who has charge of the station at Hornsby. I do not know what his name is.

Now is that all you have to say about it—you have left out the main portion—you have omitted the main screw couplings? Of course I mean them too.

But you did not tell us? Yes; but I had, of course, to put the screw couplings on. The young man brought the screw couplings from the other part of the train.

Mr. Midelton.] That is a very important piece of evidence. You put the screw couplings on first? Yes, sir.

And then you put on the air-pipe, and then the side chains? Yes, sir.

Who received the signal—the driver or the fireman? I think the driver was standing at the side when I gave the signal. I think he was on the left-hand side of the engine.

Now will you proceed from Hornsby to the first tunnel;—could you say whether the driver applied his brake between Hornsby and the tunnel? I really could not say.

Mr. Read.] Do you think that if the air-brake had been used on the cars it would be noticeable? No answer.

The Chairman.] He has already distinctly said that he does not remember. I have asked him particularly whether he remembers the driver using the air-brake at all or not.

Mr. Midelton.] Did you notice that this brake had worked properly up to Hornsby? Yes, sir; I think so; I think it acted when the driver stopped on the bank. } c

Everything went right up to Beecroft; then you went on in consequence from there to Hornsby? Yes, sir.

The Chairman.] Referring to the statement which you have already made, that soon after leaving Hornsby, when you found the train had stopped, you went forward and released the air-brake on one of the carriages;—can you now tell me which carriage that was? That would be one of the carriages of the Redfern type.

I do not mean exactly the kind of carriage it was; what I mean is where it stood in the train;—how far was it from the engine? As near as I can remember, it would be the third carriage from the engine. It was a closed second-class carriage that was next to the engine. Behind this was another car that kept me from getting to the other.

Do I understand you to say that it was the third carriage from the engine that you released the air-brake from? Yes, to the best of my recollection.

What carriage was it that you were standing on,—that you jumped upon when the driver started away? The second from the engine.

Will not this help you to remember the particular carriage from which you released the brake—the fact of your jumping on the second car from the engine; the driver started away immediately when you released this air-brake;—now was that the car the brake of which you released—was the car behind the one that you jumped on, or was it in front of it? Well, I really can't positively say just now.

But there was only one car in front of you;—you were on the second from the engine? Yes.

Now cannot you recollect;—can you tell me whether it was the car next the engine, the brake of which did not release itself? To the best of my recollection it was the second car next to the engine, the brake of which did not release itself.

Then you must have run the whole length of your train before finding out what was the matter? Yes, sir.

You remember doing so now? I do.

And then you say, to the best of your recollection, that it must have been the car next to the engine the brake of which did not release itself? Yes, sir.

I wish you would try to recollect the circumstance exactly. Try and refresh your memory, and see——

Mr. Midelton.] Was it a four-wheeled car or an eight-wheeled car? No answer.

The Chairman.] The one next the engine at this time must have been an eight-wheeled car. *To witness:—* Do you remember whether it was a four-wheeled or an eight-wheeled car? Well, I do not know. I am trying

A. Clissold. trying to recollect the position of the tap. The tap was on the right-hand side of the carriage. I was just calling to mind whether I did not stoop underneath.

Mr. Midelton.] Quite so.

Witness.] Some of them you can get at quite easily, but I really cannot for the moment say positively.

Mr. Midelton.] Where was this particular tap? On the side.

The Chairman.] And you had not to get under the car? No, I could reach it quite easily without getting under. Now that I call to mind, I think it was one of the old carriages, because I could see the grease and oil around the release tap. That is what makes me think of it. The new carriages coming out would be all bright and clean.

Mr. Midelton.] Do you remember what the tap was like? Well, I will just describe it to you. It was in this way. [*Witness gave certain illustrations to show the position and character of the tap. Mr. Midelton here showed the witness a diagram.*]

Witness.] The handle was hanging down at the side and could be moved either way. As soon as I opened it I waited until the blocks were off, because I could see that it got on the blocks.

The Chairman.] Now, after thinking over it again, can you speak as to the position of that car;—how far was it from the engine? It would be the third—about the third. I can tell you as near as can be how they were placed. The one next to the engine was of the new Redfern type. There was a closed second next to the van that telescoped into where I was standing; and next to this were four open carriages. There were nine in all.

Now I will ask you again. Can you from your recollection of the circumstances, say whether it was the first, or the second, or the third car from the engine, or the fourth from which you took off the blocks? It was the third, I believe sir.

Mr. Midelton.] The second from the engine was an American car? Yes, and it was there that I was standing.

And it was the next car which you took the break off? Yes, sir; it was a four-wheeled Second-class.

And a Redfern composite car was next to that? Yes, sir.

And what was next to that? There were four open carriages trailing. In regard to the position of the carriage which I took the block off, the one next to the engine was a new carriage. It is number 114 of the Redfern type. The next was No. 47—a first-class American carriage; the next to that was a second-class carriage, No. 73, next to that was a four-wheeled second-class; to the best of my recollection, the next to that was an eight-wheeled; and then there were four open second class carriages. These were right at the rear.

Mr. Midelton.] No. 70 was there, what is it? It is an eight-wheeler.

And what was next to that? Then the composite car. The American car.

The Chairman.] Then you can only remember eight carriages in all that you can describe? No sir; I cannot call to mind any more.

You cannot tell us what the ninth vehicle was? No. I cannot give any description of it.

Henry Perkins called in and examined:—

H. Perkins. *The Chairman.*] You are an engine-driver? Yes, sir.

Who are you working for at present? I am at present engaged with Messrs. Amos Brothers.

Mr. Midelton.] How long have you been employed at engine-driving? About six years driving; but I have been engaged with locomotives for about ten years.

The Chairman.] How long have you been employed upon this contract? About fourteen months.

You were present at the scene of the accident on Tuesday last, I believe? Yes, sir.

You saw the excursion train arrive at the Hawkesbury? Yes, sir.

Will you give us in your own way an account of what you saw on that occasion? Yes, sir. I was standing with a number of other gentlemen just about—I should say—about a chain away from the points which Proctor held. I think I was about one of the first who saw the train and heard the whistle as she came rushing along. I sang out to the men that the train had got away from them. I saw Proctor holding the points, and one of the men called out to him to stick and hold the points. Just as he did so, she flashed by, and as it struck me that I was rather close, I got out of the way. The first thing I saw after the collision was the body of the Inspector, Mr. Rennie. I saw the fireman slung over into the water, and I went to his assistance. I took him out and got him a dry pair of trousers and other clothes. I told the people who were standing about not to be alarmed, as there was no danger of the boiler bursting. I jumped over to it after I got the fireman out, and I then tried to see if I could discover the driver, for whom I looked everywhere. I did not succeed in finding him. Previous to this I looked around, and saw that the "Donkey" was working. I shut off the "Donkey," and shut off the taps of the gauge-glass. I had a look to see what the position of the engine was, and I saw that it was in forward gear, reversed, and the regulator partly open. I saw that there was no danger from it, and no cause for alarm. The steam was blowing off from the injector-valve. It was blowing off there and also out of the safety-valves, so I told the people about that there was no danger. I then looked around in order to see if I could not render some assistance; but seeing nothing to be done, I went back to the fireman, and got him a dry shirt, a pair of trousers, socks, and an overcoat. I then sent him away to the train. I then walked around to see what damage had been done to the contractor's plant, and to see how far the engine and trucks had been damaged.

The Chairman.] That pretty well represents the part you took in it? Yes; that is about what I did. I then went and had a look at the train to see if the brake-blocks were on it. I brought the fireman with me of engine 81. I found that the blocks were hanging quite loose. I did not touch them except with my foot. I saw at once that they were hanging quite loose.

The Chairman.] Did you examine the whole of the blocks? No, sir; only two pairs; saw pairs of wheels on the side of a carriage. I saw that the air was supplied from the engine. The valve was open, and the lever drawn up. I saw that the lever was open when I looked around the engine.

Mr. Midelton.] You mean the driver's break-valve? Yes; the lever by which the air is applied to the train.

Did you notice anything about the sand gear or the tender? The tender was just above the water; I was standing on the side of it.

The Chairman.] Have you any idea at what rate of speed the train came through the station? Well, a person asked me the speed and I said about 50 miles an hour. The person laughed at me and said that it could not have been above 20 miles an hour.

Mr.

Mr. Midelton.] Was she coming tender first? To the best of my belief the tender was first; I saw that ^{H Perkins.} they were waving off the train at half a mile distant.

Which side of the line were you on? I was on the hotel side, but close to the line.

Did you notice the position he was in when the driver passed you? No; I could not see who was on the engine. I could not notice the position of anyone.

You could not tell from the sound as the train came along whether the brakes were on or off? No; everything passed so quickly that I could not discern anything.

Was the "Donkey" working slow? She was working slow just as if she was at high pressure; she was just barely in motion. She was in the water, and the funnel being off, she made a peculiar noise. This peculiar sound from the exhaust from the donkey working would not let the people go near.

Mr. Thomson.] Did you notice the pressure of the air on the gauge? No; it was so disfigured that I could not notice anything.

Mr. Read.] What part of the train was it that you tried this brake? To the best of my belief it was the third carriage from the engine.

Mr. Midelton.] Was it a four-wheel or an eight-wheel carriage? I really could not say. Of course I was a bit excited by the occurrence. I brought the fireman over to the cars and asked him, "How do you account for that?"

Mr. Thompson.] Did you examine the wheels of the two carriages that telescoped? No, I did not.

Mr. Midelton.] Did you know the driver or the fireman of the wrecked train? Yes; I met them on the previous night; they were with me then. He was unable to get up the bank on the previous night, and I came back to see what was the matter with him. He could not get up the bank, as the engine slipped. That was how I got to know him. I was just talking to him for a few minutes, and he said that he would not have had it happen for a five-pound note. He got partly up the bank, but could not get up the whole way. This was when he was going on the trip to Sydney, and I am alluding to the bank leading up from Peat's Ferry to Sydney. The driver said also, "I don't suppose that they will let me come up here to-morrow now; I was to have been up here to-morrow, but on account of this happening I suppose that they will not let me come up." He seemed to think that a great many people would be going up there on that day, and for some reason or other he was anxious to be there too.

This was on the previous night? Yes.

And how could he speak of the up journey before he made it? I met him after he had tried to get up the bank and had come back again. I saw him go away from the station on Monday night; he went to the third tunnel from Peat's Ferry. I have been working on that road for several months, and have done the principal work upon it.

What is your experience upon that grade when you have loads? Well, I only went up the bank at the rate of 5 or 6 miles per hour.

But I am speaking now of going down? Oh, I always came down very cautiously, because I came down with very heavy loads; I used to have 10 or 11 tons of bricks, or stone, or whatever it might be.

Do you always have a brake van on your train? Sometimes we had a brake van.

Have you ever had a mishap? No, but I think it was because I have always been very cautious.

The Chairman.] What was the weight of the engine that you drove along that road? About 46 tons.

What would the engine weigh? About 50 tons—that is to say, the engine and the tender.

Mr. Midelton.] What engine is that you refer to? It is the "Westward-ho," and is made by Kitson. I should tell you that when I got the fireman out of the water I asked him where the train got away from them; he was then quite conscious at the time, and he said that the train got away from them just about the tanks, and that when she got away they could not pick her up again. The train got away just about the place where the grade 1 in 40 commences, near No. 2 tunnel, on the Peat's Ferry side.

Mr. Midelton.] That was his voluntary remark to you? Yes, sir, that is what he said to me.

Did he say anything else to you at that time, or did you ask him any questions? I said how did this occur? He said "We have had too many on." These were his words. He then asked me about his mate and Mr. Rennie, and I told him that I thought he was no more; that it was all over with his poor mate, and that Mr. Rennie was killed outright. He said to me that he would have forfeited his life for this man (Mr. Rennie).

Do you know if Mr. Rennie was in the habit of riding on engines belonging to the Government? No, he did not generally do so. He generally rode on the trains. He sometimes rode on the engines if he knew there was an engine-driver going who was unacquainted with the road. He used often to ask if the driver knew the road, and if he did not he would generally ride along with him on the engine to show him the road.

What was Mr. Rennie's profession? I do not know what his profession was, but he was manager for Amos Brothers.

Mr. Thompson.] Did the fireman mention anything about the brakes to you? No; he did not mention anything there about them.

Mr. Midelton.] Or about the donkey not working? No.

Did he say that anything had failed? No.

Your conversation with him the night before was a very short one? Yes; he merely said that he might be coming up to-morrow. We were talking just when he was standing on the foot-plate.

The second time he tried to get up he succeeded? Yes; but he was pushed by another engine.

Was the engine he had on Monday evening the same as he had on the second day? No; he had number 176 the first day, and number 178 the second day.

Number 178 is the one that now lies at Peat's Ferry? Yes.

You are sure of that? Yes; that was the one I saw there; he told me that he had 176 on the Monday evening.

You did not see it yourself? I could almost believe that I did see it; now I remember I did see it; I gave one look at it, and I could see that it was number 176; I know this also because he said to me, "I will not have the same engine to-morrow."

Did he say what engine he would have to-morrow? No, but he said that he was afraid that they would not allow him to come up on the following day, as he seemed very anxious to do.

William Frame examined:—

W. Frame.

Chairman.] What is your position in the Service? I am an engine driver.

How long have you been driving? Between twelve and thirteen years.

Have you been working long on the Hawkesbury line? No; only on Monday and Tuesday last.

You were down at Peate's Ferry on Tuesday, the day of the accident? Yes; I went from Sydney with the 8 a.m. special.

Will you tell us, in your own words, what you saw and did on the occasion of the accident? Well, when the train was coming down around a curve, I suppose about 500 yards away, I first saw her. When we first saw the train, I noticed that the pointsman was standing near the points, and as the train was getting closer I saw him looking up and down the line. I said to him, "You hold those points, and stick to them whatever you do." At that time I was standing about 15 or 20 yards from him, for as the train was coming down we got closer to the line. After the train passed me I followed it down as quickly as I could, and I met the contractor's driver; he was holding the fireman belonging to the runaway engine, and I then helped to carry him. I afterwards turned back and looked for the driver. After I had glanced around the engine to see if I could find him. I went up and assisted in getting a little boy out of the American car. A man carried him away, and I went back into the car. I saw that there were already too many in there to do any good, and I came out.

Were you on the wrecked engine at all? Yes.

Did you make any examination of the engine itself or its working parts? No, it was nearly covered with water, but you could just get along the foot-plate of the engine?

Did you see anybody else on the engine? Nobody at that time, but afterwards the contractor's driver and myself went on the engine together.

What did you do on that occasion? We looked around to see if we could find the driver. The contractors' driver shut the gauge glass-cocks; there was water in the glass at the time.

Did you notice whether he did anything else? Not then.

Did you notice particularly the regulator? No, I did not.

Did you make any examination of the carriages that were wrecked? I had a look around the carriages. I found that there were none of the blocks on any of the wheels; but I could not get at all of them.

How many were there that you could not get at? There was the American car. I saw part of it, and in front of that was a first-class carriage, both being heaped together.

Have you any idea of the speed of the train as she passed the pointsman? Well, I could hardly tell, but as near as I could guess I think she was going at about 60 miles an hour. She was going very fast, as was shown by the way the train was oscillating.

Mr. Midelton.] Were you the driver of the up train standing there? Yes.

You were waiting for Wilson to come in before you could go out? Yes; he had to come in before I could get away, but I was not supposed to leave there till 10 past 4; but directly after the accident the station-master told me to get ready to take the injured back to Sydney as quickly as I could.

Was that directly after the accident? No, not directly; but it was not long after I had been looking around the train.

Did Wilson make any signal at all? Yes; he was whistling all the way before he came in sight.

With what object do you think? Because he knew he was going too fast, and that he could not pull up at the station. That, I think was his idea in whistling.

To create attention at the end of the hill? Yes.

Did you notice anybody on the foot-plate of the engine as she passed you? They went past so quickly that you could hardly tell whether there was anybody on the foot-plate.

Engine first, or tender first? Tender first.

Did you have any conversation with Wilson the day before? No; I had spoken to him but had no conversation.

Have you had any difficulty in going down the incline with your train? No.

You had only been down once before? I have only been twice down altogether, and each time had no difficulty in going down.

Had you any difficulty in coming up? No.

Had you the same class of engine as Wilson? No; mine was a different class of engine. I had No. 63—one of Stephenson's.

Did you run 63 the day before? Yes; on each day.

Six wheels coupled in one case, and four wheels in the other? Yes.

How long have you been working 63? Only since last Thursday.

Is she fitted with the Westinghouse brake? Yes.

Was that done lately? Yes; but I may mention that I worked 63 when I came out here first; I then ran her along with goods.

Mr. Thompson.] Did you examine any part of the broken gear after the accident—wheels or anything like that? No, I only looked at them as I was going along.

You did not touch them? No, I did not.

Mr. Midelton.] Did Mr. Rennie ride with you the day before? No.

Did he ever ride with you? No; the Station-master at Hornsby wanted to ride with me the day before, but I would not let him.

Did you go tender first the day before? Yes, I went down tender first both days; I heard it was a steep pinch to come out, and of course it would be better to come up engine first.

Mr. Read.] What load had you the second day? I took eleven carriages the second day.*Mr. Midelton.*] I presume this was extra traffic, and that the trains Wilson and yourself were running were extra trains over the time-tables. Who regularly worked the time-table trains? Cartwright.

Is that the only man? Except the goods, and I don't think the goods go down there now.

Did Cartwright take the regular train down that day? He would take it down at night. He comes from there in the morning and goes back at night.

I think you said the pointsman was at the points when the train came in sight? He was standing over against the lever when the engine was coming around the corners. He was sent there purposely to stand at the points to let the train in.

You say he was sent there? Yes, purposely to do it; and I was afraid he was not going to do it from the way he looked; that was what made me sing out to him.

William

William Hume examined:—

W. Hume.

Chairman.] You are an engine-driver? Yes.

How long in the Department? Since 1870.

How long driving? Since 1875.

You were at the Hawkesbury River on Tuesday last when the accident took place, were you not? Yes.

What took you up there? I went up with a second special, 8.15 a.m., from Sydney.

What engine were you driving? I was driving S1.

What load had you on? On Tuesday I had equal to seven and a half.

Now give us your own account of what you saw and did in connection with the accident? Of course I arrived there about 10.20 in the morning, and I was knocking about my engine till shortly before this train came up. I then walked up towards the station to Mr. Cavanaugh. He said, "This is a go"; I said, "What is that," and he said, "This train being so late." I think she was about two hours late at this time. Driver Frame was there, and was watching some men who were chalking off some ground. I went over to him, and a few minutes afterwards I heard the train coming down the bank. I heard him continuously whistling, and I thought there was something wrong then. Almost immediately after hearing the whistling, I saw the train approaching through the cutting. The shunter was at the points, and three or four of us almost simultaneously shouted to him to stick to the points. Almost immediately afterwards the train passed, and there was no chance of doing anything except to hold the points over. As soon as the train had passed I ran down to see what had occurred. I saw the train broken up, and I assisted in getting the passengers out.

What speed do you think the train was going? Well I should think she was going fully 50 miles an hour. Well go on with your account;—what did you do next? At first I saw a little fire coming from one of the carriages. I then went back to the engine, got some water in a bucket, and we extinguished the fire. We then commenced carrying the wounded and all those who had been in any way injured in the carriages out. When that work was completed we searched for the driver, and we found him under the engine, but we could not get him out.

When did you find the driver? After the passengers were got out of the carriages.

Who found him? There were three or four of us there when he was found. I think one of the contractor's men went down into the water and he found him. He just managed to get one arm above the water, and you could just see the top of the driver's head, as the tide was pretty low at the time.

Did you make any examination of the engine as she lay in-the water? No; we could only see the top, but we noticed the air-gauge.

Tell us precisely and minutely what you did notice? I noticed the air-gauge standing at 70 lb., and I heard the Donkey working while in the water.

Did you see it? Yes.

And you could read the air-gauge? Yes, I could. The steam valve was open, for the right-hand injector was blowing off at the time, and she was wasting steam on that side.

How was the regulator—was the engine in forward or backward gear? I did not notice the reversing gear. My mate said he noticed, but I did not myself.

Did you notice anything of the sand-valves? I did not take notice of her sand-boxes. You could not see her tender valves, as she came down tender first.

Did you make any examination of the wrecked carriages, or did you look at the brake blocks, wheels, or axles? I noticed several of the brake blocks loose on the wheels, and I saw that the tires were not in any way warm. I brought my mate along to notice the brakes, and I found that the taps were turned down on all the carriages except the front carriage, and I could not get down there to see, nor could I get down to the tap on the engine. } g
e

How many tires did you feel? I felt the tires of two carriages; one of them was the composite carriage; I think it was next to the car where the guard was.

Did you feel the wheels of those vehicles which telescoped into one another? No, I did not feel them.

Mr. Thompson.] Did your mate feel them? I could not say whether he did or not.

The Chairman.] Is that all you know about the accident? That is all I am aware of.

Mr. Midelton.] Was that your first trip down there? Monday and Tuesday was the first time I have ever been past Strathfield on that road.

How did you get on with your train? I got on very well; of course I had a train that I could manage properly.

Did I understand you to say that you felt the tires of the third carriage from the engine? Yes.

Was it a four-wheeler or an eight-wheeler? It was a four-wheeler, as near as I can remember.

What were they like? They were pretty cool.

Did anybody else feel the other tires? Not that I am aware of.

The Chairman.] What was your object in feeling the tires? On account of the great speed she came down. I thought that the taps could not be turned because of the great speed at which she came down. } g

You found them cool? Yes.

If you found them hot, what would you infer? That the brakes were on.

What do you infer from finding them cool? That the brake had not been on the carriage. If it had the tires would have been very warm.

You know that from experience? Yes, both on goods and passenger trains.

You have often felt the tires of wheels to ascertain this? Yes.

Mr. Thompson.] You stated that you saw a carriage on fire? Yes.

Which one was that? I am not sure whether it was the American car or the Redfern type. The fire was in the under-frame against the gas cylinder.

You are not certain where it was? No; it was just where the two carriages were telescoped together; but I am not certain whether it was the Yankee carriage or the Redfern pattern.

Mr. Midelton.] How do you think it originated? I could not tell.

Mr. Thompson.] Could it have come from the brake-blocks? No; I fancy it was from the escape of gas.

Mr. Midelton.] Some fire may have tumbled out of the ash-pans? It might have been so. I think that is a most likely thing.

Did you have any conversation with Wilson the day before? I just spoke to him, that is all; I had no conversation with him. } g
The

W. Hume. *The Chairman.*] You have known tires to become very hot by the continual force of the brake-blocks
 Very often.
 To what extent? In coming down a hill; in other places I have found the tires very hot.
 Were they so hot that you could not touch them? Yes, often that is the case. Sometimes I have seen the brake-blocks on fire. I have seen that done, and sometimes they will do that in very short distances. But you have also found them to become very hot with the ordinary iron shoe? Yes.
 So hot that you could not touch them? Yes; I have seen it become so hot as to discolour the iron.
 Sg { *Mr. Read.*] How long after the accident was it that you examined the wheels? I could not say exactly. It was as soon as we got the passengers out of the carriages. We were very quick over that as there were a good many hands there; but I could not say exactly the time.
Mr. Thompson.] Was it half-an-hour? It might have been.
 Do you think the tires could have got cool in the time? No, not if they were very warm; they would not get cool in the time.
 This was the third car from the engine—a four-wheeled second class? Yes.
Mr. Read.] You say you did not feel the tires of the carriage next to the engine? No, I did not.
The Chairman.] You say your mate was on the spot? Yes.
 Did he render any assistance? Yes.
 Could he give us any further information than you have afforded? I could not say; but he is here.

William Neale examined:—

W. Neale. *The Chairman.*] What position do you occupy? I am a fireman.
 How long have you been firing? Three years and seven months.
 I understand that you were on the scene of the accident on Tuesday last? I was.
 Will you tell us in your own words what you saw and did as briefly as you can? I did not see anything of the train coming in. I was in a carriage at the time having something to eat; but I heard the crash, and the flying wreckage knocked me out of the carriage.
 What carriage were you in? A carriage on our own train—the first carriage from the engine.
 How came you to be knocked out of it? I was in the front end of the carriage, and some of the trucks against which the train collided struck our engine, then I helped to get the passengers out of the carriage.
 Did you go to look at the wrecked engine? Yes; after I heard that the fireman was got out I saw the engine lying there. She was engine first then; but she came down the embankment tender first.
 Did you notice the reversing gear? Yes.
 How long was that after the smash had taken place? It may have been an hour.
 Was anybody with you? Yes; the contractors engine-driver was there; he was on the engine at the time.
 What else did you notice besides reversing gear? I noticed that the lever had been opened and applied, and the indicator showed, I think, about 60 lb. of air.
 Did you see the indicator? Yes.
 Did you read it? Yes.
 Why, don't you remember the exact register? I would not be certain about it, but I think it was about 60 lbs.
 Why do you think it was 60, more than 50 or 70? I could not now positively state whether it was 60 or 70; it was one of them.
 Did you notice the figures? Yes; but I do not positively recollect.
 Did you notice anything else? I did not inspect the engine; but I saw the brake-blocks all loose and hanging.
 How many did you examine? I examined the blocks of two carriages and they were all loose.
 Did you examine the blocks of the carriages which were telescoped into one another? No; it was the two next to them that I examined.
 The third and fourth vehicles from the engine? Yes.
 Did you examine anything besides the brake-blocks? No.
 Did you feel the tires? Yes; one of them.
 Sg { How many? Of the two carriages that I examined.
 Were they cold or hot? They were perfectly cold then.
 How long was that after the accident? It might have been two and a half hours after.
 As long as that? Yes; fully.
 Did anyone feel them before you? Not that I know of.
Mr. Thompson.] Did you expect to find them hot at that time? I did after the distance they travelled if the brakes were on all the time.
 Are you any judge of the speed of trains? Yes; I can tell pretty well.
 But you did not see the train coming down? No, not till after it had left the road.
Mr. Midelton.] Did you hear the whistle? Yes, I heard a whistle before she came.
The Chairman.] Did you manipulate any part of the engine as it stood in the water? No, I did not.
 Did you see anyone else manipulate it? No, I did not.
 You merely looked at it? Yes, that is all.
 Was the steam-gauge readable? No, I think the steam-gauge was broken.
 You did not read it at any rate? No.
 Did you notice anything about the sand gear? No, I did not. I could not see the sand gear.
 Did you know driver Wilson? Yes.
 Did you see him the previous day? Yes.
 Did you have any conversation with him as to the running of the trains or engines? I only said to him that we were all strangers down there on the road, alluding to three drivers and three firemen, who were there. He was going oystering at the time.
 Going where? Going down to the river to get oysters, so I had only time to just speak to him as he passed.

Mr.

Mr. Midelton.] You are fireman to Hume? Yes.

W. Neale.

Was that remark of yours voluntary about your being all strangers there? Yes; I made the remark to Wilson when I met him.

Did he make any reply? No; he simply said "Yes" as he passed by.

Thomas Cavanaugh examined :—

The Chairman.] What is the name of your station? Hawkesbury River.

T. Cavanaugh.

How long have you been connected with the Department? Seventeen years last February.

What positions have you filled? First as porter, afterwards as guard, and now station-master.

Give us your own account of the accident which took place on Tuesday last, and the part that you took in it? The first thing I heard was whistling, naturally supposing that the train was coming in as usual. As she was coming through the cutting, I could tell that there was something wrong, and I called to the porter to stick to the points, but he says he never heard me. It was the usual thing to turn the trains on to the road. He held the points, and the train came rushing past the platform at a furious rate. As soon as she did I wrote a memo. to the Traffic Manager, and telling him that there was a great smash, and some persons killed. I ran out and got some people to assist me. We had a train standing on the other road ready to go out in the evening. I got all the men, and I got the passengers out of the carriages as soon as I possibly could. I wired again saying that I would send a train on to Hornsby with the injured passengers, and asking for medical aid to meet them there.

I want to know more particularly what transpired at your station and what, part you took in examining the train? I did not examine the train then. First of all I got all the assistance I could to get the injured people away.

Did you make any examination of the wrecked train? After I got the trains away I went around and examined the carriages. I saw that they were knocked to pieces and, one telescoped into another. The brakes seemed to be hanging quite loose, but I did not notice all of them. } g

How long was that after the accident? It was not until I got the train away with the injured persons; I cannot exactly say how long it was after the accident.

You have two platforms at your station? Yes.

And two roads only between them? Two roads only.

How were these roads occupied on the day of the accident, and at the time of the accident—just tell me how the roads were occupied before the train came in sight? One road had two trains on it with the engine Sydney way, each ready to go out at the appointed time. The other road had a number of trucks on it down below the platform. There were eight Commissioner's trucks and five contractor's trucks. I think. The contractor's engine was at the other end of them. The engine was on the road leading down to the punt.

The other road, then, was clear as far as the platform was concerned, and these trucks stood before and beyond the platform? There were two trains on one road and the trucks stood below the other platform.

I want to know more particularly how the roads were occupied between the two platforms? One road was empty, ready for the reception of the incoming train? Yes.

What direction did you give for the reception of the expected train? I told the porter to go and hold the points to let the train in.

Did you see him do it? Yes.

Did you see the train run through? Yes.

What rate do you think the train was running at? I never saw a train running so fast in my life before. I think she must have been going at about 60 miles an hour.

Where were you when the train ran past the platform? I was standing on the platform.

You saw the man at the points? Yes.

Is that all you know about it? I think so.

Patrick Proctor examined :—

Chairman.] You are a porter in the Railway Department? Yes.

P. Proctor.

Employed at the Hawkesbury River station? Yes.

Will you tell us, Proctor, what you know about the accident which took place at your station on Tuesday last? Well, this train was due at 12.20, but she was running late. I got my orders from the station-master about the time the train was due, and I went up and lowered the signals for her. I then waited about for her. Some minutes before she came I heard the whistle, and as the whistle did not stop I knew that there was something wrong. I then kept a look-out for her. As she was coming through the cutting, and I noticed that the speed of the train was altogether too heavy, I prepared for her and stuck to the points to put her on to the road. She rushed past at a great speed, but I held on to the points until she had passed by.

I suppose you are not a judge of speed? I could not say what speed she was running at.

You have not been a railway guard or fireman? I am not able to state what speed she was running at.

I did not take particular notice of that. My attention was all to the points to put her into the siding.

But you felt the train as it passed by you? Yes.

Did it affect you in any way; did you feel the rush of wind? The wind gave me a bit of a shock, and it carried my cap away about 30 yards also.

Were there any others standing by you at the time that she came into the station? There were a few men that were working there, standing by.

But did anyone else besides you notice that the train was coming in at a great speed? The station-master has since told me that he sang out to me. The fireman also said that he told me; but if they did I never heard either of them. I saw that there was some danger, and I attended to the points. If I had not done so she would have run into the main line, and there were two trains standing before her.

What you call the main line is the line running alongside the platform? Yes.

Is that all you know about it. What did you do after attending to the points? I then turned round—made the signals right, and followed the train up.

You

P. Proctor. You gave what assistance you could, I suppose? Yes, I assisted in every way I could.
Chairman.] I am glad to see that you acted like a man, and stuck to the points. Of course it was your post of duty; but some men would have left the points alone to insure their own safety? I knew that if she was allowed to run in on the main line she would have collided with a train half full of passengers.
Chairman.] Yes, you did the right thing at the right time, and I am glad to see you did it so well. I have no doubt that Mr. Read has made a note of it, and that you will hear from him in due time.

Francis Cox Johnstone examined:—

F. C. *The Chairman.*] What is your position? I am a station-master.
 Johnstone. Where? At Sydney.
 You were on duty on Tuesday morning? Yes.
 Up till what time of the day? Till 5:30 p.m.; but I gave up charge at 3 o'clock.
 You were on duty when the excursion train that came to grief at Hawkesbury River was despatched in the morning? Yes.
 Can you tell what took place when that train was made up, and what it was composed of? Commencing at the tail end, that is the furthest from the engine, we had a first-class American car, 47 is the number; then next to that we had a Redfern type first-class carriage, 114; then we had an ordinary open second class carriage, 45; another carriage of a similar kind, 25; two others also of the same kind, 43 and 19; then we had what we call a smoking composite American car, 69, and a composite Redfern type of six compartments, No. 70; then an ordinary close second-class carriage, 73, a four-wheeler, which was next to the engine.
 Was this train made up by your direction? Chiefly; it was a train that had been formed the night before.
 a But was it made up by your direction? Well, I take it that the foreman the night before would have made it up.
 Who was the foreman? Foreman King.
 What instructions were given him as to the composition of this train? I am not aware, Mr. Collins was on duty at that time.
 Which of these cars were four-wheelers and which of them eight-wheelers? The four-wheelers were the open seconds, 45, 25, 83, 19, and the closed second 73.
 Are you in a position to give us the weight of these respective vehicles? Yes. 16 tons 10 $\frac{3}{4}$ cwt. was the weight of the first-class car, 47. The other weights were—114, 17 tons 10 cwt. 3 lb.; 45, 4 tons 14 cwt.; 25, 5 tons 10 cwt.; 43, 4 tons 14 cwt.; 19, 5 tons 10 cwt.; 69, 16 tons 10 cwt.; 70, 13 tons 8 $\frac{1}{2}$ cwt.; 73, 6 tons 8 cwt.
 Did you see that train brought up to the platform? Yes, I did.
 From which platform did it start? From No. 1 platform.
 You say it was made up the night before? The greater portion of it was.
 What time was it backed into No. 1 platform? Perhaps 12 minutes before the starting time. It was not more than 15 minutes, and perhaps it was not 12; I am not quite positive.
 Was it backed in in this order? Precisely.
 The nine vehicles together? No, not all at one time. Two additional vehicles were put on subsequently.
 What vehicles were backed in first, and at the same time? All with the exception of the two last enumerated, 70 and 73.
 Were these carriages backed into the platform under your supervision? Yes; that is, I was in the middle of the yard directing the shunting, and I witnessed it.
 How long before starting were the seven vehicles backed in? The time I named; some twelve or fifteen minutes.
 When were the other two backed in? Three, or four, or perhaps five minutes before starting.
 Why were they not all backed in at the same time? We did not have them altogether. Two of the carriages were on another road.
 Were they not added because you found they would be required? Exactly.
 You did not add these two last vehicles until you found that they would be required? We did not.
 Were they backed in together? To the best of my recollection they were backed in together.
 Then these two vehicles, 70 and 73, were consequently next the engine when the train left the platform? Yes.
 Did you make any examination of the couplings and connections before the train started? No, I did not.
 Whose duty is it to do that? It is the guard's duty.
 Was the train well filled? Not quite full from here. There were passengers in every carriage but one. It was contemplated that passengers would be picked up at Strathfield and other stations between here and there.
 You do not know anything about the engines supplied to this particular train, I suppose? Nothing beyond the number.
 And the number was what? 178, I think. I noticed it was one of the light bogies.
 You have often seen this engine before? Yes.
 It has often been supplied to you for taking out trains? Yes, and for heavy trains.
 Are you in a position to say what load you have put behind an engine of that sort? Did you consider this an extravagant load for this engine? Certainly not. We have had heavier loads for the same kind of engine.
 What loads have you known to be attached to this engine, or an engine of a similar description? I have seen twenty, or over twenty attached.
 What was their destination in that case? Between Sydney and Picton and Penrith, and I think Waterfall.
 Are you able to say whether you have despatched loads behind this engine to stations on the Western Line? I cannot say that we have; but I daresay that we have; but I know that we have on the Hawkesbury Line. I know that we have put on that line as many as fifteen and a half on a similar engine. There were nine vehicles on this occasion? Yes, nine single vehicles.
 What, do you reckon that as a load, seeing that some were four-wheelers and some were eight-wheelers? According to the usual grade, we would reckon it at 14. Have

F. C. Johnstone.

Have you ever had any complaints from the Locomotive Department that these engines were overloaded when 15 or 15½ vehicles were put behind them? Nothing to my recollection.
 Would you not have heard of it if there had been any complaints? Undoubtedly; we generally know from the driver before he starts.
 Have you ever heard a driver remonstrate at anything like this load? No.
 Did you know driver Wilson? Yes, I did.
 Are you able to say where he has been in the habit of driving? Mostly over the Western Road, or some part of the Southern Road, and frequently between here and Penrith.
Mr. Midelton.] What is the maximum load you would put on a train to the Hawkesbury? It is regulated according to the power of the engine.
 Take any engine, what is the number of carriages you would attach to it going to the Hawkesbury? What is your limit—14, 15, or 20 vehicles? I should put on from 12 to 16.
 Would 16 be your maximum—would you ever put any more? I don't think I would put any more than 16—that is, 16 individual carriages.
 What would be the maximum number that you would put on supposing the traffic was heavy? From 12 to 14 or 15 vehicles.
 You would never put on any more? Certainly not more than 15 or 16.
The Chairman.] I suppose it would entirely depend upon the engine power as to the load you would put on? Exactly.
 You have no limit apart from the question of engine power? No.
 If you put on one engine you would put on a certain load, and if you had a heavier one you would put on more? Yes.
 So it depends entirely upon the number and power of the engine? Yes, exactly.
Mr. Midelton.] What would you regard as a maximum load for any engine on the Hawkesbury line? I should say fifteen or sixteen. I certainly should not put on more on account of the couplings, no matter what the power of the engine was.

Andrew Werrick examined:—

The Chairman.] What is the nature of your duties? I am an examiner in the air-brake Department.
 What is your regular duty? As the trains come in and out I walk down the trains to see if there is anything wrong, or anything that wants screwing up. I ask the drivers to try the brakes to see if they work all right, and if they don't I report it to my superior officer.
 Were you on duty on Tuesday last? Yes.
 You saw the excursion train which left the station for the Hawkesbury River at about 10.30 a.m.? Yes.
 Did you look over the train immediately before she left? Yes.
 How long before she left was it that you looked over her? I don't know exactly—not many minutes.
 She was not there more than a few minutes after being kicked down the road.
 Where was she standing when you looked at the gear? At No. 1, by the straight road.
 Was that where she took her load in? Yes.
 Do you know how many vehicles were on? No; I did not count them.
 What did you do in connection with the train? I looked through all the gear, and saw that everything was right. The shunter turned the cock handle, and I saw that all the brakes were hard on. When the driver came down I asked him to release the brakes. He did so, and the brakes acted all right.
 Was that immediately before the train started? Yes.
 You saw all the brakes go hard on, and you afterwards saw the driver release them? Yes.
 And that was immediately before the train started? Yes.
 Did you see the train start? Yes; I was there from 20 minutes to 10 till half-past 12 o'clock.
 Did you see the train back into the platform? Yes; I was on the road all the morning.
 How was the train backed in;—did they back the whole of the nine vehicles in at once, or in two portions? I think it was put in all at once.
 Was it added to after being backed in? I never saw anything backed in afterwards; but there was a race train which I had to look after about this time.
 I want you to confine your attention to this train particularly; and I want to know whether you saw this train backed in No. 1 road? Yes, I did; I was on the road at the time.
 And you saw the vehicles backed in? Yes.
 Are you able to say whether the nine vehicles were backed in at one time, or whether the larger number were backed in first and added to afterwards? I could not swear as to that. As far as I can recollect, I think there were about nine vehicles backed in at the one time; but it is only as far as I can recollect. I know this: that there were some open carriages with no brakes on. They were not between the other carriages.
 Did you see the first portion of the train backed in? Yes.
 And you say that you saw nothing added to it? No.
 Did you see the driver? Yes, I saw the driver; and I saw the shunter pull the cocks down.
 Did you remain by the train until it started? Yes.
 Could the engine have been uncoupled and have gone away and got two more carriages without your seeing it? No.
 Now will you tell us exactly how each vehicle was fitted in respect to brake gear—that is, how many vehicles had the Westinghouse brake-gear fitted to them in the shape of cylinders and reservoirs, and how many were merely fitted up with through pipes,—can you remember that? As far as I can recollect from seeing the train, I think there were three carriages next to the engine with brake gear; then there were four carriages with through pipes without gear, and then there was one carriage with brake gear at the latter end; that is as far as I can recollect.
 That only accounts for eight carriages? There might have been four or five of these open carriages with open pipes. I did not count them or take the numbers.
Mr. Thompson.] What sort of carriage was the hind one? I think it was a saloon carriage.
 Not an American car, or what you call a saloon carriage? I think it was one of those large first-class carriages.
The Chairman.] How many wheels had it? Eight wheels.

A. Werrick.

b

b

a

Mr.

- A. Werrick. *Mr. Thompson.*] Was it a carriage with compartments in it? Yes.
 A composite carriage? It had a saloon in the centre and a first-class compartment on either side.
The Chairman.] A composite first-class? Yes.
Mr. Thompson.] Did you turn off the cock at the last carriage in the train? No, the shunter does that.
 Do you see that it is turned off? Yes.
Mr. Midelton.] Did you see that it was shut on this occasion? Yes.
Mr. Read.] Did you try it by letting any air out? I examined it when the brakes were on, and it worked all right.
 You are positive of that? Yes.
The Chairman.] Do you make a point of examining each vehicle? Yes.
 On this occasion, when you told the driver to put the brakes hard on, did you make it a point to see that they were on at each vehicle? Yes; I go around to each vehicle to see if all the brakes are hard on, &c.
 And you did it in this instance? Yes.
 And when you told the driver to release the brakes, did you see that they were released? Yes.
 b } *Mr. Midelton.*] Did you see the train going out? Yes.
 Can you say positively whether an American car occupied the rear of the train, or was it a four-wheeled carriage—you would easily notice the difference in the end of the carriage—did you notice whether that was a platform at the end of the train, which would show it was an American car; or was the end of the train the plain and straight end of a composite car? I could not say that I took that much notice.
 Did you speak to Wilson before he left? I just sang out, "Driver, will you put on your brakes?"
 And he did so? Yes; and I gave him the signal to release them when I found them all right.
 You tested the brakes on each carriage? Yes.
 And then you communicated with the driver? Yes.
Mr. Read.] You are very positive about seeing the brakes on the last car working all right? Yes; that is the main, and I always look to the cock handles.
Mr. Midelton.] And they hang down, don't they? Yes; the handles hang straight down.
Mr. Thompson.] And you believe that the last car was a composite saloon carriage? Yes; as near as I can recollect.

Jacob Derham examined:—

- J. Derham. *The Chairman.*] What is your position in the service? That of a shunter.
 Were you on duty in Sydney on Tuesday last? Yes.
 Are you head shunter? No.
 Did you make up any trains on Tuesday? Yes; I assisted to make up several trains.
 Do you remember the excursion train for the Hawkesbury at 10:30 a.m.? Yes.
 Did you make up that train? Yes.
 What can you tell us about the composition of that train? To the best of my recollection it was made up of an American car, a Redfern type carriage, four second-class carriages, then another car. That was the portion that was placed down on the road first. When that part of the train was filled up they found they required more room, then a Redfern composite car and a small second were kicked down on top of them.
 Do you know in what order these two last carriages stood? The Redfern type composite came next to the American car, and the small second next to the engine.
 Did you put them together? I did not put them up.
 You shunted them up in the morning? My duty is to put them down different roads and to couple on vehicles.
 Did you couple on these two? Yes.
 Was the engine that took this train out backed on to the first seven cars that were put in before these last two were coupled? No.
 So the engine was not backed on at all till these two additional cars had been shunted on? The engine was not on till the train was complete.
 Did you finally couple the engine on to this train before it started? Yes.
 And you coupled these two last cars on? Yes.
 b } Have you anything to do with the brake connections? I turned the taps down.
 What did you do on this occasion? The tap was down on the car, and I turned the other tap down on the Redfern type composite.
 Did you turn the tap down at both ends? Yes; when I coupled the engine I turned the other one down.
 Do you remember seeing the brake tried before the train left? I did not notice it. He may have tried them whilst I was coupling them. I can answer for the brake working through the train. I saw the man who attends to the brakes going around them, and I recollect seeing the man who fills the carriages with gas waiting for him, so that he might go to another portion of the train. It was when he reached the bottom that I turned the tap down at the end nearest the engine. The man was turning the wheel at the other end, and the air being turned on caused the wheel to fly around; that proved to me the air was working through the seven vehicles. When the other portion came on the brakes were not released; but the engine-driver must have released them or the engine could not have got away from the station. It is always the practice to turn the tap down, and afterwards to release the brakes, or the train could not get away.
Mr. Midelton.] You coupled 178 engine on to 73 car? I don't recollect the number I coupled it to—some second-class four-wheeler.
 At any rate you coupled the engine to the train? Yes.
 You are sure that the cocks were opened? Yes, I am certain.
 Did you see the driver work the brake at all before starting? No.
 Did you speak to the driver before starting? No; the fireman was coming down to release the air, and I called to him that I would do so, and I did it.
Mr. Read.] You are positive that the brakes were on the end carriage of the train before the engine came on, and that the engine had to release them? Yes, it must have been through the train, for the wheel turned sharply around.
 Are you certain about the description of the carriage which was the last on the train? Yes.

What

What was it? It was an American car, with the brake facing the cabstand.

The Chairman.] How are you able to remember distinctly the rear vehicle? By seeing a man on the end of it.

What man? I believe it was the man who made the seven vehicles up.

You saw him on the end of the car? Yes.

When the car was at the platform? Yes; and had the train gone out as it was first made up there would have been a car at each end.

Do you make it a practice to put a car at the rear of a train if possible? Yes; if there is no vehicle with wheel-brake attached.

J. Derham.

b

John M'Carthy examined:—

The Chairman.] What are you? A shunter.

Were you on duty on Tuesday last? Yes.

Do you remember the excursion train which left about 10:30 for the Hawkesbury? Yes.

What had you to do with it? I was breaking the train down.

What vehicle were you on when you were breaking it down? On the car.

Where was it? At the rear of the train—or the end of the train as it went out.

You were on the vehicle which was the rear end of the train as it left Sydney? Yes; I am sure of that, for there was a wheel on the car.

How many vehicles did you shunt down? Two cars, a Redfern type, and four seconds.

That is seven? Yes.

There was a car at both ends? Yes; and I was on the car next to the buffer stops.

You worked that train down? Yes; and one of the shunters put the air on, and stopped the train. I was working the wheel hand-brake, and the blocks caused the wheel to turn around faster when the air came on.

Mr. Thompson.] Could the wheel have turned round from any other cause besides putting down the brake? I was putting the brake on, but it went round faster when the air was on.

Could it be caused by anything else;—say from a twist in the chain? I do not think so, for the brake was working all right for me, and that showed that it was all right.

The Chairman.] You were working the brake when you felt the wheel turn out of your hands? Yes.

That you attribute to the other man putting the air on? Yes.

J. M'Carthy.

b

Walter Shellshear examined:—

The Chairman.] What is your position? District Engineer in charge of the Central District.

What time did you hear of the accident which occurred on Tuesday last? It was about 3 o'clock in the afternoon a friend called on me who had been up to Parramatta.

What time were you on the spot? I went out with the relief train. I forget the exact time that we arrived, but I think it was about 7 o'clock.

Give us your own account of what transpired after your arrival, and what part you took. I went around and examined all the stock connected with the train, and the damage that was done to the other rolling-stock. I also examined the road to see if there was any serious damage in connection with that. I examined the connections of all the brake-gear throughout the train.

In the first place, what was the result of your examination in respect to brake-gear and blocks? As far as my examination at the time was concerned the whole of the brake-gear was correct, but there was one connection that I could not see at the time—it was at the end of the Redfern carriage, which was telescoped into the American car. That was the end of the first vehicle in the train, No. 114, a first-class composite carriage. With the exception of that connection, which I could not see at the time, the brake-gear was in perfect order.

Did you examine any portion of the material of the wrecked train? I noticed that a number of wheels were broken, but it was too dark to make any close examination.

Did you make any examination on the following day? Yes; I examined the train on the following day.

Had you opportunity of examining the air-cocks? I examined them all the first night, except one—that at the end of the Redfern carriage, which was completely buried by the debris.

Did you examine that on the following day? Yes, in company with Mr. Robert Scott, and that was closed. It was next to the American car, and that was the second carriage from the engine.

You say you found on the second day, Wednesday, the air-cock at the rear end of the Redfern carriage closed? Yes.

Can you describe how the carriage was situated—I mean the end of the carriage? Could that cock have been closed or affected by the collision, or was the air-cock in such a position as to lead you to infer that it had been closed before the train was wrecked? I believe it was closed before the collision, for the following reasons:—The hose-pipe was in perfect order. The small bracket holding the pipe was also in perfect order, and the handle of the cock was perfectly in line with the pipe. If it had been struck by anything it would be almost impossible for it to get into so true a line as it was. It was perfectly in line with the train-pipe.

Who were with you? Mr. Robert Scott.

Nobody else? Nobody.

When was this discovery made; was it as soon as it was possible to get to this particular part of the wreckage, or was it visible so that others might have manipulated the cock? I do not think it was possible, because at the time I went there first the buffers and the end of the carriage were completely buried in debris.

It was inaccessible? Yes. I might state my reasons for looking at the connection. In going to the river yesterday, the driver of the train stated positively in the presence of Mr. Kircaldie, that some of the people down at the ferry had felt the wheels of the vehicles, and that some of the wheels which he believed belonged to the front vehicles were very hot, and all the others were cold; and from that remark I inferred that the only way that could be accounted for would be if the air connection was shut off.

Who made that remark? The driver of the train.

W. Shellshear.

e

f

- W. Shellshear.** Had you any means of ascertaining the truth of such a statement? I had no means of ascertaining the truth of it, but it could be ascertained by examination of the wheels, because if they had the full force of the air there would be distinct marks of the wheels having skidded. The wheels were put into trucks and brought up to Eveleigh.
- g** { **Mr. Read.]** Did they say who felt the wheels? The driver stated that some of the men down there had done so, but he did not mention the name.
- Mr. Thompson.]** Do you think he knew who it was? I should think so. I don't think he would make such a statement without knowing.
- Mr. Midelton.]** Who was the driver in question? Tom Cartwright.
- I suppose that special cock has been taken off? I suppose so.
- Mr. Read.]** What time was this? I wanted to see it the first thing in the morning, but I could not get in there; but as soon as the debris was cleared I asked Mr. Scott to come in with me. It was about half-an-hour before you came up that we got in.
- You knew of it, then, when we were there yesterday? Yes.
- The Chairman.]** Mr. Scott saw this as soon as you did? Yes, he went in with me.
- f** { **Mr. Midelton.]** You examined all the cocks, and this was the only one that was closed? Yes.
- Do you think it possible that it could have been knocked into that position? There was not the slightest mark upon the handle, and what was remarkable was that the handle was in line with the pipe. If it had been struck, by anything it could not have been placed exactly in line. I do not think it could have been struck because the other material, the hose pipe, &c., did not bear the slightest mark.
- I assume that the coupling must necessarily have been fractured, inasmuch as the carriage had telescoped half-way through the other? The hose pipe was not damaged in any way, nor were any of the other connections in the immediate neighbourhood damaged in any way whatever. I believe that Mr. Scott subsequently showed it to Mr. Downes.
- Mr. Thompson.]** Was the corresponding hose on the American carriage 47 damaged in any way? No, the coupling was not damaged. I noticed particularly that none of the hose connections were damaged to any serious extent.
- Have you any reason to believe that the air cocks were not affected at all between these carriages? This one was closed when I saw it, and at the time I saw it, it would have been impossible to get at it before, as it was buried in the debris.
- Mr. Read.]** Did you notice the cock on the American car? That was open in its proper position. Every other cock in the train was hanging down.
- Mr. Midelton.]** Were all the hose couplings intact between each carriage right back—of course the connection between the American car and the four-wheeled second class was turned on account of the American car going on its side, but the other connections were complete? The coupling was drawn between the American car and second-class carriage and it was drawn between the Redfern and the American carriages, otherwise the whole of the hose connection was intact.
- I would like to know your reason for thinking how this cock became closed? I am certainly of the opinion that it was not through the accident.

Patrick Blakney, examined:—

- P. Blakney.** **The Chairman.]** What are you? A platform porter and number taker.
- a** { Did you see the excursion train for the Hawkesbury River go out from Sydney on Tuesday last? Yes.
- Did you take the numbers of the vehicle? Yes.
- And in their order? Yes.
- Will you give them to us and tell us which end you commence with? I commenced at the end nearest Devonshire-street, the rear end of the train as she would go out. The first, 47, was an American car, then there was a Redfern composite carriage, 114, then four open second-class carriages 45, 25, 43, and 19, a saloon car 69, and a composite Redfern type 70, and a close second-class carriage 73, the engine was 178.
- You produce your book showing the numbers which were taken down by you on Tuesday last? Yes.

[The Board then adjourned.]

Second Day—Friday, 24 June, 1887.

The Board met at 9:30 a.m.

PRESENT:—

DONALD VERNON, Esq., Chairman.

T. MIDELTON, Esq.,

W. V. READ, Esq.,

MAX. THOMSON, Esq.

Robert Scott called in and examined:—

- R. Scott.** **The Chairman.]** What is your position in the Department? General foreman in the locomotive shops.
- You were engaged on Tuesday last at the scene of the accident near the Hawkesbury River in clearing away the wreck? Yes, sir; I was in charge of the breakdown gang and gears.
- What time did you arrive there, Mr. Scott? I think it was about 6 o'clock.
- A little before or after? I could not say exactly.
- Did you make any particular examination of the brake blocks? No, sir, I did not.
- Or of the tires? The wheel tires? No, sir.

Did

Did you make any examination in connection with the Westinghouse air-cocks? No, sir; though the others may have done so. We were not there long enough that day. R. Scott.

Did you at any time make any examination? I think on the following morning—on Wednesday. Mr. Shellshear came and asked me if I would go and see whether the brake cock was shut or open. This brake cock was on the Redfern carriage, the one that telescoped into the American car.

Just tell us what you saw. I went in and got underneath, and found that the cock was shut, so we examined it.

Will you tell us exactly where the cock was as regards the carriage, and the exact position in which you found it. Was it at the end of the carriage, in the first place? Yes, sir, it was at the end nearest Sydney.

In the first place it was at the end nearest Sydney. Was it in the middle of the carriage or at one side? Near the middle of the head-stock of the carriage.

Mr. Midelton.] That is the middle transversely?

The Chairman.] Describe it yourself? There is a pipe running longitudinally in the carriage, and this was a bit out of the centre, and the cock was just inside the head-stock that the man could reach it easily from the end of the carriage and shut it. The handle was lying horizontally with the pipe, and it was shut. There was a nick across the cock, and when the cock was open the nick is parallel with the pipe.

When the cock is shut the nick is standing at right angles or across the pipe.

In which direction was the handle pointing? It was pointing towards the engine; towards the front of the carriage.

You remember that clearly? Yes sir.

That it was pointing to the other end of the carriage? Yes sir.

Right towards the engine? Yes sir.

Mr. Midelton.] Did you work the handle at all, or did you leave it as you found it? I did not interfere with it at all.

The Chairman.] Did you observe any traces of fracture or breakage or anything of that sort in connection with the material immediately above the pipe? Nothing whatever, sir. The hose was quite perfect. The hose and cock and handle—there was not a mark to be seen upon them as far as could I see.

Mr. Midelton.] (Showing the witness the hose, cock, and other articles.) The handle was standing towards the engine. There is no question whatever about this being the cock. I went inside that car. and underneath it, and examined it.

What is the usual position? Supposing a man had handled that, and shut it? It would be down.

Supposing the guard to have gone in and shut the cocks off, how would he have left them—which way would they be pointing? I am not sure whether the cock will open more than one way or both ways.

I suppose that we can get this cock? Yes, sir.

Mr. Read.] Those that I have seen generally opened in both ways.

Mr. Midelton.] What is your opinion about that cock as regards the position of the handle? How it got like that, and so on? Do you think it was put that way or not? Have you formed any opinion on the matter? No, sir.

Mr. Shellshear called your attention to it? He asked me to go in and see whether the cock was shut or open.

Mr. Read.] At what time in the day did this take place? It was in the afternoon; somewhere between 3 and 4 o'clock.

Was it at the time that we were there? Yes, sir, I think it was. I believe you had been there, but I am not certain whether you were on the ground at the time or not.

But I am speaking of the Board? Yes, I think you were there.

It must have been while we were there, because Mr. Shellshear came back to us? Yes, now that you remind me of it, he was there a little longer than the other gentlemen.

Mr. Thomson.] Did you draw anybody's attention to the position of that cock? Yes, sir; I drew Mr. Downes' attention to it.

Did he express any opinion about it at all? No; I do not remember that he did so.

Mr. Read.] Did you discover it when I was down there past the car? I do not think so.

Mr. Midelton.] Supposing this brake-pipe on the car, (showing witness the article) supposing the handle of the cock is in this position after it is opened—tell us whether the handle was above or below, or immediately level? It was as nearly as possible in a line with the pipe.

Chairman.] Do you know if the hose and pipe are there now? Yes, sir, they are.

Perhaps you can procure them for us? Yes, sir. I had the couplings split and brought them away without being interfered with at all.

Mr. Thomson.] Have you got the hose couplings from No. 114? Mr. Laughry took possession of all the couplings; I think he had them all identified with the exception of one on the front end of the American car. The pipe was broken and the pieces were put altogether with the cock.

Mr. Midelton.] Did you put a mark on 114 when you found it shut? No; I did not mark it.

So that you cannot swear to it again? No, sir.

Chairman.] Do you not think you would know it again if you saw it? Can you procure it for us? Yes, sir.

(By request of the Chairman, Mr. Scott hands in the break-cock in question for inspection.)

Witness.] The stop has been taken off.

Mr. Midelton.] In my opinion it has been broken off.

Mr. Thomson.] You will find several of them in the same way? I think they have been taken off so that they will shut either way; (looking at the handle) that is the way the handle was standing.

Thomas Cartwright called in and examined:—

Chairman.] What are you, Cartwright? I am an engine-driver.

How long have you been an engine-driver? I have been a driver here about 3 years.

How long have you been a driver on the Hawkesbury line? Ever since it has been opened, since last October.

T. Cartwright.

Do

T. Cartwright. Do you know anything about the accident that took place on Tuesday? No, sir; I was in Sydney at the time.

I understand that you were not there at the time, but I want to know if you had any conversation with anybody about the accident? Yes, sir, I have had conversations with several men down there, as I was running on the road every day.

Well, have you heard any of those who were engaged in or about the wrecked train express any opinion as to the condition of any of the wheels? Yes, sir; when I went home on Tuesday night I stopped at the tanks to get water. I saw the pumper, the first man, and he told me that when the engine went by she was reversed; and that they were sanding, and that they ought to have been able to stop any train with plenty of sand. He said also, that he did not think the guard could have been doing much or else he would have succeeded in stopping the train. I then went down to the station to see if I could see anything. I saw one tap shut in a closed second, but as to the order of the carriages in the train, I can't say. The contractor's driver said that he found all the blocks loose. Of course from my own knowledge of the road, I know that it was quite impossible for a train to run away if the air was on the train.

Mr. Thomson.] On which end of the closed second carriage did you see the cock shut? It was the end nearest the Hawkesbury.

Mr. Middleton.] Whereabouts on the train was the closed second carriage? There was only one closed second on the train.

What part of the train was it in? Of course I can't say that because the carriages had been shunted every way before I got there.

Chairman.] What time was it that you got there? It was about 9.50 at night. We were delayed at Hornsby all that time waiting for the other train.

You did not hear anyone make any remark as to any of the wheels being hot? Yes, sir, the cleaner said that he went and felt the wheels, and he found them to be cold.

But did you hear any one say that any of the wheels were hot? No, sir.

What engines have you been driving? I have been driving the one that is now in the river at the Hawkesbury, and also No. 78.

How did you find that engine work—I mean the one that was in the river? She was in very bad order, sir; we never get anything else but engines that are in bad order.

You mean that she was not in first-class order? She was in very bad order.

What do you mean by that? She was knocking badly, and she had a lot of side play. She would oscillate from side to side in a way that I never saw before in my twenty years' experience. In fact, that was the reason that she was taken off that running. The Permanent-way Inspector complained that she was knocking the road up, and that was the reason that she was taken away.

Taken away from where? Taken away off our running.

What was the heaviest—I mean greatest number of vehicles that you took with that engine, or any similar engine, on that road? I have it in the book here; I believe about 14 is the most I have taken down there—trucks and carriages.

You had the Westinghouse brake? Yes, sir, always that brake.

Had you any difficulty in "controlling" your train going down the grades? No, sir, never.

Never? No, sir, never.

Mr. Middleton.] What engine have you now? No. 154.

What is she? She is one of the same class of the Dub's build.

No. 178 was built in the colony? Yes, sir, she was one of the Atlas build.

The Chairman.] You say you have run some mixed trains? Yes, sir; all the trains that I run are mixed trains.

And the greatest number that you have taken down would be about equal to 14? About 13 or 14. I have it in my book.

Get the book, will you? (Book produced, and witness read from it) I took down 5 empties, 4 loaded, and 4 carriages.

And upon how many of these vehicles was the Westinghouse brake fixed? Equal to 4—2 composites.

Where did you take them to? Down to the Hawkesbury, from Hornsby.

You have never experienced any difficulty at any time in "controlling" your train? No, sir. Yesterday I had 6½ carriages, a dump car, and 2 or three of goods. I never put the brake on till I get to the tank. The guard held the train with the hand-brake down to the tank.

Mr. Middleton.] How was that train made up? The carriages and the van were next to the engine, and the goods trucks behind. We always took them down like that.

The reason for that is that the brake is connected with the engine? Yes, sir.

What is your practice—to run down tender first or otherwise? Tender first; it does not matter which ever way you go. Wilson asked me that on Monday night when he was stuck up.

Do you know what load he had on when he was stuck up? I think it was 9½, or equal to 9½; I don't exactly know the vehicles.

And how many have you brought away at one time? About ten, sir.

Did you stick up with that number? No, sir, but I had a better engine than Wilson had.

What engine did Wilson have on Monday? No. 176.

Is that the same class of engine as 178? Exactly, sir.

What is the biggest load that you ever took down? I think I have told you already, sir. I took down 4 empties, 4 loaded, and 4 carriages, and I could have taken a bigger load.

The Chairman.] You could have taken more? Yes, sir, easily. The most carriages that I ever took down would be about eleven. That would be about Easter time or holiday time.

Do you remember upon how many of the carriages the brake was fixed? I do not think that I can tell you exactly, but I should say that the brake would be fixed upon seven or eight of them.

How many more could you have taken down without any trouble with that amount of brake-power? I could take about fourteen carriages—that is if I had brakes on seven. Of course if I had lost time it would be different. If you lose time you can go down without using any air-brakes; we only used the engine and guard brakes.

Mr. Middleton.] What is your practice leaving Hornsby—do you ever test your brake before you descend from Hornsby? Yes, sir, because sometimes they do not put on the air there. I always try them

them just after leaving Hornsby, and if they do not hold there, I send my mate down. I always send my T. Cartwright. mate because you cannot trust the shunter to put them right.

I understand you to say that on more than one occasion you found that the cocks had been shut? Yes, sir, half a dozen times; both from Hornsby and the Hawkesbury. Of course leaving Hornsby we stopped at the tanks and have a good chance; that is on the 1 in 40, and we do not go far past.

Do you always make a practice of testing your brakes before going down the big incline? Yes, sir; at the tanks leaving the Hawkesbury, and at Concord going down.

But as a rule your train is generally made up at Hornsby? We very seldom uncouple at Hornsby except to take on a horse-box. We take them on behind. What I mean is that we did this when we were running to Hornsby, and before the line was running to Hawkesbury.

Mr. Read.] Have you ever known what you have said about the shunters to occur since running down the Hawkesbury before the line was open to that place? Yes, sir; it occurred sometimes when we ran from Strathfield, but it has not occurred there since we began running to the Hawkesbury, nor at Hornsby, except when we had a horse-box to pick up.

Did you make any report about this to anyone? No, sir, because it caused no delay. I had no occasion to report it since it caused no delay.

The Chairman.] When you referred to the engine just now as not being in first-class condition, you were referring more particularly to the manner in which she rolled about? Yes, sir; and the valves were working very badly. She did not pull well. No part of her was good except the wheels. She was what we call "rough."

Mr. Midelton.] Had you any conversation with the driver Wilson the day before the accident? Yes, sir. What was his opinion of it? He said it was a very rough road, and I said in reply, "yes, it is pretty rough." He said "I do not know how we are going to bring goods down here." I said, "it is alright if you know the way to hold them." He said that he would know the next time. He said also that he was afraid he would get blamed for it, and I told him that I did not see how he could be blamed for it. The engine was very light on the trailing-wheel, and she was slipping fearfully.

You are speaking now from your own experience? Yes. Wilson asked me if he should turn her, and I said "No; because if you do, you will be no better, because the road is broken with bits of pinches." It is not one continuous grade—that is what the deputation was about.

What was the deputation about, did you say? About having a turn-table down there, as we did not consider it safe going down tender first. We were not able to see anything on the road on account of going down tender first.

The Chairman.] The objection to running down tender first was principally on account of the curves there and the obstruction which the tender formed to your seeing anything? Yes, sir. The tender had a rigid wheel base, and there was no "give" in it.

Mr. Midelton.] Would that matter, to be left to yourselves, to go engine first? Yes, sir, but we cannot do it. It would not make any difference which way we went. There is an incline from Berowa right to Ryde. There would be a little advantage in having the engine going first down to the Hawkesbury? But you would lose it coming up.

So that you think that it would be six of one and half a dozen of the other? Yes, sir; there is nothing for it but to turn the engine.

Mr. Read.] Did you ever inform anyone that you had heard that the tires were found to be hot? Yes, sir; I mentioned it to Mr. Laughry. I mentioned that the wheels were found to be cold.

I said hot? I beg your pardon, I meant to have said cold.

Mr. Midelton.] Have you had any trouble with your donkey-pump? Yes, sir. I have gone down several times without any air at all. I had to send the throat-valve down to Sydney several times for repairs.

Are you stationed at the Hawkesbury? Yes, sir; and if anything goes wrong I have to send it down, if it be a part that I can take away from the engine.

Do you run the whole traffic on that line? Yes, sir; except on holidays.

Walter Shellshear recalled and examined:—

Mr. Midelton.] Referring to the brake-cock of 114 car, will you tell us which way the handle was pointing when you found it? It was pointing in the direction of the engine and towards the front of the car. W.Shellshear.

Are you quite sure about that? Yes.

We have the cock here now? Yes. (*Cock produced.*)

What is your opinion of the cock being in that position—do you think that it would be put that way by somebody who had uncoupled it, or what is your general idea about it? I presume that it had been shut off. As far as I can see there is no mark on the handle, and there is nothing to show that it could have been shut off by accident.

But as to the position that you would expect to find the cock in if shut off by the guard? No answer.

If you did it yourself—

The Chairman.] Can you say what the position would be of the cock—would you have pushed the handle away from you or to you? It would depend very much upon the position which I would be in. A man might shove it back more easily than he could pull it forward if he were in a certain position. It would be about 15 inches to the end of the handle from the end of the car.

Mr. Midelton.] But supposing you were in between two cars—which way would you work it, pull it towards you or push it from you? The probability is that I should do it in the way easiest to myself.

But what way do you think nine out of every ten men would do it? The probability is that they would do it, some one way and some another; some men might push it forward, and others might pull it to them.

But what way do you think the majority of them would do it? The majority might be as likely to push it one way as the other. I do not see that I can give you a more definite answer than that. Of course it would be a very simple matter to look through all the cars in the yard and ascertain.

Would you kindly do that, then, and take the number of the cars, and give the result in evidence? Yes; but of course the stock is scattered about, and it is only on the end of the cars that they are fixed.

The Chairman.] Well, perhaps you will do this?

Mr. Midelton.] It would be very necessary.

The

W.Shellshear. *The Chairman* (to witness.) Just take a walk through the yard, and see which way the cock-handles are standing.

f { *Mr. Read.*] With reference to the statement which driver Cartwright made to you with regard to some of the tires having been found to be hot, are you positive that he made that statement? Yes: That one of the men told him that the tires were hot, and that others of them were quite cold. He positively denies that now? Well, Mr. Kirkcaldie was on the engine at the time. He said most distinctly that the front wheels were warm, and that the others were cold.

[Mr. Shellshear hands in memorandum, showing that he had examined forty-nine cocks altogether, and forty-four of the handles were in a forward direction, towards the buffer beam, and five towards the centre of the carriage.]

Edward Andrew Laughrey called in and examined:—

E. A. Laughrey.

The Chairman.] What position do you hold? Travelling locomotive inspector.

You were at the scene of the accident on Tuesday? Yes, Sir.

What time did you arrive there? About half-past 6 o'clock in the evening.

You were there amongst the first? Amongst the first from Sydney,

How were you engaged while there? I took particular notice when there as to the position of the brakes, and the extent of the damage done to the rolling stock.

e { What did you find with regard to the brake? I found that, commencing at the rear of the train the hose-pipes all coupled up to between the second and third carriage from the engine.

Mr. Midelton.] That is, between 47 and 73? Yes; those two were coupled up there.

And everything was right from 45 to 47? No answer.

The Chairman.] Go on. The tap at the rear end of car 69 was closed—the tap in the main pipe. The others were all open. The tap on the rear end of the car next the engine I did not notice that day, as I could not get at it. On the following day I noticed that the tap was closed. The tap on the leading end of the front carriage had been broken off, and we have been since unable to find it. The tap at the leading end of the engine we found open.

Did you take notice of the brake-blocks? Yes, sir. There were brake-blocks on all the wheels of the first five carriages.

a { *Mr. Midelton.*] That is up to the closed cock of car 69? Yes, sir. The brake blocks of No. 73 were not in use. Communication had been shut off between the main pipe and the reservoir owing to some previous accident. The small pipe leading from the main pipe to the reservoir was broken off, and communication shut off.

The Chairman.] How was it shut off? There was a small tap in the pipe; that tap was closed. I tested the brake on the third and fourth carriages from the engine, and found the brakes on those carriages all right. The brakes on the first and second carriages were all broken up. That is the condition they were in.

Has the engine been recovered? No, not at that time.

Were you able to make any examination of the engine? Yes, as far as was possible, I examined the engine. A considerable portion of the engine is in the water still; but I could see that she was in full forward gear, which would represent that she was reversed against the train at the time of the accident.

Did you observe anything else about the engine? I observed that the sand valves were both open, and that sand was in both boxes. The engine hand-brake was also hard on. I found that the screw had been broken off, and was right down in the nut. The tender hand-brake was off, and would indicate that the air-brake had been in use.

Did you notice the guage closed? Yes; the pressures were down.

Were they readable? No; I think not. The effect of the accident upon the pressure in the air-guage was that it would fall to zero.

When the accident happened that would be the result? Yes.

That is on account of the severance of the connections? Yes; and allowing the pressure to escape.

The air-guage indicates a pressure in the service-pipe, and not in the reservoir? Yes; in the service-pipe.

The service-pipe would necessarily be fractured? Yes, sir; it would be broken.

Did you notice how the driver's valve stood? It was in a feeding position, with the brakes off.

Consequently that would imply that the air in the reservoir had escaped after the severance of the connections? No; that would—no doubt it got into that position by the engine turning over. It was worked freely, and was not in a position to be interfered in the engine tumbling over.

But when you say that it was in a feeding position, I understand you to mean that it was so placed as to feed the service-pipe with air? Yes.

Being in that position, and the service-pipe becoming broken, the reservoir naturally must empty itself, and the air would take a free way of escape? Yes, sir.

Therefore, even had the air-gauge indicated anything, such indication would be meaningless under those circumstances? Yes; it would be meaningless.

Are you acquainted with the engine which Wilson took out on that day? Yes, sir; I know the engine.

How would you describe that engine—what class was it? The engine was known as the 79 class. She was 18 by 24 in the cylinder, a 5-ft.-6 engine-wheels, outside cylinders four wheels coupled, and four-wheel bogie.

What was she used for? She has been used for passenger service.

How many of these engines have we at present?

Mr. Midelton.] About fifty?

Witness.] I can't tell you from memory; but we have a considerable number of them.

About how many? I should say about fifty.

The Chairman: They are in fact regular passenger engines? Yes, sir.

And constitute the majority of our regular passenger engines? Yes, sir.

They are used for passenger service on all lines, I presume? On all lines.

I do not think you have given us the weight of the engine? The weight of the engine separate from the tender?

Let

E. A. Laughrey.

Let us have the weight complete? The weight of the engine alone is 37 tons 11 cwt. 3 qrs. The weight of the tender is 21 tons 13 cwt. 3 qrs. Total, 59 tons 5 cwt. 2 qrs. The weight on the driving wheels would be about 25 tons.

Can you give us any information as to the tractive power of that engine—say upon a gradient of 1 in 40? The tractive power of that engine, taking the average pressure as being equal to 73 lb., would amount to 11,298 lb., and on a gradient of 1 in 40 she would be capable of hauling 89 tons. That is exclusive of the engine's own weight? Yes, of the engine's own weight and of the weight of the tender.

Mr. Midelton: Of course you assume the engine to be in good order? Yes; I assume that she was in good order.

And of course the power of an engine will vary with her condition? Yes.

Were there blocks fitted to the last four cars of the train, or were there only pipes? No brake blocks. Consequently, that cock on No. 69 car was closed and was properly working? Yes.

It ought to have been closed? It was in the proper position.

Unless that were explained it would appear that those four cars were cut off, so that five cars had the brake from the engine? Yes; they had the blocks.

From your examination of the train, was there any evidence to lead you to judge whether the brakes had been used in going down the incline? The only evidence that I could find was the cock on the front of the engine being open, and the tender hand-brake off.

Did you see No. 114 car the first from the engine the day after the accident—did you see the brake gear and piping, and so forth, of that car? Yes, the brake gear was considerably broken up. I could find all the parts, except the cock at the leading end with a part of the pipe.

Was the cock at the trailing end of the car in a like position? I found that closed.

Could you tell the pipe again if you saw it—that pipe and cock? Well, I do not think I could; I might do so.

Would you kindly look at this one and see if it is the same? (Cock inspected by witness) I believe that is the same. I noticed this screw as having been recently made.

Was the handle standing as it is now, or has it been changed? It was standing lengthwise with the pipe. It was in the same position as it is now. The handle was towards the centre of the car.

Would that be the usual position that you would expect it to be in if it had been shut off by a railway man? Well, I think it would be more convenient to turn it the other way, but it is possible for a man to turn it in the position in which it now is.

What is your opinion as to the cock coming into that position? How do you think it came like that?

When I noticed it in that position, and from the position of the carriage I was inclined to think that the cock had been closed by the force of the collision, as the floor of No. 114 carriage skidded along on top of the floor of No. 47 carriage, for a distance of about 20 ft., and there were marks on the underneath side of the buffer head stock of car No. 114, to indicate that when she mounted the floor of car 47 they were closely together. In fact I do not think it was possible for the cock to be open when that carriage came to rest.

Not that it had been opened in a working position? No, the two floors were like this. (Witness placing two pieces of paper one over the other) one on top of the other. I speak now of that cock with the lever hanging down. The chances are that it would strike as it works freely. A very slight tap would throw it in line with the pipe.

Mr. Read.] Did you move the tap before it was taken off the carriage? I did.

Did anyone else move it? I did not see any one else near it. I believe I was the first to find it in that position. I had considerable difficulty to get at it.

Mr. Thompson.] Do you know about what time in the day it was when you found this? I cannot now say.

Mr. Midelton.] Did you see the debris cleared away from it, and were you the first to then see that it could be handled? I believe I was the first, because I had to crawl under, along, and over the debris in order to get at it.

Did Mr. Shellshear see it before you left? I do not know that any one had seen it.

Mr. Thompson.] Was it before or after the members of this Board came up that you saw it? I could not say now, I am sure. I think it was after the train had arrived there which brought the members of the Board.

The Chairman.] After the train had arrived and before we left? Yes, that is what I mean.

Mr. Thompson.] Have you seen the wheels of No. 114? No, I have not; I believe they are in the yard, but I have not examined them.

The Chairman.] Then will you be good enough to see the wheels the first thing this afternoon, and have them ready so as to show them to us by half-past three o'clock.

The Chairman here intimated that Mr. Shellshear handed in memorandum, showing that he had examined 49 closed cocks altogether, 44 of which had their handles closed in a forward direction towards the buffer beams, and five towards the centre of the carriages.

Mr. Shellshear added at the same moment, I examined pretty well all that are in the yard; of course I did not go over the whole of them.

John Cobb called in and examined:—

The Chairman.] What is your position, Mr. Cobb? I am running foreman in the Sydney Locomotive Department.

J. Cobb.

You supply the engines for taking out trains, do you not? Well, I may tell you this, sir, that for the last three years or more the whole duties of the running arrangements of Sydney have been carried out by Mr. Privet, the Inspector, and he arranges to supply the whole of the engine drivers and firemen, and gives each man his work for the day.

Then he would be a better one to get the information from? He can give all the information that may be required. I cannot. As a matter of fact, I know nothing as to what engine or what man had been sent out with this train until after the accident.

Mr. Midelton.] Do I understand you to say that you hold Mr. Privet responsible, or are you held responsible yourself? Well, I hold him responsible. I have other duties to attend to. My time is taken up fully

- J. Cobb. fully by office work for the last three or four years, and the whole arrangements have been left to him and Mr. Farquahar of Eveleigh—each one in their respective sheds.
But you are the responsible man; you are the running foreman according to your title; do you delegate your powers to Mr. Privet, or are you held responsible yourself? I do not know how that is, but it is quite impossible for me to carry out two or three men's duties.
But are you, or are you not, responsible for Mr. Privet's acts? No, certainly not.
And yet he is your subordinate? Yes.
But you are responsible, are you not, as his superior officer? But if he does a wrong thing, I don't see that I should be blamed for it.
There is no question of a wrong thing having been done.
The Chairman.] Apart from the direct responsibility of Mr. Privet, he is the person who can give us information, so that it would perhaps be a saving of time on this particular head if we left it and called Mr. Privet.
Is there no other subject that you can inquire about—for instance about the driver.
Witness: It might also be advisable to get Mr. Farquahar, who is in charge of Eveleigh. He can give some information as to the changing of the men, and of the engines the night before.
h { *Mr. Midelton.*] We have had evidence from the witness that I want corroborated by this book or in some other way. (*At Mr. Midelton's request Mr. Cobb hands in a running repair book.*)
Witness: All repairs are entered in that book, and the person who carries out the job initials it?
Mr. Midelton.] What engine did driver Wilson take out on Monday last? It was engine 176.
But you cannot tell us without looking at the book? No, I would not know otherwise; I cannot tell of my own knowledge what engine he took out.
Mr. Thompson.] As a matter of fact I think Mr. Farquahar would be the proper man to call.
Witness: Well, yes; because Wilson was stationed at Eveleigh and not at Sydney.
Mr. Midelton.] No. 178 was the engine in question—the one that is off the road now? Yes.
Well, evidence has been given about that engine. I want to see if anything has been put in the book about it; to see whether the book and the evidence agree or does not agree. There ought to be evidence here of what Cartwright said. Is it justifiable to tell Mr. Cobb the evidence that has been given?
The Chairman.] I think so.
• { *Mr. Midelton.*] It has been given in evidence here, Mr. Cobb, that engine No. 178 was in very bad order, and that she was taken off the job previously and put on this by mistake or in some way? I do not know, sir.
But I want to see whether you can upset this or not? I cannot tell you, sir, because I don't know of my own knowledge.
The Chairman.] Well, is it possible to obtain the information?
h { *Mr. Midelton, examining the book.*] Perhaps I can get the information from the book myself? *Witness:* If there was any report about it, it would be booked by another man, and not by Cartwright.
Mr. Midelton.] There does not seem to be any report about the defective condition of this engine?
Witness: With regard to the state of the engine, the Inspector's sheet would be able to throw some light on it.
The Chairman.] What is his name? William Farquahar.
The Chairman directed that William Farquahar should be summoned to attend at 2.15 p.m. on the same day, and adjourned the inquiry accordingly.

George Stead examined:—

- G. Stead. { *The Chairman.*] What position do you hold? I am a shunter in the Railway Department, but at present I am officer in charge at Hornsby station in place of Mr. Cavanaugh.
Were you in charge of Hornsby on Tuesday last? Yes.
You remember Guard Clissold's train leaving your station? Yes.
Will you tell us all that took place at your station in connection with that train? The train was parted at Beecroft.
c { *The Chairman.*] That was not at your station. We want to know what you saw yourself? *Witness.*] A part of this train arrived at Hornsby at 1.15 p.m. I put the train in the loop, and the engine went back to fetch up two more carriages. When they came back the porter turned them in to connect them with the carriages in the loop. The guard (Clissold) put them up. When the first part of the train came up, I cut the engine off the carriages; I turned the air off and left it on the train. After the engine went away to fetch up the other carriages, I saw that the brake blocks on the train were all right, for I turned the cock and put the brake on before the driver came up with the other carriages. I noticed one thing that day when this train was disconnected; the air did not give as sharp a report as it does when the full pressure is on; so I did not think there could have been a very heavy pressure on. When the brake-pipe was being re-coupled, I fetched the coupling myself from the end of the train, and gave it to guard Clissold to make good. I came back on the opposite side of the points. I remember saying to Clissold, "Have you opened the taps," and he said, "Yes." I saw him turn one down, and I saw that the other was turned down as I had left it.
The Chairman.] You opened the tap of the first division of the train which arrived? Yes.
And you left the brake on? Yes.
In recoupling you asked Clissold if the taps were open? Yes, I saw him open one, and that the other was open as I had left it.
He did not interfere with the one you had turned down? No.
Mr. Midelton.] Who coupled the engines to the train? That I could not say, but I know if the air was left on the train as I left it, they could not have turned the brakes off.
Did the train start easily away? Yes.
Did you notice whether any of the brakes were rubbing on the wheels as the train moved away? Yes, they were rubbing but not much; one I think was rubbing slightly.
Which was that? I think it was the composite Redfern.
The Chairman.] You think the brakes were rubbing? Yes, but not much. That might show that there was not the required pressure to take the brake off. You

You mean that on this particular carriage the brake-blocks were not quite clear of the wheels? Yes, but they were all right on the other carriages. J. Cobb.

Mr. Midelton.] Whose duty is it to couple the engine to the train? The guards.

Did the guard do it on this occasion? I did not see him.

Did you notice the driver applying the Westinghouse brake in stopping the train? I did not notice him. He ran past the points, and then backed in, on to the train.

Where was the guard left when the train divided? He was left back with the train.

The Chairman.] Do you remember examining or noticing the connections of the train as it left your station? No, sir, I did not; I was over at the points.

Mr. Midelton.] Was that where you noticed the brake rubbing on the wheels of one of the carriages? Yes; it was while I was at the points.

Mr. Read.] Was it rubbing on one wheel, or were all the blocks of the car rubbing? I think all were rubbing.

Mr. Midelton.] Did you see where the train stopped to make the division before getting up to Hornsby? Yes.

It is a good distance away? Yes, 2 miles 10 chains.

The Chairman.] Who told you that? The guard.

Mr. Read.] You are quite certain that the brakes were on at your station? Yes.

The Chairman.] You are not in a position to speak of the taps between the engine and the two first carriages? No, I did not notice the second batch of carriages which came up.

Third Day—Saturday, 25 June, 1887.

Jacob Garrard, M.P., called in and examined:—

Chairman.] You were in the excursion train on Tuesday last that went to the Hawkesbury? Yes. J. Garrard, Esq., M.P.

Will you be kind enough to give us in your own words an account of the trip, as far as you remember, particularly as affecting the progress of the train? Yes. We were late in starting. I occupied the last carriage in starting away. I was sitting about the middle of the carriage on the left-hand side. Everything seemed to go alright until we got beyond Ryde. Then about a mile on the other side of Ryde we stuck. We made two or three ineffectual attempts to get over the pinch, and then the train ran right back to Ryde Station—in fact, our carriage went a little beyond the platform. By that time we got more steam on, and the driver put her to it, and overcame the pinch. I may say that I am surprised at the train sticking up there, for having been in five or six trains on the line, I have never yet been stuck up at that particular point at all events. We then went on to Eastwood, and on the other side of Eastwood we stuck again. I am not quite sure, but I think the driver again went back a little bit. He overcame that difficulty, and then at Beecroft he began to pull up again. The driver did not stop at Beecroft platform, for I remember that Mr. Barling was unable to get out, and I recollect Mr. Barling getting out in the cutting beyond the platform. The driver went on a few yards and stopped again. They then disconnected the two last carriages—the Yankee in which I was, and the other first-class carriage, and the engine went on with the other carriages, as I understood, to Hornsby, coming back in about thirty minutes after that. The engine then took our two carriages up to Hornsby, of course without any difficulty at all. We were again connected with the other carriages, making the carriage I was in the second carriage from the engine. Shall I give you my own impression of what did occur?

Chairman.] That is just what we want.

Witness.] I am doubtful —

Chairman.] Bear in mind, we do not want you to suggest any theories? Well, I will not theorise; I will confine myself to actual facts. We then started again, and went along pretty well until we reached Belmont, or what is called Coolah, about 2 miles from Hornsby. Then, to my surprise, she stuck up there again, as I had never seen a train stick there before. The driver ran back, and that is where my attention was first drawn to what I considered the recklessness of the driver, or the inefficiency of the brakes. He went back too fast for backing the train. Altogether, he went back a mile, or a mile and a quarter; and I supposed during that time he got up steam to put her at it again, and then overcame that difficulty. No further difficulty followed. At some places he went at very great speed; I presume to make up for lost time. It was not until we were in the first tunnel that I felt sure that he was going too fast; but having my wife in the train I did not say anything, as I did not wish to alarm her. Going through the second tunnel I was sure that the train had run away. My first idea was to get up and go to the end of the carriage to use the hand-brake; but I thought that would have very little effect, and would only alarm the passengers, so I kept my seat. The train rushed down at an enormous speed, and I may say that I do not think the brakes could have been acting properly throughout the train. I felt the jerking of the brake on the wheels of the carriage I was in. It was a jerking and spasmodic feeling, so that I did not think that the wheels of our carriage were properly braked.

I want you to remember the actual facts;—you have some knowledge of the Westinghouse brake? Yes. Can you remember the working of the brake in any degree after leaving Hornsby? Decidedly I can.

Will you cast your mind back, and tell us what you recollect of the application of the brake between the time of leaving Hornsby and that of the accident? I believe it was applied to the carriage I was in. From the feeling I had I believe the brake was applied.

You are quite clear that you remember the application of the brake, as far as your carriage was concerned, between Hornsby and the scene of the accident? Certainly.

Do you remember its being applied more than once? I remember it was applied when we were running back from Belmont.

J. Garrard,
Esq., M.P.

Do you remember whether there was an application made after you passed through the second tunnel? I believe there was, and that was, I think, the time that she gripped the most, and when I was made most sensible of the action of the brake. At this time I was fully persuaded that she had run away. I have been in trains going 60 miles an hour, and I am perfectly certain that I am within the mark that this train was going at that speed. Indeed, the wonder is that we did not go over the banks; but I suppose the train being heavily loaded served to keep her on the road. But the jerking was quite sufficient to greatly alarm the people. I noticed the people standing on the platform as we rushed past the station, and then came the crash; our carriage going into the other first-class carriage, and sweeping the people in different directions and on to us. Fortunately, as the end of the other carriage reached us she began to turn over, and we were saved by this means. I managed to open the window and get Mrs. Garrard clear, and I afterwards wrenched myself clear through the top of the carriage, which, of course, had previously been the side. After taking Mrs. Garrard to the hotel, I came down and went into the carriage, and observed the wreckage. I did not make particular observations, as I was suffering too acutely from an injury to my leg to take at that time any particular notice of the brake, or anything of the sort.

The carriage you were in was the rear carriage when the train left Sydney? Yes, the last carriage, and I was sitting in the middle of it on the left-hand side.

Have you any recollection of the working of the brake between Sydney and Ryde, or between Strathfield and Ryde? The train went exceedingly slow at these places, and I may say that I did not take particular notice. I had no reason to do so, but I think I felt the application of the brakes between these places, and I have no hesitation in saying that my belief is the brakes were applied occasionally.

Did you see the two portions of the train coupled together at Hornsby? Yes.

You remember seeing them coupled? Yes.

But you happened to take no particular notice of the process of coupling the train? We came on the main line and were shunted on to the other. The coupling was done remarkably quick, but I thought it was done to make up for lost time. I noticed that it was very quickly done. That we were coupled, however, was shown by the fact that the whole of the train proceeded onwards.

Do you remember the train stopping more than once between Hornsby and Peat's Ferry? Not stopping. Once we went very slow at Belmont.

And on that occasion you went back? Yes, a mile or a mile and a half.

At a great speed? Yes.

Apart from that, do you remember anything else approaching a stoppage? Well, yes; there was very nearly a stoppage beyond Belmont.

Was there a stoppage between Hornsby and Belmont? Not a stoppage, but certainly the train went very slow, showing that the driver was negotiating the incline.

Do you not remember seeing the guard after leaving Hornsby? Not after leaving Hornsby. The last time I saw the guard was just before the coupling process had taken place, and I also saw him when the engine came down to take up the two carriages. I don't distinctly remember whether I saw him again when the carriages were being coupled up at Hornsby.

Mr. Midelton.] You stated that you had an idea of going back to the hand-brake at the end of the car? Yes.

Did you notice anybody do so? I am almost certain that nobody applied the hand-brake in our car. My thought was to go there under the supposition that the brake was there, but I would not like to say whether it was there or not.

Mr. Thompson.] You say you felt the brakes being applied in your car. Are you positive whether it was the hand-brake or the Westinghouse? It was the Westinghouse brake that I felt.

Are you sure? I feel certain of that. The hand-brake would never jerk the carriage in the distinct spasmodic way which I felt it. I think the guard was on our carriage when we were at the tail end of the train as far as Beecroft, where the train was divided.

The Chairman.] But you do not remember seeing him after leaving Hornsby? No.

Were you looking about? No, not very much.

You did not stir off your seat? No, except to look out of the window when we got to Hornsby, when the coupling was taking place.

You know that these hand-brakes have a powerful effect upon these cars? Yes, but not powerful enough to give the jerking that I felt.

It was the suddenness of its action which impressed you with the fact that it was the Westinghouse? Quite so.

Mr. Midelton.] Was that after passing through the second tunnel? Yes.

When the train had evidently got away? Yes. I am inclined to think that I felt the brake just as we were going into the first tunnel.

Mr. Read.] What we want to know particularly is whether the air-brakes were acting? I think they were acting after we left Hornsby.

Mr. Midelton.] You have no doubt that they were working after leaving Hornsby? Yes; that it was working I feel perfectly satisfied.

Would you be surprised to hear that the guard rode on the platform of your car, and that he worked the hand-brake and hung on to it after leaving Hornsby right up to the time of the accident? I should be very much surprised to hear that the guard was on our carriage between Hornsby and the Hawkesbury.

Mr. Midelton.] Do you think there was anybody in the car that could positively say that the guard was not there? There was nobody in the car that I knew personally except my wife.

Do you know anybody who would know what part of the train the guard occupied? There was a man in our carriage who was moving about a good bit. He ought to know whether the guard was there or not. He was with two ladies, but I do not know who he was. I am sure, from the position which he occupied, that he would know whether the guard was on the platform of the car or not.

Chairman.] Do you happen to know any passenger who occupied a carriage beyond the one in which you were riding? Yes. I think Mr. Read, a plasterer, of Balmain, was travelling in one of the carriages at the rear of ours.

Is he a man likely to be able to give us any valuable information? I think that it is quite possible; he is an intelligent young fellow, and a master plasterer.

Do you know who coupled the train when the carriages were put together at Hornsby? I cannot say. I only know that it was done very quickly. Can

Can you remember who coupled the engine to the two carriages that were left at Beecroft? I think the guard did. During the time that the first part of the train was away I got out of the carriage and went for a walk, and when I heard the engine coming back I returned, and as she came in sight I went into our carriage, and the coupling was done whilst I was in there. I cannot say positively whether the guard actually did couple them or not.

J. Garrard,
Esq., M.P.

George Stead recalled:—

The Chairman.] You wish to add some statement to your previous evidence? Yes, about the taps. I said that I saw the guard turn one tap. I did not see him turn the two, but I saw his arms spread in an opposite direction as he would do in turning them both down, and I feel confident that both taps were turned.

G. Stead.

Mr. Midelton.] Did you know they were opened? Yes.

William Farquhar examined:—

The Chairman.] What is your position in the service? Shed-inspector at Eveleigh.
What is the nature of your duties? I inspect and see all engines out and in, and to see that all engines are in working order and the men in their places, and everything in connection with the running department.

W. Farquhar.

And you have to see that engines are supplied to take the trains out? Yes.

You remember the train that left Redfern on Tuesday morning at 10:30 for the Hawkesbury? I do.

Do you remember the engine that was sent up? Yes, 178.

Who was the driver? Thomas Wilson.

Are you aware what load the engine took out? She took fourteen.

What do you mean by fourteen? Equal to fourteen, counting the cars two and a half.

Do you consider that the engine was equal to the load? I consider that the engine would be equal to twelve on a bank of one in forty.

That is ascending the banks? Yes.

With plenty of brake power it would be equal to anything going down I suppose? Yes; three or four times that number, as long as there was brake power. When I speak of banks I assume them to be a mile or two in length at one in forty.

What would the engine be equal to in short banks? If there were only short banks then she could get up with fourteen.

Was the engine in good working order? She was in very fair working order.

How long have you been in the service? Thirty-one years last November.

How long Shed-inspector? Since the 27th of May, 1885.

How many years driving? Twenty-four.

Have you used this description of engine? Oh, yes.

For years? Yes.

So that you are thoroughly acquainted with what the engine could do? Yes, and with all classes of engines. With the exception of those which came out lately, I am fully acquainted with all of them.

What experience had the late driver Wilson? He had experience on goods and passenger trains, and he was firing on through trains before driving, and has been on passenger as well as goods trains since he became a driver.

What line has he been running on more particularly? The Western principally, as far as Penrith, and with a goods sometimes beyond Penrith.

Has he driven passenger trains beyond Penrith over the mountains? I do not think he has; but he has been firing beyond Penrith on passenger-trains.

How far has he gone with passenger-trains on the south? To Picton.

Ever beyond Picton? Only firing. I cannot remember his driving beyond Picton.

Has he ever driven goods-trains beyond Penrith? No, I do not think so.

What class driver was he? I believe he was in the second class. I believe he had been six years driving.

Has he been accustomed to the Westinghouse brake? All his driving career. He has been accustomed to its use on all the passenger-trains he has been driving.

Have you ever had any complaints against the particular engine that he was driving on the day of the accident? There was a complaint sent from Cartwright about the engine knocking about the road, and with respect to the brass and side rods. We examined all these and found his statement to be wrong. The brasses could not be better fitted than they were.

Mr. Midelton.] Did Wilson drive 178 on this day only, or was it his regular engine? No; he had it on that day only.

What had he the day before? 176.

Who had 178 previous to Wilson? Fairgrieve had her the day previous.

Has he reported any defect the engine, more particularly with regard to the air-brake? None whatever. I asked him for a report on the air-brake, and he supplied me with one.

Chairman.] What was the nature of his report? That he could drive a train with the engine with perfect safety.

Mr. Midelton.] How came he to make this report? I asked him for a report of the condition of the air-brake; it was after the accident that he was called upon for the report, and he spoke about the engine.

Was she in good order, engine and brake, the day before the accident? Yes, in thorough good order. I make it a rule to get steam up and try everything in the engine before going out.

Did you have any conversation with Wilson? In passing me he said, "I do not think I will be able to get this load out of the hole." I suppose he meant that he would not be able to get up the bank from the river. He gave me no idea by his remark of not being to take the train down.

Does

W. Farquhar.

h { Does the duty fall upon you to select the drivers, or does Mr. Cobb give you instructions? I also do so on these special days, when I make out a list of runs, and I pick the engines able to do the work. As the men go out they are generally put down for their next day's work. We generally select good men who know the roads, especially at night-time. For daylight we are not quite so particular. Wilson was an old driver, and it was daytime. We have sixty odd men to make up, and you cannot pick them for every job. I principally look out for good engines able to do the work required of them.

sg { The Board inspected the wheels of the carriage 114, next to the engine, with the object of seeing whether there were any perceptible traces of the continued use of the brake blocks, with the result that no traces whatever of anything like excessive skidding or braking were perceptible.

The Chairman informed the Board that he had made arrangements with a Locomotive Engineer to have an engine, tender, and four vehicles ready by 9.30 the following morning, fitted with a Westinghouse brake, so as to afford the Board an opportunity of making certain tests in connection with the working of the brake.

The Board were engaged for some time on Saturday morning, June 25th, in making some tests with the Westinghouse brake, with a view of ascertaining the time in which the carriage reservoirs might be emptied by the unskilful use of the appliances or driver's brake valve.

sg { On Monday afternoon, June 27th, the brake-gear of carriages Nos. 69 and 70 were examined by the Board, with a view of ascertaining whether the brakes required "taking up" or not, and they were found to be in an efficient working order, one carriage having a piston-stroke of 3 in., and the other 2½ inches.

George Stead re-called and examined:—

G. Stead.

Chairman.] You are the officer-in-charge at Hornsby? Yes.

c { I want you to go over again as precisely and minutely as you can all that you saw and did in connection with the excursion train on Tuesday last? Well, the first part of the train arrived at Hornsby Station at 1.15 p.m. I cut the engine off the carriages myself. At the same time I turned the tap on the engine and left the tap open on the train. When I cut air off I noticed that the pressure was not so great as it usually was; the report it made was not so loud. After sending the driver back I went over and got a sprag, and I jammed the sprag against the wheel-block to see if it was on. I then put it into the wheel and left it there. I then went back to my office to look after my instrument, and the remaining portion of the train arrived at 1.45. I told the porter to turn the second portion of the train into the loop. I put the signals up and I went and fetched the coupling from the tail end of the train. At the same time that I was fetching the coupling, Guard Clissold was between the two parts of the train. I left the coupling with him. I then went to the driver and gave him a staff and took the other staff from him. I crossed over the car to the platform and went to the points. I turned the train out of the loop on to the main line. Where Clissold was coupling up, I may mention, was right opposite to where I was standing at the points to turn the train from the loop on to the main line. I said to Clissold, "Do not forget the taps," and with that he put up his hand to turn down the tap. I told him right away, when he was right. At the same time I was holding the points to turn him out of the loop on to the main line.

Did you say that you saw Clissold put up his hand or put out his hand? I saw him put up his hand to turn the tap down.

In what position was he—was he standing, kneeling, or stooping? At that time he was standing, and he knelt down to put his hand on the pipe.

Did the train get away immediately Clissold gave the signal? Yes.

Did you see what became of Clissold as soon as he gave the signal? No; he was on the off side.

Did you notice whether the brakes were clear of the wheels as the train was leaving? I noticed on one of the carriages that the blocks were rubbing a little, but it was very little. I do not know which carriage it was; whether it was the Yankee carriage or the other; but it was one of the two.

How were the others? All off as far as I could see.

Do you remember noticing the blocks? I remember noticing this, one rubbing slightly.

If the others had been rubbing, would you have noticed it? Yes.

Are you perfectly satisfied that the brakes were hard on upon the first lot of carriages when they were left at the Hornsby Station? They were hard on the first carriage that came up next to the engine. I can speak positively only as to the first carriage; that is the one I tested.

Did you see any brake blocks relieved by the guard or any one else at your station? None whatever.

Mr. Midelton.] I think you said you saw the guard couple up the two cars that had been brought from the main road to your station? Yes.

That is, Nos. 114 and 47—what did you see him do with regard to the cocks? I saw him put his hand up and turn them down.

Did you see him turn both? I could not say that he turned both.

Which carriage was it? The American car.

You are sure you saw him turn that cock? Yes, I am sure.

But you cannot answer for the other? I would not swear with regard to the other. But porter Rice was standing on the opposite side from me, and he could see Clissold handle both taps.

The man you speak of can testify to that fact? Yes.

Mr. Thomson.] You say that you tested the brakes on the first car of the first lot that came up. Can you remember the car? No, I cannot.

Was it a common second class? I believe it was a second class four-wheeler.

Mr. Midelton.] You had no occasion to go between Nos. 114 and 47 vehicles? No.

Did you see anybody else go in there? No, I did not.

Chairman.] Who unhooked the first part of the train at Hornsby? I did.

Where were the driver and fireman at the time? On the engine.

Did either of them get off the engine? No. The only remark that Wilson made was, that he was doing well, and that he wanted the staff to go back again.

Guard Clissold further examined by the Board of Inquiry on June 25th, 1887:—

Mr. Vernon.] Upon which American car, Clissold, were you standing at the time of the accident? On the one nearest the engine (or the second vehicle from the engine) that turned over on its side at the river bank.

Guard
Clissold.

You are satisfied about that? I am perfectly satisfied.

Do you distinctly remember its going over? I felt it going over, and I got out on the top side.

You have no doubt about that? I have no doubt about it.

Did you see any of the passengers in the car in which you were riding? I did, and assisted them out.

Could you tell me any of their names? There were several ladies, and one young man about 20 years of age, who was dead.

Do you know Mr. Garrard, the Member, when you see him? I did not know him until he was pointed out to me on the journey. It was at Beecroft that he was pointed out to me; and he was standing on the railway line.

I understand you are not personally acquainted with any of the passengers that you assisted out of the car after the accident? No, not one, although I rendered all the assistance I could to get them out.

I want you to go back to Hornsby. After leaving Hornsby, from your last evidence, I understand that the train came to a stand? Yes.

How far was that from Hornsby? From half a mile to three-quarters of a mile on the bank—about the middle of the bank.

Did the train come to an absolute stand do you remember? Yes, quite.

Did it run back? I did not notice it running back.

Do you remember its coming to an absolute stand about half a mile or three-quarters of a mile beyond Hornsby? Yes.

And it was on that occasion that you went forward and released the air brakes of one of the carriages? Yes.

Can you recall to mind which carriage it was? I could not say positively.

Do you remember Belmont or Colah? I am not acquainted with the stations, as I was never on the road before.

This is a place about two and a half miles beyond Hornsby? I do not know it.

Do you remember the train coming to a stand soon after you left Hornsby—say perhaps a couple of miles after you got beyond Hornsby, and running back for a mile before it started again? No, sir, it did not. I can distinctly remember coming back after we left Ryde, and that is the only occasion on which we ran back; but I am quite clear that the train did not come to a stand, and have to run back between Hornsby and Peat's Perry.

Come back to Beecroft. Who coupled the engine on to the two carriages that were left there when it came back for them? I did.

Do you remember opening the taps between the engine and the Redfern car? Yes.

You remember coupling them together? Yes.

And do you remember as clearly opening the taps? Yes, I remember opening the taps.

Mr. Midelton.] Did you couple the two cars that had been brought from Beecroft on to the others that had been left at Hornsby? Yes, I did in the presence of the young man who was stationed there.

How did you operate the break gear when you coupled the two cars up,—what did you do? I turned the taps downwards, and the young man that was there remarked, did you turn the taps; and he looked underneath himself and saw that I turned them down. I think that he had the staff in his hand at the same time.

Are you quite positive that you turned both taps down? I am quite positive. I do not know whether it is necessary to mention that, when we got to the river the accident occurred; the engine driver that was there (I do not know his name, he was here yesterday speaking about the engine) said that he had reported the same engine before, about the same thing, through the donkey not acting. He was in charge of No. 81 engine. I should know the man if I saw him again. Neale was the fireman.

Mr. Vernon.] You say, Clissold, that you are quite clear that you opened the taps at Hornsby, after coupling up the two portions of the train? Quite clear, sir.

Did you and the driver test the connection before you started, by putting on the brakes and having them taken off again? The driver never came forward and said anything at all about it, and it was not tested.

Do you remember whether the brakes were on or off on the carriages that were first taken up to Hornsby, and to which you coupled the other two? I could not say for certain. On account of losing time and the way that we were bothered, and the passengers chiding me at not getting along, I was anxious to get away, and immediately the young man said get away, I gave the signal to start.

Do you remember whether your train had any difficulty in starting from Hornsby? The driver had no difficulty in starting from Hornsby.

John Pye examined at his residence by Chairman:—

The Chairman.] Do you find that you can recollect the facts and circumstances of your journey? Yes.

J. Pye.

Would it be too much for you to give me an account of the trip from Sydney. I mean just what you can remember of it? Well, we were about four or five minutes in leaving Sydney, and we had to stop everywhere until we got to Strathfield. We started away and got on right enough until we got to Ryde. We were a few minutes behind time there. Soon after leaving Ryde we came to a bank and we got stuck up there. After putting the engine to it we found her power not sufficient to get the load up; we set back to get a run at it, and I think we stuck at it again; the next time, the second or third attempt—I don't know which—we managed to get over. Previous to this Mr. Rennie got on the engine. I did not know him then.

That was near Ryde? Yes. We went on until we got just the other side of Beecroft where we stuck fast again. Mr. Rennie advised my mate, the driver of the train, to half the train and run on to Thornleigh, where he said there was a siding, and where he thought we could put in and come back for the other part of the train. He reckoned it to be about two miles. When we got there we found the siding full up,

- J. Pve. up, and there was not sufficient room for us to put in. Wilson asked someone there how far it was to Hornsby and was told that it was about two and a half miles. We went on, and the porter in charge of Thornleigh came on to Hornsby with us. We left the first part of the train at Hornsby, came back and got the other portion of the train, which we also brought up to Hornsby. We got coupled up then, and started away. After leaving Hornsby we stuck again.
- How far was that from Hornsby? I have no idea of the distance.
- But you distinctly remember sticking? Yes. Mr. Rennie said it was the last bit of 1 in 40 that we had to go up, and that after that we would have no hard pulling, and my mate proposed to have another try at it. Did you have to go back? Yes, we had to set back some distance.
- How far? I do not think it was quite half a mile. Mr. Rennie thought we would have to go back to a crossing where there is a bit of a level run. We got over the pinch, and there was no more up-hill to speak about, except one small hill of 1 in 50, and we managed that right enough. It was all down-hill after that, for I recollect Mr. Rennie saying to Wilson, "It is all down-hill after this." While we were going down the driver was working his air-brake off and on at times, and I recollect seeing him put her on when she was running around a curve, and it reduced the speed of the train. We then got into the first tunnel. We then went on, and passed through the second tunnel at the water tanks, where the driver put on his air-brake full. It did not seem to have the slightest effect. Wilson looked at me and said, "The train has got away from us." He kept the air-brake still on, but it seemed to make no effect. for it did not reduce the speed in any way. All the time after leaving this hill-top I had the engine brake on, and of course I tried to give it a touch to make it tighter. The driver reversed the engine, and there and then the engine brakes started the wheels to skid. Then I had to ease the engine brake off to free them. The train then seemed to gain on us in speed.
- And from that time? The driver then whistled to the guard to put on his brake, and kept whistling all the time afterwards.
- Have you any idea where that was? It was $\frac{1}{2}$ or $\frac{2}{3}$ of a mile from the water-tanks, and he kept the whistle on until we got down to the station. I may mention that I remember stepping across to Mr. Rennie and asking him how far it was to the station. It was at that time he said to me, "I think I will jump off here." I told him, "You will be bound to be killed if you jump off at this place, and you might escape somehow if you stop where you are."
- h { I want to ask you a question or two here. You say you got on all right to Ryde; you stopped at all stations. Do you remember any complaints being made about the working of the air-brake? No sir; but our air-pumps stopped at Ryde, and I gave it a lubrication of tallow, and it started off all right again. Did it appear to work all right from that time? It appeared to work all right from that time. You found no difficulty in pulling up at Newtown and other intermediate stations? Oh no! You remember taking up the first portion of the train to Hornsby? Yes. Do you remember who uncoupled the carriages from the engine? No; I could not say. Do you remember whether you took the guard up with you? The guard and Mr. Rennie stopped behind with the other portion of the train. The porter at Thornleigh came on with us to Hornsby, and came back with us for the latter portion of the train. When you got up to Hornsby with the second portion of the train, do you remember who coupled the two portions together? No; I did not see who it was.
- c { Do you remember getting the signal to start from Hornsby? The driver got the signal. You had no difficulty in getting away from Hornsby when you got the signal? No. Did you only stick up once after leaving Hornsby? That is all. Guard Clissold says that about half a mile on the other side of Hornsby he had to go forward to release the blocks off a particular carriage—do you remember that; and he says that as soon as he did it you started away again? We did not start ahead for we had to get back. You don't remember any other stopping beyond Hornsby but the one when you had to set back? That is all. Do you remember a place called Belmont, where there is a big advertising placard set up, about 2 miles beyond Hornsby, Coolah I think it is called in our tables? No. Do you remember whether the brake connections were tested before you started from Hornsby? I could not say that, for this reason: we had a big tender of coal, and I was cracking lumps and shovelling the best part of the way after we left Ryde station. I could not say whether they were tested or not. They may have been tested, but I could not say whether they were actually or not. At that time I was too busily engaged attending to my work. You remember leaving Hornsby, at any rate? Yes. You remember the air-brake being worked between Hornsby and Peat's Ferry, more or less? Yes. Did you happen to see Clissold anywhere between Hornsby and Peat's Ferry? I don't recollect. I may have seen him, but I did not take much notice. Of course we did not know that anything of this kind was going to happen, and before the train got away from us we had no reason to take particular notice of everything. Do you remember the driver releasing his brakes before starting from Hornsby. I ask the question because Stead, the porter at Hornsby, says that when you brought up the first portion of the carriages he uncoupled them; that he turned the taps right, and that he opened the taps of the carriages you left to turn the brakes on; that you then left to bring up the second portion, and that Clissold coupled them up. He states also that he saw Clissold open the taps properly, and that he asked Clissold whether he had opened the taps as well as seeing him doing so, and then you got away quickly, consequently the brakes which were on must have been released from the engine? I don't recollect noticing their being released. You don't remember anything as to what pressure the gauges showed at any time during the journey, do you? Yes, I do; they were showing about 85lb. pressure on leaving Hornsby. Was that the air-gauge? Oh, yes. We had 140lb. in the steam-gauge and about 85lb. in the air-gauge when we were leaving Hornsby. After leaving Hornsby the air-gauge ran up to 90lbs., and driver Wilson eased the air-pump off. Did he use the brake pretty frequently between Hornsby and the first tunnel? He would not want to use it except on the down grades. The places I most noticed him using it were on the bits of curves after leaving Hornsby. And there it had a perceptible effect? Yes. Of course it would have more effect on the curves, the engine brake being on as well.

Do you remember the driver testing the brakes before leaving Sydney? I could not say; he might do so without my knowledge.

It is customary? Yes, it is customary.

Have you been firing long with Wilson? 12 months last December, or about a year and six months altogether.

Where has he been driving principally? To and from Penrith, and he has been on suburban trains as well.

Have you been with him all this time? Yes; the time I mentioned.

Did you hear him make any complaints about the engine he had on Tuesday, the day of the accident? No. } h

Did you run short of water on the journey before you got to Hornsby? We took some in at the tank; above Ryde. There is only one tank between Ryde and Hornsby, and we took water at that tank.

Do you remember Wilson making any complaint about running short of water? No.

You are quite sure of sticking up once after leaving Hornsby and that you had to run back? Yes.

And that is the only time you were stuck up after leaving Hornsby? That was the only time.

Do you remember at any time, during the journey between Sydney and Hornsby, the train stopping and Clissold coming forward and taking the brakes off a carriage? That was where we divided the train.

You don't remember anywhere else? That was the only place. I have no recollection whatever of his coming forward and releasing the blocks from a carriage. If he did so it must have been when we were running back, for if it had been when we were going forward he would have had no difficulty in getting on the last vehicle. That is what I think about it.

Fourth Day—Monday, 27 June, 1887.

PRESENT:—

Mr. VERNON,
Mr. MIDELTON,

Mr. READ,
Mr. THOMPSON.

James Lawson called in and examined:—

The Chairman.] You were a passenger by the excursion train on Tuesday? Ycs.

Which carriage were you riding in? The first carriage.

Will you tell us in your own words what you remember of the trip? I was riding first-class with my three sons; but they were in the second compartment of the first carriage. We left Newtown about 20 minutes to 11 o'clock. I know that, because I looked at the clock just as the train came in. We got on all right as far as Ryde, and then we made a start from Ryde to go to the next station—Eastwood. Before making Eastwood the engine stuck up, and we ran back to the level again, and gained the station. Of course we went down at a fair speed to Ryde. We went back at a fair speed, not one to cause me to take much notice of. After leaving Eastwood we got past the Field of Mars; but on rising the hill between the Field of Mars and Beecroft, we got stuck up again. The engine was again reversed, and we ran back to the level, and made another start, and then we went 50 yards beyond the Beecroft platform, and there we stuck. A strange gentleman then came on the scene. He was dressed in light clothing. I afterwards found out that the name of this gentleman was Rennie. He made his appearance on the scene, and entered into conversation with the engine-driver and stoker, and guard. Presently the guard walked from the engine past our carriage. We were then in the second last carriage from the end. He walked around the other side, and on coming around, I asked the guard, "Are we going to get to the Hawkesbury to-day," and he expressed his doubts as to whether we would or not, and said, "I don't think we are." Presently those two last carriages were disconnected, and uncoupled. In disconnecting the pipe I could see that it was being disconnected almost below me. I suppose within 20 feet it was disconnected. And when it was disconnected I suppose that it was the compressed air which was flying out of the pipe that made the great hissing noise. } c

Will you tell us exactly what you heard, and what you saw? I do not want to say anything to implicate anybody beyond the point to which I am entitled to go. A very great noise was made when the disconnection took place.

Mr. Midelton.] Might I ask was it a continuous noise? Yes, for about half a minute, or a little more. The wheels of the back carriages were blocked with a piece of fire wood which was passed through the wheels, and the engine took on all the carriages, until they came to ours up to Hornsby. Mr. Reid and myself got out of the carriage, and walked around Beecroft until the engine returned. As soon as the engine returned our carriage was coupled on. It was the engine that coupled on, and not the tender, because the tender was in front. We then made Hornsby station.

The Chairman.] Did you see the coupling done? Yes. I saw the man do it, but I did not take any particular notice. I saw the stoker and fireman and guard there, but I did not see them coupling. I am speaking now with reference to the coupling at Beecroft. We got to Hornsby Station, and no time was lost in getting the American carriage, which was the second carriage from us attached to those that were taken up first. Very little time was lost. We then started, and we rode nearly to the place where I saw a placard up showing land for sale at Belmont. We did not quite reach that board. The engine was labouring very hard in going up, until at last we came to a complete standstill, and the engine refused to go any further. The engine was again reversed, and we ran at a very great speed right down to the iron sheds at Hornsby. In fact I made the same remark to a passenger in the fourth compartment adjoining me—I was in the third compartment furthest from the train, and I made the remark to him, "What a great speed we were going down the hill," and he said, "I wish we were going the other way." I found out since that his name is Hargraves. We ran down at a very high rate of speed right to the iron sheds at Hornsby. We started again from Hornsby, and got past, with some little difficulty, the point where we stuck up before. We then proceeded on our way. We got to the first tunnel; we got through the first and the second tunnels, and went through them at a fair speed, but nothing to excite any alarm. On leaving the second tunnel we commenced to run much faster, and on through the third tunnel. I still kept looking out of the window.

J. Pyc.

J. Lawson.

J. Lawson. window as we passed, and I felt myself once or twice jostled. Going through the third tunnel, and the fourth and fifth tunnels, I was still looking out of the window, and I remained looking out till we got down to within a few yards of where the smash took place. I was looking out as far as the station. I saw the stoker and whom I took to be the engine-driver making signs. I did not understand that they were making signs for relief, or anything of that kind. I did not know what they were doing. All this time the whistle was at its highest pitch, as loud, I fancied, as the steam would allow it. Then came the crash. I heard a very great noise, and saw the tender of the engine first go over the embankment. I could just see it from underneath. Our windows were then about 2 feet from the ground. I saw a great flash of flame pass along our carriage just for the moment. I thought it must have been the fire from the boiler of the engine, and it went around the carriage for a second, not more. The second carriage then drove in the compartment of the fourth compartment, and the partition that divides the fourth from the third came right on top of me, and then I endeavoured to work my way up through the *debris* and broken timber, and got up the top of the broken carriage. I got to the side, which was then exactly on top. At that time the other passengers had made their escape, and I was the last in the carriage. I then got out of the window next to the ground. I think that is all that I can remember that took place. I do not know that there is anything further that I can explain except you ask me questions.

Mr. Midelton.] What side of the train were you when you passed the Hawkesbury Station? I was on the right hand side, that is to say, towards the Brooklyn Hotel. I saw the Brooklyn Hotel as I passed.

Was that the side of the train you saw the man standing on the footplate? Yes, they were all on that side, I can swear to two. I saw three altogether, I think, but I won't swear that all three were there.

Have you any idea who it was? No; because the excitement was so great at the time, I can't swear to whether the three were there or not.

Was it the fireman, or the engine-driver, or Mr. Rennie? No answer.

Did you see two people there? Yes; there were about that, because I was leaning out of the window and saw what was going on.

Mr. Thomson.] Have you any recollection of going down from Hornsby? Do you remember feeling that the brakes were applied to your carriage or not? No.

I suppose there was some excitement then? No excitement then. I could not swear that I felt the brakes working from leaving Hornsby.

Supposing the brake was applied, would you know it? Certainly I should know.

You would know if the brake was applied to the carriage? Yes; because it makes a peculiar noise. When the brake is applied to a carriage it brings the train to a standstill almost at once. At other places I have been almost pitched from my feet by the brakes causing the train to come to a standstill.

But do you remember the application of the brakes between Hornsby and the Hawkesbury? No; I can't say that I do. In fact, if I did feel it, I should not have taken any notice of it.

After the train pulled up at Hornsby, did you notice whether the brakes were connected or not? No; I was in the carriage, and I did not pay much attention.

You know you feel it when the air of the engine is connected with the train? Our carriage was connected at Hornsby, after being first connected at Beecroft.

You did not hear any noise, or feel the air brake? No; it was on a carriage astern of us.

Mr. Midelton.] Which was the rear end of the carriage, next to you? No answer.

Witness.] When the brake was disconnected from our carriage, then this noise was distinctly heard not only by me, but by the people in our carriage who were looking out at the time. I made the remark to somebody that a rush of air was coming out. I presume it was air.

You are well acquainted with the hissing noise that the train makes sometimes on the suburban lines when pulled up? Yes; but I did not notice that when going down the incline, on account of the noise that the train made and the whistling going on.

You are quite sure that you never heard the air work at all? No; I distinctly swear that I did not.

Mr. Thomson.] You did not notice that the carriages were skidding, or taking short jumps? Yes; I noticed that. In my carriage I noticed that distinctly. I noticed that the wheels were taking short jumps. I had no reason at the time to think the matter over, but I have done so since, and I can remember it distinctly now. I put it down after I got home. It was not a complete rush on, but a number of jerks occasionally.

Was that after leaving the first tunnel? We got through the first and second tunnels first rate, and it was after that when we heard these things. When we made the second tunnel we were not running at a very high speed, but it increased and increased until we got to a very high speed.

When you observed this jumping motion you were not running at a very high speed! Oh yes; we were then between the fourth and fifth tunnels.

And the jumping continued longer than that? I distinctly felt the jerking; I am positive on that point.

After leaving Beecroft did you notice which carriage the guard was on? He was on the second carriage at the rear end.

On the one next behind? Yes; I told you why I said so. I was looking out of the window and saw him removing the blocks. They had to pull up a little to get the wheels released, and I saw him and a young man take this block out. I did not see him come back or pass our carriage on the other side, and therefore I came to the conclusion that he must be on the platform of the second carriage.

The Chairman.] Where was this? At Beecroft.

But did you see anything of the guard after leaving Hornsby? Yes; I believe I saw him again, but I would not be sure on that point. I saw somebody pass our carriage where the connections were made, but I do not remember whether it was the guard or the stoker.

But after leaving Hornsby? I did not see him again to my knowledge. Of course I saw him at Belmont. He then passed our carriage; that is where the engine was reversed to go back again to Hornsby. He was then standing on the ground. He was going towards the engine past our carriage. The engine was almost alongside of us.

But did your train stick up more than once after leaving Hornsby? No; only once.

Did you notice any stoppage except the one you have spoken of? No, except where the engine was stuck up at Belmont. The engine was reversed and we went back at a very great speed.

There was no other stoppage? No other stoppage.

Long or short? No; no stoppage long or short. I made a memorandum of the stations after I came home.

Mr.

Mr. Read.] Can you say how long you stopped at Belmont? No; but it was not more than a minute. Did you see the guard then? Yes; I saw him on the footboard. I really think he was on the tender. I saw him go up to the engine, and I am almost satisfied that I saw him on the footboard.

J. Lawson,

Did you see him on the ground at all? I saw him on the ground going up towards the engine. I saw the stoker, and I believe that the guard was on the footboard of the engine going back again to Hornsby; in fact I will swear it, because I am satisfied that I saw him there.

The Chairman.] Did you have no recollection of the train stopping just for a short time, and then backing after leaving Hornsby? No; she did not stop at all. When she did stop, she stopped until the engine was reversed and the train sent back again. Of course we went up very slowly to this point.

Mr. Read.] Did you notice the application of the brake in the way you describe before you ran back from Belmont to Hornsby? No; I did not. I never felt anything. I described it that she made a straight run down, and remarked to Mr. Hargraves the high speed at which she ran back. In fact I had come to the conclusion that the engine-driver was going back for assistance to Sydney, because we went right down to the sheds.

Mr. Middleton.] Did you hear any conversation between any men connected with the train? No; the only conversation I had was between the guard and myself. I made the remark which I have already stated, and he expressed his doubts as to getting to Hawkesbury that day.

The Chairman.] Do you happen to know any passenger who was riding in one of the rear carriages? I did know one gentleman, who came to see me the following morning.

Do you know his name? No; he called on me the next day for the purpose of expressing very great satisfaction at our fortunate escape. He was in one of the two carriages immediately behind me, and right at the end. He was at the rear end, and could see whether the guard was on the foot board or not.

Mr. Middleton.] Well, that is the evidence we want.

The Chairman.] I want to know whether you know any one who was riding in carriages five or six from the engine? No, sir, I do not. I don't know who were riding in these carriages.

Mr. Middleton.] Will you try to remember whether in running down from Hornsby to the first tunnel you noticed any application of the brakes, or heard any air escape? No; I can't say anything on that point, because I was paying particular attention to the scenery of the country all the way along. I went on the journey for the express purpose of seeing the country. Reid was at one window and I at the other. There was nothing at all surprising that we should take notice of. The train went at a fair speed, and we all seemed to be very jolly until we got to the second tunnel.

And the speed increased there? Yes. I have travelled 60 miles an hour in the Continental trains carrying the mails from Vienna to Paris, but I am quite satisfied that we ran at a much higher rate of speed than that, and I went from Dover to London at a similar speed, and I am satisfied that this speed was greater if the wheels would admit of it.

Benjamin Bragg called in and examined :—

The Chairman.] What are you? I am assistant-guard.

B. Bragg.

Did you see the accident at this place on Tuesday? I saw it just as the engine went over. I did not see her coming down from the tank.

What do you mean by that? I was just behind the flat rock. We were on the spot in about 4 minutes after at the least.

What did you do when you got to the scene of the accident? I went into the first-class car and assisted the people out. There were a lot of people there—women and children.

Did you do anything else? Yes; I went into the first car from the engine and looked at the taps.

What did you see? I saw that they were all right.

How many did you look at? I think I was looking at three taps.

On which carriages? On the car and then the second-class carriage and the next two. I did not look at the back ones.

Mr. Thomson.] By the car, what you mean is the American first-class carriage? Yes; I think it was the second from the engine.

Did you notice anything else? No, sir, because, Mr. Cavanagh came down and asked me to go away at once for medical assistance.

Did you notice the brake blocks? No, sir.

You merely looked at these taps? Yes; I looked underneath, because I heard that Clissold was underneath, and it was said the wonder was that he had not been killed. This was the first-class car. I think it was the first from the engine.

You know the first two carriages next to the engine were telescoped? I did not see them at all.

Then the car that you were speaking of as having examined the taps of is the car where you were informed Clissold was standing—was that the car that was overturned or telescoped? No; it was first lying on its side on the bank, and we went inside to get the people out.

But it had not been telescoped? No; it was on one end, and slightly injured. Directly we got the woman out who was injured, I went away with her to the public-house, and put her on a palliass.

Was that a complete first-class car? It was first-class right through, sir. It was not divided in any way, nor was there a smoking-car attached to it.

That was the one which telescoped? I don't know; but all the seats were all right, and everything was right inside. Of course we picked up a lot of rubbish off the woman who was lying in the corner. When we got the woman out we went towards the station.

Mr. Read.] There were wounded people in this carriage? Yes, sir. The woman I refer to was the last one we got out, and she was then dead.

The Chairman.] The first thing you did was to assist to take out one of the ladies? Yes, sir.

That was the young lady? Yes, sir; she had light brown clothes on.

And it was the taps on that car that you looked at? Yes, sir; I looked at the taps on the Sydney end.

And all of them on the next one to it? Yes, sir. I did not see the last one, because I had not time.

You remember the sort of carriage it was? Second-class; one of the closed seconds. There were a large number of portmanteaus and umbrellas there, and I locked up the compartment so that nobody could get in to take them out.

Mr.

B. Bragg. *Mr. Midelton.*] Was that a 4-wheeled or an 8-wheeled carriage? A 4-wheeled.
 Are you certain? No. I am not positive.
 But you thought it was a closed second? Yes; because I locked up the doors, and told the porter to watch the carriage, to let no one take anything away. There was a good deal of confusion, and there was a danger that the things might be taken away.
 You say that you saw that the cocks were all right? That they were all right—that is, if they were connected with the engine they would be all right.
 How were the handles hanging? They were hanging down. I went to see if I could find Wilson, the driver.
 What was your object in going to look at the cocks—was it the fact that the accident had taken place? No. They spoke of Clissold as having been down there upon that car. That was the reason.
Mr. Thomson.] You did not try the common brake on that car at all? No, sir; I did not try it.

E. A. Laughley recalled :—

E. A. Laughley. *Mr. Midelton.*] Will you again refer to your notes about the examination of the train at the Hawkesbury River, particularly with regard to No. 73 car, a 4-wheeler. What was the condition of that car when you examined it at the river, and was it the third from the engine? I made two examinations. On the Tuesday night or evening I found the pipes had both ends united with the adjoining cars. The four cocks were open. On the following day I made a further examination. I had an engine coupled to the carriage, and instructed the driver to charge the vehicle with air.
Mr. Read.] The one vehicle? No; two vehicles, 70 and 73. When he had done so we examined the pipes carefully, to discover any leak, as there was a chalk-mark on one side of the vehicle.
Mr. Midelton.] Which vehicle? 73—To say “Air escaping.” At first I did not detect a leak. I then asked the driver to apply the brake. He did so, but I noticed that the brake did not go on this particular vehicle. On further examination I found that the connection between the main pipe and the reservoir was closed.
 That was the day after the accident? Yes; the day after.
 Was that cock closed on the day of the accident? I think not; for on examining the blocks I found grease and little spots of mud on the face of the blocks, which would indicate that they had not been in contact with the wheel for some time previous. I think I may qualify my answer by saying that I think it was closed previous to the day of the accident, as the faces of the blocks bore evidence of their not being in contact with the wheels for some time.
 Did the blocks hang any distance from the wheels on the first or second examination that you made? They hung about an inch and a-half from the wheel.
 Have you any idea who closed that cock, or who wrote on the car “air leaking”? I have not. I have made inquiries, but I have not been able to find out who it was that closed the cock.
 Or who wrote the notice “air leaking”? No.
 Did you see that notice? Yes; it was written in two places.
 Was there any evidence of the brake having been applied on the day of the accident to composite car No. 70? No evidence, except that the cocks at the end of the pipes were open.
 Your examination of the brake-gear of that car lead you to what conclusion? That the brake was in good working order.
 What about No. 69? Also in good working order.
The Chairman.] When you say there was no evidence of the blocks having been used, beyond the fact that the air-cocks were open, what evidence was missing? Well, if the pistons had been tight, I should have expected to find the brake on when I got there. I mean on these two vehicles. It was some four hours after the accident that we arrived there.
Mr. Midelton.] Did you notice any damage to the small brake-pipe of No. 73 car? It was broken off at one end.
 Which pipe was it? The small pipe leading from the main pipe into the triple valve. That would account for the chalk-mark on the outside, “air escaping.” No doubt the person who closed the cock wrote the notice on the side of the vehicle.
Mr. Read.] The notice has been removed since? Yes; it has been replaced by “not to go out.”
 Could you recognise the writing? No; I could not recognise the writing.
The Chairman.] Are you thoroughly acquainted with the working of the Westinghouse brake? I think so. Is it possible for an unskilful driver to exhaust the air from his carriage reservoir? It is possible for him to exhaust it to such an extent as to have insufficient pressure to control his train at a steep incline.
 Have you ever had reason to remonstrate with any driver upon the injudicious use of his air? Yes, I have. On one occasion, two or three months ago, when descending the same incline I was riding in the train, I noticed particularly that the driver applied his brake very frequently, and no sooner did he have it on than he would release it again. When we arrived at the foot of the incline I went on to the engine and remarked to the driver about his unskilful handling of the brake. He then replied, complaining of the pump not being able to keep up the maximum pressure. I told him that it was not the fault of the pump. The pump appeared to be working splendidly, but it was the unskilled manner in which he had manipulated the brake that used the extra air, or in other words, that reduced the pressure unnecessarily.
 Who was that driver? Driver Cartwright. I then gave him instructions how the brake should be handled, so as to use the air sparingly, and yet to have a more beneficial result from the brake.
Mr. Midelton.] You were appointed in April, 1883, on my recommendation? Yes; in April, 1883.
 Would you mind repeating the instructions I gave you as to the duties you would have to perform—the nature of your duties as expressly laid down? They were in writing, and I have not them with me.
 Well, as near as you can, remember them. To travel over all the lines, and whenever a want of uniformity in the system of working came under my notice, to bring the same under the notice of my superiors; to instruct district inspectors, drivers, and firemen, where the want of such instruction came under my notice. I think I gave you special instructions about the jerking of trains on the suburban lines; what was the result of that; I am alluding to the latter end of 1883? I remember something about it. I used to travel with suburban drivers, and instruct them with the use of the brake where I found it was necessary.

That

That was done? It was done.

Did you find any difficulty with the men in the discharge of your duties? I have, on several occasions.

What was the nature of it. Did they take kindly to any suggestions you made, or receive your instructions kindly, or did they think you were interfering with their liberties? Many of the men were very glad to take instructions, and others did not want them; in fact would tell me that they knew all about it.

You have continued that system of giving instruction, where necessary, ever since? Yes.

Do you take a great deal of trouble in instructing drivers in the use of the brake? Yes; I have taken considerable trouble in giving instruction to drivers, relating to the handling of this brake.

Have you continued to do so up to the present time? Yes; I have continued to do so where the want of such instruction comes under my notice.

Have you ever had to come into contact with driver Wilson on this subject? Not that I remember.

Are you one of the board of examiners of drivers? Yes; for the position of first-class driver only.

Have you particularly noticed No. 178 engine with regard to the driver's valve and pressure gauge? Yes.

Did you notice where the pressure gauge was fastened? On the cab of the engine.

Mr. Read.] Fixed on the main pipe, or against the reservoir? On the main pipe.

Mr. Midelton.] Have you ever seen the gauge fastened to anything but the main pipe? No.

The Chairman.] So that the gauge indicates the amount of pressure in the service pipe? Yes; many drivers are guided by the movement of the hand on the gauge in applying the brakes.

The gauge would not necessarily indicate the pressure in the engine reservoir? No; that pressure is from 8 to 10 lbs. higher than the pressure in the main pipe.

When the driver is taking his brakes off the gauge would show the pressure in the reservoir as well as in the service pipe? If he throws the handle all the way round to the stop it would, but he only leaves it in that position for a few seconds.

Have you ever had brought under your notice any instance of the injudicious use or failure from the injudicious use, or handling, of the Westinghouse brake, on account of the gradients on the Western Mountains? Yes. I will refer you to the accident which occurred about twelve months ago on the Zig Zag, when the train run into the buffer stops. That is one case. I could refer you to another case in which I was riding on the up passenger train. After leaving Wentworth Falls, in fact while pulling up at Wentworth Falls, the driver overran the platform. At the next stopping, he again overran the platform, and this time reversed the engine against the train running at high speed. I then went on to the engine. The driver complained of having but a small percentage of his train fitted with the brake, and on examining the train I found it was the fact. Nevertheless, I considered what he had was sufficient to control the train if the brake was handled properly. He then asked me to take hold of the brake. I refused, telling him that that was not my business and that he should control his own train, but I said that he should handle the brake and do as I told him. At the next stoppage, I particularly instructed him to apply his brake in time, which he did. The train was coming to a stand just about the proper place, but, for what reason I don't know, he released the brake, which of course allowed the train to overrun the platform as in the two last cases. I then told him that I should bring the matter under the notice of the Locomotive Engineer, and after that, at all other stations until he arrived at Penrith, he stopped at the platforms with the use of the air brake alone. I did bring the matter under the notice of the Locomotive Engineer, and I believe the case was also brought before the Traffic Manager. In this case I think there were only two vehicles out of twelve fitted with the brake. Which, in your opinion, and as a matter of fact was ample to control the train? Was ample to control the train.

The driver would have to be extraordinarily careful in the use of the air? Yes.

Mr. Midelton.] Have you given special attention to the manipulation of the Westinghouse brake since you have been in the Government employ? I believe I have given more instruction on that point than on any other.

To drivers of course? To drivers.

Thomas Evans examined:—

The Chairman.] You are a carriage examiner? Yes.

Mr. Midelton.] Did you examine the train for the Hawkesbury River on Tuesday last before starting? No; I did not examine the train any further than passing her before she started.

Who did examine it? A man named Joe Butler.

Did you write anything on any of the cars previous to leaving Sydney? No.

Did you know of anybody else writing anything? No.

Have you written anything since on any of the carriages of that train? I did, at the Hawkesbury River on Tuesday night.

What did you write? I wrote on one car "Not to go out."

What car? No. 70. A composite Redfern car. I also wrote it on another; I did not notice the number. I believe it was on another train.

Never mind the other train. You wrote it on No. 70? Yes.

Did you write anything on any other car of that train? No.

Are you sure? Yes, I am sure.

You are quite sure that you only wrote on one car? Yes. They took five carriages, and that being the next one I was afraid they might take it away as well and put it into traffic; that is the reason why I marked it.

Mr. Read.] Did you notice No. 73, a four-wheeled carriage, at the Hawkesbury River that night? Yes, I did.

Did you notice anything written on that carriage then? No.

Have you noticed anything since? Only what I put on since it returned to Sydney.

What did you put on? Not to go out.

Why did you put that on? Because I got instructions that the carriages would be required to be placed together, so that the Board and Jury might see them; that is the reason why I marked it.

When you went to mark it not to go out, did you notice anything else written on it? No.

Did you know of anything the matter with this carriage 73? I noticed that one end was knocked in.

Did

T. Evans'

b

T. Evans. Did you know of anything the matter with the air brake gear? No; I was not aware that anything was the matter with the brake gear. When it came back I noticed how the air gear was, but I did not notice it before.

The Chairman.] Whose business is it to see that the carriages, before they go out, are perfectly fitted with the air brakes. Whose business is it to see that the air-brake fittings are in proper order before the carriages go out? Mr. Tempest, or whoever he appoints to do it of course. My men assist him when necessary.

Mr. Midelton.] You assist one another in fact? Yes, we assist one another.

Your special duties apply to the cars, exclusive of the brake? Yes, to the running part of the vehicles.

Mr. Tempest's men look to the brakes? Yes.

Butler you say examined that train in the morning? Yes.

J. Butler.

Joseph Butler examined:—

Chairman.] What position do you hold? I am with Mr. Evans in looking after the trains.

Mr. Midelton.] Did you examine the train which was wrecked at the Hawkesbury River previous to leaving Sydney? Yes.

On Tuesday morning? Yes.

What was the result of your examination? I found everything in working order.

How long have you been employed here? About three years.

On the same work all the time? No, I was twelve months in the carriage shop; but I have been two years with Mr. Evans.

You found nothing at all wrong with the train? Nothing at all wrong.

Chairman.] Is it a part of your duty to examine the brake appliances? Yes; to see that they go on all right, and to see that there is nothing that wants screwing up.

Did you examine every carriage on this train? Yes, from one end to another.

Can you tell us what carriages were fitted and what not fitted with brakes, and how they were fitted?

They were all fitted with air-pipes, and the brakes were tried on by Mr. Werricks, who found that all of them held tight.

Did you see Werrick try them? Yes.

Were all the vehicles fitted with brake appliances? All but the second class open carriages.

Do you remember that there was a close second class carriage on the train? Yes.

Was that fitted with a brake? There were no brakes on the open second class carriages.

But there was a closed second class 73, was that fitted with brake appliances? I could not say exactly.

Mr. Midelton.] Was the carriage next to the engine fitted, and were the brake appliances in good order? I was not in all of them when I examined the brakes, but I went through all of them to see if anything wanted screwing up.

Screwing up of what? All the bolts on the bogies.

Mr. Read.] Did you notice anything written in chalk on any of the carriages? I did not.

If the words, "Air leaking" were written in chalk, would you have noticed it? Yes, if it was on my side.

We always go up the side where there is no platform, so as to be better able to examine the train. I went up the left-hand side, and if it had been written on that side, I should have seen it.

Where did the train start from? From the far side of the wooden platform.

And you are sure that there was nothing written on the side you went along? I did not see anything.

Would you have seen it if there had been anything written there? I think so, if it had been written on that side.

Mr. Thompson.] Suppose it was written on the footboard, would you have seen it there? Yes, I would have seen it there.

The Board then adjourned.

Fifth Day—Tuesday, 28 June, 1887.

James Tempest examined:—

J. Tempest. *Chairman.*] What are your duties? I am in charge of the Westinghouse brake, under Mr. Braid.

How many men are there under you? Twelve.

And you are supposed to see that the Westinghouse break fittings of the carriage are all in good order before they go out? Yes.

Have you seen closed second-class carriage No. 73? Yes.

Have you examined it? Yes.

What did you find? I found a copper pipe broken. A supplementary pipe that leads from the main pipe to the triple valve.

Which side of the triple valve? The underside.

Did you notice anything else about the fittings; did you look at the blocks? The blocks were all right.

The tap was shut off to disconnect that vehicle from the main pipe.

Did you examine the break-blocks at all, to see whether they bore any trace of recent usage? I did not examine them for that.

Have you any idea when that pipe was broken? The carriage was examined on the 18th of June by one of my men, called John Elmsworth. As he examines them, he enters them on a slate, and I copied them in a book. It was all right then.

What did you say the man's name was who examined the carriage on the 18th? John Elmsworth.

What was the result of his examination? Nothing reported as to the carriage.

Could the pipe have been broken on the 18th? Yes?

Previous to Elmsworth's examination, could that pipe have been broken? It could have been.

And

And he would not report it? Oh yes; he would report it.

Then might we not infer that it was not broken when he examined it? Yes; that is the inference I would draw from it.

As a matter of fact, he entered nothing against the carriage on the 18th! Nothing.

Is that the last date you have any record of its being examined? Yes.

Do you know that the words "air leaking" were written on the carriage? Yes; I saw it at the Hawkesbury on Thursday. I did not get there till then.

Have you any idea who wrote the words on it? I have not. I don't know the hand-writing. I know the hand-writing of all my men, but I cannot find out who did it.

Have you tried? Yes; I have tried in the yard.

Where were the words written? On the sole bar and on the step.

Which side, as the carriage left Sydney? On the left-hand side going out of the yard.

Which side was it at the Hawkesbury supposing you were looking to the river? On the left-hand side.

When you examined the broken pipe, did it appear to be a recent break? It seemed to be recent. We often have them break. The copper gets brittle from being exposed to the air.

But it requires a jar to break them? Yes.

Can you account in any way for that breakage? It might have been broken by the accident. It must have been done with a jar, or the vibration of the carriage

Mr. Midelton.] What would be the effect of a pipe breaking on the road? The brakes would go on.

On the whole train or on one car? Throughout the train, the tender as well.

Chairman.] What is the diameter of the broken pipe? Three-eighths of an inch.

Assuming that pipe to be broken while on the train, you say it would put the brakes on? Yes.

That is, assuming that there was any air in the reservoirs? Yes.

We will suppose that the pipe broke, and that the brakes went on, how far would that broken pipe interfere with the driver taking his brakes off again by recharging? It would all depend upon the quantity of air that the driver had. If he had sufficient air to overcome the air he could take the brakes off.

With your experience of the brake would that be feasible? No; not with the way in which that pipe was broken; it was clean broken through.

But could not the driver work against such a leak as that? No; he could not.

Could he keep up sufficient pressure in his own gauge? No.

Mr. Midelton.] He could keep up pressure in the receiver under the footplate, but he could not pump into the train pipe? If he had a brake on position he could pump into his main reservoir; but it would not show on the gauge.

Chairman.] So if the gauge showed from 50 to 70 lbs. of pressure he could not have been working against a broken pipe of that sort? No.

So it could not have been broken, or, if so, it must have been shut off? Yes.

Mr. Midelton.] Do you know whether that No. 73 carriage was in good order when it left? I could not say. The man that was there could say.

Can he say whether the brake gear was in good working order or not? I don't think he is positive about No. 73.

Mr. Thompson.] At what time after the accident did you examine the car? On the Thursday.

While it was standing at the Hawkesbury River? Yes; but it might have been put in any position before I got there.

Do you know the spot where the train ran away? Yes.

Supposing that pipe was broken by a jar just as the train was running down that hill into the ferry, what would be the result, as far as the driver's experience is concerned? The brakes would go on, and if the driver did not assist with the brake-valve, and put the handle of his brake in position, it would empty his main reservoir.

But what would be his experience if he kept working his brake on and off with that pipe open? The tendency would be to lose air, but still the brake would be on.

Mr. Midelton.] Whatever he did, the brake would go on. Yes; and he could not take it off 73.

Chairman.] When you say that the breakage in that pipe must have resulted in the going on of the brakes, you are assuming that there was some air preserved in the carriage reservoirs? Certainly.

If empty, the breakage of the pipe would be neither here nor there? Quite so; evidently the man who shut that cock off knew his duty; he found the leak there, and he shut the cock off to enable the carriage to go out.

Mr. Thompson mentioned that when first seen by him the break was half-way or three-quarters around the pipe; since then it had been completely broken, showing of course the remainder of the pipe with a fresh fracture.

Witness.] They frequently break half way round.

Chairman.] What is the custom, then? "Air-leaking" is written on the card, and any one that comes across it shuts the brake off that carriage.

In the same way as was done in this particular case by someone or other? Yes.

You say you are acquainted with the hand-writing of all your men? Yes, I can pretty well tell those who brand the carriages.

And you cannot recognise this handwriting at all? I cannot.

Did it appear to be freshly written? Yes; it was very legible when I saw it; I see it has been rubbed off now; it may have been washed off with the rain.

Thomas Evans examined:—

Chairman.] You were a passenger in the excursion train to the Hawkesbury on Tuesday last? Yes.

Which carriage did you ride in? I rode in two cars; I rode in one which was, I think, third from the engine going up; and afterwards I rode in a carriage that was, I believe, the fourth from the engine

What kind of carriage was the first one? It was a second-class carriage.

Was this second-class carriage closed or open at the sides? It was closed.

With doors and windows? With doors, windows, and blinds.

T. Evans.

And

- T. Erans. And you were riding in that carriage? Yes.
- Did you ride on that carriage all the way to the Hawkesbury? No; I changed carriages at Hornsby.
- What carriage did you get into then? A similar carriage. The one I rode in first was close to the second-class smoking compartment in the American car. I went into it, and as I object to smoking I got out, and went into the next carriage. That was at Strathfield.
- Which carriage did you change into? It was the second or third carriage before the train divided, and when we were connected together again, it was No. 4.
- You changed carriages at Hornsby? Yes.
- Did you get into the carriage adjoining the one that you were in? I got into the second.
- Was it next to the first one that you were in? I think it was the next one; I am not certain.
- When you left Sydney, or when you got in at Strathfield rather, how was this second-class carriage situated, was it next to the engine? Not when I got into it. It was adjoining the second-class compartment of the American smoking carriage. It might be three or four from the engine.
- Are you satisfied that it was not next to the engine? Quite satisfied that it was not.
- When you changed carriages at Hornsby, what sort of carriage did you get into? A similar carriage, with closed sides and doors.
- How far was that from the engine as you left Hornsby? That was then No. 4.
- Was the carriage in which you finished your journey the fourth from the engine? Yes.
- Are you sure? I am positive.
- What sort of carriage was in front of you? Something of the same kind.
- Mr. Midelton.*] Was it a long car or a short four-wheeler which you got into? I could not say.
- You remember the train stopping at Beecroft? Yes.
- Did your carriage go up with the first lot? Yes.
- (After a consultation, it was made clear that the carriage the witness occupied at the time of the accident was No. 70, the fourth from the engine.)
- The Chairman.*] You remember leaving Hornsby? Yes.
- Will you tell us what you remember of the journey from the moment you left Hornsby till the accident happened? We started away from Hornsby at twenty minutes past 1 o'clock, and we went along for a little distance without anything particular occurring, except a slight hitch here and there. The engine seemed to travel very reluctantly up the hills on one occasion. I think we stopped, and had to go back again. I recollect it was near an orange orchard that we passed on the left-hand side. We went on again, and the next thing I noticed was the 29 miles 60 chains mark on the side of the road, and where we got some views of the valley beneath it. About another 20 chains beyond that we saw what we took to be the Hawkesbury River on the right hand side. Going down a little further we saw the river again on the right hand side.
- Tell us about the train? After passing the 9 miles 60 chains mark I thought we were going at a fair rate of speed, I think about 38 miles an hour, and I thought the engine-driver was putting on a spurt, and that he was making up for lost time. As we got to the first tunnel I noticed that the speed got what I call a little stiff, and that the train oscillated, pitching us backwards and forwards, and as soon as we got one jerk we would get another immediately afterwards. At that time a lady was being shaken in the train, and I got hold of her hand and we held together, and we did not feel the jerking so much. When we were passing through the second tunnel we began to realise that we were in some danger. The train was skidding in the front, and sometimes grating along the rails, and at others we could hear the train jump.
- Mr. Midelton.*] Were the brakes "on" in your carriage? No, I could not tell whether the brakes were on or not.
- None of the way down? No.
- Don't you remember their being used after leaving Hornsby? No, not on that carriage. I also saw Clissold get into the second carriage from the engine.
- The Chairman.*] When? After leaving Hornsby he was in with us till we got up to Hornsby.
- Mr. Midelton.*] Did he remain in that carriage after you passed Hornsby? Yes, all the way through.
- Did you see him afterwards? Yes, I saw him, and have known him for eighteen years.
- The Chairman.*] Are you quite clear that you saw him get on that second car at Hornsby? Yes.
- And you know he remained on it till the accident? Yes.
- You remember sticking up after leaving Hornsby? Yes.
- Do you remember seeing the guard at the time you stuck up? No, I do not.
- You did not see him after that occurred? No.
- Would you be likely to have seen him if he walked by your carriage? I am sure that I would. I was sitting close to the window, and I know him so well that I could not mistake him.
- Did you see any of the coupling preparations at Hornsby? I do not think so; passengers do not generally look for that.
- Did you notice the officer in charge at Hornsby? Yes.
- Did you see him do anything with the train? He was with Clissold.
- You left Clissold behind in the first instance? Yes.
- Did you see the officer at Hornsby before Clissold came up? Yes.
- Did you see him do anything? Only assisting the driver to get the train on the siding, off the main line.
- Anything else? I heard him say, "Where is your guard?"
- Did you happen to see what he did in the way of uncoupling? No, I did not notice anything particularly.
- You did not notice him pick up a sprag and put it into a wheel? No; I think I would have noticed that, as I was looking up and down the carriages. I am sure that I did not see any sprag. I was on the line myself for some time, on the railway lines, and I would notice what other gentlemen would not. I think I am a born detective in this case.
- You do not remember seeing anything? No.
- You did not see a young man uncoupling the engine? No.
- Nor anybody coupling it up again? No, I did not.
- Mr. Thompson.*] Which side of the train were you sitting on? On the right hand side facing the engine.
- Mr. Midelton.*] Did you look out of the window in going down from the first tunnel? I could not get a chance to do that, because at intervals we were in complete darkness in going through the tunnels.

Are

Are you acquainted with the noise the brakes make? Yes, with the hissing noise they make.

Did you hear that at all going down the hill? No, I cannot say that I did. It may have made the hissing noise; but I did not hear it. When we got through the tunnel the first thing I dreaded was a wheel breaking off the axle, and about this time a woman with a baby in her arms fainted.

Did you notice anybody shut off any of the cocks of the car in front of you at Hornsby before you left? I did not.

When you got into 70 car at Hornsby, there was another car in front of you. Did you notice anybody doing anything to that carriage? No, I did not.

Mr. Read.] Did you notice the brakes of the carriage which you got into at Hornsby? I could not say anything about them.

Mr. Middleton.] Did the train "jerk" backwards and forwards. I do not mean side oscillation. Did you feel yourselves being thrown backwards and forwards? Yes, occasionally; but there was very little rebound when we got to the end. We found ourselves thrown straight up, and we walked out of the carriage.

The Chairman.] Do you remember sticking up between Strathfield and Hornsby? Yes.

Do you remember seeing guard Clissold on the road when you stuck up at any time? I do not.

Did you speak to guard Clissold between the time of leaving Strathfield and arriving at Beecroft? I did not see him at all till I arrived at the Hawkesbury.

T. Evans.

Thomas Grace examined:—

The Chairman.] You went to the Hawkesbury in the excursion train on Tuesday last? I picked up the train at Strathfield. T. Grace.

What sort of carriage did you get into? I got into the second-class smoking compartment of a long car.

Did you retain your seat in that carriage all through? No; I was standing out on the platform looking for a jump for about 3 miles.

What I mean is, did you remain in that carriage during the whole journey? Yes, till I thought the train was running away, and then I went on to the platform of the carriage.

When the train left Hornsby you remained in the same carriage? Yes; we got out while the engine went back, and afterwards went back into the carriage again. When the train divided we got shifted further back.

Did you know the guard of the train? No.

Did you have any conversation with him during the journey? No.

You remember sticking up between Ryde and Hornsby? Yes.

Did you see the guard on that occasion? There was a man passed me by before they divided the train, and I think he belonged to the train. I asked him, in a jesting way, "What are you going to do with us? This engine has to do one of two things—pull us up, or leave us; and I think she cannot pull us." The reply was, "They have stuck too many cars on to us, and we cannot go on."

That is the only conversation which took place between you and any railway official on the journey? That is all.

You remember the train being divided at Beecroft? Yes.

You went up with the first lot to Hornsby? Yes.

Did you take any notice of what was done at Hornsby in connection with uncoupling and re-coupling the trains? We were merely shunted off, and when the other part of the train came up I do not think there was a delay of more than a minute before we went on again together.

You remember leaving Hornsby? Yes.

Now give us your own account of what you remember of the journey after leaving Hornsby? We went on very successfully, as far as I could understand, for some distance. We went at a fair rate of speed until we got close to the first tunnel. There was a party in the train who was working about there, and I recollect remarking to him that we were going to make up for lost time; but as soon as the train got out of the first tunnel I said, "The train has run away." With that I stood up and went upon the platform of the car and remained there until we got to our destination. I was standing on the right hand side, and I saw that there was no hope left for me but to jump into the water when we came to it, and I was standing there waiting for the best chance of jumping. I do not recollect seeing the little township as we passed, and I did not see the platform at Hawkesbury. I don't know whether I jumped off or how I got out of it. I heard the crash, that is all.

After leaving Hornsby, do you remember sticking up before you came to the first tunnel? I do not.

Don't you remember the train stopping after leaving Hornsby? What, after she had been made up? Yes? I do not.

Do you know the working of the Westinghouse brake when you hear it or feel it? No; but I know this, that there was no brake on the wheels of the car between me and the engine.

What makes you think that? While I was standing on the platform I noticed the car used to ride on its springs, and I could almost see between the wheels, and I noticed these wheels spinning like a spinning-top. I never saw a spinning-top revolve faster.

You are not able to say anything about the brake gear of the train—you don't know whether it was used by the driver? I don't think the brake could have been used, because the train was gaining ground every moment.

Mr. Read.] Were you on the front or back platform of the car? On the front platform towards the engine.

Did you notice any application of the brake? I noticed nothing about the brakes. My opinion was that the engine had run away, and that in a few minutes we would be in eternity, and that there was nothing for us but death.

Thomas Evans, recalled:—

The Chairman.] Having had an opportunity of seeing the carriages which were on the train, have you come to the conclusion which one you rode in after the leaving Hornsby? Yes, it was No. 70, a Redfern composite carriage.

T. Evans.

Pierce

Pierce McEncroe examined :—

- P. McEncroe. *Chairman.*] You were in the excursion train to the Hawkesbury last Tuesday? Yes.
Which carriage were you in? I was in the first-class compartment of the smoking-car.
Where did you get in? At Redfern.
Do you know the guard of the train? No.
Are you acquainted with the Westinghouse brake;—can you recognise its action when in a train? I have seen the hose-pipe running from one carriage to another.
Have you travelled much in trains? Yes, pretty constantly during the last ten years.
Did you see the guard during any part of the journey? I do not remember seeing him.
At no time? Not that I can recollect; I saw the railway men at Hornsby running backwards and forwards, but I did not take particular notice of them.
You remember going up to Hornsby. You went up with the first lot of carriages, did you not? Yes.
Did you take any notice of the railway men as they uncoupled and coupled up? No; as the engine was coming along with the other two carriages, we go into our carriage again, before they coupled up.
Would you describe to us what you remember of the journey between Hornsby and the ferry? After leaving Hornsby the train seemed to go along at a fair pace for about half way. Then we noticed the train going very fast; and I recollect a friend said to me, "The engine is going very fast," and I replied that I thought the train was making up for lost time. I never had any idea that the train was running away, and as far as the rocking and jolting were concerned, I have felt it as bad on the mountains with the mail trains, except, of course, the last knock we got.
Did the train stick up for a short time after leaving Hornsby? The train at first stuck up a little beyond Ryde, and after running back we stuck up two or three times after that.
Do you remember sticking up at Beecroft? Yes.
Do you remember sticking up after leaving Hornsby? I do not recollect.
Mr. Midelton.] Did you ride through in the same car? Yes.
Where was the car when you got in at Redfern? I fancy it was the second from the engine, but I am not sure.
The Chairman.] You say you have travelled a good deal in railway trains? Yes.
Do you know what it is to feel the brake go on? Yes; you hear a grating noise.
Have you often noticed the use of the Westinghouse brake, and the hissing noise that you frequently get by its use? Yes. I have often noticed that.
Do you remember hearing or feeling any application of the brake after leaving Hornsby? No; I do not remember feeling it.
Were any of the passengers in your compartment alarmed? Not a bit. I do not think there was a person in the compartment who had any idea that the train was running away. We were reading and smoking; but I recollect my mate remarking that the train was running very fast, and I replied something to the effect that she was making up for lost time.
Mr. Midelton.] Did you feel yourself being jerked backwards and forwards; I do not mean sideways, recollect? No. The oscillation was simply sideways, and the last knock we got sent me from one side of the carriage to the other. I was not thrown forward at all. When we got the knock, the door of the second-class compartment and the passengers rushed in and told us to clear out, as the train was smashing up.

Harry Richardson, coaching superintendent, recalled :—

- H. Richardson. *The Chairman.*] Do you know porter Stead, the officer in charge at Hornsby? Yes.
Has he had any experience with the air brakes? Yes.
Where was he engaged prior to going to Hornsby? At Sutherland, where he had to cut off all the trains that went to the National Park and Sutherland. Prior to that he was at Parramatta for several months. As shunter there he had to attach and detach engines and vehicles of passenger trains, and they were all worked by the air brake.
C It was a particular part of his duty to look after the air cocks? Yes; both at Parramatta and Sutherland. I always found him a careful man, and a man with a good knowledge of the Westinghouse brake. By way of explanation, I may say that he has always mastered what he has had to do. For instance, when he went to Sutherland, he did not know how to send telegrams; but he had not been there a fortnight before he had sufficiently mastered the instrument as to send and receive telegrams. I found him a very intelligent man, and that is the reason I put him at Hornsby.
Do you know what means are taken in Sydney to prevent an engine going away with too heavy a load? No, not as far as the Locomotive Branch is concerned. We, in the Traffic Branch, make up the suburban loads up to fifteen, sixteen, or eighteen, as the case may be, and on the mountain line and going south we put on up to seventeen, eighteen, and nineteen, and in that case we advise Picton and Penrith.
So in the cases of Picton and Penrith these long trains are regulated from there? Yes.
What about trains going to the Hawkesbury, where there is no intermediate depot? I should regulate them from here.
Whose duty would it be? So far as the engines are concerned, the Locomotive Department; but from the Traffic Branch point of view fifteen would be the load. That would be the load on account of the couplings, but I could not say what an engine would pull.
So in your opinion the Locomotive Branch would be responsible for seeing that no engine was overloaded? Certainly.
Seeing that an overloaded engine would be likely to result in delay and inconvenience, don't you think that the principal officer at the station, such as the station-master, should also take some interest in such a matter, and see that the engine is not overloaded? Certainly he does that, and I do it in scores of instances. If I find that an engine is overloaded I draw the attention of the Superintendent of Locomotives to the fact, and ask him to put a heavier engine on.
I have done that in many instances, particularly on the Illawarra line.
Mr. Midelton.] The limit for the mountains is thirteen carriages? Yes.
What would be the limit then for a grade of 1 in 40? I am not prepared to say what it would be from a locomotive point of view.
But

But what would be your limit? About fifteen.

What is the limit you would send anywhere? Well, as to that, I could put thirty on between here and Penrith and Campbelltown, provided with proper brake power.

You do not think it would be unsafe to work thirty carriages between here and Campbelltown or Penrith? It depends upon the stoppages. If the train had to stop at all the stations going along, I certainly would not do it; but if I were running a special train with a large school party or a large excursion party, without stopping between here and Campbelltown, I could safely put thirty on.

But you would not exceed thirteen beyond Penrith? No, I would not.

The Chairman.] I think you have said that you have put fifteen on the Illawarra line? Yes; and in the case of the unemployed a little time back I put twenty on. I had to bring the unemployed into town, and I put twenty carriages on, with a large American engine. I held the train very easily, as there was plenty of brake-power and a heavy goods engine. I have also taken troops up to Loftus, when I have had equal to seventeen on.

In fact, you would regulate your load according to your engine-power and brake-power, and not by the work your train had to perform? Yes. I knew that in the case of the unemployed I wanted twenty carriages, and I saw that plenty brake and engine power was provided.

Mr. Midelton.] Was that train worked with the Westinghouse brake? No, it was not; it was worked with plenty of hand brakes all over the train.

Mr. Thompson.] What is the grade from Colo up to Sutherland? About 1 in 40.

Mr. Midelton.] Do you know what engine it was in that case? I do not.

The Chairman.] You know the train that went to the Hawkesbury River? I was not in Sydney when the train left.

Are you aware of the brake power attached to that train? Yes.

In the shape of hand-brakes alone? Yes.

Do you consider that the hand-brakes alone would have been sufficient alone to control that train to Peat's Ferry? Yes.

Quite sufficient, apart from the use of the Westinghouse brake? Yes; I have no hesitation in saying that I will take that train any day in the year with the use of the hand-brakes on the two American cars.

You consider, in fact, that the engine and tender brakes together with the hand-brakes of the two large American cars, would be more than ample to control that train to Peat's Ferry? Yes, I do.

Mr. Read.] In speaking of running these heavy trains between Sydney and Penrith, you refer to non-stopping trains? Yes.

Mr. Midelton.] Suppose an engine is powerful enough to take sixteen over the Mountains, would you put sixteen on? No, not over the Mountains. The Traffic Manager has ordered thirteen to be the limit, and I have not exceeded it; but I have known a case in which fourteen have been taken.

Mr. Read.] What is the heaviest load taken to the Hawkesbury River? Equal to fifteen vehicles.

William Farquhar, Shed Inspector, recalled:—

The Chairman.] You are acting under Mr. Cobb, who is the Running Foreman? Yes.

You know that the Hawkesbury line has been opened lately? Yes.

What class of engine have you been in the habit of sending with trains to the Hawkesbury River at holiday time? Bogie engines.

Have you ever sent any other? Yes; we had a special order for heavy engines on Sundays. That is the only day we picked a heavy engine for that road.

What class of engine have you sent on the road on Sunday with the heavy load? Either a 63-class or the American class of engine.

Is that what you call the 304 class? Yes.

If I understood you the last time you were giving your evidence, Driver Wilson had never taken charge of a train as driver on a line with grades of 1 in 40? No; not beyond Penrith or Picton.

Has he travelled beyond those points? Yes, as fireman.

Well, what was your reason for sending such a man as Wilson on the Hawkesbury line on this occasion? He was a second-class driver, and had been driving for five or six years. I looked at it in that light. I did not consider there was any difficulty in the road. It was daylight, and, from my experience, I have never found any difficulty on a new road in daylight.

Therefore, you would send a man in daylight on a road that you would not send him on at night-time? Yes, I would.

What other drivers were picked out for the Hawkesbury line, on Monday or Tuesday? Frame, Hume, Wilson, and the man who runs regularly on that road were picked out for those two days.

What engines were picked out for Frame and Hume? One had a big engine, and the other had a 60-class engine. We required all the engines we could possibly spare that day. We had no engines standing by. All the engines with air supplied were in use.

Mr. Midelton.] Were all the last new ones in use? Yes.

Where did they run? One was running to Bathurst, one was running to Waterfall, and the third is just newly out.

Were these drivers sent to learn the road before Monday or Tuesday? We have had no opportunity of sending men to learn the road, only on the Sunday or Saturday.

How do you make that out? There is only one engine that runs all the traffic on that road between Strathfield and the Hawkesbury.

But could not a driver go with that driver as fireman for a week to learn the road, rather than put him on driving at first? I daresay he could; but it has never been the practice to send men on new roads like that. Wilson was there the day previous.

That was the first time? Yes.

Did he express himself to you about being at all frightened? Never made any remark.

Not to you? No, not to me.

Did he to any one else to your knowledge? No, not that I am aware of.

The Chairman.] Do you know what load the engine took out with it? I counted fourteen, counting the American cars as two and a-half, and the Redfern type as two. } h Don't

W. Farquhar.

Don't you think that under the circumstances that that was somewhat an overload for that engine? Yes, it was, rather.

Mr. Midelton.] Could you have taken that load to the Hawkesbury? I do not know. I have never been up on that road. It depends on the length of the banks. If they were short banks, I could.

h { What would you call a long bank? Anything between half a mile and a mile long. Quarter of a mile banks would not be felt much.

An engine is not necessarily supposed to bring back the exact number of carriages which it takes away to a particular station? No; it does not always do so.

Mr. Midelton.] Do you think that 178 would do so? I do not think she would with that load, if she had to come back over a bank $4\frac{1}{2}$ miles long.

Then what provision had you made for working the balance home? I have been thinking the matter over since. The other train would have had to bring some of them back.

But Wilson went away last, did he not? Yes; but he was supposed to get there four hours before the other trains came away.

The Chairman.] Goods trains occasionally work carriages back? Yes; I believe they do bring back carriages left standing at the station.

Have you any locomotive men at Peat's Ferry? No; only the driver and fireman running the train there.

Mr. Midelton.] Do you know whether Wilson protested against taking the load before he left Sydney? Only what he said to me in passing.

Where was that? As he went out at the end of the platform.

What was his remark? "I shall never be able to bring this load out of that hole."

Did not that rather excite you, that he would not come back? That made me count his train. I should not have done so but for that remark. I then counted his train to see what he had on.

Then he understood that he would have to bring the same train back? Yes; but I thought he might put some of the carriages on the other train, because they had smaller loads.

How many had they? They had eight and a half or nine.

Yet one of their engines was bigger? Yes. Our idea was that most of the people would go out by the first train, instead of which, the last one was the heaviest.

Mr. Read.] What has been the experience of other days in the way of heaviest trains; what engine do you send out with the Hawkesbury train? The same class of engine.

On previous holidays, did the trains start at the same time? Yes; I think on Queen's Birthday they were the same.

Mr. Midelton.] Was the 60-class of engine fitted up with the Westinghouse brake especially for that purpose? When the heavy engines were asked for for the Illawarra and Hawkesbury road on Sundays, we were very short of engines at the time, and we thought it was a good plan to put brakes on these. We had others working with heavy trains. We had one going to Mount Victoria, and another with a heavy goods to Penrith, and another (63) going to the Hawkesbury.

How many of the 60-class are fitted with brakes? Two.

What are the numbers? 63 and 64.

Mr. Read.] Were any in use at the Hawkesbury that day? Yes, No. 63—the first train.

Mr. Midelton.] What did it take? Eight or nine.

And the other engine, (178) had what? Fourteen.

The Chairman.] When you allotted the engine, I understand you anticipated that the reverse would be the case—that the heavy load would go in the morning? Yes; that is the reason why the heavy engine (63) was put on at 8 o'clock, because we thought most of the people would go up early in the morning, and that many of them would come back by steamer.

When it had turned out a smaller load than you had anticipated, could you not have reversed the arrangement? No; we cannot say what the load is likely to be until the train is going out, particularly at that time in the morning, when we are very busy getting engines, and the trains fill very quickly.

How many engines had to be allotted and despatched that day altogether? Somewhere about seventy-five or seventy-six altogether.

Mr. Midelton.] What is the regular number on an ordinary working-day, or take Saturday, for instance? I could hardly tell just now. I know I made up seventy-five or seventy-six on that day.

The Chairman.] The traffic is more irregular on holidays? Yes; far more irregular.

Mr. Midelton.] If you know the number on an extraordinary day, you ought to know it on an ordinary day? Well, it is about sixty-four or sixty-five that go out on an ordinary day.

The excursion train was timed to leave at 10:25? Yes.

What time was it due back here? I don't remember what time it was due back.

Is that the greatest number of trains that have been used on that line on a holiday? Yes; I don't remember any more being on that line. Of course we run other trains as far as Ryde, and no further.

Do you remember the drivers you put on that road last holiday? I have a record of it in the office, but I don't remember who they were; but these three drivers ran there on the previous day.

The Chairman.] Had you another engine available at 10:30 that morning, of a more powerful character? We had not a large engine. They were all in use for the Illawarra line, the special south and west, one at Hawkesbury, and the others on the suburban line.

If, at the last moment, you had been asked for a more powerful engine, could you have supplied it? We had not one in the yard then.

Mr. Thompson.] Do you examine the new extensions before they are opened, for the purpose of determining what class of engine should be put on? No.

Is there any person who does so? I think Mr. Cobb does so.

Have you sections of the grades supplied in the office? I have seen them in the office, but I have not received them officially.

Who instructs you as to what class of engine you are to put on? Mr. Cobb. He would say what load ought to be put on an engine, and when the loads are known, he mentions the engines that are fit for them.

I understand that class of engine has been run on the line before? Yes.

Did Mr. Cobb instruct you to use that class of engine? Yes.

Did he give you any maximum load to put on? No.

He

He did not tell you what the maximum load should be? No.
 You have never been on the line yourself? No.
 Have you been on the Illawarra line? Yes, as far as Waterfall.
 Do you know the grades of that line? I only went as a passenger. That is all.

W. Farquhar.

William Rice examined:—

The Chairman.] What duties did you perform on Tuesday last? I was told off for Hornsby.
 What did you do? I went up with this train, 10:25; I think it was 10:29 when she left; after leaving Ryde we could not get up the incline; after running back twice we managed to get up; we then went on as far as Beecroft; we had to stop there, and we came back for some distance, and the driver took in water; after that we started on again, and just got beyond the platform at Beecroft; we were obliged to stop there again, and I saw the guard go on to the driver; the guard afterwards came back and uncoupled the train there, and the engine took half the train as far as Hornsby, after which the engine came back again.

W. Rice.

Did you go on with it in the first lot of carriages? No. When the engine came back, the guard who remained behind, coupled on the other two carriages, and the engine afterwards brought the other portion of the train on to Hornsby; backed into the siding, and all the other carriages were coupled on again.

Did you see the coupling and uncoupling at Beecroft? Yes.

Who did it? The guard.

Did you see the coupling up at Hornsby? Yes.

Who did it? The guard.

Did you notice him do it? Yes.

What did he do? There was no coupling on that end of the car when the engine came back, and the young man Stead, stationed at Hornsby, went and got the coupling from the end of the other carriage and gave it to the guard, who put the coupling on.

Did you see him do it? Yes.

Did you see him couple anything else but the screw coupling? Yes; I saw him couple the air pipes.

Did you see him work the taps? Yes.

You saw him turn the taps? Yes.

Did you see the train get away? Yes.

Did you notice whether the train got away without difficulty? The train had no difficulty in getting away from Hornsby.

Did you notice how the brakes on the first lot of carriages were when you went up with the second lot? I noticed after the guard coupled up that they were all right.

What do you mean by all right? I tried them myself; I gave one of them a kick, and I could see from that that they were acting very well.

You kicked a brake block? Yes.

That was after they coupled up? Yes.

Mr. Read.] Did you hear any air escape when the brake was being put on? Yes; I heard the air escape.

The Chairman.] Do you know whether the brakes were on or off the first lot of carriages when you arrived there with the second? They were off.

How do you know? Recollect I am referring to the first portion of the train.

When you got at Hornsby with the two carriages, did you notice how the brake blocks were on the other seven carriages before the coupling up took place? No, I did not notice them.

You only notice the blocks after they were coupled? Yes.

You saw the coupling take place? Yes.

When the coupling took place did you hear anything in the way of an escape of air in connection with the application of the brake? Yes, I did.

What did that lead you to think? I thought it was the engine-driver trying the brakes at the time.

Mr. Thompson.] Did you try the brake blocks of two cars, or only one? I tried two of them.

Do you know which two? I could not tell you the two I tried.

Mr. Read.] What induced you to try them? Just a matter of thought. I thought there might be something wrong with them, so I just gave them a kick.

Mr. Thompson.] Was it the first seven, or the second lot of carriages? I tried the first and second one.

And you found them loose? Yes; and I walked as far as the end of the train.

Mr. Midelton.] Were the blocks hanging close to the wheels, or a long way off? About $\frac{1}{2}$ an inch off, that is all.

The Chairman.] You say you walked to the end of the train? Yes.

Mr. Thompson.] Which way did you walk, backwards along the seven carriages? Yes.

Did you see the guard connect the hose to the engine when it came back to Beecroft to take the other two carriages? Yes.

Did you see him connect the air-pipe? Yes, I saw him do that.

Did you see him do anything to the tap? I saw him turn the tap.

How turn the tap? Downwards.

Did he do anything to the tap on the engine? I did not see him do anything with the engine tap.

Mr. Read.] Did you notice the air-brake working on these two carriages between Beecroft and Hornsby? I noticed it in coming in to Hornsby when the driver pulled up. We were coming pretty fast and he pulled up easily.

Where did you ride? In the back car.

And you state positively that you felt the break working on this car? Yes, I am positive.

Mr. Thompson.] Did the guard touch the hand break at all in going up from Beecroft to Hornsby? No, I did not see him.

Mr. Read.] You stopped at Hornsby that day? Yes.

Mr. Midelton.] Did you see the train start from Hornsby? Yes.

Did you notice any of the blocks on the cars? No, I did not.

He

- W. Rice. Do you know any body who turned the tap off the four-wheeler No. 73? No.
Mr. Read.] How long were both lots of carriages at Hornsby before the train started away? It could not have been more than a few minutes.
 Did you see Stead there? Yes. He made a remark to the guard. He asked him if he had all the taps turned or not. The guard said yes, and Stead said "Are you sure" and Clissold said "I am sure."
Mr. Midelton. You do not know who turned the tap on 73 car. That was the first car that stood towards the river when the first part of the train came up to Hornsby. Have you heard of any body who turned that tap? No.

George Galead examined:—

- G. Galead. *The Chairman.*] Were you engaged on the Hawkesbury line on Tuesday last? Yes; I was in charge of Thornleigh Station.
 Tell us all you saw? A train came into my station about 10 minutes past 1, and the driver when he came up said "I want to put these carriages into your siding." I replied "We have no room, the siding only holds fifteen trucks and there are twelve in it now." He then said "What are we to do?" and I replied "You had better take the train on to Hornsby." I asked him where his guard was, and he said he had no guard with him, that he had left the guard behind with the remainder of the train. Hearing that, I considered it my duty to go on with the train, as the rule says we are never to despatch a train without its being in charge of some one; I saw that the driver had his staff; I placed my danger signals up, locked the office, and took the train on to Hornsby.
 Tell us what took place at Hornsby? The station-master there took hold of the points and backed the train into a siding. He then got in between a second-class carriage and the engine and uncoupled them. Whether he turned any of the air taps or not I could not say. He gave the signal to the driver, and I got off to see that the points were held back. After putting the points back I proceeded back with the driver to Beecroft, where he had left two carriages. When I had arrived at Beecroft the guard coupled on the carriages and connected the two hose pipes. At that time he had a pole such as the fettlers use to ride on the rails between the two hind wheels of one of the carriages, and the pole was slack. He gave the signal to the driver, and the driver said the break was on; and with that I looked and saw the brakes were on the two carriages. The guard said, "Wait awhile," and at this time he pulled the pole out before he attempted to start. With that the guard went to the other side of the carriage, and afterwards the brakes were released. I put my hands on the blocks and I said, "The brakes are loose now."
 Who released the brakes? The guard; he went on the other side of the train, and released the brakes. I shook them, and saw that they were off. With that he gave the driver the signal, and I jumped on to the engine. When we arrived at Thornleigh I left the train there, and the train proceeded on its journey.
 One of these two cars was an American car? Yes, I think so.
 The other one was not an American? I don't think it was.
 When you say the guard released the brakes, are we to understand that he released the air-brake? Yes, he released the air-brake.
 He never touched the hand-brake? Never touched it at all.
Mr. Midelton.] How did he release the air-brake? I don't know; I concluded that he must have turned the taps to release them. After he connected the hose-pipes, he went around to the other side of the carriage to release the brakes. I am certain that the brakes were on before that, or the carriages would have run down the steep incline on which they were standing.
 Was the hand-brake on the car? I did not see him touch the hand-brake at all.
Mr. Thompson.] Where was the guard standing when he released the brake? He was the opposite side. The two cars stood in a cutting, and he went on the other side of the cutting. I don't know exactly where he was standing when he did it.
 Have you any idea why he released the brake instead of the engine-driver? I don't know, but I know that the engine-driver made no attempt to release them.
 You are clear that you saw the guard? Yes, I saw him go around the other side of the carriage, and after that they were released.
 Are you certain that the guard released them, or might it not have been done from the engine? It might have been done from the engine, but the engine-driver was talking at this time to Mr. Rennie. Of course the fireman can give you better information on that subject than I can.
 Which carriage was it? I believe it was the American car. The carriage, I think, stood in front of it.
The Chairman.] Were the brakes on both carriages? Yes.
 Did the guard release them on both? I could not say. He went round the other side of the car to release the brakes. Immediately afterwards the brakes were released from both carriages.
Mr. Midelton.] You were on one side and he on the other? Yes.
 Did you see him release the brakes? No, I could not see him on the other side.
 You cannot say whether he did it or the driver? No, not positively.
Mr. Read.] Did you hear the usual hissing noise? I could not say that.
The Chairman.] What makes you think the guard released the brakes? Because he went on the other side, and as he went there the brakes came off.
 Did the guard then give the signal to start? Yes, and I jumped on the engine.
 And you say the driver was talking to Mr. Rennie at the time? Yes.
Mr. Read.] Where did you ride on the return journey to Thornleigh? On the engine with Mr. Rennie, the driver, and the fireman.
Mr. Midelton.] Did you see the driver use his brake? When I first went on from Thornleigh, he put his brakes on, and the brake went on hard; that was a little distance beyond my station.
 Was it the Westinghouse brake? I could not say.
 Was it the usual screw, hand-brake, or the continuous-brake? I could not say; I only know that the brake was grinding when going down the short incline with the seven carriages.
The Chairman.] You say you distinctly remember the brakes being used on these seven carriages between Beecroft and Hornsby? Yes; but the driver had no necessity to use them all the time. The driver was complaining to me about losing time.
 Did he make any remark about the brake? No; he only said, in going back for the two carriages, "I will get into a devil of a row about being an hour late, as I was late last night."

Sixth Day—Wednesday, 29 June, 1887.

June 29th. Mr. Lutton, of the firm of Lutton and Sons, engineers, ironfounders, general blacksmiths and boiler-makers, Hay-street West, Sydney, called upon the Traffic Manager and stated that he was a passenger by the train which left Sydney at 10.25 a.m. on Tuesday, the 21st June, for the Hawkesbury River. All seemed to go well until reaching Ryde; there the engine seemed to be not powerful enough to draw the load up; the boiler seemed to be priming very much; it tried once to pull the load up, but was not successful; it took in water, and then hauled the load to Beecroft. We went on from Beecroft to Hornsby, leaving two carriages at Beecroft, and we remained at Hornsby for about half-an-hour while the engine was going down for the other two carriages; I was in the second carriage from the engine when we left Sydney, and the fourth from the engine when we left Hornsby; when we left Hornsby we had another trial—not being successful in getting away at first—and she seemed to return back very quick, as though she had been relieved from some difficulty; then we went at a very fast pace until near the first tunnel, when the pace seemed to increase; on entering the second tunnel she was going at a terrific pace. My opinion is that the donkey-pump did not act, so that it would not keep the supply in the reservoirs. *Mr. Read.]* Have you any recollection of the working of the brake in your carriage in any part of the road right from Sydney to the time of the train getting away in the first tunnel? I could not say; I would not like to answer that question. I do not remember it acting at all after we left Hornsby. Of course I would not like to say for certain; that is my opinion, as the train seemed to increase in speed from the time it left Hornsby until she got away in the tunnel. I am of opinion that the brakes did not act after entering the first tunnel, as I think the wheels were revolving on account of the axle-boxes of the second or third carriage from the engine being hot when I felt them a quarter of an hour after the accident.

Seventh Day—Thursday, 30 June, 1887.

PRESENT :—

DONALD VERNON, Esq., Chairman.

T. MIDELTON, Esq.,

| W. V. READ, Esq.,

MAX. THOMSON, Esq.

John Fell called in and examined :—

The Chairman.] What are you? I am a labourer.

Where are you employed? I am employed at Mr. Tempest's, in the air-brake shop.

Were you ever engaged in examining carriages and air-brakes? Sometimes I am; occasionally.

When you found anything wrong with the brake appliances what did you do? It is my duty to fetch Chambers and look at it, and he marks it.

Did you ever mark any yourself? No, sir.

You remember the day of the accident? Yes, sir.

Have you any knowledge of the carriages which went out on that day? Only one, that is 73, a closed second. I saw the mark on one side of it—"air escaping." I called Chambers, and he marked on the other side "copper-pipe."

Did you notice anything else? I noticed that the pipe was gone; it was cracked. The pipe I mean is that going to the triple-valve. It was disconnected with the triple-valve.

Did you notice the tap? No, I did not notice the tap.

Mr. Midelton.] Where was that pipe going from, did you say? It was closed from the through-pipe—in the reservoir—to the triple-valve.*The Chairman.]* Is that all you know about it? That is all.

Where did you see that carriage on the 21st June—on the Tuesday? The carriage was standing on the top of 4-shop row.

About what time? The time that I saw it would be between 9.30 and a quarter to 10.

And at what time did Chambers see it? I brought him straight to it as soon as I saw it myself.

Mr. Read.] You are sure it was No. 73 carriage? Yes, sir.

How did you tell it? Because I do not think there is another carriage in the yard painted in the same way. I have not seen it since.

How was it painted? It was painted a dirty yellow colour.

The Chairman.] That is near enough.

John Fell.

William Thomas Chambers called in and examined :—

The Chairman.] What is your position? I am repairing the Westinghouse air-brakes out in the yard only.

Is it part of your duty to examine the brake appliances underneath the car? Yes; the brake appliances of the express and the two mails in the morning, and to see that the mails are right going out at night.

Do you ever mark off carriages when its found that they want repairs? Yes, sir, that is my duty.

Do you remember marking off any carriage on the morning of the accident, or marking anything upon the carriage? Yes, I remember a closed second. I remember marking off that a copper pipe was broken.

You saw that it was broken yourself? Yes, sir.

Did you see that the tap was turned? I can't recollect that, sir. But if the pipe is broken they cannot use the carriages if the tap was not closed. It would rob the driver of all his air, or so much as he could not be able to keep it up.

What } b

W. T. Chambers.

W. F. Chambers.

What sort of a crack was it, do you remember? It was close to the triple valve; it was broken off so that you could feel the pipe with your nail. You could put your nail into it. It was a little short bend on to the triple valve.

You do not remember noticing the position of the little tap? No sir; I do not.

Mr. Midelton.] Did you find this out yourself? No sir; there was a mark upon the carriage on one side, and then I wrote upon the other side.

Did you find this out yourself? Yes, sir; I went to the carriage without anyone telling me.

And then what did you do? I found that there was a broken pipe.

And what did you do next? I wrote upon the carriage "copper-pipe" only.

What does that mean? It means that the man who is to go around is to put the pipe right again.

Would that car be likely to go out in a train? No; I should not think that it would be likely. It should not have gone. Cars go into that shed to have the necessary repairs made that are required

Do you know who shut off the cock in that pipe? No.

Do you know who first found out about the pipe having been broken before you had anything to do with it? Nobody ever mentioned it to me or anyone else, except the man who was coming up to do it.

Are you sure that nobody else called your attention to this thing before you went and found it out yourself? No, sir; I do not recollect.

The Chairman.] Did anyone call your attention to "air escaping" being written on the car. Did Fell call your attention to it? I do not recollect that he did.

Does not Fell do something in the way of examining the cars sometimes? No, but he does in the train. He only repairs underneath.

But this was a case of repairs underneath. Do you remember his calling your attention to this case of repairs being wanted underneath, or to the fact that anything had been written on the car? No; I do not recollect that he did.

Do you remember of his ever having done so on any occasion? Oh, yes; on many occasions.

Is it possible that he may have done so on this morning without you remembering it? Yes, sir. It is possible that he might have done so.

Mr. Midelton.] Did you do anything else after you had marked the car? Yes. I came over to the other side. The train was going out.

But you did nothing more to that car? No, sir; nothing more to that car.

The Chairman.] When the tap was properly turned there would be no reason why that car should not be made up in a train, so far as the brake connections are concerned? The brake connections would be right through the train if that tap was turned right.

And the carriage would be equivalent to one with the through connection underneath? Just so.

And so far as that is concerned that car was just as fitted to be made up in a train as any car with the through connection underneath? Yes, sir; and there are several of them running now.

John Hemsworth called in and examined:—

J. Hemsworth. *The Chairman.*] What is your work? I am an engine fitter.

Have you anything to do with examining the brake appliances of carriages? Yes sir, that is my business at present to examine all valves and pistons of carriages.

Do you remember examining any of the carriages recently? Yes sir.

And finding them defective? Yes sir. Every day we have some defective ones.

Every day you find some? Yes sir.

Would you remember any particular carriage if I asked you? Yes sir. I think I would.

Do you know the carriages that went out to the Hawkesbury on the day of the accident? Yes sir, but I only know one of them, the one that was leading carriage.

Do you remember finding anything the matter with that one? Yes sir. There was a copper pipe broken on it; it was broken on one end.

To what extent was the pipe broken? It was completely severed from the collar at one end.

What about the other? The other was held firmly in its place by means of the union.

What pipe did you refer to just now? The small copper pipe connecting the main pipe through the train with the triple valve.

Did you take any notice of the little tap that shuts it off? I looked to see whether it was open or shut but was unable to get underneath and could not see accurately.

You could not see accurately? No, Sir; I cannot positively say whether it was open or shut.

What time in the morning was it that you discovered this? Yesterday, I said to Mr. Downe that it was about a quarter to 8; but since then I have thought deeply on the subject, and I find that I am mistaken. It was about a quarter past 10. I mistook another carriage for this one on Monday morning—the morning before.

Mr. Midelton.] What would have been the effect if that car had gone off without the cock being shut off? It would have let all the air out.

The Chairman.] Would the driver have been able to put his brakes on throughout the train if the pipe had been left open like that? I fear not, Sir; it would —

Do you know who shut the cock off, or whether it was shut off at all? I know it was shut off before the train went out.

You know it was shut off? I do.

Mr. Midelton.] How do you know that? Because Mr. Chambers told me that it was shut off. He told me that the tap was shut off, and that she would be all right till she came back again. That was at the time that I went to take the pipe off to repair it.

The Chairman.] And you did not take it off? No, Sir.

Are you quite clear that Chambers made that remark to you when you came to repair the pipe? I am quite certain, Sir.

And that at that time the car was on the train? Yes, Sir. It was just a minute before it went out, and there was not sufficient time to allow me to get underneath.

William Farquhar recalled and re-examined:—

The Chairman.] I want to ask you another question or two with regard to the driver Wilson—with regard to his qualifications for the work which you allotted to him on the day of the accident at the Hawkesbury. What experience had Wilson of the working of the Westinghouse brake? He had experience by the running of passenger trains on holidays and Sundays.

For how long a period? Well, he has been doing that for five or six years, anyhow, I should think.

And using the brake all that time on and off? Yes, sir.

What are the names of the men who were appointed by you to do the work on the Hawkesbury line on Tuesday? William Frame, William Hume, and Thomas Wilson.

Had you any other men available at the time who had more experience of that road than these three men? No, sir; we had not. The men available of more experience were sent on to the south and west-lines—all grades.

But had they any more experience of the Hawkesbury line? No; no more than this man Wilson.

But you think they had more experience in the working of the brake? No, sir, in the driving over heavy grades.

And working the brake on heavy grades? No, sir; no more than Wilson. I meant experience in driving trains over heavy grades.

But if a driver has more experience than another in driving heavy loads over heavy grades, he must also have a larger experience in the working of the brake on heavy grades—necessarily this must be the case? Is not that so? Well, I think Wilson had sufficient experience on any grade, only that he had not been driving on the south or west.

Wilson had been acting as driver for five or six years? Yes, sir.

How much of that time has he been working the passenger-trains? For the time that I said—on Sundays and holidays. He has been working goods-trains for a considerable time to Penrith, and shunting at Darling Harbour, and he used to take his turn with extra trains on Sundays.

And you have been accustomed to use him for extra passenger-trains? Yes, sir.

I think you told us before that Wilson had not been accustomed to drive beyond Picton or Penrith, although he had been acting as fireman? Yes; but I think he was running trains previous to this on the Hurstville line—the Illawarra line.

Mr. Midelton.] How far? I think he went on to Sutherland.

But you can tell us exactly by looking at the sheets? Yes.

The Chairman.] Will you kindly obtain the sheets and ascertain? I will.

The Board then adjourned.

Government Railways, Locomotive Engineer's Branch,

Redfern Station, 30 June, 1887.

Sir,

On looking over the running sheets, I find that driver T. Wilson ran two trains to Loftus on Anniversary Day.

D. Vernon, Esq.

W. FARQUHAR.

[See Appendices A, B, C, D, E, F, and G.]

No. 5.

Memo. by The Secretary of Railways, accompanying above Evidence.

FOR the Commissioner's information and assistance, I beg to submit the following memorandum, from which he will gather without much difficulty a knowledge of the precise evidence which the Board relied on in arriving at the conclusions upon which their report was based.

It must also be borne in mind that, in addition to what was actually given in evidence, the members of the Board had the advantage and aid afforded by a personal inspection in some matters, and by their own knowledge and experience in railway business generally, in arriving at their verdict. D. V.

THE first conclusion of the Board was that the train was amply provided with brake power, and the evidence supporting this will be found on pages 14, 15, 18, 20, and 22, marked a, and in Appendix F.

The train was composed of—engine and tender, weighing 59 tons 5 cwt. 2 qrs.; nine carriages, weighing 90 tons 16 cwt. 1 qr.; total, eleven vehicles, 150 tons 1 cwt. 3 qrs. It comprised five 4-wheeled and four 8-wheeled vehicles. The engine, the tender, and four 8-wheeled carriages all had working brakes, or 123 tons 5 cwt. 3 qrs. out of the 150 tons 1 cwt. 3 qrs. was under efficient brake power, or six (all the heaviest) out of the eleven vehicles were provided with working brakes.

The nine carriages would reckon as fourteen ordinary 4-wheeled; with engine and tender this would make in all sixteen; say out of this number equivalent to eleven were braked.

Again, the weight of the loaded train may be regarded as 167 tons. The minimum amount of brake force necessary to control this weight on a grade of 1 in 40 may be said to be 21 tons. As a matter of fact the train possessed 65 tons.

Take it in another way. This 65 tons brake power represents 13 tons retarding power. The total weight of train represents $4\frac{1}{2}$ tons of downward gravitating force, so that we get 13 tons to hold only $4\frac{1}{2}$. Or, again, before the Westinghouse brake was introduced, and we had to depend upon the system of hand-brakes, an engine such as the one that went to the Hawkesbury River would bring a load down the Western Mountain grades of 1 in 30 and 1 in 33, equal to a weight of 64 tons, and of this $7\frac{1}{2}$ tons were furnished with brakes, or 12 per cent.

The load behind the engine of the Hawkesbury train weighed 90 tons 16 cwt., and 64 tons were under brakes, or 71 per cent.

The whole of the foregoing facts are disclosed in the evidence to which reference has been given.

The second conclusion of the Board was that the brake appliances were in complete and in good working order when the train left Sydney.

Evidence of Werrick, Derham, M'Carthy, Chambers, and Hemsworth proves conclusively that the train was regularly inspected and brakes tested prior to leaving, and tested, too, by driver Wilson, whose engine did not come on to train until the nine vehicles were together.

Second-

Second-class carriage No. 73 brake appliances were disconnected in the proper way, and by means provided for the purpose, so that it became equivalent to a carriage furnished with a through pipe only. It was in no sense a disabled carriage, or one that should "not have gone out." It was not marked as "not to go out" until it arrived in Sydney after the accident.

The evidence supporting this will be found on pages 15, 16, 17, 35, 36, 45, and 46, marked "b."

The third conclusion of the Board was that the brake appliances were in the same condition when the train, after having been divided and recoupled, left Hornsby Station.

We have already seen that the pipe connections between engine and rear vehicle were good throughout when the train left Sydney.

A careful consideration of the evidence on pages numbered 5, 6, 7, 24, 27, 28, 29, 30, 31, 40, 43, and 44, marked "c," will,—

- 1st. Conclusively show that at Beecroft the train was uncoupled between the seventh and eighth vehicles (from engine); that the engine took the seven to Hornsby, and that there they were uncoupled—that is, the engine was uncoupled from the first vehicle—by Porter Steed, who, after closing the engine-tap, opened that at the end of the first vehicle, thus putting the air-brakes on.
- 2nd. The two carriages that had been left at Beecroft both had their air-brakes on, and these were released before the carriages were taken away by the engine.
- 3rd. That the reuniting of the train was performed by guard Clissold at Hornsby; that porter Steed saw him in the act of doing it, spoke to him specially about his taps, and saw him in the act of attending to them. All this is confirmed by porter Rice, who both saw and heard what took place.
- 4th. That train, after the recoupling, went away quickly and without difficulty, brake-blocks on the first lot of carriages not being taken off except from the engine.

From all this evidence it is impossible to conclude otherwise than that the connection between engine and carriages was made good, and received proper attention from those who took part in it.

A reference to the evidence on pages numbered 6, 25, 26, 29, and 32, marked "d," will be sufficient to prove that between the time of leaving Hornsby and the time of the accident the air-brake was, up to a certain point, more or less used, and we have absolutely nothing to indicate otherwise than that the connections were all good.

From the evidence on pages numbered 11, 17, 22, and 33, marked "e," it will further appear that immediately after the accident all the taps and connections that could be examined were found to be correct.

We now come to that portion of the evidence which refers to a tap, and the only one, which was found closed after the accident (excepting of course the rear tap of No. 69, which was properly shut). This evidence will be found on pages numbered 17, 18, 19, 21, 22, and 23, marked "f." After giving this every consideration, and after having been on the spot and seen the carriages before they were moved for themselves, the members of the Board have no hesitation in deciding that this tap-handle was placed in the direction in which it was found by the telescoping of the two carriages.

Assuming this particular tap to have been open immediately prior to the collision (and all the evidence up to the time of its being found closed indicates that there is no room for any other assumption), most assuredly the telescoping could not have taken place in the manner it did without shutting it.

But, further, we have already seen that this tap, which was between the eighth and last vehicle of the train as it left Sydney, was certainly in its right position when the train started.

The uncoupling at Beecroft was between the seventh and eighth vehicles, consequently the tap was not concerned in that operation.

We have, further, the positive evidence that the blocks were put on the eighth and ninth vehicles, which were left for a time at Beecroft, consequently the tap could not possibly have been closed then.

In fact, from the commencement to the close of the journey, there was no occasion for any interference with this tap.

The proof that the train left Hornsby with good through connection from engine also proves that this tap must have been open then.

The evidence of what took place between Hornsby and the Ferry affords no indication of this tap having been closed, but rather to the contrary (see Mr. Garrard's evidence, and he was riding in the carriage to the rear of this tap).

The telescoping—when the floor of the carriage (from the bottom of which this tap-handle hung perpendicularly) skidded over the top of the car in its rear for 20 feet—must, under any circumstances, and notwithstanding Mr. Shellshear's opinion, have shut it, and there cannot be any doubt that it did so.

The fourth conclusion of the Board, viz., that the train was allowed to attain a high rate of speed, and for some reason or other was uncontrolled by the driver, will not be disputed, and I need not refer to the portions of evidence referring to it.

The next conclusion of the Board was that immediately after the accident the brake-blocks were found to be off all the wheels of the carriages, the tyres of the same were all cold, and the brake connections, excepting those only which the collision evidently smashed up, were found all correct.

The evidence in support of this will be found on pages numbered 8, 10, 11, 12, 13, 18, 20, 21, and 28, marked "g."

To anyone possessing a knowledge of the mechanism and action of the Westinghouse brake, the fact that no brake-blocks were found on the wheels immediately after the collision, notwithstanding the severance of the connections, which was effected by the collision between the first and second carriages from the engine, can only point to the conclusion that there was no air in the carriage reservoirs to put them on.

The portions of evidence to be found on pages numbered 5, 6, 20, 21, 24, 27, 28, 29, 30, 31, 34, 41, and 42, marked "h," will be found to refer to the engine and its condition.

A perusal of it will be sufficient to show that the engine was of the right description and in working order, but its load was slightly too heavy. Driver Cartwright's representations to the contrary are not borne out, but we consider them disproved. With regard to the overloading, it is a pity the driver did not give some intimation of the fact before leaving Sydney, when a vehicle might have been removed, or even at Ryde, where the same course might have been adopted.

No. 6.

Coroner's Inquiry.

PEAT'S FERRY RAILWAY ACCIDENT.

Verdict.

1st. We find that William Henry Hankin's death was caused from injuries received by jumping or falling from a runaway train on the 21st June, 1887, while passing Peat's Ferry Station, fearing danger of collision or accident, knowing the train was completely beyond control of the driver.

2nd. We attribute the accident to the great want of supervision on the part of the officials in the Railway Department in not carrying out the instructions laid down for their guidance, thereby endangering the safety of the railway-travelling public. We consider the driver did all in his power to control the excessive speed of the train.

3rd. We are of opinion that the engine was not sufficiently powerful to take that train safely to its destination.

4th. We are further of opinion that the train was not properly inspected before leaving Sydney.

5th. We are likewise of opinion that the train was not properly inspected leaving Hornsby.

6th. We are of opinion the air couplings and taps on leaving Hornsby were not complete.

7th. We are of opinion that the brake-power on that train was not sufficient.

Rider.

We earnestly request the Government, on behalf of the public generally, to appoint a Commission to inquire into the management of the different branches of the Railway Department, so that an organized and more complete system be adopted.

In witness whereof, as well as the said Coroner, the Jurors aforesaid have hereunto set their hands and seals, the day and year first above written,—

HENRY SHIELL, J.P., CORONER.

JOHN KING WEIR (Foreman).

JAMES E. AMBLER.

W. H. MOYSE.

RICHARD M'INTYRE.

New South Wales, }
to wit. }

INFORMATION of witnesses severally taken and acknowledged on behalf of Our Sovereign Lady the Queen, touching the death of William Henry Hankin, at the house of Michael O'Neill, known as the Assembly Hotel, and the Darlinghurst Court-house, in the City of Sydney, in the said Colony of New South Wales, on June 23rd, 24th, 27th, 28th, 29th, and 30th, and July 1st, 4th, 5th, 6th, 7th, 8th, 11th, 12th, 13th, and 14th, in the fifty-first year of the Reign of Our Sovereign Lady Queen Victoria, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, and in the year of Our Lord one thousand eight hundred and eighty-seven, before Henry Shiell, Gentleman, Coroner for the District and City of Sydney, on an Inquisition then and there taken on view of the body of the said William Henry Hankin, lying dead at the Sydney Hospital, in the said City of Sydney, as follows:—

Mary Anne Hankin, on oath, states:—

I reside at Astolah, Grosvenor Terrace, Summer Hill; I am a married woman; the dead body just viewed by the Coroner and Jury, in my presence, at the dead-house of the Sydney Hospital, is that of my son, named William Henry Hankin, aged 17 years in October last, a native of Redfern, New South Wales; he was a clerk in the Railway Department, employed in the Railway Stores at Eveleigh; he left home on Tuesday morning last to catch the train at Summerhill, but did not say where he was going; I next saw him at the Sydney Hospital between 8 and 9 o'clock on the evening of the same day; I went there in consequence of something I heard, and saw him in an unconscious state, and shortly afterwards he died; I have no personal knowledge of the circumstances under which he received the injuries which resulted in his death.

The Jury decline to ask any questions of the witness.

Sworn and made before me, at Sydney, }
this 23rd day of June, 1887,— }

MARY ANNE HANKIN.

HENRY SHIELL, J.P., Coroner.

Walter Shoults, on oath, states:—

By the Coroner: I reside at 112, Kippax-street, and am a bricklayer; I know the deceased William Henry Hankin, well, and that was his body which was just viewed by the Coroner and Jury in my presence at the dead house of the Sydney Hospital. I saw him on Tuesday last; I met him at the Redfern Railway Station about half-past 9 o'clock on the morning of that day, and the two of us entered the same carriage of a train bound for Peat's Ferry. We left Redfern in that train about half-past 10. I think there were nine carriages attached to the engine, including two American cars; we left Sydney with the intention of going to Peat's Ferry; the carriage we were in was not very full of passengers, but I cannot speak as to the condition of the other carriages in that respect; the train was stuck up about five times going down to Peat's Ferry, and we had to run back some distance on each occasion; and the last time we were stuck up they took off the two back carriages, and left them behind, and took us on to the station next to that at Peat's Ferry; the engine then returned and brought on the two carriages that were left behind, and they were attached to the front of the train, which then started for Peat's Ferry, then

then distant, I believe, about 4 miles ; as we were proceeding from the station next Peat's Ferry towards that place, as the carriages rounded each curve they were rocking about in such a manner from side to side as to lead me to think they would capsize ; all of a sudden the deceased looked up and said to me, " My God, Gus ! the train has run away ! " and at that moment I became conscious that the train was going at a much greater speed ; the deceased picked his hat up, which was under the seat, and rushed and opened the door, put his foot on the footboard, and took hold of the handle at the side of the carriage, and almost immediately he either fell or jumped off the train ; the train at this time had not run into anything, but it ran into some carriages a few seconds after at Peat's Ferry Station ; I received no injuries whatever ; I was in about the fourth carriage from the engine ; it was not turned over ; it only bumped off the rails ; when the train stopped I got out and went back and found the deceased lying about forty yards behind the carriage in which he had been in, but not so far back as the end of the train ; he was lying on his left side, and said to me he thought his ribs were broken ; I went to Sydney with the deceased in the first train, and at the Redfern Railway Station he was taken charge of by a young man named Maloney, and I went to Summerhill to inform deceased's mother ; a young man named William Townsend was in the same carriage with us and attempted to jump off the train, but I pulled him back ; I remained in attendance on deceased till we reached Sydney.

By the Foreman : The deceased was quite well during the journey to Peat's Ferry up till the time he either jumped or fell off the train.

By Mr. Williamson, solicitor (on behalf of John Pye, the fireman, and the representatives of Thomas Wilson, deceased) : There were two Yankey cars attached to the engine ; I was in, I think, the fourth carriage from the engine, in the last compartment ; there were six people in it, but it would carry more ; the compartment next to the one I was in was full ; I entered the carriage from the side ; I cannot say that I noticed any open carriages attached to the engine—that is, the old third-class carriages.

Sworn and made before me, at Sydney, }
this 23rd June, 1887,—

WALTER SHOULTS.

H.S., Coroner.

Inquest adjourned till 10 o'clock in the forenoon of Friday, 24th June, 1887, to be resumed at No. 2 Police Station, George-street, and to proceed from thence to Peat's Ferry to view the scene of the accident.

H.S., Coroner.

Inquest resumed in pursuance of adjournment at 10 o'clock in the forenoon of Friday, the 24th June instant, when the Jury proceeded to Peat's Ferry and viewed the scene of the accident ; and, on their return to Sydney, the inquest was further adjourned till 10 o'clock in the forenoon of Monday, the 27th June instant, to be resumed at the Court-house at Darlinghurst.

H.S., Coroner.

Inquest resumed in pursuance of adjournment at 10 o'clock in the forenoon of Monday, the 27th day of June instant, at the Court-house at Darlinghurst.

H.S., Coroner.

Francis Cox Johnson, on oath, states :—

By the Coroner : I am station-master at Sydney ; I remember Tuesday, the 21st instant ; I dispatched an excursion train on that day to Peat's Ferry, on the Hawkesbury ; that train left Sydney at 10.25 a.m. ; it consisted of nine vehicles, drawn by one engine ; the weight of the train was about 90 tons, not including the passengers ; the train would carry about 400 passengers, and was not quite full ; a large engine was attached to the train, which was supplied with a Westinghouse brake ; I believe when the train left Sydney the brakes were in good order, but I did not myself inspect them ; it is customary to inspect a train on each occasion before it leaves the station to see if the brakes are in good order, and I believe this train was inspected in the usual way ; I have no personal knowledge, mine was a general supervision ; on a day like this I had trains coming in every few minutes at various intervals ; I might state, on this particular occasion, I was about 100 yards from the train in question and could see all that was going on ; I have no personal knowledge of the occurrence at Peat's Ferry ; I considered that the engine was competent for the work required of it on account of its being sent to the train ; on public holidays and other days, when the ordinary time-table is suspended for the occasion, it is the rule for the Locomotive Branch to supply engines capable of taking heavy loads down the branch lines ; it is an understood thing ; I never give any particular orders.

By Mr. Rogers (in the public interest) : There were nine carriages attached to the engine ; the dead weight of the carriages, exclusive of the passengers and engine, was about 90 tons ; the weight of the engine alone was 59 or 60 tons.

By Mr. Williamson, solicitor (on behalf of the fireman, John Pye) :—The carriages were attached to the engine as the train left Sydney, in the following order, viz. :—first, a small ordinary second-class four-wheeled carriage, commonly known as a close second ; second, a composite Redfern carriage ; third, a composite American car ; fourth, an ordinary open second ; fifth, another of the same kind ; sixth, another similar carriage ; seventh, another similar carriage ; eighth, a Redfern carriage, first class ; and ninth, an American car, first class ; the weight of the first carriage was 6 tons 8 cwt. ; second, 13 tons 8 cwt. 3 qrs. ; third, 16 tons 10 cwt. ; fourth, 5 tons 10 cwt. ; fifth, 4 tons 14 cwt. ; sixth, 5 tons 10 cwt. ; seventh, 4 tons 14 cwt. ; eighth, 17 tons 10 cwt. 3 qrs. ; and ninth, 16 tons 10 cwt. 3 qrs. ; no brake van was attached to the train because there were none available ; there were no brake blocks on fourth, fifth, sixth, and seventh carriages ; and on those four carriages there was no brake power, and that was the reason they were put in the centre of the train ; No. 3 carriage and No. 8, the Redfern car, were connected by a pipe running under the four carriages mentioned ; the whole of the train was under the control of the Westinghouse brake, with the exception of those four carriages in the centre, but the carriages in front of them and behind them were under the control of the Westinghouse brake, by the pipe running beneath

beneath them; the guard was supposed to be on the rear vehicle, the American car; there was no brake valve in that car that I am aware of, nor in any of the other carriages that I am aware of; I have had some experience in making-up trains; there is not always a brake valve in the guard's van; the use of the brake valve in the guard's van is to enable him to apply the brakes if necessary, and to assist the driver in keeping the train under control if necessary; there was no means of access for the guard from the rear to the front of this train; there were hand-brakes to the American cars; there was no hand-brake to No. 1, nor to Nos. 2, 4, 5, 6, 7, 8; 3 and 9 were the only cars that had hand-brakes; there was only one guard to the train; he had no assistant; the four cars, 4, 5, 6, and 7, were fairly filled with passengers; I never travelled the line from Hornsby to Peat's Ferry; it is only necessary to put on a brake-van when the train is not supplied with a Westinghouse brake; with the Westinghouse brake a brake-van is not necessary; the Westinghouse brake and gauge are fitted to most of the brake-vans; I have seen the Western train made up that goes over the mountains, a brake-van is always attached to that train, and that brake van under the control of the Westinghouse brake, and also under the control of the guard, so that he can help the driver to control the train if necessary.

By Mr. Rogers (in the public interest): The Western train has a brake-van besides the Westinghouse brake; the van is principally for carrying luggage; there was no luggage to this particular train; there was no brake-van available in this instance; I don't know if one would have been sent if available; I consider there was sufficient brake power on three and nine carriages; I determine the class of carriages to be sent out with a train; the making up of a train is under my supervision; the carriages to which the hand-brakes were supplied were three and nine, the 16 and 112 ton carriages; the weight of a brake van is about 16 tons; the ordinary brake-van weighs about 12 tons; if a brake-van was sent on this line, a heavy 16 ton one would be sent, but I considered numbers three and nine carriages to be as good as two brake-vans of that weight.

By Mr. Williamson, solicitor (on behalf of the fireman, John Pye): A train fitted with the Westinghouse-brake is not complete without a brake van, unless it has an American car as a substitute, that is our custom. A train having the Westinghouse-brake is not complete according to the rules of the Department without having a brake-van as a substitute attached to it; I am supplied with a copy of the rules for the working of the Westinghouse-brake; I received the copy when appointed station-master; I look at instructions to guards—[*copy read, marked, and put in*]—and I find that it is optional for me to dispense with a brake-van if I have a substitute, and I consider the American car in this instance was a substitute.

By the Coroner: I am not an engineer; I am not an expert; I have had eighteen or nineteen years' experience in the Department, and am fully conversant with the working of the Westinghouse-brake in theory and practice.

By the Foreman: If a driver or guard had any complaint to make of the working of the trains before leaving the station it would be made to me; no complaint was made to me by either the driver or guard of this train previous to its departure as to the insufficiency of the power of the engine; I was not aware that its power was insufficient to carry it to the end of the journey; if the train had been remade and the heaviest carriages placed behind the engine, I believe the power of the Westinghouse brake would be the same; I am not thoroughly acquainted with the gradients on this portion of the Northern line; if the heavy carriages were immediately behind the engine I believe it would have the same effect as if they were at the end of the train.

Sworn and made before me at Sydney, }

F. C. JOHNSON.

HENRY SHIELL, J.P., Coroner.

William Rudolph Clay, on oath, states:—

By the Coroner.] I am a legally qualified medical practitioner and resident medical officer at the Sydney Hospital; at about 1 p.m. on June the 21st I admitted a young man to the Sydney Hospital; he was in a state of extreme collapse, and the only visible injuries were several superficial bruises, principally on the right side; he soon became unconscious, and died soon after 8 p.m. on the same evening; at 12 noon on June the 23rd, by direction of the City Coroner, I made a *post-mortem* examination of the body; I found several bruises on the right side of the body and on the limbs; I found a small rupture at the base of the right lung, with a little blood effused from it; there was a very large amount of blood effused into the cavity of the abdomen; this had principally come from the right kidney, which was very severely lacerated; the liver was ruptured in five places, each rupture varying in length from 1 to 3 inches; the cause of death was shock and collapse, due to the injuries mentioned; and the dead body of the young man viewed by the Coroner and Jury in my presence, at the dead house of the Sydney Hospital, on the 23rd instant, and identified as William Henry Hankin, is that of the one mentioned in my evidence.

W. R. CLAY.

HENRY SHIELL, J.P., Coroner.

Jacob Durham, on oath, states:—

By the Coroner: I am a shunter in the employ of the Railway Department; I remember the train which started for Peat's Ferry at 10.25 a.m. on Tuesday the 21st instant; I coupled the last two cars that were attached to it; they were placed next to the engine; the train consisted of nine carriages altogether; the brake at the rear of the train was coupled at the time I put those carriages on, and I coupled the brake on to them, making the brake complete throughout the train; four of the carriages were not under the influence of the brake-power; they were four open seconds, and they were in the centre of the train; I connected the two carriages at the rear of the train by means of the air-pipe running right through under those four carriages, and they were under the influence of the brake as well as the three carriages next the engine; the train was connected in that way when it left Redfern Station; there was no brake-van attached to the train, and I know nothing of it after it left the station.

By

By Mr. Williamson, Solicitor on behalf of the fireman, John Pye:—The Westinghouse brake-van is fitted with a through-pipe, and air gauge inside the van; there are also cocks on each end to turn the air off and on; luggage or goods brake-vans are not fitted in this manner, but the whole of the brake-vans are used for carrying passengers' luggage; the Westinghouse brake-van has a brake-valve close to the gauge; the gauge is for the purpose of showing the guard the pressure of air contained in the train, and it will indicate to the guard whether or not the brake is working between his van and the engine; if the gauge shows that there is no pressure, it proves that the pipes have not been properly coupled; the use of the brake-valve is to enable the guard to stop the train if anything occurs so that he cannot communicate with the driver; I believe the reason why a brake-van was not attached to this train was because they were all in use; I did not search to see if there were any brake-vans in the yards; the train was made up with two American cars, one at each end, as substitutes for brakes; neither of those two American cars had a pressure gauge on; I do not know that the valves sometimes stick; the only indication the guard would have of air pressure being on the train would be when the driver released the train after applying the brake when he would hear the air escaping under the carriages; he would have no indication as to the amount of pressure; I have on several occasions made up trains for Peat's Ferry since the line was opened; I mean I have coupled the carriages on to the engine; I have coupled seven carriages to the engine bound for Peat's Ferry as a rule, and there was usually a brake-van at the rear and most of them were fitted up with gauge and brake valves; if a brake-van was placed on to the train without being fitted in that manner it would be for the purpose of conveying luggage only; the guard would be in that van; there would only be one guard to the train; I have been employed a little over two years and a half on the railway; during that period I have been instructed by the head shunter as to the working of the Westinghouse-brake; I was not instructed that the Westinghouse-brake was not complete unless fitted with a brake-van, gauge, and brake-valve; Mr. Tempest is the officer in charge of the brakes; Mr. Weirrick was the officer who examined the brakes of this particular train; he was in charge of the brakes that day, but I did not actually see him examine this train; I do not know the number of the two American cars attached to this train; the last vehicle attached to the train was an American car; I did not see the brakes of that car examined, but I know of my own knowledge they were in working order, because I applied the air-brake as the train was being shunted, and brought it to a stand; it was going rather slow at the time; assuming that the brakes on the last car were not in working order, applying the brakes to the rest of the train would bring it to a stand.

By Dr. Sly (on behalf of the Commissioner for Railways): From what I did on that day, I can say that the brakes were in working order on all the cars; the man on the rear car who was breaking the train down with the hand-brake having applied his hand-brake, bringing the blocks in contact with the wheels as close as he was able; my applying the air from the other end caused the blocks to come still closer, and allowed the wheel of the hand-brake to fly round, and that showed me that the air was working from the front to the rear cars; I cannot say how many cars were put on the train for Peat's Ferry on the 24th of May last; the guard has no control whatever over the pressure, he can lower the pressure by letting the air out, but he cannot increase it; if the guard is on the rear car and there is no brake-van on the train, by turning the cock at the end of the last car he can let the air out and bring the train to a stand; by cutting the pipe in any way, and causing a leak, he can stop the train at any time, no matter where he is standing, that is, assuming the train is connected right through.

By Mr. Rodgers (in the public interest): If there was a brake-van properly connected right through the train, and the driver on any account were to lose control of it the guard could stop the train; from my experience I consider this train had sufficient brake-power; supposing there was a brake-van at the rear of the train, the guard could stop the train by turning a little handle at the end of the brake-van; the handle is alongside of him, there is also a tap under the platform at the end of the American car, which by stooping down and turning the train can be stopped.

By Mr. Williamson (on behalf of John Pye, fireman):—The width of the platform from the door of an American car to the end of the platform is about 2 ft., and the tap I have mentioned is just underneath it about 6 in. from the end of the platform; I will swear it is not from 16 to 18 in.; they are what we call coupling-cocks.

By the Coroner: The train would have been more under the command of the guard if a brake-van had been attached to it; but a brake-van would not have insured greater safety.

By the Foreman: My duties are to connect and shunt carriages at Redfern Station; I coupled the last two carriages on to this train by orders of the Station-master; neither of them were American cars; the last carriage of all had a brake on it; supposing the two last carriages were removed from their place and put next to the engine, the guard would have the same control over the train by the hand-brake; the reason why the two carriages I have mentioned were attached to the train by me at Redfern was to provide more accommodation; neither the guard or driver remonstrated against their being put on.

Sworn and made before me, at Sydney, }
this 27th June, 1887,— }

JACOB DERHAM.

HENRY SHELL, J.P., Coroner.

Francis Cox Johnson recalled, on oath, states:—

Examined by Dr. Sly (on behalf of the Commissioner for Railways): There were eleven carriages attached to the engine that went from Sydney to Peat's Ferry at the same hour on the 24th May last, and the engine was about the same size; there was no brake-van on that train; there was room for the passengers in the train that started on the 21st instant, it was not quite full when it started, and there was no luggage on that train; trains are often run without brake-van, suburban trains as a rule are; the effect of a brake-van on this train would have increased the weight without any necessity.

By the Coroner: There are no steep gradients on any of the suburban lines.

By Mr. Williamson, Solicitor (on behalf of John Pye): I do not know, as a matter of fact, that the driver of the trains that started with the trains at the same hour as this train on the 24th of May last; on

on arrival at Hornsby refused to take more than one half of the train at one time to Peat's Ferry; I never heard of it before; the driver of the train on the 24th May was named Sheehan; I believe the weight of that train would be 105 tons; I have never heard of a driver since the line was opened refusing to take a train of less than eleven carriages from Hornsby to Peat's Ferry; I did not see the guard's time-sheet on the 24th May last, it was sent into either the Superintendent or Traffic Manager; I don't know if the train had any difficulty in getting from Ryde to Hornsby on the 24th May last; I did see the train return on the 24th May; I have an idea where Eastwood is.

By Dr. Sly (on behalf of the Commissioner for Railways): Two of the carriages on the train on the 24th May had no brake blocks.

Sworn and made before me, at Sydney, }
this 27th June, 1887,— }

F. C. JOHNSON.

HENRY SHIELL, J.P., Coroner.

Inquest adjourned till 10 of the clock in the forenoon of Tuesday, the 23th June instant, at Darlinghurst Court-house, for the production of further evidence.

Sydney, 27th June, 1887.

H.S., Coroner.

Inquest resumed in pursuance of adjournment at 10 o'clock, on the forenoon of Tuesday, the 28th June instant, at Darlinghurst Court-house.

Sydney, 28th June, 1887.

H.S., Coroner.

Andrew Weirick, on oath, states:—

By the Coroner: I reside in Albert-street, Redfern; I am in the employ of the Railway Department as air-brake examiner; as soon as the train is at the platform ready to start it is my duty to examine every carriage to see that the brakes are tight on them; I remain at the end of the train till the engine comes up, and when it is coupled on to the train then the brake is released; after the engine is attached to the train and the air pipes coupled, and the air cocks put down the brake is released on the carriages, and they are held by the engine, that is to say, if there is sufficient air pressure on the engine; I have nothing to do with the coupling of carriages; I performed that duty on the morning of the 21st instant, on the train that left Sydney for Peat's Ferry at 10:25, but I did not inspect the whole of that train, simply because I had not sufficient time, and I am not therefore in a position to say that the whole of the brake-power of that train was in proper working order that morning; it being a public holiday I was very busy, and I was the only one to attend to that duty on that side of the station; I saw that train start, it was not overcrowded, it was just comfortable; I don't know what engine was drawing the train. } 8

By Dr. Sly (on behalf of the Commissioner for Railways): I examined seven of the vehicles on the morning in question on the train mentioned; the air was in the last vehicle of those seven, therefore the air must have been complete with the engine through those seven carriages; I saw the driver try the air power; I asked him to try his brake; I said, "Driver, try your air," and he did so, and I saw that the air pressure was complete throughout the whole nine vehicles of the train; that was immediately before the train started, and I saw it start.

By Mr. Nathan (for Mr. Williamson, on behalf of John Pye): I only had about four minutes altogether that morning to perform my duties in regard to this train; I have been brake examiner about eighteen months; I do not know what class of vehicle was at the rear of the train, but so far as I recollect it was an eight-wheeled vehicle; I think about five out of the nine carriages were connected with brake blocks; there were four four-wheeled carriages about the centre of the train which had no brake blocks on; those were four out of the seven which I examined; the two carriages next the engine had brake blocks on them; I did not examine them, but I saw the blocks as the carriages were being shunted down; when I was making my examination, and before I spoke to the driver, I did not find any carriage connected with the Westinghouse brake not in working order.

By the Foreman: I am examiner of the air-brakes; I am not thoroughly acquainted with the air-brake and its capabilities; the shoe of the block is made of cast-iron, not steel; I have frequently travelled by trains where the Westinghouse brake-power has frequently been brought into operation; I have never seen the blocks get heated to any great extent; I think the block would have greater resisting power in a cool state; it is the shunter's duty to couple the carriages.

By a Juror: There was no brake-power on the four carriages in the centre of the train.

By another Juror: I think it was safe for the train to go to Peat's Ferry without a brake-van, considering the number of carriages that had brakes on.

By Mr. Simpson (on behalf of the Westinghouse-brake Company): I could not express an opinion as to what brake-power would be sufficient for a train of the weight of this one; I said just now that I thought it was safe for that train to go to Peat's Ferry without a brake-van; I said so, because I had seen trains return from there safe before without one; but it would have been much safer if a brake-van had been attached; I do not know the gradients on this line.

By Mr. Nathan (for Mr. Williamson, on behalf of John Pye): If there is no brake-van attached to a train I don't think it is possible for a guard to stop the train whenever he likes.

By the Coroner: It could be stopped by him if he cut the pipe, or turned the cock at any time he likes.

By Mr. Nathan (for Mr. Williamson, on behalf of John Pye): The through cock, or coupling cock, on some of the carriages are 18 inches from the end of the carriage platforms, and some are less; I cannot say how far those cocks were from the end of the two carriages at the end of this train; I think about 12 inches; they vary from 6 to 18 inches.

By Mr. Williamson (on behalf of John Pye): If the train was travelling, and I was desirous of turning that cock, I would have to lie on my stomach and put my hand underneath; if a train was travelling at an ordinary rate of speed, it would be found difficult to turn it off; in some instances when I have been examining the carriages I have found the cock pretty stiff.

By Dr. Sly (on behalf of the Commissioner for Railways): If a train is fitted with a brake-van and the Westinghouse brake fitted throughout the guard can stop the train by turning a handle in the van and applying the air to the brakes, but if the driver had already applied the air brake from his engine

engine, the guard could only assist the driver by applying the hand brake; I think the hand brake would have some little effect, the same blocks are used by both the Westinghouse and hand brakes; I have had no experience as a guard on a train; I never tried to turn one of the cocks on an American car when a train was going at the rate of 20 miles an hour, my experience has been examining and repairing those brakes.

By Mr. Simpson (on behalf of Westinghouse Brake Company): If the driver was applying his brake the guard could only assist him by applying the hand brake; if I wanted to uncouple a carriage I would close the cock and keep the air in, and if I wanted to move the carriage I would let the air out. Supposing the two vehicles next an engine were connected with the Westinghouse brake and by any mistake the carriages behind were not connected, a brake van if properly connected throughout the train would greatly assist the guard to help the driver to control the train, the driver would only have control over the two vehicles next the engine, and the guard over the rest of the train.

By Mr. Williamson (on behalf of John Pye): The hand brake on an American car is connected with the air brake, and by applying that hand-brake it only draws the piston out about 4 inches from the brake-cylinder, whereas, if the air is applied it forces it out 8 inches; the hand-brake of an American car is simply a column of iron connected by chains and rods to the pistons; the ordinary hand-brake in a brake-van is a screw connected with a strong crank, but I cannot say it is a more powerful lever than the hand-brake on an American car; I have seen pretty near all the engines in use on the railways; the brake on the tender of the engine is similar to the one on the brake-vans; I do not know that directions are given that when the Westinghouse brake fails that the hand-brake on the tender is to be applied; I have had some little experience at the railway station, and I have had complaints that the valves of the Westinghouse had stuck; when they stick they do not work; I mean the triple valves; it is connected with the small reservoir containing the air.

By Dr. Sly (on behalf of the Commissioner for Railways): The mode of examining a train before it starts is for the examiner to walk the whole length of the train and see that all the blocks are hard down; if they are down that shows that the air pressure is fully on; I did not examine the two carriages next the engine on this train, but I know they must have been connected or the carriage at the end of the train would not have released; I do not thoroughly know the system of the working of the Westinghouse brake.

By Mr. Simpson (on behalf of Westinghouse Brake Company): If water gets into the triple-valve it would cause it to stick, and it would be neglect on the part of the fitter in not letting the water out; I never heard of a triple-valve getting stuck while the train was in transit.

By a Juror: I only had 4 minutes to examine this train; it was only alongside the platform that time, it was a little late.

By Dr. Sly (on behalf of Commissioner for Railways): I can examine a train of this length in that time.

By a Juror: The train was coupled, two more carriages put on, and was ready to start in 4 minutes.

Sworn and made before me, at Sydney, }
this 28th June, 1887,— }

ANDREW WEIRICK.

HENRY SHIELL, J.P., Coroner.

Alfred Clissold, on oath, states:—

By the Coroner: I reside at 16, Shepherd-street, Chippendale, and am a guard on the railway; I was employed in that capacity on a train which left Sydney, for Peat's Ferry, at 10:29 on the morning of Tuesday the 21st instant; the train was four minutes late; it consisted of nine vehicles, exclusive of the engine, and there was no brake-van attached to the train; I was on the rear of the last carriage leaving Sydney; it was a first-class American car; I only had control of the brake-power on the last carriage, the one I was on, but the whole of the train was under the control of the Westinghouse brake, from the engine, when leaving Sydney; we were timed to stop at all stations between Sydney and Ryde, and arrived at the latter at 11:23; we were late; after the few passengers got in at Ryde, a Mr. Rennie, to the best of my recollection, got on to the engine, where he remained; after the train got about half way between Ryde and Eastwood (I am a stranger to the line after I pass Ryde), the engine came to a stand; the wheels of the engine commenced to fly round, and it came to a stand; the driver backed right back to Ryde Station, and the stationmaster waved me back to the platform with, I believe, a white handkerchief, which he had in his hand; the driver started again and came to a stand at nearly the same spot as previous; I then went forward to the engine and spoke to the driver, and he told me he did not think he could lift them and said he thought he would run short of water; he then ran back to a temporary tank and took in water; he ran some little distance back towards Ryde, and started again and took a run up the hill and succeeded in getting over the first incline, and stopped, I think, at Thornleigh; it was Eastwood where we stopped, and a few passengers got out; we again started, and arrived at Beecroft, passed the platform, and pulled up in the cutting; I went forward to the engine to ask him (the driver) what he was going to do; he did not stop in the ordinary way; he was compelled to stop, as the engine could not pull the load up; before the driver started to run to take in water—when he ran back on the first occasion—the fireman said, in the presence of the driver, "I think the donkey will fail," and at the same time the fireman stepped on to the footboard of the engine and struck the side of the cylinder of the donkey with a spanner or some other iron instrument, and the piston of the donkey then commenced to move up and down; on stopping in the cutting beyond Beecroft, the driver again said he could not lift them from there; Mr. Rennie was then standing on the footplate of the engine, although there was plenty of room in the train for him; someone on the engine, either Mr. Rennie, the driver, or fireman suggested that the train should be parted; Mr. Rennie suggested that I should get a pole or sapling and put it through the wheels of the two last vehicles, and then got off the engine and stood on the bank opposite to me; I went up on to the bank to look for a suitable sapling or pole to put through the wheels, and finally I secured one, and put it through the wheels of the last vehicle; I then parted the train; I cut off the seven vehicles next the engine and sent them on to Hornsby in charge of Mr. Rennie, and I remained behind with the two hind carriages; Mr. Rennie offered to take the seven carriages

carriages on, and I allowed him to do so ; I said to Mr. Rennie, " Will you take those on," he said, " Yes," and I stayed behind ; after a time the engine came back and took on the two carriages that were left behind, and on reaching Hornsby I placed those two carriages on to the train at the end next the engine ; I shunted those two carriages on to the seven ; after coupling up at Hornsby, in the presence of a young man in charge, he said, " All right, get away ; " I then gave the signal to the driver and the train was started, and after proceeding some distance up the first incline, after leaving Hornsby, the engine came to a stand again ; I was going forward to the engine when I noticed one of the wheels of one of the carriages skidding ; I could see the brake was on, but I could not swear the wheel was skidding ; I released the air from the brake by the release tap at the side of the carriage ; I did not go on to the engine after that ; I got out at the right hand side of the train, and the driver then started away ; I got on to the car nearest the engine, and remained on the American first-class car, which was second from the engine, and we had no other stoppage after that, and all went on right till we got through No. 1 tunnel, and between there and No. 2 tunnel I found the speed of the train increasing slightly ; I then applied my hand-brake, and the driver began to whistle a continuous whistle, and continued whistling up till the time the accident happened at the river ; the speed of the train continued to increase, and kept becoming greater and greater notwithstanding the action of the hand-brake, and I kept hanging to the brake with all my might till the train ran past the station at Peat's Ferry and into some trucks standing on the river bank, when I found the carriage turning over and I got on to the upper side of it ; the first thing I saw after I recovered myself and got out of the car was the body of Mr. Rennie apparently dead on the embankment ; I then rendered all the assistance I could in getting the wounded out of the first-class car, through the windows and out at the end, and I saw the engine in the water ; I think it was about three miles from Peat's Ferry when I first noticed that the train had run away with us, and it was then my opinion that the brake had not the resisting power ; the train attained very great speed before it reached Peat's Ferry ; it had commenced going down the incline before I applied the brake, and the train had increased in speed before that was done ; the train had acquired such a momentum before I applied the hand brake that its application became useless ; I am of opinion that if both hand brakes had been applied as the train commenced to descend the incline and before the train acquired such a momentum that they would have been sufficient to keep the train under control, but I could not get to the other hand brake ; I know that it is a steep descent down to Peat's Ferry, and in my opinion the two hand brakes would have been sufficient to have kept the train of nine carriages under control ; I attribute the train running away to some failure in the air brake from the engine.

} 19

By Mr. Rogers (in the public interests) : As soon as the fireman struck the cylinder at the side of the donkey-engine I saw the piston commence to work ; to the best of my belief it is the duty of the driver to attend to the donkey-engine, and to keep it properly lubricated, and I believe it was the duty of the driver of this engine to do so ; I could not say whether or not the piston was working before the fireman struck the cylinder of the donkey-engine, but I think he struck it to make it work ; after leaving Hornsby, and when ascending the incline, I saw the wheels of one of the carriages skidding, and I opened the release tap, and that allowed the brakes to go off ; the brake before I opened the tap was on one of the carriages ; what caused it to go on I know not ; when I opened the release tap the brake went off in a second or two, and that would show that the air was passing through the train as far as this particular carriage ; I believe it was a close carriage ; when we got between Nos. 1 and 2 tunnels, and when the train was gaining speed, I could not feel the air-brake on the train ; I believe it was on, but it was only on very slightly ; the incline approaching No. 1 tunnel is a very steep one, and the descent from No. 1 tunnel is also steep ; I do not know that the driver put on all steam when ascending the incline ; after I got on to the carriage platform the driver went on at a steady pace ; when he topped the hill I did not apply my hand-brake ; whatever brake power the train had then would be applied by the driver from the engine ; on going down the hill he would have had to steady the engine all the way down with the air-brake ; it was on the first incline after leaving Hornsby that I released the carriage wheel that I found skidding ; the air-brake is wrought on the engine by the driver ; there is a tap and gauge, but I do not know what way he works it ; if the driver had exhausted the greater part of his air on the first part of the descent, he would have very little to take him the rest of the way ; I do not know anything about the engine in use that day ; I never know what engines are,—I mean, as to their power ; when I released the air-brake, that showed the air was working as far as the carriage I was in ; I attribute the failure of air to the driver not attending to the supply of air, and letting too much of it off on the first part of the descent ; the two carriages which were the eighth and ninth leaving Sydney, became the first and second leaving Hornsby, and the four four-wheeled carriages, fourth, fifth, sixth, and seventh, became the last carriages of the train—those had no brakes ; I do not think that the changing of the carriages would make any difference where the brake power was applied ; I do not think the application of the brake is any more effective when in a concentrated form, than it is when spread throughout the train ; I believe the train could have been controlled by the two hand brakes if I could have got to them, even if the air-brakes had not been working ; there were only three men in charge of this train, viz. :—the driver, fireman, and myself ; it is not usual to send an excursion train without an assistant guard.

By Mr. Williamson (on behalf of John Pye) : I am under the control of the station-master ; when leaving Sydney station I have to obey his orders ; I am supplied with a book of the rules and regulations of the Department ; they are issued from the station-master's office ; I look at regulation 410, page 125, which reads as follows :—" Every person who goes in charge of a train as guard must be well acquainted with the road over which he has to travel ; " I knew that rule was there ; I did not tell the station-master that I was not acquainted with the road beyond Ryde ; there was no brake-van on the train ; I am supposed, before starting with a train of this kind, to see that I have all signal flags, a can of oil, a knife, &c., as set forth in rule 364, page 111 ; I did not have those articles on this day, as I had no brake-van to put them in ; the train, as a matter of fact, is under my control after leaving the Sydney station ; I look at regulation 377, page 114, and I have read that rule ; the brake-vans are not all fitted with sand boxes ; if a brake-van was next to the engine, fitted with a sand-box, with sand in it, and the sand were applied to the rails, it increases the effect of the brake ; I was never further than Ryde on that line till that day ; I never spoke to Mr. Rennie at Ryde station ; I did not speak to either the driver or fireman about Mr. Rennie being on the engine ; I did not ask him at Beecroft what he was doing there ;

I

13 { I did not put the pole through the wheels of the carriage because the hand-brake was not effective, I simply did it because Mr. Rennie told me; I know the hand-brake was effective; I went and looked for a pole for about a couple of minutes, but not because the hand-brake was not effective, I know it was effective; I had not tried the hand-brake from the time I left Sydney till I reached Beecroft; I had no occasion to use it; I had the opportunity of applying the Westinghouse brake to the whole train from the engine before I put the pole in; I uncoupled the two cars from the seven carriages; I turned the taps off; I don't know who disconnected the seven carriages from the engine at Hornsby; I asked Mr. Rennie if he would go on with the front portion of the train; I did not ask him who he was nor what he was doing on the road; I did not place anyone in charge of the hand-brake; when the engine came back for the two carriages I coupled them and turned the taps on between the Redfern car and the engine; when we got to Hornsby I coupled the two carriages on to the seven, and I turned the cocks on; I heard the air go through when I turned the cocks, but only very faint; I look at rule 368, page 112, and read it; I did not try the brakes in accordance with that rule, as I was anxious to get away; I think I arrived at Hornsby at 1.45 p.m., and we departed about 1.49; I did not think it was necessary to put an American car at the end of the train before leaving Hornsby; I look at rule 379, page 115—that rule says I should be on the last car; after leaving Hornsby I was on the second car, and could render no assistance to the seven carriages behind, as a matter of fact I was unable from my position to comply with that rule; I did not ask the station-master at Hornsby what like the road was, nor did I ask Mr. Rennie; I knew that the driver had been on the same road the day before; I am not aware that the train was stuck-up on the previous day between Ryde and Peat's Ferry; neither the driver nor fireman told me they took Mr. Rennie with them to show them the road; I had an opportunity of judging what like the road was till No. 1 tunnel was reached; if I had had a brake-van fitted up with the Westinghouse brake and gauge-valve it would have been a great assistance to me on this day; I have travelled as far as Goulburn as a passenger in a train fitted with the Westinghouse brake and they always had a brake-van attached; if I had had a brake-valve with a brake-gauge on this day I could have assisted the driver going down the incline; I could have looked at the gauge and seen what pressure the driver had on his engine, and I could have then opened the tap; supposing the gauge had shown 50 pounds of air I would have opened the tap when going down the incline; I should think if the gauge showed 50 pounds pressure the driver should have control over his train; a brake-van fitted as stated would have been a great assistance on this occasion, and might have saved the train; supposing I had had an American car fitted with the Westinghouse brake, I would have had some difficulty in getting at the cock to turn it; I would have had to lie on my belly and stretch underneath the car; I had a knife with me that day, but I did not think of cutting the pipe, as I was afraid if I did so I would throw the carriages off the line; the station-master never told me to cut the pipe in cases of emergency; I have heard it spoken of, but never heard of its being done; I was never supplied with a book showing the working of the Westinghouse brake by drawings; I don't know if the directions were issued before January, 1886; I have been in the Railway Department for some time, but I never saw any order to the effect that the Westinghouse Brake Company supplies a brake-valve and gauge to every van, but as the old vans go in for repairs they come out fitted with a brake-valve and gauge; I think the driver commenced to whistle either in No. 1 or No. 2 tunnel, and kept whistling continuously till we reached Peat's Ferry; I did not feel the train jumping—I felt great oscillation; I did not see the driver, fireman, or Mr. Rennie; there was no communication between the driver and me only by means of his whistle; I don't know what a continuous whistle means, but if I had had an assistant guard I could have sent him to ascertain what was the matter, as I could not go myself—I was hanging on to the hand-brake; I look at rule 514, page 153, relating to passenger trains; I did not comply with that rule before leaving Hornsby; I look at rule 518 on same page; I was not supplied with sprags—all I had in accordance with the regulations were flags and lamps.

Sworn and made before me at Sydney, }
this 28th June, 1887:—

ALFRED CLISSOLD.

HENRY SHELL, J.P., Coroner.

Inquest adjourned till 10 o'clock on the forenoon of Wednesday, the 29th day of June instant, at Darlinghurst Court-house, for the production of further evidence.
Sydney, 28th June, 1887. H. S., Coroner.

Inquest resumed in pursuance of adjournment at 10 o'clock in the forenoon of Wednesday, the 29th day of June instant, at Darlinghurst Court-house.
Sydney, 29th June, 1887. H. S., Coroner.

Alfred Clissold recalled, on oath, states:—

By Dr. Sly (on behalf of Commissioner for Railways): As near as I can judge the last carriage of the train was about one carriage length past the Beecroft platform when the train pulled up in the cutting; I have been twenty-eight years in the service, and I have been a guard over twenty years, during that time I have been on the Southern line, and for the past seventeen or eighteen years I have been running between Sydney and Parramatta; I ran on the Southern line as far as Goulburn; on the Goulburn line just past Picton there is a gradient of one in thirty-three, and there is a descent right into Picton Station; I can't distinctly remember, but to the best of my belief, it was one of the two carriages that were left behind that I released the air from as I have previously mentioned; Mr. Rennie, the driver, and fireman, went on with the seven carriages to Hornsby after the train was disconnected; a porter who was on the train going for duty at Hornsby remained behind with me; I am positive when the train was coupled up again at Hornsby that I made the connections complete so as to let the air pass through to the seven carriages behind; I coupled them myself in the presence of the young man in charge at Hornsby; the four carriages behind had no brake blocks but the air pipes passed right under them, the five next the engine were under the influence of the air brake; to the best of my opinion all the carriages had brake blocks only the four carriages already mentioned; after leaving Hornsby I was on the last American car, the fifth carriage

carriage from the engine; I got there so as to be as far back on the train as possible, and to be near the hand-brake power; after the train pulled up some distance past Hornsby I got off the train and went towards the engine, but before I reached it, and after I released the air, it started again; I got on to the second carriage from the engine; a large brake-van I think would be almost as heavy as an American car, but a light brake-van would only I think be about one-third of the weight; during my experience I have never stopped the train myself by the aid of the Westinghouse brake; I have never heard of any of the guards having stopped the train on any of our lines by means of the air-brake; if there had been a brake-van fitted up on this occasion and attached to the train I could have assisted the driver to stop the train by opening the air-valve a little and shutting it again; if the driver was using the brake from the engine and the current of air right through I could have assisted the driver in stopping the train; it would not be a waste of air; it would have the effect of putting the blocks on the wheels; if the connection was complete the driver could put the blocks on the wheels himself.

By the Coroner : I do not thoroughly know the working of the Westinghouse brake.

By Dr. Sly (on behalf of the Commissioner for Railways) : I am expressing an opinion about a thing I have never done myself in practice, nor did I ever hear of its being done; the instructions as to the working of the Westinghouse brake are issued in what is called the Appendix to the Working Time Table; the instructions mentioned were first issued to me about July, 1880; if I had had oil and spragg they would not have assisted to prevent this occurrence.

By Dr. Sly (on behalf of the Commissioner for Railways) : I understand the method of application of the Westinghouse brake, but not the principle.

By Mr. Nathan (on behalf of the relatives of Mr. Rennie) : I have never to my knowledge been instructed in the theoretical working of the Westinghouse brake by anyone in the Department; supposing the driver were using the brake he has power to work it by degrees; supposing I saw there was necessity, I could apply the brake from the brake-van in the same manner, and the brake would therefore be applied with greater force; I could stop the train myself if I saw any necessity without consulting the driver, by means of the air-brake, and he could stop the train in the same manner without consulting me; the porter who went out with me was not on duty on the train; the air-tap which I released a little past Hornsby was on the right hand side of the carriage; I released it from the side of the road; I had not to get under the carriage to do so; I did not afterwards get on to that carriage; I could not say whether I got on to the train in front or in rear of that carriage; the gradient on the Goulburn line is one in thirty-three; the ground at the bottom is level; there is no terminus at the bottom, and the trains could run straight on; if a train was to run away there the train, I think, could run straight on without any danger; I was directed by my superior officer to take charge of this train; he did not ask me if I knew the road; I simply saw my name stuck up for this train, and I had to go; that is the custom; I saw Mr. Rennie get on to the engine when we reached Ryde; I was led to believe that he was connected with the line; someone told me so; I had never been beyond Ryde before; I heard at Ryde that the driver was unacquainted with the road; someone told me so; I did not interfere with Mr. Rennie because I thought he was connected with the line; he had something to do with the construction of the line.

By Mr. Simpson (on behalf of Westinghouse Brake Company) : Everything went on all right after I released the taps on the carriage; I am not certain which carriage it was; the application of the brake to Nos. 1 and 2 carriages would extend to all the carriages on the train which had brakes upon them if the taps were open and the connection complete; I cannot say whether the third carriage from the engine, after coupling the train at Hornsby, had brake-blocks on it or not; I did not disconnect the seven carriages from the engine at Hornsby; when I coupled up at Hornsby I put on the screw-coupling between the second and third carriages; I then coupled the air-pipes and put the two handles down; I then gave the signal "all right," and started; there was one duty I omitted—I neglected to try the brake; I should have got the driver to test the brake before starting; I have not seen a book called "The Westinghouse Automatic Brake, described and illustrated for the New South Wales Government Railways, 1886" (fourth edition), but I am aware of the rules regarding it notwithstanding; I know the rule by which I ought, after adding to a train on its journey (where the guard ought to), have tried the brakes on (his) van, and seen that they were released from the engine; I did not know that there was a rule to the effect that if the van was not the last vehicle a test should be made by opening the cock in the brake-pipe of the last vehicle connected; I did not make any such test; there was no brake-van, no gauge, no valve, and therefore I did not examine the pressure on the gauge nor turn the handle of the valve as required by the regulation just read; I started the train from Hornsby without ascertaining whether the air-brakes were in proper working order and without applying the test which I ought to have applied; I did so because I was so hurried and jeered at; the whole thing occurred through the train being sent away with an engine too light to perform the work required of it; according to the rules supplied by the Westinghouse Brake Company to the Government the necessity of attaching a brake-van is imperatively pointed out, and I think one should be attached to all trains; I know that in case of emergency the guard, in his brake-van, according to the regulations, should apply his brake to assist the driver; I know that if I had the brake-van and air-gauge, with air in it, I could have brought the train to a stand; I know that according to the regulations a guard is supposed to stop his train in case of emergency when necessary; I am required by the regulations to open the tap and let the air out and bring the train to a stand; I would open the tap by degrees in a case of emergency, otherwise I might throw the train off the line; it would not have been any use my putting my knife into the pipe if the connection was not complete, and the reason why I did not put my knife into the pipe was for fear I would throw the train off the line; I do not know what is meant by the term slip-stop; it would, in my opinion, be dangerous to stop a train suddenly when going down a straight incline for fear of breaking the couplings; as a ground for that opinion I never knew or heard of any accident occurring through a train being stopped suddenly when going down a steep incline; I believe there was a Westinghouse brake in this engine; I have never noticed that in starting trains heavy vehicles are generally placed behind; I have generally run American cars; I think it would have been safer to place the four carriages without brake-blocks in the centre of the train; I cannot say whether the donkey wrought all right after the fireman tapped the cylinder; I heard it was found working when the engine was in the river.

By Mr. Rogers (in the public interest) : Going up the first incline past Hornsby I got off the last American car, I believe No. 5 on the train, and found one of the wheels skidding; I believe it was a small carriage;

carriage, but I cannot say what its position was; the blocks were on on all the wheels of that carriage; I saw them on and I released them by the tap at the side, and that satisfied me that the air connection was complete as far as that carriage; supposing I had had a brake-van at the end of this train all properly connected, and I in the van, and the driver had used up too much air at first, I could have assisted the driver to stop the train by opening the valve.

By Mr. Williamson (on behalf of John Pye): I look at rule book, rule 189, page 65, and read that rule, and I am not aware that either the Station-master at Sydney or Hornsby asked me to carry out the regulations, nor asked me if I had done so; I look at rule 238, page 77; I cannot say whether the Station-master at Sydney or any Station-master on the journey performed that duty on this day.

By Dr. Sly (on behalf of the Commissioner for Railways): I neglected at Hornsby to test the brake, but on connecting the brakes I heard the air rush through, but very faintly, and that showed me that the air was complete between where I was and the engine—the greater the pressure the greater the noise.

By the Foreman: I had no doubt when I saw the wheels skidding but that the air connection so far as that carriage, was complete; I cannot account for the blocks getting on to the wheels while ascending an incline.

By Mr. Rogers (in the public interests): The blocks often catch going up hill when the driver does not properly release the brakes from the engine.

By the Coroner: When I said the whole thing occurred through the train being sent away with an engine too light to perform the work required of it, I mean the engine was too light to take the load, and there was not sufficient brake-power available for me to handle to take the train down the incline.

By Mr. Simpson (on behalf of Westinghouse Brake Company): If the connections on one and two carriages were complete with the engine, and the driver had applied the brake, there would be no reason for my applying the hand-brake.

By a Juror: If the connection was not complete then the hand-brake would have been of some use.

By Mr. Simpson (on behalf of Westinghouse Brake Company): If the tap was closed on No. 2 carriage the connection would not be complete from the engine; I cannot say positively whether there were brake-blocks on No. 3 carriage as the train left Hornsby.

By Mr. Williamson (on behalf of John Pye): When I applied the hand-brake going down the hill I found it operating.

By Mr. Simpson (on behalf of Westinghouse Brake Company): If there were brake-blocks on the carriage which left Hornsby as No. 3, and if the half-inch cock on that carriage leading from the main brake-pipe of the train to the triple-valve of the carriage No. 3 had been closed, the brake would have had no power on that carriage.

Sworn and made before me, at Sydney, }
this 29th June, 1887,— }

ALFRED CLISSOLD.

HENRY SHIELL, J.P., Coroner.

Charles Henry Bennett, on oath, states:—

By the Coroner: I reside at Ryde, and am a clerk in the Department of Mines; I remember Tuesday, the 21st instant; I was at Peat's Ferry that day; I was also there on Monday, the 20th, and left at 6 o'clock in the evening with a view of returning to Ryde; I think the train by which I was returning consisted of eight carriages, and got as far as the tunnel known as No. 3 on the line, where it stopped, and the engine made several ineffectual attempts to get the train on, but after wasting half-an-hour in attempts to get on, the train had to run back to Peat's Ferry, where I remained for the night; I was at Peat's Ferry at the time of the accident on the next day, and I saw the train approaching the station as far as it could be seen, and I saw it run into some stationary trucks on the siding beyond the station; I noticed the engine of that train, and it appeared to me to be the same one we had on the previous day, or one exactly similar; I was on the balcony of the Brooklyn Hotel, and had a good view of the train, and it appeared to me from the noise that some of the brakes were acting; the train on Monday evening waited the arrival at Peat's Ferry of a train from Sydney, when the engine of that train was put on behind, and assisted it up the gradients, and the engine of the train from Sydney returned again to Peat's Ferry by itself; I am a judge of railway pace, and I think the train on Tuesday ran past the station at Peat's Ferry at a pace not exceeding about 40 miles an hour.

By Mr. Williamson (on behalf of John Pye, fireman): Monday was not my first trip to Peat's Ferry; I was there once before in the Government train—on a Sunday; I did not hear the whistle of the train on Tuesday before she came into sight; that would be about a quarter of a mile before she reached the station; the whistle was a continuous one; my idea as to the brakes being on was taken from the sound of the train; I noticed the train oscillating before she reached the station, but I did not see her jumping; I went up to the train after the collision and looked at the carriages; I did not see an examination made of the air-pipes, nor did I examine the brakes; the down gradient commences a little beyond No. 1 tunnel on the Sydney side, and continues right down to the station at Peat's Ferry, a distance of about 5 miles.

By the Foreman: I did not see the engine-driver of the train on Monday.

Sworn and made before me, at Sydney, }
this 29th June, 1887,— }

CHAS. H. BENNETT.

HENRY SHIELL, J.P., Coroner.

George Stead, on oath, states:—

16 { *By the Coroner*: I reside at Hornsby, and am acting officer-in-charge at Hornsby Railway Station; on Tuesday, the 21st instant, I was in charge of that station, and at 11:22 a.m. I received the signal from Ryde that a train was leaving there for Hornsby; Ryde is 9 miles distant from Hornsby, and Hornsby is 21 miles from Sydney; about 1:14 p.m. the train, of which I had been notified of from Ryde, arrived at Hornsby with seven carriages, and the driver, Wilson, said he wanted to put those seven carriages on the siding till he went back and brought on a portion of his train which he had left between there and Ryde; I put his train on the up loop-line and cut the engine off, and the driver then started back to bring on the remainder of his train; I left the brakes on the carriages that had blocks on when they were on the loop-line; I then went and got a spragg and put it in the wheels of one carriage.

carriage, first having tapped one of the blocks to see if the brake was acting, and found it was, and put the spragg in for greater safety; about 1.47 p.m. the second portion of this train arrived, and was backed in to the first portion, standing on the up loop-line; the second portion consisted of an American car and a carriage; guard Clissold coupled them; I took the couplings to him from the end carriage of the seven, and gave them to him, and he coupled them; after handing the couplings to Clissold, I went to the engine and exchanged the staff with the driver, went back and crossed over the platform of the second car from the engine on to the off side, and held the points; opposite to where I was holding the points, guard Clissold was making the air communications good; when I returned from handing the staff to the driver, I said to him, "Clissold, don't forget the tap," and with that I saw him put his hand up on the car and turn the tap down, and put his hand up on to the other carriage on to the pipe; I then told the guard, "Right away, when you are ready," and I held the points to let the train out. } 16

By Mr. Rogers (in the public interests): As far as I know, the air connection, as far as the Westinghouse-brake extended throughout the train, was all right; when the train left Hornsby, Clissold would know more about that than I, I left it to him; when the train was made up at Hornsby, I think five out the nine carriages had brake-blocks; the four at the rear had not brake-blocks. } 17

By Mr. Williamson (on behalf of John Pye): I have been stationed at Hornsby about six or seven months; I am acting station-master; I do not recollect anything occurring at Hornsby with a driver in April last; I don't know that a driver refused to take on one occasion to Peat's Ferry, from Hornsby, eleven and a half carriages; the guard cut off two; he did not tell me why, nor did I ask; I forget if there were any passengers in those two cars—there were none left behind; I don't know if they got out and went into other carriages and went on with the train; I do not recollect a driver in April last arriving at Hornsby with a heavy American engine and heavy train, and him refusing to take the train down unless some of it was uncoupled; I told Clissold to not forget to turn on the cock; it is a way I have got; I was coupling at Parramatta before; I am supplied with a book of rules; I looked at page 70, rules 213 and 284; I looked at the couplings in accordance with 213; I walked along the loop-line and looked at them; there is no examiner of carriages at Hornsby; I had something else to do besides examine the carriages on that day; I had the telegraph to attend to; it was not on that account that I did not make an examination; I walked along the carriages, and they seemed to me to be all right; the wheels were not tapped; I know what the examination of a train is, and I have seen one examined in Sydney; the examiner taps the wheels, examines the brakes, and should see that the blocks are all correct; I cannot say if he examines the hand-brake; I suppose he would examine the Westinghouse-brake if attached to the train; I cannot say if the guard examined the train before it left Hornsby; I walked along it, and saw that the couplings and air-connections were all right, but I did not examine the taps; I looked at rule 238, page 77—I obeyed that regulation; I saw enough to satisfy myself that the train was leaving Hornsby all right, although I did not examine the taps; there was no tap in the end of the ninth vehicle when the train left Hornsby; I did not observe whether there was a tap between the fifth and sixth vehicles; I could not see if the guard examined the tap between those vehicles; I could not see him from where I was holding the points; I left the tap open on the train when I cut the seven carriages off from the engine, but I can't say if I turned it again; I saw Clissold between the second and third carriages before the train left Hornsby, and saw him turn a tap on, but whether he turned the tap on the third carriage I can't say; I saw driver Wilson on that road the day before; I believe he had some difficulty in reaching Hornsby that day from the Hawkesbury; I can't say if he had any difficulty in reaching Hornsby from the Sydney side; the train was not uncoupled before reaching Hornsby on Monday; it came in all together; I have not had frequent complaints about the trains sticking up between Ryde and Hornsby; the ordinary train that runs to Peat's Ferry always has a brake-van; that train generally consists of equal to five carriages, the brake-van always has a gauge; the ordinary train never runs the American cars, generally the Redfern carriages; I have a little practical experience of the Westinghouse-brake; I have been attached to a train with it; some trains have brake-vans, some have not; I have been in the van fitted up with a gauge and brake-valve; I have worked that brake-valve to stop the train in shunting; if the driver had his brake hard on, the trap in the brake-van would be useless, but supposing he only had the pressure slightly on, then the guard in the brake-van could be of some service to him; the object of the gauge is to indicate the state of the pressure to the guard; I know there is a heavy gradient down to Peat's Ferry, and considering the number of carriages attached to this train, I consider it was safe for it to travel down without a brake-van; I have travelled down there in a brake-van fitted with the Westinghouse-brake, and the guard did not work the air-valve; I travelled once in a train down there with two carriages equal to four and a brake-van, the train going down on the 21st was equal to fourteen.

Sworn and made before me at Sydney, }
this 29th June, 1887,—

G. STEAD.

HENRY SHIELL, J.P., Coroner.

Inquest adjourned till 10 o'clock in the forenoon of Thursday the 30th day of June instant, at the Darlinghurst Court-house, for the production of further evidence.
Sydney, 29th June, 1887.

H.S., C.

Inquest resumed in pursuance of adjournment at 10 of the clock in the forenoon of Thursday the 30th June instant, at the Court-house at Darlinghurst.
Sydney, 30th June, 1887.

H.S., C.

George Stead recalled, on oath, states:—

By Dr. Sly (on behalf of the Commissioner for Railways): I have had eight and a half years railway experience; first of all I started as a number taker on the London and North-western Railway, England; then shunter in Abergaraney, Wales; that was a busy place, it is on the borders of England and Wales; I was then assistant guard at the same place, on the Merthia Widville section; the Westinghouse-brake was not in use on that line; I was five years in England; I had two years experience in New Zealand, at Tameroo and Fairy Creek; I was twelve months in the traffic as porter, and twelve months in the locomotive branch as cleaner; I then came to Sydney where I have had close on two years railway experience; I started as porter at Darling Harbour, then as shunter at the same place; I then went to Parramatta as shunter,

shunter, and was there about seven months ; it is a busy place, being the terminus for the Sydney trains ; it was my duty at Parramatta, when a train came in, to uncouple the engine, take it round to the other end, and couple it up again, including the Westinghouse brake ; I went from Parramatta to Waterfall, on the Illawarra line as shunter ; that was then the terminus, and my duties were similar to what they were at Parramatta ; I then went to National Park as signal man, and to Sutherland as porter, and I there made myself efficient in the telegraph, not being instructed by the Department to do so ; I went from Sutherland to Hornsby as shunter ; it was then the terminus, and my duties were then the same as at Parramatta, only I had the telegraph ; I was appointed officer-in-charge at Hornsby, when the line was opened through to Peat's Ferry ; I remember when the first seven carriages of the train in question reached Hornsby ; after shunting, the brakes were on three carriages out of the seven ; when I disconnected I cannot swear whether I left the tap open or not, but the brakes were on ; when Clissold (when he) coupled up the train again and made the connection, if he had not opened the tap, the brakes would have remained on, and he must have seen them ; the train would not have moved if he had not opened the tap ; I am confident, therefore, in my own mind, that he did make the connections ; although I did not examine every carriage, I examined the train to that extent that I was satisfied that the train was leaving all right ; the wheels of carriages are only tapped at Sydney, or after a long run.

By Mr. Nathan (on behalf of relatives of John Rennie) : When I uncoupled the train at Hornsby, I believe it was a small second that I unhooked from the engine ; I cannot swear the brake was on that vehicle, but the brake was either on the first or second vehicle ; I put the spragg in the wheel of the carriage after the engine had gone back on to the main line to bring on the remainder of the train, and after I had put the brakes on ; the brakes were working properly, and I put the spragg in for precaution ; it was part of my duty at Parramatta to uncouple the engine and bring it round and connect it at the other end of the train ; I don't know that it is the usual practice to have brake-vans to suburban trains.

By Dr. Sly (on behalf of the Commissioner for Railways) : If a brake-van were behind a train going to Parramatta it would be next the engine coming back, and whatever vehicle was next the engine going out would be last coming in.

By Mr. Nathan (on behalf of the relatives of Mr. Rennie) : I have seen a train with two brake-vans—one next the engine and one behind.

By the Foreman : I have been in charge at Hornsby since the 7th of April last ; I was on duty there on Monday, the 20th instant ; I knew the late driver Wilson personally ; I saw him that day driving an engine, but I don't know its number ; all are numbered ; I did not have any conversation with him on that day ; I spoke to the fireman ; he asked me, when going to Peat's Ferry, how far it was to the top of the bank, and I told him ; I saw driver Wilson on the following day ; he was the driver of the train in question ; I saw Wilson returning to Sydney on Monday evening, but not on the same engine as he went out on ; I saw Wilson on engine 178 on Tuesday ; that was not the engine he took down on Monday ; Wilson said to me on Tuesday, "Oh, I am doing well, George—I don't know when I will get to the Ferry," or something like that ; he was then about an hour and forty minutes late ; neither the fireman or guard made any complaint to me on Tuesday ; I saw the train leave Hornsby at 1.49 p.m., apparently all right, with the driver, fireman, and guard.

By a Juror : I took the spragg out of the wheel of the carriage when I took the couplings off the last carriage ; I think it is safe to go down from Hornsby to Peat's Ferry, without a brake-van ; that is my opinion.
