Informs House that Clerk had been summoned, 89, 351.	
Informs House of irregularities at an election and issue of Proclamation curing same, 73.	
Reports letter from Mr. Thomas Robertson, apologising for having interrupted the Proceedings of the House, 79.	
Announces course intended to be followed in carrying out Resolution that Entry be expunged from Votes and Proceedings, 91.	
Instructed by Resolution as to course to be followed in carrying out Resolution that Entry in Votes and Proceedings be expunged, 91.	
Authorized to present Additional Standing Order to Governor for approval, 28.	
Reports Governor's approval of Additional Standing Order, 31.	
Reports receipt of letter from Clerk, reporting that a document laid on the Table had not been returned to his custody by a Member who had had the use of it, 51.	
Reports retirement of Stephen W. Jones, Esq., Clerk of Legislative Assembly, 250.	
Notice of Motion to rescind appointment of Mr. James Henry Young, 252.	
Lays on Table Election Petition, Heilmrich v. W. J. Allen, Paddington, 269.	
Calls on a Deputy Chairman of Committees to act for the day only, 397, 403, 408, 416, 420, 425, 429, 432, 437, 442, 451, 454, 463, 468, 476, 479, 484, 493, 496, 500, 506, 513, 519, 524, 532, 538, 543 (?), 547, 560, 565, 573.	
Issues Warrant committing Member to custody of Sergeant-at-Arms, 480.	
Vacates Chair when motion couched in terms personal to himself is to be discussed; resumes Chair, and motion proceeded with, 579.	
Motion made (<i>Mr. Buchanan</i>) setting forth the qualifications essential to the Chairman or Speaker, that the present occupant of the Chair is deficient in the knowledge essential in anyone holding the office, and that his frequent interference is the cause of much disorder, and negatived, 579.	
RULINGS OF :—	
Motion made to dissent from, and negatived, 4, 24, 49, 156, 565.	
That it is not in order, on the motion for the adoption of the Address in Reply, to speak of any private transactions between a Minister and any person outside, that the matter was not relevant, and that any charges should be made on a specific motion, 4.	
That, on the question "That the question be now put," when there are no voices for the Noes, and when the Chair is satisfied there are forty Members present, it is not necessary to take a division, 24.	
That the Albury Cattle Sale-yards Bill, notwithstanding that the Select Committee to whom it was referred had decided at one sitting against a motion to report the Bill with amendments to the House, was not out of order, 42, 43.	
That language reflecting on the Chief Commissioner of Insolvent Estates, now an Acting Judge of the Supreme Court, infringes the rules of Debate, 49.	
That a motion adjudging a Member ("named" by Mr. Speaker) guilty of contempt can be put from the Chair, notwithstanding that the question "That the Question be now put" has been put from the Chair and is undecided, 156.	
That Registered Medical Practitioners Bill contains provisions not authorized by the Order of Leave, 192.	
That to challenge the action of the Chair under cover of a Motion for Adjournment of the House would be out of order, 224.	
That Notice of Motion to rescind appointment of Speaker was not out of order, and that motion submitted "That no Resolution reflecting upon the Speaker be entered on Votes and Proceedings" could not be put as one of Privilege, 252.	
That the Public Works Bill did not contain provisions beyond the Order of Leave, 259.	
Discussing Bill in detail on second reading, 315.	
That Councils amendments in Government Railways Bill, do not infringe on Rights of Assembly, 426.	
That Estimates were properly before the House, notwithstanding the Salaries therein shown were lower than those provided by the Civil Service Act, 433.	
That Schedules A, B, and C on Estimates are not open to discussion, as they are already provided for by Acts of Parliament, 433.	
Declines to overrule the opinion of the Chairman in reference to words used by Mr. McElhone in Committee of Supply, 452.	
That clause 3, of Chinese Restriction and Regulation Bill was not beyond order of leave, 455.	
That amendment made in Land Tax Bill was in order, 587.	
That Church of England Property Bill, although introduced in the Council as a Private Bill, should, under the 69th Standing Order, be treated as a Public Bill in the Assembly, 599.	
That by a previous decision of the House he had been relieved of the responsibility of determining whether, on a motion of adjournment, the matter stated in the notice was of urgent public importance, and that the objection should have been taken before the question was stated, 635.

ANNUAL REPORT.

TO THE HONORABLE FRANCIS ARIGAIL, ESQ., M.P., MINISTER FOR MINES, &c., &c.

Sir,

I do myself the honor to submit to you the following Report upon the working of the Department under your charge, and also upon the progress and results of Mining in this Colony during the year 1887.

The following statement indicates to some extent the amount of work performed in this Department during the past year, and shows an increase upon the preceding year.

STATEMENT of the Number of Papers Registered and of Letters Despatched by the several Branches of the Department of Mines.

Branch.	Papers registered.	Letters written.
Mines proper	19,209	10,406
Forest	11,572	3,073
Rabbit	9,077	5,250
Stock	12,860	4,073
Drills	4,399	2,558
Public Watering-places	7,176	4,121
Parks	2,731	1,438
Commons	915
	67,948	30,919*

* Exclusive of printed forms and circulars.

The number of applications made to lease Crown lands for mining purposes during the year 1887, including applications for special gold leases, was 2,588, being an increase of 1,465 as compared with the number of such applications made in 1886—considerably more than double the number.

Of the 2,588 applications so made, 992 were for auriferous land, comprising an area of 7,344 acres 3 roods and 38 perches, and 1,596 were for mineral land, comprising an area of 76,590 acres 3 roods and 4 perches.

The number of applications dealt with in 1887 was 1,750, which, compared with the number dealt with in 1886, shows a decrease of 153. Of course the large influx of applications, upon each of which more or less work was done during the year, reduced number finally dealt with within the year, and this fully accounts for the apparent decrease in the amount of work performed. I have persevered in my efforts to reduce the time occupied in dealing with applications to lease, and, considering the very large increase of work, while there has been no corresponding increases in the staff, I venture to think the result, though not all I could desire, is not altogether unsatisfactory. There are however difficulties in the way of dealing with these applications as speedily as I desire, some of which cannot be overcome without considerable expense, while the removal of others may involve fundamental changes requiring serious consideration.

Of the 1,750 applications dealt with in 1887, 731 were for gold-mining leases, comprising an area of over 4,630 acres, and 1,019 were for mineral leases covering an area of over 45,013 acres.

The area of auriferous Crown land applied for in 1887 as compared with 1886 shows an increase of 4,390 acres. The area of mineral Crown land applied for in 1887 is greater than the area applied for in 1886 by 48,353 acres.

The

The following table shows the quantity of Crown land applied for to lease during the year 1887, and the minerals to be mined for therein:—

	a.	r.	p.		a.	r.	p.
Gold	7,344	3	38	Iron	80	0	0
Diamonds	430	0	0	Manganese	160	0	0
Tin and diamonds	120	0	0	Kerosene shale	40	0	0
Tin	10,290	1	31	Coal and shale	4,740	0	0
Tin and silver	8,201	0	0	Shale and copper	40	0	0
Silver	5,295	0	21	Coal	14,627	0	32

Limestone	40	0	0	Silver, lead, limestone, and tin	20	0	0
Antimony	50	0	0	Tin and copper	60	0	0
Alum	290	0	0				
Manganese, cobalt, and copper	40	0	0	Total area	83,935	3	2

This shows a large aggregate increase upon the area applied for in 1886. The increase is chiefly in applications to mine for silver alone, or in connection with other minerals in applications to mine for coal, or coal and shale, and in applications to mine for gold.

The following table shows the area of Crown land held under application to lease, on the 31st December, 1887, and the minerals proposed to be mined:—

	a.	r.	p.		a.	r.	p.
Alum	290	0	0	Silver and spar	60	0	0
Bismuth	80	0	0	Silver, copper, and spar	20	0	0
Coal	7,142	0	0	Silver, lead, and spar	120	0	0
Copper	400	0	0	Silver, lead, tin, and copper	280	0	0
Copper and silver	559	0	0	Silver and iron	140	0	0
Coal and shale	4,500	0	0	Silver, lead, and calcite	20	0	0
Copper and tin	60	0	0	Silver and zinc	80	0	0
Cobalt and nickel	85	2	0	Silver and antimony	20	0	0
Coal, oil, and shale	640	0	0	Silver and tin	6,040	0	0
Diamonds	270	0	0	Shale	640	0	0

Manganese, cobalt, and copper	40	0	0	Gold	5,857	0	0
Silver and lead	17,816	0	0				
Silver	5,892	0	0				
					68,211	2	0

The aggregate area of Crown land held under application to lease, on the 31st December, 1887, is largely in excess of the area so held on the 31st December, 1886.

The following table shows the area of Crown land held under lease, and the minerals to be mined:—

Mineral.	Mining Act, 1874.		Mining Act Further Amendment Act, 1884.		Gold-fields Act, 1866.		Crown Lands Occupation Act, 1861.		Total.	
	a.	r. p.	a.	r. p.	a.	r. p.	a.	r. p.	a.	r. p.
Gold	3,383	2 23	308	1 27					3,692	0 10

* 2,300 yards river-bed.

The above table shows a large increase upon the area so held at the end of 1886. The increase is mainly in regard to lands occupied for the purpose of mining for coal, gold, silver, and tin, and is also to the fact that holdings under section 28 of the Mining Act have been converted into leases in terms of the Mining Act Further Amendment Act.

The number of applications for permits or authorities under section 27 or 28 of the Mining Act, to mine under reserves, received during 1887, was 172, being an increase of 28 upon the number received in 1886. The number dealt with in 1887 was 142, being less by 29 than the number dealt with in 1886.

The following table shows the area of reserved lands comprised in permits or authorities granted during 1887, and the minerals to be mined thereunder.—

	a.	r.	p.
Coal	15,860	0	21
Coal and shale	1,509	1	0
Tin	65	2	32
Silver and lead	4	2	0
Gold	248	0	0
	<u>17,687</u>	<u>2</u>	<u>13</u>

In the majority of cases the permits or authorities had not actually issued prior to the 31st December, 1887.

The aggregate area of reserved lands comprised in permits and authorities granted in 1887 is less by 3,445a. 2r. 39p. than the area so granted in 1886. This is no doubt due to the fact that reserved lands can now be leased.

The following table shows the areas of reserved lands comprised in authorities granted under sections 27 and 28, prior to 1887, still in force, and the minerals to be mined thereunder:—

	a.	r.	p.
Coal	75,225	1	5
Coal and shale	14,709	1	0
Tin	339	3	13
Shale	8	2	32
Limestone	10	0	0
Bluestone and gravel	12	0	0
Coal, iron, and shale	18	2	16
Copper and silver	2	2	16
Silver and lead	19	3	5
Copper	58	2	18
Ironstone	79	3	7
Marble	5	0	0
Gold	233	0	2
	<u>90,722</u>	<u>1</u>	<u>34</u>

Since the Mining Act Further Amendment Act became law, many holdings under permit or authority have been converted into leases.

The following table shows the areas comprised in permits or authorities (sections 27 and 28), which were in force on 31st December, 1887, and the minerals to be mined thereunder:—

	a.	r.	p.
Coal	74,163	0	10
Coal and shale	14,709	1	0
Tin	343	2	26
Shale	8	2	32
Limestone	10	0	0
Bluestone and gravel	12	0	0
Marble	5	0	0
Copper and silver	2	2	16
Silver and lead	15	3	5
Coal, iron, and shale	18	2	16
Ironstone	79	3	7
Gold	223	1	7
	<u>89,591</u>	<u>2</u>	<u>39</u>

The above table shows a decrease as compared with aggregate area so held at the end of 1886, equal to 10,274a. 1r. 5p.

A return of the holdings under section 28, in force at the end of June and December, 1887, was published on the 13th August, 1887, and the 7th March, 1888, respectively.

The business under section 45 of the Land Act, 1884, was transferred to this Department on the 1st April, 1887, since then 93 applications for permits to dig and search for gold have been received. Of these 79 have been finally dealt with. 66 permits have been granted, and 57 are now in force. 44 applications for permits in terms of section 7 of the Land Act 1884, to remove gold or reserved minerals from alienated land, were received; 23 have been finally dealt with; 11 permits have been issued.

On

On the 13th August a return was published of holdings under section 28 up to the 30th June, 1887.

In the months of May and October, 1887, and in March, 1888, particulars of gold and mineral leases in force in the several Mining Districts for the quarters ending March, June, September, and December, 1887 respectively, were published in the *Government Gazette*, and copies thereof forwarded to the several Wardens' and Mining Registrars' Offices throughout the Colony, in order that the public may know what lands are held and what conditions attach to such holdings. The Wardens have been instructed to cause all cases of non-work to be reported, and it is hoped that under the arrangement recently made by which the Wardens on the principal mining fields are to be paid as Wardens instead of being paid as Police Magistrates; these instructions will be more actively enforced than hitherto. The Inspector of Mines has been so fully occupied with work connected with Prospecting Vote and Diamond Drills in addition to his special duties, that he has been able to devote but little time to reporting upon leaseholds that are not being worked. When his other duties permit he has rendered valuable assistance in this direction. It has frequently been stated that large numbers of leaseholds are held unworked, but in most cases upon investigation these statements have been found to have been made without sufficient foundation, at the same time it is recognised that without unnecessarily harassing lessees or creating a feeling of insecurity, every effort should be made to prevent mineral lands being locked up without work.

The foregoing tables do not represent all the land occupied for mining purposes as they do not include holdings under miners' rights, or mineral licenses on Crown lands, nor the lands which have been purchased and upon which mining operations are being carried on.

GEOLOGICAL SURVEY.

The record of work done during 1887 by the Geological Survey Staff reflects great credit upon the Geological Surveyor-in-charge, Mr. C. S. Wilkinson, F.G.S., F.L.S., who has been ably assisted by Mr. David and Mr. Anderson.

The Geological Staff have examined and reported upon various parts of the Colony.

The Geological Surveyor-in-charge, assisted by Mr. W. Anderson, made an examination of the diamond bearing deposits in the Iuverell or Cope's Creek District; he also reported upon the formations north of Sydney to the Hawkesbury; the antimony lodes, near Gulgong; silver lodes at Denisontown; tin lodes at Poolamacca; and as a member of the Prospecting Board visited the gold-fields in the Albert, Byrock, Molong, Parkes, Forbes, Grenfell, Hill End and Tambaroora, Hargreaves, Mudgee, and Gulgong Districts.

Mr. T. W. E. David, Geological Surveyor, inspected the supposed diamond deposits near Warren, and reported upon the discovery of coal in the deep diamond-drill boring at Holt-Sutherland; but he has chiefly been engaged, assisted by Mr. G. A. Stonier, Field Assistant, upon a detailed survey of the Maitland District, embracing an area of about 50 square miles. Besides his previous discovery of the valuable coal-seam at Deep Creek, Mr. David, in carrying out this survey, has determined the seam which was struck in the bore at East Maitland, to be one beneath those already worked at East Maitland; and this important identification of it has led to this seam now being opened out at Rathluba.

A geological map of the district, showing the position of the different coal-seams, is in course of preparation for publication. Mr. David's exhaustive and valuable report with map and sections, upon the Vegetable Creek Tin-field has lately been published.

Mr. W. Anderson, Geological Surveyor, has furnished a report descriptive of the diamondiferous country about Lower Cope's Creek and Bingera, together with a map showing the extent of the diamond-bearing deposits. He also inspected and reported upon the coal borings at Mittagong; the silver lodes at Captain's Flat; the marble limestones near Lewis Ponds; the caves at Wellington; and the auriferous country in the Byrock, Nymagee, and Cobar Districts.

The survey has been fortunate in obtaining the services of Mr. Robert Etheridge, jun., Palaeontologist. This gentleman arrived from England in April and at once commenced duty. He has made a preliminary classification of the principal fossil collections of the Department, and has furnished several interesting reports. He is engaged upon the examination of the carboniferous fauna from the coal measures, and the first part of his palaeontological investigations is now ready for the press, and will be published in the *Memoirs of the Geological Survey of New South Wales*.

Mr. J. E. Carne, Curator of the Mining and Geological Museum, has been unremitting in meeting the increasing work connected with the examination of the mineral samples sent for assay and analysis, which, during the year, amounted to £2,221. Particulars of these assays are given herewith under the heads of the several minerals.

The

9

The Museum collections now include 20,770 registered specimens, of which typical suites have been classified and displayed as far as the limited space in the Museum will allow. On the 19th December, in accordance with your directions, the Museum was opened to the public, and it affords a valuable source of information, especially to persons interested in mining. It is to be hoped that ere long it may be possible to secure a building sufficiently large to enable the Department to display the vast and valuable collection of minerals and fossils, so as to illustrate the great mineral wealth of the Colony, and to afford greater facilities for persons interested in mining to acquire a complete knowledge of our resources. The Library of the Department is being systematically arranged; it contains many important works of reference upon mining, geology, and paleontology.

Mr. Carne proceeded to Adelaide, and in an efficient manner carried out, subject to the general designs of the Executive Commissioner, the arrangement of the mineral exhibits in the New South Wales Court in the Adelaide Jubilee Exhibition.

The Assayer, Mr. Mingaye, who was formerly assistant to Mr. C. Watt, late Government Analyst, was transferred to this Department on the 1st March. His report, herewith appended, shows the large amount of laboratory work that has been done, which, being chiefly the assay and analysis of mineral samples for prospecting parties, is of much value in aiding the development of mining enterprise—the importance of providing suitable works for making bulk assays of minerals, and determining the mode best adapted to the profitable treatment, including reduction and concentration of the various ores.

Additional improvements have been made in the Jenolan Caves, including the opening of a newly discovered cave. The electric-lighting of the Imperial Cave has been completed, under the direction of Mr. E. C. Cracknell, Superintendent of Telegraphs, who has always taken much interest in the matter. A small steam-engine is at present employed for driving the electric-dynamo machine; but, in view of extending this system of lighting to the other caverns, a turbine wheel has been provided capable of working to 15 horse-power, to be driven by one of the waterfalls on the creek immediately below the "Grand Arch." The keeper of the Jenolan Caves reports that the number of visitors during 1887 was 1,082. During the same period there were 152 visitors to the Wombeyan Caves and 876 to the Wellington Caves. A keeper has been appointed for the charge of the Yarrangobilly Caves, where an accommodation-house is being erected.

In September, Mr. Wilkinson and Mr. Slee accompanied me, as members of the Prospecting Board, to the Mount Browne and Tibbooburra Gold-field, the furthest point to the north-west in which gold has been found in New South Wales. Travelling by way of Adelaide by rail, as the present quickest route to Silverton, we took the coach thence for 250 miles almost due north to Tibbooburra. The track, for about 60 miles from Silverton to Corona Station, passes over the Barrier Ranges, which are composed of the silver and gold bearing slate and granite formations. From Corona the country becomes less hilly, though the same geological formations, with an inlet of the cretaceous, continue to within 7 miles north of Packsaddle Station, when further north to Mount Browne the country consists of the cretaceous formation. The altered slate rocks, traversed by quartz reefs, near Packsaddle Station, appear to be of a promising character for the occurrence of the precious metals. The Geological Surveyor is of opinion that throughout the vast cretaceous area artesian water may be obtained by sinking or boring. The Mount Browne Range, of slate formation, with quartz reefs, rises out of the cretaceous area like a long island, trending north-east. At the south-west end of this range are the Mount Browne gold diggings, where the gravels on the flanks of the range—the old marine gravels of the cretaceous period—are worked for gold, which has been followed down in payable quantity on the shelving slate bottom, to a depth of 220 feet, when the influx of water became too heavy for ordinary appliances. It is to prospect this deeper ground that the local miners sought aid from the Prospecting vote. These slate ranges continue with but one break at Mount Poole, north-easterly, through the Wittabreena ranges where some gold-bearing quartz reefs have been worked to Tibbooburra Diggings. At Tibbooburra, a small area of granite occurs, on which some rich "surfacing" has been obtained. This forms the northern limit of the auriferous country, which is about 130 square miles in extent. The great requirement for the development of this gold-field is permanent water, and to meet it, the Superintendent of Drills, has been instructed to put down some bores in the adjacent cretaceous formation, to ascertain how near to the diggings an artesian water supply may be obtained; for water conserved in tanks cannot be depended on. Returning to Silverton, Mr. Wilkinson inspected the tin lodes in the Barrier ranges. He states that they are numerous and that the tin ore occurs in them chiefly in patches, which will render the working of them, in many instances, difficult; but he is of opinion that their yield will largely increase our tin exports.

The Prospecting Board next proceeded to Byrock, Ironbarks, Orange, Molong, Sofala, Hill End, Tambaroora, Hargraves, Mudgee, Gulgong, Parkes, Forbes, and Grenfell, and dealt with the several applications for aid to prospect in those districts.

MINING SURVEYS.

During the year 1887, eighteen surveyors have been engaged in making surveys under the supervision of the Chief Mining Surveyor (Mr. E. F. Pitman). Of these, eight were paid salaries during the entire year (in addition to fees), and one received salary for a portion of the year only. The others were in receipt of fees only.

The total number of surveys made during the twelve months was 1,418, consisting of 637 gold-mining leases, 574 mineral leases, 153 mining tenements, 31 mining permits, 16 surveys under the Public Watering-places Act, and two surveys under the Prickly Pear Act.

During the latter months of the year there was a sudden increase of applications for leases all over the Colony, which caused the work to get somewhat in arrear, so that on the 1st January, 1888, there were 578 applications awaiting survey. Efforts are being made, however, to reduce these arrears as speedily as possible.

In the Charting Branch 1,882 applications for gold-mining and mineral leases were received, and of these 1,602 were finally dealt with during the year; and of 146 applications under the 28th section 137 were finally dealt with during the same period. In addition to this eighteen parish and gold-field maps were compiled, and a large number of miscellaneous papers were dealt with. An alphabetical list of all the maps issued by the Department has been prepared, and is now being published in pamphlet form.

The number of surveys made during 1887 slightly exceeds the number made during 1886; nevertheless, in view of the rapid influx of applications it will be necessary to increase the number of surveyors.

The number of lease applications dealt with in the Charting Branch during last year was less by 215 than during the previous year. The applications under the 28th section were, however, kept well in hand. The offer recently made by the draftsmen to keep down arrears of work by working after office hours, will, I hope, enable me to report at the end of this year that all arrears have been cleared off, and that the average time occupied in dealing with applications has been considerably reduced. In any case the offer is a meritorious one, and if carried out in good faith must result beneficially to the Department.

Mineral and Gold Applications received and dealt with in Charting Branch, 1887.

Month	Cases received	Cases dealt with.	Month.	Cases received.	Cases dealt with.
January	94	134	August	196	121
February	102	108	September	120	116
March	196	127	October	193	144
April	109	135	November	273	175
May	115	131	December	193	124
June	121	147	Total	1,882	1,602
July	161	137			

The following is a return of compiling work performed in the Charting Branch, Department of Mines, during the year 1887:—

Mining Maps compiled and published.

Parish.	County.	Mining District.	Parish.	County.	Mining District.
Albert. 2nd edition.....	Yancowinna...	Albert.	Dungowan	Parry	Peel and Uralla.
Alberta	Farnell	"	Edgar. 2nd edition	Yancowinna...	Albert.
Byjerkerno	"	"	Giles	Farnell	"
Bundawarra	Bland	Lachlan.	Lennox	Bathurst	Bathurst.
Boonoo Boonoo	Buller	New England.	Nundle	Parry	Peel and Uralla.
Castleton	Roxburgh	Bathurst.	Tuena	Georgiana	Bathurst.
Callanyu	Buller	New England.	Tamboora. 2nd edition	Wellington	Tamboora and Turon.
Carroll. 2nd edition	Wellington	Tamboora and Turon.	Worcester	Bathurst	Bathurst.
Cummings	"	"	West Fairfield	Drake	New England.

In consequence of the pressure of other work during the year very little compiling work has been performed by the staff officers usually so employed, which, together with the stoppage of all overtime, accounts for the small number of new maps prepared as compared with former years.

During the year 468 copies of mining maps have been revised, charted to date, and forwarded to the Wardens, District Surveyors, &c., not including a number so prepared for the use of the Surveyor-General's Office.

The following is a complete catalogue of all Mining Maps, arranged in alphabetical order, in the various mining districts, and giving the parish, county, locality, and date of publication, has been compiled, and is now in the hands of the Government Printer for publication in pamphlet form:—

Mining District.	No.	Folio.	Parish, or part of.	Edition.	Locality.	County.	Published.

INSPECTION OF MINES.

The Inspector of Mines reports that during the year there were eleven fatal and three non-fatal accidents. Of the fatal accidents six were caused by falls of earth. The Inspector states that a few other minor accidents occurred the particulars of which have not been reported to him. During the year the Inspector has been very fully occupied, as in addition to inspecting mines he has had to superintend the working of the diamond drills and water augers, and to serve upon the Prospecting Board. He visited Young, Temora, Barnedman, Adelong, Grenfell, Forbes, Parkes, Orange, Brown's Creek, Hill End, Tambaroora, Mudgee, Gulgong, Mount Browne, Tibooburra, Poolamacca, Silverton, Broken Hill Pinnacle, Back Creek, near Rockley, Lewis Ponds, Sunny Corner, and Vegetable Creek. The Inspector's report is attached hereto, and will no doubt be read with considerable interest.

DIAMOND DRILLS AND WATER AUGERS.

During the year the Diamond Drills have been engaged in more difficult country than usual, consequently the number of feet bored is less, and the rate per foot is higher than during the preceding year. The details are given fully in the Superintendent's Report herewith. The aggregate depth bored was 3,097 ft. 5 in., at a total cost for field-work (exclusive of office and store expenses, rent, and superintendent's travelling

travelling expenses), £2,800 16s. 2d., equal to an average of 18s. 1d. per foot. The total cost (including salaries, office, store, and all other expenses) was £3,460 17s. 7d., equal to £1 2s. 4½d. per foot. The earning of the drills for last year was £2,574 19s. 7d., but concessions were made amounting in the aggregate to £63 16s. 5d., which reduced the total earnings to £2,511 3s. 2d., equal to 16s. 2½d. per foot. The cost per foot to the Department (including all expenses) in 1887 exceeded the cost in 1886 by 4s. 7¼d., while the cost per foot to the persons employing the drills was less in 1887 than in 1886 by 2s. 11½d. This result is due to the fact that the country bored in 1887 was more difficult than in preceding years, and that the superintendent may have under estimated the cost of boring in such country. I am fully convinced that the most rigid economy and strict supervision have been exercised by the superintendent, who has striven to increase the public utility of the drills at the risk of sacrificing the profits made upon the working of the drills in former years. In 1883 the destruction of diamonds per foot bored equalled 3s. 8d., in 1884 it was reduced to 2s. 0¼d., in 1885 it was further reduced to 1s. 5¼d., in 1886 it amounted to only 8¼d., while in 1887 the cost was 1s. 6¼d. This, however, includes the diamonds lost in the bore at Clarence Siding, and they may yet be recovered.

As regards augurs, seven were in the field during the year; six were boring for water, namely, three on the road from Bourke to Wanaaring, two at Moongulla, and one near Hay. At 75 miles from Bourke artesian water was struck at a depth of 960 feet, from which 33,000 gallons per diem, flows through a pipe raised to a height of 8 feet above the surface, and at 101½ miles from Bourke, on the same line of road, artesian water was again struck at a depth of 950 feet. From this bore the water flows at the rate of 21,600 gallons per diem. One drill was engaged in prospecting for gold at Forbes. The total depth bored during the year was 2,566 feet 10 inches, or 381 feet 7 inches. The total cost of boring inclusive of carriage but exclusive of office salaries was 16s. 2½d. per foot, the cost inclusive of all expenses was £1 2s. 3½d. On the road near Hay two wells were sunk to a depth of 70 feet each, and on the Bourke Road a well was sunk and timbered to a depth of 20 bores, fenced in, and embankment constructed to conserve water, the cost of these works is included in the cost of boring. Artesian water was not found on the road near Hay, but the wells contain a good supply of water. Colours of gold were obtained by the drill employed at Forbes, but no payable lead was discovered. The most successful boring operations have been on the Bourke Wanaaring Road, where a water supply was most needed, and the value of the discovery of artesian water on that road cannot be over estimated.

MINERAL PRODUCTS.

The aggregate value of the mineral products of this Colony to the end of 1887 is £72,938,125, the value of such products for the year 1887 being £3,165,938, showing an increase as compared with 1886 of £237,511. The increase is mainly due to the increased output of gold, silver-lead ore, coal, bismuth, cobalt, &c., and to the increase in the price of tin and copper. Shale, iron, and antimony show a decrease. The largest increase is upon the products of our silver mines; but it is noticeable that the quantity of fine silver produced last year is very much less than the preceding year, while the quantity of ore exported in 1887 largely exceeds the quantity exported in 1886.

The following table shows the aggregate value of minerals the produce of New South Wales for the years 1886 and 1887 respectively compared:—

Minerals.	Quantity.		Value.		Quantity.		Value.		Increase in value.		Decrease in value.	
	1886.		£ s. d.		1887.		£ s. d.		£ s. d.		£ s. d.

Cobalt					6·40	„	1,330	0 0	1,330	0 0		

The value of the output of minerals in 1887 exceeds the value of the average annual output by £518,983.

The following Return shows the quantity and value of Gold, Coal, Shale, Copper, Tin, Silver, Silver-lead Ore, Iron, Antimony, Asbestos, and Bismuth produced in the Colony of New South Wales during the last ten years:—

Year.	Gold.		Coal.		Shale.		Copper and Regulus.		Tin and Tin Ore.		Silver.

GOLD.

I have the pleasure, for the first time for some years, of inviting attention to the fact that our output of gold shows an increase. Indeed the output for 1887 not only exceeds that of 1886, but is the largest since 1883. Notwithstanding that the search for silver lodes has engrossed so much attention lately, there have been some not unimportant discoveries of gold deposits during the past year; and if the requisite capital for their proper development be forthcoming, there appears to be reasonable grounds for anticipating a still larger increase in the gold yield during the current year. It is a very long time since so much enterprise has been developed in the search for gold and other minerals as during 1887; and the results obtained indicate not only the value of such enterprise, but the extent and richness of our resources. Unfortunately our appliances are not in all cases equal to the profitable treatment of our auriferous deposits, and, as a consequence, some very promising ventures are in a languishing condition. The following extracts from reports furnished by officers of this Department indicate the condition of gold-mining in several of the districts during the past year:—

In the Bathurst District the Wardens and Mining Registrars report:—At Clear Creek, Turner and party have just completed the erection of their battery, and had a trial crushing of 17 tons, yielding $\frac{3}{4}$ oz. per ton. Thompson and party are down a good depth at Cheshire's Creek, and the stone looks well. Gold purchased at Bathurst—463 oz. from alluvium, 926 oz. from quartz. At Mitchell, 1,127 oz. of gold was won from alluvium and 417 oz. from quartz, together valued at £5,597, was won during the year. The Junction Point Mine, near Peelwood, has been put into a Company, and is being again worked for gold. Maiden's Flat is being worked for alluvial, but is very wet. About Scrubby Rush prospecting has been going on all the year, and since the holidays the battery has been going night and day. Gold to the value of £3,750 has been got by fossickers, and sold locally. About 450 men are now working in this locality, but the number is expected to increase largely. The heavy rains gave the sluicers at Trunkey a chance during the winter. Alluvial gold to the value of £7,600. Parties have been searching for opal on the Abercrombie River. At Oberon, thirty-three men are working on or in connection with these mines, and during the year have won gold to the value of £2,400. It is thought miners will shortly regard

regard this locality with more favour. At Mount M'Donald, gold to the value of £11,000 has been obtained from quartz, but scarcely any from alluvial. 1,702 tons of quartz was crushed for a yield of 2,619 oz., or about 1 oz. 11 dwt. of gold per ton; 137 oz. was obtained from recrushing tailings. What promise to be rich reefs were found, in August last, about 6 miles from Mount M'Donald. About £767 worth of alluvial gold was sold locally at Rockley. The stoppage of the silver-mines at Mitchell led to some of the miners finding very nice gold in the Lagoon Gully. The total value of gold won was £4,830. In the Orange division, the gold won at the principal mines is valued at £21,446. At Ophir, since the Bluff Amalgamated Co. was reformed, some encouraging results have been obtained. The veins average from 15 to 18 inches wide, and the stone raised has yielded at the rate of 2 oz. 17 dwt. per ton. Other claims are being worked. At Forest Reefs, indications continue promising, and two deep shafts are being sunk in search of the lead. At Lucknow a quantity of ore has been brought to grass during the year, some of which was very rich. The value of gold won was £16,400. The yield of gold in the Carcoar division for the year, was 8,238 oz., a decrease upon the returns of the previous year, caused by the temporary suspension of work at the Brown's Creek Mine, the ground having been worked to the water level. It has now been decided to sink 50 feet deeper. During the year the Company won 3,792 oz. of gold. The deposit appears to be richer as the depth increases. At the Junction Mine, where superior gold saving machinery is being erected, and at Gully Swamp, where the mines having been worked down to the water level, it is necessary to procure pumping appliances, which is being done with all speed. Some very good results have been obtained, 107 tons of stone yielded 193 oz. of gold. The Gold Hill Mine Burnt Yards is crushing, and will shortly finish; the yield is expected to be good. The quantity of gold sent down by escort from Carcoar during the year was 8,240 oz. Trial crushings from several of the mines at Milburn Creek and Scrubby Rush have yielded remarkably well, but the stone has to be carted to Mount M'Donald 7 miles distant. At Flanagan's Gully, King's Plains Gold-field, sluicing is being carried on with success, rich patches of nuggetty gold being occasionally found. Watson and party now down 70 feet have cut several gold-bearing leaders. The main shaft of the Confidence Co. is now down 247 feet, but the deposit is very poor, averaging only 2 dwt. per ton. During the year the quantity of gold won was 5,274 oz. The quantity of gold purchased at Blayney is 330 oz. from alluvium, and 9,066 from quartz, value £33,019.

In the Mudgee District the Wardens and Mining Registrars' report:—The discovery at Maitland Bar of a nugget weighing over 300 oz.; other nuggets of smaller size were found in the division. The quantity of gold locally won purchased by the Banks at Mudgee was 3,898 oz., in addition to which a large quantity is said to have been forwarded to Sydney. A lump of ironstone containing 22 oz. of gold was found in the "Lucky Find" Company, near Appletree Flat, which has led to active prospecting in ironstone country. The Company has sent some 6 tons of the stone to Sydney for treatment. In the alluvial flats adjoining some ground has been stripped to a depth of 6 feet below which the deposit has yielded 3 to 4 dwt. per ton for the last six months. The quantity of gold won at Gulgong during the year was 1,602 oz. 16 dwt. 14 gr. The tributers at the Rhobasdah Mine are obtaining 1½ oz. to the ton without the pyrites which are said to be valuable. At Limestone Creek the results have been variable principally owing to the excess of water. Several nuggets have been found there, one weighing 30 oz. A crushing at the Mint from a reef on an adjoining hill gave 7 oz. to the ton without treating the pyrites. The quantity of gold won in the Wellington division was 556 oz. from alluvial and 96 oz. from quartz. At Ironbarks there is a great improvement in mining and the reefs appear to improve with depth. The trial crushings show such encouraging results that arrangements are being made to erect batteries.

The reefs at Ironbarks have long been abandoned, an idea having prevailed that they were valuable only on the surface. In no instance were they tested below 200 feet, and few were tested to a depth of 150 feet. The Specimen Hill claim was taken up a few months ago, one of the shafts was sunk deeper, and 10 tons of stone taken from a vein 18 inches wide at a depth of 200 feet yielded 34½ oz.; this is the greatest depth reached in the whole field. A further test of 2½ tons from the same level gave 30 oz. of gold. This has had the effect of causing work to be commenced on reefs with a view to test them at lower levels. For miles around the country is a network of reefs, all of which are known to be auriferous. On the Prince William Reef, after cleaning out an old shaft and sinking deeper very rich stone was discovered. The Princess Alexandra has been opened out, so that 150,000 tons of gold-bearing stone is now in sight. At Yeoval the Gordon Mine crushed 1,860 tons of stone for 452 oz. gold. The quantity of gold won in the Ironbarks division during the year was 1,482 oz. from alluvium and 644 oz. from quartz.

In the Tomingly division the reefs vary from 18 inches to 8 feet wide; 2,656 tons crushed yielded 2,851 oz. gold. A trial crushing of 18 tons from the Ten-mile yielded over 1 oz. of gold per ton. At Hargraves four nuggets were found by fossickers, weighing respectively 357 oz., 200 oz., 47 oz., and 32 oz. Machinery is being erected to work some of the quartz reefs. In

In the Tambaroora and Turon District the Wardens and Mining Registrars report:—At the Red Hill mine, Hill End, a main shaft has been sunk 322 feet, seven veins have been cut, four showing gold. 576 tons of quartz have been crushed for 188½ oz. gold. The Cornelian Company has been chiefly engaged in prospecting a large mass of quartz and slate, a sort of lode varying from 30 to 65 feet wide; the yield obtained from it varied from 3 to 10 dwt. per ton. They crushed about 297 tons of quartz from 241 oz. of gold. No correct estimate can be formed of the quantity of gold won at Hill End, as there is no bank and no escort. At Hargraves preparations are being made to work some of the reefs systematically, for which purpose machinery is being brought on to the ground. At Sofala prospects appear to be somewhat improving; the quantity of gold sent away by escort for the year was 4,877 oz., some of which may have come from Hill End. At the Turon River and Crudine Creek Dawson and mate obtained 9 oz. in two days, and Hyland & Co. obtained 60 oz. in four weeks. O. Johnson obtained 19 oz. of gold from one dish of wash-dirt. 31 tons of quartz raised from the Sir Garnet Wolseley Reef at a depth of 40 feet gave 63½ oz. of gold. 200 tons of quartz showing gold freely has been raised from the Turon Company, Razorback, ready for crushing. Machinery ready for erection. The Solitary Creek Company have raised 925 tons of quartz, which yielded 518 oz. 14 dwt. of gold. 74 tons of quartz from the Magenta Reef yielded 75 oz. of gold. 49 tons from Big Oakey gave 48½ oz. gold. 54 tons from New Chum gave 46 oz. 17 dwt. 28 tons from Bullock Flat gave 26 oz. 6 dwt. 15 tons from Whelan's Hill gave 21½ oz.

In the Lachlan Mining District, the Wardens and Mining Registrars report:—On the south lead at Forbes several mines are now at work with fair prospects of success. The Crinoline Co. has won over 400 oz. since May last. At Bald Hills a party is on payable wash at 170 feet; this deposit is said to be outside of the old lead. There is a number of prospecting parties at work in various parts of the division. Nicolas and party have sunk on the Pinnacle Reef, which is from 3 to 5 feet wide. The first crushing of 600 tons was not payable, but 120 tons taken from a greater depth yielded ½ oz. per ton; during the short time they have worked they have won 315 oz. At Parkes new finds are often made, some of the reefs are more than payable. There is an auriferous belt extending north of Parkes, 50 miles to Tomingley and south of Parkes, 12 miles to Strickland's Reef, and none of the reefs in this area have been tested below 260 feet, and very few to that depth. On the Buchanan Reef there are several claims being worked, some of these are yielding handsome returns. The claim which is, at present, the principal claim in Parkes, had been worked and abandoned several times before the present owner took it up, and it was not till he had persevered for a long time, in face of adverse prospects, that he found the shoot of gold which he has now been working since the end of 1883; during that time he has raised 1,363 tons of quartz, which has yielded 6,537 oz. 12 dwt. of gold, equal to 4 oz. 14 dwt. 13 gr. per ton. As the Warden justly remarks, this should be a warning to miners not to abandon a claim before giving it a thorough trial. A new reef has been discovered, from which 30 or 40 tons of stone have been taken showing coarse gold freely. Some very good quartz has been obtained by different parties from the Caledonian Hill, yielding as high as 2 oz. per ton. In the Koh-i-noor claim, near Caledonian Hill, a large body of payable stone is in sight, it averages over 1 oz. per ton. Tolhurst & Co., on Coobang Run, are obtaining stone which yields between 2 and 3 oz. per ton. The quantity of gold won in the Parkes division for the year was 5,634 oz.; of this £14½ oz. was from alluvium, equal to 4 dwt. 14.88 gr. per ton, and 4,737½ oz. from quartz, equal to 1 oz. 6 dwt. 5.46 gr. per ton. A good deal of prospecting is being done at Bachelor's Lead, 15 miles north of Parkes. At Woollogolong, about 15 miles west of Molong, a lode deposit about 13 feet wide at the surface, has been found, which has been tested to a depth of 55 feet, several samples of ore have been tested in Sydney, that from the lowest level assaying 13 oz. gold and 12 oz. silver per ton. There are about 200 tons of ore at grass, and a crushing plant is being erected. The lode can be traced on the surface a considerable distance. On the Bell River, at Sammy's Mount, 12 miles north-east of Molong, a good deal of prospecting has been done on a selection in search of a deep lead. The deepest shaft bottomed is 220 feet; 4 feet of wash-dirt was found, but not payable. Another shaft could not be bottomed on account of the quantity of water; if this can be overcome it is thought a payable lead may be found. Several parties are prospecting around Grenfell, but no finds of importance have yet been made. The Inspector of Mines points out that the quartz veins at Grenfell which proved so rich when worked some years ago have, in very few instances, been tested below 200 or 300 feet, and present a very promising field for the investment of capital. A gold-bearing quartz reef has been found at a point about 46 miles from Young, and 22 miles from Marsden; the reef is 2 feet wide, and well defined, but the stone has not yet been tested owing to the distance from the nearest battery. At Canowindra a good deal of prospecting is going on, and the known reefs appear to be improving in depth—798 tons of quartz yielded 972½ oz., equal to 1 oz. 4 dwt. 9.11 gr. per ton. There appears to be a prospect of the reefs at Cargo now getting a thorough test. At Paling Yards Creek, about 8 miles from Cudal, a shaft has been sunk 70 feet on a lode 6 to 10 feet wide, and 250 tons have been raised ready for crushing, and a small battery has been erected; 63 tons crushed at Cargo gave 13 dwt. per ton. At Boney's Rocks, near Toogong, several parties are at work, but only two or three claims are on gold, yet one

crushing of 25 tons gave 1 oz. 11 dwt. per ton. Great difficulty has been experienced in working the Burrangong Lead at Young on account of the quantity of water in the underground work. In the principal mine 400 or 500 feet of driving has been done for the purpose of cutting off the water from the main lead. The prospects obtained from the portions of the lead driven equal 5 oz. to the square fathom, and similar prospects have been obtained from other parts by boring. The quantity of gold won from the mine during the year was 247 oz. 3 dwt. 14 gr. Similar prospects have been obtained from the adjoining mine, and also from a mine on Victoria Hill—the gold won with one pick in five weeks was 45 oz. The Cunningar mine, about 15 miles south-east of Murrumburrah, is the most important mine in the district—500 tons of stone recently treated yielded 600 oz. of gold. The quantity of gold won in the Young division was 761 oz. 4 dwt. 12 gr., and the quantity in the Murrumburrah division was 843 oz. 15 dwt. 15 gr. In the Temora division there has been a considerable decrease in the output of gold. The quantity sent to the Gold Receiver in 1887 was 3,406 oz. 14 dwt. 3 gr., while in 1886 he received 7,161 oz. 10 dwt. 5 gr., of this 1,400 oz. is estimated to have been won from alluvial deposits, and 2,000 oz. from quartz. During the year very little new ground has been tested at Temora, though there is likely looking country around, and the old ground gets more and more exhausted each year; about 8,000 loads of alluvium washed gave an average of 2 dwt. per load. In quartz mining a like progress is being made. During the year the South Australian Company crushed 1,718 tons, which yielded 603 oz. 8 dwt. 6 gr. of gold. For the public the Company crushed 309 tons for a yield of 140 oz. of gold, and for tributors 195 tons for 56 oz. 5 dwt. 18 gr. The stoppage through litigation of the works at the La Mascotte mine, Sebastopol, has had the effect of all but stopping work at the adjoining mines, as there is no other crushing plant within a reasonable distance. At Barmedman the progress during the year was fairly satisfactory, 1,370 tons of quartz crushed yielded 1,454 oz. 9 dwt. 14 gr. of gold, to which must be added 87 oz. obtained from mullock. At the Hand-to-find Reef 315 tons of quartz yielded 496 oz. of gold. At Cowabee some discoveries have been made which promise to give reasonably fair yields of gold. The Inspector of Mines is of opinion that alluvial leads may be discovered in this locality.

In the Cobar Mining District the Wardens and Mining Registrars report:—After languishing for two or three years gold-mining shows signs of reviving in consequence of the discovery of gold within 3 miles of the town of Cobar. The line of reef runs a distance of 3 miles through the United and Fort Bourke Hills. Some of the shafts are sunk from 20 to 50 feet deep, the reef showing fine gold in most of them. 2 tons of stone from a 3-foot reef, at a depth of about 3 feet, in the Chesney claim, was treated at the Mint and yielded 4½ oz. per ton of gold worth £4 2s. 2d. per oz. A reef containing gold has been discovered on private property by prospectors at the Peak, about 2 miles further south. At Mount Billago, 30 miles north-west of Cobar, a shaft has been sunk 100 feet and a drive put in 40 feet. A reef has been cut, from which some samples of gold-bearing quartz have lately been taken. Some of the stone tested, it is said, gave over 5 oz. of gold and 90 oz. of silver per ton.

In the Albert Mining District the Wardens and Mining Registrars report:—It is rumoured that gold has been discovered at Gnalta, near Wilcannia. At Tibooburra, including the Granite, Two-Mile, Easter Monday, Nuggety, Six-mile, over 10 miles long by varying widths, the work is exclusively surfacing, which is chiefly worked by means of puddling machines. A machine is supposed to contain 20 loads, and 3 dwt. per load is found to pay well and to yield to the owner about £30 per week clear profit. One machine owner has been known to send away £50 worth of gold per week for several weeks running. The great difficulty is a constant supply of water within a reasonable distance of the claims, and at present, owing to the intermittent supply, mines are frequently idle, and remain so sometimes for long periods. The quantity of gold won at Tibooburra during year is estimated at 2,890 oz. At Mount Browne little surfacing has been done, but there is now a tendency to construct dams and erect puddling machines, and a much larger production of gold may be expected. At present the bulk of the gold comes from the deep ground at the One-Mile, where four or five shafts have been bottomed at depths varying from 120 feet to nearly 200 feet. The lead is about 40 feet wide and the wash 12 to 30 inches deep; the average yield is given at about 16 dwt. per load. On the flat near Billygoat Hill is a deep lead, from which yields varying from 10 to 16 dwt. per load have been obtained in the All Nations claim; but as the lead was traced down to the water level they were unable to contend with the water without the aid of a whim, which is now being erected. It is on this lead that the Company, subsidised out of the Prospecting Vote, intend sinking a shaft to reach the deep ground below water level. If they succeed and are able to drain the water, the upper portion of the lead may be profitably worked. The Whittabreeua mine is about to be worked again, and about 2 miles from it a shoot of gold has been met with in a vein, which has led to several claims being taken up. It is thought the quartz reefs in this, if properly treated, would give fair returns. The quantity of gold won in the Milparinka sub-division during the year is estimated at 1,819 oz., making for the whole division—Tibooburra and Milparinka—4,709 oz. as the year's output.

In the Tumut and Adelong Mining District the Wardens and Mining Registrars report:—At the Koh-i-noor mine, Captain's Flat, near Queanbeyan, a shaft has been sunk 100 feet, and a drive 122 feet south along the lode, which contains silver, gold, copper, and lead; and all the ore to a height of about 35 feet has been taken out, leaving a gold-bearing lode adjoining on the west unworked. Three other shafts have been sunk, and drives put in along the lode from each. In this mine are two lodes, one 20 feet wide, the other 3 feet. The quantity of ore raised during the year was 2,346 tons, which have been smelted on the mine, yielding nearly 122 tons of bullion, containing by assay 40,877 oz. of silver, 364 oz. of gold, $4\frac{1}{2}$ tons of copper, and 116 tons of lead, also 54 tons of copper matte, containing by assay estimates 4,828 oz. of silver, 13 oz. of gold, $15\frac{1}{2}$ tons of copper, and $8\frac{1}{2}$ tons of lead, and there are from 60 to 100 tons of copper matte, the actual weight and value of which have not yet been ascertained. The smelting-works were in active operation about fourteen weeks during the year. At Reid's ground sluicing claim at Brinabella about 600 cubic yards of stuff have been washed, yielding about $\frac{1}{2}$ dwt. of gold to the yard. About $2\frac{1}{2}$ tons of stone has been raised from Mac's Reef, which yielded 9 dwt. of gold to the ton. The reef is about 4 feet wide. At M'Leod's selection in the Gundagai division two trial crushings of 20 tons each have been taken from the reef, which have yielded about $\frac{1}{2}$ an oz. to the ton. The shaft has been sunk to a depth of 100 feet; the reef carries gold all the way down. A shaft is being sunk 200 feet deep to test the reef at the Victoria mine, South Gundagai. At Johnstone's Hill and Bongongolong respectively, a lode of rich pyrites is said to have been found. A few of the claims on the Gap Reef at Adelong promise to prove remunerative if capital be brought to bear upon them. The quantity of stone crushed at Adelong was 1,628 tons, yielding $1,708\frac{1}{2}$ oz. of gold, and the quantity of alluvial gold won was 833 oz. 9 dwt. 15 gr. From the Amalgamated Companies mines 410 tons quartz yielded 494 oz. 18 dwt., and from 260 tons of picked tips yielded 140 oz. 16 dwt. of gold. 90 tons of stone from Mr. Williams' mine gave 362 oz. of gold. $91\frac{1}{2}$ tons from the Lady Mary mine yielded 131 oz. 18 dwt. of gold. The repeated floods have interfered with the working of Mr. Shepard's mine; preparations are being made to work the mine on a new system, from which great results are expected. At Tarcutta only three claims are at work; 139 tons of quartz raised yielded 66 oz. 16 dwt. of gold. There are several prospecting parties out in the Tumut division. Ryan and party have taken up 50 acres of land on the Shaking Bog Creek for sluicing, and are confident of success. At Reedy Flat 530 oz. of gold was won from alluvium. The quartz reefs would pay if there were a battery on the spot, but the stone will not pay to cart 20 miles. Work has been suspended at the Bungowannah mine in the Albury division, as the ore is so refractory that the gold cannot be extracted, only 119 oz. being saved from 1,190 tons of ore; the lode or dyke is 24 feet wide. Pye & Co., Black Range, have crushed 36 tons for 108 oz. of gold, and they are about crushing again, and expect 4 oz. to the ton. The quantity of stone crushed in the Albury division was 1,381 tons for 450 oz. 6 dwt. 8 gr. In the Tumbarumba division the Buna Co. obtained 344 oz. for five months' sluicing. A nugget weighing 16 oz. and several smaller pieces were found at Upper Tumbarumba during the year. Several sluicing claims have been worked during the year with moderate success. A new reef of large size has been found in slate country at Jingellic. The reef is 6 feet wide, and carries fine gold; a trial crushing of 2 tons yielded 8 dwt. per ton. The quantity of gold raised in the division during the year was 1,690 oz. At Kiandra 2,454 oz. of gold, won chiefly by hydraulic sluicing. At the Kydra Reefs, Nimitybelle division, some parties are at work on leaders, no main reef having yet been found; one trial crushing of 25 tons yielded 25 oz. of gold. A good deal of prospecting is being done in the division. A large quartz reef is said to have been discovered at Michelago; samples of the stone have been assayed, and the results are very satisfactory.

In the Southern Mining District the Wardens and Mining Registrars report:—The Carrington Co. has been formed to test a load of iron ore in the Goulburn division. Numerous similar extensive lodes are known to exist at Jerara Creek and the Look-down. Traces of gold and silver are said to exist in the surface cappings. At Windalama, some 24 miles from Goulburn, towards Braidwood, thirteen or fourteen quartz reefs have been opened within an area of 50 acres, all carrying payable gold; one of them is said to show rich surface indications. In the same neighbourhood it is reported that a gold-bearing drift covers an area of 40 miles in length by 12 miles in width. The drift is some 1,200 feet above the present bed of the Shoalhaven River, and is said to contain several dwt. of gold per ton, but has not yet been worked, owing to the length of carriage. On the Wollondilly River, near Towrang, a lode has been discovered said to contain 10 dwt. of gold and 14 oz. of silver. A shaft is being sunk to prove its extent and value. Gold is said to have been obtained from an iron ore deposit on private land near the village of Robertson. In the Nowra division four quartz-mines are in active operation; the quantity of quartz crushed was 5,824 tons for $2,761\frac{1}{2}$ oz. of gold. Open quarrying, and passing all the stone through the battery, is regarded as the most profitable mode of working the quartz deposits on this field. The gold, as it comes from the retort, contains almost uniformly 20 per cent. of silver. In the Braidwood division the rainfall has

has assisted mining operations (except at Araluen, where the deposits can be best worked in dry seasons), though not sufficient for continuous sluicing. At Braidwood 500 oz. of gold was won from alluvium. At Major's Creek 512½ oz. of gold was won from alluvium, and 337 oz. from quartz. At Little River 155 tons of quartz crushed yielded 209 oz. of gold. There was not sufficient water for sluicing till November, consequently the results were not known by the end of the year. At the Corong Sluicing Co.'s mine, at Sailor's Gully, the water-race has been completed and the tail-race is being constructed, and has been opened out on a bed of rich auriferous wash. Other sluicing companies are engaged in preliminary works. The quantity of gold won in the division was 320 oz. At Araluen, owing to the heavy rains, some of the stripping claims were flooded and filled in, and dams and tail-races were destroyed, causing loss of time and heavy expense in reopening; consequently the yield of gold from alluvial claims—4,200 oz.—may be considered satisfactory. 103 tons of quartz from Bell's Creek yielded 44 oz. of gold. In the Moruya division several apparently promising quartz reefs have been discovered, especially about Nerrigundah and the Tuross River, and some old reefs have been reopened. A battery has been erected which it is thought will tend to the development of some of the numerous quartz reefs in the locality. A plant has also been erected to work a large true fissure quartz reef from 4 to 12 feet wide, the stone showing gold freely, at Mt. Coman. The quantity of gold won at Moruya was 273 oz. from alluvium and 108 oz. from quartz. At Nerrigundah 200 oz. of gold was won from alluvium and 20 oz. from quartz, but there are about 200 tons at grass waiting treatment as soon as the battery, which is being erected, is completed. At Quart Pot Creek a quartz reef has been discovered which from assays made appears to be rich. At Wagonga a battery of twenty heads is about to be erected to crush the stone from the Bodalla mine. At Mt. Carrington a shaft has been sunk 100 feet on a reef nearly 9 feet wide, and the stone is very rich and shows gold freely. A steam pump has been erected to drain the claims at Mogo, but it is not sufficiently powerful; but what little ground was drained gave a return of 5 oz. to the load. The quantity of gold won in the Bombala division was 745 oz. 12 dwt.

In the Hunter and Macleay Mining District the Wardens and Mining Registrars report:—Mining operations at Copeland were retarded by the heavy rains flooding shafts, &c. The Centennial Co. having constructed a large tunnel 800 feet in length with a view to cut the reef at a great depth, are about to extend their works in the hope of striking the reef; if they succeed it is thought an impetus will be given to mining in this locality. A battery has been erected at Boranel and one at the Boman River; 238 tons of quartz crushed gave 263 oz. of gold. At Dungog 153½ oz. of gold was won during the year. At Coolongolook a large quantity of stone is at grass waiting for the erection of machinery, some of which is on the ground. The Mountain Widow mine has a well-defined reef 1 foot wide, and the Suttie mine a reef 3 feet wide showing gold. At Mt. Springfield a crushing plant has been erected, and will be ready for crushing in a few days; the prospects are very good, and the reef is 18 inches wide. A trial crushing of stone from 125 feet level of the Curroeki yielded 4½ oz. to the ton, and 4 tons from the 80 feet level gave 3½ oz. per ton; the reef is 10 in. wide and well-defined. In the Kempsey division a reef has been discovered at Mt. Pigott, near Deep Creek, 16 or 18 miles from Nambuccera River, 52 miles from Kempsey, and 5 miles from Boat Harbour, some stone from which tested in Sydney returned gold at the rate of 2½ to 3 oz. per ton; this caused considerable prospecting in the locality, resulting so far in the discovery of two other well-defined reefs, extending over a large extent of country.

In the Peel and Uralla Mining District the Wardens and Mining Registrars report:—At Stewart's Brook, about 40 miles north-east of Scone, a large quantity of stone is at grass waiting to be crushed; at present it costs about 30s. per ton to cart the stone to the battery from some of the claims. The reefs vary in width from 9 inches to 3 feet wide. There is a prospect of a second battery being erected, which will reduce the cost of cartage. The quantity of stone crushed during the year was 584½ tons for 668½ oz. of gold. Reports have been published locally of the richness of certain ironstone and quartz reefs at Swamp Oak Creek, and its tributary, but no data furnished of the extent of the reefs or the results of any tests made. Some prospecting has been carried on in the ranges, near Tamworth, and some quartz specimens obtained. In the Nundle division several companies have been or are being formed to work the cement deposits at Mt. Ephraim on a large scale. The principal mine is owned by the Mt. Ephraim Co., who are actively engaged in opening up the mine, completing the erection of their plant, and will shortly commence treating the cement. The reefs at Bowling Alley Point are being vigorously worked. Foley's Reef, 3 ft. 6 in. wide in many places, has been struck again, showing gold, and sufficient stone for a crushing will soon be raised. Other companies supposed to be on the same line of reef have struck gold; one of them had a crushing which yielded 1 oz. to the ton. About Hanging Rock, a large number of rich veins have been found. At Bingera a shaft has been sunk 120 feet, on the All Nations Reef, which is about 8 feet wide; several tons of stone has been tested, yielding from 16 to 13 dwt. of free gold per ton—the pyrites containing about 5 oz. per ton. A rush to Gympie Flat, near the Diamond Mines, has afforded something more than wages to a number of men for some months past.

At

At Spring Creek a copper lode has been opened which promises good returns of gold. 1,050 oz. of gold won at Bingera during the year. At Tea-tree (Barraba) a patch of 58 oz. of gold was obtained from 1 cwt. of stone, and some rich finds have occurred at Ironbarks. In the Armidale division prospecting has been carried on with varied success in different localities. New discoveries of gold have been reported from time to time, and quartz reefs have been discovered which are said to be highly auriferous. Companies have been or are being formed to work rich quartz veins found at Baker's Creek, Hillgrove. From one of the mines 177 tons of stone, 1,360 oz. of gold was obtained. Some of trial crushings have given exceedingly rich returns, and there is reason to believe that a large yield of gold will be obtained from this locality this year if the mines be properly worked. The Eleanora Co., Hillgrove, whose main reef is 12 feet wide, obtained 2,183 oz. 18 dwt. 5 gr. of gold from 6,343 tons of stone. The yield of gold in the division is estimated at 5,000 oz. At Glen Morrison, near Walcha, the discovery of a gold-bearing leader on private land was reported. In the Tia mine, at Tia River, the reef is from 4 to 5 feet wide, and yields 13 dwt. per ton; the country is soft. At Doherty's Hill (Uralla) a shaft has been bottomed with great difficulty owing to the quantity of water, and prospects obtained of about 3 oz. per load. Machinery has now been erected for draining the mine. Other companies have sunk shafts and erected machinery, but have not yet overcome the water. A rush to Wallaby Rocks occurred. The ground is now sinking about 20 feet. One party realized at first from 1 to 2 oz. of gold per load. The present average is 11 to 13 dwt. Sluicing operations are steadily continued in several localities, results not reported, but apparently satisfactory. Work has been continued steadily at the Long Tunnel mine with, it is thought, satisfactory results. The quantity of gold won in the Uralla division during the year was 1,000 oz. approximately. The discovery of a reef containing gold and bismuth in the northern part of the Inverell division has been reported. The prospectors are said to be confident, and intend sinking in the reef to a depth of 100 feet.

In the New England Mining District the Wardens and Mining Registrars report:—Some disappointment has been felt at the results of some of the mines at Fairfield, this is supposed to be due to the fact that some of the earliest trials having shown exceptionally rich results, the first 10 tons of stone obtained having yielded 128½ oz. of gold, but it is thought the Fairfield mines will soon rank amongst the richest gold-mines in the Colony. Up to the present great difficulty has been experienced in saving the gold which is very fine, and is associated with iron and copper pyrites, and zinc blend. At Boonoo Boonoo the reefs are likely to be successfully worked. The country is granite and the reefs are large and well-defined, but the water is troublesome, the locality being wet and swampy, rendering pumping machinery necessary. About 3½ miles from the McIntyre a reef has been sunk upon to a depth of 74 feet, at which depth the reef is 6 feet wide, estimated to yield ¼ oz. per ton. A trial crushing of 24 cwt. gave a yield of 1 oz. per ton. The reefs in this district are all well-defined with soft granite walls. At Fairfield, the Strauss Co.'s battery has been at work only a few weeks on their mine, at the back of Mount Carrington, 750 tons of stone crushed yielded 476¼ oz. of gold. There are several reefs through the land, the principal one is 10 feet wide. The plant of the Mount Carrington Co., which is very complete, is nearly ready for work. The stone is obtained from large reefs. At Red Rock, about 8 miles N.W. from Fairfield, the gold is found in a gossan stone with quartz; it occurs not in veins or reefs but in great masses. The average yield is estimated at 5 to 15 dwt. per ton. The Red Rock Co. obtain their stone from an open cut or quarry in the mountain, the face is 25 to 30 feet wide, and the depths of the cutting is 20 feet. There is no appearance of reef or wall, the mountain appears to be a mass of auriferous rock. The last crushing yielded 8 to 10 dwt. per ton. About half the gold is supposed to be lost by the present system of work. 386 oz. of gold was obtained from 1,211 tons of ore crushed. The rock is said to be practically inexhaustible, and it is estimated that 3 dwt. per ton will pay for working. The quantity of gold won at Fairfield, during the year, was 302 oz. from alluvial, and 1,107 oz. from quartz. There are several other companies working similar deposits. 25 tons of stone from the Victoria Reef, Lunatic, yielded 31 oz. of gold. The Lunatic and Perseverance Reefs are all small, but true fissure lodes. Some prospecting is being done at Pretty Gully, and also at Tooloom, where there are indications of extensive alluvial deposits under basalt. The Surface Hill Co. are still working at Poverty Point, but their appliances are quite insufficient for the treatment of the vast mass of auriferous granite. Payable gold has also been found in a sort of sandstone formation, and crushings from a lode 8 feet wide, and apparently widening, have yielded 5 to 8 dwt. per ton. At Solferino the quantity of gold won during the year was 209 oz. from alluvial, and 120 oz. from quartz. In the Glen Innes division, the Glen Elgin Sluicing Co. has constructed an artificial channel 1,939 feet long, 100 feet wide, and 40 feet deep in the centre, and they have now to cut through 30 feet of hard granite to reach the depth of 70 feet which is necessary before the water of the river can be drained away. Before incurring this heavy expense the company intend to thoroughly test the deposits of gold and tin proposed to be worked. About 450 oz. of gold has been obtained by scattered parties of miners.

In

In the Clarence and Richmond Mining District the Wardens and Mining Registrars report:— Machinery is about to be erected for working the Dora line of reef, on the Mann River, which is expected to prove highly remunerative. At Nana Creek the Jubilee Co. is sinking on a reef 18 inches wide; yield, 15 dwt. per ton. Another reef 1 foot wide runs parallel to it about 30 feet from it. There are numerous reefs in the locality varying in width from 9 to 18 inches, containing gold in payable quantities; 159 tons of stone crushed gave 149 oz. 19 dwt. 8 gr. of gold. At Dalmorton a new reef has been discovered which it is said will yield 2 oz. per ton; the quantity of gold won is 100 oz. from alluvial and 120 oz. from quartz. A reef has been discovered at Smith's Creek, a tributary of the South Arm Tweed River, stone taken from the surface yielded 4 oz. 18 dwt. of gold and 10 dwt. 21 gr. of silver.

The following information has been kindly furnished by R. Hunt, Esq., F.G.S., the Deputy-Master of the Royal Mint.

QUANTITIES of Gold, the produce of New South Wales, received into the Royal Mint, Sydney, during 1886 and 1887 compared.

Department of Mines,
Sydney, 10th April, 1888.

HARRIE WOOD,
Under Secretary for Mines.

The following table is compiled from information kindly furnished by the Collector of Customs:—

EXPORT of Gold, 1887.

Gold.			Quartz Tailings and Pyrites.				Total.			
Quantity.		Value.	Quantity.		Value.	Quantity.		Value.		
oz.	dwt.	gr.	£	oz.	dwt.	gr.	£			
8,791	7	10	34,184	Tailings, 3,473 packages Pyrites, 15 tons 15 cwt.		7,808	10,977	19	10	41,992

The quantity of gold sent to the Mint, plus the quantity of gold exported in 1887, was 116,246 oz., but the Deputy Master of the Mint states that of the quantity of gold exported 5,958 oz. 12 dwt. 10 gr. had passed through the Mint and was included in his return; consequently the gold yield for 1887 may be set down at 110,288·06 oz., valued at £304,578 16s. 3d., which, as compared with the output of 1886, shows an increase of 8,871 oz.

According to the returns furnished by the Mining Registrars the output of gold for the year was less by 18,066 oz. than the quantity sent to the Mint; consequently the actual output of gold exceeds by 23,085 oz. the quantity returned by the Mining Registrars. This is doubtless due to the difficulty experienced in reaching all the gold-mines, spread as they are over such a wide territory, added to which is the strong prejudice felt by a large number of our miners against furnishing information respecting the quantity of gold won.

RETURN of Gold for 1887 from Mint and Mining Registrars compared.

District.	Mint.	Mining Registrars.	Excess.	Deficiency.

			50,980	32,914
			32,914	
			18,066	

The quantity sent to the Mint exceeds the returns by the Mining Registrars by ..

A comparison of the returns furnished by the Mining Registrars of the gold won in 1886 and 1887 respectively shows an increase of 5,421, but it is apparent that these returns are incomplete and the comparison is made chiefly with a view to indicate the importance of making these returns more complete in future.

Increase in yield for 1887			5,421	

The following table shows the results obtained from the treatment of certain parcels of alluvium in 1887, as compared with the results obtained in 1886. According to this statement the average yield in 1887 is very small compared with the average of the preceding year, but the statement embraces such a very small proportion of the total quantity treated as to be of comparatively little value for statistical purposes.

COMPARATIVE Statement of Average Yields from Alluvial Mines for 1886-7.

1886.				1887.								
District.	Quantity.	Average per ton.		Yield of Gold.	District.	Quantity.	Average per ton.		Yield of Gold.

						22,574	0	2	18·42	3,123	19	0

The following table shows the yields obtained from certain parcels of quartz crushed in several of the mining districts. I am happy to note that the return for 1887 is more complete than that for 1886, and I trust, if this improvement continues, that our returns under this head will soon be as valuable, for statistical purposes, as those published in Victoria and elsewhere. The average yield for 1887 is lower than that of the preceding year; still 9 dwt. 4·93 gr. is not altogether an unsatisfactory yield.

COMPARATIVE Statement of Average Yields from Quartz-mines for 1886-7.

The number of miners engaged in gold-mining in 1887, according to the returns furnished by the Mining Registrars, was 6,060 (being 707 less than in 1886); of these 5,420 were Europeans and 640 were Chinese; 2,527 were engaged in quartz-mining and 3,023 in alluvial mining; and as to 510 it is not specified whether alluvial or quartz.

Dividing the quantity of gold won by the number of miners employed, the result obtained is that each miner appears to have won during the year 18·19 oz. of gold, valued at £65 2s. 2·88d. It must, however, be borne in mind that a large number of our miners are not constantly engaged in mining during the whole of the year, but devote a large proportion of their time to other pursuits.

During the year the following assays have been made in this Department:—

COAL.

The output of coal for 1887, as compared with that of 1886, shows an increase of 92,322 tons, while the value of the output for 1887 exceeds that of 1886 by £43,276. The export of coal to inter-colonial ports shows an increase in quantity of 49,495 tons, and in value of £20,260. The export to foreign ports shows an increased quantity of 5,082 tons, but a decrease in value equal to £6,723. Our total export of coal for 1887 exceeds that of 1886 in quantity by 54,577 tons, and in value by £13,537, while our Home consumption in 1887 exceeds that of 1886 by 37,745 tons. The average price per ton for coal sent to Intercolonial Ports in 1887 was 10s. 5·89d. as compared with 10s. 7·22d. in 1886, the average rate from 1858 to 1887 being 11s. 2·14d. per ton. The average price per ton for coals sent to Foreign Ports in 1887 was 11s. 1·08d., as compared with 11s. 4·31d. in 1886, the average rate from 1858 to 1887 being 12s. 7·59d. per ton. The average price realized upon our total output for 1887 was 9s. 2·57d. per ton, as compared with 9s. 2·53d. per ton in 1886, and 9s. 9·45d. per ton from 1858 to 1887.

The aggregate thickness of coal-seams bored through in 1887 with the Government diamond drills was 44 ft. 8 in., namely:—At Mittagong, 33 ft. 2 in.; at Redhead, 3 ft. 10 in.; and at Bundanoon, 7 ft. 8 in.

During the month of March, 1888, the pit of the Metropolitan Coal Company, at Heathcote, reached the coal-seam at a depth of 1,095 ft., and has since then pierced the seam measuring 13 ft. of clean coal.

QUANTITY and Value of Coal raised from the opening of the Coal-seams to 1857, inclusive:—

Year.	Quantity.	Average per ton.	Value.	Year.	Quantity.	Average per ton.	Value.

1843	25,862	0 12 6·54	16,222				
					1,468,961	0 11 10·72	869,391

In the Northern District the average price of coal was 9s. 9³d. per ton in 1887, as compared with 9s. 11⁵d. per ton in 1886. In the Western District the average price of coal was 5s. 2⁷8d. per ton in 1887, as compared with 4s. 10⁵5d. in 1886. In the Southern District the average price of coal was 9s. 0⁷7d. per ton in 1887, as compared with 8s. 1⁰7d. in 1886.

The number of coal and shale mines under inspection in 1887 was 42 in the Northern District, and 30 in the Southern and Western Districts—total, 72; and notice was received of 8 opening out and of 1 abandoned, whereas in 1886 there were 66 under inspection and 11 opening out.

During the year there were 110 accidents in collieries; of these 95 were fatal, and 45 non-fatal; of the 95 fatal accidents, 81 were due to the disaster at the Bulli mine. The number of fatal accidents in 1887 exceeds the number in 1886 by 66, and the number of non-fatal accidents in 1887 exceeds the number in 1886 by 2.

COAL.

A Company has been formed to work a coal-seam near Mittagong, and another Company has been formed to work seams near Wingello. The Berrima Colliery is still putting out a limited quantity of coal, and the Erith Colliery is about to start again. Land has been taken up to work the seams of coal, three or four in number, in the Main Range, at Little Forest, near Milton. The largest seam is about 2 feet thick, the coal is bright and burns well. In the Maitland division a new Company has been formed to work the Thornley Colliery and surrounding land, and a Company is about to be formed to open a colliery in the parish of Stamford upon an area of 1,996 acres held under lease; a small colliery has been opened near East Maitland. A colliery has recently been commenced at Gunnedah.

During the year the following analyses of Coal were made by the Department:—

Locality.	Description of Mineral.	Analysis.	Coke %	Sulphur %	Specific Gravity.
Bundanoon Creek	Inferior splint coal.....	Hygroscopic moisture.....	1.02		
		Volatile hydrocarbons.....	14.96		
		Fixed carbon.....	38.38

Fuller particulars concerning the composition of the Coals of this Colony may be found in the Annual Report of this Department for the year 1880.

SHALE.

The output of shale in 1887 was less by 3,553 tons than in 1886, and the price per ton was 2s. 0 36d. per ton less than in the preceding year.

The following table shows the quantity and value of Kerosene Shale produced during the years 1865 to 1887:—

Year.	Quantity.	Average price per ton.	Total value.	Year.	Quantity.	Average price per ton.	Total value.
	Tons.	£ s. d.	£ s. d.		Tons.	£ s. d.	£ s. d.

SILVER AND LEAD.

Though the quantity of fine silver exported in 1887 was considerably less than in 1886, the quantity of silver and lead ore exported in 1887 so largely exceeded that of 1886 that, comparing the export of silver and ore for the two years, 1887 shows an increase in value over 1886 equal to £82,381. The fact that such a large proportion of the produce of our silver-mines is sent away for treatment, indicates the want of appliances or skill to treat the ore locally. It is perhaps fortunate for this branch of mining that the owners of our silver-mines recognise the expediency of sending away their ore, instead of investing capital building furnaces which may or may not be capable of treating the ore effectively. It is to be hoped that works will ere long be established in this Colony at which the various ore of silver can be treated so as to secure the maximum of profit to mine owners.

Though the result of last year's operations shows a considerable increase upon that of the preceding year, there is reason to believe that the output of the current year will greatly exceed that of last year. The following extracts from the reports furnished by officers of the Department indicate the enormous extent of country over which lodes of silver and lead ore are distributed :—

In the Bathurst District the Wardens and Mining Registrars report :—“The Tucna division has been brought prominently before the public during the year by the rich discoveries of silver ore at Costigan, near Tucna. A Company has been formed and smelters erected. Four shafts have been sunk and 30,000 oz. of silver obtained, valued at about £4,875; also 103 tons of lead. Another property was also put into a Company, called the Cordillera. Smelters are being erected, shafts sunk upon the lode, and a tunnel driven into the hill has cut the lode, which assays well. The old Peelwood copper-mine, which was abandoned some years ago, is said to be exceedingly valuable for silver, lead, and copper. At Back Creek, Rockley, most of the leases are idle under suspension, though several of them are rich in minerals, probably silver. Mitchell has been going to the bad all the year. The Sunny Corner Company (the only one working) obtained 16,472 tons of ore, 318,016 oz. of silver, valued at £55,652 16s., and they had 1,000 tons of ore at grass, valued at £3,500. At Lewis Ponds and Bulga there are lodes of silver ore which promise to equal some of our richest silver-mines. The Lewis Ponds Gold and Silver Mining Co. have sunk to a depth of 117 feet, where a gossan lode of from 5 to 20 feet in width has been struck. During the year 293 tons of ore have been raised, which is being sent to Germany for treatment. There is a probability of payable silver being found at Kempfield and Diamond Valley, near Trunkey. In the Lachlan District at Back Gamma, 15 miles north-east of Forbes, a reef which was taken up for gold is likely to prove a silver lode. At Nymagee the Nymagee has carbonate of lead and silver lodes running parallel to the copper lodes. In the Albert Mining District the Broken Hill Proprietary Company during the year raised 51,000 tons of ore, from which they obtained 65 tons 18 cwt. 1 qr. of silver, valued at £394,790, and 9,914 tons of lead, valued at £69,400. The deepest shaft is 336 feet deep, the deepest level is 316 feet, the width of the lode is from 14 feet to 170 feet. The Broken Hill Block 14 Co. raised 800 tons of ore, valued at £1,800. The British Broken Hill Co. raised 30 tons of ore, valued at £300. The Consols Co., Broken Hill, raised 50 tons of ore, valued at £1,000. The Umberumberka Co. raised 4,605 tons of ore, of which 1,605 tons was sold for £34,330, leaving 3,000 tons of ore at grass, valued at £9,000. The Barrier Ranges Co. raised in the aggregate 567 tons of ore, valued at £6,581. The Britannia and Scotia Co. raised 113 tons of ore, of which 105 tons was sold for £1,680. The Round Hill Co. raised 15 tons, which was sold for £115. The Consolidated Blocks Co., Round Hill, raised 25 tons, valued at £300. Rossiter & Co. raised 84 tons of ore, valued at £1,236. The Rise and Shine Co., Mt. Gipps, raised 40 tons of ore, valued at £160. The field in a general way is being vigorously prospected, more especially about Broken Hill, Rockwell Paddock, Pinnacles, and Purnamoota, and the galena lodes of Thackaringa have attracted considerable attention. The export of minerals from this division during 1887 were valued at £522,455. This does not include the ore sent from Thackaringa, which would probably bring the amount up £600,000. In the Tumut and Adelong Mining District, at Captain's Flat, near Queanbeyan, the Koh-i-noor Co. has two lodes, one 20 feet wide, the other 3 feet, from which 45,705 oz. silver, and 124½ tons of lead, besides gold and copper, have been obtained. A lode containing silver, gold, and lead, has been cut in the Vanderbilt mine, from which 150 tons of ore have been raised, which assays 10 to 180 oz. silver per ton, and in another mine a quartz reef has been cut which is impregnated with lead crystals. A Company is being formed to work some silver lodes at Bredbo, in the Cooma division. At Carter's mine, in the Nowra division, prospecting is still carried on, but nothing payable has yet been found. The discovery of a silver lode in the Araluen division has been reported, and the ground

ground is being tested. A silver lode has been discovered on private land at Pudman Creek, in the Yass division. At Moruya the owner of the silver-mine has been engaged some weeks in crushing, with fair results. Assays of ore from lodes near Bombala varied from 12 to 25 oz. of silver and 2 oz. of gold per ton. The Warrell Creek silver lodes in the Kempsey division are shut up from miners, the land being included in mineral conditional purchases. These lodes are well-defined, and comprise argentiferous pyrites and silver galena ores, and if opened would provide a large, new, and permanent field. At Mount Pigott, about 5 miles from Boat Harbour, a deposit of gossan ore has been found, containing gold and silver. One mile west of this a well-defined reef, 12 inches wide at surface and 24 inches at a depth of 12 feet of ferruginous quartz, heavily charged with argentiferous pyrites, silver being the predominant metal. There are many other reefs and lodes on both the western and eastern spurs containing gold, silver, antimony, &c., but as depth is reached silver will, it is thought, predominate. Near Fairfield the silver discoveries have caused great excitement, especially the mine known as the "White Rock." There is no defined lode, but the mass of rock is intersected by numerous veins of galena, sulphide of silver, &c., varying in width from 2 to 12 inches. The veinstuff is said to be about 10 per cent. of the whole mass, and the rock is found by assay to contain a considerable quantity of silver. Another discovery has been made on a granite range about 8 miles north of Tenterfield. An assay of stone from the prospector's shaft proved to be exceedingly rich in silver. The lode is well-defined. The highest assay gave 795 oz. silver and 6 oz. 12 dwt. of gold per ton, the lowest assay shows 13 oz. silver and 2 oz. 14 dwt. of gold. At Denison Town land has been applied for to test deposits of silver ore found there. The attention of capitalists has at length been drawn to the hitherto neglected silver lodes of the Vegetable Creek division. At Webb's mine, on Little Plant Creek, where fahlerz and antimony appear to predominate, the plant for treatment of the ore was completed at the end of the year. The argentiferous galena ores at Pye's Creek will, it is anticipated, prove easier of treatment. The lode in the Pye's Creek Co's. mine at a depth of 92 feet is said to be 10 feet with a core of solid galena 4 feet across and veins of the same ore 2 and 4 inches thick running through quartz and gossan on each side. A large quantity of ore has been raised and stacked, and it is intended to erect a furnace to smelt it. The ore is said to average 50 per cent. of lead, and from 50 to 720 oz. of silver per ton of lead. Shafts sunk on adjoining mines are said to have given similar results. The country taken and being explored extends southerly from Pye's Creek between 30 and 40 miles. Nine miles east of Deepwater some promising lodes have been discovered.

THE following assays of Silver, Lead, and Zinc Ores were made in the Department of Mines during the year :—

Wellington	Zinc blende from 5 miles south-east of Mitchell Creek	46.58

TIN.

At Gumble in the Molong division a lode has been found 9 feet wide between slate and granite walls. The ore has assayed as high as 60 per cent. of tin, and 2 or 3 per cent. of copper, and the average would be 7 or 8 per cent. of tin. At Poolamacca and Wankeroo, in the Barrier Ranges, a great number of tin-bearing lodes have been discovered extending over a very large extent of country; these have been tested in various places and some fair prospects have been obtained and ore of considerable value has been raised and some samples have been sent away for testing, but no ore has yet been treated on the ground. The Mount Eurioiwrie Co. are erecting a plant capable of reducing some 400 tons of ore per week.

At Bendemeer three parties have been working for tin ore and have raised $7\frac{1}{2}$ tons which realized £465. In the Inverell division, though the weather has on the whole been favourable, the output of ore has decreased to, say, about 1,536 tons; this is attributed to the fact that the alluvial deposits are nearly worked out, and although there are numerous reefs on the field very few are being worked, capital being required to develop them. The stream tin deposits in the Tenterfield division are nearly exhausted and the lodes and deep leads have not yet been prospected owing to want of capital. The quantity of tin won in the division during the year is estimated at 270 tons, valued at £16,200. A party is at work on a rich tin lode about 8 miles north-west of Tenterfield, a quantity of the ore has been bagged and sent to Sydney for treatment.

In the Glen Innes division the output of tin ore in 1887 exceeded that of 1886 by more than 700 tons. This increase was due to the rise in the price of tin and the abundant rainfall and was general throughout the division. Much of the land which had been previously prospected and abandoned as too poor to pay was taken up and worked profitably. Although prospecting for a continuation of the deep ground westward of portion S, parish of Hamilton, has failed to discover the lead supposed to trend towards the Gulf, a connected run of rich wash has been traced and worked from the Wesley mine to portion S.

A Prospecting Association has been formed at Emmaville to test the deep deposits below the basalt. If successful, an enormous expansion will be given to this branch of mining. Prospecting is being pushed on very generally over the whole division. Lode mining has been persevered in by a few parties, in spite of much difficulty. During the year the Ottery mine produced 2,171 tons 12 cwt. of tin stone, which, when crushed, returned 76 tons 3 cwt. 1 q. 18 lb. of block tin ore, or at the rate of 3.5 per cent. This Company has constructed a tunnel 340 feet, which at 350 feet is expected to cut the lode 150 feet perpendicular below the surface. At the 90-foot level the lode is in places over 10 feet wide, and there is exposed from that level upwards some twelve months' work. If the present price of tin be maintained, a great impetus will be given to lode mining. The quantity of ore raised, according to the returns furnished to the Warden, is 2,846 tons 4 cwt., valued at £185,003 on the ground. 888 tons 15 cwt. of refined tin was forwarded from the smelting works by rail to Morpeth.

Although the output of tin in 1887 did not largely exceed that of 1886, the value thereof shows an increase of £57,767. This is of course due to the increased price of tin.

TABLE

TABLE showing the quantity and value of Tin exported from, and the produce of, the Colony of New South Wales, since the opening of the Tin-fields in 1872.

Tenterfield	Tinstone (very siliceous) containing magnetite	15·3
Upper Macleay River	Stream tin sand	57·3
Wagga Wagga	Tinstone and iron gravel	43·2

COPPER.

The Wardens and Mining Registrars report.—In the Bathurst District, the Burruga mine, after having been shut down for eighteen months, was again started in September last,—during the four months 120 tons of refined copper have been sent to market. This mine has been worked to a depth of 210 feet and shows a splendid face of ore. If the present price of copper be maintained several mines in the locality will be worked. At the old copper-mines, Carrangarra, in the parish of Byng, gold and silver have been found at a considerable depth. If the statement furnished to the Mining Registrar, Orange (see his report), be true, this is a most wonderful mine. At the Belara copper-mine 100 tons of ore was raised, valued at £300, but no smelting was done. In the Cobar District the Great Cobar Company raised during the year 19,163 tons of ore, which gave 1,521 tons of fine copper, valued in Sydney at £68,445. The lode in this mine varies from 2 feet to 50 feet in width, the deepest shaft is 564 feet, and the deepest level 420 feet. Three bores have been put down, one of them proving the lode 98 feet below 564 feet. From the surface to a depth of 275 feet the lode consists of grey oxides and blue and green carbonates, below that depth the lode is composed wholly of copper pyrites. Throughout the lode there is a trace of silver and a strong trace of bismuth. About 8 miles north-west of Cobar this Company holds 60 acres in which extensive exploratory work is being done in search of a copper lode, but so far nothing payable has been found, but the indications are encouraging. The Nymagee Co., at Nymagee, raised 9,860 tons of ore, from which 1,045 tons of fine copper has been smelted, valued at £48,107. The deepest shaft is 628 feet, the deepest level is 618 feet, width of lode 10 to 25 feet. Frost & Co., at Hermitage Plains, have a shaft 40 feet deep on a lode 6 feet wide from which 50 tons has been raised. At Mount Hope some prospectors have found a little gold in an ironstone lode, but it is not known that it is payable. The place is likely to get a fair trial. A copper lode has been discovered at Budawang Mountain, in the Moruya division, specimens from which appear to be rich. The

The output of copper in 1887 shows a moderate increase upon that of 1886, and the increase in value, namely, £31,437, is very satisfactory; nevertheless there is reason to believe that the operations of the current year will show a very much larger increase.

TABLE showing the quantity and value of Copper, the produce of the Colony, exported from the Colony of New South Wales, from 1858 to 1887.

IRON.

During the year the Esk Bank Iron Co. (the only Company engaged in making iron) made 2,746 tons 12 cwt. of bar and rail iron valued at £13,459 11s. 8d., and 50 tons 16 cwt. 1 qr. 22 lb. valued at £1,083 3s. 5d. The number of men and boys employed during the year was 160.

The following analyses of Iron and Maganese Ores were made in the Department of Mines during the year :—

IRON.

Locality.	Description of Mineral.	Analysis.	
Clarence Town	Iron ore from 3½ miles from Clarence Town.	Moisture	% 4.15
		Ferric oxide	64.64
		Ferrous oxide	3.74
		Manganese oxide	trace
		Alumina	13.72
		Silica	6.59
		Lime	0.37

MANGANESE.

Locality.	Description of Mineral.	Manganese %	Colalt %
Bogan District	Manganese dioxide	87.2	
Molong	Manganese ore	67.33	

BISMUTH.

On private land near Gumble, in the Molong division, a deposit of bismuth has been discovered, and is being tested. The ore is said to assay 3 to 18 per cent. of bismuth and 4 oz. silver per ton. A shaft has been sunk on the lode, which is 2 feet wide.

In the Glen Innes division, the only mine constantly at work is the Kingsgate, where 40 men and 20 boys are employed. The ore is not found in fissure lodes, but in pipes which have been followed down in the granite rock to a depth—in some instances—of 100 feet. The ore is roughly broken, hand-picked, and washed before being bagged for shipment to England—and then averages about 50 per cent. According to the Railway Returns, 35 tons 9 cwt. 1 qr. 25 lb. was forwarded during the year. Very little work has been done on the adjoining mine, but it is apparently as rich in bismuth, and is said to contain valuable ores of silver.

The following assays of Bismuth Ores were made in the Department of Mines during the year :—

Locality.	Description of Mineral.	Bismuth, per cent.
Delaney's, Molong	Ferruginous felspathic quartzite	6.78
Molong	" veinstone with carbonate of bismuth	18.9
"	Lodestuff with sulphide and carbonate of copper, from 7 miles from Molong	2.52
"	Felspathic lodestuff with a little carbonate of bismuth, from between Molong and Parkes	0.23

This stone contains all the ingredients for the manufacture of Portland cement. If properly mixed in the right proportions, with nearly its own weight of lime, dried and calcined at a carefully regulated temperature, I do not see why a cement cannot be manufactured from the stone.

J. C. H. MINGAY, F.C.S.,
Assayer.
MISCELLANEOUS

MISCELLANEOUS ANALYSES.

Four samples of clay shale from near Sydney ; examined as to fire-brick purposes, &c.

These samples were tested by the method used in the Metallurgical Laboratory, Royal School of Mines, London, they being kneaded with water and fashioned into small prismatic pieces with sharp edges, thoroughly dried, and heated in a covered crucible for some hours in a powerful wind furnace fed with coke.

Nos. 1 and 2. —These samples were submitted to the above test in a wind furnace for some hours, and were found neither to have fused or altered in appearance, the edges remaining sharp. They are a fine description of clay, being free from grit, and I think would be useful for the manufacture of pottery fire-tiles, &c.

No. 3.—This sample contains a small quantity of organic matter (leaves, &c.) On kneading some and making it up into a "pat" and calcining, it was found to be spotted over with small holes due to the gases given off from the organic matter in the sample. The sides were sharp, and in other respects this is a good fireclay, and useful for many purposes.

No. 4.—This is a coarser description of clay, and has more sand in its composition. It is a good fireclay and stood the test well ; will make excellent firebricks.

J. C. H. MINGAYE, F.C.S.,
Assayer and Analyst.

White earth from the Warrumbungle Range ; examined for diatomacea.

Examined microscopically and found to contain diatoms, one long form being particularly noticeable.

R. ETHERIDGE,
Paleontologist.

Carbonaceous clay from Wollondilly. Ash, 61.83 %
Water from diamond drill bore at Ballimore, near Dubbo. For analysis.

Carbonate of lime	14.00
Chloride of magnesium	12.05
Oxide of iron	1.02
Alumina	trace.
Silica	0.21
Alkaline carbonates	199.38
									226.66

Epidote rock from Delaney's Dyke, Molong ; for examination.

Insoluble in acids 61.25% ; consisting of silica, alumina, lime, magnesia, and traces of iron and manganese.

Soluble in acids 38.75. Consisting of alumina, iron, lime, magnesia, silica, and traces of copper and manganese.

Metallic iron from near Bingera, for examination as to its meteoric character :—

The specimen has been submitted to a careful qualitative analysis, and found to contain strong traces of copper, cobalt, and nickel. As traces of these metals usually accompany meteoric iron, I am of opinion that this sample is meteoric iron.

J. C. H. MINGAYE, F.C.S.,
Assayer and Analyst.

Water from bore at Ballimore, Talbragar River, near Dubbo, for analysis :—

The water yielded on evaporation, 224.62 grains per gallon of fixed residue, consisting of—

Bicarbonate of sodium	183.10
Potassium	12.83
Lithium	0.05
Calcium	11.38
Magnesium	9.36
Strontium	trace.
Iron	0.70
Chloride of sodium	6.92
Alumina	trace.
Silica	0.28
		224.62

Trace of phosphates :—

Free ammonia	0.052 parts per 100,000 parts
Albuminoid ammonia	0.003 " "
Specific gravity of water, at 65 F.		= 1.00359.

NOTE.—The water was free and clear from odour, highly charged with carbonic acid, and containing a small amount of sediment, which on analysis was found to consist of silica with a small quantity of organic matter and iron. On evaporating a large quantity of the water to dryness, traces of bismuth, lead, and copper were found. These traces, I have every reason to believe, owe their presence in the water to the action of the water on the metallic drums in which the water was sent for analysis. The free ammonia is excessive ; this is probably due to the shale measures through which the water has to percolate ; but taking the albuminoid, ammonia, and other constituents into consideration, it will not condemn the water. The quantity furnished was small, and necessitated small quantities being used for the different determinations. At least 20 to 30 gallons of the water should have been received. The carbonic acid was not determined ; if this is required it will be necessary to furnish a sample in two or three soda-water bottles securely corked. On the whole this is a good mineral water, and will compare favourably with many of the English and Continental waters, being rich in bicarbonates of sodium and potassium, and containing lithia.

Ash obtained in Analysing sample of coal from diamond drill bore, Mittagong :—

Silica	67.10	} Insoluble in acids, 88.42.
Alumina	21.32	
Alumina	6.37	
Peroxide of iron	4.01	
Protoxide of manganese	trace.	} Soluble in acids, 11.58.
Lime	0.81	
Magnesia	trace.	
Phosphoric anhydride	0.22	
Sulphuric	trace.	
Alkalies (loss)	0.17	
		100.00	

DIAMONDS.

Though several mines have been opened in the Tingha division, and have been more or less regularly worked, I have been unable to obtain any record of the results. It is known that a large number of diamonds have been won in the Tingha division and elsewhere, but no details have been furnished. Attached to this report is an account of the examination of the diamond-bearing deposits in the Inverell and Cope's Creek (Tingha) divisions by the Geological Surveyor in charge, assisted by Mr. Geological Surveyor Anderson.

In

In conclusion, it affords me very great pleasure to submit the following summary of the mineral products up to the end of 1887, the value of which has reached nearly seventy-three millions sterling.

SUMMARY.

	Quantity.	Value.		Total Value.

Department of Mines,
Sydney, 10th April, 1887.

HARRIE WOOD,
Under Secretary for Mines.

WARDENS' AND MINING REGISTRARS' REPORTS.

BATHURST DISTRICT—TRUNKY, TUENA, ROCKLEY, MOUNT M'DONALD, BATHURST, OBERON, AND MITCHELL DIVISIONS.

(Mr. Warden Smith, P.M., Trunkey.)

I HAVE the honor to forward my report for the past year. From the detailed account, as given below, you will see that mining matters have progressed satisfactorily in the districts, excepting at Mitchell and Rockley. The falling off in the yield of gold at Mount M'Donald was caused by the bad state of the roads, carting to the battery being almost impossible for several months.

Tuena.—The district of Tuena has been brought prominently before the public during the year by the rich discoveries of silver ore at Mount Costigan, near Tuena. A Company was formed, smelters erected, and four shafts sunk on the property. Silver valued at about £4,875 (30,000 oz.), was obtained, also 103 tons of lead.

Another property was also put into a Company, and called the "Cordillera." Smelters are being erected. Shafts sunk upon the lode. A tunnel driven into the hill has cut the lode, which assays well.

Four miles further south brings me to the Old Peelwood Copper Mine, a freehold of 500 acres. This mine was abandoned some years ago, but the present proprietary look upon it as exceedingly valuable for silver, lead, and copper. About 8 miles west of this last property is a freehold of 640 acres, known as "Junction Point." This, together with some gold leases close by, have been put into a Company, and are being again worked for gold.

Nearer Tuena, a place near the creek, known as Maiden's Flat, is being worked for alluvial, but the ground is very wet. I don't think anything payable is to be got out of this venture.

About Scrubby Rush prospecting has been going on all the year, the battery since the holidays has been going day and night. I have not heard whether the prospects look well or not. Gold to the value of £3,750 has been got by fossickers, and sold locally. About 450 men are working on the field just now, but I believe 1,500 will be at work before the end of this quarter. 1,785 acres of land have been applied for mining purposes.

Trunkey.—During the year heavy rains fell here; this gave the sluicers a chance for short periods during the winter. Gold to the value of £7,600 (alluvial) was sold locally during the year, as against £2,462 worth sold in 1886. The Bathurst Company and Pine Ridge Company have kept on during the whole year, but I am afraid the results have not been satisfactory. 286 acres of land have been taken up for gold-mining, 50 acres being on Mount Gray. From this lease several loads of stone have been taken to Sydney *en route* to London, where the property, I believe, is owned.

Burrage.—This mine, after having been shut down for eighteen months, was again started in September last by Mr. Lloyd. During these four months 120 tons of refined copper have been sent to market. I hear the value of copper in Sydney is £60 a ton; the above would therefore be worth £7,500. If copper keeps at this figure, several other mines in the locality will be worked.

Oberon.—I think this portion of the district will shortly be looked upon by gold-miners with more favour than formerly. Only three quartz properties are being worked, yet the results of little crushings are encouraging. Thirty-three men are working on or in connection with these properties, and have won during 1887 gold to the value of £2,400.

Mount M'Donald.—Gold to the value of about £11,000 has been obtained during 1887 from quartz-mining. There has been scarcely any alluvial gold sold locally. One hundred and thirty-eight acres of land have been taken up for leasing. The mining population is about 133 men; but from the appearance of the village and the stores, one must conclude that trade is done to a large extent with the outside public, and not with the miners only.

Rockley.—This portion of the district is very dull, persons owning leases seem so anxious to get suspension of the labour condition upon their leases. I would like to hear of the sale of all mineral leases at Back Creek. I feel confident they, or several of them, are rich in minerals, probably silver. About £500 worth of alluvial gold has been sold locally, and 160 acres of land applied for as leases.

Lithgow.—In this district 89½ acres of land have been applied for as gold leases, and 3,430 for other minerals, including shale and coal.

Mitchell.—This field has been going to the bad all the year. Silver to the value of £9,042 was obtained (55,642 oz.) by the Sunny Corner Company, but no other mines are working. A great many men having been thrown out of work by the stopping of the mines, went prospecting (fossicking), and in the Lagoon Gully got some very nice gold; there were also two or three small crushings of quartz; the total yield of gold is valued at £4,830. Eighty-three acres of ground were applied for to lease, and the mining population has been reduced to about 500 men.

The total number of miners employed in the district is 1,452.

The total area of land taken up as leases is 6,002 acres.

The value of the gold won during 1887 was of a value of about £30,080. The value of silver from Tuena (30,000 oz.) and Mitchell (55,640 oz.) was about £13,917. The value of the 103 tons of lead obtained at Tuena was about £1,133. The value of the 120 tons of copper obtained at Burrage was £7,500.

Recapitulation.

Men employed	1,452
	£
Value of gold won	30,080
„ silver	13,917
„ lead	1,133
„ copper	7,500
	£52,630

BATHURST DISTRICT—ORANGE DIVISION.

(Mr. Warden Lane, M.P., Orange.)

For some months past there has been renewed activity in the direction of mining pursuits in my division of the Bathurst District.

Ophir.—The Bluff Amalgamated Company has been reformed during the past year, since which time some encouraging results have attended the operations. Other claims are still being worked, evidencing the fact that all confidence is not lost in the old "Parent Gold-field."

Forest Reefs.—Nothing very satisfactory has resulted from the great expenditure of labour in this locality during the past year, but the indications continue promising. I have been informed that scientific opinion is strongly in favour of these diggings.

Four-mile.—Some few persons continue plodding along here, thus evincing a confidence I hope may be realized.

Calinla.—Little or nothing worth reporting is being done in this neighbourhood. A few persons continue to persevere, hoping to meet with something as a reward eventually.

Lucknow.—This favoured mine continues to maintain the reputation it has borne for a series of years. Mr. Newman, the indefatigable manager, has lost none of his zeal and energy in developing its richness. A deal of stuff has been brought to "grass" during the year, some of which was very rich. I should not be surprised at something wonderful being discovered any day.

Carangara Byng.—At these old copper mines gold and silver have been found at a considerable depth. The rock resembles some of the stone at Lucknow, though it is more like quartz than carbonate of lime. The proprietor and tribute men are very sanguine as to the future of this mine.

Lewis Ponds and Bulga.—There are lodes of silver ore at these places which promise to equal some of our richest silver mines. Several mineral leases have been granted. I have heard it said by a competent judge, "these mines promise to become a second Broken Hill." The operations are in a very infantile state at present, so that I do not feel justified in saying more than the above. It is undesirable to excite an inordinate feeling in any direction. In 1872 and 1873 the gold mania raged to an ungovernable degree, which was followed by the opposite extreme to its fullest tension. A healthy excitement is productive of good; and *vice versa*.

Mr. Murphy, Mining Registrar, is collecting some details from the outlying places, and will presently, I hope, be in a position to supply interesting facts bearing upon the different mining operations I have above referred to in a general way.

Copper.—This pursuit is, I might say, a thing of the past in this district.

Mr. Murphy will send his report on receipt of the particulars he is daily expecting from the different places above indicated.

BATHURST DISTRICT—CARCOAR DIVISION.

(Mr. Warden Connolly, P.M., Carcoar.)

I HAVE the honor to forward my annual report of the Carcoar Division of the Bathurst Mining District.

The yield of gold for the past year (8,238 oz. gross) shows a decrease upon the returns of the previous year, caused chiefly by the temporary suspension of work at the Brown's Creek mine, at the Junction, now known as the "Revival," and at Galley Swamp—on the two latter, under permit from the Warden; for the erection of more efficient machinery for gold-saving purposes, at the Junction; and at Galley Swamp, for the addition of pumping machinery to Messrs. Lane & Co.'s plant. Nearly the whole of the claims on this field having been worked down to the water-level, it has become absolutely necessary to get rid of the water by means of the most modern appliances for pumping.

Two of the largest claims at Galley Swamp have recently been purchased by influential syndicates, and work is being pushed on vigorously by the new holders, with prospects of most satisfactory results; whilst the oldest and largest claim on the field, owned by Messrs. Lane & Co., when their pumping plant is completed, will no doubt maintain its position as the premier claim on this gold-field.

At the Revival mine, the old Junction, the erection of superior gold-saving machinery of the most approved kind is going on rapidly, and it is expected that within a month this valuable and extensive claim will be in full work.

The Gold Hill mine, Burnt Yards, on Church and School lands, in close proximity to the old Prince of Wales, has been crushing for some time, and will shortly finish; the yield is expected to be exceptionally good. A large number of leases have been sold in this locality, on the same estate, and more are constantly being applied for, speculators evidently having a high opinion of the auriferous deposits known to exist on these lands.

At Milburn Creek and Scrubby Rush, which adjoin, trial crushings from various shafts have yielded remarkably well; but the absence of machinery for crushing purposes must, until the want is supplied, retard the progress of the miners, the nearest battery, at Mount M'Donald, being 7 miles distant.

At Managan's Gully, a part of the King's Plains gold-field, sluicing is being carried on with success, with occasional finds of very rich patches of nuggetty gold of unusual size, slightly interspersed with quartz.

I have not heard anything in reference to copper-mining during the past year in this division; but the late rise in the price of that mineral, if permanent, will no doubt cause attention to be directed to the lodes known to exist in various places.

I think there can be very little doubt that with the large amount of capital and energy now being devoted to mining enterprise in this division, a greatly increased yield of gold may be confidently looked forward to during the current year.

BATHURST DISTRICT—MITCHELL DIVISION.

(Thos. Wright, Mining Registrar.)

During the past year mining in this portion of the Bathurst Mining District has been quiet. Although quiet, it has been firm; but owing to the large lots of land that are held by syndicates and others without employing any labour whatever, the inhabitants of the field have been forced to fossick about for a little gold wherever they could get a chance. If one-tenth of the lessees would comply with the labour conditions on their leases, there would be ample employment on the field for all hands. Sunny Corner mine is the mainstay

mainstay of the place, and that Company employ 220 men. The Pacific furnaces were kept running up to the end of the year, during which they smelted 16,472 tons of ore, which yielded 318,016 oz of silver, valued at £55,652 16s., with about 1,000 tons of ore at grass valued at £3,500. During the year this Company have erected five reverberatory furnaces for treating the Black Mineral, which is less expensive than the Pacific furnaces; and the results of treating through the reverberatory furnaces are very satisfactory indeed. The Silver King property has changed hands during the past year, and the present owners have removed the Pacific furnaces and erected a milling plant, which has turned out a complete failure; no work further than erecting the plant has been done during the year. At the Nevada mine there are a few men driving tunnels; no smelting or other work has been done during the year. The Great Mitchell Amalgamated Silver-mining Company have disposed of their smelting plant and other building to Sunny Corner Company, who have removed it on to their own property. There are four reefs in this division now at work, which are yielding from 3 dwt. up to 2½ oz. per ton.

The Old Homeward Bound reef has been taken up again for gold; this is situated at Dark Corner. Prospecting is being carried on, and the lessees are quite confident of finding something good before long.

During the year there were 7 applications for gold-mining leases and 1 application for a mineral lease; there were 319 miners' rights, 74 business licenses, and 2 mineral licenses issued. There were 1,127 oz. of alluvial gold bought by the local Banks and storekeepers, which was got on Bob's Creek, about 1 mile from Sunny Corner. The population has decreased to about 1,700 people.

BATHURST DISTRICT—BATHURST DIVISION.

(*W. G. B. Smith, Warden's Clerk.*)

I HAVE the honor to forward herewith my report for 1887. Mining in my district has, I have reason to believe, taken a decided turn for the better lately, and there is every prospect of more gold being won during this year than last. Turner and party, at Clear Creek, have just completed the erection of a battery. This battery originally cost above £2,000; it was bought for about £180 by above party; the cost of erection was about £850; it will therefore be seen that Messrs. Turner & Co. intend giving their leases a good trial. The first crushing and washing up took place on the 7th inst.: a small quantity was crushed, viz., 17 tons, which yielded nearly ½ an oz. to the ton; it is expected that the next crushing will show a considerable improvement. Thompson and party, at Cheshnis Creek, are down a good depth; some of the stone taken out looks well; they expect to be ready for crushing in four weeks, but will be caused considerable inconvenience and expense in having to cart the quartz about 5 miles to the nearest battery.

1887.

Gold leases applied for	16
Mineral leases	8
Mining tenements	1
Miners' rights issued	115
Mineral licenses	3
Business	3

BATHURST DISTRICT—ORANGE DIVISION.

(*Stephen Murphy, Mining Registrar.*)

I HAVE the honor to submit my report for the year 1887.

The mining collections for that period have been as follows.—

	£	s.	d.
225 miners' rights	88	0	0
49 mineral licenses	49	0	0
1 business license	1	0	0
Gold leases	90	10	0
Mineral leases	177	10	0
Deed fees	26	0	0
Stamp duty	11	15	0
Revenue proper	413	15	0
Survey fees, &c.	145	0	0
Total	588	15	0

In all, 13 gold-mining leases have been taken up during the year, representing an area of 105 acres, also 32 mineral leases, representing an area of 750 acres, making a total of 855 acres. The mineral leases are chiefly situate at the Bulga Mountains, about 6 miles from Orange, and at Lewis Ponds, some 16 miles distant. I have been informed that mining experts have expressed very high opinions as to the indications of heavy lodes of silver at both these localities. At the Bulga, one of the claims, known as the "Hidden Treasure," has been in the receipt of assistance from the Prospecting Vote, and fair progress is being made in the sinking of the shaft. Other parties are at work, and within a comparatively short time the locality will be well tested. Some have expressed the opinion that the Bulga is to rival the Broken Hill with respect to its silver wealth, and I trust that such may be the case.

Lewis Ponds.

The Lewis Ponds Gold and Silver Mining Company has gone to a depth of 117 feet, exposing a gossan lode of from 5 to 20 feet in width. During the year about 293 tons of ore have been raised, which, according to the numerous assays made, is estimated to yield 366 oz. gold and 13,185 oz. silver, in all, of the value of £3,882 5s. The ore is being sent to Germany for treatment, but the returns from the first shipment have not yet come to hand. Judging by the great number of highly satisfactory assays, made at different establishments, and taking into account the very favourable reports of experts, this mine should prove a most valuable property.

At Lucknow.

Mr. H. W. Newman reports that gold to the value of over £16,400 has been won during 1887, £15,326 of that sum representing the return of the New Reform G. M. Co., limited. Mr. Newman expresses regret that the Government does not take up the matter of treating refractory ores, which, he is persuaded, would very materially assist mining enterprise throughout the Colony. At present the bulk of the ore, after passing through the local machinery, is bagged and shipped to Germany for treatment. The other two Companies in Lucknow—the New Reform Pups and the Jackass Flat G. M. Co.—are described as only prospecting, though the former has gone 300 feet and the latter 150 feet deep, the indications in both cases being considered satisfactory.

Forest Reefs.

At this diggings the Great Extended Gold-mining Co., Limited was compelled to cease operations in September last, owing to the great influx of water. When this occurred the workings had reached a distance of 2,600 feet from the main shaft, and the washdirt was 25 feet lower than the shaft, and still descending. The water had been lifted from the drive to the shaft by means of hand pumps, but, at last, the inflow became too strong to be kept under by this process. This is much to be regretted, as the deeper ground showed better gold, besides which the mine employed some fifty persons on the spot, and expended large sums in the purchase of mine timber and fuel.

Great interest is being manifested in the two new shafts being put down with a view of finding the deep lead which is believed to exist at Forest Reefs. The first of these, the Band of Hope Co., is down some 230 feet, and after sinking 20 feet lower it is proposed to drive towards the deeper ground or gutter. Up to the present this Company has been able to cope with the water by means of a whim and horses.

The second new shaft is that of the Grand Junction Gold-mining Co. (No Liability), and has been sunk to a depth of some 85 feet. The sinking has been through trap rock from the surface, and has, in consequence, been both slow and expensive. The Minister for Mines, upon the recommendation of the Prospecting Board, has recently granted this Company £4 per foot for 160 feet, which will be a material assistance. As the shareholders expect to sink 260 feet (if they are in the deep ground, as they hoped), they have need of both capital and perseverance. I have recently learned that the inflow of water has so increased as to render it necessary to arrange for pumping machinery. The great increase in the volume of the water is looked upon as an indication of deep ground. It is hoped that these new efforts will prove the correctness of the prophecy attributed to a well-known geologist, viz., "That the Forest Reefs is to be the Bendigo of New South Wales."

Ophir.

At this old field a number of miners are still employed, and appear to make a decent living. The Bluff Gold-mining Co., employing ten men, are carrying on operations, and have recently been raising quartz which has yielded at the rate of 2 oz. 17 dwt. to the ton. Their deepest level is about 100 feet, and the veins average from 15 to 18 inches in width. I trust that during the present year all those who have stuck to this field in spite of all discouragements may be amply rewarded.

Carangara, Parish of Bynng.

I have been favoured with the following particulars by one of the gentlemen interested in the undertaking referred to:—

"The Carangara Estate, the property of Dr. Codrington, comprising 759 acres, was worked some years back as a copper-mine very successfully. In July, 1886, six speculators, resident in Orange, leased the estate for the purpose of prospecting for gold. At a depth of about 35 feet they met with a very rich brown vein similar to that obtained at Lucknow in the early days. From this vein as much as 12 ounces of gold was obtained to a small dish, and at the rate of 8 oz. per ton from quartz at the same level. They sank on this vein to 45 feet, getting very rich stone and specimens; then drove about 35 feet along the vein, obtaining good crushing stone. It was then decided to sink the main shaft to 95 feet, and at 90 feet a drive was started to cut the rich shoot of gold marked at the 45-foot level. After driving about 15 feet at this (the 90-ft.) level, very rich pyritous stone was struck, but the drive was continued a distance of 52 feet, the vein in the bottom of the whole length of the drive averaging about 9 inches in width, and being highly charged with galena and iron pyrites showing gold freely. A monkey shaft has lately been put down in this drive about 20 feet from the main shaft, it being apparent to the mining manager, Mr. R. Batten, that he was not deep enough to secure the best results. After sinking about 4 feet, very rich pyritous stone was struck, estimated, by good judges of its character, to yield from 2,000 oz. to 4,000 oz. to the ton. The last stone, taken from the very bottom some few days since, being the richest yet taken from the mine, contains about two-thirds gold. It is anticipated that something very rich will be obtained when this vein is sunk upon, which the owners intend to do at once. This should prove a very valuable mine in the near future."

The managers of the various local Banks have very courteously supplied me with the particulars of gold which has passed through their establishments during the year 1887, the total being 4,691 oz. 3 dwt. 6 gr., of the value of £16,494 19s. 11d., or an average of £3 11s. 6d. per oz. Of this quantity, some 417 oz. were not the product of this district, having been forwarded from Ironbarks and Cargo. No doubt a large quantity of gold is forwarded direct to Sydney, as the returns forwarded to me—which represent only the chief mines in the district—show a total of the value of £21,446 17s. 11d.

The gross value of the machinery in this mining division is estimated at £22,750.

BATHURST DISTRICT—BLAYNEY DIVISION.

(*William Roache, Mining Registrar.*)

I HAVE the honor to submit my annual report for the past year.

Mining in this portion of the division is looking better than it has for some years.

Brown's Creek Gold-mining Company having worked their ground to the water-level, a depth of 150 feet, are now about sinking their main shaft a further depth of 50 feet, which will cost about £2,500, the ground being very hard, the manager estimating that it will cost £9 per foot.

During the past year the Company have obtained 3,792 oz. of gold. The deeper they go the lode seems to be getting richer. This Company suffered a great loss through an action having been brought against

against them by a man named Cooper, who owns the adjoining property, for running sludge on his ground, and no doubt he will be a great source of annoyance to this Company if some arrangement is not come to between them. It would be a great loss to the district if this mine were to be closed, as it gives employment to about 100 men.

The Confidence Gold-mining Company, King's Plains, are now down with their main shaft 247 feet, the ground being poor, averaging 2 dwt. to the ton. During the year they have obtained 5,274 oz. 2 dwt. of gold. At present they are erecting a winding machinery, and they expect, when completed, to be able to have a night and day shift at work.

This mine, for the last four years, has paid no dividends; it has only managed to pay working expenses. Now that a Government dam has been erected, they will have no scarcity of water. The great drawback to this mine has been the great scarcity of water. Now that that difficulty has been overcome, no doubt the mine will pay handsomely.

A 10-acre lease adjoining the Confidence, and owned by Donnellan and party, who sank a shaft 120 feet, has cut the lode, which averages from 15 to 40 feet wide. This Company have sent a small crushing to Sydney, which went 12 dwt. to the ton. The dirt taken from the lode was taken promiscuously. At present this Company are not at work, having made application for suspension of work, with the view of erecting machinery on the lease.

At King's Plains, Flannagan's Gully, which has been formerly worked for alluvial, and has been very rich, a short time ago a miner named Batty obtained, at 5 ft. 6 in. from the surface, in the old workings, two nuggets—one weighing 60 oz., the other 48 oz.—which caused a rush, and several leases to be applied for. There is only a small portion of Government ground—40 acres—situated at this place.

Watson and party, who are receiving aid from the Government, are now sinking a prospecting shaft, which is down 70 feet. They have cut several gold-bearing leaders, and they expect, at a depth of 150 feet, to strike the dyke or lode which has fed the gully. Gold has been traced several places in the neighbourhood on private property, which formerly belonged to the gold-fields, but now locked up from mining; otherwise, it would give employment to a number of men for years to come.

During the year 8 gold-mining leases have been applied for, 103 miners' rights, 2 business and 2 mineral licenses.

There are two copper-mines close to Blayney—one known as the Erel copper-mine, which for some considerable time has been defunct on account of the low price of copper. The owner, Mr. Marsden, is about floating this into a Company, with a view of having it worked. This mine is situated about 300 yards from the Murrumburrah-Blayney railway line. No doubt, if the price of copper keeps up, this mine will again be at work in a very short time, which will be a great boon to the district. The other mine is situated about 1 mile from the town of Blayney, in Glasson Bros.' paddocks. The lode is small, but very rich.

BATHURST DISTRICT—ROCKLEY DIVISION.

(*Thomas C. Crommie, Mining Registrar.*)

I HAVE the honor to herewith forward you my annual report for 1887 for the Rockley Division, from which you will see that mining matters here have been very dull during the year.

During the above period I have sold 2 mineral licenses, 39 business licenses, and 56 miners' rights, making a total revenue of £54 10s., being a decrease on the previous year.

I have only received eight applications for mineral leases, making in all 165 acres, 125 of which are old cancelled portions at Wiseman's Creek, where there was great excitement for silver in the latter end of 1885, but which is now almost deserted. Owing of late to the rise in the price of copper, there is a reaction.

During the year there was an average of four men at work at the Back Creek silver-mines; they were, however, chiefly prospecting the ground during the year, and only raised about 10 tons of silver ore, which it is believed will average 75 oz. to the ton. The owners intend to float the property into a Company.

The Manganese-mining Company at Back Creek have suspended operations there since the month of June last, owing to the low price of the article in London.

Gold-mining is very dull here. A few parties on some of the creeks have made wages during the heavy rains by sluicing. One miner—Thomas Cotterill, of Back Creek—washed out over 70 oz. in this way, by employing hands and using hydraulic pressure.

BATHURST DISTRICT—OBERON DIVISION.

(*J. O. Hayes, Mining Registrar.*)

I HAVE the honor to forward my annual report of mining operations in the Oberon Division of the Bathurst Mining District for the year just closed. In doing so, I regret to say that mining in this division has not been entered into with the spirit that usually prevails on a field where working operations can be commenced with little expense. Some of the reefs in this division were operated upon many years ago by inexperienced miners, who only opened up the ground and took the stone from close to the surface. One of those claims has since been taken up by a small company of working miners, and is now worked successfully; but I fear, before very long, their efforts to make it pay will end fruitlessly, owing to the very wet nature of the country. The water is the great bone of contention on this line of reef. I have no doubt but this would prove a rich mine if floated into a Company, with a fair amount of capital, who would erect pumping machinery, to enable them to obtain the known rich deposits existing below the water-level. The ground in the vicinity of the line of reef can be worked in other respects at, comparatively speaking, little expense, not an ounce of explosives being required, the formation being so soft that the reefs can be worked out with a pick. Several leases have been taken up since I took office on 12th May last year, and as some energetic mining men are identified with them, I am hopeful that better times are in store for the mining population of this division. The following is the amount of business transacted during the year:—

	£	s.	d.
Gold-mining leases, 8.....	66	0	0
Silver-mining lease, 1	5	0	0
Miners' rights issued, 33	14	15	0
Business licenses issued, nil.....	0	0	0
Mineral license issued, 1 ..	1	0	0
	<hr/>		
	£86	15	0

BATHURST

BATHURST DISTRICT—MOUNT M'DONALD DIVISION.

(G. A. Gunning, Mining Registrar.)

I HAVE the honor to submit my report of state and progress of the mines in the Mount M'Donald Division for the year ending 31st December, 1887, and in doing so regret that the gross yield of gold for the year shows a considerable decrease as compared with the output for the previous year. The decrease may be ascribed, to a certain extent, to the cessation of operations on several claims in August last, when a number of miners were induced to try their luck at the new reefs in the parish of Tintern, about 6 miles distant from Mount M'Donald.

1,702 tons of quartz were crushed during the year for a return of 2,619 oz. 6 dwt. 1 gr. retorted gold, being an average of about 1 oz. 11 dwt. to the ton. 137 oz. 4 dwt. 9 gr. were obtained from recrushing of tailings; these, with 55 oz. of alluvial gold bought by the local storekeepers, make the gross yield for the twelve months from this field 2,811 oz. 10 dwt. 10 gr., or 579 oz. 0 dwt. 13 gr. less than the total yield of 1886.

I have, during the year, issued 133 miners' rights and 18 business licenses, amounting in value to £67 5s. I also received 34 applications for gold-mining leases, comprising an acreage of 136 acres.

In August last, M'Kellar and party, prospecting within the parish of Tintern, about 6 miles from Mount M'Donald, discovered what promised to be rich reefs. A couple of shafts have been sunk to a depth of 40 feet, and a crushing out, which gave a return of an ounce to the ton. This, if carefully worked, should prove a payable claim, as the country is very easily worked, being a kind of sandstone formation.

Aubrey and party, north of and adjoining M'Kellar and party, are down about 60 feet; reef improving as they go. This party will crush during the coming month, when a payable result is expected.

The small quantity of stone crushed from some of the claims may be accounted for thus: they were in the market for six months, and, if sold, purchasers were to have the surplus after paying the cost of raising and treating of all gold won between the time of placing under offer and the date of sale. Shareholders did not exert themselves to raise crushings.

The following are some of the principal yields for the year:—

	Tons.	oz. dwt. gr.
Balmoral.....	600	1,255 11 1
Woolstone	44	29 0 7
Price and party.....	23	51 13 11
Butcher and party	146	296 6 6
Franklin and party	40	85 19 3
Woman's Lease.....	51	136 2 5
Matheson's.....	62	143 2 5
Caledonian	224	177 12 4

I regret to say that several of the claimholders have not afforded me the information sought for relative to the reefs, &c., in their claims. I am indebted to Mr. C. H. Forwood for nearly the whole of the information; had it not been for that gentleman's kindness, I would not have been able to obtain the necessary information within the required time.

The last crushings for the year (in December) show a marked improvement, and it is anticipated that the new year will see a slight revival.

BATHURST DISTRICT—TRUNKY DIVISION.

(W. T. Lee, Mining Registrar.)

DURING 1887 the total rainfall, for which I am indebted to Mr. Surveyor Ryan, has been 42.67, or nearly 12 inches more than during 1886; the result is a considerable increase in quantity of gold won, principally alluvial, the value for 1887 being (say) £7,700, against £2,500 for 1886, showing an increase of £5,200, demonstrating rich deposits only requiring proper machinery, conserving of water, and sensible brains.

There are 173 miners on the field. During the year three applications under Amended Act of 1884 and Regulations of 1886, each for 50 acres, were made, one of which has been refused and repegged in ordinary leases. Fourteen gold leases, covering an area of 246 acres, and two mineral leases for 40 acres were applied for. Miners' rights issued, 139; business licenses, 30; mineral licenses, 2. Very little progress to report. The New Bathurst Company are not fulfilling the expectations that were raised.

Silver will probably be discovered in payable quantities near Kempfield and Diamond Valley, near Trunkey. Considerable activity prevails in mining. A party of Goulburn speculators have men employed on the Abererombie River searching for opals.

BATHURST DISTRICT—CARCOAR DIVISION.

(W. B. Warner, Mining Registrar.)

SINCE my annual report for 1886 was forwarded to you some important changes have taken place in mining matters in this district. The effects of the new revival in mining have been felt here in the shape of an increased capital being invested in the working of our local mines. This will soon be particularly noticeable in the locality known as the Junction, formerly worked for some years by Messrs. Stimson, Meyer, and others. This Company had a magnificent plant of 32 head of stamps, but the works were eventually closed, the stone not being rich enough to pay the heavy expenses attendant on crushing by steam. The plant was sold and dispersed, and the place was idle for some years till taken up by Binstead and party and worked by means of a turbine wheel and stamps, instead of by steam. It has been found, however, after a good trial, extending over several months, that so fine is the gold that, no matter how close the screen, or slow the movement of the water used, the greater portion of the gold escapes. This has been proved beyond a doubt by the numerous assays of the stone made not only in Sydney and Melbourne, but also in England. Some of the assays made by the best mining experts seem to prove that the reefs in this locality, if worked by the chlorine process as carried on at Mount Morgan, would prove equally rich. The quantity of easily available ore, which lies in immense horizontal reefs, is practically inexhaustible. Some hundreds of acres in the neighbourhood of the old workings have been taken up on both sides of the river.

The

The old Prince of Wales claim at the Burnt Yards has been purchased by a Company called the Gold Hill Mining Company, under the energetic management of Mr. William Tanner, of Orange. New machinery has been purchased, and the first crushing of the new Company is now in progress. A large portion of the Church and School Estate in the neighbourhood is highly auriferous; but the regulations relating to the Church and School Estate are anything but encouraging to mining enterprise.

At Gally Swamp some very good results have been obtained. One Company of four men having a small plant, raised during the year 107 tons of stone, which yielded 193 oz. of gold. Some of the other claims are equally good. One or two private claimholders have sold out to an Orange Company, who will soon, with their larger capital, be able to work the claims in a more economical manner, and on a very much larger scale. The veins of stone carrying the gold on this field are mostly very small, in hard country, but very rich. When the new Companies are properly at work I expect to hear of some good returns from Gally Swamp.

There is nothing new in alluvial mining. No new finds are reported, and the only places where any considerable work is going on are Flyer's Creek and The Forest.

No copper is now being worked in my division.

About 8,240 oz. of gold have been sent down by escort this year.

During the year I sold 89 miners' rights and 1 business license.

BATHURST DISTRICT—BURRAGA DIVISION.

(*William Ritchie, Mining Registrar.*)

PREVIOUS to the 1st September last mining in this division was at a standstill, owing to the low price of copper. Since that date work has been resumed in the Burraga mine, and at present there are fifty-three men employed, who have raised 1,154 tons of ore, yielding 120 tons of smelted copper; value, £7,200. This mine is worked to a depth of 240 feet, and shows a splendid face of ore; other lodes are also being opened on Mr. Lloyd's land. During the year I have issued 33 miners' rights, 15 business licenses, and 6 mineral licenses, yielding a revenue of £44.

BATHURST DISTRICT—COWRA DIVISION.

(*B. P. P. Kemp, Mining Registrar.*)

I BEG to state that although a small amount of prospecting is still going on, no favourable results have yet been met with.

BATHURST DISTRICT—TUENA DIVISION.

(*T. Fred Bell, Mining Registrar.*)

I HAVE the honor to submit, for the information of the Honorable the Minister for Mines, my report for the year 1886 upon the mining industry of the Tuena Division of the Bathurst Mining District. Gold-mining here during the year has been all but abandoned as a means of livelihood, owing to the silver-mines having broken out and given employment to those who before were dependent on fossicking and sluicing only about 730 oz. of gold having been got in this division for the past year.

During the year 1,785 acres was applied for under mineral lease, and 230 acres for gold, but there has been no work done on the latter yet; some of the leases have not been executed, and the others not yet received. There is one water-jacket at work at the Mount Costigan Silver and Lead Mining Company's works, and also one of Icke's patent smelters; but the latter has not been worked successfully so far. At the Cordilleras there are two water-jacket furnaces going up and a refiner; these will all be at work in a few weeks' time.

During the year I issued 152 miners' rights, 42 business licenses, and 19 mineral licenses.

The mining industry in this district has during the past twelve months been almost entirely confined to silver-mining, hence so little gold got. The silver-mining Companies, viz., the Mount Costigan Lead and Silver Mining Company and the Cordilleras Silver-mining Company, have kept all those who were dependent on the gold-mining industry steadily at work throughout the year.

BATHURST DISTRICT—COWRA NORTH DIVISION.

(*Wm. Cook, Mining Registrar.*)

DURING the early part of the year a small alluvial rush took place to Sullivan's Gully. The sinking was about 50 feet. The result was not payable, although some nice nuggets were found. Amongst the largest were an 18 oz. and a 5 oz. piece (pieces up to $\frac{1}{4}$ oz. have been found on the surface). While working the alluvial, quartz boulders containing rich gold were constantly found, which shows the existence of a rich reef in the neighbourhood. A Company of Sydney capitalists have now a party of men at work driving across the gully, with the hope of cutting the reef. Altogether, as near as can be estimated, about 100 oz. of gold have been taken from this part.

In quartz there is very little to report, no crushings having taken place. The Gospel Oak Company are erecting a 10-stamper battery on their property; a contract has also been taken for raising a large quantity of stone in readiness for the battery to start on. A large number of leases have been taken up on Stockyard Gully and Sullivan's Gully, all of which the shareholders have strong hopes of becoming payable with machinery close at hand.

There is little doubt that the coming year will show a very great improvement in this division, all of the miners who have visited the locality having formed a very high opinion of it.

TAMBAROORA AND TURON DISTRICT—HILL END DIVISION.

(*Mr. Warden Steel, P.M., Hill End.*)

I HAVE the honor to submit, for the information of the Honorable the Minister for Mines, my report for the past year of the Turon, Tambaroora, and Mudgee Mining Districts.

Hill End Division.—Alluvial working has been very small, although water has been most abundant during the year. The Red Hill Gold-mining Company, at Tambaroora, has been continuously at work for

for some time. On the M'Mahon lease a new shaft has been sunk 322 feet, 9 x 3, leaving three partitions. Seven veins have been cut, four showing gold. Machinery to the value of £1,400 has been erected on the lease, while the mine is making 2,500 gallons of water per hour. £1,163 has been paid for wages, and £509 for other expenses during the year. 576 tons of quartz have been crushed for a yield of 188 oz. 10 dwt. of retorted gold.

The Cornelian Gold-mining Company, Hawkins Hill, has been at work during the year, but it has for the most part been unremunerative, principally from prospecting a large mass of quartz and slaty formation of lode, which runs from 30 to 65 feet wide. The lowest gave 3 and the best about 10 dwt. per ton. Much difficulty has been experienced by an immense body of water accumulating in the underground workings. During the last month this Company have been drawing water at the rate of 2,000 gallons an hour. 241 oz. 3 dwt. of retorted gold have been obtained from 297 tons of quartz. About thirty-two men have been at work for some months—the average about twenty-seven men—until July, exclusive of wood-cutters and carters. Altogether, the last year's yield and the future prospects of this mine cannot be considered cheering. There has been a slight increase during the year in the sale of miners' rights, business licenses, and gold-lease applications.

No correct estimate of the amount of gold won in this division can be arrived at since the escort was abolished, which now finds its way *via* Windeyer and Sofala, thence by escort.

Hargraves Division.—Very little has been done here or at Windeyer. Many of the old leases have been cancelled during the year, some of which have recently been taken up; but the leases not yet being issued, no work has been commenced. Millet and party, the lessees of one of the leases referred to, have a large quantity of machinery on the ground. The plant will, it is said, cost about £1,500 when erected; and they intend to effectively prospect their leases. Mr. John Coghlan has been working on the old Eureka line of reef (formerly Bond's); and he, it is said, is bringing machinery on the ground. The shaft sunk is about 70 feet, but they have not cut the reef.

Sofala Division.—This, the oldest mining district under my charge, seems to hold its own, and is by far the richest division. The gold forwarded by escort amounts to 4,877 oz. (inclusive of some forwarded from Hill End).

Surface Hill Leases.—This property has now been formed into a Company, and everything is in order to commence operations, under the managership of Mr. A. Bullock, formerly of Hill End. One of the largest shareholders is a Mr. Morgan, of Mount Morgan notoriety, who is very sanguine of success.

Razorback Gold and Antimony Mine.—Work has been suspended in this mine, owing to one of the proprietors having proceeded to England for the purpose of procuring special machinery for working the ores, which is expected to arrive very shortly. The property belongs to Messrs. A. Oppenheimer, R. J. Rotton, and others. I may add that several parties here and at Hill End have been granted a portion of the Prospecting Vote, and have commenced work on their claims.

TAMBAROORA AND TURON DISTRICT—SOFALA DIVISION.

(M. Fagan, Mining Registrar.)

I HAVE the honor to forward my report relative to the mining interest in this division for the year 1887.

Mining matters are in much the same position as they were this time last year.

Several parties have been working in the Turon River and Crudine Creek with varying success. Dawson and mate obtained 9 oz. of gold in two days from their claim in the Crudine; Hyland & Co. obtained 60 oz. in four weeks from their sluicing claim at Maitland Point; Oliver Johnson obtained 19 oz. of gold from one dish of washdirt from his claim at Red Bank.

There are several parties of Chinese working in the old and abandoned alluvial, from whom I have been unable to obtain any information as to the amount of gold won by them, but it is believed that they have been very successful.

Spring Creek Reef, Sofala.—This reef has been abandoned; engine and plant sold for £300.

Sir Garnet Wolseley Reef.—Originally very rich to a depth of 40 or 50 ft.; 31 tons of quartz raised from a depth of 40 ft. yielded 63 oz. 15 dwt. of gold. Work on this reef has been suspended during the last three months.

Razorback, Upper Turon, under the name of the Turon Gold-mining Company (Mr. R. Spencer, Manager).—A 10-h.p. engine, with ten head of stampers, has been removed from the Homeward Bound reef, Box Ridge, to this mine. Twelve men are now employed in connection with the mine. Two tunnels have been extended 40 ft. each, from which 200 tons of quartz have been obtained, showing gold freely, and are now ready for crushing. Value of plant, £800.

Big Oakey Gold-mining Company.—This Company commenced operations in February last upon Old Surface Hill, Wattle Flat, sinking main shaft 8 ft. by 3 ft. 6 in. to a depth of 400 ft. for the purpose of intersecting all the well-known rich gold-bearing veins which have been worked in former years. The Company have a capital of £2,000, and intend to give this once very rich hill a thorough prospecting. There are six men at present employed in this mine, which is under the management of Mr. Bullock, late of Hill End.

Box Ridge Homeward Bound Company.—This Company's plant has been sold and removed to Razorback, and quartz-reefing is a thing of the past in this locality.

Solitary Creek Gold-mining Company—(on Tribute).—Six men have been employed day and night in this mine during the year, and have raised 925 tons of quartz, yielding 518 oz. 14 dwt. of gold.

Magenta (Johnson & Co., ordinary quartz claim).—74 tons of quartz raised from this claim yielded 75 oz. of gold.

Back Creek.—No mining operations have been carried on in this locality during the year. Leases held by Beyers and others have been cancelled.

The following shows the owners and results of principal parcels of quartz treated at Mr. Davidson's mill, Wattle Flat, viz.:—

	Tons.	oz.	dwt.	gr.	Reef.
Spencer, Manager	31	63	15	0	Sir G. Wolseley.
Bulson & Co.	49	48	10	0	Big Oakey.
Dowling & Co.	54	46	17	0	New Chum.
Grice & Co.	28	26	6	0	Bullock Flat.
Keeley Bros.	15	21	10	0	Whelan's Hill.
Davidson	21	14	13	0	Various.

Aid from the Prospecting Vote has been granted to the following prospecting parties in this division, viz. :—

William Johnson and Owen Lewis, Magenta Reef, Wattle Flat.
 Webb and party, Solitary Reef, Wattle Flat.
 R. Williams, Carney's Reef, Sofala.
 William M'Lean, Sandy Flat.
 Walter Allsop and party, Monkey Hill.

None of these parties have commenced active operations, nor do they intend to do so until after the holidays.

Razorback Gold and Antimony Company.—This Company have stopped work until the arrival of the hydrogen and amalgam process machinery which they have ordered from England to be set up at the mine.

At the Crudino, Palmer's Oakey, Wattle Flat, and Upper Turon there have been several parties of fossickers at work in the various old workings, from whom I have been unable to obtain any information as to the amount of gold won, but it is believed that the greater number of them have made good wages.

The following amount of gold has been transmitted per gold escort during the year, viz. :—
 4,877 oz. 7 dwt. 5 gr. ; value, £18,412 Os. 8d.

Miners' rights issued	396
Business licenses	16

Twelve applications for gold-mining leases have been received by me during the year.
 Total value of mining plant in my division, £2,260.

TAMBAROORA AND TURON DISTRICT—IRONBARKS DIVISION.

(*J. Shillington, Mining Registrar.*)

I HAVE the honor to forward herewith my annual report upon the mining industry of the Ironbarks Division of the Tambaroora and Turon Mining District. The most important work of the year has been in prospecting some of the reefs which were worked years ago and abandoned, and in the further testing of some reefs which have been held unworked for years for speculative purposes. Several parties have been rewarded by finding very rich stone, with the result that the attention of capitalists and miners has been directed to this long neglected field of auriferous quartz reefs. The popular opinion which obtained, until very recently, was that the reefs in the Ironbarks District were valuable only on the surface, and miles of reefs have in former years been surfaced; but when water was reached necessitating the employment of machinery the reefs were abandoned, and in no instance was a reef tested to a depth of 200 feet, and only one or two were tested to a depth of 150 feet.

The old Specimen Hill claim was taken up some months ago as an extended quartz claim (four men's ground), and one of the old shafts was cleared out and a lower level reached, and 10 tons of stone taken from an 18-inch vein at a depth of 200 feet yielded 34½ oz. This is the greatest depth reached on the whole field. A further trial of 2½ tons from the same level yielded 30 oz. of retorted gold. This result has had the effect of causing several parties to commence work on reefs with a view to test them at a lower level than hitherto reached, and should the results prove satisfactory there will be a great future for this portion of the district, as for miles the country is intersected by a network of reefs, all of which are known to be auriferous.

The Prince William reef has lain unworked for twelve years, during which time it has been held by various Companies; and in June last, being open for leasing, an application was made for 20 acres of the reef, and the work of clearing out and further sinking commenced, and at a distance of 6 feet from the old workings very rich stone was discovered. The value of this discovery was sufficient to cause the shareholders to commence sinking a main shaft to enable them to work the mine in a more systematic manner, and in sinking the main shaft very rich veins have been cut. The Perseverance claim was prospected to a depth of 140 feet, and three trial crushings of quartz taken from a vein 9 inches in width—15 tons stone yielded 30 oz., 4 tons yielded 12 oz., and 20 tons yielded 20 oz. At a still lower level the stone shows gold, apparently much richer in gold than any of the stone already treated.

The Princess Alexandra Extended Quartz Dam has been opened out till 150,000 tons of gold-bearing stone is now in sight. A Company has been formed to work this mine, and a battery of twenty stampers and a 25 horse-power engine has been purchased for crushing the quartz of this mine. A large dam is being constructed to conserve water necessary for carrying on the work. This will be a great acquisition to the field, as at present there is only one quartz-crushing plant of ten stampers in the neighbourhood. A Company has been formed to work the Post Office reef, and several Companies are now in course of formation to work reefs on which no work has been done for several years. Only two mines have been worked continuously during the year. The Gordon mine at Yeoval employed nine men during the year; crushed 1,860 tons of stone for 452 oz. gold, besides a quantity of copper containing a percentage of gold and silver. The Royal Jubilee Sluicing Company employed eight men. This Company has pumping machinery on the banks of the Macquarie River, at the Muckerawa Junction, capable of raising 75,000 gallons of water per hour. The returns were not satisfactory, and the Company propose erecting heavier and more complete machinery, so as to make the working remunerative, as it is believed that heavy deposits of gold are to be found on this Company's ground.

The rich gold-bearing quartz discovered during the year had the effect of causing considerable attention to be directed to the field generally, and sixty-one leases, for a total of 508 acres, have been applied for during the year, also five extended quartz claims have been registered. Two hundred and eleven miners' rights have been issued during the year, also twenty-two business licenses. No mineral licenses were issued, as this is essentially a gold-bearing district. Preparations are being made to commence work on several reefs immediately after the New Year, and a substantial increase in mining may be expected during the year 1888.

TAMBAROORA AND TURON DISTRICT—HILL END DIVISION.

(Thos. Purcell, Mining Registrar.)

I BEG to report for your information on mining operations here during the past year, and am sorry to say that the place is steadily going down. The Cornelian Co., Hawkins Hill, has been idle for some months, but has recently started work again with eighteen men. They have only crushed during the year 297 tons, yielding 241 oz. of gold. There is very little doing on Hawkins Hill except by the Cornelian Co. Clemens & Riley are working a claim lower down, and are said to be doing very well. Riley and party, on the Venus reef, are still working, but the claim is not turning out so well as was expected. Cook & Baxter, adjoining, have had payable crushings from this line. Eldridge and party, at Golden Gully, are still working, but the last crushing went very poor. I may say that is all the work that is being done at Hill End.

Hughes, Grotofaut, and party struck a new reef at Bear Gully, about $\frac{1}{4}$ of a mile north of the town, a few days ago. I saw some very rich specimens taken from it. It is from 6 to 10 inches wide, and is in very easy ground to work. Should it only continue, I should say it ought to go from 10 to 20 oz. to the ton.

At Tambaroora, the Red Hill is still being worked, although it stopped for some time after the unfortunate accident in which Cox was killed, for the purpose of getting more powerful machinery to keep the water down. They have been sinking a shaft 320 feet, and have now commenced to drive for the vein. A great deal of money and labour have been expended on this property, and it is to be hoped Mr. Newton, the proprietor, will be rewarded.

The only other reef claim at work at Tambaroora is the one known as Brown the Greek's. It has not done so well lately, but I am informed it is still payable.

The alluvial is getting poorer every year. It is, I may say, only worked by old fossickers and Chinese, and as no new ground is opened up, the old is worked over and over again. Houghton and party have lately taken up a 20-acre lease at the Cement Hills, about 12 miles west of here, on the Macquarie River. It is known that this hill contains gold in the soil, ranging from 1 dw. to 4; and this party are making a tramway to run the stuff to the river and sluice it there, and anticipate very good returns.

I have not been able to get the returns of the gold sent from here during the year. Since the Escort was abolished there is no record of it. The business people, when going to Sydney, take some; more is sent by post; and some is taken to Sofala, the nearest Bank, and sold or consigned; so it would be mere conjecture.

I have issued 302 miners' rights, there being 296 for previous year; twelve business licenses, same as previous year. There have been fifteen applications for gold-mining leases during the year, there being only eleven in 1886.

I may add, in conclusion, that the support extended by the Prospecting Board at its recent visit here has given great satisfaction, and it is generally thought that some of the parties will be successful.

MUDGEE DISTRICT—MUDGEE AND GULGONG DIVISION.

(Mr. Warden Meares, P.M., Mudgee.)

DURING the few months which have passed since I was appointed Warden of this district, in June, 1887, my duties have taken me to only the principal digging places, such as Gulgong, Canadian and Limestone Creek, and a few others of less importance, and from personal knowledge can I speak of these only, although I know something by repute of the other localities where miners are working.

Upon this I am of opinion that if (as I believe) there have been more men engaged in digging in 1887 than in the year before, it was the result of the depression which was felt in other branches of industry, and which shut out the occupation of the labourer from the ordinary channels of work available in better times. He was therefore obliged to turn to the gold-fields to seek a livelihood he could not find in any other direction.

Except for the activity brought about in this way, there would have been but little alluvial mining in this district, for the wages made generally were not sufficiently good to attract men from other work, if it could be got. I have rarely heard of any who made more than moderate wages at digging. There is no life in the industry. There seems to be about the same level everywhere, and more have been below than above it, although of course some had done well and above the average.

At Limestone Creek, about 16 miles south of Mudgee, there was a little stir for a few weeks, during part of which time there were considerably over a hundred men at work there; but the ground is limited. The natural features of the country—a narrow valley with steep sides—cause the workings to be quickly flooded, and the constant rain more than once injured the work done and drove the men from their claims, which, under the most favourable circumstances, were not very productive. The result is that now very few men are employed there.

I cannot mention any other locality where matters have been much better than at Limestone; nor are the workings in the various leases more productive than in the others. I do not know anywhere they are getting gold in sufficient quantity to attract attention, although money has been and is being spent by several lessees in the hope of a good return.

During the year a few nuggets have been found of greater or less value—notably one at Maitland Bar of over 300 oz. in weight, and said to be one of the purest ever unearthed.

I need not specify the amount of gold received by the Banks during the year, nor the number of miners' rights issued, as these particulars will be given by the Registrars at Mudgee and Gulgong.

In concluding this report I may remark that the diggers do not appear to pay much regard to the requirements of the law by providing themselves with miners' rights. One of the police found lately at Limestone Creek an average of one man in five out of over 100 who wore without these rights, and a similar state of things exists generally through the district. The miners as a body are very tenacious of what they consider their legal privileges, and stoutly resist any real or supposed interference with these; but they are not quick and anxious in proportion to pay the fee which entitles them to claim the privilege. I saw an instance here lately in which a man had got up a meeting of miners and prepared a petition, which they signed, against the fencing in of some land on this gold-field by the persons who held it under annual

annual leases. This man championed the miners before the Land Board, to whom the petition had been referred for report, and he objected to an overseer of one of the lessees giving evidence because he had not a miner's right. It subsequently transpired that this quibbling gentleman had not a miner's right himself. But there are not many so barefaced as this. The neglect of which I am writing is sometimes the result of want of thought, and sometimes of the want of official attention; but in a time of depression and deficient revenue such as now exists, I think miners might reasonably be required to pay the very moderate fee of 10s. a year for the benefits they receive. And if in other places they are as neglectful as here, the revenue would be deprived thereby to the extent of some hundreds a year.

MUDGEE MINING DISTRICT—DUBBO DIVISION.

(*Mr. Warden W. T. Caswell, P.M., Dubbo.*)

I HAVE the honor to make the seventh annual mining report for this subdivision of the Mudgee District.

The mining interest at Tomingley and Myall is still slightly progressive. The gold won from the reefs at these places in 1884 was about the value of £7,000; in 1885, £8,000; in 1886, to over £9,000; and in 1887 it has reached nearly £10,000 in value. 2,560 oz. were won; but three-fourths of this quantity was taken from No. 1 North—Mooney and party's ground—at Myall.

I have not been supplied with information from either the Dubbo Coal-mining Company or the Great Western Coal-mining Company at Ballemore; but as the latter in boring struck a mineral spring, which I know attracted the attention of the Department, I am sure you have full information of the progress made. No coal has yet been brought forward for marketable purposes.

The works of the Copper-mining Company at Girilambone are, as I reported last year, still suspended.

The population at Tomingley and Myall has neither increased nor diminished—it remains at about 250. The Public School attendance has slightly increased—it is now 35. The business establishments continue the same, all doing fairly well. A mail-coach now runs between Dubbo and Tomingley twice a week.

The water supply during the year has been ample for mining, and indeed for all purposes. A large tank—to hold 17,000 gallons—has been recently constructed for travelling stock; it is not yet full.

There are two crushing machines at Tomingley; but the quantity of quartz raised has not been nearly sufficient to keep one employed. It is said one of these crushers is to be moved to what is called the "Ten-mile," a place where there is some promising stuff, though not rich enough to be carried a distance.

The machine at Myall has done a good deal of work, principally for its owners, who are proprietors also of No. 1 North at Myall.

There have been issued at Dubbo during the year past 63 miners' rights, 7 mineral licenses, 1 business license; and at Tomingley the Registrar informs me that he issued 52 miners' rights and 7 business licenses.

As the reefs at Tomingley have not been regularly worked during 1887, I will not be able to give either the total quantity of quartz raised or the yield of gold. I will merely include in my report the scraps of information obtained from such of the miners as remained.

Tomingley Reefs.

Prospecting Claim—Tattersall and Hayes, working on reef 18 in. wide at 50-ft. level, crushed 60 tons for 62 oz. gold. The main shaft is down 150 ft.

No. 1 North.—Reakes and party crushed 114 tons of quartz for 46 oz. 12 dwt. 19 gr. of gold. This claim was abandoned for about four months, but was taken up by Croft and Reakes about four months ago. They have sunk a perpendicular shaft 160 ft., and intend sinking 40 ft. lower.

No. 2 North.—M'Donald and party crushed 75 tons for 29 oz. 9 dwt. 4 gr. of gold. They abandoned in May last, and the claim was taken up by Crowhurst and party, who crushed 78 tons for 41 oz. gold, the reef being 4 ft. wide at 140 ft. depth.

No. 3 North.—Richmond and party have crushed 320 tons for 130 oz. 17 dwt. 10 gr., and will commence stoping on reef. Reef, 8 ft. wide at 90-ft. level.

Myall.

Spare ground.—600 tons of quartz crushed for 595 oz. of gold. Width of reef, 4 ft.; depth, about 120 ft.

No. 1 North Myall.—Crushed 1,400 loads for 1,947 oz. of gold. 4-ft. reef, 130 ft. deep.

Ten-mile Ridge.

Crowhurst and party crushed a small parcel of 18 tons from the Ten-mile, which yielded over an ounce of gold to the ton.

There are no alluvial workings in Dubbo Division.

Senior-constable Bell is Mining Registrar at Tomingley.

In conclusion, I may repeat what I was able to state in the last report—that the promise for the future in mining matters is very fair.

P.S.—I am afraid the return of gold as given by the miners is not reliable. The total is over 2,868 oz., while the Bank returns of 2,560 oz. are not likely to be much below the quantity raised. I think very little gold is taken to Sydney past the Dubbo Banks. In view of the temptation to advertise the claim, I must assume the lesser quantity—2,560 oz.—is most probably correct.

MUDGEE DISTRICT—WELLINGTON DIVISION.

(*Mr. Warden Marsh, P.M., Wellington.*)

My charge of these portions of the districts recommenced in June last, and I notice with much regret that, as regards Wellington portion, mining shows very little improvement; and the only reason I can assign for this is that the alluvial workings have become, apparently, almost exhausted, and no fresh ground being discovered. The results in detail are shown in the accompanying returns.

One of the two quartz-crushing machines at Mitchell's Creek, near Wellington, has been, I understand, sold, and is about to be removed to Ironbarks. Turning to this latter division, I am glad to report

a very decided improvement, some takings and trial crushings showing such encouraging results that an impetus has been given to mining generally; the practical test being the projected formation of Companies, and consequent outlay of capital for *bond fide* working, the number of mining leases taken out, and the addition of the quartz battery about to be removed from near Wellington.

The Ironbarks and Stony Creek Gold-fields, I may venture to say, have not received that amount of attention from capitalists which they really deserve, as without doubt a very large area of country is in the highest degree auriferous, and will eventually prove to be most remunerative if systematically worked with necessary and proper machinery.

The returns herewith show such a marked improvement on the year preceding, and the further development of the old mines by deeper sinking, showing richer deposits of gold at greater depths, go far to prove that the investment of outside capital will result in the opening up of a mining district which, I feel convinced, will bear favourable comparison with any in the Colony. It is with much pleasure I record that the individual efforts of a large number of steady hard-working miners, who have been perseveringly working in these parts, are deserving of all praise, and that they are entitled to every consideration and encouragement. But the investment of capital by means of Companies, &c., with the necessary accompaniment of labour, would soon prove the richness of these gold-fields.

From the attention now being given to the place, I may fairly infer that the present efforts are not what I may call of a spasmodic character, but are really the commencement of a steady and permanent development of mining interests, the success of which, if I am not mistaken, a very near future will prove to be correct.

It will be observed that I have reported generally on the position, the details being fully set out in the accompanying returns.

MUDGEES DISTRICT—HARGRAVES DIVISION.

(*T. O'Brien, Mining Registrar.*)

I HAVE the honor to submit my report for 1887, and to state that alluvial mining in the Hargraves Division of the Mudgee Mining District has been in a very depressed condition throughout the whole year, owing to no new ground being discovered.

The old fossickers, many of them working the ground for the second or third time, manage to obtain, on an average, 15s. or 16s. weekly. Eight or ten of these fossickers were so fortunate as to unearth four nuggets, weighing respectively 357 oz., 200 oz., 47 oz., and 32 oz. These nuggets were found near the surface, in ground which had been worked many years ago.

Quartz-mining.

Several leases were applied for, but only three were granted. Mr. J. Coghlan brought a diamond drill to Hargraves in the month of January, and succeeded in boring, on the old Eurcka line of reef, three holes, to the depths of 300, 150, and 90 feet respectively. Gold was struck at the depth of 80 feet in the 150-foot bore, and the sediment containing the gold was assayed in Sydney, showing a result of 4 oz. to the ton. I have reason to believe that Mr. Coghlan is about to place machinery on his ground. Messrs. Millet and Milton are erecting machinery, valued at £2,500, on the old Company's line of reef. I am of opinion that quartz-mining will become an extensive industry in this locality should the efforts of Messrs. Millet, Milton, and Coghlan prove successful. Two hundred and fifty miners' rights and twenty-seven business licenses were issued by me during the last twelve months.

MUDGEES DISTRICT—MUDGEES DIVISION.

(*R. H. Acheson, Mining Registrar.*)

I HAVE the honor to submit for the information of the Honorable the Minister for Mines my annual report for the year 1887 on the mining industry of the Mining Division of the Mudgee Mining District.

For the year 1887 I am gladly able to say that gold-mining in the division has vastly improved on its condition in 1886, and that year showed an improvement on the preceding year. The sale of miners' rights in 1887 shows an increase of 155 on that of 1886—183 were sold in 1886, and 338 in 1887. There were 12 gold leases applied for in 1887, against 6 in 1886. These statistics are very encouraging, as also are the purchases by the Banks of gold locally won. During 1887 were purchased 3,898 oz., against 3,501 oz. in 1886. I am reliably informed that a large quantity has been forwarded to Sydney for this year through the Railway Department and by private escort, what quantity I have been unable to ascertain.

In the following I will refer to the several localities in the division which have been worked. Maitland Bar and Merrindale—the lower end of the celebrated Meroo Creek of early gold-fields fame—yet maintain their old mining population, chiefly Chinese and continental Europeans. In that locality much gold is yet got, but not in many instances beyond the making of fair wages. It was at Maitland Bar that a mining party discovered the Jubilee Nugget of 347 oz. in May last.

During 1887 was discovered and developed the property known as the "Lucky Find," in the vicinity of Apple-tree Flat. The property is now worked by the Lucky Find Gold-mining Company. A lump of ironstone from this property of about 9 cubic inches was raised, which showed some 22 oz. of gold. This specimen, for that class of gold-bearing stone, is a magnificent one, and its discovery has been instrumental in directing active attention to prospecting in ironstone country. The Company have a large area under lease, and have just forwarded some 6 tons of stone for treatment to Sydney, but with what result I have not yet heard.

In the alluvial flats adjoining the "Lucky Find," Norris and party have stripped ground to a depth of 6 feet, and realized from 3 to 4 dwt. to the load for six months' work. Outside on Crown Lands recently a miner unearthed a 16-oz. specimen.

The Rhobarbah Gold-mining Company at Cudgegong are still working on tribute, with the result, I understand, of 1½ oz. to the ton without the pyrites, which are said to be valuable. In a few months English capital is to be introduced into this mine for improved machinery and the extension of the existing funnels.

During

During 1887 was discovered the Limestone Creek Diggings. Success on them has been variable, principally owing to the excess of water. Several nice nuggets have been found there, one weighing 30 oz. On an adjoining hill, Roberts and party have taken some leases on reefs, and in a crushing from one at the Mint 7 oz. to the ton were realized without treatment of the pyrites.

The Cullenbone Diggings, which were of no small significance in 1886, maintain, with moderate returns, a small number of local miners.

At Leaning Oak Creek, near Merrendee, Wilton and party are working claims on old reefs. The reefs look well, but the water in the workings retards operations considerably.

MUDGEE MINING DISTRICT—WELLINGTON DIVISION.

(A. G. Chiplin, Mining Registrar.)

I HAVE the honor to forward herewith my annual report of the Wellington Division of the Mudgee Mining District. Having only entered on my duties from 1st June last, I am not as well versed in mining matters as I would desire.

Very little in the way of mining has been done in this division during the year; the only quartz-crushing plants in the division (two in number), and valued at £5,000 and £3,000 respectively, have been idle all the year, and for several years previously. The Belara Copper-mine, situated at Goelma, 30 miles from Wellington, raised during the year 100 tons of ore, valued at £300, but no smelting was done. This mine, when in work, employs forty men, and has a plant valued at £5,000.

From information obtained, I find that the quantity of gold received in Wellington during the year was 652 oz. 15 dwt. 13 gr., as against 432 oz. 13 dwt. 16 gr. for 1886; but it is doubtful whether the whole of this was won in this division.

During the year two gold lease applications and one mineral lease application were received.

Miners' rights sold during the year	31
Business licenses sold	"	1
Mineral "	"	6

MUDGEE DISTRICT—TOMINGLEY DIVISION.

(R. Bell, Mining Registrar.)

I HAVE the honor to report that during the past year Tomingley has been almost at a standstill, with the exception of the Myall Reefs; want of capital and small percentage of gold obtainable no doubt being the cause. The Myall Reef has been very successful, 2,000 tons of quartz, yielding 2,542 ounces of gold, having been crushed at the Company's battery during the past year; and there is every prospect of the mine continuing to be very rich, as there is still plenty of quartz in sight to work upon.

There are at present only three claims working at Tomingley—Nos. 1, 2, and 3. In the former Reaks and party raised 114 tons of stone for 46 oz. 12 dwt. 19 gr.; this claim was abandoned by them, and was taken up by Croft and party, who are now sinking a straight shaft 200 feet; they are already down about 160 feet, but have not yet come on to the reef.

No. 2 Tomingley, M'Donald and party, now Crowhurst and party, continue to crush small parcels of stone, which average about $\frac{1}{2}$ oz. to the ton.

No. 3 Richmond have not been able to do much work lately in consequence of two of the party being sick in the hospital, and the claim does not pay wages. Average yield of stone, about 8 dwt.

Crowhurst and party brought in a small parcel of 18 tons from the Ten-mile Ridges, which yielded 18 oz. 6 dwt., and there is every prospect of good gold being got at the Ridges.

The population of Tomingley is about 200 persons; average school attendance, 35. Public-houses, 2; stores, 2; butcher, 1; baker, 1; blacksmith, 1; bootmaker, 1. The water supply is now good, as there is a large Government tank lately sunk at Tomingley. Crushing machines, 3; miners' rights issued, 52; business licenses, 7.

MUDGEE DISTRICT—GULGONG DIVISION.

(H. De Boos, Mining Registrar.)

MINING work during the last twelve months has been very slack in the Gulgong portion of the Mudgee Gold-field, and affords little matter for comment, or of sufficient importance to notice in this report.

The principal event of the year, from a mining point of view, has been the taking up of the silver areas in the neighbourhood of Denison town. A number of applications have been made for mineral leases for the purpose of testing the value of this discovery, which, should it equal the prospects already obtained, will furnish work for a large mining population, and restore something like prosperity to this district. It is, however, too early to give an opinion on the subject, as nothing like a fair crushing has been made by the prospectors, who are the only party as yet at work.

The general depression in mining matters has been somewhat relieved since the distribution of the money voted by Parliament for prospecting purposes. In this district a number of parties were successful in their applications to the Prospecting Board for a share of the vote, and most of them began work early in December. Some of these parties are working in places where gold is known to exist, and where a large area of country would be available in the event of their succeeding in finding gold in payable quantities.

The Ellan Vamin claim, late Britannia, is still idle, nor does it appear likely that the proprietors will open the works again. This is to be regretted, as the ground has never been thoroughly proved, and the locality is still considered by some as one of the most likely spots in this portion of the gold-field.

On the prospecting reserve, on the Black Lead, known as Scully's, nothing has been done during the past year, with the exception of the erection of a puddling machine. The works and machinery are all in good order, and it is a pity to see them lying unused. The original reserve (160 acres) has been reduced, and the prospector now only holds 25 acres, the balance of the reserve being thrown open to the miners.

The Star Lead, adjoining the abovenamed reserve, is also idle for the present. It is held under lease, and I am informed that the lessees intend to commence work as soon as they can obtain suitable machinery for the purpose.

At

At the Nil Desperandum the work is being carried on with all possible despatch. The sinking is extremely difficult, being through limestone rock, which also makes the working of this mine very expensive. The shaft is now 270 feet deep, and there is a considerable flow of water to contend with. In my last report I mentioned the peculiar and unusual formation of the ground in this claim, and also that the Company intended sinking to the depth of 300 feet in the hope of finding the limestone resting on gravel on a slate bottom. Should this be the case, there is little doubt but that payable gold will be found, and so make this claim a valuable mining property.

Little or nothing is doing in the other portions of this gold-field. There is always a number of men scattered over the various diggings who seem to be making a living, and who appear to be satisfied with their condition; but their number is gradually diminishing year by year, as they leave to seek more remunerative work elsewhere.

Three Gold-mining Leases.—3 special gold-mining leases and 8 mineral leases have been applied for during the last twelve months; and 178 miners' rights, 11 business licenses, and 10 mineral licenses were issued from this office during the same time.

During the year 1887 the Banks purchased gold to the amount of 1,602 oz. 16 dwt. 14 gr.

LACHLAN DISTRICT—FORBES, PARKES, AND GRENFELL DIVISION.

(*Mr. Warden Sharpe, P.M., Forbes.*)

I HAVE the honor to submit, for the information of the Honorable the Minister for Mines, my annual report for the year 1887 on the Forbes Division of the Lachlan Mining District.

In the immediate neighbourhood of Forbes several alluvial mines are at work on the Old South Lead. Of these I may mention the Crinoline, the Try Again, and the Forbes Alluvial. The land they embrace is all old and abandoned ground, but the shareholders were of opinion that some unworked ground still remained, and, as regards the Crinoline, this opinion has been proved to be a correct one. And the same result will probably be arrived at in the other mines I have mentioned. In the Crinoline between 300 and 400 oz. have been obtained since May last. The Company had to incur a great deal of expense in opening up the mine and in timbering the shaft and drives. They had to purchase extensive winding machinery at a cost, in round numbers, of £900. This debt has been paid off, and the mine is now free from debt. There are 30,000 £1 shares, and it has not been necessary to call up more than 4s. on each share. In the state the mine is at present it does not seem probable that any further calls will be made. The Company have an extended alluvial claim of 25 acres. The chief expense has been in opening up the mine and in preparing to block out. Twenty-four men are at present employed, and it is intended to increase the labour at once; so that whether it is payable or not will soon be determined.

The Company known as the Forbes Alluvial adjoin the Crinoline on the south boundary. They occupy 25 acres under lease, and are erecting machinery. Their shaft had to be sunk through 30 feet of drift sand, which caused a heavy expense. As soon as the necessary machinery is completed they will further test the mine. The Britannia Quartz-mining Company are also erecting winding and pumping machinery; their crushing plant is complete and ready for work. The reef is a very large one in places, and stone yielding as much as 3 oz. to the ton has been taken from it. The Companies I have mentioned are, I am informed, almost wholly supported by local capital.

At the Bald Hills, 4 miles north of Forbes, one party of miners have been at work for some time, and I am informed that they are on payable washdirt in new ground, 170 feet sinking. This alluvial ground is outside the old lead, on which a great deal of money has been spent, but which did not give satisfactory results. Perhaps the recent discovery I have mentioned may prove of great importance. The finding of a payable lead in this neighbourhood would give a great impetus to alluvial mining in this district. The following prospecting parties are at work in this division of the Lachlan Mining District:—J. Hasenkam, at Strickland's Reef, 8 miles north of Forbes; Raphael Warner, on the Forbes and Parkes Road; Gundry, Keegan, and party, and J. W. Browne and party, at the Pinnacle Boyd Station; Henry Davidge and party between the Parkes Road and the Stockman's Waterhole. It is extremely probable that at some of these places payable gold will be found.

At the Pinnacle Reefs, about 24 miles south of Forbes, between that place and Grenfell, Nicolas and party are working eight men's ground—an extended quartz claim. This line of reef was worked twenty years ago, and at various times since. It was very "patchy," and was abandoned as not being payable. Nicolas and party determined to give it another trial, and after a considerable amount of money had been expended in sinking a shaft further along the line of reef than the old workings, they were so satisfied with the prospects they obtained that they erected a battery and crushing plant at the mine, at a cost of £900. The tanks are now to be enlarged, which will be a further expense. The Pinnacle reef, which Messrs. Nicolas and party are working, is from 3 ft. to 5 ft. wide in places. The first crushing of 600 tons was not payable; but quartz taken from a greater depth was, and a crushing of 126 tons yielded half an ounce per ton. I am informed by Mr. Nicolas that 6 dwt. per ton will pay. There are 150 tons at grass, which it is estimated will give $\frac{1}{2}$ oz. to the ton. The working shaft on this extended claim is 130 feet deep. There is water in it, but not more than can be utilized for the engine. The crushing plant with ten stampers can crush one hundred to one hundred and ten tons of stone per week. If this mine pays, and the proprietors are satisfied so far, they purpose adding ten more stampers to the battery. The last crushing of 300 tons yielded 6 dwt. per ton. This was stone taken from above the water-level. Below the water-level the stone seems richer, and 150 tons of it yielded $\frac{1}{2}$ an ounce per ton.

At Back Yamma, 15 miles north-east of Forbes, Messrs. James Twaddell and party are working a 5-acre lease, which was taken up for gold; but it seems probable that the reef contains payable silver.

Parkes.

At Parkes, which is the chief mining centre in this mining district, there are a good many quartz claims at work; new finds are often made, and it is probable that this field will yield employment to a large number of miners for many years to come, as it has for many years past. Some of the quartz claims are a good deal more than payable, and one claim, which I shall describe more fully presently, has made its owner a wealthy man. As showing that there is not much probability of the mines in this district being

being easily worked out. I may state that there is an auriferous belt extending north of Parkes some 50 miles to Tomingley, and south of Parkes 12 miles to Strickland's reef, and none of these reefs have been, I believe, tested to a greater depth than 260 feet, and very few to that depth. At the Dayspring and Homeward Bound reefs, near Parkes, a great deal of money has been expended in time past. I am informed that extended claims have been taken up for the purpose of testing these reefs at a greater depth than has hitherto been attained. In the Dayspring mine, which has been lying idle for a long period, the reef was about 4 feet wide, and crushed from 10 to 12 dwt. per ton. This should pay now, as I believe the rate of crushing at Parkes is very reasonable, and the expenses of cartage would not be large. On the Buchanan line of reef, in the town of Parkes, seven claims are working, and some of these are yielding handsome returns. I may mention Hazelhurst's, Drummond and party's, McIntosh and party's, and Backstrom and party's. The last-named are working a block of stone hitherto untried by previous owners of the claim, and have obtained some very rich specimens. In 'Possum Gully, Callaghan and party have discovered what appears to be a payable block of stone, and have raised 30 or 40 tons of stone, showing coarse gold freely. This discovery has caused a great deal of prospecting to be done in this neighbourhood, but so far without success. During the latter portion of last year some valuable stone was raised from the Caledonian Hill, near Parkes, which yielded as high as 2 oz. of gold per ton.

In Dean and party's claim, the Koh-i-noor, near the Caledonian Hill, I am informed there is a large body of stone in sight, estimated to yield over an ounce per ton. Three shafts are working, so the quantity of quartz raised should be large. At Tolthurst & Company's claim, on Coobong Run, some rich stone is being obtained, yielding between 2 and 3 oz. to the ton.

As regards alluvial mining, there have been several new discoveries during the past year, but none of any importance. At the Batchelor's lead, 15 miles north of Parkes, a number of alluvial claims are at work. A puddling machine and dam have been erected, and probably a good deal of prospecting will be done to prove the value of the lead. As I have already stated, there is one claim in the town of Parkes which has yielded, and is still yielding, a large quantity of gold. This claim is known as Hazelhurst's, and it had been worked and abandoned several times before the present owner found the shoot of gold which has made his fortune. His experience shows how careful a miner should be before he leaves a claim as worthless. In the latter end of 1883, Mr. Hazelhurst took up an extended claim, 200 feet by 400, on the reef which runs through the town of Parkes, and is known as the "Buchanan." He sank a shaft 80 feet on the Bushman's lead, and bottomed on the reef just mentioned, but the stone was not payable. He then tried an old shaft on the line of reef, driving some 38 feet, but was not successful. He then tried some stuff that had been thrown out of the old shaft, and got some colours. He concluded this came from an old drive in the shaft I have mentioned, in which was a leader. He tried this leader, which was only 6 inches in thickness, and got a little gold. There was only a small quantity of stone to be got at the one end before he would be on the adjoining claims, and at the other end the leader seemed to have differed out. But this was not the case; by driving he got some good prospects. He sold half the claim for £50, but the buyer was not satisfied with his bargain, and sold the share, two days after he bought it, back to Hazelhurst for £25. Hazelhurst then raised 13 tons, and got 3 ounces to the ton. At the end of the mine he sank a shaft, and has been working it ever since. This shoot of gold was 120 feet in length. The following crushings have been taken from this mine:—

		oz. dwt.	£ s. d.
December, 1883	13 loads gave	40 6	145 7 11

Molong.

In this division of my district a good deal of money has been spent, with, so far, no remunerative results. About 17 miles west of Molong several leases have been taken up—two by Messrs. J. E. Kelly and party, 8 acres in each. On one of these a shaft has been sunk 60 feet, on a lode discovered by Delany and party in July last. They sank on a gossan lode, and came on what Mr. Kelly informed me was called garnet rock. The lode stuff resembles fine brown sand, and contains fine gold, which was visible in every dish—some half-dozen—I saw washed. The lode appears to be large, its bearing is north and south, and its walls are slate. The proprietors appear to have great confidence in their mine, and as an evidence of this they have erected a 5-stamper battery on the lease, with power for five more stampers, if needed. They have also excavated two dams; the expense of these and the crushing plant must have been considerable. It is reckoned that 6 dwt. per ton will pay; and various assays, carefully taken, give an average of an ounce per ton. The lode has been traced for some distance through Kelly and party's lease, and two other parties are prospecting for it with a fair prospect of success.

Gumble.

Eight miles south of Kelly and party's mine, at a place called Gumble, four leases of 40 acres each and one of 30 acres have been taken up, and worked by Messrs. Kelly and party for tin. Mr. Kelly informed me that a lode had been found in these leases 9 feet in width, between slate and granite walls; that the ore taken from the lode assayed as high as 60 per cent. of tin and 2 or 3 per cent. of copper; and that the average yield would be 7 or 8 per cent. of tin. No work is being done on these leases at the present time. Between Gumble and Delany's and Kelly's mine a Mr. Hills is working a mine on private property for bismuth. I was informed that assays of the ore gave from 3 to 18 per cent. of bismuth and 4 oz. of silver per ton; that the lode is 2 feet wide; and that a shaft has been sunk on it 30 feet deep. At the Bell River, at a place called Sammy's Mount, on a selection belonging to one Nicolas Quirk, 12 miles north-east of Molong, a good deal of prospecting has been done, seeking for an alluvial lead in deep

deep ground. Two shafts were sunk—one 154 and one 220 feet deep. I was informed that a Mr. Halliday started the mine, and then Mr. Moss, of Molong, continued to work it. This gentleman told me that £400 was expended in sinking and driving. The first shaft was bottomed and colours were got, but nothing payable; the wash was 4 feet thick. The second shaft could not be bottomed on account of the water; but this will probably be overcome, and perhaps a payable lead be discovered.

Grenfell.

In this division there are no new discoveries of any importance to report. In alluvial mining—at the Quandong, a few miles from Grenfell—during the year 1,200 loads of dirt have been washed, for a yield of 180 oz., and about 100 loads remain to be put through the machine. This washdirt is expected to give about an ounce to the load. In quartz-mining in this division the returns are very small for the past year; only 147 tons of quartz were crushed, which yielded 75 oz. of gold. Some prospecting areas have been taken up, and eight leases for mining purposes, during the year. A new discovery has been made on the road from Young to Marsden. About 46 miles from Young, and 22 miles from Marsden, a gold-bearing reef has been discovered crossing the main road, and two areas have been taken up by Madden and party and Beagley and party. The latter have a shaft down about 14 feet. The reef seems well defined, and is 2 feet wide, underlying 1 in 5 feet. The other party of miners have their ground on the north side of the road, and their shaft is 25 feet deep. The two parties have applied for permits to work the reef, and seem very confident that it is payable. The distance from a crushing machine is considerable, but no doubt, if sufficient inducement is offered, and the show is good enough, this difficulty will be got over. The reef runs into leased land (for pastoral purposes) on the north side, and into a conditional purchase on the south side of the road. The place is about 7 miles from Caragabal Station.

Canowindra.

In the Canowindra division during the past year 861 tons of quartz have been crushed for a yield of 950 oz. of gold; last year 629 tons were crushed for a yield of 807 oz. 12 dwt. of gold, so that there are 148 oz. 12 dwt. of gold more than was obtained last year. This was principally obtained from the reef known as the Blue Jacket. The reef called "Hayes" contributed 75 tons for a little over an ounce per ton. A party of miners are working on the Queen of the Ranges reef, and are reported to be on payable stone. The Mining Registrar informs me that a good deal of prospecting is going on in his division, and that the mines at work appear to be improving with depth. The Ironclad mine at Cargo is now in full work, having been floated for a large sum of money in the English market. New machinery has been erected for treating the ore, which has hitherto been sent away from the mine for treatment; it contains a great deal of pyrites, and the ordinary treatment does not save the gold as it should do. At Dalecouth Hill, I am informed, Messrs. Sharp and party are raising payable stone. The alluvial mines in this division appear to be almost worked out. The Mining Registrar reports that only 50 oz. of alluvial gold were won during the past year.

Cudal.

In this division a lode has been discovered at the Paling-yards Creek, about 8 miles from Cudal. The party have raised 250 tons of lodestuff. The shaft is 70 feet deep, and the lode from 6 to 10 feet wide. A 5-stamper battery has been erected at the mine, and this expense would not have been incurred unless the assays were satisfactory. At Boney's Rocks, near Toogong, there are ten parties of miners at work, but only two or three of the claims or leases are on gold. Since my last report was written a battery has been erected at Toogong. A crushing of 25 tons from the London claim at Boney's Rocks gave an ounce and 11 dwt. per ton. Irvine and party crushed 10 tons for a yield of half an ounce. The fact that stone can be crushed within a reasonable distance of Boney's Rocks should induce miners to give the reefs in this neighbourhood a thorough trial. Until the machine at Toogong was erected the stone had to be taken to Cargo, a considerable distance, and the expense of carting must have been heavy. I have omitted to mention that a crushing of the lodestuff at Paling-yards gave a return of 13 dwt. to the ton, for 63 tons which was treated at Cargo soon after the lode was discovered. I think the lode near Molong, now being worked by Kelly, Delaney, and party, is of the same nature as that at the Paling-yards.

In conclusion, I think I am justified in stating that in the district under my charge mining is in a more flourishing condition than it was when my last report was written. As an evidence of this, the quantity of gold won from reefs in two divisions—Parkes and Canowindra—during the year 1887 is larger than the yield for the year before. It is true that the increase is not very great, but there is an increase. Further, I believe in this district the number of mines at work is considerably in excess of the number employed when my last report was made. A good many reefs, too, which were abandoned for a long period have been tested during the last few months, and have proved payable. I think the number of men who have been unable to obtain employment on railway or road work, or on stations, has probably been the reason that more prospecting has been carried on in 1887 than in previous years. The fact that the Government are willing to assist partially in prospecting places which were either too expensive to work for miners without capital, or who, if they had some means, were unwilling to undertake the whole risk of prospecting localities which they thought contained payable gold, will give an impetus to mining, which will probably lead to some valuable discoveries being made here and elsewhere. Prospecting parties are at work at the following places in this district:—J. F. Connelly and party, at Melrose Plains; Netterville, Davies, and party, near Gobondry; R. J. Phillips, the Old Dayspring Reef, Parkes; D. M. Millan, at the Tichborne; F. Brogden, at Rocky Ponds; J. F. Connelly, jun., and party, Melrose Plains; Armstrong and party, north-north-west of M'Guiggan's lease, near Parkes; Baptist Warner, near Forbes and Parkes Road; L. Hasenkarn, near Strickland Reef, Gundry; Keegan and party, near the Pinnacle; Davidge and party, between the Parkes Road and the Stockman's Waterhole; James Mitchell, Gobondry Station; J. W. Browne, at Boyd.

There seems to be reason to believe that what is called a "Mining Boom" is setting in throughout the Colony, and the exceeding richness of some silver lodes at Silverton, Broken Hill, and other places, will cause large Companies to be floated, and large areas of land to be taken up, without proper precautions being taken to ascertain whether there is even a probability of success. The disastrous results which followed the mining mania at Hill End, where miles of country were taken up, leased, and Companies formed, to work reefs which had not been discovered—to work these leases large sums of money were subscribed, which found its way into the pockets of speculators, instead of being used for the purpose

the

the shareholders intended it should be a lesson to the public not to be led into mining speculations without ascertaining first whether there is a fair prospect of success. All men who have had any experience in mining know perfectly well that because a claim is payable it does not follow that the adjoining land is equally rich, but this seems to be lost sight of when a mining mania sets in. As I have remarked in time past, want of caution and reckless plunging into mining speculations had brought ruin on many, has brought a valuable industry into disrepute, and caused a depression, the effects of which are still felt in all parts of the Colony, which is doubtless abundantly endowed with mineral wealth. Some of the newspapers, I have noticed, have done their duty in this respect, and, in view of a mining revival, have pointed out in very plain terms that the public should use the same precaution and care in dealing with a mine that they would not fail to use in any other line of business. As bearing on the prosperity of this district, I venture to remark that I think our population and wealth would be largely increased if certain parts of this district were thrown open to selection, which at the present time is not available for settlement, because it is on a restricted gold-field. I do not think that the mining interest would be prejudicially affected if this were done, as under the present Land Act ample power is given to the Minister to allow mining to be carried on, if any miner wishes to dig and search for gold on land that has been selected; and there is land in the vicinity of Parkes and Forbes of excellent quality, and in no small quantity, which would be selected at once and used for agricultural purposes, affording a home and support to a large number of families, if the opportunities were offered them to acquire possession of it. I may also remark, that a great deal of this land will never be required for mining purposes, although it is on a restricted goldfield.

LACHLAN DISTRICT—YOUNG DIVISION.

(*Mr. Warden Robinson, P.M., Young.*)

In furnishing you with my report for the last year, Young Division of the Lachlan Mining District, I have the honor to observe that very little progress in mining has been made in this locality during the past twelve months. The number of miners' rights issued is the same as we passed out for 1886. In business licenses there is a falling off to the extent of a dozen. Applications for mineral licenses are less by two than that of the preceding year. The gold won, so far as I can gather, in my division has been—for Young proper, 761 oz. 4 dwt. 12 gr., valued approximately at £2,961 14s. 11d.; Murrumburrah and other places have realised 843 oz. 15 dwt. 15 gr., representing cash exchange (say) £3,261 2s. 7d. Aggregate return for the whole of the Young Division amounts in round numbers to 1,605 oz. 0 dwt. 3 gr., and in money value, £6,222 17s. 6d. This shows a decrease in yield, compared with the previous year, of about £2,514 9s. 9d.

During the year 5 gold-mining leases have been applied for, comprising 52 acres, 6 alluvial tenements, 2 quartz claims, 5 dams, 6 water-rights, and 26 resident areas. On Victoria Hill, Messrs. Gough & Company have placed a steam-engine on their claim, of 18 acres, for pumping water from a level lower than their workings. The water is conveyed through 1,500 feet of box-race and the same length of 4-inch piping. Only one pick employed, yet during the past five weeks' labour 45 oz. of pure gold have been obtained. Since my last report the new Burrangong Gold-mining Company's leaseholds have been worked occasionally, and about £1,000 worth of gold won. The Company have added to their plant considerably, but with all their excellent appliances the heavy underflow of water is too formidable to be kept under control. This property, beyond all doubt, is highly auriferous. These holdings and plant are under offer to a wealthy English Company, into whose hands it is anticipated they will shortly pass. Adjoining the new Burrangong grounds is the South Burrangong property, upon which have recently been erected somewhat extensive plant, part of which is a 20-horse-power pumping and winding engine. Two shafts have been put down to a depth of 45 feet. These leaseholds are in every respect in character the same as the New Burrangong property.

Cunningar Mine—the Marshal McMahon old reef—is probably the most extensive gold-mining holding in the Colony. It is situated about 15 miles south-east of Murrumburrah. The Company to which it belongs has already spent about £20,000 on plant. The manager reports having recently treated 500 tons of stone, the yield being 600 oz. of gold. Sixty men are employed on the works. There is a considerable falling off in the number of miners operating at Blind Creek, near Murrumburrah. At that place and Demondrille there are twenty-four miners employed. In the neighbourhood of Wombat and Stony Creek some forty miners are occasionally working. In addition to the figures above quoted, the Mining Registrar at Murrumburrah issued forty-two miners' rights and twelve business licenses. There are only some half-dozen Chinese diggers working in the Young Division of the Lachlan Mining District.

LACHLAN DISTRICT—TEMORA, BARMEDMAN, JUNEE, AND COOTAMUNDBA DIVISION.

(*Mr. Warden Baker, P.M., Temora.*)

I do myself the honor to submit my report *re* the several divisions under my charge for the year 1887. Of necessity it will be short and incomplete; these defects are from causes which I could not control. Early in 1887 the duties of C.P.S. and District Court Registrar were added to my work, very much against my wish, as without this extra labour my hands were already very full. I was therefore compelled to neglect a large amount of Warden's duties—even those concerning Temora and the other divisions have been very much neglected. Justice to myself and to the important districts placed under my care demand that so much should be said in explanation. I am now relieved of those extra duties, and I hope soon to clear off arrears of mining work. The several Mining Registrars will have supplied their reports for their respective divisions, and these will, I trust, supply facts wanting in this report.

Temora.

Population.—From a rough estimate made by me, it would appear that the population in and about Temora has for the past year remained, as to numbers, about stationary; some have left, but new arrivals have taken their place. A considerable number of miners have during the year been engaged at work other than mining in and about the suburbs, bush-work, fencing, road contracts, &c. During the year there were issued 332 miners' rights, as against 395 issued in 1886, being a decrease in 1887 of 63, but in January, 1888, there were issued 159 miners' rights, as against 160 in the previous January; of business licenses, 71 were issued in 1887, as against 83 in 1886, being a decrease of 12. As I have before explained, these

these decreases in the number of holders of miners' rights and business licenses do not necessarily indicate a corresponding decrease in the population, because these documents are largely held by business people and others to secure a title to their residence and business areas, and as these become converted into freehold areas the necessity for holding miners' rights and business licenses decreases. During the year 1887 a large number of residence and business areas have been sold, some as J.P.s, and others by auction. The larger portion of the inhabitants in and about Temora now reside on alienated land and conditional purchases. A considerable number of "selections" have been made, and by the right sort of "selectors" too, if one may judge by the energy shown by them in making improvements. These men give large promise of speedily converting the magnificent lands of this district from little better than a dreary waste into a goodly number of pleasant and prosperous homesteads. The one great want of this district is a certain supply of water, and this can be obtained by conserving the rainfall in seasons of plenty, instead of letting it roll in all but waste to the ocean. I think the greatest legislative blessing that could be given to New South Wales would be a thoroughly good Local Government Act, with ample powers *inter alia* to deal with the proper conservation and distribution of water; and for this district such a measure would confer very special blessings.

Gold.—There has been a great decrease in the yield of gold comparing 1887 with 1886. The following statement furnished me by Sergeant Buckley the Gold Receiver at Temora, shows that during the year 1887 he received for transmission 3,406 oz. 14 dwt. 13 gr. In the year 1886 he received 7,161 oz. 10 dwt. 5 gr., showing a decrease for the year of 3,754 oz., omitting fractions. The Gold Receiver's statement is as follows:—

RETURN showing the quantities of gold received for transmission by Gold Escort, by the Gold Receiver at Temora, during the year 1887.

Date.	Quantities received.		
	oz.	dwt.	gr.
26 January.....	47	9	7
23 February.....	238	3	13
23 March.....	275	0	21
20 April.....	405	18	20
18 May.....	218	11	14
15 June.....	107	13	22
13 July.....	479	15	8
10 August.....	670	4	15
7 September.....	51	2	3
5 October.....	330	14	13
2 November.....	83	0	0
30 November.....	498	19	21
28 December.....			
Total.....	3,406	14	13

For the purpose of comparison, I give the total quantities of gold sent from Temora by escort each year, 1881 to 1887, both inclusive:—

	oz.	dwt.	gr.
1881.....	29,652	14	4
1882.....	33,348	0	7
1883.....	17,347	8	6
1884.....	14,381	16	1
1885.....	7,865	15	9
1886.....	7,161	10	5
1887.....	3,406	14	13

By the courtesy of Mr. Tompson, manager of the Bank of New South Wales, Temora, I have been furnished with the quantity of gold which passed through that Bank. This statement shows that of the gold purchased by that Bank, 755 oz. (alluvial gold, otherwise sold, about 645 oz., making 1,400 oz.) from alluvial obtained in the Temora Division, and of the gold from quartz, 662 oz. were obtained from Barmedman. I regret that I have not been able to get a return from the A.J.S. Bank for 1887, the manager being, he says, too busy to prepare it. In its absence I cannot by direct means ascertain how much gold came from quartz and how much from alluvial, nor how much from Temora proper; but as nearly as I can make out, there were from alluvial about 1,400 oz., from quartz about 2,000 oz. This, however, is but a rough estimate. The average price paid for gold by the Bank of New South Wales has been £3 17s. 6d. per oz.

The alluvial workings still find employment for the greater number of Temora miners, but many of them during the year had very poor returns for their labour; very little new ground has been tested, and, of course, the old ground every year gets more and more exhausted of gold. Still, some of the old claims continue to yield gold in payable quantities. Very little prospecting has been done, but there is about this district some likely-looking country which at some future time may pay for working. It should be borne in mind that the alluvial auriferous deposits in this district have been what in mining parlance is called "patchy." It is notorious that while one man at Lower Temora has made a not very small fortune by the nuggets found in his claim, some of the adjoining claims did not pay for working; and it is not at all unlikely that some of the country that has been prospected with unsatisfactory results may yet be proved to contain gold in payable quantities.

In quartz-mining we are just quietly holding our own, progressing, perhaps, a little, but very slowly. Mr. Elsbury, the manager of the South Australian Quartz-mining Company, has courteously furnished me with a statement showing that from their mine at Upper Temora he crushed in 1887 of quartz 1,718 tons, which yielded 603 oz. 8 dwt. 6 gr. melted gold, being a little over 7 dwt. per ton. For the public he crushed 309 tons for a yield of 140 oz. of gold, being a little over 9 dwt. per ton. The quartz from the South Australian Company's mine has been taken from a depth of 200 feet upwards to within about 60 feet from the surface. This Company now prospecting at some 270 feet below the surface with fair prospects of success. The lode is about 2 feet 6 inches wide. The manager says it is in hard blue diorite, but as they are using the rock-drills worked with compressed air they get through a fair amount of work at a moderate cost, considering the hardness of the country.

The

The Hidden Star has been working with some three or four men with satisfactory results. This property has been sold to some Victorians, who are arranging for the erection of a crushing plant.

The Mother Shipton and adjacent mines have been all but idle the whole year. These mines have been put on the London market, with what result is at present uncertain, except the ascertained fact that the works have been very much delayed. I have sometimes been sorely perplexed as to whether I ought or ought not to grant permission to these holders to suspend labour. On the one hand, to refuse such permission might have prevented a large amount of capital being put into the development of these promising mines; and on the other hand, to grant this continuous suspension of labour might just be playing into the hands of mere speculation, "Waiters on Providence." The shareholders with whom I have had to deal are men of good reputation and character—men whose interest is largely dependent on the well-being of the district. I therefore granted the necessary permission, which has been more often required than would have been needed but for some delay in issuing one of the leases, the London syndicate being very cautious not to move until they saw all the titles perfect. The immediate effect, however, of this suspension of labour has been to allow mines to lie idle, and, as a matter of course, to lessen the output of gold.

During the year 21 applications have been made for gold-mining leases; the aggregate area so applied for, 119 acres, as against 25 applications for the aggregate area of 14½ acres in the year 1886. A considerable number, however, of the gold lease applications in 1887 were for land in and about Cowabee.

At Sebastopol the principal mines are the Morning Star, the Evening Star, and the Homeward Bound, now called La Mascotte. The last of these has been all but strangled by the demon of litigation. Scarcely any work was done in 1887, and as this is the only crushing plant within reasonable distance of the other mines, the closing of these works had the effect of all but closing those adjacent thereto. From these and other causes, mining at Sebastopol has been all but at a standstill during the year.

Barmedman.

On the whole, the mining interest at Barmedman during 1887 has been fairly satisfactory. The great "floating" trouble has not, however, been *minus* here. The principal mines, including the Fiery Cross, have been offered to a London syndicate, and I am informed with success; and there can be no doubt but that these mines offer a fair and sound opportunity for the legitimate investment of capital. Much, however, will depend upon the management. Mining experts condemn the mere hand-to-mouth system adopted by the Barmedman United Company in merely "scratching" about the "shallows," instead of also going down to test the lode at deeper levels. Every practical gold-miner knows that even in the best of mines there is a large amount of uncertainty as to results, and consequent risk and speculation. Sometimes rich prizes are drawn; but at other times blanks turn up. Admitting all that fully, nevertheless it is quite certain that many mines prove to be blanks to the shareholders that would be fair prizes if properly managed. Defective management must not, however, be always laid at the manager's door. Good management often means expending large sums of money in what is called "dead" work, but work without which being done the mine could not be worked properly, and unless in such cases the shareholders find the funds the management is all but powerless.

Mr. Love, the Mining Registrar at Barmedman, has furnished me with the facts forming the basis of his report, and as they are full it would be useless for me to go over the same ground. 1,370 tons of quartz have been crushed, and have yielded 1,454 oz. 9 dwt. 14 gr. of gold, being a little over 21 dwt. per ton. To this gold add 87 oz. obtained from mullock, which gives about 1,542 oz. of gold, of the money value of £5,975. This gold, it should be remembered, is included in the 3,406 oz. hereinbefore credited to Temora.

Barmedman is a reefing district. Up to the present time no alluvial has been proved to be payable, although a fair amount of prospecting therefor has been done. At the Hard-to-find, about 2 miles north-easterly from Barmedman township, the result of the past year has been fairly encouraging 315 tons of stone have yielded 496 oz. of gold. The Company owning that property had an engine on the claim, and are now about to provide proper pumping and crushing appliances, with good prospects of being fairly remunerated for their outlay. Then, close by, there is the Phoenix "Country," which in the past gave excellent prospects, and which has never had a fair and systematic testing. On the whole, Barmedman prospects are cheery. The principal mines hold out large hopes, and, as they are under the control of local men of good sound practical common-sense and thorough integrity, will, if I mistake not—in the not very distant future—afford profitable employment for a large number of men, and make Barmedman itself a prosperous mining town.

Cootamundra.—The principal mines in this division are at Muttama, and I have not been able to visit that place during the year—at least, not since January last—and I am unable to say much about it, except that I know by correspondence with Mr. McCarthy, the Warden's Clerk, and with miners and others that considerable attention is being directed to this district by men of means; and that the prospects are such as would justify the outlay of capital in their judicious development. During the year some traces of silver and lead, but whether payable or not has not been ascertained. Here the common "floating" struggle has greatly retarded actual mining operations.

Clarendon Division.—I have not been able to visit Junee or Cowaker during the year. As to Junee, I gather from my correspondence that mining has been very quietly progressing with moderate success. At Cowaker, Belmore Reef, and thereabouts small spurts of mining excitement have cropped up during the year, owing to fresh discoveries of gold which promise to give reasonably fair yields. A crushing plant has been erected at the "Belmore," and is now in the hands of the Messrs. Ferrier, and, as far as I can ascertain, these gentlemen have largely contributed to the development of this district.

In concluding this hasty and imperfect report, I desire to again call attention to the defective state of the laws regulating gold-mining. His Honor Judge Forbes, it will be remembered, on 1st April, 1886, pronounced three regulations made by the Mining Board to be *ultra vires* (Nos. 124, 125, and 126). These regulations provided for the labour conditions under which claims were forfeitable as a penalty for non-efficient working; and it is now regarded as a settled point that non-working does not now involve forfeiture, and that a man having got registered for a claim may continue to hold it without doing a stroke of work, so long as he continues to be the holder of a minor's right. Under this impression the loafing legal shepherds are jubilant, thinking they can hold their claims in that way without risk. In that, it appears to me, they in some respects misunderstand the effect of His Honor's decision. That did not attempt to say that the Mining Board had not power to impose labour conditions, but that the Board had

had no power to make forfeiture the penalty for non-observance,—and one of the strong reasons given against forfeiture being the penalty was the fact that by section 126 of the Mining Act 1874 a breach of any regulation could be punished by a money penalty of £10. Now, pending legislation to radically cure the defective state of the present law, which is urgently required, perhaps it would be of service if these scheming lazy shepherds were made to understand and feel that the luxury of holding a claim without properly working it involved the further luxury of paying a daily penalty of £10, and that in glaring cases either the police or the Warden's bailiff be instructed to prosecute. Be that as it may, it is important that something should be done to prevent scheming loafers from locking up mines, to the great injury of the legitimate honest and industrious miner.

LACHLAN DISTRICT—BARMEDMAN DISTRICT.

(*Thomas Love, Mining Registrar.*)

I HAVE the honor herewith to submit my annual report on the mining industry in the Barmedman Division of Lachlan Mining District for the year ending 31st December, 1887. The quantity of gold won during the year amounts to 1,541 oz. 19 dwt. 7 gr.; value, £5,975 2s. 3d., at the average price of £3 17s. 6d. per ounce. All the quartz crushed gave an average of 1 oz. 1 dwt. 5 gr. per ton. Six gold-mining leases, embracing an area of 40 acres 30 perches, has been applied for during the year. Eighty-eight miners' rights and sixteen business licenses have been issued.

The mining industry in this division for the year just ended bears unfavourable comparison with the previous year. This is shown by the small quantity of stone raised during the year, being only 1,370½ tons, as against considerably over 2,000 tons raised in the latter six months of the previous year. The cause of the depression, however, is not so much a falling off in the quality of stone in the several claims as it is to the fact that nearly all the claims are worked down to the water-level, and have been converted from ordinary claims into leasehold areas. This has been followed up by obtaining suspensions of the labour conditions, and by the placing of the whole of the properties in the hands of an agent to float in the London market, with the view of obtaining the necessary funds to test the different reefs at a depth below water-level. The mines being thus, comparatively speaking, locked up, will account for the falling off in the returns, and for the decrease of the number of miners on the field, who, being unable to find employment, had to go elsewhere.

In the month of March, Hassett, Nessi, and party took up a claim immediately under the southern fall of the Ada Hill to prospect for alluvial. The sinking was about 9 feet. They obtained occasional good prospects, and found three small nuggets—one (the largest) weighing 1 oz. 15 dwt., one 1 oz. 4 dwt., and one 1 oz., besides several smaller ones. They got in all about 8 oz., but failed to trace the gold away from the prospecting claim. Several parties believing that a payable lead existed somewhere in the vicinity set to work, and a number of shafts, varying in depth from 6 to 80 feet, were bottomed, but did not succeed in finding gold, or even wash. The deeper shafts bottomed on round tertiary boulders. This is the same formation as that in which all, or nearly all, the gold-bearing reefs are found in Barmedman. In many instances the reefs have been found traversing the boulders in exactly the same manner as found in slate granite and other primary rocks. The prospecting for alluvial has now been abandoned. Practical miners express the belief that the gold found by the prospectors had been deposited by a "blow" from a reef or dyke.

Messrs. Hardy and Merton, of Wagga, who erected a steam-pumping plant at the Hard-to-find reefs in the beginning of the year, have had to discontinue work in consequence of an accident to the pumps, and the consequent flooding of the mine. Strong hope was entertained when this work was started that, should they succeed in sinking to the depth they intended (150 feet), and cutting the reef at that depth, that it would mark a new era of prosperity for that portion of the field, as the stone found above water-level, although small, was rich, having given returns of over 6 oz. to the ton. On one occasion a parcel of 5 tons taken out below water-level immediately before the accident gave a return of 18½ oz. The manager, Mr. Robert Cassin, states that he has ordered new and stronger pumps, and that another effort will be made to subdue the water and reach the 150-foot level, where he anticipates cutting a much larger body of stone than that at the 80-foot or water level.

Number of miners' rights sold, 88; number of business licenses sold, 16; number of leases applied for for gold-mining purposes, 6—embracing an area of 40 acres 30 perches; total quantity of gold obtained for year, 1,541 oz. 19 dwt. 7 gr.; value at average price of £3 17s. 6d., £5,975 2s. 3d.; number of reefs from which gold has been won during year, 10.

The greatest depth at which mines have been worked and gold obtained during the year has been at Jackson's Reef (Barmedman), Jackson's Hard-to-find, and Hardy and Merton's Hard-to-find, at a depth of 130 to 140 feet. Three hundred and fifteen tons of stone taken from above claims gave a return of 496 oz. 16 dwt. 4 gr. of gold.

LACHLAN DISTRICT—JUNEE DIVISION.

(*A. R. Elliott, Mining Registrar.*)

I HAVE the honor to state, for the information of the Honorable the Minister for Mines, that there has been very little improvement in the mining industry here during the past year. The amount of gold (alluvial) won has been 89 oz., which was purchased by Mr. Ross, manager of the Bank of New South Wales, at £3 17s. 6d. per oz. During the year I issued 34 miners' rights, and received 3 gold lease applications and 2 applications for extended quartz claims, from which latter I hear some very good prospects have been obtained. I have recently been informed that endeavours are being made to get machinery on the ground.

I hope next year to be in a position to furnish a far more favourable report.

LACHLAN DISTRICT—TEMORA DIVISION.

(*James Davoren, Mining Registrar.*)

I HAVE the honor to submit the following as my report for the Temora Division of the Lachlan Mining District for the year 1887.

The gold received by the Banks during the year was 2,191 oz.; of this, 801 oz. was from quartz and 1,390 oz. from alluvial.

I am aware that some of the miners who left this district during the year took away to Sydney and Melbourne large quantities of gold won on this field, and for which the field will not have credit in this return.

The South Australian Company's machinery was the only machine or engine at work in this division during the year.

The crushing at this machine during the year was—For the Company, 1,718 tons, which gave a yield of 603 oz. 8 dwt. 6 gr., of the value of £2,337 4s.; tributors for the Company, 195 tons, which yielded 56 oz. 5 dwt. 18 gr., of the value of £218 2s. 3d.; and for others, 309½ tons, which yielded 140 oz. 6 dwt. 21 gr., of the value of £543 16s. 8d.

In the Cowabbie portion of this district 27 claims were applied for during the year 1887, and in North Berembid 11 claims were applied for; these claims have not yet been thoroughly proved, but the opinion among experienced miners is that these districts will absorb a large amount of labour during 1888.

I issued 332 miners' rights during the year, leaving decrease in the number of 63 from the year 1886. About 100 miners are engaged in alluvial and 100 in quartz-mining; the remainder are held by persons who occupy Crown lands or hold mining interests.

I issued 71 business licenses—11 less than I issued in 1886. The cause of the decrease in the number of business licenses issued this year is, a great many of the allotments held under these titles have been purchased, rendering business licenses unnecessary.

There would be much more work done in quartz in the Temora District but most of the claims abandoned have been registered, and miners are afraid to take them up owing to the decision in the Mining Appeal Court in the case of Lucas v. Bushell and others, lest they should, after finding gold, lose both their labour and the claim.

There were about 8,000 loads of dirt washed at the various puddling machines, which gave an average of about 2 dwt. to the load.

LACHLAN DISTRICT—MURRUMBURRAH DIVISION.

(Charles Outcliffe, Mining Registrar.)

I HAVE the honor to report for the year ending 31st December, 1887:—

The gold won during the year amounted to 767 oz. 17 dwt. 15 gr., in value, £3,354 10s. 4d., showing an increase on the previous year of 169 oz. 7 dwt. 8 gr., and value, £1,039 12s. 2d.

The number of miners' rights issued has been 42; business licenses, 12. The price of gold at the Bank, £3 17s. 6d.

The Cunningham reef, situated about 12 miles from Murrumburrah, is now in active operation.

The Archdeacon reef was taken up in August last, situated 4 miles from Wombat and 8 miles from Murrumburrah. It is 800 ft. in length and 400 ft. in width; the working shaft is 60 ft. in depth of soft granite. Six tons of stone have been crushed in Sydney, yielding 4 oz. 0 dwt. 8 gr. of gold per ton.

LACHLAN DISTRICT—YOUNG DIVISION.

(W. E. Rogerson, Mining Registrar.)

I HAVE the honor to report that mining operations in this locality during the past year have exhibited but little signs of activity. The principal mine, viz., the New Burrangong, has for some time past been under offer to an English Company; hence its operations have not been of any importance latterly. During the year between 400 and 500 feet of driving have been done, principally for the purpose of cutting the water off the main lead. The prospect obtained from any part of the lead so far driven upon is, I am informed by the manager, about 5 oz. to the square fathom. Two shafts have also been sunk on the southern boundary to cut water off, one that was bottomed proving payable ground. Two bores have also been put down in different places on the mine, all of which contained payable gold at the rate of about 5 oz. to the square fathom. The amount of gold obtained from the mine was 247 oz. 3 dwt. 14 gr.

On the South Burrangong gold-mining claim there has been erected a 20-h.p. pumping and winding engine, with sheds, and two shafts have been sunk to a depth of 45 feet. Several bores have been put down, the prospects of which yielded at the rate of 5 oz. to the square fathom.

The Burrangong Steam-slucing Company, Victoria Hill (Gough and party), have recently commenced operations, with very encouraging prospects. This property consists of 18 acres, and a valuable machinery plant has been brought into operation. The yield of gold for five weeks, with one pick, was 45 oz.

During the year I have issued 390 miners' rights (same number as the previous year), 21 business and 2 mineral licenses, realizing the sum of £191. Five gold-mining applications—aggregate area, 52 acres—6 alluvial, and 2 quartz claims, 5 dams, 6 water-rights, and 26 residence areas complete the record of the year's transactions.

The following particulars *re* gold purchased in Young have been courteously supplied by the managers of the Bank of New South Wales and Union Bank respectively:—

	oz.	dwt.	gr.	£	s.	d.
Bank of New South Wales	569	8	2	2,218	10	5
Union Bank	191	16	10	743	4	6
	761	4	12			
Giving a total value of				£2,961	14	11
The average price being £3 17s. 6d. per oz.						

LACHLAN

LACHLAN DISTRICT—CUDAL DIVISION.

(W. H. Souter, Mining Registrar.)

I HAVE the honor to report as follows of the mining carried on in this division during the year 1887:—A large quantity of land has been taken up in this division, principally at Boney's Rocks, near Toogong, for gold-mining purposes. The sinking is hard stone, and can only be got out by blasting with powder. In all, 85 tons of stone have been crushed by local machinery, realizing 157 ounces of gold, valued at £467 1s. 4d. (that is in 1887). A battery has been erected at Paling Yard Creek by prospectors, Courts and party, but as it has only lately been started no returns can yet be given. The lode is of gossan, 3 to 6 feet wide, and difficult to separate from the gold; they are, however, by slow and careful working giving it a good test, which shall be duly reported. The prospectors are hardworking practical men, and will give the field a fair trial. They have about 200 tons to crush, and the lode keeps about the same width right down. A battery has also been erected at Toogong, where a certain amount of the stone at Boney's Rocks has been crushed. The Company have no fixed engine of their own at present; they are depending on an engine which the proprietor is working just now with a threshing machine at various farms in the district, but will soon be ready for crushing again. Mining prospects look fairly well in this division, and the various reefs will be thoroughly tested.

LACHLAN DISTRICT—CANOWINDRA DIVISION.

(William Cook, Mining Registrar.)

DURING the year 1887 there has been a further improvement in mining matters all through this division, the amount of gold won being 1,100 oz. against 801 oz. for 1886.

Blue Jacket, Canowindra.—This has been the principal gold producer in the division; 701 tons of stone crushed for a yield of 821 oz. 9 dwt. 12 gr. They are now working at a depth of 200 ft., the stone improving with depth.

Hayes' Reef, Belmore, is now being worked by M'Intyre and party, who crushed 69 tons for a return of 70 oz. 15 dwt.

Queen of the Ranges—Joseph Smith and party have been working during the whole of the year with poor results. They are now reported to be on payable stone.

Cargo, Dalcott Hill.—Sharp and party have had a crushing—23 tons for 39 oz. 10 dwt. 12 gr. They also crushed 1 ton of picked stone for 25 oz. gold; 4 tons of stone sent to Sydney for treatment yielded 4 oz. per ton of free gold. The pyrites have been sent to England for treatment. Mobbs and party are also working on this line of reef.

Ironclad, Cargo.—This mine, which is situated at Cargo, has been purchased by an English Company, who commenced work in June last, and a trial crushing in Sydney from the 80-ft. shaft gave 2½ oz. free gold per ton, the concentrates giving 6 oz. 19 dwt. 9 gr. per ton. The stone above this level is being put through a very indifferent battery, and averages 1 oz. free gold per ton, two concentrates assaying 8 oz. per ton. New plant is to be erected for treating the refractory ore at the deeper levels. At present over forty persons are employed at the mine and battery, operations being directed chiefly to development. The deepest point reached is 400 feet from surface; here the shoot of ore assays 4 oz. 9 dwt. 3 gr. gold, 10 oz. 11 dwt. silver, and 10·16 per cent. copper per ton. The prospects of this mine are considered very satisfactory, and high results are expected from the new plant.

Alluvial has been confined to fossicking amongst old workings at Gum Flat.

LACHLAN DISTRICT—GRENFELL DIVISION.

(W. H. Hazelton, Mining Registrar.)

I HAVE the honor to forward my report for 1887. Unfortunately I cannot record any improvement in mining matters in this division, either in alluvial or quartz. During the year the principal portion of alluvial mining has been carried on at the Quondong, at which place there has been washed about 1,200 tons of alluvial dirt, which gave a return of 180 oz. of gold. At present there are three claims working in this gully—three men in each. One party of them, John Gallagher & Co., have about 100 tons of dirt at grass; this they inform me will yield an ounce to the ton. The other two claims are prospecting. On the old main lead near Grenfell there has been very little work done. During the first part of the year two claims were worked—Fitch and party, and Gullen and party. The former washed 50 tons and the latter about 20 tons; the yield from both was 13 dwt. to the ton. This was only a patch, for they could not obtain any more payable dirt, and they abandoned it. At the Milkman's Two-mile and Star leads no mining has been done since 1886. At the Seven-mile two claims have been working, but are now abandoned, and in consequence of the persons being absent I was unable to obtain any information as to yield, &c. In March, M'Clelland and party (four men) prospected Madden's Gully for alluvial, which is situated about 2 miles south from Grenfell. After sinking and driving several shafts they only obtained the colour. In April, Ley and party (four men) prospected the locality known as Stump-hole Creek, situated on Warraderry Run, about 24 miles north-west from Grenfell, for alluvial. After giving it three months' trial, during which time several shafts were sunk and driven, but nothing payable was obtained. I may mention this party was partly assisted by the business people of the town. There are some parties prospecting for alluvial at Sandy Creek, which is about 26 miles west from Grenfell. They state that they have only obtained a strong colour, but are very confident.

In quartz I regret the return is so very small. There were only 147 tons crushed during the year. The Consofs lease, 4 acres.—Fitch and Sons have been raising stone for the last three months. Lawson's Reef.—Hincheliffe and party are also raising stone. The Enterprise, Homeward Bound, and other reefs I may say are at a standstill. The following parties have registered prospecting protection areas for quartz:—Nelson & Co., Bland; Hodge & Co., Sandy Creek; Brenner & Co., Sandy Creek. None of them have reported anything payable. There have been four ordinary quartz claims registered at Sandy Creek and one at the Bland. These parties inform me that they are prospecting, and are of an opinion that payable gold will be obtained in some of the claims at Sandy Creek. During the year eight gold-mining leases have been applied for, as under:—J. Rich, 16 acres, on O'Brien's Hill; P. Bourke, 4 acres, Lucknow Hill; J. R. Wallace & Co., 3 acres, Welcome Hill; Hogan & Spence, three leases, two 4 acres and

and one 3 acres, on the Lucknow Hill. The applicants for the three last-mentioned leases are Victorians, and I am informed that these leases are to be worked by a Melbourne or an English Company. Littlefield & Co. applied for a special gold-mining lease of 30 acres for alluvial at the junction of the Lachlan and Burrowa Rivers. In December, Messrs. Slee and Wilkinson, members of the Prospecting Board, inspected the several localities for which application for aid had been made. During the year I issued 185 miners' rights, 8 business licenses, and 1 mineral license.

LACHLAN DISTRICT—PARKES DIVISION.

(*Wm. C. Weston, Mining Registrar.*)

I HAVE the honor to forward my annual report for the Parkes portion of the Lachlan Gold-field.

The mining industry in the Parkes District shows a sound improvement for the past year, both in reefing and alluvial work. Upon the Buchanan line of reef there are seven claims working, some of which are yielding handsome returns—viz., Hazlehurst's, Drummond & Co.'s, Mcintosh & Co.'s, and Backstrom & Co.'s, the last-named working upon a block of stone which had been undiscovered by previous holders of the ground; some very rich specimens have been obtained by the party. In Possum Gully, which apparently abounds in reefs or blocks, Callaghan and party have a newly-discovered block, and have 30 or 40 tons of stone at the surface which shows coarse gold freely. The new find has caused a lot of prospecting in the vicinity, but so far without result.

During the latter portion of the year very good quartz has been obtained by different parties from the Caledonian Hill, yielding as high as 2 oz. per ton. At the Koh-i-noor claim (Dean and party's), near the Caledonian Hill, a large body of payable stone is in sight; the party have three shafts working a large easy-worked reef, and their stone averages over an ounce per ton. At Tolhurst & Co.'s, on Coobang Run, rich stone is obtained, yielding between 2 and 3 ounces per ton. The yield from reef gold for the year was 4,789 oz. 11 dwt. 7 gr., being an increase of 211 oz. upon the yield for 1886.

In alluvial work there have been several new discoveries, though none have proved more than fossickers' ground, still they employ a number of men who occasionally obtain a good patch, and also prove that there are yet undiscovered leads on the field.

At the Batchelors a number of claims are at work, and a puddling machine and dam have been erected there, which may lead to a run being found. The facilities for washing the dirt will induce further prospecting. The yield of gold for the alluvial for the year was 844 oz. 11 dwt. 22 gr., being an increase for the year of 189 oz. The total yield of gold from this field for the year 1887 was 5,634 oz. 3 dwt. 5 gr.; value, £21,128 2s. This does not include gold taken to Sydney by private hands.

378 miners' rights and 13 business licenses were issued in 1887, and 121 mining tenements registered and 14 gold-mining leases applied for during the same period.

LACHLAN DISTRICT—FORBES DIVISION.

(*E. A. T. Pery, Mining Registrar.*)

I HAVE the honor to submit my report for the Forbes Division of the Lachlan Mining District for 1887. The amount of gold won in this division (as per escort return) last year was 726 oz. 17 dwt. 18 gr., showing an increase of 230 oz. 15 dwt. 23 gr. on the amount won in 1886, to which must be added about 250 oz. still in the hands of the banks, making a total of nearly 1,000 oz. This increase is chiefly attributable to the starting of the Nil Desperandum, Crinoline, and Pinnacle workings.

The Britannia Reef Co. (Limited) are busy erecting winding and pumping machinery, and expect very shortly to have everything ready for crushing.

The Nil Desperandum Alluvial Gold-mining Co. (Limited) were getting good gold in the early part of the year, but owing to having struck a considerable body of water, were forced to suspend work, pending the erection of a new pumping plant, which, on trial, proved totally inadequate for the purpose required. Owing to the above delay, as also to the heavy expenses thereby incurred, it was found necessary to re-organize the Company, and it is hoped that under its new appellation of the "Try Again" its prospects may improve, which, owing to the good reports lately to hand, appears highly probable.

The Forbes Alluvial Gold-mining Co. (Limited), on the South Lead, Forbes, have during the year completed the sinking of their new shaft, after having experienced very considerable difficulty. The shaft bottomed on wash of a payable character. This Company has almost completed the erection of the machinery purchased from the late British Standard Gold-mining Co., at the Bald Hills, which is a first-rate plant, and expect very shortly to get to work below.

The Crinoline Alluvial Gold-mining Co. (Limited), on the South Lead, Forbes, completed the erection of their machinery in the early part of the year, and have since opened up an immense area of payable wash by means of main drives preparatory to blocking, the yield of gold from main drives having for the last four or five months paid all working expenses (including the original cost of machinery). The shareholders confidently expect when the ground is worked by "blocking" to receive handsome dividends. The total yield of gold from this claim has been over 400 oz., most of which has been obtained during the last three months.

At Strickland's Reef a large quantity of payable stone has been raised, and arrangements have been completed for the erection of a battery. Several parties are prospecting the reefs in this neighbourhood, in anticipation of its early appearance.

At the Pinnacle Reef, Messrs. Nicolas & Reymond have removed and re-erected their battery from the creek, and have been crushing some very good stone, the yield being about 315 oz. for the short time they have worked.

Several parties are sinking and prospecting in likely localities near the town, but have as yet struck nothing payable.

The Prospecting Board that lately visited the district have approved of several sites for prospecting. As but two of the above Companies have been at work (and for the latter portion of the year only), I can give no statistical returns, but trust that next year, when all are in "full swing," I may be enabled to furnish same.

During the year I have issued 243 miners' rights, 15 business licenses, and 1 mineral license.

LACHLAN

LACHLAN DISTRICT—MOLONG DIVISION.

(M. Hanly, Mining Registrar.)

I HAVE the honor to submit my report of mining in this division for the year 1887.

At Woollogolong, about 15 miles westerly from Molong, five applications have been received for gold leases, embracing 38 acres, chiefly by Mr. J. E. Kelly, Delaney Brothers, Blunden and party, McGroder and party. The prospectors are Messrs. Delaney Brothers; they found a rubble lode 13 feet wide on the surface; they sank some five shafts varying in depth from 10 feet to 55 feet, and drove 100 feet partly across the lode and partly along it. Several samples of ore were sent to Sydney for assay from the different levels; that from the lowest level is said to have assayed at the rate of 13 oz. of gold and 12 oz. of silver per ton. Mr. J. E. Kelly is now having erected a steam-crushing machine; an excavation of about 1,200 yards with embankments has been made for a dam. There are about 200 tons of ore at grass, which is being added to daily. Robards and party and Blunden and party are prospecting in their respective holdings for the lode. The purchased lands of the Messrs. McCallum Brothers come close to the mine, and the lode can be distinctly traced on the surface of their land for a considerable distance.

At Killonbutta, which is about 10 miles westerly from Molong, and about 4 miles easterly from the Woollogolong mine, Myers, Mould, and Edwards are prospecting for gold; they have a shaft sunk 40 feet. The prospects before sinking are said to have been 3 gr. of gold to the dish, obtained by Edwards. At Gumble, which is 12 miles south-westerly from Molong, five mineral leases have been applied for, embracing about 190 acres. For some reason which I do not know work has ceased on all, but probably will soon be resumed. From Mr. Andrew Delaney I ascertained that on the prospecting block 280 feet of sinking and 228 feet of driving have been done. Other parties have sunk shafts from 20 feet to 80 feet deep.

Mining in this division is only in a prospecting condition, but good results are reasonably expected.

SOUTHERN DISTRICT—ARALUEN, BRAIDWOOD, LITTLE RIVER, MAJOR'S CREEK, AND NERRIGA.

(Mr. Warden Aldcorn, P.M., Braidwood.)

MINING matters in the above divisions of the southern district during the year 1887 have continued very much as they were in the previous year.

The rainfall has been in excess of the average of several past years, and consequently a somewhat increased amount of work has been done in the way of ground-slucing. However, the supply of water has been very far from sufficient for continuous operations. The quantity of gold obtained from the above divisions, exclusive of Araluen, was about 3,000 oz., being an increase of several hundred ounces over the previous year. As regards Araluen, where the workings are best carried on in dry weather, the increased rainfall has been rather injurious than otherwise. Some of the stripping claims were filled in, causing loss of time as well as heavy expense in re-opening. There is consequently a falling off in the produce of this division, although the amount of gold obtained—over 4,000 oz.—may in the circumstances be considered satisfactory from so old a gold-field.

In my last report I mentioned that two parties were about to construct long and expensive races to work ground in the Nerriga Division, near the Shoalhaven River. One of these races has been completed for some months, and a beginning has been made in working the claims held by the Company. I have not recently visited the locality, but I am informed that the prospects are very good. The Mining Registrar will probably in his report give the latest results.

Not much progress has been made with the second race referred to, but it is expected that it will soon be vigorously proceeded with, and the cost, it is said, will be about £30,000. It is proposed to convey water both from the Shoalhaven River and the Little River, and the local manager of the Company is sanguine of very payable results in working some ground at the Oallen Crossing, Shoalhaven River.

As regards quartz-mining, there is little to report. At Little River the plant erected at a large cost by what was known as the Homeward Bound Co. was sold some months ago for about as many hundred pounds as it cost thousands, no real attempt to work the reefs in connection with which it was erected having been made. These reefs are therefore, for the present, abandoned. A few months ago a small crushing plant, worked by water-power, was erected at Little River, the object being to enable parties interested in the reefs to have trial crushings of stone made. Several lots have been tested, and in some instances showing payable results. The great want, however, is sufficient capital to efficiently work these reefs.

At Major's Creek little or nothing has been done in respect of the reefs on Crown Lands; but some time ago a quantity of stone from private land there was sent to England for treatment, and I have been informed that the results were so satisfactory as to lead to offers being made to the owners to have the reefs worked. It is to be hoped that the proposed arrangement may be satisfactorily carried out.

There have been several small efforts at prospecting made in different parts of the district, but they have not resulted in any new discovery, except that a party have found a silver lode about 35 miles to the south of Braidwood, near the Shoalhaven River. They have applied for a mineral lease.

SOUTHERN DISTRICT—NOWRA DIVISION.

(Mr. Warden M'Arthur, P.M., Nowra.)

I HAVE the honor to submit report respecting Yalwal Gold-fields. The following mines are in active work:—

1. Eclipse, No. 95.
2. Pinnacle, No. 92.
3. Homeward Bound, No. 13.
4. Pioneer, No. 93.

The Hit or Miss mine is at present at work in sinking a new drive, but are not yet on any payable stone. The detail of winnings, work in tunnelling, shaft-sinking, also number of miners employed, are set forth in the forms forwarded herewith. I should therefore desire to dwell more particularly on the reasonable prospects and general condition of the mining industry in this district. Several of the claims were recently registered for suspension pending the formation of a Company. This project appears to have failed, and at present the original holders are again working their several leases. I might here mention

mention that the mining industry of this district is very different to the general character of quartz reefing, insomuch that the lodes or veins of gold are undefined and of a very patchy and intermittent nature. Open quarrying passing through the machinery (both good and bad stone) appears to be the most payable and practicable manner of obtaining payable winning. The tunnelling and drives have not proved satisfactory, although a very large quantity of the stone would barely carry gold; still open-faced working appears to have proved the most profitable. The tunnelling and drives have not given satisfactory results, and a considerable amount of capital has been expended in testing the field by means of shafts, &c., so erratic are the veins and lodes that open quarrying passing through the machines (both poor and rich stone) has brought about the most favourable results. The principal character of the stone is dark quartz, interspersed with fine films of gold indiscriminately situated. The gold obtained is principally of a "flaky" nature. Few specimens that I have seen bear what is termed "rough" gold. Numerous prospects have been made on and about this gold-field, but the same character of auriferous stone prevails. The only way to obtain the gold resources of this field will be to erect large and extensive machinery crushing from an open-faced quarry, though a large quantity of indifferent stone would thus pass through the machinery. Still the gold-bearing stone being so scattered that the "output" from tunnels has not proved satisfactory, as it is practically impossible to trace any defined veins by shaft sinking or drives.

The Homeward Bound claim is giving highly satisfactory results. It is being worked almost entirely on a quarrying system, the stampers crushing all stone. Whether apparently payable or not, the returns of this claim are attached hereto (£5,655 12s.), having been obtained during past twelve months, whilst the working expenses are comparatively light.

The Yalwal gold-field generally requires large capital to develop and work to advantage the several mines. The difficulties of both ingress and egress greatly retard its progress. Although water is plentiful, the carriage of machinery and general stores is very expensive, thus defeating to a great extent the efforts of smaller miners and shareholders in testing the resources of their claims.

Upon looking through the several Mining Warden's reports with regard to Yalwal, I cannot find any detail entered into for departmental information and guidance of investors. Deeming it, therefore, not out of place, some retrospect and notation of geological formation would be of interest as supplement to this report.

Yalwal gold-field was proclaimed, March, 1878, and contains 97½ square miles, situated in county St. Vincent, about 24 miles west of the town of Nowra, and is practically the gold-field of the Shoalhaven district. The locality was proved to be auriferous as early as 1852, but was not actively worked for gold-reefing until about ten years ago. A large extent of the field has been prospected by pioneer fossickers, but only about 15 or 20 acres held under gold-mining lease has been operated upon with anything like system.

These leases lie on each side of the Danjera Creek. The "Pinnacle" and "Eclipse" claims, each in area about 4 acres, lie on the west of Danjera Creek; while the "Homeward Bound," 5 acres, "Pioneer," 5 acres, "Star," 8 acres, "Hit or Miss," 7 acres—also the Great Eastern (Caledonians) 12 acres—are situated on the east side of same stream, about half a mile further south-west of the valley of Danjera Creek (Yalwal).

The Etheta and Yalwal Creeks are branches of the Shoalhaven River. The Danjera Creek, upon which Yalwal township is situated is an ana-branch of the Yalwal Creek, running through series of gullies and rough mountainous country. With regard to the geological formation in the proclaimed area, from the sea coast almost to the Danjera Creek, the lower devonian system of rocks with occasional patches of alluvial deposits on them are to be found; reaching Yalwal proper, a sudden change takes place in the rock system, brought about by the occurrence of deep ravine-like valleys, radiating in almost every direction from the confluence of the Yalwal with the Shoalhaven. The lower carboniferous measures cap all the table-land in this locality. The stratifications to the edge of the cliffs has suffered little by the physical contortions widened in the valleys below. Descending into the valley of the Danjera, where the present mines are in operation, beds of micaceous shales, drift conglomerate svenitic trap, lower silurian slates, and bands of schists; also quartzites are in a more or less confused state passed through until the water level, about 900 feet below the plateau, surfaced by the carboniferous measures before referred to. Looking from the table-land down into the gullies, valleys, falls, &c., through which the Danjera and other minor streams run, the greatest confusion in the natural formation of the surrounding country exists. This character is continued for miles. The prospects throughout this broken and rugged locality have been of a favorable nature, both on the steep ranges and nearer the streams. As before mentioned, the difficulty for transit of goods and machinery, &c., has proved a formidable drawback in even making a fair prospect to thoroughly test the resources of these gullies. The auriferous character of the stone and general geological aspect would warrant a much closer and more searching investigation, which, however, would require considerable capital to undertake in a satisfactory manner.

The actual settlement or village of Yalwal, on the Danjera Creek, is about 900 feet below the table-land. The workings generally—shafts, drives, &c.—are from 100 to 400 feet above the level of the water, principally on a bold ridge or "back reef," formed for the most part of breccia and quartzites, trending from S.S. East to N.N. West. The Danjera is joined on the east side by the Yarramumura Creek from Sailors Gully, bisecting the main ridge at the village of Yalwal. This ridge is considered highly auriferous at its base, about 20 chains wide, narrowing into an open varying from a few feet to 2 chains wide. It eventually is lost in the table-land, but has been traced for a considerable distance inland. Where this ridge is bisected it is apparent that the main body is an immense dike (dyke), composed of breccia and quartzites, interlaced with minute veins of pure silica. Back from the intersecting stream the "fall away" from the top involves some difficulty in tapping the ridge, but bold steep heads of it are seen on each side of the stream, about 40 feet wide on average; the western side slightly underlying the ridge on the east. These heads or projections are not exactly opposite or in line with each other. Some mining experts are of opinion that there are two parallel dikes (dykes), one appearing on the east and one on west of the stream; but after careful examination of the country for some distance, together with the general average incline of each I am led to the conclusion that the disparity in line is what is termed a vertical "fault" in the *one* dike (dyke), or dislocation, caused by the physical disturbances which cleft the rock system at this place, where the Danjera has now formed its bed.

Further south, on the western slope, huge masses of schist, and quartzites protrude from the ferruginous clay coating on the ridge. Good results were here obtained by prospecting parties some

eight years ago. Tunnels were driven from west to east at right angles to the ridge. Here breccia, schist, quartzose were found to exist upon the rock being cut into. No *defined* reef has been met with, the lode worked in each case being simply an auriferous (in many specimens and veins highly so), and also patchy argentiferous zone of quartzite. So far the gold is principally restricted to what might be termed orbital cleavages in the stone; but no unfrequently the gold is found beyond the wall of these erratically formed cells or fissures in the stone, and sometimes it "straves" out regardless of the hitherto considered reliable local indications.

The value of the gold is from £3 2s. 6d. to as high as £3 17s. 6d. (standard), but as it comes from the retort it is found to contain almost uniformly 20 per. cent. of silver, for which the average value obtained is 4s. 6d. per ounce.

With the exception of the Homeward Bound claim, which has raised during the past twelve months about 3,000 tons stone in output from their quarry, yielding 1,740 oz. 5 dwt., of the value of £5,655 12s., together with a previous record from Mint and other source of about £16,000 since it has been in operation, all the other mines may still be said to be in the prospecting stage (the particulars of output and winnings on printed forms furnished herewith). After careful investigation and taking into consideration the geological peculiarity of this gold-field, I am of opinion that considerable latitude should be allowed in the labour conditions until the reef is actually struck and payable gold discovered, although it does not seem too stringent to require four or five men to be constantly employed on a 5-acre lease under the ordinary or usual surroundings and general character of gold-fields; but where the entire area of the claim consists of quartzose rock, almost impregnable in many places, and only desolate patches payable auriferous. Until the reef or ridge is fairly opened, I think one "shift" per day would fairly satisfy the labour conditions until crushing of payable gold is reported. At present the conditions of some of the leases require from six to eight men in constant work to obviate their liability of forfeiture or cancellation, the result being that much enterprise is checked and prospective operations so expensive and practically prohibitory to any other than large capitalists. Should the latitude I suggest be approved of, it will be calculated to improve the general progress of this gold-field, and its resources be more generally discovered. Many experienced miners have great confidence of obtaining good winnings and highly payable results when the reef or ridge is well opened. [Noted before as the dike (dyke) when describing the geological features of the country.] Heretofore the proprietors' managers have kept the records of their output and winnings in a very unsatisfactory manner, and inform me that they were never asked to produce any statement of their several workings. However, for the future, and upon the occasion of my last two visits to Yalwal, satisfactory records have been forthcoming showing the general progress and affairs connected with each holding.

Carter's silver mine or lead, M.L. 2,863, has at present three men at work. One shaft has been sunk, also two drives. More prospecting than actual mining, nothing payable having yet been discovered as far as I can learn, more machinery being required to develop this lease.

In concluding my report I may mention that this gold-field, as far as concerns shareholders, and placing it in the mining market with a view of floating a company to work on an extensive scale of crushing has been confined, I am given to understand, almost exclusively to the Melbourne or Victorian brokers. Capitalists in England have, I am informed, been interviewed with a similar view of forming a large company; to the present I have not learned of any satisfactory issue. I would also add that I have experienced the greatest difficulty in obtaining any reliable information from the working managers as to their output and general results. I can only conjecture the reason of their reticence. Considerable dissatisfaction also exists amongst the miners with regard to the privacy existing as to aggregate winnings; indeed, it was not until I threatened to adopt an extreme course that I was enabled to obtain any definite information with regard to output and comparative winnings, &c., in order to prepare this report and complete the printed forms. To overcome this difficulty in the future I have apprised each of the managers that a book must be kept for each mine, showing the business transacted. On my visits to Yalwal these are to be exhibited to me to make extracts, and from time to time report to the Department of Mines progress or otherwise. I have every reason to look upon Yalwal as one of the prospective gold-fields of the Colony, wanting only large crushing machinery to develop its resources.

I attach a rough sketch* of the locality, which, however, will convey some idea of the relative positions of the several mines.

SOUTHERN DISTRICT—BERRIMA DIVISION.

(Mr. Warden Wilshire, P.M., Berrima.)

I HAVE the honor to report for your information that, during the past year, the mining interests of the division assigned to my supervision have shown a considerable improvement on those of last year, more particularly in the district of Goulburn.

The number of miner's rights issued in that district last year were 145, as against 34 in 1886; the number of mineral leases, 34, as against 17 last year; and the number of gold leases, 54, as against 1 last year; thus showing a considerable increase in each case. There have also been issued 13 mineral permits in the same period.

Mining speculators from Victoria have been largely instrumental in this movement, and the Carrington Mine was the first to attract attention. Victorian capital is now forthcoming to open and test this mine in a manner that will shortly leave little doubt of its profitable working or otherwise. In the event of this lode (consisting, as it does, principally of iron ore) proving remunerative in the precious metals, there is little doubt but that the well known numerous and extensive lodes of similar mineral, outcropping at Jerara Creek and at Ryan's, near the Look Down, and other neighbouring localities, covering a considerable area of country, will also prove payable in gold and silver. Traces of both metals can, I am assured, be found in the surface cappings of these immense iron lodes, and as very little denudation appears to have taken place about the locality of these lodes, deep sinking into them will, in all probability, prove them payable in many places.

A great deal of local interest is therefore attached to the progress and ultimate result of the operations now being proceeded with at the Carrington Mine, and the future mining interests of the Goulburn district will be largely influenced by the success or otherwise of the Carrington tests. So far these tests are, I am informed, decidedly encouraging to the proprietor s

Quartz

* Appendix A

Quartz reefing has also received an impetus. Reefs of an exceedingly rich character, it is alleged, have lately been opened by a Mr. O'Keefe (representing Melbourne capitalists), at a place called Windalama or Narrumunga, some 24 miles in the Braidwood direction from Goulburn. Thirteen or fourteen reefs have been opened within an area of some 50 acres or so, all carrying payable gold; one of them in particular, it is alleged, showing very rich results as surface indications, and the proprietors indulge in great anticipations in connection with it.

In this same neighbourhood a very large (probably glacial) gold-bearing drift is reported to exist, similar to some now being extensively and profitably worked in New Zealand, &c. The area covered is represented as being some 40 miles in length and 12 in width; but I have not seen it, and am speaking from report only. It lies some 1,200 feet above the present Shoalhaven River bed, and is said to carry gold to the extent of several dwt. per ton (or to the load); but, owing to length of carriage and scarcity of water, the drift has not as yet been worked. I mention this matter, as the existence of this apparently very valuable drift deposit may possibly not have been made known to the Department before. In New Zealand, I believe, drift, yielding 1 grain of gold only to the ton, is worked by hydraulic machinery, &c., with highly remunerative results.

Should this Shoalhaven drift-bed prove as rich as is now represented, a very valuable mining area is here indicated, and is possibly worth some attention by the recently appointed Mining Prospecting Board, with a view of its future development.

A lode yielding, it is said, 10 dwt. of gold and 14 oz. of silver to the ton, has been discovered on the Wollondilly River, near Towrang. A shaft is being sunk to prove the value and extent of the deposit.

On the iron lodes at Ryan's (Brisbane Meadows) two or three parties are engaged sinking shafts, but some time must yet elapse before any reliable results can be arrived at. These lodes, I may mention, form part of the one spoken of by the late Rev. W. B. Clarke in his "Southern Gold-fields," tests of which, made at his instigation, were found to yield gold and silver in small quantities, the tests being of surface stuff only.

The lodes outcrop on the surface in many places in the locality, and appear to be flanked on the one side by immense limestone beds, and on the other by shaley (salurian) slates. Granite exists also, in close proximity and adjacent. Quartz reefs, containing gold, are being explored. Alluvial gold, in small quantities, is also found in Bungonia Creek within a mile or so, showing the auriferous nature of the locality.

In several other places prospecting is being vigorously proceeded with, and the district generally will receive a good searching within the next few months; but, at present, very little definite information as to future results can be supplied.

There is nothing important to report concerning the iron, coal, or shale mining in the division. The Goodya Shale Company are still carrying on an extensive and important business. A company has lately been formed to work a coal-seam near Mittagong, represented principally by Melbourne people; they are now engaged constructing a 4½ gauge tramway from the coal to the Great Southern Line, some 5 or 6 miles in length. The coal is said to be good.

Another new company has just been formed in England, for working coal seams near Wingello in this district, and which locality represents the most southerly outcrop of great New South Wales coal basin.

Berrima Colliery is still putting out a limited quantity of coal, and the Erith Colliery is, I believe, to commence operations again soon, and after a standstill of some twelve months or more.

Reverting to gold, the precious metal, in payable quantities, is said to have been obtained from an iron ore deposit on private ground near the village of Robertson; but I am not in a position to confirm this or furnish any particulars.

At the Mittagong Gold-field, a Mr. Finlay had for some time a diamond washing machine at work, testing a large drift-bed there for that gem; but, after a fruitless expenditure of some £600, he has abandoned the search, under a strong conviction that no diamonds exist there, or if so, not in payable quantities—he got none at all.

SOUTHERN DISTRICT—BOMBALA DIVISION.

(Mr. Warden Giles, P.M., Bombala.)

I HAVE the honor to submit my report for the year 1887 upon the Bombala and Cooma Divisions of the Southern and Tumut and Adelong Mining Districts, over which I exercise supervision as Warden, and which embrace the following gold-fields, viz.:—Delegate, Towomba, Nimitybelle, Collinton, Snowy River, Crackenback, and Kiandra.

As previously instructed, I presume the Mining Registrars and Wardens' Clerks in my divisions, and who are stationed at Bega, Eden, Bombala, Nimitybelle, Cooma, and Kiandra, have already furnished their reports for the past year, giving detailed accounts of the various workings, proceeds, &c.; also the number of miners' rights, business and mineral licenses, issued within their respective divisions to the 31st December last.

At Kiandra the gold won during the past year did not exceed 1,000 oz., being considerably less than the yield for 1886. I have not made my usual inspection of this gold-field owing to the temporary appointment of Mr. Love on the 1st July last, and in consequence thereof am unable to furnish fuller information at present.

The mining population of Kiandra, Crackenback, and Snowy River Gold-fields may be estimated at 400, consisting of Europeans and Chinese.

Nimitybelle Gold-field.—I am pleased to state that there is a marked improvement in mining matters upon this gold-field.

Collinton Gold-field.—Several mineral leases have been applied for. I anticipate the Bredbo Silver-mining Company will have good results from their workings at Bredbo. At Michelago there has been a considerable stir amongst miners, owing to the discovery of some new quartz reefs.

Towomba Gold-field.—Several prospecting parties have been searching for gold and silver reefs on this gold-field during the past year.

The assays made of ore taken from a reef on this field near Bombala varied from 12 to 25 oz. of silver and 2 oz. of gold to the ton.

Delegate Gold-field.—Mining business on this gold-field continues to improve. In the parishes of Quidong, Merriangah, Cambalong, and Bombala, mineral leases have been applied for with a view to searching for silver.

SOUTHERN

SOUTHERN DISTRICT—MORUYA DIVISION.

(Mr. Warden Maunsell, P.M., Moruya.)

In furnishing you with my annual report for the year ending December, 1887, I have much pleasure in informing you that the mining industry in this division, especially reef-mining, is in a much more satisfactory condition than it has been for some years past. Since my last report several new and apparently very promising discoveries of quartz reefs have been made in this division, especially in the neighbourhood of Nerrigundah and the Tuross River, parish of Cadjee, county of Dampier. From the general and Mint assays that have been made of the quartz from the various depths leads one to believe that when the machinery for crushing, now in course of erection, is completed, a very large yield of gold will be the result, and doubtless will give a sharp impetus to prospecting for others yet undiscovered, as it is the opinion both of scientific experts, who have recently visited Nerrigundah, as well as that of old practical miners, who worked the alluvial in the old Gulf Creek at Nerrigundah years ago, that numerous quartz reefs exist, yet undiscovered as in the alluvial, in the main Gulf Creek as well as in its lateral branches, numerous specimens of quartz containing gold were found by the alluvial miners, undoubtedly deposited there by the disintegration of quartz reefs in the immediate vicinity. Although for years past it was thought that quartz reef carrying gold existed, and in fact were found, no plant for crushing quartz and extracting the gold was erected on the gold-field. In consequence of the recent discoveries a capitalist in the locality has been induced to erect a very fine 10-stamper battery, which will commence operations in a few days, and crush for the public; which will be a great boon to the miners holding claims.

About 3 mile north-westerly from the Nerrigundah Village is situated the Mount Coman Quartz-mining Lease. This reef is noted for its great extent and width more than for its apparent richness. Messrs. Coman & Bloomfield, the proprietors, are erecting a large and costly plant for extracting the gold. The ore is not at all refractory, and grand results are expected, as the quartz exists in such quantities and so easy to work.

There exists in Quart-pot Creek, a small tributary of the Tuross River, and once an alluvial diggings, a recently discovered quartz reef, and several claims have been taken up, and from the report of the assay supposed to be very rich; and a crushing plant will soon be erected there, which will give an impetus to prospecting for further reefs in that vicinity.

At Wagonga, North Head, several claims and leases are amalgamated under the name of the Belle of Australia, now in the hands of the Bodalla Gold-mining Company, is now being vigorously worked, and powerful machinery for working a battery of 20 heads, with all modern appliances, will shortly be erected.

Mount Carrington, the property of Wiley, Carter, and others, is also a very fine quartz-mine, situated at the Wagonga, North Head, east of the Belle of Australia Mine. The work in this mine has been confined to sinking the shaft, which is down nearly 100 feet upon the reef, which is nearly 9 feet wide, and the stone is of a very rich quality for so wide a reef.

This party owns a small battery of 10 head of stampers, with wheeler, pans, and amalgamator; but unfortunately the machine is erected too far away from the mine, that the cost of cartage will be too heavy, and the owners are about to shift the machinery to a site adjacent to the mine. They will then be able to put through 100 tons a week if necessary, as the supply of quartz is practically unlimited. There are a few other reefs in this locality held by working miners, but the progress of development is so slow in these cases that I cannot report any very satisfactory results yet.

Near Moruya, at the Condoim Creek and at the old Donkey Hill, several of the old reefs are reopened, and some new reefs have lately been discovered. The crushing plant at the silver-mine has been renovated and repaired, and has been now some weeks engaged in crushing, with very fair results. It is the opinion of practical men that only by the most approved of modern appliances for saving gold can the ore of this locality be successfully dealt with.

Now with regard to alluvial mining, very little work is being done, as most of the diggers are engaged in the development of the quartz reefs.

A few claims are being worked at Mogo, but it is next to impossible to obtain results as to the quantity of gold obtained. One party at Mogo has erected a steam-pump to drain their claims. It was found inefficient for the purpose, so they are about to obtain a much more powerful one. What little ground, drained by the pump they used, resulted in a return of nearly 5 oz. to the load. There are other parties engaged about the heads of the Tuross River, near Dolundundah, in the county of Dampier, in prospecting. I have long intended visiting this locality, but have waited for a favourable opportunity; the winter season is too severe, and as the locality is almost uninhabited it would necessitate my camping out. Since the summer season set in, there has been so much rain that hardly a week but that the Wadbillija River has been unfordable. Lately this district has been visited by several scientific geologists, including Mr. Regd. Murray, Dr. Robertson, and others, who are highly pleased with the aspect of its mineral resources. It is the opinion of scientific men, practically acquainted with auriferous country, that large areas of auriferous drifts, yet untouched, exist within this division, and I think it is very desirable that an officer of the Department with a practical knowledge of geology should examine this district and report upon its characteristics. Such report would undoubtedly do more than anything else to stimulate alluvial mining in the district.

I would refer you to my report of recent discoveries in detail at the Gulf.

SOUTHERN DISTRICT—MILTON DIVISION.

(Jno. T. Hobbes, Mining Registrar.)

In furnishing a report of the mining operations for the past year in the District of Dowling (now Land District of Milton), I have the honor to state that this being more especially a dairying district, but little attention is bestowed upon mining matters by the residents generally. There are, however, men scattered amongst the spurs of the Main Range, extending from near the head of the Clyde River to Brooman, and westerly to the Budawang Mountain, being the south-western limit of this district, who throughout are obtaining gold in addition to other minerals.

The only movements that have taken place are, first, at Spur Gulley, near Brooman, where a few years since alluvial gold was found in payable quantities, there has been a party searching for a reef which is believed to exist in close proximity, but not being practical or experienced miners, prospecting was of short duration and without favourable results.

Near

Near the Budawang Mountain there has been recently discovered what may prove to be a good copper mine. I have been shown specimens stated to have come from it denoting great richness. As the land has been applied for at Braidwood, I am unable to give further information as to its exact locality and the work done upon it, in the way of opening out.

At Little Forest, about 7 miles from Milton, two blocks of land have been applied for for coal-mining. Under spurs of the Main Range, creeks have cut through and exposed to view, three or four seams, the largest and lowest in the creek, being about 2 feet thick, the coal is bright, burns well and appears on trial to have a large proportion of gas, no sinking has been attempted, but the proprietors are taking steps to prospect the ground by sinking a shaft or using an auger. Should they be successful, a good shipping port is to be found at Ulladulla Harbour, distant about 11 miles, the road for some distance passing through Crown Lands.

SOUTHERN DISTRICT—COBARGO DIVISION.

(*L. J. Clifford, Mining Registrar.*)

I HAVE the honor to report for your information that there has been no mining carried on in this district for the past twelve months, the miners' rights issued, viz., thirty-four, by Mining Registrar at Cobargo for the year ending 31st December, was issued to miners going to the Nerrigundah Gold-field. The number of business licenses issued up to same date is twenty-three, they are issued to persons living within the Dromedary Gold-field reserve.

SOUTHERN DISTRICT—WAGONGA DIVISION.

(*A. M. Smith, Mining Registrar.*)

I HAVE the honor to forward my report for the year 1887 of the mining industry in this division.

Wagonga.

Work at the Bodalla Gold-mining Company's reef, the Belle of Australia, has been pushed forward with energy and system under the present management, the time lost and money squandered on this reef through former mismanagement has occasioned much delay in rectifying errors. There is no plant on the ground as yet. I understand, however, that a battery of 20 head of stampers will be erected early next year, the large body of quartz looks well, and trial crushings have proved satisfactory, twenty miners have been at work in the mine ever since the leases were granted, and many more will find employment when the works are in full operation.

The Lady Carrington Reef promises to turn out a valuable property, the stone showing gold freely the reef is 9 feet wide in some places, and stone easily got, so that the battery of the Company will shortly be kept constantly at work and employ a good many hands. There not being up to the present time any machinery attached to the John Foster Reef, the quantity of stone brought to grass has been small considering the time the reef has been worked, with however only three men, an increased number of workers will result from the erection of machinery, which the proprietors are now in treaty for, and are confident that the crushings will give profitable returns.

Mount Dromedary.

Mining on the mountain is in much the same condition as it has been for years, small parties of from two to six men making good wages, the veins are narrow, consequently there is little room for the employment of more than a few men to each claim.

Nerrigundah.

Doubtless the Mining Registrar at Eurobodalla will furnish his report on this section of the gold-field; as however all applications for gold-mining leases come through the Wagonga Office, I have a better opportunity of knowing the progress made in reefing during the year. Since my last report, the discovery of several gold-bearing reefs has given an impetus to mining that promises a revival of former prosperity, the absence of crushing machinery has been a serious drawback to the holders of small claims possessed of little money. Mr. Pollock, a resident in the township, has erected a 10-stamper battery, which will be in position to crush about the middle of January, I believe it is his intention to crush for certain claims in which interests are allotted to him in consideration of crushing. The Firey Cross (the first reef discovered), White Angel, and others, are conveniently situated to this plant, the stone from all of the reefs looks well, running from 15 inches to 3 feet wide.

Mount Coman, situated at the head of North's Creek (noted for its riches in the old alluvial days) on a high peak which has an altitude of 1,000 feet from the bed of the Creek. A true fissure reef intersects the spur, being in width from 4 feet to 12 feet. The stone is laminated and of magnificent quality, showing gold freely. Regnold Murray, Government Geologist for the Victorian Government, and Theodore Rauff, of Sydney, inspected this property, and reported on it in very high terms. A crushing plant is now in transit for the future working of the mine, and Messrs. Coman & Blomfield, the proprietors, estimate the cost of the machinery at £6,000.

Quart-pot.

On the Tuross River, an old abandoned alluvial digging, has again become the scene of activity, simultaneously with the discovery of the Nerrigundah reefs, gold-bearing quartz having been found at this place; a number of claims were taken up; a miner from the ground showed me a piece of stone of about 1 lb. weight, which to use his own expression was "an alarmer;" this piece when crushed yielded at the rate of 7,000 oz. of gold to the ton. It would be premature to give any opinion of the reefs in this locality, their discovery being of so recent a date. Tin-pot, where gold in quartz is known to exist, lies in the same neighbourhood.

Alluvial.

No alluvial diggings have been discovered since the Montreal rush, what few diggers remain are scattered miles apart from each other, working alone, known by the name of *Hatters*, fossicking anywhere, having no fixed abode, they are chiefly old men, who in most instances will tell you that they had made their pile but knocked it down.

During

During the year, 105 miners' right, and 2 business licenses have been issued:—26 gold-mining leases comprising an area of 317 acres, have been applied for; 7 mineral leases were applied for, these however were refused by the Honorable the Minister for Mines, owing to the ground being auriferous, this decision gave general satisfaction amongst gold-miners, by putting a stop to a monopoly of land under the guise of searching for silver.

The form (Schedule 1) "Notice of intention to apply for a gold-mining lease," was at one time frequently taken advantage of by a renewal of the same on expiry of nine days, until it became known that the practice was an evasion of the Mining Act, and would if attempted, on representation to the Minister most likely militate against an applicant for a lease. Another method equally objectionable is now often resorted to—a party of miners (say four in number) take up ground with the object of applying for a lease, one of the party has the notice of intention posted up in his own name, at the expiration of nine days, another of the party does the same, and so on with the others; the only way to prevent this abuse is to stipulate for a deposit of 2s. 6d. or 5s. an acre, to be forfeited, unless the application is proceeded with, the deposit might appear as payment on account of rent. A great improvement is perceptible in the mining industry of the district, and it may be reasonably expected, when additional machinery is erected, that next year will far outstrip former years in quartz reefing, which will become the staple industry of the district if it is not so now.

SOUTHERN DISTRICT—EUROBADALIA DIVISION.

(*Henry J. Lea, Mining Registrar.*)

I HAVE the honor to report that a marked change for the better has taken place in mining matters at Nerrigundah during last year. Several prospecting protection areas and claims have been taken up by miners on the ranges about Nerrigundah, some of the stone obtained by them looks very well. There is at the present time about 200 tons of stone at grass, obtained by the miners from the different claims waiting to be crushed. Mr. James Pollock is erecting a battery at Nerrigundah, which will be ready for work next week, then the miners will be able to prove the value of their quartz.

Nearly all the mining business of Nerrigundah is transacted by the Warden's Clerk at Wagonga. The number of miners' rights issued here during 1887, was ninety-one and seven business licenses.

SOUTHERN DISTRICT—MORUYA DIVISION.

(*H. N. Barton, Mining Registrar.*)

In submitting the annual report of my division for the year 1887, I have the honor to state, for your information, that I have noted some very excellent prospects in quartz-mining. Some well defined reefs having been discovered near Moruya, in the neighbourhood of Myrtle and Dwyer's Creek, also at Donkey Hill. At Myrtle Creek, No. 9 gold lease of 25 acres, occupied by William Hunt, called the Phoenix, shows a continuous and well defined reef, between 2 and 3 feet wide—the quartz from which is of a very peculiar character, being of a dark slaty colour, strongly impregnated with pyrites, silver, sulphur, and some other metals. From the result of a crushing of about 4 tons at the Sydney Mint recently, the returns were unfavourable, not realizing upon an average more than 3 dwt. to the ton.

Notwithstanding this poor return, coarse shotty gold can be seen in almost every piece of stone: 25 lb. weight or thereabouts have since been chemically treated, and the returns pro rata was 5 oz. some dwt. to the ton.

Mr. Hunt, who is an old practical miner, seems quite satisfied that the stone referred to from the Phoenix requires special treatment to save the gold, which he feels sure has been lost by the ordinary process. Another reef, No. 14 lease of 15 acres, occupied by the same person, W. Hunt, shows good quartz with coarse gold running through the stone and looking rich. Eight men are at present down some 35 ft. in the solid. This reef is a clear whity brown stone, requiring only the ordinary crushing and amalgamating process. 2 tons are being crushed, but as far as I can learn, the result is not known. Upon the whole, I cannot but observe, that there is a considerable improvement in quartz reefing, and generally in this division, and experts have given their opinion that there are some rich reefs in this neighbourhood.

From 40 to 50 tons of quartz have been crushed by Guy's machine (the old silver mine plant), and the result has been good wages for three men's work for a considerable time. This stone has been grassed from little leaders from the Donkey Hill and neighbourhood.

At Mogo to the north there has been the usual returns from alluvial ground, the Monkey Gully and Cabbage-tree Creek, but both these places are very wet, but the water has been got under by an 8-horse power engine lately brought down, and a paddock 7 x 8 ft. was bottomed at 20 ft. realizing 4 oz. 10 dwt. a few days since. The owner of a lease in Mago has sunk three shafts, going down in the three about 200 ft., and he speaks favourably of the reefs he has discovered.

The miners at Hunt's reef at Myrtle and Dwyer's Creeks have returned from the holidays, and commenced sinking on W. A. Hunt's reef.

P.S.—A reef called the Little Gem, an 8-acre lease, is turning out splendid stone, a reliable reef. Only a few weeks work done as yet.

SOUTHERN DISTRICT—GUNNING DIVISION.

(*S. Pembroke, Warden's Clerk.*)

I HAVE the honor to report that mining has been at a standstill in the district of Gunning during the past year, although rumours have from time to time reached me to the effect that capitalists have visited on several occasions the "Jerrama" Creek gold-field reserve, with a view of obtaining information as to the auriferous nature of the land within the reserve. It is difficult to obtain reliable information, as miners may arrive from other districts, and prospect in the district without becoming acquainted with the fact. I have no doubt the present reaction in mining elsewhere will have the effect of causing the country around here to be prospected.

SOUTHERN DISTRICT—ARADUEN DIVISION.

(E. F. Carlile, Mining Registrar.)

My returns for the year 1887 show:—Gold obtained 4,244 oz., value £16,359 8s., being 4,200 oz. from alluvium, and 44 oz. from quartz. The amount of alluvial gold would have been much larger but for the occurrence of severe disastrous floods, which swept away some expensive weather-board and stone dams, and broke into the boxed-tail-races, destroying some of these; several of the deep drifting claims were also filled with sand, thus entailing several months' unremunerative labour to reopen.

There have not been any new finds during the year, though there was a small rush to the Upper Strachaven, which did not, however, result in any good; but I have been informed during the past few days that there are indications of a silver mine in the neighbourhood, and some work is being done to test the ground.

A little quartz mining has been done as usual at Bell's Creek, with somewhat better result than in the previous year.

SOUTHERN DISTRICT—LITTLE RIVER DIVISION.

(B. J. Galway, Mining Registrar.)

I HAVE the honor to submit for the information of the Honorable the Minister for Mines, my report for the past year, of The Little River Division of the southern district.

A start has been made to work the quartz reef in this division.

Eight leases covering 30 acres, having been applied and 155 tons of stone raised, which returned 209 oz. of gold. The depth of sinking is from 30 to 52 feet. Water being found in the working at from 30 to 40 feet.

The claims holding will have to procure pumping power before sinking deeper. The Day Dawn and Earl Granville Company have two pumps on the ground, and a drainage level has been driven into the E. G. shaft, 33 feet deep; the owner hopes to be able to prove the reef to be a further depth of 50 feet; 10 tons of stone from Earl Granville's returning 44 oz. of gold, and 5 tons from Day Dawn, 18 oz.

The reefs are all held by working men, and an apathy exists amongst the commercial and pastoral of Braidwood in regard to developing its mineral wealth. That rich and extensive deposits are to be found, is clearly proved by the extensive auriferous growth now opening up by outside parties in the adjoining division of Narriga, the district capitalists having no share in the ventures.

No rain sufficient to supply the water-races has fallen here until November; since then, there has been a moderate supply, and several of the races after a dry term of eight years are now at work. The gold to be seen will be found in the 1888 returns.

A number of the miners have been employed on the Corang race, and many old hands are finding their way back to this locality. 138 miners rights have been issued and 6 business licenses.

As the belt of deep auriferous tracts now being worked at Narriga continue to follow the course of the Corrocilly and Budawang ranges of hills through this division. No doubt when capitalists see the full development of the sluicing there, similar sluicing companies will be formed in this division.

SOUTHERN DISTRICT.—NARRIGA DIVISION.

(James Galway, Mining Registrar.)

I HAVE the honor to forward report for the past year, and with much pleasure to state that the Goring Sluicing Company's water-race is completed, and an abundant supply of water is obtained for hydraulic sluicing at their claims, Tailor's Gully.

The Manager is now engaged in preparing a tail-race, which is now 25 feet deep, and an additional depth of 100 feet can be obtained as required; and has opened out on a bed of rich auriferous wash some 75 yards in width, and of a depth at present unknown, and which prospects as high as 24 grains to the dish in some parts, and very payable prospects can be obtained from any part of ground.

This water-race is, I believe, the most complete and extensive in the Colony, and reflects great credit on all concerned.

The following is a concise description of the works, which are of a substantial description:—

The race starts from the head of the Bewley River, which takes its rise in the Buddawang Ranges, and is a tributary to the Shoalhaven River. The length of race is 24 miles, and from the starting point to the first flume a cutting of 140 feet in the rock had to be cut, a large quantity of powder and dynamite being used.

Sixty-two chains of fluming carry the water over the broken ground, and the Gorang River is twice crossed at a height of 80 feet. The water runs in galvanized iron piping, then some miles of open cuttings until the Jerricknorra Creek is reached at a level of 100 feet from its bed; here, to avoid the high flumes required a syphon, consisting of wrought-iron pipes 24 inches in diameter, is used, and which, with a fall in the entire length of 5 feet, is a success, and carries a full supply of water.

Then more cuttings with tunnels of 1,300, 400, and 300 feet in length, and another flume of 400 feet completes the race.

The Company have an abundant supply of water at present, and, to obtain this in all seasons, intend to construct a reservoir at the head of the race, where a natural basin in the mountain affords a magnificent site.

This enterprise will, if successful, cause a great revival in mining in this district. The Company's works have cost £10,000, and it is to be hoped that the pluck and energy shown by the Company will be rewarded.

Parties interested in mining visiting the district will be well rewarded by a visit to the works.

Another Sydney company have taken out water rights for a race from the Shoalhaven River at Warri, to be used near the Oallen Crossing, where 525 acres are leased. They also hold water rights from the Little River, which will connect with the main race. This race will be 7 feet wide on top, 3 feet on bottom, and 3 feet deep.

The manager has been engaged for some time sinking prospecting shafts on the leases, and with marked success. From some forty shafts, varying from 25 to 45 feet, the latter not bottomed, water being met with, prospects of 6 to 24 grains to the cubic yard has been obtained, and the further back from the river the gold obtained was coarser and the alluvial richer, and, except on the river bank, no previous work or prospecting has been done. From what I have myself seen of this company's ground a grand return for their outlay may be confidently expected.

A

A third race on a similar scale to those mentioned was taken up, starting from the Bewley or Endrick River, another tributary to the Shoalhaven, and intended for hydraulic sluicing at Terrance's Hill, in the division where a deep alluvial wash is known to exist, but the promoters were met with such exorbitant demands for compensation from holders through whose land the proposed race would pass, that they gave up the matter in disgust.

Work in the bed of the Shoalhaven River has been much interrupted by freshes in the river, and a number of the miners there have been working on the Gorang race.

Two prospecting areas for quartz are at present occupied, and, I am led to believe, encouraging prospects obtained.

SOUTHERN DISTRICT—MAJOR'S CREEK DIVISION.

(*John Heazlett, Mining Registrar.*)

IN preparing this, my statistical report for the year ending the 31st December, 1887, I find there has been a little improvement in gold mining, *i.e.*, so far as the quantity of gold won is taken into account, there being nearly 220 oz. over and above that of the year 1886. Moreover, some parcels have been taken to Braidwood and the Mint, which I may set down at 120 oz.; but whether this quantity is more or less than what has been disposed of at Braidwood during previous years I am unable to say, but this much I can say, *viz.*, the quantity set down in tabular form herewith has been purchased at the Creek; therefore the year 1887 has beaten the record of 1886, yet no new ground has been opened "in either quartz or alluvium."

In my previous reports I have said, that with a supply of water, this field would continue to yield handsome returns for many years to come, and as yet see no reason why I should alter my opinion. The past year has been the wettest we have had for a long time past, yet have not had a flood, or, as the diggers term it, "three days water up;" and until they get this very little can be done in the deep ground; that is to say, it cannot be worked profitably, not so with shallow or surface ground, and the past year having been more favorable, much shallow ground has been worked, and although not rich in gold, small returns are considered preferable to being idle.

During the past year the Long Flat portion of the field has been worked by ground-sluicing for the most part, and less puddling done in consequence, and no account can be given as to the number of loads or tons put through the mills, and the yield of gold therefrom. I may mention that there is ground enough here (old workings) to last for the next twenty years; but not having a good fall or get away for the stuff (which is tough) the process of working is rather slow. Major's Creek is much better adapted for ground-sluicing or flooding off on a large scale than what the Long Flat is, but not so rich in gold; and the main creek being wide it requires a great force of water to clean it out, which if not done, the claims become blocked or silted up.

Re quartz mining, there is little to be said in its favour, there having been only one party so engaged during the past year, and their operations have been confined to surfacing and working an old and abandoned reef, which, when first worked many years ago, was considered not payable. This party, having their own crushing mill, can make it pay better than if they were obliged to pay for the crushing; in fact, they could not afford to do so, hence erected their own battery, but having to pay rent for steam engine, and 10 per cent. royalty, they cannot do more than make a bare living, "if even so much."

What is known as Dargue's Reef at Spring Creek is having a spell, and the Snob's Reef at Big Hill has not been worked during the past six years and ten months; nevertheless, it has been held possession of all these years. I have often heard miners say that if open to be taken up they would have made up a party and have given it another trial.

I have known people to come from other parts of the Colony for the express purpose of taking up this reef, but on finding it occupied, that is, "Registered for suspension," they left this neighbourhood. I may also state that had the Snob Reef been vacant I stood a good show to have got it floated into an English Company, and have letters in my possession from a gentleman who had gone to England and successfully floated one company, and was open for more work, provided I could recommend a mundie, or, as he termed it, a pyrites mine, worthy of a fair trial. Probably this is only one of the many instances where capital is being locked out owing to speculators and adventurers taking up ground with the view to making a few pounds out of. It is not, however, the way to develop the resources of the gold-fields. During the past year I have sold forty-one miners' rights, as against sixty-one in 1886, and to account for the decrease may state that during the latter year I sold some to miners at Captain's Flat. Moreover I know that some miners within my division procure rights at Braidwood and Araluen.

SOUTHERN DISTRICT—BRAIDWOOD DIVISION.

(*C. E. O. Slear, Mining Registrar.*)

REGARDING mining matters in my portion of the Braidwood District, there has been comparatively little or no progress during the past year, no fresh discoveries have been made, and the present claims at work yielding nothing more than fair wages to those concerned. Capital is what is required to give any impetus to the mining industry here, but unfortunately does not seem to be forthcoming, however I am fully convinced that this district will ere long take a lead again as a mining centre

SOUTHERN DISTRICT—GOULBURN DIVISION.

(*A. A. Willans, Mining Registrar.*)

IN reply to your memorandum of 31st ultimo, with reference to my annual report for year 1887.

I have the honor to state that the mining in this district is at present in its infancy.

Near the end of December last I made application to the secretary of the first mine started during my time in this district, the said mine was floated into a Company called the "New Carrington Gold and Silver-mining Co.," and he (the secretary) said that in justice to the mine he could not give me a report for the year 1887, as the smelters had only been at work for about a week. Number of mineral leases applied for during year 1887 were thirty-three, of which twenty-six were applied for between 1st of August and 31st December.

Number

Number of gold-mining leases—fifty-four, all of which were applied for between 21st August and 31st December.

During the year I issued 145 miners' rights, of which 116 were issued between 1st July and 31st December. Mineral licenses issued, numbered sixty, and fifty-nine of same were issued between 1st July and 31st December. Business licenses issued, nil.

SOUTHERN DISTRICT—BOMBALA DIVISION.

(*W. A. Dorers, Mining-Registrar.*)

I HAVE the honor to tender my report, as Mining Registrar, for the year 1887; and as on the last occasion I was pleased to be able to point to distinct evidences of the revival of the local mining industry, so at this time I am glad to be able to state that the search for gold here during 1887 has been still more actively prosecuted, and has been more satisfactorily rewarded than heretofore.

There was an application, under the 28th section, for permission to mine on a reserve situated on a creek flowing into the Little Plain River. I regret to say that—although the necessary permission has been granted—the applicants do not seem as if a start was intended. This is a pity, for the locality is, in my opinion, a rich one, judging from early indications.

One very satisfactory piece of evidence lies in the fact that less Chinese and more Europeans are engaged upon the stream claims along the Delegate River, and the work itself is no longer of that desultory character which formerly characterised our local mining enterprise, but has been concentrated upon picked spots, with fairly satisfactory results. Eighteen claims, all held by Europeans, have been in work along the river, though owing to high waters the work has had to be frequently suspended. Out of these claims, Mr. John Jones' is undoubtedly the best, and he has informed me that it has yielded him a return of about £400.

I notified present right and license holders of the necessity of renewing such rights and licenses with result that nearly all have done so, and they say that better weather only is needed for the continuance of their work.

Fifteen leases have been applied for this year for the purpose of winning gold and other minerals. Six of these are situated on the Bald Hill's Forest Reserve, close to Slaughter-house Creek, covering an area of 240 acres, the assumed reef running, according to surface indications, then north and south; another six, of similar area, are situated just outside the town, upon the road to Cooma, and their trend is north-westerly; the remaining three are close to the junction of the Bombala and Delegate Rivers, on the south bank of the former, and running north and south.

The amount of gold purchased by the banks this year is 745 oz. 12 dwt., as against 254 oz. 16 dwt. for the previous one. This increase is eminently satisfactory. Also, for the year 1877, I have issued forty-nine miner's rights, twenty-four business licenses, and two mineral licenses, have received fifteen lease applications, and have registered twenty-two mining tenements, as against forty miner's rights, twenty-nine business licenses, and six mineral licenses, one lease application, three tenement registrations, for the year 1886.

I am glad to be able to point out that the work here has, during the three years I have had the honor to act as Mining Registrar, increased from almost nil to a very fair amount. During the ensuing year, when the leases now applied for have been granted, and the machinery required for their working erected, I hope to be able to record still further progress.

TUMUT AND ADELONG DISTRICT—QUEANBEYAN DIVISION.

(*Mr. Warden Woore, P.M., Queanbeyan.*)

I HAVE the honor to submit, for the information of the Honorable the Minister for Mines, my report for the year 1887 upon the Queanbeyan Division of the Tumut and Adelong Mining District.

Captain's Flat.

A large amount of work has been done in the Koh-i-noor mine. At No. 1 shaft, at the 100 feet level, a drive has been made 122 feet south along the course of the lode, which contains silver, gold, copper, and lead, and all the ore above the drive to a height of about 35 feet has been taken out, leaving a gold-bearing lode adjoining on the west unworked.

No. 2 shaft, north of No. 1, has been sunk 27 feet, and is now 76 feet deep. A drive has been made from it at that depth 70 feet, running north along the course of the lode, and at 69 feet another drive has been made 67 feet, following the course of the lode.

A new shaft (No. 3), north of No. 2, has been sunk 57 feet, and at that depth a drive has been made from it south about 55 feet along the course of the lode. At 25 feet from the shaft a rise has been made of about 50 feet to near the surface. Another drive has been made on the same level, about 50 feet north along the course of the lode, and at about 18 feet from the shaft a rise has been made of about 44 feet towards the surface.

Another new shaft (No. 4), north of No. 3, has been sunk 47 feet to the end of the 50-foot drive north from No. 3 shaft, and from the bottom of the shaft a drive has been made 43 feet north along the course of the lode.

All the ore above the drives north of No. 1 shaft has been taken out, leaving the gold-bearing lode adjoining on the west unworked.

I am informed that the total quantity of ore raised during the year is 2,346 tons, 2,106 tons of which have been smelted on the ground, yielding nearly 122 tons of bullion, containing, by assay estimates, 40,877 oz. of silver, 364 oz. gold, 4½ tons of copper, and 116 tons of lead; also 54 tons of copper matte, containing by assay estimates 4,828 oz. of silver, 13 oz. of gold, 15½ tons of copper, and 8½ tons of lead; and there are from 60 to 100 tons of copper matte, the actual weight and value of which have not yet been ascertained. The remaining 240 tons of ore are now awaiting treatment.

The average number of men kept constantly employed in the mine is about twenty-four.

The smelting works in connection with the mine have been in active operation for about fourteen weeks during the year, employing about thirty-five men.

I am informed by Mr. Scoble, the manager of the mine, that the results are likely to continue satisfactory, as the mine is at present looking very promising.

At

At the Vanderbilt mine, mineral lease portion 81, 20 acres, held by William Garland, a shaft has been sunk 62 feet, from which a drive has been made west 25 feet, intersecting a gold, silver, and lead-bearing lode about 8 feet wide, running about north and south. About 150 tons of ore have been raised, from which a number of assays have been made locally, yielding, I am informed, from 10 to 180 oz. of silver, and from 1 to 4 dwl. of gold to the ton. Two men have been employed at this mine.

Mineral lease No. 86, abandoned by McNeill and party, was taken up in September last by Messrs. R. Martin and W. A. Gibson, who have continued an old shaft to a depth of about 32 feet, and cross-cutting east about 30 feet, intersected a quartz reef about 5 feet wide, impregnated with lead crystals.

The present adult population of Captain's Flat, ascertained through the police, is 140.

Brindabella.

A small company has been formed, known as Brindabella Gold-mining Company, to work Reid's ground sluicing claims at Brindabella. Nos. 15, 16, and 29, with water-race No. 24.

Mr. Reid informs me that an average of eight men have been constantly employed on these claims during the year constructing works of a preparatory character, consisting of a head-race and trail-race, and dams, &c., at a cost of about £800, and that about 600 cubic yards of stuff have been washed, yielding about $\frac{1}{2}$ dwl. of gold to the yard.

Mac's Reef.

The 10-acre gold lease at Mac's Reef, abandoned by Messrs. Wright, was taken up in August last by Messrs. Wright, Laud, and Keefe. Two men have been employed upon it. A shaft about 50 feet deep has been sunk on the reef near the old workings. 2 tons 7 cwt of stone have been crushed, yielding about 9 dwl. of gold to the ton. At the bottom of the shaft the reef is about 4 feet wide.

Another 10-acre lease has been lately taken up at the old workings at Mac's Reef by Messrs. Bray, McAllister, and Moran, and work of a preparatory character has been commenced.

TUMUT AND ADELONG MINING DISTRICT—GUNDAGAI DIVISION.

(*Mr. Warden Weeks, P.M., Gundagai.*)

I HAVE the honor to report that during the year 1887 there has been a considerable amount of prospecting in this district, but without any very encouraging results. I am unable to report any proved payable discovery. Many of the old abandoned reefs that paid handsomely in past years have been tried again without success. The recent erection of a crushing battery at Coolac will lead to many of the reefs in that locality being tested. Mr. J. M. D. Williams, the proprietor of the battery, is testing a reef in McLeod's selection. He has sunk a shaft 100 feet, and is now driving to test the reef. Two trial crushings of 20 tons each realized about $\frac{1}{2}$ oz. to the ton, a return that ought to more than pay expenses, as the battery is close at hand. The reef carries gold all the way down the shaft, and there is no reason why rich bunches of ore, such as made this reef famous in old times, should not be met with at the lower levels. 8 and 10 oz. stone was taken out in years past at a depth of from 20 to 40 feet. This mine, if given fair trial, is looked upon as having the best prospect of any in this part of the district.

At the Victoria Mine, South Gundagai, Edrop & Co. are sinking a shaft 200 feet deep to test the country at that level. They have erected a splendid 20-head battery and pumping machinery. The dam throws back an inexhaustible supply of water. A Sydney syndicate is about to develop Matchett's Slate Quarry at South Gundagai. Their engineer is now engaged erecting a very complete plant, and hopes to be in full work within two months. This work will be watched with much interest, as, if successful, several other deposits of slate in the same locality will be opened up. Should slate-mining prove payable, it will give a great impetus to the whole district, as the deposits of slate are both good in quality and numerous.

Prospecting work is still being carried on at Johnston's Hill and Bongongolong, but with no definite results. A rich lode of pyrites is said to have been met with at both places.

I have nothing of interest to report with regard to alluvial mining.

TUMUT AND ADELONG DISTRICT—COOMA DIVISION.

(*Mr. Warden Love, P.M., Cooma.*)

I HAVE the honor to submit report for year 1887 upon the Cooma Division of the Tumut and Adelong Mining District.

Kiandra.—From the Mining Registrar and Warden's Clerk report submitted it will be seen that the amount of gold won during the year, viz., 2,451 oz., is in excess of yield in 1886. Two new leases have been taken up, and 115 miners' rights were issued. The season, as regards water, has been exceptionally good.

Michelago Creek.—Eight applications under section 28 have been made for land situated on Michelago Creek, between Cooma Road and Murrumbidgee River, and embraced in travelling stock route, No. 962. From a special inspection and report made by mining experts for Messrs. Lyons and party on this field, most favourable results may be looked for when capital has been secured to properly test leases.

Bredbo.—Messrs. O'Rourke & party, I am informed, are about to float a company to work leases held by them at Bredbo. Mining experts have reported recently upon these holdings, and assays have been made, but I am not aware of result. A considerable sum of money has been expended in this locality during the last two years, and it is anticipated that the company about to be started will develop a rich silver field. The number of miners' rights issued at Cooma office was sixty-five: mineral licenses, twenty-seven.

TUMUT AND ADELONG DISTRICT—TUMBARUMBA DIVISION.

(*Mr. Warden J. T. Makinson, P.M., Tumbarumba.*)

DURING 1887 there was a slight improvement in this Division, principally owing to the large supply of water for sluicing purposes.

The Burra Sluicing Company was most successful, the wash-up for the five months preceding Christmas resulting in a cake of 341 oz. retorted gold. A find of a 16 oz.-nugget and several smaller pieces was made by a miner at Upper Tumbarumba, and another man got, in the same locality, good coarse gold.

gold in very payable quantities. At the Mill Hill, near Tumberumba, a party of four is tunnelling between the granite and basalt to reach a spot where, twenty-five years ago, one of the present party and his mates abandoned a good prospect to go to a new rush. Hill and party (six) have had very good results from their sluicing claim in Tumberumba Creek, near the brewery. The United Tradesmen's Sluicing Company's ground has been worked by a party of tributers, but only dead work was done during the year—the cutting of a fresh head-race. Watson and party, at Tarcutta Creek, after having spent four years in cutting a tail-race and a flood-race, have their claim now in good working order, and, judging by the prospects tried when I visited the ground in December, the future results should be good.

At New Meragle, Old Maragle, and Pinchgut, several sluicing claims were worked, and, with a couple of exceptions, with only moderate success. At a claim at New Meragle, I saw 1, 2, and 3 dwt. pieces, besides fine gold, brought to light by the hose. This claim must be paying its owners handsomely.

Cazirylys and Company have begun work on a lease at Surface Hill, Carabost. The gold here is fine, and very evenly distributed, the same prospect being got from the surface to 14 feet down. A special plant, for the saving of fine gold, is being imported from New Zealand for this ground.

Quartz-mining was very dull all the year. No work has been done at the Isabella or Peep-o'-Day. Storey and party did a little towards opening the quartz reef on their lease at Paddy's River, and I am now informed that a company, with a capital of £5,000, has been formed in Sydney to work the property. The prospects seem fairly good. Straghan and Johnson found a new reef of large size in the slate country at Jingellic. It is about 6 feet wide, and carries, so far, only fine gold. A trial crushing of 2 tons gave only 8 dwts. to the ton; but the owners think that prospect from the surface sufficiently good, and are about to put a machine on the ground. When I visited the place in October, I found about 150 tons of stone raised at the various openings on the line, and trials from all parts of the heaps yielded fine gold in every instance.

The tunnel workings at Bald Hill of the defunct Basaltic Gold-mining Company, are being vigorously carried on by Rolfe and Moorehouse. Although some encouraging signs are present, this enterprise cannot yet be said to be a success.

Gold is the only mineral of value which was won in any appreciable quantity during the year. Information, carefully gathered from every available source, shows that the quantity of gold raised was—as closely as can be calculated—1,690 oz., being 310 oz. more than the 1886 yield. The number of miners' rights issued was 149—a decrease on 1886. A few of the miners left for Croydon (Q.), Silverton, and other places.

TUMUT AND ADELONG DISTRICT—TUMUT DIVISION.

(*Mr. Warden Vyner, P.M., Tumut.*)

I HAVE the honor to furnish you with my annual report of that portion of the Tumut and Adelong Mining District under my charge, which embraces Adelong, Reedy Flat, Upper and Middle Adelong, Sharp's Creek, Tarcutta, Mount Adrah, Adjenbilly, Sandy Creek, and Gobarragandra. I regret that I am unable to give an account of any improvement in the prosperity of these mining centres during the past year, and in Adelong itself there has been a still greater falling off than in 1886, there being a decrease of the amount of gold won of 3,258 oz. 12 dwt., and the population is very considerably reduced. A few of the claims on the Gap Reef at Adelong offer some promise of proving remunerative if sufficient capital could be obtained to work them; but the inducements they hold out do not seem sufficient to attract any at present.

Mr. A. D. Shepard's alluvial lease on Lower Adelong Creek has been almost unproductive during the past year; but, by the new appliances now being placed on it, a good hope is held out of its being as productive during the present year as formerly. At Tarcutta the mining interest is very much depressed, there being only three claims at work, and they are getting little or no gold, and there are only thirteen miners now at work on this field.

There has been a special lease of 50 acres (alluvial) taken up at Shaking Bog, near Adjenbilly, and a considerable number of men are at work on it; but it would be premature at present to predict the result.

No mining for metals other than gold is being prosecuted in my Division at present.

TUMUT AND ADELONG DISTRICT—ALBURY DIVISION.

(*Mr. Warden T. A. Browne, P.M., Albury.*)

I HAVE the honor to furnish my report with reference to the Albury Division of the Tumut and Adelong Mining District.

Having been gazetted as Warden so recently as last August, I have not had the opportunity of making myself personally acquainted with the extent and character of the mine-work of the district which I should have desired.

However, it may be stated generally that, although this district has been proved both in past years and quite recently to contain deposits of exceptional richness as well as fairly payable lodes and reefs, few continuously good returns can be quoted.

One of the most promising ventures was that upon purchased land, the property of Mr. Gottlob Singe, leased to the Bungowannah Company. The workings were on an auriferous conglomerate, 24 feet wide, in which prospects had satisfied them that they had an inexhaustible supply, payable even at a very low percentage.

Not less than £2,000 is estimated to have been expended upon a quartz-crushing machine, with fifteen head of stampers, a large dam, a check dam, and tramway to the workings. After the first crushing, which yielded less than 100 oz., the mine was let to tributers. They crushed 1,094 tons for 125 oz., and then, being of opinion that the appliances were not equal to the exhaustive treatment of the stone, ceased working.

The most successful mining investment at present in operation in the district is that of the Hawkview Reef, at present being worked by a company. This reef is situated upon the Hawkview Estate, 12 miles from Albury, and is understood to have lately had a crushing which went 4 oz.

At Wealund and party's claim at Black Range, 3 tons were crushed late in December, which went 31 oz. This is understood to be from a rich, but probably short, "shoot."

The

The Soudan Company, which formerly employed a large number of men in working a dyke reef at Splitter's Creek, have, I am informed, an intention of recommencing operations.

At Tarrara there would appear to be a revival of interest in mining matters, as several leases have recently been applied for.

During the past year have been issued :—

Miners' rights	119
Business licenses	6
Mineral licenses	2

TUMUT AND ADELONG DISTRICT—ADELONG DIVISION.

(J. James, Mining Registrar.)

THE business transacted during the year consists in the issue of 170 miners' rights and 6 business licenses, the receipt of 2 gold-mining lease applications; conditional registrations, 15; and 15 registrations in unsurveyed tenement register.

Through the courtesy of the managers of the local banks, I am enabled to furnish the following correct returns :—

	oz.	dwt.	gr.
Commercial Bank	1,511	15	11
New South Wales Bank	1,030	9	4
Total for the year.....	2,542	4	15

The following crushing returns for the year 1887 have been kindly furnished. —

	tons	cwt.	oz.	dwt.	gr.
Reefer Battery	958	0	1,073	1	0
Perseverance Battery.....	670	0	635	14	0
Totals.....	1,628	0	1,708	15	0

Issue of miners' rights compared :—

1886.	1887.	Decrease.
No.	No.	No.
175	170	5

Quantities of gold, the produce of this Division, compared :—

1886.			1887.			Decrease.		
tons	cwt.	gr.	tons	cwt.	gr.	tons	cwt.	gr.
2,408	10	0	1,628	0	0	780	10	0
oz.	dwt.	gr.	oz.	dwt.	gr.	oz.	cwt.	gr.
1,715	7	9	1,708	15	0	6	12	9

Quantities of alluvial gold, the produce of this Division, compared :—

1886.			1887.			Decrease.		
oz.	dwt.	gr.	oz.	dwt.	gr.	oz.	dwt.	gr.
4,085	9	6	833	9	15	3,251	19	15

Through the courtesy of Mr. William Ritchie, I am enabled to distinguish lots from several points treated at the Reefer Battery :—

	tons.	cwt.	oz.	dwt.	gr.
Corragong Mine	90	0	320	17	0
Gap Reefs	84	0	130	18	0
Donkey Hill	19	10	150	1	0
Challenger Mine	77	0	111	0	0
Mount Adrah	48	10	56	12	0
Small lots	568	0	285	13	0

The firm also sent away 41 tons of pyrites to the Cunningham Works, Harden.

Mr. A. W. Molineaux, manager for the Amalgamated Companies, states that there has been but little work done on the mines under his charge, owing to the amalgamated properties being placed under offer to an English syndicate. The number of men employed through the year has averaged twenty. The Company's tributers have crushed at the battery 410 tons of quartz for a yield of 494 oz. 18 dwt., and 260 tons of picked tip for a yield of 140 oz. 16 dwt. gold—making a total of 670 tons of crushing stuff for 635 oz. 14 dwt. gold.

He is also pleased to report that with the commencement of the new work has been resumed in at least one of the mines, having received instructions to bale the water out of the Adelong Mine preparatory to sinking the shaft. Should success attend the efforts in this direction, work will doubtless be commenced at other points.

The gold-mining leases owned by Mr. W. Williams, senior, and worked by tributers, have come to the fore. During the year, 362 oz. of gold were obtained from 90 tons of quartz, and the leases hold out at present prospects of future good returns.

Owing to the late heavy rains and consequent inflow of water, work was retarded at the Gap claims. The Crown and Appletree could not sink the shafts. At the Lady Mary, with the assistance of a pump, 91½ tons of quartz were raised and crushed. The gold won was 131 oz. 18 dwt.

Capital is needed to try the Gap veins. The present appliances are insufficient.

77 tons from the Challenger Mine may be called the outcome of fossicking. The mine, which is now full of water, has rightly deserved the censure of least development. The deepest part pierced is only 600 ft., and as most of the work formerly was confined to the hanging-wall vein, a large area of ground on the foot-wall vein remains untouched. The water rising will eventually drive out the fossicker.

The claim of Barbour and party and the gold-mining lease of Hodge Brothers, situated on Donkey Hill, are worked with results much about the same as previous years. In the lease shaft, a winze has been sunk 30 feet. The Hill has contributed 90 tons 10 cwt.

The

Alluvial.

The gold obtained from this source is 833 oz. 9 dwt. 15 gr., and, by comparison, a decrease of 3,251 oz. 19 dwt. 15 gr. is shown. In my total returns, I have excluded about 518 oz. of gold from Reedy Flat and sold to the banks here. It is probable that in my report of 1886, about 400 ounces were not excluded.

Approximately, the decrease may be stated to be 2,500 ounces, to be attributed to the entire falling off at Shepardstown.

The repeated floods have greatly interfered with Mr. Shepard's new system—not yet matured. The lease has a large area yet unworked, and, with the hydraulic injector matured, a return to the usual annual yields may be expected.

In conclusion, I must state that the present state of this gold-field is one of increased depression, and its prospective state depends on capital and greater energy.

TUMUT AND ADELONG DISTRICT—QUEANBEYAN DIVISION.

(*C. J. B. Helm, Mining Registrar.*)

I HAVE the honor to report that during the past year mining matters have been rather dull in this Division; but things are beginning to look a little more hopeful just now. A party of four local people have taken up 10 acres as a gold lease at Mac's Reef, which was an old lease abandoned in 1883. A new shaft has been sunk to a depth of 50 feet. The stone has been tested from that depth and found payable. Another party of four, from Goulburn, have applied recently for a 10-acre gold lease adjoining, and are sinking a new shaft. Some good specimens have been found.

At Brindabella, on the Goodradigbee River, a company has been formed to work 26 acres (alluvial working). A good deal of work has been done, but the water supply is not satisfactory. A head-race, 4 miles long to the works is being constructed, and an expenditure of about £900 has been incurred—so the manager, Mr. Reid, informed me. A trial washing has taken place, the result being 3 dwts. to the load.

I may state that as yet very few miner's rights have been taken out at this office this year; but of course a great number would be issued by the Mining Registrar at Captain's Flat now.

The expected visit of the Prospecting Board this week may be the means of stimulating matters about here.

TUMUT AND ADELONG DISTRICT—NIMITYBELLE DIVISION.

(*G. W. Myers, Mining Registrar.*)

I HAVE the honor to submit my annual report for the year 1887, and I am glad to state that a perceptible improvement in mining affairs has taken place during this year. At Kydra Reefs, S. McDonald, on behalf of a company, applied for a gold lease of 10 acres, on which he has kept five experienced miners regularly at work, and succeeded in raising a considerable quantity of good looking stone. Through the courtesy of Mr. S. McDonald, the proprietor of the crushing plant, I am placed in a position to say that out of a trial crushing of 25 tons of stone, which was obtained from the surface to a depth of 35 feet, the very favourable yield of 25 oz. of gold was obtained.

Kiss, Tindall, and party have also applied for a gold lease of 10 acres at Kydra, and have had five men constantly employed, who have raised a quantity of gold-bearing quartz; but, up to the date of this report, have not had a crushing. It is the intention of both the above parties to float companies. I may state that the whole of the abovementioned stone was got from leaders only, no main reef having yet been struck. Nineteen miner's rights were issued, as against seven for the preceding year. During the year many specimens of minerals were brought to me to be forwarded to Sydney for assay; and a good deal of prospecting has been done in various parts of my Division with varying success. No doubt a considerable quantity of gold in small parcels, obtained in this manner, was sold privately, and consequently I am unable to furnish any return of such.

I anticipate a further improvement in mining matters here during the coming year.

TUMUT AND ADELONG DISTRICT—TUMUT DIVISION.

(*Charles J. Lloyd, Mining Registrar.*)

ALL the mining in this Division is alluvial. No payable quartz reefs are being worked. One party is prospecting on the old Laemalac Reef, and another at Murphy's Reef, Micalong; but no machinery is at work up to date.

Neither of the banks here buy gold, owing to the very small quantity that is brought in. It is therefore very difficult to estimate the exact quantity of gold that is got in this Division. Eighty-four miner's rights were issued by me in 1887, as against fifty in 1886, which shows an increase of thirty-four miners. A large number of these are prospecting on Weejasper Creek, about 40 miles from here; but up to date no report of the discovery of payable gold has been received in this office.

Messrs. Ryan and party have applied for a 50-acre special lease on the Shaking Bog Creek, and have now about twenty men working there forming a water-race. When this is completed, they appear sanguine of getting payable gold. This is the only large undertaking in this Division. If it should prove successful there is no doubt that a stimulus will be given to the mining industry in this Division.

TUMUT AND ADELONG DISTRICT—KIANDRA DIVISION.

(*W. D. Bailey, Mining Registrar.*)

HEREWITH I have the honor to forward my report for Kiandra Division for 1887.

The number of miner's rights issued was 115.

The amount of gold won, 2,454 oz. Doubtless there were other parcels that did not pass through local buyers hands that are not accounted for in this report.

The wash-ups generally were very poor, although the past was a good season for water.

Mr. Pattinson, Manager of the Kiandra Gold-mining Company reports:—Have sluiced 2,221 hours, each with two nozzles. The average height of bank sluiced away, 110 ft. The amount of bottom cleaned

cleaned up, 6,053 superficial yards. The amount of gold won, 1,707 oz. 9 dwt. Owing to the bottom dipping we have to open a new tail-race, the turn-tunnel for which we have already driven 500 feet. When this is completed, sluicing will be resumed. Our dam at the Three-mile is now full.

Mr. Drummond, of the Empress Company, at Nine-mile, reports:—During the year we have deepened our tail-race and improved the head-races. When water was available, worked the mine with seven men. The amount of gold won, 82 oz.

Heinz and Hooper report having driven 580 feet in their tunnel, on Township Hill. Put in two air-shafts—one at 43 feet and the other at 89. At a distance of 520 feet, put in a jump-up. Struck lignite and a little gold 40 feet from the lower level. At 20 feet from lower level we followed the underlie of the lignite a distance of 70 feet, but had to desist, owing to the water getting too heavy for us.

At present we are driving the lower level to drain the water from the 20-feet level. Total amount of driving and sinking, 822 feet.

At the Eight-mile, Patterson and Patrick have not cleaned up. I cannot ascertain what their yield will be.

There were two applications to lease—one of 25, the other 20 acres.

TUMUT AND ADELONG DISTRICT—REEDY FLAT DIVISION.

(*J. T. Hely, Mining Registrar.*)

I HAVE the honor to forward you the annual report for the Reedy Flat Division of the Tumut and Adelong Mining District for the year 1887.

The number of miner's rights issued were 65; business licenses, 3.

The amount of gold purchased by Mr. Timmis, the local storekeeper, was 530 oz.; and there is no doubt that another 50 or 60 oz. were sold privately to the banks in Adelong and Tumbarumba.

A number of payable quartz reefs are known to exist in this locality, but it requires machinery on the ground, and capital to work them.

TUMUT AND ADELONG DISTRICT—ALBURY DIVISION.

(*Charles A. Conley, Mining Registrar.*)

I HAVE the honor to report that mining, last year, has not progressed so satisfactorily as anticipated.

The Bungowannah Company's machinery, although very complete and modern, could not save sufficient gold, owing to the presence of refractory ores, to warrant a continuance of the large outlay necessary for carrying on operations, and work has been suspended for the present. The Soudan Company, whose claim is situated at Splitter's Creek, after spending a large amount of capital, also gave up for time being, but are about making a fresh start. At one time the above companies employed from eighty to ninety men. Messrs. Pyc & Wealands (May Day, Black Range) have had two very good crushings—44 oz. for 20 tons, and 64 oz. for 16 tons—and are about crushing again, and anticipate 4 oz. to the load. They are down 110 feet; reef 8 inches, running east and west. Messrs. Wealands and party struck a very rich patch south of Portuguese Gully, near Black Range, which yielded 31 oz. for 3 tons; but the shoot of gold is very short. They also contemplate having another crushing shortly.

During the year a fresh start was made on the Ethiopian Lease, Black Range (Lawson and party); crushing yielded 10 oz. for 4 tons.

The Nail-can has attracted the attention of four or five different parties, but their efforts have been but poorly rewarded.

The Advance Australia Company had a trial crushing at Chiltern of 3 tons; yield, 9 oz. 1 dwt. They are still sinking on a small leader. Some prospecting has been done at Nine-mile Reserve and Portuguese Gully, with varying success.

No silver or tin mining has been done, although traces of both are to be met with in the district.

TUMUT AND ADELONG DISTRICT—COOTAMUNDRA DIVISION.

(*A. J. McCarthy, Mining Registrar.*)

I HAVE the honor to forward my report of mining operations in this Division for the year ended 31st December, 1887.

I regret to have to state that mining has made very little progress during the period, notwithstanding the large area of auriferous country in the Division.

Three gold-mining leases, one mineral lease, one extended quartz claim, and one quartz prospecting protection area, have been applied for during the past year, and forty-one miner's rights have been issued from this office for the same period. There is very little alluvial mining going on, operations being almost entirely confined to quartz.

PEEL AND URALLA DISTRICT—GLEN INNES DIVISION.

(*Mr. Warden Martin, P.M., Glen Innes.*)

Tin.

THE exceptionally high prices ruling in the home market gave an impulse to the production of this metal, which was sustained throughout the year, and, as the rainfall was abundant, the output of ore rose to more than 700 tons above that of the previous year.

The increase came from no particular lead or new ground, but was general over the whole field; and land which had formerly been prospected and abandoned as being too poor, was again taken up and worked to a profit under the altered condition of the market.

Although persevering and expensive prospecting in the deep ground westward of portion 8, in the parish of Hamilton, has failed to discover the lead supposed to be continuous to the Gulf in that direction, a connected run of rich wash has been traced and worked from the celebrated Wesley Mine, in the same parish, to the point first above indicated. A prospecting association, formed at Emmaville some months ago, have, with much public spirit, undertaken to test the ground along the course of the old basaltic overflow, and commencing at the Gulf, where a sheer fall of between 500 and 600 feet breaks the continuity

continuity of the run, they are driving a tunnel in on the face of the declivity, at a point where the wash is exposed, at what is believed to be its western limit. If further exploration should prove this theory to be true, an enormous expansion will be given to the particular mining industry which has hitherto been the most important one of the district. In any case, the output is not likely to fall off during the coming year, should the present high price of tin be maintained, as prospecting is being pushed out very generally over the whole district, and small contributions from many sources will help to swell the general total, even should no rich leads be dropped upon.

Lode mining for this metal has been persevered in under much difficulty by a determined and hopeful few, and if the field from this source, during the past twelve months, has not exceeded 150 tons, the following remarks by the managing proprietor of the Ottery Mine (Mr. J. H. Reid) foreshadows a probability of better things to come in the near future:—"During the year the Ottery Mine has produced 2,171 tons 12 cwt. tinstone, which, when crushed, returned 76 tons 3 cwt. 1 qr. 18 lbs. black tin ore, or at the rate of 3.5 per cent. The increased value of ore has enabled the proprietary to continue exploring the mine by a tunnel. That, at a distance of 350 feet from the mouth, is expected to intersect the main lode traversing the property at a point 150 feet perpendicular from the surface. Already 340 feet have been driven in at an approximate cost of £1200, and should the point of intersection show payable ore, many years' profitable work will be assured. At the 90 feet level the lode is in places over 10 feet wide, and there is now exposed to view from that level upwards some twelve months' work. The increased price obtainable for ore (£84) should give a great stimulus to lode mining, and thus afford an opening for some of the surplus labour which for some time past has been moving about the country."

The returns of ore raised, give for:—

	tons. cwt.
Vegetable Creek	2,639 14
Glen Innes... ..	206 10

which, at £65 per ton (the average price at the smelting works, Leur Hill), gives a value of £185,003 on the ground.

The average numbers of miners employed has been about:—

Europeans	500
Chinese	620

at rates of wages from 8s. downwards. Not many miners, however, are working on daily wages. The great majority are working on tribute, at rates varying according to the richness or comparative poorness of the ground.

888 tons 15 cwt. refined tin passed through the smelting works at Tent Hill, and were forwarded by rail to Morpeth, at a total cost for carriage by steam and rail of £3 16s. 8d. per ton.

Silver.

The opening up of the rich silver-mines at Silverton, coupled with the successful treatment of the local argentiferous ores at Webb's Mine, Little Plant Creek, have at last drawn the attention of capitalists to the possibility of wealth lying within the depths of the hitherto neglected silver-bearing lodes at Vegetable Creek; and now, instead of encouraging the influx of long needed capital, a word of warning is necessary in restraint of the reckless phase of speculation which thoughtlessly regards all silver-bearing properties placed on the market as of equal value, and as affording equal and certain roads to an easy and sudden acquisition of fortune. That some of the lodes discovered are very valuable can no longer be a matter of doubt, but intending investors should bear in mind that a sustained expenditure of capital will be required, under skilful and trained management, to achieve success in a form of mining where the records of failure have been so numerous.

The proprietors of Webb's Mine have been fortunate in securing the services of a thoroughly competent gentleman as captain of their mine, and to his skilful manipulation of the ores is mainly due the success which so far has been achieved. The necessary plant for treatment of the ores had been erected and raised at the close of the year, and it is expected that when the machinery is in full working order a satisfactory dividend for the shareholders will prove that the mine has not been over-valued.

The argentiferous galena ores at Pye's Creek will, it is anticipated, prove easier of reduction than those at Little Plant; but, although trial shafts are being vigorously put down on most of the properties, there are no apparent preparations to treat the ores on the ground.

The central mine on this field has been floated under the name of the "Pye's Creek Silver-mining Co.," and, from the local Managing Director, I gather that at the close of the year the shaft on the main lode had been put down 92 feet. The lode at that level was 10 feet wide, with a core of solid galena 4 feet across, and veins of the same ore 2 to 4 inches thick, running through quartz and gossau on each side. A large quantity of ore, estimated to yield from 130 to 150 oz. of silver to the ton, had been stocked at the mouth of the shaft, and it is intended to erect a reverberatory furnace on the ground for its direct smelting. The ore throughout is said to average 50 per cent. lead, and the assays, since passing the 50-foot level, to have given from 50 to 720 oz. of silver per ton of lead. Shafts sunk on adjoining properties it is said, give similar results, and altogether the outlook for silver mining is most promising in this locality.

As bands and even extensive tracts of slate are frequently met with in the granite country, on the eastern fall of the main range, it is but natural that the excitement on the subject of silver-mining should have led to much exploration in that direction; but, although much loose stuff has been submitted to assay, nothing giving so rich a promise as that of the ore from the broken country on the western fall has been discovered.

I have given Webb's and Pye's Creek Mines as examples of the best known ores in their respective localities—20 miles apart.

In the former, fersite and antimony appears to preponderate; in the latter, galena.

The country being explored and taken up on the supposed continuation of these leads extends southerly from Pye's Creek, between 30 and 40 miles. Nine miles east of Deepwater, under Capoompeta, some promising lodes have been discovered, and are being prospected.

With the exception of ore for test treatment, no metal has yet been sent out of the district.

Gold.

Gold.

With the exception of the operations undertaken by the Glen Elgin Gold-slaicing Company to turn the course of the Glen Elgin River, there has not been anything in connection with mining for this metal worthy of special notice. Unfortunately for the successful accomplishment of their object by the above company, an unexpected obstacle has shown itself at the 40-foot level in the cutting already opened, and to complete the work to the necessary depth of 70 feet a central core of 30 feet of hard granite will have to be removed before the waters of the river can be drained away.

The length of the artificial channel at present formed is 1,930 feet, and it is 100 feet wide, and 40 feet deep in the centre.

Nearly the whole of the mass cleared away consisted of decomposed granite in situ, and generally of so soft a nature as to be readily removed by hydraulic sluicing.

As the expense of removing the hard granite core by blasting will necessarily be heavy, it has been decided to stay operations in the cutting for the present, and to thoroughly test the supposed deposits of tin and gold in the bed of the river, with a view to ascertain whether there is a probability of an adequate return on the expenditure of additional capital in the venture.

About twenty-five European miners have been directly employed in mining for gold at scattered points from Glen Elgin to Oban; but as it is estimated that not more than 450 oz. have been won from the alluvial, the field cannot be looked upon as rich, nor the rate of remuneration such as to entice many into the wild country where for many years these often grey-headed men have led a solitary and reclusive life.

Gold is found associated with tin at Oban, and the ninety Chinese tin-miners at that place have contributed something to the total as above which I have given the European miners credit for. Beyond securing specimens with a view to float companies, nothing is being done with the gold-bearing reefs known to exist.

Bismuth.

It is very difficult to obtain reliable data on which to found an estimate of the output and value of this metal, as the manager of the only mine actually at work (the Kingsgate), acting under instructions from his principals, declines to give any information on those points. A personal inspection of the mine early in January showed me that forty men and twenty boys were at work at various shafts and tunnels on the company's land, and that a large amount of excavation had been effected during the year in searching for the mineral. The ore is not found in fissure lodes, as is usually the case with other metals, but in irregular shaped cavities termed "pipes," which have been followed downwards in the granite rocks to a depth in some instances of 100 feet.

The ore is roughly broken, hand-picked, and worked before being bagged for shipment to England, and averages about 50 per cent. under this treatment.

According to the railway returns, 35 tons 9 cwt. 1 qr. 25 lb. were forwarded during the year to Newcastle; and I believe this to have been about the output of the mine for the past twelve months.

At the adjoining (Glen Innes) mine, very little work has been done, in consequence, I believe, of a want of sufficient capital; but it is to all appearance as rich in bismuth as its neighbour, and is said moreover to contain some valuable ores of silver.

The country is generally of coarse granitic formation, overlaid in places with a thin crust of basalt. The bismuth-bearing granite rock is well defined, and cut off on the north, east, and west by a broad belt of slate, beyond which in those directions none of that metal has been found.

Copper.

This metal is known to exist in the district, and an analysis of a sample recently submitted for assay gave:—

Metallic copper, 13.2 per cent.

Fine silver, at the rate of 14 oz. 13 dwt. 2 gr. per ton.

It does not appear however that any action is being taken to secure or work the ground, whence the specimen was taken. In conclusion, I think I have sufficient warrant in assuming that a new life will be permanently infused into mining in this Division in consequence of the influx of capital, backed by enterprise and skill, which the silver mining excitement has brought about; and although it is quite certain that very many of the companies so easily floated to work local mineral lands will never pay a dividend on the money subscribed by the shareholders, still there are properties in every way worthy of the outlay contemplated, and whose certain return of profit will lead to an expansion of *bona fide* mining much beyond anything that could have been anticipated at the close of 1886.

BINGERA DIVISION—PEEL AND URALLA DISTRICT.

(*Mr. Warden Lawson, P.M., Bingera.*)

I HAVE the honor to report on the various goldfields in my district. On almost every field the numbers have increased. There has been greater activity, if the results have not been as satisfactory as anticipated.

Bingera Diamond fields.—These are deserted. The plant of the A.D.M. Co. has been sold and some removed, the leases forfeited and taken up by other parties, who are not doing much work.

Gold.

Bingera.—Wearne and party have sunk on the "All Nations" Reef about 120 feet. The reef is about 8 feet wide. Several tons of stone have been tested in various plants, yielding at each between 16 to 18 dwt. of fine gold per ton, and with pyrites, about 5 oz. per ton. The proprietors have not yet succeeded in placing a battery on the property.

Bobby Whillow.—A few old miners still continue to make a living. Tenders have several times been called for sinking shafts on the prospecting reserves, without obtaining respondents.

Gympie Flat.—Adjoining the diamond-fields a small rush set in at this place, and for some months past a number of men have earned more than wages.

Spring Creek.—H. Reading and party have followed a reef down some 70 feet, working the casing with profitable results for months past. Miller and party have opened a copper vein, with very promising returns so far as gold is concerned, the indications and surrounding country being very similar to the rich workings at Top Bingera years ago.

Upper

Upper Bingara.—Most of the leases forfeited. Collins, Court, & Co. placed an engine and pump on one claim, the issue was not sufficiently remunerative to induce them to continue operations. With the exception of a few men working the alluvial, the field is deserted.

Barraba.—Tea Tree Pioneer G.M. Co. have erected a battery. In one patch 112 lb. of stone yielded 58 oz. of gold. They are now down 120 feet, but the yield is not up to the expectation of promoters.

Ironbarks.—Some rich finds. At one time 200 men on ground. Geddens & Co. have erected 12-stamper battery, working their own reef, and crushing for the public. Several other companies formed and started.

Crow Mountain.—Some few hands have done well in the alluvial, finding specks up to 8 oz. A company has restarted to work the reefs which formerly yielded well.

Paling Yards.—During the wet season a few men did fairly well in alluvial.

The output for the year 1887 exceeded the preceding year on all the fields, excepting "Top Bingara."

For Bingara proper, I understand, about 1,050 oz. have been forwarded. Some interest may be attached to the discovery of some remains of extinct animals existing in this locality in ancient times. Mr. C. Cullen, of the Geological Branch, Sydney, has been busy excavating bones at Myall Creek, and up to the present has unearthed fossil remains of three distinct animals, diaptodon and others. Other interesting discoveries are anticipated.

Tin.

A discovery of tin was made on Gragin Creek, about 14 miles from Warialda. Four leases were taken up. First prospects were encouraging, but on cutting into the hill, the wash did not yield enough tin to warrant further outlay. Eight leases were also taken on the Delungra Creek, Myall Creek Run, but no work has been done.

TAMWORTH DIVISION.—PEEL AND URALLA DISTRICT.

(*Mr. Warden Irving, P.M., Tamworth.*)

THERE being no proclaimed gold-field in the portion of the Mining District of Peel River and Uralla, of which I have charge, I have necessarily but a meagre report to make at any time. Thirty miners' rights and six mineral licenses have been issued by me during 1887. I am not aware of any mining for copper, tin, manganese, cobalt, or other mineral otherwise than gold, being actively prosecuted in this division.

As regards mining for gold, five leases have been applied for at Swamp Oak Creek and Mullah Creek, a tributary of Swamp Oak Creek. Total area of those applied for portions is 70 acres. Glowing reports have appeared in local newspapers of the richness of the auriferous ironstone and quartz intended to be mined on the creeks before-mentioned, but nothing has been made known to me of any tangible nature, as to the extent of the reef or reefs, or of any assays that may have been made; nor do I know that sinking has been carried out to any depth. The mining seems to me to be chiefly of a prospecting character. It is to be hoped that there may soon be proof afforded of the stuff being payable and largely distributed, so as to afford some employment of labour and benefit, not only the applicants for the leases, but the town and district of Tamworth. In the ranges behind Tamworth some persons have been prospecting for gold. I have been shown some specimens of quartz containing gold from these ranges, but as yet no leases have been applied for. Gold has for some years back been known to exist in small quartz veins in the ranges behind Tamworth. The parties giving these reefs a trial may succeed in finding some payable quartz, though I have heard of no results from their researches as yet. There is a large extent of country between the gold-fields of Nundle and Bowling Alley Point at one extremity of the Peel District, and the gold-fields near Barraba at the other, about the nature of which, as regards gold bearing, hardly anything is known. The gold-fields I have alluded to are 70 miles to 80 miles apart. I do not think the intervening country has been thoroughly prospected.

PEEL AND URALLA DISTRICT—SCONE DIVISION.

(*Mr. Warden Parker, P.M., Scone.*)

I HAVE the honor to forward my fifth annual report upon the Scone Division of the Peel and Uralla Mining District, under my charge.

During the period 1st January to 31st December, 1887, 157 miners' rights and two business licenses have been issued in this office, being a considerable increase on the previous year, only forty-five miners' rights being issued in 1886.

At Stewart's Brook Gold-field, distant about 40 miles from Scone, in a north-easterly direction. About twenty claims (quartz) have been partially worked during the past eight months, and a great quantity of stone is to grass waiting to be crushed.

During the last year about 550 tons of stone has been crushed at the water-power battery at Stewart's Brook, ably managed by Mr. W. Towns, yielding 550 oz. of gold, of the value of about £2,000.

There are now about 200 gold miners, with their wives and families, settled on the field, and prospecting is going on briskly.

The want of crushing machinery is greatly felt on this field. The country is very rugged and precipitous. It costs about 80s. per ton to cart the stone from a number of good claims (where the reefs vary from 9 inches to 3 feet wide) a distance of about 3 miles to the site of the present and only machine on the field. This heavy charge prevents many claims from being worked; therefore the erection of a second crushing machine in a suitable place would most materially assist in the development of the field; as a yield of 1 oz. per ton would give the shareholders a good paying dividend where the cost of conveying the stone from the mouth of the claim to the battery should not cost more than (say) 10s. per ton.

I have heard from some shareholders that there is now a good prospect of their having a second machine erected at the required spot, which will thus save them 20s. per ton in expenses, and no doubt good results will follow; at least I hope so.

At Moonan Brook, the Denison Gold-field, six quartz reef claims have been partially worked during the past year, and 120 tons of stone has been crushed at the Water-power Battery, under the management of Mr. E. Williams, yielding a return of about 110 oz. of gold, of the value of £375.

At the present time ten miners are engaged at this place in gold-mining. There are many more men on the field who formerly worked as miners, but now occupy their time as wire fencers, bush labourers, &c., about the district.

In conclusion, I am happy to report that the gold-mining prospects of this division are much brighter than they have been at any time since my arrival in 1883, and I trust that the increase to our mining population may result in the discovery of good gold-bearing reefs.

PEEL AND URALLA DISTRICT—NUNDLE DIVISION.

(*Mr. Warden J. L. King, P.M., Nundle.*)

I HAVE the honor to forward my report for the past year of the Nundle Division of the Peel and Uralla Mining District. I took charge of this district on the 1st September, and since then I have made an inspection of the principal claims and leases.

During the year mining generally has taken a step forward. When Mount Ephraim was disposed of other leases were immediately applied for in the vicinity of this huge mass of cement. Leases were also taken up in other parts of the field, of which I will speak hereafter.

Mount Ephraim Company.—The operations of this company are carried out on an ancient river bed, commonly known in this district as cement, a large quantity of which had been ground sluiced by small parties previous to the present company being formed. The mine now occupies an excavated space of about 160 feet long by 100 feet wide by 57 feet deep. On the floor of this a shaft is being sunk, and which is now at a depth of about 60 feet, with a view of ascertaining the depth of the deposit.

Machinery, consisting of one 10-horse semi-compound portable engine, two 5-foot Huntington pans, capable of putting 40 tons of cement through per diem. Saw-bench and blacksmith's shop are all fixed and in first-class working order. The tables are undergoing some improvements. There is an excellent supply of water, and in a few days the company's mining manager will commence work in earnest, and the results are looked forward to with a very keen interest.

The five leases, extending from the back of "Prisk's Hotel," at the Hanging Rock, to Dangar's Gully, the site of Walker's old claim, are not being worked, with the exception of that near Walker's old tunnel. The new company are driving a tunnel under the basalt, and through serpentine formation, in search of the lead. They are now in some 450 feet. As soon as these leases are granted it is to be hoped that work will be commenced in earnest.

Two 25-acre leases have been applied for by Messrs. Seaver, Hirche, and others at the Red Hill (or Yahoo Gully), but no work has been done pending the leases being granted. The company have secured the water-race known as Power and Emblem's, which will provide an ample supply for all purposes. The results from this property are considered certain to be good, as some very coarse gold has been obtained by the ordinary hand crushing and washing process.

Henderson's Claim, at Mount Misery, is still being worked. The tunnel is now some 1,900 feet in. The cement obtained, however, is not as rich as it has been nearer the surface.

At Anderson's Flat, near Bowling Alley, Mr. Hale and Dr. Read intend to join in the expense of erecting heavy pumping machinery, and have great hopes of success after the water is mastered.

Reefs.

Work is being vigorously carried on at Foley's Reef, Bowling Alley Point. The tunnel is about 755 feet in, and they have again struck the reef showing gold. This reef is one of the finest in the district, being 3 feet 6 inches wide in many places, and very rich patches have been obtained by different parties during the progress of the tunnel. The parties who now hold the claim are working with a will, and will soon have sufficient stone for a crushing.

The John Bull and Carrington are also at work on what is believed to be the same reef. The John Bull had a crushing just before Christmas. I am informed it went 1 oz. to the ton. The owners of the Carrington, after widening their shaft, struck gold, and have since been driving to the south.

On the company's estate the Marquis of Lorne Company has been wound up with a great loss to the shareholders, but it is likely to be soon worked again in a more economical way, the opinion of many being that it is one of the best properties in the district. The Scandinavian is the only other claim at work in this locality.

In the vicinity of the Hanging Rock, Kennedy and Prisk have applied for a lease embracing their old shaft, which they abandoned some time ago on account of excess of water, and have driven a tunnel 90 feet lower down the hill, some 212 feet in. At 190 feet they struck a rich leader, and are now driving to the south of the reef showing gold, and intend stopping up towards their old shaft in which they were upon gold when driven out by the water. There are several other tunnels being driven on this line of reef, but with no very great results.

Rusicka's old claim has again been taken up by M'Nelly and Nethersole, and operations will be shortly commenced.

No work is being done on the Brown Snake reef, and the claims east of the Serpentine are all idle. A large number of rich leaders are continually being found, but are principally on or near the surface, and are in the vicinity of the Hanging Rock.

Alluvial mining is not much resorted to now, though occasionally a few nice water-worn nuggets are found. The Chinese are continually fossicking in the river and creeks, but it is impossible to say what their returns are.

The supply of water is sufficient for all purposes at present.

Nothing has been done in respect to other minerals.

The revenue has been largely increased by the rents on leases lately taken up, and the future of the field depends on the results that will be obtained from Mount Ephraim, Yahoo Gully, and Dangar's Gully leases.

Reef mining is in a better state than last year, the claims being worked with more energy.

No serious accidents to report, and very few disputes. All workings visited by me well secured and ventilated.

PEEL AND URALLA DISTRICT—ARMIDALE DIVISION.

(Mr. Warden C. E. Smith, P.M., Armidale.)

I HAVE the honor to submit my annual report for the Armidale portion of the Peel and Uralla Mining District for the year 1887. It appears the gold obtained during the past twelve months is in excess of the quantity found in 1886 by 1,000 oz., as nearly 5,000 oz. are represented as the approximate yield for 1887. Antimony ore, to the extent of 110 tons, have been raised, and about 10 tons of tin have been secured during the past year.

Prospecting has been carried on with varied success in different localities by a number of miners, and even finds of gold have occasionally been reported, and a few of the newly discovered quartz reefs are alleged to be of considerable importance and highly auriferous, but cannot be profitably developed without considerable capital, and expensive machinery directed by competent and experienced mining engineers. Companies have been formed, or are in course of formation, to work rich quartz veins found at Baker's Creek, Hillgrove, and favorable accounts of profitable workings are expected, as the crushings by George Smith and party are reported to be very remunerative, and indicate rich payable gold-field has been discovered.

The operations of the Eleanora Gold-mining Company at Hillgrove, close to Baker's Creek, extracted 2,183 oz. 18 dwt. 5 gr. of gold, valued at £8,481 16s. 6d. from 6,313 tons of stone, and gave employment to from fifty to fifty-five men, and raised 110 tons of antimony. Three shafts have been sunk respectively 175, 85, and 100 feet, but the stone raised though very poor has more than paid expenses. The machinery in use is a 25-stamper battery, air compressor, with drills, whims, &c.

PEEL AND URALLA DISTRICT—TINGHA AND INVERELL DIVISIONS.

(Mr. Warden Fraser, P.M., Inverell.)

I HAVE the honor herewith to submit my annual report for 1887 on the Tingha and Inverell Divisions of the Peel and Uralla Mining District, under my charge.

Although the weather upon the whole has been favourable for mining operations the output of ore has fallen off this year. This I attribute chiefly to the fact that the alluvial is pretty well worked out.

I estimate the whole product for the year at about 1,536 tons. Owing, however, to the advanced rates ruling for ore this year, the amount realized exceeds that of last year by some £2,000.

There has been a steady decline in the output of tin ore for the last six years, as shown by sub-joined table:—

Year.	Ore raised.	Value.
	Tons.	£
1882	3,500	186,000
1883	3,300	80,000
1884	2,700	60,000
1885	2,000	50,000
1886	18,000 ?	46,000
1887	15,000 ?	48,000

Our alluvial claims are nearly worked out, and although there are numerous reefs on the field, capital is required to develop them. Very few as yet are being worked, and unless holders induce capitalists to join them many claims must be abandoned, as capitalists hesitate to invest on values placed by lessees on undeveloped ground.

An attempt was recently made to form a private prospecting company, with a capital of £10,000, which I regret to say was unsuccessful, only some £7,000 being subscribed. Had it succeeded I believe capitalists would have operated with more confidence. The result would have been that a large mining population would be established, farmers and storekeepers would have found a cash market for their goods, and we would be independent of the long looked for railway.

The diamond industry is taking a breather, very little being done at present on that part of the field. The absurdly high expectations of holders of land of this nature prevent capitalists meeting them.

A reported discovery of gold and bismuth has been made in the north-east portion of the field. The assays are said to be good, but experienced miners suspect that the samples sent for treatment were concentrated, consequently the discovery has not caused much excitement. The prospectors, however, are very confident, and intend sinking to a depth of 100 feet to further prove the reef.

PEEL AND URALLA DISTRICT.—TINGHA DIVISION.

(Wm. Norton, Mining Registrar.)

I HAVE to report a falling off of 389 tons of tin during 1887; the value of tin won during that year was £78,138, being £11,802 less than the value of tin during 1886.

The falling-off of the yield of tin has been caused by the working out of the shallow ground. Attention has, however, been turned to the deep ground and reefs, with every prospect of future success, if the present indications continue.

With respect to the diamond field I cannot speak, as that part of the division transacts its business through the Inverell office.

PEEL AND URALLA DISTRICT.—BENDEMEER DIVISION.

(J. H. Stumbles, Mining Registrar.)

I HAVE the honor to report, for your information, that during the year ending the 31st December, 1887, there has been four applications for mineral leases received at this office—three for the purpose of mining for tin, and 1 for manganese. There has been 13 mineral licenses issued at this office, and 2 miners' rights. None of the company's are at present working their ground. Murray & party have raised 3 tons of tin, which was disposed of at £65 per ton. Northy and party have raised 2½ tons of tin, which was disposed of at £60 per ton; Hetherington and party raised 2 tons 3 cwt., which was disposed of at £60 per ton. These are the only parties at present working in the creek.

PEEL.

PEEL AND URALLA DISTRICT.—URALLA DIVISION.

(James Watt, Mining Registrar.)

I do myself the honor to submit, for the information of the Minister for Mines, the following report on mining matters in the Uralla Division of the Peel and Uralla Mining District for the year 1887.

I regret to say that there has been a falling-off in the gold yield generally as compared with that of 1886, which may, in a measure, be accounted for by the fact that copious and continuous rains fell within the latter period, enabling miners to sluice off large quantities of wash dirt which had been stored up, in some cases, for years.

At Doherty's Hill, about 3 miles west of Uralla, a considerable amount of work has been done during the year. It will be remembered that Mr. Surveyor David, when sinking the district at the latter end of 1886, pointed out this locality as one likely to bear rich deposits. Every available piece of land in the vicinity has been secured, either by lease application or under the Mining Board regulations. I am informed by old residents that the ground was tried many years ago, but the water proved an insuperable obstacle, which frustrated all the efforts of the early miners to reach the bed rock and test the ground.

Rice and party, however, have bottomed at a depth of 120 feet, obtaining (with great difficulty, on account of the rising water) prospects of about 3 oz. to the load. In January last pumping gear and machinery were erected at this claim, but proved of so unsatisfactory a character that it had to be removed. A new engine of 12-horse power is now on the ground and ready for work, which will, effectually combat the water, and the party are confident of success in the near future.

The old Rocky River Company, Jubilee Company, Tug of War, and other parties, have also done good work in sinking shafts and putting up machinery at Doherty's Hill, but no gold has, as yet, been obtained, owing to the difficulty before referred to. The work of sinking here is exceedingly laborious,—mostly through basalt of the very hardest description.

A rush took place in the beginning of last August to a spot near the Wallaby Rocks, about 2 miles south-west of Uralla. The ground is new, and the sinking soft and comparatively shallow (about 20 feet.) Brown and Bonors, Crotly, Russ, Scanlon, and others, have taken up claims here; the first-mentioned party being the most successful, realizing at first from 1 to 2 oz. to the load. The average present yield is from 11 to 23 dwt. This locality is, I fear, patchy, and not likely to become a permanently rich field.

Sluicing operations at Dodger's Rush, Cabbage Tree Creek, and Tolly's Gully, appear to be of such a payable nature as to warrant several parties continuously working them, but I am unable to obtain reliable information as to the yields and prospects of these places.

I am sorry to have to report that the Maitland Point Company have for a time suspended work. This company was formed for the purpose of thoroughly working on a large scale, by hydraulic dredging, the bed of the Rocky River, previously "fossicked" by Chinamen, and abandoned. Powerful machinery has been erected, at a cost of some £3,000, and about 5,000 tons of alluvial tailings worked, realizing about 25 oz. Owing to some part of the machinery not being of the character required to cope with the spongy, clayey soil underlying the loose sand and gravel, work was suspended, and arrangements made for rectifying the error. The company expect this year to put a very large quantity of stuff through the process.

The Long Tunnel Company (Messrs. Anderson and Young) have steadily and continuously worked their holding throughout the year, and the returns appear satisfactory.

The local branch of the Bank of New South Wales purchased 900 oz. of gold, at the rate of £3 15s. per oz.; but no idea can be formed from this of the mining resources of this district, as large quantities of gold are conveyed away by private hand.

The number of licenses issued was as follows:—

Miners' rights	266
Business licenses	5
Mineral licenses	2

as against—

Miners' rights	141
Business licenses	4
Mineral licenses	Nil.

sold in 1886.

Seven applications to lease land, amounting in the aggregate to 51 acres, have been received by me during the year; also, sixteen applications for extended claims in old and abandoned ground, representing 81 acres, and the following:—9 water-race and water-right applications; 3 dam and reservoir applications; 7 block alluvial claim applications; 2 creek claim applications; and 1 prospecting (quartz) claim application.

PEEL AND URALLA DISTRICT.—WALCHA DIVISION.

(E. Marriott, Mining Registrar.)

HEREWITH I have the honor to submit my annual report for the Walcha Division of the Peel and Uralla Mining District for the year 1887.

1. Glen Morrison.

The Glen Morrison Prospecting Company, after expending £1,000, have reopened work, for the purpose of reforming the company and raising fresh capital.

James Kean and party, working under a special permit, granted by the Minister for Mines, report having discovered a "leader" containing gold, and they intend to raise about 10 tons, for the purpose of testing.

Other local companies have been formed for the purpose of testing the reefs in this locality, which it is to be hoped will lead to fresh discoveries.

2. Tia River Reefs.

Matheson & McIntyre, the proprietors of the principal claim in this locality, have sold out to a new company, with a view to more extensive works being carried out.

Mr. J. N. Watts, on behalf of the new company, reports as follows:—The Tia Gold-mining Company have purchased the Tia Gold-mine, held under a lease by Matheson & McIntyre, consisting of two

two 6-acre leases, together with the battery of five head of stampers driven by water wheel, and all appliances. They have an experienced manager to superintend the working of the mine, and it is their intention to sink a main shaft 220 feet, so as to cut the reef through at that level; this will leave them 110 feet of a reef, averaging from 4 to 5 feet in thickness and yielding 13 dwt. to the ton; but, under improved appliances for saving gold, it is estimated that a far greater yield will result. The foundation is soft slate and sandstone, and no explosives of any kind have been used in the working, the ground being very easily worked. A tunnel at the 105-foot level will be used as a water channel.

Several claims were registered in this locality during the past year, but have not as yet proved payable.

3. *Novendoc.*

Mount Carrington Claim.—Mr. Henry Whittam reports having extended his tunnel to 400 feet, with a width of 4 feet and 6 feet high, clear of the timber. He has of late been occupied in making an "air-shaft," present depth 60 feet, to be continued 40 feet further, in order to reach the level of the tunnel.

A considerable amount of prospecting has been going on in this district, more particularly at Glen Morrison and Tia River. No new discoveries of importance have as yet been reported, but some local companies having taken over some of the old workings in the localities named, better results are looked forward to.

Miners' rights issued during the year 1887, 70; mineral and business licenses, nil. No gold or mineral leases were applied for.

About 59 oz. of gold was purchased locally, chiefly "machine gold," value, (average) £3 12s. per oz.

PEEL AND URALLA DISTRICT—BARRABA DIVISION.

(*P. Sinclair, Mining Registrar.*)

IN submitting to you my report on the Barraba Division of Peel and Uralla Gold-mining District for the year 1887, I have the honor to inform you that there has been 184 miners' rights, 6 business licenses and 1 mineral license issued. There are at present about 60 miners working and prospecting at Wooderuf Crow Mountain and Tea-tree Creek. There are many of these miners shareholders in leases. There has been in all 53 applications for leases this year (1887.) For the last three months mining business has been very slack; but, I think, now we have entered into another year there will be a reaction.

One thing we are much in want of here is proper machinery for saving the gold. A great deal of the gold found is very fine, and floats away with the mud.

There are three batteries, one at Tea-tree (the Pioneer Gold-mining Company's), which has not been at work this last twelve months, and Fletcher's, old battery, Crow Mountain and the Timour, &c., Company's at Wooderuf.

I find it difficult to furnish you with a satisfactory report, owing to the scattered position of the miners, who are some of them selectors. There has been a great decrease in the population this last three months; but some of the miners are of an opinion that there are better times coming for the district with the new year.

I cannot form an estimate of the yield of gold, according to the scattered population and the small lots that have been crushed for different parties.

I have only held the office of Mining Registrar for the last six months, and am not able to give the information that I could do if I had been longer in the position.

PEEL AND URALLA DISTRICT—BINGERA DIVISION.

(*Thos. Connolly, Mining Registrar.*)

I do myself the honor to submit to you my annual report for the year 1887, and although not as good as anticipated, on the whole it is very satisfactory. I have sold 162 miners' rights and twenty-three mineral licenses, and received sixteen applications for gold-mining leases and fifteen mineral leases. And as far as I can ascertain there has been 1,050 oz. of gold obtained during the year; which is much in advance of 1886. The gold is firm alluvial workings, and got in small quantities. Very few of the leases are worked.

PEEL AND URALLA DISTRICT—GLEN INNES DIVISION.

(*V. D. H. Besnard, Mining Registrar.*)

IN submitting my report for the year 1887 I have the honor to state that the following areas have been applied for at this office, to lease for mining purposes:—

	No.	a.	r.	p.
Gold (ordinary)	4	29	0	0
Do (special).....	1	27	2	7
Mineral	8	236	0	0

There were sold during the same period:—

Mineral licenses	103
Miners' rights	139
Business licenses	5

In 1886, seventy-six, seventy-five, and four respectively were issued at Glen Innes.

At date of writing this and for some months previously, prospecting here would seem to indicate very cheering prospects for this division.

HUNTER

HUNTER AND MACLEAY DISTRICT—COPELAND DIVISION.

(Mr. Warden M'Shane, P.M., Copeland.)

DURING the past twelve months mining has in this district been at a very low ebb, crushings have been few, and the results generally poor. The obstacles, however, have been many and great, so that poor returns are by no means to be wondered at.

A long wet season at the early part of the year flooded shafts, rendering work almost impracticable, and when hopes were revived and work once more commenced, it was again impeded by heavy rain.

Gold there must be in these parts, but work has not been carried sufficiently deep. I have had some very rich specimens shown to me, coming from nearly every part of the field, showing that the metal is not only confined to one or two localities.

Capital is greatly needed, also more improved labour and gold saving appliances.

The Centennial Gold-mining Company (Limited) having already driven at a great depth a tunnel 800 feet in length, measuring about 7 feet high by 7 feet wide, intend to commence operations at once, and extend their work, hoping to cut a rich reef at this depth, and run a tramway through the tunnel, which is sufficiently wide for a double set of lines.

Should this company succeed, a great impetus will be given to deep sinking and tunnelling, and Copeland will once more assume a more lively aspect.

A five-head of Stumper's battery, worked by water-power, has during the past year been erected at Boranel, and a battery having fifteen head (ten working) of Stampers has been erected at the Bowman, this latter being the property and worked by the Bowman River Quartz Crushing Company (Limited).

Three things are, as I have said, much needed here, capital judiciously expended, improved machinery, and experienced workers.

HUNTER AND MACLEAY DISTRICT—BULLADELDAH DIVISION.

(Mr. Warden Hawcett, P.M., Bulladelah.)

I DO myself the honor to report as follows, with respect to the Bulladelah portion of the Hunter and Macleay Mining District:—

I regret to be obliged to state that the sanguine anticipations entertained by me last year have not borne fruit, and that but little work, generally speaking, is carried out on this field.

I visited Coolongolook on the 12th and 13th of this month and found only two parties working and one just about to commence.

Conway and party and Paulson and party both expecting machinery; in fact, the greater part of that belonging to the former had arrived but unfortunately a portion was lost by wreck on the voyage to Forster. On both those claims a large quantity of stone is ready for crushing.

Conway's claim of 5 acres is close to the Mountain Widow and Paulson's 20 acres on the Suttor Reef. No leases as yet granted in either case. I found at Mount Springfield (Stuart and party's claim) machinery erected and a large dam, now full of water, constructed, and ready for work in a few days, but the plant is not powerful enough to work more than the proprietors can bring to grass. This claim is held on lease, and its prospects are very good.

I did not visit Paddy's Creek, distant about 7 miles, as there was no one working there.

In order to prevent the ground lying idle I beg to suggest that leases of the claims at present applied for be granted, and after they have been executed a reasonable time that the Mining Registrar be directed to report on all such claims, as also upon all others held under lease, and that in all those cases where work is not carried out the lessees should be called upon to show cause why their leases should not be cancelled.

Such a proceeding would either cause the then holders to work their claims or give way to those who would, as I have still reason to suppose that abundance of payable stone is to be obtained, and that all that is required to render the Coolongolook Gold-field a success are industry, capital, and economy.

As regards any mineral I should recommend a similar course to be pursued.

On the claims of the Alum Company at Bulladelah Mountain a great amount of work has been performed, and consequent on the number of men employed and the large weekly expenditure a complete transformation of the appearance of the village is taking place.

HUNTER AND MACLEAY DISTRICT—KEMPSEY DIVISION.

(Mr. Warden Ducat, P.M., Kempsey.)

IN submitting my annual report on the mining interest in my division for the year 1887, I have the honor to state that mining throughout the year has been almost nominal, such mineral leases as are in force having been granted suspension of work with the renewals, thus extending over the entire year, with only one exception—Baker's lease, at Port Macquarie. The increased demand for minerals and the advance in value I trust will be an inducement to the proprietors to rework their leases with systematic energy.

Gold.

There have been two or three prospecting parties on the creeks around the locality of Mount Sea View and the upper part of the Hastings and Ellenborough rivers with varied success. Prospects have been found in various creeks, but up to date nothing payable.

A mineral lease was applied for by Buckman and Marshall at county Raleigh, parish Newry. The lessees had some stone from the lease tested in Sydney, the test giving from 2½ to 3 oz. gold rate per ton. The lessees have now applied to have their lease converted into a gold lease. This has caused considerable excitement, and a rush has been made to the field, and prospecting was done on all the surrounding country with the result of a large area of ground being pegged out, and a further discovery of two more well defined reefs. As in all such rushes there is a great deal of exaggeration as to the extent and richness of the field. I expect after a time when it is more settled to be able to give a clear and reliable report on the field. There is very little doubt of its being a very extensive field. However, quite impossible to say yet how far the same quality of gold-bearing quartz may run and keep up its value.

Cobalt.

The cobalt mines at Port Macquarie are still being worked, but as works have to be erected, and are now in course of erection, not much work is actually being done at the shaft. A few tons of ore are at grass awaiting the completion of the works.

Eighty miners' rights have been sold this month to parties for the Deep Creek field, and doubtless many more will be applied for if the field proves a payable one.

HUNTER

HUNTER AND MACLEAY DISTRICT—DUNGOG DIVISION.

(Mr. Warden C. G. Smith, P.M., Dungog.)

I HAVE the honor to report that the gold workings at Wangat do not appear to have made much progress during the past year, only ten miners being now in that locality.

There are two registered claims, one at Upper and the other at Lower Wangat; the former styled the Marsh Creek Company, the latter the Golden Spur Company.

The Marsh Creek Company employ four men, and work by a tunnel about 200 feet long, the depth from surface being about 160 feet. The underlay is 1 in 4, north, reef bearing east and west; 70 tons crushed for 53 oz. 6 dwt., value £187.

The Golden Spur Company have driven into the hill for about 400 feet, and have a shaft sunk about 50 feet at end of tunnel. Perpendicular depth from surface about 180 feet; average width of lode, 9 inches; underlay to north 1 in 4, bearing east and west; 50 tons crushed for 109 oz., value £325. Good working country (sandstone and slate), walls well defined, gold carries about 8 per cent. of silver. With capital and energetic management, and extension east and west, this claim ought to be a good property, although the yield may not, on the whole, average nearly so much as 2 oz. to the ton.

HUNTER AND MACLEAY DISTRICT—BULLADELAH DIVISION.

(Robert Quayle, Mining Registrar.)

I DO myself the honor to report as follows respecting the Bulladelah portion of the Hunter and Macleay Mining District for the year ending 31st December, 1887. Thirteen claims have been taken up for quartz mining, 90 acres in all, and five mineral leases, containing 290 acres.

Suspension of work has been granted to Curruki and Bulli claims.

The great drawback to the gold-field has been the want of machinery. Mr. James Stuart has erected a battery on the Macleay River, and will start to crush next week. Messrs. Conway and party have a twelve-head battery on the ground for erection, and when these batteries get in full work, Cooloolook will get a fair trial.

The Curruki is down 125 feet, very wet. Four tons of stone was crushed in Sydney, which yielded 4½ oz. to the ton, from the 125-foot level, and 4 tons from the 80-foot level yielded 3½ oz. to the ton. The reef is 10 inches thick, and well defined.

Mount Springfield (late Bunker's Hill) is down 55 feet, on a reef 18 inches thick, showing gold. About 40 tons to grass. Eight men at work. Start to crush next week; a good result is expected.

The Mountain Widow claim has five shafts sunk on a well-defined reef about 1 foot thick, shows gold. The deepest shaft is 111 feet. About 50 tons to grass; nine men working.

The Suttie is down 20 feet, on a well-defined reef, 3 feet thick, and gold can be seen in the stone. Three men working; about 6 tons to grass.

The above-mentioned claims are situated at Colongolook, 20 miles from Bulladelah, and is a great reefing country.

The mineral leases are situated in the vicinity of Bulladelah. No work has been done on them except prospecting.

The Australian Alum Company, at Bulladelah, are making great headway, under the supervision of H. D. Abbott, Esq. Sheds, kilns, and tramways are being erected; about thirty men employed, and miners are being put on to get out the rock.

HUNTER AND MACLEAY DISTRICT—MAITLAND DIVISION.

(F. F. Isaac, Warden's Clerk.)

COAL is the only mineral worked in my division during the past year (being the first in which a Warden's Clerk has been appointed). There has been a decided increase in the quantity of coal won. The exact amount or value I have been unable to obtain, in consequence of there being no response from two of the collieries to my circular asking for particulars of same.

I understand, however, that particulars have been forwarded direct to your Department. I will now mention briefly the several collieries which have been at work during the past year. The Bloomfield, near East Maitland; Fitzpatrick, proprietor; yielded 1,800 tons, value, £400 10s. 6d.; from four to six men employed. Homeville, near West Maitland, recently opened, has returned 6,000 tons, value £2,100. I enclose the manager's report herewith. Rathluke; R. J. Taylor, proprietor; and Thornley; Henry Marshall, manager; have forwarded reports direct to you. A new company is now being floated to work the Thornley colliery and surrounding country, a full report of which I can forward if necessary. Four leases, covering an area of 1,996 acres, have been granted during the past year; these are situated in parish of Stanford. No works have yet been erected. Application will probably be made for amalgamation, and a company formed.

A 20-acre lease has been granted to Matthew Talip, near East Maitland. The result of the two months' working are as follows:—1,600 tons, value, £380; eight men employed.

I have issued during 1887, twenty-five miners' rights and eight mineral licenses. I have nothing further to report.

NEW ENGLAND DISTRICT—NORTHERN DIVISION.

(J. B. Graham, Warden.)

I DO myself the honor to submit my report on the Northern Division of the New England Mining District for the year 1887.

During the past year an impetus has been given to mining in this district, to a great extent in consequence of the discovery of rich silver ores; and although there have been some failures and disappointments in the gold-mines at Fairfield, which have not turned out so rich as they were supposed to be, I am pleased to be able to report that the mining industry is now in a healthier state, and more likely to be of permanent value than at any previous period. Large companies have been floated, and there is every prospect that some of the rich mineral deposits in this portion of the New England District will be developed by capital.

Disappointments

Disappointments invariably occur in new fields, especially in cases where the first finds are of great richness, such as at Fairfield, when the first 10 tons of stone obtained produced over 128 oz. of gold; but there can be little doubt that the Fairfield Mines will soon rank among the best payable and most extensive gold-mine in the Colony. As yet, great difficulty has been experienced in the treatment of the stone for the extraction of the gold. In some cases the gold is so fine that the ordinary process of crushing and amalgamating does not succeed in saving half, and in many cases iron and copper pyrites, zinc blende, &c., being associated with the gold, renders a process of extraction necessary, for which no provision has yet been made. Now that attention has been directed to the necessities of the field, no doubt capital will be obtained to successfully work the mines.

The silver-mining industry is yet in its infancy, but it promises to be of great value and importance. For convenience I will divide my report, and deal with each industry separately.

Gold.

Boonoo Boonoo Gold-field, situated about 13 miles north of Tenterfield, was many years ago an alluvial field of some importance. The alluvial was worked out, and the field virtually abandoned. Since then several attempts have been made to work the reefs; all of which have failed from want of capital or enterprise. The field has now revived, and there is every chance of its being successfully worked. The country is granite at an altitude of about 3,500 feet above the level of the sea, the reefs are large and well defined; water is very troublesome, as the locality is wet and swampy. The water greatly obstructs prospecting and working. It is impossible to sink to any depth without powerful pumping machinery. This has been one of the great drawbacks to this field. If it had not been for that, the reefs would have probably been worked years ago, as it was known many of them contained good gold. Capital will now overcome that difficulty, and the reefs will be fairly tried.

On the Golden Crown Reef a Queensland syndicate or company is represented by Mr. Benjamin. They hold about 24 acres of land under gold lease, and are now sinking on a reef about 6 feet wide. The present depth of the shaft is about 70 feet, and it is intended to drive at 90 feet. A 5-foot Huntington roller mill will be erected in connection with this mine. There are several other parties working in this locality in various reefs. There is no crushing plant yet on the field, so that it is impossible, except from assay and trial crushing, to tell what the result will be. The owners appear to be confident that the reefs are payable. The principal reefs are the McIntyre and the Golden Crown. Some alluvial working is also going on near the reefs, in a swamp known as Dismal Swamp. About twenty-six men are engaged on alluvial.

About 3½ miles from the McIntyre there is another good reef known as the Lady Mary. A company has been formed to work this reef, and preparations are being made to work it on an extensive scale. The company have 20 acres of land under gold lease. The present depth of the main shaft is about 74 feet; the reef at that depth is 6 feet wide, and estimated to go over ½ oz. of gold to the ton. A trial crushing was made of 1 ton 4 cwt. of stone, which gave a result of 1 oz. to the ton. At the 60 feet level a drive has been put in, to drain the water, leaving 14 feet of water in the shaft. To deal with this water a Tonkin pump has been erected, capable of throwing 4,000 gallons an hour. Crushing machinery is now on the way from Sydney,—it consists of a 5-foot mill "Huntington roller;" a 10-horse power engine is already on the ground. The reefs in this field are all well defined, with soft granite walls.

Fairfield gold-field, situated about 37 miles east of Tenterfield, was discovered about 18 months ago, when a rush took place, and a great number of gold leases were applied for. Possession of land was taken in many cases without sufficient prospecting, merely on the chance of striking gold, consequently a number of leases have been abandoned even after considerable labour has been expended, under the regulations relating to the employment of labour on leases on new gold-fields; but although there have been many "duffers" real mining has now made a fair start. The first mine at work was the Adeline; this was on private land. A rich find had been made on the gossion rock, on the surface, on which a company was formed and works erected before the ground had been properly prospected. The surface rock, containing the free gold, now appears to be exhausted; or, at any rate, it cannot be traced, and it has been found that at a few feet under the surface, the stone changed into a strong copper and iron pyrites reef; the machinery erected could not treat the stone, and the mine is now, consequently, idle. It was the failure of this mine that, to a great extent, shook the confidence of the public in the Fairfield mines generally.

The Shaus Gold-mining Company are working land held under gold-mining leases, at the back of Mount Carrington. The reduction plant consists of a 25-horse power engine, at present driving a 15 stamper battery, but capable of being extended to 40 head of stamps. The battery has been at work only a few weeks. 750 tons of stone has been treated, yielding 476½ oz. of standard gold. There are several reefs through the land; the principal one is 10 feet wide: the stone is easily obtained, and close to the battery. The value of the plant, &c., is about £7,000, and 27 men are employed.

The Mount Carrington Company's mine, situated in Mount Carrington, comprises an area of 21 acres, held under gold-mining leases; the reduction works are situated at the foot of the mountain; the battery has 15 head of stamps, driven by a 25-horse power engine. The gold-saving appliances are superior to any other on the field. In addition to the ordinary process of amalgamation there are six oscillating, concentrating tables, on a principle invented by Mr. John Rossiter, the manager of the mine; the mill is now ready for work; crushing will commence about the end of January. The stone is obtained from large reefs on the top of the mountain, and will be delivered at the mill by a self-acting tramway, 1,760 feet long. The works on the mine are very extensive and complete, the battery is a self-feeder, and the stone is not handled after it leaves the mine. The manager estimates, that in consequence of the labour saving appliances, less than 4 dwt. of gold will pay all expenses of getting and treating the ore.

The Kelly Gold-mining Company's mine is adjoining the Adeline mine, the stone is something of the same character, some crushings have been made, but I am not in a position to say what the result has been, the battery consists of five head of stamps.

There are many other mines working on this field, but as yet they have no machinery for the treatment of the stone, satisfactory trial crushings have been made, and many of them have proved very rich.

The Red Rock Gold-field is situated 8 miles north-westerly from Fairfield, it extends over a large area of country, and a great many gold leases have been applied for; the gold is found in a gossion stone with

with quartz, it does not appear to run in reefs or veins, but occurs in great masses; the average yield would probably be from 5 to 15 dwt. to the ton; in some instances more than an ounce has been obtained; several companies have started work in the locality; the principal and most advanced is the great Red Rock Gold-mining Company; the mine comprises 30 acres of land held under gold leases. A battery of twenty head of stamp has been erected in Crooked Creek; it is intended to increase this battery and erect another one on the Cataract River, consisting of at least 100 head. The stone now being treated is obtained from an open cut or quarry into the mountain; it is 110 feet in, the face is 25 or 30 feet wide, and the depth of the cut at the face is about 20 feet; there is no appearance of reef or walls; the mountain appears to be a mass of auriferous rock; the stone is getting richer as it goes in; the last crushing yielded from 8 to 10 dwt. per ton; the gold is very fine and difficult to save; it much resembles the Mount Morgan gold (except in value), about half of the gold is supposed to be lost by the present system of working; the gold contains a percentage of silver which reduces its value to about £3 per oz. This Company intend to greatly extend their operations; I am informed that they have made arrangements with neighbouring holders, and secured about 30 acres more land; when the additions are made to the machine at Crooked Creek and the machinery is erected on the river, this will be one of the largest gold-mines in the Colony; from prospects made, the auriferous rock appears to be practicably inexhaustible, and from the facility by which it can be quarried out and carried to the mill it is estimated that less than 3 dwt. to the ton will pay all expenses in raising and treating. This Company at present employ sixty-seven men.

The Central Red Rock Gold-mining Company's mine adjoins the Great Red Rock Company, and the stone and formation is somewhat similar; the Company intend to erect machinery on the Cataract River, and are now employing men constructing a wire tramway. Forty men are engaged by this Company.

The Mines Company of London mine also adjoins the Great Red Rock Company; the stone is similar and the formation the same as the two previously described mines. The trials and assays have been very satisfactory. The mine is well opened up by a quarry similar to that on the Great Red Rock mine. A wire tramway to the river is in course of construction; the machinery is to be erected on the Cataract River, and will consist of at least 40 head of stamps driven by a combination power of steam and water; the water-power will be obtained by a Turbin, and it will be worked when there is sufficient water; the steam-power will be reserved as an auxiliary.

There are various other mines in this locality which will in all probability be formed into companies to work. This is not a poor man's diggings, it requires capital to develop and work the mines. As soon as the success of the Great Red Rock Gold-mine is assured no doubt plenty of capital will be obtained to work a great extent of this auriferous country. From the vast quantity of auriferous stone, and the facilities to put up machinery on the Cataract River, where there is an inexhaustible supply of wood and water, this field must become of great importance.

Lunatic and Perseverance Gold-field, situated 6 miles north of Fairfield, has been known and worked for many years, at first with great success. It is now again beginning to attract attention. Two or three companies have been formed to work the reefs. A crushing of 25 tons from the Victoria reef yielded 31 oz. of gold, value £118. A tunnel has been driven into the hill which strikes the reef at the 120 feet level. This and all the reefs in the locality are small, but they are true fissure lodes, and likely to continue to a depth. A small battery is in course of erection.

In the vicinity of Pretty Gully a number of miners are prospecting, and several gold leases have been applied for.

At Tooloom prospecting is being done by a Sydney Company, under the management of Mr. Haagar, for alluvial under the basalt formation, between Pretty Gully and Tooloom. This is really a field where some assistance should be given to prospecting. There are all the indications of a large alluvial deposit existing under the basalt ranges. This deposit, if it exists, would almost certainly contain gold, as all the surrounding country is more or less auriferous, and in former years a large population worked all the creeks and gullies in the locality.

At Poverty Point the Surface Hill Gold-crushing Company are still at work, but the machinery is quite insufficient for the treatment of this vast mass of auriferous granite; at least 50 or 60 head of stamps should be working, instead of the 10-head battery at present in use; during the last year constant work has been carried on in ground-sluicing, crushing, and prospecting; the prospecting has satisfactorily proved that the extent of the auriferous grants is very great; payable gold has been found in a sort of sandstone formation, also on a large porphyritic lode, about 8 feet wide, and apparently widening; crushings from it have yielded from 5 dwt. to 8 dwt. per ton. In the ground sluicing works of the Company some delay has occurred in consequence of the collapse of a tunnel; this tunnel is the main channel for the water; it is about $\frac{1}{2}$ a mile in length.

The stone is conveyed to the mill by a self-acting tramway over very rough and difficult country. Many labour-saving appliances have been erected by the present Managing Director, Mr. Kenneth Hutchison; with machinery capable of treating a large quantity of stone this mine would pay well, and be almost inexhaustible.

In the other parts of my district little or no change has taken place in mining; there is a slight revival at Dalmorton, and I understand a Park & Lacy's roller-mill is in course of erection on that field, from which good results are expected.

At Lionville and Solferino there is very little doing.

Silver.

The late silver discoveries in this district have caused much excitement, especially that one known as the "White Rock," near Fairfield. I have fully reported on this discovery by my letter to you, dated the 18th instant, a copy of which is attached hereto (Appendix A), which can be read as part of this Appendix A. Another discovery has been made on a range of granite mountains, about 8 miles north of Tenterfield; a gold prospecting area was taken up by a miner named Bernard Rodgers; he struck a very nice-looking quartz-reef, and on getting an assay made, it was found to be exceedingly rich in silver; the reef in the prospectors shaft is 1 ft. wide, apparently widening as it goes down; it runs N.N.E., and S.S.W., with little or no underlay; it is a well-defined reef, with perfect walls of soft granite; this reef has been traced and taken up for 1 mile each side of the prospectors. Assays have been made of this stone, showing

showing as much as 795 oz. silver and 6 oz. 12 dwt. gold to the ton; the lowest assay yet made shows 13 oz. silver, and 2 oz. 14 dwt. gold. Very little work has yet been done, as the reef was only found in December last. The country is granite of a rotten decomposed nature; the stone is easily obtained, and the silver is in chlorides and sulphides. I am sending specimens down to the Department of Mines for assay; perhaps its results can be attached to this report as an Appendix.

Tin.

The tin-mining industry during the past year has not shown signs of improvement, although the price has so greatly increased; the fact is that all the shallow stream tin workings are now exhausted; the lodes and deep leads have not been prospected for from want of capital; a few Chinamen only are working on the field. During last year only 93 Mineral Licenses were issued at Wilson's Downfall, and 2 applications for Mineral Licenses received. The estimated quantity of tin won during the last year is about 270 tons.

NEW ENGLAND DISTRICT—WILSON'S DOWNFALL DIVISION.

(*J. G. Draper, Mining Registrar.*)

I HAVE the honor to forward my annual report for the year 1887, concerning the mining industry at Wilson's Downfall.

It is simply going on in the same old quiet strain; at one time there was inclination shown by a party to do a little in the shape of prospecting for leads, but their means being limited, and not meeting with encouragement, have for the present abandoned the idea, but notwithstanding this, they are still of opinion that lodes exist in the locality. Perhaps when all the stream tin is worked out and capitalists can be induced to speculate, their attention may again be turned in that direction.

The mining population in this district at present is about 300, principally Chinese, and the quantity of tin-ore won during 1887, being 270 tons, valued at £16,200.

During the year ending December 31st, 1887, I issued 93 mineral licenses, 17 miners rights, 5 business licenses, and received two applications for mineral leases.

NEW ENGLAND DISTRICT—FAIRFIELD DIVISION.

(*J. P. Curran, Mining Registrar.*)

I HAVE the honor to transmit my annual report of the mining industry in this division for the year ending December 31st, 1887.

I stated in my last annual report that a great deal of land taken up for gold-mining purposes would be found valueless, a prediction that is now verified, as a number of the leases have been allowed to be returned to the Mines Department for cancellation.

There is, however, a great deal of activity displayed in mining still, and I feel confident that when the mining land falls into the hands of wealthy companies, with suitable gold-saving appliances, that a healthy change will set in, and the permanency of this as a gold producing district will be established. It is only by working on a very large scale, and with the most approved machinery, that this ore can be treated profitably. The gold is very fine, and requires careful manipulation to prevent loss. The appliances on this field at present are very unsuitable for saving such fine gold, and the result of trial crushings of small parcels of ore from claims from which good returns were expected have been very unsatisfactory.

A number of claims on the north side of Mount Pleasant, notably Smith and Scotts, Boylands, Langs, and Bruce's, promise to be highly remunerative. The great drawback to these claims is the want of machinery to treat the ore. A public mill on this part of the field would be a great boon to the miners located here. The only battery available for treating small parcels for the public is Kelly Bros' small mill at Fairfield, which is distant more than 2½ miles from these claims, and the cost of carriage and treatment so high, that almost the whole of the gold obtained has been absorbed in expenses.

The Strauss Gold-mining Company at Sawpit Gully, on the north side of Mount Pleasant, have erected very extensive gold-saving works in close proximity to their mines, consisting of a fifteen stamp battery with three percussion tables, three wheelers pans, and three Berdons, driven by a stationary engine capable of working up to 40-horse power, to which is attached the largest boiler in the northern districts. This Company has also constructed two large dams of an area of 2 acres each for the conserving of water for mining purposes, estimated to hold a supply of water for six months in ordinary dry seasons. As about eight months of the year has been occupied in the construction of these works, they have been but a short time in a position to win gold. The result of the past four months operations is as follows:—750 tons of ore has been raised and treated for a yield of 476 ounces of gold, worth £3 17s. 6d. per ounce. The total value of machinery in connection with this company's works is £7,000, and they employ twenty-seven men, and their mining area is about 13 acres of land.

The Mount Carrington Gold-mining Company is the next of importance on this field. This Company have erected on the south side of Mount Pleasant a self-feeding fifteen stamp battery with six oscillating concentrating tables attached, which is driven by a 25 horse-power stationary engine. A self-acting wire tramway extends from the mine to the battery, a distance of 1,760 feet, the full truck in its descent drawing up the empty one. The trucks, which are self-emptying, discharge the ore into a large hopper from which the ore, by the means of slides regulated by a disc attached to the centre stamper of each box is conveyed to the stampers, thus a great deal of manual labour is dispensed with. The out offices of these works consist of laboratory and assay office, blacksmith's and carpenter's shops, and the manager's residence.

A large dam has also been constructed for the conservation of water for these works, the breast-work or embankment of which is 8 chains in length, and contains 8,000,000 gallons of water. The water is conveyed by the means of underground pipes to a shaft inside the works, from which it is pumped for use of the battery and amalgamating purposes. To keep up the supply of water in the dam a race has been brought in from Fairfield Creek, a distance of three-fourths of a mile, so that a permanent supply of water may be insured. The construction of these works reflects very great credit on the engineering skill of Mr. John Rossiter, under whose supervision the whole of the work has been carried out. The mining area of this Company's works comprise about 21 acres, and is situated on the crown of Mount Pleasant

Pleasant. There are about twenty-eight men regularly employed in the mine and works. As no crushing has yet taken place, the returns are nil. The cost of construction of mining and crushing plant is estimated at £6,500.

Kelly's Gold-mining Company.—This Company has been working a block of land, the area of which is 10 acres. The deepest shaft in the mine is 70 feet, and from that level they have been stopping up to the surface. The lode is about 4 feet wide, and the dip or underlay is to the west. About 218 tons of ore has been treated, from which they have obtained 150 oz. of gold. In connection with this mine the Company have erected a five-stamp battery, with the ordinary gold-saving appliances, on Plumlago Creek, distant about a quarter of a mile from the mine, the value of which is £1,300. The ore in this Company's mine is found to contain a large quantity of copper pyrites and zinc blend, with gold associated. The tailings are carefully stowed away with a view to subjecting them to future treatment to extract the gold therefrom.

The Mascotte Gold and Silver Mining Co.—The land held by this Company is situated at Violet Creek, about 2 miles south-east of Fairfield, and contains an area of 10 acres of land. The lode in this mine is quartz of a greenish and bluish colour, containing both gold and silver. The silver is found in a sulphide, and is somewhat difficult to treat. Experiments made here point to smelting or chlorination as the method for extracting the premier metals. The mineral so far has been proved highly payable, and the lode is 6 feet wide. The deepest shaft is 80 feet. From this level 400 tons of ore have been raised, and about 25 tons of this has been treated. The average value of bullion per ton as obtained by battery treatment, £7 7s. 7d. per ton.

At Red Rock, which is distant about 8 miles north-west of Fairfield, a great deal of work has been carried on during the past year. A number of small blocks have been bought up and converted into one large mining area. The principal works are carried on by the "Great Red Rock Gold-mining Company," of which R. W. Stuart, Esq., is the general manager. The gold here is found in a similar formation to that at Fairfield. The Red Rock Company have erected an extensive crushing plant on Crooked Creek, distant about 1 mile from their mines, consisting of a twenty-head stamper battery with the ordinary gold-saving mercury tables and chillian mills for the purpose of grinding the blankings. Thirty-two men are constantly employed, and 1,211 tons of stone has been crushed for a yield of 386 oz. of gold. From the present appearance this mine seems to be a great belt of auriferous and argentiferous quartzite. The gold is of a very fine quality, and requires very careful treatment to prevent loss. The cutting from which this Company are obtaining their crushing stuff is about 94 feet in width, and they are not yet outside of the gold-bearing stone. With such an immense body of crushing stuff a small quantity of gold per ton should pay by working on a scale by which a large quantity could be put through the mill.

Another Company has been formed (the Mines Company, of London) to work a large area of land at Red Rock, which has been acquired by the purchase of several small holdings. This Company purpose erecting a forty-head battery on the Cataract River to be driven by water power. They have already commenced operations, and are busily engaged making roads and preparing to erect tramways to their battery site from the mine. They have about 300 tons of ore ready for treatment, and an unlimited supply of stone in sight. A small parcel has been treated, which gave 13 dwt. per ton; value, £3 17s. 6d. per oz.

At Lunatic Reefs, distant about 7 miles north-east of Fairfield, a revival has taken place in mining, and a number of the old claims have been retaken up. One Company, styled the "Mount Horton Co.," are carrying on some extensive works at that place, on the old Victoria line, from which some very rich patches of gold were obtained some years ago. The present Company have driven a tunnel into the hill below the shaft from which the gold was first obtained. They are now in about 176 feet, and are at a level of 120 feet below the outcrop on the surface. Twenty-five tons have been crushed for a yield of 31 oz.; value, £118. The lode in this mine is very narrow, being only 10 inches wide, but appears to be a true fissure lode.

Other miners in the locality are actively employed in raising stone from other claims on the same line. A battery is in course of erection in close proximity to them, and is expected to be completed early in January.

An attempt has also been made during the year to resuscitate mining in the neighbourhood of Pretty Gully, distant 6 miles north of Lunatic Reefs. A small company of working miners have taken up the old Lincolnshire Reef, and have erected an eight-stamper mill on Pretty Gully. A crushing of 30 tons, some time ago, yielded 45 oz. of gold. The mill being driven by water, and its running short, they were obliged to suspend operations for a time. There are several parties working here, who have for a number of years past been making a living by working the reefs, as rich patches are occasionally met with, from which they extract the gold by hand-crushing. The reefs here are found in a slate formation, and from 1 to 5 oz. per ton has been obtained from small crushings of picked stone.

There are a few men here also engaged in alluvial digging. Mr. Farley, the local storekeeper, informs me that he has purchased, during the year, about 250 oz. of gold, of the value of £776. About twenty men are employed in this class of mining.

A prospecting party have been searching for alluvial during the past year in the basaltic formation, under the direction of Mr. C. Haager, a gentleman of great mining experience.

The basaltic formation extends over a very large area of country, and may be traced from Pretty Gully to Tooloom. Mr. Haager has not as yet met with very encouraging results, though shafts have been sunk in various likely looking places.

I have, in several of my former reports, called the attention of the Department of Mines to this particular locality, and also stated that it was my opinion that a rich deposit of gold existed beneath the basaltic rock, between Pretty Gully and the Clarence River. In this opinion many experienced miners agree with me. The undertaking is too great for a small party of miners to prospect such a vast area, unless they received Government aid.

Tooloom and Pretty Gully diggings were worked about the year 1859, and the creek claims being shallow and rich were quickly worked out; but no attempt was made to search for gold in deeper ground. Early in 1860 gold was discovered at Kiandra, which caused an exodus of all the miners from here to the south;

south; the rush to Lambing Flat and the Lachlan following shortly after, prevented a population from ever again settling down at Tooloom. The few miners who have found their way back to these old diggings have been too poor to undertake any expensive prospecting work. In conclusion, I might state that this portion of the New England Gold-fields is worthy of the inspection of the Prospecting Board. I feel certain that they would recommend that assistance be given from the Prospecting Vote to mining in this district.

Silver-mining has once more come to the front in this division. A few years ago we were entirely dependent on the silver mines of Boorook to maintain the mining population. A short time before the discovery of gold at Fairfield, the Golden Age mine at Boorook, after struggling along for more than six years, during which time it maintained a fair population, suspended work, and the place was deserted.

The discovery by Mr. John Rossiter of silver at a place called White Rock, distant about 2½ miles south-west from Fairfield, has brought silver-mining again into prominence.

The White Rock Silver Mine is covered by two mineral leases of 40 acres each, and from present indications, promises to be a valuable property. The ore is not in a defined lode, but runs in veins through the face of a precipitous rock, running east and west, whilst the veins of silver ore traverse it north and south. For a distance of three chains the veins may be seen along the face of the rock at intervals of a few feet. A cutting has been made along the face for a distance of 66 feet, in which there are twelve veins exposed, varying from 2 inches to 1 foot in width. The veins of ore are composed of galena, sulphide of silver, and zincblende, and assays in bulk up to 400 oz. per ton. A great deal of land has been secured under mineral lease in the neighbourhood of White Rock, and a great deal held as mineral prospecting areas.

During the year the following business has been done in this office:—

149 gold-mining leases applied for.
14 Mineral leases.
154 Mining tenements registered.
1,013 Miners' rights issued.
56 Business licenses.
15 Mineral licenses.

And gold obtained as follows:—

1,107 oz. 16 dwt. gold from quartz, value	£3,658	1	6
302 „ 17 „ „ „ alluvial „	1,131	1	6
Total.....	£4,789	3	0

NEW ENGLAND DISTRICT.—SOLFERINO DIVISION.

(R. B. Wilkinson, Mining Registrar.)

I HAVE the honor to forward my report on Solferino Division of New England Mining District for year 1887, and regret that I have not much information that would enable me to make a favourable report.

Mining here seems to stand at about one thing for last few years. Several new ventures are spoken of as going to be proceeded with during the forthcoming year, which may enliven the field and bring it to more notice.

The Golden Bar Reef, just discovered previous to close of last year, did not turn out to anticipations, still they have obtained a fair amount of gold for what work has been done, principally about and close to surface. A shaft has been sunk some 45 feet, and good show all through reef as they went, but country became so hard and expensive to work that they were reluctantly compelled to abandon sinking operations in main shaft, and sunk several others upon leaders running through ground, all of which gave fair prospects. The proprietors, Rose and party, are now driving on leaders in main shaft at 40 feet level, and came on to a very good show indeed within last fortnight, and brought to light some excellent specimens, which has induced a couple of capitalists to negotiate for purchase of their prospecting claim at £500 cash. Everything is arranged for transferring as soon as the cost of it is forthcoming, which is expected now every day.

Should these parties fulfil their engagement, it will cause this mine to be fully developed during this next year.

No. 1 East Golden Bar sunk a shaft to a depth of 58 feet, but nothing very promising occurred in that distance, and the ground being extremely hard and expensive to work, they had to leave it, and after driving some 30 feet, and stopping small piece out, they obtained some 6 to 7 oz., mostly loose gold, and then abandoned it.

Field of Mars' Reef, some quarter mile distance from Golden Bar, has lately been retaken up, and two parties are now engaged prospecting in the vicinity of old workings. One of the party (Pyers & Co.) has a very nice sample of loose gold obtained by washing a small leader near surface.

Lion Mine was retaken up by Mr. K. Hutchison, of Timbarra, during year, he having applied for a 12-acre lease. The applicant has lately instructed a couple of men to commence operations by preparing the face of a tunnel to go in on course of reef, therefore, there is now a probability of this long (but famous) neglected mine being opened up again and formed into a large company.

Garibaldi Prospecting Claim.—Bassetti Uduesie Company (Limited), have continuously worked their ground with four men during the year. They had a great drawback in doing a considerable amount of dead work, in shape of enlarging main tunnel to allow trucking out rock and *debris* without difficulty, the tunnel having been very badly driven in in former years by then proprietors. This party have not been in a position to realize upon their gold, or rather specimens obtained, having some 5 cwt. on hand, estimated to return 80 to 100 oz.

No. 1 North Garibaldi.—C. Harken still keeps working along single-handed, and does very well by his own report.

Shellmalia Line—Thos. Winkley has a mining tenement (previously abandoned), part of No. 5 North. He has put in a tunnel some 40 to 50 feet, and obtained a small dish of 6 oz., mostly loose gold. Air is very bad, and he is about sinking an air shaft to enable him to drive still further.

No. 8 N. Shellmalia.—Tamini and party, 5-acre lease, have driven a tunnel in some 80 to 90 feet on course of reef, and have a considerable quantity of quartz at grass. The owners sent 5 tons from their heap of quartz to Sydney for treatment, which yielded 13 dwt. 19 gr. of gold per ton, which it is estimated ought to pay handsome, with a reef of from 18 in. to 42 in., with a good battery at hand.

Band

Band of Hope Line.—J. F. Adam & Co. spent the year in driving and stoping out, and have obtained a few fair patches; stone being sent to Mint for treatment. They have now on view in Grafton some excellent specimens lately found in their ground, and several gentlemen interested are about forming a syndicate to put in a low level tunnel to prospect the lower depths of the hill.

One or two other parties are prospecting above reefs, but do not settle down to any particular spot.

Nothing particular of note to report in alluvial. Bulldog, Ewingar Creek, Old Scrub, and Cangi have still their old identities at work, and making, as in former years, upon an average of $\frac{1}{2}$ oz. per week per man.

I have issued 43 miners' rights, received 4 applications for gold-mining leases for an area of 30 acres, and one application for 6-acre lease of alluvial ground, during the year.

It is difficult to get at the full amount of gold won in this division, and give it as far as I have been able to ascertain, as follows:—From alluvial, 209 oz.; from quartz, 120 oz.; valued at £1,100. Price of gold has been from £3 to £3 13s. per oz. Number of miners at work are twelve quartz, and eighteen alluvial; total, thirty.

NEW ENGLAND DISTRICT.—TENTERFIELD DIVISION.

(*F. Burne, Mining Registrar.*)

Gold.

Boonoo Boonoo.—There has been little doing on this field beyond prospecting, as the various proprietors of claims have been prevented from work through excess of water; as yet there is no pumping machinery at work, but one in course of erection. The various reefs cut are all more or less auriferous, especially those on the Lady Mary and Golden Crown Claims, the proprietors of which are now busy with the usual preparations for the arrival of machinery. Work on most of the other claims is at present suspended, awaiting the result of the formation of an English Company. Taking into consideration the quantity of water on this field, I would suggest the advisability of adopting the plan of work now being so successfully carried on at Kiandra, namely, hydraulic sluicing. It would be highly remunerative, as there are more or less alluvial deposits, and less expensive than the ordinary means used to win gold, also the character of the country is in favour of its success.

Silver.

At a place about 8 miles to the north of the town of Tenterfield, a man named Rodgers, while prospecting for gold, discovered a very rich vein of silver ore, which he reports as averaging 362 oz. of silver and about 3 oz. of gold, the result of five assays. This reef, which has been traced for some distance, seems to run about N. by E. and S. by W. Several areas have been marked off on the supposed line of reef, and the work of prospecting is being rapidly pushed on.

Tin.

About 8 miles to the N.W. of the town of Tenterfield, Kennedy and party are at work on a very rich lode, a large quantity of ore from which they have bagged and sent to Sydney for treatment.

During the past year I have issued 345 miners' rights, 43 mineral licenses, and 6 business licenses. Also received 20 applications for gold leases, and one for a mineral lease.

CLARENCE AND RICHMOND DISTRICT—GRAFTON AND NANA CREEK DIVISIONS.

(*Mr. Warden McDougall, P.M., Grafton.*)

I now have the honor to forward you my annual report as Warden for the Clarence and Richmond River Mining Districts, under my supervision for the year ending 31st December, 1887.

I returned yesterday from holding Wardens' Courts of Inquiry at Dalmorton, on the 5th and 6th instants. Evidence taken in the cases duly forwarded by post, *via* Glen Innes.

On my way to and from Dalmorton I passed nine waggons, drawn by 154 bullocks, loaded with machinery for erection of battery, &c., at Mort and Company's (late Taylor's) Dora Reef, in the Nana River, which, if the weather keeps fine, is expected to be in full working order within three weeks from this date, the assays from stone taken from various parts of the reef being highly satisfactory, and I fully anticipate that several other reefs already discovered will prove to be rich and valuable now that there is every probability of a battery being got to the Nana River Reef.

I was informed by the men in charge of the waggons that they had succeeded in getting the boiler, weighing over 4 tons, up to the top of the mountain at Cungelbong, on Saturday last, and that men were now at work making a road 12 miles in length over other bad places between Cungelbong and the Nana River reef.

The number of miners' rights issued from the Grafton office during the year 1887 is 103, mineral licenses 13, and 2 business licenses; 5 applications for gold-mining leases and 4 for mining tenements have been made; at Dalmorton office, 33 miners' rights and 3 business licenses and 21 gold-mining lease applications; at Nana Creek Mining office, 26 miners' rights and 2 business licenses have been issued.

At Nana Creek the stone crushed at the Durgue battery was 132 $\frac{1}{2}$ tons, yielding 138 oz. 8 dwt. 8 grains of gold, and two crushings during the year at Marcolinus battery; result net to hand, nor of what alluvial gold has been obtained during the year.

CLARENCE AND RICHMOND DISTRICT—MURWILLUMBAH DIVISION.

(*Mr. Warden Bray, M.P., Murwillumbah.*)

DURING the year 1887 prospectors have been looking through the district for gold, but nothing has been found of any consequence.

In the early part of the year several miners were working on the beach between Brunswick and Point Danger. The gold was, of course, very fine, but the arrangements for saving it (copper plates, rubbed over with quick-silver) did not prove effective.

The men have all, or nearly all, left the beach now.

In December there was some little excitement amongst some prospectors, who have for some months past been working up the south arm of the Tweed River, but nothing was done further than some of them giving notice that they had pegged out a prospecting area.

CLARENCE

CLARENCE AND RICHMOND DISTRICT—LISMORE DIVISION.

(C. Coghlan, Mining Registrar.)

I do myself the honor to report for your information, that, as far as is known to the general public, mining operations, in this portion of the Richmond River District has ceased.

Fifty-six miners' rights were issued from this office; but, I believe, they were all taken out by miners going to the Fairfield (Drake) Gold-fields.

One mineral license was issued, but no mineral leases or business licenses were applied for.

CLARENCE AND RICHMOND DISTRICT—DALMORTON DIVISION.

(W. T. Poole, Mining Registrar.)

DURING the past year a little more activity has been displayed in mining, and although the return of gold won is small, the miners appear perfectly satisfied with their prospects.

In alluvial.—Several parties have been engaged working in the bed of the river, and one, Adams and party, have done a considerable amount of dead work, cutting races, &c. It is to be hoped they will be rewarded for their perseverance.

Quartz.—The Union Company's battery has changed, but only two small crushings have been got through during the year. The Sir Hercules and Just in Time Reefs have been taken up again, and new shafts started on each.

A new reef has been discovered about 4 miles south of the Just in Time, and Mr. Orr, the Prospector, states that it will go 2 oz. per ton.

The Old Liberator Reef has been taken up, and tenders called for sinking a shaft.

Two leases have been applied for in Jackass Creek, on the New Bendigo and No Name Reefs.

Prospecting is also being carried on at the Pioneer Reef and one or two others.

At the Mann River 17 leases have been applied for, but as two of these were jumps it will reduce the number of leases to 15.

Taylor's claim, on the Little Dora Reef, is reported to have excellent prospects, and has, I understand, changed hands to a Sydney syndicate, who are going to erect machinery, and as the whole of the plant has left Grafton, it is expected to be ready for crushing early in the year.

The first crushing from this claim is expected to be very good, as the assays have surpassed anything previously found in this district.

I believe the machine will crush for the public, so that the whole of the claims in the vicinity will be able to have their stone tested within a short time.

I have issued during the year 33 miners' rights, 3 business licenses, and received 21 applications for gold-mining leases, comprising an area of 83 acres 2 roods 3 perches.

I have also registered 1 machine site, 1 prospecting claim (quartz); and 1 extended claim (quartz).

CLARENCE AND RICHMOND DISTRICT—NANA CREEK DIVISION.

(George Geddes, Mining Registrar.)

FOR the information of the Honorable the Minister for Mines I have the honor to transmit my report for the past year upon the Nana Creek Division of the Clarence and Richmond Mining Districts.

The Jubilee.—This is a prospecting claim owned by Alexander Nicholson and situated on the Matilda Hill, Nana Creek. The claim was taken up on the 22nd April, 1887, and since that date, to develop the resources of the ground, labour, representing about £300 in value, has been performed. The prospecting shaft is down 34 feet; width of reef, 18 inches, bearing south-west by north-east. There are two other shafts, of no great depth, distant on either side of the aforesaid about 30 feet, both on gold; yield averaging about 15 dwt. to the ton; width of reef about 1 foot, and running parallel with the Jubilee line. To intersect this line a tunnel has been driven 160 feet, at a level of 60 feet from the crown of the hill on the north side; but the owner has had to suspend operations in that direction for want of necessary funds to enable him to continue the work. The tunnel, on completion, will serve the double purpose of a drain and an exit for the quartz. Water arises from soakage from the old workings of the abandoned Matilda line of reef, on the south side of this property, which is situated at an altitude of about 700 feet above the level of Nana Creek. Twenty-six tons of quartz from the original shaft gave 2 oz. 2 dwt. 22 gr. to the ton. I went through the Dargue battery. The amount of stone now at grass about 20 tons.

No. 1 West, on the Jubilee Line.—This is an ordinary claim, owned by John Nicholson, and was taken upon the supposed Matilda line of reef. There have been nine shafts sunk, giving a total working of 166 feet; and, in addition thereto, trenching to the extent of 50 feet has been done. The reefs run a mean course of south-west by north-east, averaging 2 feet in width, and have an underlay of about 6 inches to the foot to the south. They are impregnated with galena, iron pyrites, and various kinds of mundic. The greatest depth reached in the workings is 26 feet. In March, a crushing of 11 tons of quartz gave a return of 17 dwt. 2 gr. per ton, and in October 15 tons 10 cwt. gave about 11 dwt. There are some 14 tons of stone now at grass.

Advance Australia.—This claim, now the property of James Wilson and party, is situated near Tallewidgen Creek, in the vicinity of Oliver Anderson's claims, and has all along been looked upon as a good property. There are two shafts, each sunk to a depth of 40 feet, and another to a depth of 70 feet, none of which are, at the present time, being worked, although a fair yield of gold can be obtained. There are good reefs and leaders in all of them. Another shaft is now being sunk, and, at a depth of 30 feet, excellent gold is met with. The reef averages fully 18 inches in width. Its bearing is north and south, is in a slate formation, and going down perpendicularly. The quantity of stone now at grass is about 20 tons, and it is looked upon as 4 to 5 oz. stone.

The New Years Gift and Challenge.—These claims are the property of Oliver Anderson, and in the months of March and November, of the year 1886, applications for two leases to mine for gold of 4 acres respectively were made by him. The former only has been approved of, and that on the 7th January, 1887, but the lease has not, as yet, been tendered him for execution. The land is situated near Tallewidgen Creek, about a quarter of a mile from the Advance Australia. The original shaft, 54 feet in depth, owing to excessive rainfall in the beginning of the year, caved in, also filling in the tunnel, which pierced the hill
along

along the line of reef on the north-west side, connecting with the shaft at the 45-foot level to a distance of 86 feet. The following is an outline of the works as they now stand:—No. 1 shaft is down 8 feet, inside timbering 7 feet 6 inches by 3 feet 6 inches. No. 1 tunnel extends 93 feet; length of platform, 66 feet; width, 23 feet; length of roadway, 5 chains 9 feet. No. 2 tunnel extends 41 feet; length of platform, 32 feet; width, 20 feet; length of roadway, 4 chains 9 feet. The reef in No. 1 tunnel ranges from 9 to 20 inches in width on the floor, and its bearing is north-west and south-east. The stone gives an average yield of 1 oz. to the ton. The reef has not been struck in No. 2 tunnel, but it is thought to be not far distant. It is being driven for, and another tunnel is shortly, in connection with it, to be started. Only a few tons of stone are at grass.

The Waratah.—This, the property of Eugene Frederick Rudder, is situated at the Nymboi, some 7 miles from Nana Creek township. It is included in an application for a gold-mining lease of 7 acres made on the 24th July, 1886, but not yet granted. It was surveyed on the 7th September, 1886, and plan sent to the Mines Department by Mining Surveyor J. H. McEwan on the 30th *idem*. But very little work has been done upon this property, although a good one, since it came into the hands of its present holder. Claims such as this should not be left in abeyance, it is a positive injury to the field. Were the lease either granted or rejected it would then be compulsory for the ground to be worked, but as I understand the regulations, pending the completion of the application to lease, applicants are exempt from doing any work on the land applied for. Prior to the transfer of this claim to its present owner by the Messrs. McLeod Bros. and James Forbes, 40 tons of stone were on their account put through the Dargue battery, giving a return of 19 oz. 17 dwt. to the ton. The lot was poor compared with former crushings, but it being crushed as refuse stone the return was more favourable than was expected. There have been two other crushings on account of E. F. Rudder, at Marcolino's battery, the precise return of which I have not been able to ascertain. One, I am told, was 21 tons quartz for 11 dwt. per ton, and the value of the gold got from the other amounted to about £16.

Yankee Doodle.—This is an old abandoned claim, situated about 2 miles from Nana Creek, and near the main road to Grafton. From it, at a depth of 16 feet, James Forbes and two others took 10 tons of stone, which yielded 4 oz. 17 dwt. 5 gr. The reef, which is narrow, runs east and west. The return of gold not being thought sufficiently remunerative, work was then discontinued.

The Dargue Battery.—This has been at work during the year upon several lots of stone, a detailed list of which I give herewith.

Marcolino's Battery.—This has crushed on two occasions only, particulars of which I am unable to give fully.

Nana Creek Quartz-crushing Company's Battery.—The whole of the plant has been disposed of, and some time since removed to the Fairfield Gold-field.

Alluvial Mining.

Henry Jones.—On the 1st October, 1887, he applied for a creek claim to be worked by himself and two others. It is situated about 3 miles above the junction of Mole Creek and the Little Nymboi River. Applications were also lodged for a drainage water-race and to construct a dam. About 16 oz. of good quality gold has been obtained by them.

The undermentioned are the crushings in detail which have taken place during the year 1887:—

The Dargue Battery.

Gold-mining

Gold-mining Leases.—None applied for. Eight leases were applied for in the year 1886. Of that number five have been approved of, four of which have been declared void for non-execution of the leases on presentation, thus leaving three still to be dealt with.

During the year I have disposed of—Miners' rights, 26; business licenses, 2; mineral licenses, *nil*.

A great amount of prospecting and mining work in general has been done by the diggers throughout the year, but with all their outlay both of labour and capital, nothing of a permanent character has resulted therefrom. Yet some of the old and experienced miners having a firm faith that success will crown their efforts in the future, still labour on and they deserve to prosper.

Throughout the year rain has fallen hereabout abundantly, and throughout the Christmas holidays it was one continual downpour, causing the Orara River to rise to a considerable height. The country around is now rich with grass, and to both diggers and settlers this most recent and welcome visitation will doubtless be fully appreciated.

ALBERT DISTRICT—SILVERTON DIVISION.

(*Mr. Warden Brown, P.M., Silvertown.*)

I now have the honor to hand you the following report for the information of the Honourable the Minister for Mines on the mining industry of the Silvertown Division of the Albert Mining District for the year 1887.

This has been an exceptionally busy year, the mining revenue received at this office amounting to £13,431 13s. 6d., being more than three times the amount received for the year 1886. The following table will show the number of licenses issued and lease applications received during the past two years:—

	1887.	1886.
Business licenses	1,037	650
Mineral do.	525	285
Miners' Rights	290	103
Mineral lease application	913	208

In addition to the above, I might here state that in September last Mr. Gibson was appointed Mining Registrar at Broken Hill, and has issued 669 business licenses, 361 miners' rights, and 87 mineral licenses, amounting together to £567 5s., which makes the total amount of mining revenue received in this division for the past year £13,998 18s. 6d.

The very large increase in the number of mineral lease applications received during the past year is in a great measure due to areas applied for at Wankeroo and Poolamacca for tin mining. This industry is employing a large number of miners, and machinery is now being erected on some of the principal mines. The Mount Eurourie Co. are erecting a plant capable of reducing some 400 tons of ore per week. The Company expect to have everything ready for a start in March next, nearly all the machinery being now on the ground. The starting of these operations is being anxiously watched by all persons interested in tin-mining, as it is considered a fair test as to whether the stanniferous lodes of this division are to be remunerative. Very few persons appear to have any doubt about the result, which if satisfactory, will certainly cause employment for a large number of miners for years to come. As yet very little ore has been treated or sent away, and what has left the field can hardly be expected to be fair samples of the bulk. There is no doubt by the end of the present year the problem will be solved as to whether this branch of mining can be profitably worked in this district on a large scale or not.

In silver mining, the Broken Hill Proprietary Co. still hold the place of honor. This mine has fully maintained its reputation by producing for the year just ended silver and lead to the value of £464,190. The dividends paid during the same time amount to £200,000, the last monthly one being 30s. per share, or an increase of 50 per cent. over any previous one. Additional smelters are being erected at this mine, and will shortly be completed.

The Umberumberka mine has also developed into a first class property, and may now be reckoned as a dividend paying property.

It would be almost impossible to give individual reports of every property in this district that is now working, but in a general way the field is being vigorously prospected, more particularly on the Broken Hill lode, Rockwell paddock, Pinnacles, Purnamoota portion of the field, and all over the stanniferous portion of the division.

During the year just closed the galena lodes of Thackaringa have attracted considerable attention; work has been actively resumed, and large quantities of ore are being sent to smelting works in South Australia for treatment, with I understand, very satisfactory results.

The Silvertown tramway is now completed to Broken Hill, and will be open for general traffic on the 12th instant. It is not yet handed over by the contractors to the Company, although for the last month goods of all descriptions have been conveyed direct from the sea coast to Broken Hill, an immense boon to the different mining Companies, also to the whole district, as instanced by the revival of mining in the Thackaringa portion of this division.

Perhaps the most exciting event that occurred during the past year was the settlement of the vexed question *re* Broken Hill town and suburban lands, which had been exempted from occupation as residence or business areas since November, 1885, but in face of this exemption, some 4,000 persons had settled on these lands. The exemption was removed on 23rd September last, and I am pleased to say that the great confusion and disorder that was anticipated on this land being thrown open for occupation was averted, and the population now estimated at from 5,000 to 6,000 persons settled on the land without any disturbance, and comparatively little litigation. The settlement of this matter has already led to a decided improvement in the style of architecture displayed in the various buildings now being erected. A few weeks ago a water famine seemed probable at this town, but the late rains have dissipated any fears on that score, as the new tank just completed is full, also the soakage in the different creeks. These supplies should last over the summer months.

During the past year another township named Eurourie has been formed. It is situated about 55 miles north-east from Silvertown, and in the centre of the most promising tin mining properties. The present population is estimated at 500, there being a Police Station, two banks, six hotels, and numerous stores and other business places. I am not aware if any steps have yet been taken to provide a water supply for this locality, if not, no time should be lost in doing so.

During

During the year, little alteration has taken place in the town of Silverton. All business people appear to be quite satisfied with its future prospects.

From returns kindly given me by the local Customs officer, I find the declared value of mineral exports from this Division during the year 1887 to be £522,455. These figures do not include any ores sent from the Thackaringa mines, so that I think it is clearly within the estimate to say that ore was exported from this Division during the past year to the amount of fully £600,000.

I estimate the number of men actually employed in the mining industry on this field at about 3,000. This number I think within the mark, as from the few returns from managers that accompany this, there are more than half that number employed on some thirty mines.

Although the requisite forms were sent to all managers of the leading tin-mines, no returns have been received. Large numbers of men are employed there, and ore of considerable value has been raised during the year.

In conclusion, I may state that notwithstanding the rapid progress the mining industry has developed in this Division during the past year, everything points to far greater developments being made during the present one.

As the Mining Registrar at Silverton and Broken Hill can give no further information than contained in this report, and their time being fully occupied, I would ask that they be not required to furnish separate reports.

The following figures were quoted by Mr. McGregor, in replying to the toast, "Success to Broken Hill Proprietary Company":—"The mine has turned out 3,189,921 oz. of silver, 12,391 tons of lead, gross value of £761,000, and £272,000 has been paid in dividends."

ALBERT DISTRICT.—WILCANNIA DIVISION.

(*Mr. Warden Gower, P.M., Wilcannia.*)

I do myself the honor to inform you that no mining operations of any note have occurred during the past year in my district. A report was circulated that payable gold had been found at Mount Darwick, on Manfred Run, in September last, distant about 220 miles from Wilcannia, and 50 miles from Ivanhoe. I inspected the locality, and found the report was false, the land not being auriferous.

ALBERT DISTRICT.—MILPARINKA DIVISION.

(*Mr. Warden De Boos, P.M., Milparinka.*)

THE report upon the district under my charge must necessarily be a brief one, because of the sameness of work throughout the district. This work, with but very few exceptions, consists of surfacing.

At Tibooburra, in which general name I include the localities connected with it, namely the Granite, the Two-mile, Easter Monday, Ungetty, and the Six-mile,—an area fully 10 miles long by varying widths, the work is exclusively confined to surfacing. The same may be said of Good Friday.

In order to render the labour of the miner remunerative, dams, for the storage of water, and puddling-machines, for treating the auriferous earth, have to be constructed. Of the dams, those hitherto made have been, with very few exceptions, of the most primitive construction, and have consisted merely of earth thrown up to hold back and store the water, with very little excavation of the nature of a tank or reservoir. Three or four of the more intelligent miners have, however, excavated considerably, and have been well repaid for their labour by the additional quantity of water they have been enabled to store allowing them to work and wash when the other reservoirs have been exhausted. Besides this, the ground has been so much worked and rooted about that every rain brings down with the water large quantities of silt, which soon fill up the areas of water conservation, and which require constant attention and removal, in order to preserve anything like a reasonable amount of water. This is a work which, I am sorry to say, is very much neglected; but even where it is not, and where the silt is taken out, it is thrown up so carelessly that the next shower softens it and brings down a large proportion of it back into the dam. There is also very little attention paid to the sludge. It is run out from the puddling-machines in the most hap-hazard way, is allowed to take its own course, and consequently goes to swell the amount of silt that finds its way into the catch area of dams lower down. I have repeatedly called attention to this, and have pointed out that the foundation was being laid for a great difficulty at no very distant future date. The men, however, have such hard work for so comparatively poor and precarious a return, that it would almost seem like oppression to compel them to dig sledge-pits, especially as they argue that the ground being all surfacing, that which has been already worked has become valueless, is never likely to be worked again, and is not, therefore, injured by the sludge run upon it.

In all but a few instances there is a puddling-machine connected with each dam, as it has been found that the most economical way of treating the dirt in so far as water is concerned, is by the puddling-machine. These are of the usual construction, working two harrows, and the water being fed in from a Californian pump, worked by a Jenny-wheel. A puddling-machine will hold, say, in round numbers, 20 loads of dirt, and, on an average, one machine-full can be worked off in a day, the waste being light and friable, and easily disposed of. A yield of 3 dwt. to the load is said to pay well, though many get a living from a less yield than this. The 20 loads, at 3 dwt. to the load, would give 3 oz. per diem, or 18 oz. per week, which, at 80s. per oz. (for the gold is of very superior quality), would return £72 per week. Against this there is the cost of breaking out the dirt, of loading, and carting it to the machine, and of working the puddling-machine and Jenny-wheel. Supposing a miner to carry out all this work off his own land, he would require to employ some six men, to keep about eight horses, and to have at least two tip-carts,—at an expense of some £30 a week, leaving a very fair margin of profit for the miner.

But there are many miners who cannot work after this manner but who have to pay for carting, &c., and their profit is, consequently, very considerably diminished. Then, unfortunately, work cannot go on continuously. First, there is the failure of the water, followed possibly by a long spell of drought, in which nothing can be done; then, in moist or drooping weather, dirt cannot be drawn to the puddling-machine over the heavy soil. Then again, horses are lost, machinery gets broken or out of gear, or other preventives to work occur; so that, on the whole, the income of the successful miners is not to be reckoned on the basis of the yield of a few steady working weeks. I have been informed, however, that one miner in particular has been known, for some seven or eight weeks in succession, to send away some £50 worth of gold weekly.

Owing to the scarcity of timber, a puddling-machine is rather an expensive structure. All the parts of it must fit compactly at the edges, consequently, if the wood be not sawn, it has to be carefully dressed with the adze, in order as much as possible to prevent the gold getting into the interstices. Then the heavy timber for the arms, spindle, &c., is costly because difficult to obtain, and with the ironwork at back-block prices, a good puddling-machine represents from £120 to £150. Thus, a miner wants to be a small capitalist to enter even upon surfacing with a fair prospect of success. One man recently sold out at Tibooburra—dam, puddling-machine, horses, carts, in fact all his plant—for £350 cash, and the purchase was considered to be a bargain.

Many who are unable to meet the expense of constructing a puddling-machine work with the old-fashioned long-tom, and some even with the primitive cradle. Of course these are much longer processes, and yet, by persevering work, many miners obtain a fair living so long as water lasts and herein, after all, lies the great secret. With a regular continuous supply, you will see by the figures I have quoted, that a yield representing a fortune is obtainable, so long as the wash remains within a reasonable distance of the machine, and has not to be carted too far; but, with the water supply intermittent and precarious at the best of times, and at the worst altogether failing, the miners' work is but intermittent also, and for long periods at a dead stand-still, when he has to lie by and look at his plant lying idle, and his wash-dirt lying heaped ready for moving, without a chance of making either available. Then again, when at work, as the wash-dirt is carted away, the distance it has to be drawn to the machine becomes day by day longer and longer, until it reaches a point when carting don't pay. Thus, though the return would seem to be good, the miners have no mean difficulties to contend with.

These remarks apply principally to Tibooburra, where, as yet, no deep ground has been struck, and no underground water discovered. At Mount Browne there is comparatively but little surfacing doing; but within the last few months, seeing the good yields that have resulted from the construction of dams at Tibooburra, many of the miners here have gone in for erecting dams and puddling-machines, and there is every likelihood that the close of 1888 will see a largely increased production of gold from this source. At present the great bulk of the gold comes from the deep ground at the One-mile. Here there are four or five claims at work at depths ranging from 120 feet to nearly 200 feet. They have a lead or gutter of about 40 feet and from 12 to 30 inches deep. The average yield is given at about 16 dwt., and the greater part of the wash is puddled at the Golden Lake Water-shaft on the flat at the foot of Billy-goat Hill. Here a very good supply of water was met with at a depth of 220 feet, and though it has been constantly used for puddling purposes it shows no signs of diminution. It has struck me that two or three iron puddling-machines, worked by steam-power, and similar to those which were worked at Temora in the early days, would, in connection with a water-shaft on this flat, not only be a good speculation to the owners, but would be a great benefit to the miners, as puddling could then be done cheaply, expeditiously, and continuously, and they would not have to sit for weeks watching heaps of dirt which they know to contain gold without having the means of extracting it.

On this flat a frontage lead was proclaimed some two years ago, a base line was laid down, and some six or eight claims were taken upon it. None of them, however, did any good in so far as the production of gold was concerned, but there is reason to believe that the great expense of sinking and driving was the great drawback. The Golden Lake was one of these, and it has never been bottomed owing to the quantity of water; but though the claims on the line did no good, a block claim (the All Nations) to the north-west of the line, has been at work on and off ever since. They have had some very good yields of from $\frac{1}{2}$ oz. up to 16 dwt. to the load. The party struck the water at 180 feet, and found the ground dipping south towards the flat, and as they followed along the bottom they found it impossible with the windlass to keep the water down sufficiently to enable them to fairly work the ground. They have now commenced the erection of a whim, by means of which they calculate to be able to keep the workings clear of water. It is on this flat, some distance south of the Golden Lake, and, as is anticipated, in deeper ground, that the Mount Browne Prospecting Company, subsidised by the Government, intend putting down their shaft for testing the deep ground.

At Good Friday, which is about 2 miles north-west from Mount Poole, and at the foot of the southern face of the Whittabreena Range, there are some five-and-twenty miners at work. These cart their dirt to a soakage on the main Good Friday Creek, where it is washed in cradles. These soakages are a peculiar feature of the creeks in this part of the country. Long after all signs of surface-water have disappeared there are spots in the bed of the creek where, by reason of heavy bars of slate or bed rock, the underground water which has percolated through the surface soil—always of a sandy nature—is retained as in a reservoir, the superposed soil to a great extent preventing evaporation. These bars sometimes back the water up a long way on the bottom, and a very considerable store is obtained when this is the case. The main soakage at Good Friday will keep the miners' cradles at work a couple of months after a good fall of rain has set the creek running.

The Whittabreena Range runs away north, and joins the Warratta Range, about 10 miles south-west of Tibooburra, where the two then sweep round westerly, and join the hills that border the granite on the west and north. Several of the gulleys in the Whittabreena and Warratta Ranges are being worked for surfacing, but only scanty provision is made for storing water, and I am afraid that some of the miners lay the squatters' water under contribution for washing purposes. In the former of these ranges is the gold-mining lease of the Whittabreena Quartz-mining Company. Here there is erected a crushing plant of fifteen stampers, working with a 12-horse power engine, which engines also work a pump for drawing water from the mine. The plant has not been at work for the last twelve months; but the plant and property having been purchased by some of the Milparinka residents, the co-partnership has been remodelled, and steps are being taken for making another trial of the reef. A competent engineer has been employed for some weeks past in putting the machinery in order, and as soon as this is done the shaft, which is now full of water, will be pumped dry, a crushing will be taken out from the lower level, and, after crushing, the tailings will be reduced and sent down to Sydney for treatment. The assays of the stone from this mine have always gone very high—as high as 15 oz. to the ton; but on crushing only some 10 or 12 dwts. have been realised. It is therefore a certainty that gold was lost in the crushing, and the idea is that the water from the shaft being used for the tables, and that water being highly charged with minerals, the larger portion of the gold, and very much of the silver, has gone away in the tailings owing to the thickening of the silver by the sulphates of the mine water.

Towards the end of the year, Thomas Howo, who has been working on and off as he could procure funds from other work, at a reef known as the Elizabeth, about 2 miles north-west from the Whittabreena lease,

lease, came across a very nice shoot of gold in a leader on this line, and the stone he showed from the vein was so satisfactory that he had no difficulty in obtaining men of means to join him in taking up an extended claim on the line; and he has since been at work baling out the old shaft and getting the claim in working order. Besides this, the show of stone was so good that several other parties took up claims on the line, whilst two 5-acre leases have been applied for, and others are in contemplation. Sufficient has not yet been done on the ground to permit of any accurate opinion being formed; but I have no hesitation in saying that, with proper machinery and treatment, a large proportion of the quartz in this district would give a fair return to the miner.

The number of miners' rights issued during the year was 364, being a falling off of 39 from the preceding year, when the number was 403. There are no Chinese miners working on the field. The business licenses numbered 63, of which 23 were for six months. The same number (63) was issued in 1886, of which 37 were for six months.

There are about forty puddling-machines erected in this Division, of which three-fourths are at Tibooburra and the diggings connected with it.

With regard to the yield of gold, I have had very great difficulty in coming to a fair approximation of the quantity, owing to the fact that there is no escort, and that gold is sent away in all manner of ways. As a dependable starting point, I have ascertained that there were actually purchased at Tibooburra 2,265 oz. 9 dwts. 6 gr. during the year 1887. Three of the principal puddlers there are known to send away all their gold, and to sell none of it in the town. The amount won by these is estimated at 525 oz.; and if we put down 100 oz. (a very moderate estimate) for gold taken from the field by parties leaving, we have in round numbers a total yield for Tibooburra during 1887 of 2,890 oz. At Milparinka, during the past year, there have been actually purchased 1,669 oz. 1 dwt. 6 gr., and about 150 oz. have been taken away by parties leaving, making a total for Milparinka of 1,819, and for the whole Division of 4,709 oz.

I believe this will be found to be as near an approach to the actual yield as it is possible to get.

COBAR DISTRICT—HILLSTON DIVISION.

(*Mr. Warden O'Neill, P.M., Hillston.*)

DURING the past twelve months mining pursuits in this district have been at a standstill. At Cudgellico, no attempt whatever has been made to prospect for gold, although there is no doubt that this ore exists in that locality.

At Condobolin, as I am informed by the Registrar there, nothing has been done to speak of in the way of mining, excepting that leases have been applied for to mine for copper at Melrose.

At Mount Hope some prospecting for gold has been prosecuted, and I am told that fair evidences of gold have been discovered. Owing, however, to a conflict as to the ownership of the land upon which the gold is said to have been found, work is now suspended; but so soon as the matter in dispute has been determined, renewed efforts will be made with the view of ascertaining beyond doubt whether the ore can be got in payable quantities. In connection with this discovery several leases have been applied for, and, should success attend the labours of the prospectors, these leases will doubtless be worked with energy; otherwise, I expect that they will be abandoned. I was promised full information on this subject; but, having awaited the same for some weeks, I must now send in my report without it.

The Great Central Copper-mine has resumed work this year, and steps are being taken to re-open the mine of the New Mount Hope Copper Company, so that these two mines are likely to afford employment to a large number of men, provided the price of copper is maintained; for, without a good price for this ore, the companies cannot be expected to continue work, in consequence, mainly, of the high cost of carriage, as resulting from the remoteness of the locality of the mines from Whitton and Carrathool, the nearest points of railway communication by practicable roads.

It appears to be generally believed that the mountain ranges both on the north and south sides of the Lachlan River, in this district, contain minerals of all kinds; and I have every hope that the returning prosperity of the country, by inducing a spirit of enterprise, will cause capital to be invested in the endeavour to discover payable mines in this as yet little known part of the Colony.

I am pleased to be able to report that settlement for grazing and agricultural purposes is steadily progressing in the district. This is important as affecting a mining community; and, in the event of Mount Hope and other parts being successfully worked in the near future, the residents will have close at hand cheap flour, obtainable from the Hillston mill, as also butter, eggs, meat, poultry, hay, chaff, and cereals produced by the industry of neighbouring farmers. One thing, however, is absolutely needed, in order at once to aid the farmer, the squatter, and the mining speculator, and that is a light line of railway between Darlington Point and Hillston. This would be an immense boon to the district, and, at the same time, by diverting the Lachlan trade from Hay, would be the means of effectually silencing those persons who, in order to serve their own interests in the neighbourhood of that much overrated place—Hay—seek to draw through that town the produce of this portion of Riverina to the markets of Victoria, by railway communication between the Murray and the Murrumbidgee, *i.e.*, by the proposed line from Hay to Deniliquin.

COBAR DISTRICT—COBAR DIVISION.

(*Mr. Warden M'Kell, P.M., Cobar.*)

I HAVE the honor to forward herewith my annual report of the Cobar Mining Division for the year 1887.

Gold.

This industry being in a languishing condition for the last two or three years, it affords me very great pleasure to be able to report that during the last six months a decided improvement has taken place, in consequence of gold being discovered within 3 miles of the town, as fully notified in my previous reports. Thirty-nine applications for leases of 258 acres were received, and five applications for prospecting areas. There are about forty men working on the United and Fort Bourke Hills, the same line of reef running through both hills for a distance of about 3 miles. Some of the shafts are sunk from 20 to 50 feet, showing fine gold in most of them. Two tons of stone, taken at a depth of about 3 feet, from a 3-foot reef in the Chesney claim, were treated at the Sydney Mint, realizing 4½ oz. per ton, valued at £4 2s. 2d. per oz.

A prospecting party discovered a good reef, showing fine gold, at the Peak, about 2 miles further south, but unfortunately the land is private property.

The reefs have not been sufficiently developed to enable me to report satisfactorily; but judging from the sample of quartz procured, and the apparently well-defined character of the reefs, there is every probability of this field, if properly worked, becoming an important one.

Mount

Mount Billago.—This reef is situated at the Billago Mountain, 30 miles north-west of Cobar, on the Tindary Run. Messrs. Henderson and party hold a prospecting area, and have since floated it into a company, called the Mount Billago Prospecting Company. A shaft is sunk 100 feet, and a drive of about 40 feet put in. Some nice samples of quartz-bearing gold have lately been taken from the claim, and there is every prospect of good results being obtained shortly. I am informed that some stone tested realized over 5 oz. of gold and 90 oz. of silver per ton.

Silver.

Three applications were received for silver leases, one for 20 acres and two for 40 acres each, and other portions of land are held under mineral licenses.

Copper.

The Great Cobar Mine.—The work in this mine has not been so extensive this year as the previous one, the output of copper being 523 tons less, showing a decrease of £12,506. It was rumoured that this mine intended to close, for what reasons I am unable to ascertain. All the miners and woodcarters, with the exception of the men in the smelting sheds, were paid off; but now that copper has risen in value, I am informed there is every possibility of work being resumed at an early date on a more extensive scale.

C. S. A.—This mine is about 7 miles north of Cobar, and was taken up by Captain Williams, of the Great Cobar Company. Several men are exploring the land, but as yet have not been successful in finding anything payable, although the indications are of an encouraging nature.

Nymagee Mine appears to be still in full swing, employing fifty men more than last year. The output of copper was 433 tons less than last return, showing a decrease of £12,860 10s.

Hermitage Plains.—Very little work has been done by Messrs. Frost and O'Maboney since my last report. This mine has, since the lease was signed, been sold at a satisfactory figure to a Cobar syndicate, who intend to commence operations without delay. Three fresh applications of 40 acres each have been made for land in this locality.

The whole of the year's business was confined to the last half of it, when the following business was done:—

Miners' rights	139
Mineral licenses.....	31
Business licenses ..	1
Gold lease applications	39
Mineral lease applications ..	8
Prospecting applications.....	5
Water rights.....	2

Being the largest amount of business done since the office was established here, and now that an impetus has been given to prospectors, there is every reason to believe that discoveries of a very important nature will be made in this district, and before long Cobar will become the centre of a large and prosperous mining district.

COBAR DISTRICT—NYMAGEE DIVISION.

(H. Theo. Garland, Mining Registrar.)

I HAVE the honor to submit my annual report for the Nymagee portion of the Cobar Mining District, for the year 1887.

There have been nine miners' rights and one mineral license issued through the year.

Gold.

There have been a few prospecting for gold during the past year; but, up to the latter end of the year, they have not been successful in finding any.

Copper.

The only company in the Nymagee Division, is the Nymagee Copper-mining Company (Limited). There are 350 men and boys employed by the company. The plant at the mine consists of one 35-horse power and one 40-horse-power horizontal winding engine, two Tangyo pumps, one 11-horse power Root's blower, stone-breakers, crushers, &c.

The whole of the plant at the mine is valued at £81,000.

During the year 9,860 tons of ore have been raised, all having been smelted at the mine, and yielding 1,045 tons copper, the value of which was £48,107.

The depth of the shaft is 628 feet; the deepest level being 618 feet. width of lode from 10 feet to 25 feet, dip or underlay 10 feet in 100 feet, and bearing a strike north-north-west and south-south-east.

COBAR DISTRICT—HILLSTON DIVISION.

(D. G. M. Dougall, Mining Registrar.)

WITH reference to mining industries in this district, it is with regret that I have to announce no progress has been made during the past twelve months.

Gold-mining at Lake Cudgellico is at a complete standstill, the machinery erected some time since having been sold to a company at Forbes.

During last year, three applications for mining tenements at Cudgellico were received, all with a view to purchase the allotments as improvement purchases under the Crown Lands Act of 1884.

There were issued from this office fifty-three miners' rights, and eight business licenses, and during the same period, applications were received for six gold leases at Dromedary Hill, near Mount Hope, total area applied for being 44 acres, and one mineral lease of 25 acres at the same place.

COBAR DISTRICT—MOUNT HOPE DIVISION.

(M. Filan, Mining Registrar.)

GENERAL Report upon the state and progress of the mines in the District or Division:—The copper mines in this district are now idle about two years, but are likely to be worked again very soon. There are no gold mines working in this district as yet. There are a few men prospecting close to here who have found a little gold in an ironstone lode, but they cannot say it is payable. A few gold-mining leases have been applied for, and the place is likely to get a fair trial within a few months.

INSPECTOR OF MINES' REPORT.

In submitting my annual report for the year 1887, I have the honor to inform you that the following is a list of accidents reported on by the Wardens, Coroners, or Mining Registrars as having occurred during the year, in the Metallic Mines of New South Wales.

No. of Accidents.	Date	Name of Mine or Company.	Locality.	Persons killed.	Persons seriously injured.	Occupation.	Cause of death or injury.	Total.					Non-fatal.			
								Fall of earth.	Inhaling foul air.	Explosion shot.	Falling down shaft.	Falling of ladder.	Explosion shot.	Fall of earth.		
1	10 Jan.	No name	Meroo, Mud-gee	M. G. Grasso.	Miner	Killed by fall of earth	1
2	20 "	Ironclad Mine	Cargo	J. Hamilton	Manager.	Killed by inhaling foul air	..	1
3	29 "	W. Snell	Killed by explosion of shot	1
4	29 "	M. Daley	Injured by explosion of shot	1
5	29 Mar.	Wobb's Silver Mine.	Emmaville	J. C. Hall	Killed by falling down a shaft	1
6	15 Apr.	No name	Hill End	G. Clothier	Killed by fall of earth	1
7	15 "	J. Williams	Injured by fall of earth	1
8	27 "	Adeline Mine.	Tenterfield	C. M'Carthy.	Killed by fall of earth	1
9	27 "	J. M'Donald	Injured by fall of earth	1
10	29 "	Red Hill Mine	Tamboraora	Thomas Cox.	Killed falling down shaft.	1
11	30 "	South Broken Hill.	Broken Hill.	S. Spears	Killed by falling down ladder	1
12	2 May	No name	Kiandra	C. Stephen	Killed by fall of earth	1
13	11 July	Pinnacle	Nowra	H. Underwood	1
14	9 Aug.	Gorden Mine.	Buckinbah	J. Snow	Killed through fall of earth	1
								6	1	1	2	1	1	1	2	

A few other accidents of a minor nature may have occurred, but none other than those above-mentioned have been reported to this office. During the year, I have visited and inspected mines in the Southern, Northern, and Western Districts.

Gold.

While the alluvial yield of gold, and the alluvial miners are decreasing, quartz-mining is taking a stand as a permanent industry.

Young.

In this district several attempts have been made during the year to work systematically the auriferous deposits on the lower part of Lambing Flat, about 3 miles below the town of Young; but, so far, the heavy water-soaked drifts have baffled the companies engaged in this enterprise; but, nevertheless, it is without a doubt that rich gold exist in the valley, and that, wherever the companies' managers were able to get in a set or two of timber, the yield of gold amply repaid them. This being the case, I have no doubt but means will be found and adopted, by which all difficulties of working these heavy water-soaked drifts will be overcome.

Temora.

A few new patches in the alluvial and the quartz reefs have been discovered during the year, but nothing of any great importance. This district is now drifting from mining into an important agricultural district.

Barmedman.

Several good patches of gold have been discovered; the numerous quartz-reefs during the year; and there are very good indications that alluvial leads may be discovered when once extensive prospecting operations are carried on, with that object in view.

Adelong.

This, for many years a famous gold-field, has of late become very dull, many of the miners having left for other fields; nevertheless, capital and enterprise may yet step in, for which there is ample opportunity and encouragement, and so bring Adelong again to the front of our gold-producing districts.

Grenfell.

Very little mining is now being carried on, either in the alluvial or numerous quartz veins of the district. There is, however, a large field open for the investment of capital, as few of the quartz veins which proved so very rich and remunerative to original shareholders, have been tested below the depth of 200 to 300 feet. Four companies were formed in 1872 to work the Consols, Homeward Bound, Lucknow, and O'Brien's Reefs, but none had sufficient capital to go to work in a systematical manner. At the Lucknow Reefs, which had yielded thousands of pounds sterling to the original shareholders, a main shaft was commenced by the company; but before they reached their object in view, *i.e.*, to sink their shaft to the proposed depth, their capital was spent, and the company dissolved, which proved nothing whatever as to the permanency of the reef, and it would have been better for the district if the said company had never been formed.

Forbes.

Mining matter are looking up in this district. At the Pinnacles a 10-stamp battery is fully employed crushing from a quartz vein (owned by Messrs. Nicholas & Co., of Forbes), which has given payable results. The weekly output of their mine is 90 tons, and the yield averaged about 12 dwt. of gold

gold per ton, with thickness of reef from 2 to 3 feet. There are several other reefs in this neighbourhood well worthy being further prospected, as payable crushings have been obtained in former years; but the reefs were abandoned in 1866, when greater attractions presented themselves at the opening of the Emu Creek (Grenfell) Gold-field, and in consequence of which the only crushing machine at that time at the Pinnacle was removed to Grenfell.

Some prospecting has been carried on in the alluvial, but so far without success, although the geological features of the Pinnacle country point to the belief that alluvial auriferous deposits are very likely to exist, and that it will only require the prospectors' energy and perseverance to thoroughly search for and discover them. Should my expectations be realized, then a large tract of country between Forbes and Grenfell, which has every favourable indication of being auriferous, will receive the attention of both gold prospector and capitalist; and the lands which now principally are mere sheep walks, will become settled on by an industrious mining population, by which more industries than one would be benefited. Two parties of prospectors, aided by Government out of the Prospecting Vote, are at work. They have bottomed several shafts, but so far without payable results.

Parkes.

This district has of late years merged from an alluvial gold-field into a quartz-mining district, and is now employing a large number of miners. The principal line of reef now being worked, is that known as Hazelhurst and Quail's (formerly the Buchanan's). A large number of mines have of late been opened on this line, but so far Hazelhurst and Quail's have been the richest. Thousands of oz. have been obtained by them during the last three years, and the claims are not as yet worked out. Other mines, both north and south, are also obtaining quartz in payable quantities. Nearly all the payable claims on this reef were formerly the property of a public company, who abandoned the land, which is now being so successfully worked by the individual miner. Before the said company failed, and the land was re-occupied by the miners, it was thought by some of the inhabitants of Parkes that it would be best for the interests of the district to have all the lands surrounding the town sold in allotments, to which the Department of Mines objected. The result has proven that the latter took the soundest view, or else the land would have been held in the hands of one or two speculators, whereas at present it profitably employs a large number of men. I have for years past advocated that, if miners in the Parkes District would pay more attention to quartz-mining, they and the whole district would be greatly benefited thereby.

Orange District.

The mining operations at Lucknow, under the able management of Mr. H. W. Newman, are still in full work. Extensive machinery has been erected, and everything in connection with the mines and machinery is in first class order; but as I have frequently reported in detail upon these mines, I think it superfluous to do so in this report.

At the Torrent Reef prospecting parties are now sinking in the deep basaltic country (one of these parties has received aid from Government for prospecting). Should they succeed a large tract of auriferous country is likely to be opened, stretching from the Forest to Lucknow. At King's Plains prospecting for alluvial and reefs is also being carried on, which may lead to some new discoveries.

Brown's Creek.

This mine is still progressing under the able management of Mr. John Smith, and has yielded payable return during the year.

Hill End and Tambaroora.

A few parties of miners are still at work on the various quartz veins of this district, but nothing new has been discovered during the year. The English Company at Hawkins' Hill, who took up the land formerly held by the Star of Peace, was stopped once or twice during the year for want of funds, and has really done nothing to develop their land or to discover fresh auriferous deposits.

At the Red Hill, Tambaroora, Mr. Charlton, the manager of the Red Hill Gold-mining Co., is vigorously prosecuting his operations for the purpose of striking a known rich vein at a greater depth. This Company have really done some very hard and expensive work, and deserve every justifiable encouragement; because should they be successful in striking the reef in their main shaft, as anticipated by their manager, it would be the means of the employment of a large number of persons.

Mudgee and Gulgong.

Parties of miners are at work in various parts of these extensive gold-fields, but very few new discoveries have been made of late. It is, however, thought that the encouragement given by aid from the Prospecting Vote may lead to new gold discoveries being made, and the employment of a large number of persons. I have also visited and inspected other gold-fields in different parts of this Colony, but as no new discoveries were made on them during the year, with the exception of the Mount Browne Gold-fields, I will not unnecessarily lengthen my report.

Mount Browne.

At Mount Browne proper, at the One-mile and Four-mile, there were during the time of my inspection about eighty miners at work—seemingly making a living. Payable gold has been obtained during the year at the One-mile, sinking of 100 feet to 130 feet in depth, the bottom dipping into the cretaceous formation at the rate of about 15 feet in 100 feet; width of lead, 30 feet; thickness of wash, 12 inches. The latter is very cemented, and has to be blasted with explosives. The All Nations Claim, at Mount Browne proper, is 200 feet in depth, and dipping south-westerly into the cretaceous formation. Width of auriferous wash, from 14 to 20 feet; thickness, about 18 inches, and very much cemented. As the bottom (bed rock) in this claim dips very rapidly into the cretaceous formation, the flow of water increases, and I was informed by the claimholders, that the last two leads obtained from the deepest ground in the All Nations claim, was obtained by the men standing up to their waist in water; the yield of those two leads being 29 dwt. 22 gr. of gold. The gold is coarse, and it is probable that several branches or tributaries will be discovered,

discovered, and worked with payable results, not only near Billy Goat Hill, but on the outskirts of other parts of the cretaceous formation. If machinery is brought on this part of the gold-field to cope with the heavy flow of underground water, Mount Browne may again become prosperous, and a large number of persons may find profitable employment.

Several small rushes have taken place on the field, and although gold in payable quantities have been obtained, they have not been of any great extent or of a permanent nature.

At the Granite (Tibooburra) all the shallow auriferous country is being rapidly taken up for puddling machine purposes. There are twenty-five machines at work, and several still under construction. Some of the owners of these machines are making small fortunes, others good wages, and all seemed well satisfied with the result obtained from their labour and outlay.

The favourable season and large falls of rain have greatly facilitated the prosperity of the granite diggings, the population of which is about 250.

QUARTZ VEINS.

Very little real prospecting and systematically working has been done on any part of the Mount Browne Gold-field for the discovery of payable auriferous quartz veins with the exception of one part of the field, known as the Quartz Reefs, which are in the silurian slate formation, notwithstanding that surface indications point to the great probability that narrow but rich quartz veins will be discovered along the tract of auriferous country, *i.e.*, from Milparinka, the Two-mile, Four-mile, Good Friday, Depot Glen, Baster Monday, and the Granite. Intending prospectors should not waste their time on the large quartz blows visible on the surface in all directions of this extensive auriferous tract of country, but they should use their energy and perseverance in searching for narrow quartz veins, some of which may be covered over by alluvium, and may be discovered in the alluvial working. Quartz-mining is very likely to become the principal gold-producing industry of the Mount Browne district.

At the place known as the Quartz Reefs nothing has been done during the year, the machinery being idle, and is going to ruin.

The local price of gold is £3 19s. per oz.

SILVER.

In June last the Back Creek silver deposits were inspected by me. These deposits are situated about 6 miles from Rockley, midway between George's Plains and the Newbridge Railway Station on the Western line. At the time of my inspection the works consisted of an open cutting, in which the gold and silver was first discovered, and a drive 60 feet in length to connect said open cutting with No. 1 and No. 2 shafts, the latter of which was 40 feet in depth.

The silver deposits occur in irregular bunches and lenticular quartz veins, varying in thickness from 4 to 18 inches. Some of these veins contain a high percentage of silver and gold. Although the quartz veins are thin, the fissure in which they occur is fully 5 feet in thickness, and the matrix between said quartz veins is said to contain a small percentage of silver. Strike of veins No. 25 W. with a westerly underlay towards a limestone formation. The general geological formation of the district consists of silurian sandstone, shales, limestone, and talcose chloritic micaceous schist.

I forwarded four samples of ore to the Department of Mines for assay; the result, which I left in blank, were filled in after assay by Mr. C. S. Wilkinson, Government Geologist.

No. 1 sample was taken a few feet south of No. 2 shaft and yielded: Fine silver at the rate of 285 oz. 6 dwt. 18 gr. per ton; fine gold at the rate of 1 oz. 4 dwt. 11 gr. per ton.

No. 2 sample from No. 2 vein, the latter being 6 inches in thickness, yielded: Fine silver at the rate of 134 oz. 6 dwt. 19 gr. per ton; fine gold at the rate of 5 dwt. per ton.

No. 3 sample from top vein, about 16 inches in thickness, yielded: Fine silver at the rate of 223 oz. 15 dwt. 8 gr. per ton; fine gold at the rate of 3 oz. 5 dwt. 8 gr. per ton.

No. 4 sample from open cutting, near surface, yielded: Fine silver at the rate of 211 oz. 18 dwt. 11 gr. per ton; fine gold at the rate of 2 oz. 9 dwt. per ton.

Back Creek is an old gold-diggings, on which for years past both alluvial and quartz were worked with payable results. Owing to the large percentage of silver, the gold realized a low price, which caused the abandonment of the quartz veins in that district, but on the discovery of the Sunny Corner Silver Mines, the Back Creek quartz veins were retaken for the purpose of testing for payable silver deposits.

36 tons 18 cwt. 1 qr. of ore was forwarded for treatment to the International Smelting-works, which yielded 3,406 oz. of silver and 15 dwt. of gold per ton, which proves that by careful dressing the ore and economically working the mine highly payable return may be anticipated. So far no galena or carbonate of lead have been discovered; but as the mine has not been extensively opened, it may still be found to contain galena, also carbonate of lead. At present it is impossible to estimate the full extent of the value of these deposits.

I also reported in June last on the Lewis Ponds Gold and Silver Mines, which were very little known at the time of my report, but have since that report was published come into prominence. The Lewis Ponds Mines are situated on the eastern slope of one of the high hills of the Lewis Pond, about 15 miles by road east of Orange, 4 miles south-east of the Old Icely Copper Mine, and 10 miles north of Ophir. The geological formation consist of altered sandstone, micaceous talcose slates, porphyry, and limestone. As far as the lode has been opened, it consists of gossan ore, containing chlorides of silver and carbonates of lead, with a fair percentage of gold. Very little, if any, galena has so far been met with. The lode occurs in bunches from narrow veins to 16 feet in thickness, and its strike is north-west 10 degrees north, with a westerly underlay. About seventy different assays have been made, and I was informed with an average yield of 60 oz. of silver, and 1 oz. of gold per ton, and five assays made by the Mines Department gave the following results:—

	oz.	dwt.	gr.		oz.	dwt.	gr.
Silver.....	90	12	0	Gold.....	0	16	12 per ton.
"	46	2	12	"	1	7	0 "
"	227	6	0	"	1	6	0 "
"	213	19	0	"	0	4	0 "

At

At the time of my inspection three shafts had been sunk, viz., the working shaft 87 feet in depth, with a winze in the north level 29 ft. 6 in. making a total on the lode of 116 feet in depth, and the length opened on the course of the lode was 110 feet. An air shaft and a main shaft were also being sunk, the latter was 8 ft. x 4 ft. in the clear, was 50 feet in depth, and intended to strike the underlay of the lode at a greater depth. The ore out of the Lewis Ponds Mine could be raised at a comparatively low cost, owing to the gossan ore, and the walls of the lode being soft and require very little blasting. Fully 500 tons of ore were at grass, and several hundred tons of ore were exposed to view in the mine.

About 200 yards westerly of this lode, also in the company's land, is a large outcrop of limestone, and about 100 yards westerly of this is another outcrop containing minerals on which an old shaft had been sunk many years ago, and in which a lode can be seen from 6 to 8 inches in thickness, likely to contain both gold and silver.

No. 1, south of the above, is Spicer's Mine, on which a shaft 50 feet in depth had been sunk through a gossan lode containing gold and silver, but as to what percentage I could not ascertain, as there was no one at work at the time of my inspection.

No. 2 South (Lane and Company). Here the gossan lode partly disappears and a large quartz reef crops up. I was informed that 10 tons of quartz from this reef, and crushed at the Ophir Crushing Machine had yielded 9 oz. of gold.

No. 3 South, or the Lily Gold-mining (Prospecting Company), Upper Lewis Ponds, two shafts had been sunk, 33 feet and 76 feet respectively. This is a gossan lode, and I was informed that payable results had been obtained. I however think that nothing payable will be obtained in this mine on the shallow levels, as there is no regular lode, but strata and lode is mixed together. If a shaft from 150 feet to 200 feet in depth was sunk, the lode and walls may become better defined, and payable results might be the consequence, but at the time of my inspection, the shareholders only wasted their capital by scratching and fossicking on the higher levels.

There is plenty of timber in the vicinity of these mines, for fuel and mining purposes, and there are certainly indications which point to the great probability that these mines will by the aid of scientific and practical knowledge in working and treating these ores be made to give profitable returns for the capital invested.

About 5 miles from Orange are the Bulga Hills, on which several leases have been taken up for gold and silver mining; but very little work had been done at the time of my inspection; although by general appearances the Bulgas should contain extensive and payable auriferous and argentiferous deposits.

In my report on the Orange district in June last I also wrote that the whole country from Orange to Lewis Ponds had the appearance of being highly auriferous, argentiferous, and cupriferous, and it seemed strange that while labour was plentiful, and capital laid dormant for investment, that this part of the Orange district should be so little prospected; but I was sure that by force of circumstances this part of New South Wales would demand the attention of enterprising men, by whose action a large mining population would be settled between Orange and the Ophir, along the Bulga and Lewis Ponds Ranges.

The Silverton district, including Broken Hill. This rich and extensive district was also inspected by me during the year.

The Broken Hill Proprietary Mine, which is the premier mine of the district (and at present of New South Wales) still continues to yield large quantities of chloride ores, and is likely to do so for years to come. Their mine works and machinery is very extensive, and has been fully reported on by me on previous occasions.

Active operations in sinking and erection of machinery were carried on in the Central (formerly Nutts) mine, in which a large lode containing iron, manganese, galena, and small percentage of silver had been struck, and which on further development may prove payable and rich.

At the South Broken Hill a main shaft was being sunk and extensive machinery erected; which is an improvement in the right direction. In my last annual report I stated that if a main shaft was sunk instead of so many shallow shafts, the main lode would be more easily reached. Mineral leases have been taken up south, east, and west, but very little work had been done on any of them up to the end of the year, with the exception of the Rising Sun, about 3 miles south-westerly of Broken Hill where active mining operations are carried on, and it is thought with payable results.

North of the Broken Hill Proprietary is the Junction Mine. As stated in my annual report of last year, it has excellent prospects, and were likely to come to the front. At the time of my last inspection winding machinery were being erected, and some very good ore was raised out of the main shaft.

At the Broken Hill North a main shaft has been sunk during the year, and at the time of my inspection the underground workings had been temporarily stopped while machinery was being erected.

At the Victoria Cross only prospecting was carried on, and the prospects of this mine are likely to improve greatly as developments are carried on.

To the north of these mines are also the Consolidated, Round Hill, Cosgrove's and others; which can only be considered more or less as prospecting companies, and which by striking the lode may come to the front at any time.

Rookwell Paddock

Was fully reported on by me during 1885, since that time a great deal of progressive work has been carried on, several silver lodes have been discovered, and are now been developed, but as far as proven they do not come up to the value of the Broken Hill mines.

The Pinnacles.

These mines have been fully reported on by me on former occasions. The mines are rich in silver, but so far, the company have been baffled in successfully treating their ore. During the year extensive crushing and concentrating machinery has been erected, which also became a partial failure; nevertheless, there is a likelihood of these mines returning payable results for the capital invested.

The silver deposits are distributed over such extensive country, and the mines at work and taken up are so numerous, that space in this report will not allow me to write separately or extensively on all the mines of the district; suffice it to say, as stated in my last report, the Silverton and Broken Hill district is the richest and most extensive in New South Wales.

Sunny

Sunny Corner, in the Bathurst district was, also inspected by me. Considering the dangerous nature in working these mines, everything is done to secure the safety of the persons employed therein, and so far the mine has been singularly fortunate in the absence of accidents. Although great many improvements have been made in roasting, treating, and smelting the refractory ores the Company have been able to work their mine during the year with payable results, which is principally due to the ability, practical knowledge, and energy of Mr. Thomas Eyre, the Company's manager.

The Silver King, the Silver Queen, the Nevada, Tomkins, and other silver mines in this district, from whom such great results were expected, have had very few men employed during the year. Some have only sufficient men to comply with the labour conditions; others seem quite abandoned.

Emmaville.

The machinery for treating the ore at Webb's silver mine, near Emmaville or Vegetable Creek in the north, is rapidly approaching completion; after which, large returns of silver from this mine may be looked forward to.

TIN.

The shallow workings at the Vegetable Creek Tin-field are being turned over and over again with payable results, principally by Chinese tributors. The increased price of tin has materially helped it, and it seems surprising where the yield comes from out of the old apparently worked out ground.

The Deep Lead.

Wesley's Company have a few parties of tributors on which all seem to make good wages.

Bayley's mine has yielded well during the year. The whole of the main bottom level has nearly been worked out, with the exception of a few feeders which are now being worked. A great deal of work during the year has been done in their shallow levels, and to all appearance they have another year or two in this level which will pay to work out, should the price of tin keep up. They are shifting their plant to facilitate the working.

Cunneen, Reid, & Co.—This claim has yielded well during the year, but is now probably worked out. To give an idea of the outlay on this lease—I was informed that the mine showed at one time £6,000 on the wrong side of the ledger, but has since paid handsomely. The same company have the ground adjoining on tribute from Mr. John Lennen, and have followed the lead into tin ground. The lead is narrow here, but is highly payable; the progress of the works in this mine is a matter of interest, as it will determine the course of the lead. Mr. Cadell & Co. have prospected by boring to the boundary of the above-mentioned land, but seem not to have struck the main lead, although fair prospects have been obtained.

At the Two-mile Allen & Co. have started to work the Old Chance Lead. Messrs. Warrin & Co. have worked out their land.

Some prospecting has been done by Wesley & Co. at Mount Doubtful, but with unsatisfactory results. Prospecting operations have been resumed at Emu Flat.

Hall Bros., Kangaroo Flat.—Workings are still carried on with payable results in the land they have worked so many years, under the able management of Mr. Thomas Chandler, but it is now nearly worked out. When this is done they will have to face the wet portion of the lead known to exist in their land. This is well worth the attention of capitalists, as it is evident that the ground worked by Hall Brothers so far is but a branch of the main lead. The tin obtained by them has been on a dry, shallow bar which separates the deep, wet ground. Shafts have been sunk, but whenever the level of the bar has been reached the water became too great, notwithstanding constant baling. If a level was brought up through Hall's old workings from the creek below, and the bar pierced through, good results would be obtained, and the surrounding stanniferous country would be drained thereby.

Stormer and party, about 2 miles west of Hall's, have been working during the year with payable results.

Some prospecting is also carried on on the deep main lead, but no shaft has so far been bottomed.

For the purpose of opening up this district for tin-mining the local residents formed themselves into a company, with a capital of £5,000, to open the lead at one of the outcrops, and have started work sinking a trial shaft to obtain the depth preparatory to starting their tunnel, which when completed will be the means of draining that part of the country by gravitation, and if a similar level or tunnel was taken through Hall's property, and the bar pierced, it would no doubt prove very beneficial to the whole district.

Lodes.

The Ottery Lode at Tent Hill has given good payable results during the year, which has caused other lodes in the vicinity being prospected with fair results, but nothing systematically has been done. Want of capital is the great drawback in the development of the tin lode industry in the Tent Hill neighbourhood.

The Butler's Lode has been idle nearly all the year, excepting since it has come into possession of its new owner, who is prosecuting his work as well as he can.

The Torrington Mine, which seems patchy, has raised a fair amount of tin during the year.

At the Dutchman's Lode some prospecting has been done during the year.

Lodes have also been opened by working miners, but who generally only work that part of the ore stuff which is easily obtained, but who have not sufficient capital to develop their lodes when difficulties come in the way.

At the Silent Grove a great deal of work has been done by the Glen Smelting Company, but so far with not very encouraging results. The same may be said of Madman's Gully.

The great drawback to this district is the want of capital, and capitalists do not care to prospect the deep leads as most of the land is the freehold of (squatters) pastoralists.

The Poolamara, Euriwie, and Wankaroo tin deposit in the Silverton district were also inspected by me during the year. These deposits embrace a large tract of country, and at the present price of tin many of them should give payable returns. The ore occurs in granite dykes which traverse the schist formation. The dykes vary in thickness from 1 to several feet, with a general strike of E. 35 N. Although in most of these dykes the tin ore is found in patches; there are some in which the ore is more evenly distributed, and where work can be carried on in a more extensive and systematic manner. Most of these deposits are, however, likely to be worked by small parties, who will follow the bunches of ore until they become too expensive to work. A system similar to that adopted in the Vegetable and Cope's Creek Tin-fields of buying the tin ore direct from the miners at the mine would prove beneficial both to buyer and producer. A large quantity of tin would then be raised by the individual miner as well as by companies, numbers of men could be profitably employed, and the prosperity of that part of the district ensured. Garnets in large quantities have also been found in the Polonnaca district.

The high price of tin has also given a great impetus to prospecting in the Cope's Creek district, and a large number of persons are now profitably employed on land which two years ago was considered valueless. The several tin lodes near Tinga and Inverell ought now to receive a thorough trial.

COPPER.

The low price of copper has had a depressing effect on our industry, and with the exception of the Burrage mine in the south and the Nymagee mine in the west, very little work has been done during the year in the copper mines of New South Wales, but latterly the Cobar, Mount Hope, Great Central, and other copper mines are making preparations for active mining operations.

I have, &c.,
W. H. J. SLEE,
Inspector of Mines.

COAL AND SHALE.

TABLE compiled from Reports furnished by Owners of Collieries, showing the quantity and value of Coal and Shale won during the year 1887, and the number of Men employed in the Collieries.

REPORT of the Examiner of Coal-fields for the Colony of New South Wales, for the year 1887.

In accordance with the provisions contained in the 26th section of the Coal Mines Regulation Act, 39 Vic. No. 31, I have the honor to submit reports from the Inspectors of Collieries, with this my general report, for the year ending 31st December, 1887.

The information I have the honor to submit in respect to the condition and progress, &c., of the various coal and boghead mineral mines during the year, 1887 is as follows:—

Number of accidents in 1886 and 1887.

The number of lives lost is, I regret to say, owing to the Bulli disaster, more than those of the previous year by sixty-five, and the non-fatal accidents exceed those of last year by two. In the year ending 31st December, 1886, there were twenty-nine fatal and forty-three non-fatal accidents.

Three of the fatal accidents happened through falling down shafts; the fourth by being drowned in a shaft; the fifth to fourteenth inclusive by "falls of coal;" fifteenth by an explosion of loose powder; sixteenth, seventeenth, and eighteenth, by loaded skips; nineteenth to twenty-sixth inclusive by inhalation of carbonic acid, &c., gases; twenty-seventh through the Ferndale Colliery being flooded by tidal waters; twenty-eighth by a blow from a falling prop; and twenty-ninth by a fall of roof.

The first of the non-fatal accidents occurred through an explosion of loose powder; the second to sixteenth inclusive through "falls of coal;" seventeenth by empty skips; eighteenth, nineteenth, and twentieth by explosions of fire-damp; twenty-first to twenty-sixth inclusive by loaded skips; twenty-seventh and twenty-eighth by falling props; twenty-ninth and thirty-third inclusive through falls of stone; thirty-fourth through falling off a stage; thirty-fifth by a screen bar handle; thirty-sixth head crushed between a cage and bunting in shaft; thirty-seventh and thirty-eighth by falls of roof; thirty-ninth by the explosion of a shot; fortieth by a loaded truck; forty-first through a fall of jerry; forty-second by a loaded timber trolley; and forty-third by a fall of morgan.

In the year under review (1887) fifty-nine notices of accidents were received, ninety-four of the accidents (eighty-one of which were caused by the Bulli disaster) being fatal; and forty-five non-fatal; all of which have been inquired into, the scene of the accidents inspected, inquests attended and reports made thereon and forwarded for your information.

The names and occupations of the persons who died from injuries received and those who have been seriously injured, as well as the names of the collieries where the accidents occurred, are given in the following summary:

SUMMARY

SUMMARY showing the number of fatal and non-fatal accidents in 1887, the names and the occupations of the persons

Increase in 1887	21,908	0 0	10,420	5 2	
Decrease in 1887	3	15	

From these returns we find that in the Northern District, in the year under notice, there has been an increase of 65,676 tons in the quantity of coal raised, and an increase of £12,165 3s. 6d. in the value of it; whilst in the previous year (1886) there was an increase of 64,743 tons, and in the value of the coal raised £51,650.

In the Southern District there has been an increase of 5,738 tons, and in the value of £20,690; whilst in the previous year (1886) there was a decrease of 82,898 tons, and £80,478 in the value, which was caused by a four months' strike at most of the collieries, and if we deduct 5,738 tons, this year's (1887) increase from last year's (1886) decrease of 82,898, it gives 77,160 tons as the yearly decrease which

which has taken place since the year 1885 and prior to the 1886 four months' strike, and by deducting £20,690, this year's (1887) increase in value from last year's (1886) decrease of £80,478, we find that £59,788 represents the yearly decrease in value which has taken place since the strike, thus showing the injury done to the district thereby.

In the Western District there has been an increase of 21,908 tons, and in the value of £10,420; whilst in the previous year there was a decrease of 30,534 tons, and a decrease of £8,221 in the value, which was caused by a general depression in trade, the railway traffic being less, and brickworks not taking as much coal as in the previous year.

The following table shows comparisons between the year under notice and two preceding years, as regards the exports of coal to foreign and intercolonial ports; the quantity used for home consumption; total output and value; tons of round and small coal raised for each person employed in and about the collieries; value of round and small coal raised for each person so employed; and the quantity of coal raised for each life lost.

Complaints made of deficient ventilation, &c.—I have, as usual, inquired into sundry complaints made with respect to deficient ventilation and non-compliance with the requirements of the provisions of the Coal-mines Regulation Act, 1876. Proceedings, where necessary, have been taken to enforce the provisions of the Act, and reports furnished thereon.

NEW MINES OPENED OUT OR IN COURSE OF DEVELOPMENT DURING THE YEAR 1887.

Northumberland Colliery.

On February 7th Messrs. Blomfield and Dixon gave notice that the sinking of a shaft for coal-mining purposes had been commenced at Fassiferns, county of Northumberland, parish of Awaba. This is now the property of the Northumberland Coal and Land Company.

Bulli Mountain, Wollongong.

On June 13th Mr. Arthur Robinson notified of having commenced sinking a shaft for coal on his mineral conditionally purchased land at top of Bulli Mountain, parish of Woonona.

Singleton Coal and Coke Company.

On July 12th Mr. W. Longworth gave notice of having commenced to sink a trial shaft on a mineral lease situated in the parish of Auckland, county of Northumberland, adjoining Messrs. Nowlands' mine.

Lahiff & Ahern's Tunnel, Mount Kembla, Wollongong.

On August 2nd Mr. Lahiff notified having commenced opening out a tunnel for permanent service in the coal measures. This is in excess of work done on the same selection—seeking for kerosene shale—formerly situated at Mount Kembla, Wollongong.

Ryhope Colliery, Redhead.

On August 31st Mr. Thos. Croudace notified that he expected to commence to sink at Redhead latter end of the week.

Ferndale Colliery, Wickham.

On September 15th Mr. John Powell, colliery manager, notified having opened out a new colliery at Wickham, near Newcastle.

Oakley Park, Zig Zag, Lithgow.

On September 15th Mr. Richard Fryer, on behalf of the Oakley Park Coal-mining Company, Lithgow, gave notice of having commenced sinking on their property near the Railway Zig Zag, Lithgow.

Sunderland Colliery, East Maitland.

On October 11th Mr. Matthew Tulip notified having commenced a colliery on the 20-acre lease at Four-mile Creek.

COAL-MINES ABANDONED OR OPERATIONS SUSPENDED DURING THE YEAR 1887.

Broughall's Tighe's Hill Colliery, Tighe's Hill.

On September 24th, Mr. Jno. Jackson gave notice that the Tighe's Hill Colliery, recently worked by Broughall and partners, was finally closed on the 22nd, in consequence of all the payable coal having been worked therefrom.

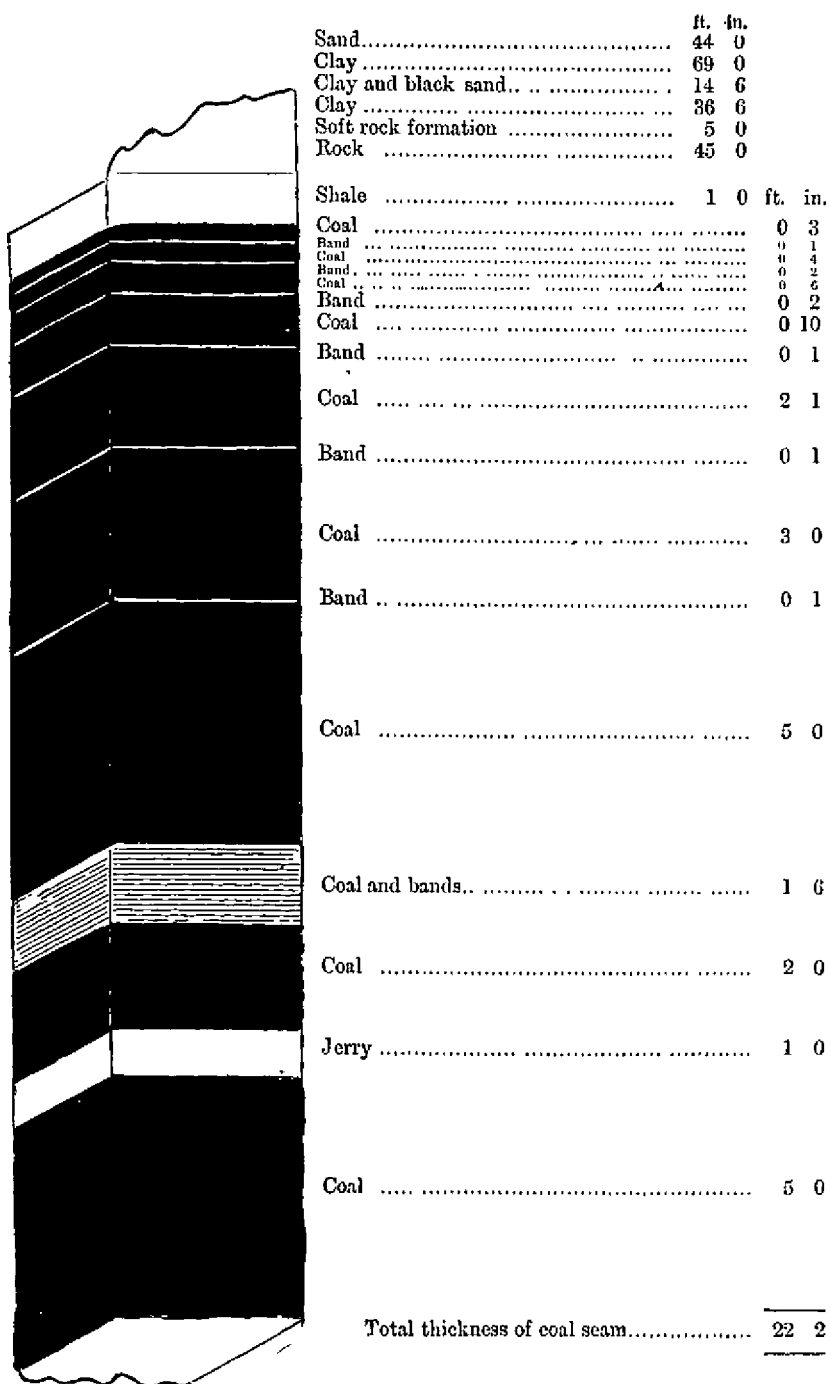

This is a section of the Borehole coal-seam, suitable for house-fire, steam, gas, blacksmith, and coking purposes, recently opened out by the Australian Agricultural Company, at their Sea Pit new winning, from whence they anticipate raising large quantities of coal from the yard, 2 feet, and Borehole coal-seams in 1889 and subsequent years. A shaft, called the Sea Pit, 15 feet in diameter, adjacent to the old F Pit and Darby-street, Newcastle, has been sunk through the last-mentioned coal. The depth from the floor of the heapstead to the top of the Borehole seam is 266 feet 6 inches, and the thickness of the seam is 16 feet 6 inches. Below this seam in the shaft a 30-foot sump has been sunk, thus making the total depth of the shaft 313 feet. The depth of the brick walling from the floor of heapstead is 48 feet 7 inches, and it is 2 feet in thickness and built in cement. The shaft is fitted up with iron slides, and steel shoes are placed on the outer side of each cage to work on those slides. A winding engine has been fitted up on the surface of 158 indicated horse-power. It is also fitted with over-winding gear and a powerful steam-brake. There is also an automatic gearing placed at the top of the shaft for working the steam-brake, should the cages be lifted above their normal working point. This automatic contrivance not only puts on the steam-brake, but it also shuts off the steam from the cylinders of the engine, and relieves them at the same time of all internal pressure. The above three objects—viz., putting on steam-brake, shutting off steam from cylinders, and relieving cylinders of internal pressure—are accomplished in one simultaneous movement. A good substantial brick building has been erected over this engine. There have been seven egg-end boilers, 30 feet x 6 feet, fitted up, and they have been roofed over in a substantial manner.

The

The old F Pit has been opened out to 15 feet diameter, and it has been sunk to the floor of the seam mentioned in the above-named shaft; and 49 feet of brick and cement walling, 18 inches thick, has been built in this shaft. A "Schiele" patent ventilating fan, 13 feet 6 inches in diameter, will be erected at this F Pit. The Company have the plans in hand for the foundations, and the work will be proceeded with at an early date. After the fan and connections have been fitted up they will commence to erect an engine of 150 horse-power for hauling coal to the bottom of the main shaft. It is also their intention to put in a slope drift from the surface, near to Darby-street, to the underground workings, at a gradient of 6 inches to the yard; and this will be used as a travelling road for the men to enter and leave their work.

SECTION of Hetton Seam, and description of Mine.

The above is an account of the strata and Borehole coal-seam sunk through by the Hetton Coal Company, at Bullock Island, adjacent to the wharf and steamer cranes fronting the Newcastle Harbour. The Borehole coal-seam was sunk through at a depth of 237 feet from the surface, by a shaft 15 ft. 10 in. in diameter, which is lined with cast-iron tubing for a depth of 180 ft. from the surface. The sinking commenced 27 November, 1885, and was completed 19 March, 1887.

The coal is of excellent quality, suitable for house-fire, steam, gas, blacksmith, and coking purposes.

A compound winding engine with two 26-inch cylinders and a 54-inch stroke, three boilers 6 ft. in diameter and 34 ft. long, Tangye pumps with an air compressor to work them, instead of steam, a substantial head-gear, and three screens, &c., have been erected, and the Company anticipate raising large quantities of coal next year (1888).

SECTION of Ferndale Coal-seam, and description of Mine.

This is a section of the Borehole coal-seam sunk through by the Ferndale Coal Company, at Wickham, adjacent to the Bullock Island Government Railway, and distant about 1 mile from the wharf and steam cranes fronting the Newcastle Harbour.

The Borehole coal-seam has been sunk through at a depth of 162 feet from the surface by a winding shaft 12 feet and an air-shaft 9 feet in diameter, lined with cast-iron tubing. The coal is of excellent quality—suitable for house-fire, steam, gas, blacksmith, and coking purposes.

A compound winding engine with two 20-inch cylinders, a 20-inch cylinder haulage engine, substantial head-gears and screens, &c., have been erected, and the Company anticipate raising large quantities of coal next year (1888).

Young Wallsend Colliery.

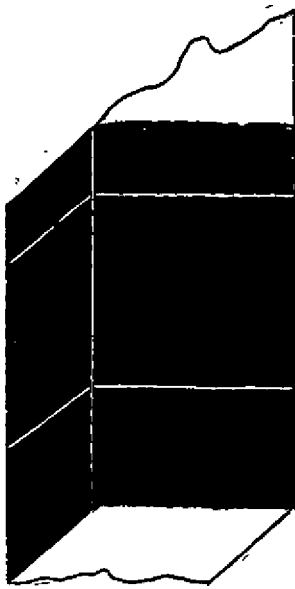

This is a new Company which has been formed and is being opened out by Messrs. Bonarius and others to work the Borehole coal-seam, from under land in the parish of Teralba, county of Northumberland, which colliery, when connected by about 2½ miles of railway to near the Cockle Creek Railway Station, will be between 9 and 10 miles distant from the Newcastle Harbour.

In December last a shaft 10 feet in diameter was in course of sinking to the Borehole coal-seam, and a pair of coupled winding engines, boiler, &c., had been erected, and material was being drawn from the shaft thereby.

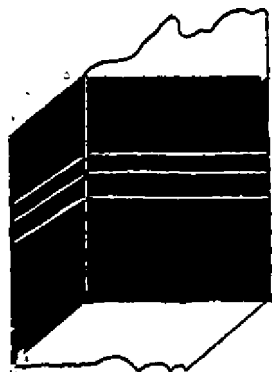

This is a section of the Borehole coal-seam—suitable for house-fire, steam, gas, blacksmith, and coking purposes—taken by Mr. Inspector Dixon, which the West Wallsend Coal Company have sunk through by a winding shaft 15 ft. in diameter and 492 ft. in depth, and by a furnace shaft 10 ft. in diameter

diameter and 492 ft. deep, situated in the parish of Teralba, county of Northumberland. The colliery will be 14 miles from the Newcastle Harbour when their branch line of about 5 miles in length has been constructed to the Government Railway, near the Teralba Station. Two coupled 25-inch cylinder winding engines, a conical drum 10 to 12 feet in diameter, four boilers 5 ft. 6 in. by 33 ft., and an iron head-gear, &c., have been erected, and when the railway line now in course of construction is completed it is intended to ship coal at Newcastle.

GREAT NORTHERN.		ft. in.
	Coarse conglomerate and pudding-stone.....	96 0
	Coal and bands	12 0
	Coal	1 3
	Band	0 0½
	Coal	3 10
	Band	0 0½
	Coal	2 6
	Chitter.	
	Thickness of coal worked.....	7 8

The above is an account of the strata and uppermost or No. 1 coal-seam (suitable for house-fire, steam, blacksmith, and coking purposes) sunk through by the Great Northern Coal Company in an air-shaft 9 feet in diameter and 130 feet deep, which is connected with an adit 10 feet wide, 7 feet high, and 450 yards in length. The mine is situated at Teralba, distant 12 miles from the Newcastle Harbour, where a branch line 30 chains in length connects it with the Homebush and Waratah Railway. A temporary haulage engine, with two 9-inch cylinders, is placed near the tunnel mouth, and is supplied with steam from a 15 horse-power vertical boiler and a Tangye pump. Three screens, engine-bank, &c., have been erected, and a "small coal-hopper," to hold 1,000 tons, is in course of construction. Also ten coke-ovens, patented by Coppee, Evence, & Co., each 15 ft. long, 7 ft. high, and 2 ft. wide, are in course of erection. They are fired from underneath the heated gases, and flame through flues on each side of oven, over the crown, and from thence into main flue. There are apertures left in sides of ovens to allow of the coal-gases getting away, and becoming ignited they assist the furnaces. The main principle is that the coal is not fired, but retorted similar to a gas works retort. The charge is supposed not to take longer than fifty hours. If the ten ovens turn out a payable percentage of coke, it is intended to erect forty additional ones.

NORTHUMBERLAND Coal and Land Co.'s Section and description of Mine.

	ft. in.	
	Black shale.	
	Hard splint coal.....	0 8½
	Coal	0 10½
	Band	0 0½
	Coal	0 3
	Band	0 1½
	Coal	0 4
	Band	0 0½
	Coal	2 1
	Total thickness of coal worked	4 6¼

The above section represents a coal-seam identical with the No. 2 opened out and abandoned at the Great Northern Coal Company's, which the Northumberland Coal Company have driven an adit into and are working for the supply of fuel to their engine-fires, the blacksmith, and others. Two shafts, 17 feet in diameter, called the Bryant and Trummer Pits, are in course of sinking to the Borehole coal-seam (as yet unproved), and the pits and pit-top are lighted by the electric light, the appliances for which have cost the Company about £400. This is the first colliery in New South Wales that has used the electric light for sinking and other purposes.

A Schiele blowing-pan, 5 feet 6 inches in diameter, with canvas pipes attached thereto, is the means used for ventilating the sinking shafts; a pair of 30-inch cylinder winding engines, four boilers, and iron head-gears, manufactured in Great Britain, are at the mine ready for erection, and half a mile of railway is in course of construction from the pits to the Government railway line. Mr. Crawford, the colliery manager, is making rapid progress with the sinking of the shafts, and anticipates winning the Borehole coal-seam about the middle of next year (1888). This new colliery is situated in the parish of Awaba, county of Northumberland, and is about 11½ miles from the Newcastle Harbour.

The above is a section, taken by Mr. Inspector Rowan, of the coal-seam recently opened out by Messrs. Cox, adjacent to the Mudgee and Sydney Railway, and about 7 miles north of Rylstone, in the county of Phillip. The lower portion, over 5 feet in thickness, is the workable part of the coal-seam, which Mr. Rowan says is a good marketable coal. On my next visit to the Western District I purpose going over this new mine.

Copy of letter sent to the Inspectors of Collieries re stoppings referred to in Royal Commission's Report.

Sir,

Department of Mines, 9 August, 1887.

As I wish to be informed of the present state and kind of all stoppings on intake air-ways and travelling roads, and especially of those adjacent to old workings, or goaves likely to contain dangerous accumulation of gases, I beg to request that you will furnish such information in your next report on the state and condition of the different mines.

I have, &c.,
JOHN MACKENZIE,
 Examiner of Coal-fields.

EXTRACTS from Mr. Inspector Dixon's Reports.

Newcastle Coal Company's Mine.—The stoppings in this colliery are built of jerry-stone, and with two walls. The outside wall is set in mortar, and the inside wall is dry. The total thickness of each stopping is about 4 feet in the bottom and about 2 feet 6 inches at the top. The stone is very strong, and the stoppings appear to be most substantial.

Stockton Colliery, September 7th.—There are no permanent brick stoppings in this colliery yet. The present stoppings are refuse stone and dirt. The manager informed me that he intended to have the stoppings built of brick, set in mortar.

Co-operative Colliery, September 9th.—There are very few brick stoppings in this colliery, and for the most part the stoppings are built with props and slabs, pointed with loam on the outside, and packed with dirt several feet in thickness on the inside, except in stenton, where both sides are pointed and kept clear of dirt.

Bullock Island, September 9th.—The stoppings in this colliery are faced with morgan stone, and packed up with dirt to the thickness of about 4 feet.

A.A. Company's Mine, September 10th.—The ordinary stoppings in this colliery are of single brick, set in mortar, and packed behind with dirt; others of 9-inch brickwork, set in mortar, with dirt behind; others of stone-work, set in mortar, and packed behind with about 6 feet of dirt.

Burwood Colliery, September 24th.—The stoppings in this colliery are of 9-inch brickwork, set in mortar, and backed up with about 6 feet of dirt.

EXTRACTS from Mr. Inspector Bates' Reports, 1887.

Wallsend Colliery.—The air-stoppings in the main intake roads are built of 9-inch brickwork; other stoppings of 4½-inch brickwork, and a few of timber, backed up with debris; the latter are 6 feet in thickness.

Greta Colliery.—The air-stoppings are built of debris, usually 6 feet thick; some of the cut-throughs are stowed from end to end.

Hillside Colliery.—The air-stoppings are built of debris, and are about 4 feet in thickness.

East Waratah.—The air-stoppings are built of debris, 3 to 4 feet thick.

Burnley's Colliery—Clay Cross.—The air-stoppings are mostly built of debris, and are 3 or 4 feet in thickness, backed up with small coal; there are a few canvas stoppings also.

New Lambton.—The air-stoppings are built of debris, 4 to 5 feet thick.

Brown's Colliery.—The air-stoppings are built of brick, 4½ inches thick, with a rib in the centre, 4½ inches, to strengthen them.

New Lambton, Opit.—The air-stoppings are built of debris, from 4 to 5 feet thick; some of the cut-throughs are stowed from end to end.

Lambton Colliery.—The air-stoppings are built of brick, 4½ inches thick.

Anvil Creek Colliery.—The air-stoppings are constructed of a wooden framework, with canvas stretched over it.

New Park Colliery.—The air-stoppings are built of debris, and are about 6 feet in thickness.

Ellesmere Colliery.—The air-stoppings are built of debris, and are about 6 feet in thickness.

EXTRACTS from Mr. Inspector Rowan's Reports.

Hermitage Colliery.—All the intake air-stoppings on the main heading are built with slack and band * * * The stoppings are in good condition.

Lithgow Valley Colliery.—All the intake air-stoppings are built with brick and lime on both sides of the main heading. * * * These stoppings are thorough and substantial.

Esk Bank.—All the intake air-stoppings on the main heading are built with slack, timber, and band. * * * The stoppings are in fair condition.

Vale of Clwydd.—The intake air-stoppings on the engine plane are built with slack, stone, and timber. * * * The stoppings are in good condition.

Zigzag.—The intake air-stoppings are built with slack and band. * * * Stoppings in fair condition.

Esk Bank Old Tunnel.—The stoppings on the main air-course are built with stone and slack. * * * The stoppings in good condition.

Main Camp Colliery.—All the stoppings on the main intake air-way are built with slack and stone. * * * The stoppings in good order.

New South Wales Shale-mine (Hartley Vale)—No. 3 Tunnel.—The stoppings on the main intake air-ways are built with stone and clay. * * * The stoppings are in good order.

Retort Coal-mine (Hartley Vale).—The intake air-stoppings are built with slack and stone, the same being in good order.

Katoomba Colliery.—The main intake air-way stoppings are built with slack and stone, the same being in fair condition.

Australian Kerosene Oil and Mining Co. (Joadja).—This colliery is wrought on the long-wall system, and has pack-walls about 9 feet thick on each side of the main intake air-way; so that these pack-walls form the air-course, and when the "top" weight settles down they are almost solid, leaving little or no waste behind the working faces.

Mittagong Colliery.—There are no waste workings in this colliery, only two headings driven into the mountain.

Great Southern Coal-mining Co. (late Berrima).—The stoppings in the main intake air-way are built with slack and band, the same being in good condition.

Leases to mine under the ocean or tidal waters.

The Examiner of Coal-fields may be asked to say whether the conditions as to 6-yard bords and 6-yard pillars should be inserted in all leases under the ocean or tidal waters, and whether any general rule should be laid down in regard to the thickness of coal to be taken out or to be left in overhead.—H.W., 3/1/87. Examiner of Coal-fields, B.C., 5/1/87.

My recommendations for special conditions to be inserted in ocean and tidal water leaseholds in the county of Northumberland are forwarded herewith.—J.M., 7/1/88. Under Secretary for Mines, B.C., 7/1/88.

Tidal Leaseholds.

Sir,

Coal-fields Office, Newcastle, 7 January, 1888.

Referring to your blank-cover communication of the 5th instant (234), I beg to recommend that in tidal leaseholds a minimum thickness of 6-yard pillars and maximum width of 6-yard bords, or any other excavations or mine works, should be insisted on, leaving the management free to exercise their discretion in altering these (by increasing the maximum thickness or decreasing the minimum width), so as to increase the general safety; and also,—

2. That the 6-yard pillars be left unwrought.
3. The thickness of coal to be wrought out not to exceed 7 feet, without the Minister's permission be obtained for working or excavating any greater thickness of the coal-seam, after it has been opened out and the character of the overlying strata proved by the lessee.
4. All headings and bords to be driven by plumb-lines.
5. All coal-workings to be accurately surveyed every three months, and the coal taken out during the previous three months to have the dates of such surveys affixed on the plan in ink, and every year's workings to be represented on the plan by some conspicuous colour.
6. The colliery plans to contain a faithful and honest record of all faults, dykes, fissures, and occurrences that are met with in the mine, and the workings delineated thereon as they are, and not as they are intended to be.
7. In one road of every pair of winning-off or leading headings, or levels, a bore to be kept going 10 feet in advance, for the purpose of foretelling the presence of any fissure, washout, open joint, fault, dyke, or otherwise; and all winning-off headings shall be driven at least 50 yards in advance of the working bords.
8. Owing to the tendency that faults, dykes, washouts, &c., possess of weakening the roof, and of permitting the passage of water through the broken material that is frequently found along their lines, or through open fissures or joints, the lessee must, on discovering a fault, washout, dyke, or fissure in a bore at the face or side of leading headings or levels, take all necessary precautions against possible danger before opening it up by the drive.
9. That the most accurate and trustworthy information be obtained by the lessees as to the thickness and character of the strata and estuary deposits overlying the coal-seam before commencing to work it.

In conclusion, I have the honor to state that the above conditions embody the Royal Commission on Collieries' recommendations for tidal water leaseholds.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

The Under Secretary for Mines.

Ocean Leaseholds.

Sir,

Coal-fields Office, Newcastle, 7 January, 1888.

Referring to your blank-cover communication of the 5th instant (No. 234), I beg to recommend that in ocean leaseholds a minimum thickness of 8-yard pillars and maximum width of 6-yard bords, or any other excavations or mine works, should be insisted on, leaving the management free to exercise their discretion in altering these (by increasing the maximum thickness or decreasing the minimum width) so as to increase the general safety; and also,—

2. The 8-yard pillars to be left unwrought.
3. The thickness of coal to be wrought out not to exceed 6 feet.
4. All headings and bords to be set out and driven by plumb-lines.
5. All coal-workings to be accurately surveyed every three months, and the coal taken out, during the previous three months to have the dates of such surveys affixed on the plan in ink, and every year's workings to be represented on the plan by some conspicuous colour.
6. The colliery plans must contain a faithful and honest record of all faults, dykes, fissures, and occurrences that are met with in the mine, and the workings delineated thereon as they are, and not as they are intended to be.
7. In one road of every pair of winning-off or leading headings or levels a bore to be kept going 10 feet in advance, for the purpose of foretelling the presence of any fissure, washout, open joint, fault, dyke, or otherwise, and all winning-off headings shall be driven at least 100 yards in advance of the working bords.
8. Owing to the tendency that faults, dykes, washouts, &c., possess of weakening the roof, and of permitting the passage of water through the broken material that is frequently found along their lines, or through open fissures or joints, the lessee must, on discovering a fault, dyke, or fissure in a bore at the face or side of leading headings or levels, take all necessary precautions against possible danger before opening it up by the drive.
9. When possible, the coal under the ocean should be attacked only after a large "gap" has been made by extensive coal-workings under the mainland. This to be in addition to special and unusual facilities being provided for the escape of men by the shafts, will afford a measure of security difficult to over-estimate.

10. That the most accurate and trustworthy information be obtained by the lessees, not only of the depth and character of the sea bottom, but also of the strata overlying the coal-seam, which strata shall be bored through, and proved a minimum thickness of 30 feet, at the face of the leading headings or levels so soon as they have been driven 100 yards in advance of the working bords, and after the first borehole has been completed, other boreholes to be so put up in advance of it at the face of the headings or levels, at distances not to exceed 20 yards.

In conclusion, I have the honor to state that the above conditions embody the Royal Commission on Collieries recommendations for ocean leaseholds.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

The Under Secretary for Mines.

P.S.—The Royal Commission on Collieries have expressed, as their opinion, that they do not see any practicable method where mining operations can, with safety, be conducted under some of the ocean leaseholds, which it may perhaps be as well to remind you of.—J.M.

The conditions recommended by the Examiner may be embodied in leases of land under the ocean or under tidal waters, as the case may be. The Examiner may be asked which leaseholds are referred to by the Commission as unsafe to work.—H.W., 10/1/88. Submitted. Approved.—F.A., 12/1/88. Examiner of Coal-fields, B.C., 17/1/88.

Stockton Ocean Lease of 680 acres (*vide* pages 58, 59, and 67 of Royal Commissioners on Collieries' Third Report) is the one referred to as impracticable to work. Referring to Frank and Garrett's leasehold of 2,516 acres (*vide* page 63) they say nothing short of boring to the actual coal-seams will afford the necessary information with accuracy required. "Hetton Lease.—That the most accurate information of the deposits overlying the coal should be ascertained at several points over this leasehold before any scheme of winning a thick coal-seam is elaborated or begun." This has not been done, although the coal-seam is being opened out and won. "Merewether's Ocean Leasehold."—That (*vide* page 67) "referring to the contemplated winning of a thick coal-seam under all tidal waters or the ocean, they desire in concluding their report on the condition of collieries adjacent to Ferndale, to summarize briefly the points, that they as practical men, connected in their various capacities with mining pursuits, believe should be observed, viz. :—'That the most accurate and trustworthy information should be obtained, not only of the depth of water and character of the sea bottom, but (in collieries mining under the Delta) of the thickness and character of the deposits that overlie the rock; some of which, such as clay, it has been seen add so materially to the security and safety of the mines. From a sincere desire to ensure safety and security to mining works, the Commission, looking to the thickness of the strata overlying the coal-seam in the case of these leaseholds (ocean), where, it is probable, no surface deposits exist, and the rock itself may form the bed of the ocean, consider that, as the workings would be extended, so to speak, toward the unknown (although it may appear arbitrary, and to some extent may restrict operations), a minimum thickness of strata should, indeed must, intervene between the top of the coal and the bed of the ocean. In the case of the undoubted proof of plastic clay overlying the rock had due consideration should be given to that circumstance. To the north of Stockton the surface deposits are, so far as proven, of so ominous a nature that, unless carefully conducted operations reveal improved conditions, the Commission do not at present see any practicable method whereby mining operations can with safety be conducted under the ocean at that part of the district.' "The Commission are fully aware that, so far as they know, no restrictions such as these indicated have been as yet considered necessary in Great Britain or her Colonies, but they are likewise unaware of coal-mining being prosecuted under similar circumstances. The peculiar conditions of the coal-fields under consideration is, in their opinion, a justification for calling attention thus early to the sources from whence danger may be apprehended. The Coal Mines Regulation Act enforces certain precautions being observed approaching suspected danger. The Commission cannot distinguish any reason why these precautionary measures should not be extended with a view to avert danger from a source novel to Colonial coal-mining, and not contemplated when the Act of 1876 was passed."—J.M., 19/1/88. Under Secretary for Mines, B.C., 19/1/88.

The attention of the owners of the collieries or lands referred to may be invited to the portions of the report referred to, and they may be invited to show that the coal-seam proposed to be worked can be worked without danger.—H.W., 20/1/88.

Submitted. Approved. Nothing further should be done towards granting the leases until all the precautions recommended by the Commission and approved by the Examiner of Coal-fields have been attended to.—F.A., 23/1/88.

ADDITIONAL extracts to those previously referred to from the Royal Commissioners on Collieries Third Report on the condition of Collieries adjacent to Ferndale :—

Mr. Jos. Wood, one of the Directors, being asked by the President of Commission, "In what way has Bullock Island Colliery been laid out?" replied, "It is worked with 6-yard bords, leaving 8-yard pillars." And at question 2500, "Has any coal been left on in the roof?" "Yes; we never touch any of the roof coal at all."

Vide page 31.—Instead of driving bords 8 yards wide, and having pillars only 4 yards in thickness to support the weight of the superincumbent strata, the directors of this colliery (Wickham and Bullock Island) have adopted the rule of driving bords 6 yards wide, leaving pillars 8 yards in thickness.

Page 66.—The absence of any data as to the thickness of the surface deposits in the valley, especially towards the sea-coast, is of itself sufficient reason for the Commission to discourage any attempt to work coal—certainly eastward of the sea-beach—until most reliable information in this direction has been obtained.

Lessees, before commencing to work coal under the sea, should first obtain ample and unquestionable data, in order to enable them to form opinions and arrive at conclusions, so that their mining works can be laid out in a system evolved from a knowledge of the facts and calculated to ensure safety and inspire confidence.

From their inspection of the collieries embraced in this report, and the opinions or views of the numerous witnesses examined, the Commission have already, as the condition of each colliery was considered, expressed their views on the salient points that had a distinct and specific bearing upon their condition. And, having directed the attention of the several witnesses to the prospective scene of operations of those collieries that contemplate the mining of a thick coal-seam under tidal waters or the ocean, desire, in concluding their report "on the condition of the Collieries adjacent to Ferndale," to summarize briefly the points that they, as practical men connected in their various capacities with mining pursuits believed should be observed on the part of those whose duty it will be to conduct these operations.

The workings should be laid off systematically and conducted carefully, and the width of bords and thickness of pillars strictly adhered to; and any laxity or carelessness on the part of the workmen should be instantly met by the imposition of a suitable fine, and in the case of continued negligence, by some easily obtained and summary form of punishment.

In the case of collieries working under the conditions anticipated, the coal-workings should be accurately surveyed every term, and the coal taken out during the previous term represented by some conspicuous colour, and the dates of such surveys affixed in ink. Colliery plans should be a faithful and honest record of all faults and occurrences that are met within the mine; and the workings should be delineated on them as they are not as they were intended to be. They should also have delineated on them the leading surface or topographical features, and this applies equally to ocean leaseholds and those on the mainland.

In one road of every pair of "winning off" or loading headings or levels a bore should be kept going (say) 9 feet in advance, for the purpose of foretelling the presence of any fissure, open joint, or fault, or otherwise; and in the case of workings under the ocean all winning off heading or level should be driven at least 100 yards in advance of the working bords.

The width of the bords, and the area and arrangement of pillars, while they ought in all cases to be graduated to suit circumstances, such as depth, character of roof, floor, or particular conditions overhead—in the case of collieries working under the ocean at the limited depths referred to (and without reference to the ordinary circumstances that should regulate the width and thickness or area of bords and pillars), may fairly be considered in a special light. The impossibility of calculating the conditions of the superincumbent strata, and the forces that repose in the ocean, makes it necessary, in the opinion of the Commission, to increase the ordinary margin considered sufficient for the safety of a mine. As no attempt under these circumstances could be made to work out or recover pillars, it becomes necessary to consider the coal pillars as so much mineral won, or impossible to recover for this reason. The size of pillars must be such as to afford ample support after exposure to the crumbling effect of the air over many years.

The Commission are, therefore, of opinion that the thickness of pillars should be materially increased beyond that generally considered necessary in the district. The strength of these pillars may be increased by a judicious arrangement of cut-throughs and roads, so as to have as few roads intersecting or branching from a main road at one place as possible.

Zig-zagging pillars, with respect to cut-throughs, may be advisable. The width of bords in the district is 8 yards. In the case of collieries working under the above conditions this width would, in the opinion of the Commission, court disaster. The width of bords should be materially reduced, and the greatest care taken to secure the roof with timber. In these general opinions the Commission are supported by almost every witness who submitted himself for examination. While many of these gentlemen condescended upon specific widths of bords and thickness of pillars, the Commission prefer, in the absence of particular and detailed information, to enunciate general opinion only, and to repeat that while these should be graduated or fixed by a knowledge of all the circumstances, yet it might be advisable to state that in case of ocean leaseholds a minimum thickness of (say) 8 yards for pillars, or maximum width of 6 yards for bords, might be insisted upon, leaving the management free to exercise their discretion in altering these (by increasing the maximum thickness, or decreasing the minimum width), so as to increase the general safety.

Knowing the tendency that "faults" possess of weakening the roof, and of permitting the passage of water through the broken material that is frequently found along their line, or through open joints in their substance, it would be well in discovering a fault or fissure in a bore to take precautions against possible danger from this source before opening it up by the drive.

In the case of some of these ocean leaseholds it may be impossible; but when possible, the coal underlying the ocean should be attacked only after a large "goaf" has been made by extensive coal workings under the main land. This, in addition to special and unusual facilities being provided for the escape of men by the shafts, would afford a measure of security difficult to over-estimate.

In conclusion, I have only to add that there were 72 collieries under inspection, and that notices have been received of 8 new mines having been opened out, against 66 collieries under inspection in the preceding year, and 11 opening out; and that the year's returns show an increase in the Northern District of 65,676 tons of round and small coal raised, and £12,165 in value; in the Southern an increase of 5,738 tons, and £20,690 in value; and in the Western District of 21,908 tons, and £10,420 in value.

I have, &c.,

JOHN MACKENZIE, F.G.S.,
Examiner of Coal-fields.

The Half-yearly Report of the Inspector of Collieries on the state of the various Collieries in the Southern and Western Districts of the Colony of New South Wales, and Accidents therein for the half-year ending 31st December, 1887.

The Examiner of Coal-fields,—

Sir,

Wollongong, 7 February, 1888.

In compliance with the requirements of clause 26 in the "Coal Mines Regulation Act, 1876," I have the honor to transmit to you this my six-monthly report on the state of the various collieries for the half-year ending 31st December, 1887.

The total number of collieries under inspection in the Southern and Western Districts during the last six months is thirty. Five new collieries have been added to the number during the last six months, viz., Rawden Colliery (near Rylstone), the Vale Colliery (near Eskbank), Oakley Park Colliery (near Eskbank), Biggar's Prospecting mines (near Dapto), making in all thirty collieries.

Western District	14 coal-mines and 2 shale-mines.
Berrima " ..	2 " 1 shale-mine.
Southern " ..	11 " "
	—
	27 3 = 30 collieries.

PRESENT STATE OF MINES.

Osborne Wallsend Colliery.—About 110 men and horses employed underground, and supplied with 32,000 cubic feet of air per minute in three separate currents. The ventilation and number of men are about equally divided. During the last six months the colliery has been laid out so as to work the bords on the "double-stall" system. This system, if properly carried out with pack walls in the centre of the bords, is a decided advantage as regards the ventilation at the working faces, as the current passes straight up to the face of each bord. The Act in all respects complied with.

Mount Kembla Colliery.—About 170 men and horses are employed underground, with a total of 40,000 cubic feet of air per minute in four separate splits, each split supplied with a fresh current of air from the main intake, and not more men on each split than the Act allows. During the last six months the return air-ways have been shortened by erecting overcasts, which gives the return air a more direct course to the furnace. A new air shaft is being sunk 12 feet in diameter. About 11 chains from the face of the main headings the bottom of the shaft will reach the workings at a depth of 320 feet. The Act in all respects complied with.

Mount Pleasant Colliery.—About 96 men and horses employed underground. The total quantity of air introduced into the mine is about 27,000 cubic feet per minute in two separate splits. The ventilation is good throughout the colliery, and the bords, as a rule, are exceptionally well timbered. The Act in all respects complied with.

North Illawarra Colliery (No. 2 Tunnel).—About 140 men and horses employed underground. The total ventilating current introduced into the mine is about 30,000 cubic feet of air per minute, the same being divided into four separate splits. None of the splits are wrought with more men than is required by the Act. Each split of air is regulated by an overcast, doing away with doors on the main intake. A new air-shaft has been sunk about 100 yards west from the entrance of the tunnel. The shaft is 10 feet in diameter and 93 feet deep. The workings and shaft will be connected in about two months. The Act in all respects complied with.

North Illawarra (No. 1 Tunnel).—Four men employed prospecting, testing the thickness and quality of coal. The main headings are driven in a distance of 33 chains. The coal at the face of the heading measures about 3 feet 6 inches.

Broker's Nose Colliery.—Work has been suspended for the last six months.

Coal Cliff Colliery.—About 77 men and horses are employed underground, and supplied with 16,000 cubic feet of air per minute in two separate splits. During the last six months a new return air-way has been made on the north-west side of the tunnel, and the return on the south side has been shortened, which has greatly improved the ventilation throughout the colliery. The Act in all respects complied with.

South Bulli Colliery (Bellamba).—About 40 men are employed and served with 10,000 cubic feet of air per minute in one current. This current is well sustained through the colliery. The Act in other respects complied with.

South Cumberland Sinking Shaft.—The shaft is now sunk to a depth of 950 feet. The manager (Mr. Harper) intends to reach the seam at a depth of 1,050 feet. Three shifts of sinkers are employed, eight sinkers on each shift. The Act in all respects complied with.

Bulli Colliery (Hillend Division).—About 57 men, 4 wheelers, and 4 horses employed and served with 26,000 cubic feet of air per minute in two separate splits. The ventilation and number of men are about equally divided. The miners are working with locked safety lamps. All the narrow headings are kept bratticed up to within 3 yards of the working face. The ventilating currents are well sustained throughout the workings.

Western District (Bulli).—About 17 men, 2 wheelers, and 2 horses employed and served with 7,000 cubic feet of air per minute. The miners in this district are also working with locked safety lamps. The Act in all respects complied with.

Four-feet Seam (Bulli).—About 18 men, 2 boys, and 2 horses employed and served with 10,000 cubic feet of air in one current. The Act in all respects complied with.

P. Lahiff, mineral selection of 38 acres, near Mount Kembla Colliery.—A heading is broke away from the side of the mountain, 10 ft. wide, 6½ ft. high. The seam of coal is the top seam, and measures 3 ft. 7 in. at the heading face.

Biggar's Prospecting Mines are situated about 11 miles south-west from Wollongong. Three tunnels have been opened out on the face of the mountain. The No. 1 heading is driven in a distance of 40 yards. The coal at the face measures 27 in.; this seam is known as the top seam in the Illawarra district. No. 2 tunnel is about 20 ft. perpendicular under the top seam, and is driven in a distance of 40 yards. The coal at the face measures 27 in. high. No.

No. 3 Tunnel is 60 ft. under the second seam, and is driven in a distance of 10 yards into what is known as the 17 ft. seam, or "dirty seam." The coal at the face measures 7 ft. high, and is very soft and sooty, the upper portion of the seam being a series of bands and layers of coal.

Berrima District.

Australian Kerosene Oil Company's Shale Mines, Joadja.—No. 1 Tunnel:—24 men, 2 wheelers, and 2 horses employed, and served with 3,000 cubic feet of air per minute. No. 2 Tunnel:—20 men, 3 wheelers, and 1 horse, and supplied with 2,600 cubic feet of air per minute. No. 3 Tunnel:—7 men employed, and served with 2,000 cubic feet of air per minute.

The above tunnels are wrought on the Longwall system. The ventilation is brought in a straight line along the working faces. The colliery is in a healthy condition throughout. The Act in all respects complied with.

Great Southern Coal-mining Company (late Berrima).—About 8 men are employed, and served with 8,400 cubic feet of air per minute in one current. The Act in other respects complied with.

Mittagong Coal-mining Company.—Underground operations suspended until the surface tram-line is completed.

Western District.

Lithgow Valley Colliery.—About 60 men, 5 wheelers, and 5 horses are employed, and served with 23,000 cubic feet of air per minute in three separate splits; each current of air is brought well round to where the men are working.

The main intake air-course stoppings have been built with brick and lime, which is a decided improvement upon the former mode of building with slack. No complaint, and the Act in all respects complied with.

Eskbank Pit.—About 70 men and horses employed underground, and supplied with 20,000 cubic feet of air per minute in two separate splits. The intake and return air-ways and travelling road in good order. The Act in all respects carried out.

Eskbank Old Tunnel.—6 men employed, and served with 5,000 cubic feet of air per minute. The intake and return air-ways in good order. The Act in other respects complied with.

Main Camp (Hartley Vale).—12 men, 2 wheelers, and 2 horses employed underground. The total amount of ventilation introduced into the mine is 23,000 cubic feet per minute. The bords are well timbered. The Act in all respects complied with.

Retort Coal-mine (Hartley Vale).—1 men employed, and served with 4,000 cubic feet of air per minute. The Act in other respects complied with.

N.W.S. Shale Mines (Hartley Vale).—No. 3 Tunnel:—50 men and horses employed underground, and supplied with 13,500 cubic feet of air per minute in one current. The ventilating current is well sustained throughout the mine. The working faces and travelling road in good order.

Hartley Old Tunnel.—10 men employed taking out pillars, and served with 2,000 cubic feet of air per minute. The Act in all respects complied with.

Katoomba Colliery.—About 56 men employed, and supplied with 7,000 cubic feet of air per minute. The bords are well timbered. The intake and return air-ways in good order. The Act in other respects complied with.

Rawden Colliery (near Rylstone).—This is a new colliery, which has been opened up during the last six months. 8 men are employed underground, and served with 3,000 cubic feet of air per minute. The colliery is opened out on the same system as the others in the Western District, viz., the pillars and bord system. 2 men are driving the second way to the day, which will come out on the mountain side. Preparations are being made at the bottom of the air-shaft to build a furnace. The Act in all respects complied with.

Carlo's Gap Colliery.—2 men are employed and served with 1,000 cubic feet of air per minute. The Act in all respects complied with.

Zig-Zag Colliery.—About 36 men, 3 wheelers, and 3 horses employed, and supplied with 15,000 cubic feet of air per minute. The intake and return air-ways in good order. No complaint; the Act in all respects complied with.

The Vale Colliery.—This is a new colliery, which is being laid off at the bottom of the Zig-Zag. The shaft is situated north-east 60 chains from the Vale of Clwydd Colliery, and is sunk to a depth of 80 ft., 12 ft. by 7 ft. Mr. Turnbull, manager, intends to reach the seam of coal at a depth of about 200 feet.

Hermitage Colliery.—6 men are employed, and served with 13,960 cubic feet per minute. During the last six months all the air-stoppings on the main intake have been built with brick and lime, and a new ventilating furnace has been built. The Act in all respects complied with.

Oakey Park Sinking Shaft.—The shaft is being sunk at the bottom of the Great Zig-Zag, Western line, about 1 mile north-east from the Zig-Zag Colliery.

The shaft is 11 feet in diameter, and sunk to a depth of 128 feet. Three shifts of sinkers are employed in the twenty-four hours. The shaft is ventilated by means of a steam-jet. The Act in all respects, complied with.

Cooverwull Mine.—One man employed. There is a good current of air going through the tunnel. The Act is complied with.

ACCIDENTS IN MINES.

During the last six months ending 31st December, 1887, I have investigated four separate accidents included in this list.

The first non-fatal accident happened to a miner named Wm. Davidson, at North Illawarra Colliery on 16th August, who was slightly burned on the shoulder by a small quantity of firedamp in the roof on the main heading.

The second non-fatal accident happened at the Australian Kerosene Shale Mines (Joadja), on 5th September, to a miner named James Charles. The spine of his back was severely injured by a fall of stone from the roof.

The

The third non-fatal accident happened at North Illawarra Jetty on 22nd September to a carpenter named G. Pinch, his left arm and leg broken by falling over the jetty into the water, a distance of 22 feet.

The fatal accident happened to a miner named Allan M'Intyre on 3rd September at Mount Kembla Colliery, by a fall of stone from the roof; from the effects of the injuries received he died while the men were carrying him home. An inquest was held at Mount Kembla Colliery concerning the death of deceased. I attended the inquest and fully agree with the verdict of accidental death returned by the Jury.

I have also examined a few other accidents which were not of a serious nature, and are not included in this list.

The usual tabulated list of accidents is hereto appended.

I have, &c.,
JAMES ROWAN,
Inspector of Collieries.

TABULATED List of fatal and non-fatal Accidents in the Southern and Western Districts of New South Wales Collieries, investigated by the Inspector of Collieries during the half-year ending 31 December, 1887.

No.	Date.	Colliery.	Sufferer.	Occupation.	Remarks, &c., on the nature and extent of Injuries.	Burned on the shoulders by fire-damp.	Brained by a fall of stone.	Leg and arm broken falling from the jetty.	Fatal injuries by a stone falling from the roof.	Fatal.	Non-fatal.

The Half-yearly Report of the Inspectors of Collieries for the Northern District in New South Wales on the present state of the Collieries inspected by the said Inspectors during the six months ending 31st December, 1887.

The Examiner of Coal-fields, Sydney,—

Newcastle, 20 January, 1888.

Sir,

Pursuant to the provisions of clause 26 in the "Coal Mines Regulation Act 1876," we have the honor to transmit to you this our six-monthly report on the state of the various collieries in the Northern District for the half-year ending 31st December, 1887.

The total number of collieries under inspection in the Northern District during the term embraced in this report is forty-two.

Teralba and Lymington have not been worked during the term, and Dunkirk Colliery has been abandoned.

PRESENT STATE OF MINES.

A. A. Co.'s Colliery.—About 700 men, &c., are employed in this colliery on the day shift, and supplied with about 100,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts, and in none of the districts are there more men than the Act allows. The two new pits known as the sea-pits have both been sunk to the main seam of coal. Splendid winding machinery has been erected at the surface in connection with the main shaft, and the work of winning out has been commenced in the seam. The Act is complied with.

Wallsend Co.'s Colliery.—About 840 men, &c., are employed in this colliery during the day, and the total quantity of air introduced into the mine per minute is about 170,000 cubic feet. The number of districts and the number of men in each district are in accordance with the Act. The current of air, however, from the new Jubilee shaft, which supplies two districts of men, &c., is passed along a heading where inflammable gas is giving off and mixing with the intake current of air. The manager has been notified of this dangerous practice under the 25th section of the "Coal Mines Regulation Act of 1876."

Apart from this, the provisions of the Act are carried out.

Newcastle Coal Co.'s Colliery.—About 400 men, &c., are employed in this mine during the day time. The total quantity of air introduced into the mine per minute is about 80,000 cubic feet. The number of districts and the number of men in each district are in keeping with the provisions of the Act. The Act is complied with in other respects also.

Burwood Colliery.—About 270 men, &c., are employed in this mine during the day time, and the total quantity of air introduced into the mine per minute is about 80,000 cubic feet. The ventilation in this colliery has been more than doubled during the year, owing to increased furnace power. The face workings are divided into separate and distinct districts, according to the Act, and none of the districts are at present overcrowded. In other respects also the Act is complied with.

Lambton Colliery.—About 440 men, &c., are employed in this mine during the day, and about 80,000 cubic feet of air per minute is available for the several districts. The number of districts and the number of men in each district are in keeping with the provisions of the Act. The Act is complied with in other respects also.

Stockton.—About 240 men, &c., are employed in this mine during the day, and supplied with about 60,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts, but at the present time one of the districts is a little overcrowded. Arrangements are, however, being made to remedy this defect as speedily as possible. The Act is complied with in other respects.

Wickham and Bullock Island Colliery.—About 130 men, &c., are employed in this mine during the day, and supplied with about 15,000 cubic feet of air per minute. The workings are divided into two separate and distinct districts. Another shaft in connection with this colliery has been commenced during the six months. The work is being vigorously proceeded with, and when the shaft is sunk to the seam and a communication got with the present workings, it will doubtless prove of great benefit to the whole colliery. The Act is complied with in other respects also.

Co-operative

Co-operative Colliery.—About 360 men, &c., are employed in this mine during the day. The quantity of air now introduced into the mine per minute is about 80,000 cubic feet. During the last six months a large ventilating furnace has been completed, and is now in good working order. The beneficial results of this addition to the ventilating power have been felt throughout the whole of the workings, and the ventilation of this colliery at the present time is good. The districts and number of men in each district are in accordance with the provisions of the Act. The Act is also complied with in other matters.

Brown's Colliery.—There are about 220 men, &c., employed in this colliery on both shifts. The total quantity of air introduced into the mine is about 54,000 cubic feet per minute. The face districts are according to the Act. In the little tunnel there are about twenty-four men, &c., who are supplied with about 6,000 cubic feet of air per minute in one current. The Act in other respects is also complied with.

Duckenfield Colliery.—About 200 men, &c., are employed in this mine during the day time. The total quantity of air per minute introduced into the mine is about 45,000 cubic feet. The separate districts are in accordance with the provisions of the Act, and the Act in other respects also is complied with.

Maryville Colliery.—This colliery was under inspection during a portion of the six months; but for some months past all operations have been suspended. In the matter of the second opening to the day or surface the Act has not yet been complied with.

Ferndale Colliery.—About fifty men, &c., are now employed in this mine, and supplied with about 13,000 cubic feet of air per minute in one current. A second opening to the day or surface has been completed, and the Act is complied with in every respect.

Tighe's Hill Colliery.—This colliery was under inspection during a portion of the six months, but is now finally abandoned.

Pride of Ferndale.—Only about four men employed in this mine. The ventilation is good, and the Act complied with in other respects.

South Waratah Colliery.—About seventy men, &c., are employed in this mine on the day shift, and supplied with about 12,000 cubic feet of air per minute in one current. During the six months a communication has been got between the Charles and Flaggy Creek pits, a distance of about 96 chains. This work was splendidly performed from both pits, and reflects the highest credit on the colliery officials and workmen. Headings are being opened out as rapidly as possible, and in all probability this will soon become a large colliery. The Act is complied with in every respect.

Old Waratah.—Only about eight men, &c., now employed in the three tunnels. The ventilation is good, and the Act complied with in every respect.

Hill End Colliery.—Only a few men occasionally employed. Act complied with.

Goose Colliery.—About eight men, &c., employed in this mine. The ventilation is good, and the Act complied with.

New Duckenfield.—About thirty men, &c., are employed in the two mines in connection with this colliery. The ventilation is good, and the requirements of the Act carried out in every respect.

New Lambton B Pit.—Only about six men, &c., are now employed in this mine, being engaged in working pillars. The ventilation is good, and the Act complied with in other respects.

New Lambton C Pit.—About seventy men, &c., are employed in this mine on one shift, and are supplied with about 21,000 cubic feet of air per minute, in three separate currents. In the adit in connection with this colliery about thirty-eight men, &c., are employed, and supplied with about 7,000 cubic feet of air per minute. The Act is complied with in other respects also.

East Waratah Colliery.—Only about forty men, &c., are now employed in this mine, and supplied with about 11,000 cubic feet of air in one current. The Act in other respects also is complied with.

Hillside Colliery, Burwood.—Only about nine men, &c., employed in this mine. The provisions of the Act are complied with.

Brookstown Colliery.—About fourteen men, &c., are employed in this mine. The ventilation is good, and the Act complied with in other respects also.

Young Wallsend.—Sinking operations have again been commenced at this new winning. Only a few men at present employed. Everything satisfactory.

West Wallsend.—The main shaft in connection with this colliery was sunk to the coal during the first six months in the year. During the last six months a splendid winding-engine has been erected, and is working well. The pit head frame is of iron, and has the appearance of being strong. This head gear is a novelty in this Colony, and might be copied to advantage. The work of opening the seam at the bottom of the main shaft has been commenced, but not many persons are yet employed. The second shaft is now down to a considerable depth, and is being sunk as speedily as possible. The provisions of the Act are complied with.

Monkwearmouth.—The main seam of coal has been reached in this new winning during the six months, but operations are for the present suspended.

Clay Cross Colliery.—About fourteen men are employed in this mine on the day shift. The ventilation is satisfactory and the Act otherwise complied with.

Helton Colliery.—The coal has been reached at this colliery during the year. The winning places are being driven, in order to open out the underground workings. The winding engines and surface arrangements are in course of completion. Everything above and below seems to be in good order and secure, and the Act complied with in every respect.

Great Northern Colliery.—About fifty men are employed in this mine. The ventilation is good, and the Act complied with in other respects.

Northumberland Colliery.—During the six months sinking operations have been commenced with two shafts, each 17 feet in diameter. Considerable progress has been made during the time. The place is fitted up with the most modern appliances in the shape of machinery, &c., for sinking, and the surface is lighted by the electric light, and everything is of the most substantial character.

Rathluba Colliery.—There are four men employed in this mine, the ventilation is good, and the provisions of the Act carried out.

Thornley Colliery.—There are eight men employed in this mine. A new shaft has been sunk, and is now used for winding coal and also for ventilation. The ventilation is good, and the Act otherwise complied with.

Sunderland Colliery.—There are only two men employed at this mine. The ventilation is satisfactory, and the Act complied with.

Bloomfield

Bloomfield Colliery.—There are only two men employed at this mine. The ventilation is satisfactory, and the Act complied with.

Homeville Colliery.—About nineteen men, &c., are employed at this mine. The ventilation is good, and the Act complied with.

Anvil Creek Colliery.—There are about twelve men employed at this mine. The ventilation is satisfactory, and the Act complied with.

Greta Colliery.—In this colliery there are about 250 men, &c., employed on the day shift. The total quantity of air introduced into the mine per minute is about 30,000 cubic feet. The face workings are divided into five distinct splits, none of which are overcrowded. The requirements of the Act are complied with in other respects.

Ellesmere Colliery.—In this colliery there are about twenty-seven men, &c., employed. The ventilation is satisfactory, and the Act complied with in every respect.

New Park Colliery.—About fifteen men, &c., are employed in this mine. The ventilation is good, and the Act complied with in other matters.

Elliott's Colliery.—Only one man and a boy employed in this mine. The Act is complied with.

Rosedale Colliery.—There are only three men employed in this mine. No cause for complaint.

We have, &c.,

JOHN DIXON,

THOS. L. BATES,

Inspectors of Collieries.

The Examiner of Coal-fields, Sydney,—

Sir,

Glebeland, 18 January, 1888.

Pursuant to the provisions of clause 26 in the "Coal-mines Regulation Act, 1876," I have the honor to transmit to you this, my six-monthly report, on the accidents which have occurred in and about the various collieries in the Northern District for the half-year ending 31st December, 1887.

ACCIDENTS IN MINE.

THE accidents investigated by me in the Northern District during the six months ending 31st December, 1887, are forty in number, twenty-seven of which I fully reported on at the time, and thirteen minor accidents, which were not at all serious, and on which I did not write full reports.

Of the twenty-seven accidents in the annexed tabulated list, five proved fatal—three by falls of coal, and two by blows from props.

Some of the non-fatal accidents were of a serious nature; others, however, were not so serious as was at first anticipated.

The first of the fatal accidents happened to a miner named George Carter, by a blow from a prop, in the Stockton Colliery, on 5th July last. The District Coroner, G. E. Martin, Esq., J.P., held an inquest on the body of deceased at Stockton, on the day following the accident. I was present at the inquest and heard all the evidence, and fully agree with the verdict of "accidental death," as returned by the jury.

The second fatal accident happened to a miner named Abraham Griffiths, by a fall of coal, in the Co-operative Colliery, on 4th August last. The injuries in this case did not prove fatal at the time, but the poor sufferer lingered for ten days after receiving the accident, and expired on 14th day of same month. On the 15th of same month the District Coroner held an inquest on the body of deceased at Plattsburg. I attended the inquest, and fully agree with the verdict of "accidental death."

The third fatal accident happened to a miner named Enoch Smith, by a fall of coal in the A.A. Co.'s Colliery on 28th September last. On the day following the accident the District Coroner held an inquest on the body of deceased at the Glebe. I was present at the inquest and fully agree with the verdict of "accidental death," as returned by the jury.

The fourth fatal accident happened to a miner named John Wilson, by a fall of coal in the Burwood Colliery on 7th November. On the following day the District Coroner held an inquest on the body of deceased at the Burwood Junction. I attended the inquest and heard all the evidence, and fully agree with the verdict of "accidental death."

The fifth fatal accident happened to a miner named Thomas Morgan, by a blow from a prop in the Burwood Colliery on 19th December last. On the day following the accident the District Coroner held an inquest on the body of deceased, in Burwood. This inquest I also attended, and fully agree with the verdict of "accidental death."

The first of the non-fatal accidents happened to a miner named John Fogo, by a fall of coal in the Co-operative Colliery, on 12th July last, and resulted in leg fracture.

The second non-fatal accident happened to a surface labourer named Robert Kyle, at the Northumberland Colliery, on 26th July, by a fall of clay, and resulted in leg fracture.

The third was a leg fracture to a driver-boy named George Lonsdale, by a fall from a horse at Brown's Colliery on 3rd August.

The fourth resulted in serious injuries to a miner named Thomas Gregory, by a fall of coal in the Wallsend Colliery on 9th August.

The fifth happened to a miner named George Hall, by the explosion of a shot in the Wallsend Colliery, on 17th August, and resulted in very severe burns to face and neck.

The sixth happened to a miner named William Reid, by a fall of morgan in the A.A. Co.'s Colliery on 31st August, and resulted in very severe injuries to head.

The seventh resulted in compound fracture of leg to a miner named John Oswald, by a fall of coal in the A.A. Co.'s Colliery on 2nd September.

The eighth was fracture of arm and injury to hip, to a miner named John Morris, by a fall of coal in the Burwood Colliery on 30th September.

The ninth resulted in severe internal injuries to a miner named John Poole, by a fall of coal in the Greta Colliery on 1st October.

The tenth was a fracture of ribs to a miner named John Cook, by a fall from a canch (or bench) of coal in the Wallsend Colliery on 3rd October.

The

The eleventh happened to a miner named William Bradley, by a fall of coal in the Wallsend Colliery, on 4th October, and resulted in severe injuries to head and neck.

The twelfth was fracture of arm and other injuries to a miner named Nathaniel Rowbottom, by a blow from a prop in the Wallsend Colliery on 4th October.

The thirteenth resulted in internal and other injuries to a surface labourer named James Oak, by being squeezed between a chain and the buffer of a wagon, at the Co-operative Colliery on 28th October.

The fourteenth happened to a miner named John Jones, by a fall of stone in the Burwood Colliery on 18th November, and resulted in severe injuries to head, face, and one hip.

The fifteenth was a thigh fracture to a miner named Joseph Fraser, by a fall of coal in the A.A. Co.'s Colliery on 22nd November.

The sixteenth was also a thigh fracture to a shiftman named William Thomas, by a runaway loaded skip in the A.A. Co.'s Colliery on 23rd November.

The seventeenth resulted in thigh fracture to a wheeler named William Jeffrey, by a loaded skip in the South Waratah Colliery on 23rd November.

The eighteenth happened to a miner named James Overton, by a fall of coal in the A.A. Co.'s Colliery on 26th November, and resulted in thigh fracture.

The nineteenth resulted in fracture of hip-bone to a miner named Thomas Evans, by a fall of coal in the A.A. Co.'s Colliery on 29th November.

The twentieth resulted in very severe injuries to head, face, and arms, to a miner named Enos Bateman, by coal blown from a shot in the Greta Colliery on 30th November.

The twenty-first resulted in a very severe fracture of thigh bone, and deep flesh wound, to a miner named Thomas Hammond, by a fall of coal in the Duckenfield Colliery on 12th December.

The twenty-second, and last non-fatal accident, happened to a miner named Andrew M'Lauchlan, by a fall of coal in the Co-operative Colliery on 13th December last, and resulted in leg fracture.

The usual tabulated list of accidents is hereto appended.

I have, &c.,
JOHN DIXON,
 Inspector of Collieries.

TABULATED LIST of fatal and non-fatal Accidents in the Northern Collieries of New South Wales, investigated by Inspector Dixon, during the half-year ending 31st December, 1887.

GEOLOGICAL SURVEY OF NEW SOUTH WALES.

Report of Progress for 1887 by the Geological Surveyor in charge.

The Under Secretary for Mines,—

Sir,

I have the honor to submit the following report of progress of the Geological Survey Branch.

With the Examiner of Coal-fields I inspected the country lying east of the Great Northern Railway line, between Sydney harbour and the Hawkesbury River, in reference to applications to mine for coal under reserves in that district.

This country consists of the Hawkesbury sandstone formation, which is about 1,000 feet in its greatest thickness, and has been eroded into numerous precipitous rocky ravines and valleys, the deepest of which is 700 feet to sea-level.

We are of opinion that the measures in which the workable coal-seams of New South Wales occur will not be reached within a depth of 1,500 feet below sea-level, or within at least 2,200 feet below the level of the Great Northern Railway line, between the 20th and 27th mile-pegs. The places where the Coal Measures are likely to come nearest to the surface are at the head of the salt-water portions of M'Garr's Creek, Narrabeen Creek, and Cowan Creek—in other words, these are the most favourable places for boring to ascertain at what depth the coal-seams actually occur. It is, of course, impossible to state with certainty what this depth may be, for there is no evidence revealing the extent of disturbance or upheaval of the Coal Measures prior to their being overlaid by the Narrabeen shale-beds and Hawkesbury formation. It is only by actual test by boring that the question can be determined.

Mr. Coghlan's bore at Narrabeen is said to have attained a depth of 1,998 feet without meeting a workable coal-seam.

At Pittwater the Hawkesbury formation is seen resting on the Narrabeen shale-beds at a few feet above sea-level.

After inspecting the Jenolan Caves with Mr. E. C. Cracknell, Superintendent of Telegraphs, for the purpose of arranging for the lighting of the caves by electricity, I proceeded to the Inverell District, accompanied by Mr. Anderson, Geological Surveyor, and examined the diamond-bearing formations at Cope's Creek. My progress report, with maps of the country on the south side of the creek, is given in Appendix No. 1.

The examination of the deposits on the north side of Cope's Creek, and also of those in the Bingera diamond-field, was continued by Mr. Anderson, whose reports and maps form Appendices Nos. 8 and 9 herewith.

The original matrix of the diamond in this country has not yet been conclusively ascertained. The Tertiary drifts are the oldest deposits in which the diamond has been found. Based upon this fact, an opinion was some years ago expressed by myself and others that the diamond may have been formed chemically in those drifts. Extended observations in the diamond-bearing districts would, however, lead me to suggest that if the Tertiary drifts be not the original matrix of the diamond, possibly its source may be in the metamorphosed Carboniferous or Devonian beds, where these have been intruded by granites and porphyries. Evidence of carbonaceous rocks having been subjected to great heat and pressure is presented in the rocks quarried for road metal at Pennant Hills, near Parramatta. If such conditions be favourable for the occurrence of the diamond, this locality should be prospected.

I visited the gold-fields in the Albert District in company with yourself and Mr. Slee, the Inspector of Mines, as members of the Prospecting Board, to inquire into the applications for aid out of the Government Prospecting Vote. These gold-fields lie within two areas, consisting of rocky ranges of slate formation, surrounded by undulating—nearly level plains—country of the Cretaceous formation. One of these areas, of about 22 square miles, extends from Mount Browne, where the principal diggings are, northerly for 11 miles to Depot Glen, 2 miles south of Mount Poole. It was in the deep gorge, where the Evelyn Creek has eroded its channel through the slate formation, that gold was first discovered in this district. The Mount Browne Ranges are composed chiefly of altered Silurian slates traversed by numerous quartz-reefs. Gold has been found in the shallow alluvial deposits, and from these traced down in payable quantity into the Cretaceous gravel beds to a depth of about 220 feet until further work has been stopped by the heavy influx of water. These gravel beds once formed the beach of the Cretaceous ocean, and where they have been deposited in hollows of the slate bed-rock along the old shore line no doubt payable gold-bearing deposits will be found; but from their mode of deposition they must necessarily be of a patchy nature. The second area, comprising about 109 square miles, commences 2½ miles north-east of Mount Poole, and after extending northerly for about 11 miles, forming the Whittabreena Ranges, turns in a north-easterly direction for 12 miles to the Granite Diggings, which are so named on account of the formation being granite, on which rich shallow alluvial deposits have been worked. The gold is chiefly of scaly character—"granite gold"—but nuggets up to 7 oz. in weight have been found on the granite bed-rock.

The township of Tibooburra, which is, by aneroid observation, 650 feet above sea-level, is situated on this granitic area. Within about 2 miles from the town, on the north-east and south sides, the great Cretaceous plains commence, in which artesian water is likely to be found by boring. About 3 miles north from Tibooburra a well, known as Scott's Well, has been sunk about 200 feet through Cretaceous sandstones and blue clay, and a good supply of water rises 60 feet in it. A Chinaman's garden alongside this well affords evidence, in the splendid growth of cabbages, carrots, onions, &c., of the success attending irrigation of the soil in this climate.

It is probable that if this well were sunk deeper water would be obtained which would rise to the surface. The Prospecting Board decided to recommend that several bores be put down in the Cretaceous formation, as near as possible to the diggings, with the view of obtaining an artesian supply for mining purposes, for, owing to the small rainfall and great evaporation, water conserved in tanks or dams cannot be depended upon.

The Whittabreena Reef, which is almost in the centre of the slate country, has been worked to a depth of 200 feet; it strikes N. 22° W., and varies from 6 inches to 2 feet wide. The mine is now idle, but particulars regarding it are given in the Annual Reports of the Department for the years 1882-4, by Mr. W. H. J. Slee, who was then Warden of this gold-field.

There

There are numerous quartz-reefs throughout the slate and granite areas, and it is probable that many of them will be found payable. But I am of opinion that much of the fine sealy gold, especially that obtained in the alluvial at Nuggoty Creek, has been derived from pyritous slates, it having been formed in the cleavage planes and joints of the slates. Further description of this locality will be found in my paper on the Geology of the Albert Gold-fields, to be published in the Records of the Geological Survey.

The great area of the palæozoic formations extends to about 7 miles north of Pack-saddle Station, where it consists of altered clay slates, traversed by quartz-reefs, which appear to be favourable for the occurrence of gold, copper, &c., and deserve the attention of prospectors.

North of this point to the Mount Browne slate ranges the formation is the Cretaceous, with a large depression near the centre, forming Lake Cobham, 360 feet above sea-level, which receives the drainage of a large extent of the surrounding country. This tract of country has been more or less furrowed into hollows by denudation; and in the hollows have accumulated fluvial deposits of sandy clays and gravels of the Pleistocene Age, while many sand ridges have been formed here and there by wind action. These ridges usually extend about east and west, and, like the waves of the sea, have been formed at right angles to the direction of the prevailing winds. Over nearly the whole of this vast Cretaceous area artesian water may be obtained by boring, and gold and other mineral deposits are likely to be discovered in the Palæozoic areas, so that this portion of New South Wales will probably become one of great mining importance.

Returning from the Mount Browne Gold-fields, and accompanied by Mr. Slec, I examined the ironstone lodes near Corona. In my report upon this district in 1884 I referred to the occurrence of a large ironstone lode about 1 mile west from Mr. Patterson's Corona Station. A sample which I then took from the surface of the lode gave an assay at the rate of 1 oz. 12½ dwt. of silver per ton, and a trace of gold. A shaft has since been sunk into it to a depth of about 30 feet, and a cross-course driven showing the lode to consist chiefly of soft ferruginous clay rubble; an average sample of this yielded neither gold nor silver; and another sample of the harder gossan assayed at the rate of 58 oz. 5 dwt. 2 gr. of silver per ton, and gold a trace.

At intervals, for about 8 miles to the south, occur many other similar gossan lodes, some cropping out at the surface for only a few feet, others for more than 100 feet in length; occasionally they contain quartz. In Hobbs's lease, within a width of 10 chains, are several ironstone lodes, one 130 ft. wide, and a shaft has been sunk, 60 ft. deep, in hard and soft clayey lodestuff. Seven miles south from Corona another lode (Horsen's), from 20 to 30 ft. wide, has been sunk upon, to a depth of 60 ft., in black and brown talcose ironstone, with irregular quartz-veins through it. About 1 mile further south is Horan's gossan lode, which is over 300 ft. long, and 25 feet wide. The north shaft on this lode is 60 ft. deep; a sample taken from it assayed at the rate of gold a trace and silver a trace.

The general direction of the belt traversed by these lodes is about N.N.W., and the ferro-manganese lodes 9 miles N.N.W. from Corona, mentioned in my previous report, are probably within the continuation of the same belt. From Corona, northerly along the main road, several manganese and ironstone lodes may be seen, and one, about 8 miles from the station, on the west side of the road, and between the road and the Out Station well, crops out above the surface in large masses of gossan; this should be prospected. About 12 miles further, in a northerly direction, the slate formation is traversed by an immense quartzite lode, varying in width from a few feet up to 200 feet, and dipping W. 5° S. at 45°. Its rocky outcrop, resembling a broken stone wall, may be seen for about 2½ miles. Mr. Harvey Patterson, of Corona, has had a shaft sunk upon it to a depth of 60 feet without obtaining payable results. Near its southern end some small gossan lodes occur, with beds of limestone. Numerous quartz reefs occur in the locality, but about 1 mile to the east of the great quartzite lode the slate formation is overlaid by the Cretaceous gravels and clays.

It is probable that in places along the margin of the Cretaceous formation, where the gravel beds rest upon the slate formation, payable gold-bearing deposits will be found, as in the Mount Browne Gold-field. Gold is said to have been found in the Coco Mountains, which lie in a northerly direction from 5 to 10 miles from this place.

I also inspected the principal tin-bearing lodes found at Caloola, Euriowie, and Wankeroo, in the Barrier Ranges. These so-called lodes are intrusive dykes of granite in the slate formation, and, with the exception of a few, the tin ore is too much scattered through the dyke stone to allow the ground to be systematically mined by large companies; nevertheless, by tributors, or small parties of miners whose labour is their capital, a large quantity of tin ore will be raised and exported from this field. My report on these tin lodes, with remarks on the Broken Hill and other lodes, is given in Appendix No. 2.

Garnets of good colour for jewellery purposes are found in some abundance at Corona, Poolamaca, Silverton, and other places. On account of the slight bluish-red colour which some of the garnets exhibit they have been mistaken for rubies. After returning from the Barrier Ranges the Prospecting Board proceeded, via Dubbo, to the Byerock District. It may be of interest to record the following observations upon the character of the country traversed:—At Dubbo the river flows through alluvial (Recent and Pleistocene) deposits. One mile west, on the north side of the railway line, the country becomes hilly; about 50 chains further, at the 280.30 mile-post, a belt of basalt, 10 chains wide, crosses the line; then there is half a mile of red sandy Tertiary beds, which crop out from under the basalt. Again, we have a strip of basalt 20 chains wide; then sandy country for three quarters of a mile, where red, yellow, and gray sandy beds rest on Hawkesbury false-bedded sandstones, which continue for 5 miles to Manoa; but at the 284.20 mile stake occurs a massive outcrop of ironstone, whether as a dyke or a superficial deposit I could not determine in passing by in the train. For about a mile from Manoa granite occurs; then for 1½ miles sandstone and sandy flats, when granite again comes to the surface for 2½ miles, succeeded by sandy flats 2 miles. Here Silurian purple and gray sandstones appear, dipping about N.N.W. at 60° for 30 chains. The next 103½ miles consists of Pleistocene sandy alluvial flat country, covered with forests in places, and open myall plains in others. One of these plains, at Trangie saw-mills, affords fertile loamy soil, under which water may be got by sinking, as will probably be the case over much of this flat country. The Cretaceous formation evidently extends under Trangie Plains. At 398 miles, low Silurian slate ridges commence, and, with occasional red loamy flats, continue to Girilambone, 1 mile west of which the slate hills rise to a height of 150 ft. The Girilambone copper lode is in these

hills.

hills. At 406½ miles the Silurian rocks are seen to be intersected by quite a network of small quartz-veins. This slate country extends to Byerock, near which, as well as at Coolabah, the Silurian rocks are overlaid by patches of Cretaceous indurated ferruginous nodular clays and pebble beds. At Coolabah some prospecting shafts have been sunk over 100 ft. in these beds, and a little gold obtained. (*See Mr. W. Anderson's Report, Appendix No. 12.*)

The elevation of this country is about 740 feet above sea-level, which is about the level of the uppermost Cretaceous beds in the Mount Browne and Silverton Districts. This is probably the southern margin of the great Cretaceous formation, an inlet from which may come up the valley of the Bogan and pass under the low country about Trangie. Doubtless Cretaceous fossils, saurians, &c., will be found in this district.

A remarkable waterhole 8 feet deep and 12 feet in diameter occurs in granite rock half a mile west of Byerock. It is from this rock that the town is so named. The hole is on the line of a joint which runs W. 30° W. The granite is coarse-grained with black mica (Biotite), and encloses angular masses of all sizes of other rocks, chiefly porphyry, which the granite probably picked up from older rocks through which it was intruded. These enclosed masses of rock are generally fine-grained, and the exposed surfaces of some have been smoothed by the natives sharpening their tomahawks on them.

For about 4 miles E. of Byerock the surface is flat, and composed of red loamy sand-soil; then a patch of granite outcrops, and beyond, for the next 8 miles, Silurian fine-grained sandstones and contorted clay slates with quartz-veins occur. At 12-13 miles there are some large beds of Silurian quartzite with quartz-reefs. There are occasionally patches of Cretaceous gravels, chiefly of angular and rounded quartz pebbles. In one patch near De Foe's dam several shafts have been sunk, the deepest being 52 feet, and a few specks of gold obtained. It is proposed to further prospect this ground in an alluvial flat, which has received the drainage from the Cretaceous and Silurian formations.

About 2 miles west of Byerock the Mulga Creek flows through an alluvial flat half a mile wide.

A shaft has been sunk here 60 feet deep in the Pleistocene gravels and red loamy clays without reaching the bed-rock. As this broad alluvial flat drains a large extent of Silurian and granite formations, overlaid in places by Cretaceous gravels, it should be prospected for a deep lead.

From Byerock the Prospecting Board proceeded to Ironbarks, Orange, Molong, The Forest, Wattle Flat, Sofala, Hill End, Tambaroora, Hargraves, Mudgee, Gulgong, Parkes, Forbes, Pinnacles, and Grenfell, and dealt with the several applications for aid to prospect reefs and alluvial deposits in those districts.

When visiting the Gulgong District I inspected the antimony lodes at Ford's Creek, near Gulgong, and also the newly-discovered gossan lodes, containing gold, silver, and lead, at Denison Town. My reports on these lodes are given in Appendices No. 3 and No. 4 respectively.

Mr. David, Geological Surveyor, proceeded to Warren and reported upon the discovery of the supposed diamonds, which he found to be quartz of no value. He witnessed, together with the Superintendent of Drills, Mr. Slec, the boring by diamond drill through the second seam of coal, 5 feet 3 inches thick, at a depth of 2,301 feet below the surface, at Holt-Sutherland. A detailed description of this coal discovery will be found in Appendix No. 6.

When submitting Mr. David's report, I wrote the following remarks:—"In this bore, a depth of 2,307 feet from the surface, or 2,175 feet below sea-level, has been attained; this is therefore the deepest diamond-drill bore in Australia. Mr. W. H. J. Slec, the Superintendent of Drills, informs me that the diameter of the bore to a depth of 500 feet is 3½ inches, and below that depth it is 3 inches. The strata passed through consist of Hawkesbury sandstone formation, 653 feet 6 inches.

	ft.	in.
Shales, sandstones, and conglomerates; the upper 314 feet, consisting chiefly of chocolate-coloured shales	1,573	3
Upper seam of coal.....	4	2
Shales, sandstone, and conglomerate	65	0
Lower seam of coal.....	5	3
Black shales.....	5	11
Total.....	2,307	1

From the first 1,003 feet bored, 94.05 per cent. of core was obtained, and of the remaining 1,304 feet the percentage was 97.54, which is evidence of the efficiency of the boring at that great depth.

The seams of coal are evidently the continuation of the Coal Cliff or Bulli seams, and the same that were pierced in the bore at Mt. Westmacott, near the Waterfalls Railway Station. The coal is also of the same semi-bituminous and splint character as that of the Bulli seams.

Whether the slight thinning out which the seams here show be merely local can only be determined, as Mr. David has pointed out, by putting down at least one more bore in the locality. It is very important that this question should be solved, owing to the proximity of the land to the metropolis.

The discovery of cupriferous shales between 1,729 feet and 1,800 feet from the surface is of interest, and should lead to further search for payable deposits. From their position in the formation these shales should be exposed at the surface, below the Hawkesbury sandstones, on the face of the Illawarra coast-range from a few miles north from Coal Cliff southerly to near Wollongong.

I had several samples of this cupriferous shale assayed, with the following results (Nos. 2 to 7 were not assayed for copper):—

No.	1	yielded at the rate of	0.21	per cent. of copper.
"	2	"	8 dwt.	1 gr. of silver per ton, with trace of gold.
"	3	"	3	" 23 "
"	4	"	5	" 21 "
"	5	"	4	" 13 "
"	6	"	13	" 1 "
"	7	"	7	" 20 "

In future borings through this formation attention should be given to these copper-bearing beds, as they probably extend under a large area in the counties of Cumberland, Camden, Cook, and Northumberland, and may in places contain payable metalliferous strata. The rock immediately below them, in the Holt-Sutherland bore, has been ascertained, by microscopic examination by Mr. Geological-Surveyor Anderson, to be a volcanic tufa. It may, therefore, have had some connection with eruption of the old igneous rocks in the Kiama District, which contain native copper, and from which it is believed the fine alluvial gold found near Shellharbour has been derived. Mr.

Mr. David, with Mr. G. A. Stonier, Field Assistant, has chiefly been engaged upon a geological survey of an area of 50 square miles in the Maitland District, where the Middle and Lower Coal Measures are well developed. In carrying out this survey, Mr. David has not only discovered a valuable seam of coal at Deep Creek, but has ascertained that the seam of coal which was struck in the diamond-drill bore at East Maitland is one below those already worked in the East Maitland collieries. In consequence of this discovery the seam is now being opened at Rathlaba. A geological map showing the position of the several coal-seams will soon be ready for publication. Under Mr. David's supervision, sections of the principal igneous rocks of New South Wales, especially of those associated with the occurrence of gold-bearing reefs, are being prepared for microscopic examination.

Mr. W. Anderson, Geological Surveyor, during the early part of the year, was engaged (*see Appendix No. 7*) upon an examination of the diamantiferous deposits in the Inverell and Bingera Districts. His reports, with maps, are herewith appended (*Appendices Nos. 8 and 9*.) From these it will be seen that there is a large extent of diamond-bearing drifts, a very small portion of which has as yet been worked. According to returns furnished by some of the mining managers it appears that upwards of 50,000 diamonds have already been obtained; they are chiefly under half a carat in weight, with some ranging up to nearly 3 carats. I have no doubt that diamond-mining in these districts, if carried out on a large scale, will become a profitable industry.

Mr. Anderson's report on the seam of coal struck in the diamond-drill bore at Mittagong is given in Appendix No. 10.

His report on the limestone deposits at Lewis Ponds will be found in Appendix No. 11.

He also proceeded to Captain's Flat and inspected certain lands, which he recommended should be reserved for mining purposes, on account of the promising future awaiting the development of the gold and silver bearing lodes in that locality.

In August, Mr. Anderson visited the Wellington Caves, and reported as to certain improvements being made in the caves. From here he went to the Byerock District and made a geological examination of that locality, more especially in reference to the occurrence of auriferous formations, which he has described in Appendix No. 12.

After spending some time in working at rock-sections, he proceeded to Nyngan, and examined the country between that town and Nymagee, Cobar, and Girilambone. (*See Appendix No. 13*.)

Mr. Robert Etheridge, jun., who had been appointed through the Agent-General in England, arrived in Sydney on 18th of April, and at once entered upon his duties as Palæontologist to the Geological Survey of New South Wales and to the Australian Museum. Now that we have the advantage of the services of a gentleman of such high repute in his special field of palæontological research, I trust that we shall soon be in a position to publish his investigations of the ancient life history of this portion of the world. Mr. Etheridge has made a preliminary classification of our principal collections of fossils, upon which he has furnished several reports (*vide Appendices Nos. 14 and 15*), and he is at present engaged upon the examination of the carboniferous fauna from the Lower Coal Measures. The first part of his work is now ready for the press, and will be published in the Memoirs of the Geological Survey of New South Wales.

Mr. J. E. Carne, Curator of the Mining and Geological Museum, has very ably performed his duties. But for his unremitting energy it would have been impossible without extra assistance to have dealt with the increasing work connected with the examination of numerous mineral samples sent to the Department for assay and analysis. During the year 2,178 mineral samples were assayed, and these were chiefly made for parties engaged upon prospecting newly discovered or unworked deposits.

According to Mr. Carne's report (*see Appendix No. 16*), 20,770 specimens have been registered for the Museum collection, only a portion of which can at present be displayed in the Museum, owing to the limited amount of space available. More accommodation for our valuable collections is greatly needed, to enable this useful and important branch of the Department to afford that valuable aid which it is capable of rendering in the development of the immense mineral resources of the Colony. By direction of the Honorable the Minister for Mines, the Museum was opened to the public on the 19th December, and it has been visited by many persons seeking information and guidance upon mining matters. The Library has acquired many valuable works of reference upon geology, palæontology, and mining.

This Department having undertaken, at the request of the Commission for the Adelaide Jubilee Exhibition, to arrange for the display of the mineral exhibits from this Colony, Mr. Carne was deputed to proceed to Adelaide to carry out the arrangements, and this he effected in a very satisfactory manner.

The Department of Mines received thirteen 1st awards for minerals and geological maps, together with eight 1st awards and one second for 2nd and other forestry exhibits.

The assay work of the Department is now performed in the laboratory at the head office, and is conducted by Mr. J. C. A. Mingaye, F.C.S., who was formerly assistant to the Government Analyst, and was transferred to this Department on the 1st March. His duties have been very heavy, owing to the large number of mineral samples submitted for assay and analysis. His report herewith (*Appendix No. 17*) shows the large amount of useful work that has been done, which reflects much credit upon Mr. Mingaye and his assistants, especially as the work has so considerably increased of late that the laboratory accommodation is insufficient for it. I trust that arrangements which are now being made for providing a new laboratory will soon be completed, for at present, owing to the numerous mineral samples submitted, a period of ten days or more has sometimes to elapse before results of assays can be made known.

Being deprived of Mr. H. T. Wilkinson's services for about one month in each quarter, on account of his having to visit Lord Howe and Norfolk Islands, caused some temporary inconvenience, which, however, was lessened by the ready help of Mr. A. H. Taylor, the assistant clerk, who is a very able young officer.

The Geological Collector, Mr. Charles Cullen, has assisted in the sorting of the fossil collections for the Palæontologist, and in packing, &c., the collections of minerals for the Adelaide Exhibition. But during the latter part of the year he has been engaged upon the collection of fossil bones from a remarkable deposit in an old "mud-spring" on the Myall Creek Station, on the property of Mr. M'Donald, who kindly granted permission for the removal of the bones. Mr. Cullen has obtained a very valuable collection of these interesting fossils of the Pleistocene period. They will be fully reported on when they arrive in Sydney. The process of exhuming them has been a difficult one, as the bones are in a fragile condition; and much credit is due to Mr. Cullen for the enthusiastic energy and the careful manner in which he has carried out the exploration of this fossiliferous deposit.

Mr.

Mr. David's geological report upon the stanniferous formations has been issued from the Government Printing Office, and forms a valuable work of reference. I am glad to report that Baron C. Ettingshausen's English translation in manuscript of his work on the Tertiary Flora of New England has been received, and is now in the printer's hands. This work will form an important addition to the palaeontological literature of Australia; and our thanks are specially due to the Baron for this valuable contribution to science.

Mr. R. Etheridge, jun., has undertaken to edit the palaeontological publications of this Department.

Additional improvements have been made during the year to the Jenolan Caves. A newly-discovered cavern has been opened; and the electric lighting of the Imperial Cave has been effected under the direction of Mr. E. C. Cracknell, Superintendent of Telegraphs, who has always manifested much interest in the matter. It is proposed to extend this system of lighting to some of the other caverns; and a turbine wheel is about to be erected at one of the waterfalls on the creek near the caves, for obtaining the motive power for driving the electro-dynamo machine. A pump or hydraulic ram will also be fixed for pumping water to the cave house, and for fountains for improving the scenery about the cave grounds. The number of visitors during the year to the Jenolan Caves was 1,082; to the Wellington Caves, 876; and to the Wombeyan Caves, 152. A caretaker, James Murray, has been appointed to the charge of the Yarrangobilly Caves, where an accommodation house is in course of erection. Plans have also been prepared for the erection of a house shortly at the Wombeyan Caves. As soon as arrangements can be made, I purpose having a further exploration carried out in the Abercrombie Caves, where I formerly discovered some narrow passages not yet explored, which were inhabited by wombats. It is probable that fossil remains will be found in the red earth forming the floors of some of the caves.

APPENDIX No. 1.

Geological Examination of the Diamond-bearing Formations in the Inverell District.

Sir,

Inverell, 31 January, 1887.

In accordance with your instructions that a geological examination should be made of the diamond-bearing formations of this district, I have the honor to submit the following progress report.

Last week, assisted by Mr. Geological Surveyor Anderson, I examined and mapped out the extent of the diamond-bearing formations on the south side of Cope's Creek, where the Round Mount, Crown Jewel, Kohinoor, Red Hill, and Collas Hill diamond mines are situated.

The diamond-mines occur in old Tertiary river drifts, and in the more recent drifts derived from them. The former were once, and are partly still-covered by basalt, which in a molten state flowed down the ancient valleys and filled up the river channels. But the enormous denudation that has since eroded the present deep valleys has swept away considerable portions both of the lava streams and of the old river deposits beneath them, leaving the remnants here and there in disconnected patches resting on the older granite and altered sedimentary rocks. It is in one of these isolated patches that the above-mentioned Companies, with the exception of that at Collas Hill, are working, by sinking and tunnelling. The deposits are extensive, and have not yet been thoroughly prospected; the wash-dirt is from a few inches to 5 feet in thickness, and has yielded on an average from 2 to nearly 4 carats per load, averaging about four or five diamonds to the carat, though diamonds between 2 and 3 carats in weight each have been found.

The returns kindly furnished me by mining managers show that about 23,000 diamonds, weighing 5,151 carats, have been obtained during the last twelve months. The Round Mount Company having washed 722 loads, yielding diamonds weighing 2,685 carats, or 3.7 carats per load. From the Crown Jewel mine, the owner, Mr. W. Brown, obtained 291 diamonds, weighing 122½ carats, in addition to 152 carats, of which the number of diamonds was not ascertained. During my visit Mr. Henderson, manager of the Sydney Company's Red Hill mine, washed 19½ loads for a yield of 205 diamonds, weighing 42 carats.

It will thus be seen that so far the average yield per load has not been a high one, though in one instance from the Round Mount mine six loads of wash yielded 1,080 diamonds, weighing 296 carats, equal to 49 carats per load; but this is an exceptional yield. However, with efficient methods of working, I feel assured that diamond-mining will become a large and profitable industry; and the proposals which I understand have been made for the Companies whose land adjoins to amalgamate, will, if carried out, no doubt greatly conduce to this end by bringing the workings under one general management, thus affording facilities for a large output at the least expense for direction and supervision.

When the rest of the district has been examined, I will describe in further detail the character of the deposits; meanwhile, I send you the accompanying map, showing the extent of the deposits referred to on the south side of Cope's Creek.

I notice that several mineral leases have been taken up embracing land which is not likely to contain payable diamond-bearing deposits.

I have, &c.,

C. S. WILKINSON,

Geological Surveyor in Charge.

The Under Secretary for Mines.

APPENDIX No. 2.

Report on Tin Lodes, near Poolamacca, in the Silverton District, New South Wales.

Sir,

Department of Mines, 24 October, 1887.

In accordance with your instructions, I have examined the tin-mining country near Poolamacca, in the Barrier Ranges. The tin-bearing rocks have been proved over an extent of country about 28 miles long, in a N.N.W. direction, and 3 miles wide; but is likely to be found over a much wider area, for the same formations are seen throughout the greater part of the Barrier Ranges as far south as Thackaringa. These formations consist of metamorphosed clay slates and mica schists intersected by dykes of granite and quartz reefs. The tin ore, cassiterite, occurs in the granite dykes, not as veins, but in black crystals, in size from a mere speck or grain, hardly visible to the naked eye, up to about 3 inches in diameter. It is not evenly disseminated through the granite, but is distributed more or less in patches, with a little ore scattered between them. In fact, the cassiterite appears crystallized like the minerals composing the rock—the quartz felspar and mica—which also often occur separately or together, in coarsely

coarsely crystalline patches in a fine-grained base of the same minerals. Sometimes one or more of these minerals predominate, so that in places the rock is chiefly composed of mica in large flakes, or of mica and quartz, or of mica and feldspar, with crystals of tin ore and black tourmaline intermixed. The granite dykes themselves are very irregular in thickness and extent, either in length or in depth. In some instances, as at Lake's Camp, they suddenly widen out for 100 ft. or more across; in others they divide into branches, or form small oblong or boat-shaped masses.

One of the most regular lodes yet opened is that which runs for about half a mile through the Euriowie North portions. In this lode also the tin ore is seen to be more regularly distributed through the granite than is usually the case. But even this lode, or granite dyke, which it really is, varies in width from 1 to 18 ft., and runs in breaks, thinning out at intervals and making again within a few feet on the west side; nevertheless, the lode appears to be sufficiently persistent to be worked on a large scale.

I was informed that a parcel of 20 tons of it, crushed at the Umberumbuka machine, yielded at the rate of 8 per cent. oxide of tin. The lode strikes N. 13° W., and has a westerly dip; it consists of coarsely crystalline granite with large flakes of mica, and traverses altered mica schists which strike north and south. The same lode continues into the Euriowie South Company's ground.

About Caloola are the lodes which I described in my former report on this field in 1881. On the Caloola Company's lode a shaft has been sunk, following the lode to a depth of 75 ft., and showing it to be much the same character as near the surface. Some 8 tons of about 50 per cent. ore have been raised during the sinking of this shaft. The lode or granite dyke dips E. 35° N. at 75°; it is from 1 to 9 ft. wide, and outcrops on the surface for about 200 yds.; the tin ore is in patches through it. Similar tin-bearing granite lodes occur about three quarters of a mile to the N.N.E. in the Cosmopolitan and other mines. One mile in a S.S.E. direction from here are the Jubilee Company's lodes; one, 18 in. wide, but thinning out on the north end, consists chiefly of quartz and feldspar with but little mica; the tin ore occurs in patches, containing about 10 per cent. of tin ore. Another granite lode 2 chains to the east is 2 ft. 6 in. wide, and has been opened for 6 ft. from the surface; only a little tin ore is visible in it. At Caloola South two dykes of coarse-grained granite are being prospected; one is 20 ft. across, as seen in an open cut 6 ft. deep, and the other, 70 ft. east, is 15 ft. wide. 2 chains north these dykes come together.

In the Bischoff Company's ground a lode 7 feet thick on surface is being driven across a depth of 35 ft.; it contains some coarse crystals of tin oxide; it strikes N. 25° W., and a few chains from it is another granite dyke also containing coarse tin in scattered crystals and large masses of quartz.

In the adjoining ground of the Queen Victoria and Prince of Wales United Co. a shaft has been put down on a granite dyke 40 ft. wide, cropping out on the top of the range; a little tin ore is seen in the stone. About 100 yards on the east side of it is another similar lode, 16 ft. wide, dipping W.S.W. at 60°; the tin ore is chiefly near the foot-wall, and on the west are two other lodes, one 52 ft. wide dipping easterly and showing a little tin. The lodes consist of coarsely-crystallized granite, very feldspathic, traversing altered schists; they vary in thickness, and in places thin out. But on the same line of strike, towards the south, other lodes, crop out through the Victory Co.'s ground. Some of these are being prospected, and a shaft 40 ft. deep has been sunk in one 8 ft. 4 in. wide. This lode strikes N. 10° W., and consists of coarse crystals of feldspar, mica, and quartz, with tin ore in patches, which, if worked separately, would probably yield 20 per cent. of ore.

About 4 miles further south is the Trident tin-mine. Here, within a width of 130 ft., the slate formation is traversed by several granite dykes, one 12 ft. wide, very micaceous and quartzose in places, with coarse tin crystals unevenly distributed. A shaft 60 ft. deep has been sunk, and the shallow alluvial in a small gully draining from the lodes have been surfaced for a few yards, and several bags of "shed-tin" obtained.

In the next mine, the Sceptre, a similar granite dyke suddenly widens out to 100 ft. at the surface. It contains large irregular patches of quartz, with chlorite, tourmaline, and crystals of tin also in patches. Its general strike is N. 20° W.; but to the south it divides into two branches, which, varying from 2 to 10 ft. thick, continue into the Cobar Co.'s ground; thence towards the Lady Don mine, where one of the dykes, 12 ft. thick, has been prospected by two tunnels driven in at different levels on the side of the slate hill. Tin ore is scarce in it, portions of it not showing any; I noticed a little fluor spar. The granite is composed of large crystalline masses of feldspar, mica, and quartz; one patch of quartz at the surface is 10 ft. wide. The dyke strikes N. 10° W. About 4 chains easterly is another similar dyke 4 to 15 ft. wide, with a very irregular strike to the N.E.

At Mount Lake occurs a dyke mass of coarse-grained granite, suddenly widening out in one place to 100 ft., with very small tin crystals appearing here and there in it. A branch vein up to 6 ft. thick, but pinching out in places, extends W. 30° S. from it for 4 chains, and shows coarse crystals of tin ore in patches. Within 15 chains to the east are four other granite dykes and quartz reefs from 1 to 10 ft. thick; they strike N.N.W., and have not yet been opened. Some small deposits of stream tin are likely to be found in the alluvial flats between these hills, together with good soakage water. Similar tin-bearing granite dykes occur to the south in Kali's claim, and also beyond, in the Mount Lake south blocks, where there is one showing coarse tin in patches, from which 50 per cent. ore might be picked; but the general average of the lode would not, I think, yield 4 per cent. of ore; it strikes N. 30° E. for about 8 chains and varies in width up to 15 ft.; but to the south it takes a more southerly course for about 200 yards, thinning out in places. There are other small lodes near on either side, and another 8 chains east is very feldspathic, varying in width up to 20 ft. for about 130 yards, with small crystals of tin in patches. These lodes have only been opened 3 ft. from the surface.

About a mile from here is the Dalcoath Co.'s. (Messrs. Sinclair and Bond's) ground, in which a lode consisting chiefly of quartz, and varying in thickness up to 8 ft., contains tin ore in patches which separately would yield about 30 per cent. ore; it strikes N. 5° W., traversing altered slates. Twenty yards from it, on the east side, is another lode of lenticular bunches of quartz up to 2 ft. thick, containing tin ore. At the Wankeroo, prospector's mine, several openings have been made along a singular outcrop of talcose schist for about 15 chains; it contains a little tin in small crystals, and strikes N. 5° W., with lenticular quartz veins 2 ft. wide. Along its southern extension lenticular veins of granite, as well as of quartz up to 3 ft. thick, occur. The patches of tin ore in the granite, if taken out separately, would yield from 20 to 30 per cent. of tin oxide. About 300 yards to the north, in the Consolidated Co.'s ground, a similar slate reef, with granite veins of irregular width up to 15 in. has been opened to a depth of 6 ft., containing coarse

coarse tin ore in patches. Twenty ft. from it, on the east side, is a large quartz-reef 3 ft. 6 in. wide and 70 ft. long. Further east 100 ft. another granite dyke 3 ft. thick would yield tin ore probably up to 2 per cent., but it could be sorted to give a higher yield. On the south side of Yancowinna Creek, in portion 95, is the Albion lode, of coarse crystalline granite in altered slate formation dipping W. 25° N. at 80° ; it would probably yield 12 to 15 per cent. of tin. A shaft has been sunk 22 ft. deep, 100 ft. further south a cutting 4 ft. deep has been made showing the lode 7 ft. wide, with a small patch of tin ore in centre. Near the S.W. corner of portion 95 is a lode 25 ft. wide showing a little tin and tourmaline; within 10 chains east are a few other lodes; one from 1 to 2 ft. thick containing some tin and brown garnets has been opened 3 ft. deep; it strikes N. 40° E. in chlorite slate. In the Pine Paddock Proprietary Co.'s leases are several tin-bearing dyke, of large-grained felspathic granite, traversing slate, and varying in thickness up to 10 ft., striking N. 5° W. to N. 20° E. Some are like short oblong or boat-shaped dykes; the tin ore with tourmaline occurs in patches, and would have to be sorted to yield 10 or 15 per cent. of ore.

On the South Wankeroo Co.'s ground three lenticular granite dykes striking N. 5° W., and up to 4 ft. thick, show coarse crystals of tin in patches; the whole, if taken out, would yield about 2 per cent. ore. A similar tin-bearing lode 4 ft. thick, and striking N. 10° W., traverses the mica slates in the Western Star Company's mine. Immediately north of these are the Granite Springs lodes. Within a diameter of 3 chains are three lenticular granite dykes up to 4 ft. thick containing a little tin ore, about 2 per cent.; strike E.N.E., N.E., and N. 5° E. (same as strata); three chains north are talcose slates like those in the Prospector's mine, with quartz, blaws, and fluor spar; 5 chains further north is a lenticular granite lode 5 ft. wide showing a little tin, and near it a quartz reef containing wolfram. Three other small lodes have also been prospected near the surface; they contain small quantities of tin ore in patches; a little stream tin was found near the head of a gully draining from them. The slate formation of the district is traversed by numerous similar granite dykes. From the above references it will be seen that the tin-bearing granite dykes, or so-called tin lodes, present more or less the same features, and from the irregular mode of occurrence both of the lodes and of the tin in them may be inferred how uncertain must be their productiveness, therefore much prospecting will be required to prove their value. But as the lodes are numerous, there can be no doubt that considerable quantities of tin ore will from time to time be raised in working the lumpy portions of them. Timber for mining purposes and surface water are scarce; but a fair supply of the latter may be obtained by sinking wells in the valleys, or by making large tanks for conserving the rainfall.

Returning from the tin-mines I took the opportunity of examining several of the silver lodes. In the War Dance mine, near Purnamoota, three small lodes have been opened in the slate country. In one, which dips S.S.E. 45° with a well-defined hanging-wall, carbonates of copper richly streaked with chloride of silver occur with the gossan. About 150 ft. from this is another parallel vein 4 to 6 in. thick of gossan, carbonates of copper and chloride of silver; a shaft has been sunk 50 ft. deep; and 3 chains further S.E. in a shaft 20 ft. deep another gossan lode showing chloride has been opened. These lodes though small yield rich ore, and appear to be of a permanent character. About 3 miles from Purnamoota are the Victory lodes in slate formation traversed by granite dykes. One, opened to a depth of 30 ft., consists of ferruginous rubble lodestuff from 6 in. to 2 ft. thick, containing small patches of argentiferous galena; it dips E. at 35° . Five chains N.N.E. another similar rubble and quartz lode 6 in. to 4 ft. thick, dipping S.E., has small veins of galena crossing it; at a depth of 40 ft.; in a shaft which is being sunk to cut this lode, a small ironstone vein containing chloride of silver is said to have been passed through. Five chains W.N.W. another lode up to 18 in. thick of porous gossan and quartz dips E.S.E. at 35° ; and in portion 16, about 20 chains W. 35° N. from the last, is a lode of gossan and quartz, varying in thickness to 18 in., containing irregular veins up to 6 in. thick of galena. From the well-defined curved hanging-wall this lode should be permanent.

It is probable that many other similar silver-bearing lodes will be discovered in this district. And though they may be too small to support smelting works at each mine, yet from them collectively will no doubt be raised considerable quantities of silver lead ore, that could be forwarded for sale or treatment at some central public reduction works.

The Umberumberka is still the deepest mine in the field, the lode described in my former report having now been worked to a depth of 400 feet, or 267 feet below the water-level. From the 300-360 feet levels the galena encloses small crystalline masses of antimonial silver ore, of which I have obtained samples for analysis. Some very fine specimens of galena, coated in places with native silver, were sent by the manager, Mr. C. H. Wilton, to the Adelaide Jubilee Exhibition. A short distance from the lode, on the north side, another lode has been exposed in the railway cutting, where it is 10 feet thick, and dipping S.S.E., almost parallel with the former lode. It consists of iron ore, has a good hanging-wall, and every appearance of being a valuable and permanent lode. It is now being prospected.

With the Inspector of Mines, Mr. Snee, I visited the Broken Hill mine, and was shown through the underground working by Mr. Patton, the newly-appointed General Manager, and Captain Piper, Mining Manager. I was surprised at the large amount of work that has already been done in proving this splendid lode to a depth of 316 feet, the water-level being about 240 feet. It is a true fissure lode, varying from 10 to 160 feet wide, and consists chiefly of porous iron and manganese oxide in places, more or less siliceous, containing carbonate of lead and chloride of silver, with occasionally carbonates of copper and zinc. These ores have resulted from the decomposition of sulphides and arsenides, which will be found in their unaltered original condition below the water-level. As one looks at the sides and headings of the drive, the gossan lodestuff, with its cavities and joints sparkling with crystals of cerussite and chloride of silver, presents a most interesting and fascinating sight. In one large natural cavity in the lode the sides were lined with black stalactites of iron ore, spangled over with white translucent crystals of carbonate of lead and carbonate of zinc, together with pale-green crystals of chloride of silver—treasures for a mineralogical museum. Sometimes the gossan is intermixed with kaolin and garnets, and in places occur angular fragments, embedded in various positions, and of all sizes, of mica slate, granite, and quartz, which had fallen from the sides of the fissure. The walls of the lode are well defined, especially the hanging-wall, which in two places I measured dips to the N.W. at 65° , but the dip varies in other places, and has changed to the E. below the 216-feet level in Mr. Cullock's shaft. I noticed that one projection on the hanging-wall had been rounded and striated by a faulting or downward-sliding movement northerly at an angle of 47° . This is an important feature, showing that though the lode must necessarily vary in width, it will continue, as far as the displacement or sliding movement of the hanging-wall has taken place,

place, probably to a great depth. The lode continues northerly with much the same character, narrowing and widening in places through blocks 14, 15, 16, and Broken Hill Junction, beyond which it seems to continue in irregular smaller lodes of a more siliceous nature, containing argentiferous galena and carbonates of lead and copper with a little chloride of silver. To the south also it passes into quartzite lodes, containing silver, lead, and copper ores sparingly distributed through the lodestuff. Similar unpromising quartzite lodes crop out again about 3 miles further south, in the Rise and Shine Co.'s ground, together with several ironstone lodes, one 8 ft. thick, and two others 1 ft. and 1 ft. 6 in. thick respectively, containing carbonate of lead, which I was informed gave on assay up to 80 oz. of silver per ton. These gossan and lead lodes should be prospected to greater depths. In portion 37, near the N.W. corner of portion 10, a shaft is being sunk to prove a favourable-looking gossan and quartz lode, which shows at the surface about 30 ft. in width.

Some promising garnet ironstone lodes containing galena are now being prospected in the Lady Byre's mine, on the southern slope of the Middle Pinnacle. At the surface three lodes crop out within a width of 130 ft., one of which is 20 ft. thick, running in a N.W. direction. A shaft has been sunk 110 ft. in the hornblende schists, and from it a drive is being put in to intersect the lodes. The lode-stuff somewhat resembles that from the Pinnacle mine. At the latter the most complete and extensive crushing and concentrating plant in the Colony has been erected under the management of Mr. Lewis, and is nearly ready for work. The rough ore is first fed into a stone-breaker, thence it passes automatically through roller-crushers, revolving screens, jiggers, Huntingdon crushers, and finally over four Fruc vanners before being again handled in its concentrated condition. This plant will afford a good example to be followed in other mining districts when the success of mines yielding classes of ores depends to a large extent upon the employment of efficient concentrating appliances.

The opening of the railway line to Silverton and Broken Hill will greatly tend to the development of the mining industry of the whole Barrier Ranges District, and I quite endorse the anticipation of the Warden, Mr. Wyman Brown, that ere long the value of the annual mineral production of this important mining district will amount to one million sterling, or one-third of that of the present production from the whole of New South Wales.

I have, &c.,

C. S. WILKINSON,

Geological Surveyor in Charge.

The Under Secretary for Mines.

APPENDIX No. 3.

Sir,

Department of Mines, Sydney, 25 November, 1887.

In accordance with your instructions, I have inspected the antimony lodes at the head of Forde's Creek, near Gulgong.

There are two small lodes cropping out at the surface about 100 feet apart. The uppermost lode is about 6 inches thick, and dips S. 15° E. at 20°, and has been exposed in an open cutting 6 feet deep and 30 feet long.

The lower lode, which has been opened to a depth of 5 feet, is about 6 inches thick, and dips S. 25° E. at 27°, but in one place at 60°.

They are breccia or rubble lodes, consisting of broken fragments of slate rock, associated with quartz, and contain oxide and sulphide of antimony.

The lode fissures have evidently been formed in each case by the faulting or sliding movement of the strata above the fissures upon the rock below it. Consequently, when the line of fissure was straight, no cavity would be formed, and there would be no chance of any large accumulation of lodestuff; but where uneven, the movement of the one above the other would leave cavities or enlargements of the fissure in which the ore would form as bunches of variable size.

The prospecting operations that have been carried out show the dip of the fissures to be almost straight, and if it should continue so the lodes would not be worth working.

But as the faulting in such strata is sometimes uneven, there is a possibility of the angle of dip curving, and allowing cavities to form, which may contain patches of payable ore deposits.

This can be better ascertained by following down each lode on its underlay than by sinking the present shafts. Then, should payable ore be discovered, a vertical shaft could be sunk for the more economic working of the deposit.

I have, &c.,

C. S. WILKINSON,

Geological Surveyor in Charge.

The Under Secretary for Mines.

APPENDIX No. 4.

Sir,

Department of Mines, Sydney, 29 November, 1887.

In accordance with your instructions, I have examined the newly-discovered lodes which are situated about 3 miles east of Denison Town.

Seven gossan lodes have been found, but only on two of them has prospecting work been done; these are in Robinson and party's lease; one of them is about 45 feet wide, dips N.N.W. at 45°, and outcrops at the surface for a length of about 200 feet. It is being prospected by a trench, from 5 feet to 10 feet deep sunk diagonally (N.W.) across it. In this the lode is seen to be well defined, and is exposed as follows, commencing from the hanging-wall, which consists of green chlorite schists:—

Assay Sample No. 1—	{ 18 ft. 0 in. Gossan, with patches of quartzite and manganese oxide.
	{ 2 ft. 0 in. Soft iron ore.
Sample No. 2—	{ 3 ft. 0 in. Siliceous gossan and quartz containing pyrites and sulphide of zinc.
Sample No. 3—	{ 21 ft. 0 in. Red and brown gossan partly siliceous.
	{ 0 ft. 3 in. Galena and carbonate of lead, in patches.
	{ 4 ft. 0 in. Gossan.
Sample No. 4—	{ 1 ft. 0 in. Gossan, with patches (up to 9 in. thick) of carbonate of lead and galena enclosing iron pyrites. (Sample 4a.)
	{ 5 ft. 0 in. Gossan.
	{ 0 ft. 3 in. Gossan, with carbonate of lead and galena.
	{ 3 ft. 0 in. Gossan and manganese oxide.
Sample No. 5—	{ 10 ft. 0 in. Altered felspathic rock.
Sample No. 6—	{ 3 ft. 0 in. Mottled gossan foot-wall, altered felspathic rock.

I collected average samples of the lodestuff from the different parts of the lode as enumerated above. The assay results are as follows:—

Assay Sample No. 1	—	Silver at the rate of 0 oz. 10 dwt. 21 gr. per ton; no gold.
Sample No. 2	—	1 oz. 1 dwt. 16 gr. „ gold, a trace.
Sample No. 3	—	0 oz. 16 dwt. 6 gr. „ gold, a trace.
Sample No. 4	—	16 oz. 12 dwt. 2 gr. „ gold, a trace.
Sample No. 4a	—	19 oz. 1 dwt. 2 gr. „ { no gold.
Sample No. 5	—	5 oz. 19 dwt. 8 gr. „ { lead, 76½ per cent.
Sample No. 6	—	„ „ a trace „ no gold.

According to these results the ore could not be profitably worked, but as the samples were taken from within only a depth of 10 feet from the surface, and the lodestuff appears to be of such a promising nature, I am of opinion that the lode should be further opened and tested at a greater depth.

About 250 feet to the S.E. another gossan and quartz lode has been opened to a depth of 8 feet in a narrow crosscut trench. It dips N.W. at 45°, is 16 feet wide, and can be traced on the surface for a length of 450 feet. An average sample of the ore taken from the full width of the lode exposed gave, on assay, at the rate of 5 dwt. 10 gr. of silver per ton, and no gold. This lode extends to the N.E. into Mr. Cox's lease. In an adjoining lease (Mr. Lowe's) two similar gossan lodes occur which have not yet been prospected: one is 30 feet wide and in massive ironstone blocks, crops out for a length of about 300 feet; the other, 50 feet distant to the S.E., is 15 feet thick, and is over 100 feet in length.

About 10 chains from these, in a south-easterly direction, on Mr. Latimer's lease, another gossan and siliceous lode crops out on the surface, 20 feet in width and 200 feet in length. It has not been opened. A sample taken from the surface gave, on assay, at the rate of 10 dwt. 21 gr. of silver per ton, and no gold.

3 chains further to the south-east, on the same lease, there is another gossan lode showing on the surface 50 feet wide and 200 feet long; and 5 chains to the south-west a more siliceous gossan lode crops out 20 feet wide and 60 feet long. These lodes have not been tested.

About 30 chains to the south-east, Messrs. Little and party are prospecting a quartzite dyke 100 feet wide with small patches of porous quartz and gossan in it. A sample of this latter gave, on assay, only a trace of silver, and no gold.

On the west side of it occurs a quartz reef about 2 feet thick, and containing iron pyrites. A sample of it yielded, on assay, at the rate of 4 oz. 7 dwt. 2 gr. of silver and 3 dwt. of gold per ton. This reef should be further prospected. About 4 chains to the N.W. is another parallel quartzite dyke 75 feet wide, and striking N.E. for about 10 chains. These dykes are not likely to prove payable.

Notwithstanding the low results afforded by the assays already made, the favourable appearance of the ore at the surface would, in my opinion, warrant the proper testing of each of the above-mentioned gossan lodes.

I have, &c.,

C. S. WILKINSON,

Geological Surveyor-in-Charge.

The Under Secretary for Mines.

APPENDIX 5.

Progress Report for 1887, by T. W. E. David, B.A., F.G.S., Geological Surveyor.

Sir,

I have the honor to furnish you with the following report of the work done by myself and the field assistant, Mr. G. A. Stonier, during the year 1887:—

From the beginning of the year until January 24th, I was employed in field work at Maitland and Mount Vincent, at the latter of which localities I examined a thick unworked seam of coal in Reserve No. 69A, in the parish of Mullbring.

I then proceeded to Sydney by your instructions to superintend the drilling through of the lower coal-seam at Holt Sutherland. My report thereon is appended. On February 5th, I returned again to Maitland, and examined the coal-measures at Raymond Terrace.

On February 18th I came to Sydney with your permission, and further examined the Holt Sutherland and Heathcote diamond-drill cores, and selected a miniature section of the former core for the Mining and Geological Museum.

On February 21th, I returned to Maitland, and on the following day examined the new shaft at Deep Creek, near Bishop's Bridge, sunk through the coal seam, the discovery of which by me had been previously reported.* My second report on this seam has already been published.*

From this date I was employed chiefly in field work near Maitland until March 23rd, when I went to Sydney, and was engaged in office work until April 2nd, when I resumed field work at Maitland till April 27th, from which date until May 3rd, I was in constant attendance at the East Maitland Court-house, my evidence being required by the Crown Solicitor. From this date until August 17th, I continued field work, when I went to Sydney and worked at the office until August 29th, when I left to report on the supposed diamonds at Warren. My report has already been given elsewhere.

I returned to the office on September 2nd, and to Maitland on September 9th, where I was employed in field work until November 12th, when my camp was broken up, and I returned to Sydney. From November 14th to December 4th, I had three weeks leave of absence, excepting November 26th, when I reported conjointly with Mr. Warden Martin on some applications for reserves for prospecting areas in the neighbourhood of Vegetable Creek. On December 7th, I returned to the office and was employed there for the rest of the year in preparing my maps, sections, and report on the Maitland District. Mr. Stonier accompanied me in the field during the earlier part of the year, and for the rest of the time was engaged in mapping out the alluvial deposits, which cover a considerable area of the coal-measures near Maitland.

By far the greater part of the year has therefore been spent by Mr. Stonier and myself in field work, the principal results of which are given in the following summary:—Mr. Stonier throughout has worked carefully and conscientiously, and his discovery of the marine fossils near Morpeth is, I consider, of great importance, as upon further examination I find that the zone of rocks, in which the fossils occur, is the actual boundary-line between the barren upper marine series and the overlying productive coal-measures of East Maitland. Such a junction-line had been anxiously looked for by us for some time, and now that it is found, it proves to be sharply defined and very persistent, for Mr. Stonier has found the same strata at Mount Vincent, over 15 miles southerly from the point where its occurrence was first observed.

Summary

Summary of Field Work.

The work done consists of,—

1. A preliminary examination of the coal-measures and their associated formations from Newcastle, on the east to Branxton, on the west a distance of 30 miles, and from Glendonbrook on the north to Broken-back Range near Mount Vincent on the south, also a distance of about 30 miles.

2. A detailed examination of the country around Maitland, comprising an area of over 50 square miles. A geological map of the latter with sections, accompanied by a detailed report, is now being prepared. The rocks comprised in this area may be broadly divided into I, *Igneous*, and II, *Sedimentary*.

The sedimentary rocks may be divided into two great groups—1, Palaeozoic, and 2, Cainozoic. The Mesozoic Group, as far as is known, is not represented, unless some of the igneous rocks may possibly be referable to the Mesozoic Era.

1. *Palaeozoic*. The rocks of this age, near Maitland, include the productive coal-measures of Stony Creek and East Maitland, and the unproductive marine series between the Stony Creek and East Maitland coal-measures, and below the Stony Creek series, and the plant beds with thin coals below the barren Lower Marine series. These strata may therefore be referred to four series ranged in the following descending order:

- V. *East Maitland Series*, 700 feet thick. { Productive coal-measures of fresh-water or estuarine origin, containing a thickness of about 36 feet of coal, out of which 22 feet has been worked from time to time. 100 feet (about), *Sanguinolites* beds; 300 feet (about), finely laminated cherty carbonaceous shales and mudstone.
- IV. *Upper Marine Series*. Thickness probably at least 5,000. Not known to contain coal. { 1,700 feet (about) strata, chiefly clayey. Exact characters at Maitland not known, owing to their being hidden under alluvial deposits. 2,000 feet (about) marine conglomerates, sandstones, and sandy shales with large "erratics."
- III. *Stony Creek and Grta Series*. Thickness 300 feet. { 300 feet lower coal-measures, in the upper half of which occur five seams of coal, having an aggregate thickness of 17 feet. Three seams have been worked, and two are now being worked.
- II. *Lower Marine Series*. { 1,000 feet (at least) Lower Marine series sandstone, shales and conglomerates. No coal.
- I. *Lepidodendron Series*. { Thickness unknown, sandstones and shales, containing plants, *Rhacopteris*, etc.

The total thickness of strata from the base of the Stony Creek series to the top of the East Maitland series, is about 6,000 feet.

The total thickness of coal known is 53 feet.

The following is a generalized section of the strata, arranged in descending order:—

	Ft.	in.	
	20	0	Conglomerate.
	53	0	Fine grained carbonaceous sandstones, and dark grey sandy shales, with thin coal seams.
	4	6	Coal seam—"Top seam" at Woodford) 3 ft. of good coal. Not being worked at present.
	63	0	Fine grained sandstone, hard like quartzite as it approaches the underlying coal seams, and dark shales with thin coal seams.
	7	0	Coal seam—(No. 2 seam at Thornley).
	5	0	Soft dark sandy shales, and shale with abundant gloss-opteris.
	6	0	Coal seam—(No. 3 seam at Thornley, and "Big Ben" in part (?) at Woodford.)
	12	0	Dark mudstone.
	3	0	Coal seam—2 ft. 3 in. coal, 9 in. next floor inferior coal. (No. 4 seam at Thornley, and "Big Ben" in part (?) at Woodford.)
	20	0	Chiefly grey sandstone, fairly hard. Upper part of section shaly.
	2	9	Coal seam—(No. 5 seam at Thornley, No. 4 seam at Woodford, where it underlies "Big Ben" at a depth of from 16 to 18 feet.)
	150	0	(about). Sandstone and shales, with beds of clay ironstone $\frac{1}{4}$ to 1 ft. thick, and towards base of section shales with large pebbles.
<i>East Maitland Series.</i>	70	0	Chiefly sandstone, hard and pebbly, near commencement of section.
	11	0	<i>Rathluba seam</i> , 4 ft. to 4½ ft. of which is worked. Splits into two seams towards Morpeth and Woodford, at the former of which localities the upper and lower portions of this seam are separated from one another by 140 ft. of strata.
	35	0	Carbonaceous sandy shales, with ironstone and thin coals, and grey sandstone.
		4-12 in.	ironstone.
	2	0	Coal Seam— <i>Ironstone seam</i> .
	45	0	Soft carbonaceous shales and soft grey sandstone.
	4	6 to 8 ft.	3 in. <i>Morpeth seam</i> . Worked to a small extent in paddock at back of Mr. Close's house, near Morpeth. This seam splits into two seams in places, the divided portions of the seam being separated by 10 ft. of brown shale. This seam has also been proved in the diamond drill bore at East Maitland Gaol.
	13	1½	Clay, rock, clay, sandstone, and shale.
	7	8	Rock and coal.
	20	7½	Rock (chert, or cherty sandstone (?)).
	16	6½	Sandstone, coal, shale, and hard blue clay.
	38	9½	Rock, shale, coal, and pipeclay.
	99	3½	"Sandstone" upper marine series probably begin here.
	201	5½	Blue shale.
	101	2½	Blue shale and pipeclay bands.
	37	3½	Blue sandstone.
	40	8½	Sandy shale.
	45	5	Blue shale. At 7 ft. from bottom of this bore a large <i>spirifer</i> , like <i>spirifer glaber</i> , in the core.
<i>Upper Marine Series</i>	1,700	0	(about). Chiefly dark grey mudstones and shales.
	400	0	Chiefly sandstones, with marine fossils especially <i>productus</i> .
	20	0	<i>Bohcarra conglomerate</i> . A hard coarse calcareous conglomerate, traceable for at least 30 miles.
	2,450	0	Chiefly marine sandy shales and clayey sandstone with erratics, some weighing a ton. Occasional conglomerate beds.
	150	0	(about). Chiefly conglomerate with marine fossils in beds of gritty sandstone.
	5	7	to 1 ft. Coal seam, chiefly cannel.
	7	0	Shale or clod.
	3	0	to 2 ft. Coal seam, bituminous coal.
	8	0	Shale and fireclay.
<i>Stony Creek Series.</i>	5	0	Coal seam, chiefly cannel.
	0	6	Coaly shale.
	3	0	Fireclay.
	1	3	Coal.
	49	0	Chiefly conglomerate.
	3	6	Coal Seam, bituminous. This is the lowest worked seam in all the coal-measures.

Base of Stony Creek series.
Top of Lower Marine series.

Below

Below this come sandstones, shales, and occasional beds of conglomerate at least 1,000 feet thick, and below this again the *Lepidodendron* series, to which the *Rhacopteris* beds near the Paterson township, are probably to be referred.

Stony Creek and Greta Coal-measures.

These strata consist of conglomerates, sandstone, and carbonaceous shales, with thin beds of clay, ironstone, and several seams of coal, the last having an aggregate thickness in places of 25 ft. These strata are capped conformably by marine conglomerates and overly conformably the marine sandstone and shales of the lower marine series.

Thickness.—This series is thinnest to the south, and thickens in a northerly direction, the thickening of the strata being accompanied by the splitting of one thick seam into several thinner seams. At Stony Creek the thickness is 300 ft., and about the same at Leconfield, near Greta.

Dip.—The dip varies from the nearly horizontal to an angle of over 30°, increasing as the areas of disturbance are approached, and lessening as the coal-measures recede from them. At Deep Creek, for instance, near Bishop's Bridge, which is furthest removed from the disturbing influence of igneous rocks, the dip is only from 2½° to 5°, while at Leconfield and Stony Creek it is 15°, and near Eclah and Bolwarra, over 30°. The systematically varying directions of dip between Maitland and Greta, as pointed out by yourself,* prove the existence of an immense anticline or dome, having its centre near Lochinvar, and united on the east by a trough 4 miles wide to a smaller anticline, the details of which have not yet been fully worked out.* The first anticline, which may be termed the Lochinvar Anticline, is about 14 miles wide and 16 miles long, and measured from the bottom of the East Maitland trough to the original top of the arch over Lochinvar, about 14,000 ft. high. The bottom of the trough would lie about 6,000 ft. below sea-level, so the top of the arch would be 8,000 ft. above the sea.

This does not necessarily imply that the land surface at Lochinvar ever actually attained that altitude, but that it would have, had not the upheaved strata been removed from time to time by denudation, while the anticline was being formed, as was probably the case. The existence of this great anticline is well shown by the changes of dip as indicated on the geological map now in course of preparation.

Faults.—As shown by yourself,† an immense fault occurs somewhere near the outcrop of the Greta seam in Black Creek, near Branxton. To prove whether or not the seam at Black Creek was identical with the Greta Seam, I had a small shaft sunk on the seam at Black Creek, by the kind permission of Mr. D. S. Mitchell, the owner, and Mr. E. V. C. Maine, the lessee of the property. The section of the seam here, given below, proves beyond question that it is the Greta Seam. The fault must, therefore, have a throw of about 2,000 ft. In the vicinity of Maitland the faults have a north-easterly or north-westerly trend, the throws being chiefly northerly.

Thickness and quality of the Coal.—At Glendonbrook, the furthest point on the north, to which the geological examination extended, a seam of coal cropping in a creek on Drinan's selection, near Billybrook, parish of Stanhope, county Durham, gave me the following descending section:—

Roof.—Conglomerate, with pebbles 2 in. to 3 in. in diameter.

Ft.	in.	
0	6	Coal, good, hard, bituminous.
1	8	Band of coaly shale.
0	8	Band of carbonaceous sandstone.
0	9	Coal, hard, good, bituminous.
0	2	Band, sandstone, and conglomerate.
1	3	Coal, good, hard, bituminous.
0	6 to 12 in.	Band, sandstone, and conglomerate.
4	0	Coal, good, hard, bituminous.

Total Coal ... 6 6
Total Seam... 9 9

Floor, Coaly Shale.

This seam has never been prospected nor worked. It is the equivalent of the Greta Seam, and the bottom, 4 ft. of clean coal, exactly resembles the Greta coal. At Leconfield, at the north end of the estate, a Government diamond drill bore has proved the existence of six seams of coal, the following being an abridged descending section:—

Ft.	in.	
179	2	Sandstone, shale, and conglomerate.
4	3	Coal.
34	4	Conglomerate with shale and sandstone below coal.
0	7	Coal.
15	10	Shale, sandstone, and conglomerate.
3	7	Coal.
31	10	Conglomerate with a little sandstone.
0	9	Coal.
65	7	Chiefly conglomerate with a little shale and sandstone.
6	1	Coal.
6	2	Shale.
40	0	Conglomerate and shale.
0	3	Coal.
70	0	Conglomerate and sandstone with a little shale.

At 1½ miles southerly from the preceding four tunnels driven into the hillside by Mr. R. Wyndham, show that these seams are coming together in a southerly direction. The section seen here is as follows:—

Ft.	in.	
107	0	Sandstone and dark grey shale in about equal proportions with occasional beds of conglomerate.
409	6	Chiefly sandstone with conglomerate.
2	0	Shale.
9	9	Conglomerate.
1	10½	Coal.
0	1½	Sandy, shale band.
1	3	Coal.
0	1½	Conglomerate band.
1	1	Coal.
0	0½	Conglomerate band.
1	6	Coal.
3	6	Sandstone and shale.
31	0	Conglomerate.

No. 1 seam.—
Coal 5 ft.
8½ in.

No.

* Annual Report of Department of Mines, 1884; page 151.

† Annual Report of Department of Mines, 1884; page 140.

	Ft.	in.	
No. 2 seam.— Coal 8 ft. 5 in.	1	9	Coal (partly perished from exposure near outcrop).
	0	1½	Clayey coal.
	0	11	Clay shale.
	0	11	Coal, good, hard, bituminous.
	0	0-0½	Band intermittent.
No. 3 seam.	5	9	Coal, good, hard, bituminous.
	1	0	Sandy shale.
	31	0	Chiefly conglomerate.
	1	9	Coal.
	10	0	(about). Shale.
	5	0	(about). Sandstone.
	30	0	(about). Conglomerate.
	0	8	Coal, full thickness not proved.
Total ..			656 11

At Greta the following section was measured by me in the dip heading from B. Pit:—

	Ft.	in.	
Not worked.	2	0	Brassy tops, inferior pyritous coal.
	0	3½	Coaly shale.
	0	8½	Coal, very soft, bituminous.
	0	2	Band grey sandy shale.
	1	0	Coal, hard, bituminous.
	0	10	Stony coal, hard, dull, black.
	0	3	Coal, hard, bituminous.
	0	4	Stony coal, like inferior cannel.
	3	1½	Coal, hard, bituminous.
	0	2 to 15 in.	Band, white stone.
	0	4	Coal cannel, with layers of softer coal.
	0	4	Coal cannel.
	2	0	Coal, hard, bituminous.
	0	2½	Coal cannel.
	0	7	Coal, hard, bituminous.
	0	6	Band black stone, clayey cannel.
	3	3	Coal, hard, bituminous, approaching cannel in places.
Total...			16 1

At Anvil Creek a seam of hard bituminous coal, 4 ft. thick, is stated by Mr. J. Mackenzie, the Examiner of Coal-fields, to underly the main seam at a depth of 16 ft. At the A Pit, at Greta, where Mr. Mackenzie's section gives the thickness of the seam there as 26 ft., the increased thickness is partly due to this lower seam being included in the section of the main seam, as it is there separated from it by a band of shale only 1½ ft. thick. A patch of kerosene shale 1 ft. 2 in. thick is stated by the same authority to occur at 2 ft. 3 in. from the top of the seam at this point.

At Black Creek, near Branxton, on the upthrow side of the great fault, I measured the following section of the Greta seam:—

Ft.	in.	
		Roof.—Conglomerate, 6 ft. seen; gritty sandstone, 3 in.
0	8	Coal, perished.
0	0½	Band grey clay.
1	9	Coal, hard, bituminous.
0	2½	Clayey coal.
0	8½	Coal, dull, black bituminous.
0	0½	Clayey coal.
0	2	Band whitish-grey fireclay—white stone.
0	8	Coal, hard, bituminous, rather dull black.
0	3	Pyritous clayey coal—black stone.
0	0½	Clayey coal.
0	6½	Coal, hard, bituminous, somewhat dull, black.
0	0½	Clayey coal.
1	3½	Coal, hard, bituminous, somewhat dull, black.
0	1½	Coal, bituminous.
0	0½	Clayey coal.
0	9	Coal, hard, bituminous.
0	0½	Clayey coal.
0	0½	Coal, a trifle softer than the average.
1	9½	Coal, very hard, bituminous.
0	8½	Coal, bituminous, rather softer.
Total... 9 10½		

Floor.—9 in. grey pyritous shale; 1½ in. black carbonaceous shale; 3 in. grey shale.

NOTE.—As this section was taken close to the outcrop of the seam, the coal in the upper part of the seam had suffered somewhat from perishing.

This seam dips W 20° N at 27°.

At Deep Creek, near Bishop's Bridge, the Greta seam dips at from 2½° to 5°.

The following is a section of the seam there measured by me.*

Ft.	in.	
		Roof.—Pebbly carbonaceous conglomerate.
1	1	Coal, hard, bituminous.
2	0	Coal, hard, bituminous, with minute concretions of pyrites, ¼ to ½ inch in diameter.
0	10	Coal, with minute streaks of pyrites.
2	0	Coal, hard, bituminous.
1	3	Coal and bands, not workable.
2	1	Coal, hard, bituminous.
0	0½	Band of brown clay.
1	3½	Coal, hard, bituminous.
0	0½	Band of brown clay.
2	0	(at least) Coal, hard, bituminous.
Total seam... 13 5		

NOTE.—This seam was described to me as being 14½ ft. thick, but the influx of water into the shaft was so strong that the workmen were unable to bale it down within less than 2 ft. of the bottom of the shaft, so that I was unable to make sure that I measured to the bottom of the seam.

Traced

Traced in a northerly direction from Deep Creek towards Maitland, this seam is found to split into several seams, as proved at Font Hill and Homeville, near Stony Creek.

The following is a section of the seams at Homeville, the section of the top seam being taken from "Sedimentary Formations of New South Wales," by Rev. W. B. Clarke, third plate at end of book, and those of the other seams from my own measurements, with the exception of the particulars of the 1 ft. 3 in. seam below the cannel seam, taken from your own notes, and the description of the strata above and below the bottom seam, supplied me by Mr. H. J. Adams:—

Ft. in.		
	5 7	Roof, conglomerate.
	7-10 0	Coal, chiefly cannel, much thinned in places through contemporaneous erosion.
		Clay shale, passing into fireclay next to underlying seam.
"Fireclay" seam.	0 5	Coal, hard, bituminous.
	0 7	Clay shale.
	2 0	Coal, hard, bituminous.
	7-9 0	Clay shale with fireclay underlying "Fireclay Seam."
	0 8	Dull, semi-cannel coal.
"Cannel" seam	0 0½	Clayey coal.
	0 6	Soft, dull, black pyritous coal.
	0 7½	Coal, bright, black, bituminous.
	3 6	Coal, cannel.
	0 6	Coaly shale.
	3 0	Fireclay.
	1 3	Coal, hard, bituminous.
49 0	Chiefly conglomerate with a little dark shale.	
3 9	Coal, hard, bituminous, with intermittent clay band ¼ to 1 in. thick at about 4 in. from roof.	
2 7	Sandy shale overlying conglomerate.	

Traced further north, across the Maitland to Lochinvar road, these seams probably thin somewhat. They have not yet been proved to extend as far north as the Hunter River above Eelah, or in an easterly direction towards Largs, Raymond Terrace, and Port Stephens. It is almost certain, however, that they extend in this direction at least as far as Largs, and the inferior kerosene shale near Port Stephens is possibly connected with these coal-measures. Considering the highly volatile character of these coals, which pass into cannel in places, and contain occasional patches of kerosene shale, as at Greta, it is somewhat surprising that no evidence has yet been met with of rock oil at points where these coal seams have been invaded by highly heated igneous rocks as near the ford over the Hunter River above Eelah, and anywhere from here to Largs, Raymond Terrace, and Port Stephens, where such a junction of coal seams and igneous rocks may exist. At all events, it would be important to test the coal-measures which underly the sand dunes between Stockton and Port Stephens to prove the existence or otherwise of the Greta seams. The upper marine series certainly continues easterly at least as far as Raymond Terrace, and probably extends to the Pacific Ocean, and although nothing whatever is known of the underlying rocks from Raymond Terrace easterly to the Pacific Ocean, it is quite possible, if not probable, that the Greta coal-measures underly the sands between Raymond Terrace and Port Stephens. The probable point of outcrop under ground is very difficult to guess at even within wide limits, as the alluvial deposits here are very extensive, and the coal-measures, especially in the neighbourhood of Port Stephens, are known to be much disturbed. The following facts ought to serve as a rough guide:—At Dempsey Island a bore has been put down to a depth of 2,000 feet without striking the upper marine series, and possibly (if the East Maitland series underly the Newcastle) without even reaching the East Maitland or Tomago coal seams (the latter being probably the equivalent of the former and of the Woodford coal seams). This theory, if right, proves a thickness of 2,000 feet of strata at least separating the Newcastle from the East Maitland coal-measures. The thickness from the top of the East Maitland series at Maitland to the top of the Greta and Stony Creek Coal measures is, as already stated, at Maitland about 6,000 feet. This would give a thickness (assuming, of course, that the East Maitland underlies the Newcastle series, and that the strata maintain their thickness between Maitland and Newcastle), of about 8,000 feet of strata at Newcastle between the Borehole seam and the Greta seam. If the direction and amount of dip between Newcastle and Port Stephens could be ascertained, it would be an easy matter to calculate at what point approximately between these two places, with this given thickness of strata, the Greta seams should crop out under the alluvials. At Stockton the dip is said to be south-easterly at a low angle. At Raymond Terrace the dip of the upper marine sandstones, "erratic" beds and conglomerates is S. 38° E. at 19°. At Raymond Terrace, however, the strata have been disturbed by intrusive igneous rocks, so that the amount here is probably considerably above the average. If this line of strike be continued, the Greta seams would run into Port Stephens somewhere near Saltwater Creek, but it is more probable that the intrusive igneous rocks at Port Stephens have changed the dips in that neighbourhood from south-easterly to southerly. The elucidation of this question must, however, be reserved for the detailed geological examination of that district.

The presence of so much volatile matter in the coal of the Greta and Stony Creek series occasions a remarkable amount of perishing in the coal, extending back from the outcrop as much as 150 feet, even in places where there is a thick rock cover over the coal. At Leconfield, for instance, a seam of coal 10 feet thick showed only 4 inches of black dirt at the outcrop, even when traced under the solid rock. The perishing of the coal had in fact been so complete as to nearly allow the roof and floor of this thick seam to touch one another; this is an important feature to be remembered with reference to prospecting coal seams in this series, as, in consequence of thick and thin seams making equally thin outcrops, it is only by tunnelling or sinking on the coal at a point sufficiently far from the crop for the coal to have escaped perishing that an estimate can be formed of its true thickness.

Quality of Coal.—The coal in the seams of this series has been classed as bituminous and cannel. Both varieties are very hard, and do not soil the fingers. This great hardness makes them very suitable for shipment. The coal is minutely laminated, but the laminae are so welded together that the coal does not break very readily along them, and its appearance may therefore be described as streaky rather than

laminated

laminated. The lustre is pitchy, but not quite as bright as that of a pure bituminous coal. The average specific gravity is about 1.275, and the average composition of the coal taken from the mean of five analyses is about as follows:—

Moisture	2.00
Volatile hydrocarbons	41.00
Fixed carbon	51.20
Ash	4.60
Sulphur	1.20
	100.00

Coke firm, not much swollen up. The cannel coal has a specific gravity of 1.35, and has the following composition:—

Moisture	2.27
Volatile hydrocarbons	35.39
Fixed carbon	53.91
Ash	8.43
	100.00

The great thickness of strata covering the Stony Creek and Greta coal series precludes the possibility of working these seams, excepting at points, where part of the covering has been removed by denudation. At East Maitland, for instance, a shaft or bore started at the base of the East Maitland Coal-measures would have to penetrate about 5,000 feet of strata before reaching the Stony Creek and Greta seams; and at Newcastle the depth would be equally great—at least, and if the theory be correct that the East Maitland Coal-measures underly the Newcastle, the depth at the latter place will be considerably greater—probably not less than 8,000 feet. The only hope that the Greta seams may occur at a workable depth at points where the so-called “Upper Coal-measures” (Newcastle series) or the “Middle Coal-measures” (East Maitland series) exist, is that there may be a great unconformity between the Upper Marine series and the Upper and Middle Coal-measures. The existence, however, of this unconformity has not yet been proved.

East Maitland Series.

The rocks of this series, as stated above, consist of sandstones, carbonaceous shales with ironstone bands, shales with large pebbles, conglomerate, chert, and white fireclay—besides a number of thin coal seams in addition to those about to be described.

The thickness of this series at the Four-mile is about 700 feet, and at Woodford about 500 feet. The series thickens, however, from Woodford in a northerly and north-westerly direction, while the materials composing the strata become coarser—shales passing into sandstones, and sandstones into conglomerates.

The rocks and coal seams in this series are far more variable than those of the Greta series, and show marked evidence of contemporaneous erosion. They dip at from 4° to 9°.

At East Maitland, the general dip is E.S.E.—being a continuation of the dip of the eastern side of the Lochinvar anticline.

The centre of the succeeding syncline is reached near the Two-mile Creek, where the East Maitland to Newcastle road crosses the creek. At the top of the next hill to the E.S.E., the dip is north-westerly. Then comes another anticline before the Four-mile Creek is reached.

From here to Woodford the dip is chiefly easterly and south-easterly. At Woodford, the dip varies from S.E. to S.W.

The result of the continuation of an easterly dip for a considerable distance from the Four-mile towards Woodford, is that at Woodford the Four-mile Creek seams reappear dipping southwards, whereas they have been denuded off the anticline between the Two-mile and Four-mile Creeks.

The lowest seam known in this series is a seam for which I propose the name of the “Morpeth” seam, because its outcrop strikes directly through the town of Morpeth, where it dips south.

From Morpeth, southerly, the outcrop is hidden under the alluvials along the East Maitland-to-Morpeth branch railway. At the Gaol Hill, the seam was struck in the diamond drill bore at 124 feet from the surface, and the outcrop reappears—from under the alluvials in Bank-street, East Maitland—above the Gas Works. From here, the outcrop has been proved by me through Miss Day’s property and the Glebe land—at both of which the two divisions of the seam are somewhat wider apart than at the Gaol Hill, and near to Gas Works.

Just below the spur of the hill, above the quarry on Wallis’ Creek near the English Cemetery, East Maitland, the crop of a seam has been proved by me—probably representing the upper division of the Morpeth seam, but a great thickening takes place here of the beds below the seam, which are principally cherts. The outcrop of the Morpeth seam has also been proved in a small shaft near Rathluba, at the head of the lagoon between Rathluba and Louth Park, and I have also found it on the road from Louth Park towards the Bloomfield Colliery, which is the furthest point to the south to which it has at present been traced.

Thickness and character of the coal.—Near Morpeth, as your field notes describe, this seam was sunk to, in a shaft, 70 ft. deep, in the paddock at the back of Mr. Close’s house, the seam consisting of 4 ft. 8 in. of coal and bands, the greatest thickness of clean coal being 1 ft. 8 in.

At the Government diamond drill bore at the East Maitland Gaol,* the section of this seam was as follows:—

Ft. in.	
2 6	Coal, with 1 in. band.
1 7	Pipeclay and blue clay.
4 2	Coal.

No other section of this seam is known to me except that obtained in the trial shaft near Rathluba, subsequent to my departure from the district.

The bottom seam struck in the diamond drill bore at Ironbark Brush, near Woodford, is probably identical with this Morpeth seam.

Rathluba

* Annual Report, 1884; p. 179.

Rathluba Seam.—The furthest point to the south to which this seam has as yet been proved is Rathluba.

At Rathluba the seam consists of a lower workable portion from 4 to 4½ ft. thick, and an upper unworkable portion about 5½ ft., with thick bands.

The following is a section of this seam at Rathluba:—

		Section at air-shaft.	
		Ft. in.	
Roof ...	{	10 0	Massive grey sandstone.
		0 8	Soft clayey sandstone, with fine pebbles.
		0 0½	Coal.
		0 2	Brown shale.
		0 1-2	Coal.
		0 1	White fireclay.
		0 5½	Perished splint coal, or chitter.
		0 2½	Brown shale.
		0 7	Coal.
		0 6-8	White fireclay.
		1 2	Coal, soft, bituminous.
		0 4½	White fireclay.
		0 1	Coal.
		0 4	Clay shale, grey, and brown.
		0 10	Coal, soft, bituminous.
		1 6	Carbonaceous clay shale, hard, blackish, brown.
		0 4	Coal, dull black splinty, with thin bands.
Worked part of seam, 4ft. of coal.	{	0 9 to 12	Coal, soft, bituminous.
		0 1½	Band of clayey coal.
		0 4	Coal, soft, bituminous.
		1 7	Coal, soft, bituminous, with 3 in. of hard splint coal at top.
		0 1-2½	Band, block stony coal.
		1 0	Coal, bituminous.

In a northerly direction from Rathluba, the seam splits the lower portion, striking through King street, East Maitland, where it was worked by Mr. Keddy, over 40 years ago.

The upper division of the seam, characterized by thick bands of white fireclay, is divided from the lower by a wedge of rock thickening northerly to such an extent that at the night-soil shaft, 207 ft. deep, on the back road to Morpeth, the strata intermediate between the two seams reach a thickness of 140 ft.

The following is a section of this shaft taken from "Mineral Products of New South Wales, 1887," plate 17:—

		Ft. in.	
		29 5	Blue and white rock.
		0 4	Coal.
		4 0	Blue rock.
		5 0	Blue and white stone.
		1 0	Indurated clay.
		0 6	Coal.
		1 0	Indurated clay.
		0 6	Coal.
		2 0	Indurated clay.
		0 8	Coal.
		0 10	Indurated clay.
		1 0	Coal.
		1 6	Indurated clay.
		1 0	Coal.
		1 2	Indurated clay.
		1 9	Coal.
		0 6	Indurated clay.
		1 5	Coal.
		8 0	Freestone.
		1 3	Coal.
		16 0	Freestone.
		2 0	Blue gravelly rock.
		71 4	Blue and white rock.
		2 0	Indurated clay.
		1 6	Coal 8 in. Coal. (Mr. Andrew Tulip's section.)
		33 6	Blue and white rock.
		4 0	Indurated clay.
		5 6	Coal.
			{ 6 in. to 9 in. Pipeclay.
			{ 1 ft. 8 in. to 2 ft. Coal.
			{ 6 in. to 8 in. Black band.
			{ 10 in. to 12 in. Coal. (Mr. Andrew Tulip's section.)
Total		198 8	

The sections in the right hand column were supplied me by Mr. Andrew Tulip, and represent the worked portions of the upper and lower seams.

The crop of the upper and lower divisions of the Rathluba seam runs out before reaching Morpeth, but as the dip here is southerly the outcrops should be traceable in an easterly direction, but are hidden under a large swamp. On the east side of this swamp however, about 1 mile south-easterly from Morpeth, Mr. Stonier has observed the outcrop of the upper division of this seam in a quarry near Mr. Doyle's house about 14 chains E.N.E. from the bridge over the ditch draining the swamp, on the Morpeth to Raymond Terrace road.

The following section of this seam was measured by me in this quarry:—

		Ft. in.	
Roof.	{	8 0	Massive grey sandstone.
		5 0	Sandy shales.
		1 0	Fireclay, whitish grey.
		0 3	Black dirt, clayey.
		0 4	Fireclay, whitish grey.

Ft.	in.	
0	1	Brown clay.
0	2	Fireclay, whitish grey.
0	1	Clay, brownish grey.
0	3	Black dirt, clayey.
0	0½	Band brown clay.
0	2½	Black dirt.
0	1-1½	Fireclay, pure white, weathering pale yellowish white.
1	3	Fireclay similar to above, but with rusty patches.
0	6	Black dirt (perished coal).
0	10	Fireclay, pure white, weathering pale yellowish grey.
0	6-7	Black dirt (perished coal).
0	2½	Clay shale, brown with rusty thin ferruginous bands.
1	1	Fireclay, slightly inferior to previous, grey.

This seam is identical with the upper seam described above in the section of the 200 feet shaft near Morpeth.

This seam is dipping about W. 15° N. at 18°. This westerly dip having given the outcrops a southerly strike brings this seam near the surface along the east side of the East Maitland Reserve, and it has been proved in a shaft sunk by Matthew Hall, at a point about 10 chains W.S.W. from the S.E. corner of the preceding reserve. According to information given me by Mr. Arthur Campbell, of Hamilton near Newcastle, the seam here, including bands, was 10½ to 11 feet thick, with 10 different layers of coal the thickest being about 1 foot. The bands were said to be from 2 to 3 inches thick.

At Woodford according to the same authority this seam has been worked from the Old Scotch Derry Shaft, where it underlies "Big Ben" seam at a depth of 112 ft. at Woodford, the seam was said to exactly resemble that in Hall's shaft, and from its stratigraphical position as well as from the association of a pure white fireclay with this seam, I have no doubt of its identity with the upper division of the Rathluba seam.

The coal in the Rathluba seam, especially in the lower part of it, is bright and bituminous, and suitable for steam, gas, and household purposes.

Spherical lumps occur in this coal, as in the Wallsend seam, but whether they are due merely to a spheroidal fracture or to a concretionary structure in the coal, has not been determined, probably the latter is the correct explanation.

An account will be given in the detailed report, of the fireclays and grey clays associated with the upper division of this seam, which are worked near Victoria-street, East Maitland, for the manufacture of fire bricks, drain pipes, &c. The next seam worked above the Rathluba, from which it is separated by about 260 ft. of strata, is the 2 ft. 9 in. seam, which at Thornley is 32 ft. below the 6 ft. seam now worked there by Mr. Marshall. At Thornley another seam has been proved 3 ft. thick, and 12 ft. below the 6 ft. seam, but the lower 6 in. of this 3 ft. seam is of inferior quality. In other parts of the district this seam probably becomes united to the upper seam.

A good section of the 2 ft. 9 in. seam is to be seen in the tunnel, about half a mile E.N.E. from the N.E. corner of portion 28, parish of Maitland, where I measured the following section of it:—

Ft.	in.	
		Roof, fine grained sandstone with fine black laminæ.
0	3	Coal, bituminous.
0	0½	Coal, dirty.
0	1	Band, brown clay.
0	1	Coal, splint, rather dirty.
0	6½	Coal, splint.
0	1	Coal, soft bituminous.
1	6	Coal, splint.
0	4½	Coal, bituminous.

Total ... 2 11½

Floor, dark clay shale.

This coal is a splint coal suitable for steam, blacksmith, and household purposes.

The next seam above this (omitting the intermittent 3 ft. seam at Thornley) is the No. 3 seam at Thornley, which varies in thickness from 3 ft., at Thornley, to 4 ft. at Bloomfield. An account of this seam, and of the overlying No. 2 seam, has already been given by me in the Annual Report for 1886, page 149.

At Thornley, the No. 1 seam, the uppermost in the series, was measured by me as follows:—

Ft.	in.	
		Roof, sandstone with coal pipes, fairly hard.
0	1	Coal and bands.
0	1½	Band, dark clay.
0	1	Coal, bituminous.
0	0½	Band, black shale.
0	3½	Coal, splint and bituminous.
0	0½	Band, black shale, with "mother-of-coal."
0	8½	Coal, splint and bituminous.
0	1½	Coal, splint, dirty.
0	2	Coal, bituminous.
0	5	Band, dark grey crumbling sandy clay shale with coal pipes.
1	0	Coal, chiefly bituminous.
1	5	Coal, hard splinty; the last two inches rather dirty.
		Floor, dark grey clayey sandstone with half-inch of black shale on top.

Total ... 4 6

This top seam at Thornley is probably identical with the "top" seam at Woodford.

Full particulars about the seams in the East Maitland series, and in the Stony Creek series, will be given in the detailed report now being prepared to accompany the geological map and sections.

The recent (?) alluvials, and the igneous rocks will also be described in the memoir.

I have, &c.,

T. W. EDGEWORTH DAVID,

Geological Surveyor.

The Geological Surveyor-in-Charge.

APPENDIX No. 6.

Sir,

Department of Mines, Sydney, 3 February, 1887.

In accordance with your instructions, I proceeded to the diamond drill bore on the Holt-Sutherland Estate, and witnessed the drawing of the core from the bore-hole on the three occasions when the lower part of the bottom seam struck in this bore-hole was being proved.

The Superintendent of Drills, Mr. W. H. J. Slee, and the engineer in charge of the drill, Mr. J. T. Pearson, informed me on my arrival on the ground on January 25th that about 6 inches of coal had been bored through at the previous drilling, but when the rods were lifted there was no coal in the core barrel, although coal dust had been coming up previously in the water, which is pumped down the bore under great pressure. The core then raised consisted of soft pebbly sandstone, and was about 1 ft. 6 in. less in length than the distance drilled. This deficiency is to be accounted for by the wearing away in the bore-hole of the core of soft sandstone and coal. Assuming that one-half of the core so lost consisted of coal, 9 in. must be added to the 6 in. of coal known to have been penetrated, so that it may be inferred that the drill bored through 1 ft. 3 in. of coal at the previous drilling.

The distance drilled on January 25th, was 2 ft., and the duplex core barrel on being raised was found to contain 2 ft. of coal core.

Boring was resumed on January 28th, and I was informed by the Superintendent that the distance bored was 4 ft. 6 in. The duplex core barrel was emptied in our presence, and contained 1 ft. 8 in. of core, of which 1 ft. 4 in. was coal, and the lowest 4 in. black carbonaceous mudstone.

On February 1st, a further distance of 3 ft. 5 in. was drilled, and when the rods were lifted the ordinary core barrel was found to contain 3 ft. 9½ in. of core, consisting of black clayey sandstone and carbonaceous sandy shales. The upper part of this core for a length of 2 ft. 2 in. showed unmistakable signs of its having been inside the duplex core barrel, which was used at the previous drilling, but not on this occasion, and so this length of the core belongs to the previous boring, and should be added to the length of core recovered from it.

The total distance drilled since the seam was first struck until it was passed through was 7 ft. 9 in., made up as follows:—

	Ft. in.	
	1 3	Bored, January 18th.
	2 0	" " 25th.
	4 6	" " February 1st.
Total	7 9	

Out of this distance of 7 ft. 9 in., 5 ft. 10 in. of core were obtained, of which 3 ft. 4 in. were chiefly coal, and the rest stone. Assuming that the length of core not accounted for (1 foot 11 inches) was coal ground to dust, and lost in the water flowing from the bore-hole, the thickness of the seam would be 5 ft. 3 in., made up as follows:—

	Ft. in.	
	3 4	Coal core, brought to the surface.
	1 11	Coal lost from various parts of the seam through the pulverization and washing away of the coal by the water forced down the tubes through the bore-hole.
Total	5 3	

Owing to the loss of part of the coal core from the causes above-mentioned, it is impossible to give an accurate section of the seam.

The following is a descending section of the portion of the core recovered:—

	Ft. in.	
	0 3½	(about) Coal, small fragments of splint and bituminous steam coal.
Sample analysed from here—No. 53.	0 9½	Coal, dull black splint and bituminous steam coal, the bituminous coal occurring in layers from ½ to ¼ inch thick.
	0 0½	Coal, soft bright black bituminous.
	0 1½	Coal, dull black splint and bituminous steam coal.
	0 0½	Coal, brown, pyritous.
Sample analysed from here—No. 54.	0 8½	Coal, dull black hard steam coal, with lamina of brittle bright black bituminous coal ¼ of an inch thick.
	0 0¼	Band, brown stony clay.
Sample analysed from here—No. 55.	0 5½	Coal, splint and bituminous steam coal.
	0 0½	Band of brown clay.
	0 0½	Coal, rather clayey.
	0 0½	Band of brown clay.
	0 0½	Coal, rather clayey.
Sample analysed from here—No. 56.	0 5½	Coal, splint and bituminous steam coal.
	0 3½	Coal, soft bituminous, with thin bands of coaly shale from ⅜ inch to ¼ inch thick, occurring at intervals of ¼ inch.
Total	3 4	

The four samples selected by me from the parts of the core above specified have been analysed by Mr. W. A. Dixon, F.I.C., F.C.S. The following is a copy of his analysis and report:—

	No. 53.	No. 54.	No. 55.	No. 56.
Specific gravity	1.44	1.34	1.43	1.36
Composition, in 100 parts.				
Moisture	0.36	0.24	0.68	0.40
Volatile hydrocarbons	13.52	14.03	12.21	12.63
Fixed carbon	70.96	73.96	69.92	74.04
Ash	14.72	11.16	16.80	12.52
Sulphur	0.44	0.61	0.39	0.41
	100.00	100.00	100.00	100.00

The coke of No. 53 (85.68 %) was black, not swollen, and rather soft. The cokes of No. 54 (85.12 %), No. 55 (86.72 %), and No. 56 (86.56 %) were all swollen slightly, firm but dark coloured. The ashes in all were dark gray. These coals are all short-flamed steam coals. The average ash is 13.8 %, which is $\frac{1}{2}$ % more than Bulli coal. They are all, however, noticeable for the small amount of volatile hydrocarbons and the high percentage of fixed carbon, and should therefore give good results under boilers built to consume Welsh coal.

The percentage of ash is rather high, but, as pointed out by yourself in your report on the core from the lower coal-seam at Heathcote, analyses of cores of coal-seams, when much of the core has been lost, do not afford conclusive evidence as to the average quality of the coal in the whole seam, because such recovered portions of the core usually contain all the stony and inferior parts of the seam, while the core lost is almost entirely composed of the softer and purer coal. Hence the proportion of ash in the seam, if calculated from the analyses, would be unduly increased.

The depth of the top of this seam below the surface is 2,295 ft. 11 in., and the total distance drilled was 2,307 ft., the bore being carried to a depth of 5 ft. 11 in. below the coal.

The bore is situated on the left bank of Dent's Creek, on the watershed into Port Hacking, at a point $1\frac{1}{2}$ mile easterly from the Sutherland Railway Station, the latter being 15 miles south of Sydney. The surface of the bore-hole is 132 ft. above sea-level, so that the bottom of the bore is about 2,175 ft. below the level of the sea.

A seam of coal, 4 ft. 2 in. in thickness, was proved in this same bore-hole, 65 feet above the seam first described, on December 24th, 1886; and there can be no doubt that these two seams at Holt-Sutherland are identical with the two seams of coal proved at Heathcote, near Mount Westmacott, about $8\frac{1}{2}$ miles S.S.W. The two coal-seams proved at Heathcote are 4 ft. 8 in. and 6 ft. 1 in. thick respectively, and were struck at respective depths of 1,513 ft. and 1,577 ft. 9 in.; they are continuations of the Bulli seams. The Holt-Sutherland bore bears about N. 29° E. from Heathcote, and the seams dip in this direction at an average rate of 127 ft. per mile. The true dip of the seams between these two points is nearly due north, at about 145 ft. per mile. This estimated rate of dip is only approximate, as this calculation does not take into account faults or local changes of dip.

No analysis has been made as yet of the coal from the upper seam at Holt-Sutherland, but, to judge from its appearance, it is a steam coal of good quality. The thickness of the upper seam being taken as 4 ft. 2 in., and the average specific gravity of the coal as 1.4, this seam contains about 7,090 tons of coal per acre, which will yield, after one-third has been deducted for waste in getting, faults, &c., about 3,550 tons of large coal and about 1,480 tons of small coal per acre.

The thickness of the lower seam being taken as 5 ft. 3 in., and the specific gravity as 1.4, the seam contains about 8,930 tons of coal per acre, which should yield, after making the same allowance as before for waste in getting and small coal, about 4,470 tons of large coal and 1,480 tons of small coal per acre.

The great depths at which the seams occur, and their thinness as compared with the principal seams of coal now being worked in this Colony, considered in conjunction with the high percentage of ash in the lower seam, leaves the question as to whether they can at present be profitably worked open to grave doubts. On the other hand, it must be borne in mind that coal-seams are liable to local thinning-out, as well as to deterioration in quality, and either of these changes may take place within a distance of a few hundred yards, as has frequently been experienced in our own coal-fields, as well as in those of other countries. As this is the only bore which has reached the coal in this neighbourhood up to the present, the only other being the similar bore at Heathcote, $8\frac{1}{2}$ miles to the south, it would be premature as yet to infer that the fine Bulli coal-seams thin out or deteriorate in quality as they approach Sydney. Considering the immense area of the ground to be proved, and the rather equivocal character of the results so far obtained, the evidence of a single bore-hole like this is, in my opinion, insufficient to justify the expenditure of a large amount of capital in developing these coal-seams. The Bulli seams have been pronounced to be workable at Heathcote, on the evidence afforded by the diamond-drill bores; but before these seams can be proved to be workable or otherwise, as far north as the Holt-Sutherland bore, at least one more borehole should be made between Holt-Sutherland and Heathcote, or east or west of the Holt-Sutherland bore.

It is interesting to note the occurrence of native copper in the mottled dark purple and green shales, a thickness of 71 feet of which was met with between 1,729 feet and 1,809 feet below the surface. Metallic copper is disseminated in scales and threads through the mass of the shales, which, like the cupriferos shales of Germany, occupy a position intermediate between the top of the coal-measures and the base of the Triassic rocks, the latter being represented at Holt-Sutherland by the Hawkesbury sandstone.

The copper shales (kupfer-schiefer) are profitably worked for copper in Germany; and it is possible that if these purple shales were carefully examined at points where they crop out at the surface patches might be found containing sufficient copper to admit of their being worked to advantage.

The Holt-Sutherland bore is the deepest and largest in Australia, the depth of the bore being 2,307 feet, and the diameter 3 inches. The bringing to the surface of 3 ft. 4 in. of coal core out of a total thickness of 5 ft. 3 in. from such a depth, when such heavy pressure of water had to be applied to keep the borehole clear, speaks for itself as to the successful management of the diamond drill at this bore.

I have, &c.,

T. W. EDGEWORTH DAVID, B.A., F.G.S.,
Geological Surveyor.

The Geological Surveyor-in-Charge.

APPENDIX No. 7.

Department of Mines, Geological Survey Branch,
Sydney, 28 February, 1888.

Sir,

I have the honor to submit the following progress report of my work during the year 1887. From the beginning of the year until January 20th I was engaged in office work, drawing up reports on the Yarrangobilly Caves and the Kiandra Gold-field.

On January 20th I left Sydney for Inverell, where I arrived on January 22nd. Here I accompanied you during your examination of the neighbouring diamantiferous deposits, and after your departure for Sydney I remained to make a geological map of the Cope's Creek Diamond-field. (See Appendix No. 8.)

On

On February 20th I rode from Inverell to Myall Creek Station, and next day, through the kindness of Mr. M'Donald, I visited the bone deposit on the run. The bones are embedded in a stiff clay, and were first exposed by the denudation caused by the neighbouring creek. They consist chiefly of the bones of *Diprotodon*, but lately the remains of *Thylacoleo* have been unearthed. These Pleistocene bone deposits are of extreme interest, because the remains from them, taken with those from our caves, form a link between the terrestrial fauna of the present time and that of the Tertiary period; and additional interest is added to them from the fact that in other parts of the world it is in such post-Tertiary deposits that the earliest traces of man are met with.

On February 22nd I proceeded to Bingera, in the neighbourhood of which I was engaged till the beginning of May, mapping geologically the diamantiferous deep lead.

On May 2nd I returned to Sydney, where I remained till June 23rd, engaged in writing a report (Appendix 9) on the Bingera Diamond-field, and in other office work.

On June 23rd I proceeded to Mittagong, to be present at the boring through a coal-seam which had been struck in the diamond-drill bore put down about a mile from the town. This bore passed through the Hawkesbury sandstone, and at 602 feet the first thin coal was struck. For the next 45 feet the bore passed through alternating beds of carbonaceous shales, splint coals, thin bituminous coals and fireclays, until at 647 feet a workable seam of good bituminous coal, 5 feet thick, was reached. I returned to town on July 7th, and reported on the section passed through. (See Appendix No. 10.)

On July 29th I left for Captain's Flat, situated about 30 miles to the south of Bungendore, for the purpose of reporting as to the alienation of certain lands, returning to Sydney on August 1st.

On August 15th I travelled to Orange, and examined and reported on a bed of limestone at Lewis Ponds. (See Appendix No. 11.) From Orange I went to Wellington, visited the caves there, and reported to you the advisability of having certain improvements carried out in connection with them. From Wellington I went on to Bourke, and from there back to Coolabah, where I inspected the deposit in which a couple of shafts had been sunk, and in which traces of gold had been found. This deposit is a loose gravelly conglomerate, at this place over a hundred feet deep, and I believe it to be a Cretaceous-Tertiary deposit, filling up the hollows and inequalities in the surface of the Silurian bed-rock of the district; and consequently, although much of it has been derived from the denudation of auriferous Silurian rocks, the gold, which no doubt occurs in the deposit, will not be concentrated in any particular part of the deposit, but will occur generally disseminated through it or in isolated patches. From Coolabah I went to Byerock, and from that place, as a starting-point, I made an examination of the general geology of a large portion of the surrounding district, my report of which is appended. (Appendix No. 12.) I returned to Sydney, *via* Girilambone, on September 30th. I was engaged in office work till October 31st, and on that date I proceeded to Orange, where I received from you my instructions with regard to the geological examination of the country between Nyngan, Nymagee, and Cobar and Girilambone. I arrived at Nyngan on November 2nd, and after examining the country in the neighbourhood of that town, I proceeded by coach to Cobar on November 14th. From here I made numerous extensive excursions over the neighbouring country, going as far south as Nymagee. During one of these excursions, to the north of Cobar, a very interesting discovery was made of the occurrence of three or four small detached hills, named *El Capitan*, consisting of that very rare form of lava, *Leucite Basalt*, the only other Australian locality for which is *Byerock Mountain*, some 30 miles north from *El Capitan*. At the latter place there are evidences, in the presence of quartzite and hard siliceous grits, below the basalt, that here the *Leucite* lava had flowed as a lava stream down a valley, burying the creek-bed at the bottom of it.

Being prevented by the heavy rains from returning to Nyngan, I left Cobar on December 4th for Bourke, from which place I returned to Sydney, arriving on December 9th, having called at Girilambone and Nyngan on the way.

Till the end of the year I was engaged in office work, writing my report on the Nyngan and Cobar District. This report is appended. (Appendix No. 13.)

I have, &c.,
WILLIAM ANDERSON,
Geological Surveyor.

The Geological Surveyor-in-Charge.

APPENDIX No. 8.

Sir,

Bingera, 30 March, 1887.

In accordance with your instructions, I have examined and mapped geologically the country immediately to the north of Cope's Creek and the Gwydir River, in the parishes of Clare, Auburn Vale, and Aconite, and have the honor to submit to you a report on the geological features of that district, accompanied by a geological map.

The rocks which occur in the area embraced by this map are:—Granite, altered sedimentary rocks, basalt and drift (Pliocene Tertiary), and a siliceous conglomerate (Miocene Tertiary).

The granite is exposed over large tracts of this area, and is, as a rule, coarsely crystalline, having the crystals of felspar porphyritically developed; but at one point in the parish of Clare the quartz is the porphyritic mineral, there being little felspar present. It contains a good deal of tourmaline, which, in some places, occurs in crystals of considerable size, as among the granite ranges which form the northern boundary of the parish of Aconite. This granite is evidently intrusive, having been intruded among a series of sedimentary rocks, of which only a few patches have been left in this district, the rest having been removed by denudation. In weathering it leaves behind it many curious and fantastic forms. Now in the shape of a perpendicular slab, standing upright out of the ground, which calls to mind the "standing stones" so laboriously raised in other countries by prehistoric man; and again as rounded hill masses, whose summits seem inaccessible, and whose smooth surfaces when seen from a distance only want the groovings and polishing to produce the *roche moutonnées* surfaces so commonly seen and so characteristic of a glaciated country, while everywhere the surface of the granite country is strewn with immense rounded boulders of granite.

The sedimentary rocks, consisting of sandstones, limestones, and shales, have been so highly altered by their contact with the granite that, as yet, little evidence has been found to prove to which of the Palæozoic formations they belong, although some fossils, which were obtained by Mr. C. S. Wilkinson,

Government:

Government Geologist, from a bed of limestone on Auburn Vale Creek, show that these rocks are either of Devonian or Carboniferous age. A large patch of them occurs between Auburn Vale Creek and Cope's Creek, where their junction with the granite is also well seen.

The basalt mostly occupies the high grounds, and it can frequently be seen covering the drifts and pipeclays which were deposited in the valleys by the rivers and creeks of the earlier Pliocene-Tertiary Period. In some places, it still remains spread over large areas, forming elevated plateaux, as in the parishes of Aconite and Auburn Vale. The rich alluvium or black soil of this district has been derived from the decomposition of this basalt. It is often very vesicular, and the cavities contain zeolites in great variety. This basalt, which, towards the end of the Tertiary Period, flowed down and filled up the valleys, burying the drift beneath it, now occupies the high grounds, because the denuding agents, such as the air, rain, and streams, found the hard compact basalt more difficult to wear away than the hills of granite and altered sedimentary rock which enclosed these valleys. From the large areas which it covers, this basalt could hardly have flowed from a single or even a series of volcanoes, but it had probably a similar origin to the great basaltic flows which took place in Western Europe towards the close of the Tertiary period—that is to say, the lava welled up through fissures or cracks in the earth's surface and spread over the country in all directions, drying up rivers, filling up the valleys and covering the lower hills. Since then the rivers and creeks have worn new channels for themselves, generally through the granite and other rocks, although in many places the basalt has been cut through, thus exposing the wash underneath it, and leaving isolated knobs capped with basalt.

The siliceous conglomerate is most largely developed to the north of the Malacca and Stockyard Hills—two isolated basalt-topped hills, near the eastern boundary of the parish of Clare. It also occurs on the basaltic plateau in the parish of Aconite. It is a silicified drift, and represents an older river drift than the Pliocene-Tertiary drift, which is present in many places below the basalt. Its pebbles are well rounded and waterworn, and have been cemented together into a very hard and compact conglomerate by the action of water containing silica in solution. It is probably of Miocene-Tertiary age. The Pliocene drift can be seen at various points resting on this siliceous conglomerate.

The Pliocene-Tertiary drift, which is at present being worked for diamonds, consists of gravels, sands, and pipeclays. The gravel and sand occur mixed together, or in more or less stratified layers, and represent the bed of the old Pliocene river. As a rule the drift is loose, but patches and layers of it often occur cemented together with iron, which has been present in solution in the water that has filtered through it. This wash may be seen cropping out from under the isolated basaltic hills, such as the Malacca and Stockyard, and also in places from beneath the denuded edges of the basaltic plateaux. The pebbles in the wash are well rounded and waterworn, and consist chiefly of quartz, altered sedimentary rock, and granite; while in the wash at the Round Mount, on the south side of Cope's Creek, clay boulders are very common, and in the wash at the Red Hill, in the parish of Gum Flat, boulders of basalt occur, which, however, have not been derived from the Tertiary basalt overlying the wash, but must have come from some older bed of basalt. The finer drift consists largely of gem stones; of these, the sapphire, topaz, garnet, zircon, and the diamond occur, while along with these the minerals tourmaline, tin, and gold are present. Tourmaline is particularly abundant, both in large and small crystals, which generally show the triangular section, and also in rounded and waterworn fragments. The diamonds do not occur in particular layers in the wash, but are generally found scattered throughout it, although in some cases small patches of wash have been discovered which have been very rich in diamonds.

The pipeclay is sometimes found resting on the wash, but more frequently it occurs alone between the bed-rock and the basalt. It is never more than a few feet in thickness, and was probably deposited in the quiet reaches and on the flats of the old rivercourse.

The deep lead which flowed westward from between Inverell and Bundarra must have passed along the line of the present course of Cope's Creek, and joined the deep lead coming from Boro Creek, near the Round Mount.

I have, &c.,

WILLIAM ANDERSON,

Geological Surveyor.

The Geological Surveyor-in-Charge.

APPENDIX No. 9.

Sir,

Department of Mines, Sydney, 10 May, 1887.

In accordance with your instructions, I have examined and mapped, geologically, the country in the immediate neighbourhood of the Bingera Diamond Mines, in the parishes of Bingera and Derra Derra, county of Murchison, and I have now the honor to submit a report on this diamond-field, accompanied by a geological map.

The base-rock of the district in which the diamond drifts occur consists of sedimentary rocks, comprising argillaceous shales, sandstones, and conglomerates, with interbedded igneous rocks. They are well exposed in section in the cuttings on the Narrabri Road, where they are seen to be much hardened and contorted. As a rule they are much jointed, and often break up into rudely polygonal prismatic pieces. This jointing, with its results, is particularly well seen in a rugged gorge lying to the north of the Narrabri Road, just before it reaches the top of the basalt range, about 6 miles from Bingera. This gorge occurs at the junction between the basalt with its underlying pipeclays and the sedimentary rocks, and its presence is largely due to the polygonal jointing of these rocks. The denuding agents, by their mechanical and chemical action on the joints, have gradually loosened the rock in polygonal masses, until now a picturesquely rugged gorge has been formed, showing precipitous faces of rock some hundreds of feet in height, on which the columnar structure is well seen. Prismatic or columnar jointing is most commonly met with in basaltic and other igneous rocks, where it is a superinduced structure, due to the contraction of the lava in cooling.

The fossils obtained from these rocks are from beds of shale in Eagle Hawk and Doctor's Creek, and consist of some undeterminable plant markings with a few casts of *Lepidodendron australis*, M'Coy, identified by Mr. R. Etheridge, junr., Palaeontologist to Geological Survey of New South Wales, the presence of which would point to the rocks being either of Lower Carboniferous or Devonian age.

Numerous veins of quartz and calcite occur traversing these rocks, the latter sometimes being as much as 2 feet in thickness. The quartz veins are usually small, although in some parts of the district they form large reefs, which in some cases, as the All Nations reef, near Bingera, are payably auriferous.

The

The Tertiary Formations consist of two beds of basalt with their underlying gravels and clays. The older basalt rests on the Tertiary clays and river gravels which contain the diamonds and gems, while the two flows of basalt are themselves separated by thick layers of clays, sands, and sometimes fine gravels. These old lava flows now form a high range, in height from 1,200 to 1,400 feet above the township of Bingera, and running in a general south-east and north-west direction. It forms the dividing range between the Gwydir and Horton Rivers, and is in places nearly cut through owing to the extensive denudation, which has also rendered its sides scarred and precipitous, and has thus freely exposed the sands, clays, and gravels below the basalts. At a few points, however, the upper and younger basalt may still be seen abutting against the sedimentary rocks, which formed the side of the old Tertiary valley down which the lava flowed.

The basalt is not uniform in texture throughout, some parts being hard and compact, while others have decomposed into botryoidal masses which have a kernel of hard basalt surrounded by concentric layers of decomposed rock. It often shows prismatic structure, and at one point to the north of Pallal Gap, the upper bed is seen to split up into thin slabs as if it were a bedded rock, but this is really due to one system of divisional planes being more developed than the others, consequently giving the rock a fissile character.

Both beds of basalt extend, with a few slight breaks in the upper one, from Five-mile Creek to about a mile north of Pallal Gap. At this point the upper basalt turns sharply to the west, while a lower and interrupted range, capped by the older basalt, runs northwards to within a few miles of the Gwydir River. In breadth it varies from a few hundred yards to nearly two miles. In all its extent the pipeclays, sands, and occasionally gravels, can be seen at intervals outcropping from beneath both beds, the lower of which is at least 300 feet thick, while the upper, at its thickest, point some distance to the north of Pallal Gap, is 350 feet in thickness.

The upper surface of the lower basalt does not show evidences of erosion having taken place to any extent during the deposition of the upper sands, clays, and gravels, therefore it is probable that there was no great lapse of time between the occurrence of the two lava flows. Sufficient time, however, must have elapsed for the drainage of the country to have reasserted itself, and for this river to have again flowed down its old valley, whose bottom was, however, covered over with a thick layer of basalt, on which were deposited the upper sands and clays, in places to the thickness of 120 feet, before the second flow of lava took place.

The Tertiary river drifts occur under both beds of basalt, and consist of fine-grained pipeclays, sands, and gravels, and the whole deposits vary from a few feet to over 100 feet in thickness. The pipeclays are variously coloured, while the sands are in many cases composed of comminuted fragments of gemstones and quartz. The gravels in which the diamonds are found are composed of large and small pebbles mingled together with sand. Sometimes the sands are arranged in lenticular patches. The pebbles are well rounded and of all sizes, and consist mostly of variously coloured jasperoid rocks, quartz, altered sedimentary rock, and in some parts stiff clay boulders, but the relative proportion of these various kinds of pebbles differs in different parts of the deposit. Sometimes the jasperoid pebbles predominate, sometimes pebbles of the altered sedimentary rock, while in few instances the clay boulders are most abundant. The drift which occurs between the two beds of basalt consists almost entirely of sand containing great numbers of small fragments of gems, such as topaz, sapphire, spinel, zircon, &c. It has been deposited pretty uniformly, averaging nearly 100 feet in thickness. In a few places fine gravels occur mixed with the sand, as at the S.W. corner of M.L. 152. In this upper drift diamonds have been picked up after rain, but they were very small. The gemstones and minerals which occur in the drifts along with the diamonds are as a rule of small size, and generally fractured. They comprise sapphire, topaz, ruby, garnet, spinel, zircon, brookite, titaniferous iron, magnetic iron, wood tin, tourmaline, quartz, opal, iron pyrites, gold, osmiridium, and the diamond. There are besides, small oval and rounded fragments of jasperoid rock of all colours, but chiefly of a light gray colour. These curious little pebbles usually average about $\frac{1}{2}$ of an inch in diameter. Their surfaces are very smooth and polished, and they are always found with the diamond, tourmaline, and other gems on the turning up of the sieve in washing. This is due to their specific gravity being nearly the same as that of the diamond.

At present diamond-mining is almost at a standstill in this district, but, on the flat, known as "Gympie Flat," to the east of the basalt range, gold is being worked in the Pleistocene alluvial deposits, which have been partially derived from the denudation of the basalt range with its underlying clays and gravels. The gold obtained here is in all respects similar in character to that which is present in the diamantiferous deposits, and there is little doubt that it has been largely derived from the denudation of these deposits. Most of the diamond-mining has been done in working the gravels which occur as isolated hills on the flat to the east of the basalt range, and from these a large number of diamonds have been obtained, besides in some cases, as on M.L. 135, large quantities of gold. These isolated deposits on the flat are probably of a different age from the drifts under the basalt. They lie at a much lower level, there being a difference of 200 or 300 feet between them and the nearest exposure of drift on the range. They were probably deposited at different times, the deposits under the basalt being the earlier of the two.

The mining operations that have been carried on for the purpose of obtaining diamonds have not been extensive.

The drift on M.L. 132 was worked as far back as 1873, by M'Caw & Wescott, who obtained 1,680 diamonds from about 100 loads of gravel. Since then altogether about 4,000 diamonds have been got from this patch of wash. On M.L. 139, five shafts, averaging 50 feet in depth, have been sunk, all through wash, which, although containing abundance of gemstones, has, as yet, yielded no diamonds.

On M.L. 9 the wash is from 5 to 8 feet thick, and 116 diamonds were obtained from 48 loads, 20 of which yielded 18 carats, while the average was $\frac{2}{3}$ of a carat to the load. The "Big Hill," on M.L. 10, was first worked by Falk & Co., of Melbourne, who got from 40 to 50 diamonds out of it, and afterwards by the Melbourne and Bingera Diamond-mining Co., but with very unsatisfactory results. On M.L. 135 the wash is about 4 feet thick and 100 lodes of it yielded 53 diamonds, weighing 15 carats.

Shafts have also been sunk on M.Ls. 20, 21, and 22, close by the Narrabri Road, but the gravels were washed for gold alone, although a few diamonds were got in the process.

A little to the west of M.L. 148 a shaft has been sunk 56 feet through sands and clays which yielded no diamonds. A few hundred yards to the N.W. of this a hard cemented wash occurs, which is full of gemstones.

On

On M.L. 125 a tunnel has been driven 40 ft. in the wash below the basalt. About a chain to the south of this is a shaft which at 45 ft. cut through 6 ft. of wash with a S.W. dip.

Another shaft close by was bottomed at 87 ft. after going through 7 ft. of wash. Some 3 loads of this were washed, and produced something like half a dozen diamonds. On the next block to the south, 126, Craddock and party have driven five tunnels, the longest of which is 170 ft. in the wash, which consists of fine sand in layers and boulders of quartz, jasperoid rock, and clay. There is a good deal of tourmaline in the wash, which thins off to 3 ft. in thickness at the end of the longest tunnel, but a little to the west several shafts have been sunk through the basalt. One, 43 ft. deep, went through 14 ft. of basalt, then pipeclay, with 7 ft. of wash below it. From the 170-ft. tunnel 35 diamonds were obtained from 3 barrowfuls. In another tunnel 17 diamonds were washed from 22 bags, each bag weighing 50 lb., while from another spot 10 diamonds were obtained from 11 bags of wash. Altogether over 500 diamonds have been taken out of this claim. While I was there one dishful of drift was washed, and it gave one diamond and 2.08 grains of gold.

On M.L. 16 there is a patch of gravel and sand which has been called the Monte Christo. The pebbles consist of quartz, jasperoid rock, and clay boulders.

A tunnel has been driven a considerable distance into the deposit, and a number of shafts have been sunk in it; one of the latter is 33 ft. deep, all in wash. 10 loads from the tunnel gave 83 diamonds, weighing 14½ carats, while at the first washing 20 loads went 5 carats to the load; the rest gave 2 carats to the load. From the shaft the wash went 1 or 1½ carats to the load. Altogether 87 loads were washed from Monte Christo, giving about 209 carats—1,134 diamonds.

At the end of the basalt range some distance south of the Gwydir River, in the parish of Banchcett, on M.L. 132, a tunnel has been driven for 200 ft. into the wash below the lower basalt. It consists of boulders of altered sedimentary rock, quartz, and a few clay boulders. At the mouth of the tunnel the wash is about a foot thick, but it increases somewhat in thickness towards the inner end of the tunnel. Three loads were washed from this tunnel which gave 23 diamonds.

About a mile further south along the range a shaft has been sunk 36 ft. through pipeclay and 2 ft. of wash, from which 3 loads were washed producing 3 diamonds.

At Five-mile Creek, south of the Narrabri Road, a shaft has been sunk through the lower deposit. It is down over 100 ft., and passes through chocolate-coloured clay with fossil leaves, light-coloured pipeclay, and 18 ft. of wash, which consists mostly of variously coloured pebbles of altered sedimentary rock, with quartz boulders and sand. A few bags only of this were washed, and from them one diamond was obtained.

On C.P. 71 a shaft, known as Lowe's Shaft, has been sunk through the top basalt. It is upwards of 230 feet deep, but not bottomed. The first 80 ft. were through the upper basalt, then 50 ft. of pipeclay, 14 ft. of sand, 50 ft. of pipeclay and lignite, and then 30 ft. in the lower basalt.

On M.L. 134 Mr. Mercer has obtained diamonds from the Pleistocene redistribution of the Tertiary gravels, having got 20 diamonds from 24 barrowfuls of wash; and there is every reason to believe that diamonds, as well as gold, are present in the alluvial of the other numerous gullies which drain from these diamantiferous deposits.

The recorded yield of diamonds from the Bingera Diamond field are as follows:—

Up to August, 1873, as recorded in Professor Liversidge's paper in the *Trans. Roy. Soc. N. S. Wales* for 1873, the number was 2,370 diamonds, the Gwydir Diamond-mining Company getting 690 diamonds from 34½ loads, and Wescott & Co. getting 1,680 diamonds.

In the Annual Reports of the Department of Mines the earliest notice of the diamond yield from Bingera is in 1883, when the Australian Diamond-mining Company obtained over 400 diamonds from 100 loads of wash at Doctor's Creek.

In the Report for 1884 (p. 88) the yield is given at 1,210 diamonds from 418½ loads, the Australian Diamond-mining Company getting 1,193 diamonds, weighing 25½ carats, from 418 loads, while Craddock and party obtained 17 diamonds from half a load.

In the Report for 1885 (p. 83) the yield obtained by the same Company was 1,134 diamonds, weighing 209 carats, from 87 loads.

Besides these recorded yields there has been a large number of diamonds obtained of which there is no record. As far as I have been able to learn, there have been at least 12,000 diamonds obtained from the Bingera Diamond field, and probably this number is below the mark.

The diamonds from the Bingera deposits are usually small, and average 4½ diamonds to the carat. They are most frequently colourless and transparent or straw-coloured, although a few specimens have been obtained of a pale brown and a greenish tint. A large number of the Bingera diamonds are fractured. Some specimens appear as if waterworn; but this is no doubt due to the faces of the crystals being round instead of flat, this being a well-known peculiarity in the crystallization of the diamond. It is hardly possible that the diamond could be abraded and have its edges and angles rounded off, even when carried along by a river current among boulders of all kinds and sizes, rolling pellmell over each other. Under these circumstances it might get fractured, but never water-worn, owing to its great hardness and the polished smoothness of its surfaces. I have not heard of nor seen any specimens of "boart" from the Bingera deposits, although it is quite possible that this useful variety of the diamond may have been overlooked in washing for the more precious variety.

In reference to the quality of the New South Wales diamonds, a valuable report has lately been published by Messrs. Davies and Etheridge, jun., on the diamonds exhibited at the Colonial and Indian Exhibition, London. From that report I quote the following conclusions arrived at by the authors:—"The diamonds of New South Wales in their physical characters are more nearly allied to those of Brazil than any other country. They have been very largely sold in London as such. As regards colour, they differ practically but little from those of other fields. The general absence of 'cleavage' and 'macles' is a point much in their favour. Stones of the rarer colours assumed by the diamond should be particularly sought for. The greater hardness of New South Wales gems will probably raise the cost of cutting, but this will be compensated for by their extra 'brilliancy.' 'Boart' should be eagerly sought for." (Report on New South Wales Diamonds by Thos. Davies, F.G.S., and R. Etheridge, jun., p. 8.)

It will be seen from the description I have given of the various formations of this locality that the diamantiferous deposits are very different from those in which diamonds are obtained at Kimberley, South Africa. Here the deposits consist of river drifts, which occur spread over the denuded surfaces of the bed-rock

bed-rock of the district. In South Africa, although diamonds were formerly worked in the drift deposits of the Vaal River, the chief source of the diamond now is in the neighbourhood of Kimberley, where they occur embedded in a curious agglomerate, which fills a series of elliptical pipe-like hollows passing vertically through the sedimentary bed-rock of the district. These hollows are supposed to be the necks or pipes of ancient volcanoes, and are, with the rock which fills them, and which is the matrix of the diamond, of volcanic origin. It may be that in this Colony the diamond has not yet been traced to its matrix, but there can be no doubt that the Bingera deposits differ widely both in origin and character from those at Kimberley.

From the barometric observations which I obtained of the edges of the basalt and of the outcrops of the pipeclays and gravels, I find that in all probability an old river channel occurs below the basalt on which Smith's and Butler's selections are situated. To the N.E. of Lowe's shaft, along the Narrabri Road, the sedimentary rock is still seen forming a series of hills, which rise above the level of the basalt, the lower bed of which runs against the older sedimentary bed-rock, this showing that here we have the side of the old valley, while immediately to the west of the W.R. 418 there is a high ridge of sedimentary rock running in a N.W. and S.E. direction. This ridge now rises above the top of the lower basalt, and in Tertiary times was no doubt a much greater height. Pebbly wash was found, 18 feet in thickness in the shaft which was sunk at the southern end of the basalt near Five-mile Creek. There is also an outcrop of pebbly wash exposed by a deep bend of the creek which flows south along the edge of the basalt into Five-mile Creek. Some distance to the north of this, where a fence crosses the creek, there is an outcrop of pipeclay which has a slight dip to the S.W. The lowest level of this edge of the basalt at which I have noticed the pebbly wash is to the S.E. of Smith's conditional purchase 71, where the creek, by taking a sharp bend, has exposed a small cliff of wash overlaid by a good thickness of pipeclays. These facts, I think, would show that here we have the old Tertiary valley still defined by the hills of sedimentary rock which enclosed it, although these are now very much denuded, and consequently much lower than they were in Tertiary times.

All over the district the denuding agents have more easily denuded away the hills of sedimentary rock than the basalt which filled the Tertiary valleys, and consequently most of the present valleys and low-lying flats have been scooped out of the sedimentary rock, leaving the hills capped with basalt.

To bottom a shaft on the basalt plateau on which Lowe's shaft has been put down it would require to be at least 500 feet deep, for, as shown by the shaft already sunk, the upper basalt is here about 100 feet thick, and below it there are about 100 feet of sands and clays, while the lower basalt is at least 300 feet thick. I consider this locality to be perhaps the most promising part of the field, and think that it ought to be prospected. Another part of the field which has shown every appearance of producing good results both in gold and diamonds, if opened up, is at Craddock's claim, M.L. 126.

I have estimated the extent of the various isolated patches of diamantiferous wash on the flat to the east of the basalt range to be roughly about 150 acres. The amount of wash under the basalt cannot as yet be computed, as it has not been prospected sufficiently to indicate its probable extent.

In conclusion, I beg to state that there is in this district a series of basalt-capped ranges which no doubt contain in many places below the basalt Tertiary river deposits similar to those from which the diamonds have been obtained at the sources of Eaglehawk and Doctor's Creeks.

I have, &c.,
WILLIAM ANDERSON,
 Geological Surveyor.

The Geological Surveyor-in-Charge.

APPENDIX No. 10.

Sir, Department of Mines, Sydney, 11 July, 1887.

In accordance with your instructions, I proceeded to the diamond-drill bore near Mittagong, and witnessed the drawing of the cores from the time the first coal was struck, on 23 June, until the coal seam was passed through on 7 July.

On my arrival the engineer informed me that the actual depth bored was 605 feet. At this depth a seam of bituminous coal, 2 inches in thickness, was struck. This was the first coal passed through below the Hawkesbury sandstones. I was present during the boring of 47 feet 10 inches below it, and witnessed the raising of the cores corresponding to that depth.

The following is a section of the strata passed through:—

Section of Diamond-drill Bore near Mittagong.

	Ft. in.	
	0 0	Sandstone.
	0 2	Bituminous coal.
Depth of first coal, 605 feet	2 0	Black shale.
	6 2	Sandstone and grit.
	0 4	Black shale.
	0 5	Splint and bituminous coal.
	0 9	Black shale.
	0 4	Fireclay.
	0 4	Black shale.
	0 7	Fine-grained sandstone.
	0 5	Black shale.
	0 2	Fireclay.
	1 2	Splint coal (inferior).
	0 1	Band.
	0 10	Bituminous coal (inferior).
	0 1	Band.
	1 8	Splint coal (inferior).
	1 6	Fireclay shales.
	0 4	Coaly shales.
	0 7	Splint coal (stony).
	0 1	Band.
	0 7	Coaly shales.
	0 8	Splint coal.
	0 1	Band.
	0 6	Coaly shale.
	1 3	Splint coal.
	0 1	Band.

			Ft. in.	
			1 4	Splint coal.
			2 10	Fireclay shales.
			1 6	Splint coal (stony).
			0 2	Fireclay shales.
			0 1	Bituminous coal.
			0 1	Band.
No. 4 Analysis	{	Sample G.	2 2	Bituminous coal.
			0 5	Fireclay shale.
			0 10	Coaly shale.
No. 3 Analysis	{	Sample F.	1 5	Splint coal.
			0 3	Black shale.
		Sample E.	1 0	Bituminous coal.
No. 2 Analysis	{	Sample D.	0 2	Splint coal.
			2 10	Bituminous coal.
		Sample C.	0 1	Band.
No. 1 Analysis	{		0 2	Splint coal.
			0 10	Bituminous coal.
		Sample B.	0 2	Splint coal.
			0 1	Band.
			0 2	Splint coal.
			0 4	Bituminous coal.
			0 1	Coaly shale.
			3 4	Bituminous coal.
			0 2	Band.
			5 0	Bituminous coal.
			0 8	Coaly shale.

Workable seam.

The cores when brought up were considerably broken, particularly those of the bituminous and splint coals, although, taken as a whole, the core was a fairly good one. This was, no doubt, due to the fact that the special core barrel was largely used after the coal was first struck.

Four samples of the principal seams of coal gave on analysis the following results:—

No.	Moisture.	Vol. Hydrocarbon.	Fixed Carbon.	Ash.	Sulphur.	Sp. Gr.	Coke.
1	1.35	25.77	60.06	12.24	0.56	1.347	72.30
2	1.40	24.61	59.22	14.08	0.69	1.376	73.30
3	1.65	27.87	52.30	17.40	0.78	1.420	69.70
4	1.17	19.25	47.59	31.42	0.57	1.338	79.01

From these results it will be seen that the workable portion of the seam is 8 ft. 11 in. thick, containing 8 ft. 8 in. of bituminous coal.

The following is the section of the seam, the top of which is 642 feet from the surface:—

Roof, splint coal.	Ft. in.
Bituminous coal	0 4
Coaly shale	0 1
Bituminous coal	3 4
Band (dark)	0 2
Bituminous coal	5 0
Floor, coaly shale.	

Samples Nos. 1 and 2, taken from this seam, are bright bituminous coals of good quality containing some thin streaks of splint coal. They are fairly good coking coals, the coke swelling considerably, and becoming hard and firm. The percentage of ash in the lower part of the seam (sample No. 1) is 12.24, and in the upper part (sample No. 2), 14.08. This amount of ash is not excessive, and would not prevent the use of the coal for domestic and steam purposes. The colour of the ash is gray. A sample of ash, taken from the 4 in., 3 ft. 4 in., and 5 feet coals of the workable seam, gave the following analysis:—

	In 100 parts.	
Silica	67.10	} Insoluble in acids, 88.42
Alumina	21.32	
Alumina	6.37	} Soluble in acids, 11.53
Protoxide of iron	4.01	
Protoxide of manganese	trace	
Lime	0.81	
Magnesia	trace	
Phosphoric anhydride	0.22	
Sulphuric	trace	
Alkalies and loss	0.17	
	100.00	

The low percentage of sulphur in the coal, together with the small amount of phosphoric and sulphuric anhydride in the ash, will enhance the value of the coal for smelting purposes.

I have, &c.,

WILLIAM ANDERSON,
Geological Surveyor.

The Geological Surveyor-in-Charge.

APPENDIX No. 11.

Sir,

Bourke, 20 August, 1887.

In accordance with your instructions, I have made an examination of the Limestone at Upper Lewis Ponds, 16 miles to the north of Orange, and have the honor to forward my report thereon.

Between Orange and Lewis Ponds the strata consist of highly altered and metamorphosed lower Palaeozoic rocks. The limestone at Upper Lewis Ponds occurs as two lenticular beds separated by a few beds of altered slates. They outcrop on the side and top of a high and steep range, and, with the accompanying talcose and chloritic slates, dip at a high angle to the east.

The

The limestone is compact and of fine texture. At the outcrop it is greyish white in colour, but at greater depths, as can be seen in the tunnel which has been driven into the side of the hill to catch the limestone, it has a bluish tinge. It contains numerous fossil remains, consisting of Brachyopoda and the broken stems of Encrinurus. Small nests of crystalline calcite occur scattered throughout the limestone. The beds are of considerable thickness. In extent it is limited, the outcrop of the lenticular beds being confined to a 20 acre mineral lease (508).

It is suitable for the manufacture of lime, and is conveniently situated for metallurgical purposes to aid in the smelting of the ore of the neighbouring silver lode. The presence of the crystalline calcite in it however, would prevent its indiscriminate use for polishing and ornamental purposes, although slabs of considerable size could no doubt be obtained by carefully selecting portions which are free from crystalline calcite. It is somewhat splintery, and this would militate against its use for sculptural purposes.

The nearest railway station to the deposit is Orange, which is 16 miles distant by road. This road is somewhat hilly, and is very bad and soft in wet weather, although it is reported in the district that it is to be improved shortly. On the road there are two creeks to be forded which are impassable when in flood.

It will thus be seen, that this deposit will have a local value for the extraction of lime from it and for metallurgical purposes, but I do not think that it will be of any great commercial value for the various ornamental uses to which a good marble could be put.

I have, &c.,

WILLIAM ANDERSON,

Geological Surveyor.

The Geological Surveyor-in-Charge.

APPENDIX No. 12.

Report on the Geology of the Byerock District.

Sir,

Geological Survey, Department of Mines, Sydney, 9 October, 1887.

In accordance with your instructions I visited Coolabah and Byerock, in the counties of Canbelego and Cowper, and having made a general examination of the geology of the surrounding districts, I have now the honor to submit my report thereon.

After visiting Coolabah I went on to Byerock, from which place I made numerous excursions in various directions into the surrounding country. The area embraced by my examination extends westward as far as the southern extension of the Gundabooka Mountains, southward for some miles past Coronga Peak, eastward for over 20 miles towards Gongolgon, and northward for over a dozen miles to Mr. Oliver's station, Kenilworth.

Most of this country appears to any one passing over it to be perfectly flat, but this is not actually the case, for although much of it consists of approximately level plains, there are in reality great numbers of small ridges and rising grounds, while at wide intervals a few isolated hills rise to a considerable height above the plains. These physical features can only be appreciated when a panoramic view of the country is obtained from one of the higher hills, such as Coronga Peak, Mount Dijon, or the Gundabooka Mountains. From such points of vantage the whole country is seen to present a series of broadly waving undulations, with the circular horizon only broken at one or two points by a few far off isolated hills rising above it. The country is thinly timbered, and the timber is, as a rule, of small size; this no doubt being due to the former prevalence of bush fires, together with the natural dryness of the climate. The most common trees are the mulga, box, beefwood, and ironwood. The scrub is only locally dense, and never impenetrable. Frequently wide open patches occur altogether free from timber, while everywhere the luxuriant growth of grass tells of the fertility of the soil. Watercourses and natural gullies are rarely met with. The chief watercourse of the district is Mulga Creek, which, although it generally contains some water, seldom flows as a creek for any length of time.

The geological formation of the district is an extension northwards of the lower palaeozoic rocks (silurian?) which occupy so wide an area to the south of Girilambone and Cobar, west of the Bogan River. Passing to the north from Girilambone, the hills and rising grounds gradually occur less frequently, and the flats become more numerous and extensive until between Byerock and Bourke the country assumes a real plain like character, similar to that produced by the horizontally bedded cretaceous rocks to the north of the River Darling.

The rocks which occur in this district are as follows:—

Igneous	...	{	Leucite basalt.
			Granite.
			Red soil.
Aqueous	...	{	Quartzites.
			Siliceous sandstones, grits, and conglomerates.
			Loose quartz conglomerates.
			Silurian slates.

The silurian or auriferous formation, together with a few small patches of granite form the base rock of the country. The hollows and irregularities in the surface of these formations have, however, been filled with siliceous sandstones, grits and conglomerates, probably of Cretaceous or Tertiary age, thus producing an approximately level country, over which the flood-loams, known as "red soil," have been deposited.

Leucite Basalt.—Byerock Mountain, 6 miles to the west of the township, consists of leucite basalt. In Ulrich's catalogue of the rocks of Victoria there is no mention of this basalt. Indeed, it is a form of basalt that is of very rare occurrence and is one of the forms of lava which have been erupted from Mount Vesuvius, near Naples, in Italy within historic times. At Byerock, however, the eruption probably took place in late Tertiary or early Pleistocene times. The basalt now occupies an area of about 3 square miles, although in former times it must have been more extensive. At its western extremity it is over 100 feet thick, while towards the east it gradually thins off. It occurs in the vicinity of a granite dyke over a quarter of a mile in width. I think it probable that the orifice from which this basalt flowed as a lava was at the western end of the mountain where the bed is thickest, and that it was probably situated on the line of weakness between the granite and the slate. There is no other basaltic rock in the country I examined, nor did I come across any rock which showed evidences of having been the orifice from which this lava flowed.

Granite.—This rock occurs only in a few small patches. It comes to the surface immediately to the south of Byerock Mountain, and on the railway at the 456-mile peg, and also about half a mile to the west of the township. It is on the surface of this last outcrop of granite that the natural waterhole occurs from which the township takes its name.

Quartzites.—Some of the highest hills in the district are composed of this rock. Coronga Peak, which rises nearly 900 feet above the neighbouring station, and the hills immediately to the north of it consist of quartzite, and so, also, do the ridges which come southward from the Gundabooka Mountains. (See Diagram No. 2.) The higher of these two ridges is about 800 feet above the plains. The upper surface of the bed of quartzite, which dips E. 25 N. at about 30°, forms the eastern slope of the ridge, while its western face is precipitous and rocky. On Curraweena Hill beds of quartzose sandstones occur interbedded with the silurian slates.

Siliceous Sandstones, Grits, and Conglomerates.—These have been exposed in a railway tank, a few hundred yards to the south of the township. The tank is only 16 feet deep, so that the bottom of the beds is not exposed. Similar beds no doubt occur under many of the other flats of the district. No fossils have yet been found in these beds to indicate their age, but they are probably Cretaceo-Tertiary deposits.

Quartz Conglomerate.—This consists of a gritty matrix, in which are embedded angular, sub-angular, and rounded pebbles, chiefly of quartz, with a few pebbles of slate and jasperoid rock. It shows false bedding, and frequently contains lenticular beds of grey and greenish clay-shale, while locally it is hardened into a cement by peroxide of iron. The pebbles are all small, averaging from 1 to 3 inches in diameter. It is widely distributed, occurring at Wilga, Coolabah, and Byerock. The deposit at Wilga has been largely used as ballast for the railway line to Bourke. At Coolabah two shafts have been sunk in this loose conglomerate, one for 70 ft., and the other for over 100 ft. This latter shaft was bottomed on the silurian slates. (See Diagram No. 1.) The deposit at the bottom of this shaft gave, when washed, a few specks of gold to the dish. It occurs under many of the flats in the district, and in many cases it has been cut into in excavating tanks. There is little doubt that it has been derived either primarily or secondarily from the denudations of the silurian or auriferous rocks, and consequently there is every probability that the pebbly drift occurring in the potholes and inequalities on the surface of the bed rock may contain a fair amount of gold, although its occurrence will be patchy.

Sixteen miles to the east of Byerock, near Defoe's tank, a series of shafts have been sunk, some of them over 40 ft. deep. They pass through a pebbly quartz drift, which in places is cemented into a very hard conglomerate. In some of the shafts a few colours of gold have been got to the dish. This is evidently a similar deposit to the quartz conglomerate of Coolabah and Wilga, except that here there are evidences of an old river course (probably Pleistocene) coming down from the gully in which Defoe's tank is situated.

Silurian Rocks.—These form the base rock of the district, and crop out on the ridges and hills wherever they rise above the surface of the red soil. They consist of talcose and chloritic slates, with quartzose sandstones, and indurated clay slates, which show well marked cleavage in some of the sections on the railway, particularly in the first 5 miles between Byerock and Bourke. At Mount Dijou small blocks of limestone are scattered about, even on the top of the mountain itself. I did not, however, see the bed of limestone *in situ*. Throughout these rocks are many quartz reefs, which as a rule do not show much mineral. In numerous localities in this district there are surface indications of the presence of ironstone lodes. Samples from a few of these have been assayed, but have given no return. The ridgy country lying between the Bogan River and the railway line seems to be the most likely part of the country to repay prospecting for alluvial gold. In the flatter part of the district, the places where prospecting ought to be begun, are in the small gullies which drain off the isolated hilly ranges. There can be little doubt that, during the Tertiary and early Pleistocene Periods when this country possessed such a very moist climate, there had been numerous river-courses draining this area. During later Pleistocene times all this country had been more or less flooded, and from these floods were deposited the red soil, the red colour being due to the greater amount of oxidation which this has undergone compared with the black overflow muds which are spread over the country in the neighbourhood of the present rivers. The presence of this coating of red soil has obliterated all the surface indications of these old river courses. The flats lying between the ridges of slate rock, doubtless, in many instances, represent old valleys, but whether the drift at the bottom of these contains payable gold or not can only be proved by prospecting them.

In conclusion I have to record my thanks to Mr. Little, of Curraweena, and also to Mr. Burton, of Coronga Peak, for their kindness in affording me information and assistance while examining the country.

I have, &c.,

WILLIAM ANDERSON,
Geological Surveyor.

The Geological Surveyor-in-Charge.

No. 1.—RAILWAY SECTION AT COOLABAH.

Scale—1 in. to 1 mile.

Vertical scale exaggerated.

No. 2.—SKETCH SECTION ACROSS SOUTHERN SPUR OF GUNDABOOKA MOUNTAINS.

APPENDIX No. 13.

Sir, Department of Mines, Geological Survey Branch, Sydney, December 12, 1887.

In accordance with your instructions I have examined the country between Nyngan, Nymagee, Cobar, and Girilambone, in reference to its general geology, and particularly as to the portions of it which should be prospected for alluvial gold and other minerals.

In the neighbourhood of the Bogan River extensive plains occur, which to the westward are broken up into undulating country by the presence, at intervals, of low north and south ridges of Silurian slates; while around Cobar and Nymagee the country assumes quite a hilly character, some of the hills attaining to a considerable height.

The Pleistocene red soil covers all the low-lying and undulating country, except in the immediate vicinity of the river-courses and gullies, where the soil is of a dirty grey colour. There can be little doubt that the wind has been one of the chief factors in the very general distribution of the red soil. Since its deposition as a flood-loam over large areas in the neighbourhood of the rivers it has been universally distributed over the whole of the interior plains. Anyone who has experienced the periodical dust-storms which sweep over this flat country, not only sees the red soil in process of distribution but will easily realize the great transporting power which the wind possesses, particularly during a dry season when there is little or no grass to fix the surface soil.

The prevailing rocks of the district I examined consist of Silurian slates, sandstones, limestones, and conglomerates. These as a rule stand nearly vertically and have a general north and south strike. It is in fissures traversing these rocks that the copper lodes of Cobar and Nymagee occur, there being no igneous rock in the immediate neighbourhood of either lode. The limestones outcropping near the Rookery station between Cobar and Nymagee are abundantly fossiliferous. Fossils from these limestones have been examined by Mr. Etheridge, Palaeontologist to the Geological Survey, who regards them as being of Wenlock or Upper Silurian age.

The conglomerate outcrops in many places for high hills, such as Billagoe Mountain, to the north of Cobar, Narri Narri Mountain, and the range of hills running along the eastern boundary of the county of Mouramba, to the north of Nymagee. These conglomerates are of Silurian age, being interbedded with the slates and limestones.

There are, however, other conglomerates in this district as the conglomerate of Bobby Mountain, 30 miles east of Cobar, which may on examination be found to rest unconformably on the Silurian, and prove to be a Devonian outlier. To the west and south-west of Nymagee there is a large area covered with reddish sandstones and thin-bedded sandy shales, which, from the few surface dips I was able to observe, seem to rest unconformably on the Silurian rocks below. These are probably Devonian. Again, to the north-east of Nymagee, in the parish of Barrow, on Babinda run, a set of red coloured grits and sandstones occur, from which a few fossil remains have been obtained. These have been examined by Mr. Etheridge, who finds that one form is distinctly carboniferous while the other is decidedly an Upper Devonian form. From their petrological characters I think that these beds will prove to be rather Upper Devonian than carboniferous.

Of igneous rocks there occur in the district granite, quartz, felspar porphyry and leucite basalt.

In the immediate vicinity of Nymagee granite occupies a considerable area to the north and east. This mass of granite is partly intrusive and partly metamorphic. On its northern boundary, where it is crossed by the track from Cobar to Nymagee, there is no gradual transition from the slate into the granite, which is here a wholly crystalline ternary granite; but on the range of granite hills, which lies a few miles to the east of Nymagee, the metamorphism from the slate into the granite is clearly and beautifully seen. On the flat between the township and these hills, the slates are altered and hardened, but with no crystalline developments in them. On nearing the hills, however, crystals of quartz and felspar gradually begin to appear in them, and then these crystalline minerals become arranged in more or less irregular wavy lines, giving the rocks a gneissose structure, which by gradual transitions passes into a wholly crystalline ternary granite. I think there can be little doubt that this metamorphism of the slates has been produced along the edges of the intrusive mass of granite.

Granite crops out about 28 miles north of Cobar, on the Bourke road. It is seamed with quartz veins, and is probably a dyke running in an easterly and westerly direction.

About 7 miles from Nymagee, on the Nyngan road, a dyke of fine-grained elvanite occurs, running in an east and west direction. A few miles further on the road crosses a broad belt of quartz and felspar porphyry. From this point the porphyry can be traced northwards, till it crosses the Cobar and Nyngan road, about 30 miles from Cobar, where it terminates about $\frac{1}{2}$ a mile to the north of the road.

Hitherto, the only locality in New South Wales, and probably in Australia, from which leucite basalt has been recorded, was Byrock Mt., about 50 miles south of Bourke. While examining the country to the north-west of Cobar, accompanied by the Rev. J. M. Curran, I visited a hill called El. Captain, situated near the northern boundary of Sussex run, in the north-east corner of the country of Camelego. Like Byrock Mt., these hills are perfectly bare of trees, and consist of leucite basalt. The most westerly ridge is about a mile in length, and of no great height. About half

way

way along its eastern edge, and at its southern end the basalt is seen to rest upon quartzite and calcareous conglomerate, which may be a consolidated river drift. About a mile to the south-east of this lies the main mass of basalt forming the heights known as "El Capitain." The highest of these is an isolated, precipitous, and somewhat conical knob, about 200 feet in height. Here the basalt shows a pseudo-lamination, which gives it a slaty character. It occurs in all degrees of textures, from scoriaceous with included pebbles of slate, to compact. Immediately to the north of this a ridge of basalt stretches for about 2 miles in an east and west direction, while some miles to the south several low hills could be seen which were bare of trees, and are no doubt composed of leucite-basalt. "El Capitain" lies in a straight line, about 33 miles due north from Byerock Mount. In the country between these two hills there is no evidence whatever of the presence of leucite-basalt, and consequently it is rather doubtful whether these two separate patches ever formed portions of the same lava flow.

In many parts of the district isolated patches of Cretaceous-Tertiary rocks occur. These are seen in the excavations made for tanks, and consist of hardened clays, quartzites, siliceous, sometimes calcareous grits and conglomerates. At the Brick-kilns, about a mile to the north of the Rookery Station, occurs a curious hill, formed of a considerable thickness of hardened white clay and grit, which is capped by a thin bed of quartzite. This is no doubt a remnant of a Cretaceous-Tertiary deposit which has resisted denudation owing to the capping of quartzite, which was probably a local spring deposit, such as we commonly find occurring elsewhere in the Colony in connection with Tertiary rocks.

The country in the neighbourhood of the intrusive quartz and felspar porphyry between Nymagee and Bobby Mt. appears favourable to the presence of metalliferous lodes.

Thirty miles to the south of Nyngan a largely porphyritic hornblende rock of the diorite type occurs. It is probably in the form of a dyke, and a quartz-reef, containing gold, silver, and copper occurs in connection with it. I would recommend that the alluvial ground lying within 1 mile north of the outcrop of this belt of dioritic rock be prospected for gold.

There is at the head of Trowel or Whitbarrow Creek an extensive flat situated about 10 miles to the north of Nymagee, where a certain amount of alluvial gold has been obtained, but further prospecting had to be abandoned on account of the scarcity of water. I should recommend that this part of the district be prospected by a Government party.

In this part of the Colony there is little to indicate the presence of former drainage channels, in the drift of which it might be expected that gold would occur wherever these channels had passed over auriferous reefs or lodes. Almost all the physical features which existed during late Tertiary and early Pleistocene times have been well nigh obliterated, not so much by local denudation as in other parts of the Colony, but by a very general levelling of the whole country, due to the distribution of the red soil. There can be little doubt that during the very moist Tertiary and Pleistocene Periods this large district was drained by a system of rivers and creeks, which must have worn channels for themselves, in some parts of their course through the Silurian rocks, and in others through the Cretaceous-Tertiary deposits. Such channels have, however, since then, been altogether obliterated by the universal distribution of the red soil and in consequence of the gradual drying of the climate. At the present time there are a few shallow watercourses, many of them hardly appreciable to the eye, but wonderfully persistent in their extent, which, however are almost always dry. It is I think quite probable that in some cases these may indicate the position of former channels; if this be the case the best means of testing these would be the prospect in the immediate neighbourhood of the present watercourses. While in the district, I heard of various places, where after a storm, the drainage in certain watercourses suddenly disappears underground at a certain spot. The reason for this I believe to be that at such places an old buried drainage-channel has been struck by the waters of the present creek, whose course, at this point, passes above an old channel. These buried channels no doubt carry off a large percentage of the surface water which is thereby lost to the pastoralist.

With regard to the water supply of this country, from a line between Nyngan and Nymagee north to the Darling, I would state that on the greater part of this country, where the Silurian rocks come near the surface and are covered only by a comparatively thin superstratum of red soil, the water supply will require to be conserved in superficial tanks. In such parts however where the Cretaceous-Tertiary clays and grits, &c., occupy depressions in the Silurian rocks, it is probable that a small local supply of water might be obtained by boring or sinking, while by the tapping of the old buried watercourses, no doubt large supplies of water could be got. But taken as a whole, this large tract of country will, in the future, have to depend for its water-supply chiefly upon its artificial tanks and dams.

In conclusion I beg to record my thanks to Mr. Prince, of Nyngan, and the Rev. J. M. Curran, of Cobar, for the kind assistance and information which they gave me during my examination of the district.

I have, &c.,

WILLIAM ANDERSON,
Geological Surveyor.

The Geological Surveyor-in-Charge.

APPENDIX No. 14.

Report of the Palæontologist for a portion of the Year 1887.

Sir, Department of Mines, Geological Survey Branch, Sydney, 3 January, 1888.

I have the honor to hand you the following "Progress Report" of work performed since I commenced the duties of Palæontologist to the Geological Survey Branch of this Department, on 18th April, 1887.

After consultation with yourself, it was arranged that my attention should be mainly devoted to naming and preparing for publication an illustrated Monograph of the Carboniferous Fossils of New South Wales, to assist in working out the stratigraphy of the Coal Measures and other associated beds.

This has progressed as rapidly as circumstances will permit, and up to the present time, I have determined and described in manuscript the Corals and Echinoderms, so far as they are represented in the collection; and some progress has been made with the Crustacea. I regret to say, however, that the collection does not now contain a large number of species known to occur here, and described in the late Professor de Koninck's work,* and other publications. It appears to me, therefore, most desirable that the description of the above groups (which may well form the first part of the proposed Monograph) should not be published, until as many as possible of the species mentioned have been procured.

You

* Recherches sur les Fossiles paléozoïques de la Nouvelle-Galles du Sud, 8vo. and 4to., Bruxelles, 1876-77.

You were kind enough to authorize the carrying out of a suggestion of mine in relation to the future conservation of the surplus portion of the collection, or that part not exhibited in the Museum, by having a room specially fitted with shelves and portable trays for its reception. Up to the present time about one-third of the specimens have been sorted, and transferred from the old store-room.

A large number of miscellaneous determinations have been made, chiefly specimens presented or obtained by the surveyors during their field-work. The more important of these have been specially reported on under the general heading of "Miscellaneous Contributions to the Palæontology of Australasia," and are comprised in the following sub-report, Nos. 1-6 inclusive.

The fine collection of fish remains obtained near Gosford, were despatched to Mr. A. S. Woodward, of the Geological Department, Natural History Museum, London, who has undertaken their description. In view of this contemplated publication, and the second edition of Dr. O. Feistmantel's "Palæozoic and Mesozoic Plants of Australia," now on its way to you, I have prepared descriptions of the limited invertebrate fauna, known to occur in the Hawkesbury-Wianamatta Series. This is ready for the printer, and will require a lithographic plate for its illustration.

In addition to the above work, I assisted the Curator in preparing the latter part of the exhibits for the late Adelaide Jubilee Exhibition, and I have organized, and aided in the arrangement of the Departmental Library.

The Geological Surveyor-in-Charge.

I have, &c.,
R. ETHERIDGE, JUNR.,
Palæontologist.

APPENDIX No. 15A.

Miscellaneous Contributions to the Palæontology of Australasia, by Robert Etheridge, jun., Esq., Palæontologist, Geological Survey of New South Wales.

No. 1.—Report on the supposed Fossiliferous Limestone from near Adelaide.

Sir,

I have the honor to inform you that I have examined both macroscopically and microscopically the block of limestone brought by yourself from near Adelaide, and I regret to say that I have failed to detect any trace of organic structure in it.

As seen in the block it presents a distinctly laminated, or concentric and somewhat waved appearance, especially on weathered surfaces, where some portions of the face have disintegrated more rapidly than others. Such layers from their difference in colour stand out in bolder relief than the general mass of the rock, and having a thin, hackly appearance, present a strong resemblance to the fossil known as *Stromatopora*.

On a large polished surface the limestone is seen to be seamed with thin layers, streaks, and lenticular masses of a greenish-yellow mineral, which on weathering forms the layers standing out in bolder relief. This is very apparent from the fact that the different degrees of hardness affect the height of the polish, the limestone polishing well, the harder layers remaining dull and unpolished.

Thin slides prepared for the microscope at once prove the non-organic structure of this rock, it becoming apparent that the greenish-yellow layers are not organic, but of mineral origin, in the form of wavy and feathery streaks, and irregular patches. The limestone is of an homogenous character, somewhat fractured here and there; it effervesces freely with acids, the insoluble portion, from experiments made by Mr. J. C. H. Mingaye, being only 25.7 per cent. The residuc consists of silicate of alumina with traces of lime and magnesia, and no doubt represents the darker and harder layers seen on the weathered surface of the limestone, and giving to it its organic appearance.

Lithologically the block on a fractured surface presented a strong resemblance to a travertine; so much so that one may hazard a conjecture as to its mode of deposition, viz., from a thermal spring, the siliceous layers being the result of after metamorphism. This is, however, a question for settlement in the field.

Mr. Mingaye remarks that this limestone "would be a very likely sample for the manufacture of Portland cement."

I have, &c.,
R.E., 16/11/87.

APPENDIX No. 15B.

No. 2.—Report on a Diatomaceous Earth from the Tertiary Beds of Warrumbungle Mountain, near Coonamble, county Gowan, New South Wales, forwarded by Mr. D. Vernon, Secretary for Railways.

THE specimen presents the usual appearance of diatomaceous earth, being white in colour, compact, homogenous, light and non-pulverulent, slightly soiling the fingers when touched. From the subjoined analysis by Mr. J. C. H. Mingaye, the earth will be seen to contain 82.62 per cent. of silica. The latter is derived from the skeletal remains of a diatom and a sponge, that of the former being largely in excess.

The frustules of the diatom are short-barrel or drum-shaped, with the extremities straight, or perhaps very faintly rounded. In transverse section these bodies appear to be globose, or almost circular, and without any definite keels or furrows around their centres. The junction surfaces are toothed, and the general surface of each frustule beautifully sculptured with dots, apparently arranged in linear series. These dots are believed by some microscopists to be punctured, by others to be elevations of the surface. The frustules are coherent in chains, as many as four still retaining their attachment. In a few cases the interposed connecting third segments are also visible. As well as the scattered frustules, the mountings (prepared by Mr. T. Whitelegge, of the Australian Museum) exhibit numbers of agglomerated masses freely distributed about, which appear to consist of broken up frustules, with a few entire cells intermingled with them. These are probably portions of the original earth not sufficiently broken up for minute examination, and would go to prove that the mass of the deposit is composed of comminuted frustules rather than entire cells. Under a $\frac{1}{4}$ -inch power the field is seen to be clouded with minute siliceous particles, probably of this nature. The characters of this diatom correspond well with those assigned by Pritchard to the genus *Melosira*, and the frustules very closely resemble those of *Melosira orichalcea*, except that our examples do not show the two median furrows crossing each frustule transversely.

The

The sponge skeletal spicules accompanying the above diatom are of great interest from their close resemblance to those of the existing Australian fresh-water sponges. They are very slightly curved, and acute at both ends, or would probably come under the term *fusiform-acerate*, as used by the late Dr. Bowerbank, and minutely denticulated. Only one entire spicule has come under notice, the majority of the individuals occurring only as fragments. All, however, exhibit the axial canal in great perfection, which for the size of the spicules appears to be large and well developed.

In the living Australian fresh-water sponges the skeletal spicules are both plain and serrated. In *Spongilla Capewelli*, Bowerbank,† from Lake Hindmarsh, Victoria, they are plain, but in two Brisbane species, *S. sceptroides*, Haswell,* and *S. botryoides*, Hasw., the spicules are covered with minute projecting points. On the other hand, in *Meyenia Ramsayi*, Hasw.‡, from the Bell River, Wellington, the spicules are perfectly smooth. For the present, it will be more convenient to regard the spicules under description as those of *Spongilla* simply.

Mr. Mingaye has furnished the accompanying analysis of the earth:—

Moisture at 105° C.	7.70
Combined moisture	3.49
Silica	82.62
Alumina, oxide of iron (trace)	5.20
Carbonate of lime	0.95
Carbonate of magnesia	trace
						99.96

R.E., 25/11/87.

APPENDIX No. 15c.

No. 3.—Report on supposed Corals forwarded by Mr. Geological Surveyor T. W. B. David from the Upper Marine Series (Permo.-Carboniferous) of Mount Vincent, near Minmi, County Northumberland, New South Wales.

THE blocks of supposed coral forwarded by Mr. Geological Surveyor David have, at the first glance, very much the appearance of a massive compound rugose coral, resembling the genus *Lithostrotion* or one of its allies. On close inspection, however, and especially when submitted to microscopic examination, the rock is at once seen to be of inorganic structure. The masses are oval, or irregularly elongate, measuring as much as 2 feet in diameter, and are in fact an impure carbonate of lime, assuming a peculiar form of crystallization.

On a fractured face the colour is blue-gray, the surface breaking up with a rough rubbly appearance. Surfaces exposed to the atmosphere, weather with a buff-yellow colour, and assume a more or less flattened-mammillated appearance, composed of nodular depressed elevations from $\frac{1}{4}$ in. to 1 in. in diameter. These without doubt do present a likeness to a group of large corallites of a compound rugose coral, the interspaces between them representing the well-marked walls of the corallites. This deceptive appearance is heightened by a central depression to each of the mammillated eminences, and would represent the columella in such a coral.

Each of these mammillæ is composed of a series of radiating acicular crystals, the columella-like depression just spoken of, representing the centre of crystallization, from which the tapering crystals radiate.

When these projections are weathered to a common level, they assume a well-marked silky lustre resembling that of Arragonite.

Thin sections prepared for the microscope admirably reveal the radiate structure of the individual groups, and further show that the cementing medium, which is always of a lighter colour, contains minute, almost microscopic, tufts of similar crystals, and in this manner demonstrates the origin of the larger ones.

From experiments made by Mr. J. C. H. Mingaye, the rock would appear to be a carbonate of lime and iron, the former mineral in by far the greater proportion. It would also appear that the lighter coloured cementing medium contains much less iron than the groups of acicular crystals.

R.E., 25/11/87.

APPENDIX No. 15d.

No. 4.—On the age and contents of a Fossiliferous Limestone, discovered by the Rev. J. Milne Curran, between Cobar and Nymagee, New South Wales.

THE hand specimens forwarded by the Rev. J. Milne Curran, from between Rookery Station and Mount Narri Narri, half-way between Cobar and Nymagee, and those subsequently collected by Mr. Geological-Surveyor W. Anderson at the same locality, consist of a dark grey-blue fossiliferous limestone, with a more or less conchoidal fracture. The organic remains, of which it is so largely composed, indicate an Upper Silurian age, and a position probably near the Wenlock Limestone, if not absolutely representing that horizon.

The specific determination of all the fossils would take some time, and more material than at present to hand. A considerable portion of the limestone, however, seems to be composed of bivalved crustaceans, belonging to the Ostracoda, probably several species, but certainly amongst them is a *Beyrichia*. Fragments of Trilobites are also present, but too much broken up to be determinable. There are portions of Polyzoa, chiefly *Fenestella*; and one coral, a *Heliolites*, but only a fragment. But the indicative information is to be gathered from the mollusca. There is a *Chonetes*, allied to *Chonetes striatella*, Dalman, but possessing more upwardly-directed spines along the hinge margin. The genus *Spirifer* is well represented by a small form strongly resembling the characteristic Wenlock shell *S. plicatella*. This species passes through many varieties, two of which are certainly represented here.

There

† Proc. Zool. Soc., 1863, p. 447.

* Proc. Linn. Soc. N. S. Wales, 1883: VII, Pt. 2, p. 209.

‡ Loc. cit., p. 210.

There is the simple condition of the shell with striae only, and no ribs, known under the varietal name of *lineata*; and there is one with broad, rounded costae, answering to the variety *interlineata*, Sby. The second species of *Spirifera* I am at present unable to distinguish from *S. crista*, Linn., and it is the most prevalent shell.

The most important species is a small *Strophomena*, corresponding, in all but size, with the peculiar and characteristic *Strophomena corrugatella*, Davidson. The surface is longitudinally traversed by strong, narrow, thread-like riblets, the interspaces bearing concentric, irregular festoon-like wrinkles, giving to the shell a not easily forgotten appearance.

Amongst the specimens more particularly collected by Mr. Anderson, there is a single example of a shell having all the appearance of *Atrypa reticularis*, Linn., a fragment which I believe to be a *Pentamerus*, after the type *P. galeatus*, Dalman, and a *Rhynchonella*. The latter is of equal importance with the *Strophomena*, as it possesses all the characters of *Rhynchonella Wilsoni*, Sby., especially the five regular ribs, and the bold truncated and square front. The list is completed by a few fragments of an *Orthoceras*.

A single piece of another limestone, obtained by the Government Geologist at Troffs, north of Condobolin, corresponds in the plentitude of the Ostracoda with the previously described rock, but not otherwise. It is said to be detrital, and may be of Upper Silurian age, but confirmatory evidence is required.

R. E., 3/1/88.

APPENDIX No. 15E.

No. 5.—The further discovery of Plesiosaurian Remains in Queensland:

Plate, Fig 1-4.*

In a brief preliminary notice before the Royal Society of New South Wales' attention was called to portions of two vertebrae, obtained by Mr. H. J. W. Crummer, Surveyor-General's Office, from the bed of a dry lake at Pitchery Creek, Barrington's Station, Central Queensland.

The fossils consist of the centrums of cervical vertebrae, without processes. They are transversely-ovate, or ellipsoidal in outline, $2\frac{1}{2}$ inches long, $4\frac{1}{2}$ inches wide, and $2\frac{1}{2}$ inches high. The upper surface is depressed convex, but below the middle line is subangular. The venous openings are two, large and distinct, the surface of the vertebrae exterior to them, and between them and the pleurae more or less concave. The centrums have a well-marked, flattened, articular surface, half an inch wide, but with sharp, erect, non-rugose external edges. Within the articular surface each centrum is depressed, but not actually concave—in fact, more flattened than concave—3 inches by $1\frac{1}{2}$ inch, smooth, and with but the faintest trace of a tubercle or prominence. The neurapophysial and pleurapophysial surfaces are contiguous to one another; and the last named, although lateral in position, are nearer to the upper than the lower surfaces of the centrums, and they in no way hide any part of the inferior surfaces of the latter. The neural arches were undoubtedly ankylosed to the centrums, and, notwithstanding that their disruption has much fractured the specimens, it is quite clear that the neurapophysial surfaces were long fore-and-aft, and somewhat narrow. Those of the pleurapophysial, on the other hand, were large, and obliquely elongated. To adopt a term of Sir R. Owen's, they have to some extent "risen" towards the parapophyses.

In the preliminary notice previously referred to these bones were by error compared to *Plesiosaurus macrospondylus*, M'Coy;¹ but as Professor M'Coy distinctly compares his species to the European *P. rugosus*, Owen, by reason of the rugosity of the centrum ends, it will at once be apparent that our fossils can have no connection with that species. The only other known species of Australian *Plesiosaurus* is *P. Sutherlandi*, M'Coy;² but, unfortunately, the description is so brief that I feel quite at a loss how to institute a comparison. The measurements given by Professor M'Coy accord fairly well with our specimens; but he states that his fossils resemble *Plesiosaurus Australis*, Owen,³ but simply with different proportions. Now, in this species, the vertebral centrums "have two large and two small venous foramina beneath;" but it will be borne in mind that in the present vertebrae these apertures are only two, and both large. Amongst other New Zealand species is *Plesiosaurus crassicosatus*, Owen,⁴ the centrums of which, according to Hector, "are deeply excavated beneath, with two venous foramina. The articular surfaces are elongated transverse, forming a contracted oval, and only moderately concave, with rounded margins."⁵ In the case of the Pitchery Creek vertebrae the margins are flattened distinctly, and the ventral surface, instead of being excavated, is on the contrary convex. The concavity mentioned by Hector is visible in his figures, and gives a character to the vertebrae not to be mistaken or overlooked. Furthermore, the centrums in our specimens have no definite tubercle which is present in *P. crassicosatus*. So far as I can gather, Mr. Crummer's fossils do not correspond to any of the New Zealand Plesiosaurs described by Dr. Hector in his excellent paper "On the Fossil Reptilia of New Zealand."⁶ In the absence of the tubercle, however, it does resemble his *P. Holmesi*, but has not the trigonal outline of the latter's vertebrae.

On the whole, the newly discovered remains from Queensland accord best with *P. Sutherlandi*, M'Coy, and from an inspection of the types, kindly lent me for the purpose of comparison by the Professor, I believe them to be this species. The transversely elongate or ellipsoidal outline of the vertebrae is a very important point in connection with the age of these remains. Although it is present in some Liassic species, as, for instance, *P. rostratus*, Owen,⁷ the character appears to be much more a typically Cretaceous one, and is a vertebral feature both in *P. planus*, Owen,⁸ and *P. latispinus*, Owen,⁹ from that formation. The Enaliosaurian remains from Queensland hitherto described were obtained from rocks which appear to be of Cretaceous age; and it is logical therefore, in the absence of contrary evidence, and in the face of the above confirmatory facts, to assume that the present bones are also derived from that formation.

APPENDIX No. 15F.

No. 6.—Diagnosis of an apparently undescribed Bivalve Shell from the Lower Marine Series, Permo-Carboniferous, of New South Wales.

Plate—, Fig. 5-10.

THE late Professor L. G. de Koninck very imperfectly described a bivalve shell from the Permo-Carboniferous rocks near Maitland, to which he gave the name of *Tellinomya Darwinii*,* without the slightest evidence that it belonged to the genus *Tellinomya*, Hall. The entire absence of information relating to the structure of the hinge should have indicated the Carboniferous genus *Nuculana*, which it outwardly resembles, rather than a Silurian genus, with which the shell in question has very little affinity. In some points our present bivalve resembles *Tellinomya Darwinii*, De Kon., in others it curiously and essentially differs from it. De Koninck's species possesses an ovately triangular outline, a produced but broad posterior end, an evenly-rounded exterior, moderately prominent umbones, and a regularly concentric-lined ornament. Turning to the new shell, we observe, on the contrary, that the outline is triangularly deltoid, and obliquely produced towards the posterior end, becoming narrower and nasute. The umbones are much elevated, a posterior slope is present, and the shell possessed a very variable, and at the same time, peculiar and characteristic form of ornament. Either Professor de Koninck's is quite a distinct shell from the present one, or his description is very carelessly written, and the figure inaccurate. I have assumed the former to be the case. Internal casts of the hinge demonstrate the existence of anterior and posterior teeth and a central cartilage pit, characters, when united with that of a very feebly-situated pallial line, clearly indicate the genus *Nuculana*, Link.

Specimens were first brought under my notice by Mr. T. Waterhouse, of West Maitland, and subsequently Mr. Geological Surveyor David called my attention to some excellent internal casts collected under his supervision. As I believe the shell to be distinct from de Koninck's *Nuculana Darwinii*, I have much pleasure in describing it as *Nuculana Waterhousei*.

Nuculana Waterhousei, sp. nov.

Sp. Char. Shell obliquely triangular-deltoid, obliquely produced posteriorly, valves convex in the umbonal region, rapidly declining to the ventral margin, which is sharp and knife-edged, the flanks sometimes slightly sulcate posteriorly. The dorsal margin arched and much shorter than the length of the valves; hinge teeth less than twelve on either side; cartilage pit apparently semicircular. Ventral margin gently convex in the centre and in the direction of the anterior end, but slightly inflected towards the posterior. Anterior end small, much more gibbous than the posterior, the margin obliquely rounded below, and insensibly disappearing. Umbones sharp, inrolled, and anteally incurved, flattened from above; escutcheon wide and well marked; pseudo-lunule defined by anterior rounded slopes. Muscular impressions large, the anterior close to the margin and rather low down; posterior scars prominent, thick at their front ends. Ornament consisting of close, always more or less concentric, although variously directed, subimbricating, rather fluctuating, wavy, zig-zag, or V-shaped laminae, and at times abruptly faulted near the centre of each valve.

Obs.—The surface ornament, although very peculiar in itself, is not altogether foreign to this group of shells. It, however, varies much on individual specimens. In one example the lower half of each valve bears concentric wavy ridges; the upper portion carries others obliquely directed from before backwards as far as the diagonal sulcus traversing the flanks; here the ridges become practically horizontal and parallel to those of the lower halves of the valves. In another case only the ridges of the ventral third are concentric, the remainder on the anterior end of each valve being oblique; but at the sulcus on the opposite end a decided V-pattern is assumed. In a third example the ventral portions of the flanks are similarly marked, the remainder of the valves being ornamented with very oblique lines from before backwards. A fourth modification is perhaps the most peculiar of all; the sulcus acts as a fault, the whole of the anterior end bearing oblique striae from before backwards and downwards, whilst those on the posterior end are obliquely deflected from below upwards and backwards.

Some species of *Nucula* are ornamented with V-shaped, oblique, and divaricating lines, such, for instance, are *Nucula Meyeri*, Gardner, from the British Gault, *Nucula Cobboldiae*, S. Wood, of the European Post Tertiary Series, and *N. ornaticissima*, d' Orb., a species occurring in the Chalk of Europe; but I am not acquainted with any form of *Nucula* marked like the fossils. For *Nucula*, with this peculiar and striking ornament, the sub-genus *Acila* has been proposed.

Locality and Horizon.—Wollombi Road Cutting, by Farley Railway Station, near West Maitland (Mr. T. Waterhouse and Mr. Geological Surveyor T. W. E. David), Lower Marine Series.

R.E., 6/1/88.

APPENDIX No. 16.

Department of Mines, Geological Survey Branch,

Mining and Geological Museum, Sydney, December, 1887.

Sir,

I have the honor to submit the following Report for the year ending 31st December, 1887.

It having been decided that the assay work of the Department of Mines, should not be performed by the Government analyst after the end of 1886, a temporary stoppage for two months occurred, only a few of the more urgent cases being dealt with outside. Mr. Mingaye, assistant to the Government Analyst, having been transferred to this Department to carry on the above work in a laboratory on the premises, commenced his duties on the 1st of March. At the close of the year, out of 2,222 samples sent to the laboratory for treatment, 2,178 were completed, against 1,799 for the whole of the previous year.

The results of the 4,214 assays and fifty-four proximate and ultimate analyses to which the above samples were submitted are fully described in Mr. Mingaye's report, and in the returns furnished herewith for embodiment in the annual report of the Under Secretary for Mines.

During the year, and especially towards its close, in consequence of the great stir in mining, the applications to the Department for assays and examinations of specimens and advice pertaining thereto, largely increased, rendering absolutely necessary a more commodious laboratory, and increased assistance both professional and clerical.

The correspondence in connection with the above, naturally increased in proportion. In addition to numerous samples verbally reported on, the senders of several hundred others which did not require assaying, were officially informed of the results of examination.

My

* Foss. Pal. Nouv.-Galles du Sud, 1877. Pl. 3, p. 285 to 1

My time being thus so largely occupied to the prevention of the performances of my other duties, I was forced to apply for clerical assistance which was granted, my present assistant—Mr. E. C. Whittel—being appointed in October.

The additions to the Museum registered during the year amounted to 1,353 specimens, but many others have been received which have not yet been entered owing to want of time and space to sort and arrange them. Many other large and valuable donations have been promised to the Museum at the close of the forthcoming Melbourne Centennial Exhibition.

The number of specimens which have been registered since the destruction of the Museum by the Garden Palace fire, is 20,770, but owing to many specimens being taken for collections, notably for the Colonial and Indian Exhibition, and the discarding of many others upon further examination by yourself and the Paleontologist, the register is but an imperfect record of the number of specimens in hand.

Proper registers have been obtained, and so soon as the work can be attempted, regular sorting and classification will be carried out. The best specimens being specially marked to be retained intact for the Museum, a working reference set selected, and the duplicates labelled and placed so as to be readily available for the purposes of exhibitions, collections, exchanges, &c. Such work is absolutely essential and should precede the preparation of any collections to be given away. Under the second category a room has been specially fitted up with shelving and covered trays of a uniform size into which this portion of the collection is being sorted.

During the year the necessity for proper book shelving for the books in the library was pointed out in a memorandum to you, which, having been approved, the Works Department was asked to carry out the desired improvements through the Colonial Architect, after considerable delay extending over several months, this was accomplished, and the books sorted and arranged by Mr. Etheridge and myself, in accordance with the system adopted in the Natural History Branch of the British Museum, and numbering and labelling commenced.

The donations to the Library during the latter part of the year largely increased in consequence of personal application by Mr. Etheridge to his scientific correspondents, and in response to official application to many institutions and individuals whose names were supplied by him. Several scientific periodicals bearing on the work of the branch have also been subscribed to.

I obtained from the registrar the list of scientific societies, &c., to whom he has been directed to forward the publications of the Department annually, and many additions having been officially made to it, the Annual Report for the year, and the Report on the Geology of Vegetable Creek, by Mr. T. W. E. David, Geological Surveyor, were despatched to them direct from this Branch, a proceeding which, if allowed to be carried out each year, will greatly expedite the despatch of publications, and relieve the registrar of work properly belonging to the Geological Survey Branch. I would beg to point out that the present system of distribution is very expensive.

The result of sending the above to kindred surveys, various societies and individuals, has already in many instances been achieved in the receipt of reciprocal donations, many of them of great scientific importance.

Cataloguing will be carried on as time will permit. The donations for the year number 330 vols. The total number of books in the library to date is 1,433.

During the early part of the year, I was largely occupied in arranging departmental and private exhibits for the Adelaide Jubilee International Exhibition, and at the latter end of May received instructions to proceed to Adelaide to plan out and arrange the space set apart as a Mining Court for New South Wales. The representation of the mineral wealth of the Colony therein displayed by the Department of Mines was acknowledged to be one of the features of the Exhibition.

Whilst in Adelaide I embraced the opportunity of soliciting donations for the Mining and Geological Museum, and upon my return submitted memorandums to you with reference to the private exhibits, and the show cases in the New South Wales Court, which resulted in obtaining for the Department, the bulk of the above-mentioned exhibits and the whole of the show cases. These will be available for museum purposes at the close of the Melbourne Centennial Exhibition; such being the case, I beg respectfully, but strongly to urge the absolute necessity for suitable provision being made for their reception by building a proper Museum and necessary work-rooms; ample material is at hand to make a display worthy of the Colony, and of increased usefulness to the community. The present Museum is altogether inadequate even for the specimens now in hand, and my time being so completely taken up with other duties, notably the examination and correspondence in connection with assay work, and exhibitions renders it impossible for me to cope with much necessary work appertaining to the Museum proper.

Attached are the lists of donors to the Museum and Library during the year.

In closing my report I desire to acknowledge the generous assistance and advice rendered me at all times by Mr. R. Etheridge, of whose valuable experience at the British Museum I have largely availed myself.

I have further to acknowledge the steady working capacity displayed by my recently appointed assistant, Mr. Whittel.

I have, &c.,

JOSEPH E. CARNE,
Curator.

The Geological Surveyor-in-Charge.

APPENDIX 16A.

DONATIONS to the Mining and Geological Museum, during 1887.

Donor.	Donation.	Locality.
Mr. R. Barton	Carbonate of lead and copper	Cooma District.
Mr. J. B. Beauregard	Sulphate of lead	Lewis Ponds Creek.
Lieut. G. R. Connor	Quartz, with free gold	Port Darwin.
Commissioner for Roads	Basalt	White Oaks.
Mr. A. Cooper	Tin ore	Table-land, New England.
Mr. B. Dunstan	Fossil fish	Gibb Tunnel, Bowral.
Mr. A. Dewherst	Glossopteris, &c	Gunnedah coal-seam.
Mr. P. Davies	Coal	Mittagong Coal Co.'s property, Nattai River, from lower 3 ft. of a 17 ft. seam.

APPENDIX 16A—continued.

Donor.	Donation.	Locality.
Mr. J. G. Dickson	Collection of auriferous granite, and other specimens.	Tabletop, Timbarra.
Fitzhardinge & Sons	Iron ore	Dubbo District.
Mr. H. D. Gordon	Gold in calcite	Lunatic.
Mr. Hogarth	Fossil-wood, shells, bones from Cretaceous deposits.	Near Wilcannia, from depth 300 ft.
Mr. J. B. Hammond	Alumite	Bulladelah.
Mr. K. Hutchinson	Auriferous granite	Surface Hill, Timbarra.
Mr. W. Hazelhurst	Gold in quartz	Hazelhurst's reef, near Parkes
Mr. Hayes, M.P.	"	Little River.
Mr. W. H. Hazelton	Aboriginal's stone hatchet	Grenfell.
Mr. J. E. Kelly, M.P.	Agates, &c.	Kimberley.
Mr. C. King, J.P.	Cretaceous fossil	Well 150 ft. deep on Mount Start, 8 miles east from Milparinka.
Mr. G. Kennedy	Tin stone and bone-stone	Near Tenterfield.
Mr. C. M. A. King	Aboriginal's nardoo mill	Near Bouika Lake.
Mr. S. Musgrave	Chromite	The Bland, 20 miles from Young.
Minnett & Co.	Auriferous quartz	True Blue No. 1, Croydon, North Queensland.
Mr. C. S. M'Glew	Tinstone in mispickel	Mount George, near Launceston, Tasmania.
Mr. Nicholas	<i>Spirifer disjunctus</i> and <i>Rhynchonella pluridon</i> . Devonian.	Hartley District.
Mr. M. O'Connor	Silver ore	Ivleen Silver-mine, 130 miles from Port Darwin.
Mr. Porter	Zeolites, &c.	New England District.
Mr. E. F. Pitman	Oxide of iron on quartz crystals	Fairfield.
Mr. H. Pryce	Ammonite	Mr. Coxton's Station at Olive Downs.
Mr. J. R. Peebles	Edible earth	Espiritu Santo.
Proprietors of the Gordon mine.	Auriferous quartz and copper ore	Gordon Mine, Buckingham.
Mr. Quodling	Fossil fish	Gosford.
Major Parrott	Collection of specimens of volcanic products from the recent eruptions at Tarawera.	New Zealand.

APPENDIX No. 17.

Report to the Geological Surveyor-in-Charge on the Analyses and Assays of Minerals, Waters, &c., received in the Laboratory for 1887.

Department of Mines, Geological Survey Branch, Laboratory,

Sydney, 28 February, 1888.

Sir,

I have the honor to furnish you with the following report respecting the various analyses, assays, &c., performed in the Laboratory connected with the Geological Survey Branch during the year 1887:—

On the 1st of March, I was transferred from the Government Analyst's Department to the Geological Survey Branch, to start a Laboratory and perform the various analyses and assays required, before this the work having been carried on by me for many years under the supervision of the late Government Analyst.

On the latter part of the month the Laboratory was fitted up with chemicals, apparatus, etc., under my supervision, the work being in the meantime carried on by me at the Laboratory of the Government Analyst (Wm. Hamlet, Esq., F.C.S.), who kindly placed his premises at the disposal of this Department for that purpose.

The Laboratory contains all the latest appliances, apparatus, &c., of the best description, capable of carrying on the large amount of work required, which has so largely increased as to necessitate the building of larger premises, and extra assistance being given.

I applied for an Assistant, which you were good enough to recommend, and I would urge that, with the large amount of analytical work and complicated minerals received in the Laboratory, that an Assistant be appointed who has had some experience in this direction, as also in the assaying of all description of minerals and metals.

2,222 numbered examples were received during the year for assay and analyses, of these 2,178 were completed by the end of the year, leaving forty-four samples on hand, the results of which were furnished by the 7th January, 1888.

4,214 assays for various metals were made, and fifty-four proximate and ultimate analyses of minerals, waters, &c., which necessitated a large amount of time and careful work.

In addition to these analyses, many of the samples were submitted to a qualitative analysis with the view of ascertaining the composition of various minerals, &c., also the specific gravity of many gemstones were taken.

I would call your attention to the large increase of work from the years 1883 to 1887.

Year 1883	242 Samples.	Year 1886	1,807 Samples.
" 1884	664 "	" 1887	2,222 "
" 1885	1,428 "		

The following assays were made during the year :—

ANTIMONY.

Three samples.

BISMUTH.

Twenty-one samples.

COPPER.

Forty-eight samples.

COBALT.

Nine samples of Manganese ore were assayed for Cobalt, and in all cases the Nickel estimated, which invariably accompanies the Cobalt, yielding from traces up to 2 per cent.

In nearly every case these minerals were found to contain Copper, yielding from traces up to 2 or 3 per cent., and in one or two samples lead and arsenic were detected.

Some of these ores should prove payable to work for the extraction of the Cobalt and Nickel, especially a few of those obtained from the Bungonia District, which were found to yield much gangue (quartz grit), and a fair percentage of Cobalt, there being very little Iron or Manganese present.

CHROMIUM.

One sample of Chrome iron ore was received for assay. This ore, to be of any commercial value, should not contain less than 50 per cent. of Sesquioxide of Chromium.

MANGANESE.

Two samples received.

This ore to be of any commercial value should contain not less than 80 per cent. of Binoxide of Manganese. There is a fair demand for an ore of good quality, it being largely used in the manufacture of spiegelisen in the Bessemer process. Worth from £4 to £5 per ton.

IRON.

Three samples assayed for the percentage of ferric oxide ($F_2 O_3$)

LEAD.

Forty-eight samples assayed. Many of these specimens were Galena, and in some cases rich in silver.

NICKEL.

Four assays made.

MERCURY.

One assay made.

PLATINUM.

One assay made.

TIN.

Fifty-four assays made.

TUNGSTEN.

One sample assayed for percentage of tungstic acid. There is a fair demand for an ore of good quality, it being used in the manufacture of steel for the purpose of hardening it. There are many other uses for this mineral.

ZINC.

Eight samples assayed for Zinc. Some of the specimens assayed were *Calamine* (Carbonate of Zinc), which I believe to be the first discovered in the Colonies.

MISCELLANEOUS ANALYSES, &C.

Analysis of a sample of mineral water obtained from a diamond drill bore, near Dubbo (No. 731)—

Total fixed residue.....	224.62 grains per gallon,
Consisting of—	
Bicarbonate of sodium	183.10 "
" potassium	12.83 "
" lithium05 "
" calcium	11.38 "
" magnesium	9.36 "
" strontium	trace "
" iron.....	.70 "
Chloride of sodium.....	6.92 "
Alumina	trace "
Silica.....	.28 "
	<hr/>
	224.62

No bromides or iodides present. No sulphates. Phosphates, a trace.
 Free ammonia..... .052 parts per 100,000 parts.
 Albuminoid (or organic) ammonia

Specific gravity of the water taken at 65° F. 1.00359.

Remarks.

Remarks.

The water was clear and free from odour, highly charged with carbonic acid gas, and contained a small amount of sediment which on analysis was found to consist of Silica, with a small quantity of organic matter and iron oxide.

On evaporating a large quantity of the water to dryness (6 gallons used), traces of Bismuth, Lead, and Copper, were found. These traces, I have every reason to believe, owe their presence in the water to the action of the water on the metallic drums in which it was received for analysis.

The free ammonia is excessive; this is probably due to the shale-measures through which the water has percolated, but taking the albuminoid ammonia, and the other constituents into consideration, it will not condemn the water.

The quantity furnished was small, and necessitated small quantities being used for the different determinations. At least 10 or 15 gallons of the water should have been received.

The carbonic acid was not determined. If this is required it will be necessary to furnish a sample in two or three soda-water bottles securely corked.

On the whole this is a good mineral water, and will compare favourably with many of the English and Continental waters, being rich in the bicarbonates of sodium and potassium, and containing Lithia.

Since this analysis was made I have seen a sample of mineral water, taken from a spring at Cooma, which promises to be of a good quality and valuable as a mineral water. I believe no analysis has yet been made of a sample.

The following analysis was made of the ash of some coal obtained from a diamond drill bore put down at Mittagong:—

Sample marked No. 727.

Silica	07·10	} Insoluble in acids = 88·42.
Alumina	21·32	
Alumina	6·37	
Peroxide of iron	4·01	} Soluble in acids = 11·58.
Protoxide of manganese.....	trace	
Lime ..	·81	
Magnesia	trace	
Phosphoric anhydride (P ² O ⁵)	·22	
Sulphuric anhydride (S O ²)	traces	
Alkalies, loss, &c.	·17	
	100·00	

LIMESTONE.

Three analyses of Limestone were made with a view of ascertaining if suitable for the manufacture of Portland cement, which I have no doubt in time will be made in the Colony. In making this article I would recommend that the stone be calcined before mixing with the right proportion of clay, and burning.

The following are a few of the analyses made:—

No. 748.

Analysis.

Moisture	·47
Silica	2·57
Alumina	·72
Carbonate of lime	94·32
Lime (CaO).....	·62
Carbonate of magnesia.....	1·22
Alkalies, loss, &c.	·08

COAL.

The following Analyses were made for the Bulli Colliery Commission:—

Proximate Analyses.

Number.	Moisture.	Volatile Hydro-carbons.	Fixed carbons.	Ash.	Sulphur.	Sp. Gravity.	Coke, per cent
554	2·15	19·02	48·92	29·39	0·52	1·52	78·31
555	2·40	16·30	50·43	30·24	·63	80·67
556	2·25	16·45	51·27	29·50	·53	80·77
557	1·40	19·00	53·37	23·70	·53	79·07
558	1·46	19·14	51·94	26·91	·55	78·85
559	1·40	20·25	51·90	25·81	·64	1·48	77·71
560	1·98	16·87	57·32	23·25	·58	80·57

NOTE.—All the samples were received in fine powder, and contained much dirt. In one or two of the samples pieces of wood and cut tobacco were visible. This will account for the high percentage of ash obtained. The colour of the ashes were from white to grey.

The samples received were rather small for analysis.

Analyses of four samples of coal from Mittagong.

Proximate Analyses.

Number.	Moisture.	Volatile hydrocarbons	Fixed carbon.	Ash.	Sulphur.	Sp. Gravity.	Coke per cent.
(1) 627	1.35	25.77	60.06	12.24	.56	1.347	72.30
(2) 628	1.40	24.61	59.22	14.08	.69	1.376	73.30
(3) 629	1.65	27.87	52.30	17.40	.78	1.420	69.70
(4) 630	1.17	19.25	47.59	31.42	.57	1.538	79.01

Nos. 1 and 2 were bright bituminous coals.

No. 3, bright bituminous coal and splint coal.

No. 4, Splint coal and bituminous bands.

Samples marked Nos. 627, 628, and 629, yielded a fair coke, which was swollen and firm. The colour of the ashes were gray.

No. 630 yielded a coke which was firm and compact, but the large percentage of ash found will render it not of much value. The colour of the ash was gray.

SHALE.

The following are the analyses of some of the samples of shale (Australian Bog-head mineral) received:—

Proximate Analyses.

Number.	Moisture.	Volatile hydrocarbons.	Fixed carbon.	Ash.	Sulphur.	Sp. gravity
396	.70	62.98	8.67	27.20	.46	1.207

IRON ORE.

The following analysis was made of a sample of Hematite containing Titaniferous Iron Ore:—

Moisture	4.15
Ferric oxide	64.64
Ferrous oxide	3.74
Manganese oxide	trace.
Alumina	13.72
Silica	6.59
Lime37
Magnesia32
Titanic acid	6.50
Phosphoric Anhydride	trace.
	<u>100.03</u>

Ore from Captain's Flat: Yielded fine silver, 16 oz. 18 dwt. 21 gr. per ton; fine gold, 4 dwt. 1 gr. per ton
A qualitative analysis was made of this ore with the view of ascertaining if suitable for treatment by one of the well known wet methods.

The Silver was found to be combined with Chlorine and Bromine (Chlorobromide of Silver); traces of Antimony and Lead were detected.

There is nothing in this ore to prevent its being treated by one of the wet methods.

LEUCITE-BASALT.

Analyses of two samples of Leucite-basalt:—

Ultimate Analyses.

	No. 1.	No. 2.
Silica	46.43	47.31
Alumina	16.72	19.06
Oxide of iron (Fe ₂ O ₃)	15.04	14.56
Lime (Ca O)	9.27	7.57

Moisture	3.20	2.31
	<u>99.84</u>	<u>100.21</u>
Sp. gravity of mineral	2.890	2.910

Both these samples were partly decomposed by hydrochloric acid with the separation of granular Silica.

The following are the analyses of some of the foreign Leucite-basalts:—

Silica	43.72	44.83
Alumina	27.34	12.21
Oxide of iron (Fe ₂ O ₃)	11.66	23.61
Lime (Ca O)	7.49	8.98
Magnesia (Mg O)	1.70	2.45
Potash (K ₂ O)	7.37	3.08
Soda (Na ₂ O)		2.34
Moisture72
	<u>99.28</u>	<u>98.22</u>
		Undetermined... 1.78

Sample marked No. 1, was obtained from Byerock No. 2, from "El Capatain," near Cobar.

It will be seen, on referring to the various analyses given, that the Alkalies vary greatly in the mineral, in some instances giving as high as 20 per cent. I believe this is the first discovery of Leucite-basalt in this Colony, therefore the analysis made should prove of value from a scientific point of view.

A small bottle said to contain the stomach and contents of a rabbit was handed to me for analysis with the view of ascertaining if Arsenic was present, a salt of that metal having been used in the rabbit infested district to poison them.

A careful analysis was made and no Arsenic, Mercury, or any of the poisonous metals detected.

On the 14th November, a specimen of Sea Urchin from Lord Howe Island, named by Robert Ethridge, Esq., "Centrostephanus Rogersi" and which exuded a pink colouring matter staining the teeth of the sharks who feed on them was received, and the following report given:—

The pink colouring matter has been examined and found to be some organic colour, probably derived from vegetable matter on which the specimen has fed. To ascertain and describe the nature and properties of this organic colouring matter would take up a large quantity of my time, and more of the specimens would have to be obtained.

On the 8th of December, a specimen was received for qualitative analysis with a view of ascertaining if it were Meteoric iron. Finding strong traces of Copper, Cobalt, and Nickel, I am of opinion that the sample is Meteoric iron.

Two samples of Infusorial earth (Tripolite) were received which I prepared for the Palæontologist, who has undertaken the microscopical examination of the specimens.

These earths are chiefly used for polishing, the Silica being in a fine state of division and free from grit, also in the manufacture of dynamite by Noble's patent, which consists of 75 per cent. of Nitroglycerine, with 25 per cent. of the earth as an absorbent, to enable it to be made up into cartridges.

Many of the samples received for assay showed free gold, and it was found in some cases impossible to get a thoroughly reliable assay. A treatment in bulk would be very advisable—by crushing and the ordinary method of amalgamation, &c.; also the concentration and treatment of the Pyrites. The plant used by Messrs. Park & Lacy seems to be a good one, having all the latest improvements as you are aware of, having inspected and reported on the plant and works.

In concluding my report I have to acknowledge the ready help given to me by the assistant, Mr. Neilson and C. Hildebrandt, junior, for their able assistance in carrying out the large amount of work received in the Laboratory for the year.

I have, &c.,

JOHN C. H. MINGAYE, F.C.S.,

Analyst and Assayer.

The Geological Surveyor-in-Charge.

SUPERINTENDENT OF DRILLS' REPORT.

Superintendent of Drills to The Under Secretary for Mines reporting on the working of the Diamond-drills and Water-augers for the year 1887.

Sir,

Department of Mines, Diamond-drill Branch, Sydney.

In submitting my annual report on the working of the Diamond-drills and Water-augers for the year 1887, I do myself the honor to attach to said report the following Appendices:—

Diamond-drills.

Appendix A.—Return showing the locality, strata, depth bored, percentage of core extracted, value of diamonds used during the year, and rate per foot, exclusive of office salaries, store wages, and rent; also Superintendent of Drills' travelling expenses.

Appendix B.—Summary of diamond-drills, showing the number of feet bored, total working cost to the Department, average cost per foot, and amounts receivable for the year 1887.

Appendix C, Nos. 1 to 9.—Sections of borings during the year 1887.

Appendix D.—Return showing the expenditure of Clarence Siding bore, without office expenditure.

Appendix E.—Return showing the total expenditure of Clarence Siding bore, including office salaries, &c.

Water-augers.

Appendix F.—Return showing the locality, depth bored, and rate per foot, exclusive of office salaries, store wages, and rent; also Superintendent of Drills' travelling expenses.

Appendix G.—Summary of water-augers showing the number of feet bored, total working cost to the Department, average cost per foot, and amounts receivable during the year 1887.

Appendix H, Nos. 1 to 11.—Sections of borings during the year 1887.

Appendix I.—Map of New South Wales, showing positions of wells and bores, as published last year, with additions.

Appendix J.—Index to wells and bores.

Appendix K.—Balance-sheet for diamond-drills.

Appendix L.—Balance-sheet for water-augers.

By first appearance it may seem as if the diamond-drill work has not progressed so favourably as in the previous year; this would be the case if only the cost at per foot is considered, and difficult works and results not taken into consideration; but whenever I have recommended the use of a diamond-drill I have looked to beneficial results as much, and at times even more than to the actual cost or number of feet bored, as I consider that the diamond-drill should be made use of in difficult country such as drifts, basalt, granite, diorite, &c., &c., as well as in some of the comparatively easy boring country of our coal measures; hence the cost at per foot has exceeded that of last year.

For instance, I recommended a diamond-drill bore to be put down at Bundanoon, within a few feet of a diamond-drill bore formerly put down by a private drill Company, where core-barrel and several rods had been lost in the bore-hole, that Company considering it too dangerous to try and recover their rods, or to bore a fresh hole near the bore-hole which was lost. The Government drill, however, commenced work within 6 feet of the lost bore-hole, and continued boring through heavy drifts, loose conglomerates, &c., &c., which almost daily choked the bore, and jammed the core-barrel, the recovery of which caused delay in boring and extra expenditure at per foot. The work was, however, completed satisfactorily, and a valuable seam of coal discovered. Had a different policy been adopted the discovery of coal would not have been made, and the diamond-drill would have been condemned as not being able to cope with difficult country. Again, at Sunny Corner very difficult country has been passed through with creditable results to the Drill Branch.

During the year a diamond-drill was also forwarded to Broken Hill, where the boring has been very slow and costly owing to the size of bore—3 inches in diameter—having to pierce through very tough granite, gneiss, quartzite, and diorite; the great toughness of the latter can be seen by the polished appearance of the core, being as smooth as glass. Here the results so far obtained overbalance the cost at per foot, although the latter seems high in comparison of the rate per foot published in former annual reports; but those reports have only shown the cost at per foot bored in comparatively easy country, whereas as stated above I have endeavoured to introduce the diamond drill in all stratas, so as to bring them into greater favour and make them more beneficial to the general public.

The Fullerton Cove bore has also proved costly, and an unusual loss of diamonds took place. The facts of the case are these: A company made application to put down a bore at Fullerton Cove to a depth of about 1,000 feet; they stated that they had already forced down tubing through the drift 221½ feet, where the hard strata was met with, and that being the case, the tubes put down by them need not be further reduced, although they would only admit of a 2-inch drill to pass through them. A drill was accordingly forwarded to bore with 2-inch bit through the tubes already down to the depth as stated above; 35 feet 7 inches more of drift was passed through, but the drift still continuing, and not being able to reduce the bore any further, the company requested that work may be stopped. Had the company forced down tubing to admit of a 3-inch instead of a 2-inch bit, the difficulties could have been surmounted and the work brought to a successful issue. At Clarence Siding the operations have been costly, only 20 feet 6 inches have been bored at the beginning of the year, and the rest of the time has been one continual difficulty; rods after rods and reamers after reamers were lost in the bore-hole, the recovery of which has been very costly. Several diamonds were also lost in the bore-hole; but I have good reasons to think that I will be able to report that all difficulties have been overcome, and most, if not all, the diamonds lost will be recovered.

Six diamond-drills were in the field at the end of the year: No. 3 drill at Red Head, No. A. and No. 7 drills at Clarence Siding, No. 10 drill at Ballimore, No. 11 drill at Broken Hill, and No. 13 drill at Fullerton Cove. A bore was also put down with No. 11 drill at Mittagong, 657 feet 6 inches in depth, piercing

piercing through a seam of coal 38 feet 5 inches in thickness with small bands of clay and shale. At Bundanoon a bore was put down during the year with No. 3 drill 380 feet 1 inch in depth, piercing a seam of coal with bands 7 feet 3½ inches in thickness, one part of the seam being solid coal 3 feet 7 inches.

No. 13 drill bored at Sunny Corner to a depth of 401 feet piercing through a lode which proved to be of little value.

The total depth bored by diamond drills during the year, is 3,097 feet 5 inches or 3,442 feet 2¼ inches less than in the year 1886. This is due as stated above to the slow boring in the granite diorite and quartzite rocks of Broken Hill, and the difficult operations at Bundanoon and Clarence Siding.

The average cost per foot of boring exclusive of office salaries, store wages, and rent, also of Superintendent of Drills travelling expenses is 18s. 1d. per foot, or 3s. 1½d. more than during the year 1886.

Total working or field cost exclusive of office salaries, store wages, and rent, also of Superintendent of Drills travelling expenses amounts to £2,800 16s. 2d., and the total earnings during the year amounts to £2,574 19s. 7d., but the total cost inclusive of all office salaries and all other expenditure in connection with the Diamond Drill Branch, amounts to £3,460 17s. 7d., or at the rate of 22s. 4½d. per foot, which is 4s. 7½d. per foot more than for the year 1886.

The loss and wear of diamonds in the bore-hole, and the cost of diamonds at per foot bored, has been greater than for the year 1886. Due to the same causes as slowness of boring, some of the diamonds were ground into mere pulp by the tough diorites, granites, and quartzites of Broken Hill. In 1886 the loss and wear of diamonds at per foot bored amounted to 8½d., but during the year 1887 the loss and wear of diamonds in the bore-holes amounts to 1s. 6½d. This includes the diamonds lost in the Clarence Siding bore-hole, which I hope to recover.

Messrs. M'Neil, Dalrymple, and M'Culloch, clerks of the Diamond-drill Branch, and Mr. J. S. Leigh, the storeman of diamond-drill store, have left no stone unturned to further the interest of the diamond-drill work, and by their unremitting attention have greatly assisted me to give more attention to my other official duties.

Percentage of core saved during the year is 64 per cent., against 80 per cent. for the year 1886. I, however, place no great importance on this, if facts in connection therewith are considered. In the hard sandstone no doubt a good percentage of core can be obtained, such as was met with at Mittagong; but at the Fullerton Cove, for instance, the drill was forced through 35 ft. 7 in. of drift, and not 1 inch of core was obtained. At Bundanoon a great deal of drift and conglomerates were pierced through, it being impossible to obtain any core. The same may be said of Ballimore, Sunny Corner, and Broken Hill. The strata at Sunny Corner consisted of slates, with a sharp underlay, which splits the core into small fragments, although the rods were raised and lowered very frequently. The same occurred at Broken Hill for the first 150 feet.

Considering the above stated facts, including the policy adopted by the Department during the year of sending diamond-drills to any kind of difficult country, which was avoided in former years, but nevertheless is more beneficial to the public, and tends to the development of the mineral resources of this rich Colony to a far greater extent than hitherto.

Water-augers.

The results obtained on the stock road Bourke to Wanaaring by the tapping of artesian water at 75-mile, at a depth of 960 feet, with a flow of water 33,000 gallons per diem, which flows through a pipe 8 feet above the surface, and again at the 101½-mile on the same road at 950 feet, with a flow of excellent water at the rate of 21,600 gallons per diem, are of such importance and beneficial character to the Colony generally, that their true value cannot be estimated at the present juncture. It may, however, be considered as certain that it will enhance the value of all the Crown lands and pastoral holdings which are within the area of the cretaceous formation. It will cause the settlement of population in these arid parts of New South Wales; townships are likely to spring up near some of the artesian wells. The numbers of the latter will no doubt increase through private enterprise, and will greatly lessen the misery, privation, and desolation caused by droughty seasons.

When once artesian wells flow between Wanaaring and Milparinka (the Mount Browne district) a distance of 136 miles in the country known as the dry track to Mount Browne (one of the driest parts of Australia even in average seasons) which work is to be commenced immediately, by bores for artesian water being put down 15 miles apart from each other, and of the successful issue I have very little doubt, as the country is known, and has been personally travelled over by me; then it is most likely that a large and new territory will be added to New South Wales; as the stock and wool which is now forwarded by Adelaide, would find its way from the Mount Poole and Cooper's Creek districts, to the Bourke Railway Station, and Sydney and as a natural consequence merchandise would be taken in return from Sydney by that route. The Government has proved by practical results, through the agency of the Diamond Drill Branch, that artesian water exists along the cretaceous formation; and it now remains for private enterprise to vigorously prosecute the boring of artesian wells.

The following is a summary from the commencement of the work from Bourke to Wanaaring up to the present time.

Soon after the opening of the Mount Browne Gold-field Mr. Geological Surveyor H. Y. L. Browne, was instructed to proceed to that gold-field for the purpose of reporting on its permanency; also on his return trip to report on the mud-springs, and the geological formation of the Paroo, Warrago, and Culgoa districts, north of the Darling River—especially with reference to the existence of artesian water—to which subject reference had been made in Mr. C. S. Wilkinson's Annual Report of the Department of Mines for the year 1880, on page 242, where he describes that an important discovery of artesian water had been made in the flat country between the Darling and Paroo Rivers, by Mr. David Brown, manager of Messrs. Officers Brothers at the Woe Wattah and Mullyes Runs, in the Albert district. Several other wells were also discovered by boring in the same district; they were, however, one and all, near mud-springs, and of comparatively shallow depths; the deepest being 110 ft.

After Mr. Geological Surveyor Browne's return from those districts, and on the receipt of his report, Mr. C. S. Wilkinson, Geological Surveyor-in-charge, advised the Government that boring for artesian water, might be undertaken by the Department of Mines on the road from Bourke to Wanaaring, and towards Milparinka. This advice was acted upon, and three water augurs—two "Tiffin,"

and

and one "Wright & Edwards," were forwarded, and active operations commenced. The work of boring was very slow, owing to the droughty seasons and consequent scarcity of water and grass, to enable teams to move about. Commencement was made 18 miles from Bourke, where several bores were put down in close proximity to each other; in some of these bores water was obtained, but not artesian, as they were not put down deep enough, and the result, therefore, to the public was nil. Several bores were also put down at the 51-mile, near Goonery Station, with the exact same result as at the 18-mile; the deepest bore only being 200 ft. 8 in., and ought to have been bored deeper, as the object should be to obtain artesian water at whatever depth, but not merely to show that a number of shallow bores could be put down at a certain cost at per foot. Results, more than the cost, must be the watchword to lead work of this kind to a successful issue. In 1884 a bore was put down at the 51½-mile, near some mud-springs at Goonery Station, and within less than half a mile from the Goonery artesian well, the result being that artesian water was tapped at a depth of 200 ft. 8 in., yielding about 15,000 gallons per diem. This well is still flowing, and is a great boon to the travelling public in those parts. A bore was also put down at the 57-mile to a depth of 545½ ft. and artesian water tapped, but the salt and fresh water flowing together to the surface, and the supply being very limited, the bore is of no public benefit, but might, before the machinery was removed, be bored deeper, but as it is within 6½ miles of the 51½-mile artesian well it is doubtful whether the cost should be incurred now. As two wells within 6½ miles of each other would not be required.

A bore was also commenced at the 75-mile and one at the 94-mile, the former was 266 ft. and the latter 321 ft. in depth. When I took charge as superintendent on September 15th, 1885, those two were the only bores in progress on that line of road, but no sooner had I taken charge than the foreman sent in his resignation, stating he could not go on any further with the work, as the machinery was too small and gave no satisfaction; also that he suffered from illness, the effects of climate. After this juncture foreman D. C. Carmichael was placed by me in charge of the work, the 94-mile bore was stopped, and the 75-mile commenced afresh from the surface so as to obtain a larger diameter, after which it was successfully carried down to a depth of 960 ft. as stated above, and obtaining a supply of artesian water equal to 33,000 gallons per diem, flowing 8 ft. above the surface. The diameter of bore at the bottom being 5 inches.

I watched and supervised this interesting work with the keenest interest and anxiety, having to contend against many difficulties and oppositions. A great outcry was raised by tank-sinkers and others, even before the depth of 600 ft. was reached, and it was publicly stated that boring for artesian water at the 75-mile would be a failure as no water would be obtained at such distance from the Goonery mud-springs, and that the cost of borings was too great, but I proved that the cost of boring at per foot was actually less than the shallow bores near the 18 and 51-miles. I urged in face of all opposition and scarcity of funds that as the bore was in the cretaceous formation and the bed rock had not been reached there were great hopes that even a larger supply of artesian water would be obtained than that in the shallow bore near the Goonery mud-springs. Results since obtained speak for themselves. Nevertheless had it not been for the support obtained from the Under Secretary for Mines, who was in sympathy with the work, the encouragement given me by Mr. C. S. Wilkinson, combined with the perseverance of foreman D. C. Carmichael, who had to undergo many hardships and privations appertaining to his work, the bores would have been abandoned in an unfinished state, the money expended on them become a mere waste, and the results to the public would have been nil.

Encouraged by the splendid results obtained at the 75-mile, I recommended that as the Kalkine Tank had been bought by the Government that the 94-mile bore which was only 4 miles from said tank, and which was only 4 in. in diameter from the surface may be stopped, and instead a bore might be put down on a site marked out by me at the 101½-mile west of Bourke, or 11½-mile east of Wanaaring (the Paroo). This received Ministerial approval, a bore was started on the 22nd June (Jubilee day) with 7-inch diameter on the surface, which was carried down with a 5-inch diameter at the lowest level. By latest report this bore has also proved successful at the depth of 952 ft., the flow of water 8 ft. above the surface was at the rate of 21,600 gallons per diem, ample for all purposes required.

During the month of May I started from Sydney, via Bourke and Wanaaring to Milparinka, for the purpose of examining the country west of the Paroo, as to its indication of an artesian water supply; I had Carmichael with me, and we took a track known as the old peg line, which had been travelled over by very few white persons. The track is generally known as the dry track to Mount Brown, and it is known that several persons have perished on this track for want of water. We successfully reached Milparinka, to which the stout heart of D. C. Carmichael contributed considerably, and I marked off eight different boring sites along that route, about 15 miles apart from each other, and it is on three of these sites nearest to Wanaaring that active operations will be commenced immediately, and I have good reason to believe with results equal, if not superior, to those obtained at the 75 and 101½-mile, between Bourke and Wanaaring. Before I close this part of my report I cannot refrain from stating that foreman D. C. Carmichael has always been willing and ready to assist me in all matters in connection with the boring operations under his immediate charge, and to whose ability, energy, and perseverance a good deal of the success obtained is due.

The machinery I am now using between Bourke and Wanaaring was only guaranteed to bore 450 feet, but by several alterations and additions in the plant and tools they have successfully bored to a depth of 960 feet.

At Gunbar Road, 13 miles from Hay, the auger has not been successful in tapping artesian water, but a large supply of excellent water, for domestic and stock purposes, was obtained, which rose from a depth of 400 feet to within 70 feet of the surface. Two wells, one at each bore, were sunk and timbered up, which now contains sufficient water for all purposes required.

As there was no likelihood that artesian water was likely to be tapped at a shallower depth than from 800 feet upwards; and, as the machinery at Moongulla Reserve was small and defective, cost and delays in forwarding articles or machinery very great, I thought it advisable to recommend that the boring for artesian water at Moongulla Reserve be discontinued, and the plant removed to Sydney; which recommendation was approved of.

In the beginning of the year there were seven water augers in the field, three on the road Bourke to Wanaaring, two at Moongulla Reserve, one near Hay, and one prospecting for gold near Forbes; the latter did a good deal of work in boring, but not successful in striking a payable lead.

The

The total number of feet bored during the year was 2,566 ft. 10 in. or 381 ft. 7 in. more than during the year 1886.

The total cost of boring at per foot, inclusive of carriage, but exclusive of office salaries, &c. &c., is 16s. 2½d.; but inclusive of all office salaries, carriage, and all other expenditure to the Government, is £1 2s. 3¼d. per foot, or 18s 9¼d. less than in the year 1886.

Glancing over the returns of the boring operations on the Bourke to Wanaaring Road, it will be seen that at the 75-mile the rate, at per foot, between the 845 feet and 960 feet depths, has been noted as £3 9s. 10¾d. This, without explanation, appears large; but this cost includes the fencing-in of the bore, the erection of tubes both in the bore and above the surface, the sinking and timbering of a shaft at the bore 20 feet in depth, the throwing across of an embankment for conservation of water, and wages paid during time of removal. If these items had been kept separately, the cost, at per foot, would have been reduced by more than half. The bore at the 101½-mile, which at the end of the year was 674 feet 5 inches in depth, cost the Government, without carriage, office salaries, &c., £1 4s. 11¼d. per foot; but inclusive of office salaries, carriage, and all expenditure whatever, £1 15s. 3¾d. per foot.

At Moongulla Reserve only 30 feet have been bored during the year; the expenditure having been mainly caused through waiting for teams, and the carriage of plant to Sydney.

The bore at Gunbar Road, near Hay, although estimated at the total cost to the Department as £1 16s. 0¼d. per foot, has not cost that amount in reality for boring alone; but this includes the sinking and timbering-up of two wells 6 feet by 3 feet 70 feet each in depth, which was necessary to conserve the water obtained by boring.

Taking, therefore, the auger work separately or collectively, the price of per foot is less than that of 1886. But the results are better still, as during the year the deepest bores in New South Wales for artesian water have been brought to a successful issue; and I have great hopes that the boring for artesian water will be still further reduced in cost, as I have had to add during the year many new tools which will come in for the next bores. But as I stated above, the results, after all, should have a keener consideration than the actual cost at per foot.

I have, &c.,

W. H. J. SLEE,
Superintendent of Drills.

APPENDIX A.

DIAMOND-DRILL work, showing average cost per foot, exclusive of office salaries, store wages, rent, and Superintendent of Drills travelling expenses to the Department.

No. of machine.	No. of bore.	Locality.	Strata.	Depths bored.			Days occupied							Rate bored per hour	Percentage of core extracted.	Cost.		Remarks.	
				Depth of bore at 31 Dec., 1886.	Depth bored during 1887.	Total depth bored.	Moving.	Erecting.	Boring.	Repairing.	Reaming.	Delays.	Holidays.			Total.	Amounts.		Per foot.
8	1	Bundanoon	Hawkesbury series and coal measures	ft. in.	ft. in.	ft. in.	..	3	45	144	62	8	9	271	Inches.	52-57	£ s. d.	£ s. d.	January 29th to September 12th trying to recover rods.

* Drifts, quartz veins, and loose conglomerate were met with, which frequently jammed the core-barrel, causing great loss of time and extra expenditure. † Only 20 ft. 6 in. of boring has been done; the principal part of this expenditure was caused through loss of core-barrel and recovery of same. ‡ Very difficult drift country was met with in this bore; the core-barrel often jammed, and was lost. § The 64 ft. 8 in. bored was below the depth of 2,273 feet, hence the extra cost in lifting and lowering rods. || This bore is 3-in. diameter, and pierced through tough granite, gneiss, diorite, and quartzite, hence the extra cost. ¶ Very difficult country was passed through. ** No boring was actually done here, but the drill was forced through 35 ft. 7 in. of drift.

J. S. McNEIL.
D. McCULLOCH.

W. H. J. SLEE,
Superintendent of Drills.

(a) Although set down as £3 9s. 10½d. per foot, more than half of that expenditure was caused by fencing in the bore, sinking and timbering shaft 20ft. in depth, fixing tubing below and above the surface, and putting up embankments for the conservation of water. (b) This bore passed through thick layers of quartzite, also through drift. (c) The principal part of the expenditure was caused through delay waiting for teams to remove plant to Sydney. (d) Two wells were sunk, one at each bore, 70 ft in depth, and timbered for conservation of water, which expenditure is included in the cost of boring at per foot. (e) Colours of gold were obtained, but no payable lead discovered.

J. S. McNEIL.
D. McCULLOCH.

Flowed over surface at the rate of 7,400 Gallons per day.

Flowed over surface at the rate of 21,600 Gallons per day.

Flowed over surface at the rate of 22,464 Gallons per day and increasing.

Fresh 851 0

Fresh 900 0

Fresh 965 0

Note:- Fresh Artesian water tapped at 851 feet, flowing over surface at the rate of 7,400 Gals. per day. At 900 feet the Artesian supply increased to 21,600 Galls. per day. At 946 feet the fresh Artesian water, flowed over at the rate of 22,464 Gals. per day. At 965 feet the water was flowing over the surface at the rate of 22,464 Galls. per day and by latest reports the supply was increasing.

Salt water was tapped in this bore at from 28 to 42 ft. and at from 140 ft. to 164 ft. 291 ft. 5 in. of this bore put down in 1888.

APPENDIX J—continued.

INDEX to Wells and Bores—continued.

No.	Locality.	District.	Strata.	Remarks.
200	Youngarrina Springs	Albert	Well 6 ft. deep; estimated 800 to 1,000 gals. good water per diem.
201	M'Crae's Well, Baongum-yarra.	"	Well 27 ft. deep; 8 or 9 ft. in rock; good supply for stock; too brackish for domestic purposes.
202	Buckley's Well, Yantabulla	"	Bottom on sandy drift	Well 40 ft. deep; water fairly good, but slightly impregnated with soda; daily yield about 150 gallons.
203	Rudder's Well, Warroo Station.	"	Well 20 ft. deep; water rose 10 ft.; very salt.
204	Tynganic Spring	"	Well 40 " excellent water; estimated at about 10,000 gallons per diem.
205	Brindingabba, Moolort Block.	"	Well 94 ft. deep; watered 12,000 sheep through drought; excellent quality.
206	"	"	Well 120 ft. deep; water excellent; rose 90 ft. in shaft.
207	Kilfera, on Kilfera Block	"	Well 150 " supply 100 gals. per diem; good water.
208	Kenmare Block	"	Well 38 " bore 197 ft.; water salt.
209	"	"	Well 35 " water very salt; very bitter; no supply.
210	Kilfera Block	"	Well 100 " said to contain powerful mineral poison.
211	Polygonum Hut	Darling	On road Booligal to Wilcannia.
212	Barrigan Well	Albert	On the "Border Run."
213	Wanganilla	Murrumbidgee	On South Wanganilla Block.
214	Pretty Pine	"	Lower Deniliquin Run.
215	Beefwood Well, on "The Wells" Block.	County Yungnulgra, Albert District.	
216	New Well, on Block Byjerk South, Paroo River.	County Landsborough, Albert District.	
217	Well	County Yungnulgra, Albert District.	Coolawundy	Well 157 ft. deep; good water.
218	Well, Block Germano East	County Yungnulgra	Coparto	Well 50 " water rises to 20 ft.
219	Junction Well, Germano East	Albert	Well 80 " good water rises to 50 of surface.
220	Danbery Well, Danbery North Block.	"	Good stock-water.
221	Minamithoo Well, Dilkoorba North Block.	300 ft. deep; good water rose to 65 ft. from surface.
222	Parkungi Block	Albert	298 " good water rose to 80 ft. from surface.
223	Well	Poolamacca	236 " good water.
224	Thackaringa Well	Albert	236 " "
225	Wanga Well	"	270 " "
226	North Ita Well	240 " "
227	Melang West Well	20 " "
228	Moredevil Station	Liverpool Plains	Artesian fresh water.
229	Myalmundi	Narromine	194 ft. deep; good water.
230	Gap Well (45 miles west of Cobar).	South Warrego	Salt.
231	Top Well, Newcombe	Muggare Back B Block	70 ft. deep; good water.
232	Dungle Well (5 miles north of previous well).	70 ft., good for stock; at 75 ft., salt.
233	Walgett Wells	Town of Walgett	40 to 50 ft.; good water in black-soil flats.
234	Triangi Well	Narromine	350 ft.; good water; equal to 5,000 to 6,000 gals. per day.
235	Chapman's Well	"	350 ft.; water brackish.
236	Randwick Asylum	Randwick	Fresh water.
237	Bingugong Well	Yanko Creek	120 ft. deep; fresh water rose 52 ft. in shaft.
238	Gorce Well	"	172 " good water rose 105 ft.
238A	Packsaddle	Albert	Blue clay on drift	102 " 14,000 gals. in twenty-four hours, brackish.
239	"	"	Supply unlimited; 250 ft. deep.
240	Tarella	"	Shaly clay and slate	250 ft. deep; water obtained by driving 10,000 gals. in twenty-four hours.
241	"	"	Conglomerate cement	Untested fresh; rose 60 ft. in shaft.
242	Packsaddle	"	Trial shaft 40 ft., salt, large supply.
243	Cobham	"	Supply large; fresh water.
244	Big Plain Well	Fresh water.
245	Bulgrandra Well	Fresh water.
246	Old Gunbar Well	Salt water.
247	Gunbar Road (13 miles from Hay).	Fresh water.
248	Gunbar Road (13 miles from Hay).	Fresh water.
249	75 miles west of Bourke	Artesian water, 950 feet deep.
250	101½ miles west of Bourke	Artesian water, 952 feet deep.

- Lower Basalt. } Tertiary.
- Drift.
- L. Carboniferous or Devonian.

Peel and Uralla Mining District

NOTES. (1) The Tertiary Basalt consists of 2 beds each about 300 feet thick and separated by finely comminuted sand varying in thickness up to 120 ft. Neither payable gold nor gemstones of any value occur in this fine drift. (2) The auriferous and diamondiferous wash occurs in places below the lower Basalt, from which it is separated by considerable thickness of pipeclays. Many of the richest patches of drift occur, uncovered by Basalt, to the N.E. and S.W. of the Basalt plateau on which Butler's & Smith's selections are situated, that below this Basalt we have a portion of the diamondiferous lead. On its eastern edge is an outcrop of pipeclay and drift which either represents the principal channel or a tributary channel passing into it. (3) There is evidence, from the presence of high slate ridges to the N.E. and S.W. of the Basalt plateau on which Butler's & Smith's selections are situated, that below this Basalt we have a portion of the diamondiferous lead. On its eastern edge is an outcrop of pipeclay and drift which either represents the principal channel or a tributary channel passing into it. (4) In the neighborhood of Craddock's Claim, M.L. 126, where good gold and diamonds have been got, there is a large body of wash under the Basalt, and the probability is that a portion of a lead exists between Craddock's and the southern boundary of the Basalt Range, south of M.L. 142 & 143. (5) Payable gold has been got in the Pleistocene alluvial of Gympie Flat. This is a redistribution of the denuded portions of the Tertiary diamondiferous lead mixed with Pleistocene and Recent detrital materials. The gold is quite of a similar character to that got in the Tertiary lead.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

EXAMINER OF COAL-FIELDS.

(REPORT OF, IN CONNECTION WITH CERTAIN CHARGES MADE AGAINST HIM IN THE LEGISLATIVE ASSEMBLY)

Ordered by the Legislative Assembly to be printed, 14 February, 1888.

No. 1.

Minute by The Secretary for Mines.

Calling upon the Examiner of Coal-fields for report in connection with certain charges made against him in the Legislative Assembly, 1st December, 1887.

MR. MACKENZIE'S attention should be called to statements made in the Legislative Assembly on Thursday evening last, by two of the Members for Northumberland, Mr. Creer and Mr. Melville.

The first gentleman stated that hundreds of letters had been written to Mr. Mackenzie by miners complaining of non-fulfilment of the law by mine-owners, and no attention was paid to them by the Examiner of Coal-fields. The other gentleman stated that Mr. Mackenzie had been drunk while trying to perform his duties. I would like Mr. Mackenzie to carefully read the *Hansard* report of what took place, and send me any reply he may desire to make to the direct charges then made against him.

F. ABIGAIL, 5/12/87.

The Examiner of Coal-fields.—H.W., 5/12/87. As desired by the Minister, I have carefully read the *Hansard*, and now forward my report thereon —J.M., 16/12/87. The Under Secretary for Mines, B.C., 16/12/87. Report submitted herewith.—H.W., 16/12/87. Seen, 19/12/87.

No. 2.

Report by The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Department of Mines, Sydney, 13 December, 1887.

With reference to your blank-cover communication of the 5th instant, forwarding me the Minister's minute directing that my attention should be called to statements made in the Legislative Assembly by Messrs. Creer and Melville, and requesting that I would carefully read the *Hansard* report of what took place, and send to him any reply I might desire to make to charges made against me, I have the honor to submit that I have read the *Hansard* report, and find that the indictment made by Messrs. Creer and Melville against me contains fifteen counts, as follows:—

1. That every miner in the Northern District with whom I have been brought into contact complains of me.
2. That the highest authority outside a court of justice has declared my statements are not to be relied upon.
3. That in consequence of the unreliability of my statements on oath I am unfit to be Examiner of Coal-fields.
4. That my accusers are very much afraid my theory of the Bulli explosion was brought about by the excessive use of brandy, which my accusers allege I drank freely at Bulli.
5. That the late Royal Commission on the Bulli disaster charge me with contributory negligence.
6. That I know very little about my profession.
7. That I grossly neglect my duties.

8.

8. That, although I have received letters complaining of illegal modes of working certain mines, I have not called upon my inspectors for reports.
9. That, on account of the many charges made against me, and my conduct generally, the late Minister for Mines removed me from Newcastle to Sydney.
10. That I tell deliberate falsehoods.
11. That I attempt to fasten most detestable crimes on innocent people.
12. That I am always three-parts drunk.
13. That I am a blatant fool.
14. That I am a scoundrel; and, finally,
15. That I am a murderer.

I hardly know whether it is expected that I should seriously answer charges so vague, reckless, untruthful, slanderous, and violent; but I think the ninth charge sufficiently lights up the whole case, as Parliament is asked to believe that the late Minister for Mines, who is a practical miner, and able to judge of the gravity of such charges, removed me from Newcastle to Sydney on account of my improper conduct, yet, nevertheless, allowed me still to retain my position as Examiner of Coal-fields.

The reason for my removal from Newcastle is explicitly stated in a minute of the late Minister for Mines, under date 17/9/86, as follows:—"In view of the large number of collieries that are now, and are about to be, opened out in the Southern and Western Districts of the Colony, I am of opinion that the Examiner of Coal-fields should be located in Sydney, which is about equi-distant from the Newcastle, Wollongong, and Lithgow coal-mining districts." And in a letter from the Under Secretary, referring to this decision of the Minister, it is stated that the object of my removal was "in order more effectually to carry out the alterations he (Mr. Fletcher) purposes for the interest of the coal trade."

With regard to the charges generally, I think it will be sufficient to quote the remarks made by Mr. Fletcher, on the 27th January, 1886, when introducing a deputation of colliery managers to his predecessor in office, Mr. Vaughn.

In the course of his remarks, Mr. Fletcher, referring to the statements made by a previous deputation of miners, characterized them as "extravagant in the extreme, and in many cases absolutely untruthful."

Further on, in connection with an attack that had been made principally upon me by the former deputation, he said: "He would also refer to the charges made against the officers of the Department. He was not there in defence of those officers, but as far as he knew of the disputes which had occurred, the proper administration of the Act—so far as the colliery proprietors were concerned—was insisted on, and he had invariably found that the Inspectors and the Examiner had done their duty without regard to either the colliery manager or the working miner. It was only fair to state this, in answer to the onslaught that had been made on an important, and, he believed, an able and efficient officer."

Mr. Croudace, colliery manager for the Scottish Australian Company, who was a member of the deputation introduced by Mr. Fletcher, also said: "The officials, in the most just and reasonable way, had, so far as he was concerned, always laid any matter of complaint before him, and begged of him to have it remedied as quickly as possible; and when that has not been done they had justly followed up by a second complaint, and insisted on the thing being attended to. When the matter had not been remedied it had been referred to the Examiner of Coal-fields, a gentleman with whom they did not come so much into contact, but who was the head of the Department; and in every instance Mr. Mackenzie had done his duty as an honorable man and a gentleman and an efficient officer."

Mr. J. Y. Neilson, the Newcastle-Wallsend Company's colliery manager, bore this testimony: "As to the officers of the Department, the Minister would find that they had been what he considered extremely harsh with him, and some very strong letters had passed between them and him; and as far as doing their duty was concerned, they rather exceeded it in the majority of cases."

Mr. Ross, the Newcastle Coal Company's manager, expressed this opinion: "The Inspectors' visits were more careful and frequent than in any other collieries in the world; they took place every eight weeks, and oftener. Any complaint by the miners brought the inspectors on the spot within forty-eight hours, to get at the root of the matter, and the managers afforded them every assistance. Altogether, the charges made by the miners' deputation against the officials and the late Minister (Mr. Abbott) were really unfair and uncalled for. He had always found the Examiner very strict in everything, and he could speak highly of that officer, and of the former and the present Inspectors, whose reports would show that the Act was carried out, and that in the spirit of the law."

Mr. Croft, colliery manager for Messrs. J. and A. Brown's Minni and Brown's collieries, who also formed a member of the deputation, said: "He concurred with the other managers in their statements, that the Government officers had always done their duty, and were rather hard on the managers than otherwise."

I think I need say nothing further in defence of the general charges of neglect of duty and incompetence urged against me than point to the above independent testimony, coming spontaneously from the lips of gentlemen who admittedly stand at the head of the coal-mining profession in New South Wales. As a commentary, however, upon the general estimation in which my detractors are held, it would perhaps be as well to add here the opinions expressed by Mr. Croudace with respect to them. He said: "Mr. Melville had made a serious charge against the Examiner of non-fulfilment of duty; but when the Minister asked him to put it in writing he did not do so, and this showed the value of it. It was a wicked, dastardly, and cowardly charge of a Member of Parliament to bring against a Government official."

The foregoing testimony, I submit, is a sufficient answer to the charges of incompetency and neglect of duty, at all events up to 1886; and as to the hundreds of letters which it is affirmed have been written to me (I suppose since), and to which I have paid no attention, I can only say that their existence is either imaginary or fictional. At all events, if they have been written I have never received more than a fractional part of them, and to all that have come to hand I have given such attention as they required. The remainder of the charges appear to be consequent upon the utterance of my convictions as to the origin of the Bulli disaster, and because my opinion in respect thereto is distasteful to the miners' unions. With regard to this matter, I desire still to say that my views are unchanged. It is not from any obstinate conceit of my own opinion that I reiterate my belief, but because nothing has ever been elicited which disproves my hypothesis. My conviction is that the whole mischief

at

at Bulli was caused by the big fall at the tunnel mouth, and that that fall was brought about by the use of some explosive. My critics have fallen into an error of exaggeration, and from their own forced and unnatural interpretation of my meaning, discountenance and condemn my views. A confusion has arisen over cause and effect. The tremendous extent of the fall seems to have created the impression that a large quantity of explosive material would be required to produce it; and because, in the process of clearing away the debris, no evidence of such destructive force (as a large quantity of explosives would produce) were discovered, it is considered that my opinion is untenable. I never supposed for an instant that any large quantity of the destructive agent employed was used, because a comparatively trifling amount was all that was required to cause not only the fall but to set light to the very large quantities of inflammable "upper dust" on the main haulage road, and cause the singeing of the horse on the highest part of his body (just as was subsequently found to be the case), and yet, from the insignificant amount of explosive force, leave no more trace of its presence than blacken such portion of rock as it came in contact with. All that was necessary to create the fall was to dislodge some sets of timber, and a force too insignificant to leave traces of its presence would be sufficient for the purpose. The Royal Commission in their report (p. 31) admit that the destruction of one or two sets of timber might bring about the damage, there being nothing to bind the sets of timber together, and I claim this opinion in support of my theory. To qualify this admission the Commission then advance a statement which has a positively reverse bearing to the meaning it is intended to convey. They say the "suggestion of explosives infers malice of no ordinary kind; it also means that they were placed there, and fired in a busy road during the busiest part of the day." With all respect I desire to point out that the most lonely part of a mine "at the busiest part of the day" is its main heading. With the exception of the men passing rapidly in and out with skips, no other living individual may be met with sometimes for hours. The miners and officials are at such times engaged far away at the face workings, and it is precisely at "the busiest part of the day" that the roadways leading into the mine are most deserted.

The remarks that my theory suggests "malice of no ordinary kind" hardly requires comment. Our goals are filled with criminals who have given play to "malice of no ordinary kind"—ships have been sunk, buildings have been burnt and blown up, railway trains have been upset, murders of all kinds have been committed, and collieries have been set on fire and subjected to other disasters, all from malice aforethought time out of mind, and the like will happen again until the Millenium arrives. And with regard to arson in connection with coal-mining, it was found necessary to pass an Act in England, in 1736, providing that any person who "wilfully and maliciously set on fire, or caused to be set on fire, any mine, pit, or delph of coal, or cannel coal, and being thereby lawfully convicted, shall be adjudged guilty of felony, and shall suffer death, as in cases of felony, without benefit of clergy."

And there have been instances which favour the presumption that the particular crime which necessitated this drastic legislation in England has been attempted in New South Wales. Now, why, because I have expressed my suspicion of some one or two persons' villainy, it should be assumed, as it appears to be, that I have maligned the whole mining community I cannot comprehend. When a murder is committed no one dreams of charging the entire community with the crime, and it is just as absurd to suppose that I charge all miners with the production of the disaster at Bulli.

Before I leave the vexed subject of the Bulli disaster, I desire to point out how very much at variance are the opinions expressed by the Commissioners with the sworn testimony of two of their leading members—Messrs. Neilson and Croudace—who appeared as witnesses for the defence in a prosecution under the Coal Mines Regulation Act, brought against Messrs. J. and A. Brown, of Newcastle, in May, 1882. The Commission (at p. 15) say that "the practice of working with naked lights after the intake air was more or less fouled by the gas exuding from Nos. 1 and 2 was, in the absence of bratticing or some means of sweeping off the gas as it escaped from the coal, reprehensible. In the absence of bratticing the space between the face of these headings and the last stenton of the ventilation must have been a magazine, so to speak, for the stowage of gas. It would also appear that Mr. Ross had given instructions to fire no shot in the actual presence of gas. So far, this was as it ought to have been; but to remove the gas the ancient and perfunctory method of beating it out with a garment into the air current was resorted to. While the management gave orders to remove the gas they provided no effectual means, such as bratticing, for doing so." Let me say I entirely agree with the dictum of the Commission in the matter, for it happens to be upon those identical points, and the neglect pointed out, that I brought the prosecution against the Messrs. J. and A. Brown. My object in instancing the case is to show how colliery managers will blow hot and cold as the occasion suits, or occurrences demand. For at the inquiry in question, before the Newcastle Police Court, it was proved that precisely similar carelessness to that commented upon above had prevailed at Brown's Colliery, and resulted in many men being burnt, and yet Messrs. Neilson and Croudace appeared and averred on oath that they "failed to see that any action was left untaken under the circumstances which the most experienced man would have taken." Let this be contrasted with opinions expressed by these gentlemen when clothed with the authority of a Royal Commission. Accompanying this, I annex report of all proceedings in connection with the case against Messrs. J. and A. Brown of Brown's Colliery, Minmi, near Newcastle.

In conclusion, I wish to point out that there is a peculiarity in reference to the administration of the Coal Mines Regulation Act which does not appear to be realized or understood by the general public. In no branch of the Civil Service are officials subjected to such direct and persistent criticism from outside sources as the Examiner and Inspectors of Collieries. By the very nature of their duties they are thrust between two contending elements that are ever wrangling and jarring with each other—capital and labour. Do what they may, it is impossible for them to escape animadversion, for in every dispute which they are called upon to investigate they are met with the consciousness that whatever decisions they may pronounce they must give dissatisfaction to one side or the other. The records of the office constantly show this. If they challenge malpractices on the part of owners or managers, appeals are constantly made to the Minister, coupled with passionate remonstrances, sometimes suggesting improper motives, and nearly always charging officers with unnecessary interference and officiousness. If complaints come from the miners, and upon investigation some of them are found to be frivolous, and not deserving of any serious notice, the officers are denounced with either neglect of duty, incompetence, or corruption, in language plentifully sprinkled with the vilest epithets which insolence, ingenuity, or malice can invent. There is no organization of labour which is knitted together, and which has such special privileges, as that of the coal-miners. No other class of artisans are able, as they are, through the inevitable concentration of their numbers,

numbers, to return Members of Parliament specially to represent them, and no other mechanics are able to maintain such internal organization as they possess. It seems to be an idea among them that the only way to keep Government officials at the highest pitch of tension in the performance of their duties is to be perpetually finding fault with them, and so officials are subjected, with or without reason, to a never-ceasing carping criticism. Every mine has a recognized coterie of its own, whose business it is to settle petty details. These coteries join in forming district councils, and the whole merge in a combined association, with paid officials, whose business in life is to show the necessity of their employment by exhibiting real or pretended vigilance in the interest of those who employ them. Their paid mission is to find fault and stir up every conceivable form of agitation, and he is naturally accepted as the most worthy of confidence who can hunt up most subjects of dispute, and scold in the strongest language and with the loudest lungs.

Nearly every colliery, too, has miners' inspectors, who are ever on the watch in the endeavour to find the Government officials tripping, and such are unhappily the vicissitudes of coal-mining—the constant liability to misfortune in the wear and tear of appliances, the sudden appearance of dangerous gases, the accidental hindrances to ventilation caused by our often very sudden changes of atmosphere, and the carelessness and recklessness of men grown familiar with danger which it is impossible to provide against—such are the unhappy conditions of the pursuit of mining that it would be wonderful indeed if cases did not frequently transpire in which opportunity is afforded, no matter how unjustly, to find fault with somebody, and lay the principal blame upon the want of vigilance on the part of the Government officers. There are only myself and three Inspectors to carry on the administration of the Act, and on all sides we are exposed to the lynx-eyed supervision of a host of critics, whom the experience of my life shows it is hopeless to expect to please.

Born, bred, and educated to my profession in the heart of one of the great coal-mining districts of England (Lancashire), I am acquainted with the idiosyncracies of miners, and it is perhaps because I know them so well, and they are aware that I know them, that I am so frequently subjected to evidences of the disfavour of their leaders here. In the Colony, however, Government coal-mining officials have a much more trying ordeal to undergo than is felt in England, because in the growth of our enterprise in this direction we have not the added experience of centuries that has been acquired in England. Our many political changes give frequent opportunity for the vagaries of professional agitators, who re-hash all subjects of complaint, and air them as fresh grievances before every new occupant of the Ministerial chair of the Mines Department. This comedy has been going on for years, and will continue until, in the fulness of time, the records and traditions of the office will point out the true nature and value of a majority of the complaints made against Government officials. It is only in justice to myself and the Inspectors that I point out these matters for the consideration of the Minister.

Surrounded on all sides, as we are, by streams of adverse criticisms, it is perhaps in keeping that I, to whom has been confided the chief position under the law, should be singled out as the principal object of attack in Parliament, and charged with every species of incompetency for the office I hold, and with a base betrayal of the trust reposed in me.

Perhaps, however, I may be permitted to suggest whether—in the face of these extraordinary charges, persisted in in face of the clearest rebuttals, and indulged in time after time with all the accessories of violent language, and notwithstanding that they have been met and disproved again and again*—it should not be the duty of the Government to uphold the honor and fair fame of their officers; and, as I am precluded from replying myself to attacks made under the shield of Parliamentary privilege, whether the Government should not insist upon any further charges being made in writing, and supported by clear evidence, and insist upon their substantiation or their complete withdrawal.

As my professional status has been challenged, and adversely contrasted with that of Dr. Robertson, the President of the late Royal Commission on the Bulli disaster, I enclose herewith a copy of my English testimonials, the genuineness of which can be easily tested, and respectfully ask that I may be furnished with a copy of those of Dr. Robertson.

I have, &c.,

JOHN MACKENZIE, F.G.S.,
Examiner of Coal-fields.

* *Vide* Parliamentary Papers:—"Pitfall at Wallsend Colliery, May 13, 1879"; "Coal-fields—Undermining of Government roads at Tighe's Hill, Newcastle, June 18, 1884"; "Mining under Railways at Anvil Creek, Greta, and Wickham Collieries, November 20, 1884"; "Ventilation of Coal-mines—Correspondence and Reports thereon, April 1, 1887."

[Enclosures.]

Testimonials of John Mackenzie, Wigan, Lancashire, England, Mining Engineer, Surveyor and Inspector of Land, Mineral, Railway, and other properties.

From Peter Higson, Esq., Her Majesty's Inspector of Mines for West Lancashire and North Wales.

Manchester, 26 November, 1861.

THE bearer hereof, Mr. John Mackenzie, of Wigan, in Lancashire, is a Mining and Civil Engineer of extensive experience and considerable merit, having learned his profession under the late William Peace, Esq., at the collieries of the Earl of Crawford and Balcarres, in Haigh, Aspull, and Holland, during which time he acted under that gentleman as a resident engineer, besides acquiring great information and good practice on the estates of the Earl of Derby, and many other noblemen and gentlemen in various districts, not in coal-mining only, but in iron and other metallic ores, besides railway and other engineering works. In leaving this country for Australia, for the benefit of his health, he carries with him the best wishes of his countrymen, who sincerely hope he may meet with that success in his profession which he so well deserves.

PETER HIGSON,

Her Majesty's Inspector of Mines for West Lancashire and North Wales.

From General the Honorable James Lindsay, M.P.

Haigh Hall, Wigan, 5 December, 1861.

Dear Sir,
As you are about to leave England for Australia, I have much pleasure in bearing testimony to the high character you bear as a Mining Engineer and Land Surveyor. This is amply proved by the employment you have from time to time received from the most distinguished of those who conduct the great mining operations of this district.

The integrity with which you have carried on your business, and the moral character you bear in the town of Wigan, and the esteem you receive from those who have the pleasure of your acquaintance, will, I trust, be the means of securing you employment in the country to which you are about to proceed. I have much pleasure in enclosing you a letter to Sir John Young, the Governor of New South Wales, which I trust may be useful to you.

I remain, faithfully yours,

JAMES LINDSAY, Major-General, M.P.

From

Dear Sir,

From Henry Woods, Esq., M.P. for Wigan.

The Larches, Wigan, 19 November, 1861.
 At the request of your friend, Mr. Roodcroft, I have very much pleasure in adding my testimony to that of your other friends and neighbours, on the occasion of your leaving Wigan to go to Australia, by saying that from my knowledge of your position and character, and from my acquaintance with your mode of conducting your business as a Mining Surveyor, I doubt not you will obtain an appointment in the Colonial Service, for which I am well assured your education, professional attainments, and personal character eminently fit you, and I shall be willing to support your views at the Colonial Service should it be requisite to do so.

I remain, dear Sir, yours truly,
 HENRY WOODS, M.P., Wigan.

From the late William Peace, Esq., F.G.S., Manager to the Right Honorable the Earl of Crawford and Balcarres Collieries.
 My Dear Sir, 5 March, 1887.

In answer to your request that I would give you a testimonial, I have great pleasure in saying that during the time you were serving your clerkship to me you conducted yourself with exemplary steadiness; and that I consider you qualified to discharge satisfactorily the duties of your profession.

Believe me to remain, very faithfully yours,
 WILLIAM PEACE.

From Thomas Part, Esq., Solicitor, Wigan.

Dear Sir,

(This gentleman is at the head of his profession in Wigan, and holds several public appointments.)

Astley Hall, Chorley, 9 December, 1861.
 I have much satisfaction in furnishing you, on your contemplated departure for Australia, with a testimonial of your ability and trustworthiness as a Land and Mineral Surveyor. My extensive practice as a solicitor in connection with the mining operations of the district has afforded me, during the several years you have been in business, ample opportunities of forming a correct judgment; and I have much satisfaction in stating that I have always found you to be prompt, industrious, very accurate, and in every way to be relied upon, and trustworthy, whether acting as Check Surveyor or in any other branch of your business. I may add that, as a pupil of the late Mr. Peace (than whom, as a practical and scientific Mining Engineer and Geologist, no one stood higher), you had peculiar advantages in the opportunity of seeing and acquiring a practical knowledge of mining operations carried on upon the most improved principles.

Whilst wishing you every success in the distant field of your contemplated labours, I cannot but regret that the state of your health should oblige you to relinquish your promising prospects here, and deprive myself and others of the advantage and satisfaction we derived from your professional services.

With best wishes for your restoration to perfect health, and success in your business.

I am, dear, yours truly,
 THOMAS PART.

From Isaiah Booth, Esq., M.E., and President of the South Lancashire and Cheshire Coal Association.

Manchester, Tuesday, 22 October, 1861.
 This is to certify that I have known Mr. John Mackenzie, of Wigan, Mining Engineer, Colliery Viewer, and Land and Mine Surveyor, for more than five years. He served his apprenticeship with my late friend, Mr. William Peace, of Haigh, near Wigan, Fellow of Geological Society, and principal manager of the collieries of the Earl of Crawford and Balcarres. Mr. Mackenzie was afterwards with Mr. Peace for two years as his paid assistant; after that he commenced business in Wigan on his own account. During the time he has been in practice I have met him on questions involving Land and Railway Surveying, Colliery and Mine Engineering, and Arbitration business. He thoroughly knows his profession, and his integrity is beyond a doubt. He leaves a good business in Wigan to go to Australia, solely on account of his health.

ISAAH BOOTH,
 Mining Engineer, and President of the above Association.

From Robert Daghish, junior, Esq., Civil Engineer.

My Dear Sir,

St. Helen's Foundry, St. Helen's, 20 November, 1861.

I am exceedingly sorry to hear you contemplate leaving England for Australia, but sincerely hope the more genial climate there may restore you to robust health, and enable you to pursue the practice and profession you have pursued whilst in your native land with so much ability and satisfaction to your clients. It certainly seems a great pity that the respectable business you have established for yourself in Wigan during the five years you have been resident there should be left for others to reap the benefit of; but I feel very sure, if your health be spared to you, the country and climate you have selected for your future home possesses all that can be desired for the exercise of your talents as a Mining Engineer and Land Agent or Surveyor. Your experience and practical knowledge of these matters will also be of service to you in having young gentlemen confided to your care and education when you become known in your new field of labours, and the fact of your late master and other townsmen having entrusted their sons to your care and keeping is the best test you can carry with you of their confidence in your ability, industry, and integrity. If, during your sojourn in Australia, I can be of any service to you or your brothers, it will give me much pleasure. And with my best wishes to you and them,

I remain, yours faithfully,
 ROBERT DAGLISH, junior.

From Henry Woodcock and N. Eckersley, Esqs., Bankers, Wigan.

Wigan, 18 November, 1861.
 We beg to state we have known and employed Mr. John Mackenzie as a Mining Engineer and Land and Mine Surveyor, and have been quite satisfied with what he has done for us. He is a steady, respectable, and trustworthy man.

HENRY WOODCOCK, } Bankers, Wigan.
 N. ECKERSLEY, }

From the Smelting, Reduction, Lime, and Coal Company (Limited), Mold, North Wales.

My Dear Sir,

5 November, 1861.

As present Chairman of the Board of Directors of the above Company, I have, individually, much pleasure in testifying to the satisfactory manner in which, in the years 1858-9, you completed a surface survey of about 520 acres for this Company, and also surveyed, levelled, and set out a line of railway for the Company. I can also at the same time congratulate you on the accuracy of your report as to the great probability of finding the cannel coal above 2 ft. 8 in. in thickness, a seam of which, 3 ft. 4 in., this Company has just reached, as well as a lower seam of 4 ft. coal, confirming the soundness of your deductions (in opposition to prevailing opinions in the district), derived from surveys of the district, and sections thereof, presented by you to this Company in 1859-60. It will afford myself and co-directors, as well as the shareholders generally, satisfaction to learn that on reaching a warmer climate your health has been restored, and that you have had an early opportunity of resuming your professional avocations, in which you appear calculated to attain a deserved and distinguished success.

Remaining, my dear Sir, yours faithfully,
 FRANCIS OWEN, Chairman.

I have great pleasure in confirming the foregoing statement.—JOSEPH WILSON, Director.

From

From Thomas Lawn, Esq., Mining Agent to the Duke of Devonshire, Earl of Derby, and Lord Muncaster.
Ulverston, 18 November, 1861.

Dear Sir,
It is with great regret I have heard from Mr. Hodgson that your health compels you to leave England for a more genial climate; but wherever you go you carry with you my warmest and sincere wishes for your welfare and happiness. Mr. H. says that you wish to send abroad a few testimonials as to your abilities and knowledge of mining surveying; and, as a practical miner of 20 years experience, I have great pleasure in testifying to your qualifications. Your surveys in Furness were most admirably effected, and the plans you completed for us were proved in every instance to be correct.

I am, Sir, yours faithfully,
THOMAS LAWN,
Mining Agent to the Duke of Devonshire, Earl of Derby, and Lord Muncaster.

From the Rev. Henry J. Gunning, M.A., Rector of Wigan.
Wigan, 16 November, 1861.

I HAVE been asked by Mr. John Mackenzie to furnish him with a testimonial, and I have much pleasure in complying with his request. Mr. Mackenzie has been known to me for several years, and is a member of my congregation. I have always considered him a well-principled and a well-conducted young man. I have had frequent opportunities of watching his conduct and of testing his ability. As a Civil Engineer, he stands high in public estimation, and his constant employment in this mining district is a strong proof of the opinion thus formed of him.

HENRY J. GUNNING,
Rector of Wigan.

From Captain Charles Hutchinson, R.N., and the Rev. Thomas Rigbye Baldwin, Vicar of Leyland.
Leyland, 28 October, 1861.

WE, the undersigned, hereby certify that we have employed Mr. John Mackenzie as our surveyor and measurer for various coal mines during several years, and we have found him not only skilful in his business, but also most vigilant and attentive to our interests; we therefore consider that we are only doing him justice by confidently recommending him to any one having occasion for his services, ourselves greatly regretting that we are deprived of his assistance in consequence of the failure of his health in this climate.

CHARLES HUTCHINSON, Captain, R.N.
T. RIGBYE BALDWIN, Vicar of Leyland.

From the St. Helen's Canal and Railway Company.
12 November, 1861.

THE bearer, Mr. John Mackenzie, surveyed and made plans of a large portion of this railway, including levels and all details required for an unusually large scale. The plans are accurately and beautifully made, and I consider Mr. Mackenzie quite fit to undertake any kind of surveying.

JAMES CROSS,
Engineer-in-Chief.

From Francis H. Thicknesse, Vicar of Deane.
Deane Vicarage, near Bolton-le-Moors.

I HAVE much pleasure in stating, in favour of Mr. John Mackenzie, of Wigan, that he is a gentleman of highly respectable family and connections, whom I have employed for several years in reporting upon mineral property in that neighbourhood, making surface and underground surveys, and acting as a check agent against lessees of coal estates. Mr. Mackenzie has always done this business with satisfaction to myself and to others who have had intimate communication with him in my interests; and I only regret that this important mineral neighbourhood should, through his unfortunate ill-health, be deprived of the services of a young man of whom those best able to give an opinion of his professional merits have reason to think so highly. On every account I sincerely wish Mr. Mackenzie success in Australia.

FRANCIS H. THICKNESSE.

From the Sovereign Mills Company.

Dear Sir,
Sovereign Mills, Wigan, 18 November, 1861.

We much regret the cause which is forcing you to leave England for a warmer climate. We hoped to have had the benefit of your skill and ability to carry our case to an end. Your report of the workings, and the surveys, both above and under ground, gave us such great satisfaction that we fear we shall feel your loss if we have to go into court. Wishing you every success in business, and that your health may be fully restored,—

We remain, yours very respectfully,
WOODS & CO.

From J. K. Hodgson, Agent to the Earl of Crawford and Balcarres, at Ulverston.

My dear Sir,
Ulverston, 18 November, 1861.

I am very sorry to learn that you are about to leave England, but far more so because your failing health compels you to go.

I well remember the testimony Dr. Huddleston bore to your accurate survey of the mines he held under Lord Derby; and Mr. Brogden is now carrying out your suggestions as to the working of the Stainton Main Vein of iron ore, and which, though some miners considered it as *worked out*, is giving prospect of abundant deposits, never but by yourself supposed to exist in the direction the workings are now progressing. If I can see Mr. Lawn I will ask him to write you a few lines as a parting farewell; he and I have had many a chat about you, and the dismal holes you had to creep down and in when in Furness. And now let me beg that you will sometimes send me a short epistle from Australia. I do assure you I will at all times be happy to contribute my mite towards giving you passing news of the old country; and with every good wish from my self and family,—

Believe me, your sincere friend,
J. K. HODGSON,
Agent here to the Earl of Crawford and Balcarres.

From George Gilroy, Esq., M.E., Manager to the Ince Hall Coal and Cannel Company.

My dear Sir,
19 November, 1861.

I was extremely sorry to learn that you were driven to the necessity of going to a distant part of the world for the benefit of your health, but I trust the change may be beneficial, and result in the permanent restoration of your usual vigour. Having for a length of time had professional business with you in connection with this and other collieries, I cannot allow you to depart without expressing my high esteem and regard for you as an active and able member of our profession, and a gentleman whose absence, even for a short period, we shall all regret.

Wishing you every prosperity,
I am, my dear Sir, yours truly,
GEO. GILROY, M.E.

From William Bryham, Esq., M.E., and Manager to the Rose Bridge and Ince Hall Collieries

18 November, 1861.
HAVING known Mr. John Mackenzie several years as a land and mine surveyor and general mining engineer, I can with confidence speak of his abilities, well-known integrity, and assiduity in his profession as being of a first-class order.

WILLIAM BRYHAM,
Mining Engineer.

From Lieutenant G. W. Gunning, J.P., The Hall, Wigan.

November, 1861.
I HAVE much pleasure in complying with Mr. John Mackenzie's request, and writing a testimonial of his character and ability. The former is of the highest stamp; the latter has been well proved during his residence in Wigan by the constant employment he has had, and the general satisfaction he has given.

G. W. GUNNING, J.P.,
For the County of Lancaster.
From

From George Daghish, Esq., F.R.C.S., J.P., &c.

Cowling House, Wigan, 18 November, 1861.
 This is to certify that I have known Messrs. John and Kenneth Mackenzie, Mining Engineers, Land, Mine, and Railway Surveyors, Colliery Viewers, &c., all their lives, and have no hesitation in stating that, had the climate of this country suited them, their eminence in their various pursuits connected with their profession would have been of a high order. The moral tone, integrity, and perseverance which they both possess are unexceptionable; and their departure from this country is regretted by all friends.

GEORGE DAGLISH, F.R.C.S.,
 England, and J.P. for the County of Lancaster, England.

From Maskell W. Peace, Secretary and Solicitor for the British Mining Association of England.

Wigan, 16 November, 1861.
 I BEG to certify that I have known Mr. John Mackenzie, Land and Mine Surveyor, Engineer, and Colliery Viewer, for the last twenty years. He served his time with my father, the late Mr. William Peace, Fellow of the Geological Society, and the Mining Engineer of the Right Hon. the Earl of Crawford and Balcarres. He is, and always has been, steady, and has borne the best character. Clients of mine have employed him, and he has always given satisfaction.

MASKELL WM. PEACE,
 Attorney and Solicitor.

From J. Latham, Esq., M.D., M.R.C.S., &c., Partner in the Moss Hall and other Coal Companies.

Wigan, 16 November, 1861.
 MR. JOHN MACKENZIE, of this town, has determined to emigrate from his native country, and I have been asked to give him a passing memento, in the form of a testimonial, as to the estimation I have formed of his general, professional, and private character. I have been acquainted with him from his boyhood to the present time; and early in his career several very pleasing incidents occurred to mark the future man to me, and in this I have not been disappointed. As regards his professional capabilities, it is only necessary to state that he was articled to the agent of the Earl of Crawford and Balcarres for the usual term of years; that he honorably completed his engagements, and gave satisfaction, as was made manifest by his having been employed in the same establishment as an assistant for some time after his apprenticeship had expired. When he commenced business on his own account a general sympathy was felt towards him, owing to his correct habits, artistic qualifications, capabilities, and generally honorable conduct. The firms in which I am a partner, in the mining department, have occasionally employed him, and with entire satisfaction. Others of my friends and acquaintances have done so, and have reported well of their transactions. Had he remained here I have no doubt but his business career would have been successful; and it only remains for me to say that my best wishes attend him, and that I augur well of his future satisfactory course through life.

JOHN LATHAM,
 Licentiate of the Edinburgh College of Physicians, Member of the London College of Surgeons, and one of the partners of the Moss Hall, the Low Hall, and of the Rainford Colliery Companies.

From John Lord, Esq., Elmsley Park, Pershore.

6 November, 1861.
 I HAVE known Mr. John Mackenzie from his youth, and having for some time employed him as a land surveyor and mining engineer, I have great pleasure in testifying to his great proficiency in his profession, and to his great respectability.

JOHN LORD.

From the Rev. George Huntington, M.A.

Cathedral Church, Manchester, 18 October, 1861.
 I HAVE much pleasure in stating that I have known Mr. John Mackenzie intimately for more than ten years. During half that time I was resident in Wigan as curate of the parish church, and had daily opportunities of forming a correct judgment of his character, conduct, and abilities. Mr. Mackenzie is a regular communicant of the Church of England. He is possessed of the highest principles, and stands second to no one for uprightness, integrity, sense of honor, and general sobriety. I have been informed, by those who have accurate means of knowing, that his professional abilities are first-rate, and that his experience is most valuable. I deeply regret the necessity which compels him to leave his native country and his promising prospects.

GEORGE HUNTINGTON, M.A.,
 Clerk.

From Joseph Ingram, Esq., J.P.

Wigan, Lancashire, 16 November, 1861.
 This is to certify that I have intimately known Mr. John Mackenzie upwards of ten years. He has for some time been extensively engaged as a mining engineer and land and mineral surveyor, and employed by large and important colliery proprietors, to whom he has given entire satisfaction. He is most attentive to business, and of a highly moral character. Mr. Mackenzie leaves England with the good wishes of all classes of his fellow-townsmen.

JOSEPH INGRAM,
 One of Her Majesty's Justices of the Peace, and for nine years Chairman of the Board of Guardians.

From Ralph Leigh, Esq., Solicitor.

I do hereby certify that I have known and been well acquainted with Mr. John Mackenzie, of the borough of Wigan, in the county of Lancaster, land and mine surveyor, and agent; that his family connections are highly respectable, and in good position in life; that he had established a good business here, and in my opinion would have materially increased it if he had continued to reside in Wigan; and that he has given up his business and good prospects in life solely through his state of health, which is such that he is advised, if he stays, his life will be shortened, and he is recommended to go to one of the Australian Colonies. I have employed Mr. John Mackenzie, and he has been employed by business connections of mine, and in every case gave entire satisfaction.

RA. LEIGH,
 Solicitor of thirty-six years standing, and Clerk of the Peace for the Borough of Wigan.
 Dated the 16th day of November, 1861.

From J. C. Leach, Esq., J.P.

The Oaks, Wigan, 19 November, 1861.
 I HAVE much pleasure in bearing testimony to the very high character of Mr. John Mackenzie, of this town. I have known him for several years, and have the greatest confidence in recommending him, feeling confident that any orders given to him will be executed with skill, promptness, and neatness, to the entire satisfaction of those who may employ him.

J. C. LEACH, J.P.

From the Rev. Howard St. George, M.A., Incumbent of Billinge.

18 November, 1861.
 I HAVE known Mr. John Mackenzie for several years, both during his apprenticeship and subsequently, as a mining engineer and land surveyor on his own account, in Wigan. He has been advised to leave England and try the effect of a warmer climate on account of his health. By strict attention to his business in Wigan, and by integrity and uprightness of conduct, he has widely extended his connection, which he is now unfortunately compelled to abandon. He hopes, however, to be enabled to pursue his professional career elsewhere, and I can with the greatest confidence recommend him to any one requiring his services.

HOWARD ST. GEORGE, M.A.,
 Incumbent of Billinge, near Wigan, Lancashire.

From

From James Wood, Esq., Land Agent to the Right Honorable the Earl of Crawford and Balcarres.

Haigh Hall, 14 November, 1861.

As land agent of the Right Honorable the Earl of Crawford and Balcarres, I have had frequently to engage the services of Mr. John Mackenzie, mining engineer and land surveyor, during the last five years. I have always been pleased with what he has done for me, and his character and abilities have always been of the highest class.

JAMES WOOD

From Edward Scott, Esq., Solicitor.

Dear Sir,

Beech Hill, Wigan, Lancashire, 11 November, 1861.

I have great pleasure in giving you my testimonial that, in my opinion, you are a person of respectability and integrity, and well qualified to give satisfaction as a land and mine surveyor. I wish you every success in your future home in Australia. Your brother Kenneth, from his skill and industry, will be a great assistance to you in your business. I send a letter of introduction to Mr. A. S. Clark, of Adelaide.

Yours truly,
EDWARD SCOTT.

From Thomas F. Taylor, Esq., Solicitor.

My dear Sir,

Wigan, 20 November, 1861.

With very sincere regret, increased by the unfortunate state of your health (which has necessitated the step), I have learned that it is your intention to leave England for Australia. As a friend I am extremely sorry to lose your valued society, and sympathize with you in the loss and inconvenience you must sustain in being obliged to abandon the large and important business connection rapidly forming around you. However, with your strict integrity, prudence, energy, and intimate knowledge of your profession (of all which qualities I am able to speak confidently from experience), I doubt not you will quickly rally around you a circle of equal value with that which you are unfortunately compelled to relinquish here. That restored health, success, and happiness may attend you in your future career is the cordial wish of,—

My dear Sir, yours faithfully,
THO. FRED. TAYLOR,
Solicitor, Wigan.

From the Rev. J. T. Browne, B.A., Incumbent of Haigh, and Domestic Chaplain to the Earl of Crawford and Balcarres.

Haigh, Wigan, 18 November, 1861.

Mr. JOHN MACKENZIE served an apprenticeship of five years to William Peace, Esq., engineer and head manager of the very extensive collieries of the Earl of Crawford and Balcarres, in Lancashire. When his apprenticeship was completed he remained for two and a half years additional, as a paid assistant. The very fact of his being taught, and afterwards employed, in an important position by such a man speaks for itself. Mr. Peace was among the most eminent engineers (connected with colliery purposes) in England; and high mention of him is made in the article "Collieries" in this last edition, 1860, of the Encyclopædia Britannica, to which I beg to refer. Mr. Mackenzie's competence to undertake professional employment on his own account has been fully tested by his clients in Wigan. As to this gentleman's personal character, I beg to say I have known him well since his childhood, and can testify that there cannot be a more trustworthy, honorable, upright person. He has excellent common-sense, and altogether is most eligible for an appointment where more than usual confidence is to be shown. I shall be happy to reply satisfactorily to any further inquiries that may be made respecting Mr. M. at any time.

J. T. BROWNE,
Incumbent of Haigh, Domestic Chaplain to the Earl of Crawford and Balcarres.

From William Ackerley, Esq., Solicitor.

My dear Sir,

Wigan, 19 November, 1861.

I am extremely sorry to learn that the failure of your health compels you to leave the country for a warmer climate. During the many years I have been acquainted with you, and during which I have had occasion frequently to employ you, your steadiness, attention to business, and thorough knowledge of your profession have given me every satisfaction. I can assure you that as far as I am able to judge, your loss, both as a professional man and as a private individual, will be deeply felt; and I think that the best wish I can express for you is that your success in Australia may be as great as it assuredly would have been here.

Yours very truly,
WIL. ACKERLEY,
Solicitor, Wigan.

From John Mayhew, Esq., Solicitor, Wigan.

Wigan, 3 December, 1861.

THIS is to certify that in my character of solicitor to the Earl of Crawford and Balcarres, and for other landowners, Coal-mining Companies, and gentlemen of influence in this district, I have become acquainted with Mr. John Mackenzie, land and mining surveyor, of this town (who for his health is about to leave England for Australia), and that I have always considered him to be fully competent to the discharge of his duties—industrious, accurate, and conscientious. I may safely add that, in my judgment, Mr. John Mackenzie, had his health permitted him to stay in Wigan, would have obtained the leading practice of the district.

JOHN MAYHEW, Esq.,
Solicitor, Wigan.

From John Thompson, Manager of Nerquis Cannel Company, Mold, North Wales.

My dear Sir,

Wigan, 7 December, 1861.

If any words of mine can be of assistance to you in your future professional career, I am glad to add my testimony to that of your other friends as to your high professional standing in this neighbourhood. I have, perhaps, had better opportunities than most of watching the care and attention which you bestowed on anything entrusted to you, and can with confidence speak to the ability you have always displayed. Wishing you every success in the land of your adoption,—

John Mackenzie, Esq., Dicconson-street, Wigan.

I remain, dear sir, yours very faithfully,
JOHN THOMPSON.

From Edward Thompson, Esq.

Tryddyn Colliery, near Mold, North Wales, 11 December, 1861.

My friend, Mr. John Mackenzie, mineral surveyor, of Wigan, has been engaged for four years professionally in the Flintshire district, both in the lead and coal fields.

Mr. Mackenzie made a survey of the Great Rhossmor Lead-mine, and is himself a shareholder and principal director of the East Rhossmor Lead-mine. I have had many opportunities of my own personal knowledge of satisfying myself of Mr. Mackenzie's efficiency as a mineral surveyor, both in the coal and lead fields.

EDWARD THOMPSON.

From

From Thomas Whaley, Esq., Coal Proprietor, Wigan.

23 November, 1861.

I HAVE known and seen Mr. Mackenzie almost daily for many years, and, from the peculiar advantages I have had, I can testify his character will bear the strictest investigation, and that he is competent to undertake any business connected with surveying and mining engineering.

Mr. Mackenzie served a full apprenticeship with my late brother-in-law, William Peace, F.G.S., manager and agent for the Earl of Crawford and Balcarres. Since he commenced business upon his own account I have frequently employed him to make surface and underground surveys, estimate the quantities of minerals gotten, which he has always executed to my satisfaction—so much so, that I paid him a large premium to take my brother as an apprentice pupil. He had then two others, and a competent assistant, whom I understand is succeeding him in business. I have pleasure in stating Mr. Mackenzie's plans, for accuracy and neatness, cannot be surpassed. He has a large circle of friends, all of whom wish him success, and regret his state of health which compels him to leave England.

THOMAS WHALEY,
Coal Proprietor, Wigan.

No. 3.

Messrs. Brown's Colliery, Minmi.

(No. 1.)

The Miners' General Secretary to The Secretary for Mines.

Sir,

Hamilton, 19 October, 1881.

I have the honor to bring under your notice the enclosed letter, which was delivered to the Government Examiner of Coal-fields on the 1st October, 1881, regarding the defective working of the Coal Mines Regulation Act of 1876, and referring to a number of accidents caused by explosions of gas at the Messrs. Brown's Colliery, Minmi. That there are just grounds for complaint will be admitted when I state that since the delivery of the letter herein mentioned another accident of a similar character has occurred at the same place, and in this instance has been officially reported, which, for some unexplained reason, has not been done in other cases equally serious.

There is, I may add, general complaint regarding defective ventilation at the principal mines in the district, not of the ventilation as a whole, but that in certain portions of the mines the ventilation is exceedingly bad, and believing it to be within the province of the Inspector for Collieries to effect some remedy in this direction, I would respectfully invite you to draw his attention to this very important subject, also the Examiner of Coal-fields.

Should you desire to have further information respecting this matter by deputation I shall be most happy to wait upon the Honorable Minister.

I have, &c.,

JAMES CURLEY,
Miners' General Secretary.

The Examiner of Coal-fields for explanation.—H.W., B.C., 22/10/81. The Under Secretary for Mines.—The correspondence with reference to this case was forwarded for the information of the Honorable the Secretary for Mines with my communication of the 22nd inst.—J.M., B.C., 24/10/81.

[Enclosure to No. 1.]

Sir,

Hamilton, 30 September, 1881.

I beg respectfully to bring under your notice the defective working of the Coal Mines Regulation Act of 1876, and the apparent indifference of your Department in endeavouring to see that the provisions of the Bill are carried out. That the subject has assumed an important aspect you may infer when I state the miners of the district have placed myself and colleagues in a position to take all necessary steps towards a remedy. A series of questions have therefore been drafted to be placed in the hands of the Members for the county, upon which subject also the co-operation of the city Members will be invited, and an inquiry the most searching will thus be opened up, and will tend to show that on the part of the Inspector of Collieries there is a great indifference.

I have before me the Mines Report of 1880 wherein the admission is made that I have made previous complaints, with the assertion that they have been immediately remedied. What is the answer to this? Three miners have been burnt in the Minmi mine recently by explosions of gas. Two of these accidents were only three weeks or one month apart from each other, and at a time when no night furnacemen were employed. If atmospheric pressure has any influence (which you will admit) in generating gas and its accumulation in mines, surely, in a climate like ours of sudden atmospheric change, it is a first condition in ventilation that the apparatus be kept in motion. Minmi is not the only place where false economy requires your immediate attention, and, what is more, constant attention.

I will put the question thus with your permission:—"It is better that accidents should be prevented by inspection, than that it should be said accidents, in the cases cited, are the inspectors."

The report of Inspector for Collieries requires attention, and, to those unacquainted with the Act, is very misleading. For instance, it is said of such a mine there are "280 men and horses, &c., in the mine, for whom 35,000 cubic feet of air per minute is introduced, which is in excess of the minimum quantity required by the Act."

The inspector does not state whether the main current is divided into the requisite number of splits, and fresh air supplied to every section of seventy men, and it is certainly impossible to be so where the anemometer will not turn, which is recorded by the local inspectors in several recent examinations, some of which are in my possession.

In conclusion, we, the undersigned, request your immediate attention towards remedying the cause of complaint—defective ventilation—in some parts of the collieries in the district.

DAVID MITCHELL, Chairman.
J. M'FADYEN, Treasurer.
JAMES CURLEY, Secretary.

The Examiner of Coal-fields.

(No. 2.)

Sir,

Coal-fields Office, Newcastle, 22 October, 1881.

I beg to forward herewith, for the information of the Honorable the Secretary for Mines, a letter received from the Chairman, Treasurer, and Secretary of the Hunter River District Coal-miners' Association, bringing under notice an alleged defective working of the Coal Mines Regulation Act, 1876, and the apparent indifference of this Department in endeavouring to see that the provisions of the Bill are carried out, with the Inspector's report thereon and a copy of my reply.

JOHN MACKENZIE,
Examiner of Coal-fields.

See Enclosures.

The Miners' General Secretary may be informed that the Examiner of Coal-fields having replied to the only specific charge made, and having asked for further information respecting the charges made in general terms, there does not appear to be any action for this Department to take until such information has been supplied.—H.W., 25/10/81. Submitted.—To be informed accordingly.—A.R., 26/10/81.

[Enclosures to No. 2.]

Sir,

That the subject has assumed an important aspect you may infer when I state the miners of the district have placed myself and colleagues in a position to take all necessary steps towards a remedy. A series of questions have therefore been drafted to be placed in the hands of the Members for the county, upon which subject also the co-operation of the city Members will be invited, and an inquiry the most searching will thus be opened up, and will tend to show that on the part of the Inspector for Collieries there is great indifference.

I have before me the Mines Report of 1880, wherein the admission is made that I have made previous "complaints," with the assertion that they have been immediately remedied. What is the answer to this? Three miners have been burnt in the Minmi mine recently by explosions of gas. Two of these accidents were only three weeks or one month apart from each other, and at a time when no night furnaceman was employed. If atmospheric pressure has any influence (which you will admit) in generating gas and its accumulation in mines, surely in a climate like ours, of sudden atmospheric change, it is a first condition in ventilation that the apparatus be kept in motion. Minmi is not the only place where false economy requires your immediate attention, and, what is more, constant attention. I will put the question thus, with your permission:—"It is better that accidents should be prevented by inspection, than that it should be said accidents in the cases cited are the inspector's." The report of the Inspector for Collieries requires attention, and to those unacquainted with the Act is very misleading. For instance, it is said of such a mine, there are "280 men and horses, &c., in the mine, for whom 35,000 cubic feet of air per minute is introduced, which is in excess of the minimum quantity required by the Act." The Inspector does not state whether the main current is divided into the requisite number of splits, and fresh air supplied to every section of seventy men; and it is certainly impossible to be so where the anemometer will not turn, which is recorded by the local inspectors in several recent examinations, some of which are in my possession. In conclusion, we, the undersigned, request your immediate attention towards remedying the cause of complaint—defective ventilation—in some parts of the collieries in the district.

DAVID MITCHELL, Chairman.
JOHN M'FADYEN, Treasurer.
JAMES CURLEY, Secretary.

The Examiner of Coal-fields.

Urgent. The Inspector of Collieries for report. To be returned.—J.M., 4/10/81.

Being unable to understand the exact meaning of the statement in the letter, "The Inspector is indifferent, &c." I can scarcely be expected to furnish a reply to it. As to the statement "That the Inspector's report does not state whether the main current is divided into the requisite number of splits, &c.," I reply that, although not so stated in the report, nevertheless such currents are divided into district currents; and the omission shall be made good in future.—T.L., 5/10/81.

Gentlemen,

Coal-fields Office, Newcastle, 22 October, 1881.

I have the honor to acknowledge the receipt of your letter of the 30th ultimo, bringing under notice an alleged defective working of the Coal Mines Regulation Act of 1876, and the apparent indifference of this Department in endeavouring to see that the provisions of the Bill are carried out.

2. In reply, I beg to inform you that as the only specific complaint brought forward in your letter had reference to the Minmi mine, I recently made it my business to make a thorough examination of Brown's colliery, by inspecting all the places where the men were at work, measuring the quantity of air circulating through the different districts or splits and the men's working places, as well as the quantity of intake and return air travelling through the mine, and found that the main current was divided into the required number of splits, and not only was there a far larger quantity of air passing through the mine than the Coal Mines Regulation Act requires, but it was properly circulated, and the mine well ventilated.

I asked each miner at work, amongst other questions, whether he considered the air he was working in was good or bad, and if he had been working in any badly ventilated places during the year, and they said they had no reason to complain of the air they were then or previously working in; that they had worked where the air was slack and deficient, when their bords, &c., had been driven past where a "cut-through" was about being "put-through."

I also inspected the bords and headings where Hunter, Gilder, Hull, Davies, Bothwell, Duggan, and Andrews were burnt by explosive gas, and made inquiries as to their injuries. Hunter, Gilder, Davies, and Bothwell being only slightly burnt it was not considered necessary by the manager to report their accidents, and the men themselves did not consider they received "serious personal injury," or that it was necessary for the manager to have reported their injuries.

The manager informed the Inspector that Duggan and Andrews had been burnt by explosive gas, and that officer reports to me that upon visiting Duggan he found he was apparently only very slightly burnt, and did not consider he had received serious personal injury.

On the 6th instant I went to the Newcastle Hospital to see Duggan, and found that his back, arms, face, and one hand had been severely scorched; and although the Inspector, when visiting him, formed the impression that no serious personal injury had been received, the case has, in my opinion, proved to be one of that character.

Dr. Harris says, whilst at the hospital, his life was for some days in danger, and Duggan says for over two weeks he was in such pain that he could not lie on his back to sleep; but, from his own account of the occurrence, I conclude that had he exercised ordinary caution the accident would not have happened.

4. In the No. 10 heading, where the seam of coal generates the most gas, and there were 42 men, boys, and horses at work (in the two shafts), I found there was 10,080 cubic feet of air per minute circulating through the working-places, and was informed that there was seldom a less quantity travelling through this part of the mine. I saw Davies, who was slightly scorched by an explosion of gas about eighteen months since, and he told me he did not consider his was a case which it was necessary to report; that he was working in a 6-foot heading at the time, and about 30 yards before the current of air. In No. 12 heading, where Andrews was burnt, there was 4,950 cubic feet of air per minute circulating through it, and only two men working in it. Mr. Brown has since my first visit appointed a fireman, whose special duty it will be to go round all the places known to contain explosive gas, before the men go to work.

Previously it was John Morgan's (the deputy's) duty to go round the dip workings, wherever fire-damp was likely to exist. And as the quantity of gas generated by the seam of coal is at present small in quantity, and there is a good current of air circulating, it appears to be unnecessary for the manager to do more than he has promised for the prevention of accident from such a source—a view supported by the miners themselves, of whom inquiry was made on the spot.

5. In conclusion, I may observe, that if you will be so good as to mention specifically the other collieries in this district to which you refer, as not carrying out the provisions of the Act, I shall take effective steps for ascertaining whether the law is complied with in each case, for the reports received from the Inspector of Collieries for some time have led me to suppose that there were no causes for complaint.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

Mr. James Curley and others

(No. 3).

The Under Secretary for Mines to Mr. J. Curley, Miners' General Secretary.

Sir,

Department of Mines, Sydney, 28 October, 1881.

Referring to your letter of the 19th instant, in which you bring under notice a communication made to the Examiner of Coal-fields, touching the alleged defective working of the Coal Mines Regulation Act 1876, and the accidents caused by explosions of gas at Messrs. Browns' Minmi Colliery, I have the honor, by the direction of the Secretary for Mines, to inform you, that as the Examiner has replied to the only specific charge made, and has asked for further information respecting such charges as have been made in general terms, there does not appear to be any action for this Department to take until such information has been supplied.

I have, &c.,

HARRIE WOOD,

Under Secretary.

(No. 4.)

Mr. J. Curley, Miner's General Secretary, to The Examiner of Coal-fields.

Sir,

Hamilton, 7 November, 1881.

I have the honor to acknowledge the receipt of your communication dated 22nd October, and referring to the second clause therein, as to the answers given by the miners respecting the ventilation being of a generally satisfactory character; this was, as I am given to understand, when you were accompanied by Messrs. J. Brown, J. Croft, and G. Durie, all representing the management, while the miners were unrepresented by any of their number, exception being taken to Mr. J. Patrick, an experienced practical miner, now in the employ of the men as check-weigher, going down the mine in company with you, so that it is nothing unreasonable to conclude the inquiry and examination partook of a partial, one-sided, and unsatisfactory character, inasmuch that a sense of intimidation would under such circumstances be at once produced. This view of the case is supported by the fact that the delegate's two sons had been some days previous to this peremptorily discharged from their work in the fitting shops adjacent to and in connection with the colliery. Mr. W. M. Williams, the delegate, I knew to be a man of exemplary character, while his sons had by their industry, won the respect and esteem of the overseers in their department.

This is most inconsistent with the courtesy uniformly observed by the gentleman representing the firm, whom I have met on several occasions at meetings between masters and men.

Admitting, however, the answers to have been given as stated, the evidence, judging from the number of accidents by explosions of gas and the time at which they occurred, it is quite evident that there has been grave indifference on the part of the management, and still more on the part of the Inspector for Collieries.

In clause 3 of your communication you state, "Hunter, Gilder, Hull, Davies, Bothwell, Duggan, and Andrews were burnt by explosive gas,"—Hunter, Gilder, Davies, and Bothwell being only slightly burnt, it was not considered necessary by the manager to report their accidents, and the men themselves did not consider they received serious personal injury or that it was necessary for the manager to have reported their injuries." The opinion of both manager and men in reference to a report is perverse in the extreme, and probably was quite different on the dates when the accidents took place, and confirms what has been said regarding indifference. If the Inspector committed a mistake in the case of Duggan's accident, which you admit, neither the management nor men are more judicious (but the latter are not requested to report, and why you include them with the management I fail to understand). What is serious personal injury? When miners are knocked down and severely burnt by gas explosions, and incapacitated from following their employment for two and three weeks together. It must be serious personal injury when these accidents are concurrent and take place at intervals of a few weeks together. It is not the slight trifling matter represented. And more especially when you consider the time at which the accidents took place, when the men had been some hours at work, the air would then be in motion, however defective, and forced about by the skips in motion, and yet gas collected in sufficient quantity to explode, which explains two important facts—

1. That there was very defective ventilation at the time of these gas explosions, or
2. That there was that amount of gas collecting in the mine requiring vigilant attention, and, in case of an accident, rendering a report imperatively necessary.

The Colliery Inspector in Duggan's case showed not only indifference and a want of judgement but is culpably negligent for not making an examination on the spot; and in reference to such examinations it would be more satisfactory if the miners were represented, and the press admitted. This would constitute something like an impartial Board of Inquiry. I cannot refrain from dissent regarding Duggan's want of caution as expressed by you. Did anyone warn him against going into his working-place on the morning of the explosion? No; and as he advanced into it the gas exploded about 15 yards from the working face. This was shortly after Hunter's accident. Duggan not only suffered serious personal injury, but, as you state, Doctor Harris considered his life was endangered; and yet the Colliery Inspector deemed this most serious case of such trifling importance that neither an enquiry was held nor an examination made. Is this in conformity with the Act? In attributing the accident to a want of ordinary caution there appears to be something strangely inconsistent, especially when you consider Hunter's, Gilder's and other accidents in connection with it. Why not attribute it to careless management and indifferent inspection? The evidence in favour of this latter conclusion is overwhelming.

Both Duggan's and Andrew's accidents were occasioned by gas explosions as they were advancing to the working face in the morning, which goes to show that no fireman had been in these places on the morning of the accidents, or he would have noticed the gas, and warned the miners against entering them, and thus have prevented all approach to danger.

Whatever may have been the state of the ventilation when the examination was made, or the quantity of air passing in the mine,—at the time of the whole of these seven accidents by gas-explosions, the whole of which were more or less serious, there was not that quantity of air passing in the mine stipulated by the Act, wherein it is stated—(2) "An adequate amount of ventilation shall be constantly produced in every mine, to dilute and render harmless noxious gasses to such an extent that the working places of the shafts, levels, stables, and workings of such mine and the travelling roads to and from such places shall be in a fit state for working and passing therein."

I enclose you a copy of statement which I have taken from William Hunter, in the presence of Mr. Patrick, which confirms what I have stated relative to the whole question:—

1. Indifference on the part of the management regarding the ventilation of the mine.
2. Negligence in not using more precaution to prevent accidents by gas explosions, and when such accidents did occur, in not reporting the same to the Examiner for Coal-fields.
3. Indifference on the part of the Colliery Inspector, who must have seen from the local press, that miners were burnt by gas explosions at Messrs. Browns' Colliery, Minmi, and when informed of the same by report from the management to apparently treat the matter with contempt, as in Duggan's case.
4. The incorrectness of the Inspector's reports, in the face of the facts brought under notice.
5. That there is room for improvement regarding the way in which the inquiries and examinations are made.

With regard to clause 5 of your communication, before I refer to it, I would draw your attention to a mine abandoned, but inundated by water, in close proximity to the Messrs. Brown's Collieries now in work, and would ask you respectfully, whether the Inspector has reported this matter to you, and whether any steps are taken as a safeguard in the event of the old tunnel workings piercing the abandoned workings of the inundated mine, and if there are efficient appliances in case of escape on account of any unexpected accident arising from such a source of danger.

In conclusion, respecting clause 5, and the specific naming of the other collieries in this district, I would mention, Wallsend, Borehole, and Lambton, and for any reference to the state of ventilation being defective in these mines in any particular portions thereof, would refer you to the recent local Inspectors as entered in the book at the respective Colliery Offices named.

I am, &c.,
JAMES CURLEY,
 Miners' General Secretary.

We, the undersigned, concur in the above statement.

DAVID MITCHELL, Chairman.
J. M'FADYEN, Treasurer.

[Enclosure to No. 4.]

William Hunter states as follows:—On the morning when I was burnt by an explosion of gas, I was working in No. 14 front heading. The heading was about 27 yards in past the cut-through; my mate was working in the back heading, which was about 6 yards past the cut-through; we had been working in these places about three weeks. Before commencing to work on them, we heard from report by the men there was fire-damp in these places; my mate, Alfred Conway, went to Mr. Thomas, the manager, and told him that we knew nothing about fire, and what the men had told us concerning these places. This was on the Monday morning before commencing to work them. Thomas, in reply, said there was no fire in the place, and if there was Durie would tell them. Durie at no time warned us about fire-damp. He said if we brushed the place with our shirts we would take no hurt. On the morning on which the accident occurred I brushed the place as usual, and had been working about two hours and a half—from half-past six to nine o'clock. I had been back from the face of the heading about 25 yards, for breakfast, only a few minutes, and on returning to the face I was brushing the place, and, when about 5 yards from the face, an explosion of gas took place. I was struck on the breast, and knocked down by the force of the explosion, and fell on my breast.

I thought it was a serious matter at the time, and was unable to follow my work for two weeks after.

I think the accident should either have been reported or steps taken to clear the gas from the places.

Mr. Durie came to see me and offered me a place to work elsewhere in the mine, and said I would go back there no more. Neither Mr. Lewis, the Colliery Inspector, nor Mr. Mackenzie visited me at the time I was off work. When I answered Mr. Mackenzie's questions Mr. J. Brown, J. Croft, and G. Durie were present, and I felt somewhat intimidated by their presence, and did not care to say anything reflecting on the management, for fear I should be dismissed.

I am a practical miner, having worked in mines for eight years. The day on which Mr. Mackenzie visited us in one of the No. 6 headings and said the air was good enough, there were very few men in that part of the mine, as the pit was filling slack and nearly all the men were cleared out.

WILLIAM HUNTER,
JOHN PATRICK,
JAMES CURLEY, Miners' General Secretary.

"Barley's Hotel," Minmi, 31 October, 1881.

The Inspector of Collieries for explanation. Copy of my letter referred to in this communication forwarded herewith.—J.M., B.C., 14/11/81.

In this statement I am blamed for indifference, but not knowing the meaning of the same as used herein, I am therefore unable to reply.

2. For the incorrectness of my report, to which I think that the result of the examination by the Examiner of Coal-fields is a sufficient answer.

3. For neglecting the accidents by explosions of fire-damp, to which I answer that I investigated each case brought under my notice.—T.L., 15/11/81.

(No. 5.)

The Miners' General Secretary to The Secretary for Mines.

Sir,

Hamilton, 8 November, 1881.

I have the honor to state that a further communication on the defective working of the Coal Mines Regulation Act, 1876, and recent accidents by explosions of gas at the Messrs. Brown's Colliery, Minmi, has been forwarded to the Examiner of Coal-fields.

A statement which I have taken from one of the miners burnt by explosive gas has also been forwarded, which confirms the allegations made respecting this important subject.

I have, &c.,
JAMES CURLEY,
 Miners' General Secretary.

Ask the Examiner what has been done in this matter.—H.W., 2/12/81.

(No. 6.)

13

No. 6.

Mr. J. Curley, Miners' General Secretary, to The Examiner of Coal-fields.

Sir,

Hamilton, 28 November, 1881.

I have the honor to respectfully call your attention to the defective state of ventilation in connection with the drive at Raspberry Gully, South Waratah. The drive is in 500 yards, more or less. Air is conveyed to the workmen by means of troughs laid on the floor of the drive, and when a change of shifts takes place water sometimes accumulates in certain places of the drive, so as to almost overflow the pipes and air current within. Gas is occasionally visible; so that the danger to the life of the workmen must be very great at times. At the time when the Inspector visited the drive recently, the workmen had been withdrawn a half shift the day previous.

I have, &c.,

JAMES CURLEY,

Miners' General Secretary.

(No. 7.)

The Examiner of Coal-fields to Mr. J. Curley, Miners' General Secretary.

Sir,

Coal-fields Office, Newcastle, 1 December, 1881.

With reference to your letter of the 28th ultimo, calling my attention to the defective state of ventilation in connection with the drive at Raspberry Gully, South Waratah Colliery, I beg to inform you that, upon going to the Colliery on the 29th ultimo, I found that Mr. Green, the Colliery Manager, was connecting the trough with the Charles Pit down-cast shaft, for the purpose of ascertaining whether the furnace would ventilate the drive better than the fan has lately done, and, as the men had not been at work the previous day, I arranged to go on the 30th idem, and see how the new method answered. Upon arriving there on the 30th ultimo, I found that the shaft which the men had to go down was full of smoke from the furnace. I then discussed with Mr. Green the advisability of remedying this, either by making Charles Pit the up-cast or putting a landing at the 6-foot seam, in the present up-cast or furnace shaft, so that the men could go to their work down Charles Pit and from thence to the bottom of the furnace shaft free of smoke, &c. This Mr. Green will do immediately, and, when completed, inform me of, and whether the ventilation is improved.

2. With respect to the gas, Mr. Green informs me that the overman is instructed, whenever the men leave the face of the drive, to examine the tunnel and see that it is free from gas, and safe to work in, before the men resume their work; and that whenever gas has been seen it has accumulated during the stopping of the fan, from 2 o'clock on Saturday night to 6 o'clock on Sunday morning.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

(No. 8.)

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 8 December, 1881.

I have the honor to inform you that a letter has been received from Mr. James Curley, the Miners' General Secretary, to the effect that a further communication has been made to you respecting the alleged defective working of the Coal Mines Regulation Act of 1876, and the recent accidents by explosions of gas at the Messrs. Browns' Colliery, Mimmi, and I accordingly request that you will be so good as to state what has been done in the matter.

I have, &c.,

HARRIE WOOD,

Under Secretary.

Copy of Mr. Curley's letter, &c., forwarded herewith. Have visited the collieries complained of, and shall reply to his letter early next week. I also forward copies of letters respecting the Raspberry Gully drive.—J.M., 10/12/81. The Under Secretary for Mines.—B.C., 10/12/81.

(No. 9.)

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 14 December, 1881.

Adverting to your letter of the 8th instant, with reference to a letter received from Mr. James Curley, the Miners' General Secretary, and my blank cover communication of the 10th idem, I have the honor to forward you, for the information of the Honorable the Secretary for Mines, a copy of my reply to Mr. Curley and others letters.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

It does not seem necessary for the Department to take any further steps in this matter, unless further moved by the Miners' General Secretary, who is in possession of Mr. Mackenzie's report, copy of which is herewith.—H.W., U.S., 19/12/81. Await further communication.—A.R., 20/12/81.

[Enclosure to No. 9.]

Sir,

Coal-fields Office, Newcastle, 13 December, 1881.

In acknowledging the receipt of your letter of the 7th ultimo, referring to the second paragraph of my communication of the 22nd October last, with regard to the answers given to me by the miners at the Mimmi Colliery, respecting the ventilation, and complaining that the inquiry and examination held on the occasion was of a partial, one-sided, and unsatisfactory character, owing to the men having been unrepresented, I beg to inform you that Mr. John Brown, the Colliery Manager, having objected to Mr. J. Patrick (who, I was informed, was the only person paid by the men at that colliery)

colliery) to accompany me during my visit, I had no alternative but to make the examination without him, although I may state that the Colliery Manager was entitled, if he thought fit, to prevent Mr. Patrick from entering the mine. As stated in my letter of 22nd October last, the mine was, at the different days I examined it, well ventilated, whatever it may have been previously; and, as I also informed you, the reports from the Inspector of Collieries had for some time led me to suppose there were no causes of complaint.

2. With respect to your remarks about persons injured by explosive gas at the same colliery, I am of opinion that it would be better and more satisfactory if all such injuries, whether serious or not, were reported to the examiner of Coal-fields by the owner or manager of the mine, although the Act does not make it imperative that such should be done.

I am also inclined to think that the presence of explosive gas, and the injuries received therefrom, were treated too lightly by the manager previous to my visiting the colliery on 4th October last, since which time a "fireman" has been appointed, whose special duty is to go around all the places known to contain explosive gas before the men go to work. Duggan told me he was about 30 yards in his bord, past the district air current, and about 5 yards from the face, not 15 yards, when the gas fired; and where I was shown his lamp was found was about the distance stated by him to me.

3. Upon making inquiries at the mine, and examining Messrs. Brown's colliery plans, I find that the nearest drives going towards the Mimi old abandoned workings inundated with water, are 35 chains, at least, distant from them, and consequently cannot be in close proximity thereto.

4. The proposal in the fourth paragraph of your letter, that the miners should be represented and the Press admitted at official examinations of collieries, is not provided for in the Act, and cannot, therefore, be complied with.

5. Adverting to the reference made in the concluding paragraph of your letter to the Wallsend, Borehole, and Lambton Collieries, I beg to inform you that I have recently made it my business to make a thorough examination of the Newcastle Wallsend Colliery, by inspecting nearly all the places where the men were at work, measuring the quantity of air circulating through the different districts (or splits) and the men's working places, as well as the quantity of intake and return air travelling through the mine.

6. On the first day, I was accompanied by William Willis (overseer), and John Naismith and David Beveridge (the men's Check Inspectors), whom the Colliery Manager permitted to accompany me through Mr. Willis' district.

In the engine bank road there were 21,600 cubic feet per minute of intake air travelling down it, and 13,860 cubic feet per minute of intake air circulating along the travelling road.

In the No. 1 district (or split) where the air enters it, near the travelling road heading, there were 5,910 cubic feet per minute of intake air for the supply of 70 men, boys, and horses at work; between Nos. 15 and 16 bords it measured 6,000, and between 18 and 19 bords 4,940 cubic feet per minute, thus showing the irregularity of the current of air circulating through this split, and that there is not the quantity of air circulating through it which the Coal Mines Regulation Act provides for, but Mr. Neilson expects that when the water shaft, now in course of being connected with the workings in this district is completed, the ventilation will be improved and exceed the requirements of the Act.

In the No. 2 district (split) there were only 11,040 cubic feet of intake air per minute coming down the "air shaft," for 133 men, boys, and horses at work there, and only 5,670 cubic feet per minute travelling along the air-way past the last working place in the split, which is far less than the Act requires. Mr. Neilson (the manager) informed me that there was and had been for some time cause for complaint with respect to a deficiency of air in this split, but anticipated that when the new "water shaft" in course of sinking is in a few days completed, it will add to the quantity of air at present supplied to men in this part of the mine. On the second day I was accompanied by Mr. Neilson (the manager), Thos. Bosfield (overseer), and John Naismith and David Beveridge (the men's Check Inspectors), who Mr. Neilson again permitted to accompany me through Mr. Bosfield's district, where I found there was the requisite quantity of air circulating through the different "splits," and the provisions of the Act complied with. The Lambton heading, or No. 1 district, having 6,031, 1,377, and 9,800, equal to 17,208 cubic feet of air per minute (by three intakes) for 141 men, boys, and horses working therein, and with respect to a complaint the men's Check Inspectors drew my attention to, which I examined, where six miners were working in bords where the air was supposed to have passed over "stagnant water," I am of opinion that as the manager is daily drawing large quantities of water away from it, and it is continually receiving fresh supplies, that the general rule in section 12 of the Act, does not apply to it, and I would further add that I could not perceive any bad effects coming from it or the air passing over it. The quantity of return air passing through the furnace shaft was—

No. 1 Split	30,564	cubic feet per minute.
No. 2 Split	12,960	" "
No. 3 Split	34,280	" "
Total	77,804	

7. On my visit to the Borehole Colliery, where I met by appointment the Colliery Manager (Mr. Turnbull), and William Lee, and Samuel Selby (the men's check inspectors), and looked over their last reports. I found that the only places they had to complain of were in the south-east side of the south-east headings, and that since the Report dated 27th June last, W. H. Britton and Henry Turner had been appointed Check Inspectors in the place of Lee and Selby. The day previous to my visit Britton and Turner had come out of the mine and asked the Manager if he would go down the pit and see if something could not be done to improve the ventilation where men were working in the south-east side of the south-east headings, as the air was heavily charged with "black-damp," so much so that in many places the men could not keep their lights burning. Mr. Turnbull immediately accompanied Britton and Turner to the places complained of, and after discussing the matter, he made such alterations, as not only gave the men a larger quantity of air, but also that of a better quality. Owing to the large quantity of "black-damp" which is given off and accumulates in this part of the A.A. Company's workings, when a hot north or north-west wind is blowing it makes it very difficult for the Manager to always keep the ventilation in this district up to the requirements of the Act. When I examined this district with Mr. Turnbull and the Check Inspectors (Lee and Selby) the day after the alteration had been made, I found that the men were quite satisfied, and the places well ventilated.

8. I have been to the Lambton Colliery, and Mr. Croudace has marked for my guidance, &c., on the coal-fields record tracings, the different splits, doors, &c., and the way the air travels through and ventilates the mine, and also informed me that he was then busy making alterations and improvements in the ventilation. The Check Inspectors reports were lent me for my perusal, and to take copies of them if I wished to do so, and Mr. Croudace told me that he should have no objection to allow the Check Inspectors to accompany me in my examination.

Upon seeing Mr. Jackson, on Saturday last, I find that the Lambton Colliery is not likely to be working this week, and I must therefore leave my examinations of it until my return from the western and southern districts, and completion of my 1881 yearly report.

Mr. J. Curley and others.

I have, &c.,
JOHN MACKENZIE,
Examiner of Coal-fields.

(No. 10.)

Mr. H. Winchester to Mr. J. Y. Neilson, Manager, Wallsend Collieries.

Sir, Coal-fields Office, Newcastle, 20 December, 1881.

With reference to your communication of the 19th instant, I beg to inform you that the Examiner of Coal-fields, who is now absent from Newcastle, anticipating your request, instructed me to furnish you with a copy of his report, if applied for, and accordingly have the honor to enclose the same herewith.

I will forward your letter to Mr. Mackenzie without delay.

I have, &c.,
HERBERT WINCHESTER.

(No. 11.)

15

(No. 11.)

Messrs. J. & A. Brown to Mr. J. Curley, Secretary, Miners' Association.

Sir,

Newcastle, 23 December, 1881.

We are much astonished to find that you have written to the Examiner of Coal-fields in the following terms:—"I would draw your attention to a mine abandoned, but inundated by water in close proximity to the Messrs. Brown's Collieries now in work, and would ask you respectfully whether the inspector has reported this matter to you, and whether any steps are taken as a safeguard in the event of the old tunnel workings piercing the abandoned workings of the inundated mine, and if there are appliances in case of escape on account of any unexpected accident arising from such a source of danger."

As the above statement is both malicious and untrue we would ask you to immediately furnish us with an explanation with respect to the same, and a withdrawal of the statement to the Examiner of Coal-fields.

In the event of this not being done we shall deal with the matter in whatever summary manner we may be advised.

We have, &c.,

J. & A. BROWN.

(No. 12.)

Mr. J. Curley, Miners' General Secretary, to N. Melville, Esq., M.P.

Hamilton, 28 December, 1881.

CAN Minister Mines meet deputation Miners' Association on Friday? Arrange same and meet in Mines Office; reply paid.

JAMES CURLEY.

PRESENTED by Mr. Melville, M.P. In the absence of the Secretary for Mines I informed Mr. Melville that the deputation would be received on Friday at 11.30 a.m.—G.E.H. (for the U.S.), 29/12/81.

Submitted.—G.E.H. (for the U.S.), 31/12/81.

(No. 13.)

Minute of The Hon. the Secretary for Mines.

Re Deputation from Miners' Association, Hamilton and Newcastle.

INFORM the Examiner of Coal-fields that it is reported that a letter having been forwarded to him by the Secretary of the Miners' Association, he forwarded an extract from the letter to the proprietors of the coal mine (Messrs. Brown), regarding which the complaint was made. Inform further that in consequence of this action on the part of the Examiner the proprietors have threatened to take summary action against the Secretary of the Miners' Association.

The Minister requires a report from the Examiner on the subject.

A.R., 4/1/82.

The Examiner of Coal-fields.—H.W., B.C., 4/1/82.

(No. 14.)

The Examiner of Coal-fields to The Under Secretary for Mines.

MESSRS. J. & A. Brown's letter to me, and my reply [forwarded herewith; also letter from J. Y. Neilson and my answer thereto.—J.M., 1/11/82.

The Under Secretary for Mines, B.C., 11/1/82. Submitted.—H.W., 16/1/82. Read.—A.R., 16/1/82.

[Enclosure to No 14.]

Sir,

Newcastle, 29 November, 1881.

Referring to your semi-official conversation with our Mr. Alexander Brown, relative to the near approach of our present workings at Brown's Colliery to some of the old Minni pit workings, and the probable consequences which might arise owing to any careless working, and of which careless working you had been informed by some person in authority, we should be very glad to know the name of your informant, as Mr. Brown, when at the mines, made it his special business to inquire into the truthfulness or otherwise of the assertion, and, we are glad to say, found it as uncalled for as it was untrue.

The Examiner of Coal-fields.

We have, &c.,

J. & A. BROWN.

Gentlemen,

Coal-fields Office, Newcastle, 7 December, 1881.

Referring to your letter of the 29th ultimo, asking me if I would tell you who it was informed me of the near approach of Brown's Colliery workings to some abandoned workings full of water in that neighbourhood, I beg to say that, in a communication received from Mr. Curley, the Miners' General Secretary, he states as follows:—"I would draw your attention to a mine abandoned, but inundated by water, in close proximity to the Messrs. Brown's Collieries now in work, and would ask you respectfully whether the Inspector has reported this matter to you, and whether any steps are taken as a safeguard in the event of the old tunnel workings piercing the abandoned workings of the inundated mine, and if there are sufficient appliances in case of escape on account of any unexpected accidents arising from such a source of danger."

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

Messrs. J. & A. Brown.

Sir,

Wallsend, 19 December, 1881.

I notice in to-day's issue of the *Newcastle Chronicle* a report of a Wallsend miners' meeting, wherein it is reported as follows:—

"Mr. Curley stated he had received a very lengthy report from Mr. Mackenzie, Examiner of Coal-fields, respecting the ventilation and stagnant water in the Wallsend workings, and on many things, &c.; and he (Mr. Curley) concludes by stating, if the meeting desired it, he would bring the report and read it to the Committee."

In reference to the above, I think you will have a perfect recollection of the Wallsend Check Inspectors asking to make a special report, you stating that it was a special report, and you could only report to your superior officer or head of your Department; and they, the Check Inspectors, had only been allowed to accompany you round the works by the courtesy of the manager, who wished to give you (the Examiner) every information. You then asked me if I was going to make any special report. I at once replied, "Not until I see your official report." Assuming

Assuming the report in paper is correct, I do think you have not acted in strict good faith, inasmuch as you have favoured the accuser with a report, and left the accused in ignorance of your conclusions; and, to say the least, it is a most unfair and inequitable arrangement, and a position which you have taken without mature thought; and I shall be glad if you will give me the same copy of your report as you have given Mr. Curley, as I must now report this matter in full to my directors on the 21st instant, when I have no doubt but that they will be as much surprised as I have been, to find that their Miners' Secretary has been furnished with information that has been withheld from the masters, the latter being equally interested and more responsible.

I am, &c.,

J. Y. NETLSON,
Colliery Manager.

The Examiner of Coal-fields.

K.

Sir, I am very much surprised at your letter forwarded to me here, and in reply thereto beg to state that I did exactly what I told you I should do, viz., reply to Mr. Curley's letter, and send you a copy of it if you wrote for one, which I left instructions with Mr. Winchester to do in my absence; also, send a copy to the Honorable the Secretary for Mines.

The Manager, Wallsend Collieries.

No. 4.

The Inspector of Collieries to The Examiner of Coal-fields.

Sir,

Newcastle, 5 April, 1882.

I have the honor to report for the information of the Honorable the Minister for Mines that an explosion of fire-damp happened at Brown's colliery on the 4th instant, by which two miners named Joseph Clewes and Richard Barrat were burned.

2. The sufferers were working together in an ordinary bord in which no gas had been seen previous to the explosion, except after shot firing, &c.

3. The fireman had examined the bord about 3.30 a.m. same day, and no gas was found there, but about 7 a.m., or three and a-half hours afterwards, it had suddenly accumulated sufficiently strong to cause the explosion which burned the two men.

4. In my opinion the masters are not blamable for the accident.

I have, &c.,

THOMAS LEWIS,
Inspector of Collieries.

No gas having been seen previous to the explosion except after shot-firing, &c., will Mr. Lewis be so good as to state whether any shot was fired between 3.30 a.m. and 7 a.m.; also what quantity of air was circulating past the entrance to or through the bord where the explosion occurred, and the number of men, boys, or horses working in that district or split.—J.M., 8/4/82. The Inspector of Collieries. To be returned.

No shot was fired between 3 and 7 a.m. Nearly 6,000 cubic feet per minute for about fifty men, &c.—T.L., 12/4/82.

Thinking this a very meagre report upon what appeared to be a serious affair, I considered it advisable to visit the colliery myself. The result of my examination, &c., will be found in the accompanying report, to which is attached a copy of notice served to Messrs. J. & A. Brown. I should be glad to be favoured with the instructions of the Minister in the matter.—J.M., 19/4/82. The Under Secretary for Mines, B.C., 19/4/82.

No. 5.

The Examiner of Coal-fields to The Proprietors of Brown's Colliery.

Gentlemen,

Coal-fields Office, Newcastle, 15 April, 1882.

In pursuance of the provisions of the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that there is a dangerous accumulation of explosive gas in the No. 10 Heading District, at your Brown's Colliery, where there are forty-five men, boys, and horses daily employed, and that the men are working with naked lights in contravention of No. 5 of the special rules for Brown's Colliery, which provides that "In any place where there is a dangerous appearance of fire-damp locked safety-lamps shall be used."

2. I also beg to draw your attention to general rule No. 5 section 12 of the Act abovementioned, viz. (5.) "If at any time it is found by the person in charge of a mine or any part thereof, or by the Examiner or Inspector, that by reasons of noxious gases prevailing in such mine or such part thereof, or of any cause whatever, the mine or the said part is dangerous, every workmen shall be withdrawn therefrom, and the Examiner or Inspector shall inspect the same, and if dangerous from inflammable gas shall make such inspection with a locked safety-lamp, and in every case make a true report of the condition of such mine or part thereof, and no workman shall, except in so far as is necessary for inquiry into the cause of danger or for the removal thereof, or for exploration, be readmitted into the mine or such part thereof as was so found dangerous until the same is stated by the Examiner or Inspector to be safe. Every such report shall be recorded in a book which shall be kept at the mine for the purpose, and shall be signed by the person reporting.

3. That there is evidently a dangerous accumulation of explosive gas in certain places of Brown's Colliery is proved by no less than nine miners having been burnt by fire-damp, seven of them, Hunter, Gilder, Hull, Davies, Bothwell, Andrews, and Clewes having most of them been seriously injured thereby. Duggan who I went to see at the Newcastle Hospital had his arms, back, face, and one hand severely scorched, and Dr. Harris told me his life was for some days in danger; and Duggan said for over two weeks he was in such pain that he could not lie on his back to sleep. Barratt, who I saw yesterday (the 14th instant), is suffering fearful agony through his face, body (down to his thighs), arms, and hands, being badly burnt by an explosion of gas which happened in No. 10 Heading District on the 4th instant; and I was told when visiting Barrat and Clewes that their medical attendant had no hopes of the recovery of the former.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coalfields.

Wednesday, 17th May, 1882.—I inspected the dip workings; find gas in 10, 16, 18 bords in 10 heading; gas in 10 and 11 headings; left all right.

MILES BUTTERWORTH.

Thursday, 18th May, 1882.—I inspected the dip workings; gas in 16 bord not dangerous; gas in 10 and 11 headings not dangerous.

MILES BUTTERWORTH.

Friday, 19th May, 1882.—I inspected the dip workings; find gas in 16 bord and 10 and 11 headings not dangerous.

MILES BUTTERWORTH.

Saturday, 20th May, 1882.—I inspected the dip workings; find gas in 16 bord not dangerous; gas in 10 heading not dangerous; gas in 11 heading not safe with a naked light.

MILES BUTTERWORTH.

Monday, 22nd May, 1882.—I inspected the dip workings; find indications of gas in 10, 14, 16 bords and 10 heading quite safe.

MILES BUTTERWORTH.

Tuesday, 23rd May, 1882.—I inspected the dip workings; find indications of gas in 14, 16 bords and 10 heading not dangerous.

MILES BUTTERWORTH.

The above extracts copied from the fireman's report book kept in Brown's colliery office, Minmi, 23rd May, 1882.

HERBERT WINCHESTER.

No. 7.

The Examiner of Coal-fields to The Honorable the Secretary for Mines.

REPORT upon two serious accidents which happened to two miners, named Richard Barrat and Joseph Clewes, on 4th April, 1882, from an explosion of fire-damp, at Brown's Colliery, Minmi.

Sir,

Coal-fields Office, Newcastle, 21 April, 1882.

I regret to have to report to you that two practical miners, named Joseph Clewes and Richard Barrat were very badly burnt by an explosion of gas at Brown's Colliery, Minmi, on the 4th instant.

2. On the 14th instant I proceeded to Minmi, and first visited the injured men and asked them to give me all the information they could as to what took place before and at the time they were burnt by explosive gas, when Clewes told me as follows:—“That Richard Barrat (20 years of age) and he were practical miners, and had been working about five months at Greta Colliery previous to coming to Minmi, where they had been getting coal about three weeks. That whilst working at Brown's Colliery had heard miners say there was gas in the bords in the No. 10 heading district, where they were working, and that he and Barrat had seen fire-damp nearly every day in the eight-yard bord they were driving. That when they commenced to get coal in the bord it had been driven 27 yards from the heading or entrance of it, and that they had driven it about 9 yards.

That the fireman, whose duty it is to go into each man's working-place in the district, known or supposed to contain gas, before the men commenced work, had been in their bord every morning before they got to it, and had chalked the day of the month on the face of it in accordance with his instructions. That, on the 4th instant, he and Barrat met the fireman in the mine at about 1 a.m., as they were going to work, and asked him whether there was any gas in their bord, and he said no. That he asked him because he and Barrat had seen more fire-damp in their bord the previous day than they had before observed, and that he remarked to Barrat and another miner who was with them it was strange the fireman could not find gas, as they had seen some almost every morning.

That on the 4th instant, when he and Barrat had got to within about 20 yards from the face of their bord they took off their coats and shirts, and after doing this Clewes went with his naked light to within 2 or 3 yards of the face, and while looking round for some tools with his light in his hand the gas fired. That the coal-seam is about 5 feet 8 inches in height, and he thinks his lamp was about 3 feet from the floor. That he also thinks Barrat was just starting to come to where he was with his naked light in his cap on his head when the gas fired, the force of it knocking Barrat down, and he as well as Barrat think it also threw him some distance.

3. From my examination of the No. 10 heading district where the gas was fired, what the firemen and some miners told me, I am of opinion that there is and has been of late a dangerous accumulation of fire-damp in it, and that Messrs. J. & A. Brown are blamable for not having taken more effectual steps for preventing explosions of gas therein. I saw three brick stoppings set in mortar which had been blown out in cut-throughs in No. 10 heading, and rebuilt, and one which had the centre portion of it blown away by the force of the explosion, and the fireman told me the mine was making so much gas that it would fill a bord in an hour, therefore, if the men went into their work an hour after the fireman had examined it, and according to his custom had “brushed out the gas” in any of the men's working places, it might be full if the men went into it an hour afterwards. One man told me that he and his mate left off work for 10 minutes “they must brush out the fire-damp” before commencing to get coal again.

4. I enclose herewith copy of notice I have served on Messrs. J. & A. Brown, which contains full particulars of the inquiries received, and shall be glad to be favoured with your instructions in the matter.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

These accidents seem serious, and from the report of the Examiner the owners are to blame in the matter. Mr. Curley and a deputation will wait upon the Secretary for Mines next Friday to discuss proposed Coal-fields Amendment Act, and also to call attention to the above accident.—G.E.H. (for the U.S.), 24/4/82.

The Examiner to take the necessary steps under the Act for the default, referred to me this report.—A.R., 28/4/82.

19

No. 8.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Sydney, 1 May, 1882.

Referring to the report furnished by you upon the serious accident which befell Joseph Clewes and Richard Barrat through an explosion of gas in Brown's Minmi Colliery, on the 4th ultimo, I have the honor to inform you, in reply to your request for instructions in the matter, that the Secretary for Mines has decided that the Examiner take the necessary steps under the Coal Mines Regulation Act, 1876, against the proprietors of the colliery for the default referred to in your report.

I have, &c.,

GERARD E. HERRING,
(For the Under Secretary).

No. 9.

Telegram from The Under Secretary for Mines to The Examiner for Coal-fields.

Sydney, 3 May, 1882.

THE Crown law officers have been asked to advise. You had better not take any steps until opinion has been obtained.

GERARD E. HERRING,
(For the Under Secretary).

No. 10.

The Examiner of Coal-fields to the Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 5 May, 1882.

I do myself the honor to request that the Honorable the Secretary for Mines will be pleased to furnish me with an authority to prosecute Messrs. James and Alexander Brown, or either of them, or their agents, under section 35 of the Coal Mines Regulation Act of 1876, 39 Vic. No. 31.

I venture to submit a form which I think will be sufficient for the purpose intended, and which has been furnished by Mr. R. W. Thompson, solicitor.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

The authority may be forwarded.—G.E.H., for the U.S., 6/5/82. Submitted for signature of Secretary for Mines. Very urgent. Forward to the Examiner of Coal-fields by to-night's post.—G.E.H., (for the U.S.), 8/5/82. Forwarded.—8/5/82. The papers in this case are still with the Examiner.—H.T., 26/7/82. Ask Examiner what has been done.—H.W., 7/8/82. Asked.—14/8/82.

In pursuance of the authority given to me for that purpose under the 35th section of the Act, 39 Vic. No. 31, known as the Coal Mines Regulation Act of 1876, I hereby authorise John Mackenzie, the Examiner of Coal-fields for the Colony of New South Wales, to prosecute James Brown and Alexander Brown, or either of them, as the owners, or one of the owners, of the coal mine known as Brown's Colliery, for all offences committed by them, or either of them, against the provisions of the said Act, or against the Regulations made thereunder, or against the special rules made by the owners of the said mine under or in pursuance of the provisions of the said Act, and for all or any of the purposes aforesaid, to lay or exhibit any information or complaint before any Justice of the Peace, and to proceed thereon for a penalty.—Given under my hand this day of May, A.D. 1882.

No. 11.

Informations.

Information—(Drawn out by R. W. Thompson, Esq.)

New South Wales, to wit.

Be it remembered that on the 9th day of May now instant, personally came and appeared before me, the undersigned, one of Her Majesty's Justices of the Peace in and for the Colony of New South Wales, John Mackenzie, of Newcastle, in the said Colony, Examiner of Coal-fields for the said Colony, duly appointed to prosecute in this behalf, and informeth me that on the 4th day of April last past, James Brown, of Newcastle, in the Colony of New South Wales, colliery proprietor, being then one of the owners of a certain mine, known as Brown's Colliery, in the District of Newcastle, neglected to observe one of the special rules established for the same colliery according to the Act, 39 Vic. No. 31, to wit rule 4 of the "Special Rules for the conduct and guidance of the persons acting in the management of Brown's Colliery, in the District of Newcastle, and all persons engaged in or about the colliery," inasmuch as an accumulation of inflammable gas having taken place in a part of the workings of the said colliery, known as No. 10 heading district, on the 4th day of April last past, whereby serious personal injury occurred to two persons, to wit, Joseph Clewes and Richard Barrat, miners, employed at the said colliery, the said James Brown, as such owner as aforesaid, permitted work to be resumed in such colliery before the gas had been removed therefrom.

JOHN MACKENZIE.

New South Wales, to wit.

BE it remembered that on the 9th of May now instant, personally came and appeared before me, the undersigned, one of Her Majesty's Justices of the Peace in and for the Colony of New South Wales, John Mackenzie, of Newcastle, in the said Colony, Examiner of Coal-fields for the said Colony, duly appointed to prosecute in this behalf, and informeth me that on or about the 17th day of April now last past, one, James Brown, of Newcastle, in the Colony of New South Wales, colliery proprietor, was one of the owners of a mine known as Brown's Colliery, at Minmi, in the said Colony, and as such owner it became and was his duty under clause 5 of the general rules to be observed in every colliery under the Act, 39 Vic. No. 31, that by reason of noxious gases prevailing in such mine or any part thereof, to cause every workman to be withdrawn therefrom, and not to permit any workman to be readmitted into the said mine or such part thereof, except in so far as was necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration, until the same was stated by the Examiner or Inspector to be safe; and that on or about the 14th day of April last past, a certain part of the said mine, to wit, the part known as No. 10 heading district became and was dangerous by reason of the noxious gases prevailing therein, and the said James Brown did not cause every workman to be withdrawn therefrom, and did permit workmen to be admitted into such part while the same was and continued to be dangerous for the reason aforesaid, and before the same was stated by the Examiner or Inspector to be safe, such workmen not being so admitted for inquiry into the cause of danger or for the removal thereof, or for exploration. And thereby and therein the said informant saith that the said James Brown, as such owner, did neglect such general rule, whereupon the said informant prayed that I, the said Justice, would proceed in the premises according to law.

The Secretary, Coal Mines Association, to The Examiner of Coal-fields.

Sir, I beg respectfully to call your attention to the enclosed letter received from Messrs. J. Clewes and R. Barrat, Minmi. Hamilton, 15 May, 1882.
I am, &c.,
JAS. CURLEY.

[Enclosure.]

Sir, We take the opportunity to let you know that we have got a summons to attend the Court at Newcastle on Thursday next, and on account of our accident fund breaking up we are without means; and we do not know how we will be able to get to Newcastle, as we have no money. We wish you to show this to Mr. Mackenzie, Government Coal-fields Examiner, to see if he will assist us with the means to get to Newcastle. We wish also that if you could make arrangements so as we could be admitted into the Newcastle Hospital. Minmi, 13 May, 1882.
We are, &c.,
RICHARD BARRAT.
JOSEPH CLEWES.

NEWCASTLE POLICE COURT—THURSDAY, 18 MAY, 1882.

(Before MR. MAIR, P.M.)

PROSECUTION UNDER THE MINING ACT.

James Brown, of the firm of Messrs. J. and A. Brown, merchants and colliery proprietors, was formally charged as follows, by the Examiner of Coal-fields—

The information ran:—

TO JAMES BROWN, of Newcastle, in the Colony of New South Wales, colliery proprietor: Whereas information hath this day been laid before one of Her Majesty's Justices of the Peace in and for the Colony of New South Wales, for that on or about the 17th day of April last past, you were one of the owners of a mine known as "Brown's Colliery," at Miami, in the aforesaid Colony, and as such owner it became and was your duty under clause 5 of the general rules to be observed in every colliery under the Act 39 Victoria No. 31, that by reason of noxious gases prevailing in such mine or any part thereof, to cause every workman to be withdrawn therefrom and not to permit any workman to be readmitted into the said mine or such part thereof, except so far as was necessary for inquiring into the cause of danger or for the removal thereof or for exploration until the same was stated by the Examiner or Inspector to be safe, and that on or about the said seventeenth day of April last past, a certain part of the said mine, to wit, the part known as No. 10 heading district became and was dangerous by reason of noxious gases prevailing therein, and that you did not cause every workman to be withdrawn therefrom, and did permit workmen to be admitted into the said part, while the same was, and continued to be dangerous for the reason aforesaid, and before the same was stated by the Examiner or Inspector to be safe, such workmen not being admitted for the purpose of inquiring into the cause of danger or for the removal thereof or for exploration and that thereby and therein you as such owner did neglect such general rule, contrary to the provisions of the aforesaid rule and the Act aforesaid.

Mr. Thompson appeared for the prosecution, Mr. Wallace for the defence.

Mr. Wallace raised a preliminary objection, inasmuch as the information did not include the word "wilfully," as required by the 34th section of the Act. Mr. Thompson replied, and in the course of argument the Act was admitted, on all sides, to be a complete muddle, and recognized as such among the entire mining class. Mr. Wallace contended that sec. 12, under which the information was laid, provided for no penalty at all, and, after discussion, the objections were overruled, and formally noted, viz., that defendant refused to plead, and that objection was taken to the information on the ground that two offences were disclosed.

John Mackenzie, Examiner of Collieries, deposed that his information was true, and Mr. James Brown, one of the proprietors of the mine, defendant; produced copy of printed rules, also notice dated 15th April; heard on 6th April of an explosion in Brown's Miami Colliery, Hunter River district, proclaimed in May, 1863 [plan showing No. 10 heading produced]; visited the mine, and found that three stopings set in brick and mortar had been blown down, and the centre of a fourth displaced, apparently by the force of an explosion; must have been a dangerous accumulation of gas, and the explosion was undoubtedly of sufficient force to hurt miners working there; the first stopping was about 37 yards from the bord face, in a cut-through in No. 10 heading; saw two men badly burned, said to have been working in the mine; Barret, one of them, burned all over down to his thighs, arms, hands, and face; Clause, the other, was also seriously burned; was shown the place by Mr. Croft (the manager), the overseer, and others; saw other men working at a cut-through near at hand, in No. 10 heading district; had given Mr. Brown no permission to have them there after the accident. By *Mr. Wallace*: Visited on the 14th April, and from the fireman's reports found that there had been more gas on the previous day; did not visit again either on the 15th, 16th, or 17th, and could not say from his own knowledge or personal inspection that there had been any noxious or dangerous gases in the mine at any time between the 4th and 17th; Mr. Thomas Lewis was Inspector of Mines on the 4th, and for some time after, and from a report from him on the 6th, he first heard of the accident [report put in]; did not approve of the method adopted by the fireman of rushing the gas out, and told Mr. Croft that he would have to serve Mr. Brown with a notice; conceived it not to be part of his duty to make any examination unless the men were withdrawn.

Miles Butterworth, fireman, gave evidence as to the condition of the pit, and existence of gas; on the 14th April found gas in 10, 12, and 22 bords, also in No. 10 and 11 headings; brushed it out, and found it so small in quantity that he could not get it in a Davey lamp, and afterwards tested the feeders with a naked lamp, finding it still very slight, and impossible to collect; on the 17th got gas in other bords, no men being at work between the 14th and that date; these bords were 10 and 12 bords, in 10 and 11 headings; on the 18th got gas in 10, 12, 14, and 22 bords, in 10 and 11 headings; this was all so slight that it would not show in the Davey lamp; the practice was on detecting gas to immediately place two rails crossways in the bord, after which no miner would attempt to enter until all was right; this had been his practice ever since he first undertook his position; was in the mine when the men were working; they were in 16 bord, in 10 heading; found it quite clear from a quarter-past 1 till half-past 3 that morning, and the men were hurt about a quarter-past 7; had not found gas every day previous. By *Mr. Wallace*: Had never known gas to accumulate in such quantities as to become dangerous, beyond small bits of feeders that he got on the face of the coal, otherwise would have at once reported; had worked in a pit for over thirty-six years, since his seventh birthday, and had worked practically as fireman since sixteen; had also worked in pits so full of gas that no open light of any sort was admitted; had a thorough knowledge of such matters, and had worked for Messrs. Brown for seven years; the gas that caused the accident beyond a doubt broke out from a grey-back; the men struck the top of the coal, and the gas escaped; it was not discernible, nor could he detect it with a lamp when he was in at 3 o'clock; always kept a written record of facts for Mr. Croft's information; where Mr. Lewis tested the place after the explosion he found gas; after it the men nearly all withdrew, and the place was stopped until the cut-through was completed, whereby ventilation was given, the time occupied being about two more shifts, and the distance about 5 feet; again inspected and found the feeder still there, but rendered harmless through the consequent existence of air which gave ventilation, and allowed the gas to escape. To *Mr. Thompson*: Some of the men, by his leave, were working in the cut-through next day with Davey lamps.

Richard Barrett aged 20, miner, and one of the injured men (exhibited his hands and other injured portions of his body) deposed that about a quarter-past seven a.m., the explosion occurred, while he was working with a mate; had been working in the same bord for nearly two months; had his coat and shirt off

off ready for work when the fire struck him, and knocked him silly, his mate being ahead nearly up to the face; had not been in the pit since the accident; would not believe Butterworth if he said there was no gas in the bord when they went in, for his mate remarked that there was at the time; found gas there the night before, and had found it over and over again when the foreman said there was none. By *Mr. Wallace*: All the adjacent bords were under the same heading; had been on the coal for about five years, and in the pit for about eleven; was working with a naked light at the time, as there was not very much gas about; saw a casing, but not a grey-back, but would not swear one did not exist; had never reported the existence of noxious gases to the manager.

Dr. Andrew Nash, duly qualified medical practitioner, residing at Wallsend, was called. *Mr. Wallace* rose to an objection, as the evidence was irrelevant. *Mr. Thompson* replied, and, after argument, the evidence was admitted. Proceeded: The last witness was very severely burned, and had his life endangered. By *Mr. Wallace*: Had never been in the colliery in question and of his own knowledge could not say that noxious gases prevailed there; could only say that he treated his patient for severe injuries from burns.

Joseph Clause (after argument as to the relevancy of his evidence to the case) deposed to being a miner recently working at Brown's Colliery, and corroborated the preliminary evidence of last witness, as to the time of entering the pit, the accident, etc.; did not speak to the foreman that morning before going into the place; stripped of all but their trousers and boots about 15 yards from their working place, his mate's lamp being on the ground, and his in his hand low down; was about three yards from the face of his work, when he turned round, lifted his light, the gas caught, and he knew no more until he recovered consciousness on his belly, and found his mate outside the bord, the gas being alight and burning him; was not hurt so much as Barret, although closer to the face, as his mate got more of its force; had noticed gas in there every day, and was always able to light it every few days. By *Mr. Wallace*: On the previous days the gas they noticed was not dangerous, and was kept harmless by the movement of their bodies whilst at work.

Mr. Mackenzie, recalled by *Mr. Thompson*: The method adopted by the fireman of brushing the explosive gas out with a bag was certainly not the proper mode, and it could not possibly send it out of the mine, and the probabilities were that, seeing the length of the bord, even had it been brushed away, it would have returned; the proper remedy was brattice-cloths, or otherwise. To *Mr. Wallace*: Had not known of such a thing as gas accumulating day by day from the face in the heading, or that it was found in a fortnight's accumulation at the end of, say, a fortnight; as a matter of fact portions of it were necessarily being daily removed by the air; there 2,400 feet of pure air going down the headings over and above the amount required by the Coal-fields Regulation Act.

This concluded the case for the prosecution.

Mr. Wallace put it to his worship whether it was worth while taking up further time by arguing the case for the defence, as it was so clear that the information had not been supported. It was quite plain that they had been charged with allowing gas to accumulate, and become dangerous "on or about the 17th April," whereas there was not a tittle of evidence to support the allegation. He has carefully watched the evidence, and failed to see that the case had been proved.

Mr. Thompson reviewed the evidence at considerable length and *Mr. Wallace* having replied,

The Police Magistrate stated that he had clearly made up his mind that the evidence was not sufficient to warrant him in convicting defendant, and the case was therefore dismissed. He expressed a hope, however, that the Act was of such a character that its clauses could be so interpreted as to give satisfaction alike to colliery owners and miners in the prevention of accidents. His Worship refused to certify for costs.

Several other charges, arising out of the same case, were postponed for hearing until this morning.

No. 17.

Extract from the *Newcastle Morning Herald and Miners' Advocate*.

NEWCASTLE POLICE COURT—THURSDAY, 19 MAY, 1882.

(Before MR. MAIR, P.M.)

ALLEGED BREACH OF THE MINING ACT.

JOSEPH CROFT was charged by the Examiner of Coal-fields that, on April 4th, it became and was his duty, as agent for and manager of Brown's colliery, to see that, after the indication of inflammable gas, no men continued to work, and that he did not cause work to be discontinued, nor did he, by his overseer or other party, take care that this duty was performed.

Mr. Thompson appeared for the prosecution, *Mr. Wallace* for the defence.

Mr. Wallace refused to plead, on several grounds; chiefly that there were two separate and distinct offences disclosed,—first, that defendant neglected to do something, and further that he neglected to instruct his overseer. It was utterly absurd to make a manager responsible for the act of some other person in connection with some matter that never came to his knowledge. It should be alleged that the particular part of rule 4 had been carried out, and the manager informed. There should have been a preliminary statement or allegation that the existence of gas had actually been so notified, and it was a *reductio ad absurdum* to suppose that the law contemplated such a thing as to hold a manager criminally liable under such circumstances. The law was terribly mixed, and in point of fact almost unworkable.

Mr. Thompson remarked that the Act was a perfect paradise for lawyers, and a thorough failure, and in framing the information he confessed that he had very great difficulty in framing such a one as would hold water. Still, he maintained that the one as drawn was good. It seemed to him that the manager was the responsible person, and could be made liable, and these special rules were intended to have the force of law if they could be made workable. Under the heading "Manager," in rule 2, it did not say what he was, but he was undoubtedly the person alluded to. He was empowered with full control over every person in connection with the colliery, and the clause that pinned him down to his responsibility was clearly set forth in a special rule. To fail in seeing that an overseer did not neglect his duty was a neglect in itself, and being guilty of such neglect they got him under rule 31. What they charged him was neglect in of clause 2, by not seeing that clause 4 was attended to.

Mr.

Mr. Wallace replied, contending that the manager and agent were two distinct persons, and did not come under one category. The whole Act was a hybrid affair; full of all sorts of compromises on either side, so much so as to be a complete muddle. He cited, in point, clause *re* the engine-driver's duties, wherein he is granted "sole and complete personal control," whereas he actually has three "bosses" over him. Seeing the character of the rules, he contended that they should be construed by common sense and reason, and not receive any strained construction.

His Worship decided to proceed with the case.

John Mackenzie, Government Examiner of Coal-fields, deposed to having heard of the recent explosion in Minmi Colliery (produced special rules); visited the pit, saw Mr. Croft, the manager, and accompanied him to the bord where the two men had been hurt, and was shown the stoppings that had been blown down; the fireman in their presence then fired some gas there, and there was undoubted indication of inflammable gas; examined the fireman's reports, and saw frequent references to gas; the injured bord was in No. 10 heading; saw men then working in a new cut-through, made for the purpose of letting air in and minimising the danger of noxious gases; produced *Gazette* containing proclamation of Hunter Coal District.

By Mr. Wallace: As a matter of fact that particular pit might at some time be perfectly free from a small quantity of gas; saw none sufficient to cause danger during his inspection; 2,100 feet fresh air over and above the regulation quantity was then running down the airways; in that particular district of the mine there was about 50 per cent. more fresh air than required by law.

James Brown, one of the owners of Minmi Colliery, deposed to Mr. Joseph Croft being their manager.

Richard Barrett gave formal evidence as to the explosion by which himself and his mate were injured; the bord when they entered was just in the condition they left it the previous night; knew what gas was, but could not say what "blowers" were; before going in asked the gas man if there was any gas about, and on his replying "no," they entered and took no more notice, thinking it quite safe; was knocked about 15 yards to the end of the bord; could not say how far the first stopping that was blown away was from their working place.

By Mr. Wallace: Had worked for six weeks at Minmi; formerly worked there under the name Quinn, his stepfather; had a copy of the rules, but had not read them; had not at any time complained of gas.

To Mr. Thompson: Anyone taking sufficient care to find gas there could have done so; had worked on coal for about five years; saw the fireman's chalk mark the morning before the explosion.

Herbert Winchester deposed to having accompanied the Examiner during his visit of inspection, and corroborated his evidence.

George Durie, overseer at the pit, stated that the men seen on Mr. Mackenzie's visit were merely working at a cut-through to give increased ventilation; had thirty-six years' experience with coal.

To Mr. Wallace: It was quite possible to pass a naked candle 2 inches from gas feeders without danger; the Inspector tried the face of the bord with a safety lamp and found some gas, and asking him how he intended to remove it, he replied, by means of the cut-through. Mr. Lewis then suggested that they had better push it on as quickly as possible, and work meantime with Davy lamps, in case of more gas; they pushed on with the cut-through and the accumulated gas disappeared; it was perfectly impossible to do away with the feeder; the effect of the cut-through would not interfere with the other bords.

By the P.M.: The men in the other bords were working as usual on the morning of the 5th April.

George Durey recalled, by the P.M.: Saw Mr. Croft about 9 a.m. the morning after the accident; Mr. Croft then knew of the explosion, and accompanied him down the pit to examine the place; gave no orders regarding stopping general work in No. 10 heading.

To Mr. Wallace: It was witness's duty to have sole charge of the pit in Mr. Croft's absence, and in virtue of the powers vested in him, he (witness) took what he considered necessary precautions; Mr. Croft's remark was, "Well, George, how are we going to get on about these stoppings," and witness answered, that steps would be at once taken to have them replaced, and the places made safe; Croft, so far as he had been able to judge, was in every way a thoroughly competent colliery manager, and he expressed this opinion after over thirty years experience; removing the gas was part of the work necessary.

Joseph Creuse, one of the injured men, stated that when the ignition took place he had his light held up 3 or 4 feet; the lighted gas ran down, caught the air, and returned, burning him on his back; had remarked to the gas man, when told that there was no gas, "it's very strange you can find none, while we can get it at any time"; had a long talk with him one morning previously about gas and one thing and another; had no chance that morning of seeing if the chalk mark was up, but had seen it up every morning before; did not know the meaning of inflammable or explosive, but knew what bad gas meant.

By Mr. Wallace: On all previous occasions, on seeing gas, they did not consider it of sufficient importance to take notice of it; had over twenty years experience, having entered the pits at 7 years of age.

This concluded the case for the prosecution.

Mr. Wallace went for a non-suit. He submitted, at considerable length, that the case had not been made out, and that his client was improperly before the Court. If the special rule was to be literally construed, and that the gas was to be absolutely and entirely removed, it simply meant the shutting up altogether of Brown's Duckenfield Colliery, seeing that it had been proved by scientific men that this was utterly impossible, both in the Minmi and other pits. Undoubtedly it was right that provision should be made for preventing the accumulation of gases, but it would be monstrous to interpret the Act or rules as implying that a pit should be stopped merely by reason of the fact that the existence of gas had been shown.

The Bench ruled that there was a case calling for a defence. Mr. Wallace then called

Thomas Croudace, mining engineer and colliery manager for the Scottish Australian Mining Company, who deposed to having twenty-eight years practical experience, and to having from his earliest years been brought up to the profession of mining engineer; had been shown the bord where the explosion took place, and examined it with a lamp, finding only a small quantity of gas; it did not always follow that

that there was danger where a feeder existed, and the small feeders he found certainly did not render the pit dangerous; if all men were withdrawn from a gaseous portion of a pit and the feeders allowed to run on, it would necessitate the total closing of that portion, either for months or years, as the case might be, until the feeders exhausted themselves; his opinion was that there was some reservoir in kerosene shale supplying the gas feeders to the Minmi colliery; the value of the colliery should certainly be £100,000, and its closing would furthermore throw several hundred men out of employment; it was quite possible for blowers of gas to displace tons of coal, and thereby set free in a few hours great quantities of inflammable gas; interviewed the injured men, and the young man Perrett admitted that he knew nothing whatever of gas, and relied entirely on his mate, further, that they had taken no precaution of dusting out their place that particular morning. After hearing the evidence he was perfectly satisfied that every reasonable prevention had been taken, and also with the anxiety shown by the management.

Miles Butterworth, fireman, deposed to having, on the morning of the 4th April, carefully tested the bord and failed to detect the slightest gas, and, as a matter of fact, walked right up to the bord with a naked light, took up a shovel, after testing the kerosene, placed it handle-down against the face and put his usual chalk mark on it to show that he had been, and inspected; had on one occasion seen a man's leg smashed in a minute by a lump of coal suddenly shooting out from a feeder; as soon as a change was noticeable in the barometer, miners might depend on it there would be a change in the gas, through the altered pressure of the atmosphere; Mr. Lewis tried the gas in his lamp, and declared it to be very thin; set to work at once with the cut through, at Mr. Lewis' suggestion, and got a hole through in about sixteen hours.

John Y. Neilson, colliery manager to Newcastle-Wallsend Colliery for twenty-two years, and with forty-two years active connection with mining matters, deposed to the result of his inspection of the mine in conjunction with Mr. Croudace; agreed with the statements made by him; he personally set fire to two men in his own colliery, causing a much greater explosion from an unforeseen explosion of gas, which had not been detected for very many years before; it was highly probable that the accumulation referred to by Butterworth could have taken place easily in the time between his inspection and when the men set to work; with ordinary care there was not the slightest danger, and the pit was perfectly safe; speaking as one who had probably had more to do with Australian mining gas than any man in the Colony, he failed to see that any action was left untaken under the circumstances which the most experienced man would have taken.

William Turnbull, colliery manager to the Australian Agricultural Company, sixteen years manager in England and seven in Australia, gave corroborative evidence; he had known blowers to come up in a few minutes, which would throw out a hundred yards of gas.

The report of Mr. Lewis, with Mr. Mackenzie's comments, was here put in as evidence. This report ran as follows:—

Newcastle, 5th April, 1882.

The Examiner of Coal-fields, Newcastle.

Sir,—I have the honor to report, for the information of the Minister of Mines, that an explosion of firedamp happened at Brown's Colliery on the 4th inst., by which two miners, named Joseph Clews and Richard Berrett, were burned.

2. The sufferers were working together in an ordinary bord in which no gas had been seen previous to the explosion, except after shot firing, &c.

3. The firemen had examined the bord about 3-30 a.m. same day, and no gas was found there; but about 7 a.m., or three and a hours afterwards, it had suddenly accumulated sufficiently strong to cause the explosion which burned two men.

4. In my opinion the masters are not blameable for the accident.

I have, &c.,

(Sd.) THOMAS LEWIS,
Inspector of Collieries.

To this were affixed the following foot-notes:—

8/4/82. No gas having been seen previous to the explosion, except after shot firing, etc., will Mr. Lewis be so good as state whether any shot was fired between 8-30 a.m. and 7 a.m.; also, what quantity of air was circulating past the entrance to, or through, the bord where the explosion occurred, and the number of men, boys, or horses working in that district or pit.—J.M.

No shot was fired between 3 and 7 a.m. Nearly 6,000 cubic feet per minute for about 50 men, &c.—J.L., 12/4/82.

Thinking this a very meagre report upon what appeared to be a serious affair, I considered it advisable to visit the colliery myself. The result of my examination, &c., will be found in the accompanying report; to which is attached a copy of notice served upon Messrs. J. and A. Brown. I should be glad to be favoured with the instructions of the Minister in the matter.—J.M. 19th April, 1882.—The Under Secretary for Mines.

The Police Magistrate remarked that the word "pit" meant the whole of the mine, and it would be somewhat absurd if there were any indication, even of dangerous gases in one part of the mine, that the whole should be closed until feeders of the character alluded to had exhausted themselves. He was inclined to think that in using the word pit, the Act contemplated reference to that portion wherein dangerous gases actually existed. By interpreting it to mean the whole mine, a manifest interference would take place; and putting the other construction on the word, it appeared from the evidence adduced that the men working were well removed from the place where an indication of danger was observed. Under all the circumstances, with every disposition to interpret the Coal-fields Regulation Act and the special colliery rules, so as to make them work harmoniously in the general good, he failed to see his way clear to inflict a penalty, and the case must therefore be dismissed.

Mr. Thompson at once withdrew a further information, and the Court rose soon after 4 p.m.

No. 18.

The Manager, Brown's Colliery, to The Examiner of Coal-fields.

Dear Sir,

20 May, 1882.

From the nature of my fireman's report on No. 11 heading this morning, instructions have been given to the men that they must not resume work until we consider it safe.

As it is of great importance that this heading should be kept continually going, you will oblige by examining the place at your earliest convenience.

Yours, &c.,

J. & A. BROWN.
J. CROFT.

Telegram from The Examiner of Coal-fields to The Under-Secretary for Mines.

22 May, 1882.

PLEASE inform Minister I have just received letter from Manager of Brown's Colliery, Minmi, stating men withdrawn from No. 11 heading, in consequence of fireman's report of 20th instant. Manager is evidently endeavouring to fix responsibility on Department, which I wish to avoid if possible, and therefore think it advisable not to leave here until this matter is settled. Hope to see the Minister Thursday morning.

JOHN MACKENZIE.

No. 24.

The Manager, Browns' Colliery, to The Examiner of Coal-fields.

Dear Sir,

Browns' Colliery Office, 31 May, 1882.

The cut-through in No. 10 heading district is finished, and now waits your examination and orders to start No. 11 back heading.

We have, &c.,

J. & A. BROWN.

J. CROFT.

No. 25.

The Examiner of Coal-fields to The Manager, Browns' Colliery.

Sir,

Coal-fields' Office, Newcastle, 2 June, 1882.

In acknowledging the receipt of your letter of the 31st ultimo, I beg to inform you that the matter referred to therein, does not appear to be one calling for the interference of this Department, and that I am of opinion, as Manager of Browns' Colliery, you ought to be able to use your own discretion as to whether the place is safe for men to work in it with a naked light. My opinion is, as I told you when I last visited the colliery, that it would be safer to use brattice-cloths in Nos. 10 and 11 headings, as the feeders of gas which you are meeting with in the No. 10 heading district are such as may at any time become more dangerous and numerous; and if you refer to the evidence given on your behalf at the Newcastle Police Court by Mr. Croudace, and generally agreed to by Mr. Turnbull and Mr. Nielson, you will find that, in "his opinion, there was a reservoir of kerosene shale supplying the gas-feeders to the Minmi Colliery, and it was quite possible for blowers of gas to displace tons of coal, and set fire in a few hours great quantities of inflammable gas." You should therefore spare no expense in taking every precaution to drive the heading and the bords containing "blowers" or "feeders of gas" in the No. 10 district, so that the lives of the men working therein and adjacent thereto may be protected as far as practicable.

2. The Act and special rules are specific in defining your duties and mine where an accumulation of inflammable gas is found to exist, and strict attention to the Act and special rules will save you and me a great deal of unnecessary trouble.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

No. 26.

Telegram from The Inspector of Collieries to The Examiner of Coal-fields.

Minmi, 28 August, 1883.

FIRE at Browns' Colliery in No. 8 District serious. Now turning water from creek into furnace shaft. Neilson and Croudace here. I will remain here till late to-night.

JOHN DIXON,
Inspector of Collieries.

No. 27.

The Inspector of Collieries to The Examiner of Coal-fields.

Sir,

Glebeland, 29 August, 1883.

I beg to state that I should have been in Newcastle to-day, but owing to its being so late last night when I arrived from Minmi I could not get the accidents at Lambton investigated, so that I had to go to Lambton this morning, and am now busy with reports of accidents. As I telegraphed yesterday the fire in Browns' Colliery is a very serious matter, owing to gas being in the mine. The manager and myself penetrated as far into the workings yesterday as we could get for smoke, but no one can tell the extent of the fire. The creek was turned into the furnace shaft last night, but I fear that enough water will not be got to drown the fire out. Mr. Croudace went to Sydney last night, but will be back to-morrow (Thursday) morning, when he will go on to Minmi again. I left Mr. Neilson at the mine when I came away last night. He will be there again to-day. Unless you instruct me to the contrary, I intend going to Minmi again to-morrow morning, as I am most anxious about the matter, for I am afraid the gas will force its way out, as the workings fill with water. I most heartily wish you may be well enough to go to-morrow also, as your advice would be valuable. Would you kindly send reply by the bearer, for, if you are sufficiently recovered to go, if you take a buggy, I should like to ride up with you; if not, I shall take the early train, as my horse is lame.

I have, &c.,
JOHN DIXON,
Inspector of Collieries.

No. 28.

FIRE in Minmi. The same will have furnace clear to-night. Will not go to-morrow unless instructed by you.

JOHN DIXON,
Inspector of Collieries.

No. 30.

Telegram from The Inspector of Collieries to The Examiner of Coal-fields.

Hamilton, 4 September, 1883.

THE Colliery Managers are going to Minmi to-day. I am also going, and will let you know the result this evening.

JNO. DIXON,
Inspector of Collieries.

No. 31.

Telegram from The Inspector of Collieries to The Examiner of Coal-fields.

Hamilton, 4 September, 1883.

FIRE about the same in number (8) eight. Nearly all out around the furnace. No sign of gas. Managers going again on Thursday next. All safe so far.

JOHN DIXON,
Inspector of Collieries.

No. 32.

The Inspector of Collieries to The Examiner of Coal-fields.

Sir,

Glebeland, 5 September, 1883.

My telegram yesterday evening would let you know that the fire at the furnace in Brown's Colliery was about mastered. I now beg to state that when I left Minmi yesterday things at the Colliery were beginning to look better, inasmuch as the workings in No. 8 were a great deal cooler, and we could get down to No. 5 door yesterday, which we could not do on Monday, owing to the terrible smoke. No. 8 is throwing off a great quantity of black damp, which will tend to put the fire out. I have not been able to find the slightest trace of inflammable gas as yet in the vicinity of the fire, and, in my opinion, the active flame in No. 8 is extinguished, but, of course, there is a great smouldering in the places where the water has not yet reached. I believe that the return from No. 10 district is now blocked

blocked with water, and now is the time the greatest care will need to be exercised in watching for the slightest sign of gas from No. 10. Before leaving on Monday night I got the overman to leave a lighted safety-lamp below where the men were working at the furnace, and cautioned the man in charge of the night shift (John Morgan) to take a walk down about every hour to see that all was safe. On going back yesterday I found the safety-lamp still in the same place, and was told that my request had been complied with. Every precaution so far has been taken to keep every one safe, and I hope soon to be able to state that the fire in No. 8 has been completely mastered.

I further beg to state that I intend going to Brown's Colliery again to-morrow unless I get instructions from you to the contrary, as the danger is not yet passed, and I feel most anxious until I know that all is right.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

No. 33.

The Inspector of Collieries to The Examiner of Coal-fields.

Sir,

Glebeland, 17 September, 1883.

I have the honor to report that I visited Brown's Colliery to-day, and found that the fire near the furnace had been completely mastered, as there is now no sign of fire in that vicinity. The furnace has been to some extent repaired, and a fire lighted therein in order to restore ventilation. A road has been made into No. 8 return, and men are engaged filling away the stone which has fallen from the roof. Traces of fire are found in the coal on either side of the heading as the stuff is filled; but a powerful hose is kept constantly at work, so that as headway is made by taking the fallen stone out the fire when seen is put out at the same time. In my opinion this is the best course that could have been adopted, for by this means the fire will be put out, and the return made ready for immediate use.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

No. 34.

Telegram from The Inspector of Collieries to The Examiner of Coal-fields.

I AM off to Minmi this morning.

Hamilton, 17 September, 1883.

JOHN DIXON,
Inspector of Collieries.

No. 35.

The Inspector of Collieries to The Examiner of Coal-fields.

Sir,

Glebeland, 11 September, 1883.

I beg to state that I am very little better to-day than I was when I saw you yesterday. If I feel well enough to-morrow I shall try to get to Minmi, and if I go I shall send telegram from Hamilton.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

No. 36.

The Examiner of Coal-fields to The Miners' General Secretary, Hamilton.

Sir,

Coal-fields Office, Newcastle, 16 January, 1883.

I beg to acknowledge the receipt of your letter of the 8th instant, written by direction of the representatives of the Miners' Association, and inviting my attention to the number of men working in one split or current of fresh air in the Lambton headings at the Wallsend mine, a question which you inform me originated at a monthly meeting of the Wallsend miners some time ago, concerning which there was some discussion and dissatisfaction expressed, &c.

In reply, I beg to state that I forwarded your letter to Mr. Inspector Dixon for his report, which I received yesterday, and from which it appears to me that the fourth general rule, section 12, of the Coal Mines Regulation Act, 1876, is complied with in the Lambton headings in the Wallsend mine.

Mr. Dixon's report is as follows:—"I entered the 1st heading from the main tunnel, Bossfield's side of the mine. Here I measured the air, and found it entering the heading at the rate of 7,680 cubic feet per minute. This current of air supplies 66 men, 5 boys, and 3 horses; total, 74 (that is when the men are all in together). But as some of the front shift men had gone home, I found only 50 men, 5 boys, and 3 horses; total, 58. I measured the current of air again at the far end of the front heading, and found it to be about 7,000 cubic feet per minute. This current of air now leaves the front heading and passes through a stenton, where it is met in the middle heading by a current of fresh air, about 8,000 cubic feet per minute, coming along the middle heading from the main engine-bank. The two currents (that is, the 7,000 cubic feet of air from the front heading and the 8,000 cubic feet in the middle heading) now mingle together and form one current of about 15,000 cubic feet of air per minute. This current of air passes through another stenton into the back heading workings, where it serves about forty-five men, boys, and horses, after which it passes to the furnace."

With respect to the concluding portion of your letter, in which you call my attention to apparent defects and want of compliance with the Coal Mines Regulation Act, and say that the miners regret, through their representatives, that there is not more permanent and satisfactory ventilation throughout the mines, I have to request that you will, as early as possible, be so good as to specifically mention the collieries in this district which you refer to.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 37.

The Examiner of Coal-fields to The Miners' General Secretary, Hamilton.

Sir,

Coal-fields Office, Newcastle, 4 June, 1883.

I beg to inform you, in reference to your letter of the 30th ultimo, that on the 22nd idem Mr. Inspector Dixon made a thorough inspection of the East Waratah Colliery, and found and reported to me that the ventilation was below the requirements of the Coal Mines Regulation Act, giving me very full particulars thereon. He also informed me that upon coming out of the workings he saw the manager, and they agreed to make a thorough search as to the cause of the deficient ventilation, with a view of having it remedied at once; and that the manager gave orders in his presence for the necessary alterations to be made; and he (Mr. Dixon) hoped to see a great change for the better in the course of a few days.

2. Mr. Dixon states in his report,—plenty of timber on hand for the miners' use.

3. With reference to the concluding paragraph of your letter of 30th ultimo, as to the urgency of my attention being drawn thereto, I must conclude that you had not then been made acquainted with the energetic steps taken on the 23rd idem, *re* ventilation of the mine.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

No. 38.

The Examiner of Coal-fields to The Manager of Brown's Colliery, Minmi.

Sir,

Coal-fields Office, Newcastle, 2 June, 1882.

In acknowledging the receipt of your letter of the 31st ultimo, I beg to inform you that the matter referred to therein does not appear to be one calling for the interference of this Department, and that I am of opinion, as manager of Brown's Colliery, you ought to be able to use your own discretion as to whether the place is safe for men to work in it with a naked light. My opinion is, as I told you when I last visited the colliery, that it would be safer to use brattice cloths in Nos. 10 and 11 headings, as the feeders of gas which you are meeting with in the No. 10 heading district are such as may at any time become more dangerous and numerous; and, if you refer to the evidence given on your behalf at the Newcastle Police Court, by Mr. Croudace, and generally agreed to by Mr. Turnbull and Mr. Neilson, you will find that in "his (Mr. Neilson's) opinion there was a reservoir of kerosene shale supplying the gas feeders to the Minmi Colliery, and it was quite possible for blowers of gas to displace tons of coal, and set free in a few hours great quantities of inflammable gas" in the No. 10 district, so that the lives of the men working therein and adjacent thereto may be protected as far as practicable.

2. The Act and special rules are specific in defining your duties and mine where an accumulation of inflammable gas is found to exist, and strict attention to the Act and special rules will save you and me a great deal of unnecessary trouble.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

No. 39.

The Examiner of Coal-fields to The Miners' General Secretary, Hamilton.

Sir,

Coal-fields Office, Newcastle, 31 January, 1885.

Referring to the acknowledgment on the 15th instant of yours of the 14th idem, informing me that you had been instructed by the miners of the Newcastle Coal-mining Company's Colliery to invite attention to the state of the ventilation of that colliery, as shown by an enclosed check inspectors' report, I beg to inform you that, in accordance with my instructions, Mr. Dixon has furnished a report, from which it appears that on his making an inspection on the 16th instant and an examination of Nos. 6 and 7 headings (first places complained of) he found the current of air, which at the time of the check inspector's report is said to have been only 2,976 cubic feet of air per minute for forty-seven men, &c., to be 5,800 cubic feet, &c.

That in No. 5 district, instead of 3,428 cubic feet per minute for forty-nine men, &c., as found by check inspectors on 8th inst., he got 4,655, or 300 cubic feet of air per minute short of the minimum required by the Act; and that there are three bords, or six men, at the lower end of No. 1 horse-road, who, although working in No. 1, are on No. 5 current to all intents and purposes; therefore, if six more men are added to No. 5 it would make a further deficiency of about 600 feet.

In No. 1 district the check inspectors showed a current of about 5,040 cubic feet of air per minute for fifty-two men, &c., but taking six men from this number, and adding them to those in No. 5 split, it makes a total of forty-six men, &c., in No. 1, and therefore does not show a deficiency on the minimum required by the Act. Mr. Dixon found the current on the 16th to be about 5,000 cubic feet, &c.

In No. 10 district he found the total intake current to be about the same as that given by check inspectors, which showed a deficiency of about 300 cubic feet for forty-eight men, &c. Mr. Dixon further states that he made two very careful measurements of the total current of air at the furnace, and both times only got 43,000 cubic feet of air per minute, although there was a very large fire on at the time, but that the under part of the furnace was choked up with dirt at the shaft end. On the 8th inst. the check inspectors got 64,600 cubic feet at the furnace, and yet, strange to say, they got a deficiency in the workings.

2. Upon Mr. Dixon coming to the top of the pit on 16th instant he saw the manager and overman and told them the state of the pit, and, its being Friday, he requested the manager to accompany him round the workings on the following Monday. The manager asked for a couple of days, in order to look through the returns, inspect stoppings, and have the furnace cleaned, &c.; Mr. Dixon advising him to enlarge mouth of intake to No. 5 district, and Mr. Ross promising to give his personal attention to the whole matter, and meet him at the pit on the 21st instant.

On

On the 21st instant Mr. Dixon and the manager went down the pit, the latter informing Mr. Dixon that since his inspection he and the overman had travelled the various returns, two men had been plastering the stoppings whenever a leakage was discovered, the furnace had been cleaned out, and the airway to No. 5 had been enlarged at the mouth of the intake. They then went through the workings together, with the following results.—

Nos. 6 and 7 headings, about 5,850 cubic feet of air per minute for forty-seven men, &c.

No. 5, about 6,200 for fifty-four men, &c. (12 ft. more area in front of this intake since 16th.)

No. 1, about 5,400 for forty-six men, &c.

No. 10, about 5,400 for forty-eight men, &c.

And at furnace, 63,180 cubic feet of air per minute.

Mr. Dixon also saying that "there were a few matters of detail in connection with the circulation of current of air in Nos. 6 and 5 that I drew the manager's attention to when we were in pit together, which he promised to attend to at once."

Mr. Dixon also says the No. 6 district is the same as that we had trouble with a good while ago, which was put right by holing into the No. 5, but since then, in November last, another creep came on and blocked up the whole district, and the consequence is that a pair of headings have again to be driven in the solid, in order to open out No. 6 district to No. 5, and the trouble will be, as on the last occasion, to force the current of air into the said headings.

3. From Mr. Dixon's report it appears that the matters complained of have been remedied, and that the provisions of the Coal Mines Regulation Act respecting the same are now complied with.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

No. 40.

The Examiner of Coal-fields to The Miners' General Secretary, Hamilton.

Sir,

Coal-fields Office, Newcastle, 31 January, 1885.

Referring to my letter of the 23rd instant, and yours of the 22nd idem, inviting my attention to an enclosed communication with reference to the alleged employment of a boy under age at the Co-operative Colliery, I beg to inform you that, in accordance with my instructions, Mr. Dixon has furnished me with a report, from which it appears that Mr. Fletcher, jun. (manager), did not know of any boy under age being employed at the colliery.

2. That the overman said a man named James Towther told him, on the 25th instant, that a boy named Alexander Bain, who had started work in the colliery, was under the age of 13 years, and the overman replied, "If that be the case I shall tell the boy's father on Tuesday to keep the boy at home."

3. That on making inquiries Mr. Dixon discovered that "the boy Bain is step-brother to A. B., and the elder Bain is the step-father, and it appears some time ago William Bain asked for employment for his son Alexander, but did not succeed, as there was no vacancy. However, he (Bain) took the boy into the pit a few times, not to work, but to get used to the mine with his father, and on that particular day one of the trapper-boys stayed at home, and young Bain was set to mind the door. It happened so again the next day, hence the employment of the boy Bain, who has only been at work eleven days altogether, and this day will be his last for some time, as both the manager and overman are much annoyed to think that such a thing has happened. The overman gave the boy employment, and he told me that he had not the slightest suspicion of the boy being under age until his attention was drawn to the matter by Towther."

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

No. 41.

Sir,

Coal-fields Office, Newcastle, 13 October, 1886.

Referring to your blank-cover communication of the 9th instant, forwarding me a letter addressed to Mr. Creer from the Miners' General Secretary, dated the 25th ultimo., complaining of an infringement of section 30 of the Coal Mines Regulation Act by the colliery manager of the Greta Colliery, accompanied with a letter from Mr. Creer to the Hon. the Secretary for Mines, with the Minister's minute thereon, requesting me to make a searching inquiry into the alleged grievance with the least possible delay, I have the honor to report as follows:—

That I went to the Greta Colliery yesterday and interviewed Mr. M'Donald, the colliery manager, Daniel Cauty (Miners' Secretary and Miners' Inspector), and Joseph Unsworth, miner, and chairman of the Greta miners, from whom I obtained the following particulars as to the grievances complained of to Mr. Curley, by the representatives of the Miners' Association:—

1. As to the suspension for two days "of the check inspectors," Mr. M'Donald answered,—That he did not suspend them, pending an investigation, for causing to be printed and published a false report of the state of the mine. The false statements were as to the number of splits and number of men in the different splits, and neglecting to hand him a written report of the inspection.

2. As to the statement made, "That upon inquiry at the office for a book in which to enter the report the clerk answered there was none," Mr. M'Donald answered,—That he did not know about their asking for it until after he had suspended them, and that the Miners' Inspectors had not, since he had been at the colliery (twelve months) before, asked for a book in which to enter their report; but to the best of his belief the inspection of 27th August was the first one made by the Miners' Inspectors since he was manager at the colliery.

3. As to the statement,—That upon requesting if they (Miners' Inspectors) could go into the mine in a certain way, they were informed they could not by the manager.

Then follows evidence of Cauty and Unsworth.

I am of opinion that the colliery manager has violated section 30 of the Coal Mines Regulation Act, and, as he maintains that he was justified in the action he has taken, will be glad to see the matter tested, and that he does not fear the result. I shall institute proceedings against him at once, unless otherwise instructed by the Minister.

Enclose special report of Inspector Dixon, accompanied by manager and Miners' Inspectors, made at request of Miners' General Secretary, from which it will be seen that the Miners' Inspectors' aneroidometer is not to be depended upon, and that the ventilation of the mine was up to the requirements of the Act when the joint inspection was made.

No. 42.

The Examiner of Coal-fields to The Miners' General Secretary, Hamilton.

Sir,

Coal-fields Office, Newcastle, 1 November, 1886.

With reference to an interview a deputation, consisting of the Miners' General Secretary, General Chairman, and Treasurer, had with the Honorable the Secretary for Mines, respecting the proper ventilation of collieries, in March last—subsequently to which the Minister informed the deputation, through you, that while he was prepared to see that the officers of the Department exercised the utmost vigilance in all matters relating to the protection of the life and health of the miners—he was anxious to secure the co-operation of the miners between the visits of the Inspectors, in order to promptly remedy any defect that might exist in regard to the ventilation of the mines, and that he would be glad if the Miners' Association would take such steps as would lead to the Miners' Inspectors at once reporting to the person in charge of the colliery any defect which Inspectors might discover during their inspection; and in the event of the owner or person in charge of the colliery not proceeding at once to remedy the defect complained of, they should report the matter to the Examiner of Coal-fields; and that if they would do this, he would issue instructions for an inspection to be made by the Examiner or an Inspector of Collieries not later than the next day, in the presence of the manager, or the person in charge of the colliery, and the Miners' Inspectors.

Since this decision was arrived at and communicated to you, alleged deficiencies of ventilation at some of the collieries have been reported by the Miners' Inspectors, and upon myself or the Inspector proceeding to the mine to investigate the complaint we have been informed by the manager and Miners' Inspectors that the Miners' Inspectors had not reported to the person in charge of the colliery the defects which they had discovered during their inspection, so as to have given him an opportunity of at once applying a remedy, if necessary.

Under these circumstances, I am directed to request that, if you have not already instructed the Miners' Inspectors at all the collieries how to act before communicating with me as to deficient ventilation, you will have the goodness to do so at your earliest convenience, and inform me whether it is the intention of the miners to assist the Department in the manner indicated by the Honorable the Secretary for Mines.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 43.

The Examiner of Coal-fields to The Miners' General Secretary, Hamilton.

Sir,

Coal-fields Office, Newcastle, 6 November, 1886.

In reply to yours of the 5th inst., I beg to inform you that the collieries referred to in my letter of the 1st instant are Greta, Newcastle Coal Company, Lambton, and Wallsend Collieries.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

Received and answered, on January 4th, 1887, letter from Greta Miners' Secretary; received and answered, on 15th January, 1887, letter of 12th, from Glebe Miners' Secretary; received and answered, on March 2nd, 1887, letter of 28th, from Burwood Miners' Secretary; received and answered, on June 13th, 1887, letter from Burwood Miners' Secretary.

1887-8.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

NORTHUMBERLAND COLLIERY.

(REPORT IN CONNECTION WITH FATAL ACCIDENT TO JOHN MANSFIELD.)

Ordered by the Legislative Assembly to be printed, 29 May, 1888.

[Laid upon the Table of the Honorable the Legislative Assembly of New South Wales by the Secretary for Mines, "A copy of the Report and Evidence in connection with the fatal accident to John Mansfield at the Northumberland Colliery."]

REPORT and Evidence, re fatal accident to John Mansfield at the Northumberland Colliery.

Sir,

Newcastle, 16 April, 1888.

I regret to report a fatal accident which occurred to a sinker named John Mansfield, on Monday evening last, 9th instant, in the Bryant sinking shaft, belonging to the Northumberland Land and Coal Company (Limited).

2. Having proceeded to the colliery on the following day to obtain some sections, on arriving on the ground I was informed of the accident, and proceeded to the abovenamed pit and made an investigation.

3. The pit, which is in course of sinking, is now about 430 feet in depth from the surface and 17 feet in diameter. Bands of coal and shale have recently been passed through and have been timbered; between this timbering, which is within about 6 feet of the shaft bottom, and the length of timbering above, it is about 50 feet of post stone, which is considered sufficiently strong to stand without timber. Prior to the accident all the soft strata in the pit was timbered, and there is nothing exposed except the conglomerate and post rock.

4. I descended the shaft in a cradle, accompanied by the Manager, Mr. Crawford, the master sinker, Mr. McGarrity, the master sinker of the night shift, Mr. Laverick, and the chargeman, Mr. J. Brooks, and as I slowly descended I made a careful examination of the sides where the walls were bare, and discovered a place where, to all appearances, a piece of stone had recently fallen away; this fresh mark measured 2 feet 6 inches by 14 inches at the deepest part and 2 to 2½ inches thick in its thickest part, and "featheredged" both ways; the position was about 12 feet below the second lot of timbering and about 70 feet from the bottom. I afterwards was shown a piece of stone brought out of the shaft by one of the sinkers. This stone was of irregular shape, 14 inches long, about 12 to 14 inches in width, and 2 to 2½ inches thick in the thickest part, "featheredged" in each direction, and weighing 14 lb. This stone, on being placed against the mark in the shaft, appeared to correspond exactly, except the "feather edges," which had been broken off in the fall.

5. From statements made to me by James Brooks, the chargeman of the shift, Wm. Mansfield, a sinker, brother of the deceased, Phillip Reynolds, a sinker, all of whom were in the bottom of the shaft at the time of the accident, I gathered the following particulars:—

6. The shift, consisting of ten sinkers and one chargeman, went down the pit at 3 o'clock on the afternoon of the day of the accident, the chargeman (Brooks) examining the sides of the shaft as he slowly descended, as shots had just been fired by the previous shift. After he (Brooks) had satisfied himself that all was safe he got all the men under his charge into the bottom, and they commenced work, filling the loose stone, and drilling holes for further blasting. They worked on this till 8 p.m., by which time eight holes had been drilled and charged; these holes were fired by the chargeman, Brooks, after which the whole of the shift sat down to supper on the pit-top. After an interval of half-an-hour, Brooks, the chargeman, according to the rules, was the first to descend the pit, in company with three of the sinkers under his charge. They thoroughly examined the shaft in their descent, keeping a special look-out for loose stones which might have been thrown up by the shots and lodged in the cribbing, and also for anything which might have the appearance of being given off where the walls were exposed. Whilst thus examining

examining the shaft a sinker, named Phillip Reynolds, thought he saw a loose piece of stone in the post bed; the bucket was immediately stopped by the chargeman, and the spot indicated was minutely examined by the men in the bucket, and no appearance of any loose stone could be found. Believing all to be secure, on reaching the bottom the chargeman gave the signal for the remainder of the men to descend, which they did almost immediately. When the whole of the men were in the bottom they took their respective places—some filling dirt into the bucket, which was then on the bottom. The empty rope was sent away, and returned with the bucket containing tools. The deceased and Reynolds commenced taking the tools out of the bucket, which had just landed on the bottom of the shaft. In the meantime the bucket, which had already been loaded with stone, was attached to the rope, and the signal given by Brooks the chargeman for it to be raised; it was raised some 6 feet from the bottom so as to be steadied for the ascent. Whilst at this point something fell down the shaft, and struck Reynolds on the right shoulder and the deceased on the head. It was then discovered that John Mansfield had been knocked down, and was lying in the sump with a fearful gash in his head. The master sinker, Laverick, who was on the pit top at the time, was at once signalled for, and descended the pit, and had the body of the deceased brought to the surface as quickly as possible. After the removal of the deceased from the pit bottom the chargeman Brooks made a search in the bottom, with a view of finding out what had caused the accident, and discovered the piece of post stone above described, which he at once concluded had fallen from the post bed, as the rest of the stuff in the bottom at that time was black shale. The fact of this stone corresponding with the mark in the post is, to my mind, conclusive evidence that this stone caused the accident.

7. The District Coroner, G. C. Martin, Esq., J.P., held an inquest on the body of deceased at Fassifern, commencing on Wednesday last, 11th inst., and continued on the following day, Thursday, 12th inst. I attended the inquest and heard all the evidence, and I fully agree with the verdict of "accidental death," as returned by the Jury.

Verdict.—We find that the said John Mansfield, at Fassifern, in the district of Newcastle, in the Colony of New South Wales, on the 9th day of April, 1888, was working in the Bryant pit at the Northumberland Coal Company's mine, was struck down and almost instantaneously killed by a fall of post rock. We further find that his death was purely accidental, but we wish to add that we consider a cradle should be used for examining the mine when necessary to be examined, and that should be at least once a week. We also wish to recommend to the Government of New South Wales the necessity of having printed rules for regulating the sinking of shafts in this Colony."

8. It will be observed that certain recommendations were made by the Jury on this occasion. 1st. That the examination of the shaft should be made from a cradle when necessary, which should be at least once a week. With this I also fully agree, and in my presence the following order was given by the Manager on Thursday:—

"A representation having been made by the chargeman that they would like the workmen to examine the shaft sides for themselves, I now authorize that any number of workmen, not exceeding four, with one chargeman, who will not interfere beyond giving the necessary signals, shall examine the shaft from top to bottom and report the condition of the same in the diary which is kept in the office of the colliery for the purpose, and the Northumberland Coal Company will pay the men for the examination so made."

In reference to the allusion to special rules in this verdict, in my opinion it is simply meant that the Government should frame a set of special rules for all sinking pits in the Colony. Action in this matter has already been taken by this Department, and the excellent special rules in use at the Northumberland new winning is the result.

I herewith beg to forward copy of evidence, which evidence clearly shows that every special rule was strictly observed.

9. In conclusion, I beg to state that, in my opinion, there is no blame attributable to owner or agent in connection with the accident.

I have, &c,
THOMAS L. BATES,
Inspector of Collieries.

[Enclosure.]

EVIDENCE taken at an inquest held at Fassifern, on April 11th and 12th, before G. E. Martin, Esq., J.P., Coroner, on the body of John Mansfield, a sinker, who was killed in the Bryant Pit, belonging to the Northumberland Coal Company, on April 9th, 1888.

By the Coroner: Wm. Mansfield, a sinker, employed at the Northumberland Coal Company's Mine, Fassifern, brother of deceased, identified the body as that of his brother, John Mansfield; on Monday night, April 9th, about 8 o'clock, I went down the Bryant Pit with the other sinkers, and a bucket of tools was sent down after us; the men in the shaft commenced filling the other bucket with stone; the bucket was then drawn up to the steadying place and then sent up; heard a man sing out, but could not tell what he said, and went to his assistance thinking he was hurt; when going to this man, saw my brother lying in the sump, and said, "My God, his brains are knocked out; I believe it is a stone from the bucket"; the master sinker came down whilst I was holding my brother.

By Mr. Dixon: Have been working here about eight months, and have worked in both pits; know there are printed sinking rules, and am acquainted with them; about half an hour before I went down a shot was fired in the pit; it is usual to examine the sides of the shaft after shot firing, and was done in this instance; ten or eleven men were at work in the bottom of the shaft at the time of the accident; I thought I was as safe in the bottom of the shaft as on this floor, and thought there was no danger; have had some experience in sinking in the district as well as here; have never had cause to complain as to the state of the shaft since I have been in the pit; know a stone struck the deceased, because I saw the stone afterwards; did not see it strike him or know where it fell from.

By Mr. Crawford: The stone which I saw on the pit top was a "post" stone, and was told that it was the stone which killed my brother; I know there are 50 feet of "post" in the shaft.

By the Jury: Are now sinking through black shale; the stone which I saw was light grey; cribbing comes between the "post" stone and the black shale; there will be about 20 feet of cribbing between; the bucket was travelling up the shaft at the time of the accident; as far as I know the bucket was examined before going up the shaft, but I have nothing to do with examining it; the chargeman was at the bell wire at the shift bottom at the time of the accident; I do not know who found the stone or who brought it up; believe the shaft is 17 feet in diameter; know nothing about wrong signals being given as I was at the other side of the shaft; three men go down with the chargeman when examining the shaft; I think a proper examination cannot be made by men in a bucket; there was a bit of powder smoke in the shaft when I went down.

By the Coroner: James Brooks, a sinker, employed at the Northumberland Company's mine, as chargeman of the shift of sinkers; I, with ten others, went to work in the Bryant shift at 3 o'clock on Monday afternoon, April 9; relieved the other chargeman, and had no complaint from him; it is a rule of the chargemen to acquaint one another of any danger when they meet, and I heard of none; after the other chargeman had come out, having fired three shots, I and three others

got

got into the bucket and went down the shaft, examining as we went down; cleared away all loose stuff, and made the shaft perfectly safe; after getting to the bottom sent the bucket up for the remainder of the men; after they were all in the bottom, commenced sending dirt away and boring holes; when we got the dirt sent out, set the remainder of the men boring till we had eight holes bored, and ready for firing; sent two lots of men up; three men and myself stayed behind to fire four holes; fired them; returning back, and fired four others; came up and went to "tucker"; after an interval of half an hour three men and myself went down the shaft and examined it thoroughly as before; got into the bottom where there was a great deal of smoke; sent for the remainder of the men; got them all down; sent the empty hook away for the other bucket, which had tools in; lowered it into the bottom; fastened a full bucket of dirt on to the rope; rapped it up to the steady mark; the driver did not take it up quite high enough; rapped three and a "cock-up," which meant "bend up fairly"; the bucket was raised a bit too high, and while rapping "lower the bucket," I heard a man call out his shoulder was hurt; spoke to him and asked him if it was hurt much; he said "yes"; this man was Phillip Reynolds; I then heard someone call out "Jack is killed"; went forward and helped others to raise him up; then rapped five for the master sinker who came down immediately; we then lifted John Mansfield into the bucket; the master sinker and three others took him up to the top; I remained in the bottom to see the rest of the men out; a thought occurred to me to ask some of the men to come and look for the stone; we looked and found one in the bottom of the pit, different to any class of stone we have at present in the bottom; we all came to the conclusion that it had come from above, and that it had been the stone which had struck John Mansfield and Phillip Reynolds; took the stone up myself in the last bucket, and put it on the pit top, and showed it to the master sinker; this stone came from a place in the pit about 70 feet above where we were working; the stone produced is the one I brought up out of the pit.

By Mr. Dixon: I had charge of the afternoon shift; have been working here about eight months; been chargeman here between six and seven months; when I sent the loaded tub away I steadied it properly before sending it up, and saw that the bottom of the bucket was clear of all stones, clay, &c., and that there was nothing projecting over the side; it is my duty to examine the sides of the shaft, and I did so just prior to the accident; do not examine the shaft except after shot firing, unless anything should fall, or think it necessary to do so; the master sinker examines the shaft every shift; it is customary to examine the shafts on a Sunday night by the chargeman, with one or two men; I examined it last Sunday night week; on that night I examined the post-bed, and am sure the stone produced came from it; there is about 50 feet of post exposed between the cribbing; the stone fell out about 12 or 14 feet below the cribbing; there is a little over 200 feet of timbering in the shaft, in three different lengths; the present depth of the Bryant pit is 430 feet; where post-stone occurs in a shaft it is not usual to timber; I always examine the shaft from the bucket, with a long scraper to push the bucket over to the side; cannot tell whether the sides are as safe when examining from a bucket as from a cradle; I never complained to the manager that I could not examine the shaft as well from the bucket, but it has been talked about amongst the men, who said that a cradle ought to be used; no obstacle has been thrown in my way by the manager or master-sinker in examining the shaft, and if any man in the shaft wished it examined I have always done so; no remarks were made by the men in the bottom of the shaft about the state of the shaft at the time of the accident, and, as chargeman of that shift, I considered the shaft perfectly safe; I am sure I have never been interfered with in any way by the management.

By the Jury: When we were going down the shaft on the Monday evening one of the men said he thought he saw a stone loose; I called "hold"; we went round the pit with the scraper; the man said he might have made a mistake, as there was a great deal of smoke in at the time; the bucket might travel a foot after calling "hold" before stopping.

By Mr. Dixon: This remark was made when passing the post-bed, and the smoke was very thick; I think air alone has forced the stone out.

By the Jury: The above stone cannot have been loose, and I do not think anything touched it; the cradle is only used in the shaft when timbering, and was not in the shaft on Monday last; about three months ago I complained to the master-sinker that the shaft was not safe, and the men were discontented; he came at once to the shaft, and we both took distances for timber and timbered it; since then there has been no complaint; the stone-post was both walled and ballasted; I have never seen posts feather off unless mixed with other stone; the Bryant pit is as safe, as well timbered, and as well looked after as any pit I have ever seen in my life.

By the Coroner: Dr. Charles Hedley, a duly qualified medical practitioner; I have this morning examined the body of John Mansfield; I found a large wound on the back portion of the top of the head, through which the brain was protruding, the wound being through the skin, bone and brain matter down to the base of the skull; the wound must have caused almost instantaneous death; possibly he may have breathed a few moments; the injury must have been caused by a heavy sharp body falling on his head with very great violence; the stone produced falling from a height would cause such a wound; there were no other marks of injury upon the body; I previously knew the deceased as a thoroughly healthy man, and knew that his name was Mansfield.

By the Coroner: Phillip Reynolds, a sinker, employed at the Northumberland Coal Company's mine; I went down the Bryant pit on Monday afternoon, at 3 o'clock, and examined the shaft with the chargeman and two others; after "crib" went down again, about 8 o'clock, the chargeman, James Urwin, Robert Goodson, Phillip Reynolds being in the bucket; we examined the shaft from top to bottom; when we got to the bottom we waited for the other men to come down; as I was coming down the pit very slowly I thought I saw a piece of stone, and told Brooks, the chargeman, of this; he stopped the bucket and looked for it, but could not find anything, and I was well satisfied to go down; the bucket did not go far after my telling the chargeman of the piece I thought I saw before it was stopped; it was then pushed over to where I thought I saw the loose stone, but could not find it; when the remainder of the men came down we sent away the hook and commenced filling stone in the bucket which was at the bottom; this bucket was just being rapped way from the bottom, and my brother was handing me the tools out of the other bucket, when something fell down, hitting me on the shoulder, and knocked me up against the side of the shaft; I then heard that my brother had been killed, and saw him put in the bucket; the body viewed by the Jury is the same I saw put in the bucket.

By Mr. Dixon: The loose piece I thought I saw was about half-way down the bed of post; have been working at this mine eleven weeks; this is my first experience in sinking; have had no reason to complain, or I would not have gone down; the bucket was swinging a bit when it left the bottom; think the bucket was about 6 feet off the bottom when I was struck; was well satisfied that the chargeman knew his duty, and I was satisfied to work with them.

[Inquest adjourned till the following day.]

By the Coroner: Thomas Laverick, master sinker at the Northumberland Coal Company's mine; I examined the Bryant pit at 5 20 p.m. on Monday, 9th April, from top to bottom, in going down and in coming up; to my idea it was as safe as could be; when it is my shift I examine the shaft after every shift of the sinkers; I examined the post rock on Monday, 9th April, and found it quite safe to my knowledge; did not see anything to cause me to think it was unsafe; did not know there was a man killed till I got down the shaft after being rapped for.

By Mr. Dixon: Have been a sinker 18 to 20 years, and had experience in the old country; have been here since the commencement of the works; was chargeman of a shift until recently, when I was put in charge as master sinker of the night shift; made a thorough examination of the Bryant pit about six or seven weeks ago; if necessary the shaft was timbered when we found any beds of soft stuff; there is about 240 feet of timber in the shaft, out of 435 feet of total depth; when I examined the shaft I did so from the large cradle; in my ordinary examination I examined the shaft from the bucket; and think it is possible to make a thorough examination of the sides of the shaft from the bucket by having two men in the bucket besides myself; am well acquainted with the sinking rules, and they are carried out every day in every item; no complaints have ever been made to me as to the unsafe state of the shaft; have had conversations with the chargeman about the cradle being used instead of the bucket for examining the shaft, and thought it would be more satisfactory to the men to have the cradle; have asked Mr. Crawford to allow me to take the cradle in; he got a cradle made last Tuesday; I spoke to him on the Monday night after the accident; the first time I spoke to him he got the cradle made; the big cradle was used in timbering, and has been on the ground all the time; the bed of post was 50 feet thick, and was a strong bed; have not seen a bed of post as strong, except "filtering" post, whilst I have been sinking; have never known a bed of post like this bricked or timbered in my experience; had not the slightest doubt about this post-bed being safe.

By the Jury: The piece of stone produced was found in the bottom of the shaft after the accident; I am certain it came out of the post-bed; I have noticed in other shafts pieces of post burst off by a blow, but never by itself after being left faced for a certain time; saw no trace of the stone having been weathered or winded; it looked to me as if it had come away freshly; cannot form any idea as to how the stone came away from the side; the stuff now being sunk through would not send up fragments more than 50 feet after shot firing; I generally sound the sides with a striking hammer or hack when examining the shaft; it would not be possible for a man to break a piece of stone like that produced off the face unless there

there was a flaw in the stone ; the large stone produced by the Jury was fast in the side, wedged in behind a stay ; tried to get it out two separate times, but could not move it ; I tried to take this stone out, which was below the conglomerate, and about 260 or 270 feet from the surface ; the stone was not put there, but was jammed by the prop ; do not know why it was taken out to-day, always considered it safe where it was.

By the Coroner : James Richards, sinker at the Northumberland Coal Company's mine ; I examined the shaft on Sunday night last, in company with Wm. Hardy ; I went down the Bryant pit at 8 o'clock, and returned to the surface at 11.20 ; went down and thoroughly examined the shaft ; this is done every Sunday night ; examined the post rock all over with a long-handled pick, and to the best of my knowledge found it safe ; if I did not I would not go to the bottom ; the piece of rock might have been shifted by a blow of air coming up the shaft.

By Mr. Dixon : In the night-time the shaft is much clearer than in the day ; there is more draught ; in my opinion I could not knock a piece of rock off the face like that produced, unless there was a flaw in it ; could not imagine the piece of stone produced getting a blow with anything ; have been a sinker twenty years in this and the old country ; never in my experience have I seen a bed of post bricked or timbered whilst sinking the shaft.

By Mr. Moore : Had I found any dangerous post I should have come out at once and informed the master sinker.

VERDICT OF THE JURY :

We find that the said John Mansfield, at Fassifern, in the District of Newcastle, in the Colony of New South Wales, on the 9th day of April, 1888, was working in the Bryant pit at the Northumberland Coal Company's mine, was struck down and almost instantaneously killed by a fall of post rock. We find that his death was purely accidental, but we wish to add that we consider a cradle should be used for examining the mine when necessary to be examined, and that should be at least once a week. We also wish to recommend to the Government of New South Wales the necessity of having printed rules for regulating the sinking of shafts in this Colony.

1887-8.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SOUTH WARATAH COLLIERY.

(PAPERS IN CONNECTION WITH THE INFLUX OF EXPLOSIVE GAS INTO.)

Ordered by the Legislative Assembly to be printed, 29 May, 1888.

[Laid upon the Table of the Honorable the Legislative Assembly of New South Wales by the Secretary for Mines, "Copies of papers in connection with the Influx of Explosive Gas into the South Waratah Colliery in February last."]

SCHEDULE.

NO.	PAGE.
1. Mr. Inspector Dixon to the Examiner of Coal-fields, reporting inspection of the South Waratah Colliery. (Minutes thereon.) 17 December, 1887.....	1
2. Same to same, reporting outburst of inflammable gas in the above-mentioned colliery. 11 February, 1888.....	2
3. Minute by the Minister for Mines on the subject. 17 February, 1888.....	3
4. The Under Secretary for Mines to Mr. T. Ridley, acknowledging services rendered in connection with the explosive gas. 20 February, 1888.....	3
5. Mr. T. Ridley in reply to above. 27 February, 1888.....	3
6. Telegram from the Under Secretary for Mines to the Examiner of Coal-fields, asking him to request Mr. Ridley to meet the Minister on station to receive watch. 11 April, 1888.....	3
7. N. Melville, Esq., M.P., to the Secretary for Mines, asking for searching inquiry into the facts in connection with the reward to Ridley. (Minute.) 11 April, 1888.....	3

9. Telegram to the Examiner of Coal-fields, asking him to make arrangements to conduct the inquiry. 26 April, 1888.....	4
10. Report of the inquiry. (Tracing.) 1 May, 1888.....	4
11. Minute by the Minister on same. 7 May, 1888.....	6
12. The Under Secretary for Mines to Messrs. Evans & Brown, conveying thanks for services rendered. &c. 7 May, 1888.....	6

No. 1.

Mr. Inspector Dixon to The Examiner of Coal-fields.

Sir,

Glebeland, 17 December, 1887.

I have the honor to report inspection of the South Waratah Colliery, on the 9th instant, as follows:—

At the time of inspection there were about 44 men, 6 boys, and 6 horses; total, about 56 men, &c., at work in the mine on one shift. The total quantity of air passing through the workings from the Flaggy Creek shaft was about 11,550 cubic feet per minute. Several bords have been turned away from the main road, about 400 yards from the bottom of Flaggy Creek shaft.

The work of holing the back heading and turning away headings for the winning out of more bords is also being carried on day and night.

(Please note.)

A heading has been commenced at right angles to the back heading to cut the old prospecting drive, which you will remember was driven when Mr. Green had charge of the colliery. This old drive is supposed to be a distance of about 80 yards from the Charles pit main road, and at the time of my visit about 60 yards had been driven. There was no person working in this heading at the time of my visit, as the men belonging to it were engaged in making an overcast on the back return. It is supposed that a considerable quantity of inflammable gas is lodged in the old drive, and when the heading which is approaching it was at work, the men worked two in a shift with safety lamps, and kept a bore 12 feet ahead

ahead of the face. I requested the overman (Mr. Ridley) to use every precaution in this matter, and, if possible, to hole the heading when the majority of the miners were out of the pit. This he (Mr. Ridley) promised to do, and also to give his personal attention to the matter until he was sure that all danger was past.

The main road was in good order throughout, and there was a plentiful supply of timber on hand ready for use.

I have, &c.,

JOHN DIXON.

Inspector of Collieries.

The Manager has promised to take all the necessary precautions in driving the new heading which is to cut the old prospecting drive supposed to contain a considerable quantity of inflammable gas.—
J.M., 21/12/87.

The Under Secretary for Mines, B.C., 21/12/87. Submitted for the information of the
Minister.—H.W., 29/12/87. Seen.—F.A., 30/12/87.

No. 2.

Mr. Inspector Dixon to The Examiner of Coal-fields.

Sir,

Glebeland, 11 February, 1888.

In my report, dated 17th December last, I stated that in the South Waratah Colliery, a narrow place had been commenced, at right angles to the back heading, to cut the old prospecting drive, which was driven when Mr. Green had charge of the colliery some years since, and that the old drive was supposed to contain a very considerable quantity of inflammable gas, &c. Since my December report, the narrow cross-cut has been driven a considerable distance, and, on Thursday last, the old drive was tapped by a borehole, the effects of which tapping I do myself the honor to give, as follows:—

2. On Thursday morning last, 9th instant, I proceeded to the South Waratah Colliery, to make an inspection of the workings, &c., and, on arrival at the colliery, I saw the overman (Mr. Thomas Ridley), who supplied me with the following particulars concerning the issue of gas from the bore which had taken place that morning. The cross-cut, which is driven in the direction of the old drive, is about 6 feet high and about 7 feet wide, and is about 6 chains in length from the main road in the colliery.

This cross-cut is about 300 yards from the Charles pit bottom. Six picked men were employed in the cross-cut, two men in one shift, working with locked safety-lamps (Clanny), and the whole length from the back heading return airway, was kept bratticed almost close to the face.

A bore, 2 inches in diameter, was kept about 10 feet ahead of the working face, so that a strong barrier of coal, &c., would be ensured as a safeguard against the inside pressure from the old drive. The whole of the ground passed through in the cross-cut was extremely hard, being a mixture of strong coal and stone, and, as an evidence of this, there was no indication of holing into the old drive, and no issue of gas, until the drill actually passed into the old workings.

Two of the miners (Henry Evans and Wm. Brown) commenced work, in the face of the cross-cut, at about 6 a.m. on Thursday morning last, and about 7 a.m. commenced to bore in the face. About 7.30 a.m., the overman (Mr. Ridley) went into the face, but had not been there many minutes when the drill went through.

At this time the whole of the cross-cut was clear of gas; but, in a few minutes after a communication was got, the gas came through the bore with a terrific rush, and made a noise which could be distinctly heard at a distance of about 200 yards from the face. The length of bore at the time was about 8 feet 4 inches.

The overman and the two miners immediately rushed out from the face towards the main road, on reaching which they found that the whole length of cross-cut, about 6 chains, had been fouled by the gas from the borehole. At this time there were about 100 men, &c., in the workings, and, on seeing the state of affairs, the overman ordered a man to the bottom of the main shaft to put out all the lights, and sent three men into the upper seam to drown the fire in the ventilating furnace. A person was also despatched along the main road, towards the working places, to order all wheelers and miners to proceed at once to the bottom of the Flaggy Creek downcast shaft, which would be about a mile from the spot where the gas was issuing.

This was all done as quickly as possible, and as the ventilating furnace was now useless (as the fire had been put out) a jet of steam was blown through the large Tangye pump at the pit bottom, and this steam at once restored the ventilation and caused a current of air of about 5,480 cubic feet per minute (as measured by Mr. Ridley at the time) to circulate through the cross-cut, and in about half-an-hour the whole of the gas was cleared away from the main road and nearly to the face of the cross-cut. I made a careful inspection of this place shortly afterwards, and found gas issuing from the bore, but no sound could be detected, only when listening at the out-end of the bore, when a slight hissing could be heard inside. There was a good current of air circulating behind the brattice at the time of my inspection, but a few feet of the brattice had been knocked down by a pony which was in the face at the time the gas was tapped, and took fright and bolted. A deputy was busy putting the brattice up again, and the two miners were working in the face as usual.

3. Yesterday (Friday) morning I paid another visit to this colliery, and found that the face of the cross cut had been holed during the night. The hole was about 1 foot high and about 2 feet 6 inches in width. The overman (Mr. Ridley) informed me that he was present at about 2 a.m. yesterday morning, when the hole was made with the pick, and that the gas again issued with terrific force, and fouled the cross-cut again for about 120 yards. This time the air current had to be reversed and coursed down behind the brattice before the gas could be broken and cleared away. When I visited this place yesterday there were no men working in it, and large danger-boards were placed across the entrance, so that no naked light might be allowed to pass from the main road, and a special man was stationed at the entrance to keep all persons out. On examining the face I found gas issuing from the hole which had been cut with the pick, and I also detected a slight trace of gas near the roof, about 12 feet back from the side of the old drive, but could not detect it in any other part of the cross-cut. From the shaft bottom to the point where the old drive has been tapped there are two dips or swallows in the old drive, and as they are filled with water there is no communication through the old drive to the upcast shaft. The

3

The overman informed me yesterday that a gang of men would commence work that night at the bottom of the upcast, and prepare the old drive so that pipes could be laid in and the water pumped out. When this is done it is expected that the air-current will be coursed through the hole in the cross-cut against the gas, and that this length of old drive between the cross-cut and the upcast shaft will be cleared of gas.

4. In conclusion, I beg to state that in my opinion great praise is due to the management of this colliery, especially the overman (Mr. Ridley), and to the miners who were in the cross-cut when the gas was tapped, for the prompt and cool manner with which they dealt with the difficulty. For had they become confused in the face of such danger the results might have been serious indeed.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

No. 3.

Minute by The Minister for Mines.

THIS case proves the necessity of carrying out the provisions of the law with the utmost stringency, and it is my wish that in all cases it be done.

Referring to the very praiseworthy conduct of "Deputy" Ridley, through whose presence of mind and calmness in danger, loss of life was prevented, I wish a letter sent to him expressing my high sense of the service he has rendered to his fellow workers by his prompt action, and inform him that I shall when visiting the North during March, have the pleasure of presenting him on behalf of the Government, with a gold watch suitably inscribed as a memento of the affair.—F.A., 17/2/88.

No. 4.

The Under Secretary for Mines to Mr. T. Ridley.

Sir,

Department of Mines, Sydney, 20 February, 1888.

With reference to the recent occurrence of explosive gas in the workings of the South Waratah Colliery, I am directed by the Secretary for Mines to express to you his high sense of the service you rendered to your fellow workmen and to the public in general, by your praiseworthy conduct when by your presence of mind and prompt action, loss of life was doubtless prevented. Mr. Abigail also desires me to say that during his visit to the North in March next, he will do himself the pleasure of presenting you, on behalf of the Government, with a gold watch, suitably inscribed, as a memento of the circumstance.

I have, &c.,

HARRIE WOOD,
Under Secretary.

No. 5.

Mr. T. Ridley to The Under Secretary for Mines.

Sir, Waratah Colliery, Charlestown, *via* Newcastle, New South Wales, 27 February, 1888.

I beg to acknowledge the receipt of your communication under date, 20th February instant, I hardly need state that I was agreeably surprised to find that my conduct simply in the discharge of my duties in the capacity of overman at this colliery, should have been so favourably noticed by the Minister for Mines and yourself.

I shall be most happy to meet Mr. Abigail during his visit to this district.

I have, &c.,

THOMAS RIDLEY.

Submitted for the information of the Minister.—H.W., 29/2/88. Seen.—F.A., 1/3/88.

Send telegram to Examiner to get Mr. Ridley to be on the station when the train which leaves Sydney to-morrow afternoon at 4.45 passes, so that the Minister may then present him with a watch. The Minister cannot stay longer than the train waits.—H.W., 11/4/88.

No. 6.

Telegram from The Under Secretary for Mines to The Examiner of Coal-fields.

Department of Mines, Sydney, 11 April, 1888.

Be good enough to inform Mr. Thomas Ridley, the overman at the Waratah Colliery, that if he will be on the station when the train which leaves Sydney to-morrow afternoon at 4.45 passes, the Minister will present him with a watch. Mr. Abigail cannot stay longer than the train waits.

HARRIE WOOD,
Under Secretary.

No. 7.

N. Melville, Esq., M.P., to The Secretary for Mines.

Sir,

Newtown, 11 April, 1888.

I am compelled from facts which have come to my knowledge concerning the so-called bravery for which you have been induced to reward with a gold watch, "*re* gas in South Waratah mine," to request that you will cause a proper inquiry into all the facts to be held, and I am confident the opinion you have formed will be changed.

Any

Any way if one is to receive reward I am confident you will upon further inquiry be pleased to reward the other two men, who performed equally as dangerous work as the man you are about to reward. The whole circumstances are such as require a searching inquiry, and in the interests of all concerned such inquiry in my opinion should be held.

I am, &c.,

N. MELVILLE.

Inform Mr. Melville, M.P., that an inquiry will be held, and if it is found that the two men referred to are deserving of special recognition for services performed under the same circumstances as those from which Ridley is getting the present they will be dealt with in a manner equal to the occasion.—
F.A., 12/4/88.

No. 8.

The Under Secretary for Mines to N. Melville, Esq., M.P.

Sir,

Department of Mines, Sydney, 14 April, 1888.

In reply to your letter of the 11th instant, asking that an inquiry may be held to ascertain if there are not others equally entitled with overman, Thomas Ridley, to a reward for their behaviour when a rush of explosive gas was met with at the South Waratah Colliery.

I have the honor to inform you that the Secretary for Mines intends that an inquiry shall be held as requested, and if it is found that the services of the two men particularly brought under notice are deserving of special recognition their claims will be dealt with in a manner worthy of the occasion.

I have, &c.,

HARRIE WOOD,

Under Secretary.

No. 9.

Telegram from The Under Secretary for Mines to The Examiner of Coal-fields.

26 April, 1888.

I PURPOSE leaving here by Saturday morning's train for Newcastle to inquire into the merits of the claim set up on behalf of the two men in the South Waratah Colliery, and shall be glad of the assistance of Mr. Dixon and yourself. Will you please make such arrangements as will enable me to get through the inquiry on Monday.

HARRIE WOOD,

Under Secretary.

No. 10.

Report.

REPORT of inquiry into the circumstances connected with the influx of Explosive Gas into the South Waratah Colliery, in February last, with a view to place all the facts before the Minister.

Sir,

1 May, 1888.

Pursuant to your instructions, I proceeded on Saturday last to Newcastle, and upon my arrival there, at 3.30 o'clock p.m., I at once wrote to Messrs. Evans and Brown (and the two miners who bored through into the old drive whence the gas issued), inviting them to meet me at the South Waratah mine on Monday, the 30th April, at 10 o'clock in the morning, and to bring with them any persons who could furnish information as to what transpired in the mine when the influx of gas took place. I did not send any notice to Mr. Ridley, as I understood he would be on the mine.

On the Monday morning I went to the South Waratah mine, accompanied by the Examiner of Coal-fields and Mr. Winchester, of the Coal-fields Office. I there found Mr. Inspector Dixon, Mr. Hunter (the Manager of the colliery), Mr. Ridley, overman, and Messrs. O. H. Evans, Wm. Brown, and S. Eggington. There were also present Messrs. J. Firth and T. Kelly, the Chairman and Secretary of the South Waratah Miners' Lodge, and a gentleman representing the *Newcastle Morning Herald*, who asked if he would be at liberty to report the proceedings. I at once told him he was at liberty to take the fullest notes of the proceedings.

We then proceeded to the Company's office, which Mr. Hunter kindly placed at my disposal for the purpose.

Before the inquiry commenced Mr. Firth asked whether he and Mr. Kelly would be permitted to be present at the inquiry and to put questions to the witnesses. I replied that they might be present, but as they were not in that part of the mine at the time of the occurrence, I could not permit them to take part in the inquiry.

I commenced the proceedings by explaining that I had come there by direction of the Minister for Mines to inquire into the matter of a complaint concerning the presentation of a gold watch to Mr. Ridley for his presence of mind and bravery in connection with the recent influx of gas in the South Waratah mine. Representations had been made to the Minister either that Mr. Ridley was not entitled to reward, or that though he was so entitled, others had an equal or greater claim to recognition. The Minister was anxious to be put in possession of all the facts in the case. With a view to place those present in possession of the facts upon which the action of the Minister was primarily based, I informed them that I proposed to read the report furnished by Mr. Inspector Dixon on the subject, and I would then ask them if there was anything in that report to which they wished to take exception to point out what it was they objected to, and their reasons for objecting.

Mr. Evans asked whether he and the others who attended the inquiry with him in response to my invitation would be paid for the loss of their day's work. I replied that I could not promise them payment, but I would promise to recommend the Minister to pay the expenses of all witnesses who had chosen to attend the inquiry. In order to avoid having to refer back to this matter, I now recommend that Messrs. Evans, Brown, and Eggington be allowed the sum of £1 each for their attendance. (Approved.—F.A., 5/5/88.)

Having

Having read Mr. Dixon's report through to them, I, at the request of Mr. Evans, again read through that portion of the report which purports to give the information concerning the occurrence furnished by Mr. Ridley to Mr. Dixon, on the 9th February, the day on which the old drive was broken into, the sentences being taken *seriatim*. I allowed the fullest latitude to all the witnesses to make any statement or explanation, or furnish further information upon each point of interest, so that, after hearing what each person who was present had to say, and after making an inspection of that portion of the mine affected by the occurrence, I might be able to place before you a connected statement of what occurred, without troubling you with a repetition of those statements which have been very ably reported by the gentleman who represented the *Newcastle Morning Herald*. [Copy of newspaper herewith.] I have marked one paragraph, in which I am reported to have expressed an opinion upon the evidence. I fully intended, and thought I had strictly adhered to my intention, not to express any opinion at the inquiry.

See *Newcastle Herald*, 1st May, 1888.

It may perhaps be convenient for me, at this point, to explain that Messrs. Evans and Brown were present when Mr. Ridley furnished Mr. Inspector Dixon with the statement of what occurred on the morning of the 9th February, but they do not appear to have paid much attention to nor to recollect what was then said. Mr. Evans expressed himself as satisfied with Mr. Dixon's report, except that part of it which gives the substance of Mr. Ridley's statement.

The following is, as far as I can gather, a true statement of what occurred:—

On the morning of the 9th of February last, at about 7 o'clock, Evans and Brown commenced boring ahead of the cross-cut [the practice being to keep a borehole a certain number of feet (say 10) ahead of the working face, so that the cross-cut should not break through without warning into an old prospecting drive, which had been driven some years ago, and which was supposed to contain a very large quantity of inflammable gas, the intention being to plug the borehole as soon as it broke through, so as to regulate the influx of gas into the mine—that is to say, to allow it to come in in such quantities only as could be carried off through the return air-course without any risk of explosion. The men were working with locked Clanny lamps. The diameter of the bore was 2 inches.]

At about half-past seven o'clock the men in the cross-cut wished to see the overman, and sent for him. He came at their request.

[The reason for sending for the overman was that Mr. Evans wished to obtain permission to be absent from the mine, because, being Mayor of Adamstown at the time, he had to come to Sydney on municipal business, and he did not wish to be absent without leave. At the same time he spoke to Mr. Ridley about a dispute he and those working with him had with the hooker-on about going up the pit. The interview had nothing to do with the gas, because they had no idea of breaking through so soon.]

Mr. Ridley, having dealt with the matters referred to him, was about to leave the men, or was leaving them, when the drill broke through and the gas rushed in with great force and noise, throwing Brown down and extinguishing Evan's lamp. Ridley was also knocked down; he thinks by the pony that was in the cross-cut, and which was probably frightened by the noise. The wheeler (Eggington) ran to the entrance to the stables, where he had left a lamp. The overman says he at once gave orders to put out all lights. He knew there were three naked lights in the stables, and he shouted out for them to be put out. Evans says he did not hear any orders given, but they were all shouting as they came along the cross-cut, "Put out the lights." Eggington says he heard Ridley call out, "Put all lights out." Brown admits that Ridley did shout out, but he regards shouting out as something different from giving orders. The overman says he gave all orders except that as regards putting out the furnace fire. He acted upon the suggestion of Evans. Eggington admits hearing the overman order the lights to be put out at the pit bottom. Brown went to the pit bottom, and ordered all lights to be put out, and Evans went in the opposite direction, along the main road some 200 or 300 yards, knowing that wheelers would be likely to be coming from that direction with naked lights, and ordered them to put out their lights and to remain where they were till further orders reached them. He then returned to the cross-cut with a Clanny lamp, and found gas there which put out the lamp; this was three or four minutes after the holing through. The overman was then away. It appears that when Brown went to order the lights to be put out at the pit bottom the overman followed and went up the pit to get an improved Davey lamp that he had at his house. Evans, after the Clanny lamp was extinguished by the gas, also went up the pit to get another lamp, and while he was lighting it the overman came to the pit-top with two Davey lamps which he lighted from Evans' lamp. It was then that Evans suggested the extinguishing of the furnace fire, saying the gas was still blowing as hard as ever. The overman did not think there was any necessity to put out the furnace fire, but Evans said it was better to be safe than sorry. The overman then ordered it to be done. While at the pit-top the overman asked the surveyor to go to the pit-bottom and prevent anyone going into the mine. He ordered the engineer to blow a jet of steam down the Tangye pump, and he sent a message to Mr. Hunter, the Manager of the colliery. The overman reckons he might have been out of the mine on this occasion ten minutes. After Brown had told the men at the pit-bottom to put out their lights he returned to the cross-cut, but feeling cold (the upper part of his body being naked) he went back to the pit-bottom and procured a bag to put over him. He then returned to the cross-cut and sat down at the entrance some few minutes till the overman returned with the Davey lamp and tested the state of the cross-cut. The overman then told Brown to open the door through the stables, but he must not take a light. It was difficult to do this, as there were trucks standing in the way, but Brown said he would make his way through by counting the trucks, and the overman was to listen so that he might know by Brown's voice if anything happened. Brown succeeded in getting through and opened the door, thus a wider opening was made to carry off the gas from the cross-cut through the stables towards the upcast shaft. The overman then directed Brown to proceed along the main road towards the working places and order all the men to the bottom of the Flaggy Creek downcast shaft. When Brown reached the drivers, who were waiting in the main road at the point where Evans had ordered them to stop, he reckoned twenty minutes had elapsed from the time the bore holed through. Eggington, who was with the drivers when Brown reached them, reckoned it was from fifteen to twenty minutes.

When he consented, in compliance with Evans' suggestion to extinguish the furnace fire, he ordered two men to assist Evans in doing it, but Evans had reached the furnace with a tub of water ready to throw on the fire when they (the two men) arrived, and it was he who put out the fire. This probably was being done while the overman was testing the state of the cross-cut with the Davey lamp, and directing the door to be opened through the stables. After the overman had ordered the men from the working places to the bottom of the Flaggy Creek shaft he probably went up the pit again to procure an

anemometer with which to measure the air currents. He then found that though the furnace fire had been extinguished the ventilation had been restored by reason of the steam blown through the Tangye pump, the air current at that time being about 5,480 cubic feet per minute, and in about half-an-hour the whole of the gas was cleared away from the main road and nearly to the face of the cross-cut. Inspector Dixon made a careful inspection of the place shortly afterwards, and found gas still issuing from the bore, but no sound could be detected except a slight hissing. A deputy was putting up the part of the brattice which had been knocked down, and two miners were working in the face as usual.

In conclusion, I have the honor to state that, in reply to questions put by me, Mr. Hunter stated that no one had any authority to give orders in the mine except himself and Mr. Ridley. He also stated that, as the furnace was so situated as to act as a dumb-drift, there was no advantage from putting out the fire, but it was a wise precaution. Mr. Evans contended that if there had been a sufficient quantity of gas and they did not at the time know how long it would take to exhaust the supply it might have come in contact with a tongue of flame from the furnace-fire, and an explosion would have been the result. I attach hereto a plan and section, showing the relative positions of the several places referred to in this report, and also of the furnace. With reference to the final clause in Mr. Inspector Dixon's report, Mr. Evans made a statement—that, in his opinion, the whole of the six men who were engaged in driving the cross-cut should be recognized, as they had all worked with great care. I stated that I had only to inquire into what had occurred on the occasion of the influx of gas, and what was done by each of those then present. Mr. Firth stated that he and the secretary of the lodge were instructed to be present at the inquiry, to protest against the presentation of any reward to any person. Mr. Evans denied that the miners' lodge had given any such instructions. I informed Mr. Firth, in reply to his question, that I had no instruction to inquire whether the old drive should have been holed into while a number of men were working in the pit.

So far as I could learn, the men had taken no steps to call the attention of the officers of this Department to the danger of holing through into the old drive while a number of men were working in the mine, from which it may perhaps be inferred that they did not foresee any danger therefrom.

Trusting the information herein and herewith conveyed will enable you to arrive at a satisfactory conclusion upon the question at issue.

I have, &c.,
HARRIE WOOD,
Under Secretary.

No. 11.

Minute by The Minister.

7 May, 1888.

HAVING carefully read the report of the Under Secretary upon this case, I am confirmed in my previous opinion, that the men in the mine, at the time of the influx of explosive gas, acted under the orders of a firm and well-directed man, Mr. Ridley, and they deserved praise for the manner that they carried out his instructions; but no special features have been disclosed to warrant me in doing more than I have already done, nor is there anything shown to prove that the recommendation of Mr. Inspector Dixon, in reference to Overman Ridley's conduct, was wrong, or that he received what his conduct did not entitle him to. Mr. Wood's report proves, to my mind, that Ridley gave valuable instructions, and the manner the men carried them out deserves letters of praise and thanks, which may be sent to them.

The Under Secretary for Mines to Mr. O. H. Evans.

Sir,

Department of Mines, Sydney, 7 May, 1888.

I have the honor, by direction of the Secretary for Mines, to convey to you his thanks for the praiseworthy manner in which you acted at the time an influx of explosive gas was met with in the South Waratah Colliery, on the 9th February last, and to assure you that he fully appreciates the importance of the valuable service you rendered on that occasion.

I have, &c.,
HARRIE WOOD,
Under Secretary.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

WEST WALLSEND COLLIERY.

(REPORT IN CONNECTION WITH FATAL ACCIDENT TO EDWARD M'CARRAN.)

*Ordered by the Legislative Assembly to be printed, 29 May, 1888.**[Laid upon the Table of the Honorable the Legislative Assembly of New South Wales by the Secretary for Mines, a copy of the Report and Evidence in connection with the fatal accident to Edward M'Carran, at the West Wallsend Colliery.]*REPORT and Evidence *re* Fatal Accident to Edward M'Carran, at the West Wallsend Colliery.

Sir,

Glebeland, 26 March, 1888.

I regret to report a fatal accident by the breaking of a winding rope and falling of a loaded bucket, which happened to a sinker named Edward M'Carran, at the West Wallsend Coal Company's second shaft, on Thursday last, 22nd instant.

2. I was duly notified of the accident by the manager of the colliery, Mr. T. J. Evans, and also by the contractor, Mr. A. M'Kinnon, and on Friday evening, 23rd instant, I proceeded to the West Wallsend Colliery to investigate the matter.

3. The scene of the accident is a sinking pit known as the second or air shaft in connection with the West Wallsend Colliery.

This shaft is 10 feet in diameter, and about 450 feet in depth from the surface.

The present contractor, Mr. Alexander M'Kinnon, took the shaft after it had been sunk to the depth of about 50 feet from the surface, and from that depth has sunk it to its present depth.

The rope in use at the time of the accident was a $\frac{7}{8}$ -in. diameter best crucible steel, bought new from M'Brair, Osborne, & Co., Clarence-street, Sydney, and has been in use since October, 1887.

According to the tables given by G. M. Percy, Esq., in his first volume of *Mechanical Engineering*, page 72, the safe working load for a rope of this description is 2 tons 4 cwt., and as the breaking strain of steel wire ropes is usually taken at five times the safe working load, the breaking strain of this rope would be about 11 tons.

The bucket in use at the time of the accident was about 2½ feet in diameter and about the same depth.

The load would vary in weight according to the nature of the material placed in the bucket, and, in my opinion, would never reach beyond 20 cwt., including the weight of the bucket, which was made of iron. The iron capping or socket at the end of the rope embraces about 1 foot of the rope, and five iron rivets are passed through to secure the capping. This capping was put on when the rope was first brought into use and has never been changed.

The spot where the rope broke was close to the top of the socket, the outside wires parting about $\frac{1}{2}$ an inch below the top of the socket. According to sworn evidence the rope was examined twice every day by the banksmen's hands several times during each shift, in order to detect broken wires.

The point of fracture had apparently not been examined for some time, as the copper wire used for lapping the end of the rope inside of the socket had been carried up about 2 inches above the top of the socket, to act as a safeguard against anything that might come in contact with the rope at this point. There is no evidence to prove that the rope was ever found defective on examination by the persons in charge, and never any complaints made to the contractor concerning the rope in any particular.

4. At the inquest on Saturday last on the body of the deceased very conflicting evidence was given concerning something which took place with the rope about a month ago.

Thomas Walsh, one of the sinkers, gave evidence that a month ago on a Sunday night, just before the cradle was put into the shaft, in order to examine the sides, &c., he saw the rope examined at the same spot as it broke on Thursday last.

He

He stated that it had then got a kink in it, but the engineer looked at it before the men went down, and said it was perfectly safe. The chargeman of the shift also looked at it and said it was perfectly safe. He (Walsh) had never examined the rope himself, but had noticed the rope attached to the fallen bucket when it came down. It had parted where the brass lapping was on.

Thomas Taylor, who was chargeman of the shift on which Walsh worked, deposed as follows:— I have always been positive that the rope was sufficiently strong for the weight it would have to bear; it is the duty of the chargeman to put the cradle into the shaft every Sunday night, and examine the shaft through; never heard anyone say there was a kink in the rope, have never seen a kink in it; if there had been a kink it would certainly have been reported; every little thing wrong is reported by one chargeman to the other; never heard that the rope was examined on the relieving of the banksmen twice a day; I never complained about the rope, or else I should not have worked under the bucket.

Thomas Wilson deposed:—I am a banksman at the West Wallsend Colliery sinking pit; in examining the rope I never found any loose strands in it; have seen copper wire bound around the rope for 4 inches above the socket; the copper wire would have covered the fracture; on a Sunday night four weeks ago, saw a kink in the rope just at the top of the copper wire, about 4 inches from the socket; it was about a quarter kink, and a bucket about three parts full was attached to it then; drew Mr. Phillip Davey's attention to it, and he thoroughly examined the rope, and said that he could not see anything the matter with it; the kink straightened itself out with the next strain that went down; it was because the kink might weaken the rope that I drew the leader's attention to it; I believe I mentioned the circumstance to Mr. M'Kinnon, but could not be certain; never saw any broken wire where the kink was, although I have often examined it; would have at once known if it had been so; did not know what copper wire was there for, possibly as a guard; the rope is $\frac{7}{8}$ in. diameter; a rope like that if sound would carry 2 tons 4 cwt. as a safe working load; and the breaking strain would be about 11 tons; I have heard several passers-by remark that the wire rope was a very thin rope for working in a shaft hauling stuff; there is a steadying point in the shaft between 45 and 50 feet from the surface; the engine slowed gradually and was steady at 50 feet; if there had been any jerk, I would have known it at once; every care has been exercised in and around the shaft; in case of complaints, representations would be made to Phillip Davey, who should inform Mr. M'Kinnon; I cannot say if Davey reported the kink to Mr. M'Kinnon; it is usual to have copper wire round winding ropes, so as to stiffen the rope and prevent it wearing around the socket; the copper wire was not removed at the time the rope was examined with the kink in it.

Phillip Davey deposed:—I am master sinker at the West Wallsend Colliery; on Thursday morning last, on hearing of the accident I went down from the shaft; I found that five men were in the bottom of the pit; one man had his arm cut off, but the others were all right, except a bit excited; I took charge, and sent the men to the surface; I never saw a kink in the rope a month since, but the engine-driver told me on a Sunday night, about five weeks ago, that there was a twist; I examined the rope then, and did not see anything the matter with it; the engine-driver showed me that the twist was about 2 feet above the socket; there is a great difference between a twist and a kink; a twist would draw out, but a kink would leave a mark, or the rope would break; the copper wire was originally placed there to keep the rope together until the clasp was fastened on it, and it was left there; the rope has been scores of times through my hands, and I never had occasion to complain to Mr. M'Kinnon about it; I have been at the pit ever since it started; the rope has been there all that time, and nothing has been done to it in the way of repairs.

Alexander M'Kinnon deposed:—I am the contractor for the sinking of the West Wallsend air-shaft; I have been using the rope since October, 1887; it was then new; it was bought from M'Brair, Osborne, & Co., Clarence-street, Sydney; it was bought for a $\frac{7}{8}$ -in. diameter rope and is the best crucible steel wire; there was no guarantee given, but, from theory, a safe working load or carrying weight would be about 3 tons; the socket is the only one that has been put on the rope; the time mentioned is a short life for a rope of that sort; I never thought that there was any necessity for changing the socket; I have examined the rope thoroughly, and no kink could possibly be within 2 or 3 feet of a socket; any slack would not be in the rope, but in the chain below it, and immediately above the bucket.

5. At the time of the accident there were five sinkers in the bottom of the shaft, four of whom escaped uninjured, but the falling bucket caught the deceased on the right arm and right foot. The arm was completely severed from the body, at a point about 4 inches below the shoulder, and the right foot was completely smashed. The injured man was conveyed to the Newcastle Hospital, where operations were performed on the injured arm and foot. Being extremely weak from shock to system and loss of blood, the poor man lingered until 2 o'clock the following morning (Friday), when death terminated his sufferings. The deceased only commenced to work in the pit for the first time at 7 o'clock on the morning of the accident.

6. The District Coroner, G. C. Martin, Esq., J.P., held an inquest on the body of deceased, at the "Naval Brigade Hotel," Watt-street, Newcastle, on Saturday afternoon, 24th instant. I attended the inquest, and heard all the evidence, and also had produced the broken ends of the rope, so that nothing might be kept back from the jury. The fullest evidence was elicited, and, after due deliberation, the following verdict was returned:—"We find that the said Edward M'Carran, at West Wallsend, in the district of Newcastle, in the Colony of New South Wales, on the 22nd day of March, 1888, was, whilst working in the shaft at the West Wallsend Mine, struck down by a bucket falling down the shaft through the rope breaking, and was seriously injured. We further find that the said Edward M'Carran was taken to the Newcastle Hospital, in the said district and Colony aforesaid, and died there on the 23rd day of March instant, from the said injuries; we are of opinion that the injuries were purely accidentally caused."

7. In conclusion the above verdict appears to exonerate all persons from blame in this matter, and so far as anything like criminal neglect is concerned, I fully agree with it, as, in my opinion, the 49th special rule of the West Wallsend Colliery has been strictly observed, inasmuch as the rope has been examined most carefully, even twice during the day. At the same time I am of opinion that the accident was caused by the rope being defective near the top of the capping where it was hidden from view by the capping and that a withering process had been acting on the enclosed wires for some time prior to the accident. This weakening of the wires was doubtless due to the fact that this position of the rope would

be subject to damp when near the pit bottom, and then to heat when at the surface in the day-time. The corrosion had evidently worked from centre to circumference until the point of weakening was reached when the usual working load could no longer be sustained. From the appearance of the outside wires I am not prepared to say that the full defect would have been made manifest even on the removal of the capping, unless the rope had been stripped to the core. However, the recapping of a rope is a matter left to the exercise of judgment, for even the best English authorities cannot lay down a hard and fast law for it. To sum up the matter, had the judgment of Mr. M'Kinnon, contractor, led him to suspect that the rope was defective inside of the socket, and had such suspicion led him to have the rope cut and recapped, in my opinion the accident would not have occurred.

I herewith forward the evidence taken at the inquest on Saturday last.

I have, &c.,
JOHN DIXON,
Inspector of Collieries.

[Enclosure.]

EVIDENCE taken at the inquest on the body of Edward M'Carran, on Saturday, 25th March, 1888.

Thomas Walsh deposed:—I am a miner and live at Wallsend; I am a married man; on Thursday morning last, the 22nd day of March instant; the deceased M'Carran and I went to the West Wallsend pit at about 7 o'clock; we went to work at boring and fired three shots, and then came to the top; we then returned down the shaft to fill the broken rock into the iron bucket; the first one went up, which was filled up to the top, and we heard stones falling in the shaft during the passage of the bucket up the shaft; I heard the bucket strike the side of the shaft, and heard it coming down; the next I heard was M'Carran calling, saying, "Tom, the bucket is on my leg;" I went towards where he was singing out in the dark; I got to him; a man named Taylor sang out for a light, and M'Carran said, "I have got some matches in my pocket, I will give you some;" he put his hand towards his pocket and said, "I have got no hand, you (meaning Taylor) put your hand in my pocket and take the matches out;" the matches were damp and we could not get a light; I was holding M'Carran in my arms and he called out for his mother; then some one helped to get M'Carran to the top of the pit; he was taken on a door to the public-house; a doctor was sent for, and a conveyance was procured to take him to Newcastle; he was about an hour lying at the public-house; some doctor from Miami was attending on him, and ordered his removal to the Newcastle Hospital; Thomas Taylor was the master-sinker in charge, and was down the pit at the time the accident occurred, and there was a man named Tom in charge of the bank at the top of the pit when we were lowered down the shaft; there were five of us down the shaft at the time of the accident; there are no printed rules for working in the shaft; I have never seen any; I have only been working in the shaft about seven weeks, and have only recognized Taylor as my boss; I have thought that the bucket alone was heavy for the rope that carried it, and about a month ago I saw the rope examined at the same spot where it broke last Thursday; it had then got a kink in it; but the engineer looked at it before the men went down, and said it was quite safe; the boss sinker was there at this time; he went and looked at the rope and said it was quite safe; about the time of the accident we were filling another bucket for the next turn of hauling, and we were all working close by it filling it up; the bucket in falling came down on the bucket at the bottom of the shaft and broke it; I do not know what it was that struck M'Carran; I do not know what occurred till I heard M'Carran crying out.

By Mr. Dixon: I am a miner, and have worked at sinking previously, and have had a lot of experience at sinking; I believe the rope, which is a wire rope, is about an inch and a half in diameter; I do not know what a steel wire rope that size would carry; I think the bucket and contents would weigh with rock about 15 cwt., but the fine cement stuff would weigh very likely about 20 cwt.; I never saw such large buckets where I have worked before; five or six men could sit in them comfortably; I have known the deceased about seven years; the accident occurred at the deceased first shift in the mine that morning; I have never examined the rope myself; I only noticed the lapping of some brass wire round the steel wire where the splice is and where it is joined next to the chain.

By Jury: I noticed the rope that was on the fallen bucket, and saw that it had parted where the brass wire lapping was on; the body just viewed by the Jury is that of my late mate, Edward M'Carran, who worked with me in the West Wallsend pit.

John Brady Nash, being duly sworn, states:—I am a legally qualified medical practitioner, residing at Wallsend; upon Thursday morning last, the 22nd March, about 11 o'clock, I saw lying in a back room, at the hotel at West Maitland, a man named Edward M'Carran; I examined him, and found that his right arm had been taken off about 4 inches below the shoulder; his right foot was also injured; the bleeding had been stopped by bandages applied above the injuries, and the injured part had been bandaged; I applied fresh compressors above the injured part, and advised that the man should be removed at once to the Newcastle Hospital; I met him at Wallsend and brought him in the tram to the Newcastle Hospital; upon consultation there with Drs. Morgan, Stapleton, Bonnefin, and Kerr, it was found necessary to amputate the arm above the seat of injury, and remove a portion of the foot; this was done, but the shock was so great that I did not then think it probable that he would recover; he died at 2 o'clock yesterday (Friday) morning in the Newcastle Hospital; the cause of death, in my opinion, was shock to the system, as the result of the injuries.

Thomas Taylor, being duly sworn, states:—I am a sinker, and live at West Wallsend; I had charge of the shift at the time of the accident, and I knew E. M'Carran; the body viewed by the Jury this day at the mortuary at the Newcastle Hospital is that of Edward M'Carran; on Thursday morning last, about 9:30, I had with me Samuel Longshaw, Thomas Jones, Thomas Welsh, and M'Carran at the bottom of the shaft; I heard a noise and I sang out "Look out, the bucket is coming"; I heard, after the bucket had fallen, M'Carran sing out "Tom, lift the bucket off;" I lifted the bucket off him; we were all in the dark, so I could not say where the bucket was on him; I caught hold of him and found that one of his arms was off.

By Mr. Dixon: The depth of the shaft is about 450 feet, and the diameter is 10 feet; I have been working there six months; the shaft was about 40 or 50 feet down when I commenced working; I have been in charge of the shift about three months; my duties as chargeman were to look after the shaft from top to bottom; I had nothing to do with the rope; it was not my duty to examine the rope; I have sunk at both Big Redhead and Burwood before I went to West Wallsend, and have been working at rock ever since I was 12 years old; I do not know the measurements of the buckets we were using, but I think they would be about 2 feet 6 inches across and about the same depth; those are not the largest buckets I have seen used in sinking; I cannot give any idea what these buckets would hold, but I should say about 12 or 15 cwt.; it never occurred to me that these buckets were too large for the rope; I am positive that I considered the rope sufficiently strong for the weight it would have to bear; it is the duty of the chargeman and his mate to put the cradle in the pit every Sunday night, and examine the shaft through; I never heard anyone say that there was a kink in the wire rope; I have never seen a kink in it; had there been any kink in the rope, or had anybody seen it, it would have been reported; I never heard any remarks made that the rope was unsafe; I have seen the rope examined on the relieving of shifts twice a day; I get my orders direct from Mr. M'Kinnon, the contractor.

By Coroner: There are no printed rules in circulation for sinking the shafts; the men are not cautioned about any particular danger in the shaft; the chargeman is supposed to look after the men in the bottom; there are no sinking helmets used in the shaft; at certain portions the shaft is bricked, that is where it is dangerous; according to my opinion it is not a wet shaft; since I have been working there, on one occasion only a plug of dynamite dropped out of the chargeman's hand in the bottom of the shaft; no accident has occurred that I know of.

By Jury: When I saw the broken rope it was at the top of the shaft; it was broken at the socket; it was a $\frac{7}{8}$ -inch rope, I believe, in diameter.

By Mr. M'Kinnon: I never had any complaint to make of the rope.

Thomas Wilson deposed:—I am banksman at the West Wallsend Company's shaft, and reside at West Wallsend; I was at the top of the shaft about 10 minutes to 9 o'clock on Thursday morning last, when a loaded bucket was coming up the shaft; the bucket was about 20 or 30 feet from the top; I was in readiness to receive the bucket had it got to the top; I was looking at the bucket, and saw it was quite steady, and all at once, the rope broke; it broke just inside the shackle; I stepped back, and called out for help, and help came, and some one shouted down the shaft, "Are you all right?" the leader

leader of the shift sang out from the bottom of the shaft, "Yes;" I then came away, and with assistance got the rope over the pulley-wheel, and then lashed another bucket on to the rope, and two men got into the bucket, and went down the shaft to the men's assistance. The first men to come up were Robert M'Dowal and the deceased; M'Carran, when he got to the top, spoke, and was conscious, but seemed very faint; I noticed that his right arm was off, also his right foot smashed, and he was then taken away.

By Mr. Dixon: My duties as banksman were to use every care at the top, and to see that no man went down drunk; at the relieving time my mate and I examined the rope alternately; if I saw links in the chain turned during the day, I would examine it and put things right; I never found a loose strand in the wire rope; I have seen copper wire bound round the rope close to the socket; this copper wire would have covered the fracture; my shift is on a Sunday night, and four weeks ago I saw a kink in the rope just at the top of the copper wire, about 4 inches from the socket; it was about a quarter kink, and a bucket, about three parts full of water, was hauled up whilst this kink was in the rope; I drew Philip Davey's attention to it, and he thoroughly examined the rope, and said that he could not see anything the matter with it; he examined it closely with a penknife as well; the kink straightened itself with the next weight that went down; I thought that this kink would tend to weaken the rope, so I drew the boss' attention to it; I believe I mentioned the circumstance to Mr. M'Kinnon; I have never seen one broken wire where the kink occurred, though I have examined the rope often since; I cannot say how long the rope has been in use; I have been only at the mine about ten or eleven weeks; I do not know for what reason the copper wire was put on the steel wire; the wire rope is $\frac{3}{4}$ of an inch in diameter; a rope like that, if sound, would carry 2 tons 4 cwt. as a safe working load; the breaking strain would be about 11 tons; I have heard several passers-by remark that the wire rope was a very thin rope for working in a shaft hauling stuff; there is a steady point in the shaft between 45 and 50 feet from the surface; the engine slowed gradually, and was steady at 50 feet; if there had been any jerk I would have known it at once; every care has been exercised in and around the shaft.

By Coroner: In case of any complaints representations would be made to Phillip Davey, who should inform Mr. M'Kinnon; Thomas Taylor was in charge of the shift at the time of the accident; he is a perfectly sober and careful man, and an experienced sinker; I cannot say if he knew about a kink in the rope a month before; cannot say whether Davey reported the kink to M'Kinnon.

By a Juror: It is usual to have copper wire round winding ropes, so as to stiffen the rope and prevent it wearing round the socket; the copper wire was not removed at the time the rope was examined with the kink in it.

Phillip Davey deposed:—I am master sinker at the West Wallsend Colliery; on Thursday last in the morning about 9 o'clock, on hearing of the accident, I went down the pit-shaft; I found that five men were in the bottom of the pit, &c.

[Please see Report for remainder of this evidence, and also that of Mr. M'Kinnon.]

This is a fatal accident which happened to a sinker at the West Wallsend Company's sinking shaft. Mr. Inspector Dixon agrees with the verdict, that the injuries were purely accidentally caused; but is of opinion that if the rope had been cut and recapped the accident would not have occurred. Therefore, if the copper wire had been removed when Thomas Wilson (the banksman) drew Davey's attention to the "kink" in the rope, one month prior to the accident, the necessity of having the defective portion of it cut off and the sound portion resocketed and capped would have been found out, and it is to be regretted that this was not done. This is, I believe, the first accident of the kind which has happened at any of the New South Wales collieries. I have to-day had an interview with Mr. Inspector Dixon, respecting it, and propose to recommend all future special sinking rules submitted for approval, that the rope used in any sinking shaft shall be recapped every three months. Dr. Robertson, the Company's consulting viewer, might perhaps be written to, suggesting that this be done in future.—J.M., 21/4/88.

The Under Secretary for Mines.—B.C., 21/4/88. Submitted.—H.W., 26/4/88. Approved.—F.A., 26/4/88.

The Under Secretary for Mines to Dr. J. R. M. Robertson.

Sir,

Department of Mines, Sydney, 5 May, 1888.

With reference to the fatal accident to Edward M'Carran, through the breaking of a winding rope at the West Wallsend Coal Company's second shaft, on the 22nd March last, I am directed by the Secretary for Mines to suggest to you the advisableness of instructions being given for such winding rope to be cut and recapped every three months.

I have, &c.,

HARRIE WOOD,
Under Secretary.

Dr. J. R. M. Robertson to The Under Secretary for Mines.

Sir,

97, Pitt-street, Sydney, 8 May, 1888.

I have the honor to acknowledge receipt of your favour, of 5th instant, only delivered this afternoon, re accident at West Wallsend.

The accident occurred to the employé of a contractor to the Company, who also provided all plant, tools, and materials, and who was in no way under my supervision or the Manager.

The colliery ropes are inspected daily, and will be carefully attended to.

The necessity for recapping every three months may be too arbitrary a rule to follow; but, as the shaft has now been completed, the practice suggested need not be discussed.

I have, however, enclosed your favour to the Manager, who, being an experienced and careful man, will give due effect to its contents.

Yours, &c.,

JAMES R. M. ROBERTSON.

Submitted for the information of the Minister.—H.W., 17/5/88. Seen.—F.A., 18/5/88.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MINERAL LANDS HELD BY MR. GARRETT, SECRETARY
FOR LANDS.
(RETURN SHOWING.)

Ordered by the Legislative Assembly to be printed, 10 July, 1888.

[Laid upon the Table of the Honorable the Legislative Assembly of New South Wales by the Secretary for Mines (in reply to a Question of Mr. McElhone, dated 26 June), a Return showing Coal or other Mineral Lands held by Mr. Garrett.]

SECTION 28, MINING ACT 1874.

Authority No. 104—THOMAS GARRETT.—Part of South Pacific Ocean, off Stockton, county Gloucester, 880 acres; date of authority, 8 March, 1878; granted by Hon. W. H. Sutor.

No rent is payable under this authority, but royalty at 6d. per ton is reserved in respect of coal raised. No royalty has yet been paid. An application has been made to convert the authority into a mineral lease. Not yet finally dealt with. Permission has also been given to work the area in connection with the Stockton Coal Company's mine.

Authority 356—HARRY FRANCK AND THOMAS GARRETT.—Part of South Pacific Ocean, off Nobby's; 2,513 acres; date of authority, 21 December, 1886; granted by Hon. James Fletcher.

Rent is payable at 1s. per acre—£125 13s. per annum—and a royalty at 6d. per ton is reserved. Rent has been paid to 31 March last. £160 16s. 5d. has been paid as rent.

Authority 361—THOMAS GARRETT.—Part of South Pacific Ocean, off Stockton Point; 40 acres 1 rood 24 perches; date of authority, 25 February, 1887; granted by Hon. Francis Abigail.

Rent is payable at 1s. per acre per annum, being £2 1s. per annum. Royalty, at the rate of 6d. per ton, is reserved on coal raised. Rent has been paid to 30 June instant = £2 15s. 3d. has been paid. An application has also been lodged by Mr. Garrett for a mineral lease of this area. Application 87-16, Newcastle, not yet approved.

Authority 370—THOMAS GARRETT.—Part of South Pacific Ocean, off Stockton; 640 acres; date of authority, 28 February, 1887; granted by Hon. Francis Abigail.

Rent is payable at 1s. per acre, being £32 per annum. Royalty, at the rate of 6d. per ton, is reserved on coal raised. Rent paid to 30th instant = £42 15s. paid. An application has also been lodged by Mr. Garrett for a mineral lease of this area. Application 87-15, Newcastle, not yet approved.

UNDER 48 VIC. No. 10.

Mineral Lease 326—THOMAS GARRETT.—County Cook, parish Blackheath; date of lease, 3 January, 1888; granted by Hon. Francis Abigail.

Rent is payable at 2s. per acre, being £248 per annum. Royalty at the rate of 6d. per ton on coal raised. Rent paid to 2 January, 1889. Area, 2,180 acres.

1887-8.

No. 1.

Mr. Inspector Bates to The Examiner of Coal-fields.

Wallsend Colliery Inspection—Main Tunnel Workings.

Sir,

Newcastle, 5 November, 1887.

I have the honor to report having inspected the above colliery on 24th and 27th October and 3rd and 4th November.

Maddison's district, No. 1 split.—The intake current of air registered 9,360 cubic feet per minute for 68 men, 4 boys, and 3 horses; total, 75; giving an average of 124 cubic feet per minute.

No. 2 split.—The intake current of air registered 5,720 cubic feet per minute for 52 men, 3 boys, and 2 horses; total, 57; giving an average of 100 cubic feet per minute.

No. 3 split.—The intake current of air registered 11,700 cubic feet per minute for 70 men, 9 boys, and 5 horses; total, 84; giving an average of 139 cubic feet per minute.

Swamp Oak District.—The intake current of air registered 9,000 cubic feet per minute for 68 men, 9 boys, and 5 horses; total, 82; giving an average of 109 cubic feet per minute.

Bosfield's District, No. 1 split.—The intake current of air registered 7,920 cubic feet per minute for 54 men, 6 boys, and 2 horses; total, 62; giving an average of 127 cubic feet per minute.

No. 2 split.—The intake current of air registered 10,260 cubic feet per minute for 72 men, 5 boys, and 5 horses; total, 82; giving an average of 125 cubic feet per minute.

No. 3 split.—The intake current of air registered 10,250 cubic feet per minute for 68 men, 8 boys, and 6 horses; total, 82; giving an average of 125 cubic feet per minute.

I examined the cross-cuts carefully, but could find no trace of fire-damp. The brattice in each heading was carried close up to the working face, and there was a good current of air travelling in each place.

A new shaft called the Jubilee Pit has been sunk for ventilating the above district. This pit is situated about a mile south of Wallsend Station, and is 296 feet in depth and 16 feet 6 inches in diameter. Headings are being driven from this pit to connect with the cross-cuts in Bosfield's district, and a considerable quantity of fire-damp is given off.

In one of the headings which is stopped, and which has been driven in about 12 yards, and is 6 feet high and 6 feet wide, the gas would ignite in a Davy lamp 2 feet 6 inches from the roof, and tailed off to nothing in a distance of 10 yards. When the whole of the air current was turned into this heading the gas was removed in about five minutes, but would accumulate quickly. This heading is fenced off and a danger notice-board put up to warn men from entering. The men working in the other headings were using Mouseler safety-lamps.

A small fan is attached to the winding-engine, and the air carried down the shaft by means of pipes; these are conducted up to the face of the working headings, to ventilate them and keep them free from gas.

A communication between this shaft and the workings of Bosfield's district in the main tunnel is expected to be made in about a month from the date of this report.

It is the intention to erect a large fan to ventilate the district connected with this shaft.

The wheeling and travelling roads were in good condition, and there was a plentiful supply of timber on the various flats.

I have, &c.,

THOS. L. BATES,

Inspector of Collieries.

Seen.—J.D., 7/11/87. The Examiner of Coal-fields, 23/11/87. Seen. The manager appears to be taking all necessary precautions for the safety of the men working in the headings where a considerable quantity of gas has been found.—J.M., 24/11/87. Under Secretary for Mines, B.C., 24/11/87. Submitted.—H.W., 8/12/87. Approved.—F.A., 9/12/87.

No. 2.

The Examiner of Coal-fields to Mr. Inspector Bates.

Sir,

Coal-fields Office, Newcastle, 3 January, 1888.

Referring to your reports on the explosive gas (carburetted hydrogen) found at and near the Newcastle-Wallsend Company's new winning at the Jubilee shaft, I beg to request that you will inform me whether the air fouled by the carburetted hydrogen gas from the heading or headings from which it exudes is sent direct into the return air-way, or is circulating past the working faces of bords, &c., where men are working with naked lights.

Also, whether any shots were fired where the gas existed, and the workmen were permitted to take into the district matches, tobacco and pipes, and to smoke.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

No. 3.

Mr. Inspector Bates to The Examiner of Coal-fields.

Wallsend Colliery.

Sir,

Newcastle, 4 January, 1888.

In reply to your letter of 3rd January, I have the honor to state that the intake air from the Jubilee shaft passes over feeders of gas in the floor of the heading, and then airs a number of bords where men are working with naked lights before reaching the furnace.

In places where the men work with safety-lamps they are cautioned not to take pipes or matches with them, and are required to leave them outside the danger-board.

When safety-lamps were in use I believe shots were fired by the deputy after examination of the place.

I have, &c.,

THOS. L. BATES,

Inspector of Collieries.

No. 4.

The Examiner of Coal-fields to Mr. Inspector Dixon.

Sir,

Coal-fields Office, Newcastle, 6 January, 1888.

Referring to my telegram of the 4th instant, desiring you to accompany me to the Newcastle-Wallsend Colliery, on the 5th idem, and the examination made by us of the Jubilee gassy district, I now beg to request that, in accordance with the provisions of the 25th section of the Coal-mines Regulation Act, 1876, you (the Inspector) will to-day notify Mr. J. Y. Neilson, the Company's colliery manager, that in view of the liability of a larger outburst of inflammable gas occurring at any time, we consider

consider it a dangerous practice for ninety-eight (98) miners to be working with naked lights in the Jubilee shaft gassy district, where we found inflammable gas very freely exuding from numerous blowers in the floor of the Jubilee headings, and where the current of air, after being fouled, is used by about sixty-eight men in one split, and thirty men working in bords, &c., in another split.

2. You should also draw his attention to the dangerous practice of having only a single trap-door in the main heading, and to the narrow bord, 36 feet in length, 6 feet wide, and 5 feet 9 inches high, at the bottom of the Jubilee down-cast shaft, where the air, being stagnant, contains a permanent reservoir of explosive gas.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 5.

Mr. Inspector Dixon to J. Y. Neilson, Esq.

Sir,

Glebeland, 6 January, 1888.

Yesterday (Thursday), accompanied by Mr. J. Mackenzie, Examiner of Coal-fields, I carefully inspected the workings in the vicinity of the Jubilee shaft in connection with the Newcastle-Wallsend Coal Company's Colliery, and found inflammable gas very freely exuding from numerous blowers in the floor of the Jubilee headings. Also in the narrow bord, 36 feet in length, 6 feet wide, and 5 feet 9 inches high, near the shaft bottom, inflammable gas could be detected in the Davy lamp 9 inches from the roof at a point 7 yards from the face, and 2 feet 4 inches from the roof 5 yards from the face, and 3 feet 5 inches from the roof at the face.

2. Having by such inspection proved beyond a doubt that inflammable gas was being engendered in the abovenamed places, and in view of the liability of a large outburst of inflammable gas occurring at any time, I hereby, in accordance with the provisions contained in the 25th section of the Coal-mines Regulation Act, 1876, give you notice that in my opinion it is a dangerous practice to allow the air current from the Jubilee shaft to ventilate one split of about sixty-eight men and another split of about thirty men, all working with naked lights, after such current of air has coursed through the Jubilee headings, where the gas is exuding.

3. I would also draw attention to the practice of having only a single trap-door on the main road between the Jubilee headings, where, in my opinion, two doors are necessary.

4. I have therefore to urge your serious and immediate attention to the above-mentioned matters, with a view to having them remedied as speedily as possible.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

Forwarded for the information of the Honorable the Secretary for Mines.—J.M., 7/1/88.
Under Secretary for Mines, B.C., 7/1/88.

No. 6.

Mr. Inspector Dixon to The Examiner of Coal-fields.

Sir,

Glebeland, 6 January, 1888.

Re our inspection of the Jubilee headings in the Newcastle-Wallsend Company's Colliery yesterday (Thursday), where we found inflammable gas very freely exuding from numerous blowers in the floor of said headings, and a current of air passing over the blowers and carrying the gas into two splits or districts where persons were employed with naked lights, and being of opinion that such was a dangerous practice, I have the honor to state that I have this day (Friday) served the manager (Mr. J. Y. Neilson) with notice, in accordance with the provisions of the 25th section of the Coal-mines Regulation Act, 1876, with a request that the matter be remedied as soon as possible.

I herewith beg to forward copy of notice.

I have, &c.,

JOHN DIXON,
Inspector of Collieries.

No. 7.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 6 January, 1888.

Herewith I have the honor to forward you, for the Minister's information, a copy of letters written by me to Mr. Inspectors Bates and Dixon with respect to a dangerous practice I find is adopted at the Newcastle-Wallsend Colliery by Mr. J. Y. Neilson, the Company's colliery manager.

2. Accompanied by Mr. Inspector Dixon, I made an examination of the Wallsend Company's Jubilee gassy district yesterday, and have to-day wired Inspector Rowan to be here Sunday morning, so that he may go to the colliery on Monday morning next and report to me whether he considers that there is a larger quantity of inflammable gas being discharged from blowers, &c., than there was when he made his inspections of the Bulli mine, after the new furnace was at work at Bulli, and at the time of the Bulli disaster.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

P.S.—I am preparing a report and plan showing the method of ventilation, &c., and will forward it to you after Mr. Rowan has visited the mine.—J.M.

No. 8.

The Examiner of Coal-fields to Mr. Inspector Rowan.

Sir,

Coal-fields Office, Newcastle, 9 January, 1888.

I wish you to go to the Jubilee gassy district (Bosfield's) at the Newcastle-Wallsend Colliery to-day, and make me a full and careful report on the method of ventilation, the number of blowers and quantity of explosive gas in those headings, the narrow bord, and in the two splits—one called No. 3, in which there are sixty-eight men and three boys working with naked lights, and three horses; and the other, No. 4, in which there are thirty men and four boys working with naked lights, and four horses.

2. The quantity of air supplied to the men, boys, and horses in each split, stating whether it is fouled with inflammable gas, the date of sinking of the Jubilee shaft to the bottom of the sump, the date when the Jubilee headings were put through to the cross-cuts driven from the main heading, the system of ventilation adopted after the headings were so cut through (showing same on a tracing of the workings), and the date of the present system of ventilation (showing the same also on a tracing of the workings).

3. Where explosive gas was first met with in the main heading, and quantity thereof in other places in Bosfield's district.

Also whether any shots were fired where gas existed, who they were fired by, what tamping was used, and show on tracings where the men worked with naked lights since the Jubilee headings were put through to the cross-cuts driven from the main heading.

4. And lastly, I wish to be informed whether you are of opinion that there is or has been less or more explosive gas discharged from blowers, &c., in the Jubilee headings, narrow bords, and other parts of Bosfield's district than there was in the Bulli mine previous to or at the time of the Bulli disaster.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

P.S.—Also report as to whether there was a trapper boy at the door between the Jubilee headings and at other single or double doors.—J. M.

Forwarded for the information of the Honorable the Secretary for Mines.—J.M., 9/1/88. The Under Secretary for Mines, B.C., 9/1/88.

No. 9.

The Examiner of Coal-fields to Mr. Inspector Bates.

Sir,

Coal-fields Office, Newcastle, 9 January, 1888.

Mr. Rowan, Inspector of Colliceries, is going to the Jubilee gassy district of the Newcastle-Wallsend Colliery to-day, and I have to request that you will accompany him, and assist to obtain the information I have desired him to report upon.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

Forwarded for the information of the Honorable the Secretary for Mines.—J.M., 9/1/88. Under Secretary for Mines, B.C., 9/1/88.

No. 10.

Report by Mr. Inspector Rowan.

Method of ventilation, &c., Wallsend Coal Company's Colliery.

Sir,

Newcastle, 12 January, 1888.

Referring to your telegram of the 7th and letter of the 9th instant, requesting me to make a full and careful report on the method of ventilation, the number of "blowers," and quantity of explosive gas in the Newcastle-Wallsend Coal Company's colliery, Jubilee shaft narrow headings, Bosfield's district.

In compliance with the above, I have the honor to state that, accompanied by Mr. Inspector Bates and Mr. Bosfield, overman, I inspected the Jubilee shaft narrow headings on the 9th and 11th instant, also Nos. 3 and 4 divisions of working.

I tested the air current at the intake about 3 chains from the bottom of the shaft, and got a register of 11,780 cubic feet of air per minute. This current is split into two divisions by means of a regulating canvas stopping. [See plan lettered A.] I tested the air current for the No. 3 split, and got a register of 6,600 cubic feet of air. This No. 3 current is conducted by a single door (at which door there is no trapper stationed) into the main front and back headings [see red arrows on plan], where four men are working, then travels on to where sixty-four men, five boys, and five horses are employed, after which it enters the return to the furnace. In the No. 4 split there are thirty men, two boys, and two horses, and served with 6,500 cubic feet of air per minute. [See direction of air current, indicated by blue arrows.]

I examined the Jubilee narrow headings and found seventeen blowers which were generating fire-damp (hydrogen gas). [See plan from No. 1 to 12.] No. 1 blower was distinctly heard humming at a distance of 22 yards; the other blowers could be heard, more or less, at distances from 5 to 10 yards off. You will see from plan that the air currents which supply the Nos. 3 and 4 districts are passed over the blowers referred to, and consequently are mixed with inflammable gas.

The narrow bord broken off the Jubilee shaft, I found, was driven a distance of 10 yards, 6 feet wide and 4 feet 10 inches high. I examined this bord with a safety-lamp. I found 2 feet 10 inches of gas (fire-damp) from the roof at the face, tapering out to a feather edge at the shaft.

Mr. Bosfield (overman) informed me gas (fire-damp) was first met with in the main heading [see plan lettered B] at fault, but was only seen in very small quantities, and could only be detected by holding the naked light to the face when a facing was stripped, and then it only ignited, and went out in the shape of a small "fluff."

I inquired of the manager, Mr. Neilson, what method the men used in firing shots during the time that the Jubilee narrow headings were being driven. He stated that the shots were fired by the deputy before the connection was made in the cross-cut to the men who were driving the headings from the shaft, but the men driving the headings from the main road fired their own shots. They were good men. He did not know what they tamped the shots with, but he knew that the brattice was kept up to within a short distance from the working place.

The quantity of explosive gas (carburetted hydrogen) is much greater in the Jubilee shaft narrow headings than ever I saw in the Bulli Colliery, previous to or since the disaster.

In reply to your memo. of to-day, the 12th instant, I beg to state that the first blower is about 44 yards from the Jubilee shaft, and the distance from the first to the twelfth blower inclusive is about 180 yards.

A danger-board is fixed at a distance of about 40 yards from the bottom of the shaft.

A fireman's caution-board is placed at the entrance of the narrow headings, near the door dividing the Nos. 3 and 4 splits of air from the Jubilee shaft. A caution-board is also affixed where the heading holed into the narrow bords in Cockroach district, as shown on plan.

I have, &c.,

JAMES ROWAN,

Inspector of Collieries.

EXTRACTS from Report Book kept in the Newcastle-Wallsend Coal Company's Office.

18th November, 1882.—Holed into two old narrow bords and found a large quantity of gas.—T. BOSFIELD.

Special report.—I visited Bosfield's district, found cross-cut just holed into old narrow bord, and discovered a quantity of standing gas; ordered all naked lights to be extinguished, and took the necessary steps to remove the gas.—J. Y. NEILSON, 18 November, 1882.

Friday, 18th November, 1882.—Holed into Moses Owen's narrow bords, and found they contained about 30 yards of gas each. Mr. Neilson also visited the place and ordered all work to be suspended. On Friday night I took men in at 12 o'clock, with brattice; cleared both places. Have visited the places Monday, 21st instant, and find them quite clear, with a good current of air travelling.—T. BOSFIELD.

25th November, 1882.—Holed into Jubilee shaft and found a small quantity of gas.—T. BOSFIELD.

No. 11.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 13 January, 1888.

I have the honor to forward, for the information of the Honorable the Secretary for Mines, the report I have received from Mr. Inspector Rowan, dated the 12th instant, which he has made at my request for the purpose of ascertaining his opinion as to whether there is or has been more explosive gas discharged from blowers, &c., in Jubilee headings narrow bord and other portions of Bosfield's district, in the Newcastle-Wallsend Coal Company's mine, than there was at Bulli previous to or at the time of the Bulli disaster, Mr. J. Y. Neilson having been one of the Royal Commissioners who reported on the Bulli Colliery accident, and consequently one who so very strongly condemned the system of ventilation in vogue at the Bulli mine prior to the disaster, and especially in allowing an air current fouled with minute quantities of explosive gas to pass on to men and boys working with naked lights, and also the practice of having single doors instead of double doors, and not withdrawing the men from the mine before shots were fired.

2. From Mr. Rowan's report it will be seen,—

- (1.) That the quantity of explosive gas in the Jubilee shaft narrow headings is much greater than ever he saw in the Bulli mine.
- (2.) That on his inspection there was no less than seventeen blowers in a length of 180 yards in the Jubilee headings generating fire-damp, one of which he heard humming at a distance of 22 yards, and others at distances of 5 or 10 yards.
- (3.) That the air currents which supply the men and boys (101) with air in the Nos. 3 and 4 districts are passed over the blowers referred to, and consequently are mixed with explosive gas.
- (4.) That shots were fired by the deputy and men.
- (5.) That a single door, at which there is no trapper-boy, is placed in the main road between Nos. 1 and 2 Jubilee headings in order to conduct the air current to the No. 3 district, where 64 men, 5 boys, and 5 horses are at work.

3. It will be seen from the plan of the Jubilee district workings Mr. Rowan has annexed to his report that a pair of headings (Jubilee) have been broken off the main road about 100 yards in bye-side of an 18-feet fault, which Bosfield told me and Mr. Inspector Dixon gave off very considerable quantities of explosive gas before and after it was crossed.

These headings are straight, and are separated by a pillar of coal 4 yards in thickness, and have been driven, one of them about 234 yards from the main road to the Jubilee shaft, and the other about 192 yards. Both of these headings from the first gave off gas, both were broken off the main road, and a single trap-door is placed between them on the main road. This door when closed intercepts the intake air current coming down the Jubilee down-cast shaft, and splits that current into two. One portion of it, fouled with inflammable gas, which is constantly and very freely exuding from "blowers" in the floor of the Jubilee headings (gassy district), is directed by stoppings and single doors to supply bords, headings, &c., where sixty-four men and five boys are at work with naked lights in air fouled with inflammable gas; and the current of air for No. 4 district is directed by stoppings and single doors and allowed to circulate and supply thirty men and two boys working in bords, headings, &c., with naked lights in the Cockroach district. And when the door in the main road between the Jubilee headings is open the principal portion of the intake air, which, when the door is shut, should circulate past the bords, &c., where the sixty-four men, five boys, and five horses are at work in the No. 3 split, would join No. 2, and go to the thirty men

two boys, and two horses at work in the Cockroach (No. 4) district, thus leaving the sixty-four men and five boys working there with naked lights with a considerable less quantity of Jubilee intake air than it is intended and it is so necessary they should be supplied with.

4. I also desire that the Minister's attention be drawn to the extracts from the "Report Book" kept in the Newcastle-Wallsend Company's office, annexed to Mr. Rowan's report, from which it will be seen that on 18th of last November, when the cross-cuts were holed into two old narrow bords (C on tracing), each of them contained 30 yards of gas, when it was found necessary to suspend all work until the places were cleared of gas; and to Mr. J. Y. Neilson telling Messrs. Rowan and Bates when leaving the Wallsend Colliery on the 11th instant to inform the Examiner, either officially or not, that he would not allow the Examiner or Inspector to again enter the district complained of until the matter was settled, and that he intended to stand or fall by the 25th section of the Act.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

Submitted the Company should be called upon to appoint an arbitrator at once.—H. W., 17/1/88.
Approved.—F.A., 18/1/88. Company called upon, 18/1/88. Remind and request prompt attention.—
H. W., 31/1/88. Reminded, &c., 31/1/88.

No. 12.

Mr. F. W. Binney to The Secretary for Mines.

Sir,

Newcastle-Wallsend Coal Company, Sydney, 13 January, 1888.

I am instructed to write you in reference to a notice given by Mr. John Dixon, Inspector of Collieries, dated the 6th January instant, to Mr. Neilson, this Company's colliery manager, of which you have doubtless been informed, and to explain the particulars as to ventilation at the several places mentioned, which will, I think, show that the complaints made by Mr. Dixon cannot be sustained.

In reference to paragraph No. 1, there are no doubt several small fissures from which a small quantity of gas exudes, but not sufficient to be likely to cause any bodily injury to the miners. These fissures at first only gave off about 40 feet of gas per hour. Since opening out some two months ago, this amount has considerably decreased by the natural drainage of the gas. Even taking the maximum of 40 feet per hour, 600 cubic feet of fresh air per hour would be sufficient to dilute and render harmless this quantity of gas, whereas 90,000 cubic feet of pure and undiluted air, at only 300 feet from the surface, are passing these places at the rate of 400 feet per minute, and no irregularity in the details of ventilation can possibly diminish this quantity. I therefore respectfully submit there can be no danger from the gas from these fissures in the vicinity of the bottom of the Jubilee shaft.

With regard to the narrow bord, no doubt a small quantity of gas is to be found, but the gas exuding from this place is included in the 40 feet above-mentioned, and cannot possibly do any harm to any person, as the place cannot be reached without the assistance of the sinking engine at the ventilating shaft except by swimming. On Mr. Dixon's visit recourse was had to the sinking bucket to swing him into this place. I therefore submit this place cannot be a source of danger. In ordinary course of working the ventilation in this place would be properly attended to.

In reply to paragraph 2 of Mr. Dixon's letter, wherein he states that, by the inspections above referred to, he has proved beyond a doubt that inflammable gas was being engendered in the above-named places, and in view of the liability of a larger outburst of inflammable gas occurring at any time, &c., &c., I would observe that the shaft mentioned by Mr. Dixon, known as the "Jubilee Shaft," is one that the Company has just completed sinking for the purpose of providing improved ventilation in a portion of their mine which it is intended to open out; that the Company has driven over 30 chains through virgin coal to connect with this ventilating shaft, during which time gas has nearly always issued from small fissures at the faces of drives and been sufficiently ventilated by ordinary brattices. The connection is now complete, leaving the coal all open for the gas to drain off. All workings are suspended up to within 400 yards of the ventilating shaft bottom, so that it is impossible for a "larger outburst" to take place, and there can be no risk to anyone until working is resumed there.

In regard to paragraph 3 in Mr. Dixon's notice, I have to point out that the matter of the door does not in any way affect the question of gas in the Jubilee heading.

In conclusion, I am desired to say that during the sinking of this ventilating shaft Mr. Dixon has frequently visited the same, and any suggestions he has made have been attended to. Mr. Bates also has visited the shaft, and the same remark may be made as to him.

The sinking of this ventilating shaft has but recently been finished; the connection with the Company's tunnel workings just completed; a very powerful Guibal fan is about ready for shipment from England, with the intention of making the ventilation of the Wallsend mine as good, if not better, than it has ever been.

My Board feel, however, that there does not exist sufficient ground for the notice given in Mr. Dixon's letter; and I am directed therefore to say that if you should consider, after inquiry, that it is necessary to take any action in regard to Mr. Dixon's notice, the Company claim to have the matter referred to arbitration, in terms of the clause of the Coal-fields Regulation Act, section 25.

I have, &c.,

F. W. BINNEY,
Secretary.

This notice having been received within the prescribed time, the matter must now be referred to arbitration, in terms of the Coal-mines Regulation Act, section 25.—H. W., 13/1/88. Submitted.

Approved.—F.A., 13/1/88.

7

No. 13.

Mr. J. Y. Neilson to Mr. Inspector Dixon.

Sir, Newcastle Wallsend Coal Company, Wallsend, 13 January, 1888.

In reference to your letter of the 6th instant, the matter is so important that I at once referred it to my Directors, who are now in communication with the Department of Mines.

With regard to the narrow bord, wherein standing gas exists, and without admitting any danger, I will stow it up. As far as the door mentioned in No. 3 paragraph is concerned, it is scarcely worth noticing.

Yours, &c.,
J. Y. NEILSON.

The Examiner of Coal-fields.—J.D., B.C., 14/1/88. These matters are now being referred to arbitration.—J.M., 17/1/88. The Under Secretary for Mines, B.C., 18/1/88.

No. 14.

The Under Secretary for Mines to The Secretary of the Newcastle-Wallsend Coal Company.

Sir, Department of Mines, Sydney, 18 January, 1888.

Referring to your letter of the 13th instant, in respect to the notice served by Mr. Inspector Dixon on Mr. Neilson, your Company's colliery manager, and in which you state that your Board do not think there is sufficient ground for such notice, and claim to have the matter referred to arbitration, in terms of the Coal-fields Regulation Act, section 25, I am directed by the Secretary for Mines to call upon your Company to appoint an arbitrator at once.

I have, &c.,
HARRIE WOOD,
Under Secretary.

No. 15.

Mr. F. W. Binney to The Under Secretary for Mines.

Sir, Newcastle-Wallsend Coal Company, Sydney, 24 January, 1888.

I have the honor to acknowledge your letter of the 18th instant, informing me that you are directed by the Secretary for Mines to call upon this Company to appoint an arbitrator at once, in terms of the Coal-fields Regulation Act, section 25, in respect of the complaint lodged by Mr. Inspector Dixon.

I laid your letter before my Board on the 19th instant, and expect in the course of a few days to be able to give you the name of the arbitrator appointed by this Company.

I have, &c.,
F. W. BINNEY,
Secretary.

Submitted for information of the Minister.—H.W., 25/1/88. Seen. As the question involved in this case is one of danger to the miners working in the Company's mine, no time should be lost in having it settled.—F.A., 1/2/88.

No. 16.

Mr. F. W. Binney to The Under Secretary for Mines.

Sir, Newcastle-Wallsend Coal Company, Sydney, 1 February, 1888.

I have just received your letter of the 31st, and from the reference to your letter of the 18th it would seem that you had not received my acknowledgment of same sent on the 24th January. Is this so?

I am, &c.,
F. W. BINNEY.

Inform that the letter referred to had been received, and take the action directed by the Minister on that letter.—H.W., 1/2/88.

No. 17.

The Under Secretary for Mines to Mr. F. W. Binney.

Sir, Department of Mines, Sydney, 2 February, 1888.

I have the honor to acknowledge the receipt of your letter of the 24th ultimo, in which you state that in the course of a few days you will be able to give the name of the arbitrator appointed by your Company to deal with the matter of the complaint lodged by Mr. Inspector Dixon, and I am to inform you that it is the desire of the Minister that the matter be settled as speedily as possible, as the question involved is one of danger to the miners working in the Company's mine.

I have, &c.,
HARRIE WOOD,
Under Secretary.

No. 18.

The Under Secretary for Mines to The Secretary of the Newcastle-Wallsend Coal Company.

Sir, Department of Mines, Sydney, 7 February, 1888.

With reference to my letter of the 2nd instant and previous communication, and also to your personal interview with the Minister respecting the disinclination of your Company to appoint an arbitrator to deal with the matter of the complaint lodged by Mr. Inspector Dixon, I am directed to invite your attention to the fact that you have not yet carried out your promise to withdraw the objection conveyed in your letter of the 13th ultimo.

I have, &c.,
HARRIE WOOD,
Under Secretary.

No. 19.

No. 19.

Mr. F. W. Binney to The Under Secretary for Mines.

Sir, Newcastle-Wallsend Coal Company, Sydney, 7 February, 1888.

I have the honor to acknowledge your letter of this date, and in reply beg to inform you that I have had no Board meeting since my interview with the Minister.

My Directors meet on Thursday, when I shall report the result of my interview with the Minister, and will then communicate with you further.

I have, &c.,

F. W. BINNEY,
Secretary.

Submitted for the information of the Minister.—H.W., 8/2/88. Secn.—F.A., 8/2/88.

Regret might be expressed that the owners think it necessary to refer this matter to the Board of Directors, instead of allowing their agent (Mr. Neilson) to deal with it, as the delay caused thereby may defeat the intentions of the Act.—H.W., 8/2/88.

Submitted. Approved.—F.A., 9/2/88.

No. 20.

Mr. F. W. Binney to The Under Secretary for Mines.

Sir, Newcastle-Wallsend Coal Company, Sydney, 9 February, 1888.

In reference to an interview with the Honorable the Minister for Mines, your letters of the 7th February, and the correspondence which has taken place in regard to the ventilation of the Wallsend mine, I am instructed by my Directors to say that they wish to withdraw the request made in my letter of the 13th January for the submission to arbitration of the matters referred to in Mr. Inspector Dixon's notice of the 6th January. They desire me to state for your information that the portion of the mine more particularly mentioned by Mr. Dixon is not being worked for coal-getting, but only for necessary work in preparation for the completion of the system of ventilation by means of a fan, and that the works in connection with this ventilation have been in progress since May, 1887, and the fan was ordered from England so long ago as 10th September last year, and is now on the way and expected here in March.

Under these circumstances, my Board desire me to submit to you that a further inspection might be made by Mr. Dixon, in order to satisfy you that the Company is taking all necessary steps to avoid ground for complaint.

I have, &c.,

F. W. BINNEY,
Secretary.

The Examiner of Coal-fields.—H.W., 9/2/88.

After consultation with the Examiner, I submit that the question at issue is one which should be settled by arbitration or by a competent Court. Therefore the owners should either withdraw the objection, so that proceedings may be taken for non-compliance with the notice, or they should appoint an arbitrator, so that the question may be settled by arbitration.—H.W., 10/2/88.

Submitted. Approved.—F.A., 11/2/88.

No. 21.

The Under Secretary for Mines to The Secretary of the Newcastle-Wallsend Coal Company.

Sir, Department of Mines, Sydney, 13 February, 1888.

Referring to your letter of the 9th instant, in which, by instruction of your Directors, you state that they desire to withdraw the request for the submission to arbitration of the matters referred to in Mr. Inspector Dixon's notice, and ask that a further inspection might be made of the mine, in order that the Department may be satisfied that the Company is taking all necessary steps to avoid ground for complaint, I have the honor, by the direction of the Secretary for Mines, to inform you that it is thought that the question at issue is one which should be settled by arbitration or by a competent Court, and that the objection should either be withdrawn, so that proceedings may be taken for non-compliance with the notice, or an arbitrator appointed to settle the question by arbitration.

I have, &c.,

HARRIE WOOD,
Under Secretary.

No. 22.

Mr. F. W. Binney to The Under Secretary for Mines.

Sir, Newcastle-Wallsend Coal Company, Sydney, 14 February, 1888.

I beg to acknowledge your letter of the 13th instant, in reference to mine of the 9th instant, and to state that in writing to request the withdrawal of the offer to submit the matter to arbitration the intention of the Directors of the Company was to leave the course free for any other steps the Minister might think fit to take in reference to the notice given by Mr. Inspector Dixon in his letter of the 6th January last. At the same time my Board thought that the Minister would probably be good enough to direct a further inspection by Mr. Dixon, on the information given in my letter as to the steps this Company was taking in reference to the ventilation.

I have, &c.,

F. W. BINNEY,
Secretary.

The contention of this Department is, that at the date of the Inspector's notice they were working in violation of the Coal-mines Regulation Act, and that the question should be determined by arbitration or by a Court of Law. Until the owners either withdraw their objection or appoint an arbitrator the hands of the Department are tied. The period within which proceedings can be taken has nearly expired, and the delay on the part of the Company, if persisted in, will have the effect of preventing the question being tested. It cannot be supposed that the owners desire to prevent the matter being brought into Court, and, therefore, they should at once withdraw their objection, or, if they prefer, appoint an arbitrator.—H.W., 15/2/88. Approved.—F.A., 15/2/88.

9

No. 23.

The Under Secretary for Mines to The Secretary of the Newcastle-Wallsend Coal Company.

Sir,

Department of Mines, Sydney, 16 February, 1888.

In answer to your letter of the 14th instant, to the effect that in writing to request the withdrawal of the offer to submit the matter of the notice served on the Company to arbitration the intention of your Directors was to leave the course free for any other steps the Minister might think fit to take in reference to such notice, I have the honor, by instruction of the Secretary for Mines, to point out that the contention of this Department is, that at the date of the Inspector's notice the owners were working in violation of the Coal-mines Regulation Act, and that the question should be determined by arbitration or by a Court of Law, and that until the owners either withdraw their objection or appoint an arbitrator the hands of the Department are tied. The period within which proceedings can be taken is nearly expired, and the delay on the part of the Company, if persisted in, will have the effect of preventing the question being tested. It is not to be supposed that the owners desire to prevent the matter being brought into Court; and, therefore, it is thought they should at once withdraw their objection, or, if they prefer, appoint an arbitrator.

I have, &c.,

HARRIE WOOD,

Under Secretary.

No. 24.

Mr. F. W. Binney to The Under Secretary for Mines.

Sir,

Newcastle-Wallsend Coal Company, Sydney, 21 February, 1888.

In reply to your letter of the 16th instant, I have the honor to inform you that the intention of the Board was to withdraw any objection to proceedings being taken by the Minister in regard to the notice given in Mr. Inspector Dixon's letter of the 6th January last. As, however, the Minister does not consider my letter of the 14th instant a sufficient withdrawal of the objection, I beg now, on behalf of the Company, to withdraw any objection raised by the Company which in any way prevents action on the part of the Minister for Mines in respect of the complaint made by Mr. Inspector Dixon in his notice of the 6th January last.

I have, &c.,

F. W. BINNEY,

Secretary.

Proceedings may now be taken to enforce the penalty under the Act.—H.W., 21/2/88.
Approved.—F.A., 21/2/88. The Examiner, 21/2/88.

No. 25.

Report by The Examiner of Coal-fields.

Re case v. J. Y. Neilson, Manager of the Wallsend Coal Company.

Sir,

Coal-fields Office, Newcastle, 13 March, 1888.

This was a prosecution for a breach, by the defendant, of the provisions of section 25 of the Coal-mines Regulation Act of 1876, in such a manner as to constitute an offence against the said Act. The facts given in evidence in proof of such offence were briefly as follows:—

In the latter part of last year the defendant, as manager of the said mine, by sinking a certain shaft, called the Jubilee shaft, and driving certain headings, called the Jubilee headings, 234 yards in length from the said shaft to the main road of the mine, opened new ground in the said mine.

On the 5th January, 1888, Mr. John Dixon, Inspector of Collieries, accompanied by me, made a careful inspection and examination of the said Jubilee district, and the system of ventilation practised therein. On such inspection he found in a narrow bord at the bottom of the Jubilee shaft 300 cubic feet of highly inflammable gas accumulated, and for a distance of about 180 yards in length in the Jubilee headings numerous blowers, all exuding highly inflammable gas. By the system of ventilation practised in that gassy part of the mine, the intake air proceeded down the Jubilee shaft, along the headings over the said blowers, and was then split by a single trap-door into two districts, in which 64 men, 5 boys, 5 horses, 30 men, 2 boys, 2 horses, respectively, worked. These men and boys all worked with naked lights. The Inspector considered this system of ventilation, in view of the risk of a sudden large outburst of inflammable gas in the said new gassy ground, to be highly dangerous to the workmen in the said splits, because the intake air was fouled with the inflammable gas exuding from the headings, and so fouled coursed to the faces where the men were working with naked lights, so that if a sudden outburst of gas in large quantities occurred an explosion was inevitable. Moreover, the Inspector regarded the single trap-door as insufficient, because, if it chanced to be permanently opened, the principal portion of the intake air which, when the door is shut, should circulate past the bords, &c., where the 64 men, 5 boys, and 5 horses are at work in the No. 3 split, would join the No. 4 and go to the 30 men, 2 boys, and 2 horses at work in the No. 4 split district, thus leaving the 64 men and 5 boys working there, with naked lights, with a considerably less quantity of Jubilee intake air than it is intended and it is so necessary they should be supplied with.

Mr. Rowan, Inspector of Collieries, also reported to me, as you are aware, that the quantity of explosive gas (carburetted hydrogen) in the Jubilee shaft narrow headings, when he inspected them on 9th and 11th January last, was much greater than ever he saw in the Bulli Colliery previous to or since the disaster.

Mr. Inspector Dixon proved that having formed the opinion he did, he gave, according to the provisions of section 25, full notice thereof, and of the above particulars in which the danger lay, to the defendant, and required the same to be remedied. The defendant referred the matter of the Inspector's complaint to his Directors in Sydney, and the Directors at first objected to remedy as required, and claimed to go to arbitration, but they afterwards entirely withdrew the reference to arbitration.

The complaints of the Inspector and his requisition to the defendant to remedy the same were not in any way attended to or complied with, and the causes of complaint still exist just as they were on 5th January, 1888. Indeed, the defendant said in his evidence in the case that he had no intention of doing what the Inspector required.

At

At the conclusion of the case for the prosecution, counsel for the defendant asked for a dismissal on the ground that the defects complained of were within section 12 and its sub-sections, and that the information should have been laid under that section, and not under section 25.

Counsel for the complainant, relying upon *in re* arbitration between Home Secretary and Fletcher, Queen's Bench Division, 339, replied that the danger was not in actual existence, but prospective, and that section 12 applies a remedy to existing danger only, while section 25 provides a precaution against future liabilities, as in the present case.

His Worship ruled that the information was properly laid under section 25, and that the facts proved sustained the information.

Several witnesses, mining experts, all but one colliery managers in the Newcastle District, were called for the defence to prove that the ventilation of that part of the mine was excellent, and no danger of the kind apprehended in fact existed. Counsel for the prosecution objected to the admission of any of this evidence, on the ground that the issue whether the danger in fact existed, as the Inspector thought, could only be raised at arbitration, as provided by section 25, and was not raised in the present case, and that the only issue in the case in such respect was when the defendant had, within twenty days, complied with the requisition of the Inspector's notice.

His Worship admitted all this evidence for the defence, although, as it appears subsequently from his judgment, he considered the issue to be as stated by counsel for the prosecution, and such evidence therefore immaterial, but deemed it prudent to allow such evidence to be given so as to satisfy the minds of workmen and other interested parties as to the safety of the mine.

His Worship found the defendant to be guilty of the offence charged, and adjudged a penalty of £1 or levy and distress, and delivered a written judgment, as follows:—

"In delivering judgment in this matter I consider it necessary to make a few observations on what has taken place.

"By the Coal-mines Regulation Act, 39 Vic. No. 31, of this Colony, an Inspector of Mines is obliged within a certain time to make an inspection of a mine—about every eight weeks—and report the same to the Minister for Mines if anything dangerous appears. Then the Inspector takes the steps named in the 25th section of the before-mentioned Act, as in this case. Now, this Act is expressly made, not for the purpose of annoying colliery managers or the proprietors of the mines, but for the safety of the people employed therein, as it has been found that men managing mines are not always the most careful; while even ignorance and the grossest carelessness prevail amongst men employed in mines, by which their lives are often in great danger, as in the Bulli catastrophe, the men having, however, at their own cost, under the 30th section of the Act, 39 Vic. No. 31, the power to employ two of their number to inspect the mine once a month, and go to every part, and their report to be recorded in a book at the mine kept for the purpose. So that the men have it in their own power to see that all is right, as well as the Government Inspectors. Every provision that man can make for the prevention of accidents, as far as can be seen, seems to have been made by this Act and the rules given to the men at collieries, and still, notwithstanding all, it is necessary that a person unconnected with the colliery should also supervise all workings, &c., as in this case. Now, from all I have heard of Mr. Dixon, the Inspector, a more competent man cannot be found for the duty, and what is more, a more honest, conscientious man. It has been said in Court that but for the Bulli catastrophe this would never have been heard of. Now, I cannot permit it to go abroad that this person was, or could ever be, actuated by any other feeling than of duty, nor his superior either, the Examiner of Coal-fields (Mr. Mackenzie). That ever-to-be-lamented accident at Bulli has, doubtless, had the effect of exciting the utmost vigilance; and therefore no reflections of any kind should in the least be cast on the officers appointed to carry out the regulations they are specially called on to perform, no matter where. The Inspector has done his duty by taking the course that he has taken, no matter whom he may offend; if otherwise, he would not be fit for his position, especially when the lives of fully ninety-three men might be at stake. And now I must in justice say a few words of the manager, Mr. Neilson, whom I have known for over a period of eight years, and I can safely say that I have ever considered him a most humane man, always spoken of as a careful one—one who would not for one single moment put the life of any man in jeopardy if he knew it. Yet, even this matter, as complained of by the Inspector, might have been unknown to him and not reported. Here I must observe that all managers or agents of mines are responsible for the acts of the officers beneath them, unless they can show gross and wilful negligence to their orders. In fact I laid this down in a colliery case from Minmi some time ago in this way or similar to it: 'A manager or agent is like the captain of a man-of-war, who gives his orders and sees them obeyed, and where disobeyed the delinquent is punished; so here, the man is either degraded or dismissed.' I have said this much in justice to the persons concerned, and now I deliver my judgment, which is as follows:—

"This action was properly brought under the 25th section of the Act, 39 Vic. No 31, as in the latter portion it states that the Court, if satisfied that the owner or agent has taken active measures for complying with the notice or award, but has not with reasonable diligence been able to complete the work, may adjourn any proceedings taken before him, or punish such offence; and if the works are completed within a reasonable time no penalty shall be inflicted. Now, as evidence for the defence, all highly practical men, accustomed to fiery mines in the mother-country, have said, upon oath, that the portion of the mine called the Jubilee headings was perfectly safe at the time they visited it, and that the intake air from that shaft, from improvements made, is perfectly pure, and that the blowers give little or no gas off from the floor, and neither is there any likelihood of the slightest danger to the men in splits Nos. 3 and 4, I feel satisfied that the mine is perfectly safe, and the men's lives in no way placed in jeopardy now, so far as human forethought can devise. Here, I regret to say, I consider the portion of the Act already stated does not apply to the remedy effected, but to the inattention of the Inspector's notice. It may happen that similar cases may occur, so many coal-mines are being opened, perhaps presided over by men who may try to defy all legal authority or moral responsibility in their greed for obtaining money, not caring for the lives of those working for them so long as they can obtain any benefit for themselves. It therefore appears to me that in wording this section the framers of this Act had this in view, and therefore made it imperative that the Inspector's notice on all occasions should be attended to. Consequently I find myself unable to deal with it as I could wish. Now, the remedy is effected by its not being perfected under the provision made by the notice referred to, and therefore I am compelled, in support of the inattention paid to the Inspector's notice, to inflict a fine as a caution to others; which fine in this case

case will be merely nominal. I therefore order you, John Young Neilson, to pay a fine of £1; if not paid directly, to be levied by distress. At the same time I have found from the evidence before me that the mine is perfectly safe, so far as human wisdom can foresee."

An application for costs by counsel for the complainant was refused.

The defendant stated in open Court that he refused and still refuses to do what the Inspector requires of him.

I have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.

No. 26.

Minute by The Minister for Mines.

Re case of the Examiner of Coal-fields *v.* J. Y. Neilson, Manager of the Wallsend Coal Company.
22nd March, 1888.

I HAVE carefully read the reports of the Police Magistrate's decision in this case, also Inspector Dixon's evidence, where he states he inspected the mine on the 5th January and the 6th and 7th March, and I feel bound to express my surprise at the said decision. The Police Magistrate appears to have decided the case upon the evidence of mine managers, whose interest it must be to defeat the action of the Department. They spoke of the condition of the mine on the date when the proceedings commenced, and set aside the evidence of those officers who spoke of the condition of the mine when the complaint was made, and the evidence of Inspector Dixon as to the state of the colliery the day before the hearing commenced, which I consider very unjust to the public and the Department. If this line of conduct is continued it will be of no use for the Department to institute any proceedings for offences against the Coal-fields Regulation Act. The Minister for Justice' attention might be called to this case.—F.A.

The Under Secretary for Justice.—H.W., B.C., 26/3/88.

No. 27.

The Police Magistrate, Waratah, to The Under Secretary for Justice.

Examiner of Coal-fields *v.* John Y. Neilson, Manager, Wallsend Coal Company.

Sir,

Waratah, 3 April, 1888.

I am in receipt of papers connected with the case noted above for explanation of my decision thereon, together with a minute from the Minister for Mines in reference thereto.

* I append the following: If the Minister, who carefully read the evidence, &c., &c., as stated in the minute, had dissected the officers' evidence before condemning me, and studied the information, he would have found in the latter, as laid by Mr. Mackenzie:—

"And did find a certain part of the said mine, to wit, the places in the vicinity of that part of the said mine known as the Jubilee shaft, dangerous, so as, in his opinion, to threaten bodily injury to persons working in the parts known as the Jubilee districts, inasmuch as inflammable gas was being engendered in the Jubilee headings."

This was on the 5th January, 1888, yet, notwithstanding this most serious charge, Mr. Dixon did not again visit the place when about ninety-six or ninety-eight men were at work, and whose lives were being endangered, until just before the holding of the Court, a considerable time, which, I think, any unprejudiced and disinterested person would be rather surprised at. Then take the evidence of the Examiner of Coal-fields. He goes with Mr. Dixon the same day, 5th January, and, on examination, states:—"I cannot say whether there was a dangerous quantity of gas there; the quantity of gas was one of the elements of ventilation. At the furthest point to which I was carried I did not see any gas that was an element of danger to ventilation. The spot is within 20 yards of the bottom of the Jubilee shaft. At the place I was carried to the air was pure and the gas insignificant in quantity. Mr. Bonsfield, the overman, told me that there was more gas than ever there was in the Bulli mine, and that was my experience from my examination. I did not order the men out. I went with a naked light myself. I did not see any danger from the headings on the day I was there."

Yet this is the day Mr. Dixon was with his superior, Mr. Mackenzie, and the day on which the information was laid.

Mr. Dixon in examination states:—"On the 5th of January the mine was dangerous and defective, and tending to the bodily injury of the persons working there."

Yet the Examiner of Coal-fields, who accompanied him, gave a different opinion. And, again, I don't call the Jubilee shaft any benefit to ventilation at all.

Mr. James Rowan, Inspector of Collieries, stated:—"I inspected the Jubilee district on two occasions, 9th and 11th January last." On examination, said:—"Before the completion of the Jubilee shaft there was complete insulation of air; the air from the Jubilee shaft would tend to explode the accumulated gases; the mine was safe before the Jubilee air-shaft was put down; the ventilation was much more complete now since the Jubilee shaft was made, provided there was no great outburst of gas."

Mr. Bates, Colliery Inspector, who I understood always attended to the mine, named in Mr. Dixon's examination, was not called, although I was given to understand he had been within the precincts of the Court.

For defence,—

Thoms Bonsfield, overman in charge of the Jubilee workings, stated:—"I never told Mr. Mackenzie that the Wallsend mine was a more firey mine than the Bulli; have never been to Bulli."

Seven managers of mines were also examined, none of whom I had ever seen before, except Mr. Turnbull, to whom I was introduced during the adjournment of the Court, and then only about a minute, yet by report I have every reason to believe that these persons are highly gifted in their profession, and as such are as highly respectable as any men, no matter whatever their positions may be, in New South Wales, and utterly incapable of saying anything in the witness-box but what they know and verily believed to be true, even to save a brother manager. All these persons declared there was no danger whatever,

whatever, and that the ventilation was good and sufficient. By the 5th sub-section of the Coal-mines Act, 39 Vic., section 12, "the following General Rules shall be observed in every Colliery"; full power is given to the Examiner or Inspector where a mine is dangerous:—

"Every workman shall be withdrawn therefrom, and the Examiner or Inspector shall inspect the same, and if the danger arises from inflammable gas shall make such inspection with a locked safety-lamp, and in every case shall make a true report of the conditions of such mine, or part thereof; and no workman shall, except in as far as necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration, be readmitted into the mine, or such part thereof so found dangerous, until the same is stated by the Examiner or Inspector to be safe."

Now, neither the Examiner nor the Inspector took the course laid down by law where a mine is dangerous. The Examiner of Coal-fields himself went within a few yards of the Jubilee shaft with a naked light the day the workings were reported dangerous.

Any person on carefully reading and comparing the whole evidence, &c., will easily perceive the motives I had in giving such a decision, chiefly an anxiety to uphold authority as far as possible consistent with right, in order to prevent any ill-feeling to exist—expressions of which were not wanting during the continuance of the case, and which might hereafter operate antagonistically to the Department.

It is with extreme regret I must observe that it appeared to me from the evidence of the officers that the notice was all-important, whilst the lives of ninety-eight men might be sacrificed at any time without any measures being further taken to provide against it by visiting the mine again, and acting on the 5th sub-section of section 12, although not done as it ought to have been done at first if danger existed.

I have, &c.,

R. I. PERROTT,

Police Magistrate.

Submitted.—A.C.F., 6/4/88.

In reference to paragraph (marked *), the Police Magistrate to be at once written to requesting him to withdraw same, and to apologize to the Minister for Mines for his insulting reference to that gentleman. Mr. Perrott's (P.M.) conduct in penning this paragraph shows an unfitness for his position which I cannot pass over lightly. Report to be sent to the Minister of Mines for his perusal.—W.C., 9/4/88.

The Under Secretary for Mines.—A.C.F., B.C., 9/4/88.

No. 28.

The Under Secretary for Justice to The Police Magistrate, Waratah.

Sir,

Department of Justice, Sydney, 9 April, 1888.

Referring to the second paragraph of your letter of the 3rd instant, furnishing an explanation of your decision in the case of the Examiner of Coal-fields *v.* John Y. Neilson, Manager Wallsend Coal Company, in which you reflect on the action taken by the Minister for Mines in the matter, I am directed by the Minister for Justice to request that you will withdraw the paragraph referred to and apologize to the Minister for Mines, for what Mr. Clarke considers your insulting reference to that gentleman.

I have, &c.,

ARCH. C. FRASER,

Acting Under Secretary.

No. 29.

Minute by The Minister for Mines.

Re case of the Examiner of Coal-fields *v.* the Wallsend Coal Company.

25 April, 1888.

THE Police Magistrate appears to have failed to recognize the drift and object of the prosecution. He appears to think the complaint was that the mine, or some part of it, was dangerous. If so, the proceedings should have been taken under section 12 (*vide* sub-section 5), whereas the proceedings were taken under section 25, the complaint being, not that the mine or any part was dangerous, but that the practice, namely, of allowing the intake air to pass along gassy headings to the working places, where a number of men and boys were working with naked lights, was dangerous. The only question before the Court was whether the Company were guilty of an offence against the Act, in that they had failed to comply with the notice. The Company did not object to remedy, and, therefore, they were, under the 25th section of the Act, tied down to the one issue.

F.A.

The Under Secretary for Justice.—H.W., B.C., 25/4/88. Submitted.—A.C.F., 30/4/88. Copy of Minister for Mines' minute to be sent to Mr. Perrott, P.M., for perusal, and, if he desires, for any further report.—W.C., 4/5/88.

No. 30.

The Under Secretary for Justice to The Police Magistrate, Waratah.

Sir,

Department of Justice, Sydney, 4 May, 1888.

Referring to your letter of the 3rd April last, and previous correspondence, respecting the decision given by you in connection with the case of the Examiner of Coal-fields *v.* John Y. Neilson, Manager of Wallsend Coal Company, I am directed by the Minister of Justice to forward for your perusal, and for any further remarks you may desire to offer thereon, the enclosed copy minute of the Minister for Mines in regard to this matter.

I have, &c.,

ARCH. C. FRASER,

Under Secretary.

No. 31.

The Police Magistrate, Waratah, to The Under Secretary for Justice.

Waratah, 8 May, 1888.

Sir,

I have the honor to acknowledge receipt of your letter of the 4th instant, enclosing a copy of a minute from the Minister for Mines, in the case of the Examiner of Coal-fields *v.* John Y. Neilson, Manager of the Wallsend Coal Company, and in reply thereto beg to say that I was guided by the evidence, *pro* and *con.*, given in the case, as I conceived it my duty to be so guided, and gave my decision accordingly, upholding the action of the Government officers (notwithstanding the arguments of Mr. J. H. Want, Queen's Counsel), and holding that the case was properly brought under the 25th section of the Act, and imposed a penalty which I thought the justice of the case demanded.

I am quite prepared to give any further explanation, if the Minister for Mines thinks it necessary.

I have, &c.,

ROBT. I. PERROTT,

Police Magistrate.

Submitted.—A.C.F., 10/5/88. Minister for Mines for approval.—W.C., 26/5/88. The Under Secretary for Mines.—A.C.F., B.C. 26/5/88.

Copy of Shorthand Notes.

Wallsend Police Court—Thursday, 8 March, 1888.

Before Mr. R. I. Perrott, P.M.

John Mackenzie (Examiner of Coal-fields) *v.* John Young Neilson.

THIS was an action brought by John Mackenzie, Examiner of Coal-fields, acting under instructions from the Honorable the Secretary for Mines, against John Young Neilson, as Manager of the Newcastle-Wallsend Coal Company, for a breach of the Coal-mines Act, 39 Victoria No 31. The following is the information :—

New South Wales to wit: Be it remembered that on the twenty-seventh day of February, in the year of our Lord one thousand eight hundred and eighty-eight, personally came and appeared before me, the undersigned, one of Her Majesty's Justices of the Peace in and for the Colony of New South Wales, John Mackenzie, of Sydney, in the Colony aforesaid, Examiner of Coal-fields for the Colony of New South Wales, duly authorized to prosecute in this behalf, and informs me that John Young Neilson is the agent of the Newcastle-Wallsend Coal Company, who are the owners of a certain coal-mine, situated at Wallsend, in the Colony aforesaid, called the Newcastle and Wallsend Coal Company's Colliery; and that on the fifth day of January, in the year one thousand eight hundred and eighty-eight, John Dixon, of Newcastle, in the said Colony, Inspector of Collieries for the northern district of the said Colony, did inspect the said Newcastle and Wallsend Coal Company's coal-mine, and did find a certain part of the said mine, to wit, the places in the vicinity of that part of the said mine known as the Jubilee shaft, dangerous, so as, in his opinion, to threaten bodily injury to persons working in the parts known as the Jubilee districts, inasmuch as inflammable gas was being engendered in the Jubilee headings, and did find that there was a liability of a larger outburst of inflammable gas occurring at any time therein, and that the air current from the said Jubilee shaft, after coursing through the said Jubilee headings, where inflammable gas was exuding—ventilating two splits of sixty-eight and thirty men respectively, who worked with naked lights, and that a single trap-door was placed on the main road between the said Jubilee headings. And that the said Inspector John Dixon, did thereafter give the said John Young Neilson, agent of the Newcastle-Wallsend Coal Company as aforesaid, notice in writing, dated the sixth day of January, one thousand eight hundred and eighty-eight, and did thereon complain of the matter aforesaid, and require the said John Young Neilson, as such agent as aforesaid, to remedy the matter of complaint aforesaid, and did state in such notice the particulars in which he, the said Inspector, considered the said part of the mine dangerous. And that the said John Young Neilson did not remedy the same forthwith. And he, the said Inspector, reported the said matter of complaint to the Minister for Mines. And that the said John Young Neilson did not within seven days after receipt of such notice as aforesaid make objections in writing to the Minister for Mines stating the grounds on which he objected to remedy the matter so complained of as aforesaid. And that the said John Young Neilson has failed to comply with the requisition of the said notice, given by the said Inspector, and remedy the matter complained of as aforesaid. And that more than twenty days have elapsed since the receipt of such notice. And the said informant further informs me, the undersigned, that he verily believes that the matter of complaint aforesaid is not provided against by any express provision of the Act 39 Victoria No. 31, or any special rule to be observed in the working of the said Newcastle-Wallsend Coal Company's mine, contrary to the provisions of the Act 39 Victoria No. 31, whereupon the said informant prays that I, the said Justice, will proceed in the premises according to law.

JOHN MACKENZIE.

Exhibited at Wallsend, in the said Colony, on }
the day first above written, before me— }
ROBERT I. PERROTT, P.M., Justice of the Peace.

Mr. Want: In the list to-day, your Worship, there is a case of Mackenzie *v.* Neilson, in which I appear for the defendant, and as I have only just arrived from Sydney, I would ask your Worship to allow the case to stand over until 12 o'clock. If you will consent to this adjournment it will give me an opportunity of looking up the case. I have consulted my friends on the other side, and they would appear to have no objection.

Mr. Edmunds: I appear for the prosecution, your Worship, and I am quite satisfied.

The Police Magistrate: You have no objection.

Mr. Edmunds: No; I have no objection to a postponement.

The Police Magistrate: Of course that is a matter which you gentlemen are at perfect liberty to arrange between yourselves.

Mr.

Mr. Want: This is a case in which the decision will rest on matters of fact, and not of law. We all know that your Worship has a very good knowledge of mining matters, and I would therefore ask you to be good enough to inspect this colliery for yourself. The complaint here is as to three different things—that a door is required to improve the ventilation; second, a dangerous outflow of gas; and third, that thereby men were in danger of bodily injury. I am perfectly sure that your Worship is well able to judge of these things, and my clients wish to be at once relieved of the imputation of having done anything of this kind, and to have any suspicion hanging over their colliery. What you will have to decide are matters of fact, and these are as to whether it is true or not these lives were endangered; and as we know that your Worship is anxious to give a fair and proper decision, and one on the merits of the case, we therefore ask your Worship, after hearing the evidence about what is complained of, to do us the favour of inspecting this portion of the colliery that we are charged with having left in a dangerous condition. It is now in operation, and I think your Worship knows sufficient about mines to say whether it is in a dangerous condition or not better than any of the witnesses can tell you.

The Police Magistrate: I shall be very happy to visit the mine and see it for myself, if the other side have no objection.

Mr. Edmunds: I am afraid we shall be obliged to take a slightly different view of the question, your Worship, to that which has been taken by my learned friend on the other side. At the same time I may say that we have no objection to your Worship inspecting the mine, if you should wish to do so; but as to the necessity of it, I think there will be some difference between my learned friend and myself. I think there will also be some difference of opinion as to the law of the case.

The Police Magistrate: Oh, of course I can quite understand that lawyers will always differ.

Mr. Edmunds: However, the time to consider the law and the other circumstances of the case is after your Worship has heard the evidence.

The Police Magistrate: I am quite at the service of both parties, if I can be of any use in assisting you to an arrangement. Of course the chief thing which I will have to guide me will be the evidence that is brought before me in the prosecution of the case, and then I shall be able to judge, having heard the evidence, whether it is necessary to visit and inspect the mine or not. I have no doubt that the evidence in this, as in other cases of a similar kind, will be very conflicting. I may tell you, gentlemen, that the defendant appeared before me several days ago, when the information was read and the plea taken. If you wish for the information you can have it read.

Mr. Want: Thank your Worship. I do not think it will be necessary to read the information, because I have a copy.

Mr. Edmunds: And I have a copy also, your Worship.

The Police Magistrate: The clerk will read the record of the case so far as it has gone.

The clerk read as follows:—"Examiner of Coal-fields *v.* John Young Neilson, charged with a breach of the Collieries Act. Information read. Defendant pleaded not guilty, and case postponed until Thursday next, 18th inst., on the application of the defendant. Costs of the day allowed—one witness, two days, £2 2s.; and professional costs, £2 2s.—R. I. PERROTT, P.M."

The Police Magistrate: In fact you will find the substance of the information in the summons which has been served on the defendant, and I cannot correct it in the slightest degree. I am told that these gentlemen, who are experienced and scientific men, should not be present in Court while the other witnesses are giving their evidence; but I will leave it to you, the gentlemen who are engaged on the other side, whether they should be asked to leave the Court. If you think that it is desirable that they should not be present, I will make the order.

Mr. Want: I would like a short adjournment, your Worship, in order that I may make myself acquainted with the facts of the case. I have not yet had time to go into the matter, and would be glad if my friend does not object for an opportunity to do so.

Mr. Edmunds: I have no objection to a short adjournment to meet my friend's convenience.

The Police Magistrate: This Court stands adjourned until 12 o'clock this day.

On resuming at 12 o'clock,—

The Police Magistrate said: The first thing to be done now is to read the information over to the defendant, if you require it.

Mr. Want: We do not think it will be necessary, as both of us have copies.

The Police Magistrate: Do you wish the witnesses in this case to leave the Court?

Mr. Edmunds: I think there is no objection to such an order.

The Police Magistrate: In that case, I think it should be done. I presume the case will depend largely upon the opinions of the scientific gentlemen who are to give evidence. Under the circumstances, therefore, I think I ought to make the usual order.

All witnesses were then directed to leave the Court until called on to give evidence.

The Police Magistrate: Those gentlemen who are experts, and who are present to give evidence, can have the use of my private room.

Mr. Edmunds then said: I appear here, your Worship, to represent the Examiner of Coal-fields, Mr. John Mackenzie, the complainant in this case, and I may state that this prosecution is brought under the 25th section of the Coal-mines Regulation Act of 1876. It may be well first of all, so that I may present the case clearly to your Worship, for me to read to you the section of the Act under which this charge has been laid. I will read the words of the section, which are as follows:—"If, in any respect (which is not provided against by any express provision of this Act or by any special rule), any Inspector finds any mine or any part thereof, or any matter, thing, or practice in or connected with any such mine, to be dangerous or defective, so as, in his opinion, to threaten or tend to the bodily injury of any person, such Inspector may give notice in writing thereof to the owner or agent of the mine, and shall state in such notice the particulars in which he considers such mine or any part thereof, or any matter, thing, or practice, to be dangerous or defective, and require the same to be remedied, and unless the same be forthwith remedied the Inspector shall also report the same to the Minister. If the owner or agent of the mine objects to remedy the matter complained of in the notice he may, within seven days after the receipt of such notice, send his objection, in writing, stating the grounds thereof, to the Minister, and thereupon the matter shall be determined by arbitration in manner provided by this Act in relation to the special rules, and the date of the receipt of such objection shall be deemed to be the date of the reference. If the owner or agent fail to comply either with the requisition of the notice given by the Inspector when

no objection is sent within the time aforesaid, or with the award made on arbitration within twenty days after the receipt of such notice or the making of the award (as the case may be), he shall be guilty of an offence against this Act, and the notice and award shall respectively be deemed to be written notice of such offence: Provided that the Court, if satisfied that the owner or agent has taken active measures for complying with the notice or award, but has not, with reasonable diligence, been able to complete the works, may adjourn any proceedings taken before them for punishing such offence, and if the works are completed within a reasonable time no penalty shall be inflicted. No person shall be precluded by any agreement from doing such acts as may be necessary to comply with the provisions of this section, or be liable, under any contract, to any penalty or forfeiture for doing such acts." It provides, as your Worship sees, that the Inspector—if, in his opinion, the mine is dangerous—may go into it and give notice that the same be remedied; and then the section proceeds, "If the owner or agent of the mine objects to remedy the matter complained of in the notice, he may, within seven days after the receipt of such notice, send his objection, in writing, stating the grounds thereof, to the Minister, and thereupon the matter shall be determined by arbitration in the manner provided by this Act." The section proceeds further:—"If the owner or agent fail to comply with the requisition of the notice given by the Inspector when no objection is sent within the time aforesaid or with the award made on arbitration within twenty days after the receipt of such notice or the making of the award (as the case may be) he shall be guilty of an offence against the Act, and the notice and award shall respectively be deemed to be written notice of such offence." So that, in the first place, if the owner or agent object to remedy the thing complained of he may refer the matter to arbitration; and if he does not do that, and fails to comply with the requisition contained in the Inspector's notice, then he is guilty of an offence under the Act. Now it appears to me that this is a very positive enactment indeed. We must discard altogether any consideration of what should be done if the owner or agent objected to remedy. He is to go to arbitration, the Act says, and then the arbitrators will decide whether he is right in objecting or not. What I say is that we may discard this altogether, because I am in a position to show you that there has been no reference to arbitration in this case. The owner or agent here has not taken the only step which the law allows him to take if he objected to do what the Inspector told him.

The case stood thus: The notice of a dangerous practice in the opinion of the Inspector has been given, and the owner has not remedied the matter. The Act then says, the owner having failed to comply with the notice or the award, "if within twenty days after the receipt of such notice, or the making of the award, as the case may be, he shall be guilty of an offence against this Act, the notice and the award shall respectively be deemed to be written notice of such offence." So that the Act puts the notice in this position, that it will have the same effect as the award, had the defendant gone to arbitration, because the proper course was either to comply with the notice in the first place, or go to arbitration and settle the point. This is a very reasonable and judicious proviso, and one which has been acted upon in Great Britain and everywhere else where similar circumstances are likely to arise. Then there is a proviso regarding the adjournment of the case:—"Provided that the Court, if satisfied that the owner or agent has taken active measures for complying with the notice or award, but has not with reasonable diligence been able to complete the works, may adjourn any proceedings taken before them for punishing such offence, and if the works are completed within a reasonable time no penalty shall be inflicted. No person shall be precluded by any agreement from doing such acts as may be necessary to comply with the provisions of this section, or be liable under any contract to any penalty or forfeiture for doing such acts." The object of this section is to give the Mining Inspector (a man on the proper performance of whose duties so much depends in a district like this, and who, as recent circumstances have shown, holds the lives of the men in his hands) great authority in the supervision of mines, and great power in cases which must always arise, and which are not to be met by any express provision of the Act or special rule of the mine. And it seems to be an extremely wise provision to make, because in the working of coal-mines there must always be great liability of unforeseen circumstances happening, of events of which there may be some slight indications which in a very great degree jeopardise, if they do not immediately destroy, the lives of those engaged in the underground workings. Now, this is the object of the Inspector's authority, and the extent of it is very great. Therefore the very fact of an owner or agent not complying with the notice within a specified time renders him guilty of an offence under this Act, such being the plain interpretation which the words of this section bear, and the interpretation which I, on behalf of the Crown, consider is the one to be placed before your Worship for your guidance. Now, I wish to briefly advert to the circumstances of this particular case. Mr. Dixon is an Inspector of Mines, residing in Newcastle, and supervising the mines of the Northern District, and, of course, it is his duty, as a man who is extensively engaged in this work, to search for any indications of gases, which are the cause of such disasters as that which recently happened at Bulli. He would be unfit for his position, and unfit to undertake the responsible duties which he is discharging, if, after such a terrible calamity as that at Bulli, he did not exercise the most careful scrutiny over the mines in his district, in order to avert a similarly terrible result. Now, going into this Wallsend mine, perhaps the greatest mine in the world, and one which I am sure has been most admirably managed—going down into this mine, and to a part of it known as the Jubilee workings, which are marked on the plan, he finds circumstances existing in that part of the mine which in his opinion—and as the Crown now contend, a correct opinion—were dangerous to the lives of those working there. For these circumstances the Act itself did not provide, nor did the special rules of the mine. The particular part of the mine into which the Inspector went is called the Jubilee district. There is a Jubilee shaft, and from this shaft there is a drive up towards the workings; first of all, one heading for a short distance, and then this heading is split into two for several hundred yards towards the workings. These splits are through new and virgin country, country which, in the opinion of most experts, is liable to contain inflammable gases—and large quantities of inflammable gases. On looking along this heading he found what no doubt startled him—he found a number of blowers. It would be impertinent in me to explain to your Worship what these blowers are.

The Police Magistrate: I understand the meaning of the term very well.

Mr. Edmunds: Now, if ever a Mining Inspector required to do something it was in this case. He found not one or two but several blowers in these Jubilee headings. Consequently, he closely inspected the system of ventilation in that particular part of the mine. He found that the ventilation of the mine, or rather for this particular part of it, was down the Jubilee shaft, and the intake of air was through this shaft, and coursed along the Jubilee headings, passing over all these blowers, and so carrying with it
whatever

whatever inflammable gases were exuding from the blowers. The air was then split into two portions, one of which went into that part of the workings known as No. 3 split, in which a large number of men were engaged; I think sixty-four men, five boys, and five horses. All the air for these men, boys, and horses was brought down the Jubilee shaft and over all these blowers. Next the Inspector found that the other portion of the air was carried into No. 4 split, where thirty men, two boys, and two horses were engaged at work, all the air which they were breathing coming over all these blowers from the intake of the Jubilee shaft. Mr. Dixon at once said that this was a defective arrangement. Now, as to whether that opinion be right or wrong I shall have very little to say to your Worship, because that question is not an issue here. All that we have to do is the fact that the Inspector formed the opinion that the ventilation was defective. More than that, he formed the opinion also that the system of ventilation in the mine was defective in another respect, that the door which split this current of air was a single trap-door. He, of course, knew from the result of an inquiry of which the defendant himself, Mr. Neilson, had the honor to be a Royal Commissioner—he knew from the report of that Commission that it was a dangerous practice to have a single door under such circumstances, and he regarded that as a defective part of the system of ventilation, as well as the other matter. And besides this, there appears to have been no trapper boy to stand at the door and work it. At all events the mere fact of having only one door is a second defective point in this system of ventilation, although they are not required to remedy that. The Inspector found, as I have said, these two defects, all the air going over a large number of blowers, and the split into which this air was being drawn being regulated by only one trap-door. It will be unnecessary for me, your Worship, to point out to you why Mr. Dixon considered this arrangement a defective one. My learned friend, the counsel for the defence, may examine Mr. Dixon on this point, although I cannot see in what way anything that Mr. Dixon may say will be material to the issue. The blowers are obviously defects, because all these men were allowed to work with naked lights, thus fouling the air they had to use. Now, it may not have caused the evil, but there is a strong probability that a large quantity of gas outrushed at Bulli, and coming in contact with the naked lights used by the men who were working there, caused the great loss of life that lately occurred. It would seem that these gases are sent by Providence to warn men of their danger, and had the finger of Providence, which pointed out the danger at Bulli, not been disregarded, the terrible result in loss of life would not have taken place. Mr. Dixon would not have been true to his position and to his responsibilities had he not gone to Mr. Neilson, the agent of this colliery—this colliery which is so admirably managed—and given him the notice contained in these words:—

J. Y. Neilson, Esq., Colliery Manager, Wallsend,—

Sir,

Yesterday (Thursday), accompanied by Mr. J. Mackenzie, Examiner of Coal-fields, I carefully inspected the workings in the vicinity of the Jubilee shaft in connection with the Newcastle-Wallsend Coal Company's Colliery, and found inflammable gas very freely exuding from numerous blowers in the floor of the Jubilee headings. Also in the narrow bord, 36 feet in length, 6 feet wide, and 5 feet 9 inches high (near the shaft bottom), inflammable gas could be detected in the Davy lamp, 9 inches from the roof at a point 7 yards from the face, and 2 feet 4 inches from the roof 3 yards from the face, and 3 feet 5 inches from the roof at the face.

2. Having by such inspection proved beyond a doubt that inflammable gas was being engendered at the above-named places, and in view of the liability of a large outburst of inflammable gas occurring at any time, I hereby, in accordance with the provisions contained in the 25th section of the Coal-mines Regulation Act of 1876, give you notice that, in my opinion, it is a dangerous practice to allow the air current from the Jubilee shaft to ventilate one split of about sixty-eight men, and another split of about thirty men, all working with naked lights, after such current of air has coursed through the Jubilee headings, where the gas is exuding.

3. I would also draw attention to the practice of having only a single trap-door on the main road between the Jubilee headings, where, in my opinion, two doors are necessary.

4. I have therefore to urge your serious and immediate attention to the above-named matters, with a view to have them remedied as speedily as possible.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

Forwarded for the information of the Honorable the Secretary for Mines.—J.M., 1/1/88. The Under Secretary for Mines, B.C., 7/1/88. To be annexed to yesterday's papers on same subject.—J.M. Vide papers 88-503 and 359 herewith.—G.W.H., 11/1/88.

There was at the bottom of the Jubilee shaft a narrow bord which had acted as a reservoir for the gas up to that time. It was found that there was a large quantity of gas stored there. Then again also in the narrow bord, 36 feet in length, 6 feet wide, and 5 feet 9 inches high (near the shaft bottom), inflammable gas could be detected with the Davy lamp 9 inches from the roof at a point 7 yards from the face, and 2 feet 4 inches from the roof 3 yards from the face, and 3 feet 5 inches from the roof at the face. Now, it may be suggested that it was Mr. Dixon's place to suggest a remedy for this defective ventilation, but I can assure your Worship that the law does not call on Mr. Dixon to do anything of the kind.

Mr. Want: If that be true, how are we to know what there is to be remedied, or how to do it?

Mr. Edmunds: I will show you exactly what the danger was of which Mr. Dixon complained, and the opinion he formed of the danger. I will prove the notice that was given the defendant, and that nothing has been done to remedy what he considered dangerous; now the Act which is in force in Great Britain, and which, fortunately for us, is exactly the same in the provisions applicable to this case.—

The Police Magistrate: The English Act has not been adopted here.

Mr. Edmunds: But the English Act, although not adopted in its entirety, is applicable. We have simply embodied its provisions in our own law, and the section is precisely the same, so that any decision given under it will be applicable to our own case. The English Act being the same as ours in this particular, and having been interpreted by the Court of Appeal in England, the opinions of Lord Esher and the other Justices will, of course, be applicable to this case. The case referred to in the report of the Court of Appeal is the Secretary of State for the Home Department *v. Fletcher*. The words of the section in the English Act being precisely the same, as I have said, as those of the 25th section in our Act, Lord Esher having read the section, the 46th of the English Act, proceeds to say:—"In this case three points were taken, two of which are of considerable importance. The Inspector of Mines for the district having inspected the appellant's mine, came to the conclusion that the use of open lamps in the mine was a source of danger, and acting, as he stated, under the Coal-mines Regulation Act, 1872, he made a requisition on the mine-owner to remedy that matter. The mine-owner has a strong opinion that the use of open lamps is more safe under the particular circumstances of the case than the use of safety-lamps. He therefore objected

objected to comply with the notice, and the matter went before an umpire, who gave a decision agreeing with the Inspector. He has made his award, and two objections are taken to it: First, that he had no jurisdiction in the matter, and, secondly, that if he had any jurisdiction, he has acted in excess of it. There was a third objection, that the umpire was not properly appointed, but that was abandoned. It is contended that the matter dealt with in the award is already provided for by the general rules of the Act, and also by the special rules, and is therefore outside the provisions of section 46 of the Act, so that no arbitration could have taken place under that section. I think, however, that neither the general rules contained in the 6th and 7th sub-sections of section 51 nor the special rules to which we have been referred are applicable to this case. The necessity for withdrawing workmen from a dangerous mine, and the regulations as to safety-lamps, where they are used, are wide of the question in the present case, which is, whether it is necessary for the safety of the workmen to stop the use of open lamps. The opinion I have come to on the second point does not make the Act so preservative of the safety of the workmen as I could have wished, but that does not affect the construction I feel bound to put on the words of the statute. We have to follow the general rule of construction, and put on the words used their ordinary meaning, and see to what conclusion that leads. Now, going through the 46th section, we find, first of all, that the Inspector has to see whether any mine, or part of a mine, or any matter, thing, or practice in or connected with such mine, is dangerous or defective, so as, in his opinion, to threaten or tend to the bodily injury of any person. Then he is to give a notice and state, not merely that the mine or practice is dangerous, but the particulars in which he considers it is so, and to require the same to be remedied. He is not told to say what he thinks to be the remedy, nor to require that remedy to be carried out. When the complaint is brought to the notice of the owner, agent, or manager, if he objects, not to a remedy proposed, but to remedy the matter complained of, he is to send an objection in writing stating his grounds to a Secretary of State, and thereupon the matter shall be determined by arbitration. What is the matter to be determined by arbitration? The Inspector has required a matter or practice to be remedied, the owner has stated his grounds for objecting to remedy the matter complained of, and the requisition of the Inspector and the objection to it of the owner are the matter which is to be determined by arbitration—that is, the question is whether the requisition of the Inspector is one to which the objections of the owner form a sufficient answer. That is all that is to be determined. There being no words which enable the Inspector to name a remedy, the arbitrator has no question of a remedy before him. If the arbitrator finds that the objections of the mine-owner are unfounded, the requisition of the Inspector stands. If after that the mine-owner does not remedy the matter complained of, he must take the consequences, but the arbitrator has nothing to do with the consequences of the mine-owner's neglect; that is for another tribunal. Applying these principles, I think the award goes beyond what I have stated to be the power of the arbitrator. The award should have followed the requisition of the Inspector, and pronounced that the matter—that is, the working the mines with open lamps—was dangerous or defective, so as to threaten or tend to the bodily injury of the persons employed in and about the said colliery. But the arbitrator has determined that the mines are to be worked with safety-lamps—that is, he has determined what is the remedy which should be adopted, and directed that to be followed. He has substantially found that the complaint is well-founded, though he has gone beyond his powers in other respects. I can see no reason, therefore, why the award should not go back to him, so that he may put it into form. When that is done it will be for the mine-owner to remedy the defect; for if he does not, he will, if the opinion of the next tribunal is against him, be liable to penalties under the Act." Then Lord Bowen says:—"There are two points in this case to which I will address myself. Whether the arbitrator has jurisdiction, and whether the award is in proper form? As to the first question, it seems to me that none of the general or special rules apply to the matter which is in dispute in this case, which is, therefore, a proper matter for arbitration. As to the other point, there is no more familiar rule than that an arbitrator ought in his award to follow the submission and only determine what is submitted to him. If he is to find out what should be done in the particular case, a direction to that effect would be found in the submission; if to say what is to be done generally, that also would be found in the submission. Applying this, the power given to the arbitrator is limited to determining the matter in difference which has arisen under the 46th section. The Inspector must first of all have come to the conclusion that the mine, or part of a mine, or any matter, thing, or practice in or connected with the mine, is dangerous or defective, so as, in his opinion, to threaten or tend to the bodily injury of any person; next he is to give notice in writing of his opinion, and is to state the particulars in which he considers the mine, part of a mine, matter, thing, or practice, is dangerous or defective; and lastly, he must require the same—that is, the thing of which he is complaining—to be remedied. In the present case the matter required to be remedied is the working of the mine with open lamps. The mine-owner sent in his objections, and thus the matter was ripe for arbitration. The umpire had to determine whether the matter complained of was dangerous, and whether the requisition for a remedy was proper; in other words, whether the matter was so dangerous as to require a remedy. The umpire ought to confine himself strictly to the authority given him, and that does not include any power to determine what is the right remedy, or to order that it shall be adopted. His award is, therefore, in my opinion, wrong in form; but as the arbitrator has in fact determined the matter submitted to him, I do not think we ought to set aside the award, but it ought to be remitted. I do not mean to suggest that there can be any other remedy for the matter complained of than to leave it off. It is sufficient for the present purpose to say that the award is wrong in form, and must be sent back to the umpire." And Lord Fry adds:—"The two questions to be decided both arise under section 46. The first inquiry is whether the matter dealt with by the requisition and notice is provided for by any general or special rule. The requisition relates to the habitual use of open lamps, and this is declared dangerous. It seems to me clear that this is not a matter dealt with in the Act or in the special rules; and if that is so, it was within the jurisdiction of the Inspector. The thing to be remedied is the practice which the Inspector has found to be dangerous, and the Act deals with objections by the owner to remedy, not the danger, but the matter complained of. Whether the matter complained of ought to be remedied is, therefore, the question about which a dispute arises, and that is the dispute which the arbitrator has to determine, and he has not to deal with anything further. I think the award ought to follow the requisition, and to state that the danger exists, and ought to be remedied, because that is the subject-matter of the dispute, but it is beyond the competence of the arbitrator to direct what is to be done to remedy the danger. Inasmuch, however, as the true matter in dispute was whether the requisition of the Inspector was right, and that has clearly

been determined by the umpire, I think the award ought to go back to him to be dealt with." Now, it is quite clear from the decision in the case which I have just quoted that, upon the words of the Act itself, if the defendant objected to remedy the matter complained of, he had only one course to take. That course was to give notice to the Minister, and then must ensue the arbitration on the point whether the Inspector was right or wrong, and whether his opinion should be followed or not. That matter was to be decided by arbitration. Then if the agent or owner does not go to arbitration, which is really what has happened in this case, then the Act states that the notice shall be the notice that an offence has been committed, the words being, "that if the owner or agent fail to comply with the requisition within twenty days he shall be guilty of an offence under the Act." So that I may state briefly, in conclusion, the exact issues of fact which remain to be settled in this case under the construction of the statute. The first is whether the Inspector gave the notice under the Act of a continuance of a practice in his opinion dangerous to the lives of the men employed in the mine, and which was not provided for specially in the Act or in the rules of the mine. The second is, did the owner or agent proceed to arbitration; and then, if he did not proceed to arbitration, did he remedy the matter complained of within twenty days. So that my learned friend, in saying that the question was as to whether Mr. Dixon was right or wrong, took—I will not say an erroneous view—but a view which cannot be sustained by—

Mr. Want: The Act says, "If the owner or agent fails to comply with the notice"; but did the defendant in this case fail to comply with the requisition?

Mr. Edmunds: Of course; you do not allow me to finish.

The Police Magistrate: The information charges the defendant with not complying with the requisition of the notice.

Mr. Want: Exactly, your Worship.

Mr. Edmunds: It is precisely following the words of the section all through, and making the defendant's neglect an offence within the meaning of the section. The words in the information are:—"And that the said John Young Neilson did not, within seven days after receipt of such notice as aforesaid, make objections in writing to the Minister for Mines, stating the grounds on which he objected to remedy the matter so complained of as aforesaid, and that the said John Young Neilson has failed to comply with the requisition of the said notice, given by the said Inspector, and remedy the matter complained of as aforesaid, and that more than twenty days have elapsed since the receipt of such notice." Now, my learned friend says that it will be necessary for your Worship to decide whether Mr. Inspector Dixon was right or wrong in his opinion; but I submit to your Worship that that is not the issue here at all, and that the nature of Mr. Dixon's opinion cannot be considered here at all. If the learned counsel for the defence intended to raise that issue, he can do it on a subsequent notice, by pursuing the proper course, and by remitting the case to arbitration. And I submit that if he wishes to dispute the decision of the Inspector respecting the state of the mine, he must go to arbitration, and there decide the matter. But if, as in this case, he receives notice, and does not go to arbitration, then, when he comes before this Court, it has simply to be shown that he received notice, and that he did not comply with the requisition of the notice within twenty days. We will prove that the defendant did not comply with the requisition of the notice; and where there is no arbitration the section which I have quoted places the notice in exactly the same position as the award would stand in in the event of there having been arbitration and a consequent award. The Act puts a defendant who does not go to arbitration in the same position when he receives the notice as it would do when the award was made; in other words, disobedience to the notice under the circumstances which I have stated is equivalent to a disobedience to the award of the arbitrators.

The Police Magistrate: It would seem to me that no notice was taken of it at all, and that there was no attempt made to improve what the Inspector complained of. And the complaint now is that there is an immense amount of inflammable gas exuding, and that therefore serious bodily injury is threatened to the men working in the mine. This, I may say, is one of the most important cases that has ever come before a Court of Petty Sessions. I have never yet had such an important case before me.

Mr. Want: Your Worship is quite right; the case is a most important one.

Mr. Edmunds: The point which I wish to make clear to your Worship is that my learned friend must not go into the question as to whether Mr. Inspector Dixon was right or wrong.

The Police Magistrate: Of course, that will have to be done.

Mr. Edmunds: Well, your Worship, I submit that it should not be done in this Court. The question as to whether the Inspector was right or wrong in the opinion which he expressed about the mine is a matter for arbitration, and the defendant in this case has not gone to arbitration. So that, for the purposes of this prosecution, the notice is just the same as to the award, because the Act says, "If the owner or agent fail to comply either with the requisition of the notice given by the Inspector when no objection is sent within the time aforesaid, or with the award made on arbitration within twenty days after the receipt of such notice or the making of the award (as the case may be), he shall be guilty of an offence against the Act, and the notice and award shall respectively be deemed to be written notice of such offence." Now, suppose, for instance, that there has been an arbitration, and that Mr. Neilson had consented to be a party to it, what would have resulted? The arbitrators would have made an award, and what would that have resulted in? Either Mr. Neilson would have had to remedy the matters complained of according to the requisition (11, 12, 13, 14, 15, and 16 of the Inspector) or he would not. If he does not remedy the defect according to the award, then he is prosecuted in this Court. I submit, therefore, that this Court cannot inquire whether the award was right or wrong. The Act places that duty upon the arbitrators. And then all that would need to be shown in that case would be the fact that there had been an award made in the usual way, and that the defendant had not complied to its terms within twenty days. Now, I submit that under the circumstances the notice is to be taken as standing precisely in the same position as the award, where there has been an award. What I submit is, that if my learned friend wishes to get behind Mr. Dixon and the information, and say that Mr. Dixon's opinion was wrong, he will endeavour to do something which the Act never intended he should be allowed to do. That should have been done by arbitration. He cannot come here now and question the opinion of the Inspector no more than if there had been an award he could come in here and question the award had the defendant not obeyed it. Therefore, the only question here which your Worship has to consider is, did Mr. Dixon give notice of a practice, in his opinion, dangerous under the Act; second, did the owner or agent proceed to arbitration; and third, did the owner or agent remedy the matter complained of within the time allowed by the Act. And if I establish these facts, then apart altogether from the question

question as to whether Mr. Dixon was right or wrong in his opinion, your duty—and I will admit that Magistrates have to perform unpleasant duties sometimes—is to inflict the penalty provided in the Act. That penalty is not a large one, and cannot exceed £10.

Mr. Want: What does that matter?

Mr. Edmunds: The case is of vast importance, though it may not involve a large pecuniary penalty. At the same time I think that no case has ever come before a Police Magistrate which involves indirectly the lives of so many persons. And if the lives of those persons are to be protected by the officials discharging the duties of Inspectors of Collieries, there is only one way in which it can be done, and that is by taking advantage of the powers given in the 25th section of the Act. If there is a danger which is likely to break out, and which, though not in actual existence, is likely to occur at any moment—as in a sudden outbreak of inflammable gas as at Bulli—then the only way the Inspector can deal with this possible danger is by a notice under the 25th section, such as was served on the defendant in this case. I have read a decision on the point given under the provisions of a section which is precisely the same as the 25th section of our Act, so as to satisfy your Worship. If the owners or agent of a mine think the Inspector is wrong, then the Act says send notice of this to the Minister and you shall have an arbitration to decide whether it is or not, but unless you do this you must obey the Inspector's requisition. The importance of the Inspector's duty demands that respect shall be paid to his opinion; but if he be wrong, or if you think so, then take him before the proper tribunal to test his opinion, but you shall not treat his notice with contempt. You shall not disregard or disobey the Inspector, whoever you may be—be you the manager or owner of the largest or the smallest colliery in the Colony. Therefore, if your Worship finds that the Inspector did give notice, and that that notice was treated with contempt, then it will be your duty (although it may be a painful duty in one sense) to inflict the penalty which the Act provides. Although the punishment is a small one, it will, I hope, be a preservative of great consequence, and it is in this sense that your duty will be a pleasurable duty, because you will be doing something to preserve the men employed in this industry from danger. You are maintaining the authority of the Inspector of Collieries, whose decision must either be set aside on arbitration or respected by these colliery managers, who must not be allowed to set themselves up to ignore the decision of an officer of the Government, whose duty it is to see that proper protection is afforded to the men who are employed in these mines.

Mr. Want: If my learned friend is right, then all that is necessary to prove us guilty is that notice was sent and was disregarded. I thought that this inquiry should certainly last several days, but if my friend's contention be sustainable—and I do not think it is—then the case should not occupy more than ten minutes.

Mr. Edmunds: Quite right; it ought to be settled within that time.

Mr. Want: But I shall show that you are utterly wrong.

Mr. Edmunds: Will you pardon me? I will leave entirely to your Worship the construction of this section of the Act, and if you agree that my interpretation is correct, if Mr. Neilson will plead guilty—

Mr. Want: I cannot allow that to be done, because I am desirous of tendering a large amount of evidence as to the present condition of the mine. I cannot plead guilty, because the last part of the section provides that if the Magistrate sees fit he need not inflict any penalty at all, provided it can be shown that certain remedy is being adopted to remove the matter complained of. I think I will be able to show my learned friend and your Worship that not only is he utterly wrong in his contention, but that he cannot go on with his case. We do not want to go into any technicalities, and I, on behalf of my client, want to know what we are charged with here. The object of counsel for the Crown is evidently to shut our mouths and prevent our getting in evidence as to the present state of the mine, but we want the public, and the whole world for that matter, to know what condition the mine is now in. If we are guilty, nothing is too bad for this Company in the way of punishment. And I now challenge my learned friend to waive all technicalities of every kind and let this case be tried on its merits. I am willing now to withdraw an objection which otherwise, I contend, must be fatal to the Crown case. Now, my learned friend says that it is under the 25th section of the Coal-mines Regulation Act which he is proceeding, but I can show your Worship that that section has nothing whatever to do with this case. He states that the Inspector has only to form an opinion as to the condition of a mine, and then, unless the agent or owner goes to arbitration, he may be fined if a remedy is not applied within a certain time. We are brought here charged with not doing a certain thing, whether we have applied the remedy or not. This 25th clause refers to cases for which no provision has been made in any other part of the Act. Now, the first part of the 25th section says:—"If in any respect, which is not provided against by any express provision of this Act, or by any special rule," &c., clearly providing that such a thing may be dealt with in some other portion of the law. Then they give us notice calling on us to remedy certain things. Who are to tell us how to remedy, or what kind of remedy it is to be? Any man, of course, knows how to put a prop in a mine, but we are called on to do certain other things to prevent bodily harm accruing. But there the question of ventilation comes in, and there are special provisions in the Act dealing with the matter. The first part of the section, as I have said, speaks of "an express provision of this Act" or "special rule" of the mine; now, if I can show you that there is an "express provision" in the Act which deals with what we are charged with, then must not the prosecution fall to the ground?

Mr. Edmunds: I quite admit it.

Mr. Want: Very well. I say that there is an express provision in this Act under which the complaint of yours comes. It is all very well to bring such cases here; but I will ask your Worship to look at the 12th section, sub-sections 2 to 6, which deal with the question of adequate ventilation:—

2. An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases; to such an extent that the working places of the shafts, levels, stables, and workings of such mine, and the travelling roads to and from such working places, shall be in a fit state for working and passing therein.
3. An adequate amount of ventilation shall mean not less (as a minimum) than 100 cubic feet of pure air per minute for each man, boy, and horse, which shall sweep undiminished along the airway past each working place.
4. Within six months after the commencement of this Act every mine shall be divided into districts or splits of not more than seventy men, and each district shall be supplied with a separate current of fresh air. All intake air shall travel free from all stagnant water, stables, and old workings, and no place shall be driven more than 35 yards before the current of air without a cut-through, put-through, or bratticed-up within 3 yards of the face of such working.

5. If at any time it is found by the person in charge of a mine or any part thereof, or by the Examiner or Inspector, that by reason of noxious gases prevailing in such mine or such part thereof, or of any cause whatever, the mine or the said part is dangerous, every workman shall be withdrawn therefrom, and the Examiner or Inspector shall inspect the same (and if the danger arises from inflammable gas shall make such inspection with a locked safety-lamp), and in every case shall make a true report of the condition of such mine or part thereof; and no workman shall, except in so far as is necessary for inquiry into the cause of danger or for the removal thereof or for exploration, be readmitted into the mine, or such part thereof as was so found dangerous, until the same is stated by the Examiner or Inspector to be safe. Every such report shall be recorded in a book which shall be kept at the mine for the purpose, and shall be signed by the person reporting.
6. All entrances to any place not in actual course of working and extension, and suspected to contain or be liable to engender dangerous gas of any kind, shall be properly walled or fenced off, so as to prevent access thereto.

It would have been absurd to have withdrawn all these men from the mine until the case had been settled by arbitration. Now I will read to the end of these rules, and your Worship will find that there is no provision in them requiring the Company to stop their works under a penalty. These are the remaining rules:—

7. Whenever any safety-lamp is required to be used it shall be first examined and securely locked by some person duly authorized for that purpose, who shall keep the key thereof.
8. Every shaft or pit which is out of use or used only as an air-pit shall be securely fenced to the satisfaction of the Examiner or Inspector.
9. Every working or pumping pit or shaft where the natural strata are not safe shall be securely cased or lined or otherwise made secure.

The Police Magistrate: I think the stoppage of works under a penalty was under the 34th section of the Act.

Mr. Want: Exactly so, your Worship; but then the Crown here are prosecuting us under the 25th section. That section, as your Worship will see, provides only for doing things by arbitration which are not provided for by any express provision or rule. The reason for that is this, that the Act draws a distinction between ventilation and something being merely wrong with the mine. With regard to the ventilation, if anything be wrong with it, they may take the men out at once, and it is provided for by the Act rather than by rule; and, therefore, in any case it cannot be brought under the 25th section. There are twenty-one days in which to remedy the matter complained of; but you may arbitrate for six months, and the men are kept at work there all the time. They cannot prosecute us under this 25th section in any way that I can see, because there is another part of the Act which applies to the offence that is charged. The information says:—"Did find a certain part of the said mine, to wit, the places in the vicinity of that part of the said mine known as the Jubilee shaft, dangerous, so as, in his opinion, to threaten bodily injury to persons working in the parts known as the Jubilee districts, inasmuch as inflammable gas was being engendered in the Jubilee headings, and did find that there was a liability of a larger outburst of inflammable gas occurring at any time therein, and that the air current from the said Jubilee shaft, after coursing through the said Jubilee headings, were inflammable gas was exuding—ventilating two splits of sixty-eight and thirty men respectively who worked with naked lights, and that a single door was placed on the main road between the said Jubilee headings." This last is as to ventilation. Now, so far as I think that they cannot prosecute us under this 25th section while this section 12 and its sub-sections remain in existence. But, if your Worship takes a different view to me on this point, there are still the merits of the case, which ought to be considered, and we ought to be allowed to introduce evidence to show the present condition of the mine. They have charged us with three distinct things, and you have to say whether we are guilty or not. What the Crown has really done in this case is to come here and say, as we have given you a certain notice under the 25th section of the Coal-mines Regulation Act, and as you have not complied with that notice or asked to go to arbitration, therefore you are guilty of a breach of the Act. They might have some grounds for doing this if they could show that we had not remedied, but they do not do that. We are charged here, as I have said, with three distinct offences, and it is for your Worship to say whether we are guilty of them or not, which you cannot do unless you agree to the reception of evidence. This is a case which demands that inquiry should not be "burked" by the Government. If his Worship the Police Magistrate goes down this mine he will soon see that the owners and the manager have been grossly and cruelly wronged; and having done this the Crown now come here and attempt to shut the mouths of those interested in the mine. Although they come into Court and repeat their charges and bring this thing to an issue, they do not want to allow evidence to be taken. They put us in a corner, and then refuse to allow us to move out of it. But they go further than this,—they charge us here with not having remedied the things complained of, and, therefore, they will have to go into the facts of the case, and show that the defects of which they made complaint have not been remedied. As to the matter not having been remedied, our reason for coming here is that the whole world may know the condition of the mine, and the perfect safety in which the men are now working. We court the fullest inquiry, and is it right under such circumstances for the Crown to "burk" investigation in this way, and, after making a wrong report as to the state of the mine, shut our mouths? Now, I rely upon this fact that they cannot proceed, for the reasons I have stated, under this 25th section. As the case required immediate attention other steps should have been taken, by withdrawing the men from work, and going on under the 12th section. If they had done this—if they had pursued the only course which the law permitted them, to take and withdraw the men from the mine—who would have dared to have sent the men back again? But even if I am wrong in this matter you will have to go into the merits of the case to see whether we are or are not properly charged with doing a most disgraceful act; but, in any case, I hope your Worship will not allow inquiry to be "burked" in this way, but that you will, for the advantage of the public and the men in this mine, allow the country to know all about its present condition, by receiving the evidence which I am prepared to tender.

Mr. Edmunds: I have said before that this case is one of vast importance, inasmuch as it is the first case that has occurred in this Colony in which the provisions of section 25 of the Coal-mines Regulation Act have been enforced. This is the only section in the Act by which such a case as this, involving a probable

probable sudden outburst of coal-gas can be met. My learned friend, the counsel for the defendant, overlooks the distinction between the danger from gas actually existing in a mine and the danger from a probable outburst of such gas occurring in future. And, in overlooking the distinction, my learned friend tries to make out that we are charging the defendant with having such a quantity of inflammable gas in the mine as would tend to produce an explosion. We are charging the defendant with no such thing. We are charging the defendant with having gases there which show a probability of a greater outburst, as is proved by the very words of the Inspector's notice:—

2. Having by such inspection proved beyond a doubt that inflammable gas was being engendered in the abovenamed places, and in view of the liability of a large outburst of inflammable gas occurring at any time, I hereby, in accordance with the provisions contained in the 25th section of the Coal-mines Regulation Act of 1876, give you notice that, in my opinion, it is a dangerous practice to allow the air current from the Jubilee shaft to ventilate one split of about sixty-eight men, and another split of about thirty men, all working with naked lights, after such current of air has coursed through the Jubilee headings, where the gas is exuding.
3. I would also draw attention to the practice of having only a single trap-door on the main road between the Jubilee headings, where, in my opinion, two doors are necessary.
4. I have, therefore, to urge your serious and immediate attention to the abovenamed matters, with a view to having them remedied as speedily as possible.

The danger, as I have said before, was pointed out by the finger of Providence, and it is the future danger, and not the present risk, which is the question here. My learned friend made some remark about the Crown "burking" inquiry. I say that, so far from this being the case, the Crown is coming here for the first time to have this section construed and its provisions applied. And I think the officers of the Crown deserve credit for bringing this danger to light, showing their honesty of purpose and independence of action. They now come here to get the proper legal interpretation of the section, and of the way in which it is to become operative. The interpretation, which we say is the correct one, is that, after the notice is given and disregarded by the owner or agent (should he refuse to go to arbitration), then the penalty comes in for setting the notice at naught. Because, as I have shown your Worship, in the event of the owner or agent not going to arbitration the notice is exactly the same as the award had there been an arbitration. It is just the same as if the award was broken after having been arrived at by a difficult and costly inquiry. Would my learned friend attempt to come into Court and say that the award, too, was wrong, and that there was no danger in the mine? It is for disobedience of the notice—just as it might have been for disregarding the award, had it been given against him had there been an arbitration—that the defendant is being tried before this Court. We state in the information that "the said John Young Neilson has failed to comply with the requisition of said notice," and nothing else; and it is for non-compliance with this requisition that the defendant is here. It is not that the notice is wrong; it is not that the defendant's mine was in such a condition that large quantities of inflammable gases were liable to be exuded: it is that he has not complied with the notice. This is the very charge in the information. Now I will deal with what my learned friend calls his technical objection. My learned friend says that this is not a case which comes within this 25th section at all, and that we should have taken advantage of other provisions in the Act; and he also states that we want to burk inquiry. We are doing no such thing. If Mr. Neilson is found guilty of this offence, this small penalty clause alone can be imposed on him. He cannot be prosecuted again. I say that we will then serve him with another notice that the same thing is going on, because we conceive it to be our most solemn duty to do so, and then Mr. Neilson can go to arbitration and have the question fully gone into. Where, then, is the use of such observations as my learned friend indulged in?

Mr. Want: The notice does not say one word about this thing tending to cause bodily harm. I will read the notice through, and ask your Worship's attention to this fact:—

J. Y. Neilson, Esquire, Colliery Manager, Wallsend,—
Sir,

Glebeland, 6 January, 1888.

Yesterday (Thursday), accompanied by Mr. J. Mackenzie, Examiner of Coal-fields, I carefully inspected the workings in the vicinity of the Jubilee shaft in connection with the Newcastle-Wallsend Coal Company's colliery, and found inflammable gas very freely exuding from numerous blowers in the floor of the Jubilee headings. Also in the narrow bord, 36 feet in length, 6 feet wide, and 5 feet 9 inches high (near the shaft bottom), inflammable gas could be detected in the Davy lamp 9 inches from the roof at a point 7 yards from the face, and 2 feet 4 inches from the roof 3 yards from the face, and 3 feet 3 inches from the roof at the face.

2. Having by such inspection proved beyond a doubt that inflammable gas was being engendered at the abovenamed places, and in view of the liability of a large outburst of inflammable gas occurring at any time, I hereby, in accordance with the provisions contained in the 25th section of the Coal-mines Regulation Act of 1876, give you notice that, in my opinion, it is a dangerous practice to allow the air current from the Jubilee shaft to ventilate one split of about sixty-eight men, and another split of about thirty men, all working with naked lights, after such current of air has coursed through the Jubilee headings, where the gas is exuding.

3. I would also draw attention to the practice of having only a single trap-door on the main road between the Jubilee headings, where, in my opinion, two doors are necessary.

4. I have, therefore, to urge your serious and immediate attention to the above-mentioned matters, with a view to have them remedied as speedily as possible.

I have, &c.,

JOHN DIXON,
Inspector of Colliceries.

Now, where is there a syllable about this causing bodily injury to anybody?

Mr. Edmunds: I am not to be put off my argument, but I will deal now with this new objection of my learned friend. Just listen to the words of the notice:—"I hereby, in accordance with the provisions of the 25th section of the Coal-mines Regulation Act, &c." Why, Mr. Dixon directs the attention of the defendant to the section itself in using these words. It will be well if your Worship reads the notice yourself.

The Police Magistrate then read the notice.

Mr. Want: There is nothing about "threatening bodily injury" in that.

Mr. Edmunds: The Inspector states distinctly the particulars in which he considers the mine dangerous, and has given notice, as he had a right to do, to have it remedied; and adds:—"I hereby give you notice"—he having found out that there was a liability to large outbursts of inflammable gas—"that, in my opinion, it is a dangerous practice to allow the air current from the Jubilee shaft to ventilate one split of about sixty-eight men, and another split of about thirty men, all working with naked lights, &c." Yet my learned friend says that this does not threaten bodily injury to anyone. How could a sudden outburst

outburst of inflammable gas coming on men who were working with naked lights do anything else than tend to their bodily injury? So that I submit to your Worship that this prosecution is properly brought under this 25th section; and the notice of the Inspector tells the defendant the particulars in which the mine is dangerous.

Mr. Want: I say that this notice refers to what is contained in the 5th sub-section to section 12.

Mr. Edmunds: How can that be, when the writer himself refers to the 25th section.

Mr. Want: His referring to the 25th section does not necessarily bring the notice under that section.

Mr. Edmunds: He told the defendant he was proceeding under the 25th section of the Act. Now, with reference to the other part of this case, as provided for in the special rules. I may tell your Worship that this case has not been brought without full consideration of that point; and this prosecution was not undertaken under this section in order, as my learned friend says, to "burk" inquiry, but rather so that the colliery managers would understand that they would have to do what the Inspectors told them, or else have a full inquiry by arbitration. If the arbitration goes against them they must carry out the award; and not having gone to arbitration they must equally obey the notice of the Inspector; and if they do not obey this notice they commit an offence under this Act, for which they are accordingly liable. And I, as representing the Crown here, say that I would consider it to be a thing very injurious to the administration of this Act if these people could come in here and say that the notice or the award was wrong, because it is necessary, in deciding a matter of this kind, that the Judge should not only be one who was experienced and trained in the law, but one who was acquainted with scientific matters, and with coal-mines particularly. It may be that there is a Police Magistrate here and there who could undertake such duties; but, as a rule, Police Magistrates are men who merely administer the law as they find it; and it may be that such a case as this would come before a gentleman who could not carry himself beyond this administration of the law. Therefore, it was that this tribunal of arbitration was constituted, to ascertain whether the Inspector was right or wrong in requiring certain things to be done. I quite agree that this is a case which demands the fullest inquiry, and no doubt the defendant will have the fullest inquiry given him by-and-bye, because we intend to serve him with another notice to have the thing complained of remedied. Now I will proceed to deal with the point raised by my learned friend that this is a case which is provided for by a special section of the Coal-mines Regulation Act. Fortunately for us we have a decision by one of the highest authorities—by the Court of Appeal in England—binding us to a certain construction of these words. And the words in the English Act are precisely the same as those in our 25th section. The case to which I refer is headed:—"In the matter of the arbitration under the Coal-mines Regulation Act of 1872, between Her Majesty's Secretary of State for the Home Department and Herbert Fletcher," and is reported in 18 Q.B.D. part 3, page 339:—"In an arbitration under S. 46 of the Coal-mines Regulation Act, 1872, the duty of the arbitrator is limited to determining whether the matter complained of by the Inspector is dangerous and ought to be remedied, and he has no power to determine what is the proper remedy, or to direct that any particular remedy be adopted."

Our section 25 re-enacts what is the law in England, and the section in the English Act is that from which ours has been taken; and so we have the advantage of an English decision on these words. Section 46 of the English Act is as follows, and your Worship will see that it is exactly the same as our section 25:—

"If in any respect (which is not provided against by any express provision of this Act or by any special rule) any Inspector finds any mine, or any part thereof, or any matter, thing, or practice in or connected with any such mine, to be dangerous or defective, so as, in his opinion, to threaten or tend to the bodily injury of any person, such Inspector may give notice in writing thereof to the owner or agent of the mine, and shall state in such notice the particulars in which he considers such mine, or any part thereof, or any matter, thing, or practice, to be dangerous or defective, and require the same to be remedied, and unless the same be forthwith remedied the Inspector shall also report the same to the Minister. If the owner or agent of the mine objects to remedy the matter complained of in the notice, he may, within seven days after the receipt of such notice, send his objection in writing, stating the grounds thereof to the Minister, and thereupon the matter shall be determined by arbitration in manner provided by this Act in relation to the special rules, and the date of the receipt of such objection shall be deemed to be the date of the reference. If the owner or agent fail to comply either with the requisition of the notice given by the Inspector, when no objection is sent within the time aforesaid, or with the award made on arbitration, within twenty days after the receipt of such notice or the making of the award, as the case may be, he shall be guilty of an offence against this Act, and the notice and award shall respectively be deemed to be written notice of such offence. Provided that the Court, if satisfied that the owner or agent has taken active measures for complying with the notice or award, but has not with reasonable diligence been able to complete the works, may adjourn any proceedings taken before them for punishing such offence, and if the works are completed within a reasonable time no penalty shall be inflicted. No person shall be precluded by any agreement from doing such acts as may be necessary to comply with the provisions of this section or be liable under any contract to any penalty or forfeiture for doing such acts."

The Police Magistrate: That is word for word with the 25th section of our Act.

Mr. Edmunds: Just so. Now the facts of this case are put the same as those with which your Worship has to deal here. This was the case—that there was a liability, a danger of a sudden outburst of gas—not merely a danger from gas actually existing in the mine, but from a probable sudden outburst. That is precisely the same as the case with which your Worship has to deal here. Here, too, there were the same indications of a liability to a sudden outburst of gas, by gas actually existing.

The Police Magistrate: Yes, that is pretty well understood. There might be very little gas existing at one time, and a great deal at some other time.

Mr. Edmunds: Now, the sub-section which has been quoted by my learned friend refers to gas actually existing. We are not complaining of the actual existence of the gas, but of the liability to a sudden outburst.

The Police Magistrate: There are many ways of getting rid of that gas. In the neighbourhood of volcanic rock, or where there is igneous formation, there is always a large amount of gas.

Mr. Want: It is only the ventilation that is complained of in this case.

Mr.

Mr. Edmunds: And then on the point that this case comes under another section than the 25th, there is the decision of the English Court on facts exactly similar in which action was taken under the same section.

Mr. Want: The facts are not the same.

Mr. Edmunds: Well, I contend that they are; and our Act in this respect is the same as the English one. In England also they have special rules the same as ours. But the Court of Appeal held that the liability to a future outburst did not come under the Act or under the special rules, and therefore we are right in taking proceedings under the 25th section. This very point was raised in the English case, the grounds of the objection to the award being that the umpire had held that there was danger of a future outbreak of gas. These sub-sections were there held to apply to something else, and were not applicable to the facts of that particular case. Now, what did the Judge say in the case:—"It is contended that the matter dealt with in the award (says Lord Esher, Master of the Rolls) is already provided for by the general rules in the Act, and also by the special rules, and is therefore outside the provisions of section 46 of the Act, so that no arbitration could take place under that section. I think, however, that neither the general rules contained in the sixth and seventh sub-sections of section 51, nor the special rules to which we have been referred, are applicable to this case. The necessity for withdrawing workmen from a dangerous mine, and the regulations as to safety-lamps, where they are used, are wide of the question in the present case, which is whether it is necessary for the safety of the workmen to stop the use of open lamps. The opinion I have come to on the second point does not make the Act so preservative of the safety of the workmen as I could have wished, but that does not affect the construction I feel bound to put on the words of the statute. We have to follow the general rule of construction, and put on the words used their ordinary meaning, and see to what conclusion that leads. Now, going through the 46th section, we find, first of all, that the Inspector has to see whether any mine, or part of a mine, or any matter, thing, or practice in or connected with such mine, is dangerous or defective, so as, in his opinion, to threaten or tend to the bodily injury of any person. Then he is to give a notice, and state not merely that the mine or practice is dangerous, but the particulars in which he considers it is so, and to require the same to be remedied. Where does his duty stop? At requiring the matter to be remedied." If Mr. Inspector Dixon had known of this judgment he could not have more closely followed the instructions which the judgment conveys. Then the other Judges (Lords Bowen and Fry) entirely concur, and go into a further discussion on the same point of law. Now, I submit that in this case, the facts being the same—

Mr. Want: The facts are quite different altogether.

Mr. Edmunds: I invite my friend's attention to the report, which shows that the facts are the same in this case as in the one in question. What was the danger in the English case? The liability of a future outburst of gas. What is the danger in the mine here? Just the same liability to a future outburst. What is the law in England with regard to this? That certain things should be done when there is a certain quantity of gas in the mine. This applies to the liability of future outbreaks. Then how can my learned friend say that the facts here are not the same, when they are precisely the same.

The Police Magistrate: It appears to me that the Legislature has seen fit to appoint certain persons to examine collieries in Australia. It appears to me that the chief thing is whether the Inspector has done his duty in what he has done, and whether the Inspector's notice not being attended to he can proceed further. This is the question I think for me to deal with without going into the question of right or wrong at all. This is the thing I have to try, and it seems to me that the notice of the Inspector was not attended to.

Mr. Want: It was, as a matter of fact, attended to.

The Police Magistrate: Supposing the danger had been removed in the meantime. There are certain penalties which colliery owners are subjected to, but which need not be applied. But it is useless, and I cannot help saying it at once that it is useless for the Government to have these examinations of mines made unless the decisions of their Inspectors are upheld.

Mr. Want: But it would be just as wicked if innocent colliery managers were found guilty of something which they had not done.

Mr. Edmunds: We will show that in his notice the Inspector states he formed his opinion from certain facts. That opinion may be right or wrong, but the defendant did not dispute it by going to arbitration. Instead of doing this, he entirely disregarded it, and this, I contend, has made him guilty of an offence under the Act. That is the case for the Crown.

At this stage the Court adjourned for half an hour.

On resuming at 2:30 p.m.,—

John Mackenzie was called in and examined:—

Mr. Edmunds: You are the Examiner of Coal-fields in New South Wales? I am.
Is this the *Gazette* notice of your appointment?

Mr. Want: You need not do that. We will admit Mr. Mackenzie's appointment.

Mr. Edmunds: Very well.

Mr. Want: We will also admit the authority to prosecute. We intend to fight the case on the merits.

Mr. Edmunds: Did you lay the information in this case, Mr. Mackenzie? I did.

And you did this by virtue of your office as Examiner of Coal-fields? Yes.

I want to ask my learned friend if he will admit the proclamation of the Hunter River District?

Mr. Want: Yes.

Mr. Edmunds: Then there are some documents which we may as well put in now—Mr. Mackenzie's report to the Minister.

Mr. Want: I want to see that. It might have reference to the State House.

[Copy of Inspector Dixon's letter to defendant, dated 6th January, 1888, with Mr. Mackenzie's minutes thereon, was then admitted in evidence.]

Mr. Edmunds: Did you forward this document which I hold in my hand as a report to the Minister for Mines under section 25 of the Coal-mines Regulation Act?

Mr. Want: Do not answer that question. I object to this matter altogether.

Witness: I did.

Mr.

Mr. Want : I object to the witness giving his answer when I objected to the question. Be good enough in future, Mr. Mackenzie, not to answer the questions when I tell you not to do so until my objection is heard.

Witness : You told me not to answer the question, but I was not aware that I was not to do so simply because you told me.

Mr. Want : I object to this document being allowed to go in as a report.

Mr. Edmunds : You produce a copy of a letter to the defendant? Yes.

I may state, for your Worship's information, that this is merely a copy of Mr. Dixon's notice to Mr. Neilson, the defendant, and it was sent to the Minister with this minute by Mr. Mackenzie on the margin, "Forward for the information of the Secretary for Mines.—J.M., 7/1/88," and addressed to the Under Secretary for Mines. My friend will admit, I presume, that it was received by the Minister for Mines.

Mr. Want : I will. Might I ask the witness, whether, before he sent in that letter or report, he visited the mine himself?

Witness : Yes; I visited it in company with Mr. Dixon.

Mr. Want : On the 5th of January last? Yes.

Will you tell me whether this plan (produced) is a representation of the Jubilee shaft which you and Mr. Dixon visited on the 5th January? The headings are correctly shown on that plan.

Is the shaft correctly shown? Yes. (After a pause)—Well, no. These workings (*pointing out certain portions on the plan*) were not there then. There was no connection between what is known as the shallow bord and the heading.

Would you tell me was [the connection complete between the Jubilee shaft and this main heading? Yes.

In other words, both these headings were carrying a current of air from the Jubilee shaft? Yes, a current of intake air across numerous blowers, about seventeen in number. When I was there we did not count the blowers.

Did you know, as Examiner of Coal-fields, that these headings had been driven first of all from the main heading towards the Jubilee shaft, and from the Jubilee shaft towards the main headings? They both gave out.

Now I did not ask you that? But I will state it—

Just answer my question? They both contained gases—

We will say that something else contains gases unless you try and keep quiet and answer the questions that I am putting to you.

Witness : You must not think that I am going to be led up to a thing by you. I must answer questions in my own way.

Mr. Want : Well, if you continue this line of conduct I will just ask his Worship to tell you, Mr. Mackenzie, to answer my questions in a proper way.

Witness : But I am doing so.

Mr. Want : You are not. I did not ask you anything about blowers.

Witness : But you will hear of them, though evidently you do not want to.

Mr. Want : Do you know that your Inspectors had examined the Jubilee headings from the main heading before the connection with the Jubilee shaft? An Inspector has done so, but I cannot say that it has been done by Inspectors.

And, therefore, if there were any blowers in this Jubilee heading, as the works went along your Inspector would see it while the work was being done? I cannot say. The Inspector will be able to answer for himself.

Well, as a skilled witness, I want to know what you think about it yourself? I cannot tell you; the Inspectors will do so.

Will you kindly answer my question as a skilled witness. In passing through the headings these blowers would show themselves? Yes.

Was any other work being done in any other heading while you were there? No, none—none in the Jubilee gassy heading.

Is it not a fact that when you saw or inspected these headings they were being used simply as a means of ventilation? This heading—

Will you answer my question yes or no. Were they, or were they not, conduit pipes for ventilation? I will answer you, but I must explain at the same time.

Just answer my question, please? Yes; but they were carrying foul gases to the main workings.

I did not ask you that? Well, I must explain. This was taking the foul air to the men who were working up there in the main working.

You wish to add something to that, do you? Yes; the air was forced down this Jubilee heading and came in contact with the foul gases exuding from the bottom of the Jubilee shaft and the Jubilee heading.

In sufficient quantities to interfere with the proper ventilation? It came in such quantities that if there had been a sudden outburst of gas there would have been serious explosion, such as occurred at Bulli some time ago.

Will you be good enough to answer my question. Did this foul air interfere with the ventilation—I want a yes or no? It did not interfere with the ventilation, but it was taking the air which had become foul with gas to the men who were working with naked lights.

Did you object to this foul air as far as the ventilation of the mine was concerned? I had nothing to do with it. The Act does not allow me to object. I only went with the Inspector.

Can you see any objection to it so far as the ventilation of the mine was concerned in supplying the air to the men? We are not talking about ventilation.

Excuse me, I am, and I want you to answer my question? Well, you are taking the air which has become foul with explosive gas to these men. I fully support my Inspector in reporting the matter.

Do you or do you not see any objection to this ventilation so far as the men were concerned? I do. Why? Because the air was foul with explosive gas.

In your opinion, when these blowers are once cut and no other work is being done there, do they decrease or increase? Well, they have been known to last for years. They have been piped up, but for years the gas has been exuding.

In that heading, as you saw it, with no work being done there, would these blowers increase or decrease in quantity? They might continue as they were, or they might decrease. I do not know that they would decrease, but they might continue in their present state for years. That is the experience which I have had from Home. I do not say that they would increase; they might continue for years, or they might decrease.

They would not increase? No; I would not say that they would not increase. I would be very foolish to say that. The blower that I saw was not likely to increase.

Have you seen the workings this morning or yesterday? No, I have not.

Have you seen them since you were down with Mr. Dixon? I am not the person—it is the Inspector.

But I am a bit curious about what you saw? No; I have not seen the workings since, but apparently you have.

Have you got any idea of the amount of air that was passing through the workings when you were down there? No, but Mr. Dixon measured the air. There were 6,600 feet in No. 3, and about 11,000 going up the two ends. There was an average of about 6,000 cubic feet of air going up each heading to ventilate Nos. 3 and 4 splits.

Where were the nearest men to that working when you saw it? There were no men working when I was down.

Do you know where the men were working? They were working here and there, in this part of the main workings (pointing out certain places on the plan), but really it is the Inspector who should tell you this.

The men were working some distance away from the Jubilee heading? Yes, in the returned air which was foul with gas. I went with the Inspector to see the mine, because I had to send a report on it to the Minister. Bosfield, the overman, told me that the men were working in the returned air fouled by gas.

What did he tell you? He said that there was more gas there than ever there had been in the Bulli mine. He was very anxious that I should go across and see how a light would be whipped out.

Was that your own experience from examination? It certainly was.

You did not order the men out? No, I did not.

Then I presume that you saw no danger at that time? Well, we could not say, because we had naked lights ourselves. We were looking for a future outburst.

But at that time you saw no danger? I cannot tell. It was a dangerous practice, and we might have been blown up ourselves.

And that was why you went with the naked light? No; we did not know of it till we got there.

Did you, as a matter of fact, see any danger from gas while you were in the mine? I looked upon it myself as a dangerous practice.

Now I will have an answer to my question. Did you or did you not see any danger in these workings from gas, as you saw them on that day? No; I cannot say that I did, but—

We will wait for the "but." We are going to have that down first. You can now make your explanations? After walking along the Jubilee heading and seeing the numerous blowers and the quantity of gas exuding from the floor, I thought it a dangerous practice, in view of some future sudden outburst of gas which might occur at any time. I thought it was dangerous to the men who were working there with naked lights in this air, which was fouled by explosive gas.

I asked you concerning the workings as they were? Oh, I know that you want me to say what suits you.

Was it the light you objected to? Yes.

Mr. Edmunds: I think it is now time, your Worship, that I entered formally my objection to this line of examination. It is utterly immaterial to the issue before your Worship what Mr. Mackenzie may have thought or may not have thought. The Act says that the Inspector is the person to examine the mine, and if he thinks that there is a dangerous practice, he is to give notice to the owner or agent and report to the Minister. If the Inspector reports, and no arbitration ensues from his action, then the owner must comply with the requisition in the notice which the Inspector serves upon him. It is utterly immaterial, therefore, what Mr. Mackenzie or any other expert whatever thought of the mine. The issues are whether the Inspector formed such an opinion, whether he gave the requisite notice to have the matter remedied, and whether the owner or agent has complied with this notice and remedied the defect complained of. But whether a witness thinks so and so is quite immaterial to the issue before you, because the defendant has his method of procedure laid down in the Act, and if he thinks that the opinion of the Inspector is a wrong opinion, then the court of arbitration provided for by the Act will settle that matter. But the defendant here not having proceeded to arbitration, he was bound to comply with the notice of the Inspector, and it is only a waste of time to go further with this line of examination. I am bound to take objection to it, and to the incurring of serious expense to the country by allowing this to go further. I therefore ask your Worship's ruling.

Mr. Want: With regard to the incurring of grave expense, I am sure that that will not disturb your Worship.

The Police Magistrate: No, it will not.

Mr. Want: If we wanted to save expense we would simply plead guilty and pay the 40s. fine, and avoid what will now cost us hundreds of pounds. My learned friend ought to know that this is not merely a pecuniary matter; we are fighting this as a matter of principle, and because we consider that we were right in doing what we did do, and we want the public to know it. Your Worship has to decide whether that objection is properly made at this time.

Mr. Edmunds: No.

Mr. Want: I am willing to admit that Mr. Mackenzie's evidence is nothing, but while we have him here—and we know that he is an authority on coal-mining—we have a right to get his opinion. I want to get from him the fact that there was no work being done in these headings, and that when these blowers were cut in this way there was no probability of their increasing; and I want to show you both by this witness and by others that there was no cause to fear any future outbreak of inflammable gas; it was simply a question of air going along which was fouled by gas. We have a number of witnesses here who are prepared to show that this mine is the best ventilated mine in the Colony, and the Crown now come in and try and shut this evidence out in the way that they have done. To amuse the Government

Inspectors and to please them we have made certain alterations which really remedy the matters complained of. First of all, I will admit there was an intention to arbitrate. Mr. Mackenzie now admits that there were no men working there at all, and that the matter involved was simply a passage of air, but I propose to show you that we have actually, at some cost, remedied these things. But I will go further and say that as none of these gentlemen have been down in the mine lately they are not in a position to say whether we have remedied this thing in twenty days or not. As the men worked along the headings they opened the blowers, but there was no gas, and there can be no possibility of any future injury, because there is no work being done. I propose to show that there are two headings connected, and that it was simply a question of ventilation, and then I wanted to ascertain from Mr. Mackenzie the state of the mine when he visited it. The Crown allege that dangerous elements existed in this mine, and say that there is a liability to the outburst of inflammable gases, and they charge us with not remedying the same thing forthwith. If we show that we have done something to remedy all this, then there is an end of this case.

The Police Magistrate: That is what I thoroughly understand.

Mr. Want: That was why I wanted your Worship to go down and see the mine for yourself, and ascertain whether it had been remedied or not. Having Mr. Mackenzie in the box we have a perfect right to ask him whether his Inspectors had gone through the mine to ascertain whether the complaint had been rectified or not. And if he did do it within twenty days, then the Crown are put out of Court altogether. These workings were simply used as a means of ventilating the mine, and the remedy which we effected there had the effect of destroying any danger whatever that existed.

Witness: I never said anything of the kind.

Mr. Want: I did not say that you said so, Mr. Mackenzie; I said that myself; it is a very strange thing that you cannot keep quiet for a while; it seems to me, your Worship, that there is a great amount of feeling being imported into this case. It seems to be a case of Bulli! Bulli!! Bulli!!!

The Police Magistrate: If danger existed in the mine, it was quite right that the Inspectors, warned by the accident at Bulli, should have drawn attention to it.

Mr. Edmunds: Certainly, your Worship; the officers would not be doing their duty unless they were made more active and watchful by this Bulli accident.

The Police Magistrate: I read a great deal about this Bulli accident, and I have come to the conclusion that that great catastrophe would not have occurred if these men had done their duty.

Mr. Want: Well, we merely want to show that our workings are all right.

Mr. Edmunds: Of course if the question before your Worship were as to whether the remedy had been applied or not, my learned friend would be quite right in endeavouring to show that the mine was safe. But that is not the question before the Court. The question is, has the defendant complied with the requisition. He can call all the mining managers in the world, and he would have a perfect right to do it if the circumstances were as he has stated. Now what is the requisition of the notice—to remedy the system of ventilation so as not to take this foul air over to where the men were working. If the defendant can show that he has complied with the requisition by changing the system of ventilation and by putting up a double trap-door, then, of course, it is an answer to the complaint made here. What they have to show is that they have remedied this dangerous practice; but, instead of doing that, my learned friend has tried to get in evidence to prove that it was not at all necessary, and that there never was any danger at all. Their course should have been to have taken the case to a court of arbitration, and if they had not obeyed the award then you would be the judge, and evidence could be received on that point. But now you are the judge as to whether the defendant has obeyed the notice or not. We are now thrown back upon the notice, and we ask you to say whether they got it, and whether or not they obeyed it. But whether the Inspector was right or wrong in his opinion is, as I said before, quite immaterial to the issue, and the questions that have been asked Mr. Mackenzie on that point are quite irrelevant. Let my learned friend show that the defendant has remedied the complaint which we have made, and has changed the system of ventilation, if he can.

Mr. Want: I simply want to show the state which this mine is in, and the state which it was in when the Inspectors visited it, and I say that there has been no alteration since. If I can prove that there was no danger then, and that there is no danger now, that will be sufficient as proving that the matter complained of has been remedied. (*To Witness*): Did you go into the narrow bord in the Jubilee shaft? No.

Were you carried through it? No.

Were you carried through a portion of it? Yes; but Mr. Dixon was the person named in the Act to examine it.

Were you carried by someone along this narrow bord? Yes; for about 20 yards from the shaft.

There was a good deal of water there? Yes.

And there was a good deal of gas there? I cannot tell you what the quantity of gas was that was there, but I could smell it; the place was full of gas; I was going to the narrow bord, but there proved to be no occasion for me to go any further; I came from the tunnel mouth.

And you did not get to the foot of the Jubilee shaft at all? No; but I was within 20 yards of it.

And you say that at that time the place near the Jubilee shaft was full of gas? No, I did not say that. I said that Mr. Dixon has said so.

Well, what do you say? I do not know; I was not there.

Did you not say just now that some place was full of gas? No; I could not have said so of my own knowledge. I was not there to have seen it, and there was no necessity for me to see it.

What is that you say, no necessity for you, the Examiner of Coal-fields, to see this? No; I went with the Inspector.

What did you go with the Inspector for? Because I preferred to go with him.

Why did you not wait till the Inspector came up and reported to you? I went with him to ascertain what he thought about it.

But you could have found that out when he came up. Now, will you tell us why you went down with him? Because I chose to do so.

Will you not tell me your reason for going down? Because I chose to go. I went down to see what the Inspector's opinion was.

Mr. Edmunds: You are Mr. Dixon's superior officer? Yes.

Mr.

Mr. Want: Was that your only reason for going down into the mine to find out what the Inspector's opinion was? Yes; I went to see what his opinion was, and also to form my own. I went down to see whether his opinion was correct or not.

Now, what did you see when you got down there; did you see any place that was full of gas? I couldn't say. Mr. Dixon will tell you all about that.

You know the place where they carried you to and put you on a seat? Yes. They tumbled me into the water, and I remained there.

There was no quantity of gas in that place? Yes; there must have been gas, because it was going towards the heading.

Was there any gas there? I cannot tell you.

Did you or did you not see? I did not go there specially to see that place. I went there to see the ventilation of the mine.

You went to see the ventilation of the mine? Yes, and to see whether it was not a dangerous practice that they were adopting.

Now, was there, or was there not, any quantity of gas at the place where they set you down? I cannot tell you.

Although you went there to see whether there was or not? No; I did not say so. I went to see the condition of the narrow bord.

Now, I ask you again, was there, or was there not, gas there in any quantity, and would not the presence of this gas in any quantity be one of the things that gave an element of danger to the ventilation of the mine? It was; but I do not look for it at that point. I might as well have looked for it down here (pointing to a certain portion of the plan).

Now, having arrived at the last point of your inspection, did you see gas there which formed an element of danger in the ventilation? That was not the last point of inspection. Another place was the last point of inspection.

Well, at the place you inspected near the Jubilee shaft, was there, or was there not, any gas which would be an element of danger to the ventilation? Mr. Dixon will tell you.

Now, I will have an answer from you. At the point to which you were carried, did you see gas in such a quantity as to be an element of danger to the ventilation? No, I did not; but I wish to add to that—

Wait a minute till this goes down.

What I wished to say was that within 20 yards of the Jubilee downcast shaft, down which all the pure intake air was coming from the surface, coursed along the Jubilee headings, where numerous blowers of gas were exuding for about 180 yards in length. And this air is protected by a single trap-door—

Is this answering my question? Yes. The men were working with naked lights in Nos. 3 and 4 split district.

We have your opinion at last? Yes; and if you had allowed me you would have had it before.

At the place where you were carried to the air was pure and was not mixed with gas? There was a little gas, but it was an insignificant quantity.

Do you happen to know that the greater part of Mr. Dixon's complaint was about the gas from this narrow bord being brought down to where you were sitting? I do not think so. I think you will find that you are wrong, but Mr. Dixon will answer this for himself.

The Police Magistrate: I now see what you are aiming at.

Mr. Want: We contend that if there was no gas there a week afterwards, the gas which was seen by the Inspector must have been remedied by us. There was no gas at the bottom of the shaft.

Witness: I was not speaking of the bottom of the shaft.

Mr. Edmunds: My objection to my learned friend's question is that he is going into the matter as to whether Mr. Dixon was right or wrong in the complaint that he made. That has nothing to do with the matter which is now before your Worship; but in any case, Mr. Dixon will be here to speak for himself.

The Police Magistrate: Yes; he must stand or fall on his own evidence.

Mr. Want: These two gentlemen, Mr. Mackenzie and Mr. Dixon, were in the mine together, and if we can show that one said there was no gas there at all—

The Police Magistrate: I understand what you are driving at.

Witness: Excuse me. I never said that no gas existed there. What I said was that there was an insignificant quantity of gas.

John Dixon called in and examined:—

Mr. Edmunds: You are an Inspector of Collieries? Yes.

You are an Inspector for the Northern District? Yes; stationed in the Northern District.

Will my learned friend admit Mr. Dixon's appointment—we have the proclamation of *Gazette* notice here?

Mr. Want: Yes, we will admit all that.

Mr. Edmunds: Do you know the Newcastle-Wallsend Mine? I do.

Is that mine in the Northern District? Yes.

Who are the owners of that mine? The Newcastle-Wallsend Coal Company.

And who is the person having, for the time being, the care and direction of this colliery?

Mr. Want: We will admit at once that the defendant is the agent for the owners of the mine.

Mr. Edmunds: As an Inspector of Collieries, did you inspect the Newcastle-Wallsend Mine on the 5th January, 1888? I did.

Did you find there any practice in existence which, in your opinion—

Mr. Want: I object to that. Let the witness answer as to what he found in the mine.

Mr. Edmunds: All right. Did you find any special practice in that mine—

Mr. Want: Ask him what he found there at once.

Mr. Edmunds: But the Inspector might have found coal or water or gas there.

Witness: I found a practice existing in that mine on that day which, in my opinion, was dangerous.

Mr. Want: What was that practice?

Mr.

Mr. Edmunds: I am going into that matter presently. We will have all that by-and-bye. (*To the witness*): To what extent, in your opinion, was the practice that you found there dangerous? I consider that it was highly dangerous.

In what manner was it dangerous? Its continuance tended to the bodily injury of the persons employed in the vicinity.

Mr. Want: He has evidently read the section.

Mr. Edmunds: Yes, under my advice. We have read it together.

Mr. Want: I know you have.

Mr. Edmunds: Now, what was that practice which you observed in the mine on that occasion? The practice that I saw was this, the coursing of a current of air impregnated with inflammable gas into two splits or districts where naked lights were being used.

Was there anything else defective or dangerous —

Mr. Want: Let him go on himself without suggesting answers.

Witness: Well, that was the practice that I saw.

Mr. Edmunds: Will you show us on the plan exactly what you did see? I came from the main workings down the main road to the Jubilee heading—going down the Jubilee headings or down a section of the Jubilee headings, where I found numerous blowers of inflammable gas. I passed down to the Jubilee shaft and swung across the Jubilee shaft in a bucket into this narrow bord. In that narrow bord there was standing gas. The thickness of the gas in the face of that narrow bord was 3 feet 5 inches; 3 yards back from the face it was 2 feet 4 inches; 7 yards back from the face it was 9 inches; and from that point it tailed off to the lip of the shaft. Three measurements had to be taken of it, and I reckoned there were somewhere about 300 cubic feet of inflammable gas in the bord at that time.

After that, what did you see? We came back over the blowers again to the point marked D on the plan B on the main road; then round this narrow bord or continuation of the main road to the place hanging canvas.

Well, and after that? After that I passed out, as I was then pretty wet.

Now, I want you to say what you thought of the system of ventilation?

Mr. Want: I object.

The Police Magistrate: That will not weigh with me one bit.

Mr. Want: But it may bring us into other things.

Mr. Edmunds: Now, will you describe the system of ventilation that you found in practice there? The system of ventilation was in taking the air down the downcast Jubilee shaft and along the Jubilee headings, where I found the blowers, and into the two splits called No. 3 and No. 4.

Do you know how many men were working in these splits? Sixty-four in one split and thirty in the other.

How was the air current regulated? The air current here was split partly by a regulator marked on the plan B; and this split by this trap-door.

How many trap-doors? It was a single door.

Was there no trapper boy there? No, no trapper.

Now, I want to ask you what your opinion is, or whether you formed any opinion at all as to the system of ventilation; and, if you did form an opinion, what that opinion was? Yes; I formed an opinion as to the ventilation at the time of this inspection.

And might I ask if your opinion of the ventilation is still the same? Yes; and that opinion is that it is a dangerous practice to utilize the intake air which has already been impregnated with inflammable gas.

To utilize the intake air in what? In ventilating places where people are working with naked lights.

Have you also formed an opinion as to the trap-door? Yes?

What was it? I considered that a single trap-door was not enough.

And you still hold that opinion? I do.

In what respect, in your opinion, was this system of ventilation dangerous? Through the air being impregnated with inflammable gas.

But in what way? Through the gas coming into contact with naked lights.

Do you mean by that, the gas coming in? Yes; I saw that if any inflammable mixture was allowed to come in and get in contact with naked lights there would be an explosion.

Now, was there danger from the gas in the mine at the time that you saw it? Yes.

Are you speaking of the actual quantity of gas that was then exuding or what? I am not speaking of the actual quantity of gas which was in that part of the mine, but of the gas which might be there? There was something more than that, there was always the liability to a sudden outburst. I had that in my mind when I was answering your question.

Mr. Want: There is one remedy for that, which is never to open the mine at all.

Mr. Edmunds: Now, I will ask you again, in what respect do you consider having only one trap-door affects the ventilation? The matter is very simple. Supposing that one trap-door were open, the current of air would pass through the door and get in the furthest split by the shorter road. It would rob the large split of its due. If the door were open, the air would pass into the smaller split known as No. 4, and would rob the men working in No. 3, through which the air should pass if it took its proper course.

How would this affect the men in No. 3 split? They would not have so much air as if that door were opened.

Would the air which they would obtain be at all sufficient? Not according to the requirements of the Act—not nearly sufficient.

After your inspection, did you send this notice to Mr. Neilson:—

J. Y. Neilson, Esq., Colliery Manager, Wallsend,—

Sir,

Yesterday (Thursday), accompanied by Mr. J. Mackenzie, Examiner of Coal-fields, I carefully inspected the workings in the vicinity of the Jubilee shaft in connection with the Newcastle-Wallsend Coal Company's Colliery, and found inflammable gas very freely exuding from numerous blowers in the floor of the Jubilee headings. Also in the narrow bord, 36 feet in length, 6 feet wide, and 5 feet 9 inches high (near the shaft bottom), inflammable gas could be detected in the Davy lamp 9 inches from the roof at a point 7 yards from the face, and 2 feet 4 inches from the roof 3 yards from the face, and 3 feet 5 inches from the roof at the face.

2. Having by such inspection proved beyond a doubt that inflammable gas was being engendered at the above-named places, and in view of the liability of a large outburst of inflammable gas occurring at any time, I hereby, in accordance with the provisions contained in the 25th section of the Coal-mines Regulation Act of 1876, give you notice that, in my opinion, it is a dangerous practice to allow the air current from the Jubilee shaft to ventilate one split of about sixty-eight men and another split of about thirty men, all working with naked lights, after such current of air has coursed through the Jubilee headings, where the gas is exuding.

3. I would also draw attention to the practice of having only a single trap-door on the main road between the Jubilee headings, where, in my opinion, two doors are necessary.

4. I have therefore to urge your serious and immediate attention to the above-named matters, with a view to have them remedied as speedily as possible.

I have, &c.,
JOHN DIXON.

I did.

Having served that notice, did you do anything else as Inspector of Collieries? Yes; I reported the matter to the Minister for Mines.

Mr. Want: Was the report in writing? Yes. The extract marked A is the report referred to.

Mr. Edmunds: Do you know Mr. Neilson's signature? Yes.

Perhaps my learned friend will also admit that this letter was written with Mr. Neilson's knowledge?

Mr. Want: Yes; we will admit it.

Mr. Edmunds: You received this as a reply from Mr. Neilson? Yes.

Have you received any other reply? No.

This is the letter:—

(88-895.)

Newcastle-Wallsend Coal Company, Sydney, 13 January, 1888.

Sir,

I am instructed to write you in reference to a notice given by Mr. John Dixon, Inspector of Collieries, dated the 6th January instant, to Mr. Neilson, this Company's Colliery Manager, of which you have doubtless been informed, and will explain the particulars as to ventilation at the several places mentioned, which will, I think, show that the complaints made by Mr. Dixon cannot be sustained. In reference to paragraph No. 1, there are, no doubt, several small fissures from which a small quantity of gas exudes, but not sufficient to be likely to cause bodily injury to the miners.

These fissures at first only gave off about 40 feet of gas per hour. Since opening out some two months ago this amount has considerably decreased by the natural drainage of the gas. Even taking the maximum of 40 feet per hour, 600 cubic feet of fresh air per hour would be sufficient to dilute and render harmless this quantity of gas, whereas 90,000 cubic feet of pure and undiluted air at only 300 feet from the surface are passing these places at the rate of 400 feet per minute, and no irregularity in the details of ventilation can possibly diminish this quantity. I therefore respectfully submit there can be no danger from the gas from these fissures in the vicinity of the bottom of the Jubilee shaft. With regard to the narrow bord, no doubt a small quantity of gas is to be found, but the gas exuding from this place is included in the 40 feet above-mentioned, and cannot possibly do any harm to any person, as the place cannot be reached without the assistance of the sinking-engine at the ventilating shaft, except by swimming. On Mr. Dixon's visit recourse was had to the sinking-bucket to swing him into this place. I therefore submit this place cannot be a source of danger. In ordinary course of working the ventilation in this place would be properly attended to.

In reply to paragraph 2 of Mr. Dixon's letter, in which he states that by the inspection above referred to he has proved beyond a doubt that inflammable gas is being engendered in the above-named places, and in view of the liability of a larger outburst of inflammable gas occurring at any time, &c., &c., I would observe that the shaft mentioned by Mr. Dixon, known as the Jubilee shaft, is one that the Company has just completed sinking for the purpose of providing improved ventilation in a portion of their mine which it is intended to open out, that the Company has driven over 30 chains through virgin coal to connect with this ventilating shaft, during which time gas has nearly always issued from small fissures at the faces of drives, and been sufficiently ventilated by ordinary brattices. The connection is now complete, leaving the coal all open for the gas to drain off. All workings are suspended up to within 400 yards of the ventilating shaft bottom, so that it is impossible for a larger outburst to take place, and there can be no risk to any one until working is resumed there.

In regard to paragraph 3 in Mr. Dixon's notice, I have to point out that the matter of the door does not in any way affect the question of gas in the Jubilee heading.

In conclusion, I am desired to say that during the sinking of this ventilating shaft Mr. Dixon has frequently visited the same, and any suggestions he has made have been attended to. Mr. Bates also has visited the shaft, and the same remark may be made as to him.

The sinking of this ventilating shaft has but recently been finished, and the connection with the Company's tunnel workings just completed. A very powerful Grubal fan is about ready for shipment from England, with the intention of making the ventilation of the Wallsend Mine as good, if not better, than it has ever been.

My Board feel, however, that there does not exist sufficient ground for the notice given in Mr. Dixon's letter, and I am directed, therefore, to say that if you should consider, after inquiry, that it is necessary to take any action in regard to Mr. Dixon's notice, the Company claim to have the matter referred to arbitration, in terms of the clause of the Coal-fields Regulation Act, section 25.

I have, &c.,
F. W. BINNEY,
Secretary.

The Honorable the Minister for Mines, Sydney.

This notice having been received within the prescribed time, the matter must now be referred to arbitration, in terms of the Coal-mines Regulation Act, section 25.—H.W., 15/1/88. Submitted. Approved.—F.A., 13/1/88.

You received this seven days after the notice was sent? Yes.

I propose, your Worship, to put in all correspondence that passed between the defendant's Company and the Minister for Mines, if my learned friend has no objection.

Mr. Want: I am much obliged to you, but I will do my own work.

Mr. Edmunds: The Minister for Mines received letters from Mr. Binney, the Secretary of the Newcastle-Wallsend Coal Company, on the 24th January and 21st February, and these letters I propose to put in evidence. They are as follows:—

(88-1,738.)

Newcastle-Wallsend Coal Company, Sydney, February, 1888.

Sir,

I have to acknowledge your letter of this date, and, in reply, have to inform you that I have had no Board meeting since my interview with the Minister. My Directors meet on Thursday, when I shall report the result of my interview with the Minister, and will then communicate with you further.

I have, &c.,
F. W. BINNEY,
Secretary.

Harrie Wood, Esq., Under Secretary for Mines, Sydney.

Submitted for the information of the Minister.—H.W., 8/2/88. Seen.—F.A., 8/2/88. Regret might be expressed that the owners think it necessary to refer this matter to the Board of Directors, instead of allowing their agent (Mr. Neilson) to deal with it, as the delay caused thereby may defeat the intentions of the Act.—H.W., 8/2/88. Submitted. Approved.—F.A., 9/2/88. Mr. Binney, 9/2/88.

(88-1,738.)

Newcastle-Wallsend Coal Company, Sydney, 1 February, 1888.

Dear Mr. Wood,

I have read your letter of the 31st, and from the reference to your letter of the 18th it would seem that you had not received my acknowledgment of same sent on the 24th January; is this so?

I am, &c.,
F. W. BINNEY.

Harrie Wood, Esq.

Inform that the letter referred to had been read, and take the action directed by the Minister on that letter.—H.W., 1/2/88. Mr. Binney informed and action taken on 2nd February, 1888. Mr. Binney reminded, 7th February, 1888. Newcastle-

Sir, Newcastle-Wallsend Coal Company, Sydney, 24 January, 1888.

I have the honor to acknowledge your letter of the 18th instant, informing me that you are directed by the Secretary for Mines to call upon this Company to appoint an arbitrator at once, in terms of the Coal-fields Regulation Act, section 35, in respect to the complaint lodged by Mr. Inspector Dixon.

I laid your letter before my Board on the 19th instant, and expect, in the course of a few days, to be able to give you the name of the arbitrator appointed by this Company.

I have, &c.,

F. W. BINNEY,

Secretary.

Harrie Wood, Esq., Under Secretary for Mines, Sydney.

Submitted for the information of the Minister.—H.W., 5/1/88. Seen. As the question involved in this case is one of danger to the miners working in the Company's mine, no time should be lost in having it settled.—F.A., 1/2/88.

Sir, Newcastle-Wallsend Coal Company, Sydney, 14 February, 1888.

I beg to acknowledge your letter of the 13th instant, in reference to mine of the 9th instant, and to state that in writing to request the withdrawal of the offer to submit the matter to arbitration the intention of the Directors of the Company was to leave the course free for any other steps the Minister might think fit to take in reference to the notice given by Mr. Inspector Dixon in his letter of the 6th January last. At the same time, my Board thought that the Minister would probably be good enough to direct a further inspection by Mr. Dixon, on the information given in my letter as to the steps the Company was taking in reference to the ventilation.

I have, &c.,

F. W. BINNEY,

Secretary.

Harrie Wood, Esq., Under Secretary for Mines, Sydney.

The contention of this Department is that, at the date of the Inspector's notice, they were working in violation of the Coal-mines Regulation Act, and that the question should be determined by arbitration or by a Court of law. Until the owners either withdraw their objection, or appoint an arbitrator, the hands of the Department are tied. The period within which proceedings can be taken has nearly expired, and the delay on the part of the Company, if persisted in, will have the effect of preventing the question being tested. It cannot be supposed that the owners desire to prevent the matter being brought into Court, and therefore they should at once withdraw their objection, or, if they prefer, appoint an arbitrator.—H.W., 15/2/88.

Submitted. Approved.—F.A., 15/2/88. Mr. Binney, 16/2/88.

Sir, Newcastle-Wallsend Coal Company, Sydney, 9 February, 1888.

In reference to an interview which I had with the Minister for Mines, your letter of the 7th February, and the correspondence which has taken place in regard to the ventilation of the Wallsend mine, I am instructed by my Directors to say that they wish to withdraw the request made in my letter of the 13th January, for the submission to arbitration of the matters referred to in Mr. Inspector Dixon's notice of the 6th January. They desire me to state for your information that the portion of the mine more particularly mentioned by Mr. Dixon is not being worked for coal-getting, but only for necessary work in preparation for the completion of the system of ventilation by means of a fan; and that the works in connection with this ventilation have been in progress since May, 1887, and the fan was ordered from England so long ago as 10th September last year, and is now on the way, and expected here in March. Under these circumstances, my Board desire me to submit to you that a further inspection might be made by Mr. Dixon, in order to satisfy you that the Company is taking all necessary steps to avoid ground for complaint.

I have, &c.,

F. W. BINNEY,

Secretary.

The Under Secretary for Mines.

The Examiner of Coal-fields.—H.W., 9/2/88.

After consultation with the Examiner, I submit that the question at issue is one which should be settled by arbitration or by a competent Court. Therefore, the owners should either withdraw the objection, so that proceedings may be taken for non-compliance with the notice, or they should appoint an arbitrator, so that the question may be settled by arbitration.—H.W., 10/2/88.

Submitted. Approved.—F.A., 11/2/88. Mr. Binney.—13/2/88.

Sir, Newcastle-Wallsend Coal Company, Sydney, 21 February, 1888.

In reply to your letter of the 16th instant, I have the honor to inform you that the intention of the Board was to withdraw any objection to proceedings being taken by the Minister in regard to the notice given in Mr. Inspector Dixon's letter of the 6th January last. As, however, the Minister does not consider my letter of the 14th instant a sufficient withdrawal of the objection, I beg now, on behalf of the Company, to withdraw any objection raised by the Company which in any way prevents action on the part of the Minister for Mines in respect of the complaint made by Mr. Inspector Dixon in his notice of the 6th January last.

I have, &c.,

F. W. BINNEY,

Secretary.

Harrie Wood, Esq., Under Secretary for Mines, Sydney.

Proceedings may now be taken to enforce the penalty under the Act.—H.W., 21/2/88. Submitted. Approved.—F.A., 21/2/88. The Examiner, 21/2/88.

Mr. Want: I have no objection to anything going in which has any connection with Mr. Neilson as colliery manager.

Mr. Edmunds: I wished your Worship to know exactly what had transpired between the Minister for Mines and the defendant here. This is all the correspondence.

The Police Magistrate: It appears that the offer of arbitration was made first, and then withdrawn.

Mr. Want: Yes, in order to allow them to come into Court?

Mr. Edmunds: Now, Mr. Dixon, referring to your notice, in which you say that, in view of the liability of a large outburst of inflammable gas occurring at any time, I hereby, in accordance with the provisions contained in the 25th section of the Coal-mines Regulation Act of 1876, give you notice that, in my opinion, it is a dangerous practice to allow the air current from the Jubilee shaft to ventilate one split of about sixty-eight men and another split of about thirty men, all working with naked lights, after such current of air has coursed through the Jubilee headings, where gas is exuding. I would also draw your attention to the practice of having only a single trap-door on the main road between the Jubilee headings, where, in my opinion, two doors are necessary. I have therefore to urge your serious and immediate attention to the abovenamed matters, with a view to having them remedied as speedily as possible. I want to ask you if you are in a position to say whether there has been any remedy to this complaint? No; there has been no remedy.

For either of these complaints? No, for neither of them.

Has the system of ventilation been in any way changed? The system of ventilation now is the same as when I notified the manager. The single door is there, and is the same.

Do the men still work with naked lights in Nos. 3 and 4 splits? They do.

And have they continued to do so? So far as I know, they have worked with naked lights all through.

Did you make another careful inspection of the mine in order to ascertain whether your requisition had been complied with or not? Yes, I did. I inspected it to see if the matters had been remedied, and I found the mine the same as it was on the 5th January.

When

When did you make this further inspection? Yesterday.

Were there any men working in the splits Nos. 3 and 4 then? Yes, men working in both splits with naked lights.

The system of ventilation is a pretty costly thing? Yes; but it depends mainly on the circumstances.

I am referring to this particular case. Is not the system of ventilation a thing that cannot be easily changed in a day or two? It can be changed, but it would cost money.

Is it a fact that the ventilation is the same now as at the time of your notice? Yes.

What would be the effect to the Company of which Mr. Neilson is the agent in case the men were compelled to work with safety-lamps instead of with naked lights? I should think that the working with safety-lamps would be more costly. A man would naturally demand more for getting coal per ton with a safety-lamp than with a naked light.

About how much more would a man working with a safety-lamp charge per ton? I can only give you an opinion about that, but I should say the cost would be about 3d. per ton. However, this is simply my opinion.

What had been done in that narrow bord since your last inspection—what alterations did you find in the narrow bord?—

Mr. Want: He has said there was no alteration.

Witness: No, I did not. I said that another heading had been made in the narrow bord, and that the standing gas had been removed. The current of air was coursing through.

And did you also look in the split where the blowers were? Yes.

Did you still find indications of inflammable gas? I did.

You still found inflammable gas exuding? Yes.

The Police Magistrate: Was it a straight wall or bord from which the gas was coming? A straight heading.

Mr. Want: Were the men working there yesterday? Yes; right down on the Jubilee headings, working the coal.

You do not mean making the heading a little wider or anything of that? Yes; but that is working the coal.

Am I to understand you to say that, when you saw this on the 6th January, you found this mine in a state which was dangerous and defective, and which threatened bodily injury to the men who were working there? Yes, I do. But this occurred on the 5th January.

You have not seen that mine since then until the day before yesterday? No. I have not been down since then until yesterday.

Were you in any part of the mine till yesterday? No.

And you swear that it is in the same condition now as you have described? No, I never swore that. I said that the air was travelling the same way.

Did you not say that you found this mine in the same condition? No, I did not.

Did you not say that there have been no complaints except the complaints referred to in my notice? Yes, of that character—that is, in the course of the current of air and the trap-door.

Is there now in that mine anything which would indicate that it is dangerous or defective, or that there is anything in any part of the mine dangerous to the persons who are working in it? I hold —

Answer the question, yes or no? I do not think that I should be called upon to give a simple yes or no to a question like that.

Mr. Edmunds: The witness may say yes or no to the question, and explain afterwards.

Mr. Want: If the Police Magistrate goes down into that mine to-morrow, will he find anything there which is dangerous to anybody, or defective, or tending to the bodily injury of the persons working in the mine? Yes, he will.

Now, let us have your explanation? Whoever visits the mine to-morrow will find that there is gas still exuding in the Jubilee heading, and that this air is still being forced into Nos. 3 and 4 splits where the men are working with naked lights, and where there may occur a sudden outburst of gas.

There may occur a sudden outburst? Yes.

But that may occur in any colliery? No, not in any colliery; but I have good grounds for thinking the causes of these splits are in what is termed virgin ground. And it is well known that where inflammable gas is found in this sort of ground that there is liability to an eruption and an outburst of gas.

What, another outburst? No; I mean the same one.

But we have had it now about three times? There are some foul spots in there which might foul the whole length of the heading in a very short time, when this foul air coming into contact with naked lights would necessarily result in an explosion.

Especially if there were dynamite there;—is not that so, Mr. Dixon? Well, I see you are getting rather restive. You had better start again.

I shall have a good stock of information when I am done with you. Now, what is there in that mine which is dangerous or defective;—what is dangerous in it? The exuding of gas.

And what is defective? The door.

The door. And what did you find there which you think tended to the bodily injury of the persons working in the mine? That is my opinion.

How much of that mine has been worked through virgin ground? About a couple of hundred yards, I should think.

What is the difference between driving through virgin ground and fresh ground? In virgin ground gas may be found in faults.

Did you ever come across any blowers in that mine before? Never.

As a matter of fact, these few blowers that are there —

Mr. Edmunds: "Few blowers," indeed.

The Police Magistrate: There might be enough there to blow us all up.

Mr. Want: No; I will insure your Worship's life for a farthing against any danger from gas in that mine. (*To Witness*): How many blowers are there? I will not give a guess, because it is very difficult to speak when men are shovelling coal about. I think it is safe to say that there is half the quantity already mentioned.

So that anyone going along there will see one-half the quantity that you did? I do not say that, because there is now more ground open. Can

Can you point out half a dozen blowers in the mine? I think I could.

Now, you say that you complained about this system of ventilation, and you stated also that it could have been improved by the expenditure of money;—what would you recommend? I do not propose to recommend anything. It is not my duty at all. I daresay the system of ventilation could be changed, but it would cost money. I am not here to advise anyone.

Was there any remedy, in your opinion, for the defects you state you saw in the ventilation of the mine? Yes, there was.

What was that remedy? It is not for me to advise or to recommend any remedy.

I do not care whether it is or not. Never mind your Inspectorship at all, but answer my question. I ask you this—you say this to the owners of the Colliery, "Remedy this defect as soon as possible"—now what do you mean? I meant that these things should be remedied, and I ask Mr. Neilson to remedy that.

The Police Magistrate: The remedy is to be devised by the arbitrators, and it is not for the Inspector to say what the remedy shall be.

Mr. Want: Exactly, your Worship; but what I want to get from the witness is a statement as to what his remedy would have been.

The Police Magistrate: The remedy would rest with the arbitrators.

Mr. Want: No, I do not think so. I am not asking the witness what he would do as an Inspector of Collieries, but I am asking him his opinion as a person who is skilled in the matter.

The Police Magistrate: Yes. The Inspector is in a very peculiar position; if he give advice and a certain thing is done it may fall to his duty by-and-bye to condemn what has been done by his advice. I, therefore, do not think that he should be asked to state what he would have done in the matter.

Mr. Want: But this is done as a cross-examination about the defendant's knowledge of coal-mining. I may have the idea that Mr. Dixon is a new chum at this business. I mention this to show you that I have a right to demand that my questions shall be answered.

The Police Magistrate: I understand you well, but still I do not think the witness should be asked to answer the question. It might place him in a very awkward position by-and-bye.

Mr. Want: Well, I will ask your Worship to take a note of it.

The Police Magistrate: You will find plenty of people who will suggest a remedy, and then ask the Inspector what his opinion is about it, and as to whether the proposed alterations meet his views or not.

Mr. Want: All right. You say that one cause of complaint was with regard to the door, and you say also that this prevented the men from getting the quantity of air required by the Act? Yes.

So that one of your causes of complaint might have been a breach of sub-section 3 of section 12? No; what I contend is, that the door might have prevented the men from getting the proper amount of air required by the Act.

Now, you say in one of these letters that there is a statement made there complaining that the Inspector has examined this work before the Jubilee shaft was reached at all. Is it a fact that you and others were there while these headings were worked up, and before the effect of the junction with the Jubilee shaft? It is a fact that I was not there, but I believe Mr. Bates was. I was not in with him. And it is another fact that I never gave advice about that, as the letter states.

Suppose these blowers that you saw there had been struck before the men effected the junction, inflammable gas would have gone down to where the men were working from the Jubilee shaft without any ventilation? Yes.

And I suppose that the air would then be very much worse than it is now? That is what I cannot tell you, because I was never down there.

Don't you think that if it was bad then it would be worse now? I do not call the Jubilee shaft any benefit to the ventilation at all.

You say that this narrow bord was full of gas? I did not say anything about its being full of gas. I said that there were about 300 feet of gas there. That gas would be making all the time, and this current of air would sweep the gas out across the shaft into the Jubilee headings on to these men.

Did you notice much of that gas coming out of the narrow bord? Well, unfortunately, we could not see it, but I know it was darting out everywhere then.

Now, I understand you to have said that this place you were in was dangerous and so forth—how long was it left without any other Inspector going to see it? You misunderstand my meaning of the word ventilation there. What I meant was that the place was always liable to a sudden outburst of gas.

And being liable to this sudden outburst of gas, how long was it before any Inspector went to see it again? Well, I did not go there again until yesterday.

Your first visit was about two months ago? Yes.

You have noticed in the Company's letters to the Minister that they make a request that you should go to see the place again? I have heard the letters read; but I had no request from the Minister for Mines to go and see the place again.

Could you detect any gas away from these blowers in any shape or form? No; no gas apart from the blowers, and what was standing in the bord when I examined it.

I suppose these blowers you could detect by putting a light to them? You could detect them about 20 yards away by listening to them. They have since decreased in sound on account of other headings having been opened alongside of them. This has been done since the 5th January.

Will you tell me what quantity of air was passing through the headings—did you test this on the 5th January? I did. It was about 13,000 cubic feet per minute.

Could you give me any idea of the quantity of gas that was coming from these blowers? No, I cannot. That can only be gauged in one way.

The Police Magistrate: That is the very thing I wanted to ask.

Mr. Want: Were not these blowers something like those lights which one sees in tobacconists' shops? Yes, something like that.

But you cannot give me any idea of the quantity of gas that comes from these blowers? No; I do not profess to be able to do that.

And can you give me any idea of the quantity of gas that would be required to make an explosion? Well, you can easily get that information. The Royal Commission that reported on the subject state that you can get an explosion with 4 per cent., but the school that we have been taught in teaches 9 per cent. as likely to cause an explosion. But another school that has been started, and I think they are right, say that 4 per cent will cause an explosion. We can learn a great deal from that. *The*

The Police Magistrate : Are there any igneous rocks about there? No; it is shale, but it is in the fault that you get the gas.

Is it not the case that the coal which comes in junction with igneous rock very often destroys the gas? Yes.

And but for that, an immense amount of gas would be generated? Yes.

Mr. Want : What I want to know is this, do you know that there are four openings in that fault already? I cannot say. We might have passed through it three or four times. I have given you most unhesitatingly my opinion.

Just answer my question. Suppose these blowers were not there, is not the ventilation of that place complete? Yes; I should say that the ventilation was all right, if there were no gas there.

Then it is the quantity of gas that is there which alone causes you to find fault? Yes; it is the fact of this place making the gas and forcing it over to where the men are working that made me serve the notice on the defendant. I may tell you that, in view of recent events, I would have served a notice on my own father under similar circumstances.

I have no doubt of that. It is a question of whether there is enough gas there to foul the air? It is a matter of opinion all along.

Was it the quantity of gas that actually existed there, or was it the quantity that was liable to come there that induced you to give the notice? Yes, that is it—the liability of more coming there.

The Police Magistrate : You never can be sure of the amount of gas that will sometimes burst out.

Mr. Want : Will you tell me this: If there was no increase of gas—and there might not have been any increase—would there be any harm at all, that is, putting aside the possibility of which you speak? As long as there is a liability there, and this cutting of the downcast shaft—

You do not appear to have heard what I said. I say putting aside possibilities? Yes; but we cannot put aside possibilities.

But supposing this—? I do not presume to say that there is so much gas being made there now as on the 5th January. I have told you that several times over.

But supposing there is no increase of gas from these blowers, would there be any danger to the men working in the mine? You are supposing something now from my notice.

Answer my question. Supposing that the gas had not increased at all since the 5th January, is the amount of gas there now detrimental to anybody? What is the use of asking me that, when men are actually working there now.

Will you just answer my question. Is the amount of gas there likely to be injurious to anybody? I cannot tell you; I am not in a position.

The Police Magistrate : Will not 5 per cent. of gas affect a man working in a mine? Yes; 5 per cent. of gas will affect a man in more ways than one, because it might get up a fire about him, and if we get it up to 9 per cent., its influence would be greater even from the miner's point of view.

Will 30 per cent. of gas destroy life? Yes.

And 5 per cent. of gas mixed with the intake air would cause an amount of prostration, while 2 or 3 per cent. would weaken a man so that he would feel it after a time? Yes.

Mr. Want : Was the gas coming out interfering with the ventilation? I cannot tell you the amount of gas that was coming out.

Can you give me any idea now as to the effect the gas had on the ventilation? No; not unless I knew what amount of gas was coming out of the place. The gas may be coming out more quietly than it did on the 5th January.

At 6 o'clock the Court adjourned until 10 o'clock on the following day.

FRIDAY, 9 MARCH.

The Court met at 10 a.m.

Mr. Edmunds said: I tender your Worship the general and special rules of the Newcastle-Wallsend Coal Company's mine, which are as follows:—

GENERAL RULES UNDER THE COAL-MINES REGULATION ACT, 1876.

The following general rules shall be observed in every colliery:—

1. Within one year and six months after commencing the working of any bord, stalls, or longwall workings in any mine, there shall be made and completed at least two separate and distinct openings to the day or surface from such mine, intercommunicating with each other, by means of either of which openings all persons employed in the colliery may at all times whatsoever pass in or out. Provided that if in any mine such bords, stalls, or longwall workings shall have been commenced before the passing of this Act, and without a second such opening as aforesaid, the same shall be completed at or before the termination of the year one thousand eight hundred and seventy-seven. And the owner of every mine wherein such two openings shall not be completed as aforesaid shall be liable to a penalty not exceeding one hundred pounds for every month during which the same shall remain incomplete.

2. An adequate amount of ventilation shall be constantly produced in every mine, to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings of such mine, and the travelling roads to and from such working places, shall be in a fit state for working and passing therein.

3. An adequate amount of ventilation shall mean not less (as a minimum) than one hundred cubic feet of pure air per minute for each man, boy, and horse, which shall sweep undiminished along the air-way past each working place.

4. Within six months after the commencement of this Act, every mine shall be divided into districts or splits of not more than seventy men, and each district shall be supplied with a separate current of fresh air. All intake air shall travel free from all stagnant water, stables, and old workings, and no place shall be driven more than thirty-five yards before the current of air without a cut-through put through or bratticed up within three yards of the face of such working place.

5. If at any time it is found by the persons in charge of a mine or any part thereof, or by the Examiner or Inspector, that, by reason of noxious gases prevailing in such mine, or such part thereof, or of any cause whatever, the mine or the said part is dangerous, every workman shall be withdrawn therefrom, and the Examiner or Inspector shall inspect the same (and if the danger arises from inflammable gas, shall make such inspection with a locked safety-lamp), and in every case shall make a true report of the condition of such mine or part thereof; and no workman shall, except in so far as is necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration, be readmitted into the mine, or such part thereof as was so found dangerous, until the same is stated by the Examiner or Inspector to be safe. Every such report shall be recorded in a book which shall be kept at the mine for that purpose, and shall be signed by the person reporting.

6. All entrances to any place not in actual course of working and extension, and suspected to contain or be liable to engender dangerous gas of any kind, shall be properly walled or fenced off so as to prevent access thereto.

7. Whenever any safety-lamp is required, it shall be first examined and securely locked by some person duly authorized for that purpose, who shall keep the key thereof.

8. Every shaft or pit which is out of use, or used only as an air-pit, shall be securely fenced to the satisfaction of the Examiner or Inspector.

9. Every working and pumping pit or shaft where the natural strata are not safe shall be securely cased or lined, or otherwise made secure.

10. Every working pit or shaft and entrance thereto shall be provided with means of communicating from the bottom of the shaft to the surface, and from the surface to the bottom of the shaft, by such distinct and definite signals as shall be prescribed by the Examiner.

11. All underground, self-acting, and engine planes on which persons travel shall be provided with some proper means of signalling between the stopping-places and the ends of the planes, at intervals of not more than twenty yards, and such places of refuge shall be at all times kept clear.

12. A sufficient cover over-head shall be used when lowering or raising persons in every working pit or shaft.

13. No single-linked chain shall be used for lowering or raising persons in any working pit or shaft, and no material shall be lowered or raised in the same cage with or in the opposite cage against any person.

14. To the drum of every machine used for lowering or raising persons, such flanges or horns, or such other appliances as shall be sufficient to prevent the rope from slipping, shall be attached.

15. A proper indicator to show the position of the load in the pit or shaft, and also an adequate brake shall be attached to every machine worked by steam or water power used for lowering or raising persons.

16. Every steam-boiler shall be provided with a proper steam-gauge, water-gauge, and safety-valve.

17. The fly-wheel of every engine shall be securely fenced to the satisfaction of the Examiner or Inspector.

18. Sufficient borehole shall be kept in advance and on both sides, to prevent inundations in every working approaching a place likely to contain a dangerous accumulation of water.

19. The roof and sides of every travelling road and working place shall be made secure, and no person, unless appointed for the purpose of exploring or repairing, shall travel or work in any such road or place until it is made secure.

Penalties.

Penalties for Offences against the Coal-mines Regulation Act, 1876.

31. If any mine be worked, and through the default of the owner or agent thereof, special rules have not been established for the same according to this Act, or the general or special rules have not been promulgated as hereinbefore provided, or if any of such general or special rules which ought to have been observed by the owner or agent of such mine be by him neglected or wilfully violated, he shall be liable to a penalty not exceeding twenty pounds, and to a further penalty of one pound for every day during which the offence continued after notice thereof in writing given by the Examiner or Inspector, and in default of payment of any such penalty to be imprisoned for any period not exceeding one month. And every person other than as aforesaid employed in or about any mine who neglects or wilfully violates any of the special rules established for such mine shall for every such offence be liable to a penalty not exceeding five pounds, or in default of payment to be imprisoned for any period not exceeding one month.

Penalties for offences not expressly provided for.

34. Every person who shall be guilty of any offence against this Act, or who shall wilfully violate or neglect to observe any provision of this Act, or any general or special rule established hereby or hereunder, for the violation or neglect of which no penalty is hereby expressly imposed, shall for every such offence be liable to a penalty not exceeding ten pounds.

SPECIAL RULES.

Department of Mines, Sydney, 4 December, 1876.

THE undermentioned Special Rules to be observed in the Newcastle-Wallsend Coal Company's Colliery, in the District of Newcastle, are now published in conformity with the provisions of the Coal-mines Regulation Act, 1876, 39 Victoria No. 31.

JOHN LUCAS.

Newcastle-Wallsend Coal Company's Colliery.

Special Rules for the conduct and guidance of the persons acting in the management of the Newcastle-Wallsend Coal Company's Colliery, in the District of Newcastle, and all persons engaged in or about the said colliery, framed under the Act 39 Victoria No. 31.

Viewer or Colliery Manager.

The viewer or colliery manager shall have full command over all other officers and persons employed in or about the colliery, who are to receive their orders from him, and to apply to him or to such other person as may be appointed to act on his behalf, for instructions as often as may be necessary; and he shall be responsible for the following duties being duly performed.

Overman.

The overman shall attend the pit every day; shall see that the rules in the different departments are closely and rigidly carried out; shall suspend any person infringing or attempting to infringe any rule, and order him out of the pit; shall receive the daily report of the deputy and fireman, and give immediate attention to any complaints, and inspect personally such parts of the mine as are reported to be unsafe, or in any way to need his attention; shall advise with daily and instruct deputies, firemen, screen-overseer, and engineer, on all points necessary, and shall observe the following general rules:—

1. Shall have full charge of all underground work.
2. Shall examine every day the different main and district air currents.
3. Shall visit every working place once each working day, and see that the hewer keeps his place sufficiently timbered; and shall suspend at once any miner neglecting or refusing to do so.
4. Shall see that a sufficient supply of timber is sent down the pit and into the different districts.
5. Shall see that the deputies, hewers, shifters, and all others under his charge in the pit, strictly and rigidly observe the rules applicable to them, and shall suspend immediately anyone infringing or attempting to infringe any rule, order him out of the pit, and report the same to the colliery manager.

Fireman.

1. The fireman shall be in the pit four hours before the workmen commence to draw coals, and shall examine carefully, with the safety-lamp, every working place where he has any reason to suspect the existence of gas.
2. Shall suspend "danger-crosses" in all places where the presence of gas is found, and when any working place (where gas has been found) is stopped, shall erect and keep up a "danger-cross" until work is started again.
3. Any person found with a candle or naked lamp beyond any "no naked light" board or "danger-cross," or any safety-lamp, shall be suspended.
4. No working place containing gas shall be set on until the miners in such places are supplied with a safety-lamp.
5. Before safety-lamps be taken into the workings, the fireman shall examine the whole lamp, and if it is all right, shall lock it for the hewer.
6. Any lamp receiving any injury shall be at once delivered up to the fireman or overman, and the fact reported to the manager.
7. No smoking shall be permitted in any place where the safety-lamps are used.
8. Any wheeler or other person injuring a door, and not immediately reporting the fact, shall be suspended.
9. Should there be any discharge of gas or any heavy fall of roof in progress, and the fireman apprehends any danger, he must replace all naked lights with safety-lamps, and send for the overman.

Whealers.

1. The wheeler shall report to the overseer first thing every morning the quantity and different lengths of props required for their hewers.
2. Shall take in, without delay, any timber the hewer may require; and neglect of this rule will be met by instant dismissal or a prosecution according to law.

Hewers.

Hewers

1. Safety-lamps shall be used in any place where the overman or fireman considers necessary.
2. A "danger-cross" will be placed in each district where safety-lamps are in use, or in any place where gas is either found or suspected to exist, beyond which no naked lights are to be taken.
3. Hewers and shifters are cautioned against discharge of gas or the appearance thereof, or if faults, backs, or water be met with; and, on appearance thereof, if using naked lights, retire from such workings, and go for the overman or deputy.
4. Hewers shall be responsible for the timbering of their own working places, and report at once to the overman or fireman any deficient supply of timber, and more especially the supply of sprags, for the supply of which, if at station, the wheeler will be held responsible.
5. Before commencing to cut the coal, shall set sprags against the face, which must be placed not more than 6 feet apart on all the portions of undercut.

Engineer.

1. The engineer shall once a day examine with the banksman the pit-ropes, bolts and hinges, main and cage chains, and shall see that the signal-rapper and wires are in good order.
2. Shall examine the working engine once a day, and see that the working parts are in repair, that the bell signal, the wire arms, and brakes are free and in good order.
3. Shall have the entire charge of the pit ropes and chains, and remove, reverse, and repair them when necessary.
4. Shall instruct the stoker in the working and regulation of the water-floats and steam-gauges, the shutting of valves when feeding the boiler, the safety-valves and dampers, and once a day shall see that they are free and in good order.
5. Shall examine from time to time all boilers, and see that they are properly cleaned, and shall have charge of all repairs to them, shall suspend the working of any boiler exhibiting weakness, or on which any valve or apparatus connected with it is out of order.
6. Shall have charge of all apparatus, crab, gin, cradle, ropes, and chains, and examine them from time to time to see that they be kept in good order.
7. Shall report daily all defects and alterations needed within his department to the colliery manager.

Head Keeper.

1. The head keeper shall have charge of the platform, banksmen, and screens, check the observance of the rules by the banksmen and onsetters, receive the report of the banksmen as to any defects observed by them, and communicate immediately with the engineer or colliery manager.
2. Shall see that all fires are extinguished when work in the pit is done, and that the safety-bars are put across the shaft.
3. Shall see that the timber, rails, &c., necessary for each day's consumption are brought over to the pit, and sent down when required by the overman.

Breaksman.

1. The breaksman shall examine once a day the engine, ropes, rolls, and horns, the ropes upon the rolls and signal bells, and shall report the result to the engineer.
2. Shall attend to the signal-board, and have a clear understanding with the banksman as to the signals in use both at coal work and at other times, and shall on no account start his engine until he has clearly understood the signal received from the banksmen.
3. Shall on no pretext leave the handle when the engine is in motion.
4. Shall examine particularly, from time to time during the day, the safety-valves and steam-gauges, and water-floats and shutting of valves, and see that they are free and in good order; shall have the charge of feeding the boilers, and be careful that one boiler is fed at a time, and that all communications with the other boilers are shut off; and shall have control over the firemen.
5. No other person shall attempt to work the engine without the permission of the engineer or colliery manager.

Banksmen and Onsetter's Banksmen.

1. Shall examine (first thing) every morning the ropes, as they pass slowly from the engine, and the different shackles, springs, belts, hinges, chains, and cages, and shall generally observe them during the day; if any of these be faulty in any particular, the fact shall be immediately reported to the engineer or colliery manager.
2. Shall not allow any man in liquor to go down the pit.
3. Shall not allow any man to take his tools with him in the cage; all tools shall be sent down in the pick-skip.
4. When men are to ascend, the agreed sign shall be given, and the skips taken out of the cage.
5. Shall report to the head keeper any defect or violation of any rule.

Onsetter.

1. The onsetter shall not allow any person to interfere with the rapper.
2. Shall report to the overman any violation of rules.
3. When men are to ascend the agreed signal shall be given by the onsetter only.

Banksmen Onsetters.

1. Shall not allow more than eight men at once in a cage.
2. Should either rope show the slightest defect he shall restrict the men riding in the cage with the better rope.
3. Any man refusing to leave the cage when ordered to do so shall be immediately suspended.
4. Shall have a clear understanding with the breaksman, and with each other, as to the signals in use.
5. Shall attend carefully to the signal-boards.

General Instructions.

1. No person acting in a place of trust shall depute anyone to do his work without the sanction of the Manager.
2. No swearing or fighting is allowed in the mine.
3. It is particularly requested that the principal agents acquaint themselves thoroughly with rules applicable to themselves, and with those which they are to enforce on others. The hewers, boys, and all other workmen upon the colliery are required to inform themselves of the rules applying to themselves as well as to others.
4. Officers and heads of departments who fail in the due and right observance of the rules, or enforcing the same for the safety of the mine and workmen, subject themselves to degradation from their respective ranks. Workmen and boys who neglect the rules, or refuse obedience to the orders of the officers, shall be sent out of the mine, with a view to the investigation of the offence and the punishment of the offender.

N.B.—By the 34th clause of the 39th Victoria No. 17, it is enacted that "every person who shall be guilty of any offence against this Act, or who shall wilfully violate or neglect to observe any provision of this Act, for the violation or neglect of which no penalty is hereby expressly imposed, or any general or special rule established hereby or hereunder, shall for every such offence be liable to a penalty not exceeding ten pounds."

The above rules have been posted up in a public place on pit top, since 3rd September, 1877.

J. Y. NEILSON,
Colliery Manager.

Wallsend Colliery, 25 September, 1877.

MINERS' TERMS AND CONDITIONS AT WALLSEND COLLIERY.

From 6th February, 1873.

1. Coals to pass over a screen, with the bars three-quarters of an inch apart; coals to be cleaned and weighed at the bottom of screen, and paid for at 2,240 lb. per ton.
2. Thick coal to be paid per ton; thin ditto per ton; pillars per ton. Narrow work: Headings and walls, 6 feet wide, 8s. per yard; ditto, with narrow bords, 9 feet wide, 6s. 6d. per yard; narrow bords, 12 feet wide, 4s. per yard; ditto, 15 feet wide, 3s. per yard; ditto, 18 feet wide, 2s. per yard; turning off bords under 8 yards wide, 6s. per yard, for cutting out to 8 yards; small coal to be paid at the rate of 6d. per skip; out-winning headings and turning-off bords from winning headings, to be allowed two skips small for every yard over 4 yards thick. 3.

3. Men to work four men in a bord when required, and, in consideration thereof, to be paid 3d. per ton extra; all double places to be worked by the four mates.
4. The miners in ordinary bords will be required (when no facing is found) to hole the coal 4 feet deep (clear) and 4½ yards wide. Cut one side full height of seam before a shot will be allowed; the remaining 3½ yards to be holed the same depth before a shot will be allowed to be put in.
5. That the miners be supplied with sufficient timber, rails, sleepers, and a man to be sent to put down the road.
6. Any man or men taken away from the coal to work shift-work will be paid 10s. per day of eight hours, but not to receive skips for that day.
7. That the manager cause to be removed all small coal or rubbish, or pay the men for doing so, at a fair valuation.
8. That the water be kept down in each place, and all taken out ready for the men to start work.
9. That in the event of any men being taken out of their places (to which they were balloted) and sent into another, such men to return to the place, should it be started again during the quarter.
10. Should two or more sets of men be out of places at the same time, to ballot for such places that are next to be started.
11. Places crossing faults or being otherwise deficient to be a matter of consideration between manager and men; and places having to crop the coal for water to be paid 1d. per ton when such crop coal exceeds 6 inches. Any case of dispute to be decided by a board of arbitration.
12. That the manager cause to be removed from the face of all working places all full skips—the empty skips to be put back to face for miner's use. Turns to be regulated throughout the pit according to prices as near as practicable.
13. When any coal is to be taken off, or to be frilled, when pit is idle, the first ballot at the station to have the first chance, and so on, in the rotation of ballot during the quarter.
14. Miners' tools to be all sharpened and wedges rolled; and, at the end of each quarter, the tokens for each bord will be placed in the bord that has to run the number, each set of men to be supplied with twenty tokens, and to pay 1d. each short of this number at the end of the quarter.
15. Either party wishing to terminate the present agreement shall be at liberty to do so by giving fourteen days' notice, in writing, to the colliery manager, who alone has the authority to give or receive any such notice, or to cancel any such notice, given by either party.

Signed on behalf of Wallsend Coal Company,—

J. Y. NEILSON,
Colliery Manager.

Signed on behalf of Wallsend Miners,—

THOMAS ALNWICK,
Chairman,
JAMES BAIRD,
Secretary.

Witness.—A. Ross.

Rules, &c., admitted in evidence, with approval of counsel for defendant.

James Rowan was then called in and examined:—

Mr. Edmunds: You are an Inspector of Collieries in New South Wales? I am.

[The *Gazette* notice of the appointment of witness as Inspector of Collieries was produced. Counsel for defendant admitted the witness's appointment.]

Do you know the Newcastle-Wallsend Coal Company's mine? I do.

Did you go down that mine recently to inspect it? I did not inspect the whole of the mine. I inspected what is known as the Jubilee heading of that mine, and the two splits in connection with that heading.

These are the two splits numbered 3 and 4 in connection with that mine? Yes.

When did you inspect this portion of the mine? On the 9th and 11th of January last.

Did you examine the system of ventilation in this heading in the two splits? I did.

I will ask you to say what the system of ventilation was. Was it the same on both occasions? Yes, it was about the same.

Will you state now what the system of ventilation was? I travelled down the main tunnel and went down the Jubilee shaft, and found that there were 11,780 cubic feet of air per minute passing down the Jubilee shaft. I took a register of the quantity. In the two splits the amount of air was 13,000 feet per minute. Eventually the current passed up the main narrow heading to the regulator marked on the plan, and was there split into two divisions or currents. It then passed into the upper or No. 4 split, as indicated by the blue arrows on the plan. The other current, indicated by the red arrow, went into No. 3 split.

How many men were supplied with air in this way in No. 4 split? About thirty men.

And how many men were supplied in this way in No. 3 split? About sixty men and a few boys and horses.

What sort of lights did the men in this pit use? Most of them used naked lights in the main narrow heading and in No. 4 split, and again at the place marked hanging canvas.

Now, I want you to describe the country over which this current of air passed before it was split into two divisions? Before it was split it passed over about seventeen blowers, as marked on the plan.

Were these blowers giving out gas when you were there? Yes, they were exuding gas.

Did you try the quality and the nature of the gas exuding from the blowers? Yes; I found it to be light carburetted hydrogen.

The Police Magistrate: That would be something like powder? Yes; it was fire-damp.

Mr. Edmunds: And this carburetted hydrogen, I need scarcely ask you, is highly inflammable? Yes.

On these occasions, was the gas so exuding being carried by the current of air into Nos. 3 and 4 splits? Yes.

About the trap-door—did that split the current? Yes; I saw that the trap-door was splitting the current.

Was that door a single trap-door? It was.

Mr. Want: Have you had any experience in fiery mines? Yes.

Where? In Scotland.

And in this Colony? Yes.

Can you tell me, when you inspected this mine and saw what the ventilation was, whether there was a sufficient quantity of air passing through to fully destroy the bad effects of the gas? There was a sufficient current to take in gas and cause what would be an explosive mixture. When I made my inspection after I left the blowers there was a sufficient quantity of fresh air coming in to prevent it from being explosive.

Was that a long way in? I cannot say.

Was not the ventilation, as you saw it, quite good enough for any colliery. Supposing you are a Colliery Inspector, or even that you were working there as a workman who merely wanted to be properly provided for, was there anything to be objected to in regard to the ventilation?

Mr. Edmunds: I object to this. This is going back over the same ground which we have touched on before. This is merely testing the accuracy of Mr. Dixon's opinion; and, as I have said before, the issue here is not as to whether Mr. Dixon was right or wrong. That was an issue which might have been considered at arbitration, but it cannot be considered here. The issue which your Worship has to deal with is not whether Mr. Dixon was right or wrong in his conclusions, but whether Mr. Dixon required the defendant in his notice to do a certain thing, and whether, within twenty days, the defendant complied with that requisition. That is really all you have to do with. My learned friend will only protract this inquiry to unnecessary lengths if he attempts to get in this evidence, and cross-examines witnesses, or calls on them to prove, that Mr. Dixon's opinion concerning the mine was not a correct one. It is not a question of expert's evidence at all, but merely whether the defendant complied with the requisition or not.

Mr. Want: My learned friend is arguing this point as if you had already decided it; but the point is one which your Worship will not have to decide until by-and-bye. I wanted to introduce evidence to show you that there is no defect in the system of ventilation, and that it would be impossible to remedy that which did not exist. My learned friend's argument is that there is a possibility of something happening. Now, how could he remedy that—how could he remedy a possibility? This is a thing which could not have been anticipated; and on that account it could not be remedied. In any case, the Crown should have proceeded under section 12. The next thing I want your Worship to know is the state of the mine when Mr. Dixon and Mr. Rowan saw it. What does remedying a thing mean? It means altering the existing state of affairs. We might have remedied this thing by hewing the coal out back and lowering the pressure of gas on the blowers. If we took your Worship through the mine and showed you that these blowers did not exist, and that the ventilation is almost perfect, then any person—be he Judge or Police Magistrate, however thoroughly versed in the law—must come to the conclusion that if this terrible state of affairs did exist when Mr. Dixon went through the mine, then it does not exist now, and therefore the matter must have been remedied. Having seen the mine yourself, and heard the evidence of the various witnesses, then you will be in a position to say whether the thing has been remedied or not, and we cannot be found guilty here. We cannot be fined for a thing which does not exist. The latter part of the 25th section says:—"Provided that the Court, if satisfied that the owner or agent has taken active measures for complying with the notice or award, but has not with reasonable diligence been able to complete the works, may adjourn any proceedings taken before them for punishing such offence, and if the works are completed within a reasonable time no penalty shall be inflicted." If the mine be perfectly safe now—and we contend that it is—we cannot be found guilty. Or your Worship may rely on the third point, that something having been done, which renders the mine safe, you need not inflict a penalty. On every one of these grounds I am entitled to show the Bench the facts of the case. You have already said that this is one of the most important cases that have ever occupied the attention of a Police Magistrate, or of the Press or the public; and, therefore, we want to show what the actual facts are in connection with the mine. I want to cross-examine the witnesses to show what the state of the mine was at the time of the Inspector's visit, and to show you what the state of it is now; and if this thing does not now exist we certainly should not be fined.

Mr. Edmunds: My learned friend argues away from my objection, and against something to which I do not object at all. My objection is not that the learned counsel for the defence cannot give evidence that they have not applied a remedy; far from it. My objection is that he cannot ask Mr. Rowan, or any other witness, whether, in his opinion, the conclusion arrived at by Mr. Dixon was right or wrong. My learned friend will persist in asking the opinion of the witness as to the ventilation. Now, my learned friend may call witnesses to show that there was no danger in the mine, although that is not now the issue. Let him show that the defendant has really remedied this matter, and that will be a real defence to the charge against him. But I submit that the opinions of experts are quite immaterial to the issue here—which is, whether notice was given, and whether the defendant complied with it, not having gone to arbitration. So long as my learned friend confines himself to such questions I will not object.

The Police Magistrate: There is no doubt that these things, as far as possible, should be gone into; at the same time we ought to see what authority the Inspectors had for their conclusions. No doubt, whatever is done in this case will serve as a precedent for the future.

Mr. Want (to Witness): Look at the fissure marked on the plan, and say what quantity of air passes along there, and whether, apart from any future liability, was not the mine then perfectly safe?

Witness: So long as there was no sudden change of temperature, and everything went on like clock-work, there would be no danger.

Now, I ask you, if there was no large collection of gas taking place, would there be any danger? If there was no sudden outburst of gas the mine was below explosion point at that time.

Now, when you were down there, did you notice what has been called the narrow bord? Yes.

There was no return to that bord at the time you were there? It was driven about 10 yards from the Jubilee shaft; then it stopped dead; it had no connection with the heading.

Was there a large quantity of gas in that narrow bord? Yes; about 250 feet of accumulated gas.

Before this connection with the Jubilee shaft, had you seen any gas at all? No.

The circuit was completed, was it? No; I was over the shaft.

Before the Jubilee shaft connected the supply from this heading the air returning amongst these men would be very much worse, would it not? Well, I think there would be some liability to an explosion, simply because it would be loaded with carbonic acid gas. This lessened the liability to an explosion, but the fresh air coming down from the shaft was filled with carbonic acid gas.

Now, I want to know this: Was the air coming up here worse than it is now? Well, I say it was loaded with more carbonic acid gas.

Was it worse before than it is now? Well, in connection with that liability—I must put it in my own way. Before the Jubilee shaft was connected with the Jubilee headings the ventilation was safer, because the air would be mixed with carbonic acid gas.

I want to know whether the mine was safer then than it was after its connection with the shaft? I say it was safer than if an outburst of gas had taken place. If there is no large outburst of gas, the present system of ventilation is safe.

And

And now, as a matter of ventilation for the men—of giving the men fresh air—which was the more complete system, that which existed before or since the connection? Taking away any liability to an increase of the gas, the ventilation is more perfect with the Jubilee shaft since the connection. The present system is the best for supplying fresh air.

And gives the persons working in the mine a much larger supply of fresh air? I do not know what was the system before.

Could you not say that there was more air since the connection? No; I cannot go by the paper.

Now, will you tell me your experience in this matter. Would these blowers decrease or increase in intensity? It was a question of the reservoir from which they are coming. Do you wish me to give my experience in blowers?

I want you to answer my question. Having tapped these blowers, from your experience, do you think they would increase or decrease? Well, that depends on where the blowers come from; I cannot tell where they come from in this particular case. Possibly they might increase.

The Police Magistrate: Nobody could possibly tell.

Mr. Want: Did you notice that most of these blowers came from the floor? Yes.

And do you know that there are only about 18 inches of coal on the floor? I did not dig down to ascertain.

Would that 18 inches of coal leave a place for a reservoir? It might have come a long way further. Fire-damp will stand in a much lesser space, and can be traced for miles, perhaps.

Would not this pressure burst the coal up? It would require a good bit of pressure to do that. If you can produce pressure enough anything can be blown up; I could not give the resistance. If a certain man had had a fulcrum he could have moved the world!

Have you been down the mine since? No; and I cannot say whether any alteration has since been made in the state of affairs.

Mr. Edmunds: I believe that you are the Inspector who inspected the Bulli mine prior to the explosion? Yes.

And can you say that the quantity of explosive gas in the Newcastle-Wallsend mine was greater or less than the quantity of gas exuding in the Bulli mine prior to the explosion?

Mr. Want: Do not answer that question. Are we going to try this Bulli case all over again? Mr. Mackenzie, who is one of the most competent authorities on the matter, said it was dynamite or some other explosive matter, and not gas, which caused the explosion at Bulli.

The Police Magistrate: We do not want to go into the Bulli case unless we can help it. I imagine that the question which Mr. Edmunds desires to put is whether these blowers were equal to those which he saw in the Bulli mine.

Mr. Want: How would that help us? It is immaterial.

The Police Magistrate: I think it might as well be left out; but still these blowers show the necessity for inspection.

Mr. Want: We do not object to inspection at all. We are anxious that your Worship should inspect the mine, if you will.

Mr. Edmunds: Then this is the case for the Crown.

Mr. Want: Formally, now, your Worship, I wish to take the objection which I have mentioned already. I say that the charges which are made here against the defendant—and I ask your Worship so to rule—are charges which should not have been made under the 25th section of the Coal-mines Regulation Act, seeing that there are special provisions in the Act which deal with the matter complained of. I say also that the only remedy which the Crown has in this case is under the 12th section, where they can order the men out of the mine. The 25th section provides that the thing required to be remedied shall be remedied forthwith, and the words clearly prove that what is charged here cannot have been intended. The information speaks of "a larger outburst of inflammable gas," and a remedy could only be applied to this by closing the colliery and stopping the work. Now, if I am right in this point, the Crown cannot possibly prosecute us under the 25th section; and therefore they cannot possibly prosecute us under the 25th section, and this case must be dismissed. They have not charged us with anything under the 12th section, and on that ground too the case should be dismissed. What I wish to draw your Worship's attention to is this, that this is not a technical point which I am taking; but that the Act provides that for anything in the way of ventilation this 12th section and its sub-sections shall be brought into operation. Undoubtedly they are intended to apply to a contingency of this kind; and the 25th section could never have been designed to apply to a case like this, because it could not have applied to a set of circumstances which had no existence. If they proceeded under the 12th section, and could show that the presence of gas was "dangerous"—this was the word—they might order the men out of the mine. The very reason of passing this 12th section and its sub-sections was that there should be express provisions and special rules to this Act which would provide for explosions or for other contingencies which were dangerous to the workmen. Therefore, the only way the Crown can proceed is under this section 12; and the 25th section has nothing whatever to do with the case, and you cannot prosecute us under it. This was the reason only that the Company refused arbitration, and why we withdrew the offer to arbitrate. They thought, and think still, that the Government had no right to come to them under the 25th section and ask them to remedy something which did not and might not ever exist; and really it is what they are asking us to do. Any common-sense person would be perfectly right in saying that it was a monstrous thing to come and ask us to remedy a thing which might never happen at all. We may do several things towards abolishing the present evil, but we are not going to remedy such a thing as might never exist, or only exist in the future. You may call a thousand witnesses to prove that a certain thing should be remedied, but you cannot remedy what is merely a liability. That is impossible—it is out of the question. The Company now come into Court and ask the Government to take any steps they like to test the safety of the mine. But if they order our men out we can put them in again; and then they could come here and say whether an offence had been committed in putting the men back. No one knows what may happen in a coal-mine. The charge should have been brought under the 12th section, and if the Crown do this we are quite willing to go into Court and have the matter decided. But if it is considered desirable, I will withdraw these objections, although I believe them to be fatal, and allow his Worship to decide the case on its merits, and say whether Mr. Inspector Dixon was right or wrong in his conclusion.

conclusion from the evidence of the expert witnesses. I am willing now to withdraw this objection and go on under the 25th section, if this is agreed to. But I object to these questions as to whether there is liability or not. No man, as I have said, can tell what may happen in a coal-mine; for a mine may be perfectly safe one day—as this one is—and the next day be blown to atoms. There may be a reservoir 5 miles off, and it may break into the mine. The real question is, have we remedied this matter in such a way as to prevent the mine being dangerous or tending to the bodily harm of the workmen. At present I ask your Worship to rule that we cannot be brought up under this 25th section. It was their duty to have brought this prosecution under the 12th section, and then we could have gone into the question as to whether there was any danger from these gases or not.

Mr. Edmunds: My learned friend thinks that I am afraid of his objection. I do not think that this objection is of very much force, as I shall show, but in any case I should not be prevailed on to do such things as I do not wish to do. This objection is evidently met by the case which I have cited to your Worship from the Court of Appeal in Queen's Bench in England in 1872. It was decided in that case that the prosecution was properly brought, as it has been brought here; in other words, the highest Court has already decided that the proper way to bring this prosecution is to bring it under the section that it has been brought under in this Court. The law of this case is not a matter for decision now, because it has been settled already. My learned friend raised the objection that the law of this case is not as it has been cited by the Queen's Bench as being the law. The 12th section of the Act and special rules apply to gases actually prevailing in the mine, and not as to the liability of gases which do not exist and which cannot be provided for in the mine. The Court has decided that the proper course was to proceed under the 46th section, which is equivalent to our 25th section. My learned friend argues that this decision of the Queen's Bench in England is wrong. Well, let him attempt to argue the question before the Supreme Court of New South Wales. He would soon find that the question is not as to the quantity of the gas already existing, but as to the liability of gas in the future. If we had dared to bring a prosecution under the 12th section, my learned friend would soon get up and say that the law has already been decided, and that your Worship has nothing to do but rule accordingly. And to that argument I should have nothing to reply, except that that decision of the Court of Appeal of England is now the law. Now, as to the other part of the argument, that a liability cannot be remedied, and is not provided for in the 25th section, I will ask him to recall that part of the requisition calling on him to remedy the single trap-door.

Mr. Want: Mr. Dixon himself admitted that this was a breach of sub-section 3 of the 12th section.

Mr. Edmunds: I think he spoke in view of a future outburst of gas.

The Police Magistrate: I am clearly of opinion that the Crown are right in proceeding in this case under the 25th section of the Coal-mines Regulation Act. I am clearly of opinion about that. Mr. Dixon's evidence is very strong indeed.

Mr. Edmunds: I will answer my learned friend's case in this way: How can a liability be done away with by putting safety-lamps there? Mr. Dixon does not ask any remedy.

The Police Magistrate: If Mr. Dixon had ordered the men out without reason he would have been liable to punishment for it.

Mr. Edmunds: But, on the other hand, had he seen the liability to this sudden outburst he would be wanting in his duty had he not taken the proper steps.

The Police Magistrate: At the same time, I think a legal gentleman has a right to take every objection that he thinks fit in the interest of his client.

Objection overruled.

William Turnbull called in and examined:—

Mr. Want: I believe you are the Colliery Manager for the A.A. Company? Yes.

And have been so for twelve years? Yes.

And how much experience have you had in coal-mining? I have had a good many years experience.

How many years? I was sixteen years manager in England before I came out to Australia. I was eight years and three months in the Hetton Colliery, and eight years at another.

Have you had any experience in fiery mines or in mines subject to gas? Yes.

We have been told here that, on the 5th January last, this Newcastle-Wallsend Colliery was in a condition that was dangerous and defective, and which tended to the bodily injury of the persons working in it. We have been told that this condition of affairs existed on the 5th January;—now, have you lately examined this colliery? Yes; last Saturday, and again on yesterday.

Who examined it with you? Mr. Ross, Manager of the Newcastle Coal Company; Mr. Thomas, of the Stockton Company; Mr. Evans, who, I think, is Manager at the West Wallsend Colliery; and Mr. Croft, who used to be Manager at Minmi.

Did you examine that portion of the mine which is known as the Jubilee heading and shaft? Yes; we went down by the tunnel and called at the furnace all along the main road.

Did you examine carefully the Jubilee heading workings and the ventilation and so forth there? Yes, the headings that go towards the Jubilee shaft and so forth.

Now, in your opinion, was there anything there dangerous or defective or threatening to lead to the bodily injury of the persons working in the mine? At the time I visited the mine there was nothing there which was anything like dangerous.

Was there anything defective that you noticed? Nothing.

Was there anything at all observable in the mine tending, in your opinion, to the bodily injury of the persons engaged in it? Nothing at all.

Will you tell me what was the quality and degree of the ventilation of the workings on that occasion? The system was very good indeed.

How was the air as to purity and as to its being free from gas? There was not the least indication or showing of gas in the air.

How was the air as to purity and supply in the mine? It was quite pure.

Did you make a careful investigation to see whether this air was good or not? Yes, I did.

And what is your opinion now with regard to the ventilation? It is very good.

And there are no symptoms of gas or anything in the air at the present time? No; so far as I could see at that time there were no symptoms or indications of gas.

Is

Is not the ventilation there something above the average? Yes, a good deal above the average.

And is not the air in that mine a good deal purer than the average? Well, it is sure to be good from the shaft.

Did you measure the air to see what quantity was passing through this Jubilee shaft? No, I did not measure the air.

Do you know whether Mr. Thomas measured the air while you were in the mine? Yes, he did.

Did you notice what the amount of air was? No; I did not give the time, and had not an instrument, but I can tell pretty close by the lamp. Whatever lamp I am carrying I can tell pretty well with it.

From your experience you can closely ascertain what is the quantity of air without measuring it? Yes.

Now, did you examine the place where you were told that there was some gas exuding? I did.

Was there any quantity of gas there at all? Very little.

Was the amount of gas which was there worth noticing at all? No; if I were the manager of the colliery I should have taken very little notice of it.

Was the supply of air in the mine quite sufficient to wipe out whatever traces of gas might have been existing? Yes, quite sufficient, and enough to do away with a great deal more gas than was in the mine when I was there.

Did you try these blowers with naked lamps? Yes.

What quantity of gas did they give out? The biggest one would be something like to what we see in a tobacconist's shop for lighting a pipe or a cigar.

Would one of these blowers even keep alight? One kept alight for two or three seconds and then went out again. Most of them simply light and go out again.

Were they distinct or indistinct? You could just discern them.

The one that was the worst was up at the far corner in the narrow bord? Yes; I see this plan No. 1.

Does not that correctly represent the workings in the Jubilee shaft? Yes, sir.

Is there now a complete circuit from the Jubilee shaft back into the main heading? Yes. The reason that I called this the worst blower is because it was set in the coal. The others along the main heading I thought nothing at all about because they were in the floor.

How much coal was on the floor? I were told that there was 2 feet of coal —

Mr. Edmunds: Never mind what you were told.

Witness: Had there been any pressure under the floor it would have lifted the coal.

Mr. Want: These blowers that you saw there, would they, in your opinion, decrease or increase? I think they would decrease.

Mr. Edmunds: How can you say that?

Mr. Want: We can say it, and we will prove it. (*To Witness*): You have seen all these headings, but there are no blowers? There was a bit of a singing or fizzing out of one corner of the main road, but you will find that in all coal-mines.

And you think that this would die out because it has died out in other workings? Yes. The blowers were sure to die out as the workings went on.

Now, you say that there were no workings at all, that there were only two headings for the supply of air in the Jubilee heading? Yes, two narrow passages for the supply of air.

Now, with all your experience of these mines, you would say that there is nothing there at present to indicate a liability to a larger outburst of inflammable gas? On this question —

I say from what you saw there? What Mr. Neilson has done he is quite right in doing; no manager could do more than he has done, and he has gone the proper way to ventilate a mine where there is any gas.

Is there anything in that mine there now that would lead you as a colliery manager to think that there is any danger of a further outbreak of gas? There is no liability so far as anyone can see to a sudden outbreak.

Is not the probability in an opposite direction—that the liability is for the gas in these headings to decrease? Oh, no. No man can tell that.

Mr. Want: But—

Mr. Edmunds: Before my learned friend goes any further I ask that time shall be given to allow the answer of the witness to be put down in the depositions.

Mr. Want: You can have it put down by-and-bye if you like.

Witness: There is no possibility of any further increase in gas in the Jubilee headings.

Mr. Want: Do you not think there would be a decrease? Yes, but there might be an increase. No one can tell in our collieries, but I would almost guarantee that there will be no increase of gas in the Jubilee headings.

Now, I want you to tell his Worship with regard to this narrow bord, because we have been told that there was once a large quantity of gas there, whether gas would have disappeared if it ever was there? No; the gas is not there now.

Mr. Edmunds: There is surely no dispute about that.

Mr. Want: I do not know whether there is or not. I do not know what you are going to say. Now, I come to the third point. You know that there is a trapper-door marked on the plan B. Is not that intended to supply a quantity of men down here and to divide the air to them? Yes; that is its only purpose. It throws the air down and supplies the men at the end of the main heading.

Is not that door merely for the purpose of supplying a certain quantity of air to the men? Yes.

And it is purely and simply a question of ventilation? Yes.

Is it possible with a current of air to keep that door open? There is a large amount of air going there. Enough to keep the door open? No, not without its being propped open. If there were no air there the door would shut.

You stated just now that you would not have the door there at all? Yes. I would have hung canvas up, and that is all that is necessary.

How much air is coming down here when the door is opened? About 5,000 feet per minute.

Where are the men working? At the end of the main road. If they took that door out altogether they would get more air.

But that door is simply a means of regulating the air to the men one way or the other, to turn the current of air? Yes.

And is hung in that way? Yes.

Can you give me any idea of the amount of gas which is escaping out of these blowers? It would take a very clever fellow to do that. You will not get me to give an opinion about that. I would not like to have the trouble of covering it up. I like to have a large lot when I am at it.

You mean to say that it was not worth measuring? No.

Taking all these things into consideration, could the supply of air be more perfect? No, it could not be more perfect.

It was perfectly free from danger of every kind? Perfectly.

Mr. Edmunds: I think that you said that there was a blower in the narrow bord? Yes, if you can call it a blower.

There is inflammable gas coming out from it? Yes.

There is also a blower in the main heading? I saw no blower there.

Where then did you see something that was singing a bit? Down in the main heading, but it is not a blower.

Does that give out inflammable gas? No; it might be giving out pure air.

Did you find it? Yes. I passed it with a naked light. It might have been pure air.

Is it a usual thing for pure air to come out from or exude from coal? No; but it is a regular thing to get pure air from the surface.

Answer my question? The blower was so little that I could not tell.

You never found the gas at all that was causing the singing noise? I never found any gas.

Was the singing caused by gas? I do not know. If you call air gas, it might be so.

Is there anything else that would cause a singing noise there except gas? I do not know.

Do you call air gas? Sometimes I call air gas, and sometimes I do not. If you ask whether it was explosive gas or not, I say there was none.

Now, supposing we call air gas just for a bit of fun? Oh, you can have a bit of fun with me.

Well, suppose you do? I will take a lecture from you on gas and air some other time.

Did you find the gas that was causing this bit of singing? I never found any explosive gas.

That is not my question at all. Supposing you call air gas, did you find the gas that had been causing this bit of singing? No, I never did; it was that little you could not find it. I went to one corner first, and then to another, without finding it out. It was like a mosquito buzzing about.

From your experience, have you found that gas exuding from coal causes a singing noise? I have heard it many a time.

Have you ever heard air exuding from coal causing a singing? If you call gas air, I have.

I am asking you that. Did you ever find air exuding from coal causing a singing? No.

Then is it not gas you found coming from blowers in that mine? I cannot tell you. You will have to go into a lot of experiments to find that out.

If you went into all the experiments you could think of, can you tell me the name of the gas that you would expect to come from a blower? I would have to go under a proper examination to tell you that.

Can you not tell me the name of the gas that comes from blowers? No; I cannot enter into that.

Mr. Want: You are not a chemist, I suppose? No.

Mr. Edmunds: May I ask how many men's lives are dependent on your knowledge and caution? Well, I think there are some 2,000 men and boys employed by our Company.

And how many are working at one time? I should say about 600 or 800 men are now working in the pit that I have charge of.

Does not virgin coal country frequently contain large quantities of fire-damp? I suppose it does.

Do you only suppose that? I tell you that I do not understand going into this matter at all. I had no idea of that when I came here.

I am very sorry for you, but I must ask you to answer my question. Could not a man tell what quantity of gas was likely to exude from virgin coal country? No, no man living.

Mr. Want: Except Mr. Dixon.

Mr. Edmunds: Mr. Dixon did not say anything of the kind. He said that enough would come out that would likely be dangerous.

Witness: I could clearly understand that if a man could tell what he is coming to.

Mr. Edmunds: Yes.

Witness: Well, no man can tell where gas is likely to come from or the quantity of it.

Mr. Want: If that is my friend's argument, we could not open up any new collieries at all.

Mr. Edmunds: We will see. There is a certain thing called a safety-lamp. (*To Witness*): This Jubilee heading is through virgin country, is it not? I think so.

Do you not know that it is so? No; I have never been over the surface.

If you take that plan as correct, will you not admit that it is virgin country? Yes, if the plan is correct, it is.

Is not a line of fault in the coal a likely place for explosive gas to exude? Yes, a very likely place.

Do you know whether there is a fault anywhere near this particular part of the workings? Yes; we passed across a fault. It is not a great distance off the workings. It is shown on the plan exhibited by the defendant.

Can anyone foretell now the quantity of inflammable gas that may exude from that mine?

Mr. Want: Where?

Mr. Edmunds: I wish to put the matter generally. (*To Witness*): Can anyone tell the quantity of inflammable gas that may exude from that mine? No; no one can tell.

It might be very little? Yes; it might be very little, or it might be none at all, or it might be a large quantity. Take the mines all over the world, and no man can tell.

Or the mines in this new country? No; or all over the whole world. Besides that little bit of thing—

Mr. Want: We have got away from the Jubilee headings,

Mr. Edmunds: Do you remember giving evidence in the case of an explosion at Minmi? Oh, this is too far back for me; I always like to look for what is coming.

Do you remember giving evidence in the case of Joseph Croft for an alleged breach of the Mining Act in Newcastle? No, not against me.

Do you remember giving evidence in a case against Joseph Croft for an alleged breach of the Mining Act in May, 1882? Yes, I do; but I do not think that my evidence in that case was taken down. It was just given to the Bench.

Was

Was not the charge there that, indications of inflammable gas having appeared, he did not cause the work to be discontinued and to withdraw the men? I cannot say now.

Was not that the charge? I cannot say now; it is too far back.

Will you not say that the prosecution was brought about inflammable gas? Yes, I will say that.

Were there not some men burned in that mine? Yes; I think two men were burned on that occasion.

You say that two men have been burned? Yes, two men.

Did you not in the evidence which you then gave before the Court say that you agreed with everything that had been done in the management. Did you not say also that everything that could reasonably be done in the management of that mine was done? Yes.

In that case, did not the overman examine the place?

Mr. Want: I object to that question.

Mr. Edmunds: Well, then, I will change it.

Witness: I will not answer the question, so that puts an end to it.

Mr. Edmunds: Mr. Turnbull, you are here as a witness, and we will see if you attempt to refuse to answer any questions. I ask you now did you not say in that case that you knew of blowers to come up that in a few months would throw out 100 yards of gas? Yes, and I have known blowers that would do a long way more than that; and I have known where this happened too.

Do you happen to know of anything that is used in any part of the world as a precaution to save the lives of workmen from such dangers? Oh, yes, different things.

What are they? The most prevalent thing is to put a hole in.

Do you know any precaution which is taken so that miners working in such places may save their lives from these dangers? Certainly, the safety-lamp.

Mr. Want: He said mines of that kind.

Witness: Yes, mines of that description.

Mr. Edmunds: Is not the safety-lamp used in England in all mines in which there is a danger of such explosions? Certainly, all the deep mines; but all the shallow mines use the naked light.

That is not a complete answer to my question. Is not the safety-lamp used in England in all mines in which there is a danger of such explosion? In all gassy mines it is, but where there is no gas found they use the naked light.

When there is a danger of a sudden outburst of gas, is not the safety-lamp an absolute necessity for the preservation of life? Yes, if there is danger in the mine.

What difference does the use of the safety-lamp make to the owners of the mine? Sometimes it makes a great deal of difference.

In what way? When they have to put the coal out and fire shots it hampers them. There are lots of ways in which it makes a difference. There is the difference in the price of hewing the coal, and in some of the mines the coal cannot be worked with the safety-lamp.

I presume it makes the coal dearer? It makes it so much dearer that the mines cannot be worked to advantage.

Would the difference caused by the use of the safety-lamp amount to 3d. per ton? It would go into 1s. in some cases, but in no case would it be less than 3d. per ton. It would depend altogether upon the mine, and what kind of coal was being obtained from it.

The Police Magistrate: Do I understand from you that where the safety-lamp is used the mine has in some cases to be shut up altogether, because it would not pay to carry it on? Yes, in some cases.

What would be the increased cost of hewing coal in the Newcastle-Wallsend mine if safety-lamps were used? I would not use safety-lamps.

I did not ask you that question.

Mr. Want: But we will have it put down though.

Witness: I have not gone into anything but my own mine. It is not for me to say regarding others.

Mr. Edmunds: Do you know anything about the investigation conducted by the late Royal Commission in England into the working of coal-mines? It is just the same now as when I was a youngster. The final conclusion was that everyone should be careful. That is the chief thing.

Mr. Want: That was the finding of the Commission? Yes.

Mr. Edmunds: You are now speaking of the Royal Commission in England? Yes.

Do you know what percentage of inflammable gas in coal-mines this Commission found to be dangerous? If you go into this matter I do not know.

Do you know now what percentage of inflammable gas in the air coursing through a mine is dangerous to the lives of the workmen employed there? Well, I have seen it stated by some that 14 and 15 per cent. is dangerous, and others say that 10 per cent. is dangerous.

Then you say that between 10 and 20 per cent. of inflammable gas is dangerous to the workmen employed in the mine? Yes.

You think that nothing under 10 per cent. is dangerous? I never said that.

Do you say so now? I never said so.

Then what is the least amount of gas in a mine that is dangerous to the workmen? That is the lowest that I will speak of.

Mr. Want: Mr. Dixon mentioned 9 per cent. as being the lowest.

Mr. Edmunds: Did he? I think he said 4 per cent. (*To Witness*): Now, will you tell me what amount of gas would really be dangerous to the men? I think a small amount of marsh gas would be dangerous.

Perhaps you will tell us a little more? No; I know nothing more.

Then it comes to this, that you, as a colliery manager, know nothing about any gas in mines except about this marsh gas? No. I do not know much about this marsh gas either; but I would know more about it whenever I have to contend with it.

Do you know of any other kind of gas that exudes from coal and that is dangerous to miners except this marsh gas? No. I did not know that you were going to put one through an examination.

Well, you are an experienced colliery manager? Yes; but I have had to pay for my experience, and I am not going now to spout it out for nothing.

But you are brought here as an expert to give evidence for the defendant? Well, let them pay for their knowledge, as I did.

Then

Then I understand you to say that if you managed this Company of which the defendant is the agent you would not put up this trap-door? Are you going back to that again?

Just answer my question? No, I would not. I would have put up a canvas door.

Would you explain how a canvas door would be better than an ordinary trap-door? Anyone who understands ventilation would know. You would get more air.

If this door was down, or say the canvas was down altogether, what would be the consequence to the ventilation? The air would work right.

Would it not split into two districts? For that mode you were illustrating —

Now, I do not ask you that. What I want you to tell me is this: If the trap-door were down, would the air split into two districts? I will give you an answer. Take out the stoppings and the air would split.

If the wood door was down it would split? Yes; and that is the reason why I would not put a door there at all.

I wish you would answer my question? I cannot answer until I see the plan and ascertain where the stoppings are.

Now, if the wooden door was down and nothing else there in that mine, would the air split as now into two districts? Certainly it would.

And split as well as it does now? I do not say that.

But would it split as well as at the present time? Well, you will have to wait till I make an examination.

Really I am afraid I cannot stop. I ask you the question again? It will split upon this place more than the quantity of air required, but I have never been to the other place.

What would direct the air then in the No. 4 split? What would direct the air in No. 4 split?

I am asking you that question. If the door were down, would the air go as now? Take out all your stoppings and the air will go down.

But I want to know, if the door were down, would the air go into No. 4 split as it does now? Which do you call No. 4 split?

Well, No. 3 split then? Well, I quite see this, that the air would treble in quantity by the door being there.

Now, if the door were down, would more air travel into No. 4 split or not? No, there would not.

Would less air go into No. 4 split? I do not know that. I cannot tell. I observe that No. 4 split is at the side where the regulator is, but No. 3 is on the other side.

If the door were taken down and nothing else done, would not the whole of the air go into No. 4 split? I do not know. If you go and examine it I do not know that you will find where the air goes to when it leaves this door. But if you go upon "ifs" and "ands" —

The Police Magistrate: Was your attention drawn to the door when you were down? Yes.

Mr. Want: He saw it open and shut.

Mr. Edmunds: What is the use of that door at all? It is no use at all, and a canvas door would have done as well.

Do you think that two doors are at all of use in the ventilation of a mine? Well, I would not have two doors.

You would not have two doors in any mine? I did not say that. It will take you about six hours again on this point.

Do you think that two doors are any use whatever in the ventilation of a mine? I have seen three and four doors.

I ask you again, do you think that two doors are of any use in the ventilation of a mine? I have seen sometimes three and sometimes four doors used.

But do you think that two are of any use—that is my question? I do think that sometimes two doors are of use in the ventilation of a mine.

Mr. Want: The reason for putting that door there is to drive the air up to the men who are in the far heading? Yes, that is the apparent object of it.

Did you try in keeping the door open to see if sufficient air went up to the men? Yes, and quite enough went up.

Now, you told my learned friend that there was a singing noise on the main road, and that you went to find out what it was. Is it not a fact that you found that this blower came from gas that was not inflammable at all? Yes, and you will find it also where there is water got; sometimes at the bed of the water. Water in a mine will cause it.

What would it be? I cannot say.

Is it not a fact that when you found this the gas was not inflammable at all? Yes. In some cases you would think that the place was full of mosquitoes; sometimes you will find it very heavy, and sometimes light.

But it is not inflammable or dangerous at all? No.

Was that the character of the singing that you heard on this main road? Yes, something similar.

Now, you were asked about tapping the fault;—was not the fault tapped at three or four other places before that? Yes; it had been tapped through a good way.

That would relieve it of the presence of gas? Yes, about that part of it it would.

If there were gas there that would relieve it? Yes.

Now, you were asked about blowers which threw out 100 yards of gas;—was that in a mine like this, or in a dangerous gassy mine? It was a very gassy mine. I saw one that threw out 2 miles of gas in about an hour and a half.

The Police Magistrate: What was the depth? About 2,400 feet. That is where there is a big pressure.

Mr. Want: Are any of the mines in this district anything like that? Nothing like it at all.

When you said that in gassy mines there was a necessity of using safety-lamps, would you call this Newcastle-Wallsend mine a gassy mine? No, nothing like it. I think you might add that you will always find these deep mines the worst to deal with when working to the rise. Had there been a floor of gas the Jubilee shafts would have got it in this case, owing to the place dipping in this Jubilee heading. You will always find gas, even at a fault. You would have tapped it up higher; but if it were level, you are as liable to tap it at one place as another.

Well,

Well, now, you said that in gassy mines it was necessary to use safety-lamps, and you would not call this a gassy mine. Now, is there the slightest necessity of using safety-lamps in this mine? Not the slightest necessity.

Would any sane man dream of doing such a thing? No, he never would.

Are there plenty of mines about Newcastle in which similar blowers make their appearance? I would not say that, because I have not been down many of them. I have never seen any gas in the A.A. Company's mine, and I have not been down the others.

Do you know that these blowers have been tapped and have died out in other mines? No; I have never heard of that.

The use of safety-lamps would prevent the firing of shots? Yes, in some mines. Some mines use powder where safety-lamps are employed.

Mr. Edmunds: Do you say that there is a rise from the Jubilee headings? Oh, that Jubilee heading—it comes again.

Do you say that there is a rise along the main road to the Jubilee heading? Oh, no; I said it was a dip.

But is it a rise or a dip to the main road? Yes.

Then from what you said, if there was any gas in the country about the Jubilee shaft—

Mr. Want: I object, this is new matter entirely, and was not introduced by me.

Mr. Edmunds: Do you admit that there was a dip in the main road to the Jubilee shaft? I think there is.

Mr. Want: What the witness said, was that there was more gas found at the top of the fault.

Witness: I would never have come into Court until there were some scores of experiments into this.

The Police Magistrate: You come from the right part of the world.

Witness: I have seen some dozens of these experiments, and went through my facings with them. Had I been a Government Inspector, I would have tried them before I came into Court.

Mr. Want: You would not have been willing to stop the whole colliery?

Mr. Edmunds: And no sane man would have done so when safety-lamps might be used.

At 1:30 p.m. the Court adjourned.

On resuming at 2 o'clock p.m.,—

Richard Thomas was called in and examined:—

Mr. Want: What are you, Mr. Thomas? I am the Manager of the Stockton Coal-mining Company. And how many years have you occupied that position? For about two years.

And before that, what were you? I was about sixteen years previously a manager.

You hold a special certificate of competency for the management of coal-mines? I hold a certificate of competency from the Government.

From the Government of New South Wales? No, from the Government of Great Britain.

And during those sixteen years that you were a manager at Home you had charge of some of the most fiery mines in Wales? Yes.

I believe you examined this Newcastle-Wallsend Colliery? I did.

On what day? On Saturday, the 3rd March.

In conjunction with a number of other skilled colliery managers? Yes.

You know this portion of the mine which is called the Jubilee workings? I do.

Did you examine these workings critically? I did.

And I believe you examined them also with regard to the gas, the ventilation, and the general working of the colliery? Yes, so far as that portion of the mine was concerned.

Your Worship will remember that the information was in respect to the Jubilee workings? I did not go into any other part of the colliery.

I believe you went into the tunnel then along the main road, towards the Jubilee workings? Yes, after being a little while at the furnace.

At the time of your visit, was there anything dangerous about these workings? Decidedly not.

At the time of your visit, was there anything defective in these workings? I noticed nothing defective.

And you saw everything that was there? I did.

Was there anything there which in any way, in your opinion, tended to the bodily injury of the persons engaged in the mine? No; I do not think so.

Well, was there anything there which even threatened to tend to the bodily injury of the persons in the mine? No; not in my opinion.

On the occasion of your visit, what was the condition of that mine with regard to the system of ventilation of the workings? I think the condition of the mine in regard to ventilation was all that could have been desired.

Were there the slightest symptoms of gas showing in these workings? No; not in the current of air.

Was the air which was being supplied to the men pure or impure? It was very pure air.

Now, after your very careful investigation and search, so far as you could see, was there any danger of an explosion of any kind? So far as I could see, there was no danger of any explosion.

Was the ventilation there above or below the general average of ventilation of mines? With regard to that portion of the mine I presume you mean. I did not inspect any other portion, so I cannot compare it with others.

Was the ventilation of that portion of the mine that you inspected above or below the average? It was above the average.

I believe that you measured the air that was flowing through the mine at the time? I saw it measured.

I understand that it was another Mr. Thomas who measured it? Yes; Mr. John Thomas, the Victorian coal-viewer. Mr. Thomas is stationed at Newcastle, and represents the Victorian Government.

He is a mining engineer and a gentleman skilled in these matters? Yes, I think so.

I believe that the Victorian people have large contracts with mines in this locality, and that Mr. Thomas inspects the different collieries on their behalf? Yes.

The Police Magistrate: That need not be taken down.

Mr. Want: Now, can you tell me from memory the particulars of the measurement which was made on that occasion? (*Witness, reading from a paper*): We measured the quantity of air coming down the mine.

Whereabouts

Whereabouts was that? From the cross-beds leading from the Jubilee shaft, just near the face of the workings. The measurement was taken within 15 yards of the separation door, marked D on the plan B, towards the face of the main heading.

And what was the result? We found 7,350 feet of air travelling through per minute. The door was held open for four or five minutes.

Was that supply of air going up to the men? Yes; in the main heading, up into No. 3 split.

Mr. Edmunds: How many men were there? I was told there were sixty-four men there. The door was held open for about five minutes, and the current having been again tried we found 4,200 cubic feet of air per minute travelling that way.

Mr. Want: Was that quite sufficient with the door open for supplying that portion of the mine where the men were at work? Not for that number of men.

I mean, with the door left entirely open, would that air be sufficient to go all round it?

Mr. Edmunds: Let the answer to the other question go down first.

Witness: That supply was sufficient for the four men working at the main heading.

Mr. Want: But you say not sufficient for the men in the other portions of the mine—in No. 3 split, where you state there were sixty-four men? Not sufficient to fulfil the requirements of the Act.

Supposing the door were left open for a little while, through accident, would that mean any alteration to the men in No. 3 split? The door would not stand open of itself.

The Police Magistrate: I presume it is hung so as to close itself independent of the force of the air? Yes.

Mr. Want: But, in any case, the force of the air was sufficient to keep the door shut? Yes.

Supposing that the door was propped open, in order to allow trucks to go through, would there be any danger to the men from want of air, or anything of that sort? No, no danger.

Then the requirements of the Act demand more air than is necessary for life; men can live much under that? Yes, in ordinary mines, such as the Newcastle-Wallsend Company's mine.

Then the men can live in the mine with a great deal less air than the Act requires? Yes.

Was this door necessary at all in this place? I think a door should have been placed there.

But such a door as you say—a canvas door, or something of that sort, would have done? I should have preferred a wooden door.

Is there the slightest necessity to have two doors there? Not the least.

You know, as a matter of fact, that only four men work beyond that door? Yes.

Then I believe you went along the main road and you found the face was—about how far up? I cannot say how far it was from the door.

How far did you go up from where the last measurement was taken? Well, it might be about 2 chains; I find by my notes it is 5 chains.

This was towards where the men were working? Yes.

Is there anything which you took with you which indicated the slightest trace of gas? We took a Davy lamp.

It is supposed to be the finest test of the presence of gas that there is? Yes.

Now, did you search carefully to ascertain whether there was any gas there at all? I did.

And were you able to discover any gas? No, I was not.

Did you try with the naked light as well? We did.

Did you hear any whistling or buzzing noise in the place? Yes; I heard a slight buzz.

Was there any trace of inflammable gas? No.

Then, I suppose, you went from there to the Jubilee shaft, along the Jubilee heading? We did.

Did you see the air measured there? Yes.

What was it? We found 12,045 cubic feet of air passing per minute.

This was within a chain of the heading? Yes.

Did you see anything at the heading as you went along which you could tell his Worship about? At the intersection of the cross-cut, about 50 yards from the Jubilee shaft, we heard some bubbling noise.

Did you examine it? Yes; and we found that it proceeded from a shallow pool of water on the floor. I passed my lamp over it, and in a minute or so the gas ignited and gave a feeble flame.

Did the flame keep alight, or was it merely flickering? We put it out.

This was with the naked light? As near as I could get the lamp to the water—within half an inch.

Now, will you tell his Worship what supply of gas was coming from that blower? Judging by the ordinary streak, I should say that about 2 cubic feet per hour were coming from it.

Did you go further along the shaft then? Yes, about 20 yards further on. There was a noiseless blower in the floor, which was pointed out to me there.

I believe you tried that blower—can you tell me how many cubic feet came from it? I think it was a little stronger than an ordinary street-lamp.

How close did you put your light to find that? Within an inch.

Did you find any other blower? Yes; at the face of the 36-feet or narrow bord.

That was up near the Jubilee shaft? Yes, about 12 yards away. I there heard a slight buzzing noise again.

Did you try it with the lamp? Yes; we put the lamp near it.

How close? Quite close to the coal.

Did it ignite then? No; it took over a minute to ignite.

What sort of light was it when you had it ignited? A very tiny jet.

How much gas do you think came from that blower? I should say that hardly 2 cubic feet per hour came from it.

Now, were these all the things that were worth speaking of? Yes.

And you made a very careful search? Yes.

Now, had that gas the slightest effect whatever on the air? It had no perceptible effect whatever on the air. There would not be more than 20 to 25 cubic feet of gas per hour there.

And what proportion would that bear to the air that was coursing through the mine? Even if it were 25 feet per hour it would be only 1 of gas to 28,000 parts of air.

And that would be the limit at the outside to its effect? Yes.

Will you tell me, in your opinion, is this mine now perfectly safe—is there any possibility of a large outbreak of gas there? I think, at the present time, the mine is safe in an eminent degree. Is

Is there, so far as human knowledge can tell, any liability or probability of an outbreak of gas there? No probability.

If these workings were continued as in similar mines, would this supply of gas increase or decrease? These blowers, which now give off gas, will naturally decrease.

Was there anything which you saw that would indicate to any man of intelligence and skill a further large outbreak of gas? Nothing.

I believe this shaft will be the outcast shaft? Yes; I noticed the preparations being made.

And you know that preparations are being made elsewhere? Yes.

You know that the Company are preparing there one of the largest shafts in the world? I do not know of any larger fan in the world.

So that whatever gas may be in these Jubilee headings will be drawn off at once? Yes, if there is any left.

When these shafts are completed, will there be any gas at all from the blowers now seen there? No.

Of course, there may at some other time be other blowers discovered? Yes.

Is there anything that can possibly be done, or required to be done, in these colliery workings for the safety of the men? Nothing.

These blowers come from the floor, do they not? There were two that were not from the floor, but I believe they all now come from the floor with one exception.

Will you tell me now if there had been any really serious pressure from gas what would have happened to the coal on the floor where there are only 18 inches of it? Had there been any strong pressure it would have forced the floor up. I have seen that happen in my experience, but there was not the least sign of it here.

In your opinion, the present system of carrying the air down to the men does not tend to do any harm either to the men or to the mine? Oh, no.

Was there any necessity, in your opinion, for the use of safety-lamps in that mine? None at all.

With the amount of air going down there there was no necessity for the use of safety-lamps? No.

Would any colliery manager in his senses have thought of using safety-lamps under the circumstances? No.

Mr. Edmunds: I object to this line of examination; the question before your Worship is whether the defendant has complied with the requisition contained in the Inspector's notice.

The Police Magistrate: I think I must admit evidence to show that they have remedied the matter complained of.

Mr. Want: If there were any necessity for using safety-lamps on the 5th January, is there any necessity now for using them? No, no necessity.

I presume that you found this Jubilee heading is now connected with the 36-foot bord, and that there is a pure current of air running right round? As to that narrow bord, the air is now quite pure, and free from any collection of gas. The bord was moist, and the air quite pure.

If there was a collection of some hundreds of feet of stagnant gas present there on the 5th January, there is no such thing there now? No, and not any sign of it.

Mr. Edmunds: The system of ventilation brought the intake air over that part of the mine where inflammable gas was exuding? Yes.

I think you said that you saw the men working there? There were no men working there that day.

Will you just tell us this—it will not take a moment to calculate it: Supposing that there had been gas exuding at the rate of 25 feet per hour, and supposing that gas had been exuding there since the 6th January inclusive, will you just state what quantity of gas had exuded and now remains there? I might by to-morrow morning.

Oh, well, I will do it for you now. There are fifty-seven days since then. Are you following me? I am rather slow at figures.

Well, you must be if it would take you till to-morrow morning to work this out. Here we have, in fifty-seven days, 1,368 hours. I really wish you would work it out for me.

Mr. Want: Oh, we will take your word for it.

Mr. Edmunds: Well, 1,368 at 5 feet per hour will give us the exact amount of gas which exuded in that time, and I do not think it will take us till to-morrow morning to do that sum. I think you will find that 34,300 feet of gas have exuded from these blowers in that time.

Mr. Want: And how many feet of fresh air went in per minute? About 1,245 per day.

Mr. Edmunds: There was actually this amount of gas imprisoned in that part of the mine.

The Police Magistrate: But it might have been carried off by the intake air.

Mr. Edmunds (to witness): So that there must have been this quantity of gas enclosed in the coal in the neighbourhood of that Jubilee heading? I do not quite understand you.

If that amount of gas had been exuded at that time that quantity must have been enclosed in the coal? Yes, within the distance travelled.

Virgin coal country always contains a large quantity of gas, does it not? It all depends upon the character of the coal.

Is there any rule or means of knowing the actual quantity of gas that may be given off in unexplored coal country like that? No rule that I am aware of.

What is the lowest percentage of inflammable gas that the safety-lamp that you use would indicate? About 3 per cent.

And do you say that this is the best means known of testing the quantity of fire-damp in a mine? It is the best practical means known, but there are some fine instruments invented which have not yet come into practical application.

Do you know the work of Abel on accidents in mines? No.

Do you know anything about it? No; not of Abel's work. I do not remember ever having heard his name mentioned even.

Mr. Want: You do well to go back to Abel for an authority.

Mr. Edmunds: Better go back to Abel than to Cain. (*To Witness*): Do you know a work of that kind edited for the Institute of Civil Engineers by Mr. James Forrest; just look at the title of this book, and see if you do not regard this work as an authority? Well, it comes from the Institute of Civil Engineers, who are not connected with mining.

But it is edited by the secretary;—look at the author's name and see if you do not regard him as an authority on these questions? I cannot say that I do. *Mr.*

Mr. Want: I would sooner take the opinion of the Police Magistrate of Wallsend on the matter.

Witness: Civil engineering is a distinct profession from mining engineering.

Mr. Edmunds: If there is a liability to a sudden outburst of gas in a mine—

Mr. Want: What have you got now—a book by Noah? Because, if so, we will ignore it.

Mr. Edmunds: Would you regard the report of the Royal Commission in England, issued in 1886, as an authority on mining? By all means.

Mr. Want: I object. English mines are altogether different; the cases are different, and we have no proof that this is the report of the Commission.

Mr. Edmunds: My learned friend has introduced opinions here—opinions which I think quite irrelevant—but as he has given evidence of opinion I want to rebut it.

The Police Magistrate: I think the witness is giving his evidence in a highly creditable manner, and I think you ought to be satisfied with it.

Mr. Edmunds: But I want to test his opinion (which has been given already) by works of authority on the subject.

Witness: There is one word that I take exception to in your statement about my evidence. I did not use the word "liability"; I said "probability."

Mr. Edmunds: You think there is no danger or liability to a sudden outbreak? No man can foretell unless he knows.

The Police Magistrate: There is one thing which we do know: where there is an upheaval of coal deposit there is generally a large gaseous formation. As to what extent any human being can tell it is not to be said. It might be miles away, and suddenly some fault might be tapped which would bring the whole of this into play; and, on the other hand, you might come upon it suddenly.

Mr. Edmunds: In this mine, can anyone say as to the liability to a sudden outburst of gas? No, unless they passed through coal very different to that which I saw when I was down there.

The Police Magistrate: The quality of the coal is, I presume, an indication of what may be expected in the way of gas? The coal will give indications, and if an outburst were imminent some kind of warning would be given.

Mr. Edmunds: But you cannot tell the quality of the coal until you get through it? The same seam of coal will maintain its character throughout, and will not vary suddenly.

The question is, would you undertake to say that there is no liability in that mine, as it stands at the present moment, to a further large outburst of inflammable gas? As it stands at the present time, certainly not. There is no liability to a large outburst of inflammable gas.

For what distance, on each side of the Jubilee headings, do you undertake to speak of the quality of the coal, and, therefore, of the nature of the gas?

Mr. Want: I object. My learned friend has no right to go beyond the Jubilee heading.

Mr. Edmunds: Well, I contend that I have. The whole charge is one of prospective danger—danger not as to what has come out already, but as to what may come out in future. I want to find out how far these workings may be continued without any liability whatever to an outburst of gas.

The Police Magistrate: I think that the witness cannot answer that question.

Mr. Edmunds: But the witness has undertaken to say that there is no liability at all to an outburst of gas.

Mr. Want: You cannot go beyond the Jubilee heading.

Mr. Edmunds: I want to find out the locality of which the witness is speaking.

The Police Magistrate: Can you say anything of the locality beyond these Jubilee workings?

Witness: I can say this, that the coal is now hard and compact, and before there is any great liability to a large outburst of inflammable gas the nature of that coal must be completely altered. Before any change takes place that coal must become soft and disintegrated, and must change its nature. And we, as a rule, receive sufficient warning from the coal to indicate the approach of such a change.

Mr. Edmunds: Can you say, as regards this mine, within what distance such a change might occur? The present appearance of the country affords no indications of such an alteration occurring.

But can you say so of this unexplored country. You have not answered my question. Can you say now in what distance in that unexplored country such a change is likely to take place? I should say that no change was likely to take place within at least 40 or 50 yards.

Do you mean to tell me that you might not come to another fault or a dyke? No; not without having the warning that I mentioned.

But in that unexplored country, is there not a likelihood of a change being met with from a fault, a road, or a dyke, within 40 or 50 yards? Certainly, I say so, so far as my experience goes.

Did you not come upon faults with the same quality of coal on both sides of it? That is good coal you mean. If you say close up to the fault, my answer is no.

Never? Not to my knowledge, nor have I ever read of such a thing.

What is the length of your experience in this Colony? Nearly two years.

You have been here not quite two years? No.

Mr. Want: Will you take this map and tell me, supposing that this mine has been worked and you found the same seam of coal all through the colliery and round it on every side, would that indicate to you that there was no likelihood to be any great change? It would.

If the far end openings were open for fifteen or sixteen years, would not these shafts lessen the liability of meeting with these faults or of gas accumulating there? Not from that district.

But within 20 chains of it? No; I think not in that coal.

We have heard it said here that in virgin ground you are more likely to find gas in some coals? Yes.

But supposing you did find virgin ground with some gas in it, would not the openings all round destroy the gas from the virgin ground? Yes; but I saw no workings so far as that.

But if the workings were within 20 chains of it, what then? Yes; that would prove this liability to be the case anywhere within that 20 chains.

But you would know from the nature of this seam and the showing of the workings round it—you could say that that coal was not likely to give a large quantity of gas? Far from it.

John Thomas called in and examined :—

Mr. Want : Are you a resident of Newcastle? I am.

How long have you been a resident of that city? I have been here for about ten years.

And I believe it is a part of your duty to view these collieries and generally inspect the coal-mines about here? Yes; general inspector.

This is done with a view of seeing what kind of coal is being sent to the Victorian Government? Yes; the coal is required for the Victorian railways.

You were appointed to your present position by the Government of Victoria? Yes; and I am not allowed to do any outside work except with their consent.

Do you go down into the collieries? Yes; I have seen them all, and very often those that we take coal from.

Have you had any experience in Wales in mining before you came here? Yes. I had about seventeen years' experience in Wales before I came to this country.

In large collieries? Yes. I served my time in large ironworks in Monmouthshire. These works employed 13,000 miners and 1,200 colliers. I was coal-viewer also for the Lord of the Manor in Gloucestershire.

I believe that, on the 3rd March last, you went to inspect this Newcastle-Wallsend Colliery with a number of other skilled gentlemen? Yes.

And I believe that you took the measurement of the air that was then passing through? I did.

Did you examine very carefully and critically what are called the Jubilee workings in the vicinity of what is known as the Jubilee shaft? Yes.

Were any of these works dangerous or defective or in such a condition as to threaten, in your opinion, to tend to the bodily injury of the persons working in the mine?

Mr. Edmunds : Now, your Worship, this is the kind of question that I have repeatedly objected to.

Mr. Want : And repeatedly ruled admissible by his Worship.

Mr. Edmunds : Well, I contend that the evidence is quite irrelevant to the issue raised here, and, therefore, it is not admissible. The offence of which the defendant is charged here in the information is, that he failed to comply with the requisition of the notice of the Inspector of Collieries. The defendant did not do what he was required to do in that notice, and the proviso which my learned friend relies on to get in this evidence cannot be referred to here. Your Worship will find that proviso at the end of the 25th section, and it is as follows :—“ Provided that the Court, if satisfied that the owner or agent has taken active measures for complying with the notice or award, but has not with reasonable diligence been able to complete the works, may adjourn any proceedings taken before them for punishing such offence, and if the works are completed within a reasonable time no penalty shall be inflicted. No person shall be precluded by any agreement from doing such acts as may be necessary to comply with the provisions of this section, or be liable under any contract to any penalty or forfeiture for doing such acts.” Therefore, the issue before this Court is, did the defendant comply with this notice? The question is not whether the notice was requisite or not; it is not whether something else might have been done, or whether the mine is not now dangerous. That is not the question. The question is, has the defendant complied with the requisition? That is the issue before your Worship, and on that issue alone the prosecution has been taken. Now, the requisition is that the defendant shall remedy the thing complained of, and this was not the working with naked lights—it was not the system of ventilation, and it was not that the men had insufficient air. Mr. Dixon did not complain of the existing quantity of air, but of the prospective danger—the danger of greater outbursts of inflammable gas. His notice to the defendant is “ in view of the liability of a large outburst of inflammable gas occurring at any time, I hereby, in accordance with the provisions contained in the 25th section of the Coal-mines Regulation Act of 1876, give you notice that, in my opinion, it is a dangerous practice to allow the air current from the Jubilee shaft to ventilate one split of about sixty-eight men and another split of about thirty men, all working with naked lights, after such current of air has coursed through the Jubilee headings, where the gas is exuding.” And then the Inspector requires them to remedy that—to remedy the course of the air where the men were working with naked lights. The only defence which I can see that it is possible for the defendant to set up here is that he did comply with the requisition of the Inspector. Evidence in this direction will be evidence to the issue, and I take your ruling now that all these questions, which tend to show what the quantity of air was, are perfectly immaterial, and should be excluded. The question you have to determine is whether the Inspector required them to do a certain thing, and that not having gone to arbitration the Company complied with the notice of the Inspector.

The Police Magistrate : But they remedied what was being complained of.

Mr. Want : That is the point, your Worship.

Mr. Edmunds : The words of the Act are, did not comply with the terms of the requisition.

The Police Magistrate : But if the defendant is brought before the Bench, and is able to show that he has remedied the matter complained of, no penalty can now be inflicted.

Mr. Edmunds : Well, I contend, your Worship, that the defendant is not at liberty to disregard the opinions of the Inspector. If he did not wish to comply with the terms of the Inspector's requisition, then his proper course was to have gone to arbitration. The defendant must comply with the requisition in the notice, even if it requires something to be done which might be a mistake. The only material issue therefore before your Worship is, did the defendant comply with the requisition. I say that we have shown that he did not do so. Now, my learned friend is trying to get you off under a side issue by falling back on the last part of the section which I have quoted, which provides that if the Court is satisfied that the defendant is endeavouring to remedy the thing complained of no penalty shall be inflicted. Well, the only way to remedy this is by complying with the Inspector's notice, and as the defendant has not done this, he should have gone to arbitration, and allowed the award to decide. My point is that the Inspector must comply with the requisition of the notice, not having gone to arbitration, whether the requisition was right or wrong. But if I can show you that the defendant has not complied with that requisition, then he must be held guilty of an offence, and be subject to the penalty. It is not that the defendant is remedying this matter by measures of his own, but that he must take active measures to do what the Inspector required him to do. The other issue is a side issue, and an improper one, because it is not competent for this Court to decide whether the measures that were taken to remedy this defect were right measures or not. I contend that this notice is the notice of the offence, the defendant

not

not having gone to arbitration, and that he must obey that notice. It is no defence to say that this defect was remedied by other means. That is no defence whatever, and all evidence which tends in that way is immaterial, and must, I contend, be excluded.

Mr. Want: I am somewhat astonished at the course which my learned friend has taken in this matter. He has waited all day yesterday and up to the present time, after your Worship has given two decisions on the subject, and heard two witnesses, before making his protest that this was not the issue. It seems to me that my learned friend is finding that his case is gradually slipping from under him. In fact, he looks it, and now, in a moment of excitement, he wants you to stop what has been going on for two days. Now, in the first place, we have been given notice to do a certain thing, and he asserts that we must do it in the way which we are directed, although Mr. Dixon in his evidence said he would not tell us how to remedy the thing. Therefore we are not told what to do, nor does the notice give us any correction on the subject. My learned friend speaks about naked lights being a danger, but I defy him to show it to me. Supposing Mr. Dixon came along and said to this Company, "I want a State House built in this mine; bury Mr. Mackenzie and Mr. Edmunds there when they die." According to my learned friend, the owners of the mine would be compelled to comply with that request. Well, now, I take it, your Worship, that that is not the meaning of this section at all. The section says:—"If in any respect (which is not provided against by any express provision of this Act, or by any special rule) any Inspector find any mine, or any part thereof, or any matter, thing, or practice in or connected with any such mine, to be dangerous or defective, so as, in his opinion, to threaten or tend to the bodily injury of any person, such Inspector may give notice in writing thereof to the owner or agent of the mine, and shall state in such notice the particulars in which he considers such mine, or any part thereof, or any matter, thing, or practice, to be dangerous or defective, and require the same to be remedied forthwith. The Inspector shall also report the same to the Minister." Then Mr. Dixon gives the defendant notice that this thing is dangerous and threatens bodily injury. My learned friend comes here and says that we are not charged with not remedying the matter, but with not complying with the requisition of the Inspector. Yet Mr. Dixon will not tell us how to effect the remedy. All he says is that the workings are dangerous, and are in such a condition as will tend to the bodily injury of the persons employed there. I had reason to complain of this reticence, and asked him what we were to do. In reply, my learned friend quotes this case, which he has furbished up from somewhere—a case which does not bind us in any way. He quotes this case to show that the Mining Inspector need not give any information, but may demand to have the thing remedied merely. Why do they not try to show that we have not remedied this thing thoroughly? They have tried to prove that the mine is in a dangerous state, and no doubt it was, according to their opinion; but I can prove by the most credible witnesses who have ever been in a Court that the mine was all right. A change has been brought about, and this colliery is now one of the best worked in the world; yet Mr. Dixon comes here and tells us that it is not fit for men to work in. If nothing else had been said or charged against the defendant, he would have had a perfect right to come here and refute this. But we can prove that we have done that which has brought about a change of affairs in this mine, and £7,000 or £8,000 worth of work is now going on. This mine will then contain one of the largest and best fans in the world. It is strange that we should be all this time fighting this question, and that my learned friend should now come and attempt to shut out this evidence.

Mr. Edmunds: The kind of argument which my learned friend addresses to the Bench is largely made up of personal ridicule, which I do not object to in him. But I object to this kind of argument being used when I quote from books of the highest authority. Now, my learned friend knows well that the case which I quoted comes from the Court of the highest authority in England, and comes in the report which has been sent from England, and which is continually being quoted in our own law Courts. How, then, can my learned friend refer to this decision as "having been got up from somewhere." Now, is this a way of arguing against the decision of authorities recognized all over Great Britain and her Dependencies wherever the law is applicable.

The Police Magistrate: But it is very seldom that two lawyers will agree.

Mr. Want: Except at dinner.

The Police Magistrate: That is the difficulty with me; I have to decide between you two gentlemen.

Mr. Edmunds: My learned friend speaks of this case as being of no weight with us. Well, I may tell your Worship that every Court in this land is bound by it.

Mr. Want: All I said was that that decision had no application to this particular case.

Mr. Edmunds: I find that the shoe is now beginning to pinch. My learned friend asserts that this decision has no application to this particular case; but his assertion is not sustained by a word of argument. I have shown that it exactly applies. The Judge who gave that decision decided that an Inspector should merely give notice, and state merely that the practice is dangerous, and demand that it should be remedied. The Judge also decided that the Inspector was not bound to state what was the remedy, his duty being to say what required to be remedied. My learned friend complained that I did not bring up this objection until I felt overwhelmed by the case which he is making out. Well, I do not feel in the slightest degree overwhelmed.

The Police Magistrate: Well, I can hardly withdraw the ruling which I have already given.

Mr. Edmunds: What my learned friend is going to show has been remedied is quite another thing. He is fully at liberty to prove that the remedy has been effected in compliance with the terms of the Inspector's notice, but not in any other way.

The Police Magistrate: That is what he is trying to do.

Mr. Edmunds: Well, I do not think so, your Worship.

The Police Magistrate: If the defendant can establish what has already been stated, I think it will be a remedy in accordance with the requisition of the Inspector.

Mr. Edmunds: No. The defendant must comply with the requisition of the notice, and that is the only remedy, I submit, which your Worship can recognize. We are now in the position as if there had been an arbitration and an award, the award requiring the defendant to remedy the same things which are complained of in the notice. If there had been an award, and they were charged before your Worship with not obeying that award, their contention here would not stand, and it will not do in this case either. The only thing which your Worship can recognize in the way of a remedy is an action of the defendant, showing that he had complied with the notice.

The Police Magistrate: Well, I decide that the Crown were right in going under the 25th section, and this will, I think, allow the defendant to show that he has remedied the matter complained of. I think certain evidence should be taken to allow me to decide whether this thing has been remedied or not. I want to see how far the defendant has obeyed the notice that has been served on him by the Inspector of Collieries.

Mr. Edmunds: Well, your Worship, that is exactly the point I take exception to. I submit that your Worship has to decide whether the matter has been remedied by complying with the requisition contained in the notice.

Mr. Want: One of the things complained of is the standing gas in the Jubilee heading.

Mr. Edmunds: I would like to read again for your Worship a portion of the Inspector's requisition. He says:—"In view of the liability of a large outburst of inflammable gas occurring at any time, I hereby, in accordance with the provisions contained in the 25th section of the Coal-mines Regulation Act of 1876, give you notice that, in my opinion, it is a dangerous practice to allow the air current from the Jubilee shaft to ventilate one split of about sixty-eight men and another split of about thirty men, all working with naked lights, after such current of air has coursed through the Jubilee headings where the gas is exuding." Now, I ask your Worship, how could they remedy this matter except by complying with the requisition of the notice. Had the defendant thought that he was right in refusing to remedy, then it was open to him to have gone to arbitration. But as he has not done that, and as he has not complied with the requisition and notice, he has been guilty of an offence under the Act.

The Police Magistrate: It seems to me that his not having complied with the notice would subject him to a certain penalty; but then, supposing it has been remedied to a certain extent?

Mr. Edmunds: But it is only on condition that the owner or agent takes such steps as will comply with the notice—not to remedy the thing complained of in any other way.

The Police Magistrate: Well, I am still of the same opinion as before.

Mr. Want: And we are both agreed in that.

Mr. Edmunds: Well, then, I will ask your Worship to make a note of my objection.

[Note entered in the following terms:—"Mr. Edmunds: I object to evidence being adduced to show that alleged dangerous practice was remedied, except such evidence as shows that the defendant complied with the requisition of the notice on the ground that compliance with the requisition of the notice is the only fact at issue."]

Mr. Want: I only tendered such evidence as that.

[At the request of Mr. Want, a note in the following terms was also entered in the depositions:—"I only tender evidence to show that defendant acted in compliance with the requisition, and secondly, that it was agreed on both sides, at his Worship's suggestion, that the issue should be this very question of remedy or no remedy."]

The Police Magistrate: I ruled, on application, before the witnesses for the defence were examined, that the sub-sections to section 12 of the Coal-mines Regulation Act should not be entertained so far as this case was concerned, and that the case was properly brought under section 25 of the same Act. And it was agreed on both sides that evidence should be taken to prove that a remedy had been adopted since the notice was given.

Mr. Edmunds: On that ruling I understand that your Worship intends to admit the evidence now tendered.

The Police Magistrate: Yes.

Mr. Want (to witness): In your opinion, when you inspected this Jubilee heading, was there anything at all there which was dangerous, or which threatened bodily injury to the persons working in the mine? Nothing whatever.

At the time of your visit, was there any large quantity of inflammable gas being engendered in the mine? We could only find one small jet, which I considered was hardly worth noticing. The current of air would destroy ten thousand times the quantity of gas that we saw in the mine.

Mr. Edmunds: I again object to this evidence.

Witness: We had the greatest difficulty in the world in igniting one little jet which we found there.

Seeing the nature of these workings and the quality of the coal, was there any liability in your opinion for any great outburst of gas in that mine? I could not see any danger at all from an outburst of gas. There was no possibility whatever of such a thing. We tried it with naked lamps, and we could see nothing.

Did you find a small blower in that narrow bord? Yes, we did.

Was there any large quantity of gas at the time of your visit accumulated in that narrow bord? No; it took six or seven minutes with the lamps before we could detect anything; before we could light the jet, and then a move of the hand would have blown it out.

Then when you were in the mine there was no stagnation or collection of gas in the main heading? None whatever. We tried it in several other places, and found nothing with the exception of a very feeble jet from the floor of the mine.

Supposing on the 5th January (when we were told that this mine was in a very dangerous and defective condition—that it was such as to threaten bodily injury to the workmen—that the air was impure, and that it was not safe to work with naked lights)—supposing that were the case on the 5th January, did the same state of affairs exist when you saw the mine on the 5th March? Not at all; there was no trace of gas.

Did you test the air that was then passing through the mine? I did.

What result did it give you? In the main current to the furnace shaft proceeding eastward we had 83,000 cubic feet per minute. On the right-hand side of the furnace shaft we got 19,680 cubic feet per minute.

This was going towards the Jubilee headings? Yes; the main cross-cut from the Jubilee heading at the face gave 7,350 cubic feet per minute.

That is just above the door? That is below the trap-door. We then opened the door, and we obtained 4,200 cubic feet per minute.

In your opinion, was that ventilation quite sufficient to have done away with any impurities from gas that were existing in the mine? I forget how many men were there. I think it would be sufficient.

We will leave out the question of the door now. Did you afterwards go to the Jubilee shaft? Yes, and I took a measurement of the current of air close by. And

And what was the amount of air there? The amount was 12,045 cubic feet per minute. After the air that went into the cross-cut had been taken out of that quantity, it left a current of air in this split of 4,695 cubic feet per minute.

Well, now, I want to know from you regarding the current of air that passed over these blowers, would there be any taint of gas in it? None whatever. The blowers, both in the solid and in the mud, were in the Jubilee side where we gauged the air. We had with us nine naked lamps, and there was not a taint of gas there. The only difficulty which we experienced while we were in the mine was the difficulty in keeping the lamps alight, owing to the wind.

Now, I want to ask you about this door that was there. Was there any necessity for two doors at that place? I cannot see it, because the split is so far safe. There are only thirty men employed there.

How much air goes down the split which has nothing to do with the door? 4,695 cubic feet per minute goes down the northern heading.
