24. Any person who shall cast any filth, rubbish, or any dead animal, or any animal with intent of drowning, into any public water-course, sewer, water-hole, creek, or canal, or who shall suffer slops, suds, or any filth of any kind to flow from his or her premises over any of the footways or streets within the Borough of Young, or shall cause or permit, or cause by means of pipes, shoots, channels, or other contrivances, filth of any kind whatever to flow into any public water-course, water-hole, river, creek, or canal, or shall obstruct or divert from its channel any sewer or water-course, river, creek, or canal, shall forfeit any sum not exceeding five pounds.

25. No cesspit, cesspool, or other receptacle for night-soil shall be of greater depth than 5 feet, 4 feet 6 inches in length, and 3 feet 6 inches in width, and shall be built of 9-inch brick work set in cement, and rendered half an inch with cement mixed in the proportion of one of cement to three of clean sharp sand, so that no soakage can escape therefrom, and that the contents thereof may be readily removed; and any person violating the provisions of this By-law shall be liable to a penalty not exceeding £10 nor less than £2.

26. Every closet shall be built in such a position that the same may be emptied without the contents being carried through any dwelling-house; and any person having or building a closet contrary to this By-law shall be liable to a penalty of not less than £2 and not more than £10.

27. If any alteration shall be requisite in the opinion of the Inspector of Nuisances, or any other officer appointed by the Council in that behalf, for preserving public health or decency in case of any existing cesspit or closet, and such Council shall adjudge such cesspit or closet to be injurious to the health or opposed to decency by exposure or otherwise, and the owner or occupier shall not make the necessary alterations after receiving 14 days' notice so to do from the Council Clerk, it shall be lawful for the Inspector of Nuisances, or other officer appointed by the Council, to make the necessary alterations, and the costs of such alterations shall be paid by the owners or occupiers of the premises whereon the same shall be.

28. Any person desirous of erecting an earth-closet must deliver to the Council Clerk seven days previous notice in writing of his intention so to do.

29. The Inspector of Nuisances or other officer appointed by the Council may visit and inspect any premises or do any work authorised by the Nuisances Prevention Act, 1875 therein, on all days except Sundays and holidays, and any person who shall hinder or obstruct any Inspector of Nuisances or other officer as aforesaid, upon any such visitation or inspection, or in the doing or performing of any work, shall forfeit and pay a penalty of not less than ten shillings nor more than forty shillings.

30. The Inspector of Nuisances shall furnish the Council with a monthly return, showing the number of cesspits emptied and earth-closets attended to, the amount due and payable for each cesspit and earth-closet attended upon, and the amount of arrears due for emptying cesspits and attending on earth-closets. He shall collect the amounts so due and payable and account therefor to the Council at the least once in every month, or as may be determined upon by such Council.

31. Any person or persons requiring their cesspits emptied shall send written notice to the Council or the Inspector of Nuisances; and any person or persons emptying or causing to be emptied any closet without the sanction of the Council shall be liable to a penalty not exceeding £10 nor less than £1.

32. The Council may charge such sum for the emptying of cesspits or attendance upon earth-closets, as may be decided

upon from time to time by resolution of the Council, and the Council or the Inspector of Nuisances on their behalf may, at any time after seven days, previous notice of their or his intention so to do shall have been left upon the premises, in respect of which such sums are payable, sue for and recover the same.

33. Every earth-closet hereafter to be built shall be provided with a galvanized iron pail of the following dimensions, namely, fifteen inches in diameter and fourteen inches in depth, such pails to be provided by the Council and sold at cost price.

34. Every earth-closet, whether already built or hereafter to be built, shall be provided with a box or earth compartment, such box or earth compartment to be without lid, and provided with a pint scoop for each occupant to throw in a pint of the stored dry earth or dry ashes through the seat into the galvanized iron pail.

35. The Inspector of Nuisances shall not take any legal proceedings under these By-laws without informing the Mayor of his intention so to do.

#### Removal of house refuse.

36. The occupier of any house, building, or premises within the Borough of Young shall cause the yard and ground adjacent or belonging thereto to be kept in a cleanly condition, and so as not to be a nuisance or injurious to health; and shall cause all dust, mud, ashes, rubbish, filth, or other such refuse matter produced or accumulated on such premises, to be collected in one place, in such yard or ground; and if at any time the occupier of any premises shall neglect or fail to have such rubbish or refuse matter so removed before it becomes a nuisance, the Inspector of Nuisances shall cause the same to be removed at the expense of such occupier. Nothing contained in this By-law shall be construed or taken to prevent the occupier of any premises from causing any manure, ashes, or other refuse matter as aforesaid, produced or accumulated thereon, to be kept for the purpose of being used for manure on any garden, or on any land contiguous to such premises: Provided such manure, ashes, or other refuse matter shall not previous to the removal thereof for use as manure on any garden or land as aforesaid, be kept not less than fifty yards from any dwelling-house, shop, or other building, or so as to be a nuisance or injurious to health.

#### Cleansing of privy cesspools.

37. The occupier of every house, building, or tenement within the Borough of Young, shall cause every privy cesspool thereon to be emptied and cleansed from time to time, so soon as any portion of the contents of such cesspool shall have so accumulated therein as to be within a distance of one foot from the top of the wall, sides, or lining of such cesspool: Provided that the contents of any privy shall not be removed or discharged therefrom except between the hours of eleven (11) p.m. and five (5) a.m.

#### Where cesspools are not provided.

38. The occupier of every house, building, or other tenement on or in which the privy or closet belonging thereto shall not be provided with a cesspool, constructed in accordance with the provisions of the preceding By-law (No. 1), shall at all times cause to be kept in such privy or closet a supply of dry powdered earth, ashes charcoal, lime, or other material efficient for deodorising night-soil; and shall cause all night-soil which may be deposited in any box, pan, bucket, or other receptacle in such privy or closet to be immediately, on the deposit thereof, covered with a quantity of dry powdered earth, or other deodorising material as aforesaid, sufficient to thoroughly and effectually deodorise the contents of such bucket, pan, or other receptacle, and such receptacle shall be emptied at least once every fortnight. Any person violating the provisions of this By-law shall be liable to a penalty not exceeding £5 nor less than 10s.

#### Stables, cow-sheds, and pig-styes.

39. The occupier of any land within the Borough of Young on which there shall be erected any stable, cow-yard, cattle-shed, or pig-stye, shall cause such premises to be kept in such a state, in respect of cleanliness, as not to be a nuisance or injurious to health, and shall cause all dung, soil, or manure produced or accumulated thereon to be collected in a place (to be approved of by the Inspector of Nuisances) in the yard of such premises, and to be there in an inoffensive condition, and so as not to be productive of any nuisance; and shall cause such dung, soil, or other manure to be from time to time removed from such premises, as often as the quantity of the same so collected or accumulated shall amount to two cubic yards. And if at any time the owner or occupier of any such premises shall neglect or fail to have such dung, soil, or other manure removed therefrom as aforesaid, the same shall be removed by the Inspector of Nuisances, at the expense of such occupier. Any person violating the provisions of this By-law shall be liable to a penalty not exceeding £5 nor less than 10s.

#### Deposit of rubbish, manure, &c.

40. No person shall deposit, or cause or suffer to be deposited in or by the side of any street, or on any road, street, or right-of-way, lane, passage, water-channel, or gutter, or in any creek, river, or reservoir, or in any other public place within

the Borough of Young (not being a manure depôt duly appointed by the Borough Council of Young as the place for the deposit of manure, rubbish, or other such refuse matter) any dust, mud, ashes, rubbish, filth, offal, manure, liquid manure, dung, or soil, and no person shall deposit, or cause or suffer to be deposited on any land, field, or garden within the Borough of Young, any night-soil, blood, offal, or other offensive matter or thing without the written consent of the Mayor or Council, and any such offensive matter or thing which shall with such consent of the said Mayor or Council be so deposited, shall be immediately on the deposit thereof covered over by the person depositing the same with such a quantity of earth as will at once prevent the escape of any noxious or offensive effluvia from any such manure, soil, or other offensive matter before mentioned: Provided that nothing contained in this By-law shall be construed or taken to prevent the use as manure, for any garden or land, of the contents of any earth-closet, or any other privy or closet where such contents are deposited on any such field or land in a perfectly deodorised state, and so as not to cause nuisance or offence either at the time of the deposit of such contents or afterwards.

#### Notice to proprietors.

41. Upon complaint being lodged at the Council Chambers that the yards, closets, or drains of any premises is or are a nuisance or offensive, and after inspection such shall be found to be the case, notice shall be given in writing to the proprietor or tenant of such premises to remove or abate such nuisance within forty-eight hours after such notice. And if after such notice the nuisance shall not be removed or abated, the proprietor or tenant of the said premises shall be liable to a penalty not exceeding twenty shillings nor less than ten shillings.

42. Upon complaint being lodged at the Town Hall, the Inspector of Nuisances may at all reasonable hours, with or without assistants, enter into and inspect any buildings, stall, or place kept or used for the sale of butchers' meat, and examine any carcase, meat, flesh, fish, or other perishable article of food which may be therein, and in case any such articles shall appear to him to be intended for human food, but unfit, the same may be seized by him. And if it shall appear to a Justice of the Peace (upon evidence taken before such Justice) to be unwholesome he shall order it to be destroyed, and the owner thereof, or other person in whose custody it was found, shall be liable to a penalty not exceeding forty shillings nor less than ten shillings.

43. All persons standing or loitering upon any of the streets, footways, or other public places in the Borough of Young to the inconvenience of the passers-by, or in any way interrupting the traffic, shall discontinue to do so on being required by any officer or servant of the Municipal Council of the Borough of Young or any police officer. Any street musician or vocalist shall when requested by any householder, or his servant, or by any officer or servant of the Municipal Council of the Borough of Young, or by any police officer depart from the neighbourhood of the premises of such householder; any person offending against either of the foregoing By-laws shall for each offence upon conviction forfeit and pay a penalty or sum not less than ten shillings nor exceeding ten pounds.

#### Cleansing butchers' shambles, slaughter-houses, &c.

44. For preserving the cleanliness of the said Borough and the health of the inhabitants thereof, it shall be lawful for the Inspector of Nuisances, or for any other officer or officers appointed by the Council from time to time, and when and as often as he or either of them shall see occasion to visit and inspect the butchers' shambles, slaughter-houses, boiling-down establishments, tanneries, fellmongering establishments, and manufactories in the said Borough, and to give such directions concerning the cleansing of the said shambles, slaughter-houses, tanneries, and establishments and manufactories, both within and without, as to him shall feel needful; and any butcher, or the owner or occupier of any such shamble, slaughter-house, tannery establishment, or manufactory, who shall refuse or neglect to comply with such directions within a reasonable time shall forfeit and pay a sum not exceeding ten pounds nor less than ten shillings.

#### Various obstructions and annoyances.

45. Every person who in any street or other public place or passage within the said Borough, to the obstruction, annoyance, or danger of the residents or passengers, shall commit any of the following offences, shall on conviction for any and every such offence forfeit and pay a penalty of not more than two pounds—

Every person who shall hoist, or caused to be hoisted, or lower, or cause to be lowered, goods of any description from any opening in the house fronting any street or public place, and close to the footway thereof, without sufficient and proper ropes and tackling.

Every person who shall carry or convey, or cause to be carried or conveyed, in any street or public place, the carcase, or any part of the carcase, of any newly slaughtered animal without a sufficient and proper cloth covering the same for the concealment from public view, or shall hawk or carry about butcher's meat for sale without covering the same as aforesaid.

Every person who shall place any line, cord, or pole across any street, lane, or passage, or hang or place clothes thereon, to the danger or annoyance of any person.

Every person who shall place any flower-pot in any upper window near to any street or public place without sufficiently guarding from being thrown down.

Every person who shall throw or cast from the roof, or any part of any house or other building, any slate, brick, part of a brick, wood, rubbish, or other material or thing (unless within a hoard or enclosure when any house or building is being erected, pulled down, or repaired).

Every blacksmith, whitesmith, anchormith, nail maker, metal-founder, lime-burner, brickmaker, potter, or other person using a forge, furnace, or kiln, and having a door, window, or aperture fronting or opening into or towards any street, lane, or passage, and not enclosing such door, or not fastening the shutters or other fastenings of such window, and closing such aperture, and placing a screen before the same every evening, within one hour after sunset, so as effectually to prevent the light from showing through the doorway, window, or aperture next or upon such street, lane, or passage.

Every person who shall be the keeper of, or have any dog or other animal which shall attack or endanger the life or limb of any person who may have the right-of-way or use of any private yard, alley, street, or any other place within the said Borough.

*Premises in state to endanger public health.*

Houses to be purified on certificate by two medical practitioners.

46. If, upon the certificate of any two duly qualified medical practitioners, it appears to the Council that any house, or part thereof, or the premises occupied in connection therewith, within the limits of the said Borough, is in a filthy or unwholesome condition that the health of any person is or may be liable to be affected or endangered thereby, and that the white-washing, cleansing, or purifying of any house, or part thereof, or the premises occupied in connection therewith, would tend to prevent or check infectious or contagious disease, the said Council shall give notice in writing to the owner or occupier of such house or part thereof, or the premises occupied in connection therewith, to white-wash, cleanse, or purify the same, as the case may require; and if the person to whom such notice is so given shall fail to comply therewith within such time as shall be specified in the said notice he shall be liable to a penalty not exceeding ten shillings for every day during which he continues to make default: Provided that no such penalties shall collectively amount to any greater sum than twenty pounds.

Penalty on indecent exposure of person.

47. Any individual who shall offend against decency by exposure of his or her person in any street or public place within the said Borough, or in the view thereof, shall on conviction forfeit and pay for every such offence a sum not exceeding ten pounds nor less than two pounds.

PART VI.

MISCELLANEOUS.

*Public Exhibitions, &c.*

Exhibitions, &c., to be licensed.

1. No exhibition other than exhibitions licensed by the Colonial Secretary under the provisions of the Act 14 Victoria No. 23, or exhibitions of a temporary character specially provided for, shall be held or kept for hire or profit within the said Borough, nor shall any bowling-alley, skittle-alley, or other place of public amusement other than a place licensed as aforesaid, or a place for temporary amusement, be used as such for hire or profit within the said Borough unless and until permission in writing be granted by the Mayor.

No exhibition, &c., on Sundays, &c.

2. No such exhibition or place of public amusement as aforesaid shall be held or kept open or used for the purposes of such public amusement on Sunday, Christmas Day, or Good Friday; and every person offending against this By-law in this behalf shall on conviction forfeit and pay a sum not exceeding five pounds nor less than two pounds for every such offence.

Wilful trespass.

3. Every person who shall wilfully let in or knowingly suffer to enter upon the reserves or public recreation ground any animals without due authority shall be deemed guilty of wilful trespass and shall be liable for every such offence to a penalty not exceeding twenty pounds nor less than two pounds.

Penalty for destroying boundary marks.

4. Any person pulling down, destroying, defacing, or injuring any marks, or any fence, or other erection without the authority of the Council, shall forfeit and pay any sum not exceeding ten pounds nor less than one pound.

Erection of houses, &c.

5. No person shall be permitted to erect any house, shop, or other building in any street, lane, or place in the Borough without first serving notice in writing on the Mayor or Council Clerk, on any lawful day, between the hours of eight o'clock a.m. and eight o'clock p.m., stating such intention, and describing the proposed situation of the building or erection, and without having received an authority from the Mayor or Council Clerk, who will give the required level and alignment, if in a proclaimed street. No person shall be at liberty to encroach beyond the building-line in any street, or lane, by the erection of houses, verandahs, door-steps, fences, or any other obstruction whatever.

Houses, &c., to be spouted.

6. All proprietors of houses within the Municipality having a frontage to any main thoroughfare shall be bound to have the same sufficiently spouted with down pipe, to be carried under the surface of the footpath into the gutter, under a penalty of ten shillings on conviction; and if not remedied at the expiration of seven days after such conviction, the offender shall be again liable to a like conviction and penalty also for every succeeding seven days.

Using bark for building in the main thoroughfares.

7. No person shall erect any building of bark or roofed with that material or with calico within the Borough, except by express permission of the Council, and then for a temporary purpose only; any person so offending shall on conviction be liable to a penalty not exceeding ten pounds, to be recovered in a summary way; and shall be bound to remove the aforesaid building within such period as the Council may determine.

BY-LAWS FOR REGULATION OF PUBLIC VEHICLES.

By-laws for the regulation and licensing of public carriers, carters, water-drawers, and public vehicles, omnibuses, cars, hackney-carriages, cabs, water-carts, drays, carts, or vans, and the drivers and conductors of passenger-carrying vehicles.

Vehicles to be licensed.

1. No vehicle shall ply or be used for hire within the Borough of Young, unless the same be duly licensed in the manner herein described.

Requisition to be made for license.

2. Before any license for plying a vehicle, or to drive, or to conduct the same, shall be granted, the party requiring such license shall obtain from the Council Clerk, free of charge, a requisition in the form of the Schedule hereunto annexed, marked with the letter A, or to the like effect, and duly fill up and sign the same, and deliver it to the Council Clerk; and in the case of drivers or conductors shall also obtain a certificate from two respectable householders, to the effect that the applicant is of good character, and competent to act as such driver or conductor, as the case may be.

Condition under which licenses to be granted.

3. No license shall be granted in respect of any vehicles which in the opinion of three Aldermen, who shall be appointed by a resolution of the Council of the said Borough, is unsafe, or in bad repair, or otherwise unfit for the accommodation and conveyance of passengers therein; nor until the number of such vehicle be painted thereon on a plate or plates affixed thereon outside on the panel of each door of such vehicle, or on such other place or places, and in such manner as the said three Aldermen may direct.

Licenses, and how to be issued.

4. Licenses for proprietors, drivers, and conductors of vehicles shall be in the form contained in the Schedule hereunto annexed, marked with the letter B, or the like effect; and any person plying, driving, or conducting any vehicle for hire with passengers without such license, shall be deemed guilty of a breach of these By-laws.

Licenses to be under Corporate seal.

5. Every license granted under these By-laws shall be under the common seal of the Borough Council of Young, and signed by the Mayor and countersigned by the Council Clerk, upon production of a certificate signed by the Aldermen who shall be appointed as aforesaid, and shall be in force from the date of such license until the 31st day of December next ensuing, subject to the conditions in section 10; and no such license shall include more than one vehicle: Provided that where the licensed vehicle shall be under repair, if the proprietor shall so desire, he may be permitted to substitute another for a period to be then specified, and endorsed on the license signed by the Mayor and countersigned as aforesaid.

Age of drivers.

6. No license shall be granted to any person to drive any passenger-carrying vehicle who shall be under the age of eighteen years.

Licenses to be made out by the Council Clerk.

7. All licenses shall be made out by the Council Clerk and numbered consecutively.

**Owner of vehicle**

8. The person in whose name a license shall appear to have been obtained shall be *prima facie* deemed to be the owner of the vehicle in respect of which the same shall have been taken out.

**Inspection of vehicles.**

9. The three Aldermen aforesaid shall, as often as they may deem it necessary, cause an inspection to be made of all or any licensed vehicles, and of the harness, horse, or horses; and if any such vehicles, harness, horse, or horses, shall at any time be found by the said Aldermen to be unfit for use, the Mayor may cancel the license of such vehicle on the written report of the said Aldermen.

**Number of license to be painted on vehicle**

10. The number of the license granted to every omnibus or car, in figures not less than four inches in height, and for every hackney carriage or cab in figures not less than two inches in height, of proportionate breadth, white upon a ground of black, shall be painted outside on the panel of the door or doors of such vehicle, or on such other part or parts thereof as the Aldermen aforesaid shall direct; and such numbers shall be kept legible and undefaced during all the time such vehicle shall ply or be used for hire.

**Water-carts.**

11. The Council shall from time to time license to ply within the Borough such carts for the sale and carrying of water as shall upon inspection be found fit for that purpose. Every such cart or vessel contained therein for the holding of water for sale shall be capable of containing not less than 100 gallons, and shall have the name of the owner, and the words "licensed water-cart" painted on such cart in legible letters.

**Water license, how obtained, &c.**

12. Every such license shall be issued on the written application of the owner thereof, in which application shall be set forth the name and surname and place of abode of the applicant; and for every such license there shall be paid to the Council the sum of two shillings and sixpence; and every such license shall be in force until the 31st day of December next ensuing, after the granting of the said license.

**Hauling water—penalty.**

13. Any person hauling or carrying water for sale or hire, otherwise than in a licensed water-cart as aforesaid, shall upon conviction be liable to a penalty not exceeding one pound.

**Name and place of abode to be painted on licensed cart, &c**

14. The name and place of abode, number of license, and the words "licensed cart, dray, or van," as the case may be, are to be painted, in letters one inch long, upon the right or off side of such cart, dray, or van.

**Vehicles to carry lights.**

15. All vehicles shall be provided with suitable lamps, to burn candles, one to be fixed on each side of the driver's box, and a third one inside of all omnibuses and closed coaches; and the same shall be lighted not later than one hour after sundown and be kept burning while the vehicles are on the stand or running in the street, either with or without passengers.

**Number of passengers to be carried.**

16. When any carriage is submitted for inspection by the owner or other applicant, with a view to obtain a license, the Aldermen appointed by the Council for that duty shall then determine upon the number of passengers the vehicle shall be permitted to carry and give a certificate to that effect, such number to be mentioned in the license.

**Legal fare, &c., to be painted on vehicle.**

17. The number of passengers the vehicle is licensed to carry shall be painted or printed in legible characters and affixed within and without the vehicle in such places as the inspecting Aldermen shall direct.

**Penalty for breaking By-laws.**

18. For every offence against the provisions of these By-laws the offender shall be liable to and pay a penalty of not more than twenty pounds nor less than ten shillings.

**License fees to be paid to Council Clerk.**

19. For every license issued under the By-laws in force for the time being in that behalf within the said Borough, there shall be paid to the Council of the said Borough, by delivering the same to the Council Clerk or other person authorised to receive the same, the several sums mentioned or set forth in Schedule C to these By-laws for the general purposes of the said Borough.

**Terms to be applied to licensed vehicles.**

20. Whenever the word "vehicle" shall be used in these By-laws, the same shall be construed to extend and apply to any omnibus, car, hackney carriage, or cab. The word "omnibus" shall extend and apply to any vehicle upon four wheels drawn by two or more horses, having seat accommo-

...ation for more than ten passengers and a driver. The word "car" shall extend and apply to any vehicle upon two or four wheels drawn by one or more horses, having seat accommodation for not more than ten nor less than five passengers and a driver. The word "hackney carriage" shall extend and apply to any vehicle upon four wheels drawn by two or more horses, and having seat accommodation for not more than five passengers and a driver, and in respect of which a hackney carriage license within the said Borough shall have been obtained. The word "cab" shall extend and apply to any vehicle upon two wheels, having seat accommodation for not more than two passengers and a driver, in respect of which a cab license within the said Borough shall have been obtained. The word "cart" shall extend and apply to any cart, dray, van, or waggon, drawn by one or more horses or other animals, used wholly and for the carriage of goods and parcels. The word "water-cart" shall extend and apply to any cart, used for the carriage of water within the said Borough in respect of which a water-cart license shall have been obtained.

**Driver to have full control over his horse or horses.**

21. No driver of any licensed vehicle shall be or remain at such a distance from his horse or horses, while attached to his vehicle, anywhere within the said Borough, as not to have immediate and full control over the same, and every person so doing shall, for every such offence, forfeit and pay a penalty or sum not exceeding five pounds nor less than five shillings.

25. No vehicle shall be allowed to stand or remain stationary on any street within the said Borough for a longer period than the time reasonably necessary to take up or set down any passenger or passengers for the time being requiring or using the same, or for loading or unloading or receiving or delivering the goods or parcels which the driver of such vehicle shall have been employed to carry; and any driver or proprietor of any such vehicle remaining stationary contrary to this By-law shall, for every such offence, forfeit and pay a penalty or sum of not exceeding five pounds nor less than five shillings.

**Penalty to be enforced for breach of By-laws.**

22. All proprietors and drivers of licensed vehicles shall at all times be amenable to, and observe and comply with, the By-laws for the time being in force for the care and management of the public roads, public streets, and public thoroughfares within the said Borough, and for every breach thereof shall incur the same penalties as other persons.

23. Any person offending against any of these By-laws shall, except when otherwise expressly provided, forfeit and pay a sum not exceeding two pounds nor less than five shillings for every such offence.

**SCHEDULE A.**

*A Requisition for license.*

To the Municipal Council of the Borough of Young—  
I, \_\_\_\_\_, residing at \_\_\_\_\_ street, within the Borough of Young, do hereby request that a license may be granted to me to \_\_\_\_\_ within the limits of the said Borough.

Dated at Young, this \_\_\_\_\_ day of \_\_\_\_\_ A.D. 18 \_\_\_\_\_.

Description of \_\_\_\_\_

Passed by the Borough Council of Young, on the 15th day of September, 1890.

(L.S.) CHRISTOPHER HORN,  
Mayor.

W. M. BARBER, Town Clerk.

1891.

## NEW SOUTH WALES.

**MAITLAND CATTLE DRIVING ACT AMENDMENT ACT, 1880.**  
(BOROUGH OF WEST MAITLAND—BY-LAWS.)

Presented to Parliament, pursuant to Act 43 Vic. No. 20, sec. 2.

Colonial Secretary's Office,  
Sydney, 14th January, 1891.

**BOROUGH OF WEST MAITLAND.—BY-LAWS.**

THE following By-laws, made by the Council of the Borough of West Maitland, under the "Maitland Cattle Driving Act Amendment Act 1880," for regulating within the boundaries of that Municipality the passage of cattle intended for sale, slaughter, or shipment or conveyance by rail, having been confirmed by His Excellency the Lieutenant-Governor, with the advice of the Executive Council, are published in accordance with the requirements of the above-cited Act.

HENRY PARKES.

**BOROUGH OF WEST MAITLAND.**

BY-LAWS for the purpose of regulating within the boundaries of the Borough of West Maitland, the passage of cattle intended for sale, slaughter, or shipment or conveyance by rail, in pursuance of the "Maitland Cattle Driving Act Amendment Act, 1880," 43 Vict. No. 20.

The Council of the Borough of West Maitland do, by virtue of the power and authority vested in such Council, hereby repeal the By-laws made and passed by the said Council on the eighteenth day of June, 1880, for the regulating within the boundaries of the said Borough, the passage of cattle intended for sale, slaughter, or shipment or conveyance by rail, and published in the Supplement to the Government Gazette, No. 418, of Saturday, 30th October, 1880, and make the following By-laws in the place of and instead of such repealed By-laws.

**Hours for cattle driving.**

No person shall drive through any street or public thoroughfare of the Borough except as hereafter mentioned, any cattle intended for sale, slaughter, or shipment or conveyance by rail, between the hours of eight o'clock a.m. and two o'clock p.m., nor between the hours of four p.m. and five p.m. during the months of April, May, June, July, August, and September, nor between the hours of eight o'clock a.m. and two o'clock p.m., nor between the hours of four o'clock p.m. and six o'clock p.m. during the other months of the year, except milch cows, cattle in teams, or working cattle; and such cattle shall only be driven as aforesaid between the hours aforesaid, and then only to and from the sale-yards at Campbell's Hill, via Regent-street, along the bank of Fishery Creek to Park-street; thence along Park-street to Louth Park Road, at its junction with Trappaud Road; thence to the bridge at Wallis Creek, and from the said bridge along Trappaud Road to its junction with Louth Park Road, thence to its junction with Park-street; thence along Park-street and the creek, to and along Regent-street to the sale-yards as aforesaid at Campbell's Hill;

and from and to Campbell's Hill Sale-yards by side road underneath the Long Bridge and High-street to the junction of High-street with St. Andrew-street to Belmore Bridge.

Cattle intended for trucking at the West Maitland Railway Station and taken from the sale-yards at Campbell's Hill, shall proceed along Regent-street; thence along the bank of Fishery Creek into Walker-street to the trucking yards at Elgin-street Railway Station; and from the bridge at Wallis Creek as aforesaid shall proceed along Trappaud Road to Louth Park Road; thence along Park-street to Elgin-street; thence along Elgin-street to the trucking yard at Elgin-street Railway Station aforesaid.

Any and every person or persons who shall drive or cause to be driven, any cattle, except those above enumerated, through any street or public thoroughfare of the said Borough, or by any routes other than those specified aforesaid during such prohibited hours, shall on conviction before any two Justices of the Peace forfeit and pay any sum not exceeding twenty shillings for each and every head of cattle so driven as aforesaid.

All penalties imposed by these By-laws for offences committed thereunder; and all sums of money ordered to be paid thereby may be recovered; and all complaints heard in a summary way before any two Justices according to the provisions of the Act fourteenth Victoria number forty-three, and the English Statutes thereby adopted, and shall when recovered be paid over to the said Council to be applied in aid of its expenses under the Act.

Made and passed by the Borough Council of West Maitland, this thirteenth day of November, one thousand eight hundred and ninety.

THOS. HUGHES,  
Council Clerk.

(L.S.) R. A. YOUNG,  
Mayor.

1891.

## NEW SOUTH WALES.

**MUNICIPALITIES.**

(WINDSOR WATER SUPPLY—BY-LAWS.)

Presented to Parliament, pursuant to Act 31 Vic. No. 12, sec. 153.

Department of Public Works,  
Sydney, 31st December, 1890.

It is hereby notified that His Excellency the Lieutenant-Governor, with the advice of the Executive Council, has been pleased to approve of the following By-laws in connection with the Water Supply of the Borough of Windsor, which have been prepared by the Municipal Council in accordance with the Municipalities Act of 1867.

BRUCE SMITH.

WHEREAS by the Municipalities Act of 1867 the Council of the Borough of Windsor is authorised and empowered from time to time to make, alter, and repeal By-laws.

Now the Council of the Borough of Windsor, under and by virtue of the powers contained in the Municipalities Act of 1867, do hereby make the By-laws following, that is to say :—

1. The following rates and charges are those which the owners and occupiers of lands and tenements shall pay in respect of water supplied by the Council, that is to say :—

(1.) For water supplied for domestic purposes, otherwise than by measure, the rate as fixed by the Council annually.

For water supplied by measure.

(2.) The rates to be charged for water supplied from the mains by measure shall be one shilling and six pence per one thousand gallons.

(3.) Water-troughs will be charged for at the rate of twenty-two shillings and six pence per annum each.

(4.) Water for steam boilers will be charged for by measure, at the rate of one shilling and six pence per one thousand gallons.

Payment of rates.

2. Assessed rates must be paid half-yearly in advance, whether a meter is used or not. In the case when a meter is used for domestic purposes, the meter account will be rendered only when it is in excess of the assessment. Cheques and post office orders will be received in payment of rates, but if the cheque tendered by any person as payment for rates due is dishonored, the Council may cut off his service, and proceed for the recovery of the amount by warrant for distress, or otherwise. Cheques and Post Office Orders must be crossed in favour of the Council.

Minimum charge by meter or otherwise is the assessed rate.

3. The minimum charge for water, whether supplied through meter or otherwise, for domestic purposes and for purposes other than domestic, is the assessed annual rate. If the water is supplied by meter, and the meter account exceeds the assess-

ment, "calculated at the rate of one shilling and six pence per one thousand gallons," then such excess shall be charged in addition to the assessment.

Building charges, &c.

4. The Council may supply water for building purposes at the rate of five shillings per room, or by meter at two shillings per one thousand gallons. The Council may supply water for the making and mixing of concrete for foundations of wooden blocks, stone cubes, or other form of permanent roadway or pavement, at the rate of one pound fifteen shillings per one thousand square yards by superficial measurement of road surface; and for all other concrete, brickwork, or masonry, at the rate of four pence per cubic yard, as measured on the work.

Horse and cow.

5. Any person who maintains horses or cows may be supplied with water without meter from the domestic service for the sum of two shillings and six pence per annum each animal in addition to the assessed annual rate of the premises on which such animal is maintained or supplied with water.

Gardens.

6. The Council may supply water for gardens, "and for such purpose may permit a hose or stand-pipe to be used," without meter, at the rate of ten shillings per annum for every one thousand square feet superficial area or part thereof, in addition to the assessed annual rate of the premises to which such garden belongs or is attached.

Before affixing service pipes, &c., license to be obtained from Council.

7. Before any person shall affix any service-pipe to any pipe of the Council, or alter, repair, or in any manner interfere with, any pipe of the Council, or any service-pipe, cock, or fitting connected with any pipe of the Council, he shall obtain from the Council a license in that behalf to execute any such work, and shall give a written guarantee in the sum of two pounds to the Council to properly complete such connection and to leave, and keep any opening in any roadway, street, or footpath with regard to such connection in proper repair for a period of two months from the date of such connection; and any unlicensed person affixing, altering, repairing, or in any manner interfering with any such pipe, cock, or fitting as aforesaid shall be liable to a penalty not exceeding ten pounds.

## Licensed plumber.

8. Before any such license shall be granted by the Council, the person applying for the same shall satisfy the Council that he is a competent plumber. His competency must be certified to by two master plumbers.

Before pipes can be uncovered two days' notice must be given to Council.

9. Any person, whether licensed as aforesaid or not, who shall offend by opening any ground so as to uncover any pipe or pipes the property of the Council, without giving two days' notice to the Mayor of his intention so to do, or shall in any way tamper with, interfere with, or alter any pipe the property of the Council, without the permission of the Mayor in writing being first obtained, or who shall wilfully or negligently break, injure, or open any lock, cock, valve, pipe, work, or engine, the property of the Council, shall be liable for each such offence to a penalty not exceeding twenty pounds.

Council or licensed plumber only empowered to tap mains, &c.

10. The Council only, or a plumber duly licensed by the Council, under the superintendence and according to the directions of the officer appointed by the Council for that purpose, is empowered to tap the main in the streets or elsewhere and attach service pipes thereto, or extend the same generally as the case may be. Any person infringing this clause shall be liable to a penalty not exceeding twenty pounds.

Penalty for communicating with pipes of the Council without notice.

11. Any person, whether licensed as aforesaid or not, who shall lay any pipe to communicate with the pipe of the Council without giving two days' notice of the day and hour when such pipe is intended to be made to communicate with the pipe of the Council, or who shall make such communication, except under the superintendence and according to the directions of some officer of the Council, or who shall lay any leaden or other pipe to communicate with a pipe of the Council of a strength and material not sanctioned by the Council, shall be liable for each such offence to a penalty not exceeding five pounds; and in the event of continuing the offence, to a further penalty of two pounds for each day after the notice of the offence from the Council.

Fee for tapping main.

12. Every application for water must be accompanied by the payment of a fee of three shillings for the tapping of any main.

Penalty for using unauthorised fittings.

13. Any person who, being an owner or occupier of lands or premises supplied with water under this Act, for the purpose of taking, in a manner not authorised by this Act, any such water, uses in or places on, or affixes or attaches to, such land or premises, or to any prescribed fittings, or wilfully permits to be used in or placed on, or affixed or attached to, such lands or premises, or to any prescribed fitting, instrument, or thing not authorised in that behalf by the Council, or who alters, misuses, injures, or removes any prescribed fitting, except for the purpose of necessary repair, shall upon conviction thereof forfeit and pay to the Council a sum not greater than ten pounds, without prejudice to the right of the Council to recover from him damages in respect to any injury by such owner or occupier done, or wilfully permitted to be done, to the Council's property, and without prejudice to the Council's right to recover from him the value of any water wasted, misused, or unduly consumed.

Owner to lay and maintain services.

14. The owner or occupier must, at his own expense, lay down and maintain all the pipes and apparatus from the main to and upon his premises. All pipes must be of galvanized wrought iron, where possible, and where lead pipes are used they must be of equal thickness throughout, and of at least the respective weights following, viz :

$\frac{3}{4}$ inch, 5lb. per yard		1 inch, 12lb. per yard.
$\frac{1}{2}$ " 6lb. "		1 $\frac{1}{4}$ " 16lb. "
$\frac{3}{8}$ " 9lb. "		1 $\frac{1}{2}$ " 20lb. "

Where wrought iron pipes are used, they must be of the kind known as galvanized wrought iron lap-welded steam tubes.

Defective fittings to be removed.

15. Any consumer's pipe, cock, cistern, or other fitting laid, fixed, or used otherwise than in accordance with these regulations and with the provisions of the Act, or which shall in the opinion of the Mayor be or become of bad or defective quality, or shall conduce to waste, misuse, or contamination of the water, shall, upon the Mayor giving notice in writing, be discontinued and disused; and the Mayor may require the same to be removed, replaced, or repaired, and may stop the supply of water to the said consumer until such pipe, cock, cistern, or other fitting shall have been removed, replaced, or repaired to the satisfaction of the Mayor.

## Quality of fittings for iron pipe

16. No person shall use, in connection with the water of the Council, any iron pipe, tee, thimble, bend, reducing coupling, plug, &c., unless it be of the best manufacture, true in section, straight, and of equal thickness, properly and truly cut with Whitworth's standard gas thread, and perfectly sound and new, and free from all defects. Every such tee, bend, tube, &c., shall be capable of withstanding a hydrostatic pressure equal to a column of water 400 feet in height.

## Joints.

17. Every person shall make all joints between tees, bends, thimbles, couplings, elbows, cocks, &c., with white or red lead and flax. All joints on lead pipes, and lead pipes with brass unions shall be of the kind known as wiped joints.

## Depth of pipe.

18. No person shall lay any service pipe on private property, below the ground service, at a less depth than 10 inches.

Pipes through drains to be properly protected.

19. No person shall lay any pipe or other apparatus through any sewer, drain, ashpit, cistern, or manure tank, or through, in, or into any place where, in the event of the pipe becoming unbound, the water of the Council conveyed through such pipe would be liable to be fouled or to escape without observation unless such pipe or apparatus be laid through an exterior cast-iron pipe or box of sufficient length and strength to afford due protection to the same, and to bring any leakage or waste within easy detection.

## Approved fittings.

20. No person shall use any taps, stop-cock, bib-cock, ball-cock, valve, closet-cistern, service-box, waste-not regulator, bath-tap or valve, or other fitting in connection with the supply of water of the Council, which is not of the best quality and approved by the Council.

## Cocks.

21. No person shall use any stop or bib-cock which is not a loose-valve, screw-down, high-pressure cock, made of hard brass or gun-metal, and in every respect of the best quality and workmanship.

## Cisterns.

22. No person shall use any cistern or tank that is not provided with an equilibrium ball-valve, and the overflow pipe laid and fixed in a suitable manner, open to inspection, and in a position approved by the Council.

Service not to communicate with rain water receptacles or underground tanks.

23. No person shall fix or use any service-pipe which communicates with any cistern, tank, or vessel intended or used for the reception of rain water, or made or used below the surface of the ground, except with express permission of the Council.

## Baths.

24. The Council will not supply any water to any bath the outlet of which is not distinct from and unconnected with the inlet or inlets, and the inlet or inlets shall be placed above the highest water-level of the bath; the outlet of such bath shall be provided with a perfectly water-tight plug-valve, or cock; no such bath shall have any overflow waste-pipe that is not laid and fixed in a suitable manner, open to inspection, and in a position approved by the Council; no bath shall exceed in dimensions 6 feet 6 inches long by 2 feet 6 inches wide by 2 feet deep, unless supplied by meter. The Council will not supply water to any bath unless the same shall be so constructed as to prevent the waste of water.

## Service connection.

25. Except by the permission of the Council, every tenement shall have an independent service-pipe connected with the main of the Council; and no person shall connect more than one tenement with the main of the Council from one service, except by permission of the Council.

## Urinal.

26. No person shall fix a service-pipe so as to communicate directly with any urinal, and every urinal shall be supplied only through a cistern or service-box, fitted with waste-preventing apparatus approved by the Council.

Water for other than domestic purposes.

27. No person shall use water supplied by the Council for other than domestic purposes except the supply is by meter, or except in the manner hereinbefore provided.

Meter to be affixed.

28. No person, except with special consent of the Council, shall affix a meter the dial of which is not capable of registering five hundred thousand gallons.

## Meters registering incorrectly.

29. If any meter shall not correctly indicate the water passing through it, the Council may charge for the supply according to the average daily consumption for any month preceding the date upon which such meter shall have been examined and found to be in order; or, at the request of the consumer, by direction of the Council, the said meter shall be tested and the charge for water supplied regulated accordingly.

## Meters not to be interfered with.

30. No person not duly authorised by the Council shall disconnect any meter, or other apparatus, from the service-pipe, or in any way interfere with the same.

## Steam-boiler to have self-acting valve.

31. If any person shall connect any service-pipe, or branch service-pipe, with any steam-boiler for the purpose of feeding or supplying the same with water, without first affixing a self-acting valve for preventing the pressure of the steam reversing or affecting the dial of the meter, he shall be liable to a penalty not exceeding five pounds, and a further penalty of two pounds for each day after notice of the offence from the Mayor to such offender.

No hose to be attached to any pipe for watering garden, &c., without meter.

32. Except as hereinbefore provided, no person shall use a hose attached to any tap or pipe used for the purpose of supplying the water of the Council for domestic purposes to any house or premises for watering any garden, laying dust, or for any purpose whatsoever, unless where a water-meter is fixed and the water supplied by measure, and any person offending against this By-law shall be liable to a penalty not exceeding five pounds.

## No tap to be in garden without meter.

33. Except as hereinbefore provided, no person shall place any tap in any garden, or sewer tap in any yard, or outside of any dwelling or premises supplied with the water of the Council to which a hose could be attached, unless a meter is fixed and the water supplied by measure; and any person offending against this By-law shall be liable to a penalty not exceeding five pounds.

## Pipes, &amp;c., to kept in repair.

34. Any person using the water supplied by the Council shall keep all pipes and other appliances in connection with the supply of water to such person in a proper state of repair.

## Inspection of work.

35. All works at any time done or to be done on private lands or premises in connection with the water supply, whether such work consists in the laying and fixing of new services, or in the extension or alteration of existing services and fittings, shall be inspected by the proper officer of the Council, and no such work shall be commenced until after the expiration of two days' notice thereof first given to the Mayor. In no case shall the water be turned on to any lands or premises when any such work shall have been executed until the said work shall have been inspected by the said officer, and certified by him on the prescribed form. No underground or enclosed work shall on any account be covered up or concealed from view until the same shall have been duly inspected and passed by the Inspector; and any person offending against this By-law shall be liable to a penalty not exceeding five pounds.

## Supply and use of water open to inspection.

36. The supply and use of water, whether for domestic purposes or under special agreement, shall be open to inspection and admeasurement whenever required; and such information must from time to time be afforded as will be sufficient to enable the Council to obtain a satisfactory account of the quantity of water actually consumed, and of the pipes, taps, cisterns, and other apparatus, and conveniences for receiving and delivering such water; any officer of the Council may at all reasonable times in the daytime enter on the premises of any person using water supplied by the Council, for the purpose of inspecting the service-pipes or other appliances of such person.

## Council may repair.

37. If the service-pipes or other appliances of any such person shall on any inspection be found to be out of repair, the Mayor may forthwith without notice repair the same in such manner as may be deemed necessary, and the cost of any such repairs may be recovered by the Council from the owner or occupier of such premises.

## Council have control of water supplied to public parks, &amp;c.

38. The water supply to public parks and gardens shall be exclusively under the control and direction of the officers of the Council, and any person turning on the water or otherwise interfering with such water supply shall be liable to a penalty not exceeding five pounds.

## Notice and application to be made on printed forms.

39. All notices and applications required by these By-laws are to be made upon printed forms to be obtained at the Council's office. Notices sent by post must be prepaid. Any sums paid by the Council on account of notices sent by post and not prepaid will be charged against and recovered from the sender.

## Council may discontinue supply.

40. The Council shall be at liberty to discontinue the supply of water immediately on the discovery of any breach of these regulations.

## Interpretation of terms.

41. In the construction of these By-laws the word "person" shall be deemed to extend to and include a corporation or any body or number of persons; the masculine shall include the feminine gender; and the word "Council" shall mean the Council of the Borough of Windsor.

## Penalties to which offenders are liable.

42. Any person committing a breach of any By-law to which no specific penalty is attached, or who shall refuse or neglect to obey any injunction in any such By-laws, shall upon conviction be liable to a penalty not exceeding twenty pounds, and in case of continuing the offence, a further penalty of not less than one pound, and not exceeding five pounds for each day after notice of such offence shall have been given by the Mayor to such offender.

Made and passed by the Municipal Council of the Borough of Windsor, this thirtieth day of August, in the year of our Lord one thousand eight hundred and ninety.

(L.S.) F. J. MORTLEY,  
Mayor.  
F. W. LINSLEY,  
Council Clerk.

1891.

## NEW SOUTH WALES.

## COUNTRY TOWNS WATER AND SEWERAGE ACT.

(GOULBURN WATER SUPPLY—BY—LAWS.)

Presented to Parliament, pursuant to Act 44 Vic. No. 14.

Department of Public Works,  
Sydney, 31st December, 1890.

It is hereby notified that His Excellency the Lieutenant-Governor, with the advice of the Executive Council, has been pleased to approve of the following By-laws in connection with the Water Supply of the Borough of Goulburn, which have been prepared in accordance with the provisions of the Country Towns Water and Sewerage Act of 1880, 44 Vic., No. 14.

BRUCE SMITH.

WHEREAS by the Country Towns Water and Sewerage Act, 44 Victoria, No. 14, the Council of the Borough of Goulburn is authorized and empowered to make and alter and repeal By-laws, they do here repeal all existing Water Supply By-laws and make the following By-laws for raising revenue and for regulating and maintaining the Water Supply of the Borough of Goulburn, to take effect from 1st January, 1891, until repealed:—

1. The following shall be the Rates and Charges for water, which shall be paid by and recoverable from the owner of the premises or the occupier or person requiring, receiving, or using the supply of water, and all such Rates and Charges may be enforced and recovered in respect of any premises situate within one hundred and fifty feet of any street or public highway along which a main water-pipe belonging to the Council is laid, although such premises are not actually supplied with water from such main (vide Clause 60 of the Act 44 Victoria, No. 14), and in respect to premises situate beyond the said one hundred and fifty feet from the main which are supplied with water (vide Sec. 4 of Clause 13):—

BY RATE ON THE ANNUAL VALUE AS ASSESSED FOR GENERAL RATES.

2. On every allotment of land and tenement of £10 assessed value and under, 10s. per annum.
3. On all lands and tenements (other than unimproved vacant land) above £10, at 1s. per £ per annum.
4. On all unimproved vacant land of the assessed annual value of £20 and over, the rate shall be 6d. per £ per annum.

BY MEASURE.

The following charges to be in addition to the charge by any of the above rates (vide clause 24 of Act 44 Vic., No. 14):—

5. Manufactories, boilers, motive power, public baths, street troughs, 1s. 6d. per 1,000 gallons.
6. Irrigation, 1s. 6d. per 1,000 gallons.
7. For water supplied to lands and tenements which, under section 163 of the Municipalities Act of 1837, are exempted from general rates—
  - (a) The property of Her Majesty, or in the occupation of the Imperial Government or the Government of New South Wales, or occupied as schools subject to the provisions of the Public Schools Act of 1866, 1s. 6d. per 1,000 gallons.
  - (b) Hospitals, benevolent institutions, and buildings used exclusively for public charitable purposes, churches, chapels, and buildings used exclusively for public worship, 1s. per 1,000 gallons.

8. The minimum charge for water, whether supplied through meter or otherwise, for domestic purposes and for other than domestic purposes, is the assessed annual rate. If the water is supplied by meter and the meter account exceeds the assessment then such excess shall be charged in addition to the assessment at the rate of 1s. 6d. per 1,000 gallons.

GENERAL PROVISIONS.

9. The Council may enter into an agreement to supply water for any purpose other than the above, or upon premises not otherwise liable for water rates, at a rate not less than 1s. 6d. per thousand gallons, and for a not less quantity than 1,000 gallons.

10. All lands or tenements becoming liable by the extension of a main, or other cause, to be charged for water during the currency of a year, or to have its previous charge increased, shall immediately pay the proportionate amount of charge or increase due to 31st December of the current year.

11. All new buildings shall be assessed from the time that notice of intention to build is lodged as if they were then erected; and the proportionate amount of charge or increase to 31st December of the current year, or to the subsequent 30th June, if the period would have been less than six months, shall be paid before permission to build can be issued.

12. All rates and charges shall be payable half-yearly in advance, whether a meter is used or not. In cases where a meter is used the meter account will be rendered only when it is in excess of the assessment.

13. Any person who maintains horses or cows may, with the consent of the Council, be supplied with water without meter from the domestic service for the sum of 5s. per annum for each animal, in addition to the assessed annual rate of the premises in which such animal is maintained or supplied with water.

14. The Council may supply water for gardens (and for such purpose may permit a hose and stand-pipe to be used) without meter at the rate of 10s. per annum for every 750 square feet superficial area, or part thereof, of such garden, in addition to the assessed annual rate of the premises to which such garden belongs, or is attached, except in respect of the premises mentioned in sub section A of clause 8 of these By-laws.

15. No person shall use water supplied by the Council for other than domestic purposes, unless the supply is by meter or except in the manner herein provided.

**REGULATIONS FOR THE GUIDANCE OF PERSONS LICENSED TO LAY ON WATER, USERS OF WATER, AND OTHERS.**

Licensed Persons only to fix Service-pipe, &c.

16. Before any person shall affix any service-pipe to any pipe of the said Council, or alter, repair, or in any manner interfere with any pipe of the said Council, or any service-pipe, cock, or fitting connected with the pipes of the said Council, he shall obtain from the said Council a license in that behalf to execute such works; and any unlicensed person affixing, altering, repairing, or in any manner interfering with such pipe, service-pipe, cock, or fitting as aforesaid shall be liable to a penalty not exceeding ten pounds.

Before pipes can be uncovered, two day's notice to Council must be given

17. Any person, whether licensed as aforesaid or not, who shall offend by opening any ground so as to uncover any pipe or pipes, the property of the Council, without giving two days' notice to the Council of his intention so to do, or who shall in any way tamper, interfere with, or alter any pipe, the property of the Council, without the permission in writing of the Council being first obtained, or who shall willfully or negligently break, injure, or open any lock, cock, valve, pipe, work, or engine, the property of the Council, shall be liable for each such offence to a penalty not exceeding twenty pounds.

Penalty for communicating with pipes of the Council without notice.

18. Any person, whether licensed as aforesaid or not, who shall lay any pipe to communicate with the pipes of the Council without giving two days' notice of the day and hour when such pipe is intended to be made to communicate with the pipes of the Council and obtaining permission, or who shall make such communication, except under the superintendence and according to the directions of some officer of the Council, or who shall lay any leaden or other pipe to communicate with a pipe of the Council of a strength and material not sanctioned by the Council, shall be liable for each such offence to a penalty not exceeding five pounds; and, in the event of continuing the offence, to a further penalty of two pounds for each day after the notice of the offence from the Council.

Council or officers only empowered to tap mains, &c.

19. The Council and its officers only are empowered to tap the main in the streets or elsewhere and attach service-pipes thereto, or extend the same generally as the case may be. Any person infringing this clause shall be liable to a penalty not exceeding twenty pounds.

Payments with application.

20. Every application for water must be accompanied by the payment of a fee of 4s. for each tapping of a main and the amount of rates and charges for water supply which may be demanded under these By-laws.

Notice of alteration and repairs.

21. In every case of repairs to service-pipe, or where it may be wished to transfer service-pipes from one main to another, or where any change or alteration to them may be required in any way, notice of such repair or alteration, &c., must be given in writing to the Town Clerk at least twenty-four hours before any such work shall be commenced, except in cases of great waste of water, when immediate steps must be taken to stop the leak, and notice given to the Town Clerk of the same forthwith.

Service-pipes.

22. All service-pipes must be laid 18 inches below the surface of roadway and gutters, and meters, where required, fixed in accordance with the direction of the Town Clerk or other authorised officer of the Council; and on each service-pipe connected with the mains must be fixed two stop-cocks—one at the junction of the main and the other on the footpath, 1 foot 6 inches from the building lines, enclosed in an iron box with proper lid, and no person shall lay any service-pipe on private property at a less depth than 10 inches below the ground surface. All service-pipes, taps, stop-cocks, valve, &c., shall be equal in quality to samples kept in the Town Clerk's office or be approved of by the Town Clerk or other authorised officer of the Council. The Council's workmen are to open the trench, bore the mains, and insert the stop-cock, the stop-cock being of the kind a sample of which is on view at the Town Clerk's office, the same being left at the Town Clerk's office along with the notice to connect. By the time these operations are completed the plumber who has been employed to lay on the service must have taken all his measurements, prepared all the pipes to the exact length complete, with the lead connections of approved length and weight per yard, properly jointed to cap linings, barrel union, &c., ready for attachment to the stop cock, so as to avert any delay in the re-filling of the trench. In the event of the articles above named not being ready for fixing at the period named the trench may be filled in again by the Council's workmen, and the re-opening and filling of the same shall be paid for by the plumber, in addition to whatever other payments which may accrue under these By-laws and Regulations. All expenses of labour in drilling, inserting stop-cock, opening and filling trenches, and charges for all cocks, materials, &c., shall be borne by the plumber,

the account for the same to be delivered without delay and paid by him to the Town Clerk immediately on receipt of the account. Failing due attention to the latter directions, the Council may cancel the license of the said plumber.

Service Connections.

23. Except by the permission of the Council every tenement shall have an independent service-pipe connected with the water main, and no person shall connect more than one tenement with the water main from one service except by permission of the Council.

Approved Fittings.

24. All service-pipes connected with the water mains shall have a length of at least two feet of  $\frac{3}{4}$ -inch lead pipe weighing nine pounds per lineal yard between the stop-cock in the main and the service-pipes, and such service-pipes shall be  $\frac{1}{2}$ -inch galvanised wrought iron pipe to within 1ft. 6in. of the building lines. All joints with lead pipes shall be of a kind known as "wiped" joints. The lead pipe above referred to shall be jointed to the stop-cock at the main and to the galvanised iron service-pipe by means of a barrel union similar to that on view in the Town Clerk's office or other approved fittings. All wrought iron pipes used in connection with the supply of water shall be of the kind known as galvanised wrought iron lap welded steam tubes. No person shall use any water meter, tap, stop-cock, bib-cock, ball-cock, valve, cistern, service-box, waste-not regulator, bath tap or valve or other fittings in connection with supply of water of the Council which is not of the best quality and approved by the Council.

Defective fittings to be removed.

25. Any consumer's pipe, cock, cistern, or other fitting laid, fixed, or used otherwise than in accordance with these Regulations and with the provisions of the Act, or which shall, in the opinion of the Council, be or become of bad or defective quality, or shall conduce to the waste, misuse, or contamination of the water, shall, upon the Council giving notice in writing, be discontinued and disused; and the Council may require the same to be removed, replaced, or repaired, and may stop the supply of water to the said consumer until such pipe, cock, cistern, or other fitting shall have been removed, replaced, or repaired to the satisfaction of the Council.

Pipes through drains to be properly protected.

26. No person shall lay any pipe or other apparatus through any sewer, drain, ash-pit, cistern, or manure-tank, or through, in, or into any place where, in the event of the pipe becoming unsound, the water of the Council conveyed through such pipe would be liable to be fouled, or to escape without observation, unless such pipe or apparatus be laid through an exterior cast-iron pipe or box of sufficient length and strength to afford due protection to the same and to bring any leakage or waste within easy detection.

Cisterns.

27. No person shall use any cistern or tank connected with any service pipe or pipe of the Council that is not provided with an equilibrium ball-valve, and the overflow-pipe laid and fixed in a suitable manner, open to inspection, and in a position approved by the Council.

Service not to communicate with rain water receptacles or underground tanks.

28. No person shall fix or use any service-pipe which communicates with any cistern, tank, or vessel intended or used for the reception of rain water, or made or used below the surface of the ground, except with the express permission of the Council.

Water-closets.

29. No person shall, without the consent in writing of the Council first obtained, construct or use any water-closet fitting not supplied from the service pertaining to the tenement through a proper closet-cistern, or service-box, fitted with approved waste-preventing apparatus. No person shall without such consent as aforesaid fix or use any service-pipe which communicates directly or indirectly with the basin or trap, or otherwise than with the cistern of a water-closet.

Urinals.

30. No person shall fix a service-pipe so as to communicate directly with any urinal, and every urinal shall be supplied only through a cistern, or service-box, fitted with waste-preventing apparatus approved by the Council.

Baths.

31. The Council will not supply any water to any bath the outlet of which is not distinct from and unconnected with the inlet or inlets; and the inlet or inlets shall be placed above the highest water-level of the bath. The outlet of such bath shall be provided with a perfectly water-tight plug, valve, or cock. No such bath shall have any overflow waste-pipe that is not laid and fixed in a suitable manner, open to inspection, and in a position approved by the Council. No such bath shall exceed in dimensions 6 feet 6 inches long by 2 feet 6 inches wide by 2 feet deep unless supplied by meter. The Council will not supply water to any bath unless the same shall be so constructed as to prevent a waste of water.

Occupiers or owners to repair and cleanse private sewers.

19. All drains and sewers communicating with any public drains or sewer shall from time to time be repaired and cleansed, subject to the supervision of the Inspector of Nuisances, at the costs and charges of the occupiers or owners of the houses, buildings, lands, and premises to which the said private sewers or drains shall respectively belong, and in case any person shall neglect to repair and cleanse, or cause any such private sewer or drain to be repaired or cleansed under the supervision of the said Inspector, he or she shall forfeit and pay for every such offence any sum not exceeding five pounds nor less than ten shillings.

Bathing.

20. Any person bathing in the Edward's River within a distance of one mile above the water works shall for every such offence forfeit and pay any sum not exceeding two pounds nor less than five shillings.

PART 4.

*By-laws regulating streets and public places.*

Persons obstructing officers of the Council.

1. Any person or persons who shall obstruct any officer of the Council while in the performance of his duty, or who shall interfere with any officer of the said Council doing or performing, or going to perform, or returning from the performance of any duty or act under these By-laws, by using any threats, offensive language, hindrance, or insulting language towards the said officer in any street, road, or other place within the said Municipality, shall forfeit and pay for every such offence a penalty not exceeding ten pounds or less than one pound.

Regulations of streets, public places, &c.

2. No new public road, street, way, park, or other place, proposed to be dedicated to the public, shall be taken under the charge and management of the Council until such road, street, way, or park, shall have been examined by a committee of works, and reported to the Council by such committee.

3. Whenever any proprietor or proprietors of land within the said Municipality shall open any road, street, or way, or lay out any park or other place for public use or recreation through or upon such land, and shall be desirous that the Council shall undertake the care and management of such street, road, way, park, or other place, he or they shall furnish the Council with a plan or plans signed by himself or themselves showing clearly the extent and position of such road, street, way, park, or other place as aforesaid, and he or they shall execute any instrument dedicating such road, street, way, park, or other place as the Council may consider necessary.

Footways may be levelled.

4. When any footway shall have been marked out, the surveyor or such other officer or person so authorised may cause the same to be levelled, and made as nearly as practicable of equal height and breadth, and with an equal slope and inclination, and for this purpose may remove any flaggings, steps, or other matter, thing, or obstruction that may injure or obstruct the said footway, or render it unequal or inconvenient, and which now is or may hereafter be erected or placed on the space marked out for any of the said footways; and the Council may after seven days notice has been given in writing to the occupier or owner of any property, remove, or cause to be removed, any asphalt or tar pavement, flagging, or brick pitching, or any material used for paving fronting the said property, which may, in the opinion of the Council or its authorised officer, be in a dangerous or dilapidated state; all expenses of such removal shall be recovered from the said occupier or owner by process of law or otherwise.

Obstructing streets, &c., by exposing goods.

5. No person shall place or expose on the footways or streets carts, parcels, packages, or produce of any kind whatever to the obstruction of the public, and every person so offending shall for such offence forfeit and pay on conviction a fine not less than ten shillings or greater than five pounds.

Guttering and down pipes.

6. Every owner or occupier of any dwelling-house, shop, or other building who shall permit rain-water to fall down from any roof, spout, balcony, or other projection upon or over any street, road, lane, or footway, or shall cause or permit any such roof or rain-water to be discharged by any pipe upon any such street, road, lane, or footway, shall if such nuisance be not abated within seven days after written notice to abate the same shall have been given by the Council or its officer, on conviction forfeit and pay for every such offence a sum not exceeding five pounds nor less than one pound: Provided that any tenant of such premises who shall erect any spouting or pipe in accordance with any such notice may deduct the cost thereof from the rent of the said premises.

Drains in footways and slops.

7. No surface drain shall be made in any footway nor any pipes laid under or across the same without the authority of the Council, and no such drain shall be used for the discharge into any street, roadway, or water-table of any offensive liquid, or matter of any kind whatever; and any person who shall offend against this By-law, or any occupier, owner, or tenant from whose premises suds, offensive matter, slops, or filth shall flow over or on any footway, water-course, street, lane, or water-table shall forfeit and pay any sum not exceeding twenty pounds or less than one pound.

Various obstructions and annoyances.

8. Every person who, in any street or other public place or passage within the said Municipality, to the obstruction, annoyance, or danger of the residents or passers-by shall commit any of the following offences shall, on conviction for any and for every such offence, forfeit and pay a penalty not exceeding two pounds or less than ten shillings:—

- (1.) Every person who shall hoist, or cause to be hoisted, or lower, or cause to be lowered, goods of any description from any opening in any house or premises fronting any street or public place, and close to the footway thereof, without sufficient and proper ropes and tackling.
- (2.) Every person who shall carry and convey, or cause to be carried and conveyed in any street or public place, the carcase, or any part of the carcase, of any newly slaughtered animal without a sufficient and proper cloth covering the same for concealment from public view, or shall hawk or carry about butcher's meat for sale without covering the same as aforesaid.
- (3.) Every person who shall place any line, cord, or pole across any street, lane, or passage, or hang or place clothes thereon, or allow any tree or shrub to overhang the footpath to the danger or annoyance of any person.
- (4.) Every person who shall throw or cast from the roof, or any part of any house or other building, any slate, brick, part of a brick, wood, rubbish, or other material or thing, unless within a hoard or enclosure when any house or building is being erected, pulled down, or repaired.
- (5.) Every person who shall, within the distance of one hundred yards from any dwelling-house, burn any rags, bones, corks, or other offensive substance to the annoyance of any inhabitant.
- (6.) Every person who shall be the keeper of or have any dog or other animal which shall attack or endanger the life or limb of any person who may have the right-of-way or use of any private yard, alley, street, or any other place within the said Municipality.

Persons loitering.

9. Any person or persons standing or loitering upon any of the footways or other public places in this Municipality, to the inconvenience or annoyance of the inhabitants or passers-by, or in any way interrupting the traffic, and shall not discontinue to do so on being requested by any officer or servant of the Municipal Council of this Municipality or any police officer, shall on conviction forfeit and pay a penalty not exceeding two pounds nor less than ten shillings.

Indecent exposure.

10. Any individual who shall offend against decency by exposure of his or her person in any street or public place within the Municipality, or in view thereof, shall on conviction forfeit and pay for every such offence a sum not exceeding ten pounds nor less than ten shillings.

Stoppage of traffic.

11. The Committee for Works, or any officer or person acting under the authority of such Committee, may at any time cause the traffic of any street, lane, or thoroughfare, or any portion thereof, to be stopped for the purpose of repairing the same, or for any necessary purpose; and any person or persons offending against this By-law, either by travelling on such street, lane, or thoroughfare, or by removing or destroying any obstruction that may be placed thereon for the purpose of suspending the traffic, shall forfeit and pay a penalty of any sum not exceeding twenty pounds nor less than two pounds for every such offence.

Drawing or trailing timber, &c.

12. Any person who shall haul or draw, or cause to be hauled or drawn upon any part of any street or public place within this Municipality any timber, stone, or other thing otherwise than upon wheeled vehicles or barrows, or shall suffer any timber, stone, or other thing which shall be carried principally or in part upon any wheeled vehicle or barrow to drag or trail upon any part of such street or public place to the injury thereof, or to hang over any part of any such vehicle or barrow so as to occupy or obstruct the street beyond the breadth of the said vehicle or barrow shall upon conviction forfeit and pay for every such offence a sum of not more than forty shillings or less than five shillings over and above the damage caused thereby.

## Breaking horses.

13. It shall not be lawful for any person or persons in any street, road, or other public place within the Municipal District of Deniliquin to drive any carriage or other vehicle for the purpose of breaking horses, or ride, drive, or lead any horse, mare, or gelding for the purpose of breaking such horse, mare, or gelding; and every person so offending shall forfeit and pay for every such offence any sum not exceeding three pounds nor less than ten shillings.

## Leaving vehicles unattended.

14. If the driver of any cart, waggon, dray, omnibus, car, carriage, or any other vehicle drawn by horse or horses, or by bullock or bullocks, shall leave the same unattended in any street, whether public or private, or shall go for a distance of more than two yards from the side of such cart or waggon or other vehicle, being in any street without passing through the rear wheel thereof a suitable chain or strap so as effectually to prevent the rotation of such wheel; such driver shall in every case forfeit a sum not less than twenty shillings nor more than three pounds.

## Vehicles to carry lights.

15. Any person who shall not carry a light upon any vehicle whilst driving through any road, street, or public place within the Municipality, between the hours of an hour after sundown and daylight, shall forfeit and pay any sum not exceeding five pounds nor less than ten shillings.

## Driving over bridges.

16. No person shall drive or ride across any bridge within this Municipality at a greater pace than walking, and for every such offence shall on conviction pay a penalty not exceeding five pounds nor less than five shillings.

## Driving stock not under control.

17. Any person who shall drive within the Municipality any cattle or horses to any yard or premises except by the route authorised in By-law eighteen of this Part without having the same coupled, led, or otherwise under control, shall for every such offence forfeit and pay any sum not exceeding five pounds nor less than five shillings.

## Stock route.

18. Any person or persons who shall drive any sheep, cattle, or horses for sale, or delivery from the Edwards River Bridge towards the south shall, unless by the express permission of the Council, follow the route hereinafter described, namely:— Along Napier-street to Charlotte-street; thence along Charlotte-street to Hardinge-street; thence along Hardinge-street on to the travelling stock route by any street south of Harleux-street and vice versa for any stock coming from the south and travelling northwards; and any person or persons offending against this By-law shall on conviction forfeit and pay any sum not exceeding ten pounds nor less than ten shillings.

## Horses, &amp;c., straying.

19. Any person who shall permit or suffer any horse, bullock, cow, calf, swine, or goat belonging to him or her or under his or her charge, to stray or go about, or to be tethered or depastured in any street, road, or public place within the Municipality, shall upon conviction forfeit and pay a penalty not exceeding two pounds nor less than two shillings and six pence.

## Public property.

20. Any person who shall wantonly or maliciously break or injure any lamp or lamp post, or extinguish any lamp set up for public convenience in the said Municipality, or who shall damage any public building, wall, fence, bridge, culvert, water-course, or other public property within the said Municipality, or who shall wilfully, and without the consent or authority of the Council, cut, break, root up, or otherwise destroy or damage the whole or any part of any tree, sapling or shrub growing upon any street or place under the management of the Council, shall forfeit and pay for every such offence any sum not less than one pound nor more than ten pounds over and above the necessary expense of repairing the injury committed.

## Affixing placards

21. Any person who shall paste or otherwise affix any placard or other paper upon any bridge, fence, or other property of the Council, or upon any wall, fence, house, or building, or deface any such bridge, fence, or other property of the Council, or any such wall, house, fence or building by chalk, paint, or in any other manner, unless with the consent of the owner thereof, shall forfeit and pay a sum not exceeding forty shillings nor less than ten shillings.

## PUBLIC GARDENS.

## Hours.

1. The Waring gardens and other public places of recreation under the management or control of the Council shall be open every day.

## Injury to things in gardens.

2. No person shall pluck any of the flowers, or walk on the beds, or borders, or climb upon or get over the fences, or remove any of the tallies, or disturb, damage, or destroy any property or thing in the gardens.

## Shooting, &amp;c.

3. No person shall carry firearms through the gardens, or shoot, snare, or destroy any wild or tame fowl either in the gardens, or in or on any water adjacent thereto, or bathe or fish in any such water.

## Driving carts.

4. No cart or other vehicle used for the conveyance of goods shall, without the authority of the proper officer of the Council, be driven through the gardens.

## Supplying plants, &amp;c.

5. Such plants, seeds, or cuttings, as are commonly purchasable at nurseries in New South Wales shall not be supplied to any person unless in exchange or for public institutions or for benevolent purposes.

## Behaviour, &amp;c.

6. No visitor shall interrupt the gardeners or labourers by conversation or otherwise, or shall use any abusive, improper, or unbecoming language to any person in such gardens, or otherwise annoy any such person, or behave in an indecent, improper, or unbecoming manner in such gardens, or sit or lie on the borders or walks except on seats provided by the Council.

## Children.

7. Children under the age of ten years not being under the control of some competent person may be removed from the gardens.

## Penalties.

8. Any person offending against any provision of the foregoing By-laws shall for the first offence forfeit and pay any sum not exceeding five pounds; for a second offence, any sum not less than ten shillings nor more than ten pounds; and for a third, and every subsequent offence, any sum not less than one pound nor more than twenty pounds; and any person may on committing such offence be forthwith removed from the gardens by the proper officer of the Council, or by any of the gardeners or labourers employed in such gardens, without affecting the liability of such person so offending to be subsequently prosecuted for such offence.

The foregoing additional By-laws were made and passed by the Municipal Council of Deniliquin, and the seal of the said Council was hereunto affixed the seventeenth day of December, one thousand eight hundred and ninety.

(L.S.) W. J. DAVIES,  
Mayor.

THOMAS O. GILLIES,  
Council Clerk.

1891.

## NEW SOUTH WALES.

## POLICE DEPARTMENT.

(REPORT FOR 1890.)

Printed in accordance with Resolutions of both Houses of Parliament.

## The Inspector-General of Police to The Principal Under Secretary.

Sir, Police Department, Inspector-General's Office, Sydney, 9 January, 1891.

In accordance with Police Regulations, and special instructions, I have the honor to make the following General Report to the Colonial Secretary regarding the operations of the Police Department for the past year.

The return showing the strength and distribution of the Establishment on the 31st December is appended hereto as usual.

The thirty-one additional constables provided on the Estimates for 1890 admitted of some small addition to the force in the Metropolis, also of the establishment of the new stations hereunder named, and for augmentation of the force at the stations at Peak Hill, Broken Hill, Newcastle, &c. :—

District.	New Stations.
Metropolitan ... ..	Greenwich.
Northern... ..	Woolgoolga.
	{ Manildra.
Western ... ..	{ East Orange.
	{ Lewis Ponds.
North-eastern ... ..	Catherine Hill Bay.
North-western ... ..	Pallamallawa.
Bourke ... ..	Coolabah.
South-western ... ..	Pinnacles.
Murray ... ..	Jiundera.

153 appointments were made during the year to fill vacancies occasioned as under, and for the increase voted :—

Resignations ... ..	68
Discharges ... ..	25
Dismissals ... ..	12
Superannuations ... ..	10
Deaths ... ..	7

The condition of the Police Reward and Superannuation Funds continues each year to become more unsatisfactory. It is much to be regretted that the pressure of public business prevented the consideration of a measure for legislative enactment to place the funds on a proper basis, but I shall not fail to bring the matter specially under the Colonial Secretary's notice before the next Session of Parliament.

Six police pensioners died in 1890, who had been in receipt of pensions amounting in the aggregate to £663 1s. 8d. per annum, and one widow of a member of the force died who had been in receipt of a pension of £50 per annum.

Ten members of the force of various ranks were superannuated during the year, five receiving pensions at rates varying between £75 and £325 per annum, aggregating to £963 15s. 5d. per annum; and five members were granted gratuities upon their discharge on certificate of unfitness for further service, which entailed a charge of £780 10s. upon the fund.

Five widows of members of the force received gratuities amounting in all to £780, and two were granted pensions of £75 and £40 per annum respectively.

The charges for the year (on the combined funds) exceeded the revenue by £2,148.

*Crime.*

As usual, in anticipation of the publication of the annual statistics, I have caused the number of apprehensions by the police for various offences during the year to be extracted from the station records in the Metropolitan District, as the figures afford an indication of the nature and extent of crime for the year. They are so far satisfactory, as they exhibit no increase on those for the previous year, notwithstanding the increase in the population.

The total number of arrests for all offences amounts to 10,732. There is an apparent increase in the number this year of 763; but deducting the Water Police return, 829, which was not included in the Metropolitan return last year, there is a total decrease of 66.

In cases of drunkenness and other offences connected therewith, the figures for 1890 show a decrease of 30 as compared with the previous year.

From an examination of the reports of crime from the Colony generally, I judge there has been a marked decrease in the more serious offences, such as murder and rape, whilst only two cases occurred of robbery under arms, one being at a Chinaman's store, and the other at a bank, when the offender shot himself dead. There has also been a decrease in the number of children found abandoned, from 25 in 1889 to 11 in 1890.

The prevalence of acts of violence to persons and property, committed in concert by bands of disorderly young men and youths in the city and suburbs, has been under the special consideration of the Colonial Secretary. The inadequacy of the means provided under the existing law to enable the magistracy and the police to repress this seriously-growing evil will probably result in some enactment being passed at an early date to deal with the matter.

There are other directions in which legislation would be of great public advantage, as tending to the moral and social improvement of the community, and I trust I may not be travelling beyond my province in taking this opportunity of referring to them:—

1. The supervision and regulation of dancing saloons and other places of resort by the young.
2. The regulation of common lodging houses.
3. The more effective inspection and regulation to secure decent accommodation for families of the poorer classes.
4. For the better protection of young girls, and for extending the age under which they may be dealt with under the Industrial Act to 18.
5. To extend the scope of the Industrial Schools' Act, to enable the magistracy to deal with "neglected children."
6. To supervise and control all factories and workshops where the young of both sexes are employed.

I am, of course, well aware that these subjects are not new to the Colonial Secretary, and that he has had them constantly under his consideration. I merely take the liberty of recalling his attention thereto.

The ordinary routine of police duties during a portion of the year was considerably interfered with by the necessity for withdrawing a large number of police from stations in the country during the strike. Notwithstanding, however, that some few complaints were made of inconvenience suffered by the residents in various districts owing to the absence of police, it was satisfactory to find that no marked increase of crime resulted therefrom.

The facilities with which police can now be moved from one post to another by railway, telegraph lines being also available in every direction, afford material aids to promptitude in concentrating police wherever required on emergency.

The use of the telephone for police purposes has been made more generally available in the city and suburbs during the year. Besides the twenty-five instruments at police stations, the telephones of the Fire Brigade Department are all available to the police, and, in addition, no less than 139 instruments in convenient situations, belonging to private citizens, have been kindly placed at my disposal for use when required. A list of the same has been printed and issued to each member of the force in the district.

The number of publicans' licenses issued throughout the Colony in 1890 was, approximately, 3,428, as compared with 3,405 in 1889. The increase was confined to the country districts, the metropolitan returns showing a decrease of three, the numbers being 855 in 1889, and 852 in 1890.

I regret that I am unable to make a favourable report regarding the working of the Licensing Act, or the control thereunder of the traffic in intoxicating drink. The limitation clauses of the Act are not observed, nor indeed can they be efficiently enforced. The prosecutions by the police in the Metropolitan District, however, increased from 337 in 1889 to 431 in 1890.

Sunday trading is not exceptional, and the difficulties in the way of securing convictions are enhanced as the licensees become more adept in the means they adopt to evade detection. The evil resulting is of considerable magnitude, as the police have good reason to know that numerous families are rendered destitute, and ruined morally, by unprincipled publicans seducing the breadwinners into their dens, where they are induced to remain Sunday after Sunday till their wages are spent, and they are rendered more than half unfit for their week's labour.

I believe (though my opinion is not shared by all of my own officers) that less evil would result were public-houses permitted to be opened during certain hours on Sunday, when what occurred would be open to public view, and to the supervision of the police.

It was confidently expected when the Licensing Boards were constituted, that many licenses would be withdrawn in country towns and villages from premises wholly unfit for public accommodation, and not required for that purpose; but wherever I go, in reply to my inquiries to the inspectors why such and such houses, obviously not required and unfit, still retain their licenses, I am informed that the Board has not seen fit to refuse to continue the licenses.

Certain amendments in the Act are, I understand, now under consideration, which, it is to be hoped, will be passed into law, and be productive of some public benefit. At present the respectable trader is absolutely at a disadvantage as compared with his less scrupulous competitor.

There were 1,263 inquests held during the year, and the reports show that in 102 cases death was attributable, either directly or indirectly, to intemperance. These figures exhibit a decrease on the previous year of 112 and 37 respectively.

The watchhouse accommodation in Sydney is at present—since the old Central Police Station was removed—very far below the requirements; but votes having been granted for new buildings for a Central Police Station (in progress), and for new lockups in Clarence-street and Regent-street, I hope to be in a position at no distant date to report that the watchhouse accommodation of Sydney fulfils all modern requirements, and equal, if not superior, to any city in the world.

Ambulance instructions to the police has been continued during the year in Sydney and at some of the more important country towns, though interfered with by the strike and other urgent duties, and I entertain a hope that in course of time a large proportion of the men will obtain certificates of qualification.

The correspondence in the department is very considerably on the increase. It has now to be maintained with Police Establishments, not only in the United Kingdom but with India, Canada, and other

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

**POLICE FORCE.**

(ALLOWANCE TO MEMBERS OF, IN SYDNEY, FOR EXTRA DUTY IN CONNECTION WITH LATE STRIKE.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

[Laid upon the Table of the House in answer to Question No. 31, of Tuesday, 26 May, 1891.]

Question.

(31.) MR. McCOURT asked THE COLONIAL SECRETARY,—

(1.) Have any extra payments been made to Police Officers on account of services rendered in connection with the late strike?

(2.) If so, will he state name and amount paid to each Officer?

Answer.

THE following allowances were paid to members of the Police Force, in Sydney, for extra duties and expenses incurred during the Strike:—

Name.	Rank.	Amount.
Read, George .....	Superintendent .....	£ s. d. 50 0 0
Ryeland, James .....	do .....	50 0 0
Mackay, Alexander .....	Inspector .....	25 0 0
Larkins, Nicholas .....	do .....	25 0 0
Lenthall, Walter E. ....	do .....	25 0 0
Atwill, Alexander.....	Sub-Inspector .....	25 0 0
Bremner, James.....	do .....	25 0 0
Cotter, Stephen J. ....	do .....	25 0 0
Lawless, Edmund .....	do .....	25 0 0
Potter, Alfred .....	do .....	25 0 0
Barry, Robert .....	do .....	25 0 0
Bell, John .....	do .....	25 0 0
Hyem, George H. ....	do .....	25 0 0
Long, William .....	do .....	25 0 0
Scott, William .....	do .....	25 0 0
Camplin, William .....	Inspector of Detectives .....	25 0 0
M'Dowell, Giles .....	Sub-Inspector of Detectives.....	25 0 0
Sutherland, John .....	Sub-Inspector .....	25 0 0

The sergeants and constables in the Metropolitan District who performed extra duties in Sydney received 2s. per diem.

The sergeants and constables belonging to the Metropolitan and Country Districts, who were detailed for duty at the Collieries, received 6s. per diem when not supplied with rations, and 3s. per diem when supplied.

The detectives, for the extra labor entailed on them, received 3s. per diem.

The officers in the Country Districts on special service received the usual travelling allowances when not supplied with rations.

1891.

## NEW SOUTH WALES.

## PRISONS.

(AMENDED REGULATIONS.)

Presented to Parliament, pursuant to Act 37 Vic. No. 14, sec. 9.

Department of Justice, Sydney, 22 December, 1890.

His Excellency the Lieutenant-Governor, with the advice of the Executive Council, has been pleased to approve of the following Regulation being substituted for amended Regulation No. 21 of the Gaol Regulations made under the Prisons Regulation Act, 4 Victoria No. 29, and which Amended Regulation was published in the *Government Gazette* of the 23rd May last, viz. :—

21.—*Hair-cutting, Shaving.*

1. All male convicted prisoners shall have their hair cut upon admission, and afterwards monthly, in a manner not to disfigure them; and, except in the case of prisoners serving sentences not exceeding three months, shall be shaved once a week. If thought necessary on the ground of health or cleanliness, any convicted prisoner may be shaved, no matter what the term of his sentence may be. Prisoners under committal shall not have their hair cut or be shaved, save so far as may be necessary to preserve their appearance as at the period of their examination.

2. Prisoners who, under this regulation, are shaved, may be permitted to grow their hair and beard as they may desire for three months before the expiration of their sentences, or of the time when, according to their conduct under the Remission Regulations, they may be eligible for discharge. Under very special circumstances the shaving may be dispensed with at any time by the Gaoler, who will report the facts to the Comptroller-General of Prisons.

ALBERT J. GOULD.

Department of Justice, Sydney, 3 March, 1891.

His Excellency the Governor, with the advice of the Executive Council, has been pleased to approve of the following Regulation being substituted for No. 26 of the Gaol Regulations, made under the Prisons Regulations Act, 4 Victoria No. 29, viz. :—

*Classification.*

26. Prisoners shall be classified as below stated; and the several classes shall, so far as the construction of the building and the necessities of the works and trades will admit, be kept apart. But any prisoner may, for special reasons, be reported in each case to the Comptroller-General, be associated with a class other than his own :—

1. Prisoners under sentences to the roads and public works, of five years and upwards.
2. Prisoners convicted of felony or misdemeanour, and sentenced to lesser periods, either to the roads and public works or to imprisonment with hard labour.
3. Prisoners under sentence of imprisonment only, and persons detained during Her Majesty's pleasure.
4. Prisoners awaiting trial, or under examination.
5. Lunatics, comprising persons supposed to be of unsound mind.
6. Debtors, comprising persons confined for contempt upon civil process.

ALBERT J. GOULD.

1891.

## NEW SOUTH WALES.

## COAST HOSPITAL, LITTLE BAY.

(REPORT ON, FOR 1890.)

Presented to Parliament by Command.

The Medical Adviser to the Government to The Colonial Secretary.

Sir,

Sydney, 22 April, 1891.

I do myself the honor to submit the Annual Report on the working of the Coast Hospital at Little Bay for the year 1890, with appendices containing the usual returns.

With a view of bringing the statistics of the Hospital into accord with those of similar institutions, the system under which they have been prepared during the last six years has been departed from, and the figures in the present report show the work of the Hospital from 1st January to 31st December. As the figures in the report for the year 1889 included the discharges up to the 31st March, 1890, a number of the cases are dealt with in the statistics for both years, and a comparison of the results will be difficult and more or less misleading.

The following general statement shows the number of patients under treatment during the year with results :—

Remaining in Hospital on 31st December, 1889	...	...	...	...	159
Admitted during the year	...	...	...	...	1,529
Total	...	...	...	...	1,688
Discharged well or convalescent...	...	...	...	...	1,186
„    relieved	...	...	...	...	183
„    unrelieved	...	...	...	...	101
Died	...	...	...	...	67
Total	...	...	...	...	1,537
Remaining in Hospital on 31st December, 1890	...	...	...	...	151
Average number resident daily throughout the year	...	...	...	...	178*
Mean resident of each patient in days	...	...	...	...	42
Rate of mortality over all cases...	...	...	...	...	430

The number of admissions was less by 280, and the daily average number in Hospital 20 less than during the previous year, the falling off being chiefly in cases of typhoid fever.

The channel through which the patients admitted during the year reached the Hospital is shown in the following short return :—

	Hospital Admission Depot.	Medical Adviser's Office.	Medical Superintendent.	Total.
General cases .....	1,257	94	38	1,389
Typhoid fever cases .....	28	103	9	140
Total .....	1,285	196	47	1,529

The following returns deal with the statistics of typhoid fever. In the first these cases are shown distributed under age and sex. The total number was 140 as against 312 in the previous year. The death-rate was 15.0, being much higher than usual, and the average stay in Hospital was 34 days, whilst it reached 39 days in the previous year.

TABLE I.—Showing the number of cases of Typhoid Fever distributed under sex and age, and the deaths at each age, which were admitted during 1890:—

(Average stay in Hospital, 34.6 days; mortality, per cent., 15.0.)

	0-5.		5-10.		10-15.		15-20.		20-30.		30-40.		40-50.		50-60.		60-70.		Total.
	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	M.	F.	
Admissions.....	4	...	5	4	9	6	13	16	38	17	17	4	4	1	2	..	...	...	140
Deaths .....	..	...	...	...	...	...	2	1	11	2	2	1	2	...	...	...	...	...	21

The number of cases of typhoid fever under treatment was smaller than during any previous year, but the type of disease was severe, the complication serious, and the mortality unusually high.

No cases occurred among members of the Hospital staff, nor did the disease spread from patient to patient in Hospital. Every care was taken to prevent infection, and the solution of corrosive sublimate, in the proportions recommended by the Board of Health, freely used.

In the second table the districts from which the typhoid fever patients were received is shown. It will be seen that these include most of the metropolitan and suburban area.

TABLE II.—Showing the number of persons suffering from Typhoid Fever who were removed to the Coast Hospital for treatment from each district during the twelve months ending 31st December, 1890, and the deaths occurring therein during the same period.

Return No. III. deals with infectious diseases, and shows the form of disease, the number of cases of each disease admitted, and the localities from which the cases were received. The total number of cases of infectious diseases, exclusive of erysipelas, received during the past seven years, was as follows:—1884, 12; 1885, 17; 1886, 50; 1887, 63; 1888, 89; 1889, 76; 1890, 46. In 1890 19 cases of erysipelas were also received.

Though there has been a falling off in the number of cases of infectious diseases admitted, owing to these diseases being but little prevalent during the period under consideration, the hospital has done good work in this direction, and by receiving cases from crowded houses and streets, and also from public institutions, has prevented the spread of very dangerous maladies. It is in this direction, as pointed out in previous reports, that the future utility of the institution must mainly be. When the Bill for the notification of infectious diseases which has been prepared by the Board of Health, and is now under the consideration of the Government, becomes law, this Hospital should be ready to receive all cases notified to the authorities in which it is found that proper provision for the care and treatment of patients and for preventing the spread of the disease cannot be made in the houses where the disease occurs. Without insisting on the removal of cases of infectious disease the Government should be in a position to offer in every case the benefits of efficient hospital treatment under circumstances best calculated for the recovery of the patient, and at the same time the best chance of preventing the spread of disease in households and in public institutions by removing cases in an early stage.

TABLE

Return No. IV shows the age, sex, and other particulars of the General Hospital cases under treatment during the year. The total number of these was 1,389, and the deaths 46, giving a mortality of 3.31, which is lower than during any former years. The average number of days in Hospital was 43.

TABLE IV.—Showing the general cases distributed under sex and age, and the deaths at each age, during the year 1890.

Return No. V deals with the cases of leprosy, of which two were admitted, and two died during the year, the number not having increased during this period.

An Act for the detention and isolation of lepers was passed at the close of the year, and a site set apart for this purpose was gazetted under the provisions of the Act. Owing to various delays, among which the rainy season was prominent, the new buildings were not completed so soon as was anticipated, and the leper patients remained in their old and unsatisfactory quarters to the close of the year. They have now however been removed to the new buildings, which are pleasantly situated, have an abundant water supply, and all necessary arrangements for care and treatment.

TABLE V.—Showing the number of Lepers who remained in Hospital at the end of 1889, who were admitted and discharged, and who died in 1890.

Number remaining in on 31st December, 1889.	Admitted.	Discharged.	Died.	Number remaining in on 31st December, 1890.
13	2	.....	2	13

Returns Nos. VI and VII show the expenditure of the Hospital for the year in detail; although the total expenditure is somewhat less than during the year 1889, the cost per head has very greatly increased. This has been due to the following circumstances:—

- 1st. The daily average number of patients has been 20 less, so that practically one ward has been closed throughout the year, whilst it was not found advisable to reduce the staff which should always be in readiness to meet emergencies, or a sudden outbreak of typhoid fever or other epidemic ailment.
- 2nd. Advantage was taken of the smaller number of patients to repaint the wards throughout at a considerable expense.
- 3rd. A large amount of refurnishing has been necessary, the bedsteads and many other articles being worn out and needing renewal.
- 4th. The contract rates for provisions, especially during the strike, have been much higher than during former years.

TABLE VI.—Working expenses of the Coast Hospital for the year 1890:—

„ sale of unserviceable goods by the Stores Department ..	3 12 0		
Total .....	£ 16,110 8 3	Total .....	£ 16,110 8 3

Very considerable alterations and additions have been carried out under the Department of the Government Architect. These include the erection of new stores, offices, and dispensary, the alteration of the old offices to form a residence for the Assistant Medical Officer, the conversion of the old stores into a room for Divine Service, &c., the erection of new bath-rooms lavatories, and closets in connection with all the wards, and considerable alterations to the water supply, so as to render this more plentiful and the service more continuous and at a fuller pressure. The drainage of the Hospital has received attention, and the substitution of water for earth-closets has been commenced and will be completed in a few weeks.

During the last Session of Parliament provision was made for building cottages for some of the married members of the staff, the necessity for which was pointed out in the last Annual Report, and four of these have already been commenced.

No changes took place among the officers of the Institution during the year, and the Medical Superintendent reports favourably of the general efficiency of the staff under his direction.

In Appendices A and B will be found the usual classification of the diseases treated, and particulars relative to the patients who died in Hospital.

I have, &c.,

F. NORTON MANNING, M.D.,

Medical Adviser to the Government.

## NEW SOUTH WALES.

## VACCINATION.

(REPORT FOR 1890.)

Presented to Parliament by Command.

The Medical Adviser to the Government to The Colonial Secretary.

Sir,

Sydney, 22 April, 1891.

I do myself the honor to forward, for the information of the Colonial Secretary, the Annual Returns of Vaccinations performed during the year 1890 by the Government Vaccinators in New South Wales, together with additional vaccination returns for the year 1888 and 1889.

The returns for 1890 show that 2,149 vaccinations were performed during the year, of which 2,112 were successful. Of the total number, 906 were performed in Sydney and its suburbs, and 1,243 in country districts. It will be seen from the returns that vaccination was only performed in 24 country districts; in 81 districts in which there are Government Vaccinators no vaccinations have been reported, and it is presumed that none have been performed.

Of the successful cases, the patients in 310 were under 1 year, in 751 between 1 and 5 years, in 696 between 5 and 10 years, and in 322 upwards of 10 years of age. The unsuccessful cases were 37, or 1.72 per cent. of the total number. (See Return No. 2.)

The additional vaccination returns for 1888 and 1889 show that in the former year 91 and in the latter 152 successful vaccinations were performed, and these numbers have been added to those in the returns already published for these years, so as to render them complete. (See Return No. 1.)

The number of births registered in the colony during 1890 was 32,051, and the vaccinations give a percentage of 6.58 on this number. It will be seen from Return No. 1 that this percentage is somewhat above the average for the last six years. The number of vaccinations in persons above 10 years of age has increased since it was decided, during the year 1889, to pay for these and for revaccinations; whilst the number in persons under 5 years of age shows some falling-off when compared with the previous year. In addition to vaccinations performed by Government Vaccinators a number are performed by private practitioners, but of these no returns are submitted. There is reason, however, to believe that these cases would not add very materially to the percentage above given. On the whole the returns show that only a very small percentage of the population is protected against small-pox by vaccination, and that, as in former years, when there is no outbreak of small-pox in Sydney, or when there is very little brought to the port by sea and treated at the Quarantine Station, there is a marked apathy on the subject, and few persons submit their children for operation.

The lists of public vaccinators have been carefully revised, and vacancies caused by removal or death have been filled in all districts where there appeared to be any call for the appointment. A constant supply of humanised calf lymph has been obtained from New Zealand for distribution, and this has been most favourably reported on by the medical practitioners using it. The Government Vaccinator for Sydney has been in a position to supply a small amount of carefully selected human lymph, and a further quantity has been obtained monthly from a trustworthy source. From a general review of the statistics of the last thirty years it will be seen that the condition of the population as to vaccination is very unsatisfactory. Except in times of public panic only some 6 or 7 per cent. of the children born in the Colony are vaccinated, and every year largely increases the proportion of unvaccinated persons to the general population. In point of fact voluntary vaccination, so far as this Colony is concerned, is a failure.

The Board of Health has, during this and previous years, had under consideration the subject of making vaccination compulsory, and has prepared a Bill with a view to this; but as the question of vaccination is now receiving attention in Great Britain, and is being thoroughly investigated by a Royal Commission, on which appear names entitled to the fullest public confidence and representing all shades of opinion, it has been deemed advisable to await the report of this Commission before making any recommendations to the Colonial Secretary.

I have, &amp;c.,

F. NORTON MANNING, M.D.

Medical Adviser to the Government.

RETURN (No. 1) showing the number of Births during the past twenty-nine years, and the number of Vaccinations performed by Government Vaccinators during the same period.

Year.	Births.	Vaccinations.	Proportion of Vaccinations to every 100 Births registered.
1861	14,681	2,349	16.00

1891.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

LEPROSY IN NEW SOUTH WALES.  
(REPORT ON.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

The Secretary to the Board of Health to The Under Secretary for Finance and Trade.

Sir, Board of Health Office, 127, Macquarie-street, Sydney, 13 May, 1891.

I have the honor, by direction of the Board of Health, to forward you herewith a report on Leprosy in New South Wales, and to suggest that as the matter is of much interest to members of the medical profession and others it should be laid before the Houses of Parliament.

I have, &c.,

EDMUND SAGER,

Secretary.

[Enclosure.]

LEPROSY IN NEW SOUTH WALES.

IN March, 1890, the Board of Health presented a brief report, showing the prevalence of leprosy in the Australian Colonies at the close of 1889, together with some particulars as to cases under care at that date in New South Wales. It was pointed out that the number of Chinese patients was slowly increasing, and that the disease was not unknown among the European population, as in addition to the two Europeans under care the Board had reason to believe that there were other cases in the Colony not in any way isolated or reported. Although much in regard to the mode of origin and the spread of the disease is still conjectural there can be little doubt but that the malady is contagious, and that isolation of the persons affected has as shown in Norway practically diminished its prevalence. Under these circumstances the Board decided to ask for the power of compulsory segregation, and a bill prepared under its direction was submitted to Parliament and became law during the Session of 1890. The Act provides for the compulsory notification of cases of leprosy, and for the establishment of a lazaret for the reception and treatment of lepers, and gives power to the Board to direct the detention of lepers in this lazaret or their isolation in their own homes, or in such place or manner as the Board may direct.

Prior to the passing of this Act patients suffering from leprosy were detained without any proper legislative authority, and it is provided in the Act that all persons detained as lepers at the Coast Hospital, Little Bay, should be deemed to have been lawfully detained, and to be lepers within the meaning of the Act.

After the passing of the Act the Board took every means to intimate to the members of the medical profession their duties thereunder, and since the Act came into operation five cases have been reported by medical practitioners, four of which on investigation proved to be true leprosy, and the fifth, acute eczema.

On the 14th January last a proclamation was published in the *Government Gazette* directing that a site at Little Bay, containing an area of 2 acres 1 rood 26 perches, should be set apart as a leper lazaret in accordance with the Act, and on the 1st of April last, new and well-arranged buildings for their reception having been completed under the direction of the Government architect, the lepers were transferred from the old to the new quarters where, under the charge of experienced wardsmen and the superintendence of the medical officers of the Coast Hospital, they receive proper attention, and are made as comfortable as their unfortunate condition permits.

They are allowed to receive the visits of friends under proper precautions, and are attended by the ministers of religion visiting the Hospital. At the same time facilities are given to medical practitioners on application to the Board to familiarise themselves with the characteristics of a disease which is not as yet well known to, or easily recognised by, the majority of the members of the medical profession.

No further information has been received from the other Australian Colonies respecting the prevalence of leprosy therein since the return published in the report of the Board for the year 1889, above mentioned, when it was shown that there were eighteen cases of leprosy under official cognisance in Australia, outside New South Wales, New Zealand, and Fiji, all in colored races—nine of the eighteen being Chinese. The Board is unaware of the spread of the disease to Europeans in any of the Australian Colonies, except New South Wales, but has received information from His Excellency the Governor of New Caledonia, M. Pardon, that the disease is extremely prevalent in that colony, where about 500 of the native population are affected and seven persons of European parentage, six convicts, and one child, all French, have been officially reported as suffering from the malady. His Excellency further reports that during the last two or three years, under regulations to ensure some degree of segregation, there has been no spread of the disease.

\*66—A

Cases

Cases of leprosy among the native-born European population of the Colony were reported in the *Medical Journals* as long ago as 1873, but the spread of the disease has been very gradual. The first cases placed under the care of the Government were three Chinese who, in the year 1879, were isolated in huts on a site at Little Bay, under the control of the Government Asylums Department, and were subsequently transferred to a cottage attached to, and in the grounds of, the Asylum for the Infirm and Destitute at Parramatta. The Department of Government Asylums is unable to give any definite information as to the subsequent history of these patients, but it is probable that three of them were identical with three patients retransferred from Parramatta to Little Bay in 1883. In this year, when the cases of leprosy first came under the care of the Board of Health, 5 only were received; at the close of 1890 there were 13, and on April 30, 1891, 15 cases. The total number under the care and control of the Board from 1883 to April 30, 1891, has been 25 cases, of which 16 were Chinese, 1 Javanese, 1 West Indian Negro, and 7 Europeans, all of the latter being natives of New South Wales, of European parentage, and, with one exception, of the male sex.

The number of cases under care in each year is shown in Appendix A. Particulars, age, nationality, &c., of all under care are given in Appendix B, and in Appendix C will be found the history and clinical notes of all the persons of European parentage, drawn up with considerable care and detail, by Dr. Ashburton Thompson, the Chief Medical Inspector to the Board. In addition to the 25 cases above-mentioned the Board has been made aware of two other cases of undoubted leprosy. The patients both died in private houses, one whilst awaiting removal to the Coast Hospital from the Richmond River district, and the other in Sydney, the latter having been seen by two medical practitioners well qualified to diagnose the disease. Both of these cases were also of European descent. One came to the Colony at 3 years of age, with his parents, who were Germans; and the other (the brother of a patient now under the control of the Board) was born in New South Wales. It will thus be seen that up to April 30 last 9 Europeans are known to have suffered or to be suffering from the disease—all of them, with one exception, being natives of New South Wales—4 of them German, and the remainder of British extraction.

The detailed history of the cases given in Appendix C, though of very considerable interest, does not furnish any grounds for definite conclusions as to the causation and spread of the disease. There are no data on which to advance a view of spontaneous, climatic, dietetic, mal-hygienic or hereditary origin of the malady, and nothing of scientific accuracy to be adduced as to contagion, though the evidence in several cases points more or less strongly in this direction.

There appears to be every reason to believe that all the cases among the Chinese, as well as the European cases developed in New South Wales, although, in the Chinese cases, the seeds of the disease may have been brought from China. In these latter cases the disease appeared at times varying from six months (the shortest) to ten years after the arrival of the patient in the Colony. The Europeans were not only born in the Colony but, with two exceptions (brother and sister), who resided for several years in South Australia, have never left it.

From Appendix B it will be seen that the cases have been found not only in Sydney and its immediate neighbourhood, but at Bathurst, Mudgee, Inverell, Newcastle, the Richmond River, and other places—that, in fact, the disease has become very widely distributed.

In all cases recently reported the Board has not only caused inquiries to be made as to the history of the patients, but has directed an examination of their immediate relatives and intimate associates, with a view, if possible, of detecting and checking any spread of the disease.

In adopting the system of segregating cases of leprosy the Board has had before it the fact that the disease is, so far as at present known, incurable, and that its efforts must be directed to prevent its reproduction or spread. The practical effects of segregation, as carried out in Norway, are so well marked and so abundantly authenticated as to offer the greatest encouragement to well directed efforts in this direction, and afford a hope that in this Colony the importation of the disease being greatly restricted by the restriction of Chinese immigration, the disease may, in a comparatively short time, be completely stamped out.

It should, however, be borne in mind that the disease is very prevalent in India, in some of the South Sea Islands, and in other places, and that it may be imported from places besides the Chinese Empire, or places largely colonized by Chinamen.

The statistics of leprosy in Norway show conclusively that under a modified form of segregation under which leper-houses were opened for the afflicted, and every encouragement given to enter them, whilst certain regulations were made for the cure and control of those remaining in their own homes, the number of cases under registration in Norway decreased in 25 years (1856 to 1880) from 2,113 to 1,606. Under a more restrictive system, adopted within the last 10 years, the segregation either in leper-houses, or by isolation in their own dwellings being compulsory, the decrease has been even more marked and satisfactory. In 1885 the number had fallen to 1,195, and in 1890 to less than 800.

The decrease has, as is shown in various reports on the subject by Dr. Hansen and others, not been due to any general amendment in the public health, nor can it be accounted for by any general improvement in diet, dwellings, soil, or climate; indeed there does not appear to be any valid reason to suppose that leprosy could be directly mitigated by dietetic, hygienic, or climatic influence in any further degree than tuberculosis or syphilis might be. Medical treatment has contributed nothing to the result since the disease has proved almost equally intractable to all remedies, and medicines have only been of service in treating symptoms, meeting emergencies, prolonging life, and making it more bearable. The chief if not the sole influence in causing the decrease would appear to be "the exclusive dealing with the individual leper as himself the source of ill to others."\*

If a similar result should follow similar measures in this Colony, and the disease, in the course of 12 or 15 years, be practically stamped out, as there is good reason to believe not only possible but probable, the cost involved in carrying out these measures will not be grudged, and this and the present restriction of the liberty of individuals will be a small price to pay for the future safety of the community.

By order of the Board of Health,  
EDMUND SAGER,  
Secretary.

\* These are all natives of New South Wales of European parentage. † Date of report. This patient has not yet been removed to Little Bay.

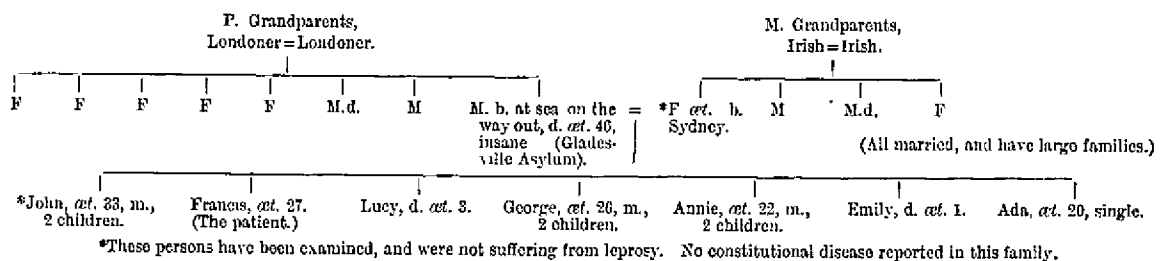

NOTE.—The only additional cases of leprosy in New South Wales which have been reported to the Board of Health are G.R., *et. 28*, whose death, certified by his medical practitioners, was reported by the City Coroner on the 18th July, 1889, and P.S., *et. 38*, died in the Richmond River District in March, 1887. Both of these persons were of European parentage.

## APPENDIX C.

HISTORICAL and Clinical Notes of Persons of European parentage, known to be suffering from Leprosy, in New South Wales. By Dr. J. Ashburton Thompson, D.P.H., Chief Medical Inspector to the Board of Health.

F.G., *et. 27*.—22 August, 1888.

His descent is as follows:—

He was weakly during infancy, but has had no important illnesses since. He lived with his parents at Penrith, Goulburn, and Bathurst until he was 11 years old; the family then came to Sydney, and he has lived there ever since. On leaving school he spent one year in the service of a cordial-maker; he then helped his mother, who kept a restaurant, his duty being to buy vegetables in the markets (frequently from Chinamen), and he did this for another year or more. At about 17 he became a carter, drawing building materials; and after a time he began to learn plastering. After some months of this work, during which his chief business had been to beat up bullock's hair and mortar with a trowel, and being between 19 and 20, he found the trowel had broken the skin over the outer side of the right fore-finger; and with this sore his present illness seems to have begun. The finger swelled; it never recovered its natural size or appearance. According to his brother's account, anæsthesia of the hands and feet was among the earliest symptoms, it being observed that he sometimes burnt or injured himself without being aware of it. Three or four years later he had an attack which is described as erysipelas and rheumatic fever, and from this the general swelling and distortion of his hands and feet date. Two years later still he began to get a disease of the eyes which has produced opacities of the cornea, and adhesions of the iris, and has rendered his sight very imperfect. Lastly, a few months ago, he tried to cut his throat, but his mother and brother saw no reason at the time to suppose him insane. He now seems to have a fair amount of strength. His hands and feet are much distorted, and some of his fingers have lost the terminal phalanges by absorption; the skin of the face and ears is thickened and roughened; and in all those situations there is very imperfect sensation—so that on being pricked with a needle he only felt that he was being touched. The patient's family have always been in comfortable circumstances. He says he was never much in the habit of eating fish; was not very fond of it; ate it occasionally like other people.

*Clinical*

## Clinical report.

23 March, 1891.

The mask is reddened—slightly, uniformly, without brown tinge, and looks rather as though it had been rouged and well powdered afterwards; the reddening ceases at the hair, except on the temples, where it stops a little short of the hair; it extends all round the neck. The skin of the face is loose and inclined to fold; it shows everywhere rather fine wrinkles, which are nearly longitudinal; they do cross each other, but at very acute angles. There is general thickening and distortion of the features; the nose is broadened and flattened, and the alæ appear to have lost substance, although they have never ulcerated. There are numerous tubercles in several situations, but most upon the cheeks, they are scarcely visible, but are very easily felt. The ears are not much deformed; there is no prominence of the superciliary ridge. The scalp is unaffected, and covered with thick silky hair; eyebrows gone; eyelashes gone; he has no beard or whisker. The whole trunk shows a brownish red or dirty red mottling, which is not very strongly marked. The hands are both considerably swollen, bluish-red, and the fingers sausage-like in shape:—Right hand: the first phalanges can be extended and flexed; the second row is permanently flexed; the third row is not distinguishable, but some firmly-attached small fragments of nail remain; the thumb is similarly deformed, but not quite so much. Left hand, the changes are the same, but not quite so great, and more of the nails remain, though without the normal shape. The legs show brown maculæ and brown mottling; on the right shin, from the insertion of the patellar tendon downwards, is a row of cicatrices of old ulcerations. The feet are not so swollen nor so deformed as the hands. *Special senses*.—The sight is now quite good; hearing good; smell (the left side of nose is permanently closed, the right only as a rule, but when the latter is free) is almost absent; voice, hoarse and without quality; but there is no dyspnoea. *General health* said to be perfectly good; seems strong and well-nourished. He has no attacks of ill-health, and no pains. *Sensation*.—There is general analgesia, but sensibility to an ordinary touch is present. I have detected no area absolutely anæsthetic. I found no spot on which he could distinguish between the prick of a pin which drew blood and a touch with the head.

H.B., æt. 17.—17 December, 1889.

His descent is as follows:—

The boy's father, formerly a publican, is now a selector and labourer, living on the Meroo (Mudgee), and has always been in fairly comfortable circumstances. This is an old gold-field, and there have always been Chinese there within his recollection; but communication of this family with them has always been strictly limited to purchases of tea and sugar, and occasionally such articles as boots from a store kept by some of them. Those who keep the store are said to have been there very long and to be well. All other conditions seem to have been those usual in the bush. Fish was very rarely to be got, and canned fish was very seldom tasted by this patient. Until 13 years of age he was well, strong, intelligent, and active. The fingers of the left hand then began to contract, and the muscles of the forearm wasted somewhat, so that a doctor supposed he had injured the limb, and that it was wasting from disuse. Next, blebs appeared on the fingers, and loss of sensation to a small extent was observed. At about 15 years of age discoloured spots of reddish-brown colour appeared on the trunk, and later on the extremities; under some treatment these disappeared or nearly disappeared a few months later, but they reappeared of a pure brown colour without the reddening. The right hand and foot in the meantime had become contracted and swollen, and lastly, about the age of 16, his face began to get discoloured, to swell, and to be disfigured.

On examination:—*The face* (being the mask alone) is disfigured by an irregular swelling or infiltration, which is rather hard; a few distinct tubercles are to be seen; in colour it is uniformly reddened, but more deeply in places, so that it looks patchy; the nose is broadened and thickened, the eyelids thickened, the eyebrows thickened and prominent; the ears have the lobe slightly thickened, but not hardened, but the tragus is both thickened and hardened, and proportionately more deformed. *Eyesight* unaffected. *Hands*.—The fingers on both sides are contracted moderately and thickened; there is swelling, or thickening at, and immediately above, both wrists. *Feet*.—Right foot is generally thickened and deformed, but the toes are scarcely contracted; it is discoloured (reddish or purplish); a blister appeared on the sole about a year ago, which broke, healed, appeared again and healed, and at last left an ulcer, which is now present. Left foot discoloration only. *Trunk and Limbs*.—These show very numerous patches of discoloration of irregular shape, which are of a quite clear brown, of the same shade as the back of a sunburnt hand; there is no reddening of these patches. They are anæsthetic, but the patient (as usual) denied this until he was shown that he could not distinguish between a touch with the head of a pin and a prick with the point.

March 21, 1891.

The whole mask is now enormously distorted by prominent, large, and more or less distinct tubercles; it is very red and of a rather bright tint; the redness ceases where the hair begins; both sides of the hypertrophied and flattened nose are generally stopped up, but sometimes are free; the ears show many tubercles, especially about the lobes; the hair of the scalp seems normal, although dry and not very thick; the eyebrows are almost gone; the eyelashes broken and short, or wanting; hair present and normal in armpits and on pubes (the maculæ mentioned below do not infringe upon the hairy surface, although they approach it very closely). The hands are much swollen (firm œdema) and of a bluish red; the fingers are sausage-like; they cannot be completely flexed; the nails are present; there are a few tubercles on the ulna side of both forearms, and on both elbows; the back of the neck is thickened and red, but the condition is rather that of firm œdema than neoplastic. All other parts of the body are covered with maculæ; these, over the trunk, arms, and upper part of thighs, are of a dirty red colour, rather faint and mottled; on the lower part of the thighs and legs they are bistre-colour, leave no unaffected skin between them or scarcely any, and are not uniform in tint but mottled; there are among

Case

these latter patches many islands of matt white (achromatic) skin of different sizes, up to an inch in diameter. The feet are swollen, bluish red, and slightly distorted. *Special senses.*—Hearing, taste, sight, and smell (when the nose is not stopped) seem normal. *Sensation.*—The achromatic patches on the legs are less sensitive than the bistre patches; in general, sensation to a touch is said to be normal; at no part examined can a prick with a needle be distinguished from a touch with the eye-end; there is therefore pretty complete analgesia everywhere, but not complete anæsthesia anywhere. There is no hyperæsthesia, nor any shooting-pains. *General Health.*—Uniformly good; strength good. *Development.*—As this patient was undoubtedly attacked before the usual date of puberty it is necessary to note that the genital organs are well developed, and that pubic hair is present in usual quantity; his voice, however, although certainly not affected by laryngeal disease as yet, is not virile, nor yet merely a boy's voice. Perhaps it may be described as "virile, but entirely without timbre." The tongue, mouth, and fauces show nothing.

H.R., *ct.*, 28, 11 August, 1890.

THE case of this patient should be read in relation to that of his cousin, P.S., deceased, which accordingly is placed first. The details are given after an extensive inquiry on the spot, made among the near relatives of both men.

The case of P.S.—L.S. immigrated from the Duchy of Nassau in 1855, bringing with him three children, of whom P. was the youngest, and aged about 3 years. The family travelled to Shoalhaven, and lived there until 1871. They removed to the Richmond River district, and ever since have lived in the neighbourhood of Jiggi Creek. P. was then about 19. He became a timber getter; and he continued to live in the same neighbourhood and to work in the surrounding district until prevented by increase of the illness which caused his death. His absences from the district were by way of holiday only; they lasted only a few weeks; and he did not travel out of New South Wales. About the age of 23 he was rafting timber, when he scratched his leg under the water in which he was wading at the time. This injury ulcerated, and healed, and broke out again several times. He showed it to a druggist, who suspected disease of the subjacent tibia; but no bone exfoliated. This ulcer having once more healed, he married at the age of 24. A few weeks afterwards it opened, and I suspect that he was never again well from that time; but all that seems certain is that about five or six years after marriage (that is, about 1881–2) he became too ill to work any longer. I found it impossible to get any reasonable account of the progress of his illness during the first five or six years which followed the injury mentioned above; but the sequence of symptoms is given by his younger brother, who lived with him during the last five years of his life, as follows:—First, the injury and ulceration mentioned above; next (the interval of time not being guessed at), a red patch on the same leg; then a breaking-out of the skin over the knees and elbows; shortly afterwards, ulceration of the finger-tips and fingers, which lost their nails, and of the toes; the hands and feet became numb; the fingers became outstretched and stiffened; the ears were not affected, although there was a small ulcer at one time behind the lobe of one of them. About three years before death his sight began to fail, and was gradually lost; and he died, aged 35, in March, 1887, or, as it seems, twelve or thirteen years from the receipt of injury to the leg. An authentic account of his state at the end of 1886 is contained in a report by the Government Medical Officer for the Lismore district, under date December 21, 1886. He says:—"Loss of sight complete; both eyes covered with a thick white film. Nasal bones apparently decayed, as the bridge of the nose had nearly disappeared. Voice husky and harsh, showing extensive mischief in the larynx. Hands swollen considerably; covered with bluish, glossy skin; all the nails disappeared, the colour about the roots darkish brown, some of them discharging a very offensive matter, others apparently dried up, the fingers being all outstretched without possibility of closing the hands. The toes present a similar appearance, with the exception of one, which is covered with dried-up nail. Below the right knee is an open sore, with a very offensive discharge. \* \* \* He informs me \* \* \* that about 1882–3 he went to Sydney and entered a hospital, whence he was transferred after a few days to one of the asylums for the infirm and destitute poor; but after a week his relations were communicated with by the authorities, ordering him to be removed, the reason assigned being that he was a leper." This gentleman did not profess to be well acquainted with leprosy, and, while expressing an opinion that the case was one of that disease, left it doubtful whether the illness might not be tertiary syphilis, which he had named it three or four days before.

I discovered nothing which tended to distinguish this man's course of life from that usual among other persons of similar position and occupation; but, on the other hand, a good deal which showed that as to association, diet, labour, exposure to weather, and the like, it was the same as that common to all who live and work in the bush. The country, both around Shoalhaven and around Lismore, is well watered, and broken by hills and ranges between which fertile valleys lie. Shoalhaven is on the sea on the east coast in S. lat. 34° 50', the latter in S. lat. 28° 42'. Malaria is not, and I believe never has been met with in either neighbourhood; and the difference of latitude, which carries with it a considerable difference of temperature, seems to be the main distinction between the two.

Communication between H.R. and P.S. I found it loosely asserted by relatives and friends that H.R. was a cousin of P.S. The following table shows what the connection was, and that there is consanguinity only between P.S. and the children of H.R. :—

It is difficult to form any useful estimate of the degree in which these two men were associated. But after a rather prolonged inquiry among the relatives and friends of both, I conclude that it was small, and, speaking generally, insignificant. The R. family preceded the S. family in settling on the Richmond River; but from arrival of the latter the several branches of both lived near each other and were

were associated as neighbours and as fellow workman. H.R.'s own statement that he "was not in P.S.'s house six times during the six years they lived near each other," which were the latter years of P.S.'s life, is borne out upon the whole by testimony of several independent witnesses. But he was present after P.S.'s death, and assisted J.D. and J.S. to place the latter in his coffin, even if (as he alleges) he had nothing to do with preparing the body for burial. As for wearing apparel which P.S. may have left behind him, I feel tolerably certain that H.R. had none of it, and that it was safely disposed of by burning or burial. It may be added here that I saw and examined P.S.'s father, mother, brother, aunt, wife, and child (*æt.* 13), as well as other persons less closely associated with him during life, and that none showed any signs of disease.

The following history of H.R. before his admission to hospital is from information furnished by his father, wife, and other relatives or connections who were in the habit of seeing him frequently:—

He has lived all his life in the Richmond River District, and for the last six years at Jiggi. He is a timber-getter, and was therefore often from home for rather long periods, but never out of the district. About September, 1888, a peg in the sole of a new boot injured the plantar surface of the left foot about the root of the great toe; this date is fixed by the same foot having been trodden on at the same time by one of a team of bullocks which he had recently purchased from his father. An ulcer followed this injury; and although it healed up it broke out again from time to time (and is still present). He was not observed to have anything else the matter with him, either constitutionally or locally, until about August, 1889, a change of colour or reddening about his forehead and eyelids being then noticed (thus his father and his wife think that swelling of the hands was the first symptom, and that the reddening, accompanied by swelling around the eyes, followed very soon). He was well able to continue at work, and about the beginning of 1890 he engaged in clearing some swampy land several miles away. He continued at this occupation for three or four months. During these months the symptoms described below began to make appearance, and, as he then saw that he was suffering from a progressive disease of some kind or other, he came to Sydney.

*Present state*.—On admission, H.R., *æt.*, 28; height, 5 feet 9 inches; weight, 10 stone; well-nourished and strong in appearance. Has been married eight years, and has two children; his wife never had any miscarriages. He complains of no feelings of illness. There is a soft, puffy swelling of the upper eyelids and over the cheek bones; the skin is hyperæmic in the same situations; the swelling is quite soft and without any feeling of thickening or hardening; perhaps there is slight anæsthesia, but this remains uncertain. The eyebrows are not prominent; I doubt whether there is any swelling of the skin under them. On causing the light to fall obliquely on the cheeks three circular spots slightly elevated are visible on the right cheek, the highest of which is an inch or so below the malar swelling mentioned above. One spot is three-eighths of an inch in diameter; the other two are smaller; they are not indurated; their surfaces do not look smooth, but inclining to nodular. The ears are unaffected. The upper part of the body presents only one patch of discolouration; this is about 4 inches in diameter, and covers the tip of the right shoulder; it is reddish, and perhaps brownish; it is not uniformly coloured; it is distinctly anæsthetic; the difference between a touch with the head and a prick with the point of a pin upon it could not be perceived, although that the skin was touched seemed to be felt. The hands (of which the backs are covered with warts of moderate size, and flat at the top), are uniformly swollen and reddened; this swelling is due to hyperæmia of the skin, and is quite noticeable; there is a little fine desquamation of the cuticle here and there; there is no distortion, but as much stiffness as may be supposed due to the mechanical impediment of the swelling; sensation is said to be perfect, but on attempting to pick up a small object it appeared to me that there was—(firstly) some loss of co-ordinating power which was not confined to the fingers, but extended to the right arm, and (secondly) that sensation in the fingers was impaired. As for the lower part of the body—on both knee-caps are scars. On the right knee-cap the scar is large, and seems due to a laceration, received, as he says, by falling over a box. On the other there may be a scar; he says it was burnt, and he sets both these injuries at about a year ago. But the appearance now seen is not exactly or not alone that which would be left by such injuries. On the left leg are three circular brownish spots, which are anæsthetic, and the skin over them is very thin; he says there have not been sores there, but the appearance is rather that of the brown cicatrix over a healed ulcer than of a patch of anæsthetic skin or leprous macula. The feet are swollen and injected like the hands, but not quite so much. At the root of the big toe of the left foot on the sole is a small circular ulcer, covered with scab. On the heel of the right foot is a large and recent chafe, from which the skin is entirely removed; he says he got this a week ago while ploughing in old and ill-fitting boots, and that he felt it at the time of injury. There is no distortion of the feet.

*Clinical note*; 25 March, 1891.

*Scalp free*. The mask shows a rather deep brownish-red discolouration, which fades off at the edges a little short of the hair, and which is not raised above the general surface; but there is a general œdema, which in consistency is between the harder and softer sorts; the chin is exempt from these changes, which are more marked on the right side; but just above a cicatrix on the right side of the chin of an old incised wound, on the chin, is a growth which may be a leprous neoplasm; there is considerable swelling of the superciliary ridge, and within the orbits; the nose is broadened and flattened, and the upper lip is slightly swollen; on the swollen parts are a few, rather indistinct, hard tubercles, but over the right malar bone is one larger than the rest associated with several quite small ones around it; the back of the neck is reddened and thickened, but there is no tubercle there. The tongue is normal; the soft palate and fauces are dusky-red and glazed. The upper part of the body in general is indistinctly mottled, without any describable change of colour; over the right shoulder is an irregular,

irregular, ill-defined, patch of dirty-red colour; it is slightly mottled; it does not reach the scapula behind, nor extend down the arm; at the tip of the clavicle is a reddened, roughened, and raised patch, about the size of a florin which may be a commencing tubercle. The fingers and hands show a moderate œdema, which is not of the soft variety, but yet is not as firm as the hard in other cases; this swelling is uniform over hands and fingers, but stops at the wrists; joints and bones are unaffected, and can be flexed with no more difficulty than seems due to their swollen condition. The feet are a little swollen, but not at all distorted. There is one rather small brown macula on the left buttock, just behind and above the trochanter. *Hair*: normal on scalp; fallen from outer end of eyebrows; from eyelids, but most from the lower ones; has not fallen from beard or moustache, although the reddening extends under the latter, under the whiskers, and a little way on the right side under the beard below angle of mouth; remains on pubes and under armpits. *Special senses*: There is nothing to note. *Sensation*: This is the same for the shoulder macula, for the face-tubercles, and for apparently normal skin about the shoulders,—namely, he could not distinguish between the head and the point of a needle, although the latter drew blood. *General health*: Good; denies all prodromal symptoms (or occasional feelings of illness at present); thinks that his nose scarcely ever bled in his life.

A.G. *et.* 14; August 20, 1890.

*History*.—Was born in Sydney, and always lived in one or other suburb, except for a short visit to Melbourne. His father was a man of some little property; he drank to excess; ten years ago (when the patient was 4 years old) he became insane in consequence, and is still in confinement; the circumstances of the family were as a rule fairly good, but have been poorer during the last few years. They habitually bought vegetables from Chinese traders (in common with nearly every other family in Sydney), but none of them has had any other communication with Asiatics than this customary dealing. The patient attended school from the usual age. He has always slept with his mother, because he was afraid in the dark; and she (chiefly) has dressed his sores. He was fond of fishing, and of fish.

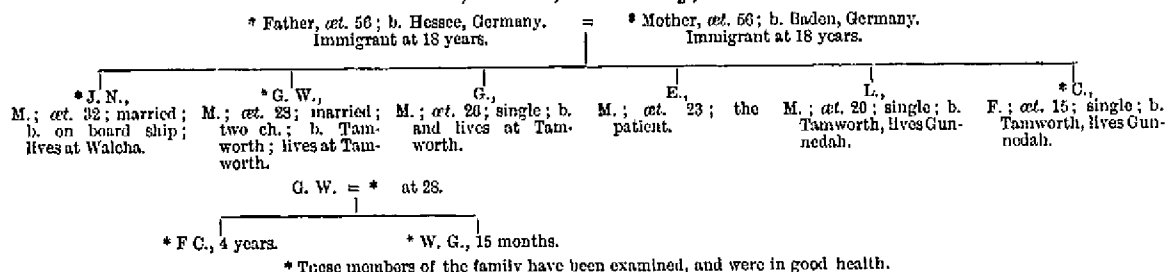

*History of illness furnished by his mother*.—At 10 years of age went with his family to Melbourne, where he stayed seven months; while there he had a cough, attended with a good deal of expectoration, and he wasted; on returning to Sydney he thoroughly recovered; at about 12 years he had some water-blisters on the fingers of the left hand, which broke and left small ulcers; he lost two nails; the attack lasted two months, and then the ulcers quite healed; soon (or immediately) after this contraction of the fore and middle fingers was noticed, and a little later some wasting of the fore-arm; he attended at a general hospital for a few weeks; after this only some cracks occasionally appeared about the fingers; so far no other parts of the body were affected; at about thirteen years he one day drew attention to his left heel, because he thought there was something the matter with it; it was seen that there was a considerable collection of matter under the hard skin, and when it was let out it smelt very offensive. The fingers of the left hand contracted more and more; next a macula was observed on the left buttock, then on the right buttock, and later still on the left arm and fore-arm; about three months ago an ulcer appeared on the left palm; it was poulticed and it healed up; a few days later he swept the floor; the next morning he pointed out some blisters on the palm of the left hand where the broom handle had rested; poultices were again applied; the blisters spread until nearly the whole of the skin of the palm, fingers, and thumb was detached; it was removed, there was no attempt at healing, and that was the beginning of ulcers mentioned below; he attended at the general hospital for a time, but as he did not improve; he applied to the Government Medical Officer for Sydney for admission to the Coast Hospital, and he was by him forwarded for survey as probably having leprosy; during the progress of the illnesses described there was alteration of the general health whenever the blisters or cracks appeared; there was then irritability, loss of appetite, and constipation; feverishness was not noticed. *Prodromal symptoms* were either absent or unobserved (unless the cough, &c., was a prodromal phase). *Present state*.—He is an intelligent boy, small for his age, and without any indication of approaching puberty; he is still afraid in the dark; temperament lymphatic, with reddish hair (resembling his paternal grandmother in this respect, and in features); the upper eyelids are slightly full or swollen; he has had ophthalmia; the swelling is apparently not œdematous; there is a circular, red, and desquamating patch, about the size of a shilling, over the right orbit; not anæsthetic; perhaps the lobes of the ears are a little thickened; but these organs are ill-shaped and ill-placed, and may be normal; the left shoulder-tip and arm on its outer side show a continuous discoloured patch, not raised; it runs on to the left fore-arm, nearly the whole of which it covers; its colour is brownish and reddish, not uniform, mottled; the margins are rather strongly marked and serpentine; the left hand has all the fingers contracted, stiffened, and wasted; the index finger has lost its nail; the fingers cannot be extended; the thumb is wasted and contracted; off all these fingers, the thumb, the palm, and a part of the dorsum, the skin is gone, and there is a shallow ulceration which varies in depth in different parts; there is no pain at all, and he says that it would not hurt him however it might be handled; on the nates are two tolerably symmetrical maculæ, of a rather deeper shade than that on the arm, and having strongly marked (or well defined) serpentine edges; the left leg has numerous smaller maculæ, rather resembling in colour that on the shoulder than those on the nates;

nates; all other parts of the body are unaffected. *Sensation*.—The maculae on left shoulder and arm are distinctly anaesthetic, and so is the apparently healthy skin of this limb; the maculae on the nates and legs are anaesthetic, but less markedly than the first-named part; sensation to touch remains, but he cannot at the parts named distinguish between a prick and a touch with a pin. *Special senses*.—Unaffected.

*March 25, 1891*.—Has grown 3 or 4 inches, is well nourished, strong, cheerful, and apparently in good health; the patch over the right eye has gone; his face shows nothing except the slight swelling (probably not leprotic) of the upper eyelids; the ears are as before; the macula over the left shoulder has so nearly disappeared as to pass unnoticed except on careful examination; but halfway down the upper arm it is still distinct although much faded, as a rather red, not brown, roughened or slightly desquamating patch, which extends down the posterior and outer surface of the fore-arm as far as the hand; there is no longer any ulceration of the hand, except where it was recently abraded by a fishing-rod; the fingers, flexed on the palm, can be extended with assistance only about half-way; but by voluntary effort the first phalanges alone can be extended and nearly to right-angles with the dorsum, the remaining two rows lying quiescent and paralysed; the macula on the left buttock is now quite gone; that on the right remains and extends intermittently down the back of the thigh and (by some separate small maculae) a little towards the front; the right foot shows a little general swelling, and there is over the right Achilles tendon a small abscess, ascribed to an ill-fitting boot. *General health*.—Good; has pins and needles in his feet rather often, but not while walking about, and thinks he sometimes has them in his hands too; some pubic hair is appearing; his voice is unaltered.

*E. U., act. 23; 5 February, 1891.*

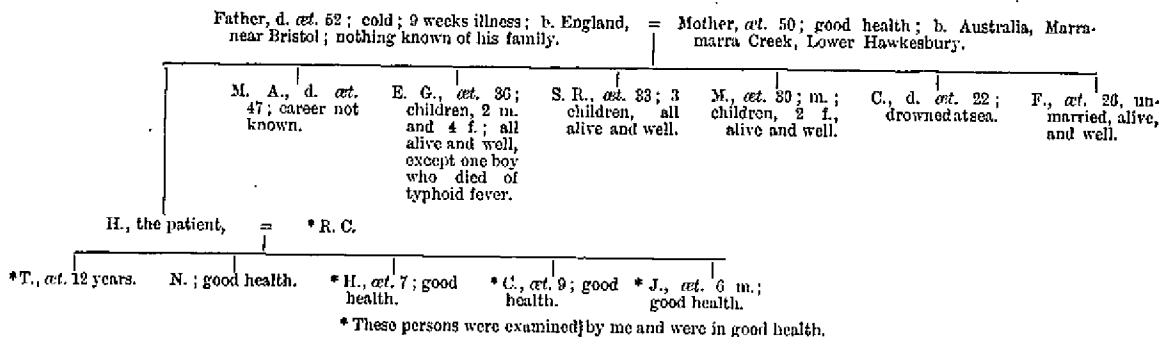

*History*.—Unmarried. His parents first lived at Singleton; they removed to a place 12 miles from Gunnedah where he was born; at 11 years of age he removed with the family to the town of Gunnedah; he became a labourer or bush-hand, and his chief occupations were fencing, shearing, and droving; he was always employed at different stations in the Gunnedah district; but once travelled sheep to Queensland, whence he returned to Gunnedah by way of Brisbane and Sydney; for four and a half years past has been employed on Wondooba run, and he left for Gunnedah only after his illness had become pronounced. Careful inquiry failed to elicit any circumstances which would distinguish his course of life from that common to others who live in the bush; he says he never had special communication with Chinese or other Asiatics; he was not fond of fish, had rarely opportunity of eating fresh fish, and has but seldom eaten canned or salted fish. *History of illness*.—(From his own account, corrected by that furnished by his adult relations at Gunnedah.) Seven years ago had a whitlow and lost unequal phalanx of right index-finger; the nail is present and normal, and the joint has without doubt been injured as alleged. He has had no other illnesses. In August, 1889, he took a stallion into Gunnedah to the show then held there; during his stay he had a small crop of blisters on the back of both hands, which "came of themselves," were not painful, lasted about a week, dried up without breaking, were unattended with ulceration and have left no scars. At the same time the backs of the hands were puffy and the puffiness remained after the blisters had healed; at the same time (or at the latest a few weeks afterwards according to his relatives), there was a slight puffiness and redness about his eyes. He himself thought that these swellings, after their first appearance, went away; but his relatives seemed certain that it remained, and stationary, until about the end of October, 1890. There was then some increase of the redness and swelling, and that caused him to consult a neighbouring doctor; syphilis was (and is) denied; however he was treated with mercurials, and within a few weeks there was improvement. A little later still there was an exacerbation, the doctor's suspicions, entertained at first, were increased; and he was recommended to enter a hospital in Sydney. He was admitted about December 25, and on January 16 he was transferred to the leproserie. He denied all feelings of illness either before the appearance of the blisters or subsequently. *Present state*: Except for the alterations of the surface, he has the appearance of a person in health; well nourished, well proportioned, and muscularly strong, and he denies all feelings of indisposition. As to his general health there is no remark to make. His physiognomy is already considerably altered, but not yet (apparently) so as to hide his natural expression altogether. This alteration is due to a general swelling, of a purplish-red colour, of the whole mask; on the forehead it ceases about half-an-inch below the hair, and has there an irregular margin, abruptly limited, and raised two or three millimetres above the natural surface which has a normal appearance. His nose is thickened and broadened; his lips thickened. Everywhere may be distinguished, by oblique illumination, tubercles beginning to rise above the surrounding surface; the ears are of a bluish cast, rather bluish-white than bluish-red, slightly thickened in the lower half, and slightly distorted (but probably they were never well-shaped). These appearances cease about the margin of the lower jaw. His hands, and his wrists about as high as over the articulation, are uniformly swollen, and are reddish; the fingers have a sausage-like appearance; there are no traces of the eruption of two years ago. The trunk and limbs (except the feet) show very numerous pale-brown maculae; these are thicker on the thighs than on the arms and trunk, and thicker still on the legs; in point of size they are generally speaking larger where they are fewer; on the body are many which are three or four centimetres across, while on the legs there are perhaps none broader than one centimetre or one and a half; two only, being large maculae near the left shoulder, have acquired a white centre within which the skin is matt, and quite different to the normal white skin between the maculae; the brown shade of colour is that of a sun-burned arm, but not quite so deep, and more transparent. The feet and ankles showed on January 16 a swelling not distinguishable from ordinary oedema;

it was, however, not quite symmetrical, there being a distinctly larger swelling over the left outer malleolus than elsewhere. This swelling in general was quite different, both in distribution and in consistency, to that seen on the hands; and now (three weeks later) it has nearly disappeared. During the three weeks of detention in the general hospital his temperature, observed twice daily, remained normal (with irregular fluctuations not exceeding half a degree), and his urine was then normal in quantity, acid, without albumen, and its specific gravity 1020. *Sensation*: He believes that it remains natural; on examination it is found to be greatly dulled everywhere, and nearly gone at points on the face; but merely dulled elsewhere, not much, and so that it is not possible to distinguish greater sensibility of normal skin on the trunk between the macula, than on the maculae themselves. Except the forehead, it should be noted that on January 16 the greater swelling of the left ankle seemed to have become more thoroughly dulled than any other spot examined.

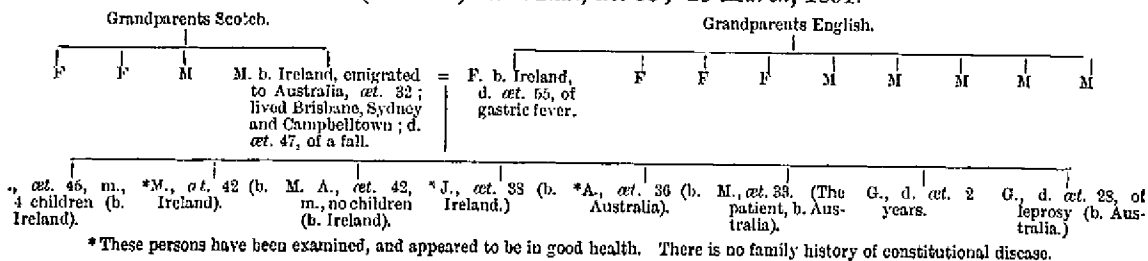

H. S., *æt.* 41; 5 February, 1891.

A STATUTORY certificate was given by me on January 23.

*History*.—H. S., *æt.* 41, was born in the Lower Hawkesbury district, on Marramarra Creek, and he lived there for a few years; the family then removed to Windsor, not many miles away, and on the Hawkesbury, and resided there for a few years; they returned to Marramarra Creek, and after an interval went again to Windsor. After this, H. left Windsor at the age of 18 to go to sea; he spent three years in coasting-vessels, and never went out of New South Wales; his residence during these years was in Sydney. He returned to the Lower Hawkesbury, where he engaged in boat-building, oyster-fishing, and running a ferry-boat. About 1877 he married. About 1886–87 he went to Sydney, and he resided there until he died on February 4, 1891. Much fresh fish and oysters was eaten from time to time. *History of Illness*.—Has had no serious illnesses. In 1877 had successive crops of boils; the crops lasted about a week each, and the boils healed in a usual way; they were believed to be common boils; they appeared on the back of the neck, on the upper part of the trunk, and elsewhere, not selecting any particular region. About this time, but after the eruption of boils had ceased, he was engaged for some days in getting out cargo from a vessel partly submerged in Darling Harbour; he was much in the water for several days. A month after this his wrists began to swell, and his nose became, and continued to be, obstructed; later, swellings appeared in different features—eyes, ears, nose, &c. But it was eighteen months before his physiognomy began to alter; and after so altering he never recovered his natural appearance. During that time he had repeated attacks of feverishness, and severe sharp pains in the legs; he was laid up by them for a month at a time, and after each attack had an interval of apparent good health. His sight remained unaffected until six or seven years later; then the right eye was invaded, and later still the left was attacked. *Present State*.—He is very weak, and very much emaciated. For a few months past he has suffered repeatedly from diarrhoea; he has also pains corresponding to the "lightning-pain" of ataxy in his legs and fore-arms. The ears are much distorted, but not hypertrophied; the soft parts of the nose are destroyed, but the bones are not sunken; in consequence of this, and the general wasting, the upper jaw appears prominent, and its bony outlines are easily followed; the skin is drawn tight over the whole skull; it is white and smooth, and at a short distance looks as though it might shine in a favourable light; but on close inspection it is seen to be traversed in all directions by exceedingly fine white lines, which seem to be due to linear atrophy. The body is emaciated in an extreme degree; the skin is wrinkled and roughened; it shows many large, ill-defined, patches of a pale reddish-brown colour; elsewhere it is of something like clay-colour. The fingers and toes are very much distorted and useless; the joints are displaced in several different directions; they show large, irregular, superficial ulcerations; I did not examine them closely enough to say whether the bones had been absorbed, or were wasting, but apparently neither had happened. As to sensation—he was under the impression that it remained normal; but after an imperfect examination I ascertained that it seemed to be uniformly dulled, and was not altogether lost anywhere. However, the ulcerations mentioned above were said to be painless. The right eye was almost useless, the left was affected to a less extent; upon the whole he could see tolerably well. His memory was quite clear, and he talked well, and without apparent fatigue.

G.R. (deceased) and M.R., *æt.* 33; 25 March, 1891.

G.R.,

G.R., deceased. The following account is taken from information furnished by his sister and his brother separately, and from the case-books of the physician whom he consulted on dates mentioned below. Was born at Campbelltown, near Sydney, in 1861. He lived there until about 1868, when he removed to Sydney. About 1870 he went to Adelaide, S.A.; in 1880 he returned to Sydney, and he died there in 1889. He was always weakly. At about 6 or 7 years of age he suffered from a chronic submaxillary or cervical swelling; this lasted two years, more or less, and receded without suppurating; at 10 or 11 years he began to suffer repeated attacks of nose bleed, and had brown patches on his body, which remained; at about 13 his face swelled; this swelling disappeared, but not long afterwards returned and remained; at about the same age his voice altered as from disease, but intermittently, and from about 24 he could speak only in whispers; he lost his eyebrows, the hair of the scalp used to fall out, and became thin. He was 5 ft. 11 in. in height, and "manly"; his voice altered in the usual way about 15, and was a man's voice subsequently, but he never got either beard or moustache. The physician referred to diagnosed this case in 1881, and furnished the following notes, with which the above account agrees nearly:—"December 16, 1881, G.R., *æt.* 19.—Said he had been ill twelve months, with breakings out on face, wrists, and legs, which were better and worse from time to time. Tubercles on various parts of skin; reddish-brown colour; parts of the face scaly; some anaesthesia; features enlarged, ears and nose notably so; no syphilis. Leprosy—February 2, 1882.—Said the remedies had cured sores. Seemed slightly better, but there was not much change. A tuberculous condition of mouth and larynx; hoarse. December 22, 1882.—During this interval the throat had become seriously diseased; he spits large quantities of yellow matter, and occasionally blood. 26 April, 1883.—Voice still very hoarse; does not complain of sore throat; thick scabs on hands wrists, and face, not on trunk; tubercles of mouth and throat not changed." He did not after this date come under the same observation. The beginning of this case cannot (according to the several accounts) have been later than the tenth or eleventh year of age; but, apparently, development was not markedly interfered with, and it would seem that the usual puberal changes took place.

*March*, 1891.—M.R., *æt.* 33, was the chief and almost the only attendant upon the above during his illness. About eight years ago she had a sore heel, attributed to a tight boot, which lasted about three weeks and healed perfectly. There was no other sign for about a year; then discoloured spots were seen on the legs, and afterwards red spots on the face, which never quite went away; later brownish or reddish-brown spots and patches appeared over the body; she lost her eyebrows four years ago; two years ago her voice was affected, but it recovered; about a year afterwards it was again altered, and has remained whispering and stridulous ever since. A written note by the physician already referred to runs as follows:—"March 22, 1887.—Disease began about three years ago; whole body tuberculous; anaesthesia."

*Present state.*—Prodromal symptoms, and illness during the eruptive stage, are both denied. The face is deformed by moderate general swelling, and not large tubercles; the brows are not very prominent, but the eyebrows are wanting; many tubercles have ulcerated and gone, and have left behind them more or less circular, shallow, excavations, over which the skin is white, and in some cases a little drawn or puckered; the soft parts of the nose are nearly gone, but the bones seem intact; the ulcerated edges of the nostrils are indrawn, and this retraction has also involved the upper lip at its junction with the nose, whence the skin is tightly drawn over the upper maxillary bones so as to give a characteristic expression to the face; the tongue is large, red, fissured both longitudinally and transversely, and has two or three mucuous plaques like those of syphilis, towards the tip on the left side, which do not amount to neoplasmata. The ears are much deformed by tubercles of moderate size. The general tint of face is dull red, inclining to yellow, and there is some desquamation. The hands are enlarged by hard oedema; the fingers can be brought only to right angles with the palm, and not bent upon themselves; no phalanges have disappeared, but all the nails are deformed; there is excessive and fixed extension of one or two fingers, and lateral displacement of one or two unequal phalanges; the skin is roughened, desquamating, reddened and (on palmar surfaces) bluish, fissured everywhere, discharging so as to slightly resemble eczema, at some points slightly ulcerated and offensive. The fore-arms and elbows show numerous tubercles, chiefly on the extensor surfaces. The feet were said to resemble the hands, but to be not quite so much damaged; she walked without apparent difficulty. On the upper part of the chest are some large patches of a rather deep reddish-brown tint, which were said to extend over all the body; among them are small islets of matt-white; symmetrically placed on the lower half of each breast is a small and superficial ulceration in a state resembling a healing burn; these are said to be the only ulcerations, except as above noted. *Special Senses.*—Sight weak (uses spectacles), but there is no appearance of invasion of the eyes; hearing good; taste and smell said to be good. Voice, whispering and stridulous. *Sensation.*—The hands are sometimes painful and irritable; undid upper buttons of dress with right hand without great difficulty, and replaced them; sensibility to touch remains, but there is analgesia, and on the upper part of the chest it was not possible to distinguish by pricking with a pin between the macula and apparently healthy skin between them. *General Health.*—Fairly good; only rises at 1 o'clock; once a week takes a short excursion by steamer or train; every three or four weeks she becomes low-spirited, and has lassitude, diarrhoea, and bleeding from the nose; menstruates regularly and normally, and at the times just mentioned; appetite very good, but prefers fruit, vegetables, and milk. Both this patient and her brother are said not to have much cared about fish; may be said to have eaten it, but rather less than ordinary.

1891.

NEW SOUTH WALES.

## REPORT

TO THE

GOVERNMENTS OF NEW SOUTH WALES, SOUTH  
AUSTRALIA AND NEW ZEALAND,

ON THE

KOCH METHOD OF TREATING TUBERCULOSIS;

BY

T. P. ANDERSON STUART, M.D.,

PROFESSOR OF PHYSIOLOGY AND DEAN OF THE FACULTY OF MEDICINE, UNIVERSITY OF SYDNEY.

---

---

Presented to both Houses of Parliament.

---

---

SYDNEY: GEORGE STEPHEN CHAPMAN, ACTING GOVERNMENT PRINTER.

1891.

## TABLE OF CONTENTS.

	PAGE.
1. LETTER TO THE COLONIAL SECRETARY, SYDNEY ... ..	1
2. REPORT ... ..	3
3. APPENDIX A.—TUBERCULOSIS AND THE TUBERCLE BACILLUS:—	
CHAPTER I.—INTRODUCTION ... ..	11
II.—TUBERCULOSIS AS A DISEASE ... ..	12
III.—THE TUBERCLE BACILLUS—	
1. Its distribution ... ..	14
2. Its preparation and detection ... ..	14
3. Its characters ... ..	15
4. Its cultivation ... ..	16
IV.—THE TRANSMISSION OF TUBERCULOSIS—	
1. Experimentally by inoculation ... ..	18
2. From parent to child before birth ... ..	19
3. From one individual to another individual after birth	20
4. From one part to another part of the same individual	22
4. APPENDIX B.—A SPECIAL ACCOUNT OF DR. KOCH'S METHOD:—	
CHAPTER I.—DESCRIPTION OF THE REMEDY—PREPARATION ... ..	23
II.—SUPPOSED MODE OF ACTION—(KOCH) ... ..	23
III.—MODE OF ADMINISTRATION ... ..	23
IV.—EXAMINATION OF DR. KOCH'S STATEMENTS: AS TO—	
1. Curative action of the remedy in various forms of tuberculosis ... ..	24
2. Diagnostic value of the remedy... ..	26
3. Proportion between the general reaction and the amount of tubercular tissue ... ..	27
4. Local reaction of tubercular tissues ... ..	27
5. Danger attending the use of the remedy ... ..	27
6. Effects of the remedy on tuberculous tissues ... ..	28
7. Effects of the remedy on the bacillus ... ..	30
8. Reasons for keeping the remedy secret... ..	30
5. APPENDIX C.—VARIOUS REPORTS ON THE TREATMENT:—	
CHAPTER I.—FROM GERMANY: DURING THE—	
1. Period of Enthusiasm ... ..	31
2. Period of Doubt ... ..	31
3. Period of Disbelief ... ..	32
II.—FROM AUSTRIA ... ..	33
III.—FROM FRANCE ... ..	33
IV.—FROM UNITED KINGDOM ... ..	34
V.—FROM ITALY ... ..	35
VI.—FROM NORWAY, DENMARK AND BELGIUM ... ..	35
6. APPENDIX D.—EFFECTS OF KOCH'S REMEDY IN SPECIAL CASES:—	
1. In healthy individuals ... ..	36
2. In non-tubercular diseases ... ..	36
3. In lupus ... ..	37
4. In phthisis of the lungs... ..	39

	PAGE.
7. APPENDIX E.—GENERAL STATISTICS BEARING UPON THE EFFECTS OF KOCH'S REMEDY DURING THE MONTHS OF OCTOBER, NOVEMBER, AND DECEMBER, 1890, AND THE GREATER PART OF JANUARY, 1891 ... ..	42
8. APPENDIX F.—HISTORY OF THE KOCH TREATMENT:—	
CHAPTER I.—A CONNECTED HISTORICAL ACCOUNT... ..	49
II.—REPORTS OF SOME OF THE HONOURS CONFERRED ON DR. KOCH AND HIS COLLABORATORS ... ..	52
III.—SOME OF THE DEPUTATIONS SENT TO BERLIN TO STUDY THE METHOD ... ..	52
IV.—SOME OF THE HOSPITALS WHERE THE TREATMENT WAS CARRIED OUT AFTER THE FIRST EXPERIMENTS AT THE CHARITÉ ... ..	53
V.—NOTES OF REPORTS BEARING ON THE REGULATION OF THE PRODUCTION AND DISTRIBUTION OF THE LYMPH ... ..	54
VI.—SPECIAL NOTES ABSTRACTED FROM VARIOUS NEWSPAPERS DURING THE MONTHS OF OCTOBER, NOVEMBER AND DECEMBER, 1890, AND JANUARY, 1891 ... ..	55
VII.—DEATHS CONNECTED WITH DR. KOCH'S TREATMENT AND RECORDED IN THE NEWSPAPERS... ..	57
VIII.—DOCUMENTS—	
1. First communication by Dr. Koch ... ..	58
2. Letters from Berlin at the time when the treatment was begun ... ..	59
3. Second communication by Dr. Koch ... ..	61
4. Letter from Berlin exposing the method followed in private clinics; another letter showing the anomalous state of things in Berlin ... ..	65
5. Speech of Dr. Von Gossler, Minister of Public Instruction, at a sitting of the Prussian Diet ... ..	65
6. Third communication by Dr. Koch ... ..	67
7. Virchow's remarks, &c. (See also Document No. 11) ... ..	69
8. Mr. Jonathan Hutchinson's Lecture on Lupus—concluding remarks ... ..	73
9. Pasteur's telegram to Koch; Koch's answer; telegram to Pasteur from the Oldenburg Institute ... ..	73
10. Dr. Koch and the German Government; Institute of Bacteriology ... ..	74
11. Letter from Virchow. (See also Document No. 7) ... ..	75
12. Translation of the "Directions for use" sent out wrapped around each bottle of the lymph by Dr. A. Libbertz ... ..	75

### PLATES.

- I. Fig. 1. Acute pulmonary tuberculosis × 195 diameters.  
 Fig. 2. Chronic tubercle of the lung × 195 diameters.
- II. Fig. 3. Acute tuberculosis of the lung × 1,000 diameters.  
 Fig. 4. Pure cultivation of the tubercle bacilli × 1,000 diameters.
- III. Fig. 5. Phthisical sputum before Koch's treatment.  
 Fig. 6. Phthisical sputum as it was at one time thought to be only after Koch's treatment.

## LETTER TO THE COLONIAL SECRETARY.

University of Sydney, April 6th, 1891.

The Honorable Sir Henry Parkes, G.C.M.G., &c., &c., &c.,  
Colonial Secretary,  
Sydney,

Sir,

I have the honour to report that in compliance with your cablegram of the 22nd November, 1890, informing me as follows: "You have been appointed to proceed to Berlin and make inquiries and report on Dr. Koch's method of curing consumption, describing the method of procedure, and sending out a supply of vaccine if practicable, if not, obtaining mode of preparation," I proceeded to Berlin in December, during what is called in the accompanying Report the "Period of Enthusiasm," and again in January during the "Period of Disbelief."

With your concurrence, the Government of South Australia requested me to act as its Representative also in the matter, and I at once undertook the commission.

The Government of New Zealand, through its Agent-General in London, Sir F. Dillon-Bell, K.C.M.G., made the like request, and after consultation with our own Agent-General, Sir Saul Samuel, K.C.M.G., I complied with that request.

The precise mode of preparation of the Koch lymph has not been disclosed even yet, but I arranged for a weekly supply to be sent to you, and to the Colonial Secretaries of South Australia and New Zealand.

The results of my observations in Berlin, London, and Edinburgh, and of my somewhat extensive special study of the recent literature of the subject are contained in the Appendices to the Report.

During the few weeks that have intervened between the end of January and the present time some important contributions to the literature of the subject have been made, the results of which I should have liked to incorporate, but I have chosen the last days of my stay in Europe (I left London on February 5th) as the terminal limit of the time to which my Report has reference, and during which I was able to conduct my investigations personally.

As far as time would permit I have endeavoured to make the Report with its Appendices complete in itself, for without some brief and more or less special account of the more purely scientific aspects of the subject the main practical question could not readily be understood or appreciated.

I have to acknowledge the advice and assistance which has been freely rendered me. In this connection I desire to specially mention the names of Sir Joseph Lister, Bart., Dr. Sheridan Delépine, Dr. G. A. Heron, Professor Crookshank, and Dr. Watson Cheyne, of London; of Professor Dr. Litten and Dr. Wolf Becher, of Berlin; and of Dr. Edington, of Edinburgh. To Professor Wilson, Dr. Gustave Lennhoff, and Dr. A. E. Mills, I am indebted for the trouble they have taken in looking over the proof sheets.

Although, according to the Report and its detailed Appendices, we cannot at present regard the lymph as a successful curative agent, yet it is the first substance that has directly and specifically affected tubercular matter within the living body. Further, it is the first example of a new method of treatment which opens up a wide field of medical activity, and by which eventually, not only tuberculosis, but also such diseases as diphtheria, tetanus and others, may possibly be prevented, cured, or even annihilated. Thus I regard the Koch lymph as a great discovery or invention, and that not so much from what it actually accomplishes, as from what it promises for the future.

It is therefore to be hoped that instead of being discouraged by the results so far obtained, all authorities will do their best to encourage further researches in this direction.

I have the honor to be,

Sir,

Your obedient servant,

T. P. ANDERSON STUART, M.D.

## REPORT.

BETWEEN the years 1850 and 1882 certain infective diseases were <sup>Introductory.</sup> shown to be caused by minute organisms in the blood and tissues. These organisms belong to the vegetable kingdom, and rank among the lowest forms of fungi and smallest of living beings. Their scientific names are generally derived from their shape—those that are in the form of slender rods are called bacilli; when the rods are shorter and thicker, they are called bacteria. Often the whole group is included under the latter term, and indeed that branch or sub-department of science which deals with those microscopical beings is termed “Bacteriology.” (App. A, i.)

In 1865 tuberculosis, including consumption or phthisis, was <sup>Tuberculosis is infective.</sup> definitely proved to be an infective disease—*i.e.*, communicable by inoculation or otherwise. (App. A, iv.)

In 1882 Dr. Robert Koch announced that tuberculosis was caused <sup>The tubercle bacillus.</sup> by a parasite, to which he gave the name of bacillus tuberculosis, and this organism is now all but universally admitted to be the cause of tuberculosis in each of its different manifestations. The evidence on which his discovery rests is, briefly—

1. He found the bacillus in all cases of the disease properly examined for it.
2. He cultivated it on artificial soils—*i.e.*, various nutrient media—and was able to transplant it again and again, and so to obtain an uncontaminated or “pure culture” of it.
3. Such a “pure culture” introduced into animals produced tuberculosis.
4. In these animals in which tuberculosis was artificially produced the same bacilli were again found in the diseased parts, and
5. The number of the bacilli in these cases was in excess of the number inoculated, so that the bacillus had actually multiplied in the body of the inoculated animal. (App. A, iii.)

Every kind of tuberculous material, since it contains the <sup>The bacillus may be found in all kinds of tuberculous material.</sup> infective particles or bacilli, may communicate the disease—*e.g.*, sputum, saliva, milk, urine, expired air, and flesh from tubercular subjects as well as lupus tissue, pus of cold abscesses, strumous glands, &c.—and in every case the results are alike, differing only in anatomical features according to the portal by which the parasite enters the body. (App. A, iv.)

The tubercle bacillus may be introduced into the body in the <sup>It may enter the body in various ways.</sup> following ways:—

1. By injecting it under the skin or into the blood. (App. A, iv, 1.)
2. It may be diffused through the air, and enter the body by inhalation. (App. A, iv, 3.)
3. It may be present in food such as the flesh of tuberculous animals, or the milk from tuberculous cows, also in saliva; even water may be the vehicle. (App. A, iv, 3.)

4. It has been suggested that it may pass through the uninjured skin, since there is some evidence to show that healthy persons have contracted phthisis by wearing the underwear of phthisical persons. But since it is definitely proved that the bacillus may enter the body through a wound or an abrasion of the skin, it may perhaps be that in the former case there was some undiscovered breach of continuity of the skin.

N.B.—There is no trustworthy evidence to show that the bacilli have ever been introduced through vaccine lymph during vaccination. (App. A, iv, 3.)

5. It is still an open question whether the bacillus may pass from a tuberculous mother to her unborn child, or whether the supposed hereditary transmission of tuberculosis consists merely in that of a special predisposition to the disease. It is even maintained by some that there is neither the one nor the other, but that the fact of more than one member of a family being affected is due to their being placed in the same surroundings and subjected to the same infective influences. The balance of competent opinion is probably in favour both of a possible direct communication of the contagium from the mother, and of the hereditary transmission of a predisposition. (App. A, iv, 2.)

Lupus certainly is tuberculous.

In lupus (*vulgaris*)—a disease chiefly affecting skin—a bacillus has been demonstrated, and it has been definitely proved that this bacillus is identical with the bacillus tuberculosis. Lupus vulgaris is thus consumption or tuberculosis of the skin. (App. A, iv, 1.)

Leprosy possibly is related.

In leprosy also a bacillus is present, which in its form and its colour reactions is hardly to be distinguished from the tubercle bacillus, but what are its real relations to the latter is not yet determined. (App. A, iii, 3.)

The bacilli can grow outside the animal body.

There can be no doubt as to the correctness of Koch's statements when he said that the tubercle bacilli find their best soil within the animal economy, but his view, "that the tubercle bacilli in their process of development are solely confined to the animal organism—they are, therefore, not accidental, but true parasites, and can hail only from the animal organism," is now known to be erroneous, for the bacilli have been cultivated on slices of potato, and at much lower temperatures than 30° C. (or 86° F.) which was the lowest temperature at which Koch could get his cultures to grow. (App. A, iii, 4.)

The search for a parasiticide.

The announcement of the discovery of the tubercle bacillus by Koch gave a great impulse to the study of these forms of life, and many investigators besides Koch himself at once began to seek a means whereby the ravages of the consumption parasite might be hindered or prevented, as has been accomplished in the case of certain other infective diseases, such as anthrax or woolsorter's disease. And it is certain that, had Koch not published his remedy about the time he did, other investigators who had been working very much on the same lines would have forestalled him by publication of their own results. (App. F, viii, 1.) The chief guiding principles in the biological part of these investigations were as follows:—It had long been noticed that when a particular microbe was allowed to grow for a long time on the same soil its growth first slackened and then stopped, but that, transferred to fresh soil, it would again start into vigorous growth. Conversely if a vigorous bacillus was planted on the old long-used soil it would not flourish. Clearly some change had been wrought in the latter soil rendering it partially or wholly effete. For various reasons it became clear that the bacilli during their growth produced substances that contaminated the soil and prevented or interfered with their own further growth

growth. If, then, these substances could be extracted from the bacilli or their surroundings, and introduced in sufficient quantity into the animal economy the hope was that the growth of the bacilli in the body would be checked. Koch extracted these bodies from the pure culture of the tubercle bacilli by means of diluted glycerine, and this extract is the so-called "lymph." What the active substances are that are contained in the Koch lymph is not really known, but they may be obtained from the lymph in the solid state, and constitute no more than a fraction of 1 per cent.—perhaps about  $\frac{1}{1000}$  of the weight of the original lymph. (App. A, iii, 4, and F. viii, 6.)

In Koch's first "further communication," neither the mode of preparation nor the nature of the remedy is given. In his second "further communication" the mode of preparation is not given, but the nature of it is stated, viz., that it is, as has been said, a glycerine extract of the pure parasite. Probably, however, it is made as follows:—The tubercle bacillus is grown in a state of "pure culture" on a suitable medium or soil, and then mixed with much diluted glycerine. The mixture is now filtered through a Chamberland or porcelain filter so as to free it from the actual organisms, and the liquid which comes through the filter is now concentrated. The brown coloured concentrated glycerine extract is the "lymph," and contains whatever substances the dilute glycerine could dissolve out of the culture. (App. F, viii, 6.) Various statements have been made as to the difficulty of preparing the lymph; it is not easy to see where the gigantic difficulty can be. Before Koch published the nature of his remedy, Hüppe and Scholl examined some of the lymph, and, without knowing how Koch produced it, succeeded in producing a liquid with similar properties. (App. C, ii.) This shows that with a well equipped bacteriological laboratory in Sydney, when the mode of preparation has been disclosed, there ought to be no difficulty in producing Koch's remedy for tuberculosis, or any other such remedy that may yet be discovered, as, for instance, for the cure of diphtheria and tetanus, of which there seems to be a possibility. This is all the more important, since it may well be that such organic fluids may not bear transmission to Australia without deterioration; it is yet to be seen how they will behave. Very slight changes in composition might lead to serious results. (App. F, i.)

There is little doubt that, from beginning to end, Koch's hand has been forced in the following manner:—He began his quest for a remedy, as he tells us in his Congress address of date 4th August, 1890, as soon as he had discovered the bacillus, *i.e.*, in 1882. By the summer of 1890 he believed he had succeeded in curing artificially induced tuberculosis in guinea pigs; and this, as is the custom with State officials in Prussia, he communicated to his superior officer, the Minister for Instruction, Dr. von Gossler. Now the meeting of the International Medical Congress was to take place in Berlin in August, and a large number of medical men was expected to be present from all the ends of the earth. (There were, in fact, about 7,000 at the gathering in the Circus Renz.) The Minister knew very well what a sensation it would cause if Koch were to announce at this Congress that he could cure consumption. But Koch was not ready. He had in contemplation thorough and varied experiments on the human subject still to be undertaken before he would come to the publication of his remedy. The Congress, however, could not wait for these, and so he must either be silent or publish incomplete work. The former did not please the Minister, while the latter was repugnant to Koch. The Minister (it is said backed up by higher influence) eventually prevailed upon Koch to say at least something at the Congress, and accordingly, on 4th August, 1890, Koch announced at the first general meeting of the Congress, at the end of his address "On Bacteriological Investigations," that he had found a substance which could render harmless

The lymph probably prepared without much difficulty.

Koch was forced to announce his remedy prematurely.

harmless pathogenic bacteria in the living body without injury to the latter. He said that "guinea pigs, which, as is well known, take tuberculosis extraordinarily easily, when they have been submitted to the actions of the substance, no longer develop tuberculosis when they are inoculated with the tuberculous virus; and that in guinea pigs, which are already in a high degree the subjects of general tuberculosis, the malady can be brought to a complete standstill, without the body of the animal being in any other way injuriously affected by the remedy." Having said this, Koch (as the Reporter learnt from an eye witness) left the meeting in order to avoid being drawn into a discussion. (App. F, i and viii, 1.)

Enthusiasm following the announcement.

The spread of the enthusiasm following this announcement was perhaps one of the most remarkable events in the history of medical science. The teachings of John Hunter were scarcely known across the Channel, in France, for forty years after they were given to the world. For a whole year before his practice of vaccination was adopted Edward Jenner met with the most violent opposition. To get the use of chloroform adopted Sir James Simpson had a bitter struggle that lasted for years. More recently still, Sir Joseph Lister's principles and practice of antiseptic surgery have been accepted only after years of opposition from many of the leaders of the profession. And yet, on the simple word of Koch, proclaimed by the aid of telegraphy and through the medium of the lay press, the whole world rang with glad tidings which went home to every heart, for there is no other disease which blights the hopes of so great a number of human beings. Not only the medical profession but also the public at large, became excited to an extraordinary extent. Practitioners and patients rushed to Berlin, and in that inclement winter much mischief was done. It is therefore to be regretted that Dr. Koch in his seclusion remained unaware, as it must be supposed that he was, of the mischief made in his name, for, as Professor Semmola justly said, later on, a simple word from Koch at that period would have sufficed to check the growing enthusiasm, and to limit it to reasonable proportions. (App. C, v.) The interest taken in the matter by the highest personages in Germany doubtless helped to foster the public interest. The Emperor received Dr. Koch in audience, and frequently received reports of the progress of the researches, as did Dr. von Gossler. The Empress Frederick had an intimate acquaintance with the details of many of the cases treated. Confidence in the results must have been firmly established, for extensive plans were framed by the authorities in connection with the various aspects of the subject. The most distinguished honours flowed in from every quarter upon Koch and his collaborators. Deputations were sent to Berlin from every quarter of the globe to study the subject, and as soon as it could be procured the lymph was carried in every direction, and presently the journals teemed with the reports of its having been employed. (App. F, i, ii, iii.)

Experiments on the human subject.

Koch, on beginning his experiments on man, was obliged, since he was not a hospital physician, to make use of the patients of other medical men. Thus he began in the Royal Charité Hospital, the largest hospital in Berlin, and a large clinical school. Here, as one can well understand, there were too many people about for anything like privacy, and so through the medium of Professor Brieger, Dr. William Levy gave up his private hospital to Koch for his experiments. Koch most likely thought that from such a private establishment nothing would prematurely reach the public—a hope, however, in which he was entirely deceived. Then again it is important to note that in his clinical work Koch largely depended upon observations made in Dr. Levy's hospital, where the phenomena attending the use of the remedy were observed probably with more enthusiasm than judgment. But this was not all; the medical men in whom Koch confided

confided did not keep his confidences, since, while the experiments were still in progress, rumours of what was going on reached outsiders, and very soon notices of it appeared in the newspapers. In the beginning of November the *National Zeitung* actually gave a fairly correct account of the use and effects of the remedy in tuberculous cases. Professor Koch was thus in a manner forced to publish, although no one knew better than he that his work, as to the effects of the remedy on the human subject, was far from complete (App. F, i.) It should also be mentioned that the cases treated in the Levy Hospital were mainly or largely cases of lupus and joint disease, which are just the class of cases in which, so far as they could have progressed in the time, one could reasonably expect an ultimate complete healing by the remedy.

There is no doubt that the secrecy maintained led to the abuse of Koch's discovery by some physicians for pecuniary considerations solely. As Professor Mendel said at a meeting of the College of Physicians and Surgeons in Berlin:—"The public have been exploited in a manner unheard of before in the history of medicine." (App. F, vi, Jan. 14.) The reporter had it from an eye witness that patients were treated for periods of as much as fourteen days without ever having been examined physically, at 20 shillings per injection; and, indeed, it was a byc word in Berlin that the whole armamentarium of certain practitioners was a syringe and a bottle of lymph. The remedy a secret.

In a few hours after the injection a case of lupus, which is tuberculosis of the skin, as has been said, manifests a local inflammation in the affected skin. This is the "local reaction." There is also a rise of the temperature of the body generally. This is the evidence of the "general reaction" to the influence of the remedy. The local reaction can of course be seen by the eye in a superficial part like the skin, but in a deep part such as the lung its occurrence can only be inferred from what is heard by the ear. (For details see Appendix F, 3rd document.) The local and general "reactions."

Owing to the high reputation of Koch as a cautious and scientific investigator his statements were tacitly accepted by many of the leaders of the scientific world; and, considering that tuberculosis kills, as is said, probably about one-seventh of the human race, it is not to be wondered at that a period of enthusiasm set in, culminating on November 14th, when Koch published his first "Further Communication." During this period nothing but hope was possible to the observer, profoundly influenced as he was by the local reaction seen in lupus and to a less degree in joint affections, &c., and inferred from the altered physical signs in phthisis of the lungs. Experience was increased as competent clinicians observed for themselves; and, as the range and number of cases treated increased, doubt began to be entertained. Finally, when many cases had died—some unexpectedly—under the treatment, and when competent pathologists had described (Virchow, January 7th, App. F. viii, 7), the results of the post mortem examinations, a decided reaction against the remedy set in. Thus where observers have altered their minds during the course of the experiments it has generally been in the direction from confidence to doubt. (App. F. i.) Enthusiasm gave place to doubt and disbelief.

Koch's account of the intimate action of his remedy is briefly summarised thus:—"The bacilli in the body produce around themselves a certain quantity of a substance that, if sufficiently concentrated, kills the living protoplasm in which they lie and by which they are nourished. When his remedy is introduced the quantity of this substance around the bacilli is increased, and thus the area of destroyed protoplasm is widened;—the bacilli are now so badly nourished that their growth is checked and they may even die. The dead protoplasm is either shed at a free surface of the body, or is gradually absorbed in its interior. (App. F, viii, 6.) In the latter case what becomes of the still Koch's conception of the intimate action of the remedy not confirmed.

still living bacilli? There is now sufficient evidence to show that they may merely spread into the adjacent healthy tissue, or that through the circulation of the blood they may be carried all over the body. (Virchow, *loc. cit.*) Koch unfortunately, as he tells us (App. F, viii, 3), was not allowed time to work up the minute structural changes produced by his remedy, and as a matter of fact his account of the same has not been confirmed. He also said that all the nodules were changed, and that no change took place elsewhere. Neither of these statements has been confirmed (Virchow, *loc. cit.*) It would seem that the real nature of the change is that an inflammation is set up around some of the nodules by which their nutrition is interfered with.

The statistical tables include analyses of 1,790 cases.

The statistics given in the appendices present summarised accounts from 10 countries by 62 observers of 1,790 cases treated, and show reports of 11 cures and 54 deaths after undergoing treatment. They cover the months of October, November, December, and the greater part of January. Of course, many more cases must have been treated than are here indicated, but it is certain that no fewer people were treated. The records of the number of cures reported, and of the number of deaths are probably more complete than that of the number of cases treated. (Apps. D. and E.)

The remedy is not protective.

*The prophylactic or protective value of the remedy* was announced in regard to guinea pigs in Koch's first utterance on the subject, but beyond what he then said nothing special has been put on record so far as is known to the Reporter. Inasmuch, however, as even under continuous treatment tubercular ulcers of the intestine are found to spread, and new tubercles to make their appearance in different parts, it does not seem to be efficient as a prophylactic. (App. F, viii, 7.)

In diagnosis it is no more than an aid.

*The diagnostic value of the remedy.*—This is the only thing which has been tolerably well confirmed, and even as a means of diagnosis the using of the lymph is no more than an *aid*, since,—

1. Certain cases are recorded in which the bacilli had been demonstrated, and yet no reaction, either general or local, followed the injection of even more than the quantity mentioned by Koch as a test, viz., 0.010 gm.
2. In some cases in which no bacilli had been seen, and even in certain healthy persons, a general reaction has followed a less quantity than 0.010 gm.

It follows, therefore, that the absolute proportion alleged by Koch to exist between the dose, the amount of tuberculous tissue and the general reaction cannot be maintained. (App. B, iv, 2, 3, 4.)

Its curative action is still open to question.

*The curative value of the remedy.*—This effect has not yet been proven, while on the other hand, in some cases the remedy has been certainly injurious. It is, however, just to say that considerable improvement, such as could hardly be obtained by any other method in the same time, has been recorded by several observers. The duration of such improvement seems, however, to be a matter of doubt in most minds. Relapses have certainly occurred in apparently cured cases. (App. B, iv, 1.)

Cures of tuberculosis have been seen under other modes of treatment.

It is important to remember that improvement similar to that observed in the so-called cases of cure has been observed before in cases of tuberculous disease, taking place either spontaneously or under the influence of concurrent fever, various medicaments, feeding, &c. Cases which have not been more than two months, at most, under observation, since the date of their alleged cure, can hardly be said to be cured in the ordinary and correct sense of the word. The word "cure" in these cases means no more than "unusually rapid cessation of grave symptoms."

From

From what we now know of its nature the lymph must to some extent vary in its composition, and it seems probable that much of the difference which can be found between the reports of the various observers must have been due to differences in the properties of the lymph itself. It is almost incredible that some observers should have failed to observe the special effects of the remedy in typical cases of tuberculosis while other equally competent persons should have found it easy to confirm Koch's statements to a certain extent. This allusion refers only to reaction and not to cure.

Different results probably partly due to differences in composition of lymph.

It will be noticed that the greatest percentage of deaths has been observed in Berlin, and, therefore, in the place where the treatment was carried out practically under the influence of its inventor and of the confidence with which he inspired his friends, and where, also, the method has been carried out for a longer time than elsewhere. Yet it must be remembered here that for a little time some of the Berlin medical men were in such a state of enthusiasm that they can hardly be held responsible for their acts; otherwise they would hardly have yielded so often to the importunity of dying patients, and consented to inject into them a material of the properties of which they knew so little. (App. E.)

The high percentage of deaths in Berlin.

As to the absence of danger insisted upon by Koch, there can be no doubt as to the reverse being true. Not merely have cases of advanced tuberculosis died, but not a few patients who might have had some more years to live have fallen victims of the experiment. A perusal of the results of the numerous post-mortem examinations contained in the detailed report will convince one of the severity of the pathological changes induced at any rate in advanced cases; and, as few of the cases there recorded have succumbed to large doses, it is evident that Koch's contention, viz., that the fluid, if not capable of curing, may yet bring about beneficial changes in advanced cases of tuberculosis, must be abandoned. (App. B, IV, 1 and 5.)

There is danger in the use of the remedy.

In presence of the results embodied in the appendices it is not possible yet to speak with much confidence, since it is evident that the treatment has still to be tried for one or two years before any positively reliable conclusion can be arrived at. It must nevertheless be well understood that the results obtained are undoubtedly in advance of anything done hitherto towards the cure of tuberculosis, and that they warrant us in entertaining the possibility that before long tuberculosis may come within the group of those contagious diseases, which, like anthrax, have been treated for some years with fair success.

The remedy still on its trial, but it affords reasonable grounds for hope of ultimate success.

The following remarks and recommendations are submitted in reference to the proper regulation of the use of Koch's lymph in the treatment of tuberculosis:—

Recommendations, &c.

Experiments should be made on a large scale on various kinds of animals; this should probably form the first step of the enquiry, for it is evident that, although Koch's method is not perfect, it is yet probably capable of improvement.

Experiments on tuberculous animals.

Until it has passed through the experimental stage, at least, the treatment should be carried out only in cases under adequate resident medical supervision with the aid of trained nursing. It is evident that these conditions are usually met only in a well appointed hospital.

Treatment of human subject should be carried out in hospitals.

In all cases of treatment of the human subject careful records should be made and preserved showing,—

Records should be kept.

- a. The previous history of the case.
- b. The actual condition immediately before the injections.
- c. Symptoms and condition following the injections, both immediately and for as long a period afterwards as the patient can be kept under observation.
- d. In case of death the exact state of matters disclosed by a careful and complete post mortem examination.

The

- Medical men should have no merely personal interest, The medical men carrying out the treatment should have no merely personal interest whatever, either in the success or failure of the remedy.
- and should consult before the treatment is begun. As in the case of the administration of an anaesthetic in Sydney, the treatment should not be undertaken by any medical officer, until after consultation with one or more colleagues as to the suitability of the case.
- Surgical cases more promising: forbidden in meningitis. The effect of the remedy has been more promising in surgical than in medical cases. Its use is absolutely contraindicated in even the earliest manifestations of tubercular meningitis.
- Dilutions should be freshly made. The dilution used should be freshly made, for in the diluted state, even with the addition of the carbolic acid, the lymph does not keep too well.
- Dose. In lupus, in gland-, bone-, and joint-tuberculosis, begin with a dose of 10 milligrammes of pure lymph; the second dose to follow in about a week.
- In phthisis of the lungs, begin with a dose of 1 mgr., repeat daily (Koch) till no general reaction follows; then similarly with 2 mgr., and then gradually increase to 10 mgr. or more.
- For children the doses are much smaller.
- Subcutaneous injection is best. The remedy is best administered by injecting the diluted lymph beneath the skin, usually employing a 1 per cent. dilution (kept from decomposing by the addition of  $\frac{1}{2}$ -1 per cent. of carbolic acid). The injections should be carried out with antiseptic precautions, although indeed this is no more necessary with this remedy than with any other hypodermic injection.
- May be combined with surgical treatment. In many cases combined treatment with Koch's remedy and surgical assistance may give the best results.
- Modes of treatment hitherto successful remain important. As Koch says, other modes of treatment, dietetic, climatic, and medical, remain as important as before.
-

## APPENDIX A.

## Tuberculosis and the Tubercle Bacillus.

## CHAPTER I.

## INTRODUCTION.

IN 1675, Leuwenhoek was first enabled by the aid of most imperfect optical apparatus to detect the existence in water, of small living organisms to which he applied the term "Infusoria." A century later, a Danish investigator named Müller, in the course of twelve years' work, described nearly four hundred forms of these animalcules, which he obtained from the salt and fresh waters of Copenhagen.

In the early part of the present century microscopical investigations had become greatly more frequent, and we find Schwann in 1837, definitely proving that the phenomena of alcoholic fermentation are due to the presence of organised bodies in the fermenting solutions.

While to him belongs the honour of having first definitely proved the true relationship of such bodies to fermentation, the first observation of their presence in such fluids had been made by Cagnard-Latour, who went so far as to infer their causal relationship to fermentation, his reason being that he had never failed to observe them in fermenting fluids. Schwann, however, by a series of carefully conducted experiments absolutely proved that these organisms were the cause of fermentation.

In 1850, Davaine and Rayer noted the presence of rod-like bodies about the size of a blood corpuscle in the blood of a sheep which had died of splenic fever. Davaine, in 1863, dealt much more fully with the matter (*Comptes rendus de l'Académie des sciences*, vol. 7, pp. 220, 351, and 386), and to the rod-like body, which he now considered to be an organised being and the actual cause of splenic fever, he gave the name of "bactéridie du charbon." This organism was, at a later date, shown by Cohn to belong to the vegetable kingdom and to that group of the fission-fungi, which has now been known for a long time as the "bacilli." In giving to Davaine the credit of thus proving the cause of this disease, it is well to note that in the course of such a disease the presence of rod-like bodies in the blood had in fact been observed by Pollender eight years previously to Davaine's communication; but no inference had been drawn as to the possibility of their having any causal relationship with the disease in question. At a still later date, 1875, we had the magnificent works by Pasteur on the part played by organisms in fermentations, on the diseases of the grape-vine, on the making and preservation of beer, and his now historical work on the diseases of silk-worms. In 1876, Koch and Pasteur, working independently, were enabled to place the statements of Davaine on a firmer basis of completed proof.

In England, Tyndall had in 1870 given a lecture on Haze and Dust (*Nature*, Jan. 27th, 1870), in which he showed that beams of light were rendered visible to us only by reason of countless particles floating in the atmosphere; and Lister, after carrying out a series of researches to prove that putrefaction and fermentation were due to the ingress of such particles into materials capable of putrescence or of fermentation, applied the knowledge which he had thus gained to the practice of surgery, with the result that his principles of antiseptic surgery have now revolutionised the methods of surgical practice, and have enabled surgeons to perform with success operations which previously to this no one would have dared to attempt.

It is, however, to Robert Koch that we are indebted for the greatest advances in the methods and practice of bacteriological research, such, for instance, as the development of the method of staining the organisms by means of the aniline dyes, the use of which had been introduced into histology by Weigert, and of the method of illuminating the object by means of the condenser suggested by Abbé. By the latter the outlines of the elements of the tissue under examination are made to disappear, whilst the objects, which have been stained by the former, are vividly seen. These improvements in method are described in his work, "*Untersuchungen über die Aetiologie der Wundinfektionskrankheiten*, 1878," translated by Watson Cheyne for the new Sydenham Society, 1880. He here shows that the inoculation of putrid matter can produce in mice and rabbits six different diseases which are truly infective, being communicable from one individual to another, and which are similar to certain diseases occurring in man after wounds of the surface. He showed that each of those six induced diseases was associated with a definite and characteristic organism; that some of these organisms were bacilli and some of them micrococci; and that the six different kinds can be distinguished not only by their physiological action on the organism, but also by their form, size, and mode of growth. He therefore concluded that these different kinds of organisms are distinct species. He named these artificial traumatic infective diseases—1. Septicæmia in mice; 2. Progressive destruction of tissue in mice; 3. Spreading abscess in rabbits; 4. Pyæmia in rabbits; 5. Septicæmia in rabbits; 6. Erysipelas in rabbits. The similar diseases in the human subject are such as septicæmia, pyæmia, puerperal fever, diphtheria, hospital gangrene, mycosis of the navel of the newly-born, erysipelas, phlegmonous suppurations, &c.

In

In 1882 Koch announced the discovery of the bacillus of tuberculosis (figs. V and III.) and from this discovery the study of bacteria and of their relationship with infective processes received an enormous impulse. Since then numerous investigators have turned their attention to cultivating the organisms of specific diseases in such a form that their original pathogenic activity is so far altered, that upon inoculation into animals they do not produce the original malignant disease, but give rise to a mild form, which afterwards more or less completely protects the animal from the malady in question, for there are certain well-known diseases which run a definite course, and one attack of which we know by long experience has the effect, in most instances, of protecting the individual from a future attack. Others have attempted to isolate from cultivations of special bacteria the poisonous principles on the possession of which the virulence of these bacteria depends, and to produce by inoculation of such poisonous products an immunity from the very disease from cases of which the organism supplying the poison had originally been obtained.

These are the principles underlying the practice of vaccination, and both of these principles are illustrated in connection with vaccination against anthrax or "wool-sorter's disease." Pasteur's vaccine consists of the anthrax microbe—the bacillus anthracis—in an attenuated form, *i.e.*, the actual bacillus anthracis modified, so that its virulence is so far diminished that it no longer causes the rapidly fatal disease, but a modified form from which the animals recover and are afterwards immune from, or proof against, the rapidly fatal form of the disease. On the other hand Wooldridge, Hankin and others have shown that the fluid from a fresh cultivation of anthrax bacilli, filtered through a Chamberland filter, and thus freed from microbes, when injected into an animal renders it proof against subsequent inoculation of virulent anthrax.

Koch's latest work is an attempt to cure tuberculosis, a disease which is, so far as we know, neither locally nor generally protective, inasmuch as it tends, usually more or less slowly, to invade the neighbouring tissues, and ultimately to be disseminated all over the body. If protection were possible through the action of the poisons excreted by the organisms characteristic of this disease, we might have expected that such protection would, after a time, be attained through the growth of these organisms within a well-defined and limited region of the body. This, however, is not the case; tubercle may exist locally for almost an indefinite time, and yet the moment an opportunity is given to it, it may spread and become widely disseminated throughout the system, and lead rapidly to a fatal issue. This thing being so, a review of the more important facts relative to this disease may not be out of place here.

## CHAPTER II.

### TUBERCULOSIS AS A DISEASE.

TUBERCULOSIS belongs to a group of diseases which from their microscopical appearances have been classified under the name of "granulated growths," or "granulomata"; and since they have been shown to be infective, are known as "infective granulomata." Their infective nature is seen by their tendency to spread from their primary centre of infection, and thus to invade the surrounding tissues. While however this spreading growth is constantly going on, the central regions of the infected parts are liable to degeneration and death. Neighbouring lymphatics are frequently involved and new foci are established therein; and from these by migration through the lymphatic system, secondary foci of disease are established in more distant parts. The tubercular virus is often eventually transferred to the blood stream, a general infection of the system occurs, and a fatal issue sooner or later supervenes.

While, as a rule, tuberculosis tends to become widely disseminated throughout the body, it nevertheless commonly affects one organ more than the rest, and so, during life, the symptoms presented are manifested especially in connection with the organ thus mainly affected. In this way, it has come to pass that tuberculosis is classified or distinguished according to the part or organ most definitely diseased. To this there is one exception, namely, acute general tuberculosis, in which the disease is not limited to one particular organ, and in which the symptoms are more in accordance with those which manifest themselves in connection with a specific infective fever, without marked signs of co-existent local inflammation.

The particular structural character of this tubercular disease is an arrangement of tissue which has been termed the "tubercle," or tubercular nodule. As the name implies, the disease is one in which the formation of nodules of morbid tissue is a characteristic feature. The nodules may be found either as single discrete or separate nodules, or, where there is a great development of them, they may be found as confluent masses.

Virchow (*Die krankhaften Geschwülste* II, 636) has described a recent tubercle as a small grey translucent nodule, not larger than a millet seed, mainly composed of cells, which (he states) have been developed from the connective tissue. He further states that the cellular elements entering into its composition are essentially identical with those found in lymphatic glands, being round cells which vary in size, some being the size of white blood corpuscles, others smaller, and others still larger, and epithelioid in character. The nuclei of these cells are somewhat homogeneous and highly refracting; some are small and spherical, while others are large, more or less transparent, and contain nucleolar bodies. An interstitial fibrillar arrangement may exist, being probably the fibres present in the region before the growth of the tubercle cells. Vessels may sometimes be found, but the latter, if present, are never of recent formation. Their existence in tubercular nodules is entirely due to the fact that they were present in the tissue before the formation of the tubercle itself, which grow around them; and if the tubercular

tubercular process had gone on further it would have obliterated them. All around the outskirts of the tubercle nodule there is found, in considerable quantity, an imperfectly formed embryonic or granulation tissue (Fig. V). In other cases we may find that an inflammatory overgrowth of fibrous tissue has taken place.

In the older nodules the central portions will often be found to have undergone degeneration, ending in caseation or the formation of a cheesy material, and upon microscopical examination of their substance, when it has been subjected to a process of staining, the central matter is found to be affected by the staining material in a manner somewhat different from that in which the surrounding cellular tissue has been affected (Fig. I). The definition, therefore, which best befits a tubercular nodule is that of a nodule of embryonic or small round-celled, non-vascular tissue, which does not grow indefinitely beyond certain limits, and which, when the mass has grown to a more or less definite size, tends to undergo central degeneration, followed by caseation. The central part of such tubercles frequently contains also a certain structure which has been considered by many observers to be characteristic of the truly tubercular process, namely, the "giant cell" (Fig. II).

According to certain descriptions the giant-cells result from the fusion of smaller cells; but according to the views of Weigert, adopted by Koch in his conception of the intimate action of his remedy, the cell in question arises from a single cell the nucleus of which has proliferated, but the body of which has not divided.

To a tubercle consisting of small or round cells only, the term "follicle" is sometimes applied: where a giant-cell is present, surrounded by epithelioid cells with less or more lymphoid cells, it is called a "giant-cell system," and the term "nodule" is then reserved for a group of follicles or giant-cell systems more or less fused together.

Baumgarten (Lehrbuch der pathologischen Mykologie, 1890), gives a most consistent account of the growth of a tubercle, and summarised it as follows: The invading bacilli are partly carried into the tissue by the lymph stream, and partly they enter by their simple movement of growth. They are not endowed with independent motility, and there is no good evidence that they are usually carried by wandering cells. Once in the tissue, partly they act like any other microscopical foreign body in exciting the surrounding cells to proliferation, but partly they have a specific action in producing cheesy degeneration of protoplasm. Both the fixed connective tissue cells and the epithelioid cells of the region proliferate to form the epithelioid and giant-cells of the tubercle. Where the number or virulence of the invading bacilli is not great the nuclei divide, but the cell-body does not, and thus the large multinucleated giant-cell is produced.

In accord with this, in follicles in which the number of bacilli is large, or their virulence marked, giant-cells are not common, for here the nuclear division is followed by that of the cell-body, so that in place of the giant-cell many smaller cells are produced. The non-nucleated cheesy centre of the giant-cell is due to necrosis or death of the protoplasm here, Weigert's "Coagulation-necrosis," produced by substances formed by the bacillus, and having the power of killing protoplasm. This dead central mass is no longer fitted to nourish the bacilli, and it is now free from the parasite.

But there is also a morbid irritation of the walls of the blood vessels of the infected area, in consequence of which there is a typical inflammatory extravasation of white blood corpuscles, or blood leucocytes, which penetrate the tubercular follicle from without inwards. Up to this time the follicle has been practically exclusively composed of epithelioid cells, but as the leucocyte infiltration increases, it gradually assumes the lymphoid character assigned to it in Virchow's description.

When the tubercle has reached the lymphoid condition, it is not capable of further progressive development. Its destiny is to break down and disappear, and that the more rapidly and completely, the more rapidly and completely the epithelioid gave place to the lymphoid structure. The tubercle cells begin to die at the centre of the tubercle, and thence the process extends outwards. The nuclei disintegrate and lose their staining power. The cell bodies shrivel and often stick together. Eventually a mass of granular cheesy *debris* is all that is left, and that gradually softens to form a pus-like fluid in which the bacilli luxuriate. This pus-like fluid is not pus, it does not contain the characteristic kind and quantity of pus-cells, it is simply cheesy matter softened to a liquid. In conformity with this description we find the purely lymphoid follicles, such as one meets with in very acute miliary tuberculosis in man, the most malignant and the richest in bacilli. In chronic cases of miliary tuberculosis the follicles are mixed epithelioid and lymphoid, and here the bacilli are fewer. The least malignant of all are the tubercles, consisting solely, or almost solely, of epithelioid and giant-cells, as we meet them in scrofulous lymph glands, in lupus, in tuberculous joints, &c., where the tuberculous material is poor in bacilli.

The foregoing account of the formation of giant-cells shows that it is really an inhibition of the normal process of proliferation, which does not proceed beyond its first stage, but is exhausted with the nuclear division. On the other hand, if in circumstances in which giant-cells are usually found, the irritation is stronger than usual, the whole process of cell-division may be completed, and then giant-cells are wanting.

Giant-cells are found elsewhere, so that they are not peculiar to tubercular growth. Some microscopical insoluble particles present in the tissue spaces so stimulate the neighbouring tissue elements as to produce giant-cells; some, on the other hand, do not. None of these foreign bodies, however, evoke true caseation, which is due solely to the specific properties of the tubercle bacillus, and is the essential peculiarity of the tubercular process.

This account of the origin of the giant-cell reproduces in miniature the course of events which we saw in the case of the whole follicle; first at the centre, activity of bacillar growth and nuclear proliferation, then death of the protoplasm, and disappearance of the nuclei and bacilli, while at the periphery in each case the nuclear or cell proliferation, and the bacillar growth are still progressing. A

A sort of capsule may be formed by the mere pushing back and condensation of the tissues surrounding the tubercle. This no doubt to some extent hinders the spread of the bacilli, and, interfering with their nutrition, depresses their vitality, but the chief cause of the limitation of the growth of the tubercle is doubtless to be found in the bacilli themselves, which, even on a free surface, form only little colonies no larger than a poppy-seed.

### CHAPTER III.

#### THE TUBERCLE BACILLUS.

##### 1. *Its Distribution.*

It may be found in any sort of tuberculous material, but especially where the process is in progress. Koch sought for and found the bacillus in the following cases in the human subject, viz., miliary tuberculosis, phthisis of the lung and intestine, phthisical sputum; tubercular ulcer of the tongue; tuberculosis of the pelvis of the ureter, of the uterus, testicle, lymph glands, bones, and joints; in lupus, &c., besides in many tuberculous affections, natural and artificial, in animals. He also examined the sputa and organs in a large number of non-tuberculous cases, and here he did not meet the bacillus in a single case.

In sputum from phthisical subjects (Fig. v.) they may in some cases be present in great numbers, while in other cases, or in the same case at another time, they may only be few in number. The number of bacilli has not necessarily any relation to the malignity of the disease.

It is not always an easy matter to demonstrate tubercle bacilli in the tissues, and that for this reason, among others, that they may be present in very small numbers. This is more particularly the case in slow-growing tubercle, such as that found in disease of the articulations, in chronic tubercular disease and in lupus. It is stated by Schleghtendal, (*Ueber das Vorkommen der Tuberkel-bacillen im Eiter, Fortschritte der Medicin, Bd. I., p. 537*) that after having examined 520 specimens of pus derived from tubercular abscesses, he had been able to find it present in only 75 per cent. of the cases examined. In cold or chronic abscesses, and in the pus which was derived from the breaking down of tubercular formations in bone, no proper pus-microbes could be found by Schleghtendal, even in cases somewhat acute in their progress. The pus cells from such cases did not present the appearances of normal pus cells, but consisted of a granular *débris* made up of broken down tissue suspended in a kind of serum. He affirmed that many cases of suppuration which follow in the wake of the tubercular process may be due to a mixed infection, tubercular and suppurative, but that the microbes causing the suppuration disappear before the abscess is opened and the examination made. In the walls of a so-called cold abscess are to be found the typical tubercle structures, containing within them the primary cause of the morbid condition, namely, the bacilli of tuberculosis. In cases, however, where pus-microbes are allowed to enter, after the abscess is opened, a change takes place, consisting in the breaking down of the superficial tubercular granulation and in the irritation of the process of suppuration, during which the patient is liable to septic infection, and to the more rapid local and possibly general spread of the tubercular process. Cold abscesses frequently terminate in a spontaneous cure, owing to the facts that the process is a slow one, that the lesion is surrounded by a dense zone of fairly firm tissue, and that when the abscesses are opened the central parts, which contain the infective material, are discharged.

##### 2. *Its Preparation and Detection.*

The bacilli are not easily made out in tissues or sputum unless they have been previously stained, yet Baumgarten has been able to detect their presence in sputum unstained by adding to it a solution of caustic potash, which has the effect of dissolving up the fatty particles, and in this way allowing the bacilli to stand out more distinctly in the field of view. Such a method is not, in ordinary hands, absolutely certain to be attended with success, and the other differential methods, which consist, in principle, of staining the bacilli of one colour and the material in which they lie, whether sputum or tissue, of a different colour, are much more satisfactory for general use. Probably the best staining method for general purposes is that known as the Ziehl-Neelsen method. The staining fluid is made as follows:—

Fuchsine pure	...	...	...	...	1 gramme.
Phenol pure	...	...	...	...	5 grammes.
Distilled water	...	...	...	...	100 cubic centimetres.
Alcohol absolute	...	...	...	...	10 cubic centimetres.

Dissolve and filter through paper.

Cover-glasses, which have been previously smeared over with sputum or other albuminous material in which tubercle bacilli are suspected to be present, are allowed to dry and then passed three times somewhat quickly through the flame of a Bunsen burner; they are then floated on some of this staining fluid contained in a watch-glass, the smeared surface of the glass being downwards.

Sections of tissue may also be stained in this solution, but they require a longer immersion than cover-glasses do.

Cover-glasses take about half an hour, while sections should be left in the solution for 24 hours. If the solution be heated in the watch-glass until steam be seen rising from it, the staining is successfully accomplished within a short time. In such a case cover-glasses are stained in five minutes, while sections are stained in half an hour.

The

The next step, the preparation having been stained, is to carry the stained object into a solution of sulphuric acid in water, of the strength of 5 per cent. (Baumgarten) to 25 per cent. (Crookshank). They are left in this for half a minute, and are thence transferred to a dish of absolute alcohol, and there washed until all colour seems to have disappeared. The result of this is, that if the preparation is examined, it will be seen that the bacilli only have been stained, while the tissue or other material remains unstained.

In order to gain some knowledge as to the topographical distribution of the bacilli in sections, as well as to render the bacilli themselves still more distinctly visible, one usually applies a second stain, which has the effect of staining the tissue of another colour, and of producing in this way a colour-contrast between the bacilli and the background.

This second staining is by putting the preparation in a weak alcoholic solution of, say, methylene blue, and then washing in water.

The preparation, if a section, is then dehydrated by absolute alcohol, in order to remove all traces of water; then, after mounting the preparation on a slide, a drop or two of oil of cloves is added to it in order to render the preparation more transparent; this is drained off; and, lastly, a drop of Canada balsam, dissolved in xylol, is added and a cover-glass at once superimposed, which completes the operation. If it be only a cover-glass that is to be examined, the treatment with alcohol and oil of cloves may be dispensed with, and the preparation may be simply dried and then mounted in balsam.

### 3. Its Characters.

If bacilli so treated are examined by means of a Zeiss 1/12 oil-immersion objective and a No. 3 or No. 4 ocular, the form of the bacillus is well defined, and the arrangement of the bacilli and their relation to their surroundings are clearly seen.

They are not so rigid looking as the bacillus of leprosy, with which, however, they have, as regards their staining reactions, much in common.

These bacilli may be distinguished from all other micro-organisms by their staining properties. Firstly, they take up the ordinary aniline dyes much more slowly than other micro-organisms do. Secondly, when once stained and exposed to the bleaching action of mineral acids and alcohol they retain the pigment more tenaciously than other micro-organisms do. These peculiarities are probably best accounted for by assuming that the bacilli have a very thick cell membrane which makes it very difficult for the pigment to penetrate; but, when once the pigment is through, protects it from the influence of decolourising agents (Ehrlich).

The bacilli themselves are rods, which measure, on an average, from 3 to 4 micromillimetres ( $1/8,000$  inch to  $1/6,000$  inch) in length, and from 0.3 to 0.5 micros. ( $1/80,000$  inch to  $1/50,000$  inch) in breadth. Their length is much more apt to vary than is their breadth, so that while we have just given the average length it must also be pointed out that they are to be found as short as 2 micros. ( $1/12,000$  inch), and in other cases as long as 6 micros. ( $1/4,000$  inch), or even 8 micros. ( $1/3,000$  inch). Their transverse diameter is almost uniform throughout their length, but they taper off somewhat towards their extremities. They are straight, or, as in old cultures and in phthisical sputum, slightly bent. In sputum they are also very long.

In cases where spore formation, as it is believed, is present, as is especially seen in the bacilli found in oldish cheesy masses, in old artificial cultures, and, above all, in phthisical sputum, the bacilli may appear as small granules placed end to end, so as to look like portions of a beaded neck-lace. These granules appear as unstained points in stained preparations. They are believed to be spores; but if they are such they have a resistance less than that of most endogenous spores, which withstand comparatively long boiling in water—some of them, indeed, for several hours. Phthisical sputum, on the other hand, can be deprived of its virulence, *i.e.*, the spores can be destroyed, by boiling it a comparatively short time. Where these granules are not present, the bacilli appear homogeneous.

The tubercle bacillus retains its virulence even in the presence of putrefaction for a considerable time. Tubercular material has been proved in this respect to retain its qualities for a period of 40 days in rotting sputum and to do the same thing for 145 days when absolutely deprived of air (Cornil and Babes, Malassez and Vignal, Schill and Fischer.) In the dried condition the bacilli lose their infective power only in 6–10 months. Maceration and putrefaction of tuberculous material in water during twenty-five days, or a succession of freezings and thawings, does not affect its power of transmitting tuberculosis to guinea-pigs. According to Galtier (*Comptes rendus Acad. des sci.*, 1887), tubercular material which has been exposed for twenty minutes to a temperature of 60° C., or for ten minutes to a temperature of 70° C., or which has been perfectly dried at 30° C., will, if inoculated into guinea-pigs, readily induce tuberculosis.

Yersin (*Annales de l'Institut Pasteur*, 1888) and P. Villemin (*Thèse de doctorat Paris*, 1888) give tables, in which they show the result of the action of many anti-septics upon tuberculous material. Heat, and especially moist heat, boiling for twenty minutes, is thus proved to be most serviceable for the sterilisation of sputum. Corrosive sublimate is not very effective for this purpose, but the action of carbolic acid is successful if it be used in strong solution, *e.g.*, an equal quantity of 5 per cent. carbolic acid solution, stirred with the sputum and allowed to stand twenty-four hours. Steam is the best means of destroying the bacillus on clothes, &c. No antiseptic is, however, known which can destroy the bacillus of tubercle within the organism without at the same time killing the animal in which it is contained.

4. *Its Cultivation.*

Of all the pathogenic organisms which have been cultivated outside the body, the tubercle bacillus is the most difficult to grow in artificial nutrient media. The environment most favourable to its growth is that within the animal body.

Cultivations of the actual bacilli of tuberculosis (Fig. IV.) were, however, obtained by Robert Koch not only from tuberculosis in the human subject, but also in various species of animals, by placing upon the surface of blood serum coagulated by heat small fragments of the diseased tissue, care being taken to prevent the admission of contaminating organisms from the air or from any other source. By this procedure there were obtained small centres of growth, which, during the earlier days, increased but slowly. During the second week such "cultures," incubated at proper temperatures, showed small whitish or yellowish points of dull appearance, some of which looked like small flakes of cholesterine as one sees it in hydrocele fluid. From this first culture a small trace is removed with a sterilized platinum needle, and transferred to a fresh portion of the same nutrient medium, over which it is carefully spread. By this means a better culture is obtained; in from ten to fifteen days is seen a very distinct growth which is formed of small disseminated whitish grains; and during the third or fourth week after inoculation a tolerably dense film is seen lying upon the surface of the serum and consisting of the bacilli in a pure state.

The bacilli do not at all liquefy the nutrient medium unless other organisms are present as an impurity. The culture is not adherent to the surface of the serum, nor does it at all penetrate its substance. If liquid be present, as is commonly the case, at the bottom of the tube, the bacilli do not mix with it to any appreciable extent. The centres of bacillus growth are brittle and are easily broken up if they be shaken or interfered with by means of a needle.

To the naked eye the colonies of bacilli present characteristic features. When examined by a magnifying power of 30 to 100 diameters they appear as fine lines which are repeatedly bent upon themselves so that while the smaller have the shape of an S, the longer colonies have a sinuous outline, are thicker at the centre than at the edges, and in the long direction taper away to delicate points, somewhat after the fashion of a pen stroke. The older colonies are considerably the thicker. As the colonies enlarge they approach one another and may thus become confluent. If one makes an "impression preparation" by laying a cover glass lightly upon some of the colonies, and then subsequently raising it and staining the material which will have adhered to its surface, the general arrangement of the colonies will be easily made out.

The long diameters of the individual bacilli are more or less parallel to the long diameter of the colony itself. The bacilli do not lie close together but are always separated by a small, but fairly-defined interval, which is, in all probability, filled up by an interstitial material. When they are present in great numbers it is common to find that many of them contain the small granules which are probably of the nature of spores.

In general they attain their maximum of growth in from three to four weeks, and do not visibly seem to grow much after that time, but even after the lapse of two or three months, however, they may be reinoculated in fresh media.

The activity of growth of cultures in tubes is slow at 30°C (86° F) attains its maximum about 37° C. (98.6° F.) diminishes at 38° C (100.4° F.) and is completely arrested at 40°C (104° F.) Nocard and Roux (*Annales de l'Institut Pasteur*, 1887, p. 29) found that, by the addition to a nutrient medium called Agar-agar, or Japanese isinglass, (which consists of the shrivelled filaments of certain algae *Gracilaria Lichenoides* and *Gigartina Speciosa*, upon which it happens that tubercle bacilli refuse to thrive) of 4 to 5 per cent. of its bulk of pure glycerine, cultivations could be got in much greater abundance than on Koch's serum medium. The same result was found when glycerine was added to serum. On such glycerinised media they appear in four days, and at the end of five days they form a grey mass, fairly thick, and showing small projections rising above the general surface of the growth. They form little islands which are frequently isolated from each other, and the general appearance of which is not unlike that of young grey tubercles as these appear on the pleurae. If they be introduced into the culture medium by the "puncture method," that is, by thrusting a needle contaminated with these bacilli into the glycerinised medium, they are found to grow well on the surface, slightly in the portion of the puncture near the surface of the medium, and not at all in the lower course of the needle track. In broths to which a proper proportion of glycerine has been added, the growth is almost as rapid, and a flocculent deposit is noticed at the bottom of the flasks. Bacilli from cultivations in glycerinised media are, as a rule, shorter than those seen in sputum, but are otherwise identical in their general form and appearance. They possess the same characteristics as the bacilli of sputum do; they stain in the same way, and they resist decoloration by acids to exactly the same degree. Glycerine does not act simply by keeping the surface moist, but, as is proved by their growth in broths to which it has been added, by absolutely supplying that ingredient which is needed to make the medium suited to their requirements.

Koch attempted to obtain cultivations of tubercle from slices of potato, but he failed, and from the results of his experiments he concluded that the bacillus of tuberculosis could grow only upon animal substances, or within the bodies of man or the lower animals, and that it could be transmitted from man to man or to animals, or *vice versa*, only by the products derived either from man or from animals. There can be no doubt as to the correctness of his statements, when

when he says that the bacilli in question find their best soil within the animal economy; but his declaration of the impossibility of their growth under ordinary conditions outside the body is now proved to be erroneous. They have been cultivated on vegetable media, and at temperatures under 60° F.

Pawlowsky (*Annales de l'Institut Pasteur*, June, 1888) has succeeded in getting cultivations upon potatoes. His experiments were conducted with materials derived from the localised tubercle of surgical cases. The method he adopts is as follows:—Slices of potato are cut with a silver knife, and introduced into test-tubes without any preliminary sterilisation. The test-tubes used are those which were already described and used by M. Roux (*Annales de l'Institut Pasteur*, January, 1888); they are somewhat like ordinary test-tubes, but have a slight constriction about 1 inch from the bottom. The object of this constriction is to prevent the potato falling to the bottom, so that any liquid present may lie below and not interfere with the "culture" on the medium above. The tubes with their contents are sterilised by heating them in the "autoclave" for twenty-five or thirty minutes at a temperature of 115° C (239° F), and are then placed for some hours in the "incubator" in order that the "sterility" or absence of other forms of life may be fully assured. Media thus prepared are inoculated with tuberculous material by a sterilised platinum spatula. In order to obtain success it is necessary, M. Pawlowsky points out, to make the seed-material actually penetrate into the medium, otherwise there is not the same certainty of success. Previous to inoculation, the material used, which had been derived from the medulla of a bone, was bruised between the platinum spatula and a sterilised knife. The tubes are closed by sealing them in the flame of a bunsen burner.

When one inoculates such media with material which has been grown upon glycerinised agar nothing is to be seen on the surface of the potato during the first ten days after the seeding, but about the twelfth day the slices of potato are covered by grey patches, which have a drier appearance than the rest of the surface. If some of this material is removed, and placed under the microscope, it will be found to consist of bacilli. About the twentieth or twenty-first day the cultures begin to present characteristic appearances. The surface, which has been sown over, is dry and somewhat white or grey looking, and is easily raised and broken by a touch of the needle. By its dryness, as contrasted with the sterile parts of the potato, and by its whiteness it is easily distinguishable. In cultivations made directly from the medulla of bone, the growth is later in arriving at its maximum, but in most of the places where the material has been sown there will be seen in about fourteen days a line or streak which presents the appearances already described as being presented by cultivations on agar.

So far as Pawlowsky has seen, cultures from the medulla or marrow of bone are even more easily obtained upon this potato medium than they are upon glycerinised agar-agar. He had also made cultivations upon potatoes which had been glycerinised by allowing them to soak up as much as they would take of a 5 per cent. solution of pure glycerine in water. In two cultures made in this way from the medulla of bone he noticed a slightly greater rapidity of growth than in those upon plain potato, but otherwise he does not consider the one medium superior to the other. In respect of their morphology, the bacilli developed are somewhat larger than those grown upon pure serum.

At the end of three weeks the cultivated bacilli are easily stained by Ehrlich's method. Generally speaking, they are homogeneous; but among them one may see some which are longer and a little thicker than the rest, and which contain the granules already spoken of when describing cultivations made in the ordinary way. Pawlowsky considers that these are veritable spores. Injections of the second and third generations of cultures on potatoes were made into the auricular veins of rabbits. The animals died, and when examined were found to be the subjects of general military tuberculosis of the lungs, had bacilli present in the medulla of the bone, and had swollen spleens, which were filled with bacilli, and which had their capsules marked by numerous grey tubercles. Thus, he concludes that the virulence of the bacilli is not at all diminished by growth on this nutrient medium. He emphasises the fact that the penetration of the potato in the first instance by the material sown thereon is a *sine qua non* of success.

The statements thus given by Pawlowsky are well borne out by what we already know from the experiments of Nocard and Roux, who state that it is greatly more difficult to obtain primary cultivations from tuberculous tissue than it is to continue them as successive cultures when once they have started growing upon glycerinised serum or agar-agar.

Thus, Koch's original results as to the soil have not been confirmed. Neither have his results as to the temperature at which the bacilli can grow. While Koch could not get it to grow under 86° F., Beever showed at the Pathological Society in London, on 6th January, 1891, cultures that he had got in glycerinised broth at or under 60° F. According to these combined results the bacillus is not an essential parasite in the animal body, but may grow and multiply outside the body at ordinary temperatures if the soil be suitable; and most likely there are plenty of suitable media all around us. This is a result of prime importance, and it justifies the position affirmed by Candler, of Melbourne, who has again and again written against Koch's original assertion of the essentially parasitic character of the tubercle bacillus.

## CHAPTER IV.

## THE TRANSMISSION OF TUBERCULOSIS.

1.—*Experimentally by inoculation.*

KLENCKE was, in 1843, the first to induce tuberculosis experimentally. This he did by injecting tuberculous material from the human subject into the jugular vein of rabbits, after which he saw disseminated tubercles of the lungs and liver; but while Klencke's literary work was remembered, his scientific work was overlooked, and so Villemin, who, in 1865, published a numerous series of carefully planned experiments is usually regarded as the first to induce tuberculosis experimentally, which he accomplished, by means of fragments of tissue derived from cases of tuberculosis introduced into the subcutaneous tissue of animals. Chauveau obtained similar results, although the sites of the resulting lesions differed, by the ingestion of food material which contained tubercles. The results of the inoculation of animals with tuberculous matter, derived either from general or local, *e.g.*, surgical, tuberculosis are always identical, as has been absolutely proved by the experiments of Koch.

Cohnheim and Salomonsen succeeded in inducing general tuberculosis by inoculation of tuberculous matter into the anterior chamber of the eye, and by injection or inoculation of tuberculous matter into the serous cavities of the thorax. The material in question was previously broken up and mixed with sterile water. In every case the result is the same, whether the material be given by injection into the trachea, by inhalation (Tappeiner), by ingestion through feeding with milk derived from tubercular sources (Gerlach), or by inoculation with lupus tissue (Cornil and Leloir), with the pus of cold abscesses (Lannelongue), or with the material derived from strumous ganglions, or, in fact, by inoculation with any and every kind of tuberculous material, from whatever source. Even water may be the vehicle by which the infection of tuberculosis is conveyed. The experiments of Chantemesse and Vidal, which were made in the laboratories of Cornil and Babes, serve to show that tubercle-bacilli can live, retaining their virulence for 20 days at ordinary temperatures, when kept in sterile water which had been derived from the river Seine; but in this water they nevertheless, after a certain time, lose their virulence entirely.

Cornet has made a series of experiments in the laboratory of Koch, for the purpose of ascertaining the possibility of inoculating with tuberculosis through an abrasion of the cutaneous surface. The method adopted by him was slightly to abrade the skin of the animals, to apply little bits of lupus-tissue and to cover these up by the application of collodion. The result is that local tuberculosis is at once set up, and that following upon this there appears a tubercular condition of the lymphatic glands nearest to the site of inoculation, while at a later date there occurs a general miliary tuberculosis of the whole animal. In the experiments of M. M. Cornil and Leloir lupus-tissue, injected into the peritoncum of guinea-pigs, set up a tubercular peritonitis, which was followed by general tuberculosis in five out of fourteen animals experimented upon.

Subcutaneous injection of tubercular matter is, in its results, similar to inoculation of an abraded cutaneous surface; it produces, that is to say, a local tuberculosis or abscess, which is subsequently followed by disease of the nearest glands, and later on by the development of general tuberculosis. The inoculation of the anterior chamber of the eye is followed by similar results. Wherever be the site of inoculation, the lungs almost invariably become attacked when the animal is allowed to die spontaneously; and the disease in the lungs may be associated with the presence of one or more cavities in these organs. All the experiments thus detailed as the expression of conditions occurring in the lower animals are directly applicable to human pathology.

The bacilli of tuberculosis are not always discoverable in pus taken from tubercular abscesses, but inoculation of animals with some of the pus always serves to demonstrate most certainly the true nature of the disease. Arloing (*Comptes rendus* t. 99 p. 991) took the material from a scrofulous gland which was caseous in the centre, and which had been excised from a boy of fourteen. This was made into a sort of emulsion which was injected into the subcutaneous connective tissue of ten rabbits and ten guinea-pigs. The rabbits remained to all appearance quite healthy, with the exception of two, in which yellow caseous granulations developed at the point of inoculation, while in all the guinea-pigs visceral tuberculosis appeared. From this same case, at a later period, another gland was removed and used in a similar way to inoculate six rabbits, and the same number of guinea-pigs. In this experiment a somewhat similar result followed—all the guinea-pigs developed tuberculosis, all the rabbits remained quite healthy. The immunity of the rabbits in these experiments is not confirmed by the experiments of other investigators. Thus Ewe (*On the relation of Scrofulous gland disease to other forms of Tuberculosis, an experimental inquiry, British Medical Journal*, 14th April, 1888), who made a series of parallel experiments, using as the material for inoculation small pieces of scrofulous glands removed by sterilized instruments, found that five rabbits, which were each inoculated by injection into the peritoneal cavity of material derived from different sources, developed intestinal tuberculosis, while another rabbit, which was inoculated developed a cold abscess.

The bacilli of tuberculosis may be overlooked in pulmonary tuberculosis in very chronic or fibrous cases, but if the material from these cases be injected into the peritoneal cavity of guinea-pigs, general tuberculosis will almost certainly be induced.

Experimentation is thus the most sure and certain mode of proving the presence of tubercle-bacilli in suspected material. When the bacilli are subsequently found at the site of the inoculation, the proof is complete, provided of course, that it can be absolutely ascertained that there was no possibility of bacilli being introduced from other sources at the time the inoculation was made.

Inoculation

Inoculation of cultivations of tubercle-bacilli into the subcutaneous tissue of most animals is almost always followed by their general dissemination in the body, producing general tuberculosis.

Inoculation of animals by cultivations grown on glycerinised media gives results identical with those obtained from cultivations grown on Koch's coagulated blood serum.

The method of cultivation used by Cohnheim, Salomonsen and Baumgarten (*Centralblatt f. d. med. Wissenschaft.*, 31st May, 1884) is perhaps one of the most instructive. By this method an inoculation is made into the anterior chamber of the eye; and if care be taken to prevent the entrance of septic micro-organisms during the operation, it permits pure cultivations to be obtained and the tubercular process to be observed during life. With such an inoculation one can obtain, behind the cornea of rabbits, material which can be removed on the tenth day, and used as a cultivation to inoculate fresh animals, and thus after a few transferences in this way from animal to animal, there is obtained a cultivation which but for the admixture of a few leucocytes is absolutely pure.

If cultivations are retransplanted successively on artificial nutrient media, there is found to be a tendency towards a diminution in their virulence, more especially if, after each transference, the cultivations are permitted to remain on the same soil for a considerable time after their maximum of growth has been established (Fig. IV). This diminished virulence may however be restored if an inoculation be made from such a cultivation into the peritoneum of a guinea-pig, and if, after tuberculosis has been set up in the guinea-pig, the tubercle from that guinea-pig be re-inoculated upon fresh artificial media.

With regard to the identity of the virus in lupus and tuberculosis, in addition to the experiments already cited, Pagenstecher and Pfeiffer (*Berliner klin. Wochenschrift*, 1883), found that if the conjunctival secretion from patients suffering from conjunctival lupus, be injected into the anterior chamber of the eyes of rabbits, in a short time certain nodules make their appearance on the iris which are in all respects identical with true tubercle of the iris. Doutrelepont (*Die Aetiologie des Lupus vulgaris*, communicated to the International Congress, Copenhagen) inoculated the anterior chamber of the eyes of eight rabbits, and the peritoneum of fifty guinea-pigs with lupus-tissue, and found that in all these animals tuberculosis was set up at the sites of inoculation—and that in three of the guinea-pigs, and one of the rabbits, general tuberculosis thereafter ensued.

Experimental tubercles always contain the bacilli of the disease, and we are indebted to Koch for a most complete description of tubercular lesion set up experimentally. He has observed that in all cases of general tuberculosis of this kind there is, in rabbits and guinea-pigs, great enlargement of the spleen and liver.

The positive results which thus accrue from experimentation upon animals complete the necessary series of proofs of the parasitic nature of the disease which is known to us as tuberculosis; its parasitic nature being conclusively established by the existence of the specific organism, by its isolation and by the reproduction through inoculation with tubercle-bacilli free and perfectly unmingled with other organisms, of all the symptoms and pathological signs which are associated with the original disease. Experiment further shows that any method of inoculation serves to produce tuberculosis if the material used be derived from a tubercular source.

## 2.—From parent to child before birth.

In considering heredity as a factor in the transmission of tuberculosis, two lines of inquiry are open: first, whether the factor transmitted is a certain constitutional predisposition to the disease; or, second, whether the actual thing—the bacillus causing the disease in question—is itself transmitted.

Under the first supposition we may include certain organic defects, the occurrence of which may leave the child more or less open to infection; or we may assume, as certain authorities do, that there is transmitted a diminished or defective vitality which renders the individual less able to withstand the infection, and that there exists among the individuals of any species a wide range in the power of resisting certain diseases has long been a well recognised fact.

Tuberculosis of the newly-born is very rare, although it does occur. Miller, at the Copenhagen Congress in 1884, reported having observed one congenital case. It is much more common between the third and twenty-fourth month of infant life. Thus Hervieux (*Société des hôpitaux*, 1886, p. 169) reports 18 cases met with in the course of 996 autopsies of infants from birth up to two years of age. West reports 118 cases, and Landouzy and Queyrat (Queyrat, *Thèse de Paris*, 1886) report 11 cases. Lancloigne (*Études sur la tuberculose*, 1<sup>re</sup> fasc., 1887, p. 85) notes 1,005 cases occurring among children from birth up to the age of 15. Leroy (*La tuberculose du premier âge, Études de la tuberculose*, t. II, 1888, p. 1.) has published observations relative to 54 cases occurring among infants from birth up to two years of age. We have thus to note as a very significant fact that whereas tuberculosis is rare at birth it is common in early infancy, during which period the food of the infant is, for the most part, milk, either human or bovine. To this, however, we must add that during early infancy the infant is liable to numerous infectious and other maladies which might either render it more susceptible to tubercular infection, or might render active an already latent tuberculosis.

There are certain facts which tend to support the probability of children being born the subjects of latent tuberculosis. Thus Jobne (*Congenitale Tuberculose, Fortschritte d. Med.*, 1885, No. 7) has found in the uterus of a cow, which died in advanced tuberculosis, a foetus in which, on examination, a tubercular nodule of the size of a pea was discovered in the lower lobe of the right lung, while the bronchial glands were tubercular, and there was also disseminated tubercle in the liver. In the tubercles  
giant,

giant-cells and bacilli were seen. No tubercle was present either in the placenta or the uterine cavity. He has, however, only found four cases of tuberculosis among 15,400 calves killed in the abattoir of Berlin. Schlcuss and Grothaus (Mitth. a.d. Thierarzt. VII) saw tubercles in the pleuræ and peritoneum in several fetuses taken from tubercular cows. Malvoz and Brouwier (*Annales de l'Institut Pasteur*, 1889, p. 153) have published the observation that in a foetal calf of 8 months, taken from the uterus, tubercle was discovered, and in a calf of 6 weeks old tubercular giant cells and bacilli were found.

Landonzy and Martin ("Faits cliniques et expérimentaux pour servir à l'histoire de l'hérédité de la tuberculose."—*Revue de médecine*, Décembre, 1883) have experimented by inoculating guinea-pigs with material from a foetus derived from a woman affected with tuberculosis; and although to all appearances the foetus itself was healthy, yet the guinea-pig died of general tuberculosis four months after the date of inoculation. Other experiments made by these observers seem to warrant their coming to the conclusion that tuberculosis may be transmitted by spores. Other observers, however, such as Nocard, Galtier, and others, working on parallel lines, have not obtained the same result. The experiments on animals of S. Toledo (*Archives de méd. expér.*, Juillet, 1889), in which he attempted to infect the foetus by injecting cultivations of bacilli into the blood of the mothers were followed by negative results so far as infection of the foetus was concerned. While, however, these results are of the greatest interest we are forced to confess that transmission of tubercle from mother to foetus has in animals absolutely been found to occur.

Jani (*Lancet*, September 4, 1886, p. 455) has made certain observations on the condition of the sexual organs of both sexes, with the view of inquiring as to the presence of tuberculosis therein. He has examined the sexual organs in nine cases of phthisical male patients, and has not been able to detect bacilli in the semen of the vesiculæ seminales, but in five out of eight cases examined he was able to detect their presence in the testicles, and, in four out of six cases examined, in the prostate. From two phthisis cases in women he got only negative results by the examination of the ovaries; in the case of one woman, a case of chronic phthisis in which intestinal tuberculosis was present, he found bacilli in the Fallopian tubes. He, therefore, thinks that the virus of this disease may be transmitted in one of two ways; either by means of the semen, or by migration of the bacilli from a tubercular abdominal cavity into the uterus.

Infection through the medium of the placental circulation seems to be unusual. In the case of a woman who died when five months advanced in pregnancy, and in whom there was acute miliary tuberculosis with a large tubercular growth in the pulmonary vein, no bacilli could be found in the placental attachments or in the lungs or other organs of the foetus. It is however quite possible that in chronic tuberculosis a tubercular nodule might form near to the placenta, which it might latterly invade and so infect the ovum.

### 3. From one individual to another after birth.

The possibility of the transmission of tuberculosis from one person to another, has been so clearly demonstrated that it is now undeniable.

#### *Reception of the contagion by inhalation.*

Contagion undoubtedly may be conveyed by the air when the material containing it is in a dry state. Martin du Magny (*Contributions à l'étude de l'inoculation tuberculeuse chez l'homme*, Thèse, Paris, 1886), from a series of collected cases, states that sputum and the animal excretions are the usual carriers of contagion, and that hence among those most liable to receive infection are physicians, nurses, butchers, &c. Like results are given by Cornet, Heron (*Evidences of the Communicability of Consumption*, 1890), and others.

In summer, during warm dry weather, the phthisical sputum on clothes, the ground, &c., is converted into dust and carried about by the air, so that the bacilli are widely dispersed. On the other hand, the occurrence in winter of such diseases as bronchitis, during which the epithelial coverings of the air-passages are desquamated, offers the most favourable opportunities for inoculation of tubercular disease by inhaling particles of dust containing tubercular matter. The virulence of phthisical sputum is more persistent than that of any other tuberculous material—probably owing to the spores contained in its bacilli.

Cornet (*Zeitschrift f. Hygiene*, 1888) has proved the presence of bacilli in the air of rooms inhabited by tubercular patients. His method of proof consisted in injecting into the peritoneal cavities of guinea-pigs some of the dust from the apartments. Tuberculosis was produced in these animals.

Inhalation experiments made by Tappeiner, Thaon, Klebs, Weichselbaum and others, produced in almost every instance the early onset of tuberculosis of the air passages, which, beginning at the larynx, almost simultaneously involved the whole tract, from which the disease spread by involving in the first place the peribronchial glands.

#### *Reception of the contagion by ingestion.*

The effect of administering experimentally by the mouth tuberculous milk is almost always to set up a tubercular ulceration of the intestinal mucous membrane, and at a later date tubercular lymphangitis and disease of the mesenteric glands. The intestinal lesions extend at a still later period to the peritoneum. On the other hand, tuberculosis of the peritoneum, occurring as a sequence to inoculation in any way, is characterised by an eruption in the first instance, of miliary tubercles in the peritoneum, the spleen, and the liver, while the intestinal mucosa and the mesenteric glands are usually found after death to be free from disease.

As regards infants, there is no doubt that if fed on tuberculous milk, they often develop tuberculosis. And it has been shown by numerous workers that the milk from tubercular cows can be proved, either by experimental injection into animals or by microscopical examination, to contain the virus of tuberculosis. Children, moreover, during the earlier months of infancy are frequently specially open to the access of tuberculosis, for during this period the onset of gastro-intestinal catarrh or of some eruptive fever, by altering the condition of the mucous membrane of the intestinal tract or that of the epithelial covering of the air passages, practically removes the natural protection of these organs, and if contagion be then present the infant is liable to infection. During this period also there is the possibility of infection being transmitted from a phthisical parent or nurse, either by the agency of natural milk or by contact, as for instance, in kissing, or where a phthisical mother chews her child's food for it. The same thing may happen where two individuals, the one phthisical, the other healthy, use the same drinking utensils, &c.

The greatest stress ought to be laid upon the fact that milk from cows suffering from tuberculosis is in the utmost degree dangerous, as being likely to carry contagion, and unboiled cows' milk should therefore always be regarded as a dangerous material. There is, of course, the same danger from the milk of mothers or nurses who are the subjects of phthisis. Edington has detailed an observation ("Lactation in a non-pregnant animal coincident with Anthrax infection," *Journal of Comparative Pathology and Therapeutics*, vol. III, p. 33) that in the case of a non-pregnant rabbit which had been inoculated with anthrax, upon the day after the inoculation the mammary glands were in a state of active secretion, that upon examining the milk, which was of a watery character, numerous anthrax bacilli were found therein, and that at the autopsy there was found to be an irregular distribution of active tissue in the gland, all the active tissue having bacillary growth near it. Such an observation would tend to indicate the possibility of bacillary growth acting as a direct stimulus to glandular secretion, and although the irritative rôle played by anthrax bacilli is widely different from that played by tubercle bacilli, yet there may exist in tubercle a certain analogy with this action of anthrax; and we do, at any rate, know that tubercular disease occurring in the mammary gland does not, at least in the early stage of the malady, check the mammary secretion.

The danger of using the flesh of tubercular cattle as food was fully discussed at the Tuberculosis Congress in 1888. Nocard, experimenting with the muscle juice of tubercular animals, found that after injecting into animals one cubic centimetre, he got only negative results. He considers that the muscle juice is destructive to bacilli, and hence that muscular tissue when used as food need not be considered dangerous. We have, however, to remember that the connective tissue between the muscular fibres may be the seat of tubercular nodules which might be invisible to the naked eye, and hence we may still conceive a distinct possibility of danger. Galtier, experimenting with a series of twenty-two animals, to determine the extent of this possibility, got positive results in five cases. Chauveau and Arloing stated that there was not a constant danger in the consumption of meat from tubercular animals, but that the danger nevertheless did really exist and had to be guarded against. Cornil and Babes think that the views expressed at the Congress on Tuberculosis as to the danger from meat went too far, and they consider that the danger is present only when one has to do with meat derived from an animal which has been the subject of general tuberculosis.

Milk used as an article of diet should be boiled. Meat should also be thoroughly heated in order to ensure the destruction of any bacilli which may possibly be present in it. It has to be remembered when meat is roasted that the central portions are not heated as much as the outer portions are; in order to kill all the bacilli in meat, if there be any, the temperature of every portion should be at least 70° C. (158° F.), and this temperature should be maintained for at least an hour.

#### *Reception of the contagion by inoculation.*

Lehmann (*Ueber einen Modus der Impf-tuberculose beim Menschen*, Deutsche med. Wochenschrift, 1886) gives a detailed record of ten cases where inoculation took place during the ceremony of circumcision; in these cases the Rabbis who sucked the parts were themselves affected with tuberculosis, and they communicated the virus through their saliva. Elsberg (*Centralblatt f. Bacteriologie u. Parasitenkunde*, Bd. II, p. 577) also details three cases similar to the above, and in the lesions of which tubercle-bacilli were demonstrated.

As to infection of wounds, Volkmann stated many years ago that tuberculosis never occurred as the result of infection during extensive surgical operations or following upon severe injuries, but that it arose readily from the entrance of infection into a small and trivial wound. The external appearances following upon infective material being applied to a small wound consist in the formation of a small nodule of tubercular growth, or the formation of a small miliary abscess, around which there appears a dense papillomatous zone. This surrounding zone subsequently breaks down and suppurates, while the central portion heals or tends to heal, with the formation of a flat cicatrix, the destructive process meanwhile going on around and spreading peripherally.

Numerous cases are detailed in which individuals have in this way become infected. Eiselsberg (*Beiträge zur Impf-tuberculose beim Menschen*, Wiener med. Wochenschrift, 1887, No. 53) details four cases, one of a girl who was infected through ear piercing, one of a man who was infected through a small wound made with the point of a knife, one of a woman who was infected from the clothes which she was washing, and which contained tubercular pus from a patient with spinal disease, and one of a girl who was infected by means of a hypodermic syringe. In all these cases the lesion was not co-existent with any other form of tuberculosis. As

As to the possibility of tubercular disease being transmitted through the agency of vaccination, the observations and experiments made so far tend to point to a negative rather than to a positive conclusion. Chauveau (Copenhagen Congress, 1884), Meyer, and others decide against the possibility of infection from this source. Strauss (Communication à la Société de biologie, 14th February, 1885), reported that in twenty vaccinations made from phthisical individuals to healthy animals no tuberculosis ensued. Notwithstanding such assertions we should remember that it has been stated that certain other diseases can be, and have been, transmitted from one infant to another through vaccine lymph, and consequently vaccination ought to be performed with lymph taken either from animals in which the absence of tuberculosis is made certain by destroying and afterwards examining them, or if human lymph is to be used the very greatest care should be exercised in its selection.

4. *From one part to another of the same individual.*

Raymond ("Contributions à l'étude de la tuberculose cutanée par inoculation directe," *France Méd.*, 1886 p. 99) details how a patient who was the subject of tuberculosis infected a small wound in his own hand by sucking it.

## APPENDIX B.

## A Special Account of Dr. Koch's Method.

## CHAPTER I.

## DESCRIPTION OF THE REMEDY—PREPARATION.

THE remedy itself is a clear straw or brown coloured fluid with a faint smell and a slightly saline taste. It does not readily decompose. It is simply a glycerine extract of pure cultivations of the tubercle bacillus.

The strength of the glycerine solution used in making this extract is from 40 to 50 per cent. in water. The active principle is precipitable by absolute alcohol, and after purification from colouring matter and other substances, a colourless dry substance can be obtained, which contains the active principle in a much more concentrated state than the glycerine extract. This active principle is of a nature not yet known. Dr. Koch believes it is not a toxalbumin, because it can withstand high temperatures, nevertheless he thinks it is a derivative of albuminous bodies. There is, however, no necessity for purification of the glycerine extract, as the substances removed during the process have no effect on the human organism.—Koch, Jan. 15, 1891, *Brit. Med. Jour.* p. 126.—The quantity of active principle in the extract is estimated at a fraction of 1 per cent., so that 1 cc. of the original extract would contain less than 0.01 gramme of active principle.

## CHAPTER II.

## SUPPOSED MODE OF ACTION—KOCH'S HYPOTHESIS.

THE guiding principle in the application of the remedy is based on the hypothesis framed by Koch regarding the action of the substance, viz., that—

- A. The bacillus tuberculosis produces a substance causing coagulative necrosis of living protoplasm.
- B. That when the protoplasm is in a state of coagulative necrosis it does not support the life of the bacillus which then degenerates and dies, provided the patch of necrosis is large enough to separate the bacillus from living tissues.
- C. That when a few bacilli are present in a part, or isolated, the artificial addition of the necrosis-producing substance in certain doses, allows the necrosis to extend further than it would have done without such help.
- D. The effects of necrosis are:—
  1. The disintegration of the tissues and the formation of a slough which in certain localities can be eliminated with its enclosed bacilli.
  2. Interference with the growth of the bacilli which thus die much sooner than is the case under ordinary circumstances.
- E. The necrosis-producing substance, which in small doses acts readily on tuberculous material, in larger doses would affect even healthy cells, such as white blood corpuscles, hence the reaction produced in healthy individuals by large doses. By others the general reaction has been considered to point to a septic action, and this is supported by the occasional appearance of exanthemata and jaundice.

## CHAPTER III.

## MODE OF ADMINISTRATION.

1. The remedy has no effect when taken by the mouth.
2. It is very active when inhaled in the form of a spray.
3. It is best administered by the subcutaneous method. The strength of the solution recommended by Koch in his first communication was one part of the original extract diluted with 100 parts of distilled water containing a small quantity of phenol ( $\frac{1}{2}$  to 1 per cent.) This solution does not keep well. One cubic centimetre of the solution will therefore correspond to 0.01 of the original lymph. One cc. of this diluted solution is the smallest dose which Koch had found at that time capable of producing an effect in a healthy human being, and is the dose with which Koch recommended cases of lupus to be treated from the beginning. Smaller doses were to be used in other cases as will be explained afterwards. To inject this fluid subcutaneously, a small syringe is used. Dr. Koch recommends a modification of the Pravaz syringe, which he has designed for bacteriological purposes; this syringe has the advantage of being easily disinfected by means of alcohol, as there is no piston. The fluid is driven by air pressure, produced by compressing a small india-rubber ball connected with the upper end of the body of the syringe. It is well to remember, however, that several bacteriologists have had equally good syringes constructed for the same purpose, some of which seem even better

better and more easily disinfected than Koch's own syringe. This is specially true of Dr. Stroschein's syringe, for a description of which, see *British Medical Journal*, 1891, I, 292. The syringe is to be disinfected every time it is going to be used by means of a watery solution of mercury chloride, 1 in 2,000, and then by means of absolute alcohol. The tube of the needle must also be carefully cleansed by the silver wire being passed through it, followed by a stream of absolute alcohol. The same precaution is also to be taken after each injection. (Although these precautions seem to be sufficient to prevent the inoculation of a patient with the tissues or fluids of another, it has been proposed by someone to use a fresh needle for each patient.) The proper quality of diluted lymph being poured into the syringe, the injection is made beneath the skin of the back below the shoulder blade. This site was chosen because here it caused least irritation to the patient. The injection is to be made slowly, and the wound may afterwards be covered by some antiseptic dressing, although in practice this has now been abandoned.

*Dosage*: Guinea-pigs are much less susceptible to the action of the remedy than man. Thus, one fifteen-hundredth part of a dose which has hardly any effect on the guinea-pig, will act very powerfully on man.

In his first further communication the doses recommended for man by Koch were--

1. In cases of lupus, 0.01 cc. of the original lymph from the first, the second dose being given after a week or two. In some cases three or four such injections were said by Koch to have produced complete cicatrization, although the patients had been suffering for many years.
2. In glandular, bone and joint-tuberculosis—treated like lupus, a speedy cure should be obtained in recent cases, slow improvement in severe cases.
3. In phthisis, Koch recommends to begin with 0.001 of the lymph, the dose to be repeated daily until no reaction can be observed, then 0.002 to be repeated daily until no reaction is obtained, and thus the dose to be increased gradually up to 0.01 cc. or more. Larger doses can, however, be used when the patients are sufficiently strong. Advanced cases of phthisis might be benefited by the remedy for a time, but were on the whole unsuitable cases for the treatment.
4. Doses for children much smaller, 0.0005, or even less being used.

#### CHAPTER IV.

##### EXAMINATION OF DR. KOCH'S STATEMENTS.

In his further communications of 15th January, Koch says, "I can only say that all I have lately seen is in harmony with my former observations, and that I have nothing to retract of what I have before stated." It is therefore evident that the indications for treatment above recorded, are those corresponding with Dr. Koch's own ideas. It is useless to go here into details of the effects of the remedy in healthy and diseased individuals; Dr. Koch's descriptions may be taken as a basis for discussion, and could hardly be shortened. In discussing his views the whole of the text of his communications will be supposed to be known, but his own sentences uttered on various occasions will be compared with each other, and with the results of statistics collected in a large number of hospitals all over Europe.

It will be necessary to consider Dr. Koch's statements seriatim, and this will be done in the following order:—

1. Curative action of the remedy in various forms of tuberculosis.
2. Diagnostic value of the remedy.
3. Proportion between the general reaction and the amount of tubercular tissue.
4. Local reaction of tubercular tissues.
5. Danger attending the injection of the remedy.
6. Effects of the fluid on tuberculous tissues.
7. Effects of the fluid on the bacillus.
8. Reasons for keeping the remedy secret.

There is still a matter difficult to explain, and that is the entire absence of reference to the work of predecessors and colleagues. It would, however, perhaps, be premature to speak on this subject.

It will not be necessary to discuss very fully anything concerned with the hypothesis regarding the nature of the remedy and of its action, as many of the facts have yet to be proved.

##### 1. Curative action of the remedy.

Koch said on 16th August, 1890, "I have at last hit upon a substance which has the power of preventing the growth of tubercle bacilli, not only in a test tube, but in the body of an animal, from these researches I do not draw any further conclusions than the possibility of rendering pathogenic bacteria in the living body harmless, without injury to the latter."

On November 22 Dr. Koch says, "The remedy does not kill the tubercle bacilli, but the tuberculous tissues; it can influence only living tuberculous tissue, it has no effect on dead tissue. In such masses of dead tissue living tubercle bacilli may possibly still be present, and are either thrown off with the necrosed tissue, or may possibly enter the neighbouring still living tissue under certain circumstances."

On

On the same date, November 22, Dr. Koch says, "That lupus spots were brought to complete cicatrisation by three or four injections, that in glandular, bone, and joint tuberculosis the result was the same as in the lupus cases. A speedy cure in recent and slight cases, slow improvement in severe cases, also, that within four to six weeks patients under treatment in the first stage of phthisis were all free from every symptom of disease and might be pronounced cured, and that these experiences led him to suppose that phthisis in the beginning could be cured with certainty by this remedy." This last sentence, however, he qualified by saying, "Relapses, naturally, may occur, but it can be assumed that they may be cured as easily and quickly as the first attack."

On January 17 he says again, "And, in regard also to the therapeutic effect of the remedy, most accounts agree that in spite of the relatively short duration of the treatment many patients show improvement, varying only in degree. In not a few cases I am informed that cure even has been attained."

One needs only to compare these various statements of Koch himself to perceive that although he believes in the therapeutic effect of his drug, yet his notions concerning its value have altered. At first, the remedy was to stop the process of tuberculosis without injury to the patient. Then it was admitted that the process could only be successful when a certain amount of living tissue could be killed, and unless that tissue was removable the extension of the bacillus was still possible. Notwithstanding this, Koch still held that many cases of internal tuberculosis were curable, and that the cure might be effected within four to six weeks. Lastly, about sixteen weeks after the beginning of the experiment, Koch is satisfied with the following statement: "Many patients show improvement varying only in degree; I am informed in not a few cases that a cure even has been attained." Koch himself, out of 150 cases selected and treated under his own eyes, mentions only two cases of cure.

It seems, therefore, that one is justified in suspecting that the results have not come up to the expectations formed at first, and that Koch himself is somewhat disappointed. But if we compare with his statements those of a large number of observers working independently of him, although following his directions, we find that the results are much less favourable than Koch would lead one to believe. In phthisis, we find that in Berlin Dr. Guttman, who seems to have obtained the most satisfactory results, and was working at the Moabit Hospital, practically under Koch's own eye, out of forty-one cases of phthisis which had been from three to six weeks under treatment, and were all in the first stage of the disease, two girls only are described as cured, and these are the same as those described by Koch himself, in which the bacilli had permanently disappeared from the sputa, the symptoms had disappeared, and the cure had continued for some time.

Another case is said to have been nearly cured, and most of the others had shown improvement; five, however, had lost weight, which would mean that, even in those early stages, at least 12 per cent. of the persons did not seem to improve, and perhaps got worse under the treatment.

Other favourable results were also recorded by Fränkel, who, however, could not report more than one case of cure by the 21st January.

Fürbringer, at the Friedrichshain Hospital, on the 27th December, out of forty-one phthisical patients, treated for four weeks, mentions ten cases as benefited in a striking manner. Ziemssen and Oppenheimer both remark that under the injection the cough is so much better that narcotics can be omitted. When, however, we come to the reports of the physicians of the Charité Hospital, where it must be remembered the treatment was first carried out in a public institution, and that very early, and under Koch's own supervision, we find that Senator, for instance, gives a very guarded opinion even on 10th December, that is, when enthusiasm was still high. He certainly does not report a single case of cure, although he mentions improvement in several cases. Dr. Leyden, of the same hospital, was also very much impressed in Koch's favour at the beginning, and was a strong believer in the efficacy of his treatment. But in the recent discussions which have taken place in Berlin, he has said nothing, or very little, and on the 14th December Jürgens reported two cases of death under Leyden after a series of very small doses. It is true that the cases were advanced. Everybody knows that on 7th January at least sixteen patients suffering from phthisis in various stages had died at the Charité whilst under, or after, treatment, as shown by Virchow's accounts of the *post-mortems*. The most interesting record, however, is that of Professor Ewald, of the Augusta Hospital, who, on 21st January, gave an account of 114 cases which had been treated by him, twenty-nine of which had received the full treatment (seventy-three were still under treatment), five died whilst under treatment (two almost certainly from the injection alone), and seven left, owing to their condition not being sufficiently improved, and to their not being satisfied with the treatment. Of all these patients, Dr. Ewald said he could not consider a single one cured. Some of those discharged had certainly improved, but he could not say for how long, whilst the treatment was so dangerous that he felt it was the duty of any physician to warn the patient of the danger he was running, just as is done before the performance of a surgical operation. These are the results of the Berlin physicians. From various towns in Germany, in Austria, France, Belgium, and even from England, Spain, and Italy, which from the first were favourable to the treatment, similar opinions could be obtained, and in some cases the treatment was condemned in very strong words. It would not be difficult to find more than thirty cases of death of phthisical patients occurring during treatment, it can therefore be said safely that Koch's treatment in advanced cases of phthisis pulmonum is now universally admitted to be contraindicated and for pulmonary phthisis,  
even

even at the early stages, it is for the present at least not considered to be a success if indeed it is not considered to be more or less a failure, at least as far as its curative properties are concerned. It is likewise contraindicated where the tuberculous process, after having progressed in the ordinary way, suddenly rapidly progresses, and on the other hand it is also contraindicated when the tuberculous matter has become encapsuled and has long lain without causing symptoms. In tubercular meningitis it is strongly contraindicated. One often meets with patients under the injection who are in a remarkable condition of well-being or well-feeling rather (euphory), probably, however, to be explained by the "great expectations" that the patients often have from the injections, and thus a simply psychical phenomenon.

In laryngeal phthisis many cases of improvement have been recorded both in Berlin and elsewhere. There are, however, some doubts as to the effect of the lymph on the amount of ulceration present.

In tuberculosis of the urinary organs the general opinion has been distinctly unfavourable, although some cases of improvement have been recorded. In tuberculosis of the testicle the results have been generally unfavourable. In intestinal tuberculosis or tuberculosis of the alimentary canal, generally speaking, the results have been very unfavourable, and several cases of death have occurred.

In tuberculosis of the brain and meninges the treatment has generally been found deadly.

In tuberculosis of the supra-renal bodies, Addison's disease, the effects have been doubtful.

In scrofula, and especially scrofulous affections of the eye, the treatment is said to be very successful by some.

In tuberculosis of the iris and internal parts of the eye the effects have apparently been, in some cases, disastrous.

In bone and joint tuberculosis opinions are much divided; it seems, however, that in cases taken so early as to make the diagnosis almost a matter of doubt, cases have been cured. But when bones have been distinctly affected the results have been generally unsatisfactory, except when there were free communications with the surfaces, through suppurating sinuses, or where operative interference had been resorted to.

In tubercular glands the results have been sometimes favourable, sometimes unfavourable, but on the whole generally good, although it is impossible to speak of a cure within such a short time. The most satisfactory result have been obtained in cases of lupus, a large number have been treated in all countries, and the immediate effects are described by almost every observer as simply marvellous, while the tendency to cicatrization is certainly considerably increased. But of the few cases which have been recorded as cured, several, including at least two which had been treated under Koch's eyes, have relapsed after a few weeks, and the process is said to have recurred with great intensity. All these statements can easily be verified by a look at the tables bearing on this subject.

The general conclusion to be derived from all this regarding the curative effects of Koch's treatment is that this effect has not been proved, and that in some cases instead of the treatment curing tuberculosis it actually kills the patient.

It is however just to say, that considerable improvement, such as could hardly be obtained by any other method in the same time, has been recorded by several observers, though the duration of this improvement seems to be a matter of doubt in most minds. Neither must I omit to mention that a great many surgeons, such as Lindner, Bardenheuer, Koehler, Bardeleben and others, say that the healing of wounds progresses more favourably with the Koch injections than without them.

Conditions in which the use of the remedy is contraindicated—we may put them together for convenience of reference—

1. Advanced cases of phthisis pulmonum.
2. Where the tuberculous process suddenly rapidly progresses after a period of comparatively slow progress.
3. Where the tuberculous matter has become encapsuled and has ceased to cause symptoms.
4. Large pleuritic effusions.
5. Tuberculosis of the brain and meninges.
6. Nephritis complicated with dropsy.
7. Extensive amyloid disease.
8. Cachexia or debility from any cause whatever.

## *2. Diagnostic value of the Remedy.*

Koch said on November 22, that: The symptoms of reaction which he had described occurred without exception in all cases where a tuberculous process was present in the organism; whilst the healthy human being reacts either not at all or scarcely at all after a dose of 0.01 cc. of the lymph, and the same holds good, that is, there is no reaction, in patients suffering from diseases other than tuberculosis. Koch adds, "I think I am justified in saying that the remedy will therefore in future form an indispensable aid to diagnosis." And on January 17, he says again, "the remedy exercises a specific action on tuberculous tissue, and can in consequence be employed as a very delicate and certain reagent in searching out hidden, and diagnosing tuberculous processes." In

In connection with the diagnostic value of the remedy we may also discuss the alleged—

3. *Proportion existing between the general reaction and the amount of tuberculous tissues.*

As experienced by Koch on November 22nd, when there is a good deal of living tuberculous tissue a small amount of the active principle suffices to cause reaction. When the tissue capable of reaction disappears a larger dose of the remedy is required to produce reaction. It may also be well to consider here the

4. *Local reaction of Tubercular tissues.*

Consisting of swelling, increased sensibility, and redness, which according to Koch are so typical and visible in all cases of tuberculosis of superficial parts, and which by analogy are also supposed to occur in the internal organs. Generally speaking it must be said that Koch's observations have been relatively confirmed, but that strong exception has been taken to his absolute statements, *i.e.*, whilst both general and local reactions have been observed in cases of tuberculosis with doses of 0.01 grm. or less, there have been not a few cases in which such reactions have not been observed even with larger doses. Thus James Israel records a case of lupus in which the bacillus was seen under the microscope, and in which nevertheless no reaction of any sort supervened. What the explanation of this is one cannot say: it is "an exception," which when explained will surely throw much light on the action of the remedy. On the other hand, healthy persons and non-tubercular patients have been reported by many to have reacted to doses smaller than 0.01. It follows that Koch by saying that the reaction occurs without exception, and that the remedy is, therefore, an indispensable aid to diagnosis, has gone further than actual facts warrant. But relying on Koch's statement some have striven to throw light on the nature of certain affections allied to tuberculosis. Thus in lupus erythematodes, Lewin, of Berlin, obtained both general and local reaction; Arning, of Hamburg, only the general reaction, and Koebner, of Berlin, only the local. On the strength of these results, Lewin would associate *L. erythematodes* and *L. vulgaris*, while the others, and especially Koebner, would still keep them apart. Leprosy is another of those allied diseases, and in this connection is of extreme interest.—(Vide the tables). It has also been used to differentiate lupus on the one hand from syphilis and carcinoma on the other hand, to determine if lichen syphiliticus has a tuberculous character, to disclose latent tuberculosis and to show whether or not after an operation any tuberculous material remains behind.

As to the proportion existing between the amount of disease and the reaction, there are very few observers ready to support Koch on that point, in fact, most observers have flatly contradicted it, and have insisted upon the extreme unreliability of the reaction.

Even the local reaction has been observed by many to be deficient in many cases. As all these accounts will be found summed up in tables only the general conclusion need be given here.

5. *Danger attending the use of the remedy.*

Regarding the absence of danger of the remedy upon which Koch himself insists from his first to his last communications, there can be no doubt as to the reverse being true.

Not only have cases of advanced tuberculosis died, but not a few patients who might have had more years to live have fallen victims of the experiment, the fatal result from pyopneumothorax due to rupture of the pleura, reported by Dr. Lazarus of the Jewish Hospital in Berlin, is an instance of a case of this kind, and others are not wanting—for instance collapse (Kast of Hamburg), perforation of the intestines (B. Fraenkel of Berlin), fatally violent reaction (Oppenheim of Berlin), also Jariach and Burckhardt. Clinical observations of fresh eruption of tubercle are recorded in lupus of the gum by Litten and Baginsky, in tuberculosis of the tongue by A. Fraenkel, Berlin, and general miliary tuberculosis has also been seen. Diarrhoea is common. Owing to the swelling of the mucosa, tracheotomy has been needed. The case of Jarisch above noted is important, for here death supervened quite unexpectedly a few hours after the injection, and it only shows that in certain circumstances the remedy just like chloroform may prove lethal. Experience alone will show whether or not the grave complications and the deaths may be put aside in view of the possible blessings conferred by the Koch remedy, as has in fact happened in the case of chloroform. And it would be unjust to omit to mention here that clinicians of great experience, such as Litten, Fraenkel and Fürbringer, of Berlin, Ziemssen of Munich, and yet others have had no untoward results whatever.

The exanthemata, herpes and jaundice that sometimes occur are, like the hysteric attacks recorded by Wolff of Goerbersdorf not important.

The danger of the remedy is also indicated by the nature of some of the symptoms supervening during treatment, such as continuous fever, intractable dyspnoea, hæmoptysis, erysipelatous rashes, albuminuria, hæmaturia, diminution of hæmoglobin, anæmia, the rapid formation of ulcers in parts apparently healthy, and perhaps the passage of the tubercle bacillus into the blood. After such a list of phenomena recorded by competent observers, it is not to be wondered at if the fluid which was at first used rather freely is now administered with extreme caution. Yet cases of death have been recorded after doses of 0.001 and of 0.002gr., which at first were considered so safe, that Koch recommended their use in cases of Phthisis *where there was great debility.*

### 6. Effects of the fluid on tuberculous tissues.

Koch says on 22nd November:—"The remedy does not kill the tubercle bacillus, but the tuberculous tissue; it can only influence living tuberculous tissue, it has no effect on dead tissue." In explaining the action of his remedy, it is evident that he considers the action in the light of a poisoning. This he expressed freely on 17th January. When speaking of the products of the tubercle bacillus he says: "among these substances is one which in a certain concentration destroys living protoplasm, and causes it to undergo a transformation into the condition called coagulation necrosis.

It is in calling forth such changes that to my mind the action of the remedy seems to consist; it contains a certain amount of the necrosis-producing substance." He goes on to say, that even in healthy persons, this substance in large doses has a deleterious influence on certain elements of the tissues; probably white blood corpuscles or cells closely related to them, this being the cause of the general reaction observed in these cases.

Now, as a result of direct observations in lupus patches, observed during life and after excision during the local reaction, both Cornil, in France, and Kromayer, in Germany, have come to the conclusion that there is considerable congestion of the vessels, abundant exudation of serum or lymph, and a considerable amount of small-cell infiltration, especially around tuberculous nodules, almost amounting to suppuration. Indeed, a thick layer of white corpuscles forms between the crust covering the lupus patch and the underlying tissues. Without going into further details, it is pretty evident that the remedy does not simply start a necrotic action, but a distinct inflammation of the parts. Cornil was struck with the fact, that in the pus covering a patch of lupus thus inflamed, a large number of bacilli were found, a thing which is all the more remarkable that the bacilli are generally very scanty in lupus.

Jürgens, Jarisch, Chiari, Korányi, and lastly Virchow, and several other observers have, by *post mortems* on numerous cases, proved that tubercular lesions of internal organs undergo similar inflammatory changes. So that although necrosis does occur under the influence of the remedy, this necrosis is probably less the direct effect of the actions of the remedy on the tubercular tissues than of an intense inflammatory reaction, modifying suddenly the condition of nutrition of all parts which are already in a state of chronic tuberculous inflammation.

The effect of the remedy on the general bodily metabolism has been investigated by Leyden, Loewy and Hirschfeld, who found that on the days when there was no fever, it was not in the least affected, and on the fever days only very little. With suitable diet the patient can be maintained in equilibrium.

The changes which have been observed in various affections and organs are the following:—

Lupus: Kromayer:—7½ hours after injection, general swelling and redness, small-cell infiltration, amounting almost to suppuration, around small yellow tubercular nodules. Nodules themselves more infiltrated with cells than usual. Epidermis and papillary layers apparently breaking down, capillaries and lymph vessels greatly infiltrated, much fibrin in lymphatics, skin at margin of lupus patch in a state of acute inflammation. Cornil: Same as Kromayer, and also exudation of serum, and of enormous numbers of lymph cells accumulating on the surface of the patch. These seem to carry away with them a large number of bacilli. Chiari: Same as Cornil and Kromayer.

Leprosy:—The case of this disease is of the highest scientific interest, because its bacilli are hardly to be distinguished, either by form or colour reaction from those of tuberculosis. According to Arning, one must distinguish between *lepra anæsthetica* and *L. tuberosa*, for the former gives no reaction, and the latter may give a general reaction. (It was Arning who was sent by Virchow to study leprosy at Hovai, and who succeeded in inoculating the disease from man to man.) Goldschmidt, of Madeira, on the other hand, saw *L. tuberosa* react locally, and even says that the effects were curative. He thinks that there is no essential difference between leprosy and tuberculosis—the one gradually passes into the other—the general reaction in leprosy merely appears later than in tuberculosis, and in the local reaction he saw the leprosy tissue break down. But, as opposed to all this, Neisser, of Breslau, who is one of the best specialists in leprosy in Germany, does not attach any importance to these observations, for without any medical treatment at all, one sometimes sees leprosy tissue break down. One case was treated by the Koch remedy in the Charité, Berlin, and remained unaffected.

Mucous membrane of month, palate and epiglottis:—Jarisch and Pommer—girl, 17; Lupus, dose 0.002. Great swelling around the ulcers. Virchow (summing up of twenty-one cases). Great swelling and formation of small tubercles in neighbourhood of ulcers.

Intestine:—Jarisch and Pommer—girl, 17; Lupus, dose 0.002, tubercular ulcers, hyperæmia, hæmorrhages, large masses of bacilli at basis of ulcers. Chiari—phthisis, three cases, ulcerated surface covered with recent very vascular granulations, no tubercle found. Jürgens—Virchow's Assistant; advanced phthisis, necrosis going on sometimes to perforation. Virchow (summing up of twenty-one cases). Fresh submiliary tubercles under peritoneum in neighbourhood of ulcers.

Larynx:—Jürgens—Advanced phthisis. Tubercular ulcers transformed into simple ulcers. Virchow (summing up of twenty-one cases). Even when base of ulcers becomes clean the surrounding parts become swollen to a very dangerous extent. Occasionally more severe phlegmonous inflammations occur (œdema glottidis erysipeloides and retropharyngeal abscesses), young tubercles seem to form in their neighbourhood.

The internal organs generally:—(Virchow) uncommonly inflamed.

Lungs:—

Lungs:—Jarisch and Pommer—girl, 17; Lupus, 0·002, tuberculous foci, hyperæmia, hæmorrhages, fibrinous and small cell exudation, large masses of bacilli in the bronchi. Chiari.—Three cases of phthisis, cavity lined with hæmorrhagic granulations, cheesy modules surrounded by zone of congestion. Korányi.—Diabetes and phthisis, hæmorrhagic hyperæmia, recent sero-hæmorrhagic pleurisy. Jürgens.—Advanced phthisis. Virchow (summing up of twenty-one cases)—

- in fatal cases of ulcerative phthisis several recent changes of considerable extent,
- (a) Caseous pneumonia of very unusual extent, and having certainly begun during treatment whilst the patients were under observation. The mass consisted of foci so close to one another that scarcely any pareuchyma was left between them;
  - (b) Another form of pneumonia still more different from what is generally found in phthisis—it is allied to catarrhal pneumonia, the products are softer, moister, and looser than in the usual forms. In the midst of the inflammatory patches foci of softening develop, leading to excavation similar to those found in gangrenous broncho-pneumonia.

This form of pneumonia might for the present be termed injection pneumonia (see Virchow's lecture and also documents).

Serous Membrane, pleura, pericardium, peritoneum:—Virchow (summing up of twenty-one cases). Showed in many cases fresh eruptions of perfectly intact submiliary tubercles, even when injections had been made weeks before; these were probably the results of fresh outbreaks. This is specially indicated by tubercles found in the epicardium, in a place not in contact with any other affected part. Jarisch and Pommer—girl, 17; lupus, 0·002. Capillary hæmorrhage of pericardium.

Lymphatic Glands:—Jarisch and Pommer—girl, 17; lupus 0·002. Mesenteric—peribronchial—cervical cheesy glands, containing tubercular foci, considerably swollen. Jürgens—(Advanced Phthisis). Tubercular foci, zone of intense congestion and granulation tissue around the tubercular foci. Virchow (summing up of twenty-one cases). Especially in bronchial and mesenteric glands—quite unusual degree of enlargement, and notably that form of medullary swelling which is characteristic of acute irritations, and is the result of proliferation of the lymphatic cells. This may, perhaps, account for the leucocytosis, observed in many cases.

Blood:—(Jürgens)—Leucocytosis.

Spleen:—Jürgens—(Advanced phthisis). Tubercular foci, zone of intense congestion and granulation tissue around them. Virchow (summing up of twenty-one cases). Miliary tuberculosis apparently quite recent in some cases.

Thymus:—Jarisch and Pommer—girl, 17; lupus, 0·002. Capillary hæmorrhages.

Bones:—Jürgens—Advanced phthisis. Diffuse hæmorrhagic softening of medulla, many giant cells, but no bacilli, in a few places tubercles undergoing cheesy degeneration.

Liver:—Jarisch and Pommer—girl, 17; lupus, 0·002. Slight cloudy swelling. Jürgens—Advanced phthisis. Fatty infiltration, with retention of bile, recent and old patches of hæmorrhage, a few true tubercles with giant cells, general leukaemic infiltration. Virchow (analysis of twenty-one cases). Recent miliary tubercles in several cases. Körte and Hausemann—child, 4 years; fungous disease of knee. Recent miliary tubercles in the liver.

Kidney:—Jarisch and Pommer—girl, 17; lupus, 0·002. Slight cloudy swelling. Jürgens—Advanced phthisis. Cheesy focus, surrounded by zone of intense hyperæmia and granulation tissue. No tubercle, no giant cell. Virchow (summing up of twenty-one cases). Miliary tuberculosis of recent origin in some cases.

Cerebellum:—Jarisch and Pommer—girl, 17; lupus, 0·002. Brain and spinal cord. Oedematous hæmorrhagic pachymeningitis, capillary hæmorrhages in spinal cord. Meninges—Virchow (analysis of twenty-one cases). Colossal hyperæmia and infiltration, recent tubercles also in brain. Old tubercles of brain and cerebellum (solitary tubercles) unaffected. Körte and Hausemann—child, 4 years; fungous disease of knee. Recent miliary tubercular meningitis, oedema, congestion of brain.

Eye:—Koenigshöfer records that scrofulous ulcers of the cornea rapidly heal under the remedy. He also saw that an atrophied eye that had lain harmlessly there for years reacted, showing that tuberculosis had been the cause of the phthisis bulbi.

A single glance over the few *post mortem* results which have just been analysed will be enough to convince one of the severity of the changes which are initiated by the fluid, at any rate in advanced tuberculosis, and as few of the cases just analysed have succumbed to the effects of large doses, it is evident that one of Koch's contentions, namely, that the fluid, if not capable of producing cure of, may bring about beneficial changes in advanced cases of tuberculosis, must be abandoned entirely.

On the other hand, it is to be remembered that so great is Virchow's reputation that very few in Germany feel themselves competent enough to venture to contradict him, and this, although rightly or wrongly, there is an impression abroad in Berlin that Virchow is not predisposed to view with favour, not to use any stronger language, the worth of Koch and his school. Yet there are some who are taking part for Koch. For instance, Professor Alb. Neisser has lately insisted that—

1. The number of fatal cases does not show anything against Koch's method, because advanced cases have been injected, not in the hope of cure, but simply to please the patient.
2. Eruptions of fresh tubercles are formed without the injections, and it is not only possible, but likely, that they sprang from tubercle bacilli already present but latent.
3. There are not a few cures recognised clinically.
4. Adverse criticism would disappear if one were to adhere strictly to Koch's injunctions.

### 7. *Effects of the fluid on the bacillus.*

In August, 1890, Koch stated that he had hit upon a substance which had the power of preventing the growth of the bacilli not only in a test tube, but in the body of an animal.

On 25th November, although he speaks of the disappearance of bacilli from the sputum of phthisical patients, he says emphatically that the remedy does not kill the bacillus.

On 15th January, he says, "the bacilli would be so disturbed in their growth (by the effects of the injection on the tuberculous tissue)—that they would die off much sooner than is the case under ordinary conditions."

From this it is evident that the original belief, that the growth of the bacillus could be checked within the body, was soon abandoned, although in his last communication Koch reintroduces it in a modified form. It is only necessary to say that whilst some observers, Guttman among others, have recorded the entire disappearance of bacilli from the sputum of at least two cases, and that for a period extending over several weeks, the great majority of observers have come to the conclusion that the bacilli remain in the sputum, even after very prolonged treatment. They seem to disappear or be modified at times, but recur after a while.

Fraenzel asserted that the bacilli either diminished in numbers, and may disappear altogether, or undergo certain changes of form, which he groups under four heads: 1. Most are smaller and thinner; 2. Some are slightly swollen at the two ends; 3. Some are broken across in the middle; and 4. Some are comparatively long, and made up of particles in a moniliform fashion. This last sort, it must be remarked, however, is found in long standing cases, even without any Koch remedy. Later, however, these changed forms were so often found in ordinary cases that the importance of the change is now given up. See Figs. V and VI.

Biodert insists that in order to find single bacilli it is necessary to employ the method of sediments.

### 8. *Reasons for keeping the remedy secret.*

On 15th November, 1890, Dr. Koch gave the following reason for not disclosing the nature of his remedy:—

"As regards the origin and the preparation of the remedy, I am unable to make any statement, as my research is not yet concluded."

On 15th January, 1891, the explanation seems to have been abandoned, and the following is volunteered:—"So long as the only point of importance was to judge of the correctness of my statements it was not essential to know what the remedy contains and what its origin is; on the contrary, it was clear that the subsequent experiments would be all the more unprejudiced the less was known of the remedy itself, but now that such experiments in sufficient number have been made, and have proved the importance of the remedy, the remaining task is to study the remedy beyond the application it has hitherto found, and, if possible, to apply the principles which lie at the foundation of the discovery to other diseases. This task, of course, demands a full knowledge of the remedy."

It is also to be remembered that in his public speeches, Herr von Gossler, alluded freely to the danger of making public a process which, on account of its complication, could only be carried out by very competent persons, and said that on that account it was necessary to place the manufacture under the control of the State.

Such conflicting arguments would, to one not knowing Koch's reputation for integrity, lead to rather uncharitable conclusions. It is, however, easy to show that Koch was probably acting under pressure, and that although his aims may appear to have been mercenary, we must blame his friends for this rather than Koch himself.

As to the position in which he has thus permitted himself to be placed in connection with the secrecy and manufacture of his remedy much might be said, but it does not seem to the Reporter that this is the proper place to discuss it.

## APPENDIX C.

## Various Reports on the Treatment.

## CHAPTER I.

## REPORTS FROM GERMANY.

## FIRST PERIOD.—PERIOD OF ENTHUSIASM.

(For statistical returns when they are not entered here see general and special statistics).

Von Bergmann, Nov. 22, 1890.—Cases treated so far were :—

1. Lupus ... ..	13 cases
2. Glandular tuberculosis ... ..	2 "
3. Tuberculosis of the joints and bones ... ..	16 "
4. Tuberculosis of the larynx ... ..	2 "
5. Syphilis (control case) ... ..	1 "

Total ... .. 34 cases inoculated.

Reaction observed in the thirty-three tubercular cases. Reaction absent in the one non-tubercular. Diagnostic value of the lymph extolled. Tubercular lesions demonstrated where they were not even suspected. Prognosis favourable. Surgical operations would however be necessary in many cases. The treatment might have to be repeated to guard against relapse. (Further details in the article).

H. Feilchenfeld, Nov. 22, 1890.—Treatment began on September 22, 1890. Three cases of lupus, one historical, as being the case in which Koch's classical symptoms were observed. A complete cure seemed to have been effected, yet the patient still reacted, and probably had more tubercular tissue awaiting destruction. Second case got worse after each injection. Third case well advanced towards cure. Cases of glandular tuberculosis.—Apparent cure had resulted, no more reaction being obtained after a time, even with large doses. Cases of tuberculosis of bones and joints.—Apparent cure, no more reaction being obtained after a time even with large doses. Phthisis.—Three cases in early stage cured, their sputum free from bacilli; auscultatory signs improved; judgment must however be reserved. Advanced phthisis.—No cure yet, but improvement of symptoms; no increase; no loss of weight.

Professor Fraentzel, Nov. 22, 1890.—Cases divided in two classes; those in (1) First state of phthisis:—Results of treatment—General improvement, appetite keener, weight increased, night sweats disappeared. Bacilli—First decreased, then became stunted; their vitality is, however, not destroyed. (2.) Advanced stages of phthisis:—Results of treatment—No change of condition. Two deaths during treatment; they were desperate cases. *Post-mortem* showed no signs of healing. Warning against large doses. One death twenty-four hours after injection. Probable necessity of very long continuation of treatment in some cases.

Professor Gerhardt, Nov. 22, 1890.—Three cases exhibited to illustrate progress made in diagnosis and treatment of tuberculosis. 1. Tuberculosis of throat:—Previous treatment had failed; reaction occurred on Monday after inoculation on Sunday. 2. Initial stage of consumption:—Marked reaction. 3. Affection of apex of lung.—Suspicion of tuberculosis, no bacillus found; injection of Koch's fluid. No reaction followed, which is conclusive proof that the affection is not tuberculous.

## SECOND PERIOD.—PERIOD OF DOUBT.

*Phthisis, Effects of Treatment.*

Fürbringer, Berlin, 27 December, 1890.—In 63 cases observed in the Friederichshain Hospital, Berlin, (41 phthisis). The classical reaction compared to an attack of influenza.

Characteristic features:—1. Rise of temperature with "characteristic Matterhorn peak." 2. Circulatory and respiratory disturbances. 3. General symptoms—prostration, pains in the head and limbs. 4. Changes in the local appearances. 5. Local pain, &c.

Occasional phenomena:—Cutaneous eruptions, jaundice, sweating. 2. Diarrhoea. 3. Albuminuria. 4. Asthmatic symptoms (Dyspnoea). Of the characteristic phenomena, one or several, even the fever may be wanting; in some cases the temperature actually falls. Good effects when they are produced occur in the course of four weeks, they consist in:—1. Modification or disappearance of physical signs. 2. Diminution of expectoration. 3. Absence of bacilli. 4. Increase in weight, &c.

Senator (Charité), Berlin, 10 December, 1890.—Treatment contra-indicated in case of—1. Nephritis complicated with dropsy. 2. Large pleuritic effusions. 3. Extensive amyloid disease. 4. Cachexia or debility from any cause whatever. 5. Tuberculosis of the brain, or meninges.

Helferich,

Helferich, Greifswald, December, 1890.—1. Usual reaction, specially in lupus. 2. Frequently the second and third injection of the same dose followed by higher fever than the first. 3. Interval between injection and onset of fever is longer after the first than after the following injections. 4. Duration of the fever diminishes after several injections when the dose at each injection is the same. 5. In one case scarlatiniform rash; in one case morbilliform rash; in about one-third of cases herpes of lips and eyelids was observed. 6. No bad effects.

Rosenbach, Breslau, December, 1890.—Complications produced:—Increased crepitations in slightly affected parts of the lungs; development of pleurisy; diarrhœa, one case; papular and vesicular eruption, one case; scarlatiniform rash in one case; albuminuria; anuria, polyuria; jaundice in one case.

When there is a natural tendency to decrease in the temperature the reaction does not cause so high a pyrexia as when the reverse is true.

### THIRD PERIOD.—PERIOD OF DISBELIEF.

#### *Post mortem examinations, results of.*

Virchow (Charité), 7th January, 1891.—Development of fresh tubercles of the sub-miliary type, specially in places where metastasis was indicated. Tuberculous ulcers already existing, show active proliferation at their edges. Lymphatic glands, especially bronchial and mesenteric, show a quite unusual degree of enlargement, and notably that form of medullary swelling which is characteristic of acute irritations, and is the result of proliferation of lymphatic cells. This may perhaps account for the leucocytosis found in many cases. In the larynx even when basis of ulcers becomes clean the surrounding parts become swollen to a dangerous extent. Occasionally more severe phlegmonous inflammations occur (œdema glottidis erysipelatodes and retropharyngeal abscesses). Young tubercles seem to form in their neighbourhood. Lungs: In fatal cases of ulcerative phthisis, recent changes of considerable extent. A. Caseous pneumonia or hepatisation in some cases so extensive that Virchow had not seen such for years, and the history proved that the consolidation had begun during treatment. B. Another form of pneumonia which is still more different from what is found usually in phthisis, it is allied to catarrhal pneumonia, but differs from it. It reminds one of a phlegmonous condition, and the products are softer, moister, and looser than in the form usually complicating phthisis. In the midst of the patches foci of softening develop, leading to the formation of excavations similar to those found in gangrenous broncho-pneumonia. In the walls of cavities may be hæmorrhage—leading to death by hæmoptysis. Serous membranes (pleura, pericardium, peritoneum) showed in many cases fresh eruptions of perfectly intact sub-miliary tubercles, even when injections had been made weeks before. These were probably the result of fresh outbreaks. This is specially indicated by tubercles found in the epicardium in a place not in contact with any affected part. Meninges: Colossal hyperæmia and infiltration and fresh tubercles. Brain: Idem. Intestine: Necrosis going on sometimes to perforation. Fresh sub-miliary tubercles under peritoneum in neighbourhood of ulcer. Old solitary tubercles of brain do not seem to be much affected. Miliary tubercles sometimes show regressive changes, but often not. Sub-miliary tubercles very often show no regressive changes. As the Koch fluid sets up visible acute inflammation of the externally affected parts, so does it likewise set up analogous changes in the diseased internal organs.

Körte: Urban Hospital, Berlin, 14th January, 1891.—1. Very severe symptoms follow the larger doses used at the beginning, so that smaller doses and longer intervals had to be resorted to. In one case of tuberculous disease of knee and true pelvis, no reaction was obtained even after 0.008. 2. In a few cases loss of weight. In some slight gain. 3. In some children with local disease only, marked anæmia had developed. 4. In one case measly eruption with herpes. 5. In a case of recent tubercle of knee-joint marked hallucinations lasting for a day after 0.008. In another case an epileptic seizure in a patient subject to them. 6. In patients which had been treated by iodoform, reaction was much delayed. 7. The intensity of the re-action did not correspond with the intensity of the disease. Some patients with extensive lesions did not react well until perhaps a dose of 0.005 had been reached, then they reacted strongly. 8. In two cases which had till then reacted moderately dyspnoea set in after doses of 0.003 and 0.009 respectively; the dyspnoea lasted till the death of the patients, which took place respectively ten and twenty-eight days after last injection.

Israel, Berlin, Jan. 21, 1891.—1. Remedy, even apart from caseous foci, does not in all cases act on tuberculous tissue. 2. The remedy does not invariably excite obvious necrosis, but inflammations. 3. There is no proportion between the degree of the local reaction and the intensity of the general reaction. 4. The degree of local reaction is no measure of curative effect. 5. Sufficient time has not elapsed to form judgment.

Ewald, Augusta Hospital, Berlin, Jan. 21, 1891.—1. One cannot predict the probable character of the reaction, nor how the case will go. 2. Bacilli had not been found in the blood after injection as recorded by V. Liebmann of Trieste. 3. Pleuritic effusions were rapidly absorbed. 4. Apparently cured cases seemed to show sign of retrogression after a short interval except in a few instances. 5. He had not yet seen one case which he could say was cured. 6. Severe and fatal hæmoptysis had occurred in two cases out of 114. 7. Tubercular meningitis had supervened on comparatively slight lung affection. 8. Some cases free from fever at the beginning of treatment, and showing only slight reactions, had developed a continuous fever, which had caused abandonment of the treatment. 9. Improvement, similar to that obtained with Koch's treatment, had been noticed by Fraentzel in 1887 with creosote treatment.

## CHAPTER II.

## REPORTS FROM AUSTRIA.

(See also general and special statistics.)

Weichselbaum, Vienna (from observation in Berlin), Nov. 29, 1891.—1. Reaction of tubercular subjects very marked. 2. Reaction does not always follow the course described by Koch. It is impossible to account for, or to foresee these departures. 3. General and local reactions sometimes assume a dangerous character. 4. Curative effect is not yet proved, but the changes are in the direction of a healing process.

Billroth, Vienna, Jan., 1891.—Will defer his verdict till he has studied the action of the remedy for a year or two.

Kaposi, Vienna, Jan., 1891.—Has noticed good improvement in lupus, but seems afraid of relapses.

Rydygier, Cracow, Dec., 1890.—Reaction well marked in tuberculous affections. In almost all cases enlargement of the spleen during the fever. Frequently slight albuminuria.

Liebmann, Trieste, Jan., 1891.—Nine cases under observation and treatment; all the patients reacted to small doses. Bacilli, sometimes broken or granular, were found in the blood on the evening of the day of the injection or the next day. They disappeared if the injection was not repeated. No bacilli could be found in the blood of patients not treated. (Results not confirmed by Ewald, nor by Cantani, nor by Phineas Abraham.)

Professor Hueppe and Dr. Scholl, Prague, Jan., 1891.—These observers analysed Koch's fluid before publication of its composition, and found it to contain: albuminoid bodies and glycerine in large quantities. 2. They prepared extracts from tubercle bacilli cultures with peptone, 3·8 per cent., glycerine, 5 per cent., common salt, 0·5 per cent., and extract of beef, 0·1 per cent., and injected it into animals with positive results, similar to those obtained by Koch. This communication reached the *Berliner Klin. Wochenschrift* nearly at the same time as Koch's article appeared; it is not known whether before or after—certainly independently.

## CHAPTER III.

## REPORTS FROM FRANCE.

Cuffer (Paris). Cases observed in Berlin in Prof. Senator's wards and probably others—1. Temperature often falls below normal. 2. Then comes the pyrexia. 3. At the beginning of the reaction there is always more or less dyspnoea, indicating congestion of the lungs. 4. The treatment may in some cases render the morbid processes more active, *e.g.*, a case of a woman who died 10 days after beginning of treatment with symptoms of acute phthisis with high fever. In three other cases the disease had been hastened in the same way. 5. Attack of congestion of liver, brain, and kidneys had been observed. 6. Possibly the effect of congestion in affected parts might be a favourable change in the morbid processes, but he had seen no proof of it.

Thibiérge (Paris), Dec. 10, 1890. Fallacies in case of lupus: Case shown as cured because there was no more reaction, but typical lupus tubercles could be seen at the margin of the so-called cured patch. Even in cases that had been under treatment for two months lupus tubercles could be seen when looked for. Not one case of even apparent cure could as yet be recorded. Dr. Thibiérge, however, says that the lymph has "a marvellous rapidity of action and a cicatrising influence on extensive and rebellious lupus ulcerations."

Ferrand (Paris), Dec. 10, 1890. Effects of Koch's remedy similar to those of a muscular poison. 1. General prostration. 2. Pain in muscles. 3. Feeling of faintness. 4. Dilatation of capillaries indicating vaso-motor paralysis. 5. Slight transient delirium. 6. Followed in some cases by coma, possibly the result of vaso-motor paralysis. 7. Really no results known which will justify its being styled a curative agent.

Henocque (Paris), Dec. 17, 1890. Spectroscopic examination of the blood of 22 patients under treatment. In 13 oxyhaemoglobin was diminished. In three oxyhaemoglobin at first diminished and then increased. In three little or no change. In three increase from the first. The changes were observed in lupus as well as in phthisis. The diminution when observed began generally on the 2nd or 3rd day. It seemed to be proportional rather to the strength of the injections. There seemed to be no relation between the amount of oxyhaemoglobin and the intensity of the reaction.

Cornil (Paris), Dec. 14, 1890. 1. Reaction does not occur in the simple way described by Koch; a kind of intermittent fever lasting sometimes three or four days is really produced. 2. Sufficient interval should be allowed between injections so as to avoid cumulative action. 3. Albuminuria which had been observed in three cases had practically entirely disappeared.

Dec. 21, 1890.—Tuberculosis of the skin. The effect of the injection seemed to drive the bacilli from the lesions with the discharge which is set up. The bacilli seem to be more numerous than before. There seems to be improvement in proportion to the extent to which the products of increased secretion can be eliminated. Remedy worthy of further trial; with proper care no great danger may be apprehended.

Articular Tuberculosis.—When there is no fistula, the joint becomes tense and painful. This swelling is produced anew after each injection. After several injections there seems to be an aggravation rather than an improvement. When there is a fistula the results may be different. Tuberculosis of the larynx.—Beneficial results may be obtained. Caution is required so as not to endanger patient's life by swelling of glottis. Surgical interference is however possible and useful.

Phthisis.—Indications for the treatment very limited. 1. Useless in acute, galloping, or pneumonic phthisis. 2. Positively hurtful where larger cavities exist. 3. Even in incipient phthisis the effect is doubtful. 4. In quiescent phthisis the treatment could not unlikely kindle the disease into fresh activity. 5. In a limited number of cases with free communication between vomica and bronchi the treatment may be of use; yet we must abandon the greater part of the hopes which were at first entertained. Tuberculosis of the Epididymis.—One case in which disease increased on the left, *i.e.*, affected side, whilst a nodule became developed on the right which was not affected before. Results not encouraging.

Crocq. (*semaine méd.*), Dec. 31st, 1890.—Denies absolutely its diagnostic or curative value: Says Koch's statements resolve themselves into gratuitous affirmations unsupported by proof.

Vidal (Paris), Jan. 14, 1891.—The results of an observation of 32 cases by a committee. General reaction is irregular. 1. It does not follow the regular type described by Koch. 2. There is no constant relation between the local and the general reaction. 3. The duration of febrile reaction is irregular; or as a rule defervescence occurred within 24 hours; but it is quite common to see the temperature go up again in the afternoon of the following day sometimes higher than on the first day. This afternoon rise in some cases occurred again on the third and fourth day. Dangers of the treatment: Lymph is a very energetic pyrogenic agent, setting up congestion and inflammation in the whole economy. This effect is so unequally distributed that it is impossible to foresee what organ will be affected. The bronchi and basis of the lungs are often greatly congested. Several instances of myocarditic and endocarditic symptoms, enlargement of the spleen and albuminuria. In three cases hæmaturia lasted 3 or 4 days. Twice erysipelas-like swelling of forehead and scalp in women suffering from lupus and who had had erysipelas before. (No streptococci found in the blood and no cultivation obtained).

#### CHAPTER IV.

##### REPORTS—THE UNITED KINGDOM.

Markham Skeritt & B. Baron, Dec. 13, 1890.—Observations made in the Berlin clinics. Types of reaction:—1. Typical marked reaction to early small doses, diminishing reaction to some or even increasing dose. 2. Increased reaction to the same or a diminished dose. 3. Prolonged or deferred reaction. 4. Effect of reaction on hectic. (a.) Favourable when there is a tendency to the substitution of the reaction type for the hectic type. (b.) Negative when hectic persists unaffected. 5. Fever originated by injection. General conclusions.—“The evidence at present at our disposal warrants the conclusion that the beneficial effects of the remedy is undoubted in tuberculosis of the skin (lupus) bones, joints, glands and throat. With regard to pulmonary phthisis whilst there is good reason to hope that in suitable cases a most satisfactory result may be obtained from this treatment, sufficient time has not yet elapsed to allow the formation of any accurate estimate of its value.”

Saundby, Simon, Barling (Birmingham), Dec. 20, 1890.—Cases observed in Berlin, under Senator, Fraentzel, Ewald, and Levy. 1. Tuberculous cases generally, but not always, react to the fluid in small doses. In some cases of undoubted tuberculosis no reaction has occurred after 0.001, 0.002, 0.003, and even 0.005 cc. of the fluid. 2. There is no absolute relation between dose and reaction. 3. The intensity of reaction depends more on individual susceptibility than on the amount of the lesion or the organ affected. It is therefore necessary to begin with small doses. 4. No reaction follows after the continued employment of the same dose. This tolerance is not acquired after a uniform number of injections. 5. Many instances have occurred of improvement, which may perhaps be only temporary; no case yet of absolute cure. Pulmonary phthisis: Favourable cases of pulmonary phthisis improvement, absence of night sweats; diminished cough; diminished expectoration; diminished bacilli. Increase of weight often following an initial loss of weight. No case of absolute cure proved. Nothing known as to relapses. Tuberculous glands diminish in size; sinuses dry up; old scars become thinner and less adherent. No case of absolute cure. Nothing known as to chance of relapse. Tuberculous Arthritis, in the earlier stages: Diminished swelling; disappearance of pain; freer movements. No absolute cure proved yet. Nothing yet known as to chance of relapse. Lupus: Patches shrink, become paler, and present no appearance of growing nodules, even after a few days. No absolute case of cure has yet been proved. Nothing can be said as yet as to chance of relapse.

Watson Cheyne (London), Jan. 31, 1891.—Great improvement can be obtained in cases of lupus. Nothing is said as to relapses. Early stages of tubercular diseases of synovial membranes can be cured. Advanced cases of tuberculosis of bones and joints have not improved.

## CHAPTER V.

## REPORTS FROM ITALY.

Bacelli, Jan. 1891.—Very favourable in cases of lupus. Encouraging in cases of pulmonary tuberculosis.

Semmola (Naples), Dec. 1890.—Not a single case of cure, even of surgical tuberculosis or lupus, had yet been reported. He did not blame Koch for the disappointments that had followed the premature announcement of his discovery; but he could not help deploring that he had remained silent in presence of the abuse which those in his confidence had made of his science. . . . One single word from him, published in time, towards the end of October, would have prevented thousands of consumptive patients from hastening to Berlin. (See also De Renzi and Cantani's reports in "Special Statistics, Phthisis.")

## CHAPTER VI.

## REPORTS FROM NORWAY, DENMARK, AND BELGIUM.

Uckermann (Christiania), November 20, 1890.—Cases attentively observed in Von Bergmann, Krause, and Levy's clinics. There was not a single case which could be said to be cured. Several cases of death seemed to have occurred as a result of the injection, e.g., two apparently from acute stenosis of larynx. In meningeal tuberculosis more cases of hæmoptysis than under any other method of treatment. Probably the lymph is a new and reliable re-agent for tuberculous tissue, but as it has to be used in tolerably large doses it is not free from danger.

Haslund (Copenhagen), December 17, 1890.—Fallacies in cases of lupus: Not seen a single cure of lupus in Berlin. Several cases shown as such were not really cured, as recent tubercles were seen at the patches supposed to be cured. As for certain cases in which skin with hair follicles had been said to have reappeared over lupus patches, there had never been lupus in those places. The classical reaction given by Koch applies only to certain forms of lupus, but not to all. Koch's method, although a valuable auxiliary, must be supplemented by usual surgical treatment.

Masius (Liège), December, 1890.—Result of examination of fourteen cases for three weeks. General and local reaction not always in proportion to the severity and extent of lesions. In one case with marked tuberculous changes a dose of 0.009 was necessary to produce the reaction. In cases where the kidneys were effected, hæmaturia occurred or albuminuria was increased. In some cases the sputa became sanguinolent, in other cases they diminished and the bacilli were modified. Some patients gained, others lost weight. Even when weight was gained there was sometimes no change in physical signs. In some cases there was increased weakness and exacerbation of disease. In one, death almost occurred.

## APPENDIX D.

### Effects of Koch's Remedy in Special Cases.

Country, Town, or Hospital.	Observer.	Date.	Nature of Cases.	Length of Treatment.	Dose in fractions of a gramme (cubic centimetre) of pure lymph.	Effects, Remarks, &c.	Improvements.	Aggravations.	Deaths.
<b>1. IN HEALTHY INDIVIDUALS.</b>									
GERMANY.									
Berlin	Koch	22 Nov., 1890	Healthy (himself)	1 injection	0.250	Three to four hours after the injection I felt pains in the limbs, fatigue, inclination to cough, difficulty in breathing, all of which quickly increased. At fifth hour an unusually violent, shivering, lasting nearly an hour, at same time sickness vomiting; temperature up to 39.66° C. After twelve hours all symptoms abated; temperature fell, and was normal next day. Feeling of languor and heaviness in limbs lasted a few days longer, and during this time the injection spot continued red and painful.			
"	"	22 " 1890	Healthy persons (numerous experiments).	1 "	0.010	Slight pain in the limbs and transient fatigue; a few had a temperature of 38° C.; many did not react at all.			
Greifswald	Peiper	22 Jan., 1891	1 perfectly healthy person.	1 "	0.010 P or under	Reaction observed			
Munich	Guttman and Bollinger.	13 " "	2 healthy bulls	1 "	0.300	No reaction. (Tuberculous cows reacted)			
AUSTRIA.									
Vienna	Maydl	— Dec., 1890	3 healthy adults	1 "	0.010 P	No reaction			
			1 healthy adult	1 "	0.002	Strong reaction			
			1 " "	1 "	0.005	"			
			1 " "	1 "	0.008	"			
HOLLAND.									
Amsterdam	Pel	28 " 1891	1 perfectly healthy person.	1 "	0.002	Reaction followed			
FRANCE.									
Paris	Soller	16 Jan., "	Himself	1 "		A few days after reaching home from Berlin he was seized with extreme lassitude; the same occurred again on the following day at the same hour, and then became so ill that for more than a week had to remain in bed, and lost all consciousness of what was going on. ( <i>Standard</i> , Jan. 16.)		Illness was attributed by Soller and several others to the injection he had received.	
<b>2. IN NON-TUBERCULAR DISEASES.</b>									
GERMANY.									
Berlin	Koch		Several cases.		0.010	None, or very slight reaction			
Greifswald	Peiper	22 Jan., 1891	21 patients affected with non-tuberculous lesions.		0.002 to 0.003	Reaction observed in many cases.			
					0.010	Reaction observed in 10 out of 16 persons ( <i>i.e.</i> , in more than 60 per cent. of cases).			
AUSTRIA.									
Vienna	Maydl	— Dec., 1890	1 case of carcinoma	1 injection	0.002	Strong reaction; temperature 39°, 1 C.			
"	"	" "	" "	1 "	0.005	Reaction; temperature 38°, 7 C.			
GERMANY.									
Berlin	Hahn	23 Dec., "	1 case of sarcoma			Very marked local and general reaction			

Country, Town, or Hospital.	Observer.	Date.	Nature of Cases.	Length of Treatment.	Dose in fractions of a gramme (cubic centimetre) of pure lymph.	Effects, remarks, &c.	Improvements.	Aggravations.	Deaths.
<b>AUSTRIA.</b>									
Cracow	Rydygier		1 epithelioma			No reaction			
"	"		1 rhinoscleroma			"			
Prague	Pick		3 rhinoscleroma cases		0.010	"			
"	"		7 cases syphilis		Up to 0.010.	"			
<b>FRANCE.</b>									
Paris, Hôpital du Midi	Humbert (Cornil).		6 " "			"			
<b>ITALY.</b>									
Genoa	Bossi		1 case of syphilis			"			
<b>UNITED STATES.</b>									
	Kinnicutt		1 " "			"			
<b>GERMANY.</b>									
Stuttgart	Königshöfer		2 cases syphilitic iritis			"			
Berlin	Körte		1 case actinomycosis		Begins 0.001	Marked general and local reaction	No improvement until operation.		
<b>AUSTRIA.</b>									
Vienna			Cases of actinomycosis			Reacted strongly			
<b>ITALY.</b>									
Genoa	Bossi		1 chronic metritis			No reaction			
<b>ENGLAND.</b>									
Bristol	Skerrit & Baron		1 case scarlatinal nephritis.			Reaction			
<b>FRANCE.</b>									
Paris	Cornil		Other non-tubercular cases.			No reaction			
			1 case lupus erythematosus.			General reaction intense. No local reaction			
<b>AUSTRIA.</b>									
Prague	Pick		1 " "			No reaction			
<b>BELGIUM.</b>									
Brussels	Casse		1 " "		0.001, 0.005.	Intense local reaction			
<b>ENGLAND.</b>									
London	Watson Cheyne		1 " "		0.005	No reaction locally			
"	J. Hutchinson and Heron.		1 " "		Up to full dose.	General reaction good. No local reaction	Temporary disappearance of patches.		
<b>GERMANY.</b>									
Berlin	Virchow		Pleurisy, with effusion	5 injections	0.005	Reaction well marked each time, and continuous fever after last injection for several weeks.			Death.
<b>ENGLAND.</b>									
Bristol	Skerrit, Harrison & Baron.		Scrous pleurisy			Marked reaction			

IN TUBERCULOUS CASES SPECIALLY OBSERVED AND DESCRIBED.

3. LUPUS.

<b>GERMANY.</b>									
Berlin	Koch		Several cases	3 or 4 injections at 1 week's interval	0.010	Typical reaction	Great improvement or cure.		
	Körte		1 case	4 weeks		" "	Improved		
			7 cases	Not long enough		" "	Doubtful		
	Israel		2 " "			" "	Improved		
			1 case pulm. tuberc.		Raised up to 0.100.	General reaction. No local reaction, even though bacilli were seen under microscope.	Doubtful		
			1 case after excision and plastic operation			Typical reaction		Fresh nodules under healthy skin.	

Country, Town, or Hospital.	Observer.	Date.	Nature of Cases	Length of Treatment.	Dose in fractions of a gramme (cubic centimetre) of pure lymph.	Effects, Remarks, &c.	Improvements.	Aggravations.	Deaths.
<b>GERMANY—contd.</b>									
<b>Berlin—contd.</b>									
	Israel .....	.....	1 case canceroid engrafted on lupus.	.....	.....	Typical reaction, canceroid increased after each injection .....	.....	.....	.....
	B. Fränkel.....	.....	1 lupus of nose.....	Few injections .....	.....	..... cicatrisation .....	Improvement .....	.....	.....
	Albrand.....	.....	1 L. of larynx .....	" " .....	.....	Reaction marked .....	Doubtful result .....	.....	.....
	.....	.....	1 tub. of conjunctiva partly excised.	.....	0·015 up to 0·150.	General and local reaction.....	Improvement .....	.....	.....
Greifswald .....	Heiferich .....	.....	4 cases .....	.....	.....	Local and general reaction, usual type.....	Great improvement .....	.....	.....
<b>AUSTRIA.</b>									
Vienna .....	Billroth .....	.....	1 case .....	.....	.....	Typical reactions; after reaction had ceased and waiting for 12 days reaction can be obtained again.	Improvement .....	.....	.....
	.....	.....	1 " (child) with tubercular disease.	.....	0·150 .....	Very severe symptoms .....	.....	.....	.....
	Kaposi .....	.....	6 cases .....	6 weeks .....	Up to 0·400, 0·500, 0·800	Typical reactions.....	Improvement .....	Relapse in one .....	.....
Prague .....	Pick .....	.....	1 case combined with syphilis.	.....	0·01 .....	General reaction, severe local reaction in lupus, no reaction in syphilitic lesions.	.....	.....	.....
Innsbruck .....	Jarisch .....	.....	4 cases .....	.....	.....	Reaction .....	.....	.....	.....

Bristol .....	Skerrit, Harrison & Baron.	.....	6 " .....	.....	.....	" " .....	.....	.....	.....
Liverpool .....	Leslie Roberts .....	.....	1 case .....	.....	Up to 0·004.	Local reaction only at first; general reaction when 0·004 was reached.	.....	.....	.....
<b>FRANCE.</b>									
Paris .....	Cornil .....	.....	3 cases .....	.....	0·003 in one case.	Good reaction first day, followed by secondary rises on 2nd, 3rd, and sometimes 4th day. The bacilli seems to be driven away with discharge and to become more numerous than before treatment.	Improvement.....	.....	.....
<b>BELGIUM.</b>									
Liege .....	Masius .....	.....	1 case of lupus and pregnancy.	.....	1st dose, 0·010; 2nd dose, 7 days; after 0·009.	Local and general reaction; intense reaction lasting 24 hours, recurring next day. Extensive scarlatina eruption, abortion; collapse; death imminent; patient partly rallied and taken home.	.....	Great aggravation.	.....
	.....	.....	2 cases .....	.....	.....	.....	Moderate improvement.	.....	.....
Brussels .....	Casso .....	.....	1 case .....	.....	0·001, 0·005.	Typical reaction .....	Apparent cure .....	.....	.....
	.....	.....	2 cases .....	.....	Same .....	" " .....	Much improved .....	.....	.....
<b>UNITED STATES.</b>									
New York .....	Kinnicutt .....	.....	2 cases of lupus with slight pulmonary complications.	.....	.....	" " .....	.....	.....	.....

Country, Town, or Hospital.	Observer.	Date.	Nature of Cases.	Length of Treatment.	Dose in fractions of a gramme (cubic centimetre) of pure lymph.	Effects, Remarks, &c.	Improvements.	Aggravations.	Deaths.
<b>REMARKS BY VARIOUS AUTHORITIES.</b>									
GERMANY. Berlin .....	Several .....	.....	Typical cases of lupus.	Several weeks, treatment.	Doses recommended by Koch.	<ol style="list-style-type: none"> <li>1. After usual reaction, and during course of treatment, an experienced dermatologist can see clearly the fresh lupus edge with its nodules, although the older parts of the lesions seem to cicatrise very well.</li> <li>2. If the treatment is interrupted for twelve days after the reaction has ceased, fresh reaction can be obtained by injecting again the fluid in same doses as before.</li> <li>3. Fresh nodules seem to develop under parts which certainly seemed healthy before.</li> <li>4. What seems to be the growth of new healthy skin is simply the reappearance of skin which had been hidden by scabs, and becomes visible when swelling and crusts disappear.</li> <li>5. Relapse occurs in cases which have been pronounced cured by Koch himself, and the state of the patient becomes again very rapidly as bad as before.</li> </ol>			
DENMARK: Copenhagen .....	Haslund .....	.....							
AUSTRIA. Vienna .....	Billroth, &c. ....	.....							
FRANCE. Paris .....	Thibierge, &c. ....	.....							
ENGLAND. London .....	J. Hutchinson and others.	.....							
These remarks suggested that combination of the method with operations will yield better results.									
GERMANY— Berlin (Moabit Hospital).	Koch .....	.....	.....	Daily .....	4. <i>Phthisis of the Lungs.</i> 0·001 to 0·002.	Reaction in almost all cases. The greater the amount of lesion the smaller the dose necessary to bring about reaction.	Within four to six weeks patients under treatment for the first stage of phthisis were all free from every symptom, and might be pronounced cured. Cases with cavities not too highly developed improved considerably, and were almost cured.		
	Guttman .....	.....	41 cases. Early stages apyretic, infiltration of apices.	3 to 6 weeks .....	0·001 to begin with.	Reaction generally occurred from the first. Weight generally increased: in some cases no gain; 5 cases lost weight. Physical signs: improved in many cases. Subjective signs: improved in all.	Many improvements. Two have remained cured for several weeks.	5 got rather worse.	
			25 cases:— (a) Advanced apyretic cases.	.....	0·001 .....	Reaction generally present .....	Some .....	Doubtful .....	
			(b) Very advanced febrile cases.	{ .....	0·001 .....	Generally produced no reaction .....	Some .....	” .....	
	Sonnenburg and Koch.	.....	4 cases. Cavity opened surgically before injection.	.....	.....	Produced reaction; apparently similar cases react very differently.	.....	” .....	
Friedrichshain Hospital.	Fürbringer .....	.....	41 cases (out of 117) ..	4 weeks .....	.....	Operation well borne. Effects of injection not very striking.	.....	” .....	
						Typical .....	10 cases very much benefited.		

Country, Town, or Hospital.	Observer.	Date.	Nature of Cases.	Length of Treatment.	Dose in fractions of a gramme (cubic centimetre) of pure lymph.	Effects, Remarks, &c.	Improvements.	Aggravations.	Deaths.
Augusta Hospital.....	Ewald .....	.....	29 cases .....	4 to 6 weeks .....	Up to 0·100...	The character of the reaction cannot be predicted, nor how the case will go.	Marked improve- ment.	Indications of retrogression in some cases after apparent cure.	
" .....	" .....	.....	14 cases (out of 114) bad.	Treatment not quite complete.	Up to 0·100...	" .....	.....	Left because condition hopeless.	
" .....	" .....	.....	3 cases .....	" .....	" .....	" .....	.....	Left dissatisfied	5 deaths.
" .....	" .....	.....	5 cases (2 of which advanced and 2 slight apical affections).	Treatment incom- plete.	0·001 up to 0·100.	Symptoms severe; continuous fever, profuse hæmoptysis.....	.....	.....	
" .....	Lindner .....	.....	73 cases .....	Under treatment..	.....	.....	Doubtful .....	.....	
" .....	" .....	.....	In a surgical case .....	.....	.....	After 1st injection, no reaction; 2nd injection, reaction local only; 3rd injection, reaction local only; 4th injection, reaction general.	.....	.....	
Charité .....	Senator .....	.....	Several cases .....	.....	.....	Reaction not proportional to lesions; physical signs improved. Bacilli altered in a few cases, but not in all.	Improvement in several cases.	.....	
" .....	Leyden .....	.....	Several cases.....	.....	From 0·001...	Reaction marked, though not proportional.....	Favourable results..	.....	2 deaths.
" .....	Jürgens .....	.....	2 cases, advanced .....	Several injections	0·001 to 0·006.	Reaction moderate .....	.....	.....	
" .....	Virchow.....	.....	Cases under other physicians, including Senator and Leyden, most of them ad- vanced.	.....	.....	.....	.....	.....	16 deaths.

## APPENDIX E.

## General Statistics

Bearing upon the Effects of Koch's Treatment during the months of October, November, and December, 1890, and the greater part of January, 1891.

1. In preparing this table none but statements found in reliable medical papers have been made use of.
2. Whenever possible or convenient the name of the hospital in which the experiments have been carried out is given, as well as the name of the observer. This was necessary owing to the fact that some physicians and surgeons have experimented in more than one hospital at a time, and on the other hand, that the cases of death recorded by other observers may, by this means, often be traced to their probable origin.
3. Whenever indefinite statements as to large or small numbers of cases have been made, none but the cases definitely indicated have been entered on the table.
4. The date given is that at which the results were brought before a society or published. (It is, therefore, in some cases a few days later than the actual date of communication to the society).
5. The length of treatment applies only to a few of the cases treated by each observer, viz., to those cases which have been longest under observation, and it is mentioned only when some definite statement to that effect could be found.
6. The doses mentioned are, as far as possible, the minimum and maximum doses recorded by each observer. In many cases, however, time has not been available to ascertain the absolute maxima and minima used, and the numbers given are those which have been found most often referred to in the reports consulted. The figures represent decimal fractions of a gramme of pure lymph.
7. The general impression of each observer concerning the effects of the remedy is given as recorded at the time of the report consulted, but it must be remembered that some observers have altered their mind somewhat rapidly. Generally speaking the change has been from confidence to doubt.
8. The results have been expressed by numbers under three heads.
  - (1.) Cases in which results favourable or unfavourable have been observed, but which have neither recovered nor died. Whenever accurate data concerning the number of favourable and unfavourable results, short of cure or death, have been clearly recorded, these have been entered in the column of symptoms, &c. These numbers will allow any one to get an idea of the meaning of doubtful results.
  - (2.) Cases in which a cure has been reported. Here it must be remembered that some of the cases entered as cures at the date of the report quoted in the table are known to have relapsed since. (These relapses are not indicated in the table, but will be referred to in the more special parts of the report.)
  - (3.) The cases of death have been recorded specially when it was possible to ascertain the actual number of patients out of which the cases had occurred. Virchow's returns, however, indicate mostly the Charité mortality, and as many of the Charité physicians had published their cases at an early date, and there was no opportunity of judging of the later results except through Virchow's numbers, these have been entered in the table.

N.B.—In summing up the observations in each country the numbers have been reduced to a percentage, and in doing so only the results given as occurring in a definite number of cases have been utilised, *e. g.*, Gerhardt, Hahn, Guttmann, Körte, Ewald, and Israel's cases.

STATISTICAL RETURNS obtainable in the Medical Journals up to the 24th of January.

Country, Town, or Hospital.	Observer.	Cases.	Date.	Length of Treatment.	Doses. Decimal fractions of a gramme of pure lymph.	Reaction, Symptoms, &c. General Remarks.	Doubtful Results—favourable or unfavourable.	Cures.	Deaths.
GERMANY.									
Berlin—Charité .....	Henoch .....	11 Children Medical.	4 Dec., 1890...	14 days .....	0·0001 to 0·0003 gr.	No reaction under 0,0003. Reaction not proportional to disease or age or even to dose within certain limits.	10	.....	1

## SUMMING UP OF GENERAL STATISTICS.

The following numbers have been collected from various papers. There must have been, however, a great many more patients under treatment than indicated in this table, but it is certain that no fewer people have been treated. The records of the number of cures and of the number of deaths are probably more complete than those of the cases injected.

The numbers here given are, therefore, mere indications of the magnitude of the experiment just now tried upon man, and cannot be used for the purpose of finding reliable proportions or percentages.

Country.	Number of Observers.	Number of Cases Injected.	Number of Cures.	Number of Deaths.
Germany ... ..	18	712	7	41
Austria ... ..	9	66	0	5
United Kingdom ... ..	14	189	4	2
France ... ..	3	66	0	1
Italy ... ..	10	58	0	1
Belgium ... ..	2	43	0	1
Spain ... ..	2	11	0	2
Russia ... ..	1	(?)	0	1
Switzerland ... ..	(?)	532	0	0
America (U.S.) ... ..	3	108	0	0
	62	1,790	11	54

In order to get an idea of the probable degree of success and failure of the treatment these rough numbers cannot be used; but if the percentage of each country, prepared as already explained, be taken a fair idea can be obtained. It will be noticed that the greatest percentage of deaths has been observed in Berlin, where the treatment was carried out practically under the influence of its inventor, and where also the method has been carried out for a longer time than elsewhere.

## APPENDIX F.

## History of the Koch Treatment of Tuberculosis.

## CHAPTER I.

## A CONNECTED HISTORICAL ACCOUNT.

IN an address on bacteriological research, delivered on the 4th August, 1890, before the Berlin Meeting of the International Medical Congress, Koch announced that he had found a *substance which had the power of preventing the growth of Tubercle Bacilli*. That even in guinea-pigs, which are extraordinarily susceptible to tuberculosis, the morbid process could be brought completely to a standstill. This, he said, was true not only in slight cases, but of guinea-pigs suffering from general tuberculosis even to a high degree. He said also that his discovery proved the possibility of rendering pathogenic bacteria in the living body harmless without injury to the latter, a thing which had hitherto been doubted.\*

Koch gave no further information at that time, but the fact that on previous occasions he had generally been able to prove the exactness of his statements gave to his communication an importance which is now-a-days seldom attached to such general announcements. Some people, however, were not a little astonished to hear Koch speak of establishing for the first time the possibility of rendering pathogenic bacteria harmless, as this had been repeatedly proved by Pasteur and his pupils. Yet the sensation caused by Koch's statement was very great, and every member of the profession waited with impatience for the time when the wonderful discovery would be divulged, most people believing that Koch would prove everything he had advanced. During the month of October various rumours were afloat concerning secret experiments which were carried out at the Charité in Professor Senator's wards in Berlin. At the end of the month the lay press began to publish information about these experiments; thus, on the 28th October, the *National Zeitung* made bold to assert that Professor Koch had at last found out a means of curing, or at least arresting, the progress of consumption. It was also stated that the strictest reticence was still observed by Professor Koch, but that his method was analogous to vaccination. His experiments, which had been carried out in the Charité, were to be continued elsewhere. It was also added that in order to devote himself wholly to his investigations his lecture work was to be taken off his hands. The correspondent of the *Times* wrote to that paper on the 30th October a letter giving information which proved afterwards to be misleading. Thus he said that the lymph contained metallic salts, was obtained by a long and extremely difficult process involving great cost, and would be available only by the wealthy, unless, indeed, the remedy was bought by the Governments of different countries for the general benefit. The lymph killed the bacillus immediately, stopping without question the progress of the disease; but long-standing cases would probably not be cured, because other parasites were in those cases present besides the tubercle bacillus. This information was given as the result of a conversation with Dr. Koch, but evidently came from some other source. It was also said that Dr. Koch would not give any further information, for that might interfere with the progress of his experiments. He was working for the whole world, and could not be bothered by individual interests. It was reported that the Berlin medical men considered that the discovery was of greater importance even than that of chloroform and that of Lister's antiseptic method. Further, it was said that Koch was carrying on his experiments in eight slight cases of consumption, the patients having signed papers in which they declared that they were undergoing the treatment voluntarily, and that they did not hold Dr. Koch responsible, even if the results of the treatment should prove fatal. Dr. Koch was said to employ one assistant only, who was bound by oath not to breathe the slightest information with regard to anything he saw or heard in the course of the treatment pursued. In addition to all this, Professor Leyden, a man of very great reputation, was reported to have said that he had the greatest faith in the discovery—that Koch would not have remained silent if he had not been sure of success; and announced, also, that the nature and effect of the discovery would be made public by an illustrated lecture, which would be made before the Medical Society within six weeks of that date. On October 31st it was further stated by the same correspondent that Dr. Koch's discovery was not special to the bacillus tuberculosis, but applied also to other vegetable parasites, the diphtheria bacillus being the next which would be experimented upon by the learned professor. It was said until public announcement of the discovery was made the Professor would not open letters of inquiry in regard to his remedy. Five hundred telegrams from England, France, and America, and innumerable letters, had reached him since the publication of the news, and the correspondence was growing hourly.†

The statements just quoted were not to be found in the lay press only, but were repeated by some of the medical papers, e.g. *British Medical Journal*, October 4th 1890, p. 1812, and November 1st, 1890, p. 1022. In,

In this last article it is stated that the remedy was probably obtained by a process similar to that by which vaccination lymph is got. The first experiments were carried out by Koch in his own laboratory. Koch's assistants noticed that animals under his treatment remained well and alive, while other animals also under his observation, but not treated, died.

The Professor's son-in-law, Staff-Surgeon Pfuhl, experimented at the Charité under his supervision. These experiments were to be transferred to another hospital in order to obtain more perfect seclusion.

On November 7th further information reached the *Times* to the following effect:— The patients who had submitted to the experiments under the seal of secrecy belonged to the highest aristocracy. A case was said to have been already cured, all the other cases were showing improvement after five or six injections. The complete treatment would, Dr. Koch thought, take from four to eight weeks, but favourable cases might take less time. Dr. Koch had an audience with the Emperor on November 6th. It is evident that most of the highest persons in Berlin took a keen interest in the discovery. The confidence in the results must have been firmly established, for extensive plans were framed by the Emperor and the Minister for Public Instruction. The Emperor frequently received reports on the progress of the researches; the Minister also received daily reports. A motion was to be brought forward in the Prussian Diet for the erection of a Bacteriological Institute, similar to the Pasteur's Institute in Paris, to be placed under the direction of Dr. Koch. It was His Majesty's intention that the Government should buy the invention outright, and should erect special hospitals for the cure of consumption. The Emperor regarded Dr. Koch's discovery as a matter of national pride, and considered it his duty to confer the benefit not only on his own people, but on the whole world. Dr. Koch was to receive a large annuity, besides a title. It would really be impossible to give even a very incomplete idea of all the wild statements which found their way into the lay and, to a certain extent, into the medical press.\* There can be little doubt that they were not all without foundation, for the interest taken in the invention by many exalted persons, the confidence exhibited by men such as Von Bergmann and other not less celebrated authorities were enough to create a feeling of confident expectation, well justified even if Koch's own reputation had not been already regarded as a sufficient guarantee. There can be no possible doubt that most of the statements alluded to had found credence with a great part of the younger members of the profession, and not a few of the older members.

On November 12th and 13th the excitement reached the highest pitch, the announcement that Koch was going to explain his method on the 14th, and that demonstrations were soon to be given caused a large number of medical men and patients to flock to Berlin. Some imperfect details of both results and treatment were now circulated. The price of the lymph was also discussed. It may be said that by that time it had become known that Koch had found that the presence of metallic substances in the lymph was not expedient. Dr. von Gossler, the Minister for Public Instruction, received a visit on the 10th from Dr. Koch, who, it is alleged, demonstrated to him that the process of manufacturing the lymph was too costly to admit of poor patients being inoculated unless the Government undertook to bear the cost. One of the first public demonstrations must have been that given in Dr. Herzheimer's Hospital, in Frankfort-on-the-Main, by Dr. Libbertz, in the case of a patient suffering from lupus. Another demonstration was also given by Staff-Surgeon Pfuhl, before the officers of the Ministry of War. Arrangements were made in Berlin to meet the expected rush of patients.

Dr. Koch was to take charge of twelve hospital wards in the Garden of the Charité Hospital.

Professor von Bergmann was to take charge of surgical cases at the hospital in the Ziegel Strasse.

Dr. Cornet was to take charge in the hospital in the Albrecht Strasse.

Dr. Levy was to take charge of pauper patients, 46 Prenzlauer Strasse.

Dr. Pfuhl was to take charge of army patients.

The anti-tubercular lymph was to be obtained from Dr. Libbertz at the rate of 25 marks (shillings) for a little bottle containing sufficient for 5,000 injections of a milligramme each. It was now said on every side that the Emperor proposed to give 2,000,000 marks, that is 1,000,000 to Koch himself and the other 1,000,000 for the founding of a State Institute for the development of his discovery. There was another announcement to the effect that the first paper on the subject would be published in Dr. Koch's own hygienic journal. There were also announcements to the effect that Dr. von Gossler had placed 200,000 marks at the disposal of Dr. Koch for the erection of a special hospital. It was also said that cases of lupus improved in a few hours, and could be completely cured in a few days.

On the 14th of November Dr. Koch's further communication on a remedy for tuberculosis† was published in a special edition of the *Deutsche Medizinische Wochenschrift* and was translated at once by a large number of medical and non-medical journals all through Europe.

In this communication the manner of using the remedy, but neither its nature nor its mode of preparation, was given.

The following is a summary of its contents:—

1. The remedy acts specifically, and on living tuberculous matter only.
2. The reaction has ensued in all the cases tried, without exception, with a dose of 0.010 gramme.
- 3.

\* See *Times*, October 29, 31, November 7, 8, 1890; *Daily Chronicle*, November 3, 7, 1890; *British Medical Journal*, October 4, November 1, 8, 15, 1890.

† See 3rd document.

3. The remedy is an indispensable aid in diagnosis.
4. Cases of slight lupus of the face were quickly healed; graver cases improved more slowly. This is brought about by the destruction of the tuberculous tissue and the shedding of the same with its load of still living bacilli.
5. If the living bacilli are not removed they may find their way into the neighbouring healthy tissues. Thus everything must be done, surgically and otherwise, to procure their removal.
6. Where the removal cannot ensue spontaneously or be brought about surgically the neighbouring tissues must be protected by continued injections.
7. The degree of the general reaction is proportional to the amount of still living tuberculous tissue present.
8. Time alone will tell if these, his conceptions of the mode of action of the remedy are correct.
9. Tuberculous bones, joints, and glands were healed in the same way as lupus.
10. Patients in the commencement of phthisis were all freed from every symptom (the night sweats stopped; the patients increased in weight and looked better; the sputum disappeared after a time) in four to six weeks, so that one could say they were cured.  
When there were moderate cavities they were considerably improved and nearly healed.  
When the cavities were large most were improved, but only temporarily, though Koch suggests that here surgical aid may be of avail.
11. He urgently advises against the use of the remedy in a rule of thumb way and without differentiation of cases.
12. All other known modes of successful treatment should be employed to help the remedy. This assistance is more likely to be obtained in hospitals or in institutions specially for the treatment of disease than in the patients' homes or elsewhere.

So that, although he qualified many of the statements which had appeared before the publication of his lecture, yet the results still were marvellous enough to keep up the excitement and the hopes created.

Koch's own well-known character helped not a little to inspire with his own confidence those who knew him, for he was distinguished for his love of truth, and had the gift of subjecting his own work to a searching criticism to a degree rarely met with. Up to this time he had tested and retested his work for years before publishing it, nor had he rested until he had followed it up into its minutest detail.

Patients began to flock to Berlin from most of the usual resorts for consumptive patients (some of which were almost emptied), and suffered greatly from that pilgrimage. Physicians from many countries had already arrived: Russian, Swedish, Danish, Austrian, Roumanian, English, Italian, French, Spanish, and American physicians were already at or on their way to Berlin. The first impression was nearly overwhelming. It is almost impossible to give an idea of the enthusiasm which seized both the profession and the public. How much even such a man as Von Bergmann was affected by it is seen from his introductory remarks at his demonstration, in which he put Koch alongside Hippocrates, and this in the presence of some of the most eminent surgeons of Germany. Lectures began to be delivered in Berlin, cases to be brought by foreign physicians and to form objects of comment. What at first made such an impression was the wonderful local reaction in surgical cases—especially lupus, where the visible inflammation and subsequent clean look of the affected part seemed to promise real healing. In this period of enthusiasm the reaction was the only thing that was studied really, and it was made use of to diagnose between tuberculosis on the one hand and carcinoma and syphilis on the other. There was indeed very little criticism of the results, and very little was said about actual cures at this time, for of course it was recognised that the time was too short for anything of the sort. In short everybody was chiefly anxious to observe the phenomena as they had been described by Koch himself. A period of doubt was, however, beginning to set in, for people gradually came to criticise Koch's statements and to publish discrepancies in the results, and as the number of patients increased several deaths occurred. Official commissions were sent to Berlin by States, towns, corporations, &c. Honours of all sorts began to pour upon Dr. Koch. Speculators began to make schemes for the exploitation of the lymph. Desperate persons offered large sums for small quantities of lymph. It is known for instance that an English medical man who was possessed of three bottles was offered £500 for a single bottle, and that the offer was rejected.

It would be difficult to realise the stir thus produced, but by tabulating below some of the facts which occurred during that week some idea may perhaps be obtained of this extraordinary movement. Gradually the doubts increased; Koch's statements were found not to be so absolute as he had put them, and great difference in the results appeared. This may have been due to differences in the composition of the lymph, for in the case of such a fluid as we now know it to be, it is difficult to conceive that its composition is constant, or even that it remains through any long period of time what it was at the beginning. Some severe complications made their appearance, and some "calamities of medicine" happened. The results of post mortem examinations of persons who had died during or after treatment were accumulating. The doubt culminated and gave place to a period of disbelief, when on January 7th the veteran pathologist, Virchow, gave in the Berlin Medical Society a summary of over twenty-eight autopsies, and drew conclusions anything but favourable to either the diagnostic or the curative value of the remedy.

## CHAPTER II.

## REPORTS OF SOME OF THE HONORS CONFERRED ON DR. KOCH AND HIS COLLABORATORS.

Vienna Medical Society elected Koch honorary member.

- Nov. 19.—Dr. Koch to be granted a patent of nobility.\*  
 Dr. Koch received in audience by the Empress Frederick. Emperor William conferred on him the Grand Cross of the Red Eagle. The first time this decoration has been bestowed upon anyone not possessing the preceding class of this order.
- „ 20.—Freedom of the City of Berlin given to Koch.
- „ 21.—It is intended to confer upon Koch the Civil Class of the Prussian Order of *Pour le Mérite*.\*
- „ 27.—Telegram from Pasteur and other celebrities congratulating Koch. Elected honorary member of the Berlin Medical Society.
- Dec. 3.—Most of the medical men immediately associated with Dr. Koch in the elaboration of his discovery have received decorations or titles such as that of Professor and Sanitätsrath from the Emperor.
- „ 13.—The Sultan has conferred on Dr. Koch the Grand Cordon of the Medjidie Order.  
 The St. Petersburg Medical Society, as well as numerous other societies, has elected Koch honorary member.
- Jan. 3.—Wurtzburg University awards Koch a gold medal worth 1,000 marks, as well as a foundation prize.

## CHAPTER III.

## SOME OF THE DEPUTATIONS SENT TO BERLIN TO STUDY THE METHOD.

- Nov. 14.—Italian Government: Three physicians.  
 Austrian Government: Prof. Weichselbaum, Prof. Drasche, and an army surgeon.  
 Hungarian Government: Several physicians.  
 Danish Government: Prof. Salomonsen.  
 Munich, Warsaw, St. Petersburg, Rome: Representative physicians.  
 Servian Government: Two physicians.  
 Roumanian Government: Two physicians.
- „ 18.—Birmingham: Four medical men.  
 Number of physicians in Berlin was estimated at 2,000.
- „ 19.—North London Consumption Hospital: Dr. John E. Squire.
- „ 18.—New York Hospitals: Dr. Loomis.  
*Lancet*: London Special Commission.  
 Several London hospitals: Watson-Cheyne, Heron, &c., &c.
- „ 21.—Cracow.—Dr. Suricki returns with a disappointing report, has seen no case of cure, except in Lupus.  
 The Brompton Hospital authorities: Decide not to send any delegate until the composition of the remedy was known.  
 The Royal College of Physicians: In considering the question concludes that it cannot encourage the use of the remedy which is a secret one.
- „ 23.—Arrival of thirty doctors from England and thirty-five from Italy.
- „ 27.—Sydney: Prof. Anderson Stuart to visit Dr. Koch on behalf of New South Wales and South Australia.  
 New Zealand: A competent medical man.
- Dec. 1.—King Humbert: His private physician.
- „ 7.—The French Hospitals: Drs. Cuffer, Ferrand, and Thibierge, return with a rather discouraging report, not having seen a single case of even lupus definitely cured.  
 American Physicians: Loomis, Snisby, Stearms, Quimby, Einborn, and Ernst are not satisfied with the effects, except in cases of lupus.
- „ 10.—Bulgaria: Two doctors sent by the government.
- „ 23.—Australia: Prof. Anderson Stuart has, after studying some hundreds of cases, made a preliminary report.—Although a great discovery, its value has not yet been fixed. In advanced cases of consumption the lymph was positively injurious, but in earlier stages the treatment apparently has a beneficial effect. He deprecates Australian patients coming to Berlin. He will take back with him a supply of the lymph which has been promised to him by Dr. Libbertz.
- „ 29.—Melbourne: Dr. Springthorpe has just arrived in quest of the lymph.  
 A great many more deputations or commissions were sent to Berlin, but the few enumerated are enough to show the wide-spread interest produced by the discovery.

CHAPTER

---

\* The Reporter is informed that this was not carried out.

## CHAPTER IV.

SOME OF HOSPITALS, &c., WHERE THE TREATMENT WAS CARRIED  
OUT AFTER FIRST EXPERIMENTS AT THE CHARITÉ.

- Nov. 14.—Berlin: Dr. Levy Clinical Hospital, in the Prenzlauer Strasse.  
Hamburg Hospital: All the consumptive patients to be inoculated.
- „ 15.—Berlin: Jewish Hospital has secured 250 marks worth of lymph.  
Pesth: Lymph tried the first time at the Rochus Hospital.  
Berlin, Dr. Cornet, 9 Albrecht Strasse, Clinical Hospital: For the cure of lung tuberculosis.  
Berlin, Dr. Levy, Germania Hotel: Rented for surgical treatment of consumption.  
Berlin, Dr. Dengler, Oranienburger Gate: Surgical and medical cases treated.
- „ 16 Berlin, Von Bergmann Royal Clinical Hospital: Surgical cases treated.
- „ 17 Berlin, Prof. Bergmann's Private Klinik.  
Dr. Cornet and Dr. William Levy, together open an hospital for tuberculosis.  
Berlin: Hospitals for the cure of consumption are springing up like mushrooms: the average cost to the patient is 25 marks a-day, and the treatment is said to last six weeks.  
Berlin: Dr. Cornet's hospital described by a visitor. See letter in *Times*\*
- „ 18.—Berlin, Charité: Case under Prof. Bardeleben.
- „ 20.—Rome: Koch's lymph arrives; to be put on trial the day after. Prof. Bacelli.  
Davos Sanatorium: Treatment begun with Koch's lymph.
- „ 26.—London: Mr. Watson Cheyne begins to inoculate patients at King's College Hospital.  
London: Dr. Heron, Victoria Park Hospital.
- „ 27.—Paris, St. Louis Hospital: Dr. Pean Schafer and Dr. Garcin begin inoculation.  
Five patients under treatment.
- „ 30.—Paris, Hôpital Laennec: Prof. Cornil.  
Berlin: Herr von Bleichroeder gives one million marks to Dr. Koch, for the founding of a new hospital for tuberculosis.  
Hyères: Establishment offered to Koch for the treatment of patients.
- Dec. 3.—Madrid, Medical College: Dr. San Martin begins inoculations.
- „ 5.—Italy, Bologna and Genoa, and several other hospitals: Inoculations going on.
- „ 5.—Paris, Cochin Hospital: Dr. Dujardin-Beaumetz, French War Office, begins inoculation.
- „ 8.—Berlin: No less than fifteen so-called hospitals for consumptive patients carried on by Koch's assistants and their medical friends.  
Vienna University: Dr. Kaposi had inoculated 30 patients, and in some cases dangerous symptoms had been observed.  
Vienna University, Prof. Schrotter: 25 patients inoculated; no bad symptoms.
- „ 9.—St. Petersburg, the Grand Duke of Oldenburg Institute: The Czar and Czarina witness inoculation of a patient affected with lupus.  
Newcastle-on-Tyne: 4 patients inoculated at the Royal Infirmary.
- „ 10.—Vienna: Prof. Billroth said to have abandoned the remedy.
- „ 11.—Palermo: Hospital to be built by a wealthy inhabitant for Koch's treatment.
- „ 11.—Birmingham: Queen's Hospital and Lock Hospital patients inoculated.
- „ 12.—Lyons, Hospital la Croix Rousse: The physicians were compelled to promise the patients that they would not be inoculated, as they refused to be treated by that method.
- „ 13.—New York, various hospitals: 36 cases injected.
- „ 14.—Berlin, Charité: Prof. Gerhardt gives a somewhat discouraging account of the remedy.  
Berlin, hospitals: Danger of large doses recognised now.  
Paris, Hospital Laennec: 30 cases injected favourable; very guarded report.
- „ 16.—Berlin, Dr. Cornet's Hospital (private hospital—1st class patients, £2 a day; 2nd class, £1 a day): People advised by correspondents not to go to Berlin.
- „ 20.—Rome and Naples: Patients continue to improve.
- „ 22.—Canada, Montreal General Hospital: 2 cases of lupus inoculated.  
New York, nine different hospitals: 116 persons under treatment.
- „ 25.—Rome: 2 cases of lupus said to be well-nigh cured; cases of phthisis less satisfactory.
- „ 29.—Bologna: 2 cases recorded cured.  
St. Petersburg, Municipal Hospital, under Dr. Sokoloff: two deaths after three doses, largest 0.003.
- „ 31.—Athens, General Hospital: Consumptive patients inoculated with the fluid received by the Queen of Greece.
- Jan. 1.—Toronto, General Hospital: First inoculation in a consumptive patient.  
Madrid, Hospital St. Jean de Dieu: 3 lepers inoculated some time ago continue well. The

The chief experiments were carried out in Berlin in the following hospitals and by the following men:—

- Berlin.—Charité: Leyden, Senator, Fräntzel, Gerhardt, Bardeleben, and Henoch.  
 Moabit: Koch, Paul Guttman, and Sonnenburg.  
 Augusta: Ewald.  
 Friedrichshain: Fuerbringer, Hahn.  
 Jewish Hospital: Lazarus and Israël.  
 Urban Hospital: Körte, A. Fraenkel.  
 Royal Clinical Hospital: Von Bergmann.  
 Private Clinics: Von Bergmann, Fränkel, Cornet, Levy, Schöler, &c.

In England, Scotland, and Ireland the experiments were carried out chiefly at the following places:—

- London.—King's College Hospital: Watson Cheyne.  
 Victoria Park Hospital: Heron.  
 London Hospital: Eve.  
 St. George's Hospital: Dent and Penrose.  
 North London Consumption: H. B. Squire.  
 St. Peter's Hospital: H. Fenwick.  
 Throat Hospital (Golden Square): M. Mackenzie.  
 Brompton Consumption Hospital.  
 Sick Children's Hospital (Paddington Green): W. Cheyne.  
 Royal Hospital for Women and Children.  
 Ormond-street Hospital: E. Squire.  
 Birmingham.—Queen's Hospital: A. E. Carter.  
 Lock Hospital.  
 Nottingham.—General Hospital; Physicians.  
 Dorset.—County Hospital.  
 Bristol.—General Hospital: Skerrit, Harrison, Baron.  
 Devon and Exeter.—Hospital.  
 Manchester.—Hospital: Gumpert.  
 Liverpool Hospital.—Leslie Roberts.  
 Newcastle.—Royal Infirmary: Rutherford.  
 Edinburgh.—Royal Infirmary, Physicians—Phillip.  
 Glasgow.—Royal Infirmary: Stevens, Workman, &c.  
 Western Hospital.  
 Victoria Hospital.  
 Aberdeen.—  
 Dublin.—Meath Hospital.  
 Richmond Hospital.  
 Mater Misericordiae, &c.

This list is intended to show only the generalisation of the treatment in the United Kingdom.

#### CHAPTER V.

#### NOTES OF REPORTS BEARING ON THE REGULATION OF THE PRODUCTION AND DISTRIBUTION OF THE LYMPH.

- Nov. 14.—A scheme made by some German capitalists to induce Dr. Koch to let them monopolise his invention was met with his refusal.  
 „ 17.—Medical corps of the Danish army said to have secured lymph.  
 „ 18.—No foreign university or hospital to be supplied until all the laboratories and hospitals in Berlin and Germany have been supplied, after which it will be provided to the large hospitals and laboratories in Vienna, Paris, and London, then to the most prominent German physicians, and finally to private practitioners.  
 „ 19.—Dr. Koch says the State must take in hand the preparation of the lymph.  
 „ 19.—Impossibility to get any lymph from Dr. Libbertz, the supply not being large enough.  
 „ 19.—Dr. Pfuhl and Dr. Libbertz are still the only persons besides Dr. Koch who know the nature of the remedy.  
 „ 19.—On account of the scarcity of guinea pigs other animals, even cows, are now being used for the production of lymph.  
 „ 19.—The preparation of the lymph will be under the control of the Prussian Minister; all the details of the subject will be settled shortly between Dr. Koch and Dr. von Gossler.  
 „ 19.—Complaints made as to the mercenary aims of those assisting Dr. Koch. Several houses have been rented by Dr. Cornet and by Dr. Dengler, and there the injections were made hastily and mechanically.  
 „ 24.—Lymph has begun to be sent to private practitioners rather freely, at least in Germany, Austria, Switzerland, and Italy.  
 „ 24.—An arrangement has been arrived at between Dr. von Gossler, Prussian Minister for Medical affairs, Dr. Miquel, Minister of Finance, on the one side, and Dr. Koch and his collaborators on the other side. The net profit of the State manufacture, and the distribution of the lymph, is estimated at four million marks yearly, of which Dr. Koch will receive a sum not exceeding one million, and his assistants 250,000 marks each.

Nov.

- Nov. 25.—Berlin: The police President has given orders that all private hospitals for the treatment of consumptive patients are to be closed at once, that all other establishments which shelter consumptive patients are to remove such persons from their premises within 8 days, as phthisis is medically described as an infectious disease.
- „ 29.—Dr. von Gossler, in reply to Herr Graff's interpellation, explains on what ground, and how the Government would take charge of the manufacture of the remedy.\*
- Dec. 8.—Dr. Cornil says it is illegal in France to use a secret remedy, so that he has to obtain special consent of the patients, or parents, before making any injection.
- „ 13.—Berlin: The Cultus Minister von Gossler has requested the directors of the University clinics, by circular, to let him have statistics of their experiences with Koch's remedy by January 1. These statements are to be united and published in the *Medizinische Jahrbücher*.
- „ 15.—Rome: Minister of the Interior has forbidden the use of Koch's lymph except in University clinics, unless by special permission.
- „ 16.—Berlin: The physicians demand that the State shall furnish them with the lymph, as their practice has fallen off 25 per cent. since the beginning of Koch's operations.
- „ 17.—It is alleged that the lymph, which was originally prepared in small vials, had, by order of Minister Gossler, been manufactured on a large scale, but the result had been a serious failure.
- „ 21.—Province of Milan: The provincial medical council has decided that the fluid cannot be used without infringement of the law against secret remedies, and has ordered confiscation of the lymph wherever found. An official of the Public Health Service has made domiciliary visits in search of the forbidden elixir, but without success; and now all the medical men whose names had been advertised as possessing the fluid have been summoned to surrender it.
- „ 27.—Vienna: It is expected that the following regulations suggested by Professor Weichselbaum to the Superior Senator of Council of Austria on November 29, will soon be confirmed by the Austrian Government. Patients should be allowed to undergo treatment only after notification of the fact had been given to the police authorities, and satisfying evidence of the genuineness of the lymph was forthcoming. (The Austrian practitioners intend to protest against this.)
- „ 27.—Austria: The Austrian Minister of Finance has sent instructions to all the Custom House officials of the Empire that Koch's fluid is to be allowed to be imported into Austria duty free. (The fluid is unfortunately described as vaccine for the destruction of the *Bacillus Tuberculosis*.)
- 1891.
- Jan. 3 or before.—The Russian Government has issued an order, that although Koch's fluid, strictly speaking comes under the law as to secret remedies, yet considering the special circumstances of the case, its employment will be allowed under the control of the authorities and on the personal responsibility of the practitioners in Crown and Communal Hospitals, the scientific organisation of which offers a guarantee of its being rightly used.
- Feb. 1.—The Prussian Government, which, according to the public avowal of Herr von Gossler, Minister of Public Instruction, meant to take the production of the lymph into its own hands, and make a kind of State monopoly of it, would appear to have meanwhile decided to let the matter rest as it is. The Government has probably been influenced by those who made bold to warn the State against assuming the whole responsibility for the preparation and retail of a medicine which has not yet realised or even promised to realise, all the sanguine predictions that were made about its efficacy.
- Jan. 26.—St. Petersburg: The Minister of Finance has issued instructions to the customs authorities to take possession of all Dr. Koch's lymph imported into Russia, and to send it to the nearest medical inspector to be examined, after which it will be given up to those to whom it belongs, or to whom it has been addressed upon the payment of the usual customs duty charged on patent medicines.
- Constantinople: The Sultan has decreed that the method should be used at first only in special institutions for the treatment of tuberculous patients.

CHAPTER VI.

SPECIAL NOTES ABSTRACTED FROM VARIOUS NEWSPAPERS DURING THE MONTHS OF OCTOBER, NOVEMBER, AND DECEMBER, 1890, AND JANUARY, 1891.

(*Times, Standard, Daily Telegraph, Daily Chronicle, St. James's Gazette, &c.*)

ONE HUNDRED THOUSAND copies of Dr. Koch's paper *Deutsche Med. Wochenschr.* were sold on the 14th November. All the whole of the previous day the publishing office was besieged by journalists and others anxious to have an early copy of the article, in one case

\* 5th Document.

case it is said that as much as £500 was offered for a proof of the article, but all offers were refused: one Vienna newspaper, however, seems to have managed to get hold of a copy. It is admitted that Dr. Koch hastened the issue of his article on account of the publicity given to the discovery by the *Times*. Much chagrin is expressed here in professional and newspaper circles at the English and American press having been ahead of the German papers with the details of Dr. Koch's experiments.

- Nov. 19.—Notes of warning begin to be sent from Berlin and Vienna.  
 Berlin: Imitations of the lymph said to be already used as evidenced by the fact that an immense number of syringes had been sold.  
 The *Berliner Tageblatt* blames Dr. Koch for entrusting only a few collaborators with his lymph, whilst great scientific establishments, hospitals, &c., were excluded from its benefit. The medical men generally are dissatisfied with this.  
 Prof. Virchow defends Koch at a meeting of the Medical Society, against the charge of premature publication, and said that it was only made in obedience to the urgent representations of the Congress and of Dr. Von Gossler.
- „ 20.—An Italian doctor is said to have offered 5,000 marks for a small bottle, but could not get any.  
 Warning from Dr. Ullmann of Vienna.
- „ 21.—Dr. Miller of New York claims to have used virus taken from calves inoculated with tubercle since 1873. Printed reports on the subject were to be found in the *New York Sun* of 6th June, 1882.
- „ 23.—Vienna professors continue to be doubtful as to the value of the treatment.
- „ 25.—Ugly disclosures concerning Dr. Levy who has asked 1,000 marks weekly for continuous treatment, or 300 marks for each injection, the fact acknowledged by Dr. Levy, although he explains that these sums were demanded in order to prevent patients from coming. (The reporter is informed that Dr. Levy was subsequently exonerated from blame by a Medical Court of Honour.)
- Dec. 1.—Dr. Dixon of Philadelphia is said by some to have discovered previous to Koch an anti-tuberculous lymph; this, however, he says himself is quite of another kind of remedy.  
 A St. Petersburg physician claims to have obtained curative effects with Brown-Séguard's fluid.
- „ 3.—Messrs. Boettger and Nadyl, architects for the Koch Institute, visit the Pasteur's Institute in Paris to take plans and measurements.
- „ 11.—Reaction begins to take place in Berlin against the treatment.
- „ 16.—Naples: Prof. Semmola in a lecture deplores that Dr. Koch has remained indifferent to the abuse which was made in all countries of his discoveries; a word from him even to the public in October, would have prevented thousands of patients from going to Berlin, and making all sorts of sacrifices in order to meet with absolute disappointment.
- „ 20.—Washington: Proposal to appropriate 100,000 dollars to enable the President to obtain from Germany a supply of Dr. Koch's lymph, and the necessary formula for its manufacture.  
 Experiments with Dr. Koch's lymph are made on cows, from the district whence Berlin derives much of its milk.
- „ 21.—Berlin Government have declined to undertake the manufacture of Dr. Koch's lymph.
- „ 25.—Chamber of the Physicians of Brandenburg has recorded a formal protest against the way in which the lymph has hitherto been distributed.
- „ 27.—It is said that in Milan the discovery is degraded in a highly disgraceful manner. Obscure doctors announce that they have received a sufficient supply of Koch's lymph. The lymph is in no case genuine, and yet phthical patients flock to these chevaliers d'industrie. The following is a translation of the inscription on the sign-board of a "dispensary."  
 "Teeth extracted, corns cut, and tuberculosis cured after Professor Koch's method."
- 1891.
- Jan. 1.—Munich: Von. Pettenkoffer says that the Emperor pressed Dr. Koch to make his discovery known, although the latter said his experiments were not yet completed. He also said that he considered as a deplorable blot on German science, that Dr. Koch's discovery had been abused by certain Berlin physicians for pecuniary ends.
- „ 2.—Berlin: Conference at the Ministry of Public Instruction between Koch and Minister concerning advisability of making the nature of the lymph public, and the conditions on which he would surrender to the State his rights of intellectual ownership.
- „ 7.—Berlin: Virchow's demonstration on the results of the P. M.'s. of more than twenty-eight patients (twenty-eight of whom had died at the Charité, the rest in other hospitals), whilst or after undergoing Koch's treatment, causes a considerable sensation and diminishes considerably the enthusiasm for the method.
- „ 14.—Constantinople: Turkish doctors sent by Sultan to study the method. The Sultan will not, however, allow the lymph to be used until it has been fairly tried in establishments specially erected for tuberculous patients.
- Jan.

Jan. 14.—Dr. Springthorpe, who has been delegated by the Melbourne University and Hospitals, has succeeded in obtaining a large quantity of lymph, and has made arrangements to have further supplies sent to him fortnightly. He has been very favourably impressed with the marvellous results which he has witnessed.

Dr. Springthorpe has expressed the opinion that much may be expected from the newly-commenced system of combining operative treatment with lymph injections.

Meeting of College of Physicians and Surgeons of Berlin.—Strong expression of opinion against the manner in which Koch's treatment is carried on in Berlin. Professor Mendel said: "The great enthusiasm which the discovery has excited has been followed among medical men by great dissatisfaction. The remedy has been kept back from most of the Berlin and provincial doctors, on the pretext that it cannot be given to medical men, because it is too dangerous." . . . "It was also said that clinical observation is necessary to secure the proper effects of the remedy; but, on the other hand, three or four private doctors have been permitted to use it without clinical observation, and on conditions which, to judge by what I have seen and heard, are anything but clinical. There is here at issue an important interest of the Medical profession which the College of Physicians and Surgeons has to defend. By giving a monopoly of the remedy to a few doctors, a state of things has been brought about for which there is no parliamentary expression. The public have been exploited in a manner unheard of before in the history of medicine. This College, which has to defend Medical honour, must deal with cases like these as specially urgent."

„ 15.—Dr. Koch publishes a further communication on a Remedy for Tuberculosis, in which he describes the experiments which have led him to the discovery and the nature of the remedy, which is a glycerine extract of pure cultures of the Bacillus Tuberculosis.\*

„ 16.—The demand for that article, as published in the *Deutsche Med. Wochenschr.*, was much smaller than for the first communication.

„ 16.—Vienna: Since the publication of Virchow's demonstrations public opinion has turned against the treatment, although the medical men still retain their expectant attitude.

Paris: Opinion generally adverse to Koch's treatment; preparation said to be incompletely disclosed.

Rome: Opinion generally favourable, but no case of cure can be produced.

New York and Washington: Lymph to be prepared by Dr. Dixon's method, which had been found before Dr. Koch's.

Berlin: The sale of Koch's lymph to be entrusted to the various chemists in the capital.

Madrid: Thirteen patients have been already inoculated at the San Juan De Dios Hospital (two of them lepers). Many patients at the San Carlos Hospital; results satisfactory.

„ 17.—New York, Bellevue Hospital: First case of consumption cured.

„ 26.—Trieste: Dr. Liebmann announces that he has found bacilli of tuberculosis in the blood of patients undergoing Koch's treatment, whilst he could not find any bacilli in the blood of other consumptive patients.

„ 27.—Mr. Jonathan Hutchinson's Lectures at the Examination Hall, London: No case of cure, even of lupus, accepted as proved. Improvement certainly followed by relapse in a case shown sometime before as cured.

Feb. 1.—Berlin: Dr. Koch leaves for Egypt, where he will stay six or eight weeks. The Government seems to have abandoned the idea of making a kind of State monopoly of the remedy.

[It is to be noted that many of the reports were entirely untrustworthy, but they are a record of what was given out from day to day as truthful.]

## CHAPTER VII.

### DEATHS CONNECTED WITH DR. KOCH'S TREATMENT AND RECORDED IN THE NEWSPAPERS.

(Up to January 19. More have been reported since.)

Nov. 14.—Berlin: A child, 12 years old, shortly after the first injection; the child was too far gone to be saved.

„ 19.—Berlin: Two patients at the Charité Hospital, after strong doses; death occurred within twenty-four hours.

Dec. 4.—Frankfort: After inoculation.

„ 5.—Berlin: One death in a private hotel from the effect of the inoculation.

„ 8.—Innsbruck: One case of lupus died after single injection, 0.002 grammes.

„ 7.—Berlin: One case in Dr. Gerhardt's clinical hospital, through failure of the heart, after 0.003 grammes.

Dec.

- Dec. 10.—Meisungen : One patient of failure of the heart after inoculation.  
 „ 11.—Paris : One of Dr. Pean's cases, in a desperate state.

## DOCUMENTS.

1. First communication by Dr. Koch.
2. Letters from Berlin at the time when the treatment was begun.
3. Second communication by Dr. Koch.
4. Letter from Berlin, exposing the method followed in private clinics. Another letter showing the anomalous state of things in Berlin.
5. Speech of Dr. Von. Gossler, Minister of Education, at a sitting of the Prussian Diet.
6. Third communication by Dr. Koch.
7. Virchow's remarks, &c.
8. Mr. Hutchinson's Lecture on Lupus; concluding remarks.
9. Pasteur's telegram to Koch. Koch's answer. Telegram to Pasteur from the Oldenburg Institute.
10. Dr. Koch and the German Government. Institute of Bacteriology.
11. Letter from Virchow.
12. Translation of the "Directions for Use" sent out wrapped around each bottle of the lymph by Dr. A. Libbertz.

## FIRST DOCUMENT.—TRANSLATION OF THE END OF KOCH'S ADDRESS TO THE INTERNATIONAL MEDICAL CONGRESS.

*British Medical Journal, August 16th, 1890.*

VERY soon after the discovery of the tubercle bacilli, I set about seeking for substances which could be used therapeutically against tuberculosis, and I have pursued this subject which has, of course, been often interrupted by my other occupations, perseveringly up to the present. In the belief that there must be a remedy for tuberculosis, I do not by any means stand alone.

Billroth has, in one of his last writings, expressed himself with all possible distinctness to the same effect, and it is well known that the same object is aimed at by many investigators. It seems to me, however, that the latter have not as a rule followed the right way in their investigations, inasmuch as they have begun their experiments on man. To that I ascribe the fact that everything which people have believed themselves to have discovered in that way—from benzoate of soda down to the hot-air treatment has proved to be a delusion. Experiments must in the first place be made, not on man, but on the parasites themselves in their pure cultures; even if substances have been found which have the power to check the development of tubercle bacilli in the cultures, man should not forthwith be chosen as the subject of experiment. But the question whether observations which have been made in a test tube hold good also in living animal bodies should first be settled in animals. Only if the experiments on animals have proved successful, should the method be tried on man.

Proceeding, according to these rules, I have in the course of time tested a very large number of substances to see what influence they would exert on the tubercle bacilli cultivated in pure cultures, with the result that not a few substances have the power, even in very small doses, of hindering the growth of tubercle bacilli, more than this, of course, a remedy cannot do. It is not necessary, as has often erroneously assumed, that the bacteria should be killed in the body; in order to make them harmless to the body, it is sufficient to prevent their growth, and their multiplication.

I have proved the following substances to be remedies which hinder such growth even in very small doses (to mention only the most important).—A number of ethereal oils, among the aromatic compounds, B-naphthylamin, Paratoluidin, Xylidin; some of the so-called tar dyes, namely, fuchsin, gentian violet, methyl blue, chinolin yellow, aniline yellow, auramin; among the metals, mercury in the form of vapour, silver and gold compounds. The compounds of cyanogen and gold were especially conspicuous, their effect surpassing that of all other substances; even in a dilution of 1 to 2 millions they checked the growth of tubercle bacilli. All the substances however remained absolutely without effect if tried on tuberculous animals. In spite of this failure I have not allowed myself to be discouraged from prosecuting the search for growth-hindering remedies, and I have at last hit upon a substance which has the power of preventing the growth of tubercle bacilli, not only in a test tube, but in the body of an animal. All experiments in  
 tuberculosis

tuberculosis are, as everyone who has had experience of them has sufficiently discovered, of very long duration; my researches on this substance therefore, although they have already occupied me for nearly a year, are not yet completed, and I can only say this much about them, that guinea-pigs, which as is well known are extraordinarily susceptible to tuberculosis if exposed to the influence of this substance, cease to react to the inoculation of tuberculous virus, and that in guinea-pigs suffering from general tuberculosis even to a high degree the morbid process can be brought completely to a standstill, without the body being in any way injuriously affected.

From these researches I, in the meantime, do not draw any further conclusion than that the possibility of rendering pathogenic bacteria in the living body harmless without injury to the latter, which has hitherto been justly doubted has been thereby established.

Should, however, the hopes based on these researches be fulfilled in the future, and should we succeed in the case of one bacterial infectious disease, in making ourselves masters of the microscopic, but hitherto victorious enemy in the human body, then it will soon also be possible, I have no doubt, to obtain the same result in the case of other diseases. This opens up a most promising field of work, with problems which are worthy to be the subject of an international competition of the noblest kind. To give even now some encouragement to further researches in this direction was the sole and only reason why I, departing from my usual custom, have made a communication on a research which is not yet completed.

#### SECOND DOCUMENT.—LETTERS FROM BERLIN.

(*Extracts from the Times.*)

Berlin, 30th October.

October 31st.—I have had a conversation with Dr. Koch on the subject of his new discovery for the cure of consumption. He prefers at present not to give any information beyond what has already been published. The only fresh particulars obtainable are that metallic salts are used in the preparation of the lymph. The lymph, having killed the bacillus, acts as a means of re-establishing the patient's health by its inherent healing powers, and, moreover, fortifies him against further invasions of the bacillus.

The lymph has been obtained by a long and extremely difficult process, involving great cost, and will therefore be available only by the wealthy, unless, indeed the remedy is bought by the Governments of different countries for the general benefit.

Dr. Koch does not expect that long standing cases of consumption of the lungs can be cured by his invention, as in such cases other parasites besides the tuberculous bacillus eat their way into the lungs, while Dr. Koch's lymph kills only the bacillus proper. This it kills, however, immediately stopping without question the progress of the consumption.

Dr. Koch refused to answer any further questions, as his doing so might interfere with the progress of his experiments. He said that entire seclusion was necessary for him; he was working for the whole world, and could not be bothered by individual interests. The invention is declared by medical men here to be of even greater importance than the discovery of chloroform or of Lister's antiseptic.

From further inquiries made this afternoon, I learn that Dr. Koch is carrying on his experiments at the present time in Professor Senator's ward at the Charité Hospital in this city on eight slight cases of consumption. The patients whom he has selected as subjects have signed papers in which they declare that they are undergoing his treatment voluntarily, and that they do not hold Dr. Koch responsible, even if the results of the treatment should prove fatal. Dr. Koch only employs one assistant, who is bound by oath not to breathe the slightest information with regard to anything he sees or hears of the course of treatment pursued. I further learn that there is a great difference between the lymph used to combat small-pox and that used in this case. Dr. Koch inoculates only persons who have already been stricken with consumption, which proves that his system is not a preventive, like vaccination against small-pox.

The well-known Professor Leyden, who is the only person in Dr. Koch's confidence, has the greatest faith in the discovery. He says that Dr. Koch would have remained silent if he were not sure of success. He will first publicly make known the nature and effect of his discovery by an illustrated lecture, which he will deliver before the Medical Society within six weeks of the present date.

Berlin, October 31st.

November 1st.—I am informed that Dr. Koch's discovery includes a method by which all vegetative parasites and bacilli in the human body can be killed. The Diphtheria bacillus is the next to be experimented upon by the learned professor after the first results on the tuberculo-bacillus have been publicly announced, although, as a matter of fact, the diphtheria bacillus has not yet been plainly recognised as a destructive microbe.

Dr. Koch will probably make his announcement to the public in regard to his remedy for consumption earlier than was anticipated, as the consumptive patients under treatment by him at the Charité Hospital are progressing most favourably. Until this announcement is made the professor will not even open letters of inquiry in regard to his remedy.

Five hundred telegrams from England, France, and America, and innumerable letters have reached him since the publication of the news of the successful result of his labours, and the correspondence is growing hourly.

Berlin,

Berlin, November 6th.

November 7th.—Every one at the Charité Hospital is under promise not to divulge anything respecting the experiments carried on by Professor Koch for the cure of consumption. The private patients under Dr. Koch's care belong to the highest aristocracy, and they have pledged their word of honour to observe silence with regard to their treatment until such time as the professor releases them from the pledge of secrecy.

I learn from a private source that a consumptive youth, the son of an official at the Berlin Hygienic Institute, of which Professor Koch is President, has already been cured by his method.

In the cases now under treatment a change for the better is observed after five or six injections of the lymph, which are made within a fortnight. In one case of long standing, however, it took a month to effect any improvement. All the patients are seen daily by Dr. Koch, their sputum is preserved and examined, their temperature noted, &c. Before another six weeks have elapsed all the patients under treatment will have passed through the period of observation, and Professor Koch will then be ready to place the results of his experiments before the world. He thinks that from four to eight weeks will be necessary to complete the cure, but slight cases may occupy less time.

If a foreigner should arrive here within the next eleven days, and be willing to place himself entirely under the rules of the Charité Hospital, as indicated in yesterday's despatch, he might succeed in coming under Dr. Koch's present experimental cure. He would have to bring with him a doctor's certificate that he is suffering with the tuberculosis bacillus; otherwise he would not be admitted. It would be of no use applying to the professor personally; the hospital authorities are competent to decide on the admission of a patient.

The intelligence telegraphed this morning relative to Dr. Koch's audience with the Emperor is confirmed by the *Berliner Politische Nachrichten*, a semi-official organ supported by the Minister of Finance. No further particulars are obtainable in regard to what passed at the interview, but I learn that a Bill is being prepared for presentation to the Reichstag, empowering the Government to appropriate a large sum of money in order to place the professor in a position to devote himself entirely to educating a staff of Government and army doctors in the method of preparing the lymph and treating consumptive patients. It is proposed to give the system a complete organisation by creating a central dépôt for the lymph in every province, such dépôt to be connected with a hospital where the poor can be treated gratuitously, that is to say, at the cost of the Government.

The Emperor regards Dr. Koch's discovery as a matter of national pride, and he considers it his duty to confer the benefit, not only on his own people, but on the whole world. As one-half of all the sickness prevalent in the German army is of a consumptive character, the Emperor is interested in the invention from military motives.

Professor Koch is personally unwilling to make money by his discovery, and the fact that the Government is taking up the invention proves that it will not be used for mercenary purposes.

Dr. Hirschwald, the publisher, who is himself a medical authority, assures me that no scientific man of repute in Germany doubts the complete and triumphant success of the discovery.

Since the experiments began the professor has found that the metallic substances in the lymph are not expedient, and has consequently excluded them.

Dr. Koch had an audience early this morning with the Emperor on the subject of the professor's treatment for the cure of consumption. His Majesty proposes that the Government shall buy the invention outright, and shall erect special hospitals for the cure of consumption. Dr. Koch will receive a large annuity, besides a title. It is stated as an assured fact that slight cases of consumption have been cured by Dr. Koch's method, and in older cases, where parts of the lung have gone, life has been lengthened, and the growth and progress of the bacillus checked, if not actually destroyed.

Berlin, November 6.

The *National Zeitung* states that it is probable that a motion will be brought forward in the Prussian Diet during the ensuing session for the erection of a Bacteriological Institute, to be placed under the direction of Dr. Koch.

Berlin, November 7.

November 8.—Dr. Koch is busy preparing the greatest quantity of lymph possible, in order to enable him to meet the great demand which is sure to arise as soon as patients begin to be generally admitted to his inoculation process.

If possible, a Bill will be submitted to the Prussian Diet on Thursday next for a grant of money for the erection of special wards in the garden of the Charity Hospital.

Dr. Koch's correspondence is now being opened by the professor's assistants. It comprises many heartrending letters from patients who rest their last hopes of recovery on the application to them of the learned doctor's invention. There are letters from mothers, begging Dr. Koch to save their children, and the communications come indiscriminately from all classes of society, and from every country in the world.

Dr. Koch is not permitted to see these appeals for fear of their disturbing his equanimity, as it is considered essential that his mind should not be diverted from the experiments upon which he is at present engaged.

THIRD

THIRD DOCUMENT.—SECOND COMMUNICATION BY DR. KOCH, *i.e.*, THE FIRST  
“ FURTHER COMMUNICATION.”

(A reprint.)

THE CURE OF CONSUMPTION : Further communications on a remedy for tuberculosis, by Professor Robert Koch, authorised translation from the original paper published in the *Deutsche Medizinische Wochenschrift*.

A REMEDY FOR TUBERCULOSIS.

IN an address which I delivered a few months ago at the International Medical Congress, I mentioned a remedy which is capable of rendering animals experimented on insusceptible to inoculation with the tubercle bacillus, which arrests the progress of tuberculosis in animals already diseased. Meanwhile experiments have been made on human patients with this remedy ; and these will be treated of in the following discourse.

Originally, it was my intention, before publishing anything on the subject, to complete all my researches thoroughly, and especially to acquire sufficient experience of the practical application of the remedy, and its preparation on a large scale. However, in spite of all precautionary measures, so many garbled and exaggerated versions have been made public, that it seems to me advisable, in order to avoid any false impressions, to give at once a sketch of the present state of the matter. It is true that, under these circumstances, the sketch can only be brief, and many important questions must be left unanswered.

The experiments have been carried out, under my direction, by Dr. A. Libbertz and Stabsarzt, Dr. E. Pfuhl, and some of them are still in progress. The necessary patients were placed at our disposal by Professor Brieger, from his Poliklinik ; Dr. W. Levy, from his private surgical clinic ; Geheimrath Fraentzel and Oberstabsarzt R. Köhler, from the Charité Hospital ; and Geheimrath von Bergmann, from the surgical clinic of the University. I wish here to express my heartfelt thanks to all these gentlemen, as well as to their assistants, for the lively interest they have shown in the cause, and for the disinterested way they have received me. It would have been impossible without all this co-operation to have advanced so far in the arduous and important investigation within so short a time.

As my work is not yet completed, I cannot make any statement here as to the origin and preparation of the remedy, but must reserve this for future occasion.\*

The remedy consists of a clear, brownish liquid, which keeps its strength without any special precautions being taken. For use, however, this fluid must be more or less diluted, and these dilutions, if prepared with distilled water, are liable to decomposition ; bacterial growths very speedily develop in them ; they become turbid, and are then quite useless. In order to avoid this, the dilutions must be sterilised by heat and preserved under a cotton-wool stopper, or what is still more convenient, be prepared with 0.5 per cent. solution of phenol.

It appears, however, that after some time the effect is weakened, both by constant heating and by mixture with the phenol solution, especially in much diluted solutions, and I have, therefore, as far as possible, made use of freshly prepared solutions.

The remedy does not take effect through the stomach ; in order to obtain a reliable effect, it must be introduced by subcutaneous injection. In our experiments we have always used for this purpose the syringe recommended by me for all bacteriological work ; it is provided with a small india-rubber ball, and is without piston. This kind of syringe can very easily be kept aseptic by rinsing it out with absolute alcohol ; and it is to this circumstance that we attribute the fact that not one single abscess has been formed in over a thousand cases of subcutaneous injection.

After several trials on other parts of the body, the place we chose for the application of the injection was the skin of the back, between the shoulder-blades and in the lumbar region, because in these places the injection produced the least local reaction, and was almost painless.

As regards the effect of the remedy on human beings, it was evident at the very beginning of the experiments, that in one very important point the effect of the remedy on man is entirely different from that on the guinea-pig, which is the animal usually experimented upon. Here again is a fresh and conclusive proof of that most important rule for all experimentalists, that an experiment on an animal gives no certain indication of the result of the same experiment upon a human being.

Human beings showed themselves to be very much more susceptible to the effects of the remedy than the guinea-pig. As much as two cubic centimetres, and even more, of the non-diluted liquid can be injected under the skin of a healthy guinea-pig without any noticeable injury to it. But for a healthy grown-up man 0.25 cubic centimètre suffice to produce a very intense effect. Calculating by body weight, therefore, the 1500th part of the quantity which produces no visible effect on the guinea-pig has a very powerful effect on the human being.

I have experienced in my own person the symptoms which arise after the injection of 0.25 cubic centimètre, having made an injection in the upper part of my arm. These symptoms were briefly as follows : Three or four hours after the injection I felt pains in the limbs, fatigue, inclination to cough, difficulty in breathing, all which speedily increased ; in the fifth hour I was seized with an unusually violent fit of shivering,

\* Those doctors who may already wish to make use of the remedy can obtain it from Dr. A. Libbertz (Lüneburg-strasse, 28 II, Berlin, N.W.), who has undertaken to prepare it, with Dr. Pfuhl's and my assistance. But I wish to state that the present supply is but small, and some weeks must elapse before larger quantities will be at our disposal.

shivering, which lasted nearly an hour; at the same time there was sickness, vomiting, and the temperature of the body rose to  $39.6^{\circ}$  C.; after about twelve hours all these symptoms gradually grew less, the temperature fell, and by the next day was again normal. The heaviness in the limbs and the feeling of languor lasted a few days longer, and the spot where the injection had been made continued red and painful for the same length of time.

For a healthy human being, the lowest limit of the effect of the remedy is about 0.01 cubic centimètre (equal to 1 cubic centimètre of the hundredth dilution), as numerous experiments have proved. Most people for whom this dose was used showed reaction merely by slight pains in the limbs and passing languor. In a few of the cases there was a slight rise in the temperature to  $38^{\circ}$ C., or a little more. Although, in regard to the dose of the remedy, there is a very considerable difference between men and animals (calculating by the weight of the body), still in some other points there is much resemblance between them.

The most important of these points is the specific effect of the remedy on tuberculous processes, of whatever kind they may be.

I will not here describe this action with reference to the animals experimented upon, as it would lead me too far from my subject, but will at once turn to the very remarkable action it has on tuberculous human beings.

A healthy human being reacts, as we have seen, either not at all, or very slightly, to the use of 0.01 cubic centimètre. Various experiments have proved that the same holds good, too, with people suffering from any disease that is not tuberculous. But it is a very different matter when the patient is tuberculous; if the same dose of the remedy (0.01 cubic centimètre)\* be injected there ensues a strong general, as well as a local reaction.

This reaction usually consists in a feverish attack, beginning, as a rule, with a shivering fit; the temperature rises to  $39^{\circ}$ , sometimes to  $40^{\circ}$ , and even to  $41^{\circ}$  C.; added to this, there are pains in the limbs, a tendency to cough, great exhaustion, and often sickness and vomiting. On several occasions a slight icteric colour was noticed, and in some cases there also appeared an eruption like measles on the chest and neck. As a rule, the attack begins four or five hours after the injection, and lasts from twelve to fifteen hours. In exceptional cases it begins later and passes off with less violence. The patients are very little affected by the attack, and as soon as it is over they feel comparatively well—as a rule, even better than they did before it.

The local reaction can best be observed in those patients whose tuberculous affections are visible; for instance, in cases of lupus. Here changes occur which show the specific anti-tuberculous action of the remedy in a very surprising degree. A few hours after the injection has been made under the skin of the back—in a spot, that is, absolutely removed from the diseased parts of the skin of the face—the lupus spots begin to swell and grow red; this is generally the case, too, before the shivering fit comes on. While the fever lasts, the swelling and redness continue to increase, and may finally become very considerable, so that the lupus tissue becomes necrotic and of a reddish-brown colour in places. Where the seat of the lupus was more sharply defined, the much swollen and red-brown spot was sometimes encircled by a whitish rim nearly 1 centimètre broad, which again would be surrounded by a highly coloured, broad red band. After the fever has gone down, the swelling of the lupus spots gradually decreases, and after two or three days they have entirely disappeared. The seats of the lupus are then covered with a crust of oozing serum, which dries on exposure to the air; this changes into scabs, which fall off after the lapse of two or three weeks and sometimes, after repeated injections of the remedy, leave behind them a smooth red scar. Generally, however, several injections are required to remove the lupus tissue completely—but more of this later on. It must be observed, as being of special importance in this proceeding, that the changes described confine themselves solely and entirely to parts of the skin affected by lupus. Even the smallest and most trifling little nodules concealed in the lupus tissue go through the whole process, and become visible in consequence of the swelling and change of colour, whereas the actual tissue where the lupus changes have taken place remains unchanged.

The observation of a lupus patient treated with this remedy is so instructive, and at the same time must be so convincing with regard to the specific nature of the remedy, that every one who wishes to adopt the remedy should begin his experiments, if possible, on lupus patients.

Less striking, but still visible to both eye and touch, are the local reactions in tuberculosis of the glands, bones, and joints, &c.,—cases which are attended by swelling, increased pain, and redness of the superficial parts. The reaction in the internal organs, especially the lungs, cannot be observed, unless, indeed, increased cough and expectoration of the consumptive patients after the first injections may be looked upon as a local reaction. In such cases the general reaction is dominant. It must nevertheless be assumed that changes take place similar to those which come under direct observation in lupus cases.

The symptoms of reaction here described occurred without any exception in those cases where a tuberculous process was present in the organism, after a dose of 0.01 cubic centimètre; and I think, therefore, I am not going too far in assuming that in future the remedy will prove to be an indispensable *diagnostic aid*. It will be possible with this remedy to diagnose doubtful cases of incipient phthisis, even after failing to determine with certainty the nature of the disease by the discovery of bacilli or elastic fibres

\* For children of three to five years of age we have injected a tenth part (0.001) of this dose; for very delicate children only 0.0005 cubic centimètre, and have produced by this a strong but not alarming reaction.

fibres in the sputum, or by a physical examination. Glandular affections, latent tuberculosis of the bone, doubtful tuberculosis of the skin, will be easily and with certainty defined as such. It will be quite possible in apparently cured cases of tuberculosis of the lungs or joints to determine whether the process of disease is really terminated, and whether there may not still be some few diseased spots which might cause the disease to break out afresh, spreading its ravages like sparks from under smouldering ashes.

The healing effects of the remedy are, however, of much greater importance than its diagnostic uses.

In describing the changes caused by a subcutaneous injection of the remedy into portions of the skin affected by lupus, it has already been mentioned that after the swelling and redness have abated, the lupus tissue does not resume its original state, but is more or less destroyed, and so disappears. In some parts, as shown by observation, this result is caused by the instant destruction of the diseased tissue after one sufficient injection, so that, at a later stage, it falls off like a dead mass. In other parts there seems to ensue a disappearance, or sort of melting away of the tissues, which requires repeated injections of the remedy for the completion of the cure. It is not yet possible to define with certainty the development of this process, as the necessary histological researches are still wanting. So much, however, is certain, that it is not a question of the destruction of the tubercle bacilli in the tissue, but only that the tissue which contains the tubercle bacilli is affected by the remedy. In this tissue, as shown by the visible swelling and redness, considerable disturbances of the circulation take place, combined evidently with serious changes in its nutrition, causing the tissue to die off more or less quickly and deeply, according to the extent with which the remedy is used.

To repeat briefly: the remedy, therefore, does not kill the tubercle bacilli, but the tuberculous tissue. This, then, gives clearly and definitely the limit of the action of the remedy. It is only capable of influencing living tuberculous tissue; it produces no effect whatever on dead tissue, such as, for instance, necrotic cheesy masses, necrotic bones, &c.; nor can it influence any tissue already rendered necrotic by the remedy itself. These dead tissue masses may still contain living tubercle bacilli, which will either be thrown off with the necrotic tissue, or may possibly, under certain circumstances, enter the neighbouring and still living tissues.

It is very necessary to give careful consideration to this peculiarity of the remedy, if its healing properties are to be turned to profitable use. The still living tuberculous tissue must therefore be destroyed, and every effort then made, for instance, by means of surgical aid, to remove the dead tissue. In those cases, however, where this is not feasible, and the organism can only help itself by slowly throwing off the tissue, a repeated use of the remedy is enjoined, in order to protect the endangered living tissue from a possible re-installation of the parasites.

The fact that the remedy renders tuberculous tissue necrotic and acts only on living tissue, helps undoubtedly to explain another and a very peculiar characteristic—namely, that it may be administered in very rapidly increasing doses. At first this might seem to be a question of habit. But when it is recognised that in the course of about three weeks the dose may be increased to 500 times the original quantity, the question of habit can no longer be entertained, as nothing analogous to such a complete and rapid adaptation of a powerfully active remedy has ever been known.

This phenomenon must rather be explained by the fact that there is much tuberculous living tissue to start with, and consequently, a small quantity of the active substance will suffice to cause a strong reaction; after each injection, however, a certain quantity of the tissue capable of reaction disappears, and comparatively increasing doses are then necessary to obtain the same degree of reaction as before. It is possible that within certain limits habit may here assert itself. As soon as a tuberculous patient has been treated with increasing doses until the result is that the reaction is as slight as that of a non-tuberculous patient, it may then be assumed that the destruction of all tuberculous tissue capable of reaction has been accomplished. The treatment will then have to be continued with slowly increasing doses, and at intervals, so as to protect the patient from fresh infection as long as there may be bacilli in his body.

Whether this conception, and the inferences arising from it be correct, the future will show. Meanwhile, I, for my part, have based and constructed thereon that method of using the remedy, which we employed as follows.

To resume with the simplest case—namely, lupus. We injected at once into nearly all those patients the full dose of 0.01 cubic centimetre, allowing the reaction to run its course to the end; then injecting again 0.01 cubic centimetre after one or two weeks, continuing in this manner until the reaction became feebler, and finally ceased entirely. In two cases of facial lupus the lupus spots were in this way brought to smooth cicatrisation after three or four injections; other lupus patients have also improved in proportion to the duration of the treatment. All these patients had been sufferers many years, and had been previously treated in various ways without success.

Tuberculous affections of the glands, bones, and joints were treated in a similar way, large doses being given at long intervals. The result was the same as in the lupus cases; rapid recovery in recent and slight cases; slow, gradual improvement where the cases were severe.

Somewhat different were the circumstances in the phthisical patients, who form the majority of our patients. Patients with decided tuberculosis of the lungs are far more susceptible to the remedy than those suffering from surgical tuberculous affections. We were obliged to lower the dose of 0.01 cubic centimetre as being much too high for a phthisical patient to begin with, and found that they nearly all reacted strongly to 0.002 and even to 0.001 cubic centimetre. But from this small first dose it is possible

to rise more or less quickly to the same quantities taken by, and agreeing with; other patients. As a rule, our plan was as follows:—First, an injection of 0·001 cubic centimetre was given to the phthisical patient, and then, when the rise in the temperature ensued, the same dose was repeated once daily until no reaction occurred. Then only was the dose increased to 0·002 cubic centimetre, until this quantity too could be taken without causing reaction, and so on, increasing by 0·001 cubic centimetre, or, at the most, 0·002 cubic centimetre, up to 0·01, and higher still. This cautious treatment seemed to me a necessity for those patients who were reduced in strength. If the above method is adhered to, the following result is easily obtainable:—A patient may be brought to bear very large doses of the remedy without suffering from fever, and in a manner barely perceptible to himself. A few of the tolerably strong phthisical patients were treated from the first, partly with larger doses, and partly with rapidly increasing doses; this treatment apparently was conducive to more rapid and favourable results. The action of the remedy in cases of phthisis generally showed itself in this way: the cough and expectoration usually increased after the first injections, but then gradually became less and less until, in the most favourable cases, they totally disappeared; the expectoration also lost its purulent character and became mucous. Only those patients whose expectoration contained bacilli were chosen for experiments, and the number of bacilli generally decreased only after the expectoration had assumed a mucous appearance. They then sometimes disappeared entirely, but were met with occasionally from time to time until the expectoration entirely stopped. Simultaneously, too, the night sweats ceased, the patients improved in appearance and increased in weight. Those patients who were treated in the early stages of phthisis were all free from the symptoms of the disease from within four to six weeks, so that they might be looked upon as cured. Patients, too, with not too highly developed cavities improved considerably, and were almost cured. Only those whose lungs contained many and large cavities did not improve objectively, although the expectoration decreased and their subjective condition was better. From these experiences I conclude that *phthisis in the early stages can be cured with certainty by this remedy.*\*

Partially, too, this may be taken for granted in cases not too far advanced.

But phthisical patients with large cavities, who almost always suffer from other complications, arising, for instance, from the penetration of other pus-forming micro-organisms into the cavities, or from incurable pathological changes in certain organs, &c., will probably only in exceptional cases derive any lasting benefit from the use of this remedy. In most cases, however, even such cases as those were cured temporarily. From this it may be concluded that in their case, too, as with other patients, the original process of disease, tuberculosis, is influenced by the remedy, and that the one thing wanting is the possibility of removing the necrotic masses of tissue, together with the secondary suppuration processes. Involuntarily the question arises, whether it might not be possible to afford relief to many of these suffering people by a combination of this new therapeutic method with surgical additions (such as the operation for empyema) or with other curative methods. And here I desire earnestly to dissuade any one from using the remedy in a conventional and indiscriminate way in all cases of tuberculosis. The treatment will probably be most simple in the early stage of phthisis, as also in any simple surgical affections; but in all other forms of tuberculosis, free scope must be allowed to medical art, so as to assist the working of the remedy by a system of careful individualisation and the appliance of other auxiliary aids. In several cases I have had a decided impression that the nursing of the patients had a very considerable influence on the result of the treatment. For this reason I strongly advocate the use of the remedy in proper institutions, where careful observation of the patients and requisite nursing can be carried out, in preference to the treatment at home or as an out-patient. It is impossible as yet to decide how far the methods of treatment hitherto acknowledged (such as mountain climate, fresh-air treatment, special diet, &c.) may advantageously be combined with the new treatment; but I believe that these therapeutic methods, when combined with the new treatment, will prove to be highly beneficial in many cases, particularly in neglected or very severe cases, as also in the convalescent stage.†

The most important point in the new treatment consists, as I have already said, in the earliest possible application of it. The first stage of phthisis ought really to be the subject for treatment, as in this way the working of the method can be more clearly and fully demonstrated. On this account, therefore, it cannot be too seriously pointed out that in future, more than ever before, all practitioners must make every effort to diagnose phthisis in as early a stage as possible. Hitherto the proof of tubercle bacilli in the sputum has been looked upon as an interesting feature, but of secondary importance only, which, though it determined the diagnosis, was of no further benefit to the patient, and was in consequence only too often neglected. This has latterly been repeatedly brought under my notice in numerous phthisical patients who had generally been in the hands of several doctors, and always without having had any examination of the sputum made. In future this must be changed. Any doctor who may neglect to diagnose phthisis in the earliest possible stage with all means at his command, and especially by examining the suspicious sputum for tubercle bacilli, is guilty of most serious neglect of his patient, whose life may depend, not only on this diagnosis, but also

\* This declaration is certainly liable to limitation, in so far as at present no conclusive experiences are yet to the fore, nor could possibly be brought forward yet, to prove that the cure is a lasting one. As a matter of course, relapses may still occur, but it may be assumed that they will be just as easily and quickly cured as the first attack. On the other hand, it may be possible, as with other infectious diseases, that patients once cured always retain their immunity. But this, too, must remain an open question for the present.

† As regards tuberculosis of the brain, larynx, and miliary tuberculosis, too little material was placed at our disposal to enable us to gain proper experience.

also on the specific treatment to be followed immediately on the completion of the diagnosis thereof. In doubtful cases a doctor ought to make a test injection, and thereby assure himself of the presence or absence of tuberculosis.

Then only will this new method of healing have become a true blessing to suffering humanity, when it has been carried so far that all cases of tuberculosis are treated in their earliest stage, preventing thereby the development of those neglected but serious cases which have hitherto formed inevitably an everlasting source of fresh infections.

In conclusion, I wish to remark that I have purposely abstained from giving any statistical reports or descriptions of individual cases in the above communication, because those doctors whose patients we made use of for our experiments have themselves undertaken to describe the different cases, and I wished my account to be as objective as possible, and in no way to encroach upon their own personal observations.

FOURTH DOCUMENT.—LETTER FROM BERLIN EXPOSING THE METHOD FOLLOWED IN PRIVATE CLINICS; ANOTHER LETTER SHOWING THE ANOMALOUS STATE OF THINGS IN BERLIN.

(Extract from the Times.)

November 18th.—A visitor to-day in the consulting rooms of Dr. Cornet, Dr. Koch's assistant, publishes the following account in the *Vossische Zeitung*:—

"Imagine a dark corridor, scarcely 4 ft. 6 in. wide, thronged with a motley assemblage of men and women. In an adjacent ante-room, of comparatively small dimensions, about thirty persons were assembled, many of them coughing owing to the close atmosphere, and all looking intently at the door of the consulting-room, waiting their turn with anxious expectancy. One patient, who appeared to be in an advanced stage of his complaint, was carried by two friends up the three narrow steps leading into the consulting-room. In the latter chamber itself three or four assistants stood by a little table. One patient was seated on a chair undressed, undergoing examination, while three others were waiting, partially undressed. Dr. Cornet was meanwhile making his way through the throng, calming the impatient, and seeing that all took their proper turn. One working man, father of four children, who appeared in great suffering, implored that his case should be taken, but had to rest satisfied with the assurance that he would be admitted as soon as there was a vacancy. Similar answers had to be given to many of the others seeking admission, although the number requesting aid grows like an avalanche."

LETTER FROM A SPECIAL CORRESPONDENT IN BERLIN.

(British Medical Journal, November 22nd, 1890.)

The excitement about Koch's new treatment is still at white heat, and has not in the least abated since the publication of last Friday. The nature of the remedy is not known, and though it is supposed to be an organic substance, even this is not certain. Why Koch should have kept his remedy a secret forms the great subject of discussion. He himself says in his publication, "I can make no communication respecting the origin and preparation of the remedy, as my research is not yet completed." But it is difficult to believe that Koch would have made clinical experiments on a large scale with a preparation that did not come up to his own standard of perfection—nay, more, that he would allow these clinical trials to be repeated by every physician lucky enough to have obtained some of the fluid before Dr. Libbertz's scanty stock was exhausted. No; it is clear that weighty reasons of an entirely different kind must have determined Koch to pursue so unusual a course, and conjecture is rife on the subject. We hear, on good authority, that Koch's demand for a Clinic and Bacteriological Institute met with unexpected opposition, and that he is determined to hold over his secret until all he thinks necessary for the realization of his scheme shall have been granted him. In the meantime we are in presence of the following curiously anomalous state of things:—In Germany, where all "secret medicines" (*Geheimmittel*) are strictly forbidden by law, and where it is illegal for a medical man to sell drugs, clinical treatment is actively carried on with a remedy the nature of which is a profound secret, the only person from whom the remedy can be obtained being Dr. Libbertz, a member of the medical profession.

Dr. Cornet, one of Koch's co-workers, has no fewer than eight temporary consulting rooms in various parts of the city, which are crowded night and day by patients, rich and poor, old and young, from such as have to be carried upstairs to those with only a slight cough. Dr. Cornet, as he enters the rooms, can scarcely make his way between these tightly-packed crowds.

FIFTH DOCUMENT.—SPEECH OF DR. VON GOSSLER AT A SITTING OF THE PRUSSIAN DIET.

(Extract from the British Medical Journal, 1890, 2nd p. 1327, Dec. 6.)

NOTES FROM BERLIN.—FROM OUR SPECIAL CORRESPONDENT.

In Saturday's sitting of the Prussian Diet, Dr. Graf asked the Government what steps they had decided on with regard to Professor Koch's discovery. Notice had been given of the question, and as it was known that Minister von Gossler would reply at the same sitting, the house was crowded in every part. Dr. Graf, having put his question, Herr von Gossler rose. His speech may be described as a hymn of praise

to Koch, all the more remarkable because up to the present day the Prussian Cabinet has never been distinguished by an enthusiasm for science. He began by a reference to Koch's address before the International Congress, and the sensation it caused in the medical world. He spoke of Koch's celebrated experiment on himself, and of the subsequent experiments on human subjects, made with the help of Professor Brieger and Dr. Levy. On October 27th Koch came to Herr von Gossler with the information that he had found a specific against tuberculosis, and asked to be relieved of his duties as director of the Hygienic Institute, in order that he might give all his time to this work. The speaker proceeded: "On the day that leave was granted to Koch, my conversation with him went deep into the matter. From the first he was ready to tell me all he knew. But I begged him not to do so, as, without any fault of mine, circumstances might arise which might lead to a disclosure on my part, and I might thus do more harm than good. This readiness to disclose everything proves that Koch's motives were purely ideal and scientific. We then discussed the arrangements which were to enable Koch to carry on his work to its conclusion, by extending his investigations to other infectious diseases. He was in favour of a clinic affiliated to some great institution, from which the cases he should require to be drafted to him, and he also spoke of a scientific institute, in which the necessary researches could be carried out. It was decided that 150 beds should be set apart for him in the Pavilion Hospital at Moabit." Herr von Gossler then went on to tell how Professor von Bergmann's university clinic had been chosen as the scene of further experiments. This clinic, he said, is now the rendezvous of physicians from all parts of the world, in which 300 medical men daily inspect cases. The Prussian Minister of Finance was consulted, and agreed with the speaker that Koch's work should be supported by state help. On November 6th the ministerial plan of action was complete, and the Minister of Finance had granted the necessary funds.

On November 7th Herr von Gossler discussed with Koch what the mode of publication was to be. Koch wished to publish every detail, but in the course of the interview, which was carried on in the presence of two witnesses, it became clear that Koch could not show the world the method of preparing the remedy. He could, of course, name the substance from which it was obtained, and describe the method of its preparation; but this method was so difficult and responsible in all its details that it must either be seen or else be independently discovered by experiment, which, according to Koch's calculation, would take an experienced experimenter six months. In view of the incalculable harm that might have arisen through irresponsible and imperfect imitations, Herr von Gossler prevailed upon Koch to reserve publication of the nature of the remedy, and took the entire responsibility of the step upon himself.

Turning to the nature of the remedy, the Cultus Minister proceeded: "It seems that in the present stage of organic chemistry the remedy cannot be analysed\* with any degree of certainty. A light may thus be thrown on a hitherto dark domain of chemistry. The method by which the remedy is obtained will probably be applicable to other infectious diseases. Koch himself lays special stress on the chemical aspect of the subject. He thinks that a new direction may be given to scientific research.

"That a secret remedy (*Geheimmittel*), the nature of which may be more or less clearly guessed, but the ingredients of which are unknown, should be accepted by the entire world on the strength of one man's single name is a fact that stands altogether by itself."

In recapitulating all that is known about the action of the remedy, Herr von Gossler said: "In future no conscientious physician will be able to ignore the remedy. As regards public hygiene, there can be no doubt that Koch's remedy—in connection with microscopic methods—will cause a complete revolution." The speaker then referred to the discovery in its bearing upon tuberculosis, and spoke of the immense sphere of usefulness that here lay before us.

After some account of the difficulties experienced by Koch and his fellow workers, through the rush of patients to Berlin after the publication of November 14th, Herr von Gossler distinctly denied the charge repeatedly made in the papers, that the poor had hitherto been excluded from the benefits of the treatment. He said expressly that in the Royal clinics preference had been, and was still, given to the poor. In Gerhardt's clinic all the patients treated were taken from the working classes. The price of the remedy was then touched upon, and Dr. Cornet defended from every suspicion of overcharging. Dr. Cornet's charge for a first consultation—including a thorough examination—was from 10 to 30 marks (10s. to £1 10s.), and for each following injection in private practice (an assistant being generally required) from 10 to 20 marks (10s. to £1). The Cultus Minister continued: "The chief difficulty for the moment lies in the fact that there is no means of manufacturing the remedy on a large scale. Dr. Libbertz has charge of the production of the lymph, and Dr. Pfahl undertakes its examination, testing its efficacy by experiments on animals. In every case three animal experiments are made, and if they are not followed by the now well-known reactions the lymph is thrown away. Koch declares that he cannot conscientiously allow the lymph to leave his hands without exercising a personal control. This forms one of the serious difficulties we have to face, and the second is the mode of sale. I am glad to be able to state that in this matter Koch and I have at last found a basis of agreement, as a result of which the Government will take in hand the remedy. We shall not rest until the State has the production of the lymph in its hands. Even if it should be found impossible to manufacture it as quickly

\* Our correspondent forwards the results of the chemical examination by Dr. Jolles in Vienna—which appears to indicate that the active principle of the fluid is a proteid body. Any such examinations, however, must be imperfect; and it would appear that the publication of such results at the present time would not serve any useful purpose.

quickly as desirable, I think the fact that the Prussian Government put its signature to the affair will have a tranquilising effect everywhere. Negotiations to this effect will be begun immediately after this sitting." Passing on to explain the proposed plan of the Government, Herr von Gossler said that, though the State is to undertake the manufacture and sale of the remedy, there is to be no centralization. He hopes that in all great clinical institutions a department will be set apart for the remedy, where paupers can also be received gratis. He spoke in gravely warning terms of the "wild tubercle clinics" that were being opened in ordinary flats all over Berlin, and which were fraught with the most serious danger to the other inhabitants, and he added that he should empower the police authorities to interfere wherever danger could be foreseen. He then went on to the project of a Koch Institute for Berlin. The project includes a sanatorium and a scientific institute; the former to receive the infectious diseases required by Koch for his researches, and the scientific institute to enable him to test the results obtained, and to continue proximity to the Charité. The sanatorium would contain pavilions for male and female patients, a small lecture theatre, and the usual offices. For the scientific department, a building close by the Charité is to be utilised, and it is hoped that the whole will be complete in April of next year. Koch is to be at the head of the institute, with two heads of departments under him and twenty practical assistants. The total cost will probably be half a million marks (£250,000). The Government architect is to proceed to Paris to study the Institute Pasteur, from which he will, no doubt, be able to obtain many useful hints.

In the meantime the municipality of Berlin has offered Koch 150 beds in one of their own hospitals; but Koch has too much work on his hands for the next few months to be able to occupy himself with other infectious diseases.

He has, therefore, proposed to the authorities to place the beds at the disposal of pauper patients, he undertaking to furnish gratis the necessary lymph, and, if desired, physicians as well. Koch is to select the cases, and Professor Ehrlich is to direct the treatment under his supervision. Private benevolence, too, has not been idle. One gentleman has placed a million marks (£500,000) at Koch's disposal for a sanatorium for the poor.

The speaker concluded with an enthusiastic peroration, in which he spoke of the happiness it gave him to smooth the path of a man of Koch's distinction, and congratulated Germany on possessing such a son.

#### SIXTH DOCUMENT.—DR. KOCH'S THIRD COMMUNICATION.

SECOND FURTHER COMMUNICATION ON A REMEDY FOR TUBERCULOSIS BY DR. KOCH.

*Deutsche Medizinische Wochenschrift*, January 15, 1891.

*British Medical Journal*, January 17, 1891.

The following translation of Dr. Koch's paper describing the composition of his lymph for the cure of tuberculosis is published in the *British Medical Journal*, January 17, 1891.

"Since the publication of my experience with a new remedy for tuberculosis two months ago many doctors have been put in possession of the remedy, and have thus been enabled to make themselves acquainted with its qualities by their own experiments. As far as I can judge by the publications that have appeared on the subject, and the letters addressed to me, my statements have, on the whole, found full confirmation. That the remedy exercises a specific action on tuberculous tissue, and can, in consequence, be employed as a very delicate and certain reagent in searching out hidden and diagnosing doubtful tuberculous processes, is agreed on all sides. And in regard also to the therapeutic effect of the remedy, most accounts agree that, in spite of the relatively short duration of the treatment, many patients show improvement, varying only in degree. In not a few cases I am informed that cure even has been attained. Only in some exceptional cases has it been affirmed that the remedy may not only be dangerous in too far advanced cases—which is freely admitted—but that it directly hastens the tuberculous process, that it is in fact harmful *per se*. I myself have had the opportunity during a month and a half of collecting further experiences regarding the therapeutic effect and the diagnostic value of the remedy in about 150 cases of various forms of tuberculosis, and I can only say that all I have lately seen is in harmony with my former observations, and that I have nothing to retract of what I have before stated.\* So long as the only point of importance was to judge of the correctness of my statements it was not essential to know what the remedy contains, and what its origin is. On the contrary, it was clear that subsequent experiments would be all the more unprejudiced the less was known of the remedy itself; but now that such experiments in sufficient number have been made and have proved the importance of the remedy, the remaining task is to study the remedy beyond the application it has hitherto found, and if possible to make use of the principles which lie at the foundation of its discovery to other diseases. This task, of course, demands a full knowledge of the remedy.

"I therefore think the right moment has come to make the necessary statements which follow, before I discuss the remedy itself. I think it imperative, for the better understanding of its action, to trace shortly the steps that led me to its discovery. If a healthy guinea-pig be inoculated with a pure cultivation of tubercle bacilli, the inoculation wound generally becomes sealed, and seems to heal up during the next few days.

It

\* "As regards the duration of the cure, I should like to state here that of the cases which I had provisionally marked cural, two have been again received into the Moabit Hospital for further observation, and that for three months no bacilli have been present in their sputum; the physical signs, too, have gradually quite disappeared.

It is only in the course of from ten to fourteen days that a hard nodule is formed, which soon opens, forming an ulcerating spot, which persists until the death of the animal; but the case is very different if an already tuberculous animal be inoculated. The most suitable animals for this experiment are animals that have been already successfully inoculated four or six weeks previously. In the case of such an animal also, the small inoculation wound becomes sealed at first; but no nodule is formed, a peculiar change taking place at the point of inoculation. Already, on the first or second day, the spot becomes hard and dark-coloured; and this is not confined to the point of inoculation, but spreads around to a diameter of 0.5 to 1.0 centimetre. During the next few days it becomes more and more clear that the epidermis thus changed is necrotic. Finally, it is thrown off, and a flat ulcerated surface remains, which generally heals quickly and completely, without carrying infection to the neighbouring lymphatic glands. Thus the inoculated tubercle bacilli act quite differently on the skin of a healthy guinea-pig and on that of a tuberculous one. But this remarkable action does not belong exclusively to living tubercle bacilli, but also in the same degree to dead ones, whether killed by low temperature of long duration which I first tried, or by boiling heat, or by certain chemicals.

"This peculiar fact having been ascertained, I followed it up in all directions, and it was then further found that pure cultivations of tubercle bacilli thus killed, after they have been ground down and suspended in water, can be injected under the skin of healthy guinea-pigs in large quantities without producing anything but local suppuration.\* Tuberculous guinea-pigs on the other hand, can be killed by an injection of very small quantities of such suspended cultures, the time being from six to forty-eight hours, according to the dose; a dose which is just insufficient to kill the animal is sufficient to produce a wide spread necrosis of the skin in the region of the point of inoculation. If the suspended matter be still more diluted, so that it is scarcely turbid to the eye, the animals remain alive, and if the injections be continued at intervals of one or two days, a noticeable improvement in their condition soon sets in, the ulcer at the point of inoculation becomes smaller, and finally cicatrises. This is never the case without such treatment. The swollen lymphatic glands become smaller, the condition as regards nutrition improves, and the progress of the disease is arrested, if it is not already so far advanced that the animal dies of debility.

"These facts formed the foundation of a therapeutic method against tuberculosis. But an obstacle to the practical application of such suspensions of the killed tubercle bacilli was found in the phenomenon that the tubercle bacilli are by no means reabsorbed, nor do they disappear in any way, but for a long time remain unchanged in their position, producing smaller or larger suppurating centres. Thus it was clear that in this method the curative effect on the tuberculous process is obtained by a soluble substance, diffused, so to speak, into the fluids that surround the tubercle bacilli, and transferred without delay to the circulating fluids of the body, whereas that which has the pus-forming quality seems to remain behind in the tubercle bacilli, or at any rate to be only very slowly dissolved. Thus the only important thing to be done was to carry out the process, which takes place within the body, outside of it also, and, if possible, to extract and isolate the curative substance from the tubercle bacilli. This problem required much work and time before at last I succeeded, by the help of a 40 or 50 per cent. solution of glycerine, in extracting the active principle from the tubercle bacilli. My further experiments on animals, and finally on human beings, were made with liquid thus obtained, and in this way also liquid, which I let other physicians have in order to repeat the experiments, was obtained. The remedy with which the new therapeutic treatment of tuberculosis is carried out is therefore a glycerine extract of pure cultivations of tubercle bacilli.

"Besides the active principle, there passes from the tubercle bacilli into the simple extract all other substances soluble in 50 per cent. and glycerine, and therefore there is found in it a certain quantity of mineral salts, pigment, and other unknown extractive substances. Some of these substances can be removed from it without difficulty, for the active principle is insoluble in absolute alcohol, and can be precipitated by it—not pure, it is true, but in combination with other extractive substances likewise insoluble in alcohol. The colouring matter, too, can be separated out, so that it is possible to obtain a colourless dry substance from the extract which contains the active principle in a much more concentrated form than the original glycerine solution; but this purifying of the glycerine extract has no advantages as regards practical application, as the substances thus removed have no action on the human organism, and the process of purifying would therefore only cause unnecessary expense. The constitution of the active principle can as yet be only a matter of conjecture. It seems to me to be a derivative of albuminous bodies, and to be in close relation to them, but it does not belong to the group of so-called toxalbumins, as it can withstand high temperatures, and, in the dialysator, passes quickly and easily through the membrane. The quantity of active principle present in the extract is, in all probability, very small; I estimate it at fractions of 1 per cent. Thus, if my assumption be correct, we have to deal with a substance the action of which, on the tuberculous organism, far surpasses that of the strongest drugs known.

Various hypotheses may, of course, be formed as regards the specific mode of action of the remedy on tuberculous tissue. Without in any way affirming that my view is the best possible explanation, I imagine the process to be as follows:—The tubercle bacilli, in their growth, produce in the living tissues—just as in the artificial cultivations—certain substances which have various, but always deleterious influences on the living elements of their surroundings—the cells. Amongst these substances is one which,

\* "Injections of this nature are among the simplest and most certain methods of producing suppuration free from living bacteria."

which, in a certain concentration, destroys living protoplasm, and causes it to undergo a transformation into the condition called "coagulation-necrosis," by Weigert. The tissue having become necrotic, this condition is so unfavourable to the nutrition of the bacillus that it is unable to develop further, and, finally, in some cases it dies off. In this way I explain the remarkable phenomenon that in organs freshly attacked by tuberculous disease, for instance in a guinea-pig's spleen or liver filled with gray nodules, numerous bacilli are found, whilst bacilli are rare, or entirely absent, when the enormously enlarged spleen consists almost entirely of whitish substance in a condition of coagulation-necrosis, such as is often found in guinea-pigs which die of tuberculosis. A solitary bacillus, however, cannot produce necrosis at a great distance, for as soon as necrosis has reached a certain extent the growth of the bacillus, and, in consequence, the production of the necrosis-producing substance diminishes, and thus a sort of mutual compensation sets in, and to this it is due that the growth of isolated bacilli is so remarkably restricted, as, for example, in the lupus, in scrofulous glands, &c. In such cases the necrosis only extends over a part of the cell, which then, in its further growth, assumes the peculiar form of a giant cell. I thus follow in this statement of my views the explanation of the growth of giant cells first given by Weigert. Now, if the necrosis-producing substance were artificially added to that contained in the tissue surrounding the bacillus, then the necrosis would extend further, and thus the conditions of nutrition of the bacillus would be much more unfavourable than is usually the case. Then, not only would the more completely necrosed tissues disintegrate, slough, and, where this is possible, take with them the enclosed bacilli, carrying them outward; but the bacilli would also be disturbed in their growth to such an extent that they would die off much sooner than is the case under ordinary conditions. It is in calling forth such changes that, to my mind, the action of the remedy seems to consist. It contains a certain amount of the necrosis-producing substance, of which a correspondingly large dose has a deleterious influence, even in healthy persons, on certain elements of the tissues, probably on the white blood corpuscles, or cells closely related to them, thus giving rise to the fever and the whole peculiar complex of symptoms. In tuberculous persons a much smaller quantity suffices to cause, at certain spots, that is, wherever tubercle bacilli vegetate and have already impregnated their surroundings with the necrosis-producing substance, a more or less extended necrosis of cells, with the accompanying symptoms affecting the entire organism. In this way it is possible to explain—at least, for the present—in a provisional way the specific influence which the remedy in certain well-recognised doses exercises on tuberculous tissue, as well as the possibility of increasing the doses in so remarkable a fashion, and finally, to explain the curative effect which the remedy undoubtedly possesses where the circumstances are at all favourable.

SEVENTH DOCUMENT.—REMARKS ON THE EFFECT OF KOCH'S REMEDY ON THE INTERNAL ORGANS OF TUBERCULOUS PATIENTS. DELIVERED IN THE DISCUSSION ON PROFESSOR B. FRAENKEL'S PAPER AT THE BERLIN MEDICAL SOCIETY, ON JANUARY 7TH, 1891. BY PROFESSOR RUDOLF VIRCHOW, BERLIN.

(Translated from the *Berliner Klinische Wochenschrift*, January 12th, 1891.—*British Medical Journal*.)

WITH reference to a rather large number of preparations which I have brought here, I beg to be allowed to make a few introductory remarks. In the first place, I wish to say that I do not, as will readily be understood, propose to speak here of my own casual observations on patients, but only of what we have been able to establish by way of anatomico-pathological research. From the beginning of the injection period up to the end of the year that has just passed away the total number of deaths of patients treated by injections of Koch's fluid that have come before us has been twenty-one. Besides these we have already had in the course of the present year, I believe, six or seven cases; even this very day we have had an opportunity of submitting some new specimens to examination.\*

It is obvious that this anatomico-pathological material must differ considerably from the clinical, in which processes visible to the eye stand in the fore-ground of observation and of interest, while we are, of course, much more concerned with the internal parts, most of which are inaccessible from the outside, and the morbid conditions of which can in many cases be only very superficially discovered, even by the most accurate examination. Perhaps, however, you will be interested in having the opportunity, even once, of seeing such results, and comparing them with those obtained by the direct examination of parts within reach.

Of the twenty-one cases which we had up to the end of December, sixteen were phthisical in the narrow sense in which the word is usually employed as denoting disease in which the essential element is that the lungs are affected. As regards the other five cases, there were among them an exquisite case of severe bone and joint tuberculosis; a case presenting the peculiar complication of carcinoma of the pancreas, with some small smooth-walled cavities with surrounding induration in the apices; a case of empyema in a lying-in woman, who would probably have died even without the injection; a case of pernicious anæmia with very slight old-standing changes in the lungs and tuberculous pleurisy; lastly, a case of tuberculous arachnitis. The other sixteen cases were, as I have already said, cases of pulmonary phthisis, in all of which ulcerative processes of greater or less extent were present; most of them were examples of true consumption.

I

\*In addition to this, my assistants have made necropsies in a large number of similar cases in other hospitals and in private, and I have seen the most important results of these examinations.

I cannot now enter into the details of these cases; perhaps I may have an opportunity of doing so at some future time. I may, however, be allowed to make some general remarks on them to the following effect: Just as the activity of Koch's remedy, as seen externally, manifests itself principally in the setting up of very acute irritation in the affected parts, with intense redness and great swelling, so does it also in the internal organs. We have seen very marked instances of this. I have here a preparation which may well be taken as a typical specimen. It comes from the clinic of my colleague, Professor Hensch, and belongs to the case of tuberculous arachnitis already referred to. I may observe that there were also changes in the lungs, consisting in some rather old-standing patches of caseous pneumonia, which might be looked upon as the source of metastatic arachnitis, and a number of recent inflammatory changes. After four injections, in all amounting to 2 milligrammes, the last of which was given 16 hours before death, the patient (a boy aged 2½ years) died, and colossal hyperæmia of the pia mater as well as of the brain substance, the like of which I never remember to have seen before, was found. The preparation before you was at first preserved simply in glycerine; it has kept fairly well also in the dry state. It shows on the surface extreme engorgement of the vessels of the pia mater, whilst internally the brain substance is dusky-red in appearance. I take this opportunity of mentioning that in this case—the only one, it may be added, of tuberculous arachnitis which has yet come before us for examination—I personally examined the tubercles; I cannot, however, say that I saw any evidence in them of retrogressive changes. The tubercles were very well formed, and presented the usual appearances of meningeal tubercles.

Similar acute hyperæmias and swellings are also seen in other internal parts. In particular it was repeatedly noted by us that even the surface of old pulmonary cavities showed unusually intense redness of the granulation layers; moreover, hæmorrhagic infiltrations of the walls were not seldom present, and even recent hæmorrhages were observed in the cavities. Thus in a man, aged 30, with an old rectal fistula and numerous tuberculous ulcers of the colon, death was the result of hæmoptysis from an old ulcerated cavity; he had received seven injections, the last thirteen days before his death, on which occasion the first bleeding occurred.

The processes observed, however, are not merely transient congestive swellings as to which it may be assumed that they will, perhaps, disappear in a very short time, but there can be no doubt that in the internal parts actual inflammatory processes, and especially active proliferations, occur to an intense degree. This holds good chiefly with regard to two places in which such appearances are very conspicuous; these are, first, the edges of existing ulcers; and next the neighbouring lymphatic glands, especially the bronchial and mesenteric. The lymphatic glands present a quite unusual degree of enlargement, and notably that form of medullary swelling characteristic of acute irritations, which is caused by rapid proliferation of the cells in the interior of the glands. It is in harmony with these large acute swellings that frequently also an increase in the colourless elements of the blood can be detected—a condition of leucocytosis to which may, perhaps, be attributable, the relative frequency with which various infiltrations of white blood corpuscles in the neighbourhood of the affected parts, especially around the tubercles themselves, can be observed.

These swellings occasionally assume a very dangerous character. I will only refer to the phenomena which are seen in the larynx, where, even in cases in which the ulcerated surfaces themselves become clean, the adjoining parts swell to an enormous extent, and cause constrictions of a very critical nature. Together with these changes, there occasionally occur other more violent forms, which take on a phlegmonous character, and remind one of œdema glottidis erysipelatodes and retropharyngeal abscess. Here is a fresh specimen of the condition from a case which occurred in January, and which will be particularly interesting to you.

As regards these inflammations, you will understand that it would be difficult to say of every inflammation occurring in such a patient whether or not it had been caused by the injection. We have at present no criterion of an objective kind which could enable us to make such a distinction. I am not in a position, although I have seen rather a large number of such cases, to say precisely how such a kind of inflammation is to be recognised and distinguished from other inflammations which occur in the course of phthisis independently of these injections. Yet there is one thing which is somewhat remarkable; and I will for the present, on account of the lateness of the hour, confine myself to an accurate statement of what we found in the lungs.

It was noticed that among the fatal cases of ulcerated phthisis the large majority exhibited recent changes of great extent, more particularly in the lungs, but also pleurisy—and for the most part very severe pleurisy—simple and tuberculous, frequently hæmorrhagic and not infrequently bilateral.

The changes in the lungs themselves may be divided into two fairly distinct categories. One of these corresponds approximately to that condition which we are accustomed to call caseous pneumonia, or, anatomically, by the name of caseous hepatisation. With respect to this, it should be understood that it is very doubtful whether caseous hepatisation stands in any direct relation to the injection. I should, perhaps, for my own part, be inclined to deny any such connection were it not that some of these cases are of quite special significance. From the most characteristic one of these comes this piece of lung, which shows such extensive caseous hepatisation that I do not remember to have seen anything like it for years. The lower lobes of both lungs, especially the right, were as large as in ordinary hepatisation, but the individual foci were packed so close together that there was hardly any normal lung tissue between them. The lung, when fresh, looked like a piece of blood pudding thickly studded with pieces of lard. The parts not occupied by caseous hepatisation had a blackish-red appearance,

appearance, and contrasted sharply with the caseous portions. This patient (an architect, aged 33) had received six injections, the last one four weeks before his death; the treatment was then discontinued, according to the statement of the doctor, because there was persistent fever, and infiltration of the lower lobe came on. In this case, therefore, the infiltrations first began after the injections, whereas previously there had only been induration at one apex; and, as to this, it was afterwards proved that for the most part it presented an older and more indurative character.

Here the acute occurrence of the change after the injections is established beyond doubt. But in other cases also the whole condition of the lungs was in no slight degree different from what we are accustomed to see in cases of consumption. I may also point out that among the sixteen cases of phthisis which we had in December there were five which showed recent caseous hepatisation in greater or less degree, but none approaching in extent the one just mentioned.

A second change is likewise found in the lungs, which must also be described as inflammatory. It is, in my opinion at least, even more different from what we usually find, although I must here also say that I cannot lay down any universally valid pathognomonic criterion. The pneumonias which develop in the course of phthisis can, as is known, be divided into three different classes. They are either caseous or of the ordinary fibrinous type—these also occur—or catarrhal, the so-called smooth pneumonias in which the essential feature is that accumulations of cells are present in the alveoli. All this is occasionally seen in phthisical patients. I may also remark that pure fibrinous pneumonia, in the ordinary sense of the word, has been present in none of the injected cases.\* The caseous form I have already mentioned. Any other variety will approximate in type to one of the forms which, according to the ordinary rubric, are classified under the head of catarrhal pneumonia. Injection-pneumonia has, in fact, points of similarity to the catarrhal variety, but I must say it has also certain differences. The ordinary catarrhal pneumonia, as we find it in phthisical patients, shows accumulations in the alveoli, which can easily be squeezed out, and are relatively fluid in character. Sometimes they are so thin as to resemble jelly, and it was on the observation of this fact that Laennec based his old doctrine that tuberculous infiltration, as he expressed it, begins with a gelatinous infiltration. Here, however, the product is not gelatinous; on the contrary, it is very watery and turbid, and it might be called a turbid infiltration. It reminds one of a phlegmonous condition. In some places it is somewhat thicker; occasionally it has, to a certain extent, the external aspect of caseous infiltration, without, however, attaining the decidedly dry character of the latter, so that if the two are situated side by side there is no difficulty in distinguishing the one from the other. The catarrhal-phlegmonous product is softer, moister, and looser than the other. Among the specimens here exhibited there is a perfectly fresh one, which, besides a huge ulcerated cavity at the apex, shows caseous, and—if I may use the expression—catarrhal infiltration side by side in the lower lobe. In two other specimens also caseous and catarrhal hepatisation may be seen side by side. Among the sixteen cases of last year, there are seven which show this more diffuse soft hepatisation.

This form has also something whereby it is clearly distinguished from the ordinary catarrhal hepatisation. It happens that in the midst of these patches foci of softening become developed, which quickly lead to breaking down of parenchyma and to a kind of excavation—for instance, in the lower lobe—such as hardly occur except in gangrenous broncho-pneumonia. This, indeed, was not very frequent. Such a result appears to me to indicate that in these cases a more potent injurious influence has been at work than that which we in other cases recognise as the cause of catarrhal pneumonia. In fact, I am under the impression that—I will not say all these cases—but a certain number of them, exhibit inflammatory processes analogous to those which we see develop on the external parts after injection, and which present a higher or lower degree of intensity, according to the nature of the individual and the special features of the case.

As regards the other results of our examinations, one thing was noted, the significance of which will have to be tested by careful clinical observations on the course of a number of cases: that is the development of fresh tubercles in these patients. It must be understood that I speak on this point with great reserve, as we possess no certain basis of fact which would enable us to pronounce with any certainty as to the duration of small tubercles—I speak here of the submiliary forms—and the age of the submiliary tubercles. On the whole, however, we are disposed to look upon such tubercles as fresh formations. A few observations on the eruption of such tubercles subsequent to injection have already been made clinically in the case of the laryngeal mucous membrane. With reference to this, I may point out that under the eyes of the observer small tubercles, speedily giving rise to new ulcers, have suddenly appeared in places which till then seemed perfectly free. People have comforted themselves with the assumption—at least, so I gather from published records—that these tubercles were present before the injection, but had escaped detection, and it is taken for granted that they will be attacked and destroyed by the remedy and transformed into ulcers. As to the correctness of this opinion in the cases cited I can, of course, say nothing; but I can say that we, examining the internal organs after injection—and especially those which I have always considered the most reliable for the observation of these fresh forms, namely, the serous membranes—have seen the eruption of entirely new submiliary tubercles under circumstances which made it scarcely probable that the tubercles were of older date. This holds good particularly of the pleura, the pericardium, and the peritoneum. The supposition that the tubercles would be powerfully influenced by the action of the remedy, and that their substance would thereby become necrosed, was never realised.

All

\* Only partial fibrinous hepatisation was sometimes found in conjunction with other changes.

All the submiliary tubercles, of which I am here speaking, were perfectly intact, even when the injections had been made weeks before. All the more am I convinced that the eruption first appeared *ex post*.

As to the lungs themselves, you know well how difficult it is to recognise these very fine tubercles in their interior with certainty. I will therefore not speak of that, and will confine my remarks to parts in which either (as in the mucous membrane of the larynx) miliary tubercles first appeared after the injection, or after a long course of injection entirely fresh and uninjured tubercles have been found on the serous membranes. Here is an intestine from one of the January cases, in which entirely fresh submiliary eruptions are seen in the vicinity of old intestinal ulcers; the same man (aged 41) had also fresh tubercles in his pericardium.

How these new eruptions are to be explained must be left for further consideration. Nevertheless, I venture to point out that if we assume that all tubercles are produced by bacilli, such out of the way parts as the pericardium deserve special attention. In one other case the so-called epicardium presented in one place, not in contact with an affected part of the lung, a small focus where four submiliary tubercles were situated close to each other in the middle of an area of intense hyperemia. Here there was no alternative but to suppose that the germs had reached that place by way of metastasis. How could we help thinking of metastatic processes here, and conjecturing whether, in fact, the bacilli had not been mobilised, and whether they had not been diffused through the body by a process of infection? Since, as you know, Dr. Koch himself considers the bacilli to be sufficiently refractory to the action of his remedy—and we have not found that they are destroyed—the possibility must not be overlooked that if in any one place a process of softening whereby the products of disintegration are rendered more fluid, or at least more mobile, is set up by the action of the remedy, these products will also be displaced, and may give rise to new foci in other places. Such a consideration is not far-fetched; and with it is connected another. If we see that during the treatment a whole lower lobe becomes filled with foci of caseous hepatisation, it is an easy step to the conclusion that material which is set free in the upper lobe by breaking up, and which is not coughed up, will perhaps be drawn in by inspiration, with the result that pneumonia such as is caused by foreign bodies—and in this case of caseous character—is set up.

I consider myself bound at least to give expression to this view, and to add a warning to practitioners to operate with greater caution in cases where it is not certain that patients have the strength completely to expectorate the broken down tissue, and the habit of doing so, and where there is, therefore, a possibility that transference of material to other parts of the lung may take place with the result of creating new foci of disease.

Permit me now to mention a little point: that is, the breaking down itself, to which my colleague, Dr. Koch attaches particular importance as being the principal result effected by his remedy. I admit that all which we have seen indicates that such an effect is produced in many places. It is not yet clear to me, however, how it is that this necrotic effect does not occur universally—that, for instance, as I have already said, the submiliary tubercles resist the remedy in many places. I acknowledge that, as has been stated by some earlier observers, for instance, in tuberculous pleurisy, individual tubercles, especially if they are at all of large size, assume an unusual turbid yellowish appearance, and, in fact can be seen with the microscope to undergo a process of disintegration. But in other cases, even after injections continued up to the day of the patient's death, nothing of the kind occurred.

Even large tubercles show themselves very refractory. We have lately had a very remarkable case, in which tuberculosis of the vertebral column and long bones was present in a boy aged three years; large tubercles were also found in the brain. The injections in all amounted to 0.012 gme. It was a case from the surgical department in which there was vertebral caries with gravitation abscesses, and many points of disease were present in the joints and long bones of the lower limb. At the necropsy it was found that the boy had an unusual abundance of the so-called solitary tubercles in his brain and cerebellum. As is well known, these tubercles owe their name to the fact that there is usually only one which may be of the size of a walnut; in this case, however, there was a whole heap, I think seven; they were therefore properly not solitary, but they belonged to that category. They were like large lumps of cheesy matter. Neither in them nor in their vicinity were any considerable changes to be seen. I noticed in their interior some soft places, but these occasionally occur in other cases without anything particular having taken place. At all events, the nodules showed no marked breaking down.

In conclusion, I wish to call attention to two points of prime importance which are rightly taken into account in every case of phthisis, namely, ulcers of the intestine, and ulcers in the respiratory organs, particularly the lungs.

As regards the intestine, there can be no doubt that necrotic processes similar to those observed on the external parts of the body in lupus, &c., take place in intestinal ulcers. In old-standing ulcers with extensive surface and thick edges, particularly in which new submiliary eruptions have occurred, we see such necrosis to an excessive degree. An example of this is afforded by the intestine here shown, which comes from one of the January cases, namely, the man with the fresh pericardial tubercles. The necrotic process there reaches right through to the serous coat. If the man had lived a couple of days longer perforation would undoubtedly have taken place, as in another case, recently mentioned, I believe, by Dr. B. Fraenkel, in which the patient died in consequence of such a perforation. Although perforation and necrosis occur also in other

other cases of tuberculous ulcer of the intestine, I feel myself obliged to point out that here we have two very severe cases, in which the necrotic process must have taken place very rapidly, occurring in the short space of two months.

The same holds good with regard to ulcers in the respiratory organs, in which very rapid disintegration takes place, and the size of the loosened masses is sometimes altogether out of proportion to the ability of the individual to expel them from his body. In this way all kinds of complications from retention and aspiration will be caused.

Among the other specimens I may mention one case of tuberculosis of the larynx of altogether unusual severity, in which twenty injections were given, the last on the day before the patient's death. This was the same man who has already been mentioned as the subject of pericardial tubercles and gangrenous ulcers of the intestine. As regards the point under consideration a fresh eruption of tubercles of extreme intensity can be seen extending over the whole of the larynx and trachea.

Another specimen shows fresh caseous hepatisation; it comes from a case in which six injections were made—the last four days before the patient's death. We have also one such case in which three injections were given, the last a week and a half before the patient's death, and in which caseous foci and diffuse inflammatory processes are found side by side. Lastly, I exhibit a specimen which was obtained only this morning; it shows the formation of abscesses, starting from bronchiectases of the lower lobe, in progress in the lungs.

#### EIGHTH DOCUMENT.—MR. HUTCHINSON'S LECTURES ON LUPUS.

##### *Concluding remarks.*

29th January.—Mr. Jonathan Hutchinson, ex-president of the Royal College of Surgeons, and an eminent authority on skin diseases, has delivered a lecture before a large and representative audience of medical men in the Examination Hall of the Royal College of Surgeons, Thames Embankment. In examining the results of Koch's treatment of lupus he demonstrated the condition of a large number of patients who were present from the various hospitals where they have been undergoing treatment for longer or shorter periods. He did not think that the improvement manifested in each case was likely to be permanent. Very definite results had on some important points been obtained, and it was highly desirable that, for the guidance of future investigators, these should be stated. He had had opportunities of collecting facts over a tolerably wide field, and he thought it might be stated, in the first place, that the injection of Koch's fluid caused the lupus patches to inflame; but even to this rule there were some striking exceptions, in which no effect whatever was produced on the patches, although the temperature rose on every occasion after nine or ten successive injections. In one case, after about a month's treatment, the injections were given up, as they produced no effect, and the patient was now in exactly the same condition as before the injections began. No one had ventured to report a single instance of cure, and, of the cases which had been shown to him as most satisfactory, he was bound to say that not a single one had come near to the condition of cure. As substantiating his statement that the treatment does not destroy or, in some cases, even touch the apple jelly deposit, the most characteristic part of the lupus formation, he quoted from a letter written by Mr. Warren Tay, of the London Hospital, who, speaking of a case in which great benefit had been obtained by the treatment, said "that there still remained nodules, which I should like to attack with the scoop." They might be obliged to suspect that the remedy, after all, was one for certain conditions of the inflammatory process, and not for tuberculosis. If they were obliged to report that nothing approaching a cure of lupus had been obtained in London, practically it might seem unnecessary to ask whether the cures were lasting. There was, however, undoubted evidence on this point. He referred to the case of Edgar Neale, the patient who was treated in Berlin, and who some months ago was exhibited at the Clinical Society as a case supposed to be almost cured. He was assured by those who took the case to Berlin and exhibited it in London, that the patient was now in a condition almost as bad as before the treatment commenced. He believed, however, from what he had seen of the treatment, that some of the patients were by the injections brought into a condition much more favourable for surgical treatment than they were before.

#### NINTH DOCUMENT.—PASTEUR'S TELEGRAM TO KOCH. KOCH'S ANSWER. TELEGRAM TO PASTEUR FROM THE OLDENBURG INSTITUTE.

November, 1889.

Au Dr. Koch, Berlin,—M. Pasteur, et les chefs du Service de l'Institut Pasteur, adressent à Robert Koch toutes leurs félicitations pour sa grande découverte.

PASTEUR.

Dr. Koch to M. Pasteur.

Most Honorable Colleague,—You have had the goodness to send by telegraph your congratulations upon the results of my researches on tuberculosis. I esteem this to be a most special honor, and I desire to express to you and your fellow-workers who have joined in your congratulations my most humble thanks. As a further expression of my gratitude, I venture, in the expectation that you will not be unwilling to test the specific action of this new substance on man, to send to you herewith a specimen of it. Accept the assurance of my highest esteem.—Obediently yours, R. KOCH.

Telegram from St. Petersburg, addressed to M. Pasteur by Prince Alexandre d'Oldenburg, Eugénie Princesse d'Oldenburg, Prince Pierre d'Oldenburg, Dr. Sperk, Prof. Anrep, Dr. Khigive, Dr. Helmann, Dr. Kraiouchkine, and Baron Feltheisen.

After the first demonstration, given to-day at the Institute, of the mode of treating lupus by Koch's method, we are happy to express a sentiment of profound veneration for you, the illustrious initiator of fruitful studies in a domain of science which this day celebrates one of its victories.

10TH DOCUMENT.—DR. KOCH AND THE GERMAN GOVERNMENT.

(*British Medical Journal*, January 10, 1891, I. p. 77).

A well-informed correspondent writes:—During the last fortnight various rumours have been telegraphed from Berlin as to the arrangements made, or about to be made, between the German Government and Professor Koch with regard to the future production of his remedy for tuberculosis, and it must be admitted that these rumours have been of a somewhat disquieting character. It has been said that Dr. Koch, and each of his assistants, had accepted a large immediate payment, and that they were to receive a royalty upon all sales in the future. Thus stated, the arrangement, it must be admitted, would partake far too much of the commercial transaction to be agreeable to the traditions of the medical profession, or the customs of men of science. It is, however, easy to give an unfavourable complexion to a transaction really of an honourable nature by inverting the steps by which the final results have been obtained, and so misrepresenting their character. It may be well to recall the circumstances under which the lymph has been discovered, and the position of Dr. Koch in relation to the German Government. Dr. Koch has been for many years Director of the Hygienic Laboratory in Berlin. This laboratory is a Government institution, maintained by the Educational Department of the German Government, and Dr. Koch, as its Director, has been an officer of that Department. All the earlier experiments for the discovery of the now famous lymph were conducted in Dr. Koch's own laboratory in the Hygienic Institute, and there the observations upon guinea-pigs and other animals, which emboldened Dr. Koch to proceed to inoculate human beings, were made. The laboratory, however, presented no facilities for making these investigations upon human beings, and Dr. Koch holds no official position with regard to any of the Berlin hospitals. He therefore found himself in a practical dilemma, inasmuch as if he were to make his experiments in a public hospital it was feared that the premature and eager discussion of incomplete observations and immature results might easily tend to interfere materially with the investigation and to produce evil results. Dr. Koch consequently hired a private house at his own expense, and obtained the assistance of two gentlemen with whom he had private acquaintance—Dr. Libbertz, an old schoolfellow, and Dr. Pfuhl, his own son-in-law. The lymph was prepared in considerable quantities in this private house by these two gentlemen under Dr. Koch's supervision, and the earliest injections in man were made in the private hospitals of Drs. Cornet and Levy. It soon became evident, however, that the interest, both among the general public and in the medical profession, was too keen to permit of the continuance of the investigation upon these lines; and Dr. Koch, acting on the advice, or, perhaps, it might be correct to say upon the instructions of Herr Von Gosler, the Minister of Education, published in the now famous preliminary paper, and distributed the lymph to certain of the hospitals in Berlin. Meanwhile, the manufacture of the lymph was carried on in the private house by Dr. Koch and his two personal private assistants. Recently this arrangement has ceased; the house in which the lymph is manufactured has been taken over by the Education Department of the German Government, and Drs. Pfuhl and Libbertz have become officers of that department. The Koch Institute, which the German Government are now erecting, will consist of two parts—a laboratory, and a new clinical department containing 150 beds. The clinical department will probably be under the direction of Professor Brieger. The observation and treatment of patients received into it, it is hoped, will afford in the future opportunities for Dr. Koch to prosecute his studies with regard not only to tuberculous diseases, but to tetanus, diphtheria, and typhoid fever. In this way the inconvenience which has arisen from his having no clinical wards of his own will be avoided.

In the laboratory, bacteriological investigations will be carried on, and at the earliest possible date the laboratory for the preparation of the anti-tuberculous liquid will be transferred to this department of the Koch Institute. The director of this bacteriological department has not yet been appointed, but the whole institute will be under the general direction of Dr. Koch, who will remain an officer of the Education Department. It is probable that the German Government will offer to Dr. Koch some recognition of the great services he has rendered while acting as a German official, such as was voted to Jenner for his services in a cognate research, and more recently to Pasteur, in France. Large national awards have repeatedly been made to successful generals in Germany and in other countries, and it is felt that there is no reason why a man of science, who has worked for the relief of human suffering, should hesitate to accept a reward which the destroyers of men have never felt the least difficulty in receiving. As to the further rumour that Dr. Koch and his assistants may receive a payment, as it were, by results in the future, it may be hoped that this rumour is unfounded. Anything like the sale of a secret or the paying of royalties on a remedy would be contrary to the hippocratic tradition.

(*British*

(*British Medical Journal*, January 31st, 1891.)

The Prussian Budget for 1891 includes a demand for 165,000 marks (£8,250) for the new Koch's Institute, which is being built close to the Charité Hospital. The annual expenses are calculated at 235,405 marks (£11,770), which are divided as follows:—20,000 marks (£1,000) for salary for the director, Professor Koch; 6,000 marks (£300) each for salaries of heads of departments, &c., &c.; a revenue of 70,000 marks (£3,500) is calculated for from paying patients.

11TH DOCUMENT.—LETTER FROM VIRCHOW.

(From *Standard*, 1st February).

Berlin, Friday night.

The *National Zeitung* publishes a letter it has received from Professor Virchow, which places this gentleman's opinions on Dr. Koch's method in a new light. In this document the eminent pathologist says:—

"Your former statement makes it appear as if I had complained of the political press for the account it gave of my demonstrations in the Medical Society here. This I must entirely deny. I only complained that erroneous communications, emanating from the Society in question, had been made in the press. The case which affects me personally was at first discussed in your columns in such a way as to create the impression that my demonstrations were directed against Dr. Koch. Pardon me remarking that such misrepresentation is calculated to cast suspicion on the most matter-of-fact discussion, if not to make it look invidious. What would become of truth if it were no longer permitted to experts freely to demonstrate and discuss subjects of unquestionably great importance? The special case in question is as follows:—My first report to the Society dealt with upwards of twenty *post-mortem* examinations. These had, in my opinion, shown that, after and owing to injections of the new medicament, severe inflammatory diseases of the lungs might arise. I had distinguished four different kinds of such inflammation. One of them seemed to me so peculiar that I thought myself at liberty to assume it to be characteristic—that, in fact, scientifically speaking, it was specifically 'injection pneumonia.' At a later meeting I showed the lung of a man who was not known to have received any injection. This lung showed considerable alterations, similar to those I had found in the specific pneumonia. I therefore did not hesitate to acknowledge that there was reason for an extenuating judgment to be derived from this experience. On the ground of these facts your reporter stated that I had retracted my previous opinion that pneumonia might be developed as a consequence of the injections. This is an error. I still adhere to that opinion, and all the conclusions which the press has drawn from the erroneous report fall to the ground. In reality, I only admitted it as a possibility that the fourth kind of inflammation of the lungs, as well as the three others, might not be a specific form of the disease. Further than this I did not go, for the previous history of the case in question is not sufficiently cleared up to enable us to regard it as positively proved that no injection had been administered."

To this statement the *National* attempts a reply, but it is very lame and without interest.

DOCUMENT 12.—TRANSLATION OF THE "DIRECTIONS FOR USE" SENT OUT WRAPPED AROUND EACH BOTTLE OF THE LYMPH.

The remedy keeps for a comparatively long time (*i.e.*, in the state in which it is sent out), but the dilutions which are to be prepared for the carrying out of the treatment easily spoil, and in consequence become cloudy. Thus, dilutions that have become cloudy or muddy must not be used.

In order to preserve the dilutions they must be boiled after every opening of the vessel containing them. This, however, is not necessary if  $\frac{1}{2}$  per cent. solution of carbolic acid has been used in preparing the dilution.

The dilutions are made in the following way:—In the first instance, a 10 per cent. solution is prepared by adding 9 cubic centimetres of distilled water, or of  $\frac{1}{2}$  per cent. carbolic acid solution to 1 c.c. of the remedy. In the same manner, a 1 per cent. solution is prepared from the 10 per cent. solution.

Thus, one has the dilutions required for the treatment of adults. For children it is expedient to employ a still weaker dilution, *e.g.*, a 0.2 per cent.

Since the weaker solutions lose their activity when kept too long, it is advisable to make fresh ones as often as possible. If distilled water has been employed in making the solutions, the latter must be kept in sterilised test-tubes closed with cotton-wool plugs. In these tubes the solutions may be most conveniently boiled over a gas or spirit flame.

The remedy is administered by means of subcutaneous injections, and experience has shown that the best sites for the injection is the skin between the shoulder-blades and in the region of the loins.

The injections are best carried out with a sterilised Koch's syringe of 1 c.c. Contents divided into tenths.

To sterilise the syringe, it is sufficient to thoroughly wash out the cylinder and the needle with absolute alcohol. Abscesses may in this way be avoided with certainty.

If one wishes to use an ordinary Pravaz syringe, before using it one must try to sterilise it as much as possible by repeatedly drawing into it absolute alcohol. But even then abscesses are not so certainly avoided.

The

The course of the temperature must be followed both before and during the injections. It is therefore necessary, at least a day before the first injection, to begin taking the temperature every three hours, and to see that this is continued during the whole time of the treatment.

The injections are to be made in the early hours of the forenoon, in order that their effect on the body's temperature, which is seen only some hours later, may still be observed on the same day.

For the first injections, in cases of pulmonary phthisis, 0·001 or 0·002 c.c. of the remedy are to be given—by injecting one or two tenths of a c.c. of the 1 per cent. solution.

On the following days the dose is cautiously raised. If the fever rises over 38·5° C. (=101·3° F.) the same dose is repeated, or perhaps it may be omitted. If no, or only slight fever occurs, the dose is raised by 0·001 to 0·002 c.c. When once the dose has reached 0·01 c.c. it can be increased by 0·01 or 0·02 c.c., but when this is being done the temperature should be closely observed. When the daily dose has reached 0·1 c.c., as a rule, it need not be further increased. Only exceptionally will one be obliged to raise it to 0·2 c.c. or more. With interruptions of one or several days the injections are then continued until the symptoms of the disease have disappeared.

In cases of not very extensive lupus in adults, one can at once give 0·01 c.c., and repeat it as necessity requires. This applies also to cases of tuberculosis of bones, joints, and glands.

Only when it has been obtained directly from the undersigned can the right condition of the remedy be guaranteed.

DR. A. LIBBERTZ.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

HOSPITAL BUILDINGS, MACQUARIE-STREET.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, and the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, to whom was referred the duty of considering and reporting upon "the original plans and estimates" for the proposed Hospital Buildings, Macquarie-street, "and also the plans and estimates for the buildings on a reduced scale of two stories only, and any other question of construction arising in the course of investigation," have, after due inquiry, resolved that it is expedient that the buildings should be completed in stone, according to the modified plans submitted to them, and in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

1. The resolution of the Legislative Assembly, referring the work to the Committee, was moved by Sir Henry Parkes, and was in the following terms:—

Resolution of the Assembly referring the work to the Committee.

"That this House, having approved of the completion of the Hospital Buildings in Macquarie-street, refers to the Parliamentary Standing Committee on Public Works the original plans and estimates for such buildings, and also the plans and estimates for the buildings on a reduced scale of two stories only,\* and any other question of construction arising in the course of investigation, and that the Committee be requested to report forthwith."

2. The resolution of the Assembly would appear to restrict the Committee to a consideration of the two sets of plans and estimates referred to them, and to a report which should simply say which of the two it was the more desirable to adopt; but inasmuch as it was felt by the Committee that a wider range of inquiry was necessary, even to enable them to properly consider the plans and estimates, and that great public interest attached to the whole question, and as by the Public Works Act the Committee are not only empowered but directed to make a searching and full investigation into every proposed work referred to them, it was decided by a majority of eight votes to four that the inquiry should, if necessary, embrace the whole question of hospital accommodation on the Macquarie-street site.

Decision of the Committee to inquire into the whole question.

3. The division at the meeting of the Committee when the decision was arrived at to make the inquiry general is shown in the following extract from the Minutes of Proceedings of 10th December, 1890:—

Extract from Minutes showing the division on the question as to the scope of the inquiry.

"The Committee proceeded to consider the proposed Hospital Buildings, Macquarie-street, and deliberated as to the terms of the resolution of the Legislative Assembly referring the matter to the Committee, and as to the powers of the Committee under the 12th clause of the Public Works Act.

"Mr. Trickett moved,—

'That in dealing with the question of the Hospital Buildings, Macquarie-street, the Committee recognise that the resolution submitting the question to the Committee limits the inquiry to that of construction only, and does not relate to the eligibility of site.'

Mr. O'Sullivan seconded the motion.

The motion was negatived on the following division:—

Ayes, 4.  
Mr. Trickett,  
Mr. Garrard,  
Mr. O'Sullivan,  
Mr. Lee.

Noes, 8.  
Mr. Lackey,  
Dr. Garran,  
Mr. Humphery,  
Mr. Cox,  
Mr. Tonkin,  
Mr. Dowel,  
Mr. McCourt,  
Mr. Garvan."

4.

\* This phrase "two stories only" really means two stories and a basement, which the Committee, it will be noticed, regard as a third story, and therefore they deal with the modified plans as plans representing three stories.

Clause of the  
Public Works  
Act directing  
full inquiry.  
Functions of  
Committee.

4. The following is the clause of the Public Works Act directing the Committee to make full inquiry respecting all proposed works referred to them :—

“ 12. The Committee shall, subject to the provisions contained in the next following section, consider and report upon all public works (except fortifications and works connected with the Military or Naval Defence of the Colony) to be executed after the passing of this Act (and whether such works are continuations, completions, repairs, reconstructions, extensions, or new works), in all cases where the estimated cost of completing such work exceeds twenty-thousand pounds. And, in considering and reporting on any such work as aforesaid, the Committee shall have regard to the stated purpose thereof, and to the necessity or advisability of carrying it out; and, where such work purports to be of a reproductive or revenue-producing character, the Committee shall have regard to the amount of revenue which such work may reasonably be expected to produce, and to the present and prospective public value of such work; and, generally, the Committee shall, in all cases, take such measures and procure such information as may enable them to inform or satisfy the Legislative Assembly as to the expediency of carrying out the work in question.”

Method of  
inquiry.

5. Having decided that the inquiry should not be restricted to a mere comparison of the two sets of plans, but should include all matters relating to the question which were of interest and importance, the Committee made a visit of inspection to the site of the proposed buildings, and proceeded to call evidence. The witnesses examined have been somewhat large in number, and the evidence is rather voluminous, but there being great difference of opinion upon the part of medical men and others as to the requirements necessary in a Hospital in Macquarie-street, and as to what ought to be done with those portions of the buildings already erected, this could scarcely be avoided. The Principal Under Secretary having laid before the Committee the plans and papers in the case, and generally explained the position in which the whole question stood, the Hon. Arthur Renwick, M.D., M.L.C., President of the Board of Directors of the Sydney Hospital, was examined. Other representatives of the Hospital Board, or of the Hospital, who appeared before the Committee, were: Mr. H. D. Russell, Secretary; and Mr. Sydney Burdekin, M.P., Treasurer; Dr. L. R. Huxtable, representing the Honorary Medical Staff; and Dr. Walter Hull, Medical Superintendent. Mr. Thomas Rowe, architect, was examined as the architect of the buildings; Mr. John Kirkpatrick, architect, as one of the competitors in 1878, when designs for the Hospital, including some from Mr. Rowe, were originally sent in; Mr. J. Horbury Hunt, President of the Institute of Architects of New South Wales, at his own request; Mr. Oswald H. Lewis, who was the architect of St. Vincent's Hospital, as one competent to express an opinion on hospital architecture; Mr. W. L. Vernon, Government Architect, in order that he might furnish a report to the Committee on Mr. Rowe's plans; and Mr. Alexander Dean, as a builder of experience and one who had something to do with the original designs for the Hospital sent in to the Hospital Board in 1878. In addition to these witnesses there were: Dr. F. N. Manning, President of the Board of Health and Medical Adviser to the Government; Hon. C. K. Mackellar, M.B., M.L.C., and Hon. H. N. MacLaurin, M.D., M.L.C., each of whom as a former Government Medical Adviser had advised the Government on the Sydney Hospital question, and had acted in association with the Hospital Board in the consideration given by the Board to the original designs sent in; Sir Alfred Roberts, Dr. W. Odillo Maher, representing the N.S.W. Branch of the British Medical Association; Hon. R. R. S. Bowker, M.D., M.L.C.; and Dr. F. Milford.

General  
statement  
of the case.

6. Stated generally, the case which, in this inquiry, the Committee have had to consider is, as it appears from the evidence, as follows:—

Some years ago the front of the old Hospital in Macquarie-street, containing about 150 beds, was pulled down in consequence of a belief that the walls were affected with hospitalism, which interfered with the treatment of surgical cases, and it was intended to build a new front that should fit in with two buildings erected at the rear of the main portion of the Hospital before the old front was pulled down, and known as the south wing and the Nightingale wing. Both these wings are at the present time good, serviceable buildings, and in constant use for hospital purposes. The cost of the new front was to be defrayed from a sum of £20,000 which had been collected in subscriptions from the public in commemoration of the recovery of the Duke of Edinburgh from the wound he received at Clontarf in 1868. This money was subsequently diverted to  
the

the erection of the Prince Alfred Hospital, and other money had to be found for the Sydney Hospital. The site of the Hospital, which was refused to the Board of Directors by Sir James Martin, was granted to them by the Government of Mr. Farnell; and with £20,000 in hand, and a corresponding amount from the Government, the Directors set about taking steps for the erection of the new Hospital front. Competitive designs were invited, the cost of the new portion of the building not to exceed £45,000, and each design to be accompanied by the certificate of a builder, showing that the building represented by the design could be erected for £45,000; and a number of designs were received. A design sent in by Mr. Thomas Rowe was approved by a majority of the Hospital Board, and he obtained the first prize, but designs from another architect were also regarded favourably, and were awarded premiums. Whether Mr. Rowe's design was accompanied by a builder's certificate, showing that the building according to his design could be erected for £45,000, or whether it was submitted to the Board without such a document being attached to it, is not quite clear. No such certificate was produced before this Committee, or could be found when it was asked for, although Mr. Rowe, according to his evidence, was under the impression that it accompanied his plan. Mr. H. D. Russell, Secretary of the Hospital, is of opinion that it was sent in with the design, but must afterwards have been lost. Whether this was so or not, however, Mr. Rowe, in his evidence, states distinctly that the building as designed by him could not have been carried out for £45,000. "To have carried out the work in a substantial manner," he says, "would have cost over £100,000," though "it would have been possible to have carried out the designs submitted, in an inferior manner, with slight brickwork, for about £50,000." To a design by Mr. John Kirkpatrick, which found favour with some members of the Board, notably Dr. MacLaurin and Dr. Mackellar, a builder's certificate stating that it could be carried out for £45,000 was attached, and Mr. Alexander Dean, the builder who gave the certificate, appeared before the Committee and confirmed the opinion he had expressed in the certificate. The Board having examined the various designs determined to enlarge their original intention as to the size, accommodation, and style of the building generally, and accordingly had a new design prepared by Mr. Rowe, in which in addition to his own ideas there were included some of the features of the other competitive designs that had been awarded premiums. It was also decided that the new plans should provide for the erection of a new wing in place of the southern wing which it had originally been intended to retain, and that the material for the whole of the buildings should be stone. These new arrangements increased the number of beds to be provided in the Hospital from 180 to 264, and the cost, in consequence of adopting stone instead of brick, which was the building material originally intended, by 20 to 25 per cent. The probable cost of the buildings designed in the first instance by Mr. Rowe, he states, never asked, and the probable cost of the enlarged design does not appear to have been known to the Board until after several contracts in connection with the erection of the new buildings had been carried out. The buildings were, in fact, commenced and raised to a certain height without the Board having any definite idea of the money that would ultimately have to be expended upon them, and it was not until £68,923 7s. 8d. had been spent, and operations had come to a standstill, in consequence of the late Sir Alexander Stuart refusing the Hospital Board a further grant of money, that calculations to get at the cost of completing the buildings were made. It was then found that the amount required to complete the work was £140,000, making the total cost in round numbers £209,000. This estimate of cost was supplied to the Government of Sir Alexander Stuart, in June, 1883, and since about that date nothing further has been done with the buildings. Questions arose as to the wisdom of spending such a large amount of money on the Hospital, and as to the suitability of the site for a hospital of the size represented by the plans; and for several years correspondence took place between the Hospital Board and the Government,

the

the Board asking for a grant, and urging the danger to patients from the necessity to provide for them in a temporary wooden building, and the Government declining to give it, for the reason that a decision had not yet been arrived at as to the course which should be taken by them with regard to the building. The plans, as enlarged by Mr. Rowe, appear to have been submitted to the Government before the erection of the buildings was commenced, and to have been approved by them, but in the belief that the total cost would not exceed £45,000. It was not until it was too late to alter the design that the Government became aware that the buildings would cost more than that amount. In 1887 a suggestion was made by the Board that a hospital on a smaller scale than that represented by the plans could be completed at a cost of £56,000 in addition to the sum already expended. This smaller hospital would be one story less in height than the building represented by the original plans, or three stories high in the pavilions, and four stories in height for the administrative building, providing accommodation for 144 beds, as against 264 beds in the larger hospital. Other modifications also were suggested. In 1887, Sir Henry Parkes informed the Hospital Board, the members of which waited upon him as a deputation, that he was in favour of continuing the buildings, and in 1890 it was decided by the Government of Sir Henry Parkes to submit the matter to Parliament in order that the necessary money for the completion of the buildings might be provided. On 5th November, 1890, the Legislative Assembly resolved,—“That, in the opinion of this House, the Government should proceed with the completion of the buildings now partially erected in Macquarie-street, for the purposes of the Sydney Hospital,” and the matter was then referred to this Committee.

Description of the Hospital according to the original plans.

7. Two sets of plans were referred to the Committee, one called the “original plans,”—but which in reality are the original plans sent in by Mr. Rowe enlarged, as decided by the Hospital Board after the competitive designs had been received,—and the other the plans for the building on a reduced scale of three stories. The original plans provide for the administrative portion of the Hospital, a north and south medical ward, a surgical ward, an eastern ward, an infectious ward, a mortuary and pathological museum, a chapel, operating room, and lecture theatre, kitchen premises, laundry and engine premises, and stores; the building to be of four stories, and the number of beds to be 264. The Nightingale wing is retained, but the south wing gives place to a portion of the new buildings. The buildings are designed in the form of a T, with a clear space all round, and could be so constructed that there would be no communication from one ward to another, or from the wards to the lifts, by which means exhalations from patients in one ward would be effectually prevented from reaching patients in any other ward. Twelve years have passed since the original plans were prepared, during which period the architect of the buildings, Mr. Rowe, has travelled in England and on the Continent of Europe, where he visited many of the largest and most improved hospitals; and he states that he saw nothing to show that his plans for the buildings in Macquarie-street could be improved in regard to any matter essential in hospital construction.

Description of the Hospital according to the amended plans.

8. The amended plans provide for hospital buildings similar in all respects to those represented by the enlarged original plans with the exception that the number of stories is three instead of four, and the number of beds in the new part 144, which with the beds in the present south wing would make a total of 222.

Cost of the proposed buildings according to the original plans.

9. The estimated total cost of the proposed buildings according to the enlarged original plans is, as will be seen from Mr. Rowe's statement, £209,000, of which nearly £69,000 has been expended, leaving £140,000 to be obtained to carry the buildings on to completion. This question of cost has been one of the principal features of the Committee's inquiry; and it is not too much to say that the circumstances in relation to it disclosed by the evidence are extraordinary. The Committee with £20,000 in hand, and an expectation of obtaining an equal or somewhat larger sum from the Government, invited designs for hospital buildings which were to be guaranteed not to cost more than £45,000. Designs were sent in, and one was accepted, but instead of a guarantee being given that the buildings according to this accepted design could be erected for £45,000, the architect

knew

knew that they could not be erected "in a substantial manner" under £100,000, or "in an inferior manner, with slight brickwork," for less than £50,000. Furthermore, he did not inform the Hospital Board of this excessive cost, and they appear to have made no effort to obtain the information. Dr. Renwick states that the Board were not aware that the cost of the buildings would be increased until after the accepted design had been enlarged, and the erection of the buildings in stone had been commenced. Mr. Russell, Secretary to the Hospital, says it was the impression of the Board that the amended design could be carried out for the proposed original cost, and that when they learned that the cost would be increased, they thought the buildings, as proposed in stone, could be erected for about £60,000. Mr. Rowe explains that he sent in to the Board his original design to cost £100,000, because it was impossible to build a hospital containing the number of beds required in a substantial and durable manner for £45,000. Asked by the Committee why he did not tell the Board what the carrying out of his design would cost, he said he did not think it was his duty to do so. Architects from all the Colonies were competing, and if he had informed the Board of the cost of his design he would simply have had to stand aside. Still it was possible to have carried out his plans in a temporary or inferior manner for the amount named by the Board. Mr. Russell in his evidence states that he thought Mr. Rowe all along studiously avoided giving the Board any information as to the increased cost, and that his answers when questioned in regard to cost were evasive. But Mr. Rowe declares emphatically that there was no desire on the part of the Board to know the cost. He knew what the work would cost, he said, but he was never asked about it, and he did not consider it his duty to force his business on the Board, who were vieing with the Prince Alfred Hospital Board,—Dr. Renwick against Sir Alfred Roberts,—the desire being to have a city hospital equal, if not superior, to the Prince Alfred Hospital. "There was no desire to know the cost—I am sure of it," he states; "for five years I was never asked the cost of the building, and I have never received a letter complaining of its cost." Later on in his examination he informed the Committee that at the laying of the foundation stone of the building he told a member of the Board that the work would cost over £200,000. The Government first became aware of the increased expenditure when they were applied to by the Board for further assistance to complete the second story, and then nearly £69,000 had been spent. At the same time, the Board, as a whole, appear to have received the first intimation of what the total expenditure would be. The circumstances surrounding this matter of cost form a very unsatisfactory and discreditable feature in the Sydney Hospital question.

10. The buildings, if completed according to the modified plans, will cost, as estimated by Mr. Rowe, £56,000, in addition to the amount already spent, or in all nearly £125,000, exclusive of the architect's commission. Mr. Rowe, the architect, has already been paid £3,226, and he claims commission on the whole transaction, as will be seen from question and answer 2203: "You would expect a commission upon the original plans? I am entitled to it. What I would do is a different thing. If this work is never completed I shall most distinctly claim my percentage on the transaction, and, dead or alive, it is a part of my estate."

Cost of the buildings according to the amended plans.

11. In view of the large amount of money already expended upon the buildings, and the much larger sum required to complete them according to the original or enlarged plans, the Committee have endeavoured to ascertain whether any unobjectionable course is available by which, while providing all the accommodation really necessary, the expenditure towards completing the buildings may be reduced even below the amount required to carry out the design represented by the modified plans. Both the original and modified designs appear to have been prepared in the most elaborate and expensive style. A desire on the part of the architect or of the Hospital Board to avoid unnecessary expenditure would have led to the retention of the present south wing instead of to its proposed demolition; but apparently, in the wish to make the buildings as imposing as possible, the south wing is to be pulled down, and the buildings generally are designed on a scale which would suggest that the architect, when preparing his plans, was influenced not so much by a desire to provide what was necessary as by a determination to leave out nothing connected with hospital accommodation, or associated with hospital architecture, likely to make the buildings equal if not superior to anything of the kind erected. The walls of the buildings, which are to be constructed of the best Pyrmont stone, are from

Efforts of the Committee to have the expenditure on the buildings reduced.

three to four feet in thickness, and this thickness is adopted even in the outbuildings where the width of the walls is equal to nearly half the space enclosed. Expense might be saved if, while the front of the buildings is erected in stone, the walls of the back portions of the buildings are constructed of brick. A hospital constructed of brick is, according to the evidence of medical men, quite as healthy, and effective in the matter of cures, as a hospital built of stone. But here again the Committee are met by the circumstance that the buildings have been carried to the height of two stories in stone, and that if any brickwork, inconsistent with the architect's plans, be now introduced the buildings will be unequal in character, and by the probability that the saving in expenditure as between the cost of stone and the cost of brick will be immaterial compared with the hybrid style of buildings which the use of brickwork now will produce. Any idea of reducing the accommodation for which the plans provide, other than by reducing the number of stories, is confronted by the same difficulty: the accommodation provided for cannot be reduced without upsetting all or much of the work which has already been carried out, and thus rendering the expenditure upon it wasted. The Committee have therefore found themselves in the peculiar position of being restrained from recommending any course outside the adoption of one or other of the two sets of plans submitted to them. Though the evidence shows forcibly that the plans have been prepared on a scale much more elaborate and expensive than is necessary, and that the expenditure already incurred, if not reckless, indicates a want of ordinary carefulness, the erection of the buildings having been carried to a certain point, the only manner in which any future expense may be saved is by reducing the height to which the buildings should be raised.

Question of site.

12. The question of site is a matter of importance in relation to any course taken with regard to the erection of a hospital. There is a difference of opinion as to whether the site in Macquarie-street is the best for a hospital for general purposes, but the question is definitely disposed of by the fact that the hospital buildings are already half-erected upon it. The sum of £69,000 having been spent on the buildings partially erected, another site for the hospital could be selected only by wasting that amount of money, for, according to the evidence, the buildings have been so designed that they are not suitable for any purposes other than those of a hospital.

Opinions as to the size and accommodation necessary in a hospital in Macquarie-street.

13. Opinions, as represented in the evidence, differ as to the size and accommodation necessary in connection with a hospital in Macquarie-street; but most of the witnesses express themselves favourable to arrangements which accord with what the Committee have determined to recommend. The Committee have decided to recommend the completion of the buildings according to the modified plans, with the retention of the present south wing, by which arrangement provision will be made for 222 beds. Dr. Renwick, President of the Sydney Hospital Board of Directors, recommends that if the original design cannot be fully carried out "the front buildings only be completed, and the south wing left as a pavilion," which would provide for 180 or 190 beds. He is, however, more in favour of providing accommodation for 250 beds. Dr. F. N. Manning is of opinion that the accommodation for a hospital should be not less than 160 beds, and not more than 200, and he thinks a hospital of two stories more workable than one of four. He is favourable to the buildings being completed in accordance with the modified plans,—giving "two stories and a basement in each pavilion, and to carry out the administrative portion with three stories, leaving the south wing." Dr. Mackellar's opinion in the matter is very similar. He does "not think it is absolutely necessary that there should be a hospital with more than 200 beds in that part of the city." Population in the metropolitan area is going westward, he says, and if we provide for purely city wants provision can be made for metropolitan wants at the Prince Alfred Hospital at the cheapest rate. Modern teaching, he points out, favours hospital buildings of no more than two stories high, and 200 beds would be sufficient to accommodate all the accident cases and some others which may arise in the city, and for which Prince Alfred Hospital would not be available. He is opposed to the south wing being pulled down, and though he does not approve of the modified plans for the hospital, principally because of the roof being, in his opinion, entirely out of proportion to the building, he admits that these plans may be made

made suitable by altering the design for the roof. Dr. MacLaurin thinks that there ought not to be more than two tiers of wards in the hospital, and that from 140 to 200 beds would be quite sufficient. His idea is "that in the Sydney Hospital and the Prince Alfred Hospital we should entirely confine ourselves to cases of very grave disease, of severe accidents, and to the more important surgical operations, and that we should have a perfectly different institution, a little way out of town, where chronic cases of sickness occurring among paupers and poor people should be treated." The proper course to take in completing the present buildings is, in his opinion, to carry out the modified plans at the cost of £56,000. The modified design, he says, is not so handsome as the original design, "but we have to make the best of it, and do the best we can." On no consideration would he have provision made in the hospital for more than 220 or 230 beds. "I would not go beyond that," he states, "on any consideration, for I think that you would have the ground sufficiently occupied then, and if you wanted more accommodation in this neighbourhood for acute cases—which I do not think you require—I would rather have a second hospital than build a larger one on that site." Sir Alfred Roberts is of opinion that 150 beds are sufficient for an accident and emergency hospital, and has no doubt "that the building now half erected may be converted into a good useful hospital of about 170 beds." He also considers that the building will be a better specimen of hospital architecture with three instead of four stories. Dr. Milford thinks that provision should be made for from 150 to 200 patients; he would not exceed the limit of 220 patients, that limit requiring 250 beds. Dr. R. R. S. Bowker is altogether opposed to there being a general hospital in Macquarie-street, or to more than 70 beds in an emergency hospital on that site. Two other medical witnesses examined—Dr. Huxtable, Hon. Physician, and Dr. Hull, Medical Superintendent, of the Sydney Hospital—favour the erection of a hospital of more than ordinary proportions. Dr. Huxtable, in a paper which he read to the Committee as setting forth the views of the Honorary Medical and Surgical Staff of the Hospital, stated that the staff "are of opinion that the Sydney Hospital should be completed upon the plan, or some modification of the plan, of the present unfinished building, and that it should be designed ultimately to accommodate 300 patients, or thereabouts." Dr. Hull recommends the completion of the portion of the buildings already begun according to the original plan, and the retention of the south wing. This would give room for 200 beds in the new structure, and if the number of beds in the south wing were reduced, which he thinks might be done, from what they are now to 66, the total number of beds available in the hospital would be 266.

14. In the course of the inquiry Mr. W. L. Vernon, Government Architect, submitted to the Committee a plan for altering the front of the proposed hospital buildings so as to admit of the widening of Macquarie-street, which he thought desirable, in view of what the Government may do in the future in erecting public buildings, including new Houses of Parliament, in that street. In its present condition Macquarie-street has a roadway, from kerb to kerb, of 39ft, and Mr. Vernon proposes to widen it by taking in the 12-feet pavement on the eastern side, and enlarging the width on the eastern side still further. Taking in the present eastern pavement would extend the width of the street on that side to the shrubs growing in the enclosure fronting the Houses of Parliament, and along the western limit of the Botanic Gardens from Bent-street towards the entrance gates of the grounds of Government House. These shrubs Mr. Vernon regards as too valuable to be destroyed, and he proposes that they shall be preserved within railings, enclosing a space of 12 or 14 feet, and that they shall occupy a position between the main street or roadway and a walk or pavement on the eastern side 40 feet in width, which walk or pavement should be carried from Chancery-square to the guard-house at the gates leading to Government House. This, Mr. Vernon explains, would provide the whole of the Government buildings in the street with presentable frontages, afford plenty of access to them, and give them generally a handsome appearance. To effect this widening of the street it would be necessary to alter the front of the hospital buildings by taking off those projections that would prevent the width from being secured, by which proceeding the hospital front would be considerably flatter, and not improved in appearance. Mr. Vernon was requested to

Proposed  
widening of  
Macquarie-  
street.

to give the matter further consideration than he appeared to have done when first suggesting it to the Committee, and in a report which he subsequently submitted on the subject he enlarged his proposal. He there suggested that the street might be widened to the extent of from 115 to 120 feet, to effect which it would be necessary to make certain important alterations in the hospital buildings. It would be necessary to take down the front central block of the buildings, and the side wings intended for accident and medical cases, and to rebuild them at least 35 feet in the rear of their present position,—an alteration which would affect the western wing of the Nightingale Ward, the question of a site for a ward or building for infectious cases, and the central ophthalmic ward buildings. The cost of removing and rebuilding the present stonework, &c., he estimated at from £10,500 to £14,500. If, he explained, it should be considered more desirable to leave the whole of the buildings untouched, and widen the street only up to the building frontage, the front entrance steps could, by a slight alteration in the internal arrangements, be kept entirely within the building, so that the street alignment could be identical with the stonework of the central building; but this plan he did not favour as much as the other, as, in his opinion, its adoption would mean “the serious curtailment for all time of an improvement for which so good an opportunity now presents itself.” By extending the width of the street to the front steps of the hospital, the street would be 80 feet wide. These suggestions to widen the street can be very well understood from a plan and a sketch which Mr. Vernon laid before the Committee, and which, for public information, are published with this Report.

Evidence as to  
Hospital  
System and  
other matters  
connected  
with hospitals.

15. A perusal of the evidence given before the Committee will show that a great deal of information was afforded by witnesses on matters closely connected with the subject of hospitals, but outside the immediate question which the Committee had to consider and upon which they have had to arrive at a decision. This information, though an unavoidable part of the testimony requisite to enable the Committee to fully understand the question referred to them for inquiry, is not of the kind which it is necessary to reproduce in this Report. At the same time it is both interesting and valuable, as it contains statements and opinions on hospital sites, hospital building, hospital accommodation, and hospital administration, from those who may be regarded as the best authorities on these subjects in the Colony. One important matter it discloses is the very defective system which appears to exist between the Government and Hospital Boards of Management, by which very large sums of public money may be spent free from Government control, and consequently with a want of proper judgment and carefulness.

Decision of  
the Com-  
mittee.

16. The Committee, as already mentioned, have decided that the Hospital Buildings should be completed according to the modified plans, and their decision is shown in the following extract from the Committee's Minutes of Proceedings:—

On the 12th March, 1891:—

“Mr. Garrard moved—

‘That, in the opinion of the Committee, the Sydney Hospital should be completed in stone, on the modified plan submitted to them, viz.: The completion of the present north, south, and east pavilions three stories high, and the administrative buildings four stories high, at a cost of £56,000, giving accommodation for 144 beds; also, that the present southern wing, with its 78 beds, be retained.’

“Mr. O'Sullivan moved as an amendment on the motion,—‘That all the words after the word ‘that’ be omitted, for the purpose of inserting the following:—‘In the opinion of this Committee it is expedient that the proposal to construct the Sydney Hospital should be carried out; but in view of the proposal to increase the width of Macquarie-street to over 100 feet, all the present buildings on the site, which stand in the way of that improvement should be removed, and a Hospital of the latest design, capable of accommodating 200 beds, should be erected in their place.’

“After discussion, Mr. O'Sullivan's amendment was, with the consent of the Committee, amended so that it should read as follows:—‘That all the words after the word ‘That’ be omitted, for the purpose of inserting the following:—‘In the opinion of this Committee, it is expedient that the proposal to construct the Sydney Hospital should be carried out; but, in view of the proposal to increase the width of Macquarie-street to over 100 feet, all the present buildings on the site which stand in the way of that improvement should be removed, and an accident and emergency hospital of the latest design, capable of accommodating 200 beds in the new structure, should be erected in their place. The Committee are further of opinion that the back wall of the main building, and also the whole of the east pavilion, should be in brick.’

“The

“The Committee divided on the Question,—‘That the words proposed to be omitted stand part of the Question.’”

Ayes, 6.  
Mr. Lackey,  
Mr. Humphery,  
Mr. Garrard,  
Mr. Copeland,  
Mr. Lee,  
Mr. McCourt.

Noes, 5.  
Dr. Garran,  
Mr. Trickett,  
Mr. Cox,  
Mr. Tonkin,  
Mr. O'Sullivan.

“The amendment was therefore negatived.

“Mr. Copeland moved—

‘That the motion be amended by omitting all the words after the word ‘the’ before the words ‘modified plan’ in the second line, and inserting the words ‘plans of Mr. Rowe, as submitted to this Committee, at a cost not exceeding £80,000; and the Committee recommend that the proposal of the Government Architect, as to widening Macquarie-street, be carried out to the extent of taking the east side of the street up to the steps of the proposed Hospital.’”

“The amendment was seconded by Mr. McCourt, and negatived on the following division:—

Ayes, 3.  
Mr. Lackey,  
Mr. Copeland,  
Mr. McCourt.

Noes, 8.  
Dr. Garran,  
Mr. Humphery,  
Mr. Trickett,  
Mr. Cox,  
Mr. Garrard,  
Mr. Tonkin,  
Mr. O'Sullivan,  
Mr. Lee.

“The original motion was then passed on the following division:—

Ayes, 7.  
Mr. Lackey,  
Mr. Humphery,  
Mr. Garrard,  
Mr. Copeland,  
Mr. Tonkin,  
Mr. O'Sullivan,  
Mr. Lee.

Noes, 3.  
Dr. Garran,  
Mr. Cox,  
Mr. McCourt.

17. The Committee suggest that, if the plans of the Hospital buildings are in any respect further revised, they should be submitted for the consideration of Mr. Vernon, for though the Hospital Committee's architect is not officially subject to the Government Architect, it is so important that the public buildings on that site should harmonise with the Government Architect's scheme, that no large sum of money should be spent there unless the Government has control over the design.

JOHN LACKEY,  
Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 12 May, 1891.

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### HOSPITAL BUILDINGS, MACQUARIE-STREET.

WEDNESDAY, 10 DECEMBER, 1890.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. GEORGE HENRY COX.

JACOB GARRARD, Esq.

JAMES EBENEZER TONKIN, Esq.

WILLIAM SPRINGTHORPE DOWEL, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM MCCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee proceeded to consider the proposed Hospital Buildings, Macquarie-street.

Critchett Walker, Esq., Principal Under Secretary, sworn, and examined:—

1. *Chairman.*] You have had a good deal to do with the initiation and consideration, so far, of the proposed Hospital Buildings in Macquarie-street? I have not had a great deal to do with the matter. I have had a good deal of correspondence about it, but it is more a medical business.

2. Is there any special evidence which you would like to submit to the Committee dealing with the circumstances under which the Government have brought forward the proposal? Yes. I am desired by the Colonial Secretary to hand to the Parliamentary Standing Committee on Public Works the plans of the proposed new Sydney Hospital, and the accompanying printed paper, giving full particulars with regard to the portions completed and partly erected, the cost already incurred, and the approximate estimates of the cost of completion of the buildings. In doing so, I would point out that it has been represented to the Government from time to time by the Directors of the hospital that the funds of the institution would not admit of their proceeding with the buildings, which had already been begun, and have remained in an unfinished state for some time past. In consequence of this representation, it was decided to submit the matter to Parliament in order that the necessary aid for the completion of the structure should be provided. This was done by resolution, on the motion of Sir Henry Parkes, on November 5th, 1890, to the following effect:—"That in the opinion of this House the Government should proceed with the completion of the buildings now partially erected in Macquarie-street, for the purposes of the Sydney Hospital," which was carried. After which the following resolution was adopted—"That this House having approved of the completion of the Hospital Buildings in Macquarie-street, refers to the Parliamentary Standing Committee on Public Works the original plans and estimates for such buildings, and also the plans and estimates for the buildings on a reduced scale of two stories only, and any other question of construction arising in the course of investigation, and that the Committee be requested to report forthwith." That is the only statement which I can make.

3. You are aware that this hospital has been for some considerable time in course of erection? Yes, a very long while.

4. The work which was being carried out some years ago was stopped and the building discontinued? Yes.

5. The money necessary to carry on this hospital is found in two distinct ways—partly by the Government, and partly by private subscriptions? They get £4,000 from the Government on the basis of £ for £.

6. Do you know what amount there is at the credit of the hospital? No, I am not aware.

7. There are, you are aware, differences of opinion about the design of the building? Yes, and as to the site too.

8. You stated that this matter had been brought directly under the consideration of the medical officers of the Government—would they be the Health Board? No; the Medical Adviser. I meant that it was more in his sphere than in mine.

9. Have the Government had various recommendations about the hospital from the different health officers who have been appointed during the last seven or eight years? I think there have been recommendations made by Dr. Manning, Dr. MacLaurin, and Dr. Mackellar.

10. Did those differ as to the design of the building? I cannot remember.

11. You are not prepared, I suppose, to say that the whole faculty agree that the proposed site is a proper one? No.

C. Walker,  
Esq.

10 Dec., 1890.

- C. Walker, Esq.  
10 Dec., 1890.
12. *Mr. Garrard.*] Can you tell us how much of the £68,928 7s. 8d. was given by the Government, and how much by private subscription? I think that amount includes everything—the whole of the expenditure by the Directors of the hospital.
13. You cannot tell us how much the Committee have had from the Government for building purposes only? No.
14. But I suppose you could furnish the information from the records of the office? Yes; I will ascertain it, and furnish it to the Committee.
15. *Mr. Trickett.*] Has the construction of the building, so far, been under the supervision of the Government or of the Hospital Committee? It has been under the supervision of the Hospital Committee as far as I know.
16. You have control of all the papers connected with this hospital? I think they are all in my Department.
17. Have there been deputations or petitions for, or against, the construction of the hospital? Yes; several deputations have waited on the Colonial Secretary on the subject from time to time.
18. And communications have been received about it? Yes.
19. Could those be collated and put before the Committee? Yes; I could get them for the Committee.
20. The design for the buildings was the result of a competition? Yes; I think so, and Mr. Rowe was the architect.
21. *Mr. O'Sullivan.*] It was the Stuart Government who proposed that these works should be stopped? I think so; but I cannot say for certain.
22. Do you know what reasons were assigned? As far as my memory serves me the Hospital Committee had no funds to go on with, and the Government would not assist them.
23. Why? That I cannot tell you. I do not know that any reason was assigned.
24. You have a minute from Sir Alexander Stuart bearing upon the point? There is a large quantity of papers bearing upon the subject.
25. Did not Sir Alexander Stuart explain in that minute the reason why the work was stopped? That I could not tell you from memory.
26. *Mr. Dowd.*] Can you furnish the Committee with the names of the Trustees for the property? Mr. Street and Dr. Renwick are two of them. Two of them, Sir Edward Deas-Thompson and the Rev. A. H. Stephen, are dead; I do not know whether their places have been filled up yet.
27. Do you consider the site of the hospital suitable for an accident hospital? I think it is.
28. Are the Government in the habit of sending many patients there? Yes; they send a large number there.
29. And, so far as your observation goes, the attendance is of a satisfactory character—the results have been good? I think so; I have heard very few complaints.

The Hon. Arthur Renwick, M.D., M.L.C., sworn and examined:—

- Hon. A. Renwick, M.D., M.L.C.  
10 Dec., 1890.
30. *Chairman.*] You are President of the Board of Directors of the Sydney Hospital? Yes.
31. And have been for some years? Yes.
32. You have always taken an active interest in that hospital? Yes.
33. You know most of the circumstances connected with the design of the proposed buildings and their history? Yes.
34. The work was stopped some years ago? Yes.
35. Can you inform the Committee of the circumstances under which it was stopped? It was stopped because the money at the disposal of the Directors was exhausted. An application was made to the Government for additional funds, but the Government declined to supply them with any more money. Sir Alexander Stuart was then in office.
36. Do you recollect what the sum in hand was when the work was commenced? I think we had somewhere about £20,000.
37. Was that composed of private subscriptions and the Government subsidy, or did it come from other sources? It was composed principally of subscriptions and donations; but the Treasurer, Mr. Burdakin, will be able to give you full information.
38. Was all the money expended in the construction of the buildings? Yes.
39. And more? Yes; a grant from the Government of about £25,000 was also expended.
40. On what grounds did the Government decline to supply any more funds—on the grounds of the unsuitability of the site? The reasons they urged were that the site was too valuable for the purposes of a hospital, and that an equally good site could be provided elsewhere at less cost.
41. Is it the case that the medical profession differ as to the eligibility of the site? No; they are unanimous that no better site could be found anywhere.
42. Is there not a difference of opinion as to the nature of the buildings which should be erected? Yes.
43. Is it generally supposed by medical men that such expensive buildings are not suited for a hospital? A very small fraction of the medical profession believe that a hospital should be constructed of such material as to permit of its being destroyed at the end of five or seven years—that no permanently lasting hospital buildings should be erected under any circumstances.
44. But the majority of medical men think that the buildings, as originally designed, should be carried out? I do not say that; I say that medical men as a whole take a different view with regard to the construction of hospitals.
45. Have the medical profession or the Trustees of the hospital come to any conclusion as to which is the most suitable design? The medical profession held a meeting a few months ago, and urged the Government, as I understand, to complete the buildings according to design. As regards the Trustees and the Board of Directors, they are desirous of having the hospital completed, either according to the original plans, or as nearly in accordance with them as possible.
46. Do you recollect what the expenditure upon the original plans was estimated at? The hospital was originally intended to contain sixty medical, seventy surgical, and twenty ophthalmic—male and female—beds, with small ophthalmic operation ward; a children's ward containing about twenty beds; a casualty ward, near the waiting-room, to contain six beds; six private single bedrooms, with baths, &c., for private paying patients

patients. These particulars are contained in the memoranda supplied to the competitors for the original design of the hospital, and a copy of which, together with a copy of the terms and conditions with regard to the designs, I now hand in:—

Hon. A.  
Kenwick,  
M.D., M.L.C.

10 Dec., 1890.

TERMS and conditions with regard to the competitive designs for the new Hospital, Macquarie-street, Sydney, N.S.W.

The Board of Directors of the Sydney Infirmary and Dispensary invite competitive designs for a Modern Pavilion Hospital on the site in Macquarie-street (as represented in the survey sketch made by Mr. Reuss), and they offer a premium of two hundred pounds for the best design; a premium of one hundred pounds for the second best design; and a premium of fifty pounds for the third best design—on the following conditions:—

1. The designs are to be approved and accepted by the Board of Directors, who shall be the sole judges of their merits, and they shall be at liberty to reject all or any of the designs if they think fit.

2. Any of the successful competitors may be employed by the Board at their pleasure as the architect to carry out the erection of the Hospital so designed, and he shall make the working drawings, and invite tenders for the performance of the works required, when he shall charge a rate of commission to be agreed upon hereafter by the Board and himself, in which case the premium awarded shall not be paid by the Board. The premium design shall be the property of the Institution.

3. The cost of the buildings to be designed shall not exceed forty-five thousand pounds (£45,000), and all competitors shall forward with their designs approved certificates that their designs can be carried out at the present (1878) rates of materials and labour in Sydney for that amount. This certificate must state distinctly that the sum named will include and cover all charges connected with the erection and completion of the structures.

4. The memoranda provided for the competitors, as to the administration requisites, ward accommodation, ground space, and other particulars, are supplied to assist the competitors, but are not in any way or manner binding on the Board.

5. The designs must be drawn to the scale of 1-16 of an inch to the foot, and be in outline only and without any back shading or colour; but sectional parts may be tinted, as also floors, &c.

6. The designs are to be distinguished by a motto. Accompanying the design each competitor must forward a sealed envelope, with his motto written on the outside, and containing within his name and address in full, and the certificate already referred to as regards the cost of the structure to be erected from his design.—(See Condition 3.)

7. Each competitor is at liberty to supply one or more designs, under different mottoes, for competition; but each separate design or set of designs shall be considered on its own merits.

8. The advertisements in connection with this competition shall appear as far as possible simultaneously in the newspapers of Sydney, Brisbane, Melbourne, and Adelaide. The Board will take every possible care of the designs forwarded to them, and will return them when no longer required, but will not undertake any responsibility in these respects.

9. The designs offered for this competition shall be received at the office of the Sydney Infirmary, Macquarie-street, Sydney, on or before 25th January, 1879, after which date no further plans, designs, or other particulars of any kind in connection with the competition shall be received.

MEMORANDA with regard to the new Hospital Buildings to be erected in Macquarie-street.

#### I. Administration Requisites.

Board-room, Manager's offices, pupils' reading-room and library, chapel.

Quarters for Superintendent, three resident medical officers, and for six pupils. [Medical officers' quarters so arranged as to be convenient for all parts of hospital.]

Quarters for steward, dispensers, cooks, carpenter, engineer, and porter.

Workshops for carpenter and engineer, store-rooms for steward, rooms for apparatus.

Dispensary Requisites.—Laboratory, dispensing-room for indoor and outdoor patients, office, large waiting-room, outdoor surgeons' consulting rooms (six), rooms for examination of patients for admission.

Baths:—In addition to the baths for administration buildings, and for the wards—general bath-rooms (for patients on admission, &c.)

Kitchen and Laundry:—Provisions to be made for steam power washing and drying machines, and all other accessories of a modern laundry.

Mortuary, with room for inquests and for pathological museum; small offices.

#### II. Ward Accommodation.

Beds to be provided—Sixty medical, seventy surgical, twenty ophthalmic (male and female) with small ophthalmic operation ward. A children's ward to contain about twenty beds. A casualty ward, near waiting-room (for patients awaiting admission) to contain six beds. Six private single bed-rooms, with baths, &c., for private paying patients.

Operation Theatre (with light from above) suitable also for lecture-room.

N.B.—(a) Particular attention must be paid to the perfect ventilation and isolation of each ward.

(b) The principle of detached pavilion wards with open corridor communication to be adopted.

(c) The various lifts required (whether worked by steam or other power) to be so contrived as to be completely out of atmospheric connection with the wards.

(d) No ward or room to be less than 16 feet in height.

(e) Nurses' rooms overlooking wards to be provided.

Remember also that sufficient room must be left on the ground in an isolated spot for three or more huts for infectious cases of disease.

#### III. Ground space and other particulars.

The size and dimensions of the buildings on the ground, the depth of rock and position of sewer, with other particulars, are given on the lithographic sketch supplied with these memoranda.

The only buildings which are to remain permanently on the hospital grounds are the Nightingale wing and the south wing, as marked on sketch. All other buildings will be removed as soon as the progress of the works permits, with the exception of the main front building facing Macquarie-street, which will be removed as soon as Parliamentary sanction is obtained for that purpose.

All the soil down to the rock (or such portions of the soil as may be connected with or affected by the present buildings) is to be removed from places where foundation and structure of old building facing Macquarie-street stands.

The main front of the new building must not be brought forward to Macquarie-street frontage further than 50 feet from alignment of street as marked on sketch.

47. Was that accommodation provided in the design which was supplied? That was the ward accommodation designed. Administration requisites were also put in the list. They consisted of a board room, manager's offices, pupils' reading-room and library, chapel, quarters for superintendent, three resident medical officers, and for six patients, quarters for steward, dispensers, cooks, carpenter, engineer, and porter, workshops for carpenter and engineer, store-rooms for steward, and rooms for apparatus. The dispensary requisites were:—Laboratory, dispensing room for indoor and outdoor patients, office, large waiting-room, outdoor surgeons' consulting rooms (six), and rooms for examination of patients for admission.

48. What was the original estimated cost of the buildings? In the terms and conditions with regard to the competitors' designs, the following paragraph refers to the cost:—

The cost of the buildings to be designed shall not exceed £45,000, and all competitors shall forward with their designs approved certificates that their designs can be carried out at the present (1878) rates of materials and labour in Sydney for that amount.

- Hon. A. Renwick, M.D., M.L.C.  
10 Dec., 1890.
49. What were the buildings to cost in the aggregate? I cannot say.
50. Do you recollect if any estimate was made after this? I may as well state what was subsequently done. Mr. Rowe's designs were approved, and obtained the first prize, if I remember rightly, and plans designed by other architects—Mr. Backhouse among them—also obtained premiums. The Board then decided to employ Mr. Rowe as their architect, and, from the competitive designs, to arrange a new design—of course for the same cost and under the same conditions as were contained in the original memoranda—and this design, the Board understood, was to be carried into effect.
51. *Dr. Garran.*] Having been so long on the Board you are thoroughly conversant with the history of the hospital? I am.
52. The original front was pulled down on account of its hospitalism? There was a rumour to the effect that it was unhealthy, and a popular outcry—a mistaken one, I think—was raised for its removal, to which the Board yielded.
53. There were difficulties with many of the surgical cases treated there? There were reported difficulties.
54. Do you think it was really necessary to pull down the whole of that front? I do not think so.
55. If the plaster had been knocked down, and the boarding replaced, would that have been sufficient? I think amply sufficient.
56. How many beds did the old front contain? About 150, I think.
57. It was the principal part of the hospital? The main part.
58. Before it was pulled down the south wing was built? Yes.
59. Do you remember at what cost? I can provide all these estimates, but not from memory.
60. Do you know how many beds the south wing carries? About eighty beds.
61. It is in use still? Yes.
62. How long has it been built? Speaking from memory, fifteen or sixteen years.
63. And it is still a serviceable building? Excellent.
64. Is it used principally for surgical or for medical cases? At the present I think it is used for both. *Dr. Chambers* uses a considerable part of it for diseases of women. It is used for a women's hospital principally.
65. You do not remember the cost of its erection? No; it was largely defrayed by private subscriptions, principally from the Cooper family. It was erected in consequence of an accident to one of that family.
66. Before the front was pulled down the Nightingale ward was built? Yes.
67. It is a good serviceable building which will last for many years? Yes.
68. The idea was to pull down the old front and to put up a new one? That was the original intention; and it was intended that the cost should be defrayed by the money which was subscribed by the public in commemoration of the recovery of Prince Alfred from a pistol wound. The money was offered to the Board of Directors, and after some little dispute as to the purposes to which it should be applied the original intention was altered.
69. Sir Alfred Roberts busied himself very actively in collecting that money? He busied himself very much in disbursing it; I do not know about collecting it.
70. You remember at the time that the subscription was being made that the question was raised as to the advisability of constructing a large hospital on that site? No; I do not.
71. Do you not remember that many of the subscribers almost attached the condition to their grants that there should be a new hospital? I do not remember that; but a new hospital was the outcome of the subscription.
72. Sir Alfred Roberts tendered this sum of £20,000 to the Trustees of the hospital? I do not know whether he tendered it, but it was tendered.
73. The site of the hospital had not at that time been granted by the Government? No.
74. Did not Sir James Martin refuse to grant it? Yes.
75. On the ground that the original promise had been given improvidently? I cannot remember the specific terms. The opinion he held was that a property of this kind should not be granted in fee-simple to any Board of Directors; but he said that they would not be disturbed so long as the site was used for hospital purposes.
76. This was originally a pauper hospital? Yes.
77. The promise of a grant was for a sick hospital? Yes.
78. For the poor? I do not think the poor were mentioned.
79. It was not intended to have a general hospital there? Yes, always.
80. The grant was afterwards obtained from Mr. Fitzpatrick's Government? Yes.
81. But before that the £20,000 had been diverted to the erection of the Prince Alfred Hospital? I cannot be quite sure, but I think so.
82. At any rate that money was not spent upon the Sydney Hospital? No.
83. When the Committee decided to pull down the old front they had no more ambitious design than to replace it with a better one? I fancy that that was the original intention.
84. They had to make provision for about 150 beds? For about 170 beds.
85. With this new building, the south wing, and the Nightingale ward, they thought that they would have sufficient accommodation? Yes, for the existing population.
86. They came to that resolution knowing that the Prince Alfred Hospital, with its large plan, was in course of inception, if not of execution? Yes.
87. So that the buildings were designed as a city hospital, leaving a larger hospital on the outskirts of the city? The Directors considered the general hospital accommodation required at that time in Sydney for the purposes of the city and of the country; but whether they considered specifically what the ultimate development of the Prince Alfred Hospital would be I could not say. I am sure they never had the full plans of the Prince Alfred Hospital before them, though they knew that a convalescent hospital was going to be built there.
88. Was the Prince Alfred Hospital designed for a convalescent hospital? The money was subscribed for such a hospital. I do not know what it was designed for.
89. Are you sure of that? I think my statement is correct. My own subscription went for that purpose, and I think you will find it stated in the original advertisement that the hospital was to be for convalescent patients.
90. Was not the money spent on the Prince Alfred Hospital subscribed to replace the front of the Sydney Hospital? Yes; as a convalescent hospital.
- 91.

91. At any rate when you commenced the erection of the new part of the Sydney Hospital you had about £20,000 in hand, and you received an equal amount from the Government? Rather more from the Government.

Hon. A.  
Renwick,  
M.D., M.L.C.

10 Dec., 1890.

92. Altogether you had £45,000 with which to replace the old front? Not to replace the old front, which was built on the old hospital system, and could never have been replaced. It was not built on the pavilion system at all, and the Directors would have been most unwise to replace it. What they wished to do was to replace the accommodation under more modern and improved conditions.

93. I do not mean to replace the old plan, but to build another structure upon the site; for that you advertised for plans, and the cost of the building was not to exceed £45,000? Yes.

94. As far as you remember, did any of the plans which were sent in keep within that estimate? I think nearly all of them did. It was provided in the original memoranda that every competitor should provide a certificate from an approved contractor to the effect that the cost of erection would not exceed £45,000.

95. And the plans sent in would have really enabled you to carry out the first intention? It was certified to that effect.

96. When you came to look into the matter, by successive incubations, this cost of £45,000 grew to £70,000, and £140,000 is now needed to complete the design? I think that scarcely states the case properly. After alterations were made in the plans, and after the medical staff of the institution had been consulted, and the design of the buildings determined upon, the Board were not aware that the cost should be increased, and a meeting was held in which it was resolved that the hospital should be built of stone instead of brick. The architect will be able to explain this matter more clearly than I can; but I understand that the increase in the cost was necessitated by that resolution. It was considered by those who supported the resolution that the style of the building should be in accordance with the important position which it occupied.

97. You increased the cost from £45,000 to what? We were not aware at the time that we were increasing the cost; but afterwards, when the stone structure had been commenced, it was explained that the cost of the building would be increased.

98. Do you know whether Mr. Rowe's plans were ever submitted to the Government and approved of by them? They have been approved of by all the Governments that have been in power since they were executed, and I think they ought to be found amongst the records of the Colonial Secretary's Office. They were submitted to the Parkes Government, to the Stuart Government, and, I think, to every subsequent Government.

99. Do you know whether the original plan for £45,000 was submitted? We had no other plan.

100. The foundations designed in the original plan are those which have been put down? Yes.

101. What Government was in power at the time the work was commenced? The Parkes Government.

102. When you decided to alter the material, did you submit the plan to the Government? I really cannot say. I do not know that I took any part in the matter.

103. Your impression is that the Committee were led to believe that they could build in stone as cheaply as in brick? If I remember rightly it was explained to them that the cost of building in stone would be much greater than the cost of building in brick; but they thought the site was such a beautiful one that it would be better to go to some additional cost to put up a fine structure. Whether they were aware of what that additional cost would be I cannot say.

104. You cannot recollect whether any fresh estimates were submitted? I have no recollection of fresh estimates being submitted.

105. Do you know whether the Government consented to the cost being increased so that a stone building might be erected? No.

106. Do you know whether the Committee made the change on its own responsibility? I have no doubt that the Secretary would be able to turn up the minutes and tell you all that occurred.

107. The accommodation provided in the plan before us is the same as was originally designed, and the administrative block is the same? I think that some additions have been made in connection with the paying patients, and additional wards have been provided for. Mr. Rowe will be able to explain that more fully than I can.

108. As a Committee-man, you know whether it is in contemplation to pull down the south ward? That will have to be done to carry out the original plans.

109. Will the Nightingale wing be pulled down? No.

110. What is shown as the north side of the hospital will be inside the Nightingale wing? Yes.

111. As a medical man, you will admit that there is always some danger from hospitalism? Not now-a-days.

112. When it does occur, is it more dangerous to surgical patients than to medical patients? Of course it must be.

113. You would particularly wish to keep operation cases free from it? I should like to explain to the Committee that hospitalism is now a thing of the past in every well-regulated institution. Since the discovery of antiseptic methods of treatment, operations under circumstances which were formerly impossible are now carried out with the best possible results. I thought that to-day I should simply be called upon to give evidence in connection with the building itself, as otherwise I would have prepared myself with a number of authorities on hospital matters. I may say, however, that one of the greatest authorities on hospital construction, who, at one time, was totally opposed to the construction of large hospitals, especially in cities, and who wrote a book against them, and did his best to prevent the erection of such hospitals—

114. *Mr. Trickett.*] Sir James Simpson? No; I forget the gentleman's name\*; he was a great friend of Miss Nightingale's—he spoke at a meeting of the Sanitary Association in England, and stated that, in his opinion, hospitals could now be built to almost any height without any danger of hospitalism, because of the perfectly preventive nature of the antiseptic treatment. Now-a-days operations can be performed of a capital nature without the occurrence of puriform matter, or of any of the dangerous symptoms which result from hospitalism.

115. *Dr. Garraan.*] You do not think that there is any necessity for treating the surgical patients away from the others? It makes little difference now-a-days.

116. But is it not a bad thing to have patients suffering from venereal, ophthalmic, and other diseases all crowded into the same building? Not if they are properly separated. If the wards were kept free from each other, with an air space between, there would be no danger.

117.

\* NOTE (on revision) :—Captain Galton is here referred to.

Hon. A.  
Renwick,  
M.D., M.L.C.  
10 Dec., 1890.

117. You said just now that the south ward was used both for surgical and medical cases? It is used for women—principally for diseases.
118. You do not think that it is important now to keep surgical patients apart? I do not think that there is anything like the risk there was in former days.
119. It is practically nil now? Yes.
120. The principal object of having hospitals in the city is to be able to deal with surgical, and very urgent medical, cases quickly? Quite so.
121. You see no reason for bringing the sick paupers to Sydney? No.
122. Do you think it is necessary to put up a building costing £800 a bed for the people who come from the country to see Dr. Strong? I think it is desirable to make provision for the people who come from the country. I am in the habit of seeing these people, and I know that very few of them come under the recommendation of their medical advisers without urgently needing the valuable advice which can only be obtained in a hospital.
123. Is there not a competition between the two hospitals for Government paying patients? I do not know.
124. It was reported so by Dr. Manning? I do not know of it.
125. There was an actual complaint made by one of the hospitals that they did not get their share of these patients? The Prince Alfred Hospital people stated that they did not get enough of these patients, but I did not know that there was any rivalry in the matter. I cannot see any ground for it.
126. If the hospital accommodation in the city proper is equal to the actual necessities of the town, cases coming from the country can just as well be treated in the outskirts of Sydney? I do not think there is sufficient room for them in one hospital.
127. Supposing there were, there would be no need to drag country patients into Macquarie-street? There would be no more need to take them there than to take them to any other place.
128. There are only 2 acres of ground in connection with the Sydney Hospital? Two acres there are equal to 40 acres elsewhere. There is no doubt about that in my mind. I would risk my professional reputation on the statement, and I can furnish the Committee with any amount of evidence to prove it.
129. You do not think that there is any advantage in having an open space all round the hospital? Not for an acute hospital; but on one side you have the Domain, and a constant sea breeze, which you could not get in any other site about Sydney unless you placed the hospital at a considerable disadvantage. Then the soil there is just the soil recommended by hospital authorities.
130. Is it an advantage to have the smoke from the smelting chimney of the Mint going into the hospital? Certainly not.
131. Do you know how far that chimney is away from the hospital? The patients have not been annoyed by it in any way—the chimney has been raised.
132. The smoke from the old chimney did come into the hospital? Yes; and complaints were made about it.
133. If you built a hospital five stories high on this site, would not the smoke come in then? Only very seldom, because the wind would generally take it in an opposite direction.
134. But when there was a southerly wind? If the buildings were erected to their full height the back parts would suffer from the smoke with a southerly wind. I think then it would be a question whether the Mint should not be removed.
135. The Mint would be an inconvenience if the hospital were raised? No doubt it would, to a particular part of it.
136. Looking at the fact that the chimney of the Mint is not 30 feet away from the southern wall of the hospital, do you think it wise to raise the building the proposed height? I think if there was any difficulty in the matter it would be wise to remove the Mint. I should make everything subservient to the sick.
137. The Mint being already there, do you think it would be wise to have the hospital windows opposite to it? I have stated that it would be undesirable to have the atmosphere tainted in any way.
138. Would that be an argument in favour of keeping down the hospital? The back portions?
139. Yes? It might be.
140. Are you in favour of destroying the south wing? Yes; to have these buildings carried out.
141. Do you not think it would be enough if we only built the front parts, and left the south wing as it is? Excluding the back portions of the hospital?
142. Yes? If the original design cannot be fully carried out, I certainly recommend that the front buildings only be completed, and the south wing left as a pavilion.
143. If only the front part of the building was constructed, how many beds would you provide for? I think about 120 beds, and those in the south ward.
144. Altogether? One hundred and eighty or 190 beds.
145. Would not 190 beds be sufficient for the surgical cases coming from Sydney? I thought so five years ago, and gave evidence to that effect. On many occasions I have given evidence and spoken publicly with regard to this particular question. My idea at first was that with St. Vincent's Hospital at one end of the city, and the growing Prince Alfred Hospital at the other, it would only be necessary to provide 150 or 200 beds for the city hospital. I thought that that number would be ample for the requirements of the city for many years to come, more particularly in view of the great improvements which have been made in surgical science, and to which I have already referred; but I am now convinced that you require a larger hospital to meet the necessities of the city, containing about 250 beds. If that number of beds can be provided for without carrying out the back portion of the proposed design, I think it would be sufficient for the present. It must be remembered that the buildings will look crowded under any circumstances. But we all know that in an accident hospital of this kind the patients are not expected to take much exercise, and very few of them do. They are only capable of moving about in the ward, or on the verandah. When they are capable of more exertion than that they should be removed to convalescent hospitals in the country. St. Vincent's Hospital has been enlarged to nearly twice its size within the time I am speaking of, and I know that a proposal has been made to extend Prince Alfred Hospital very considerably; but when it is extended to the fullest degree, and when St. Vincent's Hospital has its quantum of patients, 250 beds will still be required at the Sydney Hospital. That is about the number which I consider necessary, after having gone into the ratio of the increase of the population,

Hon. A.  
Renwick,  
M.D., M.L.C.

10 Dec., 1890.

population, and the number of sick which are received into the Sydney Hospital, and into the other hospitals. I know that if we had 250 beds we could always keep them full with really urgent cases of acute disease and accidents.

146. You remember the inquiry made into this matter by the Legislative Council? Yes.

147. Sir Alfred Roberts told that Committee that two pavilions could be put up at Prince Alfred Hospital for £15,000 and £18,000 each, which would accommodate 60 and 80 patients respectively; so that for from £30,000 to £36,000 we could accommodate from 120 to 160 people? I know he said that.

148. All the administrative arrangements there are complete now, so would it not be much cheaper to provide these beds at Prince Alfred Hospital? I think it would be very unwise to extend the accommodation of the Prince Alfred Hospital too greatly. The institution is very remote from Sydney, and from the residences of the medical gentlemen who attend it, and consequently there is great difficulty in having their constant supervision, and the character of the site and the nature of the soil, and so on, make it very undesirable to extend that hospital too much. I have the interests of Prince Alfred Hospital as much at heart as those of the Sydney Hospital, but I am speaking only from a public and professional standpoint, and I say that there will be in the immediate future, serious consequences to the internal management of the hospital unless some reasonable bounds are put to its extension. My opinion is that these hospitals should never contain more than from 250 to 300 beds, and that they should follow the population as much as possible, being placed in close proximity to those who may require them.

149. On the whole you prefer bringing patients to Macquarie-street to taking any more to Prince Alfred Hospital? I think Prince Alfred Hospital is absolutely required in the interests of the population in its neighbourhood. But I would not make it a very large hospital with 500 beds; it would be a source of danger—not from hospitalism, but from other causes.

150. It was designed to be a large hospital? Yes.

151. And it is an incomplete structure at the present time? Yes; according to the design.

152. All the administrative arrangements were made for the complete design? For a hospital of 300 or 400 beds.

153. And for an expenditure of £30,000 that number of beds could be provided? So it is said.

154. Although that is a cheaper way of providing beds, you think there are objections to it? I think so, because you do not provide beds for the people who need them at the Prince Alfred Hospital. People needing attendance in the city might die on their way out there.

155. But you admit that a very large number of your patients at the Sydney Hospital come from the country? A proportion of them do.

156. Could they not as easily go to Prince Alfred Hospital? There is no room there; and I object to too great an enlargement of any of these hospitals.

157. Even on the pavilion principle? Yes.

158. *Mr. Dowel.*] Who are the present Directors of the Sydney Hospital? The Hon. Arthur Renwick, M.D.; J. R. Street, M.P.; John Pope; Sydney Burdckin, M.P.; F. Abigail, M.P.; Michael Chapman, M.P.; the Hon. John Davies, C.M.G.; Alexander Dean; James Ewan; W. H. Flavelle; Joseph Graham; G. N. Griffiths; John Hardy; John Hourigan; I. J. Josephson; S. E. Lees, M.P.; the Hon. Dr. C. K. Mackellar; James Martin, M.P.; Richard M'Coy; Dr. Charles M'Kay; B. B. Nicoll, M.P.; Frank Senior; the Hon. R. Burdett Smith, C.M.G.; and John Starkey.

159. Is it the opinion of the Directors, as far as you can judge, that it is necessary that these buildings should be completed according to the original plans? Yes; as far as I can understand.

160. They believe that, in the interests of the poor of Sydney, the buildings should be erected as an accident hospital? Yes.

161. Are you in favour of the proposal to reduce the buildings by one story? If the buildings are not carried out according to the complete design I should prefer leaving out some portions at the back, and erecting the front portions to the proper height. That is my personal opinion.

162. You are under the impression that if only one story were erected the buildings would have a very dwarfed appearance, and not be worthy of the site? Yes; and they would not provide sufficient accommodation.

163. Have you had any large donations or bequests to the hospital? Yes; most of our money has been obtained from bequests. We have at the present time—the Treasurer will give you all particulars—about £25,000 invested in funds, of which we use only the interest.

164. Is the hospital generally full, or is it crowded? It is generally full.

165. Do you consider the present timber buildings dangerous? I consider them very dangerous.

166. What means have the Directors provided for the extinction of fires? First, for the prevention of fires, they have covered the roof entirely with galvanized-iron, and under Superintendent Bear's instructions, and according to his report, they have laid on fire-extinguishing apparatus, and the nurses are drilled and instructed in its use. In addition to that they keep a special watchman on at night to see that no outbreak of fire takes place.

167. Your opinion about the site of the hospital is fortified by that of other medical men? Yes; by the profession generally. I was a physician in the institution for fourteen or fifteen years, so I know its value.

168. Has the treatment of patients there been attended with satisfactory results? Very satisfactory.

169. With regard to the chimney of the Mint, are you not aware that there are methods for consuming smoke? Yes; of course there are.

170. Are you of opinion that the authorities should be compelled to adopt appliances for that end at the Mint? I should be very glad if they would.

171. Therefore there is no reason why the proximity of the Mint should be regarded as an objection to the erection of the hospital? Certainly not.

172. *Mr. Humphery.*] Do you know how many cases pass through the Sydney Hospital in the course of a year? In the last annual report it is stated that "The number of patients admitted into the Hospital from 1st January to 31st December, 1889, has been 3,083, an increase over the previous year of 33. Of these 1,765 were surgical, and 1,318 medical cases. 2,175 were males, and 908 were females. The largest number of admissions were in the month of January, 310; the smallest in the month of September, 189. The number of accidents and urgent cases admitted was 1,293; the number of accidents and urgent cases attended to by the residential medical staff, but not admitted, has been 3,904." There are other statements in regard to the outdoor department.

- Hon. A. Renwick, M.D., M.L.C.  
10 Dec., 1890.
173. How many beds are there in the southern wing? I could not state exactly—50 or 60, I think.
174. Is it proposed to occupy the site of the southern wing with the chapel? I think it is the chapel that goes there.
175. Will the chapel occupy the whole site? No; only a portion of it.
176. The designs before us are dated 1879; have you received any information since that date to induce you to recommend the Committee to alter them in any way? I am perfectly satisfied, from my own medical experience and from the experience of the medical gentlemen who have gone over the plans, and of a number of architects, that they cannot be very much improved upon for our purpose. These designs have been examined by Dr. Mackellar, Sir Alfred Roberts, Dr. MacLaurin, Dr. Tarrant, and every other medical man of importance in the colony at the present time. Most of these gentlemen are responsible advisers to the Board of Directors in the drawing or alteration of the designs.
177. You have no suggestion whatever to make to the Committee with regard to altering the designs? I have already stated that if the Committee considered it undesirable to carry out the design in its entirety I would suggest that the next best thing—holding the views I do with regard to the situation of hospitals, viz., that they should follow population, and not be too large, though sufficiently large to enable the working expenses to be reduced to a satisfactory amount—is to have 250 beds, if the accommodation could be obtained by leaving the south wing and removing two of the pavilions at the back. If that were done you would have a beautiful structure, and the management could be carried out satisfactorily. The Committee will understand that I am only recommending this as an alternative, and it would not provide, as this institution should, for the wants of the people of Sydney.
178. Would it provide for their present wants? Yes.
179. Amply? No, it would put us pretty much in the position that we are in at the present time.
180. Would it not give you a greater number of beds? I do not think it would, but it would give us a sense of safety which we do not possess now, and we should have buildings provided with all the modern appliances.
181. You have no figures as to cost? No, the architect will give you them.
182. *Mr. Tonkin.*] Can you tell the Committee how much of the £69,000 was advanced by the Government? I think £40,000, but I do not profess to know much about the financing of the institution.
183. Remembering the necessity for hospitals in and about Sydney, do you not think that the Government ought to find money for their erection? Decidedly, and I think they ought, as in this case, to have what they provide supplemented by the public, and that has been done as far as we have been able to do it.
184. Suppose you could not get any outside assistance, do you not think that it would be the duty of the Government to find funds? Certainly. The institution is practically killed by people recommended by the Government.
185. Coming from different parts of the colony? Yes.
186. Suppose your suggested alternative design were adopted, could the two buildings at the back be afterwards added if necessary? Yes, if they were required.
187. That would not affect the other part of the buildings in any way? Not in the slightest.
188. When you talked about there being no danger of hospitalism, you took into consideration the fact that there would be one story above another? Yes, carefully, and I have not the slightest doubt that what I said was correct.
189. Of course you know that one of the great objections to the large hospitals is the danger of this disease taking hold of the building? I have not the slightest apprehension on that score.
190. You are speaking as a man thoroughly qualified to form an opinion, having had to do with hospitals for many years? Yes, I have had some experience.

THURSDAY, 11 DECEMBER, 1890.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. GEORGE HENRY COX.

JAMES EBENEZER TONKIN, Esq.

WILLIAM SPRINGTHORPE DOWEL, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM MCCOURT, Esq.

JAMES PATRICK GAVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

Thomas Rowe, Esq., Architect of the Buildings, sworn and examined:—

- T. Rowe, Esq.  
11 Dec., 1890.
191. *Mr. Trickett.*] You are an architect of many years' standing in the city of Sydney? Yes; of thirty years' standing.
192. Will you tell the Committee how it was you first came to prepare plans for the proposed Hospital in Macquarie-street? It was in consequence of an advertisement, of which I produce a copy, calling for competitive designs.
193. Are the plans which you prepared and submitted to the Trustees the plans which we now have before us? No; they are not; I produce the original plans.
194. In the terms and conditions it says:—"The cost of the buildings to be designed shall not exceed £45,000 at the present (1878) rate of material and labour." In submitting your plans, did you state that the buildings could be constructed for that amount? We were compelled under the conditions to make a statement or to get a builder's certificate to that effect. Each competitor had to comply with that condition.
195. Is it your opinion that the buildings could have been carried out according to the plans submitted for the price named? Certainly not. To have carried out the work in a substantial manner would have cost over £100,000.
196. In the manner indicated in the conditions submitted by the Committee? It would have been possible to have carried out the designs submitted in an inferior manner, with slight brickwork, for about £50,000.
- 197.

197. When you submitted these plans to the Trustees, did you submit any letter or document with them? T. Rowe, Esq. I think not.

198. Will you kindly tell the Committee how it was that you submitted plans which would cost £100,000 to carry out, when the conditions of the competition expressly stipulated that the cost of the work should not exceed £45,000? I believe the accommodation required, according to the original conditions, was 180 beds, but in consequence of the difficulty which the competitors had in arranging their plans, because of the southern wing which was in the way, the Board, after they had chosen the set of plans which I sent in, called upon me to do the work, and there were numerous meetings held to consider the re-arrangement of the plans. 11 Dec., 1890.

199. You say that the Board determined on your set of plans; but did you tell them what it would cost to carry out your designs? I do not remember any correspondence or conversation taking place except with regard to the conditions of the competition.

200. How was it that you submitted plans which it would cost £100,000 to carry out when a limit of £45,000 had been put to the cost of the work? I will go into that matter if you will allow me. The existence of the southern wing made it difficult to arrange the ground properly, and the Hospital Committee met, together with a committee of doctors, and went into the whole thing thoroughly. The Board eventually determined to do away with the southern wing, and to enter upon a new arrangement altogether, having the buildings in the form of a T, as they are shown in the plan before the Committee.

201. Did that take place after you had submitted your plans? Yes. My plans were sixteen scale plans. The plans before the Committee are one-eighth scale plans. The Board determined to take down the southern wing, and to give the accommodation which it afforded in the new buildings, thus adding 80 beds to the design, making the total accommodation 260 beds.

202. Was this done after you had submitted your plans, or did a long interval elapse? It was done very shortly after I submitted my plans. Then the Board determined, by resolution, that they would build with stone. I remember them asking what would be the extra cost for stone—brick was originally intended. I told them from 20 to 25 per cent. more, so that there was another increase in the expense. Then numerous other buildings were added to make the work perfect as a hospital.

203. Did they instruct you to alter your plans? Certainly.

204. Was that in writing? Yes; I have pigeon holes full of writing about it.

205. Any alterations that were made in the original plans were the result of written instructions from the Trustees? They were the result of numerous consultations and written instructions. Three or four contracts were entered upon.

206. Even now I do not think you have answered the question which I first put to you. How is it that, with instructions before you to prepare plans of a building which was to cost £45,000, you submitted plans which would cost £100,000? Simply because it was impossible to build a hospital containing 180 beds in a substantial and durable manner for £45,000.

207. That was the reason why you embellished and enlarged the design? After that the design was enlarged by the addition of 80 beds, and then stone was substituted for brick, which increased the cost by 20 or 25 per cent.

208. It would be interesting to the Committee to know if, when you sent in the original plans, you pointed out that the work would in all probability cost £100,000? I was never asked the cost at that time.

209. But still you had instructions that the plan was to cost £45,000? Those instructions had passed away, and another set of plans had come into existence.

210. But I am talking about the original plans. I want to know why you sent in plans of a building to cost £100,000 when you were asked to make plans which would cost £45,000. Why did you not tell the Committee the cost? I did not think it my duty. You must remember that the plans were open to competition. Architects from all the colonies were competing, and, if I had told them that, I should simply have had to stand aside. I answer your question by saying that it would have been possible to have carried out my plans in a temporary or inferior manner for the amount named.

211. Supposing other people tendered on the basis of £45,000, would they come fairly into competition with your plans on the basis of £100,000? There were more expensive plans than that there. It is impossible for any one to devise accommodation in a substantial manner for 180 beds for the amount named.

212. Do you know whether a plan was submitted by an architect who stated that the work could be carried out for £50,000? No; I do not know anyone else's business. The 180 beds regulated the conditions.

213. Was there a bonus offered for preparing these plans? There was a £200 premium offered for the best design, but it sank into the commission.

214. Do you remember whether the acceptance of your plans was intimated to you by letter? I should think it must have been.

215. Have you that letter with you? I have not.

216. Will you kindly look for it, and send it to the Committee? I will.

217. After the original plans were submitted by you you had numerous communications and correspondence with the Committee, which resulted in the plans now before us being prepared? Yes.

218. Did you intimate to the Committee the probable cost of erecting these buildings? I was never asked it.

219. You never intimated it to them? Not during that time.

220. What was the next step in the matter;—were you instructed to go on with the buildings? We entered into contracts. The first contract was for levelling the ground, the second for the erection of the ground floor, and the third for the first floor. I am speaking of the main portion of the building; of course the kitchens, laundry, and engine-house were other contracts.

221. Can you tell us the amounts? Yes. Excavation, £2,194 15s. Kitchen premises—Mason work, £4,346 14s. 6d.; finishing trades, £2,404 19s. 4d.; gas-fitting, £41 10s.; total, £6,793 3s. 10d. Laundry and engine department, £5,731 16s. 7d.

222. How came you to let the work in detachments—why was not a contract invited for the whole building? That would have been impossible, even if the money had been at hand.

223. Then I understand that the Hospital Committee began to put up the building in this piecemeal way without knowing at all what it would ultimately cost? At that time they did not know the exact cost.

- T. Rowe, Esq.  
11 Dec., 1890.
224. Did they know the probable outlay? No, not then.
225. Did you ultimately intimate to them what the cost would be? The first intimation was made to them, I think, when the Stuart Government was in power,—when the Committee applied to them for more money. We then had to make calculations for the cost of completing the work in various ways. That was the first time a careful calculation was made.
226. Do you remember if that was in 1883? I have no dates before me. The first contract for masonry was:—North, south, and east pavilions, also centre administrative building. 1st contract—Raising walls one story from ground, £25,642 9s. 6d.; second contract for same—building walls two stories from ground (present stage of buildings), £23,701 6s. 3d.; sundries, £463 16s. 6d.; clerk of works, salary, £1,170; architect's commission, £3,226; total, with other works before mentioned, £68,923 7s. 8d.
227. Was there any stipulation as to the rate of commission to be paid to the architect? Only the usual commission.
228. That was stated? I think so—it was the understanding.
229. What is the usual commission? 5 per cent.
230. Whatever the size of the building may be? No matter what the outlay may be. 5 per cent. is the usage in Great Britain and here, and it is little enough when it takes twelve or fifteen years to build a place.
231. The buildings having been so far erected, how did you propose to go on with them—what was to be the next move—was it for the completion of the buildings, or for the erection of only a portion of them. Did you receive any more instructions from the Trustees? Their desire was to complete the buildings, but because of the want of money they proposed to economise by only building a portion of them. An estimate was made for building in stone, another for building in brick, cemented in a common manner, and another for leaving out a story. Various calculations were entered into, which I think you have before you.
232. In the document dated 3rd December, 1890, and bearing your signature? Yes.
233. According to it you apparently advise the completion of the buildings? Certainly: I think that is the wisest course.
234. And you estimate that the cost of that would be £140,000, in addition to the £68,923 already expended? Yes.
235. It is some time since the original designs were prepared? Twelve years from the coming January.
236. How do these plans compare in style with the plans of modern city hospitals? I know of no improvement. I have travelled in England and on the Continent since then, and I have seen nothing to alter my belief that they provide all the modern improvements as regards sanitation, arrangement, and so on.
237. This is to be used purely as a hospital for accidents and urgent cases. Is it not the tendency in the present day to reduce the size of such hospitals, so that too many patients shall not be crowded together? I do not consider that we are providing for a large number.
238. Not for the size of the city? I think we shall require another hospital before many years are over. This is the only public hospital within the bounds of the city which I know of.
239. Are hospitals at the present day generally built in the very substantial manner provided for in the plans? All I have seen have been built in the best manner. There are only two ways of building hospitals—one is to build of the very best material and workmanship, and the other is to build them very cheaply, so that they may be burnt down when necessary. I do not think that the latter style of hospital is much recommended by the medical faculty. The temperature in a stone building is more even than it would be in a temporary wooden building.
240. The following paragraph was written by Sir Morell Mackenzie in *The Contemporary Review* last October:—"With regard to general hospitals of large size, there is a growing feeling, both within the medical profession and among practical sanitarians and administrators, that they are open to many objections. In the first place they are an unscientific anachronism, the crowding together of such a vast number of diseased persons being as much out of place in cities as intramural burial of dead?" He is speaking of hospitals of 1,000, 1,100, and 1,200 beds; but 250 beds is not considered a large hospital. I can show you a plan of the city of London where the hospitals are within three quarters and half a mile of each other—there are sixteen within 7 miles—and some of them of the very best style of construction.
241. Do you see any possibility of reducing the cost of completing the buildings below your estimate of £140,000? Not if they are built of stone.
242. Would it make much difference if they were built of brick? It would reduce it; but if they were built of the very best brick—double compressed brick—they would cost nearly as much as if built of stone.
243. Suppose they were built of brick similar to that used for Prince Alfred Hospital? That would make a reduction of 12 or 15 per cent.
244. Not more than that? No.
245. From your experience of modern hospitals you advise that the buildings should be completed in the way suggested by the plans proposed? I know of no better way of treating the site. The work has received an immense amount of consideration from me, because I have taken a delight in it, and I know of nothing better than the material which we propose to use and the arrangements which we intend to make. The buildings are to be constructed in the form of a T, and there is a clear space all round. The site is almost in the centre of the city, as will be shown by this map. The shipping in the various bays, and the residences on the points of the harbour, will all be within a mile of the hospital.
246. Are not the prevailing summer winds from the north-east? Yes.
247. Do you not think that it would be an objection to have the wind blowing over the hospital into the city? I have never heard that raised as an objection. The breeze is rather an advantage with the deep verandahs and balconies which we shall have. It will come fresh in from the ocean. I have always heard that the percentage of cures in this hospital is greater than that in any other hospital about here.
248. Is not the proposed cost rather high—about £800 a bed? The work will be done in the very best manner, and will not have to be done twice. If I am correctly informed, the cost of the hospital at so much a bed will be less than the cost of the Prince Alfred Hospital.
249. Is the present a good time for building? I think it is very favourable.
250. Labour and materials are fairly cheap? The present is a very favourable time.
251. Do you see any way of doing without the wards at the back? One of them is now erected two stories high, while the other cannot be touched until the patients are removed from the existing wooden pavilion into the front portion and the pavilion pulled down.

252. Could we do without this second ward? It is merely a question of accommodation and money. *T. Rowe, Esq.*  
Nothing would please me more than to see the work completed.
253. Can you tell us the cost of the easternmost ward? £30,000, I think. 180 beds, at £700 a bed, would come to £126,000. That was the original accommodation provided for. To it were added 80 beds at the same rate, costing £56,000, making altogether 260 beds, costing £182,000. To that you have to add 20 per cent, the extra cost of building with stone, which would be £36,400, making altogether £218,400. Of that, £69,000 has been expended, which leaves to complete the buildings, £149,400. *11 Dec., 1890.*
254. Do you think that that part of the building already erected could be used for some other purpose than it is intended for—such as law courts? I do not think so, unless at a very great sacrifice of money. Portions of it might be used for such a purpose, but I do not think it would be advisable to make the alteration; it would be very difficult to do it economically.
255. Have you studied the question? I have.
256. The suggestion has frequently been made and talked about? I was asked by a Minister at one time to look into the matter; I did so, but I found that the difficulties were very considerable.
257. You gave the definite reply that you could not, from a professional point of view, see your way to utilise the building for any other purpose except that for which it was originally intended? Yes.
258. When you submitted your first plans, did you obtain from any builder or contractor a certificate stating that the work would not cost more than the amount named? Yes; but it was a stupid thing to ask for. I had to comply with the conditions, so I must have obtained this certificate.
259. Do you remember what the builder told you? No, I do not; there must be a builder's letter somewhere; but the certificate will amount to nothing—there is no specification.
260. *Mr. O'Sullivan.*] What is the space between the front of the buildings and the footpath? I think it is 50 feet. The conditions state that the front of the buildings must not be nearer than 50 feet to the building line.
261. Do you think that that space is sufficient for a garden and a walk? To get in the whole of the wards and the necessary buildings, it is impossible to give more.
262. The southern wing still appears to be in a good state of preservation; do you propose to pull it down? Yes; that was determined upon when the plans were altered. To carry out the design it will be necessary to take away that wing. We should never have placed the kitchen where it is if it had not been intended to remove that wing. The buildings are quite T shaped, except for the chapel and operating room, and a small building on the other side.
263. Do you interfere with the Nightingale block? No; but there will be a building at the back of that to correspond with the building at the south-east corner, where the mortuary is now.
264. Do you know the cost of the Nightingale? I think about £8,000 or £9,000.\*
265. Would the buildings present a dwarfed appearance if one story were left out? Certainly. I have a tracing here which shows what the buildings would look like if one of the stories were taken out. The calculations were made from this plan. The walls that are now standing were made extra thick in order to support a four story building; so that if one of the stories is taken out the lower walls will be unnecessarily thick.
266. You think those thick walls are absolutely necessary to carry a four story building? I certainly think so. They are only two feet thick above, while the length of the wards is 82 feet.
267. From an architectural point of view you think it would be a great blunder to leave out a story? I certainly think it would be a great pity to do so; it would dwarf the appearance of the buildings, lessen the accommodation, and, perhaps, before half a dozen years were over, the roof would have to be taken off in order to raise it. Height now-a-days means very little. We shall have hydraulic power pipes there, and the patients can be taken up and down in lifts.
268. The idea is to have an accident or an emergency hospital; would not this suit as such if another story were added? Certainly it would suit as such.
269. *Mr. Dowel.*] Of the money already expended on this work the Government have provided £45,000, have they not? I do not know; I have expended for the Board £69,000.
270. Were you not in error when you stated just now that the cost of completing the work would be £149,000. In the printed paper before us you give it as £140,000? Yes; I am in error. It was a calculation of so much per bed that gave that amount.
271. Can you produce the specifications for the erection of the buildings? I have not drawn out specifications for the work which is to be completed. That would take two or three months, and the uncertainty of their being required is too great. I have had no instructions to advertise for tenders, and therefore I have not specified the work to be completed.
272. Have you had the quantities taken out? Several times over.
273. How could you do that without specifications describing the work? I know what I intend to do, and I can make my estimates from that. If anybody else was to make an estimate he would require specifications, but I do not require them.
274. In your estimate you have provided for everything to be finished in a first-class manner? In the best manner possible.
275. Is it usual to erect large hospitals in the centres of population? They are doing it now in other places, and have always been doing it.
276. It is a fact that hospitals of a much larger description than the one before us have been placed in thickly populated places, such as the city of London? Hospitals three times as large as this.
277. Do you consider that Mr. Burdekin was correct when he stated, before the Select Committee of the Legislative Council, that if the Sydney Hospital were built of brick it would answer all requirements, and cost only one-third of the proposed expenditure? Mr. Burdekin, of course, is not an architect. He might have thought that it would cost one-third of the proposed expenditure, but I would not attempt to carry out the work for that money.
278. There is a vast difference between £33,000 and £100,000? Yes. The work might be carried out for much less than the sum proposed if you had 9-inch brickwork; but no one would think of disgracing the site and the city in that way.
279. Your opinion is that under no circumstances could the buildings have been erected as designed, using brick instead of stone, for one-third of the estimated cost? Brick would cost 25 per cent less. That would be brick, cemented, which would be very undesirable for the site. I do not advocate that construction for a moment.

- T. Rowe, Esq. 280. Have you visited St. Vincent's Hospital? I do not know that I have been in it. I have passed it a thousand times.
- 11 Dec., 1890. 281. Do you know what it cost? I do not; it would not do for a public hospital.
282. If it were decided to complete the Sydney Hospital, how long would it take to prepare the specifications? About a couple of months. I should get specifications for the masonry made out first, and that portion of the work would be going on while the other specifications were being prepared. A lot of masonry has to be done before the carpenters are required. It would not be necessary to let a contract for the whole work right off.
283. If you were to let the work piecemeal would you be able to ascertain the exact cost of the buildings? I know what the work has already cost, and I know the market prices, so that I can tell what the work still to be done will cost.
284. Is it not a fact that when the design was first submitted to the Committee they had no idea that the cost would be £208,000? I do not say it with any disrespect, but the Committee, as business men, must have known what substantial buildings of this kind would cost, but they relied, no doubt, upon getting a vote of £30,000 or £50,000 a year from the Government. They failed to do this, in consequence of the prejudice and opposition of a few people who have never ceased to cry down the proposal. If they had got this vote the work would have been carried out, and would have been a glory to the city of Sydney.
285. Taking into consideration the thickness of the foundations and walls which have already been built, would it not be, to some extent, a waste of money if the two remaining stories of the building were not carried up? I think it would be a very foolish thing not to erect the two stories. I do not think it would be wise to build only one story.
286. As a professional man you recommend the Committee to carry out the design before them in its entirety? Yes.
287. *Mr. Tonkin.*] If you had to prepare plans for similar buildings now, would you prepare plans like those before us? I certainly should design the same arrangements. I know of no improvements in that way.
288. You think that the present plans are the best and most suitable for the hospital? They are adapted to the site.
289. Is it usual in competitions for architects to send plans which, it is stated, can be carried out for a certain amount, when they know that double that amount will have to be spent? I do not say that it is usual, but it is done sometimes in competitions of this kind. The Committee were deceiving themselves. I did not think it proper to stand aside, so I competed under the conditions, and sent in a builder's certificate, which I think was rather a humiliating thing to have to do, to the effect that the buildings could be put up in a certain way for the amount stipulated.
290. But is it a usual thing to under-estimate the cost of buildings? No; it has not been my practice. In the case of the manager's residence in a public institution at Randwick, there was a deduction from my estimate to be made when the building was completed.
291. Then this was an exceptional case? I consider that it was an exceptional case.
292. Can you tell us why this was an exceptional case. The present estimate is four times the original estimate? But a great alteration in the plan was made.
293. Is the estimate before us based upon the same calculations as the original estimate for £45,000 is based upon? Certainly not.
294. What proof have the Committee, supposing they recommend the completion of the buildings, that your present estimate is more correct than your previous one? I stand in a very different position to-day. I know what the work has already cost, and I know the market prices, and, besides, I am not a competitor. I give you the estimate as an architect of 30 years' standing.
295. And you were very careful in making it? Yes.
296. Could you give the Committee an estimate of the cost of the carrying out of Dr. Renwick's suggestion? I think Dr. Renwick made a mistake when he talked about doing away with the two wards at the back. One of them is already there, and has been carried up two stories high. You will find the estimate in the paper before you.
297. What will it cost to finish off the detached building at the back which has already been taken two stories high, without going any higher? That calculation has not been made.
298. The suggestion of Dr. Renwick was to merely put a roof on that building, and to carry out in its entirety the plan of the front part of the hospital? There has been no calculation made of the cost of that. The calculation is for putting up one or two stories in brick or stone.

TUESDAY, 16 DECEMBER, 1890.

Present:

The HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.	JAMES EBENEZER TONKIN, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. GEORGE HENRY COX.	CHARLES ALFRED LEE, Esq.
JACOB GARRARD, Esq.	WILLIAM MCCOURT, Esq.
HENRY COPELAND, Esq.	JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

Henry Denham Russell, Esq., Secretary to the Sydney Hospital, sworn, and examined:—

- H. D. Russell, Esq. 299. *Mr. Humphery.*] What position do you occupy? Secretary to the Sydney Hospital.
300. How long have you held that office? Fifteen years.
- 16 Dec., 1890. 301. Are you familiar with the designs for the new buildings which are now before this Committee? I have a very fair knowledge of them.
302. How many beds can be provided if the private wards were to be used for the public—dispensing with

H. D.  
Russell, Esq.  
16 Dec., 1890.

with the third story, the existing pavilion and the existing south wing;—take the ground floor, beginning with the accident ward? On the ground floor there are twenty beds in each ward. There is only one ward on the ground or basement floor;—it is an accident ward. That is the only provision on the ground floor.

303. Is there an eastern pavilion in course of erection? Yes.

304. Is not there provision made on the ground floor? Yes; for twenty beds.

305. How many beds are provided for on the first floor in the accident ward? There are twenty in each ward.

306. Is there an accident ward on the first floor? They are both medical wards on the first floor, and there are forty beds in the two wards.

307. Is there a ward in the pavilion at the back? Yes; that will contain twenty beds, so that there will be sixty beds on the first floor. There is one surgical ward in the eastern pavilion on the first floor, and in the Macquarie-street frontage they are both medical wards.

308. Now, take the second floor? Provision is made for medical cases in the Macquarie-street frontage. There will be forty beds in the two wards. The pavilion will have a surgical ward containing twenty beds; that gives sixty beds with the second floor.

309. So that the new buildings would provide on the ground, first, and second floors for 160 beds? Yes.

310. How many beds are provided for in the existing south wing? Seventy-eight.

311. So that provides a total of 238 beds? Yes.

312. And at the present time how many beds are there? About 236 beds, all told.

313. Do you find that a sufficient number for present requirements? No.

314. How many do you think are necessary at present? From 250 to 260.

315. Are the whole of the beds usually occupied? Yes; nearly always throughout the year.

316. Do you know anything about the proposed cost of the new buildings, and how it is arrived at in the first instance? In the first instance designs were called for a hospital to cost £45,000. The architects of Sydney competed, and sent in plans of a hospital to cost £45,000, and each plan was accompanied by a letter from some well-known builder, stating that he could build the hospital for that sum.

317. Was there a builder's certificate with the plan furnished by Mr. Rowe? Yes.

318. Who was the builder? I forget. I have been trying to find out, but I think it was Mr. Alexander Dean.

319. Can you remember the terms of the certificate, and whether he stated that the work could be performed in a substantial and efficient manner for £45,000? I could not state the words, but he said that he could build that hospital, according to the plans, for £45,000.

320. Who suggested the alterations that were afterwards made in the material, and, I suppose, in the design? That was done at the Board meeting. The plans or designs after they were accepted, were referred to the medical staff, who suggested some alterations, and the architect was asked to draw up alternative plans or designs—one showing the south wing standing, the other showing the south wing cleared away. These plans, with the south wing cleared away, are the present plans of the hospital, in the shape of a T. If the south wing were to remain standing, the pavilions would run east and west.

321. As shown in this design? No.

322. Did the Committee obtain from the architect any estimate of the cost with that altered design? No.

323. Were they informed at any time what the pavilion would cost? They were never informed by the architect that the alteration would necessitate a greater outlay.

324. Was it the impression of the Board that the amended designs could be carried out for the proposed original cost? Yes.

325. Was that ever represented to them at any time? It was never represented to them by the architect.

326. Was there not any discussion when it was decided to use stone instead of brick? Yes. The architect was asked at a Board meeting if it would cost very much more to build it in stone than if it were built in brick, and the architect said that it would cost more. They asked him how much more—would it cost 15 per cent. more? He dared say it would cost 15 per cent. more. I think it was the manner in which he spoke of it to the Board of Directors, that made them think that the alteration would not cause a very great increase in the cost. They thought that for about £60,000 the buildings could be erected in stone.

327. Did they think that the whole of the work, according to the present design, could be completed for about £60,000? Yes.

328. Were they never at any time supplied with an estimate? No; the first estimate was for the ground floor, and it was not until the tenders for the basement story were accepted that they began to realise that the cost would be so large.

329. How much money has been spent up to the present time by the Board? £69,218 1s. 3d. altogether.

330. How much of that has been provided by the Government? £45,000.

331. Where was the balance obtained? From funds in possession of the Directors.

332. Is there anything now owing upon the hospital? Nothing; the Directors paid the sum of £9,000 for the completion of the second contract, and their funds were exhausted. They were obliged to get a credit from the Bank of New South Wales of £4,000. They pledged £6,000 worth of debentures with the bank as security, and four of the Directors signed a personal security for £1,000 each, making an asset of £10,000 pledged to the Bank of New South Wales.

333. Is that still owing? Yes.

334. Then, as a matter of fact, there is a debt of nearly £10,000 upon the building at this time? Yes; a debt to the hospital of £10,000 with interest.

335. Are you paying the interest or is it accumulating? We are paying the interest, but we have placed some funds in the Bank of New South Wales as a No. 2 account as a set off against the overdraft. The bank has to pay the hospital as much interest for the No. 2 account as they charge for the overdraft, which about brings us nearly clear.

336. Have you a fund in No. 2 account equal to the overdraft? No; we have £6,000 worth of debentures, and we have altogether about £20,000 invested in mortgage, and we have a sum of £7,000 lodged with the Bank of New South Wales.

H. D.  
Russell, Esq.  
16 Dec., 1890.

337. Then you have assets to the amount of £27,000 against this overdraft? Yes; but our asset of £20,000 was bequeathed to the Sydney Hospital on certain conditions—not a penny of it can be spent in building; and it was to be placed at mortgage on city property. Those are the terms of the bequest.
338. Are you permitted to use the interest in any way the Directors think proper? Yes.
339. What interest are you paying to the bank? Seven per cent.
340. Are you allowed 7 per cent. for any credit which you have? Yes.
341. From your long experience, do you think it would be sufficient at the present time to provide the pavilion in course of erection, and to complete the Macquarie-street elevation, dispensing with the third story;—would that meet requirements? I do not think it would.
342. At the present time, how many beds are occupied? There are 200 patients in the hospital now.
343. If you had thirty-eight additional beds, do you not think that would be ample for present requirements? No; the patients really do not get a fair show. They are sent out too soon, to make way for others. We have admitted 3,038 patients from the 1st of January until yesterday. Of course we discharge a corresponding number, and we are obliged to refuse admission to several patients; they have to wait for room. If we had from forty to fifty more beds it would be very much better for the suffering poor.
344. Would not the plan which I have mentioned give you nearly forty more beds? Yes.
345. Would not that be quite sufficient to meet immediate requirements? No. At the present moment in Macquarie-street we have 200 patients, and we have 232 beds. Hospital patients are of different kinds. This week our surgical wards might be overcrowded, while we might have plenty of room in the medical beds. Next week the order of things might be reversed—we might have an overcrowding of medical cases, with plenty of room for surgical cases next week.
346. Could any portion of the administrative department—that is, the centre in the Macquarie-street elevation—be used as medical and surgical wards? That is a matter of detail—they may alter the original intention.
347. Could any portion of the administrative department be utilised for a ward? I do not think so.
348. Why? Because every inch of it would be required for administrative purposes. At the present time the quarters in which the resident medical officers live are nothing more than dog-holes, and are not fit to put medical men to live and sleep in. Everyone else suffers in the same way. My office is not nearly large enough. The servants of the hospital have to be lodged in all sorts of places—the Domain is utilised for that purpose. We have our gatekeeper living in the iron building in the Domain, and that is a very good thing, because he is, at the same time, caretaker of that building. But we ought to have all the officers and servants under one roof.
349. *Dr. Garran.*] Are you acquainted with all the correspondence that has passed between the Committee and the Government? Yes.
350. Do you recollect whether the Government gave its sanction to the original plans for a building to cost £45,000? Yes; I recollect that the plans met with the approval of the Government.
351. Was any subsequent intimation given to the Government as to the proposed alterations? The alternative plan was sent into the Government, and was approved of by them.
352. Was there any intimation that there would be increased expenditure? Nothing was mentioned about that.
353. When did the Government first become aware that increased expenditure would be involved? When the Board of Directors applied for further assistance to complete the second story.
354. Had the first story then been completed? Yes.
355. Then you were committed to this larger expenditure before the Government knew anything about it? Yes.
356. Were you practically committed to Mr. Rowe's entire scheme, involving an expenditure of £210,000? Yes.
357. Then the Government gave its sanction to an expenditure of £45,000, and did not know until it was too late that the Committee had committed itself to an expenditure of £210,000? I think that is correct.
358. The Government was under the impression that it had adopted a mature scheme, and was really paying away this money for the first instalment of a very expensive scheme? Yes.
359. Your Committee themselves did not know at first what they were doing? They did not.
360. Do you think that the architect knew? I think he would know.
361. Did anybody else besides the architect know? No; it was not until the second contract was taken that the expense seemed to dawn upon the Board of Directors.
362. I ask this question because I have seen it stated, and I think it has been mentioned in Parliament, that the plans were approved of by the Government, and I want to know distinctly what plans the Government approved of? The Government approved of those plans of Mr. Rowe.
363. But without knowing what they would cost? I am not positive on that point.
364. If the Committee themselves did not know, could anyone tell the Government? No.
365. Did the architect tell the Government? I do not think he did.
366. How were the Government to know? I do not see that the Government could know.
367. Were not the Government relying on the Committee to a certain extent? Yes.
368. And the Government policy was a policy to give £25,000 to a Committee already possessing £20,000? Yes, originally that was the idea.
369. And the Government did not find out what was really taking place until it was too late to alter the scheme? Yes.
370. In your estimate of the number of beds, have you put them as close together as they are in the present hospital? Yes.
371. In the plans there are not twenty in number shown for each ward? No; but there is room for twenty beds to be placed in each ward, as they are in the present hospital.
372. Without crowding? Yes.
373. How many of your patients at the present time are country patients? I do not think we have very many. We have very few country patients as a rule. They come mostly from the city and suburbs.
374. Do they come mostly from the city proper? Yes; from Woolloomooloo, Surry Hills, Pyrmont, and Balmain.
375. Would not some of these patients be as near to Prince Alfred Hospital as to your hospital? I know that

H. D.  
Russell, Esq.  
16 Dec., 1890.

that accidents from the western part of the city and the south-western part are taken to the Sydney Hospital because the approaches are much better, and it is easier to carry patients there than to the Prince Alfred Hospital.

376. Is the accident district very largely along the lines of the wharves? Yes.
377. So that if you begin at Circular Quay and go round Darling Harbour and the Balmain and Pyrmont frontages we have got the line of the maximum number of accidents? Yes; but you must go round to Cowper Wharf. We get a great many from Woolloomooloo.
378. Still do you not get more from the western than from the eastern side? Yes; from the warehouses and factories.
379. So that should it be decided to have two or three hospitals in and about the city rather than one very large hospital, a second hospital somewhat more to the westward would be convenient to the accident area? I do not believe in small hospitals. For a small hospital you have as expensive a plant as for a large hospital, and to maintain hospitals in the manner which you have sketched out would entail enormous expense. The expenditure per bed would be something enormous.
380. I am supposing that 200 beds are considered to be a good limit to the size of a hospital in the city itself. If another hospital were erected, say, at Pyrmont, where the Technical School is going up, would not that be central for the accident area? A hospital of 200 beds is a small one.
381. Would not Pyrmont be a central site? No; it would not be a good site.
382. Which would be the next best site to Macquarie-street? Fort-street; and that would be much exposed to the westerly winds. I do not think that the results of a surgical hospital in Fort-street would be good.
383. Would it be noisy? Yes; and not easy of access.
384. Still it would be central? Yes.
385. You say you are in favour of large hospitals for the sake of economy, but do you think it is a good thing to have tier upon tier of patients? Yes. Seven or eight years ago, the greatest authority on hospital construction—Captain Galton—met an audience who were interested in hospital construction, and he then told them that his ideas as to hospital construction had all been revolutionised since he had had a conversation with Professor Lister, who assured him that by the new system of surgery there was no danger whatever of hospitalism, that hospitalism was due to bad surgery—that was the old style of surgery—and that with the new style of surgery there should be no such thing as hospitalism, and that you could build tier upon tier of wards in a hospital with benefit to the patients rather than otherwise. Since then there has been no hospitalism in any hospital in England—that is, within the last seven or eight years.
386. Was not Lister an enthusiast about his own discovery? Yes; and others followed him and adopted his views.
387. Admitting to the full the value of his antiseptic system, about which there can be no dispute, will there not be still exhalations from diseased patients, and is it wise to allow the atmosphere from the lower stories to reach the upper stories? There should be no exhalations in a well ordered surgical hospital.
388. Are not your staircases and lifts inside this building? The lifts will be inside.
389. Are not the staircases inside? But there is no communication from the wards to the lifts.
390. Not from side doors? No.
391. Nor to the staircases? No; the hospital is so constructed that there shall be no communication from one ward to another.
392. Do you think that no exhalations could pass from the lower to the upper ward even if blown out of the windows? No; I do not believe there are such things. The hospital system of surgery is too cleanly to admit of that. In the old days it was very different. I can remember when the Sydney Hospital was stated to be hospitalised. In those days I have known surgeons to admit cases of erysipelas into the accident wards. I have known patients in the erysipelas hut to be nursed by the nurses of the accident ward. They used to go backwards and forwards from one place to the other. The utensils in the erysipelas huts were brought into the accident ward, and the consequence was that erysipelas was rife in the wards; but of late years nothing of that sort has been done, and there is no erysipelas now.
393. Do you think that that bad state of things was owing more to defective management than to the condition of the building itself? It is owing to what is now called dirty surgery.
394. Do you think that if the front of the old hospital had been properly cleaned, and if it had been managed properly, it need not have been pulled down? Yes; it was pulled down in error.
395. Through not knowing how to manage the hospital? Yes.
396. Then ignorance has been the source of all the trouble about reconstructing this hospital? It has had a great deal to do with it, I believe.
397. Have you only two stories in the hospital at present? Yes.
398. Do you ever find any inconvenience in the upper wards of the hospital owing to their being over the other wards? No; no smell is perceptible.
399. Are the cases as prosperous in the upper as in the lower wards? Yes.
400. In the warm weather is it not a little hotter in the upper wards than it is in the lower story? I do not think that our hospital is very hot, because it is well protected from the sun. We have a shingle roof which is covered with galvanised iron, and underneath the shingles we have canvas, so that the heat does not enter the wards.
401. Do you take thermometrical observations in the wards? We have, sometimes.
402. Do they not show a higher reading above than below? No; but they did before we put the canvas under the shingles.
403. *Mr. Tonkin.*] Were you Secretary to the Hospital Committee when the plans were first put before the Committee? Yes.
404. Do you know anything about the details of the other plans submitted besides the one which was accepted? No.
405. Do you remember Mr. Kirkpatrick's plan? Yes.
406. How many beds did that make provision for? I forget; but I think that it provided for a little under 200.
407. Then it provided for less than the present plan? I think so; but Mr. Rowe's original plan was not intended to accommodate more than 200.
408. *Chairman.*] Was that the plan which was estimated to cost £45,000? Yes.

- H. D. Russell, Esq.  
16 Dec., 1893.
409. *Mr. Tonkin.*] If this plan is carried out as proposed—that is, in the modified form according to what we have just heard, including the south wing which is erected—will you then have only 238 beds? Yes.
410. That will be only six more than you have at present? Yes.
411. Do you think that will be sufficient for the probable requirements in a few years' time? I do not. When I was first Secretary of the Sydney Hospital it met the wants not only of the city, but of the whole colony. Since I have been Secretary the Prince Alfred Hospital has been built with over 200 beds. We have the Coast Hospital with 200 or 300 beds, and also St. Vincent's Hospital, and at the present time there is not nearly sufficient hospital accommodation for the city. In the course of ten years it will increase correspondingly.
412. What do you think ought to be the minimum number of beds for a building of the class now proposed to be erected? From 230 to 250.
413. Is that independent of the south wing which you have already erected? I do not think the south wing ought to stand if these buildings are completed; it would be in the way of light and air, and it would block the place too much.
414. Is there very much fault found with the south wing as it is at present in connection with the purposes for which it is used? It answers its purpose fairly well, but it is very far from being what it should be.
415. Is it a substantial building? Yes, very.
416. What are its particular faults? One great fault is that practically you have only two wards on each floor. There is not sufficient isolation for the different kinds of cases. There is only a small half partition between the wards, whereas we should have the different classes of cases separated in a more complete manner.
417. Is that at the present time utilised entirely for females? Yes.
418. Do you find that there is sufficient provision made for females at present without any additional buildings? No; we are crowded with females. If we had accommodation we could take in at least twenty females more than we have at present.
419. What provision is made in the proposed buildings for females? The proportion of females in a hospital is generally one to two of males. For 150 males there should be provision for 75 females.
420. Supposing the south wing were left as it is for female wards, what provision is made in the amended plans for females in addition to the seventy-eight which the south wing contains now? The division of wards in the manner in which they are to be provided was simply sketched out by the architect. That would be a matter of detail to be dealt with afterwards by the Board of Directors according to the advice which would be given by the medical staff. They might have to alter the entire arrangements shown here.
421. Then you think the accommodation for seventy-eight females would not be sufficient in a hospital containing 238 beds? That would be about the proportion. I am counting the seventy-eight beds as among the 238.
422. Do you know whether Mr. Rowe, at the time the plans were put before the Committee, in any way led them to believe that there was likely to be more expenditure than £45,000? I think Mr. Rowe all along studiously avoided giving the Committee any information of that sort. I fancy that he did.
423. He in no way hinted that it would cost at least £100,000 instead of £45,000? No; he never did.
424. Are you of opinion that 238 beds will not give sufficient accommodation for the probable requirements? I am quite sure they will not.
425. Then would you propose that the Committee should carry out the building with three stories instead of two stories? Yes.
426. Would that give sixty more beds? Yes.
427. Do you think that that would be sufficient seeing that it would give 298 beds? I do not see how you can make out 298 beds.
428. If the second floor contains sixty beds would not the third floor contain the same number? I should think so.
429. Would that be for private patients, so that that would make the difference in the number of beds? It was intended to devote the third story to private wards, and that would considerably reduce the number of beds.
430. Would the buildings be so constructed that the third story could not be used for an ordinary ward in the same way as the second story? I should say that, if necessary, it might be made into an ordinary ward.
431. Then, do I understand from your evidence that the buildings on the reduced scale would provide 238 beds, including the south wing, and, of course, excluding the east pavilion? Yes.
432. But, independently of the east pavilion, the original plan would provide for at least 260 beds? Yes.
433. That is what you suggest should be done? Yes.
434. In that case you would have to retain the present south wing? Yes.
435. *Mr. Dowel.*] Were you present when the architect delivered these plans and estimate for the present approved design? Yes.
436. What was the estimate he then submitted to the Committee? He gave no estimate whatever, he only submitted the plans.
437. Then if the architect said he did give the Committee an estimate it would not be correct? To the best of my belief it would not be correct. I have no recollection of any estimate.
438. Have you any official document on the subject? No; I have looked over the minutes carefully to find that out, but there is no record whatever of an estimate of cost.
439. Do you recollect any conversation on this subject between the Committee and the architect? I think the architect's answers with regard to cost were evasive. I know Mr. Josephson asked a question: "Would it cost much more in stone?" Mr. Rowe said "Oh, yes, it would cost more in stone than in brick," in that off-hand kind of way. He was asked "Would it cost much more than 15 per cent. extra?" He replied "Oh, yes, I think it would cost 15 per cent. more."
440. Is not the present design for stone? It was originally intended to be brick—the whole design was for brick.
441. Were the present approved designs submitted to the Committee, to be constructed of brick? Yes; I saw the minute where it was determined afterwards to construct it of stone.
442. What were the terms and mode of payment to the architect for the buildings? Five per cent. There was nothing regarding the mode of payment. When he sent in his bill it was all paid.
- 443.

H. D.  
Russell, Esq.  
16 Dec., 1890.

443. Is there anything due to the architect at present? Nothing whatever—he has been paid up in full. He has been paid £3,400 for commission. There might be a little due to him, but when he sent in his last bill for £1,000, he gave a receipt in full for all demands.
444. Then his statement, as submitted to the Committee, that he only received £3,226 is incorrect? He has received £3,400—his statement is incorrect.
445. Are you aware of the architect having given the Committee any probable estimate of the cost of the completion of these buildings? Yes; I have seen his estimates. They were here when he was examined. I have forgotten the exact amounts. I know there was one estimate for £80,000; there was another estimate for £100,000, or something less, according to the proportions of the building that was to be finished. There were also estimates of the cost in brick and in stone.
446. To put brick on top of the stone building? Yes.
447. Did the architect recommend that? No; but he was asked to give an estimate of the cost of completion in brick and in stone.
448. Has he suggested to the Committee the desirability of proceeding with this work piecemeal, or to enter into a contract for the completion of the whole? He has made no suggestion whatever with regard to the completion of the buildings.
449. Are the Committee desirous of having the buildings completed in one contract for everything complete, or do they propose to go on in the same manner as in the past, by accepting tenders in a piecemeal fashion? The Committee have made no arrangements for the future. There is a Permanent Structure Committee which manages that subject. They meet and report to the Board of Directors. If it were decided that the buildings should be gone on with that committee would be called together, and they would decide whether the contract should be for the whole or a portion.
450. Were the tenders you received for the completion of the whole of the buildings? No; the tenders were called for the stonework only of the first and second stories.
451. No bulk sum was received as a tender for the completion of the buildings? No.
452. If a tender had been received for the completion of the whole of the buildings, showing a total cost of £240,000, do you think that the Committee would have proceeded with any portion of the buildings? I do not think they would.
453. Are the assets which you have referred to New South Wales debentures? We have no debentures now; we sold them the other day.
454. Did you not say that you had some lodged at the bank? Yes; and we sold those debentures the other day. The Bank of New South Wales holds the proceeds of the sale.
455. Were they New South Wales Government debentures? Yes.
456. Have you any money deposited in the Government Savings Bank? We have a fund called the Samaritan Fund, which has been derived from small amounts left by deceased patients. That has remained in the Savings Bank for many years, and it has accumulated to a sum of over £2,000. The interest only on that is available for the relief of outgoing patients. As our expenditure of that fund has always been within our income it has increased to the sum of £2,200 or £2,300. That money is not available for building purposes.
457. Have you any money available for building purposes? None whatever. I find that there are £2,290 to the credit of the Samaritan Fund.
458. Are there no funds available in the shape of interest from mortgages or any other source which could be applied to building purposes? No; because our expenditure is just a little above our income for the present year.
459. *Mr. Trickett.*] Independently of the question of expense, do you not think it would be as well to have two or three hospitals about the city instead of one hospital, such as is proposed to be erected here? No; I do not think Sydney would be benefited at all by such an arrangement. Patients can be brought to the Sydney Hospital from any part of the city proper in a quarter of an hour. I cannot see the utility of having small hospitals.
460. Is not this hospital looked upon mostly as an urgent hospital? Yes.
461. Have you a number of cases which are not urgent cases? No.
462. Have you not a ward called "Dr. Chambers's ward"? Yes.
463. Could not those cases be treated as well at St. Vincent's Hospital as at the Sydney Hospital? These are very urgent cases, and if we had room for sixty beds we would fill the whole of them. The cases taken in are most urgent, and we sometimes have thirty or forty a week waiting for admission to that ward. Only the most urgent of cases are taken in.
464. Are not those cases who could travel 2 or 3 miles? No; they require to be carried very carefully, and only for a short distance from home to the hospital.
465. Are there not a lot of patients in another part of the building treated for venereal disease? Yes; ten beds only. Those are only the worst cases which present themselves. We make out-door patients of the bulk of them.
466. Do you not think that Sydney could do with a hospital containing less than 260 beds? No.
467. Then are you an advocate for the completion of the buildings *in toto*? Yes.
468. You have stated that of late years the increase in the number of patients has been very great—do you think that that is owing to the fact that a number of people come to the hospital to be treated who could afford to be treated outside? No. There are not many such cases, because room is of so much importance that if anything of the sort was suspected such a patient would be sent out at once to make room for more deserving cases.
469. Have you the custody of the papers connected with this building? Yes.
470. Could you produce for us Mr. Rowe's letter which was sent in with these plans in the first instance? I have no doubt we have such a letter among the archives of the hospital, but the office accommodation is insufficient, and it was absolutely necessary to put most of the old letters in the store. They could be found, but it would take a great deal of trouble.
471. *Chairman.*] Do you think that you could find the letter or certificate given by the builder in connection with Mr. Rowe's plan? I do not know that that letter ever left the Town Hall. The plans were exhibited at the Town Hall, and this letter, to the best of my recollection, was attached to the plans and specifications. I never saw that letter after the plans were removed from the Town Hall to the Sydney Hospital, but I have a distinct recollection of reading the letter when the plans were exhibited.

H. D.  
Russell, Esq.  
16 Dec., 1890.

I am under the impression that it was written by Mr. Alexander Dean, but I am not positive. I know it was written by a well known and reputable builder in Sydney.

472. We have it in evidence that Mr. Alexander Dean was the builder whose letter accompanied the plans of Mr. Kirkpatrick? It is possible that a letter may have been written by another builder. I will try to get the letter.

473. *Mr. Trickett.*] When you were examined before the Select Committee in 1887, you seemed to be not averse to having the buildings completed without the third story—since then do you think that the requirements of the people have increased so as to necessitate the completion of the whole of the buildings? Yes, since then the requirements of the people have grown enormously.

474. Do you suffer great inconvenience in the present building? Yes.

475. *Mr. Lee.*] Can you give the Committee the cost per bed per annum for treatment? It is between £60 and £70 per bed.

476. What do you estimate the cost per bed will be if the new buildings are erected according to the plan? It will be less than that.

477. Have you made any calculation? I know that the more you increase the number of beds, you reduce the cost per bed correspondingly. The expenditure for a hospital of 200 beds is the same as for a hospital of 260 beds.

478. Would the staff be the same? The staff would be very slightly increased for sixty patients.

479. Is the present wooden building found to operate against the recovery of patients? No.

480. Do the medical staff complain of it in any way? Not from a sanitary point of view.

481. Do they from a convalescent point of view? Convalescents have nothing to do with the Sydney Hospital. We cannot allow people to convalesce there. As soon as they have made sufficient improvement to warrant us in doing so, we send them away to convalesce elsewhere. So far as the recovery and improvement of patients are concerned, the results in the present building are very good.

482. Are they as good as they might be in a stone or brick building? I think so.

483. Are any complaints lodged by the medical staff at any time? No. The building, of course, is deficient in many conveniences which a perfectly equipped hospital would have. It must be so from its construction.

484. Have you known any cases which have been recommended to be removed to another hospital in consequence of inability to treat them successfully in the Sydney Hospital? No.

485. In point of treatment a wooden building is equally as good as a stone or brick building? Yes; I have no doubt it is.

486. The great difference is the want of security? Yes; a wooden building is highly dangerous.

487. Have you received reports from hospitals in other parts of the world, showing what is the usual cost of construction per bed? Yes.

488. What is the usual cost? I cannot tell you just now; but I can let you have a book, showing the cost of construction of every hospital in England.

489. Would the Directors of your hospital undertake the construction, or recommend the construction, of an enormous building without first satisfying themselves as to what is the actual cost in other parts of the world;—have they so satisfied themselves? I do not think they have.

490. Then the average cost of nearly £800 per bed may be taken as a very enormous price per bed? I do not think it is enormous.

491. May it not be thought so in the absence of any evidence to the contrary? I know that there are hospitals in England which have cost over £600 per bed, and the cost of building there is very much less than it is in this colony.

492. Have you, as Secretary of this hospital, been instructed to ascertain what is the cost per bed for construction? No.

493. So that, as a matter of fact, you do not know more than you have read? No.

494. Have you any paying patients in the present hospital? Very few.

495. Have you any conveniences for them? No; only the general wards.

496. Have you found a general desire on the part of the public to be admitted as paying patients? No.

Frederic Norton Manning, Esq., M.D., President of the Board of Health and Medical Adviser to the Government, sworn, and examined:—

F. N.  
Manning,  
Esq., M.D.  
16 Dec., 1890.

497. *Dr. Garran.*] What is your official position? President of the Board of Health and Medical Adviser to the Government.

498. How long have you been Medical Adviser to the Government? Two years.

499. During that time have you made a general report to the Government as to the requirements of Sydney for hospital accommodation? No general report. I have reported briefly on the Sydney Hospital, and also upon the expenditure of the pauper vote for hospital purposes.

500. Did you make a general memorandum on the Sydney Hospital in April last year for the Government? Yes.

501. Did you there state that the accommodation for the Sydney Hospital should not be less than 160 beds? Yes.

502. Do you feel disposed to modify those figures now? No, with this exception, that I think the ophthalmic cases ought to be treated on the same spot, and therefore there should be some increase of accommodation for those cases. I did not include the ophthalmic cases at that time. I did not then know so much about Moorecliff as I do now. At the present time my opinion is that the hospital accommodation should not exceed 200.

503. Do you think it is desirable to include ophthalmic cases in the general hospital? There is no objection provided the wards are properly arranged for them.

504. Seeing that for some reasons it is very desirable that we should not make a larger hospital on this site than is really necessary, would it not be expedient to detach the ophthalmic cases? The question is as between the ophthalmic and the female Lock cases, and I should prefer to remove the female Lock cases from the Sydney Hospital, and to have the ophthalmic cases treated there.

505. What are the reasons? There are many reasons why female Lock cases should be treated at a place where both out and in patients can be attended to, and the Sydney Hospital is in much too public a place for those people to visit;—a more retired position would be much better.

506. Is there much danger of ophthalmia spreading throughout the hospital? Not at all.
507. Are you inclined now to think that we might get rid of the female Lock ward and put the ophthalmic cases in lieu thereof? Yes.
508. If you cleared out the female Lock cases would you have room in their beds for the ophthalmic cases? No; the beds for Lock cases are not more than twenty, and the ophthalmic cases are nearly sixty. An additional reason for the change is that there is no room in Sydney or in the other hospitals for female Lock cases. We cannot treat them at Little Bay where the male Lock cases are now treated. It is not desirable to treat both in the same building.
509. Do you desire larger provision for female Lock cases than we have at present? Yes; that cannot be provided at the present hospital, and it is not advisable. It is advisable that the out Lock patients should be treated where the in patients are treated.
510. Do you want to find room in the Macquarie-street Hospital for accidents, urgent cases, and ophthalmic cases? Yes; the urgent cases, including, of course, the police cases—people found in fits, and some cases of acute disease.
511. These are three specific classes of patients? Four classes really.
512. What we may call ordinary medical cases, not urgent, and of a semi-chronic character, are not suitable for this hospital? There is no necessity to treat them there—they can be treated as well elsewhere.
513. Do you think that it is desirable to keep this hospital confined to those three classes, and make adequate provision for them? Yes.
514. Do you think that 200 beds would be sufficient for those cases? Yes; that would be ample.
515. The question of economy has been brought before the Committee a great deal, and we have been told that it would be more economical to build story on story—do you see any objection to building four stories high? I think two stories are more workable.
516. Do you see any medical objection to four stories? I do not see any great medical objection.
517. Do you think there is any risk of contamination going from the lower to the upper stories? No; if we have the staircase communicating with the open air.
518. That is having the staircases outside? Yes.
519. Is there no fear of the exhalations from the windows getting about? No.
520. Do you see no objection, for sanitary reasons, to four stories? No; but such a building would certainly be less easily worked.
521. You object to it for administrative reasons only? Yes.
522. Do you think that a hospital with 200 beds is worked more expensively than a hospital with 300 beds? Not very much. You would have to increase the nursing and medical staffs for 300 beds, but certain officers would serve for both—a medical superintendent, for instance. On the whole, however, the difference in the cost per head would not be very great.
523. I see from your memorandum that, as to the four hospitals in Sydney, the accommodation is as follows:—Sydney Hospital, 222 beds; Prince Alfred Hospital, 224 beds; St. Vincent's Hospital, 200 beds; Coast Hospital, 220 beds. We have therefore had practical experience of four hospitals of 200 beds, or a little over. Therefore have we not abundant evidence as to the cost of administering a hospital of that size? Yes; but they differ very much in cost.
524. Do they differ very much in their style of management? Yes.
525. Is Prince Alfred Hospital the most expensive of the whole? Yes; about £80 per bed. I see no reason why it should be more expensive to administer than the others.
526. Was it planned so as to give the greatest possible perfection in administration? Yes.
527. Have those ideas been realised as far as administration is concerned? Yes; I think that it answers remarkably well for all purposes.
528. Is there any waste of labour? No; as far as I am aware.
529. Is it really a convenient plan? Yes.
530. May we look upon £80 per bed per annum as the maximum cost for administration? Yes; I look upon that as a high cost.
531. What does it cost at St. Vincent's? I do not think any one can tell that. The cost of Sydney Hospital is about £67 per annum, and the Coast Hospital about £50 per annum.
532. How is it that the administration of the Coast Hospital is so much cheaper? We have not an expensive medical staff there, and we do not undertake any large operations. Operative surgery is always a very expensive department. There are some reasons why we should expect administration at the Coast Hospital to be dearer. The cost of provisions is higher owing to its distance from town.
533. Are there not a number of cases that come upon the Government which are not surgical cases or very acute cases? Yes; a great many.
534. Could not they be treated sufficiently well in a much less costly establishment than the Prince Alfred Hospital or this hospital? Yes; but many of those cases are now treated at the Coast Hospital.
535. If we had a duplicate of the Coast Hospital within an easy distance of Sydney, would not that be a great convenience for the Government just now? Yes. But what I think would be more useful still would be some properly arranged sick asylum in connection with asylums for infirm and destitute. The patients could be treated at even a cheaper rate. Many hospital cases are sent to these institutions now.
536. Do we not want an establishment of a more economical character than these palatial hospitals? Yes; I think it would be very possible to have such. Difficulties would occur as to how it could be managed.
537. Have you the administration of lunatic asylums under the Government? Yes.
538. How many patients have you to deal with? Nearly 3,000.
539. The hospital patients in Sydney do not amount to 1,000 patients altogether? Yes; about 1,000.
540. Are the lunatic patients under direct official administration? Yes. They are managed by a staff directly responsible to the Government.
541. Has not that simplicity of administration been an advantage? Yes; it has been so far as lunatic asylums are concerned, but I do not think that you could manage hospitals quite in the same way.
542. What would be the difficulty? You would have great difficulties with your consulting medical staff, of whom you must have a large number, especially in hospitals devoted to acute cases and operations, and difficulties would also arise in connection with the Medical School.
543. Do you not think that the hospital could get the services of the best surgeons in Sydney? I think they might, but there is a considerable difficulty in managing hospitals for acute and surgical cases.
544. Does not a mixed committee of private gentlemen get the services of those physicians and surgeons? Yes, as honorary officers.

F. N.  
Manning,  
Esq., M.D.

16 Dec., 1890.

F. N.  
Manning,  
Esq., M.D.  
16 Dec., 1890.

545. Would not the same men work for the Government as for the Committee? I think you would have a difficulty in procuring their services.
546. In the Sydney Hospital we are told that there is invested £20,000 of private money. We are told that to complete this building it would cost £210,000—probably £220,000. Therefore the Government would have to pay £200,000 of public money as against £20,000 of private money, and then the Government would be ousted from jurisdiction over the establishment;—do you think that that is a judicious arrangement? It does not appear to be a very business-like arrangement.
547. This money, when it has passed into the hands of the Committee, is really the property of the Trustees and the Committee of that establishment? Yes, undoubtedly.
548. Is not that the case with the Randwick Asylum at present? Yes.
549. If the Government wanted to use the Randwick Asylum as a hospital, would they not have to pass an Act of Parliament? Yes; and there is also a further question even after you had given the Committee the building. You will have to vote a considerable sum of money for the support of the institution.
550. Will not the Government have to provide four-fifths of the money required? No; about one-half.
551. May it not be as large as I have stated when the large establishment comes into work? That may be.
552. Whatever is wanted, will not the Government have to find it? Yes, unless the hospital is very largely benefited by private subscriptions or donations. Prince Alfred Hospital has been very largely benefited already by private legacies and donations.
553. When it is known that the Government will come to the rescue, is there not always a tendency for private subscriptions to fall short? Yes; that is undoubtedly the case.
554. Do you think that this mixed system of public and private management is a good system? I do not think it is. No doubt what would be very much preferable would be to make the management of hospitals, except for acute cases, part of the local Government, and take it away altogether from the central administration, handing it over to the counties, towns, and municipalities.
555. In that case you would have official administration? Yes.
556. Do you think that the municipalities would have greater facilities than the central Government for getting the services of eminent physicians and surgeons? I think you must exempt from anything of that kind one or two of the larger hospitals, and especially those connected with the Medical School.
557. Are there not on the Continent of Europe many large hospitals connected with the Government and with medical schools? Yes; but under a very altered condition of things in many respects. I do not think that you could imitate it with advantage here.
558. Looking at the disproportion between public and private contributions to this hospital, would it not be fair for the Government to say that if the private people will hand over the whole thing to the Government we shall complete the building and manage it? I am not able to regard the management of hospitals as one of the functions of the central Government.
559. Why not equally so with the management of lunatic asylums? That is a very different matter. Insane people become almost *ipso facto* wards of the State. They are totally different from ordinary sick people, who are, in almost all countries, left—and I think wisely—to the care of local or municipal Government, or to private charity.
560. Do you not look upon the victims of accident as State wards? I look upon them as being in a different position altogether. The administration of asylums for the insane by local and municipal authorities has not been found satisfactory in any place where it has been tried, especially in America.
561. Still you see the incongruity between the public and private subscriptions to the hospital. Do you think that provision for two hundred and thirty-eight beds would be sufficient in the new buildings? Yes; that would be ample.
562. There is an architectural objection that the buildings would be squat if they were not completed according to the original designs;—do you think that that is a sufficient objection to the modified plan? No. As far as one is able to judge from the plans, the buildings, even when not carried to their full height, would not look bad.
563. Supposing that instead of completing the first pavilion, already partly erected, we leave that as it is, making it one story, and we put three stories on the front—do you think that that would be an equally efficient hospital? No. I would prefer to have the buildings in accordance with the reduced plans distinctly.
564. Without attempting the second pavilion to the east? No; I would leave that out.
565. Is it your view to make two stories on the front, two stories on each pavilion, and to leave the south wing as it is? Two stories and a basement in each pavilion, and to carry out the administrative portion with three stories, leaving the south wing. I think that that would give sufficient accommodation.
566. You would not advise the erection of a larger hospital on the site? No.
567. If we wanted more accommodation in the city, have you any idea where another site could be found? I do not think that there is a necessity for more hospital accommodation in the city itself.
568. Would it not be desirable to obtain another site to the westward? The Prince Alfred Hospital is within fair reach of the whole of the western part of the city.
569. If we want more accommodation, would you rather build an additional pavilion to the Prince Alfred Hospital? Yes; because it could be done more cheaply there than anywhere else. We already have the administrative part of the Prince Alfred Hospital built.
570. Would it be putting too large a property on one site? No; there is sufficient space there.
571. If we want anything more for certain classes of cases, would you prefer to have another Coast Hospital, to deal with chronic cases? Yes; that would give the Government all it requires at this time. At the same time I do not think that the Coast Hospital should be continued as a general hospital. It ought to be devoted almost entirely to the treatment of infectious fevers and infectious diseases generally—erysipelas, Lock disease, and the treatment of lepers. A certain number of beds ought always to be kept vacant there, to serve for outbreaks of infectious diseases. At the present time if any outbreak occurs we have to clear out as best we can the general wards there.
572. Must not the Benevolent Asylum be reconstructed sooner or later? Yes.
573. Could not that be made to serve this more economical hospital which you speak of? Yes.
574. Could not the two purposes be dovetailed? Yes.
575. Could you not then reserve Little Bay for fevers and infectious cases? Yes.
576. Would you continue the Lying-in Hospital with the Benevolent Asylum? Yes, putting it in a separate pavilion.

577. Will not that have to be within reasonable distance of the University Medical School? It is certainly advisable, and it should not be too far away, both for the sake of the women going to it, and for the teaching.

578. *Mr. Trickett.*] What do you think of the Macquarie-street site? I think it is a very good one. I see no objection to it, either on the part of the sick, or of the neighbours. There has been no outbreak of disease due to it, and with the exception of phthisical and rheumatic cases, the patients have done remarkably well indeed.

579. Have you studied the question of drainage a good deal with regard to asylums? I have only a small practical knowledge of it.

580. Is the Sydney Hospital on a site that can be well drained? I understand from my inquiries that it has been particularly well drained, and that its connections with the Sydney sewers are remarkably good.

581. Is the tendency of the present day towards building hospitals of a substantial character as is proposed in this case, or is that tendency in favour of buildings of a temporary nature? Of late the tendency has been in the direction of having permanent structures and substantial buildings, with the walls of such a nature as can be easily washed or painted, and the whole risk of infection done away with in that manner. Some years ago there was a wave in the direction of putting up temporary buildings, and burning them down occasionally. That, of course, could not be done in the middle of a town. Lately, however, the authorities have been in favour of substantial structures, rendering them in the interior nearly proof against anything like infection or contagion, by means of glazed bricks and tiles, and by treating the internal surface in a manner that renders it nearly impervious.

582. We have heard objections to large hospitals—would a hospital on the modified plan to accommodate about 200 persons be considered a large hospital? No.

583. You referred to Miller's Point as a place where female Lock patients might be treated—do you not think that that would be an unsuitable position, so close to the shipping? The situation of the houses now occupied as an ophthalmic hospital is singularly retired and quiet. In my view, and in the view of others with whom I have talked upon the matter, it would be a very suitable site indeed for the Lock cases.

584. Would the approach be suitable? Many of the cases are drawn from that neighbourhood, and they would not have far to go.

585. I understand from your evidence that you are in favour of this hospital being completed on the modified scale? Yes; and I can see no objection to its being put up in a cheaper manner—the upper story being built with brick and cement, and made to look like sandstone, similar to the "Empire Hotel." That would save a considerable amount of money.

586. Would the internal construction of a building of that character be such as to prevent hospitalism? Yes.

587. What is the ordinary price per bed for the construction of hospitals? Hospitals have varied immensely in their cost, and you can hardly take the cost at home as a standard here, because building here is certainly one-third, and sometimes as much as one-half, as much again here as at home. £400 per bed is looked upon as a large expenditure for the construction of home hospitals.

588. Then if this building costs £300 per bed will not that be very high? Yes.

589. *Mr. Garvan.*] With the accommodation already provided in the hospitals here, do you think there will be any need for a large increase in hospital accommodation in Sydney and its suburbs in the near future? I think it will be necessary, if this building is carried out on the modified plan, that there should be some increase before very long in the Prince Alfred Hospital.

590. Do you say that because the Prince Alfred Hospital is in a superior location? I think an increase of accommodation could be made there more cheaply than in most other places. It would be possible to add to the Prince Alfred Hospital at a cost of £250 to £300 per bed.

591. Would it be possible to increase the accommodation at the Sydney Hospital, say to the extent of 200 beds at the same cost? Apparently not, from the plans here; but apart from that it does not appear advisable on that site, and with its surroundings, to have a larger hospital than will provide 200 beds.

592. On what ground do you recommend that the accommodation should not exceed 200 beds? The cases could be better treated a little way out of town, and there is a very limited area attached to the Sydney Hospital, so that the buildings would be put up too closely.

593. For all purposes, would you recommend the limit should be 200 beds? I think you would gain but little, from an economical point of view, by increasing the size of the hospital.

594. *Mr. Dowel.*] Have you visited the Sydney Hospital lately? I visited it yesterday.

595. Did you inspect all the buildings? I did not go into the weatherboard building, but I have been there.

596. Do you think there is great danger to life owing to the inflammable nature of those buildings? Decidedly.

597. Is provision made for the extinction of fires? Everything has been done that can be done. Mr. Bear has given advice on the matter.

598. What is your opinion as to the desirability of erecting timber and iron structures for hospitals? For infectious diseases, and in a country situation where you have a considerable amount of ground, I think such buildings are very desirable. In town, and for ordinary hospitals, I think more solid material should be used.

599. Are the wooden buildings and structures at Prince Alfred Hospital used for infectious diseases? There are none there.

600. Are you quite sure of that? I think so. I was a director of the hospital from the beginning until two years ago.

601. If Dr. Mackellar said so would he be stating what was correct? I think he must have made a mistake. There are four or five small isolated rooms, each to contain one patient, built, it may be, in a lighter style than the rest of the buildings, but I think they are of brick. The rest of the buildings are very substantial.

602. Is there not considerable expense in keeping wooden structures in repair? Yes; for both wood and iron structures there is considerable annual cost for painting, and, besides, they are subject to ravages from white ant.

603. Do you think that the wooden buildings in connection with the Sydney Hospital should remain? No; I would have them taken down as soon as possible. They are decidedly dangerous, and very unsuitable in that position.

WEDNESDAY, 17 DECEMBER, 1890.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.	JAMES EBENEZER TONKIN, Esq.
The Hon. FREDERICK THOMAS HUMPHREY.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. GEORGE HENRY COX.	CHARLES ALFRED LEE, Esq.
HENRY COPELAND, Esq.	WILLIAM McCOURT, Esq.
JACOB GARRARD, Esq.	JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

The Hon. Charles Kinnaird Mackellar, M.B., M.L.C., sworn, and examined:—

- Hon. C. K. Mackellar, M.B., M.L.C.  
17 Dec., 1890.
604. *Dr. Garran.* Were you at one time Medical Adviser to the Government? Yes, for about three years.
605. During that period did it form part of your duty to consider the question of hospital accommodation for Sydney as a whole? Yes.
606. Did you make any official report? I embodied my views in a letter to the Colonial Secretary, Sir Alexander Stuart.
607. Do you know whether any of your predecessors have done the same thing? I think not, but at the time that I wrote that letter, several other medical men of some knowledge and experience of the hospital wants of Sydney, were asked, at my instigation, to give their views—Sir Alfred Roberts, Dr. George Fortescue, Dr. MacLaurin, and Dr. Cox. They addressed letters to the Colonial Secretary, and the documents form a Parliamentary paper which was laid on the table on the 9th October, 1883.
608. Did the Colonial Secretary call for a general report on hospital accommodation in Sydney? Yes.
609. Did you avail yourself of the services of those other gentlemen to fortify your own opinions? Not at all. I was not aware what their opinions were, but I was anxious that the Colonial Secretary should get representative opinions from the medical profession. The letters were written by those gentlemen without consultation or communication in any way with me.
610. I see that your report puts the number of beds required for Sydney at that time, at 900? Yes. That was reckoned upon the basis of a population of 800,000 for the whole of the colony.
611. Did Dr. Cox put it at 810? I believe he did.
612. We had it in evidence yesterday from Dr. Manning, that the existing hospital accommodation is about 1,000, taking in St. Vincent's Hospital? I am not aware exactly what is the present hospital accommodation, but the question is a somewhat complicated one. In this country the Government takes charge of the sick paupers, while in England and other countries the Government takes no such charge—they are left to the local bodies. Therefore, the general hospital question here is more or less mixed up with the pauper workhouse question, and a large number of the persons treated in the hospitals here would, in England, be treated in workhouse infirmaries.
613. Was not the Sydney Infirmary established for a sick poor reception house? As a dispensary for the sick poor.
614. But not for a modern hospital? Not in the first instance.
615. It had more the character of a benevolent asylum or infirmary than a hospital proper? That was at its very earliest stage.
616. It naturally developed gradually into a hospital? Yes; but that development took place about the year 1845. From 1845 to 1848, it was in some sense a hospital, for I know my father was the surgeon to it.
617. The need for a hospital would grow up, and it would be to that place the hospital patients would be sent? A dispensary is scarcely the thing that would exist alone—there must be a hospital attached to it.
618. It slid from its original purpose into its present purpose? Yes.
619. From the very first onwards our hospitals have been more or less reception houses for the sick poor? Yes.
620. Are they so still? Yes.
621. In your judgment, would it be expedient to separate those two classes of cases? It is absolutely necessary that they should be separated to a greater extent than they are now. I may say in passing, that the care at present exercised to differentiate between those who are actually sick and needing close attendance, and those who are merely sick because of age or chronic infirmity, is much greater than it used to be even in my time.
622. We are told that the limited supply of beds at the Sydney Hospital almost compels that? Yes; it is a check to a certain extent. But a further check is afforded by the fact, that since the time I instituted this system, the patients sent to the Government hospitals are examined by a Government doctor, who has authority to say whether the patients shall go to an asylum, or whether attendance in a public hospital is necessary.
623. Was the old plan for persons to sit on the steps of the Colonial Secretary's office until they got an order? Yes; and many thousands of orders were given by various irresponsible persons.
624. By people who could not possibly know the circumstances of the case? Who never took the trouble to inquire.
625. Since then they have to be filtered through this officer in charge of the department? Yes; and I have no doubt that the system has worked admirably for the purposes intended.
626. Have we proper accommodation for those poor people who wait to have something done for them, and who do not want the expensive provision of a first-class hospital? We have Government asylums and asylum hospitals at Parramatta, Liverpool, and Newington.
627. Are they good enough for that class of cases? I think so.
628. Do you think that we want anything intermediate between those asylums and first-class hospitals? I think we probably do want something.
629. Do we want a cheap hospital where we can not only separate these people, but also save the enormous expense of a first-class surgical hospital? Such an institution would be very desirable.
630. Do you think that for accident cases and for urgent cases we cannot have a hospital too good? Yes.
- 631.

Hon. C. K.  
Mackellar,  
M.B., M.L.C.

17 Dec., 1890.

631. Do you think there is a waste of money to the public by admitting sick paupers into a first-class hospital? Yes. At the present time I believe a large number of those cases which are not considered to be quite eligible for treatment in a general hospital in the city are treated at Little Bay.

632. Dr. Manning is of opinion that Little Bay should be reserved for fever cases and infectious cases, and ought not to be made a pauper hospital—what is your view? In my opinion Little Bay is not fitted to be made a fever hospital. It is a great deal too far away from the city. It would be wrong to take other than the mildest cases of fever to Little Bay. It is very likely they would suffer, and I know they have suffered in times past where very great discretion has not been used in selecting the cases.

633. Was it originally built for a small-pox hospital? Yes; as a kind of quarantine hospital. Just now, and ever since I was in office, medical men sending cases to Little Bay have been required to fill up a form,—which they often do with great reluctance, and sometimes decline to do—which states that the patients will not in any way be injured by transit to Little Bay. The fact that it is necessary to fill up such a form shows that in some cases there is danger in sending them to that hospital.

634. Is it not difficult to give such a certificate in advance? Yes; and medical men naturally protect themselves by sending only the most simple cases.

635. It was not too far off for a small-pox hospital? I think it was.

636. If you could establish that hospital within 3 miles of Sydney would it be a great convenience? Yes.

637. Suppose we put up another hospital like that within 3 miles of Sydney, would it be a great convenience? I think it would relieve all the general hospitals of the city.

638. Could we not build a hospital in that style of galvanised iron for a modest sum? Yes; I think probably for £100 a bed.

639. What would be the cost of management? About £50 per bed per annum.

640. With such an expenditure could we adequately deal with a large number of cases now thrown on the Government? Yes; they could be selected from those who presented themselves to the Government officer.

641. Would that relieve Prince Alfred and the Sydney Hospital where the estimated cost is £800 per bed? Yes.

642. Is it extravagant to provide a hospital at a cost of £800 per bed for the first cost? Yes; I think it is absolutely unnecessary.

643. You would not object to that expense for surgical and urgent cases? No; experience has shown that a first-class hospital built in a city, and built of materials such as our hospitals are constructed with, will cost £800 per bed and sometimes more.

644. Do you think that the site for the Sydney Hospital is a good one? It is admirable.

645. If we had to choose afresh might we get a site more central? If I had the choice I would select Flagstaff-hill as the best in the city.

646. Was not that the original site of the first hospital? It was chosen by the military authorities in the first instance. I do not think a better site could be found, and I have searched the city. It is an airy site, and the original building is now used for a school.

647. Is the front part of the Fort-street school a remnant of the first hospital in Sydney? I believe so.

648. It has been objected by some of the medical authorities that it is too much exposed to the westerly wind? I do not attach any importance to that.

649. Could not administrative buildings be put up on the western side? Yes; I think that is a trivial objection.

650. Would the Fort-street school building be suitable for a hospital? I should scarcely like to bind myself to such an opinion—the site is not to be surpassed in Sydney.

651. Is this site particularly wanted as a central school? I do not know.

652. Have not the families removed far away from that neighbourhood? I presume they have gone to the suburbs.

653. Do they not troop in from the suburbs to go to Fort-street? Yes; because the teaching is supposed to be better.

654. If we want a second site in Sydney for a hospital have we not got that site available? I do not think there is any better site—in fact none so good.

655. Pyrmont has been suggested for a site, near the Technical School—would that be a good site? As Pyrmont, Ultimo, and the surrounding district is likely to be an industrial centre at some period in the history of the city it will be necessary to have a hospital there.

656. It has been suggested that 200 beds should be the limit for a hospital on the Macquarie-street site—do you approve of that? 200 beds might very fairly be placed on that site, and even more if necessary, but on the whole 200 beds would be sufficient.

657. Do you think that 200 beds would be sufficient for the area of 3 acres? It can scarcely be looked at in that way, because there are actually more than 3 acres. The Domain grounds are just as much available for the Sydney Hospital as if they belonged to it, because they are not occupied.

658. For building purposes is it not less than 3 acres? Yes.

659. Is not the site jammed in by Parliament House and the Mint? Yes; that is an objection to a certain extent.

660. Are you inclined to limit the beds there to 200? Looking at it from the point of view of what is absolutely necessary for the treatment of the sick, I think 200 beds would be sufficient, always provided that extra beds will be necessary before very long in some of the other hospitals, for instance, Prince Alfred Hospital. Other considerations arise in dealing with the matter—the architectural features of the street, and so on. It may be necessary to make a larger building, because of the objectionable appearance of a small building not constructed in architectural proportion.

661. Would you build a larger hospital than you really want for the sake of the appearance of the building? I would not like to say that I would build a building larger than I wanted. In fact if a building containing 250 beds were erected there, it would prevent the necessity for building on the Prince Alfred Hospital grounds, so that the beds would be used. I do not think it is absolutely necessary that there should be a hospital with more than 200 beds in that part of the city.

662. We are told that the cheapest possible way of providing extra beds would be to add new pavilions to the Prince Alfred Hospital—do you agree with that view? I have no doubt of that.

Hon. C. K.  
Mackellar,  
M.B., M.L.C.  
17 Dec., 1890.

663. So that if we provide for purely city wants, we can provide for metropolitan wants at the Prince Alfred Hospital at the cheapest rate? Yes.
664. Is there room there to complete the plan of two pavilions? Yes; and I think they should be completed.
665. Could that be done without any crowding of the ground there? Yes; the hospital should be completed, because it is quite clear to me that, taken as a Medical School, the present size of the Prince Alfred Hospital is not adequate to the requirements. Some parts of the building must be increased. If I mistake not, the lecturer upon surgery, who has the responsibility of teaching surgery to the students of the University, has something less than twenty beds under his charge, and it is quite clear that that is not a sufficient number to enable him to do his duty.
666. Would it not always be the case that the Sydney Hospital will always have more of the accident cases? I do not think so.
667. Is it not very much nearer to the accident area than the other hospital? Just now the city is extending westward.
668. Would not any man injured at the Darling Harbour wharves or at the warehouses be taken to the Sydney Hospital? If an accident occurred on the wharves that would be the case; but if ever Sydney becomes a manufacturing city, it is clear that the factories will not be on the wharves, but on the west side, and then any accidents which might occur there, would go to the Prince Alfred Hospital.
669. Might not also all the urgent cases from the country go to the Prince Alfred Hospital? I think the majority of the cases from the country go to Prince Alfred Hospital now.
670. Do you think that the Sydney Hospital is principally supplied from the area for which it is meant to be central? Yes; to a large extent.
671. It is not a country hospital? Large numbers of people from the country are treated there.
672. Could they go as easily to the Prince Alfred Hospital? Yes.
673. The special function of this hospital is to serve the city area? It is; but I would like you to understand that the disposition to centralism observed in every walk of life is especially observed with regard to the treatment of disease in this country. People in the interior suffering from ailments requiring operations naturally gravitate to Sydney, because they have an idea that they will get a selection of more experienced operators to deal with their cases, and it is quite likely that they may be right. The hospitals are used, to a certain extent, by country patients, and you cannot altogether confine yourself to the metropolis in your view of the necessity.
674. Granting all that, the Prince Alfred Hospital could be used for that purpose as well as the Sydney Hospital, and there is as good a medical staff there? Yes.
675. Is there any need, in view of these country patients, to aggravate the size of the Macquarie-street Hospital? Not the least.
676. That hospital need not be larger than the wants of the city require? I think not.
677. Two hundred beds would be sufficient for that? Yes.
678. If you had to begin this hospital *de novo*, would you propose to have a four story building? I would not.
679. Is there any medical objection to four stories? The modern teaching on this subject would have us believe that buildings should not be erected more than two stories high.
680. We have had some evidence to the effect that since the antiseptic system of surgery commenced, there is no danger in putting one layer of disease over the other? I would not go so far as that. The antiseptic system may be carried out in its entirety by those who have charge, or it may not—that would depend on the whim of the person who carried it out. I do not think that you could rely on that as a reason why the building should be more than two stories high.
681. Do you think that there is a possible risk in having tier upon tier? I would not go further than to say that all the modern teaching on this subject would have us believe that hospitals should not be constructed more than two stories high, and for purposes of administration it is clear that it would be more convenient to have two stories only.
682. In some respects, would a single floor be the best? Apart from expense, it would be perfection.
683. In this particular case, for medical purposes, are you disposed to advise that there should not be more than two stories over the basement floor? Yes, from a medical point of view; but I have seen the proposed modification of the plan, and I entirely disapprove of it.
684. Is not that partly because the roof is so top-heavy? Yes; the roof seems to be entirely out of proportion to the building. From an architectural point of view, it would make the street perfectly hideous.
685. Would it not be in the power of an architect to design a different roof? Certainly.
686. Are there very lofty buildings in the street at present? No.
687. Is not the hospital actually broader than it is high? Yes. I believe it would be possible to construct that building with two stories only and a basement.
688. Are we in fetters to this particular plan? I presume not.
689. If we decided, for medical and national reasons, that two stories are enough, surely we can make the æsthetic combine with the medical necessities? I think so.
690. There is enough architectural genius in Sydney to solve the problem? I presume so.
691. We had it in evidence yesterday from Mr. Russell that two stories, with one pavilion at the back, which is commenced, and retaining the south wing, would provide 238 beds;—do you think that that would be sufficient? That would suit all purposes. That would be quite as many beds as we want at the present time.
692. If the administrative building were raised to the full height, would there be full accommodation? That would be a sufficiently complete establishment for all purposes at present.
693. Could it be worked with fair economy? The working of such a hospital would be more expensive than if it were completed to its original dimensions; still, at the same time, all purposes would be served.
694. On the whole, would you be inclined to recommend that plan? Yes; keeping in view the fact that at no very distant period it will be necessary to erect one or more wings to the Prince Alfred Hospital.
695. After that we shall want a third hospital in Sydney? Probably so, if we look on Little Bay as a temporary expedient. The buildings there are of galvanised iron—a sufficiently good material, but not very durable. Moreover, it is situated close to the sea, and I know that the iron is more or less decayed. It is likely to decay very rapidly, and it would not be advisable to repair and make that institution permanent. It would be much better to build an institution of a cheap kind within a few miles of Sydney. At one time I thought Randwick Asylum would be a good place.

Hon. C. K.  
Mackellar,  
M.B., M.L.C.

17 Dec., 1890.

696. Is not three-fourths of the money invested in the Randwick Asylum the property of the Government? Yes; and I do not see why the Government should not have that building.
697. Did not the Government give the land? Yes.
698. Yet the Government have no control over that institution? That is an unfortunate circumstance.
699. Is it a good plan for the Government to pass away money for public purposes from its own control into the hands of bodies over whom it has no control afterwards? I am sure it is not.
700. Is it a good plan to hand over nearly £200,000 of public money to the Sydney Hospital, as against £20,000 of private money, when the Government will have no further control? It is a very bad plan. The Government have a certain amount of representation on the Sydney Hospital Board of Management, but to my mind that does not give them sufficient control. I am one of the Government representatives myself, and I have been so for a good many years; but it is quite impossible for the gentlemen who represent the Government to exercise any particular control. They control the expenditure, but they may be out-voted, or, perhaps, they may not all take the same view with regard to what is necessary in the interests of the Government.
701. In any case the Trustees are not Government nominees? No.
702. The property is vested in the Trustees? I presume the Government nominees are placed on the Board to control, to a certain extent, the management of the institution and the expenditure.
703. That does not vest the property in the Government? No.
704. Do you think it is right to pass away such masses of Government money, as is now proposed, into the hands of what are, practically, Trustees outside Government control? I think, as a principle, it is not a good thing.
705. This Committee is asked to give its sanction to an expenditure of £220,000 upon a property of which only £20,000 is really private money;—is that a wise disposition of the public funds? In this individual case I do not see how that can very well be avoided; but, as a principle, I think it is wrong. The certain amount of laxity which is shown at all times in the expenditure of the money of these institutions, makes it very clear that it is a bad principle. I think if the money which has been expended in the various hospitals had been raised by the public, it would not have been expended so lavishly as it has been.
706. We have been told by the Secretary to this hospital that the Government approval was obtained to plans estimated to cost £45,000, towards which the Government was to give £25,000, but behind the back of the Government the cost was increased to £210,000, and the Government was not enlightened until the Committee had committed themselves;—what is your opinion with regard to that? That is a very undesirable state of affairs.
707. Suppose that the Government were to say to the private possessors of this hospital, "If you surrender the institution to us we will complete the hospital, and treat it as a Government Hospital";—would you see any objection to the Government managing the hospital directly as a department of the State? Yes; I think the care of the sick should be left to the people of the country—to the benevolent.
708. Is it left to them? No; and the system that we have followed in New South Wales has been such as to stifle benevolence on the part of the rich, and at the same time it has taken away all feeling of self-reliance from the poor. It is a very bad system.
709. Is it not certain that when everybody knows that the Government will keep the hospital going that private charity will be discouraged? Yes.
710. Would it not be better to separate absolutely Government institutions from absolutely private institutions? If possible, it would be better.
711. Do you think that the Government can never shake off responsibility for dealing with accidents and urgent cases among poor people? I think it might, but it must be remembered that in this country we have no workhouse infirmaries—at least, comparatively few. That class of people is looked after by the local bodies in the mother country, and a large number of the cases treated in the Sydney Hospital have belonged to that class. I am aware that lately the Government asylums at Liverpool and Newington—certainly the latter—have been increased in size; but I question whether the accommodation which is provided for people of that class is adequate for the requirements of the colony.
712. Are you aware that it is proposed to remove the Benevolent Asylum from its present situation? I know that such an idea has been mooted.
713. Is that too valuable a site for a benevolent asylum? Yes.
714. Could not that have a hospital attached to it, answering the conditions of an institution which would only cost £100 per bed? No; I think the Benevolent Asylum might very well have a maternity hospital, and perhaps a hospital for diseases of women, attached to it.
715. That should not be too far away from the Medical School? No; it should be within a short distance of it. I think the Benevolent Asylum managers have made it a feature in their administration that parturient women should be treated at that institution.
716. Would it be desirable, in lieu of a possible new hospital, to secure a site for it in advance? Certainly it would in one of the suburbs.
717. Do you propose to have the Little Bay Hospital reproduced somewhere within reach of Sydney? It is desirable that the land should be acquired, and when Little Bay becomes very dilapidated, as no doubt it will, a new hospital should be built.
718. Have you any idea as to what should be the site? I think the Government possess a number of sites in that direction which would be sufficiently good. At any rate there are large tracts of country available.
719. Would you have it on that line of route? Yes.
720. Do you know that there are two private convalescent hospitals lately started? Yes.
721. Will they not greatly relieve the two existing city hospitals? No; I do not think the Government should depend upon such institutions; they are not of any magnitude.
722. *Mr. O'Sullivan.*] Do you favour the modified design for the hospital? Yes.
723. Would a hospital of 200 beds be sufficient to accommodate the accident cases in the city? I think it would be sufficient to accommodate all the accident cases and some others which are likely to arise in that portion of the city, and for which Prince Alfred Hospital would not be available.
724. What would you do with very many of the patients of what might be called a general hospital? I would increase the size of the Prince Alfred Hospital by building two or more pavilions. I believe that hospital was originally intended to hold about 540 beds. I think it might well do so, and it should be increased to that size in course of time.

- Hon. C. K. Mackellar, M.B., M.L.C.  
17 Dec., 1890.
725. Has it ever occurred to you that the military barracks might be converted into a general hospital? Yes; I have inspected them with that view, but I do not think that it is a very good site.
726. What would be the objection to that site? The first objection is not one of site—it is because the building is not well designed for such a purpose. It would only be suitable as a temporary hospital.
727. Would it not be an admirable position for laying out the grounds and walks for patients and giving advantages which you cannot find on any other site in the city? It would have the advantage of gardens around it, but it would not be better in that respect than the site of the Sydney Hospital, because the Domain is available for all practical purposes, and there is an unlimited area beyond the Domain right out to the Pacific Ocean.
728. Do the patients utilise the Domain for a promenade? It is not desirable that they should. Patients who are sufficiently well to go into the Domain to promenade might be treated outside the town.
729. At the military barracks would not the patients be able to promenade without giving offence to the citizens? I do not think the citizens view it in that light at all.
730. Are you also in favour of having a small hospital at Pymont? Not at present. I have stated in a letter which I wrote to the Government some years ago that a necessity for a hospital in that direction will arise in the future.
731. Are you in favour of having a smaller hospital than is indicated by the design now before us? If a building of two stories high can be made architecturally desirable, it would be well to complete it in that way, but I do not think it is desirable that the hideously ugly roof which I have seen on the plan which is here should be carried out.
732. Do you see this plan by Mr. Kirkpatrick? I know it.
733. That could be constructed for £47,000—would that be sufficient for all practical purposes? I think that would be quite sufficient. I know the plan, and I think it is an exceedingly good one. For my part, I think it is quite as good as the plan which was adopted.
734. *Mr. Tonkin.*] Do you know the south wing of the present hospital? Very well.
735. Is that a permanent building? Yes, it is of stone.
736. Do you think that that building meets the requirements of the number of patients at present in it? Yes, very well. It is desirable that that wing should be somewhat altered, but the walls are perfectly good.
737. Would you advocate its being pulled down? Certainly not.
738. Do you think that it should be utilised under the circumstances? Yes.
739. *Mr. Trickett.*] Were you a member of the Hospital Board when the designs were accepted? No.
740. Is your chief objection to a building of two stories from an architectural point of view? Yes; and to a certain extent from the point of view of the expenses of administration, and of the institution as a whole. Of course if the building is completed for 200 beds it will cost more per bed than if it were completed for 250 beds.
741. When you were examined in 1887 before a Select Committee of the House, I understood you to say then that you would prefer two small hospitals instead of a large hospital? If I had to deal with the question *de novo* I would, but even then I would recognise the fact that the administration would be more expensive in the two small hospitals.
742. You then seemed to be also of opinion that it would be better to put up wooden buildings that could be easily destroyed;—have you since changed your opinion? Not in the least. I would not be prepared to say that it would be better to put up a wooden building in the city. That would be very objectionable. But a wooden or iron building might very well be put up in the suburbs. That might be done very inexpensively.
743. Is the tendency of the present day towards building hospitals in large cities of the character you indicate, or of erecting substantial buildings? For the most part hospitals everywhere are built of brick. The climate of Europe is such that patients would scarcely get sufficient shelter in any other sort of building.
744. With regard to the question of the treatment of patients, and the fear of a building becoming subject to hospitalism, are those ideas still prevalent, or would that be done away with by the material used in a substantial building? So far as the treatment of the sick is concerned they might be equally well treated in a wooden or iron building. They can be just as well treated in a hospital that costs £100 a bed as in a hospital that costs £800 a bed. It makes no difference whatever.
745. With regard to a building becoming hospitalised—what is your view? I should say that an iron building would be less likely to become subject to hospitalism.
746. If we put up a permanent building here at a cost of about £200,000, is there not a modern way of preventing any risk whatever? I think the danger of hospitalism now is infinitely less than it was when I was a medical student twenty-five years ago.
747. Could not glazed material be used in the interior? Yes.
748. Have you any objection to the site of this hospital? No; it is an admirable site.
749. Do you think it is possible for the health of the city to be affected by it? Not in the slightest degree.
750. Will you state distinctly whether you think it is advisable that this building should be completed or not? Viewing the matter as a citizen, as well as a medical man, I think the building should be completed in some form.
751. How do you distinguish between the two? In the first place, I think it is undesirable that the building should remain a disgrace to the city in its present unfinished condition. In the second place, it is very undesirable from the point of view of a citizen that a large number of the sick should be subject to danger from fire, as they are at present. As a medical man, I think it is necessary that a permanent building should be erected.
752. We have evidence from medical gentlemen to the effect that the front of the building might be made ornate and expensive, while the back might be constructed of far less costly material;—do you think that that could be carried out? That is more a question for an architect than for a medical man, but I have not the slightest doubt that that could be done.
753. Would there be any objection to that from a medical point of view? Not in the least, from a medical point of view a brick building is quite as desirable as is a stone building.
754. In objecting to the architectural appearance of the modified building, I suppose you refer particularly to the cupolas? Yes; I think they are very ugly. I think that the roof of the proposed modification

modification is much uglier than the original design; I think that it is out of proportion to the size of the building.

755. If that could be remedied would your objection be removed? Yes; and I have no doubt that it can be removed. I would then rather advocate the finishing of the building in that style.

756. It is estimated that if the building is completed according to the original design it would cost about £800 per bed; is not that a very large sum? Yes; but that is not without precedent. Some hospitals in Europe and Australia have cost that sum, or more.

757. Still it is a large sum? Yes; unnecessarily large.

758. *Mr. Cox.*] In the present state of medical science has it not been computed that no hospital should cost more than £200 per bed? I am not aware of that.

759. Is £200 a bed amply sufficient to provide for necessary accommodation? I think £100 per bed would be sufficient if you viewed the cost from a medical point only.

760. Would any expenditure in excess of that be throwing money away? Not at all. So far as regards the necessities of the patient you might say that it would be throwing away money; but other considerations arise in building a hospital besides the mere necessities of the sick persons. For instance, in this case under consideration, we might put up a building that would hold 200 patients, at a cost of £200 per bed, but it would not be desirable to have such a building as that in Macquarie-street. You could scarcely say that if you increased the cost from £200 to £500 per bed, that the extra money would be absolutely thrown away when you have in view the adornment of the city, and other considerations.

761. Are not those merely æsthetic ideas? No, that is viewing the matter as a citizen.

762. I gather that £200 a bed would be amply sufficient for all the requirements of the patients, and that anything beyond that would be simply studying the æsthetic tastes of the people? Anything more than £200 per bed would be merely taking into consideration other circumstances that are not purely medical. I would like to make a statement to the Committee on another subject. In the paper which I handed to the Committee, I have dealt with another kind of hospital which has not been mentioned here—that is to say, a Lock hospital, which is, and has been, absolutely necessary for many years for the separate treatment of cases of venereal disease. There is no class of cases that is so much neglected by the Government, and certainly the Government should deal with those cases if it deals with any at all. A short time ago I inquired what was the number of beds available for the treatment of such cases in the Sydney Hospital. I found that there were only ten available for females. It must be manifest to everybody who thinks on the matter that there are a great many more than ten females in Sydney who need treatment for infectious disease of that kind. At St. Vincent's Hospital such cases were not received, nor were they, at that time, received at the Prince Alfred Hospital. Therefore, only ten beds were available, and from that fact I conclude that a large amount of sickness and suffering that is perfectly unnecessary is carried through the city. Whatever is done with regard to the Sydney Hospital, it is absolutely necessary that the Government should take into consideration the requirements of the city in that respect. Some years ago I wrote a minute on the subject, which was presented to the Government of the day—Sir Alexander Stuart's Government, I believe—but it was never laid upon the table. If it is possible to obtain a copy I shall hand it to the Committee, because the question is dealt with there *in extenso*.

763. *Chairman.*] Do you recommend that such cases should be treated at the main hospital, or at any of the auxiliary hospitals? Certainly not. Such cases would not be well treated at a general hospital, nor would they be treated differently at any of the other hospitals. An institution to deal with those cases should be entirely separate—of a more or less private nature. It should be placed under the care of Government officers. The feelings of the patients who avail themselves of it should be respected as far as possible. The persons who require treatment should be able to resort to such an institution with confidence that they would not be exposed in any way to the cognizance of the public. If some such system is not established the necessity will arise, at no very distant period, for the introduction of an Act of Parliament dealing with this matter, and I do not think that would be at all desirable or fair at the present juncture.

764. Do you think that such an institution would prevent the necessity for such an Act of Parliament? Yes, the passing of Acts for the regulation of what are called contagious diseases is not a desirable kind of legislation, and certainly it would be very difficult to carry out, as it has been found to be in every large city. It would be very unfair to pass such an Act when we have never provided any institution to which the unfortunate people who require treatment could go and receive treatment voluntarily.

765. *Mr. Cox.*] Are you aware that it is in force in Queensland? It is not now in force, but it was. It was found to work very badly in Queensland, and proved so exceedingly irksome to a great many people, and hurtful to the feelings of a great many people—and I think their feelings should be respected—that the Act, I believe, had to be done away with.

766. *Mr. Tonkin.*] Would you advocate that one hospital should be used for both sexes? There is no necessity for a hospital for men. I am dealing with the cases of females.

767. Is there not a hospital in Sydney for dealing with ophthalmic complaints? Yes.

768. Could not that hospital be used for this purpose? I think that would be a very good institution for the purpose.

769. Would you advise that the ophthalmic complaints should be treated in the Sydney Hospital, and that the ophthalmic hospital should be entirely used for the purpose you advocate? That was the purport of my advice seven or eight years ago, that the ophthalmic institution should be acquired and devoted to that purpose, and that the ophthalmic patients should be treated in the Sydney and Prince Alfred Hospitals, where they could be treated quite as well as they are at Moorecliff.

770. Do you see any reason to alter that opinion? No, I am more confirmed than ever in that opinion.

771. Is it necessary that an hospital of this kind should be of a private character? Yes, where it would not be overlooked.

772. How many should that hospital accommodate? I calculate it would hold forty. I believe that more persons than that are accommodated there now.

773. Would that be sufficiently large to meet the present demands? I have not made a calculation recently as to the number of cases which it will be probably necessary to treat, but I should say that forty or fifty beds would be sufficient.

774. Would you advise this Committee to recommend that such a step should be taken? Yes; I think that it might very fairly come from this Committee.

Hon. C. K.  
Mackellar,  
M.B., M.L.O.  
17 Dec., 1890.

775. That course was suggested yesterday by Dr. Manning? I was not aware that he had it in his mind at all.
776. *Mr. Garvan.*] Is there any strong objection to treating Lock patients at a general hospital? A very great objection. A great many of the women who need treatment would not go to a hospital where they would be subject to the gaze of the general public.
777. Would it not be a greater outrage to the feelings of the patients to have to go to a hospital where the mere fact of their going to it would indicate the nature of the disease? That has not been the case in the countries where I have seen such institutions. People go to these institutions for many purposes besides treatment, and probably they could go without attracting attention. The thing that annoys these people is the fact that visitors continually come to the institution and see them there when they are in a general hospital.
778. *Chairman.*] Are they not in a separate apartment in the general hospital? Yes.
779. *Mr. Garvan.*] In a general hospital could not they be isolated from the gaze of the public almost as well as they could be in a separate institution? It would be possible.
780. In going to a general hospital they would not be suspected of such a disease, whereas, they would be suspected at once if they went to a hospital which only treated venereal disease? In every general hospital I have been acquainted with the proportionate number of beds devoted to venereal disease has been much greater than the proportion devoted to it in Sydney, so that a large number of persons suffering from disease of the kind under discussion do find treatment in general hospitals. But in some of the best regulated towns which I have visited they have also a separate hospital under the care of some individual of experience, who manages to attract these people there—people who would not go to a general hospital, and he even exercises a great amount of control over them—more than you would expect to be possible with persons of their class.
781. In dealing with venereal complaints do you think there is no necessity for specially dealing with males? No; there is no objection whatever to treating them in a general hospital. They are treated in a separate ward so far as a separate ward is available.
782. Are venereal complaints so prevalent as to seriously undermine the health of the population? They are very prevalent in Sydney. There are other places in which they are more prevalent a great deal, but they are very prevalent throughout the whole of Australia.
783. Do you think that if there were better hospital accommodation it would minimise the evils of venereal complaints? Yes.
784. Is there any other disease known to you as a doctor that endangers the health of the community so much as venereal does? Probably not. I do not think there is any other disease which is so insidious in its nature, and which is so desirable to treat specially.
785. Is it more prejudicial to the health of the population than perhaps any other single complaint which you deal with? No; I do not think it kills so many people as consumption for instance, but that is a disease we have not hitherto been able to cope with. We know, however, that proper treatment frees a sufferer from syphilis to a very large extent, if not entirely. We know that that cannot be said of tuberculosis.
786. Is it a fact that syphilis in its after effects sometimes, and perhaps frequently, leads to consumption? That has been suggested, but not demonstrated.
787. As a medical man of large experience in Sydney, do you think it is desirable that provision should be made for treating venereal complaints? That has long been my opinion.
788. More particularly with reference to women? Entirely with regard to women. So far as the male sex is concerned there is sufficient accommodation.
789. Would you now recommend that a separate hospital should be built for the purpose of treating women? I would.
790. What accommodation would you recommend? Forty or fifty beds would be sufficient to begin with.
791. Would it not be much more costly to conduct a separate hospital of forty beds than to provide forty beds at the Sydney Hospital? Yes, probably.
792. Would not there be a great difference? There would not be a very great difference, but the difference would be in favour of the Sydney Hospital. I have taken all these questions into consideration, and after mature deliberation, I have come to the conclusion that the end we have in view would be best served by having a separate hospital for the treatment of Lock patients.
793. What is the accommodation for patients at the Sydney Hospital at present? About 230.
794. Evidence has been given to us that there are demands now for a great many more beds than are available at the Sydney Hospital;—in view of that would it be desirable to increase the number? No; but it would be necessary to increase the number at the Prince Alfred Hospital at no very distant time.
795. Is not the number of beds at the Prince Alfred Hospital as great as at the Sydney Hospital? I should say that there are not quite so many.
796. You see no objection to increasing the accommodation of the Prince Alfred Hospital, but you do with regard to the Sydney Hospital? Yes. The Prince Alfred Hospital might be safely constructed to hold 540 beds, as it was originally intended, but the Sydney Hospital, for various reasons, is scarcely suitable for more than 200 or 220.
797. Will one of those hospitals stand out pre-eminently as being suitable for operations? No; I think not. Perhaps if either of them were to stand out in that way it would be the Prince Alfred Hospital. Accidents do not invariably necessitate operations. The majority of the accidents which occur are fractures of limbs. As a rule they do not require any operation. Operations, on the other hand, are often necessary, because of disease of a more or less chronic nature, which do not necessitate the patients being taken to any particular hospital.
798. Would you advise the concentration of that class of work at one hospital? Yes. I think that class of work could be better done on the whole at Prince Alfred Hospital, having in view the fact that Prince Alfred Hospital is now a Medical School, and that at no distant period it will be a very large Medical School.
799. If all these cases were treated at one hospital, would there not naturally result greater skill in the practitioners who had the greater number of cases to deal with? We presume that all the gentlemen are equally skilful. The committee take the greatest care only to elect men skilled. The comparative merits of each individual operator would be very much in accordance with the whim of the persons who considered the matter. That is a matter of opinion altogether.

800. Would not the skill of an operator be affected very much by the practice he would have in operating? No doubt; but it would be impossible to say that you would send all the accidents to one hospital and all the chronic diseases to another. A certain number of cases of disease other than injury will always go to the Sydney Hospital, and a certain number of fractures will always go to the Prince Alfred Hospital.

Hon. C. K.  
Mackellar,  
M.B., M.L.C.  
17 Dec., 1890.

801. You would not make a strong recommendation to alter the existing state of things? No; it would not be desirable.

802. *Chairman.*] Are you a member of the Medical Association? Yes.

803. Did that Association hold a meeting with reference to this subject, at which they passed a resolution? I believe so, but I was not there. I was appointed one of a deputation to wait upon the Colonial Secretary, but I was unable to attend.

804. Did they pass a resolution affirming the necessity of completing the building without saying in what way? Yes. I agree with that resolution.

805. Do you think altogether that a less expensive plan of completing the building would be more desirable;—that is what is called a two story design of Mr. Kirkpatrick? Yes; but I may say that I would rather see the building completed with three stories than see it constructed according to Mr. Rowe's modified plan.

806. Would you agree with the proposal to allow the south wing to remain as part of the modified structure? I think it might very well remain. It is a very good building, and although it was contemplated that that would be pulled down, I do not think there was ever any very great necessity for pulling it down.

807. Do you think that it would detract from the uniformity of the building? It is in the rear, and it is capable of receiving a certain amount of adornment to make it more or less uniform with the general building.

808. Have you made yourself sufficiently conversant with the proposal to form an opinion as to the limit of expense to which the Government should go in the construction of this building? No.

809. You are aware that the latest plan is wonderfully in excess of the original estimate? Yes.

810. Do you think it would be undesirable to go to that large expense? I look upon it this way—that practically the country is committed to this large expense.

811. Do you not think that the modified expenditure would meet with the views of the country? Yes.

812. Do you think that a modified building would be sufficiently creditable to the architecture of the city? Yes.

813. Do you think that any additional hospital accommodation which might be required could be provided elsewhere? Yes; at the Prince Alfred Hospital.

814. Do you think it would be necessary to erect a new hospital in the city on the site of the Fort-street school? No. I think if you complete the Sydney Hospital, even in a modified way, the hospital on the Fort-street site would be unnecessary and undesirable.

815. That would be a good site if circumstances made it necessary to provide additional accommodation? It is impossible that additional accommodation should ever be required at this end of the city if you construct the Sydney Hospital, even in a modified way.

816. With regard to a Lock hospital—have you in your mind fixed upon a site for it? Some years ago I fixed upon a building now used as an ophthalmic hospital, called Moorcliff, at Daves' Point. It would be a matter of some little difficulty, but it would not be impossible to obtain a good site for a Lock hospital if the Government decided to erect one.

817. Are you of opinion that a Lock hospital, so far as females are concerned, should be apart from the general hospital? As far as possible it should be.

818. Is it the case that this complaint is making great strides in the community? I do not think so.

819. Is it making greater strides than in other seaport towns? It is very prevalent, and it is one of those diseases which should not be prevalent if the cases were treated. Every woman who suffers from this complaint is continually disseminating it throughout the city, and that is a very undesirable thing. If she were allowed to go to a hospital for treatment she would not disseminate it any longer.

820. Are these diseases followed by any more acute form of disease? They are not usually followed by any acute disease, but syphilis is attended by a great many lamentable conditions in after life.

821. When you were speaking about deference being paid to the feelings of these patients, did you refer only to prostitutes, or to persons beyond that sphere? Of course, no questions would be asked of the women who went to the institution. All that the authorities would require to know would be whether they were sick. I dare say that the majority of the persons who suffer from this disease are prostitutes; but a very large number who are not technically prostitutes also suffer.

822. Of course, in these cases they would be very glad to avail themselves of an institution where they would be less under the public gaze? I have no doubt of it.

823. *Mr. Copeland.*] In view of the rapid increase in the population will it not soon be necessary to have additional hospital accommodation besides the Sydney Hospital? Yes.

824. That being the case, what objection would you have to make this building four stories, so as to provide for an additional number of beds which are sure to be necessary? I have no great objection to its being made four stories. I said before that modern teaching on this subject would have us believe that very high buildings were not desirable as hospitals, and certainly they would not be quite so convenient for administration.

825. Could they not be made convenient by the aid of lifts and other modern appliances? That would make the building more convenient than it would otherwise be. There is no very particular objection to this building being four stories high.

826. Would it not be more ornamental and more in accord with the nature of the other buildings in the city to make it four stories high? That is a matter of taste; I think on the whole it would.

827. Would it not be beneficial in this way, that the higher the bedrooms the cooler they would be in summer time? I have no doubt that in this building every room in the hospital will be all that could be desired for the treatment of the sick.

828. Would there be very little danger from fire in a building of that kind? No danger whatever.

829. As a medical man you do not see any professional objection to having a building four stories high? Practically, I do not.

830. Would it not be cheaper to get this additional number of beds which may be required by adding an additional

- Hon. C. K. Mackellar, M.B., M.L.C.  
17 Dec., 1890.
- additional story to the building instead of erecting a new hospital? I doubt very much whether it would be cheaper than to build another pavilion at the Prince Alfred Hospital.
831. Do you consider there would be no special advantage in having the bedrooms away from the ground in the higher atmosphere? I do not think so.
832. From your experience as Medical Adviser to the Government, what would you advise with reference to allowing the Directors of the hospital to retain the management, supposing the Government expends this large sum of money;—would you advise that the Directors still retain the management, or hand it over entirely to the control of the Government? I do not think that it is a very good thing for the Government to have the entire responsibility of such an institution as this. Probably the expense would be less, but other considerations would arise, such as the fact that the benevolence of the people would be more or less checked by their being rid of the responsibility of dealing with the sick. It would pauperise the people altogether.
833. On the other hand, do you think that it is desirable to hand over such a large amount of public money to the management of an irresponsible Board of Directors? I think experience has shown that it was rather a mistake.
834. Could you suggest any intermediate course, so that while the Government would retain some control there would still be something like a Board of Management—a Commission or something of that kind? I have not formulated any scheme that would meet the case.
835. I gather that you do not consider that either system is entirely satisfactory? No.

John Kirkpatrick, Esq., Architect, sworn, and examined:—

- J. Kirkpatrick, Esq.  
17 Dec., 1890.
836. *Chairman.*] Are you an architect in Sydney? Yes.
837. How long have you been practising your profession? About thirteen years.
838. Did you submit a design for the Sydney Hospital? Yes.
839. Was that at the same time as the accepted designs were submitted? Yes.
840. Had those designs to be accompanied by a builder's certificate, certifying that the works could be carried out at the estimated cost? Yes.
841. Was the design which you submitted so certified to by Mr. Alexander Dean? Yes.
842. What was the estimated cost? I have forgotten the exact amount, but I think it was about £45,000.
843. Did Mr. Dean inspect the design thoroughly before he submitted his certificate? He did so, very carefully indeed.
844. Did he certify to the practicability of carrying out your design within the price? Yes.
845. Were the other designs accompanied by builders' certificates? That I do not remember now; but I heard afterwards, in conversation, that the successful designs were not accompanied by a certificate.
846. How many other designs were lodged besides your own and Mr. Rowe's? I think there were thirty-five different designs.
847. Were the bulk of them accompanied by builders' certificates? I do not know.
848. Do you know anything of the circumstances under which the estimate of the successful design was altered from the original amount to the large amount to which it subsequently grew? No, except I was very much surprised to see the original design carried out in stone.
849. Did it originally provide for brick? No, it was an open question. Each competitor was allowed to say what he would construct the buildings of—brick or stone—according to certain designs.
850. Your design provided for the construction of a building in brick for £45,000? Yes; in the same manner as Prince Alfred Hospital has since been carried out—that is, with double pressed brick, with stone coigns and cornices.
851. Did Mr. Rowe's original design provide for stone or brick? It would not show. The drawings were originally sent in on a very small scale—one-sixteenth of an inch to the foot. On such a scale it would be impossible to show whether it was brick or stone; it would merely show the general character of the design. I sent in three designs, marked respectively "Health," "Nightingale," and "Economy," for one express purpose—to show the Board of Directors that it was impossible to get the accommodation they required without going up into the air by building five or six stories high. In the design marked "Health" I considered that it was necessary and better to put the wards containing the beds at the back and not at the front. The design marked "Nightingale" was drawn, not for the purpose of showing that it was a good design, but to show that placing the wards fronting Macquarie-street, as in the successful design, would be a mistake, because the wards would have to be so small and short that they would only contain about sixteen beds, which is considered by hospital authorities to be a waste of money, because one nurse is supposed to be able to attend to thirty or forty patients, and in this case one nurse would be only able to look after sixteen patients. This plan showed distinctly that the proper position for the wards was at the back. Out of thirty-five competitors, twenty-seven put the wards to the back. I think the balance of the designs placed the wards in the front. I think it would be a disadvantage of a serious kind to have the wards in the front, because they would not have such a pleasant aspect as they would have looking over the Domain, besides being exposed to both westerly winds and the westerly sun. Another feature was that in constructing the wards in length available for only sixteen beds it simply left a little channel between the administration block and the other parts of the building, which, instead of serving any beneficial purpose, would create a draught. I therefore desired to put these wards in the back, as shown in the plan marked "Health."
852. How many beds did the design which you have been describing provide for altogether? One hundred and thirty-six.
853. Is that in the gross? Yes; but we were instructed that the south wing should remain. The Nightingale wing was also to remain.
854. Would the south wing interfere with the architectural appearance of the buildings? It would not be seen from the front. If Mr. Rowe's design is carried out, the south wing will have to be removed.
855. Will that design encroach upon the south wing? Yes; in these designs the buildings are put 50 feet back from the front. We were instructed to do so. In the design marked "Economy," I have shown the frontage to Macquarie-street with the entire ward. That shows the only way in which, placing the wards in the front, the necessary accommodation could be given in a two story building. There are hospitals in the world having more than two stories, but our instruction was to keep the hospital down to two stories.

856. *Dr. Garran.*] In your statement as to the number of beds in your design, have you not omitted to mention eighteen beds in the ophthalmic ward? Yes.

857. *Chairman.*] Is that in addition to the 136 you have mentioned? Yes; and in the children's ward there are twenty beds, and in the casualty ward six beds.

858. What is the total number of beds in that case altogether in your design? That is 180 beds. That is including the medical and surgical wards and irrespective of the south wing.

859. Would that give 258 beds altogether, including the south wing? Yes; 258 altogether. In the design marked "Health," the Macquarie-street frontage is shown two stories in height on the two side wings, and the administration block is three stories without the basement.

860. Have you had much experience in hospital construction in other places besides here? No; I studied under Sir Alfred Roberts for some considerable time in connection with the Prince Alfred Hospital, and I made a study particularly of the Johns Hopkins Hospital, in America.

861. Do you think that your design would meet the requirements of a main hospital in Sydney? Not for a main hospital. I still think it is only sufficiently large for an accident hospital. Without the Prince Alfred Hospital this would be nearly useless.

862. *Mr. Tonkin.*] Was competition invited for these plans in the newspapers? Yes.

863. Were any particulars of specifications given? Printed terms and conditions were supplied, which I now hand in. The advertisement merely stated that the Board required designs, and certain premiums were offered.

864. Were you bound down to any particular sum of money? The advertisements did not refer to the sum of money, but we were asked to call on the Secretary who would supply terms and conditions.

865. These terms do specify the accommodation to be provided? Yes; clause 3 provides that the cost of the building is to be £45,000.

866. Were you instructed that in sending in your plans it would be necessary to attach a builder's certificate that the building could be erected for the amount specified? The terms and conditions referred to stated that such a certificate was to be sent in. I concluded that that meant an independent certificate, so I asked Mr. Dean to give me a certificate.

867. Did you comply with these terms and conditions? Yes.

868. Have you reason to believe that the other competitors did not do so? Yes; I heard that the successful competitor or competitors did not do so. Mr. Rowe won the first prize, and Mr. Backhouse was awarded the second and third prizes. Why he was awarded the third prize was a puzzle, because one design was a duplication of the other—a tracing.

869. I suppose you could have put in a different plan if you knew that the expenditure might be £200,000? I would not have put in a different plan except that I should have made the front a great deal more elaborate, but I would not have made it more than two stories in height. I would have designed the front building for stone and made it more elaborate; but I could not have made it cost £200,000.

870. Taking your design, which is estimated to cost £45,000 in brick, what would have been the difference in cost if it were constructed in stone? It would have cost about 15 or 20 per cent. more in stone.

871. It would not have cost double? No.

872. Who were the other competitors besides the successful one? I think nearly all the Sydney architects.

873. Did they all send in certificates and comply with the terms and conditions? I was only new here then, and I did not know much of them personally. After the decision was given there were a great many letters in the *Sydney Morning Herald* from the competitors expressing dissatisfaction.

874. *Mr. Garrard.*] Is not that always the case? Nearly always.

875. *Mr. Tonkin.*] Who were the judges in this competition? I was told simply that it was the Board of the Sydney Infirmary. I do not think anyone else was called in. I thought they would have called in an architect like the late Mr. E. T. Blackett, or someone not competing.

876. When you prepared these plans, did you write out any particulars showing what the cost, or the approximate cost, of carrying out the design would be? I gave a very short *resumé* of the specifications for Mr. Dean's guidance.

877. Did Mr. Dean have sufficient information from you to take the quantities? I think so.

878. Have you any reason to believe that Mr. Dean under-estimated the cost of the building? I am sure we could now carry out the building for the same money.

THURSDAY, 18 DECEMBER, 1890.

Present:—

THE HONORABLE JOHN LACKBY (CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. GEORGE HENRY COX.

HENRY COPELAND, Esq.

JACOB GARRARD, Esq.

JAMES EBENEZER TONKIN, Esq.

WILLIAM SPRINGTHORPE DOWEL, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM MCCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

John Kirkpatrick, Esq., Architect, sworn, and further examined:—

879. *Mr. Tonkin.*] The certificate that was handed in by Mr. Dean in reference to your design was, I suppose, a guarantee to carry out the work in a thoroughly substantial manner? Yes.

880. It was not put in on the understanding that the work would be done in the most flimsy manner possible, so as to carry it out for the specified amount of £45,000? Oh no, certainly not.

881. It was to be carried out in a proper workmanlike manner? In a first-class manner—not with stone, but with brick and stone dressings.

882. If an alteration were made in building, as has been suggested, the cost would be £55,000, or 20 per cent. more? Yes.

J.  
Kirkpatrick,  
Esq.  
17 Dec., 1890.

J.  
Kirkpatrick,  
Esq.  
18 Dec., 1890.

- J. Kirkpatrick, Esq.  
18 Dec., 1890.
883. Does Mr. Dean hold a prominent position as a builder? Yes, he holds about the most prominent position as a builder, I think, in Sydney.
884. Do you know whether he has been connected with any large buildings in Sydney? Yes, I think he has been connected with most of the very large buildings in Sydney. He is now completing the large "Australia Hotel" building.
885. You have no doubt, from your own knowledge also, that his estimate was a reliable one, and that the work could be carried out for the price he mentioned? I am sure it could have been carried out for the price he gave.
886. In the event of your plans having been accepted, what position would you have been in with regard to the erection of the building? I should have expected to be appointed the architect for the building, and to have had the supervision of the work entrusted to my care. The conditions, I think, said that the Board had the power to appoint any architect they liked to carry out the work; but it is usual for the successful architect to be employed to carry out the work.
887. It is not exceptional, however, for the conditions to state that the right to employ any other architect to supervise the carrying out of the work is reserved? No.
888. I think that is done as a rule in case any man whose plan might be approved might himself not be a man that they would have confidence in to carry out the building? Yes; that is the idea of the clause.
889. So that is not exceptional? That is the ordinary clause which appears in all conditions of competitions.
890. Had you received the commission to carry out the building you would not have expected any bonus for the plans in addition to the ordinary commission? No. I think the conditions stated that the bonus was to merge into the commission. I have forgotten the terms of the conditions.
891. In the event of your plans having been accepted, and you having been authorised to carry out the work, would you have called tenders for (say) the basement, or would you have called tenders for the whole building—what is the usual course adopted? I will mention the course that was adopted with me in regard to a certain competition connected with the erection of the Presbyterian Church at Ashfield some years ago, when I gained the first prize. I was appointed the architect to carry out the work, and the committee instructed me to at once call for tenders for the whole building, which was to cost £6,000, but the lowest tender for the whole of the work was £8,000. Then they asked me if I could reduce my plans so as to make the cost £6,000, and yet carry out something of my design. I could not do so, and I relinquished the work, and twelve or eighteen months afterwards they erected a much cheaper building in brick.
892. In calling for tenders for this class of buildings is it usual to call for tenders, in the first place, for the whole of the structure, or is it usual to merely call for tenders for a portion—say the basement or anything of that sort? Sometimes tenders are called for portions of the work. But in all the competitions that I am aware of tenders have been called for the entire building, so as at once to ascertain what would be the total cost.
893. I suppose that you have not very minutely examined Mr. Rowe's plans? I did after the competition, and when they were open for the public to view in the Town Hall; but that is very long ago, and I have forgotten the exact details.
894. Did you, at that time, when you saw those plans exhibited form any idea as to the probability of the work being carried out at the specified price? I thought, and I expressed the opinion to some friends, that the building would cost something like £90,000—twice as much as the estimate; but I only judged from the small sixteenth scale drawings.
895. *Mr. Trickett.*] You have seen the foundations of the present building in Macquarie-street? Yes.
896. Do you think it would be possible to utilise those foundations as far as they have gone, for the purpose of any other building, such as an art gallery or law courts? I do not think that law courts would fit into the present foundations. They might be utilised for an art gallery if certain alterations were carried out.
897. The basement could be used for statuary rooms, and the top part could be made into an art gallery? Yes; I think an art gallery is as good a suggestion as I have heard for the utilisation of the work that is at present up.
898. But you do not think that they would be suitable for law courts? I am sure they would not.
899. The arrangement of the foundations is such that you do not see how they could be used for that purpose? I am sure that no architect could turn the building into first-class law courts.
900. *Mr. Garrard.*] The plans that Mr. Rowe sent in for the competition are quite different from the plans upon which the building is being constructed—are they not? That I could not say now from memory. I believe there were alterations, but it is twelve or thirteen years since I saw the competitive designs.
901. You are not aware of the fact that has been stated here, that the competitive plan that Mr. Rowe sent in originally, was sent to the medical officers for revision, and that afterwards instructions were given to him to draw new plans altogether, and that this was done, and that the building was begun upon these new plans? I was not aware of that. This is the first time I have heard of it.
902. *Dr. Garran.*] You say that you have studied the question of hospital structure considerably? Yes.
903. In building the wards is it a fixed rule that you must have a window between each of the beds? Yes.
904. Will you look at these plans (Mr. Rowe's) now before the Committee and see if, following that rule, we could have as many beds as are shown on those plans? No; I am inclined to think that there would be fewer beds put in than are shown here. There are seven beds shown here, and one suggested to be placed in the corner, but this bed would be practically jammed against the wall. We generally leave 4 feet between the beds and 5 feet between the end wall and the first bed, and in the 4 feet spaces we put the windows. Each window is, as a rule, brought down to within 2 feet of the floor, and run up to within 18 inches of the ceiling, and divided into sections in such a way that the upper part could always be open for ventilation purposes, but could be closed in case of great draught.
905. Then you think that sixteen beds is the maximum number that could be put in that ward? No more could be put there without departing from the accepted regulations for hospital wards, namely, that beds should be at least 4 feet apart, and that there should be a window between each bed.

J.  
Kirkpatrick,  
Esq.  
18 Dec., 1890.

906. *Chairman.*] You are now speaking of the third floor? This is the third floor; but my remarks apply not only to the third floor, but also to all the floors from the ground floor upwards.
907. *Dr. Garra.*] But would not the great space between the bed in the corner and the one on the other side of the door compensate for the being nearer the wall? No; I think the bed should be away from the wall at least 5 feet. I notice that that has been done with regard to the first bed, but this one is put in close. You could not move that bed closer because patients do not generally walk to the bath-room, and many have to be wheeled there, and great space is therefore required near the entrance.
908. This is a very important question, because Mr. Russell, the Secretary of the institution, has calculated for twenty beds in each of these wards? They could not be put there.
909. You could not put twenty beds in without drawing them nearer to each other than the regulation distance, and putting some of them under the windows? I am sure you could not get another bed in there. It would be impossible. Four feet is a very little distance. If it were less a patient would be able to reach another patient in an adjoining bed, and it would never do.
910. Practically, the number of windows determines the number of beds? Yes; as a rule.
911. And it is a general rule that the windows should come down to within 3 feet of the floor? To within 2 feet of the floor.
912. For hospital purposes long and narrow windows are the best? Yes.
913. But they do not produce the best architectural effect? No; it is unsightly to have them out of proportion.
914. If you have the windows of your wards to face a particular way, and you want great architectural effect, you are, to some extent, hampered so far as your frontage is concerned by practical necessities? Yes.
915. That would be a good reason for all the windows of your wards to be away from the front? Yes.
916. And that is what you provided for in your plans? Yes.
917. And the frontage on your plans is reserved for administrative rooms? Yes, and for a children's ward, which, I think, is not of so much consequence, those patients being smaller in number, and the ophthalmic patients also.
918. In the plans of your wards have you provided a window between each bed? Yes.
919. You have given the requisite space? Yes, I have given 6 feet and 5 feet from the walls, and 4 feet between each bed.
920. Will you look at this plan of the surgical ward again;—you observe these corner rooms—does it not strike you that for bath-room, lavatory, water-closets, and linen-closets, these massive stone walls are very expensive? Yes, very.
921. If you look at this square corner, is not the space occupied by the walls alone very nearly as much as one-half of the area inside? It is not quite one-half, but nearly.
922. Is that not a very expensive method of building? Very.
923. And this occurs on every story? On every story from the bottom to the top—five stories.
924. Even in the large wards is not the quantity of thick stone wall very great compared with the area? I think that considering there are balconies, these walls could have been reduced considerably.
925. And yet comply with the building conditions? Yes; 18 inches thick is the usual size for all houses built with stone walls, and that would have been ample.
926. You think that the stone work is needlessly massive for the wards? Yes.
927. What do you think is the most rain proof—a stone wall or a pressed brick wall? I think we have found that the brick is more rain proof.
928. If the wall is protected by a balcony, as this is, a double pressed brick wall would be pretty well rain proof? Yes. At Prince Alfred Hospital the work is carried out with brick walls, and there are two walls with a space of three inches between. There is a 9-inch wall of double pressed bricks and a 9-inch wall of ordinary cheap bricks.
929. And that wall is perfectly dry inside? Yes.
930. And yet it is in an exposed position? Very.
931. You do not need thick stone work so as to have a dry wall? I do not think the stone work is dry. In all the old stone buildings erected in Sydney in the early days we find that the inside of the wall is lined with battens, and that these are covered with laths and plaster, so that if the water comes through the wall it does not show in the interior.
932. Is our Pyrmont stone porous? Very.
933. Then really a stone wall, 2 or 3 feet in thickness, is not so dry as the brick work at Prince Alfred Hospital? No.
934. And much more expensive? Yes.
935. It is very important, I suppose, to keep a hospital very dry? Very important indeed.
936. Really we could have had a better wall in brick than we shall have in stone? Very much better.
937. Stone is really not the best material for a hospital wall? No; the greatest hospital of the age is, I think, the Johns Hopkins Hospital at Baltimore, in America, and the building there has been carried out in brick work. They were some two or three years studying the matter before they commenced to build at all, and then they selected brick as the material to be used in the construction of the hospital.
938. If you had to advise the Committee *de novo*, you would not advise them to put stone walls into this hospital? No.
939. You think a mistake has been made in building it with stone? Yes; I think so, on account of the dampness that will gradually soak through the wall.
940. Then we have gone to more expense to get a less suitable wall? I think so.
941. Supposing we put another story on the top, do you advise that that story, being more exposed even than the lower one, should be made of brick, or would it spoil the features of the building? It would spoil the features of the building very much. A great body of the work having been executed in stone, I should say that the front of the building should be carried out in stone, but that the balance of work at the back should be carried out in brick.
942. There is no necessity to do more than the front in stone? No.
943. The back is not very visible from the Domain, is it? It will be.
944. But you would not object to put the back in brick? No; I think that the back in brick, cemented, would answer the purpose far better than if it were in stone.
945. You think that the upper part of the detached pavilion might be in brick—one of the pavilions on

J.  
Kirkpatrick,  
Esq.  
18 Dec., 1890.

the eastern side, which has been begun, you would complete in brick? Yes. It would only be for the sake of the front to Macquarie-street that I would recommend stone.

946. I ask you whether, if we put only one story on, and did not make it the complete height proposed, you, as an architect, think that it would look an unsightly thing in Macquarie-street? I think it would.

947. To make it a good architectural building we must put the four stories? Yes. These pilasters are so very wide and massive that they make the building look more squat than it really is. If these pilasters had been kept narrow, instead of being so broad and massive, I think the two stories would look very well.

948. Could not that be relieved by carrying the tower up sufficiently? No, I think not. There would be no use in carrying the tower up higher—you would want a staircase to get there.

949. You think then, that for architectural reasons it would be better to put on the four stories? Yes, for architectural reasons only.

950. So far as you have studied the question as an architect, do you concur with those who dislike four stories for a hospital? Yes; I think that all hospitals that are carried out with more than two stories are very much more expensive. Each ward must have a nurse's room and a scullery, and then there would be the cost of having an extra nurse.

951. So far as your studies have led you to determine, what is the largest number of patients that one nurse is supposed to be able to attend to properly? I think between thirty-five and forty.

952. If we are building wards here for only sixteen beds in each, and if we must have a nurse to each ward, we are going on an exceedingly expensive plan of administration? Very expensive indeed.

953. Can you tell me how many beds there are in each ward of the Prince Alfred Hospital? I think thirty-five.

954. And one night nurse is sufficient for each ward? Yes.

955. And we shall want more than double the number of nurses? Yes; and each ward will have to have its own separate scullery. In this hospital the nurse's room, I was informed afterwards, would not be required, as they have the "Nightingale" wing, where the nurses live; but in Prince Alfred Hospital they are building a nurses' home for the nurses, so that they shall not have to sleep in the wards.

956. Still, there must be a scullery attached to each ward? Yes; and a nurse's sitting-room adjoining the scullery.

957. This plan chops the hospital up into rooms that are too small? Yes. The nurse's room is absurdly small—only 8 feet by 13 ft. 6 in. In that room the nurse would have to look after things for sixteen patients, keeping things hot that were brought from the kitchen, and doing other work there. It is not the width of an ordinary passage.

958. You do not think that a good working plan? No, I do not.

959. Do you think that the wards are too much scattered? No, I do not think that they are, but they are too jammed together. There is only 16 feet between them.

960. What breadth do you provide in your plan? I have given an open area in front of 48 feet, and a space of 54 feet between all my main wards.

961. What size do you make your nurse's room? I have given the nurse an area of 275 superficial feet, against 108 superficial feet in the accepted design. I have the nurse's room on one side and the scullery on the other.

962. It has been stated by some person that the westerly winds are unfavourable winds to play upon the walls of a hospital. In your plans you protect the walls from the westerly winds? Yes; they are entirely protected from the westerly winds.

963. And yet exposed to the sea breeze? Yes.

964. But on the plan that is before us the majority of the beds will be in wards exposed to the west? Yes.

965. So that in that respect the advantage of the situation has not been utilised? No; I think it is self evident that the wards of this hospital, situated near the beautiful Domain, should face the east, and not the west, otherwise you will have not only the inconvenience of the hot western sun, but also the westerly winds, in addition to the disagreeableness of facing the street.

966. The back windows of these front rooms will have an easterly aspect? Yes; but only a portion of them will have the view; the view being so interrupted by other buildings.

967. If you were planning the hospital *de novo*, you would try to keep the wards free from a westerly aspect? Yes.

968. That has been omitted on this plan? Yes.

969. On the contrary, we put the bulk of the beds in wards exposed to the west? Yes; by setting them out in the way that they have been set out in the accepted design these short wards are necessitated—there is no room. I sent the "Nightingale" and "Economy" design in merely as examples to show that no proper design could be carried out with the wards to the west. In the "Nightingale" design the wards are shown entirely to the west, and by the "Nightingale" design I wished to show the defect in the system. In order to get a two story pavilion you have to cut off the walls there, as Mr. Rowe has done here. If the wards are built to the west there is only this way of treating them in short wards to accommodate sixteen beds each, and more nurses will be required, and more nurses' rooms will have to be built. There is only this method of treating the site, or the method of throwing the wards to the back, as shown in my design, and using the front entirely for administrative purposes.

970. Though you think the design is faulty, you do not think that it is so faulty that you would abandon that structure now? I think I would abandon it entirely.

971. And devote it to some other purpose? Yes.

972. And build a better planned hospital somewhere else? I think so.

973. That is your feeling as an architect? Yes; I am fully convinced that the hospital will not be a success when it is finished, if it ever is.

974. You were asked if the building could be turned into an art gallery—do you think that it would be suitable for Parliament House? No, no more than for law courts.

975. You could not adapt it? No.

976. Might it be suitable for the purposes of a public library? No, I do not think so.

977. Nor a museum? Yes, for a technological museum or for an art gallery, but not for a first-class art gallery.

978. The light would not be very good for an art gallery? You might use the floor that you intend to put on for an art gallery.

979. But the side-lights of these floors would not do? No; but I should say that the first floor which you intend to put on the present structure would do for the exhibition of pictures, and the floors built already, and the basement, would do for the exhibition of statuary.

980. You have suggested that if we finished the building we should do the front in stone, but I suppose that we need not keep to the same thickness of stone? No.

981. Much lighter work would do? Yes.

982. It would only have the roof to carry? That would be all.

983. Do you think that the roof as shown here is too heavy? Not for the full design.

984. If we shortened it by one story the roof would be disproportionately heavy? Yes, very.

985. Would it not look very bad to have so big a roof on a low building? I think so. It would look all roof—it would have a good Indian bungalow look.

986. If we diminished the height we must alter the roof? I think so. This roof would be very steep. The surgical ward is only 26 feet wide, and the roof is 20 feet high. Why they want a roof 20 feet high with nothing in it I do not know.

987. *Mr. O'Sullivan.*] If this design were abandoned, and some other building established in place of the hospital, where do you think we could place a central hospital in Sydney? I think in the Flagstaff-hill direction there would be the most suitable place for a good central hospital such as the Sydney Infirmary.

988. Do you think that the site would be as convenient for people within a radius of 1 mile of the centre of the city as this one is? I think it would be more convenient. We have such an enormous area of parks—we have Hyde Park and the Domain dividing off the eastern portion of the city, and patients from that side have to be brought a long distance, and I think that most of the people that are placed in the Sydney Infirmary come from the western suburbs.

989. If it be decided that this building shall be completed, how far are we going to make it useful and advantageous in carrying out the objects of the hospital? I would not recommend it to be completed at all. I think it would be a complete failure as a hospital. I am sure that the inside portions that I have referred to—the nurses' accommodation, the staircases, and the passages—will certainly have to be altered—in fact, taken to pieces.

990. You do not think that, even if it were finished at the cheapest possible cost, it would be worth our while to carry it on as a hospital? It would perhaps be better to have the present stone building roofed in and the walls roughly cemented inside, so as to place in it temporarily the patients at present accommodated in the old wooden structure, which is in danger every day from fire. If £1,000 would roof it in you might perhaps make it habitable for the purpose of utilising it temporarily as a hospital, but I think that it would be better to convert it, as suggested, into a technological museum, or something of that kind, and make the building of a more permanent character.

991. Would it be desirable to pull down the walls and take up the foundations and carry out a different design altogether on the same site? That is my opinion. I would make the first loss a bad loss and pull the building all down, clear it away, and not have a hospital there at all.

992. You are aware that the walls and foundations cost about £60,000? Yes; but plenty of money has been expended by everyone and wasted, and this, I think, is unfortunately one of the cases of waste.

993. Would the stone and other material be useful for any other building? When you take down building materials you scarcely get anything for them.

994. You think it would be better to pull down the walls and take up the foundations, though they have cost £60,000, and to build in their place something of similar character, but of better design? Do you mean to build a hospital on the same site?

995. Yes? No, I do not think so. I think that a hospital should not occupy that site. I do not consider that it is a central or suitable site for a hospital.

996. You have a very strong objection to the site? I have not a very strong objection to the site, but I think that a more suitable site could be found for a hospital.

997. You have a very strong objection to the design? Yes; to the wards facing the west, and they will not be treated on what I consider a good working plan if it is carried out.

998. *Mr. Copland.*] Do you think that any better site could be chosen for a hospital, considering that this site is adjacent to the Domain:—is there any other site with an equally good aspect, considering that there is the grand Domain and the Gardens so near:—would they not be as useful to the hospital as though it were standing in very large grounds? I am of opinion that the hospital would be better placed if ground could be obtained anywhere in the direction of Flagstaff-hill. There are several sites in that direction which would be more suitable for a hospital.

999. Are there large sites there where you could have grounds in connection with the hospital? I think so. There are several open spaces on a much higher elevation, and I think as pleasantly situated as Macquarie-street is for a hospital.

1000. Would Flagstaff-hill be more sheltered from the westerly winds than the present site is? No; it would not be more sheltered nor more exposed. But the building could be designed and the wards placed in such a way that you could avoid both the westerly winds and the western sun.

1001. You said just now that this building might be used for an art gallery, although it would not be altogether suitable; do you think it could be adapted for a college for the training of teachers for the public schools. You know that the Government propose to erect a college for the training of school teachers at an estimated cost of £37,500;—do you think this could be made as suitable for that purpose? Yes, it might do for that.

1002. I suppose that the wards would do for dormitories for the students? Yes, and for class-rooms.

1003. I suppose we might reckon that it would give accommodation for at least as many teachers as it is designed to give accommodation for patients? No; I do not think that it would give accommodation for teachers to the same extent that it would give accommodation for patients, for a patient only occupies a bed, and all the wards are utilised for patients' beds, but a certain number of the wards would have to be utilised for class-rooms if the building were made into a college.

1004. Would not some of the administrative rooms be useful for class-rooms? I do not think that they would be sufficiently large—they are not very large.

1005. You think that the situation would be a suitable one for a training college? Yes; I think it is a very suitable position for a good training college.

1006. Would it be possible to so design the upper part of the building that has still to be erected as to make

J.  
Kirkpatrick,  
Esq.

18 Dec., 1890.

J.  
Kirkpatrick,  
Esq.  
18 Dec., 1890.

make it more adapted for the purposes of a training college? I think so. I think that the part which is being erected could be designed economically and suitably for a training college.

1007. So as to provide larger class-rooms, lecture halls, &c., in the upper part of the building? Yes; that could be done.

1008. *Mr. Garvan.*] If it is determined by Parliament that the hospital is to be completed on the present site, what would you recommend us to do with the existing structure, or would you suggest the advisability of inviting architects to submit fresh designs in view of the existing work? To convert this into a hospital—well, I do not think that many architects would be able to convert it into a good hospital. I, for one, would not think of sending in designs to convert this into a first-class hospital.

1009. Supposing you were charged with the work of making the hospital as best you could out of the existing structure—have you any idea at present as to what you would do with it? No; I have no idea at all. I would not like to have to do it as the building stands at present.

1010. Your advice would be to discard it altogether as a hospital? Yes.

1011. And to erect the hospital on some other place? Yes, in another position.

1012. Do you remember the time when you sent in plans at the invitation of the Trustees of the hospital about twelve years ago? Yes, in 1878.

1013. Did you consider at that time that the entire cost of the structure should not exceed £45,000 was actually incumbent upon you in sending in your plans? Yes, so incumbent that I set to work to design one that would cost that amount. To make doubly sure that my design should not be put aside on the strength of cost, I went to the trouble of getting an estimate from Mr. Deam.

1014. Would an architect, in view of the terms upon which those competitive designs were invited, be justified in sending in plans that he knew would cost considerably more than £45,000 to carry out? No, he would not be justified, but in very many cases competitive designs are called for buildings, and the amount stipulated is too low to carry out the work that is required.

1015. In such a case would the architect in sending in his plans, if he could not get the cost within the stipulated sum, give information as to the additional cost of carrying out his plans? I should recommend him to do so. As a rule it is not done.

1016. If you were competing for a prize in sending in plans, would it be a fair thing, and in accordance with the ideas of architects generally, to withhold the probable cost of carrying out the plans that you were sending in? It is very rarely that we are asked to give the exact cost and to be so particular as I understood from the terms of this competition for the new hospital. There was a special clause. As a rule it is generally mentioned in the clause that the building shall be erected not to cost more than a certain stipulated sum. But there is always a certain percentage over and above that allowed, and it is thought a fair thing to allow the architect to exceed the stipulated amount by say 10 per cent.

1017. Would it be considered a proper thing to send in plans on the express stipulation, as contained in these terms, that the cost would not exceed £45,000, and for the architect to withhold the information from the Trustees to whom the plans were sent when he knew that the building could not be erected for less than £100,000? No; that would not be a fair thing.

1018. Would you as an architect do it? Well, I did not do it. I sent in Mr. Alexander Dean's tender.

1019. There may be a code of rules among architects, and what I am desirous of ascertaining is whether amongst architects generally it is deemed a correct thing to send in plans under such conditions as are named there? It is positively not right for an architect to send in a design for a proposed building which he is fully aware is going to cost twice or three times the sum allowed by the conditions for the completion of the building.

1020. If it is decided to complete the hospital on this site, have you definite ideas as to what extent of accommodation should be given there? I do not think that the site would accommodate more than 200 beds, and even that number, I think, is rather more than the site should be asked to accommodate. There is not sufficient area for a proper hospital there. I think that under 200 beds would be better than over.

1021. *Mr. McCourt.*] When you sent in your original plans you were limited to a cost of £45,000? Yes.

1022. You are aware now that the building if completed on Mr. Rowe's plans would cost about £210,000? Yes.

1023. Supposing you were asked now to send in plans limited to £210,000 cost, could you very much improve on Mr. Rowe's design for an entirely new building? I think we could design something very much better, and I think that Mr. Rowe himself also could design something better now.

1024. Would it be so much better that it would be worth while to lose the £68,000 already expended? I am sure it would.

1025. Therefore you recommend, if the hospital is to be built, that new competitive designs should be invited? I do not know that I would recommend that new competitive plans should be invited, but I would recommend that entirely new designs should be obtained. Let a Commission be appointed, and let the Commission itself choose an architect fit to carry out the work, and let him prepare improved plans; but do not have a competition among the architects, for half the competitions are really useless.

1026. The Government would gain ultimately by sacrificing the £68,000 already expended? I am sure they would.

1027. *Mr. Dowd.*] Do you consider that your design, under the motto "Health," is superior for hospital purposes to the design of Mr. Rowe, which is now before the Committee? Yes.

1028. Have you good professional reasons for making that statement? Yes.

1029. What are the principal reasons? One of the principal reasons is the knowledge that I have since obtained of hospital construction, as well as what I had when I made the design.

1030. Are you aware that a sub-committee or board was appointed to determine the value of those plans, and that they recommended that your plans should be adopted? No, I did not know that my plans were recommended for adoption.

1031. You could not say why the Board of Directors did not carry out the recommendation of the sub-committee? No.

1032. Did you furnish with your plans any description or specification of the work generally? No; not a working specification for carrying out the work in its entirety. I gave a general description of the construction of the building, and the materials to be used therein.

1033. A sufficiently good description to enable the Directors to know what sort of a building you proposed to erect? Yes.

1034. What were the principal features in the description of the building for which you prepared this specification? I have an exact description here.

1035.

1035. Will you allow me to look at it for one moment? Yes.
1036. Are you aware whether Mr. Rowe sent in an elaborate description of his proposed building in the same way that you did? I believe he did.
1037. You proposed to erect buildings, the basement story and the foundation to be of stone? Yes.
1038. And the superstructure of white double-pressed bricks? Yes.
1039. And stone dressings? Yes.
1040. You consider that an eminently proper way of providing for the construction of a building as regards the walls? Yes.
1041. Then in reference to your internal fittings, did you provide all that was necessary as regards accommodation for the latest known requirements for hospital purposes? Yes.
1042. And you are still convinced that your design could be carried out for £45,000? Yes.
1043. And that considerable saving could be effected in the management—in working expenses—by the carrying out of your plans? Yes.

J.  
Kirkpatrick,  
Esq.  
18 Dec., 1890.

The Hon. Henry Norman MacLaurin, M.D., M.L.C., sworn, and examined:—

1044. *Mr. Trickett.*] You are a doctor of medicine? Yes.
1045. And a member of the Legislative Council? Yes.
1046. For some time you occupied the position of Medical Adviser to the Government? Yes; three or four years.
1047. I think you were also on the Board of the Sydney Hospital? I was for some time—many years ago.
1048. Have you resigned that position? I was for about ten years one of the honorary medical officers, and for several years I was on the Board of Directors as the representative of the staff.
1049. Were you on the Board at the time these plans were called for? No. As far as I remember I was not the representative at that time—one of the honorary medical officers, but not on the Board.
1050. You know the present portion of the building that has been erected in Macquarie-street? Yes.
1051. And I suppose you have seen the plans of Colonel Rowe for the proposed building? Yes; often.
1052. What are your views with regard to those designs? I always objected to them.
1053. Would you kindly tell us why? First of all because the principal wards were exposed to the west, facing Macquarie-street. I always maintained that the wards should be arranged in parallel structures, going towards the Domain, and that only the administrative part of the building should face Macquarie-street. and secondly, I objected to so many stories of wards one above the other. I do not think that we should have more than two flats of wards one above the other.
1054. You think that facing the west is a great objection to the hospital? A very great objection in that situation, because the wards are exposed to the afternoon sun, and to the westerly wind, which is very hot in summer and very cold in winter.
1055. Do you remember the old Sydney Hospital which was demolished? Yes.
1056. Those wards had windows to the west—had they not? They had.
1057. Can you state whether that was felt actually as a matter of inconvenience in that hospital? They were very hot in the afternoon on a summer day, and also very hot when the westerly wind was blowing in the summer time. In winter they were very chilly when the westerly wind was blowing.
1058. Did those climatic influences lead to frequent comment? We always thought that the westerly wind—the summer westerly wind in particular, was injurious to the patients.
1059. That was a matter of remark? Yes, of common remark, especially among the older surgeons of the institution at that time.
1060. This design has large windows to the west, has it not? I believe so.
1061. Do you think that the same objection would prevail with regard to the health and comfort of the patients? I think that is an objection.
1062. With regard to the height of the building, would you state for our information what are the objections to the number of stories? I do not think that there ought to be more than two tiers of wards—that is, one ward above another—for convenience of ventilation, and also for the convenience of administration. Therefore, I always expressed my opinion very plainly that I thought there ought not to be more than two tiers of wards, so that we could the more readily get rid of any foul air that might arise in connection with the patients.
1063. You think that, with several stories one above the other in a hospital there would be danger of disease or infection travelling from one floor to the other? Yes. I think there is a mass of impure air which it is very difficult to get rid of, and wherever practicable I think they ought to be confined to two tiers of wards.
1064. With regard to a building for a hospital in Sydney, what are your views as to the number of beds that should be provided for? I expressed my views on this subject to the Colonial Secretary some years ago. But it was part of a plan for the whole hospital arrangements of Sydney. My idea was that in the Sydney Hospital and the Prince Alfred Hospital we should entirely confine ourselves to cases of very grave disease, of severe accidents, and to the more important surgical operations, and that we should have a perfectly different institution, a little way out of town, where chronic cases of sickness occurring among paupers and poor people should be treated. If that plan were carried out, I think that from 140 to 200 beds would be quite sufficient for the Sydney Hospital—that is to say, if it were confined strictly to the reception of persons suffering from grave disease, from serious accidents, and to cases requiring important surgical operations.
1065. Do you not understand that to be the intention of the hospital, if erected on its present site? It has not been the practice either in the Sydney or the Prince Alfred Hospital.
1066. But if the practice were limited in that direction, you think 200 beds would be ample? Yes, but then it would be necessary in that case to have another institution at some convenient place where chronic cases and cases of less severity, which would not be admitted to the acute disease hospitals might be treated, and they could be treated at less expense. I suggested to the Government that Randwick Asylum should be taken for that purpose, and if it had been possible to do that, I have no doubt whatever that there would be sufficient accommodation provided at the Sydney Hospital if there were from 150 to 200 beds.

Hon. H. N.  
MacLaurin,  
M.D., M.L.C.  
18 Dec., 1890.

Hon. H. N. MacLaurin, M.D., M.L.C.  
18 Dec., 1890.

1067. Do you not think that the Prince Alfred Hospital could be so enlarged as to work in in the way you suggest? Quite impossible, except with very considerable inconvenience to the sick poor of this part of the town. That was a question which I considered when I reported to the Colonial Secretary, and if you like I will read what I wrote at the time, viz., on November 16th, 1885. I wrote:—

The second question is as to the future of the Sydney Hospital. Is it better to complete the new building to a certain extent or to dispense with a hospital in the city, trusting to the Prince Alfred Hospital as the great public general hospital of the metropolitan district?

The answer to this question depends on two principal elements:—1st. The amount of usefulness of the Sydney Hospital to the public; and—2nd. The relative expense of completing the Sydney Hospital to a moderate degree, or of enlarging the Prince Alfred Hospital sufficiently to meet public requirements.

Now, the utility of a general hospital to the public may be fairly measured by the number of severe cases admitted, and the severity of the cases admitted may be roughly estimated by the number of deaths which occur in a year. I find by a return supplied to me by the Secretary of the Sydney Hospital, which I transmit herewith, that during the past twelve months 379 deaths occurred in the institution, of which sixty-one took place within twenty-four hours of admission, and seventy-six between twenty-four and forty-eight hours of admission. This would show nearly an average of three persons admitted every week in such a desperate state of illness that death ensued within forty-eight hours, while from all causes there is an average of rather more than one death every day. Moreover, there were admitted in the year, 1,037 accidents and urgent cases, while no fewer than 3,157 accidents and cases of less urgency were treated at the gate without being taken in.

I conclude, therefore, from this, that the Sydney Hospital, even in its present very unsatisfactory state, is of the greatest possible utility as a place for the reception of cases of grave and urgent disease, and I think it would be productive of extreme inconvenience if the public were to be deprived of the benefits of an institution which is so central, and in which so much good work is done.

1068. Your views are the same to-day as when you wrote that? Precisely so. I think that you could not do without a place of some kind in a convenient and central position in the town.

1069. Coming to this particular site, what do you think of the present site for the hospital? I think it is the best site that you could get without exception.

1070. From your long experience you are not able even to suggest as good a site? No; I am certain that there is not a vacant site in Sydney which is so good and as convenient to the sick and wounded. There are plenty of sites that are suitable; but the expense of resuming them would be so enormous that they must be left out of consideration.

1071. Do I understand that at the present time you think that a hospital erected on the present site with 200 beds would be sufficient for present requirements? Yes; provided always that it was confined strictly to the reception of the class of patients that I mentioned, and in that case it would be necessary to make other provision for the more chronic cases.

1072. Would you recommend that a larger hospital than necessary, to accommodate 200 beds, should be erected there, or that a hospital sufficient for 200 beds, with such an auxiliary hospital as you suggest, should be erected? The latter is what I have always recommended. On occasions when I have had to advise the Colonial Secretary in the matter, I have always advised that there should be from 150 to 200 beds, that the Sydney Hospital should be confined to acute cases, to serious injuries, and so forth, and that another institution should be established for the more chronic cases.

1073. If it becomes a hospital with larger accommodation than for 200, does it not then merge into what might be called a large hospital? Yes, certainly.

1074. Where the difficulties and dangers of treatment of patients are increased? I think you get too crowded when you go much beyond 200 beds on this site.

1075. Is not the tendency of the day in regard to hospital construction to have not so many patients in one hospital? It depends entirely on the space and the requirements of the place. If you are in a very large town where space is valuable, you must have large hospitals; and we find that the patients do very well in them. The new hospital in Edinburgh is very large, and St. Thomas', and most of the other hospitals in London are very large.

1076. Are they for all classes of patients? Yes; but they are chiefly for persons suffering from acute diseases such as I have described. The patients I refer to as going to an institution a little way out of town, would most likely be treated in the workhouse hospitals if they were in the old country.

1077. You know the exact position of affairs—the structure, as designed by Colonel Rowe, is erected to a certain point—can you give us your views as to what should be done with the building? I looked upon it that we were in an unfortunate position, and had to make the best of what I had always looked upon as a bad move; and I thought that the best thing to do would be to complete the hospital so that there should be about 150 beds in the new building, which I was told could be done at a cost of about £50,000. That was the estimate given to me, and that is what I recommended the Government to do.

1078. Do you think still that that would be the best thing to do? I think it is the best thing—it is less costly, and ultimately would be the wisest thing, I think, for the Government to do.

1079. If you had been consulted as to the erection of an expensive and ornate building such as is depicted on this plan, what would have been your views? So far as I remember I was a member of the Board at the time it decided to call for tenders, or, at all events, I attended the Board very regularly, and I was in favour of confining the expenditure to the amount of money that I knew would be accessible—that is about £50,000.

1080. Do you believe that a hospital suitable for all purposes could have been constructed for that amount? I believe so. It would not have been ornate or very magnificent, but quite sufficient, I think, for the purpose.

1081. You have seen these massive foundations so far as they are built? Yes.

1082. Do you think that it is necessary for purposes of health that they should be such thick walls as they are? I do not think stone was necessary at all.

1083. Looking at it from a medical point of view you think that brick and cement could have been utilised just as well? I think so. It would not have looked so well, but from the point of view of patients I think it would have been equally as good.

1084. Supposing the front of the building were finished up to two stories in stone—do you think that the back portion could with safety, as regards the health of the patients, be finished in brick? I see no reason why it should not be. I do not think that it is a matter of any consequence, one way or the other.

1085. In this design which is submitted to us, there are many small compartments—rooms, sculleries, and water-closets, and places of that kind, where the walls are made of equal thickness with the main walls of the building—would you think that that was necessary? No.

1086.

1086. For a room about 12 feet square to have walls of the same thickness as those of a room 50 or 60 feet square, do you think would be necessary? No; I think that a person to build a house like that must have a very well filled purse.

1087. Notwithstanding the objection that you have to these large wards facing the west, do you still think that to make the best of a bad job we had better finish the place? I think so. I am giving the advice which I wrote before to the Government. It would have been unreasonable for me to say to the Colonial Secretary, "Take all the walls down, and dig the foundations up, and build it on a plan that I like." I never concealed from the Board the fact that I disliked that plan very much; but I had to take things as they were, and so I advised that the best thing that could be done under the circumstances was to complete it on a modified plan.

1088. Would you tell us whether you have studied the plan, looking at it as a matter of convenience or inconvenient arrangement as regards the working of the hospital? I have not studied it from that point of view for a long time. I did when the plans were subjected to examination for competition. It seemed to me that it was inconvenient in many ways. But you must remember that I always had been made to feel that the Government were, to a certain extent, responsible for that wooden building which there is at the back of the premises. Whilst I was in charge of the Health Office, I was living in constant alarm lest there should be a conflagration at the Sydney Hospital, and I was anxious to see the Government take some steps to do away with the wooden building.

1089. One gentleman so far ventured the opinion as to say that the hospital, if erected on this present design, will be found to be unworkable and a failure;—can you go so far as to say that? I do not think so. I think it can be worked. It may be a little more expensive, but in my suggestions to the Colonial Secretary I contemplated that we should be prepared for the expensive working of a place like the Sydney Hospital, for it was to be confined entirely to the most expensive class of cases—cases of acute disease and severe injury, which would require every convenience that a hospital could provide for them, and would probably require a little more expense in the way of nursing than ordinary patients in a general hospital.

1090. Do you see any objection to the use of stone in the construction of a hospital;—is it likely to absorb disease? I do not think there is anything in that. Cleanliness and necessary precaution would prevent anything of that kind.

1091. In carrying out the design as far as we can, I suppose you would advocate the completion of the back pavilion, would you not? It would be necessary in order to get a sufficient number of beds.

1092. You would look upon that as almost the best part of the hospital for the patients? I should think it is. That is the view that I always took of it.

1093. Have you considered the design in its modified form—reduced by one story? I have looked at it frequently.

1094. What are your ideas of it from an architectural point of view? Well, it is not so handsome, but we have to make the best of it, and do the best we can.

1095. Do you think that site is a suitable one in point of drainage? It can be very easily drained.

1096. Perfectly drained? Yes.

1097. Do you see any objection to the site as regards the health of the citizens? Not the slightest, because they do not admit any dangerous infectious diseases there. They do not admit scarlet fever, or diphtheria, or crysipelas, and so forth.

1098. You have had experience as regards the cost of construction of hospitals at per bed? Yes.

1099. This hospital, if constructed in its entirety, would cost about £800 per bed; is that large? That is a very large figure.

1100. We have heard of a projected site near the Flagstaff-hill; what is your opinion of that? I do not like it. First of all it is too high and exposed, in my opinion; secondly, it is very inconvenient for a large number of persons to go there as patients. It would be exceedingly inconvenient for people from Surry Hills. The Sydney Hospital treats people from all the eastern suburbs as far south, you may say, as Cleveland-street, and from Sussex-street in another direction. It would be very inconvenient for the large population that there is about Woollloomooloo, Surry Hills, and many parts in that direction—Oxford-street and so forth—to come all the way to Flagstaff-hill, and I do not see that anything would be gained by it, for I do not think that the Flagstaff-hill site is so good.

1101. It is not so convenient? No, and I do not think that it is medically so convenient, but rather too much exposed.

1102. I suppose this site is more favoured by having the Domain and the Gardens to the north-east of it? Very much so, indeed.

1103. *Mr. Copeland*] You made that report to the Colonial Secretary, I think you said, in 1885? I made reports in 1885, 1887, and 1888. The paragraph I read was from the report of 1885.

1104. I suppose that since that time population has increased by 15 per cent?—

1105. Do you think that, notwithstanding the increase in population, and the prospective increase of population, it is absolutely necessary to restrict the beds to 150 or 200? I did not say that it was absolutely necessary to restrict them to that, but that I thought that that would be sufficient, and moreover the increase of population is not so much within the space served by the Sydney Hospital, for it serves the older part of the town, and the increase of population has, I understand, been a good deal in the suburbs—more in the direction of the Prince Alfred Hospital. But undoubtedly there has been a certain increase of population.

1106. Now that we are constructing a building, do you not think that it would be desirable to make provision for a larger number of patients—I think that one suggestion here is for 264 beds? Well, if I had a free hand to do exactly as I please, the maximum accommodation that I should make under any circumstances on that site, would be a building which would take an average daily number of 200 patients. That would require probably from 220 to 230 beds. I would not go beyond that on any consideration, for I think that you would have the ground sufficiently occupied then, and if you wanted more accommodation in this neighbourhood for acute cases—which I do not think you require—I would rather have a second hospital than build a larger one on that site.

1107. Notwithstanding that the design has been laid out for 264 beds? Notwithstanding that. I would not go beyond an average daily number of 200 patients, which means about 220 or 230 beds.

1108. I suppose you would anticipate very soon having to erect another hospital altogether, so as to provide

provide for the increased number of accidents, because of increased population? I do not think it would be necessary for a long time. The town is increasing mainly towards the west, and the Prince Alfred Hospital is capable of a good deal of extension yet, and that building could be increased so as to meet the requirements of the increase of population in that direction. But I think that if you make the Sydney Hospital of the size indicated you will at once do what is the best thing on that site, and will also do what will be sufficient for the requirements of this neighbourhood for a long time.

1109. What about providing for paying patients—are there not a considerable number of patients who pay for accommodation at the Sydney Hospitals? I do not consider that we should go out of our way to consider them. Persons who can afford to pay for medical attention are not the first object of the hospital's care. A hospital is for poor people, and not for the rich. If it is convenient to take rich persons in it may be done, but I should never consider the interests of wealthy persons at all in connection with the site or the construction of a hospital.

1110. Is it not a fact that you can get better attendance in hospitals than you can possibly get by having private attendance? It is very doubtful if you can. But, even if you can, that is one of the very few privileges that the poor would have. The rich have plenty of advantages over them, and we must not grudge them that. The hospitals are mainly erected here by public money, and I do not think public money voted by Parliament is intended for the assistance of the rich. Moreover, there are several private hospitals into which a man can be admitted, if he wishes, and is able to pay for it.

1111. Equally good with the Sydney public hospitals? Quite as good.

1112. You think that the Government should provide accommodation only for those who either cannot or will not pay, but should not provide accommodation for those willing to pay for it? The Government should provide accommodation, first of all, for paupers, and secondly, it may fairly assist in providing accommodation for persons who are stricken with such severe disease or such severe accident that their means, which would enable them ordinarily to cope with misfortunes of that sort, are unable to provide them with proper treatment. There is many a respectable man with a small income, and able to support his family in ordinary circumstances, and who is able to cope with ordinary ailments, but if he gets a serious disease requiring a surgical operation of great costliness he is not able to provide for that himself, and that man is a fair object of treatment at a hospital, but a wealthy man who can get anything he likes by paying for it, ought on no consideration to be taken into a hospital maintained by public money.

1113. Notwithstanding that he is willing to pay? If willing to pay £1,000, I would not take him in—it is not the place for him. It is primarily for the poor who are not able to provide for themselves. A rich man can get medical attendance easily enough if he will pay for it.

1114. Do you think that, as a matter of fact, there are not many patients in the different Sydney hospitals, who could pay for medical attendance, but do not do so? I am certain that there are very few Government patients in the hospitals who could pay for attendance, for we have a very searching inquiry into their circumstances before we give them orders.

1115. Can you say whether there are any paying patients in the Sydney Hospital or the other hospitals? There may be some patients who pay small sums to get the ordinary treatment that other patients get, but I do not understand you to mean that kind of paying patients, but a person who required a private ward to himself.

1116. What I meant was those who are able and willing to pay a fair and reasonable amount for the attendance they received? Perhaps I have misunderstood you. There are certain persons who get admission at a little more than the Government rate, but they are poor persons, in humble circumstances, who pay a little for their admission. I understood you to refer to a man who wanted, as they do in some hospitals, to have a private ward for himself—to go in there and be treated, and pay a large weekly fee for his reception.

1117. That is the class of patients I was alluding to? That is the class of patients I would not allow to have anything given to them at all in the Sydney Hospital. The other class of patients—poor persons willing to pay a small sum of money so as to prevent themselves from falling as they fancy into the rank of paupers—are a perfectly different class, and every consideration must be given to them, and they are fair objects of the hospital's charity.

1118. I think it is the practice at the Prince Alfred Hospital to have paying patients—that is, persons who pay a full amount of compensation for what they receive? There are two classes of persons who pay at the Prince Alfred Hospital—those who pay a regular weekly sum—from £1 1s. to £2 2s. a week, and who are treated in the ordinary wards like ordinary patients in the hospital—and, on the other hand, those who pay a large sum—I think £6 6s. or £7 7s. a week—and who are provided with private wards. This is the class of patients that I object to.

1119. This is the class that I was asking you particularly about, and you think that it is not desirable to allow these patients to come to the public hospitals? At any rate I do not think these are the persons who should be considered in the construction of public hospitals—because the public money is not to be spent for them.

1120. Do you remember how many patients there are in the different wards in the Prince Alfred Hospital? I do not remember, but I think about thirty in a ward—the number varies.

1121. Do you know how many patients can, so to speak, be worked the most economically? It depends a great deal on the class of disease you are treating. If you have mixed patients—some very ill and some not so ill, some perhaps able to help themselves a good deal, or able even to assist in dealing with others—chronic cases and convalescents kept in a long time—you can deal with a larger number; but if all your cases are very serious—serious operations, serious accidents requiring constant dressings, and so forth, and very grave internal diseases, such as fevers and inflammation of the lungs, and so forth, you require a larger nursing staff.

1122. I think that in these wards provision is made for sixteen patients, do you consider that a desirable number to provide in one ward, or is it too few or too many? I think that sixteen patients, if they were of the class that I recommend, would be quite enough. To have sixteen people together very ill would give plenty of work to the people who attended to them.

1123. And I suppose that in a warm country like this—semi-tropical—it is desirable not to have so many patients together as in a cold climate like that of England? It is better not to have the wards so crowded.

1124. *Mr. Dowel.*] Have you made yourself acquainted with the merits of the design now before the Committee.

- Committee. It is a long time since I studied it. I made up my mind at that time that it was a design that I did not like.
1125. You were a member of the Board, I believe, which was appointed to inquire as to the best design for this particular purpose? I was a member of the medical staff of the hospital at the time.
1126. Was there not a Board appointed for the purpose of examining the competitive designs? I do not remember a Board being appointed, but I dare say there was a sub-committee. But if there was, I was not a member of it. However, I used to go and inspect the designs regularly at the Town Hall.
1127. You were not a member then of a sub-committee or Board that made any recommendations in reference to the designs? We made a large number of recommendations in reference to the designs, but I do not think that I was a member of any special sub-committee appointed to bring up a report on the designs.
1128. What action then did you take in reference to the plans now before the Committee? I objected to them for two principal reasons.
1129. What were they? One was that the principal wards faced the west, and the other was that there were too many tiers of wards. There were other reasons as to details.
1130. Of the plans prepared by Colonel Rowe and the competitive design marked "Health," which in your opinion is best adapted for hospital purposes? I was always in favour of the plan marked "Health," because it was carried out on lines which I thought were right.
1131. Can you say that that was the opinion of any other gentlemen you were connected with in investigating the merits of these plans? There were several others who agreed with me—not in committing ourselves exactly to the design marked "Health" as being the best of all, but in saying that that plan, that idea, that principle, was the one we approved of for hospital construction.
1132. Did you make any report to the Board of Directors or give any expression of opinion with reference to it? It is a long time since then, and I cannot give you the exact facts, but we expressed our opinion repeatedly.
1133. Can you say the reason why your recommendations were not carried out? I cannot tell that. I suppose they thought there were better men who thought the other way.
1134. Still, taking all the circumstances of the case into consideration, and having gone into the merits of both plans, you are of opinion now that the best design for hospital purposes of those two would be the one marked "Health"? I think so. I always thought that the idea of that was better than the idea of the other.
1135. But especially, I suppose, it had some influence with you on the score of cost, the whole building being completed for £45,000? We understood that all the buildings could be carried out for £45,000 or £50,000.
1136. Under the circumstances that this superior hospital, as you term it, as regards construction, can be erected at the present time for £45,000, do you think the Committee would be justified in recommending a plan that would involve a further expenditure of £145,000 in completing that building? I never recommended that, but an expenditure of £50,000 to complete the building.
1137. Are you aware that the architect does not say that the building can be completed for that amount? Yes, £56,000 is his figure; but if you do it in brick it will be cheaper, £45,000.
1138. Would you be good enough to look at the statement prepared by and signed "Thomas Rowe, architect," in which he states—"Approximate estimate to complete the whole of the above, providing accommodation for 164 beds, £140,000"? But I should never have recommended that to the Colonial Secretary.
1139. But is not that the circumstance that we have now to face—to complete the building for £140,000, the architect's estimate? I would not. I consider that the proper thing is to complete it for £56,000.
1140. That would be providing for only 144 beds? Yes; but there are certain beds in the south wing.

Hon. H. N.  
MacLaurin,  
M.D., M.L.C.

18 Dec., 1890.

TUESDAY, 3 FEBRUARY, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. FREDERICK THOMAS HUMPHERT.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES ALFRED LEE, Esq.
JACOB GARRARD, Esq.	WILLIAM McCOURT, Esq.
JAMES EBENEZER TONKIN, Esq.	JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

W. Odillo Maher, Esq., M.D., M.Ch., M.R.C.S., sworn, and examined:—

1141. *Mr. Trickett.*] Will you tell us what are your qualifications? I am doctor of medicine, master of surgery, and licentiate in midwifery of the Queen's University, Ireland, and a member of the Royal College of Surgeons, England.
1142. You have been practising in Sydney for a great number of years? For about seven years.
1143. During that time have you been connected with any of the Sydney hospitals? Yes; I have been connected with St. Vincent's Hospital for about six years, and with the Sydney Hospital for about five years.
1144. In what capacity have you been connected with the Sydney Hospital? I have been connected with both of these hospitals as ophthalmic surgeon.
1145. Have you ever studied the plans for the Sydney Hospital which were prepared by Mr. Rowe? I cannot say that I have studied them very minutely, but I have looked over them.
1146. Sufficiently to be fairly familiar with the position and general design of the buildings? I think so.
1147. What is your opinion generally with regard to them? I think that, take them all in all, they are very good.
1148. You noticed that the buildings are to be of four stories? Yes.
1149. Do you believe that that is an advantage or otherwise? I think that it is certainly not a disadvantage when you have lifts, and I believe that lifts are to be arranged in this building.

W. O. Maher,  
Esq., M.D.

3 Feb., 1891.

- W. O. Maher, Esq., M.D.  
3 Feb., 1891.
1150. You think then that it is not a disadvantage to have a hospital so many stories high? No; I think it is the experience of large hospitals at home—there are numbers of them—that it is no particular disadvantage, especially where you have lifts.
1151. Did you notice that a large portion of the accommodation provided for patients faces the west—is that an advantage or a disadvantage? I should think that probably a northerly aspect would be preferable, but I do not think that a westerly one is of very much moment. I think the advantages of the site far outweigh the disadvantages of a westerly aspect.
1152. But would it not have been better if the greater part of the accommodation for patients could have been given in pavilions to the rear of the main building, facing the north-east? You mean facing the Domain?
1153. Yes? Yes; I think it would, perhaps, have been a preferable mode of arrangement.
1154. Do you remember the old hospital building—had you any experience of it? None whatever.
1155. Then you are not in a position to say whether or not the westerly aspect of that building was a matter of nearly every day objection to patients and visitors, because of the great heat which it occasioned? No, I am not; but I am connected with St. Vincent's Hospital—the aspect of which is to the west—and I have never heard any objection to it.
1156. Is the western side of that building occupied by patients? The ends of the principal wards and the wards occupied by private patients face the west.
1157. But the large wards do not? The large wards run east and west.
1158. They are so arranged as to get the benefit of the prevailing wind from the north-east I suppose? Of course there are houses around them which interfere with that, whereas, at the Sydney Hospital, there is nothing to interfere with the breeze.
1159. Do you know that the object of the Sydney Hospital is to provide an emergency hospital for urgent cases? Yes, for accidents and acute cases.
1160. That being so, do you not think that it would be better if the building were to consist of only two stories, instead of three or four? I believe that the ward for accident cases should be on the ground floor; but I cannot see any objection to medical cases going to the other floors if there is a lift. I think it would be objectionable to take cases such as broken legs off the ground floor. But, as the plan is arranged, that will not be necessary.
1161. What are your views with regard to the site of the hospital? I think it cannot be surpassed.
1162. Is that as regards healthiness or convenience, or both? Both. I think it is the most convenient position for patients and friends. The trams and other vehicles go almost to the door. It is also most convenient for the doctors, and this is very essential; for, with accidents and acute cases, a life is sometimes lost because the doctor is not close enough. I cannot imagine a better position for a metropolitan hospital.
1163. No doubt you have heard it suggested that Flagstaff-hill, where the present public school is, would be a good site for a hospital;—do you think that that is as good a site, or a better site, than this? I think that, as regards convenience, it is a worse site, though it is a healthy site, being well elevated. Still, I do not think it is any healthier than the present site, and it is more inconvenient.
1164. More inconvenient for the medical profession? Yes; and for the patients and their friends.
1165. Do you not think that a number of the accidents which happen in the city occur in the locality of Flagstaff-hill? Certainly a great number of accidents do occur there; but then, a great number occur at Woolloomooloo Bay and Circular Quay, which are as close or closer to the Sydney Hospital than they are to Flagstaff-hill.
1166. You think that the Sydney Hospital would be centrally situated for all purposes? I think so. Of course, there are places where accidents occur frequently which are closer to the Flagstaff-hill; but there are other places where accidents also occur frequently which are closer to the proposed site.
1167. Have you given any attention to the question of the number of patients which it is desirable that a hospital on the Macquarie-street site should accommodate? Of course, I have nothing at all to do with the Sydney Hospital directly; it is with a branch of that hospital—the Moorcliff Eye Hospital—that I am connected. I merely see the out-patients in the Domain, and I have no beds in the Sydney Hospital. I can only speak from hearsay in answering your question.
1168. Still, as a medical man, you would be able to say whether a hospital should, in your opinion, be erected in Macquarie-street to accommodate 200, 300, 400, or 500 people? From conversation which I have had with other medical men who treat cases received in the Sydney Hospital, I should say that accommodation for 200 patients at present is certainly requisite.
1169. From what you have heard and seen, do you think that that accommodation would be sufficient? I have heard it most usually said that 250 is the number of beds at present required.
1170. And you think that at least 200 are needed? From all I can gather, at least accommodation for 200 patients would be required.
1171. Do you think it is desirable that the branch of treatment which you undertake should be carried on at this hospital, or at a separate institution? Looking over the plans, I do not think that the building will be altogether suitable for ophthalmic work. There are two large wards provided—one for male and the other for female patients—and it is not desirable to put all ophthalmic cases into the same ward. Many of the patients have discharges from their eyes, and you must put them in separate wards. Other cases require treatment in a darkened room, and you could not darken the whole of these large wards simply for such cases. Then again, with regard to the number of patients, I think the suggestion in the original plan is to allot thirty-six beds for ophthalmic patients, while the average number of in-patients at the Moorcliff Hospital is about fifty, so that sufficient accommodation would not be provided here. You must also remember that this hospital is for acute cases and accidents, while the majority of eye patients are chronic cases, and remain in the hospital for months.
1172. The accommodation provided in that plan for ophthalmic cases is not sufficient for present requirements? No; comparing it with what is required at Moorcliff.
1173. For the treatment of these patients you require a series of rooms? That would be preferable. There are many objections to having all the eye cases in one ward.
1174. Is it desirable that ophthalmic cases should be removed from a hospital of this kind, because of the discharges which you have mentioned? I think not, provided they have separate accommodation. There is no particular reason why they should be treated away from the main hospital.
1175. That is if the accommodation allotted to them is specially designed for their treatment? If it is suitable for their treatment,

1176. And I suppose isolated from other parts of the building—is that necessary? I do not know that it is necessary. The contagion from cases which are discharging is only a matter of contact. It is not a desirable thing to have cases which have been recently operated upon in the same wards as cases which are giving off pus. There is, however, no contagion in connection with these cases, such as there is with erysipelas.

1177. Have you given any attention to the cost of the erection of hospitals? I cannot say that I have.

1178. When did you look at these plans last? Yesterday afternoon.

1179. Do you think that the Prince Alfred Hospital could be worked with this hospital? In what way do you mean?

1180. Do you think that it is too far away to take urgent cases? It is rather far to take accidents and urgent cases occurring in the city; but there are many such cases occurring round the Prince Alfred Hospital which should certainly be taken to that hospital, and not be brought into the city.

1181. The city is extending in the direction of Prince Alfred Hospital? Yes.

1182. And I suppose Prince Alfred Hospital could be made available for all cases occurring as far from it as the intersection of Newtown-road? Yes; or even as far as the Redfern Railway Station, to which it would be as close as the Sydney Hospital is. Cases ought to be taken to the nearer hospital wherever they happen.

1183. If the building of this hospital is continued, do you think that the work should be carried out in its entirety? If it were carried out in its entirety the building would afford more accommodation than I think is what is generally understood would be sufficient for acute and urgent cases; I believe there is one pavilion which has not been started at all yet.

1184. That is the back pavilion? Yes; and then again there is a chapel, and one or two other buildings which have not been started.

1185. Do you not think that the buildings which you now mention—because of their position, giving them quietude, fresh air, and shade from the western sun—would really be better for the accommodation of patients than the buildings ranged along Macquarie-street? Yes, I think they would be preferable, for the reasons you state.

1186. Have you examined a set of plans prepared by Mr. Kirkpatrick? No; I simply saw plans similar to these before the Committee. I might mention that on 6th June last, at a meeting of the British Medical Association, New South Wales Branch, I brought forward the following resolution:—

“That, in the opinion of this Society, it is desirable that the present portion of the Sydney Hospital be completed, and that a deputation be appointed to wait on the Colonial Secretary, and urge the necessity for so doing.”

The majority of the medical men in and about Sydney belong to this society, and, consequently nearly all the medical men in and around the metropolis received notice of this meeting. There were fifty-two members present—the largest number which the secretary knows to have met together before—about ten of whom spoke, all warmly supporting the resolution, which was carried unanimously, and the following doctors agreed to form the deputation:—Drs. Hankins (President), Chambers, Goode, Fiaschi, Knaggs, Sydney Jones, Mackellar, MacLaurin, Tarrant, Quaife, Brigade-Surgeon Williams, and myself. About this time, however, Sir Henry Parkes met with his accident, and when I made inquiries as to whether he would have Mr. McMillan, who was partly attending to his Department, to receive the deputation, he gave me to understand that the matter was of such importance that he would prefer to receive the deputation himself. But before he was up and about we saw a notification in the press that it was the intention of the Government to bring forward a resolution in the House to the effect that the Sydney Hospital should be completed, and consequently the deputation never waited upon the Colonial Secretary, because such action was unnecessary.

1187. If this work is carried out, do you think it will be absolutely necessary to finish it with thick stone walls? No. I think it would be just as well to complete the front with stone, for appearance sake; but I think it would be a saving to finish the rest of the building with brick.

1188. The kind of brick now used for hospital construction is in every way as suitable from the standpoint of healthiness as stone? Yes; I should think so, when the inside walls are properly prepared.

1189. You think that the back portions of the building could be as well constructed of brick as of thick stone? I think so.

1190. Would you mind giving us your views as to the class of patients for the treatment of which this hospital should be used? I think one cannot better describe the cases than by saying accidents, acute cases, and operative cases. There are certain big operations which require to be performed in hospitals—patients coming from the country and elsewhere, and I think it as well to have these large operations performed in a central hospital—they should not be excluded from it. It is often a matter of life or death to get the medical man who has charge of a case to attend to it at once, supposing hæmorrhage or anything of that sort occurred.

1191. You do not think that chronic cases should be treated here? No.

1192. With regard to chronic cases of poor people, I am told that in many instances people get into this hospital, and there is no getting rid of them again;—where would you propose to treat such people—possibly in an out-lying hospital? They could be as well treated in an out-lying hospital. Many cases of the kind to which you refer go to the Government asylums.

1193. I should like to ask you one direct question with regard to the number of floors in the building;—it has been stated by one medical gentleman, as his opinion, that there ought not to be more than two floors, both to provide proper ventilation, and also to obtain convenience of administration;—do you agree with that opinion? I think, if you had space enough, it would be just as well to have all the patients on the ground floor. It may be that the fewer floors there are the better, but I fail to see any material objection to four floors.

1194. You see no objection on the grounds I have suggested? I think not. There are nearly 3 acres of land there, and accommodation is to be provided for under 300 patients, so that the air space is very ample. You could not find a better site in town for fresh air.

1195. You do not think that there is any possibility of infection or foul air rising from ward to ward? I think that it is more a theoretical than a practical objection which has been advanced as to the height of the building.

1196. *Dr. Garran.*] I believe you are principally connected with eye cases, and that you cannot, therefore, speak of the general work of the hospital? I can speak of it only from hearsay.

- W. O. Maher,  
Esq., M.D.  
3 Feb., 1891.
1197. Could you tell me whether you get as good results there in the present wooden building as in the south wing? I know nothing at all about that. I have nothing to do directly with the Sydney Hospital.
1198. You have been for some years at St. Vincent's. Do you get as good results there as in the present wooden building in Macquarie-street? I do not know what results are obtained in the wooden building of which you speak—none of my patients are there; they are all down at Millor's Point, at Moorcliff.
1199. Is St. Vincent's Hospital a satisfactory one? Yes.
1200. Do you know the cost of it per bed? No.
1201. Do you know the cost of managing it per bed? No.
1202. That hospital faces the west? Yes.
1203. Do the wards face the west? Half of the private wards face the west, as do also the ends of the general wards, which run east and west.
1204. The large wards have their windows north and south? Principally. There is one large window facing the west.
1205. Have you formed any opinion as to the desirability or otherwise of facing the west? I do not think that it is a desirable aspect. I think that a northerly or easterly aspect is preferable.
1206. A westerly aspect makes the wards very hot in summer? It is certainly hottest in the afternoon.
1207. And very cold in winter? I have not given that any thought—it may be so.
1208. I understand you to say that the eye cases are mostly chronic, so that there is no absolute necessity for dealing with them in Macquarie-street? I think it would be most undesirable to keep chronic cases there.
1209. We should treat ophthalmic cases somewhere else? Yes; I consider that the ophthalmic arrangements in this plan are not desirable.
1210. And you think it would be better not to make any provision for ophthalmic cases here? I think so.
1211. They could be as well treated on the fringe of the city as in the centre of it? Yes.
1212. With regard to Lock cases—is there any urgency for their being treated in Macquarie-street? I have no experience of them; but, as far as their urgency goes, there is no necessity for treating them there.
1213. They would be as well treated elsewhere? Certainly, except in one or two instances.
1214. Then the real necessity of this hospital is for accidents and urgent cases, to which you would like to add important operative cases from the country? Yes.
1215. If these operative cases could be treated elsewhere, there would be no absolute necessity for taking them to Macquarie-street? They might be treated elsewhere; but I think that it is desirable to have such cases near to the residence of the surgeon who has dealt with them, so that if any emergency should arise he may be within call.
1216. Do you think the operative surgeon should live within a comparatively short distance of the hospital? I think it is better for his patients that he should do so.
1217. Do accidents arise from the operative surgeons not being in immediate attendance? I have heard of them.
1218. They have not arisen within your personal experience? No.
1219. If the hospital were a mile away from the operative surgeon's house, might a patient die before the doctor could get to him? Quite possibly.
1220. Do you know whether such a thing has happened? I have heard of such a thing happening.
1221. We were told that a great necessity for this hospital is to receive local accidents, and if you take away the eye cases and the Lock cases, you only require beds enough for accidents and urgent cases occurring within a mile or a mile and a half of the building? That is so.
1222. How many beds would meet that requirement? I can only speak from hearsay. I should say from 200 to 250.
1223. You think that if you provided for 200 beds, that would be enough? I think you want to allow some margin. I should think there would be 200 patients occupying these beds, and you would require a margin of about one-sixth or one-eighth of the whole number of beds—about thirty beds.
1224. I meant to leave a margin—would 225 or 230 beds be enough? I should say so.
1225. *Mr. Tonkin.*] Have you carefully gone through the plans before the Committee? I cannot say that I have gone through them with particular care. I have looked over them for ten minutes or so.
1226. Have you made any study of the latest hospital improvements? No; I have not.
1227. You could not compare these plans with any improved hospital buildings in other parts of the world? Prince Alfred Hospital is the only hospital I know of with which to compare them.
1228. Do you think that it is not advantageous to have the lifts from one floor to another outside of the buildings instead of inside, so that the different floors are not actually connected? I do not think that in the plan they are actually connected—there is an open passage from the lift into the ward.
1229. But the lift is inside the building? It is inside the walls.
1230. Do you not think it would be preferable to have the lift outside altogether? There is certainly no objection to it, and I daresay that if there is any sort of contagion to be carried about, it would on the whole be preferable; but I do not think that it is of much importance.
1231. *Mr. Garvan.*] I think that you said the plan before us, on the whole, was a good one? Yes.
1232. You do not know of any other design that would be greatly superior to it in any way? I have not studied the designs of recent hospitals; but I consider the design before the Committee is very good.
1233. Speaking as a doctor of some experience, you do not see anything in this plan to emphatically condemn it? Certainly not.
1234. The number of beds suggested has been about 250—would the cases presenting themselves with the present population require that number? Well, many have said that 200 beds would meet all requirements, while many others—perhaps more—state that 250 would be required—that actual accommodation for 200 cases, and a number of extra beds would be sufficient.
1235. Do you know the number of beds which the present hospital, including the weatherboard building, contains? I think about 230.
1236. Are you aware that they are generally full? They are very full, I believe. The lowest number of patients during any day last year was 217.
1237. And, seeing that the city is growing rapidly, would it be necessary to increase that number? Well, of course, the plans would allow for an extension of accommodation if it were necessary. The whole design would afford accommodation for more than 250 patients.

1238. Do you think it would be wise to make provision for a greater number of cases than those at present accommodated? From all I hear, 250 beds would provide ample accommodation for the present, and for a few years to come.

1239. If 217 is the lowest number of patients accommodated on any one day during past years, that would show that, even with 250 beds, the hospital would be fully occupied? Yes.

1240. If it is fully occupied at present, and we are going to expend money on the erection of a new hospital, should we not make provision for the accommodation of a larger number of patients? I think the idea is to exclude from the new hospital some of the cases at present taken in there, such as Lock cases, which are neither accidents, acute cases, nor cases of urgency. There are at present Lock wards at this hospital.

1241. Those, you think, might, without disadvantage, be removed? I should say that they might be removed with advantage.

1242. You have not observed any disadvantage through wards facing the west? No; I have not.

1243. It is not any well recognised disadvantage for a ward to face the west? I have never heard any objection to a westerly aspect, though other aspects are preferable.

1244. The Prince Alfred Hospital is, I suppose, about two miles from this hospital;—is it any disadvantage to any class of patients to be treated there instead of at the Sydney Hospital? I think it is a decided disadvantage. For instance, with accidents happening at the wharves close to this hospital, it would, in many cases, be a very serious matter, and probably a fatal matter, to take the patient out to Prince Alfred Hospital. I should think it would be far preferable to have a hospital close at hand to deal with serious accidents of that kind.

1245. That disadvantage would only apply to accidents occurring close to the Sydney Hospital? Certainly.

1246. Are there any other disadvantages distinct from this in treating cases at Prince Alfred Hospital? No.

1247. Is there not a tendency on the part of the ablest of the profession to centre in some part of the city? I fail to understand your meaning.

1248. Instead of finding them in the suburbs, are you not most likely to find them in the centre of the city? I think they would prefer to have the urgent and acute cases in the centre of the city for the sake of convenience; in fact, it is absolutely necessary to have them there.

1249. Do not the doctors on the staff of the Sydney Hospital have their consulting rooms at a fairly convenient distance from the hospital? Yes; that is, the majority of them.

1250. Are the medical staff of the Prince Alfred Hospital located in the vicinity of that institution? No; I think the majority of them practice in Sydney.

1251. Is it not a disadvantage to the patients for the doctors to be living at so great a distance from the hospital? I think there are certain emergencies, in which it is a decided advantage for the patients to be near the doctors.

1252. Would it not be better to have the medical staff of the hospital composed of doctors living near the institution? You mean to have the medical staff composed only of doctors living within a certain radius of the hospital?

1253. Yes? No; I think that would be a very bad thing. You cannot expect men, simply because they are appointed to a hospital, to live next to it. It is the aim of the directors of a hospital to get the best qualified men to attend the patients of the hospital, and I think it would hardly be advantageous to confine the Directors of the Prince Alfred Hospital in their choice to the doctors residing near the hospital.

1254. Of the medical staff of Prince Alfred Hospital, do many live close to the hospital, or do they live closer to the Sydney Hospital? I think the staff of the Sydney Hospital, as a whole, live closer to the Sydney Hospital than the staff of Prince Alfred live to the latter institution—in fact, I am sure of it.

1255. But you think it is an advantage for the doctors to live as close as possible to the institution with which they are connected? For dealing with accidents and important operations, where hæmorrhage or anything like that may occur, I think it is a decided advantage to have the doctors close at hand.

1256. But is there not a doctor connected with the hospital who is able to attend to such cases? Yes; but the doctors of the hospital staff are more experienced than the house surgeons, and I think it is an advantage to have the most experienced doctors at hand in such cases.

1257. The most experienced doctors will generally be located in the centre of the city? Yes, though some of them live in the suburbs as well. Some of the physicians of the Prince Alfred Hospital live in the suburbs. It is urgent surgical cases that I have been referring to.

1258. As a rule the majority of the most experienced doctors live in the centre of the city? Yes.

1259. And consequently nearer to the Sydney than to the Prince Alfred Hospital? Yes.

1260. And will there not be a tendency for the number of patients in the Sydney Hospital to increase? Of course, as population increases the number of accidents and acute cases will also increase, but that will be the only reason of increase. I do not think that the fact of the majority of the most experienced doctors living in the city would have very much to do with the increase of patients at the Sydney Hospital. Accidents will go to the Sydney Hospital simply because it is the nearest place.

1261. When Dr. Manning was being examined here he recommended that the Lock cases should be entirely removed from the Sydney Hospital, and that provision should be made there for ophthalmic cases—what is your opinion on that point? I think it would be desirable to have the Lock cases removed, and for the reasons which I have stated, I do not think the plan is a good one for the treatment and accommodation of ophthalmic patients. I think that such patients should be treated elsewhere.

1262. You think an improvement could be made in the design of the hospital, as regards the ophthalmic wards? Yes. If the ophthalmic patients from Moorecliff were brought here, it would make the lowest daily number of patients 267.

1263. Would there be any danger to the health of the patients themselves or of the general public in concentrating so many cases in one hospital? I do not think that at this site there would be any danger whatever.

1264. What is the largest number that you think might safely be accommodated in this hospital, taking into consideration the hospital grounds and the Domain which they adjoin? If I were to compare the site and accommodation with any of the large hospitals in London, I should say that there ought to be room there for at least 500 or 600 patients. It is a recognised rule not to have more than 100 patients to the

W. O. Maher,  
Esq., M.D.  
3 Feb., 1891.

W. O. Maher, the acre, and there being three acres of ground to this hospital, it could accommodate 300 patients under ordinary circumstances; but taking into account the large space of ground in front which will never be occupied, I think you could accommodate a great many more than that there.

Esq., M.D.

3 Feb., 1891.

1265. So you see no danger to the public health or to the health of the patients in increasing the accommodation to 500 or 600 beds? That is so.

1266. Is it not likely that by the increase of population you will, within the next ten or fifteen years, have to provide for that number of cases there? Of course, increased population means an increased number of accidents; but I do not think that so much accommodation will be required for very many years to come.

1267. In the time mentioned would we want any increase in accommodation? That is, over 250 beds?

1268. Yes? It is quite possible.

1269. Would you recommend us to make provision at the present time for a greater number than that? I think 250 beds would meet the requirements for the present, and for a few years to come.

WEDNESDAY, 4 FEBRUARY, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. WILLIAM JOSEPH TRICKETT.

JACOB GARRARD, Esq.

HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.

WILLIAM SPRINGTHORPE DOWEL, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM McCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

Sir Alfred Roberts, Knt., sworn, and examined:—

Sir  
A. Roberts,  
Knt.

4 Feb., 1891.

1270. *Witness.*] Since I received the summons of the Committee I jotted down a few remarks in connection with the subject of inquiry which, if you will permit me, I shall be glad to read, and they will form a framework upon which I can afterwards be questioned. They are as follows:—

I venture to suggest that it is necessary for the efficiency of the Metropolitan Hospital accommodation that it should be designed upon a distinct system, instead of being allowed to grow up without arrangement. Such a system, could it be framed now, should embrace a general hospital, an accident and emergency hospital, a fever hospital, a hospital for convalescing patients, a female Lock hospital, a children's hospital, and a lying-in hospital.

The site, character, organisation, and size of each should be determined after due consideration of the present and probable future requirements, and should be devoted to the purpose for which it was erected. A system having been determined upon, the existing institutions should be utilised as far as possible, but such as do not accord with the system adopted should, as opportunity occurs, be altered, enlarged, diminished, or removed as may be required, to form an efficient part of the general scheme.

The accident and emergency hospital should be situated on a healthy site, as nearly as possible in the centre of the shipping, manufactories, quarries, warehouses, &c. It should be devoted to the reception of accidents and cases of emergency only, and its size determined by experience, as to the number of those cases.

It should be of the best construction, and fitted with every modern appliance, consequently its first cost and its current expenditure will be considerable.

The fever hospital should be outside, but not too distant from the city. In construction it should be simple yet complete—with separate buildings for the different fevers. Its erection should be well considered, as its current expenditure will be large and uncertain in consequence of the great irregularity in the number of occupied beds at various times.

The general hospital should be situated outside the city, and capable of receiving all varieties of medical and surgical disease, as well as the accident and emergency cases from the neighbourhood around it. It should be the clinical department of the University Medical School, and be an efficient training school for nurses. It should, therefore, embody all modern improvements for treating every variety of disease, and imparting the best form of instruction to the medical students and nurses.

It should be of the best known form of construction, and in size should not ultimately exceed 450 or 500 beds. The accommodation at present should be sufficient for existing requirements, and it should be capable of being added to from time to time as circumstances require.

A convalescent hospital has recently been built through the beneficence of a citizen, and is now in good working order. I need not therefore occupy your time in reference to it, except to remark that it has already proved itself capable of affording material relief to the Sydney, Prince Alfred, and St. Vincent's Hospitals, and will prove even more so in future. The cost of each patient is half what it is in the Sydney and Prince Alfred Hospitals, and the inmates appear to benefit greatly by the change into the country and the surroundings of a hospital home.

The female Lock hospital should be detached and situated in a secluded but not distant position; it should be simple in construction and organization and not be costly to support. The patients it is intended for should not be in either the general or the accident hospital as at present.

The children's hospital should have a cheerful, bright, healthy site, and the building should be also cheerful. It should also be good and carefully arranged, surrounded by well kept garden grounds, and have every sanitary advantage. The present accommodation required would be about 100 beds, but it should be capable of gradual increase.

The lying-in hospital should, in my opinion, be in connection with the University Medical School, but I am unable to say, without further inquiry, what amount of accommodation it should contain.

In

In regard to the size of a contemplated accident and emergency hospital, I find, on referring to the report of the Medical Superintendent of the Sydney Hospital for 1889, that the 3,296 cases treated were classified as follows:—

Sir  
A. Roberts,  
Knt.  
4 Feb., 1891.

Diseases of the respiratory system .....	237
„ of the digestive system .....	209
„ of the nervous system .....	294
„ general .....	436
„ of the circulatory system .....	92
„ urinary and generative organs .....	299
„ women.....	141
„ of skin and cellular tissue .....	172
„ of bones and joints .....	124
„ of throat, mouth, ear, and nose.....	57
Fractures and dislocations .....	311
Local injuries .....	482
Burns, poisons, &c. ....	80
Diseases of eye—treated in another building.....	362
Making a total of .....	3,296

Of these cases the following would appear to represent those for whom accommodation would probably be required in a future hospital devoted to accidents and emergency cases:—	
Fractures and dislocations .....	311
Local injuries.....	482
Burns, poison cases, &c. ....	80
10 per cent. of all the other cases, as representing a full average of those who might offer themselves for admission, suffering from acute symptoms, disabling them from going to a hospital further off.....	243
Making a total for the year of .....	1,116

Calculating that each patient remains in the hospital thirty days on an average throughout the year, it would appear necessary to provide accommodation for ninety-three beds, to which should be added 10 per cent. for unoccupied beds, cleaning, &c., with (say) forty-seven beds with increased requirements in future years,—making 150 beds altogether.

In regard to the latter point, however, it appears probable that the future extension of manufactories, quarries, &c., will be in a direction further from the site of the Sydney Hospital, so that the demands for beds for accidents, &c., will not much increase. Accidents and emergency cases should be taken to the nearest hospital. The amount of accommodation for these cases, therefore, may be limited, in every hospital, to that which will liberally provide for the accidents, &c., which occur nearer to the hospital than to any other.

It is also of importance that the general hospital which forms the Clinical Medical School, where the University medical students acquire the practical knowledge of their profession, should contain cases of every phase of disease for their observation, while it is practically known to be an advantage to the patients to be in a hospital with a medical school attached to it.

The site of the Sydney Hospital, in a sanitary sense, is an excellent one; whether the citizens wish to have it occupied by a hospital I cannot say.

I have no doubt but that an equally healthy and convenient one can be found elsewhere.

Should the present site be retained for an accident hospital it must always be a source of regret if it is not utilised in a more suitable manner than by the present severe building so near the street.

I should like to see a hospital of the size before indicated placed in the centre, and the grounds well laid out and planted. In this way it might be made a not displeasing object from the Domain and Macquarie-street, and at the same time more cheerful and healthy for the patients.

I have no doubt but that the building now half erected may be converted into a good useful hospital of about 170 beds, and, viewing it as a professional man, I consider it will be a better specimen of hospital architecture, with three instead of four stories. I also think that the large east wings are undesirable.

Supposing it is decided to convert this structure into an accident hospital it will shortly be necessary to add two more pavilions to the Prince Alfred Hospital to meet the increasing demands for beds there.

1271. *Dr. Garran.*] How long have you been in medical practice in Sydney? About forty years.

1272. When did you first begin your connection with the hospital? Very shortly after I came here. I was invited by the then honorary staff to join them at the first vacancy that occurred after my arrival.

1273. For over thirty years you have been connected with the hospitals in Sydney? I have. I was eighteen years surgeon to the Sydney Hospital.

1274. Did you not, before Prince Alfred Hospital was commenced, make a tour through Europe? Yes; and part of India.

1275. For the purpose of examining the leading hospitals there? Yes.

1276. Did you go to America? I did not; I went to Bombay.

1277. You made a systematic observation of the principal hospitals in Europe and India, and brought back the information which you obtained, and embodied it in a report? Yes.

1278. So that you have given special attention to the question of hospital construction, and have made it a study? I have.

1279. Have you prepared for the Government at any time any official reports upon the hospital requirements for Sydney? No, not of the hospital requirements. I have read papers at the Royal Society upon the subject; but I have not made any full official report upon the hospital requirements.

1280. You have studied the subject? I have.

1281. And you have expressed your opinion thereupon? Yes.

1282. And in the paper which you have read you have stated to the Committee what you think the hospital requirements of Sydney are as a whole? Yes.

1283. Former witnesses have told us that one want of Sydney is a hospital for chronic cases which lumber up the existing hospitals;—you do not make provision for such a hospital? I did not speak of it in that paper, because I was thinking only of hospitals in Sydney itself; but I should very much like to add such a hospital to the list. I think it is the most important feature in present hospital requirements.

1284.

- Sir  
A. Roberts,  
Knt.  
4 Feb., 1891.
1284. How many beds would you provide for a hospital of that kind? Two hundred at present.
1285. One medical witness told us that for such a hospital all absolutely essential requirements could be provided for about £200 a bed;—what is your opinion? The original estimate?
1286. A plain brick hospital? I think from £200 to £250.
1287. Then we could really ease off the present large hospitals to some extent if we built a hospital of 200 beds at about £250 a bed? For the original cost of construction?
1288. Yes? Yes.
1289. What would be the annual working cost per bed in such a hospital? About £10.
1290. Such a hospital would give suitable and reasonable accommodation for the class of patients requiring it? Quite so.
1291. You would leave to the principal hospitals the dealing with accident, urgent, and operative cases? And acute cases.
1292. You would not stint money in connection with them—you would make them as good as possible? Yes.
1293. Situated as we are now, with the Prince Alfred Hospital partly erected, would you complete that building? Yes, as required.
1294. How many new pavilions would you add there? I should put two at present, and a third when required.
1295. Containing how many beds each? Containing from sixty to sixty-six beds each.
1296. About 130 new beds? Yes.
1297. How much would those two new pavilions cost? About £20,000 each.
1298. Then for £40,000 we can now give first-class hospital accommodation to 130 more patients? Quite so, and improve the advantages to the Medical School very considerably.
1299. That is the cheapest way in which we can provide accommodation? Yes; by utilising these expensive hospitals for bad cases, which require what I may call master treatment, and by weeding out chronic cases—either cases which become chronic, or which prove themselves so after admission, since many cases have to be admitted at once, and, after a short length of treatment, can be transferred elsewhere.
1300. Would the ground at Prince Alfred Hospital be overcrowded if we completed that hospital? No; sites for three more pavilions stand vacant.
1301. You think there is quite enough ground for completing the whole design? There are 13 acres.
1302. The site is an airy one? Very.
1303. Has experience shown it to be healthy? Yes.
1304. It has been sometimes said that it is in a gully, and very misty? There was some swampy ground in the University Domain, towards the Parramatta-road, and below the foot of the hospital grounds, where, in certain states of the atmosphere, mist used to remain, but it never entered the hospital grounds.
1305. The hospital is above the creek? Well above it.
1306. Do you know whether the actual elevation of the lowest part of that hospital is as high as the Macquarie-street Hospital? The elevation in both cases is much about the same.
1307. At Prince Alfred Hospital you are a little more inland? Yes.
1308. And a little freer from the sea breeze? The sea breeze is modified by a couple of miles, but there is very little foliage to keep it from us.
1309. Is that an advantage or a disadvantage? I should not like to be far away from it, because of its cooling powers; but I should like to see it modified by foliage, in order that some of its moisture might be absorbed.
1310. Then, on the whole, irrespective of other considerations, you consider the Prince Alfred site as good as the Macquarie-street site? Yes.
1311. Is the former conveniently situated as a Medical School in connection with the University? Yes, very conveniently situated.
1312. Does it need completion to become a satisfactory Medical School? Yes. I should like to see a larger variety of cases there. Up to the present our students have done extremely well, and have shown themselves to be very well up in their profession, but I have always the feeling that I should like to see the hospital larger for the sake of giving the students a broader experience before they go away into the country districts, where they are left entirely to themselves, and have to act upon their own judgment without assistance.
1313. Then there are two reasons why we should complete the Prince Alfred Hospital—first, because that is the cheapest way of providing 130 new beds; and, secondly, because it will increase its use as a Medical School? Yes. I may also state that the second reason is a double one. It has always been considered among the profession—and the hospital authorities actually state that it is an advantage to the patients to be in a hospital which is attached to a medical school, because, usually speaking, such a hospital attracts to itself the more active-minded and better of the profession, and there is more energy and go in the place—it does not gravitate at all down to the tendencies of a hospital for chronics.
1314. A medical school attached to a hospital keeps it up? It is an advantage to the patients as well as to the students to have a medical school attached to a hospital.
1315. Can you, at Prince Alfred Hospital, which is a good distance from the city, get as good visiting surgeons as they get at Macquarie-street? Quite as good—we get our pick.
1316. How often do they attend, as a rule? By the rules, the honorary surgeons and physicians are required to attend twelve times a month—that is, three times a week.
1317. Whenever there is need of an operation the operating surgeon can be in attendance? Yes.
1318. Is he bound by his appointment to be in attendance? Yes.
1319. There is no danger of a fatal delay occurring because the operating surgeon cannot come? Not the slightest. I read the evidence taken yesterday, and have been over our list, and I think that all our surgeons and assistant surgeons have laid themselves on to the hospital by telephone, and about twelve minutes' drive takes them to it.
1320. Not more than twelve minutes' drive in a cab? From twelve to fifteen minutes, according to where they reside.
1321. If we determine to get an airy site for the hospital we may have to make a sacrifice in doing so—do we gain more than we lose by putting Prince Alfred Hospital so far from the heart of the city? I am

am quite sure that the desire to belong to a hospital connected with the Medical School, and which has such a large number of operations to perform as we have there, is so great that we collect the best men to be had for hospital work.

Sir  
A. Roberts,  
Knt.

4 Feb., 1891.

1322. You were concerned in the movement for collecting the first fund for this hospital? Yes. When I said the best men, in answer to the last question, I did not mean better men than those who attend other hospitals; I mean equally good.

1323. You were also concerned in choosing the site for this hospital? Yes.

1324. After all these years of experience, do you doubt the wisdom of that choice? I do not. I visited the site many times before proposing it, and I noticed many points in connection with it. One was its comparative proximity to the cemetery, and I would not absolutely make up my mind before I asked Professor Smith to carefully consider the question, and to give a written opinion of the nature of the site. He gave an absolutely positive opinion that it was a thoroughly sound and excellent site, and our experience since has fully verified that opinion. The recovery from operations has been very good, and stands in very favourable contrast to the recoveries in the majority of cases at home. This is shown by the fact that the hospital has become very popular for operations—so much so, that there were nearly 800 last year.

1325. Patients show their appreciation of the hospital by seeking it out? By coming to it from all parts.

1326. If you had to make the choice over again you could not choose a better site? I think not.

1327. You think you have no reason to regret the choice? No.

1328. And the best thing for us to do is to complete that hospital? Yes. You might put a hospital on the top of the sand-hills; but the position would be almost inaccessible. I have not the slightest reason to regret the selection.

1329. Would not Randwick be too close to the sea breeze? Such a site would have some disadvantages.

1330. You think that for the climate the present site is better than a site at Randwick would be? Yes.

1331. Suppose we take it for granted that it would be a wise thing to enlarge Prince Alfred Hospital at a cost of £40,000, we still have to provide an accident hospital for the city proper? Yes.

1332. You say in your paper that such a hospital should be as near as possible to the centre of the accident area? Yes.

1333. What do you consider to be the accident area of Sydney? The present accident area extends round by the wharves, and where the active traffic of the city is.

1334. It would begin at the Circular Quay and end at Pymont? It would begin at the Circular Quay and extend to the Pymont bridge, including the warehouses in the centre of the city.

1335. But if you were to pick a site in the centre of that area it would be a very noisy one? Not necessarily. About two-thirds of the way up Flagstaff-hill.

1336. Is not the site in Macquarie-street a very quiet one? It is a quiet one.

1337. Is not that a great advantage? It is; but the site now is not so quiet as it was before the wooden paving was put down.

1338. But for a big city, it is a very quiet site? Yes.

1339. It is beautifully open to the sea breeze in the rear? Yes.

1340. But it is not quite in the centre of the accident area? No, it is not.

1341. Still, taking its advantages and its disadvantages, and setting them against each other, it is an undeniably good site? An undeniably good hospital site.

1342. Still you would not build a large hospital on that site? No.

1343. What is the largest-sized hospital you would build there? I should say 200 beds.

1344. You would allow 180 beds in constant use, and twenty as a margin? A little would depend upon the building. If you had to utilise the present building—

1345. Suppose you had a new building? Not more than 200 beds. I should have it back from the street, and well away from the Domain, with plenty of garden around it, so as to make it cheerful for the patients.

1346. We have had evidence to the effect that it would be better for patients not to be in wards facing the west, and that therefore the frontage ought to be given entirely to administrative work—the wards running east and west to get the full sea breeze and shelter? I think that is a great point; but I am not sure that I should not have them at an angle—north-east and south-east.

1347. That would give them rather a crooked appearance? I do not myself care anything about that. I should like to build what is best for my patients.

1348. You remember the old front that was pulled down? I do.

1349. Do you recollect whether the patients in the wards which had a westerly aspect suffered from the extreme heat in summer and the cold in winter? There were some few days in which they did; but the inconvenience is not impressed on my mind very much.

1350. You do not lay very much stress upon this westerly exposure? I do not.

1351. Still if you could do it, you would prefer not to have the wards facing the west? Yes, provided they got a good share of the sun each day.

1352. At the Prince Alfred Hospital you have not built any westerly wards? No.

1353. If you built these new wards you would have to face that inconvenience? Yes, or put up circular wards.

1354. That would minimise the inconvenience of the westerly aspect? Yes; and would give them free ventilation from each quarter from which the wind blew.

1355. Then you would have to alter the original plan? Yes; but the wards would stand on the original sites.

1356. Has this modification been suggested as an after thought? Yes. Circular buildings have come into more active use since the hospital was designed.

1357. They are very convenient for administrative purposes? I think they have a great many good points.

1358. The nurses are in the centre? Yes; they can supervise their wards from the centre, and go to any bed in the ward by traversing half the width of the ward.

1359. While you do not attach any extreme importance to a westerly aspect, you would avoid it if you could? Yes, on account of the heat in the afternoon.

1360. If we build any hospital on this site, you would prefer to put as many of the patients away from the westerly aspect as possible? Yes.

Sr  
A. Roberts,  
Knt.  
4 Feb., 1891.

1361. You observe that the plan before us gives most of the wards a westerly aspect? Yes, the building is to be erected on the site of the old hospital.
1362. You do not think that that is an advantage? I do not.
1363. If we adopted your suggestion about not going on with the wards at the back, we should have none but westerly wards? Yes. My objection to the wards at the back is that in many states of the atmosphere they create a *cul de sac*, and prevent ventilation.
1364. You would rather leave the front free to the sea breeze to come at? I would.
1365. Otherwise those two buildings would be very suitable? Yes.
1366. They would actually form the best part of the hospital? Yes; but for the reason which I have mentioned, I think it would be better to do away with one of them, and make the other half its proposed length.
1367. The foundations of one of these wards are laid, while the other has not been commenced. If we go on with the work, would you recommend the completion of that already begun? That might be done, but even that would be too long.
1368. The top plan behind you shows the frontage to Macquarie-street and to the back, and you will see that to the rear of the administrative block is the staircase;—from that you pass into one pavilion, and through it into the other, so that there is no access to the easternmost pavilion except through the nearer pavilion;—there is no other staircase shown? There is a staircase in each pavilion, but I do not see whether any of these staircases lead uninterruptedly to the three stories. The thought occurred to me yesterday when I was waiting here, and I have brought a plan with me to-day showing one of the pavilions of the Prince Alfred Hospital, which will explain what I mean. By it you see that a person can only reach the upper ward by entering the staircase from the outside air. There is no communication between the air of the ward downstairs with the air of the ward upstairs. When there is such communication the staircase acts as a well-hole—the wards get hotter and hotter as you go upwards, and the air from the downstairs wards is drawn up into the higher wards.
1369. Every staircase should be prevented from drawing up exhalations from the wards? Yes. On this plan the lower ward is entered from a corridor by a level door, and the upper ward is also entered from a corridor.
1370. The question has been raised here as to whether hospitals are better built of brick, which construction admits of a double wall, or of stone? I do not think it matters.
1371. You think that stone can be kept as dry as brick? I myself prefer a double wall, but I do not think the material matters.
1372. You think a double wall is dry? Yes.
1373. Then, to build a hospital of stone has no medical advantages—its advantages are simply architectural? Quite so.
1374. In building a new hospital would you spend 20 or 25 per cent. more merely to build of stone? I would not.
1375. You think it is simply throwing away money? Yes. My idea is that a hospital should be as good as it can be made, but that there should be no extra money expended upon architecture.
1376. You intimate in your memorandum that you would not include Lock and ophthalmic cases in your general hospitals? I did not say ophthalmic cases.
1377. Would you put the ophthalmic cases in the general hospital? I should, because of the Medical School.
1378. You would do it because of the students? Yes; and I see no disadvantage through such cases being there.
1379. But you see no means of providing for them in this central city accident hospital? Certainly not.
1380. There are none of them urgent? No.
1381. They could be taken to any part of the city or suburbs? Yes; with the exception of accidents.
1382. Dr. Maher, yesterday, told us that he would prefer a series of moderately-sized wards to one large ward? Yes; I quite agree with him.
1383. Then you would have to adapt your ward for that purpose? Yes; I should adapt a pavilion, or a portion of a pavilion, to that purpose.
1384. You would not necessarily take such cases away from the general hospital? Certainly not.
1385. You would rather have them in Prince Alfred Hospital than in a small detached hospital close by? Yes.
1386. Lock cases you would treat separately? Yes.
1387. But you would not have male and female cases in the same building? No.
1388. You would have two buildings? Yes.
1389. Would not your plan multiply the number of hospitals? No; the male patients could go into the general hospital.
1390. You would only have one ward for them? Yes.
1391. In a hospital where you have got the windows fixed, you can only put one bed between each two windows. If you look at the plan you will find that the windows adapt the wards for sixteen beds, but Mr. Russell, the Secretary of the hospital, says that he was reckoning to put twenty patients in each ward;—that would not be possible? Not as they are designed; but I have not measured the exact length of the wards.
1392. The air space might be sufficient, but, with these windows, you could not put more than sixteen patients in a ward? Not unless you made alternate windows blank, or did not allow them to be open.
1393. If we consider that each ward can only take sixteen patients, we shall not be able to hold as many in two stories as were calculated for on a basis of twenty to each ward? How many are the two stories calculated to hold?
1394. Two hundred and thirty, by putting twenty into each ward; on the ground floor there would be sixteen beds, together with sixteen in the first of the east pavilions, giving thirty-two altogether on that floor? Are you speaking of the basement?
1395. Yes; the basement takes sixteen? I should hesitate about making the basement ward into an accident ward.
1396. It saves the lifting of the patients? An accident ward is called upon to take in very bad cases, and I should not like to put very bad cases into a basement floor.
1397. Still that is the provision; there are thirty-two on the ground floor, all the other rooms there being taken

Sir  
A. Roberts,  
Knt.

4 Feb., 1891.

taken up for administrative and other purposes; then going to the floor above we have three wards of sixteen beds each, making altogether forty-eight beds, and then we have forty-eight beds on the floor above that again; then we are told that they accommodate seventy-five in the south wing, making only 203 beds altogether;—would you stop at that? I should stop at less than that.

1398. You would not go to more than that? I certainly should not go to that. You will observe from the memorandum which I read that the number of accidents and emergencies are really very small. In my calculation for an accident and emergency hospital I make a liberal allowance for outside cases, and I think that 150 beds would be ample for such a hospital.

1399. If we severely keep away all other cases? If you take in 10 per cent. of all other cases, and allow a sufficient proportion for unoccupied beds—there ought always to be spare beds to allow others to be cleansed and so on—you will only require 150 beds altogether.

1400. This provision then for 203 is ample? It is too much, because it provides a temptation to the staff to take in general cases which, I hold, ought to go to a general hospital.

1401. It has been stated by one witness that a hospital like this should take in a certain number of those operating cases which come in from the country and suburbs;—do you think that that is so? No; I cannot see any reason to support the argument. All surgeons who belong to a hospital like, of course, to have as many interesting cases as they can, and I would not give very much for a surgeon who did not endeavour to collect in such cases: but I think that if a large number of beds were provided it would be a temptation to the surgeons to take these cases into what should be an accident and emergency hospital only.

1402. Still, we must consider what the public want rather than the wish of the surgeons? Yes; but I think that a general hospital, where the most complete arrangements can be made for operations and treatment, is the best place for receiving these cases.

1403. In making provision for beds here, you do not think that we need take into account the need for providing a certain number of beds for operating cases? No.

1404. Were you not concerned in the building of the hospital at Little Bay? Yes.

1405. That was originally intended for a small-pox hospital? Yes.

1406. We now deal with those cases in the ship moored at the Quarantine Ground? Yes; and at the Quarantine Station.

1407. But the Little Bay Hospital is very convenient for other purposes? Very.

1408. Is it not, however, rather inconveniently remote? Yes; especially for typhoids.

1409. If it were three miles away, that would be better than six miles? Not for chronic cases. If a chronic hospital were built that might be further off.

1410. Have you thought about a site for this chronic hospital? No.

1411. Would Parramatta be too far? It might well be on the hills outside Parramatta.

1412. Would the north side of Parramatta be too far? Not at all.

1413. There is no necessity for the hospital being close to the city? No: it would be better away. My idea always was that such a hospital should be for chronic and incurable cases. I object to having an incurable hospital, since it would suggest uncomfortable thoughts to the patients, but there might be an incurable pavilion for males, and another for females, attached to the chronic hospital.

1414. Would there be any economy in having a hospital at Parramatta? I think so. The experience I have had so far in the management of the Carrington Hospital, which is at Camden, is that the distance is no drawback, except with regard to the expense of transmission, which comes to about 10s. a patient, there and back.

1415. How many beds are there in each ward at Prince Alfred Hospital? Thirty-two.

1416. Is that too many for one nurse to look after? They require four nurses and a night nurse.

1417. You observed that the plan before us is designed with sixteen-bed wards;—do you think that that is needlessly expensive? That is a point on which there may be difference of opinion, and either party may be in the right. The reason for deciding on thirty-two beds in Prince Alfred Hospital was that that was the maximum number which a sister, who is the nursing head of the ward, could supervise with most perfect satisfaction.

1418. Would you, in this hospital, require a sister for each ward? It is probable that a sister could supervise two of these wards on the same flat if there was easy access between them.

1419. You do not consider it an objection to the plan that it is designed for sixteen-bed wards? That is no objection in itself, but you will observe that these sixteen-bed wards give you eight walls to be built and kept clean, and eight corners, which makes them additionally expensive.

1420. You think that they are needlessly costly in plan and in administration? Yes.

1421. Then this is not a perfect hospital plan? I did not say that it was.

1422. Then to that extent you condemn it? Yes.

1423. If we carried it out we should not, in your judgment, have a first-class hospital? I do not think you can ever make it so now.

1424. You had a good deal to do with choosing iron as the material for the Little Bay Hospital? No: I think that was settled before I took charge of its completion; but it was altered very much afterwards.

1425. How has the experiment succeeded? Very well.

1426. Was the hospital cheap in construction? Not very. It was built under a great strain; it was put up in a very short time—when there was a panic in the place; and I think it cost more for that reason.

1427. Supposing it were built now under contract, would an iron hospital be cheaper than a wooden one? Yes.

1428. You can ventilate it as well? Yes.

1429. And keep it as cool? Yes.

1430. How many years will it last? I should say fifty years.

1431. You would not recommend that a cheap hospital of the kind of which you speak should be built of iron instead of brick? I am not sure that I should not—it depends on what it is wanted for. I strongly object to cheap hospitals—such as weatherboard hospitals—because they are retained long after they become decayed, which I hold to be a very unsound practice. There is always a reluctance to pull them down, although they are only intended to last for a very few years, and there is a temptation to retain them as long as they will stand up.

1432. Do you know whether good results are obtained in the temporary wooden hospital in Macquarie-street? I cannot say. The results of the cases are not entered in the Medical Superintendent's report, and I have not felt it my duty to inquire.

1433.

Sir  
A. Roberts,  
Knt.  
4 Feb., 1891.

1433. You do not know if they are inferior to what you get at Prince Alfred Hospital? No.
1434. From anything you know to the contrary they may be as good? Quite so.
1435. *Mr. Humphery.*] How many tiers of wards are there in Prince Alfred Hospital? Two in the original design; one small ward was subsequently added to utilise a lofty portion of the basement.
1436. Do you think it is objectionable to have four tiers of wards? Yes.
1437. Would it be more economical and more convenient to have two tiers instead of four? It would be more economical to have four tiers, because then you only require one roof.
1438. That is in cost of construction—I speak as regards management and conveniences? It would be more convenient to have two tiers.
1439. Would it be less expensive to manage four tiers than to manage two tiers? I hardly like to answer the question straight away, so much would depend upon having a good safe-working lift. If you had not such a lift, I think the stairs would kill the nurses.
1440. You said that in some respects you considered the designs of the Macquarie-street Hospital defective—will you point out what you consider defective in them? I very much disapprove of having four floors; I disapprove of the proximity of the building to the street; and I disapprove of having a heavy massive structure. Then, I do not like the large projection at right angles to the main building—it prevents the free course of the breezes.
1441. You would do away with both of the buildings? No, but I would curtail them.
1442. You mean you would not have the pavilion nearest the administrative department more than two tiers high? Yes, and I would make it shorter.
1443. By how much would you make it shorter? That would depend upon the necessities of the case.
1444. To provide accommodation for casualties, how many beds would you have in the central pavilion? According to my idea 150 beds would be ample. In the basement you would have thirty-two beds, thirty-two beds above that, and thirty-two beds above that again—ninety-six altogether.
1445. That would be in the north and west wings? Then there is the present south wing.
1446. That would make the accommodation 171 beds, so you would omit the other pavilions entirely? I think I should.
1447. You would omit the eastern pavilions entirely, and the fourth story of the north and south pavilions? Yes.
1448. Would you leave the administrative department at the elevation shown on the design, or would you reduce it? That would depend upon the size of the staff.
1449. Not upon the necessity for bringing it into harmony with the pavilions? No; that is a mere architectural matter.
1450. Can you make any suggestions that would improve the present designs, omitting these two pavilions? I should hardly like to do that without considering the subject.
1451. Prince Alfred Hospital is under your supervision? No; I am only honorary secretary to it.
1452. Have any improvements been made upon the original design? Yes; we are now building a nurses' home, which was not provided for in the original plan, but which we now see was an omission.
1453. Would it be necessary to provide a building of that kind in Macquarie-street? Not if the Nightingale wing were left standing.
1454. I do not think it is the intention of the Trustees to remove it? I think it is to remain.
1455. So that another such building would be unnecessary? Yes.
1456. Has there been any other important alteration in Prince Alfred Hospital design? I think that we require a disinfecting apparatus to cleanse foul mattresses, so that they shall not have to be taken out of the place. We need this for two reasons—one is that we import our own horsehair, and it is of first-class quality, and if it is sent off the premises it may not always come back to us; while the other is that it is not well to have a bed that has been partially rotted and soiled by typhoid patients disinfected outside the hospital. A corrugated iron building would be necessary to carry out this work.
1457. Would you suggest such a building for Macquarie-street? For every hospital where they have to deal with typhoid cases.
1458. What position should that building occupy in connection with the Macquarie-street Hospital? It would have to be on the site of the old mortuary—on the north-east corner.
1459. What should be its dimensions? I should think about 40 feet square, or 40 feet by 30 feet.
1460. One story? A single story, and I think it should be surrounded by a corrugated iron fence, though that would be a very small matter.
1461. *Mr. Dowel.*] Were you connected with the Sydney Hospital when the Directors called for competitive designs? No.
1462. Were the designs submitted to you in any way for approval? No.
1463. You know nothing of the number of designs sent in? I know there were several sent in.
1464. Did you ever see any of them? I did.
1465. Did you ever see one by Mr. Kirkpatrick, with the motto "Health"? That is the only one I saw.
1466. Did that design strike you as a suitable one? When I saw the design that was accepted it struck me that Mr. Kirkpatrick's was the better of the two.
1467. Because it would have been less costly in construction and would have afforded more conveniences? I think it was the better planned design.
1468. And a better design from an architectural point of view? Yes. I do not remember that I considered the question of cost.
1469. It is estimated that it will cost £741 per bed to complete the buildings according to the original plans—is not that a large sum for a hospital to cost? It is.
1470. Do you know of any other hospital which has cost as much per bed? St. Thomas'.
1471. What did it cost? That cost, with the site, nearly £1,000 per bed. A large sum was paid for the site.
1472. Taking away the cost of the site, what would that hospital have cost per bed? About £700, if I remember aright. But we must remember that £700 in London goes further than the same amount would go here.
1473. You have already told us that £250 per bed will be the cost of the construction of certain buildings at Prince Alfred Hospital? Yes; but the administrative buildings of a hospital take up more than two-fifths of the whole expenditure, and in providing more accommodation at Prince Alfred Hospital you have only to make provision for the wards.

Sir  
A. Roberts,  
Knt.

4 Feb., 1891.

1474. That is one reason why the cost is so much less? Yes.
1475. Are not a large number of patients taken at the Sydney Hospital who ought to go to the Prince Alfred Hospital? I think so.
1476. Do you not think that to a large extent that could be avoided by having ambulance stations at various parts of the city? Yes; I intended to draw the attention of the Committee to the necessity of having a thoroughly efficient ambulance service in the city. It is a matter I have thought of for a long time, and I am anxious to see such a service established.
1477. Are you in favour of an emergency hospital at Flagstaff-hill? That would depend entirely upon whether the Legislature decided to build a hospital in Macquarie-street.
1478. Supposing the Prince Alfred Hospital were completed, what would be the total number of beds provided for there? Four hundred and fifty.
1479. Prince Alfred Hospital is to a large extent built of brick? Yes.
1480. Pressed brick? Hard pressed brick facings, the inside bricks cemented with the best plaster and painted.
1481. You consider that mode of structure sufficient for all necessary purposes? Quite.
1482. And a building constructed in that manner would be much cheaper than one constructed with stone? Yes.
1483. *Mr. O'Sullivan.*] If your recommendation with regard to the abolition of the eastern pavilion and the removing of the beds from the basement were carried out there would only be room for about 175 beds? Yes.
1484. Do you think that such a hospital would be large enough to accommodate the accidents occurring in the city? I do. I fancy that the accidents occurring near to the Sydney Hospital have arrived at pretty near their maximum. The only further increase that is likely to arise will come from the density of traffic being increased—more work being rushed through the warehouses. The manufactories in touch with the Sydney Hospital will not increase, and for these reasons I think that 150 beds here would be ample.
1485. Have you allowed for the building of additional wharves, and the increase of shipping at North Shore and Woolloomooloo Bay? With an increase of shipping at North Shore you would have to have a hospital there for accidents and emergency cases.
1486. Your idea is that there should be a number of small accident hospitals, and one large general hospital? Not at present.
1487. Supposing it was decided to have a hospital on the Macquarie-street site, do you think it would be better to go on with the present building, or to abandon that entirely, and build a new hospital in the middle of the grounds? I can only answer that from a professional point of view. I think it would be far better to have the site quite clear, and that the hospital should be in the centre of the grounds, further away from Macquarie-street.
1488. If the cost of putting a new building into the centre of the grounds would be the same as the cost of partially completing the present building you think it would be better to start afresh? Much better.
1489. *Mr. Trickett.*] Have you considered any other site as desirable or good for a hospital in this locality—have you looked round at all for Government land which might be used for a hospital? Yes, I have looked round, and I thought that a site near the National School would be a very good one.
1490. But I mean nearer the present building—such as Cook Park, where the bowling green is,—do you think that that would be a good site? Yes, a very good site in a sanitary sense, but it would not be so central as the present site; you would be verging up towards St. Vincent's, and away from the wharves.
1491. Do you think that it would be as good a site as that which we are now considering? Except for its distance, it would be better.
1492. The reason for my asking this is that it has been suggested that the foundation on the present site might be used for some other building, and then if we could get a site such as Cook Park, and start the hospital altogether afresh, would you see any objection to doing so? No; but the hospital should be built on the upper part of that park, because the lower part was, I remember, filled up with rubbish.
1493. Do I understand that you would altogether object to accident patients being treated in the basement of this building as designed by Mr. Rowe? Yes.
1494. You do not think that that would be desirable? No.
1495. Chronic cases might be treated there? Yes.
1496. But it would not be desirable to treat patients in a dismal atmosphere of that kind? Certainly not.

Alexander Dean, Esq., Builder, sworn, and examined:—

1497. *Chairman*] You have been engaged in practising your calling as a builder in Sydney for very many years? Thirty-five years.
1498. During that time you have had a lot of experience in connection with different buildings in and about Sydney? Yes.
1499. Have you given special attention to the different designs which have been submitted for the construction of a hospital in Macquarie-street? I saw one design at the time that the designs were asked for. I was not then a Director of the hospital, but since then I have been a Director of the institution, and have seen other designs. It is customary for architects and owners, before they finally decide to carry out a work, to ask me to give them an estimate of its probable cost.
1500. In regard to the designs for this hospital it was a condition that they should be accompanied by a builder's certificate, certifying that they could be carried out for a certain amount? Yes.
1501. Did you give such a certificate in connection with any of the designs? I gave one to Mr. Kirkpatrick.
1502. Do you remember the estimated cost of that design? Yes. I had no specifications, but I merely went over the plans and cubed them. They were for a brick and cement building, everything being of the plainest kind, the arrangements being suitable for a hospital, at an approximate cost of £45,000.
1503. You felt that you were justified in giving this certificate? Yes.
1504. You did not give a certificate in any other case? No.
1505. Do you know of any other builder who gave a certificate in any other case? No.
1506. You have heard of the great disparity between the proposed cost of the buildings designed by Mr. Rowe and the proposed cost of those designed by Mr. Kirkpatrick? Yes. I have been a Director of the hospital for many years now, and I have often heard the matter brought before the Board.

1507.

A. Dean, Esq.

4 Feb., 1891.

- A. Dean, Esq. 1507. Was it with the general concurrence of the Directors of the Sydney Hospital that this increased outlay was undertaken? That was before my time—I was not then a Director.
- 4 Feb., 1891. 1508. Have you formed any opinion as to the requirements in regard to hospital buildings? I have been home twice, and I have gone through some of the hospitals there, and have looked over them very carefully. I have also seen the plans of this hospital several times, and I have often been through the portion that has been completed.
1509. Do you think that these plans are well suited for a hospital? Yes; the site is second to none in the world. The buildings could have been constructed very much more cheaply if brick and cement had been used.
1510. Looking at the character of the site and all surrounding circumstances, do you think the Government would be warranted in expending the large amount upon the building required by Mr. Rowe's design? I cannot see how they can do otherwise now. The elevations will have to be carried out, and if you remove what has already been done, there will have been a complete loss of £68,000. I do not see how you can patch up the building unless you build with common brick on top of the stone, after the fashion of the Doge's Palace in Venice, where they commenced to build the first story splendidly and afterwards finished in common brick.
1511. Some evidence has been given as to the practicability of cutting down the building and having three stories instead of four? That would affect the elevation very much.
1512. Would it affect the appearance of the building? It would dwarf the building very much, though it could be done.
1513. You think that the present design, if carried out, would be a very sightly one? Yes.
1514. And you think that the situation deserves such a building? It is a beautiful site—the best I ever saw.
1515. Do you think that such a site should be taken for a hospital? Where else could you go? All sorts of accidents occur at the wharves, and in the heart of the city, and you want a hospital that can be easily got at. This hospital is well known, and I am sure that the artisans of Sydney deserve that they should have every attention close at hand in case of accident.
1516. You have not seen the certificate which you have supplied with Mr. Kirkpatrick's design since it was sent in? No; I have looked over my letter book, but I cannot find it. I cannot say whether I copied it.
1517. You are certain that you supplied it? Yes, and that the amount was what I said.
1518. The design sent in by Mr. Kirkpatrick was not so comprehensive as the one before us? Nothing like it, and the material was very much cheaper too.
1519. It was brick? Brick and cement.
1520. A brick front, too? Yes.
1521. Do you think the designs sent in would have been sufficient for the requirements of a hospital in this position? I think so; but I cannot tell from seeing the plans alone—a great deal depends upon the specifications.
1522. Is great inconvenience felt now in the hospital through the want of proper accommodation? Very much inconvenience. It is a source of anxiety to me every time I take my seat on the Board.
1523. In some cases they have to reject applications? Yes; and then there is the danger of fire to which the patients are exposed. This is a source of great anxiety to each and every one of the Directors.
1524. Mr. Dowel.] Did you prepare an approximate estimate of the cost of Mr. Kirkpatrick's design having the motto "Health"? Yes.
1525. Your estimate was £45,000? Yes.
1526. Taking into consideration the cost of materials and labour at the present time, would that sum be exceeded now? I do not think it would.
1527. The work could be done as cheaply now as it could have been done five years back? Yes; I think so;—in fact competition is very much keener now than it was then.
1528. The probability is that the work would be done for less now than your estimate? I could not say.
1529. If there is more competition, the builders must be satisfied with less profits? Their profits are very small now.
1530. And the probability is that the work would cost less now than it would have cost some years ago? Yes.
1531. You are aware that it is estimated that a sum of £80,000 would be required to complete the building? Yes. The Board asked me, as a builder, to say roughly what it would cost, and I said £100,000.
1532. Then you think that Mr. Rowe under-estimates the cost of the work? My estimate was only approximate, but from my experience and knowledge I thought that £100,000 would be required to complete the building.
1533. You say it could not be completed for the amount estimated? I do not think it could. I think that to finish the building according to the plan it would cost £100,000—my feeling is strong upon that point.
1534. As regards hospital construction, I suppose you have formed the opinion that good double-pressed bricks, and stone facings or dressings, would be equally as good as stone? A brick front with stone facings is very expensive, though not so expensive as stone alone—it is the next thing to stone in expense. Builders, as a rule, do not like stone facings—they either like a building to be all brick or all stone.
1535. Are you not aware that Mr. Kirkpatrick provided for double-pressed bricks and stone facings? I saw no specifications.
1536. Would you recommend that the present south wing should be taken down for the purpose of completing Mr. Rowe's design? No, I should not. I have thought over the matter several times as a Director, and I consider that by taking off 20 feet next to the new building, to admit of air, and cementing the walls and generally repairing it, it can well be left to stand.
1537. As a matter of economy it could still be utilised? Yes.
1538. Mr. Rowe's proposal is to pull down the whole of the south wing? I do not think that is necessary, and I think the Directors are generally of that opinion.
1539. Would it not be desirable, for the satisfaction of the Directors and of the Government, that before the completion of the building is proceeded with, tenders should be called for to ascertain the exact cost of the work? There would be a difficulty in getting tenders, unless each tenderer was paid for his services. It would be best to pick out half-a-dozen respectable builders, and get estimates from them.

1540. As a practical builder, you are aware that you could not give a correct estimate of the cost of the building unless a specification of the cost of that building were prepared? I could not.
1541. Mr. Rowe has informed the Committee that no specification has been prepared, and, therefore, to a certain extent, his estimate must be an approximate one? It could not be otherwise.
1542. Would you recommend that a specification be prepared, so as to satisfy the Government, the Directors, and this Committee? Yes; I should recommend that five or six respectable and well-known builders should be asked to give the Government a price; but, first of all, the architect, whoever he may be, must provide a specification showing the details and everything complete, just as if the building were going to be commenced.
1543. You do not think that a sufficiently accurate estimate could be obtained to the satisfaction of the Committee, except in that way? No. The custom with practical builders and architects is to cube up a work to ascertain its cost roughly, but they can only choose a figure from their own experience. A young architect just starting to practise his profession would have no idea what figure to choose unless he had had experience in the carrying out of a similar work before. Sixpence, 6½d., 7d., 7½d., 10d., might be chosen, according to the size of the building, and the difference of a half-penny, more or less, would affect the estimate considerably, especially if the building were a large one.
1544. And you could only choose an accurate figure by knowing something of the details of the building, according to the architect's intention? Exactly.
1545. At the present time there is a vast discrepancy between your estimate and Mr. Rowe's estimate, and you think the only way to settle the matter is to have a proper estimate prepared from the specification? Yes; but it must not be A, B, C, or D who are picked out, but men of position, who would not give a price without being able to carry out the work at that price, otherwise you might get men who, for the sake of notoriety, would give a price either ridiculously high or absurdly low—it would be necessary to get men of position.
1546. Reliable, trustworthy contractors? Yes.

A. Dean, Esq.  
4 Feb., 1891.

Sydney Burdokin, Esq., M.P., Treasurer, Sydney Hospital, sworn, and examined:—

1547. *Chairman.*] You have been a resident of Sydney for a long time? All my life.
1548. You know a great deal about the proposed Hospital Buildings? I have lived in Macquarie-street since I was about two years of age.
1549. You have watched the progress of these buildings from their different stages? Yes.
1550. Have you taken an active part in connection with the proposed new buildings? I have been concerned in the matter since its inception. The old buildings were of such a character that it was thought that they should be demolished, and it was considered that Sydney had arrived at such a state that a hospital should be built here which would be an ornament to the city and safe for its patients. It was also thought that the old building contained germs of disease which might interfere with surgical cases, and so it was pulled down. Designs for a new building were then called for, and Mr. Rowe's design was selected as the most suitable. It was criticised on various occasions by various medical men, and many alterations were made in it to suit the medical profession in the city. Ultimately the design before the Committee was decided upon as combining all modern requirements for a hospital, and being best suited to the circumstances of the city. Originally it was intended to build this erection in brick, but a decision was come to by the Directors that it would be better, because of the importance of the colony, and of the nature of the site, that it should be built of stone.
1551. When the decision was come to by the Committee in reference to this design, did they consider the question of cost? I think it was not estimated that the alteration from brick to stone would make such a very great difference in the cost of construction.
1552. Do you remember the amount of the first estimate? I think it was something above £50,000. My impression at the time, from the discussion which took place before the Board, was that the alteration from brick to stone would not increase the cost more than about one-third. I may be wrong, but that is my impression.
1553. You are aware that the structure as far as it has gone has cost £68,000? Yes. I may say, in passing, that the evidence which I gave before the Select Committee of the Legislative Council on this subject embraces, to a very large extent, all that I can say about it, except that I then said that the accident cases came principally from the Circular Quay and Darling Harbour, whereas circumstances have now somewhat altered, and a very large number of accidents now come from the Woolloomooloo Bay district, making the hospital even more central than it was ten or fifteen years ago.
1554. Then you consider that under all the circumstances the site is about the best you could have? I have not the least hesitation in saying that it is the best site that could be fixed upon. Almost every medical man of eminence admits that it is the site of all others for a hospital. It is easily accessible for patients, has everything that can be desired from the point of view of health, and it is convenient to the physicians and surgeons. Because of this convenience, we have the best talent in the community always ready and willing to offer assistance in the alleviation of distress and the cure of disease. The medical gentlemen belonging to the honorary staff can attend to their duties in that hospital without in any considerable way interfering with their private practice.
1555. You are aware that the project, if carried out according to the present design, would ultimately cost something like £150,000? Yes; but although the amount seems, perhaps, somewhat large, it cannot be considered extravagant when we consider the magnificent buildings going up in and around Sydney, and remember the value of the site. If the position were in private hands the expenditure of such a sum would be looked upon as a mere bagatelle.
1556. It has been suggested that a story less might be built, or that the structure might be completed on a less expensive scale;—would you favour an alteration of that sort? I have given a great deal of attention to this hospital for very many years, and what I earnestly desire is to see sufficient accommodation provided for accidents and urgent cases around the city, and Mr. Rowe's original design—whether it was of brick or stone, is a matter of small consequence—allowing for 270 beds, gives the very least accommodation that we ought to expect to have to provide in such a central position. To cut this building down from three stories to two would mutilate it from an architect's point of view, and would render us incapable of performing the services that might legitimately be expected from us. The hospital is in a commercial

4 Feb., 1891.

commercial centre, where accidents occur in large numbers. The admissions are sometimes fifty and sixty a week, and many of the cases are extremely urgent, and have to remain five, six, and seven weeks in the hospital, and we could not take them unless we had a fair amount of accommodation. I am fully convinced that it is infinitely more economical and better to have all the medical and surgical talent that we can get at one institution, instead of having it divided among several small hospitals about the city.

1557. Do you think you express the opinions of the Directors? I think I am fully in accord with the Directors.

1558. *Mr. O'Sullivan.*] From your experience, how many beds do you think would be required in this hospital? In 1887, when giving evidence, I said that the accommodation designed by Mr. Kowe was 270 beds. For three years we had an average number of 268 patients in the summer months and not less than 208 in the winter months, and the accidents are increasing.

1559. But the majority of cases last year were really not accidents at all? From different circumstances, I have not been able to pay that close attention to the management of the hospital during the last year or fifteen months that I gave to it formerly; but I know that the cases there are either accidents or urgent cases that cannot be sent to a distance. All pauper or Government cases are referred to Dr. Strong, who allots them to the different hospitals—the Coast, Prince Alfred, and the Sydney Hospital. Every case that admits of delay is submitted to Dr. Strong, and he sends it in whatever direction he thinks fit.

1560. In 1889, out of 3,296 patients admitted, 1,116 were what might be termed accident or urgent cases? I cannot account for the difference. To my knowledge we admit no cases except accidents, urgent cases, and cases sent to us by the Government. Of course there are paid cases.

1561. Sir Alfred Roberts is of opinion that 170 beds would suffice for this hospital;—do you think that he ought to be an authority on the subject? Sir Alfred Roberts is a gentleman of large experience, who deservedly stands at the top of the medical profession here; but he has now not been connected with the Sydney Hospital for many years, and his whole sympathy, I have no hesitation in saying, lies with the Prince Alfred Hospital. I think he does not know as much about the Sydney Hospital as those gentlemen who are more immediately connected with it.

1562. Do you think that, from your experience on the Board, you are better able to judge of the requirements of the hospital than Sir Alfred Roberts is? I think infinitely better, though I would not presume to judge of a surgical case.

1563. The figures I have read show that the majority of the cases treated at your hospital are not surgical cases? I am surprised at that statement, and I think it requires explanation. You will understand that we are not likely to take in cases that are not accidents or urgent cases if we can avoid doing so, unless they are paid for, because the institution requires a large amount of money to carry it on, and the subscriptions are more or less limited. My explanation is, that these cases may have had some special feature that made them command admission.

1564. If these figures were supplied by Sir Alfred Roberts, they may be taken as reliable? I do not know that he knows anything about the working of the hospital. I think that, upon communication with the authorities, I shall be able to supply an explanation wholly satisfactory to the Committee.

1565. I presume that Sir Alfred Roberts would get his figures from the records of the hospital? I can only say, from watching the working of the hospital more or less every day for all these years, that the accidents are increasing, and a communication which I received from the Secretary, and which I have unfortunately mislaid, showed me clearly that all these cases have increased largely during the last two years. I should say that the demand for admission to-day is infinitely greater than it was in 1887, and I have no hesitation in saying that I shall be able to give you a satisfactory explanation of the discrepancy.

1566. Do you contend that 270 beds are necessary for an accident hospital, or are they for an accident hospital and a general hospital combined? The accidents and urgent cases may average from fifty to sixty a week, and may remain in the hospital four or five weeks, while, as population increases, the number of accidents increase, so that it is always well to have a few beds in reserve. When the accommodation is insufficient, patients have to be placed in the passages, and the wards are overcrowded. There are some cases which must at all hazards be admitted.

1567. You consider that 270 beds are required for this hospital as an accident hospital? I consider that is the very smallest number which we should have in the city of Sydney for a central hospital, and I have no hesitation in saying that if the number of patients there went up to 300 it would not be dangerous to the public health. I have lived in the street all my life, and I have never known any trouble from the hospital. I would as soon have a hospital on the proposed site as I would have any other public building there, and I should infinitely prefer it to a private house. The hospital has not been detrimental to the value of property in this street. The only objection I have heard to its erection there is the value of the site, which I do not think will go down with the Committee. In my former evidence, I stated that the area of the grounds is 2½ acres, but the air space may be considered to be the whole Pacific, while the building is protected from the prevailing westerly winds, which are rather serious in surgical cases, by the good class of houses on the other side of the street. As you go through the evidence, I think you will find that almost every medical man, without exception—not considering those who made up their minds many years ago—is of opinion that there is no superior site in the world, and in the evidence of different gentlemen which I have read they say that all the best conducted hospitals in London and on the Continent are close to where the accidents occur, and in the centre of the city, though without any injury to the health of either the city population or the hospital patients.

1568. *Mr. Humphery.*] You expressed the opinion that the design should be carried out without modifications;—have you considered whether it is desirable to remove the south wing, which now gives accommodation to between seventy and eighty patients? I think it would be a waste of money to remove the southern wing, and the only good that would be gained by taking it away would be that it would put one pavilion a little closer to the boundary wall. This building was erected many years ago at a large cost, and has been remarkably useful, and I should consider it a piece of wilful extravagance to remove it. I would almost as soon agree to the removal of the Nightingale wing.

1569. To that extent you would modify the opinion that the plan should be carried out in its entirety? What I mean is, so that the fullest accommodation may be given. It would not affect the accommodation to leave the southern wing standing, though it would save £8,000 or £10,000. It seems to me of very little importance whether the design is carried out in brick or stone, as that would only affect the appearance of the building. But in connection with the hospital there are operating theatres, affording oppor-  
tunities

tunities to gentlemen for learning their profession, and I think it would be well, in a national undertaking like this, to have the building complete as a medical educational establishment as well as a hospital for the sick poor of Sydney. S. Burdekin,  
Esq., M.P.  
4 Feb., 1891.

1570. *Mr. Dowel.* Would you propose to have any but accident and emergency cases in this hospital? I should certainly not propose to have, as we never have had, any case of an infectious character in it.

1571. You simply propose to confine its use to the treatment of accident and emergency cases? You will understand that there are many cases which present themselves which it would almost be a breach of humanity to turn from the door, so that I think it would be undesirable to make the rules absolutely hard and fast; but, speaking generally, of course the hospital is for accidents and emergency cases. In these very urgent cases the proportion of deaths within twenty-four hours after arrival is very large.

1572. Are you aware that 3,083 cases were admitted in one year, and that out of that number there were only 1,293 accident and emergency cases, leaving a total of 1,790 patients who might have been sent elsewhere;—that information is given in one of your reports? I will see that you get some explanation of that.

1573. You have had very considerable experience in building operations? Yes, all my life.

1574. When the Directors accepted Mr. Rowe's design, do you remember whether any specification, in connection with the plan, was submitted? I do not recollect any specification; but I know that it was expected that this hospital should have been built for a very moderate sum indeed compared with the present estimate. I was so impressed that it would be in the best interests of the institution to carry out the work, that, being then in the country, I wrote down specially to the Chairman to ask him to be sure to accept one of the designs; I forgot the amount. The Directors, unfortunately, I think, decided to erect a stone building, and the price went up, though when the site is taken into account, I think that was a small sin.

1575. On the score of economy, you then favoured the erection of a brick building? Yes.

1576. If the architect had informed you that the building was going to involve the expenditure of £150,000 or £200,000, would you have sanctioned the outlay, or do you think your fellow Directors would have done so? I should have considered the matter very carefully, to see whether this large expenditure could not be cut down.

1577. The Directors called for competitive designs not to exceed a cost of £50,000;—do you remember what steps they took to obtain an opinion as to the merits of this particular design? I admit that the Directors seemed to have been very blamable in incurring an expenditure of £147,000 where they started with the idea of spending £50,000. That admits of explanation. These plans were submitted to, and criticised by, the public at the Town Hall, when Mr. Rowe's plan was selected.

1578. Upon whose recommendation? By the Board generally. All the plans, without exception, were submitted to the medical fraternity of the city, and from the time that the plan was selected, and until the foundation stone was laid, the medical men were constantly making alterations; and I have not the slightest hesitation in saying that these alterations added £50,000 or £60,000 to the cost of construction. I think that point ought not to be overlooked. You will understand that, as a body, the Directors are laymen, and the suggestions of the medical men were adopted by them; and this, in addition to the alteration from brick to stone, will account for the increase of cost.

1579. Does it not prove that the original design was very defective, since all these alterations had to be made? The medical men are everything you can desire as medical men; but when they come to deal with bricks and mortar, I think they are about as unsatisfactory a set of men as you can get, and what a practical man would accomplish for a £5 note, would cost a set of surgeons and doctors £50.

1580. Were the whole of these designs submitted to a Board for the purpose of inquiry, so that they might report upon them to the Directors? As far as I recollect, all the plans were exhibited in one of the upper rooms of the Town Hall, and the public were invited to inspect and criticise them. The Directors, after a certain period, taking into consideration the opinions of the public, and the advice of their staff, proceeded to the selection of a plan, and, rightly or wrongly, adopted that submitted by Mr. Rowe.

1581. Was not the design marked "Health," strongly recommended by the medical men whom you consulted at the time? I hardly recollect any special plan, but in all these matters majorities must rule. I can hardly tell you from memory what the different mottoes were; but the majority of the Directors favoured one particular plan, and, therefore, that plan was adopted.

1582. Is it not a fact that Sir Alfred Roberts and Dr. MacLaurin strongly recommended a plan prepared by Mr. Kirkpatrick, and marked "Health"? I hardly recollect the details; but in dealing with this question it cannot be forgotten that Sir Alfred Roberts is the principal of what may be looked upon as a rival institution, and it might be thought that the success of the Sydney Hospital might take from that of the Prince Alfred Hospital.

1583. Do you recollect whether a builder's certificate accompanied Mr. Rowe's plan? I think a certificate accompanied the design, to the effect that the building could be constructed for so many thousand pounds; and I think it was because the price seemed to me so reasonable that I wrote to Dr. Renwick asking that the work should be adopted.

1584. Was it not a condition of the competition that a builder's certificate should accompany each plan? Yes.

1585. You cannot, of your own knowledge, say whether such a certificate did accompany the plan? I supposed that everything that came before us was regular, and it was no part of my duty to go into details. I have no doubt that whatever should have been done was done, and that when the design was submitted to the medical gentlemen it was found that the necessary accommodation could not be given for the amount stated.

THURSDAY, 5 FEBRUARY, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.	JAMES EBENEZER TONKIN, Esq.
The Hon. FREDERICK THOMAS HUMPHREY.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
JACOB GARRARD, Esq.	CHARLES ALFRED LEE, Esq.
HENRY COPELAND, Esq.	WILLIAM MCCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

The Hon. Henry Norman MacLaurin, M.D., M.L.C., sworn, and further examined.—

- Hon. H. N. MacLaurin, M.D., M.L.C.  
5 Feb., 1891.
1586. *Dr. Garran.*] On your previous examination I understood you to say that, taking a large view of the wants of the metropolis, you thought that one of our wants was a moderately cheap but adequate hospital for the chronic sick poor? Yes.
1587. How many beds would you like to have in that hospital? I recommended from 350 to 380.
1588. You would not have it larger than that? That was the number that I could get into my scheme. My scheme left room for extension afterwards.
1589. And you think that that work could be done at a cost, for really necessary purposes, of £200 a bed? It could have been done for very much less than that if my plan had been carried out? My plan was to resume the Randwick Asylum, which was almost empty at that time, and make such changes in it—they would be of a very moderate character—as would be necessary. It seemed to me that the total expense of turning it into a place which might be used for the accommodation of about 350 patients would be between £7,000 and £8,000, or under £10,000. That would be for furniture and for remodelling the bathroom, lavatory, and closet accommodation.
1590. Seeing that three-fourths of the capital invested in that building was Government money, you think that the Government would have an equitable right to walk in and take possession of it? Yes.
1591. But they could not take possession of it without an Act of Parliament? No.
1592. They are laying out their money at the present time? I suppose so.
1593. They get no *quid pro quo* for what they have spent at Randwick? A very small number of children are kept there in proportion to the number that they could accommodate, and it seemed to me that these children could, in the public interest, be much better boarded out. The asylum seemed just the place wanted for a chronic hospital to relieve the two metropolitan hospitals, and, to a certain extent, the asylums for the destitute.
1594. You do not think that it is too near the sea breeze for a chronic hospital? I do not think so—it is very healthy.
1595. We had evidence given yesterday to the effect that a position a little inland, where the sea breeze is mitigated, is very beneficial? It depends on the place. There is no doubt that all chronic people like a little change of air sometimes, but we cannot provide everything. It would be quite reasonable to build a hospital a little further inland, but that would cost a very large sum of money, and it seemed to me that the Asylum at Randwick was exactly suited for a hospital for the vast majority of patients at less expense, while I thought that if it were found that some of the patients would be better inland, part of the Liverpool Asylum could be used by them.
1596. If the Government could buy out certain people who have rights in the Randwick building, that would be the cheapest way of establishing this hospital? Yes, and, moreover, part of that building would do exceedingly well for a Lock Hospital for women. It is perfectly sheltered and isolated, and would accommodate sixty or seventy persons, so far as I remember.
1597. If the Government could only obtain that building there would be an immediate relief to our hospital wants? Yes; and this hospital could be conducted at a very cheap rate. I calculated that the annual expense of carrying on the institution would not be much more than £40 a bed, and if we could treat the great majority of chronic cases at that cheap rate, we should not grudge spending at a higher rate on the patients really seriously ill in the Prince Alfred Hospital or the Sydney Hospital.
1598. You agree that, for accidents and urgent and operative cases, we cannot have a hospital too well equipped? We cannot object to any expenditure on such cases; but I object to treating chronic paupers at an expense far beyond what is necessary for them. I refer to persons of whose perfect recovery there is no prospect. I think that such people should be treated in an institution where they could be kept more economically.
1599. With all proper respect for, and humanity towards, the sick poor, you think that the expenditure of £200 or £250 a bed would absolutely meet their necessities? I should think so. The annual cost would be a little over £40, whereas in the other hospitals it is necessarily very much greater.
1600. You think that it is simply a waste of public money, and no real humanity to provide accommodation for these people at £800 a bed? I think so.
1601. Do you know the cost of St. Vincent's Hospital a bed? No.
1602. That is a useful hospital? Yes, but it cannot be turned to account so readily by the public as the other hospitals can.
1603. Yes; but I am talking of the building? It is a very good place.
1604. Should you think it would cost more than £250 a bed? I would not like to say. I have not seen the accounts, though I have no doubt the authorities would give you the accounts if you required them.
1605. That hospital is plain, simple, and useful? Yes.
1606. A hospital of that kind would suit chronic cases? Perfectly.
1607. You say £200 a bed would be enough? I would rather not give any figures as to the actual cost of construction, because I have not calculated that, though I should think that would be enough. A great deal, however, depends on the size of the institution. If you were building an institution for a small number of beds it would be more costly than if you were building an institution for a large number of beds. I think, for a hospital containing 350 beds, £200 or £300 a bed would be quite sufficient.

1608.

1608. How many beds would you fit up at Randwick? The present building would provide accommodation for 350, or, in case of emergency, up to 380. It is impossible to estimate exactly the expense of new furniture, but I believe that if it were bought judiciously and economically, £6,000 would be required.

1609. Do you think that if we cleared out of Prince Alfred Hospital and the Sydney Hospital all the patients for which these hospitals are not exactly suitable, and provided in them for all the patients who ought to be provided for, we should require 350 beds to accommodate the sick chronic poor? There are a good number of patients in the asylums who would be better treated in a hospital than where they are.

1610. You think you are not making too much provision? Not at all; I could have filled the building in a month.

1611. And you think that the expenditure would be a good one? That is a question that would require grave consideration. I think that we ought ultimately to provide accommodation for these people; but whether it would be a wise thing to spend £87,000 or £100,000 on this work at once is another question, because when you come to build a perfectly new institution you find that there are a great number of sources of expense that would not come in in a place like Randwick.

1612. Still we are not doing the right thing now; we are spending too much on some patients and neglecting other patients who ought to be better treated than they are in the asylums? Yes.

1613. So we are penurious on the one hand and wasteful on the other? I would not call it penurious; they get what is required, but the accommodation is not as it should be.

1614. Speaking as a doctor, you know that there are some cases in the asylums that should be better treated than they are? Yes.

1615. Suppose we provided 350 beds at Randwick or elsewhere, what effect would that have upon the enlargement of Prince Alfred Hospital, or upon the size of the Macquarie-street Hospital? Even with 350 chronic beds you could not do with less in Macquarie-street than the daily average number of 200 beds.

1616. We were told yesterday that it was very desirable, both for economic reasons and in order to improve the facilities for a Medical School there, to complete that building? I do not think it would be necessary to make that building much larger than it is. Prince Alfred's is a hospital which must always be run on expensive lines; it is impossible to treat patients there in an economical way, and, therefore, in justice to the public funds, we are bound to see that the people treated there are persons who are seriously ill. I think with 200 beds at Macquarie-street, and 250 beds at Prince Alfred's, we could meet all requirements for a few years, though if the population of the city and the country goes on increasing, it will be necessary to enlarge the accommodation for very urgent cases of sickness, surgical disease, and injury. At present I do not think that it is necessary.

1617. Still, we are told that for £40,000 we could put up two pavilions providing 130 extra beds. Would not that be the cheapest way of providing those beds? It might be, so far as the building went, but I do not believe that you could keep up that hospital at such a cheap rate as a hospital intended for chronic cases only, and for many reasons. In the first place, if you put 130 more beds in Prince Alfred Hospital, it would not relieve you from the necessity of having a hospital in town; you would still require that, and I do not believe that you would require 130 extra beds for acute and surgical cases, and severe accidents, in Prince Alfred's. I do not believe that the supply of patients there would be sufficient to fill them, so you would be compelled to keep mainly chronic cases there.

1618. I am trying to get at the limitation for Macquarie-street. If you severely limit the accommodation there to 200 beds, and that together with the accommodation at Prince Alfred's is not adequate, you have these two pavilions to fall back upon? Yes; and my idea was to have another hospital entirely under the control of the Government, where the expenditure would be looked after more accurately than it can be in any institution conducted by a Board. In that institution I should have only chronic patients, and, supposing it were built, I think 200 beds at the Sydney Hospital, and the present accommodation of Prince Alfred's, would be sufficient for severe cases. If the supply of those cases were greater than the accommodation afforded, we could then think about enlarging Prince Alfred Hospital.

1619. Then you would provide 200 beds in Macquarie-street? Yes.

1620. You would acquire the Randwick Asylum, and make provision there for chronic cases? Yes.

1621. If you then wanted more beds, you would add to the Prince Alfred Hospital? Yes, and part of my scheme was to retain the Little Bay Hospital entirely for infectious cases, and under the Government control.

1622. You would put the recovery of the Randwick Asylum, or the providing of equivalent accommodation, before the enlargement of Prince Alfred? Yes; because if we got that I think 200 beds at the Sydney Hospital, and the present accommodation at Prince Alfred's, would be sufficient to meet all the requirements of very severe cases.

1623. Would you provide for ophthalmic cases in Macquarie-street, or would you treat them elsewhere? They have a very convenient arrangement just now, treating them at Moorcliff. It is a matter of convenience.

1624. You would not think it necessary to provide beds at £800 each there? No.

1625. Would you treat the Lock patients there? By my scheme I would treat all the female Lock patients at Randwick. The male Lock patients would require to be treated in one of the main hospitals.

1626. But they are not urgent cases that must be taken immediately to the hospital? Some are and some are not; there is a great variety.

1627. But a great number of them are not urgent? No; but there is a great variety. Some are of the utmost urgency, and must be attended to at once, or the patients will probably die. Others, again, are distinctly chronic cases which might be treated anywhere.

1628. You do not require any large ward in Macquarie-street for a Lock ward? No; but you would need a ward for urinary diseases, which would require considerable surgical skill in their treatment.

1629. You would keep that hospital strictly for surgical cases? For accidents, surgical diseases requiring operations, and cases of grave internal disease.

1630. Cases coming from the country could go to any suitable hospital; there is no absolute necessity for providing for them in Macquarie-street? No; but in Macquarie-street you would provide surgeons of great skill and experience to deal with accidents there, and why not turn their abilities to account for the treatment of these cases?

1631. You would like to give them the advantage of the operating cases? I should give the operating cases the advantage of being treated by them. You cannot keep a surgeon dealing exclusively with compound fractures; you must give him a variety or he will get tired of his work.

1632. Have you ever thought of the Government taking sole control of the Sydney and Prince Alfred Hospitals? I have very often, but I do not think that it would be a good thing. The objections to it

are

Hon. H. N.  
MacLaurin,

Hon. H. N. MacLaurin, M.D., M.L.C.  
5 Feb., 1891.

are, first, that the Government could not properly command, on the whole, the first-class medical skill of the town so readily as the Boards can. The Boards get the best surgeons and physicians in the city to attend the hospitals, and for nothing; but the Government cannot have any gratis service. The Government can only have service for which it pays, and it would often not be worth the while of the surgeon or physician who is aiming at the highest success in his profession, to become the paid servant of the Government.

1633. That is only an economic argument? Another argument is that there should be a certain amount of public supervision over institutions of this kind, and I think that the Board in this way exercise their functions very well. The fact of the matter is that the hospitals are more under the eyes of the public now than they would be if they were entirely under the Government supervision.

1634. But still they are less under the eyes of the Government. Do you think that if this hospital in Macquarie-street had been severely under the inspection of the Government, its cost would have sprung from £40,000 to £200,000 without the knowledge of the Government? That is the fault of the constitution of the Hospital Board, and especially of the constitution given to it by a late Act, when certain Directors were nominated by the Government. It was supposed at the time that, through these Directors, the Government would be able to exercise a distinct influence upon the actions of the Board, but it turned out to be quite the reverse. The Government nominees hold their office for life, and are responsible to no one, and the Government do not like to take the very strong step of dismissing a man from an office of that kind. These nominees know that they have never to come up for election again, and that they can do what they please. I remember on one very important occasion, when the Government proposed what I thought was a very right step in connection with the hospital, that the principal opponent of the action of the Government was a Government Director.

1635. Then it comes to this,—If this hospital is completed, as it would have been completed but for the interference of Sir Alexander Stuart, it would have cost something like £250,000, of which only £20,000 would be private money, and yet the Government is practically ousted from all control of the building—is that a right state of things? No; but the Government were to a certain extent to blame,—they should have kept a stricter watch.

1636. The plans were put before them, and they approved of them upon the information that the building was to cost £50,000. They were not approached again until the Committee had pledged itself to an expenditure of £210,000 as the minimum? I was not in any office under Government at the time, though I daresay that was quite true. The Government regulation now-a-days is, that before the Hospital Directors can spend any money, or before they can draw a penny of Government money, a plan of the proposed building must be submitted and approved of by the Government, and upon those plans the Committee must work. Plans and specifications must be submitted and approved before the Committee can draw a penny of public money.

1637. These plans were submitted and approved of, and then the Committee deviated from them? The only action the Government could have taken then was to refuse to pay any more money.

1638. That is what they did do, and their action led to the stoppage of the works. What I want to know is whether you consider that the Government ought to have had more control? I do not see how the Government could have prevented what happened. Putting the case in the way in which you have put it, it practically amounts to this, that the Board of Directors broke faith with the Government after engaging to carry on the work upon a certain scale by carrying it out on a very different scale.

1639. The Secretary of the hospital said that they did not quite know what they were doing? I did not know the circumstances at the time. I was not acquainted with any of the inner working of the case, and I know nothing whatever of the relations between the Committee and the Government. I only know what the rule now is, and that rule, for the last seven years at all events, has given the Government the most perfect and thorough control over the expenditure of hospital committees in constructing new buildings. The committees cannot spend any money at all without submitting plans and working drawings, which must be approved of, and a letter of approval must be sent by the Colonial Secretary to the committees before they can draw any subsidy.

1640. You think such a thing could not happen again? I do not know what private influence may do—that is an element which no regulation can prevent; but if the regular course of official business is carried out such an occurrence as you described could not happen now.

1641. Now, with regard to the number of beds in the Macquarie-street Hospital. It has been explained to us that the number of beds is determined by the number of windows in the wards, that you must have a bed between every two windows, and, therefore, these wards can only hold sixteen beds each. If we take the building two stories high, and carry out one pavilion, that will give exactly 203 beds. Do you think that that number is sufficient? You retain the south wing?

1642. Yes? Is it included in that accommodation?

1643. Yes? It would be more convenient if you had 220 or 230 beds—you would have an average daily number of 190 or 195 beds occupied, and you must always have a few beds for cases of emergency.

1644. That being so, would you rather have a third story, and provide thirty-two additional beds in that way, or would you complete the second pavilion with three wards of sixteen beds each? Giving a total number of 250 beds?

1645. Yes? And how many beds would it give you if you were completing the three stories?

1646. There would only be two additional wards? That would be thirty-two additional beds. That is a question which I should have to go into pretty carefully, and one which it would take me some little time to consider. I do not think there would be very much difference between the two, but it is objectionable in every case to have three stories.

1647. Sir Alfred Roberts thought that if a second pavilion were built it would check the sea breeze? It might—one would require to study the plans, and see how much of the open space it would occupy. In either case, as I understand from you, there would be three stories of wards.

1648. It is now proposed to put only two stories on the front building? Just so; that was one of the suggestions I made. Taking it altogether, much as I object to three stories, I should be inclined to put a third story on the front of the building in Macquarie-street.

1649. It would be a little awkward, however, to make the two front buildings two stories and the administrative buildings and pavilions three stories? Yes; taking it altogether, I think it would be best to put a third story in the front.

1650. Have you any dislike to westerly aspects? I do not like that aspect at all—I do not think that it is good for a house, or for anything else if you can avoid it.

1651.

Hon. H. N.  
MacLaurin,  
M.D., M.L.C.  
5 Feb., 1891.

1651. The principal wards in this building all front the west? I objected to that at the time when the plans were under consideration.
1652. If we go and multiply the wards in the front, nearly every bed in the hospital will be in a ward having a westerly aspect? When you are in a corner you must make the best of it.
1653. You think we are in a corner? Yes. I think the best thing to do would be to pull down the building and build on a plan to suit, but that would be too unreasonable.
1654. We have spent nearly £70,000 on the work up to the present, and we are told that for £50,000 we could have put up a hospital in brick that would have answered all medical purposes—better than this hospital ever can do? That design was more in accordance with my views, at all events.
1655. Supposing that for £50,000 we could complete in brick a hospital having accommodation for 250 beds, we should have to put that £50,000 on the top of £70,000? Yes.
1656. If we cleared all that has been built away, and spent £50,000 on a fresh erection we should have for medical purposes not only as good, but, in some respects, a better institution than the one designed? Although you had an estimate to do it for £50,000, I question if it would be completed for that. You know that when you once begin to build a number of alterations have to be made.
1657. We have Mr. Dean's estimate that it could be done for £50,000? I know that.
1658. And Mr. Burdekin told us that if the doctors interfered with the work it could not be carried out for twice the money? The doctors had less to do with the expense of this institution than any one. There was a distinct difference of opinion between them and the Board, and they had to give way. Although an estimate has been given for £50,000, we must always allow a certain margin for necessary alterations.
1659. Still, Mr. Dean says that he could, in the present state of the labour market, carry out Mr. Kirkpatrick's design for £50,000? I think if we could get Mr. Kirkpatrick's hospital for £50,000 it would be better than anything we can do with this.
1660. Can we get anything as good on this building? I always thought that Mr. Kirkpatrick's plan was very much better than this.
1661. Could we, by spending £50,000 on the present building, get for medical purposes a structure as good as that designed by Mr. Kirkpatrick? No; I do not think you could. I think Mr. Kirkpatrick's plan would be a better plan, if he could put it up for £50,000, which I doubt.
1662. Then it comes to this: we must waste £70,000 in any case, because we shall have to spend £50,000 to make this building effective, and if we pull down what has been already built it will take £50,000 to put up another building? It would not be such a handsome building.
1663. Do you think that this building will be handsome if it is finished with two stories of brick? As far as it goes it is a very sound, strong building, and to pull it down would delay the completion of the hospital, and continue the risk of fire in the present structure.
1664. Putting the delay aside, and looking only to the question of expense, we should do as well financially if we pulled the present building down and began again? You could then build on a much better plan.
1665. If some one gave us £70,000 for the dressed stone already on the ground, we should be very much happier? I think so.
1666. Some of the witnesses have told us that the best thing we can do is to clear away and begin again? You would not have the best plan you can possibly get by completing this building in the way recommended, but you would have a good building, and it would save a great deal of time if you went on with the building now. Besides, it would be unnecessarily offensive to the Board of Directors to remove what they have built, and thus prove them guilty of public incapacity.
1667. You think that, having gone so far, we had better muddle through? I would finish the building in the way suggested.
1668. *Mr. Garvan.*] You have said that about 200 beds would be sufficient for this hospital;—why do you limit the accommodation to that number of beds? I think that would provide enough accommodation for the serious cases occurring in this part of the town; but I should want about thirty beds beside that for emergencies. I formed my opinion from the experience which I had when I was Medical Officer to the Government, and constantly inquired into the number of patients in the hospital, and the character of the cases there.
1669. Is there a demand for that number of beds? Yes; but at the present time there are always a few patients who are admitted because they must be admitted somewhere, but who need not go into such an expensive place as the Sydney Hospital if we provided accommodation for them in a cheaper chronic hospital. When I speak of 200 beds, I say that with that accommodation you will only be able to provide for severe cases, which must be taken in.
1670. Those severe cases will not necessarily come from the immediate neighbourhood of the hospital, but they may come from the country? Mostly, they come from round about the Circular Quay, Woolloomooloo, Surry Hills, Lower George-street, Kent-street, Clarence-street, Sussex-street, and those places.
1671. Are there not a considerable number of cases requiring severe surgical operations which come from different parts of the colony? There are always a few, but not many in comparison with those coming from the city.
1672. You do not think that the cases from the country will increase very much? I do not think so, because such cases can be as well treated in the Prince Alfred Hospital. What makes it necessary for us to have this hospital in Macquarie-street is the requirements of the population of the city itself. The number of persons who die in this hospital within forty-eight hours of admission shows that there is a constant stream of persons there so dangerously ill that they could not bear to be carried any distance.
1673. You think that 200 beds will always provide accommodation for such cases? I think if we could have an average daily number of 200 beds that would provide for the requirements of this part of the town.
1674. Is there any objection, from a medical point of view, to concentrating a larger number of patients there? I think that there is not space there for a very large hospital. I think that about 200 beds is what one would like to have, considering the site.
1675. Have you considered that the land is alongside the Domain? Yes; but however good the surroundings of a place may be, one must not crowd it too much.
1676. You think that anything much over 200 beds would be crowding it dangerously? I think that it would be injudicious to provide more accommodation than that.

J. Horbury Hunt, Esq., President of the Institute of Architects of New South Wales,  
sworn, and examined :—

- J. H. Hunt, Esq.  
5 Feb., 1891.
1677. *Chairman.*] You are President of the Institute of Architects? Yes.
1678. How long have you held that position? About two years. I was one of its founders in 1871.
1679. You have been in practice as an architect in this colony for a great number of years? I have been in active service for nearly thirty years.
1680. Has the practice of your profession led you to study any particular branch of architecture, or have you been engaged in architecture generally? Generally.
1681. Have you had much to do with hospital architecture? I did at one time give it considerable study, and at the present time I possess a very good library on hospital planning and construction generally; but things have been worked so strangely of late in our profession in regard to these matters that it is hardly worth one's while to offer his services, since those services are so many times sought in a manner which puts it beneath the dignity of a man who has any respect for his profession to offer, viz., by public competition.
1682. During the time you have been practising your profession, have you actually constructed hospitals? I have not, except the Hospital for Sick Children, which was not of much importance, and I have prepared designs for the Catherine Hayes and the Armidale Hospitals. In conjunction with Sir Alfred Roberts, I prepared, some years ago, a design to show what might be done in the arrangement of modern hospitals for our country towns. With your permission, I would like to refer to competitions in hospital buildings, and I will give instances to support what I have to say. Those hospitals designed under the competition system, are, I think, all of them unsuccessful. In my position as President of the Institute, I, with a few others, am endeavouring to get this system of competition put upon an honorable basis, more especially since the Government is now going to become a large patron of our profession—public works of the colony are to be given out to public competition; and I go so far as to say that there is no question pertaining to our building operations that is of more importance than this. I have been assisting the Minister, and Mr. Barling, and Mr. Vernon to try to frame a system of rules for public competition that will make the promoters, whether Government or private individuals, on the one side, and members of our profession on the other, respect the conditions issued, and that shall make the conditions binding on both parties.
1683. We are now engaged rather in considering a specific work than in inquiring into the general system of dealing with architects in connection with hospital construction, and we are anxious to get from you, as far as we can, your knowledge of the circumstances surrounding this hospital in Macquarie-street? I would beg a little indulgence but for a few moments. The opportunity of showing what these competitions have come to may never occur again.
1684. I am afraid that that is not our business? The evidence which I will give you will, I assure you, be most valuable to this Committee in dealing with public works which will come to you in the future under competition.
1685. There is a great deal of evidence which would be valuable to us which we have not now time to collect;—are the circumstances to which you refer connected with this building in any way? Well, I will confine my remarks strictly to this building. I am not a competing architect, and during all the years in which I have practised I have only entered into three competitions, in one of which I was successful. I was, however, asked by one of the Directors of this hospital to send in a competitive design for this work; but although I had been successful in the Catherine Hayes Hospital drawings, which were sent home to Miss Nightingale, and approved of by her, after those drawings came back a competition was brought about and determined in favour of Mr. Rowe, so that my labour was thrown away, and that bitter experience made me say "it was no use for me to touch this work under the strong conditions laid down, by which the competitors were bound to supply a certificate from a competent builder, to be forwarded with their design, in proof that it could be carried out for £45,000." In the event of it being proved that an architect's design could not be carried out for that sum it would be thrown on his hands, and he would not be entitled to his commission. I said, "It is impossible to undertake the work you have laid out there for the money. You will not see it many feet above the ground for £45,000." I do not wish to name the gentleman, he is now very old, and he said, "Mr. Hunt, do you suppose we are going to stick at £45,000 for a building that we take a fancy to," but I said that that would not be according to the conditions. The designs were exhibited at the Town Hall, and I took a great deal of interest in them, and I wrote a strong protest against the adoption of this design.
1686. Mr. Rowe's? The design that obtained the premium. I was not a competitor in this case, though I took a professional interest in the work, and two other designs were sent in which I considered very much superior to that selected—one was by Mr. Kirkpatrick, and the other by Mr. Backhouse. I named their mottoes in a letter which I wrote to the Press, and I did all I could to prevent Mr. Rowe's design from being carried forward. You see, as a rule, when these competitions are entered into the drawings that are sent in are never adhered to, and with all respect to Mr. Rowe and to other keen competing architects like him, I say that it is the object of the successful competitor, when his design is brought before the Board, to get it quietly shifted to one side by constant amendments on amendments, so that he shall be free from the contract entered into, and get something else done. If the original design were exhibited here and compared with that before the Committee you would see the great difference that there is between them—not only is stone substituted for brick, but one thing hitches on to another until the building becomes much more costly than was first proposed, while the architect eventually gets to be exonerated from all blame, because the Directors have themselves departed from the conditions first laid down. I looked upon Mr. Rowe's design as an unsuitable building to be placed on such a limited piece of ground as the site of this hospital is. He wanted to provide more accommodation on the land than it would carry.
1687. You objected to the design? Very strongly.
1688. Had you special reasons for doing so? Yes; because I felt that the competitor had violated the conditions laid down.
1689. That is that the design was estimated to cost what it could never be carried out for? He produced a design which could not have been carried out for £45,500.
1690. Was that design accompanied by a builder's certificate? I do not know about Mr. Rowe's design, but I know that Mr. Kirkpatrick's design was supported by a certificate from a well-known builder, Mr. Alexander Dean, and with the greatest respect for Mr. Dean ——— 1691.

1691. Can you tax your recollection to say that a builder's certificate accompanied Mr. Rowe's first design? I am sure there was not a builder's certificate with it. I know the position which I am in, and I am as certain as possible that the only man who supported his design by a builder's certificate was Mr. Kirkpatrick. I do not think he had left Mr. Blackett at that time. He was just starting in life, and was naturally anxious to make himself as secure as possible.

1692. Had you any objection to the design, except from your conviction that it could not be carried out for the price named? Would you allow me to explain one word more in regard to this certificate? I should like to point out to you—and I do it with the greatest respect to Mr. Dean—that no architect or builder can state a price for a building of that character by measuring it per cubic foot and give a certificate that would be worth the paper it was written upon. It is utterly impossible for a man to estimate the cost of a building per cubic foot if he has had no experience of that kind of work. With regard to the cost per cubic foot of the building in which we are assembled, and of the Lands Office, I was informed that although both buildings came out of, and were under the supervision of the same department, there was nearly 20 per cent. difference between them, and the style of architecture, as you see, is the same for both. That proves the fallacy of this system of estimating by cubic measurement. It is very well for wool stores or blocks of warehouses, when a number of them have been constructed from which you can get an average, while a fractional part of a penny per cubic foot in 100,000 or 1,000,000 cubic feet makes a great difference. The only way to get a true estimate is to finish the plans accurately, with all details, and then take the measurements, as they are taken in England, by quantity surveyors.

1693. You did not go particularly into the character of the design as far as its usefulness for hospital purposes was concerned? Yes, I did.

1694. Did you object to it on that ground? I objected to it on every ground. I thought it was an unsuitable design for the site.

1695. Do you think the site a good one? I do.

1696. Do you think it worth the expenditure proposed by this design? Yes, for a suitable building; but I think that the design is unsuitable for the site. It is too lumpy, and altogether unsuitable for a hospital. I do not know whether you are acquainted with this publication,—“Johns Hopkins Hospital.” This book was published for private circulation. A committee were charged with the erection of a hospital at Philadelphia, and they sought the assistance of five of the most able physicians and surgeons in the United States and England, whose suggestions and plans are here published. The Committee followed these suggestions, and had designs prepared accordingly, instead of having a sort of free fight competition among men who had no experience of the matter brought before them.

1697. Have you given any special attention to the accommodation provided by Mr. Rowe? I will not venture to criticise that. Although Mr. Rowe and myself are not at the present time on speaking terms—he is leading one section of the profession, while I am at the head of the Institute of Architects, and things have not gone on very smoothly between us—still, I am willing and ready at any time to assist him, or the Directors conjointly, with my advice pertaining to the construction of this hospital, and I think that if all hard feeling were put to one side this work could be carried through successfully.

1698. That is the building already begun? I would drop down the side wings, as proposed by Mr. Rowe, and as shown on the lithograph which I have here. These designs were worked out some ten years ago, but if a man of even less experience than Mr. Rowe were planning a hospital now he would plan it differently from this, because hospital architecture has walked ahead immensely since then. But I think that if Mr. Rowe, the Directors, and all hands buckled to, and worked with a will, this plan could be modified so as to meet requirements, without sweeping it all away.

1699. You could not tell approximately what the cost would be? I have always avoided giving these guessing estimates. The same thing occurred in connection with the Walker Hospital as occurred in this case. Architects were asked to compete for a hospital costing £27,000, and now contracts have been accepted for a work costing £46,000, though that is a private matter, nevertheless an unjust competition.

1700. *Mr. Tonkin.*] Do I understand from you that it is a usual thing with architects entering into competitions to send in plans that they know perfectly well cannot be carried out for the amount stipulated? It is a disgraceful practice, and becoming a common one.

1701. Is it done by the respectable class of architects? There are a certain class of men who push business, and if they are very pushing they are looked upon as very clever men.

1702. That is as a kind of clever blacklegs? No, they are generally acknowledged;\* and then there are some directors and members of the competitive committees who delight in this vicious system. I look upon the system as pitting one man against another to see who can tell the biggest lie on paper.

1703. Is this generally done? It is getting to be so general that it is of very great importance, and you will have any amount of this sort of work to deal with by-and-bye. I desired that my evidence pertaining to this vicious system of competition should be a warning note to the Secretary for Works, and make him the more cautious as to how he frames conditions that should be binding on both parties.

1704. How many architects are there in Sydney who would not lend themselves to this kind of thing? Perhaps half a dozen out of fifty are strictly non-competing architects.

1705. Have you made a study lately of hospital improvements? I am a very close student of my profession, and I study and read everything that comes before me, whether it deals with hospitals or anything else pertaining to my profession; but it is almost lost time, because you get no chance to use the knowledge you acquire. I was invited to draw a design for the hospital at Armidale, and, assisted by Sir Alfred Roberts, I sent in a design, but in their conditions they did not allow so much for the whole hospital as was required for the administrative department; and when I wrote to the Secretary and inquired if this was not a clerical mistake, he wrote back to say that the Board were quite able to manage their own business—in many instances the secretaries of these competitive committees treat our men as if we were pick-ups from the street. I replied, saying that any gentleman who had built a four-roomed cottage would see that the work could not be done for the money. In spite of my written warning as to cost my design was accepted. A law action arose out of the case, which went to the Supreme Court, and I won it, much to their discredit.

1706. You have been carefully through these plans? Not at present with the care that an architect should give to them.

1707. You know the positions of the wards, closets, operating-rooms, and so on? I have not seen these plans for many years before yesterday.

1708.

\* NOTE (on revision):—There is a class of men who, by persistent pushing, eventually get to be considered very clever men.

- J. H. Hunt, Esq.  
5 Feb., 1891.
1708. I want you to point out on them something that you are perfectly clear is wrong, according to the advanced knowledge of hospital science? Well, it is considered a bad thing to have a bed in a corner. The medical men always tell you that the cases in the corner beds progress most slowly, though this fault in planning was excusable when the plans were designed.
1709. Is there anything else which you see to be objectionable? Another objection is the stair communication. The stairs continue from the top to the bottom in the ordinary way, and make a big draught funnel, communicating with the wards through the lobbies. This, although it would not have been criticised then, would be severely criticised now.
1710. What is the modern improvement? To disconnect the wards as much as possible.
1711. Supposing they had lifts there, would they be outside? Yes. This is one of those features of hospital buildings which would be picked out quickly by the youngest medical man who might be criticising the design.
1712. Do you know how far the construction has gone up to the present? One story.
1713. Has it gone on too far to prevent the necessary alterations from being made? No; as I have said before, if all ugly feeling were put on one side, it might be done.
1714. Is it necessary for all the architects in Sydney to come together to make these alterations? No.
1715. How many would it be necessary to bring together? Another architect to act with Mr. Rowe as a mediator. He would be a consulting architect. If the Board were to select a man to help them and Mr. Rowe, he would act as a mediator, and could render a great deal of assistance.
1716. Do you know what is the estimated cost of finishing this building? I only know what I have read and seen here.
1717. Have you looked over the estimates? Yes; last night I read over this report of 1887.
1718. Do you think that Mr. Rowe is in a position to make an estimate of the cost of finishing the buildings without taking out the quantities and so on? He ought to be. A builder would require all of the details and specifications to be fully written out before he could be certain of the architect's intentions; but the architect himself has his intentions in his brain, and can make an estimate without specifications, because he knows what he has to do.
1719. Then, am I to understand from that that Mr. Rowe knew, at the time he started the present building, that they would cost £210,000? He ought to have known; but I think that Mr. Rowe is not all to blame, and that if the blame could be equally weighed a very large proportion would be divided among the Committee. He who knows least on the committee generally has most to say, and when he gets everything and every person into a mess, draws out and leaves the poor architect to stand in the breach.
1720. Is there anything else in these plans that you think should be altered? If I had a clear piece of ground to work on I should produce a very different design from that, and so would Mr. Rowe with his present knowledge and experience.
1721. Do you think it would be advantageous to pull down what has already been erected? No; I think it would be a great sin.
1722. Can you suggest any improvements, then? You could save a good deal by dropping down the front part, as proposed by Mr. Rowe. [*Witness here described on the plans the alteration he wished to suggest.*] You have had the opinion of medical gentlemen, which is of much more value than mine. I know that those of repute in the medical profession say that a one-story hospital is the most perfect you can put up; that two stories are admissible, and that anything after that reduces the efficiency of the hospital. Three stories are not so good, and four stories are very bad; though in a limited space, such as this, you cannot altogether go by that rule.
1723. If 250 beds are required, and that accommodation cannot be found without building a portion of the hospital three stories high, would you recommend that work? I would not recommend the carrying of the Macquarie-street front more than one story high.
1724. *Mr. Lee.*] One story higher than it is at present? One story beyond what it is now.
1725. *Mr. Garrard.*] Two stories and a basement? Yes.
1726. *Mr. Humphery.*] One less than shown on the design? Yes.
1727. *Mr. Tonkin.*] You would carry it out according to the design, except that you would have a story less? Yes. I also think the towers might be dispensed with, they are utterly useless. A less expensive roof over the whole.
1728. Would that affect the style of the architecture, considering that we have spent £68,000 principally on show? I think the towers in the amended design look much better than those in the original design. The original design looks too much like a coffee palace.
1729. *Dr. Garran.*] If you put another story on what is already built, would you make it of brick? I would not disgrace the name of the colony by patching a national building which has been started in stone with brick and cement, but I would never have built with stone in the first place. Our sandstone is the worst material possible for use in hospital construction.
1730. Would you put brick at the back? No; in a public building you should have all sides as fronts.
1731. Would you sacrifice the health of the patients to appearance? No; but as you have started I think you will have to go on.
1732. Having made one blunder we must blunder on to the end? That is what you must do, yet amend as you go. A plastic double pressed brick would be an unequalled material.
1733. The hospital should never have been built of stone, and since the building will probably last 100 or 200 years, would it not be better to clear away what has already been put up, and build with brick on the foundations? Many of the best authorities say that a hospital should not stand more than twenty-five years.
1734. They say now that with the new antiseptic treatment it may last indefinitely. You would not clear away what has been put up down to the foundations? If you did that, better to clear everything away and take advantage of the newest designs. You should not then stop at the foundations.
1735. Would you take down one story and build it up again with brick? I would not patch any part of it with different material.
1736. You see those little projections for closets, &c.—are they very expensive? They should be built with thinner walls. I would keep the exterior walls of stone, and modify the inside walls wherever possible.
1737. Three of these walls must be of stone? Yes; but all the sub-dividing walls could be brick.
1738. Then you would go on piling up stone when brick would do? Well, just fancy what the building would look like otherwise,

J. H. Hunt,  
Esq.  
6 Feb., 1891.

1739. Would it not be cheaper to pull it all down? I think you should go on with the stone. With the saving you could make in several ways, the expense of stone would not be much more than the expense of stone facings and brick; but the stone is very bad. The stone of this building in which we are is fretting away, and from the fronts of some buildings you can scoop out pecks of disintegrated sandstone.

1740. If we are going to put up one story more in front, and build up two stories at the back, we shall have a great deal of stonework? Yes, and you would have to protect the parts that decay by painting, as they are now doing at the A.M.P. buildings.

1741. Do you recommend us to go on with stone instead of pulling everything down and beginning again? I think it would be better to find out what it would all cost in stone; you would then know your position exactly. If I saw any attempt to finish this building in brick plastered over with cement, I should oppose the proposal in the Press. It would be a crying shame to do the work in that way.

1742. If we are to build with brick at all we must pull down what has been already built, and you cannot say whether that is the best plan? If you go that far I should certainly say clear everything away.

1743. *Mr. Lee.*] Are you aware of the various estimates of cost given for the completion of this building? I only know what is here in the report before me; I have no other knowledge.

1744. Are you aware whether there is a specification in connection with the original or amended plan;—the amended plan is to carry the building two stories high instead of three stories? I have never seen it.

1745. Would it be possible for an architect or builder to give an accurate estimate of cost without specifications? The architect himself could, with such elaborate drawings as those now before us, but a builder could not.

1746. Could any other architect besides the person who designed the plans make an estimate? He should go nearer to a correct estimate than a builder would; but I should not like to put my valuation against Mr. Rowe's. He knows every little thing for which he is going to provide; he has it all in his head.

1747. This is not after all greatly a rule of thumb? No; not with properly prepared drawings. It would be with competitive drawings, and that is the cause of all this trouble.

1748. The Committee want to arrive at a definite estimate of the cost, and would like to ascertain what is the best way to get at it? Through the architect.

1749. Supposing it were thought desirable to have the assistance of an outside architect, would he be able to make an accurate estimate? He might, but it would not be so reliable as the estimate of the architect who designed the plans.

1750. In any case it would be merely an estimate? No, not with such drawings as these.

1751. But, in the absence of a specification, it is very hard for any man to prepare an estimate of cost? The specifications convey to a second or third party the architect's intention, while the architect himself knows his own intentions without writing a specification.

1752. I quite apprehend that; but supposing it were desirable to check the architect's figures, how could that be done? You could not do it without a specification.

1753. Is it your opinion that, to arrive at an accurate estimate of the cost of these buildings, it will be necessary to have a specification prepared? Yes; if you want builders to give you an estimate.

1754. *Mr. Garvan.*] You see that the casualty ward is below the ground level;—is it desirable in a hospital to have patients underground? Most undesirable.

1755. Even though that floor is only underground in front, you still condemn it as a ward for patients? You might excavate a clear area out to the line of street; that would give more air.

1756. *Chairman.*] Then you would have to go down from Macquarie-street? Yes; you might bridge across as well.

1757. Would not that take away from the sightliness of the structure? It would make the ward more healthy—better ventilated.

1758. *Mr. Garvan.*] Would it not have been better, instead of carrying out your suggestion, to have had the foundation 3, 4, or 5 feet higher, so as to make the floor level with the ground above? Mr. Rowe had to contend with the fall of the ground at the back, and he has in a sort of way halved the difference.

1759. Do you think that that was the best thing to do with the ground? He could not have done very much otherwise with the slope of the ground.

1760. You said that it was undesirable to have a ward underground? Yes.

1761. But then you say that what has been done was the best thing for an architect to do? No; I say that now that you have got the ward below the ground line, you can cut right away to the Macquarie-street alignment.

1762. Would you alter the elevation of the plan? You would not notice it from the other side of Macquarie-street, or even from the kerb-stone on the same side of the street. You would only notice it by walking right up to the wall and looking through the railings. I wish that was the worst difficulty you had to contend with.

1763. *Mr. Dowell.*] You have informed the Committee that you have a copy of the terms and conditions with regard to the competitive designs for the new hospital in Macquarie-street—those are the designs before the Committee? No; the competitive designs are not here.

1764. Well, these are amended plans? Yes; they are re-cast.

1765. You informed the Committee that you had a copy of the conditions? Yes; you had to pay £1. 1s. and copies were given to you—we have to pay these competition promoters to tell us what they want.

1766. You also informed the Committee that one of the conditions was that if the architect's estimate was exceeded, he would have to go without his commission? Yes; he would be thrown out.

1767. Which is the clause that says that? Clause No. 1 gives the Board power to reject designs that do not comply with the conditions, and, therefore, they would have power to reject a design costing £60,000, because they had stipulated that the building was to cost £45,000.

1768. There is nothing there about commission; would you not like to amend your evidence in this respect? I would amend it by saying that I interpret the conditions to amount to this: That if a design exceeded £45,000 the architect was disqualified from receiving a premium—failing to receive a premium he could not secure a commission.

1769. You told the Committee that you had had some experience with competitive designs, and that one of your designs was successful? Yes; but I had nothing to do with this competition.

1770. What was the practice adopted in the competition in which you were successful;—first you sent in a sketch plan? Yes; regular competition plan to a small scale.

1771. You sent in competition drawings, and afterwards prepared working drawings and specifications for the carrying out of the work? Yes; after adoption.

1772. Should not a specification have been prepared when these plans were accepted, to have entitled Mr. Rowe to carry out the work properly and to give the fullest information to the Directors? He would have to do that.

- J. H. Hunt, Esq.  
5 Feb., 1891.
1773. Mr. Rowe has informed the Committee that no specification has been prepared to guide the Directors up to the present time? I think there must be some error there, because he has built one portion of the building, and the specification that would be required for that part would be required for the whole building.
1774. Mr. Rowe has informed the Committee that no specifications have been prepared to complete the remaining portion of the building, and that it would take two months to prepare such specifications; is that irregular or is it not;—when once a design is accepted, should not specifications be sent to the Directors so that the work might be carried on? This has been more than accepted—it has been partly carried out. The specifications for the first part of the building would guide them for the whole of it.
1775. Is it not right and proper that the architect should furnish the Directors, for their guidance, not only with plans, but also with specifications for the whole building? I suppose it is only an appendix or a few pages that are now required. The specification-in-chief must have been supplied to the builders who carried on the work.
1776. Are you in a better position to give evidence as regards the matter than is Mr. Rowe himself, who has stated that no specifications have been prepared for carrying out the remaining portion of the building? Mr. Rowe must know his own business better than I do.
1777. Was it not a very irregular practice for an architect's plans to be accepted by a Board of Directors without his furnishing specifications for their guidance, so that they might arrive at a correct estimate of the cost of the building? Yes, if such is the case.
1778. Would it not also have been the usual practice to have had the quantities taken out? That is a practice only now coming into use. At that time there was not a quantity surveyor in the colony, and now there are two in Victoria, and the Sydney builders and contractors have one in this colony.
1779. The architect would take out the quantities? Yes; he could do so.
1780. You have informed the Committee that, in designing a large building like this, you could carry the whole of the particulars in your head and arrive at an estimate? Yes.
1781. Would you not have to take out the quantities for your own guidance? I would scribble out bits of specification here and there, but I would not want such a specification as I should have to supply to a builder.
1782. You condemn the system of cubing? I do.
1783. Therefore you substitute something in its place? But there is no analogy between the two systems—one is as irrelevant to the other as the design of the Chairman's chair is to the architecture of this room.
1784. You, as a professional man, say that of late very great improvements have been made in hospital designs? Yes; and I repeat it is not fair to judge these plans prepared so many years ago with our knowledge of to-day.
1785. Would it be desirable or advisable that the Committee should recommend that this design should be carried out when you state that there are very many improvements which could be made in it? I say that there has been a great waste of money, but I think that the difficulties could be surmounted if all buckled to with a will, and worked together harmoniously. If they are pulling against each other, as I understand they are, what heart can the architect have in his work.
1786. Are the internal arrangements and general designs such as you would recommend the Committee to accept? You could not get away from them now; but improve when you can as you go on.
1787. Still you, as a professional man, say that the design is defective and faulty, and not up to the requirements of present scientific knowledge? Yes.
1788. Have you any suggestion to make to the Committee on the score of working expense? No; that is a question that belongs to the doctors.
1789. It does not come within your province? Not as an architect.
1790. Not to provide for the economical working of the hospital? The architects and doctors must work together. We should be guided by the doctors.
1791. Would you play second fiddle to the doctors? I would play third fiddle to them in many things, and be glad to have their support and assistance in a work of this kind.
1792. Under the circumstances, what do you think is the best thing to be done? Buckle to, consider it with the architect, and then see what can be done.
1793. But you are aware that there is no friction between Colonel Rowe and the Directors—they are on the best of terms? I know that some of them are not.
1794. *Mr. O'Sullivan.*] Your chief objection to the plan appeared to be that the buildings are too large for the site? They overdo the sight.
1795. If it is proposed to reduce the eastern pavilion and to get rid of the buildings at the back of it, will not that do away with your objection? I should like to retain it—the central line of wards.
1796. It has been suggested that the second part of the eastern pavilion should be abolished altogether;—do you think that that would be desirable? The medical men are, I suppose, the best to determine that; but I should prefer to build the central part straight through to the Domain boundary, and keep down the side wings facing Macquarie-street.

TUESDAY, 10 FEBRUARY, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. WILLIAM JOSEPH TRICKETT

The Hon. GEORGE HENRY COX.

JACOB GARRARD, Esq.

HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.

WILLIAM SPRINGTHORPE DOWEL, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM MCCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

Hon. R. R. S.  
Bowker, M.D.

The Hon. Richard Ryther Steer Bowker, M.D., F.R.C.S., M.L.C., sworn, and examined:—

1797. *Chairman.*] You have been practising in Sydney for a considerable time as a medical man? Yes.

1798. And you have taken some interest, at various times, in the Sydney Hospital? Yes.

10 Feb., 1891. 1799. You are aware of the circumstances under which the new buildings were commenced? Yes. 1800.

1800. Were you then a member of the medical staff of the hospital? Not of the Sydney Hospital.

1801. Have you been at any time? Never, at any time.

1802. Did you give much attention to the different projects that were submitted at this time? I saw a project for building a large general hospital within the city of Sydney, and I knew positively that to do that was to sacrifice a number of innocent lives, so I therefore did all I could to oppose the project.

1803. You have opposed the design submitted? I have always opposed the building of a large general hospital, such as the one now in contemplation, within the city, for the reason I have just stated—that I know it would sacrifice a number of innocent lives.

1804. Do I understand that you propose the erection of any hospital building on this site? A small emergency hospital, in my opinion, might, or might not, be erected there. Such a hospital would do very well there, except that the position would not be quite so convenient to the locality from whence most of the patients come as a site which has been mentioned might be; I refer to the Flagstaff-hill. I never busied myself as to where this hospital should be. My object was to oppose the building of a large general hospital in this position for the reasons which I have stated.

1805. You have been consistent in your opposition to the erection of a large hospital on this site? I moved a motion in the Assembly ten years ago to the effect that it was not expedient to build a large general hospital—that is a hospital above a certain size, I forget the number of beds I mentioned, but I think sixty or seventy, to provide for emergency cases—on this site.

1806. You did not consider the competitive designs or plans very much one way or the other? No; the whole design—the building of a large hospital of over 200 beds on this site—was the matter to which I gave my attention.

1807. You have not considered the plans upon which the present structure was commenced? No.

1808. You have not considered the plan which was sent in by Mr. Kirkpatrick? No, except that I know that all the plans provided for a large number of beds—a larger number than, according to my notions, and to those of the scientific authorities of the day, should have been provided for.

1809. How many beds do you think there ought to be in this hospital? I should think certainly not above seventy—just sufficient to make it an emergency hospital.

1810. And you think the site the best for an emergency hospital? I think you might probably have a more convenient site. If it were, perhaps, in a more convenient or nearer place you could not object to it.

1811. Do you think that the site is too large and too expensive for a mere emergency hospital? Decidedly too large.\* If an emergency hospital were placed there the elaborate structure now designed would, according to my notions, be of no use whatever, but rather a hindrance.

1812. You are aware that already a large expenditure has been incurred in carrying out Mr. Rowe's design? I have considered that, but as in former times it was found necessary to pull down the hospital because it was unhealthy, so it will be found necessary to remove this hospital for the same reason.

1813. Do you recommend the completion or the demolition of the building? I am not an architect, but my notion is that it should be used for some other purpose if possible, or if it could not be utilised for any other purpose that it should be pulled down.

1814. Have you any reasons which you wish to give to show that the site is objectionable for a general hospital? Well, it is exposed to a more unhealthy atmosphere than a hospital a little way out of town would be exposed to. A town atmosphere is called by scientific writers *malaria urbana*, that is, an atmosphere impregnated with obnoxious elements which make it unhealthy for people who are well, and especially unhealthy for people who are sick. The atmosphere is made unwholesome by the breathing of so many people and by putrid human emanations. I have late modern works to substantiate what I say, together with my own knowledge and common sense.

1815. You think that these objections apply pointedly to this particular site? When the westerly wind blows it brings to that hospital an atmosphere laden with these mephitic human exhalations. It is known by experience that patients recover better in a healthy atmosphere. The late Franco-Prussian and American wars have been experiments on a very large scale on the sanitation of hospitals. But anyone may judge which is most likely to conduce to the recovery of patients—an atmosphere laden with these mephitic and putrid human exhalations or an atmosphere such as we should have in the country, fragrant with eucalyptus. Then we should have room for the expansion of the hospital as population increased and more accommodation was required. In every way I thought it would be an utter absurdity to build a large general hospital here.

1816. And with reference to the site as a position for an accident hospital, you think a better site might be chosen? An emergency hospital is a necessity, and we must submit to certain inconveniences and an injurious atmosphere in such a hospital. We cannot help ourselves, because the hospital must be in a place to which patients can be taken at once, though all who can go to the more healthy hospital should be sent there, or else innocent lives will be sacrificed to ignorance.

1817. Then how far from Sydney do you think it would be safe to go with the general hospital? I have not considered that very much. I have not examined the grounds. What I have done has chiefly been to see the faults of the present hospital. But it is the opinion of an authority on the subject—the person who was chosen out of all France to write a work upon hospitals—that within half an hour's march would do. By march I suppose he means transmission by rail or by any other conveyance—anywhere within half an hour. My notion would be somewhere about the Centennial Park, or North Shore, or on the line, or anywhere a little way in the country.

1818. How would that meet the convenience of medical men of skill, such as usually supervise the hospital patients? There would be plenty of medical men to go there, and it is well known that the difference between one medical man and another is counterbalanced by the surroundings and the proper sanitation of hospitals.

1819. You think the same medical skill would be available if the general hospital were moved out of Sydney? Without the least doubt in the world.

1820. Had you anything to do with Prince Alfred Hospital? I never had anything to do with any Sydney hospital. Mr. Frederick Dangar asked me to send in an application, but I had had a good deal of hospital practice, so I declined.

1821. *Dr. Garran.* Have you paid any attention to the question as to whether it is better to build hospitals of brick or of stone? After the Franco-Prussian war it was found that tents were actually more conducive to health than ordinary hospitals; but since then, in America, where they have built temporary hospitals with

Hon. R. R. S.  
Bowker, M.D.  
10 Feb., 1891.

\* NOTE (on revision) :—Instead of site, I mean here the plan.

Hon. R. B. S. Bowker, M.D. with a view to pulling them down after a certain time, they have found that the hospitals have lasted longer than they were intended to last, and that they were an inconvenience, and therefore the science of the day seems to say that brick or stone will do best.

10 Feb., 1891.

1822. Do you know the Pyrmont stone? No, I cannot say that I know it very well.

1823. You admit that we must have an accident hospital in Sydney? I admit that.

1824. And we must have it of 200 beds? Nothing of the kind—it would be a sacrifice of life.

1825. You would keep it down strictly to the accident limit? To accidents and emergencies.

1826. Then the plan before us is altogether too large for your ideas? Altogether too large, and too elaborate; it is not simple enough in construction. It looks to me more like a mausoleum than anything else.

1827. You condemn it *in toto*? Yes; the plan, and site, and everything else, as far as a large hospital is concerned. I may say that a gentleman of very great experience of hospitals in Sydney—of more experience than any one else, I think—Sir Alfred Roberts, thought that about thirty beds would provide enough accommodation. My opinion is that that accommodation would be scarcely enough;—I think that more than that number of beds would be required.

1828. *Mr. Tonkin.*] Under the circumstances do you recommend that we should pull this building down, I may explain to you that it has already cost us £68,000, and that it is said that it will cost as much more, if not £100,000, to finish it. We are also given to understand that we can put up a very good hospital on this site for a great deal less money. Would you, under the circumstances, recommend that the building should be pulled down and another hospital built on the site in conformity with your ideas—a small accident and emergency hospital? I may say that it is found that the healthiest hospitals are those of one story only.

1829. Then you recommend the Committee to advise that this structure should be pulled down, and an altogether new building put in its place? If this building cannot be used for anything else I should have it pulled down. It will certainly save a great deal of expense to pull it down.

1830. You think that under any consideration it should not be gone on with for hospital purposes? Not as a large general hospital, nor as a hospital at all, I think.

1831. Do you think that one accident hospital would be sufficient for Sydney? At present I think it would, but you may perhaps require to enlarge it, and it is even possible that an emergency hospital in another position may be required in future, though at present I do not think it will be required.

1832. Do you think that the site which we are dealing with is the best that can be found in Sydney for an accident and emergency hospital? No; I think a more convenient site might be found.

1833. Where? I have heard the Flagstaff-hill mentioned. That is rather nearer the locality from whence patients mostly come.

1834. Have you made a study of the interior architecture of hospitals so far as late improvements are concerned? I have made a moderate study of them, but what I wish to show is that a large general hospital should not be built within the precincts of a town if it can be avoided. I have also studied the construction of hospitals so far as to be sure that one-story pavilions are the most conducive to the recovery of patients. It was found by Hunter—a very great name in medicine and surgery;—that more people died under exactly similar circumstances in upper wards than in lower wards, and I know that Miss Florence Nightingale, who is a very great authority, perhaps greater than any other living authority on hospitals—although I heard a speech in which it was said that she approved of the plan and position of this hospital—is distinctly of opinion that one-story hospitals are more conducive than others to the recovery of patients. From what she says, and from my own observation and reasoning, I am quite convinced that our hospitals should be only one story high.

1835. Have you had any chance of investigating the details of this plan? No.

1836. Then you do not know the particulars of the interior arrangements? No; the outside arrangements are quite sufficient to condemn the whole affair in my eyes.

1837. Then I understand from you that you think that in the interests of the patients it would be advisable to take down this building, notwithstanding all the money that has been expended upon it, and to erect a hospital for emergency cases and for accidents, having the general hospital at least two miles out of the city? Yes, certainly; though I would add that I do not consider this the most convenient site for an emergency hospital.

1838. But supposing we had to take this site for hospital purposes, you think it would be better to erect a smaller building there? Without the least doubt.

1839. And to put up with the first loss? Yes; because as sure as can be, you would have the same experience as you had before. The old hospital had to be pulled down, because the mortality there was too great, and the same thing would happen again, and this hospital would have to be removed also. One great authority says: "Remove all general hospitals out of town." That is, remove them if they are there already.

1840. The object of having only one story is to prevent contagion from the lower stories? It was found by experience that more patients died in the upper stories than in the lower, and the reason for that was supposed to be that the exhalations from the lower story affected those in the upper stories.

1841. Do you think that that evil could be averted, supposing there were no communication between the floors? Still there is a better circulation of air, and a hospital is more easily ventilated and is healthier when it is only one story high. I have an article here referring to the building of a new hospital at Halifax, in Yorkshire. It is to be of sixteen one-story pavilions, and they are just about getting out plans for it.

1842. Do you know how many beds it is to contain? I will read from the article before me:—

"A new infirmary is shortly to be built at Halifax, and the Committee have invited five architects to send in competitive plans. The new building will be erected on a site in Heath School-lane, but it is not proposed to proceed at once with the building of the entire scheme which comprises sixteen pavilions, an administrative block, and a nurses' house. At present nine pavilions only will be erected, together with a portion of the administrative block and of the nurses' house."

That gives an opportunity, as population increases, of enlarging the size of the hospital—

"The pavilions will all be one story high, but with a basement under—"

to allow the free circulation of the air,

"and will be connected with the administrative buildings by corridors. Of the sixteen to be eventually built, thirteen will each contain one long ward for twenty beds, and a separate ward for two beds

beds. The cubical space in the long wards will not be less than 1,500 cubic feet, and the floor space not less than 116 square feet to each bed, the intention being, apparently, to allow a height of 13 feet to be reckoned in calculating the cubic space." Hon. R. R. S.  
Bowker, M.D.

1843. I suppose you have no doubt that this is the latest scientific mode of constructing a hospital? In Heidelberg they have these wards of one story high, and they have them also in a great many other places. The date of the paper from which I read is April 5, 1890. 10 Feb., 1891.

1844. *Mr. Dowell.*] The nearest approach which we could get to your ideas, without pulling down the whole buildings, would be to put a roof on the structure as it stands;—would you recommend that? No; the present structure is too elaborate, as if it were designed to shut out the air, instead of to allow the air to circulate.

1845. *Mr. Trickett.*] You have stated that you would recommend a hospital of seventy beds for the present? I did not say that number exactly, though that is more than Sir Alfred Roberts—who is a very famous authority on the subject—thinks necessary.

1846. Sir Alfred Roberts has been recently examined by us, and he recommends a much larger hospital than that, even for emergency cases. What I wanted to ask was whether, in recommending seventy beds, you have inquired into the necessities of the case? No; I say I merely guess at that number.

1847. Will you tell us what you meant by emergency cases? I meant broken limbs, accidents of any kind, wounds, and such sudden illnesses as it would not be safe to remove to the general hospital at once.

1848. Would you recommend Lock cases to be treated there? No; outdoor cases might be treated in dispensaries; but those that required other treatment might safely be dealt with at the general hospital.

1849. Would you recommend that ophthalmic cases should be treated there? I am not quite sure about ophthalmic cases. Most of those cases in this country are what they call granular ophthalmia, and it is well known that good sanitary conditions are of first-rate importance to getting them well, and, other things being equal, country air would, without doubt, be better for them; so that I think they would be better treated in the outside hospital, in all probability.

1850. This hospital, as designed, has three stories, besides the basement—do you think that that is desirable? I think that to build such a hospital would be to sacrifice lives on the altar of ignorance.

1851. We have an alternative proposal before us to take it two stories with the basement? Two stories are not as bad as three, but the best authorities say that one-story buildings are most conducive to the recovery of the sick, and therefore I advocate such buildings. We have plenty of land to be able to have the very best hospital accommodation. As Sir James Hector said in a speech at New Zealand, we ought to take advantage of all modern resources, and learn and improve by them.

1852. Do you know the area of land included in this hospital site—it is between 2 and 3 acres? Yes.

1853. How many people do you think we could safely provide hospital accommodation for there on your plan? According to the plan that is recommended by almost everyone, except, perhaps, where rivalry comes in, one-story buildings are the thing. But you could not accommodate so many people with one-story pavilions as you could with two-story pavilions, though an emergency hospital would not require so much accommodation.

1854. You have not calculated how many people we could accommodate on that area with safety? The old plan says you may put eighty to an acre, but I am sure that it is healthier to have much fewer, and that we should have our large hospitals outside, and let the patients breathe the emanations from the gum trees instead of the putrid emanations of man. To my mind it is quite out of the question to put this number or anything like it here.

1855. Do you think that this is a healthy site for a hospital? I have mentioned two or three times that it is not so healthy as a hospital site in the country would be, because of these human emanations.

1856. I do not wish to compare it with country sites, which, of course, would be better, but taking it as a town site, do you think it is suitable for a hospital? It is as good as any that could be got without resuming land. I may say, however, that there may be some reasons against its healthiness of which we do not quite know. We know positively that there was an undue mortality in the old hospital, and that lives were sacrificed there that should not have been lost. The building was pulled down in consequence of this mortality, but perhaps we are not quite sure of all the reasons for it, though we know positively that it took place.

1857. *Mr. O'Sullivan.*] According to the report of the Medical Superintendent of the Sydney Hospital for 1889 there were 1,116 cases of fracture, local injury, burns, poisons, &c., treated in this hospital. Do you think that seventy beds, as suggested by you, would supply that demand for accommodation? The data you give are not sufficient to reason upon. There might be cases of broken arms that could easily be taken to the general hospital outside the city without any harm to the patients. If the 1,100 cases of fracture were so urgent that they could not be removed to either Prince Alfred Hospital or to a hospital outside of the city your question would be answered in another way, but a great many of these fractures, no doubt, might easily have been treated in hospitals outside the city. It was found in the time of war that wounded people could be removed great distances very often without injury, so that your data cannot be reasoned upon, because we do not know the circumstances of the case. We cannot tell how many could have been removed out of town.

1858. *Mr. Garvan.*] You stated just now that the extreme number of beds that you would recommend for this hospital would be seventy; but you have also stated that you attach a great deal of weight to the opinion of Sir Alfred Roberts on the subject, and when you gave your opinion you said that you had in view the opinion of Sir Alfred Roberts that only thirty beds would be required. Now, in the evidence which has been given before this Committee, Sir Alfred Roberts stated that he placed the minimum at 150 beds, and in reply to several questions he stated that he would be favourable to a hospital containing 200 beds. Knowing of that evidence would you alter your opinion? Certainly not. I do not give an exact number, but I think in the motion which I moved in the Assembly I stated that there should not be more than 100 beds, and I say now at a guess that there should be about 70 beds. I think I modified the number a little from what Sir Alfred Roberts said, but I think that 200 is too many.

1859. *Mr. Lee.*] You are acquainted with the present temporary buildings used as the Sydney Hospital? I have only seen the outside of the buildings.

1860. Have you never been through the hospital? Many years ago I attended some cases there for old Dr. Douglas, but for many years I have not been inside of it.

1861. You are not aware of the present condition of that building? I was quite satisfied from the outside of it, and from its situation, that it was altogether wrong, and I did not give myself the trouble to go into it.

- Hon. R. R. S. 1862. You know the material of which it is built? Stone or brick, I think.
- Bowker, M.D. 1863. Mostly wood? The present building?
- 10 Feb., 1891. 1864. I am speaking of the building now in use? Oh, of wood—I know that.
1865. Do you think that that building is suitable as an accident or an urgency hospital for the city? I think some American hospitals have been built of wood, and they have been found to answer every purpose. It was found in France that what they call *hopitaux baragues*, i.e., hut hospitals, were more healthy than large stone hospitals.
1866. Is not such a building exposed to great danger from fire? I think there has been no fire hitherto in these wooden buildings, and I think they ought to be able to do away with the danger of fire—at any rate for a time. A book which I have here says that “in the Boston City Hospital there are two wooden one-story pavilions covered with corrugated iron, built as temporary structures in 1876,” so that in Boston, where the medical men are acute and sharp enough, they have not found these buildings too dangerous. The book from which I have quoted was published in 1886, so that these wooden buildings have been in existence for ten years.
1867. Well, to come back to my question—do you think that the building now used as the Sydney Hospital is sufficient for the purposes of an accident and emergency hospital for this city? I had not the least idea of these wooden buildings being continued. My idea was to have a small emergency hospital in the place of the proposed general hospital.
1868. Are you of opinion that the present building should be removed and a more suitable one erected? I am; but I do not say where it should be erected.
1869. You are clearly of opinion that the building should be removed? Yes.
1870. In view of the circumstances connected with the building partially erected, do you think it would be advisable to complete the structure which has been commenced, and upon which £68,000 has been expended, in stone, at a cost of £56,000, to give accommodation for 144 beds? No.
1871. Now, as an alternative, keeping all the circumstances of the case well in view, would you recommend that this structure be taken down—the stone portion? Either taken down or utilised for some other purpose.
1872. If it is utilised for something else the site will have to be disposed of, and in that case you will have to find another site? So much the better. Although where human life is concerned, I do not think much about expense, yet if we do consider it it would be far less expensive to sell this site and obtain a more convenient one in another place.
1873. But under no circumstances, I presume, would you recommend a large hospital within the city boundaries? Decidedly not.
1874. And you are clearly of opinion that an emergency hospital not exceeding 100 beds will be sufficient? I think it would; I am sure it would be sufficient. But if it were not sufficient together with Prince Alfred Hospital, we could have a general hospital a little outside the city, of which we might all be proud, and which would properly fulfil its work without any sacrifice of life.
1875. Do you not think that within a few years, when the population of the city and suburbs increases, more accommodation than 100 beds will be required? In that case, as I told you a little while ago, it might be advisable to have an emergency hospital in another position, unless there were sufficient land available to increase the existing hospital at Flagstaff-hill or anywhere else. A hospital might, under such circumstances, be expanded if it were not thought advisable to construct another emergency hospital somewhere else.
1876. If we decided to complete this building in stone two stories high, to provide for 144 beds, do you think that it would endanger the public health or the health of the patients in the building? Most decidedly. If one-story hospitals are most conducive to recovery, it is a matter of reason that two-story hospitals are not so conducive to recovery, and some lives would be lost in such a hospital that ought to be saved.
1877. Your evidence would be invaluable if we were discussing the commencement of a hospital, but this inquiry is to see how we can best complete a hospital already commenced? I think that the best way would be not to complete it at all.
1878. *Mr. Cox.*] You know St. Thomas' Hospital in London? Yes.
1879. Is not that a magnificent structure, built on the most approved principles of the science of the day? No.
1880. Is it now considered to be a mistake? It is by a great many.
1881. You would not think it desirable to perpetuate such another mistake in Sydney? Decidedly not. An authority says, “There are differences now in the rate of mortality in different London hospitals, especially with regard to surgical cases, evidently due to defective sanitary conditions,” so that we are not to follow the London example. Here we have an admission from a London writer that the hospitals there are not all so good with regard to sanitary conditions as they ought to be.

Frederick Milford, Esq., M.D., sworn, and examined:—

- F. Milford, Esq., M.D., 1882. *Chairman.*] You are a qualified medical man? Yes.
- 10 Feb., 1891. 1883. You have been practising in Sydney for some years? Yes; since 1858, with the exception of one year.
1884. Have you taken any interest in the proposed hospital arrangements? Oh, yes; I take as much interest in them as most medical men in Sydney, I think.
1885. Have you been on the Medical Board who attend to cases at the hospital? I have been on the Medical Board of New South Wales for some twenty years, but I am not on the Board of Health.
1886. You have had to do with hospital cases? I have been twenty-five years surgeon to the St. Vincent's Hospital, six months surgeon to the Prince Alfred Hospital, and two years at the Brisbane Hospital.
1887. Has your attention been drawn to the different designs which have been submitted with reference to the Hospital Buildings in Macquarie-street? Yes; I had a plan of them sent to me by Sir Alfred Stephen to look over.
1888. You know the nature of some of the designs that were submitted—do you know Mr. Rowe's design, upon which the buildings were commenced? That is the only one I know.
1889. Did you see Mr. Kirkpatrick's design? No, I never did. 1890.

F. Milford,  
Esq., M.D.  
10 Feb., 1891.

1890. You do not recollect any other besides Mr. Rowe's? No; that is the only one I have seen.
1891. Did you examine Mr. Rowe's design when it was submitted to you? Yes.
1892. From your knowledge of hospital treatment and accommodation, did you come to the conclusion that it was a good design? Well, I think it is a little behind the modern designs of what hospitals should be.
1893. Do you think the site is a good one for a general hospital? Excellent—the best in the city.
1894. You do not participate in the opinion held by Dr. Bowker, that a site like that in the neighbourhood of a large city is undesirable for a general hospital? No; I think the hospital should be there for these reasons: first, that the site is in the midst of where the patients come from; and next, that it is in the midst of where the surgeons and physicians attending the hospital reside; so that the doctors can get quickly to their patients when they are required.
1895. You do not think that it is a site that should be used only for a hospital for accidents and emergency cases? I think acute cases should be treated there, and serious surgical cases—I do not think chronic cases should be.
1896. To what extent do you think accommodation should be provided there? I think for from 150 to 200 patients. I would not exceed the limit of 220 patients—that would give 250 beds. I should on no account give more accommodation than that, because there is, as I understand, less than 3 acres of ground there. In England it is held that one acre of ground can accommodate 100 patients, while in France they consider forty to the acre the correct thing.
1897. Do you know the reason of that difference—is it the result of climate? Possibly it is because of the more unsanitary state of the towns in France than in England. The drainage in the former place is not carried on so well as it should be. Even in Paris, a short time ago, the privies were in a very shocking state. That has something to do with it.
1898. Had you much experience of hospital life before you came to the colonies? I came here when I was 10 years old, so that it is not likely.
1899. You are aware of the extent to which this design has been carried out, the amount of money that has been expended, and the state in which the building is now? Yes, I went over it yesterday with Dr. Hall.
1900. Do you think it would be wise for the Government to proceed with the building, or to adopt some less expensive design, or to alter the design altogether? I understand that £68,000 has already been laid out on the walls, and they are, no doubt, very excellently built. I think that if another story were put on the pavilions, as they stand, and the basement story used for patients' dining-rooms, but not bed-rooms, the hospital would, for a long time, be free from hospitalism, if means were adopted internally to prevent it.
1901. Do you know of any better site in Sydney for the purposes of a general hospital than this one? No.
1902. And you think the situation is very good? Very good. I have had an opportunity of knowing, because I was there for four years as a student. I was in the old Infirmary between 1848 and 1852.
1903. Then you would go on with the present building in a modified form? Yes; there is only one thing antagonistic, and that is that the buildings in the neighbourhood are rather close. There is the Mint on one side, the Houses of Parliament on the other, and the private dwellings across the road. The eastern aspect is splendid—they have all the Domain there, and get the sea breezes.
1904. They have all the open space to the sea? Yes.
1905. Do you think that the alteration in design would deteriorate the architectural value of the building very much? I do not think so, with proper ornamentation, and so on. I think that would be a secondary consideration—the main consideration is the patients.
1906. You admit that the site is a very good one, and worthy of a building that would not be a discredit to the city? Yes, but it is important in building a hospital that there should not be more than two stories. In France the Tallet system is carried out with pavilions one story high, on arches. The arches are not covered underneath, but are perfectly open, so that there is a free current of air passing through them. I have got a small chart here showing the system.
1907. What are the main features of the Tallet system? Pavilions of one story, 25 feet high, supported upon a series of arches, which are from 12 feet to 14 feet high. Then there is a wall composed of wrought-iron pillars at intervals of 5 feet, with brickwork in between. The roof finishes in a pointed Gothic arch, and is also made of brickwork, lined inside with plaster, and the plaster is painted. The flooring is of pine boards, and has concrete or cement underneath. The roof is covered with tiles and concrete, and comes up into an arch to allow a free current of air to pass upward, and thus proper ventilation is secured, which is advantageous to the patients. These hospitals can be cleansed either by flame—for they cannot be burnt—or by water. Then the corners of the rooms are rounded so as to have nothing to stop the free flow of air. The walls are hollow to allow of the passage of air up through them, and there are openings in them at intervals of 4 or 5 feet below and above, with valves attached so as to allow the air to enter only below and have exit above.
1908. Buildings of that sort to accommodate a large number of patients would occupy a considerable space of ground? Yes; they only have about twenty patients in each ward, with a wall space of  $7\frac{1}{2}$  feet, a cubic space of 1,500 feet, and a ground space of about 100 feet or rather more. I believe there is one hospital there, St. Eloise, which has 400 patients. That would require ten pavilions, there being two wards in each pavilion.
1909. Is this style of hospital architecture of modern growth? Quite modern.
1910. And is it able to evade what is called hospitalism? That is the idea of it, and I take it that with ordinary care and good drainage hospitalism will be quite avoided.
1911. Is this class of building put up in the large towns? That is in the immediate neighbourhood of St. Eloise.
1912. And where would that be—near Paris? I am not quite sure.
1913. Dr. Garran.] Were you for many years at St. Vincent's Hospital? For twenty-five years.
1914. Was that an effective hospital? Yes, it was very good at times.
1915. Did it give you good results? Excellent results. After the first eight or ten years hospitalism occasionally showed itself in bad cases, but now it is quite got over, and has been for some years.
1916. Do you know what that hospital cost per bed as it stands now? The whole of the land, buildings, furniture,

- F. Milford, Esq., M.D.  
10 Feb., 1891.
- furniture, and everything connected with the hospital, together with the building belonging to the Sisters themselves, cost something like £40,000, and provided accommodation for 150 beds.
1917. Rather less than £300 per bed all told? Yes; that includes everything connected with the hospital.
1918. Of what material is it built? Of stone, and brick, and iron.
1919. Have you any preference for stone, brick, or iron for a hospital? I think the mode of building which I have just mentioned would be the best.
1920. If you had to choose between brick and stone which would you select? I take it that stone would be preferable.
1921. It is more expensive? Yes.
1922. Cannot you make a dry double wall with brick? I take it that good sandstone would not absorb moisture so much as brick does. I am not aware exactly which is the best.
1923. Your experience at St. Vincent's shows that £300 a bed is ample for a useful hospital? There was great economy displayed in the formation of that institution. It was not assisted by the Government in any way, except that at one time £1,000 was given towards it. The people there had to be very economical—everybody tried to do their best to enable the Sisters to get the hospital.
1924. Are you at present at Prince Alfred Hospital? No; I left it six months ago.
1925. You have been there? I have been for six months.
1926. Do you think better results were obtained at Prince Alfred's? No; I cannot say that I do. I had a case of hospitalism there—a case of corymbelias originated in the hospital.
1927. You think St. Vincent's will stand comparison with the other hospitals? Decidedly, with any of them.
1928. Yet it was very much cheaper in construction? I believe so. I really do not know what Prince Alfred Hospital cost.
1929. You have paid some attention, have you not, to the influence of westerly winds on patients? Yes.
1930. Do you think them unfavourable? Decidedly; the cold ones. I do not think the warm winds are injurious.
1931. You do not mind the hot dry wind of summer? No; that is not injurious. I think it is beneficial.
1932. It is the cold biting wind of winter that you dislike? Yes; I think it is most injurious, and I will mention a reason for that: A school which I attend is exposed to westerly weather, and some seventy or eighty pupils board there. That school, as a rule, in north-easterly and southerly winds is perfectly healthy, but directly a strong westerly wind comes the pupils get croup in some cases, diphtheria, and bronchitis.
1933. Is that school at Hunter's Hill? No, it is not at Hunter's Hill; but I will not mention where it is.
1934. If you look at Mr. Rowe's plan you will see that a great many of the wards face the west? Yes; but the hospital is protected by the buildings in Macquarie-street.
1935. The upper stories are rather above the buildings in Macquarie-street? The upper stories are.
1936. Do you think that a disadvantage in the plan? Yes; I think that would be one reason why I should not be inclined to build so high, but only an inferior reason.
1937. We have had a plan submitted to us in which all the western part was given up to administrative buildings, by which the wards were sheltered, running at right angles at the back;—do you think that that is a better design? I think it would be; but as the building is now in existence I do not think it would be worth while to disturb it simply for this reason.
1938. If you had to begin again you would adopt that plan? Yes, or the Tollett system.
1939. Suppose with £70,000 you could build in brick a hospital on that plan, and it would cost you as much to finish the present hospital, which would you do? I would rather use the £70,000 in building another hospital on the same site.
1940. If you had £70,000, and it would either complete this hospital or pay for its demolition and the construction of a brick hospital on another plan, you would rather pull the existing buildings down and build a brick hospital? Yes, if I could get accommodation for 200 patients.
1941. But if it would be very much cheaper to complete the present plan you would complete it? Yes, I would. But on no consideration would I allow the bed of a patient to remain in the basement story. That I look upon as most improper.
1942. Is it not rather a convenience in the case of a broken limb to put the patient to bed without raising him? It might be for the moment, but it would be very inconvenient for the patient if he afterwards got pyæmia.
1943. You think he gets better air upstairs? Yes; I think the basement floor should not be used for any patient.
1944. You object to the accident ward on the ground floor? On the basement I certainly would. I would have that part perfectly free, with as much fresh air as possible passing through it, so as to prevent hospitalism in the future. Under any circumstances you would not get hospitalism for two or three years, but you want to keep the place altogether free from pyæmia or erysipelas.
1945. If you do away with sixteen beds on the ground floor in front, and sixteen beds on the ground floor in the pavilion, you leave no ground floor beds at all? No, I would not. I would use that floor for dining-rooms or music-rooms, or for anything else but sleeping rooms.
1946. Then you take away thirty-two beds from the plan? Well, I do not mind that.
1947. *Mr. Garrard.*] I do not like that to go into evidence. The so-called basement is only in the front part of the building—there is no basement at the back. Dr. Garran is reckoning the back building as a basement, when it is nothing of the kind? The basement is the floor in front—the lowest floor in the front of the building.
1948. *Chairman.*] That would only take away sixteen beds.
1949. *Dr. Garran.*] Do you call the ground floor of a pavilion a basement? Anything on the ground floor.
1950. You object to the ground floor? Yes, because it prevents the fresh air from passing underneath.
1951. *Mr. Garrard.*] If the floor is above the ground, do you not get the fresh air underneath? If it is raised on pillars or arches.
1952. *Dr. Garran.*] How far should the floor be from the ground—1, 2, or 3 feet? On an average 5 feet. If there was a hill the floor would be almost right on the ground at one end, and 10 or 12 feet off it at the other.

F. Milford,  
Esq., M.D.

10 Feb., 1891.

1953. You would not have any part of it nearer than 5 feet of the ground? No.
1954. *Mr. Tonkin.*] I understood you to say that you would not recommend more than two stories for any hospital? Yes.
1955. Would you recommend that the upper story should communicate with the lower story from the inside? No; it would be much better without the communication. The stories should be divided as much as possible, and there should be cement and concrete over the roof of the first story.
1956. So that you would cut off all direct communication entirely, and have a lift or staircase on the outside? Yes; there should not be any communication between them.
1957. If you were told that there is that communication in this building, would you consider it a great drawback? I think it would not be desirable; I think it would be a drawback.
1958. Do you know how long these plans have been drafted? No, I know nothing about them.
1959. Do you think there has been much improvement in hospital architecture during the last ten or twelve years? I think the two plans I showed you are great improvements.
1960. Those are the latest? Yes.
1961. There have been vast improvements during the last ten or twelve years I suppose? Yes.
1962. Supposing those plans to have been perfectly up to the time twelve years ago they would be greatly behind the time now? I think if I had plenty of money and were building a hospital, I should build it after one or other of the plans which I have given you.
1963. Supposing you know that it will cost £70,000 or £80,000 to finish this hospital, and that we can construct a hospital giving the same accommodation on later and improved principles for the same money, would you recommend us to pull the existing building down and to start afresh? Yes, I think so; if you could accommodate 200 beds and do away with the basement, which I look upon as very detrimental to the hospital.
1964. You would build it entirely on the latest principles? Yes, I think so.
1965. You would prefer to do that to finishing the present buildings? I think so.
1966. You think that the health of the patients is of more importance than the appearance of the building? I think so. I think it is just possible that after a time hospitalism might be engendered in that building; but with great cleanliness, perfect ventilation, and good drainage, and the modern anti-septic system it is not nearly so likely as it was twenty or thirty years ago. The old building was full of hospitalism, and constant cases of erysipelas and pyæmia originated in the wards.
1967. At St. Vincent's Hospital is the accommodation equal to what it would be in this hospital? Quite equal—equal to that in any hospital in the world, I think.\*
1968. If that hospital only cost £266 a bed to complete, what would you say if you were told that the estimated cost of this building is £800 a bed without land or furniture? I really do not know anything about it.
1969. But, as a man of common sense, would you not think that it would be a waste of public money to pay £800 a bed for a building when an equally good place in every way could be built for something over £200? I think it would be better to pay the lesser sum than it would to pay the larger.
1970. Do you think it is necessary for hospitals to be built in such an elaborate manner as to appear to be made for show—for the ornamentation of a city? I think it would be better to have buildings that would please the eye as well as cure the patients.
1971. Would you advise the expenditure of the difference between £266 a bed and £800 a bed for the express purpose of making the outside of the hospital ornamental? No; I would not, though I would give a little more to improve the appearance of the building. I would rather not answer these questions, because I really know nothing about the matter, and I think the Committee are better able to answer them.
1972. *Mr. Dowel.*] You consider that a very great and fatal mistake has been made in the design of this building by constructing a portion of the first floor below the surface level of the ground, do you not? Yes; and in designing it for beds. I think there ought to be a free current of air underneath the first room that is used for patients, as there is now in the wooden building, which is supported by pillars. There is a fine current of air underneath that building.
1973. If the lower portion of the building, or the ground floor, were used for purposes independent of hospital purposes, you would have no objection to that particular floor? No; with great cleanliness, good ventilation, good sewerage, and the antiseptic treatment of patients.
1974. You have stated to the Committee that you consider that this building should not exceed two stories in height? Yes.
1975. Then you recommend that a roof should be put on to the present structure as it stands? No. I would add another story and so dispense with the basement.
1976. *Mr. Trickett.*] Do you consider the site a good one? Yes, I think so. I do not think the hospital would be so good with three stories as with two.
1977. On some former occasion did you not say that there were objections to the site? I do not recollect, I may have said so.
1978. Did you say anything about the Nightingale wing. Do you remember saying that it interfered very much with the north-east breezes? I may have said so. I said to-day that the buildings were too near to other buildings.
1979. You stated when you were examined before the Legislative Council that the hospital is protected against the sea breeze by the structure called the Nightingale wing, which interferes with the free air of the main building; then you said that if the Nightingale wing were taken down this would be the most suitable site in Sydney for a hospital? Yes; I think the Nightingale wing is a disadvantage there.
1980. Would you still recommend that it should be removed if the large structure were put up? Yes, I think so.

Walter Liberty Vernon, Esq., Government Architect, sworn, and examined:—

1981. *Witness.*] I should like to explain that I am giving evidence entirely on my own responsibility. I am not giving official evidence. I am here simply as an individual. I W.L. Vernon,  
Esq.

1982. *Chairman.*] Have you been engaged in practising your profession in Sydney very long? About eight years. I have been practising my profession about eighteen years altogether. 10 Feb., 1891.

25—K

1983.

\*NOTE (on revision):—I allude here to the new portions of the building.

W. L. Vernon, 1983. You were ten years before that? In London.

- Esq.  
10 Feb., 1891.
1984. Have you had any experience during the practice of your profession, either here or in London, in hospital matters? I have no wish to give any evidence as to these buildings. I wish to give evidence, if I may, upon the question of the laying out of Macquarie-street with regard to the future buildings which the Government may eventually put up there. The alteration would to some extent affect the frontage of these buildings so far as they are constructed. It is upon this point alone that I should like to give evidence.
1985. Still you will not object to give such evidence as you can upon hospitals? I would rather not give evidence on that subject. The question to which I refer is a very important one if you like to raise it.
1986. Have you had experience of hospitals in London? To some extent I have, and in the country, too, in England.
1987. You know the buildings which it is proposed to construct in Macquarie-street? I have simply looked at their frontage so far as Macquarie-street is concerned—I have not studied them to any extent.
1988. Have you made yourself acquainted with any of the designs for a hospital in Macquarie-street which have been submitted? I cannot say that I have.
1989. Do you know the design which was accepted, and which has been partly carried out by Mr. Row? I have simply looked at it in connection with the frontage to the street.
1990. Have you gone over the building? Never.
1991. Nor over the ground? Never.
1992. Have you ever seen the plan submitted by Mr. Kirkpatrick? Only hanging in this room.
1993. You have not seen it otherwise? No.
1994. Is your knowledge of the proposed buildings of such a character as would justify you in giving an opinion as to whether they should be carried out? I think that as the buildings are in an unfinished state, and that as a question has been raised as to whether they should be there, it is an opportune moment to say whether they should not be altered to allow of the laying out of Macquarie-street in a manner suitable to the public buildings that may be erected there.
1995. Have you thought of any alteration? I have a plan showing my scheme here.
1996. You would widen Macquarie-street? At present Macquarie-street is only 39 feet wide, as far as the roadway is concerned. I propose to widen it by taking in the 12 feet pavement on the eastern side, which brings the road up to the shrubs, which are too valuable and too handsome to be destroyed, so then I propose to have a walk or a pavement 40 feet wide from Chancery-square right down to the Government Guard House, so that the whole of the Government buildings shall have presentable frontages, plenty of access, and a handsome appearance. I have an imaginary sketch of my proposal here, which will give you some idea of what I mean.
1997. You think, then, that this would be an improvement to the street? I think it is absolutely necessary to consider something of the kind.
1998. How would that affect the proposed buildings themselves;—can you show us about the line it would cut off? It would cut off the lavatories in front, and a portion of the central building, but it would leave the whole of this colonnade wing entirely untouched.
1999. I suppose that you see that it would considerably mutilate the design as it stands before us? I do not see any difficulty in getting over that.
2000. You think that this site is a good one for a hospital generally? I would rather not give an opinion, if you will allow me. I have not thought it over. I should like to say that this is the only building which would interfere with a scheme such as I suggest.
2001. For the rest it would only take in open space? Or temporary buildings which must, sooner or later, be taken down.
2002. *Mr. Lee.*] You have not studied the drawings that have been submitted to this Committee? No, I have not, excepting in regard to my suggestion.
2003. The Committee are given to understand that no specifications have been prepared from these drawings, and yet several estimates of cost have been submitted. Now, do you think that a reliable estimate of cost can be given in the absence of a specification? I do not. An approximate estimate can be given, but only an approximate estimate.
2004. Then you think that to find an estimate of sufficient accuracy to guide the Committee in coming to a conclusion it would be necessary, in the first instance, to have a specification prepared? I think so, most decidedly.
2005. Do you think that any architect who might draw a set of designs could fairly accurately give an estimate of the cost of the proposed buildings, in the absence of specifications? I would answer the question this way: A block of buildings may vary to the extent of £100 a bed entirely on the specification. The specification might be such that the work would cost £250 a bed, or £350 a bed, and yet the design on the plans would be exactly the same.
2006. Would it be possible for any other architect, besides the gentleman who prepared the designs, to take them up as you now see them and give a proper estimate of the cost of the work? He would give an approximate estimate, using a two-foot rule.
2007. By cubing up? Yes, but it is a very bad way of estimating.
2008. Then it may be found that this work will cost £20,000 more than the estimate submitted to the Committee? I cannot say.
2009. Do you think it would be possible for there to be that difference in cost? I cannot say with regard to this particular case; but it would be possible.
2010. Would the Committee be safe in accepting an estimate of this character in the absence of a specification? I think they would be safer in having a written specification.
2011. It is quite possible, when the specification is written, and a proper estimate made, that the present estimate may be exceeded by £20,000? It is not altogether reliable—there is no doubt about that.
2012. This is a semi-Government building. Have you any opinion to offer as to the preparation of specifications before the work is taken up? Simply this: that you get a more reliable estimate from a specification than you do without it.
2013. But supposing the Government of the country were to say: "Well, it is estimated that this work can be carried out for £56,000, and tenders were called for it, is it not within the range of possibility that the work might cost £20,000 more?" Quite within the range. But there is a general rule which allows about 10 per cent. variation from an approximate estimate. It is impossible to arrive at a correct estimate without a specification—even contractors cannot do it.
- 2014.

2014. Would you counsel the specification being drawn out before any expenditure was entered upon? *W. L. Vernon, Esq.*  
Decidedly.
2015. *Mr. O'Sullivan.*] You suggest that Macquarie-street should be widened by 40 feet? By the eastern pavement; and then that 40 feet of pathway should be put inside the shrubs again, leaving a space of 12 or 14 feet for the shrubs. *10 Feb., 1891.*
2016. The carrying out of that work would, as you have shown, necessitate the cutting down of some of the present hospital buildings? It would cut off the projection of the pavilions.
2017. Bearing that in mind, and as it is likely that Macquarie-street will be altered in the way you suggest, would it not be better to take away the present buildings, and to build a fresh hospital? It would be far better to set them back.
2018. Then you recommend that the present walls should be pulled down, and that a fresh hospital should be erected? I say that the projected pavilions should certainly be cut down. I will not express an opinion as to the remainder of the hospital—the scheme affects no important portions of it.
2019. But would it not look rather peculiar if the buildings were rasped off just to suit your particular design? They might be rebuilt, but I do not like to express an opinion upon that point. My object is to get sufficient public space in front, and, of course, to make the building conform with any future public buildings. The Law Courts might come on the other side of it, and the Houses of Parliament on the other side. If the hospital stood out between the two as a projection it would spoil the effect.
2020. With that probability would it not be better to pull the walls down and to construct a fresh hospital further back? Yes.
2021. *Mr. Humphrey.*] You say it would only be necessary to take off a portion of the pavilions? Yes; the lavatory projections and the central façade.
2022. Then you would have to take in a great portion of the administrative department? A comparatively small portion.
2023. You would have to take off the balconies and the front rooms? No; you do not touch the balconies.
2024. You would have to take off the approaches? Yes.
2025. And the front rooms? A portion of the front rooms, and the water-closets, and find a space for them in the rear.
2026. Would the remainder of the building then come up to your alignment? It would be a few feet behind it.
2027. How many feet back from your alignment would the main building then be? Only 4 or 5 feet.
2028. *Mr. Tonkin.*] From an architectural point of view what appearance would that building have if you cut off all those projections? I do not think it would by any means ruin it, because there are many façades which are flatter in appearance than the present design.
2029. You would take off the whole of the projections so that it would be perfectly flat all along? Almost so; but then you get the projection again in the slope of the roof. I admit that it will not improve it.
2030. Would it not have a very peculiar effect upon the building. The beauty of the building, from an architectural point of view, is its projections? Yes, to a very great extent.
2031. If your scheme were carried out, would it not do away with all the beauty of the building? It would deteriorate it, there is no doubt.
2032. Under these circumstances do you not think it would be better to take it down altogether and put it further back? I think it would.
2033. You do not wish to say anything about the plan? Nothing whatever.
2034. If the Committee thought that a different plan should be carried out, and recommended that the existing structure should be pulled down, that would be what you wish? Yes. I should then set the building back as many feet as you could possibly spare.
2035. As many feet as would be necessary to make it compare with other frontages which you had here? Quite so.
2036. How many feet do you think that would be from the present position? I would say 30 feet at least.
2037. Are there no other buildings, except the little insignificant buildings below Parliament House, that would be affected by putting the alignment back 30 feet? I would put it back 40 feet. There are no buildings that would be affected by it. They are all temporary.
2038. Are you referring to Parliament House? To Parliament House, the Mint, and the Law Courts.
2039. You would not touch the Law Courts? I presume they will be rebuilt at some time.
2040. Do you propose to go in front of them? No; the alteration will start from the bend in Chancery-square.
2041. Do you think that the great improvement which the widening of this street would make in the city would, independently of any other question, warrant the Committee in recommending that a portion of the present hospital buildings should be pulled down? Taken in connection with the probable building of new Houses of Parliament, I think it is absolutely necessary if you wish to beautify the city.
2042. *Mr. Dowel.*] Have you given any special attention to hospital construction as regards modern improvements lately? I have always had my eyes open to it one way or another.
2043. Have there been many improvements in hospital construction during the last thirteen years? A great many.
2044. Are you aware that this design was prepared twelve or thirteen years ago? I know it of repute as having been made some time ago.
2045. You are clearly of opinion that since that design was made great improvements in hospital construction have been going on in other parts of the world? I presume so. I cannot say that that plan is in advance of the times, or that it is equal with the times, because I do not know about it.
2046. Still, you know that within the last thirteen years very material improvements have been made in hospital construction? Undoubtedly—they are being made every day.
2047. Have you given any attention to the terms and conditions with regard to competitive designs for public buildings? I have.
2048. It is the policy of the Secretary for Works, I believe, that public buildings should be competed for? I understand so.
2049. Would you consider it a condition that a specification should be submitted after a design has been accepted?

- W. L. Vernon, accepted? The first condition would be that a sketch plan should be submitted. The best of these plans is then dealt with, and proper drawings and specifications are prepared on the strength of the sketch.
- 10 Feb., 1891. *Esq.* 2050. You would not consider the competitive designs complete without specifications? Certainly not—  
one is a part of the other.
2051. Would you be surprised to learn that there is no specification for the completion of this building except for the work that has already been proceeded with? I was not aware what had taken place.
2052. You would be surprised to learn that that is the fact—that no specification in connection with this design has been prepared up to the present time? Probably Mr. Rowe was not instructed to prepare one. I do not know how that would be.
2053. I asked whether it is not the practice, and whether you would not insist that a specification should accompany a design after a sketch had been prepared? Yes; but it depends upon the instructions given to the architect. The competition is open to the world; then a man is selected, and he has instructions what to do. If he is instructed to prepare drawings he prepares drawings only; if he is instructed to get everything ready for contracting he necessarily prepares a specification. I do not know the circumstances under which this work was carried out at all.
2054. Do you, as a professional man, think that a correct estimate of the cost of work could be prepared without specifications having been first written out? Not within 10 per cent. at the very least.
2055. In a design for a hospital would you approve of a portion of the ground floor being below the surface level? Certainly not for patients—administrative offices might, under certain circumstances, be below or half below.
2056. You would consider it a radical defect in the design that one portion of the ground floor should be below the surface level? If it were intended for the use of patients I certainly should.
2057. In carrying out the plan which you have submitted to the Committee for the improvement of Macquarie-street, are there any difficulties as to the resumption of land? With the exception of the Mint there would not be any. I do not know how that matter stands, but I understand that the Mint is held by the Imperial Government. Besides that there is no difficulty at all.
2058. Would there be no difficulty with the hospital authorities, Directors, or Trustees? Of course there is the hospital question, but I always understood that it is a semi-Government scheme.
2059. But are you aware that the ground is vested in Trustees outside of Government control? I presume that it is, but still I think that the Government have full power to resume.
2060. Still, under these circumstances, you recommend that your scheme should be carried out? I think that some such scheme as that should overcome all difficulties because of its importance.
2061. *Mr. Trickett.*] An alternative scheme has been proposed to this Committee. It is suggested that instead of the hospital building being three stories high it should be two stories high. Looking at the plan, will you state what you think the effect would be, from an architectural point of view, to make the alteration, keeping the same roof? I think it would rather improve the building to take the top story off. I do not think those lofty buildings are altogether the handsomest.
2062. Is not the roof a very heavy one? I think that in construction it would appear very much smaller. A geometrical drawing always exaggerates the roof, compared with the ordinary perspective view from the street level.
2063. Looking at the roof on the plan it is very heavy? To my eye it is not. I am accustomed to see them geometrically—ordinarily you see them in perspective.
2064. You do not think it would seem heavy? No, it recedes or fore-shortens.
2065. Would you look at the back lavatories and water closets;—they are very small rooms are they not? Yes, the lavatories are very small.
2066. Do you think it is necessary that the walls for these small rooms should be of the thickness indicated by the plan—of the same thickness as the walls of the main building? They appear very thick, but that has to do with the monumental character of the building. The stonework, so far as the lavatories are concerned, is not needed, but so far as the appearance of the building is concerned it is needed.
2067. Supposing for the same money we can pull down the present structure and erect a new building, giving the same accommodation for the same money as would be required to complete this building, which would be the best thing to do? Having in view the scheme which I have put before you, I should say build a new hospital; but I should not say that with regard to the hospital accommodation itself. I do not wish to give an opinion about that.
2068. But, independently of your scheme, if you could build a hospital of more modern principles and giving the same accommodation for the same price as you can complete this for, which would you do? I doubt if you can do that.
2069. But supposing that you can? I would rather not give an opinion.
2070. The original design contemplates the completion of the back pavilions in dressed stone. From your experience of hospitals, and considering that these buildings would be out of sight from the street, do you think that brick would be as good as stone? I think so.
2071. Would not bricks be cheaper than stone? Yes, much cheaper. You have to protect the brick-work against the rain in wet weather. If you did that with cavity walls it would be all right.
2072. I would ask you the same question with regard to the front of the hospital;—would it be desirable to complete that in stone or brick? I should say stone, because stone is the national material.
2073. But for the sake of effect? Stone. The buildings on either side would be of a handsome character, and it would be a pity to spoil them.
2074. But for the back? I think for that part of the building which would simply be seen from the Domain we might economise and use brick.

WEDNESDAY, 11 FEBRUARY, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. GEORGE HENRY COX.

JACOB GARRARD, Esq.

HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.

WILLIAM SPRINGTHORPE DOWEL, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM McCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

Thomas Rowe, Esq., Architect of the Buildings, sworn, and further examined:—

2075. *Dr. Garran.*] You have already given evidence to the effect that, after your original design was submitted, modifications were considered by yourself and the Committee? Very considerable modifications; in fact, an entirely new plan I should say.

T. Rowe,  
Esq.

2076. One of those was the substitution of stone for brick? Yes.

2077. Was that your suggestion? No.

11 Feb., 1891.

2078. It was suggested to you? It was suggested, and my opinion was asked. I always advise city buildings to be erected of stone, and twelve years ago there was not so much brickwork—that is the superior kind of brickwork—done as there is now.

2079. This change did not originate with you? It did not.

2080. Some witnesses have stated that for hospital purposes they preferred brick to stone, because it admits of a double, and, therefore, a dry wall;—have you thought of that? I have built many buildings of hollow walls, and on that principle I erected the Nightingale wing, which is built of hollow walls. I am an advocate of hollow walls in some cases.

2081. It is very important in a hospital that we should secure dry walls? It is important; but I do not mean to say that stone is not dry.

2082. Is not the Pymont stone somewhat absorbent? It is, but I have made tests of it on that very ground, and the stone absorbed less than the brick. I can give you that test if you like to see it.

2083. Does it not often happen that the Pymont stone, during the first year or two, lets the wet come right through? I have never known it to occur in substantial buildings with thick walls, and I have erected as many such buildings as most people in the city.

2084. As an architect, you see no reason for preferring brick for a hospital? I do not. The test I speak of was quite in favour of the stone. The stone was obtained from Pymont quarries; it was what is termed best bottom block stone, and was cut into the size of bricks,  $9\frac{1}{4} \times 9 \times 4\frac{1}{2}$ . Two of these pieces were cemented together, and two good double pressed bricks were obtained from the Government Printing Office, and also cemented together. Both the stone and the bricks were then dried for a considerable length of time on the top of a furnace and weighed. The bricks, dried, weighed 25 lb. 13 $\frac{1}{2}$  oz., the stone, dry, 31 lb. 15 oz. After 30 minutes' spray had played on the bricks they weighed 26 lb. 13 oz., and after the stone had been under the spray for the same length of time it weighed 32 lb. 1 oz. After 2 $\frac{1}{2}$  hours' spray the bricks weighed 27 lb. 11 oz., and the stone 32 lb. 4 oz. After 4 $\frac{1}{2}$  hours the bricks weighed 28 lb. 3 oz., and the stone 32 lb. 6 oz., and after 6 hours the bricks 28 lb. 6 oz., and the stone 32 lb. 7 oz., so that in each case the test was in favour of the stone.

2085. Then, except for the bricks admitting of a double wall, you do not see that they give any advantage in the way of dryness? A double wall has this advantage in all house buildings, that it can be more easily ventilated than an ordinary wall. You can put in a ventilator anywhere.

2086. But does it not guarantee a dry inside wall? It does.

2087. Which is a matter of supreme importance in a hospital? Yes. At the same time do not suppose for a moment that water can penetrate 2-foot solid stone walls.

2088. Is cement as permeable to water as brick? It all depends upon the quality of the brick.

2089. Because in your experiment you had two bricks cemented—would the fact of their being cemented give you two qualities of material? They were only cemented together—not covered with cement. The stone was treated in the same way.

2090. Had not your original design only two stories? No, I have three.

2091. I refer to your original design? It is here somewhere, and had three stories, I think, though it is so long back that I forget.

2092. Both in the front and in the pavilions? Yes; they were running north and south. I am sure it was three stories high, though I should like to refresh my memory.

2093. Was the subdivision in the first plan the same as it is now? It is a vastly different plan altogether now.

2094. You divide your present plan into wards of sixteen and twenty beds each, and each of these subdivisions has thick strong walls all round, so that that makes a very large quantity of stonework? Certainly.

2095. And stonework is dearer than brickwork? Yes.

2096. How much per cent.? Twenty to 25 per cent.

2097. At the corners of the pavilions there are small buildings for lavatories and other purposes, all of which have thick stone walls? Yes.

2098. You see the immense quantity of stonework that there is in the plans? Yes.

2099. All that, I presume, has helped to mount up the expense? Yes; but the building was to be carried to a considerable height, and it was intended to store water for the use of the lavatories and sanitary arrangements under the towers. Then there was gearing and machinery in other parts of the building.

2100. You do not think that the walls are unnecessarily thick? I could, of course, have constructed the building of less thickness, but in designing a public building that was to stand for ages the desire was to erect one that could not be found fault with in regard to strength.

2101. Is not the quantity of thick stone walls very large indeed in comparison with the area enclosed? I do not think so, though, of course, another architect might say so.

2102. All this helped to pile up the expense? Certainly; the more substantially you build a place the more expensive it is.

2103.

T. Rowe,  
Esq.  
11 Feb., 1891.

2103. In some of the other plans submitted to us, instead of two detached buildings in the rear of the main building there were long wards. Would these long wards not be cheaper, because they would not require so many walls? They would be a little cheaper, but there would be cross walls, and it would not be possible to put such large wards under one nurse.

2104. There never is only one nurse in these wards. Did you have any particular object in breaking up the wards to accommodate sixteen and twenty beds each? In that particular arrangement of the site it works out in that way. Placing the administrative quarters in the centre, there is only room for that length of ward on each side of the administrative department. Then, breaking down the centre again, with the fall of the ground it also works out in that way, leaving proper space between the extreme eastern wall and the Domain.

2105. Could you not have put the two pavilions together and made one long ward, thus saving expense? I could have done so, but I do not think it would be desirable. As the building is broken up now, a doctor leaving his quarters at night on any floor of the administrative department could travel over the whole of it by means of the balconies.

2106. Was this arrangement of wards submitted to the doctors at the time? On several occasions.

2107. And they all approved of it? Yes. On one occasion I sent in a request asking to be allowed to meet the doctors to discuss with them the position of the wards, and a time for the meeting was fixed. Dr. Jones was in the chair, and several members of the profession were present. The meeting was called by Dr. Dixon. I have the notice here now. I remember addressing that meeting for nearly three-fourths of an hour upon the matter of the position of the wards, as to whether they should be north and south, or east and west. The meeting was convinced that my plan was a correct one. Dr. Jones agreed with me and the opinion was forwarded to the Board, and, after several sketches had been submitted, this plan was adopted. Of course, as I have stated before, the intention of the Board to take down the southern wing, led to the adoption of these new apartments. I should like to say a word about the position of these wards. Of course, you cannot throw a ward upon a comparatively small site like this, in any way you like. You cannot face it north-east, anglewise, across a valuable piece of land like this frontage in Macquarie-street. You are bound to build parallel with the street, or with the side lines, and so you have to build either north and south, or east and west. It then becomes a question which is the better position for a ward, and I have strong opinions that north and south is the better position for a ward on that site. I know the objections that were made to it, viz., that it throws a flank side open to the west; but, admitting that, you must remember that there are deep balconies in front. The buildings are protected with piers and arches, and the heat of the sun can always be regulated by blinds. Now we come to the east and west position, which many think the best. With that position you throw the entire flank of the ward, say 80 or 100 feet, to the south, and it is well known that patients along a cold southern wall do not succeed like they do along a northern wall. That has been proved, and when the patients have been moved from the south to the north they have succeeded better. Many lives, no doubt, have been lost by reason of the cold wall. But the other position is open to no such danger. What I have said about the southern wall has been proved in many instances. In the lanes and alleys of the city, and in terraces, wherever the flank walls face the south, the children do not thrive so well, plants will not grow properly, and there is sickness generally. I proved that to the doctors, and they agreed with me.

2108. The best aspect for houses is north-east and south-west? I would place my building so that it could be bathed by the sun throughout the year, though you cannot do that in the streets of Sydney.

2109. Would not that give you a north-easterly and a southerly aspect? Not directly. If you bathed the house all the year round you would have no part of the building to the south. We know that the sun is the greatest blessing we can enjoy, and a great scavenger.

2110. A north and south position makes half the house good and half of it bad? By a little arrangement you could get the sun to dry it properly.

2111. By turning it a little more to the north-east? Yes.

2112. Do you mean to say that this question of throwing so many wards to the west was thoroughly worked out by the doctors? Yes, by a committee of doctors called at my own request. It was, I believe, agreed to unanimously. Dr. Jones agreed to it, and the opinion was forwarded to the Hospital Committee.

2113. We have medical evidence to the effect that some doctors always disapproved of this arrangement, and preferred to have a screen to the front, and all the wards at the back? Doctors differ, and of course some doctors have never made a study of the matter. There are some doctors who have made a great study of it, but they are only a few, I think.

2114. You are quite clear in your own mind that this matter was considered and approved of? Certainly, I swear to it.

2115. The whole question of a westerly aspect was gone into? I lectured the doctors for nearly an hour on the question, bringing evidence from Russia and from other parts, which I had read up. I showed that the fences of the colony are moss grown on the south side, and that all our trees droop to the west.

2116. In the case of a southerly aspect, if the buildings were arcaded, would not that protect it from all damp? I do not think so—weather comes in horizontally sometimes. I do not say from damp, but I mean that the wall would be cold. The temperature along the south wall inside will be vastly different from the temperature along the northern wall.

2117. Has not the present south wing of the Infirmary got one side exposed to the south? Yes.

2118. We hear that that ward answers all purposes admirably? Yes; but when life was suspended by a thread the temperature along that wall would make a difference.

2119. Do you know of any medical man in the colony who has testified to this fact? I do not know of any.

2120. Are not several of the walls of Prince Alfred's exposed to the south? If the wards run east and west they must be.

2121. Have you heard of any objections being made to that building on the score of position? I have not heard of any; but I have not made any inquiries. I know that the old building that stood in Macquarie-street was a very successful building. Some wonderful cures were performed there.

2122. Was the question of making this accident ward in front, on the north basement, considered by the doctors? I presume the whole thing has been brought before numerous doctors, some of whom are now dead, and they must have approved of it. Various designs were submitted in pencil before this was fixed upon.

2123. You have heard no objection to it made? I have not. That floor is raised, I think, 3 feet, with apertures

- apertures under every window big enough for a man to get in. The ground below floor is to be concreted and asphalted. T. Rowe, Esq.  
11 Feb., 1891.
2124. Still, the floor is a basement? It is not even a half basement. It is a ground floor on the other side of the building, so that it is not correctly a basement, being 3 feet below the level of the ground, which is 15 feet away from wall of ward.
2125. You have never heard any objection to that floor being used as a ward? I have not. Every provision has been made for its ventilation.
2126. Do you recollect the name of the builder who gave you a certificate? I do not. I have been trying to think.
2127. Do you recollect whether you had a certificate? I presume I must have conformed with the conditions, but I have no knowledge.
2128. Mr. Russell, the Secretary, reports that he has no record of any certificate being sent in—you cannot charge your memory with the fact? I cannot.
2129. If there had been a certificate sent in to the effect that the work could have been done for £45,000 would it have been worth anything? No.
2130. You know yourself that it could not have been done for twice that money? Not in a substantial manner, as a public building should be erected.
2131. After all that has been said, and you have had access to the evidence I believe, do you still see any reason to find fault with your own plan? I know of no improvement in hospital construction, with the exception of what are termed circular wards, and I do not think that they have found much favour. Then, of course, in sanitary matters there has been a great march of improvement since these plans were designed. I do not mean in the arrangement of the lavatories and closets and so on, but in the plumbing and other work. There have been vast improvements in these matters, but they are the only improvements that have taken place that I know of. When I designed this plan I had the plans of all the largest hospitals in England before me. I made the work a study, and delighted in it, and since then I have seen many of these hospitals myself, and I know of nothing better than is shown here. All the conveniences are thoroughly cut off by passages, and double provision almost is made to prevent anything connecting the wards.
2132. At the time you submitted your plans did any of the doctors object to three stories? I cannot say. I dare say there may have been a difference of opinion on that subject, but I do not remember any conversation in particular about it. The arrangement was adopted, of course.
2133. You have submitted some estimates for different proposals for finishing the work—are any of them based on thought-out details? The estimates now submitted are based upon the works already carried out, and detailed estimates have been gone into, but that has only been done of late years, during the time of the Stuart Government, when estimates were asked for.
2134. Do you think that these estimates are really trustworthy? I do; they are based upon work already performed. All the finishing work has been gone into in detail.
2135. Could you guarantee that they would be within 10 per cent. of the cost? Of course, it would be very uncustomary for an architect to give such a guarantee, but I venture to say that I could guarantee them within 10 per cent.
2136. Do you think it would be a very great mistake to finish the front of this building in brick? It would—not that I am opposed to the use of brick, but having started with stone, I think it would be a pity to complete even a part of the building with brick. There is really no back to this building. The Domain side is as much exposed to view as is the Macquarie-street front, and I think that having already started in stone it would be a great pity to use brick.
2137. If the front were done in stone you would have the back also done in stone? I think so. To build one side of stone and the other of brick would be a mistake with a building of this kind and such a magnificent site, where it may possibly become a neighbour to splendid public buildings on either side. The Mint and Parliament Houses will probably give way, and the building will then be more open than it is now, and it should be a worthy companion to any new Government structures there.
2138. Your cheapest estimate for finishing in brick you, as an architect, throw over entirely? That estimate was asked for by the Committee; I do not agree with the intention, and I think that to use cement would be abominable.
2139. The only reduction you would propose would be to take off a story and to finish in stone? Yes; but then, of course, there would be a waste of material in the present walls, they being unnecessarily thick for only one story more.
2140. Their thickness has been planned for carrying four stories? Yes.
2141. The only economy you could suggest would be to take off a story and to finish with stone? It was not suggested by me. I was requested by the Committee to give estimates for various proposals.
2142. Do you think that the building could be completed with one story less for £56,000? I think so.
2143. You know that up to the present we have spent nearly £70,000 upon the foundations and the first story for stonework only. Now to put on the second story there would be as much stonework as there is in the first story, and the roof would be as costly at least as the foundations? The roof would, of course, cost as much for this building as for the completed structure.
2144. Would the roof cost more than the foundations? I do not think so.
2145. But then you have all the internal work to do? Yes. When you speak of the foundation you mean the basement part only.
2146. Yes? That cost £25,600. The roof would not cost that.
2147. Do you think you can put another story and the roof on the building, and do all the internal work for less money than you have spent in doing what you have already done—one story and the basement? I think another story could be put upon the building, and the whole work, providing for 144 beds, finished for about £56,000.
2148. You think that the extra work could all be done for less than you have already spent? I think so.
2149. What was the cost of the foundations? The cost of raising the walls one story from the ground was £25,642 9s. 6d.
2150. What was the cost of the next story? £23,701 6s. 3d. There were some sundries amounting to £463 16s. 6d.
2151. Then the next story, by itself pure and simple, could be done for another £23,000? Yes; I think the market is a little more favourable now than then.

T. Rowe,  
Esq.  
11 Feb., 1891.

2152. In this estimate of £56,000 you have included one pavilion, have you not? Yes; at the back.
2153. That is only one story high at present? Two stories high.
2154. It is the same height as the rest of the building? Yes.
2155. Do you think that you could complete it and all the work in front, together with all the interior work for both buildings, for £56,000? That is the estimate.
2156. Remembering that you have spent nearly £70,000 on what has already been done? The £70,000 includes the kitchens, which cost £6,793, the excavation, and the laundry and engine house.
2157. You see no reason for doubting the soundness of this estimate? No, I do not, because the walls would be slightly lighter if we had not to go so high, though the building would look a miserable dwarfed thing. There is no reason why another floor should not be given to get the extra accommodation, seeing that the foundations cost so much, and that it will cost so much to roof the building. It would be a positive loss not to put another story between the roof and the foundations, while it would lessen the cost per bed to do that.
2158. If you take off a story the cost of the roof will be about the same as if it were built according to design? Yes.
2159. Will it look squat on your plan to take off a story? Very, indeed.
2160. You will not like it? It will not look well at all, and then if you run up the administrative block to the full height it will make it look still worse.
2161. The Government Architect, yesterday, proposed to widen Macquarie-street, and he would like to take off the corner projections and the front rooms of your central department;—would not that give the building a long uniform façade? How could you take those conveniences away from the hospital?
2162. You would have to provide them somewhere else? It is not so easy to do that, and to make the thing perfect in itself.
2163. If that were done, would it not be possible to push the building further back? It would be possible to take a few feet along the frontage, but it would be a pity to go as far as you suggest.
2164. You think it would very materially interfere with your plans? Very. Of course it is a very desirable thing to have a broad street there, but for all practical purposes it is wide enough now, and when new Government buildings are erected they will naturally retire from the street.
2165. The question is, before we complete this building should we adopt the Government Architect's plan and adapt ourselves to it? That would be a very difficult matter to express an opinion upon hastily. The street might be widened as far as the steps entering the administrative blocks—10, 12, or 15 feet.
2166. You would not recommend an interference with your frontage at all? I certainly should not.
2167. You would rather diminish the width of the proposed broad pathway? It would throw the whole thing into confusion.
2168. *Mr. Tonkin.*] Did I understand you to say just now that there have been no improvements in hospital construction since these plans came out? With the exception of the circular ward system.
2169. Have you not heard that one-story buildings are now advised for hospitals in the Continental cities? Many have thought for years that such buildings should be used, but there is a great difference of opinion upon the subject, owing to improved modes of surgery and so on; they are now not afraid to go in for three or four stories, though some advocate one-story buildings as the best.
2170. Is it a good policy to have beds, as shown on your plan, right in the corner of the room? They are away from the corners. I do not know of any right up in the corners. There is a fair space for the nurses to get by.
2171. Is there room for the nurse to get round on the other side? Yes; a space is left.
2172. Do you think there is any objection to a staircase in a hospital? There are no staircases in the wards. They are all outside, away from the wards.
2173. But the staircases are inside the building? Inside the walls, of course, but outside the wards.
2174. But they are in the passages leading to the wards? Yes; from the staircase landings you go into a lobby and then into the wards.
2175. Do you think it is advisable to have such a connection between one ward and another—between the upper and lower stories? I see no evil in it where the wards are cut off and properly ventilated with opposite currents and air shafts.
2176. Has this subject been discussed by medical men? All these points have been discussed and provided for.
2177. Supposing it was decided to complete this building, would you suggest that tenders be called for the entire work, or would you do it piecemeal as the other part of it has been done? Tenders could be called for the entire work. The reason that it was done in a piecemeal way before was for the sake of convenience, to meet the funds in hand. The unfinished portion could be completed in one tender, if necessary.
2178. Have you specifications prepared for calling for tenders? I have done nothing; I have done nothing for many years.
2179. The estimate which you give is made purely from your mental calculation? Yes. Of course we know from previous tenders what the masonry will cost, and I have the plans before me, so that I could measure up floors, and count the doors and windows and so on.
2180. Would there not be a large amount of internal work that you have not had to call tenders for? I know all about those estimates. There is no uncertainty about that.
2181. You are quite satisfied that the work can be carried out for the price you estimate? Within 10 per cent. of it. There must always be a margin one way or another.
2182. Then you must have known at the time you put your plans in that the work could not be constructed for the estimated cost? When those plans were completed I knew what they were worth, and I stated that the work would cost £200,000.
2183. But I am speaking of the first plans—the competition plans? Well, I am speaking of these plans.
2184. But in regard to the competitive plans, I say that if you knew from your mental calculations what it would cost to finish this building, you must have known when you put those plans in that they could not be completed for £45,000? The structure could be built for that money, but not in the way a public building should be erected. There are so many degrees of excellence. There is a cotton dress and there is a silk one, there is tweed and there is broadcloth.
2185. But is it not a usual thing that the work should be done in a workmanlike manner; when tenders are called for is that not stated? Those plans were set aside altogether. This is an entirely new design.

T. Rowe,  
Esq.

11 Feb., 1891.

2186. I know that very well. Do you know a gentleman named Horbury Hunt? Yes, I know Mr. Hunt.
2187. He is a prominent man in your profession, I believe? I suppose so.
2188. Does he hold a prominent position? Yes; he holds a prominent position.
2189. If he should tell this Committee that out of the whole body of architects in Sydney there were only five who would give in a proper and fair estimate of the cost of a competitive design, would he be stating a fact? I should take it that that was a sort of libel upon the profession.
2190. But is it a usual thing for the profession to hand in competitive plans of a building at a much less price than they know these plans can be carried out for? It is frequently done. These competitions take place all over the colonies, and everyone vies with the other, each in trying to do the utmost he can for himself. These competitions are not satisfactory things.
2191. But that is acting in a very dishonest manner. If you lead people to believe that a building will only cost £45,000, when you know that it will cost £100,000, is that honest? Well, I say I can do it in a way as it were, but not as a substantial public building ought to be erected.
2192. But did you not know that it was a public building that you were competing for, and that it would have to be built in a substantial manner? But I want to know what that has to do with this other plan?
2193. I want a reply to my question? I have answered the question over and over again.
2194. What is your reply? That I competed for this work, but I do not know if I sent in a builder's certificate, though I think I did. The Committee said, "We want a building containing so many beds, for £45,000," and I competed with thirty-two others, who all considered that they were abiding by the conditions of competition, for the work.
2195. And you knew at the time that your plan could not be carried out for the money? Not in the way I should like the work to be done.
2196. Could you have carried out your original plan in any way for £45,000? I believe it could have done it in some way—in an inferior manner.
2197. What would have been the difference? I think that the work they asked for was worth over £100,000 to carry it out in a substantial manner, as a public building should be erected on a site of such importance.
2198. Do you hold with what Mr. Hunt says, that there are not more than five gentlemen in your profession who would not lend themselves to that? I should be very sorry to say so. I said that the statement was a libel on the profession. Mr. Hunt's ideas of things and mine are different.
2199. What amount of commission have you received on this building already? I have received £3,226 as commission.
2200. Was there not £140 more for something else? There may have been commission for other things—I think there were. I had to do with the ophthalmic hospital at Miller's Point, and with preparing the buildings for carrying on the hospital work in the Domain—various things which do not belong to the permanent structure work; but the amount which I have stated is the amount of commission which I have received for permanent structure work.
2201. In the event of this building being completed according to the modified plan, would you expect a commission upon the outlay—that is, supposing one story were taken off, would you expect the commission upon the cost of completing the building? As if the four stories were completed?
2202. No. Supposing we took off the top story, to reduce the cost of finishing the building, would you still expect your commission on the work? Certainly; and I am entitled to a percentage on the cost of the story deducted, upon the work not carried out.
2203. You would expect a commission upon the original plans? I am entitled to it. What I would do is a different thing. If this work is never completed I shall most distinctly claim my percentage on the transaction, and, dead or alive, it is a part of my estate.
2204. Suppose the Committee decide that the portion of the building erected is not fit for hospital purposes, and that it should be cleared away and another put in its place, would you still expect commission? Yes. I can prove that it is a suitable building, perfect in every respect, and my plan has been adopted. It is not my fault that the work has broken down. I am entitled to the commission, according to the rules of the Architects' Institute both here and in England.
2205. But if the weight of evidence taken before this Committee should go to prove that this is not a proper building for a hospital? It was accepted as a proper plan by a number of medical men, and I defy any one to prove that it was not. That cannot be proved. It is impossible. Because prejudiced men, and the green-eyed monster have interfered in this work, that has nothing to do with a straightforward transaction of mine. The plans have been accepted, the work has been commenced, and it is not my fault that it has been discontinued, so, therefore, I am entitled to my commission.
2206. Have the Committee been misled in any way as to the actual cost of this building? I have been forty years in this city, and I am the father of a large family, and I defy any man living to charge me with doing anything dishonorable. I knew what this work would cost, but I was never asked; and was it my duty to force my business upon the Committee? The Committee were vying with the Prince Alfred Hospital people, Dr. Renwick against Dr. Roberts, and the desire was to have a city hospital equal, if not superior, to the Prince Alfred Hospital. There was no desire to know the cost—I am sure of it. There is no letter in existence finding fault with me or my conduct in connection with this hospital building. There is not one. The Secretary cannot produce such a letter, and I have none. For five years I was never asked the cost of that building, and I have never received a letter complaining of its cost.
2207. Then, so far as the expenditure is concerned, you had *carte blanche* to do as you thought proper with the building? I do not say that—certainly not. This plan was adopted, and there was a desire to have a perfectly substantial building. These shrewd business men knew what they were doing, and they desired to have a good building, when they found out that the miserable £45,000 would not do it.
2208. Mr. Trickett.] Will you look at the plans "Elevation to Macquarie-street." You will see that the basement is indicated there as being half below the level of the ground as it were;—is it intended that patients shall be treated in that bottom story? Yes.
2209. And in the right-hand pavilion as well? No; the out-door patients go down the stairs there into the verandah, and take their seats. They are then drafted through to the doctors on each side, who examine them and give them their prescriptions, and then they pass through the dispensary, obtain their medicines, and go out. One side is for out-door patients, and the other is the casualty ward.
2210. The southern basement is for out-door patients? Yes.
2211. And the northern basement is for casualty cases? Yes. I should like to explain to the Committee that

T. Rowe,  
Esq.  
11 Feb., 1891.

that the doctors can go all over the institution on each floor (*pointing out the convenience on the plan*). I am very sorry to say that the green-eyed monster has had a great deal to do with this matter from the start. It has been most irritating for the last twelve years.

2212. *Mr. Copeland.*] You have been carrying out works of this character for many years in Sydney, have you not? I think I have built as many hospitals as any man here. I built the Catherine Hayes Hospital out at Randwick—the Randwick Asylum, a hospital in Newcastle, another in Singleton, and some others. This matter has been on my mind for twelve years or more.

2213. And I suppose you have also acted as architect for other large buildings in different parts of the colony? Nearly as much as any man. I do not say more than any man; but I have been practising as an architect for over thirty years.

2214. In this colony? Yes.

2215. When you were last examined by the Committee you stated that you had a letter sent to you by the Hospital Committee, accepting your plans? Yes, I have it here.

2216. Will you read it, so that it may go in as evidence? It is dated the 12th August, 1879:—

Sir,—I have been desired to inform you that, at a meeting of the Board of Directors, held on the 6th inst., you were appointed as architect to this Institution.

Your obedient servant,  
H. D. RUSSELL.

2217. That letter simply informs you that you were appointed architect? Yes.

2218. Did it imply that your plans were accepted by the Committee? I think not, because that must have been after the competition was decided. I was then appointed architect, and I had the competitive plans handed over to me. There was my own plan, and two sets of plans from Mr. Backhouse, from which I had to get out other plans. Then the doctors' meeting took place, and various other meetings, and pencil sketches were submitted of new arrangements. After a long discussion, at different times, the Committee decided to take down the southern wing, and to strike out upon this new work in the form of a letter 'T', giving more accommodation.

2219. So that as a matter of fact, after you were appointed architect to the hospital, your plans were entirely disposed of? They were set aside altogether.

2220. These new plans were then adopted by the Committee;—is that so? That is so.

2221. When those plans were adopted I suppose they were fully discussed, and considered at various times? They were.

2222. Can you tell us the names of the members of the Hospital Committee at that time? I could not tell you the whole of the members.

2223. Can you tell us a few of the leading members? It is unsafe for me after so long a time to venture. Dr. Renwick was president.

2224. We have a list here of the present Directors of the Hospital. Was J. R. Street a member? Yes.

2225. John Pope? I am not certain.

2226. Sydney Burdekin? I think so.

2227. Mr. Abigail? I am not certain; I think so.

2228. Michael Chapman? Yes.

2229. The Hon John Davies? I am not certain;—he may have been.

2230. Alexander Dean? No.

2231. James Ewan? No.

2232. W. H. Flavelle? I do not think so.

2233. Joseph Graham? I am not certain.

2234. G. N. Griffiths? I think so.

2235. John Hardy? No, I think not.

2236. John Hourigan? No, I do not think so.

2237. I. J. Josephson? Yes.

2238. S. E. Lees? I think not.

2239. Dr. Mackellar? Yes.

2240. James Martin? No, I think not.

2241. Richard M'Coy? Yes.

2242. Dr. Charles Mackay? Yes.

2243. B. B. Nicoll? I do not know.

2244. Frank Senior? Yes.

2245. R. Burdett-Smith? I am not certain.

2246. John Starkey? I think so.

2247. In addition to that Committee did any other committee of medical men inquire into this matter? There was a committee of medical men.

2248. Do you remember their names? Two or three of them are dead now.

2249. Still, they were living at that time? There was a large committee. Dr. Jones was one, Dr. Dixon, I think, was another. A very good doctor was the doctor of the institution. He knew a good deal about the matter; but he is now dead; I cannot remember his name. There were ten or twelve doctors present at the meeting.

2250. All of whom were prominent men? Yes; the greater number of them were men of standing.

2251. This Committee, I suppose, devoted some considerable time to the matter before they ultimately decided to adopt these new plans? They had several meetings among themselves, at which I was not present.

2252. Were you present at any of the meetings? Yes, I think so.

2253. Did they make any amendments on your plans? All their suggestions were gathered up and worked into form, and eventually submitted to the Board.

2254. They made suggestions, and you adopted them;—you gave effect to them in your new plans? Yes.

2255. The old plans which were submitted on the price of £45,000 were utterly abandoned? Yes.

2256. Did you ever inform either the medical committee or the general Committee that you could carry out the erection of those buildings for £45,000? Never.

2257. Did you ever give them to understand that you could carry them out for anything like that? I was never asked. The thing speaks for itself. How could the Committee spend £68,000—the first large contract

contract was for £25,600 odd, the second for £23,000, and another for the kitchens, £6,793, and for the laundry, £5,700 odd—for a little more than one-third of the whole structure, and expect that work to be completed for £45,000? They said nothing about the expense to me, but as business men they knew thoroughly well that if a little over one-third of the building cost that amount the whole thing would cost something like £200,000.

T. Howe,  
Esq.  
11 Feb., 1891.

2258. The original plans were for a building to cost £45,000;—can you say what was the difference between that building and the building now proposed, that is, with regard to accommodation and the nature of the work? This building has, of course, more accommodation, and is designed for masonry, and it is of a more substantial and of a better character altogether.

2259. What accommodation is provided for in the original plans? Accommodation was provided in accordance with the conditions of the competition.

2260. Do you remember how many beds? I cannot tell you from memory, but I think 180.

2261. Can you furnish the Committee with a copy of your original plans? I brought them here on my first visit, together with the map of the city, showing that this site is the most central that could be selected.

2262. Did those plans provide for an equal amount of accommodation for the nurses, medical men, and the rest of the staff? I think so, in proportion to the size of the building. It was laid down in the conditions that all that was to be provided for.

2263. I suppose then, that the Committee may understand that the original plans provided for the same accommodation throughout, except that there were 180 beds instead of 240, and that the same conveniences were provided in the first design, only not upon such a substantial scale? Yes. I think there may be a little extra convenience provided here, but generally speaking there were the necessary conveniences for the carrying on of the hospital in the other plan.

2264. Only, I suppose, the building did not pretend to be upon such a palatial scale as this is? Certainly not—not of so large or so substantial a character.

2265. Was the original design similar to this in appearance—had it the same elevation, the same number of stories—was it T shaped? It was arranged differently. The arrangement in front was similar.

2266. It was drawn to scale? Yes.

2267. Did it give the same thickness of walls? No.

2268. Was it the same elevation? No.

2269. Were the principal rooms the same size? I could not say, but I should not think so. I do not think there is a likeness between the two plans, or at all events it is very small.

2270. At any rate those plans were deliberately put on one side by the Committee, and you were instructed to draw out altogether fresh plans? They were deliberately set aside.

2271. Do you know whether there was any opposition to the work at the time—whether any section of the Committee opposed the proposal? No; I do not remember any such opposition.

2272. Your impression is that the plan was agreed to almost unanimously? I have no recollection of any opposition. I should have remembered it, I think, if there had been any great amount of opposition.

2273. So that the Committee went into this new proposal with their eyes thoroughly wide open? As business men they must have known what they were doing. When Governor Loftus was laying down the foundation stone, I told a member of the Committee that the work would cost over £200,000.

2274. You stated that publicly? I stated it to one of the Committee.

2275. Did you make the statement publicly? No.

2276. Do you remember the name of the Committeeman? I do, perfectly well, but I would rather not mention names—it was a casual conversation; it was not official.

2277. I suppose the Committeemen were constantly in the habit of viewing this new building? Every week, and some of them every day almost.

2278. Was there any meeting called with a view to countermanding your action and stopping the progress of the work? None whatever.

2279. Was there any meeting called expressing dissatisfaction with the work? I never received a letter nor heard a complaint made verbally with regard to the cost.

2280. Can you say when you first began to hear dissatisfaction expressed with the expense? I have never heard any dissatisfaction except from outside. I never received a word of it from the Committee. When money was required and the Government was approached, I was requested to prepare estimates of the cost of completing the building.

2281. So that right up to the time that the erection of the building was stopped, you never heard any expressions of dissatisfaction from the Committee? Never; not one word.

2282. At that time they knew what the building would cost—over £200,000? At the time they applied to the Stuart Government they knew. No estimate had been sent in previously, because it was never asked for.

2283. I suppose it is the practice throughout the profession, whether for Government buildings or private buildings, in this colony, or in any other colony or country, that whenever plans are approved of by a committee, and they take upon themselves the responsibility of adopting them, the architect becomes legally entitled to his commission? I take it so—certainly.

2284. Is that the practice in the profession? Certainly. I hope the world do not suppose that the 5 per cent. is all profit to an architect. If he gets 1½ per cent. out of the transaction he is perfectly satisfied.

2285. What commission did you get on this work? Five per cent., but that is not all profit. If an architect gets 1½, or 2 per cent. at the very utmost, he is very pleased. He has got his rent and his staff of draughtsmen to pay. I merely mention this because some gentlemen think that the 5 per cent. drops into the architect's pocket. If a merchant could call all that he sold profit, an architect could call all his 5 per cent. profit.

2286. What is the nature of your services? Producing plans and specifications in duplicate, working out details, supervising the work from the time of its commencement up to the time of its completion, and making out quantities for checking payments. Every payment has to be checked by measurement, and every detail is a separate study. There are always a number of draughtsmen at work upon important buildings getting out details, from the time of its commencement until the time of its completion.

2287.

- T. Rowe,  
Esq.  
11 Feb., 1891.
2287. You necessarily have to employ draughtsmen and other persons to do the work? Yes; and some men at from £250 to £300 a year.
2288. All of whom have to be paid out of the 5 per cent.? Certainly. Looking at it in that light, I have really had very little out of this transaction.
2289. Was there room to have erected the building further back from the street? I think not, because of the extreme eastern wing, which would have gone too far out into the Domain. The building could not have gone further back, besides, the present Nightingale wing would then have been in the way, because the northernmost wing overlaps the Nightingale wing.
2290. So that you were forced to bring the building as far to the front as you have? Yes; it is adapted to the site, to the inch almost.
2291. You had to adjust the buildings to the size of the land, and to the position of the existing buildings, which had to be used during the erection of the new building? Yes.
2292. I suppose if the suggestion of the Government Architect about widening Macquarie-street were carried out, it would completely destroy this building? I think it would wreck the whole arrangement. I am not speaking as to its beauty, but it would affect the general arrangement of the hospital. I do not think you could make a perfect building of it afterwards unless you took it all down and re-designed it.
2293. In any case it would bring the building flush with the side of the street, would it not? Nearly, I presume.
2294. Five feet back from the side of the street. Is it your opinion, as an architect, that that would very much destroy the appearance of the building? It certainly would. I like Mr. Vernon's idea. I think it is very praiseworthy on his part to attempt something of this kind, but the question is has he not attempted too much. If we could give him 4 or 5 feet to alter the street a little, it would be advisable.
2295. Suppose the Government were to entertain the idea of pulling down this building, would it be possible to utilise the stonework again, putting the blocks up in the same positions, so as to re-erect the building on the same plan further back? If you followed the same plan further back you could utilise the stone, but the moment you go off to any other design, you naturally destroy a large portion of the stone. All material, when taken down in that way, depreciates to a very great extent—you would not get its full value.
2296. Still you could use the material again? You could use a great deal of it.
2297. So long as you retained the same design? Yes.
2298. To do that, it would be necessary even to root out the foundations? Yes; you would have to commence *de novo*.
2299. You think there could be 5 or 6 feet spared for the purpose of widening the street? I think so. There are nearly 14 feet from the building line up to the wall of the entrance steps. There could be 12 or 14 feet taken along there for the purpose of widening the street. This would apparently throw the building nearer the street, but it would, in fact, be no nearer than it is now, and if the street were asphalted it would prevent the noise from reaching the patients. I think this will have to be done in any case.
2300. Seeing that the street would not be a narrow one, this would not take away from the beauty of the building, especially when it was looked at from the opposite side of the street? I do not think it would in any way take away from the beauty of the building to give up 10 or 12 feet there; but some would complain that it was too near the building line, though that is complained of now. Really it would have no effect upon the working of the hospital.
2301. That is, if the street were asphalted? Yes. There would be really no difference to the comfort of the patients.
2302. Do you think it would be a great improvement to have Macquarie-street widened in that way? I strongly advocate the widening of the street if it can be done.
2303. With regard to the carrying out of the original design, I suppose you are pretty well read in all the modern literature upon hospitals, and know the designs of hospitals in other countries. Can you tell the Committee of any buildings that are already erected, and have been recently erected for hospital purposes, three or four stories high? St. Thomas' Hospital, London, is four stories high—it is the best in London.
2304. But it was built some time ago, was it not? Yes.
2305. When was it built? Twenty years ago, perhaps.
2306. Do you know of any recent erection three or four stories high? I cannot call any particular one to mind, but I have seen several in *The Builder*.\*
2307. Can you, as an architect, see any strong and valid objections to a hospital building being three stories high? I cannot see any. The patient, bed, and everything, is put into a lift, and taken to the highest story, if necessary. There is no inconvenience. The only objection that could be raised is that there may be communication between the wards, but I think there is very little chance of that in such a site. The site is open and breezy, and the hospital is well ventilated, and has windows for an opposite current, and flues in the walls, and I cannot see how there can be any communication between one floor and another. I certainly know of no objection to a four-story hospital, and I think it is all nonsense to say that there is an objection. If there is an objection to four stories, there must be an objection to three, and so it comes down to one story. I say that there can be no objection, because hospitals are kept so remarkably clean as to prevent harm arising. The wards are cut off by lobbies from the landings of staircases by two sets of doorways.
2308. Can you say whether in other structures—leaving hospitals out of consideration—the upper rooms are more unhealthy than the lower rooms. Supposing I was sleeping in a garret, in which there was plenty of air, at the top of a six-story building, would it be less healthily situated than on a ground floor? The illustration hardly applies, because there would be direct communication from the staircase, and a hot roof, but in this hospital there is an enormous roof space, and the wards are well ventilated, and there is no direct communication with the air in the staircases.
2309. Is altitude a disadvantage generally? Some say that it is an advantage—that the higher you go the purer the air. If any of the gases or smells from the lower floors were permitted to go up into an upper floor, it would be objectionable; but that being prevented, it must be an advantage to be high up.

\* NOTE (on revision):—There are two or three in Edinburgh and Glasgow.

2310. Would the emanations from the ground or second floor be likely to rise in the atmosphere? I do not think so. T. Rowe, Esq.
2311. Would they be lighter than the atmosphere, and so rise? I do not think they would affect the upper stories. All these places are ventilated out through the balconies, taking anything that might arise out to the depth of the balcony, 9 or 10 feet from the walls. 11 Feb., 1891.
2312. These emanations having once gone out by the windows or doors, would they be likely to rise and enter the top story? I do not think so.
2313. If they did, you would consider it a very valid objection to the construction of a hospital here at all? It would be objectionable, but there is nothing objectionable about a hospital ward when it is kept perfectly clean. The nurses in all these places are perfectly healthy, and look as well, if not better, than most other people.
2314. Speaking as a professional man, if you had to draw plans for another hospital, would you recommend that it should have three stories? Yes, or more.
2315. Especially upon a site where the space was limited? I would. If I knew of any alterations that would improve that set of plans, I certainly would distinctly state them to the Committee. I know of no improvements that I could make on these plans, except with regard to sanitary matters, I was going to say; but those arrangements cannot be shown on the plans. I know of no improvement in the arrangement of the hospital, and I should like any one to prove the contrary. It is impossible—though from prejudice, jealousy, or something else, they say that it could be better. I say that this is a perfect set of hospital plans.
2316. When you spoke about the experiment as to the absorbent character of bricks and stone, you did not give the net results; after exposure to the spray for six hours the bricks had, according to your figures, absorbed 2 lb. 6½ oz. of moisture, while the stone had only absorbed 8 oz.;—what kind of bricks were they? Two bricks taken from the building in course of erection at the Government Printing Office—two red pressed bricks. A man was sent down to obtain them.
2317. And from the experiment you learnt that stone is less likely to be damp than brick? That is a correct statement.
2318. So far as the inside is concerned, is it not customary to cover the walls with some kind of cement? In this case it would have to be done. Tiles are really the best—non-absorbent, glazed tiles, or even glass. There are cements—Parian cement and others—that are not absorbing material, which would have to be adopted for the interior walls; something smooth, that could be washed down with ease.
2319. Whether stone or brick were used? Yes.
2320. Mr. Dowel.] In reply to a question by Mr. Copeland just now, you stated that the test which you mentioned was in favour of the stone? Yes.
2321. Is it not a fact that the bricks with which you made the test were not compressed bricks? It was a double-compressed brick. I would not make the experiment with an ordinary stock brick, and I would not say that we are not making possibly better double-compressed bricks now than then. I do not wish to deprecate the use of bricks in any way. This was a practical experiment; but there may be better double-compressed bricks now.
2322. When you sent in your competitive plans, can you remember who was president of the Board of Directors? Dr. Renwick.
2323. Then I supposed you recognised him as a prominent man on the Board, and also, to a certain extent, as its mouthpiece? Yes; and he is an authority, too, on this kind of work. Well, Dr. Renwick, in reply to question 50, says:—"The Board then decided to employ Mr. Rowe as their architect, and from the competitive designs to arrange a new design; of course, for the same cost and under the same conditions as were contained in the original memoranda, and this design the Board understood was to be carried into effect."
2324. Was that so? That is impossible; it is a mistake.
2325. Dr. Garran asked him this question:—"You increased the cost from £45,000 to what?" and to it he replied, "We were not aware at the time that we were increasing the cost, but afterwards, when the stone structure had been commenced, it was explained that the cost of the building would be increased." The minute in the hospital books will prove it. When I was asked the question what stone would cost, no contract had been entered into.
2326. You gave the Committee some answer in reference to this particular question? A resolution was moved by Mr. Josephson. He asked, "What would it cost to build with stone?" and my reply was "From 20 to 25 per cent." I believe it was a resolution of his that was carried at that meeting. No works had then been carried out. Their minute book would prove this.
2327. Would you consider that Mr. Russell was a tolerably competent authority on this particular question? He ought to remember, but he is, of course, the servant of the institution.
2328. In reply to question 324:—"Was it the impression of the Board that the amended designs could be carried out for the proposed original cost?" he said, "Yes." Well, that is absurd.
2329. Then in reply to the next question:—"Was that ever reported to them at any time?" he replied, "It was never reported to them by the architect." Then a further question was put to him:—"Was there not any discussion when it was decided to use stone instead of brick?" to which he replied, "Yes; the architect was asked at a Board meeting if it would cost very much more to build it in stone than if it were built in brick, and the architect said that it would cost more. They asked him how much more—would it cost 15 per cent. more. He dared say it would cost 15 per cent. more"—not 25 per cent., as you state now? I said from 20 to 25 per cent.—that is my experience.
2330. Do you think that the witness represented the impression which you conveyed to the Board of Directors when he said, "They thought that for about £60,000 the buildings could be erected in stone." That was 15 per cent. in addition to what you estimated? I do not know what they thought. I was not asked to give an estimate.
2331. Question 327 is very plain and direct:—"Did they think the whole of the work, according to the present design, could be completed for about £60,000? Yes." The transaction speaks for itself. How could a body of men spend £68,000 on a little more than one-third of the building, and expect the whole work to cost £60,000. It is utter nonsense.
2332. But this was when your designs were first accepted, and brought before the notice of the Directors. There is Dr. Renwick's statement, that he is under the impression that the whole of this work could be carried out for £45,000? Dr. Renwick never expected to have this design carried out for £60,000, when it took an expenditure of £69,000 to carry out a little more than one-third of the building. 2333.

T. Rowe,  
Esq.  
11 Feb., 1891.

2333. But at that time no part of the building was erected. I should like to draw your attention to question 357, which was put to Mr. Russell:—"Then the Government gave its sanction to an expenditure of £45,000, and did not know until it was too late that the Committee had committed itself to an expenditure of £210,000? I think that is correct."—did you know anything of that;—can you say that the Government were aware at that particular time that this increased expenditure would be the result of carrying out your plans? I do not know. I only know that when the Stuart Government were in power the Committee went to them for money, and I think I, as their architect, went with them. I had made previous calculations, but I never informed them on any occasion. I had nothing to do with them in the matter.

2334. Then Dr. Renwick is not correct when he states that you informed the Board of Directors that the additional cost for stone would be 15 per cent. on £45,000, making a total of £60,000? No, I never said anything of the kind. He is in error.

2335. And so is the Secretary? Yes.

2336. Did you ever at any time inform the Directors officially that this building was going to cost £210,000? No, certainly not; not until the expenditure of £69,000. There was no estimate made for the completion.

2337. But in an informal manner, when the foundation stone was being laid, you told one of the Directors that the cost would be £210,000? Yes, I did; in the presence of a witness.

2338. Did you at any time have any conversation with the Government officials to give them information as to the cost of this building? I do not remember. I went round the building with Mr. Barnett on one occasion, but I think that had nothing to do with the outlay. I think it was to see whether the building could be converted into something else.

2339. Are you not aware that during the time the plans were under consideration they were submitted to the Government for inspection and approval before the Government would commit themselves to this expenditure;—did you have any conversation with any architects with reference to this matter? I think a set of the plans were sent to the Colonial Architect on behalf of the Government.

2340. And they were approved of by the Government previous to the expense being incurred? Yes, I think that is correct.

2341. But at that time you had not submitted this estimate of the total cost of the completion of the work? No, I was never asked. The Colonial Architect must have reported to the Government, I presume. I cannot tell whether he approved of the plans, but I presume he did.

2342. *Mr. Copeland.*] There is nothing to show that he did not approve of them? Not that I know of.

2343. *Mr. Dowel.*] At that time had any discussion arisen as regards the additional cost of the buildings through the alteration of the designs? Certainly not.

2344. No discussion had arisen? None whatever.

2345. The evidence of Dr. Renwick and Mr. Russell was correct when they said that £15,000 was the amount that you were limited to as regards the cost of construction? You are now going back to the original plans.

2346. No; I am referring to a statement of Dr. Renwick, who said that the Board employed you to arrange a new design, of course, for the same cost and under the same conditions as obtained under the original memoranda, and this design was to be carried into effect? That is utterly impossible. How could I put in sixty or seventy more beds, and build in stone, for the original amount. The doctor is wrong.

2347. *Mr. Garrard.*] With regard to the memorandum of outlay furnished by you, the item "excavation, £2,194 15s.," is for the whole building—the incomplete portion as well as the portion that has been completed? That is for levelling the surface, to make a level plateau upon which to start the building.

2348. What you call the north, south, and east pavilions, and the centre administrative building, besides the laundry and other places? No; not the laundry and kitchen. Many years ago it was thought that that site was impregnated with disease, and some of the doctors suggested cropping it. I cropped it by taking away thousands of loads, and levelling it down, preparing for this new erection.

2349. The excavation, kitchen premises, and laundry and engine department cost £14,700 odd? Yes.

2350. That department is actually complete? Yes. The kitchen means kitchen, scullery, pantry, and servants' room; but it has been reported in Parliament that the kitchen itself cost £16,000.\*

2351. Then the first story of the three pavilions and the administrative building cost £25,642 9s. 6d.? Yes.

2352. The next story over that cost £23,701 6s. 6d., or, in other words, £1,941 less? Yes; but then there are £463 for sundries.

2353. Is that a charge against the second story? I think so.

2354. Well, at any rate, the second story cost something like £1,500 less than the first? Yes.

2355. Going by that, what would it cost to carry up the building another story higher? I think you have the estimate before you;—£56,000 to build another story and complete the whole.

2356. But I want from you an approximate estimate of what the third story would cost? I do not know.

2357. There is £1,500 difference between the cost of the first and second story? You are speaking of the masonry only?

2358. Just what you have already done? If you take £23,000 for the cost of the second story, the next story would be somewhat like that.

2359. I find that there is a difference of £1,500 between the cost of the first and second story? That is accounted for because of the massive foundations, broad footings, and larger masonry used in the first story.

2360. I understand that; but I want to get at the probable cost of the stonework of the third story? I should say £23,000 or £24,000, and the second story would cost £24,000 if the £463 were chargeable to it.

2361. Now, what will it cost approximately to add one story more to the administrative building only—about one-fourth of that? Well, I do not think that you are far off.

2362. Say £6,000? That would be about a reasonable thing. You could not put it at one-third, because there is not so much in the middle as there is at the wings.

2363. Am I right in saying about £6,000? I think so.

2364. Now can you give me any idea of the cost of roofing in the whole of these buildings, including the administrative block? No; I could do that at my office; but I could not do it here. I have the whole of the roofing taken out in squares at the office, and the whole of the detail estimated.

2365. You would not like to give me an approximate idea now? I could not answer the question.

2366. Would I be safe in assuming £5,000? That would not do it.

2367.

\* NOTE (on revision):—Its actual cost was £6,793 3s. 10d.

T. Rowe,  
Esq.

11 Feb., 1891.

2367. Can you give me any idea of the probable cost of the internal fittings of these three pavilions, and of the administrative buildings, for three stories and for four? I could not take them out in that way.

2368. You have some idea, I presume? I have no desire to speak roughly. I can vouch for the correctness of the estimates which I have given on paper at the request of the Committee; but to go into another kind of estimate now without figures before me, would be an exceedingly dangerous thing.

2369. Is there not some rough proportion between the cost of the internal fittings of a building when the roof is on, and the cost of the building itself? No; you must take out the quantities, and a great deal depends upon the quality of the fittings. You must take them out in detail.

2370. I suppose the internal fittings of a hospital would not cost as much in proportion as the internal fittings of an ordinary building? In a large ward there are not so many doors, but there are more windows. The administrative part is merely a residence. The hospital walls would have to be tiled or finished in some other expensive way.

2371. What is the height of the ground above the ground floor in front—what is that floor below the street level? Not more than 4 or 5 feet, I think.

2372. How high is the floor of the eastern pavilion above the ground? I think it will average about 3 feet or 3 feet 6 inches. There is ample space to get underneath.

2373. Roughly, the rear portion of the north and south pavilions being 5 feet below the level of the ground at the front, would be about level with it at the back? No; it would be about 3 feet 6 inches above it at the back.

2374. Some witnesses have spoken of that floor, owing to its being below the ground level in front, as a basement, while on your plans it is called the ground floor. I suppose that is a matter of taste? No; this is not a basement, it is a ground floor.

2375. A basement would be a floor below the ground level all round, more or less? Yes.

2376. Where it is only below the ground level in front and above at the rear, you term it a ground floor? Yes.

2377. It is proposed that the ground floor of the northern pavilion should be a casualty ward. Has there ever been any objection by the hospital authorities to its use as a ward? I have never heard of any.

2378. Do you think it undesirable that a room partially below the ground level should be used as a ward? I see no objection for a casualty ward, if it is well ventilated underneath. I described to the Committee just now that there are openings under every window. A man can walk about there almost. It is concreted and asphalted below the floor.

2379. Is it intended to slope the ground down from the street level to the front of the building, or will you only leave a space immediately in front for light? It is intended to level the present surface as low as we can, to admit all the light and air possible into the ground floor.\*

2380. Supposing the medical fraternity thought it undesirable to use that room as a ward, it would only deprive the hospital of sixteen beds? Yes.

2381. Do you think there can be any objection to using the ground floor of the first eastern pavilion as a ward? Certainly not.

2382. That floor would be 3 feet 6 inches above the ground level? Considerably more; the ground slopes away.

2383. It is well ventilated underneath? Certainly; there are large openings under each window on each side, so that a current of air can go through and through.

2384. If the building were erected on the modified scale, it would give us on the ground floor a casualty ward containing sixteen beds, and the eastern pavilion ward also containing sixteen beds; on the first floor of the north and south pavilions forty beds, twenty in each; and in the eastern pavilion sixteen beds; and on the second floor a similar number of beds? Yes.

2385. Do you know the number of beds in the present south ward? I do not know the exact number.

2386. Would there be any serious objection to retaining that ward—I understand that it is in good preservation? Inside it is not bad, but it would want a lot of doing up, and, if it remained, it would materially affect the completeness of the building, because the kitchens are driven close up to it. We should never have thought of putting them there if it had not been intended to remove that wing.

2387. The new building would give us 144 beds, and there would be seventy-eight beds in the existing south ward? Yes.

2388. That would be forty-eight beds for surgical cases and 174 for medical cases? Where the southern wing stands it was intended to put up an infectious diseases ward, a pathological museum, and other buildings.

2389. That is not in the project before us? It is, if you complete the whole buildings; but, if you only complete a portion, of course it is not.

2390. What will it cost to remove the present temporary wooden building? It would not cost much. Anyone would take it down for the material, I think.

2491. *Mr. Humphery.*] In the original design the administrative block showed one story less than in the present design? Yes; but because of the number of young doctors likely to study there it was necessary to increase the accommodation.

2392. If, in the original design, the administrative block was one story less than it is in this design, in what way would the diminishing of the present buildings spoil their design? To lessen the side wards would spoil the design.

2393. Is there any reason why the administrative block should not now be four stories instead of five? I had no reason for making it five, but I think it was necessary to provide accommodation for the number of young doctors likely to go there to walk the hospital. There were not sufficient beds to accommodate them.

2394. As far as the design is concerned, did not that, in your opinion, injure the appearance of the elevation? No, I do not think so much of that. That part would better bear reducing than the ward buildings.

2395. It will simply be restoring the building to the original design? No; I do not say that.

2396. It will simply be reducing the administrative block to what it was in the original plan? Yes.

2397. Would not the south and north pavilions bear reducing by one story if the design of the roof were altered? The design of the roof is altered in the sketch before the Committee.

2398. Could it not be altered so that the whole of the buildings would be in harmony? You have massive foundations and wards' walls that would bear another story, and it would be a very great sacrifice to lose that story.

2399.

\* NOTE (on revision):—The dwarf wall supporting the bank will be 15 feet away from main wall of ward there will be no obstruction of light whatever, being only 4 feet high, more or less.

T. Rowe, Esq. 2399. Leaving out of sight the thickness of the walls, could not the design be reduced by one story without destroying the harmony of the block? In my opinion it is not desirable; but others may think that it would not affect it. I myself prefer the higher building, though, in one sense, it does not matter to me what is done.

11 Feb., 1891.

TUESDAY, 17 FEBRUARY, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY COPELAND, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	JAMES EDENEZER TONKIN, Esq.
The Hon. GEORGE HENRY COX.	EDWARD WILLIAM O'SULLIVAN, Esq.
JACOB GARRARD, Esq.	CHARLES ALFRED LEE, Esq.
JAMES PATRICK GARVAN, Esq.	

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

Walter Liberty Vernon, Esq., Government Architect, sworn, and further examined:—

W. L. Vernon, Esq. 2400. *Mr. Garvan.*] Do you know the site of the Sydney Hospital, in Macquarie-street? Yes.  
 2401. You know the buildings which are upon it at present? I have not been through them.  
 2402. Do you know them sufficiently well to speak with any degree of definiteness? No, I do not.  
 2403. Unless you know the place well it will be of little use me asking the question I wish to ask;—I wish to ascertain from you, as an architect of undoubted eminence in the city, what your opinion is as to what is best to be done with these buildings in view of the instructions given to this Committee;—have you ever been over the place? No; I have seen it from the street and from the Domain.  
 2404. *Mr. Garvan* suggested that the witness be invited to examine the buildings.  
 2405. *Chairman.*] Supposing the Committee came to the conclusion that it would be desirable to remove the present structure back for some distance, to fall in with your project of widening the street,—could you give us some idea of the approximate cost of the removal of the building? In its present form?  
 2406. Yes? I could arrive at it approximately.  
 2407. *Mr. Copeland.*] In forming your estimate you would take into consideration the fact that the stone could be used again? Undoubtedly.  
 2408. Supposing you were to make Macquarie-street 120 feet wide, would that allow space enough on the hospital grounds to re-erect the hospital buildings, according to the present design? I will look and see. I could not tell you now.

17 Feb., 1891.

WEDNESDAY, 18 FEBRUARY, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.	HENRY COPELAND, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES ALFRED LEE, Esq.
The Hon. GEORGE HENRY COX.	WILLIAM MCCOURT, Esq.
JACOB GARRARD, Esq.	JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

Louis Ralston Huxtable, Esq., M.B., Mast. Surg., Hon. Physician, Sydney Hospital, sworn, and examined:—

L. R. Huxtable, Esq., M.B. 2409. *Chairman.*] What is your position in the Sydney Hospital? I am an Honorary Physician to the Sydney Hospital.  
 2410. How long have you been in that capacity? About twelve months.  
 2411. Have you been very long in the colony? I have been a resident here for upwards of three years.  
 2412. You naturally take a considerable interest in the hospital accommodation and requirements? A great amount of interest. I may say that I attended to submit to you, on behalf of the Honorary Medical Staff of the Sydney Hospital, a statement which the staff has drawn up of its views on the question of the completion of the hospital, which statement I should like to read to the Committee.  
 2413. Who are the medical men by whom the pamphlet has been drawn up? Dr. Tarrant, Dr. Brady, Dr. Goode, Dr. Chambers, Dr. Ellis, Dr. T. Dixon, Dr. Munro, Dr. Odillo Maher, Dr. Thomas Evans, Dr. Worrall, Dr. Wilkinson, Dr. Pickburn, Dr. Rennie, and myself. There is one member of the medical staff whose signature and approbation has not been as yet secured, owing to his not having been present at the meetings of the staff at which the statement was prepared.  
 2414. *Mr. Cox.*] Who is the other doctor? Dr. O'Connor.  
 2415. *Chairman.*] Will you be good enough to read the statement? (*Witness read the following statement*):—

To the Chairman and Members of the Parliamentary Standing Committee on Public Works.

Gentlemen,

We, the members of the Honorary Medical and Surgical Staff of the Sydney Hospital, beg respectfully to submit to your Committee the following statement of the opinion which we entertain upon the question of the completion of the hospital, together with a number of important facts relating to that question, upon which facts our opinion is based.

In order to place the matter before the Committee as concisely as possible, it will be well to state briefly the opinion we have arrived at, and to add thereto the considerations upon which it is based. We are, then, of opinion that the Sydney Hospital should be completed upon the plan, or some modification of the plan, of the present unfinished building, and that it should be designed ultimately to accommodate 300 patients, or thereabouts. The considerations upon which these opinions are based are as follows, namely:—

- I. The demand for hospital accommodation, as shown by the statistics of the hospital to the present time.
- II. The nature of that demand.
- III. The estimated increased demand for hospital accommodation in the future.
- IV. The site of the hospital.
- V. The nature of the building which it is proposed to erect.

As the Committee are aware, the accommodation at the Sydney Hospital is at present as follows:—

In Macquarie-street .....	224 beds
In the Ophthalmic Branch at Miller's Point.....	60 "

Total..... 290 and

For the sake of convenience in compiling statistics, it has been the practice hitherto to include all patients treated by the hospital in one return. The number of patients treated in the Macquarie-street Buildings may, therefore, be accurately arrived at by subtracting from the gross numbers those treated at Miller's Point, namely, for 1889, 362 cases, and for 1890, 364 cases, the approximate number of inmates daily being 50.

In the year 1889 3,296 cases were treated in hospital, and allowing each case a residence of thirty days—which would be about a fair average, the average residence in English hospitals being thirty-one days (Mulhall)—274 or 275 beds would be required to provide for this number of patients. To this should be added, as has been found necessary in all general hospitals, a provision of 10 per cent. of beds occupied: for temporarily occupied beds, cleaning, &c., say twenty-seven beds, making a total of 302.

In the following year, 1890, there were under treatment in the hospital during the year 3,416, which, on similar calculations, would show a necessity for 284 beds which, with the 10 per cent. addition explained above, would amount to 312 beds in all.

As may be seen, however, by referring to the statistics of the hospital, the average duration of stay during the last two years has fallen considerably below thirty days, being for 1889, twenty-seven days, and for 1890, twenty-five days.

This diminution in the average stay of the patients serves to mark the fact that they have been discharged at a very early period, perhaps in some cases earlier than the medical staff would have considered wise or safe, a course of action which is, however, imperative with the present accommodation in order to make room for new urgent cases.

As special mention has been made by witnesses before the Public Works Committee of three classes of cases treated, namely the Lock, Gynaecological, and Ophthalmic cases, we wish to place the following considerations before the Committee.

Accommodation is at present afforded for twenty Lock patients, male and female. It will be conceded that it is desirable not to treat this class of case in general wards. Unless, however, some provision is made for treating urgent cases among these unfortunate persons, great suffering in many, and undoubtedly death in some, would be the result. Every medical man is acquainted with the urgent nature of some of these cases, and the high surgical skill required to treat and operate on them. These remarks are quite as applicable to the Gynaecological cases.

It seems, therefore, to the staff of this hospital that some accommodation for these cases is absolutely necessary, and as a matter of experience it is found that the very limited accommodation at present provided for these two classes of cases is insufficient to meet the demand made upon it.

With regard to the Ophthalmic cases, the majority of them cannot be looked on as urgent ones.

A small number are, however, extremely urgent, if an attempt is to be made to save sight of injured or, in some cases, diseased eyes.

Deducting, however, the number of beds provided in the Ophthalmic Department from the total requirements under average condition, as shown above, viz., 312, we find that a total of 246 beds are immediately required for absolutely urgent cases at the Macquarie-street site.

It is true that up to the present time the rapidly increasing demand has been met by the 224 beds available in Macquarie-street, in the manner shown above. But the reduction of the period of residence in hospital to so low an average as twenty-five days, cannot be regarded as satisfactory, nor in many cases as justifiable.

As shown above, there was an increase of demand between the years 1889 and 1890 of 120 cases, and it is clear that this increasing pressure cannot much longer be met by any temporary expedients.

Having thus shown the demand which exists for increased accommodation, we desire to consider.

#### II.—The Nature of that Demand.

The opinion has been repeatedly expressed that a large number of the patients admitted to the Sydney Hospital are cases which are not urgent and might be treated in a hospital situated at a distance from the city, as well or better than in this hospital. Now we, the members of the staff wish emphatically to dissent from this opinion, and to state that to our personal knowledge cases admitted to the Macquarie-street Hospital are invariable cases of urgency, and that in very few instances could any of them be removed to a more distant hospital; in fact, that as the hospital is at present administered it is emphatically an emergency hospital.

Sir Alf. Roberts, in his evidence on this subject before the Committee, has stated that, in his opinion, during 1889 only 1,116 of the cases admitted to the Sydney Hospital could be considered as urgent ones, and that the remaining 2,180 were of the nature noted above, that is to say not urgent. In support of this statement, he handed in an extract from that year's published statistics, with notes appended to show how he arrived at this result.

Upon referring to these, it will be seen that Sir A. Roberts takes the cases of injury and poisoning, amounting to 873, and to these adds 10 per cent. of the other cases, that is to say 10 per cent. of 2,423, viz., 243, to arrive at the number mentioned above.

Now, the number of deaths occurring among inmates of the hospital in that year was 282; of these from injury and poisoning died sixty; leaving a balance of 222 deaths among that class of cases of which Sir A. Roberts estimates that only 243 were really eligible as cases of emergency; that is to say, either Sir A. Roberts is of opinion that only cases in an absolutely moribund condition are to be regarded as cases of emergency, or he must have made an error in his calculations so egregious as to invalidate altogether the deductions made from them, for even to a layman it must be obvious that a very large proportion of cases over and above those in this extreme condition must occur as genuine cases of emergency, demanding immediate admission to hospital.

Sir Alfred Roberts, moreover, stated in his evidence that no report as to the result of the cases treated appeared in the Medical Superintendent's report, from which he drew his information. As a matter of fact, the result of every case treated, and of every operation performed, is contained in that report, and is as full and as complete as is the report of any other hospital in any part of the world.

Further, with respect to the class of people by whom this institution is used. Some light may be thrown upon this question by taking note of the amount received from paying patients as compared with the returns from other hospitals. In the year 1889 this amount was £1,445.

During the same year the amount received from patients in the Prince Alfred Hospital was £3,881, and in St. Vincent £2,991. And here it should be noted that in every case admitted to the hospital a strict examination of the circumstances of the patients is made, and payment demanded and secured whenever practicable.

It will thus be seen that the Sydney Hospital is more largely devoted to the use of the absolutely destitute sick than either of the kindred institutions alluded to here.

#### III.—The estimated Increased Demand in the future.

The constantly increasing demand for hospital accommodation, which proceeds *pari passu* with increasing population, has hitherto been met by the whole of the Metropolitan Hospitals, namely, the Sydney Hospital, the Prince Alfred Hospital, and the St. Vincent, together with accommodation for certain classes of cases at the Coast Hospital, Little Bay. The last named must, on account of its remote position, always be restricted in its use. Of the others, the limit of accommodation possible on the sites occupied by them respectively is already almost reached in two, namely, by the Sydney Hospital and St. Vincent. There remains, then, the Prince Alfred Hospital with scope sufficient for very considerable extension, and upon this institution will necessarily fall the onus of providing for the increase which must take place in the future. The hospital accommodation at present provided in general Hospitals within the Sydney Metropolitan area is as follows:—Balmain Cottage, 8; North Shore Cottage, 12; Little Bay, 272; Parramatta, 23; Prince Alfred, 224; St. Vincent, 133; Sydney Hospital, 290; total, 962 beds for a population of 400,000. Now, the increase of population in Sydney during the past decade has amounted to 157,509, and it is estimated by the Government Statistical Department that the population in the year 1900 will amount "to from 550,000 to 600,000."

The proportion of beds available at present to population is one to 415, as may be seen from the figures given above, and upon this basis we may safely conclude that we shall require to provide, within the next ten years, from 363 to 483 additional beds. This demand will have to be met, as has been shown, by the Prince Alfred Hospital, or by the construction of some other general hospital, and it is therefore clear that the site of the Sydney Hospital being dedicated to hospital purposes, and being suitable for the purpose, should, if only from the economic point of view, be utilised at once to its fullest capacity. For it is plain that we are within measurable distance of a time when, even having made the fullest possible use of the means at our present disposal, we shall have to look outside those means to meet the demand of the near future.

IV.—The Site of the Hospital.

L. R.  
Huxtable,  
Esq., M.B.  
18 Feb, 1891.

The area of the site is 2 acres 3 roods 19 perches, or almost 3 acres. English authorities on hospital construction are agreed that 100 beds to the acre may be allowed as a fair average under average conditions. The Sydney Hospital site is therefore capable of carrying 300 beds, or close upon it.

Little remains to be said as to the eligibility of the site, for the reason that with respect to it there can be but one opinion, namely, that whether regard be had to its central position, its elevation and exposure, its soil and surroundings, it is in every way a site which, for hospital purposes, it would be difficult anywhere to equal, and impossible to excel.

The site occupies a slight eminence, the fall being towards the Domain and the city. It is bounded on one side by our largest city park, and is separated only by the Mint from the wide expanse of Hyde Park and its annexes. On either side of it stand public buildings, and from these facts and the fact that between it and the quarter from which our prevailing winds, north-east, come, there stand nothing but wood and water, it is not too much to say that for hospital purposes the site is an ideal one. The only objection, in fact, that has ever been raised to it, even by the most positive opponents of the hospital, has been that it is too good, that is to say, too valuable a site for the purpose. In addition to the purely sanitary aspect of the site, there must be taken into consideration its central position, a point, in many ways, of the utmost importance with respect to the work done by this hospital.

Within a few hundred yards of it lies densely populated Woolloomooloo, and, extending from this, Paddington and Surry Hills, of equally dense population, and all of them of the class from which hospital patients are drawn, no part of either being too remote to be effectively served by the hospital. The Darling Harbour district, of a character similar to the foregoing, lies within half a mile of the hospital to the west, and it would be impossible to have a hospital more advantageously placed with respect to the great wharves of the city, a never-failing and ever-increasing source of cases of accident and urgency.

V.—The Character of the Proposed Building.

Much of the opposition to the completion of the hospital has been based upon an impression, which has gained with the public some degree of currency, to the effect that the plans of the buildings now standing unfinished provide for a hospital which would be unsuitable for hospital purposes, and that they are in every way bad plans; and further, that they are generally recognised to be so, and generally condemned by the members of the medical profession.

The staff of the hospital desire to place on record their strong protest against this impression, inasmuch as, from their personal knowledge, it is not in accordance with facts. For themselves, as well as for a large majority of the medical profession, they are in a position to state emphatically that the plans are by no means to be regarded in the unfavourable way noted above. In the design of the hospital all the essentials of hospital construction have been rigidly adhered to. The building is designed on the pavilion system, now universally acknowledged to be the best system hitherto adopted; the wards are well proportioned (an average cubic space of upwards of 1,700 feet to each bed has been, with extra space where demanded by infectious wards, &c., provided for); due provision has been made for excellent lighting and ventilation; the sanitary arrangements are admirable throughout, the wards and the pavilions are so disposed with respect to one another as to give the best possible opportunity of economic and efficient administration; and the plan provides for a hospital complete in every department. The arrangement of beds in the wards is the best arrangement known, each bed being placed between two windows. This is so throughout all the pavilions, and is only noted here because it has been stated to the Committee that the beds are not, and cannot, on account of the design of the ward, be so arranged.

These are briefly the salient facts of the case with regard to the plans.

Now, by those who have adversely criticised these plans, two objections to them have been raised:—

1st. The fact that the pavilions run north and south instead of east and west.

2nd. The fact that the height of the pavilions is four stories.

In the opinion of the staff the first of these objections is altogether invalid, and the second, if admitted to have weight elsewhere, does not apply in the conditions obtaining here.

The facts with regard to the disposition of the pavilions are these: Two of them front Macquarie-street, and face, therefore, east and west. The others stand at right angles to the foregoing and face north and south. The buildings are therefore arranged in T form, and it should be specially noted that the stem of the T abuts from the horizontal portion, opposite the central administrative block, and not opposite either one of the first-named pavilions, thus:—

The ideal disposition of hospital buildings under average conditions is, that they should run north and south, and face east and west, the advantage of such position being that the sun's rays may thus be daily distributed as equally as possible on both faces of the buildings. Certain local conditions may render a modification of this arrangement necessary in individual cases, and among these most important is the question of prevailing winds in localities where the climatic conditions are extreme or severe. In our climate, and on this site, such modification is unnecessary, the only wind from which it is at any time necessary to protect being the cold westerly wind of winter, which prevails only for from ten to twelve weeks during the year, and is very intermittent, which, as compared with the biting easterly wind of England and Scotland, is of a very mild character, and from which an efficient protection is afforded by the lofty buildings of the opposite side of Macquarie-street.

But, as has been stated above, the remaining two pavilions face north and south, which on the facts given above may be argued not to be the best possible arrangement. This might be at once granted were there no other factors to be considered. But, taking the whole of the facts into consideration, the proposed building will be found to be admirably arranged for, had the last-named pavilions been placed parallel with the first, and so facing west and east, the free access of light and air, and the outlook must have been interfered with in a way which is impossible under the present plans, and which would have far outweighed any possible advantage to be gained from the east and west aspect. And the staff would again direct special attention to the first diagram given, in which it is shown that the two latter pavilions do not abut upon any portion of the east and west pavilions, but only approach the administrative part of that building, whereas had the north and south pavilions been placed parallel to the others they must have approached them more or less nearly throughout the whole length, as shown in the second diagram.

Diagram II.

With

With respect to the second objection to the present plans, the height (four stories) of the pavilions, the staff would, in the first place, point out that the objection had very special weight in days in which the enormous advantages of lifts or elevators were unknown. Since the introduction of these appliances, with which all the pavilions of the hospital as planned are to be provided, more than half the force of this objection to buildings of the contemplated height has been removed, the conveyance of patients and stores from floor to floor being made an easier, and, in the case of patients, a less irksome matter than the travelling through very lengthy corridors. As far as economy of administration goes, the arrangement in four stories has a decided advantage over any less height, as far as the transport of patients is concerned it has an advantage, and there remains only the purely sanitary aspect of the question. It must at once be granted that to crowd very lofty buildings on a restricted area would be an unwise course to pursue, since such an arrangement must interfere more or less with access of free light and moving air, two most important elements of health. It is for instance obvious that to surround a relatively small quadrangle with lofty buildings so as to create a pool of stagnant air and to interfere with the admittance of sunlight would be a serious error. This would be especially true in a climate damp and comparatively sunless, and in a closely pent city site.

But these objections do not in any wise apply to the plan of the Sydney Hospital, which has been so arranged that each pavilion is completely free and open on both sides, and they still less apply in a climate where, as in ours, the amount of sunlight during the year is so great.

It may be here pointed out that some of the largest and most important, and one at least of the newest London hospitals have been built of *at least* this height without any ill consequences in a climate where the degree of sunlight is perhaps one-fourth of that which we enjoy. St. Thomas', St. George's, St. Bartholomew's, and the London are all of them of four, and, here and there, of five stories.

In conclusion of this part of the subject, the staff would remark that they should have felt it unnecessary to enter so fully into this matter of the character of the building, had it not been that a large amount of misapprehension has been in vogue with respect to the building, and that a feeling has apparently obtained with the public to the effect that the building planned is in some way hopelessly and utterly unsuited for hospital purposes, and that to complete it would be only to perpetuate an error. The staff believe that they have shown, on the contrary, that the buildings, if completed as planned, would provide an admirable and complete modern hospital, which would be of lasting benefit to the community for which it is intended. Apart from their own personal knowledge of the state of medical opinion on this subject, the staff would direct attention to the fact that, at a special and largely attended meeting of the British Medical Association some months ago, a resolution embodying that opinion was passed unanimously.

One more point under this head may be regarded as having special significance. The present temporary buildings have consisted of pavilions running both north and south and east and west. They have been pavilions in every way inferior to those which would be provided in the new building. Nevertheless, for some years past, the results obtained in both surgical and medical cases have been all that could be desired.

The impression which at one time obtained among members of the medical profession in Sydney, that the east and west frontage was a disadvantageous one, originated at a time when the Sydney Hospital, which fronted east and west, was the only one existing here, and when the bad results, which were frequent in it, were due to an extremely defective sanitary condition, when, in fact, patients were lying above, and operations were performed over what was afterwards proved to be a large collection of sewage matter. In ignorance of this condition of affairs, many causes were assigned, and among them the western aspect, for the bad results obtained.

#### *General Considerations.*

Of these, there are some which, while of considerable importance, appear to the staff to be not of vital importance, and, moreover, to involve issues which may be regarded as being somewhat outside their special province. Such is the purely æsthetic aspect of the matter, namely, the question of the completion of the building on a plan which shall be not only a thoroughly well equipped and useful hospital, but at the same time a building architecturally worthy of this great city and of this noble site. The question has, however, its utilitarian as well as its æsthetic side.

Want of popular interest in our public charities is one which is keenly felt by all who have to do with their administration. The difficulty of rousing that interest is shown by our scanty subscription lists as compared with the number of our well-to-do population. The causes of this want of interest are no doubt complicated, and the correction of it must be a matter of time and of education in the duty of the public with respect to our charities. But one thing is true of our people here, as it is true of people elsewhere, *viz.* that their interest is much more readily roused and held by an institution occupying a conspicuous site and housed in a handsome building, than by one of mean proportions and remote position. It is not too much to hope that by completing a structure of which the citizens, as such, might be proud, the increase of subscriptions may be a very substantial aid to its maintenance in the future.

To illustrate the force and truth of the foregoing we may draw attention to the fact that the amount of subscription to the Sydney Hospital has considerably decreased of late. It cannot but detract from public sympathy with the hospital that its Patron, Lord Carrington, should have strongly and publicly expressed his disapprobation of the condition of the hospital buildings, but it must be acknowledged that such criticism is not only permissible but is demanded by the present state of affairs, and it is clearly impossible to regain lost sympathy except by removing the cause of dissatisfaction and distrust. There are notoriously many citizens, as may be seen by the statement of our collector, who decline to subscribe to a hospital which they properly regard as being at any moment a possible scene of dreadful disaster. We cannot deny that were the hospital to take fire a terrible loss of life must inevitably occur, and the near possibility of such a calamity was strikingly shown by the recent great fire in the city.

But there is a consideration which may with propriety be discussed here, and on which the staff feel that they may be permitted to express a strong opinion, falling as it does within their special province. It is a truth, universally accepted as such by all those whose practical experience of hospital work entitle them to form an opinion upon the subject, that the work of a general hospital of large size is never carried out to the best possible effect unless students are attached to and work in it. Were it necessary to support this statement by authorities it could not, perhaps, be done more weightily than by quoting the words of Sir James Paget, whose utterances on this matter are entitled to the greatest respect. Speaking of the opening of the new Liverpool Hospital a few weeks ago, he said, "But with that hospital, admirable as it is, great as is the good it may do, I should like to say I believe it will be very imperfect unless the means of science teaching and of the whole teaching of medicine in the school be quite equivalent to it. The best working of a hospital of that magnitude, and of any place like it, is that there should be a medical school of high equal order with it. I doubt very much whether one good man in a hundred would do the best he possibly could in any one hospital of large size, unless he were a teacher at the same time—unless there were pupils around him, not only for him to have the satisfaction of teaching, but for him to be conscious that they are watching, and carefully estimating, and sometimes not unkindly criticising his work. It increases his sense of responsibility and his desire for repute, and the zeal for which everyone works, if he is conscious of being watched and praised or blamed by those who are competent to judge of him, and who are educated up to the full capacity of doing so perfectly; and this can only be when a medical school of the highest level is combined with a hospital such as this will be." And Sir A. Roberts, in his evidence before the Committee, states: "It is practically known to be an advantage to the patients to be in a hospital with a medical school attached to it."

It cannot, therefore, be regarded in the light of a reflection upon the manner in which the staff of any hospital discharge their duties to say that no matter how well that work may be done in the absence of students it will be better done with their aid, and the staff of the Sydney Hospital feel very strongly that the work of that hospital will never be done to the best possible advantage until the teaching of students within the hospital be made possible by the provision of suitable accommodation. For years past such use of the hospital has been out of the question. Several years ago the Senate of the University approached the Sydney Hospital authorities on this matter, and it is well known that up to the present time the amount of clinical material available at Prince Alfred Hospital is insufficient to meet the demand for teaching purposes. By providing a hospital in which it might be possible to make use of the valuable teaching material which is already in every other way available, but which now is utterly wasted, a double benefit would accrue, namely, a distinct advantage to the hospital and its patients, and a much-needed addition to the opportunities of clinical training now enjoyed by the students of the University.

One more point must be noted here, though the desire of the staff to avoid unnecessary length prevents their entering fully into the matter. A department of the hospital of the utmost importance to the sick poor, *viz.* the out-patient one, is at present carried on in the temporary shed in the Domain. This department consists of Eye, Ear, Nose, and Throat, and Gynecological branches, under members of the Honorary Medical Staff, and departments for general diseases under the District

Esq., M.B.  
18 Feb., 1891.

District Surgeons and Resident Medical Staff. In these various branches 14,204 new patients were treated last year. To these patients it was a matter of great moment that they should be able to have medical advice at so central an institution as the Sydney Hospital, instead of being compelled to travel to an institution in one of the suburbs. Should the hospital be deprived of the use of the temporary building, this large section of the public would at once be compelled to go without medical advice, or to go to the expense and loss of time of travelling to a more distant institution, there being no other place in the present building where they could be attended to.

Many a case of disease thus early and efficiently treated is arrested, the sufferer spared a long and grave illness, and the hospital the necessity for providing in-door accommodation and attention.

In respectfully submitting to your Committee the foregoing statement, the staff of the hospital desire to recapitulate the points which they have endeavoured to prove in support of their opinion as to the necessity for the completion of the Sydney Hospital:—

- I. They have shown the urgent need for increased and improved accommodation.
- II. They have shown the class of persons, namely, the absolutely indigent poor, by whom the hospital is almost exclusively used.
- III. They have estimated the probable increase of demand in the near future, and shown that in view of it, the utmost capacity of the Sydney Hospital site will soon be demanded for use.
- IV. They have shown that the site of the hospital, as a city hospital, is in every way most eligible.
- V. Finally, they have shown that the proposed building, if completed, will provide a perfect modern hospital.

In conclusion, the staff of the hospital desire that the facts and figures contained in their statement may be strictly investigated, feeling sure that the position they have taken up will be, by such investigation, fully corroborated.

HARMAN J. TARRANT, Chairman Medical Committee, Hony. Surgeon, Sydney Hospital, since 1880.

MAURICE J. O'CONNOR, Honorary Surgeon.

A. WATSON MUNRO, Hon. Physician.

THOMAS DIXSON, Hon. Physician.

W. H. GOODE, M.D., Hon. Surgeon to the Sydney Hospital, late Honorary Surgeon, for six years, to the Prince Alfred Hospital.

GEORGE E. RENNIE, M.D., Honorary Pathologist.

W. CAMAC WILKINSON, M.D., late Hon. Phys., now Phys. to Ear and Throat Dept.

W. ODILLO MAHER, M.D., Honorary Ophthalmic Surgeon.

A. J. BRADY, Hon. Surgeon, Ear, Nose and Throat Department, connected with Medical Staff of Sydney Hospital since 1874.

THOMAS PICKBURN, M.D., Hon. Physician, Sydney Hospital.

HENRY A. ELLIS, Hon. Surgeon.

T. CHAMBERS, Physician to the Department for Women.

RALEIGH WORKALL, Hon. Assist. Surgeon to the Department for Women.

THOMAS EVANS, Ophthalmic Surgeon, since 1882, formerly Ophthalmic Surgeon to the Prince Alfred Hospital for six years.

L. RAISTON HUXTABLE, Honorary Physician.

I should like to state that I will be able to forward to the Committee to-morrow a corrected copy of this statement, along with the signatures of the honorary medical staff attached.

2416. Then the copy which you have read is not signed? It is not.

2417. *Mr. Garrard.*] Objection has been taken to placing patients on the ground floor (some people call it the basement)—that is, the lower floor, in the northern pavilion; do you think there is any serious objection to persons being placed in that portion of the building? I do not see how there can be any possible objection; the floor is not a basement floor; it is strictly a ground floor. Underneath it there is an open space, freely ventilated from side to side; between each of the windows there are manholes, and the space below the ward is to be concreted all over, so that there will be free access of light and air.

2418. But, as a matter of fact, the floor level will be considerably lower than the level of the street in the front? It happens that it will be a few feet lower—perhaps 3 feet—than the greatest height of Macquarie-street level, which is, of course, an artificial height, but on the eastern aspect the floor of that ward will be 3 feet above the natural ground level.

2419. And the floor level of the eastern pavilion will be higher still above the ground level? Yes.

2420. At all events you do not attach much importance to any objection which can be raised? There cannot possibly be any importance attached to it.

2421. Therefore, in estimating the capacity of this proposed building we can reasonably take that floor as a ward? Undoubtedly; even if it were possible to conceive that as a reasonable objection, only one ward in the whole hospital is in that condition. The corresponding wards on the other side of the hospital—that is the southern wing of the western pavilion—are entirely devoted to out patients' departments and offices. Therefore, the condition referred to applies only to one small ward for casualty cases, which only remain in the hospital one night. They would not remain in the ward more than twenty-four hours.

2422. I gather from the statement which you have read that the medical staff are clearly of opinion that the building should be completed as originally designed? That is so.

2423. They do not recommend the alternative design of taking off one floor? No.

2424. The argument all through the statement is that the two eastern pavilions should be built. At present only a portion of one of them is built. It is not intended to go on with the more eastern one at present? I understand that it is intended to allow the south wing to stand.

2425. The southern wing is not a very old building? Not very old.

2426. It is good enough for all practical purposes? It is an excellent temporary expedient.

2427. If the alternative plan is carried out, and the southern wing is retained, it will give sufficient accommodation for some years to come? For some years to come, if the now unfinished pavilions be completed according to the original plan.

2428. And we can, if necessary, build an additional eastern wing afterwards? Exactly.

2429. There is no fear of any disease being transmitted from one floor to another by any staircase? None whatever.

2430. As a matter of fact, the openings from one floor to another are entirely separate from the wards? Entirely.

2431. And there are lifts to each of these pavilions? Yes.

2432. Is Dr. O'Connor antagonistic to the statement you have put in;—did he refuse to sign it? I have not had an opportunity of ascertaining his views. The final meeting of the staff was only held on Monday evening, when the statement was drafted into its present form. Dr. O'Connor was not present at the meeting.

2433. Was this statement drawn up by one or more medical men, the others signing it after perusal, or was it the outcome of several meetings and deliberations? It was considered by a general meeting of the staff. It was considered desirable, in view of the very brief time we had at our disposal, to appoint a sub-committee. That sub-committee consisted of Dr. Tarrant, Dr. Brady, Dr. Goode, and myself. The sub-committee

sub-committee prepared a report, considered it several times amongst themselves, and finally submitted it to the staff, when it was, after some alterations had been made, accepted.

2434. Before being adopted, was it sent round to each member of the staff, so that they could go through it at leisure, or was it merely read at the last meeting and adopted? The various members of the staff had an opportunity of considering the most important parts of it, as it was printed. It was printed in sections, and many of the members of the staff had an opportunity of considering it then.

2435. *Mr. Trickett.* Are you aware that these plans were prepared thirteen years ago? Yes.

2436. Is the Committee to understand that the medical men, whose report you have read, unanimously agree that no possible improvement can be made in the plan—that it is a perfect one? I could only give my own opinion. I think it is impossible to conceive any hospital which has ever been built in regard to which it would not be possible to find some defect. The whole history of hospital construction has been one of constant advance.

2437. Seeing that these buildings were constructed thirteen years ago, is there any improvement which can be suggested now? No improvements of any vital importance. We have shown in the statement presented that in all essential particulars the hospital is a modern one, designed on the best known system, and for administrative purposes everything is admirably arranged. If we went into matters of minute detail, I could point out an objection, but it is so slight that it really ought not to be considered. For instance, one bed is placed in the corner of the ward, and not between two windows. That is a thing which, if the hospital had to be built over again, would no doubt be altered.

2438. I am not referring to anything so trifling as that—I am referring to general construction? We are satisfied that it is a perfect modern hospital.

2439. Have not circular wards come into vogue lately? I do not know of any hospital in which they are actually in use.

2440. Have not hospitals of one story come into vogue of late? I ought to mention that I am acquainted, more or less, with the construction of the New Royal Liverpool Hospital, which is of the size of the one proposed to be constructed here. It has 300 beds, and there is, I believe, one circular ward; but I am not certain.

2441. The circular ward system is not a general one? It is not; it is exceptional.

2442. What is the modern practice in regard to building hospitals; do they not often build them of one story, upon piles, with a current of air underneath them? I know of no hospital built upon piles.

2443. Upon arches, with a current of air beneath;—are not French hospitals built in that manner? I cannot answer from personal experience.

2444. With regard to American hospitals—have you not heard that the new hospital being constructed at Halifax is built on that principle? I am quite ignorant of it. The most modern hospital I am acquainted with is the Royal Liverpool Hospital, to which I have alluded, which is built in pavilions, in the same way as it is proposed to build the Sydney hospital.

2445. How many stories has it? Two.

2446. Is it an advantage or otherwise to have three stories? From an administrative, economic point of view, it is a decided advantage. With regard to the sanitary point of view, we have shown in the statement presented that there can be no possible disadvantage attaching to it.

2447. And you think there is no fear of infection going from one story to the other? I cannot conceive any possibility of it.

2448. That is a matter which has received your careful consideration? The staircase is completely outside the ward,—it may be regarded as a separate structure.

2449. Would you recommend cases of eye disease being treated in this building, or in a separate hospital? In a big city like this we ought to have an ophthalmic hospital.

2450. You think these pavilions would not be suitable for the treatment of ophthalmic cases in their various stages? It would be possible to find suitable accommodation for a limited number, as is proposed to be done.

2451. Do you not want a number of rooms for ophthalmic cases? You require dark rooms, operating-rooms, and so forth.

2452. These do not seem to be provided for? It is not contemplated, excepting for cases of absolute emergency, with which every general hospital has to deal.

2453. I gather from the statement put in, that you recommend that Lock cases should be treated in the hospital? Only cases of absolute urgency. As a matter of experience it has been found, in the Sydney Hospital, that the twenty beds which have been provided for that purpose are fully demanded.

2454. Have you seen the analysis of cases which Dr. Roberts put in when giving his evidence? Yes.

2455. Did it not strike you that a great many of them were cases which could be treated as well at the Prince Alfred Hospital, or at some distance away, instead of being brought to a hospital in the centre of the city? I think that matter is very fully dealt with in the statement put in.

2456. I should like you to go through the list which Dr. Roberts put in, and see whether your views agree with his. For instance, he only takes cases of fractures, local injuries, burns, and poisons, as apparently being the cases which should be treated in the hospital? Then he gives a string of other cases—diseases of the respiratory organs, and so on.

2457. Are all these cases, excepting the three I have named, cases which could be treated as well at the Prince Alfred Hospital as at the Sydney Hospital. For instance, take the case of a person suffering from derangement of the digestive system. There are 209 of those. No harm would be done if some were taken to the Prince Alfred Hospital? The cases relating to the digestive organs taken to a hospital are always, or nearly always, extreme cases. They are not cases of mere indigestion. A man who comes to the hospital suffering from indigestion is never admitted. They are cases of grave organic disease, cases of cancer in the stomach, or some such serious mischief. Therefore you will not gather that we have taken in 209 cases of indigestion. We deal with that matter in the statement put in. We took the total which Sir Alfred Roberts had given to the Committee.

2458. He gives 1,116 out of 3,296? Yes; he gives, as you see, 243—that is 10 per cent. of the cases,—as possible admissions. We have shown that out of the 243, 222 actually died. We have taken the cases of death from all these other complaints—that is, from fractures, dislocations, local injuries, burns, and poisoning—and the remaining deaths amount to 222 cases out of 243, which Sir Alfred Roberts has stated to be eligible, in his opinion, as cases of emergency. Plainly, there must have been a very much larger number than that. It would simply mean that one would not take into the hospital any patients unless they were absolutely dying.

L. R.  
Huxtable,  
Esq., M.B.  
18 Feb., 1891.

2459. Do you think the institution is much abused by people entering it who could well afford to pay? That is a matter outside my province, but the staff have made inquiries, and I think they have satisfied themselves that in every case a very strict investigation is made, and payment is secured wherever possible.

2460. I asked the question because the figures you read in the statement put in seemed to give such a low proportion of people who pay to the Sydney Hospital compared with other hospitals? The difference is due to the class of persons treated. The Sydney Hospital is undoubtedly the hospital of the people.

2461. And, as far as your observation goes, you think there is not any great abuse by people entering it and not paying when they are able to pay? I believe there is a certain amount of abuse in every hospital; but it is as little in the Sydney Hospital as in any with which I am acquainted.

2462. Is there any officer who makes inquiry before the patients are received as to whether they can pay or not? I cannot give you any information as to the method of inquiry, but I know from personal observation that every official connected with the institution is only too keen to obtain funds for its support.

2463. We have several schemes under consideration, one of them being that these back buildings should be completed with brick;—what are your views in regard to that matter? That is purely an economic question. In my opinion it does not matter whether they are completed in stone or brick.

2464. Is there any objection, from a medical point of view? Not the least.

2465. It would not affect the heating properties of the hospital, if it were properly constructed? Not in the least.

2466. As a matter of fact, would not hollow brick walls be cooler and drier than stone walls? I should like to qualify my statement to this extent. I consider—although the question of expense is no doubt a serious one—that the putting up of these very massive stone walls facing the west, from which we get the very hot westerly sun, will prove to be a distinct advantage. In other words, these massive stone walls will undoubtedly keep the temperature of the wards more equal in winter and summer; but such an arrangement as you suggest, a cellular wall or a double-brick wall, would undoubtedly answer the same purpose.

2467. You have had no experience of the old hospital buildings? None, excepting what I have heard from students and residents.

2468. *Mr. Copeland.*] It has been suggested by the Government Architect that it would be very desirable at the present juncture to widen Macquarie-street; to do that it would be necessary to pull down a portion, if not the whole of the present new structure;—what is your opinion in reference to that matter;—do you think it would be at all feasible to widen the street to (say) another 40 feet, and so bring the front steps of the present building—that is, without pulling it down—flush with the side of the street;—*Mr. Rowe* says:—

With reference to the widening of Macquarie-street to 100 feet, as suggested by the Government Architect, the idea may be a good one, but it certainly cannot be done unless the entire structure parallel with Macquarie-street, viz., the north and south wings, together with the administrative block, are taken down, leaving the eastern wing (which is doubtful), kitchen premises, laundry, engine-house, &c., standing.

The entire site would then have to be rearranged with the greatest difficulty, proportionate loss on works erected being about £40,000.

My suggestion of 80 feet for said street would not affect the hospital buildings much by giving 14 feet up to wall of steps leading to administrative block, which would become the building line of street with dwarf wall on same.

Supposing this suggestion were carried out to make the street 80 feet wide, the steps of the building will be brought flush with the side of the street;—would that in any way do away with the usefulness of the building, by there being too much noise near the windows? I do not know that it would be a very serious disadvantage; because I apprehend that even were the walls too near the road for comfort, any noise caused by street traffic could be overcome by altering the pavement of the street—by making it a noiseless pavement.

2469. Supposing it were deemed desirable to pull down the new building, and to remove it back, so as to carry out the suggestion of the Government Architect to make the street 120 feet wide;—do you think it would be feasible to pull down the building now, and could we find space to re-erect the building, so as to give the necessary amount of accommodation? Certainly not the amount of accommodation which is at present demanded. Of course I cannot at once calculate how much would be taken off; but it is extremely undesirable, whatever height you may make your hospital buildings, to put more than 100 beds to the acre.

2470. What do you say is the exact area available? It is close upon 3 acres, and an arrangement such as that suggested would seriously encroach upon the area available for the hospital site.

2471. The present plans of *Mr. Rowe* only anticipate providing for, I think, 230 beds;—according to your scale only  $2\frac{1}{2}$  acres would be required for that number;—what is your opinion in regard to pulling down the structure and re-erecting it on the same plans a little further back, so as to enable the street to be widened, say to 140 feet? I am afraid my opinion on that point would not be worth much. I have had no opportunity of calculating the area of ground which would be left after widening the street, nor of studying the necessary rearrangement and disposition of the pavilions.

2472. Will there be room for another pavilion, or for an alteration of the position of the pavilions? I think it is possible that that might be done, if sufficient area for the hospital is left. Possibly the ground could be so arranged as to carry the number of beds required.

2473. Do you not think that the fact of the Domain being behind the building to some extent does away with the necessity of having such a large area of ground for a certain number of beds;—I take it that the scale you have alluded to, of 100 beds per acre, does not contemplate large grounds being attached to the hospital;—for all practical purposes the whole of the Domain is attached to the hospital, and could we not make an allowance on that ground? Yes; I think that might be done.

2474. The pulling down of the new structure would not in any way interfere with your relief of the outside patients in the meantime; I think they are not in any way connected with the new building? When the new building is completed they will be treated in it. At present they are only temporarily accommodated in a galvanised iron shed in the Domain.

2475. The pulling down of the new structure and putting it further back would not in any way interfere with the relief of the outdoor patients? No; providing that the accommodation in the Domain is not interfered with. We possess that accommodation only on sufferance; it may be taken away by the Government at any time.

2476. *Mr. Humphery.*] When were you last on the site of the Hospital Buildings? This morning.

L. R.  
Huxtable,  
Esq., M.B.  
18 Feb., 1891.

2477. Can you say from your examination of the buildings, according to the design of Mr. Rowe, whether, if they were removed, they could be placed nearer the Domain without taking down the existing south wing, and also the Nightingale wing? I just now expressed some diffidence in giving an opinion on that point, because, obviously, such an opinion cannot be worth much. I have never contemplated such a thing, nor have I had time to think of it.
2478. Are not the existing buildings in close proximity to each other—the Nightingale wing, the hospital buildings, according to Mr. Rowe's design, and the southern wing? No; there is a space between the Nightingale wing and the eastern pavilion, now partly completed—I suppose there must be 30 yards between the two.
2479. What about the northern pavilion—the pavilion fronting Macquarie-street? As far as I recollect, there is very little space between that and the Nightingale wing.
2480. Do you think it would be possible to shift that portion of the design further westward without taking down the Nightingale wing? I think it would be hardly possible to move it further westward without interfering with the Nightingale wing. I give this kind of evidence with great reluctance, because it is obvious that, as I had not time to think the matter out, my opinion cannot be worth much.
2481. You know where the south wing is? Yes.
2482. Is it in close proximity to the south wing on Mr. Rowe's design? As far as I recollect, it almost abuts upon it.
2483. Do you think it possible to remove that portion of Mr. Rowe's design without destroying the south wing? No.
2484. You have said that very admirable results have been experienced in the treatment of cases in the present temporary wooden building? Yes.
2485. Have similar results been obtained in the southern wing? I do not know that any comparison has been made. I have, however, a ward in each, and the results, according to my experience, have, during the past twelve months, been equally good.
2486. There is, therefore, no reason whatever for the removal of the south wing, with the view of obtaining better results from the treatment of cases? No.
2487. Do you know what building it is intended should occupy the present site of the south wing? Yes; some small one-storied wards for infectious cases.
2488. Is it not a chapel? No; the chapel is on the other side.
2489. The present south wing accommodates about seventy-eight beds? Yes.
2490. Do you think it would be wise to remove that wing for the purpose of carrying out the entire design, or would it be better to carry out such portion of the design which may be completed without necessitating the removal of the south wing? In the present state of affairs, it would be far better to complete that portion of the hospital which has been started, namely, the north and south wings, and the eastern pavilion, and to leave the south wing to stand for the present. I believe we should then have very efficient accommodation for a long time to come.
2491. *Dr. Garran.*] I understand from the memorandum put in that you agree to the plans of this hospital on the ground that it should be made a complete general hospital? Yes.
2492. Are you aware that four highly competent witnesses, three of whom have been Government Medical Officers, and the other is Sir Alfred Roberts, have stated that it ought not to be a general hospital, but should be restricted to an emergency hospital? Yes.
2493. Then your statement is made knowing the authority which is arrayed against you on the other side? The statement was made in full knowledge of the evidence given to the Committee, which was supplied to the staff of the hospital.
2494. Then there is a difference of opinion amongst the medical authorities on the subject? Apparently.
2495. Are you aware that in order to ease the pressure on the hospitals, Dr. MacLaurin, Dr. Mackellar, and Dr. Manning, and, I think, Sir Alfred Roberts, plead for a comparatively economically constructed hospital to receive the cases of the chronic sick poor? Yes.
2496. If that were done, would it not greatly relieve the pressure on the Sydney and Prince Alfred Hospitals? I believe so.
2497. And would there then be the same necessity for a large hospital of 300 or 400 beds on this site? Even if we were relieved to a considerable extent there would still exist the necessity for a hospital of the size for which we have pleaded. We have shown that the average stay in the hospital has been reduced from what has been universal in English hospitals, viz., thirty-one days to twenty-five days. Over and over again we are absolutely compelled to dismiss a man before we are satisfied in our minds that we ought to do so, in order to make room for a still more urgent case. The reduction from thirty-one to twenty-five is a serious one indeed. I cannot say anything which indicates more strongly the pressure which is borne by the hospital at present or the unfavourable conditions under which it is worked.
2498. Am I to understand that there are no cases taken in which are not strictly emergency cases? Speaking generally, that is true. Of course, it is impossible to say that no other cases come in during the twelve months.
2499. Then you do not think a hospital of 300 beds would be too large upon that site? I do not think so.
2500. And that the site, with its airiness in the rear, would carry 300 beds? Easily. The estimate is made by taking average sites in average cities, and our site is one with which it is absolutely impossible to find fault. It is practically in the country.
2501. You have looked upon the question purely from a medical point of view? Not from the financial point of view.
2502. Not from the architectural or economical point of view? Only from the architectural point of view as far as it relates to the construction of the wards.
2503. What do you consider the best size for a ward? The most economically worked ward would be, in my opinion, one of about twenty-five beds.
2504. Would one sister be required for each ward? Yes, to work the hospital efficiently.
2505. And you would want as many sisters as you had wards? Yes.
2506. And how many nurses? I suppose we should require four nurses for each ward.
2507. You are aware that there is no ward here containing twenty-five beds? I am aware of it.
2508. They have either twenty or sixteen beds? Yes.
2509. How many nurses are there for twenty beds? Four.

L. R.  
Huxtable,  
Esq., M.B.  
18 Feb., 1891.

2510. Then it is rather an uneconomical plan for twenty beds? Yes.
2511. Supposing we have a three-story building, would it do to put the nurses in the top story, and take the Nightingale wing for an ophthalmic ward? That is a question which I have not considered, but I suppose it would be possible to do it.
2512. Are not the nurses at the Prince Alfred Hospital accommodated in the upper story? I believe they are, but I am not personally acquainted with their quarters.
2513. I gathered from your answers to Mr. Humphery, that you do not think it would be very possible to put the front of this building back without destroying the other buildings which are there? I think it would be quite impossible to put the pavilions facing Macquarie-street further east without doing so.
2514. Do you know of any other site which would be equally good for the hospital? I know of none so good.
2515. It has been suggested to the Committee that Cook Park, near the Museum, would be an excellent site? It is a very good site, indeed.
2516. Is it better or worse than this? It is certainly not better. Our site is certainly better if only for this reason, that the Macquarie-street site has a fall in both directions. It occupies the crest of the hill. It has a fall toward the Domain, and from Macquarie-street, towards the south. The other site has not that advantage. The ground rises for some distance. The crest of the hill, in fact, is in Hyde Park.
2517. But that crest of the hill would be a little on the westerly side? Yes.
2518. Where you would want a little screening off? Yes; but it would shut off so much sun.
2519. Do you not think you would get sun enough? I doubt it.
2520. Have you ever been in the Museum or the Grammar School on a hot summer's afternoon? No.
2521. If the easternmost of these pavilions is built, will it necessitate the pulling down of the south wing? No.
2522. You need not pull down that wing unless you want to erect the small structures which are on the plan? It may be a desirable thing, as I pointed out just now, in regard to the economic and efficient administration of the place, but it certainly would not be absolutely necessary—that is to say, there is plenty of room for the south wing to stand without interfering with the east pavilion.
2523. And these scattered buildings are not absolutely necessary for the working of the hospital? Isolation wards are highly desirable.
2524. For what cases? Infectious cases.
2525. Do you have any infectious cases? Not if it is possible to avoid them.
2526. We have been told distinctly that you take in no infectious cases? They occasionally arise in the hospital.
2527. But you do not take them in as infectious cases? Certainly not.
2528. Then you do not propose the small wards for cases to be taken in? No.
2529. But only for infectious cases arising within the hospital? Yes.
2530. It has been stated that the beds on the southern wall of the hospital are not, in this climate, so favourable as beds on the northern side—is that your experience? It is not. I have beds on the south side of the south wing, and in the easternmost pavilion, and during the last twelve months I have satisfied myself there is no serious disadvantage in the southern exposure.
2531. And you see no objection to that at all? Not under the conditions which prevail there.
2532. Nor with regard to the two pavilions behind the hospital—you do not think the southern wall would be any disadvantage? No. There is a wide, open space there which would, to my mind, remove any possible objection.
2533. But it is not the want of open space, but the coldness of the ward, which may be an objection? I can only judge from my experience in the south wing of the present hospital, and it has been as I have stated.
2534. There is no perceptible difference in the temperature on the southern and northern wall? No.
2535. Have you tried it with a thermometer? No; I speak from ordinary observation.
2536. You think that the aspect on the one side is as good as on the other? Certainly.
2537. East or west, north or south, the beds are equally well placed? Exactly.
2538. *Mr. Garvan.*] You attach considerable importance to abundance of light, sun, and air for a hospital? Yes.
2539. If there was anything in the structure of the building which militated against the free access of light and air it would be a drawback? Undoubtedly.
2540. Will you direct your attention to the plan. Take notice of the towers or pavilions. One tower wall extends about 24 feet out beyond the windows of the dormitories. The same thing occurs at both ends. Do not these projecting walls tend very much to prevent that free circulation of light and air which we should possess in their absence? They do tend to do so, but any walls of any sort must interfere with light and air to a certain extent, but, in my opinion, these projections are no disadvantage. You will have the full morning sun shining upon that part of the building.
2541. The wall of that tower is, you think, no obstruction to light and heat, and would not militate against the health of the patients? No.
2542. Would it be an advantage to remove the tower, so as to allow free access of light and air along the balcony? My impression is that with the ventilation such as exists there you have as much light and air as you could wish for. There is a limit, of course, to the amount of air required. You want a certain amount of protection from sun and wind, and so on. I cannot see any reasonable objection.
2543. You do not think it would be any great advantage, from a health point of view, to have these walls removed altogether? No.
2544. You speak in reference to using the ground floor as a ward. You expressed the opinion that the fact of its being a little underground did not militate against its healthiness? I pointed out that the floor of the Macquarie-street aspect is some 3 feet below the utmost elevation of Macquarie-street, which, of course, is an artificial elevation; but, on the other hand, on the eastern side the floor is 3 feet above the ground, and beneath the floor there is a large space which is asphalted or concreted, and from side to side there is ventilation through a series of manholes. It is impossible for anything of a deleterious character to lodge underneath that floor.
2545. If the ward were below the natural level of Macquarie-street, would that be a disadvantage? It might be, possibly, but not necessarily. If it were in such a position that light and air were excluded it might be objectionable, but not where plenty of light and air is obtained.

L. R.  
Huxtable,  
Esq., M.B.  
18 Feb., 1891.

2546. You would have no objection, if you were a patient yourself, to being in one of these wards on the ground floor? None whatever. I should like to point out that this is the only ward in the hospital which occupies that position, and it is a casualty ward, which contains ten or twelve beds. A casualty ward is one into which a patient who has been brought into the hospital suffering some injury is placed—a cut head, for instance, requiring to be stitched. The patient, perhaps, is unconscious, and he is put there so as not to disturb the other ward, and he remains there until he has recovered, and he is then turned out.
2547. You express an opinion rather favourable to an easterly and westerly aspect? Yes.
2548. In expressing that opinion, am I to understand that you are opposed to the pavilions with a north and south aspect? No. In the statement put in we have pointed out that, taking all the circumstances into consideration, the arrangement proposed was decidedly the best.
2549. Would it not be more desirable to adopt a smaller easterly and westerly aspect with sufficient space between the two? No; because there are still other matters to be considered. In the first place, you set up an ideal, and say that that is the best thing that could be had, but you have to carry it out. If you place a row of pavilions here, and another there, it would be impossible to work the hospital—that is to say, it would be necessary to have two administrative blocks.
2550. Even though it may be advantageous from a theoretical point of view, you could not recommend it from a practical point of view? That is so. I should like to state that it so happens that I was the mover of the resolution which resulted in the statement which has been presented being drawn up, and it is upon this account that I have been called to give evidence. As a junior in my connection with the institution, I feel that my evidence is not as strong, or weighty, as would be the evidence of those who have been longer associated with it—Dr. Tarrant, Dr. Brady, or Dr. Goode, who were associated in preparing the statement presented. I consider that the Committee would obtain most valuable information, as indeed the hospital staff has obtained it, from Dr. Hull, the Medical Superintendent of the Hospital, whose information upon these points would be very valuable indeed.

Oswald H. Lewis, Esq., Architect, sworn, and examined:—

2551. *Chairman.*] You are an architect in Sydney? Yes; I am the senior architect. I have been in O. H. Lewis, Esq.  
practice here for thirty-six years. 18 Feb., 1891.
2552. Have you had anything to do with the construction of the Sydney Hospital? No. I built St. Vincent's Hospital.
2553. You were the consulting architect of St. Vincent's Hospital? Yes.
2554. Have you given much attention to the principles upon which the new Sydney Hospital is proposed to be built? No. I examined the plans when they were exhibited, but those which are here to-day are not those which I saw at the Town Hall.
2555. Have you seen these plans before? Yes. I have had a look at them since I came here to-day.
2556. Have you made yourself well acquainted with the construction of hospitals generally? I have.
2557. Do you consider these plans suitable? I never did. I never believed in any hospital over two stories high.
2558. The height is your principal objection? Yes.
2559. What do you think about the site from a sanitary point of view? It is a good site, but I do not think there is land enough for a hospital. There are only about 2½ acres. The buildings will take up one acre.
2560. For an emergency hospital, would it not be difficult to get a site sufficiently large? It is a very good site for an accident hospital; you could not better the situation.
2561. How many beds are there in St. Vincent's Hospital? One hundred and seventy-seven. It was built for 200, and we allow 2,250 feet for each patient.
2562. Do you think that is sufficient? In England, 1,500 to 2,000 feet are allowed. All hospitals should be built upon arches.
2563. Considering the progress which has been made with the proposed Hospital Buildings in Macquarie-street, would you recommend their abolition or completion? I should take them down.
2564. Would you abandon the site, or put up another building? Put up another building for an accident hospital only.
2565. Are you aware of the amount of money which has been expended there? I hear it is about £70,000.
2566. In the face of that, you would still recommend the removal? It would, I think, be a great saving. I have heard some talk about setting the hospital back, but that is an impossibility. Besides, you have not ground enough.
2567. Do you think it is desirable to widen the street? No. You could not keep the present building up to make anything of it, even if it was for an accident hospital.
2568. Do you think it would be desirable to widen the street as far as it could be widened without interfering with the buildings? I do not see the necessity for widening it.
2569. I suppose, if you were to suggest a design, it would be on a different principle altogether? It would be on a far cheaper principle.
2570. *Mr. Garvan.*] What was the cost of St. Vincent's Hospital? £37,000.
2571. Have you much knowledge of hospital construction? Yes; from books.
2572. I suppose you have paid some attention to the question of hospital construction? Yes; there have been great improvements during the last two or three years.
2573. Has your attention been directed to the advantage or otherwise of what are called circular wards? Yes; you ought never to have any angles in hospitals.
2574. You think circular wards would tend to the greater healthiness of the hospital? No doubt.
2575. Would you recommend them in the construction of the Sydney Hospital? Certainly.
2576. Would it increase the cost per bed much? It would make very little difference.
2577. Are you in favour of high-built hospitals? I would never exceed two stories. All the books of modern date would tell you not to exceed that height. It is also best to build upon arches, so that the air may pass underneath.
2578. You would have every ward, then, at least from 3 to 5 feet above the level of the ground? Yes.
2579. According to the plan, one of the wards is below the level of Macquarie-street, though higher than the level at the back;—do you think that that fact will militate against healthiness? There is no question about it.
2580. What is your reason for making that statement so decisively? I think most of the doctors and nurses are of my opinion. There is always a nasty smell arising from the floors of hospitals.

- O. H. Lewis, Esq.  
18 Feb., 1891.
2581. And you think it would be undesirable to have any beds upon what is called the ground floor of this hospital, it being partly below the level of Macquarie-street? No ward should be below the ground.
2582. I understand you have seen the plans which are here to-day, or corresponding ones? I have seen the corresponding ones.
2583. Do you approve of the building altogether as a hospital? No.
2584. Why? On account of the height, and I prefer that the foundation should be built upon arches.
2585. In view of the fact that £70,000 have been already expended, what would you recommend should be done with the building? Take it down altogether, and reconstruct it.
2586. On a different plan? Yes; there have been great improvements in hospital construction during the last twelve years.
2587. And you think that the construction of hospitals has so much improved that it would be desirable to adopt new plans? Yes, on a more modern system, and at less cost. To finish the present building will cost more than has already been spent.
2588. Would there be any objection to finishing the building in brick and cement instead of stone? It would not look so nice.
2589. Could you not carry it out in the same dimensions in brick and mortar as those indicated in the stonework? Yes; but it would not look as well. It would spoil the building.
2590. What difference would there be in the cost between brick and cement and massive stonework? Massive stonework will cost about £100,000.
2591. What is the difference in percentage between brick and stonework? Brickwork would be done for about half the cost. The present stonework is a fine bit of work, and it is very expensive.
2592. Is there any advantage, from a hospital point of view, in putting up a building of stone? I should prefer brick.
2593. Even apart from the economical question? Yes; it forms a better key for cement. All walls of hospitals should be of cement, for washing-down purposes.
2594. On the whole, you think it would be wiser not to finish this building at all? I think so.
2595. But to reconstruct it on what you call a better plan? On a more modern system.
2596. We have had evidence to the effect that the plan was sufficiently perfect to warrant the Government in going on with it;—you do not agree with that? No, I do not.
2597. *Mr. O'Sullivan.* You appear to have great faith in arches for the basement of hospitals? Yes.
2598. Why did you not build St. Vincent's Hospital on arches? You might call them arches, only they are termed "square."
2599. Would it be possible to convert this basement into arches now? If there is a basement to it. There is no doubt that arches from 3 to 5 feet high are more modern.
2600. You think, then, with your knowledge as an architect of long experience, that this design is obsolete? Yes.
2601. And that we ought to go in for something more modern? Yes.
2602. More for the purpose of utility than of ornament? Yes.
2603. Do you recollect how many beds there are in each ward of St. Vincent's Hospital? No; I built for 200 beds altogether.
2604. You do not know how many wards there are? I have not the plans—it covers about an acre of ground.

Thomas Rowe, Esq., Architect of the Buildings, sworn, and further examined:—

- T. Rowe, Esq.  
18 Feb., 1891.
2605. *Mr. Garrard.* You furnished the Committee with a statement as to the various contracts which have been taken for the Sydney Hospital, and also with certain suggestions as to the widening of the street;—you are aware that Mr. Vernon suggests that the street should be widened to 100 feet? More than that, I think.
2606. Then that would necessitate the pulling down of the whole of the northern and southern blocks? Yes.
2607. They could not be erected, then, without also removing the eastern pavilion? It could not be done unless you pulled down the eastern pavilion, the Nightingale wing, and part of the southern. It will affect the whole of the arrangement.
2608. The whole of the north, south, and eastern pavilions, and an interference with the Nightingale wing and the southern wing? Yes.
2609. Unless, of course, you altered the design? The whole of the site will have to be rearranged and the hospital entirely re-designed.
2610. And then some of the material which has already been placed there might be utilised, and other portions of it would be useless? The greater portion would be valueless.
2611. In the paper which you sent in, you suggest that it would be possible to widen the street to 80 feet, bringing the building-line up to the wall of the steps which give access to the administrative portion of the building? Yes, I suggested that.
2612. Then if the hospital were erected to its full height afterwards, would it not have a towering appearance above the street? I do not think so.
2613. Is not one of the objections to the height of the building the fact that it does not stand sufficiently far back from the street? From the western side of the street the appearance will not be altered. It will certainly affect the height in walking along the new eastern pathway. The height would appear greater then.
2614. But you think it would not interfere very materially with the appearance of the building, even if the road were widened to 80 feet? I do not think it would be a very serious matter.
2615. But do you think it desirable that the street should be widened? As there is such a desire for broad streets, I think the matter is one which ought to be considered.
2616. But is not the desire for wide streets more for the purpose of giving room for traffic? For both traffic and effect, I presume.
2617. We can never anticipate very much traffic in Macquarie-street? I should be sorry to say that. I think the time will come when the traffic from there to Circular Quay and the wharves will be very considerable.

2618. You are looking forward to the time when the Government House grounds and Farm Cove will be utilised for warehouses? I certainly do think that in fifty or 100 years' time the traffic will be considerable, and the time may come when persons may regret that the street has not been widened.

2619. You are aware that it is proposed to erect large buildings for Parliament House upon a site just beyond the present Parliament House;—do you think it likely, in view of that fact, that Farm Cove will be given up for business? I think it is quite possible. I often think there will be a road right through Hyde Park. The Park must give way to the progress of the times. I might mention that the erection of the hospital upon its present site will not prevent the resuming of 14 feet of land at any time. There will be no buildings along that 14-foot line.

2620. Have you anything further to say in addition to that with which you have already furnished us? No. I heard a very amusing statement made just now by Mr. Lewis. I do not think he has ever seen the plans.

2621. He admitted that he had only seen them since he came into the room? Yes, and yet he contends it is not a modern hospital. I should like to mention that I sent these plans twelve years ago to Miss Nightingale, in England, but unfortunately they got mislaid in the Orient stores at home. I expected to find them when I visited England subsequently, but could not. I afterwards received them upon my return. I mention that to show that it was my intention to have visited Miss Nightingale with the plans, and to have explained them to her, and to have obtained her approval of them if she thought well of them, but I was defeated in my object. I have no fear of meeting the greatest authority in England with them. If the Committee will take them and send them to the highest authority in England, I think it will be the means of setting aside all these nonsensical quibbles which have arisen from persons who are really no authorities whatever.

2622. *Mr. O'Sullivan.*] Are we to understand that your plans cannot be modified or altered so as to fall in with the idea of Mr. Vernon for widening the street? It is utterly impossible to move the buildings back. The entire site is adjusted to present arrangements to a few inches. It is so carefully adjusted that you could not take the building down without rearranging and readjusting the whole.

THURSDAY, 26 FEBRUARY, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. GEORGE HENRY COX.

JACOB GARRARD, Esq.

HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.

WILLIAM SPRINGTHORPE DOWEL, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM MCCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

Walter Liberty Vernon, Esq., Government Architect, sworn, and further examined:—

2623. *Mr. O'Sullivan.*] Will you read your Report on the widening of Macquarie-street, and the removal of a portion of the Sydney Hospital Buildings? Yes.

Report re widening of Macquarie-street, and the necessary removal of a portion of the Sydney Hospital Buildings, now partially erected.

Sir,

Sydney, 20 February, 1891.

In reference to the proposed scheme for widening Macquarie-street, and the probability of setting back the present stone carcass of the Sydney Hospital, in order to be in accord with that scheme, also as to the cost of such rebuilding, I have the honor to make the following Report:—

I have personally inspected the buildings of the Sydney Hospital, and find that in order to fall in with the scheme for widening Macquarie-street, now before you, it will be necessary to take down the front central block, and the side wings apportioned for accident and medical cases, and to rebuild them at least 35 feet in the rear of their present position. This will affect the western wing of the Nightingale wards to some extent, but will not do so with the permanent kitchens and other offices. The site of infectious wards' building would, however, have to be reconsidered.

The central ophthalmic ward buildings will also be affected by the proposal, and it appears to me there are two alternatives for meeting this latter difficulty, viz.:—1st. By rebuilding the main central building close up to, and contiguous to, this ward, omitting the present courtyard gangway, and leaving this ward and also the eastern ophthalmic—as shown on the plans—entirely untouched, and capable of completion. 2nd. By rebuilding the central ophthalmic ward to the eastward of its present site, utilising, however, its eastern lavatories, &c., by making them its western ones, and producing the ward indefinitely towards the Domain boundary, and omitting altogether the separate eastern ophthalmic ward hereinbefore referred to.

These modes of treatment will give, in the first alternative, a total accommodation of 224 beds and twenty-four private wards; and, in the second, about 184 beds and twenty-four private wards. Having regard to the question of light, air, &c., and for other important reasons, I consider the second is the preferable one.

I estimate the cost, approximately, of removing and rebuilding the present stonework, &c., as indicated in the first alternative, at £10,500, and in the second alternative at £14,500.

If, however, the question of leaving the whole of the buildings untouched, and widening Macquarie-street only up to the building frontage, is considered, I would point out that the front entrance steps, by a slight alteration in the internal arrangements, could be kept entirely within the building, so that the street alignment could be identical with the stonework of central building; but, against this proposition, I would respectfully and strongly urge that its adoption would mean the serious curtailment, for all time, of an improvement for which so good an opportunity now presents itself.

In addition to which the accident and medical ward (partly in half basement) would be brought into most objectionable proximity with the noise and publicity of a great thoroughfare.

I have, &c.,

W. L. VERNON.

The Chairman, Public Works Committee.

2624. By your No. 2 scheme, costing £14,500, you would not very materially interfere with the present design? Excepting that I leave out one ophthalmic ward entirely.

2625. But you would not interfere very much with the design of the front of the building? Not at all;—it would be precisely similar; it would be rebuilt in fact.

2626. The building then, would present a bold appearance to this new broad street which you would construct? It would have the same appearance as that shown on the design at present.

2627. And you think that building would be capable of carrying 224 beds, and twenty-four private wards? That is the calculation I make.

2628.

T. Rowe,  
Esq.

18 Feb., 1891.

- W. L. Vernon, Esq.  
26 Feb., 1891.
2628. If this proposed modification is not carried out, but the alteration of the steps is carried out, the building will be right up to the street alignment? Close up.
2629. Would it not be in the way of this new street? I think it would—decidedly.
2630. To see a building standing out so much as that would be a blemish on the street? It would.
2631. Having in view the fact that this improvement will possibly stand for all time, and that now or never we can make this improvement whilst all the buildings are public property, you recommend that your No. 2 scheme should be adopted, so that this widening of the street may take place? I think the expense in attaining that object would be well incurred. I think it is worth it.
2632. Supposing the old building at the back called the south wing were allowed to stand? It does not interfere with that.
2633. Your modification would not interfere with the existing building called the south wing. The building I refer to is the old building there now—a stone building? Of course, that goes entirely.
2634. That would have to be pulled down if your modification is carried out? Yes, I think it is taken away in this design.
2635. Then you have taken Mr. Rowe's design, and have endeavoured to modify it? I have seen how it is possible to modify the present design, and shift the building further back.
2636. In the event of the south wing being allowed to stand, that building, to comply with your modification, would have to go? If it is the old building, certainly it would.
2637. The Nightingale wing also would have to go? A portion of it.
2638. I suppose you can utilise the greater portion of it? I think so.
2639. You would, I suppose, simply cut off the western end? Yes.
2640. And you consider the whole of this modification can be carried out at a cost of £14,500? It would, so far as the present stonework is concerned.
2641. And the imposing design which we have now would still be retained? It would re-erect the present stone in a new position.
2642. At the same time allowing you to carry out this improvement of widening Macquarie-street? Yes.
2643. What would the total width be then? From 115 to 120 feet.
2644. *Dr. Garran.*] If you pull down all that you propose to pull down, what proportion will you leave untouched? I say about £4,000.
2645. But would you leave untouched about one-fourth? Yes.
2646. Now, as to the second scheme? In the second scheme I take down nine-tenths.
2647. And you could use up the stone? Yes.
2648. Without damage? I allow for waste and damage in my estimate.
2649. The second scheme, therefore, which you prefer, is to all intents and purposes a rebuilding? Yes.
2650. New foundations? Yes.
2651. Merely using the same material? Yes.
2652. You have allowed for the cost of taking down, I suppose? Yes.
2653. And putting up? Yes.
2654. And you utilise all the material? Yes.
2655. And you allow 10 per cent. for damage? We allowed rather less than that.
2656. Under the circumstances, would it not be worth while to study the whole site *de novo*, and consider the new plan? I can hardly give an opinion.
2657. What do you consider the cash value of the stone stacked? Very little, unless it is to be used again for the same purpose it is worth almost nothing.
2658. What would be the cost of cutting the stone again? I presume what it cost originally.
2659. You do not know what that is? Between £50,000 and £60,000.
2660. Mere material alone? Do you mean the stone alone?
2661. Yes? The stone would come to about one-fifth of the cost.
2662. £10,000? I should say so.
2663. I asked that because a great many witnesses, some architectural and some medical, have said that if we were beginning again brick would be a preferable material for the building. Is it worth while, for the sake of using that £10,000 worth of material, to stick to stone? My opinion is that if you build in Macquarie-street you should build in stone.
2664. For ornamental and architectural purposes? Yes; that is, the portions facing Macquarie-street.
2665. Of course, a medical witness naturally considers the medical aspects, and we are told that with a double wall we can ensure a dry building more than we can with fixed stone. Our stone is, to a certain extent, porous, and more likely to give us a damp wall. It is rather an argument against that site if you are obliged to use stone there, especially as brick will be best for medical purposes? I have no opinion on the hospital as a hospital.
2666. If you put your road back, and make this a grand façade, would it not be better to keep the whole of that for offices, and not have a hospital interfering with it at all? I do not, of course, know the future scheme of the Government for filling up the whole of that street, and I cannot possibly tell.
2667. A hospital would not interfere with another line of public offices there? I do not think so.
2668. If you adopt either of these two plans you have a broad footpath between the road and the buildings? Forty feet.
2669. But, in dealing with the hospital we must bring the patients as close up to the lift as we can by means of ambulances;—how do you provide a roadway into the front? I should take roadways across into the interior of the premises, and drive right into the court-yard.
2670. But there is no provision for a court-yard here? I think it would have to be considered.
2671. And that would knock away some room? There are two gateways and archways.
2672. Could you get in at the back of the mall? You could get through here (*pointing to the plan*).
2673. You must make a roadway in some way or other? Yes.
2674. Would you cross the mall? Yes.
2675. Then it would not be an unbroken pathway? I would not define the roadways, but I would put breaks in the shrubbery in front.
2676. You do not think it would be better to make the shrubberies and small roadways on either side, so as to bring carriages close to the front? I think myself, that a wide path would give a handsome appearance to the building, and you could have the traffic further from it.

2677. But whatever building is put there, whether Parliament House or any other building, the people will want to be driven close up to it? Yes.
2678. And if you intersect your mall with so many of these roadways you cut it up? It is put down elsewhere. W. L. Vernon,  
Esq.  
26 Feb., 1891,
2679. But if you go the other way you will have a long line of shrubbery in front of your building? That is a minor matter; if one can get the space, I think that is the great object.
2680. You said it would be necessary to pull down the south wing, but Mr. Rowe does not propose to pull it down, unless he builds those small infectious wards;—would you, when you back your frontage, hit the south wing? I should hit the infectious ward.
2681. Would you shift the present south wing 35 feet back? I think so.
2682. You practically take away part of the Nightingale wing and part of the south wing? Yes.
2683. Then we should want more nursing accommodation? I think in any case the south wing ought to be removed.
2684. But if we remove the Nightingale wing we shall want more room for the nurses? You would have room in the spaces to rebuild.
2685. There is very little space between the proposed building and the Nightingale wing? I do not think it is possible to put a very large amount of accommodation on that site in any case.
2686. You have not considered the question of the number of beds to fill that site? I have simply numbered them on the plan.
2687. But you have not separately studied that matter? No.
2688. If you push that back 35 feet you reduce the area considerably? Yes.
2689. It is only 2½ acres now;—would you bring it down to 2 acres? Probably I should.
2690. So that it would be less available for a large hospital even than it is now? The accommodation undoubtedly would be diminished.
2691. Do you think that the building is too near the Mint to be suitable? It has struck me that a portion of it is already part of the Mint—one and the same building.
2692. No; there is a space of about 10 feet between the two, and about 10 feet on the other side, between the Nightingale wing and the Legislative Council Chamber. Does it strike you that it is rather close? Very close for a hospital.
2693. Is not that rather against the site as it is? Undoubtedly.
2694. And you are going to make it smaller still? I do not propose to decrease the space between the hospital and the general building.
2695. But you are going to reduce the building accommodation? I decrease it from east to west, not from north to south.
2696. That will decrease the building accommodation? Yes.
2697. You are going to take away practically three-quarters of an acre? Pretty well that.
2698. If your second plan is really the preferable one, do not you think that it is such a complete *boulevardement* that the Government would be justified in reconsidering the whole question of the construction of a new hospital altogether? I think there is no doubt that the matter should be reconsidered to some extent. I cannot say to what extent, because I do not like to give an opinion.
2699. Some of the medical witnesses are in favour not merely of an accident hospital, but of a good, full-sized hospital, with a medical school. Do you think, with your reduced area, you could possibly put that up? It is impossible.
2700. Then if we take your plans we must rigidly confine the hospital to a moderately-sized building? I think you must.
2701. Have you read the medical evidence which has been given? No.
2702. You have simply studied it in the light of an architect to whom, to some extent, is committed the future adornment of the city? Simply in the light of the street frontage.
2703. If we have a small hospital there you would like a two or three-storied building? Do you mean from an architectural point of view?
2704. Yes? I think there would be no objection to a three-storied building.
2705. Would not a two-storied building look rather stumpy, in view of the buildings that are going to be erected there? Owing to its long frontage it might do so; but there are buildings and buildings. I do not think that if this were reduced to two stories it would affect the design. I think it would be sufficiently high for architectural effect.
2706. The construction of the roof, of course, will have to be reconsidered? The roof would look heavier than it is now.
2707. Would it not look heavier from the street? Not so heavy as it looks on the drawing.
2708. But still, would it look nice? I hardly like to express an opinion.
2709. I am only putting it in this way because it is not worth while making a great sacrifice to architecture and then not get a satisfactory result? There is no doubt that the roof ought to be kept in proportion to the two stories.
2710. If you are going to diminish the area upon which the building rests, would not that be a stronger reason for making a three-storied building instead of two? To provide accommodation it would.
2711. Do you think the Nightingale wing keeps the sun off at all? Not to a great extent.
2712. If this building is carried out we shall have three parallel buildings at right angles to the main front—the Nightingale wing, the central pavilion, and the south wing;—do you think they stand in each other's way at all in regard to the sun and light? The central wing would, no doubt, in the middle of the day, take some sun off the southern wing; but then you get the southern wing right down the court-yard.
2713. Will not the Nightingale wing, to some extent, keep the sun from the eastern side of the central row of buildings? It would in the middle of the day, but not to any serious extent.
2714. Will not these pavilions keep the sun out of the south wing? It might a little out of the Nightingale wing.
2715. Is it desirable on that bit of land to have three or four parallel rows of buildings? I think it is making the site carry a great deal.
2716. The Legislative Council Chamber keeps the sun off the Nightingale wing on one side? A little.
2717. And the other side faces the south? Yes.
2718. Does much sun ever get into the Nightingale wing at all either way? Not on the southern side; but I think it does on the east and west.
- 2719.

- W. L. Vernon, Esq.  
26 Feb., 1891.
2719. The bulk of the rooms do not get the sun? I saw it with the sun on the southern front, to some extent, at a sharp angle. It was covering the whole of the front when I saw it.
2720. Would the Nightingale wing cover the central pavilion in the same way as the Legislative Council Chamber covers the Nightingale wing? Probably to some extent; but it is not so near the central wing as the Council Chamber.
2721. Do you think they will get sun enough on that side? I do not; the buildings will shut it out to some extent.
2722. Not even to the lowest story? I do not think so; it might in the winter-time, when the sun is lower in the horizon.
2723. If these pavilions are put up to the height of three stories, do you think they will shadow the south wing? They will do more than the Nightingale wing would shadow the centre.
2724. They will be loftier buildings? Yes.
2725. So that the south wing will not be so sunny and light if this plan is carried out as it is now? I do not think the lower portion will get quite so much sun; but then I presume the southern wing will be taken down.
2726. All these considerations point to the fact that we ought to reconsider the whole plan if we are going to alter the structure? There is no doubt that the question of pushing the front back does require reconsideration.
2727. It is such a complete change as to justify fresh consideration? I think a fresh site for an infectious ward, for instance, is required.
2728. *Mr. Copeland.*] What is the present width of Macquarie-street? 61 feet.
2729. Have you measured it? Yes; it was evidently intended to be a chain road, but it has been encroached upon.
2730. Is that from building to building? Yes.
2731. Is that opposite the hospital? About; but the frontage is a little irregular in places. Some of the houses break out more than others, but this width was taken opposite the hospital.
2732. If you could get an extra 20 feet added on to your 61 feet, do you think that would be a satisfactory solution of the whole question without disturbing the present buildings? Twenty feet is better than nothing at all, I admit.
2733. Would it not be a very substantial improvement? It would; but I do not think it would be an improvement equal to the necessities of the occasion.
2734. Would it not be possible for you to carry out the idea to a great extent when you get past the hospital—when you get down to what are the present Parliamentary Buildings. Supposing you got 20 feet opposite the hospital. You could get 19 feet 7 inches, I understand, additional, without interfering with the building at all, by taking the street up to the front of the steps. You could get that additional width, so that that would make the street 80 feet wide. Would not that be a very respectable width, and save all consideration of destroying a considerable amount of really good work which has been done in the past? It would, of course, prevent any disturbance of the present front of the hospital.
2735. Would it not be better, in view of all the risks and chances which may occur if once we commence to pull the building down, to make sure of getting 20 feet, or 19 feet 7 inches, which I understand from Mr. Rowe is the actual distance between the present street and the front of the steps? I think it would make such an awkward break in the improvement that it would be self-condemned when it was completed. It would be a standing eyesore.
2736. Do you know of any buildings which are similarly circumstanced, where the steps come right down to the side of the street? Yes.
2737. Do you know the Melbourne buildings? Yes.
2738. Do you know that the steps to the Parliamentary Buildings come down to the front of Spring-street? Yes.
2739. The Treasury Buildings;—in all these buildings the steps come down to the front of the street? But then they have a street from 160 to 200 feet wide. It makes all the difference.
2740. The Treasury Buildings have a much narrower street than that? I cannot tell from memory.
2741. At any rate, it appears that you can get, without any interference whatever with the present buildings, and without interfering with the original design, an extra width of 19 feet 7 inches; that would bring the street up to a total width of 81 feet 7 inches;—would not that be a satisfactory solution of the question? It would, of course, meet it to a certain extent, but in doing it you would have to sweep away the whole of these shrubs from one end to the other.
2742. Which shrubs? The existing shrubs—not opposite the hospital, but those opposite the buildings adjoining. There is a row of valuable shrubs, which it would be a thousand pities to disturb.
2743. You mean along the Gardens? Yes.
2744. Those shrubs, in any case, would have to go? I propose to retain them.
2745. Those shrubs are of no special value—similar shrubs could be grown again in a very few years? Probably; but it seems a pity to cut shrubs down.
2746. Are there not similar shrubs all through the Gardens? They have all the advantage of mature growth, which gives them a handsome appearance. You can replant, but it takes years before they grow up.
2747. Would not these shrubs, in any case, soon lose their healthy appearance if a roadway were taken on either side of them? I do not think so. I think they would rather improve.
2748. By having dust on both sides? There would be no dust in that street—it is all paved. You could not retain the shrubs of the existing Hospital Buildings in the way you suggest, because they will take at least from 10 to 15 feet width, and that would leave only about 4 or 5 feet between that and the hospital, which would be nothing at all. The shrubs would have to go entirely.
2749. But there are no shrubs in front of the Hospital Buildings? There are none opposite the hospital, but there are on either side.
2750. Would you still have a space from the bottom of the steps to the wall of the building; you could plant shrubs there, if you wished, for ornamental purposes? That could be done.
2751. Then there is nothing which need trouble us in moving from there down to opposite Hunter-street;—there are no shrubs of any consequence down to Hunter-street? There are some in front of the present Parliament House.

W. L. Vernon,  
Esq.  
26 Feb., 1891.

2752. Supposing you get as far as Hunter-street without destroying any shrubs, what difficulty would there be in carrying out this shrubbery idea down to the Government House gates? The present shrubs could remain there without being touched.

2753. And when the new Parliament Houses are built, you could provide for continuing these shrubs in front of them, and then, when other buildings are put in place of the present old Parliamentary Buildings, you could still make provision for carrying out the shrubbery so as to bring it back again, ultimately, right up to the Hospital Buildings? I think the front of the hospital would look very awkward standing out in the pathway.

2754. In your plan do you propose to take the street the full width right down to the water? No; to the Government House gates.

2755. Where would be the difficulty of having the street a little bit narrower at the upper end any more than having it a little bit narrower at the lower end? One likes to make the road symmetrical if possible.

2756. If this building were not in the way no doubt it would be an excellent idea to give effect to it; but would not this be an excellent way of compromising the difficulty, by being satisfied to take the width of the street right up to the foot of the steps, the same as is done in connection with many other public buildings, and thereby getting 80 feet width of a street; are there any other streets in Sydney 80 feet wide? Unfortunately not many. It is as wide opposite the Town Hall.

2757. At any rate, 80 feet is a very satisfactory width? It is for ordinary commercial buildings, but not for the public buildings of the colony.

2758. Is there anything to prevent you from putting back a public building as far from the front of the street as you choose;—for instance, the new Parliament House Buildings; would you put them as far back as you could? I would, certainly.

2759. Would not that have a similar effect to having a wide street? Not if the hospital were left in its present position. It would spoil the whole perspective of the street.

2760. Supposing the street were carried 80 feet wide from one end to the other, would it spoil the appearance of the street to have one building projecting a little beyond the others? In this case the projection of the hospital would be so excessive that it would look very unsightly. Of course, you do not want a tame uniformity of building line, especially in large important buildings, but this would be so pronounced in actuality that it would always be an eyesore if you widen the street at all.

2761. Perhaps it would add to the additional beauty of the Parliament House Buildings by showing them off a little further back? That is a matter of individual taste.

2762. Would not there be a little additional beauty in having some variety in the position of the front of the buildings? I admit that, but in this instance it is too pronounced.

2763. You think a street with a width of 80 feet would not be sufficient? I do not think it is enough at all.

2764. All the circumstances considered, rather than be satisfied with a width of 80 feet of street, you would pull down the whole of the work that has been done? I think the cost—£14,500 or whatever it may be, should not stand in the way of the improvement.

2765. But I understand the cost, £14,500, will not give us back the same buildings which are intended to be erected there now? It gives you them back, excepting about forty beds.

2766. Is it not desirable, considering the rapid increase of Sydney and suburbs, to have as large a building as convenient? I am not prepared to give an opinion on the hospital itself.

2767. You know that the population of Sydney and suburbs has doubled itself in fifteen years? I suppose so.

2768. Considering the time it will take to finish this building, is it not desirable to have it as large as we conveniently can, without crowding the ground too much? I think if you build a hospital you should build it to meet the requirements of the place.

2769. Seeing that we are utilising such a valuable piece of ground, is it not desirable that we should continue to have as much space as possible, so as to give as much accommodation as possible, in view of the rapidly increasing population? That depends very much on the views you hold as to the accommodation required.

2770. You would not favour being satisfied to allow the buildings to remain, and to have the street 80 feet in width? Eighty feet is better than nothing, but I should not be satisfied, from an architectural point of view.

2771. *Mr. Tonkin.*] Have you studied the plans or buildings from a hospital construction point of view? I have not; I have simply studied them in regard to the cost of taking them down and rebuilding them.

2772. You could not give the Committee any idea of your own in regard to the science of building modern hospitals? I am not prepared to give evidence on that point at all.

2773. When you studied the question of the number of beds which would be required if you moved the building back, did you take into consideration the doing away with the south wing altogether? I have paid no attention to the south wing.

2774. What number of beds do you say you would accommodate? Two hundred and twenty-four beds, and twenty-four private wards.

2775. That is not the alteration you would propose? No.

2776. The other would be for 184 beds, and twenty-four private wards? Yes.

2777. That is for the building itself, independent of any other out-buildings which now exist? It is the accommodation on these plans.

2778. Independent of any other? Yes.

2779. That is for a three-story building? Yes.

2780. But I understand that would diminish the accommodation for the nurses in the Nightingale Ward;—you would cut off a portion of that? It would cut off the western wing, no doubt.

2781. Then it would not leave sufficient accommodation there? I should say not.

2782. Supposing we had to utilise the main portion of the main building for the nurses, that would again reduce the 184 beds? If you reduced the ward it would; but it is possible to find accommodation without reducing the wards.

2783. Where could it be found? I would suggest that it could be found in the upper story.

2784. How many beds would your proposal find accommodation for if there were only two stories to the building, as is suggested by many of the witnesses? Sixty-two less.

2785.

- W. L. Vernon, Esq.  
26 Feb., 1891.
2785. That would not interfere with the twenty-four private wards? No.
2786. If the whole of the buildings were pulled down, what would be the approximate value of the stone now on the ground for the purposes of any other building;—supposing it were decided to construct the building on other plans, what would be the value of the stone on the ground now? It is difficult to tell—it might be worth £4,000 or £5,000, but there is a great deal of brickwork.
2787. Would you advise, under any consideration, the construction of the building of stone if constructed in this street? Undoubtedly.
2788. Would it not do for the back to be of brick? Yes.
2789. All you wish the stone for is to improve the architectural appearance of the street? Yes. It would be a great pity to cut off the projections. It could be done, but it would interfere with the design.
2790. How far back from the edge of your suggested footpath would you commence to build? I would go back 30 feet to the projections, and 35 feet to the building.
2791. That would be 130 feet or 135 feet from the houses on the opposite side of the street? About that.
2792. *Mr. Humphery.*] What is the width of the steps leading up to the administrative block? The steps stand out from the wall about 15 feet.
2793. If these were removed, and an entrance were made into the administrative block without steps you would have 95 feet? Yes, up to the building.
2794. If you effect an entrance to the administrative block by means of an archway instead of steps, you could have 95 feet between the main wall of the administrative block and the houses on the opposite side? About 94 feet.
2795. And you are seeking for 100 feet? Yes, but I am wanting to set the building back in addition.
2796. *Mr. Dowel.*] With regard to the Royal Mint, would you remove a portion of those buildings? The outside of the buildings.
2797. What do you estimate the cost of that portion of the work to be? I have viewed it more in the light of the fact that the Mint some day will have to be rebuilt.
2798. It would involve some cost? Probably some accommodation would have to be found elsewhere.
2799. You have estimated the cost of the removal of the Sydney Hospital Buildings at £14,500;—your plan also would involve the removal of a portion of the Lending Library? I do not propose that the whole thing should be done at once. It would undoubtedly have to be rebuilt some day.
2800. At what do you estimate the total cost of the improvements which you suggest? I have not gone into it.
2801. You have made no calculation as to it whatever? No.
2802. You are aware that a large quantity of wool and other merchandise passes along Macquarie-street? Yes.
2803. And that would be a good reason for putting the hospital further back from the street? Undoubtedly.
2804. *Mr. Lee.*] Does the £14,500 include the re-erection of that building as well as taking it down? Yes.
2805. Restoring it to the same condition in which it exists now? Exactly.
2806. *Mr. Garvan.*] Do you attach a good deal of importance to the widening of Macquarie-street? I do.
2807. Do you know of any cities in the world where streets of that character are laid out? I know a great many, having travelled a good deal. I do not know of any street so narrow for its public buildings, or so mean looking.
2808. Could you name any of the great cities of the world where a street of that character is laid out as wide as that, and as wide as you propose? I do not know one so narrow. I have seen a great many of the Senate Houses in the States, and in European capitals. I have seen public buildings in India which have a wide space in front of them.
2809. Quite as wide as this street? Far wider. In Bombay, for instance, the street is probably 400 feet wide. There is a range of public buildings, probably a quarter of a mile long.
2810. Do you know the width of the street in front of Parliament House, Melbourne? I should judge it to be from 160 feet to 200 feet from the White Hart Hotel to the railings of Parliament House.
2811. That would be wider than even what you propose to increase this street to? It would. I am speaking from memory.
2812. You are almost certain, at any rate, it is not a less width than what you propose now? I am certain of that.
2813. Do you think it would add very much to the beauty of the city if the street were widened to the extent you propose? Having in view the new buildings which will probably be put up, I think it would.
2814. I presume if we do not do it now, and we place any large public buildings on the ground, it will become almost impossible to do it in the future? It will become more difficult, at any rate.
2815. There will be no cost involved upon the Government of the day other than the mere cost of removing these buildings? As the public buildings are put up, I suppose the widening will take place at the same time, but I do not propose to widen it at once, but as the buildings are erected, therefore the cost will go into the cost of the buildings.
2816. How long would it take the shrubs you refer to to attain the point of perfection which they are in now? Some of the trees which are there now are probably 20 years old.
2817. If we were to do away with them it would take a similar length of time to bring them to their present condition? I think so.
2818. In your opinion the trees and shrubs add very much to the beauty of a place? Very much, especially where you can get the semi-tropical foliage which you can get in Sydney.
2819. You think it an important feature of your proposal to be allowed to retain the shrubbery? It adds to the general handsome appearance. I should be sorry to see them done away with.
2820. You have shown in your sketch plan an extension from Moore-street;—is that in direct line with the street in front of the Post Office now? Yes; it is only a suppositious opening however.
2821. You bring it out in a direct line? Yes.
2822. Have you made any special study of hospital buildings? No. I have had to do with them more or less.

2823. Have you ever designed any, or had them constructed under your supervision? I have designed one or two cottage hospitals, but not a large one of this description. I have worked on them in my younger days.
2824. *Mr. Trickett.*] Do you know St. Thomas' Hospital, London? Yes.
2825. Do the buildings there come right out to the street, or have the patients, in order to enter the building, to go inside a wall or rail? Yes; it stands back from the street on the one side, and faces the Thames Embankment on the other.
2826. Therefore, in order to get patients into the hospital you would not have to discharge them in the street, but take them inside the enclosure? The only street steps attached to the hospital lead to the treasury department.
2827. Seeing that in the Macquarie-street building the accident ward is on the basement on the northern side, and under your arrangement you could come right under the building from the street, do you think it desirable that people suffering from accidents should be lifted out into the street, and carried right into the accident ward? I think it is very undesirable.
2828. Is it not desirable that a building of that character should stand back some distance from the street? It should do, as it does at present.
2829. But, according to one of your proposals, if we bring the street right up to the building that inconvenience in regard to patients would occur? It would.
2830. Is it not desirable to alter that if possible? I think so.
2831. Therefore you lean towards shifting the building back? I do.
2832. *Mr. O'Sullivan.*] What is the object in having this wide street? As a good setting to the buildings.
2833. To show off the buildings? And also for the purposes of the increased traffic which must arise.
2834. Would not these plantations of shrubs be in the way of a good site for those buildings? No; I think they would all help the general appearance.
2835. Would they not interfere with the view of the building coming down the street? Not of that height.
2836. Would it not be better to remove the shrubs, and have beds of variegated flowers in their place? Anything of that kind improves a building.
2837. Do you recollect the position of the foundation stone of the new Houses of Parliament? Yes.
2838. Have you considered the site of the new Houses of Parliament as subordinate to your present proposal? I have marked the site of the Parliament Houses on the sketch plan, because I have an idea, and it is the general idea, that the Parliament Houses were to go down by the statue, and to face down Bent-street.
2839. Do you know that the site between the present Parliament House and the Domain was purchased partly for the site of a new Parliament House? I do not know it as a fact—probably it may be.
2840. I see you propose making a main entrance to the Domain opposite Hunter-street? I assumed that the Parliament Houses were going below that, and then you would require a fresh entrance to the Domain.
2841. Are these three minor entrances shown on the plan? Those are assumed entrances to Parliament House.
2842. Under those circumstances you provided for the extension of the new Parliament Houses below Bent-street? Yes, northward.
2843. Is the road you propose on the northern side of the shrubbery supposed to be a vehicular road, or simply for foot traffic? For foot traffic; but it could be laid down for other purposes.
2844. Under your proposal you will retain the street as it is at present, leaving the shrubbery, and then a street east of that again? Yes; but I would put the present pathway on the eastern side right into the road itself.
2845. Speaking of the lower part of Macquarie-street, between Bent-street and the entrance to Government House, do you think that will be an improvement? I think it would give a greater idea of breadth if the street were taken all the way down.
2846. But will it not destroy these beautiful grounds in front, which are now laid out so beautifully, and which have such fine lawns? Well, it is a matter for consideration.
2847. You think it is a matter of taste between the landscape gardener and the architect? No; I say the landscape gardener should come in there; but I think the fact of making the fencing further back would have very little effect upon the general appearance. It would still have that park-like and garden-like appearance, and it would give you a broader street generally.
2848. As a matter of fact, are you taking steps in reference to the new Houses of Parliament? None whatever yet.
2849. Of course, if you were doing so, you would consider more definitely the proposal you are making with reference to the widening of the street? Yes.
2850. And it is just possible your design of the Houses of Parliament would be such as to interpose to prevent the carrying out of your design of widening the street? I do not think that is likely.
2851. Then do you propose to encroach upon the Domain? I should, of course, design the Houses of Parliament to be placed where Parliament wished them to be placed.

Thomas Rowe, Esq., Architect of the Buildings, sworn, and further examined:—

2852. *Mr. Trickett.*] You see the plan before you in regard to the proposed widening of Macquarie-street? Yes.
2853. Will you kindly give the Committee your advice in regard to it as affecting the building which you have designed for a hospital? As I have stated before, if Mr. Vernon's plan is carried out it will, I think, necessitate the rearrangement of the entire site.
2854. You have heard Mr. Vernon examined. He submits two proposals—one to bring Macquarie-street right up to the face of the present buildings, and to take away the steps and make an arch entrance into the administrative part of your design. What are your views in regard to that? I rather disagree with Mr. Vernon there. I should prefer leaving the steps, and, instead of taking the whole of the vacant space between the building and the street line, as Mr. Vernon has proposed, I would give him half that space. But if it were a desirable thing to take the line of the street up to the front of the building—that is the line doing away with the steps—it would be a very difficult matter to put the steps as suggested by Mr.

T. Rowe,  
Esq.  
26 Feb., 1891.

Mr. Vernon. There is 9 feet in height to get up from the level of the street, and that would necessitate eighteen steps. With each of these a foot deep you would require some 17 or 18 feet to get into the lobby, which would entirely ruin the interior part of the building. If desirable, it could be done in a different way from that. If the building line were taken right up to the front of the administrative part of the building these steps could be erected, and the administrative block could be entered from the side by steps instead of, as Mr. Vernon suggested, by means of steps inside the porch.

2855. There is plenty of width there for a good approach? Yes. I merely suggest it as possible to do that, but I still contend it would be far better to leave the outer steps and bring the building line up to the wall of the steps.

2856. What is the width of the passages on each side of the administrative block? Eighteen feet.

2857. If you had steps there would they not interfere with the drive for the purpose of getting patients in? No.

2858. You have studied hospital construction very largely;—can you tell us of any hospital of such large proportions as this which goes right up to the street? I cannot. There are some, I know, but it is not a desirable thing for any public building to be close to the street.

2859. With regard to a hospital in a city like Sydney and in a street like Macquarie-street, where the traffic is likely to increase year by year, is it not very desirable that a building should be kept back from the roadway? I must admit that it is a desirable thing.

2860. The same as you have designed it now—you have kept it back? But if Mr. Vernon's plan was adopted, or an amendment upon this plan, and the building line was brought to the front of the administrative block, and there were a shrubbery and a broad path along there, the traffic would be where it is now. It makes no difference whatever.

2861. And ample means could be left for getting patients in without their having to be taken out into the street? It was never intended.

2862. Even if you have your steps on the north and south sides of the administrative branch, could provision be made for taking in the patients conveniently? If the plan is carried out the old southern wing, or a portion of it, should be taken away.

2863. It would necessitate the southern wing coming away? Yes.

2864. If these steps were taken away from the front of the building, would it not very much detract from its appearance? Yes, certainly; I prefer the steps. There is no necessity for the street line to be straight. There can be no objection to a broken line; it frequently adds to beauty.

2865. Agreeing that it would be a great city improvement to widen the street, as suggested by Mr. Vernon, you think the hospital could remain in its present position without being a disfigurement? Yes, and retain the steps.

2866. You do not think it would be a disfigurement to have a slightly broken line? No.

2867. You have heard Mr. Vernon state that the foundations could be removed back for £14,500;—do you agree with him or not? To take the whole down?

2868. To take down the whole of the front buildings, and the pavilion, and move them back? I understand his suggestion is to take down the three front blocks. I do not agree with him. I prefer rearranging the whole; it would ruin the Nightingale wing.

2869. Have you had time to consider whether you agree with his estimate of the cost of doing that work? I have not had time to estimate.

2870. But if that had to be done, would it not alter your design very much? It would alter the whole thing, so that it would be better to commence over again. The building is so nicely adjusted now on the site that if you touch it you must take down the whole and rearrange.

2871. There is a little confusion in my mind as to the south-eastern buildings; in your design is it intended to leave them there—the portion which now is occupied as a Lock hospital? That is to be entirely demolished—the whole of that southern building which is a Lock ward, &c.

2872. The only portion which would remain would be the portion used as a dead-house and for other offices? Yes.

2873. The whole of the remaining southern portion would have to be removed? Yes.

2874. Am I to take it that you dissent entirely from Mr. Vernon's proposal? Not entirely. I disagree with the idea of moving the buildings back.

2875. *Mr. Humphrey.* When you say it will be necessary to remove the south wing, you mean to carry out your design in its entirety? Yes.

2876. There is nothing to prevent the completion of what is called the eastern wing, and the Macquarie-street frontage, without touching the south wing? No; there is nothing to prevent that, but you cannot carry out the design ultimately without taking down that wing; neither could you get proper access to the accident cases, as they come in from the southern gateway.

2877. Is there not ample space on the northern side of the block? It is possible when the little buildings which are there are taken down.

2878. And, excepting for the purpose of gaining access to the eastern pavilion, it is not necessary to remove any portion of the south wing? No.\*

2879. So that it would be really an advantage to enter by the north instead of by the south side? It would.

2880. Are the buildings you propose to put on the present site of the south wing absolutely necessary to the hospital? It was considered so at the time.

2881. What are the buildings intended to be? Three infectious diseases wards, the nurses' room, an inquest room, a post mortem room, and a waiting room. Over the chapel is the operating ward.

2882. None of the buildings you mention are immediately necessary or absolutely essential? It would be an imperfect hospital without them. They have them in wooden buildings at present. The operating ward is in the present old wooden building which will be demolished by-and-by.

2883. If the evidence we have before us shows that the south wing can stand, and that the Macquarie-street frontage with the eastern pavilion complete would give all necessary accommodation—would you agree with that evidence? I say it leaves the hospital imperfect. The kitchen, as I have stated before, was placed very close to the front portion of the southern wing. It would never have been placed there had it been

\* NOTE (on revision).—But if steps to the administrative portion are to be placed at the sides, it would be necessary to have an entrance in the south end also. Therefore a portion of the south wing would have to come down.

been intended to take the southern wing down. It is out of place at present and crowded, but when the southern wing is taken down, and the other buildings erected, it will be more open and perfect in itself.

2884. You do not agree with the opinion expressed by some of the members of the Hospital Committee that it would be undesirable to remove the south wing? I do not. The south wing will require a great deal to be done to it. The balconies and verandahs are defective, and I think it will take some thousands to put it in a proper state of repair.

2885. Do you know that the results have been most satisfactory in that south wing—equally satisfactory to those obtained in the present wooden building? I have not heard anything to the contrary.

2886. *Mr. Garvan.*] If you had not been committed to the building, would you favour the idea of a street as wide as is suggested by Mr. Vernon? I do not know that I should have gone so wide as Mr. Vernon. I think it is rather unnecessary. It is sacrificing valuable ground. Eighty feet is my favourite width for a street in this colony.

2887. You think 80 feet would be sufficient even for the purpose of showing to advantage a magnificent building such as the hospital? Yes. I am afraid if Mr. Vernon took away so much ground he would have a difficulty with his new Houses of Parliament for want of space.

2888. Take your mind away from any question of the difficulty there may be of finding room for the Houses of Parliament. If you were laying out the street originally, you would still keep to 80 feet, instead of 110, as is suggested? I think 80 feet is wide enough. Too wide a street in a colony of this kind is irksome.

2889. For the purposes of beauty or health you would not have any street wider than 80 feet? I certainly have long been under the impression that if I were going to lay out the city on its present site I should adopt 80-foot streets. I am not a great favourite of planting in the streets. We have our reserves, parks, and so on.

2890. Are you aware of the locality of some of the great hospitals in the world, and whether their distance from other buildings is greater or less than is the case in Macquarie-street? They vary very much. Some are up to the road, and others retire considerably from the road. It all depends on the site they have had to work upon. Here we have had a difficulty to contend with, but if the site had been half as deep again I would have gone back 40 or 50 feet more.

2891. Do you think it would be an advantage for them to be further back? I certainly think so. Any one would prefer living 40, 50, or even 100 feet back from the street.

2892. Admitting that it is an advantage to shift them further back from the street, would you be prepared to say that we might incur some expense in carrying out that idea of yours? No expense would be incurred by carrying out my idea.

2893. Supposing we could give effect to your idea of putting the buildings 40 feet back, do you think we would be warranted in going to any expense to do that? I do not think so in this particular case. It would so wreck the whole arrangement, and the cost would be so considerable, that I should not advise it. I do not see the necessity of sacrificing so much money for the sake of widening the street to the width suggested.

2894. Mr. Vernon, in his plan for widening the street, made a suggestion to the effect that whilst still retaining the general width we should arch round in front of the buildings? Exactly.

2895. And that would carry out Mr. Vernon's idea in its main points without interfering with the site of your building? Just so.

2896. Do you not think that that might be favourably considered? I think so; it would be a broken line, and I am always an admirer of a broken line, especially where there are trees.

2897. If that idea were adopted it would still bring the hospital, comparatively speaking, very close to the street—that is, to foot passengers? Yes, but not for vehicular traffic.

2898. Is there much disadvantage in having a hospital so close even to the foot passenger traffic of the street? I do not think so.

2899. Would there be any danger to the health of the public in passing so close to a hospital full of sick people? I do not think so—not in this case; it is the administrative block only which would be very close. The other parts are still retired a considerable depth from the building line. The ward wall would be back, I suppose, 25 feet from the building line.

2900. Supposing it became the policy of the Government to take in a portion of the Domain, and to give you unlimited room for the erection of a hospital, do you think, then, that it would be desirable to go to an expense of say £20,000 to shift the hospital 40 or 50 feet back from Macquarie-street? If the Government submitted to that it would be desirable.

2901. Even if it cost £20,000? I think so.

2902. Your objection at present to go back is by reason of the actual condition of things? Yes.

2903. And it was in view of that that you designed the actual location of the hospital? Yes.

2904. But there would be a decided advantage to have room to go back? Certainly.

2905. *Dr. Garvan.*] I understand you to say you would like to reconsider the whole of the structure if you are to adopt either of Mr. Vernon's plans? It would have to be reconsidered if Mr. Vernon's plan is adopted.

2906. If you are compelled to put up your hospital on 2 acres instead of 2½ acres, you would like to rearrange the whole of the place? Certainly.

2907. You would hardly recognise your own work if it were altered to suit a different-sized ground? It would have to be taken down to suit a different size.

2908. If you were reduced to 2 acres, do you think you could give the accommodation you originally designed? It is possible to do it with a four-storied building.

2909. You could not do it without overcrowding? I do not say that we should overcrowd the site. It would simply be a case of going up higher.

2910. You cannot get extra ground either to the north or south? No.

2911. You are as close to the adjoining buildings as you ought to be? Yes.

2912. It would be better to have more ground if you could? Yes.

2913. Your opinion is that we must either go on with the present plan or reconsider the whole matter entirely? I think so.

2914. And if we have a smaller area there is no doubt but that we must go higher? It must be so; and I am still of opinion that, in order to get the accommodation, we ought to have four stories now. I think it will be a great pity to omit the fourth story whilst we have such massive foundations already erected.

T. Rowe,  
Req.  
26 Feb., 1891.

T. Rowe,  
Esq.  
26 Feb., 1891.

2915. After all the medical testimony you have heard you are quite in favour of the full height? I am.  
 2916. I would like to point out there is no communication in connection with these staircases for bad air; they are doubly cut off by walls. At the head of the staircase there is a door, and then you enter into a lobby, and then there are doors into the ward again. It is impossible, because of the perfect ventilation, for any bad air to escape from the ward. There can be no possible communication with the staircase.  
 2917. You do not think any bad air can be sucked into that lobby and then up the staircase? I do not.  
 2918. If we diminish the area of the ground we must go up in height? Yes.  
 2919. If going back does away with part of the Nightingale wing, we should have to put another story upon that wing, or accommodate the nurses in the highest story of the building? The Nightingale wing will not bear another story,—it is wholly of slight brickwork. I erected it more than twenty years ago.  
 2920. If we take a third or a fourth part of that we shall be short of nurses' room? Yes. We shall have to provide for them.  
 2921. Either off the premises or in a higher story? Yes. The nurses are entirely shut off now in that wing to themselves. If you place them in the extra story at the top of main building they will not be isolated. The object is to have them in one building to themselves.  
 2922. To give them as much change as possible? Yes, and to keep them away even from the patients.  
 2923. On the whole, looking at the cost, you say, "Stand to the present plan"? I do.  
 2924. And you do not object to a moderate widening of Macquarie-street, but not to so much as would interfere with any part of your plans? That is so.  
 2925. *Mr. Humphery.*] What is the cost of the Nightingale wing? £8,000 or £9,000. It has four stories with an attic.

TUESDAY, 3 MARCH, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.  
 The Hon. FREDERICK THOMAS HUMPHERY.  
 The Hon. WILLIAM JOSEPH TRICKETT.  
 The Hon. GEORGE HENRY COX.  
 JACOB GARRARD, Esq.  
 HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.  
 WILLIAM SPRINGTHORPE DOWEL, Esq.  
 EDWARD WILLIAM O'SULLIVAN, Esq.  
 CHARLES ALFRED LEE, Esq.  
 WILLIAM MCCOURT, Esq.  
 JAMES PATRICK GARTAN, Esq.

The Committee further considered the proposed Hospital Buildings, Macquarie-street.

Walter Hull, Esq., M.D., Medical Superintendent of the Sydney Hospital, sworn, and examined:—

W. Hull,  
Esq., M.D.  
3 Mar., 1891.

2926. *Chairman.*] You are Medical Superintendent of the Sydney Hospital? Yes.  
 2927. How long have you held that position? Over two years.  
 2927½. Then the Hospital Buildings have been in a state of stagnation during your time? Yes.  
 2928. Do you desire to tender any special evidence? I have prepared a statement of my views, because I think that I can state my chief points more briefly in that way. I may state that I am not a member of the honorary medical staff; therefore I am not in any way responsible for the former statement, which was a statement from the honorary medical staff. I, as one of the paid executive officers of the hospital, wish to offer evidence on my own part entirely.  
 2929. It is simply upon the evidence that you wish to speak? Yes. With regard to the points mentioned in my letter to the Committee, I think it is desirable to take those points *seriatim*. With regard to the first point—the number of beds absolutely required at the present time—I wish to say that the number of cases admitted into the Macquarie-street Hospital during last year was 2,874, and when the list of diseases, which has been made as full as possible, is examined in detail, it is, in my opinion, easy for anyone, without special medical training, to see that, on the whole, the cases admitted were of great gravity, and required hospital treatment. To the non-medical mind, perhaps, the bald statement that 274 cases of disease of the digestive system were treated might not convey much information, but when it is pointed out that cases of cancer of the abdominal viscera, cases of peritonitis, of ulcer of the stomach, of intestinal obstruction, and strangulated hernia, together with many other cases equally urgent, are included in this class the matter is made clear. Some of the diseases, such as the cases of gastritis and dyspepsia, it may be said might have been treated elsewhere, but in nearly all these the symptoms were so grave at the time of admission as to lead the receiving medical officer to suspect some more dangerous complication in the background, as in large numbers of them was the case. I am prepared to express the opinion that, having seen all the cases admitted to the hospital during the last two years, and knowing that many have been refused admission who would, had more space been available, have been taken in, some accommodation over and above that at present available is highly desirable, and I think that that would be met by completing the portion of the building already begun, according to the original plan. This would give room for 200 beds in the new structure, and the number of beds in the south wing could be reduced. It would be difficult to conceive of stronger corroboration of the facts mentioned above than is contained in a Report presented by the Government Medical Adviser to Parliament, dated 1st May, 1890. In that Report Dr. Strong, the late Government Medical Officer, stated as follows:—"Could I do as I would wish I would send more pauper patients to the Prince Alfred Hospital, for the authorities there are particularly obliging, and have never refused admission to any case sent with my order, which I cannot say of the sister hospital." It must be explained that Dr. Strong issued orders for pauper patients, the expenses of whose treatment was borne by Government. It was not from any desire to be disobliging that many of his cases were not taken into the Sydney Hospital; indeed, from a money point of view, the hospital was acting in direct opposition to its own interests by taking in free patients and refusing those sent by Dr. Strong, but it was owing to the Hospital beds being required for cases of a more urgent nature than these, although, as may be implied from Dr. Strong's words, he would not have sent cases to the Sydney Hospital had he deemed it safe to send them on to the Prince Alfred. I may also state that during the last two years it

has

has frequently been my unpleasant duty to have to go into the wards and discharge patients before I considered they were quite fit to be discharged, in order to take in more urgent cases presenting themselves for admission at the gates of the hospital.

W. Hull,  
Esq., M.D.  
3 Mar., 1891

With regard to my second point—the area being sufficiently large to accommodate the patients necessary—I may state that during the last nine years there have been 225 beds provided in the temporary structures, and for the greater part of that time they have been utilised to the fullest extent. Now, the space occupied by the unfinished portions of the hospital precludes the use of fully two-thirds of the area otherwise available. Supposing the accumulation of numerous buildings upon a small site to be an obstacle to free circulation of air and access of sunlight, as it undoubtedly is, there should have been during this period marked evidence of the bad results occurring from this source, if, as has been stated, 300 beds is too large a number for the whole site (three times more) to carry. I am in a position to state that during the last two years it has not been possible to trace any bad result to the accumulation of the patients upon this fraction of the hospital grounds; there has not been a single case of erysipelas in any of the surgical wards during that time; in short, both medical and surgical wards have been as free from anything denoting the prejudicial effect of overcrowding as I should wish to see. I consider this a remarkable fact from two points of view, viz., 1st. We have, as before stated, the unfinished buildings occupying the larger moiety of the space; they are unroofed, and the rain has free access to the interior of them; the rain during the wet seasons, which have been frequent for the last two or three years, cannot be got out of the foundations at once, and although nothing insanitary is allowed to remain in them, the buildings are less free from objection than they would be if fully finished and inhabited. Again, owing to the great pressure for beds, the south wing is made to accommodate more patients by at least ten than it should. Having had the opportunity of observing the housing under these unfavourable conditions of almost as large a number of patients as the proposed new Hospital Buildings will accommodate, I have no hesitation in expressing the opinion that the site is quite capable of carrying with safety more patients than are proposed by the completion of the new buildings to be placed upon it.

With regard to the central position of the hospital, I have prepared a table which shows that patients are drawn chiefly, and nearly equally, from all quarters within a radius of less than a mile of the present site. As the residence of those patients, the subject of accident would have no significance, owing to the fact that accidents occur away from home, these cases are grouped alone, and it is safe to conclude that they were tolerably equally distributed among the districts adjacent to the hospital. The patients under the heading "no home" were those brought by the police, many of whom were found lying in a dying condition in the Domain, or recent arrivals, whose serious condition prevented their being sent on to the Benevolent Asylums; moreover, many of the medical cases, some of whose addresses were given as in the country or suburbs, were really seized with acute illness in the neighbourhood of the hospital; but as it is impossible to obtain from the records the exact number in whom this was the case, all cases with the exception of accidents are tabled with reference to their homes. The return is as follows:—

Table showing the number of Patients admitted to the Macquarie-street Hospital during the years 1889 and 1890, from each part of the City and Suburbs, and the number from the Country:—

From the City proper:—	
Electoral Districts—	
East (including Woolloomooloo, east of George-street .....	613
West (including Pyrmont and Ultimo), west of George-street.....	877
South (including Surry Hills), between Liverpool and Cleveland-streets .....	553
* No home .....	496
* Accidents .....	1,678
	4,217
	* Chiefly from the City.
North-western Suburbs—	
The Glebe.....	148
Balmain .....	85
	233
Eastern Suburbs—	
Woollahra .....	58
Waverley .....	56
Paddington .....	138
Randwick.....	17
	269
East Central Suburbs—	
Redfern and Waterloo .....	259
Newtown .....	95
	354
Northern Suburbs .....	71
Western and Southern Suburbs .....	225
Country .....	282
	5,651
	Summary.

Northern Suburbs .....	71
Western and Southern Suburbs .....	225
Country .....	282
	5,651

With regard to the fourth point—medical education—a striking fact which is observed when the Sydney Hospital statistics are examined in detail, is the relatively large number of cases of medical and surgical emergency treated in both the in-door and out-door departments. The Sydney Hospital is so situated that nearly all the accidents occurring about Sydney will be, for many years to come, brought to its doors. Upon comparing the statistics of the Sydney and Prince Alfred Hospitals, as contained in the two last published Annual Reports, viz., for 1888 and 1889, the importance of the Sydney Hospital, as far

W. Hull,  
Esq., M.D.  
3 Mar., 1891.

far as this department of its work is concerned, is very apparent. During 1888, 115 cases of fracture and dislocation were admitted to the Prince Alfred Hospital, as compared with 310 to the Sydney Hospital. During 1889, the numbers were respectively 123 and 311. The number of accident cases admitted to the Sydney Hospital during this time were more than double those admitted to the Prince Alfred Hospital. Whilst the attendances at the Prince Alfred Hospital averaged about 175 a week, those at the Sydney Hospital averaged between 700 and 800. As illustrating the great difference in the class of cases applying for relief at the two hospitals during 1889, *one* dislocation of the shoulder was reduced at the Prince Alfred Hospital, as compared with *twenty-seven* at the Sydney Hospital. *Three* amputations of the finger for accident were performed at the former, compared with *thirty-seven* at the latter. This fact, which I have ventured to emphasise here, has a most important bearing upon the question of medical education. In the practical education of medical men great importance is always attached to the work done by students as dressers and clinical clerks. An indispensable condition for turning out good men is for them to have had the opportunity of gaining the confidence and readiness of resource which assisting in a large casualty and accident department will alone give. There is ample material for the education of a large number of students in this important element at the Sydney Hospital, and in my opinion this is essentially the field in medical education which should be filled by that institution. For it to fulfil this object worthily it must be a general hospital, although no doubt the number of beds set apart for accidents and the most urgent medical cases will far exceed those set apart for comparatively less urgent ones. It requires little reflection to convince anyone that no surgeon worthy of the name would be willing to confine his attention to fractured skulls and other injuries, or that the physicians would be content to treat cases of cerebral hæmorrhage only. Supposing that able men were willing to undertake such duties, they would soon deteriorate. It is therefore necessary, in order to allow the hospital to secure a capable staff, and for the sake of maintaining it at a proper level of excellence, that a fair number of general severe cases should be treated there.

2930. *Mr. Humphrey.*] How far does the eastern boundary of the hospital district extend? As regards the cases in the table, cases coming from Woolloomooloo, and from Woollahra, and so on, are tabled as cases from the eastern suburbs.

2931. You will see, according to your own statement, that the number of cases coming from the eastern district is very disproportionate to the number coming from the western district? The number from the eastern district is 613, the number from the western district is 877, and the number from the southern district is 553; the southern district includes Surry Hills. The cases from the southern and eastern districts are largely in excess of the cases from the western district only. It was with a view of showing that the hospital is centrally situated that I quoted the figures. There is no doubt, of course, that a larger number of cases come from the western district; but the hospital is fed by patients coming from the other two districts almost equally. I mean that there are 1,100 or 1,200 patients coming from the eastern and southern districts who would be very much further from the hospital if it were placed anywhere nearer the western district than it is.

2932. It has been suggested that Cook Park would be a suitable site for the hospital—would that site be more central than the present site according to your table? I am not quite sure. It is a very short distance from the hospital. I should not like to express an opinion.

2933. It would be equally central as a site? It would be very nearly as central.

2934. Would it in your opinion be equally as good? I do not know whether there is sufficient space available there. I have not given that any consideration. Of course, the points upon which I am ready to express a strong opinion are points which I have carefully studied. I have not studied this other question at all.

2935. You cannot, then, offer any assistance? I am afraid I cannot in regard to that point.

2936. I think you stated that the very best results have been secured in the present wooden structure and the south wing? Quite so.

2937. Notwithstanding that a fraction only of the ground is occupied by those two buildings? Quite so.

2938. Do you hope for any better results from the completion of these large stone buildings? We always hope to improve our results. Our general experience is that we get improved results as the years go on.

2939. What are your grounds for thinking that you will be able to do even better by completing the present stone structure than by using the temporary wooden structure? I do not think I expressed any opinion as to our doing better at all in the remarks I made. I said I think that I could trace no results to improper crowding in the present hospital. But the points I wish to emphasise are these: That we have not a sufficient number of beds to accommodate the patients applying for admission, and that in my opinion the patients at present, in some portions of the building at any rate, are too closely crowded, although fortunately we have not been able to trace any bad results to that.

2940. Do you advise the removal of the south wing, or do you think it should remain? I think, under present circumstances, it might remain with great advantage.

2941. Then you would not recommend the removal of the south wing with a view to completing the buildings, which, according to the designs on the easel, are to be erected on the site which that wing now occupies? Well, of course it depends upon what point of view one looks at the subject from. If the Committee wish to have an architecturally very fine building there, there is no doubt that the proper thing would be to take away the south wing and build another pavilion, which would cost a large sum. But if it is desirable to save money, my opinion is that the present south wing should remain where it is, as being quite capable of supplying the wants which many of the hospital patients require, and if at some future time it is felt desirable to pull down the south wing, to make the buildings architecturally more beautiful, it can be done.

2942. Do you think the requirements of the hospital would be met if the buildings which are already commenced were completed up to one story less than this plan shows—not the original design, but the improved design? I certainly do not think that the accommodation would be sufficient for present purposes.

2943. You think it is absolutely necessary to have four stories? I think it is absolutely necessary to have as many beds in the hospital as we have at present, and I think it is highly desirable to have a few more beds than we have. I think I have shown clearly that many patients who have applied for admission—cases of an urgent nature requiring admission—could not be taken in, and that we had to discharge many

many patients before they were quite fit to go. We have also had to crowd the wards in the south wing, although that wing at present is made to accommodate more beds than in my opinion it ought to do. We have had to put up extra beds in that wing for patients.

W. Hull,  
Esq., M.D.  
3 Mar., 191.

2914. How many do you think should occupy that wing? It accommodates at present seventy-six patients. I think that at least ten should be taken from that number.

2915. You think that sixty-six should be the maximum number of patients? Yes.

2916. And with 200 beds in the completed buildings you would have 266 beds? Quite so.

2917. Do you think that that would meet the requirements for some years? I think it would.

2918. You think it will be necessary to build the second eastern pavilion—that is, the most eastern pavilion? I think not.

2919. Do you think it is necessary at all? I do not think it is necessary at the present time.

2920. Having studied the plans, do you think it would be an advantage to the hospital that it should not be erected? No, I do not think that.

2921. Giving, as it would, more open space? I think there is sufficient open space.

2922. Even if that pavilion were erected? Quite so. I think the most eastern pavilion should not be erected unless the south wing is pulled down. If the south wing is allowed to stand I do not think there is any necessity for building the most eastern pavilion.

2923. Only in the event of the south wing being pulled down you would recommend that the most eastern pavilion—that is the one not yet commenced—should be erected? Quite so.

2924. Mr. Vernon, the Government Architect, has submitted a plan for the improvement of Macquarie-street, which he proposes to make 100 feet wide, and in order to increase the width to 99 feet the street would be brought up to the front elevation of the proposed Hospital Buildings, after removing these steps, making it necessary, perhaps, to enter by means of the archway or by steps on the other side of the administrative block. Do you think that would disfigure the building or cause the slightest inconvenience in the management of the hospital? Of course, it is a matter of opinion as to whether it would disfigure the building; many persons could form a better opinion on that point than I could.

2925. Would it be inconvenient in the management of the hospital? Certainly it would inconvenience the management.

2926. In what way? A portion of the administrative block would be taken up with increased staircases and steps, I presume.

2927. Hardly, as you will see if you look at the plan of the centre block. Suppose that, instead of this opening being made in the masonry for the steps, a larger archway were made into the ground floor or basement, do you think that that would materially inconvenience the management of the hospital? It would inconvenience it to a certain extent, because that is a waiting-room for out-patients requiring medicine, and so on. I do not say it would make any material difference. I daresay some other arrangements might be made.

2928. You know that originally the administrative block was one story less than is shown on this design on the easel? I was not acquainted with that fact.

2929. With the exception, perhaps, that other provision would have to be made for people waiting for medicine, do you think anything would be likely to accrue that would greatly inconvenience the management of the hospital if that alteration were made in the entrance? Nothing occurs to me at this moment with regard to the management.

2930. Would it inconvenience the management in any way if the entrance were made at the northern instead of the southern end of the building? I do not know that that would inconvenience the management; but, as a matter of fact, this portion of the ground floor is cut up for small consulting-rooms for the doctors who see out-patients. I think it would be very difficult to remove the walls which divide this part of the ground floor.

2931. *Dr. Garran.* You say that your results are good in this wooden hospital;—are they as good as the average results obtained in other parts of the world? I think they are quite as good.

2932. For the number of beds your patients do as well as patients do in any other hospital in the world? I think they do.

2933. You have at present 76 beds in the south wing—how many beds have you in the wooden building? About 150. We have altogether 224 beds.

2934. You will have 266 beds in the new hospital? Quite so.

2935. You will only get that small difference of gain—about thirty beds—at a cost of £80,000 or £90,000? I do not pretend to know anything about the cost at all.

2936. Your cases from the city are 4,217, as against 5,651 altogether? Quite so.

2937. Nearly four-fifths of your cases come from the city proper? Yes.

2938. This hospital is not absolutely in the centre of the accident area—it is on the margin of it? I do not know what you regard as the accident area.

2939. Take all the cases which come from the western side of the hospital? I have shown in the table that 877 cases came from the western portion of the city, including Pyrmont, Ultimo, and Darling Harbour, and that from the eastern and southern portions of the city there came about 1,200 cases.

2940. You have not mentioned here where you include Circular Quay and Darling Harbour cases? I have given a very full and detailed statement in the table.

2941. You say "accidents, 1,678," but you do not say where they came from? It is impossible to say. In order to do so it would be necessary to report in the hospital books the addresses of the patients and the places from which they happened to have been casually brought. That is never done anywhere to my knowledge.

2942. Do not accidents mostly take place at the wharves, in factories, and in connection with the erection of public buildings? No doubt they do. I think that a great many come from the wharves at Woolloomooloo; many cases come from the Woolloomooloo district.

2943. There is only one wharf there, Cowper Wharf? There is only one wharf, but a great many cases come from the Woolloomooloo district and from Surry Hills. A large number of the accidents occur in street brawls and so on. I cannot say the actual proportion of accident cases which come from wharves and from the streets, but I should say quite as many come from the one as from the other.

2944. Is the present situation of the hospital central for accidents, as a rule? I think so.

- W. Hall,  
Esq., M.D.  
3 Mar., 1891.
2975. You recommend, I understand, that the hospital should be put up to the full height? I think we require the number of beds it would give us, and I do not see any objection to its being done from a medical point of view.
2976. No risk of effluvia passing from a lower tier of beds to a higher tier? No. I may say that I lived in hospitals in England for five years, almost without intermission. One of the hospitals had five stories—not five tiers of patients, but four tiers of patients and a story above, in which the nurses were accommodated—and no bad results were obtained in that hospital. Both medical and surgical cases were treated in the top wards, as well as in the bottom wards.
2977. In your present hospital you have nothing but two stories? No.
2978. Do you find any difference in the upper story over the lower story? I do not see any difference.
2979. Not the slightest? We treat medical cases upstairs and surgical cases downstairs.
2980. You do not attach much importance to the aspect of the windows of the hospital? I attach no importance to that.
2981. You do not oppose a westerly aspect? I am speaking from an experience of two years in the colony.
2982. Has the south wing any windows on the southern side? It has windows on both sides.
2983. Below and above? Yes.
2984. Do you get much sun into the wing? Yes, there is sun—quite sufficient sun.
2985. You do not want more sun? I do not think we want more sun.
2986. You think it is not a colder hospital than the wooden one? No, I do not think there is very much difference between the two.
2987. Does the wooden building screen the sea breeze from the south wing as it stands now? No. I do not think it does. I have noticed nothing appreciable in that way.
2988. It would be all the better for the south wing if the wooden building were away? I think it would be much better, because the hospital would then be put in a position in which it could be administered properly.
2989. Then the south wing would get more sea breeze than it does if it were away? It certainly would get more.
2990. Your recommendation is that the front should be put up to three stories? It should be put up to the full height as originally planned—that is to say, four stories.
2991. The eastern pavilion, if built four stories, would have twenty beds in each ward? No, sixteen beds.
2992. You could not do without sixty-four beds altogether? I think about 260 beds are wanted altogether.
2993. You spoke as if you wanted a medical school attached to this hospital—do you think it can be built large enough to make a medical school? I am afraid that I have been misapprehended. I did not say that I wished to make the hospital a medical school—only that it should act as a supplement to the Prince Alfred Hospital, which I consider is not, and will not for many years to come be in a position to teach students certain departments of their work, and the material for teaching those departments being sufficiently ample at the Sydney Hospital, I consider that it will be greatly to the advantage of the Medical School for students to attend there.
2994. I understand you to point out that there is an immense deal more accident experience at the Sydney Hospital? Quite so; but the education of students depends only partly on training in accident cases. I consider that students cannot be trained anywhere else so efficiently in that class of cases as they can be trained at the Sydney Hospital.
2995. You have not the present appliances for a medical school? We have no accommodation.
2996. If you want to attach a medical school to the hospital you will want more? We should want no more than we should have by having the building properly completed.
2997. You will want a lecture-room, a pathological museum, and a variety of other things? That is not at all necessary. It is desirable that a room should be used for lectures, and it is intended that the operating theatre should be used on occasion as a lecture-room for giving clinical lectures, and so on. It is not intended to erect a museum and carry on the whole teaching of medical science at that hospital. What is intended to be done is simply to teach those portions of medical work which can be taught more efficiently there than at the Prince Alfred Hospital.
2998. Do you think that in ten years' time we should really want a city hospital proper, capable of holding 300 or 400 beds? I think it is quite possible that in ten years' time more hospital accommodation will be required in Sydney than even the completion of this building will afford. We shall be short of beds in ten years' time even with the erection of this building.
2999. Even if we added this new building, we should be short of beds in ten years' time? I think it is not at all unlikely.
3000. Would you put up an extra pavilion then, or go in for a new hospital? I prefer not to express an opinion on that subject.
3001. You say that if we put up an extra pavilion we must pull down the south wing? I do not say it is absolutely necessary. I say I think it would be desirable to do so.
3002. You will only get sixty-four beds in the new pavilion, and lose sixty-six beds in the south wing? Quite so.
3003. You would gain in architecture, but you would gain nothing in accommodation? Quite so.
3004. *Mr. Tonkin.*] I understand that you are in favour of retaining the present south wing as it is? Yes.
3005. Do you find any inconvenience from the proximity of the kitchen to that building? No. There is inconvenience in administration, but I have noticed no detriment to the patients. The offices of the kitchen are close to the building, but the kitchen itself is a great distance from the south wing.
3006. You find no inconvenience at all from its proximity? I notice no insanitary inconvenience.
3007. Do you think one emergency and accident hospital is sufficient for the city of Sydney? I think that this hospital, when completed, will be sufficient for a very long time.
3008. Do you think it would be better if, instead of having one hospital of 260 beds, we had one hospital on that site with 130 beds, and another hospital, say on Flagstaff-hill, with 130 beds? I think it would be highly undesirable, in the interests of the patients at any rate. It might be a good thing for certain members of the medical profession who are anxious to be connected with a hospital, but it would certainly be undesirable in the interests of patients to have two hospitals of that character. It is desirable that a hospital of a fair size should have a certain number of medical men to form its staff, and a small hospital would not be so likely to attract medical men of some standing as a larger hospital would. 3009.

W. Hall,  
Esq., M.D.  
Mar. 1891.

3009. You think it is entirely in favour of the patients to have one large hospital? I think it is more desirable that the present building should be finished than that two smaller buildings should be erected in different parts of the city.
3010. If two hospitals were built would they not be more in the neighbourhood of accidents? There is no doubt that some patients would be nearer one hospital and that other patients would be nearer the other hospital.
3011. Would that be any advantage? I think that, taking the whole of the circumstances into consideration, the advantages accruing from that arrangement would not counterbalance the advantages accruing from a properly appointed hospital erected in one position.
3012. Would not the expense of administration be reduced if the patients were concentrated in one position? With hospitals below a certain size the administration is more expensive.
3013. Is that one of the reasons why you advocate the erection of a large hospital, or are you speaking entirely on behalf of the patients? I am speaking now on behalf of the patients.
3014. Do you take into consideration at Sydney Hospital the expense attached to the treatment of patients? I do, certainly.
3015. Would there be any difference if the hospital contained 260 beds, or 160 beds? Certainly, the expense per bed would be much larger in the latter.
3016. Do you find any difference in the administration of a hospital if it has four stories, instead of one of two stories? My opinion is that a four-storied building is as easily administered as a two-storied one.
3017. And with as good results to the patients? I think so, other things being equal. Of course, if you put up a four-storied building in a very narrow lane, I do not suppose it would be so; but under the conditions that apply to the Macquarie-street site, I think it would, certainly.
3018. But is not the latest suggestion, from the medical point of view, that a hospital should be only one story high? I am not aware of that fact. I know a large number of the hospital buildings in London very intimately, and I know that many hospitals have been built there with four or five stories during the last ten years.
3019. And they are considered to be very highly satisfactory? The results are satisfactory.
3020. You have no fear on that score, whether the Sydney Hospital is a four or a three-storied building? I have none.
3021. But you seem not to be satisfied with any reduction in the number of beds. If we reduce the buildings by one story, as has been suggested, you think the hospital will not meet the requirements? I think not.
3022. Do you think there is any particular plan on which the hospital could be erected without taking up the whole of that frontage—do you think it would be in any way advantageous to erect the administrative department in the opposite direction, running east and west instead of north and south? I think not.
3023. You have no complaint about the building facing the west, as it does? I have none.
3024. *Mr. Dowel.*] How many patients were treated in the Sydney Hospital during 1890? 3,416 cases.
3025. How many surgical and medical cases were there in that number? Speaking approximately, there were about 1,200 or 1,300 surgical cases, about 365 eye cases, about 200 gynecological cases, about 100 Lock cases, and the remainder would be medical cases.
3026. How many accident and urgent cases were admitted? I consider that 95 per cent. of the cases admitted to Macquarie-street were urgent cases.
3027. Does that statement bear out the Report of the Hospital Committee? I think so, certainly.
3028. Do you think it is desirable or wise that cases "other than accident or urgent cases" should be treated there? I have already expressed an opinion upon that matter. I observe that you have a copy of the Hospital Report in your hand; and perhaps I may be permitted to say that I have spoken to the Secretary about the use of that expression "other than accident or urgent cases." It is a very misleading expression which will be omitted from the Report for this year. What is meant by the expression "accident and urgent cases" is, as is shown further on in the Report, accident and urgent cases admitted without orders from the Government or from subscribers—cases which present themselves at the door, and are taken in simply on account of their urgency. Many of the urgent and accident cases come armed with an order from subscribers, or armed with orders from the Government. They are just as urgent as the other cases, but they are not put down in that list. It has always been the habit of the Hospital Committee to put down as urgent and accident cases only cases which have not been paid for by anybody.
3029. In your opinion is the proposed and partially constructed building too near Macquarie-street? I think not.
3030. Do you anticipate that the very large amount of traffic in the street will have an injurious effect upon the patients? I do not think that it is at all likely that any injurious effect can be produced in that way.
3031. If you had an opportunity of setting out that building yourself on that particular site, would you place it farther back from the street? I should not.
3032. You approve of the distance it is from the road? I do.
3033. Do you anticipate any great danger to human life from the inflammable character of the present wooden hospital? I certainly think there would be very great danger to life if the building caught fire. I certainly think there is a risk to the patients. Although every precaution is taken to prevent the occurrence of a fire, yet a fire is not an impossible thing there.
3034. With an intimate knowledge of the whole of that site, do you think that the building could be placed further back with advantage, (say) 50 feet further back than it is? I think it would very seriously curtail the amount of space available for hospital work.
3035. You would not recommend, therefore, that the building should be put back any further than it is? No.
3036. *Mr. Cox.*] You say that 95 per cent. of the cases in 1889 were really urgent and emergency cases;—who is responsible for the admission of the other 5 per cent.? I am responsible for their admission.
3037. How do you account for the admission of so many cases which are neither urgent nor emergency cases? It is highly difficult to exclude some cases which may not be actually urgent. It is not easy, and sometimes not possible, to draw a line between urgency and non-urgency. Cases sometimes are admitted for a night or two where a small operation is desirable. There is always a certain small percentage of cases of that nature admitted to every hospital.
3038. Five per cent. means 170 patients a year;—might not some of these emergency cases be treated outside

W. Hull,  
Esq., M.D.  
8 Mar., 1891.

outside—might not some of the persons be sent to their homes and treated there? It is always a matter of what one is able to do. For instance, one might admit a man who comes there insensible from a blow on the head, and from drink. If there is no bed in the hospital he must, of course, be taken to his own home, and he might have nothing the matter with him; but, on the other hand, he might have a fractured skull, and it is highly desirable, therefore, that he should be detained in the hospital. If there is no accommodation one has no alternative but to send him home, and let him run the risk. There are a large number of cases of that nature admitted to every hospital, and it requires great judgment not to take in cases unnecessarily, and, on the other hand, not to send away those who ought to be admitted.

3039. You spoke just now of admitting dyspeptic patients—surely they do not require beds? Many of these cases are very urgent. Some persons who suffer from acute dyspepsia and gastritis diseases, which run into one another, die within a short time of coming into the hospital; others get better and go out. It is impossible to draw strictly a line between cases of dyspepsia, such as we admit, and cases of a more grave nature.

3040. Is it necessary to treat all ophthalmic cases in the hospital? No; such cases are included in the table which I read. They are treated at Miller's Point Hospital.

3041. There is no necessity to give them beds then? Not so far as their urgency is concerned. With the exception of quite a trivial number in the general hospital, they are very well provided for at present at the Miller's Point Hospital.

3042. Are cases of lesser importance, such as broken arms and legs, treated in the hospital and provided with beds? There were 200 cases of fractures of elbow and other fractures in the out-patient department last year. In 1889 there were twenty-seven cases of dislocation of shoulder; they were treated largely as out-patients.

3043. Do you provide beds in any case for small fractures of that kind? We find no beds for patients unless we consider it would endanger their welfare to send them away.

3044. *Mr. Trickett.*] Is it your idea that this should be a large general hospital, and not an urgency one? My view is, that the Sydney Hospital should be a hospital of about 260 beds—that the number of emergency cases presenting themselves to the hospital are so numerous that the number of beds available is insufficient to meet absolute requirements for that class of cases.

3045. You say that all these beds will be required for emergency cases? Quite so.

3046. According to your evidence, the larger proportion of cases are medical cases? There are more medical than surgical cases.

3047. Could not these cases be well treated at suburban hospitals, such as the Prince Alfred Hospital? I think not.

3048. Why not? Because they are of too urgent a nature. Most of the medical cases are more urgent, with regard to the desirability of getting them quickly into hospital, than are most of the surgical cases. Take, for instance, such cases as typhoid fever. Last year there were about twelve or fourteen deaths from typhoid fever within a few days of their admission—that shows the great urgency of the cases, and how bad the patients are when they come. No doubt some of the other cases, if they had not been brought to the hospital which was closest, would have died. I consider it is much more important to take a case of bad pneumonia or typhoid fever, and many other diseases, to a hospital quickly, than it is to take a man with a broken leg, although it is highly desirable that both cases should be treated quickly. Still, if one has to choose between the two cases, one must give the preference to the case of pneumonia. In one case a patient is simply inconvenienced and put to pain by having to travel a longer distance, while in the other case a patient would probably be killed by the longer transit.

3049. Is it desirable to have typhoid fever patients treated right in the heart of the city? It is absolutely necessary, unless the patients are to die in transit. I may say that there is no chance of infection or anything of that kind likely to arise from the treatment of such patients in the city.

3050. Has not the treatment of typhoid fever patients been very successful at the Little Bay Hospital? I believe it has.

3051. Is that too far to take typhoid patients in a severe stage? I am in a position to state that no cases of a severe type are ever taken down there.

3052. For what reason? Because it involves a risk to the patients.

3053. What inquiry is made as to the ability of patients to pay for their treatment at the Sydney Hospital? Every applicant for admission is questioned as to his circumstances, and if, upon due inquiry, it is considered that he is in a position to contribute towards his maintenance, he is compelled to contribute, so far as we can compel him. Of course, if a patient comes to the hospital in a seriously low condition, we do not wait to get the money from him before we admit him. We admit him, and trust to his honor to give us the money when he can. But in many cases, unfortunately, they do not do so.

3054. Do you think the Sydney Hospital is subjected to much abuse in that direction? I think it is subjected to very little abuse indeed.

3055. According to the plan submitted to the Committee, some ophthalmic wards are provided for;—is it desirable to treat ophthalmic patients in large wards? It is not a desirable way of treating the majority of ophthalmic cases, such as we treat in this hospital. But I may point out, with regard to the inscription on the plan, that the wards will be just as suitable for treating surgical or medical cases as they will be for treating ophthalmic cases.

3056. Do you think it is desirable that ophthalmic cases should be treated in a hospital of this character? I do not think there is room to treat them at the present moment at the Sydney Hospital.

3057. If there were room there, would it be a good thing to have cases of that kind there? I think it would not be a disadvantage to do so.

3058. If proper accommodation were provided? Quite so.

3059. For the treatment of ophthalmic cases, is it not desirable to have a suite of rooms where different degrees of light can be obtained? For certain cases it is.

3060. There does not seem to be any provision of that kind made according to the plan? There is no provision made. As a matter of fact, if the ophthalmic cases treated at the Miller's Point branch were treated at that hospital it would be necessary to provide at least fifty more beds.

3061. Therefore, those letters inscribed on the plan are deceiving? Quite so. The plans were prepared over ten years ago, and the requirements of the city no doubt have increased very largely in the interval. The city and the suburbs contain 150,000 more persons than they did ten years ago, and there is no doubt that the strain on hospital accommodation in Sydney is much larger now than it was ten years ago. It is much larger than it was five years ago.

3062. Do you think it is also desirable to treat Lock cases in a general hospital? I think it is absolutely necessary to treat a certain number of them in a general hospital.
3063. Would it not be better to have a more retired place for a Lock hospital than this site affords? It might be if it were considered necessary to provide for a large number of Lock patients.
3064. Is that particular ward overcrowded at present? No. In one or two cases only have I found any difficulty in accommodating all the Lock patients who present themselves and require indoor treatment. I have been put to a little difficulty to provide for a case now and then, but, as a general rule, we have about sufficient accommodation for the Lock patients that we have to provide for.
3065. We have had some evidence that these foundations can be removed, and that another hospital of a purely modern character can be provided, giving the same accommodation as is proposed in these plans, for the same money. Do you think it is desirable to raise the foundations and build a new hospital? I certainly think it would be undesirable from my point of view. The question requires to be dealt with at once. The thing has gone on so long that there will be great scandal if proper accommodation is not very soon provided for the patients. I consider that the thing has gone on so long that it is really impossible to go on much longer without scandal arising. I think it would be highly undesirable, therefore, to delay the work. I think that the present hospital, as projected, is a very good one indeed. I do not see that there is any need for altering it at all.
3066. *Mr. Lee.*] Have you given the question of cost any consideration? The cost I have considered, but I would rather not give evidence on that subject, because I do not consider that I am qualified to do so.
3067. Are you of opinion that the hospital should be completed at a cost of £750 per bed? I am aware of the fact that many hospitals in other parts of the world, in England for instance, have cost as much or more. I am also aware that the expenses of hospital building are very great—probably greater here than in England.
3068. Can you cite any instance where the cost has equalled the proposed cost of the Sydney Hospital? I believe the cost of building St. Thomas' Hospital in London was quite equal to the proposed cost of the Sydney Hospital?
3069. Have you been connected with any hospitals in the old country? I was a student of St. Thomas' Hospital, and I lived in that hospital as resident medical officer in various capacities for three years.
3070. It is built on the pavilion plan? Yes.
3071. Somewhat similar to the plan of the Sydney Hospital? Very similar to this plan.
3072. Has it attained the highest percentage of results? It has always been noted for obtaining very good results. It has always been a surgical hospital; more beds are set apart for surgical cases than for any other cases.
3073. I suppose you are aware that the portion of the second story which has been erected has cost £68,000, and that the Government have already contributed £45,000 towards the work;—are you of opinion that the hospital should be carried out in its entirety even at a cost of £100,000? I am not considering the cost at all.
3074. You prefer not to touch on that point? I do not feel qualified to do so.
3075. You are aware that even if it is completed the accommodation will amount to 200 beds? Yes; that is to say, the portion already commenced, if completed according to the original plan, and excluding the accommodation in the south wing.
3076. *Mr. O'Sullivan.*] Has there not been for some time past a feeling of rivalry between the Sydney Hospital and the Prince Alfred Hospital as to which should have the grandest and completest establishment? I have never seen or heard of any evidence pointing to that.
3077. Supposing it has been admitted here by a witness competent to speak on the subject, do you think there is any truth in the statement? I really do not know, I do not know anything one way or the other. As far as my acquaintance goes with the Directors on the Board of the Sydney Hospital, they have never expressed, during my residence there, any feeling at all either antagonistic to, or in rivalry of, the other institution. That is all I can state on that point.

W. Hull,  
Esq., M.D.  
3 Mar., 1891.

## PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## Hospital Buildings, Macquarie-street.

## APPENDIX.

## A.

## PRECIS OF PAPERS RELATING TO THE SYDNEY HOSPITAL.

- August, 1883. On the 9th October, 1883, papers were laid before Parliament in connection with Sydney Hospital accommodation and position. These comprised a minute by Sir Alexander Stuart in reference to the request of the hospital for a further grant of £50,000, and giving reasons for his opinion that "it would be better to cease further aid to the erection of the Sydney Hospital, and that Government should resume it and expend its present value in completing the Prince Alfred, and in proceeding with some of the other hospitals alluded to." Opinions on the general question were then obtained from Drs. MacLaurin, Mackellar (President of the Board of Health and Medical Adviser to the Government), J. C. Cox, Sir Alfred Roberts, and George Fortescue, M.B., and attached to the papers was a block plan for Sanatorium at Little Bay.
- 10 September, 1883. The Principal Under Secretary, by direction of the Colonial Secretary, then wrote to the Board of Directors informing them that Cabinet had decided not to advise the granting of any more money for the building now in progress, but offering—should they decide to abandon the project—to entertain the resumption of ground and buildings, and to expend the value thereof in other hospital accommodation, as the needs of Sydney or the colony required.
- 17th November, 1884. The Superintendent of Metropolitan Fire Brigades reported on the condition of the buildings at present used. On November 17th, 1884, he wrote to the effect that the female wards were held to be substantial, and almost free from external risk of fire. The male wards, however, as regarded protection from fire, were most dangerous. Although supplied with plenty of hydrants, these would be useless, on account of the short lengths of the hose, if fire broke out in the lavatories, theatre, or more remote parts of the buildings.
- 16th November, 1885. A minute dated 2nd September, 1885, was written by the Colonial Secretary (Sir Alexander Stuart) on the position of Government with respect to the hospitals and the maintenance of patients therein. This dealt especially with the alleged inadequacy of the Government contributions and suggested a plan for a basis of operations:—(1) That a general Hospital Board be formed; (2) The completion of Prince Alfred Hospital Buildings; (3) That the Sydney Hospital Committee should sell to Government at a valuation their present site and buildings. The minute also dealt at length with other matters connected with hospitals other than the Sydney Hospital.
- The Medical Adviser to the Government in his report on the above minute gives his views on the whole question, with especial reference to the maintenance of Government patients. He was of opinion, after consideration of the *pros* and *cons*, that the buildings should be completed, to contain 140 beds at a cost of £50,000; and that a sum of £5,000 should be expended on the Prince Alfred Hospital to complete the present design, providing an accommodation of 204 beds. He also reported that it was absolutely necessary that hospitals should be established for the especial treatment of contagious diseases.
- On the 9th April and 2nd September, 1885, the Secretary of the Sydney Hospital wrote asking that the Government would pay the overdraft of £10,000 which had been incurred in connection with the hospital, and for which certain members of the Hospital Board had made themselves personally liable. The Colonial Secretary replied that he would be glad to confer with the President, but that no payment could be made without the consent of Parliament. The Sydney Hospital authorities on the 11th February, and again on the 15th March, 1886, requested the Colonial Secretary to receive a deputation asking that a sum of money be placed upon the Estimates for the purpose of finishing the Hospital Buildings; and on Easter Monday of the same year Sir Alfred Stephen wrote advocating the conversion of the unfinished structure into Houses of Parliament.
- On the 14th August, 1886, the Secretary of the Sydney Hospital again wrote to the Colonial Secretary on the subject of the overdraft, requesting that the amount of £14,307 8s. 10d., then due to the Bank of New South Wales, might be liquidated by the Government, as the Board of Directors were being charged 8 per cent. interest for the same; he further drew attention to the fact that previous Governments had promised to pay it off, and that since the meeting of the Board they had been further embarrassed by a demand from their architect for the payment of £1,000 due to him as commission.
- On the 4th November, 1886, the Secretary wrote asking for a reply to the above letter, and on the same date for the favour of a deputation re completion of Buildings.
- A report was received on the 1st December, 1886, from the Superintendent of Metropolitan Fire Brigades, relating to a slight accident which had occurred at the Sydney Hospital, and which might have been of a most serious character, by a great part of the ceiling in north end lavatory of G ward falling, thereby breaking a gas bracket, allowing the gas to ignite between the lining boards of the lavatory and the ward itself. He recommended that steps should be at once taken to have the structure removed, as, if a fire once got a firm hold, nothing could prevent its destruction in fifteen minutes.
- The Principal Under Secretary then forwarded this report to the Secretary, Sydney Hospital, pointing out the urgent necessity for a remedy being taken to avert such a catastrophe.
- On the 2nd December the Secretary of the Sydney Hospital acknowledged the receipt of the report, and asked for a postponement of the deputation, which had been arranged for Friday, the 3rd instant, in order to consider the request and prepare suggestions. The deputation was received on the 10th December, when the Colonial Secretary was requested to place an additional £50,000 on the Estimates for the completion of the hospital, together with the sum of £10,000 for which the Directors had become responsible with the Bank of New South Wales.
- The question of accommodation was gone into fully, and Mr. Dibbs informed them that he would think the matter over in consultation with Dr. Renwick, and, if possible, submit to the Cabinet their joint proposal for the future hospital.
- After the next meeting of the Sydney Hospital Board the secretary wrote for the information of the Colonial Secretary, that the Directors desired, before considering the question of the removal of patients, to ascertain the intentions of the Government as to placing a sum of money on the Estimates to complete the hospital. The Colonial Secretary replied that he must decline to discuss the question of further progress until the removal of the patients from the impending danger; he viewed the letter from the Board as a distinct refusal to move in the matter, he had therefore directed the Health Officer to cause an inspection to be made of each of the inmates in the temporary building, so that the Government patients might be removed forthwith, and the Medical Adviser to the Government was requested to furnish an opinion and report as to the most suitable place for the removal to, of the patients in the temporary structure, and, on receipt of above report, prompt action would be taken.
- On receipt of this letter the Board of Directors met, the result being that it was discovered that a serious omission had been made in not forwarding to the Colonial Secretary a copy of the resolutions passed on the 20th December, which they feared might have misled the Colonial Secretary as to their real intentions, and asked for a reconsideration of the matter.
- 12th January, 1887. A change of Ministry having in the meantime occurred, Mr. Dibbs on leaving office left on record a minute containing certain recommendations with regard to the prevention of fire at the Sydney Hospital, emphasising the great danger to patients in the present structure, and suggested that the matter should be dealt with before the meeting of Parliament,

## APPENDIX.

Parliament, or, at least, before the Estimates for 1887 were submitted. He further pointed out that the whole of the Government patients had been removed, but that there were still a large number of ordinary patients in the building exposed to wholesale destruction in the event of fire. A copy of this minute was forwarded to the Board of Directors.

The next communication from the Directors was dated 4th March, 1887, reiterating their former request for a sum of money to be placed on the Estimates to complete the buildings and pay off the overdraft, and asking for a deputation on the subject. 14th January, 1887

Before receiving them the Colonial Secretary asked for details as to the amount already expended, and the number of patients provided for by plans.

Full details were accordingly supplied on the 15th March, showing that the total amount expended to date was £68,218 1s. 3d., of which £45,000 was contributed by the Government, and £23,218 1s. 3d. from the Hospital Funds, and that to complete the buildings according to the original plan providing for 270 beds would require £216,000, and suggesting that a smaller scale of hospital might be completed at a cost of £50,000. Appended to this letter was an estimate by their architect as to probable cost of alternative plans for completion of buildings.

The Colonial Secretary, Sir Henry Parkes, received the Board of Directors on the 18th March, 1887, and informed them that he was in favour of continuing the buildings, and that he would lay the matter before his colleagues as early as possible.

Another deputation took place on the 16th November, 1887, but nothing definite was arrived at.

On 14th April, 1888, the Government Medical Officer drew the attention of the Medical Adviser to the Government to the great dearth of beds in the Metropolitan and Coast Hospitals, and asked for assistance in devising some means for further hospital accommodation. The Medical Adviser then wrote to the Directors of the Sydney and Prince Alfred Hospitals on the above subject, and received in reply from the former, a letter, stating that they could see no way to assist the sick poor, unless the Government would provide house accommodation, or premises adjacent to the hospital, in which case their honorary medical staff would freely give their services.

The Directors of Prince Alfred Hospital suggested that suitable tents should be erected in their grounds as a temporary means of relief, until permanent buildings could be put up, and in the absence of any Government scheme for a separate Lock hospital, a weatherboard building should be provided in the grounds. They further pointed out that three additional pavilions, contemplated in the original design, which would accommodate 240 more patients, could be at once proceeded with.

On these questions the Medical Adviser to the Government reported adversely, and advised that the building of the Randwick Asylum should be used for the purpose, by which 350 beds would, in a very short time, be added to the accommodation available for the sick poor. 5th June, 1888.

About January, 1889, the Medical Adviser to the Government (Dr. MacLaurin) was requested by the Colonial Secretary to report upon what action had been taken with reference to the wooden building attached to the Sydney Hospital. He reported that it was still used for the reception of male patients, and concurred in the opinion of the Superintendent of Metropolitan Fire Brigades as to the great danger of fire, and its unsuitability for the reception of patients. He suggested that the Board of Directors should be requested to offer any suggestion they might think proper as to the best means for immediately removing the patients from that dangerous building.

Another report, on verbal instructions from the Colonial Secretary, was, on the 15th April, furnished by Dr. F. Norton Manning, who had succeeded Dr. MacLaurin as Medical Adviser to the Government, stating that a hospital in a central position in Sydney was an absolute necessity for the treatment of accidents, &c.; also, that he considered the present site was a healthy one, and well suited to the treatment of accidents and acute diseases; that although other sites might be found, none possessed its advantages, and although somewhat limited in area and not large enough for the General Hospital originally planned, it was sufficient for accidents and acute diseases.

## B.

## SYDNEY HOSPITAL BUILDINGS.

(PARTICULARS RESPECTING.)

*Ordered by the Legislative Assembly to be printed, 3 December, 1890.*

## SYDNEY HOSPITAL BUILDINGS.

Portions completed and partly erected.

THE portions of the buildings completed are—Kitchen premises, also laundry and engine department.

The kitchen premises consist of kitchen, pantries, scullery, servants' hall, servants' bedrooms, &amp;c.

Portions completed.

The laundry and engine department comprises laundry, linen-rooms, drying-room, engine-room, boiler-room, engineers' and carpenters' shops. A portion of the building is used as a mortuary.

The portions of the buildings partly erected, viz., to the height of two storeys from the ground level, are the north, south, and east pavilions, also the centre administrative building. Portions partly erected.

The outlay on the above works has amounted to £68,923 7s. 8d., as follows:—

Outlay.

<i>Outlay.</i>		£	s.	d.
Excavation.....		2,194	15	0
Kitchen premises—	£ s. d.			
Mason work .....	4,346 14 6			
Finishing trades .....	2,404 19 4			
Gas-fitting.....	41 10 0			
	6,793 3 10			
Laundry and engine department .....	5,731 16 7			
North, south, and east pavilions, also centre administrative building—				
1st contract—Raising walls one storey from ground .....	25,642 9 6			
2nd contract for same—Building walls two storeys from ground (present stage of buildings) .....	23,701 6 3			
Sundries .....	463 16 6			
Clerk of Works' salary .....	1,170 0 0			
Architect's commission .....	3,226 0 0			
	68,923 7 8			

Completion of buildings (partly erected) according to original plans, in stone walls.

*Approximate Estimate.*

North, south, and east pavilions, also the centre administrative building—four storeys high in pavilions, and five storeys in height for administrative building—providing accommodation for 200 beds .....

£50,000

200 beds.

or £744 per bed.

Completion of buildings (partly erected) one storey less in height than indicated upon original plans, in stone walls.

*Approximate Estimate.*

North, south, and east pavilions, also the centre administrative building—three storeys high in pavilions, and four storeys in height for administrative building—providing accommodation for 144 beds.....

£56,000

144 beds

or £360 per bed.

*Note.*—The foundations and substructure having been prepared for the massive walls arranged upon the original plans it would be undesirable to reduce the buildings by one storey of their intended height. The buildings covering, as they do, a very large area of ground, the height, as designed, is necessary to be built to prevent the whole looking squat, as there would be a chance of them appearing, if curtailed in height. Completion

Completion of the whole of the buildings in stone walls according to original plans.

The buildings are eleven in number, and comprise the following :—

Administrative Block.  
North Medical Ward.  
South Medical Ward.  
Surgical Ward.  
Eastern Ward.  
Infectious Ward.  
Mortuary and Pathological Museum.  
Chapel: Operating-room and Lecture Theatre.  
Kitchen premises.  
Laundry and Engine premises.  
Stores.

264 beds. *Approximate Estimate.*  
To complete the whole of the above, providing accommodation for 264 beds... £140,000  
or less than £500 per bed.

Completion of buildings (partly erected) in brick walls, and cemented.

*Note.*—It is very undesirable to change the material already adopted, stone being preferable in every respect. The character of the buildings would be very much lessened, being brought down to the level of the commonest street architecture by the introduction of brick and cemented walls. Double-pressed bricks would be the only permissible alternative material from stone, but their cost, with stone dressings, would amount to about the same price as stone.

200 beds. *Approximate Estimate.*  
North, south, and east pavilions, also the centre administrative building—four storeys high in pavilions, and five storeys in height for administrative building—providing accommodation for 200 beds ..... £65,000  
or £670 per bed.

Completion of buildings (partly erected) one storey less in height than indicated upon original plan, in brick walls and cemented.

144 beds. *Approximate Estimate.*  
North, south, and east pavilions, also the centre administrative building—three storeys high in pavilions and four storeys in height for administrative building—providing accommodation for 144 beds ..... £45,000  
or £300 per bed.

Completion of the whole of the buildings in brick walls and cemented.

The buildings are eleven in number, as described above.

264 beds. *Approximate Estimate.*  
To complete the whole of the above—providing accommodation for 264 beds ..... £105,000  
or about £660 per bed.

The original conditions of competition required buildings to cost £45,000, which was an utter impossibility to provide, unless being built in a fragile manner of slight brickwork.

After the competition was decided the present old southern wing caused a serious difficulty in the arrangement of the new pavilions. It was therefore decided to eventually demolish it, and the accommodation of same to be provided in new structures in the form of the letter T. This, together with the decision to build of stone, increased the expense of the buildings. The whole scheme was made further perfect from constant consultation with the Board and medical men.

Granted that £50,000 per annum was expended for three years, the whole of the works would be completed, leaving a noble monument, perfect in its arrangement and construction, which would reflect credit and honor upon Sydney and the colony for generations to come.

Vickery's Chambers, Pitt-street,  
3rd December, 1890.

THOMAS ROWE,  
Architect.

### C.

[To Evidence of Critchett Walker, Esq.]

GOVERNMENT CONTRIBUTIONS TO SYDNEY HOSPITAL FOR BUILDING PURPOSES.

Dear Sir,

I forward herewith the information, as promised to your Committee by me when giving evidence with reference to the Sydney Hospital. 4 February, 1891.

Yours, &c.,

CRITCHETT WALKER,  
Principal Under Secretary.

The Secretary, Parliamentary Standing Committee on Public Works.

Question 12.—Of the £68,923 7s. 8d. spent upon the buildings the Government has contributed £45,000, the balance, £23,923 7s. 8d., being paid by the Hospital authorities.

Questions 13 and 14.—The amount contributed by the Government for building purposes only is £45,000, made up of two instalments of £12,500 each, and one of £20,000.

Question 16.—These papers are now in the possession of Mr. Lyne, Secretary, Works Committee.

Questions 17, 18, 19. Do do do

### D.

[To Evidence of Sydney Burdekin, Esq., M.P.]

PATIENTS ADMITTED INTO SYDNEY HOSPITAL DURING 1889 AND 1890.

WITH insignificant exceptions the cases admitted into the Sydney Hospital were all urgent ones, as the following statistics will show :—During 1889 there were 3,296 cases under treatment. Of these cases 1,293 were urgent and accident cases admitted without orders from Government or subscribers. It is not implied by this statement that the other cases were not urgent; in fact these cases were, on the whole, as urgent as those admitted without orders—as on account of the great pressure cases have to be carefully selected according to their urgency. The medical cases under treatment were 1,368, of whom 200 died, a mortality of nearly 15 per cent. The surgical cases amounted to 1,193, of whom 76 or 6½ per cent. died. The gynaecological cases numbered 141, of whom 7 died, a mortality of 5 per cent. Lock and ophthalmic cases were 586, with no mortality.

In 1890 there were 3,416 cases under treatment, of whom 3,177 were admitted during the year. 1,349 of these cases were admitted as accidents and urgent cases without orders from Government or subscribers. The cases treated may be classified as follows :—Medical, 1,485, with a mortality of 251, or 17·7 per cent.; surgical, 1,251, with a mortality of 6·5 per cent.; diseases of women, 168, with a mortality of 7, or 4·1 per cent.; Lock and ophthalmic cases, 439, with no mortality.

In 1889 the average number of occupied beds was 236, and the largest number in occupation at any one time during that year was 264. The average duration of stay was 27 days.

In 1890 the average number of occupied beds was 240, and the largest number of beds occupied at any one time was 271. The average duration of stay was 25 days.

[To Evidence of H. D. Russell, Esq.]

COPY OF MINUTES OF HOSPITAL BOARD.

MR. H. D. RUSSELL, Secretary to the Board of Directors of the Sydney Hospital, when under examination by the Committee, respecting the Hospital Buildings, promised to endeavour to obtain for them a letter from a builder which he believed accompanied the plans of Mr. Thomas Rowe, certifying that the building represented by the plans could be erected for £45,000. He afterwards informed the Secretary of the Committee that this letter could not be found, and he forwarded the following letter, together with a copy of all the minutes connected with meetings of the Hospital Board, relating to the subject of the plans for the new hospital.

Sir,

I forward herewith copies of all Board minutes bearing upon the adoption of the plans of the new hospital. You will observe that the present accepted plan is not the original one which gained the premium. The amended plan combined some of the best features of the three first prize plans, together with those of "Health" (Mr. Kirkpatrick's plan).

You will observe that Mr. Rowe had promised to give the Directors the estimated cost of the new plan, but he never did, and the plan was sent to the Government for approval without it.

The builder's certificate (which was attached to every competitive design) was never left at this office; it went away with the original plan when it was taken away by Mr. Rowe for alteration; and the alternative plans subsequently exhibited did not possess the "builder's certificate of cost."

Sydney Hospital, 28 January, 1891.

I remain, &amp;c.,

H. D. RUSSELL,

Secretary.

To the Secretary, Parliamentary Standing Committee on Public Works.

## EXTRACTS from Monthly Board Minute Book in reference to Plans of new Hospital.

A letter was received from the secretary of the Honorary Medical Staff, stating that the most suitable of the plans selected by the Sub-committee for the permanent building are "Specs," "I Bide," and "Bono Operi," and that the plan bearing the motto "Health," is worthy of reconsideration, being approved by some of the members of the staff.—Referred to the Temporary and Permanent Building Committee. 1st April, 1879. Monthly meeting.

A letter was read from the Honorary Consulting and Honorary Medical and Surgical Officers of the Institution, stating that a meeting of the staff had been held, Dr. Renwick in the chair. Drs. P. Sydney Jones, Cox, Morgan, O'Rielly, Belgrave, Dixon, and West were present, and it was resolved, on the motion of Dr. Cox, seconded by Dr. P. Sydney Jones, that the present site of the Sydney Infirmary is an excellent one, and well adapted for the erection of a city hospital. 7th April, 1879. Adjourned meeting.

A letter was also read, signed by Drs. McKay and Quaise, notifying their concurrence with the above resolution.

It was moved that this Board do proceed to the selection of three designs by ballot, and then proceed to arrange (by ballot) the plans in order of merit. 8th April, 1879. Special Board meeting.

Moved, as an amendment, that the recommendation of the Honorary Medical Staff and the Sub-committee, as to the three most suitable plans, be adopted.

The amendment was carried and a ballot was taken with the following result (Messrs. Senior and Clarke having been appointed scrutineers):—"Bono Operi," 15 votes; "I Bide," 4 votes; "Specs," 2 votes. The result of a second ballot to decide as to the second and third premiums was as follows:—"I Bide," 12 votes; "Specs," 8 votes.

A letter was read from the Honorary Medical Staff, recommending that the pavilions of the proposed new hospital should run from east to west, and that the south wing be removed as incongruous in appearance to the new structure, and recommending the basement plans of "I Bide" and "Specs" as most suitable, and condemning that of "Bono Operi," and objecting to any drainage system that is brought under the buildings. 1st July, 1879. Monthly meeting.

The Permanent Structure Committee reported progress, and stated it was recommended that the remuneration of the architect should be at the rate of 5 per cent, and that the representatives of the Honorary Medical Staff should be added to the Committee. 5th August, 1879. Monthly meeting.

The Board proceeded to the election of an architect. Messrs. Benjamin Backhouse and Thomas Rowe were nominated, and a ballot was taken which resulted in favour of Mr. Thomas Rowe by two votes.

After some discussion as to the amount of the remuneration to be paid to the architect, it was resolved to leave the settlement of the question in the hands of the Permanent Structure Committee.

The Permanent Structure Committee reported they had agreed to recommend that the architect's rate of remuneration should be 5 per cent. That Mr. Rowe had been instructed to prepare:— 2nd Sept., 1879. Monthly Meeting.

(1.) Alternate plans of a hospital; one showing the south wing standing, the other with the south wing cleared away.

(2.) That all pavilion wards shall run from east to west.

(3.) That as far as possible the basement plan of "Specs" to be adopted—not insisting, however, that the basement should be completely out of the ground.

(4.) That the proposed new buildings shall be of two stories only as far as wards are concerned.

(5.) That provision be made for from 200 to 250 beds, on condition that 100 square feet or 1,500 feet (cubic) be provided for each patient.

(6.) That all wards shall be 50 feet from the street, and not less than 25 feet from the Domain wall. (This does not apply to the administrative block.)

Resolved, that the report of the Permanent Structure Committee be adopted.

The President reported that the architect had been instructed to draw up as far as possible from the premium plans a suitable design for a new hospital, that he had done so, and that after several consultations with the Permanent Structure Committee and the Medical Staff, the designs now laid on the table had met with unanimous approval. 23rd Sept., 1879. Special Meeting.

A letter was read from the secretary of the Honorary Medical Staff, conveying a copy of the following resolution, passed by them at a meeting held on 19th instant, viz.:—"That the new plans submitted by Mr. Rowe met with the general approval of the Honorary Medical Staff."

The architect produced and explained the plan to the Board.

It was moved, "That the plans now submitted be adopted, and that the Board directs them to be referred to the Government for approval."

It was moved as an amendment, "That this meeting adjourns to this day week, and that the plans in the meantime be exhibited in the Board room."

The amendment was carried, and the Secretary was instructed to allow only the Directors to examine the plans.

It was resolved, "That this Board adopts the plans now submitted, and directs them to be referred to the Government for approval." Adjourned meeting, 30th September, 1879.

It was resolved, "That in the opinion of this Board, the main portions of the new hospital should be built of stone."

The architect stated that as soon as he has completed the plans to submit to Government he will be in a position to give an estimate of the cost of the building.

The President reported that the architect had prepared the plans for the new hospital, which are now on view in the Board room, and recommended for the approval and adoption of the Board, subject to the further consideration of the Honorary Medical Staff. The Permanent Structure Committee further recommended that the architect be instructed to call for tenders for the erection of the new kitchen as early as possible. These recommendations were adopted. Monthly meeting, 3rd February, 1880.

The President reported that the new plans of the hospital building have been examined by the Honorary Medical Staff and approved, that plans of a new kitchen (as authorised) have been prepared, and are now under the consideration of the Medical Staff. Monthly meeting, 2nd March, 1880.

It was reported that the following tenders for the erection of a new kitchen had been accepted, viz., Mr. Gawthorpe for masonry and brickwork, £4,100; Messrs. Bynall and Clarke for finishing trades, £2,164; and that a period of eight months was allowed for the erection. The report was adopted. Monthly meeting, 6th April, 1880.

The President reported that the plans of the proposed new structure, which have been approved by the Honorary Medical Staff and the Directors, had been forwarded to the Colonial Secretary. Monthly meeting, 6th July, 1880.

[To Evidence of Hon. C. K. Mackellar, M.L.C.]

## NECESSITY FOR ESTABLISHMENT OF A LOCK HOSPITAL IN SYDNEY.

Sydney, 30 January, 1883.

Sir, As to Necessity for Establishment of a Lock Hospital in Sydney.  
In accordance with your desire that I should express my opinion as to the necessity for the establishment of Lock Hospitals in this city, I have the honor to forward to you herewith an epitome of my views thereon.

I have, &amp;c.,

CHARLES K. MACKELLAR, M.B.,  
Medical Adviser to the Government.

The Hon. the Colonial Secretary.

[Enclosure.]

## LOCK HOSPITALS.

THE fact that venereal disease exists to an alarming extent in all classes of this community no one can doubt, nor is there any question that the hospital accommodation at present available for its treatment entirely fails to exert any marked influence in lessening the number of those affected; this failure is due to a variety of causes, but I believe that it is chiefly owing to the exceedingly scanty accommodation afforded by the hospitals of this city for the treatment of such ailments.

I have the authority of Mr. Fosbery, the Inspector-General of Police, for saying that there are about three hundred (300) women in Sydney who live wholly by prostitution, and I think that I may safely estimate the number of those who occasionally supplement their earnings by the same mode of life at fully double the number, so that we have a grand total of nine hundred (900) women very likely to acquire and disseminate the disease.

One of the secretaries of the "Association for promoting the Extension of the Contagious Disease Act, 1886, to the civil population of the United Kingdom," says that the proportion of diseased to healthy prostitutes in London is one in three, whilst Mr. Simon, F.R.C.S., the late Medical Adviser to the Privy Council, in a recent paper upon prostitution deemed the proportion of diseased women to be one in six; if we adopt the latter estimate we have one hundred and fifty (150) women constantly affected, while for their treatment at the present time there are in the Sydney Hospital only 10 beds available, and none at either the Prince Alfred or St. Vincent's Hospitals.

The Secretary of the Sydney Hospital informs me that "the female Lock ward is always full, and that females are frequently treated as out-patients both for gonorrhœa and syphilis, whilst males with gonorrhœa are as a rule not admitted to the hospital, but treated as dispensary patients."

It is clear therefore that a very much larger accommodation for the treatment of the disease is absolutely necessary; but in my opinion merely increasing the number of female Lock beds in the general hospitals would not meet the difficulty, as those institutions afford no special facilities for the treatment of these cases, and, further, a considerable amount of publicity, which is very much objected to by such persons, is unavoidable in their treatment in a general hospital. Under these circumstances it is not surprising that both syphilis and gonorrhœa are rapidly disseminated throughout the community.

It is in vain to expect that a woman of the town will at once desist from prostitution on being infected with venereal disease; she is usually totally destitute of means wherewith to pay for her maintenance and treatment whilst ill, and as a natural consequence continues to practice her calling very much to the detriment of her own health, and with destructive results to the general community.

I have given much careful and anxious consideration to this subject, and am forced to the conclusion that State interference in some way is absolutely necessary, either by police supervision and medical inspection, which, however, is objected to by a large portion of the community, on both moral, constitutional, and even medical grounds; or the establishment of Lock hospitals where diseased women could readily, without charge, and with a reasonable amount of privacy, obtain the most skilful treatment.

I desire to give my emphatic opinion that the latter course is in every way the most desirable.

I would recommend that a special institution, wholly under Government supervision, should be opened for the treatment of females suffering from venereal disease; that in it every facility should be offered for the ready and skilful treatment of such disorders; and although I fully recognise the difficulty likely to be encountered in administering such an institution, I would, nevertheless, recommend that it should be on the voluntary principle, *i.e.*, that the inmates should be free from police supervision, and subject only to the regulations under which all public hospitals are governed.

Institutions of the kind suggested have been created in some districts of the United Kingdom, notably in Glasgow, where their establishment has been attended with a large amount of good.

As regards the treatment of the male portion of the community, I think that the present arrangements in the general hospitals are quite adequate, and that all that is required is that a large number of beds should be allotted to venereal disease. I do not think that any good result would follow their treatment in a special institution.

CHARLES K. MACKELLAR, M.B.,

Medical Adviser to the Government.

Sydney, 27 January, 1883.

## F 1.

## DESIRABLENESS OF ESTABLISHING A LOCK HOSPITAL IN SYDNEY.

Minute by the Colonial Secretary.

IN a debate last session upon the second reading of the Contagious Diseases Bill, I took occasion, when opposing the introduction of the Contagious Diseases Act, to point out that no attempt had been made to establish a Lock Hospital as a remedial measure, and that no time should be lost in doing so, so as to do something to stop the ravages of the foul disease without having recourse to the demoralising agency of the Contagious Diseases Acts.

I have since then had the question further impressed upon me by the perusal of the minority report of the Select Committee of the House of Commons last year, and the report of Dr. Nevins to the Home Secretary, dated March, 1876.

Without at present entering into the *quæstio verata* of the application of the Contagious Diseases Acts being beneficial or otherwise, it is undeniable, from the perusal of these documents, that the benefit of well administered Lock Hospitals for females is proved beyond a doubt.

The evidence is very clear that when such hospitals are conducted with kind and thoughtful sympathy on the part of the matron, they are valued by the poor unfortunates who seek the shelter of such institutions, and in the main they are content to remain until fully cured, without any legal powers of restraint or detention being required.

Men can shift for themselves as hospital out-patients, but the women, if common prostitutes, have neither the comforts of home nor the ability to bear the expense, and thus are, by the circumstances of their surroundings, forced to continue their prostitution, often to their own detriment, and certainly to the spreading of the disease throughout the community.

I am desirous, therefore, of taking the earliest opportunity, after my accession to office, to express my desire that a Lock Hospital be established in some convenient neighbourhood without unnecessary delay.

I invite the attention of the Medical Adviser to the Government to the documents to which I have alluded, and which will be found herewith, and generally to the whole subject of establishing a Lock Hospital, as the first step to be taken towards remedying or alleviating this scourge of society.

A.S., 31/1/83.

## G.

[To Evidence of T. Rowe, Esq.]

## HOSPITAL BUILDINGS, MACQUARIE-STREET.

ARTER my sixteenth to an inch scale sketch, competitive plans were selected. Numerous meetings were held for consultation by the Committee and medical men

A new idea was then determined upon, viz.: to demolish present old south wing, and include accommodation of same on an entirely new arrangement.

I was thereupon instructed to submit other sketch plans, and eventually I was instructed to prepare the working drawings, which consist of ten large sheets of plans, sections, and elevations, representing eleven distinct blocks of buildings, two only of which have been completed, and four others in course of erection.

The accommodation thus represented provides for 264 beds, in place of 182 beds, being an additional number of eighty-two beds over the accommodation indicated in the original competitive plans.

All the buildings were to be built of Pyrmont best bottom block stone in place of brick.

When the plans were completed no estimate was requested from me, but estimates were given for the separate contracts entered into, the dates and amounts being as follows:—

	£	s.	d.	£	s.	d.
No. 1 Contract, 23rd November, 1879.—Excavation of site: Contractor, Adam Sharpe .....				2,194	15	0
No. 2 Contract, 25th March, 1880.—Kitchen, scullery, servants' hall, and servants' bedrooms, &c.: Contractor for masons' work, Gawthorpe .....	4,346	14	6			
Ditto for carpentering and finishing trades (Bignell and Clark) .....	2,404	19	4			
Contractor for gas-fittings, Keating .....	41	10	0	6,793	3	10
No. 3 Contract, 20th October, 1880.—Laundry, engine house, &c.: Contractor, Moxon .....				5,731	16	7
No. 4 Contract, 24th November, 1880.—North, south, and east wings, also centre administrative buildings, foundations, and one story only: Contractor, Aulston .....				26,642	9	6
No. 5 Contract, 28th August, 1882.—North, south, and east wings, also centre administrative block, one more story on top of No. 4 contract: Contractor, Aulston .....				23,701	6	3
Commission .....	3,226	0	0			
Clerk of works .....	1,170	0	0	4,896	0	0
				£68,459	11	2

Consequently, it will be seen that five contracts were entered into in succession from 23rd November, 1879, to 28th August, 1882, amounting in all to £68,459 11s. 2d.; for less than one-third of the whole value of the works shown on the plans. All these contracts were duly accepted, legally entered into, and moneys certified by me from time to time. Not one of these certificates were dishonoured, and no complaint ever reached me either verbally or in writing.

The last certificate was given in the beginning of 1884, and an estimate for completion of portion, and the whole of buildings was given in June, 1893, for the information of the Stuart Government, and even after that report no complaint reached me.

Since that date the works have been idle and exposed to all kinds of weather. I think it only right to say that the exposed works have depreciated in value, and will cost about £2,000 to put in proper repair. This should be provided for in the present estimate. If the Committee had anticipated such a delay no doubt the exposed portions of the work would have been protected.

I herewith enclose a copy of the report of 16th September, 1890.

With reference to thickness of walls, they are in accordance with the "Building Act" (see Building Surveyor's signature on plans), and not stronger than necessary for the strains and weights they have to support. The floors are intended to be fire-proof, concreted on iron girders, with joisting and flooring over same, giving an area of 82 feet long x 26 feet wide.

The corner towers are arranged to support water tanks, to contain several day's supply for baths, lavatories, w. c.'s, urinals, and other purposes, and gearing for lifts. The cupolas over same will not look too high when executed, viz, at a height of 80 feet from ground level. The wards communicate by doorways with lobbies on every floor. From these lobbies there is access through doorways to staircases, lifts, passages, balconies, lavatories, &c.

With reference to the widening of Macquarie-street to 100 feet, as suggested by the Government Architect, the idea may be a good one, but it certainly cannot be done unless the entire structure parallel with Macquarie-street, viz., the north and south wings, together with the administrative block, are taken down, leaving the eastern wing (which is doubtful), kitchen premises, laundry, engine house, &c., standing.

The entire site would then have to be rearranged with the greatest difficulty, proportionate loss on works erected being about £40,000.

This does not include the value of stone and other materials which could be utilised if same design is carried out.

This arrangement would probably entail a loss of about £35,000.

My suggestion of 80 feet for said street would not affect the Hospital Buildings much by giving 14 feet up to wall of steps leading to administrative block, which would become the building line of street with dwarf wall on same.

The Sydney Hospital I always thought would be a crowning effort of my long architectural career, but of late years the subject has become wearisome and annoying through the persistence of a few, and, doubtless, the "green-eyed monster" has had a great deal to do and say in the matter.

In conclusion, I must again say that the whole should be erected in accordance with the approved plans, providing Sydney with a handsome and perfect hospital for all time to come.

But if it is considered desirable to widen Macquarie-street, in accordance with the plans submitted by Mr. Vernon, it will be necessary to curtail the accommodation, and rearrange the whole on a smaller scale.

I do not think it would be desirable to build one or even two stories up on the present walls and having no provision for its completion, thereby leaving it an imperfect hospital without the accessory buildings required for the purpose of properly carrying out hospital work.

The whole of the buildings should be built to the present plans, or smaller erections, which should be as perfect as it is possible to arrange them under the circumstances; even then the difficulties to overcome would be great.

THOMAS ROWE,  
Architect.

The Parliamentary Standing Committee on Public Works.

## 61.

## SYDNEY HOSPITAL BUILDINGS.

Copy of Report forwarded to Hospital Committee.

ACCORDING to request I have carefully examined the various works connected with the different buildings, and have the honour to report as follows:—

The walls throughout show no indications of settlement, standing as solidly as when first built.

No indications of damp are visible, arising from foundations; the extra precaution taken at the time of erection, by building the walls in cement, and laying two damp courses, having been an effectual preventive.

Between the administrative block and wings, however, where roadway is intended to be lowered, the stonework is affected by the damp from temporary roadway, which is generally above level of damp courses.

The stonework generally is discolored, the effect of wind and weather being allowed to affect it from every quarter.

From a similar cause, including thorough saturation from time to time on top of walls without cover, nearly all soffits of topmost cornice, and several sill courses are fretted, the bed mouldings in many instances having lost their original form.

The surface of some of the rubbed stonework, particularly near the top of walls, has been injuriously affected by the severe exposure, particularly caused through the heavy rainstorms which we have just experienced.

The damage to mason work can be repaired to a great extent, it being improbable that any portion of it will require to be replaced by other materials.

The mason work of kitchen and other premises is wearing well, showing no signs of deterioration, having had the necessary advantage of being covered where intended. The ground floor of the various apartments has been laid with asphalt. This, I would recommend, should be replaced with tiles, which can now be laid at a reasonable cost, and produce a clean and healthful floor.

The brickwork is still in good order.

The iron girders have begun to rust, and should be hammered all over at once, and painted four coats of best oil paint.

All the timber work seems sound, the precaution having been taken some time ago to kerosene the whole of exposed portions.

Steps should be taken without delay to carefully clean down and rub with sandstone all the rubbed stone work, including mouldings. This would arrest the decay which has commenced.

Thereafter, the whole of the top of the walls should be cemented their full breadth with Portland cement one inch thick, and all joints carefully puttied.

Vickery's Chambers, Pitt-street, 16th September, 1890.

THOMAS ROWE,  
Architect.

21 October, 1890.

Sydney Hospital Buildings.

Dear Sir,

In reply to your letter of the 23rd ultimo, I have carefully calculated the probable cost of repairs suggested to be executed in my report, and find that they amount to about the sum of two thousand pounds (£2,000).

The repairs as suggested by me are urgently necessary, to prevent a decay which is certain to be more rapid in the future than it has been in the past, now that deterioration has decidedly set in.

Yours faithfully,  
THOMAS ROWE,  
Architect.

H. D. Russell, Esq., Secretary, Sydney Hospital.

## RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS FOR QUARTER ENDING 31 DECEMBER, 1890.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Offices of the Railway Commissioners of New South Wales,  
Sydney, 30 January, 1891.

To THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report for the quarter ending the 31st of December, 1890, upon the subjects specified, viz. :—

- (I.) "The state of the traffic returns, with the approximate cost and earnings of trains per ton per train mile, in respect of goods and passengers, respectively, carried during the past quarter."
- (II.) "The general condition of the lines, and accommodation for the traffic."
- (III.) "The special rates (if any) which have been made, and the reasons for making such rates."
- (IV.) "The appointments and removals, with the circumstances attending each case."

## I.—STATE OF THE TRAFFIC.

Railways.	Quarter ending 31st December, 1889.	Quarter ending 31st December, 1890.
Miles open ... ..	*	2,182
Revenue ... { Passenger ... 1889. 1890.	£280,454	£306,192
{ Merchandise ... 526,171	607,649	
Expenditure ... ..	£428,561	£495,324
Train miles run ... ..	2,167,037	2,230,595
Earnings per train mile ... ..	7/5½	8/2½
Expenditure per train mile ... ..	3/11½	4/5½
Percentage—Expenditure to earnings ... ..	53.13	54.18
Number of passengers ... ..	4,350,857	4,885,357

Leichhardt to Five Dock, 2 miles 39 chains ... .. Opened 14 October, 1890.

#### II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

#### III.—SPECIAL RATES.

A statement of the Special Rates, and the reasons for making the same, will be found attached, Appendix, page 5.

#### IV.—STAFF.

These Returns are given as an Appendix, pages 5 to 9.

#### GENERAL REMARKS.

##### RAILWAYS.

The revenue for the quarter shows the large increase of £107,000. This is all the more satisfactory as the traffic during the first month of the quarter showed a decrease in consequence of the Maritime Strike.

The traffic during the months of November and December was so abnormal, and taxed the present resources of the Department so severely, that it may be mentioned that the mineral traffic carried during November and December amounted to 441,824 tons, as against 82,695 tons during September and October. At the end of October the wool traffic showed a decrease of 60,994 bales, whereas at the end of December this decrease had been overtaken and an increased traffic was shown of 34,052 bales, a total of 321,952 bales having been carried in the two months, an increase of 95,046 bales over the corresponding period of the previous year.

The greater facilities afforded for passenger travel continue to materially increase the revenue from this branch of the traffic, over half a million of additional passengers having been carried during the quarter.

An entirely new traffic is being created by the running of cheap Excursion Trains, by means of which passengers can travel, second-class, Sydney to Bourke and back, a distance of over 1,000 miles, for 35s., Sydney to Albury and back, nearly 800 miles, for 25s., &c.

In

In consequence of the Strike the supply of fuel to the Locomotive Department led to an increased cost for the quarter of £10,000, and the arrangements we were compelled to make so as to obtain supplies during the period of difficulty will cause the expenses in this Department to be increased during the coming year.

It will be seen from the table at the beginning of the Report that a substantial increase to the train earnings per mile has been effected, and that, after deducting the expenses, a net earning of 3s. 9d. (an increase of 3¼d.) per train mile on a mileage of 2,230,595 miles has been secured.

#### CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The work of relaying and reballasting the lines is being pushed forward as rapidly as possible.

The facilities for dealing with the traffic are being improved in various directions.

The terminal accommodation for goods traffic in Sydney requires to be considerably enlarged, and the work of connecting the existing lines with the Darling Island property is about to be commenced, and by this means and by rearranging the working of Darling Harbour we trust that the public requirements will be much more conveniently met.

The various duplication works are progressing satisfactorily, and it is expected that the second line between Como and Sutherland (thus completing the double line as far as Waterfall, a distance of 24 miles) will be open before Easter, and also that the Main Southern Line duplication will be completed for the greater part of the distance to Campbelltown by the same date.

#### TRAMWAYS.

The traffic shows a fair increase; the expenses were, however, seriously affected by the cost of fuel during the Strike, an increase of over £3,000 occurring under this head. It is therefore satisfactory to state that in addition to meeting this expense, 5 new tram-cars and one new motor have been paid for out of revenue and an increased profit of £1,077 made.

We have the honor to be,

Sir,

Your most obedient Servants,

E. M. G. EDDY,  
Chief Commissioner.

W. M. FEHON,  
Commissioner.

CHARLES OLIVER,  
Commissioner.

## APPENDICES.

## APPENDIX I.

Minute from The Engineer-in-Chief for Existing Lines to The Secretary to the  
Railway Commissioners.

New South Wales Government Railways,  
Engineer-in-Chief for Existing Lines Branch, Sydney, 29 January, 1891.

Report on Condition of Lines for the quarter ending the 31st December, 1890.

Sir,

I have the honor to report, as under, on the condition of the Railways for the quarter ending 31st December, 1890:—

The more favorable weather that has prevailed during the past quarter has enabled the road in all Divisions to be maintained in a more satisfactory condition.

The draining and reballasting of the Suburban Line has not progressed so rapidly as could have been wished, but now that a more abundant supply of metal is available it is hoped that the progress will be much more rapid.

On the other Divisions the work is being energetically pushed forward, and as more engine power and trucks are now available the progress in the future should be very considerable.

The quarry at Bowral is now open.

The work of resleepering has been seriously retarded on all Divisions by reason of the slow delivery of sleepers, with the exception of the Western Division, where the supply is obtained from Dubbo.

With regard to the duplication of the Suburban Line, good progress has been made with the section from Redfern to Macdonaldtown, on a portion of which the rails are already laid and ballasted. The section from Macdonaldtown to Petersham has been let, and the work is making good progress. A further length between Petersham and Croydon is also let.

The widening between Strathfield and Flomington is going on rapidly, and the loop between Homebush and the Northern Line is in a forward state, and will be opened for traffic shortly. Very good progress has also been made with the works in connection with the new Marshalling Sidings at Clyde.

The duplication between Oatley's and Como, and Loftus and Heathcote, was opened for traffic in November last, and the next section, between Heathcote and Waterfall, in December. The length between Como and Sutherland will, it is hoped, be ready for traffic towards the end of next month.

With regard to the widening of the Southern Line the portion between Granville and Merrylands was opened for traffic on the 1st instant. A further section, including Guildford, will be brought into use on the 1st proximo. The works between this point and Campbelltown are being energetically pushed forward, and it is hoped that a considerable portion of this length will be ready for opening in the course of the next two months. The widening between Campbelltown and Picton is making satisfactory progress. The grades on both these portions of the line are being considerably improved. Tenders have been called for widening the line between Mittagong and Bowral tunnel.

With regard to the widening between Strathfield and Ryde this is being completed, and, it is hoped, will be ready for opening at an early date. A further section from Ryde to Hornsby has been let.

Between Adamstown and Teralba the laying of the rails is going on as rapidly as the supply of sleepers will permit.

The raising of the embankment between East and West Maitland is in progress.

The deviations for improving the curves between Springwood and Katoomba are being proceeded with.

The work of deviating portions of the Mudgee Line has been rapidly pushed forward, and the permanent way is now being laid.

A large number of Contracts for station buildings, goods-sheds, guards' barracks, &c., have been let and are proceeding satisfactorily, and extensive repairs have been carried out to existing structures.

I have, &c.,  
J. ANGUS,  
per WILLIAM T. FOXLEE,  
Deputy Engineer.

The Secretary.

## APPENDIX II.

## New South Wales Government Railways.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the special rates which have been made, and the reasons for making such rates, quarter ending 31st December, 1890.

Article.	Rate.	Reason for such Rate.
Shunting trucks into the Farmers' and Dairymen's Milk Company's Siding, Darling Harbour.	2s. 6d. per truck .....	Special arrangement.
Patent asphaltum, 7 bitumen, in bags or blocks.	A rate and conditions .....	To induce traffic.
Metal from Narrandera to Jerilderie, for Municipal Council.	If sent at Department's convenience, 3s. 1d. per ton...	To secure traffic.
Roofing tiles .....	A rate minimum, 2 tons .....	To increase traffic.
Boats and outriggers .....	Minimum charge, 10s. each .....	do
Buggies .....	do 7s. 6d. each .....	do
Bullock drays .....	In 4-wheel truck, minimum charge, 15s. each .....	do
Do .....	In 4-wheel or large 8-wheel trucks, minimum charge, 20s. each.	do
Yearly season tickets, to include sleeping-berths between Sydney and Melbourne, permitting the journey to be broken at intermediate stations.	£85 per annum, to take effect from 1st January, 1891	do
Coal loaded in owners' trucks, and hauled by owners' locomotives over Mount Keira branch line.	½d. per ton per mile .....	To encourage traffic.
Coal in owners' trucks, and hauled by owners' engines, Corrimal to Mount Keira Junction.	2d. per ton minimum ; 5 tons per truck.	do

## NEW SOUTH WALES.

## RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS FOR QUARTER ENDING 31 MARCH, 1891.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Offices of the Railway Commissioners of New South Wales,  
Sydney, 28th April, 1891.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report for the quarter ending the 31st of March, 1891, upon the subjects specified, viz. :—

- (I.) "The state of the traffic returns, with the approximate cost and earnings of trains per ton per train mile, in respect of goods and passengers, respectively, carried during the past quarter."
- (II.) "The general condition of the lines, and accommodation for the traffic."
- (III.) "The special rates (if any) which have been made, and the reasons for making such rates."
- (IV.) "The appointments and removals, with the circumstances attending each case."

## I.—STATE OF THE TRAFFIC.

Railways.							Quarter ending 31st March, 1890.	Quarter ending 31st March, 1891.	
Miles open	...	...	...	...	...	...	*	2,182	2,182
Revenue	{	Passenger	...	1890.	1891.	...	£614,772	£741,134	
	{	Merchandise	...	£277,149	£322,725	...			
			...	337,623	418,409	...			
Expenditure	...	...	...	...	...	...	£383,338	£431,870	
Train miles run	...	...	...	...	...	...	1,896,027	2,087,500	
Earnings per train mile	...	...	...	...	...	...	6/5½	7/1½	
Expenditure per train mile	...	...	...	...	...	...	4/0½	4/1½	
Percentage—Expenditure to earnings	...	...	...	...	...	...	62.35	58.27	
Number of passengers	...	...	...	...	...	...	4,164,998	4,852,759	
Tonnage of goods traffic	...	...	...	...	...	...	820,586	1,123,134	
Tonnage of live stock traffic	...	...	...	...	...	...	23,621	27,575	

NOTE.—Information as to the cost and earnings of trains per ton per mile cannot be given, as a large proportion of the train mileage is used for carrying both goods and passenger traffic.

\* This column shows the adjusted figures after final settlement of accounts for the quarter.

Tramways.	Quarter ending 31st March, 1890.	Quarter ending 31st March, 1891.
Miles open ... ..	* 39½	42½
Revenue from all sources ... ..	£66,766	£77,307
Expenditure ... ..	£53,432	£58,336

## II.—CONDITION OF THE LINES.

A report on the condition of the lines will be found as an Appendix, page 4.

## III.—SPECIAL RATES.

A statement of the Special Rates, and the reasons for making the same, will be found attached, Appendix, page 4.

## IV.—STAFF.

These Returns are given as an Appendix, pages 5 to 9.

## GENERAL REMARKS.

The revenue for the quarter shows most satisfactory results, the large aggregate increase of £126,362 having been contributed to by all descriptions of traffic. Coaching traffic increased by £45,576, and the Goods Department traffic by £80,786.

In regard to the Passenger traffic it may be mentioned that Easter falling in March this year, instead of April as last year, to some extent helped to swell the traffic for this quarter.

As the accommodation for second-class passengers has been so much improved of late, it may be interesting to state that it has not drawn traffic from the first-class carriages, but has simply led to a development in the business, the first-class traffic showing an increase of £13,473 for the quarter, and the second-class of £29,475.

The cheap excursion trains have also contributed to the general increase in the passenger traffic.

In regard to the goods traffic the principal items of increase are in wool of £26,719, general merchandise £29,075.

The tonnage of coal moved in the Newcastle district shows an increase of 173,000 tons, in consequence of the extra shipments of coal following the termination of the strike.

The increased earnings of 7½d. per mile upon the 2,087,500 miles run during the quarter is also a satisfactory feature in the working.

CONDITION

CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

Considerable progress has been made in improving the state of the permanent way by reballasting and relaying.

Some of the duplication works have also been brought into use, and it is expected that in a few months the double line will be completed to Picton.

The sections of line from Strathfield to Ryde, and Adamstown to Teralba, will be completed in about a month.

The duplication of the Illawarra line to Waterfall has been completed.

Good progress is being made with the quadruplication of the Suburban line.

TRAMWAYS.

The working of the Tramways shows improved results, there being an increase of £10,541 in the receipts, and the working expenses have been reduced by nearly 5 per cent., although debited for the quarter with the renewal of 3 motors and 10 tram-cars.

Several new waiting-rooms have been opened for the convenience of tramway passengers.

We have the honor to be,

Sir,

Your most obedient Servants,

E. M. G. EDDY,

Chief Commissioner.

W. M. FEHON,

Commissioner.

CHARLES OLIVER,

Commissioner.

## APPENDICES.

## APPENDIX I.

## Minute from The Engineer-in-Chief for Existing Lines to The Secretary to the Railway Commissioners.

New South Wales Government Railways,  
Engineer-in-Chief for Existing Lines Branch, Sydney, 21 April, 1891.

Report on Condition of Lines for quarter ending 31st March, 1891.

Sir,

I have the honor to report, for the information of the Railway Commissioners, on the condition of the Railways for the quarter ending 31st March, 1891, as follows:—

The permanent-way, as also the bridges, station and other buildings have been satisfactorily maintained.

Relaying.—On all the divisions the work of relaying, resleepering, draining and reballasting has made fair progress, the draining and ballasting of the Suburban Line being completed.

Deviations.—The work of improving the curves on the Mountains, in the neighbourhood of Katoomba, has been so far carried out that a considerable length is now ready for the permanent-way to be laid.

A contract has also been let for the deviation of the Western Line at Lapstone Hill to dispense with the Zig Zag.

On the Mudgee Line the deviation rendered necessary on account of land-slips have been completed.

Duplication Works.—The contract for the duplication works from Redfern to Flemington on the Suburban Line have made fair progress, the portion from Redfern to the Illawarra Junction being so far advanced as to permit of its being opened in a few weeks.

The duplication of the Southern Line between Granville and Campbelltown, with the exception of a short section, about 2 miles, was so far completed as to allow of the heavy traffic between Sydney and Campbelltown for the Easter encampment been carried.

The duplication between Oatley's and Waterfall, on the Illawarra Line, has been completed, with the exception of the station arrangements at Waterfall.

The widening of the line between Strathfield and Ryde will be completed in about a month.

The widening from Adamstown to Teralba is expected to be totally completed by the 1st of June; a section between Adamstown and Young, Wallsend Junction, having been opened for traffic on the 20th March.

The duplication between Mittagong and Bowral has also made fair progress.

The raising of the embankment between East and West Maitland has also made fair progress.

The Marshalling sidings at Clyde have been pushed rapidly forward, three-quarters of the earth-work has been completed, and the culverts and underbridges have been finished.

The Homebush curve for connecting the Northern and Suburban Lines has been so far completed as to allow of its being shortly opened for traffic.

Waterways.—The abutments for the Duck River Bridge have been built to level of girder bed, and a dam has been constructed on inlet side of bridge.

The contract for providing more waterways at Bourke is progressing satisfactorily; four deviations have been completed and several bridges are well in hand.

A large number of contracts for buildings of various kinds have been let and are progressing satisfactorily.

I have, &c.,  
J. ANGUS.

## APPENDIX II.

New South Wales Government Railways.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the special rates which have been made, and the reasons for making such rates, quarter ending 31st of March, 1891.

Article.	Rate.	Reason for such Rate.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## RAILWAYS OF NEW SOUTH WALES.

DESCRIPTION OF THE LINES AND WORKS OF CONSTRUCTION, BY HENRY DEANE, ACTING ENGINEER-IN-CHIEF.)

*Ordered by the Legislative Assembly to be printed, 26 May, 1891.*

### Description of the Railways of New South Wales, by The Acting Engineer-in-Chief.

THERE are three main trunk lines in this Colony, which are called the GREAT SOUTHERN, the GREAT WESTERN, and the GREAT NORTHERN Railways.

The principal branches in connection with the above are:—

Junce, on the Southern Line, to Hay, called also the South-western Railway, with a branch from Narrandera to Jerilderie, the latter being the terminus.

Goulburn, on the Southern Line, to the terminal station at Cooma.

Werris Creek, on the Great Northern Line, to Narrabri, called also the North-western Railway.

There are besides:—

On the Great Southern Line—The Darling Harbour, Haslem's Creek, the Collingwood, and the Cootamundra to Gundagai.

On the Great Western Line—The Blacktown to Richmond, and Wallerawang to Mudgee.

On the Great Northern Line—The Bullock Island and Morpeth branches.

There are also the following connecting lines:—The Southern and Northern Junction Railway, from Strathfield, on the Southern Line, to Hamilton, on the Great Northern, with a branch from Hornsby to St. Leonards; and the line from Murrumburrah, on the Great Southern Railway, to Blayney, on the Great Western.

Lastly, there is the Illawarra Railway, which leaves the Southern Line at Eveleigh, and runs to Wollongong and Kiama, the present terminus of which will shortly be extended to Nowra.

The gauge throughout is 4 ft. 8½ in., this being the almost universal gauge now of the majority of railways throughout the world. It was adopted at a very early period of railway construction in England, on what was necessarily at that time a very limited experience of what would ultimately be found the best; nevertheless, it has stood its ground, as evidenced by its world-wide imitation. Ireland, India, Spain, and Victoria are the principal exceptions to the rule, in one direction, the general opinion at the time that railway works were begun in those countries tending towards a wider gauge, stimulated, no doubt, by the high authority of Brunel, who had adopted, in opposition to the majority of English engineers, a 7 ft. gauge for the Great Western Line. The general experience since, however, has been in favour of the original English gauge, and many thousands of miles in the United States have been altered at a great expense from smaller and larger gauges to what is now, by universal nomenclature, called the standard gauge. Narrower gauges have been adopted in the other Australasian Colonies, Cape Colony, and in the Indian branch lines.

In addition to the railways enumerated above, there is one owned and worked by a private company. This railway, which is a single line throughout, and laid to a gauge of 5 feet 3 inches, to correspond with that of the Victorian Railways, commences at the Echuca Station by a Junction with the Victorian Railway from Sandhurst to Echuca. After crossing the Murray River and entering New South Wales, the line passes through the town of Moama and terminates at South Deniliquin, being a length of 45 miles.

The works of this private line are of the lightest description; the curves all have a radius of 80 chains, and the line is practically level throughout. The permanent-way consists of flat-bottomed iron rails, 50lb. to the yard, fished at the joints, and spiked to the sleepers.

### GREAT SOUTHERN RAILWAY.

The Great Southern Line forms the greater part of the connection between Sydney and Melbourne. It skirts, and finally crosses the Main Dividing Range near Goulburn, and descends into the valley of the Murray, at which river it meets the Victorian system. The line commences at Sydney, 64 feet above sea-level, and passing near to Parramatta, and through Liverpool and Campbelltown, crosses the Nepean River at Menangle, 259 feet, and Stone-quarry Creek, 549 feet above the sea-level, and intersects the Southern Road a short distance south of Lower Picton; thence through the Redbank Range by a tunnel to the eastward of the Government village of Redbank, it ascends to the table-land between Redbank and Myrtle Creek on the east, and the lagoons and Cedar Creek on the west. The range dividing the Bargo River tributaries from those of the Nattai River and Chain of Lagoons is then followed

followed to a point 16 miles from Picton, at an elevation of 2,027 feet, where the line passes through the range to the westward, and after crossing several tributaries of the Bargo River, and passing near to the "Prince Albert Inn," crosses the Southern Road where it is intersected by the Nattai Creek; thence to the eastward of the Fitzroy Iron-mines, crossing the Mittagong Range at Gibraltar Gap by a tunnel 2,222 feet above sea-level, it is continued through the Wingecarribee Estate, crossing the Wingecarribee River about 2 miles west of Bong Bong.

From this point the line passes to the eastward of Gillinambullam Range, crossing the Old Southern Road where it is intersected by White's Creek; thence to the eastward of Sutton Forest and the western foot of Mount Broughton, it rises gradually to the summit of Paddy's River Range, 2,357 feet above sea-level, near Vine Lodge, the residence of A. Badgery, Esq. The range dividing the tributaries of the Shoalhaven River from the sources of Paddy's River is then followed to the Old Southern Road, about a mile and a half south of Paddy's River; thence passing Bombala Swamp, it follows generally the course of Barber's Creek to near Glen Rock, crossing the Southern Road about 2 miles north of Marulan, and passing Lockyersleigh, crosses Narrambulla Creek and the Wollondilly River; thence skirting the spurs of the Cookbundoon Ranges, it reaches a point about a mile distant from and to the westward of Towrang, where it again crosses the Wollondilly, and follows the valley of that river generally to Goulburn, at an elevation of 2,071 feet above the sea.

From Goulburn the line follows the direction of the Mulwarree Creek, and after crossing and recrossing the Southern Road, and the first, second, and third Breadalbane Plains, it continues to the Cullerin Range, at an elevation of 2,392 feet; thence descending the Cullerin Range on the south side, it crosses Lerida Creek or Fish River, and passing Gunning crosses Jerriwa Creek, 1,806 feet above sea-level, and ascends gradually to the summit-level of the Muntoon Range, 2,229 feet; thence passing Yass, Bowning, Binalong, Murrumburrah, Cootamundra, Berthingra and Junee, the River Murrumbidgee is crossed by a viaduct nearly 2 miles in length, close to the town of Wagga Wagga, the rails at this point being 606 feet above the sea. The line from this point is continued in a southerly direction to Albury, 531 feet above sea-level, on the River Murray, the boundary between New South Wales and Victoria.

The total length of the line from Sydney to Albury is 386 miles.

From Sydney to Granville Junction, a distance of 13 miles, the railway is a double line; but the remaining distance to Albury—373 miles—has been laid down as a single line only. The duplication is now, however, being extended to Picton. From Sydney to Granville Junction is essentially a suburban line, with stations at frequent intervals to accommodate this class of traffic, and operations are now in hand to quadruple most of this length, the double line being insufficient to meet the pressure of the suburban and the combined long-distance traffic of all the systems which has to run upon it.

A connection has further been made between the New South Wales railway system at Albury with the Victorian system at Wodonga—the river Murray being spanned by an iron bridge. The rails have been laid over this connecting link to a mixed gauge, to suit the trains from each Colony.

#### EXCAVATIONS AND EMBANKMENTS.

Upon the double line, Sydney to Parramatta Junction, 13 miles, the formation width is 30 feet, with slopes of 1 to 1. The slopes of the embankments are  $1\frac{1}{2}$  to 1, and the width at the top 30 feet. From the Junction to Liverpool, 9 miles, the earthworks and bridges have been constructed for a double line, but only a single line of rails has been laid down.

From Liverpool to Goulburn, 112 miles, the formation width of cuttings and embankments is 18 feet, with slopes for cuttings varying with the character of the material passed through. In ordinary earthwork they are 1 to 1. In rock the sides are left perpendicular, or with a slope of  $\frac{1}{2}$  or  $\frac{1}{4}$  to 1.

All the the ombankments have slopes of  $1\frac{1}{2}$  to 1 throughout.

From Goulburn to Albury, 386 miles from Sydney, the whole of the cuttings have a formation width of 15 feet only, with slopes similar to those between Liverpool and Goulburn. The embankments have generally a formation width of 18 feet, although the width specified is 15 feet, with slopes in all cases of not less than  $1\frac{1}{2}$  to 1.

Beyond this point the specified width of formation on embankments is 17 feet, but they are generally somewhat wider.

#### WORKS.

The first important work upon this line from Sydney to Goulburn is the bridge over the river Nepean at Menangle, about 40 miles from Sydney, which consists of wrought-iron continuous box girders for a double line, 498 feet in length, extending over three openings of 150 feet clear span each, resting on stone piers, the masonry being set in Portland cement. The height of the bridge, from the level of the water in the river to underside of the girders, is 65 feet. The approach on the Sydney or northern side is 978 feet long, in spans of 26 feet each, of timber, constructed for a single line. The approach on the southern side is of timber, 432 feet in length, in spans of 26 feet.

The viaduct at Picton over the Stonequarry Creek, 53 miles from Sydney, is built in masonry, and consists of five openings of 40 feet each. The arches are semi-circular, and on an incline of 1 in 40. In consequence of its proximity to Picton Station it has been built for a double line of railway. Its entire length is 276 feet, and its extreme height, from foundations to rail level, 78 feet.

The Picton Tunnel through Redbank Range, 54 miles from Sydney, is 198 yards in length, lined with brickwork, set in cement throughout, and constructed for a single line of way. In form it is elliptical, 15 feet wide in its widest part, and 17 feet high from rail level to soffit of arch.

The Gibraltar Tunnel, 79 miles from Sydney, the excavation for which was through hard shale and sandstone, is 572 yards in length. It has been lined throughout with brickwork and masonry in cement, and is of the same form and dimensions as the tunnel through the Redbank Range at Picton.

The viaduct over Barber's Creek, 111 miles from Sydney, is 340 feet in length, and consists of five spans of 60 feet each, having two wrought-iron plate girders 13 feet apart, 4 feet 7 inches deep, resting on stone piers set in Portland cement, the railway being carried on cross girders 13 inches deep and 3 feet apart.

The viaduct over the first crossing of the Wollondilly River, 122 miles from Sydney, is 616 feet long, and consists of one span of 130 feet, having wrought-iron box girders 13 feet 6 inches apart, and 10 feet deep, and cross girders 13 inches deep, and seven spans of 60 feet, of wrought-iron plate girders similar to those over Barber's Creek. The girders rest on brick piers set in Portland cement.

The

The viaduct over the second crossing of the same river at 127 miles from Sydney is 614 feet in length, having one span of 130 feet, and six spans of 60 feet, precisely similar in construction to the first crossing. The height of the rails above ordinary water level is 46 feet.

Boxer's Creek Viaduct, 127 miles 34 chains, from Sydney, is 206 feet in length, and consists of two spans of 60 feet each of wrought-iron plate girders, similar to those at Barber's Creek, resting on brick piers set in Portland cement. The height from rails to water-level is 46 feet.

Mulwarree Creek Viaduct, which is close to the town of Goulburn, and 133 miles from Sydney, is 858 feet in length, and consists of twelve spans of 60 feet each of wrought-iron plate girders, similar in construction to those at Barber's Creek, and resting upon brick piers set in Portland cement.

The steepest gradient on this length is 1 in 30 for an aggregate length of 2 miles 72 chains, and the sharpest curve is of 16 chains radius.

From Goulburn to Albury, a distance of 253 miles 31 chains, the formation widths of both cuttings and embankments was specified to be 15 feet; but the banks were generally made not less than 17 feet. The permanent-way is of a lighter description than that used between Sydney and Goulburn, being as far as Wagga Wagga flat-bottomed iron rails, fish-jointed, and weighing 70 lbs. per lineal yard. From Wagga Wagga to Albury the rails are of steel, weighing 71½ lbs. per lineal yard. The sleepers are reduced to 8 feet in length, 9 in. x 4½ in., and placed closer together.

The highest point reached is at 142 miles 79 chains, and is 2394.50 feet above high-water spring tide at Sydney.

In addition to the ordinary timber bridges, the Murrumbidgee River at Wagga Wagga is crossed by a wrought-iron lattice girder bridge, consisting of four clear spans of 150 feet each. The girders rest upon cast-iron cylinders, 9 feet diameter, bedded upon coarse gravel, at an average depth of 61 feet from surface of ground. The clear height above summer level of river is 33 feet 6 inches, and is 12 feet above the highest known flood level.

In connection with this bridge, timber approaches across the country liable to floods have been made. The Northern approach consists of 261 spans of 29 feet 6 inches each, and the Southern of 61 spans of 29 feet 6 inches each, making a total length of 9,499 feet.

The steepest gradient is 1 in 40 for an aggregate length of 4 miles 40 chains, and the smallest radius of a curve is 19 chains.

The total amount of excavation (not including foundations) between Goulburn and Albury is 2,624,79½ cubic yards.

There are seventy-nine stations on the main line, excluding the sixteen suburban stations, being an average of 4.88 miles apart.

#### ALBURY TO THE MURRAY RIVER.

(Length 1 mile 31 chains.)

On this length, which terminates on the Southern or Victorian side of the river, and connects the New South Wales and Victorian Railways, the width of formation is increased to 28 feet to accommodate a double line,—one constructed on the New South Wales gauge of 4 feet 8½ inches, and one on the Victorian gauge of 5 feet 3 inches.

The rails, which are steel, single headed, and fish-jointed, weigh 71½ lbs. per lineal yard. The sleepers are of approved colonial hardwood, being 9 feet long, 9 inches by 4½ inches, for the New South Wales gauge, and 10 feet long, 9 inches by 4½ inches for the Victorian gauge.

The ballast is 6 inches deep under the sleepers, and boxed up for a depth of 8 inches from the under side of the sleepers between the rails, and for a depth of 9 inches on the outside of the rail, the width at the top being 20 feet 2 inches, and the bottom width 23 feet 4 inches.

The Murray River is crossed by a wrought-iron lattice girder bridge, constructed for double line, and consisting of two clear spans of 150 feet each; the girders rest upon cast-iron cylinders, 9 feet diameter, and are filled with concrete, upon which the bed-stones rest. The clear height above summer level of river is 20 feet 6 inches, and is 3 feet 3 inches above the highest known flood level.

In connection with this bridge, timber approaches have been built on the New South Wales side, consisting of forty-five 26 feet spans.

The cost for construction of iron bridge was borne equally by this Colony and Victoria.

The total amount of excavation in this length is 127,334 cubic yards.

Pending the completion of the permanent iron bridge, a temporary line was constructed by the New South Wales Government to the north bank of the river, to join a temporary bridge across the river erected by the Victorian Government, and on this line the through traffic between Sydney and Melbourne commenced on the 14th June, 1883.

#### BRANCH LINES.

##### GOULBURN TO COOMA.

This branch leaves the Great Southern Railway at 137 miles 47 chains 26 links from Sydney passing through Bungendore, Queanbeyan, and Michelago, and terminates at Cooma, 263 miles 50 chains 24 links from Sydney, being a length of 126 miles 2 chains 98 links of single line.

The highest point reached is at 263 miles 30 chains, and is 2,729 feet above high-water spring tides at Sydney.

The steepest gradient is 1 in 40 for an aggregate length of 20 miles 22 chains, and the sharpest curve is of 12 chains radius.

In addition to the ordinary timber bridges and waterways, the Molonglo and Queanbeyan Rivers are crossed by timber laminated arch bridges resting on brick piers and abutments, having four 80-foot and five 80-foot spans respectively. Ingolara Creek and the Bredbo River are crossed by under-truss timber bridges, the former having five spans of 42 feet each and two of 20 feet each, built on piles with brick foundations in the channel of creek, and the latter ten spans of 42 feet each, built on piles with brick abutments. Umaralla River is crossed by an over-truss timber bridge of five 42-foot, forty 26-foot and two 15-foot 6-inch spans built on piles.

There are four (4) tunnels constructed for single line, of an aggregate length of 939 yards, lined throughout with brickwork set in cement.

The total amount of excavation (not including foundations) is 3,599,301 cubic yards. There are fifteen stations on this branch.

COOTAMUNDRA.

## COOTAMUNDRA TO GUNDAGAI.

This branch leaves the Great Southern Railway at 253 miles 45 chains 19 links (near Cootamundra), and terminates at Gundagai, on the north bank of the Murrumbidgee River, 286 miles 58 chains from Sydney, being a length of 33 miles 14 chains 81 links of single line.

The highest point reached is at 255 miles 27 chains, and is 1,086.35 feet above high-water spring tides at Sydney.

The sharpest gradient is 1 in 50 for an aggregate length of 2 miles 5 chains, and the sharpest curve is of 12 chains radius.

The total amount of excavation on main line, exclusive of foundations, is 518,386 cubic yards, and from the Gundagai Station-yard 100,276 cubic yards, of which 90,276 cubic yards are rock. This line has four stations.

## JUNEE TO HAY.

This branch, which is called the South-western Railway, leaves the Great Southern Railway at 286 miles 24 chains from Sydney, and passing on the outskirts of Narrandera follows the northern bank of the Murrumbidgee River to Hay, 454 miles from Sydney, being a length of 167 miles 56 chains of single line.

The highest point reached is at 297 miles 19 chains, and is 1,143.40 feet above high-water spring tides at Sydney.

The steepest gradient is 1 in 40 for an aggregate length of 40 chains, and the sharpest curve is of 20 chains radius.

The total amount of excavation (not including foundations) is 1,660,893 cubic yards.

There are no works of any special importance on this extension.

## NARRANDERA TO JERILDERIE.

This line leaves the extension from Junee to Hay at Narrandera, 347 miles 13 chains from Sydney, and terminates at Jerilderie, 412 miles 3 chains from Sydney, being a length of 64 miles 70 chains of single line.

The highest point on this section is at 355 miles 15 chains, and is 572.81 feet above high-water spring tides at Sydney.

The steepest gradient is 1 in 50 for a total length of 44 chains, and the sharpest curve is of 20 chains radius.

In addition to the ordinary timber bridges and waterways, the Murrumbidgee River at Narrandera is crossed by a wrought-iron lattice girder bridge, constructed for a single line, and consisting of two clear spans of 150 feet each. The superstructure rests upon cast-iron cylinders, 9 feet diameter, filled with concrete, upon which the bed stones rest. The clear height above summer level of river is 22 feet 6 inches and is 6 feet above the highest known flood level.

In connection with this bridge, timber approaches have been built across the river flats which are liable to flood. The northern approach consists of eighty 26-foot spans, and the southern of 101 26-foot spans.

During the construction of the works, it was deemed necessary by the contractors to make a temporary line to and across the river. This was purchased by the Government, in order to open the traffic between Narrandera and Jerilderie, pending the completion of the permanent bridge.

The total amount of excavation (not including foundations) is 185,886 cubic yards.

The Darling Harbour Branch, 1 mile in length, has been constructed for a double line, and connects the main line at Redfern with the waters of Port Jackson.

The Rookwood Cemetery Branch (single line), one quarter of a mile in length, leaves the main line at Haslem's Creek, 10 miles from Sydney, and runs to the Necropolis.

Collingwood Branch (single line), half a mile in length, connects the Liverpool station, 22 miles from Sydney, with a large wool-washing establishment and the Liverpool paper-mills.

## PERMANENT-WAY, RAILS, &amp;c.

The rails on the length from Sydney to Goulburn, 134 miles, are of wrought-iron, double-headed and fish-jointed throughout, and weigh 75 lbs. per yard. The chairs are 25 lbs. each, and are secured to the sleepers with wrought-iron spikes.

From Goulburn to Wagga Wagga, a distance of 170 miles, the permanent-way is of a lighter description. The rails, which are single-headed and fish-jointed, in lengths of 18 and 21 feet, weigh 70 lbs. per yard, and are secured to the sleepers by spikes and screws alternately.

From Wagga Wagga to the River Murray the rails are of steel and weigh 71½ lbs. per lineal yard.

The permanent way on the branch lines is the same as on the main line from Wagga Wagga to Albury.

## SLEEPERS.

From Sydney to Goulburn the sleepers are of ironbark, pure box, blue-gum, and red-gum timbers, rectangular in shape, 9 feet long, 10 x 5, and are placed 3 feet apart from centre to centre throughout.

From Goulburn to Albury, and on the branch lines, the sleepers are of ironbark, grey-gum, blackbutt, and other colonial hardwood, 8 feet long, 9 inches by 4½ inches, and rectangular in form. They are placed 2 feet 8½ inches apart from centre to centre for 21-foot rails, and 2 feet 3 inches at the joints. For the 18-foot rails the sleepers are 2 feet 7½ inches apart from centre to centre, and 2 feet 3 inches at the joints. The bed for the rails is planed by machinery at an angle of 1 in 20, inclining towards the centre of the roadway. To keep the road in gauge, the rails are notched into the sleepers to the full thickness of the bottom flange on the outside of the rail. (See drawing.)

## BALLAST.

## BALLAST.

From Sydney to Picton, 53 miles, the ballast consists of broken sandstone, 12 inches in depth from the under side of the sleepers, and of a gauge of 3 inches, boxed up with a similar kind of stone 8 inches in depth, broken to a gauge of 2 inches.

From Picton to Goulburn the ballast is also of sandstone, broken to a cube of 3 inches, for a depth of 6 inches under the sleepers in the centre of the roadway, and 8 inches in depth at the back of the border stones, and of a width of 11 feet. Border stones (*see drawing*), 8 inches in thickness and 12 inches wide, are laid on each side of the ballasting, their extreme edges being 6 feet 6 inches from the centre of the roadway, and laid parallel with the centre line throughout. The rails and sleepers are laid upon the bottom ballast, and boxed up with broken stone of a gauge of 2 inches for a depth of 8 inches from the under side of the sleepers between the rails, and for a depth of 9 inches on the outside of the rails, the width at the top being 9 feet 8 inches, and the bottom width 11 feet 7 inches.

The ballast on that portion of the line between Goulburn and Albury, and on the branch lines, is of stone broken to a gauge of 3 inches, and 6 inches in depth under the sleepers, 11 feet 9 inches in width at the bottom of the slope, boxed up with similar stone to within  $1\frac{1}{2}$  inch of the level of the rails on the outside, and 3 inches below the rails in the centre of the roadway.

The rails, sleepers, and ballast on the Darling Harbour, Rookwood, and Collingwood branches are the same as on the main line to Goulburn.

## ILLAWARRA RAILWAY.

## EXTENSION, SYDNEY TO WOLLONGONG AND KIAMA.

This extension, which is also called the Illawarra and South Coast Line, leaves the Great Southern Railway near Macdonaldtown, 1 mile 5 chains from Redfern Station, and passing through Marrickville, Tempe, Kogarah, and a portion of the National Park, follows the course of the Port Hacking River for about a mile, then passes through Clifton, Bulli, Wollongong, Dapto, and, after skirting the western shore of Lake Illawarra for a short distance, terminates at Kiama, 69 miles 79 chains from Sydney. As far as Hurstville, 9 miles from Sydney, this line is a suburban one, on which there are nine stations—beyond this there are twenty-eight stations.

There are nine tunnels on this extension, of an aggregate length of 4,634 $\frac{1}{2}$  yards, constructed for single line. Tunnel No. 9 is lined throughout with cement concrete; the others are lined with brickwork set in cement.

The highest point reached is at 23 miles 1 chain, and is 767.97 feet above high-water spring tides at Sydney.

The steepest gradient is 1 in 40 for an aggregate length of 2 miles 27 $\frac{1}{2}$  chains, and the sharpest curve is of 10 chains radius.

In addition to the ordinary bridges and waterways, Cook's River, at 4 miles 18 chains, is crossed by a wrought-iron web-plate girder bridge, constructed for double line, and consisting of three spans of 66 feet each from centre to centre of piers, and two 22 feet 6 inches and two 8 feet 6 inches timber openings. The superstructure rests upon cast-iron cylinders, 5 feet diameter, which are bedded on rock, and are filled with cement concrete.

The clear height of the bridge above high-water level is 7 feet 3 inches.

George's River, at 12 miles 20 chains is crossed by a wrought-iron lattice girder bridge of six spans of 159 feet each from centre to centre of pier, continuous over three spans, and constructed for single line. The girders rest upon cast-iron cylinders, 11 feet in diameter, up to low-water mark, tapering to 9 feet diameter up to high-water level, and from thence the cylinders are of an uniform diameter to the top. These cylinders are filled with cement concrete, and on this are set the bed-stones and roller-plates upon which the superstructure rests.

The northern end girders rest upon a stone abutment, but at the south end the embankment is carried out to the last pair of cylinders.

The clear height of the bridge above high-water level is 35 feet.

Port Hacking River is crossed at 28 miles 31 chains by an over-truss timber bridge, constructed for single line, having seven 42-foot spans from centre to centre of piers, and one ordinary 20-foot span at each end. The end piers consist of piles on a concrete foundation, and the remaining piers, which are liable to flood, are constructed of piles, resting on dwarf piers built of brickwork set in cement.

The permanent-way is laid for a double line from the junction with the Great Southern Railway to 9 miles 48 $\frac{1}{2}$  chains, and from thence to Kiama for a single line. The rails, which are of steel, single-headed and fish-jointed, weigh 71 $\frac{1}{2}$  lb. per lineal yard; the sleepers are of approved colonial hardwood, 8 feet long, 9 inches by 4 $\frac{1}{2}$  inches, and the ballasting is similar to that between Goulburn and Albury and on the branch lines.

The total amount of excavation, not including foundations, is 3,191,066 cubic yards.

## BRANCH LINE TO NATIONAL PARK.

This branch, which is 1 mile 15 chains in length, leaves the Illawarra Line at 16 miles 30 chains from Sydney, and terminates in the National Park. The earthworks, waterways, &c., are of an extremely light description, and do not call for special mention. The permanent-way is similar to that on the main line, excepting that the depth of ballast under the sleepers is only 4 inches instead of 6 inches, and the road is not "boxed up."

## GREAT WESTERN RAILWAY.

The high main dividing range of the Colony, or watershed between eastern and western rivers, runs nearly parallel to the coast, at about 100 miles therefrom, and the problem of connecting Sydney by rail with the town of Bathurst and the western districts of the Colony beyond necessitated the consideration of the best way of surmounting this elevation, having the question of economy, which, at the time of the construction of the western line, was paramount, prominently in view. Several spurs, with valleys between, spring out from the range towards the coast, and in order to get to the top, the main spur nearest the general line of the Sydney and Bathurst connection was chosen for the route. This spur originates

originates on the main range north of Wallerawang, running eastwardly, and after maintaining its level generally as high as the main range itself for about 40 miles, drops then at a severe grade down to Emu Plains, 35 miles from Sydney, when it dies out. Its sides are exceedingly precipitous, forming the beautiful ravines and waterfalls which contribute to the fine scenery for which the district is noted, but the top, though in many places narrow and tortuous, contains the only, comparatively speaking, easy ground for railway construction between Sydney and the main range. The western line follows the top of the spur closely for over 50 miles, and only leaves it to reach Lithgow Valley, near Wallerawang, where the line falls to the Cox River, and again rises to the main range, crossing its summit at Rydal, at a lower level than it had reached on the spur.

The extremity of the spur at Emu Plains being very steep, is climbed at Lapstone Hill by a zig-zag, a device in railway construction which had been successfully carried out and worked on both of the railway ascents up the western ghauts near Bombay, leading from that town to the Madras and Bengal presidencies. It is also in extensive use on the Lima and Oroya Railway in Peru. This arrangement, on a larger scale than at Lapstone Hill, is also put into requisition on the descent to the Lithgow Valley, by what is called the Great Zig-zag.

The railway commences near to Granville by a junction, called the Granville Junction, with the Southern Railway, and passing through Parramatta, St. Mary's, South Creek, and Penrith, crosses the Nepean River, 94 feet above sea-level, to the township of Emu; thence ascending, the line intersects the Western Road 155 feet above the level of Emu Plains, and crosses Knapsack Gully at a further elevation of 245 feet above them, reaching the lower points of the first or Lapstone Zig-zag at an elevation of 414 feet above sea-level. From this point the trains are pushed up the Zig-zag for a length of 30 chains until an elevation of 470 feet is attained. The line is then continued to the summit of Lapstone Hill, near the old "Pilgrim Inn," on the Western Road. It then follows the main spur above mentioned, passing Springwood, Blue Mountain, Weatherboard, Pulpit Hill, Blackheath, 3,494 feet in height, to near Shepherd's Toll-bar and Mount Victoria, 3,422 feet above the sea. Still following the spur which here divides the waters of the river Lett from the sources of the Grose River, to Mount Wilson, where another spur is thrown off to the north, the rails at the entrance of which are 3,658 feet above sea-level. The line reaches its summit level at Mount Clarence tunnel, 88 miles from Sydney, and 52 miles from the commencement of the ascent of the Blue Mountain Ranges at Emu Plains. The line then descends on a gradient of 1 in 42 towards Lithgow Valley, reaching the upper points of the Great Zig-zag, 91 miles from Sydney, at an elevation of 3,362 feet.

To reach Lithgow Valley, the line descends from the upper points of the Great Zig-zag on an incline of 1 in 42, and runs nearly parallel with the main line, but in an opposite direction, for a distance of 67 chains. After passing over two viaducts and through a short tunnel it reaches the lower points of the Great Zig-zag at an elevation of 3,261 feet.

The line then continues down Lithgow Valley to a point on the Mudgee Road, near Coerwill, where it crosses Brown's River; thence passing the range between Brown's River and the Middle River, it proceeds through the Middle River Range, which is pierced with a tunnel; thence skirting Wallerawang or Piper's Flat, to the north, it crosses Cox's River, and follows the Horse Gully to the lowest point in the Main Dividing Range, between the eastern and western waters, a short distance north of the township of Rydal. From this point the line crosses the Western Road, and follows generally the course of Solitary Creek to within half-a-mile of its confluence with the Fish River; thence running round the foot of Tarana Mountain, and crossing an undulating country it reaches Dirty Swamp, Tindall's Hollow, and Bathurst Plains. After passing Raglan and Kelso, it crosses the river Macquarie and enters the town of Bathurst, 145 miles from Sydney, or 132 from Parramatta Junction, at an elevation of 2,153 feet. From Bathurst the line proceeds along the Vale Creek Road, George's Plains, Blayney, and Spring Hill, to Orange, 192 miles from Sydney, at an elevation of 2,843 feet. The highest point on this portion of the line is 3,138 feet at Spring Grove, 179 miles from Sydney. From Orange the line runs through some difficult country by way of Ironbarks, Apsley, Wellington and Ponto to Dubbo. The highest elevation attained on this section is 2,972 feet at 204 miles from Sydney. From Dubbo the line gradually descends into the great western plains through easy and level country, passing Narramine, Nevertire, Nyngan, Girilambone, Wilga, and Byrock, to Bourke, the terminal station, on the Darling River, 503 miles from Sydney, at an elevation of 347 feet.

#### EXCAVATIONS AND EMBANKMENTS.

The formation width of both cuttings and embankments between the Parramatta Junction and Bathurst is 18 feet, the slopes being the same as those described for the Southern Line.

After commencing the ascent of Lapstone Hill at about 37 miles from Sydney, until the line reaches Rydal, 111 miles from Sydney, the cuttings are principally through hard shale or compact sandstone rock, and the sides of the excavations are, therefore, left almost perpendicular.

From Rydal to near Bathurst the excavations are to a considerable extent through granite, and the sides are treated the same as those through sandstone.

The total quantity of excavation, principally in rock, on the line between Penrith and Bathurst, a distance of 111 miles, is five and a half millions of cubic yards.

#### WORKS.

The Bridge over the River Nepean, at Penrith, 35 miles from Sydney, is constructed for a double line, and carries the Main Western Road and a single line of railway. It consists of three openings of 186 feet clear span each, and one span of 127 feet. The larger openings have two main girders of the box form, each 594 feet in length, of an extreme depth of 13 feet, and placed 25 feet 6 inches apart in the clear. The roadway is carried on wrought-iron cross girders 18 inches deep, and placed 3 feet apart centre and centre, and covered with 3-inch planking throughout. The span of 127 feet has also wrought-iron girders of the box form, 135 feet in length and 10 feet in depth. The rails are 49 feet above the ordinary level of the river.

There are also three spans of 26 feet, of timber framing, on the eastern side of the bridge, and three similar spans on the western side, and a timber viaduct between the Penrith Station and the River Nepean, consisting of 64 spans of 26 feet each.

The

The Knapsack Gully Viaduct, 38 miles from Sydney, consists of five spans of 50 feet each and two spans of 20 feet each. It is built for a single line of railway, in masonry set in Portland cement, and on an incline of 1 in 30. The length is 388 feet, and the greatest height from the foundations to the level of rails is 126 feet.

Mount Clarence Tunnel, which pierces through Mount Clarence, 88½ miles from Sydney, is 539 yards in length, and lined throughout with masonry set in cement.

Between this point and Wallerawang Station, 105 miles from Sydney, there are seven viaducts, all built in masonry set in Portland cement, of an aggregate length of 2,225 feet, varying in height from 10 to 70 feet, and consisting of the following spans:—

Four openings, each 10 feet span.	Two openings, each 27 feet span.
Two openings, each 15 feet span.	Thirty-seven openings, each 30 feet span.
Three openings, each 20 feet span.	One opening, 54 feet span.
Fourteen openings, each 25 feet span.	

There are also three tunnels—one on the Lithgow Valley Zig-zag, 77 yards in length; one at Morangaroo, 267 yards in length; and one under the Mudgee Road, 47 yards in length.

Beyond Wallerawang the line passes through Rydal and down the valley of Solitary Creek, over which stream the following bridges have been erected in a distance of 9 miles:—

No. 1.	One 30 feet span, built in brickwork.
” 2.	One 30 ” ”
” 3.	One 30 ” ”
” 4.	Two 30 ” ”
” 5.	Two 30 ” ”
” 6.	Four 30 ” ”
” 7.	One 60 ” (skew) iron plate girder, with brick abutments.
” 8.	One 60 ” ” ”
” 9.	One 50 ” built in brickwork.
” 10.	One 60 ” (skew) iron girder, with brick abutments.
” 11.	One 50 ” built in brickwork.
” 12.	One 50 ” ”
” 13.	One 60 ” (skew) iron girder, with brick abutments.
” 14.	Two 50 ” built in brickwork.
” 15.	One 66 ” (skew) iron plate girders, with brick abutments.
” 16.	One 50 ” built in brickwork.
” 17.	Two 60 ” (skew) iron plate girders, with brick piers and abutments.

The bridge over the River Macquarie at Bathurst, 144 miles from Sydney, is constructed for a single line with two continuous wrought-iron lattice girders of 480 feet each in total length, 12 feet 6 inches in depth, and placed 14 feet apart. It is divided into three spans of 150 feet each, each span being supported on two cast-iron cylinders 9 feet in diameter, sunk to a solid foundation of an average depth of 14 feet below the ordinary level of the water in the river. These cylinders are filled with concrete composed of gravel and cement, in the proportion of six of gravel to one cement. The height of the rails on this bridge above sea-level is 2,152 feet.

#### PERMANENT-WAY.—RAILS, &C.

From Granville Junction to Bathurst, a distance of 132 miles, the rails are of wrought-iron, double-headed and fish-jointed throughout, and weigh 75 lbs. per yard.

The chairs, of cast-iron, 25 lb. each, are secured to the sleepers with wrought-iron spikes.

#### SLEEPERS.

The sleepers between Parramatta Junction and Bathurst are principally of ironbark timber, 9 feet long, 10 inches x 5 inches and rectangular in shape. They are placed 3 feet apart from centre to centre on straight portions of the road, and on curves of a larger radius than 30 chains, but on all curves from 15 chains to 30 chains radius inclusive the distance apart is 2 feet 9 inches from centre to centre, and upon all curves under 15 chains radius they are laid 2 feet 3 inches apart from centre to centre.

#### BALLAST.

From Parramatta Junction to Penrith, a distance of 21 miles, the ballast consists of broken stone 12 inches in depth from the under side of the sleepers, and of a gauge of 3 inches, and boxed up with broken stone of a gauge of 2 inches for a depth of 8 inches.

From Penrith to Bathurst, a distance of 111 miles, the ballast is of stone broken to a cube of 3 inches, but 6 inches only in depth under the sleepers in the centre of the roadway, and 8 inches in depth and of a width of 11 feet at the back of the border stones (*see drawing*), which are 8 inches in thickness and 12 inches wide, and are laid on each side of the ballasting, their extreme edges being 6 feet 6 inches from the centre of the roadway and laid parallel with the centre line throughout.

The rails and sleepers are laid upon the bottom ballast and boxed up with broken stone of a gauge of 2 inches for a depth of 10 inches from the under side of the sleepers between the rails, and for a depth 10½ inches on the outside of the rails, the width at the top being 9 feet 8 inches, and the bottom width 11 feet 7 inches.

#### CURVES.

The sharpest curve on the portion of the line from Granville Junction to Penrith (21 miles) is of 30 chains radius. Between Penrith and Bathurst, a distance of 111 miles, the sharpest curve is 8 chains radius, the total length of such curves being 5 miles, including those upon the two Zig-zags. There are also on this length 20 miles of curves, ranging from 8 chains to 12 chains radius.

#### GRADIENTS.

## GRADIENTS.

From Granville Junction to Penrith the steepest gradient is 1 in 66 for a length of 74 chains  
From Penrith to Bathurst the total lengths of the steepest inclines are as under:—

1	in	30	for	1	mile	and	63	chains
1	"	33	"	16	miles	and	53	chains
1	"	40	"	6	"		20	"
1	"	42	"	4	"		2	"
1	"	46	"				31	"
1	"	47.89	for				70	"
1	"	48	for				48	"
1	"	50	"	4	miles	and	77	"

making  $35\frac{1}{2}$  miles of inclines, ranging from 1 in 30 to 1 in 50. The longest continuous incline of 1 in 33 is 1 mile 66 chains.

From Bathurst to Bourke, a distance of 353 miles  $71\frac{1}{2}$  chains, the formation of cuttings is 15 feet, and embankments not less than 17 feet.

The highest point reached is at Springsure, about 7 miles from Blayney, and  $3\frac{1}{4}$  miles from Bathurst, and is 3,238 feet above high-water springtides at Sydney.

In addition to the ordinary timber bridge and waterways, there are two wrought-iron lattice girder bridges, each consisting of three clear spans of 150 feet—one crossing the Macquarie River at Wellington, and one crossing the same river at Dubbo.

The girders rest upon cast-iron cylinders, 11 feet diameter at the bottom, tapering to 9 feet diameter at the top. These cylinders are filled with cement concrete, mixed in the proportion of six parts of gravel to one part of cement.

The clear height above summer level of river is 49 feet and 48 feet respectively, and both bridges are 6 feet above the highest known flood-level.

The Bogan River, at Nyngan, is crossed by a timber bridge, consisting of six over-truss spans, 39 feet from centre to centre of piers, with seventeen ordinary 26-foot openings at each end—making the total length of bridge 1,118 feet.

The clear height above highest known flood-level is 4 feet.

The steepest gradient is 1 in 40, for an aggregate length of 12 miles 13 chains; and the sharpest curve is of 12 chains radius.

The total amount of excavation (not including foundations) is 4,789,450 cubic yards.

## PERMANENT-WAY, RAILS, &amp;C.

From Bathurst to Bourke the permanent-way is of a lighter description than that between Granville Junction and Bathurst, the rails being of iron, single-headed, and fish-jointed throughout as far as Dubbo, and weigh 70 lb. per lineal yard. From Dubbo to Bourke the rails are of steel, also single-headed and fish-jointed throughout, and weigh  $71\frac{1}{2}$  lb. per lineal yard. They are in lengths of 24, 21, and 18 feet, and are secured to the sleepers by spikes and screws alternately.

## SLEEPERS.

The sleepers are of ironbark, stringybark, gray and blue gum, and other approved colonial hardwoods, 8 feet long, 9 inches  $\times$   $4\frac{1}{2}$  inches, and rectangular in form. For 24 feet rails, there are nine; 21 feet, eight, and 18 feet, seven sleepers.

The beds for the rails are planed by machinery, inclined from the inside at an angle of 1 in 20. To keep the road in gauge, the rails are notched into the sleepers to the full thickness of the bottom flange on the outside of the rail.

## BALLAST.

From Bathurst, for a distance of 27 miles, the ballast is clean gravel from the River Macquarie; from thence to Wellington, stone broken to a  $2\frac{1}{2}$  inch gauge; between Wellington and Dubbo, a mixture of broken stone and gravel, the latter from the bed of the Macquarie River; from Dubbo to Girilambone, wholly of gravel from the Macquarie River; and from Girilambone to Bourke, the ballast is screened quartz gravel obtained in the vicinity of Wilga, 413 miles from Sydney.

The ballast throughout is 6 inches in thickness under the sleepers, and to within  $1\frac{1}{2}$  inch of the level of the rails on the outside, and 3 inches below the rails in the centre of the roadway.

The width of ballast at the foot of slope is 11 feet 9 inches, and at the top 8 feet 7 inches.

There are eighty-six stations on the Great Western main line, at an average distance apart of 5.70 miles.

## BRANCH LINES.

## WALLERAWANG TO MUDGEER.

This branch leaves the Great Western Railway at Wallerawang, 104 miles 39 chains from Sydney, and after passing through Piper's Flat, Capertee, and Rylstone, terminates in the town of Mudgee, 189 miles 13 chains 15 links from Sydney, being a length of 84 miles 54 chains 15 links.

The highest point reached is at 109 miles 47 chains, and is 3,093.58 feet above high-water spring tides at Sydney.

The steepest gradient is 1 in 40 for an aggregate length of 4 miles 53 chains, and the sharpest curve is of 12 chains radius.

There are two tunnels, constructed for a single line, of an aggregate length of 605 yards, lined throughout with brickwork set in cement.

In addition to the ordinary timber bridges and waterways, the Cudgegong River is crossed at 157 miles 57 chains by an over-truss timber bridge, consisting of five spans of 39 feet each, from centre to centre of piers, with an ordinary timber span of 18 feet at each end. The superstructure is built on piles, and is 9 feet clear above the highest known flood level. The same river is again crossed at 186 miles 53 chains by a bridge of similar construction, having three 39, and two 18 feet spans. This is also built on piles, and is 6 feet clear above the highest known flood level.

The permanent-way is laid for a single line throughout, with flat-bottomed, single-headed steel rails, weighing  $71\frac{1}{2}$  lb. per lineal yard, and is similar in every other respect to that on the main line between Orange and Bourke.

The total amount of excavation, not including foundations, is 3,426,238 cubic yards.

#### RICHMOND BRANCH.

This branch, which is 16 miles in length, is a single line, and joins the main line at Blacktown, 22 miles from Sydney, and was originally constructed for a horse tramway; but before the rails (40 lb. per yard) were laid down, it was decided, on Mr. Whitton's recommendation, to work it with locomotive engines, and rails 55 lb. to the yard were adopted.

This works are of a light description throughout.

#### EXTENSION, MURRUMBURRAH TO BLAYNEY.

This extension is 109 miles 52 chains 10 links in length, and commences by a junction at Demon-drille, on the Great Southern Railway, 231 miles 19 chains 30 links from Sydney, and after passing through Young, Cowra, and Carcoar, joins the Great Western Railway near Blayney, 172 miles 45 chains 57 links from Sydney, thus connecting the Southern and Western main trunk lines.

There is one tunnel on this length, 308 yards long, constructed for a single line, and is lined throughout with cement concrete, mixed in the proportion of one part of cement to six parts of sand and broken stone.

The highest elevation reached on this extension is at 1 mile 73 chains south of junction with Great Western Railway, and is 3,160.26 feet above high-water spring tides at Sydney.

In addition to the ordinary timber bridges and waterways, the Lachlan River, at Cowra, is crossed by a wrought-iron lattice girder bridge of three continuous spans of 159 feet each from centre to centre of piers, having also four end spans of wrought-iron web-plate girders, viz., two of 60 feet, and two of 61 feet in the clear. The superstructure rests upon cast-iron cylinders, which are bottomed on granite, and are filled with cement concrete, mixed in the proportion of one part of cement to six parts of broken stone and sand. These cylinders are 11 feet diameter at the bottom, tapering to 9 feet diameter at the top for the lattice girders, and 7 feet diameter at the bottom and 5 feet diameter at the top for the web-plate girders.

In connection with this bridge, timber approaches have been built at each end across the river flats which are liable to floods. The northern approach consists of one 12-foot and eight 26-foot spans, and the southern of one 12-foot and six 26-foot spans.

The clear height above the highest known flood level is 9 feet.

The steepest gradient is 1 in 40 for an aggregate length of 13 miles 20 chains, and the sharpest curve is of 12 chains radius.

The permanent-way is laid for a single line throughout, with flat-bottomed single-headed steel rails, weighing  $71\frac{1}{2}$  lb. per lineal yard, and the main trunk line from junction with the Great Western Railway to Blayney station, a distance of 1 mile 65 chains 86 links, has been duplicated.

The remainder of the permanent-way is similar in every respect to that between Goulburn and Albury, and Orange and Bourke.

The formation widths of cuttings is 15 feet, and of embankments, not less than 17 feet.

The total amount of excavations, not including foundations, is 2,622,104 cubic yards.

#### ORANGE TO MOLONG.

This line, which forms a portion of the proposed extension to Parkes and Forbes, is 22 miles 57 chains 39 links in length, and commences by a junction with the Great Western Railway at 191 miles 17 chains 61 links from Sydney, and terminates in the town of Molong.

The highest point is reached at 192 miles 60 chains, and is 2,979.09 feet above high-water spring tides at Sydney.

The steepest gradient is 1 in 40 for an aggregate length of 5 miles 57 chains, and the sharpest curve on the main line is of 24 chains radius; but the western fork, at the junction with the Great Western Railway is 15 chains radius, and the eastern fork is 20 chains radius. There is also one short curve of 16 chains radius at the entrance to the Molong station-yard.

The permanent-way is laid for a single line throughout, with flat-bottomed single-headed steel rails, weighing  $71\frac{1}{2}$  lb. per lineal yard. The sleepers are the same in description and arrangement as those on the Bathurst to Bourke section.

The ballast throughout is stone, broken to a  $2\frac{1}{2}$  inch gauge, and is 6 inches in thickness under the sleepers, and to within  $1\frac{1}{2}$  inch of the level of the rails on the outside, and 3 inches below the rails in the centre of the roadway.

The width of ballast at the foot of slope is 11 feet 9 inches, and at the top 8 feet 7 inches.

The total amount of excavation (not including foundation) is 737,034 cubic yards.

There are no works of any special importance in this extension.

## GREAT NORTHERN RAILWAY.

This system connects Newcastle with the table-land of New England and with Queensland. It gradually ascends and crosses the main divide about 225 miles beyond Newcastle, keeping then on its western slope, but at a high elevation throughout, to its junction with the Queensland system. The line commences at the Port of Newcastle, on the River Hunter, about 70 miles from Sydney, 2 feet above sea-level at high-water, and following the valley of that river passes Honeysuckle Point, Waratah, Hexham, East Maitland, and West Maitland—20 miles from Newcastle. At this point the line leaves the Valley of the Hunter, and taking a north-westerly course passes Wollombi, Lochinvar, Branxton, and intersecting the Old Northern Road near to New Froug, again reaches the Valley of the Hunter at Singleton, 49 miles from Newcastle; thence crossing the River Hunter, at an elevation of 150 feet above sea-level, the line ascends a range on the north side of the river to a height of 451 feet, and descends rapidly to Glennie's Creek, 231 feet above the sea; thence passing Camberwell and Liddell, it intersects the Northern Road at 69½ miles from Newcastle; then ascending the Grass-tree Hill, at 73½ miles from Newcastle, and at an elevation of 688 feet above the sea, it gradually descends to Musclebrook; here the Northern Road is again crossed, and on reaching Aberdeen the River Hunter is a second time crossed, at 88 miles from Newcastle, and 560 feet above the sea; thence passing Scone and Wingen the line ascends to Warland Range, 1,400 feet above sea-level, and passing Murulla and Haydonton it reaches Murrurundi, 120 miles from Newcastle, at an elevation of 1,546 feet.

From Murrurundi the line proceeds northward, crossing the Liverpool range in tunnel 528 yards in length, at an elevation of 2,112 feet, passing the towns of Quirindi, Tamworth, Uralla, Armidale, Glen Innes, and Tenterfield to Wallangarra, on the Queensland Border, where a joint terminal station has been established, the New South Wales and Queensland lines overlapping each other on opposite sides of a large and long platform, specially built for interchanging purposes. An elevation of 4,512 feet is reached on this line at Ben Lomond, 400 miles from Sydney, that being the highest point reached by any railway in Australasia.

## EXCAVATIONS AND EMBANKMENTS.

From Newcastle to near East Maitland, 17 miles, the formation widths of both cuttings and embankments are for a double line of way, and 30 feet wide at formation level, with slopes in cuttings of 1 to 1 in ordinary earthwork, but through rock the sides are left perpendicular or with a very slight batter of from  $\frac{1}{2}$  to  $\frac{1}{4}$  to 1. The slopes to embankments are throughout  $1\frac{1}{2}$  to 1.

From near East Maitland to Murrurundi, 103 miles of single line, the formation width of both cuttings and embankments is 18 feet, the slopes being the same as those above described.

## WORKS.

The Bridge over the River Hunter at Singleton, 49½ miles from Newcastle, has five timber openings of 80 feet span each, and two arches of 15 feet each in masonry. The piers and abutments are built in ashlar masonry set in Portland cement. It is designed to carry the Main Northern Road in addition to a single line of railway.

Each span consists of four laminated timber arches under the roadway, having a rise of 12 feet 3 inches. They are each formed of planks 3 inches in thickness, and bent by steaming, and fastened together with wrought-iron bolts. These main ribs are 3 feet deep at the springing, diminishing to 2 feet at the crown of the arch, and are 15 inches in thickness. Resting on the top of each arch is a longitudinal beam of ironbark timber, 12 inches by 12 inches extending the full length of the bridge, supported over the spandrels by open timber bracing. Joists 10 inches by 7 inches, and 30 feet long, are then laid across the roadway 3 feet apart from centre to centre, and covered with 3-inch planking throughout the full length of the bridge. The width between the parapets is 27 feet 6 inches.

The bridge over the River Hunter at Aberdeen, 88 miles from Newcastle, is of the same construction as the lattice girder bridge over the River Macquarie at Bathurst, on the Western Railway, with the exception of the depth of the cylinders, which for this bridge are sunk an average depth of 20 feet below the ordinary level of the water in the river.

## PERMANENT-WAY.—RAILS, &amp;c.

From Newcastle to West Maitland, a distance of 20 miles, the railway is a double line. From that point to Murrurundi it is a single line. The rails are of wrought-iron, double-headed, and fish-jointed throughout, and weigh 75 lb. per yard. The chairs are of cast-iron, 25 lb. each, and are secured to the sleepers with wrought-iron spikes.

## SLEEPERS.

From Newcastle to Murrurundi the sleepers are principally of ironbark timber, 9 feet long, 10 inches x 5 inches, and rectangular in shape. They are placed 3 feet apart from centre to centre.

## BALLAST.

From Newcastle to Singleton, a distance of 49 miles, the ballast consists either of broken stone or gravel from the River Hunter, 12 inches in thickness to the under side of the sleepers for a width of 13 feet, and boxed up for an average width of 10 feet 7 inches, and an average depth of 8 inches.

From Singleton to Murrurundi the ballast consists of clean gravel, 6 inches in thickness in the centre of the roadway, and 7 inches in thickness under the ends of the sleepers, and of a width of 15 feet at the bottom of the slope, and 10 feet 6 inches at the top, boxed up to within 2 inches of the level of the rails in the centre of the roadway, and  $1\frac{1}{2}$  inch on the outside.

## CURVES.

On the line from Newcastle to Murrurundi, with the exception of one curve of 20 chains radius through the town of Musclebrook, there is no curve of a smaller radius than 30 chains.

## GRADIENTS.

## GRADIENTS.

Between Newcastle and West Maitland, 20 miles, the steepest gradient for a very short distance is 1 in 63, and from West Maitland to Singleton 1 in 80.

From Singleton to Muscleshbrook there are four short inclines of 1 in 33, and from Muscleshbrook to Murrurundi the steepest gradient is 1 in 50.

From Murrurundi to the Queensland Border, a distance of 277 miles 78 chains, the line is constructed for a single road, and the formation width of excavation is 15 feet. The formation width of embankments is also 15 feet as far as Tamworth, but from Tamworth to the Queensland Border the width of banks is not less than 17 feet.

There are two tunnels in this extension, constructed for a single line, of an aggregate length of 693 yards, and are lined throughout with brickwork, set in Portland cement.

In addition to the ordinary timber bridges and waterways, the following bridges require special notice, viz.:—

## Bridge over the Peel River, at Tamworth.

”	Peel-street	”
”	Macdonald River.	”
”	Beardy River.	”
”	Severn River	”
”	Bluff River	”
”	Tenterfield Creek.	”

## BRIDGE OVER THE PEEL RIVER.

This is a wrought-iron lattice girder bridge, constructed for a single line, and consisting of one clear span of 150 feet. The superstructure rests upon cast-iron cylinders, 9 feet in diameter, which are filled with cement concrete, mixed in the proportion of six parts of stone and sand to one part of cement.

The south approach to this bridge is constructed of timber, and consists of sixty-nine 26 feet and one 32 feet spans.

## BRIDGE OVER PEEL-STREET, TAMWORTH.

This street is crossed by a web plate wrought-iron girder, constructed for a single line, and consists of one clear span of 61 feet. The superstructure rests upon piers built of brickwork, set in Portland cement.

The Peel River and Peel-street bridges are connected by a timber viaduct, consisting of one span of 31 feet 9½ inches, and six spans of 29 feet 9¼ inches.

The north approach to Peel-street Bridge is constructed of timber, and consists of nineteen 29 feet 6 inches spans.

## BRIDGE OVER THE M'DONALD RIVER.

This is a wrought-iron lattice girder bridge, constructed for a single line, and having one clear span of 150 feet. The girders rest upon piers built of brickwork, set in cement.

## BRIDGE OVER THE BEARDY RIVER.

This river is crossed at 331 miles 63 chains from Newcastle by a timber under-truss girder bridge of nine spans of 42 feet each, and the ordinary abutment spans of 16 feet each, resting upon piles.

## BRIDGE OVER THE SEVERN RIVER.

The Severn River, at 336 miles 42 chains from Newcastle, is crossed by a similar bridge of thirteen spans of 42 feet each, and two ordinary girder spans of 16 feet each, resting on piles.

## BRIDGE OVER THE BLUFF RIVER.

This bridge, which crosses the Bluff River at 369 miles 62 chains from Newcastle, is similar in construction to those crossing the Beardy and Severn Rivers, and consists of ten spans of 42 feet each, with two ordinary girder spans of 16 feet each.

## BRIDGE OVER TENTERFIELD CREEK.

This creek is crossed, at 387 miles 50 chains from Newcastle, by an under-truss timber girder bridge consisting of four spans of 42 feet each, and two spans of 40 feet each resting on brick piers.

The total amount of excavation, not including foundation, between Murrurundi and the Queensland Border is 7,998,469 cubic yards.

## PERMANENT-WAY—RAILS, &amp;c.

From Murrurundi to Tamworth the rails are of iron, single headed and fish-jointed throughout, and weigh 70 lb. per lineal yard. They are in lengths of 21 feet and 18 feet, and are secured to the sleepers by spikes and screws alternately.

From Tamworth to the Queensland Border, the rails are of steel, single headed and fish-jointed throughout, and weigh 71½ lb per lineal yard. They are in lengths of 24 feet, 21 feet, and 18 feet, and are secured to the sleepers in a similar manner.

## SLEEPERS.

From Murrurundi to Tamworth the sleepers are of ironbark, stringybark, tallow-wood and other colonial hardwoods, 8 feet long 9 inches x 4½ inches, and rectangular in form. For 21 feet rails they are placed 3 feet 1 inch apart from centre to centre, 2 feet 6 inches at the joints; and for 18 feet rails, 3 feet 1 inch, and 2 feet 7 inches at the joints.

From Tamworth to Tenterfield the sleepers are of the same description, and for 24 feet rails are placed 2 feet 8½ inches apart from centre to centre, and 2 feet 3 inches at the joints; for 21 feet rails, 2 feet 8½ inches, and 2 feet 3 inches at the joints; and for 18 feet rails, 2 feet 7½ inches, and 2 feet 3 inches at the joints.

From

From Tenterfield to the Queensland Border the sleepers are also of the same description, and for 24 feet rails are placed 2 feet 9½ inches apart from centre to centre, and 1 foot 9 inches at the joints; and for 21 feet rails, 2 feet 9 inches, and 1 foot 9 inches at the joints.

To keep the road in gauge the rails are notched into the sleepers to the full thickness of the bottom flange on the outside of the rails. (*See drawing*)

The bed for the rails is planed by machinery, and inclined from the inside at an angle of 1 in 20.

#### BALLAST.

From Murrurundi to the Queensland Border the ballast is of clean gravel or broken stone, 6 inches in thickness in the centre of the roadway, and 7 inches under the ends of the sleepers, of a width of 11 feet 9 inches at the bottom of the slopes and 8 feet 7 inches at top, and boxed up to within 3 inches of the level of the rails in the centre of the roadway, and 1½ inches at the sides.

#### CURVES.

The sharpest curve is of 10 chains radius.

#### GRADIENTS.

The steepest gradient is 1 in 40 for an aggregate length of 21 miles 4 chains.

#### BRANCHES.

The Bullock Island Branch is a double line, 1½ mile in length, exclusive of sidings, and joins the main line 2 miles from Newcastle. It is a mineral line exclusively, and connects the main line with the extensive wharfs erected by the Department of Harbours and Rivers.

The rails are of steel throughout, and of the same weight and section as the main line. The smallest radius of a curve is 12 chains, and the steepest gradient 1 in 200.

The Morpeth Branch, which is a single line, is nearly 4 miles in length, and leaves the main line at the East Maitland Junction, 18 miles from Newcastle, terminating at the town of Morpeth, the head of the navigable waters of the Hunter River.

The works and permanent-way are similar to those for the main line.

The smallest radius of a curve is 20 chains, and the steepest gradient is 1 in 100.

### NORTH-WESTERN RAILWAY.

#### WERRIS CREEK TO NARRABRI.

This extension is 96 miles 65 chains in length, and commences by a junction at Werris Creek, on the Great Northern Railway, 155 miles 10 chains from Newcastle, and after passing through Breeza, Gunnedah, and Boggabri terminates at Narrabri, 251 miles 75 chains from Newcastle.

The highest point on the line is near its junction with the Great Northern Railway, and is 1,241·30 feet above high-water spring tides at Newcastle.

The steepest gradient is 1 in 50 for an aggregate length of 75 chains, and the sharpest curve is of 20 chains radius.

The permanent-way is laid for a single line throughout, with flat-bottomed single-headed iron rails weighing 70 lbs. per lineal yard, and is similar in every other respect to that on the main line between Murrurundi and Tenterfield.

The other works on this extension are of the ordinary class, and do not call for special mention.

The total amount of excavation, not including foundations, is 1,068,766 cubic yards.

### SOUTHERN AND NORTHERN JUNCTION RAILWAY.

#### HOMEBUSH TO WARATAH.

This extension is 92 miles 54 chains 44 links in length, and commences by a junction with the Great Southern Railway at Strathfield, 7 miles 24 chains 11 links from Sydney, and after passing through Ryde crosses the Hawkesbury River at Long Island, about 10 miles from the point where the river enters the sea at Broken Bay; thence runs along the western shore of Mullet Creek, an arm of the Hawkesbury, for about 4½ miles, and, passing through Gosford, joins the Great Northern Railway at Hamilton, 2 miles north of Newcastle, thus connecting the Southern and Northern main trunk lines.

The total amount of excavation, not including foundations, is 4,370,927 cubic yards.

There are eight tunnels, of an aggregate length of 3,760½ yards, all constructed for double line, and lined throughout with brickwork set in cement. The longest tunnel, which is also the longest in the Colonies, is 1,958 lineal yards, and the shortest is 80½.

In addition to the ordinary waterways and timber bridges, the following have been erected, all constructed for double line, viz. :—

Parramatta River	6	spans of	150	feet,	wrought-iron lattice girders.
Hawkesbury River	7	"	410	"	steel Whipple truss.
Woy Woy River	3	"	61	"	wrought-iron web-plate girders.
Broadwater River	3	"	61	"	" "
Ourimbah Creek	3	"	61	"	" "
Wyong Creek	3	"	61	"	" "
Wallarrah Creek	3	"	61	"	" "
Dora Creek	7	"	61	"	" "
Cockle Creek	4	"	61	"	" "

PARRAMATTA

## PARRAMATTA RIVER BRIDGE.

This is a wrought-iron lattice girder bridge, constructed for a double line, and consists of six spans of 159 feet each from centre to centre of piers; the girders are continuous over three spans. The superstructure rests upon cast-iron cylinders which are bottomed on rock; these cylinders are 11 feet diameter from the foundation to high-water level, and from thence taper to a diameter of 9 feet at the underside of the girders. They are filled with concrete, mixed in the proportion of one part of Portland cement to six parts of broken stone and sand.

## BRIDGE OVER THE HAWKESBURY RIVER.

This bridge is the largest of its kind in the Southern Hemisphere, and, as regards its foundations, one of the most remarkable in the world, that of one of the piers being 161 feet below water-level, this being the deepest bridge-foundation yet constructed. There are seven spans of 416 feet from centre to centre of the piers, which are built upon foundation caissons of novel description, the caisson for each pair being rectangular in form, with rounded ends 48 feet by 20 feet splaying out 2 feet wider all round the bottom. Inside the caissons there are three wrought iron dredging tubes arranged on the longitudinal centre line of each caisson. These tubes, as well as the spaces between them and the inside of the caissons, were filled with cement concrete, forming a solid mass entirely below the water, on which the masonry piers were erected. There are only two other instances of bridge-foundations on this system, the sinking of which was, to some extent, simultaneous with these, namely, the Jubilee Bridge over the Hooghly, in India, and the Poughkeepsit Bridge, over the Hudson River, in America. The masonry in the piers is sandstone, set in cement, excepting the plinth, which is hard trachyte from Bowral. The abutments are entirely local sandstone, set in cement. The superstructure is built up with steel riveted plates, on the Whipple truss principle, and the members are connected by steel pins. One end of each span is fixed to a pedestal, bolted down to the pier or abutment on which it rests, the other end resting on expansion rollers, to allow for movement under varying temperatures. The main girders are 410 feet in length, from centre to centre of bearings, the height of the main girder being 58 feet, the clear width apart of the main girders being 25 feet 5½ inches, to allow for a double line of railway. A double line of rails has been laid down throughout, guard-rails being fixed parallel to them.

The total length of the bridge between abutments is 2,900 feet 3 inches, and the clear height above high-water is 40 feet.

## WOY WOY BRIDGE.

Woy Woy Creek, an arm of the Broadwater at Gosford, is crossed by a wrought-iron web-plate girder bridge, constructed for a double line, and consists of three spans of 66 feet from centre to centre of piers. The girders are continuous, and rest upon cast-iron cylinders, 5 feet in diameter, bedded upon rock. These cylinders are filled with cement concrete, mixed in the proportion of one part of cement to six parts of broken stone and sand.

## IRON BRIDGES OVER THE BROADWATER, OURIMBAH, WYONG, AND WALLARAH CREEKS.

These bridges are similar in every respect to that over Woy Woy Creek, excepting that the cylinders in Ourimbah Creek are bedded on hard red clay.

## DORA CREEK BRIDGE.

This bridge consists of seven spans of 66 feet each from centre to centre of piers, and the girders are continuous over four and three spans respectively, and is in every other respect similar to the bridge over Woy Woy Creek.

## COCKLE CREEK BRIDGE.

This bridge consists of four continuous spans of 66 feet each from centre to centre of piers, and is also similar in every other respect to the bridge over the Woy Woy Creek.

## EXCAVATIONS AND EMBANKMENTS.

The formation width of cuttings is 15 feet for single line and 26 feet for double line, with slopes varying with the character of the material passed through. In ordinary earthwork they are 1 to 1. In rock the sides are left perpendicular, or at such a slope that the material will safely stand it.

All the embankment have slopes of 1½ to 1 throughout, and the formation width is not less than 17 feet for single line and 28 feet for double line.

## PERMANENT-WAY,—RAILS, &amp;c.

The permanent-way is laid for a single line from Strathfield Junction to Brooklyn; from Brooklyn to the north side of the Hawkesbury River, the line is double; from the north side of the Hawkesbury to 99 miles 54 chains it is again laid for a single line; and from thence to junction with the Great Northern Railway for a double line. The rails are of steel, single-headed, and fish-jointed throughout, and weigh 71½ lb. per lineal yard. They are in lengths of 24 feet and 21 feet, and are secured to the sleepers by spikes and screws alternately.

## SLEEPERS.

The sleepers are of ironbark, stringybark, red mahogany, and other Colonial hardwood, 8 feet long, 9 inches x 4½ inches, and rectangular in form. For 24 feet rails they are placed 2 feet 9¾ inches apart from centre to centre, and 1 foot 9 inches at the joints; and for 21 feet rails 2 feet 9 inches, and 1 foot 9 inches at the joints. The bed for the rails is planed by machinery at an angle of 1 in 20, inclining towards the centre of the roadway. To keep the road in gauge the rails are notched into the sleepers to the full thickness of the bottom flange on the outside of the rail. (See drawing).

## BALLAST.

From Strathfield to Gosford the ballast is of broken sandstone, and from Gosford to Hamilton of gravel, excavated from a hill near Teralba, and is 6 inches in thickness under the sleepers in the centre of the roadway, and 7 inches at the ends, 11 feet 9 inches wide at the bottom of the slopes, and 8 feet 7 inches at the top, and boxed up to within 3 inches of the level of the rails in the centre of the roadway, and  $1\frac{1}{2}$  inch at the sides.

## CURVES.

The sharpest curve is of 11 chains radius.

## GRADIENTS.

The steepest gradient is 1 in 40 for an aggregate length of 9 miles 9 chains.

## NORTH SHORE RAILWAY.

## HORNSBY TO ST. LEONARDS.

This line leaves the Southern and Northern Junction Railway at Hornsby, 20 miles 68 chains from Sydney, and is completed for a distance of 10 miles 41 chains to St. Leonards; but it is proposed ultimately to extend it to the deep waters of the harbour at Milson's Point, a further distance of about 2 miles 66 chains.

The works and permanent-way are similar to those for the main line. The steepest grade is 1 in 50, and the sharpest curve is of 15 chains radius.

It will be seen that, excluding the ascent to the Blue Mountains and short lengths on the Great Southern and Great Northern Railways, the prevalent "ruling grade" on all the lines is 1 in 40—that is to say, this is the steepest incline on the different lengths ruling the maximum load to be carried. In such rough country as this Colony generally is, this grade, or near approximations to it, is, by general agreement among engineers, the ruling one most commonly fixed upon. In the Cape Colony, where the mileage approaches that of New South Wales, there is no less than 30 per cent. of the whole length on this grade; while in India, which is generally a flatter country, 1 in 50 has been adopted. This also is the Queensland limit. In Ceylon it is 1 in 44; and on the Canadian Pacific, Southern Pacific, and Central Pacific, lines of unusually great length, it is about 1 in 46. In America generally between 1 in 40 and 1 in 50 has been very generally fixed upon. In exceptional cases throughout the world the 1 in 40 grade has been frequently exceeded.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

EXTENSION OF KIAMA TO NOWRA RAILWAY INTO THE TOWN OF NOWRA.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, and the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, to whom was referred the duty of considering and reporting upon "the expediency of extending the Kiama to Nowra railway from the present proposed terminus, across the Shoalhaven River, into the town of Nowra," have, after due inquiry, resolved that it is expedient the railway should be extended as proposed; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

1. The proposed railway extension consists of one and a-half mile of line to continue the Kiama to Nowra railway from its present proposed terminus on the north bank of the Shoalhaven River, across the river, into the town of Nowra. In the proposal to extend the railway from Kiama to Nowra, upon which the Committee reported on 22 April, 1890, the terminus was to be for the present on the north bank of the river at Bomaderry, and a temporary branch line, three-quarters of a mile in length, was to be constructed from Bomaderry to Broughton Creek Road, close to the road bridge which spans the river, and forms the road communication with Nowra. This terminus had been decided upon by the Department of Public Works in order to save the expense of a railway bridge across the river, until it should be determined to extend the railway to Jervis Bay; and though it was admitted it would be more convenient to the residents of Nowra to have the railway bridge constructed, and the line carried into the town, yet it was thought the proposed temporary branch line from the point on the north bank of the river where the railway bridge would eventually have to be placed, to the neighbourhood of the road bridge, would to a large extent meet requirements, and for the present be sufficient. The Committee thought otherwise, their opinion being based upon the results of an inquiry made by a Sectional Committee who visited Nowra for the purposes of inspection and the taking of evidence. The Sectional Committee considered that the line should be taken to the town of Nowra, in order to secure the maximum amount of traffic, and that it was not advisable to have any deviation from Bomaderry to Broughton Creek Road, in view of the great necessity to construct the railway bridge across the river at as early a date as possible. This expression of opinion, which was set forth in the Report of the Committee, led, with other circumstances, to the proposal, now under consideration, that the railway bridge should be constructed, and the railway taken into Nowra. The official description of the proposed extension represents it as commencing at the terminus of the the Kiama to Nowra Railway at 92 miles 32 chains from Sydney, whence it proceeds across the Shoalhaven River by a bridge just above the entrance of the Bomaderry Creek and the old ferry, and thence curving to the right approaches the town of Nowra, terminating at Worrigece-street, 93 miles 70½ chains from Sydney, the extension itself being a length of 1 mile 38½ chains.

Description of  
the proposed  
extension.

Estimated cost.

2. The estimated cost of the proposed extension, including the cost of the bridge, is £75,000. The estimated cost of the bridge is £60,000. The Acting Engineer-in-Chief for Railways expresses himself as confident that the work can be carried out for the amount stated.

Railway Commissioners' Report.

3. The Railway Commissioners, in accordance with one of the provisions of clause 13 of the Public Works Act, have reported upon the proposal. They point out that the estimate of £75,000 is equal to the cost of  $4\frac{1}{2}$  miles of the line terminating on the Sydney side of the Shoalhaven River, and for "the small traffic to be carried" this expenditure is not, in their opinion, justified. "If," they say, "it is deemed advisable to make the extension, thus increasing the burden in connection with interest and working expenses by £2,925 per annum, we would suggest the introduction of a clause in the bill, authorising the Railway Commissioners to charge for all traffic passing over this one mile as for  $4\frac{1}{2}$  miles."

The evidence in the inquiry.

4. Though the Committee in their Report upon the extension of the railway from Kiama to Nowra recommended the taking of the line to the town of Nowra, it was necessary in the present inquiry to obtain information on some points which were not previously apparent. Those were: the nature of the river bed at the site proposed for the railway bridge, and the question whether a suitable foundation had been found for the structure; the style of bridge proposed; the suggestion of the Railway Commissioners that the traffic over the  $1\frac{1}{2}$  mile of railway extension should be charged as for  $4\frac{1}{2}$  miles; the advantage or otherwise of carrying the railway on to Jervis Bay; and, generally, the results that might be looked for from extending the railway into Nowra.

The site of the railway bridge.

5. The site of the bridge to carry the railway has been chosen at the point of the river indicated for two reasons: to serve Nowra as much as possible, and to avoid crossing the river at a navigable part where, unless the bridge were fitted with a swing, the navigation of vessels trading on the river would be greatly interfered with. A straighter line to Jervis Bay could be obtained by crossing the river nearer its mouth, but if that route were adopted the bridge would have to be a swing-bridge. The site has also been chosen for the reason that a reef of rocks runs from the northern bank of the river so far across the stream that the greater part of the bridge can be built on narrow foundations, and where the deep water exists it will not be necessary to go more than 83 feet below high water for the deepest pier. At this depth also rock will be reached. The foundation of the bridge will therefore be satisfactory. The adoption of this site for the bridge will prevent ocean steamers from going quite as far up the river as hitherto they have been able to do, but it is not anticipated that this will cause any serious inconvenience.

Style of the bridge.

6. The bridge is to be constructed of steel girders upon cast-iron cylinders filled with concrete, the whole structure being in outline similar to the railway bridge across the Hawkesbury. It will carry a single line of railway. In the opinion of the Department of Public Works there will not for a very long time to come be any possibility of a traffic from the district to the railway that will justify the construction of a double line. The reef of rocks at the site chosen for the bridge is, however, sufficiently wide to enable the bridge to be doubled at any time this should be considered necessary.

The extra carriage rate suggested by the Railway Commissioners.

7. In the consideration given by the Committee to the suggestion of the Railway Commissioners respecting the extra carriage rate that should be charged on the proposed extension, it was thought advisable to ascertain from some accredited representative of the town of Nowra whether the residents are prepared to pay such a rate, and Mr. Robert Patterson, Mayor of Nowra, was examined on this point. He states that the residents are quite prepared to pay the extra charge. A majority of the business people, asked by him personally, are unanimous in saying they are agreeable to it. Passengers, also, he said, would far rather travel in the train from and to Nowra than enter or leave the train on the other side of the river. These statements were corroborated by another representative of Nowra, Mr. John Maclean, who also gave evidence on the subject. The proposal of the Railway Commissioners

Commissioners to charge an extra rate on a certain length of railway is new to this colony, but the practice is common in England, and has been followed in New Zealand.

8. The extension of the railway beyond Nowra, though not at the present time actually under consideration, is, nevertheless, a matter of some importance in connection with the proposed extension of the line into the town of Nowra. The extension into Nowra has been laid out primarily in view of the railway going on to Jervis Bay, and, in fact, is part of a general railway scheme having its terminus further south. The evidence taken by the Committee indicates the probability of the railway being so extended, and this is used by those who support the proposed extension into Nowra as an additional reason why that proposal should be carried out.

Extension of  
the railway  
beyond  
Nowra.

9. Generally, the results that may be looked for from the extension of the railway into Nowra are favourable. Nowra is described as being in a flourishing condition, and as steadily progressing. The Chief Traffic Manager of the Railway Department thinks that for a time the extension will be worked at a loss, but he has no doubt that in the course of two, three, or four years it will pay the interest on the cost of the bridge very well. This conclusion he arrives at, he states, "from the immense increase we have had from other stations similarly situated"; and his evidence on this point is supported strongly by a return supplied by the Secretary to the Railway Commissioners, and published with this Report as an Appendix, which shows a very large increase in the traffic to and from Kiama station, the present terminal point of the Illawarra Railway. The Chief Traffic Manager says, moreover, that the bridge is necessary to enable the railway to secure all the traffic that should come to it, for without the bridge much of the produce now going into the town of Nowra will continue to be carried by steamer to Sydney. Another important consideration is that by carrying the railway into Nowra, the temporary line which it was intended to construct from Bomaderry, on the north side of the river, to Broughton Creek Road, will not be required; and instead of a large terminal station being wanted at Bomaderry, a small local station, to meet the convenience of people living on the north side of the river, will be all that is necessary.

General  
results  
expected from  
the proposed  
extension.

10. The Committee are of opinion that the proposed extension should be carried out, and they have arrived at that decision on the grounds set forth in the foregoing portions of this Report, which may be recapitulated briefly as follows:—

Decision  
of the  
Committee.

- (1) In their Report upon the extension of the railway from Kiama to Nowra the Committee recommended the present proposal.
- (2) The people of Nowra are prepared to pay the extra carriage rate proposed by the Railway Commissioners.
- (3) The extension into the town of Nowra is a part of the general scheme for extending the Illawarra Railway from Kiama further south, and the Committee are of opinion that it cannot be very long before the railway is carried to Jervis Bay.
- (4) The prospect of the extension into Nowra proving payable at the extra rate suggested is encouraging.
- (5) By taking the railway into Nowra the expense of constructing a temporary branch railway and large terminal station on the north side of the river will be avoided.

The whole of the evidence in the inquiry was considered by the Committee on Tuesday, 17 March, 1891, and the following extract from the Minutes of Proceedings will show the resolution that was passed:—

Mr. Humphery moved—

"That, in the opinion of the Committee, it is expedient the proposed Extension of the Kiama to Nowra Railway, from the present proposed terminus, across the Shoalhaven River, into the town of Nowra, as referred to the Committee by the Legislative Assembly, be carried out."

Dr. Garran seconded the motion.

Mr. Garvan moved as an amendment on the motion :—

“That all the words after the word ‘Committee,’ in the first line, be omitted, with a view to insert the following: ‘It is inexpedient to approve of the construction of a bridge over the Shoalhaven River until it is proposed to extend the railway into the country south of that river.’”

Mr. Cox seconded the amendment.

The amendment was negatived on the following division :—

Ayes, 2.

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### EXTENSION OF KIAMA TO NOWRA RAILWAY INTO THE TOWN OF NOWRA.

THURSDAY, 19 FEBRUARY, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.	HENRY COPELAND, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JAMES EBENEZER TONKIN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. GEORGE HENRY COX.	CHARLES ALFRED LEE, Esq.
JACOB GARRARD, Esq.	WILLIAM MCCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee proceeded to consider the proposed Extension of the Kiama to Nowra Railway into the Town of Nowra.

Joseph Barling, Esq., Under Secretary for Public Works, sworn, and examined:—

1. *Chairman.*] Perhaps the shortest way will be for you to make a statement of the circumstances under which this work has been initiated? I have only a very few remarks to make with regard to this matter, as I think it has been thoroughly considered by the Committee on a previous occasion, and have, therefore, only to introduce the subject, and hand in the official documents. In introducing this proposed Extension to Parliament, Mr. Secretary Bruce Smith said:—

"This is simply a reference to the Public Works Committee of the advisableness of extending the railway from Kiama to Nowra across the river into the town of Nowra by means of a bridge over the Shoalhaven River. The Public Works Committee recommended the proposal, and it is now submitted to the House."

With regard to the question itself, I may, perhaps, be allowed to quote a paragraph or two from the Report of your Committee.

"The route of the proposed railway appears from the evidence and from the personal examination made by the Sectional Committee to be the best that could be chosen, except that the Sectional Committee are of opinion that the line should be taken into the town of Nowra. \* \* \* \* \* The explanation of the railway construction officers regarding the intention to terminate the line for the present on the north bank of the Shoalhaven River, and about a mile from Nowra, is that the contemplated terminus of the railway is Jervis Bay, and that it is not necessary in order to get to Jervis Bay for the line to go into Nowra. The Sectional Committee, who visited the district, consider the line should be taken to the town, in order to secure the maximum amount of traffic, and that it is inadvisable to have any deviation from Bomaderry to Broughton Creek-road."

With regard to the statement that it is not necessary in order to get to Jervis Bay for the line to go into Nowra, I may refer to the evidence given by Mr. Deane upon that point. He was asked the following questions:—

"If you had to cross the river lower down, would you have to have a swing-bridge? Yes; because steamers go right up to Nowra.

"Of course, if Huskisson or Jervis Bay is the point you are looking at, a straighter line would be to cross the river nearer Numba—nearer the mouth of the river? There is a great bend in the line to get right to Nowra.

"Was the object of that to avoid crossing the river at a navigable point? Partly on that account, and partly to serve Nowra."

I refer to this to show that the location of the bridge has been determined not merely to serve Nowra, but to attain the equally important object of avoiding crossing the river at a navigable point, as would be the case were a crossing at Numba selected, although that would be in the more direct route to Jervis Bay. With regard to the extension of the railway to Jervis Bay, I am to say that the Minister for Works has no present intention of recommending the continuation of the line to that place. I will now hand in the Report of the Railway Commissioners on the subject, the Official Description of the Line which

J. Barling, Esq.  
19 Feb., 1891.

was laid upon the table of the House, and a *précis* showing the state of the case from the point when the last inquiry took place. The following are the Official Description and the Railway Commissioners' Report:—

## OFFICIAL DESCRIPTION OF THE PROPOSED EXTENSION.

Extension of Kiama to Nowra Railway, across the Shoalhaven River into the Town of Nowra.

THIS line commences at the terminus of the authorised Kiama to Nowra Railway at 92 miles 32 chains from Sydney, crosses the Shoalhaven River by a bridge just above the entrance of the Bomaderry Creek and the old ferry, then, curving to the right, approaches the Town of Nowra and terminates at Worrigeer-street at 93 miles 70½ chains, being a total length of 1 mile 38½ chains.

Estimated cost, £75,000.  
December 19th, 1890.

H.D.

## RAILWAY COMMISSIONERS' REPORT.

Office of the Railway Commissioners of New South Wales, Sydney, 4 July, 1890.

## Kiama to Nowra Extension.

THE cost of the line terminating on the Sydney side of the river is estimated at £381,300. Distance, 22½ miles—equal to £17,000 per mile.

The revised estimate for the bridge and extension into the town, a distance of 1 mile, is £75,000, being equal to the cost of 4½ miles of ordinary railway. For the small traffic to be carried this large expenditure is not, in our opinion, justified. If, however, it is deemed advisable to make the extension, thus increasing the burden in connection with interest and working expenses by £2,925 per annum, we would suggest the introduction of a clause in the Bill, authorising the Railway Commissioners to charge for all traffic passing over this 1 mile as for 4½ miles.

E. M. G. EDDY,  
Chief Commissioner.  
W. M. FEHON,  
CHAS. OLIVER,  
Commissioners.

To the Secretary for Public Works, Sydney.

With regard to that portion of the Commissioners' Report in which they advise that a Bill should be passed to enable them to charge over four times the ordinary rate for this 1 mile of railway, the Minister authorises me to say:—"Regarding the Commissioners' suggestion for a differential rate, the Government have come to no determination upon the matter."

2 *Dr. Garran.*] Have the Ministry come to any determination in regard to the extension to Jervis Bay? They have no present intention—that is, the Minister has no present intention of recommending it to the Cabinet.

3. Then the line does not come before us as the Jervis Bay extension? Certainly not.

4. It is purely a Nowra line? At present it is a Nowra line, although I may point out that if there should be an extension to Jervis Bay the section now proposed would necessarily form part of it.

5. I want to have it clear that we are not asked to do this as part of a projected scheme? No; it is simply put before the Committee at present as an Extension into Nowra.

Henry Deane, Esq., Acting Engineer-in-Chief for Railways, sworn, and examined:—

H. Deane,  
Esq.  
19 Feb., 1891.

6. *Mr. Humphery.*] Have you let a contract for the construction of a railway from Kiama to Bomaderry? Yes.

7. Where is the terminus to be? A short distance from the northern bank of the river.

8. Is it marked on the plan by a mile peg? Ninety-two miles and 32 chains from Sydney.

9. Is it proposed that the approach to the bridge shall start from that point? No; the opening of the bridge will start at the river bank, as shown on the sketch plan.

10. You have to cross the Bomaderry Creek? No; the present contract crosses the Bomaderry Creek.

11. Then the present contract takes the line across the Bomaderry Creek to 92 miles and 32 chains;—what distance will that be from the bank of the river? Thirteen chains.

12. How far is that from the existing bridge? Close on half a mile.

13. Can you say what is the estimated cost for constructing the line from Kiama to the point you have indicated on the bank of the river, having in view the fact that you have let the contract for the permanent way? No revision has been made of the estimated cost. The estimated cost is that mentioned previously. The contract has been let for a lower sum than the Government estimate. It was let for about £30,000 less.

14. In designing the bridge now under the consideration of the Committee, did you make an estimate of the cost? Yes.

15. What is the estimated cost? £60,000.

16. Do you think it can be built for that money? Yes.

17. Will that include the approaches on both sides? It will include the abutments on each side.

18. Will it include the whole of the work between the present point and the bridge on the northern side? There are a few chains—13 chains—of earthwork which it would not include, but that is a mere trifle.

19. That is ordinary railway line? Yes. It very likely would include that as well. I expect to be able to build the bridge, if it is authorised, for a trifle under the £60,000.

20. What will be the additional cost of taking the line to the intended terminus near Nowra? That has been estimated at £15,000—the additional cost beyond the bridge of carrying the line into the town.

21. So that the total cost will be £75,000? Yes; it may be a few pounds less than the £75,000. I intend, if possible, to limit the cost of the work by the £75,000. There will not be more than a few pounds difference.

22. That would be covered by the 10 per cent.? Yes.

23. Since you were last examined, have you visited the district and gone over the route of the proposed line? I have been to Nowra since.

24. Can you say anything as to the nature of the foundations of the bridge? Yes. The borings were taken before the other portion of the line was authorised, because the direction that the present authorised line had to take depended upon the borings of the river. The original position for crossing the river was shown to be impracticable, and it had to be shifted. The line that is now being carried out has been carried out in such a direction that the most favourable crossing might be obtained.

25. Will you state what the result of the borings has been? The result has been to show that there is a reef of rocks running across from the northern bank of the river, which enables the greater part of the bridge to be built with shallow foundations. H. Deane,  
Esq.
26. Does that ridge extend right across the river to the southern side? Not right across—it is pretty deep on the southern side. Still, we shall not be under the necessity of going more than 83 feet below high water for the deepest pier. 19 Feb., 1891.
27. Will that pier, which you think will necessitate a depth of 83 feet, rest upon rock? Yes.
28. You have ascertained that beyond doubt? Yes.
29. Of course you are aware that the piers of the existing bridge have not reached rock? No; they only went into mud, or something that was looked upon as a little better than mud.
30. *Mr. Tonkin.*] Does your estimate include all buildings, such as the station-house at Nowra and goods shed? Yes; I consider the £75,000 sufficient to cover that.
31. What will be the grade for this  $1\frac{1}{2}$  mile of line? The grades are practically level.
32. Have you any idea of the nature of the country between Nowra and Jervis Bay? I have not been between Nowra and Jervis Bay, but a line has been staked out.
33. Could you give the Committee any idea of the grades upon that line? No. That line is capable of very considerable improvement, and before a line was submitted I should have it re-surveyed. I do not suppose there is any reason why easy grades should not be obtainable there. I think the ruling grade at present is 1 in 50.
34. Is the country between Nowra and Jervis Bay mountainous or level? The section shows undulating country.
35. Would a line from Nowra to Jervis Bay be an expensive one to construct? The original estimate was about £11,000 per mile, but I believe it could be constructed for about £9,000; but that would include some works at the Jervis Bay end.
36. Would it include the resumptions of land? No.
37. Not including the resumptions of land;—is not that a very high price for an ordinary line? It is quite possible that the cost might be reduced below that amount; but I have nothing reliable to go upon.
38. How many miles is it from Nowra to Jervis Bay? About 15.
39. Is the country between Nowra and Jervis Bay similar to that between Goulburn and Crookwell? No; I think it is of a different character.
40. Which would be the most difficult country upon which to construct a railway? Well, you see, I have not been over it. We know pretty well what the Goulburn to Crookwell line has been estimated to cost. It may be that this line could be so improved as to cost no more than what has been estimated for the Goulburn to Crookwell line.
41. That would be not much more than one-half of what has been estimated for this line? Yes; but I could not say. In this rainy district waterways and culverts will have to be considered, and they would be of a more expensive character than they would be further inland, because you would have to provide for a heavier rainfall. Again, the earthworks would be through harder material.
42. Of course, this portion of the line is to be constructed in a more substantial style;—I presume 72-lb. rails will be used? 71½-lb.—the same as the main trunk lines of the colony.
43. *Mr. O'Sullivan*] If this bridge is constructed, and the line is taken into Nowra, it will save the construction of a portion of a temporary line from Bomaderry? That temporary line, of course, would not be necessary.
44. What was the estimated cost of that temporary line? £3,500. I said in evidence given on a previous occasion:—"The cost of making the branch line I have estimated at £3,500, and the materials that could be utilised would be worth £1,500, so that the cost of the line itself, after making all deductions, would be £2,000."
45. *Mr. Garrard.*] What is the headway of your bridge to high-water mark? 21 feet.
46. That virtually stops all navigation above that height? Yes. It is the same headway as that which has been given for the road bridge.
47. But do not ocean steamers at present go up above the site of your proposed bridge? They do; but there is no reason why they should not stop below it afterwards.
48. They will stop out in the Pacific Ocean if you put a few more bridges across? But you do not want to put any more across.
49. As a matter of fact ocean going boats do come above the present site of your bridge? Yes.
50. Has there been any representation on the part of the steam navigation companies or others in reference to the stoppage of this navigable water? I think the steamers which chiefly run there were owned by the late Mr. Berry, and are now in the hands of Mr. John Hay. He has not objected in the slightest to the alteration.
51. At all events you do not propose to put any swing in the bridge? No.
52. I suppose the bridge is to be constructed for a single line of railway? Yes.
53. Is there any possibility of the trade warranting a double line in the future? Not for a long time to come.
54. So it was thought of the George's River bridge? Yes; but that is comparatively close to Sydney.
55. It is only a matter of years, you know? It is only a matter of years certainly, but all the tunnels on the line from Waterfall downwards are single tunnels. They would have to be duplicated as well as the bridge.
56. They are being duplicated on both sides of that particular bridge, are they not? The tunnels are not being duplicated. The Commissioners have duplicated the line up to Waterfall, and I believe they are taking steps to duplicate in patches beyond.
57. What would be the additional cost of making that bridge to carry a double line of rails;—would it be 75 per cent.? I do not think it would cost anything like that; it would be about 40 per cent.
58. And if in the future the traffic demands a double line across there it means the erection of a new bridge at a cost of £60,000? Yes.
59. I see that the proposed bridge does not run quite parallel with the road bridge;—is that for the purpose of enabling you to get better foundations? The object of that is to follow the rock as much as possible.
60. It looks as if you had gone away to the eastward for the purpose of getting more of a curve? Yes, it does; but if the line had been carried straight across we should have got into greater depths on the southern side of the river.

H. Deane,  
Esq.  
19 Feb., 1891.

61. It was done for the purpose of utilising a better bottom for the bridge? Yes.
62. What sort of a bridge do you want for the Bomaderry Creek, which intervenes? That is on the present contract.
63. I thought you said you only came to 92 miles? 92 miles 32 chains.
64. Does that carry you over the creek? Yes.
65. At all events, the bridge over the Bomaderry Creek has been included in the line now under consideration, and you have only to face this bridge? Yes.
66. What is it built of? Timber.
67. What is the proposed bridge across the river to be built of—iron or steel? I have got out the estimate for steel.
68. Wooden piles in the shallow portion, or iron? Iron.
69. Cast iron, wrought iron, or steel? Cast iron cylinders filled with concrete.
70. What size? Five feet.
71. What is the size of the main cylinders in the river? Eleven feet below, and 8 feet at the top.
72. It is a similar plan of bridge to that over the Hawkesbury? Yes; it is similar in outline, but the Hawkesbury is a pin-bridge.
73. Is there much valuable property to resume in order to get so close into the centre of Nowra as you propose to go? I think not. Where we approach Nowra, after making the bond, there is a little bit of rising in the ground on the left at 93 miles 30 chains, but beyond there, stretching away to the left, there is a big swamp, so that there is really no choice in the direction of the line. You could not go straight, because you would go through a swamp.
74. Are the crossings over the Terrara-road level crossings? Yes.
75. Do you propose to deviate the road where the line goes upon it for several chains? Yes; that would have to be deviated.
76. Is there any way of overcoming these level crossings except at very increased expense? I do not think so. The present Terrara-road level is about 8 feet below the formation level. It would have to be lowered 10 feet to have a proper crossing.
77. There would not be room to get a load of hay under that? No. Besides, you have to allow for the thickness of the bridge. I do not think it would be desirable to attempt to abolish the level crossing there. Of course, there are cases where level crossings must be adopted.
78. Are you of opinion that level crossings are undesirable where you can get rid of them at any slight expense? I do not like level crossings at all.
79. What is the originally estimated cost of the bridge to cross the river? £97,000.
80. That was upon the old site, higher up? Yes.
81. There you would have to have gone considerably deeper for your foundations? Yes.
82. And getting the better crossing has diminished the cost? Yes.
83. Does crossing the river lower down where you now propose to cross increase the length of the line at all? Not appreciably.
84. What you have lost on one side you have gained on the other, I suppose? Yes.
85. Have you come to any conclusion as to what will be the probable life of this bridge? It will, I think, last long enough for all purposes.
86. Was the actual price for which you have let the Kiama to Nowra line higher or lower than your estimate? It was about £30,000 lower.
87. You have based your present estimate, I suppose, on information gained in connection with the tenders for that line? No; those tenders would not be any guide at all.
88. They are principally earthworks on that line? Yes.
89. And the great expense in this instance is the bridge? Yes.
90. And in connection with that bridge you have bridges of a similar character to work upon? Yes.
91. Are the longitudinal girders steel or iron? They are steel. I propose to have them all of steel.
92. I thought you said you were going to have wood? Yes, over the Bomaderry Creek, but not in connection with this bridge.
93. *Mr. Garvan.*] Will any additional traffic, either goods or passenger, be developed by the construction of this railway to Nowra? I have not considered the traffic question.
94. Does not that question affect the question of advising the construction of the line? It does; but as under the Public Works Act the Railway Commissioners are expected to report upon these matters, I have been given to understand that it is undesirable that I should express any opinion upon them.
95. You have been given to understand that, I presume, from the Ministerial head? Yes; and therefore I have not considered the matter from that point of view.
96. But still this Committee is a superior authority to the Minister in asking for information. If you have any information to guide us it is our duty to obtain it from you? I regret to say I have not.
97. From your knowledge of railways generally, and the locality through which this railway passes, do you know of any special trade which is likely to be developed by the carrying out of the work? I can say this—that if the line is carried into Nowra, business people there are much more likely to use it than they would be if it is left on the northern side of the river, because there will be less inducement for them to go to the steamers.
98. You think that by taking the line to Nowra they would be more likely to send their goods to Sydney than they would be if it were left as it is? Yes.
99. Do you think that that would make any appreciable difference? I really have not considered the amount.
100. Do you know the nature of the trade between that district and Sydney? Agricultural produce and dairy produce.
101. I understand you to say that you have not travelled over the country between Jervis Bay? No.
102. But you understand generally what the character of the country generally is. Have you any report from any official as to the character of the country? Yes, there are reports.
103. Is it a level country? It is undulating, with low spurs. The section does not show the country to be level.
104. What are the relative levels of Nowra and Huskisson? They will be about the same.
105. So that any deviation from a perfect level would be by an intervening rising and falling of the ground? Yes.

106. I understood you to say that if the railway were to be constructed there it could be constructed for about £9,000 a mile? £11,000.
107. I understood you to say afterwards that it might be constructed for half that amount? I said I believed it could be reduced by about £2,000.
108. Would it be possible to construct a railway from Nowra to Jervis Bay for the same amount as it will cost to construct this bridge and approaches across the river? You mean for £75,000?
109. Yes? Without further survey I am not in a position to say.
110. You could not say definitely that it would be impossible to do it? I do not think it is likely, because even at £6,000 per mile it would amount to £90,000, and that would not allow for any works at the termination.
111. If it would only cost about the same to construct a railway from Nowra to Jervis Bay, which would you recommend for any purpose for which a railway should be constructed—to make the 15 miles of line from Nowra to Jervis Bay, or to make this bridge across the river? If you made the line from Nowra to Jervis Bay without the bridge you would have an isolated length of line, so that if I had the choice I should prefer the bridge.
112. The line from Nowra to Jervis Bay would serve the needs of a number of people who would want to send their produce to a deep-sea fishing port, would it not? I do not say that the advantages to be gained would be so great.
113. *Dr. Garran.*] Who was the officer who made the borings? Mr. Hutchison.
114. He is quite a trustworthy officer? Yes.
115. You have no doubt or anxiety on that score? Not at all. Mr. Wright was also in the neighbourhood at the time.
116. You had Mr. Wright's testimony to support the testimony of Mr. Hutchison? Yes.
117. And from their reports you are quite satisfied? Yes.
118. Looking at the plan, the cap of the reef has been washed away at the point where you will have to go deeper? Yes.
119. But it is equally sound as rock? Yes.
120. Is the breadth of the reef enough to enable you to double the bridge hereafter? Yes.
121. Have you a good foundation for a double bridge? Yes.
122. You would simply have to duplicate your work? Yes.
123. Who surveyed the extension to Jervis Bay?\* Mr. Wright.
124. How long ago was it done? In 1888.
125. It has never been examined since? It has been examined. I have been down there.
126. You have not examined it with a view of improvement? I went down and looked over the ground with Mr. Wright, and decided what course the line was to take.
127. I am speaking of the extension to Jervis Bay—who examined that? Mr. Wright has been down part of the way.
128. But who originally laid out the route? I do not remember; I think it was Mr. Hardy.
129. Is he still in the Department? Yes.
130. How long ago was that done? A good many years ago.
131. It is quite possible, looking at the improvements which have been made in many lines, that improvements might be made in this? Yes, I am sure they could be made.
132. With that knowledge any estimate at present is really worthless? Yes.
133. You might improve the grade? Yes.
134. You might diminish the earthworks? Yes.
135. So that it is all in the air at present as to what that line would cost? Yes; nothing really reliable has been obtained.
136. And the estimate you have given us may be looked upon as a large maximum? Yes.
137. It could not exceed that? Certainly not.
138. And you have not been instructed to make any more careful surveys? The fact is, that there has not been time. It would have been done if there had not been so much pressing work in addition.
139. We may say, practically, that we know very little about the possibility of that extension? As to cost?
140. Yes? You know that the price is limited by the amount given, and that it might be considerably reduced.
141. All you can say is that it is a comparatively easy country, and that the line would not exceed in cost the amount you name? Yes.

John Wright Esq., District Engineer, Department of the Engineer-in-Chief for Railways, sworn, and examined:—

142. *Chairman.*] You are the surveyor who has been engaged in the survey of this line? In correcting the survey, or making alterations of the line from Kiama to Nowra, and a portion of the distance to Jervis Bay, but I have not been able to complete it yet.
143. You have, at all events, made a complete survey of the line as far as Nowra? Yes.
144. And you are acquainted with the route from the terminus on the north side of the river to the town of Nowra? Yes.
145. How long have you resided in the district? Two and a half years.
146. Are you aware of the character of the trade which is carried on? Yes.
147. Is it a very fertile district? Yes, it is very prolific.
148. And a large grain producing district? Yes.
149. Large quantities of maize are produced? Yes.
150. And lucerne? Yes, and hay and dairy produce.
151. What is the value of land in the neighbourhood of which it is proposed to build the bridge? Quite recently 40 acres not quite a mile from the line were sold for £100 an acre.
152. And you think that most similar land about there would realise a price equal to that? Yes.
153. The grain traffic from there now is, I assume, taken by the steamers? Yes. 154.

\* NOTE (on revision) :—I replied to this and the following questions thinking that Dr. Garran said "Nowra," not "Jervis Bay."—H.D.

- J. Wright,  
Esq.  
19 Feb., 1891.
154. They come right to Sydney? Yes.
155. And they go right up to the town of Nowra? The Illawarra Steamship Company send a drogher up the river of light draught of water. They cannot send their steamers up. They have a steamer of light draught which comes up the river as far as the present bridge. Mr. Berry has small steamers of 40 or 50 tons which come right up from Sydney. The Illawarra Steamship Company's steamers remain at Crookwell Point—10 miles from Nowra.
156. Then there are two lines of communication? Yes.
157. Do you suppose, from your knowledge of the district, that if the railway were constructed to Nowra the sea trade would be diverted to the railway? I could hardly speak definitely in regard to that. I can only speak from my former experience that up to 100 miles in other parts of the world, and between that and 150 miles, railway carriage must, in consequence of its almost certainty of despatch and arrival, beat a sea traffic.
158. Have you travelled much between Nowra and Jervis Bay? Not quite to Jervis Bay. As far as the Currumbene was as far as I could get to.
159. How far is that? 11 miles from Nowra.
160. What is the distance from Nowra to the Bay? 15 or 16 miles.
161. Are there any very formidable difficulties in the way of railway construction in the shape of estuaries, creeks, or rivers? There is only the Currumbene Creek. That will be rather a difficult crossing.
162. Is it tolerably good agricultural country down there? It is not good agricultural country. You could judge of it best by saying that it is something like the country between Parramatta and Penrith. If it were cleared it would be very much the same country.
163. There is no agricultural soil as in the neighbourhood of the Shoalhaven River? No, excepting some good flats along the valley of the Currumbene.
164. *Mr. Copeland.*] Do you anticipate any coal being discovered in that neighbourhood? We are trying to discover coal. Perhaps I am interested in the matter and had better not give evidence on the point. I am one of a syndicate boring for coal down there.
165. In what direction? Some considerable distance to the west of Jervis Bay.
166. Have you not ceased boring there? No, not yet.
167. You might, if you do not object, give the Committee any information which you have as to the probabilities of obtaining coal where you are boring? I should not like to do that.
168. Can you say how deep you have gone? We are only down about 180 feet at present.
169. Do you know of any outcrops of coal in that neighbourhood? I do not—I have not seen any.
170. Are there any deposits of limestone or anything at all likely to give traffic to a railway from Nowra to Jervis Bay? I should think that the gold discoveries about the Yalwal would give a deal of traffic to a line between Nowra and Jervis Bay. The Homeward Bound and other mines are turning out very well.
171. Can you say whether there are any iron deposits at Jervis Bay? I could not say anything about its mineral resources at all.
172. Do you anticipate that the people from Nowra and that district would travel by rail to Sydney, or would they travel from Nowra to Jervis Bay and come up by steamer? Although they have the steamer to their doors, the evidence given to the Committee some twelve months ago showed that the coach traffic between Nowra and Kiama was something like 400 per week. The steamers hardly carry a passenger at present. The people would never go to Jervis Bay for the purpose of travelling by steamer.
173. I do not mean the passenger traffic, but the goods traffic;—do you know what the freight is from Nowra to Sydney by steamer? I have no idea.
174. You are aware that large steamers would be able to go into Jervis Bay? Yes.
175. And that they would take freight at much less rates than small steamers? Yes; but I do not think that the people would send it, as it would incur two handlings when there need be only one. Probably if the goods were going to Melbourne or any of the southern or western colonies, produce would be shipped at Jervis Bay, but anything coming this way would, I think, come by rail.
176. You think they would rather pay the heavy railway rates than the slight railway rate to Jervis Bay, and ship their produce there? Yes. You overlook the two handlings. There is the handling of the goods upon the train and upon the steamer. You have a good example of railway and steamer competition at Kiama at present. The passenger and goods traffic of the steamers there has fallen off very much. It is decreasing daily, whereas the railway traffic is increasing daily.
177. The passengers come by train to Sydney? Yes, and the carriage of perishable goods on the railway is daily increasing. They are not sent so much by steamer as they were, so the agents tell me.
178. I suppose you do not know whether any coal has been discovered about Nowra itself, or whether there are any indications of coal? No. The geological stratification is against its discovery.
179. *Mr. O'Sullivan.*] You were present in the Court-house at Nowra when the Sectional Committee sat there? Yes.
180. Did you not hear some valuable evidence given with regard to the traffic from Nowra to Sydney by sea as well as by land? Yes.
181. Did you not hear storekeepers say they would prefer to use steamers unless the railway were brought into the town of Nowra? Yes.
182. Did they not give evidence to show it would be cheaper for them to use the steamers? Yes.
183. Owing to the cost of transit from Nowra to the present station across the bridge? The mile and a half was the bone of contention.
184. Was there not a general consensus of opinion that it would be far more profitable to use the railway if it were constructed? Yes.
185. *Mr. Lee.*] Do you notice the position of the line from Bomaderry Creek to the town of Nowra. Is there any possibility of avoiding that immense curve which has to be taken and to have the line straightened? At 10 chains below the present road bridge the foundations were found to be 160 feet in depth, and they got narrower and narrower as we went down the river. We were bound to go in the direction indicated on the plan in order to get the shallowest foundations.
186. In the event of the foundation difficulty having been overcome, could the line have run in a straight direction? Yes.
187. Would the saving in that respect have been greater than the extra cost of the foundations? No.

J. Wright,  
Esq.  
10 Feb., 1891.

We could construct five 60-foot spans for one-half the money that we could construct one 300-foot span for. We could not possibly get a more direct route into Nowra. We were bound on the one hand by an immense swamp, and the great depth of the foundations on the southern side of the river precluded any possibility of our going any higher up.

188. You thoroughly explored that portion of the country and the bearings for the site of a bridge, and in your opinion that is the most suitable and only site available? Yes.

189. You are very clear on that point? I am.

190. You have been Resident Engineer in charge of the line for some time? I have.

191. You were always in charge of the line from Kiama to Nowra? Yes.

192. Have you given much attention to the district beyond Nowra, towards Jervis Bay? No; I have only been over the line for the purpose of seeing whether we could improve it.

193. Are there any obstacles which would present themselves if it were determined to take the line to Jervis Bay? No.

194. Are there any water-courses? Yes, a great number.

195. Would it be an expensive line? No.

196. The work could be carried out at an average cost? Yes.

197. Is the country between Nowra and the Currumbene Creek as good as it is between Nowra and Kiama? No.

198. The nearer you approach the coast the worse it is? No, not in that case.

199. As you have been compelled to reside in the district for some time, you have, I suppose, noticed the development of trade? Yes.

200. Is it not a fact that there is one trade which formerly never came to Sydney by boat—that is, the milk trade? Yes; they could not carry it with sufficient despatch.

201. It is now growing into a large trade? Yes.

202. Is it feasible to suppose that that class of trade would come from Nowra? I do not think it would come from Nowra itself; but the butter and what-not would come from there.

203. The cost of taking this line from the present terminus to Nowra—1½ miles—would be £75,000? Yes.

204. Can you offer any suggestion by which that amount might be reduced? No.

205. A cheaper description of bridge for instance? No.

206. Do you think that is the minimum of cost? That is a question which I never interfere with.

207. I ask you as an engineer whether you can offer any suggestion by which it can be constructed for a less amount? No; the matter has been discussed by Mr. Deane and myself, and the 60-foot spans are the most economical where the foundations are very shallow.

208. Do you know of any cheaper system? No, I do not.

209. From an engineering point of view you are prepared to adopt that bridge? I am.

210. *Mr. O'Sullivan.*] How would you describe the bridge;—of what character is it? It is an ordinary plate girder bridge upon cylinders, and a Webb girder, I suppose, for the balance; but that is a question with which I have nothing to do; it comes within the province of the Chief. My work is mostly outside, and I have very little to do with estimating, excepting when I am in the office.

211. Supposing you were asked as an engineer to produce a bridge, would you have chosen that bridge? Undoubtedly.

212. In your opinion, it is the best kind of bridge for a river like the Shoalhaven? Undoubtedly. It is a question in which you are governed by the foundations, and the foundations only. Had they been 100-foot foundations we should have had to adopt larger spans, 300-foot spans.

213. *Dr. Garran.*] You said that the Yalwal traffic would feed the extension from Nowra to Jervis Bay? Yes.

214. Does it now go to Nowra straight? Yes.

215. Would it hit some station beyond Nowra itself? Yes; I think so.

216. How far out? Some few miles out.

217. Yalwal is to the west of Nowra? West and south.

218. If the line were continued to Jervis Bay, which has a magnificent harbour, is it not possible that the Melbourne steamers might call there on their way from Sydney to Melbourne? No doubt.

219. And in that case would not a great deal of passenger and goods traffic trend down to Jervis Bay to take the steamer there? No doubt.

220. People from Shoalhaven would not take the steamer in Sydney when they could get in at Jervis Bay? No.

221. Do you think the coal near Kiama would find its way more cheaply to Jervis Bay than to Sydney? Yes; it would be very much cheaper to send the coal almost from Wollongong.

222. You have not been on foot the whole of the way to Jervis Bay? No.

223. How far have you been? About two-thirds of the distance—11 or 12 miles.

224. From what you saw, do you think the line as laid out could be improved? It might be; but I do not think there would be very much improvement. The ruling grade now is 1 in 44, and we might probably reduce it to 1 in 50. We might probably run out some of the curves and reduce the earth-works.

225. But, as it is undulating country, you must have a certain quantity of cuttings and embankments? Yes, and the waterways will be somewhat expensive, as there are so many water-courses.

226. *Mr. Tonkin.*] Have you lived long at Nowra? Not long in the district. I go to Nowra regularly. I lived there five or six months, whilst the borings were being proceeded with.

227. Have you noticed whether the place is prospering? It appears to be.

228. Do you think there are sufficient indications of prosperity to warrant the additional expenditure of £75,000 in the erection of this bridge? I do.

229. You know that a larger sum has already been voted by Parliament to construct the railway to the river;—do you think the prosperity of the place warrants the expenditure of an additional £75,000? Yes.

230. Do you know that the interest upon that amount would be nearly £3,000 a year? Yes.

231. Do you think that that would be likely to be returned from the district in addition to what would be returned from the construction of the railway to the river? I hardly think that, but still it is part of the scheme, and it is a very important township. It is one of the most important townships of the south, and it is the centre of a very fertile area.

- J. Wright,  
Esq.  
19 Feb., 1891.
232. Could you give the Committee any idea as to whether the inhabitants of Nowra would be satisfied to pay a little extra freight for this concession—this bridge—that is to say that they would be satisfied to pay upon one mile of railway what would ordinarily be charged upon  $4\frac{1}{2}$  miles of railway? That is a matter upon which I could not express an opinion, but I think they would.
233. Do you think, if the question were left to the inhabitants of Nowra, they would agree to the bridge being constructed on the condition that they paid freight upon  $4\frac{1}{2}$  miles of railway instead of upon a mile of railway? I think they would.
234. Then you think it is not an unfair thing for the Commissioners to be allowed to charge a little extra on account of the extra expenditure? I cannot say anything about that; I decline to express an opinion on the policy of the Commissioners. They know their business and I know mine.
235. I am not asking your opinion upon the policy of the Commissioners—I am asking you whether you think the people would be satisfied to pay the extra money? But you asked me if I thought that that clause which the Commissioners wish to insert in the Act was unfair or not.
236. You believe that the people themselves, rather than be without the bridge, would be satisfied to pay this extra freight? I think so.
237. Do you think it would be a fair thing to the country at large to tax the other portion of the country for the special benefit of the people of Nowra to the extent of £3,000 a year? You are now touching a question of policy, and if you will excuse me I will prefer not to answer.
238. Can you give us an idea of the proportion of engineering difficulties between Kiama and Nowra, as compared with those between Nowra and Jervis Bay? I think it would be about half as light—that is to say, it would cost about half the money per mile.
239. If one cost £17,000 per mile the other would cost about £8,500? Yes.
240. You know the country between Nowra and Kiama? Yes.
241. And you have been over it sufficiently to enable you to form that estimate? Yes.
242. *Mr. Humphery.*] In the event of this bridge not being constructed at present, do you think it would be long before it would be absolutely necessary to have it constructed, in order to secure the maximum amount of the traffic of the district? I do not think it would be long before the bridge would have to be constructed.
243. Have you taken into consideration what the cost of the temporary station buildings on the northern side of the river will be? There was an estimate made.
244. Do you think if the line were to terminate for any period on the northern side of the river it would have the effect of creating a new township there in rivalry to the existing Government township of Nowra? No doubt it would. Wherever you make a railway terminus whatever township there may be there will increase. At Kiama there is no township—there is a graveyard on one side and the sea on the other.
245. The land on the northern side of the river is not Government land? No; it is private land.
246. Under the circumstances, do you think it would be desirable that the railway should stop on the northern side of the river at the present time, or that it should be carried across at once as part of the present scheme of extension from Kiama to Nowra? Yes; I think it ought to be carried on.
247. You think it would be better? I think it would be better for everybody. It must be borne in mind that it is part of the scheme to extend the line to Jervis Bay, which will have to be undertaken at some time or other.
248. Can you say whether the traffic on the Illawarra line during the past year has increased? It has increased wonderfully.
249. Appreciably? Wonderfully, and it is still increasing.
250. It is just a year since the Report on the proposed line from Kiama to Nowra was presented—do you think the traffic since that Report was presented has been very much greater than the traffic of the previous year? Yes; I can give you one instance. Mr. McLean, the stationmaster at Kiama, told me he took £200 on Christmas Eve for passenger fares from Kiama alone.
251. Can you say whether the traffic between Kiama and Nowra has increased? Yes; it is increasing daily.
252. Has it increased, do you think, in proportion to the traffic between Kiama and Sydney? Yes.
253. *Mr. Cox.*] In the event of differential rates being imposed by the Commissioners between the present proposed terminus and the one on the south side of the river, would not the objects sought to be attained, be defeated by people sending their goods to the present proposed terminus, rather than the one on the south side of the river, in order to obviate the payment of the extra charge it is proposed to make? You mean that if there is a station on the north side of the river, the people will send the whole of their produce there rather than load it at Nowra?
254. And pay the extra charge which the Commissioners propose to impose? That is a question which I could only answer in this way. Say that the charge is 1d. per ton per mile, it will cost them  $4\frac{1}{2}$ d. They could not take it over and bring it back from one side to the other for that amount, so I suppose it would not make much difference.
255. That only means for heavy goods—for coal and so on; but for light traffic it would be perhaps 2s. 3d., 2s. 6d., or 2s. 8d. per ton per mile? I do not know that it would make much difference.

---

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

- H.  
McLachlan,  
Esq.  
19 Feb., 1891.
256. *Mr. Humphery.*] Are you in a position to say whether the traffic between Kiama and Sydney has increased during the last year over the year 1889? I think there has been an increase; but, of course, the results have not been worked out. We do not keep separate sections.
257. Are you not in a position to say whether the returns from Kiama to Sydney have been greater this last than they were in the previous year? Not from memory.
258. Do you include the whole of the suburban traffic in the accounts you keep? We do not work out a section; but I could look the matter up, and see if the passenger and goods traffic from Kiama to Wollongong has increased. That would be a factor to the whole question.
259. In your accounts, do you not divide the traffic (say) from beyond Waterfall and that which occurs between Waterfall and Sydney? We do not keep sectional returns at all now.

260. Would the local stations be able to supply the local traffic? Yes; the actual amount of business done at each station.

261. Are you able to say, without referring to the stationmasters, whether there has been an increase? I could not say from memory, but I could soon ascertain and let you know.

262. Have the Railway Commissioners given any consideration to the proposal to Extend the Railway into the Township of Nowra by the erection of a bridge? Yes, they have.

263. It is proposed to charge for  $4\frac{1}{2}$  miles instead of for  $1\frac{1}{2}$  miles, the actual length of the line? Yes.

264. Has it been customary to make a similar increased charge where the construction of a portion of the line, for the purpose of bringing it into a township, has been more expensive than the cost of the whole of the line? No; it has not been customary in this colony.

265. Has a similar course been pursued in connection with any line now being operated by the Commissioners? Not in this colony.

266. Then this is a new departure? It is. I may say that we have one somewhat similar instance in connection with the tramway to Camden. Mr. Lackey was Minister at the time that line was laid down as a feeding-line. The people expressed themselves as being prepared, if they could only get the line, to pay an increase on the ordinary charge. Practically, they pay about double rates.

267. Do they still pay double rates? They still pay higher than the ordinary rates.

268. What would be the ordinary rate for  $1\frac{1}{2}$  miles between the present terminal point and Nowra? The charge is as 5 is to 2. Of course, the charge varies according to the class of merchandise carried. There are different rates for different descriptions of traffic.

269. How do you regulate;—by a mileage rate? Yes.

270. For passenger and goods? Yes. If you take the goods classification you will see that the mileage varies according to each mile.

271. What is the third-class mileage rate between Kiama and Sydney? It will come to about 7d. a mile for general goods.

272. Then you propose to charge about three times that? We charge for 5 miles as against 2.

273. You charge 1s. 9d. as against 7d. the ordinary rate? It would be about 1s. 9d. additional for general goods.

274. You ask for permission to charge all traffic passing over  $1\frac{1}{2}$  miles from the present terminal point into Nowra as passing over  $4\frac{1}{2}$  miles? I may put it in this way. The half-mile we charge as a full mile. We want to charge 2s. 11d. for the full distance.

275. That is three times the ordinary charge? Nearly.

276. Is it intended to have a railway station on the northern side of the Shoalhaven River? The proposal is to bring it into the town.

277. At the present time? At present the proposal is to have it on the Sydney side of the river.

278. Do you propose to build a railway station? Yes.

279. In the event of the line being extended to Nowra, will it be necessary to build a station there? You will want to have a small local station there.

280. One and a half miles from Nowra? There would be a number of people come in on that side of the river.

281. Do you think that by making the extra charge you will get from the increased traffic a fair return on the cost of the bridge? I do not know if we should get increased traffic, but the existing, at that rate, would help us to get a fair return on the cost of the bridge. Of course, by charging the ordinary mileage rates it would not.

282. Unless the railway were taken to Nowra would you not lose a large amount of traffic, which would go by steamer? I am not sure of that—I do not think so.

283. You think it would make little or no difference to the residents of Nowra if the railway were  $1\frac{1}{2}$  miles from the township? I think we should get the same passenger traffic. For instance, at Kiama, where they have an awkward distance to go, I think we get all the passenger traffic.

284. Is it not extremely inconvenient at Kiama at the present time? That is admitted.

285. Do you think that it is a mistake to terminate the line at the present station? No doubt it would be a greater convenience to have it in the township.

286. Would it not have been better to have taken the railway to Kiama instead of stopping at the present terminal point? It would be a great convenience, but of course that is a matter which is regulated by the Government of the day.

287. Would it not be more convenient for working the railway? It would have been a great convenience in every way, both for the people and for us. It would have paid us better.

288. *Mr. Tonkin.*] Do the Commissioners intend carrying the railway from Nowra to Jervis Bay? They have never reported upon that proposal; it has never been submitted to them.

289. Do you think it would be advisable to construct the line to Nowra as a terminus, at a cost of £75,000, if there was no provision to allow the Commissioners to charge extra for freight carried? The Commissioners think it would not pay without making the extra charge.

290. Then that would be a tax upon some other portion of the country? It would in that sense.

291. Does not all the revenue from the railway go into one sack, so to speak? Yes.

292. And those parts of railways which do not pay have to be paid for by those parts which do pay? Of course, it is borne by the colony as a whole.

293. Knowing that, do you think it would be justifiable for us to recommend the expenditure of £75,000 at a loss to the country of £3,000 a year? I think the Commissioners have said that they would not be prepared to recommend it unless they could get, on account of the increased expenditure, a charge upon 5 miles, so as to help to pay the interest on the cost of the bridge. It has not been usual in this colony to make such a charge, but it is usual at home. We have several instances. For instance, there is a bridge on the North Eastern line, near Newcastle, about half a mile in length, and the Railway Company gets paid six times the amount of the ordinary haulage on account of the increased cost of that bridge. Then there is the Runcorn Bridge, near Liverpool. Traffic across this bridge pays for 7 miles instead of for one. I believe over the Tay Bridge the traffic pays for 10 miles instead of for one.

294. With regard to the construction of a station on the Sydney side of the river, whether the railway went into Nowra or not that station would have to be constructed? I am inclined to think the people would ask for it.

H.  
McLachlan,  
Esq.  
19 Feb., 1891.

- H. McLachlan, Esq.  
19 Feb., 1891.
295. How would you get the river traffic from the droghers, or small boats coming down the river, into your trains if you had not a station on the bank of the river? Unfortunately, I am not well acquainted with the locality, but it seems to me that we should require a small station on the banks of the river.
296. Under any circumstances? It almost seems so.
297. That is whether the line is carried to Nowra, or whether it stops where it was originally intended to stop? Yes.
298. So that that expenditure cannot be taken into consideration as a reduction on the £75,000? Not materially. Of course a smaller station would do, and there would be less working expenditure.
299. Do you think it is likely that any produce coming down the river, if you had not a station on the banks of the river, would be carried  $1\frac{1}{2}$  miles to Nowra, instead of being shipped on the river and sent round by water? I think a station would be demanded on the side of the river, and no doubt it would help us to get the river traffic which we might otherwise lose.
300. Is not there a certain amount of traffic on the northern bank of the river, which could not very well be got across the river to Nowra for shipment? I think it would be much more convenient on the northern side of the river. For instance, it would accommodate the Cambewarra district.
301. If the terminus were to be at Jervis Bay, I take it that it would be hardly fair to ask the people of Nowra to pay this extra charge for carriage? Perhaps that would have a bearing on the matter, but that extension has never been considered.
- 301 $\frac{1}{2}$ . And this Extension is wholly and solely for the benefit of the people of Nowra? Yes.
302. *Dr. Garran.*] How long will it be before the present contract for Nowra is completed? I have not the facts before me—it is carried out under a different Department.
303. You do not know whether the bridge can be opened at the same time as the line? I should hardly think it can. The iron work would have to be imported.
304. And you think that for some time the traffic will have to stop on the north side? Yes.
305. Supposing you carry out the plan for an extra charge, would not there be some risk of an omnibus taking people from Nowra to the Bomaderry side for 3d. or 4d., and so “jockeying” you? Some people might do it, but I think you would find that most people would go from the terminus and pay the extra charge.
306. You do not think you will be cut out by that traffic? Not to any extent. A through carriage would regulate the whole thing.
307. *Mr. O'Sullivan.*] This extra charge will be put on, I suppose, because the people of Nowra are to obtain a special benefit by the crection of this bridge? They are to get this benefit—that the railway will be brought into their town instead of remaining  $1\frac{1}{2}$  miles outside.
308. You are building a tramway from Yass Station to Yass—are you going to impose a special charge upon that? I do not think that point has actually been decided. No doubt we will charge a local rate, which will be higher than the through rate from Yass to Sydney.
309. Is it not a fact that, proportionately speaking, some districts of this country have always been paying for the benefit of other districts? By paying for railways which do not pay their way?
310. Yes? I daresay it could be looked upon in that light.
311. The colony as a whole gets the benefit of railway construction? Yes.
312. Therefore it is no real loss to any particular district? No, the country gets the benefit as a whole.
313. With regard to the suspicion that you may be “jockeyed” out of your freight by unloading taking place at Bomaderry—what will be the freight from Bomaderry into Nowra at the fourfold rate? It will depend upon the class of traffic. Upon maize it would only amount to 3d. or 4d. a ton.
314. Do you know that they would have to pay 2s. 6d. a ton for produce from Nowra to Bomaderry Station by the old bridge? No doubt it would come to 2s.
315. If those are the rates sworn to in this Report, there is not much likelihood of the Department being cheated out of freight by unloading at Bomaderry? I do not think there would be any.

THURSDAY, 5 MARCH, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

THE HON. ANDREW GARRAN.

THE HON. FREDERICK THOMAS HUMPHERY.

THE HON. WILLIAM JOSEPH TRICKETT.

THE HON. GEORGE HENRY COX.

JACOB GARRARD, Esq.

HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.

WILLIAM SPRINGTHORPE DOWEL, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

JAMES PATRICK GABVAN, Esq.

The Committee further considered the proposed Extension of the Kiama to Nowra Railway into the Town of Nowra.

David Kirkealdie, Esq., Chief Traffic Manager, Railway Department, sworn, and examined:—

- D. Kirkealdie, Esq.  
5 Mar., 1891.
316. *Mr. Tonkin.*] What position do you hold? I am Chief Traffic Manager.
317. How long have you held that position? About two years.
318. You know the portion of the line which we are investigating? I have never been on the ground, but I know it from statistics and hearsay very well.
319. Can you place any statistics before the Committee as to the probable returns from the proposed Extension? I went into the question about eighteen months ago, and the approximate amount arrived at then was £6,157.
320. You are referring to the annual return? Yes.

321.

321. Do you know the cost of the proposed extension from Kiama to Nowra? I find from the printed papers that the estimate of the Engineer-in-Chief is £538,633. D. Kirkcaldie,  
Esq.  
5 Mar., 1891.
322. I am alluding to the particular portion between the present terminal point and the township of Nowra? I think it was put down roughly at £75,000, including bridges and approaches.
323. Have you seen the estimate of coaching traffic which has been placed before the Committee by the Secretary for Railways? I have not.
324. Have you any idea of the passenger traffic? Not the slightest.
325. Does this sum of £6,157 include the goods as well as the passenger traffic? Yes; it is made up in this way: About £2,891 is put down for coaching traffic, passenger traffic, parcels traffic, and mails, and the balance of £3,266 is put down for goods and live stock traffic.
326. When was that estimate made? About eighteen months ago, I think.
327. Is the traffic increasing or decreasing? It is increasing.
328. Is there any perceptible increase; is there anything to warrant an alteration in these figures? Yes; there is a very large increase which I shall be able to show presently, when I get the statistics which I have sent for.
329. Looking at these returns which have been placed before the Committee, you will see that the Extension is expected to yield three times your estimate;—can you say if it will come to anything like that amount? No; it will not amount to anything like that.
330. Your estimate refers to that part of the line between Kiama and Nowra? To the north side of the Shoalhaven River.
331. In framing that estimate did you allow for the increased traffic likely to accrue from the construction of the railway beyond Nowra to Jervis Bay? We allowed a little, but not much.
332. Do you not anticipate a very large increase of traffic from such extension? There will naturally be a large increase. The total earnings at Kiama and Mount Kembla Stations for 1889 were £4,688 19s., while for 1890 they amounted to £7,283 2s. 2d.
333. Is not that a marvellous increase in twelve months? Yes. Pretty well all the stations down there, I may mention, are showing a very large increase.
334. In your estimate of £6,157 have you allowed for any increase of that sort? Not for any prospective increase. We simply took the traffic which we might reasonably expect to get at the time of the opening of the railway. I may mention also that at Wollongong, where we are also in competition with sea carriage, the revenue was £6,330 17s. 1d. in 1889, and £7,797 15s. 4d. in 1890.
335. If the railway is taken across the Shoalhaven River into the township of Nowra, is it your intention to carry at the same rates right throughout? There has been a proposition to charge an increased rate over the bridge.
336. Is it the intention of the Department to make that charge? It has been talked of, but I do not know if it will be carried out.
337. What is it likely to be? Well, a charge, probably, of twice or thrice the ordinary mileage rate might be made.
338. Do you know whether the inhabitants of Nowra have agreed to that proposition, or whether they know anything about it? I do not think the matter has ever been mentioned outside the Department.
339. Where did it emanate from? From the practice adopted elsewhere.
340. Why is it suggested in the case of this line? To cover the increased cost of the bridge—£75,000 for a half-mile bridge. It may not be done, it has simply been mentioned. On the high-level bridge at Newcastle-on-Tyne the circumstances are somewhat the same as they are at Shoalhaven; the bridge there is half-a-mile in length, and they charge for 3 miles. Again, in New Zealand, on the line from Wellington to Masterton, a charge of about 3 miles is made for every mile over those very steep gradients.
341. Was it not principally on account of that suggestion that this proposition was put before Parliament? I think it is very probable.
342. Have you any idea of the class of country beyond Nowra? No; except from hearsay.
343. Have you heard that it is likely to carry a large population? I am told that it is magnificent country.
344. You know from experience, I suppose, that wherever a line has been constructed into good country the traffic has increased wonderfully? Always.
345. The mere construction of the line would increase the traffic? Yes.
346. And also the population? In a good agricultural country it always follows that, with the construction of a railway, the traffic develops largely.
347. Have you any doubt in your own mind about this Extension paying if it is carried out? It may not pay for a year or two, but I have no doubt that it will pay eventually; in a couple of years it will pay very well.
348. Do you know what the principal traffic will consist of? Farming and dairy produce, stock, and general goods.
349. Is any mining carried on there—is there any likelihood of getting an increased traffic from mining? I am not aware of anything of that kind.
350. Do you know if this Extension has been carried out with a view to making a further extension to Huskisson, as is suggested on that map? I have no knowledge, but I believe it has been mentioned.
351. You cannot say that it is absolutely the intention of the Commissioners to charge this extra rate over the river? I cannot.
352. It will probably be governed by the returns of the Extension? Very likely.
353. *Mr. O'Sullivan.*] If this bridge is not constructed the line will remain on the north side of the Shoalhaven River? Yes.
354. The town of Nowra—the centre of trade in the district—is situated on the south bank of that river? Yes.
355. Is it not probable, unless this bridge be constructed, that the large amount of trade which ought to go by railway will go by steamer from Nowra? I think it is probable. The wharf, as I understand, is on the south side of the river; if the railway is not carried across the river the station will be on the north side, and everything will have to cross the river; and, to that extent, we shall be handicapped.
356. Is it not a fact that at the present time the rates charged by steamer are lower than the rates that will be charged by railway? Yes.

- D. Kirkcaldie, Esq.  
5 Mar., 1891.
357. Therefore it is extremely probable that unless you construct a bridge across the river much of the trade now going to the town of Nowra will still go by steamer? Yes.
358. Therefore, the bridge is absolutely necessary to make the Kiama to Nowra line profitable? I cannot say that, but it will be an increased facility to the Nowra people.
359. *Mr. Garvan.*] If the bridge is not constructed do you think you will lose any passenger traffic that otherwise would come to the line? I do not think so.
360. Consequently, the construction of the bridge will not bring any additional passenger traffic? No.
361. Will it bring additional goods traffic? I think so; it must to some extent.
362. To the extent of paying interest on the cost of the construction of the bridge? I do not say it will for a time. It is just a matter of time when the bridge must be constructed, whether it is now or some years hence.
363. In expressing the opinion that in time the bridge must be constructed, have you in view only the local requirements of the place, or the extension of the railway beyond that place? The extension of the railway beyond.
364. Will it not then be time enough to deal with the bridge when it is proposed to extend the railway beyond? Yes; but for the sake of the interest on £75,000 I think it is always best to give the greatest amount of facilities we possibly can.
365. If all the steam passenger traffic will come by the railway with the terminus where it is now that will come if you construct the bridge, does it not seem a waste of expenditure to build a bridge at a cost of £75,000? I would not say that entirely. I think you will get a certain amount of traffic from away up north.
366. But a mile will not make any difference as far as the passenger traffic is concerned? No.
367. Does not the passenger traffic constitute much the larger source of revenue? No; it is rather less than the goods and live stock traffic.
368. A return placed before the Committee by the Secretary for Railways, shows that the outward coach and goods traffic at Kiama for the twelve months ending December, 1889, amounted to £847 5s., but that the passenger traffic yielded a revenue of £2,631? Yes, but since then I should think that things have been pretty well reversed, as we have given them facilities which did not exist before for the conveyance of goods traffic.
369. For 1890—I am speaking now of inward traffic—the revenue from goods amounts to £2,177, and the revenue from coaching traffic amounts to £6,915. If the coaching traffic constitutes so large a proportion of your revenue, and you will not increase the coaching traffic at all by the construction of this bridge, do you think still that it will be desirable to go to the expense of constructing the bridge? Yes, I think it will. It is the goods traffic that we must take there. It is not the passenger traffic that we shall get.
370. Can you form any estimate of how much more goods traffic you are likely to get by the railway if you construct this bridge? I could not; I do not for a moment say that the bridge is indispensable. What I say is, that for the sake of the interest on the £75,000, particularly as it is only a question of time when the bridge must be built, and additional facilities given to the inhabitants of Nowra, the expense might almost as well be incurred now as in two or three years time, when, in my opinion, the bridge will have to be constructed as the railway is carried further on.
371. But your supposition is that the bridge must be constructed in view of the extension of the railway beyond? Quite so.
372. But there is no proposal at the present time to extend it? No.
373. Would it not be fitting to wait until it is proposed to extend the railway beyond? Perhaps it might.
374. As far as I can form an opinion from inquiries, there will be no increase in the passenger traffic, and very little increase, if any, in the goods traffic from the construction of the bridge? Not very much.
375. From a business point of view, what argument weighed with you in advising the construction of the bridge? Simply the facilities that will be given. It is not a question of money with me. I should simply say, in view of the facilities that will be afforded to the people of Nowra, that it would be better perhaps to construct the bridge now than in two or three years' time.
376. But supposing it were decided not to extend the railway beyond Nowra, would you advise the construction of the bridge? Yes; it is a good public work. I think it is a pity to stop a railway about 1½ miles from the town.
377. How do you estimate the goodness of a public work—is it not by the facilities which it will give to trade? Yes.
378. But from your evidence I gather that it will give no additional facilities to bring passenger traffic, and very little for goods traffic? Not to the Railway Department; it will give great facilities to the people of Nowra.
379. But not in proportion to the expenditure? The expenditure will only be the interest on £75,000—that is, £3,000 a year.
380. Would it be a fair question to ask you whether you think the railway will be extended beyond Nowra in any short space of time? That question I could not answer; but I should think it will.
381. I would not suggest the question only that the nature of the answers have been to justify the construction of the bridge in view of the possible extension of the railway beyond Nowra? I should think it will be extended. As far as my information goes, the country is of such a character that it will well warrant the extension of the railway beyond Nowra.
382. Beyond Nowra, in what direction—do you mean on to Jervis Bay? On to Jervis Bay.
383. Have you ever been over the country between Nowra and Jervis Bay? No.
384. Are you under the impression that it is very rich land? I do not know anything about the country immediately around Jervis Bay, but I believe there is very good country between the two points.
385. If you were to learn that the country between Jervis Bay and Nowra is only very moderate land—rather indifferent land—would it in any way influence you with reference to the construction of a bridge? I do not think so.
386. If the character of the land was so poor that you would not think it would pay to extend the railway on to Jervis Bay, would that alter your opinion as to the advisability of constructing this bridge? I do not think so. I am not saying that the bridge should be constructed in view of the extension of the railway to Jervis Bay alone. I think the facilities which it will give will be very large by-and-by.

387. It will be giving facilities to do a business which, I understand, will not come to the railway? Not to the Railway Department. It will simply give facilities to the people of Nowra, and, of course, as regards the country around, there will be a mile and a half less distance for the people to go. D. Kirkcaldie,  
Esq.  
5 Mar., 1891.
388. *Mr. Humphery.*] Has not the extension of the railway to Kiama had the effect of creating traffic? Yes, largely.
389. When was that line opened? On the 9th November, 1887.
390. It has, therefore, been open the whole of 1888, 1889, and 1890? Yes.
391. Will you say what the traffic was during 1887? That information I have not with me at present.
392. It was considerably less than it was in 1888? Very much less.
393. In your opinion, has the opening of the railway to Kiama had the effect of increasing traffic—that is to say, in the year 1890 over the year 1889? Yes, undoubtedly.
394. Has that increase of traffic been in consequence of the opening of the railway and the facilities afforded for transit? Well, a good deal of the traffic has been taken from the steamers by the more speedy transit afforded by the line.
395. Was not that transit given during 1889? Yes.
396. Yet there is an increase of nearly 70 per cent.? From £4,639 to £7,283.
397. How do you explain that increase? Simply by reason of the greater facilities and the greater production down there.
398. The growth of the traffic was through the facilities afforded by the railway? Yes.
399. Is it likely that you will secure the maximum traffic in the Shoalhaven district unless the bridge is constructed over the river? Well, I think we would, to a large extent. I would not like to go so far as to say that we will not get traffic if the bridge is not built, but I think we shall certainly get more if it is.
400. Do you think the Extension of the line to Nowra will cause an increase of traffic proportionate to the increase of traffic which has taken place at Kiama during 1889 and 1890? I would not like to say as much as that, but there is no doubt that it will lead to the development of the district, and probably increase the traffic a little.
401. Therefore, although it may not return the interest on the cost of construction immediately, you think it will in the course of a few years? I do.
402. In order to cover the interest on the cost of construction, there is a proposal to charge a mile and a half from the present terminal point to the town of Nowra as  $4\frac{1}{2}$  miles? Yes.
403. That would be inappreciable on the total distance of 95 miles? Yes.
404. Therefore, the inhabitants of Nowra could well afford to pay that increased haulage charge? Very well.
405. And have no reason to feel dissatisfied at being placed on a slightly different footing through other people using lines which have been less costly? Oh, no. I am quite sure that they would rather pay the increased rate, and have their goods taken into the town of Nowra, than have them left on the northern side of the river.
406. Of course, they would have to pay cartage if the line were not taken across the river? Yes; they would have to pay for cartage.
407. Would you recommend the construction of the bridge? I would.
408. Will it be better for the Department, in working the railway, to have the terminus in the town of Nowra instead of on the northern bank of the river, one mile and a half from the township? It does not matter to the Department as far as expenditure is concerned. It will cost a little more for expenditure.
409. Will it cost more to work the line at Nowra than on the northern side of the river? Yes; because I think we shall have to keep a staff on the northern side of the river, too, in order to catch a certain amount of traffic.
410. Must you not have a station there to catch the Cambewarra traffic? Yes.
411. That would be necessary in any case? Yes.
412. In answer to Mr. Tonkin you gave some figures for the years 1889 and 1890, as showing the traffic at Kiama during those years;—will you look at the return furnished by the Secretary for Railways, and also his letter, and tell me if you have not made a mistake in these figures? I gave you the earnings at Kiama for the year ending June, 1890. I gave you the figures for the railway year.
413. Taking the year 1889, what was the inward coaching traffic? That I cannot tell you from this return. The number of tickets issued at Kiama was 10,820, and the revenue derived at Kiama from the coaching traffic was £3,929 5s. 2d.
414. The Secretary's return shows the coaching traffic for 1889 to be £5,500 inwards and £4,346 outwards, so that, according to that return, the coaching traffic for the year was nearly £10,000? Yes; I was giving you the figures for the outward traffic alone—for the coaching traffic.
415. Do you think Mr. McLachlan's return, showing the coaching traffic to be nearly £10,000 for 1889 and £11,740 for 1890, while the goods traffic was £4,070 for 1889 and £6,895 for 1890, correct? Yes, certainly.
416. You observe there is a very appreciable difference between these figures and the figures which you gave? Yes; I was giving you the figures from the Commissioners' Report.
417. *Dr. Garran.*] Supposing it were absolutely certain that the line was not to be extended beyond Nowra for ten years to come, would you still recommend the construction of a bridge on its own merits? No, I would not.
418. Not even if you could get the extra charge for coaching? Yes; then I would say that the bridge ought to be constructed, because the loss would be very small.
419. Do you think that if the bridge were made, and that charge were levied, the people could not "jockey" you by taking the omnibus from the town to the north side of the river, and get in there? But experience tells us they would not do it.
420. Do not people expect to be carried by railway a great deal more cheaply than by coach? Yes.
421. The Sectional Committee brought up evidence to the effect that people are travelling now very largely from Shoalhaven to Kiama at a coaching charge of 6d. a mile;—what were you charging by railway? About 2d. a mile.
422. They will go three times as cheap? Yes.
423. If you tried to charge them 4d., would they pay it willingly? Yes; they would have increased facilities.

- D. Kirkcaldie, Esq.  
5 Mar., 1891.
424. They would pay it rather than not have the railway? Rather than travel by coach.
425. You think you could levy, if the line were not paying, a coach levy of 4d., and get paid? I think so.
426. You think that people will not go out of their way to pay for a short distance like that? I do not think so.
427. Looking at that district as a traffic manager, does it strike you that an extension of the line to Jervis Bay, looking at the harbour there, is likely to be a profitable one? I have never been in the district, but I understand that the country round about Jervis Bay itself is not good.
428. Looking at the possibility of Jervis Bay being a shipping port, with coal and other products going down to Melbourne, do you think there is likely to be a coal traffic on that line? I do not think so. I do not think there will ever be very much coal shipped there for Melbourne.
429. Would any of the coal mines be nearer to Jervis Bay than to Sydney? No.
430. Would it pay them better to come to Sydney? Yes.
431. Would not all the produce from that district going to Melbourne or Adelaide prefer to go from Jervis Bay rather than from Sydney? Unfortunately there is none going—it all comes to Sydney.
432. Sydney is the best market? It is the only market.
433. Suppose the people oversupplied the market and had to ship, would Jervis Bay be the nearer port for them? I do not think so. I think Wollongong would, if they make the improvements there which are contemplated.
434. At present larger vessels can get into Jervis Bay than can get into Wollongong in all weathers? Yes.
435. The large coasting steamers running down to Melbourne would not call at present at Wollongong? Not at the present time. They will by-and-bye.
436. If there were any export from that district would Jervis Bay make a port of shipment for the district? That depends entirely on the sort of accommodation which is provided at Wollongong.
437. Supposing Wollongong remains as it is? Then I should say Jervis Bay is the proper place, or perhaps Lake Illawarra.
438. Supposing that the district between Nowra and Jervis Bay is only second class country, and is therefore not very productive, is there likely to be any considerable shipment at Jervis Bay if that extension is made? I do not think so.
439. You are not prepared to say that it is likely to be a very profitable line? No.
440. The extension would have to depend on other circumstances—either naval reasons or the expediency of getting to Jervis Bay? Quite so.
441. The making of the bridge depends very largely on the probability of the extension to Jervis Bay? I would not say that. I should say that if the Railway Commissioners can get 4½ miles' freight for 1½ miles' journey, by all means make the bridge.
442. You say erect the bridge on its own merits, irrespective of any possible extension? Irrespective of any possible extension in that case.
443. *Mr. Cox.*] You are aware that there was a very large traffic from Kiama before the railway was extended to that place? Yes.
444. How was that conveyed? By sea principally.
445. Is there a considerable amount of traffic conveyed now by steamer? I believe there is a fairly considerable amount, but nothing like what there used to be.
446. With regard to the questions put to you by Mr. Humphery, the large increase in the traffic from Kiama to Sydney is due in fact to the steamers being shunted? Not shunted altogether. There is a good deal of traffic there now. It is partly due to the development of the district, and partly to the removal of traffic from the steamers to the railway.
447. The railway gets the traffic which the steamers previously had? A pretty large portion of it. Still, we carry a great deal more milk from the district than was ever carried before.
448. But in quoting these figures, it is unfair to say that all this traffic has been developed by the railway? It has not been developed by the railway altogether.
449. It has been partly taken by the railway to the detriment of the steamships, I suppose? It is partly due to the development of the district, and partly to the removal of traffic from steamers to the railway.
450. *Mr. O'Sullivan.*] Dr. Garran asked you a question just now as to the likelihood of this railway developing passenger traffic beyond Nowra, is it not a fact that many passengers in going to Great Britain land from the steamers at Plymouth, and take the railway to London in order to avoid a trip through the Channel? Yes.
451. Is it not likely that if a little town is established at Jervis Bay, passengers by steamers will land there, and take the railway to Sydney? I do not think so.
452. If they do it at home why should they not do it here? They do it at Melbourne.
453. We are talking about the future;—we know that Jervis Bay is not Plymouth just now; but there may be a thriving little city there yet, and, if that should be the case, is it not likely that passengers will land there in a good harbour, and possibly the mails will be landed there too, and brought up to Sydney by the railway? I do not think so. I think passengers who want to avoid the sea will land at either Adelaide or Melbourne.
454. Do you not think they would save a day's trip by water if they could? They can save more by landing at Melbourne; I do not think they will land at Jervis Bay.
455. *Mr. Garvan.*] What will be the increased revenue from the extra charge over the bridge, supposing it is levied at the rate of 4½ miles for 1? I have not made that calculation at all.
456. Could you not give me a rough estimate of what it is likely to be? I should say it would be from £1,500 to £2,000 a year.
457. From all sources—goods and passengers? Yes.
458. That would be the total income? The total increase.
459. In order to get that total increase, what would it cost for wages and wear and tear? Nothing like that.
460. More than a third, I suppose? Not more than a third at the outside.
461. That would give you, roughly speaking, £1,000 a year net? Yes.
462. That £1,000 would not nearly pay the interest of the cost of construction, would it? No. I am taking that increase on whatever we would get from going into Kiama. I should put down the interest at £3,000 a year.
- 463.

463. The not increase on the revenue you would get would be the difference between £1,500 or £2,000, and the cost of getting that revenue? Yes. I should estimate the total amount derived from the north side to the south side, supposing  $4\frac{1}{2}$  miles are charged, at about £2,000.
464. That is the increase on your revenue? Yes.
465. What do you put down as the total goods and passenger traffic for the whole of the line from Kiama to Nowra? £6,157; that is nearly all the Nowra traffic.
466. How many miles of line is that? 22 miles, I think.
467. The total estimated revenue is about £6,000 for 22 miles of railway, and you think you would get £2,000 extra by extending the line over the river? Perhaps £2,000 is rather a high estimate in that case; but in the course of a very short time we should get it.
468. You look at £2,000, then, as a good maximum amount to obtain in two or three years? Yes.
469. And a third of that sum would go for expenses, leaving you about £1,300 to pay the interest on the cost of construction? Yes.
470. Then it would be a largely losing investment, would it not? For a time it would. I have no doubt that in the course of two, three, or four years it would pay the interest on the cost of the bridge very well, if the district is what I have heard it is.
471. You have not shown us any figures or estimates that would justify that conclusion? I can only suggest the conclusion from the immense increase we have had from other stations similarly situated. It is impossible to give any figures which would justify an assertion of that kind except by drawing a comparison with other stations.
472. If it is decided to construct this bridge, do you think it will make a further extension of the railway more likely than if we decline to take that course? I think it is highly probable.
473. It would be more likely to secure the additional extension? Oh yes; it will be a large expenditure.
474. *Mr. Trickett.*] You propose to impose differential rates at the end of the line? Yes. It has been mentioned.
475. Is there any place in the colony where that policy is adopted? Not in Australia, but there is in New Zealand.
476. Is it a similar case in New Zealand? In New Zealand the charge is three times the actual distance, over the steepest part of what is known as the Rimutaka Range, from Wellington to Masterton.
477. How long is the line over the ranges? About 5 miles of 1 in 17.
478. Is that found to answer the public convenience? Oh, yes.
479. For that 5 miles they charge 15 for all passengers and goods? Yes.
480. From your experience in New South Wales, do you not think an agitation would be started immediately to get these differential rates altered? I have no doubt whatever that it would. I daresay that in time there would be no hesitation in withdrawing the differential rates; but for a time, in order to give better facilities, I think the Commissioners will be perfectly justified in calling upon the people to pay the additional rate if the bridge is constructed.
481. If the railway goes across the river it will not go right into the town—it cannot go into the centre of the town? No, not into the centre.
482. The terminus would be about a quarter of a mile from the centre? Yes.
483. How far is the present terminus from the centre of the town? About a mile and a half.
484. So that the people will gain a mile and a quarter by the proposed Extension? Yes.
485. Do they not take all their produce now to the steamers? Yes.
486. How far is the wharf from the centre of the town? About a mile.
487. Does not a great deal of this produce come from a very long distance round Nowra? Yes.
488. Of what area of country can Nowra be said to be the centre? I could not say.
489. Twenty miles, do you think? I should think about 20 miles.
490. Does it make much difference to the traders, when they have travelled 20 miles, whether they take their produce a mile further? No; I do not say it does; but there is a certain class of produce which will never come by steamer—for instance, the milk traffic. In fact, the whole dairy produce traffic has grown enormously since the railway was constructed to Nowra.
491. They now have to take their produce to the steamer; does it matter much to them whether they take it a mile further to the railway? Not for the present description of traffic.
492. Then this proposed expensive bridge and railway are to meet future requirements? To a large extent, for the future.
493. *Mr. Tonkin.*] I think you misunderstood me a little in regard to the figures; the figures, as furnished by the Secretary for Railways, state that in 1889 the coaching traffic at Kiama amounted in round numbers to £13,850, and the goods traffic for the same period amounted to about £4,000? Yes, those are the earnings of all traffic booked to and from Kiama.
494. And in the following year, 1890, according to these figures, the coaching traffic amounted to £11,700, and the goods traffic to £8,000, showing an increase in one year of about £7,000? Yes.
495. These figures, you say, are correct? Yes.
496. That increase could not be caused by the extra traffic which you took from the steamers? Not all; there is the development to be counted.
497. Nearly the whole of the increase must be due to development? A great deal of it is. Of course, the traffic has been pretty largely increased by the opening of the Bombo quarries. There is a large body of men working there.
498. That is no new development, because it was carried by the water before? It was, to a small extent.
499. Do you think much of this increase is due to taking traffic away from the steamers? There is a certain amount.
500. And the steamers are still losing ground? I think so.
501. Nevertheless, there must have been a large percentage of the increase due to development? Yes.

William Lovegrove, Esq., Agent and Financier, sworn, and examined:—

502. *Chairman.*] Are you a resident of Sydney or Nowra? I am a resident of Sydney at present, but I have property in Shoalhaven.
503. Are you engaged in business in Sydney? I am an agent and a financier.
504. *Dr. Garran.*] Do you know the nature of the proposition before this Committee? Very well.

W.  
Lovegrove,  
Esq.  
5 Mar., 1891.

W.  
Lovegrove,  
Esq.  
5 Mar., 1891.

505. You know the locality very well? Every inch of it.

506. Do you think, in the interests of the district, it will be better to stop on the north side of the river than cross to the south? If you stop on the north side you will interfere considerably with vested interests on the south side of the river, and besides that you will lose a great deal of traffic.

507. How? On the south side of the river there are three municipalities, each containing a large population. If there is a station on the south side they will come up, as they have been accustomed to come, to Nowra, where every facility in the way of shops and that sort of thing has been provided for their benefit, and in addition to that they will have the railway; but, on the other hand, if they have to go over to Bomaderry, they will go over to a place which is still bush, and they will feel that the vested interests which may arise will be liable to be rudely shaken when the railway is carried on further, in the same way as North Kiama at the present moment does not attract any population, because it has been felt all along that the railway would have to be taken to Kiama itself.

508. Still, the station at North Kiama accommodates the traffic of Kiama? Not very well.

509. We are told that very few passengers now take the steamer from Kiama to Sydney? Yes.

510. I suppose everyone who takes the railway would be going northward? Yes.

511. He would not refuse to take the railway because he had to go a mile and a half in an omnibus? I have been used to seeing traffic on the railways at home as well as out here, and I know that the traffic very largely increases from the presence of the railway, that if a railway is not there a traffic never begins to be made, and the traffic alters in its quality and quantity because of the facilities given.

512. Is not the facility which the railway gives, even if the station is on the north side of the river, so great as to cut out all competition? No, I think not; nor is it so great as to encourage travelling from certain parts of the district.

513. Do you think that if the railway stops on the north side of the river the people will send their produce by steamer to Sydney? I do not think of Sydney only in the matter. There will be a great suburban traffic, as it were, from one end of the district to the other.

514. The suburban traffic could only be from the town of Nowra to the north side of the river? There is the town of Nowra, the village of Terrara, Numba, and Greenwell Point.

515. The railway does not go through them all? No, it will serve them all.

516. There will not be any suburban traffic between these points on the railway? I think so. At the present time a great many persons living on the south side ride 15 or 20 miles to Broughton Creek—that is to Berry—to attend cattle sales and things of that sort. Well, these people will go by rail if the line is extended. And people from Berry, wanting maize, will very likely go to the south of the district if they think they can get it a few pence cheaper, and the traffic in the district will be larger.

517. You are of opinion that the passenger traffic will considerably increase if the bridge is made? I have no doubt of it.

518. And, looking at the extra cost of  $1\frac{1}{2}$  miles, do you think the people will be willing to pay the extra fare? I have no doubt about it.

519. Or would they take an omnibus across the river? No, they would not think of it.

520. They would rather pay three times the ordinary rate for that mile than avoid the extra charge? They would not have an extra charge, because the omnibus would charge them that at least.

521. How much would the omnibus charge? I suppose an omnibus would not take a man from Nowra to the proposed terminus on the north side under 6d.

522. You think the people will prefer to be carried in the railway itself for the last mile and a half, and put down in the township? Just so.

523. You think that the Department is pretty sure to get the extra fare? I have no doubt of it.

524. And that the people will be willing to pay it? Yes.

525. Do you know anything of the country between Nowra and Jervis Bay? Yes.

526. Is it first, second, or third class country? I should say it is second class country.

527. If the railway ran through that country would it be capable of carrying a population? I have no doubt that if the railway ran to Jervis Bay, the whole of the Government reserves there would be taken up. If the Government chose to sell the reserves at free selection prices, of course they could be content with £1 an acre, but if they chose to keep it until they could sell it by auction to the highest bidder, it would fetch £10 per acre on an average.

528. Do you think the reserves are large enough, if sold by auction at their railway value, to pay half the cost of continuing the line? I should say they would pay the whole of the cost easily.

529. The Government have reserved land there which, if alienated at its improved value, would really pay for the construction of that line? Just so. I have no doubt that the Government would be fully recouped the cost of the line.

530. How much a mile do you estimate the line will cost? From Nowra to Jervis Bay it ought to be constructed for £5,000 a mile.

531. That is a very much lower estimate than the estimate put before the Committee? Well, the line could be made almost absolutely flat if you chose.

532. We are told that the country is rather undulating, and that there must be a good many small cuttings made? I may mention that when the surveyor came down to the district to make the trial survey, he came to me and I drove him over the first 5 miles of that line, and showed him four tidal points. The place was an absolute flat, and we did not rise or fall 10 feet anywhere.

533. Do you know the route in which the railway has been made out? Yes.

534. Do you think it could be improved? Well, it may be that the cutting which they make in one place is necessary in order to fill up hollows. But there should be no cuttings there except for the purpose of filling up hollows somewhere else.

535. Do you think that if the railway were extended, there should be any considerable shipping business done at Jervis Bay? I have no doubt about it.

536. What sort would it be? I think that all the coal from Kiama south will go to Jervis Bay.

537. Is the Kiama coal mining district nearer to Jervis Bay than to Sydney? A great deal.

538. How much? It is as twenty miles is to 70 miles.

539. Where would be the midway point between the two places? As nearly as possible it is Wollongong.

540. Wollongong coal would go equally to one port or the other? They mostly have their own ports. The construction of the railway was delayed so long that they made their own jetties.

541. But, in the case of new mines which have no jetties, it would be as easy for them to send their coal

W.  
Lovegrove,  
Esq.  
5 Mar., 1891.

coal to one port as the other? Just so; but the mines which are about to be opened south of Wollongong are endeavouring to convert the Illawarra Lake into a port of shipment.

542. But, supposing that neither Wollongong nor Lake Illawarra is made a good harbour, anything south of Wollongong would be nearer to Jervis Bay than to Sydney? Just so.

543. And if shipping facilities are given at Jervis Bay, you can put coal on board there more cheaply than at Sydney? From Kiama.

544. How many miles is it from Nowra to Jervis Bay? Ten miles as the crow flies. I think it is nearly 12 miles by the line.

545. You see by the map that the line is carried beyond the township of Huskisson. Is the point to which it is carried a good shipping place? About that matter the late Mr. Sutherland made the remark, "After all those old fellows knew as much about it as anybody, Mr. Thompson chose the best place."

546. It is a good place for shipping? Oh yes.

547. What sort of produce would be grown between Nowra and Jervis Bay? Well, at 5 miles from Nowra you would still be close to the maize growing part of the Shoalhaven district. The maize ground also grows potatoes. Wheat growing was given up there because of the rust. But I have no doubt that a great portion of that land when it once had a market would be turned into market gardens.

548. For the supply of the metropolis? Being the richest land in the colony, first of all to supply the metropolis, afterwards to supply Jervis Bay, and also local wants.

549. Do you think it will pay to send garden produce to Sydney? The middleman gets a great deal out of the produce, but I think he would leave a little.

550. You think it would pay? Yes. I have sent up cabbages from there to Sydney, and they gave me 3s. a dozen for them, and it paid me.

551. Do you think the local produce would be a fair remunerative business for the line? It would increase immensely.

552. Would that extension draw traffic from the back country at all? Yes.

553. Is there any land occupied to the west of it from which it would draw traffic? Yes. One coal seam has been found, which, with coal and shale, is 32 feet from top to bottom.

554. Is it marketable coal? There is 8 feet of marketable coal, and 3 feet of bituminous shale.

555. How far is it from the proposed Extension? About 16 miles from Jervis Bay as the crow flies.

556. Not on the railway? No, to the west.

557. Would it come into that railway by a branch line? I think it would go to the port.

558. The railway would not get any of that traffic? No. It runs at the foot of the mountains containing the coal.

559. Does it skirt the foot of all the ranges? Yes.

560. Would it be possible to go beyond Jervis Bay further south? Yes. The line would be almost an absolute flat. It would go west for the first 6 miles to the head of George's Basin; it would then reach Ulladulla-road, and pick up the Ulladulla traffic.

561. Could you get to Ulladulla with an easy line? I would rather let an engineer answer the question, but I think so. I do not think there would be a tunnel on the whole line.

562. Your opinion is that that extension would pay if the reserved land were put to the capital account of the line? I have no doubt of it.

563. Would it pay in the absence of that? I think so.

564. Looking at that, you think the bridge ought to be made at once to prepare for that extension? I think so. I was always of opinion that the other bridge was to carry the railway; but I believe Mr. Whitton condemned it.

565. *Mr. Copeland.*] You stated just now that some of the richest land in the country lies between Nowra and Jervis Bay—where is it situated? The line, as laid down, goes within a couple of miles of Mr. Berry's dairy, of Jindiandie.

566. But, getting away from the Shoalhaven district, on the line between Nowra and Jervis Bay, where is it? That is 5 miles from Nowra, nearly half way to Jervis Bay.

567. How far away from the line is this land situated? About 2 miles.

568. Going south from that point, do you know of any good land? Not for corn. There is very good land for fruit, and also good land for wheat.

569. Is there any wheat grown there? There is no wheat grown now.

570. How long has that land been in its present condition? It is very nearly all in bush, except the old grant of Comberton Grange, and is reserved land.

571. Is there any traffic from Jervis Bay at all? It is more in the nature of a picnic traffic—you go down picnicing to Jervis Bay.

572. I suppose there is not a very large fleet of vessels sailing from the Bay? No; but at the Bay they build vessels.

573. Is there a ketch doing the traffic between Jervis Bay and some of the coast towns? At times there has been a steamer, and at times there have been two or three ketches running there.

574. Is there any vessel running regularly to Jervis Bay? I cannot tell you that; but I fancy two vessels are running up regularly with timber—Mr. George Dent and Mr. John Parnell both ship logs there. I think one party consigns to Mr. George Hill, of Sydney.

575. As a matter of fact, is not all of the land around Jervis Bay of the poorest description; is it not all sand-hills and carboniferous sandstone country? Yes.

576. Is there any land within 5, 6, or 7 miles of Jervis Bay that is fit to plough? Yes.

577. Where is it? On the north side of Currambene Creek, and from there up to Gerald's Yard.

578. You mean in the flat? I mean in the reserve, No. 33.

579. There is no wheat grown there at present? No.

580. Is any other farm produce grown there within 5 or 6 miles? It is nearly all reserve there, with the exception of the two or three estates I mentioned.

581. I suppose you do not know the area of these reserves? No; there must be something like 400 square miles at the back of Jervis Bay which has not been alienated yet, and which consists of sandstone ridges, breaking down into steep and precipitous creeks. These creeks are all gold-bearing.

582. You stated a little while ago that a coal seam some 16 feet thick had been discovered at Jervis Bay? Yes, close to the head waters of the Clyde.

583. Are you not aware that the coal-seam has been abandoned; that just recently they put a bore down

W.  
Lovegrove,  
Esq.

5 Mar., 1891.

to something like a depth of 1,100 feet? No; that is not the place at all—no bore was necessary, as the seam was exposed on the side of the rock.

584. There is coal cropping out on the surface at the head of the Clyde;—are you not aware that a syndicate of Nowra men have put down a bore there to a depth of 1,100 feet? That is likely.

585. And that they have abandoned it? That is also likely.

586. Through not having discovered payable coal? Because they are below the coal to begin with. It is above them, in the mountains.

587. Have you any practical knowledge of the coal deposits? Yes.

588. You have seen them yourself? Yes.

589. Can you say which way the coal seams are dipping? Well, the coal seam runs from Wollongong along the foot of the cliffs, right down to Broughton Creek: at that point it turns off inland, and then it is covered. It comes out again on the face of the cliff at the head waters of the Clyde. I have heard of it from two places in the Budawang Ranges south of that, and it has been found at the back of Ulladulla, but always in the high lands.

590. Do you mean to imply that coal does not extend from there towards Jervis Bay? No. The moment you get to the face of the cliffs there appears to have been a depression of a couple of thousand feet. The late Rev. W. B. Clark said that no coal would be found in that country. I look upon all these bores as being put down in defiance of his instructions.

591. I suppose you are not aware that the present Government Geologist asserts that coal is dipping north-east, and that coal will be discovered at a depth of 2,300 feet at Jervis Bay? If that is the case they have only to go 500 feet more, as they have put a bore down to a depth of 1,800 feet.

592. And did not discover anything? Not so far as I know.

593. Your impression is that there is no coal at Jervis Bay? I think not at Jervis Bay.

594. And that it is not likely to develop any traffic? I think that these coal seams from Kiama south would go to Jervis Bay. I do not see where else they could go.

595. When you say you think the coal seams would go to Jervis Bay; do you mean to say that the coal seams will continue to Jervis Bay? No; the coal seams run inland from the proposed line. At Broughton Creek they are within 4 miles of the line.

596. You do not think there will be any coal traffic from Jervis Bay? I think I have said to the contrary.

597. Do you expect any coal traffic at Jervis Bay? Yes.

598. Where is the coal to be obtained? In the mountains from Kiama to Bomaderry.

599. Do you expect any coal to be found within 5, 6 or 7 miles of Jervis Bay? No.

600. Where do you expect the coal to be brought from to Jervis Bay? From the mountains south of Kiama.

601. From Jamberoo? Yes the Jamberoo seam would go there.

602. You think they will bring the coal to Jervis Bay in preference to sending it north? I think so.

603. Do you think the traffic will gravitate from Nowra to Jervis Bay, instead of going from Nowra to Sydney? Well I do not think that altogether, but I think that by degrees the traffic will establish itself at Jervis Bay, and it may prove of a very strong character. But I do not say that it will interfere with our considering Sydney as our head city.

604. Supposing that coal is found there and it has to go to Melbourne, you think it would be much preferable, I suppose, to bring it to Jervis Bay for shipment? Possibly, but there are other things which govern that traffic.

605. What other things? If a vessel has to come to Sydney and unload her cargo there, she will take in her coal there, she will not go down to Jervis Bay to get her coal.

606. Can you see any other traffic which may be developed at Jervis Bay? The principal part of the Wandandian and the Conjola is a farming district; then there is a road westward to Braidwood; here are also minerals.

607. What kind of minerals? There is an outcrop of copper 30 miles in length.

608. What distance is it from Jervis Bay? About 30 miles.

609. Do you think the trade from that copper bearing country would gravitate to Jervis Bay? I think there would be a better search for minerals—better working for minerals once railway facilities were provided.

610. At the present time there is very little traffic at all at Jervis Bay? Very little.

611. *Mr. Dowd.*] Have you seen any of the coal and shale which you say extends near to Jervis Bay? I saw specimens only in the hands of Mr. Seaver, M.P.

612. Would this be a rough section of the coal and shale you refer to (*showing section to witness*)? Yes; I daresay I have in my office a more detailed section than this; but that is the way in which it appears, with small bands of sandstone every now and then.

613. Below the lower seam, and on the flat country, bores, I understand, had been put down with no results? With no returns, as far as I know.

614. Do you anticipate that this coal and shale is of good marketable quality, and will go to Jervis Bay for shipment? The first report on it was made by Mr. Norman, the Victorian Geologist; the second report was made by Mr. Seaver, M.P.; and I think Mr. Wilkinson, the New South Wales Government Geologist, has also made a report.

615. Do you anticipate that it will be a source of revenue to the railway? If it creates a population it will create traffic to the railway.

616. Do you think it is in sufficiently close proximity to the proposed line to create a revenue? Yes; if it is worked it must create a revenue.

617. Would the land to which you refer, between Jervis Bay and Nowra, be suitable for dairying or pastoral purposes? Well, some people would use it for dairying, but it would not be put to its best use. It is wheat growing land, and most of it is good fruit land.

618. You think it will be generally used for that purpose? Yes.

619. Is any wheat grown on that part of the land at the present time? Yes. By the way, that question reminds me that there are wheat growers within two miles of Jervis Bay.

620. What is the nature of their crops;—is it good? I think they have been satisfied with their crops, because they have continued to grow wheat.

621. Have they had much rust? The owner of one of these farms told me that his wheat is proof against rust.

622. Have you any personal knowledge of that part of the district as regards wheat growing? Yes, I have seen crops of wheat there.
623. Were they good crops? They were fair crops—I should not call them best crops. We have had 50 bushels to the acre at Terrara, but these were not over 20 bushels to the acre.
624. *Mr. Humphery.*] What settlement is there beyond Jervis Bay, within (say) 25 miles? There is the most splendid settlement to be found in the country at Milton and Conjola. It might be carried very much further up the bed of the Conjola if there was a railway.
625. What is the distance from Conjola to Jervis Bay? From 15 to 20 miles.
626. And from Milton? About 20 miles.
627. How far is it from Milton to the steamers' wharf at Boat Harbour? From 4 to 12 miles—that is a settler nearest to Conjola will have 12 miles to go to get to the Harbour.
628. What distance would the settlers round Milton have to go to reach the steamer? From 4 to 12 miles.
629. If there were a railway to Jervis Bay, do you think that nearly the whole of the passenger traffic from Milton to Jervis Bay would go to the Bay? It would be very strongly drawn that way.
630. A considerable portion of it? Yes.
631. What is the population of Conjola? I suppose it is not much less than 1,000, while in that district there must be 5,000 persons.
632. At present, I suppose, the only mode of conveyance between Milton and Sydney would be either by steamer or by coach to Kiama? Yes. Some have driven up in their buggies; but not many.
633. Do many people travel by coach between Milton and Kiama since the opening of the railway? I am not well able to say. I see many who come up in their own buggies.
634. *Mr. O'Sullivan.*] Does not Nowra stand at the junction of five or six roads? Yes; it stands at the junction of the Yalwal-road, the Ulladulla-road, the Greenwell Point-road, the Terrara-road, the Cambewarra-road, and the Braidwood-road.
635. It is, therefore, an important centre of trade for the districts which those roads serve? There is no doubt of it.
636. If a railway were run to Jervis Bay, do you not think it would lead to a large passenger traffic for persons going further south down to Pambula, Eden, and Bega, and other towns on the coast? Yes.
637. Instead of starting from Sydney, they would go by train to Jervis Bay and start from that point? I have no doubt that traffic would be sure to grow up.
638. There would also probably be traffic from the steamers coming from Tasmania and New Zealand? These companies are so strong that they might refuse to call at Jervis Bay if they thought it would injure them in their passage; otherwise, I think passengers would like to land there very much.
639. It is quite possible that the practice of landing passengers there would grow up? Yes; if they could.
640. You think that the construction of a line to Jervis Bay might create a traffic of this nature? Yes; and I have not the slightest doubt that in heavy weather a great many of these steamers, even if they were not bound to call at Jervis Bay, would be only too glad to put in there and land their passengers.

W.  
Lovegrove,  
Esq.

5 Mar., 1891.

WEDNESDAY, 11 MARCH, 1891.

Present:—

JACOB GARRARD, Esq. (VICE-CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. GEORGE HENRY COX.

HENRY CORRLAND, Esq.

JAMES EBENEZER TONKIN, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM McCOURT, Esq.

The Committee further considered the proposed Extension of the Kiama to Nowra Railway into the Town of Nowra.

Robert Patterson, Esq., Mayor of Nowra, sworn, and examined:—

641. *Vice-Chairman.*] You are Mayor of Nowra? Yes.
642. How long have you held that position? About nine months.
643. How long have you been an alderman? Six years.
644. Have you been a resident of Nowra for some time? I am a native, and I am entirely acquainted with the whole district.
645. *Mr. Humphery.*] Do you know that the present railway extension will terminate on the northern side of the Shoalhaven River? Yes.
646. It is proposed to construct a bridge over the river, so that the railway may be taken into the township of Nowra, at an estimated cost of £75,000; can you furnish any information to justify the construction of the proposed bridge? The only message that I had from your Committee was with reference to whether the Nowra people would pay the 4½-mile traffic rate for the extension of a mile and a half into the town.
647. Then you are not prepared to give information as to the traffic that may be expected in the event of the railway going into the township? No.
648. Would the people of Nowra be prepared to pay the rate for 4½ miles, instead of for only a mile and a half, in the event of the railway being constructed into the town? Yes.
649. How have you ascertained that? I went round personally and asked the majority of the business people in Nowra, stating the objections the Commissioners had raised, and they were all unanimous in saying that they were agreeable. Some said that even if they had to pay ten times that amount for the carriage of their goods they would prefer that to having to drag their goods from the other side of the river.
650. What would be the disadvantage of allowing the terminus to remain, as at present, on the northern side? The carters would be a very great disadvantage.

R. Patterson,  
Esq.

11 Mar., 1891.

- R. Patterson, Esq.  
11 Mar., 1891.
651. Would there be less traffic for the railway? I think so, because the people round about Nowra, who ship at Greenwell Point, would prefer to send their goods by the railway if it came into the town, but I do not think they would go over the bridge to the present terminus.
652. Do they move their produce by carts or by boats? By carts to the boats.
653. So that, instead of taking the produce by carts to the boats, they would take it direct to the railway station if it was in Nowra? Yes.
654. The distance of the present terminal point from Nowra is a mile and a half;—do you think that that would prevent them from carrying their produce over the existing bridge? I do.
655. Would it not be very much easier, when the produce is on the carts, to carry it to the northern side than to ship it? The  $1\frac{1}{2}$  miles over the river and the  $1\frac{1}{2}$  miles back make 3 miles, and people coming a distance would prefer to save that 3 miles, as it would enable them to get their day's work over during the daylight.
656. You think it would lead to considerable increase of the goods traffic to the railway if the line were extended to the township? I am sure of it.
657. Do you think it would cause any increase in the passenger traffic? I could not say that it would make any great difference in the passenger traffic.
658. That is, over the whole distance to Sydney; but would there be any difference as between Berry and Nowra;—what is the distance between those two places? Ten miles.
659. Would people use the railway instead of driving from Nowra to Berry? The majority now travel from Nowra to Kiama for the railway.
660. You think that the passenger traffic would remain much the same, whether the railway crossed the river or remained where it is? Yes.
661. *Dr. Garran.*] You have said that the storekeepers would rather pay an extra charge for goods if the line went into the town;—do you think that the passengers would? Yes.
662. Supposing an enterprising man ran an omnibus to the Bomaderry Station, do you think he would carry the people? I do not.
663. What would he have to charge to make it pay? About 1s.
664. Could he not do it for about 6d.? An enterprising man who had the whole traffic perhaps might, but I think that about 1s. would be fair.
665. You do not think the passengers would care to travel the extra distance in an omnibus, but that they would rather get into the train at Nowra? They would rather get in at Nowra, and pay extra.
666. Do you think that if the railway is brought across the river it will be desirable to extend it to Jervis Bay? I could not say. I do not see that there is anything particular at present to induce the Government to take the line to Jervis Bay.
667. It would not injure Nowra, would it? Not to a great extent, because Nowra depends very little upon Jervis Bay. I think it would rather help Nowra.
668. I suppose there is no local hostility in Nowra to the extension? Not any.
669. Nor any great local desire? No.
670. *Mr. Copeland.*] Suppose the railway extended to Jervis Bay, which way would the traffic go? From Jervis Bay to Nowra, I think.
671. If the railway were taken to Jervis Bay, would there not be lines of steamers calling in at Jervis Bay? There is nothing for them to call for at present.
672. Do you think it would not be cheaper to send the traffic from Nowra to Jervis Bay, and from there to Sydney by steamer? Yes.
673. So that if the line were extended to Jervis Bay the traffic would then go from Nowra to Jervis Bay by train, then from Jervis Bay to Sydney by steamer? Very probably.
674. Do you know anything at all about the country between Nowra and Jervis Bay? I know pretty well all of it.
675. What is the nature of that country? It is not good agricultural land. Most of what has been taken up was very inferior at the time when it was taken up, but since it has been cleared it has turned into very fair grazing ground. It is a place that is very well watered and good for fruit growing. Some splendid fruit grown there was exhibited at the last Nowra Show. It was grown on land between Nowra and Jervis Bay that has been only opened up a few years.
676. Is there any good timber there? Yes; it is splendidly timbered.
677. What kind of timber is it? Spotted gum, ironbark, blackbutt, and different kinds of gum.
678. Is the ironbark suitable for sleepers or girders? Yes; it is a good class of timber.
679. Would there be sufficient ironbark to create a traffic in it? There are different ranges between Jervis Bay and Nowra, all containing ironbark and spotted gum.
680. Good-sized trees? Yes.
681. And there would be a timber traffic if the railway were constructed? Yes; there are three saw-mills there now.
682. Where are those? One of them is shut up, but there are two in operation—one at Nowra, and one at the Falls, between Jervis Bay and Nowra.
683. I suppose there is very little produce of any kind grown between Nowra and Jervis Bay? Very little. There is no cultivation going on, but dairying is carried on. There are two butter factories now between Nowra and Jervis Bay.
684. Is there any indication of coal down there? I could not say. They have been prospecting, but I have not heard the result.
685. Is there any kerosene shale? No.
686. Any iron ore? I know nothing about the mineral resources of the district at all.
687. *Vice-Chairman.*] Do you know anything about the reserves down there. Are there any large Government reserves? There is one reserve that I know of—I could not say what size it is.
688. How far from Nowra? About 6 miles.
689. Would that be on the line from Nowra to Jervis Bay? It would be close to the line.
690. *Mr. Copeland.*] The line is surveyed through it, is it not? Yes.
691. *Vice-Chairman.*] You say that the business people of Nowra would be willing to pay this extra carriage rate? Yes.
692. I suppose they would not be likely to back out of that arrangement when the railway is made? No; all the gentlemen I have spoken to are business men who can be relied upon.

693. You are aware that in some parts of the colony people are apt to promise things, and when they get what they want ask for something different? Yes. R. Patterson, Esq.
694. You think that the Nowra people are above that? Oh, yes.
695. *Mr. Tonkin.*] Do you know what the extra charge would be per ton? By what I have ascertained, it would be 2d. a mile. 11 Mar., 1891.
696. Do you mean on the whole journey? I do not know the carriage.
697. Do you know that it makes only 4½d. difference on the whole line to Sydney? I understand that it is 6d.
698. Do you think the people of Nowra would object to that? No; it costs them 2s. 6d. a ton to have the goods carted from the wharf.
699. Then it is 2s. 6d. against 4½d.? Yes.
700. Suppose an omnibus carries passengers for 6d. to and from Bomaderry, and there is the railway running, is it not an ordinary thing for people going from country districts to Sydney to take a lot of baggage with them, and would it not be very awkward for them to be travelling in an omnibus? It would be rather awkward.
701. Then, would the people not rather pay the same price and go by train? Yes.
702. Then you think there is no doubt that the people will be satisfied to pay 4½d. extra for goods, and a little extra for fares, if the line goes into the town? I am quite positive of it.
703. You have come here authorized by the principal residents of Nowra to make that statement to the Committee? Yes.
704. Do you know the site of the proposed bridge? Yes.
705. It is just below the navigation point now? Yes; about a half-a-mile below the present bridge.
706. Is there any objection to the cutting off of your navigable water;—do not ocean steamers come above the proposed bridge? Yes, nearly up to the present bridge.
707. In future they will have to stop below the railway bridge? Yes.
708. Do you think that any injustice would be done to people interested in getting goods by steamers? If people felt inclined to have goods brought by water they would not have much further to go in consequence of the bridge.
709. You have heard of no objection to the available navigable water being diminished by the erection of the proposed bridge? Not a word.
710. *Mr. Humphery.*] The Illawarra Company's boats do not go up to Bomaderry? No. Mr. Hay has one boat running which comes up to the wharf at the bridge.

John Maclean, Esq., Journalist, Nowra, sworn, and examined:—

711. *Vice-Chairman.*] You are an alderman of Nowra? I am a journalist, and was recently elected an alderman. J. Maclean, Esq. 11 Mar., 1891.
712. You are proprietor of the local paper? Yes.
713. *Mr. McCourt.*] You have resided a long while there? I have been thirteen years there.
714. Do you know where the proposed bridge is to be erected? Yes.
715. Will it be a great convenience to the people of Nowra? Yes. You cannot see the present terminus with a telescope from Nowra.
716. With regard to the extra charge, do you think the people of Nowra will be satisfied with that? I think that if it were four times the amount proposed they would still be satisfied.
717. What is the amount? I should take it to be about 2d. a mile on four miles. It would be, say, 8d. or 10d. on the journey from Sydney on goods or a first-class ticket, and the difference would be three miles of haulage occupying probably 1½ hours. That is, waiting at the goods shed, loading and unloading, it would occupy 1½ hours, which at 1s. an hour for the man's wages, and another shilling for the horse and cart, would make it 2s. or 2s. 6d. for the haulage by horse-power as against 8d. or 10d. for the haulage by locomotive.
718. Would it be 8d. or 10d. for a passenger? 2d. per mile for 4½ miles would be about 9d.
719. Could not any enterprising coach proprietor compete with the railway? I do not think so—for much shorter distances they charge 1s. They charge 1s. from the hotel in the town to the show-ground, half a mile away.
720. Even if omnibuses could compete would people break their journey, or would they not prefer to go right on to Nowra? They would prefer to go on to Nowra.
721. It has been said that if a line were constructed to Jervis Bay, that traffic would go to Jervis Bay, and from there to Sydney by steamer? That question is solved already by the fact that steamers now leave Nowra; yet 75 per cent. of the traffic goes by road to Kiama in preference to taking the steamer from Nowra.
722. So the traffic would not go to Jervis Bay? Ocean steamers now come to the bridge, yet 75 per cent. of the traffic goes to Kiama by coach. If people now travel by coach 30 miles to the railway, they would surely take the train from Nowra if they could.
723. Have you any idea how long it will take to construct this bridge? The present bridge over the same river was commenced late in 1879, and was opened on the 1st August, 1881. That would be a little over eighteen months. About twenty months, I think, was occupied, including the making of the approaches.
724. Have you any idea when the railway will be completed from Kiama to Bomaderry? I think within contract time.
725. What is that? That would be two years from last January.
726. *Dr. Garran.*] With regard to the last question, there is abundance of time to get the bridge up by the time the railway is completed? Yes.
727. Do you see any necessity for a temporary station on the north side of the river? There would be no necessity for that at all.
728. The line may be opened right through to Nowra? It must, with ordinary expedition, be constructed to Nowra within contract time. It is a surface line from the time it enters the Berry estate until it reaches Bomaderry.
729. The line gets through its difficulties when it gets to Gerringong? Yes; the estimate is about £7,000 a mile, exclusive of the bridge at Berry, to cost £21,000. 730.

- J. Maclean, Esq.  
11 Mar., 1891.
730. Have you ever traversed the country between Nowra and Jervis Bay? Yes.
731. Do you think it would be well to extend the line to Jervis Bay? I think it would, in view of the rule that traffic is increased by the certainty of the means of communication. We are at the mercy of a bar-bound river, and it is very difficult to get machinery into the district. We are returning at present a Government diamond-drill, and we are not certain whether to send it to Kiama to the train, or to send it by the ocean steamer.
732. That trouble will be over when you get the railway? Yes.
733. Will the district have any advantage from the extension of that line to Jervis Bay? I think it would, because the whole of the land, or almost the whole of the unreserved land, not dairy farmers' land, which must be first-rate land, would be taken up by the fruit growing class, who have had experience on the Parramatta River and elsewhere. All the unreserved land has been taken up between Nowra and Jervis Bay, chiefly by gardeners and others; but if the reserves were opened these, too, would be taken up.
734. And is the reserved land as good for fruit as the unreserved land? It is of the same kind as that which has been taken up.
735. What is the value of the timber land per acre? They allow £1 a thousand cubic feet at the mills. At that rate it will be worth about £10 an acre.
736. Do you think the land at present worth £10 an acre? Yes. They would get at least ten logs of timber per acre, which, without the cost of carriage, would come to £6 an acre.
737. They have the labour and carriage to take out of that? Yes.
738. Would it be worth while to have the land for the use of the timber only? I think if it was made into a railway timber reserve, and if cut up in small areas of 40 acres each after the railway was made, it would bring £6 an acre.
739. We are told that there are 55,000 acres between Nowra and Jervis Bay. That would pay for the construction of a railway twice over, would it not? Yes. I am speaking of facts. I could mention land as high as £10 an acre in value.
740. I do not want to bring exceptionally valuable land into account. Take the whole reserve. Suppose it were given to the Railway Commissioners for railway capital, and the line made there, and the land sold at its value, do you think that the national estate would pay the cost of the line? I think it would pay it twice over, even allowing for patches of inferior land.
741. You have no doubt about the accuracy of that answer? I have no doubt, from the land sales that occurred in the district.
742. *M<sup>r</sup>. Copeland.*] Do you think that anything like the whole of that 55,000 acres would average ten logs to the acre? Yes. I think probably two-thirds of it would. Some of it has gone as high as twenty logs to the acre.
743. That is in the country between Nowra and Jervis Bay? Yes; Reserve 33 it is called.
744. Is that the land which is held for coal? Yes, a good deal, I think, has been applied for under leases.
745. You have, as a proprietor of a paper, a good deal of information about the district generally. Can you say anything about the increase of the population at Nowra during recent years? It has increased about five-fold since I have been there.
746. How long have you been there? About twelve years.
747. And the population in twelve years has increased five-fold? Yes.
748. How do you arrive at that conclusion. Is it from the number of electors on the roll? From the valuation of ratable property within the borough at different times.
749. But would the value of the property give the population? It would give the number of householders. We had to increase the number of members of the local Municipal Council, and it was necessary to take a census in order to ascertain whether we were entitled to nine or six aldermen. That was taken about five years ago, when the population of the town was found to be considerably over 1,000, and it is estimated to have nearly doubled itself since.
750. And you expect the population to continue increasing, especially if you get the railway there? Building is going on vigorously at the present time.
751. You said, in answer to a question, that you did not think that if the railway was taken to Jervis Bay that there would be any ocean traffic, because there is very little now? Yes.
752. Did you consider, in making that statement, that if the railway should be taken to Jervis Bay a very much larger and safer class of steamers would go to Jervis Bay than those that go to Bomaderry? Yes, with regard to mineral traffic, which would be sure to be developed.
753. Jervis Bay is a fine harbour—there is plenty of water there, good shelter, and a great deal of room for ships? Yes.
754. Therefore, if the railway were constructed to Jervis Bay, would you anticipate Melbourne and Tasmanian steamers coaling there? I think they would coal there, instead of at any of the open roadsteads, such as Wollongong and Port Kembla, if coal is found at Jervis Bay. In that case probably considerable traffic will develop between Jervis Bay, Victoria, and South Australia.
755. Has any good coal been found there? I know that flying surveys have been made to Jervis Bay by Melbourne capitalists, and I have had correspondence from capitalists desiring to be informed if there was anything in the shape of coal being developed at Jervis Bay, as if there was they desired to invest.
756. Do you know the country beyond Jervis Bay—between there and Twofold Bay? Yes.
757. Do you think that there is a possibility of the line being carried to Bega? I think if the railway could be constructed at a cheaper rate per mile than the present line, it would pay to make it the whole way, as the land is of the usual average quality, and there is ample rainfall.
758. Have you a personal knowledge of the country? Yes; I have travelled over it.
759. What is the nature of the land? The geological formation about Jervis Bay is chiefly carboniferous.
760. That is, as poor as it can be? It is rather poor for agriculture, but not for orchards.
761. Is the land about Ulladulla rich? It is alternately volcanic and carboniferous till you get to Moruya, then the land is good—it is second rate agricultural land.
762. I suppose there are patches of good land? Yes, patches of good land along the rivers.
763. And about the mountains? Yes, most of it is taken up, but it is not cultivated—it is under grass. People cannot get any produce to market from behind the coastal ranges which will not walk to market.
764. Supposing there was a railway from Jervis Bay to Twofold Bay, do you think that much land would be brought under cultivation? I think that a great deal of land now used for pastoral purposes would be used for other purposes—for agriculture, for vineyards, and the like. 765.

765. Can you say whether a line has been surveyed—has there been any flying survey made? Not by the route you have mentioned. There has been round from Cooma, towards Twofold Bay, and Eden to Bega.

J. Maclean,  
Esq.  
11 Mar., 1891.

766. Do you think that they will have to go very far inland to be able to get a line? There would be much less engineering difficulties in the way than there have been between Sydney and Kiama; but after leaving Ulladulla, the country would not be so populous. But, with certain means of communication, the land and the good rainfall taken together would draw population.

767. Is there any communication between the two bays? There is mail communication.

768. In some places it is so rough that the coach cannot travel, is it not? Several of the rivers are not bridged, and it is necessary to go round by the head of the river, which is generally in precipitous country.

769. You know that there is some idea of taking a railway along the coast so as to join it with the Victorian railway from Bairnsdale, to make a second overland railway between Sydney and Melbourne? Yes.

770. Do you know the distance between Jarvis Bay and Twofold Bay? I could not say exactly.

771. What is the distance, approximately, by road from Jarvis Bay to Bega? The distance from Jarvis Bay to Bega is about 100 miles.

772. Do you think there is enough good land to ever warrant a line being constructed between the two places? I think so. The progress of population in those places, and the growth of the towns, already show far more development than we see upon some of the railway lines going westward.

773. I suppose the climate is everything that could be desired for settlement? Yes. In Russell's "Climate and Geography of New South Wales," it is put on a parallel with Naples.

774. I suppose it is never very hot and never very cold? It is temperate and humid.

775. *Mr. Tonkin.* Suppose this project to be carried out and it is determined to erect the bridge, do you think it will be necessary to erect a large station at Bomaderry? I do not.

776. I suppose there would have to be a station at Bomaderry under any circumstances? I think not, unless there is to be a station at every mile and a half. A goods platform would meet requirements.

777. Then there is no township there? There never has been. The only store that has ever existed there has been closed. There was a post-office there and it has been closed, too.

778. Then the expense of erecting a large station there could be avoided altogether if the bridge were finished at the same time that the railway was finished? Yes.

779. That should be taken into consideration? I think it should be a very strong item. We are on a parallel with Kiama. In that case the terminus was on the other side of a steep hill and the Commissioners were going to erect a substantial building, but it was pointed out by the Members of Parliament that it would be unwise to erect anything but a temporary building as the line would have to go further on. The temporary station at Kiama was built at an expense of £200 and the materials can be taken up and sold.

## APPENDIX.

### A.

#### PRECIS OF PROCEEDINGS RELATING TO THE EXTENSION OF THE RAILWAY ACROSS THE SHOALHAVEN RIVER TO NOWRA.

THE question of constructing the line from Kiama to Nowra was referred to the Railway Commissioners, and they in their Report, while approving of the line, recommended that it should for the present stop short on the north side of the river. They considered that the erection of the bridge over the Shoalhaven River (estimated to cost £100,000) should be postponed until the line was carried further south. They pointed out that if this arrangement were adopted a temporary station on the north bank, with approaches, might be provided for £3,000, while a saving in interest on cost and in working expenses of £3,745 would be effected.

In this shape the project was submitted for the consideration of the Public Works Committee, but they did not adopt the views of the Railway Commissioners. The Committee in their Report wrote:—"The stoppage of the proposed railway outside Nowra is a circumstance not regarded with favour by the people of Nowra. The explanation of the railway construction officers regarding the intention to terminate the line for the present on the north bank of the Shoalhaven River, and about a mile from Nowra, is that the contemplated terminus of the railway is Jarvis Bay, and that it is not necessary in order to get to Jarvis Bay for the line to go into Nowra. The Sectional Committee who visited the district consider the line should be taken to the town in order to secure the maximum amount of traffic, and that it is unadvisable to have any deviation from Bomaderry to Broughton Creek-road in view of the great necessity to construct the bridge at as early a date as possible."

The Construction Department subsequently reduced the estimate for the bridge to £75,000.

In June last a deputation waited upon the Minister to urge the extension of the line up to Nowra, and the Minister promised to ask the Railway Commissioners if the reduction in the estimate for the bridge would justify them in modifying their Report as to the expediency of extending the line at once into Nowra.

The matter was accordingly again referred to the Commissioners, and they reported that the estimate for the whole line (Kiama to Nowra) was equal to £17,000 a mile, and that the revised estimate for taking the line across the river to Nowra, a distance of a mile, was therefore equal to the cost of 4½ miles of ordinary line. For the small amount of traffic to be carried they did not consider this expenditure, which would increase the annual burden by £2,325, advisable, but if the measure were determined upon they would suggest the insertion in the Bill of a clause empowering the Commissioners to charge for all traffic passing over this 1 mile as for 4½ miles.

Hereon Mr. Barling wrote that the Minister had promised to recommend the extension into Nowra to the Cabinet with a view to its being referred to the Works Committee. 23/11/90.

The Minister intimated that the matter must await the settlement of the railway policy of the Government, and that he would recommend the Cabinet to allow him to submit it to the Public Works Committee.

Recently, also, in the House, in reply to Mr. Morton, the Minister stated that he hoped to have the papers ready to enable him to submit the matter to the House.

C.A.B., 15/12/90.

[To Evidence of H. McLachlan, Esq.]

TRAFFIC AT KIAMA RAILWAY STATION.

Government Railways of New South Wales, Secretary's Office,  
Sydney, 28th February, 1891.

Sir,  
In compliance with the request of your Committee, I have pleasure in forwarding Return showing the traffic to and from  
Kiama Station for the years 1889 and 1890.

I have, &c.,

H. McLACHLAN,  
Secretary.

The Secretary, Public Works Committee.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM COBAR TO COCKBURN.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, and the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Cobar to Cockburn," have, after due inquiry, resolved that it is expedient the railway should be constructed as far as Broken Hill; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

1. The proposed line of railway, according to the official description, would leave the end of the line from Nyngan to Cobar at 459 miles 36 chains 59·8 links from Sydney, and proceed in a westerly direction through the counties of Robinson, Borroondara, Rankin, and Werunda, to Lake Poopelloe, and thence through the remaining portion of the county of Werunda in a south-westerly and north-westerly direction to Wilcannia, following the direction of the main road the whole of the way. The Darling River would be crossed at a point 615 miles 50 chains from Sydney, and the Railway would then pass through the town of Wilcannia, running between and parallel to Murray and Brougham Streets. Leaving Wilcannia at Desailly-street, it would proceed through the counties of Young, Tandora, and Yancowinna, going from Desailly-street in a westerly direction to the north of Lake Woychugga, and following the general direction of the main road from Wilcannia to Broken Hill. Between the distance of 655 miles and 720 miles from Sydney the main road would be crossed four times, and 10 miles further the township of Taltingan (Round Hill) would be passed through. Thence the line would proceed to Broken Hill, which would be reached at a distance of 735 miles, and further on the Pinnacles would be reached at 745 miles, Thackaringa at 756 miles, and Cockburn, the terminal point, at 765 miles 29 chains 58·8 links—the length of the line from Cobar to Cockburn being 306 miles. The steepest grade on the line, it was at first thought, would be 1 in 75, but this can be improved so that the ruling grade shall be 1 in 100, and the sharpest curve is 16 radius.

2. The Acting Engineer-in-Chief for Railways estimates the cost of the proposed railway at £1,168,000. An estimate made from rough data in July, 1889, represented the cost at £1,037,000, which was made up of £440,000, for the line from Cobar to Wilcannia; £57,000 for a bridge over the Darling River, and for viaducts; £390,000 for the line from Wilcannia to Broken Hill; and £150,000 for the portion of line from Broken Hill to Cockburn. Since the date of that estimate more complete surveys than previously carried out have been made, and this has led to an alteration in the estimate of cost. The cost of the bridge over the Darling and of the viaducts was in the first estimate considerably under-estimated. "Not only," the Acting Engineer-in-Chief says in a report to the Under Secretary for Public Works, "are the floods more serious than before reported, but the result of some of the borings of the river-bed indicates the necessity of deeper foundations," and he is of opinion, therefore,

therefore, after careful consideration, that it will be necessary to increase the estimate for the bridge by £35,000. In the first estimate, also, the expense of fencing the railway was omitted, and the cost of fencing is in the amended estimate set down at £36,000. The original estimate has also been increased by an estimate of £60,000, which is considered to be the cost of making the ruling grade of the railway 1 in 100 instead of 1 in 75. These several increases make the estimated total cost £1,168,000. If, however, the line should be constructed only as far as Broken Hill the cost, as estimated, would be £1,018,000.

Railway Com-  
missioners'  
Report.

3. The Railway Commissioners in their Report quote the rough estimate of the total cost of the line from Cobar to Cockburn, £1,037,000, and calculated upon this estimate they state the interest, at  $3\frac{1}{2}$  per cent., as £36,295, a rough estimate of the cost of working at £51,000, and interest on rolling stock at £3,339, or a total cost per annum of £90,634. They say in their Report: "It is impossible to offer a pronounced opinion upon the probable financial success of such a large undertaking from the outset, but there is no doubt ultimately it will be successful, and as it is most desirable to open up communications with remote portions of the colony of New South Wales, which are at present nearly, if not wholly, commercially connected with our sister colonies, we strongly advise the Government to adopt the scheme, and to commence it in about four sections, so as to get it open throughout as quickly as possible." They point out that lines of this character can only be dealt with upon national principles, but they have also, they say, a commercial aspect, and the probabilities of a satisfactory traffic on the railway are good. They consider it is fair to assume that at least a portion of the traffic now going from and to Wilcannia and the surrounding district by water would go by rail, if such a means of transit were available; that the railway would have a material effect on the prospects of pastoralists by affording them a ready means of selling part of their stock in times of drought, or of removing them to parts of the colony where pasturage may be available; that the rates paid for the conveyance of the stores now used on stations being, by the present means of transit, excessive, it is very probable these stores would be obtained by means of the proposed railway; and that the mining industry at Broken Hill would be very likely to produce a traffic on the railway which, among other things, would open up a market for coal and coke from our western coal-fields. The construction of the line would also ensure a railway route as short from Sydney to Adelaide,—and shorter to places north of Adelaide,—as that now existing *via* Melbourne, the New South Wales Railways receiving by the new route a 771 miles' proportion, instead of 387 miles, as at present, to Albury; and, with regard to the New South Wales northern system of railways and Queensland, if a line should be constructed from Werris Creek to the Western Railway, a shortening of distance between Queensland and South Australia of about 400 miles would be effected. On the question of the increased cost of construction based upon the additional cost of a bridge over the Darling River, and of flood-openings, and also of fencing and the improvement of grades, the Commissioners say that the additional expense for improving the grades and for fencing should, in their opinion, be undertaken. They strongly recommend the "adoption of the easiest possible grade which can be obtained at a reasonable cost on all lines, but with regard to the line to Broken Hill the question of grade is of exceptional importance, as unless low rates can be fixed—and this question depends upon the grades—there will be no hope of competing with South Australia for the Barrier trade." In explanation of this they state that the difference between the hauling power of an engine of the class that would be placed upon this railway on a grade of 1 in 100 and 1 in 75 is about 100 tons per train.

Method of  
Inquiry.

4. In this inquiry it has not been found necessary to appoint a Sectional Committee to visit the districts through which the railway would go, a Sectional Committee having passed through them as recently as October, 1889, when inquiring respecting the then proposed railway from Nyngan to Cobar. It has been sufficient to examine witnesses in Sydney, and these have included not only the professional officers of the Public Works and Railway Departments, and other witnesses whom it was thought necessary to call, or who desired to give evidence, but also the Members of Parliament representing the districts concerned in the present proposal, and gentlemen specially appointed to come before the Committee from Broken Hill, as representatives of that town and district. Much of the evidence taken by  
the

the Sectional Committee on the Nyngan to Cobar Railway had reference to the extension of the line to Wilcannia and Broken Hill, and their report and the evidence upon which their report was based, together with the report of the Committee on that railway, should be read in conjunction with the Report and evidence in the present inquiry.

5. A favourable opinion of the proposed railway was expressed by the Committee in their Report on the railway from Nyngan to Cobar. That line was referred to them "in view of the probable extension of the Railway from Cobar to Wilcannia and Silverton, and so on to the South Australian border," and in the inquiry which the Committee made they did not confine themselves to the question of the expediency or otherwise of constructing a railway as far as Cobar, but directed their attention also to the larger question of opening up communication by railway with the extreme north-western portion of the colony, and they recommended the construction of the railway to Cobar, "as part of a line eventually to extend to Wilcannia and Broken Hill, and to connect with the South Australian railway system." This recommendation was based upon the evidence taken and upon a personal acquaintance with the districts made by the Sectional Committee, who travelled, examining witnesses *en route*, from Nyngan to Cockburn and Adelaide.

Opinion of the Committee with regard to this line in their Report on the railway from Nyngan to Cobar.

6. The towns and districts that would be served by the proposed railway are some of the most important in New South Wales, and they are so situated that without railway communication with Sydney they are compelled to trade almost exclusively with Adelaide and Melbourne. Evidences were apparent to the Sectional Committee that garden produce and wheat could be successfully cultivated with irrigation or a sufficient rainfall. Irrigation, the Sectional Committee believed, could be carried out to some extent from the Darling River, as by the locking of the river the water could be thrown back into creeks and ana-branches to distances of from 20 to 50 miles. At one place—Fulham Station—there was seen a fine crop of wheat growing on land which the proprietor stated had simply been harrowed. Wool also was found to be produced on the different stations in large quantities. Wilcannia, the centre of a very large district, was ascertained to be doing a large amount of trade, principally by means of shipping on the Darling River, evidence having been given to the Sectional Committee that the annual freight earned inwards and outwards at that town was at least £80,000. This town is also the centre of the trade for the Paroo, Mount Browne, and the south-west portion of Queensland. Between Wilcannia and Broken Hill the route of the railway passes through country occupied by pastoralists whose stations are extensive, and the quantities of wool produced on which, in favourable seasons, are large. The Sectional Committee, in their Report, stated that they had been very much impressed by the rich character of the soil over the greater portion of the route which they traversed, a very noticeable feature about it being that wherever agriculture had been undertaken that year, which was doubtless a very exceptionally favourable one, it had been a success, the crops, fruits, and vegetables having been of a most luxuriant character. The country along a portion of the route appeared to them to be well suited for small holdings; and from a mining point of view a line of railway to Broken Hill would traverse some very promising fields. The railway to Wilcannia, in their opinion, would serve the Mount Browne district, which is considered to be rich in mineral wealth; and with respect to Broken Hill, from the evidence obtained and the personal inspection made by the Sectional Committee, that mining centre appeared to be marvellously rich, not only in silver but in other minerals. At the time the Sectional Committee visited Broken Hill its population numbered 16,000. It is now, according to the evidence given by the Mayor of Broken Hill, 24,000. The evidence of the various witnesses examined by the Sectional Committee as to the actual trade done in imports and exports was considered by them to be "truly astonishing," an important feature in connection therewith being the circumstance that nearly one-seventh of the entire railway revenue of South Australia for the period 1887-8 was derived from Broken Hill.

Towns and districts to be served by the railway.

7. The principal reason in favour of the construction of the proposed railway, at least as far as Broken Hill, is that the line will be a national one affording railway facilities to parts of the colony where importance justifies the expenditure in providing such facilities. That there will be from the first, or for some time afterwards,

Prospects of traffic on the railway.

afterwards, a paying traffic on the line is not expected, but that the traffic will grow and ultimately become profitable is, as will be seen from most of the evidence, extremely probable. The Railway Commissioners view the railway as a "national undertaking." They have not estimated the actual results to be obtained from the construction of the line, but they point out that the population between Cobar and Wilcannia have now no practical means of getting to market, except one route, which in certain seasons may for some considerable time be impassable; that, in a time of drought, large numbers of stock are sacrificed because there are no means of removing them to parts of the colony where pasturage could be obtained; that Wilcannia is entirely dependent on water carriage, which is very uncertain; and that, as to Broken Hill, it is at present so completely cut off from communication with Sydney that its population are compelled to conduct all their business with Adelaide or Port Pirie. The Commissioners believe that the people of Wilcannia and the district surrounding that town will use the railway in preference to the river which now provides their water carriage, as it will afford them quick and certain transit for their produce and merchandise; and they are of opinion that there will be a considerable traffic between Sydney and Broken Hill. "At present," the Secretary to the Railway Commissioners, in his evidence, states, "a great deal goes by sea from Sydney to Port Pirie, and is sent on to Broken Hill by railway, and we have steamers arriving frequently from Port Pirie and Adelaide with cargoes of ore and bullion from Broken Hill. We think that the construction of this railway would lead to the establishment of factories and smelting works in the western district, and thus create a traffic. We also believe it would bring large quantities of low-grade ores to be treated at the coal-mines." The railway, it is believed, could fairly and successfully compete for the traffic. The Commissioners are obtaining some locomotives much more powerful than those at present in use, and they are having built a great number of trucks of large carrying capacity, by which means they expect to be able to convey greater loads than now with less dead weight, and at cheap rates. Supplies, they think, will also be taken by the railway to Broken Hill from Sydney, instead of being sent *via* Adelaide. Apart from business advantages which it is believed the use of the railway will afford, it is thought that the sympathy of the people will be with it, so as to make it as far as possible profitable. That has been the experience of the Railway Department in regard to the railways in the districts of Riverina; and with respect to the railway to Bourke, the Committee are informed that the River Darling, instead of taking traffic from the railway, has brought it to the line. The Commissioners do not consider it wise to say at present what will be the actual charge for the conveyance of wool from Wilcannia to Sydney, but they believe they can fix a rate which will largely command the traffic; and with regard to Broken Hill, the evidence of the witnesses who came specially from that town to appear before the Committee strongly supports the belief that there will be a large traffic between Broken Hill and Sydney, both in goods and passengers. The Sectional Committee, who in the latter part of 1889 visited Wilcannia, expressed the opinion that from that centre a very large trade might be relied upon, and respecting a trade from Broken Hill they said in their report: "The amount of traffic likely to be derived from Broken Hill is difficult to calculate, but it will be chiefly derivable from the carriage of coke, coal, timber, lime and ironstone fluxes, ores, bullion, wool, fodder, building material, and general merchandise." This traffic, they considered, would develop with the increase of population, and it appeared to them probable that the railway would also be used for removing starving stock in seasons of drought, and for the conveyance of fodder to stations, as well as by the travelling public as "the shortest and most direct route to the Barrier Ranges from Sydney and the important intervening centres."

Evidence in  
opposition to  
the railway.

8. Among the witnesses examined by the Committee, there are four whose evidence is not favourable to the construction of the railway. One of these is Mr. Alexander Brown, M.P. for Newcastle, and he objects to the railway being carried out because it is opposed to the "spirit of general co-operation on the part of the whole of the colonies," which will be one of the results of Federation, if it should be brought about; because traffic on the line can only be obtained on a basis of differential rates; because the line passes through a part of New South Wales where there is little or no population, and probably will not be

for

for years to come a population which would warrant the expenditure of such a large sum of money ; and because the Broken Hill trade is not likely to come to Sydney, except at exceptionally low rates of freight under a severe competition with South Australia. The cost of transit by land, as compared with the cost of sea traffic, will not, he says, warrant the conclusion that coal will be taken by the railway from Lithgow to Broken Hill, or ores brought from Broken Hill to Lithgow for smelting purposes; and, with regard to coke, his evidence is to the effect that the Broken Hill mines will continue to be supplied with the English article. He opposes the railway on some other grounds also, but generally, in his opinion, the line will be a feeder to the South Australian railways and the South Australian seaboard, and a heavy drag upon the railway revenue of New South Wales. Another opposing witness is the Hon. J. P. Abbott, Speaker of the Legislative Assembly, and Member for Wentworth. In his opinion, "the extension of the line of railway to Broken Hill, with a view of developing the trade or getting it from that part of the colony to Sydney, is an absurdity." He considers that the extent of haulage would be too great as compared with that to the nearest seaport in South Australia; that traffic could only be diverted from Broken Hill to Sydney by a system of differential rates, which would fall chiefly upon the people of the colony generally; and that it will be many years before a population will be settled in the districts through which the line will pass who will become customers of the railway. He does not see any chance of a line extended into these districts doing what the railways extended into other pastoral districts in the colony have not done; and he thinks that the route proposed for the railway is not the best,—that if it should be determined to make a railway to Broken Hill, it would be better to extend it from Forbes towards Menindie. Inasmuch, however, as the railway has been extended from Nyngan to Cobar, he is of opinion that it should now go on to Wilcannia; but in that event the river Darling should be locked, and dues equivalent to the railway charges imposed, which proceeding would probably force the traffic, that would otherwise go by the river, on to the railway. In the present condition of the river, if the railway were carried beyond Wilcannia to Broken Hill, the probable effect would be to send produce towards Adelaide instead of bringing it to Wilcannia for transit to Sydney. Another witness who is not favourable to the proposed line is Mr. D. Kirkcaldie, Chief Traffic Manager of the Railway Department. He appears to be very doubtful, not only that the railway will be profitable, but also that it will attract any appreciable proportion of the traffic of the border districts to Sydney; but he recognises its importance as a national line, which will open up the country. The fourth witness whose evidence is against the railway is Mr. Edward Heaton, of Wright, Heaton, & Co.

9. While a few of the witnesses examined by the Committee disapprove of the proposed railway, by far the larger part of the evidence given in the present inquiry, as well as that in the inquiry respecting the railway from Nyngan to Cobar, is in favour of the construction of the railway as far as Broken Hill. Mr. Deane, the Acting Engineer-in-Chief for Railways, states that the calculations upon the result of which he bases his estimate of cost have been made as carefully as possible, and that the estimate represents the lowest cost consistent with stability to meet the demand for light railways. This statement, and the circumstance that the ruling grade in the line will be 1 in 100, make the railway desirable from an engineering point of view. Some of the country over which the line must be taken is in wet weather very soft and spongy, but it is believed by the engineers that it can be drained by a drain on each side of the railway sufficiently to prevent any injury to the permanent way. As for the prospects of the line proving profitable opinions are expressed by some witnesses that a paying traffic will be obtained almost from the first, but the bulk of the testimony on that point is that it will be a matter of gradual development, and ultimately certain. There is no chance of the failure of the line in the way the line to Hay has been a failure, for the circumstances are different, and though the Chief Railway Traffic Manager is not very favourably disposed towards the railway it will be found that his objections to it are based more on assumption than upon reliable data. The people of Wilcannia and those of Broken Hill appear to be very desirous of being connected by railway with Sydney, and to trade with Sydney, and there is no evidence to show that the progress of those places in population, and the means for affording a large traffic to the railway, will not be continuous. Some of the trade

of the districts which now goes to South Australia or Victoria will doubtless continue to go to those colonies, but there is every probability, from the disposition of the people to deal with New South Wales, and the ability of the Railway Commissioners to charge railway rates sufficiently low to attract the trade to the line, that a satisfactory traffic will be secured. There is also to be considered the important circumstance that the cost of a road between Cobar and Broken Hill would be at least half as much as the cost of a railway, irrespective of the cost of maintenance.

Reasons why  
the railway  
should not go  
beyond  
Broken Hill.

10. The Committee are of opinion that the railway should be constructed as far as Broken Hill, and for the present stop there, and they form this opinion upon important evidence given before them. In the inquiry concerning the railway from Nyngan to Cobar they arrived at the conclusion, already mentioned in this Report, that the line between those places should form part of a railway, "eventually to extend to Wilcannia and Broken Hill, and to connect with the South Australian Railway system." In the present inquiry evidence has been given which has led them to modify that recommendation. One of the witnesses examined was the Secretary of the Silverton Tramway Company, who have a tramway line in operation between Broken Hill and Cockburn. This witness stated that in July last contracts were entered into between the Company and four of the largest mining Companies of Broken Hill, for a period of eight years, for the conveyance, between Broken Hill and Cockburn, of all the produce of the mines and all articles or goods necessary as requirements for the mines, and that contracts were at a later date entered into in the same way with four other mining companies for a period of two and a half years. The contracts with the first-mentioned four Companies have seven and a half years to run, and those with the four other Companies two and a half years. The Committee endeavoured to obtain from the Tramway Company copies of these contracts, but were unsuccessful, the Tramway Company declining to give them; and the only information as to the details of the contracts available was obtained from the Secretary at the time he was under examination. According to his statements these contracts are so worded that they virtually give the Tramway Company a monopoly for the periods mentioned, in the carriage of everything required by these mining Companies, and, as a consequence, would exclude the use by these Companies of coal or coke that might be obtained by means of the New South Wales railway, supposing it were constructed to Broken Hill. The whole of the tonnage of coal and coke, he says, must, according to these contracts, go over the Silverton Tramway, and, in the same way, the contracts would prevent the Companies from sending any ores by the New South Wales line. Questioned as to whether there was any provision which would permit the Companies to annul the contracts, he gave the Committee to understand that there was not, but the witnesses who attended before the Committee from Broken Hill expressed the opinion, from information they had received, that there was such a power in the hands of the Companies. In the absence, however, of direct information on the point, the weight of evidence is in favour of the idea that the Companies are bound to give all their traffic for the periods mentioned to the Tramway Company, and this is supported by the fact that many of the directors of the Companies are shareholders in the Tramway Company. These contracts during their continuance would be certain to have a material effect upon the traffic of a railway constructed by this colony between Broken Hill and Cockburn. Another reason against the construction of this portion of the proposed railway is the want of uniformity of gauge that would exist between Cockburn, Terowie, and Adelaide. The gauge of the New South Wales line would be 4 feet 8½ inches; that of the South Australian railway from Cockburn to Terowie is 3 feet 6 inches; and that from Terowie to Adelaide 5 feet 3 inches. This difference of gauge would probably interfere greatly with both passenger and goods traffic, the frequent change being irksome to passengers and detrimental to goods. The Silverton Tramway, having a gauge of 3 feet 6 inches, has the advantage of being able to convey goods without transshipment between Broken Hill and Port Pirie; the gauge on the South Australian line between Port Pirie and the Border being the same as that of the tramway, and this circumstance is of importance in the consideration of any proposal to construct a railway between Broken Hill and Cockburn, inasmuch as a portion of the traffic in connection with Broken Hill is carried on with Port Pirie. The charges on the tramway at present appear to be high, but the Secretary informed the Committee that the  
Company

Company could reduce their rates very much below what are now charged, and still work the tramway at a profit. At present the Company is paying a dividend of 50 per cent. per annum on the paid-up capital, which is £1 per share. The Government of New South Wales have power, under the Silverton Tramway Company's Act, to resume the tramway, but only after a period of twenty-one years from the time of the passing of the Act, and sixteen years of that time have yet to run.

11. On Thursday, 30 April, 1891,—

Mr. Trickett moved,—

“That, in the opinion of this Committee, it is expedient that the proposed Railway from Cobar to Cockburn, as referred to the Committee by the Legislative Assembly, be carried out.”

Mr. Dowel seconded the motion.

Mr O'Sullivan moved, as an amendment,—

“That, after the words ‘carried out,’ the following words be added, ‘as far as Broken Hill.’”

Mr. Copeland seconded the amendment.

The Committee divided on the Question—“That the words proposed to be added be so added,”—with the following result:—

Ayes, 9.	Noes, 3.
Mr. Lackey,	Mr. Dowel,
Dr. Garran,	Mr. McCourt,
Mr. Humphery,	Mr. Garvan.
Mr. Trickett,	
Mr. Cox,	
Mr. Garrard,	
Mr. Copeland,	
Mr. O'Sullivan,	
Mr. Lee.	

The amendment was therefore passed, and the motion as amended was adopted on the following division:—

Ayes, 8.	Noes, 4.
Mr. Lackey,	Dr. Garran,
Mr. Humphery,	Mr. Dowel,
Mr. Trickett,	Mr. McCourt,
Mr. Cox,	Mr. Garvan.
Mr. Garrard,	
Mr. Copeland,	
Mr. O'Sullivan,	
Mr. Lee.	

JOHN LACKEY,  
Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 14 May, 1891.

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### RAILWAY FROM COBAR TO COCKBURN.

TUESDAY, 24 FEBRUARY, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. GEORGE HENRY COX.

JACOB GARRARD, Esq.

HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM MCCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee proceeded to consider the proposed Railway from Cobar to Cockburn.

Joseph Barling, Esq., Under Secretary for Public Works, sworn, and examined:—

1. *Chairman.*] What evidence can you give in reference to this proposed work? The Minister, in introducing this proposal to Parliament in December last, made, *inter alia*, the following remarks:—

"I wish now to refer to the remarks of the Public Works Committee as to the necessity of this line, and I shall only quote from a few paragraphs of their Report. I should like to say in the first place—and I use the words of the Report—that 'the line from Nyngan to Cobar was referred to them in view of the probable extension of the railway from Cobar to Wilcannia and Silverton, and so on to the South Australian Border.' I read that to show that the Public Works Committee in approving of the line from Nyngan to Cobar, did not do so on the mere merits of the line *per se*, but on the merits of the line as part of an intercolonial line to South Australia. They say:

"The Committee, therefore, in making their investigations, have not confined themselves merely to the expediency of constructing a railway as far as Cobar, but have directed their attention also to the larger question of opening up communication by railway with the extreme north-western portion of the colony."

"Then we have in the Report the most favourable statement as to the prospect of this line, and if honorable members are curious about it and will either take that Report or the Sectional Committee's Report upon which it was founded, they will find almost unlimited evidence in favour of the construction of this line. I should just like to quote from Mr. Whitton's opinion on this matter. He wrote an opinion on the subject in 1889, very shortly before he left the colony. He said:

"In reply to the Minister's Minute of this date I have no hesitation in stating that if it be considered desirable to construct a railway to connect Wilcannia with the railway system of the colony, and which might eventually be extended to Silverton, the best route to adopt would be from Nyngan to Cobar, thence to Wilcannia and Silverton.

"This route would form almost a direct line from Nyngan to Silverton where connection could be made with the South Australian railways, thus providing a through route to Adelaide.

"In my opinion this would form a very important line and would directly connect Adelaide with Sydney, and the distance would be nearly the same as the line now passing through Victoria.

"The country from Nyngan to Wilcannia is remarkably easy for railway construction, no important bridges or heavy cuttings will be required in the whole distance."

"I think I have now quoted sufficient to justify me in asking the House to pass the resolution that the proposal shall go to the Public Works Committee for investigation."

I may, perhaps, also be permitted to quote a few extracts from the Report of the Committee itself:—

"While considering the question of establishing railway communication between Sydney and Broken Hill and Silverton, the Committee have not ignored the fact that other routes have been suggested by which to reach those localities without adopting the line from Nyngan to Cobar at all. The railway already extends to Hay, a distance of 454 miles, and thence to Broken Hill would be 274 miles, as against 355 from Nyngan to Broken Hill, or a saving of 81 miles of new line to construct. The total length of line from Sydney to Broken Hill, *via* Nyngan and Cobar, would be 732 miles, while by way of Hay it would be 728, involving a saving of only 4 miles in the total length. There is yet another route which has been suggested, and that is to go along the valley of the Lachlan River, by way of Forbes and Condobolin, striking the Darling at Menindie, and thence proceeding on to Silverton. This line, it appears, has not yet been surveyed; but, according to a return furnished by Mr. Deane, this route would be the shortest by about 64 miles. The railway in this direction is as yet only constructed as far as Molong, 216 miles; so that, in order to reach Broken Hill, about 450 miles of new line would have to be constructed, as against 355 miles by the Nyngan-Cobar route. But it must be borne in mind that the last-named route will embrace the thriving township of Wilcannia and district, which would not be served by any other proposed route.

"Under these circumstances, and especially considering the necessity for establishing railway communication with the great mining centres of the north-western portion of the colony as soon as possible, the Committee, after due consideration, have come to the conclusion that it would be better to recommend the adoption of the line from Nyngan to Cobar, as part of a line eventually to extend to Wilcannia and Broken Hill, and to connect with the South Australian railway system."

J. Barling,  
Esq.  
24 Feb., 1891.

Perhaps the Report of the Commissioners may be taken as read. I would, however, especially draw attention to that part of the Commissioners' Report, in which they make the following remarks as bearing upon this question:—

"Of course it is impossible to offer a pronounced opinion upon the probable financial success of such a large undertaking from the outset, but there is no doubt ultimately it will be successful, and as it is most desirable to open up communication with remote portions of the colony of New South Wales, which are at present nearly, if not wholly, commercially connected with our sister colonies, we strongly advise the Government to adopt the scheme, and to commence it in about four sections, so as to get it opened throughout as quickly as possible.

"We suggest the route for the line from Broken Hill to the South Australian Border at Cockburn, *via* the Pinnacles and Thackaringa, as the mining industry at the Pinnacles requires the aid of a railway to develop it, and a private company is also being projected to afford this facility; and we would advise the Government not to grant powers to another private company in the district."

Mr. Deane, Acting Engineer-in-Chief for Railways, reports as follows:—

*Subject:—Cobar to Cockburn Railway.*

I HAVE the honor to submit the following:—

The estimate for this line furnished from very rough data in July, 1889, is as follows:—

Cobar to Wilcannia .....	£440,000
Bridge over Darling and viaducts .....	57,000
Wilcannia to Broken Hill .....	390,000
Broken Hill to Cockburn.....	150,000
	<hr/>
	£1,037,000

The result of the surveys has been to show that, with the exception of the bridge over the Darling, and viaducts, the total estimate will remain the same, although the amounts would be somewhat differently disposed in the items.

The ruling gradient is 1 in 75. There are some places between Cobar and Wilcannia, and Broken Hill and Cockburn, where economical considerations necessitate this grade. If, however, a ruling grade of 1 in 100, as recommended by the Railway Commissioners for the Nyngan to Cobar line, were adopted, an additional sum of £60,000 would be required for this improvement.

With regard to the bridge over the Darling, and viaducts, the information just obtained shows that the cost is considerably under estimated. Not only are the floods more serious than before reported, but the result of some of the borings of the river bed indicates the necessity of deeper foundations. I am of opinion, therefore, after careful consideration, that it will be necessary to increase the estimate for the bridge by £35,000.

I would also call attention to the fact that, as in the Nyngan to Cobar line, the fencing has been, for the most part, left out.

As these lines will have to be run over at night, I think it most undesirable to leave them unfenced, and I would recommend that the cost of fencing, viz., £36,000, should also be added.

The following would be the revised estimate:—

Original estimate.....	£1,037,000
Add for additional cost of Darling Bridge and flood openings .....	35,000
Fencing.....	36,000
	<hr/>
	£1,108,000
Add improvement of grades from 1 in 75 to 1 in 100 .....	60,000
	<hr/>
	£1,168,000

The Under Secretary for Public Works.

H. DEANE.

This Report, by the direction of the Minister, was sent to the Railway Commissioners, with the following memorandum:—

"The Commissioners will see from this Report of Mr. Deane, that the estimate has been revised, chiefly due to the easing of the grades recommended by them and approved by the Minister, and the enlargement of the waterways. Perhaps, therefore, they would like to revise their Report in view of this."

Mr. Eddy and Mr. Oliver add the following memorandum:—

"The additional expense for improving the grades and for fencing should, in our opinion, be undertaken. The question of the viaduct and bridge in connection with the river Darling is one affecting the Works Department."

I now hand in a description of the line, which I would ask should be taken as part of my evidence:—

Cobar to Cockburn Railway, *via* Wilcannia and Broken Hill.

Length—305 miles 73 chains.

THIS proposed line would leave the end of the authorised line—Nyngan to Cobar Railway—at 459 miles 36 chains 59·8 links, and proceed in a westerly direction through counties of Robinson, Booroondara, Rankin, and Werunda to Lake Poopelloe; thence through remainder of Werunda to Wilcannia in a south-westerly and north-westerly direction. From its commencement at Cobar it follows the direction of the main road to Wilcannia, which it leaves at 511 miles 70 chains, intersecting it again at 560 miles 70 chains and 568 miles 70 chains, respectively; it crosses the Darling River at 615 miles 50 chains; thence through the town of Wilcannia, running between and parallel to Murray and Brougham streets. Between Wilcannia and Cockburn it passes through the counties of Young, Tandora, and Yancowinna. After leaving Wilcannia at Desailly-street, it proceeds in a westerly direction to the north of Lake Woychugga at 622 miles, and distant therefrom 20 chains. Intersecting the main road, Wilcannia to Broken Hill, at 655 miles, the general direction of which it follows, and crosses four times between 655 miles and 720 miles. Passing through the township of Taltangan (Round Hill) at 730 miles, it proceeds to Broken Hill, which is reached at 735 miles; the Pinnacles are reached at 745 miles, Thackaringa, 756 miles; and Cockburn, where it terminates, at 765 miles 29 chains 59·8 links. The steepest grade is 1 in 75; the sharpest curve is 16 radius.

Original estimate .....	£1,037,000
Add for additional cost of bridge and flood openings .....	35,000
Fencing .....	36,000
	<hr/>
	£1,108,000
Add for improvement of grades—1 in 75 to 1 in 100 .....	60,000
	<hr/>
	£1,168,000
	<hr/>
Cobar to Wilcannia—158 miles, at £3,050 .....	£501,900
Darling bridge and viaduct—(£57,000 and £35,000).....	92,000
Wilcannia to Broken Hill—119 miles, at £2,870 .....	359,530
Broken Hill to Cockburn—30 miles, £3,952 .....	118,570
	<hr/>
	£1,072,000
Fencing .....	36,000
	<hr/>
	£1,108,000
Improvement of grades .....	60,000
	<hr/>
	£1,168,000

With

With regard to the reduction of the grade 1 in 75 to 1 in 100, a similar alteration has been made in the Nyngan to Cobar line. Correspondence leading up to that decision may, perhaps, be of use to the Committee. It is as follows:—

J. Barling,  
Esq.

24 Feb., 1891.

Sir, Government Railways of New South Wales, Secretary's Office, Sydney, 9 December, 1890.  
I have the honor, by direction of the Railway Commissioners, to forward herewith the enclosed statement in reference to the grades on the Nyngan to Cobar line for the information of the Honorable the Minister for Works.

I have, &c.,

H. McLACHLAN,

Secretary.

The Under Secretary, Public Works Department, Sydney.

Office of the Railway Commissioners, Sydney, 8 December, 1890.  
Nyngan to Cobar Line.

With reference to the question of improving the grades on the Nyngan to Cobar line, since we called attention to the matter considerable improvement has been made, but still a grade of 1 in 70 is the ruling one. Mr. Deane estimates that it would cost about £20,000 to still further improve this, so that 1 in 100 will be the heaviest grade; and, as the whole of the traffic of the proposed intercolonial line must pass over this first section of 81 miles, we strongly recommend the expenditure of the additional £20,000.

This improvement will also have an important bearing on the further extension to connect with the South Australian railways, as the only way in which the line to Broken Hill can be made to pay for some years to come will be by economising working expenses, and the weight of paying load that can be taken by goods trains will be a very important element in the matter.

This question of grades is of even greater importance upon this line than upon the main lines, as it has been decided to have a light class of permanent way which will of necessity compel us to work this line with a lighter class of locomotive than would otherwise be the case.

E. M. G. EDDY,  
Chief Commissioner.  
W. M. FEHON,  
Commissioner.  
CHARLES OLIVER,  
Commissioner.

Mr. Deane was then asked to report on this matter, and on 15th December, 1890, he did so as follows:—

"The original grades on this line were 1 in 50. After consultation with the Commissioners I arranged to have the survey altered so as to get a ruling grade of 1 in 75."

2. *Mr. Copeland.*] Was not the original grade 1 in 40? It was originally.

3. *Mr. Garrard.*] Mr. Deane, when giving evidence on the proposed railway from Nyngan to Cobar, was asked the following question:—"At all events you say you think the steepest grade was 1 in 40? The steepest grade when the plans were first completed was 1 in 40. Afterwards it was improved, on the section only, to 1 in 50—there was no re-staking?" That is the explanation. Mr. Deane's Report continues:—

"The line, as authorised, has this grade. Parliament fixed the limit of cost at £2,560 per mile. If a ruling grade of 1 in 100 is now substituted the total expenditure will be increased by £20,000. This money would no doubt be well expended, but it should be pointed out that, to make the alteration of real use the grades on the proposed line between Cobar and Cockburn should also be improved in like manner. To carry out this latter improvement an extra expenditure of about £60,000 would be involved. I have reported on this matter separately."

This was sent to the Railway Commissioners for any further remarks they might wish to make on the matter, and it brought this minute dated 16th December, 1890:—

Government Railways of New South Wales, Secretary's Office, Sydney, 16 December, 1890.

With reference to the matter of the improvement of grades on the Nyngan to Cobar line, I am directed to say that the Commissioners have only dealt with the line authorised by Parliament, as the question of the grades on the further extension will come before them later on. They would, however, strongly recommend the adoption of the easiest possible grade which can be obtained at a reasonable cost on all lines; but in regard to the line to Broken Hill the question of grade is of exceptional importance, as, unless low rates can be fixed—and this question depends upon the grades—there will be no hope of competing with South Australia for the Barrier trade.

It may be added that the difference between the hauling power of an engine of the class that will be placed upon this line on a grade of 1 in 100 and 1 in 70, is about 100 tons greater per train; it will therefore be seen how important it is to have as easy a grade as possible.

H. McLACHLAN,

Secretary.

The Under Secretary, Public Works Department, Sydney.

I may mention that Mr. Eddy also made personal representations on the subject, urging most strongly that this alteration in the grade should be made. The matter was then brought by the Minister, Mr. Bruce Smith, before the Cabinet, and, after consideration by the Cabinet, this was the decision:—

"Cabinet authorises the expenditure of £20,000 in the improvement of the grade on the line already authorised by Parliament between Nyngan and Cobar."

The Minister also added the following memorandum:—

"Let Mr. Deane make provision for the reduced grades in the extension of the line from Cobar to Cockburn—"

which, as you will see by the papers I have handed in, has been done.

4. *Mr. Copeland.*] Does that extend the line to any material distance? I have not gone into that question. You will be able to examine Mr. Deane on that point.

5. *Mr. Garrard.*] Then I understand the Ministry have authorised an expenditure of £20,000 beyond what was voted by Parliament? Quite so. If it is not done now the opportunity is gone. With regard to fencing, which will be dealt with by Mr. Deane, and which has also been provided for, it will be interesting to the Committee to have placed before them some further evidence. It had come to the knowledge of the Minister, from various sources, that the plan adopted of not fencing the lines in South Australia had not been very successful, and he thereupon directed me to write to the Chief Commissioner of Railways and ask him if he would be so good as to communicate with the Railway Commissioners of South Australia with the view of their forwarding some information on the point. As a result the following letter was written to Mr. Eddy by the Chairman of the Railway Commissioners of South Australia:—

My dear Sir,

Adelaide, 23 October, 1890.

I herewith return Mr. Barling's letter, and for your information have to state that our intercolonial line, between Murray Bridge and Bordertown, has remained unfenced since its opening. We felt, however, that with trains travelling at a high rate of speed the risk was too great, and having had several narrow escapes from accidents, besides killing from time to time large numbers of sheep, we recommended the Government to fence the line, and Parliament has approved of the expenditure.

Between

J. Barling,  
Esq.  
24 Feb., 1891.

Between Petersburg and Cockburn, a distance of 144½ miles, the line has remained unfenced since its opening. In this case we have had several escapes, and trains have been thrown off the metals through coming in contact with animals which have sought the ballast, as they invariably will, to lie down. In this case also we advised that the line should be fenced, and the expenditure having been approved by Parliament, we have called for tenders for the supply of the necessary materials, and the work will be commenced as early as possible.

On the transcontinental line, from Moralena Creek to Cobnadatta, a distance of 396 miles, the line runs through unfenced country, which, however, is not very heavily stocked.

If there is any further information you would like, and will let me know, it shall be forwarded to you.

I am, &c.,  
J. H. SMITH,

Chairman.

E. M. G. Eddy, Esq., Chief Commissioner of Railways, Sydney, N.S.W.

Mr. Bruce Smith, of course, considered this, and as a result the cost of fencing has been added to the original estimate. Upon this matter Mr. Deane says:—

“My opinion always has been, and I have expressed it before the Public Works Committee, that unfenced lines of railway can only be safely worked in daylight.”

It may be interesting to the Committee to know the attitude which the Minister has taken in the matter of the construction of a private tram line. On the 8th July, 1890, Mr. J. P. Abbott, the present Speaker, asked the following question:—

“I desire to ask the Secretary for Public Works to state what the Government intend to do in regard to the Broken Hill-Pinnacles Tramway Bill? I understood from the Government the other night that they were going to push on the extension of the railway system to Broken Hill, and would not allow any private interests to spring up in the meantime.

“Mr. BRUCE SMITH: The question as to how this contemplated private tramway will affect the public interest has not been discussed particularly by the Cabinet; but I can say that the Government are fully determined to carry a railway from Cobar to Cockburn, and inasmuch as the railway will pass from Broken Hill to Cockburn, almost over the direct route which it is intended to take for the proposed tramway, I cannot offer any encouragement whatever to gentlemen promoting that measure. Honorable members are aware that the present Silverton tramway has been a source of loud complaint by the people in the district, owing to the very heavy charges imposed. I understand that, contemplating that the Government are going into that part of the colony with a railway of their own, the company has taken steps to secure contracts for a number of years with most of the Broken Hill silver mines. I can only say that it is fully determined to construct a railway there, notwithstanding all private interests, and I think it will be found highly undesirable for any private interests to compete with the Government railways.”

In conclusion, I would refer to a statement made by myself to this Committee in September last, in which I made the following remarks:—

“The Minister for Works regards this extension chiefly in connection with the proposition to carry the line further on to Broken Hill and the South Australian Border, and the report of the Committee will determine him as to his recommendations to the Cabinet with regard to the further extension alluded to.”

I am authorised by Mr. Bruce Smith to emphasise this statement, and to add that he considers the main justification in having proposed the Nyngan to Cobar line, and now advocating the further extension to the South Australian Border, is the intercolonial aspect of the whole proposal, doubly important now in view of the great increase in the importance of the Barrier district.

6. *Chairman.*] Are there any Ministerial records in the office of any project to lock the Darling in this neighbourhood? There are. I have a number of papers on the subject, and a very important report on the subject by Mr. Darley, but that report has not yet been considered by the Cabinet. The Minister regards it as a separate and distinct work, and not having any bearing on the railway, excepting so far as it is likely to increase the prospects of the railway, which, however, he regards as possessing sufficient merits of itself. The Minister desires me to say that he has the greatest pleasure in putting all the papers at the disposal of the Committee. I have only just received Mr. Darley's report and other papers on the subject, and I have not had an opportunity of carefully looking over them since they have been printed.

Henry Deane, Esq., Acting Engineer-in-Chief for Railways, sworn, and examined:—

H. Deane,  
Esq.  
24 Feb., 1891.

7. *Mr. Copeland.*] Have you been over the proposed line? No.

8. The reports which you have received are, I suppose, from the most capable officers? Yes; we have had very good officers employed upon that line.

9. Are you individually of opinion that this is the most proper route for the line to take—from Cobar to Wilcannia? Yes; I am, certainly.

10. Have you given consideration to the other routes—taking the line from Forbes to Condobolin, and so on through Wilcannia? Yes.

11. Can you give the Committee the difference in the lengths of the lines marked on the map? They have all been supplied before, in connection with the inquiry on the line from Nyngan to Cobar, pages 7 and 8 of the Appendices to the Report on the Nyngan to Cobar line contain the various distances.

12. What are the ruling grades between Nyngan and the Blue Mountains—the big Zig Zag? There is one grade of 1 in 33.

13. Where? At Locksley.

14. The object of my present questions is to ascertain whether there is any possibility of reducing the grades between the level country and the steeper country, so as to make it worth while going to the expense of reducing the grade on this proposed western line. Do you think there would be any chance of cutting out any of those steep grades, or how far do you think the level of the lines can be extended coming towards Sydney. You have a grade, for instance, from Nyngan to Cobar, of 1 in 100. How far will a level grade extend from Nyngan towards Sydney? Between Dubbo and Nyngan there are grades much steeper than that.

14½. I notice on the map between Cobar and Wilcannia, and as you approach Wilcannia, a sharp curve in the line—what is the cause of that? That is to avoid some of the flooded country, and the lagoons. It is the best and most favourable route. The curve is with the object of avoiding, in the first place, some high ground, and, further on, the lake and flooded country.

15. How much does the detour increase the length of the line? It makes it 8 miles longer.

16. Would it not have been possible to have gone to the north of this range, or to have cut through a gap so as to make a direct line to Wilcannia? I think not. Every possible means were taken to select the best route.

17. Have you had a survey of the country north of this range? No; there has been no actual survey, but an examination has been made.

18. Before this inquiry is closed will you endeavour to elicit the information as to the possibilities of taking

taking the route in a more direct line so as to avoid this 8 miles curve? Yes; I will obtain more information, but I may state that one of the surveyors for the Department, Mr. Marshall, is now engaged in revising the line, and he is making, in places, some considerable deviations. Mr. Firth, who has just returned from the district, informs me that he has deviated in one place to the extent of 8 miles away from the old line—that is at the Bulla ranges, about 50 miles from Cobar.

H. Deane,  
Esq.  
24 Feb., 1891.

19. So that the line laid down on the map is not to be considered by the Committee as a hard and fast line? No.
20. It merely indicates the general direction? Yes, the general direction and principle.
21. Is the deviation which you have referred to north or south of the line submitted? I am not yet in a position to say. I have only just had the report from Mr. Firth.
22. Have you obtained good foundations for the bridge at Wilcannia? Yes.
23. Is the surveyor who made the survey across the Darling—Mr. Marshall—in Sydney, or is he located on the ground? He is in the district now. The original survey was, I think, made by Mr. Marshall and Mr. Wickham.
24. You are satisfied that a good foundation has been obtained for the bridge? Yes, I have had borings taken there, and they are in progress now, and so far as they have gone there is a very good foundation.
25. Before the inquiry is closed, will you take the trouble to look through the reports as to why this line is taken as marked on the plan, instead of being taken nearer the ferry? I am quite sure that it is the best section.
26. When the Committee were travelling over the country on the other side of the Darling, they found that miles of it were so soft that it could not bear them walking over it. We very often sank to the knees so soon as the surface was broken. Do you think the country will bear a railway unless there is some sort of foundation obtained for it? It only requires to be well drained by ditches on each side of the line.
27. Would you be able to drain the country when it is such a dead level for miles? It would have a fall one way or another. I am of opinion that over a country which is so level, and where the water after heavy rain would remain for some time, it is a mistake to make a surface line. You would get a far more durable line if it were raised some height from the surface.
28. What plan do you propose to adopt in building this line? The plan which has been proposed is simply to make it very much of a surface line—to raise it a few inches above the surface, but not make any heavy embankments.
29. And you propose to lay cross sleepers in the ordinary way? Yes.
30. On ballast? Yes.
31. Have you considered whether it would be desirable to have longitudinal sleepers in that country? I am sure the cross sleepers are the best.
32. I notice that the estimate is £2,800 odd per mile for that part of the line—Wilcannia to Broken Hill? I made a report to the Minister for Public Works, in which I stated that the result of the surveys has been to show that, with the exception of the bridge over the Darling, and viaducts, the total estimate will remain the same, although the amounts would be somewhat differently disposed in the items. So that the portion from Cockburn to Wilcannia would be more expensive than what was put down at first, but the other portions—Wilcannia to Broken Hill, and Broken Hill to Cockburn—would be less; but, in re-submitting the estimate, I would confirm the general total, subject to the additions which have been pointed out to the House, but I would not adhere to the cost of the different portions.
33. With regard to this written estimate which has been given out to us this afternoon, is not that your final recommendation or estimate? Yes. Cobar to Wilcannia, 158 miles, £3,050.
34. Wilcannia to Broken Hill? £2,870.
35. I should like to know whether those figures are based on careful calculations, or whether they are put down with the idea of being subject to considerable variations? No; they have been gone into as carefully as possible. I might refer especially to the Wilcanna to Broken Hill portion. The way in which I have made up the £2,870 is as follows:—Earthworks, £300 per mile; culverts, £150; permanent way and ballast, £2,300.
36. *Mr. Garvan.*] Does that include the rails? Yes. Fencing part, distributed over line, £20; and other work, £100. That makes £2,870.
37. *Mr. Lee.*] Is that the cost per mile? Yes.
38. That is exclusive of the bridge across the river? Yes; that is a different item.
39. *Mr. Copeland.*] What depth of ballast do you calculate upon? Six inches under the sleepers.
40. Will that 6 inches of ballast be laid on the grass? No, on the bank—on the formation.
41. You would throw up the formation first? Yes.
42. At what height? It is reckoned that in the greater part of the length it would be from 8 inches to 1 foot in height.
43. And how many inches of ballast? Six.
44. That will make it 14 or 15 inches high above the level of the surrounding country? To the bottom of the sleepers, yes.
45. And you lay the sleepers on the top of this ballast? Yes.
46. Do you think, knowing the extraordinary rotten nature of the country, so rotten that if a coach goes off the beaten track it will go down, and a horse in some instances will go almost out of sight;—do you think that that will be a sufficient foundation over which to run a heavy locomotive and heavy ballast train? No, I do not, throughout; but the rotten foundation does not occur all the way.
47. Have you had the country examined;—have you had pot-holes, for instance, sunk in the ground in the wet season, so as to ascertain the nature of the soil? No.
48. I may tell you that there does not appear to be any bottom to it;—when once the grass is broken it is like walking in a mortar pit? There are some stretches of similar country between Nyngan and Cobar.
49. Have you tested the country in any way between Nyngan and Cobar;—have you ascertained whether the ground is likely to be able to bear locomotives? The country will bear them if the embankment is raised, and I propose to raise it about 18 inches or 2 feet above the surface, and then it will be drained with side ditches.
50. But, assuming the country is a dead level—as it is, for many miles, as level as a table—how will you get over the difficulty of drainage? The question is whether there is any country anywhere which is an absolutely dead level.

H. Deane,  
Esq.  
24 Feb., 1891.

51. What I want to know is whether you are not under-estimating very considerably the expenses of constructing the line—whether, instead of 6 inches of ballast, you will not have to put down much more, and whether you will not find that the line cannot be constructed for £2,870 per mile. Where do you propose to get the ballast from? We shall have to get it from where we can;—run it from one end of the line, or get it from wherever there are hills in the country.
52. At how much per mile have you estimated the fencing? The additional amount which has been put down for fencing is £36,000 for the whole length, and that would be about £120 per mile for the two fences. Assuming that an amount of fencing equal to about £40 per mile was distributed over the line before, that would make about £160 per mile, or £80 per mile for each side.
53. What sort of fence do you propose to put up? A wire fence.
54. At a cost of £80 per mile? That is to cover all expenses,—all returns and everything.
55. You are speaking of £80 per mile for a single fence? Yes.
56. *Mr. Humphery.*] But your estimate only provides for about £50? You mean in the £36,000.
57. Yes? I may mention that before this £36,000 was added, I had included an amount for part of the fencing of the line near settlements, which would have to be done in any case, and this £36,000 is for the fencing in the open part of the country alone. It would come to somewhat less than £80 a mile. The amount I have put down frequently for fencing has been £156, and I find that it is not at all out of the way. It is not merely a lot of plain fencing which you have to do, but you have to turn it into crossings and heavy waterways. There are a lot of angles in it which a squatter has not to provide for. You have to put down a stronger fence than a squatter would put down, because in a railway you have to deal with the safety of human life, and not with the safety of stock.
58. *Mr. Copeland.*] But I suppose human life will be safe enough, so long as the cattle are kept off the line? Yes; but if stock get over a squatter's fence there is no human life lost. It may be a little disagreeable, but no serious damage is done. But if cattle went upon the line they may wreck a train.
59. How many wires have you proposed? Seven.
60. Of what gauge? No. 6, I think. In the specification for fencing the Nyngan to Cobar line the contractor has priced it at 3s. 6d. per rod.
61. How much is that per mile? £56.
62. *Mr. Tonkin.*] Does he find all the material? Yes.
63. *Mr. Copeland.*] Were tenders called for that as a separate work? No, it is part of the contract. He is to be responsible for the fencing. It is most desirable that the general contractor should have the contract for the fencing as well.
64. Have you any engineer superintending the erection of all these works while they are being constructed? Yes.
65. Would it not be as competent for him to superintend the erection of a fence as it would be for a squatter to see that his fence is properly put up? It is not a question of seeing that the fence is properly put up, but a question of having the line fenced in properly, and not having to pay extra for heavy damages. When a contractor puts up a fence he is responsible for it until the whole line is completed. He very often damages it, or has to break through it in order to make tracks; or some portions of it cannot be completed until the end of the work; and if you let it to another man you would, perhaps, after taking the line over and paying for it, have to do no end of repairs which had occurred from one reason or another; or you would have to complete pieces which had not been finished up, and for these short pieces alone you would have to pay a much higher price than you would pay for the general contract.
66. Is it not a fact that the squatters in the immediate vicinity of this proposed railway do not pay more than £40 a mile for a similar fence? I have never seen any fence in any district, and I have not seen any fence in any district which I should consider satisfactory, which would cost less than about 3s. 6d. a rod. You must remember what I have said about the contractor maintaining his work. He is not fully paid for his work until the end of the job. He has to make good any damage done, and he has to keep ways open for his teams to go along the line. There are a great many things to be considered,—it is not a mere making of the fence.
67. Would you not be paying a good deal more for a fence if you let it in a separate contract, and gave the men who put it up the full benefit of the price, instead of giving the benefit of the price to the contractor, who sub-lets it to somebody else who does the work for about half the money. The contractor in this case, if your estimate of £80 is correct, will sub-let the work for not more than £50 a mile? Supposing he does sub-let it for that amount, he still has the maintenance and the repairs I have already mentioned, and the short bits of fencing which he has to carry out himself out of the balance.
68. Would it not be possible for the Government themselves, having local engineers superintending the work, to have tenders accepted for doing this work direct, and for it to be done as required? I do not think so. I know that where contractors have sub-let their work they have very great difficulty in getting men to do it, unless they can do it straightforward. They will not do it in little bits.
69. Do not railway contractors, as a matter of fact, always sub-let their work to other contractors? They nearly always do for long straight bits of fencing. Sometimes they provide the timber, and sometimes they only pay for the erection, but as a rule they do not sub-let the whole of the fencing. They nearly always provide the wire themselves, and then they get somebody else to provide the posts, and somebody else to erect; or, perhaps, they let the posts or rails, as the case may be, and they erect them in one sub-contract.
70. Where do you propose to have stations? That is a matter which has yet to be settled by the Railway Commissioners.
71. Then you have not estimated the cost of station buildings? No; excepting approximately.
72. You have included in the estimates something for station buildings? Yes, small amounts, because it was always understood in making this line that everything should be done in as sparing a manner as possible.
73. I suppose the buildings will be of wood. Do you propose to have any platforms? The Railway Commissioners were willing to do without platforms altogether at one time; but I think that the amount which has been inserted in the estimate provides sufficient accommodation for a time. I am sure it would not satisfy the people if there were any increase of traffic in five or ten years, but as the Commissioners think profits may come from the line after a time, it will be possible then to add to the accommodation for passengers.

74. Have you given any consideration to the question of the cost of the stations at Wilcannia or Broken Hill? No more than that I have put down certain amounts for station buildings. Over the whole of the line between Cobar and Broken Hill I have put down the amount at £26,000.

75. Can you say how much of that you have allotted to Broken Hill and Wilcannia? I have put down £10,000 for each of the two sections—Cobar to Wilcannia and Wilcannia to Broken Hill—and £6,000 for the other section—Broken Hill to Cockburn.

76. I suppose you have not sufficiently advanced your estimates to be able to say what you intend doing at any of those places? I have merely put down a lump sum. It is impossible to consider in detail matters of this kind until the line is authorised. The practise is to put down a lump sum, which is likely to cover all contingencies.

77. I suppose the Committee can look upon the whole of these estimates as having been very roughly estimated? I would not say that. They have been cut down very low to suit the desire for light lines. I do not think, if the line is made, as intended, there should be much difficulty in carrying it out at this cost, always remembering that one might have to call upon the 10 per cent. which is allowed in connection with the estimates.

78. You think you will not be likely to call upon more than 10 per cent. additional? I cannot say. I should be very sorry to guarantee, because if tenders are being called for one line after another prices are sure to go up. It is very difficult to estimate the cost of the work in a country like that. Contractors may take very different views of things from what one takes in the office, and there are no works of a similar description which serve as a guide at all.

79. The Government have not hitherto constructed any similar class of railways? No. The Nyngan to Cobar line is to some extent a guide.

80. *Mr. Garrard.*] Is not the Nyngan to Bourke a similar line? That is a line which, where it goes over the flats, is chiefly made on embankments. It is a different class of line from so-called light lines.

81. *Mr. Copeland.*] The intention of the Commissioners, of course, is to run trains right through without stopping at night-time? Night and day.

82. Where do you anticipate getting your sleepers from? We may get some red gum from the Darling; it is also possible that some may have to be brought from the Dubbo district.

83. Where do you anticipate getting the sleepers from for the Nyngan to Cobar line? They are chiefly being obtained from the Dubbo district.

84. Are they red gum or ironbark? Mostly ironbark. The contractors have delivered a few red gum sleepers, but they do not appear to be very satisfactory.

85. When do you anticipate having the line to Cobar completed, so as to be open for traffic? The contract terminates in April of next year, but the contractors have got well ahead with the earthworks. If they have no difficulty about getting sleepers they ought to be completed, I think, long before the contract time.

86. Would not you be able to get the line constructed at a considerably cheaper rate between Cobar and Cockburn, if the line was open to Cobar before any contracts were let, so that the contractors would be able to get the use of that railway? Not cheaper than what I have put it down at, because I have gone upon the assumption that the line will be opened before the contracts for the extension are let. I have also gone upon the assumption that the work will be started from the Darling as well; but I am speaking just now with reference to the Cobar end of that particular section.

87. Do you know whether it is the intention of the Department to call for tenders for three or four sections? I should recommend that it should be divided into a number of contracts. There would be a contract for the bridge, for instance.

88. There would be a contract, I suppose, from Wilcannia towards Cobar—about half way; another from Cobar, about half way towards Wilcannia? Yes.

89. Then another one from Wilcannia, some distance towards Cockburn? Yes; the work could be divided into six contracts.

90. Would you recommend commencing a contract at Cockburn, and extending it towards Broken Hill? Yes.

91. And having to take all the sleepers and other material on the South Australian line? Yes; I think some arrangement might be made to bring materials through. It all depends on what arrangements can be made.

92. Would not that make it very expensive? Not much more than it would be to start from Wilcannia, because you would have to get your materials first at Wilcannia, and then you would have to take them over 100 miles of line before you got them to Broken Hill.

93. The report says that there are no steeper grades than 1 in 100 from Wilcannia to Cockburn? No; it is proposed to make them 1 in 100.

94. The estimate, I suppose, is for a single line? Yes; for a single line the whole of the way from Cobar.

95. I suppose there will be no tunnels and no expensive bridges, except the one at Wilcannia? No.

96. Will the bridge at Wilcannia be constructed for a single line? Yes; the estimate of cost does not provide for a double line.

97. I suppose the bridge will be built in such a way that if a double line should be found necessary you would be able to extend the bridge so as to carry it? No. It is proposed to build it complete in itself, so that it would have to be doubled in case a double line were required.

98. What would be the difference between building a bridge so as to carry a double line, and building one so as to carry only a single line? It would make between 50 and 60 per cent. more. £92,000 is down for the bridge and viaduct, and to that we should have to add about £46,000.

99. You have £57,000 down for the bridge alone? The first estimate for the bridge and viaduct was £57,000. Afterwards I added to the amount, because I had further information about the borings and the extent of the floods.

100. But the approaches to the viaduct could be increased so as to carry another set of rails at any time without any additional cost? Yes, they could.

101. That is to say, they could be done as well at any future time as now? Pretty nearly. There will be a little extra, but not very much.

102. Is it to be an iron bridge or a wooden one? I propose an iron bridge over the main channel, upon wooden piles.

H. Deane,  
Esq.  
24 Feb., 1891.

- H. Deane, Esq.  
24 Feb., 1891.
103. Would it not be worth while to construct a bridge so as to be able to carry a double line if necessary;—I want to know how much additional cost that would incur? For the bridge itself it would be, I daresay, about £10,000 additional for the main spans.
104. If that were not done now, and it had to be done in the future as a separate job, of course it would cost just as much for a second bridge as it will for the first? Yes, it would.
105. Would it not be worth while to consider whether it would not be desirable to build a bridge so as to enable it to carry a double line if necessary? I do not think so. I think it is doubtful whether the traffic would ever be so very great as to render it inconvenient. Supposing you had this line doubled throughout, with the exception of the bridge, and you had to work the bridge as a single line it would not be a serious inconvenience.
106. *Mr. O'Sullivan.*] The gauge of the line from Petersburg to Cockburn is the same as ours, is it not? No; 3 feet 6 inches.
107. Then there would have to be a change of carriages at Cockburn? Yes.
108. Why has the Department chosen to go from Broken Hill to Cockburn, *via* the Pinnacles, when they could have taken the whole of the line *via* Silvertown? There is a tramway *via* Silvertown.
109. Was it not understood that it would be resumed by the Government, and the track used for the railways? Yes; I believe the Bill allows for resumption.
- 109½. So that, even now you may possibly change the route from Broken Hill to Cockburn, and go by way of Silvertown to the Pinnacles? It is most direct to go by the Pinnacles. As this line will serve the purpose of a through intercolonial line it is desirable that no detour should be made.
110. Then they do not anticipate much trouble from the competition of the tramway line from Cockburn to Broken Hill? I can scarcely venture to give an opinion upon that point; but I suppose that each line would bear its own traffic.

WEDNESDAY, 25 FEBRUARY, 1891.

Present:—

JACOB GARRARD, Esq. (VICE-CHAIRMAN).

The Hon. ANDREW GARRARD.	JAMES EBENEZER TONKIN, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES ALFRED LEE, Esq.
The Hon. GEORGE HENRY COX.	WILLIAM McCOURT, Esq.
HENRY COPELAND, Esq.	JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

Henry Deane, Esq., Acting Engineer-in-Chief for Railways, sworn, and further examined:—

- H. Deane, Esq.  
25 Feb., 1891.
111. *Mr. Tonkin.*] Are the tenders which have been accepted for the construction of the line from Nyngan to Cobar much above or below the estimated cost of construction? The contract which has been let for that line is above the estimated cost.
112. Much above it? The estimate for the portion of the work which was let by contract is £128,904. Smith and Finlayson's contract price, reckoned at schedule rates, amounts to £133,311 7s. 6d.—that is, between £4,000 and £5,000 above the estimate.
113. Was that the lowest tender? Yes.
114. Do you think that the contract is likely to be carried out? Yes; but on some of the items the tenderers will lose.
115. Is there much difference between that and the next tender? I have not the list with me.
116. How much is that tender per mile? About £1,640.
117. What is the difference between £1,640 and our price caused by. Is it caused by any deviation or alteration in the grades? No alteration in the grades is included. The quantities and prices are those which were included in the original estimate.
118. I want to know whether there is any reason why the contractor's tender is above your estimate; was there any alteration in the plan after your estimate was made;—for instance, is the line for a grade of 1 in 75 or 1 in 100? 1 in 75.
119. Then there has to be added to that a sum of £20,000 on account of the grade being reduced to 1 in 100? Yes.
120. And that will make it about £25,000 more than your originally estimated cost? Yes.
121. Where is the contractors' schedule price larger than your schedule price? There are a great many items.
122. I should like to know those which make the most material difference? Some are above and some are below. The earthworks are £3,000 below the estimate.
123. And I should take it that the ballasting is above your estimate? Yes, about £13,000 above. Against that there is the laying of the permanent way, which is £7,000 below, so that altogether there will be about £5,000 difference in the laying and ballasting of the permanent way, more than the Government estimate. That would account for the whole difference.
124. What I want the Committee to understand is that there is a possibility of greater difficulty in obtaining ballast beyond Cobar, than there is between Nyngan and Cobar, and the consequence is that your estimate beyond Cobar may be further from the actual cost than what it would be to Cobar? The price put down for ballast for the Nyngan to Cobar line was 4s. 3d. The price calculated beyond was 6s.
125. Then you have allowed for greater difficulty in obtaining stone beyond Cobar? Yes.
126. What was the contractor's price per yard between Nyngan and Cobar? 6s.
127. He has jumped from 4s. 3d. to 6s.? Yes, but he has the laying of the permanent way, which is only 1s. 1d.
128. But that would not affect the obtaining of ballast beyond? No.
129. Supposing his price—6s. per yard for ballast—be a fair one between Nyngan and Cobar, you have not in your estimate allowed any more beyond? No. I have taken 6s. throughout as a fair average.

H. Deane,  
Esq.  
25 Feb., 1891.

130. Have you had a report from any of your officers as to the probability of obtaining ballast between Cobar and Wilcannia? Yes; they have reported that ballast can be obtained from all the hills.
131. Of course, you know there are very few hills; between Wilcannia and Silverton, no doubt, the ballast will be easy enough to obtain, but I fancy there will be great difficulty in obtaining ballast between Cobar and Wilcannia. Consequently, my line of examination is to obtain from you whether you have taken that into consideration in your estimate? I have taken it for granted that all the hills and ranges which we cross, or come in contact with, or approach, will produce ballast. I think there will be no difficulty on that account.
132. But if there should be an equal increase upon your estimate for the ballasting beyond Cobar, comparing it with the line from Nyngan to Cobar, you will be a long way short of your estimate of the cost—in that particular portion of the work, I mean? That is to say, that supposing the tenders show a larger price for ballast, it would make a great deal of difference and materially affect the contract; but I do not anticipate that there would be a great deal of difference.
133. But there is a difference of 4s. 6d. and 6s.? Yes; but it is a very high price—they have a very high price for ballast.
134. Were any of the schedule prices for ballast from any other of the tenders less than the one accepted? I have not the information with me, but I can soon obtain it.
135. In the meantime, have you any idea of the grades of the line from Adelaide to Broken Hill? No.
136. Was there much difference between your estimated price of the sleepers and the contractor's price? 3d.
137. That is not a material difference? No.
138. Is the ballast the main alteration which creates this difference? Yes; it may be attributed to the ballast entirely. Other items balance one another.
139. What is the weight of the rails to be laid on the line? 60-lb.—the same as on the Nyngan to Cobar line.
140. And the number of sleepers to the mile? About 2,000.
141. Is that about the same number as on the trunk lines? Yes.
142. Only that our trunk lines have 72-lb. rails? Yes. I find that the second tenderer put down 4s. 6d. for ballasting.
143. Then he must have been very much higher in some other portions of the tender? Yes.
144. What does the ballast consist of? It will be gravel for a good part of it; some of it will be broken metal.
145. Where can it be got? At present they are getting gravel.
146. Is the preference left to the contractor as to whether he puts down gravel or broken metal? Entirely; so long as it passes inspection and is good serviceable ballast.
147. Was the 4s. 6d. of the next tenderer the lowest scheduled price for ballast of any of the tenderers? Yes; and 10s. was the highest.
148. Is there to be a large amount of embankment, or will a lot of the sleepers be laid on the surface of the ground from Cobar to Wilcannia? In no place will they be laid on the surface of the ground. There will always be a slight embankment, excepting where you are in cutting.
149. Can you give us an idea of the average height of the embankment? Where the line is constructed as forming, it will vary from 8 inches to 1 foot in depth, unless there are special circumstances, such as were mentioned yesterday, which will necessitate the embankment being higher, for instance, where the ground is too wet and boggy.
150. Do you think the height you have fixed for your embankments—say, 1 foot—is sufficient to cope with the heavy floods we have in the back country? It is very difficult to say, but I believe so; but one might be deceived, and it is possible that in places they may have to be raised when we come to actual work. The reason I think so is that on the Nyngan to Cobar line it has been found necessary to raise portions of the work, because the water has been more troublesome, owing to the late heavy rains, than was anticipated.
151. Is that alteration included in the extra £25,000 beyond the estimate? It would be included in the £25,000.
152. I understand that the actual cost of the Nyngan to Cobar line will be about £25,000 over the estimated cost? Yes.
153. That is £5,000 for the tender and £20,000 in the alteration of the grades? Yes.
154. Will that include this extra embankment? It will, partly. I think these extra embankments will cost about £5,000 altogether. Perhaps half of that will be covered by the alteration of the grades.
155. In the event of your having to raise the embankment on the line under investigation, would that make a material difference in the cost of construction, supposing it had to be made a foot higher than you have estimated? If it had to be made a foot higher all through, I should be of opinion that the estimate was too low; but I think the £60,000 which has been put down for the alteration of gradients may be expected to cover that, especially if, as I mentioned yesterday, there is an understanding that we may be allowed to call upon the 10 per cent.
156. You know that there will be many miles of this embankment in one continuous level, because it is almost a level country? Yes.
157. Have you made provision in that portion for waterways under the rails? Yes; I have put an amount down for waterways.
158. You know that any overflow of the river will probably be on one side of the line? Yes. It will be necessary to provide for drainage in any case.
159. You have done that? Yes; I have provided an amount which comes to about £200 per mile throughout, on the average, for culverts.
160. Have you taken into consideration the peculiarly friable nature of the soil which will form these embankments when water comes into contact with it? You mean that it is peculiarly liable to wash away? I imagine, when it is raised over the surface of the ground and upon an embankment, that will cease to operate.
161. And the ballast being mixed with it to a certain extent? Yes. Of course, it is understood that in connection with these estimates everything has been done in the most saving manner, and when the traffic increases the line will have to be very much improved. More ballast will have to be put on when the trains

H. Deane,  
Esq.  
25 Feb., 1891.

trains are running, and in the course of ten years, if there is a good traffic on the line, it ought to be in a different condition from what it will be on the first day it is opened.

162. In making this estimate, you have reduced the cost to the lowest possible amount? The lowest cost, consistent with stability, to meet the demand for light railways.

163. You know that this is more or less an experimental line? Yes.

164. And you have no precedent to go upon in any similar line in the colony? No.

165. Under those circumstances, have you been a little more careful in estimating the probabilities of what I was just asking you;—that is, as to the soil washing away from the embankment? Yes; I think sufficient care has been bestowed.

166. Have you been in that part of the country? No.

167. I think Mr. Copeland explained it to you exactly? I perfectly understood it, because I have seen the same thing in other parts of the colony. No doubt it has developed to a larger extent there than elsewhere.

168. Having had experience of these tenders of the line from Nyngan to Cobar, is it your opinion that the estimate you have made in the cost of the line from Cobar to Broken Hill will be carried out; do you think the price is not too low? No; I think it is as fair an estimate as one could possibly make.

169. You do not consider that the ballast is likely to be 25 per cent. more than you have estimated? No, I think 6s. ought to be about right.

170. Do you know how many stations it is intended to put between Cobar and Wilcannia? No; the Commissioners will have to decide that.

171. *Mr. Trickett.*] Whilst on the question of gravel supply, will you look at questions 1768 and 1770 in the evidence taken on the Nyngan to Cobar railway? Yes.

172. That is the evidence of Mr. Bode, one of your surveyors? Yes.

173. Does he not state that the ground is of a gravelly nature, and also that there is plenty of ballast obtainable in the ranges, consisting of good hardstone? Yes.

174. Have you any reason to doubt that statement? No.

175. Is he a reliable officer? I believe him to be a thoroughly reliable officer. I have a very good opinion of him.

176. Does he not also state that he is making a survey from Wilcannia outwards? Yes.

177. And that he has gone a considerable distance? Yes.

178. Would you also turn to questions 2274, 2285, and 2286. Those questions embrace the evidence of Mr. Wickham, one of your surveyors? Yes.

179. And was he not working at the other end, from Broken Hill towards Wilcannia? Yes.

180. Does not his evidence confirm that of the other surveyor;—does he not, in fact, say that the country is stony in parts—that it is full of stones and ridgy, and is he not further asked if he did not come across suitable material for ballast, and he said, "Yes, there is a very large amount"? Yes.

181. He was asked the following question:—"Was it sandstone?" He replied:—"No, it is the usual rock which occurs in this country. I could not give you the name of it, but it would make a very suitable ballast."

182. He gives that evidence? Yes.

183. Have you any reason to doubt his evidence in that respect? No.

184. That evidence, I suppose, has guided you in coming to the belief that there is plenty of ballast? Yes.

185. I suppose you could not point out on the feature map the ridges referred to, not having been in the locality? I think they are mentioned in the evidence. Mr. Bode says that there is a ridge about 4 miles from Wilcannia, and that he skirted some hills about 65 miles from Wilcannia. 65 miles would not be such a long stretch. If, starting from Wilcannia, you have a ridge 4 miles out, it would be very easy to get ballast from there and do one half the line, and at the other end there will be no difficulty about ballast.

186. As far as we can judge from the surveyors who made the actual survey, there is plenty of ballast procurable along the whole of the line of railway from Cobar to Broken Hill? I do not think there will be any difficulty at all.

187. Seeing that the line is proposed to be fenced in, are you providing for the use of cattle stops instead of gates? Yes.

188. Experience in South Australia has shown them to be fairly suitable? Yes.

189. And they are to be adopted here instead of gates, and the necessary expense of gate-keeping? Yes; we have not any of them yet; but they will be adopted on the Culcairn to Corowa, and some of the other lines.

190. And they will be adopted on this line? Yes.

191. Will you look at the Appendices on pages 7 and 8 of the main Report, "Distances." I want you to tell us, so that it may be concisely put in this part of the evidence, what is the distance from Cobar to Cockburn by this proposed route. I make it 311 miles? Yes; but that is by Silverton. It is a shorter distance by Broken Hill and through Thackaringa.

192. By Silverton, it is 311 miles? Yes.

193. What is it direct to Broken Hill and Cockburn? About 306 miles. With the improvement of the grades it may be necessary to increase the line. That is, as the line has been actually surveyed it is 306 miles; but there will be a few miles addition through the improvement of the grades.

194. Will you tell us, from the next page, what is the distance from Forbes to Cockburn by way of Menindie and Silverton? I make it 440 miles.

195. So that, taking the route from Cobar to Cockburn by way of Broken Hill, as against the line from Forbes to Cockburn, the Cobar to Cockburn line is 120 miles shorter? Yes; less to construct.

196. Would not that be a great consideration in connection with the construction of a railway, if two rival routes came into consideration? Decidedly.

197. *Dr. Garran.*] Is this new line before the Committee as strong and stable a line as that between Nyngan and Cobar? Yes.

198. You have not made any further reductions in estimates? No.

199. Then whenever we see a fair length of the line from Nyngan to Cobar made, we shall have a fair sample of what the whole route is to be? Yes.

H. Deane,  
Esq.

25 Feb., 1891.

200. In making the line from Nyngan to Bourke, you made a strong trunk line? Yes; the banks, I think, we raised 2 or 3 feet above the level of the plains.
201. Have you ever had the water over it excepting at the Bourke end? No; the waterways have been increased in places.
202. Have you ever found it dangerous to bank up the water? No; I have not heard of it being so, further than that an increase of waterways has been necessitated in certain places.
203. Have you ever found that line sink at all in the wet weather through the softness of the ground underneath it? I could not say whether that has occurred. Of course, I have not the maintenance to look after.
204. Have you had any reason to think you have gone needlessly to expense in raising that bank, and that you might have made it nearer the surface? It might have been carried out in the same way as this line.
205. This is not quite so solid a line as the other;—with all your experience of the permanent way of that line, so far as the raising of the bank is concerned, do you now think you could have economised? You mean supposing we had to make that line short of money?
206. No;—supposing you had to make it over again, would you economise on that part? If it was with the object of making a good stable line, I would make it stronger than what is proposed. That is to say, I would go in more heavily for earthworks, and make stronger banks than on the Nyngan to Cobar line.
207. Then, as an engineer, you would rather spend a little more than a little less? Yes; I would sooner spend more money on this line.
208. But still they are making a new experiment? Yes.
209. And we shall not know the result of it until we get the first heavy rain after traffic has commenced? Perhaps so, but we have already had some experience of the line during course of construction.
210. What kind of experience? Well, when the water has stood on the ground, in some cases as much as 18 inches.
211. On either side of the line? Yes.
212. And does that soften the bed underneath the line? Yes; the ground is boggy.
213. But you are not running any heavy traffic over it present? No.
214. Does the line give under that traffic? Well, if you were to attempt to drive a team over the line with heavily laden drays you would probably sink in axle deep.
215. But I am not talking of traffic across the line, but contractors' waggons going along the line? They have not any waggons along the line, because the only waggons they will use will be the ballast waggons.
216. They are making the bank out of side ditches? Yes.
217. So that they have had no test as to whether the line is elastic or not? No, no test at present; but there is no doubt that the weight of the heaviest locomotive is so well distributed by the rails, sleepers, and ballast, that the effect of it would be infinitesimal as compared with a heavily laden dray.
218. It would be more like a roller going over it than a cart-wheel? Yes; because it is distributed over the area of the sleepers and ballast.
219. Still, it is all made earth thrown up on the bank? Yes.
220. And is it not sometimes the case that when a surface is made you sink in more than you would if you do not cut the surface? If the surface of the ground were hard or tenacious it would be so. I think, as a rule, it is better to throw up the surface of the ground, because you get the drainage, and if the contractor, as is usually done in works of this kind, rolls the surface with a proper roller, you get a crust on the top of the bank which resists moisture.
221. Then you do not really disturb the surface where the bank is going to be made. You throw the earth on the top? Yes.
222. So that you get any benefit there may be from the original hardness? Yes.
223. And you think that that might be further hardened by being rolled first? I mean the bank itself. That is the practice before the ballast goes on.
224. And that makes it nearly as hard as the original surface? It hardens it considerably.
225. Still, it remains a fact that we shall have to wait for the first heavy rains after the line is completed before we know the result of this experiment? No, I do not think any special results may be anticipated so long as we take care to give sufficient waterway, and keep the surface of the bank above the standing water. It may be expected to stand pretty fairly. It will probably subside slightly. All new banks are liable to do this for a considerable time after their formation.
226. The mere pressure of a load on the rails would tend a little to press the earth down into the ditches, would it not? Yes, especially when wet it would compress.
227. And you have no fear of the result of the experiment? No; on banks which are much higher than this settlements take place.
228. What depth and breadth are your ditches? Just whatever is necessary to make up the embankment.
229. In some places they are deeper than in others? Yes, 18 inches is about the usual depth of a side cutting.
230. I suppose the survey which has been made shows you that there is very seldom a real flat patch of land over which to make a line? Yes.
231. There is always some fall one way or another? Yes. On the Nyngan to Bourke line I notice the gradients run almost from mile to mile, and there is no more than a couple of feet difference when you get to the other end of the mile.
232. When you have made your ditches will the water run off down them or soak? In most cases it will eventually run away.
233. But it may be standing for some time in the ditches? In some cases.
234. That will have a tendency to soften the earth all round for some distance? It does. Of course, the earth becomes waterlogged and water cannot go away.
235. If there is water in each of these ditches on the side of the bank will there be a tendency to soften the ground under your bank? No more than there would be otherwise.
236. You do not think there is any risk if the ditches are full of their undermining? Not on that account. Of course, I would rather see them empty.
237. You are going to spend some money in the further reduction of the grade;—is that expenditure to be by lengthening the line or going into cuttings? Going into cuttings.

- H. Deane, Esq.  
25 Feb., 1891.
238. Then you will have some dirt out of these cuttings which will be available for banks? Yes. I have not decided whether it is desirable to go deeper into cuttings, or whether we should put it all into banks. But still the expenditure is calculated, and part of the expenditure will cover the raising of the banks.
239. I want to know whether you are going to spend the money in detours or cuttings? Not in detours. The course of the line will remain exactly the same as it is now.
240. So far as the present contract has gone, has any change been made in the gradients? Yes; the contractors have instructions to make them 1 in 100. Unfortunately, before the Commissioners had asked for the alterations, a considerable portion of this end of the line had been constructed.
241. That will not be an extra charge upon the contract; it will be according to the scheduled price? Yes; I believe so.
242. So that the price for all this work is fixed? Yes; I may say that the contractors have stated their objection to its being considered in that way.
243. Is there likely to be any quarrel with the contractor about it? I do not think so.
244. You told Mr. Copeland yesterday, that an officer now on the line will see if you can avoid this detour of 8 miles in getting in to Wilcannia; supposing he should go more north to avoid that, it might be desirable to cross the river above Wilcannia? I think I said yesterday, that I was convinced that the line proposed was the best, as it gave the best level. I think that I implied that it went south partly to avoid higher ground and partly to avoid a lake or a number of lagoons. I believe, if you go on the other side and try to straighten up the line, you would come into difficulties with swamps and low-lying ground.
245. Do you know whether the river has been examined a few miles above or below the site of the bridge, to see if there are any reefs across? I do not think it has been examined very far above, because it was made an important object to get into Wilcannia; but I do not believe there is any real difference, or any real advantage to be gained by going much above or below.
246. This route entering into Wilcannia was, I suppose, part of the original line from Condobolin to Wilcannia, marked green on the plan? Yes.
247. And the surveyor from Cobar struck that line? Yes, he struck it there. It is the only approach to Wilcannia.
248. Do you know how many years ago it is since the Cobar to Wilcannia route was surveyed? Two or three years ago.
249. Who surveyed it? I cannot tell from memory.
250. Is it a gentleman still in the Department? I believe so.
251. Have any surveys been made at Menindie for a bridge? Not by the Railway Department.
252. That has never been explored at all? No.
253. Has the line from Broken Hill to Cockburn, through Thackaringa and the Pinnacles, been as carefully surveyed as the rest? Yes.
254. Do you keep the gradient down to 1 in 100? We can, but it will be very difficult.
255. It is not quite such a level country? No; it is rougher.
256. You still think without extra expense you can keep that gradient? I think we can. It is just possible that there may be one steeper grade, for which it will be necessary to get extra engine-power; but that would not be a serious matter.
257. What weight of engine are you going to run on this line? I suppose not more than 40 or 45 tons.
258. It is built for that? Yes; that is what I should take to be a proper engine, without the tender.
259. Then it is not intended to carry a heavier locomotive than that? No. It would be undesirable to use the heaviest locomotives over a line of that character.
260. It is part of the principle of this cheap line that it is to have a light locomotive? Not exactly a light locomotive, but to avoid using the very heaviest ones.
261. Of medium quality, too? Yes; one which a few years ago might have been considered a very heavy one. If we come to have a heavy traffic we shall have to multiply the trains with these light locomotives, or strengthen the lines to carry a heavier one.
262. And in so strengthening it will you have to strengthen both the rails and the ballast? Not necessarily; but if the line has to carry a very large amount of traffic, of course it ought to be very much improved in the way of putting down extra ballast.
263. You know they had to strengthen the Petersburg to Cockburn line very considerably the moment their traffic had developed? Yes.
264. It was built as a light line at first, not expecting so heavy a traffic, and the Commissioners found it necessary to go to considerable expense? Yes.
265. Whilst it is an experiment, do you think it is wise to adhere to the grade and strength you have fixed? Yes.
266. You think that in all things it is well proportioned? Yes.
267. You have seen no reason since you have planned it to alter the general strength of the different parts? No; I think the minimum strength has been adopted.
268. You have almost had to strain your feelings as an engineer to come so low? I would very much prefer making a more substantial line, but still, I think it will answer the purpose, and that is all.
269. *Mr. O'Sullivan.* Now that you have decided to fence this line, has the Department any idea of making it a rabbit-proof fence? No; we have not gone into that.
270. You said, in reply to a question by Mr. Trickett, that the matter of fixing the stations would be left to the Commissioners? Yes.
271. Will the building of these stations be a new contract? They will be a separate contract.
272. Therefore their cost will have to be added to the cost of the first contract? Do you refer to the Nyngan to Cobar line?
273. The line right through? In the line right through the estimate includes station buildings and other works.
274. Is it not usual in the first contract to prepare the sites for the stations? So far as they can be arranged beforehand. The earthworks are nearly always part of the original contract, because before the main contractor has finished it is known what is to be done with the station sites; but he never has the buildings to undertake. That is always a separate contract.
275. In the first section from Nyngan to Cobar, then, you have fixed the sites of the stations? No; not yet.
276. Then all the preparation of the sites for these stations will be subsequent contracts? Yes.
277. And this, of course, in the end, must be added on to the cost of the line? Yes. 278.

278. *Mr. Lee.*] Will you explain the average levels of the sectional plan in the neighbourhood of the Darling at Wilcannia; do the blue lines show the height of the highest known flood above the surveyed line? The red line shows the proposed formation level, and the blue line the flood level.

H. Deane,  
Esq.  
25 Feb., 1891.

279. And in every instance has the line been kept above the known flood level? Yes.

280. Even at a distance of 3 or 4 miles back from the Darling? Yes; and flood openings have been provided.

281. Upon what portions of the line have you provided for piles and viaducts? In all places where the deepest depressions occur, or where it is most noticeable that the water flows across the line. I have allowed in the estimates for nearly 17,000 lineal feet of flood openings in the neighbourhood of Wilcannia.

282. Is that the locality where they will be most required? Yes; Wilcannia, and a few miles back.

283. Then you have observed, in the location of this line, that in every instance it shall be above the highest known flood level of the water? Yes.

284. How do the flood openings and waterways stand in comparison with the waterways on the western line to Bourke? I do not see how to make a comparison.

285. You have found it necessary to enlarge the waterways in the neighbourhood of Bourke owing to recent floods? Yes.

286. Have you made a provision in this plan to the extent equal to your alterations in the Bourke district? The cases are so entirely different. At Bourke we do not cross the Darling, although we cross a considerable area of flooded country.

287. I am speaking more in regard to the back-water—the overflow from the river in time of flood—where there is an immense area of country covered, and the current is very slow. What provision have you made to enable that large body of water to discharge itself and keep your line free? I have allowed for three miles of waterways.

288. Having had recent experience of the ordinary waterways in flat country at times when it has proved quite insufficient, have you, in view of that experience, increased the size of your openings on this line? Yes. I gave careful attention to the matter after the flood. Mr. Marshall, the surveyor, was sent to Wilcannia to observe the effect of the flood, and the result has been that my estimate for the Wilcannia bridge has been increased to £92,000. That is in a great measure owing to the increased waterways which I considered necessary.

289. And you have increased your waterways in proportion? Yes. In all these depressions at Wilcannia, on this side of the river, extensive flood openings have been left.

Thomas Rhodes Firth, Esq., Acting Inspecting Engineer, Department of the Engineer-in-Chief for Railways, sworn, and examined:—

290. *Mr. Copeland.*] You know the country between Cobar and Cockburn? Yes; I have been over it.

T. R. Firth,  
Esq.

291. Have you only been over it once? Only once.

292. You have not been over it again since you were with the Sectional Committee? No.

293. Your only experience of the line, then, was what you gathered while with the Sectional Committee? Yes, so far as the country is concerned.

25 Feb., 1891.

294. You are aware that the grade has been extended from 1 in 75 to 1 in 100? Yes.

295. Have you any official information as to where the grades have been flattened out? Wherever there was a steep grade of 1 in 50 it has been worked out to 1 in 75, with the possibility of getting it to 1 in 100.

296. You cannot tell what length of grades have been reduced to 1 in 100? No.

297. Can you say what the probable additional expense will be? I could not say exactly, but it will be very trifling, because several deviations have been made where these grades of 1 in 40 and 1 in 50 were by curving round the ridges.

298. Can you say how much longer the line has been lengthened so as to avoid these pinches? It will not exceed 2 miles altogether.

299. I suppose you are of opinion that the getting of this additional grade of 1 in 100 has not been a very expensive matter? It has not.

300. It will be of very great advantage to the Department in being able to carry so much greater loads? Decidedly.

301. What was the reason of making the deviation just before you get to Wilcannia? It was to avoid a large lake.

302. Can you say positively whether surveys have been made with the view of straightening the line? No surveys have been made, but the country was examined north of that lake during the surveys, and they had sufficient reason to keep on the south side.

303. Have surveys been made to ascertain whether you could get the road through any gaps in the range? I do not know of any. I believe the country was examined.

304. Do you know how much longer that deviation has made the line to Wilcannia? I could not say.

305. As an engineer, do you not think it would be worth while to have this country examined to ascertain whether that deviation could not be obviated so as to save 10 miles of construction, and 10 miles of constant running;—the Engineer-in-Chief has estimated it at 10 miles? It is worth examining if 10 miles can be saved.

306. Do you know exactly where the surveyor is in that district? He is at the Bulla Ranges now, 55 miles from Cobar.

307. There will be no difficulty in getting him to make a thorough examination of that country? No. He will be finished where he is now about the end of May. He could then go for it.

308. You remember the country west of Wilcannia being exceedingly rotten—so rotten that members of the Committee frequently sank pretty well up to their knees when they left the coach? Yes.

309. I do not know whether you had any personal experience of that or not? Not much of it, but I can thoroughly believe it.

310. Do you think 12 inches of road formation, and 6 inches of metalling will be sufficient support to carry a locomotive and heavy train over that very rotten ground, remembering the fact of the country being a dead level, and almost impossible of drainage? I think from 12 to 18 inches would be sufficient, because the drains which would have to make this formation would naturally consolidate the ground. It would become encrusted, and the water would not penetrate so much after these drains have been made, as it does at present when there are no drains.

- T. R. Firth, Esq.  
25 Feb., 1891.
311. But if the ground is a dead level the cutting of a drain would merely be the means of making a channel filled with water? Yes; but we have not found any country yet which is dead level—it all has a slight fall. You cannot tell by the eye in which direction the fall is.
312. Would not the fact of the ground being so rotten and full of water, that it was more like mortar, go to show that there was no drainage;—of course, I am only speaking of some places? I think by cutting the drain which must necessarily be made in forming the embankment 18 inches high, you would help to consolidate the ground. We should have to make drains on each side of the railway to form the railway, and I think that would help to give a permanent drainage to the ground.
313. Do you know of any ground where railways have been constructed over a similar place? Yes, I saw some the other day between Nyngan and Cobar.
314. I do not remember any ground of such a dead level as the plains to which I am referring? The Hermitage Plains are very similar and are quite as bad.
315. But you have not had experience of running over Hermitage Plains? Not with an engine.
316. Is there any similar rotten ground between Dubbo and Bourke? I do not know that country excepting by travelling by train.
317. Supposing this ground should prove by boring, or sinking a shaft, to have no sub-soil—in fact to have no bottom to it,—and that for feet and feet down it is all similar to mixed mortar in the wet weather, do you think that merely putting 12 inches of soil—12 inches of the same kind of sandy rotten soil, and 6 inches of metal would form an embankment sufficiently strong to carry an engine and a goods train? I think 18 inches would.
318. What would be the difference in cost per mile between forming a road of 12 inches, and forming one of 18 inches? About £400, it might be a little more, because all the waterways would have to be a little longer. But as I suppose this would only occur in some places, £300 per mile of railway might do it.
319. I suppose if the railway were built in the manner proposed by the engineer, it would always be an easy matter if it were found that the line were sinking to raise the roadway, seeing that there is so much level to work upon? It would be easy to do it, but in the meantime the trains might be stopped.
320. I suppose it would be possible for you to lose the run of a locomotive as well if once it got down through the surface? I think the rails and the sleepers would hang somewhere.
321. With reference to the Cobar line which is now being built on a grade of 1 in 100, we have been informed by Mr. Deane that the total contract price is £133,311. I notice that tenders were formally called for when the Cobar line was passed by Parliament, before which it was on the old survey of a grade of 1 in 40, and the lowest tender then was £121,799, so that this contract is now let for less than £12,000 more than the lowest tenderer then, although in this case we are getting a grade of 1 in 100, whilst formerly the grade was 1 in 40? I believe the tender was for grades of 1 in 75. There is £20,000 extra to alter the grades to 1 in 100.
322. As an engineer, do you think that it is worth while the country paying this additional amount to get a better grade? I think so, and more especially as in this case it allows us to make better embankments.
323. Can you say what sort of a bridge you propose building across Stephen's Creek? I could not say—no details have been got out. Probably it will have concrete pillar-piers or cylinders. It depends entirely on the depths of the borings for fountains.
324. Then you cannot at present form an estimate as to the cost of that bridge? No.
325. Is the Department in possession of sufficient information to enable it to form anything like a reliable estimate of the cost of the bridge at Wilcannia, across the Darling? We are in possession of sufficient information to form an approximate estimate, but not an accurate one. Borings have been taken there, but I have not seen them. They have not been worked up at all. If I remember rightly the road bridge borings were 18 feet below the bed of the river.
326. And no borings have been taken at Stephen's Creek? No.
327. Do you know whether this estimate has been formed on the calculation of having a line without platforms, or are the platforms to be built in the usual manner at the different stations? A certain amount is put down for stations, but very few will be required on that length. Comparatively speaking, the stations will be a very small item.
328. Do you know where it is proposed to get ballast for the line between Cobar and Wilcannia? I think all the ridges we come to give good ballast, a kind of gravel, a mixed kind of schist. So far as I can judge, it will be similar country to the line between Nyngan and Cobar. At every 10 or 12 miles they can get ballast.
329. What about ballast on the other side of the line, between Wilcannia and Broken Hill? I cannot speak so well about that, but I do not think there will be any difficulty. The surveyors' reports state that ballast can be got at different places.
330. Is it the intention, or would you advise that such should be done, to commence building one section of the line from Cockburn to Broken Hill;—have any figures been gone into at all? I am not aware that they have. It would simply amount to a question of the cost of the transport of material.
331. You have made no recommendations, I suppose? No.
332. Mr. Tonkin.] If you were going to recommend the Government to construct this line, would you recommend them to commence at Cockburn, taking into consideration the carriage of the material? Of course, if the line were not sufficiently surveyed for us to commence at once I should recommend that it should be commenced at Wilcannia and Cobar.
333. Do you not think it would be better to run the supplies over our own railways, and give them the advantage of carriage, instead of sending them *via* Adelaide? Yes; unless there was a very great difference in the cost.
334. You do not think there would be any difficulty about the floods in that country? I think we shall make sufficient provision for them. Directly the last flood took place at Bourke I sent a surveyor to Wilcannia with special instructions to mark the height of the flood. We have that information now.
335. Mr. Copeland.] All the way over the proposed line? Yes.
336. Mr. Tonkin.] Do you think that the soil to which Mr. Copeland has been referring will not dissolve and melt away when the water mixes with it, supposing it is pitched up on the embankment? No. The only danger is of the soft soil underneath allowing the wet to sink through it.
337. You do not think it will actually dissolve and run away? No; I think the embankment itself will get stronger.

338. *Mr. O'Sullivan.*] Carry your mind along the track to Barneto, where I suppose the surveyor is now, there is a peculiar turn in the line there—a little semi-circle—what is that caused by? I suppose that was to get over the Bulla Ranges.

339. There is a range of hills somewhere out there? Yes.

340. And instead of going through it you prefer to go round it? We have gone round it, about 8 miles nearly. We can get 1 in 100 by going there, whereas it was 1 in 40 before.

T. R. Firth,  
Esq.  
25 Feb., 1891.

WEDNESDAY, 11 MARCH, 1891.

Present:—

JACOB GARRARD, Esq. (VICE-CHAIRMAN).

The Hon. ANDREW GARRAN.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. GEORGE HENRY COX.

HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

WILLIAM McCOURT, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

341. *Vice-Chairman.*] You occupy the position of Secretary to the Railway Commissioners? Yes.

342. *Mr. Trickett.*] You were not examined at the inquiry in reference to the line from Nyngan to Cobar, were you? No.

343. You remember that at that inquiry the Commissioners put in a memorandum dated the 15th July, 1889? Yes.

344. And in that memorandum they stated that they considered the Nyngan and Cobar line in connection with its ultimate extension to Wilcannia and Cockburn? Yes.

345. They then took a favourable view of it? Yes.

346. Do you know what the Commissioners' views are at present on the subject? They are the same now as they were then.

347. Have you gone into the question with a view of showing what traffic would be carried between Cobar and Wilcannia? As the Commissioners pointed out in their Report, the traffic is very difficult to arrive at. They could not form any definite estimate as to what it will be. I think the Commissioners pointed out in their Report that this line would be a national undertaking. The people between Wilcannia, and Cobar, and Nyngan have no practical means of getting to market, except one route, which in certain seasons may be impassable for some considerable time, without a railway. In time of drought the people in that district are in want of means of transit for their stock, which, in the absence of the railway, have to be sacrificed. If they had a railway they could move their stock to some other part of the colony where there may be land available for pasturage. Experience has shown that when a drought is prevalent in one part of the country there is sufficient feed for cattle in other parts. The Commissioners have not gone into the question as to the extent of the results to be obtained from the construction of the line, but they view it more as a national undertaking.

348. Wilcannia is dependent very much on water carriage? At present it is.

349. And that is a very uncertain means of transit? Wilcannia is better off than places further north; but its means of transit are uncertain.

350. Do you think that if the railway were established that by reason of the people there belonging to New South Wales they would use the railway in preference to water carriage? They would. It would be to their advantage to do so. I do not know that there would be any favouritism about it. It would be to their advantage, because they would get quick and certain transit.

351. And if they had certain transit, would it not save them the necessity of getting up large stocks at one time? Yes; if they could order goods at any time there would be no necessity to get large stocks in.

352. There is no means of getting the wool away when the river is unnavigable? No. A gentleman told me only to-day, at Darling Harbour, that the stationmaster had pointed out some wool from the back blocks which had been two years reaching Sydney.

353. Where was it from? It was western wool from the back blocks beyond Nyngan. Some wool has been delayed by road from six to eighteen months.

354. If they had railway accommodation, would it not be a great advantage to get that wool direct to Sydney? It would be a great saving to the people, who would get quick returns, instead of waiting.

355. As to the town of Broken Hill—have you considered the railway from a commercial point of view at all;—of what benefit would it be to the colony? We should get a good deal of the traffic from Broken Hill. At present a great deal goes by sea from Sydney to Port Pirie, and is sent on to Broken Hill by railway, and we have steamers arriving frequently from Port Pirie and Adelaide with cargoes of ore and bullion from Broken Hill. We think that the construction of this railway would lead to the establishment of factories and smelting works in the Western district, and thus create a traffic. We also believe that it would bring large quantities of low grade ores to be treated at the coal mines.

356. Would it be as cheap as bringing it round by Adelaide? I believe that we could fairly compete for the traffic.

357. That the railway would bring the bullion to Sydney? Yes; and bring the low grade ores to Lithgow. The Commissioners have considered the question of heavier loads, and they are getting out much more powerful locomotives than we at present use, and they are having built a large number of trucks of large carrying capacity, so that we can carry bigger loads with less deadweight. That would help us to convey heavy loads at cheap rates.

358. Would supplies be taken from Sydney to Broken Hill, instead of going *via* Adelaide, if this line were constructed? Yes, to some extent; we should have a quicker means of transit, and a through traffic to Broken Hill.

359. If means of communication were established by railway, and freights were nearly equal, do you not think that the sympathy of the people might lead them to use the railway belonging to their own colony? I think that has been the experience in Riverina.

H.  
McLachlan,  
Esq.  
11 Mar., 1891.

- H.  
McLachlan,  
Esq.  
11 Mar., 1891.
360. That has been the experience? Yes. Of course, as regards the other colonies, there is one difficulty in the way in the shape of Border dues, and the trouble of getting across.
361. You know the route which has been suggested. Have you any fresh route to suggest, or any deviation? No. Of course, the Commissioners simply look at the line referred to them, and, in accordance with the usual practice, they went over this line from Cobar to Wilcannia and Broken Hill.
362. You are not aware of whether they have gone into the question of a railway by way of the Lachlan Valley 2nd Menindie? No.
363. If a railway is to be constructed to Cockburn, the route to Broken Hill would be the shortest? Yes.
364. Although it will not be the shortest direct route? No; it will be the shortest length of the line to be constructed.
365. Do you know whether any suggestions have been made by any private company to construct a railway? There has been one—the proposed line from Menindie to Broken Hill.
366. But not a suggestion in regard to this proposed route? Not so far as I know.
367. Have you been over the proposed line? No.
368. Are you aware of any engineering or other difficulties that have been suggested to the Commissioners, and of which the Committee should have cognisance? No. The engineering difficulties seem to be principally crossing the Darling at Wilcannia.
369. Is that a difficulty? It is a mere matter of expense.
370. Do you think they have considered the practicability of constructing a reasonably light line of railway over that soft surface of country? They were assured by the engineers that a line could be constructed at a cost of £1,037,000.
371. Have you got similar country already traversed by a railway? The Bourke, the Hay, and the Narrabri country is all similar.
372. What was the cost per mile of this railway? I think about £5,000, but I have not the figures.
373. They do not anticipate any difficulty in that direction? No. We had the engineer's estimate, and I think he has been examined by the Committee. The Commissioners do not question it.
374. With regard to fencing on this line, have the Commissioners varied their opinion with regard to that since they dealt with the proposed line from Nyngan to Cobar? No. I do not know that they have looked into that again.
375. Do they desire to have this line fenced? I think they mentioned in the Report that it might be left without fencing.
376. Did the Commissioners alter their opinion with reference to this particular line? Only as far as gradients were concerned. They recommended an extra expenditure to get a better grade.
377. Does the present estimate of cost include fencing? I think not.
378. You have probably seen the movement in South Australia in regard to the matter, and the correspondence recommending that fencing should be carried out on these country lines? Yes.
379. Do the Commissioners approve of that? They have not expressed a decided opinion, as far as I am aware. Of course, the South Australian evidence affects the question rather largely.
380. The tendency of that evidence is that it is desirable to have fencing? Yes. Of course, if you were running fast trains in the night-time it would affect the question.
381. You have not given us any evidence as to the probable traffic to Wilcannia other than has been given by Mr. Kirkcaldie? No; we have no direct evidence. I do not think it has been ascertained.
382. The Sectional Committee that inquired into the proposed line from Nyngan to Cobar have gone fully into it? Yes. The Commissioners have no further information than that.
383. That evidence was taken over twelve months ago? Yes.
384. As far as your knowledge goes the traffic is not likely to have decreased? It would be substantially the same. They have had good seasons, and if anything, circumstances are more favourable.
385. *Mr. Tomkin.*] Could you tell the Committee what the freight would be for wool from Wilcannia? Say about 2d. per mile. The Commissioners thought it would be rather unwise to go into that question, and make it public at present. They think they could make a rate that would largely command the traffic.
386. Do you know what the ordinary freight is from Wilcannia to Port Pirie or to Adelaide? No. The traffic goes down the river, and the charges vary.
387. You have been carefully through that? Yes.
388. And after doing so you think you will be able to compete with the average prices paid? Yes. Of course, they are very conflicting. When the river is high the charge is lower than when it is not. We have had to make arrangements to meet the same river competition from Bourke and Hay.
389. There would hardly be as much competition at Bourke as there would be at Wilcannia—the river at Wilcannia is better than it is at Bourke? That would affect it in a certain degree. We might have to cut the prices a little.
390. Have you found often at Bourke, for instance, the river a great competitor in regard to traffic? No; it has been rather an assistance—it has been bringing wool to us.
391. It has not affected the return to the railway? Not to a great extent at Bourke.
392. And you anticipate something similar at Wilcannia? Yes.
393. What is the lowest charge now for a long distance per mile per ton? I could not say from memory—a little over 2d., I think.
394. That would be a little above the ordinary freight by river to Port Pirie and Adelaide? Yes.
395. Do you think it is possible, if this line were constructed, for the Commissioners to be able to reduce the freight so as to bring the produce this way instead of its going to Adelaide? Yes. We think we should get a large amount of it.
396. You know the distance from Silverton to Adelaide, and from Silverton to Sydney? It is more than double to Sydney.
397. Under the circumstances, do you think it probable that you will bring some of that trade here? We do. At present a great deal of goods go from Sydney to Broken Hill. We see the ore and the bullion coming into Sydney at the present time.
398. You would bring it by rail instead of its taking the circuitous route that it does now? We should get some of the trade.
399. From Wilcannia you would be in a better position to compete? Much better.

H.  
McLachlan,  
Esq.

11 Mar., 1891.

400. Do you know whether it has been considered that there is a possibility of a line from Wilcannia to Silverton being a detriment to the traffic;—I mean that it will take the traffic from Wilcannia towards Adelaide instead of bringing it this way? No; we do not think that that will happen. Of course, a little may go from the vicinity of the Adelaide Border.

401. Do you know that a great deal of the traffic has been taken by teams from Wilcannia to Silverton when the river was not navigable? They had no option but to send it by teams.

402. I suppose the Commissioners have looked over the evidence which has been taken by the Sectional Committee? Yes; the Commissioners had an opportunity of going through it.

403. There is an immense traffic at Wilcannia? Yes; it is shown to be of rather large value. The tonnage, I think, is not mentioned. That would be a good guide to us.

404. I suppose that, from the evidence taken, the Commissioners have no doubt that the line would be a paying one at some future time? They do not expect that it will be an immediate commercial success.

405. Have they compared it with the Hay line? No.

406. Do you think it will be such a success as the Hay line? We think it will be a better line.

407. You know that we are losing money on the Hay line? Yes.

408. You do not anticipate such a heavy loss, if there is any, as we have on the Hay line? No; we anticipate that it will be a much better line than the Hay line.

409. Do you know what the Hay line cost? A little over £1,000,000.

410. I mean per mile? I think if worked out, with the rolling stock and everything else, it comes out to about £8,000 per mile.

411. That would be a great deal more than this line is expected to cost? Yes.

412. Were there any more engineering difficulties on the Hay line than there would be on this? No; they were something similar.

413. How do you account for the smaller cost of construction? Materials are very much cheaper now.

414. Is there more competition among contractors;—is work done cheaper? The work may be done a little cheaper. The engineers have given us that estimate. They think that the work can be done for that.

415. Have the Commissioners expressed any opinion with regard to the fencing;—do they think that the line ought to be fenced? Their original opinion was that it should be unfenced.

416. Have they altered that opinion? Not as far as I am aware. That has not been gone over again.

417. You think it would not be necessary? As Mr. Trickett has pointed out, the evidence from South Australia may lead the Commissioners to alter their opinion.

418. *Mr. Copeland.*] You have regulations here, issued by the Commissioners, under which you are prepared to carry mineral ores—the charge being a shade under a halfpenny per ton per mile;—have the Commissioners considered the probability of mineral ores being sent from Broken Hill to Lithgow, and the rolling stock returning with coal or coke for Broken Hill? Yes; they have considered that, and they think it will form an important element in the traffic.

419. Suppose such a traffic were to grow up, would it be possible to carry minerals at a lower rate than  $\frac{1}{2}$ d. per ton per mile in purely mineral trains, considering the great length of the route, and that there would be only one loading and unloading over the whole of that distance? It is a very low rate now, and I daresay that we may be able to command the trade at that rate. If we could not command the trade the Commissioners would consider whether they could reduce the charge.

420. I suppose you know that on some railways in America they carry minerals at much less than a  $\frac{1}{2}$ d. per ton? I do not think they carry them at much less than a  $\frac{1}{2}$ d.

421. The distance from Sydney to Broken Hill by this route would be 732 miles? That would be about the distance.

422. 732 miles, at a  $\frac{1}{2}$ d. per ton per mile, would be £1 10s. 6d. per ton? You must take off 4s. 2d. for the distance from Sydney to Lithgow.

423. That would be £1 6s. 4d. per ton? Yes.

424. Do the Commissioners think that there would be a chance of developing an interchange of trade between Lithgow and Broken Hill;—do you think it would pay them to charge one-third of a penny per ton for 6-ton trucks, mineral ores being carried from Broken Hill to Lithgow, and coal from Lithgow to Broken Hill? It would largely depend upon what the traffic would be. If we found that it would not bear a  $\frac{1}{2}$ d. per ton the rate might perhaps be reduced; but it is already a very low rate.

425. I think there are some tolerably steep gradients on the line? Between Lithgow and Nyngan there are, but from Nyngan down we could take very big loads.

426. I suppose it would be quite possible for them to bring from Broken Hill to Nyngan or Dubbo full train loads? Yes; a very full train load.

427. Then they could divide the train, and leave some of the waggons to be picked up afterwards? We are getting very large trucks built, to hold about 30 tons each, and we are getting very powerful engines out, so that we should be able to run very big train loads.

428. I find that between Dubbo and Nyngan there is a gradient of 1 in 50? Yes; only between those places.

429. The highest gradient between Nyngan and Broken Hill is 1 in 100? Yes.

430. Do you think it would be possible to reduce the freight even lower than a  $\frac{1}{2}$ d. per ton per mile? We might make a small reduction, but the charge is a very low one at present. If we take 300 tons by train, that only means 12s. 6d. per train mile. Take off one-third it would bring it down to 8s. That might possibly pay with frequent train loads.

431. You have a regulation even now under which you can charge something less than  $\frac{1}{2}$ d. per ton? Yes— $2\frac{1}{2}$ d. for 6 tons. That is the cheapest that we propose, and it is only for big lots—nothing less than 30 trucks a week.

432. A minimum of  $\frac{1}{2}$ d. would be £7 or nearly? About £8 per truck.

433. Then I suppose one inducement for the Committee to recommend the construction of this line is that you would be able to develop a mineral trade between the silver and the coal districts? That is an important element.

434. Have you any knowledge of the country north-west of Mount Browne? No.

435. Have you given any consideration as to whether there would be any traffic from Wilcannia up to the Paroo country and out to Mount Browne, where alluvial mining is being carried on? Of course, we think that we could make a trade from Sydney to Wilcannia in sending their supplies.

H.  
McLachlan,  
Esq.  
11 Mar., 1891

436. You think it would divert some of the trade from those parts? Yes.
437. Suppose the bottom was to fall out of Broken Hill, what is your opinion with reference to the traffic that could be done between Wilcannia and Sydney? There would be a good traffic done. It is a very big district. Wilcannia is the centre of a vast area of country, the importance of which is shown by the statistics of the trade.
438. Suppose the trade from the west of Wilcannia was to be taken to Adelaide, and the rest was to come eastward to Sydney, do you think the line would be likely to pay? We do not look forward to its being an immediately payable line. The Commissioners regard it as a national undertaking. They have one object in view, and that is to bring Wilcannia closer to Sydney.
439. I suppose, as far as the Railway Department is concerned, it would make very little difference whether you carried the traffic from Wilcannia to Cockburn, or from Cockburn to Wilcannia? Not a great deal of difference, as long as we got paid for it.
440. If you found the traffic going that way, you would take care to charge rates that would pay a fair interest on the cost of construction? Yes; we do that between Albury and Wagga Wagga.
441. You would not extend your sympathy to the trade to the same extent as you would if you found it coming to our own metropolis? We should charge the lowest rates, proportionately, for a long distance.
442. You would try to make the line pay expenses? Yes.
443. Especially if you found the trade going to the other colony? Yes.
444. *Mfr. Cox.*] Do you not think that £36,000 is a very large item for fencing? It is a very long line. That is the engineers' estimate, based on their past experience.
445. Are you aware that in Queensland no fences are put up except wire and posts? We are using wire fences, too.
446. *Dr. Garran.*] If this line is made to Broken Hill, which will be the best seaport to Wilcannia? Port Pirie?
447. And the next best? Well, Port Pirie and Adelaide.
448. And there would be one break of gauge? Yes.
449. How many miles would that break of gauge be equal to—I mean the transshipment? That has not been worked out, but the handling of the traffic would be worth (say) 1s. a ton. I should say that it would be equal to 50 miles' cheap carriage.
450. Of course, other things being equal, the tendency would be to make Port Pirie or Adelaide the seaport of Wilcannia? Yes; that being the shorter distance.
451. And what about Bourke? It would not affect Bourke; I do not see how it could.
452. Would there be no tendency of cargo to come down the river in steamers? I think not.
453. You said that the river had not affected the railway at Bourke materially? Not materially.
454. Did you not two years ago very materially reduce your rates to compete with the river steamers? I think we have put them up since that time.
455. But you did reduce them? We had them lower, proportionately, at Bourke than in other parts where there was no competition.
456. You have found the steamer competition considerable? We got most of the wool at the rates we quoted.
457. We had evidence from Mr. Kirkcaldie that the wool from above Bourke had passed the railway terminus and gone down the river? There is a great deal coming from above Bourke down to Bourke.
458. More recent experience shows that you are now competing successfully? Yes; this has been by far the greatest wool season that we have ever had. We have carried more wool than ever before.
459. Has much of the wool gone down the river past Bourke this season? Not a great deal. The wool has been brought to us.
460. You are not losing much now? Not a great deal—the season is over.
461. Then Bourke is sweeping the circle round it? Yes; we are getting a bigger trade than ever from there.
462. Are the rates lower now than they were when the railway was opened? No; we have been able to raise them.
463. You are feeling your position by degrees? Yes.
464. And you are getting the full rates now? Yes; we are getting a price that pays us. Some little time ago the rates in the Riverina district were affected by the railway rates of other colonies, and we entered into a compact with the others to put up the rate £1 per ton. It has been the railway rates that affected the carriage.
465. There was no competing railway to Bourke? The traffic has been carried from Echuca and other places up the river where there are railways.
466. Then you have settled down to a state of things in which you can command the Bourke traffic at a paying rate? Yes.
467. Does the wool pay as well as hay? The Western line was a fairly profitable line when we got the last returns.
468. Does it pay as well as hay on the other lines? The rates are higher.
469. Does it give as good a profit as carrying wheat? We get double the rates for wool; it is a much better paying traffic.
470. In view of your experience of Bourke over two or three seasons, do you think you will be able to compete for the Wilcannia traffic, as against the tendency to send it down to Port Pirie and Adelaide? Yes; we think we shall get a large portion of that trade by this railway.
471. Not all of it? No doubt some will go by water.
472. You would still have the river to compete with? Yes.
473. You do not think we shall be creating a fresh railway rivalry by making this line? No.
474. You have seen the evidence obtained by the Sectional Committee as to the commerce of Wilcannia? Yes.
475. Have you checked it? No; we took it as being fairly accurate.
476. Have the Commissioners had any calculations made to see whether, if the trade kept up, it would pay to make the line to Wilcannia for the sake of that trade? No; they have not gone closely into estimating the traffic. They look upon the line more in the light of one opening-up communication with Adelaide, and with a part of the country which is at present without any proper means of transit.
477. Suppose the trade to be as stated, if you got the whole of that trade at your charges, would that pay the interest on the cost of the line? I think Mr. Kirkcaldie will give you some information on that point, as he has been looking into it.

H.  
McLachlan,  
Esq.

11 Mar., 1891.

478. We have actual figures as to what the present trade is; we should like to know if it will pay to make a line such as is now proposed? I have not gone into that.
479. You have spoken about the mineral traffic between Broken Hill and the Western mines, do you know that it has been brought out in evidence that a line through the Lachlan Valley would be 62 miles shorter? Yes.
480. Would not that make a considerable difference in the cost of transit? Yes; it would affect the mineral traffic by 2s. 6d. per ton.
481. Would not that almost turn the trade? It would affect the low grade ores.
482. And there is an immense mass of those ores in that district? Yes.
483. If you had a through line, would not the tendency be to send the low grade ores to the collieries and to have coal carried to the mines for treating the high grade ores? That is what we expect to get a traffic from.
484. If you make this line through to Broken Hill, I suppose there would be no chance of making the other for a great many years to come? No; it would not pay to have two lines.
485. If this is adopted it is good-bye to the other? Practically so.
486. Would it not kill the prospect of the Wentworth to Hay line? Not altogether. With regard to this line also, we should consider one from the Western district connecting from the Northern line. If Queensland people going to Adelaide go from Werris Creek to Dubbo, that would save 400 miles. That is a line that will, no doubt, some day be made.
487. The Commissioners spoke in favour of a line from Cowra, on account of its giving convenience to Melbourne as well as Sydney traffic;—have they lost sight of that? I do not know that they have looked at it in connection with this line.
488. The line having been settled as far as Cobar, you think that that settles the question of a line by the Lachlan Valley? It does to a large extent. There is such a long stretch of country over which a new line would have to be made.
489. Still, it is 62 miles further from Sydney to Broken Hill than it would be the other way? Yes; still, the making of the line to Cobar has affected the question.
490. You think it has settled the question? To a large extent. The other question has not been looked at by the Commissioners. They only considered the route submitted.
491. *Mr. O'Sullivan.*] The Commissioners drew up an estimate of the traffic of this line? You will find from their Report that they abstained from giving an estimate of the traffic.
492. Since they expressed an opinion upon the line has it been determined to reduce the grade? Yes, from 1 in 70 to 1 in 100.
493. Will not that help to reduce the expense of working it? It will allow us to carry bigger loads.
494. It will reduce the expense? We expect a bigger traffic, but I do not know that the Commissioners would ask that the estimate of working expenses should be reduced materially in any way.
495. The reduction of the grade to 1 in 100 is an argument that has arisen in favour of this line since our last inquiry? Yes.
496. Has the attention of the Commissioners been directed to the evidence of the Collector of Customs of Wilcannia, and of Mr. George Doake, a merchant of Wilcannia? I think that they saw that evidence. The same information was brought under their notice in a general way.
497. I notice that Mr. Doake says that the outward and inward traffic of Wilcannia for three years amounted, in round numbers, to 209,000 tons, and that the value of that tonnage was £3,306,000; that should be a very large trade. Wilcannia is the centre of the trade of the Mount Browne district and other large districts? It is a very large district.
498. And a railway to Wilcannia must tap the trade of all that district? Yes.
499. Is it not probable that if a line were taken up the Lachlan Valley to Menindie a large section of that trade would be lost? It might shift the trade from Wilcannia to Menindie, but the alternative line was not submitted to the Commissioners.
500. Would it not shift the trade of Wilcannia to Broken Hill? It might have that effect, Menindie being so much closer.
501. Are you aware that at present teams and camels are going to the Queensland Border from Broken Hill? No; I think most of the Queensland trade is done from Bourke.
502. This line to Broken Hill would serve as a valuable stock line? Yes; and it will be an important stock-saving line in the case of drought.
503. It would be a valuable line for giving a short cut from Adelaide to Brisbane if the line from Werris Creek to Dubbo is carried out? Yes; it would save 400 miles.
504. It will be a valuable line for bringing passengers from Port Augusta to Port Darwin? Yes.
505. It will be a valuable line for passengers coming out from Great Britain, India, and other places? No doubt it would save them a big distance, but the project is rather remote at present.
506. Is this line not one-third of the way across the continent? It will be some time before you get steamers to run that way.
507. It will be some time before we get this line? If it is decided to construct this line the Commissioners would like to make a start from four points at once, and in this way they thought that it might be made in eighteen months.
508. Admitting all that, there is no doubt that this line across the continent will be completed at no distant date? I could not say that.
509. Has not the line been constructed to a distance of 700 miles? I think not.
510. A section already runs from Port Darwin, does it not? Yes, for 70 miles.
511. It shows, then, that the South Australian people are in earnest? They have a tremendous stretch of the line yet to make.
512. That is only a matter of time? Yes, I daresay.
513. Then this line will be available for bringing passengers overland through Central Australia? It would save a big distance, but we may ultimately have a line from Bourke to tap that line.
514. From whatever point of view it is looked at, it seems a desirable line to construct? It is, from a national point of view.
515. You have no doubt that the trade of Broken Hill will be gained? Yes; as I have pointed out, a portion of it will still go to Adelaide.
516. *Mr. Lee.*] What has been the effect of our low rates upon the grain and mineral traffic so far—has it increased the traffic? Last year happened to be, unfortunately, a more favourable grain season than this has been.

H.  
McLachlan,  
Esq.  
11 Mar., 1891.

517. Last year was the first year you brought into operation your low rates for grain? Yes; in August.
518. Did those low rates induce people at long distances to use the railways for the carriage of their grain? We have not yet got any clear statistical results.
519. Did you get more last year than the previous years? I have not the figures.
520. Can you tell me anything about the carriage of the low grade ores in consequence of your reduced rates? We are commencing to find that a good quantity of low grade ores are coming down.
521. Have you not found that there was a very large increase in consignments of ores since you reduced the rate? Yes.
522. People are getting to understand the advantage of reduced rates? I do not think the people know it generally enough yet.
523. Are there not large works in the metropolitan district—the Clyde works? Yes.
524. Is it not a fact that large quantities of ores have been sent down to Sydney? Yes; they are getting large quantities.
525. Is it not a fact that those works were in existence before you reduced your rate? Yes.
526. Have you reason to suppose that the quantity has increased since you decreased the rates? We feel sure that it has, and that as people get to know more about it, they will send down more of their low grade ores.
527. Is the Department sufficiently well satisfied to continue the reduced rates? Yes.
528. Has the traffic come up to their expectations? I think so. I think the Commissioners are fairly satisfied.
529. Have they any reason to increase the rates because they have not been availed of as largely as was expected? No; they have not had any thought of increasing the rates.
530. One  $\frac{1}{2}$ d. per ton per mile is £1 6s. 6d. from Broken Hill to Lithgow? Yes.
531. Do you not look forward to a return freight as well? Yes; we think there will be coke and coal going back.
532. What is the present rate per ton per mile of coal? The general thing for a long distance is about  $\frac{1}{2}$ d. We should probably make it about the same both ways.
533. Therefore, at the present rate for long distances, coal could be carried to Broken Hill at £1 19s. 9d. per ton? Yes; the Commissioners do not wish to go into it at present.
534. Are you keeping well in view the proposal to reduce the grades to 1 in 100, so as to admit of the largest possible load being carried? Yes; the Commissioners have recommended that.
535. Is that an important factor in the future prospects of the line? Very important.
536. If you can carry at a low rate, the more the line is likely to be used? Yes; and a better position we shall be in to compete for the trade.
537. Have the Commissioners given any consideration to the question of a uniform gauge? Yes; the Chief Commissioner in particular has given much consideration to the question.
538. Have they applied it to this line as to getting a uniform gauge with Queensland? Not particularly; but they look upon it as most desirable.
539. Have they any special evidence on behalf of this line as tending towards it? Of course, it might lead the South Australian people to see the awkwardness of having a break of gauge on the Border. There seems to be a feeling in that colony in favour of the gauge that we have here, and also in favour of a uniform gauge.
540. Since the Great Northern line has been constructed to Tenterfield, you have had to compete with the coastal trade on the eastern side for 120 miles, and on the northern 220 miles, and do you find still that a fair proportion of the goods traffic is going to Tenterfield? Yes; we have a very good traffic to Glen Innes and Tenterfield.
541. You get a fair share? A very fair share.
542. The same argument will apply to this line to Broken Hill, which has Adelaide at one end and the Darling River at the other? We think we shall get a fair proportion of the trade. It is a difficult thing to estimate what actual traffic we should get.
543. I want you to compare the value of the Hay traffic and the contemplated traffic from Broken Hill; are we likely to fall into the same error as we did in making that line to Hay? Well, we have a big market at each end of this line.
544. Was there, or was there not, at Hay anything approaching the population that there is now at Broken Hill? Nothing like it.
545. Was there ever the trade at Hay that there was done at Broken Hill? Nothing like it.
546. Is it fair to assume that in starting this line to the large population in the extreme west, we are bound to get a proportion of the trade of that district? We think we shall get it, and the traffic will be kept within the colony, both passenger and goods.
547. Are you not depending entirely for a return trade from Hay upon wool and stock? Yes.
548. But it is not so with regard to Broken Hill? No; on the Broken Hill line there would be a mineral trade as well as a pastoral trade.
549. Do you expect any increase in the pastoral trade? Yes; the country will be taken up under home-stead leases between Cobar and Wilcanhia.
550. But is there not at present a much larger prospect of traffic to and from Broken Hill than there ever was at Hay? Yes.
551. Do you think there is any analogy between the two lines? There is, and yet there is not. They both pass through pastoral country, but in this case we have a bigger centre with a large mineral trade.
552. The Hay line passes only through pastoral country, but this line will have at its terminus a great mining and commercial centre? Yes; and it will be a connecting link between two great commercial capitals—Adelaide and Sydney.
553. What I want to know is whether we are pursuing the same course as we did in regard to the Hay line, or are the conditions different? They are different.
554. Are the prospects of this line better? They are better, and you have a bigger object in view at the other end.
555. *Mr. Humphrey.* The distance between Broken Hill and Adelaide is about 300 miles? A little better, I think, than that.
556. And between Bowenfels and Broken Hill about 670 miles? About 640 miles.

557. At the present time, are not considerable quantities of ore being sent from Broken Hill to Port Pirie and Adelaide for smelting? We know that large quantities of ore are sent, and I think that there are smelting works in Adelaide.

H.  
McLachlan,  
Esq.

558. What reason have you to think that any large quantity of ore will be sent 640 miles to Bowenfels, instead of 330 miles to Port Pirie and Adelaide? At present there is no material for smelting at Port Pirie. They have to bring it there.

11 Mar., 1891.

559. What would be the cost of taking the coke and coal by water from Newcastle to Port Pirie? That varies, perhaps, every month. It is a matter that you cannot fairly get at.

560. Do you think that water carriage would be less than the railway carriage? Taking everything into consideration—the question of two or three handlings, and the sending of the ore from Broken Hill to Port Pirie, the carriage of the coal from Newcastle, and other difficulties, we think that a large quantity of ore will come to Lithgow.

561. You have considered that? Yes; it has been fully considered.

562. Wilcannia is about 450 miles from Adelaide, is it not, as against 600 miles from Sydney? There is about 150 miles difference between the two.

563. What reason have you to think that the produce in the vicinity of Wilcannia would be sent to Sydney for shipment in preference to Adelaide? The certainty of quick transit would pretty well equalise the difference in their haulage.

564. Would there not be equally rapid transit from Wilcannia to Adelaide? There is a break in the gauge, and the Commissioners do not like to go into the question of rates. There would be competitive rates.

565. You have taken that into consideration? Yes.

566. And recommend the line? The Commissioners would like it to be understood that they recommend it largely as a national line.

567. Leaving the nationality of the line out, is there a prospect of its paying interest on the cost of construction within a few years? They think that in time the traffic will grow so as to make it a commercial success, but they do not anticipate that that would be for some years to come.

568. Can you give any time? They would not like to do that. The line would give national advantages to the colony. That is the way in which they look at it.

569. *Mr. Copeland.*] Are you aware that at the present time there is a considerable amount of ore sent from Broken Hill to Adelaide, from Adelaide to Sydney, and from Sydney to the Clyde works? I did not know that there were great quantities, but I knew the ore was being sent. We understood that mostly it was being treated at Port Pirie or Broken Hill.

570. Only the other night I travelled to Melbourne with one of the directors of the Clyde Company, who told me that they were erecting additional furnaces to enable them to treat Broken Hill ores at the Clyde works. Have you any information in the Department to show what quantity of ore has been taken from Redfern to the Clyde? We could easily get it.

571. Could you ask Mr. Kirkcaldie to be prepared with that information when he is examined? Yes.

572. I suppose you would be under the impression that if they now send the ore from Broken Hill to Adelaide, and from Adelaide to Sydney by sea, then from Sydney to the Clyde works, having all these changes, that they would be very likely to send the ore in much larger quantities if they could send it right through direct? That would be strongly in favour of our contention that it would be sent to Lithgow.

TUESDAY, 17 MARCH, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

THE HON. ANDREW GARRAN.

THE HON. FREDERICK THOMAS HUMPHERY.

THE HON. WILLIAM JOSEPH TRICKETT.

THE HON. GEORGE HENRY COX.

JACOB GARRARD, Esq.

HENRY COPELAND, Esq.

JAMES EBENEZER TONKIN, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

WILLIAM McCOURT, Esq.

JAMES PATRICK GARVAN, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

Harrie Wood, Esq., Under Secretary for Mines, sworn, and examined:—

573. *Mr. Copeland.*] I believe you are Under Secretary for Mines? Yes.

574. How long have you occupied that position? Since 1874.

575. Do you know the country to the west of Cobar, and between Cobar and Wilcannia? No.

576. Do you know the country north-west of Wilcannia—Mount Browne way? Yes.

577. Have you personally inspected it? I have travelled through it twice.

578. Can you tell the Committee whether there are any mining fields in that direction? Yes; I know the fields at Milparinka, Mount Browne, and Tibooburra; but discoveries have been made since I was there in other parts, and I know from the official records that a number of leases have been applied for and taken up in those places.

579. What is the nature of the mining? Alluvial gold-mining and quartz-mining in the Milparinka district.

580. Milparinka is between Wilcannia and Mount Browne? Yes; Mount Browne is no great distance from Milparinka. Tibooburra is further towards the Queensland Border.

581. Then there is gold-mining, and there is quartz as well as alluvial? I cannot say that there is actually any quartz-mining at the present time, but there has been. When I was at Warratta Creek they had a crushing plant, but it was standing idle.

582. Then the other class of mining is deep alluvial—is it? It is not very deep; but the probability is that they will get deeper still. They have got down, I think, somewhere about 120 or 130 feet.\*

583. Can you say any and what mines are payable? Some of the mines at Mount Browne have been paying very well.

584.

H. Wood,  
Esq.

17 Mar., 1891.

\* NOTE (on revision):—This should have been 220 or 230. I now find that the shaft was bottomed 247 feet, but was supposed to be not in the deepest ground; therefore the shaft was sunk 30 feet into the bed-rock, making a total depth of 277 feet.

- H. Wood, Esq.  
7 Mar., 1891.
584. Were those the shallower mines? They were somewhat shallower than those I have mentioned, I think. But the difficulty in some of these places is the scarcity of water.
585. Is there not a considerable quantity of water on the ground in some of them? Yes, in the deeper mines.
586. Have any of the deeper mines been proved to contain payable gold? Yes; that one known as the Prospecting Claim at Mount Browne has proved payable gold in deep ground. They have a great quantity of water there to contend with.
587. Have they proved the width of the lead? Not that I am aware of.
588. Have they proved that it is a gutter or lead? I cannot say that they have proved the sides of the lead. As far as I know, their works have not extended to that length yet.
589. Do you know how far they have driven out the wash? No; they were unable to get into deep ground for a long time—I do not know whether they are actually in the deepest ground yet. They had to work in the shallower part on account of the water.
590. You have had mining experience at Ballarat, have you not? Yes.
591. From your Ballarat experience, do you think that Mount Browne is likely to be a permanent gold-field? The characteristics of the country are so different from anything they have at Ballarat that it would be difficult to form an opinion from the amount of work that was done when I was there.
592. Have they not got trap rock in the formation? I am not aware that they have. They may have. The shaft that they had been working was pretty nearly full of water when I was there. There was no chance of seeing the formation.
593. Can you tell the Committee how many leases have been taken up for gold-mining purposes in that district, and the area of them? Yes. At Milparinka there are twenty-nine gold leases, comprising an area of 466 acres 1 rood 24 perches; and there are two mineral leases, containing 28 acres\*, at Milparinka.
594. Are all these leases now in force? Yes. Then there are four applications for gold leases not yet dealt with, containing 71 acres 1 rood 16 perches, at Milparinka.
595. And what number at Mount Browne? Milparinka is where the office is situated. Mount Browne is only about 16 or 18 miles from Milparinka.
596. Is that the only gold-field in that district? No; there are gullies, and so forth, stretching right away from Milparinka towards Tibooburra.
597. What number of leases have been taken up at Tibooburra? None. The areas are only held in claims by small miners who use puddling machines.
598. I suppose good payable gold has been obtained at Tibooburra? Yes. The difficulty there is the scarcity of water. They cannot work for a considerable time on account of having no water in the dams.
599. Can you say how many miners' rights were issued in the whole of the district last year? I can get that information.
600. Can you give the Committee any idea how many people are located on these gold-fields? I can give that information later on, but I have not got it with me.
601. You do not know the amount of revenue the Government has received by mineral licenses and leases? We can easily get at the revenue from leases, because mineral leases represent 5s. an acre per annum, and gold leases £1 an acre per annum.
602. I should like to know if those leases were actually in force last year? Yes, those were actually in force.
603. Have there not been some opal mines discovered in that neighbourhood? Yes.
604. Where are they situated? The place is known as the parish of Kirk.
605. How far is the position from Wilcannia? I think about 90 miles.
606. In which direction? On the road towards Milparinka. It is very nearly north—a little west of north.
607. Still, it is within the territory of New South Wales? Yes; it is not so far from Wilcannia as Milparinka.
608. Then is it your opinion that there is likely to be mining enterprise carried on in that district for the future? I should think it is highly probable. There are two or three other places in the district where leases have been taken up for silver, copper, and gold, besides Milparinka and Tibooburra.
609. Have you any information as to the machinery that has gone up into that neighbourhood? I am not aware that any machinery has gone to any of those places, except that there was some sent to Poolamacca.
610. Has there been a winding-engine or a pump-engine sent up? Yes, to Mount Browne. But with the exception of Mount Browne, I do not know of any place besides Poolamacca to which machinery has been sent.
611. I understood you to say that they had proved payable dirt in the deep ground that has been troubled with water? Yes. Above the water level it was payable. That was because the expense of working was so much less.
612. Are we to understand that since they have got to the water the ground is not payable? No. As far as I know, it is. But their work has been delayed by having to get machinery to contend with the water.
613. Assuming that the ground is payable, is there any large area of deep ground likely to be opened up? I think that would be a question that Mr. Wilkinson would be able to answer better than I should.
614. Is there any other place open for mining that you know of between Wilcannia and Broken Hill? I cannot exactly say that there would be between Wilcannia and Broken Hill, because if you take a line from Wilcannia to Broken Hill those places would all be to the north of that line.
615. But in places so situated that a railway from Wilcannia to Broken Hill would be of service in developing such mines? It is very possible that the railway would be of service to them, although the railway would probably not go very near to them.
616. What places are you alluding to now? To Milparinka, Wonnaminuta, Nunthcrungie, and the opal mines in the parish of Kirk.
617. Can you tell the Committee anything in reference to the opal mines—whether they have been reported on favourably? We have seen some very good samples of opals from there.
618. Have any of your officers inspected the mines? No—none of the geological officers. I can give you the area of land held under mineral leases at those various places. At Poolamacca there are thirty-seven mineral

\* NOTE (on revision):—See written statement handed in.

H. Wood,  
Esq.  
17 Mar., 1891.

mineral leases, comprising 1,459 acres 23 perches; at Corona there are thirty-five leases, comprising 1,364 acres 3 roods 8 perches; at Nuntherungie there are four leases, comprising 160 acres; in the parish of Kirk there are eleven leases, comprising 460 acres. Then there are applications pending as follows:—Poolamacca, forty-six, comprising 1,820 acres; Corona, two, comprising 80 acres; at Nuntherungie, eighty-eight applications, comprising 3,460 acres; in the parish of Kirk five applications, comprising 184 acres 2 roods 28½ perches.

619. Do you think that the whole of those places would be benefited by the construction of the proposed railway? I do not think there can be any doubt about that.

620. Have you any information as to the number of leases in the vicinity of Broken Hill? No. I did not know that I should be required to give that information, but I can get it.

621. Will you prepare a return of the number of the leases and the area of them, in the whole of the Broken Hill district, from Broken Hill to Cockburn? Yes.

622. And will you supplement that return with the number of miner's rights and mineral licenses, and the total revenue derived from them; also the revenue derived from the leases? Yes.

623. *Dr. Garran.*] From the map, I see that the mineral district lies rather to the north-west of Wilcannia? Yes.

624. It does not lie directly on the line between Wilcannia and Broken Hill? No.

625. So that if we are going to get the benefit of a railway we should rather go north-west than south-west? It would suit the miners better, no doubt.

626. Do you know of any limestone there? Yes; there is limestone at a place called Terrawingie.

627. That would not be on the line of road? I do not know whether it would be.

628. Do you think any material for flux would be found on the line between Wilcannia and Broken Hill? I do not know.

629. You know of no outcrop of ironstone? No.

630. Nor of limestone? No; but Mr. Wilkinson would be able to tell you better.

631. *Mr. Tonkin.*] Can you tell the Committee whether there has been an increase or decrease in the population in the country north-west of Wilcannia within the last twelve months;—do your returns show that the country is as good as previously, or better, or worse? I should think better.

632. You think there is a solid increase? Yes; but further back still, in point of time, there were a greater number of people at Poolamacca and Corona than there are now in all probability. Those mines were mostly abandoned, but a good many of them are being taken up again.

633. Are those gold mines? No; at Poolamacca tin, and at Corona silver.

634. Is the population of Milparinka increasing or decreasing? I think it is pretty much the same. As far as I recollect there has been no very great variation.

635. Do you think that in the event of the railway being constructed it would assist in increasing the population there? Only in a very limited degree, I should think, because the railway will be such a considerable distance from them.

636. Do you think that the mineral fields are fully populated, as regards their bearing capacity? I do not. I think they are fully populated, as far as the facilities for working, on account of the water, are concerned. In the Tibbooburra district now they are nearly all puddling. The rainfall there is comparatively small, and the only way of conserving the water is by means of little dams, the contents of which cannot last long.

637. Do you know whether any minerals have been carted away from there to be sent to Adelaide for treatment? Not from Mount Browne or Tibbooburra, but ores might have been taken from other mines.

638. That would come to Wilcannia? I do not know. Possibly some would, but any from Corona and Poolamacca would go through Silverton.

639. You have not heard that there has been a large quantity of minerals sent down by boat from Wilcannia? No. It is possible that some may have been sent down for test, but not in large quantities.

640. You say you do not know the country between Cobar and Wilcannia? I do not.

641. Have there been any minerals discovered there of any kind at all? Not that I am aware of. I have heard that there is mineral country there.

642. There is nothing doing there through the Department? No.

643. Do you know the Cobar copper mines? Only by repute. They have been standing for some time, but it is reported that they will start again if the railway is made.

644. Do you know any other copper mines working in that locality? There are some gold mines.

645. Any other copper mines? Not any working at present. The Nymagee mine is within the Cobar district.

646. You could not say, of your own knowledge, whether the Cobar mine is likely to start again? I only know from wardens' reports that it will.

647. Then we have every reason to believe that it would? Oh, yes, as soon as the railway is there. One of the difficulties which they have had to contend with was want of fuel.

648. *Mr. Garvan.*] With reference to the proposed railway, do you think there is any gold mining industry anywhere in that country to form an argument in favour of the construction of the line? No; except that the gold miners might provide passenger traffic on the railway.

649. Is gold mining of that character that the State would be warranted in constructing a railway merely for the gold mining industry? No.

650. Gold mining is not of that certain and continuous character that would warrant the construction of the railway? I do not think so. The only advantage I see from it would be that it would enable them to get their machinery more easily to the mines.

651. The production of the gold mining industry would afford very little freight? Very little, I should say.

652. Almost nothing? Almost nothing.

653. What length of time, on the average, have any of the good gold mines lasted anywhere in the colonies? I know some that have been in work since 1856 continuously.

654. But are there not a much greater number that do not continue that length of time? No doubt.

655. If the country were suitable for agriculture, would it not then warrant the construction of a railway if gold were discovered, in the expectation that when the gold mining was done people would resort to agriculture? Yes.

- H. Wood, Esq.  
17 Mar., 1891.
656. Do these conditions exist at any of the mines bearing upon this railway? No; I cannot say that they do, owing to the sparse rainfall. I think it very likely that the soil would be good enough in some places for agricultural purposes, but want of water is the difficulty.
657. But if gold mining ceased in those places there would be nothing to sustain the population at all? No; I should not think so, except just a pastoral population.
658. Is there any coal mining in the district, or any probability of it? I have never heard that there was any coal there at all.

[Charles Smith Wilkinson, Esq., Geological Surveyor (in charge), Department of Mines, sworn, and examined:—

- C. S. Wilkinson, Esq.  
17 Mar., 1891.
659. *Mr. Copeland.*] What position do you occupy? Geological Surveyor (in charge).
660. How long have you held that position? Since 1874.
661. Prior to that time did you have any experience of a similar occupation? I had over nine years' experience on the Victorian Geological Survey.
662. You have travelled over the country which the proposed railway will traverse, I believe, between Cobar and Wilcannia, and between Wilcannia and Broken Hill? Yes.
663. You have seen the whole of that country, then? I have travelled from Wilcannia to Broken Hill, and inspected a great deal of country on either side, and from there to Mount Browne.
664. Have you travelled between Cobar and Wilcannia? I have not.
665. From the official records in the Department, do you know of any mineral country between Cobar and Wilcannia that would warrant the extension of the railway beyond Cobar? From specimens which I have received from various correspondents, I conclude that nearly the whole of the country between Cobar and Wilcannia, is of metalliferous formation, with patches of sandy areas between, which, no doubt, cover up metalliferous ground.
666. Then you would anticipate that copper and silver would be discovered on the road between Cobar and Wilcannia? Yes.
667. Do you know of any iron deposits suitable for fluxing purposes, which would create a traffic for the railway between there and Broken Hill? I have heard of the occurrence of iron ore between Cobar and Wilcannia, but have not seen it.
668. But, as far as the section of the country between Cobar and Wilcannia is concerned, you have seen specimens which indicated that there would be mineral fields opened up eventually, in the shape of silver and copper mines? Yes, I believe the formation of the country is favourable to the occurrence of metalliferous lodes, such as gold, copper, silver, and iron.
669. I suppose there are no indications of coal in that country? No.
670. Crossing the Darling, and confining your attention to the west of the Darling, what is your impression about the alluvial fields at Mount Browne, Milparinka, and round there;—do you think they are likely to be of a permanent character? The deep sinking is likely to be permanent, but the shallow deposits only afford employment during very wet weather. They are practically worked out.
671. Do you think all the shallow deposits are worked out, and that all have been discovered that are likely to exist? I think they have all been discovered; but there are extensive patches which would pay if water could be brought on to them. In wet seasons the miners work on them, making £3 or £4 per week per man.
672. Has the country been prospected? For shallow alluvial it has.
673. With reference to the deep country, has it been sufficiently prospected to warrant you in saying it is likely to be payable if it gets watered? I inspected the deepest claim there, where payable gold has been traced down to the water. I have reason to believe that there are many extensive deposits of the same nature all around the Mount Browne Range. I think they will find permanent payable deposits of gold.
674. Is it likely to take the form of leads? No; leads are deposits formed by river flows. Mount Browne has been a cretaceous island in the ocean, and there payable gold will be found in patches, not in leads.
675. Do you think the deposit is likely to be extensive and to give employment for a long time to come? I think it will last for many years.
676. Is there any chance of any other deep deposits being discovered besides that one? I may be permitted to point out that from Cobar there is a belt of mineral formation stretching across the country to Broken Hill and Silverton, the margin of which is more or less covered with shallow deposits. There was a spur to the north, but the low ground became covered with a marine formation, leaving the higher points of the land, Mount Browne and Tiboooburra, surrounded by a cretaceous formation, and in the patches you get the alluvial deposits; there are found in many places on these patches quartz reefs. The scarcity of water and the cost of provisions prevents them being worked at the present day, but, no doubt, rich gold-bearing reefs will be worked there in the future, when greater facilities for mining are obtained. We have a large patch starting a few miles west of Wilcannia, going in a north-westerly direction, including the Cooningberry Range, then south-westerly to Cockburn, and then back to near Wilcannia. It embraces metalliferous formations.
677. Do you expect that there are many lodes up to the present undiscovered, which will yet be found of a payable character? Yes.
678. Taking the whole of the Broken Hill district and the Mount Browne district, you think that part of the country is not likely to give out for many years to come? No, it will rather increase in mining importance.
679. There is not likely to be any coal there? No; the nearest carboniferous formation is in the Dubbo district.
680. Do you know anything likely to create a traffic between Wilcannia and Broken Hill in the shape of limestone or iron ore for fluxing purposes? Not unless they find iron ore between Cobar and Wilcannia, but I have seen no evidence of it between Wilcannia and Broken Hill, except in very small lodes which would not be payable to work.
681. Do you think, from what you have seen in other parts of this colony and in the other colonies, that the construction of this railway, *via* Cobar to Broken Hill, would tend to develop those mineral fields? It depends entirely upon the cost of transit upon the railway line. It is 300 miles from Adelaide to Broken Hill, as against 600 miles from Broken Hill to Sydney.

C. S.  
Wilkinson,  
Esq.  
17 Mar., 1891.

682. Do you not think there would probably be a traffic between the intermediate places;—do you not think the people from Wilcannia might run up to Broken Hill and to places between those places, and would not that have a tendency to induce speculation and encourage prospecting? Not to any very great extent, because the population in that part of the country is so small. The speculators come from the cities, but I think the cost of production on the whole would be lessened by utilising the coal found in the Dubbo district.

683. Do you know, what is an undoubted fact, that some of the mines of Cobar are carried on almost entirely on capital owned by Wilcannia people? I was not aware of that.

684. A large proportion of the shares in the Occidental mine at Cobar are held by Wilcannia people; would not the same thing take place if a railway were made from Cobar to Broken Hill; would it not be likely to develop new mining industries? It would awaken more interest, I daresay.

685. Would it not enable the people to get about the country better? Certainly.

686. I suppose that during a period of drought it is practically impossible to get about the country prospecting? Quite so.

687. If a railway were constructed, water tanks were made, and water conserved, would it not enable people to get about the country better? It would enable them to get from one place to another more readily than they can do on horseback.

688. Do you think there would be any possibility of a trade of this character springing up; do you think that the Broken Hill mine owners and the owners, of any intermediate mines that may be discovered, will send ore to be melted to furnaces to be erected at (say) Lithgow, if the Railway Commissioners afforded cheap carriage to encourage them. Trains bringing ore to Lithgow and taking back coal to Broken Hill, do you think there is any probability of a traffic like that being developed? I think so, if the rates of transit were less than those to Adelaide or to Port Pirie. There are many things to be considered. At present the coke manufactured in this country is not equal to that imported from home for smelting purposes, and which they use at Port Pirie. I am of opinion that if attention is given to the manufacture of coke, coke quite equal to that imported can be made here.

689. Have we no good coke at Newcastle, Wallsend, or any of those places? None equal to the English coke for large furnaces. For that reason they get over 25,000 tons of this coke every year from England.

690. Suppose some amount of attention were given to the manufacture of coke here, do you think we could produce coke as good as that which is imported? I think we could.

691. In making it at home, is not the coal crushed and washed? In some instances, but not in all.

692. You think they could make superior coke by paying greater attention to the manufacture of it? I think so.

693. Do you know anything of the coal supposed to be found at Dubbo? Yes; I have seen the seam near Dubbo.

694. What is the nature of the seam? It contains too many bands to be profitably worked in the ordinary way; but if coal-washing machinery were introduced I believe it would be very valuable, and could be worked for the manufacture of coke.

695. How thick is the seam? I think about 10 feet, including the bands.

696. Do you remember the thickness of the bands? The greatest thickness of coal between the bands was from 6 to 9 inches.

697. Do you think it would ever pay to work a seam so full of bands as that? With washing machinery it might. In Scotland I saw a seam containing, including the bands, about 20 per cent. of ash. This was washed down to about 6 per cent. of ash at a cost of 1½d. per ton. I think that the Dubbo coal might be treated in a similar way.

698. Are there any iron clay bands intermixed? There are clay bands, but not iron.

699. Is there any iron about Dubbo—anything that would facilitate smelting at Dubbo? I have seen one large lode a few miles to the west of Dubbo; it has not been opened at all.

700. Is there any limestone? Yes, between Wellington and Dubbo there is an immense quantity.

701. Did you test the quality of the coal at Dubbo? Yes, it was equal to the Newcastle coal as regards quality.

702. To the best Newcastle coal? Yes.

703. Then it would undoubtedly make coke if proper attention were paid to its manufacture? I could not say whether it would make coke. The seam was not opened, and I could not judge of its qualities for coke making unless I got a sample after it had been opened up. It has been opened since, but I have not seen a sample. It may not be suitable for coke when it has been exposed for some time. That which I tested, though it gave gas properties equal to those of the Newcastle coal, could not be tested for coke.

704. If it gave good gas, was not that a favourable indication? Yes. That is my reason for saying that it would probably make good coke.

705. Would you think it possible to develop a traffic between Broken Hill and Dubbo if they were to commence to make coke at Dubbo? I believe so.

706. Take the coke one way, and bring ore from Broken Hill to Dubbo? It could be supplied cheaper from Dubbo, if the carriage was ½d. a ton per mile, than it could be imported from England.

707. I suppose you know that the Commissioners are only charging ¼d. per ton per mile for minerals, under certain conditions; 2½d. per mile for a truck containing 6 tons for every train of over 30 trucks—the minimum rate being 15s. per truck. That is less than ¼d. per ton per mile? Yes.

708. You think that if the Commissioners were only to charge at that rate it would be cheaper for the Broken Hill people to get their coke from Dubbo than from England? Yes.

709. Have you inspected the mines of Broken Hill lately? Not since 1887.

710. You cannot tell the Committee anything with reference to the payable character, or otherwise, of the ores at the deepest levels of Broken Hill? Not from inspection. But my belief is that they will be equally profitably worked, but will require different machinery for treating the sulphides instead of gossan ore.

711. Have you sufficient information to warrant you in expressing any opinion as to the sulphide ores continuing payable down to any great depth? Only that the lode bears evidence of being a very permanent one, and continues to a considerable depth, and as the upper portion of the lode is merely the oxidised portion of the original lode, there is no reason to suppose that the lode will decrease in richness in going deeper.

- C. S. Wilkinson, Esq.  
17 Mar., 1891.
712. It will only change the constituent parts? Yes, and require different treatment.
713. *Mr. Tonkin.*] Would not a ton of sulphide ore contain less silver from the same lode than a ton of gossan ore? Yes, because the gossan ore is lighter.
714. Then, though at the bottom it may not be quite so rich per ton, still it is a payable ore? Yes.
715. Have you not had experience of that at Sunny Corner? Yes.
716. Do you believe that there are any other lodes on the other side of Broken Hill that will develop the same class of lodes? I have seen small ones only 2 or 3 ft. in thickness. I inspected over a hundred, but it would not pay to erect works upon such lodes. No doubt many will be found which will contribute large supplies of ores to central smelting works.
717. Those would all be developed if the railway were constructed? I think so.
718. I suppose you know that what you have mentioned does take place around Silverton? Yes.
719. And there is a possibility of it nearer Wilcannia? Yes.
720. Then, if that were the case, the railway would find a traffic at once? Yes.
721. More especially if we could erect smelting works at Dubbo, or where the coal is found? Yes, or perhaps at Wilcannia.
722. Wilcannia would be well situated for smelting works, would it not, on account of the river being alongside of it? Yes. It is better to carry coke to the smelters than to carry the ore.
723. As a matter of fact, however, they do carry a lot of ore now to Adelaide and Port Pirie? Yes.
724. I mean from mines that actually have smelting appliances? Yes.
725. Have you any reason to believe that the country between Wilcannia and Broken Hill is likely to maintain a large mining population? It will maintain a very scattered population, because the lodes appear to occur in belts with barren areas between. I think the population will, in the future, be large as the reefs are opened; but there will be no large centres like Broken Hill.
726. Do you know anything of the lode discovered near Calker's Well? No lodes were opened up at the time when I visited the place, but I indicated it on my map as a favourable place for prospectors to go to look for gold—not for silver—and in the last two years they have discovered gold about 38 miles west of Wilcannia.
727. Do you anticipate any development in tin mines in that district? Yes; north of Broken Hill I believe large quantities of tin will be raised.
728. Is that so situated that it can be worked with water? Water could be conserved. The features of the country are such that good reservoirs could be made, and the rainfall is sufficient if the reservoirs are made large enough.
729. Is it alluvial tin or lode tin? Lode tin.
730. Then they would not require so much water as they would in dealing with alluvial tin? About the same.
731. I think you say you have not been along the line of country between Cobar and Wilcannia? No.
732. But still you believe that country to contain minerals? I know it to be of metalliferous formation, where we should expect to find payable lodes.
733. I think you told Mr. Copeland that the construction of the railway would result in the development of the minerals in the district? It would offer many facilities indirectly to the miners, and I think directly, if they succeed in getting good coke at Dubbo. I think there will be a large supply of coke required in the Broken Hill and Wilcannia districts. The whole country north and south of the narrow belt which I have described is pastoral and not mineral bearing. Any mineral that may be valuable in that country is gypsum. 70 miles from Wilcannia there are very large beds of gypsum, which may come in for use for agricultural purposes. That is south south-east of Wilcannia.
734. *Dr. Garran.*] Is that on the road between Condobolin and Menindie? No; to the north of that.
735. Not much? Not very much.
736. *Mr. Tonkin.*] Do you know much about Cobar? No; I have not been to Cobar.
737. *Dr. Garran.*] On a direct line between Wilcannia and Broken Hill, do you know of any mineral outcrops at present? Near Calker's Wells there is a gold-bearing reef. They find payable reefs near Broken Hill, in the Mount Gipps country—small payable silver lodes.
738. But on the direct line itself, is there much that would give a traffic to the railway? Not that I know of; but I expect the formation is similar.
739. You think that minerals may be discovered? Yes.
740. Is the district between Wilcannia and Milparinka more of a mineral district? No; it is precisely of the same formation for about 130 miles north of Broken Hill, on the road to Milparinka, as the Broken Hill country.
741. As some of the mineral country has been overlaid with alluvial deposits, you cannot tell what there is underneath? No.
742. You may be surprised by a discovery at any time? I do not think any discovery would be made there.
743. In that district you are not likely to find minerals at a payable depth? Only round the margin of the older formation.
744. Near Mount Browne is the margin of the mineral country? Yes.
745. But between that and the Darling it is uncertain? The formation continues from Silverton almost to Wilcannia, almost without a break, but there is a very wide break between Wilcannia and Mount Browne.
746. Then you think a line from Wilcannia to Broken Hill would run over a possible mineral country all the way? Nearly all the way.
747. And between Menindie and Broken Hill, would that be mineral country? About one half of the country between Menindie and Cockburn would be mineral country.
748. The first part, between Menindie and Broken Hill, would not be mineral, but the second would be? The first half is all pastoral. I may also point out, as it may have a direct bearing on the future of the district, the occurrence of artesian waters throughout all this district north of the mineral-bearing country. The last artesian well which has been referred to in the press is to the south-east of Milparinka.
749. About how many miles? I could not say from memory. No doubt the opening of artesian wells will increase the value of that country 100-fold, and lead to good settlement.
750. What do you consider the area of this mineral belt in our colony west of the Darling? 6,600 square miles.

C. S.  
Wilkinson,  
Esq.

17 Mar., 1891.

751. And what is about the area of the cretaceous formation north of the Darling? About 40,000 square miles.
752. Right away up to the Paroo? Yes.
753. Wilcannia itself is on a cretaceous formation? No; it is on a Devonian formation. North of Wilcannia there has been a discovery of opal rocks which may become of some importance.
754. Do you look upon that Devonian formation as favourable to mineral deposits? Not in that locality.
755. But that is the old rock? Yes, it is.
756. And some of that flat country is filled up with the washings from that rock? Yes. That district, when it has plenty of water applied to the soil, is very fertile. When I was at Mount Browne I visited a Chinaman's garden, where I saw vegetables equal in size and quality to any that I have seen in Sydney. I saw white turnips 5 inches in diameter, and carrots 3 inches in diameter. They were grown by irrigation.
757. *Mr. Cox.*] Where was the water taken from? From a well.
758. It was not artesian water? No; it was soakage water.
759. *Dr. Garran.*] If we draw a line through the meridian of Wilcannia to the northern boundary of the colony, the country between that and our external boundary is, in the main, mineral country? About half of it. The north-western and south-western portion would be mineral.
760. *Mr. Copeland.*] Have you seen the opal discovery? I have not seen the discovery, but I have seen the formation in which it occurs, and I think there will be extensive deposits of it. I have seen some of the opals from it, and they were the finest specimens I have seen in Australia.
761. And likely to have a good commercial value? Yes.
762. From the nature of the opal formation is there any likelihood of other deposits being discovered, or is that likely to have occurred alone? It occurs alone in the cretaceous formation. There are no other minerals, except gypsum, with it.
763. As there is a large area of cretaceous formation, is there not likely to be other finds of opal besides that already made? I think there will be in different parts of the district, but not by sinking.
764. What I meant was this—that as these opals have been found there is a probability, I suppose, of others being found? Yes. The same formation extends north to Cooper's Creek, where they first found opals, and there is no reason why they should not be found in any part of the country between.
765. How far south do these cretaceous beds extend? To within about 70 miles north of Wilcannia. The boundary has not been accurately defined yet, but that is approximately the position.
766. Is there a very large deposit of gypsum? Yes; very extensive.
767. Would not that be very valuable for different purposes? It would.
768. Would it be useful to take that to Broken Hill for fluxing purposes? No, not for smelting.

WEDNESDAY, 18 MARCH, 1891.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. ANDREW GARRAN.	JAMES EBENEZER TONKIN, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. GEORGE HENRY COX.	WILLIAM McCOURT, Esq.
HENRY COPELAND, Esq.	JAMES PATRICK GARYAN, Esq.

The Committee further considered the proposed Railway from Cobar to Cockburn.

Alexander Brown, Esq., M.P., sworn, and examined:—

769. *Dr. Garran.*] Are you one of the members for Newcastle? I am.
770. You are aware that it is proposed to construct a line from Cobar to Wilcannia and Broken Hill? Yes.
771. Have you, as member for Newcastle, any objections to offer to that line? I have.
772. Will you state them? I have no objections to offer as member for Newcastle, but I do object as a member of Parliament. To simplify the proceedings, I have briefly jotted down my objections, and I will go through them, and then members of the Committee can ask me any questions afterwards.
773. That will be part of your sworn evidence? Yes; my first objection is that with the probable federation of the colonies, the proposed railway ought not to be constructed; that it is in opposition to the spirit of general co-operation on the part of the whole of the colonies, where trade, according to our present Premier, will find its way to its natural channels, and not be carried on in artificial channels as hitherto. Another objection is that any trade that this line will secure can only be obtained on the basis of differential rates. That is owing to its great length. The line passes through a bad part of New South Wales as far as population is concerned. There is little or no population on the route, and there is not likely to be any population on it for years to come, which would warrant the expenditure of such a large sum of money. The construction of the line can only be supported on the supposition that the Broken Hill trade will find its way to Sydney, and that we should be able to supply the Broken Hill territory with produce from Sydney. I take it that that is one of the principal allegations in favour of its construction. This is impossible, as, had it not been for the Broken Hill trade, South Australia would almost have been compelled to annex itself to Victoria. I am not romancing. The Broken Hill trade is of such importance to South Australia, that before the Broken Hill mines came into existence, some of the prominent men in South Australia—I do not say in their political life—but some of the prominent business men had talked over the question as to the advisability of South Australia being annexed to Victoria, and I attach great importance to that fact. The Broken Hill trade represents to South Australia almost one-half of the total imports of the colony. This trade is not to be obtained by Sydney, except under very severe competition. The railway rates now for carriage are not payable rates, and what would it be if they came into conflict with South Australia. The South Australian Government will compete for this trade as I know, no matter what you do. The trade to them is of such importance that when you come into competition with them

A. Brown,  
Esq., M.P.

A. Brown,  
Esq., M.P.  
18 Mar., 1891.

they will lower their present rates in order to keep it. An important reason alleged in favour of the construction of this railway is that it will be possible to take coal from Lithgow to Broken Hill, and to bring ores from Broken Hill to Lithgow, for smelting purposes. But the cost of transit by land, as compared with the cost of sea traffic, will not warrant that conclusion. The distance by land from Broken Hill to Lithgow, *via* Wilcannia, and Cobar, is 639 miles, whilst the distance from Broken Hill to Port Pirie is only 254 miles, and from Broken Hill to Port Adelaide 334 miles. Another reason given for the construction of the line is that ores are likely to be conveyed from Broken Hill to Lithgow for smelting purposes, but that is disposed of by the fact that the principal mines have already got their smelters erected, either at the mine or on the South Australian sea-board. I cannot be particularly accurate with regard to the figures which I am about to quote, because it is difficult to get definite information from the Government. I will give some statistics as to the actual rates at which ores and produce are likely to be carried between those places. The Government have not furnished me with an estimate, and I have been obliged to take my information from the goods book to the best of my ability. To carry ore at the New South Wales rate from Broken Hill to Lithgow, say 639 miles, would cost 25s. a ton. The charge for coal and coke from Lithgow to Broken Hill would be about 35s. These are arbitrary figures, but I believe they are considerably lower than they ought to be put. Upon bullion from Broken Hill to Sydney, the rate would be 84s. 10d.; on mine timber from Sydney to Broken Hill, 65s. 7d. per ton; on mine timber from Dubbo to Broken Hill, 40s. 9d. a ton; on first-class goods from Sydney to Broken Hill, £8 9s. 10d. a ton; on second-class goods from Sydney to Broken Hill, £10 11s. 9d. a ton; on third-class goods, £14 15s. 5d. a ton. These are the various New South Wales rates between those various points as far as I am able to ascertain them, and I believe that they are correct. Some changes may have been made in them, but I do not believe that they have been diminished. The rates from Broken Hill to Port Pirie, 254 miles, and Adelaide, 324 miles, have been furnished to me by the Adelaide people, and they are as follows:—To Port Pirie, ore, per ton, 16s. 6d., to Adelaide, 20s.; coal to Port Pirie, 23s., to Adelaide, 28s. 6d.; bullion to Port Pirie, 33s. 6d., to Adelaide, 42s.; coke to Port Pirie, 29s. 6d., to Adelaide, 37s.; mine timber to Port Pirie, 32s. 6d., to Adelaide, 41s.; first-class goods to Port Pirie, £3 1s., to Adelaide, £3 16s. 1d.; second-class goods to Port Pirie £4 10s. 5d., to Adelaide, £5 13s. 2d.; third-class goods to Port Pirie, £5 19s. 10d., to Adelaide, £7 10s. 2d. Another feature, as I pointed out to the Committee, must be considered, and that is that these rates, in case New South Wales enters into competition with South Australia for the Broken Hill trade, will be reduced by at least 25 per cent. on the South Australian railways. The Government of South Australia, through their Commissioners, had made a compact with the Silverton Tramway Company, which was entered into in 1888 for the haulage of all goods and passengers over the Silverton tramway for a period of five years, and on the 1st July, 1890, a new agreement was signed for a term of ten years, more favourable to the Silverton Tramway Company than that entered into in 1888. It is true that so far the South Australian Parliament, as a Parliament, have repudiated that contract, but the Silverton Tramway Company are perfectly satisfied with it, and the Commissioners are working under that contract, which really prevents any possibility of any railway we may make competing for the ores and produce of Broken Hill.

774. Do the rates which you have quoted include the Silverton Tramway rates? They do.

775. Under the old contribution or the new one? I could not tell. I was told that those were the rates.

776. Those are the rates that they are working under now? That is what I am told. Another objection to the proposed railway is that in order to get the trade of Wilcannia in that neighbourhood, we shall have to adopt a principle similar to those in existence, as regards Bourke and Albury, as Wilcannia is only distant from Port Pirie 374 miles; whilst from Sydney it is 615 miles distant—and the New South Wales Government will be practically making a railway to expedite the shipment of produce from South Australian ports. I have a letter from a prominent man in South Australia whose name I cannot give, but whose remarks on this subject I intend to read. They point conclusively to the fact, that if this railway is constructed it will really be a feeder for the South Australian railways, and the South Australian sea-board. Another objection to the line, is that all the principal mining companies have agreements for eight years from July, 1890, with the Tramway Company for the carriage of their products, and until the expiry of those agreements, I should say that three-quarters of the trade will find its way over the tramway to South Australia. The line, if constructed, will, in my opinion, be a heavy drag upon the railway revenue.

777. What did you say was the distance from Wilcannia to Port Pirie? 374 miles.

778. How do you make it out? Those are the figures which have been furnished to me officially. I believe it is impossible that the proposed line can pay working expenses unless the largest concessions are made, and a similar policy is pursued to that which we have adopted in regard to the existing Border lines. We shall not get any trade over the line unless that is done. The bridging of the Darling is, I think, likely to be much more costly than it is supposed to be, and with the heavy floods that occur in the river a very substantial structure must be erected. Another objection which I have to the line is that the question of a universal gauge is unsettled, and until it is settled the line should not be made, particularly as there is no immediate hurry for its construction. I have always had a strong objection to a national line, as this will be called, that being a synonymous term for a Sydney line. When we make our dictionary the two words "national" and "Sydney" will be synonymous. There is an important item to which I would call special attention, and that is the quality of the coke used at Broken Hill for mining purposes. The matter is one of which I have had considerable experience. I have already supplied the companies myself, but I am not supplying them now, because I am not able to supply coke of the quality that they want, and unfortunately the Newcastle people are largely out of the trade. One reason alleged in favour of the line is that the coke from Lithgow would be likely to go to Broken Hill, but I will show that the quality of the coke required by the companies is of such a superior character that up to the present time we have not been able to obtain it, so as to compete with the English article. I have obtained from the metallurgist in connection with a Broken Hill mine a statement as to what he considers to be the quality of the coke necessary for smelting purposes. The English coke is worth £1 a ton more than coke made in the colonies for smelting purposes. I had a contract myself for the supply to a Broken Hill company of coke from Newcastle, a kind that is known as "purified coke." Dr. Carran knows that the Purified Coke Company produces a very excellent quality of coke.

779. The recent report is that Rix Creek coke is the best? We supplied Rix Creek coke to a Broken Hill company, but they did not like it, and the only coke which they would take was that of the Purified Coke Company, attached to the Wallsend mine. Our contract with them was to supply coke at 52s., and that was plus 29s. 6d. for freight and other charges, leaving the price of the coke on its arrival

at

at Broken Hill at 81s. 6d. per ton. Now they are supplied with coke from England, the Brancepeth coke, which is the best delivered in Port Pirie, at 54s., and the freight up from Port Pirie is 29s. 6d., which makes the total cost 83s. 6d. for the English as against 81s. 6d. for the colonial coke; and the English, according to the report of this metallurgist, is 20s. a ton superior to the colonial coke. At any rate, as far as I am concerned, my contract ceased for the reason that I could not compete with the English coke, it was of such superior quality to our coke. They are now burning the bulk of their stuff with English coke. English coke can be delivered at Port Pirie by contract for 54s., German coke for 52s. 6d., New Zealand coke 52s. 6d., Australian coke from 48s. to 55s. I estimate the freight on coke from Lithgow to Broken Hill at 35s. The figure has been fixed arbitrarily. The present rate from Newcastle to Orange, which I have paid, does not pay the cost of traction, which, the distance being 280 miles, is £1 7s. On the same ratio it would cost from Newcastle to Broken Hill £4, while they can deliver Brancepeth coke at current rates at Broken Hill, cost and freight, for 83s. 6d., which is 20s. a ton better than Australian coke for smelting purposes, as compared with Newcastle coke delivered by rail at £4, the cost being £1 10s., making it £5 10s. a ton.

780. You are speaking of Australian, as if the Newcastle and the Lithgow coke were of the same character? No. The Lithgow coke is so inferior for smelting purposes that it is useless to take it into consideration in connection with the proposed railway. So much is that so, that in a test made by metallurgists at Broken Hill it does not appear to have been tried. Even the mines in the vicinity of Lithgow do not use it. For £4 3s. 6d. a ton they can get a coke at Broken Hill 20s. a ton better than the best that can be got in the colonies, which will cost by rail £5 10s. a ton, so that really to compete with the English coke the colonial article would require to be landed at Broken Hill at £3 1s. 6d. instead of at £5 10s.

781. *Mr. Cox.*] What is the rate at which coke could be carried from Lithgow to Broken Hill? I have not been able to obtain an estimate.

782. We are told that it can be carried for less than  $\frac{1}{2}$ d. per ton per mile? The Railway Department may make some extraordinary concessions. My estimate is based on what I have paid recently from Newcastle to Orange, and I say that it would be necessary to deliver the coke at Broken Hill at a cost of £3 1s. 6d. instead of at £5 10s. Port Pirie is the natural outlet for the Broken Hill territory, and this is manifest from the fact that the tonnage at Port Pirie, which was considered the out-port, is, in consequence of the development of Broken Hill, larger than that of Port Adelaide. I say that Lithgow coke is unfit for smelting purposes, and with the excellent quality required for silver-smelting it would be useless. The mines in the immediate vicinity of Lithgow, such as the Tom Lewis Ponds, get all their supplies of coke from Newcastle, although Lithgow coke is available for them almost at their doors. Their getting their supplies of coke from Newcastle demonstrates that it would be useless to expect a trade at Broken Hill for Lithgow coke. They buy it at Newcastle, pay a considerably advanced price for it, pay railage for 294 miles, rather than take the Lithgow coke, distant by rail only 96 miles. General merchandise imported from the United Kingdom can be delivered on the sea-board at Port Pirie quite as cheaply as it can be delivered at Sydney, and the difference in freight from Port Pirie to Broken Hill, or Adelaide to Broken Hill, would be so immeasurably superior to what it would be from Sydney that, unless the railway people would carry the stuff almost for nothing, the Sydney merchants could not possibly compete for the business. Through passengers from Queensland or Sydney would never be likely to go to Adelaide by this route, as it would prevent their going through Melbourne. Ninety per cent. of the passengers would rather go through Melbourne and Adelaide, where most of them would have business, than through the desolate country which they would have to pass through to reach Broken Hill, *via* Cobar and Wilcannia. Another objection to the proposed line is that when the river is navigable the trade will go to South Australia, no matter what rates we charge. Competition by railway with water carriage is manifestly impossible. I will read Mr. Schlapp's report on the quality of various kinds of coke. It is as follows:—

15 January, 1890.

THE results obtained from different brands of coke are as follows:—A. As we have used more Brancepeth than any other brand we will take this coke as a basis of comparison:—

*Hood's coke.*—This coke contains about 1 per cent. more ash than A; the coke, however, is firmer and makes less waste in transit, so that the final results are fully equal to A.

*Shamrock coke.*—Ash contents about 1 per cent. higher than A. This coke is very firm without being too heavy, it makes the least waste (fine coke broken in transit) of any coke we have had, and is fully equal to A.

*Purified coke, Newcastle.*—Contents of ash, very variable, 8 to 15 per cent.; besides making a large amount of waste in transit, this coke is not hard enough to bear burden in the furnaces. I do not consider this coke profitable unless the price were at least 20s. less than A.

*Co-operative coke.*—Very inferior; is not worth the freight to the Barrier.

*Kennedy Bros., Grey Valley.*—Contents of ash, 9 to 10 per cent.; coke is very small and friable; it is not strong enough to bear the burden in the furnace. Price would be about same as purified coke.

*Marley Hill.*—This is the poorest English coke we have ever had; besides containing 9 to 10 per cent. of ash, it is very friable; the waste in screenings is very heavy, and the coke is not strong enough to bear the burden of the charge in the furnace.

*Australian Coke-making Co.'s, Sydney.*—Contents of ash, 13 per cent.; the coke is very firm, and makes very little waste in transit; it is a first-class coke, barring the ash; its value to us would be 18s. to 20s. less than A.

*Bull's Coke Co., Sydney.*—Contents of ash, 14 to 15 per cent.; coke is firm and large, making little waste in screenings; is a first-class coke, barring the ash; value about the same as Australian Coke-making Co.'s.

*Kelley & Co., Brisbane.*—Sample of only 5 tons—coke contained 8 per cent. ash; it is a first-class hard coke, and is worth 12s. to 14s. less than A. (A later sample contained 14 per cent. ash.)

*British and Westport coke.*—Contents of ash, 5 per cent.; other qualities of coke very good; if this company can guarantee to keep the quality of their coke up to sample and burn the coke a little harder it will be equal to A. I think the English coal used in the manufacture of this coke is brought out as ballast in coke ships, and would therefore be from different pits; this might make the products from their ovens variable.

*Brydon, Jones, & Co.*—Coke ex "Annie Brown" contained 16 per cent. ash; it is a very large, firm coke, free from dust, and if the ash could be reduced by washing would be very fair coke for our purpose.

*Waterstorm coke.*—No sample received.

*Brunner Coal Co.*—No sample received.

H. H. SCHLAPP.

783. *Mr. Trickett.*] There is nothing in Mr. Schlapp's report about Lithgow? They will not use it. They say, "It does not suit us. We can get English coke 20s. a ton less than you can supply it for." There

is

A. Brown,  
Esq., M.P.  
18 Mar., 1891.

A. Brown,  
Esq., M.P.  
18 Mar., 1891

is one other thing to which I would call attention. I said just now that from a prominent man in South Australia I had received a communication in reference to this railway, and, as I stated, I am not at liberty to disclose the writer's name, but I will read the letter to the Committee, who I know are only anxious to arrive at a correct conclusion. He says:

"I have no apprehension whatever about the Colar-Cockburn line. I see now that the estimated cost of construction has gone up to £5,000 per mile. If they bring the line simply to Broken Hill, it will, as I have always maintained, be a collecting ground for at least 100 miles of New South Wales country for the Broken Hill district and South Australia. If they bring the line to Cockburn it can only be for that express purpose, and I think there will be a very considerable amount of opposition in New South Wales before any scheme is carried out which would have the effect of still more diverting the trade from Sydney and the New South Wales railways."

That is the opinion of a gentleman connected with South Australia, and one very competent to offer an opinion.

784. *Mr. O'Sullivan.*] I should like to direct your attention to the evidence of Mr. Lane, late Mayor of Broken Hill. He says: "If we could get coal at about 30s. or 35s. per ton we would use it exclusively in preference to wood." Do you think you could get coal to Broken Hill at a cost of 35s. per ton? No.

785. You say that is not possible? It is not.

786. With reference to coke, Mr. Lane was asked, "What does your coke cost you?" and his answer is, "About £5 5s. per ton; the railway freights are about £1 18s. 9d. per ton?" I have given the price at 83s. 6d. per ton.

787. There is a great difference between Mr. Lane's estimate and Mr. Schlapp's? That is not Mr. Schlapp's. It is taken from the records of a Broken Hill Company. Mr. Schlapp has only given a scientific opinion in reference to the coke.

788. Mr. Lane says the cost is £5 5s. a ton;—how are we to get over that discrepancy? I cannot tell you. I was contracting for the supply of coke at the prices which I have stated.

789. Mr. Lane was asked, "Where does the coke come from?" and he said, "It is nearly all English. We have tried some of the Newcastle coke, and it did not give satisfactory results. In fact we could not use it, it was so high in the percentage of ash";—do you not think that the reason for buying English coke is that it is superior, and not cheaper, than the colonial? It is cheaper to them to buy, and superior because they get better results from it.

790. Mr. Lane was asked his opinion about Newcastle coke, and he condemns it, saying that it is not properly strained and manufactured;—do you not think that one reason why they do not buy the colonial coke is that you have not perfected your system of manufacture? We have it as perfect as we can have it with the quality of coal that we have got.

791. Are we to understand that the Newcastle coal is not as good as the English coal? I do not think it is. I think the Newcastle coal is, all round, superior to any coal in the world, but the English coal possesses specific qualities for cooking, for steam, and for gas purposes.

792. Is the same mode of treatment adhered to in making coke from all classes of coal? No.

793. Mr. Lane was asked this question, "It would be used exclusively if you could get it?" and his answer was, "Yes, if we get it for 30s. or 35s. per ton. I would use 100 tons per week myself. Then the other companies would use in proportion.";—I presume your answer is that you cannot supply it at that rate? We could not. The price from Port Pirie to Broken Hill is 29s. 6d.

794. *Mr. Garvan.*] Mr. Lane says that the freight is 33s. 9d.? That is delivered at Broken Hill, not Port Pirie.

795. Then that must be exclusive of the railway freight? The railway freight is 29s. 6d.

796. *Mr. O'Sullivan.*] What would be the ordinary price of coal delivered at Port Pirie? About 20s. a ton.

797. And do you think it impossible for a railway to Broken Hill to deliver coal there at less than 35s. a ton? I do.

798. Even if special concessions were allowed in order to develop the industries of the country? Certainly.

799. You are aware that there are very large shipments of bullion from Broken Hill, *via* Port Pirie, to Sydney? Yes; it suits the particular steamers that are engaged in that part of the business to have to come round that way.

800. *Dr. Garran.*] You say that in view of the federal arrangement that may be forthcoming, it is not desirable to make a railway to our frontier which would be longer than a railway already existing in South Australia? I do.

801. But is it not a fact that the southern, western, and northern boundaries of New South Wales are all further from Sydney than from the rival capitals; is not Albury nearer to Melbourne than Sydney;—is not Wentworth nearer to Adelaide than Sydney, and Tenterfield nearer to Brisbane than Sydney? Yes.

802. You would not object to our making lines right through? No; but I hope the time will come when the trade will be allowed to find its natural channel.

803. You do not object to these lines to the frontier simply because the frontier is further from Sydney than from the other capitals? No.

804. Then why should you object to this through route as being anti-federal? Because I think it is a thing that ought to be settled by the Federal Parliament. If we ever get a Federal Parliament this railway may never be built.

805. Do you object to making a line from Hay to Wentworth? The objection to that line is that it would draw trade away from New South Wales.

806. I say do you object to it on federal grounds? I am not in a position to speak upon that subject.

807. This colony, so long as it has its own self-government, must make its own railways to the frontier? I think if we had a Federal Parliament many of the railways that we are now proposing would not be constructed.

808. Suppose the power to make the railways still remained with the provincial government? Then we shall never have federation.

809. Are you aware that Broken Hill is now, in population, the second city in New South Wales? I am not—I should doubt it.

810. Has any other city in the colony more than 12,000 people? Newcastle must have 25,000, and, including the coal mining townships, 70,000 people.

811. Supposing Broken Hill to be third city in the colony, would it have a claim to be connected with the metropolis? I do not think it would, because this would not be the metropolis for that place. I say that place would take its ratio from wherever the capital would be. It would be connected with that some day, and its trade would go to South Australia, where it ought to go.

A. Brown,  
Esq., M. P.  
18 Mar., 1891.

812. But that part of the country is under the Government of New South Wales? It is; but it is more South Australian in spirit than anything else.

813. We have the responsibility of governing it? Yes.

814. Do you not think a city of that size has a fair claim to be connected with the metropolis that governs it? No. I think we can spend our money in a much better way.

815. On the ground that the trade goes to Port Pirie, you would not allow Broken Hill to be connected with Sydney at all? I would let the trade go into its natural channels.

816. Would that prevent it? Yes. The Government would establish differential rates, and impose all kinds of restrictions to draw the trade to Sydney.

817. You say that in spite of all this the trade would go? I believe that a great proportion of it would. We should collect a quantity of stuff for the South Australian railways. No doubt some portion of the trade would come to Sydney.

818. Would not that be an enormous advantage to the people of Broken Hill to have cheaper transit than they have now? Yes; but you are going to give it to them at the cost of the general community, and I object to that.

819. Suppose the Railway Commissioners are of opinion, having carefully studied the matter, that they could carry to Broken Hill at a rate that would be remunerative, should we be making any sacrifice then? I am not going to attach more than ordinary importance to the opinion of the Railway Commissioners. I am not satisfied with the Railway Commissioners' estimate with regard to the coal traffic, as it has come under my notice. The Commissioners have promised to supply me with information showing that our traffic from Newcastle was a losing game, but they have not supplied it yet.

820. From the mines? I am speaking of the mines at Newcastle.

821. Do you mean that the Commissioners said that the trade from the mines to the port of Newcastle was not a paying trade? They did say so, and I asked the Chief Commissioner on what ground they made the statement, and he promised to furnish me with the information. He qualified his statement by saying that some of his subordinates had given a wrong basis. His predecessor in office had told me previously that the minimum rate gave something like 6d. per ton. I think we are only in our infancy with regard to the coal traffic.

822. Do you mean to say that it has been officially stated to you that the coal traffic on the Western line pays better than the traffic on the Northern? No; I believe that every ton of coal that they carry on the Western line is carried at a loss, and that they have a differential basis for Newcastle and the north, as compared with the other lines.

823. We are speaking of the statement of the Commissioners on the matter. Have they made a statement in regard to the profit on the Southern and Northern lines, which you dispute? Yes, with regard to the Northern line.

824. And with regard to the Western and Southern? No; I have had no communication with them with regard to that. I know what the regulations are in connection with the Northern line, and what obtains on the Southern and Western lines. I have to find 300 tons before they will move an engine. The traction is 2 miles, and the minimum charge is 10d. a ton. But I have seen them coming up the Illawarra line bursting themselves with a load of 80 tons.

825. What do they charge per ton per mile? One penny, and they find trucks.

826. On the Southern line? They charge 1d. a mile, but they charge me a minimum of 10d.—to me about 2d. a mile.

827. By your evidence you want to cast some doubt upon the accuracy of the calculations in regard to the traffic on the proposed line? Yes, as regards the coal traffic.

828. You think that the Commissioners have been misled? I do. The coal traffic on the Southern and Western lines does not pay.

829. The tendency of your evidence is to warn the Committee against trusting those calculations? I do warn them.

830. And if we are told that coal can be carried at  $\frac{1}{3}$ d. a ton per mile, you doubt it? I doubt it.

831. You are aware that this Committee has greatly exerted itself to reduce the gradients on the railways? Yes.

832. And we are promised that the line from Nyngan to Broken Hill shall not have a grade exceeding 1 in 100 all through? Yes.

833. And that when that grade is obtained they can carry at a minimum freight. Therefore you can hardly state the cost of freight? No, you cannot give a fair estimate.

834. We cannot from present experience? No, you could not. I made an inquiry of the Department as to an estimate to carry coal and coke on this particular railway, and they sent me in a memorandum, and asked if it was to develop a new trade, because they would make a difference.

835. Have you any information to give us to disprove that, with a gradient of not more than 1 in 100, we could carry coal at a profit with a charge of only  $\frac{1}{3}$ d. a ton? I have no information on that score. If they can do that from Nyngan to Broken Hill then they can do it with us at Newcastle, because the gradients there are 1 in 100, or, at any rate, easy gradients.

836. All the way to your mine? Yes. The new line from Sydney to Newcastle is not so. I think that the load to Wallsend is eighteen to twenty trucks—to our mine it is thirty trucks. A load on the mountains is eight or nine trucks.

837. You cannot disprove that they can carry at  $\frac{1}{3}$ d. per ton per mile? I cannot. It may be so but I doubt it.

838. You doubt it because you have had reason to doubt the accuracy of certain calculations from the same quarter? Yes.

839. You cannot point out any evidence to convince the Committee that it is a wrong estimate? No. The Commissioners are the persons authorised to give you the information.

840. We have had evidence before us that the trade of Wilcannia alone is very considerable. Have you any reason to doubt that? No, except from information from former residents of Wilcannia.

841. Did you consider the evidence that was brought before the Sectional Committee on the line? I read it in the press at the time.

842. You had no reason for checking it? No.

843.

- A. Brown,  
Esq., M.P.  
18 Mar, 1891.
843. You say that the river must always be a successful competitor when the water is up? Yes.
844. We have it in evidence that there is very little competition with the railway at Bourke from the river, and the river is in a good state this season? There must be some exceptional reason for it—perhaps the rates are very low.
845. We are told that the rates are higher than they were, yet the railway gets nearly the whole of the wool in competition with the river. Can you disprove that? I do not believe that they get all the wool.
846. Not all, but the greater portion of it. They get an increasing portion? Yes, that is true. There is an increase throughout the country and they are entitled to some of it.
847. It is in excess this season—do you doubt that? I do. I doubt their being able to compete with the river traffic at any time; I do not think that any railway can compete with water carriage.
848. We have the assurance of the Secretary for Railways that that is the case this season? I should like something more than his mere statement. The trade must have increased in consequence of other things, apart from the question of competition.
849. We are told that the railways are getting an increased proportion of the trade at rates higher than those which were in force some time ago; do you doubt that? I do.
850. You think that if we went to Wilcannia, lower down the stream, we should have no chance against the competition of the boats? Not when the river was up.
851. The storekeepers at Wilcannia say that they would prefer to trade with Sydney? Oh, yes.
852. You think their evidence is to be taken with qualifications? Yes.
853. And you think the saving of time would be nothing, as people could get their supplies down the river? Yes.
854. You think that there would be no great settled population on the line? I do.
855. Suppose we could construct a line that would settle population, would you object to that? I do not think so. I do not think there is any necessity for this railway at present. There is a disposition now to ask for a railway *via* Forbes, and that way.
856. You would not patronise that any more than any other? No.
857. Not even if it could be shown that we could settle a line of farmers along the route? No.
858. You have an invincible repugnance to the proposed line? I think there is no necessity for it.
859. Your opinion is that as soon as federation is accomplished, differential rates will disappear? Most assuredly.
860. And that free trade in freights will prevail over the whole continent? Yes.
861. And every producer everywhere will fetch and carry from the most convenient port? Yes; and that no one port will have preference over another.
862. Your opinion is that the Federal Government will exercise its authority over that matter? Yes.
863. And prevent differential rates from being imposed, even if they do not own the railways? Yes, but I do not know how they can do it without owning the railways. In America they had to employ inter-State Commissioners to settle the question.
864. You have gone largely into the question as to the use of coke. Is smelting done with coal? No, never; not silver smelting.
865. Are you sure as to the correctness of your statement that the quality of the coke depends upon the quality of the coal? Yes, I think so; and I have had something to do with it. A certain quality of coal produces better coke than other kinds of coal.
866. The best of all modes of manufacture cannot get good coke out of inferior coal? No; I cannot produce coke from my coal as good as the Wallsend Company can produce from theirs.
867. As far as the ash is concerned, does not that depend upon defective washing in the first instance? I do not know. The particular company to which I refer wash their coal.
868. Do they crush it fine enough, and wash it thoroughly? They have done everything they could to sustain the trade by endeavouring to produce an article which would correspond with the requirements of the Broken Hill smelters.
869. Have they not received reports from London drawing attention to the washing process? I do not know.
870. You would not say that they are doing the very best with their material at present? Not absolutely; but I know that the Purified Coke Company wash their coal, and that they have sent out experts to ascertain what they could do to improve their present plant.
871. Do you think the coke companies have given the matter that thorough attention which they would do if the trade were larger? I think it has been watched as much as it is likely to be.
872. You know the coke manufactories of Newcastle? I do.
873. Do you think they are really doing the best that can be done with the material? They might make some slight improvements, but the result of a visit of one of the men in charge to some of the places in England was to lead them to the conclusion that they could do very little towards improving their present means of production.
874. He had been to England to see what improvements he could introduce? Yes; and he found that one or two improvements might be made. But we have not been able to get into the trade again, nor shall we whilst the English coke is available at the present price.
875. We must either bring the quality of our coke up to that, or send it in at a cheaper rate? Yes.
876. You do not see how we can do that? I do not.
877. As far as the coke trade is concerned, you see no hope? I see none.
878. If we were to bring the inferior ores to our coal mines, where we could make moderately good coke, would that pay if there were freights both ways? I should not think so.
879. Are you familiar with the smelting of copper ore at Waratah? Yes.
880. Did it pay to send inferior ore to Waratah and to send coal back? At a nominal freight. That is what it was.
881. Is not  $\frac{1}{2}$ d. a ton a nominal charge? It comes to a good sum in 600 miles.
882. Do you not think there is the same chance of making the traffic pay by railway as there is by sea? I do not. In the case alluded to it is a failure. One of the companies is pretty well insolvent. They have smelted very little for years.
883. You do not mean to say it would pay better to send poor ores to Port Pirie and round to Newcastle? I could not say that.
884. That would be a heavy charge? It would.

A. Brown,  
Esq., M.P.

18 Mar., 1891.

885. You are aware that there is a large quantity of the poor ores? Yes; at every mining place.
886. Then dealing with them is an economical problem? Yes.
887. At present the tendency is to smelt at Broken Hill instead of at Port Pirie? Yes.
888. According to the evidence taken at Broken Hill by the Sectional Committee, they prefer to have all the arrangements with regard to the ores under one inspection, so the tendency at present is to concentrate all the processes at Broken Hill? Yes.
889. The cheapness of fuel, then, is a matter of supreme importance? Yes.
890. And if we could manage to put our coke down there at 1s. or 6d. below the English price, we should get that trade? No; you will find all they have to do is to import further supplies of coke.
891. They would not, unless they could get it cheaper than we could supply it? Yes; but you cannot get the coke to compete.
892. Suppose we could? Well, then it would be a matter for the company.
893. You are speaking only of coal at present? Under our conditions we cannot supply coke to Broken Hill.
894. Do you think there would be any passenger traffic across there? I do not think so. I think that if I were a passenger I should go through Melbourne and Adelaide.
895. Do you think that passengers would not prefer to go straight to their destination? In nine cases out of ten the passengers would have business in one or other of those cities on the route. I know that I should go *via* Melbourne and Adelaide.
896. It would take you longer? It would take me longer, no doubt. The journey between Sydney and Broken Hill by this route would be more expeditious.
897. It will be a shorter line between Sydney and Adelaide when this line is completed, so that it will be a better mail route? It will be a quicker one.
898. It will be a better route for passengers arriving by the mail steamers at Port Adelaide? I do not think so. When they got to Adelaide they would go to Melbourne. They would prefer the wide gauge route.
899. By this route they could do the journey with less discomfort? I do not know a better route than the present one from Adelaide.
900. Do you know a better one from Melbourne than the Albury route? The passengers would be heartily glad to get into the broad gauge trains at Albury.
901. You think, then, that there will be no passenger traffic on the proposed line? Not much. Of course, these are only my opinions with regard to it.
902. You have mentioned the bridge as being a very great difficulty;—are you aware that our engineers have looked into that question? No.
903. They tell us that there is a good foundation for a bridge there;—do you doubt that? I have not much faith in our colonial engineers.
904. With regard to what bridge have you been disappointed? We were told by our engineers that the bridge over the Hawkesbury was to cost £750,000, yet it was actually built for £400,000.
905. Could we not call in the aid of Americans? Yes. But as you put it to me the question was raised as to my opinion of the gentlemen in charge of the Public Works Department. The country is strewn all over with monuments of their indifference, incapacity, and inability.
906. Yes, but they know what has been done. We have one example at Shoalhaven and another at the Hawkesbury? Yes; it may be possible to get something of the same kind in this instance. I do not want to reflect upon our engineers, but we ought to get an estimate from outside sources.
907. If they tell us that they can do the work at from £60,000 to £75,000, we need not suppose that it will cost much more? It would be well to ascertain whether it would or not.
908. You are of opinion, I gather, that what are called national reasons, are practically no reasons at all? I have begun to look upon the term "national" as synonymous with "Sydney."
909. Is Newcastle as near to the port of Broken Hill by land as Sydney is? No.
910. Suppose a line were made through Cassilis and on to Dubbo, would that bring Newcastle nearer? It would not be so near.
911. Newcastle is out of it altogether? Yes. I am not here as the member for Newcastle.
912. You have no feeling in the matter? I am not concerned about Newcastle. I am only giving my evidence conscientiously in opposition to the project which I shall oppose in Parliament if the Committee pass it.
913. You do not think that Newcastle is to be in any way injured? No.
914. *Mr. Copeland.*] What is the price of Newcastle coal in Sydney at the present time? It varies. The coal from some collieries is 14s. 6d. a ton; but that from some of the inferior small mines is about 12s. 6d. a ton.
915. Would that be taking delivery at the railway? Yes; that would be taking delivery from aboard ship. The coal comes round in steam colliers.
916. What would it cost to get the coal from the colliery to the railway supposing we wanted Newcastle coal? You would have to put it in the railway trucks at Darling Harbour. That would cost another 1s. a ton. Some collieries like Wallsend, will not sell for less than 15s.
917. Suppose a trade should spring up between the Newcastle collieries and Broken Hill, the coal being sent by rail, what would it cost to get the coal delivered as far as Sydney by water, and put into railway trucks? It would cost 15s. a ton.
918. We have here the evidence of Mr. Bristowe, the accountant to the Broken Hill Proprietary Company, that Newcastle coal delivered at the Broken Hill mine costs £2 7s. 1d. a ton;—he says, "We buy it at Port Pirie at 21s. 5d. per ton, and the difference between 21s. 5d. and £2 7s. 1d. is the amount of the carriage from Port Pirie to the mine"—you gave some figures as to the railway rates from Lithgow to Broken Hill? Yes.
919. I have here a statement which was published on the 1st. August, 1890, by the Railway Commissioners, which shows that one of their rates for ores is 2s. 3d. per truck per mile for every truck over thirty per week, the minimum per truck being 15s. There would be no necessity for a minimum in this case, as you will perceive that that would be 11 farthings per mile upon 6 tons, which would be something less than  $\frac{1}{4}$ d. per ton per mile;—what do you pay per ton per mile from your mine to the shipping at Newcastle? We used to pay a minimum charge of 10d. Some of us do it now.
920. Is that in the owners' or in the Commissioners' trucks? In the owners' trucks. We have to find our own waggons. There are some collieries within a few yards of the shoots, and the minimum charge for them is 6d.
921. That is in the owners' trucks? Yes.

A. Brown,  
Esq., M.P.  
18 Mar., 1891.

922. What is the price charged in Commissioners' trucks? We never use Commissioners' trucks, but some use those D trucks.

923. As a matter of fact there is a specific charge made, I suppose, as a minimum rate, but the same rate is not extended when the journey is a lengthy one;—I suppose they charge at a much less rate for 50 miles than they do for 1 mile? I am not an authority upon that point.

924. The distance from Lithgow to Broken Hill is 639 miles, and the rate at present is, for 6-ton trucks, 11 farthings—that is less than  $\frac{1}{4}$ d. per ton per mile. That is irrespective of distance. Would it not be a fair presumption that if they charged that and can make it pay, that when they have only one loading and one unloading for 630 miles they would be able to do it for one-third of a penny per mile? The presumption is in that direction, no doubt.

925. Do you know anything of the railway rates in America for minerals? No.

926. You are not aware that they are carrying minerals at even less than one-third of a penny per mile? I have heard that.

927. If the Broken Hill Company at present is paying £2 7s. 1d. for Newcastle coal, going round by way of Port Pirie and then by rail, would they not be able to supply coal from Lithgow to Broken Hill, even at the rate of  $\frac{1}{4}$ d. per ton per mile, which would be 25s. per ton for the route;—would they not be able to compete with Newcastle coal taken round by Port Pirie? It is not the Newcastle coal alone, there is the river, the South Australian railways and the Silverton tramway.

928. But we have it in evidence that all the coal they are using is Newcastle coal, for which they pay £2 7s. 1d. a ton delivered at the mine? That is about the highest rate you could estimate it at.

929. If you deduct 25s. for the railway rate from £2 7s. 1d., that would leave £1 2s. 1d. per ton as the value of the coal at Lithgow. Can you say whether the coal at Lithgow would be as good for steam purposes;—would it be as good or nearly as good? It would be nearly as good for all practical purposes.

930. Then do you think that if there was a margin of £1 2s. 1d. per ton between the railway rates and the value of the coal obtained at Lithgow, that would enable the Lithgow people to deliver their coal at Broken Hill? Yes, if there was that margin, and on your figures I admit that there is a margin.

931. Do you know what is the selling price of coal at the mines at Lithgow? Three shillings or 4s. a ton, I believe.

932. I think they are supplying the Government at about 4s. a ton? Yes.

933. You perceive that the best coal at Lithgow at 4s. a ton would pay the Government 25s. a ton for haulage, and the Lithgow coal could be delivered at Broken Hill for 25s., as against £2 7s. 1d., which they are paying for coal from Newcastle, going round by Port Pirie, and by the railway and tramway? I admit all these figures. But in supporting the proposed railway you have not to speculate on possibilities, but to find out what will be a certainty. You have given us the highest price of coal. At present Newcastle coal is 11s. a ton, but how long it will remain at that is a matter of speculation. I should not be surprised to hear during the next few weeks that it had gone down to 7s. a ton. The competition on the coast by steam tonnage is considerable, so you must look at the possibility of freights between Newcastle and Port Pirie being considerably reduced. You might find that the South Australian people themselves will fight for this trade, because they will have the trade if they have to reduce their rates. The Silverton tramway will follow in the same course. These are matters which you have to consider.

934. Of course, you admit that Broken Hill will follow the usual principle, and will go to the cheapest source of supply? No doubt about that.

935. At the present rates for coal? At any rates; but it is not fair to take the present rates, because, whilst you are taking one side of the question, it might be shown that coal would rise in price. There might be a strike.

936. You perceive that there is a margin at present on their estimate? Yes.

937. A margin to the extent of supplying coal at 29s. per ton by railway, as against Newcastle coal at £2 7s. 1d. a ton? Yes.

938. Would that not leave a margin for the Newcastle people to supply similar coal to what has been used at present? Not at all.

939. Not if the coal were sent by steamer to Sydney? No; it could not be done. The moment you commence to handle coal in the way you are speaking of you destroy its value.

940. You said that it could be put into the Commissioners' trucks at Darling Harbour at 15s. per ton? Yes.

941. If the railway were open to Broken Hill, and you could deliver coal at Darling Harbour into the Commissioners' trucks at 15s. a ton, you still consider that the coal from Sydney, allowing a higher rate, because you will have a margin of 2s. 1d. as between Sydney and Newcastle on account of the higher grade;—do you think you would be able to supply it, sending it all the way from Sydney to Broken Hill by railway, at the same rate that you are now paying for coal going round by Port Pirie? You mean, of course, with reference to the price of coal. I suppose you are taking the Commissioners' estimate.

942. I am taking the advertised rates, making no allowance for reduced rates which they are of necessity bound to make when they undertake these long journeys. In all probability they will charge a lower rate for a long journey than for a short one; I am not taking that into consideration yet; you will see that they will be able to send coal even from Newcastle, if it is delivered by ship at Darling Harbour? Well, I have no faith in it at all. The figures, as you put them, are incontestable on that basis.

943. I suppose you know that they are timbering their mines with Oregon pine? Yes.

944. We have it in evidence that that timber will not last many years, and that if hardwood timber could be supplied from New South Wales they would be very glad to use it; do you think it likely that a trade in mining timber would spring up? If they carry timber at the same rate as the coal, I do not doubt it.

945. Do you know of any practical reason why they should not carry timber for mining at the same rate as they would carry coal? I do not. I have never been able to ascertain the basis on which the railway people work their business.

946. At any rate, if the line were constructed, I suppose the best principle would be to get as much traffic as they possibly could? Certainly, provided that it paid.

947. We have it in the evidence of Mr. Bristowe that the English coke costs at the mine £5 5s. a ton. That was stated on the 28th October, 1889. We have here the official report of the Broken Hill Company up to the 12th December, 1890, which shows that at the present moment they are still continuing to pay £5 5s. a ton for English coke delivered at the mine. But you stated in your evidence that English coke cost 83s. 6d. per ton? My information came from the company themselves.

948. There is the report of the company and the evidence of the accountant? I do not doubt that I could furnish you with tenders from a firm I am connected with offering to supply English coke at the price which I have mentioned.

A. Brown,  
Esq., M.P.

18 Mar., 1891.

949. Then here is the evidence of Mr. Lane, who was Mayor of Broken Hill. He was asked this question: "Supposing a railway were made by way of Wilcannia or Menindie, and you could get New South Wales coal from Bulli, Wollongong, or Lithgow here, would it be practicable to send trains of coal from the coal mines there to Broken Hill and give a return cargo of ore and have smelters at each end and to do that profitably?" His reply was, "The question of smelting, of course, would be to have a place where flux is handy and fuel and water. If there were smelters at the other end we could always return cargoes, and on the other hand if the carriage on bullion was less or the same as is now being sent *via* Port Pirie to Sydney, we could send all the trucks back loaded with bullion." Then the next question is "But you would not have the same bulk of bullion to send back as you would have of coal coming here?" and his reply is, "Yes; we would have more tonnage of bullion than we would of coal coming in." Then another question was as follows: "Then you could send a full load of bullion back in return for a full load of coal?" and his answer to that was "Yes."—So you see the mining managers themselves have entertained the idea, of course, on the supposition that if they keep the trains loaded both ways they will get the railway carriage at reduced rates? Yes; I should not doubt that. Their business is to maintain competition. If they can get the New South Wales Government to make a railway, they will have the South Australian people in their own hands.

950. Speaking on what you term national grounds, do you think it a desirable thing for this colony to have to pay the expense of governing Broken Hill, and yet for us to make no attempt to reclaim the trade that should properly belong to this colony? It all depends upon the cost.

951. Suppose we could do it without cost? If you could do it without cost, it would be right to make an effort to do it.

952. Is it not a fact that in America they have been in the habit of building railways right out into the country, where there are no large towns, on the supposition that trade would follow the trains? Yes.

953. On that ground do you not think that we are justified in making a railway to develop those mines? I do not think so with the limited population we have to day.

954. But is not the building of railways the way to increase the population? Yes; but the comparison with America is not a fair one. You must consider the hundreds of thousands of people who arrive in America every year.

955. Have not the Americans made railways where there was no population? Yes; and they have made towns.

956. Would you then, from your point of view, advocate the building of a railway, or defer the matter for all time? I would not defer it for all time; but merely for the present.

957. Until other interests arose, and we might have to pay more for the resumption of the land? I think that when you make a railway, you ought to be in a position to resume the land for nothing. I should vote for an Act of Parliament giving that power.

958. Do you know whether the railway from Newcastle to Sydney is paying? I doubt it.

959. Were you one of those who advocated the building of it? I was not; I opposed it; and also the Illawarra line. I think they are both twenty-five years ahead of their time. The Newcastle line is made along a coast route, where the land is of no value.

960. You think we are not justified in making a railway into the interior to connect Adelaide and Sydney by the shortest route? I do not think you are.

961. Notwithstanding that we should tap several large mining centres, including Cobar, Wilcannia, and Broken Hill? I do not look upon that line to Cobar favourably—I opposed it.

962. Notwithstanding that the taking of the line there may have the effect of re-opening the Cobar and other copper mines? If a small copper mine of that kind requires expenditure, the country ought not to spend the money.

963. Do you think the Cobar Copper Company is a small company? It is small compared with the large companies of America and England.

964. Are we to understand that in your opinion, railways should only be made where population is already established? They should be made where there is a prospect of their paying. We are deep enough in debt already, and should not undertake this line. We could spend the money more profitably on irrigation.

965. What did you say was the population of Newcastle? Between 60,000 and 70,000.

966. What is the population of Newcastle itself? About 20,000.

967. I have just obtained information from the Government Statistician that the population of Newcastle is 15,000, and the total population of the whole district 52,892? I am only telling you as far as I can see myself. I think there are 7,000 or 8,000 electors on the roll for the city.

968. *Mr. O'Sullivan.*] Starting from Newcastle at present, and going to Broken Hill, *via* Nyngan, would be very much longer than going *via* Werris Creek? Yes.

969. If a line is made to Werris Creek, that would materially shorten the distance between Newcastle and Broken Hill? Yes.

970. And improve your chance of competing in the coke and coal trade? I do not believe it. The gradients over the Liverpool Range must be excessive.

971. The charge would be less? Then I should hope we should have the same rates extended to us at Newcastle as they would have on the south and the west; but I doubt it.

972. Do you think it possible, by a special rate, to develop the resources of the country so that you could land coal and coke and bring back bullion? I do not think it is possible from my experience. I know what the wear and tear of rolling stock is.

973. You know that the Government are working a species of protection by carrying wool and other produce at such rates as will keep the trade in the country? Yes.

974. It is possible that in the future they might make a special rate? I presume they would have to make a special rate to attract trade.

975. You do not think there would be much passenger traffic between Sydney and Broken Hill if the line is made? No.
